## Indian Journal of Public Health Research & Development

**EXECUTIVE EDITOR**

Vidya Surwade  
Associate Professor, Dr Baba Saheb Ambedkar, Medical College & Hospital, Rohinee, Delhi

### INTERNATIONAL EDITORIAL ADVISORY BOARD

| 1.  | Dr. Abdul Rashid Khan | B. Md Jagar Din, (Associate Professor)  
Department of Public Health Medicine, Penang Medical College, Penang, Malaysia |
| 2.  | Dr. V Kumar | (Consulting Physician)  
Mount View Hospital, Las Vegas, USA |
| 3.  | Basheer A. Al-Sum | Botany and Microbiology Deptt, College of Science, King Saud University, Riyadh, Saudi Arabia |
| 4.  | Dr. Ch Vijay Kumar | (Associate Professor)  
Public Health and Community Medicine, University of Burauni, Oman |
| 5.  | Dr. VMC Ramaswamy | (Senior Lecturer)  
Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur |
| 6.  | Kartavya J. Vyas | (Clinical Researcher)  
Department of Deployment Health Research, Naval Health Research Center, San Diego, CA (USA) |
| 7.  | Prof. PK Pokharel | (Community Medicine)  
BP Koirala Institute of Health Sciences, Nepal |

### NATIONAL SCIENTIFIC COMMITTEE

| 1.  | Dr. Anju D Ade | (Professor)  
Community Medicine Department, SVIMS, Sri Padamavati Medical College, Tirupati, Andhra Pradesh |
| 2.  | Dr. E. Venkata Rao | (Associate Professor)  
Community Medicine, Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa |
| 3.  | Dr. Amit K. Singh | (Associate Professor)  
Community Medicine, VCSG Govt. Medical College, Srinagar – Gahrwal, Uttarakhand |
| 4.  | Dr. R G Viveki | (Associate Professor)  
Community Medicine, Belgium Institute of Medical Sciences, Belgium, Karnataka |
| 5.  | Dr. Santosh Kumar Mulage | (Assistant Professor)  
Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS), Karnataka |
| 6.  | Dr. Gouri K. Padhy | (Associate Professor)  
Community and Family Medicine, All India Institute of Medical Sciences, Raipur |
| 7.  | Dr. Ritu Goyal | (Associate Professor)  
Anaesthesia, Sarnwathi Institute of Medical Sciences, Panchsheel Nagar |
| 8.  | Dr. Anand Kalaskar | (Associate Professor)  
Microbiology, Prathima Institute of Medical Sciences, AP |
| 9.  | Dr. Md. Amirul Hassan | (Associate Professor)  
Community Medicine, Government Medical College, Ambedkar Nagar, UP |
| 10. | Dr. N. Girish | (Associate Professor)  
Microbiology, VMS&RC, Bangalore |
| 11. | Dr. BR Hungund | (Associate Professor)  
Pathology, JNMC, Belgaum |
| 12. | Dr Sartaj Ahmad | PhD Medical Sociology, Associate Professor, Swati Vivekananda Subharti University Meerut, UP, India |
| 13. | Dr Sumeeta Soni | (Associate Professor)  
Microbiology Department, B.J. Medical College, Ahmedabad, Gujarat, India |

### NATIONAL EDITORIAL ADVISORY BOARD

| 5.  | Prof. Samarendra Mahapatro | (Pediatrician)  
Hi-Tech Medical College, Bhubaneswar, Orissa |
| 6.  | Dr. Abhiruchi Galhotra | (Additional Professor)  
Community and Family Medicine, All India Institute of Medical Sciences, Raipur |
| 7.  | Prof. Deepthi Pruthvi | (Pathologist)  
SS Institute of Medical Sciences & Research Center, Davangere, Karnataka |
| 8.  | Prof. G S Meena | (Director Professor)  
Maulana Azad Medical College, New Delhi |
| 9.  | Prof. Pradeep Khanna | (Community Medicine)  
Post Graduate Institute of Medical Sciences, Rohtak, Haryana |
| 10. | Dr. Sunil Mehra | (Paediatrician & Executive Director)  
MAMTA Health Institute of Mother & Child, New Delhi |
| 11. | Dr Shailendra Handu | Associate Professor, Phrmra, DM (Pharma, PG Chandidgarh) |
| 12. | Dr. A.C. Dhariwal | Directorate of National Vector Borne Disease Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of India, Delhi |

Print-ISSN: 0976-0245 | Electronic-ISSN: 0976-5506  
Frequency: Quarterly  
(Four issues per volume)

**Indian Journal of Public Health Research & Development** is a double blind peer reviewed international journal. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia. The journal has been assigned International Standards Serial Number (ISSN) and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

Institute of Medico-legal Publications  
Logix Office Tower, Unit No. 1704, Logix City Centre Mall, Sector- 32, Noida - 201 301 (Uttar Pradesh)
1. Self Care Practices among People with Type II Diabetes Mellitus in an Urban Area of Ernakulam, Kerala ................................................................. 01
   Aravind M S, Teena Mary Joy, P S Rakesh

2. Effect of Tailor Made Exercise Programme in ACL Reconstruction of Knee Joint ......................... 06
   Amrut D Ravan, G Varadharajuulu, Sandeep Shinde

3. Assessment of Musculoskeletal Problems among Women IT Professionals ................................. 12
   Sivapriya KR, Pankaj B Shah, Palani Gopal

4. Evaluation of Serum Biomarkers to Assess Health Status in Urban Traffic Police Personnel .......... 18
   Sudha K, K Ashok Prabhu, Sowndarya K, Durga Rao

   Divya Khanna, Jai Veer Singh, Monika Agarwal , Vishwajeet Kumar

6. Comparison of Contamination of Tooth Brush among Dental Students and Patients ....................... 28
   Aravinthrajkumar Govindaraj, Deepa Gurunathan, Geetha

7. Awareness of Ill – Effects to Tobacco in General Population ......................................................... 34
   Karpagavalli Shanmugasundaram, Prasanthi S

8. Factors Influencing Dental Avoidance Behavior among Adolescents in India- Application of Contemplation Ladder .................................................................................................................. 39
   Mithun Pai BH, Rajesh G, Ramya Shenoy, Ashwini Rao, Shweta Yellapurkar

9. Prevalence of Use of Tobacco Products among Aizawl Population ................................................. 45
   Bhushan Priyanka, Singla Ashish, Sehrawat Sangeeta, Ajuja Sandhya, Nandkeoliar Tanya, Kumar Kundan,

     Kavita Choudhary, Maharaj Singh

11. Association of Periodontal Disease, Obesity and Serum Cholesterol Levels: Is there a Link? ........ 59
    Mamatha Shetty, Swathi Shetty

12. Assess the Awareness and Information Needs Regarding Normal Developmental Milestones of 1 to 3 Year Children among the Mothers of Infants, in a View to Prepare Information Booklet ......................... 64
    Sachin Tukaram Gadade, Aparna Bhushan Kale
13. Effect of Early Trunk Facilitation on Functional Mobility in Hemiplegic Individuals
   Shreedip Patil, G Varadharajulu, Suraj Kanase

14. Comparative Study to Predict the Kidney Disease for the Clinical Data Using Classification
    Techniques
   Gurucharan Singh Saluja, N Maheswari

15. Evaluating the Effects of Neck Exercise on Post Thyroidectomy Patients- A Pilot Study
   D Ezhil Bhavani, Monisha R, Kamalanathan P

16. Duel Burden of Underweight and Overweight among Likely to Conceive Women of Rural North Karnataka:
    Prevalence and Its Social-Demographic Determinants-Baseline Result of DBW Cohort Study
   Tika Ram Gurung, Balachandra S Kodkany, Shivanand Mastiholi, Vijayalaxmi S Neginhal (Gurung)

17. Comparison of Quality of Life among Oral and General Cancer Patients
   L Sri Varsha, Sreedevi Dharman

18. A Study on the Knowledge of Causes and Prevalance of Pigmentation of Gingivae among Dental
    Students
   Janhvi Manohar, Abilasha. R

19. Impact of Pre and Post National Level Eligibility Examination on Dental Education System
   Deepak Nallasamy, Pratibha Ramani

20. Effectiveness of SMS Feature of Mobile Phone in Management of Type 2 Diabetes: A Review
    Divya Tripathi, Neena Bhatia

21. A Study on Quality of Life among Working and Non Working Married Women
    Ishita Mukerji, Mamata Mahapatra

22. Management of a Mandibular Second Molar with a C Shaped Canal Using Canal Mapping and Continuous
    Wave of Condensation Techniques - A Case Report
    Karthik Shetty, Bettina Ashwini Vergis, Kartik S Nath

23. Work Place Health Promotion among Supporting Staff with Hypertension and/or Type 2 Diabetes Mellitus
    at Rajya Vokkaligara Sangha, Bengaluru
    Madugula Sreeraksha, Husna Banu, Shubhashree O,M, Swetha Srinivasa, KiranNagaraju

24. Relationship between Dental Anxiety, Oral Health Related Quality of Life and Oral Health Status of Indian
    Coast Guard Personnel in Mangalore, Karnataka
    Subhajit Routh, Mithun Pai BH, Gururaghavendran Rajesh Ramya Shenoy, Swapna Sarit

25. Effect of Blink Rate among Visual Display Terminal and Non-Visual Display Terminal User
    Mohammad Nooruz Zaman, Varsha Singh

26. Nickel Induced Alteration of Pathophysiology of Lungs in Experimental Rats
    R Chandramouli Reddy, Basavaraj Devaranavadagi, Kusal K Das

27. Consequences Towards E-Pharmacy and its Validated Growth Firms on Herbal and Organic
    Products
    M.Anbarasi, S.Praveen Kumar

28. Study of Bronchoscopy in HIV Infected Patients of Maharashtra Population
    Ashok. S. Bansode; Nitin Chitte

Self Care Practices among People with Type II Diabetes Mellitus in an Urban Area of Ernakulam, Kerala

Aravind M S¹, Teena Mary Joy², P S Rakesh³
¹MPH Scholar; ²Assistant Professor, MD Community Medicine; ³Assistant Professor, MD Community Medicine, Amrita Institute of Medical Science, Kochi, Kerala

Abstract

Introduction: Diabetes prevalence has been rising more rapidly in middle- and low-income countries. In 2015, an estimated 1.6 million deaths were directly caused by diabetes worldwide. The Crude prevalence rate in the urban areas of India is thought to be 9%, while in Kerala it was estimated to be around 20%. Diabetes can be controlled and its consequences avoided with proper self-care practices. This study attempts to assess the current self-care practices among people with diabetes in a selected urban area of Ernakulam district.

Methodology: The cross sectional studies included 240 households, which were selected using systematic random sampling. Trained interns used a validated questionnaire – diabetes self-management questionnaire (DSMQ), to collect data. Self-care practices were assessed using a 16-item questionnaire. The scale score ranges from 0-10. People who obtained ≥6.67 were considered to have good self-care practices.

Results: Out of 99 people with type two diabetes mellitus in the survey, 68 answered Diabetic Self-care Management Questionnaire. Mean age of the study participants was 62.59 (SD +/-11.2). Majority of the respondents were males (57.4%). Overall 51% of people obtained high score (CI 39.13-62.87). In the sub domain scores 60.3% of people got low score in physical activity, and 54.4% people obtained low score in the domain of dietary care. People with higher education obtained higher scores compared to people with low educational background (p=<0.005).

Conclusion: The result of this study shows that the self-care behaviour among people with diabetes in urban areas of Ernakulam were poor in the domain of physical activity and dietary care. Non-compliance to diabetic management is expected to increase the complications and increase the cost of health care. A good diabetes self-management behaviour change communication program at the primary care level with emphasis on motivating good self-care behaviours are the need of the hour.

Keywords: Self care practices, Type II diabetes mellitus, Lifestyle modifications

Introduction

Prevalence of diabetes mellitus has been rising more rapidly in middle- and low-income countries. In 2015, worldwide an estimated 1.5 million deaths were directly caused by diabetes (¹). WHO projects that diabetes will be the 7th leading cause of death in 2030. The Crude prevalence rate in the urban areas of India is thought to be 9%, while in Kerala it was estimated to be around 20% (²).

Treatment of diabetes includes changes in lifestyle, most of which people with diabetes must provide for themselves on a daily basis. Self-management of diabetes involves a therapeutic regimen of a healthy diet, exercise, no smoking, low alcohol intake, glucose monitoring and medications. Good self-care practices...
have been found to be positively correlated with good glycaemic control, reduction of complications and improvement in quality of life\(^3\).

Majority of day-to-day care in diabetes is handled by patients or families. Managing the daily care of diabetes seems to be a challenging task for many patients. A recent study from an urban area of southern India had shown that good diet and exercise was being followed by only 29% and 19.5% of the patients with diabetes, respectively, blood sugar monitoring and drug adherence were better with prevalence of 70% and 79.8% \(^4\). With this background the present study was undertaken among people with type 2 diabetes in a community setting to assess the self-care practices regarding diabetes. Primary objective of the study was to assess the Self Care Practices among people with type II Diabetes Mellitus in an urban area of Ernakulam, Kerala. Secondary objective was to study the factors associated with good self-care practices among people with Type II Diabetes Mellitus.

**Materials and Method**

The Corporation of Kochi is the largest municipal corporation in Kerala both in area and population. This is the second most important port city in the western coast of India and is the commercial capital of the State. Primary health care system in City, like other urban areas in Kerala, was not well established and was functioning sub optimally with weak referral system and inadequate attention to public health till recently when 16 urban Primary Health Centres were set up in Kochi city under National Urban Health Mission.

A pilot project for prevention and control of Non Communicable Diseases was launched by the urban training centre of the Dept. of Community Medicine, Amrita Institute of Medical Sciences in 65\(^{th}\) division of Kochi Corporation. A community-based, cross-sectional survey was carried out from June to August 2017, in the area among people with Type 2 diabetes mellitus to assess the self-care practices that were followed by them.

The cross sectional study included 240 households, which were selected using systematic random sampling. Every 5\(^{th}\) house was visited to gather information regarding Non Communicable Diseases. Interview was conducted using structured questionnaires by trained social workers and interns. The present study pertains to people with type 2 Diabetes Mellitus. Permanent residents of the 65\(^{th}\) division those who were diagnosed to have type II Diabetes Mellitus were administered a second questionnaire to gather information regarding self-care practices. Questionnaire was an adapted version of 16-item Diabetes Self Management Questionnaire (DSMQ). DSMQ questionnaire allows the summation to a sum scale score as well as estimation of four subscale scores. The subscales were: Glucose Management, Dietary Control, Physical Activity and Hospital Care Use. The questionnaire was originally in English and was translated and back translated to and from Malayalam. The questionnaire was pilot tested before the actual start of the study. Critically ill persons who were unable to respond to the questions were excluded from the study. Houses were visited at least 2 times to administer the questionnaire to the diabetics. The data entry and analysis were performed using statistical software SPSS version 20. Quantitative variables were expressed as mean with standard deviation and qualitative variables as proportions. Scale scores were calculated as sums of item scores and then transformed to a scale ranging from 0 to 10 (raw score / theoretical maximum score * 10. A transformed score of ten thus represented the highest self-rating of the assessed behaviour. People who obtained ≥6.9 (mean value) out of 10 were considered to have higher score. Chi square test was used to test the statistical significance between proportions.

**Results**

Out of 99 people with type two diabetes mellitus in the survey, 68 answered Diabetic Self-care Management Questionnaire. Mean age of the study participants was 62.59 (SD +/-11.2). Majority of the respondents were males (57.4%). Majority of the study population belonged to Hindu religion (44.1%) and were married (86.8%). Among the participants, 38.2% were with higher educational qualification. Duration of diabetes was 10 years or more in 54% of participants (table1). Overall 51% of people obtained high score (CI 39.13-62.87). In the sub domain scores 60.3% of people got low score in physical activity, and 54.4% people obtained low score in the domain of dietary care. Of them 52.9%, patients got high score. People with higher education obtained higher scores as compared to people with low educational background (p=<0.005) (table 3).

| .151 | .966 | .005 | .265 | .486 |

**Discussion**

Non-compliance to diabetic management is expected to increase the complications and increase the cost of health care. The current study provides a perspective from a community-based sample in Kerala regarding the diabetes self-care practices. Good diet and physical activity was being followed by only 45.6% and 39.7% of the study participants respectively. Education had found significant association (p=0.005) with self-care practices. There were very few community based studies in the aspects of self-care practices among diabetic people. In another community-based study to assess the prevalence of good diabetes self-care behaviour in an urban Southern Indian community, good diet and exercise was being followed by only 29% and 19.5% of the patients with diabetes. A facility-based cross-sectional study conducted in Government Winlock Hospital, Mangalore showed that self-care practices were found to be unsatisfactory in almost all aspects except for blood sugar monitoring and treatment adherence. A healthy eating plan on a daily basis was followed by 45.9% of the participants and daily exercises for 30 min were followed by 43.4% (5). In another community-based cross-sectional study in Rural Sullia, Karnataka, participants obtained low score in the domain of physical activity and only 19% of the study participants followed the recommended 20–30 min exercise per day for at least 5 days a week (6). The study self-care Practices among Diabetic Patients in Anand district of Gujarat showed less practice in dietary care and exercises (7). The higher compliance as compared to community based studies from other parts of the country could be due to the higher literacy rate and good health seeking behaviour of the people of Kerala. It could also be due to variations in the tools and definitions used in different studies to elicit compliance.

Blood samples were not analysed for HbA1c or other physiological measures so the relationship of good self-care practices and diabetes control could not have established by the study. Sample size was small and the collected data was based on self-report. Despite these limitations, this study has provided the foundation
for future studies among persons living with diabetes in relation to their diabetes management. Future study may use qualitative design to understand the barriers and facilitators to engage in diabetes self-care practices.

A practicing clinician should be able to identify persons at risk of noncompliance like Lower educational status and give extra attention to them to motivate self-care behaviours in them. From a public health point of view, the State needs good diabetes self-management education programmes at the primary care level with emphasis on motivating good self-care behaviours including lifestyle modification. Behaviour change communications should be continuous with enhancement of motivation to change and sustain the changes.

**Conclusion**

The result of this study shows that the self-care behaviour among people with diabetes in urban areas of Ernakulam were poor in the domain of physical activity and dietary care. A good diabetes self-management behaviour change communication program at the primary care level with emphasis on motivating good self-care behaviours including lifestyle modifications are the need of the hour.

Effect of Tailor Made Exercise Program in ACL Reconstruction of Knee Joint

Amrut D Ravan¹, G Varadharajulu², Sandeep Shinde³

¹Physiotherapist, Faculty of Physiotherapy, ²Dean, Faculty of Physiotherapy, ³Assistant Professor, Krishna College of Physiotherapy, KIMS ‘deemed to be’ University, Karad, Maharashtra, India

Abstract

Introduction: ACL reconstructions have been reported to demonstrate a disproportionate loss of strength of quadriceps muscle. The effect of tailor made exercise program patient’s belief about exercise, experience of using exercise in daily management of ACL rehabilitation program.

Objectives: The objective is to evaluate the effect of tailor made exercise program on pain, to determine effectiveness of tailor made exercise program on muscle strength, and the effectiveness of tailor made exercise program on lower extremity function scale.

Method: A comparative study was conducted at Physiotherapy Department of Krishna Institute of Medical Sciences. A total of 60 subjects were equally divided into two groups by lottery method. Group A was given tailor made exercise program, Group B was given conventional rehabilitation program.

Results: Statistical analysis was done by paired t test and unpaired t test. p values for manual muscle testing, Numerical pain rating scale, lower extremity function scale were calculated. While comparing the post-interventional values of manual muscle testing, Numerical pain rating scale, lower extremity function scale, the result revealed that tailor made exercise program is effective.

Conclusion: From the study it can be concluded that, tailor made exercise program is significantly effective in improving muscle strength and lower extremity function.

Keywords: ACL; Reconstruction, rehabilitation, tailor made exercise.

Introduction

ACL tear

ACL tear is a relatively common sporting injury affecting the knee and is characterized by tearing of the Anterior Cruciate Ligament (ACL), an important stabilizing structure of the knee. It is typically caused by twisting the knee beyond its normal limits (hyperextension) and forward movement of the tibia on the femur. When these movements are excessive and beyond what the ACL can withstand, tearing to the ACL occurs. This condition is known as an ACL tear and may range from a small partial tear resulting in minimal pain, to a complete rupture of the ACL resulting in significant pain and disability, requiring comprehensive rehabilitation and potentially surgery.

Causes

Anterior cruciate ligament (ACL) injuries are caused when the knee is straightened beyond its normal limits (hyperextended), twisted, or bent side to side.
Typical situations that can lead to ACL injuries include:

Changing direction quickly or cutting around an obstacle or another player with one foot solidly planted on the ground. (This can happen in sports that put high demand on the ACL, such as basketball, football, soccer, skiing, and gymnastics.)

Landing after a jump with a sudden slowing down, especially if the leg is straight or slightly bent (such as in basketball).

Falling off a ladder, stepping off a curb, jumping from a moderate or extreme

**Mechanisms of Injury / Pathological Process**

Three major types of ACL injuries are described: 

- **Direct Contact**: 30% of the cases
- **Indirect Contact**
- **Non-Contact**: 70% of the cases: by doing a wrong movement 

Smaller size and different shape of the intercondylar notch. A narrow intercondylar notch and a plateau environment are risk factors of predisposing female non-athletes with knee OA to ACL injury aged 41-65 years.

Wider pelvis and greater Q angle. A wider pelvis requires the femur to have a greater angle towards the knee, lesser muscle strength provides less knee support, and hormonal variations may alter the laxity of ligaments.

Greater ligament laxity. Young athletes with no modifiable risk factors like ligament laxity are at a particularly increased risk of recurrent injury following ACL reconstruction (ACLR).

Shoe surface interface. The pooled data from the three studies suggest that the chances of injury are approximately 2.5 times higher when higher levels of rotational traction are present at the shoe-surface interface.

Neuromuscular factors Risk factors for ACL injuries include environmental factors (e.g. high level of friction between shoes and the playing surface) and anatomical factors (e.g. narrow femoral intercondylar notch).

**Tailor made exercise program:**

Exercise intervention can be defined as a range of physical activities involving muscular contraction and repetitive bodily movement that is planned, structured, and purposely aimed at improving one or more components of physical fitness.

Exercise intervention is a general concept that can have many variations such as different

- Modes (e.g., various types of exercises), dosages (e.g., intensity, duration, frequency), and delivery methods (e.g., individualized, class-based, home-based).
- Aerobic exercise, strengthening exercise, flexibility exercise, and neuromuscular training

Such as agility and perturbation training should be prescribed to people with ACL Reconstruction.

In ACL reconstruction, priority of exercise prescription should be given to regain the client’s

- Knee flexibility, muscle strength, and neuromuscular control, as these impairments are the primary causes
- Of difficulties in physical functioning.

We rarely hear about tailor made exercise programs. Now, we can agree that some physical activity is better than no activity but there is NOT ONE pre-formatted program that will meet everyone’s unique needs.

A 100% Tailor Made Program from a true health and fitness professional is the only acceptable path forward.

Strength training by tailor made program does promote neural and muscular adaptations that are complementary to the well-known effects of voluntary resistance training.”

**Materials and Method**

A experimental study was conducted in and around hospitals of karad, following a simple random sampling technique on a sample size of 60. The participants were divided into 2 groups. The study protocol was started after being approved by institutional ethical committee of Krishna Institute of Medical Sciences Deemed To Be University, Karad. Subjects were selected according to inclusion criteria. Written informed consent was taken and the whole study was explained to them. Each
subject was assessed for strength of muscles, intensity of pain and activity limitation by using, manual muscle testing, and Numeric Pain Rating Scale and lower extremity function scale. The equipments used were (1) continue passive movement (cpm). (2) Theraband, (3) muscle stimulator. Inclusion criteria was as follows: (1) Age group between 18-40 year. (2) Patients after ACL reconstruction with Bone Patellar Tendon Bone (BPTB) graft. (3) Males and females are both. Exclusion criteria was as follows: (1) patients with associated fracture, injuries and dislocation. (2) patients having systemic disease, neurological disorder (3) any serious uncontrolled medical disease.

Group A: experimental group

In experimental group 30 subjects will be given:

Experimental Group

Tailor made exercise program

After post-operative ACL reconstruction there is pain and inflammation occurs so patients given ice application and continues passive motion (CPM). Then strengthening exercise phase wise protocol given to patients.

Group B: control group

30 subjects will be given only conventional physiotherapy protocol.

The conventional physiotherapy protocol is divided into 3 phases and each phase includes various exercises which is given to the patients.

All outcome measure were assessed before starting and at the end of treatment.

With Manual Muscle Testing (MMT), p value more than 0.05 shows that there was no significant difference in the post test scores, of experimental and control groups.

P value less than 0.05 shows that there was significant difference in the in the post test scores, of experimental and control groups with numerical Pain Rating Scale (NPRS).

**Discussion**

In this study, sample of 60 subjects were drawn from the study population. The data were collected to describe the sample characteristics with demographic variables like age and gender. The sample was divided in to two groups, one experimental group of 30 subjects given tailor made exercise program. Other control group of 30 subjects treated with only conventional physiotherapy protocol.

In case of experimental group most of them 43.33% were between 26-30 years of age group, 26.67% between 21-25 years, 20% belonged to 31-35 age groups and 6.67% between 36-40 age group and remaining 3.33% in age group 15-20 years with 66.67% were male and remaining 33.33% were female. In case of control group most of them 36.67% were between 26-30 years of age group, 23.33% between 21-25 years, 20% belonged to 31-35 and 36-40 age groups with 60.00% were male and remaining 40.00% were female.

The Numerical Pain Rating Scale (NPRS) is a segmented numeric version of the visual analogue scale (VAS) in which a respondent selects a whole number (0–10 integers) that best reflects the intensity of his/her pain. It is a one-dimensional measure of pain intensity in adults, including those with chronic pain. High test–retest reliability has been observed in both literate and illiterate patients (r = 0.96 and 0.95) for construct validity, the NPRS was shown to be highly correlated with the VAS correlations range from 0.86 to 0.95.

Manual muscle testing (MMT) is a method of using the strength and response of a muscle to test function in the body. MMT (Medical Research Council score) Score ranges between 0-5, minimum 0, maximum 5/5. (r = 0.78)

The Lower Extremity Functional Scale (LEFS) is a questionnaire containing 20 questions about a person’s ability to perform everyday tasks. The LEFS can be used by clinicians as a measure of patients’ initial function, on-going progress and outcome, as well as to set functional goals. The LEFS reliability was 0.94 can be used to evaluate the functional impairment of a patient with a disorder of one or both lower extremities. It can be used to monitor the patient over time and to evaluate the effectiveness of an intervention.

The average pre-test score with the Numerical Pain Rating Scale (NPRS) in case of experimental group was 5.83 and in case of post-test was 3.20 & in case of control group was 7.03 and in case of post-test was 4.13.

The average pre-test score with the Manual muscle testing (MMT) in case of experimental group was 2.86 and in case of post-test was 4.56 & in case of control group was 2.70 and in case of post-test was 4.53.

The average pre-test score with the Lower extremity functional scale (LEFS) in case of experimental group was 18.63 and in case of post-test was 82.58 & in case of control group was 19.17 and in case of post-test was 75.42.

Comparison of Pre-test and Post test scores in Experimental Group & control group with Lower Extremity Functional Scale (LEFS), p value less than 0.05 shows that there was significant difference.

Inter group comparison with Lower Extremity Functional Scale (LEFS), p value less than 0.05 shows that there was significant difference in the post test scores, of experimental and control groups with numerical Pain Rating Scale (NPRS).

P value less than 0.05 shows that there was significant difference in the in the post test scores, of experimental and control groups with Lower Extremity Functional Scale (LEFS), p value less than 0.05 shows that there was significant difference in the post test scores, of experimental and control groups with numerical Pain Rating Scale (NPRS).

The statistical analysis shows insignificant result for all scales (p<0.05) except one result for LEFS. The electrical stimulation (NMES/SDIDC) in conjunction
with conventional rehab protocol shows no significant difference. Though Eriksson et al (1979), Delitto et al (1988) studied and found that electrical stimulation prevent the muscle atrophy after major knee ligament surgery. They concluded that tailor made exercise program helped to improve torque generating capability of the knee satiability after operation on the knee ligaments but the fact is those finding were qualified by isokinetic apparatus not by the functional parameters. The present study had some limitation that must be considered. The sample size considered for the study was small so generalizations are difficult. It would be of interest to evaluate the effectiveness of regular application of NMES to investigate whether an application of tailor made exercise program has a beneficial effect.

Conclusion

This study was undertaken to evaluate the effect of tailor made exercise programme in ACL reconstruction of knee joint.

GROUP A received tailor made exercise program and GROUP B received conventional physiotherapy program.

The outcome measure used were NPRS for intensity of pain, MMT used for muscle strength and lower extremity function scale used for daily living activity.

Statistical analysis was done using INSTAT software. Nonparametric paired and unpaired t test used for within the group and between the group analyses.

Thus, from the above study it concludes that patients in group A with ACL reconstruction of knee joint showed significant improvement in NPRS, MMT, LEFS clinically and statistically than group B.

This study accepts alternative hypothesis.

Conflict of Interest: This study can be carried out with tailor made exercise program activities, periodic assessment of outcome measures, comparison can be done between male and female subjects, study can be done with larger sample size.

Ethical Clearance: Ethical clearance was taken from institutional committee of Krishna institute of medical science, deemed University,Karad.

Source of Funding: Source of funding is Krishna institute of medical sciences deemed University,Karad.

Assessment of Musculoskeletal Problems among Women IT Professionals

Sivapriya KR¹, Pankaj B Shah², Palani Gopal³

¹Assistant Professor of Community Medicine, Tagore Medical College, Chennai, ²Professor and Head, Department of Community Medicine, Sri Ramachandra Medical College & Research Institute, Sri Ramachandra University

Abstract

Introduction: India is a developing economy and IT industry is a major contributor for India’s industrial and economic growth. The prevalence of computer users are exponentially increasing with years, and as a result of the duration and intensity of exposure to computers, the health problems related to prolonged computer use are also on the rise. This study was done to evaluate the musculoskeletal problems among women IT professionals.

Methodology: This cross sectional study was carried out among 609 women with over one year of experience working in one of the large projects in a software company in Chennai. Data collection comprised of work related history, questions related to self reported symptoms of musculoskeletal problems and symptoms of carpal tunnel syndrome. Wong-Baker faces scale was used to assess the severity of pain. Clinical examination was carried out by the investigator to look for the signs of carpal tunnel syndrome namely phalen’s sign and tinel’s sign.

Results: The mean age of the participants was 24.9 years. Over 57.2% had a work experience <3 years. Musculoskeletal problems were present in 73.1% of the participants. Carpal tunnel syndrome was present among 6.1% of the participants. Software developers were significantly at risk of musculoskeletal problems (p<0.05)

Conclusion: The high prevalence of musculoskeletal problems emphasizes the need for continuous, motivational, on site health education and rehabilitative measures to prevent the impact of these problems on the quality of life.

Keywords: Carpal Tunnel Syndrome, Musculoskeletal problems, Software professionals

Introduction

In today’s world, computers have become an essential commodity in day to day life. All the industries are dependent on computers. The role of Information Technology (IT) professionals becomes very crucial in every economic infrastructure of today’s world. According to National Association of Software and Service Companies (NASSCOM), the demand of IT professionals is on the rise. Around one million computer professionals are graduating from various courses every year. As computers have become a vital tool in every dimension and backbone of today’s occupational and non-occupational settings, the number of computer users is rising exponentially worldwide and is expected to exceed 1 billion in 2010.¹

The hazards of long term computer use are many. Their jobs are more sedentary, requiring more cognitive processing, mental attention, though requiring less expenditure of energy.² Continuous exposure to computer can lead to problems like musculoskeletal disorders, computer vision syndrome and psychological problems. In a study done in Delhi, the computer related morbidity was present in 93% and the prevalence of musculoskeletal problems was 77.5%. The females had more problems (96.7%) comparing to males (91.3%).³
Studies by various international medical research institutes showed that 80-90% of people who use computers regularly are likely to suffer from health problems. ASSOCHAM (Association of Chambers of Commerce, India) analyzed the issue through their study and it was revealed that 68% of the working females between 21-52 years were found to be afflicted to lifestyle disease such as obesity, depression, chronic backache, diabetes, hypertension etc.4

A rapidly growing sector, its sustainability depends on the welfare of its workers. An in-depth assessment of the burden of musculoskeletal problems will help in streamlining the health care services for this sector, with a special focus on prevention and rehabilitation, will help raising this awareness.5

Objectives
• To estimate the prevalence of musculoskeletal problems among women IT professionals
• To evaluate the risk factors associated with musculoskeletal problems

Methodology

Study setting

This study was carried out as a cross sectional study in an IT company located at Siruseri, Chennai, over a period of four months.

Study population

The study population comprised of women IT professionals working in the IT company. A total of 12,000 software professionals working on various projects in the IT company. Permission was granted for conducting the study in 22 projects.

Sample size and sampling

With the available literature, the prevalence of wrist pain among computer professionals was 23%6 and with a limit of accuracy as 15% of anticipated prevalence and with Zα value of 1.96, the sample size calculated was 572. Accounting 5% for refusal rates, the final sample size was calculated as 602.

Out of the 22 projects, in four projects the number of women employees was more than 1000. Amongst these four projects one project was selected by simple random sampling, using the table of random numbers, which consisted of 703 women who had worked in the company for over a year. Amongst them, 609 women consented for the study.

Inclusion criteria

Women IT employees
Minimum one year experience.

Exclusion criteria

Pregnant and lactating women were excluded.

Ethical approval and informed consent

Approval from the Institutional Ethics Committee was obtained. The participants were explained in detail about the study and informed consent was obtained prior to the data collection.

Data collection tools

A structured questionnaire was developed consisting of questions related to background information, details of work including working hours with computer; work experience in IT, type of breaks availed during working hours. Questions related to self reported symptoms of musculoskeletal problems and symptoms of carpal tunnel syndrome. Wong-Baker faces scale was used to assess the severity of pain.7

Clinical examination was carried out by the investigator to look for the signs of carpal tunnel syndrome namely phalen’s sign and tinel’s sign and examination of joints only for the participants having pain for tenderness, rigidity, swelling and range of movements.8,9

Body mass index and waist hip ratio were measured to assess the obesity.10 The assessment of physical activity was done using International Physical Activity Questionnaire Short form.11

The questionnaire was pretested on 30 participants from a different project to test the validity. The results of pre-test are not included in the analysis.

Data analysis

Data entry and analysis of the variables was done using Statistical Package for Social Sciences (SPSS) version 16 software. The prevalence of musculoskeletal
problems were computed as percentages. Chi square test was used to analyze the statistical significance of risk factors.

**Results**

This study was carried out among 609 women IT employees. The Mean age of the study participants was 24.9 ± 2.1 years. Majority of the study population were undergraduates 466 (76.5%) and 512 (84.1%) were living in nuclear families. The background characteristics of the participants are described in Table - 1.

The details of role, work experience, working hours with computer are given in Table - 2. Most of the women, 556 (91.3%) were working as software developers. Among the study subjects, 349 (57.2%) had less than 3 yrs of total IT experience. The mean duration of working with computers in office was 9 ± 1.29 hours. About 527 (86.5%) avail breaks during working hours.

The overall prevalence of musculoskeletal problems among the study participants was 73.1% (95%CI-69.6-76.6). (Figure 1) The most commonly reported musculoskeletal problems were low back pain in 235 (38.6%) women and 228 (37.4%) women had neck pain. Shoulder/arm pain was reported by 177(29%) women. The other musculoskeletal problems reported were knee pain 95(15.6%), hand pain including fingers 75(12.3%), wrist pain in 62(10.2%) women and foot pain 61(10%).

The low back pain was severe among 29(12.3%) and neck pain among 24(10.5%). Those reported shoulder/arm pain 22(12.4%) experiencing severe pain. Among the study subjects, 63(14.2%) women were found to suffer from any one severe pain. (table-3) About 37 women had Carpal Tunnel Syndrome with a prevalence of 6.1% (95% CI 4.2 to 8.0). All the women, 37(6.1%) had phalen’s sign positive and 25(4.1%) women had positive tinel’s sign.

Among the study subjects, software developers were found to have more musculoskeletal problems(74.3%) with an odds ratio of 1.90 (95%CI: 1.02-3.52) compared to project leaders (60.4%) [ value 4.753, p = 0.029]. Subjects having 6 years or more work experience in IT had more musculoskeletal problems (76.3%) than the subjects with less than 6 years work experience (72.6%). (Table 4)

Figure 1: Prevalence of various musculoskeletal problems

**Discussion**

More than 2.5 million people are employed in IT sector either directly or indirectly, making it one of the biggest job creators in India. This has led to the new genre of occupational health problems. It was observed by other studies done among men and women IT professionals resulted with very high computer related morbidity.

In the current study, the mean age of the participants was 24.96 years. The study population was similar to studies done by Bakthiar and Sharma A and Talwar et al. Majority of the women, 84.1% were living in nuclear family and 23.8% were married. Only 8.7% were in the project lead role while 91.3% of subjects were software developers. Talwar et al, Branda et al and Bakthiari et al also had similar findings. In the present study, the average working hours per day with computer in office were 9±1.29 hours and 26.1% were found working more than 10 hours. The working hours were similar when compared to other studies. Nearly 50% were working with computer at home. A study done by Mohamed et al. in Chennai reported similarly. In the current study, it was found that only 17.9% women were in the high level of physical activity. This is probably due to their sedentary lifestyle.

In the present study, the prevalence of musculoskeletal problems was 73.1%. The common musculoskeletal problems reported by the subjects were low back pain (38.6%), neck pain (37.4%), shoulder/arm pain (29%) and hand pain including fingers (12.3%). This observation is in accordance with study done by Talwar et al. A study done in Delhi study also reported similar findings. It was also found that low back pain was more prevalent (38.6%). A study done in Kolkata by Banibra et al also reported similarly.

The second commonly reported musculoskeletal problem was neck pain (37.4%). In a study done in Finland by Korhonen et al. the incidence of local neck pain reported was also 34.4%. In the current study, pains perceived by the participants with high severity were low back pain, neck pain and shoulder/arm pain. In Mauritius, Subratty et al. reported similar findings. In the present study, the prevalence of carpal tunnel syndrome was 6.1%. Similar results were found in a study done by Mohamed Ali et al.

It was found that the musculoskeletal problems were more (74.3%) common among software developers compared to project leaders (60.4%) [OR=1.9; p=0.029], and also with work experience ≥ 6 years (76.3%) [OR=1.2; p=0.49]. Sharma et al showed similar results.

**Conclusion**

Musculoskeletal problems are morbid health problems among women, and its impact on quality of life is severe, when it is induced occupationally. This study elucidates the need for occupational safety and rehabilitative measures, complemented with continuous onsite motivation and health education as a part of a
larger policy implementation.

Evaluation of Serum Biomarkers to Assess Health Status in Urban Traffic Police Personnel

Sudha K¹, K Ashok Prabhu¹, Sowndarya K², Durga Rao³
¹Associate Professor, ²Tutor, ³Research Scholar, Department of Biochemistry, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal

Abstract

Traffic police personnel face multiple occupational hazards as they are continuously exposed to vehicular emissions and work in a noisy, polluted environment. The objective of the present study is to explore the impact of air pollution on health of traffic police, by evaluation of serum biomarkers.

The study population included 200 traffic police who worked outdoor on roads with heavy flow of vehicles and who were exposed to pollutants. 50 age and sex matched healthy subjects who worked indoor were considered as controls. Further, the traffic police group was subdivided into 4 groups based on the number of years of their exposure to urban pollutants. Group I included subjects with less than 5 years of exposure, Group II 6 to 10 years, Group III 11 to 20 years and group IV more than 20 years.

Biochemical parameters like glucose, cholesterol, bilirubin and other markers of liver function and renal function were estimated in fasting blood samples using spectrophotometric methods. 37% of the traffic police were pre-diabetic and 10% were diabetic. Hypercholesterolemia in police strongly suggest the risk of cardiovascular diseases. Significantly elevated total bilirubin, direct and indirect bilirubin levels in police indicate the prevalence of sub clinical jaundice. Further, increased serum transaminases demonstrate mild hepatocellular damage. Albumin globulin ratio decreased with the increase in duration of exposure to pollution within the police sub groups. Markedly high urea may be a sign of renal dysfunction in police personnel. Uric acid, the latest marker of pre-diabetes and insulin resistance, increased steadily from group I to IV along with glucose. The current study emphasizes the need for regular health checkups and create awareness regarding early diagnosis of organ dysfunction by investigation of biomarkers in police personnel.

Keywords: Traffic Police, Air pollution Liver function tests, Renal function tests, Diabetes mellitus

Introduction

Police personnel, the law enforcement authority of the society, are always under stress as they deal with unique shock situations and psycho social stressors¹. Traffic police on an average work almost eight hours per day. In addition to various stressors, they are exposed to various chemical pollutants like lead, sulfur dioxide, carbon monoxide, manganese, methanol which can cause biochemical alterations in blood cells, lungs, detoxifying organ like liver². Urbanization, increased automobile usage and traffic noise not only affects physical and mental health but may be a key factor in pathogenesis of several diseases³. Though recruitment of police is based on physical fitness, regular health checkups are seldom done throughout their career. Majority of studies on policemen, are on decreased lung function and increased respiratory morbidity due to vehicular emissions rich in benzene and other aromatic hydrocarbons⁴. To date most studies have focused on risk factors related to work environment in developed countries. Data are scarce for developing country like India where diabetes burden is very high and air pollution is on a rise. Hence, the
The aim of the present study is to assess the health status of police by estimation of various biochemical markers in the blood that would determine the subclinical organ dysfunction.

**Materials and Method**

The study population included 200 traffic police who worked outdoor on roads with heavy flow of vehicles, and who were exposed to pollutants. 50 age and sex matched healthy subjects who worked indoor were considered as controls. Further, the traffic police group was subdivided into 4 groups based on the number of years of their exposure to urban pollutants. Group I included subjects with less than 5 years of exposure, Group II 6 to 10 years, Group III 11 to 20 years and group IV more than 20 years of exposure to pollutants. Habitual smokers, alcoholics and subjects with systemic illness were excluded from the study. Informed consent was collected from all the participants along with a standardized questionnaire on food habits and personal details.

Fasting blood sample was collected in fluoride vacutainer for glucose estimation and rest in plain vacutainer for the estimation of biomarkers to assess liver and kidney functions. Analysis was carried out immediately in Cobas 6000 chemistry analyzer using spectrophotometric methods. Data was analyzed statistically using student t test and intergroup comparison was done by ANOVA followed by post hoc Tukey’s multiple comparison. The difference of p < 0.05 was considered significant.

**Results**

Fasting blood glucose (FBG) level of 37% of the traffic police was in pre-diabetic range and 10% in diabetic range, which was significantly higher compared to healthy controls. Serum creatinine levels remained unaltered in police compared to normal individuals, although urea and uric acid were significantly higher than controls. Total bilirubin, direct and indirect bilirubin levels were significantly elevated in police (p<0.01) compared to healthy controls. 68% of the traffic police had elevated conjugated bilirubin. Both the hepatic enzymes ALT and AST were also elevated in police, the increase was statistically significant. However, ALP and total proteins, albumin and globulins remained normal in the study group. Total cholesterol was significantly high in police group compared to normal. (Table 1)

FBG levels in group III and group IV were significantly higher than group I with statistical significance of p<0.001 and p<0.05 respectively. Serum uric acid level steadily increased from group I to group IV. The difference between group III and group IV were highly significant (p<0.03). Total bilirubin and unconjugated bilirubin levels steadily increased with number of years of exposure to pollutants. Bilirubin values in Group IV was significantly higher than Group I (p<0.05). Further, albumin levels and A/G ratio steadily decreased from Group I to Group IV, and the difference between group I and group III & IV were statistically significant (p<0.05). (Table 2)

Discussion

Traffic police face multiple occupational hazards, which not only impact mental health but also increases physical health risks. Results of the present study showed that 37% of police personnel were pre-diabetic and 10% were diabetic, the prevalence of which was much higher than the normal population. This was in accordance with the earlier studies done on police personnel of Saudi community. A cohort study demonstrated that occupational stress was an independent predictor of diabetes mellitus. Further, FBG was significantly
high in police personnel with long term exposure to air pollutants. A positive correlation between serum cortisol and blood glucose was seen in police\textsuperscript{9}. Insulin resistance, increased consumption of high carbohydrate, low fiber diet, obesity and lack of physical exercise might have led to increase FBG in police personnel \textsuperscript{10}. Most recent Chinese study showed that exposure to sulfur dioxide, nitric oxide, ozone the major air pollutants increased the prevalence of diabetes mellitus and also was associated with high fasting glucose level\textsuperscript{11}. Though creatinine, the renal function marker did not alter significantly in police personnel compared to normal population, other markers like urea and uric acid elevated significantly with the increase in the number of years of exposure to pollutants. Recent articles not only consider uric acid as a potential risk factor of diabetes mellitus, hypertension and CVD but also a marker of pre-diabetes \textsuperscript{12,13}. Police in Group IV and Group V with high FBG also showed hyperuricemia which highlights the fact that renal clearance of uric acid is reduced with insulin resistance. Physical activity and exercise the protectors of cardiovascular diseases are considerably lower in police personnel \textsuperscript{14}. One of the earlier reports on morbidity profile of police personnel showed prevalence of hypertension, dyslipidemia and cardiovascular diseases \textsuperscript{15}, which is justified by hypercholesterolemia observed in approximately 30\% of the study group, with a steady increase from group I to IV. Several studies observed hypercholesterolemia in people who worked in night shifts. Regular consumption of saturated fat rich diet from restaurants would have led to hypercholesterolemia \textsuperscript{16}. Occupational stress was demonstrated to be a risk factor for non-alcoholic fatty liver disease (NAFLD) among Chinese policemen \textsuperscript{17}. Elevated total bilirubin, both direct and indirect bilirubin in police corroborate with the findings of other workers. Moreover, increased use of automobiles and exposure to diesel exhausts may mediate pathogenesis of NAFLD, inflammation and oxidative stress in police. Urinary 8OHdG, most sensitive marker of DNA damage was markedly elevated in traffic police exposed to vehicular exhausts, with concomitant increase in mutated cytochrome P450 and glutathione S transferase, enzymes known to play a significant role in detoxification of xenobiotics \textsuperscript{18}. The other proposed mechanisms by which occupational stress affect liver function include cytokine related inflammation and activation of hypothalamic pituitary adrenal axis \textsuperscript{19}. Present study observed a steady rise in serum transaminases ALT and AST in police with the number of years of exposure to pollutants. A steady decline in serum albumin may signify a decrease in synthetic function of the liver, in addition to its possible degradation by oxidants. The increase in globulins may be secondary to subclinical inflammatory response to pollutants.

On the whole, the current study emphasizes the need to arrange regular health checkups and create awareness regarding benefits of life style modifications and early diagnosis of organ dysfunction by investigations of biomarkers in police personnel. Further, to minimize the adverse effects of vehicular exhaust, preventive strategies should to be adopted by traffic police.

Bio-Social Characteristics as Determinants of Maternal Death: A Community based Case-Control Study

Divya Khanna¹, Jai Veer Singh², Monika Agarwal³, Vishwajeet Kumar⁴
¹Assistant Professor, Department of Preventive Oncology, Mahamana Pandit Madan Mohan Malviya Cancer Centre, TATA Cancer Centre, BHU Road, Varanasi, U.P, ²Professor, Department of Community Medicine & Principal, Hind Institute of Medical Sciences, Barabanki, UP, India, ³Professor (MD.), Department of Community Medicine, King George's Medical University, ⁴Director of Community Empowerment Lab, Luckow, UP, India

Abstract

Background: The WHO estimates that of the 529 000 maternal deaths occurring every year 136 000 take place in India.

Method: This was a community based case-control study done in rural areas of Lucknow, UP (India) in a period of one year. 90 maternal deaths were identified and were matched with two controls. Data were analysed using SPSS version 17.0 and Open Epi version 2.3. Results have been given in form of Unadjusted Odds ratio (UOR) and Adjusted Odds ratio (AOR).

Results: The most important direct cause of maternal death was Hemorrhage. Anaemia was the most important indirect cause of death. Poverty, illiteracy, age of the mother, occupation of the husband were found as significant risk factors for maternal death.

Conclusion: The most vulnerable group for maternal death are the women who are illiterate, belongs to the weaker section of the society and coming with increasing at the time of pregnancy. Women coming with this background needs special focus and ensuring that these women receive appropriate health care right from the conception till the termination of her pregnancy is the need of the hour in order to prevent maternal deaths.

Keywords: case-control study, risk factors, bio-social, maternal death

Introduction

Though India has made an appreciable progress in improving the overall health status of its population but it is is far from satisfaction. The pace of decline in trends of maternal mortality and child mortality has been slow but steady.¹ The National Family health survey (NFHS)-1 (1992-93) was the first to provide the national level estimates of maternal mortality ratio (MMR) for India as 437 per 100,00 live births.² In the year 2013-2014 MMR of India was 167 per 100,00 live births. MMR of Uttar Pradesh, the most populated stated of India, was second highest as 285 per 100,00 live births.³

Several reasons are cited for high maternal mortality in India including poverty, illiteracy. This highlights the need to view maternal mortality as a human rights issue.⁴ Different causes of maternal deaths may develop due to certain social factors working in the background. The aim of our study was to assess the bio-social factors which lead to a mother towards maternal death.

Method

This was a community-based case-control study conducted on 90 maternal deaths identified during the one year study. Study participants were the females...
(age group of 15-49 years) in the study area who either delivered and were alive after 42 days of the postpartum period or died within 42 days of termination of pregnancy in the reference period. All maternal deaths identified in all the rural blocks during the study period were enrolled through snow-balling technique.

Each of the maternal death was matched with two controls. One was a geographical-matched control and other was complication matched control. All controls were drawn from the same community from where the maternal death cases were taken. Maternal deaths were identified through ASHA and ANM. A home visit was made to the family of deceased after the mourning period. Best suitable respondents were interviewed after taking informed consent. For controls mothers, self-reported symptoms were taken and family was inquired for logistics and health seeking.

**Maternal death** (ICD-10\(^5\) definition) is defined as death of a woman during pregnancy or within 42 days from the end of pregnancy, irrespective of the duration and site of pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not accidental or incidental causes.\(^5\)

**Geographical matched control** was defined as mother who lived in same village where a maternal death took place and had delivered normally in the same reference period without any obstetric complications (which needed urgent hospitalization) during ante-/intra-/post-natal period and was alive after 42 days of post-partum period. Random selection was done from the list of deliveries that took place in same geographical area and in same reference period using ASHAs delivery register.

**Complication matched control** was defined as a mother who had a similar biomedical complication (either direct obstetric causes or indirect medical causes of morbidity which needed hospitalization) and was admitted for the complication at a tertiary health centre of Lucknow such as district hospitals or medical college for management but survived and was alive after 42 days of post-partum period.

Non co-operative families, mothers who died due to accidental/incidental causes and late maternal deaths (ICD-10\(^5\) definition: deaths due to direct or indirect obstetric causes after 42 days of termination of pregnancy but less than one year of termination of pregnancy), maternal deaths due to rare non-pregnancy related causes (like leukaemia, burns) and mother residing in urban areas of Lucknow were not enrolled.

The study area was Lucknow district, capital of Uttar Pradesh. As per Census 2011, Lucknow catered a population of 4,588,455 with an average literacy rate of 79.33 Sex Ratio of 940 per 1000 males far below the national average.\(^6\)

Data collection was done through two schedules. Verbal autopsy was conducted using UNICEF’s maternal and perinatal death inquiry and response tool to ascertain the cause of maternal death. A pre-tested and semi-structured schedule was used for both cases and controls to identify their biosocial characteristics. ICD-10 definitions were used for complications during pregnancy and delivery.\(^5\) The completed interview schedules were reviewed by experts to verify the cause of death. Relevant modifications were made in after pretesting.

Data was tabulated on Microsoft Excel Sheet and analyzed by using the software SPSS, Version 17.0 and Open Epi, Version 2.3. All variables were entered as categorical. The significance test used was MacNemar test for paired data. Bivariate analysis and multin was carried out to compare the characteristics (independent /predictor variables) of the cases and controls with a dichotomous outcome which was maternal death or maternal survival and unadjusted odds ratio (OR) and 95 % confidence intervals were calculated for risk factors of maternal death. Risk factors obtained significant in bivariate analysis were subjected to conditional multiple logistic regressions for adjustment of confounding variables and the results have been given in form of unadjusted OR (UOR) and Adjusted OR (AOR).

**Ethical Consideration:** The study received clearance from the Ethical Board Committee of the King George’s Medical University, Lucknow, UP, India. The objective, purpose of the study were explained to all the participants in their local language and written informed consent taken.

**Results**

A total of 90 maternal deaths were identified during the study period. These were matched with 90 geographical controls and 87 complication controls. Three cases of maternal death were from Hepatitis and
Tuberculosis and Tetanus for which matched control could not be identified from the given community. Seventy-three deaths (82.2%) occurred due to the direct cause of maternal death. The most common direct cause of maternal death was Hemorrhage (37, 41.1%), followed by Peurperal Sepsis (16, 17.8%), Ruptured Uterus/Obstructed Labour (9, 10%), Pre-Eclampsia/Eclampsia (8, 8.9%). Three cases of deaths due to abortion and one death due to maternal tetanus was reported. Sixteen deaths occurred due to indirect causes of maternal death. Amongst indirect causes, Anemia (14, 15.6%) was the most important cause of death. Fourth-fifth of the death due to indirect causes was due to Anemia.

The distribution of bio-social risk factors amongst maternal deaths and the geographical matched controls, who were apparently healthy till 42 days of post-partum period, were compared after adjustment for confounding factors with multinomial regression. It was seen that increasing age, scheduled caste community, husband being a farmer or a labour, illiteracy of the mother were the most important predictors for maternal death. Maternal age 30 years and above increased the odds of death by four-fold (OR 3.7; 95% CI 1.1-12.7). Coming from scheduled caste community increased the odds of death by three-fold (OR 2.9; 95% CI 1.3-6.8). Husband being a farmer or a labour raised the odds of death by six-fold (OR 5.79; 95% CI 1.8-19.1). Illiteracy status of the mother increased the odds of death by four-fold (OR 4.3; 95% CI 1.5-12.1). Illiteracy status of husband was found statistically significant on univariate analysis but significance was lost after adjustment. (Table-1)

The distribution of bio-social risk factors amongst maternal deaths and the complication matched controls, who developed same complication but survived from it, were compared after adjustment for confounding factors with multinomial regression. It was seen that husband being a farmer or a labour, illiteracy of the mother, belonging to the poorest class of socio-economic status (Class V) and family not able to generate income whole year were the most important predictors for maternal death. Husband being a farmer or a labour raised the odds of death by nine-fold (OR 8.9; 95% CI 2.9-27.1). Illiteracy status of the mother increased the odds of death by two and half times (OR 2.5; 95% CI 1.1-5.7). Poor socio-economic status also increased the odds of death by six-fold (OR 6.0; 95% CI 2.2-16.2) and family not able to generate income for whole year raised the odds of death by three-fold (OR 3.4; 95% CI 1.2-10.4) (Table-2)

Discussion

In the present study the majority of maternal deaths were due to direct causes amongst which obstetric hemorrhage was the most important cause of death. Amongst the indirect causes Anemia was the most important cause of death. This finding is in concordance with the figures from India and worldwide.\(^7,8\)

In the present study increasing age of the mother was found as an important risk factor for maternal death specially compared to geographical control but not against complication matched control. This finding suggests that increasing age is a risk factor for development of obstetric complications which if left unattended may lead to maternal death. Or finding is in line with other case-control studies conducted in India.\(^9,10\) A Birth cohort study from US (1995-2000) which included 8079996 live births reported that the risks for most obstetric complications such as Prolonged labour, dysfunctional labour, excessive labour bleeding, mal-presentation increased with increasing maternal age.\(^11\)

We observed that illiteracy status of both the husband and wife had a risk for maternal death. Illiteracy status of the women increased the risk of death when compared to apparently healthy geographical control while the illiteracy status of the husband increased the risk of death when compared to complication matched control. This finding suggests that mother’s literacy status may have a role in preventing the development of complication but once the complication has developed the decision making to seek for health care depends on the literacy status of the husband. Several studies have cited that in Indian setup it’s the male members of the house who takes decision for seeking health care especially when it is related to logistics like time, transport and money.\(^10,12,13\)

Proxy indicators for poverty such as socio-economic class, income generation for only part of year, belonging to scheduled class rural community and husband working as a farmer or labour were found to be significant risk factors when compared to both geographical and complication matched control. This finding suggests that poverty has a role to play in both development of maternal complications and occurrence of maternal death. Or finding is in line with studies conducted in different parts of India.\(^9,10,14\)
Limitations of the study:

1. Small sample size: Since maternal death being a rare event the sample size was small and hence weaker risk factors may not have been detected.

2. Recall bias: The result may be influenced by the recall bias as the reference period was large and families who faced the event long back couldn’t give as good an information as those who faced the event recently especially regarding logistics and delays. To minimize this bias we interviewed the family as early as possible.

3. Information bias: In our study respondents amongst cases were the family members whereas the controls responded personally. Hence some variables/events may have gone unnoticed by the family members. To minimize this bias we tried to collect information from the best suitable respondent who was there at the time of specific pregnancy-related events.

Conclusion

We conclude that poverty, illiteracy, weaker section of society, increasing age of the mothers were important bio-social risk factors contributing to maternal death through a web of causation. Thereby women coming with this background needs special focus and ensuring that these women receive appropriate health care right from the conception till the termination of her pregnancy is the need of the hour in order to prevent maternal deaths.

Conflict of Interest: We declare that we have no conflict of interest.

Comparision of Contamination of Tooth Brush among Dental Students and Patients

Aravinthrajkumar Govindaraj1, Deepa Gurunathan2, Geetha3
1Post Graduate Student, Department of Orthodontics, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai, 2Professor, Department of Pedodontics, 3Professor, Department of Microbiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Introduction: The insertion of fixed appliances alters the oral microbiological profile, thus increasing the risk for caries and gingivitis considerably. Furthermore, caries and gingivitis prevention demands greater efforts in tooth brushing, since brushing becomes more complicated as substantial parts of the tooth surface are covered with attachments. Tooth brushing is most common method of maintaining oral hygiene. Contaminated tooth brushes can be a source of infection. The main aim of the study is to compare the contamination of tooth brush among dental students and patients undergoing orthodontic treatment.

Material and Method: Welcare orthodontic tooth brushes were used for the study. Twenty random subjects were selected for the study which included two groups of 10 subjects containing 10 dental students and 10 patients undergoing orthodontic treatment. Same tooth brush and tooth paste was given all the samples. The subjects were given instructions for brushing and asked to return the samples after one week. The samples are tested for bacterial colony forming units in nutrient agar culture plate.

Results: It has been found from the result that there is no statistical difference between the number of colony forming units in the nutrient agar culture plate between the tooth brush obtained from the dental students and the patients undergoing orthodontic treatment.

Conclusion: though there were no statistical difference between the two groups, there were colony forming bacteria in both the cases. Thus it is very essential to rinse the brush properly and store the same in a dry container to prevent contamination from external environment.

Keywords: Toothbrush, Contamination, Orthodontics, Malocclusion, Oral hygiene

Introduction

Tooth brush is most common oral hygiene aid to promote oral health and prevent dental diseases. Tooth brushes can get contaminated with microorganisms present in oral cavity. Retention and survival of microorganisms on tooth brush after brushing represents a possible cause of re-contamination of the mouth. Tooth brushes are usually rinsed in plain water and are stored in Bathroom which harbours millions of microorganisms. These micro-organisms usually grow in moist conditions.

Due to increase in demand for the presence of a well aesthetic dentition, the prevalence of population undergoing Orthodontic treatment has significantly increased in the past few years. The esthetics of patient plays an important role in development of social and psychological state of the patient [1]. People who are dissatisfied with their appearance are the ones who seek for orthodontic treatment [2]. Tooth brush contamination
occurs not only from the oral environment but also from the outside environment and surroundings where the tooth brushes are usually stored. The purpose of this study is to evaluate and to study if there is any difference in the number of bacterial colonies formed by contamination of tooth brush from the oral and external environment between the tooth brushes obtained from the dental students and the tooth brushes from the patients undergoing orthodontic treatment.

**Materials and Methodology**

Twenty random people were selected using convenience sampling method for the study and were divided into two groups. Convenient sampling method was used for selecting the samples. One group included ten patients who were undergoing orthodontic treatment in the department of orthodontics in Saveetha dental college, Chennai and other group included ten postgraduate dental students without fixed orthodontic appliance studying in the same university. Informed consent was obtained from all the subjects participating in the study.

**Inclusion criteria**

Patients undergoing fixed orthodontic treatment in one group and post graduate students not undergoing orthodontic treatment in another group.

Subjects between age of 18-30 years.

Subjects who had no active periodontal problems or carious lesions.

Subjects with no systemic disease or health conditions.

**Exclusion criteria**

Subjects with active carious lesions and current or previous history of periodontal problems.

Subjects with any systemic health problems or conditions.

Subjects taking any anti-infective agents or any form of medications.

Welcare orthodontic tooth brushes (fig 1) were used for this study to find the contamination of tooth brushes in this study and Colgate anticavity active salt tooth paste was also given to the patients for this study. All the subjects were given the same tooth brush and tooth paste to prevent any bias during the study. They were given instructions about the method of tooth brushing.

![Welcare orthodontic tooth brush](image)

The tooth brush samples were collected from all the subjects after one week and were taken for microbiological study. The subjects were instructed to return the tooth brushes after one week in a wrapped aluminium foil to prevent any contamination during the transportation. Then the samples were examined for colony forming units in the department of Microbiology in Saveetha dental college and hospital, Chennai. The examiner was blinded from the group of tooth brush which the sample belonged to prevent any bias. One single tuft of each of the tooth brushes obtained from the subjects were removed using a sterilized metal tweezer and is added to test tube containing 1 ml of saline to form a bacterial suspension. The bacteria are then uncoated by gently tapping the test tube. 10 micro litre of the suspension is pipetted out using sterilized micro litre tips on to a culture plate containing solid nutrient agar culture medium. The bacterial suspension is inoculated into the culture plate containing the culture medium by streaking the pipetted out liquid using sterile cotton swab. Then the plates are incubated and were examined for the bacterial colony forming units after the incubation period of minimum twelve hours.

After the incubation period the culture media plates are examined for the number of bacterial colonies.

**Results**

The number of microbiological colonies formed from the toothbrush samples obtained from the subjects are tabulated below.
### Group 1 [Patients undergoing orthodontic treatment] | Bacterial colony count | Group 2 [Students not undergoing orthodontic treatment] | Bacterial colony count
---|---|---|---
Nagarajan | 94 | Sunayna | 64
Santhosh | 79 | Subashree | 173
Gladyston | 232 | Sukanya | 0
Faridha | 89 | Sruthi | 74
Shyam | Confluent growth | Aravind | 94
Devaki | 156 | Joji | 42
Karthik | 142 | Swetha | Confluent growth
Prasanth | Confluent growth | Vaishnavi | 49
Muthulakshmi | 93 | Vignesh | 109
Azhagar | 206 | Joseph | 148

The number of bacterial colonies obtained from the twenty samples is tabulated. The bacteria identified from the smears prepared from the colonies showed increased prevalence of *Streptococcus* mutans, *Lactobacillus* and *Staphylococcus* in the samples obtained from Group 2 [Dental students undergoing orthodontic treatment] and prevalence of *Streptococcus* mutans, *Lactobacillus* species, *Staphylococcus* and *Enterococcus* bacterium in the samples obtained from Group 1 [Patients undergoing orthodontic treatment].

### Discussion

Patients undergoing orthodontic treatment are more prone for alteration in their microbiological profile. The results obtained in the study showed no significant difference in the number of bacterial colonies formed in the culture medium (fig 2 & fig 3). The samples obtained from the patients undergoing orthodontic treatment showed mild difference in the number of bacterial colonies but the difference was not statistically significant [p>0.05]. Further study with increased sample size is essential to prove the statistical significance in the difference in number of bacterial colonies.

The type of bacteria obtained from the colonies was studied by preparing a smear of the colonies in the culture medium. It showed that there was presence of *Streptococcus*, *staphylococcus* and *lactobacillus* bacteria from the colonies obtained from all the tooth brushes. This showed the contamination of the toothbrush with microorganisms. Few samples from group 1 [n=2] showed the presence of *enterococcus* bacterium in their smear.

Malocclusion is one of the most common dental disorders that the dentists come across in their daily practice. The prevalence of malocclusion has been studied
by many authors. Sarabjeet Singh et al [3] studied the prevalence of malocclusion and the need for orthodontic treatment in children of Himachal Pradesh and stated that greater need for orthodontic treatment was seen in 37.55% of the sample taken into the study. Aniket H. Vibhute [4] and Ramachandhra Prabhakar et al [5] studied the prevalence of malocclusion in subjects of Maharashtra and Chennai respectively. They stated that Angle’s class 1 malocclusion was the most common malocclusion seen among the population with class 1 molar relation with spacing and crowding. The prevalence of malocclusion in the school going children of Bangalore was studied by Usha Mohan Das et al [6]. They stated that 71% of the studied subjects had malocclusion and out of it 61% subjects had class 1 malocclusion and mostly with crowded lower anterior teeth. Goyal Sandeep et al [7] did a retrospective hospital based study on the prevalence of malocclusion in a hospital in Rwanda and stated that Angle’s class 1 malocclusion was the most prevalent malocclusion among the subjects included in the study.

Microbial alterations in the oral cavity after fixed orthodontic treatment was studied by many researchers in the past two decades [8-10]. These studies showed that there was definite increase in the number of micro-organisms such as Lactobacillus species and Streptococcus mutans in saliva and stated that it was mainly due to the accumulation of plaque on the tooth surface and poor oral hygiene maintenance. They also stated that there are alterations in oral salivary flow and pH. The rate of stimulated salivary flow was increased in the patients undergoing orthodontic treatment. A systematic review on the effect of fixed orthodontic appliance was done by Amanda Osório Ayres de Freitas et al [11]. They stated that the literature revealed only moderate evidence to show the presence of fixed orthodontic appliances influences the amount of oral microorganisms. The effect of fixed orthodontic appliance on oral health status was studied by Kenan Cantekin et al [12]. The results of their study showed that DMFT counts and the Periodontal Index were increased in a group of young dental patients undergoing fixed orthodontic treatment, and thus the patients undergoing orthodontic treatment must follow a very rigid oral hygiene protocol.

The contamination of tooth brush was studied by various authors in the past few decades. It was as early as 1989 when Muller HP et al [13] studied the contamination of tooth brush by A. actinomycetemcomitans from the patients harbouring them. They stated that 62% of the toothbrushes of the subjects showed significant amount of the bacteria when the organisms were found in the mucous membranes of the saliva. A pilot study on the microbial contamination of tooth brush was done by S.S. Taji et al [14]. They stated that the total number of bacterial colonies per toothbrush was found to be $10^4$ to $10^5$ colony forming units. However there was no incidence of the presence of Streptococcus mutans or lactobacillus in their samples. A review of literature on the contamination of tooth brush was done by Michelle R. Frazelle et al [15]. They found that toothbrushes of subjects who are healthy and toothbrushes of subjects with any oral diseases became contaminated with the pathogenic bacteria from the dental plaque, environment, design, or due to combination of these factors. Rashmi Naik et al [16] in their study stated that the contamination of tooth brush is a potential threat to oral and general health and said that it was very essential to disinfect tooth brush once in a while.

The microbial contamination of the tooth brushes and their decontamination was studied by various authors [17-19]. They showed that there was severe contamination of tooth brushes with streptococcus mutans immediately after brushing.

Jay Chamele et al [20] did an in-vitro study to compare the efficacy of microwaves and chlorhexidine in decontamination toothbrushes and pacifiers. They showed spraying the tooth brush with 0.12% of chlorhexidine and irradiation of the toothbrush with microwave for seven minutes had equal effect on disinfection of toothbrushes and pacifiers. A comparison between the efficacy of ultra-violet rays and microwaves in disinfection of toothbrushes was studied by S. K. Gujari et al [21]. They showed that after disinfection with microwave of ultra-violet rays there was significant reduction in the number of colony forming units thus showing their efficacy in decontamination of tooth brushes. The contamination of tooth brushes with antibacterial properties by microorganisms was studied by M. Efstratiou et al [22]. They stated that the toothbrushes with antibacterial properties in which the bristles were coated with triclosan had no effect against the number of colony forming units and on the other hand tooth pastes significantly reduced the contamination of the toothbrushes with microorganisms.
Conclusion

Patients undergoing orthodontic treatment for aesthetic and functional needs have been increased in the past few decades. The maintenance of oral hygiene in such patients becomes difficult due to the presence of various attachments on tooth surface. This may result in various infections of the gingival and the periodontal structures. Thus it is very essential to prevent contamination from external sources. The contamination of tooth brushes was seen in both groups and there was no statistical difference in the number of colony forming units between both groups. There was presence of enterococcus bacterium in few samples of group 1 along with the streptococcus, staphylococcus and lactobacillus species and the reason for which cannot be justified. Thus it is very essential to follow strict oral hygiene protocols in all conditions. Frequent change of tooth brush and effect of disinfection should be considered in the future studies.

Abstract

Introduction: Tobacco – related illnesses are on the rise due to increase in the number of people using tobacco products in smoking and smokeless forms. Tobacco acts as an etiological factor for various diseases affecting oral and general health. The aim of this study is to assess the level of awareness of the ill – effects of tobacco use in general population.

Materials and Method: The assessment of knowledge and awareness of the effects of tobacco use – smoking and smokeless is done by evaluating the answers to 20 - point questionnaire. The questionnaire was designed to enquire the extent of awareness of the respondents regarding the risks and hazards to tobacco use on oral and general health. The participants of the study were asked to fill the questionnaire either electronically or in the form of hand – outs. The results of the study were compiled and expressed in frequencies and percentages.

Results: 83% of the study population were aware of the ill – effects of tobacco use. Majority of the participants were aware that smoking causes lung cancer. 88% of the study population were aware of the risks of passive smoking. About 16 % were unaware of the complications of passive smoking. 78% of respondents were aware that tobacco chewing can cause oral cancer.

Conclusion: Increased awareness of ill – effects of tobacco can lead to decrease in the number of people using tobacco and related products. Raising mass awareness movements against tobacco, tobacco control and cessation measures can be undertaken to develop tobacco – free future generations.

Keywords: Tobacco, Smoking, Oral cancer, Awareness, Passive smoking

Introduction

Tobacco is a leafy plant belonging to the family Nicotiana. It contains an alkaloid called nicotine which is a highly addictive drug. It is grown and consumed all over the world. The tobacco leaves are cured (dried), processed and used in various forms. Tobacco products are used mainly in smoking and smokeless forms.

Smoking forms of tobacco include cigarettes, beedi, hookah, cigars, pipes and smokeless forms are betel quid chewing, mishri, khaini, gutka, snuff, and as an ingredient of pan masala¹.

India is the third largest producer of tobacco and second largest consumer of tobacco products. A variety of tobacco products available at low costs also acts an incentive for substantial number of users in India. The use of both smoking and smokeless forms are prevalent². According to WHO global report on trends in prevalence of tobacco smoking 2015³, about 13% of the Indian population were smokers. WHO also estimated that by 2025, 8% of the population will be smokers, if the efforts to control tobacco persists in the same pace.

Tobacco smoke contains about 5000 chemicals of which about 98 are proven to be carcinogenic⁴. The
health hazards of tobacco smoking include increased risk of oral cancer, lung cancer, heart diseases. Smokeless tobacco is the chief etiological factor for oral cancer, gastro-esophageal cancer, periodontal diseases and pre-malignant lesions in the oral cavity. The health hazards of tobacco smoke do not cease with the smokers, but also affects the non-smokers near them. It is known that passive smoking is as dangerous as active smoking as there is “no risk – free level of exposure”. The airborne nicotine from second – hand smoke is known to be absorbed in similar concentrations as in active smoking and have displayed high levels of nicotine biomarkers in non-smokers. Second – hand smoke is linked to frequent and severe asthma attacks, ear infections, sudden infant death syndrome in babies, learning difficulties and neurobehavioural effects in children. The knowledge and the understanding of the risks of passive smoking can help prevent initiation of the habit in non – smokers and to establish regulations to prevent exposure of general population to second - hand smoke.

The awareness about these hazards can help reduce the number of tobacco – related deaths, facilitates the users to quit the habit and also impede non – users from becoming users. This study aims at evaluating the awareness of general population regarding the ill-effects of tobacco in the form of a questionnaire survey.

**Materials and Method**

A questionnaire containing 20 questions to assess the extent of awareness of the ill – effects of tobacco was designed. The details of the subject – name, age, current and past tobacco status, and habit history, perception about the health hazards of use of smoking and smokeless forms, passive smoking, and readiness to quit the habit were assessed using the questionnaire. The study sample was identified as general population and not specified by age groups.

The hazards of tobacco use in smoking form such as heart diseases, lung cancer, oral cancer, pulmonary tuberculosis, low – birth weight in infants born to pregnant women who smoke and impotence in men were listed. The ill – effects of tobacco chewing like oral cancer, stomach cancer, gum recession and gum disease, tooth loss, whitish patches that turn malignant and unaware of the effects were tabulated. The risks of passive smoking such as Lung infections, Ear infections, frequent and severe asthma attacks, lung cancer, impaired lung function and slow lung growth in children, learning difficulties, developmental delays and neurobehavioural effects in children, miscarriages in women exposed to passive smoke, sudden infant death syndrome in babies and unaware of the risks were enumerated. The respondents were required to select the options which they were aware of as an adverse effect of smoking, tobacco chewing and passive smoking.

Respondents answered the questionnaire either electronically or in handouts provided to them. 100 responses were collected and evaluated. The results obtained were analyzed and tabulated using frequencies and percentages.

**Results**

The majority of the respondents belonged to the age group 16-30 years (38%), followed by 30% of respondents from the age group 31-45 years. Only 3% of the respondents were from age less than 15 years (Figure 1). Majority of the participants who are users responded to the age at which they started using tobacco as 16-30 years (67%).

Of the 100 respondents, 72% of them were non-users and 28% were users of tobacco and related products. Of the 28% of users, 86% of them were smokers and 14% used chewable or snuff type of tobacco. Out of 72% of current non-users, 6 respondents were past users – 4 of them used tobacco in smoking form and 2 of them used in smokeless form.

In response to who introduced them to the habit, 45% of them answered as Friends, 29% as relative and 26% as self. Of the 26% of respondents, 50% of them started using tobacco by seeing others use it (Figure 2).
72% of the participants responded in denial to the use of tobacco in the household. Of the 100 respondents, 34% of them were exposed to tobacco products at work.

**Awareness of ill – effects of tobacco use:**

83% of the study population were aware of the ill – effects of tobacco use.

**Ill – effects of tobacco smoking:**

76% of the study population were aware that smoking causes lung cancer and 66% were knowledgeable about oral cancer as a consequence of smoking (Table 1). Respondents were comparatively unaware of the increase in the risk of pulmonary tuberculosis and impotence in men as a possible side effect of smoking.

**Awareness of ill – effects of passive smoking:**

With regard to the knowledge of ill –effects of passive smoking, 88% of the study population were aware of the risks of passive smoking. 66% of the respondents answered that they were aware that passive smoking increases the risk of heart attack and stroke in non – smokers.

57% and 49% of the participants were aware that passive smoking can cause lung cancer and frequent and severe asthma attacks respectively (Table 2).

16% of the respondents were unaware of the complications of passive smoking.

92% of the participants were aware of the advertising of ill – effects on various tobacco products. Of the 28% of users, 43% exhibited readiness to quit the habit after knowing the ill – effects of tobacco. 51% of the study population expressed willingness to advice someone to...
stop smoking in public.

Discussion

There were a few previous studies that are done to measure the extent of awareness of general population about the ill – effects of tobacco – in smoking, smokeless forms as well as passive smoking. The study population was confined to specific age groups such as adolescents, school children, college – going and medical students in many previous studies. Chitalkar et al reported that 90% medical students were aware of role of smoking in causing oral and lung cancer. Similar results were reported by Raina et al in study done to assess the knowledge, attitude, and behavioral determinants of tobacco use among high school students (age 13–15 years) in Bangalore. However, negative results were reported by Basavaraj et al. The results of their study showed that only 4% of their study population had good awareness about effects of smoking on oral health. As the present study is not age – specific, the level of awareness among various age groups of the population can be assessed.

In the present study, the study population (83%) was well aware of the ill-effects of tobacco. The awareness regarding lung cancer as an outcome of smoking was maximum among the participants followed by oral cancer. It is similar to the results reported by Hansen et al and Ariyawardana et al. Hansen et al reported that 99% and 95% of the study population identified that smoking and passive smoking as a risk factor for lung cancer. Ariyawardana et al reported 95% awareness of oral cancer of which only 44.9% were aware of precancerous lesions.

78% of the respondents were familiar with the fact that tobacco chewing can cause oral cancer. The knowledge about premalignant lesions is low (27%) in the study population. About 9% of the population were unaware of the hazards of tobacco chewing. The awareness of premalignant lesions can be beneficial to the general public as it can lead to early diagnosis and prevention of the lesion from progressing into a malignancy.

The results of the present study was higher with reference to the knowledge of the participants on second hand smoke or passive smoking. About 88% of the study population were aware of the adverse effects of passive smoking. The awareness of lung cancer and lung infections as a result of passive smoking was more prevalent among the respondents followed by increased frequency and severity of asthma attacks. 16% of the participants were unaware of the consequences of passive smoking. Knowledge of passive smoking can help building a smoke – free environment and obstruct the progression of passive smoking induced health hazards in future generations.

Out of 28% users, 57% were in precontemplation stage of change. Such patients need to be counseled to assist them in quitting tobacco use. Raising awareness about Nicotine replacement therapies and other pharmacologic – based strategies that can help reduce the symptoms of withdrawal can improve the chances of quitting in these users.

Conclusion

Even though the present study was not age specific, there was reduced number of responses from adolescents and school children (< 15 years). Hence, the extent of awareness of ill – effects of tobacco could not be studied adequately in this age group and is a limitation of the present study. The study population was limited to 100 and future research with a higher sample size and equal distribution of the participants among various age groups is required to assess the exact level of awareness of the adverse effects of tobacco use in general population.

Another limitation of this study is that there was only 28% of the survey population who were users of tobacco products. Hence the quantification of awareness of tobacco related illnesses in users cannot be done.

Increased awareness of ill – effects of tobacco can lead to decrease in the number of people using tobacco and related products. Raising mass awareness movements against tobacco, tobacco control and cessation measures can be undertaken to develop tobacco – free future generations. Knowledge about tobacco replacement therapies should be disseminated among young smokers to aid them in quitting their habit.

Abstract

Health workers are incessantly in dilemma as to why people healthy or otherwise avoid health professionals. This study aimed at establishing an association between the dental ladder and numerous psychosocial factors associated with dental avoidance in an adolescent population using a Contemplation Ladder. This study is an analytical cross-sectional study which evaluates attitudes of subjects towards their oral health and future intentions to go to a dentist in the coastal city of Mangalore. The Dental Contemplation Ladder is based on the ladder developed by Biener and Abrams. The questionnaires used in the study included the Modified Dental Anxiety Scale (MDAS, the Dental Neglect Scale (DNS) and the Revised Dental Beliefs Survey (R-DBS). The Pearson chi square association between the ladder scores and gender showed high statistical significance (p <0.001) with females having higher ladder scores than males. A one-way ANOVA demonstrated a significant difference between the variables with (p<0.05) for all three psychosocial variables. The regression models showed a statistically significant relation between the ladder scores and psycho social variables. The study provides an important link between dental absenteeism and different psychological and social parameters and the interrelation and association of these to the differing stages of change in adolescent population.

Keywords: dental avoidance, adolescent, dental ladder, health behavior models, psychosocial factors.

Introduction

Health workers are incessantly in dilemma as to why people healthy or otherwise avoid health professionals. This scenario deteriorates in the dental health setup, when patients even after desensitisation do not turn-up on a regular basis at the dentist’s office. When viewed in the aspect of a dental health professional, this cohort forms a major impediment to any program and this jargon severely interferes with the comprehensive treatment plan tailor-made for the individual and in turn causes a greater set back to the treating dentists.

It’s always a matter of controversy as well as a conundrum as to why individuals avoid dental treatment. To pinpoint where the problem lies is very difficult. There are many factors that might contribute towards dental avoidance of which, dental fear is among the most dominating factors followed by dental anxiety. The other contributing factors for avoidance might include dental indifference,2 high costs of dental care3, ‘trust’, and ‘fear of negative information’. However, the EFA further suggested a general factor with all 15 items. By using the CFA, five factors were found based on the EFA solution and the original DBS dimensions. A general factor, ‘social interaction distress in dental treatment’, and four more narrow dimensions, ‘communication’, ‘trust’, ‘fear of negative information’ (originally labelled ‘belittlement’ perceptions of the dental experience as being uncontrollable, unpredictable, dangerous.4and this might be explained by the less frequent dental visiting

DOI Number: 10.5958/0976-5506.2019.01849.7
of many fearful people. The objectives of this study were to investigate differences between dentally fearful people who regularly attend the dentist and fearful people who infrequently visit the dentist. A random sample of 1,082 Australians ! 15 yr of age completed a mailed questionnaire (response rate = 71.6%). The solutions for all these problems might be related to the behaviour, attitude and beliefs of individuals and thus, focus on behavioural sciences is the need for the hour. Health behaviour research is now focusing increasingly on many such models and their application in changing health behaviour in the community.

There are many models that assess health behaviour needs of the individual. The foremost models that have been practised for health behavioural change are the Health Belief Model, the Theory of Planned Behaviour, Transtheoretical Model and social cognitive theory. However, in the present study The Transtheoretical Model (TTM) developed by Prochaska, Norcross, and DiClemente was applied, which measured an individual’s readiness to adopt new health behaviour.

The study aimed at establishing an association between the dental ladder and numerous factors associated with dental absenteeism in an adolescent population. Adolescents between the ages of 10 and 19 years are a vulnerable group and are the bridges between the young and the old and are often the population that is routinely missed for screening especially for dental diseases. Many serious diseases in adulthood have their roots in adolescence and catching them younger seems the best preventive modality that can be practiced worldwide.

We hypothesized that the participants who selected higher scores on the Ladder would also provide convincing acceptance for statements inquiring about their intentions to go to a dental health professional (DHP), their attitudes towards DHP, and negative beliefs about DHP all of it in turn reflecting their oral health status.

**Method**

Study type and Study Setting: This study was an analytical cross-sectional study which evaluated the attitudes of subjects towards their oral health and future intentions to go to a dentist in an urban and rural locale in the coastal city of Mangalore in India. The list of all institutions in Mangalore city was obtained from Authorities. Two urban and rural institutions were randomly selected. The participants who were familiar with English and Kannada and were present during the study period were included in the study.

**Material**

The Dental Contemplation Ladder was based on the ladder developed by Biener and Abrams originally meant for smoking cessation, the words at five different rungs of ladder were modified accordingly and referred to the stages of change of the Transtheoretical Model (TTM) developed by Prochaska, Norcross, and DiClemente. The Kannada version of the ladder was designed by translating and back-translating the English wording. The ladder was reassigned the values of the rungs to range from 1 (lowest rung) to 10 (highest rung). Other questionnaires used in the study included the Modified Dental Anxiety Scale (MDAS), the Dental Neglect Scale (DNS) and the Revised Dental Beliefs Survey (R-DBS).

Sample size was calculated using the formula: G power 3, which was calculated from pilot study among 30 adolescents. The final sample size was estimated to be 381 considering 5% allowable error.

Ethical clearance was obtained from the Institutional Ethics Committee. Permissions were obtained from the Head of the institutions of the Colleges, randomly selected by lottery method. Participants gave written informed consent before answering the questionnaire and undergoing an oral examination.

**Statistical analysis**

Data was analyzed using Statistical Package for Social Sciences (SPSS), version 16.0 (SPSS Inc., Chicago IL). Mean (X) and Standard Deviation (SD) was calculated. The Chi square and Fisher’s exact tests was used for comparison of categorical data. Pearson product-moment correlation was used to correlate ladder scores with other variables. Multiple means between the groups of all parameters were compared with ANOVA and a post hoc test. The inter relationships between parameters which were found to correlate significantly were assessed using multiple linear regression analysis and p value < 0.05 was considered statistically significant.
Results

Of the 526 participants present on the days of study 458 of them were subjected to the oral health examination and answered the questionnaire with a response rate of 87 percent. The mean age of the participants was 18.37 (SD= 0.54), the number of males in the sample was slightly higher than the female representatives at 55%. More than half of the representatives were from the rural background (56.3%). Demographic and psychosocial variables and association with ladder scores in rural and urban population Table 1.

Reliability analysis revealed a Cronbach’s alpha value of 0.93. Split-half reliability and Guttman split-half reliability were found to be 0.76 and 0.74, respectively. Test-retest reliability reflects the variation in measurements taken by an instrument on the same subject under the same conditions and was found to be 0.74 (p < 0.01)

The Pearson chi square association between the ladder scores and gender showed high statistical significance (p <0.001) with females having higher ladder scores than males. The rural and urban divide between the participants was contrasting nonetheless as there was a highly significant association (p <0.001) between the rural and urban participants with more than 57(25%) ready to go to the dentist as opposed to 48(24%) of urban population who were unwilling to go to a dentist. Pearson product-moment correlation between the ladder scores and the psychosocial variables demonstrated some meaningful and noteworthy correlations, dental ladder scores were positively correlated with dental belief with (r= +0.046) and was negatively correlated with dental anxiety (r= -0.33) (p<0.001). [Table 2]

A one-way between subjects ANOVA was conducted to compare the effect of ladder scores on dental anxiety, dental neglect and dental belief. There was a significant difference between the variables with (p<0.05) level for the three psychosocial variables.

The multiple comparison Regression models were created with ladder scores kept as dependent variables and MDAS, the DNS, the Revised Dental Beliefs Survey, caries experience, and gender as independent variables it showed a statistically significant relation between the ladder scores, dental anxiety and caries experience. Discussion

Adolescence is described as a transitional phase between childhood and adulthood, with a biological beginning (puberty) and a social ending\textsuperscript{14}, they form the main bulk of population worldwide, around 1 in every 6 person in this world is an adolescent which numbers to around 1.2 billion people aged 10 to 19. Adolescents are a vulnerable group and are the bridges between the young and the old and are often the population that is routinely missed for screening especially for dental diseases. Many serious diseases in adulthood have their roots in adolescence and catching them younger seems the best preventive.

In the present study the mean dental anxiety scores were 9.8(1.5-4.4) and dental neglect scores 3.5 (1.5 – 4.6) and dental beliefs scores were 87.4 (40-163). The dental anxiety scores were similar to the studies conducted by Appukuttan et al\textsuperscript{15} and Fotedar et al\textsuperscript{16} in India, but
contrasts to the studies done by Pratima et al\textsuperscript{17}, Marya et al\textsuperscript{18} and Tunc et al\textsuperscript{19}. Where the dental anxiety scores were higher among participants as all these studies were hospital based studies and the mean age of participants was higher than that of the our study. The scores in the dental belief scales were similar to that of studies conducted by Coolidge et al\textsuperscript{13}. The main aspect of this study was to assess the relationship between dental ladder scores and that of all three scales namely MDAS\textsuperscript{11}, DNS\textsuperscript{12} and R-DBS\textsuperscript{13}.

The regression analysis where the dependent variable was dental ladder and afore mentioned variables resulted that the dental ladder scores which predicted dental avoidance among Indian adolescents was strongly associated with dental anxiety and dental neglect but weekly associated with dental belief which corresponded to many studies in literature\textsuperscript{5} and this might be explained by the less frequent dental visiting of many fearful people. The objectives of this study were to investigate differences between dentally fearful people who regularly attend the dentist and fearful people who infrequently visit the dentist. A random sample of 1,082 Australians ! 15 yr of age completed a mailed questionnaire (response rate = 71.6\%,\textsuperscript{20,21,22} The root cause of dental avoidance is probably a dynamic phenomenon with a root cause that remains constant. Very few dynamic conclusions can be sought for as to why people do not visit dentist but underlying dental anxiety seems to play a very important factor.

The present study aims at finding what stage the individuals are in their phase of change and tries to quantify the differing psychosocial characters that effect dental absenteeism. This study showed that an adolescent with lower ladder scores (no thoughts of going to dentist) had higher dental anxiety scores, higher dental neglect scores and lower dental beliefs score. Whereas higher ladder scores had strikingly opposite finding and all these values were statistically significant. This makes it clearer that dental absenteeism is a frame of mind similar to habit, as the present area of study is located in such an area where there is abundance of dental care providers.

The most important feature of this ladder is its graphical representation of the stage of which the subject is in, with direct and explicit words for each of the stages. Once this is evaluated the subjects then can be treated accordingly as to what intervention is required for the specific stage\textsuperscript{7}. The correlation of ladder with dental anxiety and dental belief as demonstrated in this study can also pave way as a substitute to the heavier load of questions, allowing the use of a fast and easy application in order to determine the state for changes.\textsuperscript{23}

Conclusion

The study is especially important from the perspective that it opens newer insights on dental absenteeism as no other study in dental literature could be retrieved on this population with relation to the use of the dental ladder. Nevertheless, this descriptive analytical study provides a new dimension for future research in the different socio economic and geographical settings. The graphical representation of the ladder is much more simpler than any questionnaire and provides a base for further research as adolescents form an important cohort in the community which if neglected might form a serious public health concern in future.

Abstract

Diseases arising due to usage of tobacco is one of the most common cause of premature death & disability around the world. In 3rd round of Nationwide survey across India held in 2005-06 by National Family Health Survey estimated that tobacco consumption habit was among 57.6% males & 10.8% females. Mizoram is a small hilly state located in Northeast of India.

Aims & Objective: (a) Pattern & Prevalence of use of tobacco among local population (b) Reasons for tobacco consumption (c) Attitude and knowledge regarding tobacco consumption.

Materials & Method: 275 patients reporting for dental treatment was selected for the study. Data was recorded in Microsoft Excel software and SPSS Version 19 was used. To analyse the association between the different parameters Chi square test was applied & the level of significance for the present study was fixed at p≤0.05.

Results: 80% of the sample had some or other form of tobacco habit. Smoking was more prevalent among males (64.5%) whereas tobacco chewing was more common among females (77.5%). Habit of tobacco chewing was highest among house wife 48.3%. Smoking among students was 32.3 %.

Conclusion: High percentage of tobacco use is not due to ignorance or illiteracy but due to social custom, habit & acceptance of the same in the society. State government will have to strictly implement the tobacco control mechanism. Sale & consumption of tobacco in public will have to be banned legally.

Key-words: Tobacco, Population, Smoking, Prevalence, Store, Myeloperoxidase (MPO)

Introduction

Tobacco consumption and related diseases is one of the major health challenges that developing countries like India face. Of the total population of India roughly 70% of the population reside in rural area and most of them depend on agriculture for livelihood & belong to low socio-economic status and habit of tobacco is very high among them.

Side effects / diseases arising due to usage of tobacco is one of the most common cause of premature death & disability around the world.¹ Situation is very alarming especially in the developing countries as most of the disease arising due to usage of tobacco is preventable in nature & related to one’s lifestyle. On an average 4.9 million² death occurring annually may be due to usage of tobacco and if this trend continues roughly 10 million² population is expected to die by the year 2020 with 70%² of them will be from developing countries. Based on some studies about 2/3rd of the world population addicted to tobacco/smoking belong to either developing or under developed countries and if this trend continues it may leads to 8.3 million deaths annually by the year 2030³ with 80% of them being from low & middle per capital
Prevalence of consumption of one or other form of tobacco among the world population is well documented. There have been instances wherein the individual having tobacco & smoking habit and suffering from cancer, cardiovascular, respiratory disease or any other health problem are likely to develop more systematic problems & die prematurely than the non smokers.

In 3rd round of Nationwide survey across India held in 2005-06 by National Family Health Survey stated that there is widespread usage of tobacco among males 57.6% whereas among females it is 10.8%. India being the most populated country is also the second largest producer & usage of tobacco & related products in the world. Usage of both the forms of tobacco i.e smokeless & smoking is very high among the Indian population.

Mizoram is a small hilly state located in Northeast of India. Aizawl being the capital of the state has one district hospital and numerous private dental practitioners. To know the prevalence and pattern of tobacco use among the population is important as this information may be utilized to enable laws, measures & develop strategies for effective tobacco control. Thus a questionnaire based study was carried with the aim and objective to assess the

(a) Pattern & prevalence of use of tobacco among local population
(b) Reasons for tobacco consumption
(c) Attitude and knowledge regarding tobacco consumption

Materials And Method

Study Area

According to census survey 2011 Aizawl city is very progressive in terms of literacy, sex ratio, and population growth. Aizawl has a population of 400309 of which male and female were 199270 and 201039 respectively. Average literacy rate was 97.89%. With regards to Sex Ratio, it stood at 1009 per 1000 male. 78.63% of population or 3,14,754 people lived in urban region of which 1,55,490 are males & 1,59,264 are females with a Sex Ratio 1024 per 1000 male. 21.37% population or a total of 85,555 of population lives in rural area; of these 43,780 are males and 41,775 are females with a sex ratio of 954 females per 1000 males.

Study Design

It’s a questionnaire based study. Questionnaire was prepared in both English and local Mizo language for the convenience of the patients. A local interpreter was used to communicate with the study subjects.

Sample Size

275 study subjects were selected for the study. Out of these 12 questionnaires were rejected due to errors in filling up the form.

Statistical Data Analysis

The data was recorded in Microsoft excel software & SPSS version 19 was used to study the data.

To analyze the association between the different parameters Chi Square test was applied & the level of significance for the present study was fixed at p≤0.05.

Results

Socio-Economic Distribution

Out of 263 subjects 111 (42%) of the subjects were male and 152 (58%) were females. Among these 71(27%) of the sample belonged to rural area & 192(73%) belonged to urban area Table 1. Maximum 79(30%) of the subjects belonged to the age group of 31-40 yrs followed by 69(26%) in the age group of 18-24 yrs. 88.6% of the study sample were literate. 30(11%) of the respondent were illiterate. 191(72.6%) of the respondent belonged to middle class followed by 47(17.9%) belonging to low socio-economic status. 80(30.4%) of the female respondents were housewife followed by 69(26.2%) sample in service.

Personal Habit

Majority of the respondents 118(44.9%) and 182(69.2%) underwent only emergency medical and dental treatment as and when required. Only 19(7.2%) of the responden underwent regular dental check up. A very high percentage of the sample 80.6% had some or other form of oral habit. Among them 45.6% had tobacco chewing habit followed by 11.8% who had smoking habit; 21.7% of the sample having more than one habit Graph 1. High prevalence of chewing tobacco and smoking 93 (77.5%) & 11 (35.5%) respectively
was found among the female study subjects Table 2. About 57 (47.5%) of the subjects studied up to high school had tobacco chewing habit whereas 15 (48.4%) of the graduate had smoking habit. Habit of tobacco chewing and smoking was most common among the middle income group subjects 90 (75%) & 26 (83.9%) respectively. 58 (48.3%) of the housewife had habit of tobacco chewing followed by self employed 27 (22.5%) & service 25 (20.8%) subjects.

Among the respondents having oral habit 42% of the subjects used 10-20 tobacco packets/cigarette in a day followed by 25.9% having less than 10 quantities and 11.3% having more than 30 quantities Graph 2. About 43.6% of the respondents chewed & kept the tobacco product in their moth for 10-20 minutes.

Knowledge about Tobacco Chewing

90.1% respondent knew that chewing tobacco or smoking is injuries to health whereas 9.1% were not bothered about the consequences or harmful effects. About 37.3% of the subjects knew about harmful effects from the TV/Print media followed by 27% from friends and family. Only 12.5% of the respondent knew about the harmful effects from the government banners and posters. Only 28.5% of the respondents were willing to quite the oral habit voluntarily but a good number of them 25.6% refused to do so were as 26.6% of them said they may try to quite.

Tobacco Habit & Respondent

91% of the respondent bought the tobacco product from shop. 71(33.49%) had the habit of chewing & then swallowing the tobacco product while 52(24.52%) of them kept the tobacco product & then spit it. About 67(31.6%) of the respondent started the habit on their own wish whereas 86(40.6%) of the subject answered with more than one option. Despite knowing the hazards of tobacco usage 58(27.4%) subjects stated that it has become a habit as the reason of continued usage of the tobacco product whereas 66(31.1%) & 17(8%) reported to use it as a favourite time pass & for social reasons respectively. 55(51.4%) of the respondents had no specific time of usage of tobacco product while 51(24.1%) used to have it after food.

**Graph 1: Prevalence of Any Form of Tobacco/Alcohol**

**Graph 2: Frequency & Duration of Usage**
Discussion

The study results show widespread prevalence of tobacco chewing/smoking among the study population. Almost 8 out of 10 or 80% of the study subjects had some or other form of tobacco habit. The usage of tobacco is substantially high & when compared to national average of 35% among Indian population and when compared to 67.6% of Mizoram population having oral habit in a study by H K Chaturvedi & et al. It may be due to study being conducted at a dental centre were majority of the study population were dental patient and it is well established fact that use of tobacco products leads to dental disease among others. 45.6% of the respondent used smokeless tobacco much higher than the national average of 21% & 11% used to smoke as compared to national average of 9%. The combined usage of some or other form of oral habit was 21.7% much higher to national usage of 5%.

Use of any form of tobacco among male was 43.26% less when compared to national average of 48% but similar to a study by H K Chaturvedi et al among Mizoram population and that among females was 56.73% higher when compared to national average of 20% and 45.7% in a study by H K Chaturvedi et al. Smoking was more prevalent among males (64.5%) whereas tobacco chewing was more common among females (77.5%) indicating presence of sex differences in tobacco use pattern. Similar results were found in as study by H K Chaturvedi & Giovini et al. Use of tobacco among Indian women show quantum jump of 11% in the year 2005-06 to 20% in the year 2009-10 as reported by Durgesh Nandan Jha. Habit of tobacco chewing was highest among the house wife 48.3% followed by employed samples (20.8%) similar to study by H K Chaturvedi. Overall use of tobacco among student respondent was 14.15% similar to a study by C T Sreeramareddy et al & by H K Chaturvedi et al. Smoking among students was 32.3 % similar to a study by DN Sinha et al wherein smoking among Mizoram student was 34.5% highest among the eight Northeastern states.

Easy availability and being offered by friends was cited by 6.1% & 15.6% as reasons for motivation to start oral habit with 40.6% of the respondent choosing more than one reason. Similar reasons were cited by the subjects in study by D N Sinha & PC Gupta on medical students of Patna & by Urvashi J et al on urban population of Jamnagar city in Gujarat. 91% of the respondent bought tobacco from the shop as these products are freely available & consumption is widely accepted in the society similar to national average where 87% of the Indian Population bought the product from stores/shops. 25.9% of the respondent used to have 10 packets/cigarettes of tobacco product which is similar to national average of 25%. 42% of the subjects had 10-20 pkts/cigarette in a day much higher when compared to similar study by Urvish J et al.

28.5% of the respondent was willingly to quite the habit similar to other studies by JD Sargent but less when compared to national average of 35% who are willingly to quite. 25.6% of the respondent were a concern as they were not willingly to quite the habit despite 90% of the subjects knowing that tobacco usage is injurious to health. Similar response was given by adult population during the national health survey study. 37.3% of the subjects knew about the hazardous of tobacco habit from TV/Print Media similar to response during national tobacco survey followed by 27% from friends & family and only 12.5% from government banners and posters much lower when compared to national average.

Prevalence of malaria is very high in North Eastern states of India particularly Mizoram were 7359/100000 population suffered from the disease; almost double that of national average of 3697/100000 population. Tobacco was used as medicinal/therapeutic value very long time back. Tobacco used to be administered orally for malaria/intermittent fever when allopathic treatment was not available. Since malaria was very common use of tobacco as medicinal product was also very common among the masses. This may be one of the reasons for high percentage of tobacco usage and also habit of population who either chew/keep & swallow the tobacco product as they may have learnt it from their ancestors.

Conclusion

Our study concludes that in the state of Mizoram use of tobacco is exceptionally high as compared to national across the various categories like gender, sex, occupation and education etc. This high percentage is not due to ignorance or illiteracy but mostly due to the social custom, habit and acceptance of the same in the society. Almost all the respondent knew about the harmful effect but still used the tobacco product as it is freely available and consumption is not considered a
bad habit among the common masses. Government & health officials will have to take proactive measures and bring about behavioural change among the population to tackle this menace. Owing to severe side effects of tobacco usage WHO in 2005 asked various countries to implement Framework Convention on tobacco control. Many countries including India took proactive measures such as high taxes, bigger pictorial warnings on packs, public awareness etc, so as to bring down the widespread usage of tobacco among the masses. Because of these proactive measures worldwide smoking among the people decreased by almost a third 29.4% to 15.3% between the years 1990 to 2015.  

State government will have to strictly implement the tobacco control mechanism. Sale & consumption of tobacco in public should be banned. The use of tobacco products among women is also high and specific health programmes targeting the particular gender should be implemented. It should emphasize on the fact that usage of tobacco not only affects one’s personal health but is hazardous to the health of her spouse, her embryo & children and affects the society as whole.

Abstract

Voiding Dysfunction is one of the common non life-threatening medical condition among perimenopausal women worldwide. Nearly one third of women face voiding problems during their life and it may affect their physical, mental, social, and overall health related quality of life. The aim of this study was to assess prevalence of voiding dysfunction and its impact on quality of life among perimenopausal women. The total 390 perimenopausal women in the age group of 40 – 60 years were selected through purposive sampling technique from selected area of Hoshiarpur, Punjab. International Consultation on Incontinence Questionnaire – Female Lower Urinary Tract System (ICIQ- FLTUS) was used for assessing prevalence of voiding dysfunction and modified King’s Health Questionnaire was used for assessing quality of life. The collected data were tabulated and analysed by using descriptive and inferential statistics. The study findings revealed that out of 390 perimenopausal women, 96(24.61%) suffer with voiding dysfunction. Out of 96 perimenopausal women with voiding dysfunction, 38(39.59%) had mild impact, 53(55.21%) had moderate impact, and 5(5.20%) had severe impact on quality of life. There was statistical significant relationship found between quality of life and age (F=3.38, p=0.02), education (F=4.18, p=0.003), occupation (t=2.89, p=0.04), family income (F=3.28, p=0.02) and type of delivery (t=1.98, p=0.05) of perimenopausal women with voiding dysfunction. The voiding dysfunction is an existing health problem among perimenopausal women and it had impact on quality of life.

Keywords: Prevalence, Quality of life, Voiding dysfunction, Perimenopausal women

Introduction

A woman’s reproductive system is a delicate and complex system in the body. Women reproductive life is cyclical in nature. Puberty and perimenopause demarcate the beginning and end of the female reproductive life cycle and are two major transitions in a woman’s life.¹

Perimenopause is the time period during which women’s body shifts more or less from regular ovulation and menstrual periods towards permanent infertility or menopause. Perimenopausal age usually starts in a woman’s mid to late 40s and remain in this transitory state for approximately 4–5 years before reaching menopause.² Irregular menstrual periods are one of the first signs of perimenopause. Estrogen is a hormone that helps to regulate the menstruation and keeps the bladder and urethra healthy and functioning properly. As a woman reaches near to the stage of menopause the estrogen level begins dropping and this lack of estrogens may cause the pelvic muscles to weaken. They may no longer be able to control bladder as they did before. As estrogens levels continue to drop throughout, the symptoms of voiding dysfunction may become worse.³

Voiding dysfunction is a common, distressing, non life- threatening condition in which there is a
poor coordination between the bladder muscle and the urethra. According to the American College of Physicians, about 50% of women between the ages of 40 to 60 years and nearly 75% of women over the age of 75 years, have symptoms of voiding dysfunction in the form of urinary incontinence, voiding and filling symptoms. As per various research study findings report perimenopausal women with voiding dysfunction suffer with wide range of symptoms, which include hesitancy, weak stream, intermittency, straining to void, spraying or a split stream, incomplete bladder emptying, a need to immediately re-void, position-dependent micturition and postmicturition dribbling. Sometimes women complain of concomitant stress and/or urge urinary incontinence.

Voiding dysfunction is a silent global epidemic and it is associated with high economic costs, psychological morbidity and adverse effects on the quality of life. Quality of Life is a broad ranging concept affected in a complex way by the person’s physical health, psychological state, levels of independence, social relationships, personal beliefs and their relationship to salient features of their environment. Numerous recent research study findings indicate that voiding dysfunction in whichever form, sweepingly affect the life of the women. It generates feelings of anger, sadness, embarrassment and depression. Women may avoid social gatherings and lose self-confidence, which has a proportional impact on their social interactions, sexual life and emotional health.

In the light of above facts and personal experiences, voiding dysfunction among female population is quite a common health problem and it may affect the quality of life in various ways. Hence, the researcher strongly felt the need of assessing the prevalence of voiding dysfunction and its impact on quality of life among perimenopausal women.

Material And Method

This was a quantitative non experimental study with descriptive cross sectional design conducted in the month of April 2017 among 390 perimenopausal women in the age group of 40 to 60 years in selected rural community of Sataur, Hoshiarpur District of Punjab. The sample size was determined based on the results of a pilot study and was computed by power analysis. The samples were selected through nonprobability purposive sampling technique. The inclusion criteria for sample selection included: Perimenopausal women in the age group of 40 to 60 years willing to participate in the study. The exclusion criteria included: perimenopausal women with any gynaecological disorder, surgical menopause and on hormonal therapy.

To execute the study, the researcher obtained official written permission from the Sarpanch of selected village and written informed consent from perimenopausal women after explaining the study purpose and assuring for confidentiality and anonymity. The structured tool was used for data collection and it consisted of three sections. Section A: Socio-demographic variables of perimenopausal women: It consisted of 9 variables including age, education, occupation, type of family, family income, religion, type of delivery and history of gynecological surgery. Section B: Standardized ICIQ-FLUTS (International consultation on incontinence questionnaire- female lower urinary tract system) questionnaire: It consisted of total 12 items under 3 subscales as filling, voiding and incontinence symptoms, to assess the prevalence of voiding dysfunction. If there was presence of 3 or more symptoms then women was considered to have voiding dysfunction. Section C: Modified King’s Health Questionnaire: It consisted of 29 items under eight domains of quality of life ( general health – 2 items, role limitation-2 items, physical/social limitation-4 items, personal relationship – 3 items, emotions- 3 items, sleep/energy- 2 items, coping measures- 4 items, urinary symptoms- 9 items) was used to assess the impact of voiding dysfunction on quality of life among perimenopausal women. Each item was scored against four points from 1 to 4. The total score of the items in each category was added to yield a total raw score. Total raw score was ranging between 29 to116 and it was interpreted in terms of impact on quality of life as mild impact (≤ 40%), moderate impact (41-60%), and severe impact (61-100%). The tool was translated in to Hindi and tested by back translation into English.

The content validity of tool was obtained from the six experts in the field of medicine and nursing. Reliability of tool was checked by test-retest method and it was found 0.96 for ICIQ – FLUTS Questionnaire and 0.92 for modified King’s health questionnaire, hence both tools was considered reliable for data collection. During data collection, the perimenopausal women’s of 40-60 years were identified and screened for voiding dysfunction through ICIQ – FLUTS Questionnaire, following this the assessment of impact of voiding dysfunction on
quality of life was done through modified Kings Health Questionnaire. The collected data was tabulated and analyzed in accordance with objectives of the study by using descriptive and inferential statistics with the help of Statistical Package for the Social Sciences version 16 software (SPSS Inc., Chicago, IL, USA) and Instat.

Findings

The socio-demographic variables of perimenopausal women showed that, majority of perimenopausal women were, in the age group of 55-60 years (36.92%), educated up to secondary class (32.05%), married (73.33%), working (57.17%), living in joint family (58.20%), having family income between 20,001-30,000 ₹/month (40.51), belongs to Sikh religion (80.25%), having normal vaginal delivery (85.12%), and having no history of gynaecological surgery (91.28%)

As per the prevalence of voiding dysfunction among perimenopausal women, out of 390 perimenopausal women, 96(24.61%) were sufferers with voiding dysfunction. Among them, 38(39.58%) were having incontinence symptoms, 33(34.37%) were having voiding symptoms and 25(26.05%) were having filling symptoms.

Figure 1: Percentage distribution of perimenopausal women with voiding dysfunction as per levels of impact on quality of life

Figure 1 depicts that, among the perimenopausal women with voiding dysfunction, almost one third i.e. 38(39.59%) had mild impact, almost half i.e. 53(55.21%) had moderate impact, and least i.e.5 (5.20%) had severe impact on quality of life.

Table 1: Mean, mean percentage and rank order of domains of quality of life among perimenopausal women with voiding dysfunction

Discussion

Voiding dysfunction is a common health problem among women and has negative impact on women’s health and results in diminished overall quality of life. The present study aimed to assess prevalence of voiding dysfunction and its impact on quality of life among perimenopausal women.

In this study, the prevalence of voiding dysfunction among perimenopausal women was found 24.61%. Similarly, the studies conducted in Telangana and
Madhya Pradesh states of India reported the prevalence of urinary incontinence 10% and 18% respectively which is slightly lower than the prevalence of present study.\textsuperscript{11,12} On the other hand, International studies conducted in Nigeria, Qatar, Saudi Arabia and Turkey reported prevalence of voiding dysfunction/urinary incontinence from 12.6% to 44.6%.\textsuperscript{13-16} This wide difference in prevalence could be due to different socio-demographic population, cultural practices, health seeking behaviour of the women’s and availability of health care services. In the present study, the most common form of voiding dysfunction found among perimenopausal women was urinary incontinence symptoms. These findings are similar with the findings of the study conducted in Turkey and Saudi Arabia which revealed that the urinary incontinence is the most prevalent form of voiding dysfunction among women.\textsuperscript{15,16}

The findings of this study showed that most of the perimenopausal women with voiding dysfunction had mild to moderate impact on their quality of life. The almost similar findings were observed in the various studies conducted in Telangana, Qatar, Saudi Arabia and South Africa.\textsuperscript{11,14,15,17} Whereas the present study findings are contradictory to the study conducted in Nigeria which revealed that voiding dysfunction had severe impact on quality of life of perimenopausal women.\textsuperscript{13} As per findings of the present study, the impact was equitable over all domains measured for quality of life namely urinary symptoms (44.66%), general health (43.87%), sleep/energy (42.37%), coping measures (36.56%), role limitation (36.37%), emotions (36.16%), physical/social limitation (31.37%) and personal relationship (23.41%). These findings are almost consistent with the findings of the studies conducted in Madhya Pradesh and Saudi Arabia.\textsuperscript{12,15}

The findings of this study demonstrated that age, education, occupation, family income and type of delivery had significant relationship with quality of life among perimenopausal women with voiding dysfunction. These findings are consistent to the findings from Madhya Pradesh, India which revealed that the increasing age and low education status negatively affect the quality of life of perimenopausal women with voiding dysfunction.\textsuperscript{12}

**Conclusion**

Voiding dysfunction is a significant prevalent problem among the perimenopausal women, with a significant mild to moderate impact on their quality of life. Nurses are often the initial health care professionals, who can engage in identifying the cases, creating awareness campaigns to change perceptions, improve knowledge and empower women to seek early intervention to this problem in order to improve quality of life.

**Conflict of Interest:** Nil

**Source of Funding:** Self

**Ethical Clearance:** Ethical clearance was obtained from the Institutional Ethical Committee of Shri Guru Dass College of Nursing, Hoshiarpur, Punjab and written informed consent was obtained from perimenopausal women.

Association of Periodontal Disease, Obesity and Serum Cholesterol Levels: Is there a Link?

Mamatha Shetty¹, Swathi Shetty²
¹Associate Professor, ²Oral Surgeon, AB Shetty Dental College, Mangalore, Karnataka State, India

Abstract

Background—Recent studies indicate that there is more than a causal relationship between serum lipid level, systemic health, and infectious oral disease like periodontitis. Periodontal disease is a destructive inflammatory disease inducing catabolic state characterized by altered lipid metabolism and hypertriglyceridemia.

Objective—The aim of present study was to investigate the association between periodontal status, cholesterol levels and Body Mass Index in normal and obese group.

Material & Method: A sample of 60 subjects; 30 subjects with normal BMI and 30 subjects with obese BMI with an age range of 30 to 65 years were included in the study. After clinical measurement of periodontium was done the serum samples of the both groups were drawn to estimate levels of High-density Lipoprotein, Low-density Lipoprotein, and Triglycerides.

Results—There was no statistically significant association observed in relation to Mean age, LDL and HDL cholesterols and TG in subjects with healthy periodontium and periodontitis (p>0.05). Our study did not find significant association between periodontal status, normal and obese body mass index.

Conclusions: In our study, we did not observe, significant association between the periodontal status, cholesterol levels and body mass Index in normal and obese group.

Key-words: periodontal disease, inflammation, obesity, cholesterol level.

Introduction

Periodontal disease refers to the inflammatory processes that occur in the tissues surrounding the teeth in response to bacterial accumulations, or dental plaque, on the teeth. The bacterial accumulations cause an inflammatory response from the body.¹ It is caused predominantly by gram-negative, anaerobic bacteria that induces local and systemic elevations of pro-inflammatory cytokines, such as tumour necrosis factor-alpha (TNF-α), interleukin -1β (IL-1β) and IL-6, this further leads to an increased mobilization of lipids from the liver and adipose tissue.²

The definition of obesity is based on the Body Mass Index (BMI) which is the ratio of body weight (in kg) to body height (in m) squared. BMI is highly correlated with fat mass and morbidity and mortality, and therefore sufficiently reflects obesity-related disease risk in a wide range of populations. Epidemiological studies have studied the association between obesity and periodontitis.³ One consequence of obesity might be increased risk for periodontal disease, although periodontal inflammation in turn may exaggerate the metabolic syndrome of which obesity is one component.⁴

Recent studies indicate that there is more than a causal relationship between serum lipid levels and systemic health (particularly cardiovascular disease, diabetes, tissue repair capacity and immune cell function), and periodontitis. In terms of potential relationship between periodontitis and systemic disease, it is possible that periodontitis-induced changes in
immune cell function, causes metabolic dysregulation of lipid metabolism through mechanisms involving proinflammatory cytokines.[5]

The high prevalence of both obesity and periodontal disease poses a substantial public health risk. Although obesity is becoming a worldwide problem, there is a small number of works devoted to this problem, especially about the relationship between obesity, cholesterol and periodontal disease. The aim of this study was to explore the association between obesity, serum cholesterol level and periodontal disease among adult population.

Materials and Method

A Cross-sectional case control study was conducted to investigate the association between periodontal status, cholesterol levels and body mass index in normal and obese group at AB Shetty Dental College, Mangalore, and Karnataka. A total of 60 subjects between age group of 30-65yrs, were randomly recruited from out patient’s attending the department of periodontics from May 2011 to 2012 and were classified into normal body mass index group and obese body mass index group based on body mass index, it was calculated using formula weight in kilograms divided by height in meter square (kg/m²).

Ethical clearance was obtained from the institutional ethics committee. All participants’ rights were protected and written informed consents were obtained before the procedures according to the Helsinki Declaration. Number and date of permission-Cert no:ABSM/EC/5/2011 Date-31-01-2011.

To ensure uniform interpretation, understanding and application by the examiner, codes and criteria for various conditions to be observed were recorded in the performa and the examiner were priorly calibrated and trained in the department. Study participants will be included if they have complete dentition, and are aged between 30-45 years, and are non-smokers and have no history of systemic disease or antibiotic therapy in the past 6 months. Study participants will be excluded if they are aged less than 30 years or aged above 65 years and are having systemic disease or have received oral prophylaxis or antibiotic therapy in the last 6 months. Study participants will be excluded if they had body mass index (BMI<18.5kg/m²).

A performa was used to record study subjects age, gender, height, weight, and periodontal status. The subjects BMI was calculated using formula weight in kilograms divided by height in meter square (kg/m²). The weight of each subject was measured to nearest 0.5 kg, using a portable analog weighing machine, manufactured by Edryl, India. The height was measured to nearest 0.5cm, using portable height measuring unit (floor model, manufactured by Narang scales Enterprises, Agra). The patients were divided into two groups according to their BMI (BMI) as normal (BMI<25.0 kg/m²) and obese BMI (30.0kg/m2 or more). [6]

Periodontal Examination and Assessment:

Periodontal disease was measured by single examiner, using William’s graduated periodontal probe, by measuring pocket depth and clinical attachment loss. Pocket depth was measured from gingival margin to base of the pocket. Clinical attachment loss was measured from the cement-enamel junction to the base of the pocket. Clinically, chronic periodontitis was defined as clinical attachment loss of ≥ 3mm and pocket depth ≥ 4mm in 30% of the total sites examined. [7]

Estimation of Cholesterol Levels: Two ml of blood sample was taken from each patient and sent to the Central Laboratory, Nitte University Research Centre, and was tested for low density cholesterol, high density cholesterol and Triglycerides using enzymatic analysis. All cholesterol determinations were made using the Total Serum Cholesterol Assay Reagent. High-density lipoprotein (HDL) cholesterol was measured by the precipitation procedure with DextraLip®50, (Genzyme Diagnostics). Triglycerides (TG) measured enzymatically with glycerol blanking using reagents from Miles-Technicon (Tarrytown, NY).Low-density lipoprotein cholesterol and triglyceride analyses were all performed on an Abbott Spectrum (Abbott Diagnostics, Irvine, TX) while direct LDL filtrates were analysed on a Cobas(Roche Diagnostics,Montclair,NJ).

The data obtained was subjected to statistical analysis with the consult of a statistician. Statistical analysis was done using Statistical Package of Social Science (SPSS 11.0; Chicago Inc., USA).The tests employed were Student’s t-test and Chi-square(X²). The level of significance was fixed at p<0.05.

The following study comprised of 60 patients they were divided into 2 groups of 30 patients each into normal BMI and obese BMI. The mean age of patients with normal BMI was 39.3±4.85 (mean ± SD) and the
The mean age of obese subjects was 46.6± 9.8 (mean ± SD) years.

There is a statistically significant difference in mean age as well as LDL cholesterol with subjects with normal and obese BMI with p values of 0.001 and 0.000, respectively. However, it was observed that there was no statistically significant association between HDL cholesterol, TG and BMI. [Table1]. The Mean age, LDL and HDL cholesterols and TG did not show any significant difference between healthy periodontium or periodontitis group p<0.05[Table 2]. There was no significant difference between the normal, obese BMI groups and healthy periodontium and periodontitis groups [Table 3].

Table 1 – Association between BMI (BMI) and high-density lipoprotein (HDL) and low-density lipoprotein (LDL) cholesterols and TG (TG) levels in both (Obese and Normal) study groups.

P<0.05, SD- Standard deviation; HDL-c - High-density Lipoprotein cholesterol; LDL-c - Low-density Lipoprotein cholesterol; TG-TG

There is a statistically significant difference between the mean age as well as LDL cholesterol in subjects with normal and obese BMI with p values of 0.001 and 0.000, respectively. However, it was observed that there was no statistically significant association between HDL cholesterol, TG and BMI.

Chi square value: 0.271, p value-0.016

There was no significant difference between the mean BMI and presence and absence of periodontitis [Table 3]
Discussion

Periodontal disease, caused mainly by bacteria, is characterized by inflammation and destruction of the attachment apparatus of the teeth and it affects large number of the adult population. Obesity is a systemic disease that predisposes to a variety of co-morbidities and complication that effect overall health. Recent studies have proposed several possible biological mechanisms that could mediate the association between BMI and periodontal infection. But it is still unclear whether being overweight or obese truly precedes periodontal disease.\cite{3-4}

The mean age of patients with normal BMI was 39.3±4.85 (mean ± SD) and the mean age of obese subjects was 46.6± 9.8 (mean ± SD) years it was statistically significant.

In our study there was significantly increased LDL cholesterol in obese BMI group compared to normal BMI group, however no association was found in relation to periodontal status. In our study, there were no smokers in all groups thus, smoking had smaller impact on the results. HDL is the compound containing both lipid and protein, which transport cholesterol to liver for excretion in the bile\cite{9-10}

In our study, the absolute values of HDL -cholesterol levels were low in patients with periodontitis but statistical insignificant. Present study showed that there was a difference in the mean values of low density cholesterol and TG between subjects with periodontitis and healthy periodontium, but it was not statistically significant. Previous studies demonstrated that there was a positive correlation between tooth loss and the levels of TG and LDL and a negative correlation between tooth loss and the levels of HDL and a positive correlation of blood pressure and the blood lipid index were significantly associated with the presence of periodontal pockets respectively. Patients with hyperlipidemia showed higher values of periodontal parameters compared to those with normolipidemic subjects.\cite{10-13}

Present study also showed that BMI was weakly associated with chronic periodontitis and the association was not statistically significant. Studies have suggested that there was no difference in clinical periodontal parameters, significant differences in inflammatory or metabolic parameters were found between overweight/obese and normal-weight patients in their systematic review.\cite{14} There was no casual relation between body weight and periodontal infection, and the association which is often observed, is due to number of shared risk factors. No association was observed between measures of obesity and periodontitis, although this study identified an association between number of episodes of obesity and risk factor for dental calculus, and number of teeth with gingivitis. The combination of these two conditions in obese subjects suggests these individuals may be at greater risk of chronic periodontitis.\cite{15}

The limitations of our study are small sample size and inability to account for confounding factors. Further longitudinal studies with larger sample size are needed to verify association between obesity and periodontal disease.

Conclusions

Our study concludes that no association was observed between serum cholesterol levels, Body mass Index and periodontal disease status.

Assess the Awareness and Information Needs Regarding Normal Developmental Milestones of 1 to 3 Year Children among the Mothers of Infants, in a View to Prepare Information Booklet

Sachin Tukaram Gadade¹, Aparna Bhushan Kale²

¹M.Sc Nursing, ²Assistant Professor, Department of Pediatric Nursing, Bharati Vidyapeeth (Deemed To Be University), College of Nursing, Sangli, Maharashtra, India

Abstract

Background: Developmental milestone are a set of functional skills or age specific tasks that most children can do at a certain age range. Child development mentions how a child becomes able to do more consisting of many different things as they grows older. Development is different than growth. Growth refers to the child’s development: Although each milestone has an age level, the actual age when a normally developing child reaches that milestone can vary quite a bit. Aims & Objectives: To assess the awareness and information needs regarding normal developmental milestones of 1 to 3 year children among the mothers of infants. And to find out the association between level of knowledge with selected socio demographic variables.

Material & Method: a community based descriptive study conducted among 200 samples on mothers of 1 to 3 year children by using simple random sampling technique through structured questionnaires. Inclusion criteria of study was mothers having first child. Result & Conclusion: study shows that there was 162(81%) Mothers of 8-12 month children’s having below average knowledge, and 38 (19%) were having above average knowledge regarding normal developmental milestones of 1-3 year Children’s. Study concluded that there was maximum mothers are having below average knowledge regarding normal developmental milestones of 1-3 year Children’s. So need to aware them or educate to mothers regarding normal developmental milestones of 1 to 3 year children.

Keywords—Normal developmental milestones, Mothers knowledge.

Introduction

“As your kids grow they may forget what you, but won’t forget how you made them feel.”

- Kevin Health

Developmental milestone are a set of functional skills or age specific tasks that most children can do at a certain age range. Child development mentions how a child becomes able to do more consisting of many different things as they grows older. Development is different than growth. Growth refers to the child’s development: Although each milestone has an age level, the actual age when a normally developing child reaches that milestone can vary quite a bit. Every child is unique (S. Neil). Over the past decade there has been a growing recognition of the involvement of the home in several public health and hygienic issues. Perhaps the best understood of these issues is the role of mother in preventing the delay in growth of infant Child development is one of the crucial issues of the twentieth century. Among the reasons for this interest is that child development affects the society at large. Consequently the manner in which the parents bring up their children has become the concern of the state and society. If the state does not make this concern, maladjusted children of today may become the anti-social elements of tomorrow.

More than 200 million children’s under 5years of age in developing countries do not reach their developmental potential. Children, especially infants and toddlers constitute the most disadvantaged group.
as far as psychosocial development is concerned. This is attributable to the greater vulnerability of developing brain in the early formatting years. Besides biological determinants, family environments of young children are major predictors of cognitive and socio emotional abilities. The present study is an attempt to assess the magnitude of global developmental delay among children less than 3 years of age and to analyze the impact of important biological ambient environmental factors on their psychosocial development.2

Review of Literature

The reviewed literature for the present study were organized under the following headings-

Section-I: - Review of Literatures Related to knowledge regarding selected aspects of growth and development among mothers.

Section-II: - Review of literatures related to problems identified during developmental period

A study done by Shivani Rikhy, Suzanne Tough et al in 2010 on parental knowledge of child development has been associated with more effective parenting strategies and better child outcomes, computer assisted telephone interviews were completed with 1443 randomly selected adults. Result shows that parents and females were better able to identify physical developmental milestones compared to non-parents and males. 81% of parents correctly responded that a child’s experience in the first year of life has an important impact on later school performance, 70% correctly responded that a child’s ability to learn is not set from birth, 50% of adults correctly responded that children learn more from hearing someone speak than from television, and 45% recognized that parents’ emotional closeness with a baby influences later achievement. Parents were most likely to use doctors/pediatricians, books, and nurses as resources. Among parents, there was no relationship between knowledge and parenting morale. Study concluded that the majority of adults were unable to correctly answer questions related to when children under six years of age typically achieve developmental milestones.3

Materials and Methodology

In this study the population was consists of 200 mothers of infants. Inclusion criteria was mothers of 8-12 month children, and exclusion criteria was mothers who are having more than one child. Sample size was calculated by using power analysis based on previous researches, quantitative research approach and descriptive research study design was used for the study. stratified sampling technique is used for differentiate the samples in strata’s & Then simple random sampling technique through lottery method was used for randomly selection of samples from selected strata’s among mothers of 8-12 month children. Based on study objectives self-structured questionnaire was used for the collection of data. The tool was divided into two sections. The first section contained demographic variable. The second section contained 28 multiple choice questions with four options for assessing the knowledge. Question was related on normal developmental milestones of 1-3 year children. The correct answer scored with one mark and incorrect answer zero mark and maximum score was 28. For the structured questionnaire test the grading of the score was formulated by investigator with the help
of statistician. The total was divided into two categories, 1-14 marks indicates below average knowledge and 15-28 marks indicates above average knowledge, Permission was obtained from the research committee of the Bharati Vidyapeeth Deemed to be University College of Nursing, Sangli, Pearson’s chi square test was obtained to find out association between the knowledge score and selected demographic variables.

Result and Discussion

Study shows that maximum 162 (81%) Mothers of 8-12 month children’s having below average knowledge, and 38 (19%) were having above average knowledge regarding normal developmental milestones of 1-3 year Children’s.

In age category maximum 60% mothers were from age group of 21 to 25 years. 34.5% belongs to the age group of 26 to 30 years and 5.5% from age group of 31 to 35 years. Educational Qualification:- It was found that 44% mothers are had secondary education, 39% are had primary education and 17% had higher secondary education. Type of family: - 65% mothers were belongs to the joint family and remaining 35% mothers are from nuclear family. Previous knowledge sources related to this study:- It was found that 89.5% mothers of infants was not having previous knowledge and 10.5% mothers was having previous knowledge regarding normal developmental milestones of 1-3 year children’s through, 5.5% mothers from books, 4% from TV, 0.5% from college and remaining 0.5% mothers through newspaper. The Pearson’s chi-square test was used to find out association between demographic variables knowledge. For the age Pearson’s Chi-square value is 1.073 and ‘p’ value is 0.585 which is more than 0.05 it shows there is no significant association between age of mothers with knowledge score. In education Chi-square value is 18.031 and ‘p’ value is 0.000 which is less than 0.05 it shows there is highly significant association between the education of mothers with knowledge score. In type of family Chi-square value is 7.61 and ‘p’ value is 0.006 which is less than 0.05 it shows there is highly significant association between type of family and knowledge score.

Conclusion

Maximum mothers was having not aware and less knowledge about the normal developmental milestones. They needs teaching or educate to improve their knowledge about normal developmental milestones of 1 to 3 year children

Conflict of Interest: Nil

Source of Funding: Self-Funding

Ethical Considerations: Ethical committee letter were submitted to the Bharati Vidyapeeth (to be Deemed) University, Pune

And obtained permission from university to conduct the research. Permission from concerned authority and parent of each sample were obtained before data collection.

Effect of Early Trunk Facilitation on Functional Mobility in Hemiplegic Individuals

Shreedip Patil¹, G Varadharajulu², Suraj Kanase³
¹MPT, ²Dean, Faculty of Physiotherapy, ³Associate Professor, Krishna College of Physiotherapy, KIMSDTU, Karad, Maharashtra, India

Abstract

Objectives: To find and compare the effect of conventional exercise and proprioceptive neuromuscular facilitation for early trunk facilitation on functional mobility in hemiplegic individuals.

Method: 30 subjects diagnosed with hemiplegia were included on the basis of inclusion and exclusion criteria in this study. These subjects were allocated in two groups by simple random sampling method. In the study pre and post treatment outcome assessment was taken on Barthel Index. Group A received conventional functional mobility exercises and trunk proprioceptive neuromuscular facilitation and Group B received only conventional functional mobility exercises for 4 weeks treatment protocol.

Results: 30 subjects participated in the study. Intra group comparison results showed statistically significant improvement in Barthel index score in both the groups (p <0.0001). Inter group comparison results showed Group A was statistically significant in showing improvement in Barthel Index score than Group B (p = 0.003).

Conclusion: Group A treated with conventional functional mobility exercises and trunk proprioceptive neuromuscular facilitation for early trunk facilitation showed significant improvement in functional mobility than Group B.

Keywords: Hemiplegia, Early trunk facilitation, conventional functional mobility exercises, proprioceptive neuromuscular facilitation, Barthel Index.

Introduction

Stroke is also termed as cerebrovascular accident. Stroke is defined as rapid onset of focal neurological deficit, resulting from diseases of the cerebral vasculature and its contents.

World Health Organisation defines stroke as a “rapidly developing clinical sign of local (at times global) disturbances of cerebral functions lasting more than 24 hr or leading to death with no apparent cause other than vascular origin”.

If the symptom resolves within the 24 hours of onset it is called as transient ischemic attack even though presenting with similar feature it is not considered as stroke.

It is the most common neurological disorder and the second commonest medical condition in the developed world that causes disability among adults.

Major risk factors are Hypertension, Heart disease and Diabetes. Stroke may be haemorrhagic or ischemic in nature. Embolism or thrombosis can lead to ischemic stroke.

Stroke leads to the long-term disability and leading preventable disability Which causes focal deficits including changes in the level of consciousness and impairments of sensory, motor, cognitive, perceptual and language functions.
Motor deficits are characterized by paralysis (hemiplegia) or weakness (hemiparesis) typically on the side of body opposite to the side of lesion.

Complete loss of voluntary movements in the arm and leg on one side is termed as Hemiplegia. It is characterized by altered muscle tone and tendon reflex, difficulty or inability to move upper and lower extremity.

After stroke functional performance gets impaired due to sensory and motor impairment of trunk. Bilateral impairment of the trunk muscles is present in patients with stroke.

Ability of trunk muscles that is trunk control is very essential as it allow the body to remain upright, adjust weight shifts, and performs selective movements of the trunk so it helps to maintain the centre of mass within the base of support during static and dynamic postural adjustments.

Trunk control is a fundamental component for performing All Daily Living activities. For balance and use of extremity during every day functional activities and higher-level tasks good trunk stability is essential. Thus, Trunk control is an early predictor of Functional outcome after stroke.

Most literature available which are focusing on the hemiplegic upper and lower limbs while the trunk receives little attention.

Dickstein et al. (2004) reported that the anticipatory activity of trunk muscles is impaired in stroke patients. Therefore, improving trunk stability is the major goal of rehabilitation in many stroke patients.

In physiotherapy a variety of movement therapy approaches are available for retraining motor skills in adult patients with hemiplegia.

**Functional Mobility:**

Functional mobility defined as person’s ability to move around in his or her environment. Examples include walking, scooting along a bed, and rising from a chair.

Getting up from a chair, walking up the stairs, or making yourself food are just a few examples of how functional mobility could be measured.

There are three main areas of functional mobility: 1) Bed mobility 2) Transfer 3) Ambulation

**PROPRIOCEPTIVE NEUROMUSCULAR FACILITATION (PNF):**

PNF has been used for very long time for the functional improvement of stroke.

PNF is an approach to therapeutic exercise that combines functionally based diagonal pattern of movement with techniques of neuromuscular facilitation to evoke motor responses and improve neuromuscular control and function.

To improve the functional mobility in hemiplegic individuals. Early trunk facilitation is needed as an intervention in order to achieve early functional mobility.

As there is lack of literature on benefits of trunk facilitation to improve trunk mobility in hemiplegic subjects

The specific trunk control exercises should be studied as a therapeutic intervention so as to facilitate functional mobility.

Till date many neurophysiological techniques are available which mainly concentrates on reducing the limb spasticity and rehabilitation for better mobility of the limbs.

Despite the trunk performance is considered to be the important predictor for balance and functional performance, the evidence supporting the effectiveness of trunk rehabilitation is rare.

So, the present study conducted to rule out the effect of early trunk facilitation in gaining early functional mobility.

**Materials and Method**

**Participants**

30 subjects who diagnosed as Hemiplegia, based on inclusion and exclusion criteria were selected. Both male and female between age group 45-65 yr. willing to participate were included in the study. Written consent was taken. The criteria for inclusion were as follows: 1) Participants with stroke 2) Diagnosed as hemiplegia 3) Brunstrom stage 1. Exclusion criteria were as follow: 1) Participants with Any Other Neurological Condition, Musculoskeletal Conditions 2) Those Are Not Willing to
Participate in The Study. 3) Who Has Already Developed Synergy Pattern. functional mobility was recorded on Barthel Index pre-interventional and post interventional.

**Interventions**

30 subjects were divided into two group (n=15 in each group) by simple random sampling method. Group A were treated with conventional functional mobility exercises and trunk proprioceptive neuromuscular facilitation for early trunk facilitation to improve functional mobility and Group B were treated only with conventional functional mobility exercises for 4 weeks 5days/week. Pre and post treatment assessment were done with Barthel Index. Post treatment assessment was taken at 4 weeks.

**Conventional functional mobility exercises consisting of following exercise protocol**

**Positioning**

Passive RIMP (Reflex Inhibitory Movement Pattern) for Upper limb and Lower limb : 30 repetitions X 3 sets

**PELVIC BRIDGING:**

Lay on the exercise mat and place one leg flat on the floor with the knee bent. Place the other leg on an exercise ball. Using the core muscles, lift the pelvis off the mat and slowly lower back down. Repeat for 10 repetitions.

Functional mobility exercises included following  

1.**SUPINE-TO-SIDE LYING:**

subject lies in supine position. Therapist turn the subject neck towards affected side and cross the leg with unaffected leg over affected leg. Using posterior superior iliac spine (PSIS) as a key point therapist turned the subject towards the affected side and took the patient in side lying position.

2.**SIDE LYING- SITTING:**

Subject lies in side lying position on unaffected side then he asked to bear the weight on unaffected upper limb to get in sitting position at the edge of the plinth.

3.**SITTING-TO- STANDING:**

Subject was in sitting position with hip and knee in 90-90 degree and feet resting on the floor .one assistant was standing in front of the subject. subject’s hands were resting on the shoulder of the assistant. Therapist was standing behind the subject. Holding at the key point that is at PSIS subject was encourage to get in standing position.

**Trunk Proprioceptive Neuromuscular Facilitation:**

Protocol of three PNF technique were given to the subjects that is rhythmic initiation, slow reversal and agonistic reversal for pelvis for 45 minutes. For 5 days a week for total duration of 4 week. Each technique was given for 10 min

**Data Analysis**

**TABLE 1: AGE DISTRIBUTION**

<table>
<thead>
<tr>
<th></th>
<th>GROUP A</th>
<th>GROUP B</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGE IN YEAR</td>
<td>56.4</td>
<td>60.86</td>
</tr>
</tbody>
</table>

The statistical analysis shows that the mean age of subjects included in Group A was 56.4 year and that in group B was 60.86 years. According to unpaired t test as p value is 0.0558. the difference is considered as not quite significant.

**TABLE 2. GENDER DISTRIBUTION IN THE STUDY**

</table>

The pre-treatment values were in group A 10+6.81 and 6.66+6.17 in group B respectively, were as post interventional value for group A is 35.66+8.83 and group B is 25.33+7.188. Inter group analysis for functional mobility between group A versus group B showed statistically very significant difference. This was done by using unpaired ‘t’ test. (Mann-Whitney test).

**Discussion**

The study, Effect of early trunk facilitation on functional mobility in hemiplegic individual was undertaken with the aim to evaluate the effect of early trunk facilitation on functional mobility in subjects with hemiplegia.

The objectives of the study, to determine the effect of trunk PNF with conventional functional mobility exercises and conventional functional mobility exercises alone for early trunk facilitation to improve the functional mobility in hemiplegic individuals.

The study was included 30 subjects diagnosed as hemiplegia of age group 45 to 65 years approaching to the outpatient physiotherapy department of Krishna hospital, karad. Depending upon the inclusion and exclusion criteria and those who were willing to participate were included in the study. In this study subjects were divided into two group, Group A and Group B. With simple random sampling technique (lottery method). Group A was treated with conventional functional mobility exercises and trunk proprioceptive neuromuscular facilitation and Group B was treated with conventional functional mobility exercise. Interventions were carried out for 4 weeks with 5 times per week.

Functional mobility of the individual is scored on Barthel index which is one of the best reliable and valid outcome measure.

This study shows significant difference in pre and post treatment values in both the groups. Group A which was treated with trunk proprioceptive neuromuscular facilitation with conventional trunk mobility exercises showed significant improvement in the outcome variables.

Statistical analysis was done by using ‘Paired t- test’ for within group comparison and ‘Unpaired t-test’ for between the group comparisons.

Target population or target age group for the stroke or cerebrovascular accident is the age 40 yr. and older. So, for this study age criteria were set in between 45 to 65. Mean for Group A was 56.4 and Group B was 60.86 which shows that there is no significant difference in mean age group of both the group.

Study showed that incidence of stroke is greater in men than women. In this study Group A has 11 male participant and group B has 9 male participants. Group A has 4 female participants and Group B has 6 female participants. which shows that there is poor gender distribution occurred which means males are more affected than female participants.

In the study pre-interventional values for Barthel index score were 10+6.81 and post interventional values for Barthel index were 35.66+8.83 in GROUP A.

p value is <0.0001 considered extremely significant.

In the study pre-interventional values for Barthel index score were 6.66+6.17 and post interventional value were 25.33+7.18 in GROUP B.

p value is 0.001 considered extremely significant.

In study pre-interventional values for Barthel index were 10+6.81 for group A and 6.66+6.17 for group B.

p value is 0.1753 considered not significant.

In the study post-interventional values for Barthel index were 35.66+8.83 for group A and 25.33+7.188 for
p value is 0.003 which is considered as extremely significant.

In the study for difference calculation statistical analysis was done with unpaired t test (mannwhitnty test) from which mean value for group A was 25.66 + 5.627 and mean value for group B was 18.33 + 6.455 respectively.

p value is 0.57 which is very significant in nature and u value for it is 179.50

The proprioceptive neuromuscular facilitation (PNF) technique is a method to improve the trunk stability of stroke patients. PNF stimulates proprioceptors within the muscles and tendons, thereby improving functions and increasing muscle strength, flexibility, and balance. The PNF approach utilizes a typical diagonal pattern to stimulate proprioceptive sensation. Improving proprioceptive sensation, and techniques of PNF help to normalize the tone of affected side trunk muscles, lengthening the contracted structures, relax the hypertonic muscles, initiating the movements, strengthening the weak muscles and improving the control of the pelvis, which helps to improve the trunk control.

Kumar et al (2012), in his study stated that specific PNF technique are very beneficial techniques for improving functional independence in patient with stroke especially in area like locomotion which is very important for functional mobility. Which correlates with this study.

The Group A where the subjects were treated with Trunk PNF and conventional functional mobility exercises showed extremely significant results in functional mobility improvement because, the subjects here received trunk PNF in addition and they also received the treatment benefitted with the same physiological effect as the other group.

**Result**

Based on the results of the present study it is concluded that both the Groups showed improvement in Barthel Index Score. Group A showed extremely significant result than Group B in improving functional mobility in hemiplegic individuals.

**Conclusion**

Results supported that conventional functional mobility exercises with trunk proprioceptive neuromuscular facilitation was more effective than only conventional functional mobility exercises for early trunk facilitation and in improving functional mobility in hemiplegic individuals.

**Conflict of Interest:** There were no conflicts of interest in this study

Comparative Study to Predict the Kidney Disease for the Clinical Data Using Classification Techniques

Gurucharan Singh Saluja¹, N Maheswari²
¹Student, ²Professor, School of Computing Science and Engineering, Vellore Institute of Technology, Chennai, India

Abstract

Data mining has proven to be very helpful and extremely effective. It has been used to uncover patterns from big stored information and then used that pattern to build or train classification models. Classification models are helpful to large clinical data for guidance and decision making. Through classification models, the disease can be classified, and also describes that disease is on which stage, from this patient receives better health care services. Kidney is one of the important organs of human body, it extracts waste creatinine and provides purified blood to other organs. Like that, a disease of another organ can also affect the kidney. Kidney disease can be caught by some tests but other diseases can also affect the kidney. This happens when medicinal services authorities utilize data mining projects to recognize and observe patients disease and plan the correct involvement required. So, the causes and effect of disease after period of time, from old data will be predicted using efficient classification techniques.

Keywords: Data Mining, Classification Models, Kidney Disease, Predicted, Medicinal Services

Introduction

Health care organizations are facing many new problems related to disease every day. Kidney disease is basically that condition in which kidneys will not work properly or we can say that the severe decrease of kidney function. Kidney disease can be tested by two major tests which are ¹³ Albumin-to-Creatinine Ratio (ACR) and Glomerular Filtration Rate (GFR).

So, kidney disease depends on the extract of creatinine, which is a waste material comes out from the filtration of blood, and it is removed from the body with urine. To diagnose the kidney disease urine test was preferred. Through urine test which checks for creatinine can describe the situation of the kidney that it will extract protein and filter the blood properly or not.

But what if another disease also affects the kidney²². So, this paper describes how other disease affects the kidney using data mining techniques. Cost of diagnosis of most diseases is heavy since many experiments are required to predict the disease. Selecting attributes which are really important for prediction of disease which can reduce this cost. Thus dimensionality reduction plays an important role in medical diagnosis. Some recent studies widely use feature selection techniques, and to extract some pattern data mining technique is used.

Data Mining

Data Mining is the process used to get useful information from the raw data or bulk of data by extracting of some pattern from the large datasets. Some basic steps for data mining process are Initially, collection of data which are stored in data warehouses is preprocess as well as analysis and get some pattern through which data is sort and finally, from this, the result is prepared.

The contribution of this article is to present a comprehensive study of comparing different classification techniques like naïve Bayes, SVM,
Random Forest to demonstrate techniques performance. With the help of kidney data, describe that how another disease can be affected to the kidney. Hence, a new guideline is prepared for future studies in prediction models.

**Literature Survey**

They shows some data mining technique respect to the Healthcare Organisation with their advantage and disadvantage. Many Techniques have their own limitation to deal with data like Neural Network is may able to deal with noisy data properly for training but in case of hundreds and thousands of input features or complex problem it gives poor performance where SVM is provided better performance and accurate performance compare to other but it limitation is that its fail when number of samples is less whether number of features is large, like that in Decision Tree is accepts and process all type of input but its limitation is its restricted to one output attribute. They concluded with that it is not possible to say that which technique is better than other because they have different advantage and disadvantage so, it is totally dependent on scenario or requirement.

Many predictive models are checked to use for Amyotrophic Lateral Sclerosis (ALS) disease progression and the probability of possibilities and come to that conclusion that SVM is somehow better than other. ALS is nervous system disease which impacts in physical functioning as well as muscles weakness and it is difficult to catch this disease in early stage because it takes 12 months (approximate) to complete its entire test but through data mining techniques it is easy to predict result on the basis of 3 months test.

The prediction model is prepared for diabetes checker and it checks that the person is in normal, Pre-diabetic, Diabetic condition by using éclat algorithm, if the patient had diabetes since many years then this algorithm calculates control and un-controlled condition of the diabetes disease.

Kidney disease or renal failure are discussed by the authors. The condition is described in which the patient faces the kidneys problem like not operate properly and uncertain activity. So, for prevention of kidney problem data mining techniques is used to predict kidney problem in early stages with low cost and in efficient time.

For feature subset selection algorithm is divided into two categories: Filter and Wrapper methods. In Filter methods learning algorithms is used but that algorithm is not necessary to give feedback. Whether in other method, learning algorithms are used but that algorithm gives feedback. That reduces not only the number of features

The author gave the overview of the feature extraction and feature selection, and with this, it also deals with outlier data. Before applying feature selection techniques, they preprocess data, then they apply PCA for feature extraction. For classifying the heart disease more accurate result, they use filter subset selection with wrapper filter.

The authors compare the two classification techniques i.e. Naïve Bayes and decision tree and check which technique is appropriate to classify the heart disease.

Machine learning is a collection of techniques and all have its own limitation so the authors trying to create ensemble framework using 3 famous techniques i.e. Neural Network, Least Square-Support Vector Machine and Naïve Bayes. So, the evidence-based clinical decision gets improved and Patients who give their time and money for treatment of heart disease will also get reduced.

Examine the clinical dataset. To do that they adopt a naive Bayes, K Nearest-Neighbor, SVM, C4.5 Decision tree. They set the upper bound for feature selection and for each time, they take 10-fold cross-validation and to finalize the result they calculate its average.

Alarm management for Chronic Kidney Disease(CKD) is discussed. They take some important value which is basically access or observe from the human body. If those values are not in the predefined size then there is may change of something wrong.

To diagnose Kidney Disease, they show that SVM is the best algorithm for detecting the kidney disease as well as the current information above blood circulation. Although risk factors for occurrence and progression of CKD have been identified, their utility for CKD risk stratification through prediction models remains unclear. They critically assessed risk models to predict CKD and its progression, and evaluated their suitability for clinical use.
Method

Data mining have a collection of many techniques. According to data, techniques have its own pros and cons. Some technique can be work with missing value like naïve Bayes but some cannot support missing value. So this play very important role, if medical data come into pictures. Let discuss, some important step which is taken to construct the perfect model.

Preprocessing

Before applying any technique, first of all, data is needed and the data must be in the stage where technique will give more accurate output. Dataset has been taken from kaggle. To remove noisy data, choose only that patient record for which creatinine is tested. Serum creatinine is tested for check the kidney’s filter capacity, and the normal range for healthy person is 0.8 to 1.3. and if serum creatinine is diagnosed in increased from the normal range, so it is treated as a bad condition of the kidney. That is why, treat the patient in risk stage if the serum creatinine is not in normal stage. So, for the further process, it will compare with other disease and check the patient situation.

Feature Selection

Feature selection is the process to identify the best attribute. In this, we choose only Serum creatinine, Diabetes Mellitus, Coronary Artery disease, Appetite Test, Pulmonary Embolism, Hypertension. Serum creatinine is a basic test for kidney and other columns indicate the other disease data.

In Table 1, Serum creatinine is a test for kidney disease and the other column is showing the other diseases detail of the same patient. Diabetes Mellitus column is showing that patient is suffering from diabetes, where Coronary Artery disease is related to heart disease, Pulmonary Embolism is related to lungs disease.

Classification Technique

The main objective is to predict the patient’s kidney test report, that he/she is in normal stage or in risk stage, even after checking how much kidney is affected by other diseases too, using data mining techniques. Data mining has a collection of techniques and each technique has its own limitations which makes it different from other techniques. After pre processing and feature selection, in the other step, the dataset is ready to apply the techniques. The supervised technique is used to classify this data because kidney disease is in generally two stages that is a normal stage or at risk stage. And because supervised technique is used, So, techniques need some labels through which it classifies the data. So, here it has two labels that are Normal and Risk. Now for kidney dataset, Serum creatinine is considered for labeling the data because it is the test through which kidney creatinine has been tested.

But all the other column is ordinal variable(i.e. suffering from a disease or not) and serum creatinine is a numerical value. Therefore, first convert numerical values into the ordinal values. So for that, set the limit to convert the numerical into ordinal variable and kidney is on risk stage only if serum creatinine is greater then 1.3. so, set 1.3 limits for converting the numerical into ordinal. Now, Dataset is ready to apply the supervised technique in this data. So, In this paper, data are classified by naïve Bayes, SVM, Random Forest.

Naïve Bayes is basically probability-based classification. It follows the Bayes theorem to classify the data. It is supervised technique and also uses the label to classify the data. Naïve Bayes is one of the famous algorithms because it compares one attribute to another attribute separately and applies Bayes theorem to classify that. So, In this, the ordinal value of serum creatinine is compared to other attributes and then classifies that the patient is having a kidney problem or not.
Using Naïve Bayes classification, Class which contain the label for classification (i.e. Normal and Risk) is comparing with other and apply Bayes theorem separately for all present number of class is available (for this case Bayes theorem applied for both normal and risk stage) and last finally, it will classify that patient is in normal or risk stage.

Support Vector Machine is a classification and regression prediction tool and it is also supervised technique, it is famous for its automatic deal with over-fit data. SVM classifies the data using vector and regression line. Vector and regression process is executing again and again until it gives fewer errors and also creates margin line closest point with each side so from that algorithm get help to classify the problem.

For the constraints:

\[ y_i (\mathbf{w}^T f(x_i) + b), \]

where \( C \) is the capacity constant, \( \mathbf{w} \) is the vector of coefficients, \( b \) is a constant, and \( E_i \) represents inputs. The index \( i \) labels the \( N \) training cases. Note that \( y \in \pm 1 \) represents the class labels and \( x \) represents the independent variables. The kernel \( f(x_i) \) is utilized to change information from the contribution to the feature space. It ought to be noticed that the bigger the \( C \), the more the mistake is punished. Hence, \( C \) ought to be chosen with care to abstain from overfitting.

Random Forest is classification and regression model which builds many decision trees, through those trees, the model will predict the result. It gives first priority to the attribute which is having greatest Mean Gini value. For kidney disease dataset, Random Forest works with 500 trees.

It works in following steps

Random Forest as per its name implies random, It takes random rows from the dataset and creates a separate subset of them.

For each subset, it follows the decision tree concept (i.e. Calculates gain, entropy, etc. According to gain index, it set each node). So, each subset has its own decision tree.

Same input provides to every decision tree and takes output as a vote, the maximum vote treated as main classified output.

**Results and Discussion**

So, in this paper, The dataset size in which above techniques are applied is 400 rows and 25 columns. From that, to train the model 70% of rows has been taken, and the rest rows are taken to test the model. Figure 1 shows the accuracy rate of all above classification techniques.

![Figure 1: Accuracy](chart.png)

Here, the accuracy for Naïve Bayes and SVM are same although their true positive and false positive are different because both the techniques are different in some aspects which are comparing the attributes as well as labeling resulted in data.

The highest accuracy is obtained as 92.96% using Random Forest, because it creates all possible decision tree. So at the time of checking the new data, it compares with an existing trees to label the result.

**Conclusion**

In this paper, Classification techniques are used to classify whether the patient’s kidney is in normal stage or in risk stage. Along with that it also checks how much it is affected by the other diseases. To prepare a better model, firstly it should be trained. But for some techniques, data must be in acceptance stage (i.e. Removing noisy data, dealing with missing values, etc.) and for that, preprocessing and feature selection are used. For dealing with noisy data, select only that patient’s detail whose Kidney (or creatinine) test has been conducted and for feature selection, select the relevant column like serum creatinine which is specifically a kidney test and other diseases result column. This study compares the...
techniques and trains them separately. Each technique has its separate functionality and accuracy, but from the experiment and result, it is clear that random forest is the best for kidney dataset because it has better accuracy rate.

Evaluating the Effects of Neck Exercise on Post Thyroidectomy Patients- A Pilot Study

D Ezhil Bhavani1, Monisha R1, Kamalanathan P2
1Assistant Professor, SRM College of Physiotherapy, 2Associate Professor, SRM College of Physiotherapy, SRM Institute of Science and Technology, Chennai

Abstract

Background: The most vital hormone gland is the thyroid gland and it has an important role in the human growth and development. Thyroidectomy ends with discomfort symptoms in patients for their rest of their life, they try to live their life with discomfort in their neck Objective: To evaluate the efficacy and safety of neck exercises to reduce post-thyroidectomy symptoms for patients undergoing thyroid surgery Methodology: Convenient sampling has been employed to select the patients who underwent thyroidectomy. After getting informed consent signed, a total of 5 volunteer patients who experienced a total thyroidectomy and were older than 50 years participated in the study. On the Post operative day 1, the stretching exercises were instructed Discussion: Thyroidectomy is the commonly performed procedures worldwide and it represents the principal treatment modality for thyroid diseases. Complications following thyroid surgery are rare but their effects can persist as life -threatening. The majority of the studied patients were females which show that thyroid disorders were present among females more than males Conclusion: Education and neck stretching exercises significantly improved the neck condition of patients in pain and disability of the neck.

Keywords: Thyroidectomy, Neck Exercises, Rehabilitation

Introduction

The most vital hormone gland is the thyroid gland and it has an important role in the human growth and development. It helps to regulate many body functions. Total thyroidectomy is the most common surgical management preferred in patients with Cancer and thyroid operations were predominant if the patients diagnosed with goiter and hyperthyroidism. The most important and feared complications following thyroidectomy is recurrent laryngeal nerve palsy. Thyroidectomy ends with discomfort symptoms in patients for their rest of their life, they try to live their life with discomfort in their neck. These patients frequently reports discomfort in their neck such as pain, stress in the neck, stiffness around the shoulder and restriction in shoulder and neck range of motion difficulties.

Discomfort exists in all the patients with post thyroidectomy incisions is because of the hyper extended position adapted by the patient during the surgical procedure. This current pilot study examined the patients during the early postoperative period, patients were examined initially the neck ROM and the position of neck adapted by the patient is examined in detail.

In early postoperative period, patients were observed and instructed in Post Operative Day 0 to not to keep their neck hyper-extended and they have been advised to walk in and around the ward. During the initial observation all these patients adapted a static posture with the fear of moving the limbs and mobilizing themselves in the bed. After mobilization, a poor posture has been simultaneously adapted by the patients because of discomfort and fear of pain around the neck.

This neck discomfort has perfect correlation with the activity of daily living in patients underwent thyroidectomy. In hospital clinical practice, the need for physiotherapy management in patients underwent total

Corresponding Author:

thyroidectomy has not paid much attention and focus, because of the poor referral rate for physiotherapy rehabilitation. Lack of referral rate is because of the poor knowledge in physiotherapy management protocol in the rehabilitation of patients undergoing thyroidectomy. Neck movements are recommended to avoid negative experiences following thyroidectomy. These basic neck stretching exercises will improve pain perception in patients by improving neuromuscular coordination, muscle weakness can be prevented.

Objective

To evaluate the efficacy and safety of neck exercises to reduce post-thyroidectomy symptoms for patients undergoing thyroid surgery

Need for the study

According to SRM MEICAL HOSPITAL AND RESEARCH INSTITUTE, CHENNAI, Hospital records from (2017 to 2018) incidence of thyroidectomy operations have been drastically increased. However, most of the patients complain of neck pain and disability. This has been observed during daily clinical practice, but the patients were not having adequate knowledge about neck exercise and the advantages of practicing this exercise to reduce the neck pain and disability. They have been educated and referred for physiotherapy treatment sessions. So this study is considered the first in this group of patients to increasing their knowledge and practice in an attempt to decrease the incidence of this complication.

Methodology

Convenient sampling has been employed to select the patients who underwent thyroidectomy. After getting informed consent signed, a total of 5 volunteer patients who experienced a total thyroidectomy and were older than 50 years participated in the study. The patients were examined for cognitive deficit and any other neuromuscular disorder. Patients with hearing impairment and mental problem that interfered with communication and patients with neck dissection, neck drain during thyroidectomy and those who experienced neck pain before the operation have been excluded out of the study. The study included patients who underwent total thyroidectomy. Baseline assessments were done by the therapist on neck pain and disability. Subjects were educated about the neck rehabilitation exercises and they have been assigned into stretching exercise. On the Post operative day 1, the stretching exercises were instructed and it consist of eight steps

Previous researchers have highlighted the importance of stretching exercises following several types of thyroid surgeries and its efficient ways to reduce pain, improve quality of life. There is a hypothesis that neck stretching exercise on post operative day 1 will have a negative effect on incision healing, hence the study has been done to prove the added benefits of neck exercise in patients with total thyroidectomy. Neck pain leads to psychological difficulties in patients’ activity of daily living. Patients were asked to perform five replicates of all the neck exercise, three times per day (morning, afternoon, and evening) for 1 week. All the treatment session was monitored and the patients were given feedback of how they performed the stretching exercises. At the end of the one week treatment session they have been given an exercise pamphlet and advised with home exercise programme. Their neck pain and disability as well as healing of the wound was checked and assessed with Neck pain and disability index questionnaire. NDI has ten items that measures pain intensity, personal care, lifting, reading, headaches, concentration, work, driving, sleeping, and recreation. Scoring for neck pain and disability index questionnaire was calculated by considering the 10 items, each with a score up to 5, for a total score of 50. Grading of neck pain and disability index questionnaire was No disability (0-4), Mild disability (5-14), Moderate disability (15-24), Severe disability (25-34), and Complete disability equals 35 and above.

Discussion

Thyroidectomy is the commonly performed procedures worldwide and it represents the principal treatment modality for thyroid diseases. Complication rates dependent on preoperative and post operative physiotherapy rehabilitation programme. Complications following thyroid surgery are rare but their effects can persist as life-threatening. The majority of the studied patients were females which show that thyroid disorders were present among females more than males. All the patients included in the study were a known case of diabetes and hypertension. This finding was congruent with Al-Gaffer who mentioned that diabetic patients have susceptibility to different types of thyroid dysfunction. By this pilot study it has been evident that patients show...
a reduction in neck pain and disability after 1 week of exercise intervention.

**Conclusion**

Education and neck stretching exercises significantly improved the neck condition of patients in pain and disability of the neck.

**Recommendations**

Future research is needed in patients with larger samples grouping and by developing a new treatment and follow-up protocol and to use the validated neck pain and disability questionnaire in monitoring patient’s condition.

Duel Burden of Underweight and Overweight among Likely to Conceive Women of Rural North Karnataka: Prevalence and Its Social-Demographic Determinants-Baseline Result of DBW Cohort Study

Tika Ram Gurung¹, Balachandra S Kodkany², Shivanand Mastiholi³, Vijayalaxmi S Neginhal (Gurung)⁴
¹PhD Scholar, KLE Academy of Higher Education & Research (KLE University), ²Principal Investigator, JNMC-UMKC, KLE University, Belgaum, Karnataka, India, ³Senior Medical Officer, CHC Kittur, Belgaum, Karnataka, ⁴District Program Coordinator, Non Communicable Disease, Government of Karnataka

Abstract

Background: The duel burden of malnutrition is characterized by the coexistence of under-nutrition along with overweight, obesity or diet-related NCDs, within individuals, households and populations, and across the life-course. Hence a study carried out to identify the prevalence of underweight and overweight among likely to conceive women and its determinants.

Method: Determinants of Birth Weight (DBW): a community based prospective cohort study at rural North Karnataka collected information from 1293 likely to conceive women on pretested interview schedule. Nutrition status of women was graded based on WHO international BMI categories. Chi Square test and multinomial logistic regression were applied to identify the determinants of underweight and overweight with the 95% confidence interval with P values less than 0.05.

Result: The prevalence of underweight, normal weight, overweight and obesity was found 35.1%, 52.4%, 9.7% and 2.7% respectively with mean±SD BMI 20.4 kg/m²±3.876 kg/m². The determinants of duel burden of underweight and overweight found in the study were current age of women, age at menarche, family type and education level of women and p value less than 0.05.

Conclusion: Younger age group women, women from joint family and women with lower education level are more likely to suffer from both underweight and overweight in North Karnataka.

Keywords: Body Mass Index; duel burden BMI; determinants, likely to conceive women, North Karnataka

Introduction

Background and Research Problem

The duel burden of malnutrition is characterized by the coexistence of under-nutrition along with overweight, obesity or diet-related NCDs, within individuals, households and populations, and across the life-course.¹ Today nearly one in three persons globally suffer from at least one form of malnutrition: wasting, stunting, vitamin and mineral deficiency, overweight or obesity and diet-related NCDs. In 2014, approximately 462 million adults worldwide were underweight, while 1.9 billion were either overweight or obese.¹

The ‘dual burden’ of health concern caused through both underweight and overweight is significantly important for public health policy in developing nations to address.² The problem relating to malnutrition for both men and women should receive equal attention. However, concerns relating to women in developing countries deserve extra attention because of cultural and economic backdrops among women. Secondly, maternal malnutrition directly affects the pregnancy outcome and

DOI Number: 10.5958/0976-5506.2019.01857.6
An augmented numbers of literatures assert that an increased BMI of women is independently associated with increasing risk of adverse obstetric and neonatal outcome. Women with a low BMI is often associated with low nutritional status and adverse health outcomes, such as low birthweight, preterm birth, mental health impairment, increased risk of early mortality, and higher risk of infant mortality. Beside, overweight are at a greater risk of gestational diabetes and larger birth weights in their offspring, putting their infants at higher risk from overweight and obesity later in life; in addition, accelerated weight gain in early life is associated with higher body mass index and obesity later in life. However, it also lead to increased risk for hypertension, and preeclampsia in pregnancy, caesarean and instrumental deliveries, hemorrhage, infection and maternal mortality during labor. Thus, our objective is to assess the prevalence and determinants of underweight and overweight including obesity among likely to conceive married women in rural North Karnataka.

Materials and Method

Study design and participants. Baseline data of Determinants of Birth Weight (DBW): a community based prospective cohort study at rural area of North Karnataka was analyzed. All Likely to Conceive Women (LTCW) were invited to participate in the screening based on the eligible criteria: 15-45 years of married women residing since last one year in study area; not using any family planning method; and last delivery was before 6 month at the time of screening. In DBW cohort study, 1293 LTC women age 14-45 years were selected using proportional allocation sampling technique from 3 PHC covered area in rural North Karnataka. The currently pregnant women and women suffering from sterility problem were excluded from the study.

Outcome measure:

Women’s weight status, indicated by their BMI category, was used as the outcome variable in the analyses. The well-trained field staff measured bodysize of women during at-home. Weight was measured using an electronic scale with a precision of 0.1 kg, and height with a wall mounted height measuring scale, which can provide accurate measurements to the nearest 0.1 cm. The WHO International BMI cutoff points was used to grade the nutrition status of women as <18.5 kg/m² as underweight, 18.5 to 24.99 kg/m² as normal weight, 25 to 29.9 kg/m² as overweight and ≥30 kg/m² as obesity.

Exposure variables

The study considers demographic, socioeconomic and dietary factors to assess the nutritional status of likely to conceive women. The effect of one variable on malnutrition is likely to be confounded with the effects of other variables. Therefore, demographic, socioeconomic and dietary characteristics were controlled statistically. The variables included as covariates are: women’s current age at interview, age at menarche, age at first pregnancy, family type, birthweight of women, women religion, caste, mother tongue of women, women’s education level, work for pay status and vegetarian or non-vegetarian as dietary factor.

Analysis

Data was entered in Ms. Excel sheet and transferred to SPSS ver. 20 for analysis. LTC women were categorized based on World Health Organization International cutoff points. Simple analysis like percentage, mean, standard deviation and range of different variable was calculated. Chi-square and multinomial logistic regression analysis were applied with 95% confidence interval (CI) and p value less than 0.05.

Ethical Consideration: Ethical approval was taken from institutional review board of KLE University before conducting the study. Written informed consent was taken from all participants before interview and measurement of body height and weight.

Result

Characteristic of Participants: Socio-demographic:

Out of 1293 participants, almost half (49.7%) LTC women were 20-24 years of age group where as 26.3% from 25-29 years of age group, 13.5% from 15-19 years of age group and only 10.6% women were 30 or more years of age. The mean±SD ages of participants were 23.7±4.3 years with minimum and maximum age 15 and 44 years respectively. Among those 67.1% women menarche had occurred on 10-14 years of their age and in remaining 32.9% menarche had occurred on 15-21 years of age. The mean±SD age at menarche was 13.9±1.5 years with minimum 10 years and maximum 21 years of age. More than quarter (32%) participants
married before 18 years of her age. Among the surveyed women, mean±SD age at marriage was 18.8±3.1 years and minimum and maximum were 5 years to 32 years of age respectively. 9.8% participant become pregnant before completion of her 18 years of age and 20.8% participants were nulligravida. The mean±SD age at first pregnancy was 20.5±3.1 years and minimum age was 13 years and maximum was 37 years of age. Majority (74.9%) of women belong to joint family and only 25.1% from nuclear family. In the study, women were asked to recall her birthweight and 14.6% women told that they were normal, 6.8% reported they were small and 4.7% told they were big. Whereas, 73.9% women told they don’t know their birthweight.

**Socio-economic:**

Among the study participants, 89.9% LTC women belonged to Hindu religion, 9% belonged to Muslim communities and 1.1% was from other religions. Majority (63.6%) participants were from general caste, 17.9% from ST, 12.8% from OBC and 5.7% from SC communities. By their mother tongue 43.3% were from Kannada, 46.6% Marathi, 9% Urdu and 1.2% other languages. Among the participant, 12.1% women were illiterate where as 7.6% had completed her graduate or more, 66% women had completed her secondary education and 14.3% had completed primary education. Likewise, 4.1% women work for pay and remaining 95.9% women work not for pay.

**Dietary:**

Majority (82%) LTC women were non-vegetarian whereas 18% women were pure vegetarian on her diet.

**Prevalence of Underweight, overweight and obesity among LTC women**

The distribution of likely to conceive women across categories of BMI showed that, 35.1% women were underweight, 52.4% were normal weight, 9.7% were overweight and 2.7% were obese (Fig.1). Mean±SD BMI observed was 20.4 kg/m²±3.876 kg/m² whereas minimum and maximum BMI were 13.2 kg/m² and 44.9 kg/m² respectively.

![Figure No.1: Nutrition Status of LTC women base on BMI WHO International Classification (n=1293)](image)

**BMI and socio-demographic factors**

The associated p values in chi-square analysis suggested significant difference (p<0.05) in three categories of BMI by different groups of exposure variableslike current age, age at menarche, age at marriage, age at first pregnancy, family type, caste, mother tongue, women’s education level and work for pay but not significant with birthweight of women, religion, and vegetarian or non-vegetarian diet (Table 1).

Determinants of underweight and overweight
Statistically significant variables on chi-square test were further taken for multinominal logistic regression to assess their net effect on outcome measure (Table 2). Compared to the elder, the younger were more likely to be underweight and overweight. Interestingly, the risk of underweight and overweight among women whose menarche occurred during 10-14 years has 63% and 46% lower as compared to menarche occurred during 15-19 years of age respectively. Nuclear family has 2.17 and 2.22 lower odds of having underweight and overweight respectively as compared with women belong to joint family which is statistically significant at p value less than 0.001. Likewise, this study reveal that women who pursued higher education level has the significantly lower risk for being underweight and overweight as compared with no education women which is statistically significant. In multinominal logistic regression age at marriage, age at first pregnancy, caste of women, women’s mother tongue and work for pay were statistically not significant though they were significantly associated with underweight and overweight on chi-square test.

**Discussion**

The present study assesses the nutrition status of likely to conceive women in North Karnataka and its socio-demographic determinants. Nutrition status was measured using WHO BMI international cut off point. The finding documents the co-existence of duel burden of under nutrition and overweight among likely to conceive women in rural North Karnataka. Finding shows that, prevalence of underweight, normal weight and overweight was 35.1%, 52.4% and 12.4% (overweight 9.7% and obesity 2.7%) respectively. The prevalence of underweight and overweight is lower as compared with NFHS-4 survey result. The reason might
be the geographical region and urbanization. The lower prevalence might be this study was carried out in rural area of North Karnataka only.

Our study reveal that socio-demographic determinants like younger women, women with late menarche, women from joint family and low education level significantly greater risk of being underweight and overweight among likely to conceive women of rural north Karnataka. The increase likelihood of being underweight among the younger women, compared to their elder counterparts, and decrease risk of underweight among women who were belong to nuclear family may be partly attributed to physical activities, cultural norms, and food practicing. Biological phenomena are also concerned with underweight of young women compared to their elders. In our study not only underweight is common in younger women but also overweight as well which is different than other studies. The reason may be the younger age group is more prone to risk of malnutrition as compared with their counterpart due change in generation.

In present study also reveal that those women who experienced her menarche after crossing 14 years of age are more prone to develop underweight and overweight later in her life as compared to those experiences her menarche at 11 to 14 years of her age. Finding reveals a strong significant relation between BMI and women’s level of education. The higher the level of education, the lower was the risk of being underweight as well as overweight.

Though the relationship between education and overweight is not so robust,having more years of education reduces the prevalence of underweight among likely to conceive women in rural north Karnataka. Thought number of studies, there was a positive relationship between education and obesity.\(^5,9,10\) However, some studies from industrial countries and in a few developing countries demonstrated that the burden of obesity is shifting toward low-educated which is similar with our study result.\(^5,11,12\) A cross-sectional estimates from a study of twins conducted by Webbink et al. (2008), also confirms the negative relationship between education and the probability of being overweight. Yoon et al. (2006) also found that higher levels of education for women resulted in lower BMI.\(^13\)

**Conclusion**

India is facing double burden of underweight and overweight. The finding suggest that malnutrition among likely to conceive women in north Karnataka is determined by many socio-demographic factors like age of women, age at menarche, education level of women and the family type she belonged to. The duel existence of underweight and overweight among likely to conceive women in North Karnataka must be taken in consideration so that public health intervention may be adopted through appropriate policy hence to reduce the risk of women developing different types of non communicable diseases as well increase the chance of healthy pregnancy outcome.

Comparison of Quality of Life among Oral and General Cancer Patients

L Sri Varsha¹, Sreedevi Dharman²
¹Graduate Student, ²Reader, Department of Oral Medicine and Radiology, Saveetha Dental College

Abstract

Background: Cancer is a disease involving abnormal proliferation of cells and potential to invade to other parts of the body. The different types of cancer based on sites are oral cancer, breast cancer, lung cancer, prostate cancer, cervical cancer, gastric cancer, colon cancer, lymphoma, melanoma, leukemia. As cancer alters the quality of life to a great extent, aim of the study was to determine the quality of life and compare it among various types of cancers.

Objective: To evaluate the quality of life among general and oral cancer patients.

Materials and Method: 18 patients were selected (10 oral cancer and 8 general cancer patients). EORTC QLQ-C30 was the tool used for general cancer patients and UWQOL was the tool used for oral cancer patients and assessment done.

Results: The mean value of overall and health related quality of life in oral cancer patients were 32.8±4.84 and 28.7±4.71 compared to general cancer were 55.2±6.54 and 50.9±7.37, with significant difference(p=<0.05)

The important domains the oral cancer patients chose were pain (60%), swallowing (60%) and taste (60%).

General cancer patients, had a fairly favourable quality of life in relation to physical function(75%),cognitive function(75%), sleeping patterns(100%)

Conclusion: We found that general cancer patients led a better quality of life when compared with oral cancer patients. The oral and maxillofacial region is associated with appearance and important life-maintaining functions like mastication, speech, resulting in difficulty in coping up with the negative impact of the disease and treatment.

Clinical Significance: Quality of life in oral cancer patients will be altered to a greater extent, hence risk factors causing cancer should be identified and controlled.

Keywords: oral cancer, quality of life, radiotherapy, chemotherapy, general cancer.

Introduction

Cancer is a disease involving abnormal proliferation of cells and potential to invade to other parts of the body. The different types of cancer based on sites are oral cancer, breast cancer, lung cancer, prostate cancer, cervix cancer, gastric cancer, colon cancer, lymphoma, melanoma, leukaemia. Oral cancer is a malignant neoplasm which is found on the lip, floor of the mouth, cheek lining, gingiva, palate or in the tongue. Oral cancer is one among the most prevalent cancers in India. Chronic alcoholism, use of tobacco like cigarettes and smokeless tobacco, betel nut chewing and human papilloma virus(HPV) are the most common risk factors for oral cancer.

CORRESPONDING AUTHOR:
Sreedevi Dharman
Reader, Department of Oral Medicine and Radiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Science, Saveetha University, No.162, Poonamalle High Road, Chennai-600077 Tamil Nadu, India, Email Id-sanjamrut@gmail.com
General cancer patients are cancers occurring in rest of the body other than oral cavity such as breast cancer, lung cancer, prostate cancer, cervix cancer, gastric cancer, colon cancer, lymphoma, melanoma, leukaemia. Breast cancer develops from the breast tissues. They develop in the cells lining the milk duct and lobules that supply the ducts with milk. The cause of breast cancer include factors such as older age, family history of breast cancer, early menarche and late menopause, exposure to radiation, obesity, oral contraceptives, and alcohol consumption. Dietary patterns are also involved in the risk factors of breast cancer. It causes depletion of essential factor that normally protects against the development of breast cancer. Dietary habits such as high fat, low vegetables and fruits, low fibre and high carbohydrates may increase the risk of acquiring breast cancer. Circulating sex hormones like oestradiol, dehydroepiandrosterone sulfate, androgens, testosterone and sex hormone binding globulin are also associated with breast cancer risk.

Cervical cancer is a cancer arising from the cervix. Human papilloma virus causes cervical cancer in more than 90% of the cases. Other risk factors include smoking, weak immune system, birth control pills and multiple sexual partners.

Gastric cancer is the cancer developed from the lining of the stomach. The most common cause of infection is helicobacter pylori. The other risk factors include smoking, dietary pattern and obesity.

Cancer can alter and affect the quality of life of a patient based on varying degrees of severity depending on the site and the stage of cancer. Quality of life (Qol) is defined as an individual’s perception of their position in life, in the context of the culture and value systems in their life and in relation to their goals, expectations, standards and concerns. Its performance concern various aspects of life, including physical, psychological and social health. The evolution of the study of the QoL has allowed instruments used for its evaluation to become more precise to understand and compare the health status of populations, as well as for evaluating the impact of certain medical interventions, symptoms, and physical function over time and the ability to observe areas with greater problems to provide specific therapies.

Various literature studies show the quality of life in oral cancer patients and the quality of life in patients with cancer in other parts of the body. But literature is not available on the comparison of the quality of life between the different types of cancer and about which cancer patient has a better quality of life.

Hence this study aims in comparison of quality of life among oral cancer and general cancer patients undergoing radiotherapy and chemotherapy.

**Materials and Method**

Questionnaire for this study was formed with the help of various tools used in assessing the quality of life in cancer patients. Comparison of quality of life was done between oral cancer and general cancer. Two scales were used. EORTC QLQ-C30 instrument was used to determine the quality of life in general cancer patients. It is a 30-item questionnaire composed of multi-item scales. It includes four functional scales [physical (PF), cognitive (CF), emotional (EF) and social (SF)], three symptom scales (fatigue, pain, nausea and vomiting), and a global health and quality of life scale (QL). Remaining single items assess symptoms that are frequently reported by cancer patients, such as dyspnoea, loss of appetite, sleep disturbances, constipation and diarrhoea, and an item on the financial impact of disease and treatment. The responses were classified under favourable, fairly favourable and non favourable quality of life.

UW-QOL instrument was specifically developed for the QOL assessment of patients with cancer of the head and neck. It comprises of ten specific questions addressing important domains for the QOL assessment of patients with oral and oropharyngeal cancer like pain, appearance, activity, recreation, swallowing, chewing, speech, shoulder, taste and saliva. The patients were asked to choose 3 important domains each which affected them the most from the 10 domains listed in the questionnaire.

The study was conducted in Dr. Rai CBC centre, Saveetha dental college, Chennai. A total of 18 patients were selected for this study of which 10 were oral cancer patients and 8 were general cancer patients. Research was conducted with ethical clearance in accordance with the Helsinki Declaration of 1975, as revised in 2000.

The EORTC QLQ-C30 questionnaire was distributed among general cancer patients, UW-QOL questionnaire
among oral cancer patients. The questionnaire was in English. The questionnaire was translated into the regional language (Tamil) for the patient’s understanding and the answers were noted down.

The questionnaires were scored according to the scoring pattern given by the instruments. The data were entered into Excel sheet and the mean value and standard deviation was derived. The P value was determined.

**Results**

In a total of 10 oral cancer patients, 8 were male and 2 were female. The site of oral cancer are as follows: tongue (30%), lips (10%), pharynx (10%), floor of the mouth (10%), lower oesopharynx (10%), buccal mucosa (10%), soft palate (10%) and maxilla (10%) Figure 1. The domains the patients chose were pain (60%)(n=6) swallowing (60%)(n=6) taste (60%)(n=6), appearance (20%)(n=2), chewing (10%)(n=1) speech (10%)(n=1) and shoulder (10%)(n=1). Figure 2. The mean value and standard deviation of all the domains are mentioned in Table 1.

In a total of 8 general cancer patients, 7 were female and 1 was male. The site of general cancer are as follows: cervix cancer (62%), breast cancer (25%) and gastric cancer (13%) Figure 3. In relation to general, social functions, fatigue and gastric problems, 87.5% (n=7) patients felt that they were leading a fairly favourable life and 12.5% (n=1) of patients felt that they were leading a non favourable quality of life. 75% (n=6) of patients felt that they were leading a fairly favourable quality of life in relation to physical function, cognitive function, emotional function and pain. 25% (n=2) of the patients felt that they were leading a favourable quality of life in relation to physical function, 25% (n=2) fairly favourable quality of life in relation to cognitive function and 62.5% (n=5) of the patients had a non favourable quality of life and 37.5% (n=3) of the patients had a fairly favourable quality of life in relation to sleep patterns. Figure 4

The mean value of health related quality of life was 28.7±4.71 in oral cancer patients and 50.9±7.37 in general cancer patients. The mean value of overall quality of life was 32.8±4.84 in oral cancer patients and 55.2±6.54 in general cancer patients. Table 2 When comparing the mean value of oral and general cancer patients, oral cancer patients had a poor quality of life when compared with general cancer patients.

There was a significant difference in the health related and overall quality of life between oral and general cancer patients. (p=0.023) Table 2.

Discussion

In oral cancer patients, the most common site of cancer was found to be the tongue with 30%. Oral cancer was found to be more prevalent in male patients with 80%. Adverse habits such as smoking, drinking and pan chewing attributed to this condition. Patients were asked to choose 3 factors which affected them the most from pain, appearance, activity, recreation, swallowing, chewing, speech, shoulder, taste, saliva, mood and anxiety. The most important domains were pain, swallowing and taste followed by appearance and then chewing, speech and shoulder.

In general cancer patients, the most common site of cancer was found to be cervix with 62%. General cancer was found to be more prevalent in female with 87.5%.

There was a significant difference between the health related and overall quality of life of oral and general cancer patients. \( p=0.023 \). There was a significant difference between the overall and health related quality of life in oral and general cancer patients.

In a study conducted in brazil, 28 oral cancer patients appraised their health-related QOL at the baseline as worse than during the month before diagnosis, at the one-year follow-up, the proportion was reduced to one third.\(^{12}\)

Budischewski et al\(^{13}\) used EORTC QLQ-C30 tool to study QOL in 61 breast cancer patients at the beginning of RT and 6 weeks after RT was completed. These authors achieved a response rate of 68 % at their post-RT time evaluation, whereas our response rates for the same questionnaire at 1 and 6 months post-RT were 96 and 86 %, respectively.

Bansal et al\(^{14}\) used the EORTC tool to evaluate 45 patients with head and neck cancer at three time points: the start of RT, fourth week of RT, and 1 month after RT. These authors found that global health status and physical, social, and emotional functioning all declined significantly during RT. One month after RT, they observed improvement in all the functional scale scores, but none had returned to pre- RT levels.

Most of the Oral cancer patients are associated with adverse habits like tobacco usage, pan chewing that creates negative coping, esthetical disfigurement, difficulty in speech, swallowing.
Chewing, taste, hampers day to day functioning of life, affecting physical, psychological and social health resulting in poor quality of life compared to general cancer patients.

Quality of patients on the whole in cancer patients are affected but oral cancer patients suffer more due to the involvement of oral cavity in appearance, speech, mastication, taste.

There are deficient studies that compares the quality of life between oral and general cancer patients. More studies should concentrate on comparison of quality of life among various cancer patients in order to understand the quality of life the patient undergoes during their course, identify the risk factors and effective steps to be taken to control cancer.

**Conclusion**

We found that general cancer patients led a better quality of life when compared with oral cancer patients. The oral and maxillofacial region is associated with important life-maintaining functions like breathing, mastication, speech, etc. The surgical resection of oral cancer often results in disfigurement of face, alteration of speech, decreased ability of mastication, change in taste, etc leading to a poor quality of life. While providing a disease-free life to a cancer patient is definitely an important goal, the ultimate aim is to provide an acceptable quality of life for the comprehensive physical, emotional and social well-being of all patients. The quality of life will be altered to a greater extent in cancer patients with or without treatment. Thus, the ultimate goal must be in preventing cancer.

**Clinical Significance:** Quality of life in oral cancer patients will be altered to a greater extent, hence potential risk factors causing cancer should be identified and controlled.

Introduction: The deposition of colouring matter, coloration or discolouration by a pigment pertaining to the gingiva is called gingival pigmentation. The development of pigmentation is regulated by the individual’s genetic make-up. The normal physiological colour of gingiva is coral or salmon pink with physiological variations of melanin pigmentation. Melanin is a non-hemoglobin derived brown pigment produced by melanocytes. In this study, we will be studying the prevalence and causes of pigmentation of gingiva.

Materials & Materials: Fifty dental undergraduate and postgraduate students from Saveetha Dental College were included in a questionnaire based study that assessed their knowledge and practice on gingival pigmentation and their answers were evaluated.

Results: Among fifty subjects, only 8.16% hadn’t come across a patient with gingival pigmentation due to pathological factors these were mostly third year students. A good value of 91.84% experienced a patient with gingival pigmentation due to pathological factors with a SD ±0.27 and most of them particularly the senior students had good knowledge about gingival pigmentation. The most reported cause for gingival pigmentation was the consumption of tobacco, 24.49% then an 18.37% due to amalgam tattoo, followed by smoking and usage of anti-malarials with a 14.29%.

Conclusion: The senior most class, the interns were more knowledgeable about the prevalence and causes of gingival pigmentation. The subjects included in this study were over-all educated about the causes and the concept of gingival pigmentation.

Keywords: gingival pigmentation, discolouration, melanin, oral mucosa, aesthetic

Introduction

Pigmentation is discolouration of the oral mucosa or gingiva due to the wide variety of conditions and lesions. Oral pigmentation has been associated with various systemic and localized conditions. Oral pigmentation has been associated with a variety of endogenous and exogenous etiologic factors. Most pigmentation is caused by five primary pigments namely, melanin, melanoid, oxyhemoglobin, reduced hemoglobin and carotene. Of all these, the most commonly observed pigment in oral mucosa is melanin. The clinical history, symmetry and uniformity of the lesion are crucial in determining the clinical differential diagnosis. Melanocytes are branched or dendritic cells which are found at the epidermal and dermal junction of the skin and mucous membrane that form melanin. The melanocytes are situated in the intercellular epidermal areas and form complex outlines by their long processes

The gingiva is the most frequently pigmented tissue in the oral cavity. Dummett and Baren's implicated many systemic and local factors as causes of changes.
in oral pigmentation. The deposition of coloring matter, coloration, or discoloration by a pigment pertaining to the gingiva is gingival pigmentation. Physiologic pigmentation which is the main condition observed, probably is determined genetically. However, as Dummett suggested, the degree of pigmentation is related part to mechanical, chemical and physical stimulation. High levels of oral melanin pigmentation usually are observed in individuals of African, East Asian or Hispanic backgrounds. Clinically, gingival pigmentation does not present medical problems, it is more of an aesthetic concern for patients. A periodontal plastic surgical procedure known as Gingival depigmentation is employed whereby the gingival hyperpigmentation is removed or reduced by various techniques.

The gingivae are the most frequently pigmented intraoral tissues. The most common location was the attached gingiva (27.5%) followed in decreasing order by the papillary gingiva, the marginal gingiva, and the alveolar mucosa. Gingival pigmentation can occur due to pathological reasons as well, it has been associated with a variety of lesions and conditions such as endocrine diseases like Addison’s disease, Albright’s syndrome, Acromegaly, Nelson’s syndrome, exposure to heavy metals e.g. lead, bismuth, mercury, silver, arsenic, gold. In children, the possible sources of exposure include lead contaminated water or paint and mercury or silver containing drugs. It can be related to deadly diseases such as Kaposi’s sarcoma. It is the most common malignancy associated with human immunodeficiency virus infection and it may potentially affect every part of the body. Although, palate is the most common site of site of AIDS related Kaposi’s sarcoma, intraoral lesions may also involve the gingiva and other areas and HIV oral melanosis. Such patients undergo hyperpigmentation of skin, nails and mucous membrane. The etiology of such hyper pigmentation remains undetermined though it may be attributed to medication or adrenocortical involvement by opportunistic parasites.

It may also be drug induced as a variety of medications, common pathological cause of gingival pigmentation is smoking associated melanosis, tobacco consumption and gingivitis, accidental displacement of metal particles in oral soft tissues during restorative dental procedures using amalgam may result in amalgam tattoo.

Though there is abundance in knowledge on the depigmentation methods, there is inadequate knowledge of what gingival hyperpigmentation is. Thus, the motivation of this study was to assess the knowledge of dental students (III, IV years and interns) about gingival pigmentation due to pathology and its causes. There has been no study in the region regarding the issue thus there is a gap that needs to be filled. One of the aims of this study was to fill this gap.

**Materials and Method**

This study included a sample of 50 students, studying in Saveetha Dental College and Hospitals, in their III, IV year and interns who are assigned to practice on patients as the dental hospital serves as a training institution for undergraduate and postgraduate dental students and is a major referral center for dental cases. The subjects were administered with a questionnaire on their experience of coming across patients having gingival pigmentation, their causes and prevalence.

The questionnaire was created by using a survey-tool app, Survey Planet and was distributed among the students.

**Results**

Among these 50 subjects, only 8.16% hadn’t come across a patient with gingival pigmentation due to pathological factors these were mostly III year students. A good value of 91.84% experienced a patient with gingival pigmentation due to pathological factors with a SD ±0.27.

It may also be drug induced as a variety of medications, common pathological cause of gingival pigmentation is smoking associated melanosis, tobacco consumption and gingivitis, accidental displacement of metal particles in oral soft tissues during restorative dental procedures using amalgam may result in amalgam tattoo.

The chief complaint of the patient were scaling, dental caries, routine check-up, malocclusion and bleeding gums. However, only 4% presented a case of gingivitis (SD ±1.78).
When asked about the diagnosis of the excessive pigmentation, the answers varied from gingivitis to usage of acne medication. The most reported cause for gingival pigmentation was the consumption of tobacco, 24.49% then an 18.37% due to amalgam tattoo (pigmentation due to tooth restoration material), followed by smoking and usage of anti-malarials with a 14.29%. Usage of acne medication, particularly, Minocycline and exposure to heavy metals were the reported cause by 10.20% of the subjects. It was strange to note that only 8.16% of the subjects diagnosed the cause of their patient’s gingival pigmentation as gingivitis.

Melanin hyperpigmentation usually does not present as a medical problem, but patients may complain their black gums are unaesthetic. This problem is aggravated in patients with a gummy smile or excessive gingival display depigmentation is a periodontal plastic surgical procedure whereby the gingival hyperpigmentation is removed or reduced by various techniques. The questionnaire presented to the subjects asked them about the treatment plan they would suggest for gingival hyperpigmentation to assess their awareness about it. Majority of the subjects said they would advise Laser Gum Bleaching (64.58%) and about 16.67% advised Cryosurgery, 10.42% voted for Scalpel Surgery, an 8.33% for Electro surgery and it was good to know that 0% of the students said that they would advise gingivectomy unless it’s a severe and needed treatment plan.

In more than half of the cases, the patients were smokers or tobacco consumers (54.17%) whereas only 45.83% were non-smokers. The prevalence of gingival pigmentation was tested by questioning the subjects about the gender more susceptible to gingival hyperpigmentation and 81.25% felt it was males and 18.75% observed more hyperpigmentation in females.

It was evident that the majority of the interns, i.e., 48% had more knowledge about hyperpigmentation of gingiva and it’s causes as they were more experienced in the field. As most of them were females, it is agreeable that females were more educated about gingival pigmentation. However, according to Shankar et al., the difference in perception of gingival pigmentation among males and females was not statistically important and the occurrence did not vary with age or gender which did not correlate with our result of the increased occurrence in males. The reason that the patients visited...
the subjects in the first place gives us an initial look into the causes of hyperpigmentation. From the results it is apparent that people weren’t aware about their pigmentation being associated with a variety of lesions and conditions. According to Matundra T et al, only 27% of the subjects found the gingival hyperpigmentation unaesthetic and desired to get treatment.\(^\text{22}\)

Intraoral pigmentations could be focal, diffuse or multifocal. They may be black, gray, blue, purple or brown in color. They may be flat or swollen. They can be localized accumulations of melanin, hemosiderin, exogenous metal or some are even indications of an internal disease. The differential diagnosis can belengthy in certain conditions with multiple and complex lesions with pigmentations.\(^\text{23}\) The students’ diagnosis of the gingival hyperpigmentation was assessed and the most reported cause was the consumption of tobacco and smoking which further causes smoker’s melanosis. This correlated with the study done by Hagoo et al who demonstrated that smoking is a contributing factor to gum hyperpigmentation.\(^\text{24}\)Smoking may cause oral pigmentation in light-skinned individuals and accentuate the pigmentation of dark skinned patients.\(^\text{25}\) There is increased production of melanin, which may provide a biologic defence against the noxious agents present in tobacco smoke.\(^\text{26}\) Smoker’s melanosis occurs in up to 21.5% of smokers.\(^\text{27}\) The intensity of the pigmentation is related to the duration and amount of smoking.\(^\text{27-28}\)

The second leading cause of gingival pigmentation reported was amalgam tattoo, 18.37%. The pigmentation of the oral mucous membrane by tooth restoration material (amalgam) is a common finding in dental practice. The lesion represents embedded amalgam particles and usually manifests itself as an isolated bluish or black macule in various areas.\(^\text{1}\) However, Ghanpanchi J et al., reported only 3% occurrence of amalgam tattoo even though it is common.\(^\text{6}\) The much lesser reported cause was due to usage of drugs and exposure to heavy metals. Minocycline is a synthetic tetracycline that is commonly used in the treatment of acne vulgaris. Although tetracycline causes pigmentation of bones and teeth, minocycline alone is also responsible for soft tissue pigmentation. It is typically seen as brown melanin deposits on the tongue, gingiva, hard palate and the mucous membrane.According to Matundra T et al, almost all the subjects who were on medication had gingival hyperpigmentation.\(^\text{22}\)

Demand for enhancing therapy of gingival melanin pigmentation is common and various methods have been used for depigmentation, each with its own advantages and restrictions.\(^\text{29}\) Most of the subjects suggested Laser Gum Bleaching as a treatment option and the least number suggested gingivectomy. Lasers have the advantages of easy handling, short treatment time, haemostasis, and bactericidal effects.\(^\text{10}\) The Nd: YAG laser produces invisible, near infrared light with a wavelength of 1064 nm. This type of laser is used to eliminate various types of hyper pigmented lesion in dermatological surgery, as well as to produce depigmentation in skin.\(^\text{10}\) Treatment by diode lasers is a better option than Nd: YAG laser as they do not produce any deleterious effects on the root surface of teeth as reported by Lagdive S et al, and it has the unique characteristic of removing only a thin layer of epithelium in a clean manner.\(^\text{31}\) More than 80% of the subjects observed and knew that dark skinned people were more susceptible to gingival hyperpigmentation than fair skinned ones. anatomic distribution of melanin pigmentation in the gingiva and also quantify it in a South Indian population, who have darker skin color owing to more melanin content, and tend to have more oralpigmentation than their counterparts in North and Northeast India. This could be attributed to their genetic traits.\(^\text{32}\) Looking into the location of the gingiva which was most pigmented, students reported attached gingiva being the most pigmented followed by papillary gingiva.

This correlated with the results reported by Ponnaiyan et al, that majority of the subjects had pigmentation in the interdental papilla and attached gingiva.\(^\text{33}\)

**Conclusion**

The senior most class, the interns were more knowledgeable about the prevalence and causes of gingival pigmentation. The subjects included in this study were over-all educated about the causes and the concept of gingival pigmentation. This may be due to the inclusion of the same topic in their curriculum and/or due to the seminars and conferences conducted on gingival pigmentation and its treatment modalities.

Impact of Pre and Post National Level Eligibility Examination on Dental Education System

Deepak Nallasamy¹, Pratibha Ramani²

¹Director of Academics, ²Professor and Head, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

Abstract

Preadmission factors is consistent across higher education disciplines and is quantified through a well-defined minimum and maximum level of achievement. Dentistry is a highly skill oriented profession which requires highly motivated academic and clinical orientation involving intense hard work and dedication for a successful career. The selection process with the advent of computerisation has become more mechanical involving minimum human intervention. Combination of many factors are chosen to predict the academic performance of medical and dental students post admission into the dental school. Entrance examination and education systems should lighten up the lives of students, cherish their dreams, and reward their hard work. A single entrance examination like NEET system followed in India in a stricter sense cannot truly reflect the aptitude and intelligence of students. Ultimately, if the system of entry is streamlined and academic along with clinical calibration is ensured, the concept of exit examination can be waived so as the student can be ready for practice or postgraduate studies.

Keywords: NEET, Dental education, Impact, Entrance examination

Introduction

Preadmission factors is consistent across higher education disciplines and is quantified through a well-defined minimum and maximum level of achievement. Achieving at a high level in preadmission factor scores is considered an excellent predictor of the likelihood for student success in their educational program. Preadmission factors, defined broadly, are the scores or grades used to evaluate the academic and personal readiness of a prospective student to enter graduate-level specialty training. Professional College is a graduate school-level institution, the purpose of which is to prepare students for a specific career field. Examples of professional schools offering specialized advanced degrees include medicine, business, dentistry, engineering, law, among many others degrees.

Specialization requires a narrow focus on developing the necessary skill level to become an expert in that discipline. Expertise is derived from substantial training, which is nontransferable and utilizes higher order principles to solve problems with more accuracy. In order for excellence to occur, the demonstration of acquired expertise is seen as a necessary requirement within the discipline of study. Dentistry is a highly skill oriented profession which requires highly motivated academic and clinical orientation involving intense hard work and dedication for a successful career.

Students from varied regional, academic and socioeconomic backgrounds seek admission to the dental schools. The admission qualifications and entry criteria vary greatly in different countries. In many Asian countries, students can seek admission to undergraduate dental degree course soon after they leave the secondary schools. Also, the students compete for limited number of seats. Selection criteria vary greatly, depending upon the country and even within the same country, different entry qualifications and procedures are mandatory to

Selection Process in Different Countries

Demand for dental profession has always been on the high until recent times owing to its importance in the society. The profession may be taken as personal choice or as a second choice in many situations to medicine.

The selection process with the advent of computerisation has become more mechanical involving minimum human intervention. In most of the cases, faculty members are not involved in the selection of the students, except in very few select institutions, where a panel of academicians perform this task. However, the responsibility of helping the students to progress in their career is totally dependent on the academic institution. Institutions across the globe have adopted diverse methods to achieve the best selection criteria. Arabian Gulf University, Iran, and in Chile have defined a grade of 80-90% in high school, national university entrance examination (Konkoor) score along with an interview to test their effective and psychomotor skills which have been set as a requirement for admission.

All dental schools in the United States utilize the applicant’s general undergraduate grade point average (GPA), the undergraduate science grade point average (SGPA), and the Dental Admission Test (DAT) scores as factors for admissions. The DAT is a necessary tool to compare students from different schools as it is the only national standardized test available for dental school admissions. The DAT consists of a Quantitative Reasoning Test, a Reading Comprehension Test, a Survey of the Natural Sciences, and a Perceptual Ability Test. In order to optimize the admissions and graduation process, it is critically important that dental schools be able to predict the future academic performance and clinical competency of students in the dental curriculum. The evidence based literature is sated with the effects of different variables on predicting student performance at dental schools. Many studies have assessed the relationship between predictor variables and student performance in preclinical or restorative laboratory courses, but there have been few studies emphasizing overall clinical performance. Predental exams and preclinical predictors have largely shown insignificant correlation with preclinical laboratory course performance.

Combination of many factors are chosen to predict the academic performance of medical and dental students. Various cognitive factors have been identified as contributory to the learning outcome of students in the past. In recent years, various non-cognitive factors also have been attributed to the performance of the students. These factors significantly contribute to the success in practice. A possibility of employing the predictive power of personal statements and evaluations to improve the academic performance has not been explored fully. This forms an important part of current selection process in developed countries such as United Kingdom. A few similar studies have been reported from medical and dental schools in other countries as well, out of which many are from countries in the Middle East.

Indian Scenario

In India to standardise the admission procedures, Medical Council of India (MCI) and Dental council of India (DCI) have introduced National Eligibility Cum Entrance Test (NEET) as the entry requirement for the undergraduate medical and dental course from 2016. Further, MCI has also suggested that it may be desirable to introduce an exit examination which will screen the academic competencies of the qualifying doctors, who are expected to carry out healthcare activities in the country. These efforts would, address the issue of academic competencies of the incumbent graduate.

Before NEET was mandatory, the cut off marks were 50% marks for general and 40% for the reserved. From 2016, 50th and 40th percentiles. This opened the doors for candidates under just 18 – 20% in the NEET. With just 5% marks in physics, 10% in chemistry and 20 odd percentile in biology of NEET candidates got admission into medical and dental courses in the past 2 years. Percentile measures the proportion not the score. This 50 percentile measures students with more marks than the bottom half, 90th percentile comprise students with more marks than the bottom 90% and so on. It does not mean they have 90% marks. Percentile cut offs introduced for NEET lowered the marks bar became counterproductive.

The problem of dental education starts with the admission. Most of the dental students opt for dentistry as a second choice because they do not get through Medicine course through common entrance test for medicine, dental and other paramedical branches. Thus,
most if not all, dental admissions are not by choice and this leads to lack of interest in the dental practice\textsuperscript{14}.

The solution for this problem is separate entrance for dental curriculum as only those genuinely interested students with good dental acumen and aptitude will get selected and not as a second choice. Another factor in Indian dental education system is more of a theoretical approach to various subjects. Practical training in some dental schools where patient flow is good is excellent, especially in government and very few private dental colleges, but in the schools where the patient flow is less, the student do not develop the confidence in treating patients. The problem base learning and teaching along with advance technology will give an overall perspective to dental students to handle a patient in private practice as it has become the norm of the day.\textsuperscript{15}

Studies focussing on these attributes in Indian medical students are scanty. There have been reports suggesting various parameters as predictors of academic excellence during the dental graduate course \textsuperscript{16}. Medium of instruction during secondary school education posed as an important factor contributing to a successful graduate course education. Hence English medium education has been identified quite often as an enhancing factor for success. It is well known that scholastic success is guided by cognitive factors like pattern of thinking, levels of interaction, adaptation over time.\textsuperscript{17} In addition to these, success of a dental graduate is also dependent upon other qualities such as commitment to practice dentistry, compassion, empathy, sense of professionalism which are collectively grouped as non-cognitive factors. These factors may have a direct positive relationship to student’s performance and their future outcomes. Moreover all these factors tend to act as variables which could influence the progress of a prospective student in their journey of graduation and future.

Dental education system nuances

Dental curriculum involves intense training, dedication of time and effort by students. Medical education is supported also by heavy funding and non-completion of the course can be a burden to the society. Therefore it becomes important to identify the students who require remedial measures and implement early intervention. These students who lack motivation require a support system, if they were to continue the course. If it is possible to predict students who might have trouble in achieving the required academic competencies, it should be possible to help these students by way of tutoring or mentoring, thereby ensuring continued progress of the students and avoid failures. Nottingham studies suggest that 10-15\% of the medical student intake face crucial problems academically.\textsuperscript{18} Though these students have been selected to study medicine by rigorous cognitive screening procedures, several non-cognitive factors had also significant role in completion of the course. Most of the students who participated were well motivated showing that they were determined to complete their medical studies with good honours. Small number of students who were not motivated and took this course on account of some pressure needed guidance to pursue the course or must be channelized towards their field of interest. Even students with good aptitude required guidance on learning and test taking strategies in order to accomplish success in completing their curriculum within stipulated time. Elimination of fear factor with constant reinforcement by the faculty by providing additional guidance and appropriate mentoring have complimented all the above factors. Thus students with fear factor need to be addressed as just studying alone may not be helpful to complete this professional course and this deficit can be easily corrected with appropriate measures.\textsuperscript{19}

Eligibility Norms

The National Academy of Sciences, USA, has identified and enlisted the issues with curriculum such as basic science concepts weakly connected to clinical education and experience, curriculum not sufficiently at par with the current dental sciences and practice, implementation of comprehensive patient care as a model of clinical education, and the most important one in which dental curriculum being overcrowded does not allow for the development of critical and logical thinking.\textsuperscript{20} The overall treatment planning should be taught for a patient as a whole rather than one subject at a time. Another most important curriculum change needed in dentistry so as to reduce the attrition of students not opting for dentistry as a first option is to teach or make them aware of dental practice economics.

Little information is available in the literature regarding the relationship of predental and preclinical predictors to productivity and success in the clinical
environment of a dental school. While preclinical predictors typically evaluate the fund of biomedical and basic science knowledge, it is not unreasonable to suggest that success in evaluating and solving scientific and biomedical problems has direct correlations to addressing, evaluating, and solving problems in a clinical setting. Although some of the skills required to effectively treat patients in a clinical setting may not have direct associations with more academic measures, there is likely some overlap between the skill sets required for academic success and those for clinical success.21

Students who succeed academically are typically highly motivated, organized, creative problem-solvers. These same attributes can be plausibly linked to those who perform well in clinical settings.

One can consider different possibilities for student skill set pairings. Some students may have significant success with didactic work but lack the psychomotor skills to perform at an equivalent level clinically. Alternatively, there may be some students for whom didactic learning is a significant challenge, but who have excellent hand skills. Associations between the predictors and clinical outcomes in these students may be inconsistent, as students may be able to successfully compensate based on their stronger skill area, a student with excellent hand skills may be able to compensate for a lack of didactic knowledge. While certain knowledge gaps may be evident between students at different times during the course of their dental education, these gaps will eventually be filled with knowledge gained from clinical experience. In other words, all students reach the same point of clinical competence prior to graduation. With regard to clinical productivity, it may be that once clinical thresholds for a given procedure are achieved, students feel little to no incentive to seek out additional procedures and may end up transferring patients to other students. Finally, it may be that clinical evaluations cannot be effectively compared to standardized examinations due to the subjective nature of faculty grading for clinical procedures and variability between clinical faculty in terms of the amount of assistance given to students.22

**Institutional Observation**

An initial observation at our institution where we compared the performance of students who had entered through the common entrance examinations along with the dexterity and aptitude tests and students who had entered through NEET qualifying examinations. Most students initially rated as high or low achievers as per the NEET scores and the non NEET examination scores, the performance among through Non NEET exam Qualifiers were significantly better than the NEET exam qualifiers in the final university examination.

**Conclusion**

A single entrance examination like NEET in a stricter sense cannot truly reflect the aptitude and intelligence of students. Ultimately, if the system of entry is streamlined and academic along with clinical calibration is ensured, the concept of exit examination can be waived so as the student can be ready for practice or postgraduate studies.

Effectiveness of SMS Feature of Mobile Phone in Management of Type 2 Diabetes: A Review

Divya Tripathi¹, Neena Bhatia²

¹Ph.D Scholar, Department of Food and Nutrition, Lady Irwin College, University of Delhi, ²Associate Professor, Department of Food and Nutrition, Lady Irwin College, University of Delhi

Abstract

The objective of this review is to evaluate the effectiveness of SMS feature of mobile phones in management of type 2 diabetes in different countries, their potential role in clinical and community settings, and the current state of research. A comprehensive electronic search was conducted and studies from 2004 to 2018 were included. In this review 32 articles were included in which number of people participated were 18-955, age of participant lies between 16-75 yrs, participants received interventions for the duration of 1 to 24 month. Messages were categorized into 3 types-reminder messages, messages for treatment assistance and educational and motivational messages. It was observed that there was significant improvement in blood sugar and HbA1c levels of the patients, adherence to medical advice, health lifestyle, knowledge and self-efficacy, user satisfaction with intervention was also assessed in many studies which was found to be high. Significant evidences are there to prove that mobile phone SMS service used in reminders, disease monitoring and disease management is highly useful in improving the glycemic control of Type 2 Diabetes patients.

Keywords: Type 2 diabetes, mobile phone, short message service, intervention, type 2 diabetes management.

Introduction

As per the latest report given by International telecommunication union, no of mobile phone subscriptions are more than total number of people on earth. By the end of the year 2018 mobile-cellular subscriptions touched the mark of 8 billion. In developed countries saturation rate is reached, with only modest growth in the last five years, but growth in developing countries is sustained ¹. Mobile phone text messaging shows strong potential as a tool to achieve optimal health care. The biggest advantage of text messaging lies in its being asynchronous, as it can be accessed at any time that is convenient to a subscriber. Furthermore, even if a phone has been turned off, messages get delivered when the phone is switched on again² inexpe nsive, and instant. This systematic review provides an overview of behavior change interventions for disease management and prevention delivered through text messaging. Evidence on behavior change and clinical outcomes was compiled from randomized or quasi-experimental controlled trials of text message interventions published in peer-reviewed journals by June 2009. Only those interventions using text message as the primary mode of communication were included. Study quality was assessed by using a standardized measure. Seventeen articles representing 12 studies (5 disease prevention and 7 disease management.

Research evidence has shown that mobile technology is found to be beneficial in dietary and weight management³,⁴, physical activity involvement⁵,⁶ and asthma control⁷,⁸ along with diabetes management. Diabetes management is multifaceted task requiring education about glucose monitoring, lifestyle modification like weight management, exercise and diet and also managing diabetes complications and review of all medication

details, all these regimens take considerable time in the restricted clinic visit. This requires continuous communications between the healthcare providers and patients for successful management, especially in those patients who have difficulty in controlling their diabetes. The use of telemedicine and mhealth systems can facilitate communications between patients and their medical team for better training on corrective actions that can be taken and generic messages include topical "newsletters" and anonymized tips from other participants. The system also allows patients to submit data and questions to the diabetes care team.

**OBJECTIVES:** The aim was to explore how patients with type 1 diabetes interact with the Sweet Talk system in order to understand its utility to this user group.

**METHODS:** Subjects were 64 young people with diabetes who were participating in the intervention arms of a randomized controlled trial. All text messages submitted to Sweet Talk during a 12-month period were recorded. Messaging patterns and content were analyzed using mixed quantitative and qualitative methods.

**RESULTS:** Patients submitted 1180 messages during the observation period (mean 18.4, median 6).

Non-adherence is a serious challenge to chronic disease management with an average adherence rate of only 50% among patients with chronic diseases.

In 2014 the global prevalence of diabetes was estimated to be 8.5% among adults aged 18+ years. Because of the seemingly ubiquitous nature of mobile phones, many researchers and healthcare providers have used mobile phones as a way to educate or help people to manage their diabetes which will be reviewed in the current review article.

The capacity of mobile technology is touching new heights. Current technologies are facilitating low cost interventions. There are potential economies of scale due to its ease of use and ease of providing large scale intervention for large populations [recent examples are high use of mobile application, large scale distribution of useful messages]. Mobile technologies which are utilized most often are text messages (SMS), mobile applications, and multiple media [MMS and photos] interventions. These technologies supports interaction between healthcare providers and patients, which allows people to obtain extra help when needed.

Existing review studies on mhealth interventions gives attention to areas like application of specific devices e.g., mobile phones, or specific functions of the mobile phone e.g., text messaging can be individually tailored, and allows instant delivery with asynchronous receipt, suggesting potential as a delivery channel for health behavior interventions. Evidence acquisition: An electronic database search was conducted for studies published between January 1990 and March 2008. Studies were included in the review if they (1) or individual diseases or different disease management e.g., diabetes care or chronic disease management.

The objective of this review is to evaluate the evidence on the impact of SMS technology based intervention in improving health outcomes, processes of care and behavior change for persons with type 2 diabetes.

**Method: Data Source**

A comprehensive electronic literature search was conducted, and articles published till 2018 were included, using Google Scholar [Google, Mountain View, California], and PubMed [US National Institutes of Health’s National Library of Medicine NIH]. Studies from 2004 to 2018 were included in the review. The following search terms were included in various combinations: type 2 diabetes, phone, cell phone, mobile phone, text, text message, short message service, SMS, mhealth, health behavior, prevention, intervention, adherence.

**Inclusion and Exclusion criteria**

Inclusion criteria required that studies be randomized, non-randomized, quasi-experimental controlled trials or pre-post interventions for diabetes management, in any population, that used text messaging as the primary mode of intervention. Studies were required to measure the impact of text message interventions by assessing change in health behavior, health outcomes, and/or clinical outcomes using pre/post-tests. Additionally, studies had to be published in a peer-reviewed journal.

Studies utilizing communication technologies other than mobile phone text messaging, such as the Internet, e-mail, phone calls, or video messaging, were included only if text messaging was the primary mode of communication and the other technologies were supplementary. Review articles, study protocols and
commentaries were excluded.

**Result**

The earliest year of publication of study which is included is 2004. The sample sizes taken in the studies ranged from 18 to 955. Studies took place in several countries including Spain, S. Korea, U.S.A, New Zealand, Bahrain, Iran, Saudi Arabia, Philippines, Netherlands, Senegal, Democratic Republic of Congo, Philippines, Cambodia, Egypt, India, and Bangladesh. Patients were recruited from primary, secondary, and tertiary health care centers. On reviewing it was found that based on SMS the interventions could be divided into three categories which are as follows:

**Reminder Messages:** Patients often experience difficulties in following the recommendations provided by health care providers. Adherence to oral anti-diabetics is reported to be in the range of 36% to 93%\(^{25}\). Though reasons for not following a particular regimen are diverse but the most commonly discussed barrier is forgetfulness\(^{26,27}\). If patients get reminders about following their diabetes management it could be of immense help\(^{28,29}\). Several interventions were given to the patients which were found to be useful in increasing medication adherence, self-monitoring of blood glucose and adhering to daily healthy regimen.

In a study conducted by Roca et al. (2004) a web based server was created which was capable of receiving and displaying patients data. In this server patients can enter their daily measurements [eg blood glucose levels, body weight etc] using their mobile phones. Pre-recorded acknowledgements sent to their phones in addition 5 more messages were sent about their monthly HbA1C value, message with advice, automatic reminders and warning messages (total 25 messages)\(^9\).

Similar system was developed by Dick et al. (2011) SMS-DMcare, this was basically a reminder system which reminds patients about their medication, blood glucose monitoring, foot care and appointments with their healthcare providers. The purpose of this study was to investigate the feasibility of using short message service in assisting self-management of diabetes\(^30\).

Fischer et al. (2012) developed a software platform, this system sent text messages prompts requesting fasting blood sugar values for three fixed days in a week and send appointment reminder messages to patients three times in advance. The objective behind this intervention was to assess the feasibility of involving adults having diabetes, in self-management behaviors between their two clinic visits by using cell phone text messaging to provide blood sugar measurement reminders and appointment reminders\(^31\).

Vervolet et al. (2012) developed a real time medication monitoring electronic medicine dispenser which is equipped with a GSM system. Every time a SMS is sent to the patient, when the dispenser is not opened within prescribed time, reminding patients about their missed medication. This greatly helped in adhering to medication\(^12\).

**Messages For Treatment Assistance:**

Combination of world wide web and mobile phones SMS features is found to be very efficient in providing individualized care to the patients. Increasing the patient-healthcare provider contact have the potential to increase the adherence from the side of patient and ease of providing care from the side of healthcare provider. In the following studies the system was created which worked like virtual clinic which provided real time individualized care to the patients.

In a study conducted by Kwon et al. (2004), researchers developed an intervention in which a specialized web based diabetic patient management system was created. In this system all the medical history along with socio-demographic details and other information like smoking and alcohol history of patients was stored. During the study all the patients could contact their healthcare provider through specialized electronic chart on the web and they also sent their self-monitored blood glucose levels, medication dosage and hyper and hypoglycemic events. In return physician sent back recommendations via SMS on drug adjustment, dietitian and nurses sent recommendations related to medical nutrition therapy and exercise. The period of the intervention was three months. Biochemical measures changes seen after the intervention\(^23\).

Another study was conducted by Kim et al. (2007), in the study was conducted to see the effect of text messaging on plasma blood glucose levels of diabetic patients for the period of six months. In this study also a website was developed in which all medical and other
relevant history of patients were recorded in the software system. Patients could access the website and need to enter their daily blood glucose value, drug information etc. in the system. Optimum recommendations based on these inputs were sent by researchers via SMS weekly to the patient. For eg messages like, ‘Please add one tablet of sulfonylurea in the evening’; ‘Lack of exercise may be the cause of the aggravated glucose level’. This six month intervention consisted of continuous diabetes education and suggestions related to diet, physical activity, medication and self monitoring of blood glucose.

Same interventions were given by Kim et al(2006) for 12 weeks , Kim et al(2008)6, 9, and 12 months. Methods: This is a quasi-experimental design with pre- and follow-up tests. Participants were recruited from the endocrinology outpatient department of tertiary care hospital located in an urban city of South Korea. Eighteen patients were randomly assigned to an intervention group and 16 to a control group. The goal of the intervention was to decrease body weight and keep blood glucose concentrations close to the normal range. Patients were requested to record their blood glucose level in a weekly diary on the website by personal cellular phones or computer internet. The researcher sent optimal recommendations to each patient, by both the cellular phone and the Internet weekly. The intervention was applied for 1 year. Results: Glycosylated hemoglobin (HbA1c and Yoon et al(2008) for 1 year each.

Faridi et al.(2008) developed an interactive informational feedback system called NICHE [Novel Interactive Cell-phone technology for Health Enhancement] which used wireless remote technology to provide tailored feedback and reminders, based on patient specific data to patients via SMS. In this the patients were required to upload their fasting blood glucose and pedometer reading daily on NICHE server in response to that they received tailored messages related to HbA1c, BMI, blood pressure, physical activity, diabetes self-care and self-efficacy.

In an intervention given by Hussein et al (2011), a new approach was introduced to increase interaction with healthcare provider. In this case control study the intervention group was provided with two mobile numbers one of the clinician [SMS-MD] and other of a diabetes educator [SMS-DE]. The patient could send unlimited SMSs to both of them between the clinic visits. The main objective was to solve the problems of patients in anytime anywhere manner and give individualized care. Patients asked questions about sick days, travel days, hypo and hyper glycemia, dietary advice etc. the healthcare providers replied efficiently and solved their problems.

**Educational and Motivational Messaging Intervention**

Diabetes self-management education and support (DSME/S) provides the help to people with diabetes to make their decisions and do such activities which has shown improvement in health outcomes. “Diabetes self-management education (DSME) is the process of facilitating the knowledge, skill, and ability necessary for diabetes self-care. Diabetes self-management support (DSMS) refers to the support that is required for implementing and sustaining coping skills and behaviors needed to self-manage on an ongoing basis.” Several interventions were given which helped in imparting diabetes education to the patients.

Shetty et al,(2011) developed an intervention in which the intervention group received SMS once in 3 days as a reminder message to strictly adhere to dietary modification, physical activity and medication adherence. The messages consisted of instructions relate to medical nutrition therapy, physical activity and medication adherence. Messages on healthy living habits were also sent.

A uni-directional text message intervention was also developed by Arora et al (2012) in which the main focus was on increasing the motivation of patients along with increasing self-efficacy and their ability to adhere to self-care activities. The messages were categorized in four categories, first being the educational or motivational messages related to blood glucose control, healthy eating, foot care, heart care etc. messages like “Controlling your blood glucose, blood pressure, and cholesterol—can mean a longer and healthier life,” and “Eat more fruits, vegetables, beans, and whole grains and less salt and fat.” Second type medication reminder messages, third type of messages were categorized as healthy living challenges in which small challenges were given and fourth type is trivia messages which were in the form of questions and answers to increase the knowledge of patients and to engage them.
Goodarzi et al. (2012) conducted a similar study in which their main objective was to educate the patients about their disease via SMS feature of mobile phone. In this intervention 4 messages were sent per week containing information related to knowledge, attitude, behavior and self-efficacy in type 2 diabetes. In an intervention by Abbas et al. (2015), 5-7 educational messages were sent per week which covered the areas like general diabetes care knowledge like its signs and symptoms, diet related information, psychotherapy and latest new related to diabetes management. These messages were also considered as reminders for medication adherence self-monitoring of blood glucose.

Similarly, in an intervention conducted by Islam et al. in Bangladesh, over the period of 6 months 90 messages were sent. These messages were educational messages and the content was revolving around medication reminders, education of diabetes and its complication and raising awareness about dietary management and physical activity. The purpose was to measure the impact of SMS on newly diagnosed type 2 diabetes patients. In a recent intervention given by Dobson et al. (2015) to assess the usability and acceptability of SMS as a tool for properly managing poorly controlled diabetes, a program called SMS4BG was developed. This program was developed to help adults whose blood glucose was poorly controlled. In this intervention several modules were developed on different areas of diabetes management. The messages in different module ranged from 2-5 and were based on diabetes education, perception of illness, emotional encouragement to control blood glucose well. Also modules were covering the area of smoking cessation and other topics like diet and exercise. The patients got the option to choose one or more modules and receive messages base on their choice with the support of health care providers, is critical for successful outcomes, however, frequent clinical contact is costly. Text messages via short message service (SMS).

In a study conducted by Patnaik et al. (2015) stress management was done via text messages in type 2 diabetes patients. In this text messages related to stress management were sent to the patients.

**Outcome Measures**

Intervention length ranged from four weeks to two year, and, for all studies conducted data was collected at baseline and immediately after the intervention. Some studies included intermediate follow-up times, but none had long-term follow-up that extended beyond completion of the intervention. Mostly the studies were Randomized control study & Few studies were Pre-post.

Outcome measures were many but mainly there were 4 type of outcomes:

**Biochemical Measures**: it was utilized most as the indicator for success of the SMS based intervention. Change in Value of HbA1c from baseline to intervention period & variation between intervention group & control group. Change in HbA1c levels were measured in 19 studies (Fig. 2). In 19 studies difference in the mean percentage change of HbA1c before and after intervention in the intervention and control groups was the most observed parameter to measure the effect of intervention. The minimum and maximum difference reported in the intervention group was -0.41 and -1.7 respectively. Statistically significant decrease was observed in HbA1c levels in 12 studies. Seven studies did not show any significant decrease in mean HbA1c.

</table>
Other biochemical parameters were Fasting & Post Prandial blood glucose24,34,35 Serum triglycerides23,41.

2. Compliance & adherence: Compliance to the intervention or to the Diabetes management regime was another parameter which was measured in many studies, stress level44 was also measured and managed in a study conducted by Patnaik et al(2015), adherence to diet and physical activity 49.

3. User satisfaction: Another important parameter which was measured was user satisfaction with the intervention, frequency of messages sent and the information sent through messages was assessed9,23,30,36,37,40,43,46,47,50–53.

4. Change in knowledge, practice & self-efficacy—many interventions apart from biochemical parameters also assessed change in the knowledge, practice or self-efficacy of the patients30,36,41,42,47,53,54.

Though mostly earlier studies shown positive impact of text message based intervention but many studies of later times did not show statistically significant result as far as HbA1c is concerned36,42,51–54, but those studies were acceptable when it comes to user satisfaction & behavior change.

Discussion

Maintaining healthy lifestyle in type 2 diabetes patients is fundamental for their healthy life. Mobile phone technology is found to be very useful in interventions where the target is changes in behavior and lifestyle, and are particularly associated with chronic diseases management. This study reviewed thirty-two studies that assessed the effect of interventions which uses SMS feature of mobile phone for the management of type 2 diabetes. It provides evidence that there is a significant effect of mobile technique on type 2 diabetes management.

The main contribution of the present review is that it provides the current state of mHealth based studies using SMS, and the findings are based on interventions given in different countries. Among the studies reviewed, randomized controlled design was the most applied study design. This design enhanced the comparability of the outcomes. Also, quantitative measures were used in most of the studies for key outcomes, which are HbA1c, blood glucose values, change in knowledge, practice & self-efficacy of patients. Several scales were used in many studies to measure the change in knowledge, attitude, behavior and self-efficacy, medication adherence & physical activity levels of the participants. Many interventions were checked for its feasibility and usability. User satisfaction with the intervention was also used in many studies.

Many healthcare providers and organizations are searching for cost-effective ways of providing high-quality healthcare to patients, and using mobile phones may prove to be one effective strategy. However, cost issue was mentioned in one of the studies9. The SMS technology is useful because mobile phone penetration is very high across the world especially in developing countries1. It is also evident that the technology is easy to use2. Now-a-days mobile phones are available which works in local languages too, it is even more helpful because that will curb the limitation of language faced by several patients55.

Despite the strengths of mobile phone technology in type 2 Diabetes management, there are some potential limitations which should be taken into consideration while interpreting the results. One is that many studies have small sample size and are pilot studies though showing positive results the same findings cannot be expected for the large population. Large studies are required to prove the positive outcomes more strongly.

Another drawback related to these studies is that the interventions are of not very long durations except some, which are of 1 year 34,35,39 & one intervention was of 2 year56 which did not show any significant result. Most interventions are of duration around 3 months and some are as short as four weeks30. Mobile based interventions are quite new in its origin and most studies are still in exploratory stage. Its potential needs to be exploited more with large scale studies and long duration interventions.

SMS based intervention relies heavily on the willingness of the participant, that is, it is working more towards the behavioral changes which bring several limitations to it. For mobile phone technology to be effective, continuous compliance and adherence is very important. It is essential for it to be very flexible keeping in view the requirements of the patients. In some studies it was found that type of intervention which was given
was difficult for patients to handle and additional training was required24,36.

Although new opportunities are promised by mobile phone technology to reach Type 2 diabetes patients anytime and anywhere, mobile health interventions may result in the exclusion of some populations like those who are illiterates or don’t have access to a mobile phone 2.

The current review paper is done by the authors in search for the relevant literatures. Some studies might have been missed due to limitations of search source. This limitation may lead to some selection bias. Further studies should be continued to confirm the findings.

Mobiles are advancing rapidly and are ubiquitously available at low cost overcoming the limitation of stationary computers to deliver information on demand with flexibility and convenience for people on the move2.

Overall the study results suggested that SMS may provide a simple, fast, efficient and low-cost adjunct to the medical management of diabetes at a distance.

**Conclusion**

The purpose of this review is to evaluate the contribution of SMS based intervention in the management of type 2 diabetes. In this review most studies were based on the utilization of SMS feature of mobile phone in communicating the healthcare information to individuals saving time and money and proper one to one based communication. SMS based information caters the need of personalized healthcare which is particularly required in chronic disease like diabetes. After reviewing the available data, it can be concluded that SMS based interventions are potential tool, for the management of Type 2 diabetes.

Research Paper

A Study on Quality of Life among Working and Non Working Married Women

Ishita Mukerji1, Mamata Mahapatra2

1Research Scholar, Amity institute of Psychology and Allied Sciences, Amity University Noida U.P,
2Professor, Amity Institute of Psychology and Allied Sciences, Amity University Noida, U.P

Abstract

The objective of the research study was aimed to examine the significant difference in the quality of life among non working married women and working married women. The motive of of studying about the non-working and working married women because of the leading unsuccessful, stressful, juggled life of the women post marriage. Both career women and homemakers have to perform many responsibilities which includes taking care of the household chores, family and office work. Quality of life scale by B.L Dubey were used in the research study and keeping in view the objective of the study, an empirical investigation was undertaken and thereafter data were formulated & evaluated by the T-test and ANOVA test The sample of the study consisted of 100 married women (50- career women and 50-homemakers). Their age ranged between 25-40 years and the research has been done in Delhi NCR. The study reported that working married women have a better quality of life as compared to non working married women.

Keywords: quality of life scale, non working married women, working married women

Introduction

The term personal satisfaction (QOL) references the general prosperity of people and social orders. The term is utilized in a wide scope of settings, including the fields of global improvement, medicinal services, and legislative issues. Personal satisfaction ought not be mistaken for the idea of way of life, which depends principally on salary. Rather, standard markers of the personal satisfaction incorporate riches and business, yet additionally the fabricated condition, physical and emotional well-being, instruction, amusement and recreation time, and social having a place. While Personal satisfaction (QOL) has for some time been an express or understood approach objective, satisfactory definition and estimation have been slippery. Differing “objective” and “emotional” pointers over a scope of controls and scales, and late work on abstract prosperity (SWB) reviews and the brain science of bliss have prodded intrigue. Likewise as often as possible related are ideas, for example, opportunity, human rights, and satisfaction. Nonetheless, since bliss is abstract and difficult to gauge, different measures are commonly given need. It has additionally been demonstrated that bliss, as much as it tends to be estimated, does not really increment correspondingly with the solace that outcomes from expanding salary. Subsequently, way of life ought not be taken to be a proportion of joy. Likewise in some cases considered related is the idea of human security, however the last might be considered at a progressively essential dimension, and for all people. The choice to drive is frequently a choice to offer need to business related qualities. In the event that suburbanites have been fruitful in accomplishing their work targets, they would anticipate that them should be more happy with their work life than double profession respondents who may have made vocation bargains (Green and Zenisek).
The driving way of life gives the chance to extraordinary focus and additional time at work by the partition of work and non-work life (Shelter and Vanderslice; Farris). Relationship, family life, and individual time fulfillment. Eye to eye association while living in a similar living arrangement is expected to encourage passionate closeness and lucidity in family life (Kirschner and Walum). The estimation of personal satisfaction (QOL) frames an imperative proportion of result, which is reliant on the abstract appraisal of a person’s wellbeing and prosperity (Wilkinson et al.,) and identifies with those parts of a person’s life that sway legitimately upon their wellbeing (Patrick and Erickson,.). The significance given to this vital proportion of psychosocial working can be best summed up by the World Wellbeing Association (WHO) as a “people’ impression of their situation in life with regards to the way of life and esteem frameworks in which they live and in connection to their objectives, desires, benchmarks and concerns” (The WHOQOL Gathering).

The term working couples has been first developed by Rapoport and Rapoport (1976), and refers to a particular sort of working couples in which the two individuals seek after an expert profession and want work-related improvement. Working couples, then again reflect more an essential as opposed to a desire to work. In other words, working couples work with a specific end goal to acquire a family wage and their inspirations are essentially determined by money related rewards as opposed to a requirement for self-satisfaction.

Aldous (1982), pointed out that utilizing the working couples phrasing would involve that women’s voluntary work in the household is not “genuine” work. In spite of the fact that the usage of the term dual earner has perceptible worth, the term working couple was used in this exploration Gorissen, (2009). Likewise distinguished four general kinds of working couples: accommodators, acrobats, opponents, and partners. These four kinds are described by either high or low inclusion with family and profession issues Hall (1980). Dual working workers find themselves in a consistent manipulating act to associate work and family request. To exacerbate the situation; the careers of both partners are exceptionally interrelated and working decisions and experiences of each accomplice are probably going to influence the other Parker and Arthur, (2004). His challenge for working couples is to coordinate two independent journeys and to to guarantee that each adds to the achievements of the other. The most every now and again referred to issues by working couples are work-family struggle division of work for family unit activities Greenhaus & Beutell, (1985). A female contribution and movement has improved working couples, the female need to keep up the work, family unit, and child care duties together, makes work and family part strain King, (2005).

Both partners of working couples may advantage from the status of „dual-workings,“ aside from the challenges experienced. A favorable benefit for such a family is an expanded way of life Green & Zenisek, (1983) because of the most prominent family wage through a twofold paycheck Gorissen, (2009). Lee (1980) set that working couples confront numerous issues as they have to assume an excessive number of roles with an excessive number of demands on time and vitality. Working couples find it a continuous juggling act to syndicate both family demands and work Gorissen, (2009), and therefore experience work-family struggle; a struggle in the relationship amongst family roles and work.

According to Shiju Joseph and Anand Inbanathan (2016), one of the foundational connections that has experienced considerable changes as of late in India is the bond between wedded couples. A concurrent change with extensive outcomes is the new found spotlight on profession among women. The interface of career and home has offered to meet people’s high expectations that impact the quality of the couple’s relationship. In this specific circumstance, the paper looks to comprehend the couple relationship of wedded experts from a sociological viewpoint in an Indian urban setting. The dual career couples circumstance outfits convincing proof of the expanding educational and career goals of women. A critical extent of these women in the workforce involves spouses and moms whose business status will request a huge change in their example of activities, duties and obligations, requiring a reassessment of the family condition Henry and Parthasarathy, (2010). Working couples likewise go up against everyday difficulties with respect to the household activity management, Anderson & Spruill, (1993). Household activities, for example cleaning, shopping, cooking, and doing laundry are generally done by the women in a
family. On the other hand, in working couples, females have less time to do these important exercises identified with the family Neault & Pickerell, (2005).  

**Review of Literature**

In quality of life, a significant difference found between working married women and non working married women because quality of life means having an interesting job to go, feeling safe, confident and happy with it, feeling close to the people who share with life, having fun and loving life, all these are important to be happy life. It is also meant to have the freedom to choose things people wish.

In a study examined by Bunker and Barbara B in 1992 in relation to the quality of life of couples in two types of dual-career families initially gave out the following results. Individuals belonging to the 90 commuting and 133 single residence dual career couples were distinguished on the basis of the factors of satisfaction and stress. Commuters were much more satisfied with their work life and with the time they had for themselves, and were dissatisfied with family life, with their partners relationships, and conclusively with life as a whole. The commuters did not report on experiencing a more stressful lifestyle than did the single - residence dual-career career respondents, and the commuters reported significantly less overload than the others.

There were no significant interactions of gender with dual-career family type of measures of either satisfaction or stress. Among commuters, there were no significant differences in self-reported satisfaction or stress among those who traveled and those who stayed at the primary residence, and there were no Commuter Role (traveler vs. non traveler) x Gender interactions. It was concluded that the commuting lifestyle can have both rewards and costs, and that in some ways single-residence dual-career lifestyle may be more stressful and dissatisfying. This study compared the quality of life in commuting couples and in dual-career couples who live together in a single residence. To examine the benefits and the costs of these two lifestyles, chose to focus on satisfaction and stress as quality of life indicators. Previous studies of commuting couples have not empirically compared commuter couples to other types of couples (Bunker & Vanderslice, 1982; Douvan & Pleck, 1978; Farris, 1978; Gerstel, 1977; Gerstel & Gross, 1981, 1984; Gross, 1980; Kirschner & Walum, 1978). Rather, the self-reported satisfactions and stresses of commuting couples have been accepted at face value without appropriate comparisons.

Brendan Fisher et al (2007) this article demonstrates that Enhancing Quality of Life (QOL) has long been an explicit or implicit goal for individuals, communities, nations, and the world. They relate QOL to the opportunities that are provided to meet human needs in the forms of built, human, social and natural capital in addition to time.

Rahman and Asaduzzaman (2008) an Author, examined the study was correlate between mental health and marital adjustment of middle class employed married women and housewives. The sample of the following research consists of middle class women. The data was collected by using dyadic adjustment scale of Spancer and General Health Questionnaire of Goldberg. The result indicated that the mental health of the employed married women was significantly higher. Moreover, marital adjustment of employment women was significantly higher than house-wives.

In a research conducted by Gani et al in 2010, it was studied that what were the causes, consequences, and correlates of working family conflicts among dual working women. By the results it was found that there were many factors which contributed in making the role conflict of working women a reality. It was seen that the phenomenon of marital adjustment was given.. marriage being a priority in all cultures, is one of the most important commitment of an individual made in his or her life. Marital adjustment has always been related to age, job status, type of marriage, place of stay and home stresses, mental illness, depression, education, sex role attitude, happiness, success in life and many other factors.

**Methodology**

**Aim**

The present research aim is to study the Quality of Life of Working and non working married women

**Hypotheses**

There will be a significant difference in the quality of life of working and non working married women.
There will be a significant difference in satisfactory and satisfying dimension of quality of life among working and non working married women

Sample

A total 100 Married women of 25-40 years age has been taken for the proposed study out of which 50 were working married women and 50 were non working married women. Respondents were taken from Delhi-NCR

Design

Considered the most appropriate method for this research was survey method. Questionnaires and the personal interview method were adopted to conduct the survey.

Instruments

SPSS tool and excel sheet were used. The Quality of Life scaleby B.L Dubey is a standardized tool used for measuring the extent of quality life among working married women and non working married women. The Quality of Life Questionnaire comprises of 25 (twenty five) extremely discriminating “Strongly Agree” “Agree” “Undecided” “Disagree” and “Strongly Disagree” kind of questionnaire were there to locate the quality of life of the respondents.

Procedure

In the study the researcher formed a good rapport before with the participant through personal interaction before filling up the questionnaire to make the participant comfortable. The data for working respondents was collected from private service organizations such as corporates, schools, banks and IT institutes of Delhi NCR and the data for non working respondents were contacted at their residence or at a general place and brief them regarding the research study. The respondents were asked to fill-up all the statements by following the instruction given in each of the questionnaire and were briefed about the objective of the study, its significance and importance of their responses in this study. After the completion of the questionnaire paper the participants were appraised for cooperation and help in the study.

Result and Discussion

In the initial step, mean and S.D., for every variable was put under measurable examination, at that point, higher statistical processes were begun in which, T-test & ANOVA were taken. Results are presented in the mentioned below tables. In comparison, significant difference was found.

<p>| Table. ANOVA scores of Quality of life Scale in non-working married women and working married women |

The data depict analysis of variance between non-working married women and working married women. All the dimensions (satisfying, satisfactory) of married women showing the p values and their significant level that indicating a significant difference between the working married women and non-working married women lying at 0.01 levels and 0.05 levels. Quality of life with working and non working women differs with each other and it depends not only upon wealth and employment, but also the built environment, physical and mental health, education, recreation and leisure time, and social belonging. The part of working women has changed all through the world because of financial conditions and social requests. This has brought about a situation in which working women have colossal strain to build up a career as strong as their male partners while managing dynamic engagement in individual life. Overall working women enjoying Quality of Life better than non-working women.

**Conclusion**

The present research determine: the study about the quality of life in working married women and non-working married women and there were two dimensions to analysis the quality of life, i.e., satisfying and satisfactory. This study portrays that working married women have a better quality of life and has a better lifestyle as compared to non working married women.

**Ethical Clearance** – This is a part of Supporting Ph.D research work and ethical committee wing is not applicable for this research.

*The result is significant at the 0.05 level

**The result is significant at the 0.01 level.

Management of a Mandibular Second Molar with a C Shaped Canal Using Canal Mapping and Continuous Wave of Condensation Techniques -A Case Report

Karthik Shetty1, Bettina Ashwini Vergis2, Kartik S Nath

1Additional Professor, 2Post graduate Student, Dept. of Conservative Dentistry & Endodontics, Manipal Academy of Higher Education, Manipal, Karnataka, India

Abstract

Cone Beam Computed Tomography has proven to be an indispensable tool in Endodontics in recent times. The three dimensional visualization has aided in predictable management of teeth with complex canal anatomy. In this case report, a non-vital mandibular second molar with a C-shaped canal configuration was subjected to CBCT analysis. The images were then used to create 2-D and 3-D canal mapping for a meticulous reproduction of the canal intricacies. After canal instrumentation, thermoplasticized obturation was done using Continuous wave of condensation technique. This case report stresses on the importance of contemporary technology for precision in dentistry.

This case report demonstrates the value of CBCT, 2-D and 3-D canal mapping as well as Continuous Wave of Condensation technique of obturation in the management of teeth with C-shaped canal configuration.

The purpose was to describe a standardized and precise method of mapping the complicated C-shaped canal anatomy using CBCT. This also highlights the importance of Continuous wave technique of obturation as a predictable technique to three-dimensionally seal the C-shaped canal system.

Keywords: Cone Beam Computed Tomography Shaped canals, Continuous wave of condensation.

Introduction

Complete filling of root canals after shaping and cleaning procedures is the main objective of root canal therapy. Successful endodontic treatment needs proper knowledge about aberrant root canal systems. The root canal anatomy has been studied for a long time now. One of the first pieces of work was done by Hess and Zucker way back in 1925 called ‘The anatomies of the root canals of the teeth of the permanent and deciduous dentition’. We have come a long way since then in terms of knowledge and the technologies available to study this small intriguing space. C-shaped configuration is one of the most important anatomic variations of the root canal system.

C-shaped canal morphology, which was first documented in endodontic literature by Cooke and Cox in 1979, has been reported with an incidence rate of 2.7% to 44.5% in mandibular second molars. The instrumentation and obturation of these canal spaces is always a challenge. Melton first classified C-shaped canals in 1991. Fan later modified this classification in 2004. Fan provided two classifications, namely the anatomic and the radiographic classification. Yhe incidence is rare in white populations and is common in mandibular second molars of Chinese and Lebanese populations. One interesting fact is that the presence of a C-shaped configuration in a tooth is accompanied...
by a contralateral occurrence with a high percentage of around 70%.  

**Case Report**

In this case report, a female patient, aged 40 years, reported to the department of Conservative Dentistry and Endodontics with pain in the lower left back tooth region. On examination, deep Class V caries was observed with respect to the lower left second molar (LL7). IOPA revealed radiolucency involving the pulp. Pulp vitality testing revealed no response to cold test, heat test and a delayed response to EPT.

Based on the history and clinical findings, a diagnosis of symptomatic apical periodontitis associated with pulp necrosis was inferred. Access opening was done and a C-shaped canal was detected. A CBCT was advised to plan the further treatment. CBCT revealed a C-shaped canal configuration which had a distobuccal apical exit. This was a C1 configuration according to Fan’s classification with a single C-shaped canal from the orifice exiting through single buccally placed apical foramen. A detailed examination of the CBCT was done and a schematic diagram of the root canal space was made to create a 2D canal map for better visualization of the canal anatomy at various cross-sectional levels (Fig 1). The CBCT image was then subjected to digital coloring of the root canal space (Planmeca Oy, Helsinki, Finland) in order to create a detailed image of the extensions of the root canal. This visualization of the volume and marginal extensions of the canal by CBCT 3D mapping (Fig 2), was of enormous help in tackling the variations within the canal space during the obturation phase. It made the obturation more predictable and accurate as compared to random application of pressure during the vertical compaction of thermoplasticized gutta-percha.

Root canal instrumentation was done along with copious irrigation using a combination of saline and sodium hypochlorite over two appointments using iRaCe system (FKG Dentaire, LaChaux-de-Fonds, SA, Switzerland). Obturation was done with the Continuous wave obturation technique using the Elements obturation unit (Sybron Endo, USA). The canal was coated with Bioroot RCS sealer (Septodont, USA) and a size 35/.04 taper master gutta-percha cone (Dentsply Maillefer, Ballaigues, Switzerland) was inserted into the canal till full working length.

A prefitted Buchanan heated plugger (Kerr Dental, USA) attached to the Elements obturation unit was driven smoothly through the Gutta percha, to within 5 mm of the binding point. After releasing the switch, firm apical pressure was applied for 5 seconds to prevent cooling shrinkage. One second of separation burst was applied after which, the electric plugger was withdrawn. This completed the down pack. The thermoplasticized Gutta percha was injected in 2 phases of 4- to 5-mm thick layers, into the root canal space during the backfilling using the Elements obturation unit. Pre fitted Buchanan hand pluggers (Kerr Dental, USA) were then used to pack the apical gutta-percha plug as well as the following layers of thermoplasticized gutta-percha. Heated gutta-percha was compacted with a Buchanan hand plugger size 1 at the first phase and size 2 at the second phase. The access cavity was then sealed off with composite (3M ESPE, USA) in preparation for the subsequent crown.
FIG 1: 2D Reproduction of the canal space.

FIG 2A and 2B: 3D rendering of the c-shaped Canal.

FIG 2B: 3D rendering of the c-shaped Canal.

FIG 3A: Pre operative-Axial section of coronal third of the canal (7.5 mm from the apex).

FIG 3B: Post operative-Axial section of coronal third of the canal (7.5 mm from the apex).

FIG 4A: Pre operative-Axial section of middle third of the canal (5 mm from the apex).

FIG 4B: Post operative-Axial section of middle third of the canal (5 mm from the apex).
Discussion

There are several ways to obturate root canals. The lateral compaction technique is the most commonly used technique. Despite the fact that a large number of accessory gutta-percha cones are used in C-shaped canals, it has been reported that their radiographic appearance has less density than normal root canals. The gutta-percha does not fill the narrow connecting areas of the C-shaped canal system. Heat softened solid core carriers are quite effective but unpredictable and a single obturator is often unable to fill the canal completely, creating the need for more than one obturator. The injectable cold filling method consists of a gutta-percha and sealer combination in an injectable system, which has cold, fluid, and self-curing filling material. These are more useful as sealers than as stand-alone obturation solutions for total filling of the root canal spaces. In the present case, Continuous wave of condensation technique has been employed using Elements obturation unit.

The continuous wave of condensation technique was introduced in 1987 by Buchanan with an aim to simplify obturation. In this technique, one single pre fitted heated plugger is used to shear off Gutta-percha up to 5mm from the apex during down-pack, followed by back fill with thermoplasticized Gutta percha. Buchanan hand pluggers of larger sizes are then used to further condense the softened Gutta percha and create a dense pack. The application of heat and apical pressure to a well-adapted master gutta-percha cone will also create hydraulic pressure within the canal. The hydraulic pressure created, will in turn move the heated gutta-percha and sealer apically and laterally to further seal canal irregularities.

Previous studies have shown that thermoplasticized gutta-percha is more appropriate for filling root canal abnormalities, but in C-shaped canals, divergent areas that are frequently unshaped may show resistance to obturation material flow. This particular disadvantage can be overcome by the continuous wave of condensation technique used in this case report by vertically compacting the warm plasticized gutta-percha into the narrow spaces within the root canal system.

Summary

The challenges that are typically faced when treating C-shaped canals have been addressed in this case report. The mystery of the canal variations has been unraveled for a more predictable treatment plan. The short comings of only using thermoplasticized gutta-percha is that in C-shaped canals, divergent areas that are narrow and difficult to access will show resistance to flow of the obturation material. Continuous wave of condensation technique helps overcome this. The ability of the clinician to understand the complexities of the clinical cases and usage of the latest available equipment will always result in optimal results.

Abstract

Introduction: Workplace health promotion is defined as prevention, minimization and elimination of health hazards and also maintaining, promoting working ability. Diabetes mellitus and Hypertension are chronic health illness which is increasingly becoming a major health issue in the present society. It is often reported that only half of the patients with chronic conditions adhere to the medications properly. It requires patient education to accomplish adequate control and avoid adverse health consequences.

Objectives: To promote health at workplace by improving medication adherence for Supporting staff with history of hypertension and Type 2 diabetes mellitus by counselling aided Patient information leaflet.

Methodology: A prospective interventional study was conducted among the supporting staff of Rajya Vokkaligara Sangha, Bengaluru for a period of 6 months. A total of 26 patients, were enrolled based on the inclusion criteria. Their blood pressure and random blood sugar level was measured in each follow-up. Four follow-ups were conducted every 15 days once. The patients were interviewed using MARS and were counselled. Obtained data was entered into MS Excel sheet and analysed. The statistical analysis was done using Chi square test with p<0.05.

Results: It was found that adherence level was low in the case of test group MARS scale presented only 30.76% of subjects were adherent. Fourth follow-up showed 83.33% of increased adherence level. Chi-square test value was 0.0016 (p<0.05) results statistically proved that there is significant difference in the adherence level between the follow-up. By the end of the study, there was a significant decrease in mean SBP, mean DBP; and RBS levels.

Conclusion: Thereby, by educating the participants about their understanding of the illness, importance of adhering to the medications, lifestyle modifications and dietary recommendation, there will be gradual increase in the adherence rate.

Keywords: Hypertension, type 2 diabetes mellitus, counselling, patient information leaflet.

Introduction

Health promotion in the workplace is defined as prevention, minimization and elimination of health hazards and also maintaining, promoting working ability of an individual. Illness at workplace can result in declined work rate which originates from two factors absenteeism and presenteeism. Health promoting activities at workplace directly correlates with the employee’s health augmentation, and decline in the health care cost. Rising rate of chronic diseases eventually combined with an aging workforce is making health promotional activities prioritizing, in any
organizational setup.

Chronic health diseases are enormously rising across all age groups, adding enormous burden to already high costs of health care. Older workers typically suffer from chronic disease conditions and have multiple health risks. Diabetes and hypertension are the highest burden of non-communicable diseases to the populations worldwide. According to WHO patients in low income and middle-income countries experience higher rate of morbidity from non-communicable diseases. As estimate 366 million and 1 billion people globally are living with diabetes and hypertension respectively. By 2020 prevalence of these diseases is expected to increase in between 13 and 30%.

Adherence to treatment, healthy lifestyle, physical activities, smoking, diet, and salt intake are important factors for effective management of chronic diseases. Different tools have been used to assess adherence and there is no particular gold standard to measure adherence. Standardized and self-reported questionnaires have frequently been used because they are low in both cost and time expenditure.

Patient counselling is also one of the strategic methods to improve adherence. One of the counselling aid is by providing information leaflet’s which explains illness, signs and symptoms, and further complications risk factors, and required lifestyle modifications. Counselling enhances patient understanding about illness, and also about using medications, nutritional diet to be followed accordingly all together put in place results in better therapeutic outcome and increased in quality of life.

Materials and Method

STUDY SITE

Prospective interventional study was conducted in the five different organizations of Rajya Vokkaligara Sangha, Bengaluru for a period of six months from November to April 2017-18. The study was approved by the institutional ethics committee Committee of Visveswarapura Institute of Pharmaceutical Sciences (VIPS), Rajya Vokkaligara Sangha, Bengaluru – 70.

STUDY POPULATION

INCLUSION CRITERIA; Supporting staff with a history of Hypertension and/or Type 2 diabetes mellitus for more than 6 months and on medication, aged above 40 years, either sex with no other co-morbidities and complications. He/she should be working as a full-time employee of Rajya Vokkaligara Sangha Bangalore.

EXCLUSION CRITERIA: Supporting staff who are newly diagnosed with hypertension and/or Type 2 diabetes mellitus and are less than 40 years of age and also who are not willing to give informed consent. Gestational diabetes and drug induced diabetic.

STUDY DESIGN

All the study subjects were the supporting staff working Rajya Vokkaligara Sangha were included based on inclusion criteria and they were considered as test group. The patient’s demographic were recorded in a self-designed data collection which includes information regarding their medications, past medication history and their family history, then respective tests were conducted accordingly to their diagnosis. Blood pressure was measured using standard sphygmomanometer and random blood sugar was measured using a high quality glucometer. The test group, during their first follow-up were counselled with a health information leaflet based on their diagnosis. Study population were explained about their chronic condition, signs and symptoms; its risk factors, complications, and life style modifications, essential dietary changes required, rationality of drug use that are essential for their condition and also according to their work schedule. The counselling was done in the local/native language. Each follow up was done once in every 15 days for two months. In each follow-up staff were counselled with further life style changes required for their condition keeping their previous counselling facts into consideration. MARS scale was provided in each follow-up to observe changes in their medication adherence level, and also to evaluate the impact of counselling influences participant’s medication adherence level and augments their health at work place.

STUDY INSTRUMENT

MEDICATION ADHERENCE RATING SCALE (MARS)

Standard medication adherence scale MARS was given to the study participant. Permission was taken for using the MARS SCALE. This scale is based on two already existing self-report measures of compliance. The first is the Drug Attitude Inventory (DAI) and the second
is the Medication Adherence Questionnaire (MAQ). These compliance measures have been combined to produce a compliance scale.

The MARS consists of 10 items that require yes/no responses. Score classified as adherent ranging from 6 to 10 scale points and as non-adherent ranging from 0-5 scale points.

**Statistical Analysis**

Collected data was entered in Microsoft Excel sheet and was analysed. Chi-square test was applied to prove statistical significance between the follow

### Results

Study included total number of 26 participant’s and their mean age 50.6 years out of which 65.38 % were males and 34.61 % were females. Study population were distributed based on their age and they were categorized into five different groups [Table1]. Study population were also distributed based on their educational status, diagnosis [table2]. Adherence level was low in the case of test group, 47.05% of study population falls under the blood pressure range of 140-159/90-99 mmHg, 35.29%, 17.64%, of study population falls under the range of >160/100 mmHg, 120-139/80-89 mmHg according to the JNC-7 classification, whereas about 73.33%, 26.66% of population showed random blood sugar value more > 200, < 200 mg/dl. MARS presented only 69.23 % of subjects where adherent to the medication.

In first follow-up 52.94% of population falls under the blood pressure range of 140-159/90-99 mmHg and 35.29%, 17.64%, of study population falls under the range of >160/100 mmHg, 120-139/80-89 mmHg. Study group under the category of RBS was 60%, and remaining 40 % of population displayed RBS value <200 mg/dl. MARS presented only 40% of subjects where adherent to the medication.

During second follow-up 47.05% of study population falls under the blood pressure range of 140-159/90-99 mmHg. There was significant decrease when compared to the first follow-up, 35.29%, 17.64% of study population drop down under the grouping of 120-139/80-89 mmHg, >160/100 mmHg. Study population under the sort of RBS value >200 mg/dl, <200 mg/dl was 53.64%, 38.47%. Based on the following results there was significant increase in the rate of adherence percentage i.e. 58.33% among when compared to the first follow-up.

Third follow-up 23.52% of population were under category of blood pressure category of 160/100 mmHg and 35.29%, 41.17% of population slope down under the blood pressure range of 140-159 mmHg, 120-139/90-99 mmHg. There was significant increase in the fraction, 75% of population having their of random blood sugar value under 200 mg/dl. In the case of third follow-up adherent percentage was significantly amplified i.e. 73.91% when compared to the first, second follow-up.

In the last follow-up there was significant decrease in blood pressure value and study population under the blood pressure range of 160/100 mmHg was decreased to 5.88% and 47.05%, 41.17%, 5.88% of study population were considered under the blood pressure range of 140-159/90-99 mmHg. Subjects underneath the category of <200 mg/dl, 200 mg/dl were 76.94%, 23.07%. In fourth follow-up 83.33% of subjects were adherent.

Data was entered in Microsoft Excel sheet and it was analysed. Descriptive analysis used to describe demographic details, disease characteristics and their medication adherent scores. Percentages and graphical representations were used to describe categorical variables such as demographic details, disease characteristics.

Chi-square test value was 0.0016 which was less than p<0.05 these results statistically proved that there was statistically significant difference in the adherence level between the four follow-ups. There was also graphically significant variation in mean systolic, mean diastolic, mean random blood sugar in among each follow-up. [Figure 1, figure 2, figure 3].

This proves that counselling the subjects regarding their chronic illness and suggesting lifestyle modifications to them based on their values of blood pressure and random blood sugar and also providing patient information leaflet to the study population has resulted in positive impact in increasing their adherence level, maintaining healthy life style and also helped in improving their health at work place.

Discussion

Two strategies were used for counselling the participant’s – one was using a patient information leaflet and other was using visual power point presentations. In the first three follow-ups they were counselled using a patient information leaflet. In the last follow-up presentations was done on hypertension and/or Type 2 diabetes mellitus because pictorial representations will have greater impact on participant’s and assist them to comprehend their condition in better way and also aids them to know the importance of life style modification in these chronic illness.

Among the study population 65.4% were males and 34.6% were females; indicating that hypertension and/or Type 2 diabetes mellitus affect both the gender, and considerably s male population being affected to a higher extent. In the study, adherence and strategies to improve medication adherence were identified as key factors for the medication management of hypertension and Type 2 diabetes mellitus. The different reasons behind the non-adherence was explained by participants [table 3].

Factors associated with non-adherence was evaluated in the test group factors such as age, gender, educational status, social habits were co-related with non-adherence. In the study 40-44 years, 60-64 years of study population showed (100%) of non-adherence to medications, 45-49 years, 50-54 years, 55-59 years of age group showed non-adherence percentage of 66.6%, 60%, 70%. Based on above outcomes, age can also be considered one of the non-adherence both can be co-related vice versa.

Gender was co-related to evaluate the factor of non-adherence in study the females were more adherent to their medications when compared to males. Male population bared 76.47% of non-adherence to the medications when compared to the female population. In comparison with the study conducted by Co-relating the educational status to evaluate the factor for non-adherence, the percentage of population completed 10th standard or below had non-adherence level of 77%, 100% of non-adherence seen in participant’s who completed pre-university and 60% of non-adherence was seen in staff who were graduates. Graduates have significantly high medication adherence level when compared to school or pre-university. According to above outcomes educational status can also be considered as one of the factor of non-adherence.

The existing scale measures medication adherence to a specific medication. However, patients with hypertension and/or type 2 diabetes mellitus are often treated with more than one medication. Therefore, to investigate medication adherence, the scale must be simple, validated, reliable and easy for the implementation as it has to be repeated for each medication. Medication Adherence Report Scale (MARS -10) questionnaire was utilised for its ease of application. The MARS – 10 was developed by Hogan et al. and has been widely used in different studies on a variety of chronic illness like type 2 diabetes mellitus, hypertension and chronic obstructive pulmonary disorder (COPD). There were two drop-outs in the study. Our study examined the impact of Workplace health promotion on BP and Type 2 DM among the raiya vokkaligara sangha employees. Overall the mean SBP and mean DBP and mean RBS was improved in every follow up and these findings were clinically significant. This improvement could be contributed by individualized lifestyle counselling that managed to increase awareness and positive lifestyle changes (diet and physical activity) in the control of HTN and type 2DM.
Conclusion

Study the population were educated about Hypertension and/or Type 2 Diabetes mellitus by expending health information leaflet and also they were explained regarding importance of adhering to medications, lifestyle changes, and dietary recommendations required based on their work environment to improve their quality of life at workplace. Medication adherence level were evaluated in each follow up based on MARS. Our study proven that there is a significant increase in the medication adherence level from first to fourth follow up. In conclusion “healthier workforce can be a safer workforce, a safer workforce can be a healthier workforce”.

Abstract

Background: Dental anxiety implies feelings of uneasiness, anxiousness and fear on thinking about dentistry and dental treatment situations. Oral Health-Related Quality of Life (OHRQoL) assesses the impact that oral diseases might have on the overall quality of life of individuals. It is a crucial aid in treatment planning and also for assessment of interventions. Literature regarding oral health status of Coast Guard personnel in India is scarce with almost no studies regarding their dental anxiety and OHRQoL.

Objectives: To assess the relationship between Dental Anxiety, OHRQoL and Oral Health Status of Indian coast guard personnel in Mangalore, Karnataka.

Method: A cross-sectional study was carried out among coast guard personnel in Mangalore. Dental Anxiety Questionnaire (DAQ) and 14-item Oral Health Impact Profile (OHIP-14) were employed to assess dental anxiety and OHRQoL respectively. WHO Oral Health Assessment Form was employed for assessment of oral health status of participants.

Results: Findings showed that participants had poor oral hygiene with a dental caries prevalence of 62.9%, and periodontal disease prevalence of 81.9%. About 72% of the participants had low dental anxiety while visiting a dentist and almost all the participants reported good OHRQoL. OHRQoL and dental anxiety or oral health status showed no statistically significant association (p >0.05).

Conclusions: The findings showed that the overall oral health status of Coast Guard personnel were relatively poor with high treatment needs.

Keywords: Coast Guard, dental anxiety, oral health status, quality of life.

Introduction

Feelings of uneasiness, anxiousness and fear when individuals think about dentistry and dental treatment situations is encompassed by the term dental anxiety. This anxiety might be one of the major determinants of poor oral health and might lead to individuals avoiding visiting dentists.¹ Investigators are now employing certain indicators for assessment and comparison of various oral health related issues in individuals and populations. One such indicator is Oral health-related quality of life (OHRQoL), which is now often being described in the literature.² Researchers have also demonstrated the close relationship between dental anxiety and low OHRQoL scores in populations.²³
An important characteristic of health-related quality of life is that it reflects the patient’s perspectives about the impact of health-related problems. OHRQoL has been defined as “A multidimensional construct that reflects (among other things) people’s comfort when eating, sleeping, and engaging in social interaction; their self-esteem; and their satisfaction with respect to their oral health”.  

Coast Guards are entrusted with the responsibility of security along the coast-lines of a nation. The Indian Coast Guard is entrusted with control over the territorial waters of India and it safeguards India’s naval interests and administers naval law. They are an integral part of a nation’s defense forces and are assigned various security operations and missions. As designated by the Secretary of Homeland Security, they are permitted to carry firearms on them and can arrest miscreants to ensure appropriate enforcement of the law of the land.  

Protecting the health of the armed forces is one of the critical aspects of any society. Mapping the oral disease burden in this community is fundamental for prevention and control of oral diseases among them. This information is essential for determining priorities and planning oral health programs. Literature regarding oral health status of Coast Guard personnel in India is scarce, especially regarding their dental anxiety and OHRQoL.  

**Material and Method**

The present study was undertaken to determine the relationship between dental anxiety, oral health status and OHRQoL among Indian coast guard personnel in Mangalore, Karnataka. A cross-sectional, descriptive study design was employed in the present study. Mangalore is the District headquarters, with a Commander of district (DIG rank), Executive officers (commandant rank), Technical officers (commandant rank), District operational officers (commandant rank), District work officers (deputy commandant rank), District medical officer (lieutenant rank from Indian navy) and District logistic officers (assistant lieutenant rank). All the 277 personnel in the District Headquarters at Mangalore were included in the study.  

Inclusion criteria included all Indian Coast guard personnel presently working at District Headquarters, Mangalore and willing to sign informed consent form. Ethical approval was obtained from the Institutional Ethics Committee (IEC) of MCODS, Mangalore, following which the protocol was submitted to the University for approval. Calibration was done and kappa value was found to be 0.94 indicating good agreement.  

The study was conducted at the Office of the Indian Coast Guard at Panambur and at coast guard ships (leaving from Mangalore port), 20 kilometers from Mangalore city. Data collection was done using questionnaires and an oral examination. Demographic details, medical history and dental attendance patterns of the study subjects were obtained using an interview schedule.  

The following instruments were used for collection of data. The Dental Anxiety Questionnaire (DAQ) was employed to assess dental anxiety among respondents. OHRQoL was measured by employing the 14-item Oral Health Impact Profile (OHIP-14). The WHO Oral Health Assessment Form was employed for measuring oral health status of respondents.  

**Results**

A total of 277 coast guard personnel in the city of Mangalore were included in the present study. There were 84 personnel (30.3%) belonged to the rank of commander, 14 were (5.1%) chief commander ranked officers, 165 (59.6%) were officers, 12 (4.3%) were lieutenant and 2 were (0.7%) DGO/IG ranked officers.  

Oral health examination was undertaken for all participants, followed by administration of questionnaire on dental anxiety and OHRQoL. A total of 108 (39%) personnel reported they have been working for less than 5 years, 70 (25.3%) of them reported to have worked for 5-10 years, while 97 (35%) reported that they are working for more than 10 years.  

Overall, 188 (67%) have reported to having mixed diet and a majority of 277 participants (99.2%) used toothbrush as the main aid for brushing, while 1 (0.4%) person reported to use neem and finger for brushing. When the participants were asked about their brushing patterns, 207 (74.7%) of them reported to have used the combination of horizontal and vertical strokes during brushing.  

A total of 60 (21.7%) respondents reported smoking while 216 (78%) were non-smokers. Overall, 3 (5%) participants have reported of having smokeless tobacco.
A total of 21 (7.6%) reported to have positive history of tobacco chewing. A total of 202 (72.2%) of the participants reported as having no fear while dentist visit, whereas 38 (13.7%) of them reported experiencing a little fear while seeing a dentist. It was observed that 37 (13.3%) participants experienced a little fear to very much fearful while visiting dentists. While examining the temporomandibular joint, 2 (0.7%) participants reported symptoms of TMJ.

Overall, diffuse and hypoplasia of the enamel was observed in 4 (1.1%) participants while diffuse type of enamel hypoplasia was seen in 1 (0.4%) participant. Mean OHIP among the respondents of the present study was found to be 3.69 (SD=0.45). Distribution of OHRQoL scores revealed that 86 (31%) respondents very often found it difficult to relax due to oral health problem. A total of 2 respondents reported that they felt embarrassed due to oral health problem very often (table no 1). Regarding CPI scores, 50 (18.1%) participants were healthy individuals, while 12 (4%) had bleeding on probing and 155 (56%) participants had calculus. Shallow pocket depth (4-5mm) were seen in 48 (17.3%) respondents had while 13 (4.7%) respondents had pocket depth of 6-8mm (table no 4). Overall, 3 (1.1%) participants had very mild form of fluorosis while 9 (3.2%) had mild fluorosis.

The mean decay was found as 1.54 while number of mean missing teeth was 0.877 and mean filled teeth was found to be 0.61 . There was no statistically significant association between OHRQoL and dental anxiety among the respondents (p= -0.41). Results also indicated that there was no statistically significant association between DMFT and OHIP of participants (p= 0.995). Similarly, there was no statistically significant association between DMFT and dental anxiety (p=0.13) (table no 2).

OHIP- Oral health impact profile

DAQ- Dental Anxiety Questionnaire

CPI- Community periodontal index

DMFT- Decayed, Missing, Filled teeth

**, Correlation is significant at the 0.01 level.

*, Correlation is significant at the 0.05 level.

Discussion

The present study was conducted to ascertain the relationship between dental anxiety, OHRQoL and oral health status of Indian Coast Guard personnel in Mangalore, Karnataka. The present study is the first systematic endeavor to examine the association between dental anxiety, dental health parameters and OHRQoL among Coast Guard personnel.

Number of participants with decayed teeth in the present study (63.2%) was higher than those reported by Bhardwaj et al. among policemen of Shimla, Skec et al. among Croatian army personnel, Sohi et al., among North Indian policemen and Singh et al. among Bhopal policemen. Jasmin et al. reported a higher prevalence of dental caries among Malaysian army compared to our study. Mean scores for DMFT in the present study (2.94) were higher than those reported by Singh et al., and Skec et al.

Mean decay of respondents in the present study was 1.54, which was lower than the findings reported by Skec et al., and Jasmin et al., among the Croatian army and Malaysian army respectively. The decayed component was found to be higher among respondents in the present study than those reported by Singh et al. Study by Kelbauska et al., among Lithuanian army reported higher prevalence of smoking among the participants compared to our study (22%). About alcohol consumption our study findings showed higher number coast guards (40.8%) consume alcohol than reported by Satapathy et al. Regarding tobacco chewing, our study showed lower prevalence than those reported by Satapathy et al.

Fluorosis was found to be lesser among the participants in the present study as compared to that reported by Bhalla et al. The probable reason could be the fact that Bhalla et al., conducted their study in a high-fluoride area. The percentage of participants with dentures in the present study was lower than that
reported by Sohi et al.,\textsuperscript{11} and Kudo et al.\textsuperscript{17} Regarding prosthetic need of participants, findings of the present study were similar to the study reported by Bhalla et al.\textsuperscript{16}

OHRQoL scores were found to be higher in the present study than those reported by Kudo et al.\textsuperscript{17} among Japanese army personnel. Results of the present study provide baseline information which can be useful for initiating further research on probable consequences of dental anxiety among army personnel. OHRQoL might be used as a substitute for screening of Army personnel in conditions like community wide assessments to detect individuals likely to have severe caries and periodontal problems.

Findings of our study show high prevalence of dental caries and periodontal problems among Coast Guards. The findings of the present study showed no significant co-relation between effect of poor oral health on OHRQoL and showed little impact of dental anxiety on OHRQoL. In developing countries, the rising trend in caries incidence is attributed to significant changes in life-style patterns.

An inherent limitation of the present study was the cross-sectional design which does not give any insights into the causality. Lack of time and interest might alter the answering pattern of participants. A major limitation in answering the questionnaire may be the associated social desirability bias and lack of complete understanding of the questionnaire.

Conclusions

In conclusion, this study demonstrated high prevalence of dental caries among coast guards in Mangalore city. Though our findings failed to show significant association but the overall oral health status of coast guard personnel were relatively poor and require early treatment. Thus there is a need for oral health promotion and awareness among military personnel. As the life style for the participants were very strict, disciplined and hectic, early identification of dental problems and treatment would be highly useful.

Effect of Blink Rate among Visual Display Terminal and Non-Visual Display Terminal User

Mohammad Nooruz Zaman\textsuperscript{1,2}, Varsha Singh\textsuperscript{3}

\textsuperscript{1}Assistant Professor, Sankara Eye Hospital, Punjab, India, \textsuperscript{2}Chitkara School of Health Sciences, Chitkara University Punjab, India, \textsuperscript{3}Assistant Professor, Centre for Life Sciences, Chitkara School of Health Sciences, Chitkara University, Punjab, India

Abstract

The digital technology has become a necessity and is integrated into our daily activities. This ever increasing use of visual display terminal (VDT) has led to an increase in eye-related symptoms. Dry eye disease (DED) is frequently encountered problem among VDT users. Not just the adults, but it is becoming common among children as well especially when they have reduced amount of outdoor activities. Dry eye occurs can happen due to inadequate amount of tears or poor quality of tears due to reduced blink rate. Subjects on digital device users are often found to have symptoms but with little evidence to compare with non-visual display terminal users. A total of 288 subjects were recruited in the study. Of which 144 were VDT and 144 were non-VDT users. The mean age of VDT and non-VDT users were 27.72±4.88 years (Male= 102, Female = 42) and 25.96±5.43 years (Male=77, Female=67), respectively. Blink rate of VDT and non-VDT users were recorded. All the subjects were given Ocular Surface Disease Index (OSDI) questionnaire to record their symptomatic score for dry eye. Data were collated and analysed on SPSSv21 and correlation analysis was performed between VDT users and non-VDT users using paired sample test. $P$-value<0.05 and confidence interval (CI) of 95% was considered statistically significant. 82.64\% of VDT users were found to have affected blink rate. Mean blink rate in VDT and non-VDT users were found to be 5.88±4.88 and 11.12±7.84 respectively ($P = 0.01$). Risk of blink rate getting affected due to VDT use were found to be higher than non-VDT (OR=3.02; 95\% CI (1.75-5.22), p =0.001). Statistical significant differences were found in blink rate of VDT and non-VDT users of different age group ($p<0.05$). Prevalence of dry eye was found out to be 44.44 \% as per OSDI score. It also shows that male were more symptomatic for dry eye compared to female in both the groups of VDT and non-VDT.

VDT users were found to have reduced blink rate and were found to be more symptomatic for dry eye. Therefore, a quick and non-invasive description may be a useful aid to the diagnosis and prevention of further chronic ocular problems.

Key words: Blink rate, Visual Display Terminal, Dry eye disease, Ocular surface disease index

Introduction

The technological innovations has touched every part of our lives, whether home or at work. The digital technology has become a necessity and is integrated into our daily activities. We spend more and more hours with visual display terminal (VDT) devices such as computers, laptops, TV screens, mobile phones and tablets. Use of VDT devices is often associated with eye and visual problems. Typical ocular complaints experienced by intensive VDT devices (more than 3 hours a day) include dryness, redness, burning, sandy-gritty eye irritation or sensitivity to light and eye fatigue. These symptoms are also known as Dry Eye Disease (DED), which is a major part of the Computer Vision Syndrome (CVS) \cite{1}.
Blinking of an eye spread tears on the whole surface and provides lubrication, wash away dust and microorganisms. Blinking ensures the normal distribution of the tear film. Any abnormalities to blinking may result in poor tear distribution and hence cause damage to the ocular surface. It has been reported that the normal spontaneous blink rate is between 12 and 15/min. The blink rate may be affected by many factors, including Parkinson's disease, corneal sensitivity disorders, progressive supra nuclear palsy and other factors such as changes in the gaze, lighting, ambient temperature, and humidity that reduce the number of blinks and cause excessive ocular surface exposure.

In dry eye disease, blink may function as a compensator for a dysfunctional and unstable tear film further worsening the negative consequences on visual function. Spontaneous eye blinking has been found to be significantly reduced during use of digital screen. Dry eye disease during VDT operation could be caused by either a reduced blink rate or increased corneal exposure produced by the primary gaze position of the monitor. Reduced blinking may also exaggerate symptoms of pre-existing dry eye, which could be exacerbated by other aspects of the work environment. Changes in the blink rate and pattern during computer use may cause ocular discomfort due to lack of adequate tear distribution leading to dry eye disease (DED). DED is a condition of various aetiologies, acting through common mechanisms of tear hyperosmolarity and instability. This ultimately causes ocular surface inflammation, epithelial (corneal and conjunctival goblet) cell damage and the subsequent symptoms associated with the condition. DED can affect one or both eyes and being an asymptomatic disease, its diagnosis is inaccurate without assessing symptoms of dry eye disease. The symptoms include irritation, grittiness, burning, soreness, watery eyes and visual disturbances. Further, a compromised corneal epithelium may increase the risk of ocular infection. The prevalence of DED is reported by various epidemiological studies with 5% to over 35% at different ages, with a greater incidence in the older population and those of Asian and Hispanic races. Recent studies reported that the individual with DED were more likely to experience difficulties with reading, professional work, driving, watching television and using computers. The impact of DED on visual function includes reduction in contrast sensitivity, visual acuity, and vision related quality of life. The purpose of the present study was to determine the effect of blink rate among VDT users.

Method

Study Design

The present study was a cross sectional design conducted from June 2017- June 2018 at Sankara Eye Hospital, Punjab, India.

Subject and Data Collection

A total of 288 participants aged between 18 to 35 years were selected. Prior permission was taken from the organisation and subjects and informed consent was obtained from all subjects. Subjects were randomly selected and underwent detailed ocular examination and medical history. The duration of daily VDT work was specified into two groups’ as follows: VDT= more than 2 hours per day and non-VDT= less than 2 hours per day.

Inclusion/exclusion criteria

All the subjects with best corrected visual acuity 0.0 logMAR for distance and near. Subjects with the following factors were excluded such as age above 35 years, subjects with any ocular disease, those who undergone any refractive surgery, history of contact lens wear, diabetes mellitus, connective tissue disease, postmenopausal oestrogens therapy, medications like lubricating eye drop, vitamin A therapy or any binocular vision anomalies.

Methodology

Blink rate was assessed by instructing subjects to read text aloud. The text was composed of cognitively demanding stories. VDT users were instructed to read from a laptop screen (dell with a 14-in monitor) and non-VDT users were instructed to read from hard copy at a viewing distance of 40 cm for a continuous 2 minute period. A forehead rest was used throughout the task to maintain a constant viewing angle and working distance. The text was single spaced, black, 10-point Times New Roman font, with a contrast of approximately 80%. Target luminance was approximately 15 cd m². To ensure concentration, subjects were told that they would be asked questions about the passage at the end of the session. During the task, subjects blink rate was assessed and OSDI questionnaire was also distributed to find out symptomatic dry eye score. The OSDI was assessed on a
scale of 0 to 100, with higher scores representing greater disability. OSDI is a 12 items questionnaire based on visual function, ocular symptoms and environmental trigger where subjects recall symptoms of 1 week. Total OSDI scores are calculated as \( \text{OSDI} = \frac{\text{sum of scores} \times 25}{\text{number of questions answered}} \). The scores ranging 0 to 12 represented normal, 13 to 22 as mild DED, 23 to 32 moderate DED, and >33 as severe Dry Eye Disease (DED) [19].

**Result**

A total of 288 subjects were recruited in this study, of which 144 were VDT users and 144 were Non-VDT users where mean age of VDT users and Non-VDT users were 27.72±4.88 years (Male= 102, Female = 42) and 25.96±5.43 years (Male=77, Female=67) respectively (Table 1). 82.64% of VDT users were found to have affected blink rate (Table 2). Mean blink rate in VDT and non-VDT users were found to be 5.88±4.88 and 11.12±7.84 respectively. There was statistical significant changes in blink rate in between VDT and Non-VDT (\( p = 0.001 \)). Risk of blink rate getting affected due to VDT use were found to be higher than Non-VDT (OR=3.02; 95% CI (1.75-5.22), \( p =0.001 \)).

Mean blink rate of male and female in VDT users were found to be 4.99 ± 4.52 and 7.95 ± 5.11 respectively whereas mean blink rate of male and female in non VDT users were found to be 10.23 ±7.62 and 11.72 ± 7.60. Statistical significant difference was found between blink rate of male and female of VDT users (\( p=0.01 \)) (Table 3).

Table 4 shows statistical significant differences in blink rate of VDT and non-VDT users of different age group. Out of all subjects with affected blink rate (<12 per min) in VDT and non-VDT 37.82% of VDT and 38.64% of non- VDT showed symptoms of DED of OSDI scale (Table 1).

OSDI scores and their associated factors

Table 5 shows the prevalence of dry eye to be 44.44%. It also shows that male were more symptomatic for dry eye compared to female in both the groups of VDT and non-VDT. There was statistical difference between the genders whereas female showed higher OSDI score in VDT users as compared to male (p=0.001). A statistical significance difference was observed between the age group 15-20 years (p= 0.01) (Table 6).

Discussion

The mean blink rate of VDT users were found to be lesser than non-VDT users were 5.88 and 11.12 respectively. Several studies have shown that blink rate is reduced during visual display terminal device operation. Previous studies have reported normally people blink 10-15 times per minute. Studies have shown that the blink rate is significantly diminished when working at a computer [9]. This could be the reason for reduction in blink rate found in this study during performing reading
tasks in VDT. One possible explanation is that the attention demand is higher during reading tasks which reduces the blink rate [21].

A total of 44.44% of subjects were having dry eye symptoms and OSDI score showed there were significant changes between VDT and non-VDT users. According to the result the prevalence of DED in VDT users were found to be higher in female and young age group. The prevalence of dry eye disease had been found to be variable from the previous population based as well as hospital-based studies. Studies have reported the prevalence of dry eye to be varying from 5% to as high as 73.5% [20]. Recent update from the Dry Eye Workshop (DEWS) stated that the global prevalence of dry eye disease to be around 17% while several other studies show a higher prevalence of approximately 30% in people of Asian descent. As per a survey conducted in 2015, 92% of eye care practitioners suspected that modern technology contributes to increase in dry eye symptoms among young adults [22].

This study reflects a major burden of DED among the non-clinical population of VDT and non-VDT user. DED was found to be equally (44.44%) affecting both VDT and non-VDT users but severity were more in VDT users which is in agreement with previous study where 23.4% presented definite dry eye and 44.4% suspect dry eye while among controls, 2.9% presented definite dry eye and 52.8% suspect DED [23]. Dry eye disease is a multifactorial disease of the tears and ocular surface it can affect both VDT as well non-VDT users. The study was limited to 288 subjects and requires a larger population to further analyse for the prevalence of DED and its association with blink rate in VDT and non-VDT respondents.

**Conclusion**

This study confirmed that the blink rate decreases in VDT users which can leads to DED so specially designed ocular examination associated counselling for VDT users would go a long way in preventing the loss of productivity and morbidity arises from the condition.

Nickel Induced Alteration of Pathophysiology of Lungs in Experimental Rats

R Chandramouli Reddy1,2, Basavaraj Devaranavadagi1, Kusal K Das2

1Department of Biochemistry, 2Laboratory of Vascular Physiology and Medicine, Department of Physiology; Shri B.M.Patil Medical College, Hospital and Research Centre, BLDE (Deemed to be University), Vijayapura, Karnataka, India

Abstract

Background: Nickel and its compounds are known lung carcinogens, hypoxia mimicking effect of divalent nickel (Ni (II)) plays a crucial role in transformation of cells and the progression of tumours. In this study we aimed to evaluate the possible pathophysiological alterations of lung tissues of rats exposed to nickel sulphate.

Materials & Method: For this study 12 male albino rats were randomly divided into two groups: control (placebo), NiSO4 and given respective interventions for 21 days. % body weight gain, pulmonary-somatic index was calculated. In lung tissue homogenates of all groups of animals, concentration of lipid peroxidation product malondialdehyde (MDA), nitric oxide (NO) and antioxidant l-ascorbic acid was estimated spectrophotometrically and lung tissue histopathological observations were also made.

Results: Our results shows significantly decreased % body weight gain, elevated lung tissue MDA, NO and concomitant decrease of l-ascorbic acid concentration in NiSO4 treated groups when compared to control group. Histopathological observations of lung tissue sections of NiSO4 treated group showed eosinophilic oedema fluid filled alveoli, cystic macrophages, thickened interstitial septa, leucocytic infiltration, haemorrhage and acute bronchiolitis.

Conclusion: Our results demonstrate that heavy metal nickel exposure leads to increased pulmonary oxidative and nitrosative stress, decreased concentrations of antioxidants like l-ascorbic acid and histopathological alterations in lungs. So we can conclude that people exposed to heavy metals like nickel may be more prone for lung disorders irrespective of the route of exposure.

Keywords: nickel, lungs, histopathology, malondialdehyde, nitric oxide, l-ascorbic acid, lipid peroxidation

Introduction

Industrial usage of heavy metals like nickel (II), cobalt and chromium (VI) is increasing, so industrial workers are more prone to exposure related health consequences1. Occupational exposure of nickel mainly occurs in the people working in industries like stainless steel manufacturing, electroplating, mining and metallurgy1. It has been reported that experimental animals administered with nickel sulfate leads to increased concentrations of lipid peroxide products, decreased activities of antioxidants like glutathione, superoxide dismutase (SOD), catalase (CAT) and glutathione peroxidase (GSH-Px)2. In many studies it has been reported that nickel toxicity leads to oxidative stress and the depletion of ascorbic acid levels in the cells might be one of the reasons3. Further it has been observed that lungs are the primary target organs...
in case of nickel exposure. It has also reported that consumption of nickel through water and food develop pneumo-toxicity\textsuperscript{4}. Hence the present study has been undertaken to evaluate the effect of nickel sulphate on pathophysiological changes in lung tissue.

**Materials and Method**

**Selection of Animals and Treatment:** 12 male rats of albino Wistar strain (\textit{Rattus norvegicus}) weighing 170 to 200 gm were acclimatized 12 hours light-dark cycle, 32 ± 2°C temperature for 10 days in the Central Animal House facility of BLDE (Deemed to be University), India. Animals were fed with standard pellet diet and water \textit{ad libitum}.

Rats were randomly distributed into 2 groups having 6 animals in each group. Animals of control group were treated with placebo and NiSO\textsubscript{4} group rats were treated with nickel sulphate in double distilled water at a dose of 2.0 mg/100 gm b.wt intraperitoneally for 21 days\textsuperscript{5}.

### % Body Weight Gain

Body weight of all groups of animals was recorded by using Sortorious digital scale before and after the intervention period. % body weight change was calculated by using the following formula\textsuperscript{6}.

\[
\text{% Body weight gain} = \frac{\text{Final body weight (gm)} - \text{Initial body weight (gm)}}{\text{Initial body weight (gm)}} \times 100
\]

### Animal sacrifice and Tissue collection:

After the 21 days of intervention period all groups of animals were anesthetized and sacrificed by cervical dislocation. Animals were dissected and lungs were taken out carefully, half lung stored at -20°C in phosphate buffer for biochemical parameters and half stored in buffered 10% formalin for histopathological procedures.

### Pulmonary- somatic index

After dissection both the lungs were washed in cold saline to remove excess blood and weight was taken by using digital scale. Pulmonary somatic index was calculated by using the following formula\textsuperscript{7}.

\[
\text{Pulmonary somatic index} = \frac{\text{Lungs weight (gm)}}{\text{Final body weight (gm)}} \times 100
\]

### Lung tissue lipid peroxide estimation

Lipid peroxidation product malondialdehyde (MDA) was estimated in lung tissue homogenate by Buege and Aust (1978) method\textsuperscript{8}. In brief 10% of lung tissue homogenate was prepared in 0.1 M phosphate buffer by using a tissue homogenizer (REMI Motors Pvt. Ltd, Mumbai, India), homogenate was centrifuged and supernatant was used for MDA estimation. In acidic conditions MDA reacts with Thiobarbituric acid (TBA) and gives pink colour and the absorbance was measured at 535 nm by using UV-Visible spectrophotometer (Schimadzu UV 1800, Japan).

### Lung nitric oxide and l-ascorbic acid estimation

Lungs were dissected out, washed with chilled saline immediately and stored in tissue container at -20°C until used. Lung tissue homogenate was prepared by using 0.9 % saline (500 mg of lung/ 5 ml 0.9 % saline); 1 ml homogenate was mixed with 2 ml of ethanol (1:2 v/v) and cold centrifuged (4 °C) at 1500xg for 15 min and used for tissue nitric oxide estimation\textsuperscript{9}. 1ml of supernatant was collected and mixed with 2 ml of 10% TCA and centrifuged at 4°C at 1500xg for 15 min for the quantitation of tissue l-ascorbic acid\textsuperscript{10}.

### Lung Histopathology Procedure

Lung tissues were dissected and washed in cold saline to remove the excess blood and then tissues were stored in 10% neutral buffered formalin for histopathological evaluations. Paraffin blocks were made with fixed tissues and made sections of 3-5 μm thickness, deparaffinized, rehydrated and stained with haematoxylin and eosin (H&E)\textsuperscript{11}. The stained tissue sections were observed under a photomicroscope and photographed (Olympus BH-2 with Samsung digital colour camera, Model No. SDC-242).

### Statistical Methods

Values will be presented as Mean ± SD. \( P \) value \( \leq 0.05 \) will be considered as statistically significant. Comparison of values between two groups was done by unpaired ‘t’ test by using SPSS (Version.16.0) software.

### Results

Our results showed significant decrease in % body weight gain in NiSO\textsubscript{4} treated rats when compared to control rats (Table 1). We had also observed no statistically significant difference in pulmonary-somatic index between control and NiSO\textsubscript{4} rats.
Table 1: Statistical comparison of % body weight gain, pulmonary-somatic index and concentrations of MDA, NOx, l-ascorbic acid in lung tissues of control and NiSO$_4$ groups (n=6 in each group).

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Control</th>

</tr>
<tr>
<td>Lung l-ascorbic acid (mg/gm of tissue)</td>
<td>14.10 ± 3.87</td>
<td>4.95 ± 1.25</td>
<td>0.001*</td>
</tr>
</tbody>
</table>

Values are expressed as Mean ± SD. Unpaired ‘t’ test was done to compare the values between two groups. p value (>0.05) not significant, p* (<0.001) highly significant; MDA,malondialdehyde; NOx,nitric oxide.

We have observed significant increase of lung tissue MDA and NO concentration in NiSO$_4$ treated rats when compared to control group. We have also observed a significant decrease in antioxidant vitamin l-ascorbic acid concentration in NiSO$_4$ treated rats when compared to control (Table 1).

H&E stained lung tissue sections of control group rats (Fig. 1a & 1b) showed normal lung histological architecture like lung parenchyma consisting of bronchi, bronchioles and thin walled alveoli separated by intervening interstitial connective tissue containing small pulmonary capillaries.

H&E stained lung sections (Fig. 1c & 1d) of NiSO$_4$ treated group showed dilated alveolar spaces filled with eosinophilic oedema fluid and cystic macrophages. It also showed thickened interstitial septa by oedema, congestion and haemorrhages and leucocytic infiltration and acute bronchiolitis.

**Discussion**

Pulmonary somatic index represents the degree of damage to the pulmonary system. Decreased lung somatic index in NiSO$_4$ treated group may be due to decreased protein synthesis, inflammation, fibrosis, haemorrhage etc.

NiSO$_4$ is known to be inducer of reactive oxygen species (ROS), and we have observed increased concentrations of MDA in lung tissues. All biological
membranes contain unsaturated fatty acids in their structure, hence peroxidation of membrane lipids leads the membrane damage and cell necrosis8,12. MDA is the product resulted from peroxidation of poly unsaturated fatty acids (PUFA)8. Formation of lipid endoperoxides in unsaturated fatty acids containing at least 3 methylene interrupted double bonds lead to the formation of malondialdehyde as a breakdown product8. Increased MDA levels in lung tissue indicating increased oxidative stress and cell damage in the present study.

Nickel sulphate induces increased lung nitric oxide concentration which may be due to increased activities of inducible nitric oxide synthase (i-NOS) in lung tissues6. Increased NOx level in nickel treated rats probably reacted with superoxide and produced peroxynitrite to develop nitrosative stress in the lungs12. Peroxynitrite interns alter the protein structure and affects its function in target tissues12. These findings in the present study were supported by the results of histopathological studies.

Intra cellular ascorbic acid concentration is a marker of oxidant-anti oxidant balance and it has been found that nickel induces intracellular ascorbic acid depletion leads to altered cell signaling mechanism resulted in carcinogenesis 13. Our study also showed decreased concentration of ascorbic acid in lung tissues, these decreased antioxidant levels may lead to oxidant-antioxidant imbalance, oxidative and nitrosative stress which finally leads to cell necrosis and even cell death.

The histopathological observations on lung tissues in nickel treated rats clearly indicate pathological alterations in lung tissue by inducing integrity of alveolar tissues. The observations from the present study clearly indicate nickel induced oxidative stress and oxidant-antioxidant imbalance, generate lung tissue inflammatory responses 14. Possibly nickel induced alveolar damages may lead to develop cellular hypoxia and may alter pathophysiology of lung tissues 15.

Conclusion

Nickel sulphate is found to be a pulmonary toxic heavy metal which leads to develop oxidative and nitrosative stress in lung tissues. Histopathology of lungs in nickel treatment supports these observation.

Consequences Towards E-Pharmacy and its Validated Growth Firms on Herbal and Organic Products

M.Anbarasi¹, S.Praveen Kumar²
¹Research Scholar, Dept of MBA, Bharath University, Chennai, ²Professor & Head, Dept of Management Studies, Bharath University, Chennai, India

Abstract

The sudden regulatory challenges and pharmacist activities last year filed a plea against online pharmacy and drug stores, over 280 online medical stores (Netmeds, 1mg, Sasta Sundar, Pharm easy, and Myrameds etc) have started up in the year 2010 where they reached tremendous growth by the year 2018, by marketing the medical products in particular selling the herbal, ayurvedic, especially the organic product in name of Bio, Go green etc., they achieved the target in selling the counter drugs too, where this article represents, the sudden consequences towards e-pharmacy and its validated growth firms on Herbal and Organic products with a comparison of offline and online medical stores and in constant whether the selling and buying of herbal and organic products in online have really affected people overall and its growth towards herbal and organic growth sectors.

Keywords: Ayurveda, Herbal, Organic, E-pharmacy, Online.

Introduction

Buying medicines online seems convenient but many are wary over the easy availability of drugs sold online. The associations of retail chemists and pharmacists are up in arms against the draft rules issued by the centre on sale of drugs by online pharmacies. The new rules have been proposed to ensure accessibility and availability of genuine drugs to people across India from authentic online portals. These rules have been issued by the Central government’s Department of Health and family welfare to seek inputs from stakeholders.

As we discussed, The sudden regulatory challenges and pharmacist activities last year filed a plea against online pharmacy and drug stores, over 280 online medical stores (Netmeds, 1mg, Sasta Sundar, Pharm easy, and Myrameds etc) have started up in the year 2010 where they reached tremendous growth by the year 2018, by marketing the medical products in particular selling the herbal, ayurvedic, especially the organic product in name of Bio, Go green etc., they achieved the target in selling the counter drugs too, where this article represents, the sudden consequences towards e-pharmacy and its validated growth firms on Herbal and Organic products with a comparison of offline and online medical stores and in constant whether the selling and buying of herbal and organic products in online have really affected people overall and its growth towards herbal and organic growth sectors.

What is an e-pharmacy:

An online pharmacy, Internet pharmacy, or mail-order pharmacy is an e-pharmacy that operates over the Internet and sends the orders to customers through the mail or shipping companies.

Online pharmacies might include:

1. Pharmacy benefit manager – A large administrator of corporate prescription drug plans
2. Legitimate Internet pharmacy in the same country as the person ordering.
3. Legitimate Internet pharmacy in a different country than the person ordering. This pharmacy usually is licensed by its home country and

Corresponding author:
M.Anbarasi
Email: scholars_4@yahoo.com
follows those regulations, not those of the international orders.

**Role of Online Pharmacy in India**

Online pharmacies in India have significantly increased due to growing E-commerce in India and little regulation of the industry, it has been clearly mention in Wikipedia also.

So far there is no regulatory control over the drug buying advertisements on national television or through the web series.

Definitely, the incredible technology have built a major platform in meeting the healthcare objectives in India among the people with a simple and ethical word Bio, where, the Indian government was planning to spend Rs. 1,000 crore on computer literacy project for 50 lakh people over a period of 3 years, concerning to abide Indian citizens to access government services in field of e-education, e-health and e-governance, similarly, the healthcare providers in India are also expected to spend $10.5 billion on IT products and services in 2018.

**Legal status in India**

There is no specific law to deal with online pharmacies in India but multiple laws govern online pharmacies in an indirect manner. The Drugs and Cosmetics Act, 1940, and the Drugs and Cosmetics Rules, 1945, have guidelines on the sale of Schedule H and Schedule X drugs. These can be sold only on prescription and there are specific rules, including for labeling and bar coding.

**Online pharmacy laws in India**

When it comes to online pharmacy laws they are no particular and in specific laws on selling drugs in online particularly in India, since, the The Information Technology Act 2000 governs some of the legal issues pertaining to online dealings but it is silent on the aspect of online pharmacy. As a result, illegal online pharmacies have been increasing in India. It has been said that, if properly regulated, online pharmacies in India could prove beneficial to various stakeholders.

The reason when coming to the Indian Internet Pharmacies Association (IIPA) now it is renamed as Digital Health Platforms (DHP) and the big meeting held in Bangalore, The IIPA Secratry, Kiran Divakaran said, the member pharmacies will self regulate until the law of the land catches up to advancements in technology with the following conditions.

1. No Sale without prescription.
2. No Sale of Schedule X drugs.
3. Final Packing in a tamper-proof cover under the personal supervision of registered Pharmacist of the pharmacy.
4. Valid Bill for Every sale.
5. Facilitate Medicine Recall in case directed by the Govt.

The IIPA also is working actively with the Central Government to bring in changes to the regulations including the use of AADHAAR Number linked prescriptions to ensure there is no misuse.

With these regulatory affairs as the platform many online pharmacy navigated in several ways in playing a specific marketing role in selling ayurveda, herbal and organic products overall, with an effective and authorized e-pharmacy draft (28th August, 2018), released by the Union Health Ministry of India, the draft rules slated, the sale of drugs by online / e-pharmacies with an aim to regulate online sale of medicines across India and provide patients access to genuine drugs from authentic online portals. With the important point like:

a. No person will distribute or sell, stock, exhibit or offer for sale of drugs through e-pharmacy portal unless registered.

b. Any person who intends to conduct the business of e-pharmacy shall apply for the grant of registration to the Central Licensing Authority in Form 18 (AA) through the online portal of the Central Government.

c. The application of registration of e-pharmacy will have to be accompanied by a sum of INR Rs. 50,000 while asserting that an e-pharmacy registration holder will have to comply with provisions of Information Technology Act, 2000 (21 of 2000).

d. No e-pharmacy shall advertise any drug on radio or television or internet or print or any other media for any purpose.

e. The e-pharmacies portals are mandatory
required to have at least 12 Hours and all seven days a week customer support and grievance readress of all stakeholders. The customer support should have a registered pharmacist in place to answer the queries of customers through such customer helpline.

**Consequences on e-pharmacy in India**

As we discussed earlier, over 280 online medical stores (Netmeds, 1mg, Sasta Sundar, Pharm easy, and Myrameds etc) have started up in the year 2010 where they reached tremendous growth by the year 2018, by marketing the medical products in particular selling the herbal, ayurvedic, especially the organic product in name of Bio, Go green etc., they achieved the target in selling the counter drugs too, there was a strong opposition on online drug stores raised by AICDA (All India Chemist and Druggist Association) and IPA (The Indian Pharmaceutical Association) stating that, “We strongly oppose online drugstores. We held an emergency meeting today and will launch a nationwide protest on September 20 to oppose these rules. All pharmacy shops will close down. Our entire association is against online pharmacy as the authenticity of prescriptions on these sites cannot be cross-checked. It will destroy lakhs of jobs,” The MRPA argued that nearly 8.5 lakh conventional chemist outlets will be shut down leading to the loss of more than two crore direct and indirect jobs.

![Fig 1: Pill – Popping facts represented by J S Shinde, president, AICDA](image)

AICDA also said that this compromises the financial and medical privacy of customers. The data for which could be misused or sold to insurance companies and hospitals.

In these circumstances, after several pleas and trial a challenging a order banning sale of medicines online till the central health ministry formalizes the regulatory environment for web-based drug aggregators, the Delhi high court has asked the authorities to file their stand on or before the next date of hearing February 25, 2019. With these recent issues, amendments and several consequences depicted on the e-pharmacy sectors, do the online drug war have really affected the herbal and organic products in selling and buying through online have raised up with two questions:

1. If yes what is the validation towards the competition
2. If no merely the down fall on buying and selling and
3. How far the e-pharmacy pharmacist faces the consequences.

**Growth firms on Herbal and Organic products**

Consumers are attracted to herbal and organic products for their health and beauty needs, since they believe that these products does not have any potential side effects that may come from taking certain herbs. The stakeholders and retailers have achieved best way to do attain their marketing level on selling their products in e-pharmacy and in the online pharmacy marketing these products have exhibited and provided extensive information for all of their products with a clear prescription page, side effects, colorful diagrams, product reviews and ratings. In addition to an A-to-Z guide to herbs and some organic supplements, you should also answer consumer questions such as:

- How should I use this herb? Can I drink it or use it as aromatherapy?
- How much can I use at one time?
- Are there any side effects?
- Can I use it with certain medications?

to attract people in front of their desk as a time consuming manner etc., the growth of herbal and organic products have achieved their peak level in online pharmacy business. Yes, with a few examples and questions, here we can validate the growth of these products.

**Herbal and Organic products Versus Online pharmacy**

The organic and herbal product segment is still at a nascent stage in India; both the Government and private players need to develop a strong policy framework that can benefit all involved. The organic farming industry
in India holds immense potential to grow, provided it receives steady investment and benefits from both existing and new initiatives like incentivizing organic cultivation, food processing, certification and regulatory ease and tax benefits. Some of the challenges faced by the organic sector emerged to sell their products in online pharmacy to achieve their selling targets.

**Raise up and Challenges**

In year 2018, there were a huge promotions and records in selling products like Himalaya, Herba life, Patanjali, Khadhi, Organics etc., with a great effort on describing the products with their benefits and side effects. While online pharmacies could be a boon for consumers, these have acquired a not-so-commendable reputation due to various reasons, the primary of which is the unregulated manner of functioning.

Online pharmacies reduce transactional costs and the costs of obtaining organic and herbal products through a more efficient centralized order-processing system. The reduced procurement and transactional costs are passed onto consumers in the form of lower prices (Fig 2). The anonymity offered by the internet encourages consumers to seek information about medicines that they would otherwise avoid asking their physician or at an offline pharmacy. Some of the pharmacy who attained their growth by year 2018:

![Fig 2: Health buddy Honest Organic Tea, which has been standard and certified with www.sastasunder.com.](image)

**Competitive Analysis of the Indian E-Pharmacy Market**

1. NetMeds
2. 1mg
3. Apollo Pharmacy
4. Healthkart
5. PharmEasy
6. MyraMed
7. Care On Go
8. Metapharmacy.in
9. Medidart.com
10. Medplusmart

**Down fall on buying and selling**

The IPA insisted that the government will have to extra cautious about sale of medicines through the internet. Only digital prescriptions with chronological numbering pan-India should be accepted as legal prescriptions because the possibility of forging cannot be ruled out if scanned or written prescriptions are allowed. In contrast, online suppliers will not be able to ensure temperature control on medicines which may cause resistance towards antibiotics. Patients’ safety and quality of drug should be of a paramount importance. With these downfalls the consumers or the regular visitors in 73% have stopped in seeking and buying organic and herbal products through online and visit nearby stores, even though they knew it’s the products of stakeholders.
and retailers the sudden trails on e-pharmacy have also countered the growth of herbal and organic products.

**Challenges and concerns towards implications**

Right from the advent of E-pharmacies in India, it appears that this organic and herbal Entrepreneur has been viewed suspiciously by the regulator; even though the regulator had clarified that there was no restriction on online sale of drugs provided that it complied with the existing legal regime. It can be argued that while some of this suspicion that they need full freedom to sell the herbal and organic products on the same online stores under the same banner.

While the draft rules are not yet available in the public domain, one interesting proposal that is being mooted is to allow E-pharmacies to obtain a single registration from the Central Drugs Standard Control Organization, instead of obtaining different registrations from each state where such E-pharmacy will operate, in particular with selling the herbal and organic products with a community trade name and authorized selling codes and regulatory without abiding with drugs. While it remains to be seen how these regulations will address the aforementioned identified concerns and challenges, the recent move on part of the Government to encourage this sector especially the community branded herbal and organic products and to introduce a specific legal regime for governing online sale of these should be welcomed as a favorable step by E-pharmacies.

**Conclusion**

To conclude, with few challenges and concerns, it is true, that consumers are attracted to herbal and organic products for their health and beauty needs, since they believe that these products does not have any potential side effects that may come from taking certain herbs. The stakeholders and retailers have achieved best way to do attain their marketing level on selling their products in e-pharmacy and in the online pharmacy marketing these products have exhibited and provided extensive information for all of their products with a clear prescription page, side effects, colorful diagrams, product reviews and ratings. Where, even though the high court bans the e-pharmacy selling, they can ban only some of the antibiotics and regulated medications in selling which will be good statement on considering public health and population in buying drugs in online, in contrast they cannot ban the selling of herbal or organic products, yes, it’s a challenge in growth sectors, sure due to some facts people may stop buying the organic products in online, but it’s the important role for the stakeholders and retailers of the herbal and organic products to achieve their target in this incredible field.

**Discussion**

Consumer awareness is the key to curb; consumers need to be educated about the need to verify the authenticity of the service provider as well as the product and to avoid sites that sell drugs without a legal prescription. Good online pharmacies have well-defined safety and quality benchmarks, uncomplicated privacy and security policies, a verifiable physical address and licensed pharmacist on roll. A mutual awareness of online purchase of medicines by the patient and consumer is necessary for better management and avoidance of the consequences of self-medication. We need to reflect on the consumers’ interests and inclinations for online pharmacies to enhance a symbiotic the physician-pharmacist-patient relationship. These measures coupled with adequate monitoring from regulators can help the consumer reap rich benefits of these pharmacies.

**Ethical Clearance**: Since the article studies about online promotion on herbal products there is no need of clearance.

**Source of Funding**: Self.

**Conflict of Interest**: NIL.

Study of Bronchoscopy in HIV Infected Patients of Maharashtra Population

Ashok. S. Bansode¹; Nitin Chitte²
¹Assistant Professor; ²Senior Resident, Department of Pulmonary Medicine. Prakash Institute of Medical Sciences and Research Urun- Islampur, Sangli (District) (Maharashtra)

Abstract

In the present study 90(58 males and 32 females) HIV infected tuberculosis patients were studied. Fibro optic bronchoscopy was used to study the pulmonary tuberculosis. Brachioalveolar clevage (BAL) and trans-bronchial biopsy (TBB) was performed In Zn stain study 58(64.4%) positive and in TB culture test 32(35.5%) positivity was observed. Bronchoscopic study with Zn test was done. Test positive with TB was 8(8.8%) additional test positive with TB was 6(6.6%). Sensitivity test was 16(17.7%), incremental sensitivity test was 9 (10%) specificity tests was 18(22.2%), PPV was 20(22.2%), and NPV was 13(14.4%). These obtained values were more significant and higher than value of non-bronchoscopic studies. Moreover this present bronchoscopy study was quite helpful for early diagnose and early to treat the patients of HIV infected pulmonary tuberculosis patients, so that lifespan of HIV infected patients can be prolonged.

Key words – BAL, TBB, TB Zeihl Nelson stain, BPV, PPV.

Introduction

Epidemiologic studies have proved that patients infected with human immune deficiency virus (HIV) are at increased risk of developing tuberculosis majority of the patients with tuberculosis are suffering with AIDS.¹ The sensitivity of sputum acid – fast bacilli (AFB) smears in HIV infected tuberculosis patients ranges from 31 to 80 percentage in different studies.²(3) However because of a typical appearance on chest roentgenograms, the diagnosis of tuberculosis may not suspected in HIV infected patients and sputum may not be positive for acid fast staining.⁴ hence it was difficult to diagnose the AIDS in tuberculosis patients therefore bronchoscope study in immuno comprised patients was carried out to confirm tuberculosis in HIV patients. Brancho alveolar levage (BAL) and transbromchial biopsy (TBB) were done for early diagnosis of tuberculosis in HIV patients⁵ so that the life span of HIV patients can be prolonged by proper treatment and creating immunity among HIV patients.

Material and Method

The 90 patients (58 males 32 females) were regularly visiting to pulmonary medicine department of Prakash institute of medical sciences research institute Urun- Islampur -415409, Sangli (Maharashtra) having symptoms of TB but suffering with HIV infection, aged between 20-45 year were selected for study.

Fibro-Optic bronchoscopy (FOB) was performed trans-nasally after premedication with sedatives, opiates and atropine. Topical lidocaine (xylocaine 2%) was used for local anesthesia, after inspection of the airways; the bronchoscope was wedged in a subsegmental bronchus of either the right middle lobe or lingula, when diffuse parenchymal disease was present. In patients with focal parenchymal involvement, the bronchoscope was wedged in areas of maximal involvement, as evident on chest roentgenogram. The Bronchoalveolar levage (BAL) consisted of 5 or 6 thirty (30) ml aliquots of normal saline solution, fluid was aspirated using mechanical suction. Subsequently a series of trans
bronchial biopsy (TBB) was performed after instillation of 2 to 5 ml of epinephrine (1: 1,000) aliquots of BAL fluid were sent for staining of the cell pellate in cytology laboratory, for AFB smear and culture and for potassium hydroxide preparation and fungal culture, Bronchoscopy with ZN staining were performed.

The obtained results with bronchoscopy Zn, Bronchoscopy culture were compared with previous studies performed without bronchoscopy.

The duration of study was about three years.

Table – 2 comparative study of non bronchoscopic study with zn and bronchoscopic study with zn for diagnosis of TB in HIV infected patients with percentage.

1 – Test positive with TB in non – Bronchoscopic study was 3(3.3%) and bronchoscopic study was 8(8.8%) 2 – Additional test positive with TB in non Bronchoscopic study was 3(3.3%) and bronchoscopic zn study was 6(6.6%) 3 – sensitivity of zn was 10(11.1%) in non bronchoscopic study and 16(17.7%) in bronchoscopic study 4- incremental sensitivity was 10(11.1%) in non – bronchoscopic zn study 9(10%) in bronchoscopic study 5 – specificity was 24(26.6%) in non- bronchoscopic and 18(20%) in bronchoscopic study 6-PPV test was 25(27.7%) in non bronchoscopic and bronchoscopic study 20(22.2%) in was 15(16.6%) in 7- NPV test 13(14.4%) in bronchoscopic study
Discussion

In the present study of bronchoscopy in HIV infected patients of Maharashtra population zn stain test 58(64.4%) and TB culture test 32(35.5%) were positive (Table-1). Tests positive with TB 8(8.8%), additional test positive with TB 6(6.6%), sensitivity test 16(17.7%), incremental sensitivity test 9(10%) specificity test 18(20%) PPV 20(22.2%) NPV 13(14.4%) (Table-2) these findings were more or less in agreement with previous studies.(6)(7)(8) This study will be quite useful in HIV patients with TB. Because early detection of TB in HIV patients very important so that the patients are not late for the treatment and reduce the disease transmission. Diagnostic confirmation of pulmonary TB in HIV patients becomes problematic when clinical symptoms are suspicious. Microbiological examinations are most important for detecting the etiologic micro organism. The problem is the need of good quality of samples which is often very difficult to obtain in HIV TB patients hence bronchoscopic study was conducted to collect good quality of samples. ie BAL TBB.(9) In the present study HIV in TB patients had CD4 was below 200 cells /ul The present study findings were higher than previous non bronchoscopic study Zn smear examination were more significant than culture study with solid media required time to grow of 3-8 weeks. Liquid media detected 10% more TB cases positive than solid media study and required shorter duration of incubation for the growth of mycobacterium.(10) As non bronchoscopic study give negative results, and test were also time consuming but the bronchoscopic studies shorten the diagnostic time of pulmonary TB in HIV infected patients so that clinician could immediately provide TB treatment. Apart from mycobacterium, kaposis sarcoma, invasive aspergillosis, cryptomegalovirus pneumonia, were also observed during BAL, TBB, study, and treated accordingly.

Summary and Conclusion

The present study of bronchoscopy in HIV infected tuberculosis patients is quite helpful to early diagnose HIV patient suffering with pulmonary tuberculosis. But for usage of bronchoscopy require trained and cost effective expert moreover this study require to correlate the CD4 cell count to confirm the severity of disease and create awareness among the patients regarding nutritious food intake to create immunity to prolong the life span of the patient so that in due course of time there will be vaccine or treatment to eradicate the HIV disease in future.

Study of Dyslipidemia and Cardio Vascular Risk in Rheumatoid Arthritis Patients

Rajkumar Dhonthula1, Tilak Ram1

1Assistant Professor Department of General Medicine, Mediciti Institute of Medical Sciences (MIMS)
Ghanpur Medchal mandal and district Telangana State

Abstract

Rheumatoid arthritis is one of the commonest inflammatory arthritis and is commonly associated with various metabolic abnormalities including dyslipidemia which is an important risk factor for cardiovascular diseases. In this study 90 patients of Rheumatoid Arthritis (65 Females 25 males) aged between 35 to 60 years were included and compared with controlled (normal) group. The lipid profile study in RA patients and controlled group was compared.

Mean total cholesterol, LDL, VLDL and triglyceride levels 158.1, 187.5, 39.8 191.4 respectively were higher than normal in our study with a high significant p values (p<0.01) for all these parameters. The mean HDL level in this study was lower (23.80) as compared to normal subject with a significant p value of < 0.01.

Mean value of DBP (diastolic BP) in RA patients was 85.2 in controlled group 82.0 and p value was significant (p<0.01). Mean value of SBP (systolic BP) in RA patients was 139.8 and in controlled group 131.6 (p<0.01). The associated clinical manifestations were 20(22%) had angina, 7(7.7%) had MI, 27(30%) had diabetes mellitus, 17(18.8%) had IHD, 19(21.1%) were obese. This study of abnormal lipid profile in RA patients will be quite useful to evaluate and predict the risk factors for cardio vascular events in RA patients and to improve morbidity and mortality in such patients.

Key-words- RA= Rheumatoid Arthritis, IH= Ischemic Heart disease MI= myocardial infarction, DM = diabetes mellitus

Introduction

Rheumatoid Arthritis (RA), a chronic inflammatory joint disease of unknown etiology affects the both sexes, predominantly females than males. The mortality due to RA ranges from 1.3 to 3%.1 The increased mortality is largely attributed to cardio vascular disease (CVD) particularly coronary atherosclerosis2. The cardio vascular morbidity found in RA patients appears to be two folds or more compared to general population. The increased CVD risk in RA has many causes such as dyslipidemia, diabetes mellitus (DM) and hypertension. Moreover it is viewed that Anti Rheumatic drugs improve the adverse lipid profile seen in RA. Hence attempt is made to study the various parameters of lipid profile and blood pressure in RA patients so that elevated lipid profile and its association with disease activity with RA can be correlated because dyslipidemia is already present in early RA which has great risk of cardio vascular diseases.

Material and Method

This is a cross sectional observational study conducted at Mediciti Institute of Medical Science hospital Ghanpur Medchal mandal Telangana state over a period of three years from 2014 to 2017. Ninety patients including both sexes (25 males and 65 females),
aged between 35 to 60 years, who visited the medicine department at our institute, were selected for study. These patients were diagnosed rheumatoid arthritis (RA) patients. Their lipid profile test was carried out and their blood pressure was also recorded. The same number of healthy males and females (control group) were also studied including lipid profiles and blood pressure and compared with RA patients.

HIV, osteoarthritis and post traumatic patients having joint pain were excluded from the study.

Discussion

Rheumatoid arthritis is associated with systemic inflammation and is commonly associated with dyslipidemia. Lipid abnormalities are often associated with increased risk for various cardiovascular disorders. RA patients have an increased risk for CVD even at relatively low cholesterol levels. Dyslipidemia is a frequent occurrence in RA patients. Hadda V et al reported dyslipidemia in 38.5% of RA patients. In the present study of dyslipidemia and cardio vascular risk in RA patients the lipid profile of RA patients was compared with controlled group. Our study found that RA was associated with higher than normal levels of Total Cholesterol, LDL, VLDL and triglyceride with significant p value (<0.01). But the level of HDL was found to be lower than normal control group.

Mean value of SBP (systolic BP) was also higher in RA patients compared to controlled group. The associated clinical manifestation were 20(22.2%) angina, 07(7.7%) MI, 27(30%) DM, 17(18.8%) IHD, 19(21.1%) was obesity (Table-2). These findings are more or less in agreement with previous workers.

The RA and heart disease share common underpinnings involving inflammation. The high levels of inflammation characterize rheumatic diseases. The important metabolic feature of RA is the catabolic state leading to loss of body cell mass due to accelerated loss of skeletal muscle due to effects of various inflammatory mediators. These mediators are also associated with altered TC and HDL levels. Apolipoprotein A-1 is the protein present in HDL-C particles whereas apo lipoprotien B found on the LDL-C, VLDL and chylomicrons particles. Hence assessment of plasma apo A.1 and apo B allow an assessment of total number of anti-atherogenic and atherogenic particles respectively. LP(a) is modified from LDL in which apo A is bound to apo B. It is reported that apo B is a better predictor of cardio vascular events than LDL-C; and apoB/apoA ratio is a strong risk factor for cardio vascular diseases (CVD). In a study conducted to find out relation between lipid profile and rheumatoid arthritis, it was found that atherogenic lipid abnormality was often seen in patients with rheumatoid arthritis. It is also hypothesized that, rising lipid profile might be related to the development of RA by a common or linked background. This could be due to socio- economic (including dietary) or a genetic background. Alternately lipids might modulate the susceptibility to the development of inflammatory diseases such as RA.

The LDL levels are quite abnormal in RA which is associated with increased risk factors for cardio vascular diseases. When LDL becomes dense and concentrated, LDL gets oxidized and leads to a cascade of inflammatory process and ultimately causes atherosclerosis. The proinflammatory HDL is associated with elevated oxidized LDL and promotes inflammation. This process elevates phospholipids which will be great risk to cardio-vascular diseases.

It has been observed that relatively low values of dyslipidemia renders RA patients at three fold increased CVD risk. Patients with RA need stringent management of dyslipidemia which will benefit these patients by lowering the risk for development of various CVD. Lipid lowering drugs may have beneficial effects in RA as these drugs have anti-inflammatory and immune
modulatory properties also.

**Summary and Conclusion**

RA is an idiopathic, inflammatory disease and is associated with dyslipidemia in significant number of patients. RA associated dyslipidemia increases the risk for various cardio vascular diseases. Detection and management of dyslipidemia in RA should be part of routine management of RA patients. The findings of this study warrants further research involving larger cohort of RA patients because little is known about relation between inflammation and lipoprotein levels which determine the risk to cardio vascular disease in RA patients.

Study of Prevalence of Migraine Associated with Cardio-Vascular Diseases in Women of Maharashtra Population

Ashok R. Kulkarni¹, Vanita A Kulkarni²

¹Associate Professor, Department of Medicine. Prakash Institute of Medical Science, Urun Islampur; Sangli District Maharashtra, ²Professor and Head, Department of Microbiology Government Medical College Miraj (Maharashtra)

Abstract

50 adult females patients aged between 20-55 years old, having complaint of migraine were studied. Their associated clinical problems were obesity 7(14%), hypertensive 16(32%), D.M-9(18%), alcoholic 5(10%), usage of oral contraceptives 8(16%), insomnia 5(10%). Their previous history was hypertension 20(40%), hypcholesterolemia 14(28%), IHD.7(14%), stroke 5(10%), MI 4(8%). Their menstrual status was, normal menses patients were 15(30%), irregular menses 10(20%), menorrhagia 10(20%), oligomenorrhea 5(10%), premenopausal 5(10%) post-menopausal 5(10%). This study of migraine, associated with cardio-vascular diseases will be quite helpful to physician, cardiologist and endocrinologist because etiology of migraine is still obscure.

Keywords- Migraine, IHD= Ischemic heart disease, MI= Myocardial infaction

Introduction

Migraine is a primary headache disorder which mainly affects the women than men i.e. women are affected three to four times more than men (1)(2). Migraine is a specially migraine with aura , has been consistently associated with increased risk of stroke, including both ischemic and hemorrhagic subtypes. (3)(4) Although pathophysiology of migraine has close links with the vascular system, the mechanism by which migraine increases the risk of stroke remains unclear(5). The probable factors could be endovascular dysfunction, increased thrombotic susceptibility. ** Many prospective studies have reported * association between migraine and * cardiovascular diseases including ischemic heart diseases and cardio vascular death. Hence attempt was made to evaluate the migraine and associated diseases of cardio vascular system in females of different age groups so that such patients can be treated efficiently to avoid the cardio vascular death.

Material and Method

50 adult female patients aged between 20 to 55 years old, having complaint of migraine who were regularly visiting Prakash Institute of Medical Sciences Urun Islampur-415409, Sangli District Maharashtra* were selected for study. These patients had migraine with different complaints like unilateral pain, some had throbbing pain, aggravated by movement , nausea, vomiting, photophobia.*

Other associated findings were hypercholesterolemia, D.M, use of oral contraceptive, alcoholism. These women with migraine mainly associated with cardiovascular disease like IHD, MI.* It was confirmed by ECG, echocardiography and angiography, moreover lipid profile, Troponin test were also carried out and treated accordingly. The duration of study was about 2 years and 8 months.

Table-3: Menstrual status of women suffering with migraine. Female having normal menses were 15 (30%), irregular menses 10(20%), oligomenorrhea 5(10%), menorrhagia 10(20%), premenopausal 5(10%), post-menopausal 5(10%).

Discussion

In the present study of prevalence of migraine associated with CVD, the obese females were 16 (32%), females with diabetes mellitus were 9(18%), alcoholic were 5 (10%), females using of oral contraceptive were 8(16%), and insomnic were 5 (10).(Table-1). In this study, the previous history of hypertension was noted in 20 (40%) females, Hyper cholesterol were 14 (28%) IHD were 7(14%) stroke 5(10%) MI 4(8%) (Table-2). The menstrual status of women suffering with migraine was-- normal menses females were 15 (30%), irregular menses 10(20%) menorrhagia 10(20%), oligomenorrhea5(10%) premenopausal 5(10%) post-menopausal 5 (10%) (Table-3). These finding were more or less in agreement with previous studies. Increased thrombogenic susceptibility which enhance the thrombogenic action as a indicator of migraine which leads to inflammation of neuro –vascular bundle.

Moreover due to increased body mass index and hypercholesterol in women, the migraine is quite common in them, which correlates with CVD which aggravates, the hormonal secretions hence majority of the females have variation in the menstrual status (Table-3).
It can be also hypothesized that obesity, D.M, usage of contraceptives will have more cholesterol, which leads to hypertension, moreover insomnia causes anxiety, which also elevate the blood pressure and obstruct the release of neurotransmitters which causes inflammation* and results into migraine.

Obstruction or slow release of neurotransmitters may impair the release of endocrine glands, hence variation in the menses profile, D.M. is observed in the women suffering with migraine 9(18%).

Due to the variation or in-coordination between neurovascular flow and hyper cholesterolemia may lead to Ischemia, MI, and stroke in these patients.

Migraine with aura can be described as variation in the secretion of neurotransmitters such as GABA, dopamine, serotonin etc because migraine is mainly associated with depression. It is established fact that majority of Indian women are suffering with OCD (obsessive compulsive disorder) hence hypnotic drugs are used to treat migraine.

Hence it can be associated with depression, lethargy, elevated lipid profile which results into CVD.

**Summary and Conclusion**

The present study of prevalence of migraine associated with CVD in females of Maharashtra will be quite helpful to physician, cardiologist, psychiatrist and endocrinologist also because migraine is associated with many hormonal irregular secretions. Because exact cause and mechanism of migraine is still unclear the study warrants further hormonal genetic angiological neurological evaluation.

Study of Respiratory Tract Infection in Diabetic Mellitus Patients of Maharashtra Population

Nitin Chitte¹, Ashok S Bansode²

¹Senior Resident, ²Assistant Professor Department of Pulmonary Medicine, Prakash Institute of Medical Sciences And Research Urun Islampur, Dist. Sangli, Maharashtra

Abstract

90 patients (65 males and 25 females) aged between 32 to 60 years known diabetic suffering with respiratory tract infections were studied. Their habits were smoking 24(26.6%) tobacco chewers 20 (22.2%), alcoholic 19(21.1%), sedatives 6(6.6%), non-addicted patients were 21(23.3%). Their symptoms were cough 20(22.2%), fever 25(27.7%), breathlessness 8(8.8%), chest pain 6(6.6%), Anorexia 9(10%), haemoptysis 10(11.1%), weight loss. (13.3%), organism observed were mycobacterium 39(43.3%), pseudomonas aeruginosa 12(13.3%), influenza (H1N1) 10(11.1%), klebsiella pnemonia 9(10%). No pathogens in found in 20(22.2%). Radiological study had maxillary sinusitis 22 (24.4%), frontal sinusitis 8(88%), DNS 11(12.2%), allergic rhinitis 10(11.1%). Pulmonary infection 39(43.3%). Among infection bilateral infection was 20(22.2%), unilateral infection was 19(21.1%). In the lesion study of pulmonary was exudate was 19(21.1), nodular was 12(13.3%), cavity formation was 8(8.8%). Associated complications besides respiratory tract infections were vasculopathy 24(26.6%), retino pathy 16(17.7%), nephropathy 10(11.1%), neuropathy 6(6.6%), and no abnormal complication in 34(37.7%), patients. This study will be certainly helpful to physician, radiologist, pathologist and endocrinologist because respiratory tract infection in diabetes mellitus is characterized by alterations in host defense in the entire body. The D.M strongly associated with micro vascular and neurological complication.

Keywords – DM = Diabetes Mellitus Pulmonary, Respiratory Hyperglycemic

Introduction

Diabetes mellitus is a clinical syndrome associated with deficiency of insulin secretion or action. It is considered one of the largest emerging threats to health in the 21st century It is predicted that there will be 380 million persons with DM Globally in 2025(1) DM is associated with reduced response of T cells, neutrophil functions and disorder of humoral immunity. (2)(3) consequently. DM increases the susceptibility to infections like streptococcus pneumonia and influenza virus(4) and pulmonary tuberculosis which is multidrug resistant tuberculosis and that treatment failures and death are more frequent in these patients. In addition tuberculosis infection and treatment may complicate the glycemic control. The magnitude and duration of D.M is strongly associated with the severity of micro vascular and neurological complications.(5) The presence of these complications add to the risk of infections may also be based on conditions that interfere with normal clearance mechanism immune cells function. Hence attempt was made to study the symptoms, habits, organism involved in the respiratory tract infections in D.M Patients Moreover associated complications of DM Patients suffering with respiratory tract infections were also studied so that this study will be useful to physician to correlate or predict the possible complications and treat the patients efficiently.

Discussion

In the present study of respiratory tract infections in diabetic mellitus patients of Maharashtra smoking were 24(26.6%), tobacco chewers were 20(22.2%) alcoholic were 19(21.1%), on sedatives were 6(6.6%) and patients without any addictions were 21(23.3%) (Table-1) as already these patients have reduced immunity and habits like smoking, chewing tobacco, alcohol again curtails the immunity and patients would be more prone for infection whenever there is change in climate, food intake, etc. The symptoms of respiratory tract infected diabetic patients had cough 20(22.2%), fever 25(27.7%), breathlessness 8(8.8%), chest pain 6(6.6%), anorexia 9(10%), haemoptysis. 10 (11.1%), weight loss 12(13.3%) (Table – 2)

Organism observed in respiratory tract infected diabetic patients mycobacterium bacilli were 39(43.3%), pseudomonas aeruginosa were 12(13.3%), influenza (H1N1) were 10(11.1%) klebsiella pneumonia were 9(10%). Patients without any abnormal disease were 20(22.2%). (Table -3) In the radiological study of respiratory tract infected diabetes mellitus patients had maxillary sinusitis were 22 (24.4%), frontal sinusitis were 8(8.8%), deviated nasal septum were 11(12.2%) allergic rhinitis were 10(11.1%) pulmonary infected patients were 39(43.3%) among these patients unilaterally infected were 19(21.1%) and bilaterally infected were 20(22.2%), in the study of pulmonary lesions – exudative were 19(21.1%), nodular were 12(13.3%), and cavity formation were 8(8.8%). These findings were more or less in agreement with previous studies (6)(7)(8) It is suggested that, DM depresses the immune responses (eg. Chemotaxis, phagocytosis, and antigen presentation in response to all above mentioned) pathogens like mycobacterium, pseudomonas aeruginosa, etc infection and affecting T – cell function and proliferation) facilitating infection and progression to symptomatic diseases. Staphylococcal infections is a major pathogen in the etiology of both community acquired and nascomial pneumonia in DM patients.
Gram negative aerobes cause all community acquired respiration infections.\(^9\) Gram positive cocci. H. influenza associated with high risk of respiratory tract infection in DM patients.

Next to mycobacterium: in the present study the associated complication were vasculopathic patients were 24(26.6%), retinopathic were 16(17.7%), nephropathic were 10(11.1%) neuropathic were 6(6.6%), and patients with no abnormal complications were 34(37.7%), (table-5) These findings were more or less in agreement with previous studies\(^{10}\) Apart from mycobacterium these associated complication leads to morbidity and mortality. These complications are due to hyperglycemia which impairs wide range of functions in neutrophils and monocytes (macrophages). In addition to this DM alters the function of capillary endothelium, the rigidity of red blood corpuscles and changes oxygen dissociation curve which results into vascular, neural, nephropathic complications moreover, some medication may impair the host defense Eg. Calcium channel blockers may impair the phagocytic function where as digoxin may decrease the clearance of pnemocci from the lower respiratory tree, anti DM medication cause abnormalities in ciliary motility which causes upper respiratory infections like sinusitis, allergic rhinitis etc.

**Summary and Conclusion**

The present study of respiratory tract infection in DM patients of both sexes in Maharashtra is quite helpful to the physician, pathologist and radiologist to correlate the symptoms, clinical features and associated complications but this study demands further histopathological, genetic, molecular, radiological studies because exact interaction of host defense with respiratory pathogens is still obscure and specific pulmonary immune mechanisms in DM patients is yet to be known.

Study of Diabetic Neuropathy among Telangana Population

Rajhounsh Veershattappa
Assistant Professor, Department of General Medicine, MNR Medical College and Hospital,
Sangareddy, Telangana State

Abstract

90 known diabetic patients (48 females 42 males) aged between 30-68 years old of Telangana region were studied. The regional classification of diabetic neuropathy was, distal symmetrical peripheral neuropathy were 32(35.5%) proximal neuropathy were 18(20%) cranial and truncal neuropathy were 12(13.3%). Mononeuropathy multiplex were 28(31.1%), the clinical manifestation were cardio vascular were 25(27.7%), included HTN – 11(12.2%), tachycardia 9(10%) orthostatic hypotension 5(5.5%), Gastrointestinal were 27(30%) included oesophageal 6(6.6%), Gastroparesis 8(8.8%), Constipation 6(6.6%), diarrhea 7(7.7%). Genitourinary 23(25.5%) included Erectile dysfunction 7(7.7%), Neurogenic bladder 10(11.1%), Cystopathy 6(6.6%). Miscellaneous were 15 (16.6%) included sweating disturbance 6(6.6%), heat intolerance 5(5.5%), hypoglycemia 4(4.4%), Biochemical study included duration of D.M 1 to 4 year were 10(11.1%), 5 to 10 years were 32 (35.5%) more than 10 years were 48(53.3%), FBG – in 44(48.8%), patients had 197 to 210(mg/dl), 46(51.1%) patients had 211 to 232(mg/dl) HbA1c value in 42 (46.6%) patients had 8.89 to 9.10 (mg/dl) patients had 9.20 to 10.5(mg/dl). Total cholesterol in 41(45.5%) patients had 177 to 181 mg/dl, 49(54.4%) had 182 to 184 mg/dl. LDL levels in 38 (42.2%) patients 102 to 107 mg/dl. 52(57.7%) patients 108 to 111 mg/dl. Triglyceride level in 39(43.3%), was 149 to 152, 51(56.6%) patients had 153 to 158 mg/dl. Systolic BP in 46(51.1%) patients had 132 to 137 (mmHg) 44(48.8%) patients had 138 to 141(mmmHg). Diastolic BP in 43 (mmHg) (47.7%) patient had 83.8 to 85.2 (mmHg) 47(52.2%) patients had 86 to 90 (mm/Hg). This study will b quite useful to endocrinologist, physician to correlate the regional DN and its clinical manifestation, bio-chemical study to rule out the severity of disease and treat the patients efficiently.

Keywords : DM, DN, FBG, HbA1c, Telangana

Introduction

Diabetic neuropathy is (DN) is a common disorder and defined as sign and symptoms of peripheral nerve dysfunction in a patients with diabetes mellitus (DM) in whom other causes of peripheral nerve dysfunction have been excluded. These is a higher prevalence in India and associated with cardio vascular mortality. It needs hospitalization more frequently than other complications of diabetes. And also most common cause of nontraumatic amputation. Diabetic neuropathy accounts for silent myocardial infarction and shortens the little span because it impairs cardiovascular autonomic control in diabetes mellitus patients. All types of diabetic patients, insulin dependent diabetic mellitus (IDDM), non Insulin dependent diabetes (NIDDM) and secondary diabetic patients can develop neuropathy. The prevalence of neuropathy increases with the duration of diabetic mellitus.

Hence attempt was made to study the DN patients with various parameters so that endocrinologist, physician can treat such patients efficiently to prevent the risk factors of morbidity and mortality.

Material and Method

90 known diabetic patients (48 females, 42 male)
aged between 30-68 years old who were regularly visiting
Mamtha medical college Khummum, MNR medical
college and hospital Sangareddy 502294, Telangana
were selected for study. Each patient was studied with
their sign and symptoms, past history, duration of
diabetes mellitus, associated clinical manifestations,
their blood pressure (SBP, DBP) was recorded, FBG,
HbA1c test were carried out, moreover. Total cholesterol,
LDL triglyceride test were also carried out to know the
severity of DM, and DN. HIV and malignant patients
with DM were excluded from the study.

This study was done in two institutions of Telangana.
1 – Mamatha medical college Khumum & 2- MNR
medical college and Hospital Sangareddy. The duration
of study was about three years.

Table 3: Biochemical analysis of Diabetic neuropathic patients 1- duration of diabetic milletus (DM) patients – 1 to 4 years DM were 10(11.1%), 5 to 10 years were 32 (35.5%), more than 10 years were 48(53.3%).

2. Fasting blood glucose (FBG) value in 42 (46.6%), mg /dl. patients had 8.89 to 9.10, mg / g. 48(53.3%), patients had 9.20 to 10.5

3. HbA1c value in 42(46.6%) patients had 8.89 to 9.10, mg /dl. and in 48 (53.3%) patients had 9.20 to 10.5 mg / dl.

4. Total cholesterol value in 41(45.5%) patients 177 to 181, mg/dl. and in 49 (54.4%) patients had 182 to 184, mg / dl.

5. LDL value in 38(42.2%) patients had 102 to 107mg /dl. 52(57.7%) patients had 108 to 111. mg /dl.

7. Systolic B.P – in 46(515%) patients had 132 to 137(mmHg) 44(48.8%) patients had 138 to 141, (mmHg)
8. Diastolic BP: In 43 (47.7%) patients had 83.82 to 85.20 (mmHg), in 47 (52.2%) 86 to 90 (mmHg)

**Discussion**

In the present study of Diabetic Neuropathy (DN) in Telangana population. The regional classification of DN was distal symmetrical peripheral neuropathy patients were 32 (35.5%) proximal neuropathic were 18 (20%) cranial and truncal neuropaths were 12 (13.3%) Mono neuropathic multiplex were 28 (35.5%) (Table-1). These values were more or less in agreement with previous studies. Among these DN Distal symmetrical polyneuropathy is quite common (35.5%). It may be sensory or motor and may involve small or large fibres or both. Sensory impairment occurs in glove and stocking distribution and motor signs are not prominent. The sensory symptoms reach up to knee level before the fingers are involved because of length dependent dying back process. Fibre dependent axonopathy results in increased predisposition in taller people. Distal symmetrical polyneuropathic is further classified into large fibre and small fibre neuropathy. Large fibre neuropathy is characterized by painless paresthesia with impairment of vibration, joint position, touch and pressure sensations and loss of ankle reflex. In advance stage sensory ataxia may occur. Large fibre neuropathy results in slowing of nerve conduction, impairment of quality of life and activities of daily living. Small fibre neuropathy on the other hand associated with pain and temperature sensations which are often associated with autonomic neuropathy. About 15% diabetic patients experience persistent pain in DN. Pain in DN can be spontaneous or stimulus induced, severe or intractable. DN pain is typically worst in night can be described as burning, pins, and needles, shooting, aching, jabbling, sharp, cramping, tingling, cold, or allodynia. Some patients develop predominantly small fibre neuropathy manifesting with pain and paraesthesia early in the course of diabetes that may be associated with insulin therapy (insulin neuritis). Sometimes acute DN pain is associated with weight loss and depression and has been formed as diabetic neuropathic cachexia. This syndrome commonly occurs in men and can occur at any time in the course of both type -1 and type II diabetes. It is self limiting and responds to symptomatic treatment.

Diabetic autonomic neuropathy affects various parts of the body (Table-2) Cardiovascular 25 (27.7%), includes HTN 11 (12.2%) tachycardia 9 (10%), orthohypotension 5 (5.5%)

**GIT** – 27 (30%) includes oesophageal dysfunction 6 (6.6%), gastroparesis 8 (8.8%), constipation 6 (6.6%), diarrhea 7 (7.7%), Genito-urinary 23 (25.5%), includes erectile dysfunction 7 (7.7%) neurogenic bladder 10 (11.1%) cystopathy 6 (6.6%). Miscellaneous manifestations (16.6%) included sweating disturbance 6 (6.6%), heat intolerance 5 (5.5%), hypoglycemia 4 (4.4%) (Table-2) Because of diversity of symptoms autonomic DN often goes un-noticed by both patients and physician. Proximal DN includes thoracic radiculopathy and proximal diffuse lower extremity weakness that should be grouped under a single term diabetic polyradiculopathy, as these are diverse manifestations of the same phenomenon, root or proximal nerve involvement. The weakness of pelvio-femoral muscle occurs abruptly in step wise manner in severe DN even knee reflex is reduced or absent. Diabetic truncal neuropathy 12 patients (13.3%) is associated with pain and paresthesia in T4-T12 in chest or abdominal distribution. Bulging of abdominal wall may occur because of muscle weakness. Mono neuropathies had nerve entrapment than infarction hence carpal tunnel syndrome is three times more in DM patients than non-DM patients. Multiple DN had involvement of two or more nerves (28 patients 31.1%) and nerve infarction occurs because of occlusion of vasa nervorum and should be differentiated from systemic vasculitis. In DM viscosity of blood reduced due to hyperglycemia and many bio-chemical changes in blood occurred (Table-3)

**Summary and Conclusion**

The present study diabetic neuropathy among Telangana population is quite useful to endocrinologist, physician and pathologist to diagnose and treat the risk factors of DM patients. But this study demands further genetic, patho-physiological, nutritional and bio molecular study because exact mechanism of hyperglycemia with nervous system and neuromuscular junction is still unclear. Unfortunately the basic research of DN focused on carbohydrate metabolism, amino acids and lipids bio-chemical changes rather than nervous, neuro-vascular, neuromuscular junctions and neurotransmitters study

Study of Level of Serum Magnesium in Bronchial Asthma Patients of Telangana Population

Rajhounsh Veershettappa
Assistant Professor, Department of General Medicine M.N.R Medical College and Hospital Sangareddy, Telangana State

Abstract

70 patients (45 males and 28 females) aged between 30 to 70 year old suffering with bronchial asthma and control or normal group of 70 volunteers who did not have any respiratory diseases were studied. The mean value of BMI in bronchial asthma patients was 24.5 (SD±0.62), in control group-7 was 26.4 (SD±1.065) ‘t’ test value was 17.2 (p <0.0 ) p value was highly significant. Mean value of FEV1, in bronchial asthma patients was 44.9 (SD±0.043) and in control group it 93,4 (SD±1.37), ‘t ‘ test was 27.9 (p<0.01) the p value was highly significant. The mean value of serum magnesium in bronchical asthma patients was 1.66 (SD±0.1) and in control group it was 2.27 (SD± 0.02) ‘t’ test was 35.62 (p<0.00) this study of comparison between BMI, FEV1 and S. magnesium will be certainly helpful to physician, chest-medicine, specialist to predict or explore other values by knowing any one value of studied parameter. So that bronchial asthma can be treated efficiently because bronchial asthma is an idiopathic and allergic disease.

Keywords : BMI, FEV1, S.mg, Telangana.

Introduction

Magnesium has been considered as an adjunct therapy for severe and life threatening asthma exacerbation. Magnesium can induce bronchial smooth muscle relaxation in dose- dependent manner by inhibiting calcium influx into cytosol histamine release from mast cells or acetylcholine release from cholinergic nerve endings. It also may increase bronchodilator effect of β2 agonist by increasing the receptor affinity. The usage of magnesium (Mg) was first reported by Okayama in 1936, by infusing in asthma patients. At the same time usage of nebulised Mg also gained scientific interests, as an adjacent therapy to improve pulmonary functions and reduce hospitalization of bronchial asthma patients. Hence attempt was made to study the levels of Mg in asthmatic patients and compared with normal healthy subjects. Physician can differentiate the severity of the diseases by knowing the levels of Mg and treat the patient efficiently and avoid the risk of morbidity and mortality.

Material and Method

70 patients 42 males 28 females aged between 30 to 70 years old suffering with bronchial asthma were selected for study. And healthy 70 volunteers who did not have any respiratory disease were selected for study as control (normal group)

Their previous and present history, occupations, duration of asthma was noted. Pulmonary function test was carried by using spirometry, peak expiration flow rate (PEFR). Forced expiatory volume (FEV) was noted. Venous blood was collected from each patient for study of serum magnesium, ESR AEC study. Collected blood was allowed to coagulate, then centrifuged to separate serum and kept at -20° in Effendorf tubes. Serum magnesium level was measured by using ELISA kit. Apart from this chest-x-ray, sputum for AFB investigation was also carried out in bronchial asthmatics. The bronchial asthma patients suffering with HIV, malignancy diabetes

were excluded from the study. The studied parameters including BMI in both control group and bronchial asthma patients were compared statistically by using SPSS software. This study was carried out in two medical colleges of Telanagana, 1) Mamata Medical college Kummam and 2) MNR medical college Sangareddy (Telengana state). The duration of this study was about three years.

Statistically S.Magnum values are significantly less in Bronchial asthma patients than normal peoples \( (p<0.01) \).

**Discussion**

In the present study of level of serum magnesium among Telangana population BMI mean value in bronchial asthmatics patients was 24.54 (SD=0.62) and in controlled group it was 26.44 (SD=0.65) ‘t’ test value was 17.24 difference was 68 \( (p<0.01) \) p value was highly significant (Table-1).

The FEV mean value in bronchial asthmatic patients was 44.99 (SD= 0.043) and controlled group it was 93.49 (1.137) ‘t’ test value was 279.7 difference value was 68 \( (p<0.001) \) p value was highly significant (Table 2).

The level of Serum Mg, mean value in bronchial asthma patients was 1.66 (SD±0.14) and controlled group it was 2.27 (SD±0.02) ‘t’ test value was 35.6 difference was 68 \( (p< 0.01) \) The P value was highly Significant (Table-3). These obtained value were more or less in agreement with previous studies(56).

Serum magnesium plays vital role in the pathophysiology of allergic reactions especially in bronchial asthma(7). Contraction and dilation of myofibrillar proteins in smooth muscles of bronchi are due to the
phosphorylation and de-phosphorylation process which includes enzymes myosin kinase and myosin phosphates. Myosine kinase is magnesium dependent and myosine phosphatase is calcium dependent enzyme. Since magnesium is involved in calcium transport across the cellular membrane, both enzymes directly or indirectly influenced by magnesium (S.Mg) level\(^8\). Hence S.Mg plays vital role in contraction and dilatation of muscles of broncho-alveoli. Therefore reduction in S.Mg level leads to hyperactive of broncho- alveoli. Thus there will be aggravation of respiratory movement usually observed in bronchial asthma and there is reduced FEV\(_1\) level also (Table-2,3). It was proved that S.Mg level 2gm is ideal to treat the bronchial asthma S.Mg is also used as tocolytic agent for preterm labor, given I.V route up to 6gm/dl but continuous infusion may cause major toxicity when S.Mg is at 9 gm/dl and above causes loss of reflexes, blurred vision, lethargy muscle weakness, pulmonary Oedema\(^9\). In the case of hyper magnesium level hemodialysis was done to prevent high risk to renal function. Hence nebulised Mg is proved more efficient to control or relive from episodes of bronchial asthma as adjacent dosage. Treatment of altered Mg++ status depends on the clinical setting and may include the addition of a potassium/mg++ sparing drug to an existing diuretic regimen.

S.Mg is a cofactor of over 300 intracellular enzymatic reaction utilizing high energy phosphate bounds, magnesium has been implicated in smooth muscle contraction. Apart from relaxing bronchial smooth muscle it has calcium channel blocking properties, inhibition of cholinergic neuromuscular transmission with decreased sensibility to the depolarizing action of acetylcholine and stabilizing the mast cells, T-lymphocytes\(^10\), stimulation of nitric oxide and prostacyclin.

**Summary and Conclusion**

The present study of S.Mg in bronchial asthma patients among Telangana population is quite helpful to physician to treat the bronchial asthma with S.Mg as an adjacent dosage for relaxation of hyper activity broncho alveoli. This study suggests there is a strong relationship between intracellular Mg levels and methacholine bronchial reactivity. Hence Mg level alterations may play a role in the pathogenesis of bronchial asthma. But this study demands further patho- physiological, genetic, bio molecular, nutritional study to throw more light upon this subject because exact intracellular action of S.Mg on smooth musculature of broncho-alveolar is still unclear.

Study of Risk Factors in Type -2 Diabetes in Both Sexes of Maharashtra Population

Ashok R Kulkarni¹, Vanita A Kulkarni²

¹Associate Professor, Department of Medicine, Prakash Institute of Medical Sciences, Urn, Islampur, Dist.Sangli, Maharashtra, ²Professor and Head , Department of Microbiology Government Medical Collage, Miraj, Maharashtra

Abstract

Out of 90(ninety) type -2 diabetics 45were males and 45 were females. The age of the both sexes was about between 40-60 years old. The various parameters like * systolic blood pressure, diastolic blood pressure, diabetic retinopathy, diabetic foot, hypercholesterolemia & lipid disorders, cardiovascular diseases like IHD were studied . In the systolic blood pressure study, hypertensives * 32(71%) were males, 30(66.6%) were females.while in diastolic hypertensives, 22(48.8%)were males, 18(40%) were females. In diabetic retinopathy 5(11.1%) were males, 6(13.3%) were females. In the diabetic foot, males were 4(8.8%) and females were 3(6.6%). The duration of diagnosis of type-2 diabetes varied from 7 to 3 years. 12(26.6%) were males, 15(33.3%) were females-diagnosed 7 years back ; 24(53.3%)were males, 22(48.8%)were females-diagnosed 5 years back ,while 9(20%) were males, 8(17.7%) were females-diagnosed 3 years back. Increased level of cholesterol was observed:-31(68.8%) were males,33(73.3%) were females. Increased triglyceride level was observed :- 30(66.6%)were  males,35(77.7%)  were  females. Increased LDL level was 7(15.5%) in males, 8(17.7%) in female . Decreased HDL level was 15(33.3%) in males, 13(28.8%) in females. Increased albumin excretion was 4(8.8%)in females. and other CVD were 7(15.5%) in males, and 6(13.3%)in females. this study of risk factors in type diabetic will be helpful to physician ,cardiologist and endocrinologist to avoid premature mortality of such patients because excess mortality was noted even in patients without hypertension and increased lipid profile

Keywords – type:2 diabetes , CVD=cardio vascular disease HTN =hypertension HDL,LDL

Introduction

Type -2 diabetes is one of the major cause of mortality and morbidity in India and abroad as well. 19.8% of men and 24.8% of women deaths occur due to diabetes(2) Heart disease is the major cause of death associated with diabetes(3)(4). The prevalence of type -2 diabetes is increasing quickly in developing countries like India because of changes in life style which have occurred in last decades. According to estimate provided by the world health organization (WHO), by the year 2025 more than 75% of people with diabetes will be living in the developing countries.(5) The majority of the people with the type -2 diabetes are aged between 40 to 65 years that correspond to the most productive period of their lives. Better management of disease has resulted in the longer survival of patients with type -2 diabetes. As type_2 diabetes is associated with obesity,CVD, * various parameters were used to rule out the severity of the type- 2 diabetes so that the risk factors can be treated efficiently and the life span of type-2 diabetes patients can be prolonged for longer time.

Materials and Method

45 males and 45 females of know type -2 diabetic patients (total 90 patients) who were regularly visiting Prakash Institute Of Medical Sciences, Urn- Islampur 415409(Maharashtra) were selected for the study . The
age of the patient in both sexes was about 40-60 years. The biochemical examination—fasting glucose, HBA1c, total cholesterol, triglyceride, high density lipoprotein (HDL), low density lipoprotein (LDL) S-CK MB, S. troponin-1 test were carried out to rule out cardiac diseases. Visual examination was also done to find out diabetic retinopathy. The blood pressure of the patient was also recorded (DBP SBP). Moreover their family history of diabetes and cardiovascular diseases were also noted. The duration of this study was about three years.

</table>

Table-3. In the cardiovascular study of type-2 diabetic patients IHD were 5(8.8%) in males, and 4(8.8%) in females and other cardiovascular disease were 7(15.5%) in males and 6(13.3%) in females.

**Discussion**

This study indicates that the disease was lately diagnosed, 12(26.6%) were males, 15(33.3%) females was diagnosed after 7 years. 24(53.3%) males 22(48.8%) females were diagnosed after 5 years and 9(20%) males 8(17.7%) females were diagnosed after 3 years (table 2) hence they were late to get proper treatment.

The blood pressure - systolic blood pressure was studied- 23(51.1%) were males, 18(40%) were female hypertension. While in diastolic hypertensive 23,(51.1%) were males, 27(60%) were females. Diabetic retinopathy were 5(11.1%) in males, 6(13.3%) were female patients. Diabetic foot was observed in 4(8.8%) in males, 3(6.6%) in females. These finding were more or less observed in previous studies.

In the present study increased cholesterol level was 31(68.8%) in males 33(73.3%) in females. Increased triglyceride was 30(66.6%) in males, 35(77.7%) in females. the LDL level was increased in 7(15.5%) in males, 8(17.7%) in females. decreased HDL Level was 15(33.3%)In males, 13(28.8%) in females. Increased excretion of albumin was 4(8.8%) in male patients and 5(11.1%) in female patients (table2). These finding were also more or less in agreement with previous studies. Moreover ischemic heart disease(IHD) was 5(11.1%) in male patients 4(8.8%) in female patients other CVD were 7(15.5%) in males and 6(13.3%) in females (tableNo3). These findings also more or less in agreement with previous studies. The cardiovascular disease is lesser in females could be due to better glycemic control among females as compared to males. High blood glucose level leads to oxidative stress and mitochondrial overproduction of superoxide which has been recognized in the pathogenesis of diabetic micro and macro vascular complication, leads to diabetic retinopathy, IHD and diabetic foot etc. As noted earlier changes in life style and carbohydrate and fatty food intake leads to increase in serum cholesterol and triglycerides which are significantly associated with CVD risk factors.

**Summary and Conclusion**

The present study of risk in type-2 diabetes in both sexes of Maharashtra population will be helpful to physician and cardiologist to prevent the risk factors in due course of time by treating such patients meticulously efficiently but this study demands further genetic and nutrition study because exact mechanism of genetic constitution for elevation of lipid profile, hyperglycemia blood pressure is still obscure.

Prevalence and Antithrombotic Management of Atrial Fibrillation in the Elderly Patients

Tilak Ram¹, Rajkumar Dhonthula²
¹Assistant Professor, Department of General Medicine Mediciti Institute of Medical Sciences, (MIMS) Ghanpur, Medchal Mandal and District, Telangana State, ²Assistant Professor, Department of General Medicine Institute of Medical Sciences Ghanpur Medchal Mandal and District Telangana State

Abstract

Atrial fibrillation is associated with an increased risk of thromboembolic events like stroke which is a leading cause of morbidity and mortality worldwide. If AF is treated with anticoagulant therapy in selected patients, it improves outcome in such patients. Out of 200 elderly patients aged between 65 to 78 years of age selected for the study 30 patients (15%) were diagnosed as Atrial Fibrillation. Out of these 30 patients with AF 7(23.3%) were alcoholic, 6(20%) had generalized anxiety, 8(26.6%) had stressful life, 5(16.6%) were having over intake of salt and fatty food, 4(13.3%) were tobacco chewers. Seven patients (23.3%) were hypertensive, 5(10.6%) had Diabetes mellitus, 8(26.6%) had coronary heart disease, 4(13.3%) had hyperthyroidism, 3(10%) had abnormal cardiac valve, 3(10%) had peripheral arterial diseases. In the study of Bleeding risk scores Atria had – 3 anemic, 2 had severe renal disease, 1 was above 76 years of age, 2 had HTN. In HAS-BLED score 1 had HTN, 1 had abnormal liver or kidney function, 1 had stroke, 1 had bleeding, 1 was above 76 years of age, 1 had drug or alcohol abuse, In Hemorrhagic score 1 had hepatic or renal disease, 1 was above 75, 1 had reduced platelet count, 1 had re-bleeding, 1 had HTN, 1 was anemic, 1 had genetic factor, 1 had stroke. Aspirin and clopidogrel are in routine use as antithrombotic while heparin and various oral agents are widely used as anticoagulant. This study in elderly patient highlights the need for screening for detection and appropriate treatment of AF to prevent various embolic complications like stroke and mitigate the burden of high morbidity and mortality in such patients.

Keywords: AF= Atrial fibrillation, HTN = Hypertensive, DM=Diabetes mellitus VKAs= Vitamin K antagonist, OAC= oral anticoagulant

Introduction

Atrial fibrillation is a common disease in the elderly. Among patients with atrial fibrillation (AF) elderly patients have worse prognosis with higher mortality and major adverse cardiovascular events compared with subjects between 50 to 60 year.(1) The risk of stroke is increased four to five folds in patients with AF, particularly in elderly. AF contributes significantly to risk of symptoms, hospitalization, and stroke. Ischemic strokes associated to AF are more likely to be chronically disabled, bedridden, and require constant nursing care particularly in elderly.(2) Therefore, prevention of stroke is an important goal in these patients. In this context, anticoagulation should be considered for such patients. However age is not the only independent predictor of stroke in AF patients but also of bleeding (3). AF is a challenging issue in elderly subjects due to their high number of co morbidities including cardiovascular diseases, kidney diseases, cognitive disorders, falls and poly pharmacy(4). As a result, the management of these patients is challenging in most cases. Although the use of anticoagulants has increased in the last years, they are still underused in elderly population. Hence, attempt
has been made to find out appropriate management of patients with AF and provide some practical recommendation about controversial issues so that such patients can be managed more efficiently.

Material and method

Two hundred elderly patients aged between 65 to 78 years visiting Medicine department at Medicitii Institute of medical sciences and Hospital Ghanpur Medchal Mandal Telangana- 501401 were studied. These patients were being treated for peripheral vascular disease, HTN and other cardiovascular diseases. Out of these 200 patients, 30 patients (15%) were diagnosed and confirmed as AF. The history of individual patients was studied. All essential radiological, biochemical, ECG test were carried out to study AF and treated accordingly.

This is a cross-sectional observational study conducted over a period of three years from 2015 to 2018. Majority of patients belonged to middle socio-economic status. Most of them were alcoholic, tobacco chewers, and leading stressful life. The male female ratio was 2:1. Patients having HIV Infection and Malignancy were excluded from the study.

Table-4: Thromboembolic rate is compared with previous studies.

The present study findings are more or less in agreement with previous studies.

CHAD= congestive heart failure, Hypertension, Age, Diabetes mellitus, stroke / transient heart attack/ thrombo embolism.

Discussion

Atrial fibrillation is associated with an increased risk of thromboembolic events like stroke which causes significant morbidity and mortality worldwide. If AF is treated with anticoagulant therapy in selected patients, it improves outcome in such patients. Appropriate patient selection is essential to ensure that benefits of anticoagulant therapy outweigh the risk of bleeding due to anticoagulant. The prevalence of AF varies from 0.5%−15% depending on studied populations such as age, gender, as well as geography. Aging is an important factor for the AF pathophysiology. In the present study
of AF in elderly patients 15% patients were found to have AF (30 patients out of 200). Clinical profile of these patients revealed that some of them had associated factors which contribute to incidence of AF like alcohol or tobacco use, stressful life and excessive use of fatty food. Besides AF some of the patients had comorbid conditions like HTN, DM, CAD, hyperthyroidism and peripheral vascular disease (Table-2). In the study of bleeding risk scores in ATRIA scores – 3 were anemic, 2 had severe renal disease, 1 was above 76, 2 were HTN, 1 had abnormal liver and kidney functions, 1 had stroke, 1 had bleeding, 1 was more than 76 years, 2 had HTN and 1 had-BLED score was 1 HTN 1 had Abnormal liver and kidney functions, 1 had stroke, 1 had bleeding, 1 was more than 76 year, 1 drug or alcohol abuse. In the hemorrhages score 1 had hepatic or renal disease, 1 was above 76 years 1 had reduced platelet count or function, 1 had re-bleeding, 1 was anemic, 1 had genetic disorders, 1 had stroke(Table-3). These findings are more less in agreement with previous studies.\(^{(5),(6)}\)

It has been observed that majority of elderly individuals with AF are less likely to receive oral anticoagulants (OAC) therapies as compared with their younger counter parts\(^{(8)}\) and when treated with vitamin k antagonist (VKAs), there is a relatively high rate of discontinuation resulting in a high rate of stroke or death. This under treatment of very elderly represents a paradox because older patients are at high risk of stroke and are more likely to need anticoagulant therapy compared with younger patients. There are many reasons for the under treatment of AF in the elderly, physician related factors, patient related factors, and practical aspect of therapy. The overriding concern, however is the fear of putting the patient at risk for major bleeding as a result of anticoagulant therapy, while the fear of leaving the patient open to stroke is of lesser concern.\(^{(9)}\) Numerous trials have documented the increased risk of stroke while also showing an increased risk of bleeding with OAC therapy.\(^{(10)}\) When major bleeding is increased due to anticoagulants in elderly patients, physicians may withhold therapy or prescribe Aspirin, a clearly less effective antithrombotic therapy but one that physicians feel is less likely to cause major bleeding. New direct oral anticoagulants are rapidly gaining acceptability for stroke prevention in AF. Direct oral anticoagulants have been shown to be more effective than aspirin in preventing embolism in patients with AF and the risk of bleeding is not increased.\(^{(11)}\)

It is worth to recognize that elderly with AF have higher risk of stroke than those of youngsters. Therefore detection and appropriate management of AF with thromboembolic prophylaxis is essential in such patients. Acts of omitting anticoagulant therapy are more serious that acts of committing the therapy with anticoagulants in selected patients with AF.

**Summary and Conclusion**

The present study of AF in elderly patients highlights significant prevalence of AF especially in elderly population. There is need for careful screening programme to detect and appropriately treat AF to prevent various thromboembolic complications like stroke. It will greatly reduce the incidence of AF related morbidities and mortalities. Anticoagulant therapy in AF leads to risk reduction for primary as well as secondary prevention of thromboembolism particularly in elderly people. The use of guide line recommended stroke scoring systems in combination with a bleeding risk factor assessment can help to determine the net clinical benefits of anticoagulant therapy in older adults with AF. There is need for a larger study to understand the implications of use of anticoagulant in patients with AF.

Abstract

The question on many lips is: Will Artificial Intelligence(AI) replace human doctors? It is already apparent that AI will be able to assist clinicians in making superior decisions clinically. AI can harvest the latest medical knowledge from literature, thereby assisting in the endeavor to provide optimal patient care by assisting physicians. AI can help significantly in the reduction of human diagnostic and therapeutic errors. Important legislations that regulate patient data, like the European Union’s GPDR and the HIPAA in the US, are very protective of patient privacy. These laws require hospitals to keep certain kinds of data within local systems, thereby limiting what can go up to servers in the cloud. The need of the hour is a solution that will fulfil 3 conditions: 1. It must keep health information safe. 2. It must be able to leverage the advantages provided by the crowd. 3. It must be compliant with the privacy regulations of the government.

Key words: Artificial intelligence, healthcare.

Introduction

The success of AI in healthcare can be attributed to the fast growing accessibility of healthcare data, combined with the quick development of analytic methods in big data.¹-³ AI is capable of “learning” features from very large quantums of healthcare data, which it then uses to glean insights to be implemented in clinical practice. AI has the capacity to improve its accuracy by using feedback to learn and self correct. AI can harvest the latest medical knowledge from literature, thereby assisting in the endeavor to provide optimal patient care by assisting physicians. AI can help significantly in the reduction of human diagnostic and therapeutic errors.³,⁴,⁵,⁸ More specifically, at the stage of diagnosis, a significant amount of AI literature analyses data from electrodiagnosis, genetic testing and diagnosis imaging.

In the analysis of diagnostic images that have substantial data information, radiologists have been advised to use AI technologies.⁹

Types of AI

AI devices fall into two main categories: Machine Learning (ML) and Natural Language Processing (NLP). ML analyses structured data like genetic and imaging data. ML clusters the traits of patients and assesses the disease outcome probability.¹⁰ In contrast, NLP analyses unstructured data like medical literature and clinical notes. NLP aims to turn texts to machine readable structured data, which is then amenable to analysis by ML.¹¹

Epidemiological focus

AI literature in healthcare is mostly focussed on heart disease, cancer and nervous system disease. A double blinded validation study has shown that the IBM Watson for oncology, which is an AI system, is reliable in providing assistance in diagnosing cancer.¹² In quadriplegic patients, the control of movement has been
restored through an AI system. The Arterys cardio DL application uses AI to provide automated, editable ventricle segmentations based on conventional cardiac MRI images. The focus on these three medical areas is to be expected. They are leading causes of death. Early diagnoses are critical to preventing or delaying disease associated mortality and morbidity. These medical areas are more amenable to early diagnoses by improvements in imaging, genetics, and EMR, which are the strengths of the AI system. AI has also been used in the diagnosis of congenital cataract disease and diabetic retinopathy.

**AI devices**

AI devices are of three types: 1. Classical ML techniques. 2. Deep learning techniques. 3. NLP

Classical ML: This involves the construction of algorithms for data analysis. Patient traits and medical outcomes of interest are examples of inputs to these algorithms. Patient traits include baseline data like age and gender, and disease-specific data like clinical examination, medication history, signs and symptoms, radiological images, and gene expression. Examples for medical outcomes are patient survival times and tumor sizes. ML can be of three types: supervised, semisupervised, and unsupervised learning. A real-world example of supervised learning would be the task of grouping fruits in a basket. If the physical features of the different fruits are already known and the individual fruits in the basket are then grouped based on the prior knowledge of the physical features, it is supervised learning. Unsupervised learning would be where all the fruits are new to us, and we then proceed to classify them by giving each of them a particular name based on their physical features. Semisupervised learning is a mixture of supervised and unsupervised learning. A real-world example would be the development of a fraud detection model for a large bank. The bank might be aware of some instances of fraud, but not all of them. The bank can then label the dataset with instances of fraud that they are aware of, but the rest of the data will remain unlabeled. The bank can use a semi-supervised learning algorithm to label the data and retrain the model with the newly labeled dataset. The re-trained model is then applied to new data to identify fraud with a higher degree of accuracy, using supervised machine learning techniques. There is however, no way to verify that the algorithm would produce labels that are a hundred percent accurate. The outcomes from semisupervised learning techniques are therefore less trustworthy than the outcomes from traditional supervised techniques.

**Deep learning techniques**

Deep learning is a subset of machine learning. Artificial neural networks, which are algorithms inspired by the human brain, learn from large amounts of data. The term ‘deep learning’ comes from the fact that neural networks have multiple (deep) layers that facilitate learning.

**Natural language processing (NLP)**

ML algorithms can be operationalized straight away after ensuring adequate quality control, on genetic, image, and Electrophysiology (EP) data that are machine understandable. But there are large amounts of clinical information like discharge summaries, physical examination, operative notes, and clinical laboratory reports that are in the form of narrative text. This information is unstructured and incomprehensible for the computer program. NLP aims at extracting relevant data from the narrative text to facilitate better clinical decision making. The NLP pipeline has two parts: 1. Text processing 2. Classification. In text processing, a series of disease-specific key words are identified by NLP in the clinical notes from the historical databases. Validated keywords are used to enrich structured data and support clinical decision making.

NLP has been able to read chest X-ray reports and assist the antibiotic assistant system alert physicians to the possible need for anti-infective therapy. NLP has been proven to be capable of automatically monitoring laboratory-based adverse effects. Through the implementation of NLP on clinical notes, 14 cerebral aneurysms disease-associated variables were identified. These variables were successfully used to classify patients into two categories: Normal and those with Cerebral aneurysm disease. The accuracy rates were 95% and 86% on the training and validation samples respectively. The NLP was used to extract peripheral arterial disease-related keywords from narrative clinical notes. These keywords were then used to classify patients into normal patients and those with peripheral arterial disease. This was achieved with more than 90% accuracy.
AI in stroke

More than 500 million people across the world suffer some form of stroke each year. Stroke leads the list of causes of death in China. It is the fifth leading cause of death in North America. The global financial burden of stroke is enormous, to the tune of US$689 billion in medical expenses.\(^\text{24,25}\)

Early detection and diagnosis:

85% of stroke is caused by cerebral infarction, which is caused by a thrombus in the vessel. But only a few patients receive treatment on time because of the lack of detecting ability for early stroke symptoms. A movement detecting device for early stroke prediction has been developed.\(^\text{26}\) The implementation of two ML algorithms into the device was done for the model building solution. The algorithms are PCA and genetic fuzzy finite state machine. Neuroimaging techniques, especially MRI and CT, are important for disease evaluation and diagnosis of stroke. Naïve Bayes classification has been used to identify stroke lesion in T1-weighted MRI.\(^\text{27}\) The results are comparable with manual lesion delineation performed by human experts. Three dimensional CNN has been attempted for lesion segmentation in multimodel brain MRI.\(^\text{28}\) For the final post processing of the CNN’s soft segmentation maps, a fully connected conditional random field model was used.

Treatment of stroke

The prediction and analysis of the performance of stroke treatment has been done using ML. The prognosis and survival rate has a strong relationship with the outcome of intravenous thrombolysis, which is a critical emergency measure. The prediction of whether patients with TPA treatment would develop intracranial haemorrhage was done using SVM by CT scan.\(^\text{29}\) Whole brain images were used as input into the SVM. The performance was better than that for conventional radiology based methods. With the objective of improving the clinical decision making process of treatment with Tpa, a stroke treatment model was proposed. This model analysed clinical trials, practice guidelines and meta analyses using Bayesian belief network.\(^\text{30}\)

Outcome and prognosis:

The prognosis of stroke and disease mortality are affected by many factors. With the objective of providing better support to the clinical decision making process, a model for predicting the 3 month treatment outcome by analyzing physiological parameters in the 48 hours following stroke was proposed. This model uses logistic regression.\(^\text{31}\) A database of clinical information of 107 patients who underwent intra-arterial therapy for acute anterior or posterior circulation stroke was compiled.\(^\text{32}\) This data was analysed with SVM and artificial neural network. The prediction accuracy was more than 70%. ML techniques were used to identify factors that influence the outcomes in brain arteriovenous malformation treated with endovascular embolization, with 97.5% accuracy.\(^\text{33}\) An optimal algorithm has been used to predict 30 day mortality.\(^\text{34}\) This algorithm has been seen to have a higher predictive accuracy than existing methods. SVM has been used to predict stroke mortality at discharge.\(^\text{35}\)

Brain images have also been analysed to predict the outcome of stroke treatment. CT scan data has been analysed with ML to evaluate cerebral oedema after hemispheric infarction.\(^\text{36}\) With random forest, cerebrospinal fluid is automatically identified and shifts on CT scan are analysed. This has been proven to be more efficient and accurate than conventional methods. Functional connectivity was extracted from MRI and functional MRI data and ridge regression and multitask learning was used to predict cognitive deficiency after stroke.\(^\text{37}\) The relationship between lesions extracted from MRI images and the treatment outcome via Gaussian process regression model has been studied and this model has been used to predict the severity of cognitive impairments after stroke and the course of recovery over time.\(^\text{38}\)

Discussion

To be successful, an AI system must have the ML component to analyse structured data (genetic data, EP data, images) and the NLP component to mine unstructured texts. The sophisticated algorithms are then trained with healthcare data. The system is then ready to assist physicians with disease diagnosis and suggestions for treatment. In this field, the IBM Watson system is a pioneer. This system has both the ML and the NLP modules, and has made significant progress in oncology. Research shows that 99% of treatment recommendations from Watson are in line with decisions from physicians. Watson, in collaboration with Quest diagnostics, offers the AI genetic diagnostic analysis. This system is making an impact on actual clinical practices. Through the process of analyzing genetic data, Watson successfully identified...
a rare secondary leukemia in Japan. This leukemia is caused by myelodysplastic syndromes.

The CC Cruiser which is cloud based, can be used to connect an AI system with data input from the front end and clinical actions at the back end. Patient demographic information and clinical data is fed into the AI system. This data includes medical notes, images, blood pressure, EP results, genetic results etc. This data is then used by the AI system to suggest clinical decisions to physicians. Feedback on these AI suggestions is fed into the AI system so that it can keep continually improving.  

Regulations are currently an obstacle. At present, we do not have regulations that have standards to assess the AI systems safety and efficacy. The US FDA has made the first effort to fill this lacuna. They have attempted to provide guidance to assess AI systems. The first guideline has placed AI systems under the category of ‘general wellness products’. This category is loosely regulated for devices that are intended only for ‘general use’ and that pose negligible risk to consumers. The second guideline proposes that evidence be utilized to assess AI system performance. A third guideline sheds light on and gives clarity to the rules to be followed for the adaptive design for clinical trials. These trials would be used to assess the AI system operating characteristics. The first FDA approved deep learning clinical platform is Arterys’ medical imaging platform. This platform helps cardiologists diagnose cardiac diseases.  

The second barrier is data exchange. For good results, AI systems need continuous training with data from clinical studies. Continuous data supply is a challenge. The current system has neither incentives nor regulatory requirements for the sharing of data. The need of the hour is a legal and regulatory framework that can indemnify software companies. This framework needs to be able to approve new technologies. An algorithm, once it has received regulatory approvals, learns from more data, adapts and changes. This new learning cannot be used in clinical practice without securing updated approvals. The regulatory cycle is not yet equipped to adequately address the machine learning environment.  

Data privacy is another issue that needs to be addressed adequately. Important legislations that regulate patient data, like the European Union’s GDPR and the HIPAA in the US, are very protective of patient privacy. These laws require hospitals to keep certain kinds of data within local systems, thereby limiting what can go up to servers in the cloud. The need of the hour is a solution that will fulfil 3 conditions: 1. It must keep health information safe. 2. It must be able to leverage the advantages provided by the crowd. 3. It must be compliant with the privacy regulations of the government. In China and India, that have populations with a large patient to doctor ratio, the ability of AI to help doctors reach more patients can be a driver to include DL into the clinical process. There is a global demand for better healthcare. Many nations would want to leverage the benefits of AI.

Workforce Diversity – Challenges in Inclusion of People with Disabilities in the Hospitality Industry

Amit Vashisht1, Vishal Verma2, Aakriti Saini2, Deepika Jhamb3

1Research Scholar, Chitkara Business School, Chitkara University, Punjab, India, 2Assistant Professor, Chitkara College of Hospitality Management, Chitkara University, Punjab, India, 3Associate Professor, Chitkara Business School, Chitkara University, Punjab, India

Abstract

The existing literature on diversity, disability and employability points out towards social inequality and highlight the gaps that exist in the hospitality job market for people with disabilities. The nature of tasks and job roles in the hospitality sector has created unrealistic and problematic expectations for people with disabilities. The purpose of this paper is to identify the challenges faced by people with disabilities as far as employment in the Indian hospitality sector is concerned. In-depth interviews with ten managers belonging to ten different five-star hotels were conducted with the help of a semi-structured questionnaire. The responses were analyzed, transcribed, and common themes were identified. One of the significant findings of the study is that most of the hotels consider employing people with disabilities as a corporate social responsibility. Professional and social factors emerged as important challenges in the inclusion of people with disabilities (PWDs) in the Indian hospitality industry.

Keywords: People with Disabilities (PWDs); Employment; Hiring Practices; Challenges; Hospitality Industry

Introduction

Being employed is one of the vital tasks in the life of a common man1. But for disabled people work is more important and having any disability usually means isolation from society2,3 and work is the only moment to diminish that loneliness4. Being employed is mandatory to reduce isolation, but the disabled people have mostly specified that they feel ignored and hardly included in any activity of abled persons5. Hence, it is imperative that having a job is not enough, but merging socially with abled people is vital to give your best shot at work.

In terms of the level of education, people with disabilities (PWDs) tend to be less educated as compared to non-disabled people6. Subsequently, they also face challenges while searching for employment. Statistics from7 show that in some countries, unemployment among PWDs is 80 percent and more. On a global scale, 15% of the world population is of PWDs, and this is increasing because of chronic diseases as well as an ageing population8. In India, it is estimated that a total of 2.21% of the total population falls in the category of PWDs which is an increase of 0.8% since 2011 census9.

The present study aims at assessing the challenges faced by PWDs while searching for employment in the Indian hospitality industry. This paper attempts to study the responses and suggest solutions for increasing employability and sustainability for PWDs.

Review of Literature

Previous literature on PWDs suggests that for many human resource managers, it is a challenge to define and develop a complete understanding of what disability means10. Disability is generally associated as a stigma11 and the longevity of employment for PWDs is adversely affected by the lack of social acceptance by the non-disabled coworkers12, 13. Coworkers and employers attitude also create hindrances and difficulties at the
workplace for PWDs\textsuperscript{14,15} has listed financial implications of creating workplace accommodations, lack of employer’s awareness and “attitude of entitlement” as the reasons for low employment rate amongst PWDs. The entire employment cycle is governed by legislation on disability, yet PWDs face problems at their workplace during different stages of their employment\textsuperscript{16}. Study on hospitality employers conducted in Canada shows that employers are not aware as to how effective PWDs will be in a hospitality-related workplace and hence there is a need for greater education and understanding amongst hoteliers as far as employability of PWDs is concerned\textsuperscript{17}.

Available literature shows many studies in the domain of hiring and accommodating PWDs. The Theory of Planned Behavior\textsuperscript{18} is perhaps one of the most closely-knit theories as far as this topic is concerned. TPB provides detailed constructs on a wide range of employer perceptions relating to issues of hiring as well as making the workplace favourable for PWDs. The theory explains human behaviour as “a function of salient information or beliefs, relevant to the behaviour.” Since the perceived behavioural control may vary from situation to situation, hence TPB can be applied to a wide range of behaviours. Further, the seminal disability framework given by\textsuperscript{19} suggests and indicates towards the beliefs and a set of formal workplace activities that affect the treatment of PWDs at the workplace. The model presents a framework of factors that affect the treatment of PWDs in an organization. As per the model, the function of (i) individual attributed (of the disabled individual and that of the employer), (ii) business factors, for e.g.: regulations, legislation, and (iii) organizational features (values, norms, policies) affect the way PWDs may be treated in an organization. To reduce discrimination against PWDs,\textsuperscript{20} suggests that employee training from the stand-point of increasing awareness about PWDs as well as workshops on intergroup interactions can significantly be fruitful. Once hired, the human resource department of that organization should make sure that the employee with a disability is assigned to a suitable job role supported by a career development plan\textsuperscript{21}. Therefore, it becomes imperative to address the challenges faced by the hospitality businesses and systematically deal with them.

**Research Design/Method** – In-depth personal interviews were conducted using a Semi-structured questionnaire. This questionnaire was developed by the authors to gather and record vital information regarding the employment of PWDs and to let the respondents speak on the challenges and other issues unique to their respective organizations. During data collection, hotel human resource or training managers were approached as they are responsible for hiring, framing, and implementing policies aimed at the inclusion of PWDs in their respective organizations. Generally, the time allotted by the manager was forty to sixty minutes. Chandigarh Tri-City (located in north India) comprising of three cities, Chandigarh, Panchkula & Mohali was the area of study\textsuperscript{22,23,24}

**Response received from the respondents:**

Based on the responses received, it is found that out of 10 respondents, 5 of them had a policy in place. However, the other five were yet to frame a policy but were more than eager to employ PWDs in their organization. It was interesting to note and see the responses given by the hotel managers. On average, all hotels were in the medium to a large segment of hotels consisting of eighty-five to two hundred guest rooms with at least three to five food and beverage outlets. On average, the employee strength of each of these hotels was one hundred to two hundred full-time employees. The average age group of employees was twenty-four years to thirty-five years.

1. What percentage of the diverse workforce in the hotel belongs to PWDs and what kind of disability they have?
Table 1: Percentage of PWDs

<table>

<td></td>
</tr>
<tr>
<td>Respondent 5</td>
<td>Three employees with disability, Orthopedically impaired, acid attack victim and LGBT (Lesbian, Gay, Bi-sexual and Transgender) respectively.</td>
<td></td>
</tr>
</tbody>
</table>

Limited employment opportunities for PWDs - Based on the response, the authors can say that generally number of PWDs employed is very less as compared to abled co-workers as depicted in Table 1. Only one respondent followed a mandate to employ 20% of the total workforce with PWDs, whereas all other respondents only employed 2-5 PWDs. Secondly, the common disability employed was either speech impaired, hearing impaired, and physically challenged. The author also got to know that one of the respondents considers and firmly believes that victims of acid attack and people from the LGBT community also needed social inclusion.

2. What steps have the organization taken to retain, promote, train & develop PWDs?

Table 2: Overall Development of PWDs

<table>
<thead>

</tr>
<tr>
<td>Respondent 4</td>
<td>Special sessions on hygiene and grooming.</td>
<td></td>
</tr>
<tr>
<td>Respondent 5</td>
<td>Training for the abled workforce on LGBT sensitization.</td>
<td></td>
</tr>
</tbody>
</table>

Organizations versatility towards PWDs - From the data in Table 2, the authors observed that the five respondents who have employed PWDs were flexible and adaptable to accommodate the special needs of PWDs. To retain, promote, and train PWDs, the organizations conducted continuous and regular training sessions for the PWDs as well as the non-disabled coworkers. Majority of the organizations adopted flexible working hours, equal increment, and assigned similar “key performance indicators” which were at par with that of non-disabled coworkers. Some organizations were associated with NGOs for specialized trainings, e.g. Indian Sign Language Training, which helps the non-disabled coworkers to adapt well with PWDs. An organization had also developed a unique kit which had a Name Badge, Menu Card, and useful equipment. Another organization conducted regular training and sensitization session on LGBT community for the entire workforce.
3. List any five challenges that the hotel faces in the operationalization of such policies and programs for PWDs.

**Table 3: Challenges in Inclusion of PWDs**

<table>
<thead>
<tr>
<th>Respondent 1</th>
<th>Result</th>

<td>Social acceptability from the abled workforce was a challenge.</td>
<td></td>
</tr>
<tr>
<td>Respondent 4</td>
<td>Critical feedback from guests regarding employees with disabilities.</td>
<td></td>
</tr>
<tr>
<td>Respondent 5</td>
<td>The hotel is in the process of framing guidelines for hiring people from LGBT community.</td>
<td></td>
</tr>
</tbody>
</table>

Table 3 brings out the Professional & Social Challenges faced by an organization. The authors learned from the respondents that generally PWDs were inflexible in following rules & regulations which were, at times, adjusted or made specially to accommodate the special needs of PWDs. The authors also learned that PWDs needed continuous supervision at work, which burdened the abled coworkers. The respondents also cited social acceptability & embarrassment for guests, career progression, and growth. The respondents also shared that longevity of employment in hiring PWDs was a concern, and when PWDs were given these special provisions, e.g., flexible working hours, the abled workforce felt deprived. A respondent was also in the process of framing guidelines for hiring of people from LGBT community.

4. What is the extent of support and assistance that the organization receives from external stakeholders like local government bodies and NGOs?

**Table 4: Support from Stakeholders**

<table>
<thead>

<td>Tie-up with the local Gram Panchayat and the Village Sarpanch</td>
<td></td>
</tr>
<tr>
<td>Respondent 5</td>
<td>The organization has enlisted NGOs</td>
<td></td>
</tr>
</tbody>
</table>

Table 4 details the sources for recruitment & skill development. The authors learnt that respondents had a healthy association with NGOs for recruitment and skill training of PWDs. Respondent number three had an in-house skill development vertical which imparted special training to PWDs whereas in the case of respondent number four, the local Gram Panchayat & the Village Sarpanch was also involved in the employment of PWDs.
5. Are there any benefits (organizational or financial) associated with employing PWDs?

Table 5: Benefits Acquired

<tr>
<td>Respondent 5</td>
<td>LGBT &amp; acid attack survivors should be included in the list of PWDs</td>
<td></td>
</tr>
</tbody>
</table>

Table 6 brings out the Best Practices & Way forward as far as employing PWDs is concerned. From the responses received, the authors have learned that the employers of PWDs were concerned about career growth and the overall social well-being. PWDs employed in an organization were invited along with their families to employee recognition forum organized on the occasion of the World Disability Day. To encourage mobility and a sense of independence, an organization provided growth and promotion opportunity to PWDs by inter-organizational transfers to different locations. These initiatives keep PWDs motivated and loyal toward the organization and also have a favourable impact on the longevity of employees.

Major Findings and Conclusion

The results of the study have highlighted significant issues regarding the inclusion of PWDs in hospitality industry that need to be addressed. Firstly, as far as having a policy to employee PWDs is concerned, the analysis of the responses show that fifty percent of the respondents are yet to frame a policy and employee PWDs. It could be a significant step towards empowering and uplifting PWDs as getting employment will support PWDs financially as well as morally. Secondly, the non-disabled coworkers in hospitality organizations need to be made aware and sensitive towards the special needs of PWDs. Thirdly, to increase the coordination between employers and PWDs, the government at the local level may introduce schemes or create platforms for raising awareness on the issue of employment of PWDs. The responses show that employing PWDs is viewed as a corporate social responsibility. The authors believe that the findings related to employing of PWDs help in improving the current situation if organizations don’t just hire PWDs as an obligation. Addressing the paradigm shift from CSR can help in the overall integration and inclusion of PWDs in our society.

Implications and Future Scope

The study has future scope whereby further research can be conducted with a larger sample size of classified hotels across different cities. Quick Service Restaurants where expectations from employees and nature of work are not as demanding as classified hotels may also be included in further studies.

Abstract

Background: Drug abuse and HIV/AIDS are major health issues worldwide with an immense impact on human health. People who engage in drug use or high-risk behaviours associated with drug use put themselves at risk for contracting viral infections like HIV/AIDS. So, awareness among them is essential.

Methods: This cross-sectional study was conducted on all drug abusers visiting Outpatient Opioid Assisted Treatment (OOAT) centre from 1st April 2019 to 31st May 2019 and who had given consent for HIV testing. Awareness about HIV/AIDS was ascertained and valid conclusions drawn. Data management and analysis was done by using Microsoft excel and SPSS. Results: Out of 376 drug abusers, 349 (92.8%) were males and 27 (7.2%) were females. Educational status of the study subjects was significantly associated with the awareness about the disease. Conclusions: On statistical analysis, it was observed that 7.7% of the patients were HIV positive and educational status was significantly associated with the awareness about the various aspects of the disease (p<0.005).

Keywords: Drug abuse, HIV/AIDS, awareness, Socio-demographic factors.

Introduction

Drug abuse as well as HIV disease are a major health issues over various parts of the world. Worldwide, there were about 1.8 million new cases of HIV in 2017; among which young people aged 13 to 24 accounted for 21% of all new HIV diagnoses. Young people mostly include gay or bisexual men and who inject drugs.

Drug abuse has been linked to HIV (human immunodeficiency virus) and AIDS (acquired immune deficiency disorder) since the epidemic began in the 1970s. People who engage in drug use or high-risk behaviours associated with drug use put themselves at risk for contracting viral infections such as HIV/AIDS or hepatitis. It happens basically due to two reasons i.e. when people inject drugs and share needles or other drug equipment and when drugs impair judgment and people have unprotected sex with an infected partner. According to the CDC, one in ten HIV diagnoses occur among people who inject drugs and among females, 21 percent of HIV cases were attributed to intravenous drug users (IDU). Additionally, women who become infected with a virus can pass it to their baby during pregnancy, regardless of their drug use.

To halt the epidemic of HIV/AIDS epidemic we require a three pronged strategy: (a) prevention of drug abuse among young people; (b) provision and facilitation of access to drug abuse treatment; and (c) establishment of effective outreach to engage drug users in HIV preventive strategies that protect them and their partners from exposure to the virus and encourage the uptake of substance abuse treatment and medical care.
Over the last few decades, drug consumption has become one of the biggest problems affecting millions of children and youth in India. There are few states and cities in India which have taken the lead in drug consumption. Punjab in the Northern part of India has been facing a bane of drug epidemic over the last couple of decades. In 2015, a study commissioned by the Ministry of Social Justice and Empowerment (MoSJE), Government of India showed that the total number of drug users in Punjab are 2,32,856. In view of this problem, Government of Punjab started Out Patient Opioid Assisted Treatment (OOAT) centres in various districts of Punjab in the year 2017 where drug abusers could get treatment and routine tests free of cost. Seeing the gravity of problem the study was undertaken in an OOAT centre in Amritsar city and awareness of the drug abusers about HIV/AIDS was ascertained.

Material and Method

The study was a cross-sectional study conducted from 1st April 2019 to 31st May 2019 among all the drug users visiting in the Government run OOAT centre in Amritsar city and who had undergone HIV testing after their informed consent. The critically ill patients and who did not give informed consent were excluded from the study.

A total of 376 patients were included in the study. A pre-designed and pre-tested proforma was administered to the subjects after taking his/her consent. Questionnaire included questions regarding the sociodemographic profile, type of drug abuse and age at which they started drug abuse. Their HIV status was confirmed from the centre records and noted. A Questionnaire was also designed to assess the knowledge about HIV/AIDS keeping in view their risky behaviour and the valid conclusions were drawn.

Data analysis was done by SPSS version 20. Chi-square test was applied to prove their statistical significance and p<0.05 was considered to be significant.

Ethics: The research proposal was approved by the college ethical committee at the time of commencement of the study.

Results

The present study was carried out on 376 drug users visiting under Government run OOAT centre in Amritsar city. The sociodemographic profile, type of addiction, HIV status and knowledge about HIV/AIDS were ascertained. The total sample consisted of 349 (92.8%) males and 27 (7.2%) females.

Table 1 shows the distribution of cases according to their socio-demographic profile. Most of the patients were young i.e. 310 (82.5%) were less than 35 years of age. 56 (14.9%) and 10 (2.7%) were in the age groups of 36-50 years and >50 years. 92.8% were males and
only 7.2% were females. As far as their educational status is concerned, 144 (38.3%) were illiterate, 172 (45.7%) studied up to the secondary school or below and 60 (15.9%) were studied up to high school and above. Regarding occupation, 154 (41%) were labourers, 59 (15.7%) were drivers, 17 (4.5%) were doing business, 57 (15.2%) were in job, 23 (6.1%) were housewives, 12 (3.2%) were students and 54 (14.4%) were in other occupations or unemployed. Out of the total, 187 (49.7%) were married, 173 (46%) were single and 16 (4.3%) were included in others (widow/widower/divorced).

It is evident from the table 2 that out of the total 376 cases, 170 (45.2%) were intravenous drug users, 136 (36.2%) were heroine addict, 64 (17%) used to take oral drugs and 6 (1.6%) were taking opium. 136 (36.2%) started drug abuse at < 15 years of age and 240 (63.8%) started at ≥ 15 years. Regarding their HIV status, 347 (92.3%) were non-reactive while 29 (7.7%) were found to be HIV positive.

</table>
Perusal of table 3 shows the distribution of cases according to their awareness about HIV/AIDS. All the cases had heard about the disease and the source was newspaper in 65 (17.2%), television in 104 (27.6%), radio in 50 (13.3%), books in 19 (5.1%) and other people in 138 (36.7%) cases. Out of the total, 70.6% and 77.2% were aware about the infectious nature and the spreading nature of the disease respectively. Regarding the mode of spread, out of 291 cases who knew the spreading nature, according to 140 (48.1%), 64 (22%), 61 (21%) mode of spread was sexual, blood transfusion and intravenous injections respectively. 24 (8.2%) replied that disease spreads by sharing utensils and shaking hands and only 2 (0.7%) were aware about the mother to child transmission. 61.2% and 64.6% of the cases responded that the disease is curable and life threatening respectively. 166 (44%) replied that the duration of treatment is in months and 127 (33.7%) replied this in years, 78 and 5 cases replied this in weeks and days respectively. 337 (89.6%) knew that the co-infections are present with the disease out of which 107 (31.7%), 42 (12.5%), 71 (21.1%), 28 (8.3%) and 89 (26.4%) named the common co-infection as tuberculosis, jaundice, diarrhoea/vomiting, skin manifestations and generalized weakness respectively. Regarding the means of protection maximum cases i.e. 115 named condom use followed by blood check-ups (96), needle/syringe sterilization (79), avoiding commercial sex workers (37), single partner (33) and avoid pregnancy (2). 14 cases didn’t know any means of protection.

</tbody>
</table>
As is evident from the table 4 that those who were illiterate were less aware about the infectious nature of the disease, spreading of the disease, life threatening and curable nature of disease as compared to those who were educated upto secondary school or above secondary school. So, the educational status was significantly associated with the knowledge (p< 0.05) except knowledge about the co-infections where no association was observed.

## Discussion

Table 1 reveals the socio-demographic profile of the drug users. Our study showed that 82.5% of the cases were young i.e. <35 years and 92.8% were males. A similar study by Lin TY et al in Taiwan also reported the mean age of drug users was 36.1 years and 90.9% were men.

Our study showed that around 62% were literate, 76.4% were working and 49.7% were married. Almost similar results were observed in a study by Avasthi et al in Chandigarh that most of the respondents were males in their early 30s, educated up to middle level. About were married, and most were employed. A study conducted by MoSJE Government of India in Punjab in the year 2015 revealed that 89% of drug users are literate, 83% are working and 99% are males.

The present study (Table 2) depicts that most common type of abuse was intravenous drugs (45.2%) followed by heroine in 36.2% of cases. 63.8% of the cases started drugs at 15 years or more and HIV was positive among 7.7% of the cases. Jolley E et al in their systemic review observed that HIV prevalence varies from 5-10% and heroine is the most commonly used drug followed by others and intravenous route is followed mostly.

Table 3 presents the distribution of cases according to their knowledge about HIV/AIDS. All the drug users had heard about HIV and the common sources were other people and television followed by radio and newspaper. More than 70% knew about the infectious and spreading nature of the disease. Most common mode of spread was reported as sexual (48.1%) followed by blood transfusion (22%) and intravenous injections (21%). More than 60% knew about the life threatening nature of HIV and 80.6% knew about the co-infections and most common reply was tuberculosis. Condom use was the most commonly answered means of protection. Some of the similar results were seen by Bertoni N et al in Brazil.

As is evident in table 4 that that knowledge regarding infectious nature (p=0.000), spreading nature (p= 0.002), life threatening nature (p= 0.004) and curability (p= 0.019) among drug users was significantly associated with their educational status while knowledge about co-infections had no significant association. Chen B et al in their study also revealed education had significant effect on the HIV/AIDS knowledge awareness.

## Conclusion

There is a relative dearth of literature regarding drug abusers and their awareness about HIV/AIDS as they comprise the high risk group. Moreover, knowledge was found to be significantly associated with the educational status so counselling should be reinforced. Comorbid medical and psychiatric conditions and complex cofactors such as poverty, access to care, and psychosocial variables make assessment and interpretation of results challenging.

Abstract

Avulsion and replantation of the teeth following traumatic injury causes complication such as inflammatory and replacement resorption. This case report describes a traumatic injury to the permanent maxillary central incisor exhibited pulpal necrosis leading to periapical cyst with massive bone loss and extensive external inflammatory root resorption. Endodontic therapy and surgery was performed to salvage the tooth with poor prognosis. The multiple resorptive defects were debrided and restored with resin modified glass ionomer cement. The postoperative follow-up revealed improved healing. The prognosis of the tooth which was badly destructed due to external inflammatory resorption was greatly enhanced with appropriate treatment plan and ultimately increased the longevity of the tooth.

Key words: External Inflammatory resorption, CBCT, RMGIC

Introduction

External resorption is a progressive and destructive loss of tooth structure, initiated by a mineralized or denuded area of the root surface. External tooth resorption can be classified into surface resorption, external inflammatory resorption (EIR), external replacement resorption, external cervical resorption and transient apical breakdown. External resorption results as a most common complication after tooth replantation with a reported prevalence of 57- 80\%.\(^{[1]}\) The combination of bacteria in the root canal and cemental damage on the external root surface results in EIR.

The basic treatment for EIR is the elimination of bacteria from the root canal and/or dentinal tubules by endodontic therapy to arrest the resorptive process. Various approaches have been suggested for the treatment of external inflammatory root resorption like, nonsurgical root canal treatment combined with a calcium hydroxide dressing and MTA obturation. The surgical treatment of external inflammatory root resorption has generally involved periodontal flap reflection, curettage and restoration of the defect with amalgam, glass ionomer cements (GIC), resin modified glass ionomer cement (RMGIC), MTA or reverse sandwich restoration.\(^{[2]}\)

A case report of external inflammatory root resorption diagnosed using cone beam computed tomography, restored with resin modified glass ionomer cement is presented in this article.

Case report:

A 21-year-old male patient was referred to the Department of Conservative Dentistry and Endodontics...
with a complaint of pain in the upper right front tooth for the past 1 week. The patient gave the past history of a traumatic avulsion injury, followed by replantation within 20-30 min, 3 years earlier. The tooth was not transported in any storage media before replantation and root canal treatment was not performed following replantation.

There was no relevant medical history, and an intraoral examination revealed a mobility in #8 (grade II), #7 and #9 (grade I). After performing sensitivity tests, tooth #7, 8 and 9 was diagnosed as having pulpal necrosis. The teeth showed no discoloration [Figure 1], pain on percussion on #7, 8 and 9 and periodontal probing depths were physiological (<3 mm) at all sites except for the labial surface of #8 in which copious bleeding and periodontal pocket (7 mm) was found. Radiographic examination showed multiple irregular radiolucent areas invading the radicular dentin in both mesial and distal aspects of tooth #8, calcified canal in tooth #9 and periapical radiolucency involving teeth #8 and 9 [Figure 2]. The pulp canal and chamber spaces were regular and well defined in tooth #8 with interdental bone loss between teeth #8 and #9. A provisional diagnosis of external inflammatory resorption caused by avulsion of tooth #8, because of the associated necrotic pulp, pulpal necrosis with periapical pathology of teeth #7 and 8, calcified canal with periapical periodontitis of tooth #9 was made. Patient was advised to extract the tooth #8 considering the poor prognosis due to extensive bone loss. As the patient refused for extraction, further treatment was planned. After obtaining informed consent, the patient received local anesthesia of 2% lidocaine with 1:100,000 adrenaline (LOX 2%; Neon Laboratories Ltd, Mumbai, India). A rubber dam was placed, and the endodontic access opening was performed using Endo access bur no. A0164 (Dentsply Maillefer, Ballaigues, Switzerland) and slow-speed diamond KGS 3203 (Dentsply Maillefer) in tooth #7, 8 and 9. Due to the presence of pus discharge from the canals of the teeth #7 and 8, open dressing was given for a day. In order to determine the extent and depth of the lesion in three spatial levels, CBCT was performed. Based on CBCT images and three dimensional reconstructions [Figure 3A, 3B, 3C, 3D] a diagnosis of EIR and various resorption sites were confirmed. The patient was again informed of treatment plan alternatives, and poor prognosis of the case.

Then, a working length radiograph of teeth #7, 8 and 9 were taken after negotiation of the calcified canal of tooth #9. The root canals were gently irrigated using 3% sodium hypochlorite. The canals of teeth #7, 8 and 9 were prepared to size 55, 60 and 55 by using K-files. Calcium hydroxide intracanal medication was changed every week for a period of 1 month. Before obturation, intracanal irrigation was performed with 2% chlorhexidine and sterile saline alternatively and a final rinse with 1 ml 1.25% sodium hypochlorite and 17% EDTA. The canal systems were dried with absorbent paper points and obturated by the lateral condensation technique with gutta-percha and AH plus sealer (Dentsply Maillefer) [Figure 4A]. The entrance filling for coronal seal was given with GIC (Fuji II, GC Corporation, Tokyo, Japan). Teeth #6, 7, 8, 9, 10, 11 were splinted together to establish stability during surgical procedure.

The surgical procedure was performed under local infiltration anesthesia (2% lidocaine with 1:100,000 adrenaline) on both the vestibular and palatal mucosa. An intrasulcular incision was made from the distal surface of the maxillary right canine to the distal surface of the maxillary left lateral incisor, and full-thickness mucoperiosteal flap was elevated. The periapical lesion was enucleated and histopathological findings confirmed it to be a periapical cyst. Surgical exploration revealed multiple resorptive lesions as observed in CBCT. Granulomatous tissue within the defect area was removed by curettage and 90% trichloroacetic acid solution on a cotton pellet was applied to the resorptive defect for coagulation necrosis. The root tip was resected, and retrograde preparation was performed using surgical ultrasonic tips (Satelec Acteon Cor, Mérignac, France) and P Max surgical micromotor with ultrasonic generator (Satelec Acteon Cor, Mérignac, France). After isolation, only the easily accessed resorption areas were restored with RMGIC (Fuji II LC; GC Corporation, Tokyo, Japan) and the retrograde filling was performed using white MTA (ProRoot MTA, Dentsply Maillefer, Tulsa, OK). The flap was repositioned without tension and sutured interproximally with nonabsorbable sutures (Silk; Dogsan, Trabzon, Turkey). The sutures and splint were removed at the end of the first week, and the patient was asymptomatic [Figure 4B]. One year follow-up of the case did not reveal any progression of the resorption, and good bone healing was evident [Figure 4C]. Gingival healing appeared complete with normal probing depth, no gingival recession, no loss of clinical attachment and absence of mobility. The patient was asymptomatic, and the tooth was deemed healthy.
Discussion

External inflammatory resorption in this case has been induced following avulsion and replantation of the tooth. Replantation had been performed within 20 – 30 min following avulsion and the tooth had been exposed to dry environment throughout the time period. Although the ideal time to begin root canal treatment is 7–10 days post replantation in closed apex. The tooth was not root canal treated for 3 years. These are the reasons for the occurrence and progression of resorption. Although the treatment outcome of the tooth which is symptomatic, with excessive mobility and radiographic evidence of resorption is unfavorable, it was decided to salvage the tooth as the patient was not willing for extraction.

Cone beam computed tomography (CBCT) is a useful tool in endodontics. CBCT has been used to assess the extension of an EIR. In the present case, CBCT was used to observe the size and extent of the periapical lesion, size and location of the resorptive defect in the three spatial levels, as, CBCT seems to be useful in the evaluation of EIR, and its diagnostic performance was better than that of periapical radiography.

In this case, a combination of pulpal necrosis and calcification occurred following traumatic injury. The necrotic tissue of the offended teeth which was susceptible to bacterial contamination progressed to cause the periapical cyst. The combination of bacteria in the root canal and cemental damage on the external root surface following avulsion injury resulted in external inflammatory root resorption, which was in the form of multiple moth eaten appearance in the conventional radiographic and tomographic images.

The splinting of teeth together with composite resin enhanced the stability of teeth and eliminated the chances of teeth being displaced or extruded during surgical procedure. Although, splinting during surgical management of resorption is not in routine practice, it was considered to be mandatory in the present case having excessive bone loss and mobility. Splinting seems to be a promising option while performing the surgery so as to achieve a predictable treatment outcome.

The restoration of choice for resorptive lesions should reinforce the tooth structure, possess a coefficient of thermal expansion close to that of the tooth structure, and promote good biological response. The light-cured RMGIC has been used in the present case to restore the
accessible resorptive lesions to have a control on the setting reaction with a short setting time. It has favorable physical properties similar to those of resin cements while retaining the basic features of the conventional glass ionomer cement.\(^5\) It has been clearly shown that RMGIC is biologically acceptable in an in vivo environment.\(^6\) Few inaccessible resorptive lesions were left without restoration as TCA was used to cauterize the residual resorptive tissue.\(^7\)

Although we recommend reverse sandwich restoration (RSR) to be the better technique to restore the resorptive defects,\(^2\) the same technique was not advocated in the present case. The defects were not deep that demands root reinforcement with RSR. Alternatively, MTA also could be used; MTA is not affected in the presence of moisture. The development of subgingival plaque could be promoted as a result of the rough surface of MTA. Because MTA is not a hard material, it could not reinforce the tooth structure and be partially scraped off during mechanical cleaning of the root surface.\(^8\) Hence, RMGIC was used instead of MTA. Although the incorporation of 2-hydroxyethyl methacrylate to the formulation of conventional GIC resulted in enhanced flexural strength and elastic modulus, the biocompatibility of RMGIC is compromised in vitro.\(^9\) On the contrary, it has been clearly shown that RMGIC is biologically acceptable in an in vivo environment because of local removal of 2-hydroxyethyl methacrylate via lymphatic drainage over time.\(^10\) Moreover, the concentration of inorganic ions, namely Sr\(^{2+}\), Al\(^{3+}\), and F\(^-\), released from RMGIC are too low to be cytotoxic.\(^9\) Accordingly, the RMGIC was well tolerated by periodontal tissues in our case. The present case is still under observation to monitor the longevity of the tooth.

**Conclusion**

The tooth with poor prognosis was salvaged by the removal of granulomatous tissues and the repair of the resorptive defects with RMGIC. The use of CBCT in this case had proved to be the best diagnostic imaging modality for EIR. Further long term clinical follow-up are required to provide more information about the longevity of the tooth.

Utilization of Health Care: Factors Affecting Utilization of Health Care in Rural Areas of Jorhat District of Assam

Sampurna Khound
PhD. Research scholar, Omeo Kumar Das Institute of Social Change and Development, VIP Rd. Upper Hengrabari, Guwahati, Assam

Abstract
To examine the use of health service for treatment in rural areas of Jorhat district, a cross sectional household survey was conducted with a sample of 242. As the population increases with the limited resources government alone cannot cater the health of whole population. Private health sector is equally important for the improvement of health of the people. In view of this present study was planned to examine the utilization of health care facility. This study was done particularly in rural areas, so private facilities were not available nearer to them. Most of the respondents were belong to lower income group, as they cannot afford the huge medical expenses of private hospitals. A binary logit model has been used to determine the factors influence the utilisation of public health facility.

Keywords: Utilisation, public health facility, Socio-economic factors

Introduction
Good utilization of health service serves to improve the health status of the population.1 There are various studies which have shown that only physical existence of the health service is only enough to guarantee their use as other socio-economic factors could influence their access and thus utilization.

India is a developing country with a growth of Gross Domestic Product (GDP) during 2018-19 is estimated at 7.2 per cent as compared to the growth rate of 6.7 per cent in 2017-18. Growth of any country directly reflects the wellbeing of its population which is related to good health. Health has been declared a fundamental right in many countries. National governments all over the world are striving to expand and improve their health care services. Health care for prevention and promotion of health is one of the basic human rights, as declared in the Universal Declaration of Human Rights (Article 25). With the economic growth, population also increased rapidly and 25% of rural and 14% urban population still living below poverty line. With the limited resource government alone cannot serve the whole population. To meet the demand and supply private health sector is equally important for the improvement of health status of the people. Private services expand rapidly in urban areas but with a limited extent in rural areas.

Access to health service is considered as a link between the health system and population it served. The type of the service provided, whether it is reachable or not, people perception about the service, acceptability of the service provided, all influence the access and utilization of service.2 In some the studies poor education about when to seek care, poverty, perceived high cost of services; inadequacy of available services such as lack of drugs, basic laboratory services, inadequate number of healthcare workers, poor quality of care and proximity to the facility were identified as perceived factors barriers to utilization of health facility. Increasing the utilization of health service is one of the important objectives of the government because it has direct impact on burden of disease. Assam government took various family welfare schemes to increase the utilization of health service to improve health status. The present study tries to analyse the utilization of health care and factors affecting this.

Objective: The present study was planned with the following objectives:

- To assess the utilization of health service.
- To assess the relationship of various socio-economic and demographic factors affecting utilization of health service.

Materials and Method

Study design: Both primary and secondary sources of information used in the study. The study was cross sectional for a period of three month. Sample was drawn from the rural population of Jorhat district. Secondary information has been collected from different sources like the Directorate of Economics and Statistics, Directorate of Public Health, Planning Board, District Medical Offices, Journals, Books etc.

Sample Size: The sample has been selected using a multi stage design. Two development blocks of the district have been selected for field study mainly on the basis of highest proportion of rural population. Sample blocks are Jorhat block and Titabor block. From the two development blocks, 2 gaon panchayat (G.P) have been selected purposively. From the two gaon panchayat 25 percent of village has been selected on the basis of highest proportion of rural population. Four villages have been selected from the two G.P. Finally, 10% households has been selected from each of the villages are randomly. The total sample size of the study is 242 households.

Analytical tool: Tabulation was done to present the collected information in systematic way. Bar diagram, pie charts were used where needed. Statistical methods are like percentage, averages were also used. A logit model has been used to examine the factors influencing the utilisation of health service.

Result and Discussion

India is a signatory to the Alma Ata declaration, which aims at achieving ‘Health for all’ by the year 2000 AD’. Government gave much effort to achieve this. The present study tries to analyse the utilization of health service among the rural population. By reviewing various studies it has been found that utilization is affected by various socio-economic factors. In a study by Shukla et al, in the rural areas of Lucknow found that utilization of health service is affected by socio-economic factors like caste, occupation and cost of the service they received.9

In the study area disease prevalence rate has been tried to find out. Prevalence rate refers to the proportion of people in a population who have a particular disease at a specific point of time or over a specific period of time, regardless of when that illness or condition began, per 1000 population.

Prevalence rate=

The numerator includes not only new cases but also old cases (i.e. people who remained ill during the specific point or period of time) and the denominator includes the total population. The disease prevalence rate was found 262.89.

The respondents who have visited public or private health care facility are included in the present study. Out of the total households 242, 164 were visited to public health facility, 55 were visited to private and 23 to others.
visited to public health facility. People engaged in above mentioned occupation indicates a poor paying capacity of people. In this study cost of health service provider came out as a main reason for choice of provider. Free service at the public health facility and nearer to households attracted people to public service provider. Selection of health service provider also depends on type of disease people suffered from. The sample households reported that the complex cases which cannot get cured in rural health institutions are referred to a higher facility as most of the PHC and CHC are not in a position to deliver the specialized health care service.

Source: Field survey

It appears from the table 1 that 47.89 percent of households seek treatment from district hospital. Likewise 13.38 percent of household visited for treatment in PHC and CHC particularly belong to Bekajan development block as it was located at a far distance from Jorhat town. However, treatment sought from private hospital relatively lowers (14.79). 23.94 percent of households visit to private clinic for treatment.

Maternal and child health care given much importance for improving the quality of human resource and there are various welfare schemes have launched by state government emphasizing on preventive and educational aspects of maternal health care so that institutional delivery can be increased. In Jorhat district it seems to have been working good and almost all the mothers during the last 5 years in the survey area reported that their delivery took place in health institutions. Among them 84.91 percent of pregnant lady consult doctor before delivery but 15.09 percent did not consult any doctor and they reported reason behind this as economic constrain and some of them were not aware of this. It was also reported that ASHA workers doing their jobs sincere which helped in increased the institutional delivery.

Source: Field Survey
With regard to the selection of place of delivery among different caste group showed that most of the backward caste (SC/ST) people choose public institutions for delivery. In various income groups as monthly per capita consumption expenditure increases people preference for private institutions increased. 10.50 per cent delivery took place at home whose monthly per capita consumption expenditure is 500 and bellow. Agriculturist and daily wage earner preferred public health facility and they reported main reason behind this was low cost. A study done by Patrick found that main reasons for visiting public health facility are closeness, affordability and availability of facility.

Immunization is the process by which a child is made immune by vaccine. Vaccine stimulates the baby’s own immune system to protect the person against subsequent infection or disease. In the surveyed area it has been reported that most of the children getting vaccine in government institutions like SC, PHC, CHC and government hospital. It has been found that out of total children who received complete vaccine. 55.85 percent vaccinate their child at sub-centre. Total 89.19 percent receive vaccine from government hospital, on the other hand only 10.81 percent received from private institutions.

A logistic regression model has been used to examine the factors influence the utilization of public health service. The binomial logistic model applied here can be written as

$$ PHS_i = \ln\left( \frac{1}{1-P_i} \right) = \beta_0 + \beta_1 C_i + \beta_2 F_i + \beta_3 E_i + \beta_4 O_i + \beta_5 M_i + \beta_6 D_i + \beta_7 C_0 + U_i $$

Where, $P_i$ is the predicted probability of accessibility of primary health care which is coded as 1 and 1-$P_i$ is the predicted probability that does not use primary health care which is coded as 0. $B_j$ represents the constant term includes in the model. $\beta_1, \beta_2, \ldots$ are regression coefficient for each of the explanatory variables, $U_i$ is the stochastic error term.

Cox & Snell $R^2 = .638$
Nagelkerke $R^2 = .896$
Hosmer and Lemeshow Goodness of fit test statistic $= .993$
*** implies 1% level of significant
** implies 5% level of significant

Estimated result of the logistic regression model shows that out of the 7 influencing variables included in the model, only 3 variables such as education, distance and MPCE are found to be significant factors determining the Utilisation of health care facility. Caste, type of family, occupation and communication facility is not found to be significant. Nagelkerke test and Hosmer and Lemeshow goodness of fit test shows that model is good fitted.

It is found, an increase in the education of the respondent decrease the use of public health care facility by 1.754 units. So far as relationship between distance from the place of residence and utilization of public health care facility is found to significant. The β coefficient for distance is being -1.622. The negative sign indicates that if the distance between place of residence and public health care increases the likelihood of use of public health care facility decrease.

Another factor which is found to be highly significant is the monthly per capita consumption expenditure (MPCE). It is also found to be negatively significant with the dependent variable. It is found that if MPCE increase use of public health care facility decrease by -31.557 units. This shows that if their consumption expenditure increases their ability to purchase health care improved so they switch from public to private facility.

Respondents were asked how much they satisfied from the services provide through Public health facility. The following table shows their response.

Source: Field survey
Values within parenthesis are row percentage.

From the table 5 it is observed that a mixed response got from the respondents. Most of the respondent reported waiting room facility, availability of medicine, provision of operation theatre, ambulance facility and testing laboratory in primary health centers as poor.

**Conclusion**

In this study we found that socio-economic factors have an influence on the use of health care facility. Education, distance between the place of residence and health care facility and also monthly per capita consumption expenditure are found to be important determinant of utilization of public health care facility. In the study it is also revealed that low cost of the health service and availability of the facility as the main reasons for use of public health care. Opinion on the public health facility shows that respondents are not satisfied with the availability of medicine, testing laboratory, ambulance facility, operation theatre etc. in the hospitals. It needs an effective and continuous strategy to improve the public health care facility. Monitoring and supervision of the services in the government health centres is essential for improving the quality of care. The process of current evaluation should be strengthened to monitor the performance of the public health facility.

Effect of Therapeutic Laser in the Management of Diabetic Foot Ulcer

Vahini Devi. Ch1, Chiranjeevi. Jannu1, Prathap Suganthirababu2, Goverdhan Puchchakayala3

1Research Scholar, Saveetha University, Chennai, India, 2Associate Professor, College of Allied health Sciences, Gulf Medical University, Ajman, UAE, 3Director of Clinical Pharmacy, Vaagdevi College of Pharmacy, Ramnagar, Warangal, Telangana, India

Abstract

Introduction: Diabetic foot ulcer (DFU) is one of the common complications of diabetes mellitus (DM), which leads to lower limb amputation. The most frequent underlying etiologies are neuropathy, trauma, deformity, high plantar pressures and peripheral arterial disease. Loss of protective sensation is the primary factor in foot ulceration in diabetics.

Methods and methodology: 30 male and female patients were selected based on the inclusion criteria (according to wagner grading system). They were divided into two groups randomly and named group A as control group and group B as experimental group. Group A received conventional therapy where as group B has received therapeutic laser (TL) Helium – Neon (He – Ne) of 660nm wavelength with a dosage of 4J/cm² for five days a week for four weeks. Their pre and post intervention values were taken and analyzed by using T test.

Results: Both the groups were compared with pre intervention and post intervention scores by using T test. Group A results were not significant where as group B results showed significant values at p <05.

Keywords: Diabetic foot ulcer (DFU), Diabetes mellitus (DM), Therapeutic laser (TL), Helium Neon laser (He – Ne)

Introduction

Diabetes mellitus (DM) is one of the common problem in humans worldwide. In recent times India has more number of diabetics. According to International diabetes foundation and World health organization India is called as capital of diabetes1. Currently it affects more than 62 million Indians. It is more than 7.1 adult populations. The average age of onset is 42.5 years2. According to Indian Heart Association it is estimated that by 2035 there would be 109 million individuals with diabetes3. Indian Council for Medical Research (ICMR) conducted a large community study and revealed that lower proportion of population is affected in the states of North India (Chandigarh 0.12 million, Jharkhand 0.96 million) when compared with Maharashtra (9.2 million), Tamil Nadu (4.8 million)4 and 12% of Telangana population5.

During the course of the disease, 50% of patients eventually develop the complications6. Off these complications diabetic foot ulcer (DFU) are one the significant complication which leads to lower limb amputation. The most frequent underlying etiologies are neuropathy, trauma, deformity, high plantar pressures and peripheral arterial disease. Loss of protective sensation is the primary factor in foot ulceration in diabetics7.

The uncontrolled diabetic individuals, results from skin break and exposure of underneath structures and common under the great toe, ball of the feet and on the dorsum aspect of the foot. The causes for ulcer formation are decreased blood supply which causes vascular disease and leads to delay in ulcer healing, due to elevated blood sugar levels the healing process will be delayed and increase in infection rate, nerve damage will cause tingling sensation or no sensation which converts wounds into ulcers. Skin dryness is a common factor which results in cracking, calluses, corns and bleeding.
wounds. If the foot ulcer is not treated at the earliest it may lead to foot amputation. Many treatments like wound cleaning, debridement, skin grafting, antibiotics, vasodilators, pain management, different types of bandages and therapeutic treatments like ultrasound, infrared rays and ultraviolet rays, thermotherapy and exercises were tried to treat the foot ulcers, but the results are unsatisfactory.

**Therapeutic lasers:** These are also called as cold laser which produce a maximal output less than 1mW and produces a photo chemical rather than thermal effects. Laser lights depth of penetration depends on the type of laser energy delivered. Absorption of helium – neon (He-Ne) occurs rapidly in superficial tissues especially in the first 2 – 5 mm. The response that occurs is called as direct effect where as there will be 8 – 10mm of indirect effect.

**Wagner classification system:** Wagner ulcer classification system is the most widely accepted classification system for diabetic foot ulcers and lesions. It is based on the depth of penetration, presence of osteomyelitis or gangrene, and the extent of tissue necrosis. Wagner classification system is most widely used to describe the natural history of the devascular foot. This system assesses ulcer depth and the presence of osteomyelitis or gangrene by using the following grades: grade 0 (pre- or post ulcerative lesion), grade 1 (partial/full thickness ulcer), grade 2 (probing to tendon or capsule), grade 3 (deep with osteitis), grade 4 (partial foot gangrene), and grade 5 (whole foot gangrene).

**Materials and Methodology:**

Total 30 male and female patients suffering with DFU were selected into the study from Vaagdevi physiotherapy rehabilitation centre and MGM hospital. The duration of the study lasted for four weeks. Patients who had DFU were included into the study. Patients suffering with other types of wounds, neurological disorders, orthopedic and cardiac complications were excluded from the study.

Both males and females suffering with DFU were selected for the study from Vaagdevi Physiotherapy and Paediatric rehabilitation centre and MGM hospital. These 30 patients were divided randomly into two groups according to simple randomization by using hat method. Group A has 15 patients and group B has 15 patients. Group A patients are named as control group and received conventional treatment like antibiotics, adhesive backing film and silicone coated foam. Whereas Group B patients are named as experimental group and were positioned comfortably and treated with Therapeutic laser (Helium – neon) with a wavelength of 660 nm with a dosage of 4J/cm² for five days a week for four weeks along with antibiotics. Patients were stratified and their pre and post intervention status of wound was recorded according to Wagner grading system.

**Results**

Post intervention scores for both the groups were calculated. Their mean and standard deviation was calculated. Both the groups were compared with pre intervention and post intervention scores by using T test. Group A results were not significant where as group B results showed significant values at p <05.

**Discussion**

DFU causes a major healthcare problem with significant cause of morbidity and mortality. It causes financial burden to the diabetics. In patients with DFU healing process is arrested at inflammatory stage, and its further progression is not clearly known. Several biological processes at cellular and molecular levels are involved in wound healing. Moist wound therapy is known to promote fibroblast and keratinocyte proliferation and migration, collagen synthesis, earlyangiogenesis and wound contraction. At present, there are various categories of moist dressings available such as adhesive backing film, silicone coated foam, hydrogels, hydrocolloids etc. Unfortunately, all moist dressings cause fluid retention; most of them require secondary
dressing and hence are not the best choice for exudative wounds\textsuperscript{13}. Therapeutic laser properties of healing are likely to be photobiomodulation which results in increased production of granulation, proliferation of fibroblast, collagen synthesis, neovascularization, and early epithelialization. Therapeutic laser is gaining lot of interest when compared with other non-invasive treatment modalities\textsuperscript{14-22}.

Low-level laser radiation was found to have a stimulating effect on cells, and high-energy radiation had an inhibiting effect. The application of lasers to stimulate wound healing in cases of non healing ulcers has been recommended\textsuperscript{23}. Therapeutic laser stimulates the release of cytokines and growth factors into the circulation. These are responsible for vasodilatation of the vessels and formation of new capillaries. Ulcer bed with edge was irradiated locally with TL (660nm), about 4-J/cm\textsuperscript{2} for 10 minutes five days a week for four weeks. After four weeks of intervention, the experimental group showed a significant reduction in the ulcer size.

Schindl A et al., has conducted a case study on diabetic neuropathic foot ulcer. They applied Low intensity laser therapy with a wavelength of 670 nm diode laser. They have administered laser for duration of four weeks with four sessions per week. They found that the ulcer has been completely healed, even after a follow-up of nine months, there was no recurrence of foot ulcer\textsuperscript{24}.

**Conclusion**

This study concludes that therapeutic laser has shown encouraging results in the management of diabetic foot ulcers. Further investigations and intervention with various laser dosages are necessary for better results.

Abstract

Talent acquisition is a long-term strategy to make hiring process more effective and efficient. It is an important task in every organization to succeed their operations in the competitive environment. Cloud based technology is the emerging practice which solves many problems in real time works especially human resource management. Many health industry experts and human resource managers trust the cloud technology that it can develop the services and research of health care and assist to find the talent candidate. The main objectives of the study are a) to study the invasion of cloud technology and its benefits in talent acquisition and b) to analyze the recent technological changes as well as to identify and overcome the challenges in the health industry in talent acquisitions process. Secondary data was collected from web sources and journals. Interviews with human resource managers of health sectors and cloud vendors were conducted during December 2018 to identify their opinions towards use of cloud in talent acquisition.

Keywords: acquisition, cloud, health care industry, human resource, recruitment, talent, technology

Introduction

The processes of recruitment and talent acquisition are the critical tasks in every organization to succeed their operations effectively and efficiently. In the battle of hiring talent candidates, the worldwide talent acquisition, technology in staffing and services market is undergoing a transformation to cloud technology. In cloud model, data are stored in the remote server in the internet rather than the server placed inside the organization (local server), so that it can be easily accessed from any place at any time by authorized personnel of an organization. Agarwal described that the cloud is renovating nearly all types of industries in the market especially service sector such as health, education, banking, recruitment etc. He also pointed out the PwC’s worldwide survey report that the sector’s use of cloud computing increased up to 73 per cent in 2017 from 68 per cent in 2016 in which human resource industry benefitting most. Currently many health industries are investing more amount in cloud technologies and adopting the engine of SMAC (Social media, Mobile technology, Analytics, and Cloud model) driven HR to get maximum benefits on investments in marketing. Cloud technology supports healthcare applications like EMRs, HIS, PACS, and others affordable and easily accessible.

Statement of the Problem

Bagai described in his recent study that small scale sectors are not having the adequate resources to trace talent individuals for their short term projects, just in time assignments, over-time works, and seasonal jobs. They are facing difficulties to find good candidates among the availability of more resumes received in the organization. Nowadays all online activities and communications are linked with cloud computing. A research report of Peoplescout.com said that 46 per cent of hiring managers felt difficulty in filling full-time employees for skilled medical positions and it also predicted that around 2.3 million jobs in the healthcare sector to be
filled by 2026, 0.7 million nurse jobs to be filled by 2024 and 1.04 million potential physician vacancies by 2030. The Bureau of Labor projects statistics estimated that healthcare occupation in United States economy will grow 18 per cent from 2016 to 2026 and scope for 2.3 million jobs in the same industry. Growing healthcare sector face new challenges in retaining top talent and also need to secure talent. Technology advancements in talent acquisition evolving candidate expectations in health industry and the need for more advanced workforce planning put force on recruiters to keep pace with new demands. It is important to analyze the impact and the challenges faced by the recruiters while implementing cloud technology in health industries. The study aims to explore the benefits of cloud for talent acquisition and its importance in health industry.

Review of Literature

Recruitment is a major activity of human resource department in an organization to fulfill the immediate vacancies while talent acquisition is a strategy for long-term to hire talent individual more productive and efficient. The process of talent acquisition will take more time and at last it will facilitate to build a good team in an organization. Some of the specific product markets (niche) create demand for talent acquisition strategies contain financial management, technology, law and medicine. Now-a-days, promoting company culture on social medias like facebook ads, you tube ads, LinkedIn, Twitter etc. can be a great utility for building employment brand and obtain talent individuals for the skilled job positions.

White described the application of cloud model in recruitment and onboarding of new personnel in an organization such as finding the right candidate, accessing the data at anytime from anywhere, sharing data quickly, security etc. The cloud technologies help to recruiters to reduce recruiting time for technical and highly skilled positions, while increasing the quality and multiple skill sources of applicants. Due to discrepancies in existing Applicant Tracking Systems (ATS), hiring companies miss out on more than 50 per cent qualified candidates and technology enterprises improperly classify up to 80 per cent of candidates. A recent analysis conducted by the Staffing Industry in 2018 said that the organizations are spending 82 billion US dollar on a global level for storing and managing the data in human cloud. Johnson and Diman highlighted in their study that the maximum numbers of small and medium sized companies are using cloud-based Human Resource Information System (HRIS) for daily human resource operations, supporting from top management as well as vendors. Little revealed that the recent adoption of cloud computing and its models like Platform as an Service (PaaS), Software as a Service (SaaS) and so on are influencing the relationships with learning management systems and learning content management systems. There is a huge demand for customer and vendor investment in the talent acquisition market because of availability of new functions. In order to face new challenges and improve internal recruiting programs, processes and capabilities, many healthcare sectors are approaching to a Recruitment Process Outsourcing (RPO) partner to hire top talent employees in the job market. Most of the above researches in this paper revealed that the necessity of cloud recruitment and usage of cloud models in talent acquisition in the current scenario.

Objectives of the Study

The main objectives of this study are:

i. To study the invasion of cloud technology and its benefits in talent acquisition.

ii. To analyse the recent technological changes in the health industry in the process of talent acquisition.

iii. To identify and overcome the challenges in cloud based talent acquisition in health industry.

Research Methodology

In order to achieve the objectives of the study, secondary data was collected from web sources and journals to identify the recent trends, benefits and opportunities in usage of cloud model in health sector’s recruitment process. Interviews with HR managers of health sectors and cloud vendors were conducted during December 2018 to identify their opinions towards employment of cloud in talent acquisition. This study is basically done as an exploratory research.

Application of cloud model in talent acquisition

Cloud provides various service models and each model performs different functions for fulfilling the needs of different people. The most important models of cloud technology are supporting to improve the services in recruitment and talent acquisition. As
a customer, you pay for what you use. IaaS is a type of a service model of cloud which provides computing resources virtually in the internet and offer large storage for all medical facilities. In PaaS model gives the ability to the customer to deploy customer created apps using programming languages, tools etc. SaaS model provides leases applications or softwares which are owned by them to its client. Apart from this, HRaaS provides human resource service under cloud model. There are three types of deployment models in cloud technology such as private, public and hybrid model. In Private cloud model, services are offered to a minimum number of people in addition with a security tool firewall and companies are allowed to take control over their data. Public cloud is a service provider that provides resources such as software applications and storage and which are accessible to general public over the internet. In some cases, organizations can use Hybrid model, a mix of private cloud for on-premises and public cloud for third party services. Currently, cloud service providers such as Google cloud platform, Digital ocean, IBM cloud, Amazon web services, terremark worldwide and Microsoft Azure are the major vendors in the world.

Reasons for adopting cloud-based recruitment and talent acquisition

The following are the reasons why the organization should adopt cloud-based recruitment technology to meet talent acquisition.

a) Integrated approach to candidate management: SaaS model provides an integrated approach to applicant management and tracking system. A unified software system offers various functions such as analysis of applicants experience, acquisition, on-boarding, supplying and progression.

b) Innovative assessment and filtering techniques: A cloud-based Recruitment Management System (RMS) will permit the employers and HR managers to easily find the skilled employees at affordable cost, assess and categorize the top candidates. It will help to make 360° view innovative assessment and filtering techniques of top applicants.

c) Effective interaction between hiring managers and recruitment teams: Bersin[1] reported that the cloud based effective software solution improves the collaboration between the hiring managers and recruitment team. This will impact to take smart decisions, increase the value and improves the productivity of the concern.

d) Large-scale data analytics: The talent-centric recruitment organization will emphasis on detailed analysis of candidates through predictive analysis and Big data technology. The cloud model helps the hiring managers to access all important private data on mobile devices at required time.

e) Mobile optimization and social integration: A report by PWC[12] said that 73 per cent of CEOs citing skills shortages at crisis levels. Absence of mobile optimization technological issues can be sorted out by embedding Candidate Relationship Management system software, adoption of social media tools and the cloud based proactive tool for social interaction.

f) Chatbots for candidate engagement: In order to facilitate effective candidates engagement, hiring organizations are using chatbots and data mining algorithms to filter the resume of skilled candidates, identifying best prospects and screening process.

g) Choosing the right candidate: It helps to choose right candidates with required skills from large volume of data in the very short period.

h) 24/7 service: Hiring managers can work with cloud based recruitment software and access the data 24/7 at any place whether on vacation, in medical leave, business meetings/trips, or even at home.

i) Rapid data sharing and Better Security: The data stored in the cloud server can be shared widely within the company with secured tools.

j) Speeds up the Recruitment Process, Cost reduction and easy implementation: It helps companies save on installation costs, customize platform to meet specific needs and it takes very less time to implement.

Challenges and cloud based solutions for talent acquisition in health industry

The following are the general challenges faced by the HR team who works for talent acquisition while implementing the cloud technology for their operations. Meeting cloud expenses, working with multi-cloud model from different cloud service provider, transformation of existing process onto the cloud, lack
of understanding and knowledge about the cloud, difficult to convert backend process of HR Activities, lock-in a product affects transition to a peer product, cloud downtime and violation in data security are the common challenges faced by all types of industries. The major challenges faced by the health industries for talent acquisition process and the solutions for resolving them are described below.

i. Increasing turnover rates in health care industry is an important problem for HR managers. The demand for specialized healthcare positions, lack of internal resources, global expansion and mergers in healthcare sector also urge the need for scalable, cost-effective recruiting services and designing talent acquisition solution for their dynamic hiring needs. According to Compdata’s Benchmark Pro Survey conducted by Bares in 28,000 organisations in 2015 found that healthcare ranked second highest in turnover rates at 14.2 per cent compared to other industries. The fluctuation in hiring volume can be faced by RPO services by deploying more number of recruiters.

ii. Talent shortage is existing in all clinical, allied and non-clinical roles. An increase in number of hospital visits, long-term patients, and routine doctor appointments are creating the need for recruiting more vital allied and non-clinical staff. This issue can be addressed by AI enabled sourcing tools that can be used to discover patterns in candidates’ resumes, social profiles and screening the existing resumes in a healthcare organization’s applicant tracking system (ATS).

iii. Negative candidates experience will result in losing qualified candidates and posting of more number of poor reviews/comments on social medias and various job sites. Organisations should work for patient satisfaction, must understand the patients’ journey and feedback about a healthcare provider. In order to face this challenge, an optimized candidate experience such as automated interview, recruitment in mobile and social media, evolving talent communities, video interviews, digital assessments, bespoke job descriptions, customized career websites, balancing of human interaction and partnering with RPO can be implemented to deliver a highly personalized application experience.

iv. Online job advertisements and application submission, searching job and application in smartphone, AI & ML, big data, predictive analytics, increasing usages of different social medias, video and chatbots interviews, digital assessments and automated emails are optimizing the recruiting functions and increasing the customer expectations. RPO partners are utilizing machine learning technologies for developing algorithms for good hiring process from existing candidate data in the healthcare organizations.

Apart from these, there are some common recommendations to overcome the challenges in talent acquisition process. They are a) seeking assistance from various technological solutions for cloud cost management, b) making relationship with cloud computing partner, c) a centralized cloud team for cost and budget preparation, d) maintaining a proper infrastructure, e) trained HR personnel in cloud, f) proper designing of security frameworks, g) backup solutions and disaster recovery, h) protective efforts during downtime and i) improving corporate culture that guarantees data security.

**Conclusion**

There is need to modernize the health industry with advanced IT infrastructure for enabling faster, safer and efficient health care delivery. While implementing this cloud technology in health care sector, organisations should give assurance for patient privacy and sensitive personal information. Separate cloud model for healthcare is a most important need for addressing the security issues and fulfilling the various requirements in the health sectors. Currently, many developed countries like US are using cloud based information clearing houses for exchanging health information between hospitals, physicians and various health systems. Health organisations are practicing to store medical records and images in the cloud. Other side, a continuous cloud based research is conducted by the pharmaceutical industries for cheaper, additional effective treatment protocols and medicines. In order to implement the effective health care operations in rural/remote areas through mobile environment and a transformational shift from traditional healthcare to cloud health care, a separate healthcare cloud model is necessary for healthcare industry.
Ethical Clearance: This study was conducted using secondary data from web sources and journals to identify the recent trends, benefits and opportunities in usage of cloud model in health sector’s recruitment process. Interviews with HR managers of health sectors and cloud vendors in Bengaluru city were conducted during December 2018 to identify their opinions towards employment of cloud in talent acquisition.

Contours of ‘Clinical Legal Education’

Shefali Raizada¹, J.K. Mittal²
¹Ph.D Scholar (Law), Amity Law School, Noida, Amity University, ²Professor Emeritus, Law (Ph.D. Guide) Amity Law School, Amity University, Noida

Abstract

Law is central to society; governs everyday lives. It is one of the most rewarding, challenging and respected areas of study which develops intellectual and interpersonal abilities. Study of Law gives skills in abstract thinking, critical analysis and political problem solving aptitude. Basic aim of law education is to develop perception and jurisprudential understanding of the environment, local and global to know the cultural and social aspects of the time. Clinical legal education being one of the facets of entire Law curriculum provides for access to justice to the marginalized and disadvantaged sections of the society and to focus on promoting ethical responsibilities of the legal profession.

In India recent efforts to develop and expand serious clinical programs can serve as a positive example for the future expansion throughout the region. Prior to the establishment of formal and independent programme, legal training was tied directly to colonizing power. Now the clinical practice has become mandatory requirement for legal institution but still facing challenges. In view of making education globally competitive, there is need to adopt best practices and embrace new technologies for wider access to justice and to address community’s perceptions and experiences of issues.

Keywords: Law education, justice, social responsibility, rule of law, legal skills, global standards

Introduction

The contoursof ‘Clinical Legal Education’ can, well, be illustrated by a Jug Suraiyan(columnist for, Times of India, dialogue between ‘Lawyer’ in his chambers and ‘Client’ upon entry as below:

Lawyer : My dear, what obliges you to come here?

Client : Sir, I suffer from a number of thorns of life and so at your place for aid and advice.

Lawyer : Please deposit the fee for consultation and then tell me your ills.

Client : Sahib, I am poor and unable to pay you fee-it is so big. May I, still,

beg of your mercy and disclose my troubles?

Lawyer : (After viewing the client’s poor and pitiable condition) Well, you can.

Client : For sure, my woes veer round the past, present and future.

Lawyer : (With surprise) How!

Client :

1. Few years back, I would have some ill-gotten money, which I lent to an old friend of mine on rukka(pronote) and promise of soon return with modest interest. The said friend is now my foe and refuses to give back even my principal-nothing to say of interest. Upon making of demand(s), he threatens me and my family with dire consequences. And we live under a thatch, which hardly prevents sun or, rain.

These glaring events and many more in hide define our murky past.

My eldest daughter was entangled in a #Me too affair and is ashamed of initiating any criminal action. My second daughter was gang raped and local police has turned a deaf ear to our report. My third minor

DOI Number: 10.5958/0976-5506.2019.01883.7
daughter was enamors of a boy in the vicinity and is insisting upon a matrimonial knot without delay. My only son was divorced twice—once on his own accord and next at the effort of his second spouse, who would complain of dowry-demand and domestic violence.

Now the question is and my worry…..

How to arrange and monetize the marriage(s) of daughters—it is the most worrisome problem:. How to maintain and preserve the muddy walls of the house and fleeting straws of the chhappar. How to earn the meagre crusts daily for feeding the large family—it is the last of many more torments.

Frankly speaking, these are the frosties of our future.

Lawyer: Enough and enough, stop your tale. I have diagnosed your malady—it is ‘Ignorance’, for which the ‘Remedy’ can be sought at the doors of a clinical expert of legal education.

In sooth, the lawyer’s retort contains a sound advice—legally as well as clinically vetted. To the like effect is the celebrated comment made, on the law of coercion, by the beadle, Mr. Bumble, in ‘Oliver Twist’ of Charles Dickens, which was quoted as beneath:

‘The law supposes that your wife acts under your direction. ‘If the law supposes that’, said Mr. Bumble, ‘the law is a ass—a idiot. If that’s the eye of the law, the law’s a bachelor, and the worst I wish the law is, that his eyes may be opened by experience—by experience’. Surely, the noun ‘experience’ must, by the spirit-rule of interpretation, signify the practical aspects of clinical education. Trite to say that India lives in villages so much so that the above dialogue, although imaginary, reveals the constant cankering of unawareness and lack of legal knowledge amongst the laymen.

Concept of legal clinics based on medical clinics

The concept of ‘Clinical Education ‘hails from its medical counterpart, whereby the medical students are so groomed, under the supervision of experienced doctors of a hospital, as to be able to assess the patient’s symptoms for the purpose of diagnosis and, then, prescribe treatment. In the context of legal education, it is a law college and institutes endowing the students with practical skills under the guidance of well-versed teachers from the ‘Faculty’ or ‘Bar’. Instructions in law, need, as such, be more aligned to clinical than theories. The old order of lectures in class-room, very often shooting overhead or passing through deaf ears, must change and give way to internship, so that the students may visit the proceedings, on the criminal, civil, revenue and writ side from beginning to the end. In a sense, clinical legal education aims at perfecting a democratic process of learning of how to plead, with grace and gratuity, for the woes of the downtrodden and marginalized sections of the society, too, to the ultimate fulfilment of objectives of social justice. In such a backdrop students are sure to gain (a) valuable legal skills, while delivering much needed legal services to the underprivileged communities, (b) shy traits of empathy and (c) keen insights into various burning issues.

There is need to understand the concept of welfare of society as a whole through these clinics. For certain, the goal of legal education is to pass on a number of concrete abilities to students i.e. to have concern for the lives of others, to grasp policies, to think about the good of the nation, and to recognize fellow-citizens with equal rights irrespective of caste, creed, religion, gender. Legal clinics offer the opportunity for students and faculty to engage with communities around them. Much of the conversation between student and client involves gathering facts and developing legal strategy dissensions, often more beyond that. Much trusted and personal relationship is born, which can mature and deepen over the course of time.

Clinical process and necessary skills

The object of the clinical component in the Law curriculum is to impart the necessary skills, attitudes and ethics among the law graduates who want to take career in the field of law and administration of justice. After independence, legal career was largely confined to litigation in courts and tribunals as well as civil and judicial services. With economic liberalization, opportunities for; legally trained people have opened up in a variety of jobs including corporate law firms doing transaction practice, in-house counsels in companies and industries, dispute settlement outside litigation including mediation, conciliation and arbitration, law reporting and publishing sectors and legal process outsourcing work. Under Rule of Law concept teaching and research have generated rigorous demand in major way where academicians, lawyers and legal professionals have to work with all required skills in expanded way. Through clinical processes of experimental learning,
students cultivate key skills to examine policies, law, regulations, local needs, traditions, circumstances and practices of that areas; to gain substantive exposure to principles of clinical legal education, international law on human rights and its implementation, theory of good governance, status of civil societies and scope of local and regional jurisdictions etc. and work towards the promotion of a democracy, that values and enhances the life-perspectives of all citizens of the nation.

As medical clinics provide instant relief and remedy likewise Legal clinics may be referred as to provide solution to clients in legal matters. Both these clinics are also referred as the part of teaching—learning while doing in association with respective field expert. These problems may relate to a business, compliance with laws and regulations, violation of rights or any of domestic grievances etc. Legal knowledge bearing on the problem can be learnt by reading laws and consulting earlier judicial decisions and precedents on the issues involved. And by applying this knowledge to problem, solutions may be found and skills may be developed to determine strategies, to assess the risks and to make decisions on the best way to proceed to get desired results and to some extent simulation exercises in college can help to practice skills.

**Local and Global Dimensions**

Clinical education as linked to social action and different local dimensions, in present scenario, increasingly getting global. Success of law schools and law students are connected with their association with society and community. With the growing time, this global mission has begun to develop clinical programs and helps to ease the path towards institutionalizing the clinical concept. The missionary zeal can, alone, pave the path for such a reach, so as to refine and streamline the professional techniques of budding lawyers by practical methods of experiential sort verging upon social needs of global dimension. In 1921, the Carnegie Foundation for the Advancement of Teaching, U.S. observed that legal education was lacking in clinical facilities as compared to engineering and medical education. It was suggested to develop legal aid to make justice more accessible and provide students real world experiences. In the result, major social issues saw the light of the day world-wide in the 1960s and 1970s as to poverty, consumer & civil rights and women-empowerment etc. and the clamors for institutionalizing the idea of practical training. Growth and acceptance of clinical programs around the world has supported new initiatives that reached across borders with no breaks, and no transcending regional and national barriers, which include Association of University of South Africa, Legal Aid Institutions in Nigeria, Polish Legal Clinics Foundation, Russian Clinical Legal Education Foundation and many others tapping, inter alia, to facilitate—the key elements of the programmes, that influence the clinical education around the world. Though Clinical Legal Education in India has grown significantly in quality and quantity but implementation is still not so smooth. Clinical programs face greater hurdles in securing the adequate faculty support for approving the program as a credited course. There are the constraints to discuss as mentioned here—

**Operational difficulties for clinical education in India**

Firstly, there is the problem of determining the source of expertise in the field of legal clinics. The lawyers, serious at the Bar, are more devoted to developing of their professional skills for money, rather than the zests for public services sans money. The students are, already, loaded with the heavy curriculum of compulsory subjects, optional subjects, core subjects etc., playing truancy, as well as hesitancy in class-rooms with a finger of scorn at outdoor/extraneous activities. The professors are, by and large, novices in the area, untrained for the errand and uninterested for the extra-curricular walkouts. The absence of bonus-expectancy, further, marginalizes them from the project. The vacuum is, thus, rampant and persistent for no chance of early fill-ups.

Secondly, the requisite number of clinicians is to be ascertained depending upon the area likely to be covered, population likely to be affected and litigation likely to be handled. Is n’t it so stupendous and deceptive a task!

Thirdly, the question is to ascertain the quality of such an expert. In case of matters covered by the dialogue, the expert, whether a practicing lawyer or a studying student, need be versed in the(a) laws of negotiable instruments, court fees, women’s rights, criminal and civil procedure, public interest litigation, legal aid, matrimonial and domestic causes,(b)non-statutory various government schemes of housing, education, healthcare, medicine and old age-cum-poverty pension and(c)earlier experiences of, and through, court visits. Where, and with whom, is
the stick of measurement and power of certification?

Fourthly, only he knows where, when and how to find the said unbranded God-father! In the Clients’ clinic! Let its location(s) be disclosed in a manner accessible to all, sundry and needy. The timings be notified and presence of the clinical helper(s) ensured. In the else, the expert(s) may visit village after village and represent justice at the doors.

Fifthly, the legal aids are hard and delayed to come and never sufficient to cover every nook and corner of the expenditure actually done at various stages of the adventure to the frequent passing of the buck to the litigant himself. Can, in such eventualities, the aim of free justice to the poor be actualized?

Sixthly, the clinical assistances are supposed to be gratuitous public services. Be as it may, but money, alone, makes the mare go. As such, the so-called experts feel inclined to work out their services only upon their palms being greased. The needy is to oblige the needful before the recognition of his/her litigious travails. The very purpose of legal mission is defeated.

Seventhly, the virus of corruption too is entering the portals in mysterious ways. According to Voltaire, even if God did not exist, we would have to invent Him. And we have, successfully, invented Him in the area of clinical philanthropy of law as well.

Eighthly, the pursuits, subsequent to the advice of the clinical counsel, are likely, in majority of cases, to trigger frequent races to some court. In the result, he may sit back and abandon the venture as ‘unwept, unhonored and unsung’.

Lastly, the point for probe is whether the costs involved in the operationalization of the system do measure up to the beneficial trickles. The answer should be a definite ‘no’.

Despite all the above mentioned locks, clocks and blocks, the clinical education in law is, paradoxically, lauded at all juristic counters of the world of the day. Presently it is looked upon as much an essential method of teaching law as a new tool of legal therapy to undertake doctrinal analysis, to make policy choices essential to lawyer-roles as apparent for a socially relevant legal education for the future. These clinics can venture on service to public agencies dealing with welfare, prisons, social services etc. Where the authorities may be well disposed to receive fresh ideas, critiques and evaluations; “by Prof. Kenneth-L Penegar, while recommending the steps to facilitate the transition for clinical education at the Annual Meeting of the Association of American Law Schools in 1981.

Legal aid camps-steps to clinical experiences

Clinical Legal Education’, which to accomplish, the following steps need consideration for, ultimately, being adhered to:

1) The two -tier system, of 5-year or 3-year LL.B.course, be off the track and every aspirant, whether graduate or under-graduate must submit and subscribe to the former.

2) The last of the 5 years be set apart for clinical pursuits.

3) There be a distinct department of ‘Clinical Legal Education’ housed in a separate building within the campus.

4) Building be full with structural and infrastructural amenities for purposes of organizing ,in mock style, clinical programmes in the nature of moot courts, Lok Adalats, criminal & civil trials, legal aid camps.

5) The earlier pass-outs and aspiring novices from the Bar be, also, accommodated on request and payment of nominal fees. Their attendance and participation be ensured to be regular without any, real or supposed, truancy.

6) Faculty be drawn from among the (a) trained professors, (b) experienced members of the Bar, and(c)retired judges/judicial officers-their terms being on salary or honorarium as ruled or regulated.

7) Funding be the responsibility of the law school/college/ university concerned.

8) Indoor exercises, theoretical as well as practical, be followed and supplemented, in due course of time, by field-work in the form of reaching legal services to the people hit by some natural calamity. Custodial victims, rural illiterates and persons requiring some more service-oriented help and spot- learning in the chamber
of lawyer(s) qua factual investigation, legal drafting, criminal and civil procedures, tricks of adversary litigation and moral values of legal profession.

Upon maturing such a backdrop, the legal education in India ought to get legally as well as clinically, democratized to serve “We, the People of India...” The transition is, of course, to involve much time and energy for the sake of planning, developing and executing.

Conclusion

Unfortunately, India is not rising fully to the occasions of clinical philosophy, although serious efforts are on to develop and expand wide-ranging clinical programmes. Earlier, legal training of the professionals was in the prerogative of the colonizing power and laid by haphazard. There were no programmes of standard in British India. In independent India, the practical legal training became, placidly, formalized, albeit not without many an affront. It was in 1977, the Committee on National Juridicature proposed and insisted upon law schools to participate in legal aid activities believing that law school clinics would offer the opportunity not only to provide skills-training, but would also, be able to sensitize students towards the broader social obligations of the legal profession11, (Government of India, 1973 & 1977). In 1981, the Committee for Implementing Legal Aid Schemes concluded with the same litigation oriented legal aid programs. As under draft of National Education Policy 201912, it is stated that the function of the legal education is to inculcate the values of Indian democracy in law students.

Let all hands, high and low, white and black, rich and poor and so on, join to create sensitivity to the cry for law reforms and focus on community’s perceptions and experiences on issues of relevance to the domain of clinical legal education.

Effectiveness of an Educational Package on Health Promotion Behaviours of Mothers of Asthmatic Children in Karnataka, India: A Quasi Experimental Study

Erna Judith Roach¹, Nalini Bhaskaranand²

¹Assistant Professor, Maternal and Child Health Department, College of Nursing, Sultan Qaboos University, Sultanate of Oman, ²Professor, Department of Pediatric Medicine, Kasturba Medical College, Manipal University, Manipal, Karnataka, India

Abstract

Background: Asthma education for mothers of asthmatic children is one of the cornerstones of management of childhood asthma. Empowering mothers with health promotion behaviors can reduce recurrent asthma exacerbations and improve health outcomes of asthmatic children.

Objectives: To assess the health promotion behaviors of mothers of asthmatic children, and to determine the effectiveness of an educational package on health promotion behaviors.

Method: A quasi- experimental design with block randomization was used to collect data from a sample of mothers (N=80) distributed between the experimental (n=40) and control (n =40) group. The study was conducted in the Pediatric Outpatient Departments of selected hospitals. A Baseline Proforma and a Health Promotion Behaviors scale was used to collect data. The educational package (information booklet and video) was administered to the experimental group and the control group received routine care.

Results: The post-test mean health promotion behavior scores of the experimental group 87.58 ± 3.30 (CI: 86.52 - 88.63) was significantly higher than that of the control group 79.00± 5.98 (CI: 77.09 - 80.91). The two-factor analysis of variance for repeated measures and the Post hoc Bonferroni test showed statistically significant improvement in the experimental group compared to the control group.

Conclusion: The education package was effective in improving the health promotion behaviors of mothers of asthmatic children. Pediatric outpatient units can utilize the educational package to promote the health and quality of life of asthmatic children.

Keywords: Bronchial asthma, Educational package, Health promotion, Health behavior.

Introduction

Asthma is the most common and potentially serious non – communicable chronic disease among children. According to the World Health Organization (WHO) globally around 235 million people currently suffer from asthma.¹ India has an estimated 15 – 20 million asthmatics with an estimated prevalence ranging between 10% to 15% in 5-11-year-old children.² The strongest risk factors being genetic predisposition and indoor and outdoor environmental exposure to respiratory irritants that provoke allergic airway reactions and cause exacerbations.¹ In the year 2015, the overall morbidity burden of asthma was estimated at nearly 65 million and more than 82,000 deaths were due to asthma. The burden of asthma was highest among individuals living in households using solid fuels (firewood~80%,
Asthma in children is rapidly rising with an estimated prevalence of 18.2%, but the disease still remains highly underdiagnosed in children. Although asthma is not curable, the symptoms and episodic attacks can be prevented with appropriate health promotion behaviors. However, most parents lack adequate knowledge on the appropriate behaviors that can be implemented to promote the health of their children. Generally, children with poorly controlled asthma have an increased risk of poor academic performance due to increased number of missed school days, and psychological and behavioral problems such as anxiety and decreased self-esteem. Pediatric asthma can cause disruption to the family and loss of productivity at the work place. Hence, pediatric asthma education can have a positive effect on caregiver management behavior.

Interventions aimed at teaching families’ better asthma management approaches may have the potential to alter biological profiles in children. Education on optimal home management of asthmatic children involves controlling the triggers, accurate symptom identification followed by timely and appropriate treatment. This influences their quality of life by preventing frequent exacerbations, and helping them to have normal lives as other children. Sweet et al. conducted a study to implement a multifaceted home-based intervention for 115 parents of asthmatic children with a goal of improving asthma outcomes by controlling indoor asthma triggers in the home environment. Data was collected at baseline and 6 months following the intervention. The findings revealed significant reduction in asthma symptom days, nighttime awakenings, days with activity limitation and albuterol use. There was significant reduction in emergency department visits, missed school days, and caregiver missed work days with improvement in caregiver quality of life. Another study by Williams et al. also implemented an educational intervention for parents of asthmatic children during emergency department visits to improve their understanding of the child’s asthma severity. They found that the intervention group who received the educational session had significant improvement in outpatient follow-up rate (50% vs. 20.8%, \( P < 0.001 \)) compared to the control group who did not receive the educational intervention. The current study was conducted to assess the existing health promotion behaviors of mothers of asthmatic children and to determine the effectiveness of an educational package on health promotion behaviors.

**Material and Method**

A quasi-experimental pretest posttest control group design was used. The study was conducted in the pediatric outpatient departments of two selected hospitals in Dakshina Kannada and Udupi districts in Karnataka (India). The purposive sampling technique was used to select mothers of children diagnosed with persistent asthma. Persistent asthma was defined as the severity of asthma as classified by Global Initiative Network for Asthma (GINA) guidelines as mild persistent, moderate persistent and severe persistent asthma and as diagnosed by the physician. Written informed consent was obtained from the mothers who were willing to participate in the study. Thereafter the mothers were randomized (n=40) to the experimental and control group by block randomization. On the first day (pretest), the Baseline Performa and the Health Promotion Behaviors rating scale was administered to the participants. The rating scale was developed by the researchers to assess the extent to which the mothers of asthmatic children adopted healthy behaviors at home in order to promote the health of their children. The scale consisted of six areas of health promotion and these were: environmental control (11 items); physical activity (5 items); self-care (3 items); medication (2 items); emotional support (2 items); and preventive measures (9 items). The validity and reliability of the tool was established before it was administered to the mothers. After completion of pre-test data collection, participants in the experimental group received the educational package (information booklet and video on childhood asthma and health promotion behaviors) in a private area in the outpatient department, and those in the control group received routine care. The intervention (educational package) involved individualized administration of an information booklet and video which included an introduction on the respiratory system, an overview of asthma (meaning, triggers, mechanism and effect of bronchial obstruction, signs and symptoms, diagnosis, and treatment), techniques of drug administration, common side effects and dangers of noncompliance, prevention and control measures/ health promotion behaviors, and when to consult a doctor. The post-test data was collected at 180 days after the intervention for both groups and using the same rating scale.
**Statistical Analysis**

Mean, Standard deviation, Median, two factor ANOVA for repeated measures and Post hoc Bonferroni test for comparison of effect within and between groups for pretest and posttest health promotion behavior scores of experimental and control groups were computed.

**Results / Findings**

**Sample characteristics**

The mean age of participants (mothers) in the experimental group was 37.73 ± 5.68 (CI: 35.91 - 39.54) and in the control group it was 36.35 ± 5.34 (CI: 34.64 - 38.05). The majority of participants in both groups were between >30-40 years of age. Most of the mothers in the experimental group (27.5%) had high school education, and an equal percentage had intermediate level of education. There were 22.5% graduates / postgraduates in this group. In the control group, 37.5% had high school education, there were 20% mothers with intermediate level of education and 27.5% with graduation/post-graduation. The majority of mothers in both groups were housewives, and the other detailed description of the sample has been previously reported.¹²

**Effectiveness of the educational package towards health promotion behaviors**

The summary of the pre and posttest health promotion behavior scores of both groups is presented in Table 1. A comparison of the control and intervention group pre-test mean health promotion behavior scores showed no significant difference (M=78.68±6.81; CI: 76.50 - 80.85) and (M=79.60 ± 4.88; CI: 78.04 - 81.16) respectively. The posttest mean health promotion behavior score in the experimental group (M = 87.58 ± 3.30; CI: 86.52 - 88.63) was significantly higher than the posttest mean score (M= 79.00 ± 5.98; CI: 77.09 - 80.91) of the control group. The mean percentage of the posttest in the experimental group was 91.23% when compared to the pretest which was 82.92%. In the control group mean percentage of the posttest was 82.29 % and the pretest was 81.96%. There was an increase in health promotion behavior scores in the experimental group (8.31%) and minimal increase (0.33%) in the control group.

The median, quartiles and range of scores on health promotion behavior is depicted in the Box and Whiskers plot as in Figure 1. The median of posttest health promotion behavior scores in the experimental group (88.00) were significantly higher than the pretest median (79.50). The posttest scores ranged from 80.00 to 94.00, and the pretest scores range from 73.00 to 89.00. In the control group the posttest median 79.00 was lower than the pretest median 79.50. The posttest scores ranged from 64.00 to 90.00 and the pretest scores range from 62.00 to 90.00.
Fig 1: Box and Whisker plot showing the median, quartiles and range of pretest and posttest health promotion behavior scores in the experimental and control group

The effectiveness of the educational package in terms of improvement in health promotion behavior was determined by computing the two factor ANOVA for repeated measures and Post hoc Bonferroni test. The two factor ANOVA for repeated measures results presented in Table 2 shows that there was significant improvement from the mean pretest to posttest health promotion behavior scores within groups (F= 59.187, p< 0.01). A significant difference in health promotion behavior scores between the experimental and control group was also found (F= 50.280, p< 0.01).

Further within and between groups pairwise comparisons were done by computing the Post hoc Bonferroni test as shown in Table 3. Significant improvement in health promotion behavior scores from pretest to posttest was found only in the experimental group (p < 0.01) with mean difference 7.98 (CI: 6.19 – 9.76) and not in the control group with mean difference .33 (CI: .93 – 1.58), respectively. When the mean improvement between the experimental and control group was compared the Bonferroni test showed significant difference in scores between experimental and control group (p < 0.01) with mean difference 7.65 (CI: 5.50 – 9.80) indicating significant improvement in health promotion behavior in the experimental group.
than in the control group.

Discussion

The findings of the study revealed that the posttest mean health promotion behaviour scores was higher than the pretest mean health promotion behaviour scores only in the experimental group (87.58 ± 3.30 vs. 79.60 ± 4.88). In the control group the scores were almost similar (79.00 ± 5.98 vs. 78.68 ± 6.81) in pretest and posttest. An increase of 8.31% in the experimental group and only 0.33% in the control group was found. The education package used in our study was effective in improving the health promotion behavior of mothers of children with asthma.

The findings of our study concur with those of other studies using similar interventions. Zuniga et al\textsuperscript{13} in their non-randomized, longitudinal study tested the effectiveness of an educational intervention on 115 parents of Head Start children with or without an asthma diagnosis. The results of the follow-up survey after 6 months of the educational intervention showed a statistically significant increase in asthma and healthy home-knowledge (p < 0.001) in several areas. Moreover, at 6 months’ post-intervention 98.4 % of them made changes in their households as a result of their training.\textsuperscript{13} A nonrandomized longitudinal study was conducted in Rio Grande Valley of Texas in which an Asthma and Healthy Homes educational intervention training (N= 89) was implemented for parents of children from low income families. Significant changes were found in the behaviour among participants who received the training.\textsuperscript{14}

Tzeng et al\textsuperscript{15} in their study on the effectiveness of a nurse-led patient-centered asthma education programme on home environmental control behaviours of parents of children with moderate or severe asthma found that the level of improvement in dust and cleaning methods was significantly greater among parents in the experimental group than among those in the comparison group (p < 0.05). Children with moderate or severe asthma in the experimental group had fewer signs/symptoms of asthma and better lung function than children in the comparison group. Similarly, Jones et al\textsuperscript{16} tested an asthma education program in 204 underserved Latino families with an asthmatic child and found that participants made significant change to the child’s bedroom environment leading to reduction in mean triggers from 2.4 to 1.8, p<0.001 and increase in mean number of controller (0.7 to 0.9, p<0.001) medications. The present study found improvement in health promotion behaviours scores after the implementation of the educational package, indicating better health practices adopted by mothers at home.

The above discussion shows that educational interventions can bring about significant changes in parental behaviors and in promoting the health of their asthmatic children.

Conclusion

The study results showed that the educational package was effective in improving health promotion behaviours of mothers of asthmatic children. Statistically significant improvement was found in mothers who received the educational package compared to the control group. Thus well designed asthma education programs for parents of asthmatic children are a good strategy for improving health promotion behaviors and the health of the affected children.
Conflict of Interest - The authors declare that there is no conflict of interest in this study.

Source of Funding – This study was a self-funded project

Ethical Clearance: Ethical clearance was obtained from the Institutional Ethics Committee, Kasturba Hospital Manipal. Formal administrative permission was obtained from the Heads of selected Hospitals and Departments. A written information sheet regarding the study was given to the mothers prior to obtaining consent. A signed written informed consent form was obtained indicating voluntary participation in the study.

Abstract

Introduction: Diabetes mellitus is characterized by absolute or relative insufficiencies in insulin secretion and/or its action associated with chronic hyperglycemia and disturbed carbohydrate, lipid and protein metabolism.

Aim: This case control study was conducted involving 20 patients diagnosed with type 2 diabetes mellitus (T2DM) and 20 healthy individuals. The peripheral blood mononuclear cells were used for study the expression profile of fatty acid metabolism genes.

Material and Method: In this case control study, involved twenty diabetes (T2DM) individuals and twenty healthy controls. The serum was subjected for different biochemical assays and molecular study include an expression profile of fatty acid metabolism genes.

Results: Diabetes patients showed a significant increase (P≤0.001) in fasting serum glucose than healthy control. Serum total cholesterol (P≤0.01), triglyceride (P≤0.001) and VLDL (P≤0.001) was increased significantly in diabetes patients as compared to healthy individuals. However, HDL and LDL cholesterol levels were decreased. Liver enzymes such as SGOT and SGPT (P≤0.001) along with kidney markers creatinine and urea (P≤0.01) were increased in diabetes patients as compared to healthy individuals. The Sterol regulatory element-binding protein 1 (SERBP-1c) expression was found to be upregulated in the diabetic condition. Hence, the genes regulated by SREBP-1c i.e. fatty acid synthase (FASN) and acetyl-CoA carboxylase (ACC) was also found to be upregulated.

Conclusion: The expression profiles of PBMCs can be applied for the study of quantitative differences and similarities between T2DM patients and non-diabetic individuals. This leads to contribute with new perspectives for a better understanding of the disease.

Keywords: Diabetes, lipid profile, fatty acid synthase, acetyl-CoA carboxylase, kidney markers

Introduction

Diabetes mellitus (DM) is an epidemic disease. Diabetes is a metabolic disorder characterized by hyperglycemia as results of the insulin resistance and lack of the insulin. It is currently estimated that diabetes prevalence by 2030 will include 439 million adults worldwide. Three types of diabetes are reported viz. Gestational diabetes, type 1 diabetes mellitus (T1DM) and type 2 diabetes mellitus (T2DM). Type 2 diabetes mellitus begins with insulin resistance, a condition in which cells fail to respond to insulin properly. As the disease progresses a lack of insulin may also develop. Out of these three types of diabetes, type 2 diabetes mellitus is most prevalent. Type 2 diabetes or hyperglycemia is mostly the result of defects in insulin secretion or defect in insulin action or many a times both the defects exists.
Diabetes and its associated complications are closely related and often not considered separately. Diabetes is associated with macrovascular and microvascular complications. Diabetic nephropathy is diabetic complication in which albuminuria is caused due to impaired glomerular filtration rate. Due to this abnormal function is caused in the tubules which caused glomerular damage. Diabetic neuropathy is likely caused more by abnormalities in neuronal cells dysfunction. These abnormalities were also reflected on the gene expression level. For gene expression study, PBMCs are readily accessible cellular material in human. Alternative cellular material, getting from invasive tissue biopsies, which is not feasible or even possible in healthy volunteers for ethical reasons. It may reflects gene expression adipocytes or hepatocytes and also shows the responses of dietary modifications and drugs treatments at the level of gene expression. Earlier studies revealed that PBMCs can display gene expression characteristic for certain diseases like atherosclerosis. Currently sulphonylureas and metformin are the mainstays in the treatment of T2DM and represent the most commonly used oral hypoglycaemic agents (OHAs). Metformin and glibenclimide are the only OHAs included on the WHO list of essential medicines, helped in part by their availability as generics.

With this background, we aim to study the biochemical alteration and gene modulation in the healthy and diabetes individuals. The serum glucose, lipid profile, liver function test and kidney function markers were evaluated from the serum sample. The expression of some genes also evaluated in the present study.

**Materials and Method**

In the present study, diabetic and healthy individuals were screened for the blood biochemistry and molecular alteration near area of Pune, Maharashtra, India.

**Participant enrollment**

From the diabetic patients and healthy participants, fasting blood (n=20 each) was collected by a single puncture once for each individual after obtaining informed consent. Age and gender matched healthy control (n=20) participant was recruited for the present study.

T2DM patients consider the age group between 23-60 years (Fasting Plasma Glucose (FPG) ≥ 126 mg/dl) (As per the ADA guidelines). Individuals with HIV/ HBsAg, underweight (BMI ≤ 18.5), with any bodily injury and/or wounds, post surgical and alcoholic were excluded from the study.

**Blood collection and separation of serum/plasma sample**

After getting participant consent, blood was collected (2ml) in the plain and EDTA vacutainers from the vein. Then plain vacutainer was kept at room temperature (RT) for 30 min for blood cloting. Then samples were centrifuged at 2000rpm for 15 min at RT. Then serum was pipette out in clean eppendorf tubes and kept at 20°C for further study.

Blood was collected in EDTA vacutainers and overlay on histopaque density gradient medium. Then blood was subjected to centrifugation at 1550rpm (Histopaque-1077 gradient, Sigma–Aldrich). The white PBMCs layer was separated and dispenced in trizol reagent for the RNA isolation.

**Blood biochemistry from serum**

Serum sample was used to assess various biochemical parameters such as, glucose, total cholesterol (TC), triglycerides (TGs), LDL cholesterol, HDL cholesterol, urea, creatinine, and enzymes like serum glutamic pyruvic transaminase (SGPT), glutamic oxaloacetic transaminase (SGOT), by using commercially available kits (Coral Clinical Systems, Goa, India).

**Molecular analysis from isolated peripheral blood mononuclear cell (PBMC)**

The RNA from the PBMC’s was extracted by using TRIZOL method (Invitrogen CA, USA) as per the given protocol. Quality of RNA was determined on 0.8% agarose gel electrophoresis. Then, quantity of RNA was measured using spectrophotometer (NanoDrop ND-1000, Eppendorf, Germany). The c-DNA was synthesized from isolated RNA by using the SuperScript first-strand synthesis kit (Invitrogen, CA, USA) as per the suppliers protocol. The synthesized cDNA was used for the analysis of expression profiles of selected genes by quantitative real-time PCR.
i) Gene selection

Transcription factor, namely Sterol Regulatory Element-Binding Proteins (SREBP) were regulating fatty acid metabolism gene viz. Fatty Acid Synthase (FASN) and Acetyl-CoA Carboxylase (ACC) were selected for the study. The primers used in the present study are depicted in the Table 1. The qPCR analysis was performed with the help of a StepOnerealtime PCR system (Applied Biosystems, CA, USA) along with SYBr gene expression assays (Applied Biosystems, CA, USA).

Statistical Analysis

All samples were analyzed in triplicates. The data were subjected to statistical analysis using GraphPadInstat (3.0, Trial Version). Results were presented as Mean ± Standard Error (SE). The unpaired t test was performed to estimate the statistical significance.

Results

Diabetic (n=20) and healthy individuals (n=20) were recruited in the present study after their consent. The fasting venom blood was collected and evaluated for various biochemical assays.

Assessment of Serum Glucose

Serum glucose was significantly increased (P≤0.001) in the T2DM individuals as compared with the healthy individuals. The serum glucose level is shown in the Figure 1.

Figure 1: Serum glucose of healthy and diabetic individuals

Assessment of serum lipid profile

Serum cholesterol level of healthy and diabetic individuals is depicted in Figure 2. The serum cholesterol, triglyceride, LDL and VLDL levels were elevated in diabetic individuals as compared to healthy individuals. The diabetic individuals showed non-significant decrease in serum HDL levels as compared to healthy individuals.
Figure 4: Serum creatinine and urea levels of healthy and diabetic individuals

Gene expression analysis of fatty acid metabolism gene along with their transcription factor

Figure 5 depicted the expression of Sterol regulatory element-binding protein (SERB1c), Fatty Acid Synthase (FASN) and Acetyl-CoA Carboxylase (ACC) genes. All these genes showed upregulation in their expression level.

Discussion

In the present study, we evaluate the biochemical variations and molecular alteration in the fatty acid metabolism genes in the type 2 diabetes mellitus patients and their respective healthy control. In the present study, serum glucose, TC, TG, LDL and VLDL levels were found to be increased in the diabetes patients. Though, all diabetic patients were on different medication and still they exhibits elevated blood glucose. The age and gender match was one of the basic criteria for the enrollment of patients or healthy subjects. This criteria was reported by various authors previously. In the present study, the same age and gender criteria was followed for the selection of healthy subjects.
The delay in the first phase of insulin secretion, although of some diagnostic import, does not appear to act independently in the pathogenesis of type 2 diabetes. In some early-onset patients with type 2 diabetes (perhaps as many as 20%)\textsuperscript{17,18}, there may be a deficiency in insulin secretion that may or may not be due to autoimmune destruction of the β-cell and is not due to a deficiency in the glucokinase gene. In the great majority of patients with type 2 diabetes (±80%), the delay in immediate insulin response is accompanied by a secondary hypersecretory phase of insulin release as a result of either an inherited or acquired defect within the β-cell or a compensatory response to peripheral insulin resistance.

Abou-Seif and Abd-Allah\textsuperscript{19} investigates the relationship among diabetes mellitus, lipid profiles, nitric oxide activity, pancreatic amylase activity and antioxidant status in fifty-five non-insulin-dependent and forty insulin-dependent diabetes mellitus (DM) and twenty non-diabetes individuals. The serum total cholesterol, triglyceride and low-density lipoprotein-cholesterol were higher in both types of diabetes mellitus in comparison to the control subjects. However, there is simultaneously decreased in the serum high-density lipoprotein-cholesterol (HDLc) levels in both types of diabetes mellitus. Our results are accordance with this report. It PBMCs may represents a similar gene expression as of adipocytes or hepatocytes and also demonstrate the responses of dietary modifications and drugs treatments at the level of gene expression\textsuperscript{11}.

Transcription factors such as SREBPs involved in the regulation of fatty acid and cholesterol metabolism in the liver. SREBPs consist of two isoform i.e SREBP1 and SREBP-2. SREBP-1 having two isoforms which included 1a and 1c. SREBP-1c is relatively abundant in the liver. Up regulation of SREBP-1a gene expression has been shown to result in the increased production of cholesterol and TG\textsuperscript{8}, while over expression of SREBP-1c resulted in elevated level of TG\textsuperscript{9}. Our results are accordance with this report. We have observed phenomenon in PBMC’s and agree with statement of Shimomura et al.\textsuperscript{20} elevated expression of lipogenic genes, acetyl-CoA carboxylase (ACC) and fatty acid synthase (FAS) in diabetic mice following the over expression of SREBP 1c. FASN is the central enzyme in de novo lipogenesis, catalysing the conversion of malonyl CoA into palmitate.

**Conclusion**

In the present study, elevated levels of serum glucose and lipid profile were observed as compared to the healthy control. The serum HDL level was significantly decreased as compared to healthy control. The fatty acid metabolism genes were also found to be upregulated. This may be one of the reasons for elevated lipid profile. The diabetes patients, which are recruited in the present study, are on allopathic medications. Such as, metformin, glibenclamide, statin etc. These drugs are known for their target action and some adverse side effects also, when recommended for long term use. So, there is still scope for better drug management strategy, which will have low or no side effects. The expression profiles of PBMCs can be applied for the study of quantitative differences and similarities between T2DM patients and non-diabetic individuals. This leads to contribute with new perspectives for a better understanding of the disease.

**Ethical Clearance:** The blood was collected from the pathological laboratory after their investigation. Oral consent was taken before enrolled the patients in the study.

The Relationship between Mobile Phone & Laptop Use on Physical Well-Being of College Students in India

Arti Chandani¹, Arzzan Daji², Ashray Sawhney², Mita Mehta³, Tajamul Islam¹, Prakrit Prakash⁴, B. Neeraja⁵

¹Associate Professor, ²Student, ³Associate Professor, Symbiosis Institute of Management Studies, Symbiosis International (Deemed University), Pune, MH, India; ⁴Student, Manipal Institute of Technology, Manipal, Udupi, Karnataka, India; ⁵Professor & Dean Academics, Dr. MGR Educational and Research Institute University, Chennai, India

Abstract

As the use and access of technology is increasing among the college population, researchers began to assess the effect of technology on the health, behaviour and the health status of the student population. Playing mobile games, surfing the net, visiting social networking sites are defined traditionally as sedentary behaviours. The relationship which were of interest to the researchers are use of Mobile/laptop by college students and its impact on Physical well-being of these students.

The present study presents results which are of utmost importance to students, parents, colleges, institutes etc. We are living in an era of technological disruptions where technology is paving its way in all walks of life and education is not untouched. Mobile and laptop has not only changed the education system and its delivery mechanism but also student’s behaviour and their health, which is part of this study. It has impacted students and teachers at the same time.

The results of the study show that there is significant difference in mobile usage and use of mobile for gaming purpose among under graduate and post graduate students. It was also found that usage of WhatsApp application on mobile has negative impact on the physical well-being of college students of India. Further it was concluded that there is negative relation between self-perception of physical activity and physical well-being of these students. The mobile penetration in last few years which has impacted significantly each branch of society; banking transaction, social media, interaction as well as education.

Keywords: College Students, Physical well-being, Mobile, laptop, WhatsApp

Introduction

College students, today, have increasing access to technology. These students are the pioneers in consumption of technology with 98% of students reporting using a computer in the present study. 100% of students reported they owned and used mobile devices and 98% reported owning and using a laptop. The mobile phone is an electronic device which can perform high speed data operations and can also perform logical, arithmetic and storage function. The usage of internet has increased exponentially in case of the youth. Additionally, half of today’s youth access internet via their mobile devices, which helps them facilitate online browsing. Use of mobile tends to help people move towards sedentary behaviour and those who have huge amount of sedentary behaviour, tend to be less active, physically. Lepp et. al concluded that those college students who were using mobile more were less physically fit than those students who were using mobile less [¹].

DOI Number: 10.5958/0976-5506.2019.01886.2
The data collected using the questionnaire for this research suggested that use of mobile and laptop affects their physical activity. For example, one participant said, “we are addicted, no doubt”, while another participant said, “We are in the era where phones and laptops have become an important part of life and it varies from person to person on how they make use of it. But it surely helps us in many ways”.

Mobile phone has been adopted at fastest pace among college students and the frequencies at which these mobile phone operate lead to harmful effects on their health and behaviour. Academic performance was negatively impacted due to higher use of mobile and it also led to higher level of anxiety among college students \cite{2}. Female students had shown more negative impact of excessive use of internet and mobile phone among undergraduate students of Ramon Llull University of Spain. It was also reported that the students of broadcasting and journalism had negative impact of excessive use of internet and mobile phone in comparison to the students of other disciplines. The variance of the general indicators of psychological distress were also explained by the Perceived Emotional Intelligence, but to a lesser degree than the maladaptive use of the Internet and the Mobile Phones \cite{3}.

**Mobile/laptop use and physical well-being**

Lepp \cite{1} has confirmed that people with more usage of cell phones are more likely to show sedentary behaviour rather than participation in physical activities than those whose cell phone usage is less. In comparison to all other nations, Korean students had scored low in life satisfaction and affective well-being in a survey conducted on 350 students \cite{4}. Another study which was performed on 145 Canadian students by Steven et al (2010) concluded insufficiently active students had higher levels of fatigue and lower level of vigour in comparison to active students.

Penedo \cite{5} performed a review of the existing literature on physical activity, exercise and physical and mental health where they validated physical activity and exercise have benefits on physical and mental health outcomes. Those who were active in their regular physical activity have reported desirable health outcomes.

Irwin \cite{6} administered a survey to university students with an objective to measure prevalence of physical activity at a level which is necessary for health gains for at least one month. It was found that majority of the students were physical less active, and this may lead to other serious health problems. He emphasised that there is a greater need for interventions in order to improve physical activity in this population. Based on the literature review, the following hypotheses are presented:

**H1: Usage of mobile phone/laptop does not differ significantly across different level of education of college students in India**

**H2: Usage of mobile for WhatsApp Application is negatively correlated to physical well-being of college students in India**

Mental and social well-being of college students improves due to physical activity and participation in sports as reported by previous research while present research reported that the students who participated in athletics and team sports had very low depression scores \cite{7}. There exists a positive relation between Facebook usage and social adjustments among students of undergraduate programme while at the same time there is a negative impact of Facebook on physical health. Students who were in first year spent more time on Facebook, had fewer friends and were emotionally strongly connected than final year students. There was a positive impact of using Facebook for connecting with peers on students during later stages of their life in college \cite{8}.

Bianchi \cite{9} conducted a research which highlighted the problems of excessive use of mobile and its impact on physical and mental well-being of adults and youngsters. They tried to establish relationship between extraversion, self-esteem, neuroticism, gender, age and excess mobile use and results reported that neuroticism could not predict higher use while extraversion and low self-esteem were important factors. Mobile phone usage was found to high and problem use in case of young people.

White \cite{10} conducted a study whose purpose was the relation between sleep time and mobile use in college students. The study reported that various aspects of mobile phones like addictive text messaging, problematic messaging, and problem mobile phone use are related to sleep quality, which will negatively impact the health of
the user. As today’s youth are the most technologically oriented group, they are also the most sleep deprived.

Vandelanotte [11] studied the use of internet and computers and its relation with obesity and overweightness. The respondents who use internet and laptop for low time, had active behaviour i.e. low sedentary behaviour while participants who used more internet and high leisure time were 1.46 times more likely to be overweight and 2.52 times more likely to be obese. There is a need for decrease in internet usage which will have a positive impact on the sedentary behaviour among youth.

H3: Self-perception about physical activity is positively and significantly correlated to physical well-being of college students in India

Materials and Method

Objective

There has been a growing concern about usage of mobile and laptop among college students. Most of the students are so addicted to these devices that it hampers their life. This became the need of the study and study is being conducted with following objectives:

- To understand the mobile and laptop usage among undergraduate and post graduate college students
- To study usage of WhatsApp application and its impact on physical well-being of college students in India
- To observe relation between self-perception about physical activity and physical well-being of college students in India.

Participants and procedures

The participants were undergraduate and post graduate students from different college of India. The students were from technical (B.Tech/B.E: Bachelor of Technology/ Bachelor of engineering) as well as from non-technical (programmes in commerce, economics, designing, etc.) background. The key variables of the study are “use of mobile and laptop on physical well-being of college students”. The researchers explained the purpose of the study to the respondents.

Measures

The survey used 2 sections to collect the participant’s response namely: demographic information, use of mobile/laptop[12]. Business students those who expected to be successful at materialistic ambition in comparison to other goals were found to be more unhappy most of the time (r=0.22, p<0.05) and had marginal higher anxiety (r=-0.19, p<0.10) [13]. Males had reported to have high depression who were low in the relative importance of intrinsic aspirations (p<0.05) [14].

Subjects

A total of 196 students pursuing their under graduation or post-graduation took part in the survey where 7 respondents did not complete survey, leaving total sample to be 187 and there were 126 male and 61 female students. The respondents were from all over India including metro city, tier I and tier II as well as tier III cities.

Findings and Discussion

Researchers have used the data collected from survey to test the hypotheses. The data was coded and uploaded in SPSS version 22 where statistical test were
Table 1: Level of study and Number of hours spent on mobile/laptop/gaming

<td>.617</td>
</tr>
</tbody>
</table>

The first table shows means are higher for undergraduates than post graduates, which means they spend significantly more time on mobiles and games than the post graduates. The values are not found to be significant for usage of laptop. Undergraduate students are coded as 1 while postgraduate students are coded as 2. Undergraduate students spend 3.613 hours per day on average while post graduate students spend 3.074 hours per day on mobile. It is also found in the statistical result that undergraduate students spend 1.022 hours on playing games on mobiles while post graduate students spend 0.617 hours on playing games.

</tbody>
</table>

Table 2 shows t-test for equality of means among undergraduate and post graduate students. There is significant difference between undergraduates and post-graduates in the number of hours spend on mobile and number of hours spend on gaming on mobile. The difference was not found to be significant in terms of time spent on laptop. P value for number of hours spend on mobile is 0.06 while on playing games on mobile is 0.016 which are <0.05, thus the researcher rejected hypothesis that Use of mobile/laptop is positively and significantly correlated to level of education of college students in India. There is significant difference between undergraduates and post-graduates in the number of hours on mobile and number of hours on gaming.

Table 3: Use of WhatsApp Application and its impact on Physical Well-being

</table>

The college students spend a lot of time on WhatsApp application as it is seen from the survey results. Correlation analysis indicates that the usage of WhatsApp has a significant negative relationship with the physical well-being. Pearson correlation is negative (-0.209) and statistically significant at 0.01 level (P value < 0.01) as seen in table 3. Given these results the authors rejected H2 that use of mobile for WhatsApp Application is positively and significantly correlated to physical well-being of college students in India.

</tr>
</tbody>
</table>
The results indicate that there is a significant difference on physical well-being (P value < 0.05) between those who think that technology has hampered their physical activity and those who think that technology has not hampered their physical activity (See Table 5). Further, the means in Table 4 indicate that those who think technology has hampered their physical activity have lesser means on physical well-being, and those who think that technology has not hampered their physical activity have higher means on physical well-being. This leads to rejection of H3 that self-perception about physical activity is positively and significantly correlated to physical well-being of college students in India.

**Conclusion**

The study took survey (by administering questionnaire) of college students in India. These respondents were from all over India pursuing their undergraduate degree programme or post graduate degree programme. A total of 187 responses were received and objective was to find the relation of mobile and laptop usage among college students. It is concluded that undergraduate students spend more time on mobile and gaming application in comparison to post graduate students. It was also found that use of mobile application, WhatsApp, has a negative impact on the physical well-being of college students. The students have a self-perception about their physical activity level. This was further tested with the help of statistical software and results show that there is negative relation between students’ self-perception of physical activeness and physical well-being.

**Limitations:** The limitation to the present research is that it is limited to college students in India. Another limitation is that it concerns only use of technology namely mobile and laptop and does not cover other areas.

**Conflict-of-Interest Statement:** We, authors of the manuscript titled, “The Relationship Between Mobile Phone & Laptop Use on Physical Well-Being of College Students in India” hereby declare that we don’t have any conflict of interest in writing, peer review and editorial decision making, nor we have any personal relationship with journal and its members.

**Source of Funding:** The source of funding for doing this research is self i.e. all the authors have contributed to this paper and shared the related expenses.

Abstract

The golden ratio otherwise known as the Divine Proportion or Phi, is a mathematical ratio with special properties and aesthetic significance. An enormous number of things in the universe are engineered around the ratio, ranging from the human body to the ark of the covenant to snail shells to the orbits of the planets. The divine ratio and golden rectangles appear throughout the ancient architecture and art. The golden ratio is believed to be the most aesthetically pleasing and harmonious means of design. The Golden section, also known as Phi, is manifested in the structure of the human body. In the present study 50 normal subjects both male and female were randomly screened ranging 25 to 30 years in Chennai were selected. The total height of a subject from the plinth to the head end was measured using the height measuring scale with off shoes and straight stature and then the navel height from plinth to umbilicus was also measured. The data collected was tabulated and the total height divided by the navel height was calculated. The ratio obtained was 1.621 which is close to 1.618…. which is known as the golden ratio, golden proportion or divine proportion.

Keywords: Aesthetic, Divine Proportion, Measuring scale, Navel height, Plinth.

Introduction

Egyptians used the golden proportion, Phi in the constructions of the great pyramids and in the design of the hieroglyphs found on the tomb walls. The ancient inhabitants embraced Phi in the sun pyramids. The Greek used Phi in their architecture. Throughout the history, the ratio of 1.6180339887…. for the length-width of rectangle has been considered most pleasing to the eye. The golden section is a special ratio that is also called as Golden ratio, the Divine proportion, or the Golden rectangle.

The golden quantitative relation otherwise referred to as the Divine Proportion or alphabetic character, is a mathematical ratio with special properties and aesthetic significance. An enormous variety of things within the universe square measure designed round the quantitative relation, ranging from the human body to the ark of the covenant to snail shells to the orbits of the planets. The divine quantitative relation and golden rectangles seem throughout the traditional design and art. The golden quantitative relation is believed to be the foremost esthetically pleasing and harmonious suggests that of style. Statistical analysis indicates that “the people involuntarily provide preference to proportions that approximate to the quotient (Golden ration)¹.

The Fibonacci numbers are Nature’s numbering system. They appear everywhere in Nature, from the leaf arrangement in plants, to the pattern of the florets of a flower, the bracts of a pinecone, or the scales of a pineapple. The Fibonacci numbers square measure so applicable to the expansion of each animate thing, including a single cell, a grain of wheat, a hive of bees, and even all of mankind. It plays an important role within the arrangement of petals in flowers, structure of DNA and various proportions in human face, structure of sea shells etc.

Occurrence of this proportion in biological science is frequent, viz within the clock cycle of brain waves, in hearing and balance organ etc. Here we tend to want to explore the mysterious secrets of golden quantitative relation hid within the human anatomy. If we tend to take the quantitative relation of 2 serial numbers in Fibonacci’s series, (1, 1, 2, 3, 5, 8, 13...), we will find the following series of numbers: 1 1 =, 2 1 = 2 3 2 = 1.5, 5 3 = 1.666... , 8 5 = 1.6, 13 8 = 1.625, 21 13 = 1.61538... . It is easier to see what is happening if we plot the ratios on a graph (Figure 1).

Likewise Phi is also studied in the height of the human body

**History**

Mathematician Mark Barr projected exploitation the primary letter within the name of Greek sculptor statue maker, phi, to symbolize the golden quantitative relation. Usually, the minuscule kind (φ or φ) is employed. Sometimes the majuscule kind (ᶲ) is employed for the reciprocal of the golden quantitative relation, 1/ᶲ.

The golden quantitative relation has fascinated Western intellectuals of various interests for a minimum of a pair of, 400 years. Some of the foremost effective mathematical minds of all ages, from philosopher and Euclid in ancient Greece, through the medieval Italian scientist Leonardo of city and therefore the Renaissance stargazer Johannes Kepler, to current scientific figures like Oxford man of science Roger Penrose, have spent endless hours over this simple ratio and its properties. But the fascination with the Golden quantitative relation isn’t confined simply to mathematicians. Biologists, artists, musicians, architects, psychologists, and even mystics have pondered and debated the premise of its presence and attractiveness. In fact, it’s most likely honest to mention that the Golden quantitative relation has galvanized thinkers of all disciplines like no different variety within the history of arithmetic.

Ancient Greek mathematicians initial studied what we tend to currently decision the golden quantitative relation because of its frequent look in pure mathematics. The division of a line into “extreme and mean ratio” (the golden section) is vital within the pure mathematics of normal pentagrams and pentagons. The Greeks sometimes attributed discovery of this idea to mathematician or his followers. The regular star, that incorporates a regular pentagon inscribed among it, was the Pythagoreans’ image. Euclid’s parts provides the primary noted written definition of what’s currently known as the golden ratio: “A line is claimed to own been cut in extreme and mean ratio when, because the whole line is to the larger phase, therefore is that the larger to the less.” geometrician explains a construction for cutting (sectioning) a line “in extreme and mean ratio”, i.e. the golden ratio. Throughout the weather, many propositions (theorems in trendy terminology) and their proofs use the golden quantitative relation. Some of these propositions show that the golden quantitative relation appears to be sinking right down to a selected worth, which we call the golden ratio or the golden number. The golden ratio 1.618034... is also known as the proportionality or the golden mean or simply the golden variety. It is usually delineated by a Greek letter alphabetic character φ.

In the shape, there are instances of the Fibonacci Phi (φ) although it has not been widely discussed. For example, the length of the primary finger joint to the length of consecutive 2 joints is adequate the length of the 2 joints to the length of the whole finger [4-6].

**Figure 1: Picturisation of convergence of Fibonacci series.**

relation is Associate in Nursing real.

Aim

The aim of the present study is to determine whether the height of the individual is close to the golden proportion.

Materials & Method

Fifty subjects (both male and female) in the age range of 25 to 30 years residing in Chennai were randomly chosen as subjects. The following measurements were taken bare-footed, total height of a subject from the plinth to the head and the navel height from plinth to umbilicus. Healthy subjects having primary and secondary curve of spine were included in the study, while, those with pot belly, pregnancy, Spine deformities, knee deformities, limb length discrepancy and impaired voluntary control were excluded.

Total height of a subject from the plinth to the head end was measured using the height measuring scale with off shoes and straight stature (Figure 2). Then the navel height from plinth to umbilicus was also measured (Figure 3). The data collected was tabulated and statistically analyzed.

Results

The data collected was tabulated and the total height divided by the navel height was calculated. The ratio obtained was 1.621 which is close to 1.618…. which is known as the golden ratio.

Graph 1 depicts the recorded measurements and the total height divided by the navel height was calculated. The ratio obtained was 1.621 which is close to 1.618…. which is known as the golden ratio, golden proportion or divine proportion.

Discussion

In the material body, there are instances of the Fibonacci alphabetic character (φ) though it’s not been widely mentioned. In 1973, Dr. William Littler proposed that ratio of the lengths of the phalanges, and that the flexor and extensor movement of the primary fingers approximate the golden spiral. In 1998, Gupta et al., confirmed that the motion of the phalanges do approximate the pattern of the golden spiral, excluding for the fifth digit owing to abduction of the digit during extension.

Through empirical proof obtained through picture taking analysis of the hands of 197 people, Hamilton and Dunsmuir in 2002 ended that the ratios between the phalange lengths of the digits do not approximate the golden quantitative relation worth of (φ) 1.618. However, Hutchison and Hutchison (2010) showed that the info collected by Hamilton et al. (2002) overlooked the relationship that Littler actually proposed. Hamilton and Dunsmuir (2010) confirmed that the os length quantitative relation knowledge obtained from their subjects compared to people who were virtually at random listed by Littler in 1973, were in fact comparable and approximated the Fibonacci value of (φ) of 1.618.

Ashrafian and Atasioun noted that the number of branches from vessels in the heart follows the Fibonacci sequences. In 2013, Yetkin et al. showed that the golden ratio of Phi (φ) 1.618, exists within the cardiac cycle of the human heart beat. In 1991, Perez proposed that the DNA gene-coding region sequences were strongly related to the Golden Ratio and Fibonacci/Lucas integer numbers.
The rule of golden proportions has been planned in a shot to outline anatomical beauty. It is commonly accepted that facial beauty is correlates with anatomical symmetry. One of the most options of the face is that the mouth and teeth. Thus, professionals inside the sphere of medicine have tried to quantitatively characterize the parameters of an aesthetically appealing smile. In 1973, Lombardi was the first to officially propose the existence of having proportionate teeth, but dismissed the idea of using the rule of golden proportions to create aesthetic teeth. In 1978, Levin was the primary to watch that: 1) the breadth of the jaw central tooth is in golden proportion to the breadth of the lateral tooth. 2) The width of the maxillary lateral incisor is in golden proportion to the width of the canine. Further analysis into the connection between the golden proportion, dental arrangement, and an aesthetic smile was developed by Rickets in 1982. He implemented the use of the golden proportions in the treatment of patients. While Levin’s observation of the golden ratio existing in dentition is undeniable, its application to developing an aesthetically appealing smile has recently been questioned and often dismissed. In 2007, Dio et al. attempted to empirically define the basis for determining/judging beauty.

The existence of the golden quantitative relation continues to be discovered in many completely different instances of the human anatomy, attempting to use its proportions as a measure of beauty is not something that should be standardized. It is influenced by different factors including cultural influences. The diversity of biology in its essence is what constitutes its beauty, whereas the observations of the golden proportion in nature highlights study style, proportions, and symmetry.

**Conclusion**

In the exploration of the origins of life through arithmetic, the incidence of the Golden magnitude relation, Fibonacci Series and the underlying screenwriter series are discovered in many aspects of life on planet earth and within the cosmos. Although wide known in non-biological fields like design and art, it’s not been well explored within the human biology. Recent work has begun to explore the understanding of such development documented at many completely different scales and systems within the human anatomy and physiology starting from medical science, dentistry, the spiral of the human ear, the circulatory system and the human order. The observance of such ostensibly universal idea begs the question of the origin of life; but, a lot of analysis must be performed to explore its physiological role in biology. While some could dispute the importance of the Golden magnitude relation, it’s apparent that through our history there has been a fascination with it. Many can speculate on the validity of it in nature, additionally as in our history. It’s necessary to comprehend that, whereas a number of these examples mentioned are in reality more or less good to Golden magnitude relation, there still could be significance to the approximate price. Understanding its practical role could also be a keystone to creating quantum advances in many fields like computer science, medicine engineering styles, and human regeneration, amongst others.

Evaluation of Medication Adherence Level of Cardiovascular Disease Related Patients

Navjot Kaur¹, Supriti Agrawal², Hemendra Gautam³

¹Research Scholar, Amity Institute of Pharmacy, Amity University, Noida (UP), ²Assistant Professor, Amity Business School, Amity University, Noida (UP), ³Director, Future Institute of Pharmacy, Bareilly (UP)

Abstract

The chronic diseases, these days have taken its place in the society with high mortality rate and the category of cardiovascular diseases has its key role. The major cause for higher mortality rate is non-adherence. The cross-sectional study was done for 3 months in various hospitals, clinics and societies in Delhi-NCR. A total of 334 patients were assessed by conducting an interview using structured questionnaire. The patient adherence level was analysed by using Morisky Medication Adherence Scale (MMAS). The study was compared among males (n=187) and females (n=147) category of patients where the adherence levels for male were 14.4%, 47% and 38.5% for high, medium and low adherence respectively and for females the levels were 14.2%, 44.8% and 40.8% for high, medium and low adherence respectively. The other factors were also studied by calculating their descriptive statistics. In conclusion, the study revealed medium adherence level among the participants and efforts are needed by healthcare professionals as well as patients so as to realize the full benefits of provided therapies or treatment or medication.

Keywords- MMAS-8, mortality rate, adherence, structured questionnaire, cardiovascular diseases.

Introduction

The Indian Pharmaceutical scenario has been totally changed these days. As the times passes, the chronic diseases has taken its place at higher side that also affected the mortality rate. Talking about the cardiovascular related diseases, the death rate in developed countries such as US has decreased but in case of India the rate has increased by 34% in between 1990-2016 and in US it has declined by 41%¹. In the report by WHO i.e. World Health Organization in 2018, it has been estimated that till year 2030, the rate will increase and also about 23.6 million people will die due to cardiovascular disease [²]. The cardiovascular diseases are therefore the foremost cause of mortality rate all over the world.

It has been very well said that the chronic diseases can only be cured if the patient adhere to the medications and treatments provided by the healthcare professionals. The term adherence is basically defined as the degree of level at which the patients follow up their medical instructions given by the physician or doctors [³]. For the betterment in the disease and timely procurement, it is very essential for the patients to take their medications properly without affecting the lifestyle and also to agree the recommendations given by healthcare professional. The major 3 steps that includes in adherence are-start-up of the treatment, implementation of the given treatment and at last the discontinuation of therapy [⁴]. The adherence rate is at low level in chronic kind of diseases in comparison with acute diseases [⁵]. The major factors that are responsible for poor patient adherence are demographic factors, dosage form of drugs, cost of medications, number of medications, attitude of patient towards medications etc. [⁶]. The proper level of medication adherence has its own importance for the wellness of the patients at every extent.

The key role of physicians or doctors or pharmacist or any other healthcare professional may help the patients...
towards better adherence. They can be connected with the help of internet facilities currently. The physicians or doctors also at the same time agree about the positivity of using internet more actively in their practices but are somewhat worry that if patients indulge themselves on internet for the information or other activities then they may not consult them for their problems face-to-face \(^7\). Instead of this internet proved it to be the best source for information and interaction with doctors and patients. Internet enhances the doctor-patient interaction in many ways and are as follows \(^8\). 

Firstly, the patients enjoy communicating with doctors or health experts.

Secondly, it appears to be the more convenient way to research online, online appointments and other services provided by the authorities at any time.

Thirdly, it offers the ability to consult international or national experts in particular field in easy manner.

In simple manner, internet is like a catalyst and promoter in enhancing and facilitating the role of doctors and patients in appropriate manner. According to the report by Microsoft, nearly 9 out of 10 respondents reported at least instance where the web search for symptoms of medical conditions, treatments and diagnostics for acute and chronic illness \(^9\). It is very important for the healthcare professionals as well as the patients to fill the gap in between communication so as to cure the diseases in better way.

The non-adherence towards the medications and treatment can be due to many reasons such as incorrect doses, slow or delay treatment and not following the given instructions by the healthcare professional. In one of the research, the non-adherence is said to be multi factorial \(^5\) as there are many reasons due to which the patients don’t take their medications properly and some of the reasons are as follows-

- Psychological reasons
- Missed the upcoming appointments with physicians
- Intricacy of the treatment provided
- Cost of the medication is not affordable
- Patient and provider relationship is badly chosen
- Lack of belief in the benefit of the treatment
- Side-effects from the treatment taken
- Insufficient follow up by the healthcare provider

It is thus the major concern among the Indian pharmaceutical market to enhance the level of patient adherence for improved and enhanced treatment of respective chronic illness.

**Objectives**

- To analyse the conditions that affect the patient adherence.
- To analyse patient adherence level by Morisky Medication Adherence Scale.
- To fill the gap between patients and healthcare providers.

**Materials and Method**

**Patients and study design**

The cross-sectional study was done on cardiovascular disease related patients. A total number of 334 patients were taken from various hospitals of Delhi-NCR. The data was collected from July 2018 to September 2018. The patients included were from the category of various cardiovascular diseases such as- coronary heart disease (heart attacks), cerebrovascular disease, raised blood pressure (hypertension), peripheral artery disease, rheumatic heart disease, congenital heart disease and heart failure.

**Data collection**

The data was collected on the basis of eight item Morisky Medication Adherence Questionnaire that is the standard and widely used scale. The patients responded yes or no to the questions asked as shown in table 1. The scores were given further on the basis of data collected. The patients ranging for scale more than 2 were low adherent, 1 or 2 were considered medium adherent and 0 were considered as high adherent.

</tbody>
</table>

The questionnaire also had few general questions regarding demographic studies and also related to their disease. The descriptive statistics test using SPSS version 16 was used to find out demographic studies and various other analysis.

Result and Discussion

The total of 334 patients were analysed in the study and out of which 147 were females and 187 were males. The patients that were not interested to fill the questionnaire were skipped and interested patients were selected.

Item selection-

The study was categorised on the basis of demographic factors and MMAS-8 in which 8 questions were asked on their medications taken and to know overall adherence level towards medications and treatment. The statements were designed accordingly so as to know the adherence level of patients towards medications or treatment in better way.

MMAQ’s score for male and female-

In case of male and female patients, the majority of them were medium adherent towards the medications and treatment i.e. 88 (47.7%) and 66 (44.8%) in number respectively. Comparatively, both types of participants have equal score for the adherence level. The table-2 shows the comparative score of adherence level.

Table 2- Showing Adherence Level Score of Male and Female Participants

<td>66 (44.8%)</td>
<td>60 (40.8%)</td>
<td>147</td>
</tr>
</tbody>
</table>

Pre-testing of the questionnaire-

The pre-testing of the questionnaire was done by selecting about 45 patients randomly and they were asked for giving marks on language and clarity of the questionnaire. On the basis of the suggestions, the changes were done.

Reliability of the survey-

The reliability of the questionnaire was checked
with the help of Cronbach’s alpha and the value was 0.70 which has been mentioned in the table 3. The value showed the good reliability of the statements.

### Study on factors-

There were various factors which were included in the study to analyse the reasons that usually affects the patient adherence level. For the study, the descriptive statistics was done by calculating the mean and standard deviation of individual factors which has been mentioned in the table-4. The factors were marked on the basis of 5-point likert scale and examined the level of agreement of the patients.

</tbody>
</table>

The descriptive statistics of the factors resulted in various analysis towards the patient adherence level for betterment in treatment and medication process. It has been recommended that the factors such as knowledge of disease, awareness of therapies and medications, addiction towards smoking, tobacco and alcohol had affected the patient adherence level in more improved approach. Also, the factor that was involved in the study was the overall relationship with healthcare providers as they occupy indispensable role in improving patient health by providing time-to-time awareness, showing personal concern, positive feedback etc. empowers the patients to participate in taking care of themselves in smarter way. The other factors that proved to be the poor cause of adherence level is the cost of medications and treatment, unpleasant side effects, skipping of medications without doctor’s concern, lifestyle interference, poor time management and cultural beliefs.

Thus, it is important for the healthcare providers to have a good relationship with their patients and also to build trust for effectiveness and improvements in patient’s health.
It is has been studied that the participants taken in the study were medium adherent towards the medications and treatments that were provided by the doctors or physicians. The poor adherence level directly or indirectly affects the health of the patients with the negative outcome in all ways. The study revealed that the poor adherence level differs on gender and other demographic factors. The data compilation was done with the help of Morisky Medication Adherence Score that summarised various limiting factors for poor adherence level.

The factors such as cost of medications, addiction of tobacco or smoking or alcohol, communication with the doctors, long waiting times, awareness towards medications and diseases, support of the family, monotonous life schedule etc. affected the poor adherence level at present time among the patients. It is the major role of the patients to monitor their diseases timely and this can be done by internet and online services. The patients must follow the interventions that are designed by the healthcare providers to get themselves updated in all better ways.

Also, it is the key role of all type of healthcare providers to help their patients in improving the adherence towards their treatment. It is the duty of the pharmaceutical companies to improve the profitability of patient-doctor relationship through various campaigns and programs. The difference in the relationship can be improved by the technology that summarizes the pharmaceutical market in healthier and enhanced way.

**Conclusion**

The study identifies that now-a-days patients are not more adherent towards their medications and treatment due to large number of factors. The inappropriate behaviour towards non-adherence causes patients to have long and sometimes serious illness. The results from MMAS-8 also showed that majority of the patients are low adherent towards their treatment. The major objective of the research was to analyse the factors that affect patient adherence level towards medication and treatment and some of the factors were like- monotonous life schedule, long waiting times in hospitals, irregular visits to doctors, severe symptoms during medications, interaction with healthcare professionals, family support, forgetfulness, high cost of medications and treatment etc.

On the support of improving patient adherence level, there are various factors that may help patients to stick towards medications such as- regular patient counselling, various campaigns by the hospitals or clinics, digital reminders for the patients provided by the medical healthcare professional and family support. Thus, it is very essential for the patients to stick to the treatment and medications for better improvement of the health.

**Ethical Clearance**- For this study there was no requirement for ethical clearance certificate as there was no treatment given to the patients to analyse the results.

**Source of Funding**- The Source Of Funding Was Self.

**Conflict of Interest**- Nil

Evaluating Nurses’ Perspective towards Service Quality and Patient Satisfaction in Private Hospitals: An Empirical Study in Yemen

Raed Mohammed Ali Al-Daoar¹, Shanmugam Munusamy²

¹Ph.D Research Scholar; ²Professor and Head, Department of Management Studies, BS Abdur Rahman Crescent Institute of Science and Technology, Chennai, India

Abstract

Nurses have a direct association with all activities of the health care in hospitals, such as pain management, assisting surgeries, patient care and the business side of health services. They represent a major group in the delivery of service. Several studies have been found in literature measuring the perspective of nurses concerning service quality and satisfaction of patients in different contexts but no studies were found in Yemen. The aim of the current research is to examine the perspective of nurses concerning service quality and satisfaction of patients in Yemeni private hospitals. To achieve this aim, a reliable and valid Arabic version of the SERVQUAL scale was applied for gathering the required data from 250 nurses. The data were analyzed by using proper statistical methods such as confirmatory factor analysis (CFA) and structural equation modeling (SEM). The study shows that Yemeni private hospitals deliver a good quality service. The findings of the SEM prove that all quality dimensions of service, except physical environment and quality of staff it well in predicting patient satisfaction. The study’s results could be used by private hospitals in Yemen for developing quality of staff and physical environment improvement strategies.

Keywords: SERVQUAL, Nurses, Perception, Service Quality, Patient Satisfaction.

Introduction

Providing high quality services has become the main objective of businesses to promote the competitive advantage and ensure success. Improving the quality of the product and service is a major issue that influences consumers’ satisfaction, loyalty, word-of-mouth and behavioral intentions thereby, that will effects on the success of businesses. In the competitive environment of healthcare, realizing and understanding the perspective of customers and providers concerning quality of service can assist in delivering better quality.

In healthcare sector, nurses have direct-relationship with patients and providers and they contribute to all parts of the hospital services. Hence, their perspective is crucial for improving the quality of services and satisfaction of patients.

Dimensions and Measurement of Health Care Service Quality

Quality was defined as “the capability of a product or service to satisfy clients’ needs”. “The quality of health care is capability of services to meet patients’ needs efficiently, effectively, and affordable.”

Parasuraman have finalized five factors: tangible, empathy, responsiveness, reliability, and assurance as service quality dimensions. These dimensions were applied by several researchers in different contexts of healthcare to evaluate service quality. The World Health Organization suggested six dimensions: effectiveness, efficiency, equitability, accessibility, safety and acceptance for developing the health care service quality. In the present research, the quality dimensions of service are representing through physical environment, staff quality, trust, administrative procedures, and clinical care process.

Parasuraman’s SERVQUAL scale is extensively acceptable scale in evaluating service quality from the
perspective of customers and providers, and has been used by many researchers in healthcare\(^1\), \(^1\)7, \(^1\)8, \(^1\)9. It was found that all dimensions except responsiveness strongly influence patient satisfaction\(^1\)2, \(^1\)4, \(^1\)5, \(^1\)20.

The investigation of nurses’ perspective towards service quality and patients’ satisfaction is vital to improve and develop strategies of delivering process. It also, creates good impression in nurses and leads to an engagement of nurses in delivering high quality care services\(^2\)1. Proper communication between nurse and patient helps in enhancing patients’ satisfaction\(^2\)2.

**Research hypotheses.**

**H1a**: Satisfaction of patients significantly and positively influenced by the physical environment.

**H1b**: Satisfaction of patients significantly and positively influenced by staff quality.

**H1c**: Satisfaction of patients significantly and positively influenced by the clinical care process.

**H1d**: Satisfaction of patients significantly and positively influenced by administrative procedures.

**H1e**: Satisfaction of patients significantly and positively influenced by trust.

**Research methodology**

The research was carried out on 250 nurses who work in private hospitals in IBB city, Yemen, a convenience sampling method was employed in this research. An Arabic version of SERVQUAL instrument with thirty items were validated and applied in this research. The collected data has been processed and analyzed to assess the perspective of nurses toward the quality and satisfaction in Yemeni private healthcare. Analysis of data and test hypotheses was done by applying SPSS version (20.0). CFA and Cronbach’s Alpha techniques were applied to examine the reliability and validity of the questionnaire. Frequency and percentage statistics were applied to interpret nurses’ demographic characteristics and SEM was used to test hypotheses and evaluate the influence of service quality dimensions on the patients’ satisfaction.

**Results and Discussion**

This section is dealing with discussion of outcomes of analysis, such as descriptive, reliability, CFA and SEM.

**Profile of Participants**

Table 1 is described Nurses’ demographic characteristics. It signifies that about 50.8% of nurses were male and 49.2% are females. About 66.8% of the participants were aged in a group of 19-29 years, followed by group age of 30-39 years 31.6 %. The group age of 40 years and above has the lowest number of the respondents 14.3%.

</tbody>
</table>

Categorizing nurses by their level of education, it is shown that around 84% nurses held a professional diploma, 13.2% nurses are graduates and 2.8% nurses studied up to high school. With respect to the experience, it is revealed that about 60% nurses have 1 to 5 years of work experience, 17.2% nurses have less than one year of work experience, and 22.8% of nurses have more than one 5 years of work experience.

**Test for the reliability and validity**

Table 2 is represents the results of reliability and validity of the current study which signifies that there is a good fitness of the model measurement since the values exceed the standard value of model fit; \(\chi^2/df = \)
1.472; Goodness of Fit Index (GFI) = 0.881; Adjusted Goodness of Fit Index (AGFI) = 0.849; Normed Fit Index (NFI) = 0.919; Incremental Fit Index (IFI) = 0.973; Comparative Fit Index (CFI) = 0.972; and Root Mean Square Error of Approximation (RMSEA) = 0.044. The findings of CFA test show that all items are significant at 0.001 level and correlated to their proposed variables. Therefore, the convergent validity criterion has been confirmed in this research.

Note: $\chi^2$/df = 1.472; GFI = 0.881; AGFI = 0.849; NFI = 0.919; IFI = 0.973; CFI = 0.972; and RMSEA = 0.044. FL=Factor Loading, AVE=Average variance extracted, CR= construct reliability, CA=Cronbach’s alpha
The standard value of the composite reliability (CR) is 0.60 and the measurement model has exceeded this value. Therefore, all the measurable items have been archived the condition of the construct reliability. It also, shows that all variable have greater than the standard value of Cronbach’s alpha (CA) value 0.70 signifying that there is a very good internal consistency in all variables of this study. Thus, it the reliability of the current questionnaire confirms. The average variance extracted (AVE) values of all variables are above the standard value of 0.50. Therefore, the current study achieved the requirements of convergent validity and reliability. Table 2 indicates that the loadings of factor (FL) of all items were above the standard value of 0.5 hence, all 30 items were used for (SEM) analysis.

**Discriminate Validity**

Table 3 indicates the correlation matrix to ascertain the discriminate validity of the proposed model. It indicates that all interrelationships have an association below 0.70. It also shows that all values are below the values of square roots of AVE for conforming variables.

</table>

Note: A bold Numbers is denoting to square root of the average variance extracted (AVE) and the values under the diagonal denote to the correlation between variables.

**Structural equation model**

After conformed the reliability and validating of the proposed model, SEM method was carried out in AMOS version (20.0) to examine hypotheses and determine the structural fitness of the model.

![Figure 1 – SEM Model based on Standardized Coefficient of the Effect of Service Quality on Satisfaction of Patients.](image)

Figure 1 is a graphical representation (along with regression weights) of the association between quality dimensions of service and satisfaction of patients. The diagram of SEM is resulting from the direct relationship between the study’s variables. It also shows the correlation value of dimensions and their corresponding regression weights.

Table 5 Specifies the unstandardized coefficient (β) values of physical environment (β= -0.049, p > 0.005) and quality of staff (β= -0.043, p > 0.005) indicating that they have not significantly effect on patient satisfaction. β values of clinical care process (β= 0.169, p < 0.001), administrative procedures (β= 0.127, p < 0.001) and trust (β = 0.339, p < 0.001) specifying that it has significantly contributed to satisfaction of patients.

</tr>
</tbody>
</table>

Note: ** indicate to significant at 1% level

According to the results of SEM, physical environment and quality of staff have not significantly influence on satisfaction of patients, therefore; hypotheses H2a and H2b are not approved. Since the clinical care process, administrative procedures and trust have a significant influence on patients’ satisfaction, therefore, supporting hypotheses H2c, H2d, and H2e. Based on the standardized path coefficient dimension of trust has the height contributing on patients’ satisfaction followed by the clinical care process and the lowest contributing of quality of service on patients’ satisfaction was found in the dimension of physical environment. P-value =0.27 is above 0.05 which specify that the model is perfect in fit. The calculate value of Chi square in this research is 4.051 with degree of freedom χ²/df 1.350 which is less than standard value (≤ 5.00) P-value 0.256 which is greater than 0.05. The value of GFI in this study is 0.995, AGFI value in this research is 0.963, and values of NFI and CFI are 0.985 and 0.996 respectively which also greater than the standard value 0.90. RMSEA value of the current study is 0.038 which is less than the standard value 0.08. Since all findings of SEM model (P-value, χ²/df, GFI, AGFI, CFI and RMSEA values) of this research are exceeding the standard values of model fitness. Hence the model is perfectly fit.

**Discussion**

The dimensions of the physical environment and staff quality have not been significant effect on patient satisfaction. By contrast, earlier researches that focus on the significance of the staff-quality to ensure patients’ satisfaction is supported by previous studies that confirmed that the satisfaction of patients significantly affected by the personnel-quality. The quality of nurses and doctors’ communication is yet another important dimension to patients. Hence the owners and managers of Yemeni private hospitals need to focus more on factors such as adopting new technology and modern equipment, provide proper training to their staff to deliver a good service and ensure the satisfaction of patients.

It also, found that patients’ satisfaction is significantly affected by trust. The clinical care process reflected as an influential aspect in the quality of healthcare services through its importance impacts on the satisfaction of patients. This result is confirmed by many studies who reported that patient satisfaction is significantly affected by quality of clinical care processes. Administrative procedures also have a vital role in the satisfaction of patients. Many researchers have revealed that administrative procedure has positively effected on the satisfaction of patients. According to the nurses the dimension of trust has the highest effect on patients’ satisfaction and the lowest effect was found in the factor of physical environment.
Conclusion

The current research was aimed to examine the perspective of nurses concerning the quality dimensions of healthcare service and its influence on the satisfaction of patients in Yemeni private hospitals in Ibb city. The findings show that the independent dimensions except physical environment and quality of staff have a good predictive power and efficiency in describing the relations between the satisfaction of patients and healthcare quality from the viewpoint of nurses. It also confirms that the trust has the highest effect on the satisfaction of patients, and physical environment have lowest impact. So, the study suggests that improving the physical environment and quality of staff dimensions will result in increasing the level of satisfaction. The current study was carried out a quantitative method and focused only on the perspectives of nurses employed in private hospitals at Ibb. Further studies can be carried out qualitative approaches in the other Yemeni cities and public hospitals to study the perspectives of other stakeholders and gain better understanding of patients’ satisfaction and quality of service in the Yemeni healthcare industry.

Escape from Reality: An Analysis of Corporate Culture and Quest for Quasi-Relationships in the Virtual World

S.Sarayu Priyadharshini¹, S.Patchainayagi²

¹Research Scholar, ²Assistant Professor, School of Social Sciences and Languages, Vandalur to Kelambakkam road, VIT Chennai

Abstract

The world wars followed by Industrialization and subsequently by Globalization have restructured the livelihood of enormous people. Specifically, it has transformed the culture, lifestyle, family structure and traditions followed by the ancestors. This become as the significant reason that traditional joint family framework are dismantled and the Nuclear family perception has formed. People started to live in small groups and assemble together on particular occasions and other related family functions.

The fondness towards high standard of living and their race behind the materialistic desires up surged the culture of single parent and working parents. This destroyed the parent and child relationship. The loneliness set across the young minds leads them to anxiety triggered with depression.

Technology which is designated to soothe the depression caused by loneliness, as it progressive, in turn, it increased the crack between the relationships. People talk less to each other in reality but regularly post their views on social networks. This longing thirst for a virtual relationship made both their real and virtual world complex. This paper elucidates the impact of technology addictions and gaming affects physically and psychologically, the individuals and especially children i.e. the risk in virtual world relationships with reference to the text Ready Player one by Ernest Cline and Reamde by Neal Stephenson.

Keyword: MMORPG, Virtual Reality, corporate culture, Family Structure, globalization

Introduction

The Globalization took after by industrialization plays vital role in building the nation which got crushed during the world wars. The fast development needs more work forces to assemble a mighty nation. This in turn changed the mindset of the people and made them all to run behind the materialistic development. People started becoming more selfish, greedy in earning money and saving it for themselves. This affects the family setup which breaks the joint family framework and nuclear family setup has widely spread among everyone.

Throughout the human history, reproduction, socialization and building relationships with all the community have been the significant role of every human being. These specific qualities are rich in the joint family structure. But now Nuclear Family framework is moulded in which just parents and children live together. Money has begun to occupy the lives of the people. This makes both men and women to work in order to lead a luxurious life. They went to jobs leaving their children alone in the home. This forlornness and the absence of parental love and care at the budding age make a crevice in the Parent-Kid relationship.

Children and young adults who are prone to loneliness are engaged with latest technology. The innovative advancement in communication and entertainment reduces the depression and anxiety. The advance in technology helps in setting relationships in a virtual world and also helps them with a chance to discover an association with a virtual home far from real home. This social media connection makes a more confounded relationship which influences the individuals with more anxiety. One of the technology helps in diminishing loneliness is the games. Development of videogames has grown into an unimaginable extent which attracts people irrespective of all the ages.
Video games have gained much importance all over the world and Video game diversion effects have been researched and entrenched in both the positive and negative outcomes such as valuable effects of pro social games on helping, Constructive outcomes of activity games on visual-spatial skills and hurtful effects of quick paced games on subjective control. Video games are updated to various newer versions to attract people and satisfy them in a better way. One of such innovative advancement is RPG i.e. Role playing games in videogames. Firstly, only one player can take up a role and play inside the game. Later it extend its arm to many players i.e. MMORPG Massively multiplayer online role playing game.

**MMORPG**

MMORPG Massively multiplayer online role playing games is the most recent and advanced version of videogames which merges with the latest technology. Virtual reality is the heart of MMORPG, is a simulated environment similar to the real world generated by computer-user interface. It is an open world game play in which a new world is created inside the game where one can live their life happily because it has all the original components such as politics, economy, society etc. Also user can experience and explore different imaginative worlds.

In ready player one by Ernest Cline OASIS is the virtual world created by a billionaire James Halliday. The last will of Halliday is that one who unlock three secret gates and finds the Easter egg which is hidden inside can inherit his entire fortune and also gain absolute control over OASIS.

In Neal Stephenson’s Reamde T’Rain is the game i.e. virtual world created by Richard Forthrast to experience adventure and acquire crypto currency through gold farming.

**Game Addiction: Lack of interfamily bond between parents and children**

Nuclear family structure lacks the family values, tradition and culture because they miss the love, care and support of the old and experienced elders. This in turn makes them learn and experience each and every situation of the life by themselves. The prime part of their life is spent in experiencing to grow better.

Man is a social being. The first twenty years of his life is spent to develop himself as a whole, responsible and knowledgeable person in the society. After this stage the first and foremost social grouping is experienced in his family. In the joint family environment, both men and women from infancy to childhood, adolescence to adulthood grow physically, psychologically and socially. Happy, peaceful and comfortable life, to a men and women, on a greater extent relies in the quality of their family life. The individual has to come across the phases of growth from passive receptivity, dynamic independence and at last extreme rot. During all these stages, the family demonstrates different experiences which results in sculpting a man or woman with moral and virtuous ideas or making them grow against all the morals and virtues of the society.

Parents in the nuclear family structure leave children alone in home or with caretaker to go for their jobs. Generally women take the responsibilities of home and children but when women join the workforce it gets shaken. The question of taking up the responsibilities make them question, quarrel between each other and finally end up in getting separated. For survival, they still stick on to jobs leaving their children alone in home. People like baby sitter, care taker and technologies like baby monitoring are there, the love and care of the parents is lacking to the toddlers. On the other hand, when there is only one source of income i.e. only male in a family is earning, and then the economic dependence of the counterpart leads to the psychological depression. It also adversely affects the economic status also bothers the parent-kid relationship. When children grew up in such situations the bond between children and the parent becomes less and the technology replaces the parents. The social media and the games of the higher end like online highly addictive games attract and alienate people from the family to experience a new virtual world i.e. utopian or dystopian world.

The dystopian feature of ready player one by Ernest cline exhibits the disaster of the ruined world due to third world war in 2049. Proper family structure does not prevail in the society because of the world war. They have lost their home, family members, parents and children. This affected them psychologically and has created a great depression in their mind. Every individual in ready player one craves to escape the bitter reality, as one of the billionaire and the designer of the OASIS game announce that whoever finds three copper keys
and unlock the Easter egg can acquire all his fortunes. The protagonist “wade watts” lives in the container piled up home in the city of Oklahoma often travels in OASIS in search of hidden fortune. There he finds lot of friends who were also in search of the fortune. He find many new relationship and able to socialize with them in a better way than in reality. He feels more comfortable to express his feelings and lives a life to his wish there. Though the relationships in OASIS are filled with doubts and risks, he sees them only as avatars and not as real life characters. The advantage of OASIS is that they can take up any role or character to their wish and fulfil all their dreams to the best. This satisfies his psychological illness and fulfils his needs.

Ernest cline projects the people of all the ages are addicted towards the game in order to forget reality and live happy life. But even after coming back to the reality the impact created inside the virtual world follows them. This slowly makes them forget the reality. Physically and psychologically they have become very weak to live their normal life.

Reamde by Neal Stephenson depicts the addiction of people towards the games. Especially when the ransom ware attacked on T’Rain, an MMORPG game and created chaos, People started losing temper and chaos prevailed. The in-game money i.e. crypto currency is affected by the ransom ware which makes people to pay some valuable resources of the game in exchange for the encryption key to play the game. They are in the situation that they must lose all their worldly resources or die in virtual world which will also be threat to their real life. Thus, the need for the players to continue the game, risking their own life shows how people were addicted to the game.

**Virtual reality – the advent of science and technology over individual quest**

From the invention of Fire and the wheel to the Hyper loop and Mars colony, the innovation benefits in the evolution of human being. The innovation and invention in communication and lifestyle changed the phase of luxury to a basic need. The combination of technology in the smart devices jumped ahead in Human-Computer Interaction. Even though the positive effect of technology and the Internet in various studies is evident, there are numerous hurtful impacts exist. Regoniel explains that “a couple of the negative consequences of the Internet such as compulsion, damaging and inescapable pornography, the loss of human touch, criminal action, for example, phishing, misleading, Master card theft, and wholesale fraud, and the surrender of family” (Bakardjieva,47)

Internet is the best Teacher which teaches or gives information about anything that exists in the world. It also explores other addictive entertaining aspects such as social media and gaming. Virtual reality helps one in immersing oneself into another world hiding the reality. This gives lot of pleasure to everyone and makes them more addictive.

This is evident in Ernest cline’s Ready player one that to forget and accept the bitter pain of the reality. Everyone irrespective of all the ages begin to spend their time in virtual world. This affects their health severely because the radiation and vibrations are sent to human brain to make one accept the fake things for reality. This may also result in death.

**Information overload**

One of the primary dangerous consequences of the Internet is an ongoing wonder called information overload. Indeed, even before the origin of the Internet and the exponential development of information and technology, Herbert Simon prophetically says,

“In a world flourishing with information, the wealth of information implies a scarcity of something unique: a lack of whatever it is that information expands. What information expends is fairly self-evident: it devours the attention of its recipients” (Soper, 1)

According to Herbert Simon’s sayings information overload has become as the significant reason for all the problems. Unwanted, addictive information become as open source where anyone can learn about anything which spoil their mind and teach them all unwanted, immoral values which might damage their life.

This is evident in Neal Stephenson’s Reamde because of the exposure to the internet; everyone began to play the game T’Rain and lost all their private and confidential documents. Also they invested real money in virtual gold farming and converting it to crypto currency to become as a millionaire or billionaire. This greedy attitude towards money is initiated or induced
through the over usage of internet and the unwanted content comprehended in it.

**The misguided feeling of reality**

Sherry Turkle, in her book Alone Together expressively lights up

“Human connections are rich, and they are untidy, and they are requesting. Also, we tidy them up with innovative technology” (p. 32)³

According to Turkle’s sayings Virtual reality can only seem to be real but not real. One can feel like they are travelling or experiencing different world or environment but alienation follows them everywhere. Human being cannot easily accept the alien world as his own because he lost the real human touch, empathy etc.

In Ernest cline ready player one, the protagonist wade watts and his friend spend most of their time in OASIS searching the key. They get new relationships but are unable to express their true feelings, real time worries etc because of the insecurity. They are forced to hide their true emotion which affects them psychologically.

**The sense of forlornness**

Turkle concedes that technology is a substitute for associating with others up close and personal. She trusts that our organized lives prompt us escaping each other. As opposed to talking eye to eye or even on the telephone, texting is the favoured alternative. This can prompt confusing the sender’s or receiver’s aim.

In ready player one, their quest for inheriting a real fortune they exploit themselves and the OASIS in search of the key. Even though they have no clue about what it is or how does it look or how the people are chasing for it. In Reamde, a concept of gold farming is narrated. It is assumed to have originated from China or Korea where a set of computer geeks with all the tech gadgets they harvest in-game money or resources. This in-game money or resources helps the player to gain access, buy or upgrade themselves in the game. These gold diggers will give away in-game money in exchange for real-world money or cryptocurrencies. Characters in both the ready player one and Reamde have detached themselves from the real world to satisfy their longingness in the virtual world.

**Effects of Technological addiction in Familial relationships**

In today’s modern society roughly about 40 percent of the total populace is connected online at any instance. Besides this, the worldwide Internet practice has developed about 6 overlap throughout the past decades, with nearly 96 percent of Internet users in the country of Korea using rapid Internet associations in disparity with 78% in the United Kingdom, and 56% in the United States. Comparing the use of Internet access during 2000, the United States has dramatically increased its usage, although shrewd Internet use has increased generously towards the end of 2011, signifying that Internet utilization implementing various hardware devices has turned into an exceedingly powerful movement for the two adolescents and adults. (Young, 21)⁴

The MMORPG games like OASIS in Ready Player One and T’Rain in Reamde which is designed to be real-world exploration like theme named as open world game have missions/tasks which may extend to weeks or months to complete. Though there is an in-game purchase which gives away gadgets and powers to complete the mission but the players who were addicted never opt for that option. When the game is over instead of getting into the real world, they get mentally disturbed and look for the next mission or game and choose to be wholly detached from the real world.

**Conclusion**

Robots taking over Humanity will no longer be fictitious if there is still an increase in technological addiction. Humans need to socialize more and to contribute more towards community living. Humans tend to live in a community in the early civilizations which paved the way for innovations by understanding the needs. Since Humans have survived millions of years without the tools, using only the human mind, being their ultimate tool for survival. The relationship is to be real and not made up one like found in the social media. People must be aware and be cautious in dealing with both the virtual and real-world relationships, and never let them take over by technology.

Patient’s Perception on Esthetic Restoration of Primary Anterior Teeth

Sumit Gaur¹, Reshma M², Rupali Agnihotri³

¹Associate Professor, Department of Pedodontics and Preventive Dentistry, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education (MAHE), Manipal, Karnataka, India, ²Ex Student, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education (MAHE), Manipal, Karnataka, India, ³Associate Professor, Department of Periodontology, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education (MAHE), Manipal, Karnataka, India

Abstract

Background and Aim: The present study aimed to assess the social and self-perceptions of children (4 to 8 years) regarding the esthetics of restored primary anterior teeth.

Materials and Method: A total of 135 children seeking dental treatment were asked questions about the dental restorations of primary anterior teeth after showing them pictures of restored carious lesions.

Results: They showed increased acceptability for Zirconia crowns as compared to other forms of restorations.

Conclusion: The children can perceive esthetics of their anterior restored teeth as early as 4 years of age which is important when planning esthetic restorations for them.

Key words: Esthetics; Primary teeth; Patient Perception

Introduction

Aesthetics is an integral component of dentistry. Lately, increasing awareness among the patients has attracted them towards contemporary aesthetic dental treatments which not only improves their appearance but also overall personality. Current esthetic science has standardized the body and facial esthetics whereby the individuals are judged based on their appearance and any deviation from normal is unacceptable, whether in an adult or a child. Although there is abundance of literature regarding esthetics of adults, esthetic perception in children has been rarely evaluated. According to Jean Piaget, “a child’s perception of self and appearance develops only by the age of 8 years.” Conversely, child psychology studies suggest that children are conscious of their body image from a very young age and differ in self-perception of body image when compared to parents.

Usually children with a normal dental appearance are considered more attractive and perceived to be socially and intellectually more competent and better adjusted psychologically. Therefore primary dentition esthetics is imperative which has led to the emergence of “pediatric aesthetic dentistry” that deals with the maintenance and enhancement of the beauty of the mouth of infants and children through adolescence, including those with special health care needs.

The early childhood caries (ECC), trauma or congenital malformations may adversely affect primary dentition aesthetics. They occur in about 30 to 90% of the children in developed nations. Their diagnosis, prevention and restoration is often a challenge owing to the small size of primary maxillary incisor teeth where retentive, esthetic and fracture resistant restorations are...
often difficult to provide\(^8\).

The ECC affects labial surface of maxillary anteriors in children \(\geq 5\) years of age, producing an unaesthetic appearance which may be treated with various restorations. The parental satisfaction for these restorations as well as their differences in opinions with the dentists has been evaluated earlier \(^9,10\). However, children’s aesthetic perception about their dental aesthetics has not been investigated\(^11\).

Untreated dental afflictions often cause psychological and social problems in children, producing a negative impact on their social relationships and personality and may continue throughout their life\(^12\). These social consequences of anterior dental esthetics have been rarely evaluated in children. Further, their perception on altered esthetics and its psychosocial and emotional consequences are seldom considered important\(^13\). Although emotional aspects are difficult to evaluate in a child, it is not impossible\(^14\).

Eventhough, recent advancements in anterior restorations have enabled complete esthetic rehabilitation of the primary anterior teeth, it is often difficult to give a satisfactory treatment to a child owing to the difference in view point of the patient, parent and the dentist\(^15\). It has been seen that the parents are more interested in preserving esthetically damaged anterior teeth rather than the replacement of extracted or missing teeth\(^16\). A proper parental education in this regard may be helpful in providing the best treatment to the children. Besides, a dentists experience in pediatric aesthetics is essential to enable parents to make right decisions for their children.

The children are highly concerned about the esthetics of primary anterior teeth as was revealed in a survey assessing social and self-perception of 431 children\(^14\). With this background the current study aimed to assess the social and self-perceptions of children (4 to 8 years) regarding the esthetics of restored primary anterior teeth.

**Materials and Method**

This cross-sectional study was approved by the Ethics Committee of Kasturba Hospital, Manipal, Karnataka, India (IEC 826/2016). A written informed consent was obtained from the parents/legal guardians of the participants for participation in the study. The study included a questionnaire and photographs of previously treated subjects to determine the perceptions of the children regarding the aesthetic restorations of primary anterior teeth. It enabled the dentist to recognize a child’s perception of his/her primary anterior teeth esthetics and their opinion regarding the best restoration. The questionnaire was prepared in both English and local language. The demographic characteristics and closed end responses to the questions were recorded after showing the pictures of carious lesions and aesthetic restorations viz glass ionomer restorations (GIC), polycarbonate crowns, composite restorations and zirconia crowns to each participant. The purpose of the study was explained to them by a single examiner to rule out bias.

The inclusion criteria was co-operative children of 4 to 8 years of age with ability to comprehend and understand simple questions of the questionnaire (Table1). The exclusion criteria was children outside the age range of 4 to 8 years and those with special care needs or medically compromised patients.

The included children were subdivided into 3 groups based on their age as:

- Group A: 4 to 5 years
- Group B: 5.1 to 7 years
- Group C: 7.1 to 8 years

About 200 children who fulfilled the inclusion criteria filled the questionnaire (Psychological Impact of Dental Esthetics Questionnaire). A modified form of questionnaire which was validated in an earlier study was utilized\(^17\). The children saw the photographs of primary anterior teeth before and after dental restorations/rehabilitation and rated their perception using closed ended questions i.e. they marked the response as either “yes” or “No”. This helped in assessing their satisfaction with the appearance and color of anterior teeth.

**Statistical evaluation:**

Statistical analyses was done with the help of the Statistical Package for the Social Sciences software (SPSS) version 20. The data was analyzed using Chi square test. The statistical significance was set at \(p < 0.05\) and results were considered significant if \(p < 0.05\).

**Results**

Out of 200 children, only 135 children completed the questionnaire. Among them, 70 (51.8 %) were males
and 65 (48.14%) were females. About 31.85% were in the group A (n=43); 45.18% in group B (n=61) and 22.9% in group C (n=31).

The subjects were questioned about their dental appearance specifically in relation to tooth color, preference towards friend’s teeth, their hesitation to look into mirror due to deformities of teeth. It was found that 65.9% (n=89) of the children were not happy with the appearance of their teeth, 68.14% of them were dissatisfied with the color of their teeth, 78.5% (n=106) expressed a desire for better looking teeth, 70.3% (n=95) often looked at their teeth in the mirror, 56.29% (n=76) had hesitation in smiling due to their teeth, 71.11% felt that their friend’s teeth were better looking, 71.1% (n=96) desired to undergo treatment to improve the appearance of their teeth while 54.8% of the children did not like the appearance of unrestored teeth that were shown to them in a picture. The most preferred type of restorations were Zirconia crowns. These were followed by composite restorations (25.9%) and polycarbonate crowns (0.06%) and GIC (0.01%).

An intergroup analysis showed that there was no significant difference in the opinion of the children as well as their preference for a restoration (p>0.05) (tables 1 and 2). Furthermore, there was no gender difference in the opinions, although the percentage of females regarding positive esthetic perceptions was more (table 3).

Discussion

Esthetics and specifically the dental esthetics is an integral component of personality of both adults and children. This study attempted to understand the dental esthetic insight of children and their preference for restoration of mutilated anterior teeth. The results showed that irrespective of the age and gender, children are conscious about their esthetics from very young age of 4 years. This was evident as 54.8% of the children did not like the picture of unrestored carious teeth and 65.9% of the children were not happy with the appearance of their teeth while 68.14% were dissatisfied with the color of their teeth and 78.5% expressed a
desire for better looking teeth. Therefore, it is imperative for a dentist to remember that a child observes dental esthetic alterations in his/her peers or in him/herself and esthetic restorations in them should be very similar to the appearance of natural primary teeth. In the current study, majority of children were influenced by the appearance of their friend’s teeth and wished to have similar teeth. This reflects the role of friends and peers in self-esthetic perception. Besides, their ability to identify and dislike the unaesthetic and unrestored teeth suggests that they developed esthetic perceptions at a very early age and any negative self-opinions from childhood may influence self-confidence in future. This was evident as majority of children were hesitant in smiling and looked at the mirror very often. Furthermore, the children (71.1%) wanted to undergo treatment to improve their dental esthetics which reflects their consciousness and acceptability for dental procedures. They recognized Zirconia crowns as most acceptable followed by composites and polycarbonate crowns. This was in accordance with another study where Zirconia crowns were suggested as most acceptable restorations for mutilated teeth. Furthermore, increased number of girls were dissatisfied with the appearance and colour of the teeth while more number of boys had a psychological impact of unaesthetic teeth. This was revealed from the fact that the latter wished better looking teeth, frequently saw teeth in mirror, were hesitant in smiling and perceived friend’s teeth to be better. They wanted to undergo esthetic dental treatment which is in accordance with another study whereby the boys were more saddened with the unaesthetic appearance of the teeth.

Children “do feel sad about their own mouths” and any alterations to primary anterior teeth escalates their dissatisfaction. For children, dental esthetics are the main reason for seeking dental treatment and age showed no significant association with their feelings. These results are significant as a very young child is often neglected by the dentist while choosing a treatment plan. Recent work in child psychology shows that consciousness about self can begin as early as 3–5 years of age which was evident in the present study also. It was attributed increased exposure to media from a very young age. In the present study the four year old children opinions were very close to those of older children and could perceive esthetics of their mutilated teeth, which should be restored. Just because the primary incisors would be replaced cannot be accepted as an excuse for negligence and the pediatric dentist should take care about this aspect.

Conclusion

The present study showed that irrespective of age and gender, children were affected by dental esthetic alterations and were motivated to receive treatment. They effectively perceived resemblance to natural teeth as majority of them preferred zirconia crowns for esthetic rehabilitation. A pediatric dentist should keep esthetics in mind before planning treatment of mutilated primary anterior teeth and should counsel the parents about the esthetics of primary anterior teeth. This would further improve the quality of life and personality development of children with damaged primary anteriors.

Human Capital and their Working Environment: A Study with Special Reference to Health and Safety of Manufacturing MSMEs in Emerging Economy

Vidhya Vinayachandran¹, A.S. Ambily¹

¹Department of Commerce and Management, Amrita School of Arts and Sciences, Kochi, Amrita Vishwa Vidyapeetham, India

Abstract

Much of the literatures were heavily focusing on the importance of human resource management among large enterprises. As we are in the era of knowledge economy, it is important that knowledge forms the pillar for the development of an enterprise. It is imperative for both entrepreneurs and workers. Also, it is necessary for creating a healthy environment to absorb such knowledge practices among entrepreneurs as well as workers. Thus the present study focuses on micro, small and medium enterprises which share a major portion of Industrial sector in emerging economy. Providing favorable working atmosphere for workers especially with reference to healthy and safe atmosphere, is given least importance by the owners of SMEs and the study claims to fill the gap on the same. The study is also useful to managers, policymakers, as well as academicians as it stresses on the necessity of human capital investment among MSMEs.

Keywords: Human resources, working conditions, MSMEs, knowledge economy, emerging economy.

Introduction

The concept of human capital has been widely discussed among entrepreneurs especially in developed countries. But it is being discussed less among the workers especially, belonging to small and medium enterprises. Humans without creative mind have nothing to contribute towards industrial development. Moving from traditionally focused man made products, now the industries are moving towards machine building capacity, where the men operating the same, should process the knowledge on how to operate such automated systems. The workers of developing countries should realize the knowledge acquired at present becomes outdated as the world is moving in a technological era.

Small and medium enterprises are the heart and soul of both developed and developing economy. In order to survive, they should be well versed in new and improved technologies, where the role of entrepreneurs as well as workers in contributing towards manufacturing output through extensive learning has turned a matter of debate. It is being noticed that smaller firms provide lesser attention to the development of human assets. In the case of developing economy, especially India, Micro, Small and Medium Enterprises are considered as seed bed for employment generation. Researchers identified specifically the role played by manufacturing sector, in creating employment is worth to be noted. India is blessed with immense knowledgeable and skilled workers. Small and medium enterprises enhance the employment generation capabilities with respect to manufacturing sectors. It is being argued that entry as well as exit with respect to employment in SMEs is not much complicated. To have well-equipped MSMEs with sophisticated technology, the entrepreneurs as well as the workers should welcome such recent changes. For ensuring the same, it is the responsibility of the entrepreneurs to provide their workers with good amenities and facilities together with molding and training to make them aware of the advantages and disadvantages of technology improved machineries.
Thus, it is necessary to provide them with a healthy atmosphere which is being discussed subsequent topics.

**Literature Reviews**

As per the theory of Resource based view, resources can be categorized as physical capital, human capital and organizational capital. How well the human stocks are managed effectively and efficiently especially with respect to small and medium enterprises is being discussed as an emerging topic by the researchers. Human capital is the aggregate of knowledge, skill, and experience inherent as well as acquired by the individual worker. A developing country is characterized not by increasing stocks of human capital; instead it exhibited a declining trend in human capital stock. Evidences from empirical researches proved that experience is an important constituent of human capital. A better working environment coupled with better occupational health and safety, wages, flexible working hours, as well as training facilities. The manager of small and medium enterprises will always have a practice of curtailing cost, which has an indirect effect on excessive labor turnover. A multiple factors were used for measuring organizational climate. Even in the developed countries, studies proved that workers irrespective of younger as well as older age groups are exposed to chronic illness due to unhealthy working atmosphere. Favorable working environment is also influenced by fair remuneration as well as financial incentives. Financial benefits are essential for drilling out the competencies inherent among the workers, which ultimately enriches the standard of living among workers.

**Statement of the Problem**

Micro Small and Medium Enterprises suffers from resource deficiencies especially in connection with skilled workforce which may hamper the operational efficiency of MSMEs. Researchers pointed that India is placed highest next to Philippines with respect to turnover rates of skilled workforce. This poses a serious threat towards the productivity of manufacturing sectors, especially small and medium enterprises. The requirement of skilled workforce is increasingly important in the production sites of micro, small and medium enterprises. Increased turnover rates may due to inadequate working atmosphere which makes the workers dissatisfied. This necessitated creation of a positive work environment which leads to reduction in attrition rates of workers.

The present study travels along with the workers in the production plant of Kerala, which is considered as aspiring hub among Southern region of Kerala and also identifying the important factors which creates a favorable work environment, which enables the MSMEs to gain competitive advantage over others.

**Objectives of the Study**

To identify whether the mean scores of human capital remains the same with respect to physical settings at work place among Micro, Small and Medium Enterprises.

**Research Methodology**

The study is purely descriptive and analytical in nature. The working environment of plant workers has been studied based on interview schedules based on established literatures. All constructs were selected based on conducting reliability test of Cronbach’s alpha greater than 0.7. Kerala is projected to become aspiring hub of the report of Make in India Initiative. Also Kerala is placed least among the top 10 States in the growth of Micro, Small and Medium Enterprises, based on the report of Entrepreneurs Memorandum Part II registered as per Ministry of MSME 2014-15. As a measure to improve the competitiveness among Kerala MSMEs, an initiative called Kerala Perspective Plan 2030 was developed by Kerala State Planning Board, 2015, to develop a sound and sustainable industrial base. It also aimed to improve the skill level of workers, which proves to be important in this knowledge driven economy.

A favorable working environment is influenced by several factors proposed by was the basis of framing interview schedules in relation to work environment. The scale designed is applicable irrespective of the nature of the organization. An exploratory factor analysis is performed in order to reduce huge set of variables into a reduced size. The production workers in the plant are selected from engineering, food and plastic sectors. The total number of population of production workers in the plant is about 1158 and through the method of simple random sampling, sample size of 215 is selected for the study.

**Analysis and Interpretation**

The results of descriptive analysis are as follows: From the descriptive analysis, the concentration of production workers is higher in micro and medium
sectors of about 36 percent (both micro and small). In micro sectors, machines are of manual and semi-automatic in nature. Thus the worker requirements in those plants are higher. In the case of medium sectors, there is a need to cater to bulk production requirements. Also the manufacturing activity ranges from sorting, grading, assembling as well as packaging. Therefore for performing these functions, greater manpower requirements are essential. The proportion of male workers (71 percent) is higher than female workers in the production plant (60 percent). This is because more heavy and skilled labors are required in the production plant. Even though female workers are employed in the plant, there remains a problem of their continuous existence.

### Exploratory Factor Analysis

For performing exploratory factor analysis, Keyser Meyer Oklin measure of sampling adequacy should be greater than 0.5, where the present study’s KMO value is about 0.8 which is adequate. Also Bartlett’s test of sphericity also generated significant value of less than 0.05. Rotated component matrix was used to interpret the factors which have a highest loading to least loaded among the work environment factors. By conducting exploratory factor analysis, 7 factor component matrix was generated. A questionnaire with 38 items was distributed to the respondents and by conducting factor analysis 3 questions were eliminated because of low factor loading less than 0.4. A rotated component matrix table was generated which determines the important factors of work environment of plant workers among MSMEs.

Source: Primary data

From table no: 5, the first and foremost factor responsible for generating a favorable working environment is the Physical setting of the work place. Mostly the infrastructure in relation to plant with reference to proper ventilation, lights and pollution free atmosphere is very crucial for ensuring healthy workplace among the plant workers with respect to micro, small and medium enterprises. It is being established in various literatures that health issues reports with respect to workers is increasing especially those who are engaged in small and medium enterprises. Eye diseases, hearing losses, respiratory problems, and skin diseases are the most commonly reported issues. Therefore, the remaining sections of the paper focuses on the human capital of workers in the plant differ with respect to physical settings at the work place among MSMEs.

Hypothesis

The mean scores of human capital of plant workers remain the same with respect to physical settings at work place among MSMEs.

Source: Primary data
From table no: 2, it is being inferred that, with respect to education of plant workers, those workers with respect to highest educational qualifications is perceived to have highest perception in connection with physical settings. Such workers may be technicians, biochemists, who are directly responsible for conforming to the quality of the products. But in micro sectors, the number of technicians is relatively less as a result of improper and unhealthy safety practices. In micro sectors, workers working in the plant are not provided with goggles, gloves, helmets as protective measure to safeguard their health. Workers complain about carrying of heavy sacks which causes severe muscle cracks and injuries. As majority of workers are having basic or below basic education, the entrepreneurs are careless in treating the workers and as a result plant workers turnover rates tends to be increasing. Despite the plant workers with higher experience ranging from 15-20 years is relatively higher. Plant workers having basic education are higher in micro sectors. They perform the job without having any demands and such workers are highly satisfied with the working atmosphere. They are provided with safety measures in order to overcome occupational hazards in relation to their respective units. These workers are given an initial training with regard to safety and healthy practices with respect to a particular job.

Source: Primary data

From table no: 3, is clear that workers having highest educational qualification and higher experience replied with a positive opinion in relation to the healthy working environment in relation to small sectors. Their educational levels significantly influence their consciousness towards safety practices which enhances the productivity of respective units. Among various factors of working environment, experienced workers motivation to continue in the work is largely influenced by the infrastructural amenities and facilities provided at the work place.

Source: Primary data
From table no: 4, it is being inferred that, the human capital of plant workers with respect to physical settings is high among workers having higher educational background and those having greater experience. It is of great pleasure to the plant workers to work in such a healthy and safe working environment and as a result, they are having an urge to work in that related field. It is being inferred that even in the case of medium sectors, the workers who are highly qualified are comparatively low. But for certain jobs, workers with specified technical qualification is mandatory and intake in relation to the same is very poor. Despite the medium sectors are vigilant towards equipping the plant with better production technologies. Irrespective of micro, small and medium enterprises, the concentration of aged group is high and therefore quarterly training in relation to safety measures and practices together with formation of committees to discuss safety measures has become common practice among medium sectors. Technology oriented units should be more cautious as it involves heavy work in terms of cutting, bending, welding which may cause severe health hazards to workers in the plant. Also the surroundings are kept neat and tidy.

Suggestions and Conclusions

Plant workers who are having low levels of education should be provided with safety training and classes periodically to ensure their safety and health, especially in the case of micro and small sectors. The traces of metal scraps in the work surroundings increase the possibility of injuries, and keeping the surroundings neat and tidy is mandatory. Plant should be constructed in such a way that appropriate space should be allocated to each manufacturing task. At present, the plant is congested without giving consideration to movement of workers which hamper the productive efficiency of workers. Cranes should be encouraged for moving bunch of stock from one place to another. Use of protective mask, gloves, helmets etc. should be made mandatory. Hazardous materials which are highly inflammable should be located in an isolated area.

Are Muslims Incurring Higher Out-of-Pocket Expenditures than Hindus in Reproductive Healthcare at Sub-District Levels in Karnataka?

Rupa Sarkar, Mahesh E

1PhD Economics Scholar, Adjunct Faculty, CHRIST (Deemed to be University), Bangalore, 2Assistant Professor, Department of Economics, CHRIST (Deemed to be University), Bangalore

Abstract

Background and Objective: This study was undertaken to evaluate level of differences found in Out-of-pocket expenditures (OOPE) among Hindus and Muslims, OOPE being a sub-component while constructing reproductive health account (RHA) matrices for Ramanagara district, Karnataka.

Method: Adopting multistage stratified sampling method, individual level data was collected using survey tools, catering to six dimensions of RH functions, taken from ‘WHO Guide to produce RH Sub-Account’. 517 Hindu and Muslim men and women meeting inclusion criteria of reproductive age (15-49) incurring RH expenditures in last one year were included followed later by only 382 uninsured individuals for hypothesis testing.

Results: Muslims showing almost double OOPE in RH necessitated hypothesis testing of significant difference in OOPE, equating groups, post exclusion of insured individuals. Statistically significant difference was revealed in RH expenditures using Mann-Whitney U test.

Interpretations and conclusions: Vicious cycle of disparity in education levels, lower income levels, negligible health coverage, strenuous work conditions, poor living standards, repeated RH contingencies leading to massive borrowing financed OOPE in RH continues.

Keywords: Reproductive health, Health expenditures, OOP health expenditure, Health insurance, Health and Inequality

Introduction

Out-of-pocket payments (OOPPs) are defined as direct payments made by individuals to health care providers at the time of service use excluding any prepayment for health services.1 According to National Human Rights Commission (NHRC) report, 66% of all health expenditures are borne by OOPE. In RH, only 21% access full free Antenatal Care (ANC) and 5% avail maternity leave. 6000 INR guaranteed by National Food Securities Act (NFSA) pertains to first child only.2

Pre-NHM and post-NHM status failing to show difference when compared using data from 60th and 71st rounds of National Sample Survey (NSS) evokes concern similar to us.3 Demographic variables majorly influenced prevalence of RH disorders and treatment seeking behaviour.4 Yet, OOPE in RH of Muslims was found lesser than Hindus in Karnataka (category B state) was intriguing.5

Our study was convinced with the Sachar and Kundu Committee report that share of Muslims in regular income jobs was extremely low and hint at possible discrimination6,7 moreover negligible reversible contraception methods led to 2.61 Fertility Rate (FR)

among Muslim women. Our study wanted to test parity in OOPE in RH in light of the state’s Integrated Public Health Policy 2017 claiming equity in socio-demographic factors.

Sachar, Kundu and the High Level Expert Group (HLEG) reports recommended need of small-scale regional studies for looking into needs of minority communities. Not many studies in RH sector have been undertaken at sub-district levels and no study has been so far done to compare the RH expenditures between uninsured Hindus and Muslims. This study is an effort in this direction. The researchers wanted to test the hypothesis of presence of a significant difference in amount of OOPE involved in various RH functions across Hindus and Muslims.

**Material and Method**

*Study design:* We used cross-sectional survey design adopting multistage stratified sampling method. Karnataka, a state, lagging in RH indicators in Southern India, chosen in first stage was followed by Ramanagara, a medium developed RH indicator district in second stage. Third stage involved choosing two talukas Ramanagara and Chennapatna indicating medium RH performance.

Ramanagara district has 1 district hospital, 3 general hospitals, 4 community health centres (CHCs), 61 primary health centres (PHCs), 240 sub-centres, and 4 urban primary health centres (UPHC). In the fourth stage 10 PHCs were chosen, 3 each from rural areas in both the talukas, 2 PHCs and 1 CHC in urban area of Ramanagara taluka and 2 PHCs and 1 District Taluka Hospital in urban Chennapatna Taluka. Permission was taken from the Ramanagara District Health Office to visit these 12 Health Facilities and administer the questionnaires to those individuals who visited these facilities. In the final stage the questionnaire was administered to only those individuals who confirmed incurring RH expenditures in last one year (March 2017-March 2018).

*Data collection:* The survey tools Men’s and Women’s questionnaires (used as interview schedules) catering to RH, Pregnancy, Neonatal, Family Planning, Abortion and Miscarriage issues taken from ‘WHO Guide to produce RH Sub-Account’ for collecting data covered curative, preventive, rehabilitative, palliative, ambulatory and psycho-social support for in-patient and out-patient health expenditures incurred at various health provider levels including patient and attendants’ expenditures on consultation, drugs, radiology, dietary supplements, accommodation charges, food and transport.

According to 2011 Ramanagara census, 56.01% of total population of 1082636 is in RH age group (15-49) i.e. 606384 individuals. Deciding on confidence level of 95% and a confidence interval of 1.25 the sample size estimated was 6085. As per PHCs, in a year, not more than 1/10th of RH age group would face any RH situation, a sample size of maximum 600 individuals was estimated.

517 individuals including 129 Hindus and 130 Muslims (132 Males and 127 Females) and 130 Hindus and 128 Muslims (131 Males and 127 Females) were chosen from Ramanagara and Chennapatna talukas respectively.

*Statistical analysis:* Data was processed using Excel and SPSS 20. The OOPE on RH, dependent scaled variable consisted of expenditures incurred on 6 RH functions. The dependent variable was mapped against the categorical variable of two religions constituting 99.2% of the total population in the district.

Finding a huge difference between the two religions, study was extended to find if significant differences persist in OOPE among uninsured individuals. Since sample included 191 Hindus and 255 Muslims who were uninsured, it was decided to select 191 Hindus and 191 Muslims for comparing actual differences in OOPE in RH in the last one year. (dropping off 64 outlier cases). Post estimation of descriptive statistics and failure of normality, non-parametric (Mann-Whitney U) test was performed to prove hypothesis of a significant difference existing in RH expenditures incurred on the six RH functions across Hindus and Muslims.

*Ethical consideration:* Institutional ethical clearance was taken before data collection. After orientation about study details, privacy concerns and interview environment verbal consent was taken from all participants. Minors and illiterates were interviewed in the presence of another adult family member. Data was aggregated maintaining complete privacy of personal details.
Findings

Table I shows that very few Muslims reached ‘beyond middle school’. Outcome can be occupation bias and job engagement at seasonal, low-paid daily-wage. Further negligible insurance coverage was found among Muslims all leading to heavy borrowing to finance OOPE in RH.

Table II shows an average Muslim incurring two to five times higher OOPE in RH than a Hindu in all RH functions considered in this study. To find out whether the difference was caused due to a greater number of insured individuals among Hindus it was necessary to find out the actual difference between the two communities after removing the effect of insurance.

Table III reveals a visibly greater amount of per capita OOPE in RH expenditure incurred on three RH functions after removing the influence of insurance. It was important to find out whether this difference in OOPE in RH expenditures was statistically significant. Before choosing a parametric test for finding this out it was imperative to know the normality of the sample data on RH expenditures.

Table IV shows non-normality of data on all the six accounts of OOPE in RH expenditures. A hypothesis of statistically significant difference existing between OOPE in RH expenditures of the two communities was tested using non-parametric Mann-Whitney U test.

Table V shows that a statistically significant difference exists in OOPE in RH between the two communities across three RH functions pertaining to reproductive health, prenatal till postpartum health and neonatal health.

Discussion and Conclusion

Finding of this study that Muslims were more engaged in occupations which were physically strenuous, seasonal and low paid indicating a toll on their RH is similar to the finding of earlier studies. \(^{12,13}\) 19 RH disorder cases among Muslims yet adding up to 77% of RH disorder expenditure of Hindus with 102 RH disorder cases corroborates this. Their negligible insurance coverage mainly financed by heavy borrowing leading to poor nutritional habits, hygiene and habitation conditions, was termed as impoverishment by another study. \(^{14}\)

On an average it was found that Muslim individuals had a family size of six compared to Hindus having four. The Muslim women having delivered before were ineligible for cash support from schemes like ‘Extended Thayi Bhagya (Plus)’. Each day of missed work led to wage loss drove them towards private tertiary level providers claiming faster recovery rates, better reputation and easier access. This is similar to what has been reported earlier. \(^{15}\)

Study finding that frequent pregnancies and childbirth with not much attention provided to one’s health might have added to their RH disorders is in line with an earlier study report. \(^{16}\) The number of abortions and miscarriages were also found to be higher in Muslim women unlike Hindu women is supported by a recent study. \(^{17}\)

Although the hypothesis was supported yet the study suffers from limitation arising out of difficult recall and evidence about one year of expenditure amounts incurred on various heads. The study was delimited to only 12 Health facilities and respondents were chosen from individuals who visited these facilities mostly belonging to neighbouring areas.

In conclusion, the findings of this study are consistent with the claim of researchers that the OOP expenses are extremely high for people in transitioning economies and that they are deeply influenced by socio-economic factors. \(^{4,6,17,18}\)

Policy Recommendations

Our first finding indicating Muslim individuals rarely reached ‘beyond middle school’ is in line with two earlier reports. \(^{6,18}\) This is one reason why they face occupation bias and are recruited in jobs which are seasonal, low-paid and based on daily-wages. \(^{11}\)

Incentivising schemes like RMSA and low interest entrepreneurship funding for minority start-ups is recommended.

Second finding of negligible insurance coverage and awareness among Muslims is supported by other
We therefore recommend inclusive social welfare schemes like ‘Prasothi Araike’ and ‘Extended Thayi Bhagya Plus’ to be made available irrespective of restraints like number of live births. Thorough investigation into Central government schemes like ‘Pradhan Manthri Mathru Vandana Yojana’ reportedly of little use, due to eligibility and disbursement criterions, is needed.

Third finding shows two to five times higher OOPE in RH incurred by an average Muslim individual in all RH functions is supported by an earlier study. We strongly suggest introduction of better sickness and maternity benefit packages in informal sector.

Our last finding revealed higher per capita RH expenditure among uninsured Muslims on three RH functions is in contrast to an earlier study finding of convergence of OOPE among the two communities. Reason cited for lower preference for public facilities due to absence of doctors, rude behaviour, longer queues, medicine shortage and distance is supported by an earlier study. A designated monitoring committee needs to look into such matters of lack of medical infrastructure and disrespectful attitude of health professionals thereby giving more meaningful direction to individual finances saved.

Factors Affecting Delivery of Maternal and Newborn Care in Rural Public Health System in Madhya Pradesh, India

Mamta Verma¹, Kanchan Mukherjee²
¹PhD Scholar, Tata Institute of Social Sciences, Mumbai, Maharashtra, India,
²Professor, School of Health Systems Studies, Tata Institute of Social Sciences, Mumbai, India

Abstract

Supply side factors affect maternal and child health indicators. This review discusses the current status of maternal and child health indicators in the Indian State of Madhya Pradesh, and the various factors affecting healthcare delivery in rural settings.

Supply side factors like infrastructure, human resources, logistics support, medicines and other equipments affect health care delivery by nurses who are the primary care providers in almost 75% of the rural population in India.

Keywords: Maternal care, Newborn care, Rural public health system, barriers for health care delivery

Introduction

The World Health Organization (WHO) has recommend in the Sustainable Developmental Goal (SDG) 3 a health target to reduce the global maternal mortality ratio to less than 70 per 100,000 births. However, majority of the developing countries are far from achieving these goals [1]. This is due to the poor healthcare delivery system in majority of the African, Latin American and South Asian countries [1]. Globally, most of the maternal deaths occur during antenatal, natal, delivery and postnatal periods [2,3]. Maternal mortality is higher among women living in rural areas and poorer communities [1].

The high number of maternal deaths in some areas of the world reflects inequities in access to health services, and highlights the gap between the rich and the poor. Almost all maternal deaths (99%) occur in developing countries. More than half of these deaths occur in sub-Saharan Africa and almost one-third occur in South Asia. More than half of maternal deaths occur in fragile and humanitarian settings [1]. The major complications that account for nearly 75% of all maternal deaths are severe bleeding (mostly bleeding after childbirth), infections (usually after childbirth), high blood pressure during pregnancy (pre-eclampsia and eclampsia), complications from delivery and unsafe abortion [4]. All of them are preventable with proper healthcare delivery system.

Another very important aspect is newborn care. It was estimated that approximately 2.7 million newborn babies died in 2015 [5], and an additional 2.6 million were stillborn [6]. It is particularly important that all births are attended by skilled health professionals, as timely management and treatment can make the difference between life and death for both the mother and the baby.

Antenatal care is the most effective strategy for maternal and newborn health. Approximately three-fourth of India’s population lives in rural area where access to qualified skilled physician is not possible. Hence, nurses can help meet this commitment provided they are skilled, supported and mandate [7].

In this review, we discuss the current maternal and child health indicators in Madhya Pradesh, outline organizational structure of rural public health delivery system and the factors that affect delivery of maternal and newborn care in the rural population.

Maternal health throughout India and in Madhya Pradesh

As per census of India 2011, maternal mortality rate in Madhya Pradesh is 29, which is very high in comparison to national average of 11.7 [8].
Maternal mortality ratio of India is 167 [8] and that of Madhya Pradesh is 310 [12]. Within Madhya Pradesh, it is highest in Shahdol division (435), followed by Sagar (397), Rewa (336), Chambal (311), Jabalpur (310), and lowest in Gwalior division (262) [8].

Child health throughout India and in Madhya Pradesh

Infant mortality rate in India is 42, and in Madhya Pradesh is 67 [20]. There is a wide gap of infant mortality between urban and rural areas of Madhya Pradesh. It is 50 in urban and 72 in rural areas [20]. Infant mortality rate in rural India is 46 and in urban India is 28 [20]. Neonatal health indicators are dismal in Madhya Pradesh. Overall neonatal mortality rate in Madhya Pradesh is 44, with wide difference among rural and urban areas. In rural areas, neonatal mortality rate is 49, while in urban areas, it is 32 [20]. Neonatal mortality rate in India is 29, in rural it is 33 and in urban it is 16 [20]. Initial one-month survival of a newborn is very crucial. Post neonatal mortality rate is 22 in Madhya Pradesh. In rural areas it is 24 and in urban areas it is 18 [8]. Post neonatal mortality rate in India is 12, in rural India it is 14 and in urban India it is 12 [8].

Structure and Methodology

After determining the main challenges for delivering proper maternal and child healthcare in rural and tribal areas, we have reviewed the evidence from relevant literature to determine the different social, economic, and political sources of these challenges.

Our attempt to comprehensively review the factors affecting delivery of proper maternal and child healthcare in rural and tribal areas will be useful to identify potential solutions to these problems.

Rural public healthcare system of India

Public healthcare is based on a three-tier system across India based on the population norms. Almost 75% of the rural population is dependent on nurses for healthcare delivery in rural India.

Three tier system of rural India

Sub centre (SC): It is the first point of contact between primary healthcare and community. Sub centres are responsible for effective communication and maternal and child health services, family welfare, nutrition, immunization, diarrhea control and control of communicable diseases programmes.

There are a total of 153655 sub centers in India. In Madhya Pradesh, 9192 sub centers are functioning. Status of facilities and infrastructure is unsatisfactory in these sub centres. 63.7% of ANM are living in sub center campus quarters. 31.8% of sub centers do not have regular water supply. 20.5% sub centers are running without electricity supply and 18% of sub centers do not have all weather motorable approach road. Shortfall in health infrastructure at sub center level is 26% in Madhya Pradesh [9].

Approximately 14276874 tribals in Madhya Pradesh require 4758 sub centers. However, there are only 2952 functioning sub centers, and there is a shortfall of 1806 sub centers in tribal areas of Madhya Pradesh [9].

Primary health centre: It is first contact point between the community and the medical officer. It provides preventive, promotive and curative health services. It is a referral unit for six sub centers, with 4-6 beds manned by a medical officer in charge, 14 subordinate paramedical staff, one nurse mid-wife (staff nurse) and two additional contractual staff nurses.

In Madhya Pradesh, a total of 1171 primary health centers are functioning. Infrastructure at these primary health centers are inadequate in Madhya Pradesh. About 97.4% of primary health centers do not have labour room, 37% primary centers work without an OT, 9.6% primary health centers do not have water supply, 6.7% of primary health centers do not have all-weather motorable approach road and about 98.4% of primary health centers have four bed capacity. Shortfall in health infrastructure at primary health center level is 41% in Madhya Pradesh [7].

In the tribal areas of Madhya Pradesh, a total of 713 primary health centers are required, but only 332 are present with a shortfall of 381 primary health centers [9].

Community health centre: There are a total of 5396 functioning community health centers across India. In Madhya Pradesh, the number of community health centers is 334. 100% community health centers have a labour room. 313 community health centers have an OT. There are 62 stable newborn care units and 323 newborn care corners in the community health centres of Madhya Pradesh. Shortfall in health infrastructure at
the community health centre level is 33% in Madhya Pradesh [9].

In the tribal areas of Madhya Pradesh, 178 community health centres are needed, but only 104 are present, with a shortfall of 74 community health centres [9].

---

**Inadequate infrastructure:** There is a gross deficiency of Primary health center (PHC), Community health centers (CHC) and Sub centers (SC) in many parts of India [11]. Gross deficiency varies from 20-45% in various states. Another major problem faced by healthcare providers is basic amenities like safe water supply and electricity, which are lacking in numerous peripheral centers.

**Deficient manpower:** The second major challenge that affects health care delivery is deficient manpower. Deficiency of manpower varies from region to region, rural and hilly areas, etc. There is unwillingness among doctors and other health personnel to serve in rural areas. The deficiency of specialists in rural healthcare is more than 90% in Chhattisgarh, Jharkhand and Rajasthan, while it was nearly 86% in Uttarakhand and Odisha. Similar deficiencies in manpower and infrastructures were observed in African countries [12].

**Status of human resources in Madhya Pradesh**

There is gross deficiency of human resources in rural and tribal areas. Table 1 shows that the deficiency of doctors and specialists is almost 40-75% of the sanctioned posts in these areas.

**Table 1: Status of human resources in rural health care in Madhya Pradesh [9]**

</tbody>
</table>
Patient load: Any government healthcare setup in India has heavy patient workload. Some of the doctors even consult more than 200 patients within 3-4 hours in the outpatient department. It is impossible to provide optimal care to a patient in less than a minute. Another problem is absenteeism from duties. In various regions of India, it was found that almost 30-55% of doctors and paramedical staff remained absent from duties.  

Poor quality of services: Public sector hospitals especially in rural areas very commonly offer poor quality of services due to the above-mentioned deficiencies. Although social, economic and cultural factors affect ANC, other factors are also responsible for poor delivery of services. Shortage of healthcare providers is also responsible. Other barriers include commodities/logistics (drugs and non-drug consumables and medical equipment), skilled human resources, appropriate technology and the capacity to handle maternity cases. Availability of accessible emergency obstetric services (such as parenteral oxytocics, antibiotics and anticonvulsants, assisted deliveries, manual extraction of the placenta, blood transfusions, etc) are mandatory for the continuum of quality maternity healthcare. 

Doctor-nurse hierarchy: Nearly three-fourth of the participants stated that many doctors at primary health centers did not follow evidence-based guidelines and argued with the nurses who followed these guidelines. Many participants reported that doctors were rude and disrespectful towards nurses. 

Corruption: About half of the participants in few studies disclosed multiple types of corruption practices affecting patient care. Several reported that nurses collect money directly from patients for conducting deliveries. Some participants reported that even ASHA workers received financial incentives to refer patients to nursing clinics than referring to the nearest district hospital. 

Preference for male newborn baby: Many participants reported that in Bihar people prefer male newborn baby and hence they neglect female newborn baby, threaten nurses and pressurize them to not resuscitate female newborns. 

Other barriers: Administrative support to manage supplies and equipments could be a major factor for improving care. Nursing supervision and feedback can improve care at primary health centers as is evident by mobile nurse mentor training programme. 

Social and political issues related to delivery of healthcare in rural India: The Medical Council of India (MCI) has observed that Indian medical graduates are neither competent nor willing to work in rural healthcare delivery system. Vision document of 2015 by MCI also observed that poor communication skills and attitudes are responsible for poor quality of services at hospital. The new curriculum of MCI is being implemented from August 2019. This will incorporate foundation course. This may help to obtain better medical graduates after a few years who will have better skills, which will improve the quality of services in rural healthcare delivery system. 

Political will is a critical factor responsible for healthcare delivery. The government refuses to offer even a modest increase in the budget for rural healthcare which demonstrates a lack of political commitment to the welfare of the general population. 

What are the solutions for these challenges? 

Preventive aspect is critical for health for all. If we can provide safe water supply, sanitation, food and education to the entire population, it will improve health outcomes. If the patient workload will decrease, then the quality of care will definitely improve. 

Strengthening of infrastructure and human resources: India has one of the largest peripheral health delivery systems in the world. Paramedical personnel and nurses are the key healthcare providers in rural India. Improving supplies and additional incentives may be motivating factors for peripheral health workers. 

Institutional policy review: Monthly review and feedback of all stakeholders are important. Since each setting has its own challenges, a common policy will not solve these problems and individual solutions are needed at the local level. 

There is an urgent need to provide better living and working conditions in peripheral areas. Accommodations should be provided with better infrastructures to encourage doctors and nurses to serve rural areas. 

Training a large number of paramedical personnel or reviving licentiate courses are important to fill the gap in the availability of primary level healthcare. 

All the vacancies of doctors and paramedical staff should be filled with positive administrative efforts.
The local communities, peoples organizations, and representative bodies should be involved in ‘the planning, organization, operation and control of primary healthcare, making fullest use of local, national and other available resources’ in the true spirit of the ‘primary health care’ as enunciated in the Alma Ata Declaration of 1977.\cite{21}

**Conclusion**

This review identified many evidences for barriers and facilitators of maternal care. Health system strengthening coupled with strong political will and community mobilization are some of the strategies needed to improve health system. Community awareness is also important for antenatal, natal, postnatal and neonatal care. Involvement of local NGOs, leaders, government and panchayat will improve the social issues.

Role of Color Doppler in Fetal Growth Restriction & Its Fetal Outcome: A Prospective Study

Tanu Bhati¹, Rajni Agarwal², R.C Purohit², Subhash Chand Sylonia³, Kalpana Verma⁴, Sukla Debbarma⁵

¹P.G Student, ²Professor, Obstetrics & Gynaecology, ³Professor, Radio-Diagnosis, ⁴Asso. Professor; ⁵Senior Resident, Obstetrics & Gynaecology, Saraswathi Medical College, Anwarpur, Hapur, U.P

Abstract

Objectives: To study the role of Color Doppler in FGR and fetal outcomes.

Methodology: The study was carried out on 100 antenatal females in their third trimester with IUGR by using color Doppler of various arteries. These patients were followed up & the perinatal outcomes were recorded.

Results: Out of 100 clinically suspected FGR cases, 41 were healthy baby, 4 were intrauterine deaths, 3 were neonatal deaths, 52 were admitted in NICU in which 25 cases were in respiratory distress & 3 cases were on mechanical ventilator. Out of 100 cases, 64 were spontaneous vaginal delivered, 14 were delivered by induction & 22 cases delivered by caesarean section.

Conclusion: Abnormal Doppler waveform changes indicate adverse perinatal outcome of pregnancies with FGR. Doppler study helps to reduce perinatal mortality & morbidity by timely & appropriate interventions.

Keywords: IUGR, Ductus Venosus, Color Doppler, Constitutionally small, Umbilical artery (UA), Middle Cerebral artery (MCA).

Introduction

FGR is defined as a fetal growth less than 10th percentile for the gestational age. The IUGR may be symmetric & asymmetric¹. About 70 percent of fetuses with a birth weight below the 10th centile for gestational age are constitutionally small & remaining 30 percent, the cause of IUGR is pathological².

IUGR is an indicator of the increased risk of perinatal & long term mortality & morbidity. IUGR is the consequence of abnormal condition. Factors like placental insufficiency, maternal hypertension, cardiovascular disease, diabetes, infection, low socioeconomic status, previous history & preeclampsia are some of the known risk factors for IUGR³.

The 1st application of Doppler velocimetry in obstetricians was reported by Fitzgerald & Drumm & McCallum et al. The significance of Doppler ultrasound in evaluating pregnancies that have the risk for FGR has become indispensable⁴, ⁵.

There are two major categories of FGR: Symmetrical & asymmetrical. Asymmetrical FGR is more common(70%). In asymmetrical FGR, there is restriction of weight followed by length. The head continues to grow at normal or near-normal rates(head sparing). Symmetrical FGR is less common (20-30%). It is commonly known as global growth restriction & indicates that the fetus has developed slowly throughout the duration of the pregnancy & was thus affected from a very early stage.

The umbilical artery (UA) Doppler ultrasound in the second trimester in high risk pregnancies could be used to predict the development of IUGR later in the pregnancy. UA Doppler can be used in the management & follow up of the fetuses with IUGR. The pattern of changes in the UA Doppler velocimetry can further
predict the fetal outcome.

Ductus venosus (DV) Doppler is the strongest single Doppler parameter that predicts the short-term risk of fetal death in early onset FGR & it has been shown to become abnormal only in advanced stages of fetal compromise & shown to have good correlation with cord acidemia & perinatal mortality.

**Materials & Method**

This is a prospective observational study on 100 patients which was conducted in department of Obstetrics & Gynaecology of Saraswathi Institute Of Medical Sciences, Pilkhuwa, Hapur.

Inclusion Criteria-
- Gestational age beyond 28 weeks or more.
- Singleton pregnancies with fundal height less than period of gestation by 4 weeks or more.
- Excellent dates & good dates.

Exclusion Criteria-
- Congenital malformation of fetus.
- Oligohydramnios.
- Poor dates.
- Multifetal pregnancies.
- Informed consent was obtained from the women who underwent color Doppler study. Studies of various arteries was performed using Color Doppler ultrasound with 3.5MHz curvilinear probe. To use Doppler velocimetry, patients were first scanned in the routine fashion using B-mode. Then, the vessels of interest were confirmed by Color Doppler. The Doppler signal was then obtained by placing the Doppler gate directly over the vessel of interest.

After delivery birth weight (immediately within six hours) was measured on an electronic machine, APGAR score after one & five minutes of birth. Baby anthropometry i.e. length, head circumference, abdominal circumference, upper segment & lower segment ratio were measured.

In our study, out of 100 cases of high risk, abnormal Uterine artery indices were seen in 44 cases among which Uterine artery diastolic notch with increased Doppler indices was seen in 8 cases, while the rest(36) showed only abnormal Uterine artery PI with no diastolic notching.

All the 8 patients showing early diastolic notching resulted in poor outcomes, suggesting a high degree of positive predictive value of persistence of diastolic notching in late pregnancy for predicting unfavourable outcome. The findings in the present study suggest that the increased Doppler indices in Uterine artery with associated diastolic notch & persistence of diastolic
notch after 26 weeks constitute a warning sign & indicate the requirement of timely & intense fetal surveillance & intervention.

Discussion

Doppler imaging is of value for monitoring the pregnancy because it provides indirect evidence of fetal compromise. Numerous studies support the value of Doppler waveform indexes of the Umbilical artery & perhaps of fetal cerebral arteries for assessing the prognosis of foetuses with IUGR. In particular, frequencies of Caesarean section for fetal distress, admission to neonatal intensive care unit & perinatal mortality are all twofold to fourfold higher in growth retarded foetuses with abnormal Umbilical artery waveform than in those with normal waveform.

In our group of patients, 52 patients were primipara associated with IUGR. In our study, in the high risk group with abnormal Umbilical artery Doppler indices (52 cases), 38 cases had reduced end diastolic velocity in Umbilical artery flow, out of whom 29 cases had abnormal fetal outcome. The sensitivity of Middle Cerebral Artery indices in identifying adverse fetal outcome in the present study was sensitivity of 5.68%
with a specificity of 66.6%, a positive predictive value of 55.5% & a negative predictive value of 8.79%.

**Conclusion**

The findings in the present study thus suggest that Doppler flowmetry is a useful method for the prediction of IUGR in high risk pregnancies. Abnormal Doppler waveform changes indicate adverse perinatal outcome of pregnancies with FGR. Doppler study helps to reduce perinatal mortality & morbidity by timely & appropriate interventions.

Numerous studies support the value of Doppler waveform indexes of Umbilical artery & perhaps of fetal Cerebral arteries for assessing the prognosis of foetuses with IUGR. Elevation of the Umbilical artery Systolic/Diastolic ratio or of the pulsatility index is a moderately accurate predictor of adverse outcome in growth-retarded foetuses. In particular, the frequencies of Caesarean section for fetal distress, admission to neonatal intensive care unit & perinatal mortality are all twofold to fourfold higher in growth retarded foetuses with abnormal Umbilical artery waveforms than in those with normal waveforms.

Assessment of Sleep Hygiene among School going Adolescents in Chennai

Srihari R¹, Dilara K², Latha R³, Manikandan S⁴
¹Demonstrator, Department of Physiology, ²Professor, Department of Physiology, ³Professor, Department of Paediatrics, Sri Ramachandra Medical College & RI, Chennai, ⁴Associate Professor, Department of Physiology, Tagore Medical College & Hospital, Chennai

Abstract

Aim:- Adolescence is a transition phase and good sleep is required for better academic performance and good health. Recent lifestyle modifications have increased the prevalence of sleep disorders among adolescents. Hence, current study aims to assess sleep hygiene among school going adolescents in Chennai.

Methods:- The study was conducted among 132 school going adolescents in Chennai between the age group 15-19yrs. Sleep habits were assessed using general questionnaire and sleep hygiene was assessed using Epworth Sleepiness Scale for Children and Adolescents (ESS-CHAD).

Results:- The overall prevalence of excessive daytime sleepiness was found to be 23.5%. 80.2% were found to sleep less than the required duration and 74.2% reported of sleepiness during morning sessions.

Conclusion:- There is a lack of sleep hygiene among school going adolescents in Chennai. Adolescents should be taught about the importance and benefits of good nocturnal sleep for a healthy future.

Keywords:- Adolescents, Sleep hygiene, Excessive Daytime Sleepiness (EDS)

Introduction

Adolescence is a transition period between childhood and adulthood, and has been identified as high period of storm and stress during an individual’s life. WHO has defined Adolescence as ‘period between 10-19yrs of age in an individual’s life’¹. Adolescence has been divided in to early (10-14yrs) middle (15-17yrs) and late adolescence (17-19yrs). Adolescence is associated with increased and varied Physical, mental and social changes¹.

Sleep is a Physiological process which is required for good physical, mental and social well being². Sleep requirement varies across ages and adolescents require a nocturnal sleep of 9.2 hrs per day³. A good sleep is required for good health and compromise in sleep quantity or quality increases risk of cardiovascular disorders and other metabolic disorders. In recent days due to lifestyle modifications there is an increased prevalence of sleep disturbances among general population¹. As adolescents are facing enormous pressure by means of academics and various internal and external factors prevalence of sleep disturbances among adolescents is also in rise. Also sleep is required for memory consolidation which is indispensable especially for adolescents for their better academic performance⁴. Adolescence is the phase where an individual will be in the peak of their school education and any disturbance in sleep would affect their health and academic performance, which would ultimately affect their higher education and career. Hence, assessment of sleep hygiene among adolescents becomes need of the hour and the current study proposes to assess the sleep hygiene among school going adolescents in Chennai.
Material and Method

Study participants:-

The current study is a cross sectional study and was initiated after obtaining clearance from the institutional ethics committee. The school was chosen using computer randomization software from the school directory list of the Urban Corporation. Participants were healthy male (84) and female (48) school going adolescents between the age group 15-19yrs (n-132). Participants with sleep disorders, metabolic disorders or any neuro-psychiatric disorders were excluded and those who are healthy and gave consent were included.

Study tools:-

General details and sleep habits of the participants were collected using questionnaire and sleep hygiene of the participants was assessed used Epworth Sleepiness Scale for Children and Adolescents (ESS-CHAD) after obtaining permission from the questionnaire authors. Epworth Sleepiness scale assesses sleep hygiene through Excessive Daytime Sleepiness (EDS) of an individual. Excessive daytime sleepiness is a condition where an ‘individual would be asleep when expected to be awake’. EDS is a symptom of compromised sleep hygiene, Hence, assessment of EDS would reveal sleep hygiene of an individual.

ESS consists of 8 different situations and the adolescent score his/her chances of dozing from a scale of 0-3 where 0 indicates no chances of dozing, 1 indicates slight chances of dozing, 2 indicates moderate chances of dozing and 3 indicates severe chances of dozing respectively. A total score of > 10 indicates EDS in an individual - thus compromised sleep hygiene.

Study procedure:-

The study procedure was explained and written permission was obtained from the school authorities. Informed consent form was distributed to the students two days before the day of data collection and informed consent was obtained from the parents and assent was obtained from the participants. General questionnaire and ESS-CHAD was explained to the participants and they were asked to rate their chances of dozing from a scale of 0-3.

Statistical Analysis:-

The data were tabulated and analyzed using SPSS software version 21.0. Descriptive statistics was calculated for the background variables. Categorical variables were described as percentage.

Findings

The current study was conducted 136 participants and due to incomplete responses 4 were excluded and responses of 132 participants were considered for analysis. Among 132 participants mean age was found to be 15.56 ± 0.75. Gender wise 63.6% were males and 36.4% were females. Highest percentage of study population (38.6%) belongs to the board exam appearing class. (Table 1)

 Indicates highest prevalence of dozing
Discussion

The current study assessed the sleep hygiene of school going adolescents in Chennai. Majority of the adolescents of the study belong to the board exam appearing class and their average sleep duration was lesser than the required sleep duration. Due to reduction in nocturnal sleep duration most of the participants have reported of sleepiness in the morning sessions thus showing a compromise in sleep hygiene.

Excessive Daytime Sleepiness (EDS) among the adolescents was found to be 23.5%, which is lesser than a study reported from south India. Studies have also shown that sleep quality is diminishing among adolescents universally and even more diminishing in adolescents of developing countries. In current study sleep duration among study participants was found to be lesser than the required duration. School going adolescents are exposed to extended classes, academic loads and achievement pressure along with age related psycho-physiological pressures. These physical and mental factors could disturb the sleep quality and quantity, making prone for EDS.

Dozing was not much reported by the participants for most of the questions, but mild dozing was reported during reading and travelling as a passenger in car. Moderate dozing pattern was reported while lying in the afternoon. Severe dozing pattern was not reported for any of the questions.

EDS reflects poor sleep hygiene and is associated with negative health. In EDS there will be increased level of daytime sympathetic activity thus increasing the level of inflammatory mediators such as TNF α and IL-6. Chronic elevation of these inflammatory mediators makes the adolescents more prone for metabolic disorders such as Type II Diabetes Mellitus, hypertension, early coronary artery disease. Also poor sleep hygiene is associated with increased stress, poor academic performance, absenteeism, irritability, cognitive deficit and decreased quality of interpersonal relationships. Thus compromised sleep hygiene impairs physical, mental and social well being of adolescents.

Conclusion

The current study shows that sleep duration is less and EDS prevalence is high among school going adolescents in Chennai. Both these factors are associated with poor sleep hygiene. Hence, in order to improve sleep hygiene of adolescents, importance and benefits of good sleep should be taught to them for better academic performance and overall good health.

Study of Hernias of Anterior Abdominal Wall of Andrapradesh

Rajesh Jasti1, KVR Ram Mohan2

1Assistent Professor, Department of General Surgery Mamtha Academy of Medical Sciences Bachupally Hyderabad (Telangana State), 2Assistant Professor, Department of General Surgery GSL Medical College, Rajahmundry

Abstract

93 adult patients of hernias (60 males and 33 females) aged between 30 to 70 years patients were studied. 27(29%) had umbilical 17(18.2%) had para – umbilical 11(11.8%) had epigastrium 38(40.8%) had inguinal hernia. The base line manifestation of hernia were 15(16%) were alcoholic 11(11.8%) had cough due to smoking 17(18.2%) had diabetes mellitus. 12(12.9%) had coronary disease, 7(7.5%) were tobacco chewers, 10(10.7%) were obese, 9(96%) had constipation, 12(12.9%) had constipation, clinical manifestations were 25(26.8%) had welling, 19(20.4%) had pain, 23(24.7%) had abdominal distention, 9(9.6%) had irreducible hernia, 4(43%) had vomiting, 6(6.4%) had strangulation, 7(7.5%) had intestine obstruction. Post operative infections were 11(11.8%) wound infections in anatomical group 7(7.5%) wound infections in mesh repair 9(9.6%) had seroma in anatomical repair, 5(5.3%) had seroma in mesh repair, recurrence of different hernias in anatomical repair a. 2(2.1%) in paraumbilical, 4(4.3%) umbilical, 1(1%) epigastrium 5(5.3%) in inguinal. In the mesh repair, b) 1(1%) paraumbilical, 2(2%) umbilical, 3(3.2%) inguinal. This study of different hernias of anterior abdominal wall with various clinical manifestation post surgical infections, recurrence of hernia will be quite useful to surgeons to treat the different hernias meticulously and prevent morbidity and mortality because strangulated and obstructive hernia need emergency treatment to avoid mortality of the patients.

Keywords- DM = Diabetic Mellitus HTN= Hypertension. Mesh repair seroma.

Introduction

Hernias of the anterior abdominal wall are very common surgical condition affecting all ages and both sexes. It is an abnormal protrusion of peritoneal lined sac through the muscular covering of the abdomen. Most common symptoms of hernia include swelling, heavy feeling of abdomen, and discomfort in the abdomen regions, especially when coughing. Lifting, or bending over. However, symptoms may not appear in some people and they will only realize that they have hernia during medical check-up. The hernia can also be characterized as a rupture in smooth tissue through which an organ protrudes or pushes through.

Material and Method

93 adult patients (60 males and 33 females) aged between 30 to 70 years regularly visiting General surgery department GSL Medical college hospital Rajahmundry-533296. (Andrapradesh) selected for study. Radiological (USG and CTScan) was done to confirm the hernia and blood investigation was done to study the co-morbidity of the patients. Detail history of each patients was
recorded small defects of hernia were sutured and large and wide were closed by mesh repair

The herniated patients with HIV, malignancy, gangrenous hernia pregnant females, were excluded from the study. The duration of the study was about four years. (2014 to 2018)

Table-2 Age wise classification of hernia 19(20.4%) were aged between 30-40 year 25(26.8%) were between 41-50, 39(41.9%) were between 51-60 years

Table-3 Base line manifestation of hernia 15(16.1%) were alcoholic, 11(11.8%) had cough due to smoking, 17(18.2%) were diabetes mellitus (type –II DM) 12(12.9%) had coronary diseases. 7(7.5%) were Tobacco – chewers 10(10.7%) were obese 9(9.6%) had constipation, 12(12.9%) had Hyper tension (HTN)

Table-4 clinical manifestation of anterior abdominal wall – 25(26.8%) had swelling, 19(20.4%) had severe
The clinical manifestations were 25(26.8%) had swelling 19(20.4%) had pain, 23(24.7%) had abdominal distention, 9(9.6%) had irreducible hernia 4(4.3%) had vomiting, 6(6.4%) had strangulation 7(7.5%) had intestinal obstruction (Table-4) post operative infections were 11(11.8%) wound infections in anatomical group, 7(7.5%) wound infections in mesh repair, 9(9.6%) seroma in anatomical group, 5(5.3%) seroma mesh repair (Table-5) recurrence of different hernia in anatomical repair 2(2%), paraumbilical 4(4.3%) umbilical 1(1%) epigastrium 5(5.3%) Inguinal In mesh repair 1(1%) was para-umbilical 2(2.1%) umbilical, 3(3.2%) Inguinal recurrence was noted (Table-6) These obtained values were more or less in agreement with previous studies. (5)(6)(7)

The associated risk factors can be weakness of abdominal wall which contributes to hernia and increased abdominal pressure which can cause hernia contributing factors can be anatomical, congenital, connected with the sex, age weight gain, injury, post – operative scar, etc Causative , factors can be obstructive uropathy, ascitis, cirrhosis of liver, portal HTN etc. DM, obesity, alcoholism, smoking were main causative factors for post surgical infections and recurrence of hernia(10) moreover deposition of adipose tissue differs between genders and perhaps this contributes to gender differences in hernia formation therefore obesity, physical strain, pregnancy are important etiological factors in the development of abdominal hernia

### Summary and Conclusion

The present study of prevalence of abdominal hernia in Andrapradesh population will be quite useful for ideal approach and treat. Early diagnosis easily accessible health facilities and health education are important to prevent complication. New modality of treatment should be adopted as the standard choice of care to prevent recurrence but this study demands further patho – physiological, genetic, nutritional, neuro- muscular study to throw more light upon herniation because little is known about the pathophysiology of intrabdominal pressure in adaptation of erect posture

This research paper was approved by ethical committee of GSL medical college and hospital Rajahmundry – 533296 (Andrapradesh)

Alzheimer’s Disease: Causes, Treatment Methods and Current Perceptions

Naveen Prem Kumar Ravuri¹, S. Parthasarathi²

¹B. Pharm Student, Department of Pharmaceutical Engineering and Technology, Indian Institute of Technology (Banaras Hindu University), Varanashi, Uttar Pradesh, India, ²Research Mentor, Accendere Knowledge Management Services, CL Educate Ltd., New Delhi

Abstract
This report provides latest information and different ways and methods for diagnosing and treating Alzheimer’s disease (AD). It also includes history, prevalence and incidence rates, and therapeutic drugs for AD. In therapeutic research, many drugs, namely tramiprosate, tarenflurbil, bapineuzimab, donepezil and memontine etc are developed to prevent the formation of plaques and neurofibrillary tangles which are the major causes for Alzheimer’s disease. Many organizations and committees are still providing funds and promoting research on diagnosis and treatment methods for AD. The prevalence rate is increasing exponentially against age and it is increasing rapidly after 65 years of age, whereas there are 24.2 million people suffering with AD and in 4.2 million persons the disease is getting incident every year.

Keywords: Alzheimer’s disease, Treatment, Biomarkers, Neuropathology, Epidemiology.

Introduction
In the year 1901, on Nov-25, a woman by name Auguste was admitted to a hospital in Frankfurt and examined by a German psychiatrist Alois Alzheimer. She had symptoms like reduced compression and memory, aphasia, disorientation, unpredictable behavior, paranoia, auditory hallucinations and pronounced psychosocial impairment. Alzheimer continued taking her case until her death on April 8, 1906. Later on, he started studying about neuropathological disorders. In 1906, Nov-4, Alzheimer described about patient Auguste, her symptoms, and behavioral changes during the course of the disease. At necropsy, there were plaques and neurofibrillary tangles. Later on, his name Alzheimer came into usage which indicates the largest cause of primary dementia.

Auguste and her case history file:
The following is taken from Alzheimer’s case history file from Auguste D.

“She is quite cooperative during her physical examination process. But once during this physical examination process she asked about a child who was called by someone else. she know that it was Mrs.Twin. Later she screamed, became nervous and at the end she repeatedly said I will not be cut. I do not cut myself”. After her death, Alzheimer examined her brain and found clumps of proteins and tangles in neuronal cells. Alzheimer reported his research findings in a lecture entitled “A characteristic disease of the cerebral cortex”; there after researchers started focusing on this disease.

Epidemiology
In the year 2005, Alzheimer Disease international commissioned an international group of experts to estimate the prevalence and incidence rate of dementia which leads to Alzheimer’s disease. According to the report, nearly 24.2 million people were suffering from dementia and 4.6 million new cases arising every year. The prevalence rate is increasing exponentially against age and it is highly increasing after 65 years (Fig. 1).
Cause of Alzheimer disease:

Role of genes

Role of genes on AD was first reported by Glenner and Wong, 1984 by predicting AD gene on chromosome 21. It has been reported that nearly 90 % of the AD patients were sporadic. AD is primarily caused by the overproduction of amyloid-β (Aβ) peptides in the brain, owing to the mutations in either the APP gene or genes encoding presenilin 1 (PSEN1) or presenilin 2 (PSEN2). Presenilin is the core proteins in the gamma secretase complex, which is responsible for the cleavage and release of Aβ. Based on the age of onset, AD can be classified into two types: early-onset AD (EOAD) and later-onset AD (LOAD). For late-onset Alzheimer’s disease, a polymorphism for apolipoprotein E (ApoE) on chromosome 19 has been found to affect the risk of Alzheimer’s disease. ApoE gene code helps in carrying the cholesterol in the bloodstream. ApoE comes in different forms, commonly referred as alleles, most frequently occurring alleles are: apoE2, apoE3 and apoE4. One or more copies of apoE4 increases the risk of getting AD, because of the efficient binding process of apoE4 which enhances the deposition of the Aβ peptide.

Retromer deficiency

Retromer is a multi-subunit complex associated with the cytosolic face of endosomes and mediates retrograde transport of transmembrane proteins from endosomes to the trans-Golgi network. Retromer deficiency causes hippocampal dysfunction, neurodegeneration and accumulation of beta-amyloid leading to AD. The memory which is dependent on hippocampus get damaged in LOAD (Late Onset of AD) is due to accumulation of soluble and insoluble beta-amyloid. Soluble beta-amyloid is neurotoxic. After various studies on mice, Muhammad, Flores was observed that retromer deficiency express human wild-type amyloid precursor protein (APP) and human-site APP-cleaving enzyme (BACE) which leads to accumulation of beta-amyloid and results in AD.

Tau’s hypothesis

Tau is protein. The tau’s hypothesis proposes that the tau protein abnormalities initiate the disease cascade. In this model, hyperphosphorylated tau begins to pair with other threads of tau. Eventually, they form neurofibrillary tangles inside nerve cell bodies and leads to microtubules disintegration, collapse the structure of cell’s cytoskeleton and neuron transport system. This may result first in malfunctions in biochemical communication between neurons and later in the death of the cells.

Amyloid cascade hypothesis

Beta-amyloid is a fragment of a larger protein “amyloid precursor protein-APP”. In 1991, the amyloid hypothesis postulated that extracellular amyloid β-peptide (Aβ) deposits (PLAQUES) are the fundamental cause of the disease. These plaques are called SENILE PLAQUES. Senile plaques are more complex; they consist of extracellular deposits of amyloid material and are associated with swollen, distorted neuronal processes called dystrophic neuritis finally leading to Alzheimer’s disease. Hardy and Selkoe reported that Aβ accumulation is the driving force of Alzheimer’s disease pathogenesis. The rest of the disease process like formation of neurofibrillary tangles is mainly attributed through the imbalance between Aβ production and Aβ clearance. According to this hypothesis, aggregation of beta-amyloid can disturb cell-to-cell communications and activate the immune cells, which lead to inflammation in brain cells. Numerous researchers inspired by Amyloid cascade hypothesis and brought clinical trials to test the medication to treat/reduce the course of Alzheimer’s disease, and to stop the formation of beta-amyloid plaques. The clinical trials on patients successfully removed the patient’s plaques, however, it didn’t show any clinical improvements beyond that. Hence it created the debate among researchers, whether the amyloid cascade hypothesis may be wrong (though it correlate the plaques but not with AD).
**Cholinergic hypothesis**

Cholinergic hypothesis proposed that degeneration of cholinergic neurons in the basal forebrain and the associated loss of cholinergic neurotransmission in the cerebral cortex and other areas contributed significantly to the deterioration in cognitive function seen in patients with Alzheimer’s disease.11

**Treatment methods for Alzheimer’s disease:**

U.S Food and Drug Administration (FDA) approved six drugs for treating Alzheimer’s disease temporarily, which can improve symptoms by increasing the number of neurotransmitters in the brain. These drugs show different impacts on different persons and are registered in clinicaltrials.gov which stands for National Institute of Health registry of publicly and privately funded clinical studies. It is well known that 244 drugs were tested through clinical trials during 2002-2012. Based on the clinical trial results, only one of the 244 drugs is successfully received FDA approval. The difficulty in the developing treatment for AD is high cost involved in drug development and requires more time to conclude the therapeutic effect of the drug. There are two approaches for treating AD: (i) beta-amyloid approach, and (ii) therapeutic treatment.

**Beta-amyloid**

**Decreasing beta-amyloid production:** The experimental drugs prevent those enzymes or proteins that help the formation of plaques from APP. Many scientists worked to identify those proteins. Of all the proteins beta secretase and gamma secretase were the primary proteins involved in this process. By inhibiting these proteins further formation of plaques can be prevented. Secretase inhibitors are that block the clipping action of secretases. Another class of drugs reduces beta-amyloid by changing the way secretases work or encouraging secretases, such as alpha-secretase, to cut APP into fragments other than beta-amyloid. Zhu, Wu12 demonstrated the Berberine (alkaloidal component of *Rhizoma coptidis*) could reduce the production of beta-amyloid by inhibiting the expression of BACE via activation of the ERK1/2 pathway.

**Preventing beta-amyloid aggregation:** As AD is due to the presence of amyloid plaques, scientists have explored drugs that can prevent beta-amyloid aggregation which is the most important way to treat Alzheimer’s Disease. Some studies suggest that the toxic effects of beta-amyloid occur before the formation of plaques and oligomers, so researchers are looking for ways to prevent the initial interactions between beta-amyloid and nerve cells that lead to toxicity.

**Increasing beta-amyloid removal:** Beta-amyloid is generated from APP by sequential cleavages by BACE-1 and the gamma-secretase complex. Research has been focused on developing drug molecule which could reduce the generation of beta-amyloid and its cellular toxicity.13 Methods to increase removal of beta-amyloid from the brain are,

- Mobilizing the immune system to produce antibodies to attack beta-amyloid,
- Administering laboratory-produced antibodies to beta-amyloid and
- Administering natural agents with anti-amyloid effects.

**Immune system-generated antibodies to beta-amyloid:** Experimental agents in this category are called “active vaccines.” These vaccines incorporate a beta-amyloid fragment that is attached to a carrier protein. When injected, the body should produce antibodies to attack beta-amyloid and reduce levels of beta-amyloid in the brain.

**Laboratory-produced antibodies to beta-amyloid:** Experimental drugs in this category are called “passive vaccines.” These vaccines may be safer because they can be given in predetermined doses and do not stay in the body after dosing ends.

**Natural agents with anti-amyloid effects:** Intravenous immunoglobulin (IVIg) contains a broad array of natural antibodies that may reduce beta-amyloid levels. IVIg is obtained from the plasma of human blood donors.

Therapeutic treatment for Alzheimer’s disease

In the last two decades, pharmaceutical industries were primarily focused on the developed of the effective AD drugs. Researchers followed different strategies and hypothesis to design the drug and met multiple failures of drug molecules in the clinical trials.14,15 Several medications are approved by the U.S. Food and Drug Administration (FDA) to treat the symptoms of AD
including Donepezil (Aricept), rivastigmine (Exelon), and galantamine (Razadyne) to treat mild to moderate Alzheimer’s; Donepezil, memantine (Namenda), and Namzaric (combination of memantine and donepezil) to treat moderate to severe Alzheimer’s. These drugs work by regulating neurotransmitters, the brain chemicals that transmit messages between neurons. These drugs may help the patient in maintaining their thinking, memory, and communication skills and help with certain behavioral problems. However, these drugs don’t change the underlying disease process. They are effective for some but not all people and may help only for a limited time.

**Cholinesterase inhibitors:**

Cholinesterase is a family of enzymes which catalyzes the hydrolysis of the neurotransmitter acetylcholine (ACh) into choline and acetic acid to allow a cholinergic neuron to return to its resting state after activation. These drugs work by boosting the level of cell-to-cell communication and by providing a neurotransmitter (acetylcholine) that is depleted in the brain by Alzheimer’s disease. Cholinesterase inhibitors can improve neuropsychiatric symptoms, such as agitation or depression, as well. Commonly prescribed cholinesterase inhibitors include donepezil (Aricept), galantamine (Razadyne) and rivastigmine (Exelon).

**Memantine (namenda):** Memantine is widely applied for many neurological disorders, including Alzheimer’s disease. Memantine was first synthesized in the 1960s and its therapeutic effect was observed only in 1970’s. The mechanism of action is blockade of current flow through the channels of N-methyl-D-aspartate (NMDA) receptors, which is a glutamate receptor subfamily broadly involved in brain function. Memantine drug works in another brain cell communication network and slows the progression of symptoms with moderate to severe Alzheimer’s disease.

**Bapineuzumab:** Bapineuzumab is the immunological approach of treating AD patients, its composed of humanized anti-Aβ monoclonal antibodies. This drug also showed similar results like tramiprosate and tarenflurbil.

**Creating a safe and supportive environment**

Creating good living facilities for AD patients is a part of the treatment. For few AD patients, reducing the brain challenging tasks will make life simple and easier. The below provided steps will help Alzheimer’s patients to some extent:

- Try to take regular appointments on the same day and same time weekly or monthly.
- Try to keep handrails wherever necessary so that you cannot slip or fall.
- Also wear comfortable shoes and slippers.
- Maintain only necessary number of mirrors to prevent confusions that occur due to opposite images.
- Always keep meaningful photographs and things on the walls of the house of the patient.
- Form your daily time table to do anything without forgetting them.
- Keep mobiles, purses and everything at a fixed place at home so that they cannot get lost.

**Exercise:** Regular is important for everybody for maintaining proper health—and it is highly important for people with AD. Daily walk is necessary for maintaining the proper functioning of joints, muscles and heart. Exercise can also promote restful sleep and prevent constipation. It is very important to wear some identification by an Alzheimer patient when he go outside for daily walking or any other purpose without company of known person to him.

**Nutrition:** People with AD may forget to eat, lose interest in preparing meals or not eat a healthy combination of foods. They may also forget to drink enough, leading to dehydration and constipation.

**Water, juice and other healthy beverages:** Try to ensure that a person with Alzheimer’s disease drinks at least several full glasses of liquids every day. Avoid beverages with caffeine, which can increase restlessness, interfere with sleep and trigger a frequent need to urinate.

Few nutritional foods are marketed as “medical foods” to treat the disease to some extent. But these medical foods are not approved by the food and drug administration because except the marketing claims those who are claiming to make use of these foods cannot show any information about the safety of these foods.

**Alternative medicine:** Herbal preparations and
vitamins can be used to prevent or delay AD. However, till date, there is no strong evidence that any of these therapies slow the progression of cognitive decline.

**Conclusion**

AD is mainly due to the formation of beta amyloid plaques, hyper phosphorylation of Tau protein and inhibition of cholinergic neurotransmitters. In therapeutic research many drugs were discovered to treat AD and its symptoms, but none of drug molecule shown precise result for AD. On the other hand, prevalence rate is highly increasing after 65 years. Neuropathological studies of AD reported that hyper phosphorylated tau protein by phosphate groups cause neuronal damage and even neuronal cell death. Even the beta amyloid plaques formed from APP by gamma and beta secretase enzymes is another major cause for AD. The diagnosis of AD can be done by MRI and PET scans or using SPECT, but complete diagnosis cannot be done using these scans. It takes few days or weeks for a diagnosis. The genetical studies of AD reported that APO E gene is responsible for the production of Amyloid Presursor Protein (APP) from which beta Amyloid plaques are formed. In treating Alzheimer’s disease, therapeutic research have high scope in future because beta secretase and gamma secretase enzymes should be inhibited to prevent the formation of plaques and prevention of hyperphorylations of Tau proteins.

New Technologies and their Impact on Agriculture with Special Reference to Tamilnadu

S Thangamayan¹, S N Sugumar²

¹Assistant Professor; ²Professor and Head, Department of Economics, VELS Institute of Science, Technology and Advanced Studies, Pallavaram, Chennai

Abstract

Traditional technology is slowly giving way to modern technology. Technological change or the new strategy proposes to make a new technological breakthrough in India which comprises the introduction of new and HYV of improved seeds, increased application of the recommended dose of fertilizers and extension of the use of pesticides that can save crop from destruction by insects. This technological change brought spectacular changes in the agriculture production of our country. Agriculture provides direct livelihood to 59 per cent of the labour force in India. 35 per cent of India’s population below the poverty line lives in rural areas, and is directly or indirectly dependent on agriculture. The present study makes an attempt to analyse the impact of agriculture production in Tamil Nadu. By and large, the study concluded that small farmers are economically more efficient than large farmers irrespective of varieties of rice cultivation in the study area. This is indicated that apart from efficient allocation of inputs, direct supervision and farm management are crucial determinants of economic efficiency.

Keywords: Agriculture production, Technology Impact.

Introduction

Agriculture is the backbone of Indian economy as major chunk of population of the country is engaged and dependent on agriculture. It provides employment to large number of people, raw materials to industrial units and food for survival to all. The introduction of scientific farm technology during mid-sixties has increased the agricultural production and the country turned out from a position of deficit in food grain production to surplus one. Traditional technology is slowly giving way to modern technology.¹ This transformation to new technology and techniques brings to the fore new problems and thus offers new opportunities and new avenues of research to agricultural economists. The ‘New Strategy’ for agricultural development, which was initiated in 1966, in essence called for the implementation of High Yielding Varieties Programme (HYVP) in all districts selected under Intensive Agricultural District Programme (IADP) and allied schemes. Technological change or the new strategy proposes to make a new technological breakthrough in India which comprises the introduction of new and HYV of improved seeds, increased application of the recommended dose of fertilizers and extension of the use of pesticides that can save crop from destruction by insects. This technological change brought spectacular changes in the agriculture production of our country. The increase in production of food grains recorded after 1966-67 is described as Green Revolution. The rapid introduction of HYV of paddy and wheat and their multiplied effects on other crops justify the name Green Revolution. To study the characteristics of sample farmers, labour utilization, input and output structure, cost and returns for small and large farmers cultivating High Yielding Variety and Traditional Variety of rice. The production performance of the rice production is of critical importance in improving the efficient use of resources. The cost of production and net returns obtained per unit would determine the profitability of the rice production. The profitability of an enterprise depends upon the efficient

DOI Number: 10.5958/0976-5506.2019.01900.4
use of the resources in production. The present study is a modest attempt in this regard.²

**Review of Literature**

Davis and Martinin their study,³ “The Relationship between Yields on Farm and in Experiments Station” was observed to vary according to the cultivation season. During good years, the yield at experiment station was found to increase more rapidly than the yield on farm within the same district. This was mainly because the farmers were more interested in measuring their profit by limiting their input investments, while the experimenters only aimed at measuring yield and had no cost restraints.

Francies, Tripathy in his study,⁴ “A Study of Technological Crop in Adoption of New Rice Technology in Coastal Orissa and Constraints Responsible in the same”, concluded that, about 17 per cent of the gap in the yield was caused by technology gap. The different package of practices individually accounts for the technological gaps. Nearly 20 per cent of the gap was due to the ecological factors like temperature, soil, rainfall and sunshine intensity.

**Objectives of the study**

To analyze the cost and return structure of Traditional and High Yielding Variety technology of and of small and large farmers producing Traditional and High Yielding Variety of rice.

To study the impact of new technology on factor shares and to measure the nature of factor biases in technical change.

**Statement of The Problem**

The new farm technology adopted since the mid sixties has helped in revolutionizing Indian agriculture. Technological change in agriculture is characterized by the use of pesticides, irrigation, machinery, improved implements, soil conservation and the like. The new agricultural strategy was the first to adopt modern inputs and derive the benefits as a sequel. The production performance of the rice production is of critical importance in improving the efficient use of resources.⁵ The cost of production and net returns obtained per unit would determine the profitability of the Agriculture production.

Source: Sample Survey

Table-2 reveals that HYV of rice cultivation is biased in favor of human labour, pesticides and land and it against for bullock labour, fertilizer and capital. This shows the need for intensive use of human labour, pesticides and land rather than fertilizer and other variable inputs in the HYV of rice cultivation. Thus, the cultivation of HYV of rice leads to a considerable using a labour in the study area. The HYV of rice cultivation reduces the problem of unemployment in the agricultural sector, particularly in the study area.

</table>

It is inferred from table 4 that the inadequate credit facilities were ranked first followed by water shortage. Non-availability of input (seeds) was ranked third and severity of diseases and pest attacks ranked fourth. Traditional methods and weeds were ranked fifth and sixth.

**PRESENT SITUATION OF TAMILNADU AGRICULTURE**

Agriculture provides direct livelihood to 59 per cent of the labour force in India. 35 per cent of India’s population below the poverty line lives in rural areas, and is directly or indirectly dependent on agriculture. Agriculture contributes more than 22 per cent of GDP (2007 estimates), although the share has progressively come down from 57 per cent in 1950-51. In developed countries like the UK and USA, the share of agriculture in GDP is only around two per cent. It accounts for about 10 per cent of total value of India’s commodity exports. Bulk of agricultural exports consists of 13 key commodities including tea, coffee, tobacco, cashew, spices, raw cotton and sugar. Almost 30 per cent of tea produced in the country and 50 per cent of coffee and jute are exported. In addition to this, credit must be given for export of manufactured goods using agricultural raw materials, which accounts for another 15 per cent of India’s exports. Indian agriculture has been able to improve the per capita net availability of foodgrains to 451 grams (2007) from 395 grams in 1950’s. The gross irrigated area increased from less than one million hectares per annum before green revolution (mid 60s) to about 2.5 million hectares per annum during the 1970’s. Total gross irrigated area is now 80 million hectares. Total food grains (cereals and pulses) production increased from 48.1 million tonnes in 1950-51 to 230.67 million tonnes in 2008. While overall growth in food grains production has been impressive assisted by the technological breakthrough, one disturbing aspect is the year-to-year fluctuation in cereals output which affects the employment and income of the poor who depend solely on on-farm activities.

**Conclusion**

Thus, it is concluded from the analysis that small farmers are economically more efficient than large farmers irrespective of varieties of Agriculture production. This indicated that apart from efficient allocation of inputs, direct supervision and farm management are crucial determinants of economic efficiency. Government should encourage the farmers to start co-operative societies in the study area in order to develop a direct link between the wholesalers/retailers, processors and exporters to cut down the marketing cost incurred for lengthy channel. Such measures shall certainly pave the way for the farmer’s greater success.

Prevalence of Musculoskeletal Disorders and Visual Problems among Software Engineers and its Association with Work Related Variables

Smitha M C, Amogha Shree, Aiswarya Hari, M R Narayana Murthy

1Assistant Professor, 2Postgraduate, 3Undergraduate, 4Professor and Head,
Department of Community Medicine, JSS Medical College, Mysuru

Abstract

Background: WHO refers musculoskeletal disorder as “work-related conditions” because they can be caused by work exposures as well as non-work factors. They form the second greatest cause of disability, as measured by years lived with disability (YLDs) worldwide and across most regions of the world. With the increase in the computer usage in every field, with the IT boom and with the vision of digitalized India; studies on health among computer users is the need of the hour. Objectives: 1. To estimate the prevalence of Work related Musculoskeletal Disorder and Computer Vision Syndrome. 2. To assess the association of work related exposure variables with Work related Musculoskeletal Disorder and Computer Vision Syndrome. Methodology: A Cross-sectional study conducted among IT professionals with minimum of 6 months of work experience and minimum 4 hours of working on computers daily were included in the study. Standardized Nordic Questionnaire was used to collect information on musculoskeletal symptoms, visual symptoms and work related variables. Results: 89% of the study participants had work related musculoskeletal disorders. Majority had trouble in lower-back followed by neck, wrist and shoulder. Significant statistical association was found between work related exposure variables: age, sex, number of breaks taken during working hours and years of experience with WMSD. The prevalence of Computer vision syndrome is seen to be 86.5%. Majority of them had redness of eyes followed by headache, watering of eyes and burning/itching sensation in the eyes. Association of sex, exercise, and breaks taken during working hours had significant statistical association with CVS. Conclusion: In the present study, more than three fourth were found to have WMSD and CVS. Proper ergonomics at work place and periodic health checkups of employees by physician and ophthalmologist will reduce WMSD and CVS.

Keywords: Work related musculoskeletal disorders, Computer vision syndrome, IT professionals, India.

Introduction

Musculoskeletal conditions include joint diseases such as osteoarthritis and rheumatoid arthritis; back and neck pain; osteoporosis and fragility fractures; soft tissue rheumatism; injuries due to sports and in the workplace; and trauma commonly related to road traffic accidents. They cause pain, physical disability and loss of personal and economic independence1. Work related Musculoskeletal Disorder (WMSD) being an extremely common condition is the disorder of the muscles, skeleton and related tissues which have been empirically shown or are suspected to have been caused by a workplace activity (particularly a repetitive activity)2. World Health Organization refers to them as “work-related conditions” because they can be caused by work exposures as well as non-work factors. They form the second greatest cause of disability, as measured by years lived with disability (YLDs) worldwide and across most regions of the world1. With the increase in the computer usage in every field, with the IT boom...
and with the vision of digitalized India; studies related to musculoskeletal disorders is the need of the hour. Another health issue common among software engineers is Computer Vision Syndrome (CVS). It is also referred to as Digital Eye Strain, described by a group of eye and vision-related problems that result from prolonged computer, tablet, e-reader and cell phone use. Though various studies conducted in India show the prevalence of Musculoskeletal disorder between 54% - 76.5% (4-10) and CVS ranging from 33.7% - 83.5% (8-13), there are limited studies available on the association of work related variables with WMSD and CVS. Hence this study is planned with the intention to contribute in this direction.

**Objectives**

- To estimate the prevalence of Work related Musculoskeletal Disorder and Computer Vision Syndrome
- To assess the association of work related exposure variables with Work related Musculoskeletal Disorder and Computer Vision Syndrome

**Methodology**

It was a Cross-sectional study conducted among the IT professionals working in the Software Companies of Mysuru and Bengaluru city. The study duration was 2 months. Professionals with minimum of 6 months of work experience and minimum 4 hours of working on computers daily are included in the study. Those with previous history of traumatic injuries associated with falls, trips or accidents, congenital musculoskeletal problems, pre-existing neuromuscular conditions and medical history of ankylosing spondylitis, peripheral neuropathy, rheumatoid arthritis or any other condition affecting the bone or muscles and those with visual problems diagnosed prior to joining for work were excluded from the study. Using the formula $4pq/l^2$, with the prevalence of 76.5% from the previous study and allowable error of 10% sample size was estimated to be 72. With a non-response rate of 10%, the sample size obtained was 80 which were rounded to 100. Hence questionnaire was mailed to 100 to collect the data. Line listing of Software companies in Mysuru city and Bengaluru city. The mail id’s of the employees were collected. Pre structured and pre tested Questionnaire was mailed to employees and data was collected. Standardized Nordic Questionnaire was used to collect information on musculoskeletal symptoms, visual symptoms and work related variables.

**Statistical Analysis:**

Data obtained was entered into SPSS V.22 and analyzed using the same. Analysis was done by using descriptive statistics viz proportions, mean etc. and inferential statistics like chi-square analysis was used to know the association of work related exposure variables with musculoskeletal disorder and visual problems. Results are presented in appropriate tables and figures as required.

**Ethical Considerations:**

Voluntariness and Confidentiality is the guiding principles of the study. Informed consent was obtained from every study participant. Ethical clearance was obtained from the Ethics Committee.

**Results**

Among the 100 study participants 12 did not respond and hence data from 82 employees were included for data analysis. Among the study participants, the mean age was 29±6 yrs. 69.5% were under 30 years of age and majority (61%) were males. 67% had less than 5 years of experience, 39% exercised regularly and majority (51%) took break less than 3 times/day during working hours, followed by 30.5% who did not take break.89% of the study participants had work related musculoskeletal disorders. Majority had trouble in lower-back(56.1%) followed by neck(46.3%), wrist(41.5%) and shoulder(37.8%). 86.5% of the study participants had computer vision syndrome. Majority of the study participants had redness of eyes (57.3%) followed by headache (54.9%), watering of eyes (54.9%) and burning/itching sensation in the eyes(50%).

There was significant statistical association seen between age (affecting more above 30 years), sex (affecting more number of males), breaks taken (affecting those who did not take breaks/ took < 3 breaks) and job experience( affecting those with >5 yrs) with Work related musculoskeletal symptoms (Table 1).

*Fisher exact test

Discussion

With respect to the prevalence of Work related musculoskeletal disorder in our study was 89%. Various studies have shown prevalence ranging from 20 to 93.3% [5]. Sharma et al study conducted at Delhi reported 77.5%, Talwar R et al study reported 76.5%, Giri et al reported 73.3%, Saleem M et al study and Prasad et al conducted at Nagpur reported 69% and 67% respectively and Shbair & Abdulla conducted at Jordan reported a very high prevalence of 93.3%. This contrast result was noted as they included professionals from varied job like computer programmers, secretaries, engineers and computer lab supervisors. WMSD affecting lower-back (56.1%) was found in majority of the employees followed by neck(46.3%), wrist(41.5%)
shoulder (37.8%) and knees (13.4%). Similar results was noted in Swetha NB et al study\(^\text{11}\) where in lower-back was affected in back and neck was 55% and 46.6% respectively. Similar order of occurrence i.e lower back (40.4 %), followed by the upper back (39.5 %), neck (38.6 %), hand/wrist (36.8%) and shoulder (15.2 %) and least in knees (2.2%) was noted by Moom R et al study\(^\text{4}\). Sillapaa J et al study\(^\text{12}\) showed a that WMSD affected neck (63%) in majority of the study participants. Significant statistical association was found between the work related exposure variables with WMSD with respect to age, sex, number of breaks taken during working hours and years of experience. Regarding the association the present study shows that as the age advances and work experience increases WMSD, which is in par with the findings of Moom R et al study\(^\text{4}\), Saleem et al study\(^\text{5}\) and Sharma et al study\(^\text{6}\). Sex is associated with WMSD affecting Men more compared to women. This may be due to the reason that women are regularly involved in household chores which might contribute to routine stretching of muscles in them. Taking no/less breaks during working hours was statistically associated with WMSD. This finding is in par with Shwetha NB et al study\(^\text{11}\).

The **prevalence of Computer vision syndrome** is seen to be 86.5%. Similar observation was seen in the Venkatesh et al study\(^\text{13}\) (83.5%) and Logaraj M et al study\(^\text{15}\) (80.3%). Swetha NB et al\(^\text{11}\), Sharma AK et al\(^\text{6}\) and Talwar R\(^\text{7}\) et al also reported a prevalence of 78.33% 76% and 76% respectively. Study done by Chendilnathan C et al\(^\text{16}\) reported prevalence of CVS as 97.4%. This may be due to the reason that their inclusion criteria was to included professionals with less than 4 hours of working/day on computer. Common **visual problems** reported were redness of eyes (57.3%), headache (54.9%), watering of eyes (54.9%) and burning/itching sensation in the eyes (50%). Similar findings were also seen in Shanta kumari N et al study\(^\text{13}\): headache (53.3%) and burning sensation (54.8%), Chendilnathan C et al\(^\text{16}\) study : headache (56%) and Talwar R et al\(^\text{7}\) study: redness of eyes(40.7%), headache (29.2%), and burning/itching (29.8%). Our results contrasted with the findings of Swetha NB et al\(^\text{11}\) where redness of eyes was 9% and common symptoms noted were watering(39%) and pain in the eyes(39%). Association of sex, exercise, and breaks taken during working hours had significant statistical association with CVS, which was in par with Lograj M et al study\(^\text{15}\).

While the **Strength** of our study would be that we have tried to associate the work related exposure variables with Work related Musculoskeletal disorders and Visual symptoms apart from identifying their prevalence. There are very few studies focusing on such objective. The **Limitation** of our study would be a small sample size and inclusion of only software engineers as study participants because of which comparison of the findings was not possible.

**Conclusion**

In the present study, more than three fourth were found to have WMSD and CVS. Proper ergonomics at work place and periodic health checkups of employees by physician and ophthalmologist will reduce WMSD and CVS.

Our **Recommendations** would be to adopt proper ergonomics at work place, creating enabling environment for frequent mini breaks which wouldn’t affect the work productivity, organizing physical activity sessions or workshops at workplace and periodic health checkups of employees by physician and ophthalmologist.

Educational & Research Institute University

Abstract

Objective: The aim of the study was to find out the prevalence and predictors of musculoskeletal problems in desk job workers.

Background of the Study: Musculoskeletal disorders were commonly reported by office workers worldwide. At the same time the duration of computer work in a modern occupational setting has increased dramatically. On work process, most of the desk job workers have pain in their neck, back region and even abnormal posture may also occur sometimes. The risk of developing musculoskeletal disorders was higher among workers who have a high work strain and muscle tension. Awareness and knowledge of the relationship between computer usage and musculoskeletal disorders are essential to prevent before it could progressed.

Methodology: This is a observational study of survey method includes a total of 100 subjects who are selected between the age group of 30 to 40 years among the desk job workers based on inclusion and exclusion criteria. Data regarding the musculoskeletal problem were collected using the Orebro Musculoskeletal Pain questionnaire, Patient Health questionnaire (PHQ) and Cornell Musculoskeletal disorder questionnaire.

Result: On comparing the prevalence of musculoskeletal problems among desk job workers, the collected data shows that the prevalence of neck pain with 47 % and shoulder pain with 28% is more than the other sites like lower back, upper back, elbow, knee, leg and ankle.

Conclusion: This study concluded that desk job workers are more prone to neck pain than comparing to pain at any other sites.

Keywords: Orebro musculoskeletal pain questionnaire, PHQ and Cornell musculoskeletal pain questionnaire and Desk job workers.

Introduction

Musculoskeletal disorders (MSDs) are injuries or pain in the human musculoskeletal system, including the joints, ligaments, muscles, nerves, tendons, and structures that support limbs, neck and back1. MSDs can arise because of improper physical factors with ergonomic, psychological, social, and occupational factors. MSDs are an increasing healthcare issue globally, it is the second leading cause of disability7. Musculoskeletal disorders are the most prevalent disorders among computer operators in general populations3,4. For people who spend a great deal of time with computer, work related neck pain is a common problem encountered every day. The musculoskeletal pain can be attributed to numerous risk factors, including prolonged static posture, repetitive
movement, poor posture, genetic predisposition, mental stress, age and physical condition\(^3\). Both men and women are prone to neck pain but it is most common in women (53.7\%) than in men (32.7\%) \(^3\).

Neck pain is the most common chronic pain problems with a reported prevalence of 22\% to 30\%\(^6,7\). The cervical region is an important structure that supports the weight of the head and provides more mobility to cervical spine on the contrary to the stability. Because of this the muscles around the cervical region is most commonly stressed and leads to neck pain. It usually involves muscle spasm, strain and tightness of the neck muscles. The presence of problems in the muscle and bones causes limitation of joint range\(^8\).

Globally, the overall prevalence of neck pain in general population ranges between 0.4\% and 86.8\%. The incidence of neck pain was estimated to be in the range between 10.4\% and 21.3\% with a higher incidence noted in office and computer workers\(^9\). India has 18.7\% population who suffer from neck pain and it affects 45\% of today workers\(^10\).

LBP is a very common health problem worldwide. Most cases of lower back pain can be linked to a general cause such as muscle strain, injury, or overuse. In industrial workers, it affects approximately 60\% \(^11\). The Low Back Pain is the major work related musculoskeletal disorder among the IT Professionals \(^12\).

Shoulder is also a common health problem worldwide and it is a major cause of disability. Shoulder pain affects about 16\% to 21\% in the general populations\(^13\).

Consequently this study was done on samples using computer to a large extent which is focused on risk factors for the development of muscular skeletal symptoms. Based on the duration of computer usage, repetitive movement, static and non-neutral wrist, arm neck work posture, lack of variations and psycho socio factors, the development of musculoskeletal disorder varies\(^14\).

Due to the long lever arm of the upper limb, the shoulder joint can be exposed to high forces. The tendons around the joint (rotator cuff) have a poor blood supply and are therefore more prone to degenerate with age than the tendons in other locations. Injuries and tendon inflammation can be common cause of MSDs in this area.\(^15\)

Orebro musculoskeletal pain screening questionnaire (OMPSQ) was developed by Linton and Halden. OMPSQ can be used to identify patients with spinal pain. This questionnaire can be considered as a validated tool for identifying patients with chronic neck pain \(^7\). The Patient Health Questionnaire (PHQ) is a self-administered version of the PRIME-MD diagnostic instrument for common mental disorders. PHQ-9 scores of 5, 10, 15, and 20 represented mild, moderate, moderately severe, and severe depression, respectively. The PHQ-9 was highly valid and reliable tools to screen depression \(^16\). Cornell Musculoskeletal Discomfort Questionnaires (CMDQ) has been developed by Dr. Alan Hedge. CMDQ is a well-designed data collection tool. The CMDQ was highly valid and reliable \(^17\).

**Materials & Method**

This is an observational study conducted at corporate sector & took nearly 2 month (Jan 2018-Mar 2018) to complete the study. Once the study gets approved from IRB REF NO: IV C- 034/ PHYSIO/ IRB/2017-2018, 100 samples were selected from 140 volunteers based on inclusion criteria of both males and females, Age group between 30 to 40, Minimum 8 hours of office workers and excluded Cervical disc degenerative disease, Herniated disc, cervical spine fracture, Meningitis, Tuberculosis of spine.

The subjects were fully explained about the study, the questionnaire to be filled and benefits of participating in the study. Initially demographic variables of the samples collected & were asked to fill the consent form in acceptance for study participation duly signed by samples & therapist ensuring confidentiality. Questionnaires were given to the subjects that include Orebro musculoskeletal pain questionnaire, Patient Health questionnaire (PHQ) and Cornell musculoskeletal disorder questionnaire.

**Data Analysis**

The collected data were tabulated and analysed using descriptive Statistics and Regression Analysis. All the parameters were assessed using statistical package for social science (SPSS) version 24. Descriptive Statistics was adopted to find the Mean Standard deviation, Minimum and Maximum Range. Multiple Logistic Regression analysis was done to find the factors associated with Orebro musculoskeletal pain score, Cornell musculoskeletal disorder questionnaire &

</table>

The above table shows that there is a statistically significant association between Work Hours and Musculoskeletal Disorder (MSD) in Desk Job Workers. Work hours have been positively associated with higher Orebro musculoskeletal pain score and Patient Health Questionnaire.

Result

The prevalence of musculoskeletal disorders among the desk job workers based on the site is higher in neck region with 47% followed by shoulder, lower back, upper back, elbow, knee, leg & ankle with 28%, 10%, 2%, 5%, 4% and 4% respectively (table 2). Gross percentage for OMPQ was 89% with low risk and 11%
with moderate risk. The depression among desk job workers was severe with 15%, moderate with 71%, mild with 13% and minimal with 1%.

Regression Analysis of Significant Factors Predicting Musculoskeletal Pain Score among Desk Job Workers shows a significant association between work hours and musculoskeletal disorder. Work hours have been positively associated with higher OMPS and PHQ with the p value 0.041* which is 1.37 lower and 1.96 upper in 95% confidence interval.

The results shows that, there are some factors which predict musculoskeletal disorders like long hours of work & in general females are affected more than males.

Discussion

This is an Experimental study with 100 sample size who were desk job workers. The results showed higher prevalence of disorders in the neck & shoulder complaints in the study population compared to low back, leg, arm & upper back complaints. In this present study it was observed that age, sex, smoking/drinking habit job duration and posture also contribute to increase in MSD in desk job workers. It is recommended that proper work posture; healthy working conditions must be provided which can make the work easier and more relaxed. Furthermore musculoskeletal complaints of neck & shoulder in particular, were more common among women than men, even though women & men are working for same time. Another study confirmed our finding, showing the prevalence of symptoms in the neck & upper extremities per year was found to be 51% among men &72% among women.

The prevalence of pain was high for all musculoskeletal locations, overall more than 80% of responding Danish fisherman reported low back pain with more than 80%of Danish fisherman reporting only Low back pain during past year.

Another study assessed the prevalence of MSDS among rubber tapper on two larger plantations in Srilanka, work environment behavioural psychosocial factor of interest. The prevalence of MSDS in last 12month was high where 66% of tappers suffered from at least one MSD. The most common body region involved was the back 43%, shoulder 23% & neck 19.3%. Musculoskeletal problem amongst profession truck drivers has often been associated with high prevalence of low back pain.

The factor that contribute to cause the pain are drivers and might include prolonged sitting, exposure of whole body vibration and other non-driving factor such as heavy lifting, poor dieting & other psychological factor. 81% of them reported some musculoskeletal pain during the previous 12 month & 60% reported low back pain. In the prevalence of musculoskeletal among the tailor was reported to be 65.4%most common site being neck followed by low back pain, upper back & shoulder.

Tailoring involves monotonous, highly repetitive tasks like cutting, pressing and finishing performed in a sitting working posture with upper back curved and head bent over the sewing machine.so far working in this awkward posture for a long duration increased the chance of developing musculoskeletal disorders.

A systematic review of literature had shown musculoskeletal disorders in workers was associated with age, previous neck pain, high quantitative job demands, low physical capacity, work posture, repetitive work. In additions gender, occupation, headache, emotional problem, smoking may be associated by musculoskeletal disorders. Such as working hours on the computer, prolonged sitting & forward flexion posture during working which were most common factors which had enhanced the risk of developing musculoskeletal disorder of among office employees.

Conclusion

This study concludes that there is prevalence of musculoskeletal disorders among office employees. People using computer for more than 8 hours, Age, gender, length of employment, health status and job satisfaction were known as risk factor for developing musculoskeletal disorders. This study was done to create awareness among the desk job workers about the long working hours & habitual poor posture which leads to musculoskeletal disorders. It is the responsibility of the corporate sector to design the working atmosphere ergonomically & comfortably to protect the health of their employees.

Limitation of the Study

Small sample size, Exercise intervention were not included for MSD, Limited age group, Limited to desk job workers only (tailors, textiles, weavers)

Authors Contribution: All authors have contributed equally.
Conflict of Interest: ‘Conflicts of interest: none’

Ethical Considerations: The manuscript is approved by the Institutional Review board of faculty of physiotherapy. All the procedures were performed in accordance with the ethical standards of the responsible ethics committee both (Institutional and national) on human experimentation and the Helsinki Declaration of 1964 (as revised in 2008).

Declaration of patient consent

The authors certify that they have obtained all appropriate patient consent forms. In the form the patient(s) has/have given his/her/their consent for his/her/their images and other clinical information to be reported in the journal. The patients understand that their names and initials will not be published and due efforts will be made to conceal their identity, but anonymity cannot be guaranteed

Prevalence of Myths and Misconceptions about Dental Extractions among Outpatients of a Private Dental College Hospital

S.G. Sudarssan¹, P.U. Abdul Wahab²
¹Post Graduate Student, ²Professor, Department of Oral and Maxillofacial Surgery, Saveetha Dental College and Hospital, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Background: Myths related to oral ailments and dental health care practices are very common in Indian society and it is strenuous to break this chain as these myths are deep rooted in the society. This study assesses the prevalence of myths and misconceptions about dental extraction among the outpatients of a private dental college hospital, the analysis of which provides an indirect measure of the knowledge, attitude and health seeking behavior of the community.

Materials and Method: A cross-sectional study was conducted by the out-patients attending dental institute, in Chennai city. A total of 200 individuals were included, data were collected using a pretested and validated two-part questionnaire including demographic data, questions regarding dental myth. Data obtained were statistically analyzed using descriptive statistics, chi square test.

Result: Based on gender among the participants of the survey, females were more believers of the myth and misconceptions (P < 0.05). Based on socioeconomic status, prevalence of the myths and misconceptions about dental extractions were high among lower class category (P < 0.05).

Conclusion: Almost all the participants believed in one or more myth pertaining to dental extractions.

Keywords: myths, dental, tooth extraction, misconception, oral health, gender, socio economic status.

Introduction

Oral health prevails to be an entity of negligence despite of constant and continuous efforts for health promotion, worldwide. The standard of oral health of a population greatly depends on elements such as diet, socioeconomic status, educational qualification and oral hygiene practices¹. Indian population is comprised of people from various different cultural backgrounds and there is a significant influence of the myths on the health seeking behavior of these people ². Scientifically myths are regarded as extensive and unquestioned false perspective that emerges from false traditional beliefs and non-scientific knowledge. These myths eventually get deep rooted in the minds of the future generations over a period of time and lead them towards a wrong protocol making it difficult for the dentist to provide satisfying treatment ³, ⁴. This kind of myths and misconceptions are also prevalent due to falsely exaggerated and manipulated information publicized by those who personally had a previous negative dental experience ⁵. Myths related to oral ailments and dental health care practices are very common in Indian society and it is strenuous to break this chain as these myths are deep rooted in the society. Understanding the prevalence of such myths and misconceptions becomes essential even to a health care provider to direct the society towards
proper heath care. One has to take some efforts to make oneself aware and understand the principle behind each myth regarding health because blindly believing or following it might lead to uneventful consequences. Thus public health awareness regarding these myths and misconceptions about dental health is required at the individual as well as community level. As the society becomes more complex, people’s expectations of health care is rising dramatically, understanding the myths and misconceptions about oral diseases is important in providing excellent care and health education to both patients and healthy individuals. The high prevalence of these myths will prevent such population from attaining proper dental care even if it could be made available to them. The purpose of this study is to assess the prevalence of myths and misconceptions about dental extraction among the population, the analysis of which provides an indirect measure of the knowledge, attitude and health seeking behavior of the community.

Materials and Method

Study Population:

A questionnaire descriptive “cross sectional study” was conducted among the outpatients in the age of 20-80 years attending the OPD of department of oral and maxillofacial surgery in Saveetha dental college and hospital; Chennai. The study involved 200 patients as participants. The identity of the patient who participated was maintained confidentially.

Inclusion Criteria:

Patients visiting the dental OPD who voluntarily agreed to participate

Exclusion Criteria:

People who refuse to participate in the study and people who could not comprehend the questions of the study despite the assistance.

Collection of Data

A questionnaire was developed to assess the prevalence of dental myth and misconceptions among the outpatients of department of oral surgery. The questionnaire was developed in English language. All the questions were given alternative options to facilitate the participants to make quick choices, and participants were asked to tick the most appropriate answer. Before finalizing the questionnaire, the questions were pretested in a pilot study on 15 patients, to assess their ability to interpret it. The questionnaire appeared to be easily understood and was finalized with no modification.

Permission was obtained from the institution authorities to administer the questionnaire to the patients. The objective of the study was explained to all the patients who participated in the study and also verbal consent was obtained from all of them. The completed questionnaire was collected back in 10-15 min by the investigator and checked for completeness. Any incomplete forms were asked to be completed. For the patients who did not understand the language a volunteer helped to translate all the questions with the choices of response and filled the form on behalf of the patient with the patient’s choice of responses.

The questionnaire was divided into two parts:

The first part of the questionnaire contained personal data of the patient such as name, age, gender, educational qualification, previous extraction history and B.G.Prasad’s scale was used to assess the socio-economic status. This scale divides the population into 5 categories based on their per capita income and the second part of the questionnaire contained 13 close ended questions about myths and misconceptions about dental extractions.

To statistically analyse the awareness among the study population, the responses to the questions were recorded as correct or wrong. Every correct answer was given a score of 1 and wrong answer was given a score of 0. Individuals receiving a total score of <7 was considered Low attitude and those with total score ≥ 7 was considered High attitude.

</tbody>
</table>

About 43(21%) participants believed that extraction of upper front tooth affects vision, 51(25%) believed that extraction of upper back tooth affects nerves connected to brain, 28(14%) participants had a misconception that extraction of lower jaw teeth can affect heart. 101(50%) participants believed that extraction site suturing indicated some complication due to the extraction. 103 (51%) participants had a misconception that suturing is more painful than tooth extraction. 45(22%) participants believed in avoiding head bath for a week after tooth extraction is mandatory. 54(27%) participants thought that extraction was better than to save a tooth. 2 (1%) participants believed that there is chance of new tooth to erupt on extraction of a permanent tooth. 41(20%) participants believed that skinny and weak patients are prone to excessive bleeding during extraction. 39(19%) participants believe that extraction during pregnancy causes abortion. 25(12%) participants had a misconception that drugs cure tooth problems. 64(32%) participants believed that tooth extractions should be avoided during monsoon and winter. 84(42%) participants had a misconception that no solid food can
be consumed for a week after extraction.

Almost all the participants believed in one or more myth pertaining to dental extractions.

Based on the scores given to the correct and wrong answers of the participants to the questionnaire, the awareness of the participants was estimated.

**BASED ON GENDER:** (Graph 1): Among the participants of the survey 54.6% of males and 71.8% of females had a low attitude showing females have more belief in myths and misconceptions (P< 0.05).

**BASED ON SOCIOECONOMIC STATUS:** (Graph 2) Among the participants of the survey 100% of the upper class category, 80.7% of the upper middle class category, 50% of Middle class category, 18.4% of the Lower middle class and 3% of the Lower class category had a high attitude. This highlighted the prevalence of the myths and misconceptions about dental extractions in lower class category followed by lower middle class category of people (P< 0.05).

**Graph 1: Attitude of male and female on myth about dental extraction.**

**Graph 2: Association of dental myth scores with SES of the study population**

**Discussion**

Dental and oral diseases are the fourth most expensive diseases to treat. The total cost of traditional operative dental care would exceed the entire health care budget in many low income countries of the developing world. A remarkable influential factor is the awareness and educational level of population which reflects a country’s literacy rate. Education provides an individual the means of empowerment and freedom to promote creative thinking and imagination. This may also help in propelling an individual positively towards general as well as oral health. Myths can be prevalent in a population due to a variety of reasons like poor education, socioeconomic status, cultural beliefs and social misconceptions.

India being a developing country, is struggling to provide the necessary oral health to its population as majority of the Indian population resides in rural areas. India has a low budget to meet the oral health treatment needs, a high disease burden and a low literacy rate of its general population. All these act as predisposing factors that direct the general population to poor oral healthcare, false treatment need assumptions, and false beliefs.

Results of this study illustrate lack of knowledge and awareness about dental health on part of the general community. Prevalence of a large number of myths and misconceptions has adversely affected the community dental health. Literacy level of people and their socioeconomic status play a key role in the development of health sector of a country. In this study it was observed that the percentage of people who believed in myths was higher among the lower and lower middle class of socioeconomic category. The findings show that females believe more in myths and misconceptions than males.

Nearly 21% of the participants thought that extraction of the upper front tooth under local anesthesia may cause impairment of patient’s vision. The fact being that there is no relationship between vision and extraction of the upper front tooth. The results are similar to the studies done by Saravanan and Thirineervannan where 20% believed in the myth and Singh SV et al where 26% participants believed in the myth. While this figure is less compared to some other study reports which show nearly 35%-79% believe in this myth.

Nearly 27% of the participants thought that extraction of the teeth is a better option that to save it. This may be due to inadequate knowledge about treatment modalities like restoration and root canal treatments for saving a
tooth. This can also be due to the high cost and multiple visits needed for root canal treatment whereas extraction is a single visit procedure. This figure is less when compared to the previous studies done by Ripika Sharma et al. showing nearly 49% and Ain TS et al. showing 59% agreed to this fact.

The result of the current study shows that nearly half of the participants (50%) believed that suturing the extraction socket is an indication of some complication or mishap during the procedure and nearly 51% of the participants had a misconception that suturing will be more painful than extraction of the teeth. This was the most prevalent myth of the current study. The reason behind this might be due to the portrayal of suturing procedures in South Indian movies, indicating extensive trauma and injury. People are misled by this and assume that suturing itself is a serious surgical procedure indicating complications. A positive finding of this study was that most people were aware that tooth does not erupt after extraction of a permanent tooth.

**Limitation**

The results of this study cannot be applied to a larger population since this study was done in an urban setting. Furthermore, qualitative and quantitative research regarding the prevalence of myth and misconceptions about dental extraction on a larger sample and for a longer period of time in different regions and different population is necessary to validate the results of this study.

**Conclusion**

The study population has significant belief in one or more myth about dental extraction.

Effects of Musical Therapy and Physiotherapy in Pregnancy Induced Hypertension

Mayuri Dhananjay Gogate1, Namrata R Patil2
1Intern, Faculty of Physiotherapy, Krishna Deemed To Be University, Karad, Maharashtra, India, 2Pediatric department, Faculty of Physiotherapy, KIMSDU, Karad, Maharashtra, India

Abstract

Objective: To find out the effectiveness of musical therapy and physiotherapy in pregnancy induced hypertension.

Materials and Method: Ethical clearance was obtained from the Institutional Ethical Committee.40 women attending the antenatal therapy at physiotherapy outpatient department, Krishna Hospital, Karad, Maharashtra, India, were women with 3rd trimester of pregnancy with mild pregnancy induced hypertension participated in this study; 20 women in the GROUP A i.e. music group and 20 women in the GROUP B i.e. music and physiotherapy group by convenient sampling with random allocation of the subject.

Result: Inter group statistical analysis for systolic blood pressure revealed extremely significant in post intervention for group B (p<0.0001). Diastolic blood pressure was extremely significant for group B (P value<0.0001). Pulse rate was extremely significant for group B (p<0.0001). While Post intervention analysis showed extremely significant difference between Group A and Group B (p<0.0001).Group B treated with musical therapy and physiotherapy was extremely significant.

Conclusion: An integrated approach to combination of musical therapy and physiotherapy is safe and effective. It decreases the systolic blood pressure, diastolic blood pressure and pulse rate with less complication in delivery.

Keywords: Musical therapy, conventional physiotherapy, pregnancy induced hypertension.

Introduction

Severe stress or constant stress can negatively impact a pregnancy, leading to complications like poor health, preterm birth, low birth weight, sleep deprivation, and increased risk of behavioral and developmental problems in children1. Pregnancy is a condition in which women undergo distinct physiological changes and stress and is accompanied by unique physical and psychological demands. There is a need to manage the various physical, emotional, mental and pain states that arise throughout the stages of pregnancy and labour.

Hypertension is one of the common medical complications of pregnancy and contributes significantly to maternal and perinatal morbidity and mortality. Hypertension is a sign of an underlying pathology which may be pre-existing or appears for the first time during pregnancy. In the developing countries with inadequately cared pregnancy, this entity on many occasions remains undetected till major complications supervene.

Pre-eclampsia defined as pregnancy induced hypertension and proteinuria frequently combined with edema is asymptomatic in some women but induce severe symptoms in others. Hypertensive disorders during pregnancy are one of the leading causes of maternal death and are important causes of neonatal morbidity and mortality. The cause of this disease is however still unknown. Pre-eclampsia is a multisystem disorder of unknown etiology characterized by development of hypertension to the extent of 140/90mmHg or more with proteinuria after the 20th week in a previously normotensive and nonproteinuric woman. Edema is common in normal pregnancy. Edema has been excluded
from the diagnostic criteria unless it is pathological.

Music is noninvasive, culturally acceptable intervention with multiple direct and indirect beneficial effects on mother and foetus through the pregnancy and perinatal period. Music has been shown to beneficially affect stress response, besides direct influence on emotions and behavioral effects on cognitive performance can also occur. Music has a long history of healing physical and mental illness. Many clinical findings indicate that music reduces blood pressure in various patients and attenuates symptoms in various types of diseases.¹

To cope up with psychological and emotional changes physiotherapy will integrate body, mind and spirit. It will reduce the severity of anxiety, improves their breathing capacity to have a natural, pleasurable feeling throughout all three trimesters. They bring harmony; develop a restful and positive attitude towards life. Create positive mental and physical development of the fetus, inside the womb of the mother, which ensures the baby’s healthy growth in the womb.⁵

Yoga typically combines stretching exercises and different poses with deep breathing and meditation, yoga is designed to stretch and tone the muscles and to keep the spine and joints flexible. Some suggest that bending, twisting and stretching movements also massage the internal organs and glands. Yoga poses are generally done with deep, diaphragmatic breathing that is thought to increase oxygen flow to the brain. A series of poses that are called Asanas in Sanskrit are performed slowly and sequentially, concentrating each movement on the deep abdominal breathing that accompanies each movement.⁶

Yoga has been effective with patients who have mild to moderate hypertension. In another group who were at risk of cardiovascular disease, resting systolic and diastolic blood pressure decreased after 20 weeks of yoga.⁶

**Method**

It was experimental study conducted in physiotherapy department of Krishna institute of medical sciences. women with 3rd trimester checked for presences of pregnancy induced hypertension and its stage. After collecting the complete sample size 20 women include in GROUP A i.e. musical therapy group and GROUP B i.e. musical and physiotherapy group by convenient sampling with random allocation of the subject. In GROUP A women received musical therapy in which they listen OMKAR mantra in a low voice 30 min for 7 days in a week till the delivery. In GROUP B patient received musical therapy and physiotherapy in which they received the combination musical and physiotherapy. For musical therapy they also listen OMKAR mantra same as group A for 30 min and in additional they practice yoga and pranayama as part of physiotherapy treatment. Yoga practices, including physical postures, breathing, and meditation were practice 30 min daily during study period.

**Discussion**

Being pregnant is one of the most special and magical experience a woman can have in her lifetime. During pregnancy she can experience many changes in her body be it psychological or physiological. These changes give her many pleasant and unpleasant experiences. Pregnancy may be a magical experience but there are some risk factors that can occur along the way which may cause a life threatening situation.

Pregnancy induced hypertension is one of the most common medical complication, it causes high risk pregnancy period. The pathology is still unknown. It could be pre-existing or can appear for the first time during pregnancy. The identification of hypertension and effective management may help to save the mother and the baby and reduce the complication during delivery.

Hypertension during pregnancy leads to premature aging of placenta, the vasoconstriction of the blood vessels occur leading to reduced blood flow. Due to impaired blood supply some changes occur into the maternal blood vessels resulting in anatomical and functional changes in the placenta and all of these put the fetus into danger. Glomerular endotheliosis, swelling of endothelial cells, reduced renal blood flow and glomerular filtrate rate can occur. In several cases the intense anorexia can produce extensive arterial thrombosis leading to bilateral renal cortical necrosis.

Intense vasospasm causes periportal hemorrhagic necrosis of the liver occurs due to thrombosis of arterioles, focal necrosis of hemorrhage in the myocardium may affect the conducting system leading to heart failures, and there is evidence of edema or hemorrhagic bronchopneumonia.

In this study, 40 subjects were assessed for eligibility, out of which 40 completed the study. Pre-treatment outcome measure for pregnancy induced hypertension is systolic blood pressure, diastolic blood pressure and pulse rate.

In study has shown clinically significant changes in systolic blood pressure, diastolic blood pressure and pulse rate. These findings suggest that combination of musical therapy and physiotherapy is effective in reducing in high blood pressure. Calming and soothing music helps to smile, sing and to relax and reduce stress.
during pregnancy ¹.

Musical therapy includes OMKAAR MANTRA in low voice. The mantra contains various rhythmic frequencies of vibrations which help to relax the mind and decrease the stress level. Physiotherapy includes the combination of Yoga and Pranayama.

Yoga and pranayamas are beneficial for the treatment of cardiopulmonary diseases, autonomic nervous system imbalances and psychological or stress related disorders. Slow pranayamic breathing is one of the most practical relaxation techniques. Pranayam play a role in controlling systemic vascular resistance and heart rate ¹⁷.

The word ‘yoga’ is derived from the Sanskrit verb ‘yuj’ which means the Union. This refers to the union of the individual consciousness with that of the Universal Divine consciousness that can be achieved by the wide variety of practices that range from yogasanas, pranayamas, mudras, kriyas, relaxation and medication techniques ¹⁸.

Yoga typically combines stretching exercises and different poses with deep breathing and meditation, yoga is designed to stretch and tone muscles and to keep the joints and spine flexible. Some suggest that bending. Twisting and stretching movements also massage the internal organs and glands ⁶.

Yoga has been effective with patients who have mild to moderate hypertension ⁶. Regular practice of yoga and pranayama with the combination of musical therapy is very helpful to decrease the blood pressure during pregnancy.

Group B was more significant as compared to group A, group A was not given yogasanas and pranayamas for stress management. Group A was given only musical therapy while group B was given combination of physiotherapy and musical therapy.

The treatment of group A was less effective because it includes only musical therapy in which the patient was supposed to perform ‘Omkaar mantra’ for 30 minutes a week as therapy. While group B was given the combination of musical therapy and physiotherapy for 30 minutes.

Hence the alternate hypothesis is proved because there is a significant change in between two groups on pregnancy induced hypertension.

The limitations of the study: 1. The study can be done in other areas of the country. 2. The study is done in Asian race. 3. The study is limited to a small sample size which makes it difficult to extrapolate the result. 4. This study is limited to 3rd trimester of pregnancy. 5. This study was limited to shorter duration follow up period.

Suggestion and recommendation of the study: 1. This study should be conducted with large number of people. 2. This study can be done on longer duration with longer follow up period for the assessment of long term benefits.

Conclusion

Regular practice of yogasanas and pranayama is beneficial for health. Music is effective to reduce stress, anxiety; but combination musical therapy and physiotherapy is more effective to reduce systolic and diastolic pressure, pulse rate which is increased due to stress and anxiety.

Conflicts of Interests: The authors declare that there is no conflict of interest concerning the content of the present study.

Profile HIV Infected Children at an ART Centre of Karnataka

Narayan V Nayak¹, Abhishek Prayag²

¹Associate Professor, Department of Pediatrics, ²Assistant Professor, Department of Community Medicine, Karwar Institute of Medical Sciences, Karwar

Abstract

Introduction: Children (<15 years) account for 6.54%, while females contributed around two fifth (40.5%) of total HIV infections. During 2016-17, 53721 HIV exposed live birth were reported out of which 86.7% received ARV drug. Despite this, HIV infection rates have been on the increase among women and their infants in some states of India, probably due to complex social and cultural issues that limit the effectiveness of prevention programmes. Often, children from families affected by AIDS are left orphans and many drop out of school to care for sick parents or to earn a livelihood.

Methodology: Data was collected from the ART Centre of Uttarkannada District. Record based data from the year 2008 to 2018 April of pediatric age group i.e. from 0-18 years was considered for the study. Age, status of the case and treatment related variables were obtained from the centre. The period of study was two months (April and May 2018).

Results: Total registered cases were 189 among which 54.5% were boys and 45.5% were girls. 139(73.5%) were on treatment. Majority i.e. 31.7% belonged to age group between 0-5 years. Loss to follow up and Opting out of treatment constituted around 8% of the cases.

Recommendation: Scaling up of infant diagnostic services and strengthening programs to retain HIV exposed children in care and ensure timely testing for HIV infection.

Keywords: HIV, CHILDREN, ART, KARNATAKA

Introduction

HIV/AIDS not only affects children personally but also affects their families and parental care. The total number of People Living with HIV (PLHIV) in India was estimated at 21.17 (17.11 lakhs—26.49 lakhs) in 2015 compared with 22.26 lakhs (18.00 1&-27.85 lakhs in 2007)¹. Children (<15 years) account for 6.54%, while females contributed around two fifth (40.5%) of total HIV infections (NACO 2016-17 report)². More than 90% of the HIV infections in children are the result of maternal-to-child transmission (MTCT).³ The MTCT rate ranges from 20% to 45% in the developing world.⁴

In India during 2016-17, out of the annual target 140 lakhs, 76.2 lakhs of pregnant women tested for HIV AIDS 5233 were HIV positive as new cases and out of which 4935 (94.3%) initiated lifelong ART, the known HIV positive pregnant women availed ICTC service during this period is 1,172. During 2016-17 (till September 2016), 53721 HIV exposed live birth were reported out of which 4,651 (86.7%) received ARV drug. Though this, HIV infection rates have been on the increase among women and their infants in some states of India, probably due to complex social and cultural issues that limit the effectiveness of prevention programmes.

Effective treatment, early diagnosis and public health campaigns have contributed to a 39% decrease in new HIV infections between 2000 and 2016 (WHO HIV/AIDS Fact sheet, 2018)⁵. The complex social...
stratification in India increases the risk of HIV infection in vulnerable groups majorly women and children. Often, children from families affected by AIDS are left orphans and many drop out of school to care for sick parents or to earn a livelihood. Lack of information on STIs and HIV, peer pressure and lack of access to clinical care increases their vulnerability and risk to HIV infection. Many affected children are left without even the rudiments of healthcare due to discrimination and poor public health system.

The goal of ‘zero new HIV infections, zero discrimination and zero AIDS-related deaths’ made on Worlds AIDS day in 2010 to be more realistic if the barriers to prevention, treatment and care for HIV women and children are managed well. It is the need of the hour to know profile of HIV infected children. Hence this study was planned at an ART center in Karnataka.

Materials and Method

Data was collected from the ART Centre of Uttarkannada District. Record based data from the year 2008 to 2018 April of pediatric age group i.e. from 0-18 years was considered for the study. Age, status of the case and treatment related variables were obtained from the centre. The period of study was two months (April and May 2018). All the cases registered at the centre whose data were available were included for the study. Data analysis done in the form of tables and percentages.

Findings

Total number of Children (0-18 years) registered at the ART Centre during 2008-18 was 189 among which 54.5% were boys and 45.5% were girls (Table 1). At the ART Centre, 139(73.5%) were on treatment i.e. 75.7% of boys registered and 70.9% of registered girls. Among the 189 registered cases majority i.e. 31.7% belonged to age group between 0-5 years (Table 2). Most of the cases registered were from KUMTA Taluka constituting 14.2% followed by SIRSI with 13.7% cases and the least was seen in JOIDA Taluka with around 2.6% (Table 3). Among the 139 started on ART at the Centre, 73 (52.5%) of them were alive on ART, 17 (12.2%) were reported dead, 38 of them took transfer to other ART Centre. Loss to follow up and Opting out of treatment constituted around 8% of the cases (Table 4). Table 5 shows the status of children who were not initiated on ART.

Discussion

Paediatric HIV infection is worldwide public health challenge disproportionately affecting children in the poorest parts of the world. In our study the enrollment for boy to girl ratio was 1.2:1. A study conducted in Nepal (child discussion) had enrolled ratio of boys to girl as 2.5:1. Only 4.7% of the cases in this study were diagnosed before 2 years of age. This suggests that there is a delay in making diagnosis of paediatric HIV infection. About half of HIV infected children die undiagnosed before their second birthday. Most of them will have acquired HIV in utero or around the time of birth. More than half (50-60% of the children) develop symptoms early in life and, in the absence of timely diagnosis and effective treatment, die by the time they are two years old. Early diagnosis and initiation of ART in children < 2 years of age is of utmost importance since failure to do so may result in rapid progression of disease and early mortality. Majority i.e. 31.7% belonged to age group between 0-5 years, this also shares similarities with the other studies done in India and Nepal by Madhivan et al, Gomber et al and Poudel et al.

Population of Uttarkannada is around 14.5 Lakhs as per 2011 census. Kumta and Sirsi taluka constitute more than 3 lakh Population. In our study highest number of cases were registered from these two Talukas and least cases from Joida taluka which has population less than 55,000. It was seen that 28% of transfer out cases were reported at the ART, this may because of establishment of another ART at Sirsi taluka, for the benefit of patients in and around the taluka.

In our analysis it was found that almost 21% was the mortality among the children in whom ART treatment was initiated. Among these majority were boys (59%) as compared to girls, similarly a study conducted by Ullas Ulahannan et al in Karnataka also showed increased mortality (70%) among males. Loss to follow (LTF) and opt out from treatment was seen among 8% of children. It may be due to in some cases children will be with the care takers due to death of their parents, and the need for follow up might be neglected by the care takers. Loss to followup of mothers and their children challenges the potential effectiveness of the PPTCT program. Even though PPTCT programs report reduced rates of infection among infants tested at 2 months of age, there is limited priority on retention of HIV exposed infants in care. A study from Maharashtra reports that 10.9% and
19.6% of women were LTF before and after delivery. Significant factors associated with LTF included poor education, low economic status, and registration beyond 20 weeks of pregnancy. Although current regimens have substantially and dramatically decreased AIDS related opportunistic infections and deaths, retention in care with lifelong adherence is imperative to achieve and maintain viral suppression as well as prevent drug resistance.

**Conclusions and Recommendations**

Promote counseling, emotional support, and skill building for coping mechanisms for mothers living with HIV/AIDS. Scaling up of infant diagnostic services and strengthening programs to retain HIV-exposed children in care and ensure timely testing for HIV infection. Ensure continued followup of exposed babies for their full participation in postnatal care. Strengthen mechanisms for integrating PPTCT across private sector by means of promoting public–private partnership. Capacity building and sensitization of community level workers on HIV prevention. A comprehensive study including sociodemographic profile, anthropometric data, biochemical data, clinical signs, and dietary intake data among the same group of children will give a better insight into the situation.

Abstract

Background: Asthma patients have a high exposure to different allergens, but have little awareness concerning their specific trigger factors.

Method: A quantitative approach using descriptive research design was conducted among 100 asthma patients were selected through convenience sampling. A trigger factor checklist and a semi-structured questionnaire regarding knowledge level on asthma control were administered. The data analysis was done by appropriate descriptive statistics and principal factor analysis.

Results: In this study, 91% of asthma patients reported that home dust and mites was their major trigger factor, 66% of participants reported that once pre-sensitized to home dust mite it always triggered asthma attacks. The study revealed that home dust mites was the most predominant trigger factor identified in 45% of cases and other interrelated trigger factors noted are climate, pollen and stress/anxiety. We also found that 25% of participants had poor knowledge about asthma control. Majority of asthma patients were unable to pinpoint a specific trigger factors.

Conclusion: If asthma patients can identify and avoid home dust / mites then majority of asthma sudden attacks can be prevented.

Keywords: Asthma, trigger factors, control measures, factor analysis

Introduction

Asthma is a chronic inflammatory disease of the airways presenting in all ages with severity ranging from outpatient treatable exacerbations to those needing ICU admission and ventilators support. Often it is a chronically debilitating disease affecting quality of life even in between exacerbation. In people with asthma the bronchi become overly reactive and more sensitive to all kinds of asthma triggers.1

Globally asthma is one of the most common chronic diseases, and it is estimated that 334 million people worldwide currently have asthma.2 This chronic disease affecting 1-18% population in different countries in all age groups.3 A study estimated that the prevalence of asthma is to be 2.05% among those aged >15 years, with a national burden of 18 million asthmatics.4 In Kerala prevalence of asthma among males was 2.44% while that of females is 3.14%.5

Asthma triggers can be allergic such as dust mites or non-allergic such as exercise, viral infections, smoke or other irritants. It is important to identify both allergic and non-allergic triggers and develop strategies to avoid...
exposures. Due to the influence of the triggering factors most of asthmatics experiences shortness of breath, nocturnal coughing, wheezing, difficulty breathing, and chest tightness during the asthma attack.

Avoidance of trigger factors that exacerbate asthma is an important part of disease control, particularly if the disease is refractory to usual treatment. Even if the trigger factors are not completely avoidable, attempts to reduce their effects may still be possible. Medical advice would then depend on knowledge of the types and range of probable trigger factors for in asthma. However, most prior studies on trigger factors focused on one or a few trigger factors. The influence on knowledge and health outcomes is not fully examined. Poor awareness and knowledge among the patients can influence the progression of asthma. The investigators believe that assessment of triggering factors and asthma control measures are important for asthma management.

Materials and Method

A quantitative approach using descriptive research design was used for the study. The study was conducted in Amrita Institute of Medical Sciences in Kerala. Ethical clearance was obtained from the institutional ethical committee prior to the data collection. Certain refinement was made in the tool based on the pilot study conducted and the investigators collected the clinical sample through convenience sampling technique. A 100 patients with asthma participated in the study. Informed consent was obtained from each participant in the study.

The socio demographic and clinical data were collected using a semi-structured interview schedule. A trigger factor checklist containing 18 trigger factors were given identify their perceived triggers and graded according to the patients perception. The eighteen trigger factors are home dust/mites, climate, pollen allergy, molds, stress/anxiety/emotions, food/additives, animal furs/dander’s/hairs/ feathers, exercises, infections, air pollutants, drugs, cockroaches, air conditioners, citrus fruits, job related chemical exposure, over eating, crowded place and insufficient sleep. The semi-structured questionnaire containing 25 questions designed to measure their level of asthma control which was modified from GINA (2010) guidelines was given to the patients and each subject queries were addressed on a 1:1 basis to avoid inconsistency in data collection. After reading each statement the patients were asked to select a suitable response.

The Principal factor analysis method was used to identify relationship between various trigger factors and to identify the predominant trigger factor. The statistical analysis was performed using SPSS statistical software 17.0 version of Windows.

Results

![Bar graph showing percentage of trigger factors perceived.](image)

Figure 1: Bar graph showing percentage of trigger factors perceived.
The table shows that home dust and mites are the most frequent triggers accounting for about 91% cases of asthma attacks. Trigger factors such as climate, air pollution and job related chemical exposure was about 77%, 64% and 52% respectively. Stress and anxiety (48%), air conditioner (45%), pollen (37%) were the other culprits in the study. Mold and animal trigger factors suspected 34% of the time. Trigger factors like over-eating and insufficient sleep were reported in about 10% of the cases. Trigger factors such as food, infections, exercise and crowded places reported 25%, 20%, 16% and 15% respectively. Cockroaches, drugs and citrus fruits triggers were also involved in the study which showed around 10%.

The table 1 illustrates the proportion according to the grading of occurrence in eighteen trigger factors. Out of 18 trigger factors studied for the 100 patients a substantial proportion (66%) of people reported that dust/mites always triggers the asthma attacks, whereas about 9% of patients never had dust/mites triggered attacks of asthma. On the other hand, trigger factors with citrus fruits accounts the least factor with only 2% of participants reported very often asthma attacks.

The study also identified that number of trigger factor varies from patient to patient. About 15% of asthma patients have minimum 3 trigger factors.
Principal Factor Analysis

The factor analysis disentangles complex interrelationships among variables and identifies which variables ‘go together ‘as unified concepts. The Kaiser Meyer Olkin (KMO) value measured 0.572 which is recommended value to proceed for principal factor analysis. Bartlett’s Test of Sphericity is conducted to test the strength of relationship among variable. The obtained significance level is .000 which is less than 0.05 to get a correlation matrix. The Communalities are extracted by utilizing principal component analysis.

</tbody>
</table>

Extraction Method: Principal Component Analysis.

Table 2 illustrates the total variances explained by each of the extracted components to represent the variations in each of the 18 variables. Each variable is standardized with the maximum variance for each as 1.0. An eigenvalue is obtained and value 1.0 or greater is retained in the study which reflects the proportion of variances explained by the component.

In the presented study seven components out of 18 components with eigenvalue ≥ 1.0 explain almost 75% the total variances. Dust/Mites component whose value is > 1.0 indicates a strong relationship exists among the group of variables under the study.

Table 3: Rotated Component Matrix

Table 3 shows rotation of 7 extracted components whose eigenvalues are greater than 1.0 are loaded and the values greater than .30 gives a good interpretation to the study. A correlation cut off value of .40 is appropriate but can range from-1 to +1. The guidelines for interpreting factor loadings as: .71= excellent, .63= very good, .55= good, .45= fair and .32= poor (Comrey and Lee’s, 1992).

The home dust/mites have very good relationship with grade Pollen (.628) and also have good relationship with animal fur/dander’s/hairs (.581), cockroaches (.566) and job related chemical exposure .541. The home dust/mites have fair relationship with molds (.467), air pollutants (.447) and Air conditioners (.428).

In addition to that climate shows a good relationship with exercise (.510), citrus fruits (.537) and crowded places (.522). Pollen reported a good relationship between insufficient sleep (.576) and molds showed a good correlation with crowded places (.553). Stress/anxiety/ emotions showed a good correlation between exercises (.536) and over eating (.590).

**Knowledge level of control Measures**

(n=100)

![Bar chart showing knowledge level on asthma control measures](image)

*Figure 2: Knowledge level on asthma control measures*
The chart shows the knowledge level of asthma control measures in 100 patients. The study showed that 23% participants thought that their asthma control measure was poor and 8% of participants bought that they have good control to prevent exposure to specific allergens. On the contrary, the study showed that about 69% of patients have a moderate control in preventing acute attacks of asthma.

**Discussion**

This is one among the few studies which evaluated multiple asthma trigger factors in asthma patients. A similar study conducted by Kay Choong, Jason Phual, Tow Keang Lim (2009) to identify the trigger factors in asthma suggests that trigger factors were more common in asthma (93.8%). The study found that there are various trigger factors among asthma patients. The study concluded that knowledge of trigger factors may be useful in optimizing disease management.

The result highlighted that, about 91% of asthma patients in the study reported that home dust and mites were their major triggering factor. The 66% of participants reported that exposure to home dust mites always triggers asthma attacks. All the asthma patients reported at least one trigger factor. A maximum of fourteen asthma triggers identified in one patient.

This findings are comparable to the study conducted by Mao D, Tang R, Wu R, Hu H, Sun L, Zhu H, et al (2014) to determine the clinical profiles and prevalence trends in the characteristics of patients with asthma in Beijing shows that the top 5 allergens were dust (9.1%), mites (8.8%), seafood (8.2%), pollen (6.3%), and animal fur (6%).

As the frequency of home dust and mites was higher, an exploratory factor analysis has been done to identify which variables go together. The study revealed that out of 18 triggers, the first 7 trigger factors retained in the study which represents a relationship between other trigger factors. The retained trigger factors are home dust/ mites, climate, pollen allergy, molds, stress/ anxiety, food/ additives, animal fur/dander’s/ hairs/ feathers. The seven retained trigger factors were again subjected to principal component analysis to get a rotated component matrix which explains the relationship between other trigger factors. The home dust mites contains eight variables or 44.44% of the total 18 trigger factors included in the study and accounts for the most predominant trigger factor which have very good relationship with pollen and good relationship between animal fur/dander’s/ hairs, cockroaches and job related chemical exposure. Moreover it has fair relationship with molds, air pollutants and Air conditioners.

Moreover, the study also finds out the knowledge level of asthma control measures instituted by the patients. The investigators noted that around 25 percent of participants had poor knowledge about asthma control measures and 69% of participants still need further education to better understanding about their disease. The 88% of asthma patients in our study was unable to pinpoint their exact trigger factor which exacerbates their asthma. A similar study result is revealed in a study conducted by Ozturk AB, Ozyigit PL, Kostek O, Keskin H (2015) shows that knowledge of asthma was very low in elderly patients and usual asthma care was largely insufficient.

**Conclusion**

Identifying asthma triggers is a sort of cost effective secondary prevention. The study indicates that home dust/mites are the most common and predominant trigger factor which plays a crucial role in asthma well-being. If this trigger factor is identified and avoidable majority of asthma sudden attacks can be prevented.

Moreover a good asthma control is possible only by identifying and avoiding all the trigger factors. It is a herculean task for the consulting doctor to identify each patients trigger factors and to provide avoidance counseling. More studies should be implemented on each asthma trigger factors and mass education should be done to the public through multifaceted programmes.

Radiation Induced Oral Mucositis: Onset, Severity and Associated Risk Factors among Head and Neck Cancer Patients- A Prospective Observational Study

Prabha Lis Thomas¹, Harmeet Kaur², Karthik S Rishi³

¹Research Scholar, Vice Principal Krupanidhi College of Nursing, Chikabellandur, Carmelaram, Bangalore,

³Radiotherapy, Consultant, Radiation Oncology, Sri Shankara Cancer Hospital and Research Centre, Bangalore

Abstract

Objectives: This study aimed at describing the onset, severity of radiation induced oral mucositis and identifying the factors associated with the development of oral mucositis among patients with head and neck cancer.

Method: This prospective observational study was conducted on 30 head and neck cancer patients who were scheduled to undergo radiation therapy and consented to participate. Data was collected by using a baseline Performa and WHO Oral Toxicity scale. The patients were followed up during the entire course of radiation therapy and were weekly monitored for the development of oral mucositis. The data was analysed using descriptive and inferential statistics.

Result: The present study findings revealed that oral mucositis developed in all head and neck cancer patients receiving radiation therapy with a predominance of grade 3 mucositis. Therapy related factors including cumulative and fractionated radiation dose and receipt of concurrent chemotherapy as well as patient related factors such as previous smoking and tobacco chewing habits were associated with a high risk of oral mucositis.

Conclusion: The study findings suggest that oral mucositis is a common acute reaction during head and neck irradiation and appropriate risk based interventions are needed to reduce the severity of mucositis.

Keywords: Radiation induced oral mucositis, onset, severity and risk factors

Introduction

Radiotherapy plays an important role in the treatment of head and neck cancer and is an effective treatment modality to kill cancer cells and to control tumour growth. Radiotherapy is used alone or in conjunction with surgery or chemotherapy. Evidences show that multimodal cancer therapy or aggressive single modality increases the tumour control and cancer survival at an expense of increased patient morbidity and acute side effects¹. Patients undergoing radiation receive a succession of fractionated radiation doses, which in cumulative doses can trigger multiple pathways to initiate mucosal injury². The rate of mucosal damage is directly related to the rate at which cells divide and hence normal tissues with rapid cell proliferation, such as mucous membranes and skin epithelium are at a greater risk for developing radiation induced injury³.

Oral mucositis is one of the most common complications that head and neck cancer patients experience during radiotherapy, with an incidence rate of nearly 100 %⁴. Radiation induced oral mucositis is defined as a reactive inflammation-like process of the oral and oropharyngeal mucous membranes and tongue after radiation exposure⁵. The severity of mucositis is determined by fractionated and cumulative dose, volume of irradiated tissue⁶ and the severity increases throughout the course⁶. Oral mucositis presents as erythema of the oral mucosa in the first 2–3 weeks of
radiation therapy and progresses to ulceration and pseudo membranes as the dose of radiation increases\(^7\). A prospective study conducted on 135 head and neck cancer patients receiving radiation therapy reported an incidence of mucositis grade 2, 3, and 4 in 82% of patients and ulcerations were initiated at a mean of 14.6 radiation fractions\(^8\).

Mucositis causes significant pain and functional changes such as difficulty in speaking, swallowing and dysguesia\(^9\). Oral mucositis pain along with functional changes interfere with the patient’s ability to eat and drink and can lead to weight loss predisposing them to secondary infections and nutritional deficiencies. Hence Radiation-induced oral mucositis has also a significant economic impact due to costs associated with pain management, liquid diet supplements, gastrostomy tube placement or total parenteral nutrition, management of secondary infections and hospitalizations\(^10, 11\). Furthermore, patients with severe mucositis are at higher risk of unplanned breaks/delays in radiation therapy, adversely affecting tumour control and treatment outcomes\(^8\).

Understanding the risk factors of oral mucosal reactions could facilitate accurate treatment plans to minimize the incidence and severity of reactions. Despite an increased frequency and profound clinical impact, the risk factors of oral mucositis in head and neck cancer patients have not been well defined. Currently many factors have been identified to have an association with mucositis and include poor oral hygiene and periodontal disease, chronic alcohol consumption, cigarette smoking, hypo salivation, low body mass index \(\text{BMI} < 18.5\), age, gender, concurrent diseases such as diabetes mellitus\(^13\), tumour location, a cumulative radiation dose 5000 cGy, and concomitant chemotherapy \(^11\).

In the current study, interrelationship between patient characteristics, therapy related factors, and the occurrence of oral mucositis was statistically analyzed. Since oral mucositis is one of the most frequent dose limiting complications of radiation therapy in head and neck cancer patients, identifying the risk factors will be of great value to the researchers, health care planners and care providers in planning more effective individualized risk based treatment for patients.

**Materials and Method**

The study employed a descriptive approach and histopathologically confirmed patients of head and neck cancer scheduled to receive radiotherapy were selected randomly as per the inclusion criteria. Exclusion criteria included patients younger than 18 years and patients with co morbid conditions (poorly controlled diabetes mellitus, hypertension, schizophrenia, bipolar disorders, and severe depression). The subjects were followed up during the entire course of radiation therapy.

**Data collection method**

Base line Performa was used to collect demographic data and WHO toxicity criteria was used to grade mucositis based on soreness, erythema, presence of ulcerations, ability to swallow solid food and the extent to which alimention is not possible. It categorized the severity of oral mucositis in to 4 grades on a 4 point scale ranging from 0-4. A single calibrated observer measured the grades at baseline before starting of radiation and every week till the end of therapy.

**Statistical analysis**

The data were typed into an Excel spreadsheet, and the software program used to obtain the statistical calculation was SPSS (Statistical Package for Social Sciences; IBM Corporation, Armonk, NY, USA) version 23.

**Results**

A total of 30 patients who fulfilled the eligibility criteria were included in the study and the study comprised of 77% males and 23% females. 57% of them were aged above 60 years and 23% of them were educated up to higher secondary. It was found that 56.66% were ex-smokers and 37% of them had a prior history of tobacco chewing. None of the respondents were smoking or using tobacco during the treatment course. Among the respondents who reported a history of smoking habits \(n=17\), 70% of them had a history of 10 pack years of smoking and the remaining \(30\%)\) had 11-20 pack years of smoking. Primary tumor sites were oral cavity \(63\%\), Laryngeal cavity \(23\%\), and pharyngeal cavity \(13\%\). A high proportion of tumours were classified as T2 \(44\%)\), followed by T3 \(30\%)\); T4 \(23\%)\) and T1 \(3\%)\) and 92% of the subjects had undergone surgical resection of the primary tumour site. Majority \(47\%)\) of the patients received a cumulative dose of 70 Gy and a fractionated dose of 2Gy per day \(73\%)\). 46.66% of the subjects received concurrent
chemotherapy during radiation and all of them received Cisplatin. Fifty percentages of the subjects had a normal BMI and 10% of the subjects were obese.

The analysis revealed that all the subjects developed radiation induced oral mucositis. Oral mucositis was categorized in to tolerable (grade1&2) and intolerable mucositis (grade3&4) based on the severity. It is observed that 43% developed grade 1 or 2 mucositis at the end of first week, and this percentage was increased to 76% by the end of second week, 83% by third week and all the subjects developed tolerable or intolerable mucositis by third week. Intolerable mucositis appeared by the end of second week in 7% of subjects and this percentage was increased gradually to 83% in sixth week and all the subjects who received radiation for 7 weeks developed intolerable mucositis by the end of the therapy. One subject developed grade 4 mucositis by the end of third week and the number of subjects with grade 4 mucositis was increased to 4 by the end of sixth week (fig1). Ryle’s tube feeding was started for all the subjects who developed grade 4 mucositis. Chi square analysis revealed a significant association between previous smoking and tobacco chewing habits, fractionated and cumulative radiation dose and receipt of concurrent chemotherapy with development of intolerable Mucositis (Table1).

## Discussion

Oral mucositis, an important sequel of cancer therapy is characterized by generalized erythema, pseudo membranous degeneration, frank ulceration and haemorrhage. The incidence of oral mucositis has been described as ubiquitous among patients with head and neck cancer treated with conventional chemo radiation regimen. It has been observed that all the participants developed RIM during the course of treatment and grade 1 mucositis was present by the end of first week (10Gy) in 43% of subjects. Analysis revealed a higher incidence of oral mucositis between third and seventh week of treatment with a predominance of grade 3 mucositis.

The current study reveals that oral mucositis is a very common side effect of radiation therapy to head and neck. The study findings are correlated with the findings of a study conducted on 30 Head and Neck cancer patients receiving IMRT which described a significant increase in incidence and severity of oral mucositis starting from second week of radiation and a 100% incidence of radiation induced mucositis by third week of radiation with a predominance of grade 3 in fourth week. Similar findings are reported by a retrospective study consisting of 204 consecutive head and neck cancer patients in which oral mucositis occurred in 91% of subjects with a predominance of severe mucositis (66%) where as in the present study all the subjects (n=19) who continued the treatment for seven weeks developed grade 3 mucositis. The difference in incidence of intolerable mucositis may be due to the characteristics of the subjects as majority of subjects (63%) in the present study were with cancer of oral cavity and the volume of oral mucosa that is exposed to radiation has an influence on the severity of oral mucositis. The consistency of these findings substantiate the clinical significance of radiation induced oral mucositis.

A variety of patient related factors have been reported by the literature which can increase the potential of developing oral mucositis during chemo radiation including age of the patient, nutritional status, type of malignancy, prior or current history of tobacco or alcohol use. There are conflicting data relating to the effects of age on the development of mucositis. In general, younger patients appear to have an increased risk of chemotherapy-induced mucositis as cells with high mitotic activity are more sensitive to radiation. The current study did not find any association with age and the severity of mucositis. A prior history of smoking and tobacco chewing was found to be associated with a higher incidence of oral mucositis. The degree and duration of mucositis has been reported to be directly related to the treatment factors such as total dose and fraction, the volume of tissue treated and the receipt of concomitant chemotherapy. Cumulative and daily dose of radiation, previous smoking and tobacco chewing habits and receipt of concomitant chemotherapy were found to have significant association with an increased

The consistency of these findings substantiate the clinical significance of radiation induced oral mucositis.
risk of oral mucositis. The current study is limited to a small sample size of 30 and to a single setting. Even though there are conflicting views on patient related and therapy related risk factors of oral mucositis, defining the most important factors associated with occurrence of oral mucositis will be very useful to improve patients’ performance status during chemo radiation.

**Conclusion**

The present study confirms that oral mucositis is a common complication among head and neck cancer patients receiving radiation therapy with a higher incidence of severe mucositis from third to seventh week of radiation therapy. Identification of risk factors which can predict the severity of oral mucositis is useful in teaching the patients to detect the signs of mucositis and to overcome its effects.

**Conflict of Interest:** Nil

**Ethical Clearance:** The study was approved by the hospital ethical committee. Patients and their caregivers indicated their willingness to participate in the study after the details of the study had been explained to them. The subjects were also informed that they had the right to withdraw from the study at any time during the course of the study and written informed consent was obtained from them.

Effectiveness of a Multicomponent Intervention Programme on Blood Pressure of School Children

Sunil Moothedath¹, Valsamma Joseph²
¹Professor and Head, Department of Child Health Nursing, Amrita College of Nursing, Amrita Vishwa Vidypeetham, Kochi, India, ²Principal, Govt. College of Nursing, Thrissur

Abstract

A study was conducted to find out the Effectiveness of a Multicomponent Intervention Programme on blood pressure of school children from selected schools of Kerala. Objectives of the study: (1) To find out the prevalence of pre hypertension and hypertension among school children. (2) To find out the effectiveness of a multi component intervention programme on blood pressure of school children

Methodology & Design:
Evaluative research approach with pre-test post-test control group design was used. 220 school children with pre hypertension in the age group of 13-16 years studying in 8th and 9th standards were included using simple random sampling in the study after screening 1328 children. A multi component intervention programme aimed at diet, exercise and lifestyle modifications of school children was then implemented.

Results:
The prevalence of pre systolic hypertension and pre diastolic hypertension among the study population was 265/1000 and 226/1000 respectively. The mean systolic blood pressure in the experimental group was significantly reduced after the multi component intervention programme (117.23 ± 5.36) compared to pre-test (119.25 ± 4.90). There was a significant association of systolic blood pressure of school children only with their class of study (χ²= 4.98, p=0.026).

Conclusion: Multi component intervention programme was effective in reducing the blood pressure of school children. The results of the present study is very much encouraging that similar programmes can definitely help in controlling life style diseases among children which is an emerging public health problem.

Keywords: Blood pressure, prehypertension, systolic blood pressure (SBP), diastolic blood pressure (DBP), school children, multicomponent intervention programme.

Introduction

Healthy children only can build a healthy nation. The foundation stone of many adulthood diseases including hypertension are laid in the childhood itself. It is well known that blood pressure (BP) increases consistently from infancy to adolescence. The lifestyle of the present generation is such that they are more prone to these types of conditions. Elevated blood pressure in children and adolescents may be an early expression of essential hypertension in adulthood. Hypertension has been identified as a major health problem globally and is an important risk factor for the development of coronary artery disease and stroke. It was estimated that around 1 billion of the adult world population was found to have hypertension in the year 2000 and this is expected to increase 1.56 billion by 2025. Though hypertension is mostly a problem of adults, its etiologic process starts in childhood. Studies have documented a 1-2% prevalence of childhood hypertension in the developed countries and 5-10% in the developing countries. Various Indian studies have also shown a prevalence which ranges from 0.96% to 11.4%. A cross sectional study was done to find the prevalence of sustained hypertension and pre hypertension among school children aged 11-17 years. A total of 1085 apparently healthy students from rural
and urban schools from northern India were examined. Hypertension was identified in 62 (5.9%) children and pre hypertension in 130 (12.3%). Rates of elevated BP were significantly higher (46.5% vs 17%, \( P<0.001 \)) among those with high body mass index (BMI) compared to those with normal BMI. The study concludes that nearly 20% of the school children had elevated blood pressures. Another study conducted among 24,842 school children from Kerala showed that 10.1% of children with normal weight, 17.34% of children with overweight and 18.32% of children who are obese were having hypertension. Another study was conducted to assess the prevalence of cardiovascular risk factors among school children of Delhi. They performed a cross-sectional survey among 485 school children studying in classes 6, 7 and 8 in two government and one private schools in New Delhi using convenience sampling. The prevalence of pre hypertension, stage 1 hypertension and stage 2 hypertension was 12.4%, 6.8% and 1.4% respectively. The study concludes that there is a notable prevalence (20.4%) of pre hypertension and hypertension among the study group.

It is very evident from these studies that the prevalence of hypertension and pre hypertension is a matter of concern as it is a childhood antecedent of serious cardiovascular disease conditions at a later age. It is important that clinical measures be taken to reduce these risks and optimize health outcomes. Early detection and prompt intervention are the two important strategies of reducing the morbidity and mortality rates of any disease conditions as well as in reducing the complications. The present study is one such attempt to find out the effectiveness of a school based intervention programme in reducing the future risks of hypertension among school children.

Objectives of the Study were to find out the prevalence of pre hypertension and hypertension among school children and to find out the effectiveness of a multi component intervention programme on blood pressure of school children

**Methodology**

The research approach was evaluative approach with pre-test post-test control group design. The study was done among children in the age group of 13-16 years from selected schools of Ernakulam district of Kerala State. The study was done on 220 (110 in experimental and 110 in control group) pre hypertensive school children selected randomly. Total enumeration method was used for the initial screening. Students from 8th and 9th standards (age 13-16 years) were taken from ten schools selected randomly from Ernakulam district. After the screening 1328 children, 381 children were found to have pre systolic hypertension or pre diastolic hypertension (Pre SHT/ Pre DHT) with blood pressure between 90th and 95th percentile or both. All these pre hypertensive children were considered for the study. The ten schools were then randomly divided into two groups (control and experimental). 110 children from each group of schools were selected randomly for the study. The multi component intervention programme (MCIP) was implemented for the experimental group. The blood pressure of both groups was checked at 4th month and 8th month and a reinforcement of the educational programme was done using an information leaflet only for the experimental group. Finally the blood pressure was done at 12th month for both the groups.

**Multi Component Intervention Programme (MCIP):** A systematically planned educational programme which provides information on childhood hypertension and the measures to be taken to prevent the development of hypertension (healthy lifestyle practices including diet, exercise, stress reduction etc.) with an intention to improve the knowledge, attitude and practice of school children on prevention of hypertension. This programme was implemented through direct teaching in two sessions of 45 minutes each and supplemented by information leaflet

**Ethical Clearance:** Ethical clearance was obtained from the Institutional Ethical Committee of Amrita Institute of Medical Sciences.

Data analysis was done on 210 samples (106 and 104 children respectively in the control and experimental groups, after attrition of 10 samples) using descriptive and inferential statistics.

**Results**

Majority of the subjects (63.2% in the control and 61.5% in the experimental groups) were 14 years old. Out of 106 school children from the control group, 56.6% were males and 43.4% were females. Out of 104 school children from the experimental group, 54.8% were males and 45.2% were females. Majority of the school children in the control group and experimental
group were from nuclear families (74.5% and 80.8% respectively). Majority of the school children in the control and experimental groups (81.1% and 79.8% respectively) were non-vegetarians.

Majority of the school children in the control and experimental groups (67% and 76.9% respectively) were having no family history of hypertension. School children in the experimental and control groups were homogenous in terms of the background variables (p>0.05).

ANCOVA was done to confirm that the baseline blood pressure status has not affected the post test means of the blood pressure values of the control and experimental group. After adjusting the post test means of systolic blood pressure (SBP) values, the experimental group had lower mean systolic blood pressure values than the control group. The difference was significant in the mean post test SBP values at 8th and 12th months (F=4.89; p=0.028 and F=29.08; p=<0.001 respectively). Hence it can be concluded that the MCIP was effective in reducing the systolic blood pressure of the experimental group.

ANCOVA was done to confirm that the baseline blood pressure status has not affected the post test means of the blood pressure values of the control and experimental groups. After adjusting the post test means of diastolic blood pressure (DBP) values, the experimental group had lower mean diastolic blood pressure values than the control group. But the difference was statistically significant only in the mean post test DBP values at 8th month (F=12.67; p=<0.001) even though the mean diastolic blood pressure value was lower at 12 months in the experimental group.

There was a significant association of systolic blood pressure of school children with their class of study. No significant associations were found between other variables under study.

Also there were no associations found between diastolic blood pressure and any of the socio demographic variables under study.

Discussion

The findings of the screening showed a similar status of blood pressure in school children as showed by many previous research studies. The studies conducted
by Avinash Sharma et.al, Akis N et.al, Nogueira PC et.al, Anand T et.al, Manuraj et.al, Buch N et.al and Nkeh-Chungag BN et.al supports the findings of the present study. The multi component programme which is an educational intervention programme was the crux of the study. The programme was aimed at improvement of the knowledge and attitude of the children thereby developing a healthy lifestyle practice. Several such attempts are made by many researchers elsewhere but hardly very few efforts were done in the local settings of Kerala with regard to childhood hypertension. The present study findings are in congruence with the results of studies conducted by Grad I, Jan S et.al, Taha AZ, Meagher D, Mann KV, Yan Ping Wan, P.D Angelopoulose et.al, McMurray et.al, Subramanian H et.al, and Cai L et.al.

The findings of the present study show that hypertension among school children is a health concern not only of the developed countries but of developing countries like India. Life style modifications will definitely have an impact in reducing such health problems.

**Conclusion**

The study was an attempt towards reducing the chances of hypertension by modifying the life style of school children. The multi component intervention programme was effective in reducing the systolic blood pressure of school children. Though it was a humble beginning on a relatively small group, this gives a ray of hope that a definite change can be made with collective effort on a large scale. The present study could achieve its objectives. This was a good attempt in addressing a very important and emerging health problem among children. The results of the study were in congruence with the findings of the results of the previous researches.

Abstract

Introduction: Obstructive sleep apnea (OSA) is defined by the number of apnea and hypopnea episodes per hour of sleep (apnea–hypopnea index, AHI), reflecting the degree of departure from the normal physiology of breathing during sleep. It can be influenced by both genetic and environmental factors. From the literature it is evident that the polymorphism of ACE gene is linked to various disorders. The study aims to chart the polymorphism of the ACE gene in the OSA patients.

Material and Method: A total number of 100 subjects (50 OSA and 50 control) were involved in the study. ACE gene I/D allele and genotypes distribution were analyzed in both the OSA and the control group. The data collected was subjected to statistical analysis.

Results: The study showed that there was a higher frequency of I allele in the patients with OSA. Patients with sleep apnea had a higher frequency of II genotype, compared to control group.

Conclusion: It is evident from the study that the higher frequency of I allele is associated with the presence of Obstructive sleep apnea. Hence, ACE gene polymorphism might be useful to ascertain the risk of developing OSA.

Keywords: Alleles, Angiotensin converting Enzyme, Genetic Polymorphism, Genotype, Renin-Angiotensin System, Obstructive Sleep Apnea,

Introduction

The obstructive sleep apnea (OSA) is characterized by episodes of partial or total upper airway obstruction during sleep with airflow interruption. This is caused by any obstruction in the upper-airway at the pharyngeal level despite normal functioning of the respiratory muscles. This phenomenon is accompanied by decrease in oxygen saturation and increased carbon dioxide saturation in the blood. The patient experiences transient awakening, which helps in reestablishing the upper airway permeability. Consequently, the patient usually complains of fatigue and excessive daytime drowsiness, attention or memory impairment, and habitual snoring history¹.

According to The American Academy of Sleep Medicine, OSA can be diagnosed by the number of apnea/hypopnea events during sleep, which is known as the apnea-hypopnea index (AHI). The AHI index measures the number of events occurring per hour of sleep. The repetitive occurrence of these events contributes to disturbed sleep which results in excessive daytime sleepiness. The American Academy of Sleep Medicine considers OSA severity by the AHI classification (mild—5 to 15; moderate—15 to 30, and severe—>30) and by the degree of daytime drowsiness (mild: unwanted drowsiness or involuntary episodes occurring during activities. The gold standard for diagnosing Obstructive Sleep Apnea is Polysomnography².

The major risk factor for OSA is obesity around the cervical and abdominal region followed by structural abnormalities of upper airways, which decrease airway patency due to fat deposition around the collapsible region of the pharynx resulting in narrowing of the area. Most affected patients are men compared to women which may be because of the longer pharyngeal portion of upper airway and larger fat deposits around it³.

The etiology of OSA is not yet fully understood. It may be due to a combination of structural, genetic predisposition and hormonal factors. Genes which influence the risk of OSA, demonstrate polymorphisms which have been observed to occur in diseases of similar pathogenesis to OSA. Apolipoprotein E gene (APOE), leptin and leptin receptor genes, pro-inflammatory cytokine genes including TNFA1, IL-6, IL-1, as well as β2-adrenergic receptor gene (ADRB2) and angiotensin converting enzyme gene (ACE) are some of the genes involved in the risk of OSA⁴.

Numerous polymorphisms have been identified recently about the genetic polymorphisms of the angiotensin converting enzyme gene and its correlations with various disorders.⁵ In 1990, Rigat et al⁶ studied the polymorphism for the first time. The polymorphism consisted of insertion or deletion of 287 base pairs within one of the noncoding parts of the ACE gene. This alteration can result in three genotypes which affect activity of angiotensin converting enzyme (II, DD, ID). Allele D is believed to be associated with 60% higher activity of serum ACE. Homozygotes DD have maximal ACE activity while heterozygotes ID have intermediate activity. II genotype (lack of D allele) has the lowest serum ACE activity. Genotype DD of the ACE gene therefore leads to increased production of angiotensin II and increased inactivation of bradykinin. Significant correlation was observed between polymorphism of the ACE gene and cardiovascular morbidity and mortality. Subjects with DD genotype of the ACE gene had increased risk of myocardial infarction, hypertrophy of the left ventricle, post-infarct myocardial remodeling, and idiopathic arterial hypertension.

The aim of the study was to assess the incidence of insertion/deletion polymorphism of the ACE gene in patients with obstructive sleep apnea and healthy subjects, as well as to analyze the influence of this polymorphism on the risk of OSA occurrence in Indian population.

**Material and method**

The present study was approved by the Institutional Human Ethics committee, Institute of Medical science and SUM Hospital, Bhubaneswar, Odisha (DMR/IMS-SH/SOA/10657). A written informed consent was obtained from all the participants after giving the information sheet and explaining the procedure (Source of funding- Self).

The study group consisted of 100 participants (50 case and 50 control, aged 25–40 years). The cases were selected on the basis of type 4 sleep study data with an AHI of 15 or more to confirm the patients with moderate to severe OSA. The patients with history of cardiovascular disease, asthma and other medical histories were excluded from the study.

Patients were first evaluated using Epworth Sleepiness scale, developed in Epworth, Australia (Epworth Sleepiness Scale, ESS). The questionnaire consists of eight questions concerning the patient’s daily activity. Interpretation of the answers may disclose mild (< 10 points), moderate (10–16 points), or marked somnolence during the daytime (> 16 points), which requires further diagnostics.

Patients with scores more than 16 underwent the home sleep study to confirm OSA and after the confirmatory diagnosis these patients were included in the OSA group.

The control group were selected from the questionnaire-based study with the ESS score less than 10 and with no history of snoring and disturbed sleep.
Each participant from the study as well as control group filled in a written informed consent and a venous blood sample was collected for genetic testing. Blood samples were collected into tubes containing ethylene diamine tetra acetic acid (EDTA) and stored at –20°C. Isolation of DNA from peripheral blood was performed using HiMedia DNA kit (HiMedia, USA).

The DNA was amplified using the Forward Primer: 5’CTGGAGACCACTCCCATCCTTTCT3’ and reverse primer 5’GATGGTGGCCATCACATTCGTCAGAT3’ to study the polymorphism site of the ACE gene (insertion/deletion). Polymerase chain reaction (PCR) was performed in the Mastercycler pro vapo.protect™(Eppendrof) with the following sequence: initial denaturation at 96°C for 15 min, followed by 30 cycles of denaturation at 95°C for 30 s, hybridisation with starters at 61°C for 30 s, and elongation at 72°C for 2.5 minutes. After completion of all cycles, final elongation occurred at 72°C for 10 minutes.

The obtained PCR products were 190 base pairs (bp) for allele D or 480 bp for allele I. 2% agarose gel with ethidium bromide was used for Separation of DNA. After completion of electrophoresis, DNA bands were visualised using transiluminator under UV light.

For homozygous genotypes II and DD, a single band was present, representing 490 bp product or 190 bp product, respectively. Electrophoresis of PCR products from heterozygous ID subjects produced two bands simultaneously: one of 490 bp and one of 190 bp. Chi-square test was used to analyze the association of various alleles and genes in OSA and control group.

Results

In the group with OSA, II genotype was found in 20 persons (40%), ID genotype in 22 (44%), and DD genotype in 8 (16%). Incidences of respective genotypes in the control group were as follows: II genotype in 16 patients (32%), ID genotype in 18 (36%), and DD genotype in 16 (32%). No significant differences were observed in the incidence of respective ACE genotypes between the study and the control group. However, II genotype was observed more often in patients with sleep apnea than in the healthy patients (p = 0.116).

Furthermore, I allele (both II homozygotes and ID heterozygotes) was more frequently identified in OSA subjects (42 persons, 62%) than in healthy patients (34 patients, 50%; $\chi^2 = .890$).

Discussion

Obstructive sleep apnea is multifactorial in nature, involving genetic factors, obstruction in the upper airway, obesity etc. Currently the association of OSA with various genes is being studied to determine the potentially susceptible gene. The angiotensin-converting enzyme (ACE) contains 26 exons and 25 introns and is located on chromosome 17q23. ACE is essential in converting angiotensin I into angiotensin II, which is mainly an effector molecule in the renin–angiotensin–aldosterone system (RAAS), and RAAS activation may have a role in the development of obstructive sleep apnea (OSA). Most studies published till date highlight the relationships between ACE activity and ACE polymorphism, risk of OSA complications, including arterial hypertension, as well as the occurrence of other diseases coexisting with OSA.

In this study genetic testing is performed in order to assess the incidence of insertion/deletion polymorphism of the ACE gene in patients with OSA and in healthy control subjects presenting no respiratory disturbances during sleep.

Distribution of II, ID, and DD genotypes did not differ significantly between the two groups, although the II genotype was slightly more frequently present in subjects with OSA. These results are in line with data published by other researchers.

In the present study it was found that in the patients with OSA there is an increased incidence of I allele and significantly lower incidence of D allele of the ACE gene. In the healthy patients there was equal distribution of I and D allele. So it may be concluded from the present study that the presence of I allele positively correlated with the risk of OSA development. The results of this study was similar to the study done by A Barcelo et al.

Renata Rubinsztajn and Ryszarda Chazan analyzed ACE polymorphism in 62 persons with OSA and identified the II genotype in 23.8% of patients, ID genotype in 47.6%, and DD genotype in 28.6%.

In a study done by Ogus et al in a Turkish population, no significant differences was observed in the incidence of the respective ACE genotypes between patients with OSA and healthy persons; however, the
I allele was identified more frequently in patients with sleep apnea than in control subjects \( (p = 0.02) \), and the risk of developing apnea in group of I allele carriers was 2.41. These authors suggest that II and ID genotypes of the ACE gene may correlate with a higher risk of developing apnoea in the Turkish population was similar to our study.

The increase in I allele lowers the ACE level, increasing the risk of OSA development. The lower ACE level reduces the vasoconstriction which may increase the collapse and obstruction of the upper respiratory tract leading to the development of OSA\(^{10,11}\).

Correlation between ACE gene polymorphisms and the risk of developing cardiovascular diseases in patients with OSA have been extensively studied. Koyama et al.\(^ {12}\) found that I allele occurs commonly in men with arterial hypertension and mild-to-moderate sleep apnea. These results led to the hypothesis that the presence of I allele of ACE gene in men suffering from arterial hypertension has a protective effect against severe OSA. This study had included 266 Brazilian patients with OSA.

Lee et al.\(^ {13}\) conducted a study on subjects of Asian ethnicity. The study considered 1,227 patients with OSA and 1,227 healthy subjects. No correlation was found between ACE gene polymorphism and risk of OSA development or disease severity. The presence of either I or D allele did not have any correlation with the risk of development of OSA. This study is not in accordance to the current study.

Zhang et al.\(^ {14}\) in their study showed that I allele of the ACE gene occurs more frequently in subjects with coexisting arterial hypertension and moderate-to-severe OSA as compared to healthy persons. No such correlation was observed for I allele in patients with arterial hypertension and mild OSA versus control persons. Central obesity in patients with OSA and hypertension correlate with the presence of the D allele in the ACE locus. However, polymorphisms of the ACE gene were not investigated in patients with OSA who did not have arterial hypertension. Furthermore, the study was based on 174 patients of Asian origin, coming from the Han population, thereby hindering direct result comparison with studies concerning Caucasian subjects, even though the results seem to be similar.

Wisconsin Sleep Cohort Study done on 1,100 mostly Caucasian participants, highlighted the correlation between ACE gene polymorphisms and risk of arterial hypertension in patients with OSA. Lin et al.\(^ {15}\) showed that the risk of developing arterial hypertension in patients with mild-to-moderate OSA is correlated with presence of the D allele. These authors found significant increased arterial pressure in subjects with DD genotype, and lowest effect for the type II genotype. This correlation was found to be significant for patients with mild OSA.

Similar results were shown by Bostrom et al.\(^ {16,17}\), who compared 157 patients suffering from OSA and arterial hypertension with 181 persons suffering from OSA but with no history of hypertension. Irrespective of the OSA severity, the presence of the D allele indicated an increased risk of developing arterial hypertension in patients with sleep apnea. These results were contradictory to those published by Patela et al.\(^ {18}\), who observed 972 subjects during the Cleveland Family Study. The described a lower risk of arterial hypertension in carriers of the D allele in the ACE gene locus.

**Conclusion**

From the present study it is evident that the patients with OSA and the healthy patients had similar genotype distribution for ACE. The patients with OSA had increased presence of I allele whereas healthy patients had similar distribution of both I and D allele. The II genotype presented a higher frequency in the patients with Obstructive sleep apnea. Based on the present study it may be concluded that the presence of I allele might have an increased risk of developing OSA.

Role of Physiotherapy Post Renal Transplantation - A Case Report

Charitha Matta1, Peteti Sairam1, P Kamalanathan2, A Sankarganesh1, R Padmanaban4

1MPT Students, 2Associate Professor; 3Assistant Professor; 4Professor and Head, Department of Nephrology, SRM Institute of Science and Technology, Kattankulathur

Abstract

Introduction: Physiotherapy is widely used in the renal transplant intensive care unit to minimize post-operative respiratory and musculoskeletal complications. Patients undergoing kidney allotransplants need help in recovery. Improvement of health status after the intervention depends in large measure on cooperation of the therapeutic team. For many physiotherapists, rehabilitation after transplantation becomes a problem with such patients, and there is very sparely available data in the literature about methods for encouraging patients to exercise. Hence this study was taken. Objective: To assess the changes in, pulmonary, physiological and renal outcome in patient with renal transplant. Methodology: A case of chronic kidney disease was reported to SRM General Hospital, Chennai and planned for renal transplant, post operatively patient complaints of pain over lower abdomen and right side while moving around the bed and during sitting. Patient underwent physiotherapy for 2weeks in SRM General Hospital and followed up for three months. Physiotherapy Intervention program including chest physiotherapy, early mobilization and therapeutic exercises was given following which physiological parameters, hemoglobin and renal profile. Results: The improvement in physiological parameters and hemoglobin. There has been a modest improvement in vo2 max. Conclusion: An individualized post renal transplant physiotherapy intervention improved pulmonary and physiological outcomes than renal outcomes in renal transplant.

Keywords: post renal transplantation, physiotherapy, exercise, Vo2max, MET.

Introduction

In last two decades, renal, heart, liver and lung transplantations have become common, successful and progressively improved, among which renal transplantation is the most frequent.[1] Although the number of successful transplantations increases, new challenges have arisen in the management of long-term complications of transplantation.[2] Even successfully transplanted renal transplant recipients (RTRs) suffer from hypertension (HTN), coronary artery diseases, skin cancers, diabetes, bone diseases, and various infections. Survival is compromised by an increased cardiovascular risk.[3-6] The cardiovascular events are represented as one of the major causes of death among RTRs.[1,3,5,7] Incidence and prevalence rate of cardiovascular disease (CVD) are four to six times higher in RTRs compared to the general population.[8] Among RTRs, HTN, obesity, anemia, muscle wasting, and use of immunosuppressive drugs commonly coexist as long-term complications.[3,8-10]

Pharmacological treatments alone cannot efficiently reduce all cardiovascular risks. It also does not efficiently improve work capacity and quality of life including biological and psychological problems. Furthermore, immunosuppressive drugs have their own side effects such as excessive weight gain, HTN, dyslipidemia, and muscle wasting.[3-5] Moreover, after a successful renal transplantation, 83% of RTRs have a tendency that does not go back to work due to depression such as complex phenomenon and this type of sedentary lifestyle is also
one of the risk factors for CVD\textsuperscript{[4,9,11]} Incorporating “non-pharmacological” therapies such as physical training which are able to reverse this trend is very important\textsuperscript{[3]}

**Methodology**

This is a single case report to analyze role of Physical therapy intervention on physiological outcome in a patient with renal transplantation the study was conducted at SRM medical college hospital and research institute Chennai, the subject was taken from a surgical intensive care unit.

**Case Report**

A 44-year-old male, presented at our institute with complaints of abdominal pain, shortness of breath while walking 15–20 steps on a level surface and reduced work capacity. He was investigated and diagnosed to have End stage renal disease with haemodialysis and underwent living donor (wife) renal transplantation on 24\textsuperscript{th} October 2017. He was a nonsmoker and a known case of HTN for 10 years. He was diagnosed with chronic kidney disease. In the subsequent years, he complained of having mild dyspnea during routine work, weakness, fatigue, and weight gain of 4–5 kg within 2 months. However, he ignored the complaints.

However, after 2 months, dyspnea at rest was present with pitting pedal edema extending up to the knees (bilateral). On consulting the nephrologist, he was diagnosed with chronic kidney disease (CKD) stage 4 with abnormal laboratory findings (serum creatinine-5 mg/dl, estimated glomerular filtration rate [GFR]-23 mL/min/1.73 m2). Gradually, the subject progressed to end stage kidney disease (serum creatinine: 19 mg/dl, estimated GFR <15 ml/min/1.73 m2). A planned live allograft renal transplantation (willingly given kidney by his wife) was performed after HLA typing and negative Centers for Disease Control and Prevention cross match. The subject was monitored in the intensive care unit for 15 days before he was transferred to the ward. He was discharged after 6 days in ward advised for routine laboratory investigations which include complete blood count, serum creatinine, serum glucose, and BUN at every week for 2 month.

**Physiotherapy Intervention**

**Procedure:**

The ICU patients who referred for physiotherapy were included for the study after obtaining informed consent from the patient / patient care taker.

In the institutional setup from day 1 of post operation to 15 days of post operation, patient underwent various aerobic and anaerobic exercises include Day 1–5\textsuperscript{th} Deep breathing exercises, Chest expansion exercises, Chest physiotherapy(percussion), Ankle and Toe movements, Alternate leg slides, Incentive spirometry (600cc/sec). Patient made to sit with support. On 5\textsuperscript{th} day patient made to walk with in the ICU (4 rounds) (RPE 10), These exercises are followed for Frequency: 6 days/week, Intensity: 10 RPE, Time: 30 min/session. From Day 6\textsuperscript{th}– 10\textsuperscript{th} the exercises were progressed based on the patients exercise capacity AROM and Strengthening exercises to bilateral upper and lower limbs, Deep breathing exercises, Chest expansion exercises, Chest physiotherapy (percussion), Incentive spirometry (1200cc/sec), patient Made to walk around the ICU (6 rounds) (RPE 13). Day 11\textsuperscript{th}–15\textsuperscript{th} AROM and Strengthening exercises to bilateral upper and lower limbs, Deep breathing exercises, Chest expansion exercises, Incentive spirometry (1200cc/sec) with 10 sec hold, patient made to walk around the ICU for (7 rounds) (RPE 13) Routine Chest physiotherapy continued, active exercise to bilateral upper and lower limbs, pelvic bridging exercise, Along with patient made high sitting, sit to stand, walking was given.

In the community based session patient performed a series of aerobic exercises and resisted exercises based on his exercise capacities by self monitoring the Target heart rate (THR) initially up to 50% and progressing to 55 to 60%. From Day 16\textsuperscript{th} – 60\textsuperscript{th} Chest care continued, limb care such as stretching, Active range of motion to right upper and lower limb, Strengthening Active range of motion exercise bilateral upper and lower limb. Day 61\textsuperscript{st} – 90\textsuperscript{th} limb care such as stretching, Active range of motion to right upper and lower limb, Strengthening Active range of motion exercise bilateral upper and lower limb, cycling activities done, ambulation done 15 – 30 minutes RPE 13. Day 91\textsuperscript{st} – 120\textsuperscript{th} strengthening exercises, Active range of motion to right upper and lower limb, Strengthening Active range of motion exercise bilateral upper and lower limb. Cycling activities, ambulation for more than 30 min.

**Reassessment**

Before the discharge from on the hospital on December 23\textsuperscript{rd} patient was made to perform six minute
walk test which shows a pre test values of Respiratory rate -24 breaths /min, Heart rate -85beats /min, Resting blood pressure – 130/80 mm of hg and the post test values were Respiratory rate -28 breaths /min, Heart rate -92beats /min, Resting blood pressure – 140/90mm of hg ,Number of laps covered – 6, Distance covered – 360meters, MET -2.5, $VO_2$ max-8.1ml/kg/min.

Patient was made to repeat six minute walk test after 6 weeks of community training on February 15th pre test values was Respiratory rate -24 breaths /min, Heart rate -85beats /min, Resting blood pressure – 120/80mm of hg and the post test values were Respiratory rate -26 breaths /min, Heart rate -90beats /min, Resting blood pressure – 130/90mm of hg, Number of laps covered – 8, Distance covered – 420meters. MET – 3.5, $VO_2$ max- 10ml/kg/min.

Data Analysis

The changes in the parameters were noted for everyday and the physiological outcomes in a post renal transplantation patient receiving chest and limb physiotherapy were analyzed after the data was taken from day of physiotherapy received to till discharge.

Results

The purpose of this case study was to present the effects of Role of physical therapy intervention on patient with renal transplantation patient tolerated the prescribed interventions very well. Regular physical exercise improves exercise capacity and quality of life (GaniyuSokunbi et al).The positive results of exercise Capacity, our results support the efficacy and need for Physiotherapy intervention for this patient. However the hemoglobin level showed improvement in following physical therapy.

Discussion

The study was a single-subject design, which was worthy for evaluating physiological outcome and response of an individual subject with renal transplantation. Resisted training was proved beneficial when combined with aerobic exercises on CKD and end-stage renal disease. We investigated the efficacy of aerobic exercise with resisted training in preventing post renal transplant complications. The results of the single-case study indicate that appropriate, regular, and supervised aerobic exercises with resisted training protocol can reduce post renal transplant complications and improving work capacity. The changes in renal parameters were insignificant which indicates the potential benefits of physiotherapy in improving the physiological outcomes in renal transplant are independent of improvement in renal parameters [10, 12] Post transplant complications and mortality among RTR’s are highly influenced by physical
inactivity. Researchers have suggested the need for intervention studies to investigate the long-term effects of physical activity\cite{6,8,11}. In our study, the Institutional phase consisted of aerobic exercise, which showed improvement in symptoms within 15 days; however, the effect was not sustained after 15 days of cessation of the intervention. Hence, in the community phase, progressive resisted exercises were included along with aerobic exercises for 4 months under telecommunication and self monitoring the Target Heart Rate (THR) initialing from 50% and progressing to 55-60%.

In addition, the concept of the breathing exercise has changed over the years and only recently includes active upper and lower limb exercises, supervised walking, and the use of steps. These latter changes in body position, as well as breathing exercises, In the present study, the patient performed upper and lower limb exercises combined with breathing exercises and used training loads of 1kg to 3kg. However, there is no consensus regarding the weight of the training load, the number of series, and the frequency of the exercise protocol, each of which could have been insufficient and could have influenced our results.

VO2 max during the institutional phase was stable and community phase showed improvement in aerobic phase along with resisted phase. During this period, any sign of graft rejection was not seen\cite{3-5} Results of other outcome measures Hb level indicate improvement, which was in accordance with the result of other studies\cite{10,15,17,25} Combined aerobic exercises and resisted training show better improvement not only over the symptoms but also over the factors, which are responsible for causing after transplant complications. The objective of our study was fulfilled by the interventions, which is worthwhile and is feasible to follow in clinical practice. However, there is a requirement to apply the interventions over a large group of RTR’s as the results of our study were acquired from a single-case design.

The limitations of this study was first single case study, second long term follow up was not considered, third in community phase patient was not under therapist supervision (telecommunication was done).

Further study can be aimed at large sample population, long term follow up, community rehabilitation phase under therapist supervision, investigating the effect of exercise on late complications of renal transplantation.

**Conclusion**

This case report shows that aerobic exercises with resisted training intervention are capable of not only improving and maintaining the overall health of RTR’s and prevent post transplantation complications. Physical therapy intervention also has definite role in improving quality of walking and exercise performance in patient with post renal transplantation. On other hand physiotherapy plays no role in improving renal parameters. However this needs to be verified in larger sample before generalization of these finding.

2. GaniyuSokunbi 2017, Exercise and Rehabilitation Needs for Kidney Transplantation

Perceptions for Community Medicine Subject amongst Undergraduate Medical Students of Deemed University Kolhapur, Maharashtra

Jeevankumar U Yadav¹, Deepmala J Yadav²

¹ Professor, Department of Community Medicine, D.Y.Patil Medical College, Kolhapur, India,
² Ex Assistant Professor, Dept. of Physiology

Abstract

Background: Community Medicine is included in medical education to make the medical students aware and responsible for community. The broad aim of teaching community medicine for undergraduate is to prepare them to function as community and first level physician in accordance with institutional goals.

Method: Cross sectional study conducted from April to August 2015. 240 medical students of 3rd to 7th term MBBS of D.Y.Patil Medical College, Kolhapur participated. All were explained purpose of study and assured confidentiality. Data collected from willing participants using pre-tested questionnaire contains primary data and interest, perceptions of teaching methods, curriculum, preference, career, etc in community medicine.

Results: 70.42% students interested in CM subject. Less field visits (45.07%), more calculations & formulae (32.39%) were prime reasons of non-interest. Majority (67.50%) purchased text book in 3rd year & K. Park remains most preferred (75.83%). Learning CM leads to positive change in life style. Majority knows importance of subject in PG entrance but few consider it in top five. 53 students interested for career in CM while 60.83% not interested. 87.08% felt CM important in clinical practice and 82.08% claimed it helps to get them closer to community. 84.17% told field / community visits needed for better understanding and 87.08% felt need of social awareness activities. 84.17% told field visits needed for better understanding and 87.08% felt need of social awareness activities. 89.17% agreed getting knowledge of Government programmes/ policies from subject.

Conclusions: Minimal interaction of students with community and public health services with more of lecture based teaching in Community Medicine may be the key issues. It should be more interactive, student centric, problem solving and evidence based, focusing to the community needs.

Keywords: community medicine, medical students, perception, interest, importance.

Introduction

Community Medicine is entirely related to the community and diseases related to it. The scope of medicine has expanded during last few decades to include health problems of individuals and community. Systems should integrate health promotions and disease prevention on one hand and treatment for acute illnesses and chronic care on the other. (¹) One of a good definition of Community Medicine by the WHO is “the study of health and disease in the population of defined communities or groups in order to identify their health needs, and to plan, implement and evaluate health programs to effectively meet these needs.” MCI says about MBBS curriculum that, “Undergraduate medical curriculum (shall be) oriented towards training students to undertake the responsibility of a physician of first contact, capable of looking after preventive, promotive, curative & rehabilitative aspects of medicine.” (²)

To a student of medicine, Community Medicine often appears as an aberration. Little does he realise that community medicine offers him the only link with real life experience and enables him to visualise a system
of affordable health care which is most relevant to the needs of our country.\(^3\)

Doctors who have decided to set up private practice can benefit from the discipline of community medicine. Knowledge of community dynamics, community skills and cultural factors related to health improves the doctor-patient interaction and directly leads to increased patient confidence and improved compliance.\(^3\)

Currently teaching in Community Medicine is lecture based in the Ivory towers of medical colleges with little interaction with community and public health services, while ideally it should be student centered, evidence based and problem solving type of active learning and capable of addressing to the community needs.\(^2\) The crux of the matter is why should medical student study community medicine? There are number of reasons why student needs to master this discipline.\(^3\) Subject of Community medicine is considered a game changer in improving the community health. It is lauded universally but receives only a lip service–be the political leaders, health planners or administrators. Most medical students also neither perceive it important nor find it interesting and find it one of the least liked subjects during entire MBBS. Students read it just to clear the university exam or acquire factual knowledge needed to clear postgraduate (PG) entrance exams.\(^2\)

Despite the National Health Policy 2002’s recommendation of reserving 25% of all post-graduation seats for CM, no such commitment of increasing seats for CM was observed in any of colleges/Institutions in India.\(^4\) In fact prior to this it’s important to know the students’ perception about community medicine subject and career preferences as it may determine the success of universal health coverage in India.

All this necessitates planning the study in undergraduate medical students to know their perception for community medicine subject and career preferences from their point of view.

**Method**

The Cross-Sectional study was conducted at Medical College of D.Y.Patil Deemed University, Kolhapur, Maharashtra. The study populations were medical students from second and third MBBS. 240 students had participated in present study. Only 3\(^{rd}\) to 7\(^{th}\) term MBBS students of second and third (Part I) MBBS, those willing were included in study. First and Third (Part II) MBBS students and unwilling to participate were excluded from study. Study subjects were selected randomly and explained the purpose of study and assured confidentiality. The data has been collected from April to August 2015. The semi-structured, self-administered, pre-tested questionnaire used to collect data. It contains almost 25 questions about primary information, their interest in the subject, their perceptions about curriculum, teaching methods and faculty, importance given to subject, orientation, and preferences for career. The collected data was tabulated and analysed for descriptive statistics.

**Results**

Total 240 medical students from 3\(^{rd}\) to 7\(^{th}\) term MBBS of D.Y.Patil Medical College, Kolhapur included. There were 135 (56.25%) boys, 105 (43.75%) girls. 70.42% students were interested in community medicine subject. Most common reason for interest was getting knowledge for clinical practice (56.21%), easy & scoring subject (24.26%), and also good teachers (17.16%). About 29.58% students were not interested in the subject. Prime reason for non-interest was less field visits (45.07%), calculations & formulae (32.39%).

Almost 50.83% students agreed, Community Medicine should be taught from first year. While 18.33%, 6.67% & 22.92% opined, subject should be taught from 3\(^{rd}\), 4\(^{th}\) & 6\(^{th}\) term respectively. Preferred teaching methods were blackboard (39.17%), practical (34.17%), power point presentation (25%). Majority (67.50%) purchased text books in 3\(^{rd}\) year while 20.42% in 2\(^{nd}\) year, only 7.92% in 1\(^{st}\) year. Most preferred (75.83%) textbook of CM was K. Park. Few (9.58%) preferred other than Park, 7.08% referring class notes also.

Studying CM subject was weekly 35.42%, monthly 19.17%, few daily 11.67%. About 33.75% were studying just before examinations. Class attendance found regular in 70.83%, occasional 20%, monthly 5%, while 4.17% use to attend field visits only. Learning CM revealed positive change in life style among 79.17%, no change in 20.83%. Change in hygiene 37.37%, diet 36.84%, exercise 17.89% and smoking 7.89%. Senior’s advices to study regularly 52.92%, study just before exam & you’ll easily pass 27.08%, useless subject & waste of time 18.33%. Majority (85%) known importance of subject in PG entrance, while 13.33% not known. CM
has significant weightage in PG entrance examination. Majority (135) told subject carries 20%, 86 told 10% and 19 told 5% weightage. 60.83% not interested for career in CM but 53 interested for career in CM as medical officer 23, teaching 8, NGOs 9, administration 9, research 3 & Surveillance MO 1. About 17.92% consider CM in top five subjects, remaining 82.08% don’t.

According 49.17% students CM is too basic and vast subject, 65.83% it’s not subject to score. Efforts by teachers were enough in 67.08% while 87.08% felt subject an important in clinical practice. Field / community visits needed for better understanding of subject in 84.17%, social awareness activities needed 87.08%. Many (89.17%) getting knowledge of government health policies from subject. Subject helps to remove social stigma as per 87.08%, also helps to promote duty and ethical practice in 77.92% while 82.08% claimed CM helps getting closer to community. (Table no. 2)

84.02% students sometimes attended & 68.04% sometimes participated in seminars, posters, debates, etc activities in CM as part of Health Day celebrations, Village adaption scheme, etc. 15.98% never attended and 31.96% never participated in such type of activities throughout curriculum.

Discussion

Main objective of Community Medicine teaching is to expose medical students to Primary and Secondary healthcare settings where they will render competent promotive, preventive, curative and rehabilitative services. This helps them to serve the needy people in community as primary healthcare physicians, with holistic approach, in alignment with the National Health Goals and vision of the Ministry of Health. (5)

We found 70.42% students interested in Community Medicine subject as getting knowledge for clinical practice (56.21%), easy & scoring (24.26%). While 29.58% were not interested in CM due to less field / community visits (45.07%), calculations (32.39%). P.K. Mandal et al (6) majority (51%) thought that subject necessary to study medicine in real community situation. 59% not satisfied with the syllabus. Common topic wanted to exclude was environmental sanitation (19%) and maximum new inputs were in favour of private and public health care delivery (15.89%). Tutorial (44.3%) and family study (41.9%) learning were favoured teaching methods. Students preferred problem related (55.7%), MCQs (53.3%) for theoretical exam. For practical examination community was preferred venue (64.3%).

Similarly our study preferences to teaching methods were blackboard (39.17%), practical (34.17%), power point presentation (25%). Field / community visits needed for better understanding of subject according to 84.17% which quoted by many studies. 89.17% expressed are getting knowledge of Government health programmes, policies from CM which attains important objective of subject. CM subject help to promote ethical practice by 77.92% students need to be more efficiently incorporated in curriculum to improve health provider’s image and quality health care in India. 82.08% claimed CM helps to get them closer to community which provides opportunities to understand community and their needs is the essence to produce family physicians.

Many (60.83%) were not interested for career, but 39.17% interested for career in Community Medicine as MO, teaching, NGOs, administration, research & analysis & Surveillance MO. Only 7.92% of students consider CM in top five subjects. Sitanshu Shekhar Kar et al (7) showed, there is limited preference for PSM as career of choice. Curriculum modification and explanation of career path after post graduation in community will help to generate interest in subject. Sigh G et al (8) only 6% students marked community medicine as career option, and only one female student wants it as only career option. With a dream to become famous and earning doctor, they just do not want it. Almost all have not even heard of it before MBBS. Almost 40% said clearly do not like Community Medicine and not interested, 20% were clueless about subject, good number cited it boring, other reasons were clinical orientation, feel branch has no scope with low salary and low satisfaction, rural work, no role models. As community medicine is linked to community so more of community visits and rural postings suggested 45% students.

There is need to increase manpower in areas such as Community Medicine, psychiatry and ophthalmology among others in India. (9,10,11) Understanding factors that influence students’ decisions regarding future career may help in taking corrective measures. Study done at private medical college in southern India has shown almost all students (99.2%) wish to pursue postgraduate studies, higher than 83.5% in the study done at government medical college, Delhi. (12)

Roy B et al (13) students give more preference for PG course in clinical subjects than para clinical subjects. Author observed only 22.5% preferred career in community medicine. But contrary to that, 85% consider this subject to be important to crack the PG entrance exam. In Harsha Kumar HN et al (14), there were no significant gender differences on preferences for research career. It was seen that among females medicine and OBG were most preferred PG courses and among males surgery was most preferred PG courses but community medicine was among less popular subject. Sadawarte MK et al (15) about 65% students expressed CM has limited scope as career and they believed that CM professionals become Public Health Administrators only. Around 70% claimed CM is an ideal choice for PG as there is not much financial gain in CM. About 22% males commented Knowledge of CM is essential for successful medical practice. Very striking finding is that around 87% compared CM with sociology and there is no need to keep it as post-graduate subject. About 60% students said they would not choose CM as career. 40% students who choose CM as career gave reasons as lots of job opportunities, administrative skills, opportunity to serve community and a good career for females.
Conclusion

Observations drawn from small sample of medical students of deemed university may be limitation. Many students interested in Community Medicine subject but not as career. Non-interest was mainly due to minimal community / field visits and more of calculations. There was not only positive change in life style of many students while learning CM in terms of hygiene, diet, exercise, and smoking but also they knew the importance of subject in PG entrance that carries 20% weightage. Even though few students consider CM amongst top five subjects, it is not popular subject among them. As teachers and public health professionals, has responsibility to teach students with interest and confidence. Teachers need to be more passionate, become role models to make real difference. Active and participatory teaching learning, project and problem based learning, promoting better available text books for creating interest, better utilization of computers and internet, reprioritizing contents, students’ feedback worth to improve teaching / evaluation, community/field exposure of students for better understanding, etc. are suggestions to inspire students. Minimal interaction of students with community and public health services with more of lecture based teaching in Community Medicine in medical institutions may be the key issues. Rather it should be more interactive, student centric, problem solving and evidence based and focus to the community needs.

Comparison of Various Digital Imaging Software in the Determination of Artificial Proximal Caries-An In Vitro Study

Karthiga Senthil1, Sreedevi Dharman2

1Graduate Student, Saveetha Dental College, 2Senior Lecturer, Department of Oral Medicine & Radiology, Saveetha Institute of Medical, and Technical Sciences, SIMATS, Vellapanchavadi, Chennai, Tamil Nadu

Abstract

Background: Several new digital systems has been introduced in the world of dentistry for diagnosis of caries. Instantaneous generation of high-resolution digital images and manipulation or processing of the captured image for enhanced diagnostic performance is one among the various advantages. This study was aimed to compare the efficiency of digital imaging softwares in contrast brightness enhancement for caries detection.

Objective: To evaluate the efficiency of digital Imaging software in detecting caries

Materials and Method: 12 extracted teeth were collected. Artificial caries defects were created. They were arranged 3 in blocks made of plaster, bitewing radiographs were taken in contrast brightness mode in various digital radiographic software like Lynx Vision, Vatech, Dentsply Sirona, Carestream Kodak, Vixwin and Dr. Suni and the results were analysed.

Results: The mean value of efficiency for contrast brightness enhancement for each digital radiographic software system was Carestream Kodak (88.1%), Dr. Suni (80.45%), Vatech (72.12%), Vixwin (66.67%), Dentsply Sirona (27.24%), Lynxvision (4.49%). There was a statistically significant difference observed between the weighted mean of contrast brightness enhancement among various digital radiographic software. (one-way ANOVA p<0.01).

Conclusion: Efficiency of Kodak Carestream was higher than the other digital radiographic software in contrast brightness enhancement (p<0.05) for caries detection under the experimental conditions.

Clinical significance: The use of radiographs for the diagnosis of carious lesions has become an inevitable process. Thus the softwares should be developed in such a way that it gives a superior quality facilities and modes for the assessment of initial proximal caries which is not visible to the human eye on clinical examination.

Keywords - Imaging; digital; dental; bitewing; proximal caries

Introduction

Digital radiography is a Recent Advancement in the field of maxillofacial radiology and does not require the use of a conventional radiographic film. The first digital dental radiographic system was the RVG (Radio-Visio-Graphy) system introduced in 1989 by Trophy. Film is replaced by sensors nowadays which sends images to computer. Since then, several companies...
have introduced digital systems specifically for dental imaging. Digital systems have many advantages including lower radiation doses, real time imaging, no requirement for dark rooms, and image manipulation can be easily performed. One of the greater advantages of digital imaging systems that aid in the diagnostic accuracy are the image enhancements such as contrast and brightness adjustment, colour-coded, subtraction, gray-scale reversed, or emboss modulation. In cases with thick crown and large proximal surfaces like in posterior teeth the difficulty arises in detection of early caries development. Hence these lesions need to be diagnosed by clinical examination along with radiography. The current day digital systems display their images in their own software, which have been developed with various differences in their design, ease of use for user, different options for enhancing quality of image.

Thus, this study aims at comparing the efficiency of contrast brightness image processing of six digital x-ray software programs (Vixwin 2000, Carestream Kodak, Lynx Vision, Vatech, Dentsply Sirona and Dr. Suni digital x-ray) in detecting small artificial caries defects on approximal surfaces.

**Materials And Method**

**Preparation of samples**

Twelve extracted human maxillary and mandibular posterior permanent teeth from the orthodontic and periodontal treatment were used. They composed of 8 premolars and 4 molars with no restoration, fracture or caries lesion and had smooth contact surface. High speed diamond bur was used to create 24 small artificial caries defects randomly. The teeth then were mounted in utility wax blocks which contained 2 premolars and 1 molar each to mimic the tooth-soft tissue relationship. A prominent part of proximal surfaces were placed at the same vertical level to simulate normal anatomical contacts. 2 Bitewing radiographs were taken using 6 CCD digital image systems at 70 kVp, 15 milli-amperage for 0.04 seconds. A 12inch source-to-object distance was used with the angle between x-ray beam and teeth long axis of 8 degrees to compensate for the slight bend of the tilt of the maxillary teeth in clinical situation.

**Dental image evaluations**

Dental images were viewed on a monitor screen with help of Carestream Kodak, Lynx Vision, Vatech, Dentsply Sirona, Vixwin and Dr. Suni, which are the image enhancement software programs of the 6 digital image systems mentioned above respectively. The radiographs were enhanced with contrast-brightness. A 14 millimetres thick pink wax, cover the whole detector surface, was placed between the tooth block and x-ray tube to mimic the tooth-soft tissue relationship. Source-to-object distance was 10 inch with the angle between x-ray beam and teeth long axis of 10 degrees each system. 26 interns from Saveetha dental college who were familiar with the digital radiography systems assessed the radiographs from each modality for presence or absence of small carious lesion on proximal surfaces.

**Data analysis**

Radiographs were analysed, mean, Standard deviation was calculated by SPSS Software. To compare the mean difference among various radiographic digital software in contrast brightness, one-way ANOVA with Tukey HSD Post Hoc was performed.

**Results**

The mean values of efficiency for contrast brightness enhancement in proximal caries detection for each radiographic image processing software was calculated. All of the observers had a very good knowledge in the methods of reading a Radiograph.

Figure I- Shows the radiographic image of contrast brightness enhancement among various Digital Imaging Softwares. The Radiographic image for Carestream Kodak is given in Fig.1(a), Vixwin in Fig.2(a), Lynxvision in Fig.3(a).

The mean values and standard deviation of contrast brightness enhancement is given for each radiograph in percentage in Table 1. The mean value of efficiency for each digital radiographic software system was 88.1% for Carestream Kodak, 66.67% for Vixwin, 4.49% for Lynxvision, 72.12% for Vatech, 27.24% for Dentsply Sirona and 80.45% for Dr.Suni. One way ANOVA to compare the mean proportions among various digital radiographic software using contrast brightness enhancement is given in Table 2. There was a statistically significant difference observed between the weighted mean of contrast brightness enhancement among various digital radiographic software. (one way ANOVA p<0.01). Figure II – Depicts the bar graph for
the mean values for contrast brightness enhancement among various Digital Imaging Softwares.

Table 1 – shows the mean and SD for contrast brightness enhancement in % among various digital radiographic software.

Figure I- Shows the radiographic image of contrast brightness enhancement among various Digital Imaging Softwares.
Discussion

The digital radiographs in the present study were evaluated by 26 observers which composed dental interns. The mean value of efficiency for each digital radiographic system was 88.1% for Carestream Kodak, 66.67% for Vixwin, 4.49% for Lynxvision, 72.12% for Vatech, 27.24% for Dentsply Sirona and 80.45% for Dr. Suni with SD of 12.9, 14.0,8.16,33.6,20.35% and 25.5% respectively. Radiograph A showed slightly higher mean values for contrast-brightness enhancement.

Langlais et al. found that a high level of observer disagreement in the case of caries limited to the enamel, although their studies was based on natural carious lesion. Kang et al. carried out a phantom study and reported that the inter examiner reproducibility (kappa value) was 0.43 for detecting the proximal caries and defects. Various factors that may influence the inter observer agreements include scale contrast, time, duration for image evaluation, experience and familiarity of the observers with the digital radiographic systems.

Gotfredsen et al. evaluated observers’ use of image-enhancement facilities and time consumption in assessing approximal and occlusal caries in radiographs taken with four digital systems. They concluded that the observers took advantage of the facilities available for enhancement of density and contrast in digital images. Hintze compared the caries diagnostic accuracy of two software modalities used in the assessment of digital radiographs obtained with four different dental systems. He concluded that there was no significant difference in caries diagnostic accuracy between two software modalities used for examination of digital radiographs obtained with four different digital systems, and the software modality did not influence the mutual rank of the four systems relating to their diagnostic accuracy.

According to various authors such as Syrioupoulos et al., White and Yoon and Castro et al, deeper caries lesions were easier to detect by radiographic systems than relatively superficial ones. The material used in their studies consisted of sound surfaces with artificially induced enamel and dentine caries whereas in the present study, the caries sample was composed of artificially created cavities. Castro et al observed that the detection rate for enamel lesions was rarer in all digital modalities evaluated in their study while the lesions penetrating the dentine, were easier to detect more consistently. Enamel lesions detection has always been an issue in dentistry with the help of radiographs. On the other hand its clinical diagnosis is even harder to perform than radiographic diagnosis. Improved methods have been introduced in order to overcome radiographic limitation in this area.

In Alkurt et al. there was no significant difference between F-speed (flow- x ray) film and direct digital imaging system for proximal caries detection and diagnosis.

In 2007, Berkhout et al evaluated the effect of high and standard resolutions of digital radiography systems and concluded that spatial resolution had no effect on enhancing the diagnosis of caries. Furthermore, the
results showed different functions of sensors in the aforementioned study.  

Li et al., in their study on the effect of resolution of PSP devices showed that scanned images in the Durr VistaScan device did not provide adequate quality for detection of caries and also had significant differences with other resolutions studied.  

Wenzel et al. assessed the effect of spatial resolution on the diagnostic accuracy of caries. In their study, the observers were allowed to use enhancement filters and occlusal caries were also evaluated in addition to proximal caries. They found no significant difference between different resolutions of receptors except for the VistaScan® system. They concluded that diagnostic accuracy of caries is slightly affected by increasing the spatial resolution. Also, significant differences were found between the understudy receptors and it was concluded that Digora® Optime system had higher sensitivity and lower specificity than the other systems. 

Mehdizadeh et al., concluded that changing the resolution had very little effect on the diagnostic accuracy for detection of proximal caries and the standard resolution of the understudy systems had insignificant superiority over their high resolution for caries diagnosis. Moreover, they reported that the results of interpretation of radiographs obtained by Schick system at standard resolution had the highest similarity to pathologic examination results compared to other systems. Superiority of Schick over Soredex system in their study may be attributed to the higher spatial resolution of CMOS systems over PSP. However, they had a small sample size and extent and distribution of caries were not specified; these factors may have affected the obtained result.  

Recent studies that evaluated the accuracy of interpretation of various radiographic methods showed differences in the diagnosis between individual observers. These difference might have been due to differences in experience, training or visual perception. Stookey and others reported that differences in diagnostic performance as a limitation of the radiographic interpretation of the high degree of variability of intra and inter-observers. According to Dunn and Kantorment who stated that the art of radiographic interpretation is an activity of high cognitive level which can be associated with the knowledge and experience of the examiner. 

**Conclusion**

In summary, this in vitro investigation has demonstrated that the Kodak Carestream and Suni digital imaging software system is almost equivalent in terms of efficiency for contrast brightness enhancements for carious lesion detection under the experimental conditions. This further indicates a deeper research with experienced observers using other enhancement features of commercially available dental digital imaging systems.

Integrated Clinical Experience on Clinical Skills and Self-Esteem

K T Moly¹, Deepak Krishna²

¹Principal, Amrita College of Nursing. ²Asst. Professor, Dept. of Medical Surgical Nursing, Amrita Vishwa Vidyapeetham, Kochi

Abstract

Background: The need for new clinical teaching models to provide quality experiences for student nurses to bridge the theory practice gap has been realized long back. Newer preceptorship models like integrated clinical experience (ICE) can develop competence and confidence. The process of learning clinical decision making must be practiced during nursing education programs.

Objective: To evaluate the perceived effect of ICE on clinical skills and self-esteem among undergraduate nursing students.

Method: Quantitative, One group pre test post-test design. Data was collected from 139 final year undergraduate nursing students using total enumerative sampling. The students were given clinical experience continuously for a month in one clinical area in two shifts under a professional registered nurse. The students’ perceptions on clinical skills were assessed using self developed Questionnaire and self esteem using Rosenberg self-esteem scale before and after ICE.

Results: The perceived effect of ICE on all the twenty clinical skills and self esteem were found to be statistically significant (p value <0.001). The pre and post percentages of the sample on three levels of self esteem were – low self esteem 8.6/2.2, normal 90.7/84.9 and high 0.7/12.9.

Conclusion: ICE can smoothen the role transition from student to professional nurse as it affects the clinical skills and self esteem which are central to clinical decision making. However the preceptor’s attributes, competency and training on preceptorship are influencing factors to be ensured for better outcomes.

Keywords: Perceived effect, ICE, clinical skills, self esteem.

Introduction

Clinical decision making (CDM) is a “cornerstone skill for nurses”.[1] They are generally the first to observe cues in patients which may warrant making a clinical decision. Bakalis and Watson (2005) proclaim that nurses who make effective clinical decisions provide safer, more competent nursing care.[2] Thompson (2002) further declares that the quality of health care is dependent upon the “clinical decisions of the professionals delivering it”. Effective CDM “is the principal skill that separates professional nursing personnel from ancillary or technical personnel and differentiates a novice from an expert”.[3] The process of learning CDM must not begin as a graduate nurse; it must be introduced and practiced during nursing education programs.

Currently the B.Sc Nursing course in India is a 4 year programme that has 2115 hrs of theory (21 subjects) & 3795 hours of clinical practice (>100 areas) along with clinical assignments. As the course covers almost all broad and super specialty areas of medicine and

DOI Number: 10.5958/0976-5506.2019.01913.2
nursing, often the students are rotated too frequently from one area to another. Moreover, the clinical assignments the students have to complete in time exert lot of strain and stress on them. They get hardly time to get acquainted with the protocols and policies in patient care, professional communication during this flow. Hence as novice nurses they become panic and go into what is usually described as “reality shock”.

In developed countries the gap in the beginning of practice is bridged with adaptation courses. ICE provides students an opportunity to integrate academic knowledge and skills with practical experience while concurrently completing course work in the academic programme. ICE is focused on the foundation of clinical practice and the development of professional behaviors.

In 2011 American Association of Colleges of Nursing in their Essentials of Baccalaureate Education for Professional Nursing Practice identified the need for additional and new clinical teaching models to provide quality experiences for students and to bridge the gap between nursing school and the reality of the new professional nursing role. Educational clinical placements using the preceptor model may be beneficial in the role transition of a student to a professional nurse. This one-to-one role-modeling experience can increase student learning, efficiency and self-confidence.

Although there are many studies about student self-confidence in general there is limited research on how preceptor courses affect student perceptions related to their clinical skills and self esteem.[5-8]

In reviewing the literature on the value of the preceptor model for clinical teaching, studies confirm positive outcomes for role socialization.[9] The preceptor’s knowledge and experience provide the main asset to student learning.[10]

Based on these reviews, the investigators wanted to explore the perceived effect of ICE on the clinical skills and self-esteem of the final year undergraduate nursing students presuming to shape the nurses of tomorrow.

Methodology

A quantitative, one group pre test post-test design was used for the study. Data was collected from 139 final year undergraduate nursing students using total enumerative sampling. The students were given clinical experience continuously for a month in one clinical area in two shifts under a professional registered nurse.

The following tools were used to collect data from the sample.

Tool 1: Questionnaire on sample characteristics

Tool 2: self developed Questionnaire on Perception of clinical skills.

Clinical skills had two sets of questions. Set – 1 included 10 questions on various aspects of comprehensive nursing care like assessment, planning and providing prioritized nursing care, health education and documentation. Clinical skills set- 2 included 10 questions on general aspects in patient care, formalities related to patient insurance and accreditation, policies and protocols.

Tool 3: The Rosenberg self-esteem scale.

A four point likert scale of self report measure of self esteem with an internal consistency ranging from 0.77-0.88, reliability 0.82 – 0.85 and validity 0.55. The scale has ten statements. The scoring is as follows; low self esteem < 15, normal 15-25 and high self esteem > 25. The higher the score the better is the self esteem.

Ethical Consideration

Ethical clearance was obtained from the Institutional Ethical & Scientific Committee before data collection. Informed written consent was obtained from each subject.

The above table shows that there was a perceived effect of ICE on self esteem in the sample which was statistically
significant at p value <0.001.

Discussion

The present study was conducted among 139 undergraduate student nurses mostly (99.3%) in the age group 19-24 years with an objective of exploring their perceived effect on ICE on their clinical skills and self esteem. 97.1% of the sample were females.

The mean differences in all the twenty clinical skills (both set-1 and set-2) assessed were found to be statistically significant specially in ability to administer medications (1.151) and ability to understand/prepare the assigned patients for the diagnostic tests (1.014) in set-1 clinical skills. In clinical skill set-2 it was noted in awareness on policies and protocols in the assigned clinical area (1.058) and ability to handle equipment used in patient care (0.971). The perceived effect of ICE on self esteem also was found to be statistically significant at p value <0.001.

Similar findings were observed in a study to Improve Clinical Competence and Confidence of Senior Nursing Students (sample 95) through Clinical Preceptorship by Kimberly H. Kim et al. in USA, California(2014).[11] Results indicated that the clinical preceptorship improved students’ perceived competency skills and confidence in providing nursing care. However the tools used were Senior Preceptorship Experience Questionnaire, Graduate Nurse Survey, and Quality and Safety Education for Nurses tools.

The present study findings are also in tune with a Chinese study (2017) using preceptors to improve nursing students’ clinical learning outcomes: A Malawian students’ perspective by Ngaiyaye EP, Bvumbwe T, MCur and Chipeta MC revealed a gain in confidence and competence in clinical practice when supported by preceptors.[12]

Another study was conducted by Berry (2005) on nursing students’ satisfaction and perceptions of achieving the objectives of a clinical course after completing a preceptored clinical experience compared to students completing a traditional clinical rotation. The preceptor model was identified as a positive experience since it provided immersion into the RN role in a safe environment.[13] Myrick’s (2002) identified the one-to-one relationship as a “safety net”- there was always someone there to answer students’ questions. Both of these studies found that the one-to-one relationship contributed to students’ self-confidence and competence in performing skills and the development of their ability to think critically.[14]

Review of literature also has shown that ICEs are used in other professional courses like physical therapy yielding better outcomes. The feedbacks were obtained not only from the students but also from faculty and patients and were found to be meeting their intended goals and highly satisfactory.[15] An Australian study (2012) by McNamara J et al. on work-integrated learning (WIL) as a component of the capstone experience in undergraduate law presents an argument for the inclusion of WIL as a component of a capstone experience.[16]

The investigators could not come across any studies which did not have an impact on competencies and confidence among any category of students who underwent the so called ICE or capstone experience. Still it is quite surprising and worth exploring to identify the barriers in integrating such an effective model.

Conclusion

ICE can smoothen the role transition from student to professional nurse as it affects the clinical skills and self esteem which are central to clinical decision making. However the preceptor’s attributes, competency and training on preceptorship are influencing factors to be ensured for better outcomes.

Simulation Based Learning in Selected Clinical Skills among Nursing Students in Selected Nursing College of Pune

Sheela Upendra¹, Sheetal Barde², Kalpana Sawane², Shitalwaghmare²

¹Assoc. Professor, ²Asst. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Simulator METIman is considered high fidelity, prehospital/nursing modal to teach the fundamentals of nursing practice, which is a computerized manikin that stimulates the real life settings. Method: Quantitative research approach, Pre-experimental one group Pre test - Post test research design adopted for the study. The samples were 60 nursing students. Simple Random sampling technique was used. Tool included; Demographic Proforma of the sample & Checklist was used to assess the skills on selected clinical skills. Reliability of tool was 0.86. Pretest followed by Simulation based learning by use of METIman that simulates with the control of computer, for performing the selected clinical skills i.e. Cardio Pulmonary Resuscitation, Tracheostomy suctioning, Auscultation of various normal and abnormal heart and lungs sounds and rate, rhythm of respiratory system; followed by Post test. Result: Majority of 57% of the student nurses had poor skill score, 42% of them had average skill score and only 2% of them had good skill score, Paired t-test applied. T-value was found to be -12.668 with 59 degrees of freedom. Corresponding p-value was found to be very small (of order of 0.001) the null hypothesis H₀ is rejected and hence H₁ is accepted, indicates simulation based learning had significantly improved the skill of the nursing students. Majority of nursing students are of excellent opinion regarding simulation based learning to enhance the clinical skill. Discussion: The findings of the present study revealed that simulation based learning is effective advanced technology to improve the clinical skill among nursing students. Similar findings were observed in study where use of simulation to teach Cardiopulmonary Resuscitation skills was effective as the number of attempts required by nursing students is less.

Keywords: Simulation based learning; Clinical skills; Nursing student.

Introduction

Today’s practicing nurses are challenged by a rapidly changing healthcare arena that demands highly skilled and adaptive responses. There are different types and classification of simulators that varies according to the degree of their resemblance to the reality, Such as Low-fidelity, medium-fidelity and high fidelity[1]. Simulator METIman is considered high fidelity, prehospital/nursing modal to teach the fundamentals of nursing practice, which is a computerized manikin that stimulates the real life settings. METIman comes with standard equipment that allows students and trainers the ability to create a number of possible clinical circumstances. It derives with wide-ranging clinical features and skills designed precisely for emergency medical team and nurses. METIman proceeds simulation learning to a new and inspiring level of practicality. METIman is the perfect crony for patient simulation. In Nursing, it is a type of reflective exercise in which nursing students practice and review their performances and realize how teaching is actually is applied to skill and receives feedback from the trainer.

Need of the study

Simulator (METIman) is designed to deliver the most realistic training possible whilst remaining easy to set up and simple to operate. METIman is easy to use learning features that are designed for teaching basic nursing and pre-hospital skills in order to avoid medical/Nursing error. Medical errors affect one in 10 patients worldwide. In 2013 study, the Harvard University
estimated that India has recorded 5.2 million injuries each year due to medical errors and adverse events. WHO lists India among the top 10 killers in the world due to medical errors? The reason behind this is that we have not trained doctors and Nurses to measure the clinical outcomes; this is why practice of clinical skills on medical simulation proves to be the most effective way to bring down the medical / nursing error. [2]

A study on Analysis of an opinion on low versus high fidelity simulation among Nursing students in 2017 have revealed that High fidelity simulation is more effective than the low fidelity simulation according to the opinions of Nursing students. A significant association was found between the opinion score and previous training and workshop. [3] The present study seeks to empower Nurses with advanced teaching technology i.e simulation based learning improvising clinical skill in the Nursing Practice.

Statement of the problem

“Simulation Based Learning in Selected Clinical Skills among Nursing Students in Selected Nursing College of Pune”

Objectives:

1. To assess the Selected Clinical Skills among Student Nurses.

2. To evaluate the Effectiveness of Simulation Based Learning in Selected Clinical Skills among Nursing Students.

Hypothesis:

H₀ - There is no significant difference between Pre test and Post-test skill score of Nursing students on Simulation Based Learning.

H₁ - There is significant difference between Pre-test and Post-test skill score of Nursing students on Simulation Based Learning.

Methodology: Quantitative Research approach was adopted in the study. Pre-experimental one group Pre test - Post test research design adopted for the study. The samples were 60 Nursing students. Simple Random Sampling technique was used. Tool was developed in two Sections: Section I: Demographic Proforma of the sample ; included age, gender, Nursing programme and Exposure to simulation based training previously. Section II: Checklist was used to assess the skills on selected clinical skills. Checklist had 42 statements. The experts validated the relevancy, objectivity and appropriateness in tool. Reliability of tool was calculated by Cronbach’s alpha method and was 0.86

The permission to conduct the study was taken from the administration department of Nursing college. The period of data collection commenced from March 2017 to April 2017. After taking the consent from the subjects, the investigator has administered Pre test to respondents following which Simulation based learning was taken by use of METIman that simulates with the control of computer, for performing the selected clinical skills i.e. Cardio Pulmonary Resuscitation, Tracheostomy suctioning, Auscultation of various normal and abnormal heart and lungs sounds and rate & rhythm of respiratory system; followed by administration of Post test from same respondents.

Findings: Based on the objectives and the hypothesis the data was analysed using both descriptive and inferential statistics.

<td></td>
</tr>
</tbody>
</table>

Paired t-test applied for comparison of pre-test and post-test skill scores among nursing students on simulation based learning. T-value was found to be -12.668 with 59 degrees of freedom. Corresponding p-value was found to be very small (of order of 0.001). Since the p-value is very small (< 0.05), the null hypothesis $H_0$ is rejected and hence $H_1$ is accepted. In Pre test, average skill score was 14.42 with standard deviation of 6.168 whereas in post-test average skill score was 29.83 with standard deviation of 5.869. This indicates that the simulation based learning had significantly improved the skill of the nursing students regarding simulation based learning.

**Discussion**

The findings of the present study revealed that simulation based learning is effective advanced technology to improve the clinical skill among nursing students. Checklist was used to assess the skills among the nursing students. Similar findings were observed in the study conducted by Adhyapak; use of simulation to teach Cardiopulmonary Resuscitation skills was effective as the number of attempts required by nursing students is less. Researches had used the checklist to assess the CPR skills among the nursing skills.[4]

**Recommendation**

A comparative study can be conducted among nursing students and nursing staff.

A similar study can be undertaken in domain like knowledge and attitude of simulation based learning.

A similar study can be replicated on a large sample.

**Conclusion**

It is concluded from the study findings that the skills of nursing students was poor before the administration of simulation based learning on selected clinical skills. The simulation based learning helped nursing students to enhance the clinical skills which was evident in the post test skill score. There was a statistical significant difference between pre test and post test skill scores. Hence the simulation based learning been proved to be an effective strategy for enhancing the skill of nursing students. Nurses, regardless of specific qualifications, should receive and undergo simulation based learning to enhance clinical skills. Simulation creates experiential learning, which has been shown to help learners, which are necessary for safe and effective clinical practice. It is concluded that advance technologies are essential to acquire the ability to recognize and respond to clinical emergencies and for ascertaining competency.

Correlation between Nuclear Density of Age related Cataract and Effective Phaco Time in Phacoemulsification Surgery in a Semi Urban Hospital

Arun Samal\textsuperscript{1}, Sitansu Panda\textsuperscript{2}, Chandra Sekhar Sahoo\textsuperscript{3}, Ankit Ratan\textsuperscript{4}

\textsuperscript{1}Associate Professor Ophthalmology, HI Tech Medical College & Hospital, Bhubaneswar & Consultant Ophthalmologist, Kalinga Eye Hospital, Dhenkanal, Odisha, \textsuperscript{2}Professor Department of Anatomy, IMS and SUM hospital, Siksha “O” Anusandhan Deemed to be University, K8, Kalinga nagar, Bhubaneswar Odisha, India, \textsuperscript{3}Consultant Paediatric Ophthalmologist, Kalinga Eye Hospital, Dhenkanal, Odisha, \textsuperscript{4}Junior Resident Department of Ophthalmology, HI Tech Medical College & Hospital, Bhubaneswar

Abstract

Objective: To correlate effective phaco time in continuous mode of phacoemulsification surgery in different grades of nuclear cataract.

Materials and Method: Cataract was graded according to LOCS III classification system under slit lamp examination. Ninety consecutive Patients of 44 male and 46 female undergoing phacoemulsification surgery were included in this study. Phacoemulsification was conducted using Carl Zeiss Model –Visalis 100 phaco machine under constant setting in continuous mode. The total Phaco time and the Effective phaco time displayed on the panel were recorded meticulously for each surgery.

Result: Of the total Ninety patients, 8 had grade I, 11 grade II, 31 grade III, 24 grade IV and 16 grade V. The mean Effective Phacoemulsification Time for grade I, for male was 48.83 seconds and for female 37.50 seconds; Under grade II, for male was 57.20 seconds and for female 46.17 seconds; Under grade III, for male was 64.76 seconds and for female 63.50 seconds; Under grade IV, for male was 63.50 seconds and for female 87.42 seconds; Under grade V, for male was 72.00 seconds and for female 88.00 seconds.

Conclusion: No difference in incidence of number of cataract in male (48.9\%) and female (51.1\%). Higher the grade of nuclear Cataract more is the effective phaco time in conventional coaxial continuous mode.

Keywords: Cataract, Effective Phaco time, LOCS III Classification, Phacoemulsification

Introduction

Cataract is the commonest form of blindness can be cured. Goal of cataract surgery is restoration of vision by removing cataractous lens with putting an intraocular lens in the place resulting to high quality instant visual and systemic rehabilitation. Lens opacities classification system, version III (LOCS III) classify cataract into Nuclear 1-6 grades as per nuclear opalescence (NO) and nuclear colour (NC), cortical (C) 1-5 grades and posterior subcapsular (P) 1-5 grades\textsuperscript{12}.

Phacoemulsification technique is the present day accepted method of surgical procedure in all the grades\textsuperscript{3}. Age related cataract affect centre of nucleus (Nuclear), Posterior aspect of lens (Posterior sub capsular) and edge of lens (cortical). Nuclear cataract is most common type.

Dr Charles Kelman invented Phacoemulsification in 1960 and first performed phaco surgery in Human eye in 1967\textsuperscript{1}. In Phacoemulsification the phaco tip oscillate at about frequency of 40 KHZ/Sec. which
is constant and delivered in continuous, pulse, burst, hyperpulse and hyperburst modes. The stroke length of phaco needle could be of longitudinal, transverse or torsional depending on phaco machine configuration\textsuperscript{4,5}. Longitudinal stroke length is 2-4mils (one thousandth of inch) in most machines\textsuperscript{6}. Longitudinal movement of phaco tip cause jack hammer effect and cavitation on the lens\textsuperscript{7}. It also create fluid and acoust wave causing break down of nucleus. The longitudinal movement of phaco needle varies in phacoemulsification surgery on foot pedal control. Foot pedal positions are: 0 – Rest position, 1 - Irrigation, 2 – Vacuum, 3 – Ultrasound energy active and goes on.

Basic setting is continuous in which US energy is delivered continuously with variable power; controlled by foot pedal depression without off period\textsuperscript{7,8}. Phaco power is delivered continuously can be linear or panel mode. In Linear control on depressing more in foot pedal position 3, the stroke length of phaco needle increases and power rises from zero to preset level\textsuperscript{9,10}. It operated by surgeons suitability depending on cataract grade.

All other modes ie; Pulse, Burst, Hyperpuls and Hyperburst modes are not continuous but having US on and off period\textsuperscript{6,7,8,10}. In Pulse mode there is phaco on and off period and power is linearly controlled by foot pedal depression which is of <20 pulses / second of fixed power. The ultrasound energy used is 50% less than continuous mode. In Hyperpulse mode high pulse of US energy > 100 pulse / second is delivered using less phaco energy but gives same effect as continuous. In Burst mode burst of phaco is delivered with a variable off period and US is delivered is of 80 milliseconds in minute. It is continuous on last position of 3rd position of foot pedal depression\textsuperscript{8}. In HyperBurst mode US is delivered in milliseconds as short as 4 ms results less phaco energy and less heat and it is continuous.

Phaco power is set in the panel as per nuclear hardness and variability is controlled by foot pedal excursion. It creates mechanical impact on lens, cavitation and implosion producing heat, cooled by irrigating fluid preventing damage.

Disadvantages of continuous mode are thermal injury to ocular tissues and decrease flowbility which can be controlled by Linear phaco power. Delivering 100% US energy for 20 seconds is equivalent to 50% energy for 40 seconds. Phaco time and phaco power should be less to decrease complications; carried out on foot pedal control and phaco power setting on linear mode. Less power will fail to cut but push the nucleus mechanically causing zonular stress and high power will cause chattering of nucleus and may pierce the nucleus causing posterior capsule rent, wound burn, endothelial loss. For sculpting 50% to 100% power is required depending on nuclear hardness. For soft cataract less power and more vacuum required. Objective is to generate less air bubble. After cracking further divisions if required, require lesser power setting. Lesser EPT gives rise to clearer cornea, better vision on Post-operative period and higher patient satisfaction\textsuperscript{5}. The foot pedal is pressed more or less as per nucleus hardness in continuous mode. Total phaco time is the time duration of foot pedal position 3 where as, Effective phaco time measures the US energy used if 100% power used for the purpose It is calculated by the phacomachine. Different phaco modulations can be adjusted by setting in the machine\textsuperscript{6}. Lesser the total phaco time correspondingly less EPT, results clearer cornea and better visual outcome postoperatively, higher patient satisfaction, less endothelial damage and late complications like pseudophakic bullous keratopathy. Cataract hardness is directly proportional to the effective phaco power used under different settings.

Phacoemulsification deals with emulsification of the Cataractous nucleus by basic techniques like Trench Divide Conquer Nucleofractis (TDC ) and Crater Divide Conquer Nucleofractis (CDC ). CDC is advocated in dense total cataract where TDC is difficult. But standard technique is TDC inside the capsular bag which can be performed with / without nuclear cleavage. Other techniques like chip and flip, stop and chop, bimanual nuclear tilt etc, are surgeon preference.

Materials and Method

A total of Ninty Patients were selected randomly within the study period of one year from April 2017 to March 2018; those had undergone Phacoemulsification cataract surgeries in a private sector eye hospital of Dhenknal Town in Odisha. This study adhered to the declaration of Helesinki and approval for the study was obtained from Hospital ethics committee. Informed consent, risk benefit of surgery, Patient s demographic data, Hardness of cataract, EPT, type of Phaco technique, phaco modes and settings, were documented.
All the Phacoemulsification cataract surgeries were conducted using the Same Phaco Machine Carl Zeiss Model - Visalis 100 by Dr Arun Samal. Nuclear hardness were graded according to LOCS III classification grading system on Slit lamp examination.

Preoperative examination and inclusion criteria were: patients age more than 40 years, clear cornea, normal intraocular pressure, anterior chamber depth and normal pupil dilatation > 6mm. Exclusion criteria were raised intraocular pressure, corneal pathology, shallow anterior chamber depth, zonular dialysis, complicated cataract, retinal pathology, glaucoma, small pupil, pseudoexfoliation and previous ocular surgeries. All the patients conforming inclusion and exclusion criteria were included in the study. Patients were explained the ocular condition, the surgical procedure and risk of complications. Informed consent was taken from the patient and attending relative.

Routine pre-operative systemic investigations were carried out like blood pressure, Fasting and post prandial blood sugar, urine examination. Ophthalmological work up of visual acuity for distance and near, Slit lamp examination, Intra ocular pressure, lacrimal sac Irrigation, Fundoscopy and physical fitness were taken. Slit lamp examination carried out for grades of cataract with low magnification slit beam at 45 degree angulation. Slit beam height was adjusted little more than the pupil diameter and width was adjusted for clear view in hazy cortex, illumination was increased for nucleus to be viewed. Grading of Hardness of the Nucleus was done as per colour code laid down in Lens Opacity Classification system, (LOCS III).

Preoperative patient preparation done with Tropicamide 1% and phenylephrine 2.5% eyedrop; instilled 3 times at 15 minutes interval before 1 hour of surgery. Aseptic cleaning of lid and brow with 10% povidone Iodine solution was done. 5% topical povidone iodine solution instilled 5 minutes before surgery. Anaesthetic preparation consists of peribulbar infiltration of 2% xylocaine with adrenaline 1:200 000 mixed with Hyaluronidase. Balanced salt solution used as Irrigating solution in all the cases, Bottle Height was kept at 110 cm above the patients head level.

Anterior Chamber entry was made by a two planar 2.8mm Limbal incision in 10.30 o clock position in all the eyes. Viscoelastic healon was used. About 5mm Continuous curvilinear capsulorrhexis made by Uttrata capsulorrhexis forceps. Hydrodissection and hydrodelineation done. Phacoemulsification carried out in conventional coaxial procedure of 2.8 mm limbal entry in continuous mode on linear setting. Endcapsular Phacoemulsification carried out by Trench divide and conquer Nucleofractis (TDC) technique. Phaco machine parameters were phaco power 50, Vacumm 60 mm Hg, Flow rate 25. A + designed trench is made with a width of about two times the phaco tip diameter in the nucleus. Nucleus is fractured with the help of a second instrument from the side port. Phaco parameter was unchanged in trenching and emulsification of nuclear fragments. Cortical cleaning was done and Acrylic foldable intraocular lens was put in capsular bag. The total phaco time and effective phaco time were noted down meticulously in each case. Anterior chamber was washed, inflated and entry site hydrated with irrigating solution. All patients were advised to instill topical antibiotic steroid combination on tapering doses up to 1month and followed up at 1st day, 1st week and 4th week postoperatively. Details of preoperative work up, intraoperative procedure and post operative follow up were recorded in the patients individual case sheet.

Result

During the one year period of study a total of 90 patients had undergone cataract surgery through phacoemulsification procedure; out of which 44 (48.9%) were male and 46 (51.1%) female. Within the age group of 40 – 50 years there were 10 (11.11%) patients, in 51-60 years 39 (43.33%) patients, in 61-70 years 41 (45.56%) patients [Table 1]. Under Grade I cataract, there were 8 patients; Grade II,11 patients; Grade III, 31 patients; Grade IV, 24 patients and under Grade V, 16 patients (Table 2). The mean age of male patient was 59.3 years with a standard deviation of 6.18 and for female 57.6 years with a standard deviation of 7.05. The mean age of both the males and females was 58.44 years with a standard deviation of 6.69.

Those having nuclear grade 1 cataract had a mean age of 56 years; grade II, 55.9 years; Grade III, 58.87 years; Grade IV, 59.56 years and Grade V, 60 years [Figure – 1]. Mean effective phaco time (EPT) for each individual case was recorded against different grades of cataract. The mean EPT for grade I was 46 seconds with a SD of 28.28; for grade II, 51.18 seconds with a SD of 18.30; for Grade III, 63.16 seconds with a SD of 21.24; for grade IV, 75.46 seconds with a SD of 34.17 and for grade V, 84 seconds with a SD of 38.28 (Table 3). For male patients the mean EPT for grade I, grade II, grade III, grade IV and grade V were 48.83, 57.20, 64.76, 63.50 and 72.00 seconds respectively. For female patients the mean EPT for grade I, grade II, grade III, grade IV and Grade V were 37.50, 46.17, 61.21, 87.42 and 88.00 seconds respectively (Table 2).

Analysis of variance (ANOVA) test was conducted on total cases in which F=3.8955 with 4 degree of freedom for between grades and 85 d.f. for within grades. The ANOVA test was found to be statistically significant at p < 0.05 with p value = 0.00593. Further sex wise one way ANOVA was conducted. For male patients F = 0.8647 with p value = 0.4936 which indicated that the test is not statistically significant at p < 0.05. For female patients F = 3.0265 with p value = 0.028 which indicate that the test is statistically significant at p < 0.05.

Discussion

In this study Peribulbar anaesthesia was given in all cases. CCC Performed in all cases and bottle height kept constant. Phacoemulsification carried out in 90 eyes of 90 patients of Grades 1 – 5. Phacoemulsification done in conventional coaxial 2.8 mm limbal entry in continuous mode of constant power in linear setting both for trenching and emulsification in all the grades of cataract. The mean of Effective phaco time is more in higher grades of nuclear sclerosis than lower grades. Mean EPT is more than other phaco modulations and other phaco techniques. EPT is less in Direct chop technique stated by Ramamurthy LB et al11. Ahn DS et al12, stated less EPT in conventional Pulse mode. This study correlates to other studies13,14. For trenching continuous mode is better than other modes. Again mean EPT is more in higher grades of cataract in continuous mode than Burst and pulse modes.

Conclusion

Phacoemulsification technique of cataract surgery
is the standard procedure with judicious patient screening for proper and satisfactory visual outcome. EPT is more in conventional continuous mode than other modulations and other Phacoemulsification techniques. EPT is also more than Transverse and Torsional modulation.

A Phenomenological Study to Assess the Lived Experience of Health Related Quality of Life of Diabetic Patient in Selected Hospitals of Pune City

Vivek Patidar¹, Deepak Sethi², Sharadha Ramesh³

¹M.Sc Nursing Student, ²Assistant Professor, ³Director, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Diabetes is the top health emergencies from the 21st century. Every year more people live with diabetes that could be a result of sedentary life and health related complication. First world health organization’s global report in (2016) about diabetes shows that the numbers of peoples with diabetes, almost from the year 1980 to 2014, has quadrupled. The number of peoples with diabetes has been increased from 108 million in 1980 to 422 million in 2014. The study aims to assess the Health related quality of life of diabetic patients. Phenomenological research design was used with Purposive sampling technique to select the participants. Sample size was 10 as determined by data saturation technique using a semi-structured questionnaire technique was adapted to collected data using colaizzi approach. The study finding revealed that in Baseline data 30% of the diabetic patients had age 25-35 years and 70% of them had age 35-45 years. 50% of them were females and 50% of them were male. 50% of them had higher secondary, 40% of them were illiterate and 10% of them had secondary education. 90% of them were married and 10% of them were unmarried and 30% of them had 5-10 years of working experience. 10% of them were non-vegetarians and 90% of them were vegetarians. All of them had family history of diabetes. 40% of their fathers having diabetes and 60 of their mothers had diabetes mellitus. And common themes were found like confusion, giddiness, restlessness and uncomfortable, effect of the medications as Anger, Anxiety, Frustration, Headache, Irritation, Nausea, Stress and Vomiting, ‘Confusion about the dose’, ‘Difficult to manage’, ‘Difficult to remember dose’, ‘Easy to manage’ and ‘Forget amount and dose of medication’. Joint pain, Tenderness, Tiredness Uncomfortable and Weakness.

Keywords: Diabetes Mellitus, Phenomenological Study.

Introduction

Diabetes was considered a disease of the wealthy in ancient India, and was known as Madhumeha (sweet urine disease); it was observed that ants were attracted to the urine. The ancient Greeks coined the term «diabetes», meaning excessive urination with dehydration, but neither they nor the Romans appreciated that the urine contained sugar; «diabetes» was considered a kidney disease until the 18th century. The sweet taste of the urine was known to Avicenna (1000 AD) and to Thomas Willis in the 17th century. The sweet taste was known to be due to glucose by the start of the 19th century, and raised glucose in the blood was recognized soon afterwards. The modern era was heralded by the discovery of Oskar Murkowski that removal of the pancreas resulted in diabetes, followed by the discovery of insulin in 1921-22. The herbalists of the middle Ages already knew the beneficial effects of the herb Galega officinalis, which ultimately led to the discovery of metformin. Likewise, Claude Bernard with his «pique diabetique» already suspected that the brain was somehow involved in the causation of diabetes, a topic that continues to attract research attention today. These examples show that many people have made the same observations and considered the same hypotheses at widely differing times, and that valuable finding are sometimes obscured by the fogs of time.

Diabetes Mellitus ("diabetes" for short) is a serious disease that occurs when your body has difficulty
properly regulating the amount of dissolved sugar (glucose) in your blood stream. It is unrelated to a similarly named disorder “Diabetes Insipidus” which involves kidney-related fluid retention problems. In order to understand diabetes, it is necessary to first understand the role glucose plays with regard to the body, and what can happen when regulation of glucose fails and blood sugar levels become dangerously low or high. The tissues and cells that make up the human body are living things, and require food to stay alive. The food cells eat is a type of sugar called glucose. Fixed in place as they are, the body’s cells are completely dependent on the blood stream in which they are bathed to bring glucose to them. Without access to adequate glucose, the body’s cells have nothing to fuel themselves with and soon die.

Human beings eat food, not glucose. Human foods get converted into glucose as a part of the normal digestion process. Once converted, glucose enters the blood stream, causing the level of dissolved glucose inside the blood to rise. The blood stream then carries the dissolved glucose to the various tissues and cells of the body. Though glucose may be available in the blood, nearby cells are not able to access that glucose without the aid of a chemical hormone called insulin. Insulin acts as a key to open the cells, allowing them to receive and utilize available glucose. Cells absorb glucose from the blood in the presence of insulin, and blood sugar levels drop as sugar leaves the blood and enters the cells. Insulin can be thought of as a bridge for glucose between the blood stream and cells.

Diabetes is common, affecting 23.6 million Americans according to a 2007 survey by the American Diabetes Association (CDC, 2008). Unfortunately that number is on the rise as roughly 1.6 million more Americans are diagnosed with diabetes every year (CDC, 2008). Diabetes comes in two major forms and a third less common form.

Type-1 Diabetes. The first major form of diabetes, known simply as Type 1 diabetes is an autoimmune disease wherein the body’s own immune system attacks and destroys the cells within the pancreas that produce insulin, rendering the affected person unable to produce insulin naturally. This type of diabetes was formerly known as Insulin Dependent Diabetes Mellitus, which is an inaccurate term because both major types of diabetes can require insulin treatment. Also known as juvenile diabetes, Type 1 diabetes often begins in childhood. It is fairly rare, accounting for only 5% or so of all diabetes cases. It would be a deadly disease except for the fact that insulin produced external to the body can be manually injected to substitute for what the body can no longer produce on its own. Persons with Type 1 diabetes must learn to periodically check their blood sugar and self-administer insulin shots in order to keep their blood sugar levels normalized. Though diet modifications cannot cure Type 1 diabetes, they are important to follow anyway so as to keep blood sugar swings minimized as much as possible.

Type 2 Diabetes. Type 2 diabetes is different than Type 1 diabetes in that it begins with a gradual decrease in the body’s ability to respond to insulin (a condition known as «Insulin Resistance»), rather than an abrupt stoppage of actual insulin production. Insulin resistance occurs when the body is repeatedly subjected to high levels of insulin in the blood stream. After a while the cells do not respond as vigorously to insulin as they once would. At this point it takes a higher level of insulin to get the same amount of glucose into the cells. This can be thought of a little like «the boy who cried wolf.» Initially, every time the boy cried out everyone came running quickly and efficiently. However, after running to the child multiple times and finding him completely safe the villagers stopped responding to his calls. Only after the disease has progressed does actual insulin production start to decrease. Though the mechanisms causing Type 1 and Type 2 diabetes are different, the net results are identical; blood glucose levels stay higher than normal and dangerous Hyperglycemia (high blood sugar) can result.

Hyperglycemia occurs when your blood glucose levels become too high, indicating the body’s inability to use the sugar that is present in the bloodstream. This occurs either because insulin is not available (Type 1 diabetes) or because the cells are resistant to the present insulin (Type 2 diabetes). Hyperglycemia is a sign that the body’s tissues are, to one degree or another, starving for glucose. In extreme and untreated cases, hyperglycemia can be very serious, leading to ketoacidosis, coma and even death.

Research Statement: A Phenomenological Study To Assess The Lived Experience Of Health Related Quality Of Life Of Diabetic Patient In Selected Hospitals Of Pune City.
Aims: 1. To assess the Health related quality of life of diabetic patients.

Methodology

- **Research approach:** Qualitative approach
- **Research design:** Phenomenological research design
- **Sampling technique:** Purposive sampling
- **Sample size:** 10 (as determined by data saturation technique)
- **Sampling criteria:**
  - **Inclusion criteria:**
    1. Who had developed diabetic mellitus (more than 2 years).
    2. Patient those who are available in that time
  - **Exclusion criteria:**
    1. Patients those who are not willing for Personal interaction

Data Collection Procedure: The data collection was done in 2 phases;

- **Section 1:** Includes Baseline Data Which Includes Age, Gender, Education Status, Marital Status, And Type Of Living Etc.
- **SECTION B-:** Includes Questions for In-Depth Interview.

Results

Section I: Baseline data:

• 30% of the diabetic patients had age 25-35 years and 70% of them had age 35-45 years.
• 50% of them were females and 50% of them were male.
• 50% of them had higher secondary, 40% of them were illiterate and 10% of them had secondary education.
• 90% of them were married and 10% of them were unmarried.
• 90% of them had joint family and 10% of them had nuclear family.
• All of them were Hindu.
• 80% of them had monthly family income more than Rs. 10000 and 20% of them had monthly family income Rs.10001-30000.
• 70% of them had less than 5 years of working experience and 30% of them had 5-10 years of working experience.
• 10% of them were non-vegetarians and 90% of them were vegetarians.
• All of them had family history of diabetes.
• 40% of their fathers having diabetes and 60% of their mothers had diabetes mellitus.

Section II

• Analysis of data related to Health Related quality of life of diabetic patients

• The diabetes patients when responding about the understanding of diabetes mellitus mainly mentioned the effect of DM and Reason of DM. While mentioning the effect of DM, they spoke about confusion, giddiness, restlessness and uncomforted. Whereas speaking about reasons of DM, they mentioned the reasons as blood sugar level rise issue and imbalance of insulin hormones.

• While responding on management of the daily dose of medication, they responded around two subthemes ‘Effect of medications’ and ‘Management of dose’. They mentioned the effect of the medications as Anger, Anxiety, Frustration, Headache, Irritation, Nausea, Stress and Vomiting. About management of daily dose they spoke around ‘Confusion about the dose’, ‘Difficult to manage’, ‘Difficult to remember dose’, ‘easy to manage’ and ‘Forget amount and dose of medication’

• While responding on Daily exercises they spoke around adverse effects and positive effects of daily exercise. They mentioned ‘Joint pain’, ‘Tenderness’, ‘Tiredness’, ‘Uncomfortable’ and ‘Weakness’ as the adverse effects of daily exercises if done excessively. They mentioned ‘Ability to work long time’, ‘Cure’, ‘Generate new energy’, ‘Healthy’ and ‘Perfect body shape’ as the benefits of daily exercises.

• On Management of dietary pattern their responses were around the subthemes ‘Feeling’, ‘Health related’ and ‘manage to follow’. Their feelings were Anger, Feeling very unlucky, Irritation, ‘not feeling good’. They had health related points ‘Cure’, ‘Keep healthy’ and ‘Proper homemade food’. To manage the dietary pattern, they ‘avoid parties’, few of them had problems like nausea and vomiting, it was difficult to follow, not feeling good and few of them think it is very hectic to follow the dietary pattern.

• They also spoke around management of Hypoglycemia at home with the subthemes ‘Diet related’, ‘Personal care’ and ‘Personal hygiene’. They mentioned ‘Proper healthy diet’, ‘Proper soft diet’ and few of them take some amount of sugar to manage Hypoglycemia. They mentioned daily dose of insulin injection, proper medication and proper rest for personal care. They also mentioned ‘Hand washing before and after food’, ‘Maintain personal hygiene’ and ‘Wash legs at bed time’ for personal hygiene.

• The responses on life style modifications required for managing diabetes were spread over three subthemes viz.,Encourage oneself, Exercise, Spirituality and Intake related. They encourage themselves to be a good human, better to themselves, they will cure and maintain good repo with others. They do morning walk, yoga and deep breathing exercises. They believe in god, pray to god and sing spiritual songs. They avoid bad habits like smoking, chewing tobacco. They take morning breakfast.

Conclusion

It deals with the introduction. Analysis and interpretation of the data collected for baseline data of diabetic patients and Analysis and interpretation of the data collected for interviewing of diabetic patients by semi-structured questionnaire.

Conflict of Interest: There is no conflict of interest in the present study.

Source of Funding: Self

Ethical Clearance: The present has cleared the Institutional Ethical Committee and informed & written consent was taken from the participation.

Oral Health Literacy among Students of an Engineering College in Puducherry

Arunima Chauhan¹, Sunya Gyati², Kuldeep Singh Shekhawat³, M Senthil⁴

¹Associate Professor, Faculty of Dentistry, Melaka Manipal Medical College [Manipal Campus], Manipal Academy of Higher Education, Manipal, Karnataka, India, ²Postgraduate student, Dept. of Conservative Dentistry and Endodontics, Swami Devi Dayal Dental College and Hospital, Barwala, Panchkula, Haryana, India, ³Associate Professor, Dept. of Public Health Dentistry, Century international institute of Dental sciences and Research Centre, Kasaragod, Kerala, ⁴Professor, Dept. of Public Health Dentistry, Indira Gandhi Institute of Dental Sciences, Pondy - Cuddalore Main Road, Puducherry UT, India

Abstract

Background: Oral health literacy, plays an important role in the maintenance and promotion of oral health. However, there is limited data on Oral Health Literacy (OHL) among those not related to healthcare professionals.

Aim: To determine the OHL of students pursuing their graduation in technical stream (engineering) with secondary objective to determine its association with gender, perception of their oral health and oral health behaviour.

Methodology: A cross sectional questionnaire study was conducted among 236 students. A 17 item Oral Health Literacy – Adult Questionnaire (OHL-AQ) was distributed to determine their OHL scores. In addition, data on age, gender, brushing habits, visits to dentists, their self-rating of oral health and source of information was obtained. The data was analysed for mean differences using students ‘t’ tests with significance set at 0.05.

Results: More than 59 percent had inadequate oral health literacy. Overall mean score was 5.8 ± 2.7. More than 63 percent of study participants had not visited the dentist in the last 6 months and only 36 percent brushed their teeth twice a day. Majority rated their oral health as ‘good’. Those rating their oral health as ‘good’ had higher OHL-AQ scores (p<0.05). Gender, visits to dentist and brushing habits had no influence on OHL-AQ score (p>0.05). Internet was the commonly reported source of information.

Conclusion: OHL was found to be inadequate among the study participants. Oral health is an important concept that needs to be followed irrespective of educational background. Efforts needs to be directed towards those population with limited levels of Oral Health Literacy.

Keywords: Dentist, Health Literacy, Oral Health Literacy, Oral Health Behaviour, Tooth brushing

Introduction

Health literacy is defined as “the degree to which individuals have the capacity to obtain, process, and understand basic health information and services needed to make appropriate decisions”. The health benefits of improving health literacy are higher utilization of preventive services, lower rate of emergencies and hospitalization care, etc., resulting in lower health care...
expenditures, ability to know when and how to enter
the health care system, and how to make the best use of
health services.  

Oral Health Literacy (OHL) has been defined as
“The degree to which individuals have the capacity
to obtain, process, and understand basic oral health
information and service needed to make appropriate
health decisions and act on them.” OHL is interplay
between culture and society, the health system, education
system, and oral health outcomes indicating that it may
be a new determinant of oral health and should be
considered more intensively in oral health research. 3, 4
Most of the oral health care delivery systems are situated
in the urban areas, thereby leaving the rural population
disadvantaged. 5 Current evidence suggests that OHL
is associated with various factors like education level,
ethnic group, utilization of dental services, knowledge
regarding oral health and oral self-care behaviour 6-8

The simple concept of oral hygiene should be
understood equally by everyone irrespective of their
educational background. Lack of OHL can create
a significant barrier in preventing oral diseases and
promoting good oral health. For better understanding
and optimal utilization of oral health services by any
population group, it is important that we determine
their oral health literacy. The present study aimed to
determine the oral health literacy of students pursuing
their graduation in technical stream (engineering) with
a secondary objective to determine its association
with gender, perception of oral health and oral health
behaviour (brushing habits and visits made to dentist).

Methodology

Study setting and design

A Cross-sectional questionnaire study was
conducted in one conveniently selected engineering
college situated in Puducherry. Puducherry was a French
colonial settlement in India until 1954. It has a literacy
rate of about 86.5 percent 9 and is an educational centre
with medical, dental, engineering and other degree
colleges providing undergraduate and postgraduate
courses. The study was conducted in the month of June
2015. Permission to conduct the study was obtained
from the concerned authorities of Indira Gandhi Institute
of Dental Sciences (IGIDS), Puducherry. The study was
conducted in accordance with the Helsinki Declaration
of 1975, as revised in 2000. A letter of permission was
obtained from the Dean of IGIDS addressed to the Dean
of engineering college seeking permission to conduct
the study.

Participants

The permission was obtained from the Dean of
the engineering college and a specific day and time
was scheduled so as not to affect the daily academic
curriculum. A request was made not to reveal the
information about the study, day and time to the students.
On the pre-decided day and time, the investigator with
one faculty approached the students in lecture halls. The
nature of the study was explained to them. Participants
with a minimum age of 18 years, without any cognitive,
hearing or vision impairment, not having any difficulty
in understanding the questionnaire given by the principal
investigator and those providing informed consent were
included. Students not willing to be a part of the study
were given the autonomy to do so. They were also
assured of confidentiality and anonymity.

Study Sample and sampling

The sample size was calculated with a precision of
1.96 at 95% confidence level with an permissible alpha
error of 5% and prevalence of 19.1% (from previous
literature), the sample size for the present study was
found to be 236. Those students present on the day of
study (irrespective of their branches/streams and year of
study) and fulfilling the inclusion criteria were included
in the present study.

Measurement and Instrument

The instrument used in the present study was
developed and tested by Sistani et al in 2014. It is a valid
and reliable instrument with an internal consistency
of 0.72 and Intra-class correlation coefficient of 0.84. 10
The validity and reliability of this questionnaire has
been previously confirmed. 11 The questionnaire (OHL-
AQ) consists of 17 items in four sections: reading
comprehension, numeracy, listening and decision-
making. The reading comprehension section consisted
of six items with words omitted from one passage (three
uncompleted sentences) on oral health knowledge. The
numeracy section consists of four questions to assess
calculation skills related to mouthwash and antibiotics
prescription. The listening component has two questions
for assessment of communication skills. The decision-
making section contains five questions related to
common dental problems and items extracted from the medical history form. Correct answers were scored 1 and incorrect answers were scored 0. Sum of correct answers were then calculated to provide the total score for the questionnaire ranging from 0 to 17. It was categorized as inadequate literacy for scores 0 - 9, marginal literacy for scores 10 - 11 and adequate literacy for those scoring above 12.

Two additional item, a) “how do you rate your oral health at present?” and b) source of knowledge regarding oral health were separately elicited. Response for self-rating of oral health was recorded as ‘good’ or ‘poor’. The measure of ‘good’ was scored as 1 and ‘poor’ scored as 0 for analysis. Demographic variables like age, gender, brushing habits and visit to the dentist in the last 6 months were also elicited. The OHL-AQ was not tested for its reliability and validity in the present study setting.

The questionnaire was distributed to participants, which they had to read, listen comprehend and select the answers accordingly from the given options. Those questionnaires with more than one response for any item and incomplete questionnaires were excluded from analysis. The data was analysed for differences in OHL mean scores with respect to gender, their rating of oral health and oral health behaviours by student ‘t’ test using Statistical Package for Social Sciences version 16.0.0 (SPSS Inc., Chicago, IL, USA)

**Results**

A total of 200 questionnaires were subjected to analysis. The response rate was 84.7 (200/236) percent. The mean age of the study participants was 21.1 years with more males than females. The mean OHL-AQ score was 5.8 ± 2.7. Only one percent of the participants had adequate OHL, 39.5 percent had marginal, 59.5 percent had inadequate OHL. Thirty six percent brushed their teeth twice a day and 36.5 percent of the participants reported visiting a dentist in the last 6 months.

Majority of the participants rated their oral health as good. There was no statistically significant difference in OHL-AQ scores among gender, oral hygiene behaviour (visits to dentist and frequency of brushing teeth) [P>0.05], but significant differences were observed in mean scores of participants who rated their oral health as in a ‘good’ condition [P<0.05].

*significance level at p<0.05; mean diff: Mean Difference

Discussion

Oral health is an integral part of general health. To our knowledge, there is limited literature to assess the oral health literacy using OHL-AQ, with the same study parameters. The mean OHL-AQ scores in the present study was 5.8 (3.1 – 7.8). Studies conducted using the same instrument among different target population have documented higher scores. 6, 12 This implies the assumption of poor oral health status among study participants since low OHL can be a predictor for poor self-reported/oral health status. 6, 8, 10 However, OHL-AQ scores revealed about 59 percent of study participants had inadequate OHL. This may limit their ability to process and understand basic oral health information. In addition, literature points out that limited OHL has proved to be a barrier in utilization of dental services and dental visits. 13, 14

Various instruments have been used in the past to assess OHL. 15–17 For the present study we, opted for Oral Health Literacy – Adult Questionnaire (OHL-AQ). In addition to reading comprehension and numeracy, OHL-AQ is reinforced with listening and decision making domain producing a more stable and comprehensive score which mimics the probable applicability by the study participants. Our study showed that OHL scores had no significant association with gender (P>0.05). Similar results were also observed among students in Iran and adults in India respectively. 12, 18 Though insignificant, in the present study it was observed that females scored higher than males, indicating that females are more receptive to instructions for better oral health.

Oral health behavior is fundamental to the maintenance of oral health; therefore, brushing teeth and visits to dentist was considered for comparison with mean OHL-AQ scores. There was no significant difference between mean OHL-AQ scores with visits to dentist and brushing habits (P>0.05). Such insignificant associations were also observed among American adults. 17, 19 Perhaps overall lower mean scores is a contributing factor highlighting inadequate dental knowledge of study participants. This indicates the need for incorporation of guest lectures, seminars on oral health topics as a part of their extracurricular activities.
in their educational curricula.

The findings in the present study also confirm that majority of the study participants had not been to a dentist in the last 6 months and brushed their teeth only once a day. Though utilization of oral services is subjective, brushing teeth and regular visit to dentist is a step towards preventive measures. The insignificance mentioned above is justified since, by not visiting a dentist the likelihood of study participants receiving proper oral hygiene instructions is reduced thereby prompting to search for other avenues. Perhaps it might have its origin in their childhood. One effective way to promote this behaviour is school based dental care, where children visit a dentist for check-ups at regular intervals which may continue in adulthood. Tooth brushing is a healthy behaviour, which indicates a person’s attitude to oral health. It is also proved that higher OHL scores relate to more frequent tooth brushing.

In the present study we observed significant differences between OHL-AQ scores and oral health status \( (P<0.05) \) among study participants which is in agreement with studies conducted in Iran and Australia respectively. However, the present assessment was subjective (self-reported by students); requiring further scientific evidence to confirm this finding and to validate the accuracy of self-reports by students. We also wanted to know the source of information these study participants referred for relevant oral health knowledge. Forty five percent of these often browsed the internet to obtain or confirm their doubts related to oral health. This was followed by information related to oral health in newspapers. One effective method to improve OHL is to increase the rendezvous of students, adults and general population with oral health messages printed on daily life utilities. Informative, short yet impactful messages on coffee mugs, fountain pens, key chains, water bottles, lunch boxes and pencil boxes are innovative methods which may help in the long run. Perhaps further research can be directed towards this unexplored domain to prove/disapprove the hypothesis.

**Conclusion**

From the present study it can be concluded that OHL was found to be inadequate among the study participants. OHL scores were not associated with gender, visits to dentist and brushing habits. There is a need to make constant efforts to improve OHL so that people do adopt practices that have been scientifically shown to be effective in maintaining oral health which otherwise could result in higher prevalence’s of oral diseases.

Infertility its Socio-demographic Correlates and Causes in Rural and Urban areas of Allahabad District

Khurshid Parveen¹, Samreen Kazmi², Shiv Prakash³
¹Professor, ²PG, ³Professor & Head, Deptt. of Community Medicine, Moti Lal Nehru Medical College, Allahabad

Abstract

Introduction: Childbearing is an extremely important event in every human’s life and is strongly associated with the ultimate goals of completeness and family integration. Infertility can threaten a woman’s identity, status and economic security and consequently, be a major source of anxiety leading to lowered self-esteem. Infertile couples have high negative feelings and poor social support.¹

The present study was done with the following objectives: 1. To study the socio demographic profile of eligible couple in study population. 2. Find out the various medical factors associated with infertility.

Material & Method: The present study was a cross sectional descriptive study was conducted on eligible couples of urban and rural areas of Allahabad district. Data was collected by a structured questionnaire designed for the purpose.

Result & Conclusion: A total of 422 couples were studied from urban and rural areas each. Majority of the couples in both rural and urban areas belonged to 26-35yrs of age. Association between infertility and education of females, and their occupation were statistically significant. In urban area most common cause of infertility was semen abnormality followed by PCOD, in rural area PID and STIs/RTIs, followed by tubal factors and semen factors.

Keywords: Infertility, Rural, Urban, and medical causes of infertility.

Introduction

Childbearing is an extremely important event in every human’s life and is strongly associated with the ultimate goals of completeness and family integration. The consequences of infertility are manifold and can include societal repercussions and personal suffering. Childless women experience stigma and isolation. Infertility can threaten a woman’s identity, status and economic security and consequently, be a major source of anxiety leading to lowered self-esteem. Infertile couples have high negative feelings and poor social support.¹

Consequences of infertility for couples in developing countries (like India), where children are highly valued for economic and socio cultural as well as personal reason are great. Infertility is a global health issue, affecting approximately 8-10% of couples worldwide.²

Etiology of infertility varies from region to region and from one population to another. The biological and social factors including stress due to economic status, religious attitudes, age at marriage, urbanization leading to modernization, higher literacy, contraceptive usage and nuclear families play a significant role in lowering fertility.³ For a large part, infertility is related to conditions that are preventable in principle such as STIs, infections and parasitic diseases, health care practices leading to iatrogenic pathology, exposure to toxic substances either in the diet or environment and complications suffered during post partum or post abortion period, particularly in case of an unsafely induced abortion.⁴
STIs are generally considered the leading preventable cause of infertility worldwide, especially in developing countries. Other causes of female infertility include tubal blockage, PID caused by infections like TB, advanced maternal age, uterine problems, endometriosis, hormonal problems, etc. Male infertility is most commonly due to deficiencies in the semen, and semen quality is used as a surrogate measure of male fecundity.

The Ninth Five-Year Plan (1997–2002) document of Government of India included infertility in the comprehensive reproductive and child health package. Services for infertility and RTI are available only at district and sub district hospitals and some community health centres.

The present study was done with the following objectives:

1. To study the socio demographic profile of eligible couple in study population.
2. Find out the various medical factors associated with infertility.

Material and Method

This cross sectional study was conducted among the eligible couples (wherein the wife was in the age group of 15-45 years) of Allahabad district during the period of one year. Statistically valid sample size was drawn, based on reported P= 4% (prevalence of infertility according to NFHS 3 Survey)

\[ L = \frac{P}{2} = 2 \]

\[ 4PQ/L*2 = 422 \] (adding non-response rate of 10%)

422 subjects were taken from rural and urban area each. Therefore the sample size was 844.

Sampling Technique: Multistage random Sampling was used to reach the required sample size. In the first stage, Allahabad district was divided into four quadrants and various blocks & wards were listed. Subsequently, one block and one ward was selected randomly from each quadrant followed by listing of all the villages of the selected blocks and wards of the selected colonies. Then 1 colony per ward & 1 village per block were randomly selected. Finally the households of colonies and villages were visited and eligible couples were interviewed. House to house visits were done in the selected villages and colonies and eligible couples were identified for collection of data. Study subjects were explained in detail about the purpose and objective of the study. Informed consent was obtained & they were ensured that all information would be kept confidential.

Among the couples those who were exposed to the risk of pregnancy were considered and couples with inability to conceive despite cohabitation and exposure to the risk of pregnancy (in the absence of contraception) for two years or more (as per WHO Epidemiological definition) were included in the study. Detailed information was collected on a predesigned and pretested questionnaire Data regarding medical conditions associated with infertility was also collected based on the investigation reports that were available with the couples at the time of survey. Data was collected and entered into data sheet of the Statistical Package for the Social Sciences (SPSS) version 21. Data was analysed and statistically evaluated by using chi square test.

Results

Socio demographic profile of study couples

Table 1 shows the distribution of study couples in urban and rural areas on the basis of their age. A total of 422 couples were studied from urban and rural areas each. It can be seen that majority of females in both the areas, 244 (57.82%) in urban area and 229 (54.27%) in rural areas belonged to the age group of 26-35 years. Similarly, majority of male partners in both the areas, 207 (49.05%) in urban area and 232 (54.98%) in rural areas belonged to the age group of 26-35 years.

It also shows that out of the 422 females in urban areas 75 (17.77 %) were illiterate. A total of 32 (7.58%) females were Graduates and only 15 (3.55%) were post graduates. A total of 49 (11.61%) males were illiterate in the urban areas. Only 30 (7.11%) were post graduates.

In rural areas, most of the females i.e. 184 (43.60%) were illiterate. A total of 32 (7.58%) females were Graduates and only 15 (3.55%) were post graduates. A total of 49 (11.61%) males were illiterate in the urban areas. Only 30 (7.11%) were post graduates.

In rural areas, most of the females i.e. 184 (43.60%) were illiterate. Very few i.e. 3 (0.71%) were Graduate. Among the males 89 (21.09%) were illiterate. There were only 11 (2.61%) graduates and 3 (0.71%) were post graduates.

Table 1 also shows the occupation of females and their male partners in both urban and rural areas. It can be seen that majority of females in both the areas, 347 (82.23 %) in urban areas and 359 (85.07%) in rural areas
were housewives. A total of 7 (1.66%) females were professions but none of them in rural areas. In males 172 (40.76%) were engaged in private job followed by 77 (18.25%) labourers, 46 (10.90%) shopkeepers. Out of the total 422 male partners in urban areas, 23 (5.45%) were unemployed. In rural areas majority of the male partners 151 (35.78%) were labourers, followed by 126 (29.85%) who were engaged in agriculture, 9 (2.13%) of them were Professionals, few were teacher.

Distribution of study couples according to their religion can be observed from table 2. It can be seen that in urban areas most of the couples, 343 (81.28%), belonged to the religion of Hinduism followed by those belonging to Islam i.e. 75 (17.77%) couples and only 4 (0.95%) couples belonged to Christianity. Similarly in rural areas the most common religion was Hinduism with 373 (88.39%) couples which was more as compared to that in urban areas. This shows significant association between the religion of study couple (p<0.05).

Table 3 depict the socioeconomic status of the couples in rural and urban areas. Maximum number of couples in both the areas, 154 (36.49%) in urban areas and 173 (40.99%) in rural areas belonged to Upper Lower Class. This association was statistically significant (p<0.05).

Table 4 depict the fertility status of the couples on the basis of their residence. Out of the total 422 couples in the urban areas 50 (11.84%) couples were infertile and a total of 22 (5.21%) couples were infertile in the rural area. Thus it can be seen that the prevalence of infertility in urban area is 11.84% and in rural area it is 5.21%. This implies that is there is significant association between fertility status of the couple and residence of study couple (p<0.05).

Medical factors associated with infertility
Table 5 depict the different medical causes of infertility in the study couples. It can be observed that in urban areas the most common cause of infertility was semen abnormality 13(28.26%) and in rural areas PID and other STIs/RTIs were found to be the most common cause 7(35.00%). Infertility remained unexplained in 17.39% and 10% of the infertile couples in urban and rural areas respectively.

Discussion: In the present study it was found that maximum proportion (10.15%) of infertility was found among the females who belonged to the age group of 26-35 years and minimum proportion of infertility (3.25%) was found among females in the age group of 15-25 years. Maximum proportion (9.57%) of infertility was found among the male partners who belonged to the age group of 26-35 years and minimum proportion of infertility (3.66%) was found among the male partners in the age group of 15-25 years. Similar findings by S. Shamila et al9 (2011) reported that maximum infertility of females visiting infertility clinics prevailed between 25-30 years of age, with 43.80%, 47.95% and 36.26% in Kanyakumari, Thirunelveli and Thiruvananthapuram, respectively. Izatulla Jumayev et al10 (2012) also found that maximum females with infertility ranged between 19 - 35 (mean age 25.8 years).

Regarding the education status of infertile couples in the present study, maximum (26.67%) proportion of infertility was found among those females who were educated upto post graduate level and the association between infertility and education status of females was found to be statistically significant. This could be because delaying marriage and childbirth may be more common among the females who go for higher education. Among the male partners also maximum (12.12%) proportion of infertility was found among those were educated upto post graduate level and no association was found between the education status of male partners and infertility. Similar results were reported by S. Shamila et al11 (2011). It was observed that educational status was the most important variable; women with secondary school education and above had markedly lower average fertility (P < 0.01) than the less educated. Ajeet Vasant Saoji (2014)12 in a case-control study in Nagpur reported that approximately 52.7% of primary infertility cases received educations of Graduation and above compared to 47.2 % of the control and an estimated OR of 2.2,(95% CI 1.02-4.82).

In the present study it was found that infertility was highest (28.57%) among the females who were doing professional jobs (Doctor, Engineer and lawyers) minimum proportion (6.80%) of infertility was seen among the housewives. The association between infertility and occupation was found to be statistically significant. Regarding the occupation of male partners, it was observed that maximum proportion (14.71%) of infertility was seen in couples where the male partners were doing business. No association was found between infertility and occupation of male partners. Similar
findings were reported by Mokhtar S et al\textsuperscript{13} (2006) who conducted a case control study and observed that about 57.6% of cases and 68% of controls were housewives, with significant association of being infertile.

In the present study, it was observed that more proportion (9.36%) of infertility was found in couples following Hinduism as compared to those following Islam (4.03%). Similar to our findings were the results reported by Paul C. Adamson et al\textsuperscript{14} (2011) who studied the prevalence and correlates of infertility among young females of Mysore and reported that over half of the study participants reported their religion as Hindu (60.1%).

In the present study maximum proportion of infertility was seen among couples belonging to Upper (16.67%) and Upper Middle class (16.95%), minimum proportion of infertility was seen among those belonging to Upper Lower class (6.73%), and the association between infertility and socioeconomic status of couples was found to be statistically significant. This may be because females belonging to affluent classes tend to delay their marriage and childbirth and are also mostly obese and all these factors cumulatively affect fertility. Similar to the findings of our study, Sameer Valsangkar et al\textsuperscript{15} (2011) also found that a higher socio-economic status was significant for outcome of infertility.

In the present study, the most common cause of infertility in urban areas was semen factors (28.26%) followed by PCOD (23.91%). Other common causes were PID and other STIs/RTIs 7(15.22%), tubal factors (13.04%), endometriosis (8.70%), and hypothyroidism (10.87%). In rural areas commonest cause of infertility was PID and other STIS/RTIS (35.00%) followed by semen factors and tubal factors (20.00% each). Similarly, Jehoshua Dor et al\textsuperscript{16} (1977) did an evaluation of etiologic factors in infertile couples of Israel and found that male infertility factors were involved in 28%, ovulatory disturbances in 31.5%, tubal factors in 16.3%, and undiscovered factors in 17.6%.

Conclusion

The present study was conducted on eligible couples of rural and urban areas of Allahabad district. Majority of females in both the urban (57.82%) and rural (54.27%) areas, belonged to the age group of 26-35 years, similar findings were there in their male partners. Most of them were Hindus. Majority of females in urban areas were educated up to Secondary level and only 17.77% females were illiterate. In urban 11.61% males were illiterate. In rural areas, majority of male partners (24.88%) attained education up to Primary level and 21.09% were illiterate. Regarding the occupation of females, it was found that in both urban and rural areas majority were housewives. Maximum couples in both the areas, 36.49% in urban areas and 40.99% in rural areas belonged to Upper Lower Class. In urban area the most common cause of infertility was semen abnormalities (28.26%) followed by PCOD (23.91%). The cause remained unexplained in 17.39% cases. Other causes were PIDs and other STIs/RTIs (15.22%), tubal factors (13.04%), hypothyroidism (10.87%) and endometriosis (8.70%) etc. The cause of infertility in rural area was mostly PID and STIs/RTIs (35.00%), followed by tubal factors and semen factors (20.00% each) and genital Tuberculosis (15.00%).

Recommendation: Awareness about the potential risks for infertility should be spread through health education in the community. In urban areas life style modification can also work. In rural areas infection prevention can reduce the burden of infertility. Non-Government Organizations should also assist in conducting training workshops for the health care providers.

Evaluating the Efficacy of Myeloperoxidase and other Biochemical Parameters in the Diagnosis of Chronic Kidney Disease among Diabetic Patients: A Cross-sectional Study

Samudrala Sangeeta¹, Jeevan Ambekar², Tunguthurthi Sudhakar³, Nilima Dongre⁴

¹Ph.D scholar, Department of Biochemistry, Shri B.M.Patil Medical College, BLDE (Deemed to be University), Vijayapur; ²Professor, Department of Biochemistry, Shri B.M.Patil Medical College, BLDE (Deemed to be University), Vijayapur; ³Professor of Biochemistry, CAIMS, Karimnagar; ⁴Associate Professor, Department of Biochemistry, Shri B.M.Patil Medical College, BLDE (Deemed to be University), Vijayapur

Abstract

Introduction: Chronic kidney disease (CKD) is a public health problem across the globe which is characterized by the accumulation of various substances like urea, creatinine, electrolytes, water, in the human body. CKD patients are more prone to increased risk of developing oxidative stress due to metabolic disorders, immunodeficiency and persistent infections and inflammation. Myeloperoxidase may participate as one of the mediators of oxidative modification of biomolecules/tissues and contribute to the development of co-morbidities and complications in patients with CKD.

Aims and objectives: The present study was undertaken to assess the role of Myeloperoxidase, HbA1c, Urea, Creatinine urine microalbumin and eGFR in chronic kidney disease in diabetic and non diabetic patients.

Materials and Method: A cross sectional study consisting of two groups with 50 participants each was carried out. Group-I included 50 Chronic kidney disease patients without Diabetes mellitus (CKD-ND) & Group-II included 50 patients of Chronic kidney disease with Diabetes mellitus (CKD-DM). Myeloperoxidase, HbA1c, Urea, Creatinine and urine microalbumin were estimated in the blood and urine samples by using Erba & ELISA kits on XL-640 clinical chemistry analyzer and ELISA reader.

Results: The values of Myeloperoxidase were statistically decreased in diabetic patients with chronic kidney disease (Group-II) when compared with Non diabetic patients with chronic kidney disease (Group-I). Myeloperoxidase levels were compared with Urea, Creatinine, Microalbumin and eGFR levels. eGFR levels showed a significant negative correlation with MPO levels.

Conclusion: The present study showed that decreased serum MPO can be used as an indicator for chronic kidney disease in diabetic patients which can prevent further complications. MPO levels decline steadily as CKD progresses, which might be due to the inhibitory effect of uraemic toxins on the enzyme.

Keywords: Myeloperoxidase, Chronic Kidney Disease, Diabetes mellitus, Estimated glomerular filtration rate (eGFR), urine Microalbumin.

Introduction

CKD is a slow and progressive disorder of kidney dysfunction which is reported worldwide affecting 750 million people globally [¹]. In India, diabetes and hypertension account for 40–60% cases of CKD [²]. Chronic kidney disease (CKD) is a global threat to
health in general and for developing countries like India, because of the dietary habits, socio economic status and life style.

CKD patients are at higher risk related to oxidative stress, metabolic disorders and other pathologies. Hence CKD is a major cause of morbidity and mortality due to lack of proper diagnosis and treatment. The mammalian heme peroxidase enzymes play a major role in human immune abnormalities. Heme peroxidases are the acceptors which utilize $H_2O_2$ to catalyze oxidative reactions. MPO is an oxidizing agent whose elevated levels have been associated with CAD, atherosclerotic lesions. Hence this study is first of its kind to correlate the association between MPO levels in CKD with and without diabetes.

MPO is produced by neutrophilic granulocytes which along with heme (as co-factors) is microbicidal/bactericidal by producing HOCl, $H_2O_2$ and Cl anions. MPO is a basic arginine rich glycosylated protein (isoelectric point $>10$) \cite{3} which is comprised of two subunits, encoded within a single mRNA molecule. Studies also revealed that apart from being bactericidal its major role also has been associated with non-microbial inflammatory process and neuro degenerative diseases. There are studies which correlate MPO as enzymatic source of bioactive lipids and other products which have emphasized that they adversely affect the cardio protective capacity of high density lipoproteins and as well induce endothelial dysfunction \cite{4,5}. This study is an attempt to understand the role of MPO as a predictor for early detection of CKD in diabetic patients. Hence a cross-sectional study was carried out among CKD patients with and without diabetes. The following are the objectives:

1). Correlation of MPO levels with eGFR
2). Correlation of MPO levels with Microalbumin

**Materials and Method**

A cross sectional study was conducted in the department of Biochemistry in collaboration with Medicine and Nephrology, at central laboratory of Prathima Institute of Medical Sciences during the period of June 2015 to September 2016. Two comparative groups consisting of 50 study participants each were enrolled in the study. The study was approved by the ethical committee of the institute (IEC/PIMS: 2015/01).

Age and sex matched healthy controls were enrolled from the allied hospital. Informed consent was obtained from all the participants in the study. Clinical history and demographic details of the patients were collected using structured questionnaire. In each group, subjects were selected by simple random sampling technique. The groups were divided as follows:

- **Group-I** 50 CKD without Diabetes (CKD-ND)
- **Group-II** 50 CKD with Diabetes (CKD-DM)

**Inclusion criteria:**

- Age $\geq$ 40 years, and $\leq$ 70 years
- Clinically Confirmed diabetic patients with duration of diabetes $>5$ years and $<10$ years
- Clinically confirmed patients of CKD

**Exclusion criteria:**

- Not willing to consent,
- Duration of diabetes $<5$ years and $>10$ years

Under aseptic conditions, 5ml random venous blood sample was collected from each participant by anti cubital vein puncture in a disposable syringe of which 2 ml was collected into a EDTA vaccutainer for the estimation of HbA1c and the remaining was transferred into a plain bulb. After centrifugation serum was separated and used for the estimation of biochemical parameters like Urea, Creatinine and Myeloperoxidase. A random urine sample of 5 ml was collected in a sterile container for the estimation of Microalbumin. Myeloperoxidase was estimated by ELISA method. Urea and Creatinine were estimated in serum sample and Microalbumin was estimated in the urine sample collected from the above subjects on XL-640 fully automated analyser. eGFR was calculated using CKD-EPI formula.

Serum Urea is estimated by Berthelot method.\cite{6}

GFR is calculated by using CKD-EPI creatinine equation 2009.

$$GFR = 141 \times \min(S_{cr}/\kappa, 1)^{\alpha} \times \max(S_{cr}/\kappa, 1)^{-1.209} \times 0.993^{\text{Age}} \times 1.018 \times 1.159 \times 0.857 \times \text{[if female]} \times 1.135 \times \text{[if black]} \times \text{[if female]} \times 1.018 \times 1.159 \times 0.857 \times \text{[if female]} \times 1.135 \times \text{[if black]}.\cite{7}$$

Glycosylated haemoglobin is a boronate affinity which was estimated by immuno chromatographic method using Nycocard reader.
Creatinine was estimated by Jaffe’s Method. Microalbumin is estimated by pyrogallol red method. Myeloperoxidase is estimated by standard protocol using ELISA technique.

**Statistical analysis:** The results were expressed as Mean±SD and student’s t-test was done to compare the mean parameters. Correlation analysis were done using Karl Pearson’s correlation coefficient. Statistical significance was considered at the level of 5% (p-value < 0.05). Statistical analysis was performed by SPSS version 20.

**Results**

The results of two groups were expressed as Mean±SD. Table 1 shows the comparison of Group-I (CKD-ND) with Group-II (CKD-DM). It summarizes the Mean±SD of Serum Myeloperoxidase, Serum Creatinine, Urea, HbA1c, Urine microalbumin and eGFR. The Myeloperoxidase levels of Group-II were (7.59±3.71) which is significantly lower as compared to in Group-I (10.41±4.75). The eGFR levels were significantly decreased in Group-I (15.40±12.21) compared to Group-II (19.14±13.51) respectively. Microalbumin levels were higher in Group-II (138.78±90.47) when compared to Group-I (71.94±64.26). The Creatinine levels of Group-I were (6.24±4.13) as compared to (4.78±2.77) in Group-II. The values of HbA1c in Group-II (7.69±1.17) were higher when compared to Group-I (5.34±0.49). The results also reveals that the values of serum Myeloperoxidase were significantly decreased in Group-II when compared to Group-I. ‘p’ value(<0.001) was found statistically significant for Myeloperoxidase and Creatinine in Group-II.

</table>

Correlation studies revealed a negative correlation between Myeloperoxidase and eGFR in Group-I (CKD-ND) and a positive correlation in Group-II (CKD-DM). The correlation co-efficient value ‘r’ was -0.005 and ‘p’ value was 0.972 for Group-I (CKD-ND). The value of ‘r’ was 0.114 and ‘p’ value was 0.431 in Group-II (CKD-DM). This indicates that there was a significant positive correlation between Myeloperoxidase and eGFR in Group-II when compared with Group-I. The reason for non significant correlation may be due to non linearity and small sample size.

Discussion

Proteinuria is the common indication for end stage renal diseases (ESRD) which is more commonly seen in patients with CKD. It might contribute to the complications associated with the progression of the disease. It also influences the mortality in CKD patients. HOCl and MPO derived oxidants induces damage to the renal tissue there by contributing to the renal complications [11]. Lipid peroxidation is induced
by extracellular MPO which is capable of catalyzing lipoprotein peroxidation in vivo, thus resulting in atherosclerosis which is common in CKD patients. Due to its cationic character it can bind to the negatively charged structures of endothelial cells and albumin.[12].

In this study, we aimed at evaluating the levels of Myeloperoxidase, Microalbumin and calculation of eGFR using CKD-EPI equation in diabetic and non diabetic patients. There was a significant decrease in MPO levels, and an increase in microalbumin levels in Diabetics with CKD when compared with non diabetics with CKD. The decrease in MPO levels implies that MPO and its derived oxidants such as HOCl (hypochlorous acid) interferes with various cell functions which may contribute to damage of renal tissues resulting in the accumulation of uremic toxins which indicates decline in renal function.

Our study demonstrates that there is a progressive fall in mean serum MPO levels with advancing renal disease. MPO is an enzyme which has been shown to play an important role in the initiation and progression of atherosclerosis. Several mechanisms by which elevated levels of MPO can promote cardiovascular complications have been described [13]. Therefore this study was undertaken to determine the activity of MPO in patients with CKD. However, our results have shown that serum MPO levels are significantly lower in CKD patients with diabetes mellitus as compared to CKD patients without diabetes mellitus. The present study has also shown a significant negative correlation between Urea and MPO in CKD-DM; while no significant correlation was observed in the CKD-ND subjects. Hence, it could be speculated that the decline in MPO levels in CKD patients might be due to the inhibitory action of uraemic toxins, particularly CNO-, on this enzyme.

**Conclusion**

Estimation of serum MPO in CKD patients can be helpful in better prognosis. This study shows that serum MPO levels can be used an indicator for CKD patients with Diabetes mellitus in assessing the renal impairment and to prevent further complications. Microalbuminuria should be corrected at an early stage to delay the renal damage and development of cardiovascular complications in CKD patients.

Effect of Telemonitoring Versus Conventional Physiotherapy Techniques in Improving Grip Strength among Postmenopausal Home Makers

P Kamalnathan¹, A Aishwarya²

¹Associate Professor, ²Student, SRM College of Physiotherapy Srm Institute of Science and Technology, Kanchipuram District, Kattankulathur

Abstract

Background: Hand grip strength is an important for performing hand movements in day to day activities. Reduction in same is caused by age, postmenopausal and repeated performance of chores. Studies suggest that reduced isometric is due to menopause. Telemonitoring use is becoming increasingly common all over the world. However, supplemental evidence to further the use of telemonitoring for providing enhanced service access to postmenopausal women with decreased hand grip strength is limited, causing a need to find out telemonitoring effect in performing exercises. Methodology: Experimental study of pre-post type was conducted among postmenopausal home makers with convenient sampling of 60 samples within age group of 45-60 in Chennai. Nordic questionnaire was given to find out musculoskeletal problems. Selected participants were given Patient Rated Wrist Hand Evaluation to rate pain and tested for hand grip strength in right dominant hand using Jamar Hand Held Dynamometer. Based on results, participants were taught hand grip strengthening exercises and asked to perform for 3 days per week for 6 weeks. They were divided into three groups; was monitored using video, second was taught and given a printout of exercise and third were just taught. Post test was done on completion of 6 weeks. Results: Group A which underwent telemonitoring for 6 weeks has shown a significant change in mean value between the pre test and post test of hand grip strength in the dominant right hand at P<0.005. Conclusion: In accordance with the statistical result, all those who have underwent telemonitoring exercises have shown significant improvement in the hand grip of the dominant right hand. Thus, there is a significant effect of telemonitoring exercise in improving grip strength among postmenopausal home makers.

Key Words: Hand grip, Post menopausal women, Hand exercises, Telemonitoring.

Introduction

Menopause, a stage in life of women when the menstruation ceases. It is the end of women’s reproductive years and is regarded as a normal part of ageing. [1] Menopause usually occurs in a women’s late 40s to early 50s. Menopausal women experience musculoskeletal changes such as muscle atrophy, muscle weakness and osteoporosis. [1] The reason for musculoskeletal pain (MSK) in postmenopausal women are multi factorial such as age, body mass index etc. [2]

The prevalence rates of MSK pain is found to range from 53.4% to 85.0%. [3] A large percentage of the patients develop chronic or recurrent MSK pain beyond menopause. Several studies show that, there is even a decrease in the hand grip strength of postmenopausal women as age progresses.

Hand grip strength is an indispensible part of performing everyday activities. Being bereft of strength and vigor may possibly be due to the combined effects of physical and psychological factors. Physical factors

include reduction in contracting muscle fibers, reduction in firing rate of motor unit. Psychological factors include pain, fear of pain, and fear of injury. Hand grip plays a very important role in performing every household activity. The reduction in hand grip strength could be amounted to age factor, post menopausal cause and repeated performance of household chores. [5]

Kjerland (1953) reported that women attain maximum grip strength between the ages 25 and 26. [3] This finding suggests that menopause may be one of the primary reasons which cause a loss in isometric strength. This loss can be reduced by giving hand grip strengthening exercises and monitoring the accuracy of the movements performed. [9] The substantial barriers to monitor the accuracy of the movements performed must be avoided in order to provide effective results. Thus there is a need for creative strategies such as telemonitoring to enrich and assess the physiotherapy services for decreased hand grip strength in high need communities. [10] The usage of telemonitoring is raising commonly all over the world [10]. The available evidence to further the case for its use in improving access to physiotherapy services among postmenopausal women with decreased hand grip strength is limited. Thus, there is a need for finding out the effect of telemonitoring in performing the hand grip strengthening exercises.

Methodology

Study design was experimental, pre post test type. Total 60 samples who underwent menopause naturally were selected between the age group of 45-60 in and around Triplicane, Chennai, with pain in their wrist and hands for the past 6 months as analyzed in the Nordic Questionnaire were included. Subjects whose pre test of measuring the hand grip strength in the dominant right hand which measured <25.35 Kg and the Patient Rated Wrist/Hand Evaluation (PRWHE) scale rating between 31-70 were all included in this study. Subjects with PRWHE scale rating 0-30 and 71-100, Rheumatoid hand, Peripheral nerve injury, Type II Diabetes mellitus, Recent hand fractures, Recent hand surgery, Burns in hand, Osteoarthritis in hand, Subject with surgical menopause (hysterectomy), Subject who were on hormonal replacement therapy, History of any neurological and musculoskeletal disorders were excluded.

Sixty eligible post menopausal home makers were selected randomly according to the inclusion and exclusion criteria, and were given a Nordic questionnaire. Out of sixty, fifty six participants who were suffering from pain in their Wrist and Hands for the past six months were included in this study. Participants were explained clearly about the procedure and informed consent was obtained. A pretest was done which consisted of measuring the Hand grip strength of the dominant right hand with the Hand Held Dynamometer before intervention. During the measurement, subject was made to sit with back, pelvis, and knees as close to 90 degrees as possible, shoulder is adducted and neutrally rotated, elbow flexed at 90 degrees, forearm neutral, wrist held between 0-15 degrees of ulnar deviation. The arm is not supported and the dynamometer is presented vertically and in line with the forearm. The dynamometer was held in the right dominant hand and directions were given to squeeze the dynamometer with the maximum isometric effort. The readings were noted. The subjects were also asked to rate their pain and functional difficulty in their wrist/hands in the Patient Rated Wrist Hand Evaluation (PRWHE) scale. The subjects whose grip strength measured less than 25.35 Kg and the PRWHE scale rating between 31-70 were included in this study. Forty six eligible participants were explained clearly about the procedure and written informed consent was obtained.

Hand grip strengthening exercises was taught to all the participants which included normal movements such as wrist flexion, wrist extension, ulnar deviation, radial deviation, making and unmaking of fist, opposition of the thumb and exercises to be done with the putty (Fig.1) such as Scissor spread, Thumb press, Thumb extension, Thumb pinch strengthening, Thumb adduction, Three jaw chuck pinch, Finger hook, Full grip, Finger extension, Finger scissor, Finger spread.
Each exercise 5 repetitions on 1st week, 7 repetitions on 2nd and 3rd week, 9 repetitions on 4th week and 10 repetitions on 5th and 6th week for 3 alternative days for per week. Later, the forty six participants were divided into three groups randomly as GROUP A, GROUP B, GROUP C. Video calling facility was set up in the house of the participants of Group A and their accuracy of the exercises performed was monitored. Group B participants were given a print out of the exercises to be performed with illustrations and pictures in it. Group C participants were only taught the exercises without any follow up. Post intervention, measurement of the dominant right hand strength and scoring of the PRWHE scale was done.

Group A participants were given a Telemonitoring Satisfaction Survey Form (TSS) to see the impact on telemonitoring. It consisted of eight items rated on a 5-point scale (1= completely disagree, 5=completely agree). Questions on following themes like:

**Comfortable being evaluated & intervene**

**Video monitoring was as accurate as being face to face**

Areas of Functional Independency considered
Technology interference with the protocol

Clarity of the video and audio

Continuing rehab through video helped in improving grip strength

‘e-rehab services’ help you to save your monetary expenses

Would use televideo process again

DATA ANALYSIS

Dominant right hand grip strength measures were calculated, analyzed and tabulated. The data analysis was done by using SPSS version 20.

GRAPH 1 shows the results of Nordic questionnaire
**Graph 2**: Graph 2 shows comparison of mean values of pre and post test of dominant right hand grip strength of all three groups.

**Graph 3**: Graph 3 shows comparison of mean values of pre and post test of dominant right hand PRWHE scale rating of all three groups.

**Graph 4**: Graph 4 shows the results of Telemonitoring Satisfaction Survey form.

**Results**

Graph 1, 93.3% of the participants suffered from pain in their wrist and dominant right hand.

Graph 2 the variation in grip strength between the three groups is noticeable which is evident from the change percentage as in Group A (31.81%), Group B (18.19%), Group C (14.24%) with P<0.005. Thus, there was a significant improvement in the grip strength of all the participants.

Table 1 and Table 2 shows the comparison of the mean difference of Group A=8.28, Group B=4.23, Group C=3.17 with P<0.005, it is evident that Group A which underwent telemonitoring for 6 weeks had a convincing increase in the grip strength of all the 16 participants.

Graph 3, the mean score of participants in the pre test and post test of the PRWHE scale has reduced; pain (to), specific activities (to), usual activities (to), which shows that there is very little effect of conventional method in improving the grip strength.

According to Graph 4, 60% of the participants were satisfied with the telemonitoring process.

**Discussion**

The primary purpose of this study was to assess the impact of six weeks ‘Telemonitoring’ focusing on strengthening the hand grip while at home to the post menopausal home makers by performing hand grip strengthening exercises by performing normal wrist movements and exercises using a putty. The monitoring was done through video.

Hand grip strength is important for performing hand movements in day to day activities. Reduction in same is caused by age, postmenopausal and repeated performance of chores.

According to some studies postmenopausal causes decrease in hand grip strength and hand function. Also, musculoskeletal pain have showed a decline when the exercises done were monitored through video.

Statistical analysis of this study showed that the group which underwent the process of telemonitoring have significant changes in mean values from 17.75 to 26.03 between pre and post test of measuring the hand grip in the dominant right hand.

Statistical analysis of this study showed that the group which performed exercises seeing the print out given have significant changes in mean values from 19.933 to 24.37 between pre and post test of measuring the hand grip in the dominant right hand.

Statistical analysis of this study showed that the group which were only taught the exercises without any follow up have significant changes in mean values from 19.07 to 22.03 between pre and post test of measuring the hand grip in the dominant right hand and the PRWHE.
scale rating also showed a significant change in the functional ability which is evident from the mean values of pain scale from 35 to 15, specific activities from 40 to 20, functional activities from 45 to 18.

Statistical analysis of this study showed that 60% of the participants who underwent the process of telemonitoring stated that this method of exercise training was beneficial to them, 13% had a neutral opinion and 27% reported that they were not satisfied with this kind of training since they found it very new to get adapted.

Therefore this study revealed that the process of Telemonitoring was found to be beneficial for most of the postmenopausal women who had reduced hand grip strength and difficulty in performing functional activities.

**Conclusion**

As with the statistical results, the hand grip strengthening exercises for the postmenopausal home makers by the use of concept Telemonitoring can lead to improvement in functional abilities in daily routine. Thus, there is a significant effect of telemonitoring exercise in improving grip strength among postmenopausal home makers. The limitations of the study are Sample size was small, Study was pertained to a particular population, there were connectivity issues since the internet was not stable, exercises were performed only once in a day, only hand muscles were concentrated for the intervention, only dominant right hand was concentrated. Recommendations for the further study are larger sample size can be used, study duration can be increased, exercises frequency for per can be increased, non dominant hand measurement can also be considered, intervention can be given to whole upper limb, a comparison between men and women can be done, Telemonitoring could be done to other musculoskeletal disorders, Study could be done on wider population.

Abstract

Background: Identification of reasons behind TB stigma will enable us to provide programmatic inputs for effective intervention strategies. Aim of this investigation was to study the social stigma among the tuberculosis patients. Method: One hundred and fifty tuberculosis patients seeking treatment at DOTS centers were interviewed using semi-structured, pre-tested questionnaire. Subjects diagnosed with tuberculosis, taking treatment at these DOTS centers and patients of age more than 18 years formed the inclusion criteria. Study subjects were randomly selected and interviewed when they visited the DOTS center. Results: Out of total, 65.3% subjects experienced stigma. 42% had fear of disclosing illness to his or her friends. Almost 31% did not disclose their illness to friends. In 20% of the cases, their friends avoided them after knowing about their illness. About 64% had fear of disclosing illness at place of work. Almost 34% of study subjects did not disclose their illness at workplace. Problems related to marriage prospects were expressed by 48.6% of unmarried female patients. Conclusion: Stigma among tuberculosis patients still remains a problem. We found scope to improve various aspects like motivate patient’s family to provide family support, involvement of community DOTS providers in order to reduce negative reactions of the family. Client centered tailored approach to reduce TB stigma is expected to pay dividends towards effective tuberculosis control.

Keywords: Tuberculosis, Social stigma, Workplace.

Introduction

Tuberculosis (TB) remains an important public health problem of our country. India accounts for nearly one fifth of the global TB burden. Every day in India more than 20,000 people develop the disease, and more than 1000 die from TB.¹ TB patient not only experiences physical sufferings but also psychological trauma and social consequences. TB is a classical example of a disease with both medical and social dimensions, characterized by its close relation to poor socio-economic conditions.² Recently social stigma has increasingly been recognized in tuberculosis patients.

Social stigma is ‘an undesirable or discrediting attribute that an individual possesses, thus reducing that individual’s status in the eyes of society’.³ Stigma to TB is a critical factor, which not only delays the initiation of treatment but is also a key factor in non adherence to TB treatment. TB is already a highly stigmatized disease.² It is known that stigma in TB is perpetrated and reinforced by health staff, family, neighbours, and other groups.⁵,⁶

Usually men deal with stigma at work place and community level whereas women have to deal it within the household and in the immediate neighborhood and

DOI Number: 10.5958/0976-5506.2019.01921.1
society. Identification of the sources and consequences of stigma will enable us to provide programmatic inputs for effective intervention strategies. Therefore this study was done to assess the social stigma among the tuberculosis patients attending DOTS centers. Another objective was to find out the factors related to social stigma perceived by them.

Materials and Method

Department of sociology and community medicine conducted this cross-sectional study jointly during May-December 2017. Tuberculosis patients taking treatment at DOTS centers in the study area formed the study population. Information about DOTS centers in the study area was fetched from the office of civil surgeon. Based on that information, five DOTS centers were selected randomly. Purposive sampling technique was adopted. Thirty eligible patients were interviewed at each DOTS center. Thus sample size was 150. Patients diagnosed with tuberculosis, seeking treatment at these DOTS centers and patients of age more than 18 years formed the inclusion criteria.

DOTS centers were approached around 11 am. Study subjects were randomly selected and interviewed when they visited the DOTS center. Four to five interviews were conducted in a single day. One DOTS center was covered in one such visit. A single interviewer conducted all the interviews to keep sense of uniformity. It took an average of 20 minutes to complete one interview.

Pre-structured, pretested questionnaire was used for data collection. The questionnaire consisted of questions related to: Socio-demographic profile, Treatment history and Social stigma among TB patients attending DOTS centre. Written informed consent was obtained in the local language from every study subject before conducting each interview. They were explained about the nature and purpose of study and requested to participate. To obtain consent, he read the contents of the consent information sheet out loud to each respondent, who was given the opportunity to ask the questions. They were assured privacy and confidentiality of the information provided.

The collected data was entered in Microsoft Excel. Coding of the variables was done. The analysis was done by Statistical Package for the Social Sciences (SPSS) version 21. Interpretation of the collected data was done by using appropriate statistical methods.

Results

Most patients (56.7%) were in the age group of 18-40 years. Males outnumbered females. Majority (61.3%) of the subjects were married. Most of the study subjects were from nuclear family. (Table 1) Out of total, 98 (65.3%) subjects experienced stigma.

Discussion

Stigma is perceived as an important social determinant of health. Tuberculosis is a social disease with medical manifestations in true sense. When diseases are stigmatized, individuals show reluctance in seeking medical care and non-adherence to treatment probably due to fear of the social and economic consequences following diagnosis. In this study, 65.3% subjects experienced one or other forms of the stigma. Our findings confirm the results of another study from
Thailand, which shows that stigma is present on patients perspective towards TB. Another study from Delhi is also in concordance with our observations. Understanding patient’s perception about tuberculosis will enable better design of a client- oriented comprehensive programme for tuberculosis. By identifying both the sources and consequences of stigma, social science research has elucidated the need for effective intervention strategies.

We observed that 42% had fear of disclosing illness to his or her friends. Almost 31% did not disclose their illness to friends. A similar finding was recorded by Rajeswari R et al in her study on perceptions of tuberculosis patients about their physical, mental and social well-being. She observed that 6.7% of patients gave wrong names and addresses to avoid being exposed as TB patients to their acquaintances. These results are cohort with others. It could be due to feeling of insecurity, less autonomy and power, feeling of loosing the job perceived by the patients.

It was observed in this study that 37% of females and 19.8% of males were shocked and upset by reaction of family members. It is a common myth among people that the food/utensil gets contaminated on being used by a person who eats from it, if he or she is having some disease like tuberculosis. TB patients are often subjected to such unnecessary sanctions at home. Fears about getting infected with TB, often lead to isolating experiences such as forcing a TB patient to use a separate utensil. Other forms of isolation included washing clothes separately, giving separate room, neglect by the families and not being permitted to attend the social functions with more male patients reporting this.

Patients with low TB knowledge were more likely to have severe forms of TB disease. Another study was conducted in Thailand to assess social stigma, knowledge and belief about TB/HIV co-infected patients. In that study, 65% reported high TB stigma, 23% had low TB knowledge and 49% were having low HIV knowledge. We find a definite scope to motivate patient’s family to provide family support and involvement of community DOTS providers in order to reduce negative reactions of the family.

Not surprisingly our study shows that problems related to marriage prospects were expressed by 48.6% of unmarried female patients. Another study reported that parents of the young women don’t want to reveal their daughter’s illness or don’t want to send them to DOTS due to difficulties that may arise in marrying them. It was also noted that unmarried females deliberately looked for health care center for her treatment far away from home because they had apprehension that disclosure of the diagnosis could cause them harm in searching a partner for her marriage. The impact of TB-related stigma on marriage was also noted in few other investigations. Many of these found that TB-related stigma affected the marriage prospects of both genders, with men having a slightly more difficult time finding a wife in areas with a low female/male ratio. Another author from Sialkot observed divorce as a direct consequence of TB to be more likely to affect females and TB-infected females were more likely than TB-infected males to face difficult marital prospects.

There are several strengths of this study. Firstly, study conducted by collaborative efforts of a sociologist and medical fraternity enabled us to study various aspects of tuberculosis in a better way. Secondly, we studied social stigma among tuberculosis patients, a very pertinent aspect of TB. Adherence to TB treatment is expected with reduction in stigma. There are few limitations as well. Relation between stigma and education and socioeconomic status was not carried out in this investigation. Reactions of family with educational status of the family were also not studied here. Such dimensions shall be carried out in further studies.

Conclusions

Findings of the present study indicate that stigma among tuberculosis patients still remains a problem. Keeping factors behind such stigma in mind, we found scope to improve various aspects like motivate patient’s family to provide family support, involvement of community DOTS providers in order to reduce negative reactions of the family. Such client centered tailored approach to reduce TB stigma is expected to pay dividends towards effective tuberculosis control.

Effect of Yoga on Anxiety in School Going Children of Age 12-14 Years

Baliga Meghana Narendra¹, Subhash Chandra Rai², Rashmitha A.P³

¹Post Graduate Student, ²Assistant Professor, ³Assistant Professor, Nitte Institute of Physiotherapy, Nitte (Deemed to be University), Deralakatte, Mangaluru

Abstract

Background: Anxiety is one of the most common cause of delay in academic progression in school going children. There are many schools which are still unaware of such problems faced by children and its ill effects. This study focuses on effect of yoga on anxiety for such children.

Aim: The aim of the study was to compare the effect of yoga and General awareness on reduction of anxiety in school going children of age 12-14 years.

Methodology: 93 school going children were screened using Westside Test Anxiety Scale. 57 children were eligible and were included in the study. They received treatment for 40 minutes a day, 5 days a week for 30 days. Pre and Post treatment their anxiety as well academic results were collected and assessed.

Results: Paired sample t-test was used to compare effectiveness of intervention on anxiety score for which mean pre-score was 2.59±0.51 for intervention and 2.93±0.50 for General awareness group. And post were 2.03±0.78, 2.54±0.66 respectively.

Conclusion: Yoga as an intervention was more effective in treating academic anxiety compared to General awareness intervention for 12-14 years children.

Keywords: Yoga, anxiety, children, General awareness, Re-education, Westside Test Anxiety Scale

Introduction

Anxiety is an emotion which comprises feelings of tension, worried thoughts and physical changes like increased blood pressure¹. Academic anxiety is a type of state anxiety which relates to the unpleasant things from the environment such as academic institutions including teachers and certain subjects.²

The feeling of anxiety is mixture of our perception of events or situations and our body’s physiological reaction. In response, the body prepares to fight or flight, pumping more blood to the heart and muscles and tapering down of all non-essential functions. This builds up more anxiety which explicit in the form of psychogenic symptoms or anxiety disorders.³

The core risk phase for development of symptoms and syndromes of anxiety is considered as childhood, adolescence and teenage which may range from brief mild symptoms of anxiety to full-fledged anxiety disorder. The period around puberty is considered as tactful period for development of anxiety. The gender difference at the time of puberty is said to have relation to severity and the types of anxiety and other psychopathology.⁴

Untreated anxiety disorders may have ill effects which can have both short and long term detrimental effects in children of adolescent age.

The overall estimated prevalence for anxiety disorders globally is 8% that makes it as the most common psychiatric diagnosis in school going children.
(ranging from 4 to 25 %). The report of Indian study quotes incidence of childhood psychiatric disorders as 18/1000 per year.4.

Test anxiety is a transitory emotional state. Factors which influences the level of anxiety in children are problems related to recalling information, difficulty in memorizing things, poor study techniques and lack of confidence and time management skills.5

Test anxiety is directly proportional to the difficulty level of the tests and their importance in successful progress of the students.5

The demographic variables which may influence test anxiety levels include age, gender, ethnicity, area of residence and type of family.5

Yoga is the science to keep mind calm and steady and the emotions by overcoming anxiety conditions and attaining relaxation. Yoga therapy is practical discipline incorporating a wide variety of practices whose goal is the development of a state of mental and physical health, wellbeing, inner harmony and ultimately a union of human individual with the universal.7

The main highlight of yoga is that it can coordinate psycho physiological response, which is the contrast to the anxiety response.8

The science behind yoga works on the outermost layer of personality and physical body.9

The beauty of yoga is that it travels from physical levels and moves in to mental and emotional level.10

At intellectual level yoga can sharpen memory, improve concentration and decrease anxiety levels. At spiritual level yoga creates an alertness to search for happiness within oneself and to be at peace.11

There are studies done on the other variables which influences levels of anxiety and also in other age group. Awareness on how it can be treated very easily is less. There are many ways by which anxiety is targeted including yoga in other age group children. But, there is no retrieved literature which targets test anxiety by yogic methodology in 12-14 year old children. So, there is need to do a study on this aspect.

**Materials And Method**

The investigator visited many schools in Mangaluru and selected a school which was not giving yoga. Children were recruited from Vishwa Mangala English medium school, Konaje, Mangaluru. Prior to commencement of study institutional ethical clearance was obtained. Procedure was explained and consent and permission letter was taken for the same. The children between 12-14 years was assessed using Westside test anxiety scale questionnaire. It was assessor blinded. 93 students were assessed initially before their academic test and their form was evaluated. Children who were 12-14 years and were school going both boys and girls, children having anxiety between 2.0-5.0 in Westside test anxiety scale were included in the study. Children undergoing yoga therapy already and children undergoing psychological counseling were not taken for study. As per inclusion criteria only 57 students were opted for the study.

57 subjects were divided by convenient sampling method, 32 were in intervention group and 25 were in pamphlet group.

Students started receiving interventions immediately after their 1st academic test. The intervention group received yoga as a therapy for 30 days, weekly 5 days for 40 minutes.

They were not told the purpose of giving yoga. They were given yoga in school auditorium were no benches and desks where present and it was well ventilated room with good amount of light entering the room. Consent was taken from their parents. And only those students were included who were interested to undertake this program.

They were assessed after their academic test with same outcome measure and their pre and post academic test marks were collected from the school for further analysis.

Other group which was of general awareness group, they received re-education pamphlet on how to reduce anxiety and they were asked to read it and apply it on them. After their test and after 30 days of span even they were assessed using Westside test anxiety scale. Even their academic marks were collected for analysis.

**MATERIALS REQUIRED**- Classroom or any hall without benches and desks, Yoga mat, printed counselling pamphlet, outcome measure forms, and pens.
YOGA INTERVENTION GROUP-

Sitting in Vajrasana – Namskara mudra- Chant om (9 rounds) (2mins) ṭ, Bhunamana STANDING- Hands in and out breathing (2mins), Ankle stretch breathing (2mins) ṭ, Hands stretch breathing (2mins), Trikonasana breathing (2mins).

SUPINE SERIES- Shavasana, Straight leg raising (alternate leg) breathing (2mins) ṭ

Setubandasana breathing (2mins).

PRONE SERIES-Bhujajasana breathing (2mins), Shalavasana breathing (2mins).

SITTING-Rabbit breathing (2mins) *, Dog breathing (eyes closed) (2mins), Tiger breathing (2mins) ṭ, Shashankasana breathing (2mins).

Relaxation (3mins) shavasana. Sitting in vajarasana – end the session by chanting shanthi mantra

GENERAL AWARENESS GROUP-

General education in the form of printed pamphlets which includes remedial measures.

Statistical Analysis

The collected information was summarized using the descriptive statistics such as frequency, percentage, mean and S.D.

To compare the outcome measures between the 2 groups independent sample t-test was used. To compare the pre and post measurements paired t-test was used. To compare difference and proportion chi-square test was used.

The p value less than 0.05 was considered as significant.

Table 1- Comparison of pre-test anxiety scores according to groups

<table>

</table>

Paired sample t-test was used to compare effectiveness of yogic intervention on anxiety score for which mean pre-score was 2.59±0.51 for intervention and 2.93±0.50 for general awareness group. The obtained scores after intervention was 2.030.78 for intervention group and 2.54± 0.66 for general awareness group. The obtained p value was <0.05 for both interventional and general awareness group. The interventional group p value is less than general awareness group. Hence, intervention group is more effective.
Paired sample t-test was used to compare effectiveness of yogic intervention on anxiety score for which mean pre-score was 13.59±4.71 for intervention and 13.52±4.52 for general awareness group. The obtained scores after intervention was 14.09±3.10 for intervention group and 14.56± 4.44 for general awareness group. The obtained p value was <0.05. Hence there was effect.

**Discussion**

Age around puberty i.e., 12 – 14 years is considered as most vulnerable age for the development of anxiety.4

In earlier studies it was targeted on children between 15- 18 years; high school children, as it is the peak time in schooling and turning point for major career goals26. Noggle et al shows that age at which most mental disorders begins in adults, occurs during childhood and adolescent age. In that around 7.5% of adolescents meets DSM IV-TR criteria for one or more mental health condition is increasing the anxiety affects at earlier ages of life.28 Also reduced physical activity and more classroom teachings increases the risk of anxiety. Therefore this study targeted on anxiety levels of those children. One of the study conducted by Chaman Lal Banga on academic anxiety levels of secondary school children in 2015 showed 16% of children getting affected with anxiety of similar age.2

The reason why yoga must have helped in reducing anxiety at schools as concluded by one of the systematic review states that the practice of yoga emphasize body awareness and involves focusing ones attention.27 Since our study focused on breathing exercise which had very interesting animal related name, it made children to enjoy on what they were doing and pulled their attention on their body.

Since it was breathing exercise it produced effects such as relaxation, self-control, concentration, self-efficacy and body awareness. Yoga practice reduces psychological arousal.26

One of the study, effect of shambavi mudra protocol on breathing regulation on perceived stress and well-being in healthy population where 21 minute intervention for 6 weeks had a significant reduction in perceived stress and anxiety 26 which was similar to our study which had 40 minute of breathing exercise for 4 weeks and showed positive results.

There is an executive function that is still not mature in children and adolescents. Yoga techniques which is related to breathing helps add attentional control. As frontal lobe matures children’s capacity to exercise attentional control increases.28

For pamphlet group it was more of sedentary classroom based education more than physical. It was self-administered. It was completely ones choice to accept it or not. However both the groups had significant but intervention group had more compared to that of pamphlet group.

In addition to that this study also collected student’s test results which was conducted on monthly basis post intervention and compared it with the results of pre intervention.

There are very limited evidence of RCTs observing the effects of yoga on psychology and cognitive functions in school setting. And this could be one of the study proving benefits of yoga on anxiety in school setting with positive results for lesser age group.

In future this will be part of teaching students about wellness and health and that of primary academic instruction. For the children who are suffering from anxiety related problems this could create difference in
the matter of success and failure both in their personal and professional life.

However the study has some limitations like Small sample size with only one school taken for the study due to time and permission constraint because it was out of their academic curriculum. Level of anxiety may differ from different schools and different board of education.

**Conclusion**

The results of the present comparative study concludes that yoga as an intervention was more effective in treating academic anxiety compared to re-education pamphlet intervention for 12-14 years children.

This study also shows that yoga as an intervention can also help in improving academic performances in children of this age group which is added benefit of this.

Expectation of Life by Employment Status in India

Bagsmrita Bhagawati¹, Labananda Choudhury²

¹Assistant Professor Dept.of Statistics, B.H.College, Howly, Assam, India,
²Professor Dept.of Statistics, Gauhati University, Guwahati, Assam, India

Abstract

Introduction: Life expectancy is a powerful summary measure of life tables. The mortality pattern of a population is influenced by considering the changing trend in the value of life expectancy. These in turn assess the progress of the nation by highlighting the issues of equity, poverty, and gender. One of the important socioeconomic aspects of mankind is the length of working life i.e. in employment status. The employment status of an individual determines economic potentiality, which in turn ensures economic security as well as increases participation rates in society and the economy.

Method and materials: In this context this study will measure gender wise life expectancy by employment status among urban and rural populace of India. The data is secondary, taken from Sample Registration system (SRS) and National Sample Survey (NSS).

Findings and Conclusion: This study reveals that life expectancy by employment status varies among its male and female population. A larger value of life expectancy by employment status is observed for rural populace of India as compared to its urban.

Keywords: Life expectancy, Employment status, Rural and Urban population of India, Male-female population

Introduction

Life expectancy is a powerful summary measure of life tables. The mortality pattern of a population is influenced by considering the changing trend in the value of life expectancy. A decent standard of living is one of the essential elements in gaining life expectancy. Hence life expectancy is considered as an index of social well being. These in turn assess the progress of the nation by highlighting the issues of equity, poverty, and gender. Further, one of the important socioeconomic aspects of mankind is the length of working life particularly in employment status. The employment status of an individual determines economic viability, which in turn ensures economic security as well as increases participation rates in society and the economy.

It endorses better health and education among employed persons and its dependent members. Hence, it enhances a kind of sense of dignity to the employed people. The expectation of life by employment status of an individual can be obtained by combining mortality rates and labour force participation ratios. (Kintner, 2004)¹. This indicator called life expectancy by employment status gives the average number of years a man or a woman lives in the employment status. It is based on age-specific mortality rates and age specific proportions of employed workers which is computed by life table method. It marks the persons years of life in employment status. One of the earliest works on occupational differences in life expectancy by grouping occupations into five classes was done by Benjamin² in 1969 in England by using 1951 data. He found that mortality was higher in the lowest class as compared to higher classes. A study by Kitagawa and Hauser³ using 1960 data in the United States in 1973 observed that both higher education and higher income were independently associated with longer life expectancy. The benefit was more visible among population having both high income and high

DOI Number: 10.5958/0976-5506.2019.01923.5
educational advantage than just having one or the other. Later on in 1993 many researchers opined that this socio-economic difference was widening over time. A study by Valkonen in 1991 also revealed occupational differences in life expectancy in Finland. This study, therefore, in an attempt to measure the gender wise life expectancy by employment status among urban-rural populace of India by analyzing secondary data aspires to associate itself with this global emerging trend.

**Objective**

The objective is to compute life expectancy by employment status for the male and female of urban and rural residents of India for the years 1992-93, 1998-99, 2003-04 and 2008-09.

**Method and Materials**

The data required for calculating life expectancy by employment status are the proportion of employed persons and age specific mortality rates. In this section we discuss the proportion of employed persons and age specific mortality rates in detail as shown below:

**Detail description on age specific proportion of employed persons**

In this study the proportion of employed persons is the age specific usual status worker population ratio (ASWPR) during 1993-94, 1999-2000, 2004-05 and 2009-10 for urban-rural and male-female population of India, obtained from National Sample Survey Organisation/Office (NSSO). In this study the selected ages of expectation of life by employment status are 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55 and 60. The life expectancy by employment status at different ages represents the average number of years a man or woman lives if he enters the labour force in that age. Although ages 5 and 10 may seem to be inappropriate entry for the purpose of our study, it should however be noted that in India we have the evil precedence of child labour even from more tender ages. Further, the inclusion of these two age groups in NSSO clearly indicates the prevalence of workers (although in a smaller proportion) of these age group. It is also a fact that the selection of younger ages of 5 and 10 would help in mapping the expectation of life by employment status among the small proportion of persons employed in these ages.

**Aspects on age specific mortality rates**

Another data required for this study is the age specific mortality rates, obtained from Sample Registration System (SRS). The Sample Registration System is a large scale demographic sample survey based on the mechanism of a dual record system with the objective of providing reliable estimates of fertility and mortality indicators at state and national levels for rural and urban areas respectively. In this study life table of SRS 1990-1994, 1996-2000, 2001-05 and 2006-10 with midyear 1993, 1998, 2003 and 2008 respectively as input table has been used. These life tables constructed by the Sample Registration System are used as input for deriving the life expectancy by employment status for the years 1992-93, 1998-99, 2003-04 and 2008-09. The life tables of SRS are considered one year preceding the age specific worker population ratio of NSSO since in NSSO the activity status of a person are measured one year preceding the date of survey. Das and Patel (2004) also refer NFHS1 (National family Health Survey1, 1992-93-93) and NFHS2 (National family Health Survey2, 1998-99-99) to the period 1991-92 and 1997-98 respectively in their study of constructing life tables from two rounds of NFHS,1991-99. Since the NFHS-1 and NFHS-2 death rates are based on the average annual number of deaths occurring to usual residents of the household during the two-year period preceding the survey, approximately referring to the period 1991-92 and 1997-98 respectively. This justifies the study of using \( L_x \) of SRS life tables of 1990-1994, 1996-2000, 2001-05 and 2006-10 as a multiplier with age specific worker population ratio of NSSO of 1993-94, 1999-2000, 2004-05 and 2009-10.

**Steps to compute expectation of life by employment status**

The \( L_x \) of ordinary life table is multiplied with age specific worker population ratio (ASWPR) to obtain the persons year lived by employment status. This is the only new element in life table of employment status and the formula is

\[
E_{nL_x} \text{ by employment status} = L_x * \text{ASWPR}.
\]

Where \( L_x \) is the total number of person-years living in age group \( x \)

ASWPR is the number of persons usually employed in a particular age group per 1000 persons in that age.
And $E_n L_x$ is person-years lived by employment status.

Like in an ordinary life table, life expectancy by employment status ($E_x E$) is estimated by dividing the cumulative person years by employment status ($E_T x$) by the $(l_x)$ column i.e.

$$e_x \text{ by employment status (} E_x E) = \frac{T_x \text{ by employment status (} E_T x)}{l_x}$$

where $T_x$ by employment status ($E_T x$) $= \sum E_n L_x$

### Table 1: Sex wise Expectation of life by employment status at selected ages for urban and rural India during 1992-93, 1998-99, 2003-04 and 2008-09

Findings and Conclusions

In this section we first compute expectation of life by employment status at selected ages for the males and females of urban and rural population of India for the years 1992-93, 1998-99, 2003-04 and 2008-09 in table 1. This will help in visualising the portrait of sex wise average length of life by employment status among the urban and rural residents of India along the periods. The life expectancy by employment status in 1992-93 varied from 37.22 (at age 10) to 2.08 (at age 60+) among urban males. In 1992-93, the life expectancy by employment status among the urban females differed from 11.49 to 0.54 in the same ages. Among its rural male masses this value swings from 40.43 at age 10 to 3.25 at age 60+ in 1992-93. The corresponding females figure are 23.19 at age 10 to 1.14 at age 60+ in the same year. In 1998-99 urban males life expectancy by employment status ranged from 6.28 years at age 10 to 1.89 at age 60+. The females of the same year life expectancy by employment status vary from 9.97 to 0.28 years at the same ages as in male population. It is seen that in 1998-99 the rural male life expectancy by employment status swing from 39.37 to 2.97 in the same ages. The figures are 21.75 and 1.03 among female members of rural India. The expectation of life by employment status among the urban males (females) of India in 2003-04 varies from 36.90 (11.19) years at age 10 to 1.73 (0.48) years at age 60+. The corresponding figures in 2008-09 are 36.13 (9.13) and 1.62 (0.34). This figure among rural males (females) of India ranges from 39.75 (23.44) at age 10 to 3.01 (1.21) at age 60+ in 2003-04. In 2008-09, the maximum and minimum expectation of life by employment status among the rural males (females) are 38.81 (18.28) and 3.03 (1.08) years respectively in the same aforesaid ages. It is observed that expectancy years by employment status is higher at age 10 for all the years of rural-urban and male-female population. This table also relates that life expectancy by employment status among urban males was highest in 1992-93 with 37.22 years, followed by 36.90 years in 2003-04, 36.13 years in 2008-09. The lowest of 36.28 years is observed in 1998-99 at age 10. The same sequence is observed for other ages among the urban males of India. However among urban females of India, the longer value of life expectancy by employment status is seen for the 1992-93 with 11.49 years, followed by 11.19 years in 2003-04, 9.97 years in 1998-99 and a small figure of 9.13 years in 2008-09 at age 10. The other selected ages of urban females also follow the similar pattern. This table also relay that life expectancy by employment status among rural males is highest in 1992-93 with 40.43 years, followed by 39.75 years in 2003-04, 39.37 in 1998-99 and 38.81 years in 2008-09. Among its female members this trend is 23.44 years in 2003-04, 23.19 years in 1992-93, 21.75 in 1998-99 and 18.28 years in 2008-09 at age 10. The same pattern is followed by other ages by rural male and female population. In general we observed that life expectancy by employment status in rural India is greater than urban India. The male members lived more years by employment status than its female counterparts both in rural and urban areas. The age 10 is enjoying maximum life expectancy by employment status as compared to other ages among the rural-urban and male-female population of India. The argument for selecting the age 10 is already discussed in the aforesaid section. Swee-Hock13 (1965) also selected 10-14 instead of 15-19 age groups in constructing male abridged working life tables for Malaya for three major ethnicities: Malays, Chinese and Indians for the year 1957. Further Matin (1986)14 constructed life tables for working men and women of Bangladesh from aged 10 years and above by using data from 1981 Bangladesh Population Census.

There is no Conflict of Interest in this paper.

This paper is Funded by the authors themselves.

Since the data is secondary and used with proper arguments the authors do not feel the need of ethical clearance.

What Determines Gender Preference at Birth? 
A Review Based on Available Literature

Asha Rani Morla¹, B.S Ilayaraja², Uppu Praveen³
¹MSc Nursing, ²Assistant Professor, ³PG-Tutor, Teerthanker Mahaveer College of Nursing, Teerthanker Mahaveer University, Moradabad

Abstract

Introduction: Every person in this world have equal rights to live irrespective of their gender. Instead of getting equal rights in society as women they are not even getting a right to born. Defining “female foeticide as aborting a female foetus after sex determination test”¹. There are certain factors like preference for son, economic burden to rear a girl child.² Objectives: 1. To identify and describe the reasons for gender preference among antenatal women. 2. To determine awareness and attitude and perception on gender preference and female foeticide. Method: A comprehensive review of published literature and journal articles from Pub Med and EBSCO databases was done by following specific search strategy for each database. Initial 3610 titles were retrieved and after screening 10 articles were selected for full test screening. Finally 10 articles were selected based on the inclusion criteria. Results: Three research studies highlighted that preference for the son is high in our society with various reasons like security in old age, carries the name and fame of the family and financial security and carry out the last days rituals of the parents and daughters are not preferred due to fear of dowry. Two research studies reveal that most of the subjects have favorable attitude against to sex determination and female foeticide. Most of the subjects were aware about Prenatal diagnostic technique act (PNDT). Conclusion: The strong desire for male child will make the families to undergo for female foeticide. Ultimate aim of education is change the behavior. Keywords: Gender preference, female foeticide, Sex-determination, PNDT Act, Antenatal women

Introduction

Every person in this world have equal rights to live irrespective of their gender. The modern society creates a situation for a women in such way that they are in risk group to face multi dimensional problems such as trafficking, acid attacks, rape etc. Female foeticide is one of the serious problem in our society, which is completely against to the human rights. Instead of getting equal rights in society, women are not even getting a right to be born¹. Female foeticide means aborting a female foetus after sex determination test¹. There are certain factors like preference for son, economic burden to rear a girl child, feeling like daughter as parayadhan (others property), fear of dowry, certain cultural influences and misusing of the advanced technologies like Ultrasound, which make the people to commit for female foeticide irrespective of their socio-economic status ². Need for eliminating concept of gender preference:

The sex ratio variation in India is drastic as per the literature and statistics found on electronic data base from 2007-2017. According to censes 2011 sex ratio in India, for every 1000 males there are 918 females. This decline sex ratio leads to various problems in our society like improper family set-up, violence against women.³ The government of India introduced PNDT (Prenatal diagnostics techniques) act with the intention
to prevent the female foeticide. According to this act sex-determination was considered as illegal and the offenders should be punished.

The strong desire for male child will make the families to undergo for female foeticide. Ultimate aim of education is to change the behavior of people. With the help of awareness campaigns and counseling sessions we need to change the behavior of society.

From the above background information it is very clear that the strive of preference for son in the form of female foeticide have lot of impact in our society. Hence a review of literature for identifying the reasons for gender preference among antenatal women carried out.

Methodology

Search Strategy methods:

A computerized search has done to collect the articles which are available in different databases from the year of 2007 to 2017. The search strategy was limited to only English language and considered only the studies which are conducted on human species.

Initial search strategy made by using the terminologies and its synonyms which are processed in databases such as Pub Med-Medline and EBSCO, the key words along with the synonyms were added in the MESH after that search builder was developed based on key words and later on the main search was done. The terminologies which have been used to collect the article are as follows:

Keywords: Awareness, Knowledge, Attitude, Perception, Gender preferences, Female foeticide, Sex determination test and prenatal diagnostic act.

Types of studies

Cross-sectional study, Survey, Phenomological studies.

Types of participants

Antenatal women and married couple.

Settings

Hospitals, Clinics Urban and Rural areas, Educational Institutions.

The systematic search was conducted by framing the terms individually and in combination with all and synonyms, also according to the data base. In addition to this, a manual Google scholar search was under taken using the key words and search synonyms from already found articles. An addition of 3 articles were found. Initial search retrieved 3610 articles over which 96 articles were selected manually. 96 Duplicate records were removed and 22 articles are included according to the eligibility criteria. Among these 5 studies were excluded due to lack of full texts. 7 articles are not related to gender preferences. Hence 10 articles were screened which includes quantitative and qualitative studies.

1. AUTHOR: Vadera, Joshi, Undakat, Yadav & Sudha, 2007. SOURCE AND TITLE: A Study on knowledge and attitude Regarding Gender preference and female foeticide among pregnant women. COUNTRY: India. VARIABLES: Knowledge and attitude on gender preferences and female foeticide. INSTRUMENTS: Structured questionnaire by interview method. SAMPLE AND SAMPLING TECHNIQUE: 195, Systematic sampling. DESIGN: Cross-sectional study. DURATION: 2 Months. FINDINGS: 1.Preference for male child because son carries name of the family and supports them in old age. 2. Subjects were aware about consequences of female foeticide like violence against women and disturbance in the family set up. 3. Few subjects reported that they would opt for female foeticide if the gender of foetus is female. CONCLUSION: Desire for having son in the family is the major reason for declined sex ratio and there is a need for awareness regarding consequences of female foeticide

Level Investigation of Sex Determination in a semi urban Area of Northern India. COUNTRY: India. VARIABLES: Sex determination and associated factors. INSTRUMENTS: Structured interview schedule. SAMPLE AND SAMPLING TECHNIQUE: 983, purposive sampling technique. DESIGN: Cross-sectional study. DURATION: 3 Months. FINDINGS: The study revealed that: 1.Few subjects underwent for sex determination as well as female foeticide. 2. Female foeticide was more in general category caste when compared to other backward caste. 3. The rate of opting for sex determination was low in illiterate and majority of couples who opted for sex determination were literates. CONCLUSION: The study concluded that there is a need for implementing equal property for a girl child. Action should be taken to eliminate gender inequalities in the society.

VARIABLES: Gender preference and factors affecting gender preference, INSTRUMENTS: Semi-structured interview. SAMPLE AND SAMPLING TECHNIQUE: 390, purposive sampling technique. DESIGN: Cross-sectional study. DURATION: 2 Months. FINDINGS: Most of the subjects had preference for a male child especially in rural areas and among illiterates because of security in old age, symbol of status and continuation of future generations. Only few subjects preferred daughters because they help in household work and daughters are considered as goddess LAXMI CONCLUSION: Study concluded that appropriate strategies to improve the security at old age and to remove the dowry system will improve preference for daughters so that the stability in sex ratio can be achieved.

5. AUTHOR : Jagdeep, Rani & Hardeep, 2014. SOURCE AND TITLE: A study to assess the attitude and family support of couples toward the birth of a girl child in selected rural and urban areas of the Punjab. COUNTRY: India. VARIABLES: Attitude and family support on birth of girl child. INSTRUMENTS: Self structured interview. SAMPLE AND SAMPLING TECHNIQUE: 200, purposive sampling technique. DESIGN: Quantitative design (cross-sectional design). DURATION: 3 Months. FINDINGS: 1. Majority of the subjects have favorable attitude towards birth of a girl child. 2. Most of the subjects revealed that family members are supporting for a girl child. 3. Compared to rural area, people of urban area are having positive attitude and family support for a girl child. CONCLUSION: The study concluded that the mean favorable attitude and family support was more in urban couple than rural couple.

6. AUTHOR : Nithin etal., 2014. SOURCE AND TITLE: Awareness and attitudes regarding prenatal sex Determination, pre-conception and pre-natal diagnostic techniques act (PCPNDTA) among pregnant women in southern India. COUNTRY: India. VARIABLES: Semi-structured questionnaire by interview method. INSTRUMENTS: Semi-structured questionnaire by interview method. SAMPLE AND SAMPLING TECHNIQUE: 132, Convenient sampling technique. DESIGN: Cross-sectional study. FINDINGS: Majority of the subjects were aware about sex determination test and subjects knew that ultra-sonography is the method for sex determination. Subjects were aware about PNDT act. Most of the subjects responded that sex determination is illegal and the offenders should be punished. Few subjects were ready for sex determination if they had a chance and few of them were ready for termination of pregnancy if the gender of the foetus was female CONCLUSION: The study concluded that most of the subjects are ready for sex determination which indicates there is a need for providing awareness on legal punishments.

7. AUTHOR : Pavithra, Dhanpal & Lokanath,2015. SOURCE AND TITLE: A study of gender preference, knowledge and attitude regarding prenatal diagnostic techniques act among pregnant women in an urban slum of Bengaluru. COUNTRY: India. VARIABLES: Knowledge and attitude regarding gender preference and prenatal diagnostic act INSTRUMENTS: Structured questionnaire (few open ended questions). SAMPLE AND SAMPLING TECHNIQUE: 100, purposive sampling technique. DESIGN: Quantitative (cross-sectional design). DURATION: 3 Months. FINDINGS: Very few subjects have good knowledge about PNDT act but most of them responded that sex determination was punishable offence. Majority of the subjects have positive attitude towards female foeticide. Most of the subjects responded that they are preferring for son, and few subjects are ready for sex determination and even for female foeticide. CONCLUSION: Study concluded that female foeticide is against the human rights and has huge impact on the society. Everyone in the society
8. AUTHOR : Sarkar & Dasgupta 2015. **SOURCE AND TITLE:** Gender preference and perception of PNDT: A community based study among ever married women in a rural area of West Bengal **COUNTRY:** India. **VARIABLES:** Gender preference and perception of PNDT **INSTRUMENTS:** Semi-structured questionnaire, interview method. **SAMPLE AND SAMPLING TECHNIQUE:** 96, simple random sampling technique. **DESIGN:** Cross-sectional study. **DURATION:** 2 Months. **FINDINGS:** The study revealed that only few subjects had no gender preferences and most of the subjects replied that at least one son is compulsory in a family. The reasons for preference of male child are security in the old age and carries name of the family. **CONCLUSION:** The study concluded that there is a need for awareness related to female foeticide and attitude change towards male child.

9. **AUTHOR:** Christian, Sonaliya & Garsondiya, 2014 **SOURCE AND TITLE:** Female foeticide in the view of fertile females-A study among suburban pregnant women of Gujarat, India **COUNTRY:** India. **VARIABLES** Female foeticide in the view of fertile females. **INSTRUMENTS:** Structured questionnaire, Interview method. **SAMPLE AND SAMPLING TECHNIQUE:** 200, purposive sampling technique. **DESIGN:** Cross-sectional study. **DURATION:** 6 Months. **FINDINGS:** Majority of the subjects didn’t have birth preferences. But few subjects had preference for son. Many subjects considered son or daughter as God’s gift. Few Subjects considered sex determination as a sin. Most of the subjects were aware that the sex determination is punishable in our country. **CONCLUSION:** The study concluded that most of the subjects have favorable attitude being against to sex determination and female foeticide.

10. **AUTHOR:** Purwar, 2015. **SOURCE AND TITLE:** Gender violence due to female foeticide: Across-sectional study from banda,Uttar Pradesh **COUNTRY:** India. **VARIABLES** Gender violence, female foeticide **INSTRUMENTS:** Structured questionnaire, Interview method. **SAMPLE AND SAMPLING TECHNIQUE:** 100, Random sampling technique. **DESIGN:** Cross-sectional study. **DURATION:** 20 days. **FINDINGS:** Most of the subjects replied that boys carries name of the family, they are compulsory for the funeral activities of last days. Few subjects responded that female foeticide was due to burden of dowry.

**Conclusion**

The Government and NGO’s should take variety of strategies like providing awareness on consequences of this unethical practice and strict legal punishments for the offenders.

**Summary of the findings:**

The available literature refined to get 9 quantitative and 1 qualitative approach.

Three research studies highlighted that preference for the son high in our society with various reasons like security in old age, carries the name and fame of the family and financial security and carry out the last days rituals of the parents and daughters are not preferred due to fear of dowry.

Two research studies reveal that most of the subjects have favorable attitude being against to sex determination and female foeticide.

Four research studies found that people were aware about sex-determination tests and method for sex-determination. The subjects were aware that female foeticide and sex determination is illegal practice and it leads to legal punishment for the offenders (PNDT Act)

One research study revealed that practice of sex determination is most common in literate families compare with illiterate families.

**Importance in education:**

Female foeticide is one of the issue which is against to the human rights. These unethical practices are happening due to lack of awareness in our society. The nursing education system should focus on the providing awareness campaigns to the community and make the nursing graduates as responsible health team member for prevention of this malpractice.

**Limitations:**

- Data search was limited
- Search strategy was refined to gender preferences, female foeticide only
Conclusion

Preference for the son in our society can be changed with the help of behavior change communication and awareness regarding consequences of the female foeticide.

Prevalence of Malnutrition and Non communicable disease among South Indian Women: an Urban-Rural Comparison

Soumya1; Abhishek Singh Chauhan2; Subhi Srivastava2
1M.Sc. in Health Statistics, 2Research Scholar, Department of Community Medicine, IMS, Banaras Hindu University, India

Abstract

The aim of this study is to examine the urban rural differentials in the effects of socio economic predictors on underweight and underweight/obesity of ever-married women in South Indian States. The effect of malnutrition and other risk factors on non-communicable diseases is also examined. Nutritional status, socio economic and demographic background of women was obtained from the nationally representative DHS data (NFHS 2015-2016). Multinomial and binary logistic regression was performed in determining the risk factors of malnutrition and examining the effect of malnutrition and associated risk factors on non-communicable diseases. The result revealed that in rural and urban settings, women of age less than 20 years were 2.78(OR=3.78, 95% CI=2.10-6.80) and 0.72(OR=1.72, 95% CI=1.15-2.57) times more likely to be underweight. Women from urban areas were significantly less likely to suffer from anemia (OR=.96, 95% CI=.94-.99) and hypertension (OR .94, 95% CI= .90-.97) than those from urban areas. Women who were categorized as overweight were less likely to suffer from anemia and more likely to suffer from diabetes respectively.

Keywords: Malnutrition, Non Communicable disease, NFHS-4.

Introduction

Adequate nutrition is an essential condition for attaining good health, quality life and stimulating national productivity. The World Health Organization estimated global prevalence of obesity as 400 million in 2005 and the predicted figure for 2015 was 700 million[3]. Illiterate women from rural parts of India having marriage at low ages and low standard of living was more likely to have prevalence of nutritional deficiency.

One of the common problem among women taking improper nutrition is anemia which is a decrease in the total amount of hemoglobin in the blood and may include feeling tired, weakness, breath shortness or a poor ability of daily work routine on the other hand, some non-communicable diseases here (diabetes and hypertension) were more likely to be prevalent among women having overweight or obese and are a result of daily life style among the study participants. Coexistence of diabetes and hypertension frequently, leading to additive increase in the risk of life threatening cardiovascular events.

Diabetes has become the seventh leading attributable risk factor for burden of disease in south Asian countries[2]. The economic and disease burden associated with non-communicable disease puts enormous pressure on unsound health systems in low income countries. Therefore understanding the extent and diagnosis of non-communicable diseases may reveal helps to reduce premature death, disability and household economic shock. A research based on multi countries revealed that people belong to low income countries and with lower economic profile were less likely to receive a timely...
diagnosis and treatment for their non-communicable diseases [1].

The prevalence of malnutrition and non-communicable disease is increasing over the years among Indian women but the rates as well as the effect of covariates may differ across urban-rural settings. The specific objective of this study is to examine whether there are any urban-rural differentials in the effect of risk factors on prevalence of malnutrition (underweight and obesity) among women residing in south states of India. According to the National Family Health Survey report published in December 2017, the frequency of women suffering from hypertension and diabetes are relatively higher in south states as compared to other states areas and also shows a high distribution of anemic women across these states. Therefore, the Models will be fitted to the DHS data (NFHS 2015-16) by filtering in the five south states (Andhra Pradesh, Karnataka, Kerala, Tamil Nadu and Telangana) and weighting techniques was employed to ensure the correct representativeness for providing a comprehensive picture of nutrition and non-communicable disease for women residing in these states.

**Materials and method**

**Data description**

This study used data from DHS (Demographic and Health Surveys), from NFHS (National Family Health Surveys) data set of year 2015-16. The 2015-16 National Family Health Survey (NFHS-4) is a nationally representative survey with a sample of 628,892 residential households in all the sample households, women of age 15-49 who are usual members of the selected households were interviewed in the survey.

**Dependent and independent variables**

For the measurement of nutritional status, Body mass index is considered as dependent variable and the women under the study areas were categorized as underweight (up to 18.50 kg m–2) as first category, normal (between 18.50 and 24.9 kg m–2) as second category and combining overweight (between 25.0 and 29.9 kg m–2) and obese (30.0 kg m–2 or more) for third category.

The blood glucose measurement for the women was used for considering women as normal and diabetic. The prevalence of anemia is determined based on hemoglobin levels and the subjects were categorized as anemic if the hemoglobin level is below 12 g dl – 1 for non-pregnant and below 11 g dl – 1 for pregnant women otherwise not anemic. Women were considered as hypertensive if their systolic pressure was more than or equal to 140, diastolic pressure was more than or equal to 90 and if they are currently taking a medicine for maintaining their blood pressure.

The independent variables used for this study is based on the existing literature and data availability. Background characteristics of the respondents were re grouped into categories as age ( up to 20, 21-30, 31-40, 41-49 years), age at first cohabitation ( up to 15, 15-17, 18 or above), total children ever born ( 0, 1-2, 3-4, 5 or more), education (illiterate, primary, secondary, higher secondary) and household wealth status( low, middle, high).

**Statistical Analysis**

The NFHS adopted appropriate survey methodology to obtain a representative sample but the final sample does not guarantee a complete representativeness in terms of proportional allocation at strata and cluster levels. To ensure the representativeness of the sample at various levels, sampling weights was calculated separately for each sampling stage and cluster based on sampling probabilities. The design of the survey (stratification and clustering) and sample weights were incorporated into the analyses using svy routines of weighting sample techniques. All the dependent and independent variables considered in the study were categorical. Frequency and graphs were used to show the distribution of prevalence of non-communicable disease among respondents. Multinomial logistic regression technique was employed to estimate the covariates and binary logistic regression models were fitted to estimate the effect of risk factors on non-communicable disease and the effects of the predictor variables on dependent variables

(Nutritional level, anemia, diabetes and hypertension of ever-married women) were estimated by odds ratio (OR) of each category relative to the reference category and separate analyses were performed for respondents from rural and urban areas. All the analyses were performed by SPSS 22 version.
Results

As revealed in figure 1, only 7.6% of urban women were underweight, whereas the percentage of overweight or obese (44%) was higher in urban. However the percentages of women having normal nutritional status were more in rural areas as compared to urban areas.

RC stands for reference category. Figures in parentheses indicate 95% confidence interval of odds ratio; ***P<0.01, **P<0.05, *P<0.10.

Figure 2: Percentages of women with Anemia by nutritional status.

Figure 3: Percentages of women with Diabetes by nutritional status.

Figure 4: Percentages of women with Hypertension by nutritional status.
The adjusted ORs of being underweight and overweight with 95% Confidence Interval for various categories of predictor variables (with respect to the normal as reference category) are presented in Table 1 and separate models are fitted for urban and rural areas. Women of lesser age were more likely to be underweight compared to women of higher ages 41-49 as reference category both in urban and rural settings. Prevalence of being underweight was more prominent in rural than in urban areas. However, Age of respondent at the time of cohabitation in the prevalence of obesity or overweight of women were not statistically significant. In rural areas, illiterate women, women with primary level of education and with secondary level of education were .59 (OR = 1.59; CI = 1.16-2.17), .16 (OR = 1.16; CI = .85-1.59) and 0.20 (OR = 1.20, CI = .93-1.55) times more likely to be underweight than those with above secondary education.

Household economic status showed significant effects in both urban and rural settings, women who were low and middle economic status were more likely to be underweight and accordingly less likely to be overweight or obese than those who were rich, those from urban households categorized as poor and middle wealth were 0.83 (OR = 1.83; CI = 1.37-2.45) and 0.65 (OR = 1.65; CI = 1.34-2.03) times, respectively, more likely to be underweight although the figures for rural setting are 1.05 (OR = 2.05; CI = 1.75-2.41) and 0.49 (OR = 1.49; CI = 1.29–1.73), respectively. The percentage of women with various non-communicable diseases by nutritional status has been shown in Figure 2, 3 and 4 and revealed that anemia was more prevalent among underweight women whereas other non-communicable disease such as hypertension and diabetes are more prevalent among overweight women.

RC stands for reference category. Figures in parentheses indicate 95% confidence interval of odds ratio; ***P⩽0.01, **0.01oP⩽0.05, *0.05oP⩽0.10.

The adjusted odds ratios with 95% confidence intervals of non-communicable diseases among ever married women with three set of predictor variables (Place of residence, Household wealth status and Nutritional level) with respect to reference category are presented on table 2. Household wealth also showed a significant association with non-communicable disease, such that women from middle and rich wealth household categories were less likely to suffer from anemia with respect to those from poor households but the association is reversed for diabetes as women from middle wealth status were 0.04 (OR = 1.04; CI = 0.93–1.17) and rich wealth status were 0.41 (OR = 1.41; CI = 1.27–1.56) times more likely to suffer from diabetes as compared to those from poor wealth status. Finally, nutrition also showed a highly significant association with all non-communicable diseases, such that women in normal (OR = 0.76; CI = 0.73–0.79) or overweight (OR = 0.67; CI=0.64 –0.69) were less likely to suffer from anemia with those who were underweight. It can be stated the risk of having diabetes and hypertension increases as the weight increases. The same pattern holds for hypertension, where women in normal or overweight categories were 0.68 (OR = 1.68; CI = 1.56–1.81) and up to 3.02 (OR = 4.02; CI = 3.73–4.34) times more likely to
suffer from hypertension with respect to those who were underweight.

**Discussion**

For the overall population, higher percentages of underweight women are from rural settings whereas higher percentage of overweight women is from urban settings. Educational status of their husband showed more significant effect on nutritional status of women than their own educational status. Women from middle and rich wealth status were less likely to be underweight and more likely to be overweight in both area of residence. This may be due to reason as the poor woman does not afford sufficient and proper food to maintain their nutritional level, lack of knowledge may also result in adverse nutritional outcome. In terms of non-communicable diseases, underweight women were more likely to suffer from anemia and less likely to suffer from diabetes and hypertension and this may be due to the fact that both anemia and overweight share a common risk factor in terms of food intake and improper nutrition. The main implication of this paper is that authorities should develop special programs for educating young women living in rural areas and urban slums regarding alternative low-cost balanced food options which may help reduce underweight and anemia. Women of higher age and higher economic status are more vulnerable to be overweight which proves to be high risk for diabetes and hypertension so these study participants must be targeted to discourage the consumption of junk food and to encourage physical activity.

Analysis of Functional Efficiency of Quadriceps in Patients Recovered from Symptoms of Osteoarthritis of Knee Joint

Mallika Iyer¹, S Anandh², Jharashree Sahoo³, G Varadhrajulu⁴
¹Intern, ²Professor, Faculty of Physiotherapy, ³Assistant Professor, Faculty of Physiology, KIMSDU, ⁴Dean, Faculty of Physiotherapy, Krishna Institute of Medical Sciences Deemed to be University, Karad, Maharashtra, India.

Abstract

Objective: To compare the extensor muscle strength (quadriceps) between normal subjects and subjects who have recovered from osteoarthritis of knee (grade 1 and 2).

Method: A total of 46 subjects were screened as per inclusion and exclusion criteria and they were briefed about the study and outcome measures. Informed consent was taken from the subjects. Subjects were selected by the convenient sampling method. The subjects were then divided to the respective groups. Group A included all the subjects who were recovered from Osteoarthritis of knee (grade 1 and 2) and group B included all the normal individuals of same age group and same geographical area. The efficiency of the quadriceps muscle was checked with the mean amplitude values of EMG, and the disability index pre and post test was checked with the help of WOMAC scale. Subjects for group A was selected with the help of radiological findings of knee, history and symptoms.

Conclusion: The study concludes that the progression of osteoarthritis of the knee can be controlled by maintaining muscle power and concentrating on the other joints in addition to taking caution towards stress factors on activity. The mean amplitude of quadriceps muscle recorded with surface EMG in osteoarthritis subjects post recovery of symptoms (after physiotherapy treatment) was similar to the normal subjects of same age group.

Keywords: Osteoarthritis, knee, physiotherapy treatment, quadriceps, electromyography, functional efficiency, WOMAC.

Introduction

More studies suggest that treatment directed towards increasing the muscle function in those with symptomatic osteoarthritis can produce favorable results. For patients with osteoarthritis, where any surgical procedure is not advisable or where there is no concern. It is a challenge, to show progress irrespective of multiple predisposing factors leading to progressive osteoarthritis joint damage, so at all possible stages the research is mandatory to work with patients with limited ability.

Magnitude of economy, social cost of the disabling condition, restricts the patients to follow safe exercises procedures on their own.

The precise causes and factors influencing osteoarthritis is not yet understood or evident. The extensor muscle in particular have great demand in withstand stresses created by damaged joint structures in addition to others tissues. Failure to generate required muscular force, create a fall or severe painful condition'

Goals of therapeutic exercises in osteoarthritis is mostly related to activation and strengthening the muscles surrounding knee joint to achieve, any particular goals.

The goals are maintained with range of motion with sufficient functional activities; maintaining sufficient muscle strength to the patient level of function; improve
joint stability and decreases biomechanical stress upon joint; to improve endurance of all the functional activities, to achieve efficient gait pattern and decrease pain which is long term and short term goals. Isometrics, isotonic and isokinetic exercises are used more or less equally, depends upon joint stability. Post exercises should also be considered in treatment for osteoarthritis. So individuals program, for each patient is to be scheduled to have maximum benefit with pain relief. So physiological study on quadriceps has been done using surface EMG. Physiotherapy prescription for joint protection needs to be done with proper analysis for muscle function inspite of avoiding alteration/recommending non weight bearing, partial weight bearing/aquatic/promoting till tolerance level/progressing with individual physical performance should not be adopted with approximation.  

The purpose of this study is to check the state or quality of the quadriceps muscle of being efficient in the patients who have recovered from osteoarthritis of knee as compared to the individuals who had no history of osteoarthritis of knee.

- **Study type**: post test (1 time)
- **Sampling method**: Convenient sampling
- **Study Duration**: 3 months
- **Sample size**: 46
- **Place of study**: Karad.

Sampling methods: After baseline assessment, the patients were divided into 2 groups, Group A and Group B.

**Group A**: 23 subjects recovered from symptoms of OA grade 1 and grade 2 and just after physiotherapy treatment.

**Group B**: 23 normal individuals with similar age group from same geographical area and health/physical status.

**Materials**:

- Data Collection sheet
- Consent form
- Pen
- Pencil
- EMG machine
- Surface electrodes

**Outcome measures**:

The Western Ontario and McMaster Universities Osteoarthritis Index. (WOMAC):

Electromyography (EMG):

**Procedure**:

This was an observational study to check the quadriceps muscle efficiency in patients who have recovered from symptoms of osteoarthritis of knee grade 1 and 2, considering symptoms control on discharge of OPD treatments.

Subjects were explained about the procedure of the study. All the patients who had recovered from symptoms of osteoarthritis of knee grade 1 and 2 were included in group A and all normal individuals who had no history of osteoarthritis were included in group B.

**Group A**: 23 patients who had recovered from symptoms of osteoarthritis of knee joint grade 1 and 2 and subjects who got discharged from OPD were in group A. They were assessed for efficiency of quadriceps muscle with the help of surface electrode EMG (completely non invasive procedure), and further assessed with WOMAC knee disability index.

**Group B**: 23 normal individuals with no history of osteoarthritis, symptoms, and belong to same age group appropriately who had been randomly selected. They were assessed with the same procedure as group A. Further the EMG outcomes of both the groups were compared.

**Outcome measures**:

WOMAC score of group A subjects was assessed compared using the pre and post test WOMAC score values. It was not considered for group B subjects as they are normal.

EMG recording: The efficiency of the quadriceps muscle was checked by electromyography (EMG), the recording of the EMG was done by using surface
Results and statistics

Unpaired t test was used for statistical analysis of pre and post test within Group A subjects with osteoarthritis of knee.

Mann whitney’s test was used for comparing both groups and statistical analysis. Group A (subjects with osteoarthritis) and Group B (normal individuals).

Electromyography:

The mean amplitude was taken into consideration to check the efficiency of quadriceps muscle.

46 subjects participated in the study belonging to similar age group and geographical areas restricted to one place.

23 patients who had recovered from symptoms of osteoarthritis of knee joint grade 1 and 2 / discharged from OPD of physiotherapy during 1st and 2nd day were in group A.

And 23 subjects who are normal and had no history of osteoarthritis of knee were in group B.

Then the mean amplitude values of EMG of both the groups were compared.

</tbody>
</table>

Statistical analysis between pre and post test for group A (subjects who were recovered from symptoms of osteoarthritis) were taken. Pre test mean of WOMAC score was 31.76 ± 6.854 and the post test mean of WOMAC score was 26.108 ± 3.996. Inter group analysis of WOMAC score had shown very significant. This was done by unpaired t test. (“P” Value 0.0030).
Discussion

The study subjects with osteoarthritis of knee have presented with the following characteristics which was shared by the therapist undergone treatment for study subjects.

Muscle fatigue was predominant in osteoarthritis limb. Subjects had shown more trick movements during walking and other activities in the stress of affected limb was taken over by hip and trunk muscles and foot, so it has shown pain, tiredness and weakness. Muscle degeneration and atrophy was found in subjects with major knee deformities so patients with knee deformities with valgus and varus deformities were not considered for study.

The study has given implications regarding early identification of osteoporosis this is evident from the subjects with reference to the exercises performance and progression which have delayed the process of strengthening. In case of inflammatory changes which have influence the muscle strength was taken cared during treatment process.

ELECTROMYOGRAPHY

The noninvasive method using surface EMG sensors were used in the study by placing them on the skin above the muscle of interest as per the physiological response in OA knee patients.

Considering easy applicability eradicating risk of infection and group motor unit pattern can be studied by application over the maximum girth of Quadriceps muscle the preferred site of quadriceps was located at the maximum girth thus the study was undertaken in the similar pattern to quantify the mean amplitude changes with the observation upon discharge patients recovered from symptoms.

The study has ruled out some practical issues regarding skin fold thickness and its relationship to EMG observation.

The surface EMG can be used as an indicator for muscle fatigue during isometric sub maximal contractions, muscle fatigue I accompanied by decrease in motor unit firing rate and conduction velocity as a major for maintenance and safe progression for activities the mean amplitude was observe.

In the above study the EMG results shows that the mean amplitude of group A almost reached to the mean amplitude of group B. The mean amplitude results show that the efficiency of quadriceps muscle in the patients who have recovered from the symptoms almost reaches to the level of normal individuals after symptoms control.

WOMAC

Group A patients have been assessed with WOMAC self reporting multi dimensional questioner to assess pain, stiffness and physical functional disability. 2 times at the start of session and at the end while discharge for easy approach the questions have been translated in their mother tongue and outcome recorded. The study has shown significant results in all 3 categories pain, stiffness, function) as the subjects were homogeneous and without ay deformities of the knee. (P value less than 0.01). 70 percent of the subjects were females and both genders emotional states were similar and it has direct influence upon pain and function.

Intra group analysis for mean amplitude of EMG revealed statically significant. Group A and Group B values of mean amplitude of EMG was took. This was done by using Mann Whitney’s test. For group A mean ±SD was 150.10 ± 4.069 and for group B mean ± SD was 153.43± 3.745 (“P” value = 0.0102)

Inter group analysis for WOMAC score for group A(pre and post test) was done by unpaired t test. Statistically it is revealed as very significant. Pre test mean ± SD was 31.76 ± 6.854 and post test mean ± SD was 26.108±3.996. (“P” value = 0.0030)

The study has shown clinically significant changes in WOMAC scale scoring and Mean amplitude of EMG.

This mean amplitude of EMG findings suggest that the functional efficiency of quadriceps muscle in patients recovered from osteoarthritis (after physiotherapy treatment) reaches to the normal individuals functional efficiency of quadriceps muscle.

Conclusion

The study concludes that the progression of osteoarthritis of the knee can be controlled by maintaining muscle power and concentrating on the other joints in addition to taking caution towards stress factors on activity. The mean amplitude of quadriceps muscle recorded with surface EMG in osteoarthritis
subjects post recovery of symptoms (after physiotherapy treatment) was similar to the normal subjects of same age group.

**Conflict on Interest:** There were no conflicts on interest in this study.

Effectiveness of Multimodal Sensory Stimulation in Improving Motor Outcomes of Preterm Infants

H Karthika Ponni¹, A Rajarajeswari², R Sivakumar³
¹Postgraduate, ²Associate Professor, ³Professor & Principal, Faculty of Physiotherapy, Sri Ramachandra Medical College & Research Institute, Porur, Chennai, Tamil Nadu

Abstract

Background: Preterm birth is defined as babies born alive at less than 37 weeks of gestation. Due to the lack of the in-vitro environment and their exposure to harmful environment of the NICU has led to the preterm infants having a long term disability. The awareness of environmental factors on development gave rise to the formation of early intervention program. Multimodal interventional strategies which primarily use touch, vision, sound, and movement stimulation has shown to have an immediate physiological effect. However, the long term effect of multimodal stimulation with proper dosage in improving the motor outcomes is not well established.

Aim: The current study aimed to analyse the effectiveness of multimodal sensory stimulation in improving the motor outcomes of the preterm infant at one month of corrected age

Methodology: A quasi-experimental study (pre and post test design) was conducted in Sri Ramachandra Medical centre and Hospital. Preterm infants with GA of 28-36 weeks, who were medically stable and referred for early stimulation, were recruited in the study by convenient sampling. Baseline parameters were assessed using Hammersmith neurological scale, after which the mothers were counselled about age appropriate milestone development. They were then taught to perform touch, kinaesthetic, vision, auditory, vestibular and proprioceptive therapy under the guidance of the therapist. On discharge, a pamphlet was given to the mothers and were educated to continue the therapy. At one month of corrected age, the preterm infants were reassessed using HNE.

Results: The result shows that mean pre-therapy and post-therapy values of the preterm group had a significant improvement.

Conclusion: Multimodal stimulation is effective in improving the motor outcomes of the preterm infants, at one month of corrected age.

Keywords: multimodal sensory stimulation, preterm infants, hammersmith neurological assessment scale, KMC

Introduction or Background

WHO defined preterm birth as babies born alive at less than 37 completed weeks of gestation. According to the millennium developmental goals indicator the region with the highest incidence rate of preterm birth (13.4% of all preterm birth) is southern and south-east Asia and India ranks first in yearly prevalence of preterm birth among the South Asian countries¹.

Advances in the care of preterm babies has lead to decrease in their mortality rate and increased their survival rate. Preterm babies once survived truly possess a global problem in low-income countries such as south Asia¹.
During normal embryological development, developing brain is highly plastic. The fetal development in the intra uterine environment provides an optimal surrounding for the formation and maturation of the synapses².

Myelination of the CNS starts from 14 weeks of gestation and reaches a peak from 25-37 weeks. Myelination of the thalamic structure, cortical structure and optic radiation occurs at 25 weeks, 35 weeks and 35 weeks respectively³.

Gyrification process spans from 10-28 weeks of gestation and occurs in a hierarchical manner, with the primary sulci appearing first followed by the secondary and tertiary gyri. Due to gyriification and formation of sulcus, the fetal brain develops from the lissencephalic structure to that of an adult brain with sulcus and gyri. Thereby the surface area of the cortical grey matter increases, and more neurons gets packed in the cortex, this increases the ability of the cortex to process information⁴,⁵.

This process of normal development is disturbed in the case of preterm infant, who are born before 40 weeks of gestation, and are further worsened by the early exposure of the preterm to the harmful environment of NICU. As a result, the preterm infants are subjected to long term morbidities⁶.

21% of preterm infants born before 32 weeks of gestation have severe white matter injury. Furthermore, the reduction in size of the corpus callosum of the preterm infant positively correlates with the development of cerebral palsy in their later age⁷,⁸,⁹.

Due to perinatal illness of prematurity like lung infections and bronchopulmonary dysplasia 17-23% of very preterm and 12% of late preterm infants suffer from neurodevelopmental impairments in terms of impaired upper and lower limb functions, lack of independent ambulation and vision and hearing loss at preschool age¹⁰,¹¹.

These studies suggest that the infants born as very and late preterm are having extended developmental, behavioural problems which needs special care and educational services to address these morbidities.

The initial experiences which the infants gain, will pave way for the appropriate development of the synapse².

However, the preterm infants are kept in the NICU in their initial days of life. This increases their survival and also exposes them to the loud and harmful environment of the NICU, this develop compensatory physiological responses, is not ideal for the neurodevelopmental need and may become permanent to cause delirious long term effect¹².

The awareness of environmental factors on development gave rise to the formation of early intervention program, which are aimed at providing an optimal environment by removing environmental barriers to promote the developmental needs of the maturing brain¹³.

The term ‘early intervention’ designates educational strategies and neuroprotection strategies aimed at enhancing brain development by enhancing cerebral plasticity and neuro-protection at improving the environmental and neurological experiences of the preterm infant during the critical period of development, thereby improving the plasticity of the developing brain to promote normal development and prevent disabilities¹⁴,¹⁵.

Early intervention which is started early before 40 weeks of postmenstrual age, prior to any structural changes to the brain is most effective in improving the cognitive and behavioral outcome in preterm infants².

The neurological system receives input from all the sensory pathways such as touch, vision, sound, and movement to explore the possibilities of neural connection and forms new synapses, which can be further trained to produce proper developmental outcomes¹⁶.

Successful implementation of this multimodal sensory stimulation as an early intervention strategy requires full participation from parents¹⁷.

Studies which uses multimodal sensory stimulation as intervention strategies are large in number, all have shown to improve cognitive function but motor outcome were not well established, also, effective component for a successful intervention to improve motor outcome with appropriate dosage of intervention were not established¹⁸.

Early detection of any delay in motor development is always beneficial, but all the studies conducted so far
in assessing the effect of early sensory stimulation in improving cognitive outcomes are assessed at 40 weeks of postmenopausal age, 3rd, 6th, 9th, and 12th month of corrected age. A study which assess the developmental improvement, as early as one month of corrected age is not established.

Hence, analysing the level of development in motor outcomes achieved as a result of a dosed multimodal stimulus with different combination in improving the motor outcomes at one month of corrected age forms the basis of this study.

**Material and Method**

This quasi-experimental study (pre-test and post-test design) involved subjects who were preterm infants of GA 28-37 weeks to analyze the effect of multimodal sensory stimulation in improving their motor outcomes at one month of corrected age.

Subjects were recruited from Neonatal ICU of Sri Ramachandra Medical Center and Hospital. 26 preterm infants with the gestational age of 28-36 weeks, who were medically stable and referred for early stimulation, were included in the study using convenient sampling. Infants who were extremely preterm (<27 or 28 weeks), infants with congenital deformities, infants who underwent major surgeries, infants who were medically unstable and with mechanical ventilator support were excluded.

Duration of the study was from the day the multimodal stimulation therapy was initiated till one month of corrected age.

**Procedure:**

Informed consent was obtained from mother. Included preterm infants were assessed for the baseline parameters of tone, reflexes, movement and behaviour using the hammersmith neurological assessment scale.

After the initial assessment, the mothers of the preterm infants were counselled about age appropriate milestone development and were taught techniques of multimodal early stimulation (provided by the mother under the guidance of the physiotherapist).

The early multimodal stimulation exercise program was started from the CALMING INTERACTION IN ISOLETTE:

<table>

The pre-therapy and post-therapy score of the preterm group was statistically analyzed using the Wilcoxon signed rank test, to establish the effectiveness of multimodal stimulation in improving the motor development of the preterm infants.

All statistical analysis was performed using the software SPSS version 17.0.

There is a significant improvement in the motor outcome of the preterm infant from baseline to one month of corrected age (p < 0.001).

</tbody>
</table>

n = 26, p ≤0.05, Wilcoxon signed rank test

This significance can be contributed to the fact that this treatment model was started early from birth till one of corrected age, a period of time which is considered as critical period, were the systems undergo extensive transition from uterine environment to the external environment. Furthermore, from GA of 34-40 weeks synaptogenesis and myelination is at its peak, during which 40,000 synapses are formed every second and myelination of precentral, postcentral, optic radiation and acoustic radiation occurs during this stage. So multimodal sensory stimulation which has all the components of touch and kinesthetic, auditory stimulation and proprioception in proper dosage at this period of GA could have contributed to the improvement of motor outcomes.

The role of parents in providing comfort and care to the neonate who is getting adjusted to the extra-uterine environment helps in rapid improvement of physiological and psychological development. This study uses active participation of the parent in performing the therapy. Furthermore once the neonate is allowed to remove from the isolette KMC is initiated, the effectiveness of KMC is already been well established. These factors could have contributed to the significant development which was observed in this study.

These findings suggest that the protocol used in this study which follows tactile, vision, kinaesthetic, proprioception, and vestibular stimulation provided by the parent under the guidance of the parents and initiated as soon from the isolette and continued till one month of corrected age is an effective protocol in improving the total motor outcomes of the preterm infants at one month.

Further analysis maybe required to find the effect of this multimodal stimulation program in motor development in later stages.

Conclusion

The conclusion of the study is that the multimodal sensory stimulation of the preterm infants seem to be effective in improving the motor outcomes of these infants at one month of corrected age. The data from this study will contribute to the literature by providing a protocol of multimodal stimulation which is dosed and easy to apply. Also comparison of the preterm and full term development at one month of age will help the therapist in determining the optimal development which is to be attained by the preterm infant at that age point.

Violence against Doctor is a Threat in India: A Study in a Tertiary Care Institution

Ramesh Verma1, Kapil Bhalla2, Rohit Dhaka3, Ginni Agrawal4, Mukesh Dhankar5, Avneet Singh6, Gopal Kumar4

1Professor, Department of Community Medicine, 2Associate Professor, Department of Pediatric, 3Senior Resident, 4Junior Resident, Department of Community Medicine, Pt B D Sharma PGIMS, Rohtak (Haryana) India, 5Associate Professor, Department of Pediatric, LHMC, New Delhi, 6Professor, Department of Community Medicine CMC, Ludhiana (Pb)

Abstract

Background: Violence at work place is defined as an act of aggression, physical assault, or threatening behavior that occurs in a work setting and causes physical or emotional harm to an employee.1 In India, because of increasing burden of population and shortage of doctors, there is only one government allopathic doctor to look after 10,189 people and only one government hospital for every 90,340 population. Indian Medical Association (IMA) published a report which shows that nearly 75% of doctors in their careers have faced physical or threat violence at some point. Also, one in four MBBS, MD, DM, MCh. doctors have faced allegations of medical negligence in courts and consumer forums. 88% MBBS and specialist doctors have faced anger or violence of patients or relatives in their professional career at least once.

Methodology: The study was cross-sectional in design and carried out in a tertiary care institution in Haryana. The study recruited 300 residents working in the accident and emergency unit, intensive care unit, operation theatres and trauma centre of the institute.

Results: The prevalence of violence against doctors in the present study was come out to be 75.6% and maximum violence was faced by male resident i.e 71.5%. The relationship between gender and place of violence among residents which was found statistically significant.

Conclusion and Recommendations: Workplace violence in any form and in any setting is unacceptable. The study recommended that there should be enhanced security system at government hospitals for the delivery of safe, effective and truly universal health care in the long term.

Keywords: Violence, Gender, Residents, Doctor, Hospital

Background

Violence at work place is defined as an act of aggression, physical assault, or threatening behavior that occurs in a work setting and causes physical or emotional harm to an employee.1 In India, because of increasing burden of population and shortage of doctors, there is only one government allopathic doctor to look after 10,189 people and only one government hospital for every 90,340 population. India being a developing country where 30% population living in below poverty line, accounts for over half of the estimated 100 million people which is pushed into poverty worldwide every year due to high out-of-pocket expenses on healthcare, that’s why more and more people are seeking healthcare services in the government hospital. Lack of infrastructure, facilities and staffs in government hospitals frequently come across as causes of violence against health care providers.2

Indian Medical Association (IMA) published a report which shows that nearly 75% of doctors in their careers have faced physical or threat violence at some point. Also, one in four MBBS, MD, DM, MCh. doctors have faced allegations of medical negligence in courts and consumer forums. 88% MBBS and specialist doctors have faced anger or violence of patients or relatives in their professional career at least once. Similarly, Deyl S had also reported in his study that over 75% of doctors have faced violence at their workplaces.3
According to WHO, 8% to 38% of health care functionaries said that they faced physical or other violence in their careers and common violence are kicks, scratches, bites and spitting which are perpetrated by patients or their relative. Violence against health care workers is unacceptable. It’s not only impacts on the psychological and physical well-being of health-care workers, but it also affects the motivation of their job and this violence compromises the quality of patient care and puts health-care provision at risk.\textsuperscript{4} A report published in America where it was reported that in nineties, more 100 healthcare providers in the hospital died as a result of violence.\textsuperscript{5} British Medical Association revealed that one-third respondents had been a victim of verbal or physical attack in the year 2008.\textsuperscript{6} Chinese doctors are also frequently the victims of violence.\textsuperscript{7} There are several factors which trigger these violences. These are poor infrastructure at government hospitals, poor communication between doctors and patients, lack of faith in doctors and judicial process, rising cost of healthcare and so forth. National newspapers are regularly reporting that doctors are being daily verbally abused, assaulted, manhandled and even killed by the patient’s relatives. Dissatisfaction of patient is one of the major causes that perpetrators agitated friends and their relatives. The most common settings for such violences are in accident and emergency units, pediatrics care unit, intensive care unit, and post-surgical wards.\textsuperscript{8} In Haryana, no such type of study has ever been conducted on incidence of violence against doctors, therefore the present study was planned with the objective to find out incidence and determinants of violence against the doctors in a tertiary care institution of Haryana.

Material and Method: The study was cross sectional study in design and carried out from November 2017 to January 2018 at one of the premier institutes of Haryana, Pt. B. D. Sharma PGIMS, Rohtak which is a tertiary care institution having 1700 beds. This is a teaching institute having 200 MBBS seats, 145 MD & Diploma students, 06 MCh, 02 DM seats per year and 250 faculty members. This tertiary care institution is providing health care services to an average of 4000-5000 patients daily and 300-400 accident and emergency cases. The previous study reported that most of violences reported from accident and emergency unit, intensive care unit, operation theatres and trauma centre that’s why this study recruited all residents working in this areas.\textsuperscript{8}

The investigator contacted personally with the subjects and informed written consent was sought. Those subjects who gave willingness were included in the study. The objective and nature of the study was explained before starting the study. The assurance about the confidentiality of the information was given to the residents. Interview was started with general discussion to build up a rapport with respondents and to gain their confidence. A pre-tested semi-structured interview schedule was administered to know incidence of violence against study subjects and the responses were recorded by the investigator himself. The questionnaire included name, age, sex, place of working, types of violence and factors responsible for this violence etc. The data was analyzed by applying percentages and proportions for different parameters.

The study recruited 300 junior residents of a tertiary care institution and found that 196/300 (65%) were male residents and rest (35%) were female residents. Majority of residents were aged below 30 years with mean of study participants being 21.3 years. The study was carried out among residents working in Accident and Emergency unit (47%) followed by Trauma centre.
The prevalence of violence against doctors in the present study was found to be 75.6% (197/300). Out of total violence faced by doctors, maximum violence was faced by male resident i.e. 71.5%. Majority (71.7%) of doctors faced verbal violence, 36 (17.2%) doctors faced physical violence and 20 residents (10.1%) faced threats from patients relative or friends. Majority of doctors didn’t know the doctor protection law and only 8.5% doctors who faced the violence didn’t lodge the First Information Report (FIR) in police station.

All residents suggested that strict legal steps should be taken by government. 83.5% of resident said that doctors should not be overburdened with their work and 78% doctors suggested that valid consent should be taken before treatment. Majority (95%) of doctors said that there should be installation of CCTV cameras in institution, 81% doctors suggested that entry of patient’s relative or friend in the hospital should be restricted. </table>
Table 3 shows the gender-wise association of violence among doctors and found that the association between gender and type of violence was statistically significant (p<0.001). The study also studied the relationship between gender and place of violence among residents which was found statistically significant (p<0.01). Association between gender and year of experience of working was also come out to be statistically significant (p<0.05).

**Discussion**

In India, prevalence of violence against doctors has increased. World Health Organization (WHO) also shows concern about the violence against the doctors working in South East Asia region. Due to lack of proper security system, the violence in government hospital is also increasing. It is need of hour for government of India to look into possible solutions for this problem.

The present study was carried out in a tertiary care institution of Haryana and recruited 300 residents. Out of 300 subjects, 65% were male residents and rests were female residents. 47% residents from Accident and Emergency unit followed by 29% residents from Trauma centre and 12% residents from Obstetrics and gynecology unit, Pediatrics and Intensive care unit. The study also recorded the year of experience and found that 83% residents had less than 3 years experience.

The prevalence of violence against doctors in the present study was come out to be 75.6% (197/300). Ori J et al conducted a similar study in Manipur where they reported the same prevalence of workplace violence against post graduate students as in the present study i.e 78.3%. Kapoor M C also reported similar observation that more than 75% of doctors face violence during their practice. Also the Indian Medical Association (IMA) carried out a study, in which they reported that over 75% of doctors have faced some kind of violence in the form of verbal, threats, and/or physical abuse from their patients at their work place. Anand T also reported that verbal abuse (75.4%) was the most common form of violence amongst doctors working in a tertiary care institution. Kumar M et al also consistent with the present study. i.e 87.32% of the incidents were of verbal violence among residents. Some international studies also agreed with our study that verbal abuse was common form of violence among doctors.

Our study took the suggestions from residents to prevent these violences and found that all doctors suggested that strict legal steps should be taken by government. 83.5% of resident felt that doctors should not be overburden with work and 78% doctors suggested that valid consent should be taken before treatment. Majority (95%) of doctors said that there should be installation of CCTV cameras in institution, 81% doctors suggested that entry of patient’s relative or friend in the hospital should be restricted i.e with the patients only one attendant should be allowed in accident and emergency unit or in OPD. 190 doctors said that there should be proper security system and 79% of doctors suggested that there should one counselor in each unit for proper counseling of patients. Nagpal N in his study suggested that legal steps needed to be taken by the government, valid and informed consent should be taken before starting the treatment, there should be proper documentation of the patient’s course in hospital.

In the present study, the association between gender and type of violence was found out to be statistically significant (p<0.001). Also, association between gender and year of experience of working also come out to be statistically significant (p<0.05). This could be because of the fact that the doctors having less experience are unable to handle certain situations and patients tend to look down on them. Some of studies have also gave same opinion.

In the current study, majority of doctors didn’t know the doctor protection law and only 8.5% doctors who faced the violence didn’t lodge the First Information Report (FIR) in police station. This highlights the need to encourage reporting of violence among afflicted workers not only in police station but also to the higher authorities of institution and to develop institutional mechanisms for speedy measures to avoid such events.

In the present study, maximum violence occurred in accident and emergency unit and the relationship between gender and place of violence among residents was found statistically significant (p<0.01). Anand T reported similar observations. Few international studies quoted that usually the environment in the accident and emergency department was recognized
as a violent.\textsuperscript{20} Usually in the emergency and accident department, the patients come with critically ill and they are accompanied by relatives who are anxious and stressed. If they feel that the patient was not attended well, they are more prone to aggression and violence. To handle these situation, the treating doctors should talk politely, should explain in simple-to-understand manner, the nature of the illness/injury, all laboratory investigations required, the possible line or course of management and prognosis.

**Conclusion and Recommendations:**

Workplace violence in any form and in any setting is unacceptable. Violences against doctors are increasing day by day in the government hospitals so there is need of hour to bring about changes in legislations of the Indian Penal Code and Criminal Procedure Code, so that these changes can prevent future incidents of violence against doctors. However, to implement this, there is need of coordinated effort by all section of society. The study also recommended that there should be enhanced security system at government hospitals for the delivery of safe, effective and truly universal health care in the long term.

Abstract

HIV and AIDS are a serious challenge for the developing as well as the developed world. The problem of HIV transmission among women still constitutes high figures in world. In 2016, it was estimated that 36.7 million people were infected with HIV/AIDS in the world among which 17.8 million were women. In India the total number of people living with HIV was 21.17 lakhs in 2015 among which children (<15) account for 6.54% while females contributed around one fifth (40.5%) of total HIV infection. Women in India constitutes a very big part around one fifth of total population living with HIV (40.5%). The importance of mass media for health promotion and disease prevention is well known. Among the total women 92.1% of women have heard the word HIV/AIDS and only 7.9% of women had not. The objective of the study is to assess awareness and knowledge of HIV/AIDS and to examine the associations of exposure to mass media with awareness and comprehensive knowledge of HIV/AIDS, targeting ever-married women in India who are considered as a potentially high risk group. Our study shows that the women listening to radio have a significant association with the comprehensive knowledge of HIV.

Introduction

HIV and AIDS are a serious challenge for the developing as well as the developed world. The problem of HIV transmission among women still constitutes high figures in world. ¹ In 2016, it was estimated that 36.7 million people were infected with HIV/AIDS in the world among which 17.8 million were women ¹. In India the total number of people living with HIV was 21.17 lakhs in 2015 among which children (<15) account for 6.54% while females contributed around one fifth (40.5%) of total HIV infection².

Undivided Andhra Pradesh and Telangana have the highest number of people living with HIV (3.95 lakhs) followed by Maharashtra (3.01 lakh), Karnataka (1.99 lakh), Gujarat (1.66 lakh), Bihar (1.51 lakh) and Uttar Pradesh (1.50 lakhs). These seven states accounts for two third (64.4%) of total people living with HIV. Rajasthan (1.03 lakhs) Tamil Nadu (1.43 lakhs) and West Bengal (1.29 lakhs) states with estimated people living with HIV number of 1 lakhs or more. There are various stigma and discrimination related with HIV that plays as barrier in effective fighting with HIV/AIDS epidemic. Due to these stigma and discrimination people with HIV are shunned by the family and the community. Stigmatization make people hesitate for getting tested, therefore most of the people are unaware of their status and they are making other infected. Education and knowledge of HIV/AIDS plays a very important role in for the prevention of HIV. There are several reasons for the stigma towards people living with HIV among the general population specially youth living in rural areas don’t have adequate and sufficient knowledge of about modes of transmission of HIV due to cultural or religious beliefs or lack of education³.
Women in India constitute a very big part around one-fifth of the total population living with HIV (40.5%). The importance of mass media for health promotion and disease prevention is well known. Routine exposure and strategic use of mass media play a vital role in promoting awareness, increasing knowledge and changing health behaviors.\textsuperscript{15-17} Mass media channels, radio, television, and newspapers, for example, have been suggested to be vital sources of information about HIV/AIDS for ordinary people\textsuperscript{4-6}.

1 Senior specialist coder, Logix health solutions pvt, Bangalore, India

2 Research Scholar, Department of community medicine, Institute of medical sciences, Banaras Hindu University, India

So there is an immense need of assessing the awareness of HIV among women in India and examine the association of exposure to mass media. Therefore, this study aimed to assess awareness and knowledge of HIV/AIDS and to examine the associations of exposure to mass media with awareness and comprehensive knowledge of HIV/AIDS, targeting ever-married women in India who are considered as a potentially high-risk group.

**Material and Method**

This study was based on the secondary data obtained from National Health and Family Welfare (NFHS-4) conducted in 2015-2016. This survey collected demographic, socioeconomic, and behavioral data, as well as blood samples for HIV testing from nationally representative samples of adult women and men. The NFHS-4 was conducted by IIPS (International Institute of Population Studies).

**Dependent Variable**

The study consists of two types of dependent variable. These variables were assessed by a series of question which were designed to evaluate awareness and knowledge. Awareness of HIV/AIDS was based on the question, “Have you ever heard of HIV/AIDS?” Knowledge of HIV/AIDS was measured with a series of eleven questions asking whether each of the given statements were true. These questions were given only to those who had heard of HIV/AIDS. The statements were: 1) the risk of HIV transmission can be reduced by having sex with only one uninfected partner, who has no other partners; 2) a person can reduce the risk of getting HIV by using a condom every time they have sex; 3) a healthy-looking person can have HIV; 4) a person can get HIV from mosquito bites; 5) a person can get HIV by sharing food with someone who is infected; 6) a person can get HIV by an unsterilized needle/syringe; 7) a person can get HIV by unsafe blood transfusion; 8) HIV can be transmitted from mother to child during pregnancy; 9) HIV can be transmitted from mother to child during delivery; and 10) HIV can be transmitted from mother to child during breastfeeding. Because the first five questions were used for Millennium Developing Goals Indicator 6.3 (percentage of women aged 15–24 years with comprehensive knowledge of HIV/AIDS), “comprehensive knowledge of HIV/AIDS” in this study was also defined as correctly answering all five of these questions.

**Independent Variable**

The NFHS questionnaire included questions on the frequency of media usage, such as television, radio, and newspapers/magazines, using three categories; “not at all”, “less than once a week” and “at least once a week”.

**Statistical Analysis**

Descriptive statistics of the socio demographic characteristic of the respondent by awareness of HIV/AIDS are summarized. Logistic regression analyses were performed to estimate odds ratios (ORs) of awareness or comprehensive knowledge and 95% confidence intervals (CIs) adjusted by respondent’s age, education, current marital status, and household’s wealth index. A P-value of less than 0.05 was considered statistically significant.

**Result and Discussion**

Most of the female were married (69.5%). About 18.3% of women had no education at all. The highest numbers of female were from Uttar Pradesh (10.1%). Women with higher education has highest awareness as compared to other. Television was found to be the most famous medium among all 66.8% of women watched television almost every day and 6.8% at less than week (Table 2). Women with least exposure to media was radio 5.4% of women listen to radio almost every day. Among 10 statement related question about knowledge of HIV/AIDS the proportion for correct answer was highest for People can get HIV/AIDS from blood products or
blood transfusions (81.9%) and lowest for Can get HIV by sharing food with person who has AIDS (61.2%) as shown in Table 3. Awareness of HIV/AIDS was significantly associated with exposure to each of three forms of media (radio, newspaper, and television), as well as with exposure to any type of media when they were combined together (Table 4).

Adjusted OR of awareness of HIV/AIDS was significant for the media exposure as compared to not at all except at least once a week in radio and less than once a week in Television compared to not at all. Table 5 shows the odd ratio of comprehensive knowledge of HIV/AIDS. The associations between comprehensive knowledge and exposure to newspaper, television or radio for the entire category were significant. Those who were exposed radio for less than once a week, at least than once a week, almost every week showed a significantly high OR of comprehensive knowledge as compared to not at all.

By using national representative data, the least awareness was found among all the state was in Chandigarh and Daman and Diu. In our study it was found the married women has a higher awareness of HIV. It was also find that knowledge of all ten questions was quite high among all the women. In our study significant association was found among comprehensive knowledge and all media exposure. Among the total women 92.1% of women have heard the word HIV/AIDS and only 7.9% of women had not. This shows that awareness of HIV among women is quite high in India. Our study shows that the women listening to radio have a significant association with the comprehensive knowledge of HIV. So to reduce the risk and transmission of HIV more knowledge should be given through radio to the women in India. Our study also shows the awareness of HIV was low among the Women with no education so it is very important for the government to take concern on education for minimizing the risk of transmission of HIV.

A Study to Assess the Effectiveness of Cognitive Stimulation Therapy with Reference to Cognitive Level among Patient with Dementia in Selected Rehabilitation Center of Pune District

Nirmala Gurung1, Sheela Upendra2
1Second Year MSC Nursing, 2Associate Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Introduction: Cognitive impairment and dementia are increasing globally and are predicted to rise more in developing regions. It is very important to know that every individuals are born with a different cognitive but many of patient with dementia develop cognitive impairment as disease progress, but to improve the cognitive level to its maximum capacity depends on their involvement in different cognitive stimulation activities. Cognitive stimulation is an involvement of group in different activities and discussions aiming at improving the functioning. Objectives: To evaluate the pre- interventional cognitive level of the Patient With Dementia, To evaluate the effectiveness of cognitive stimulation therapy in Patient With Dementia in selected rehabilitation center, To find the association between the cognitive level of the Patient With Dementia and the selected demographic variables. Materials And Method: Quasi experimental, non randomized control design was conducted on 50 patient with dementia who met the inclusion criteria, by using non-Probabilility purposive sampling. In pretest cognitive level was assessed with the help of standardized Montreal Cognitive Assessment scale followed by Cognitive stimulation therapy which included the 14 sessions of various activities in a period of 4 week was given. On 7th day after intervention post-test was conducted using the same tool by the investigators. Result: Paired t-test used and was found to be 3.82 with 49 degrees of freedom at this 0.05 level which is more than the table value and also the corresponding p-value was small (less than 0.05), hence the null hypothesis is rejected. Cognitive stimulation therapy was found to be effective in patient with dementia. Family history and the duration of illness were found to have significant association with cognitive level of patient with dementia. Conclusion: This study suggests that the cognitive stimulation therapy is helpful in improving the cognitive level of the patient with dementia.

Keywords: Cognitive Level; Dementia; Cognitive Stimulation Therapy; Effectiveness

Introduction

Dementia is an acquired disabling syndrome characterized by progressive deterioration in multiple cognitive domains its severe enough to interfere with daily functioning. Alzheimer’s disease (AD) is the most common cause of dementia, but increasing evidence from population-based neuropathological and neuroimaging studies shows that mixed brain pathologies especially in very old people.1 In the year 2016 on “Recent global trends in the prevalence and incidence of dementia, and survival with dementia. The aim of the study was to project that there is increasing in number of older people at risk. The result revealed that there was increasing prevalence in East Asia.2

Prevalence and incidence of dementia rising with advancing age, and 70% of all dementia cases occur in people who are above at least 75 years old.3 The worldwide increase in the number of older adults, more in those who are at least 80 years old. Because dementia is a one of the prevalent cause of disability and hospitalization of older people, the increased prevalence of this syndrome places more tedious pressures on health-care systems and society. The World Alzheimer Report estimates that, in 2010, there was 35.6 million whereas it is estimated to increase upto 65.7 million by 2030 and 115.4 million by 2050 in worldwide if the
effective measures are not taken.

Cognitive stimulation therapy is important for stimulating the mind, the group sessions offer an opportunity to share experiences and talk with other people with dementia in a relaxed and supportive and cooperative environment. They join in the different activities and conversations this helps them to build self-esteem and confident. Research has shown that CST offers value for money (we call this cost-effective). It has significant benefits to the thinking and memory skills of the people who take part in it. It is very important to bear in our minds that all individuals are born with a phenomenal cognitive but many of dementia patient develop cognitive impairment as disease progress, but to use the cognitive level to its maximum potential depends on their involvement in different cognitive stimulation activities.

Need of the study: A study conducted by Martin Prince et al. in the year 2016 on "Recent global trends in the prevalence and incidence of dementia, and survival with dementia. The aim of the study was to project that there is increasing in number of older people at risk. The result revealed that there was increasing prevalence in East Asia along with worsening cardiovascular disease."

Cognitive Stimulation (CS) has been adapted from rehabilitation programs with individuals with head trauma, stroke, and other neurological disorders, and applied to older adults with dementia. Its aim is on individuals with mild to moderate dementia to improve memory, attention, and general cognitive function. This includes a variety of cognitive training strategies, including specific memory training, general problem solving, multisensory stimulation, word games and puzzles, social activities, and/or use of notebooks or calendars. Hypothesis: H₀ - There is no significance difference in the cognitive level of patient with dementia after the cognitive stimulation therapy.

Operational definition: Effectiveness-It refers to the capacity to produce desired effect of cognitive stimulation therapy in enhancing the cognition of patient with dementia at the rehabilitation center. Cognitive level- "The Cognitive level of the patient with dementia before and after the cognitive stimulation therapy. Cognitive stimulation therapy-Therapy used to stimulate cognitive level among people with mild to moderate dementia through a series of 14 themed activities in 4 weeks, designed to help them to continue to learn and stay engaged. Patient With Dementia - Those patients who are suffering from the dementia and are in mild to moderate state. Rehabilitation center- "The availability of the dementia patient in selected Rehabilitation center, Pune."

Materials and Method

A quantitative, quasi experimental, Non Randomized Control Design was used. In this study dependent variable was the cognitive level of Patient With Dementia and Independent variable was Cognitive Stimulation Therapy. The sample chosen for the present study was 50 patient with dementia by using non-probability, purposive sampling technique which filled in the inclusion criteria and were selected from Rehabilitation center, Pune. The tool used for this study was demographic data (age group, religion, occupational status before illness, socio-economic status, family history of dementia, duration of illness, type of dementia and gender) and the Montreal cognitive assessment tool (visuospatial, naming, attention, language, abstraction, delayed recall and orientation).

Inclusion criteria:

Dementia with a diagnosis of mild to moderate dementia (Montreal Cognitive Assessment score of 10 or more).

Dementia person can have a 'meaningful' conversation.

Dementia person's vision is good enough to see pictures.

Dementia person is likely to remain in a session for 45 minutes

The study includes both male and female dementia patient.

The dementia patient who able to understand, speaks (Hindi, Marathi & English) and cooperate.

Exclusion criteria:

Those within the past 6 weeks who have had a recent acute medical illness such as stroke or heart attack.

Patient who was not present at the time of data collection.
Data Collection: A formal letter seeking approval to conduct the main study was taken. The data collection was carried out from 10/3/18 to 7/4/18 through purposive sampling technique was adopted to grab a sample size of 50. A systematic plan was prepared for the study and efforts were made to stick to the planned schedule. The group were divided into experimental (25) and control(25) followed by pretest. The experimental Group received a cognitive stimulation therapy whereas control group received as usual treatment. Posttest conducted after 7 days i.e on 14/4/18.

Researchers applied Fisher’s exact test for association of cognitive level of dementia patient with their demographic variables. Since p-value corresponding to family history of dementia and duration of illness is small (less than 0.05), family history and the duration of illness was found to have significant association with cognitive level of patient with dementia.

**Conclusion**

Cognitive Stimulation Therapy given to the experimental group found to be effective and play pivotal role in improving the cognitive level in dementia patient, while comparing with the control group. The health care professionals should know that there is a hope in dementia care and that there is something that can be done to improve their condition, As the improvement in cognition is directly proportional to the improvement in quality of life, self-care daily activities and depression. This study suggest that the cognitive stimulation therapy can be extended and prolonged for a longer period of time independently of the dementia, as it will result in slow down the dementia process.

Assessment of Drug Adherence and Prescription Pattern of Hypertensive Patient’s in a Rural Community of Ludhiana

Rohit David¹, Daneshwar Singh², Shavinder Singh³

¹Assistant Professor, Department of Community Medicine, Government Medical College and Hospital, Rajnandgaon, Chhattishgarh, ²Assistant Professor, ³Professor and Head, Department of Community Medicine, Christian Medical College Ludhiana

Abstract

Background: Hypertension is inadequately controlled in most patients due to poor treatment adherence. Not much is known about the anti hypertensive drug prescription pattern in rural areas. Objectives: The present study was conducted to assess the drug adherence and prescribing patterns of antihypertensive in hypertensive patients and adherence of prescribing pattern with existing guidelines. Materials and Method: The cross sectional study was conducted in the rural field practice area of Community Medicine department of Christian Medical College, over a period of one year. A house to house survey of 214 diagnosed hypertensive patients was conducted using a predesigned pretested structured questionnaire. After completing the interview, two blood pressure readings were recorded in sitting position in the right arm using an electronic BP monitoring device. Treatment adherence was assessed using Morisky Green Levine Scale. The data was entered and analyzed using Microsoft Excel 2010 and Epi Info 7.14. Results: Only 4.7% of respondents achieved blood pressure control with treatment. Respondents on monotherapy had higher treatment adherence than those on combination therapy. Keywords: Adherence, Hypertension, Prescription Pattern

Introduction

Hypertension is a chronic condition of concern due to its role in the causation of coronary heart disease, stroke and other vascular complications. It is the commonest cardiovascular disorder, posing a major public health challenge to population in socio-economic and epidemiological transition. It is one of the major risk factors for cardiovascular mortality, which accounts for 20-50 percent of all deaths. Although blood pressure is easily measured, it had taken several decades to realize that arterial hypertension is a frequent, worldwide health disorder. High blood pressure is one of the most common – and manageable – risks for disabling and life-threatening strokes and other cardiovascular events. While relatively easy to detect and manage, high blood pressure is largely an invisible and neglected condition in low-resource settings, creating substantial disability and premature mortality. It is estimated that more than one billion adults are hypertensive worldwide and this figure is projected to increase to 1.56 billion by the year 2025, which is an increase of 60 % from 2000. A whopping 9.4 million deaths occur worldwide every year because of hypertension, with it being responsible for about 50 % of mortality due to heart disease and stroke. Epidemiological studies demonstrated that prevalence of hypertension is increasing rapidly in India, varying from 4 to 15 % in urban and 2-8 % in rural population. Lowering of systolic blood pressure by 10-12 mm Hg and diastolic blood pressure by 5-6 mm Hg confers relative risk reductions of 35-40% for stroke and 12-16% for coronary heart disease within 5 years of initiating treatment. The choice of an antihypertensive drug is based on efficacy, side-effects, effects on other systems and cost. Accordingly, there is a need to contemplate the exemplar of usage of antihypertensive drugs, to see if the current usage is rational and in concordance with current guidelines for treatment of hypertension. Studying the prescribing patterns is that part of a medical audit which seeks monitoring, evaluating and if necessary, suggesting necessary modifications to the prescribers to achieve rational and cost effective medical care.
Changes over time in terms of recommended guidelines and innovation in drug formulations have resulted in modification to the prescription patterns of antihypertensive drugs. This kind of study highlights the gaps and help in improving the patient health care further. Thus, this study was conducted to assess the drug adherence and prescribing patterns of antihypertensive in hypertensive patients and adherence of prescribing pattern with existing guidelines.

**Materials and Method**

This was a community based Cross Sectional Study conducted in the field practice area of Community Medicine Department, CMC, Ludhiana, Punjab. This was a questionnaire based assessment.

**Study Population:** The study population consisted of all hypertensive patients residing in the in the field practice area of Community Medicine Department, CMC, Ludhiana, Punjab.

**Study Period:** Study was undertaken from the month of August 2015 to October 2015 for a period of three months.

**Inclusion Criteria:** All patients of either sex with primary essential hypertensive patients diagnosed as per Joint National Committee-VII (JNC-VII) guidelines and those receiving or prescribed with antihypertensive drugs in the above time period were included.

**Exclusion Criteria:** Patients below the age of 18 years, female who were pregnant, those who were absent on the day of visit and all those not unwilling to participate in the study are excluded from the study.

**Sample Size and Sampling Technique:** Sample size was calculated with an estimated prevalence of 30%, precision of 6%, and confidence interval of 95%. Prescriptions of 214 patients aged more than 18 years (Mean: 52.6 ±14.6) with a male to female ratio of 1:1.2 were selected by simple random sampling technique using table of random numbers. Approval was taken from the Institutional Ethics Committee prior to the commencement of the study (Ref. No. BFUHS/2K13/P-Th/9868).

**Study tool:** A semi-structured self-administrative pre tested questionnaire was developed with the aid of a WHO tool – “How to investigate drug use in health facilities” and Morisky Green Levine medication adherence scale for data collection to fully meet the demands of this research. Reliability is ensured by justification of approaches within the context of study that it is a time-bound applied research. The questionnaire used was pretested and checked for face validity. No major changes were made after the pretest.

**Measures:** Systolic and diastolic blood pressure (SBP & DBP) was measured twice at an interval of 3 min in the sitting position after a 15 min rest, and the mean was taken. Stage of hypertension at diagnosis was according to the JNC 7 classification. Patients with systolic blood pressure of 140–159 mmHg or diastolic 90–99 mmHg were classified as stage 1 while patients with systolic blood pressure of ≥ 160 mmHg or diastolic ≥ 100 mmHg were classified as having stage 2 hypertension. The primary outcomes used was the achievement rates of target blood pressure (i.e BP < 140/90 mmHg or < 130/80 mm Hg for diabetics). Persistence with therapy according to the International Society for Pharmacoeconomics & Outcomes research was defined as the continuing use in time of the prescribed therapy. This was recorded as documented from patient’s history in the prescription. The scheduled clinic visits were assessed. Blood pressure control was defined as the maintenance of blood pressures values less than 140/90 mm Hg during at least two successive appointments. Adherence to drug regimen was assessed using patient’s prescriptions. Drug adherence was assessed according to Morisky Green Levine medication adherence scale.

**Data Collection and Procedure:** Data were collected by household survey of diagnosed hypertensive patients enrolled in departmental disease registry. After obtaining their informed consent the participants were interviewed using the basic parameters stipulated in our questionnaire. We enquired about the available prescription at that time of visit, history of visiting a health facility in the catchment area and relevant data was collected.

**Statistical analyses:** Data obtained were collated and analyzed statistically by Microsoft Excel 2010 and Epi Info 7.14 for various parameters relating to prescription pattern. Each completed questionnaire was coded on pre-arranged coding to minimize errors.

Discussion

The study included respondents above 18 years of age (mean 52.6 +/- 14.6) residing in the field practice area of Christian Medical College Ludhiana Punjab. The study included 214 respondents with a gender distribution of 67.3% Females and 32.7% Males. In Bangalore 45.3% and 54.6% male were studied by Rachana et al.(18). So according to the present study, majority of respondents were above 60 years. Similar to a study conducted by Abegaz et al(20) where majority of respondents(25.5%) were between 51 to 60 years.

The study also showed that only 4.7% of respondents had achieved normal blood pressure, even with treatment. And majority of respondents were in stage 1 hypertension. As seen here that only medications do not control hypertension, other factors like periodic follow up and proper lifestyle modifications are a must. Most of the study conducted on hypertension treatment also showed that majority of respondents were in stage 1 hypertension(19). Most commonly used anti hypertension drug group (41.1%) were found to be Calcium Channel Blockers (CCB). CCB are not only effective in controlling Blood Pressure, but are also comparatively cheaper than most other anti hypertension medications, thus promoting better adherence. Where Rakesh et al(19) found that CCB were the most common used monotherapy for hypertension treatment. Also in a study conducted on drug utilization, it was concluded that CCB comes under the most commonly prescribed drug group by S.Datta(21). The statement are contradictory to the guidelines for Hypertension control presented in JNC 7 criteria, where diuretics were advised for stage 1 hypertension(22) before trying other groups, which is not followed by many treating physician till date.

In our study it was seen that majority of respondents were on monotherapy (51.4%). And most of the respondents in stage 1 hypertension were prescribed monotherapy, which is in accordance to JNC 7 treatment guidelines for stage 1 hypertension. Rachana et al (18) also concluded in her study that majority of respondents were in Stage 1 hypertension and monotherapy(48.9%) treatment. The study conducted by Xu et al(23) in China, it was found that majority of physician prescribed monotherapy for blood pressure control instead of polytherapy.

It was seen in the study that 53.5% respondents had low treatment adherence. More emphasis should be laid by treating physician to educate for life style modification along with treatment, as only by promoting high adherence along with risk factor modifications will lead to better blood pressure control. In the study of Rakesh et al(19), it was seen that adherence rates were
higher with monotherapy with polytherapy, and higher adherence rates were seen in stage 1 hypertension then in stage 2 hypertension. Similar findings were confirmed by our study, which showed that higher treatment adherence was seen in monotherapy than with combination therapy, and this association was found to be statistically significant.

**Summary**

The present study of Assessment of Drug adherence and Prescription Pattern of hypertensive patients, is based on a house to house survey of diagnosed hypertensive patients in the field practice area of Christian Medical College, Ludhiana. Most of the respondents of the study were above 60 years (44.4%) and females (67.3%). It was seen in the study that only 4.7% of respondents had achieved normal blood pressure and most of them were still in stage 1 hypertension. The majority of respondents were prescribed anti hypertensive drug class was CCB (41.1%). Most of the respondents were on monotherapy.

In the study it was seen that 53.3% had low treatment adherence according to morisky green adherence scale. It was also seen that respondents on monotherapy showed higher treatment adherence than with combination therapy, and this association was found to be statistically significant.

**Conclusion**

The results suggest that the rural population of Ludhiana has a large number of uncontrolled hypertensive patients, most of whom have low treatment adherence. The study concluded that the recommended prescription pattern, as according to JNC 7 were not practiced in the rural community by the prescribing physicians, one of the factors leading to low treatment adherence and uncontrolled hypertension. Hence steps must be taken to educate the prescribing physicians along with the patients on recommended treatment guidelines for hypertension. And also emphasis should be put on regular follow up, health education and life style modification to effectively treat this non communicable disease leading to further improvement its treatment adherence.

**Limitation of Study:** The study was conducted in the morning hours, thus most of the working males could not be contacted leading to more females than males in the study.

**Strength of the Study:** Christian Medical College Ludhiana maintains a detailed registry of hypertensive patients in its field practice area, so most of the hypertensive patients could be contracted through it. Morisky Green Levine treatment adherence scale, used in the study, is a standardized scale for measuring drug adherence.

Biomass Energy: Prospects and Problems

M Ramesh¹, S Saravanan¹, S N Sugumar², S Chandrachud³

¹Assistant Professor; ²Professor and Head, ³Associate Professor, Dept. of Economics, VISTAS

Abstract

Biomass energy consumption is very significant almost in all the countries. In India, 80 percent of the households depend on firewood and cow dung cakes for the cooking needs. Biomass energy can be tapped throughout the year through agricultural waste, human and animal waste. The better utilization of biomass would be the best alternative to the fast depleted fossil fuels like petrol, coal and natural gas. Electricity through biomass gasifier emits less CO₂ compared to the coal based electricity plants. The methane is generated from bio waste through land fill method and the methane gas is utilized like Liquefied Petroleum Gas. Hence, biomass energy has the features of environmental friendly, social acceptability and sustainability in its uses. Bio energy crops are widespread, although the availability of land for expansion is a question.

Keywords: Biomass, Fossil fuel, Green energy, Biomass Gasifier, Ethanol.

Introduction

Biomass is a term which is used to describe material of recent biological origin that can be used either as a source of energy or for its chemical components. It consists of trees, crop algae and other plants as well as agricultural and forest residues. It also consists of many materials including food and drink manufacturing effluents, manures, industrial by-products and household wastes. At present, in the global scenario biomass contributes 14 per cent of the world energy and 38 percent to the developing countries. (Wood and Hall, 1994). The substantial use of biomass energy in the developing countries especially in the rural areas helps to meet out the energy crisis.

Biomass energy is one of the green energy items and it plays a vital role around the globe. Non-renewable items like oil, coal and natural gas are getting depleted very fast in recent years. Besides, the use of fossil fuel emits more pollution. Environmental degradation such as global warming, ozone depletion and acid rain etc., arises due to the pollutant air.

Hence, the world is giving importance to biomass. Solar, Tidal and wind energy are highly renewable sources. Biomass meets the cooking energy needs of most of the rural households and half of the urban households. Despite it is the commercial energy in India, biomass continues to dominate energy supply especially in rural areas. It is estimated that the share of biomass in total energy in India vary from nearly a third (36 per cent) to half (46 per cent) of total energy.¹ In this backdrop this article tries to trace the importance of biomass energy, biomass energy potential in various states, problems in its utilization and environmental impacts.

Importance of Biomass Utilization

Fossil fuels emit more CO₂ and it is the main reason for global warming and acid rain. Eventually, all the countries are taking many initiatives to check the climate change. Renewable energy source such as solar, wind, tidal and geo-thermal do not emit Green House gasses. Electricity through biomass gasifier emits less CO₂ compared to the coal based electricity plants². The methane is generated from bio waste through land fill method and the methane gas is utilized like Liquefied Petroleum Gas. Hence, biomass energy has the features of environmental friendly, social acceptability and sustainability in its uses.

The comparative position of the biomass potential as assessed by MNRE and the State Nodal Agencies (SNAs) is given in Table 1.

Analysis of the data in the table 1 brings out that there were variations in the biomass potential assessed by MNRE and the SNAs in the 16 states that undertook such study. Eight SNAs had not done any potential assessment; significant among them was the SNA of
Madhya Pradesh, which ranked sixth in terms of potential assessed by MNRE.

**Source:** Ministry of New and Renewable Energy and State Nodal Agencies, 2017

**Problems in the Utilization of Biomass**

There are no proper markets is the most important issue for biomass in India. Owing to the non-availability of markets, ensuring reliable and enhanced biomass supply and technologies at competitive cost is inconsistent. The most economical option is to focus on better utilization of biomass waste through improved collection of agro residues and dung, better utilization of waste from sugar mills especially the molasses which can be converted into ethanol.

In India Kerosene is the substitute commercial fuel for biomass in the domestic cooking sector. The biomass competes with kerosene in domestic use. In commercial energy market. The price of biomass in the market is equal to the price of kerosene and diesel as kerosene and...
diesel are getting subsidies. The kerosene is subsidized to the tune of 60 per cent and due to these reasons the biomass products are not able to get the economic prices in the commercial energy market in India.

The people’s awareness on biomass utilization also less in developing countries compared to developed countries. Awareness campaign may be given to the people, especially to the rural masses about the potential, value and environmental concerns over the biomass energy utilization. The Ministry of New and Renewable Energy (MNRE) may take more initiative with the collaboration of ministry of agricultural for the better utilization of biomass energy in India.

**Environmental Impacts of Biomass Energy**

Biomass energy system is not free from environmental issues that must be addressed. Biomass energy projects has issues such as air pollution, impact on forests and impact due to crop cultivation, these issues must be addressed in the environmental point of view Other non-renewable energy sources caused more net contribution of carbon dioxide. But the biomass energy can be produced and consumed in a sustainable manner. The burning of fossil fuels result in more carbon, that carbon is stored underground for years, this leads to atmospheric greenhouse gases. Hence, if we use biomass wisely, it can have environmental advantages over the use of fossil fuels. An appropriate level of biomass energy use can have less environmental impacts than our current means of energy production.

**Conclusion**

Biomass energy consumption is very significant almost in all the countries. In India, 80 percent of the households depend on firewood and cow dung cakes for the cooking needs. Biomass energy can be tapped throughout the year through agricultural waste, human and animal waste. The better utilization of biomass would be the best alternative to the fast depleted fossil fuels like petrol, coal and natural gas. The main problem for the biomass energy is the non-availability of regular markets. If the local bodies take initiatives with the help of central and state governments for the better trading and utilization, biomass energy would do many wonders and boost the rural economy.

Assess Knowledge and Practice Regarding Partograph among Staff Nurses: Pre experimental Study

Shalu Sharma¹, Akoijam Mamata Devi²

¹Lecturer, Faculty of Nursing, SGT University, Gurugram, Haryana, ²Professor, HOD of Obstetric & Gynecological Nursing, Faculty of Nursing, SGT University, Gurugram, Haryana

Abstract

Background: Inadequate care during labor results in threats to the life of the mother and fetus. In order to prevent complications during labor and for a better outcome, it is essential to follow the simple and effective tool such as a Partograph, by the health care providers with an adequate knowledge and skill. Partograph represent graphical record of cervical dilation during labor.

Design: Pre experimental one group pre test post test design was used to assess the Effectiveness of Self Instructional Module (SIM) on Knowledge and Practice regarding Partograph. Convenient sampling techniques were used to select sample. Informed written consent was taken from each Staff Nurses. A structured questionnaire and checklist were used to assess the knowledge and practice.

Result: The findings of the study revealed that pre test knowledge 70% had inadequate, 30% had moderate knowledge and pre test practice 65% had poor 35% had average practice regarding partograph among staff nurse. Post test knowledge 67% had adequate knowledge, 33% had moderate knowledge and post test practice 78% good practice, 22% had average practice regarding partograph among staff nurse. Knowledge was significantly associated with educational qualification 0.016 at significance of p<0.05 level. There is no association was found between knowledge and other demographic variables like age, total working experience, experience in maternity unit, work place and attend any in-service education on monitoring labor process. In practice, experience in maternity unit was significant 0.045 at p<0.05 level and attend any in-services education on monitoring labor was 0.021at p< 0.05 level. No association found between practice and other demographic variables like age, education qualification, total working experience, work place etc.

Conclusion: Self instructional module will be effective in improving knowledge and practice regarding partograph among staff nurses in recognized hospitals at Gurugram.

Keyword: Labor, physiologic process, complications, Partograph, cervical dilation.

Introduction

A partograph is one of the valuable appropriate technologies in use for improved monitoring of labor progress, maternal and fetal wellbeing. It is an important tool for managing labor. This is through enabling clinicians (midwives and doctors) to plot examination findings from their assessments on the partograph. The belief that its use was applicable in developed and developing settings led to its introduction worldwide. A number of common partograph designs incorporate an alert and action line. The development of the partograph provided health professionals with a pictorial overview of labor progress, maternal and fetal condition to allow early identification and diagnosis of pathological labor. Its use is critical in preventing maternal and perinatal morbidity and mortality.

Globally, there were an estimated number of 287,000 maternal deaths or a maternal mortality ratio (MMR) of...
210 maternal deaths per 100,000 live births in the year 2014. The estimated total number of 287,000 maternal deaths\(^4\).

Worldwide, 85% (245,000) of the majority of maternal deaths and complications attributable to obstructed and prolonged labor could be prevented by cost-effective and affordable health interventions like the use of partograph\(^5\).

Therefore the partograph should be used for all women admitted in established labor. The partograph serves as an “early warning system” and assists in early decision on transfer, augmentation and termination of labor. It also increases the quality and regularity of all observations on the fetus and the mother in labor and aids early recognition of problems with either. Prolonged labor in the developing world is commonly due to cephalo-pelvic disproportion which may result in obstructed labor, maternal dehydration, exhaustion, uterine rupture and vesico-vaginal fistula\(^6\).

**Methodology**

**Research design:**

One group pre test post test experimental group design was adopted to accomplish the main objective of the study i.e, to assess the effectiveness of the SIM on knowledge and practice regarding partograph.

**Selection of field for study:**

The study was conducted on staff nurses working in maternity unit in recognized hospital. The investigator had selected 13 staff nurses from SGT hospital, 16 staff nurses selected from Civil hospital, 14 staff nurses selected from E.S.I.C Hospital, 08 staff nurses selected from Sunrise Hospital Gurugram and 09 staff nurses, were selected from Columbia Asia Hospital, Gurugram who all are working in maternity units. The rational for selecting the samples from these recognized hospitals was the researcher familiarity with setting area, availability of the subjects and feasibility of conducting the study.

**Hypotheses**

**H1:** There will be significant difference in pre test and post test knowledge regarding partograph among staff nurses in recognized hospitals at Gurugram.

**H2:** There will be significant difference in pre test and post test practice regarding partograph among staff nurses in recognized hospitals at Gurugram.

**H3:** There will be significant association between the post test knowledge, and practice regarding partograph among staff nurses with their selected demographic variables.

**Sample and sampling technique:**

The sample size for the final study consists of 60 Staff Nurses working in maternity unit in recognized hospitals. Convenient sampling technique was used to select the sample. The rational was the number of staff nurses working in maternity units was limited.

**Variables under study:**

**Independent variable:** Independent variable was Self instructional module regarding partograph.

**Dependent variable:** Dependent variables are knowledge and practice regarding partograph among Staff Nurses.

**Demographic variables** – Age, professional qualification, total year of experience, total year of experience in maternity unit, work place and attend any previous in-service education in partograph.

**Tools for data collection:**

Section a: Selected demographic variables

Section b: Prepared SIM on partograph

Section c: Structured questionnaire to assess knowledge regarding partograph.

Section d: Checklist to assess expressed practice regarding partograph.

**Description of tool:**

The tool has been developed to assess the effectiveness of self instructional module.

**Section a:** This is prepared to collect the data regarding Age (in years), Educational qualification, Total working experience, Experience in maternity unit, Workplace, Attend any in-service education on monitoring labor process.

**Section b:** self instructional module it is a study material on WHO modified partograph.
Section c: This section deals with structured knowledge questionnaire. It consist 27 questions which was used to assess the level of knowledge regarding partograph among staff nurses in recognized hospitals Gurugram. Each correct response carries one (1) mark, incorrect responses carries zero (0) marks.

Section d: This section deals with a checklist for assessing the expressed practice regarding partograph among staff nurses in recognized hospitals Gurugram. Each ‘YES’ response carries one (1) marks and ‘NO’ carries zero (0) mark.

Results

Major findings:

The analysis of data revealed the following headings:

Age (in years), majority of percentage (53.33%) of staff nurses were in the age group of 20-29 years.

Educational qualification, majority of percentage (53.33%) of staff nurses were in the age group general nursing midwifery (GNM).

Total working experience, majority of percentage (61.66%) of staff nurses were having a experience less than 5 years.

Experience in maternity unit, majority of percentage (48.33%) of staff nurse had a experience in between 1-5 year.

Workplace, majority of percentage (63.33%) of staff nurses were working in private hospitals.

Attend any in-service education on monitoring labor process, majority of percentage (85%) of staff nurses those who are not attended any in service education program.

Association of post test knowledge regarding partograph among staff nurses with selected demograph variables. Educational qualification was found statistically significant at of 0.006 p<0.05.
Association of post test practice regarding partograph among staff nurses with selected demographic variables such as age (in years). Maternity experience was 0.045, attend any in-service education was 0.021 on monitoring labor process was found statistically significant at at p<0.05.

Association of post test knowledge regarding partograph among staff nurses with selected demographic variables such as age (in years), total working experience, and workplace, maternity experience, attend any in-service education on monitoring labor process was not found statistically significant at the level of significance of p<0.05.

Association of post test practice regarding partograph among staff nurses with selected demographic variables such as age (in years), total working experience, and workplace, Educational qualification was not found statistically significant at the level of significance of p<0.05.

Summary

The study was conducted to assess the effectiveness of self instructional module (SIM) on knowledge and practice regarding partograph among staff nurses in recognized hospitals at Gurugram”. Convenient sampling technique was used for selection of samples. Therefore conceptual framework was developed based on Daniel stufflebeam’s evaluation model (CIPP model). The pilot study was conducted during the month of November and December on 09 Staff Nurses were selected in Aarvy hospital Gurugram. This procedure was done to ensure the reliability of tools and feasibility of study. Socio demographic variables like age, Educational qualification, Total working experience, Experience in maternity unit, Workplace, Attended any in –service education on monitoring labor process, Structured questionnaire for knowledge and checklist for practice were used to assess the knowledge and practice regarding partograph. The actual data collection procedure was carried out from December to January. Total sample of 60 Staff Nurses were selected by using convenient sampling technique from recognized hospitals are SGT hospital, Civil hospital, E.S.I.C hospital, Sunrise hospital and Columbia Asia hospital. Before collection of final data were taken informed consent were taken from Staff Nurses. Therefore the data of the final study was collected and analyzed by using descriptive and inferential statistics. Calculation of frequency, percentage, means, standard deviation, chi-square, t-test was done. The data has been represented in the form of tables, bars and pie diagrams. The 70 % Staff nurses had inadequate knowledge 30% had moderate knowledge and 65% had poor practice 35% had a average practice in pre test and 67% staff nurses had adequate knowledge 33% were had moderate knowledge and 78% had good practice 22% had average practice in post test regarding partograph among staff nurses. In this study demographic variables such as educational qualification (GNM) was 0.006 showing association with knowledge score and maternity experience (1-5 year) was 0.45 and attend any in-service education was 0.021 showing association with practice score at the level of significance of p<0.05. The study shows the significant difference with paired’t’ test value for knowledge (19.023) and for practice (23.799) at p<0.05 level of significance. Hence it proven that the research hypothesis was accepted.

Conclusion

The Study concluded that there was a significant difference in knowledge and practice score of staff Nurses before and after administering the self instructional module (SIM) regarding partograph. The association of post test knowledge and practice score regarding partograph among staff nurses with selected demographic variables educational qualification was 0.006, experience in maternity was 0.045, attend any in-service education program was 0.021 found significant at p<0.05 level of significance. It was proven that the effectiveness of self instructional modules was effective for staff nurses regarding partograph.

Ethical Clearance: Research proposal was approved by ethical / DRC committee of Faculty of Nursing, SGT University.

Short Term Effect of Physical Activity on Anxiety and Depression in Adolescents

S Dharmayat¹, S R Murthy²

¹Associate Professor, Department of Community Physiotherapy, ²PG Student Department of Pediatric Physiotherapy, KAHER Institute of Physiotherapy, Belagavi, India

Abstract

Background: Mental health disorders pose an emotional, social, academic burden on the children as well as their parents and families. Non-pharmacological therapy has been proved to be useful in various studies by improving the mental status of the individual. Physical activity is a low risk and high benefit intervention that can be explored in the management for depression and anxiety.

Method: A short-term physical activity programme was given to 70 children (27 males, 43 females) aged 12-16 years who fulfilled the criteria for anxiety and depression on 3 scales: SCARED, CES-DC and RCADS. The physical activity programme was given for 6 sessions over 2 weeks. Pre and post scores of the three scales were noted.

Results: There was a 12.4% reduction in the scores of CES-DC, 13.35% on SCARED and 10% reduction in the scores of RCADS post-intervention. (p<0.05)

Conclusion: There was a significant reduction in the anxiety and depression levels after the physical activity program. Physical activity has a positive effect in reducing depression and anxiety in adolescents.

Keywords: adolescents, anxiety, depression, Physical activity.

Introduction

Mental health disorders pose an emotional, social, academic burden on the children as well as their parents and families. The prevalence of psychiatric disorders was found to be ranging from 6.33% to as far as 46% in school based studies. Studies have shown that 1 in 3 children and/or adolescents may have one or more psychiatric disorder by the age of 16 years.

Depression and anxiety are the most common mental health disorders affecting the adolescents and student population. Clinic based studies reported 1.2% to 9.2% incidence of affect disorders in children amongst which unipolar depression was the most common.

According to WHO, Depression is a common mental disorder that presents with depressed mood, loss of interest or pleasure, decreased energy, feelings of guilt or low self-worth, disturbed sleep or appetite, and poor concentration. Merriam-Webster defines anxiety as an abnormal and overwhelming sense of apprehension and fear often marked by physical signs (such as tension, sweating, and increased pulse rate), by doubt concerning the reality and nature of the threat, and by self-doubt about one’s capacity to cope with it. The signs and symptoms of generalized anxiety disorder according to National Institute of Mental Health are: restlessness or feeling wound-up or on edge, being easily fatigued, difficulty concentrating or having their minds go blank, irritability, muscle tension, difficulty controlling the worry, sleep problems (difficulty falling or staying asleep or restless, unsatisfying sleep).

The risk factors for depression and anxiety in children are gender (females are more prone to develop...
Indian Journal of Public Health Research & Development, August 2019, Vol. 10, No. 8

anxiety), age, temperament, parental factors, cultural factors, toxic environment, negative life experiences/adversities, parental loss, sexual abuse, peer violence, etc. This increases social withdrawal and suicidal tendencies.

Commonly used treatments for mental disorders include psychotherapy and pharmacotherapy for diagnosed cases. But attention is not paid to the subclinical cases which are just falling in the pit of depression and anxiety disorders. Screening at the appropriate time will help us to know the subclinical cases which can be prevented to go into terminal cases. Non-pharmacological therapy has been proved to be useful in various studies by improving the mental status of the individual.

The role of Physiotherapy in mental health is to provide motivation, promote wellness and address associated co-morbidities by designing exercise programs. There is evidence that improving the physical well-being also improves security and self-esteem. Physical activity has shown to provide positive effects in improving mental health but the study designs were poor with long term interventions and there was a need for further research. Hence this study was conducted to observe the short term effects of physical activity on depression and anxiety in adolescents.

OBJECTIVES: To screen for the incidence of depression and anxiety in adolescents.

To find the short term effect of physical activity on depression and anxiety in adolescents.

Methodology

Single group pre-post interventional study. Ethical clearance was obtained by Institutional Ethical Committee. All participants provided an appropriate informed assent/consent.

Participants: Subjects were recruited from various schools of Belagavi city. After obtaining permission from the school authorities, children attending regular school in the age group of 12-16 years were screened for depression and anxiety using the SCARED, CES-DC and RACDS scales. The subjects who scored >15 on CES-DC, >25 on SCARED willing to participate were included in the study.

Children with physical contraindications to exercise, children with diagnosed psychiatric disorders, lack of willingness to exercise and children with recent infections and illness in the past month were excluded from the study.

Procedure

A brief demographic data of the participants such as age, gender, class along their family characteristics was obtained. The participants were given a 2 week physical activity programme for 30 minutes, 3 days/week on alternate days at the same time every session. The physical activity programme was given by a Physiotherapist to a group of 10 children at a time.

Intervention: The exercises were conducted on the school playground. The physical activity protocol included: warm up exercises for the first 5-7 minutes (arm circles, hand slaps, arms overhead, shoulder rotation, trunk side bends, trunk rotations, trunk bends, squats, single leg lunges and trunk forward bends- 5 repetitions each). Physical activity phase was for 30 minutes which included exercises in a progressive manner as: First week- Shuttle run between two cones placed at a distance of 15m - 10 rounds, hopping- 50 hops on each leg, jumping jacks- 20 repetitions, skipping- 50 skips. Second week: Shuttle run between two cones placed at a distance of 15m - 15 rounds, hopping- 50 hops on each leg, jumping jacks- 30 repetitions, skipping- 100 skips. The cool down phase lasted for 5-7 minutes with: light jogging, spot marching, heel raises (5 repetitions), Head tilts (5 repetitions), shoulder shrugs (5 repetitions), breathing exercises, trunk rotations (5 repetitions), ankle movements (5 repetitions).

Screening for depression and anxiety was done by using Screen for Child Anxiety Related Disorders, Center for Epidemiological Studies-Depression scale for Children and Revised Children’s Anxiety and Depression Scale

The CES-DC is an inventory of 20 self-report items regarding depressive symptoms. Each item asks how often a symptom has occurred within the last week. Response choices are assigned point values, which are added together to determine a total measure score. Response choices for each item and their corresponding point values are as follows:0 points: “Not at all”, 1 point: “A little”, 2 points: “Some”, 3 points: “A lot”. A few items are scored in opposite order which reflect positive affect. Scores on the CES-DC range from 0 to
60, in which higher scores suggest a greater presence of depressive symptoms. A score of 15 or higher is interpreted to indicate a risk for depression.

The SCARED consists of 41 items and 5 factors that parallel the DSM-IV classification of anxiety disorders. Response choices for each item and their corresponding point values are as follows: 0 points: “Not True or hardly ever true”, 1 point: “Somewhat true or sometimes true”, 2 points: “Very true or often true”. Interpretation: Total scores of >25 indicate the presence of anxiety disorder.

RCADS is a 47-item, youth self-report questionnaire with subscales including: separation anxiety disorder (SAD), social phobia (SP), generalized anxiety disorder (GAD), panic disorder (PD), obsessive compulsive disorder (OCD), and major depressive disorder (MDD). It also yields a Total Anxiety Scale (sum of the 5 anxiety subscales) and a Total Internalizing Scale (sum of all 6 subscales). Items are rated on a 4-point Likert-scale from 0 (“never”) to 3 (“always”).

Statistical Analysis: Analysis was done using SPSS 21. Normality tests of the change in pre-test and post-test scores was done by Kolmogorov Smirnov test. The data following normal distribution were analysed using dependent-t test. For the data that did not follow normal distribution, Wilcoxon matched paired test was applied. For the difference in scores between gender, ANOVA was used.

Results

Sample characteristics:

70 subjects (22.15%) out of 316 screened were found to have depression and anxiety symptoms. Out of the total sample, 61.43% were females and 38.57% were males (Table 1). 58% of the participants were in the first sibling position in their families. 70% of the participants belonged to a nuclear family.

SCARED-After intervention, there was a reduction in the scores of SCARED with a mean difference of 5.41 points between the pre (mean=40.54) and post (mean=35.13) scores (Table 2). There was a highly significant difference in the anxiety levels of the subjects as indicated by a decrease in scores by 13.35% (p<0.0001).

CES-DC- There was a mean difference of 4.37 points between pre (mean=35.26) and post (mean=30.89). There was a 12.4% of reduction in the scores of CES-DC post physical activity which is highly significant.(p<0.0001)

All the components of RCADS had a significant decrease in the scores post intervention. The MDD (7.16%), GAD (9.45%), OCD (9.14%), PD (9.61%), SAD(7.59%), SP (7.59%) showed highly significant differences post intervention. (p<0.0001)

The total anxiety score reduced by a mean of 7.37 points, with a difference of 10.76% which is highly significant.(p<0.0001) The anxiety depression scores reduced by a difference of 10.19%. (p<0.0001).

There was no difference in the scores between males and females in total anxiety and anxiety-depression scores pre-intervention and post-intervention (p>0.05). (Table 3)

Discussion

Children with depression and anxiety showed a significant reduction in their symptoms after the 2 week physical activity programme. Given that there is a high prevalence of depression and anxiety in adolescent age group, these results are important. The results of the present study are consistent with existing research that physical activity has antidepressant and anxiolytic effects.

The psychological effects of exercise are best seen when the mental health status is poor prior to the exercise, as in case of depression and anxiety. Physical activity has shown to improve the mental status of the children. In our study, after screening, depression and
anxiety was found more in females as compared to males. However, when subjected to physical activity, no gender interactions were seen\textsuperscript{12}.

All subjects completed the 2 week supervised physical activity programme with no absenteeism. Conducting the physical activity sessions during the school time at the playground gave a good compliance. As the intervention was conducted in a playful manner, there was no direct address to their problems which could further worsen the symptoms. In depression and anxiety, social withdrawal is one of the most commonly seen symptoms. A potential impact on the psychological status has been established by group exercises rather than individualized sessions\textsuperscript{19}. Our study intervention was given in supervised group session which also served as a medium to improve their social interactions, which has been proved to have an antidepressant and anxiolytic effect.

A healthy body leads to a healthy mind and vice versa. Physical activity has various physiological effects that also play a role in improving the psychological outcomes of an individual. Higher physical activity levels have shown to reduce the depression and anxiety symptoms\textsuperscript{20}. Good mental health in turn helps to maintain a good physical health which improves the overall performance and quality of life, cutting down on the health-care expenses.

Physical activity can be routinely included in the lifestyle of adolescents which will help to improve their mental health status. This will also prove useful in avoiding complications related to psychological disorders such as lethargy, obesity etc. Further, psychologists and psychiatrists dealing with depression and anxiety should consider physical activity as a part of therapy.

The present study has several limitations. Firstly, other factors that contribute to depression and anxiety were not considered. Secondly, stressors such as an upcoming examination or conflicts were not noted in the study. Pre-menstrual syndrome and the menstruation period was not considered in case of females while assessing for their depression and anxiety symptoms. Finally, a follow up of their mental health status was not taken after intervention. Further research could be done to find gender interactions and follow up effect of physical activity on depression and anxiety.

**Conclusion**

There is a high prevalence of depression and anxiety among adolescents, which has negative consequences on health and functioning. Physical activity plays a significant role in reducing the symptoms of anxiety and depression. There is a positive effect of physical activity on the mental health of the adolescents with anxiety and depression.

Abstract

Introduction: The significance of occlusion and its importance as a causative factor and aggravator of temporomandibular disorders (TMD) is a much debated subject. Objectives: The primary objective of this study was to investigate the association between varying path of closure and TMD. Materials and Method: 90 subjects aged from 12 to 25 year subjects were divided into four groups comprising patients exhibiting forward, backward, lateral and normal path of closure. The Helkimo Anamnestic and Dysfunction Index modified by Athanasiou and Melsen (HI) was used for the clinical evaluation of the temporomandibular joint (TMJ) in order to classify the TMD and the amount of severity. Results: Patients having an altered path of closure of the showed substantially higher scores of Helkimo Anamnestic index. Among the three different subject groups more severe form of TMD were associated with the forward path of closure followed by backward, and then lateral path of closure. Conclusion: Patients having an altered path of closure of the mandible showed increased association with TMD as compared to the patients having the normal path of closure which makes it imperative to evaluate the TMJ in patients with altered path of closure.

Keywords- Malocclusion, Mandible, Temporomandibular Joint Disorders.

Introduction

Temporomandibular disorders (TMD) are “a group of conditions which have many signs and symptoms that affect the temporomandibular joints (TMJ), the muscles of mastication, or both.” TMD is most of the time considered to be a single syndrome, but the current modern view is that TMD is a group of various linked disorders with many similar characteristics. TMD are more usually seen in the adult population and 1/3 of adult population have at least one symptom, which consists of either agony in jawbone or neck, headache and clicking sound or discordance within the joint region. Several theories have suggested that the functional problems and the morphological malocclusion have been related to be the cause of the TMD. Accomplishment of an ideal occlusion through orthodontic therapy or adjustments in the occlusion can help to get rid of the pain and dysfunction, and ordinary working of the masticatory framework relies upon the coordinated functioning of the TMJ. Hidaka, Roth and Corday and others have emphasized on the significance of orthodontists going for functional occlusion where centric relation and centric occlusion correspond.

The significance of occlusion and its importance in the causative factor and aggravation of TMD, compared with other sources, have been dealt in detail but it is still debatable in the present scenario also. Patients who have altered occlusions are thought to have more chances of TMD as compared to those who have a normal occlusion. So, the primary objective of this study was to investigate the association between varying path of closure and
Temporomandibular disorders.

**Materials and Methodology**

The Study was a case-control in vivo study. The sample was decided based on previous data and with the power of sample set at 95% and 95% confidence interval the sample size arrived at was 90. Ethical clearance was taken from the Institutional ethics committee. Patients selected for this study, were then divided into 4 groups as following-1st group comprising patients exhibiting forward path of closure, 2nd group with backward path of closure, 3rd group with lateral path of closure and 4th group with normal path of closure which formed the control group. Study duration extended from January 2015 to December 2016. The present study had the following inclusion and exclusion criteria:

**Inclusion criteria:** No previous history of orthodontic treatment, presence of more than 10 teeth in every arch, no prosthesis to be present in the patient’s mouth and age group from 12 to 25 year.

**Exclusion criteria:** Osteoarthritis of TMJ, Tumors in the temporomandibular joint region, congenital craniofacial syndromes, traumatic injuries of the TMJ, pregnant patients.

At the initial appointment, patients were assessed for the path of closure by the researcher and the co-researcher in order to remove the observer bias all the patients were reassessed by the co examiner. Subjects who met the inclusion criteria were included until a sample of 90 eligible subjects were identified i.e.15 subjects each with Forward path of closure, Backward path of closure and Lateral path of closure, 45 subjects with Normal path of closure. The Helkimo Anamnestic and Dysfunction Index modified by Athanasiou and Melsen (HI) was used for the clinical evaluation of the TMJ, which evaluated the mandibular range of motion, proper functioning of the TMJ, and presence of any joint or muscle pain, in order to classify the temporomandibular joint disorder and the amount of severity. The Helkimo Index modified by Athanasiou and Melsen which was used in our study helped to evaluate the TMJ for:

The mobility of the mandible (Figure a)

i) Normal = 0

ii) Reduced = 1

iii) Severely reduced = 2

The functioning of TMJ (Figure b)

i) Plane movement without sounds and deviations < 2 mm = 0

ii) Sounds in one or both joints and/or deviations > 2 mm = 1

iii) Locking or luxation = 5

Pain in the muscles (Figure c)

i) No pain on palpation = 0

ii) Pain on palpation at one to three sites = 1

iii) Pain at four or more palpation sites = 5

Pain in the TMJ region

i) No pain on palpation = 0

ii) Lateral aspect pain = 1

iii) Distal aspect pain = 5.

The sum of scores was used to evaluate the TMJ function as

Normal TMJ function (score 0),

Moderate TMD (score 1-4)

Severe TMD (score 5-20)

The test results obtained were statistically analyzed using the Statistical Package for Social Sciences (SPSS) version 20. The mean, median and standard deviations of TMD and different path of closure were calculated. The association between TMD and different path of closure were assessed using Kruskal Wallis test and Posthoc Bonferroni’s test. Qualitative analysis was done using the Chi-Square test.

**Results**

Patients having an altered path of closure of the mandible i.e. forward, backward or the lateral path of closure of the mandible showed substantially higher scores of Helkimo Anamnestic index which signifies association of path of closure of the mandible with the TMD. Among the three different subject groups of path of closure of the mandible, more severe form of TMDS were associated with the forward path of closure with a maximum score of 9 and a mean value of 4.3, followed by backward path of closure with the maximum score of 7 and a mean value of 4.0, and then lateral path of closure subjects with a maximum score of 4 and mean value of 1.5 (Table 1). The result (Table 2) shows an association of TMD with the subjects having a forward and backward path of closure as compared to subjects
having a normal path of closure of the mandible. The qualitative analysis (Table 3) shows significant co-relation of the TMD with the subjects having an altered path of closure as compared to the subjects having a normal path of closure of the mandible.

Discussion

Temporomandibular Disorder (TMD) is the main cause of pain of non-dental origin in the oro-facial region including head, face and related structures. The etiology and the pathophysiology of TMD are poorly understood. It is generally accepted that the etiology is multifactorial, involving a large number of direct and indirect causal factors. Among such factors, occlusion is frequently cited as one of the major etiological factors causing TMD. It is well known from epidemiologic studies that TMD-related signs and symptoms, particularly temporomandibular joint (TMJ) sounds, are frequently found in children and adolescents and show increased prevalence among subjects between 10 and 45 years old.⁵
Many studies have focused on the TMJ relationships of patients with various malocclusions. The current study focused on the relationships of the TMD with the altered path of closure of the mandible. It is important to find out if there is an underlying TMD before the beginning of any irreversible treatment.

Bakke advocated that even though there is much argument in the literature regarding the importance of occlusion in TMD, still there is no doubt that occlusal discrepancies like malocclusion, occlusal prematurities etc. alters the normal masticatory muscle activity. The current study reports a significant influence of altered path of closure of the mandible on signs of TMD. Thilander et al. established that TMD are more commonly linked with posterior crossbite, anterior open bite, Angle Class III malocclusion, and extreme maxillary overjet (positive/negative). Now the doubt comes if proper measures are taken i.e. proper treatment is provided to correct the malocclusion in such cases, will it prevent the development of TMD or will reduce the incidence of TMD is still a matter of debate as we know that mandibular dysfunction can be caused due to various reasons.

Irrespective of the cause-effect association, it is necessary to figure out the patients who have TMD before commencement of any irreversible form of treatment, which includes orthodontic therapy, since TMD affirmative signs and symptoms which may develop during or after the therapy might be considered to be a consequence of the therapy provided.

In the current study there has been a significant correlation between the altered path of closure of the mandible and the TMD. Temporomandibular disorder signs and symptoms fluctuate unpredictably, indicating an increased demand for evaluating TMJ of patients with malocclusions. As stated by Michalak et al. along with establishing the type of malocclusion it is important to determine the occurrence of parafunctions, as they can lead to changes in the TMJ. Riolo ML reported that positive association was present with certain type of malocclusion and TMD. They found out that negative association is present in relation to TMD and functional shift of occlusion but they found positive relation of TMD with various other malocclusions like open bite, and class II malocclusions. On the other hand Pullinger et al. found positive association in relation to the TMD and functional shift of the occlusion. They also found out that luxation and clicking of the joint is not commonly present in the class II division II malocclusion but it is present when posterior cross bite is present and it is more common when the posterior crossbite is unilateral. In their study they used Helkimo Anamnestic index to evaluate the TMJ which is the same index that is used in the current study for the evaluation of temporomandibular joint. Fuentes et al. stated that position of the condyle in the glenoid fossa is altered by the functional shift of the occlusion leading to TMD which is in concurrence with the current study.

Kerstein and Grundset defined occlusion time as the time between the first occlusal contact and the reaching of the complete habitual intercuspation. The occlusion time length can be correlated to the existence of premature occlusal contacts, and occlusal instability when closing into complete intercuspation. In their study, subjects with TMD showed significant differences from the control group who presented without TMD symptoms. In fact, the subjects affected by TMD had Occlusion times about 0.18 s longer than the non-TMD subjects. This signifies that patients in whom occlusal prematurities are present leads to altered path of closure of the mandible which is associated with TMD. In fact, premature contacts can result in condylar displacement, which may cause friction and increased intra-articular pressure on the TMJ, contributing to alteration of the disc position on the condyle, possibly leading to the onset of TMD that can have negative effects on muscle activity levels.

The etiologic importance of malocclusion on the development of TMD must be viewed with this in mind. In addition to malocclusion other variables such as psychological health and muscle endurances have shown to be strongly associated with TMD. As it has already been proven in the literature, these variables were not included in the current study which can be attributed as a probable limitation of the current study.

**Conclusion**

Patients having an altered path of closure of the mandible i.e. forward path of closure, backward path of closure, and lateral path of closure of the mandible showed increased association with TMD as compared to the patients having the normal path of closure of the mandible. Among the groups of patients having an altered path of closure of the mandible the maximum
severity of TMD were present in the patients having the forward path of closure of the mandible and least severe form of TMD were associated in the group of patients having the lateral path of closure of the mandible. In this digital era where proper diagnostic aids such as CBCT and MRI are present for the evaluation of TMJ, appropriate precaution should be taken before the start of the orthodontic treatment. It is imperative to evaluate the TMJ in patients having altered path of closure of the mandible as they present with increased incidence of TMD. Therefore evaluation of the temporomandibular joint (TMJ) during and after the orthodontic therapy is essential to avoid the development of temporomandibular joint disorders (TMD).

Abstract

A study was conducted to find out the effectiveness of an educational intervention programme on knowledge, attitude and practice regarding prevention of hypertension among school children from selected schools of Kerala. Objectives of the study: (1) To find out the effectiveness of an educational intervention programme on knowledge, attitude and practice of school children regarding prevention of hypertension (2) To find out the correlation between knowledge, attitude and practice (3) To find out the association of knowledge, attitude and practice with selected variables. Methodology & Design: Evaluative research approach with pre-test post-test control group design was used. 220 school children with pre hypertension in the age group of 13-16 years studying in 8th and 9th standards were included using simple random sampling in the study. An educational intervention programme aimed at diet, exercise and lifestyle modifications of school children was then implemented. Results: The overall pre test knowledge score was 14.97 ± 5.06 in the control group and 15.37 ± 5.47 in the experimental group. Also it was seen that majority of school children in the control group (84%) and experimental group (75%) were having a favourable attitude on prevention of hypertension. And almost half of the school children in the control group (47.2%) and experimental group (48.1%) were having a fair practice on prevention of hypertension. After the intervention there was a significant difference between the post test knowledge and attitude scores of the control and experimental groups. The practice score also was significantly improved. Conclusion: The results of the present study is very much encouraging that similar programmes can definitely help in controlling life style diseases among children which is an emerging public health problem.

Keywords: Blood pressure, pre hypertension, knowledge, attitude, practice, school children, educational intervention programme.

Introduction

The corner stone in the building up of a healthy nation is the group of healthy children in that country. The foundation of many adulthood diseases including hypertension are laid in the childhood itself. It is a known fact that blood pressure (BP) increases consistently from infancy to adolescence. The present generation is having a lifestyle which makes them prone to these types of conditions. Elevated blood pressure in children and adolescents may be an early expression of essential hypertension in adulthood¹. It is identified that hypertension is a major health problem globally and is an important risk factor for the development of coronary artery disease and stroke². It was also estimated that around 1 billion of the adult world population was hypertensive in the year 2000 and this is expected to increase 1.56 billion by 2025.³ Though it is mostly a problem of adults, the etiologic process starts in childhood. Studies have documented a 1-2% prevalence

DOI Number: 10.5958/0976-5506.2019.01936.3
of childhood hypertension in the developed countries and 5-10% in the developing countries. Various Indian studies have also shown a prevalence which ranges from 0.96% to 11.4%. A cross sectional study was done to find the prevalence of sustained hypertension and pre hypertension among school children aged 11-17 years. A total of 1085 apparently healthy students from rural and urban schools from northern India were examined. Hypertension was identified in 62 (5.9%) children and pre hypertension in 130 (12.3%). The study concludes that nearly 20% of the school children had elevated blood pressures. Another study conducted among 24,842 school children from Kerala showed that 10.1% of children with normal weight, 17.34% of children with overweight and 18.32% of children who are obese were having hypertension. Another study was conducted to assess the prevalence of cardiovascular risk factors among school children of Delhi. In this cross sectional survey, it was found that the prevalence of pre hypertension, stage 1 hypertension and stage 2 hypertension was 12.4%, 6.8% and 1.4% respectively. The study concludes that there is a notable prevalence (20.4%) of pre hypertension and hypertension among the study group.

It is very evident from these studies that the prevalence of hypertension and pre hypertension is a matter of concern. This is a childhood antecedent of serious cardiovascular disease conditions at a later age. Therefore it is important that preventive measures be taken to reduce these risks and optimize the health outcomes. Early detection and prompt intervention are the two important strategies of reducing the morbidity and mortality rates of any disease conditions as well as in reducing the complications. The present study is one such attempt to find out the effectiveness of a school based educational intervention programme in reducing the future risks of hypertension among school children.

**Objectives of the Study were:**

To find out the effectiveness of an educational intervention programme on knowledge, attitude and practice of school children on prevention of hypertension to find out the correlation between knowledge, attitude and practice of school children on prevention of hypertension to find out the association between knowledge, attitude and practice with selected socio demographic variables.

**Methodology**

The research approach was evaluative approach with pre-test post-test control group design. The study was done among children in the age group of 13-16 years from selected schools of Ernakulam district of Kerala State. For this 220 (110 in experimental and 110 in control group) pre hypertensive school children were selected randomly. Students from 8th and 9th standards (age 13-16 years) were taken from ten schools selected randomly from Ernakulam district. After the screening 1328 children, 381 children were found to have pre systolic hypertension or pre diastolic hypertension (Pre SHT/ Pre DHT) with blood pressure between 90th and 95th percentile or both. All these pre hypertensive children were considered for the study. The ten schools were then randomly divided into two groups (control and experimental). 110 children from each group of schools were selected randomly for the study. After doing the baseline assessment, the educational intervention programme aimed at lifestyle modifications was implemented for the experimental group. Reinforcement of the educational programme was also done using an information leaflet at 4th and 8th months, only for the experimental group. Finally the knowledge, attitude and practice of both groups were checked at 12th month.

**Educational Intervention Programme:** A systematically planned educational programme which provides information on childhood hypertension and the measures to be taken to prevent the development of hypertension (healthy lifestyle practices including diet, exercise, stress reduction etc.) with an intention to improve the knowledge, attitude and practice of school children on prevention of hypertension. This programme was implemented through direct teaching in two sessions of 45 minutes each and supplemented by information leaflet.

**Ethical Clearance:** Ethical clearance was obtained from the Institutional Ethical Committee of Amrita Institute of Medical Sciences.

Data analysis was done on 210 samples (106 and 104 children respectively in the control and experimental groups, after attrition of 10 samples) using descriptive and inferential statistics.

**Results**

The overall pre test knowledge score was 14.97
± 5.06 (48.3%) in the control group and 15.37 ± 5.47 (49.6%) in the experimental group. The highest score was found in the area of prevention, with 75.9% in the control group and 64.9% in the experiment group. The lowest score was found in the area of symptoms of the disease, with 19.3% in the control group and 35.6% in experimental group. Majority of school children in the control group (70.8%) and experimental groups (61.5%) were having average knowledge on prevention of hypertension in the pretest. The percentage of school children having good knowledge on prevention of hypertension in the control and experimental groups were only 11.3% and 18.3% respectively. Also it was seen that majority of school children in the control group (84%) and experimental group (75%) were having a favourable attitude on prevention of hypertension. Regarding the practice it was seen that in the pre test almost half of the school children in the control group (47.2%) and experimental group (48.1%) were having a fair practice on prevention of hypertension.

Table 1 Mean, SD and t values of knowledge scores of school children regarding prevention of hypertension

** Significant at 0.01 level.

Results of ANCOVA shows that the experimental group had a higher mean practice score (15.31) than the control group (13.73) with F value= 66.74 (p=<0.001) indicating that the educational intervention programme was effective in improving the practice of school children towards prevention of hypertension.

Regarding the association, it was seen that there was a significant association between the knowledge of school children and their class of study, and location of school and family history of hypertension. No significant association was found between knowledge and age, gender, type of school, type of family, educational status of the parents, occupational status of the parents and type of food intake. Similarly, there was a significant association between the attitude of school children and their type of school. Also there was a significant association between the practice of school children and their type of school, location of school and educational status of the mother. No significant association was found between practice of school children and other variables under study.
Discussion

The aim of the study was to find out the effectiveness of an educational intervention programme on the knowledge, attitude and practice of school children towards prevention of hypertension. The focus of intervention in the present study was not on the children who are already hypertensive who need to take definitive treatment. The study was an attempt towards reducing the chances of hypertension by modifying the lifestyle of school children. Lack of adequate knowledge about hypertension and its contributing factors also was a problem in school children. The educational intervention programme was effective in improving the knowledge of the children about hypertension and its consequences which in turn had an influence on their attitude. Attitudinal change is the preliminary factor which makes a change in the practices. The intervention by the investigator could make a positive impact in this direction. It gives a ray of hope that a definite change can be made with collective effort on a large scale.

The educational intervention programme was aimed at improvement of the knowledge and attitude of the children thereby developing a healthy lifestyle practice. Several such attempts are made by many researchers elsewhere but hardly very few efforts were done in the local settings of Kerala with regard to childhood hypertension. The present study findings are in congruence with the results of studies conducted by Grad I, Jan S et.al, Taha AZ, Meagher D, Yan Ping Wan, P.D Angelopoulose et.al, McMurray et.al, Subramanian H et.al, and Cai L et.al.

The findings of the present study show that hypertension among school children is a health concern not only of the developed countries but of developing countries like India. Life style modifications will definitely have an impact in reducing such health problems. This can be facilitated through educational interventions which can improve the knowledge, attitude and practices of school children.

Conclusion

The study was an attempt towards reducing the chances of hypertension by modifying the lifestyle of school children. The educational intervention programme was effective in improving the knowledge and attitude of school children thereby improving the practices. The present study could achieve its objectives. This was a good attempt in addressing a very important and emerging health problem among children. The results of the study were in congruence with the findings of the results of the previous researches.

A Study to Assess the Effect of School based Education on Knowledge and Perception of Teachers Regarding Safe School Environment at Selected Schools of Pune City

Sonali M Tagde¹, Kalpana Sawane², Sharada Ramesh³

¹PG Scholar, ²Assistant Professor, ³Directors, Department of Nursing, Symbiosis College of Nursing, SIDU, Pune, India

Abstract

Background: A healthier school environment is one in which the school setting in this environment, good nutrition, physical activity, basic safety, clean air and water, access to care, and education about making healthy choices allow students to thrive. In a healthy school, students learn through lessons and by example to value their own health and that of the environment. Controlling communicable disease in the school setting is of outmost importance.

Aim: To evaluate the effectiveness of school based education on knowledge and perception of teachers regarding safe school environment.

Method: A quantitative research approach was used in this study. Research design was Pre-experimental: pre-test post-test. The consent was taken from the subjects for participation in study. Sample size was 60 primary and secondary schools teachers. The 10 subjects in each group were Convenience sampling technique was used. Data was compiled and analysis was done by using inferential and descriptive statistics.

Result and Discussion: The purpose of the present study is to assess the knowledge and attitude of teachers regarding safe school environment of selected schools at Pune city, with a view to develop a structured planned teaching programmed. The present study indicate that the 48.6% of the teacher in pre-test poor knowledge and 56.0% in post –test of the teacher is better knowledge. According to the level of the perception, the study revealed that the 46.2% of the teacher in pre-test poor knowledge and 58.8% in post –test of the teacher is better knowledge. There is moderately positive coefficient of correlation between knowledge and perception of teachers towards safe school environment is 0.020

Summary and Conclusion: In summary, the school teachers knowledge and perception regarding safe school environment is 48.6% in before intervention and 51.4% is better knowledge and perception of school teachers after intervention

Keywords: School Base Education, Teachers, Safe School Environment.

Introduction

The word ‘teacher’ represents; transfer of the knowledge from the teacher to the taught. In fact, the foundation that builds a person’s life is to great extend is based on the knowledge, he gets from his teacher. If there is somebody other than parents who plays an important role in children development, they are the teachers.
to consider the perceptions teachers hold regarding safety at school.\textsuperscript{4}

Safe school environment in school is necessary to support the academic success of each child, giving them the opportunity to learn and achieve in a safe and nurturing environment school safety promotes increased learning feelings of school unity, higher level of pro-social behavior and decreased level of violence.\textsuperscript{5}

A healthier school environment is one in which the school setting supports students’ health and well-being and helps them build a strong foundation for learning. In this environment, good nutrition, physical activity, basic safety, clean air and water, access to care, and education about making healthy choices allow students to thrive. In a healthy school, students learn through lessons and by example to value their own health and that of the environment.\textsuperscript{6}

Controlling communicable disease in the school setting is of outmost importance.

Providing a safe, comfortable, and healthy environment facilitates the educational process, encourages social development, and allows children to acquire healthy attitudes towards school.

Children who are ill or feel unwell can create difficulties in the school setting. An ill child cannot always fully participate in class or educational activities. Worse yet, the child with a communicable disease may spread the illness o others. Accordingly, it is essential that educators help to control the spread of communicable disease by safe, effective, and practical efforts. Hand washing is the single most important way to prevent the spread of communicable diseases. Open the window to let the fresh air in, follow a good housekeeping schedule and disinfect in the proper way, do not share the personal items among children and keep their belongings separate, exclude sick children and staff.\textsuperscript{7}

**Objectives of the study**

- To assess the knowledge of teachers regarding safe school environment.
- To assess the perception of teachers regarding safe school environment.
- To evaluate the effectiveness of school based education on knowledge and perception of teachers regarding safe school environment.
- To find the association between knowledge and perception with selected demographic variable

**Hypothesis**

Research hypothesis (H1): There is significant association between school based education on knowledge and perception of teachers regarding safe school environment at selected school of Pune city.

Null hypothesis (H0): There is no significant association of school based education on knowledge and perception of teacher regarding safe school environment at selected school of Pune city

**Material amd Method**

A quantitative research approach was used in this study. Research design was Pre-experimental: pre-test post-test. The consent was taken from the subjects for participation in study. Sample size was 60 primary and secondary schools teachers. The 10 subjects in each group were Convenience sampling technique was used.

**Analysis and Interpretation**

This section deals with description of demographic variables of the study subject. The researcher analyzed and categorized the samples into various groups based on the socio demographic variables.

Frequency and Percentage Distribution of subject according to socio Demographic variables

</table>
Table 2 indicates that there is moderately positive coefficient of correlation between knowledge and perception of teachers towards safe school environment is 0.020. Hence $H_1$ is accepted.

The present study was undertaken to assess the knowledge and perception of teachers regarding safe school environment, with a view developing structured planned teaching programmed. The study significantly proved that there is a correlation between knowledge and perception. There another similar study conducted in Mangalore, which was published in the international journal of community medicine J P Majra., et al has conducted study on school environment and sanitation in rural India. The study was carried in rural areas of Mangalore Taluk in Dakshin Kannada District of Karnataka. A total of 20 randomly selected government schools were studied for their environment and sanitation facilities. Out of these twenty schools, four schools were primary schools, 14 were primary plus upper primary and two schools were from primary to high school level. Eighteen (90%) of the schools were overcrowded. Ventilation and day light was adequate for 12(60%) and 14(70%) of the schools respectively. Cleanliness of school compound/classrooms was adequate in 80% of the schools. There were no separate rooms for serving the midday meals in any of the schools under study. Eighteen (90%) of the schools were having drinking water points. Liquid and solid waste disposal was insanitary in six (30%) and eight (40%) of the schools respectively. Only half of the schools had adequate latrines for boys and 60% for girls. Only two (10%) of the schools had adequate hand washing points with soap. Environment and sanitation facilities at many of the schools are not fully satisfactory.

Discussion

The school teachers knowledge and perception regarding safe school environment is 48.6% in before intervention and 51.4% is better knowledge and perception of school teachers after intervention. Teachers’ knowledge of SHP are needed to improve the current suboptimal level of implementation. So it is important to provide information about training needs to upgrade the teacher’s knowledge and understanding in the component of safe school programme.

Conclusion

The school teachers knowledge and perception regarding safe school environment is 48.6% in before intervention and 51.4% is better knowledge and perception of school teachers after intervention.

Ethical Consideration: Ethical approval to conduct the study to obtained from the ethical committee of the Symbiosis college of nursing. Official permission was
obtained from the education department, Pune Municipal Corporation

A Study to Assess the Effectiveness of Povidone Iodine Ointment Versus Framycetin Sulphate Cream Over Episiotomy Wound Healing among Postnatal Mothers

Sulekha Kamble¹, Shital Waghmare², Merlin Suji³

¹MSc. Nursing (OBS & GYN), Symbiosis College of Nursing (SCON), Symbiosis International University, ²Asst.Professor, Symbiosis College of Nursing (SCON), ³Tutor, Symbiosis College of Nursing (SCON), Symbiosis International University, Shital

Abstract

Background: In India around 56% of women is undergoing for episiotomy in all vaginal deliveries and in Maharashtra the episiotomy rate is too high, as it ranges from 80% to 90% and in Pune the rate is about 80%.

Objective: To assess the effectiveness of Povidone Iodine Ointment versus Framycetin Sulphate Cream over episiotomy wound healing among postnatal mothers.

Methodology: Pre-experimental; one-shot case study design was used in this study and the total sample size was 40 (20 in experimental group-I and 20 in experimental group-II). The Experimental group-I was given the application of Povidone Iodine and the experimental group-II was given Framycetin Sulphate Cream. Healing of episiotomy wound was assessed by using a modified REEDA scale and the episiotomy Pain was assessed by Visual Analogue Scale amongst both the groups.

Results: In Povidone application group, the average change in REEDA score was 1.1 on day 2, 1.6 on day 3, 2.7 on day 4 and 3.2 on day 5. In Framycetin application group, average change in REEDA score was 0.6 on day 2, 1.7 on day 3, 2.5 on day 4 and 3.1 on day 5. t-values for these groups were 1.9, 0.1, 0.5 and 0.2 with 38 degrees of freedom. Corresponding to p-values were 0.034, 0.444, 0.305 and 0.405, which indicates that p-value is small (less than 0.05), the Povidone is significantly more effective as compared to Framycetin group. On day 3, day 4 and day 5, p-values are large (greater than 0.05), the difference between the effect of Povidone and Framycetin application is not significant.

Conclusion: Hence it can be concluded that the Povidone Iodine Ointment and the Framycetin Sulphate Cream are effective in healing of episiotomy wound. But Povidone iodine has more effective than Framycetin in the process of healing of episiotomy wound.

Keywords: Povidone Iodine Ointment, Framycetin Sulphate Cream, Episiotomy wound healing, postnatal mothers.

Introduction

The motherhood is seen as a God-giving role for this reason it is blessed, they way and manner societies conceptualize motherhood in a way has come to appreciation of general request because it is seen as a symbol of the national-state ¹.

Postnatal care (PNC) is the care given to the mother and her newborn baby immediately after the birth and for the first six weeks of life. This period marks the establishment of a new phase of family life for women and their partners and the beginning of the lifelong health record for newborn babies (or neonates — a term often used by doctors, nurses and midwives)².

The days and weeks following childbirth – the postnatal period – is a critical phase in the lives of mothers and newborn babies. Most maternal and infant deaths occur during this time. Yet, this is the most neglected period for the provision of quality care ³.
Management of the perineum is an important component of vaginal birth. In current obstetric practice, incision of the perineal body and vagina to enlarge the vaginal opening and facilitate delivery is referred to as an episiotomy. Couples have now become more involved in the decision-making process surrounding the birth of their infant and have questioned the routine use of technology during labor and delivery. Along with many other “routine” practices, the use of episiotomy has become controversial. Episiotomy can be midline or at an angle from the posterior end of the vulva, is performed under local anaesthesia and it is sutured closed after delivery. The type of episiotomy includes medico-lateral, median, and lateral and J shaped episiotomy. Among this medico-lateral episiotomy is done commonly. The nursing students should be taught the importance of relieving episiotomy pain and enhancing wound healing in postnatal mothers, and there is a need for extensive and intensive research in this area.

The first performance of episiotomy was done in 1742, when perineal incisions were used to facilitate deliveries. A systematic review available in the Cochrane Library showed that episiotomy is not only a procedure that should not be performed routinely but also it is both unnecessary and possibly harmful. Since the 2000s, selective episiotomy has been systematically recommended worldwide. The assumption for the decline in the number of episiotomies is discussed and confirmed, recalling that nowadays high rates of episiotomy remain in less industrialised countries and East Asia. According to the American college of Obstetrics and Gynaecology, approximately one in three women having a vaginal delivery also have an episiotomy. There is lack of data from India on the pattern of episiotomy use and its immediate complications among facility births.

Povidone-Iodine (betadine) is a broad spectrum antiseptic for topical application in the treatment and prevention of infections in wounds. It contains antibiotics that work by slowing or stopping the growth of bacteria and thereby promotes wound healing and relieves pain. Framycetin is a broad spectrum aminoglycoside antibiotic but not active against fungi, viruses, and most anaerobic bacteria.

The postnatal period refers to 6 weeks period after childbirth. The period is popularly termed the fourth trimester of pregnancy. Postnatal women are more prone for puerperal infection as a result of episiotomy which can be prevented by proper postnatal care. The researcher feels that midwives have an important role in care of perineal wounds following child birth.

Methodology

Pre-experimental; one-shot case study design was used in this study and the total sample size was 40 (20 in experimental group -I and 20 in experimental group -II). The Experimental group I was given the application of Povidone Iodine and the experimental group II was given group was given the Framycetin Sulphate Cream and it was administered for 5 days morning and evening. Healing of episiotomy wound was assessed by using modified REEDA scale and the episiotomy Pain was assessed by Visual Analogue Scale amongst both the groups. The participants of the study were selected by using non probability purposive sampling technique. The inclusion criteria were maintained as the postnatal mothers who had undergone full term normal vaginal delivery with episiotomy. The sample of 40 postnatal mothers was selected. Povidone Iodine ointment was administered to experimental group I and Framycetin Cream was administered to experimental group II with duration of in the morning and evening for four days. The demographic, obstetric and birth details were collected with the use of structured questionnaires. Formal Permission was obtained from PCMC for conduct of study in YCM hospital and this study is ethically approved from ethical committee of Symbiosis College of Nursing, Pune. Written informed consent was obtained from each participant at the time of recruitment to the study. Participants were provided adequate information about the study and ensured for confidentiality of their information and the voluntariness of participation in or withdrawal from the study.

Result

The data were analysed using the Descriptive and Inferential statistics. Researcher has applied paired t-test for assessing the effect of Povidone iodine ointment and Framycetin sulphate cream on episiotomy wound healing among postnatal mothers. The data were presented as absolute and relative frequencies, mean, standard deviation, and minimum and maximum values. The level of significance was set at less than 0.05.
Mean age in the Povidone iodine group was 45% of them had 22-25 years of age and in the Framycetin group was 60% of them had 22-25 years of age. Most of the women were housewives and held diploma or lower educational degrees. I regard to gestational age around 45% were 36-38 weeks among both groups. All participants had mediolateral episiotomy among two groups.

Average REEDA score on day1 was 3.9, 2.8 on day2, 2.3 on day 3, 1.2 on day 4 and 0.7 on day 5. t-value for these observations were 5.8, 6.5, 9.7 and 9.2 on day 2, day3, day 4 and day5 respectively with 19 degrees of freedom. (Table1) Corresponding p-values were of the order of 0.000, which were small (less than 0.05), the null hypothesis is rejected. This is evident that the Povidone iodine ointment on episiotomy wound healing among postnatal mothers is significantly effective.

</table>

Since p-values corresponding to all the demographic variables are large (greater than 0.05), none of the demographic variables was found to have significant association with approximation.

Discussion

The results of the present study showed that the Povidone iodine ointment and Framycetin cream have similar effects on pain relief post episiotomy. A study conducted in 2016 conducted to assess the effectiveness of Povidone Iodine Sit bath versus Lavender Oil Sit bath on episiotomy pain and wound healing among postnatal mothers undergo normal vaginal delivery. The findings of the study shows that there was significant difference between the pre and post interventional level of episiotomy pain and wound healing among postnatal mothers undergo normal vaginal delivery. Like in the current study, it shows that Povidone iodine is effective for reducing the episiotomy pain and wound healing.

A Conducted a randomized clinical trial (2015) to assess the “Role of soap and water in the treatment of wound dehiscence compared to normal saline plus Povidone-iodine”, the result showed that there was no significant difference between the results of two groups. An Experimental study conducted,(2011) titled” Effect of Sodium fustigate, Framycetin sulphate on experimentally induced burn wound healing Sodium fustigate B and Framycetin A significantly decreased the duration of epithelialisation and increased % of wound contraction in comparison to the control group. The study showed that Framycetin possess significant wound healing58.In the present study also shows that the Framycetin application was effective for reducing the episiotomy pain and wound healing .In the present study though there is no significant difference in the Povidone iodine versus Framycetin cream.

Study findings revealed that though the average effect of Povidone application is higher at all the time points that Framycetin application, the difference between the average effects of Povidone and Framycetin application is not significant.

Conclusion

This study shows that the effectiveness of Povidone iodine and Framycetin cream was similar in post episiotomy pain relief. The application of both antibacterial agents is a simple, safe, and effective method for reducing the pain experienced by women following episiotomy within first, second, third, fourth and fifth days after childbirth. This study confirms analgesic and anti-inflammatory effect of Povidone iodine and Framycetin cream which has been reported in traditional medicine text books. Though the Average effect of Povidone application is higher at all the time points that Framycetin application, the difference between the average effects of Povidone and Framycetin application is not significant related pain and wound healing.

Mind Empowerment and Perennial Crops Cultivation

Shakeela¹, S N Sugumar²
¹Research Scholar, Vistas Chennai, ²Prof. and Head, Department of Economics, VISTAS, Chennai

Abstract

Agriculture is the backbone of Indian economy. 50% of the Indian population is depending on Agriculture and it contributes 17-18% to the country’s Gross domestic product (GDP). Among Indian states Tamil Nadu occupies the second position by producing Agricultural produces in a large scale basis. A country not only depends on physical factor alone for its economic development but also human development especially mental development. Scientific developments changed the traditional food habits and life style. The contaminated soil is poisoning the Agricultural products which intern poisoning human being especially human mind. Poor mental health weakens human’s capability & productivity which ultimately results in economic backwardness. Different methods are used to develop the mind power. This study demonstrates the empowerment of mental health through Agriculture, especially through the cultivation of Perennial crops like Mango & Banana.

Keywords – Agriculture, Perennial crops, Economic development & mental development.

Results

Mental health improvement can be done by improving the gut. Gut is being considered as the second Brain. Mango helps in boosting the power of gut. Bananas are naturally free of fat, sodium and cholesterol. Bananas are high in potassium, which helps the brain to transmit messages.

Introduction

Literally agriculture is the back bone of an economy whether it is developed or developing economy as its feeds the mankind and animals. Food is the major source of survival as well as growth of human body. Food not only facilitates the growth of human body but also it is detrimental to growth of human body if the food is excess, inadequate or in appropriate. Agricultural surplus not only leads to the development of trade and commerce but also it is a way of our lives and it is directly and indirectly facilitating the growth of human development physically and mentally. The crops that we cultivate bring harmony and ensure overall development of human body¹. That is why the authors made an attempt to analyse the significance of mango and banana cultivation on human development.

Research Objective

To analyze the role of Perennial crops in the development of mental health, in order to accelerate healthy Economy through mango and banana cultivation.

Review of literature

Kavitha.P, (2017) in her study stated that the Mangoes promote brain health and improve the concentration of mind. According to a study published in the journal Oxidative Medicine and Cellular Longevity, there are several components in mangoes that help increase cholinergic function and decrease oxidative stress. This, in turn, enhances memory. The glutamine acid provided by mangoes is also known to boost memory and promote mental alertness and mangoes contain vitamin B6, which is vital for maintaining and improving brain function.

Kanathur Smitha, B. Ramya Prabhu, Seranthimata Samshuddin and S. Dhiraj Kamath¹ concluded that the regular consumption of the standard recommended daily intake levels of the vitamins, mineral and other nutrients for our body needs is the first step in keeping a healthy physic and mind. Banana is an edible fruit which is rich in minerals and vitamins. Hence this report presents a comparative study of mineral
Contents in variety of bananas cultivated in coastal belt of Karnataka, India. Calcium (47.19 mg per 100g fresh weight), sodium (6.02 mg per 100g fresh weight) are found to be the most abundant in Galhi variety of banana and potassium (397.01 mg per 100g fresh weight) is found rich in Cavendish variety of banana. These minerals are indispensable for the development of human brain.

**Statement of the problem**

Today’s generation is very much in need of Brain & Mind power to compete in this World. To improve the power of Brain students are learning lot of things, undergoing activities which provoke their thinking abilities. The physical part of the body i.e. brain is taken care to an utmost extent leaving the Psychic part i.e. mind which operates and has a greater impact on the whole system of body.

Mental health disorders are the most important challenge to the mankind in the present World as it is also true to India. Research shows that response time of students has reduced due to the scientific advancement and modern facilities in television, computer, telephones etc. Lot of mental problems like pressure, stress, depression, anxiety, anger occupies human’s day to day life. Especially adults suffer physically and mentally to a greater extent.

Economic development of a country depends upon the economics of human health. Human health is determined by both physical and mental health. Physical health is being taken care in a greater extent, whereas mental health is being neglected totally. This ends up in a pathetic condition of our country having child abuse, rape, murders, thefts, suicides etc in a larger scale. Healthy relationship between Mind and Brain will definitely have an extraordinary output and also will improve the economy of our country in a greater extent.

**Mind and brain relationship**

Generally brain is considered as Mind. Actually it is not so. Brain is physical object and Mind is psychic object. Mind is what makes us human. Brain is one of the parts of human body. We can see the brain with our eyes, we can take photographs of brain and the same can be operated to rectify the diseases. Whereas Mind cannot be seen directly, we cannot take photographs and the same cannot be operated for its defects. We can keep our body in a relaxed condition without any movements. But at the same time Mind cannot be kept in a relaxed position, it will be always wandering, will be moving from one object to another continuously. Hence Brain and Mind are different entities and Brain acts as a utensil to hold the Mind until the end of human lifetime and Brain is a guesthouse to accommodate Mind for a specific period of time.

Brain is a nonphysical continuum which does not have a form, functions to understand and perceive the objects. In general our Mind is conveyed by our brain like a light is conveyed by a glass. The Brain acts like a CPU – Central Processing Unit of the body. It translates the contents such as feelings, thoughts, believes, memories, imaginations, emotions, attitudes etc; of Mind into complex patterns of nerve cell firing and chemical release. Mind is the complete set of activities being performed in the body with the help of Brain. Hence healthy Brain leads to healthy Mind. Unhealthy Mind leads to physical as well as mental sufferings. All our sufferings are not because of other aspects; it is purely of our own state of Mind. Purifying of Mind leads to healthy Mind in turn results in liberation from sufferings and gaining happiness and peace forever.

**Mental illness**

Mental illness is a disease where a person finds difficult to cope with demands & routines of daily life and also having thought & behavior disturbance. Difficulty in facing daily problems, inability to cope with demanding activities, confused thinking, high & low feelings, delusions, hallucinations, suicidal thoughts, social withdrawal are mostly faced by the adults with mental illness. Depression, stress, fear, anxiety, worries, changes in sleeping & eating habits and physical ailments are common mental problems faced by both adults & children to a greater extent.

In addition to the general mental problems children are facing additional mental illnesses like poor performance in education, poor grades in spite of hard work, aggressive behaviors, lack of obedience, nightmares, poor pattern recognition, poor response time, lack of alertness and hyper activity which are challenging demands to be taken care to establish an healthy economy.

Mental illness is said to be the main reason for the current problems that India is facing nowadays like
suicides, child abuse, murders, thefts, fights and wars. NIMHANS (The National Institute of Mental Health And Nero Sciences) reveals that 13.7 percent of India’s general population has various mental disorders due to experiencing stress, life style complexities, economic instability and poor dietary habits.

Nutrients for Mental health

Nutrients are a substance that provides nourishment required for growth, repair and proper functioning of human body. There are 13 essential vitamins: vitamins A, C, D, E, K, and 8 B vitamins. Vitamins play many important roles in our body, such as maintaining skin, acting as antioxidants to protect our cells from damage, and contributing to healthy reproduction & growth, strong bones and normal blood clotting.

There are 16 essential minerals - calcium, phosphorus, potassium, sulfur, sodium, chloride, magnesium, iron, zinc, copper, manganese, iodine, and selenium, molybdenum, chromium, and fluoride, play important roles in maintaining blood pressure, fluid & electrolyte balance, and bone health; making new cells; delivering oxygen to cells; and contributing to normal muscle and nerve functioning.

The following nutrients protect the Brain from ageing and preserves the cognitive functions and keep the mental health intact.

- Omega-3 fatty acids –
- B-Complex Vitamins – Vitamin B1,B2,B3,B5,B6,B7,B9,B12
- Vitamin C
- Vitamin D
- Vitamin E
- Minerals - Calcium, Magnesium and Zinc
- Amino acids
- Microbiotics
- Proteins & Choline
- Carbohydrates
- Fibre
- Iron

Mango - perennial crop for mental health

Perennial crops means that the crops which are alive throughout the year and harvested multiple times before the death. Mango is the national fruit of India and also it holds the title of “King of fruits”. India is the World’s major producer of Mango. India’s share is around 50 to 52% of world’s mango production. India produces 1000 varieties of mango. Since it is originated between 4000 and 5000 years ago, it has become part of all religious ceremonies, wedding celebrations and community festivals. The leaves of the mango tree are being used to decorate during festivals. In Indian mythology, many stories mentioned the mango tree. Mango is one of the fruit which is cultivated mostly in tropical areas. Mango’s nativity is South and Southeast Asia.

Mango for Mental health

Mango is one of the richest brain foods and which improves the mental health by enhancing the brain neurotransmitters through vitamin B6. It supports in achieving healthy mood and sleep patterns, develops immunity power, protects brain from aging and protects from constipation problems. Mental health improvement can be done by improving the gut. Gut is being considered as the second Brain. Mango helps in boosting the power of gut.

Nutrients available in Mango are:

- Vitamin A - Antioxidant needed for immunity
- Vitamin B6 - Needed for growth and maintenance
- Vitamin B9 – Folate or Folic acid - Important in genetic, metabolic and nervous system health
- Vitamin C - Antioxidant needed for immunity
- Vitamin E - Antioxidant that protect against Alzheimer’s disease (progressive mental deterioration).
Cont...

- Vitamin K - Helps in bone formation and bone repair.
- Calcium - Essential for strong bones.
- Iron - Essential to blood cell production, growth, immune health and energy.
- Magnesium - Balances calcium, improves cardiovascular and bone health.
- Copper - Helps to build blood cells, bone and collagen.
- Proteins - It is major source of energy, helps in body building, repair & maintenance, produces some hormones & enzymes, develops immunity and transports oxygen.
- Carbohydrates - Provides energy and helps for digestion.
- Fibre - Keeps the digestive system healthy.

Usage of Mango tree

Nowadays most of the people are suffering from diabetic due to life style and emotional disorders. This is not only common among the adults but also the children. Medical expenditure has become the major item in the monthly budget. This is again results in mental tension, whereas in the conventional treatment this is not at all expensive if we take the decoction of mango leaves over a period of 48 days for reducing sugar level. Hugging Mango tree for 20 minutes also will reduce blood pressure and sugar level in the blood. Taking rest under Mango tree also will help the people normalize the BP and blood sugar. Therefore planting one or two Mango trees or a Mango orchard and consumption of mango fruits will improve the individuals financially, physically and mentally.

Banana

Banana is a perennial plant that replaces itself. Bananas do not grow from a seed but grows from underground stems called rhizomes. Banana is the only plant in which all the parts of it are used fully. Banana is one of the oldest fruits known to mankind and also being consumed widely all over the world. India is the topper in Banana production in the World. It ranks fourth among the World’s food crops.

Bananas are naturally free of fat, sodium and cholesterol. Bananas are high in potassium, which helps the brain to transmit messages. Banana is the most perfect Brain food. It supplies nutrients essential for proper neurological functions. It also helps the Brain to regulate moods & appetite and also supports cognitive functions like focus & memory. It produces chemicals which promote good mental health.

Nutrients available in Banana are

- Vitamin B6 - Prevents from neurological disorders. Helps to grow new cells
- Vitamin B9 – Folate or Folic acid - Important in genetic, metabolic and nervous system health
- Vitamin C - Boosts immune system & cell health. Improves the absorption of other nutrients
- Magnesium - Promotes proper electrical activity between nerve cells in the brain.
Manganese - Necessary for bone health and metabolism.

Potassium - Provides good nerve & muscle function. Maintains balance of fluid in the body.

Proteins - It is major source of energy, helps in body building, repair & maintenance, produces some hormones & enzymes, develops immunity and transports oxygen.

Carbohydrates - provides energy and helps for digestion.

Fibre - Keeps the digestive system healthy.

Dopamine, Serotonin - Neuro transmitters enhances brain function and helps to keep the mood stable & bright.

Conclusion

Our ancestors had healthy food and systematic lifestyle which in turn resulted in healthy brain and mind with peaceful life pattern. But present diet and lifestyle in this modern era differs significantly. Busy lifestyle paved a path for the processed food which affects the generation in all aspects. The healthy genetic and environment handed over by our ancestors, may not be the same quality when we leave it to our future generation. Hence whatever we eat today not only affects our own health but also have impacts in our next generation. This can be counteracted by taking the help of Agriculture in getting healthy food to empower the Mind which can improve the Economy of India by improving the minds. Mental health improvement can be done by improving the gut. Gut is being considered as the second Brain. Mango helps in boosting the power of gut. Bananas are naturally free of fat, sodium and cholesterol. Bananas are high in potassium, which helps the brain to transmit messages. At this juncture, it is pertinent to contemplate that farmers should go for perennial crops like mango and banana cultivation as they are indispensable for human development, physically and mentally, which in turn accelerates the economic growth at a rapid rate.

Discussion

As the quality and the purity of the food determine healthy life, people are sensitive now-a-days as well as smart to differentiate the organic and in organic crops. The advanced technologies especially, genetically modified technology in agriculture makes hue and cry among the people. Therefore, the traditional cultivation of perennial crops and its impact on human development may be a solace to the present generation.

Effect of Conventional Therapy and Postioning with Isometric Shoulder Exercises on Functional Shoulder Subluxation in Post Stroke Survivors

Viraj S Sawant¹, Suraj B Kanase²
¹Internee, ²Associate Professor, Faculty of Physiotherapy, Krishna Institute of Medical Sciences Deemed To Be University, Karad, Maharashtra, India

Abstract

Objective: To determine the effects of conventional therapy with positioning and shoulder isometric exercises on functional shoulder subluxation in post stroke survivors.

Method: A total of 40 subjects were screened as per inclusion and exclusion criteria and they were briefed about the study and interventions. Informed consent was taken from the subjects initially through the neurological assessment of each subject taken as per data collection sheet. Subjects were selected by simple random sampling, lottery method & were allocated alternatively to group A and group B, who had post stroke shoulder subluxation. The amount of pain and subluxation was noted by Shoulder pain and Disability index and Sulcus sign. Subjects were selected according to the  Brunnstorm stages of recovery with stage 2 and above.

Conclusion: The use of shoulder isometric exercises along with positioning helps in normalizing tone, reducing spasticity and to decrease the chances of reoccurrence of subluxation in upper extremity in subjects with hemiparesis. In addition, results supported that these shoulder isometric exercises given along with conventional treatment and positioning was more effective than conventional treatment alone for elbow flexors, forearm pronators, wrist flexors specifically and slightly effective for shoulder abductors & shoulder external rotators.

Keywords: isometric exercises, subluxation, tone, spasticity, sulcus sign, brunnstorm stages, stroke.

Introduction

Stroke is a disease that occurs when the blood supply to the brain is stopped or when a brain haemorrhage occurs, causing body motor disorders and a sudden disturbance of consciousness¹. Ischemic stroke is the most common type, affecting about 80 percent of individuals with stroke, and results when a clot blocks or impairs blood flow, depriving the brain of essential oxygen and nutrients. Hemorrhagic stroke occurs when blood vessels rupture, causing leakage of blood in or around the brain. The term cerebrovascular accident (CVA) is used interchangeably with stroke to refer to the vascular conditions of the brain. Clinically, a variety of focal deficits are possible, including changes in the level of consciousness and impairments of sensory, motor, cognitive, perceptual, and language functions. To be classified as stroke, neurological deficits must persist for at least 24 hours. Motor deficits are characterized by paralysis (hemiplegia) or weakness (hemiparesis), typically on the side of the body opposite the side of the lesion.

The location and extent of brain injury, the amount of collateral blood flow, and early acute care management determine the severity of neurological
deficits in an individual patient. Impairments may resolve spontaneously as brain swelling subsides (reversible ischemic neurological deficit), generally within 3 weeks. Residual neurological impairments are those that persist longer than 3 weeks and may lead to permanent disability. Strokes are classified by etiological categories (thrombosis, embolus, or haemorrhage), specific vascular territory (anterior cerebral artery syndrome, middle cerebral artery syndrome, and so forth), and management categories (transient ischemic attack, minor stroke, major stroke, deteriorating stroke, young stroke)².

Early warning signs of stroke are sudden numbness or weakness of the face, arm, or leg especially on one side of the body. Sudden confusion, trouble speaking or understanding. Sudden trouble seeing in one or both eyes. Sudden trouble walking, dizziness, loss of balance or coordination. Sudden severe headaches with no known cause.

Other important but less common stroke symptoms are sudden nausea, fever, and vomiting distinguished from a viral illness by the speed of onset (minutes or hours versus several days). Brief loss of consciousness or a period of decreased consciousness (fainting, confusion, or coma).

Glenohumeral subluxation- The shoulder complex consists of four separate joints, which afford it incredible mobility in all the plane of motion, but at the expense of its stability. The glenohumeral joint (GH) relies on the integrity of muscular and capsuloligamentous structures rather than bony conformation for its stability. Injury or paralysis of muscles around the shoulder complex may lead to GH subluxation. Glenohumeral subluxation (GHS), a frequent complication for patients with poststroke.² The vulnerability of the glenohumeral joint to subluxation is a function of the anatomy of the joint. As an extremely mobile joint, it sacrifices stability for mobility.⁵

Method

Study design: Comparative study.

Participants: A total of 40 subjects, both male and female with post stroke shoulder subluxation were taken in the study. Patients with middle cerebral artery involvement, stage 2 and above Brunnstrom stages of recovery along with subluxated shoulder were included in the study whereas subjects with acute stroke, subjects with transient ischemic attack, associated psychological disorder, perceptual disorders, significant visual and auditory impairment or any orthopaedic disorders were not included in the study. Written informed consent was taken from the subjects those willing to participate. The subjects were randomly allocated by simple random sampling, lottery method & were allocated alternatively to group A and group B, who had post stroke shoulder subluxation. The amount of pain and subluxation was noted by Shoulder pain and Disability index and Sulcus sign. The outcome assessment was done post treatment.

Interventions:

Two groups were formed Group A (study group) where subjects were treated with shoulder isometrics exercises with positioning along with conventional treatment and Group B (control group) where subjects were treated only with conventional treatment.

All the subjects were treated once a day, 5 times a week.

Control group subjects were treated with conventional exercises only. This includes sensory re-education like stroking with different textured fabrics, pressing objects into the hand (coin, button, key), or drawing shapes/letters/numbers on the skin, icing, brushing or vibrating, soft tissue/joint mobilization and range of motion exercises (passive or active assisted exercises), positioning, splinting, stretching, electrical stimulation, reaching activities, functional mobility exercises, locomotor training and balance training.²⁻⁶⁻⁷⁻⁸⁻¹⁴

Study group was treated with all the exercises given for the control group in addition to the isometric shoulder exercises.

Each patient in the study group repeated the exercise 10 times. The exercises were performed with assistance once a day, five times per week for six weeks. The bedside isometric shoulder exercises include shoulder forward flexion, horizontal shoulder abduction, horizontal shoulder adduction, shoulder internal and external rotation along with shoulder shrug in a seated position.

Outcome measures:

Brunnstrom Stages of Recovery: The purpose of the Brunnstrom Stages of Recovery is to evaluate motor
recovery of stroke subjects. The Spearman correlation coefficients of inter-rater reliability ranged from 0.9276 to 0.9458, those for intrarater reliability from 0.8020 to 0.9798. The Spearman correlation coefficients for concurrent validity had a value of 0.620.  

Shoulder pain and disability index: The purpose of Shoulder pain and disability index is to evaluate current shoulder pain and disability. The reliability coefficients of ICC≥0.89 in a variety of patients populations. The SPADI demonstrated good construct validity, correlating well with other region-specific shoulder questionnaires.  

Modified Ashworth Scale: The purpose of the Modified Ashworth Scale is to measure spasticity in subjects who have lesions of the CNS or neurological disorders. The Modified Ashworth Scale is a quick and easy measure that can assist a clinician’s assessment of spasticity during passive soft-tissue stretching. Excellent to Adequate Test-Retest Reliability (Gregson et al 1999). Intra reliability adequate with ranges of 57.7% to 85% (Blackburn et al, 2002). Inter reliability with ranges of 42.5%-50% (Blackburn et al,2002)  

Result

Statistics: Statistical analysis was performed by using Instat-Graph pad. The average mean age of participants in Group A was 54.6 ± 4.041 and Group B was 54.4 ± 3.512, which showed there is no significant difference in age of subjects in both groups (t = 0.06575 & p = 0.8605) which was done by unpaired t-test.  

Discussion  

Stroke is a leading cause of serious long term disability in adults. More than 60% of stroke survivals suffer from persistent neurological deficit. Stroke patient incidence rate range from 0.2 to 2.5 per 1,000 populations per year in India. This illness costing millions in lost work as well as millions in medical state and insurance resources every year, represents a challenging area of management for physiotherapists.  

So the present clinical trial was conducted to find out the effect of conventional therapy and positioning with isometric shoulder exercises on functional shoulder subluxation in post stroke survivors.  

40 subjects clinically and radiologically diagnosed with stroke having hemiparesis and fulfilling inclusion and exclusion criteria with age above 40 years were included in the study. Further they were classified according to Brunnstorm stages of Recovery as stage 2 and above. They were allocated into two groups, Group A and Group B, each containing 20 subjects. A baseline treatment was given with an addition of isometric shoulder exercises in Group A and only baseline or conventional treatment in Group B. The outcome was measured by Modified Ashworth Scale and SPADI.  

Conventional treatment of sensory re-education, passive exercises, functional mobility training, gait training, balance training, supportive devices, stretching, electrical stimulation was common for both the groups.  

Statistical analysis was performed by using Instat-Graph pad. The average mean age of participants in Group A was 54.6 ± 4.041 and Group B was 54.4 ± 3.512, which showed there is no significant difference in age of subjects in both groups (t = 0.06575 & p = 0.8605) which was done by unpaired t-test. The total number of participants included over 40 Group A contained 10 males and 10 females and Group B had 13 males and 7 females. Out of 40 subjects 12 had left side affected and
8 had right side affected for group A and 11 had left side affected and 9 had right side affected.

Friedman Statistics test was used to analyse the effect of isometric shoulder exercises along with conventional therapy and positioning on spasticity within the groups which showed that there was significant reduction on spasticity (p<0.0001) post treatment. Mann-Whitney test was used to analyse the effect of isometric shoulder exercises along with conventional therapy and positioning on spasticity between the groups. There was no significant difference for shoulder abductors, shoulder external rotators, elbow flexors and forearm pronators post 2 weeks but there was quite significant, significant and extremely significant difference post 4 weeks and post 6 weeks, p value less than 0.05 and upto 0.08.

The results from the statistical analysis of the present study supported the alternative hypothesis which stated that there will be beneficial effect to the subjects treated with shoulder isometric exercises along with conventional therapy and positioning.

Hence above results showed that Group A subjects treated with shoulder isometric exercises along with conventional therapy and positioning showed better reduction in spasticity.

Thus it can be stated from above study that physical therapy interventions like isometric shoulder exercises are more efficacious and cost effective.

**Conclusion**

The use of shoulder isometric exercises along with positioning helps in normalizing tone, reducing spasticity and to decrease the chances of reoccurrence of subluxation in upper extremity in subjects with hemiparesis. In addition, results supported that these shoulder isometric exercises given along with conventional treatment and positioning was more effective than conventional treatment alone for elbow flexors, forearm pronators, wrist flexors specifically and slightly effective for shoulder abductors & shoulder external rotators.

Knowledge and Self-Reported Practice Regarding Mobility Safety Measures of Patients among Employees

Regina Antony¹, Anju Ir², Anisha Mohanan², Binoop Pushkaran²

¹Associate Professor, Department of Medical Surgical Nursing, ²Fourth Year B Sc Nursing Students, Amrita College of Nursing, Amrita Vishwa Vidyapeetham, Kochi, Kerala, India

Abstract

Background of the Study: The falls suffered by the patients during their hospitalization are one of the most important occurrence in the breakdown of security and often responsible for an increased number of hospital days and worse recovery conditions. The aim of the study were to assess the knowledge regarding mobility safety measures of patients with spinal cord injury among patient mobility services (PMS) employees and identify the self reported practice of body mechanism of the employees.

Materials and Method: Quantitative approach with non experimental survey design was used. The study was conducted among 60 patient mobility service department employee in Amrita Institute of Medical Sciences, Kochi (AIMS) sampling technique used was convenience sampling. A knowledge questionnaire regarding mobility measures in spinal cord injury patients and a self-reported questionnaire was distributed to 60 patient mobility employee to identify the physical activity levels, personal characteristics, and associated work factors.

Result: The participants age were between 17-25 years, majority (51.7%) of them were males. Most of the employees 26.7% had poor knowledge, 55% had average knowledge and 18.3% had good knowledge.50% of the employee had good practice skill, 31.7% had excellent practice skill 10% had average skill and 8.3% had poor skill.31.7% employee did not have and 41(68.3%) employee had experience in shifting patients’ with spinal cord injury. There was significant association between area of work and safety mobility measures using \( \chi^2 = 0.045, (p=0.05) \) and there was also highly significant association between previous exposure of information and body mechanics \( \chi^2 = 0.001(p=0.001) \).

Conclusion: Overall results provide relevant feedback of the knowledge and the self-reported practice of the employee which throws light on the importance of reducing and possibly minimizing threats as well as extend safe patient handling.

Keywords: Mobility safety measures, body mechanics, employees.

Introduction

Most of the general public acknowledges the paralysis associated with a spinal cord injury¹. Proper techniques in handling and transferring of the spinal cord injured patient immediately after the trauma may prevent further neurological damage and resulting complications. As management of Spinal Cord Injury (SCI) should begin at the site of the injury, awareness of proper techniques of acute management would avoid the complications in injured patients ². The physical and technical difficulties involved in the work of staff often lead to the occurrence of problems, the reasons for which are not easy to identify and clarify³.

Hospital falls are common and may lead to negative outcomes such as injuries, prolonged hospitalization
and legal liability. Falls or accidents are responsible for considerable morbidity, immobility, and mortality among, mainly in older peoples. In health care facilities, patient accidents have been a major contributing factor associated with patient injuries that result in increased length of the hospital stay and costs. Falls that occur in hospitalized patients are a wide spread and serious threat to patient safety. The falls suffered by the patients during their hospitalization are one of the most important occurrence in the breakdown of security and often responsible for an increased number of hospital days and worse recovery conditions. According to IGAS a Portugal study conducted based on hospital accidents (2007) globally 4,200 accidents are registered related to patient falls from stretchers, beds, armchairs or wheelchairs. In this study, it was ascertained that, 85 of these cases patient ended with dying. Developing practices to reduce or minimize this necessary risk represents a potentially important area of patient safety research. This study focuses on transportation of critically ill patients by health professionals (paramedics, nurses, physicians and/or respiratory therapists) between hospitals (to receive higher levels of care) and within the hospital (for diagnostic or therapeutic procedures). Maintaining the body mechanics of hospital employees during shifting, turning of patients reduces the incidence of back injury among hospital employees and provides awareness about self-injury prevention among them.

Nanna S. Hellesø, Bente Nordtug, Hildfrid V. Brataas (2016) conducted a qualitative study on Patient transfer skills and safety culture using content analysis approach. Data were answers to open questions about patient transfer practice and the meaning of a multi-component intervention carried out in one Norwegian municipality. Research focus were on patient transfer skills, safety culture, and psychosocial climate at the workplace. Purposive sampling included sixty-one health care personnel. All had been participating in the intervention. The analysis revealed the theme “Competence, practice and health impact” with sub themes “Measures facilitates change” and “Influence over time”. The intervention seemed to promote a safety climate with positive impact on employees’ health. Further, the transfer movements were more comfortable and safe for the patients and they became more self-reliant. Comprehensive, educational, and technical measures facilitated for change. After intervention termination, the intervention had persistent influence over time on daily ergonomic patient transfer practices.

Katarina Kjellberg, Monica Lagerström, Mats Hagberg, (2003) conducted a study on 102 nurses in orthopedic ward on Work technique of nurses in patient transfer tasks and associations with personal factors. Back disorders among nursing personnel are associated with the worktask of assisting patients during transfers. The objectives of the study were to explore the work technique applied by nursing personnel in patient transfer tasks and determine whether different personal factors were associated with work technique safety. A work technique score was calculated for each performed transfer. It indicated the level of musculoskeletal safety and hazard for the nurse. The results indicated an association between poor work techniques and low-back symptoms.

Patricia Finch Guthrie, Linda Westphal, Bruce Dahlman, Mark Berg, Kathy Behnam and Deborah Ferrell conducted an evidence-based on the work-related injuries of nurses. A patient lifting intervention for preventing process to implementation of effective lifting intervention, in the orthopedic and neurology units in a Minnesota hospital. The injuries for the two units decreased from 21 to 9 injuries, while the salary and work replacement costs were $48,220 and $2,560 in 2001 and 2002 respectively. The lift team averaged 80 lifts per day and 95% of the nursing staff attended the back school.

Nevertheless, there are very few literature regarding knowledge, health and working conditions among the patient mobility service employees conducted in India. Here this study designs with the aim of investigation, in the above mentioned area.

Materials and Method

The study participants in this study were sixty patient mobility service employees who have a pivotal role in transferring or shifting of the patient having different type of disabilities for minimum of one year work service atAIMS, Kochi. Subjects were selected using non probability convenient sampling technique. Non experimental survey design was used in this study. The setting was selected because of the easy accessibility of the group, familiarity with setting, convenience in terms of adequate sample and the cooperation offered by the management. The researcher explained the purpose of the study and obtained an informed consent from each
subject. Knowledge questionnaire on mobility safety measures in transferring patients with spinal cord injury and Self-Assessment Body Mechanic Questionnaire were used to assess their awareness in handling, transferring & safety of patients’ with spinal cord injury respectively. Data analysis was done by using descriptive & inferential statistics.

The data presented in table 1 enumerates that the subjects were of the age group between 15 – 25 years, 40 % subjects were of the age group between 17 – 20 years, and 60 % were of the age group between 21 – 25 years, 29 (48.3%) subjects were females and 31 (51.7%) subjects were males, the educational level of subjects having degree were 2 (3.3%) , high school education were 18 (30%) and secondary education were 40 (66.7%). Utility of transferring devices 15 (25%) subjects mainly used stretchers for mobility of patients', and 45 (75%) subjects used wheel chair for the mobility of patients'. Experience in shifting spinal cord injury patients’ 19 (31.7%) subjects did not have and 41 (68.3%) subjects had experience, 42 (70%) subjects received exposure of information regarding transfer of spinal injury patients’ from health personnel 2 (3.3%) subjects got through internet ,2 (3.3%) subjects gained through observation of handling patient 14 (23.3%) subjects had no exposure.

Section II: Description of level of knowledge level of subjects on safety mobility measures

The data illustrated in Figure 1 shows that among 60 subjects, 12 (20%) subjects had >2 years of experience in patient mobility service 8 (13.3%) subjects had 2 years, and 14 (23.3%) subjects had 1 year, 26 (43.3%) subjects were newly joined in AIMS, Kochi.

Section III: Description of Self-reported practice of PMS employee's body mechanics

The data presented in table 2 enumerates the self-reported practice of subject’s body mechanism in shifting of spinal cord injury patients’. The practice was graded as poor, average, good, excellent. Majority of the subjects 30 (50%) had good practice skill, 19 (31.7%) subjects had excellent practice skill, 6 (10%) subjects had average skill and 5 (8.3%) subjects had poor skill.

Data presented in table 4 shows that, there was a highly significant association between previous exposure of information and body mechanics at, (P=0.001).
Discussion

The present study findings implicates that 33(55%) employee have average knowledge of patient mobility measures followed by 16(26.7%) having poor knowledge and 11(18.3%) employee having good knowledge of patient mobility measures.

A descriptive study conducted by RMIM Weerasekara, BMHSK Banneheka, T Sivananthawerl and Fahim Mohamed, Faculty of Allied Health Sciences, University of Peradeniya, Sri Lanka regarding awareness among school athlete about handling and transferring techniques of a suspected spinal cord injured athlete, The findings shows that when considering about the proportions of the scores (awareness), majority of the students (43.6%) scored 41-60. The percentage of students who have scored 20-41 was almost similar to that of students scored 61-80 (26.7% and 23.4% respectively). In contrast, only a few students (0.4%) scored over 80. It was also found that, 94.7% (n=230) of the participants were willing to update and improve their knowledge regarding the correct techniques in handling and transferring of a suspected spinal cord injured person ².

The supportive study findings and the present study findings indicates the necessity of imparting knowledge regarding transferring and shifting suspected spinal cord injury target group is vital to prevent further complications.

Conclusion

This study found that use of the body mechanics principle can reduce clinical-practice fatigue and increase employee practice satisfaction. Various training programs that can increase use of the body mechanics principle among patient mobility employees’ need to be developed so that they can contribute to the formation of proper habits for physical activities for the safe nursing of patients.

Oxidative Stress and Role of Glutathione S-transferase in Brain Health and Ageing

Asima Tripathy, Rajat Kumar Pradhan

1Assistant Professor, Department of Zoology, 2Assistant Professor, Department of Physics, Bhadrak Autonomous College, Bhadrak, India

ABSTRACT

Oxidative stress arises because the antioxidant defense system of the human body is not entirely efficient. The major enzymes belong to this category are superoxide dismutase, catalase, glutathione peroxidase and glutathione reductase. GSTs are the major determinants of the intracellular concentration of 4HNE and account for the metabolism of the majority of cellular 4HNE through its conjugation to GSH. Therefore, GSTs and the transporter(s) catalyzing the efflux of GS-HNE are likely to play a major role in regulating 4HNE homeostasis in cells. Consequently, these proteins should be relevant to the mechanisms that regulate 4HNE-mediated signaling for apoptosis, differentiation, proliferation and thus affecting ageing. This mechanism can be exploited to manufacture appropriate drugs to decelerate the ageing process by 4HNE regulation.

Keywords: Glutathione s-transferase (GST), Oxidative stress, Ageing, Reactive Oxygen Species (ROS), 4-hydroxy-2-transnonenal (4HNE)

Introduction

In aerobes oxygen is essential for the maintenance of vital functions of the cells. During respiration 80-95% of the total oxygen consumed by the body is reduced to water by electron transport chain of mitochondria. However, 3-5% of oxygen consumed by mitochondria is leaked. This leakage of oxygen from electron transport chain leads to formation of superoxide (O$_2^-$) radical by reduction of an electron from the ground state of oxygen molecule[1]. However, during various metabolic activities the other sites of oxygen radical production are microsomes[2], peroxisomes[3] and cytosol[4], which was latter extended by McCord and Fridovich[5] into “superoxide theory of oxygen toxicity” reveals that superoxide formation is one of the major factors in oxygen toxicity.

Addition of one or more electrons to O$_2^-$ forms peroxide ion (O$_2^{-2}$). Hydrogen peroxide reacts with iron it forms hydroxyl radical[6]. Hydroxyl radical is one of the potent oxidants, which affects every type of organic cellular macromolecules instantaneously, and results in lipid peroxidation (LPx), protein degradation enzyme inactivation, DNA damage and ultimately cell death. However, the partial reduction of oxygen forms reactive chemical intermediates. These intermediates are known as reactive oxygen species (ROS) or free radicals.

The most important free radicals in biological systems are radical derivatives of oxygen. Oxygen is required to transfer various substances for the release of the energy and detoxify xenobiotics. During this process oxygen acts as terminal electron acceptor and is eventually converted to more stable compound, water. This reduction of one O$_2$ via the cytochrome oxidase system of respiratory chain requires 4 electrons. Such type of reduction is known as transvalent reduction of oxygen to water[7].

Sources of ROS in biological system are cellular metabolic processes such as mitochondrial electron transport, endoplasmic reticulum oxidation, Enzymatic activity etc and environmental factors such as drugs,
pesticides, tobacco smoke, alcohol, radiations, high temperature etc. ROS have important roles in regulation of gene transcription in higher eukaryotes, development and differentiation, mitochondrial oxidation, oxygen transportation by haemoglobin, cytochrome P 450 activity. They cause oxidation and peroxidation of proteins, lipids, and DNA, which can lead to significant cellular damage and even tissue or organ failure (ROS-mediated diseases). Knight in his review has related various diseases/ disorders to ROS. (Aging, Atherosclerosis, Brain disorders, cancer, cardiac myopathy, Chronic granulomatous disease, Diabetes mellitus, Eye disorders, inflammatory disorders, Iron overload, Lung disorders, Nutritional deficiency, Radiation injury, Rheumatoid arthritis, Skin disorders).

Betteridge reported that, the free radicals can be produced by several different biochemical processes within the body. Shivakumar et al. recorded that in rats, the levels of thiobarbituric acid reactive products, indicative of lipid peroxidation, were very low at birth and increased to adult levels by the 16th day after birth. Moreover, the free radicals and lipid peroxidation have been reported to be increased in the aged breain of rats. Also, the lipid peroxidation showed an elevated increase with the aging: this fact is more evident in neuronal than in glial cells of rats. The increased levels of thiobarbituric acid-reactive substances (TBARS) suggest a net increase in the levels of oxygen free radicals which could be due to their increased production and/or decreased destruction.

Role of Oxidative stress on Health and Brain Ageing: Since oxidative stress arises because the antioxidant defense system of the human body is not entirely efficient and increased free radical production is likely to lead to damage. In response to mild oxidative stress the body can increase its antioxidant defense levels. Unfortunately, severe oxidative stress caused by toxins capable of making free radicals or depleting antioxidant defenses can lead to cell injury and death. There is increasing evidence that free-radical-induced oxidative stress contribute to diseases such as neurodegenerative disease, chronic inflammatory disease, cancer and cardiovascular disease. Alzheimer’s disease is a neurodegenerative disease associated with the ageing brain.

Oxidative Defense System: Production of oxyradicals or reactive oxygen species by cells is inevitable therefore cellular system has developed efficient defenses to neutralize the oxyradicals in course of evolution. The antioxidant defenses are highly conserved in nature. There are two major types of antioxidant defenses seen in organisms. The first type comprises of a cascade of enzymes known as antioxidant enzymes. These enzymes act in concert. The major enzymes belonging to this category are superoxide dismutase, catalase, glutathione peroxidase and glutathione reductase. The other type constitutes of small antioxidant molecules such as ascorbic acid, tocopherol, ubiquinone, uric acid and beta carotenoids.

Reactive Oxygen Species: Aerobic organisms generate reactive oxygen species (ROS) such as superoxide anion radical (O2•−), hydrogen peroxide (H2O2) and hydroxyl radical (•OH) as a result of oxidative metabolism. •OH can initiate lipid peroxidation (LPO) in tissues. Among all the antioxidants glutathione s-tranferase is having a great role as an anti aging agent in the body by detoxification of the toxic materials.

GSTs: Determinants of Cellular Concentration of 4HNE: GSTs are the major determinants of the intracellular concentration of 4HNE and account for the metabolism of the majority of cellular 4HNE through its conjugation to GSH. Of the multiple cell constituents, 4HNE and other unsaturated aldehydes display the highest reactivity with thiols. 4HNE readily forms a Michael adduct with GSH, and the reaction is further accelerated by GSTs. The GSTA4-4 isoform is particularly effective conjugating 4HNE to GSH. This is generally considered a detoxification step, although glutathione-conjugates of α, β-unsaturated aldehydes have been shown to be toxic.

4HNE is formed primarily from the degradation of ω-6 polyunsaturated fatty acids such as arachidonic and linoleic acids. GSTs can regulate intracellular levels of 4HNE by attenuating its formation through their glutathione-peroxidase activity and also by conjugating it to GSH through their transferase activity. In mammalian tissues, a subgroup of alpha-class GST isozymes has high activity for conjugating 4HNE to GSH. Vatsayan et al. have shown that GSTA4 knock-out mice having impaired 4HNE metabolism and increased 4HNE levels in tissues are more sensitive to the toxicity of oxidant chemicals/oxidative stress suggesting the role of 4HNE in the mechanisms of toxicity of oxidant xenobiotics and a protective role of GSTA4-4 against oxidative stress.
Role of 4HNE in Aging: The accumulation of ROS without sufficient antioxidant defenses produces oxidative damage to all macromolecules. Oxidation of lipids, in particular, affects cell membranes and other lipid-containing structures and has important pathological implications due to the high reactivity of its products. Short-lived ROS convert polyunsaturated fatty acids, through a chain reaction via lipid hydroperoxides, into rather stable, but reactive and thus toxic α,β-unsaturated aldehydes, such as 4HNE, acrolein, and malondialdehyde (MDA).[30]. As electrophiles, such α,β-unsaturated aldehydes can form Michael adducts on nucleophilic centers of proteins (targeting lysine, cysteine and histidine) and can cause protein cross-linking.[31]. 4HNE is considered to be a signaling molecule that conveys the information that an oxidative event has occurred. The signal then coordinates an appropriate cellular response.

Discussion

Glutathione S-transferases (GSTs) regulate 4HNE concentrations and belong to a family of multifunctional enzymes whose roles in detoxification of electrophilic xenobiotics or electrophilic metabolites is well established[22,32-36]. In general, GSTs catalyze the conjugation of a wide variety of structurally dissimilar compounds containing electrophilic carbon, nitrogen, or sulfur atoms to GSH - the major endogenous low-molecular-weight nonprotein thiol synthesized de novo in mammalian cells[37-38]. Disruption of GSH metabolism has a major impact on cellular defenses and normal physiology, and evidence is emerging that GSTs are involved in the regulation of 4HNE-mediated signaling processes[23]. GSTs are the major determinants of the intracellular concentration of 4HNE and account for the metabolism of the majority of cellular 4HNE through its conjugation to GSH. Of the multiple cell constituents, 4HNE and other unsaturated aldehydes display the highest reactivity with thiols[17]. 4HNE readily forms a Michael adduct with GSH, and the reaction is further accelerated by GSTs. The GSTA4-4 isoform is particularly effective conjugating 4HNE to GSH[18-21]. This is generally considered a detoxification step, although glutathione-conjugates of α, β-unsaturated aldehydes have been shown to be toxic[22]. GST catalyze conjugation of lipid aldehydes; including 4HNE, with GSH and the reduction of those conjugates by AR are the major defense against oxidative stress-induced cytotoxicity[39-41]. GST-catalyzed GS-lipid aldehyde conjugation is the main mechanism of detoxification of endogenous lipid aldehydes, including 4HNE, as well as the metabolism of xenobiotics. GS-lipid aldehyde conjugates such as GS-HNE are readily reduced by AR to corresponding GS-lipid alcohols, such as GS-DHN[45]. Both GS-HNE and GS-DHN are actively transported out of the cells[42, 43-44].

Conclusions

Adduction of toxic aldehydes with GSH and their active transport out of the cells may be the major defenses against the oxidative stress-induced cytotoxicity, genotoxicity and a number of related diseases[45]. Thus GSTs are relevant to the regulating mechanisms for 4HNE-mediated apoptosis, differentiation and proliferation. This mechanism can be exploited to manufacture drugs to decelerate the ageing process. Research on antioxidants has gained much interest due to increased evidence of the importance of antioxidants in human health. This has brought about considerable research on defining and finding components with anti-oxidative activity in humans and in other biological systems[46].

Methylation-Assisted Epigenetic Evolution and the Psycho-biology of Human Experiences

Asima Tripathy¹, Rajat Kumar Pradhan²

¹Assistant Professor, Department of Zoology, ²Assistant Professor, Department of Physics, Bhadrak Auto. College, Bhadrak, Odisha

ABSTRACT

DNA methylation-assisted epigenetic variation can provide an evolutionarily and ecologically important source of phenotypic variation among individuals. Through evolution by control over thoughts and emotions one can interpret the phenomenal experiences in a different light. Understanding of epigenetic mechanisms will provide insights into individual and population processes at both ecological and evolutionary time scales. Instead of biology controlling an individual’s evolution through genetic expression, the latter may very well be determined by the individual’s thoughts, actions and experiences. Epigenetics shows that the thoughts and the experiences control the biology. By changing the thoughts, one can influence and shape the genetic make-up and in turn can determine one’s evolution in accordance with the experiences generated.

Keywords: DNA methylation, Epigenetics, thoughts, Evolutionary force, genetic make-up.

Introduction

Evolutionary biology is currently experiencing an emergence of several research areas that transcend the boundaries of the Modern Synthesis, which was the last major conceptual integration in evolutionary biology[1]. The Modern Synthesis used the concepts of population genetics to integrate Mendelian genetics with evolution by natural selection[2]. The role of epigenetics in evolution and ecology is a more recent focus to have a concrete background.

The Darwinian theory of evolution contends that mutations come about by chance and amongst such mutations rarely, a few survive. This contention is slightly modified now[3]. The new thought that has emerged in this deliberation is that “the urge of life” has an innate tendency to generate more and more complex forms appropriate to the environmental changes[3]. This implies that the fundamental cause of adaptive evolution is the “urge”, which is lodged in the psychology of the individual.

Regarding “natural selection” Dobzhansky[4] opines that, “species are produced not because they are needed for some purpose” beyond themselves. Though not explained further by him, it implies that it is their mind and thought, or their purpose, leading to phenotypic manifestation, which in turn, gives rise to speciation. Thus conscious thought leads to evolution. In his view, nothing in biology makes sense except in the light of evolution.

According to Weismann Homo sapiens is an optimistic sobriquet; translated as “knowing man” it is merely descriptive of our species[5]. We are animals that specialize in thinking and knowing (cognition) and it is our extraordinary cognitive powers, which have enabled us to do remarkable things[5]. The “development of art of novel thinking” is an important stage in the evolution of human cognition[6].

However, the second kind of co-evolutionary process, “gene-culture co-evolution”, involves the interaction of genetic and non-genetic mechanisms that allow individuals to acquire adaptively relevant-information from others, not via the replication of DNA sequences, but through learning[7].

Molecular biology is the basis of Biogenesis. As a result of the discovery of genetic code and the basic molecules DNA, RNA in the living cell[8]. Scientists believe that consciousness is an epiphenomenon of complexity[3].

DOI Number: 10.5958/0976-5506.2019.01943.0
The fast growing field of epigenetics seems to indicate that an individual is the product of its experiences in its life, which cause changes in the operation and functioning of the genes. Genes actually switch on or off depending on the in experiences. In other words, an individual is born with certain genes, but the experiences in its life determine which genes get expressed and which don’t. In this way, the environments in which an individual is placed to get the experiences are the determinants of the expressions of the genes.

**Epigenetics and Methylation:** Epigenetics has expanded to the study of heritable changes in gene expression and function without alterations in the DNA sequence and to the study of stably heritable phenotypes that occur without alterations in DNA sequence. Epigenetic mechanisms interact with genetic, physiological, and morphological systems and may be an important component of organism-environment interactions. Some epigenetic characters can be stably transmitted across generations. Thus, epigenetics has a mechanism of heredity that was not considered in the framework of the Modern Synthesis. Epigenetic mechanisms may play critical roles in phenotypic plasticity, soft inheritance, an individual’s response to environmental stressors, invasive species biology and conservation biology. Understanding epigenetics will likely to provide insights into individual and population processes at both ecological and evolutionary time scales.

Pigliucci has identified several major areas of innovation that transcend the Modern Synthesis: epigenetics, evolvability, phenotypic plasticity, evolution on adaptive landscapes, evolutionary developmental biology, and systems biology. Integrating these new ideas with the Modern Synthesis forms a new conceptual framework of evolution, which they termed the Extended Synthesis, as it will extend, rather than refute, the Modern Synthesis. This subject has been the focus of much recent work, and an excellent description is provided in the book: *Evolution—The Extended Synthesis*. The importance Epigenetics as one of the core areas of molecular biology in the Extended Synthesis.

Epigenetic variation in DNA methylation can provide an evolutionarily and ecologically important source of phenotypic variation among individuals. The violet (*Viola cazorlensis*) has a high level of inter-individual DNA methylation variation that differentiated populations from southeastern Spain and variation among individuals was related to 2 Genetics Research International the amount of damage caused by herbivory. The invasive Japanese knotweed (*Fallopia japonica* and *F. x. bohemica*) has significant differences in DNA methylation among populations from the northeastern United States, and a portion of the variation could be attributed to different habitats. Allopolyplod orchids (*Dactylorhiza majalis* s.str, *D. traunsteineri* s.l., and *D. ebudensis*) have variation in DNA methylation that was significantly related to environmental variables. Genetically identical dandelion (*Taraxacum officinale*) plants develop variation in DNA methylation in response to stressors, and many of these changes are stably inherited in the next generation. As a specific example, house sparrows (*Passer domesticus*) from North America and Africa introduced into Europe have a higher level of variation in DNA methylation compared with these birds in their native environments, which suggests that DNA methylation may compensate for the decreased genetic variation caused by introduction into a new environment.

**Gene activation by conscious thought:** Every minute of every day, the physical body is physically reacting, literally changing, in response to thoughts that run through our mind. The first requirement for sketching this new vision is to address the glaring omission of the biology of emotion which remains conspicuously missing from even our most enduring explanatory paradigms. In its usage here, the term “emotion” refers directly to the rich pallet of human emotional experiences, such common everyday feelings as happiness, sadness, courage, fear, gratitude, anger, admiration, envy, love and hate. Such feelings modulate thoughts and motivate actions; they often mediate social interactions, and play an enormous part in our everyday lives. When one exercises compassion and consciously practices gratitude, there is a surge of rewarding neurotransmitters, like dopamine, and one experiences a general alerting and brightening of the mind, correlated with more of the neurochemical norepinephrine.

What flows through the mind also sculpts the brain in permanent ways. We can think of the mind as the movement of information through the nervous system, which on a physical level is all the electrical signals running back and forth, most of which is happening below the conscious awareness. As a thought travels
through the brain, neurons fire together in distinctive ways based on the specific information being handled, and those patterns of neural activity actually change the neural structure. Busy regions of the brain start making new connections with each other, and the existing synapses connecting neurons which experience more activity get stronger and become more sensitive, and start building more receptors. New synapses are also formed in the process.\[25\]

One example of this is the well-known London cab driver studies which showed that the longer someone had been driving a taxi, the larger their hippocampus, a part of the brain involved in visual-spatial memory. Their brains literally expanded to accommodate the cognitive demands of navigating London’s tangle of streets. Research has also proven the numerous benefits of meditation for one’s brain and shown that meditation produces measurable results, from changes in grey matter volume to reduced activity in the “me” centers of the brain to enhanced connectivity between brain regions.\[25\]

There are thousands upon thousands of receptors on each cell in our body. Each receptor is specific to one peptide, or protein. When we have feelings of anger, sadness, guilt, excitement, happiness or nervousness, each such emotion releases its own flurry of neuropeptides. Those peptides surge through the body and connect with those receptors which change the structure of each cell as a whole. Where this gets interesting is when the cells actually divide. If a cell has been exposed to a certain peptide more than others, the new cell that is produced through its division will have more of the receptor that matches with that specific peptide. Likewise, the cell will also have less receptors for peptides that its mother/sister cell was not exposed to as often.

So, if one keeps bombarding the cells with peptides from negative thoughts, one is literally programming one’s cells to receive more of the same negative peptides in the future. What is even worse is that one is also simultaneously lessening the number of receptors of positive peptides on the cells, making oneself more inclined towards negativity.

The thoughts have a direct access to beneficial genetic activity which also affects how well the cells function, via the genetic activity inside the cells.

Every cell in the physical body is replaced in about every two months. One can thus reprogram one’s pessimistic cells to be more optimistic by acts of compassion. We are affecting our genes with every thought we have.

This means that one’s biology doesn’t really spell one’s destiny, and that one isn’t controlled by one’s genetic make-up. Instead, genetic activity can be determined by the thoughts, attitudes, and experiences. Epigenetics shows that thoughts and experiences control the biology. By changing the thoughts, one can influence and shape one’s genetic make-up. One has a choice in determining what input the genes receive. The more positive the input, the more positive is the output of the genes.

Leading edge, evidence-based theories about the new forms of cognition that emerged in the course of human evolution come from a range of disciplines, including anthropology, archaeology, economics, evolutionary biology, neuroscience, philosophy, psychology and quantum physics. The new forms of cognition involve causal reasoning, imitation, language, metacognition and theory of mind.\[5\]

**Thoughts for conscious evolution:** Recent Epigenetics researches on the regulation of gene expression in the central nervous system (CNS) during stress mainly focus on three mechanisms: DNA methylation, histone modifications and microRNA activity, which can be responsible for dynamic molecular adaptations of the CNS to stressors. The primary circuit that initiates, regulates and terminates a stress response is the limbic–hypothalamic–pituitary–adrenal axis (LHPA). The stress-controlling brain areas also react dynamically to stress and have long-term effects. Psychogenic stress can cause adaptive changes in the CNS leading to behavioral changes, gene activity or synaptic plasticity in the hippocampus. The epigenetic basis of such molecular adaptations in the brain lead to genome-wide epigenetic changes through DNA methylation due to chronic psychogenic stressors. Thus stress response to such psychogenic stressors has specific epigenetic mechanisms in the CNS.

Stressors are of course negative in character in the sense that they have an adverse effect on the organism. But nevertheless it shows that the states of the mind can and do affect the body. Changing over to a positive stance, we recognize that we have much more power than ever believed to influence our physical and mental realities. Our mindset is recognized by our body — right
down to the genetic level, and the more we improve our mental habits, the more beneficial response we get from the body. We can’t control what has happened in the past, which shaped the brain we have today, programmed our cells, and caused certain genes to switch on. However, we do have the power at this moment and in going forward to choose our perspective and behavior, which will change our brain, cells, and genes. A possible neuropsychological mechanism of thought-encoding could be that a repeated thought leads to its accentuation and then on a chain of events occurs as follows: thought neural circuit ⇒ mutation inheritance of mutated genetic pattern ⇒ as corresponding Neural-correlate-forming genes in the off-spring. Similar thought in the off-spring. 

Conclusion

Evolutionary Psychology has of late focused on different aspects of human cognition and the genetic effects produced by conscious experiences through such processes as DNA methylation. DNA methylation is a source of inter-individual phenotypic variation. Shea has proposed the concept of ‘inherited representation’ which takes into account genetic, epigenetic and cultural inheritance as factors determining the production of adaptive phenotypes.

On the other hand, the law of cause and effect finds a profound place in all the philosophies wherein it is clearly spelt out how actions by individuals with different motives lead them to different planes of experience. The operative principles behind the law of cause and effect are very deep and profound, allowing us to see life not as a set of random occurrences, but rather as a predictable formula of conscious free choice that can be molded and shaped to create the life we would like to experience and enjoy on a daily basis. Every human thought, word and deed is a cause that sets off a wave of energy throughout the universe which in turn creates the effect whether desirable or undesirable, resulting in the corresponding form of physical manifestation. Thus the whole universe is a physical manifestation of the giant evolutionary force of the cosmic urge using the genes only as the medium of its variegated operations.

Validation of Pregnancy Physical Activity Questionnaire (TAMIL)

Kavipriya S., B. Sathya Prabha, N. Venkatesh

1MPT II Year, 2Associate Professor, 3Course Chairman, Faculty of Physiotherapy, Sri Ramachandra Medical Centre and Research Institute (Deemed to be university), Chennai

ABSTRACT

Background: Physical activity is very important during pregnancy for better maternal and foetal health. The physical activity during pregnancy varies with different periods of gestation. Therefore, the pregnancy physical activity is quite difficult to assess. The pregnancy physical activity questionnaire developed by Prof. Lisa Chasan Taber et al. (2004) is one of the few currently available questionnaires for measuring the physical activity during pregnancy. It was found to have few activities like mowing the lawn with mower which were not practiced in Tamil population thus there was a need to translate and culturally adapt the questionnaire.

Methodology: Total 75 mothers were screened and finally 50 participants were selected according to the inclusion and exclusion criteria. First session the mothers were administered with Tamil PPAQ and they were asked to fill details about past 7 days. The same was repeated after 1 week with English questionnaire for validation. In the last session, the mothers were administered with Tamil PPAQ for reliability analysis.

Results: Internal consistency analysis of the Tamil PPAQ using Cronbach’s alpha between the two Tamil PPAQ is good with the value 0.83. The test retest reliability was done between the Tamil PPAQ and English PPAQ by Intraclass correlation coefficient which ranged from good to excellent (0.81-0.95).

Conclusion: The Tamil PPAQ is a valid and reliable tool. It has good accuracy for the measurement of physical activity of various intensities and types among pregnant women.

Keywords: Pregnancy, trimesters, physical activity, Pregnancy Physical Activity Questionnaire.

Introduction

Maternal physical and physiological changes are normal adaptation during pregnancy to meet maternal and foetal needs. The changes occur in cardiovascular, hematologic, metabolic, renal, respiratory and skin. The alteration of body’s posture and weight gain results as the pregnancy progresses. Due to the maternal changes mothers experiences musculoskeletal disorders such as upper back pain, lower back pain, pelvic girdle pain, leg cramps, upper and lower limb pain.

Physical activity is very important during pregnancy for better maternal and foetal health. PA during pregnancy reduces the risk of several medical complications during pregnancy. Studies stated that active life style during pregnancy reduce the risk of gestational diabetes, hypertension during pregnancy. Moderate physical activity practice among uncomplicated pregnancy mothers may reduce and prevent the lower back pain, reduces the risk of cardiovascular stress, increases the aerobic capacity and helps in prevention of hypertension, gestational diabetes, vascular complications such as thrombosis and varicose veins during pregnancy. The awareness about the pregnancy physical activity and its benefits are not much publicized. There is some evidence that PA during pregnancy is associated with a reduced length of labor, reduced fatigue, stress, anxiety and depression as well as improved well-being, self-confidence and satisfied with appearance.

The Clinical Practice Obstetric Committee of Canada recommended that “all women without contraindications should be encouraged to participate in aerobic and strength- condition exercise as part of a healthy lifestyle during their pregnancy” 5,1. In spite of several recommendations on pregnancy PA, the prevalence across gestation yet seems to be low among
the obstetric population worldwide. The physical activity during pregnancy varies with different periods of gestation. Therefore, assessment of pregnancy physical activity is quite difficult to assess. An ideal measurement tool is needed to report the optimal physical activity during pregnancy.

The questionnaire is a simple, practicable, easy to administer tool for evaluating the physical activity during gestational period. Mostly antenatal physical activity levels rely on self reported assessment tools like questionnaires or physical activity recalls. Physical activity assessment tools, such as accelerometer and pedometers have been promoted as effective objective methods. Though many questionnaires have been developed and validated on physical activity in normal population, the items in those questionnaires could not be used for pregnant mothers. The pregnancy physical activity questionnaire (PPAQ) developed by Prof. Lisa Chasan Taber et al. (2004) is one of the few currently available questionnaire for estimating the pregnancy physical activity levels. It includes questions on trimester specific PA. PPAQ measures five areas such as occupation, household activities, child care activities and sports/exercises.

Translation process: Forward translation was done by an expert in Tamil language. Back translation was done by an expert who has good knowledge in both Tamil and English. Pilot trial was done in 5 mothers for any difficulties in understanding the language. After making further corrections, final draft of PPAQ-Tamil was developed.

Validation process: Total 75 mothers were screened and finally 50 participants were selected according to the inclusion (mothers with 32-36 weeks of gestation & mothers with working knowledge of English and Tamil.) and exclusion criteria (mothers in their first and second trimester, high-risk mothers with placenta previa, hypertension, cervical encirclement, seizure disorders, uncontrolled GDM, respiratory disease, renal disease, cardiac problems, history of previous miscarriage). A written informed consent was obtained from the mothers in their comfortable language. The study was conducted in 3 sessions, each with a gap of 7 days. First week the mothers were administered with Tamil PPAQ, they were asked to fill details about past 7 days. The same was repeated after 1 week with back translated English question for validation. In the last session, the mothers were administered with Tamil PPAQ for reliability analysis.

Cronbach’s Alpha-0.83
Results

The data obtained from the questionnaire in three sessions with 7 days gap from 50 pregnant women were used to analyze the reliability and validity of the PPAQ Tamil. Statistical analysis was done using the SPSS 23 version (Statistical package for social sciences). The test retest reliability and validity was assessed using Intraclass correlation coefficient and Cronbach’s alpha. Total 50 pregnant women were included in the study, out of which 50% were primipara and 50% were multipara. 48% were of 32 weeks of gestation, 26% were of 33 weeks of gestation and the rest 26% were of 34 weeks of gestation during their first session (Table-1).

The internal consistency of Tamil PPAQ was good with Cronbach’s alpha value of 0.83. The validity of the translated PPAQ was assessed using Intraclass correlation coefficient. The ICC value for total activities was good with the score of 0.89. The ICC values of the subscales of intensities such as sedentary, light, moderate and vigorous were 0.77, 0.93, 0.81, and 0.84 respectively. ICC values for subscales of type of activity were 0.91, 0.96 and 0.82 for household, sports & exercise and occupation respectively.

Discussion

Physical activity during pregnancy is one of the primary elements for healthy pregnancy to reduce the risk of medical complications. It is important for the healthcare providers to examine the pregnant women about physical activity level or practice. There is a lack of tool to measure the physical activity during the gestational period. The Pregnancy Physical Activity Questionnaire developed by Prof. Lisa Chasan Taber et al. (2004) found to be a valid tool. There were cultural variances in the activities specified in the questionnaire. The current study is the first attempt to translate and validate the Pregnancy Physical Activity Questionnaire in Tamil.

In PPAQ, the activities like mowing the lawn and riding the lawn mower were replaced with activities that were done by the pregnant mothers in Tamil population. There was also some difference in metric values like ‘gallons’ which were changed to ‘kilogram’. Changes were made with the permission from the author Lisa Chasan Taber. Similar cultural adaptations were made by other researcher also. In Vietnamese version ‘mowing the lawn using a walking mower’, ‘raking and gardening’ was removed, since these activities are not widespread in Vietnam. Instead activities related to riding bicycle or motorbike was added. The author also replaced ‘a car’ with ‘a motorbike’ as most of the people use bicycle or motorbike for transportation and the unit gallons was replaced with litres. In Polish version, question regarding riding the mower was removed and the number of questions was reduced from 36 to 35. French version ‘mowing the lawn using a walking mower’, ‘raking and gardening’, were adapted to ‘shovelling the snow’ according to the climatic condition. In Japanese version riding bicycle was added in going to places section, as riding bicycle is the basic mode of transportation for Japanese women. And also carrying one gallon of milk was replaced with carrying 3 kg rice bag. The Turkish version did not have any cultural variance but had difference in metric values and few instructions which were difficult to understand were changed. The Hindi and Marathi version replaced activities related to mowing the lawn with kitchen activities.

The Internal consistency analysis of the Tamil PPAQ using Cronbach’s alpha between the two Tamil PPAQ is good with the value 0.83 (Table 2). The Cronbach’s alpha value for Turkish PPAQ was under the recommended range 0.70-0.95. The test retest reliability was done between the Tamil PPAQ and English PPAQ by Intraclass correlation coefficient the internal consistency ranged from good to excellent with the ICC values 0.89, 0.77, 0.93, 0.81, 0.84, 0.91, 0.95 and 0.82 for total physical activity, sedentary, light, moderate, vigorous, house hold, sports and exercise and occupation respectively (Table 2). Lisa Chasan Taber et al. (2004) administered English PPAQ twice with seven days gap, polish PPAQ was administered twice with one week gap and both showed substantial level of reliability.

Limitations

The objective measure of physical activity level can be done with accelerometers and pedometers.

Screening first and second trimester mothers would have been more helpful to analyse the PA levels during pregnancy.
Conclusion

The translated and culturally adapted Tamil PPAQ is a valid and reliable tool with good accuracy for the measurement of physical activity of various intensities and types among pregnant women.

Effectiveness of Chlorhexidine Bath, Saline Bath and Standard Bath on Skin Health Status

Divya Abraham¹, Vinitha Ravindran², Mercy Joseph³

¹Lecturer, Amrita College of Nursing, Amrita Vishwavidyapeetham, Kochi; ²Professor, College of Nursing, Christian Medical Vellore; ³Lecturer, Amrita College of Nursing, Amrita Vishwavidyapeetham, Kochi, India

ABSTRACT

Introduction: The skin is the largest organ on our body which is not sterile but thousands of bacteria live on skin permanently. Bathing with various antiseptic solutions are practiced at hospital setting to remove all these microorganisms. Chlorhexidine wipes are the most commonly used medicated bath at hospitals. Though bathing with these medicated wipes are efficient in removing microorganisms than standard bathing with soap and water, the maintenance of skin health status of the individual need to be considered.

Objective: To assess the effectiveness of chlorhexidine, saline and standard bath on skin health status.

Method: An experimental was conducted among 102 subjects, selected using consecutive sampling and were randomly allocated to three groups (chlorhexidine, saline and standard bath). Skin health status of all subjects were assessed before, 2hrs and 24 hrs after the intervention by an individual who is blinded to the intervention using Neonatal skin assessment score.

Results: The mean skin health status scores were 3.03, 3.12, 3.03 at 2hrs 3.00, 3.06, and 3.00 at 24 hours in chlorhexidine, saline and standard bath respectively and were almost the same after the intervention in all three groups. This finding indicated that chlorhexidine and saline did not make any difference in the skin condition.

Conclusion: The present study supports the use of chlorhexidine, and saline wipes in children since it didn’t cause any adverse reactions, yet other studies conducted in neonates and infants alerts the health care professionals in using all these antiseptic wipes in children.

Keywords: Chlorhexidine bath, saline bath, standard bath, skin health status

Introduction

The skin is the largest organ on our body. The main role of the skin is to provide a barrier which prevents infection, the loss of water from the body, and penetration of irritants and allergens. These functions depend on the maintenance of skin integrity. The skin also acts as a barrier that limits invasion and growth of pathogenic bacteria, which include the mechanical rigidity of the stratum corneum, its low moisture content, stratum corneum lipids, production of lysozyme, acidity (pH 5), and defences.

Skin is also excellent at absorbing things, any products you put on the skin gets absorbed easily. It is a great advantage for getting beneficial remedies into our body through bathing. But unfortunately, the skin will also absorb all the toxins and artificial chemical ingredients found in so many skin care and beauty products.

Skin is not sterile. Indeed, thousands of bacteria live on skin permanently and contribute to health by maintaining a steady colony that inhibits establishment of harmful yeast and fungal infections. These bacterial populations are referred to as the ‘resident flora’. A number of bacteria are present on the skin for a short period due to transfer from other people or the environment, and these constitute the ‘transient flora’.

Bathing is the commonly used hygienic measure which can do more than refresh, cleanse and hydrate your skin, it’s also a great way to relax and decompress from a stressful day. As it discussed earlier skin bacteria live naturally in the outer keratinized layers of the epidermis, and it follows that bathing with water or with dilute solutions of surface-active agents will remove many of that microorganisms like Staph, MRSA and other pathogens on the skin. 

Soap has been used for bathing for many decades, but trends has changed recently. Doctors often prescribe bleach baths and baths with chemically laden disinfectants to people with stubborn Staph and MRSA skin infections. While these MRSA baths and Staph baths may kill infecting bacteria on your skin, they can also kill off the good bacteria that help protect your skin. Though bleach and toxic chemical disinfectants can remove the pathogens from the skin, it can also weaken your immune system, cause skin irritations and allergic reactions.

Bathing with antiseptic solutions has become common in health care setting too. Chlorhexidine gluconate (CHG) is a routinely used antiseptic to disinfect skin in a variety of product types in healthcare settings. It is a broad-spectrum antiseptic which is effective against pathogens.

CHG is known to adhere to and remain on skin even after rinsing with water. When used in pre-operative skin preparations and pre-surgical hand disinfectants, CHG slows repopulation of the resident flora for hours after the initial use (persistence). It has been suggested that residual CHG can kill transient organisms contaminating the skin long after product application. CHG-based products are used frequently in the healthcare setting for peripheral and central venous catheter (CVC) site skin preparation, daily bathing of intensive care unit patients, full-body newborn skin cleansing, umbilical cord care, and Staphylococcus aureus decolonization.

At present, whole body bathing or showering with skin antiseptic in order to prevent surgical site infection is a widespread practice before surgery. The aim of washing is to make the skin as clean as possible by removing transient flora and some resident flora.

Though chlorhexidine and other disinfectant solutions like saline are good at removing the pathogens from the skin, concerns regarding skin breakdown were the most common reservations that health professionals have cited for their hesitation to use CHG. The poor skin integrity may be a significant factor in the most of the client’s.

It is also very important to consider that baby’s skin has a less developed epidermal barrier than adults and thus is more prone to damage; recent research suggests that the stratum corneum of infants becomes ‘adult-like’ only after one year of life. Also, most areas of skin are dry, creating an unfavorable environment for bacterial replication.

The researcher felt that maintenance of skin health is equally important as removing pathogens from the skin. And as said before skin of the children are at more risk than of adult population. So the present study is aimed at assessing the effectiveness of chlorhexidine, saline and standard bath on the skin health status of children.

Method

The study was conducted among 102 children who got admitted to the pediatric wards of a tertiary care hospital, Vellore. Subjects were selected using non-probability consecutive sampling. Written consent was obtained from the parents of the subjects after explaining the purpose of the study. After getting the consent the researcher randomly allotted the subjects into three groups by using a random table numbers. Skin health status of all subjects were assessed before the intervention, 2hrs and 24 hrs after intervention by an individual who is blinded to the intervention using Neonatal skin assessment score. Which is a standardized validated tool developed by Association of Women’s health obstetric and neonatal nurses (AWHONN) in collaboration with National Association of Neonatal Nurses (NANN). Which assess the skin health status in terms of dryness, erythema and excoriation. Reliability of this tool is done by using interrater reliability which is 0.7 and interrater reliability is 0.6. It has also been validated in a population of older child. Data was analyzed using descriptive and inferential statistics. Ethical clearance was obtained from Institutional review board.

Table 1 shows that majority (40.2%) of children were in the age group of infant (0-1years) and 61.8% were males. More than half (69.6%) children were from rural community and most (39.2%) were from middle class socioeconomic status.

From the above figure it’s clear that bathing with chlorhexidine did not make any change in the skin health status of the children.

Figure 1: Distribution of children who received chlorhexidine bath based on their skin heath status.

N = 102 (n = 34)

Figure 2: Distribution of children who received saline bath based on the skin heath status.

N = 102 (n = 34)
From the above figure it’s clear that 91% of them had perfect score before and after 2hrs of saline bath but after 24 hrs 94% of them had perfect score.

\[ N = 102 \ (n = 34) \]

![Skin health status](image)

**Figure 3: Distribution of children who received standard bath (soap and water) based on the skin heath status**

From the above figure it’s clear that after 24 hrs. of standard bath all the subjects had a perfect score.

From the above table it’s clear that there was no significant difference in the mean skin health status of subjects after 24 hrs. of intervention.

**Discussion**

Skin is the largest sense organ of our body. Each individual’s skin reacts differently to the application of solutions, especially medicated ones. It has been documented that chlorhexidine causes side effects like itching, swelling and chest tightness in some individuals (PubMed Health, 2015). Saline has been proven to be a gentle skin cleanser because of it’s isotonic properties. As the present study included two types of solutions in addition to soap and water, assessing the skin status to look for any reactions to the agents used for bathing became vital. The skin health in terms of erythema, dryness and breakdown was assessed using the Neonatal skin condition score. The skin assessment was done by a second person who was blinded to the intervention.

The analysis of the present study revealed that majority of the children (95%) had perfect score (that is 3) during the pre-assessment. At 2hrs of intervention majority (97%) in chlorhexidine, (91%) in saline and (97%) in standard bath had perfect score, and at 24 hours 97%, 94% and 100% in chlorhexidine, saline, standard bath respectively had perfect score. The mean
scores were 3.03, 3.12, 3.03 at 2hrs 3.00, 3.06, and 3.00 at 24 hours in chlorhexidine, saline and standard bath respectively and were almost the same after the intervention in all three groups. This finding indicated that chlorhexidine and saline did not make any difference in the skin condition in terms of erythema or dryness and breakdown.

These findings are comparable with the similar study done by Shankar et al. (2009) among 60 infants (20 in each group chlorhexidine, saline and non-cleansing) admitted in a neonatal intensive care unit of a tertiary care hospital. The study could not find any significant difference in the skin condition between the three groups, and none of the infants developed erythema or fissuring of the skin and the median scores were same in all three groups. Similar results have been reported from other studies too. It is also supported by two other studies done by Darmstadt et al. (2007) and Mullany et al., (2008) in neonates which reported that cleaning with chlorhexidine had no adverse effects on skin condition. The cleansing treatment was not associated with any skin irritation. Whereas dry skin with scales was reported in one infant from each of the treatment groups prior to the intervention, and again at 2 hours after the intervention.

The results are, however, in contrast with the observation by Garland et al., who found localized contact dermatitis after the use of chlorhexidine–gluconate impregnated dressing and hence were not in favor of its prolonged use in infants. It is contrary to the findings of the study by Montecalvo et al., (2012) who noted skin rashes and thrombocytopenia after the skin was cleansed with 2% chlorhexidine.

Another study conducted in neonatal intensive care units of United States, where twenty-eight participants (51%) who used CHG in their NICU reported adverse reactions. All were skin reactions and included erythema (32%), erosions (7%), or burns (61%)

**Conclusion**

Skin cleansing with antiseptic solutions during hospitalization are very efficient in removing the pathogens/ microorganisms from the body and thus by preventing nosocomial infections and reducing the hospital stay. But at the same time maintenance of a good skin health status is also important especially in children. The present study supports the use chlorhexidine, and saline wipes since it didn’t cause any adverse reactions in children, yet other studies conducted in neonates and infants alerts the health care professionals in using all these antiseptic wipes in children.

ABSTRACT

Background: The launch of operational framework for India’s first national cancer screening programme in 2016 was a landmark event in the background of poor screening coverage status. Our study aims to determine the factors deciding the uptake of cervical screening amongst women in rural India.

Method: A cross-sectional, observational study was carried out amongst the women attending a secondary health centre of a district from Northern India. A total of 1250 women aged above 30 years who were never diagnosed or treated for cervical cancer were enrolled. After taking informed consent all women were interviewed about their bio-social profile and if they ever underwent screening of cervical cancer. Chi-square or Fisher’s exact test was applied to find out significant difference in distribution of bio-social variables (predictors) amongst the study population. The significant predictor variables were subjected to Binary and Multiple Logistic Regression. Unadjusted and Adjusted Prevalence Odds Ratio with 95% Confidence Interval were generated.

Results: Religion, working status of the women, history of multiple sexual contacts were important factors influencing the utilization of screening.

Conclusion: We conclude that cervical cancer screening is a cost-effective strategy in saving lives. We can tap its benefits only when we identify and remove the hurdles in the utilization of cervical cancer screening.

Keywords: Screening, Cancer Cervix, India, Uptake Determinants

Introduction

The launch of operational framework for India’s first national cancer screening programme in November 2016 was a landmark event for the country in background of poor screening coverage status.¹ Opportunistic screening in various regions of India varied from 6.95 in Kerala to 0.006% and 0.002% in the western state of Maharashtra and Tamil Nadu respectively.²⁻⁵ Most of the women who cannot tap the benefit of early screening present with advanced and late stages and treatment in these stages which leaves the women both financially and prognostically weaker resulting in poor compliance.⁶⁻⁷ Compared with other cancers, screening for cervical cancer is the most effective.⁸ However geographical, economic, social and gender based factors may serve as barriers for the women to reach out for screening especially in a low resource settings.⁸⁻¹¹ Thereby our study aims to determine the factors working in background which decide the uptake of cervical screening amongst women attending a rural health care setting from Northern India.

Method

A cross-sectional, observational study was carried out amongst the women attending a secondary health
care centre of Ghaziabad, a district from Northern state of India (Uttar Pradesh). All of the women aged above 30 years who were never diagnosed or treated for cervical cancer were enrolled. The duration of the study was one year (October 2016-October 2017). A total of 1250 women were enrolled during the reference period through purposive sampling. Based on the study of Everlyne et al\textsuperscript{12} that estimated proportion of women having no awareness for cervical cancer amongst women who underwent cervical cancer screening to be 35% and women who never underwent screening to be 69% our sample collected satisfied the required sample size calculated using G*Power 3.1.9.2 at 95% confidence levels, 80% power of the study and 5% margin of error.

A semi-structured scheduled was designed seeking information about the socio-demographic profile, personal and sexual history, family history of cervical cancer and past history of Diabetes Mellitus (DM), gynecological complaints such as history of excess vaginal discharge, post coital-bleeding, inter-menstrual bleeding, awareness of cervical cancer and history of Human Papilloma Virus (HPV) vaccination. For awareness of cervical cancer women were asked to enumerate at-least two correct symptoms of cervical cancer. Finally women were asked if they ever underwent screening of cervical cancer.

Statistical analysis was performed using IBM SPSS version 16.0. Results were expressed in frequencies and percentages for categorical variables and Mean ± Standard deviation for continuous variables. The data collected for bio-social predictor (independent) variables was converted as categorical data and chi-square or Fisher’s exact tests was applied to find out the statistically significant difference in proportions of predictor variables amongst the women who had undergone cervical screening and who had not. The predictor variables found statistically significant were then subjected to binary logistic regression and Unadjusted Prevalence Odds Ratio (UPOR) with 95 % Confidence Interval (CI) was generated. These variables were then subjected to Multiple Logistic Regression in order to control the effect of confounding and Adjusted Prevalence Odds Ratio (APOR) with 95% CI was generated. The dichotomous outcome was whether the woman has ever undergone cervical cancer screening or not. For all the statistical tests a two-sided p value of <0.05 was considered as statistically significant.

Ethical Consideration: The study was initiated after getting clearance from the Ethical Board Committee of the Santosh Medical University, Ghaziabad, Uttar Pradesh, India. The objective, the purpose and the method of the study were explained to all the participants in their local easy to understand language. An informed consent, in the local language was obtained from all the participants who were eligible for the study.

Results

A total of 1250 women in the age group between 30 to 70 years who visited the Obstetrics and Gynecology unit of secondary health care centre were enrolled. The mean age of the participants was 40.35±3.73 with an age range of 30-65 years. The proportion of women who had undergone cervical cancer screening was 3.04%. Less than one-third (29.9%) of the women had awareness of cervical cancer. (Table-2)

Biosocial characteristics: Majority of the study participants were from rural background (67.8%). More than half (53%) were Illiterate. Women who were from Hindu background were nearly four times more likely to report undergoing cervical screening than women from Muslim background. Literate mothers were also four times more likely to report undergoing screening compared to mothers who were illiterate. Working women were six times more likely to report undergoing screening compared to mothers who...
Discussion

We observed that the proportion of women who reported undergoing cervical cancer screening was just 3.04%. Our finding is in line with several studies from India which report poor screening coverage in Indian setup. 2-5 Less than one-third (29.9%) of the women were aware about cervical cancer. Awareness of cervical cancer reported from Indian studies showed variations according to the parameters used for awareness and the geographically area chosen for the study.13-16

We observed that literate women, women who are working are more likely to undergo screening for cancer cervix. Our finding is in concordance with findings from other studies. 17,18 Women who were Muslim by religion were less likely to undergo screening. This can be partly explained due to their social customs which reduces the risk of development of cervical cancer. A study from Southern India has reported statistically significant ratios for cervical cancer amongst Hindus (2.5 times) and Christians (1.9 times) compared to Muslim women. The incidence rate for penile cancer was 2.2 per 100000 among Hindus, 0.8 among Christians and nil among Muslims.19

Woman, whose husband was working professionally and was not consuming alcohol or tobacco, was more likely to undergo screening. This finding reflects that husbands do have role in influencing the health seeking behavior of the women. Studies from Indian setup and other developing countries have stated how woman lacks the decision making power and depends on her husband for seeking health care.11,20

Multiple sexual contacts of the women positively influenced uptake of screening. This may be due to the fact that women having multiple sexual contacts were likely to be aware of the risk of cancer and thus are more likely to undergo screening. Our finding is supported by another study from Nigeria.21 Women who were aware about the cervical cancer, who had received HPV vaccination in past, had positive family history of cervical cancer or had complaints related to cervical cancer such as post-coital and inter-menstrual bleeding 22 were more likely to report for cervical cancer screening.

Personal History of the women and their husband: It was observed that women who had multiple sexual contacts were nearly seven times more likely to report undergoing cervical cancer screening compared to women who never had multiple sexual contacts. Women whose husbands were regularly consuming tobacco (chewing/smoking) and alcohol reduced the chances of reporting undergoing cervical cancer screening by 65% and 63% respectively compared to women whose husband were not consuming tobacco and alcohol. (Table-2) No statistically significant difference in proportion was observed for smoking status of the women and history of multiple sexual contacts of the husbands amongst the study population.

Cervical cancer related history: Only six women (0.5%) reported to have received HPV vaccination. Women who had been vaccinated for HPV were thirty-four times more likely to report undergoing cervical cancer screening than women who were never vaccinated. Also women who reported positive family history of cervical cancer were nearly three times more likely to report undergoing cervical cancer screening. Women who were aware about cervical cancer were nearly forty-six times more likely to report undergoing screening compared to mothers who were never vaccinated. Also women who reported positive family history of cervical cancer were more likely to report for cervical cancer screening.

Predictors of uptake of cervical cancer screening: After adjusting all the variables found significant on bivariate analysis, using multiple logistic regression it was observed that women who were Hindu by religion, working, having history of multiple sexual contacts, receiving HPV vaccination, having inter-menstrual bleeding and being aware of cervical cancer were more likely to undergo cervical cancer screening than their counter-parts. On the other hand women whose husbands were regularly consuming alcohol were less likely to report for screening compared to women whose husbands do not consume alcohol. (Table-3)
screening. This finding suggests that women who got aware about cervical cancer either through a positive health experience of health education and vaccination or a negative experience through family history of developing cervical cancer are more likely to undergo screening.

**Conclusion**

We conclude that both positive and negative aspects of the biosocial profile of the woman influence her uptake in screening. Cancer screening is a cost effective strategy in saving lives. We can tap its benefits only when we identify and remove the hurdles and encourage positive environment such as literacy, women empowerment through self-reliance and decision making power, health promotion activities through awareness and HPV vaccination which will significantly influence utilization of cervical cancer screening.

ABSTRACT

Objectives: The study aims to assess the patterns, severity and clinical outcome of poisoning incidents among the peoples admitted in a tertiary care hospital, Rajahmundry, India.

Method: A retrospective assessment was conducted over a period of one year in a tertiary care teaching hospital; data was collected from the medico-legal case register of the hospital. The data needed for the study was collected using an appropriate data collection form.

Results: The study involved 187 patients with a mean age of 27.95±10.38 years. The commonly used poisoning agent was pesticides (n=111). The intentional poisoning incident was (n=183) higher than accidental (n=4) poisoning. Male (n=103) populations were more prone to commit suicide compared to the female (n=84) population. The literates (n=155) are predominantly higher among the population. The poisoning ratio was higher in the rural (n=131) population compare to urban (n=27) and semi urban (n=29) population.

Conclusions: A majority of patients whose severity of illness was predicted to be mild to moderate recovered from the poisoning. In contrast, patients whose illness was predicted to be severe were either discharged with severe morbidity or deceased.

Keywords: Deliberate poisoning, parasuicide, pattern, clinical outcome, Glasgow coma scale

Introduction

Deliberate poisoning, when it is nonfatal, and particularly when it is grouped together with self-injury, is also called deliberate self-harm (DSH)¹, attempted suicide or parasuicide. It is estimated that 200,000 people die due to poisoning in the world². In young adults it appears to be an almost accepted pattern of social behaviour and, as a result, it has become a major medical problem in both social and economic terms³. The World Health Organization’s definition of parasuicide in a recent international study was: ‘An act with nonfatal outcome, in which an individual deliberately initiates a no habitual behaviour that, without intervention from others, will cause self-harm, or deliberately ingests a substance in excess of the prescribed or generally recognized therapeutic dosage and which is aimed at realizing changes which the subject desired via the actual or expected physical consequences⁴. A parasuicide episode may be defined as the self- exposure of an individual (by ingestion or inhalation) to an amount of substance associated with the significant potential to cause harm. Parasuicide is one of the commonest acute medical presentations in the Emergency Department⁵. The occurrence of parasuicide with toxic substances (e.g., pesticides, household products, and medicines) has been a major concern worldwide. Parasuicide is heterogeneous and may be indicative of psychological disorders including: alcohol and substance abuse,

eating disorders, dissociative, somatoform, or body dysmorphic disorders, depression and anxiety disorders, posttraumatic stress disorder, or several personality disorders and schizophrenia. Poisoning occurs as a result of agricultural use, accidental exposure, suicide and, rarely, homicide. In a retrospective study of suicide, we found that the interval between first suicidal behaviour and the suicide was related to the patient’s sex and mental disorder. In developing country like India, it predominantly occurs in young people impulsively responding to stressful events who have little desire to die. Deaths are rare, since the medicines ingested are of low toxicity or easily treated. This study aimed to identify the poisoning and its properties in an agricultural area of East Godavari district, Andhra Pradesh, India, with the expectation that such knowledge will direct future campaigns to prevent self-harm, thereby preventing the deaths due to suicides with timely intervention.

Method

Research Design: A retrospective hospital based study was conducted to determine the pattern of poisoning from the medico-legal case register dated January 2008 to January 2018.

Study Population: People who consumed any chemical, drugs, plants or any substance intentionally or unintentionally poisoning cases were identified from the medico-legal case register. Animal poisoning or any other form of suicide (hanging or using weapon) are excluded. Relevant data was collected from the patients’ case notes, treatment charts, nursing notes, laboratory reports and discharge summaries.

Sample Size: A total of 256 case was found in the medico-legal case register. We added 187 case according to the inclusion criteria. Using an appropriate data collection form, data are collected from the case register. A data related to socio demographic, poison, treatment, severity indicators, and actual outcome.

Assessment of Severity of Poisoning: As per the severity indicators of GCS the data was collected and assessed to determine the severity score/level/grade of patients. GCS scores were calculated on the basis of motor response to pain, and verbal and eye responses.

Results

Patterns of Poisoning: The patterns of poisoning based on the data collected from the hospital are given in the Table1. Pesticides are the most highly used substance for poisoning (n=111), followed by Medicines (n=32); other substance (n=44) and Plant poisons (n=4). All the patients admitted for poisoning cases belongs to intentional (n=183), only (n=4) is unintentional. The major route of exposure was by oral (n=187),

Socio-Demographic Patterns of Poisoning: The incidents of poisoning was categorized by age, marital status, occupation, place of residence, and educational background, the results are given in the Table2. The age range of the patients is between 12 to 73 with a mean±S.D. age of 27.95±10.38 years. The ratio of male to female was 1.23:1. The age group between 16-25 years (n=100) was more prone to commit suicide. The suicidal tendency was higher in Illiterates (n=32), and we found similar with graduates (n=32), secondary (n=31) and higher secondary (n=30), Based on occupation both Labour workers (n=49) and home makers (n=49) are committing suicide, followed by Students (n=43), Salaried peoples are the least group (n=4).

Socio-Economic Patterns of Poisoning: The incidents of poisoning was also classified based on social-economical classes in middle (n=139), followed by poor (n=31) and (n=17) are given in Table 3.

Lag Time: The mean time interval was 4.13 hours (range 15 min to 58 hours). Patient from urban areas were brought to hospital earlier than from rural areas (mean 3.25 h vs 11.15 h). Similarly, patient belonging to higher income groups had significantly shorter time lapse. However, there was no difference in time interval between those who survived and those who died.

Glasgow Coma Scale (GCS): The GCS was used to identify the level of consciousness which can be used to interpret the neurological functions of the patient Table 4. Majority of the patients show Mild head injury (n=174), Moderate Head Injury (n=3) and Severe Head Injury (n=10). Out of the 10 Severe Head Injury (n=2) are deceased.

Discussion

The age specific pattern of poisoning in this study is to that of the most developing country most occur in young peoples 16-25 years of age, then falls steadily with increased in age, similar to Churi S et al10 but other studied reported that 20-30 years was higher Kumar, Ganesh, S et al, Chattoraj A et al, Srivastava et al, Aminak et al, Maharani, B et al11-13. The agent used for poisoning is similar to that of the research article published by Churi S et al, Kumar, Ganesh, S et al, Chattoraj A et al, Khan, Pathan Amanulla et al, Aminak et al, Maharani, B et al10-14 who states that pesticides are used more for intentional poisoning, which is followed by drug over dosage, in Srivastava et al study they reported that house hold materials are highly used for suicide. In the group of pesticides organophosphates compounds are used
more, as the availability of pesticides is easy availability through the pesticides shops.

It is estimated that more than 2 million peoples are dying due to poisoning in the world. In most of the condition male are more who commit suicide compared to the women this is been already proved in many studies Churi S et al, Kumar, Ganesh, S et al, Chattoraj A et al, Khan, Pathan Amanulla et al, Amitaet al, Maharani, B et al in our study we reported the same.

In the present Study the married peoples 56.68% are more prone to come suicide compared to unmarried people 41.71% and 1.6 % was divorced, our observation was similar to the study of Churi S et al, Chattoraj A et al and Maharani B et al. This might be due to the family stress and financial problems in the families.

In the population of 187, with occupation of manual labour 27.3% and home makers are 26.2%, which is followed by students 22.99%, similar result was identified from Kumar, Ganesh, S et al and Maharani B et al, there was a different in Kumar, Ganesh, S et al11 and Churi S et al10 study. In this they have concluded that formers commit more suicide which was followed by the students. This difference is due to the study location and the environment.

The present study site is in a rural area, where the study has more rural peoples 70.05% who are prone to commit suicide compared to Urban and semi urban population which was proved with our study and also it is similar with Churi S et al 60.6% and Chattoraj A et al 64%10,12.

We evaluated the literacy level of the patients who commit suicide, we found 49.73% are above secondary school grade. Illiterate was 17.11%, this was supported by the study of Churi S et al and Chattoraj A et al10,12.

In the present study, pesticides 59.36%, drug overdose 17.11%, were most common types of poisoning, the retrospective studies point out the same Poisoning agents which is used as organ of phosphorus was the most used poisoning agent to commit suicide which is proved in majority of the work except Sriniva. Kulfi study has given a result of household 44.1 % drug abuse 18.8 % agricultural poisoning 12.8 %.

When analysing the social economic background of the patient, middle class 75.4% are from this group and other study also have the same results Churi S et al. Followed by rich 14.97% there was a deviation in the study of Churi S et al10, they have concluded that the poor socio-economic background was the second most common group to commit suicide. We evaluated that poor socio-economic background was 9.63% reported according to our study.

We identified by using Glasgow Coma Scale, that patients with mild head injury 93.05% can have a better improvement comparative to moderate head injury 1.6% and Severe head injury 5.35% we have two disease patients the amount of poison which is used is very high and also the lag time was also correlating with this incident.

**Conclusion**

As it was a retrospective study, it was difficult to draw conclusions regarding the role of first aid in acute poisoning. Suicidal tendency wearing on social economic condition and socio demographic pattern which is a growing health problem in developing country the most commonly used poisoning agents are pesticides and medicines which was identified in our study. The most common cause of poisoning was intentional which indicates that by patient counselling and effective medical management is very important. The scary searches GSC has an excellent sensitivity to identify the clinical outcome and which might predict the severity in emergency centre so implementing the use of Jessie scale is highly recommended.

A Study on the Capital Expenditure and Operational Costs Incurred to Establish and Run a Proposed Stand alone 30 Bedded Dialysis Center in Hyderabad, India

M.S.Siddarth Sai1, M.Samhitha2, Malvika3

1Senior Resident, Dept of Hospital Administration, KIMS, Narketpally; 2Intern, Apollo Institute of Medical Sciences, Hyderabad; 3Junior Resident, Dept of Hospital Administration, NIMS, Hyderabad

ABSTRACT

Dialysis centers attached to hospitals will be unable to meet the growing need of ESRD patients and this need will have to be fulfilled with standalone dialysis units. This study focuses on the capital expenditure and operational costs required to establish and run a stand alone 30 bedded dialysis unit in Hyderabad. The total project cost to establish a 30 bedded standalone dialysis unit would be Rs 2.8 crores. Operational cost per month to run the unit at 50-70% occupancy would be Rs 18.65 lakhs. Fixed costs per month would be Rs 14.6 Lakhs and the variable cost per session of dialysis would be Rs 1011.

Keywords: Dialysis centers, Project cost, Operational cost

Introduction

Dialysis is the artificial replacement for lost kidney function, in the people affected with End Stage Renal Disease (ESRD). It has been known for many years that ESRD is associated with very high mortality. In India the first Hemodialysis facility was established in 1961 at the CMC Vellore; Over the last three decades many more dialysis facilities have been established in Government sector, in Charitable Trust run institutions & by Private Nephrologists. The incidence of end stage renal disease was estimated to be 180 to 200 per million populations. In India, the projected number of deaths due to CKD was around 5.23 million in 2014 and is expected to rise to 7.63 million in 2020. Therefore several thousands of patients have to live on maintenance dialysis in India. Dialysis units attached to hospitals will find it difficult to meet this need and stand alone dialysis units would be the way forward. This study aims to find the costs to be incurred in establishing such units.

Objective

1. Calculating the total cost to be incurred in establishing a 30 bedded dialysis unit.
2. Calculating the fixed costs and variable costs associated with the dialysis unit.
3. Calculating the monthly and annual operational costs required for running the unit.

Methodology

- An observational and comparative study was done where the data pertaining to dialysis was collected and analyzed.
- Various market suppliers of Dialysis equipments were contacted and quotations collected for the required equipment.

Our market is facing changes every day. Many new things develop over time and the whole scenario can alter in only a few seconds. There are some factors that are beyond your control. But, you can control a lot of these things and one among them is costs. Cost accounting provides the detailed cost information that management needs to control current operations and plan for the future. Cost Accounting aims at computing cost of production/service in a scientific manner and facilitate cost control and cost reduction.
Norms for equipment and staffing was done as per guidelines.

Based on the quotations and the equipment requirements, Total cost of the project required to establish the unit has been calculated.

Fixed, Operational and variable costs have been calculated after identifying the consumables required for a session.

Cost of consumables and variable cost for a session of Dialysis

Estimated cost of Electricity per session – 80 Rs
Estimated Cost of water per session – 30 Rs
Estimated cost of Laundry per session – 10 Rs
Total Variable cost per session = 1011

Fixed costs per month
- Salaries – 8.1 L
- Rent and Building Maintenance – 3 L
- Loan EMI – 2.5 L
- Depreciation -1 L
Total – 14,60,000

Discussion

The total project cost required to establish a 30 bedded standalone dialysis unit would be Rs 2.8 crores. Of the above, 1.8 crores is required only for the HD
machines. Nearly 70% of the project cost is being spent on the medical equipment. This would also result in a high depreciation. Operational cost per month to run the unit at 50-70% occupancy would be Rs 18.65 lakhs. For the center to be self sustainable and profitable in the long run, nearly 18 lakhs of revenue should be generated per month. Fixed costs per month would be Rs 14.6 Lakhs and the variable cost per session of dialysis would be Rs 1011. The variable cost helps us in finalizing the tariff of each session.

**Conclusion**

With the rising incidence of ESRD, the requirement of Dialysis centers in India is rising. Dialysis centers attached to hospitals will be unable to meet this need and this need will have to be fulfilled with standalone dialysis units. The total project cost to establish a 30 bedded standalone dialysis unit with the latest HD machines would be Rs 2.8 crores.

Assessment of Communication Skills of Budding Doctors in a Tertiary Care Centre Puducherry

Prasad T¹, Prasad S², Lokknath³
¹Asst. Professor, Department of Community Medicine, Aarupadai Veedu Medical College & Hospital, Pondicherry; ²Asst. Professor, Department of Community Medicine, Govt Thiruvarur Medical College & Hospital, Thiruvarur, Tamilnadu; ³MBBS II year student, Aarupadai Veedu Medical College & Hospital, Pondicherry

ABSTRACT

Background: In our country, the doctor-patient relationship has declined immensely and is portrayed as outburst of violence against doctors. Enhancing patient centeredness has been the toughest part of health care as there is no specific medical school curricula that augment their competency in social and communication skills.

Objectives: 1) To assess the self-rating of communication skills of the interns with the patients. 2) To objectively assess the communication skills of interns during their patient interaction. 3) To find if there is any correlation existing within the spectrum of communication skills being observed.

Methods: Forty interns of Aarupadai Veedu Medical College and Hospital, Puducherry were enrolled in August-September 2016. MAAS global rating list and Conversation Skill Rating Scale (CSRS) were used respectively for objective assessment and perception of their inherent patient-interaction skills.

Results: Young doctors rated them as an average conversationalist, socially semi-skilled, moderately competent and also partially appropriate and effective in the way they communicate with the patients (overall average score of 3.6/7). They were slightly above average (score 4/6) in being attentive, physically examining and managing illness in addition to being empathetic, informative to patients, in spite of having inadequate exploratory skills (score 3/6). When a young doctor thinks of being socially skilled, he/she delivers himself/herself as an excellent conversationalist and a competent communicator as evident from significantly positive Spearman's correlation coefficient (P<.05). Doctors who were efficient enough to summarize could endure themselves being better in all the components of a proficient communicator (P<.05).

Conclusion: In order to maximize the significance of inter-personal communication skills among doctors, efforts to imibe the sessions for skills and inter-personal development in the medical curriculum is indispensible to build a healthy doctor-patient relations in future.

Keywords: doctor-patient relationship, communication skills

Introduction

Patient-centeredness in health care system is evolving to be an important approach in effective health care delivery. Effective and competent communication by the physicians to their patients remain one of the core elements of patient-centeredness.¹² Moreover, physician’s skills in communication revealing their overall social competencies, have been identified as one of the six competencies by the Accreditation Council on Graduate Medical Education (ACGME) required for the effective practice of medicine.¹³
Communication in medical school curricula was informally imparted without a specific focus on improving the skills of the budding doctors. This traditional method left gaps in the teaching method that is getting widened with the prevailing circumstances.\[^5\] With the transition from paternalistic approach to individualism, the physicians are facing an extra burden in answering patient’s questions and educating them in pertinent manner.\[^6\] The patient population being diverse among Indians with significant variation in their language, cultural, educational and social background, there has to be vibrant strategy to be adopted by the physicians to tackle them accordingly.\[^7\]

Despite the understanding of this growing issue compiled to scarcity of the studies in Puducherry revealing communication skills of the doctors, the purpose of this study is to assess the same in the budding doctors of our future.

**Objectives**

1. To assess the self-rating of communication skills of the interns with the patients.
2. To objectively assess the communication skills of interns during their patient interaction.
3. To find if there is any correlation existing within the spectrum of communication skills being observed.
4. To suggest measures to improve interpersonal communication of young doctors.

**Materials & Method**

This cross-sectional study was carried out at Out-patient Department & In-patient Department of Aarupadai Veedu Medical College and Hospital, Puducherry. The study was conducted during August-September 2016. Convenient sampling was made and about forty interns were enrolled. We used Conversation Skill Rating Scale (CSRS) for self-rating\[^8\] and MAAS global rating list\[^9\] for doctor patient communication skills for the objective assessment. Statistical analysis were done using SPSS software (Version 22.0, Chicago, USA). Quantitative variables were presented as mean and SD (or median and IQ range). The variables were analyzed using Independent sample t-test and Spearman's correlation coefficient. p-value less than 0.05 was considered to be significant.

The study protocol was approved by the institutional ethics sub-committee following which the study was initiated. Informed verbal consent was taken from the patients before conducting the study.

**Results**

A total of forty interns students were subjected for the 20 interview sessions. The junior doctors rated them as an average conversationalist, socially semi-skilled, moderately competent and are partially appropriate and effective in the way they communicate with the patients. (Table 1)

The individual components of a good doctor -patient communication skills was assessed using MAAS scale. (Table 2) It showed that, all the budding doctors are good at introducing themselves to the patient. They were reasonably good at exploring the reasons they seek the doctors for the prevailing health conditions and in reciprocating their concerns. Only an average score was awarded to the junior doctors in the way they physically examine patients following a proper explanation of the procedure being done. In managing the illness discussing possible alternatives, the male doctors (score 4/6) were better compared to their counterpart (score 3.5/6) and was statistically significant.

They were also partially good in explaining the do’s and don’ts in an understandable language to the patient in addition to summarization and structuring of the diverse phases of appropriate interaction in sequence. Yet, they lack in skills exploring patient’s understanding of the information given and in addition to responding to their non-verbal gestures.

Discussion

The novel of this study is the intra-skills correlations that were observed among the budding doctors. Table 3 shows that, a doctor who feels himself socially skilled is also a good conversationalist ($\rho = .468, P = .002$) and being a competent communicator ($\rho = .389, P = .013$) and vice-versa. In addition, the young doctors adjudicate their appropriateness in their conduct when they tend to over-rate their social ability ($\rho = .311, P = .05$). However, their competencies and effectiveness in communication have not been found to be correlated which might be due to the fact that, he or she might choose not to be competent or be impaired by anxiety or any inner motivation, in spite of possessing adequate understanding and abilities. Fentiman IS et al.,[10] in their study have revealed the importance of barriers of good communication like doctors burden of work, patients anxiety, etc and it is significant for a doctor to get through such barriers to provide a patient centered care.

In table 4, the picture of how one competency go hand in hand with the rest has been clearly depicted. A doctor who is attentive to the complaints betters in managing the patients by providing alternate options and involving in shared decision making ($\rho = .390, P = .01$). A work by Lee RG et al.,[11] have stated that the practitioners need to move beyond the traditional one-way approach with the patients which might not suit in all circumstances and hence shared decision making would remain a possible solution for it. Performing a proper physical examination aids in eminent managerial skills ($\rho = .404, P = .01$) in addition to the delivering of a compendious summary to the patient concerned ($\rho = .414, P = .008$). When they happen to be informative to

Towards the Implementation of IoT for Environmental vStatus Verification in Homes

R. Bala¹, S. Aravind²

¹Student, ²Assistant Professor, Department of Electronics and Communication, Saveetha School of Engineering, Saveetha University, Chennai

ABSTRACT

In this paper, we have revealed a compelling impel-mentation for Internet of Things utilized for checking general household conditions by methods for ease universal detecting sys-tem. The portrayal about the coordinated system design and the interconnecting instruments for the dependable estimation of parameters by savvy sensors and transmission of information through web is being exhibited.

Keywords: Internet of things (IoT), wireless sensor network, home automation, ZigBee, energy management.

Introduction

With the advancements in Internet technologies and Wireless Sensor Networks (WSN), a new trend in the era of ubiquity is being realized. Enormous increase in users of Internet and modifications on the internetworking technologies enable networking of everyday objects [1]. “Internet of Things (IoT)” is all about physical items talking to each other, machine-to-machine communications and person-to-computer communications will be extended to “things” [2], [3]. Key technologies that will drive the future IoT will be related to Smart sensor technologies including WSN, Nanotechnology and Miniaturization.

Humans usually inside their home interact with the environment settings like light, air, etc., and regulate accordingly. If the settings of the environment can be made to respond to human behaviour automatically, then there are several advantages

There are several examples of intelligent home automation or “Smart Home Monitoring” in research labs around the world, such as the GatorTech Smart House [11], Casas Smart Home [12], iDorm [13], Georgia Tech Aware Home [14], Place Lab [15], etc. To date, there has been no complete development of a monitoring smart home of commercial perspective, nor any investigation into how such a house is perceived by either the inhabitants or their careers. The smart homes designed so far are for different purposes such as information collection and decision support system for the wellbeing of the inhabitants [16], [17], storing and retrieving of multimedia data [17] and surveillance, where the data is captured from the environment and processed to obtain information that can help to raise alarms, in order to protect the home and the inhabitants from burglaries, theft and natural disasters [17].

This paper illustrates an effective low-cost and flexible solution for condition monitoring and energy management in home.

System Description

The remote measurement and controlling of domestic devices over the Internet can be mechanized by following certain network architectural design strategies and applying ZigBee communication standards. The unified system will assist the inhabitants to avoid multiple systems to monitor their domestic utilization. The system can be run with the help of an inhabitant favorite laptop or i-pad device. Fig.1 shows the basic layout depicting key elements of the integrated WSN with internet system. It consists of i) Smart Sensing devices, ii) IoT Gateway and iii) Internet Server.

A. ZigBee Wireless Sensor Network: The ZigBee WSN comprises of XBee-S2 modules built by Digi [23] are configured as end devices (sensor nodes) and communicate wirelessly to a coordinator in the form of a mesh topology. If the
end device is within the range of the coordinator device, the system runs like a star topology. Otherwise, hopping takes place and the outer most end device will send its data to the nearby router and consequently the data will reach to the coordinator.

The sensing unit type #3 measures the environmental conditioning values such as temperature, light intensity, humidity, etc.,. Thus, the fabrication of different types of sensing units enabled in remote monitoring and controlling of house-hold appliances through IoT gateway and IoT application. Depicts the fabricated sensing units used in the IoT application.

The power supplies for sensing unit’s type #1 and type #2 are from electrical outlets, whereas for type #3 the power is supplied from a battery. Type #1 and type #2 radio units are continuously on, therefore consume 40 mA. Type #3 radio units’ uses a duty cycling method in which, it is on for 30 ms for every 5 secs, therefore current consumption is 0.24 mAh.

The wireless sensing units with internal sensors to measure temperature, light, humidity, electrical parameters, etc., are deployed at the house. Electrical sensing units are fabricated in such a way that they can be easily plugged into power points and can operate according to their functional characteristics within an indoor range of about 70-80 meters provided an XBee S2 Pro module is used. We considered Xbee-S2 modules in the present setup as they provide sufficient indoor range (i.e. up to 40 meters).

C. IoT Application Gateway: The transformation of sensing information between the ZigBee and IPv6 network is executed by a program at the IoT application gateway, as the ZigBee network does not have the architecture to communicate with internet protocols. The IoT application gateway consists of a program for trans-forming ZigBee addresses and encapsulating data payloads in an internet protocol. The XBee-S2 modules produce sample packets which are converted by
the application gateway to IPv6 User Datagram Protocol (UDP) packets and sent to a server. Command packets to control the XBee-S2 modules are encapsulated in an UDP packet by the server, and converted by the IoT application gateway to ZigBee packets.

D. Sensor Characteristics: The environmental parameters (temperature, humidity and light) are important aspects for deciding whether equipment such as (fans, electric heaters or lamps) should be switched on or off in a wireless monitoring network used for energy management in the home. The following sensors are used in the present setup.

The sensor nodes used in the ZigBee WSN have a temper-ature sensor (TMP 36) [25] operating in the range of −20 °C to +125 °C. The output voltage out of this sensor varies 1 °C for every 10mV with 500mV offset voltage. The light sensor used was BPW21R [26], consists of a planar silicon NPN photodiode that is equipped with a flat glass window and built in colour correction filter designed to approximate the spectral response of the human eye. The power dissipation is about 300 mW with operating temperature range of −40 °C to +125 °C and sensitivity to 9 nA/lx [26]. The AC voltage sensor has a range of 200-280 Volts-RMS with an accuracy of± 2Volts-RMS. The current sensor consisted of an ASM010 current transformer manufactured by Talema [27], with a range of 1 to 100 Amps and operating temperature range from −40 °C to +120 °C.

Implementation Details

A. Address Transformation: The key element in the data transformation from ZigBee to IPV6 format is the address translation. This was implemented by the application gateway program for determining the source or destination address of a packet that encapsulates a ZigBee packets’ payload. The corresponding application gateway performs the address transformation mechanism for ZigBee to address non ZigBee nodes. ZigBee is based upon the 802.14.5 protocol which uses a 64 bit address for each node on a PAN, and 16 bits to identify the PAN ID. IPv6 uses 128 bits to address a node on the network, of which 48 bits represent the network, 16 bits represent the local network (PAN ID), and 64 bits represent the host id (sensor node). Therefore, the node address for 802.15.4 can placed in an IPv6 address, and the PAN ID can be used to identify the ZigBee network in an IPv6 address. The address transformation of ZigBee and IPv6 packet.

B. Packet Translation: The packets originated from the XBee-S2 network are sent to a server using a tunnelling technique, where the addressing information is removed and placed in the encapsulating protocol. Packets destined for the XBee-S2 network use a stateful translation where the source address is stored on the gateway. This enables reply packets from the XBee-S2 network to be sent to the correct address.

A serial interface is used to transmit Application Programming Interface (API) packets from/to the coordinator and router. The WRT54GL router has two serial ports – one of which is used to connect to the XBee-S2 coordinator. The router performs the conversion of the XBee-S2 API packet to an IPv6 packet.

C. Transmission Over IP: The Linux-OpenWRT software provides the networking architecture to participate in many types of networks. These networks are abstracted into devices, which generalizes management and configuration. This abstraction requires device drivers which operate in the kernel space, making development difficult.

The IPv6 can be used with a TUN/TAP driver provided the kernel has IPv6 support. This means a virtual IPv6 network can be created, where packets destined for this network are routed to a user space program. IPv6 packets can also be created and sent via the TUN/TAP driver and will appear to originate from the virtual network.

D. Storage of Data: The UDP packets produced at the gateway encapsulate sample data to be sent to windows based server. An application running on the server uses the standard socket interface to receive UDP packets on an arbitrary port, and stores the relevant information in the MySQL database. The database table has 4 columns; source address, time, source channel and sample data. Rows are added to this table for each UDP packet received.
Experimental Results

The developed system is tested by installing the Smart sensing units and setting up a ZigBee based WSN at few houses. Interconnecting ZigBee network with IPv6 network is performed by connecting and configuring the modified router (IoT application gateway) as discussed in section III. Integrated system was continuously used and generated real-time graphical representation of the sensing information.

Reliability: The reliability of the system was determined by comparing the calculated value with the amount of sensor information received correctly. The lost packets include the total of lost packets between sensing device-coordinator, coordinator-router and router-server. The difference between arrival times of successive sensor information gives the interval value. If the time interval is greater or less than 10 seconds then there was an error. When the interval is less than 10 secs then the sample information received was incorrect or duplicated and therefore it is erroneous.

Throughput: The throughput of the sensing module is the amount of data sent from the sensing module to the server in a given time period [28]. The amount of data in each sample packet was 16 bytes, which is sent every 10 seconds. Therefore the throughput of the sensing module was 1.6 bytes per second. To measure the throughput of the sensing module, the number of packets received in a 5 minute time span was considered. The throughput was obtained by dividing the time interval of 5 minutes. The throughput of a sensing module for the period of one month. The average throughput is 1.55 bytes/second and the reli-ability was 97%. Investigation into the sporadic significant change in throughput is in process.

Discussion and Future Work

With the advancements in technology, it is expected that the availability of internet is everywhere and online at all time. Low-cost smart sensor node development enabled devices to be connected easily and corresponding information can be accessible globally. With the features of scalability, fault tolerance and effective power consumption of nodes and trans-ceiver IoT have facilitated ubiquity computational ability to internetwork heterogeneous smart devices easily and facilitate availability of data anywhere. In this paper, we proposed an efficient method for internetworking of 802.15.4 with IP network.

Conclusion

The longitudinal learning framework could give a discretion instrument to better task of the gadgets in observing stage. The structure of the observing framework depends on a mix of unavoidable conveyed detecting units, data framework for information collection, and thinking and setting mindfulness. Results are empowering as the unwavering quality of detecting data transmission through the proposed coordinated system engineering is 97%. The model was tried to produce ongoing graphical data instead of a proving ground situation.

Evaluation of Contamination of Different Regions of Surgeon’s Face During Minor Oral Surgical Procedures

S. G. Sudarssan¹, P. U. Abdul Wahab²
¹Post Graduate Student, ²Professor; Department of Oral and Maxillofacial Surgery, Saveetha Dental College and Hospital, Saveetha Institute of Medical and Technical Sciences, Chennai, India

ABSTRACT

Aim: To determine the high risk region of contamination on a dental surgeon’s face during minor surgical procedures and investigate the relationship between duration of surgery and use of powered instrument on facial contamination by blood splatters.

Materials and Method: This study involved total of 60 minor surgical procedures. The contamination of different regions of the surgeons face was evaluated with the help of a custom made face shield with a sponge. At the end of each procedure the face shield was detached from the surgeon’s face and was subjected for analysis. To determine the incidence of blood and salivary splatters in different zones of the face, four reference boxes of 12cms x 3 cms (Fontal region, Orbital region, Nasal region and Oral region) was determined on checked white A4 sheet (21 cms x 29.7 cms). Each face shield was individually examined by placing the transparent sheet over the white A4 sheet with the reference boxes such that the borders of the face shield and the A4 sheet are approximated and the visible particles on each reference boxes were counted. One way analysis of variance (ANOVA) and chi square tests were used for data analysis.

Results: Results were tabulated with regard to instrumentation, the time factor, the incidence of splatter on different regions of face. Contamination different regions of dental surgeons face was significantly different (P < 0.05). And the contamination increased with increase in duration of the procedure and use of powered tools (P < 0.05).

Conclusion: Among different regions of the face orbital and nasal region have a high chance of getting contaminated.

Keywords: contamination, blood splatter, salivary splatter, face, minor oral surgery.

Introduction

Health care workers especially dental surgeons and dental assistants are more subjected to infectious diseases through aerosol and splatter in routine dental practice ¹, ², ³. For most of the last century, dentists have not used any protective equipment for eye, nose, mouth but the increasing incidence of infectious diseases accentuates the principles of infection control ⁴. The blood and saliva confront an identified risk of this group to pathogens like hepatitis B virus (HBV), hepatitis C virus (HCV) and human immunodeficiency virus (HIV) ⁵. There is a yearly increase of 5.84% in contamination rate of healthcare workers ², ³ 2.5% of HIV infection and 40% of HBV and HCV infections in health care workers is accounted to be through occupational cross infection as stated by world health organization (WHO). Dental surgeons often deal with blood and saliva and also use powered instruments for various procedures. Oral cavity acts as a perfect environment for the survival of various pathogenic organisms. Thus WHO emphasizes the use of personnel protective equipments (PPE) for the safety of dental healthcare workers ⁶. PPE such as gloves, gowns, masks, protective eyewear or face shields and other

DOI Number: 10.5958/0976-5506.2019.01951.X
protective barriers and safety devices are meant to prevent exposure to blood-borne pathogens through mucous membrane, intact skin or through parenteral routes. Blood and saliva being potential pathogen carriers are a threat to dental surgeons as they are converted into aerosol or splatter by the use of powered instruments during various procedure. Micik and colleagues defined the terms ‘aerosol’ and ‘splatters’. Aerosol is defined as particles less than 50 micrometer in diameter. Splatter is defined as particles larger than 50 µm in diameter. Micik and colleagues stated that these particles or droplets are ejected forcibly from the operating site and are in a trajectory similar to that of a bullet until they contact a surface or fall to the floor. Studies of Checchi et al demonstrates that the exposed areas of dentists face are at high risk of infection.

This study aims at evaluating contamination of different regions of the dental surgeons face during various minor surgical procedures and determining the high risk region.

**Materials and Method**

This study involved total of 60 minor surgical procedures done under local anesthesia all of which were intra oral procedures. The contamination of different regions of the surgeons face during the surgical procedures was evaluated with the help of a transparent sheet measuring 21 cms x 29.7 cms. The sheet was secured to the fore head of the operating surgeon with a help of an elastic band over a piece of sponge measuring 29.7 cms x 2.5 cms x 2.5 cms placed at upper border of the sheet for comfort of placement, forming a face shield (Figure 1). This face shield was positioned and placed on all the surgeons by the same person. The surgeon performed the surgical procedures with the face shield secured to the face throughout the procedure. All the surgeons who operated were right handed dentists. The type of procedure done, time taken for the completion of the procedure and the site where the procedure is being done and involvement of a powered tool in each procedure were noted. At the end of each procedure the face shield was detached from the surgeon’s face and the sponge was discarded and it was set aside to dry at normal room temperature. Once the sheet has dried completely it was subjected for analysis.

To determine the incidence of blood and salivary splatters in different zones on the face, four reference boxes of 12cms x 3 cms was determined on checked white A4 sheet (21 cms x 29.7 cms). The four boxes were labeled as Fontal region, Orbital region, Nasal region and Oral region. Frontal region (Forehead region) represented area of face from hair line to the upper eye brow. Orbital region (eye region) represented area of face from upper eye brow to lower eyelid. Nasal region (nose region) represented area of face from base of lower eyelid to the base of the nose. Oral region (mouth region) represented area from the philtrum of upper lip to the prominence of chin. Each face shield was individually examined by placing the transparent sheet over the white A4 sheet with the reference boxes such that the borders of the face shield and the A4 sheet are approximated and the visible particles on each reference boxes representing different regions of the face were counted.

**Figure 1: Custom made face shield**

**Result**

With regards to instrumentation: Out of the 60 procedures performed under local anesthesia 100% of the procedures were intra oral procedures. Blood and salivary splatters occurred to the face shield in 42 cases (70%) and 18 cases (30%) were devoid of any splatter on examination. In 40 procedures (67%) powered tool was used. Of these cases 36 cases (90%) produced splatter to the face shield. In 20 surgical procedures (33%) powered tool was not used of which 4 procedures (20%) resulted in splatter to the face shield. This was highly significant (P<0.00001).
With regards to the time factor: Out of the 60 procedures included 19 cases (32%) took less than 15 minutes for completion. Of these cases only 2 cases (10%) resulted in blood splatter to the face shield. 41 procedures lasted more than 15 minutes to get completed of which 40 cases (98%) produced blood splatters to the face shield. This was also significant (p˂0.00001)

With regards to incidence of splatter on different areas of face: Out of the 60 procedures included, Frontal region had splatters in 26.7% (16/60) of the cases; Orbital region had splatters in 63.3% (38/60) of the cases; Nasal Region had splatters in 50% (30/60) of the cases and Oral region had splatters in 36.66% (22/60) of the cases. There was statistically significant difference between the incidences of blood splatters in different regions of the face (p˂0.00001). Blood and salivary splatters were significantly higher in the Orbital region followed by Nasal region when compared with Frontal region and Oral region (Graph 1).

Graph 1: Incidence of splatter in different regions of face during minor oral surgical procedures

Discussion

This study shows that during minor oral surgical procedures there is a high chance of facial contamination with blood and salivary splatters. The rate of contamination increases significantly with the use of powered tools during the procedures. This result can be backed up by the fact that usage of powered tools during intra oral surgical procedures produces an aerosol effect, with blood and salivary particles spraying outwards. Also the contamination increases as the length of the procedure increases more that 15 minutes. Among the different regions of the face, orbital region has the higher incidence of getting contaminated followed by the nasal region when compared to the contamination of frontal and oral region.

Blood and saliva in oral cavity during the minor surgical procedures is a potential carrier of infectious pathogenic microorganisms. These microorganisms gain access the operating surgeon either by direct contact or through splatter. Aerosolization of the blood and saliva during surgical procedures is contributed by the use of high speed rotary instruments and surgical drills.

The splatter that arise from oral cavity due to the use of high speed handpieces and powered surgical drills can
vary in size from 50 micrometer in diameter to several millimeters and it can be projected from the patient’s oral cavity to a distance of 15-120 cms\textsuperscript{17,19}. These splatter or aerosol that escape the operative site can gain access to the operative surgeons respiratory system, skin, nose, eye or mouth or can get deposited in the collar, cloth or on the hair of the surgeon.

A study done by Schnetler JF\textsuperscript{20} shows that there are even higher threat of HIV and Hep B and C viruses being transmitted to the operating surgeon and the dental assistant through contamination of eyes by blood splatter. Also there is a high probability risk of saliva containing other pathogenic bacteria such as Streptococcus pyogenes, Haemophilus influenza, Staphylococcus spp, Pseudomonas spp, Acinetobacter spp, M.tuberculosis and viruses such as Epstein barr virus, cytomegalovirus and herpes virus from infected individuals\textsuperscript{21}. The gingival crevicular fluid also contributes to infecting the saliva with pathogenic organisms\textsuperscript{17}.

The result of this study is agrees with various different studies done previously, which have shown that the blood splatter contamination during various surgical procedures varies from 25\% to 51\%\textsuperscript{22,23,24,25,26,27}. But a study done by Endo S et al\textsuperscript{28} showed that contamination in mask region was higher when compared eye region, which was in contrast to other mentioned studies.

Another study conducted by Nejatidanesh F et al\textsuperscript{29} shows that among the different areas of face eye and nose regions are more prone to contamination with splatter and aerosol during prosthetic and periodontal procedures.

Despite the risk of infection of conjunctiva of the eye resulting from exposure to blood and body fluids the use of face shields among health care workers has been reported to be as low as 4\%\textsuperscript{30}. The upper facial protection is not widely used because of inconvenience\textsuperscript{31}.

Following proper dental ergonomics during every dental surgical procedure and maintaining proper precautionary measures will protect the operating surgeon and the dental assistants from the contamination risks. It is mandatory to use personal protective equipments like head cap, face mask and also a protective eye wear or a visor mask to prevent contamination of eye from splatter of saliva and blood. High power suction devices must be used for surgical procedures utilizing micromotor handpieces and other powered tools. Betadine or chlorhexidine mouth rinse should be given to every patient before the start of each surgical procedure to reduce the bacterial load of the oral cavity\textsuperscript{17,32}.

**Conclusion**

Among different areas of the face both region around eyes and nose have a high chance of getting contaminated when compared to the region of forehead and mouth. Rate of contamination increases with the use of powered tools. Emphasis should be made by the operator to reinforce the use of proper eye protection like eyewear, visor mask or face shield along with other personal protective equipments during all minor oral surgical procedures.

ABSTRACT

Background: Physical activity level among young adults are grossly reduced due to urbanization and tremendous increase in technology and this has led to increase in changes in body fat composition and functional capacity. Physical inactivity poses various threats to health of an individual. The relationship between body composition, physical activity and functional capacity needs to be understood and studied hence this study was taken up.

Objective: To find the association of body composition with physical activity and functional capacity.

Methodology: An observational study with sample of 150 both men and women of age group between 18-30 years. Anthropometric measurements were taken like Body Mass Index, Waist-Hip ratio, Skin fold, % body fat. Physical activity level was assessed using IPAQ long form and functional capacity was assessed by 6 minutes walk test. Results were analyzed by Regression analysis and Pearson’s correlation method by SPSS software 23.0 version.

Results: In this study we observed about 92% participants were moderately active and 4% were highly active and 4% had low physical activity. The mean 6 minutes distance achieved by male is 645.03 ± 57.498 and female is 566.22 ± 64. There is a significant effect of body composition on functional capacity, the Body Mass Index being the most influential factor.

Conclusion: This study concludes that in college students Body Mass Index was the most influential factor for functional capacity. There is a need to create an awareness about physical activity among college students and need for regular fitness assessment for this group of population.

Keywords: Body composition, body mass index, waist hip ratio, Physical activity, functional capacity, young adults.

Introduction

Globally physical inactivity level has increased one out of five adults are physically inactive.¹ Physically inactive and obesity are the primary risk factors for the primary and secondary cardiovascular diseases, neurological issues like stroke and certain musculoskeletal impairments.

Developing country like India now- a- days facing prevalence of coronary artery disease at a very young age predicting for further worsening of the India’s health status². Awareness regarding physical inactivity has to take place among young population in India.³ Obesity and physically inactivity not only causes physical or pathological health issues but also causes mental and psychological impairments. This social stress factor results even in the poor academic and/or functional abilities of young adults.
Obesity is usually reported in terms of Body Mass Index (BMI) and abdominal obesity in terms of Waist Circumference (WC) and percentage of body fat. Abdominal obesity measured as WC is a better marker of obesity related metabolic risk than BMI among Indians. If a child develops obesity probability chances are more for continuation of obesity in adulthood. Prevention is better than cure.

Physical activity has to be facilitated to prevent obesity and its risk factors. Thus right from young adulthood encouraging young adult to engage in any sport activity or aerobic activity would result in fit and healthy young adults.

Physical activity regulates and maintains lipid profile of our body by improving HDL which has anti oxidant property and reduces the risk of atheroma formation and by reducing LDL which causes oxidative stress which further results in the formation of atheroma in the blood vessels which leads to cardiovascular complications or stroke. Physical activity also has a major role in influence of fitness of bone density in adulthood in understanding bone maturation and in preventing bone related diseases.

People who were physically active have lower mortality rate than people who have sedentary habits. Physical activity reduces metabolic disorders and prevents hormonal dysfunctions. Especially in women it prevents breast and cervix cancers and also prevents colon and gastric cancers in both male and female.

Physical activity have several beneficial effects like improving all general fitness components like cardiac fitness, muscular endurance, and flexibility and strengthening of the major muscle groups & also plays a major role to overcome stress and enhances mental ability which indirectly improves academic performance of the students and work efficiency among young adults.

As young adults sit in classroom for most of the daytime their sedentary state tends to increase. This has an impact on their physical activity which further leads to abnormal body composition and lethargy. Since no such study has been done to find the relationship of WHR, BMI, Body fat%, physical activity, skin fold measurement on functional capacity in young Indian college students this study was taken up.

In this modern era, physical activity level in young adults has greatly reduced due to availability of resources and this increases the likelihood of developing life style related diseases. Hence this study aims at finding out the physical activity level of the college students and the influence of that on their functional capacity.

**Methodology**

**Study Design:** Observational study

**Sampling Design:** Purposive Sampling.

**Sample Size:** 150 calculated by power analysis.

**Subject recruitment:** Ethical committee clearance was obtained from SRI RAMACHANDRA UNIVERSITY ethics committee for student’s proposal. REF: CSP/16/SEP/51/274.

Paramedical collage students from Sri Ramachandra University were recruited as sample with age group of 18-30 years of age both genders, consented subjects were included for the study. People with h/o medical disorders particularly hypothyroidism, pulmonary or cardiovascular diseases, recent illness in last 4 weeks, musculoskeletal injuries or disorders, neurological disease or impaired cognitive function, pregnancy were excluded.

The recruited subjects physical activity level was assessed using International Physical Activity Questionnaire (IPAQ- long form).

Body composition measurements were taken as BMI by weight in kilograms divided by height in centimeter square. And body fat is measured by two methods 1. Bio-electrical impedance body fat analyzer. 2. Skin fold measurement (3 fold measurement for men: chest, abdomen and thigh and for women: triceps, supra-iliac region and thigh) were taken. Waist circumference and hip circumference were measured with measuring tape and ratio was calculated.

Functional capacity was calculated using six-minute walk test. Before and after the test vitals were monitored like pulse rate, respiratory rate, RPE, B.P, Spo2.

**Tool description:** Tools used in this study were Stadiometer and weighing scale, measuring tape, calculator, skin-fold calipers model name-Personal body fat tester, bio-electrical impedance body fat analyzer (Omron model-HBF-306), IPAQ questionnaire, pulse-oxymeter, Borg scale (6-20), sphygmomanometer, two cones, stopwatch.
IPAQ (long form): It’s a self-assessing questionnaire commonly used to assess the physical activity level of all age groups which was validated and reliable in almost seven countries worldwide. It consists of five components of questions including activities related to job-related, transport, house-hold and gardening, recreation and sports, and time spent for sitting within recent 7 days. The activities that has to be assessed are walking, moderate-intensity activities and vigorous intensity activities measured in MET-minute/week.

Six-minute walk test: Six-minute walk test was conducted in around 50 meters corridor by 30 meters as testing area and subjects were subjected to walk from the 30 meters marked cones considering one point as starting point and same point as ending point for one complete lap of 60 meters and another end point is considered as half lap of 30 meters. Subjects were asked to walk as fast as they can uptil their available range to complete the maximal available distance they can within six-minutes time period. Subjects should not allowed to run or jog they were allowed only to walk.

Statistical analysis: In this study the data were collected from 150 subjects. The collected data were analyzed with IBM.SPSS statistics software 23.0 version. To describe about the data descriptive statistics frequency analysis, percentage analysis were used for categorical variables and the mean and standard deviation were used for continuous variables. To assess the relationship between the variables Pearson’s Correlation with scatter plot was used. In all the following statistical tools the probability value .05 is considered as significant level.

Results

The influence of variables age, gender, BMI, W:H, skin-fold measurement, % body fat, P.A score on functional capacity was analyzed by regression analysis and by Pearson’s correlation.

Statistical analysis was tabulated and results were shown as follows.

The present study shows a weak positive correlation between P.A score and 6 MWD achieved and statistically significant. This shows that as physical activity level increases the functional capacity also increases. There was a very weak negative correlation shown between BMI, skinfold measurement and 6 minutes distance achieved. It is showing that as there is an increase in BMI and skinfold measurement there would be reduction in functional capacity. It shows that if there is an increase in skinfold measurement there will be an reduction in 6 minutes distance achieved and it is statistically significant. There is a moderate negative correlation between % fat and 6 MWD achieved. It shows that if there is an increase in % body fat there will be reduction in 6 minutes achieved. Excessive body fat increases the work load for a given amount of exercise hence this could have led to reduction in 6MWD (Table:2)

There is a very weak negative correlation shown between % fat and P.A score. Increase in body fat percentage reduces the physical activity and it is statistically not significant. There is a very weak positive correlation shown between W:H and P.A score and it is statistically significant. There is a strong positive correlation shown between BMI and P.A score though statistically not significant (Table:3) To predict the functional capacity with variables such as physical activity score, BMI, W:H% and fat percentage the linear regression model was used. The results shows that all the variables has significant effect on 6MWD. Among the variables BMI significantly affects the 6MWD. (Table:5)

Discussion

A recent study found that the number of overweight and obese people globally increased from 857 million in 1980 to 2.1 billion in 2013.\textsuperscript{11} BMI provides the most useful population-level measure of overweight and obesity as it is the same for both sexes and for all ages of adults. In the present study of 150 subjects 53% were overweight based on BMI (Male–mean 23.4, Female–mean 23.2) showed a positive correlation with age.

Skinfold thickness has been used for the assessment of body composition.\textsuperscript{12} In the present study based on skinfold measurements 53% were overfat and on basis of body fat percentage 36% were obese. And it showed negative correlation with functional capacity. The mean
skin fold measurement and body fat percentage were higher in females in the present study.

Waist-to-Hip ratio (WHR) has been suggested as a more accurate assessor of adiposity than the BMI in predicting cardiovascular disease risk. Present study showed normal waist hip ratio in both genders, & showed a weak positive correlation with physical activity and 6MWD.

The 6 MWT is a simple, inexpensive test for the measurement of functional capacity. Obesity increases the workload for a given amount of exercise. The present study show a negative correlation between BMI and 6MWD, this shows that the increased workload due to obesity has reduced the distance walked. The 6 MWD achieved by males were approximately 80 metres more than females. Similar study done by Gosselink R and coworkers on healthy subjects showed 6MWD was greater in males than females.

In the present study BMI and fat percentage were found to be positively correlated and negative correlation between BMI, physical activity score and functional capacity in both genders.

A study done by Anjana et al showed that physical inactivity is increasing tremendously in India with fewer than 10% engaging in recreational physical activity even in the present study it was noted only 4% of the individuals are involved in vigorous physical activity. physical activity and functional capacity showed a weak positive correlation thus physical inactivity would reduce the functional capacity of an individual. In the present study since there was lack of vigorous physical activity the correlation could have been weak. Regression analysis showed that among all variables BMI is the most influential.

Based on the findings of this study, the following recommendations are made:

1. The assessment of fitness and health levels of students should be a permanent feature in the colleges.
2. Education on the need to engage in regular and appropriate levels of physical activity should be given to students at regular intervals so that health risks associated with physical inactivity will be reduced.
3. Increased physical activity emphasized in female students in particular to improve their fitness levels.
4. A multicentric study to be conducted in this student population with large sample size.

Conclusion

The current study concludes that there exists a relationship between body composition and functional capacity in young adults and among the variables BMI is the most influential factor. It was also found that the study population lacks vigorous physical activities and the sedentary behavior were also to be found on higher side.

Role of Diet and Lifestyle on Individual Health: A Global Public Health Concern

Saptarshi Chatterjee1, Mousumi Das2, Payal Varsani3, Shreya Savaliya3

1Department of Microbiology, School of Life Science & Biotechnology, Adamas University, Kolkata, West Bengal; 2Assistant Professor, 3Student, M.Sc., Department of Microbiology, Shree M & N Virani Science College (Autonomous), Rajkot, Gujarat, India

ABSTRACT
Diet and Lifestyle disorders have been a major public health threat in the present world. In contrast to the advancement in scientific and technological sphere, the diet and lifestyle of individual has witnessed a drastic anomaly, compromising the requisites of good health. The fast paced society has often provoked unhealthy lifestyle (i.e. smoking, drinking etc) and more often skipping the habits for remaining fit (i.e. physical activity). Simultaneously, there is an increase in uptake of junk food that has led to the global problem of obesity. Sufficiency of sleep and sound mental health can curb the menace to a certain level. The choice of food habits vary between age groups and improper consumption has added to the problem. It is also strongly related to the socio economic status of individual. However, there are several indicators like BMI, skin fold, waist circumference etc. that can aid the process of monitoring individual health in terms of being obese. Several diseases including cardiovascular, metabolic or reproductive are directly or indirectly related to obesity that is influenced by lifestyle and diet. Thus, the present life style and diet is under threat for well being of individual and public health as well.

Keywords: Life style, diet, obesity, diseases, food habit, Obesity Indicators, Physical activity

Introduction
Obesity, a complex health issue has reached epidemic levels and has become major public health concerns. It results from a combination of causes and factors, including individual, behavior and genetics. BMI, waist circumference etc. are promising indicator to obesity. Diet and Lifestyle habits have predominant influence on the obesity. Moreover, food habits, consumption of junk foods and socio-economic status have also influence obesity, to a great extent. This review attempts to elucidate the role of diet and lifestyle on individual health along with public health concerns.

Diet and Life-style: Diet is an individual concept that significantly influences health outcomes despite wide range of variation because of diversity of cultural groups and population. An unhealthy lifestyle is a serious and unnoticed problem. The impacts on unhealthy outcomes like overweight, obesity or some other metabolic disorder are still controversial in children and adolescents. College years are the most crucial in development of healthy and unhealthy habits. This problem is inadvertently present is selected populations especially those staying away from home or even during holiday season. Watching television, usage of mobile and lack of exercise are major lifestyle irregularities that possess effect on diet and subsequently the health of individual. Jobs requiring rotating shifts also influence the health of an individual.

Life style habits: Lifestyle of individual plays an important role in the health especially in terms of health issues related to obesity. Fig 1 demonstrates a list of factors of life-style in human that influences obesity and related disorders.
Physical Activity: Physical activity is strongly related to obesity. Physical inactivity is inversely correlated with the risk of obesity for children and the adolescents. With the advent of time, the daily energy expenditure has declined up to 100 kcal approx because of reduced physical activity. Physical activity also varies with occupation. According to Hill et al., a threshold for physical activity exists above which people are in their 'regulated zone' being able to strike a balance between energy intake and energy expenditure. While, below the threshold, lies the 'unregulated zone' having imbalance leading to obesity. Effect of physical activity on children youth and young adults have been widely studied where the balance between energy intake and energy expenditure plays a crucial role.

Preference of Beverages: Preference of beverage primarily depends on the geographic location and its climatic condition. Table 1 shows a list of preferred beverages and its calorific value. Consumption of sugar sweetened beverages particularly carbohydrates soft drinks may be a key contributor of overweight and obesity. A dietary guideline on selection of beverage for moderate intake of sugar represents the role of beverage in sugar intake and subsequent obesity. Alcohol, which is another world-wide choice of beverage, has a controversial impact of obesity. Though its relation with the enhancement of coronary heart disease is well established, yet several epidemiologic studies relating alcohol consumption to obesity do not agree and suggests that alcohol consumption did not increase the risk of obesity.

Sleep: Sleep is an important modulator of neuroendocrine function and glucose metabolism. The role of sleep duration in the regulation of glucose metabolism, appetite and cardio-metabolic risk is well understood. Despite of relationship, the sleep duration and obesity are associated with numerous factors and may vary with age to a great extent showed the relationship between short sleep duration and weight gain, while the association of long sleep duration and risk of obesity also persists.

Food habits:
Veg vs Non-veg: Vegetarian diets may play a beneficial role in promoting health and preventing obesity. A study has indicated that BMI increases when a wider spectrum of animal products are eaten. Some experimental data suggests that vegetarian diets may carry metabolic advantages for prevention of type 2 diabetes. The lower prevalence of diabetes in vegetarian than semi or non-vegetarians was found while; processed meat consumption was a risk factor for diabetes. Vegetarian diet is however associated with an elevated prevalence of mental disorders.

Junk Food: Junk food has been considered a major source of obesity and associated health problems. This not only increased daily calories, but sugar, saturated fat and sodium intakes as well. More frequent use of fast food like burger and French fries was associated with higher risk of overweight and obesity. The association between fast food consumption and BMI could be due to...
to other specific dietary factors like higher fat intake, greater consumption of sugary drinks, fewer fruits and non-starchy vegetables. There is no association between higher fast food consumption and BMI in adolescents while the relation exists for children 30.

Socio-economic status: Family: Low family income and socioeconomic status were significantly associated with childhood depression through stressful life events, family environment and neighborhood characteristics31. Socio economic status shows a stronger bond with obesity and lack of recreational physical activity in women than in any other subgroup32, 33. The relationship between SES and obesity differs in developed and developing societies34.

Occupation: Individual countries suggest that socio-economic status and weight are positively associated in lower income countries and negatively associated in higher income countries 35. The global epidemic of obesity continues to worsen and the ready availability of cheap energy-dense foods and increasing sedentary lifestyle are considered likely causes. There have also been changes in the types of occupation in which workers are employed - from ‘high activity’ to ‘low activity’ occupations and the work environment that contemporary workers experience within a given occupation may now involve more sedentary times than previously36.

Obesity and its Indicators:

BMI: The BMI was invented by Belgian polymath Adolphe Quetelet in the 1800s, and consequently is sometimes known as the Quetelet index. Body Mass Index (BMI) is a mathematical expression used as an indicator to monitor under nutrition and overweight related to health outcome37 (WHO, 1995) in which weight and height are measured and calculated. According to CDC, it is expressed as weight in kg divided by square of height in meters (kg/m²). The simplicity, noninvasiveness and inexpensive nature have popularized the technique of BMI calculation. However, the method in not beyond question since BMI indicates body fatness rather than the excess body fat 38 or location of fat deposition 39. The universal standard for BMI 40 varies to that of Asians. BMI is utilized as an indicator for several epidemiological studies and its impact on parameters like age 41, location 42, disease 43 have been widely studied.

Waist Circumference: It is a measurement taken around the abdomen at the level of the umbilicus i.e. belly button. The waist measurement follows the gender specific standard exceeding which it increases the risk for weight related health problems. A protruding belly or high waist circumference is the accumulation of fat in visceral and posterior subcutaneous adipose tissue compartments 44. It is also associated with diabetes 45. Apart from food habit, stress hormone cortisol also promotes visceral fat deposition46. Thresholds for waist circumference have been recommended for various populations and its impact on sex, age, ethnicity and disease is stated by the World Health Organization as their recent research findings47. Though Waist circumference has been used as a standalone indicator like BMI in determining obesity, yet waist circumference/height ratio is considered as more applicable48.

Skin Fold: The measurement of skin fold is an old and common method for assessing body fat percentage 49 besides BMI 50. The sum of skinfold thickness is related to total body density51. Apart from efficiency of the measurement method i.e. accuracy of the calipers, age and gender of the individual also affect on this measurement a subsequent interpretation52. Various sites of measurements are used in performing skin fold based experiment as shown in Fig 2. Multiple site based measurement can be relied over a single site measurement of skin fold53.

Blood Pressure: The relationship between obesity and hypertension is well established fact. Blood pressure is an easy and accurate measure of hypertension which is a complex phenomenon, coordinated by several systems of the body. In the cardiovascular system renin-angiotensin system (RAS) plays a major role which is associated with controlling energy balance and metabolic rate thereby influencing obesity 53, 54. Activation of the sympathetic nervous system has been considered to have an important function in the pathogenesis of
obesity-related hypertension. However, age affects the blood pressure to a great extent while height affects considerably less. Therefore, high blood pressure of hypertension emerges as a major risk factor related to obesity and other diseases.

**Blood Glucose Level:** Fasting blood glucose has been related to Fat mass (FM) and percent body fat (PBF) and thus used a biochemical or metabolic indicator to obesity. High blood glucose level is a significant concern for Type 2 diabetes which is associated with BMI. The association is strong for high BMI on having increased risk of type 2 diabetes.

**Role of Age and Gender:** Obesity is an emerging and serious health crisis and threat for public health. The curse of obesity is dependent of age, as one of the factors. However slower metabolism or basal metabolic rate (BMR) is the principle behind the process despite of several other factors being cumulatively involved. Several studies reveal the dynamic relationship of age and sex on obesity.

**Obesity and Mental State:** Weight gain is shown to induced by antipsychotic drugs (AP) under chronic administration.

Depressive symptoms in both genders are prominent in obese patients. The relationship between mood and mental disorder is also governed by social or cultural factors. Building self esteem along with treatment of obesity should be a route of treatment for such cases.

**Disease Associated:** There are several reports of occurrence of diseases that are linked to obesity. However not all of them are directly related, yet correlation between disease and obesity is strong. In many of the cases, obesity acts as an indicator or influences the occurrence of certain diseases as a risk factor. The following Figure 3 shows a few of the diseases that are connected with obesity.

**Fig. 3: Diseases associated with obesity**

**Public health concern:** India is one of the countries burdened with the issue of obesity. The prevalence of obesity has doubled in adults and children and tripled in adolescents over the past 2 decades. Fig 4 shows the burden of obesity across the rural and urban population of India (source: World obesity). A population based strategy based on demographics and the prevailing scenario of that particular region can be of importance to minimize or eradicate the further spread of obesity. Identification and understanding of determinant factors is important in designing public health strategies to combat obesity. Obesity policy action framework has been illustrated by Sacks et al. while, Khan et al has put forward a recommended community strategies and measurements to prevent obesity in the United States. Mexico has also initiated a public health strategy against overweight and obesity as National Agreement for Nutritional Health.

**Conclusions**

There is a popular proverb in English, ‘Health is Wealth’. However, the present fast-paced lifestyle has left almost no time for individual to care for personal health. The diet has altered significantly and homemade cooked foods have replaced junk and ready to eat fast food in meeting the demand for daily life. This alteration of lifestyle and diet has significant effect on individual health. The problem has exceeded from a problem of an individual to a common problem posing global threat on public health. Therefore, adequate knowledge regarding life style and diet can render serious preventive measure before the issue becomes a severe curse.

Valgus Osteotomy an Effective Option for the Management of Fracture of Neck of Femur in Young and Middle Age Patients: A Prospective Study

Pradhan P1, Saxena V2
1Professor, Department of Orthopaedics, BRD Medical College, Gorakhpur, UP; 2Associate Professor, Department of Orthopaedics, Government Institute of Medical Sciences, Greater Noida, UP

ABSTRACT

Background: The fracture neck of femur in young and middle age patients, is one of challenging and unsolved fracture as management and results are concerned. Prognosis is usually unpredictable owing to usual complications in the form of avascular necrosis and non-union. Neglected fractures further enhance the challenge as the procedures to treat these are technically demanding and have not been given consistently reproducible results.

Material and Method: This study is based upon the management of 27 patients of fracture neck of femur who were treated primarily with valgus intertrochanteric osteotomy and internal fixation with double angled dynamic hip screw at BRD Medical college, Gorakhpur.

Results: Majority of patients were in 31-40 years of age group and sustained fracture as a result of road traffic accident. The union achieved in 26 patients with average time of 4.5 months to unite. Average Harris hip score at final follow up was 90.

Conclusion: valgus osteotomy and internal fixation is an optimal method that removes shearing stress and creates compressive forces at fracture site and enhance the bony healing. However, degenerative arthritis, persistent limping due to decrease in abductor lever arm length remains the limitation of this procedure.

Keywords: valgus, osteotomy, fracture neck femur, young

Introduction

Fracture neck of femur is quite common in old age however, number of young and middle age patients are increasing due to high energy trauma like road traffic accidents, fall from height etc. and contribute significant social and financial burden to the society.1-3 The management of fracture neck of femur remains challenging in middle aged patients with high failure rates and complications. The complications related to these fractures are Avascular Necrosis, Non-union and osteoarthritis.4-6 The results of this entity in middle aged patients is influenced by the displacement type, Degree of posterior comminution, duration of fracture, accuracy of reduction and rigidity of internal fixation. The duration of fracture and non-union have a direct relationship with each other. In developing countries, lack of awareness and poorly organized health system often delay the patient’s arrival to appropriate centre to address the fracture neck of femur. In young patients, with good general condition, reasonable size femoral neck and normal joint space, salvage of femoral head remains the aim of treatment. Various head preservation surgery options for such neglected fracture of neck of femur are osteosynthesis along with fibular graft, muscle pedicle bone graft and osteotomy with or without internal fixation. Valgus osteotomy and internal fixation remains good option for fracture neck of femur in young and middle age patients with no evidence of avascular necrosis.7-9 The main advantage of this procedure is to

DOI Number: 10.5958/0976-5506.2019.01954.5
convert shearing forces at fracture site to compressive forces and to compensate for limb length shortening that occurs due to absorption of neck. Valgus osteotomy is also useful in improving the stability of highly unstable fracture of neck of femur with significant posterior comminution or high Powell’s angle. The present study was undertaken to establish the usefulness of valgus osteotomy as primary and effective option for the management of fracture neck of femur in young and middle age patients.

**Material and Method**

This prospective study was carried out by authors at BRD Medical college, Gorakhpur between June 2010 to October 2012. This study comprised of patients with fracture neck of femur in 20 to 60 years of age group. The Informed consent was taken from all patients prior to inclusion into study. The study was authorized by the local ethical committee and was performed in accordance with the ethical standards of the 1964 declaration of Helsinki as revised in 2000. Thirty patients presented to hospital with isolated fracture of neck of femur included, however patients with polytrauma or associated injuries were excluded from the study. three patients didn’t turn up to follow up later in the study so 27 patients were included in study and investigated. Valgus osteotomy was used primarily to treat these fractures and fixed primarily with double angled barrel plate and compression screw, Prebent 4.5 mm Dynamic compression plate and screws were also used in few patients. Careful preoperative templating is performed to determine the angle of wedge and angle of insertion of sliding compression screw. Regional anaesthesia was preferred over general anaesthesia for these patients. The patient laid supine on fracture table that allows excellent fluoroscopic visualization of the proximal femur. Lateral approach was used to expose theses fractures. The fracture was initially transfixed by guide wire and then Richard screw is placed at an angle determined by preoperative planning. The intertrochanteric wedge osteotomy was done after marking the wedge with guide wires under image intensifier. Double angled barrel plate was applied to Richard screw and abduction done to close the wedge and plate secured to shaft of femur with 4.5 mm cortical screws. Closure done over suction drain which was removed on third postoperative day.

The patient started non-weight bearing walk and quadriceps drill exercises on third post op day. The required time to union was documented. Fracture union, femoral head necrosis, arthrosis, and femoral head destruction and limb shortening were considered in follow up. The patients were followed up for a period of one year and Evaluation of patient done in accordance of Harris Hip Score Evaluation system.

**Figure 1:** Vertical fracture line through neck more prone to develop non-union. 95° blade or screw is inserted at an acute angle equal to effective angle of implant–wedge angle. Proximal femoral osteotomy is created and a wedge removed. Valgus created at osteotomy site and secured with plate and screws.

**Figure 2:** Radiograph showing fracture neck of femur with vertical fracture line.

**Figure 3:** Immediate post op radiograph showing valgus osteotomy fixed with double angle DHS. Fracture line has become horizontal.
Figure 4: Eight months post op radiographs showing union of fracture neck of femur with consolidated osteotomy site.

Results

Majority of patients were in the range of 31-40 years age and male to female ratio was 2:1 (18 males and 9 females). Majority of patients sustained fracture neck of femur as a result of significant trauma and most common mode of injury in these cases was road traffic accident and only 25.9% patients sustained fracture as a result of trivial fall. Approximately 93% patients presented after a week post injury to the hospital. The late presentation was due to illiteracy, ignorance and belief in traditional bone setters. Anaemia was the predominant co-morbid condition associated with 50% of patients with fracture of neck of femur consistent with poor general health of patients of eastern UP, followed by cardiac problems and hypertension. About 60% of cases were of transcervical type. Average preoperative shortening was 1.7 cm. The average delay in hospital, in seeking management was 9.6 weeks. In Majority of patients started exercises in bed on second post op day and partial weight bearing started at 6-10 weeks, however full weight bearing started after 14 weeks or radiological union. The average time of union was 4.5 months and one patient had non-union. Two patients had superficial stitch line infection which was controlled with change of antibiotics. Average Harris Hip Score was 64 preop and 90 at last follow up. There was no case of avascular necrosis or implant failure. Statistical analysis was done and P value <0.05 was considered statistically significant.

Discussion

Fracture neck of femur as such and neglected fracture in particular is considerable challenge to orthopaedic surgeon as far as union is concerned. The precarious blood supply, endosteal fracture healing, absence of periosteum around the neck, presence of angiogenic inhibiting factor in the synovial fluid and shearing stress at fracture site always predisposes to non-union and avascular necrosis. Despite improvements in understanding of reduction of fracture, better positioning of implant and better x-ray techniques, non-union results in 10-34% of cases. Early surgical intervention, anatomical reduction and rigid fixation reduces the complication rates however, delayed management reduces the possibility of closed reduction and jeopardise the vascularity leading to avascular necrosis. The various modalities in the management of neglected fracture neck of femur in young patients depends upon vascularity of femoral head and are internal fixation along with fibular or muscle pedicle bone grafting and valgus osteotomy.

The natural head must be preserved as far as possible particularly in young and middle age patients. Muscle pedicle bone grafting procedure is undertaken in patients with avascular head with impending non-union in the absence of segmental collapse requiring open reduction. However, these procedures are technically demanding and have not been given consistently reproducible results. Authors evaluated valgus osteotomy primarily to treat delayed presented and neglected fracture neck of femur. Pauwel first described the biomechanics of repositional osteotomy. Weight bearing forces across a vertically oriented fracture line produce shear stresses at the fracture site that favour the production of fibrous tissue. Valgus intertrochanteric osteotomy reorients the fracture site into a more horizontal position. Axial loading in this situation encourages osteogenesis and fracture union. After osteotomy, it is fixed with either angled blade plate or double angled dynamic hip screw but
blade plate is associated with higher rates of suboptimal position and implant failure while hip screw give more compression at fracture site. In the present study authors have evaluated valgus osteotomy and internal fixation primarily with double angle Dynamic hip screw. The rate of union was 96.3%, which was compatible with studies conducted by Marti et al and other authors.16,17 The average preoperative neck shaft angle improved from $112^\circ$ (82-123°) to $136^\circ$ (118-155°), which is comparable to other studies.18,19 This valgusization has an advantage of reducing shortening of limb length, However, it may also lead to limb lengthening as a result of excessive wedge removal at the time of osteotomy. Functional outcome of patients evaluated by Harris Hip score which was 90 at last follow up and was consistent with similar studies.

Although valgus osteotomy and internal fixation is an effective procedure in neglected fracture neck femur, it’s utility in treating fresh fracture of neck of femur with high grade Powel angle and significant comminution is well established. This procedure is head salvaging procedure and does not require open anatomical reduction of fracture. This technique converts shearing stress at fracture site to compressive one and enhance union. This procedure itself may lead to avascular necrosis, early onset degenerative arthritis and decreased abductor lever arm. However, our study showed satisfying results as far as the union rates and functional results are concerned.

**Conclusion**

Valgus osteotomy should be considered as an effective option for management of fracture neck of femur in young and middle age patients and provides compression of fracture site and high success rate.

Effect of Caregiver Education on Quality of Life and Burden among Caregivers of Children with Cerebral Palsy: A Quasi Experimental Study

Shilna Rani P¹, Purusotham Chippala²

¹Assistant Professor, ²Associate Professor, Nitte Institute of Physiotherapy, Mangaluru

ABSTRACT

Background: Cerebral palsy is one of the common neurodevelopmental disorders seen in children and is associated with lifelong disability. Caregiver’s health and well-being can be adversely affected because of long term delivery of care. It has been showed that family involved method is the best treatment strategy in needs of children with cerebral palsy.

Aim of the study: To investigate the effect of caregiver education on quality of life and burden among caregivers of children with cerebral palsy.

Methodology: The study used quasi experimental research design. 32 caregivers of children with cerebral palsy were included in the study. Caregiver education has been implemented to the participants. Quality of life and burden has been assessed by using WHOQOL-BREF and caregiver burden scale before and after one month of the caregiver education.

Results: The results showed that there is a positive effect of caregiver education on quality of life and burden among caregivers of children with cerebral palsy. The WHOQOL-BREF shows a statistically significant results across 3 domains; physical, psychological and environmental whereas social component didn’t show any significant change (p value >0.05). Caregiver burden scale also shows statistically significant results (p value <0.05)

Conclusion: The caregiver education programme may be helpful for improving the quality of life and reducing the burden among caregivers of children with cerebral palsy.

Keywords: Neurodevelopmental disorder, caregiver, World Health Organization, quality of life, cerebral palsy, burden, caregiver education.

Introduction

A caregiver is demarcated as a family member who has been living with the patient, and has been closely involved in his or her activities of daily living, health care and community relations for more than a year and at least 6 to 10 hours a day.¹ Caregiver burden is the stress experienced by the person who cares a disabled patient. Caregiver’s health and well-being can be deleteriously affected because of long term delivery of care.²

Cerebral palsy is one of such disorder which requires long term care and it is considered as one of the most common neurodevelopmental disorders in children.¹ Cerebral palsy results from insults to the brain during the developmental period and can cause dysfunction of posture and movement, accompanied by impairment in sensation, perception and cognition.³ The worldwide incidence is about 2 to 2.5 per 1000 live birth. In India the incidence is around 3 cases per 1000 live birth.⁴

Delivering care for a child with cerebral palsy is accompanying with financial burden. Parents were conveyed that for providing basic care needs significant

DOI Number: 10.5958/0976-5506.2019.01955.7
amount of money and time. These may include consultation fee, transportation expense, food, cost of tablet and adaptive equipment.\textsuperscript{5}

World Health Organization states quality of life as individual’s insight of their position in life in the perspective of the culture and value systems in which they live and in relation to their aims, hopes, morals and concerns.\textsuperscript{6} Quality of life of siblings and parents in turn affects the well-being of the disabled children and family. Family centred care has shown to be more effective than patient centred care.\textsuperscript{7}

Physical therapy for children with cerebral palsy improves the neuromotor element at the level of body structure and function allowing them to carry out their activities of daily life.\textsuperscript{8} Strategies designed to aid the caregiver help them to become a more skilled and self-reliant provider. These interventions will help to prevent the complications of cerebral palsy. Interventions such as role playing and practice are considered to relief the caregiver burden and aid to understand how to carry the child at home. Addition of an educational program for primary caregivers to rehabilitation develops self- and freedom of movement.\textsuperscript{9}

With the advanced health care, the children with cerebral palsy are living longer and there is also a move from institution to family centred care. So the responsibility of caregiver is also greater than before. Most of the studies were reported a positive effect of family centred rehabilitation on cerebral palsy. Past studies were more on nursing practices.\textsuperscript{9,10} An education programme will need to be designed in physiotherapeutic aspect to provide a clear understanding of the caregiving process, how to take care of the cerebral palsy child at home, exercises that can be delivered at home, and various relaxation techniques for the child.

Most studies on caregiver burden were conducted in western countries. In India only few studies were done on this topic. So this study was designed to help and create awareness and better understanding regarding the quality of life, caregiver burden, and also the care giving process in order to take better care of their child through caregiver education in future. It is therefore suggested that inform the public about various programmes and guidelines that can be employed to help the caregiver, their level of stress and quality of life so that the governmental and non-governmental organisation can provide financial support as well as basic care required by the child. The aim of this study was to investigate the effect of caregiver education on quality of life and burden among caregivers of children with cerebral palsy. So in future the well-being of cerebral palsy children and caregiver can be improve with proper caregiver education.

Materials and Method

Source of Data: Data has been obtained from the caregivers of cerebral palsy children from Samanvayasampanmula Kendra special school at Kapikad (Thokkottu) and department of paediatric physiotherapy in Justice K S Hedge charitable hospital, Mangaluru.

Study Design: Quasi Experimental Study (Pre and post comparison study).

Target Population: Caregivers of children with cerebral palsy

Study Duration: 1 year

Sampling Method: Convenient sampling.

Inclusion criteria

- Caregivers of children with any type of cerebral palsy (1-14 years age group) irrespective of their gender.
- Caregiver who have been providing care for more than 1 year.
- Caregiver who spends at least 6 to 10 hours per day with the Cerebral palsy child.

Exclusion criteria

- Caregivers who are not willing to give consent and participate in the study.
- Caregivers who have more than one child with chronic illness.

Sample Procedure: Approval from scientific committee and Institutional Ethics Committee of Nitte Deemed to be University was obtained prior to the commencement of the study. Before commencing the study consent form were obtained from the participants. Principal investigator was post graduate student of physiotherapy. Face to face interview was conducted with parents...
and collected the socio-demographic details. After that caregiver burden and quality of life has been assessed by using caregiver burden scale\textsuperscript{2} and WHOQOL Scale.\textsuperscript{11} Instructions regarding the scale were explained clearly to the caregiver. Prior to the study both scales were converted to local language.

**Caregiver education programme**: It consists of three phases. In first phase explanation regarding the necessity of caregiving and various caregiving techniques has taught to the parents, which includes relaxation techniques, positioning, feeding position, training of activities of daily living, stretching etc. In second phase demonstration of caregiving has been done on the child for a period of 15 minutes. In the third phase caregiver were asked to practice the learned things. The participants were advised to deliver the same thing to the child at home.

A pamphlet was developed for the caregivers of children with cerebral palsy. It covered details regarding the,

1. Various positioning of the child that can be done at home.
2. Relaxation techniques on the lap and in sitting position.
3. Lifting and carrying techniques.
4. Various activities that can be encouraged in supine, prone, kneeling, sitting and standing position.
5. Stretching of tight muscles of upper and lower limb.
7. Wrong and right positioning for feeding.
8. Ideas for shoe ware and clothing for facilitating to wear and remove it from the body.

The content of the pamphlet was constructed and modified from literature and validated by experts. Follow up was done when the caregiver has come for taking physiotherapy treatment for the child and through telephone once a week. After a month quality of life and burden has been assessed again by using the caregiver burden scale and WHOQOL- BREF.

Statistical analysis was done by paired t test using SPSS 16.0 version. p value <0.05 considered significant. The socio-demographic details were analysed by using frequency and percentage of descriptive statistics. Effects size was calculated by using cohen’s d.

**Results**

A total of 32 caregivers of children with cerebral palsy were included in this study. Out of 32 participants 91% were female and 9 % were male. Mean age of the female participant was 36.00 years with a SD of 6.245 and mean age of the male participant’s was 33.51 years with a SD of 5.30. Since the p value is more than 0.05 suggesting age is homogeneously distributed among male and female participants. Table 1 shows socio-demographic details of the participants.

(* Indicates significance.)

There is a mean difference of 4.93 on WHOQOL and mean difference of 3.26 on caregiver burden scale for employed participants. A mean difference of 3.6 on WHOQOL and mean difference of 2.07 on caregiver burden scale for unemployed person. Pre and post comparison of quality of life and burden in relation to the educational level of participants revealed that there difference of 2.04 on WHOQOL and mean difference of 3.61 on caregiver burden scale for primary level educated participants. A mean difference of 2.90 on WHOQOL and mean difference of 2.36 on caregiver burden scale for secondary level educated participants. A mean difference of 4.15 on WHOQOL and mean difference of 4.1 on caregiver burden scale for graduated participants.

Pre and post comparison of quality of life and burden in relation to the socio-economic level of the participants showed that there is a mean difference of 1.78 on WHOQOL and mean difference of 2.12 on caregiver burden scale for participants of lower class socio economic level. A mean difference of 2.1 on WHOQOL and mean difference of 3.65 on caregiver burden scale for participants of middle class socio economic level. A mean difference of 3.23 on WHOQOL and mean difference of 4.84 on caregiver burden scale for participants of upper class socio economic level.

Discussion

The purpose of the present study was to investigate the effect of caregiver education on quality of life and burden among caregivers of children with cerebral palsy. It was a quasi experimental research design, compared the dependent variables before and after the intervention and there is no control group. Findings of the present study indicated that there was a statistical significance in quality of life and caregiver burden among the caregivers of children with cerebral palsy after caregiver education.

The study reports a similar findings of a study done by Carol Singago et al (2015) that the mother of a children with cerebral palsy are experiencing more burden compared to father and in 90% of the cases mother is the primary caregiver providing an endless care to the child. In this study 91% of participants were mother of cerebral palsy child and experiencing burden and poor quality of life.

Eliza Cristina Macedo et al (2015) conducted a study on burden and quality of mothers of children and adolescence with chronic diseases and found that the physical and mental health of the mothers is adversely affected. Another study conducted by Lucia paris et al to investigate the impact of cerebral palsy on child’s as well as family’s quality of life. Results showed that cerebral palsy had more effect on mothers quality of life compared to fathers.

The study also showed a significant change in caregiver burden after caregiver education. Compared to unemployed participants employed participants showed more difference in mean on WHOQOL-BREF and...
caregiver burden scale, which indicated that occupation plays a role in quality of life and burden among the participants.

Level of education of the participants also showed a difference in mean value on WHOQOL-BREF and CBS. Participants of higher educational level (graduate) showed a better quality of life and less burden compared others. The participants of different socio economic level also showed a relationship with quality of life and burden. Participants of upper class family showed a reduced burden for caregiving and an improved quality of life. Thus it is stated that the socio demographic variables like education, occupation and economic status were related to the quality of life and caregiver burden.

In this study individual oriented education was implemented to the caregivers of children with cerebral palsy. Yeowell reported a similar finding that individual oriented intervention was more beneficial for improving the quality of life compared to group sessions. According to the data bases searched it is the first study which provides a caregiver education programme in a physiotherapy perspective. Past studies were on nursing practices. The caregiver education can help to provide adequate knowledge and self practicing skills related to the condition, so that better care can be delivered at home. Descriptive longitudinal studies can be done on the same topic, so that it will help to evaluate the effectiveness over a long period of time. Limitations of the present study findings were there was no control group and the severity of burden depends on the type of cerebral palsy. In this study all types of cerebral palsy were included.

Conclusion

The caregiver education programme was found to improve the quality of life and reduce the burden among caregivers of children with cerebral palsy. Health care professionals can include the active participation of caregivers in the rehabilitation program so that better treatment can be delivered

A Study to Assess Fear Perceived by Children Undergoing Painful Invasive Intravenous Procedures

Sushma Oommen¹, Asha P. Shetty²
¹Associate Professor, KDA Nursing College C/O Kokilaben Dhirubhai Ambani Hospital, Four Bungalows, Andheri west, Mumbai, Maharashtra; ²Professor-cum-Principal, College of Nursing AIIMS Bhubaneswar, Sijua, Dumduma Post, Khurdha District, Odisha, India

ABSTRACT

Introduction: Pain can be physiological but also includes spiritual, emotional and psychosocial dimension. The child may associate a great deal of anxiety and fear with pain. In the health care setting medical procedures that are applied using a needle, such as venipuncture and immunization are the most common and important sources of pain for children, causing anxiety, distress and fear. Atraumatic care focuses on reducing the negative impact of such procedures.

Statement of Problem: A descriptive study to assess the fear perceived by children prior to Painful Invasive intravenous procedures.

Objectives: To determine fear perceived by children prior to Painful Invasive intravenous procedures and to determine the association between selected variables and fear.

Method: A descriptive study was done to determine fear perceived by children prior to Painful Invasive intravenous procedures among 48 children. The subjects were selected by purposive sampling technique. The level of fear was assessed using Children’s fear scale.

Findings: Maximum children 97.9% had some level of fear whereas only 2.08% verbalized that they have no fear or procedure. Correlation coefficient between Fear of invasive procedures and selected demographic variables like age, Gender, Birth order, previous experience of painful procedure and presence of caregiver were calculated Fisher Exact test showed significant association between fear and birth order.

Keywords: Children, Fear, Pain, Invasive procedures, Intravenous Cannulation

Introduction

A child’s pain is one of the most compelling as well as most perplexing clinical situation for parents as well as health professionals (Lynda Dalhquist).¹ Children of all ages, including newborn experiences pain. The nurse is often unable to prevent pain but can do much to reduce the physical discomfort. The expression of pain is influenced by the child’s culture and parents’ child-rearing practice. The child may associate a great deal of anxiety and fear with pain and may perceive that pain is punishment for some misdeed.² Pain is physiological but also includes spiritual, emotional and psychosocial dimensions. The goal of pain management in any age or condition throughout the lifecycle is same to focus all the dimensions and to provide maximum pain relief with minimal side effect.

‘Medical fear’ is defined as “any experience that involves medical personnel or procedures involved in the process of evaluating or modifying health status in traditional health care settings (Steward and Steward)”³ In the health care setting medical procedures that are applied using a needle, such as venous access and immunization are the most common and important
sources of pain for children, causing anxiety, distress and fear (Blount 2009, Uman et al 2006). During placement of needle experience of pain is common and this painful experience is a source of fear leading to distress behavior. Pain-related fear is associated with high levels of disability, depressive symptoms, and school impairment. Human being is programmed to encounter fear, and in most cases, fear is adaptive. Pain an unconditioned noxious stimulus which triggers our fear response and alerts our flight-or-fight system to respond. Unfortunately, after only a few repetitions conditioning happens to pain-related fear happens and then it generalizes. These experiences are continued through pain anticipation and leads to operant process of reinforcement. This further causes increased fear and distress even more pain during future invasive procedures. Thus Pain management is the key responsibility of all pediatric health professionals.

The resulting pain due to medical procedures may be considered “mild” by some individuals; however, for many, these needle procedures are far from pricking pain at a local site and are associated with a high degree of pain and fear. Children in particular, are concerned about needle pain. The fear of needles prior to medical procedures like injections and vaccinations is so severe that they experience extreme emotional distress also want to stay away from any medical procedure in future. Pain is a most ubiquitous problem both in children and adults. It is a predominantly subjective emotional distress that also leads to impairment in the quality of life (Katz, 2002). Moreover, fear of pain experienced due to medical procedures in childhood usually continues up to adulthood.

An individual may have risk factors and protective factors influencing the pathway by which the severe needle fear would develop. These factors can predispose, precipitate, perpetuate, or protect against the development of pathologic fear.

There are many Predisposing factors like genetic factors, past life events, or temperament of child, which increases fear during such procedures. Developmental age, Birth order, and presence of care giver may alter the level of fear. Studies show that human being is biologically prepared to be scared of needles because of pain and fear of injury. Female tend to be more afraid and younger age have been shown to be significantly related to needle fear and phobia.

Pain caused by needles may disappear in short time but it may lead to long-lasting emotional effect and fear which may further lead to psychological problems avoidance of medical care or delay in treatment. ‘Trypanophobia’ is extreme fear of medical procedures involving needle. During childhood though these procedures may be very essential thus the health care worker must ensure that they adopt interventions to prevent negative effect like fear.

Effective management of pain is the fundamental right of a person and foremost responsibility of a nurse. International Network On Health Promoting Hospitals And Health Care Services (2010) defines the right of the child as “Children have the right not to feel Pain” Prevention or alteration of negative memories is a crucial part of breaking the negative feedback loop that can cause greater anxiety and pain during future procedures (Cohen 2008, Rocha 2009).

As Invasive intravenous procedures are most common type of painful procedures and the associated fear is a common phenomenon thus the investigator felt the need to assess the fear perceived by children prior to Painful Invasive intravenous procedures.

**Statement of Problem:** A descriptive study to assess the fear perceived by children prior to Painful Invasive intravenous procedures.

**Objectives**

The objectives of the study were to:

1. To determine fear perceived by children prior to Painful Invasive intravenous procedures.
2. To determine the association between selected variables and fear perceived by children during Invasive intravenous procedures.

**Research Hypothesis:** H1-There will be significant association between Fear and selected variables among children at 0.05 level of significance.

**Delimitation:** The study will be delimit to:

- Children admitted in paediatric wards of selected hospital of Mumbai.
- Children aged between 3 to 12 years of age.
- Children undergoing invasive intravenous procedure.
Child’s fear of procedure will be measured only prior to procedure.

Materials and Method

A descriptive study was done to determine fear perceived by children prior to Painful Invasive intravenous procedures among 48 children in a selected hospital after obtaining prior administrative and ethical permission. The subjects were selected by purposive sampling technique. After initial introduction consent and assent were obtained from parents and children. Then fear was assessed using children’s fear scale.

Sample criteria

Inclusion criteria: Inclusion criteria for sampling referred to the children,
- Within the age of 3 -12 years.
- Admitted to paediatric ward undergoing intravenous procedures.
- Willing to participate in the study.

Exclusion criteria: Exclusion criteria for sampling referred to children,
- Who are critically ill.
- Those who are unable to verbalize.
- Children with skin abrasions or any type of skin lesions at procedure site.

Data collection tools: The baseline data was assessed using a questionnaire. Child’s perceived fear was assessed using Children fear scale (McMurtry, C.M., Noel, M., Chambers, C.T., McGrath, P.J. (2011)). Investigator obtained permission to use the tool

The Children’s Fear Scale was adapted from the Faces Anxiety Scale (McKinley, Coote, & Stein-Parbury, 2003) to measure fear in children undergoing painful medical procedures. The initial validation study (McMurty, Noel, Chambers, & McGrath, 2011) with children undergoing venipuncture demonstrated construct validity as well as test-retest and interrater reliability. This scale has 5 faces are showing different amounts of being scared. The left most face shows least scared and the right most face shows maximum fear .The child pointed out the face corresponding their level of fear and it was recorded by the investigator.

The study findings (Table-1) revealed that 41.67% children were preschoolers compared to 58.33 School-agers. 79.1% were boys whereas 20.8 were girls. 13 children (27.08 %) among 48 were youngest as compared to 10.42% Middle 27.08 % Eldest and 35.42 % were only child for their parents. Most of the children (79.1%) had history of previous invasive intravenous procedure. Along with 47.9 % children their parents accompanied during procedure whereas for 52.08% parents were not present.
Figure 1. Shows that maximum children i.e.31.25% experienced Bit more fear whereas 27.08% and 22.9% had Little bit fear and much more fear16.7% children perceive extreme fear and only 2.08 % children verbalized that they had No fear or procedure.

Correlation coefficient between Fear of invasive procedures and selected demographic variables like age, Gender, Birth order, previous experience of painful procedure and presence of caregiver were calculated using Kendal’s Tau. There was weak Negligible positive correlation between Pain and age(.077), Weak Positive correlation between Pain and Birth order(0.365), Pain and presence of caregiver(0.224) and weak Negative association between Pain and Gender, Pain and previous experience.

7.92 % of children had some degree of fear of painful procedure .Most of the youngest children in the family had little bit fear (41.15 %) followed by 38.5% with extreme fear of procedure. 41.2 % of children who were the only child had extreme fear. Fisher Exact test showed significant association between fear and birth order at (P> .05)

The study findings were similar to (Martin et. al. 2007) who found that children with higher levels of anxiety had a higher fear of pain and it was associated increased pain. The findings suggested that anxiety sensitivity and fear of pain may play important and distinct roles pain and pain-related disability in children

**Conclusion**

The gate control theory of pain clearly depicts that emotion factor like fear shapes the pain experience as well as future pain adaptation. This study also shows that almost all children exposed to painful procedures have fear. Moreover fear has bidirectional relationship like more pain experience may lead to high level of fear and vice versa. Although acute pain from needles typically dissipates in the minutes, hours, or days after a needle, the emotional sequela of unmanaged pain, most notably a fear of needles, can have a much longer lasting impact. Though these procedures may be very essential measures should be adopted to reduce the negative effect like fear. Health care personnel should plan interventions which will reduce pain as well as fear and distress before during and after the procedure.

Prediction and Identification of Cancer and Normal Genes Through Wavelet Transform Technique

D. Sobya¹, Sumitha Manoj¹

¹Associate Professor, Department of Electronics and Communication Engineering, Raja Rajeswari College of Engineering, Bengaluru, Karnataka, India

ABSTRACT

Currently, in the field of bioinformatics the most important advanced practice of genome signal processing is used to analyze the biological sequences without involving any biological testing or treatments. To analyze the genome data with the help of signal processing concepts the technique of genome signal processing is being adopted. According to the earlier medical research reports, it was understood that the deadly disease of cancer is origin due to genetic abnormality. Some of the signal processing concepts such as Fourier transform, short term Fourier transform, wavelet transform, etc are used for analyzing the biological sequences. Wavelet transform is an important tool for analyzing the cancer genome. The main objective of this research article is to develop the necessary algorithm and to test for several databases available at National Center for Biotechnology Information. In this research the analysis was carried out by using MatlabR2015b for simulations which supports Bioinformatics toolbox. From the results it was found that, the coefficient of variation for cancer genes are always much higher than the normal genes.

Keywords: Detection, Cancer and Normal Genes, Genome Signal Processing, Deoxy Ribo Nucleic Acid, Bioinformatics, Wavelet Transform

Introduction

In the past decades, the disease of cancer is very difficult to identify and cure. Based on the medical research reports, due to cancer cells mortality rate has been significantly increased. After many research inventions in the medical field, the cancer disease has been diagnosed and treated. The major restrictions in the treatment or prediction of cancer disease with the use of biological concepts are high cost and more time consumption [1]. Genome Signal Processing (GSP) technology is the application of Digital Signal Processing Concepts (DSPC) for analyzing genomic sequences [2], [3]. Cancer disease is mainly caused due to environmental agents, chemical exploitation, mutation in the Deoxy Ribo Nucleic Acid (DNA) sequences, etc [4]. DNA is a double stranded molecule found in the chromosomes of the human cell and its major function is to provide instructions for synthesis of the human cell [5]. During the reproduction, DNA makes up chromosomes which are responsible for transferring the genetic information or instructions from parent cell to offspring. Mutation is the sudden alteration in the DNA sequences during cell division which can cause cancer disease [6], [7]. In an earlier research, the various types of mutations occur in DNA sequences such as substitution, insertion or deletion, copy number of alterations and translocations were explained [8].

It is not possible to analyze the DNA sequences as such in the character form of A, T, G, C. It is mandatory to convert the character form of DNA sequences into numerical form. Various numbers of mapping techniques are available for conversion of DNA sequences [9], [10]. The various types of numerical representations were clearly discussed with its merits and demerits in an earlier research. Among the various types of numerical representation techniques, Electron Ion Interaction Potential (EIIP) technique of average

Email: sobyadevaraj@gmail.com
energy of delocalized electrons of nucleotide has more advantages compared to other methods [11], [12]. EIIIP contains more biological information without much loss and it enhances the discrimination capability and exhibits physicochemical property. The conventional way of Voss representation increases computational complexity since the results of mapping sequences contains four sequences [13]. EIIIP reduces computational overhead by about 75% and it is well known that the exon region reflects period-3- behaviour whereas intron region does not reflect. Hence, it is mandatory to identify the protein coding region in the analysis of genomic sequences [14]-[16]. To analyse the genomic sequences, signal processing concepts are well suited and also among many DSP concepts wavelet transform have been mostly used due to many benefits such as high accuracy resolution, independent of window length, time frequency domain representation, local feature identification, and multi-resolution scalability [17]-[19]. An alternative way to achieve higher accuracy of gene identification was described in an earlier research and the results shows that the wavelet approach is feasible and better than other methods of signal processing [20].

In this article section I describe the introduction which includes about Genome signal processing, DNA, Literature survey of some research papers, section II explain the objective and proposed methodology which describes the steps and procedure have to be followed in the proposed method, section III shows the algorithm and flowchart which involves the flow of the proposed method, section IV describes the results and simulations which clearly shows the discrimination of normal and cancer cells using MatlabR2015b and section V reveals the final conclusion.

Proposed Methodology

The main objective of this research is to develop the necessary algorithm and to test for several databases available at National Center for Biotechnology Information (NCBI) by wavelet transform technique and MatlabR2015b. The various proposed methods were discussed as follows.

Data Collection: The initial process of this research is to extract the DNA sequences. There are so many ways to collect the databases. There are many websites are available for collecting the DNA sequences such as Pubmed, Uniprot, NCBI, etc whereas in this research article, NCBI website was used for collecting the DNA sequences.

EIIIP Technique: The symbolic DNA sequences are converted into numerical sequences using EIIIP representation technique. By applying EIIIP values to each nucleotide, the conversion is to be carried out and the observed EIIIP values for each nucleotide are 0.1260 for A, 0.0806 for G, 0.1335 for T and 0.1340 for C nucleotide respectively.

Wavelet Transform Technique: Wavelet transform is an important mathematical analysis tool in analyzing biological sequences. In this article, wavelet transform is applied for normal and mutated numeric sequences hence, the mutated regions should be predicted which is different from normal sequences.

Power Spectral Analysis: The Power Spectral Density (PSD) graph should be plotted for both normal and the cancer cells. The discrimination between the normal and the cancer cells has to be determined by observing the spikes in the plot of genomic normal and the cancer sequences.

Parameter Evaluation: The mean amplitude, standard deviation, mean normalized frequency, coefficient of variation are the parameters calculated here for both normal and the cancer sequences. By estimating the ratio for those parameters, the differentiation between the normal and the cancer cells should be predicted.

Methodology and Algorithm: The various processes in the proposed methodology are existing data base collection, numerical mapping, analysis with wavelet transform technique, power spectral analysis and evaluation of the parameters with results.

The algorithm for the proposed methodology described as following.

Step 1: Primarily, the databases of normal and the cancer cells required for analysis have to be collected from open access NCBI website.

Step 2: The extracted DNA sequences are converted into numerical sequences using the representation technique called EIIIP.

Step 3: The wavelet technique is applied to the normal and manually mutated numeric sequences. The classification between the normal and mutated sequences has been identified and point out in the wavelet plot.

Step 4: The cancer sequences are also collected and converted into numeric sequences. The wavelet transform is applied to those sequences as same as done in step 2 and 3.
Step 5: Then, the power spectral density has to be computed for normal and the cancer sequences and observe the difference by the presence or absence of spikes.

Step 6: In another way of identifying the differentiation between the normal and the cancer cells, the parameters such as mean amplitude, standard deviation, mean normalized frequency and the coefficient of variation has been computed.

Simulation and Results

The required simulations and results have been developed using MatlabR2015b which supports Bioinformatics toolbox. The results have been taken by doing two methods such as the identification of mutation region and the analysis of both normal and the cancer cells. The normal and the cancer cells with its respective accession numbers were collected from NCBI and are shown in Table 1.

Method 1: The first method involves the identification of mutation region. The normal sequences of DNA have been collected and converted into numerical representation by using EIIP mapping technique. The EIIP values were plotted for the DNA sequences {…AATCTGAGCCAGTGAAGA….} to find out the maximum values. The X-axis represents nucleotide indices (A, T, C, G) and the Y-axis represents EIIP values (0.1260, 0.1335, 0.1340 and 0.0806). Manually mutate some base pairs of DNA sequences and then conversion technique EIIP was applied for accession number AF186608 and accession number AF083883 before mutation are shown in Figure 1.
Now the wavelet transform was applied to the numeric sequences of both normal and mutated cells. In the wavelet plot of the mutated cells, the mutation region has been clearly indicated in red colour oval box for accession number AF1866608 and accession number AF083883 after mutation are shown in Figure 2. This method is very much useful for identifying the mutation spots in the normal sequences by applying wavelet transform. Wavelet transform plays a major role in observing the mutation region which occurs in the DNA sequences cause cancer.

**Figure 2: Wavelet Transform Plot for Mutated Cell**

**Method II:** In the previous method, the analysis was carried out only in the normal sequences. It is well known that mutation in DNA sequences can cause cancer and hence, the mutation region which causes cancer has been identified in the first method. The second method involves the analysis of both normal and the cancer cells for which, the cancer DNA sequences also collected in addition to the normal sequences. As same as in the previous method, the EIIP mapping technique and the wavelet transform also performed for both the normal and the cancer cells. Here, the power spectral density has been computed and in the PSD plot of cancer cells the spikes are present. The spikes are absent in the normal cells. By this observation, it is easy to predict the normal and the cancer cells. The power spectral plots for normal sequences for the accession numbers AF1866608, AF083883, AF186614 and AF348448 are shown in Figure 3. Similarly, the power spectral plots for cancer sequences for the accession numbers NM_007294.3, AF284036, EE178466 and NM_000142.4 are shown in Figure 4.

**Figure 3: Plot of Power Spectrum for Normal Cell**
The parameters like mean amplitude, standard deviation, mean normalized frequency and the coefficient of variation have been evaluated. The following are the inferences have been taken from those parameters of normal and the cancer cells.

- The ratio between mean amplitude to the standard deviation is more than 1 for normal cells and less than one for cancer cells.
- The coefficient of variation is more than 100% for cancer cells and less than 100% for normal cells.
- The ratio between mean amplitude to the mean normalized frequency is less than 1 for cancer cells and more than 1 for normal cells.

The different parameters with its evaluated values for cancer and normal cells with the ratio of mean amplitude to standard deviation, mean amplitude to mean normalized frequency and coefficient of variation are given in Table 2.

Conclusion

The objective of prediction and identification of cancerous genes was carried out by using wavelet transform technique which is one of the most advanced signal processing concept. An efficient algorithm has been developed for analyzing normal and cancer cells and identification of cancer genes. The ratio of mean amplitude to standard deviation, ratio of mean amplitude to mean normalized frequency and coefficient of variation for cancer and normal cells was found. From the results it was found that, the values of cancer genes mean amplitude to standard deviation and values of mean amplitude to mean normalized frequency are higher than normal genes. Whereas the coefficient of variation results for different cancer genes are lower than the normal genes. For further research the wavelet transform technique has become great scope for analyzing biological sequences in cancer genome.

ABSTRACT

Introduction: Cervical cancer is one of the commonly occurring cancers among women. More than ninety percent of mortality related cervical cancer are reported from middle and low-income countries.

Objectives: To assess the knowledge regarding cervical cancer and HPV vaccination among medical undergraduates in Mangalore.

Materials and Method: This cross sectional study was conducted among medical undergraduates studying at Kasturba Medical College, Mangalore. A pre tested semi structured questionnaire was used for collection of the data. Approval from Institutional Ethics Committee of Kasturba Medical College, Mangalore was obtained before commencement of the study. Data was entered and analysed using SPSS ver. 11.5.

Results: The study involved 154 (40.3%) males and 228 (59.7%) female students. It was found that that aetiology for cervical cancer was known among 347 (90.8%) and 326 (85.3%) knew about correct mode of transmission. Awareness regarding ideal age for HPV vaccination was observed in 45.5% (n=174) of the participants.

Conclusion: The present study showed that awareness regarding cervical cancer was good, but the knowledge regarding HPV vaccination was sub optimal among medical undergraduates.

Keywords: Human Papilloma Virus, Medical Undergraduates, Mangalore

Introduction

Cervical cancer is one of the most common cancers among females. Around five lakh cases were reported in the year 2018 and constitutes just more than five percent of female cancers globally. More than ninety percent of mortality related cervical cancer are reported from middle and low income countries. [1] Around 1.3 lakh newly diagnosed cervical cancer cases and around 75,000 mortalities are reported from India every year which constitutes around 33% of cervical cancer death globally. Human Papilloma Virus 16 and 18 are responsible for more than two third of cervical cancer cases. These are also the most reported genotypes responsible for cervical cancer cases in India. [2]

As mass scale regular screening is tough to achieve in developing nations like India, vaccination can be considered as the best strategy for prevention of cervical cancer. [2]

The chances of detection of abnormal smear while performing PAP smear screening is 35%, but if screening is not performed on a routine basis such women can have 4% life time risk of having cervical cancer. [3] As mass scale regular screening is tough to achieve in developing nations like India, vaccination can be considered as the best strategy for prevention of cervical cancer. [2]

Currently two recombinant DNA vaccines i.e. Gardasil™ and Cervarix™ are available in the market. Gardasil™ provides protection against genital warts and cervical cancer, whereas Cervarix™ provides protection against cervical cancer and dysplasia.
Three doses of HPV vaccination is recommended for females aged 11-12 years as per the recommendation of Advisory Committee on Immunization Practices. The vaccination can begin as early as 9 years to 13 to 26 years. In India mass vaccination against HPV is not feasible due to its high cost.

As medical undergraduates are considered to be future doctors of the society, their knowledge regarding Cervical cancer screening and vaccination is vital in guiding patients regarding HPV vaccination, considering the huge burden of cervical cancer in India. Hence, the present study was conducted to assess the knowledge regarding cervical cancer and HPV vaccination among medical undergraduates in Mangalore.

**Materials and Method**

This descriptive cross sectional study was done among medical undergraduates studying at Kasturba Medical College, Mangalore. A sample size of 400 was calculated considering a power of 80%, precision (relative) of 10% & confidence level of 95% based on the study where the awareness regarding appropriate age for HPV vaccination was 49%. Convenience sampling was used for selection of study subjects. The study was done over a period of 4 months and a pre tested semi structured questionnaire was used for collection of the data. The questionnaire consisted of questions related to knowledge about cervical cancer, HPV vaccination and cervical cancer screening. Participants who refused to give the written informed consent were excluded from the study. Approval for ethical consideration was received from Ethics Committee of Kasturba Medical College, Mangalore. Necessary approval was also obtained from the head of the institution to distribute the questionnaire to medical undergraduates. Data was entered and analysed using SPSS ver. 11.5 and presented in the form of proportions.

**Findings**

Awareness regarding ideal age for HPV vaccination was observed in 45.5% (n=174) of the participants and 42.9% (n=164) of the students knew that HPV vaccine can be given to boys as shown in table 2.

On analysing the reasons for not receiving the vaccine, 38% (n=146) of the medical students were under the opine that cost of the vaccine is the main hindrance followed by lack of awareness towards HPV vaccine (n=132, 34.5%). Around 80.1% (n=306) felt that HPV vaccine must be added to national immunization schedule.
Discussion

The burden of cervical cancer is very high in India and it is one of the top cause of mortality in women. The present study has been done to assess the knowledge regarding cervical cancer and HPV vaccine among future doctors.

In contrast to our study findings where 91% of them knew that virus was the aetiology for cervical cancer, in a study conducted at Thirupathi [7] all the participants of the study were aware of the aetiology. Whereas a study done at Manipal [8] and Mangalore [9] has shown findings similar to our study. A findings similar to our study was observed in a study conducted at Manipal and Mangalore [8,9] where more than three fourth of the students were aware that cervical cancer is preventable. However 95% of the students from Thirupathi [7] were aware of the same. In contrast to study done among medical undergraduates at Thirupathi [7] and Kerala [10] where more than three fourth of the study participants were aware that cervical cancer is transmitted through sexual route, a study done among female in general population at Delhi [11] it was observed to be only one third. Less than half of participants in our study were aware that HPV vaccine can be administered to males similar to studies done at Southern part of India. [7,9] However awareness was very low regarding this in a study conducted at Mehta et al [6] and Deeksha Pandey et al [8].

On analysing the results for correct age for HPV vaccination, a finding similar to our study was observed in a study done by Mehta et al [6] whereas it was more than three fourth in a study done at Mangalore. [9] It is evident from our study that nearly two third of the medical undergraduates were aware that two doses of HPV vaccines to be given, whereas it was only 29% for two doses and 60.6% for three doses in a study conducted at Thirupathi [7] However in a study done at coastal part of South India three fourth of the participants knew that three doses of HPV vaccine is required [9]. High cost was cited as a major hindrance for HPV vaccination in the present study, in congruence to a study done at Andhra Pradesh [7]. However social stigma was cited as a major hindrance for HPV vaccination by general female population of Delhi. [11]

Conclusion

The present study showed that awareness regarding cervical cancer was good, but the knowledge regarding HPV vaccination was sub optimal among medical undergraduates. It emphasis the need to incorporate these aspects in their medical undergraduate curriculum.

Comparison of the Effects of Various Irrigants on Apically Extruded Debris after Biomechanical Preparation with Four Different Rotary Endodontic Files: An in Vitro Study

Kanchan Bhagat1, Ankush Jasrotia1, Neeru Bhagat2, Sandeep Kumar Gupta3

1Senior Resident Deptt. of Conservative Dentistry and Endodontics, Indira Gandhi Govt. Dental College and Hospital, Jammu; 2Consultant Orthodontist, Jammu; 3Senior Lecturer, MNDAV Dental College and Hospital, Solan, Himachal Pradesh, India

ABSTRACT

Aims: The purpose of this in vitro study was to assess the amount of apically extruded debris during the root canal preparation using different rotary instrumentation systems and different irrigants.

Materials and Method: In this study, 80 human mandibular first premolars were randomly assigned to 4 groups (n = 20 teeth/group). Each group was then divided into four subgroups. In each group, the root canals were instrumented according to the manufacturer’s instructions using the Protaper, Mtwo, K3 and full-sequence rotary Hyflex CM instruments. The canals of sub groups of each group were irrigated with four different irrigants: sodium hypochlorite, chlorhexidine and normal saline. Preweighed eppendorf tubes were used to collect the debris that extruded apically which was assessed with an electronic balance and compared.

Results: Protaper demonstrated maximum extrusion, while hyflex demonstrated least extrusion compared to other experimental groups and 5% Sodium Hypochlorite in each group demonstrated maximum extrusion, while Normal saline in each group demonstrated least extrusion.

Conclusions: Under the conditions of this study, it can be concluded that all systems extruded debris beyond the apical foramen.

Keywords: Apically extruded debris, ProTaper, Mtwo, K3, Hyflex, Irrigants.

Introduction

The main objective of endodontic therapy is to clean the root canal system. During root canal preparation, irrigants, dentin chips, pulp tissue, and microorganisms may be extruded into the periradicular tissues, and these extruded materials may cause postoperative pain and complications.1 Many studies examining the apicalextrusion of debris have stated that all instrumentation techniques and instruments are associated with the extrusion of debris.2-6

Sodium hypochlorite (NaOCl) is the most popular irrigant, and it is used at different concentrations ranging from 0.5%–6%. It is used because of its good tissue-dissolving ability and good antibacterial action.3,4 Chlorhexidine (CHX) is another irrigant that has the ability to kill various microorganisms, but it has no ability to dissolve pulp tissue.5,6

Earlier studies have evaluated the amount of AED by various instruments or techniques but none of them have investigated the effect of various types or concentrations of irrigants on AED. Therefore, the aim of the present study was to compare the amount of apically extruded debris after the preparation of the root canals in extracted human teeth using different rotary files systems and irrigants.

Materials and Method

A total of 80 freshly extracted human permanent mandibular premolars with a single root and a single
The inclusion criteria were one root canal with one apical foramen, root curvature between 0°-10° (by using the method of Schneider), no root caries, root canal calcifications and open apices. The collected teeth were washed under tap water to remove blood stains and soft tissue remnants. The external root surfaces of experimental teeth were cleaned of adherent remnants and debris with periodontal curette and were stored in physiological saline solution.

To have similar tooth lengths, all teeth were measured, and the crowns were ground with a high-speed bur under copious water spray until equal lengths of 14 mm were achieved. Access cavity was then prepared on each tooth, with a round bur (size ¼). The working length of each tooth was determined by inserting a size 15 K file (Mani, Tochigi, Japan). Eighty samples were assigned to 4 groups of 20 samples each on the basis of instrument used for canal preparation. Further each group was divided into 4 subgroups of 5 teeth each. In every group, subgroups were instrumented with same rotary file but with different root canal irrigants.

**Group 1 (P):** Singleinstrument (Rotary Protaper) was used for instrumentation. Further the group was divided in to 4 subgroups based on the 4 different irrigants used

- **a. Sub group 1:** (5 samples)
  5% Sodium hypochlorite as root canal irrigant
- **b. Sub group 2:** (5 samples)
  2.5% Sodium hypochlorite as root canal irrigant
- **c. Sub group 3:** (5 samples)
  2% Chlorhexidine as root canal irrigant
- **d. Sub group 4:** (5 samples)
  Normal saline as root canal irrigant

**Group 2(M):** Rotary Mtwo was used for instrumentation. Further the group was divided in to 4 subgroups based on the 4 different irrigants used

- **a. Sub group 1:** (5 samples)
  5% Sodium hypochlorite as root canal irrigant
- **b. Sub group 2:** (5 samples)
  2.5% Sodium hypochlorite as root canal irrigant
- **c. Sub group 3:** (5 samples)
  2% Chlorhexidine as root canal irrigant
- **d. Sub group 4:** (5 samples)
  Normal saline as root canal irrigant

**Group 3(K):** Rotary K3 was used for instrumentation. Further the group was divided in to 4 subgroups based on the 4 different irrigants used

- **a. Sub group 1:** (5 samples)
  5% Sodium hypochlorite as root canal irrigant
- **b. Sub group 2:** (5 samples)
  2.5% Sodium hypochlorite as root canal irrigant
- **c. Sub group 3:** (5 samples)
  2% Chlorhexidine as root canal irrigant
- **d. Sub group 4:** (5 samples)
  Normal saline as root canal irrigant

**Group 4(H):** Rotary Hyflex was used for instrumentation. Further the group was divided in to 4 subgroups based on the 4 different irrigants used

- **a. Sub group 1:** (5 samples)
  5% Sodium hypochlorite as root canal irrigant
- **b. Sub group 2:** (5 samples)
  2.5% Sodium hypochlorite as root canal irrigant
- **c. Sub group 3:** (5 samples)
  2% Chlorhexidine as root canal irrigant
- **d. Sub group 4:** (5 samples)
  Normal saline as root canal irrigant

One Eppendorf tube for each tooth was pre-weighed prior to canal instrumentation with a 0.0001 electronic weighing machine (Sartorius Cubis, Gottingen, Germany), 3 consecutive measurements were done, and the mean measurement for each tube was considered to be its weight. If these 3 consecutive measurements showed very different numbers, the process of weighing was continued until 3 similar measurements were obtained that only differed in the last digit by 1–2.

Debris and irrigant extruded through the apical foramen was collected in an eppendorf tube. This preweighed eppendorf tube was placed into a larger glass vial. This second bottle was used to hold the device during instrumentation so that no contact to the collecting vial was possible. A 27-gauge needle was inserted into each Eppendorf tube cover to balance the air pressure between the inside and outside of the tube during the insertion. The instrumentation was done by a single operator.

In each of these 4 test groups, 20 canals were enlarged. One set of instruments was used to prepare 4
All root canal preparations were completed by a single operator. The root canals of the four groups were instrumented with rotary Protaper, Mtwo rotary, K3 and Hyflex instruments. The files were used with X-Smart endomotor (Tulsa dental, DENTSPLY Switzerland) as per manufacturer’s instructions. Last apical file of tip size 30 was used in all the groups. The preparation sequence wereas follows:

1. **Group 1**: ProTaper instruments were used according to the manufacturer’s instructions using a gentle in-and-out motion. The instrumentation sequence was SX at two thirds of the WL; S1 and S2 at WL -1 mm; and then F1 (20.07), F2 (25.08), and F3 (30.09), at the WL. Once the instrument had negotiated to the end of the canal and had rotated freely, it was removed.

2. **Group 2**: All Mtwo instruments were used to the full length of the canals according to the manufacturer’s instructions using a gentle in-and-out motion. The instrumentation sequence was 10.04, 15.05, 20.06, 25.06, and 30.05.

3. **Group 3**: Canals were prepared with 0.10 taper K-3 instrument to the resistance followed by 0.08 taper instruments. Then, were further prepared with #40 K-3 instruments to the resistance from largest instrument to smallest reaching the working length. After middle third scouting with #10 K-files; #35 and s#30 K-3 instruments were used in crown down fashion till the working length was reached.

4. **Group 4**: The hyflex instruments were used in a gentle in-and-out motion with a rotational speed of 500 rpm and 250-g/cm torque. The instrumentation sequence was 25.08 (two thirds of the working length), 20.04, 25.04, 20.06 and 30.04 (full working length).

The extruded debris and the irrigant were collected in a preweighed tube. Once instrumentation had been completed, each tooth was separated from the eppendorf tube, and the debris adhering to the root surface was collected from the root surface by washing the root with 1 mL of distilled water into the tube. The receptor tubes were then stored in an incubator at 70° C for 5 days in order to evaporate the moisture before weighing the dry debris.

An electronic balance (Sartorius Cubis, Gottingen, Germany) with an accuracy of 0.0001g was used to weigh the tubes containing the debris. The dry weight of extruded debris was calculated by subtracting the weight of the empty tube from the weight of the tube containing debris. The amount of extruded debris and comparison of mean AED between different groups was done using Analysis of Variance and Tukey’s post-hoc test. The level of significance was fixed at p<0.05.

**Results**

All samples of Group 1 (protaper) demonstrated maximum extrusion, while Group 4 (hyflex) demonstrated least extrusion compared to other experimental groups (Graph 1) and 5% Sodium hypochlorite in each group demonstrated maximum extrusion, while normal saline in each group demonstrated least extrusion (Graph 2-5).

The mean AED obtained after preparation with protaperwas 0.1215 g, with Mtwo was 0.0903 g, with K3 was 0.0292 g, and with hyflex was 0.0202. There was no statistically significant difference between K3 and Hyflex (P > .05). There was no significant differences in the mean AED with Protaper and Mtwo (p>0.05). Mean AED obtained with protaper was significantly higher than that with K3 and Hyflex (p<0.05). Mean AED obtained with MTWO was significantly higher than that with K3 and Hyflex (p<0.05). There was no significant difference in the mean AED obtained with K3 and Hyflex (p>0.05) (Table 1).

In Group 1 (Protaper), the mean AED with 5% NaOCl was 0.2600 g with a standard deviation of 0.0540, with 2.5% NaOCl was 0.1837 g with a standard deviation of 0.0295, with 2% chlorohexidine was 0.0286 g with a standard deviation of 0.0130, and with normal saline was 0.0137 g with a standard deviation of 0.0041 (Table 3).

The comparison of mean AED obtained with various irrigants in Group 1 (Protaper), Group 2 (Mtwo) and Group 3 (K3) showed statistically significant differences. In all these groups, mean AED with 5% NaOCl was significantly higher than 2.5% NaOCl, 2% CHX and normal saline. Mean AED with 2.5% NaOCl was significantly higher than 2% CHX and normal saline. There were no significant differences between mean AED obtained with 2% CHX and normal saline (Table 4-8). The comparison of mean AED obtained with various irrigants in Group 4 (Hyflex), showed statistically significant differences. Mean AED with
5% NaOCl was significantly higher than 2.5% NaOCl, 2% CHX and normal saline. There was no significant difference between mean AED obtained with 2.5% NaOCl when compared with 2% CHX and normal saline (Table 9,10).

Discussion

In the present study, eighty single rooted human extracted mandibular premolars with straight roots and mature apex were selected. The reason for the selection of single rooted teeth with a single canal and having relatively less curvatures was to eliminate the complication likely to arise during instrumentation of severely curved canals. Teeth with mature apices were selected since there wouldn’t have been any control over the amount of apically extruded debris in cases of teeth with open apices.

In the present study, the teeth were ground coronally to keep the root canals similar in length in various subgroups and to create an easy reference point for the determination of working length. Schafer et al reported that to achieve endodontic success, minimum apical preparation for mandibular canines and first premolars should be up to tip size 30. So, all the teeth used in the study were instrumented till apical size 30 for all the groups.

In the present study, Protaper rotary instrument extruded significantly more debris than Mtwo, K3 and Hyflex rotary instrument. The final file of the ProTaper rotary instrument F3 has an apical taper of 0.09, which is much larger than the K3 that has a 0.04 taper. The large taper of the F3 instrument increases the stiffness of the file tip and the use of larger and greater taper apical files performed more aggressive cutting in the root canals. This could have been a reason for more apically extruded debris by Protaper group than the others used in the study.

Greater apical extrusion of debris is seen with Mtwo Rotary Ni-Ti instruments in comparison with K3 and Hyflex files. This may be attributed to its Standardized length preparation technique (Single-length technique) where all the Ni-Ti instruments are taken to full working length and also to the double cutting-edge geometry of Mtwo instruments. Because of its specific design characteristics, cutting efficiency, and its standardized length preparation technique Mtwo Rotary Ni-Ti instruments remove adequate amount of dentin in a short period of time thereby unable to displace the debris coronally, leading to significantly greater amount of apical extrusion of debris. In the present study, this could have been the reason for more AED in case of Mtwo group than K3 and Hyflex group.

HyFlex rotary instruments have been introduced recently. They are made from a controlled memory (CM) NiTi wire, which is manufactured by a unique process that controls the material’s memory. This CM feature makes the files extremely flexible and makes the instruments more resistant to cyclic fatigue than non-CM NiTi instruments. In the present study, the reason for the least debris extrusion with the HyFlex group compared to Protaper, Mtwo and K3 group might be caused by this unwinding feature of the instruments.

According to the results of the present study, apical debris extrusion occurred independent of the type of instrument and irrigant used. The present study showed that different root canal irrigants and different concentrations of irrigants can produce different amounts of AED. In the present study, 2 different concentrations of NaOCl were used because they have different tissue-dissolving ability, and this might influence the amount of AED produced during root canal preparation.

NaOCl is the most frequently used irrigant for root canal preparation. There is no general agreement regarding the ideal concentration of NaOCl that should be used in endodontics. It has been reported that 0.5% NaOCl has the same antibacterial activity compared with 5.25%, but its tissue-dissolving ability is less.

Hence, in the present study, 2 different concentrations of NaOCl (2.5% and 5%) were tested.

The dissolving capability of sodium hypochlorite relies on its concentration, volume, and contact time of the solution but also on the surface area of the exposed tissue. Previous studies have shown that the tissue-dissolving ability of sodium hypochlorite solution decreases if it is diluted.

Chlorhexidine cannot be advocated as the main irrigant in standard endodontic cases, because: (a) chlorhexidine is unable to dissolve necrotic tissue remnants, and (b) chlorhexidine is less effective on Gram-negative than on Gram-positive bacteria.

Conclusion

In conclusion, under the conditions of the present study, all instrumentation systems produced extrusion of debris.
of debris and irrigants apically. All samples of Group 1 (protaper) demonstrated maximum extrusion, while Group 4 (hyflex) demonstrated least extrusion compared to other experimental groups and 5% Sodium Hypochlorite in each group demonstrated maximum extrusion, while Normal saline in each group demonstrated least extrusion.

Clinical Characteristics and Associated Disability of Headache among Medical Undergraduates

Ramesh Holla¹, Darshan BB¹, Yew Ze Ying², Teo Raymond², Edric Ponniah², Koh Su San², Ng Yen Yen²

¹Associate Professor, Department of Community Medicine, ²MBBS Student, Kasturba Medical College, Mangalore, Faculty of Health Sciences, Manipal Academy of Higher Education, Manipal

ABSTRACT

Introduction: Headache is the most common neurological disorder and is broadly classified into the migraine headache and tension headache. Students are more susceptible for headache.

Objectives: To determine the proportion, types and triggering factors for headache among medical undergraduates.

Materials and Method: This cross sectional study among 470 medical students was conducted at Kasturba Medical College Mangalore. Medical undergraduates studying in 2nd and 3rd and 4th MBBS were included in the study. Data was collected based on questionnaire, which had 3 sections. Section A includes personal information Section B includes question related to characteristics of Section C includes questions related migraine disability assessment (MIDAS). SPSS Version 11.5 was used for entering and analyzing the data. Descriptive statistics like proportion, mean and standard deviation were used to express the results.

Results: Most of the study participants were females (n=288, 61.3%) and the mean age of study participants was 20.68 (1.35) years. Out of 470 study participants 63% (n=295) of them reported of having headache in the last three months with 78% (n= 230) of them had tension type headache. It was found that 66.8% (n=197) had MIDAS Grade 1 disability.

Conclusion: The present study revealed that majority of the medical undergraduates had headache with tension type being the most common. Most of the students had little or no disability associated with headache.

Keywords: Characteristics, headache, disability, medical undergraduates

Introduction

Headache is the most common neurological disorder and is broadly classified into the migraine headache and tension headache. [¹,²] Tension headaches are common and are due to neck muscles going into spasm. Migraine is a severe form of headache, which shows familial predisposition and is recurrent in nature [²]. Migraine headache has been considered as one among the top 20 debilitating diseases globally [³].

In a study conducted by National Headache Foundation, over 45 million Americans reported to suffer from chronic headache. [⁴] It is estimated that more than 10 percent of school and college students suffer from headache which is more than the combined incidence of diabetes and asthma. [⁵] Tension headaches constitutes majority of headaches and are more common when there is stress and inadequate sleep. [⁶]

Despite of all the researched conducted about various types of headaches in the recent past, the exact etiology of headache is poorly understood and frequently mistreated. [⁷] As lot of stress is associated with students’ life, they are more susceptible to various
headaches. In spite of lot work that has been done in the area of headache, much still requires explanation. Hence, the present study was conducted to determine the characteristics of headache and associated disabilities among the medical undergraduates.

Materials and Method

This cross sectional study was begun after getting the approval from IEC of Kasturba Medical College Mangalore and written informed consent from the study subjects. The sample size of 470 was calculated based on the previous study wherein 46% of the medical students had headache[8] with 10% relative precision and 95% confidence level. Medical undergraduates studying in 2nd and 3rd and 4th MBBS were included in the study. A non-probability sampling was adopted for selection of the study participants. Data was collected based on questionnaire which had 3 sections. Section A includes personal information of the study participants. Section B includes question related to characteristics of headache namely duration, frequency, site, type, severity and triggering factors of headache. Section C includes questions related migraine disability assessment (MIDAS) [9] The questionnaire was prepared after thorough review of literature of published articles and guidelines adopted by International Headache Society (IHS) regarding the classification of headache.

Operational definition of migraine is headache attacks which lasted for 4-72 hours without treatment or failure of treatment which fulfills at least two of the following characteristics: moderate or severe pain intensity, aggravation by or avoidance of routine physical activity, unilateral headache, feelings of pulsation. During migraine, at least nausea and/or vomiting or photophobia and phonophobia is experienced.

Operational definition of tension type headache is attacks which lasted for 30 minutes to 7 days which fulfills at least two of the following characteristics: mild or moderate pain intensity, no aggravation by routine physical activity, bilateral headache, feelings of pressing or tightening (no pulsation). During headache, no nausea or vomiting or no more than one of photophobia or phonophobia. [10]

SPSS Version 11.5 was used for entering and analyzing the data. Descriptive statistics like proportion, mean and standard deviation were used to express the results.

Out of 470 study participants 63% (n=295) of them reported of having headache in the last three months with 78% (n=230) of them had tension type headache and remaining had migraine type of headache. Among 290 students who had headache, 218 students (73.9%) gave the family history of headache.

Among the participants who had headache attack in the last 3 months, 65.1% (n=192) of them had headache episodes that lasted for hours, 84.4% (n=249) of them did not take medication and most of them suffered from moderate pain (n=167, 56.6%) as depicted in Table 2.

* Multiple responses

The most common triggering factors of headache among medical students are irregular sleep (73.2%, n=216), emotional stress or anxiety (55.3%, n=163), exposure to bright light or sun (43.4%, n=128), and exams (41.4%, n=122) as shown in Table 3.

### Table 4: Disability Associated with headache as per MIDAS Score (N = 295)

<table>

</tbody>
</table>

On analyzing the disability associated with headache as per MIDAS score, It was found that 66.8% (n=197) had MIDAS Grade 1 disability followed by mild disability in 15.3% (n=045) among the study participants. Details are shown in Table 4.

### Discussion

The current study focused on the proportion and various types of headache among the medical undergraduates. It also analyzed the characteristics and triggering factors associated with headache.

The current study involved 470 medical undergraduates who were assessed for proportion of headache. It was observed from the study that headache was prevalent in almost two third of the study participants. Similar observation was made in a study conducted at Isfahan University of Medical sciences [11], whereas a study conducted at Athens University [12] and University of Lagos [13] has shown lower proportion of 39.6% and 46% respectively.

After analyzing the various types of headache in the present study, it was evident that more than three fourth of the medical undergraduates were having tension type headache in the preceding three months. Studies done at Isfahan University, University of Lagos, Kuwait and Sultan Qaboos University also shown higher proportion of tension headache among their student population. [11, 13,14, 15]

The proportion of migraine among females was more in a study done at Kuwait by Al-hashel. [14] Similar observation were also made at Isfahan University of Medical Sciences [11], Sultan Qaboos University [15] and Univesity of Lagos. [13]

In contrast to a study conducted at University of Lagos [13] where a family history of headache was found in less than quarter of study participants; in the present study it was nearly three fourth.

In the present study, it was found that most common triggering factors of headache among medical students were irregular sleep, emotional stress or anxiety, exposure to bright light or sun and exams. A finding similar to this was made in the study conducted at Kuwait, wherein stress, irregular sleep, substantial reading, smoking, fasting and exams were quoted as the common triggering factors for headache among student population. [14]
Conclusion

The present study revealed that majority of the medical undergraduates had headache with tension type being the most common. The major triggering factors being irregular sleep, emotional stress or anxiety. Most of the students had little or no disability associated with headache.

ABSTRACT

Physicians used Cardiotocography (CTG) to knowing of fetal well-being and potential complications from pregnant women. They used a continuous electronic record of the baby’s heart rate took from the mother’s abdomen. They visualized the unhealthiness that will give an opportunity for early intervention. CTG class status is classified in this paper with machine learning methods by using attributes of data obtained from the uterine contraction (UC) and fetal heart rate (FHR) signals and visualized the acquired information. This classification and visualization will help the doctor while treatment the patient. Experimental results has shown good accuracy score and low error rate.

Keywords: Cardiotocography; classification; machine learning; data mining; uterine contraction; fetal heart rate;

Introduction

In recent years technology of Data mining especially machine learning having many new developments. Also techniques improvements in machine learning had contributed in handling of new kinds of data types and applications. However, the field of machine learning and its application in medical domain is still active so that the possibilities of the application are still limitless [1-5]. Comprehensible knowledge extraction from medical CTG data is one of the challenges in this domain of research. So the use of machine learning tools is gradually increased day by day. This is mainly because the effectiveness of classification with machine learning and recognition systems has improved in a great deal to help medical experts in diagnosing diseases [1-5].

CTG is a technical means of recording the FHR, UC during pregnancy, typically in the third trimester to evaluate maternal and fetal well-being [6]. FHR patterns are observed manually by obstetricians during the process of CTG analysis. The currently proposed computation and machine learning techniques for FHR can be used for analyzing and classifying the CTG data to avoid human mistakes and helps the doctors to take a decision.

Literature Survey

Magenes G et al., [6] proposed classification method with neural process, that will describe states of fetal behaviors under fetal pathological conditions, with CTG data. In this approach the classifiers are trained and tested with fetal heart rate signals data.

Warrick PA et al., [7] proposed a classification model with SVM. In this authors trained the model with UP and FHR signals data and finding the relation in terms of an impulse response function. They obtained the results with a detector that combined the decisions of classifiers using both feature sets. It detected half of the pathological cases, with very few false positives.

Jacob SG, Ramani RG [8] used the Cardiotocography dataset, forming the clustering, and tells the significance of each attribute. In this work authors first analyze, then compare and then declare the impact of machine learning techniques by detecting outliers, executing ML techniques on Cardiotocography dataset.

Sahin H and Subasi A. [9] evaluated the eight prominent ML techniques for classification on the CTG data. It is necessary to predict newborn babies health, especially for the critical cases.

Sundar. C et al., [10] implemented a classification model with artificial neural network (ANN) for CTG data. According to their classification metrics, the performance of the proposed classification provided significant performance.
Tomáš P et al., [11] proposed a model that will automatically recognizes the prenatal care states. This models is mostly used in prenatal care for support decision systems

Spilka J et al., [12] proposed the model for FHR classification and evaluated conventional features and compared them to the nonlinear ones. The experiments were performed using a database of 217 FHR records with objective annotations, i.e. pH measurement.

Ocak H, Ertunc HM. [13] presented a model that will predicts the fetal state from FHR & UC signals from CTG data. The proposed scheme is with adaptive neuro-fuzzy inference systems (ANFIS). The proposed model predicted the normal and the pathological state.

Esra Mahsereci Karabulut, Turgay Ibrikci [14] used the adaptive boosting ensemble of decision trees for predicting the CTG data. They analyzed the CTG features and they also compared with the prominent ML techniques.

Yılmaz E, Kılıkçıer Ç[15] proposed a classification model with least squares support vector machine (LS-SVM) that will use a binary decision tree. They used CTG data to determine the fetal state.

Permanasari AE, Nurlayli A [16] proposed a model for classification with decision tree to analyze the CTG data for fetal state. In this author classified three classes called normal, suspicious or pathologic.

In a review of articles published on this subject, it was found that its important area which will give the good information. So, in this work, we are going to evaluate some of the statistical, machine learning techniques for the classification of CTG data.

Methodology

The system design proposed in this paper comprises of data pre-processing, model design and model evaluation.

Data pre-processing: In this phase, the training dataset is downloaded from the UCI Irvine Machine Learning Repository and is described by 2126 instances of Cardiotocography data and 23 attributes out of which 1 to 22 considered as input attributes and 23th attribute NSP is considered as output variable class. Hence this paper focuses on the performance of multi-class categorization. All the attributes in the dataset are considered because every attribute having their own importance. In this step we are standardized the dataset with standard scalar function provided by Python.

Model Design: In this phase, standardized dataset from pre-processing phase is taken and split it into parts based on 75% and 25% criteria one is for training and another is for testing. The training dataset is given as input to classifier model. In this paper three classification techniques called Decision tree classifier, Random forest classifier and AdaBoost classifiers are used. These three classification methods are trained by training dataset. After successful completion of training, models are tested with testing dataset.

Model evaluation: In this phase, used models are evaluated with evaluation metrics called Accuracy, precision, recall, F1 score etc.,

Decision Tree Classifier[17]: It uses a decision tree, where the target variable can take a discrete set of values are called classification trees. It initially pick the best attribute/feature, the best attribute is one which best splits or separates the data. For best attribute selection it used information gain or Gini index (Binary tree).

Random forest Classifier[18]: It is an ensemble algorithm. It created by a set of decision trees from randomly selected subset of training set. It then aggregates the votes from different decision trees to decide the target class.

AdaBoost Classifier[19]: It is also called Adaptive Boosting. It fits a sequence of weak learners on different weighted training data. It starts by predicting original data set and gives equal weight to each observation. If prediction is incorrect using the first learner, then it gives higher weight to observation which has been predicted incorrectly. This process can be performed iteratively until a limit is reached in the number of models or accuracy.

Dataset

Cardiotocography Data Set is downloaded from UCI repository, consists of measurements of fetal heart rate (FHR) and uterine contraction (UC) features on cardiotocograms classified by expert obstetricians. 2126 fetal cardiotocograms (CTGs) were automatically
processed and the respective diagnostic features measured. The CTGs were also classified by three expert obstetricians and a consensus classification label assigned to each of them. Classification was both with respect to a morphologic pattern (A, B, C, ... ) and to a fetal state (N, S, P). Therefore the dataset can be used either for 10-class or 3-class experiments. But in this paper, we considered 3-class called fetal state.

The dataset consists of 2126 instances and 23 attributes, out of which 1 to 22 considered as input attributes and 23th attribute NSP is considered as output variable class. This output variable further having three classes called N=normal represented with 1, S=suspect represented with 2 and P=pathologic represented with 3.

**Attribute Information:**

- **LB** - FHR baseline (beats per minute)
- **AC** - No. of accelerations per second
- **FM** - No. of fetal movements per second
- **UC** - No. of uterine contractions per second
- **DL** - No. of light decelerations per second
- **DS** - No. of severe decelerations per second
- **DP** - No. of prolonged decelerations per second
- **ASTV** - percentage of time with abnormal short term variability
- **MSTV** - mean value of short term variability
- **ALTV** - percentage of time with abnormal long term variability
- **MLTV** - mean value of long term variability
- **Width** - width of FHR histogram
- **Min** - minimum of FHR histogram
- **Max** - Maximum of FHR histogram
- **Nmax** - No. of histogram peaks
- **Nzeros** - No. of histogram zeros
- **Mode** - histogram mode
- **Mean** - histogram mean
- **Median** - histogram median
- **Variance** - histogram variance
- **Tendency** - histogram tendency
- **CLASS** - FHR pattern class code (1 to 10)
- **NSP** - fetal state class code (N=normal; S=suspect; P=pathologic)

Fig 2 has shown the histogram of 1 to 22 features, from Fig 1, it is observed that every feature is important. Fig 1 shows the Bar plot of attribute 23, from fig 1, it is observed that class 1 having 1655 instances, class 2 having 295 and class 3 having 176 instances. Fig 3 shows the diagonal correlation matrix of 1 to 22 input attributes.

**Class Information:** We used the data for a three class classification problem. The descriptions for the three classes are *Normal*: A CTG where all four features fall into the reassuring category

**Suspicious**: A CTG whose features fall into one of the non-reassuring categories and the reassuring category and the remainder of features are reassuring

**Pathological**: A CTG whose features fall into two or more of the Non-reassuring the reassuring category or two or more abnormal categories.

![Fig. 1: Bar plot of 23rd target attribute](image-url)
Fig. 2: Histogram of 1 to 22 attributes
Result Analysis

**Accuracy:** It is computed as “the total number of two correct predictions, True Positive (TP) + True Negative (TN) divided by the total number of Positive (P) + Negative (N)”.

\[ \text{Accuracy} = \frac{TP + TN}{P + N} \]

**Precision:** It is computed as “the number of correct positive predictions (TP) divided by the total number of positive predictions (TP + FP)”.

\[ \text{Precision} = \frac{TP}{TP + FP} \]

**Recall:** It is computed as “the number of correct positive predictions (TP) divided by the total number of positives (P)”.

\[ \text{Recall} = \frac{TP}{P} \]

**Confusion Matrix:** It is a summary of prediction values on a classification problem. It shows the classification models predictions. It gives us insight not only into the errors being made by a classifier but more importantly the types of errors that are being made.

Evolution metrics of DTC classifier for CTG dataset is shown in Table 1. Evolution metrics of RF classifier for CTG dataset is shown in Table 2. Evolution metrics of AdaBoost classifier for CTG dataset is shown in Table 3. Confusion matrix of DTC classifier for testing dataset is shown in Fig 4, Confusion matrix of RF classifier for testing dataset is shown in Fig 5, Accuracy and F1 score comparison of DTC, RF and AdaBoost classifiers is shown in Fig 6.

F1 score comparison is accurate to this dataset because target class data is unequally distributed. From Fig 6, it is observed that DTC classifier exhibits good F1 score of 96.4 which is good score than other two classifier. So it is concluded that DTC is good fitting method for CTG dataset.

Conclusions

Computer based studies especially machine learning models place vital role in every field of research, medical diagnosis is also one of the area that leads to great advance in clinical decision support systems. Due to computer based studies importance, in this paper we designed a prediction model which classified the CTG dataset class status which is very useful to doctor while treating the patient. Experiments are conducted based on CTG dataset, and gained good evaluation metrics for DTC, RG and AdaBoost classifiers. DTC gained 96.40% of F1 score, RF gained 93.46 % F1 score and AdaBoost gained 81.34% F1 score.

Ethical Clearance: Cardiotocography Data Set is downloaded from UCI repository, consists of measurements of fetal heart rate (FHR) and uterine contraction (UC) features on cardiotocograms and classified by expert obstetricians. 2126 fetal cardiotocograms (CTGs) were automatically processed and the respective diagnostic features measured. Different classifiers are applied on testing data based on the values of training. The classifiers are predict the data and validation will applied on predicted data, testing and training data.

Revenge Pornography: Impact on the Mental Health of Victims and Legal Remedies

Nirmal Rallan¹, Komal Vig²
¹PhD Scholar (Law), ²Associate Professor (Law), Amity University, Noida

ABSTRACT

Revenge porn is one of the most devastating cyber sexual crime all over the world. The latest mobile and communication technologies have resulted in easy uploading and accessing the online content. The perpetrator may be an unsuspecting facebook friend, an anonymous stalker or a jilted lover. But once the damage is done, the victim’s life is never the same. This paper analyses the legal approach to the problem of revenge porn in UK and India, its impact on victims and possible preventive measures to address the related issues.

Keywords: Revenge, porn, perpetrator, technology, impact

Introduction

The advancements in information technology has changed the moral codes of conduct in society. Images can be uploaded and downloaded with ease at the click of a mouse. The development of technology assisted communication and instant messaging especially through mobile phones has led to a new forms of sexual crimes such as cyber harassment, cyber stalking and revenge porn. Though all these crimes have serious repercussions on the mental health of the victims but revenge porn is the most damaging of all. In most of these crimes the victims are generally females usually teens and young adults. This paper analyses the crime of revenge porn, legal options available in India and its psychological impact on the victims.

Salter M and Crofts T define revenge porn as images and videos made by men with the consent of the women they were intimately involved with, but then distributed online without her consent typically following the termination of a relationship.¹ The perpetrator may be known or unknown to the victim. This could be the work of a jilted lover, ex-boyfriend, or even a cyber stalker who may have gained access to victim’s pictures somehow. So the real motivation behind the crime may be revenge, entertainment or even profit-making.² According to an estimate, in England and Wales, the number of alleged cases being investigated by officers has more than doubled in the last four years – from 852 in 2015-16 to 1853 in 2018-19.³ This number is expected to rise in future due to the popularity of social media platforms and instant transmission methods.

Impact on Mental Health of Victims: The victims can get the content removed and deleted from the internet. But the major issue seems to be that even if the content is removed online, there may still be links available or dead pages displaying the name of the victim. The victims experience a feeling of humiliation, ashamed, exposed and loss of reputation. They may have to live under a different identity and a different get up life long. They may sue the perpetrators and the websites for damages but the pain and humiliation remains. Victims may experience a general loss of trust in others after being victimized by revenge porn. Along with the loss of trust and feeling of betrayal, many participants may experience more severe and disruptive mental health effects such as Post-traumatic Stress disorder (PTSD), anxiety, and depression and suicidal tendencies. These experiences are more or less the same as those experience by victims of sexual assault.⁴ For managing these psychological effects, the victims are required to undergo long term counselling and also need family support.

Legal Approach in UK: Revenge porn became an offence in England and Wales in April 2015. It is a
specific offence under the Criminal Justice and Courts Act, 2015 which involves distribution of private and personal explicit pictures, images, or videos of an individual through online or offline medium. Similar laws were introduced in Northern Ireland and Scotland. This is usually done maliciously by perpetrators so as to cause embarrassment, distress and shame to victims in public. Under the Act, if found guilty, the accused can be sentenced up to two years in prison. The Revenge Porn Helpline in UK is dedicated to supporting the victims of intimate image abuse. Social media platforms like Twitter, Facebook and search engines like Google etc. have prohibited the posting of revenge porn and sexual images without the consent. However, the revenge porn laws have been criticized on the ground that they do not afford anonymity to the complainant or victim which results in further victimization of the victims. Revenge porn is currently categorized as a “communications crime”, meaning that victims are not granted anonymity. During the court case, victims who have already been publicly shamed, embarrassed, and abused are expected to come forward without the guarantee of anonymity, drawing further publicity to their case and subsequently, their images.

**Legal Approach in India:** In India, revenge porn is not a specific crime under the law in India. Indian law criminalises dissemination of obscene content for whatever purposes it may be. Also there is lack of ground level sensitivity on part of the authorities to deal with the cases of revenge porn. The legal provisions under which the accused can be booked are:

- Section 67 and 67A of the Information Technology Act, 2000
- Section 500 of Indian Penal Code (hereinafter IPC) for criminal defamation
- Section 504 and 506 of IPC for criminal intimidation
- Section 354 and 509 IPC for outraging the modesty of women
- Section 354 A to D of IPC for sexual harassment, compelling to disrobe, voyeurism and intent to dishonor respectively.

The conservative and patriarchal set up of Indian society is not usually victim-friendly and the girl is blamed for sharing her intimate images. As a result very few victims may come forward to report the crime or may continue to be further victimized by the perpetrator. Because of this the actual filing of cases may be very few and the magnitude of the problem in India is still not known due to poor reporting. The first ever conviction in India for revenge porn was done by a court in East Midnapore, Bengal some time back, where the accused was jailed for five years. A beginning has been made and more such convictions would definitely have a deterrent effect on the perpetrators.

**Conclusion**

As a preventive measure, cyber awareness programmes may be conducted in schools and colleges for the younger generations so that they do not fall into the trap of sharing their intimate images. Also public awareness should be created to respect others’ privacy and consent. Intermediaries and service providers need to be held responsible for spread of content without the consent of those whose sexual images or videos are uploaded. It is their duty to ensure that the illegal content is not uploaded and is completely deleted from the public domain if uploaded at all. Victim’s identity must be protected at all costs by the authorities during the trial. Society needs to change its mindset and attitude towards the victims. Free of cost counselling and rehabilitative services needs to be provided to the victims by the State.

An Analysis of Job Insecurity of Employees Working on I.T. & ITeS Companies, Resulting in Stress and Health Problems & their Perception towards the Career Growth —A Study with Reference to Chennai City

A. Shanmugam¹, N Kalyanaraman²

¹Ph.D (P.T.) Research Scholar, ²Research Supervisor, School of Management, [Vels Institute of Science Technology and Advanced, Studies (VISTAS)], Pallavaram, Chennai

ABSTRACT

To analyze the depth of job insecurity and their indifferent sustainable development towards their career growth which affects the morale of the employees and in turn which leads to stress were taken in this study domain. To measure the influence of personal and organizational profile of the employees on their perception towards job insecurity. Job insecurity is one of the most common stressors in contemporary working life. Job insecurity is so stressful from a variety of physical and psychological problems, including heart disease, loss of sleep and psychological distress. Job security companies’ results in developing core competencies and managerial capabilities by increasing the value of the workforce and provides career opportunities and in retaining quality employees. The employees prefer working for companies with full job security engaging them in challenging work involving cutting edge technology that is possible through effective HRM practices. It also results to next generation job aspirants expecting to possess a positive attitude towards the profession and equip themselves with the required skills to enter the industry and also gear up for their sustainable development in the career growth.
