EXECUTIVE EDITOR

Vidya Surwade

Associate Professor, Dr Baba Saheb Ambedkar,Medical College & Hospital Rohinee, Delhi

INTERNATIONAL EDITORIAL ADVISORY BOARD

1. **Dr Abdul Rashid Khan B.** Md Jagar Din, Associate Professor, Department of Public Health Medicine, Penang Medical College, Penang , Malaysia
2. **Dr V Kumar,** Consulting Physician, Mount View Hospital, Las Vegas, USA
3. **Basheer A. Al-Sum,** Botany and Microbiology Deptt, College of Science, King Saud University, Riyadh, Saudi Arabia
4. **Dr Ch Vijay Kumar,** Associate Professor, Public Health and Community Medicine, University of Buraimi, Oman
5. **Dr VMC Ramaswamy,** Senior Lecturer, Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur
6. **Kartavya J. Vyas,** Clinical Researcher, Department of Deployment Health Research, Naval Health Research Center, San Diego, CA (USA)
7. **Prof PK Pokharel,** Community Medicine, BP Koirala Institute of Health Sciences, Nepal
8. **Sajjad Salim Issa AL-Musawi** supervisor for student of the Arab board in family medicine
9. **Prof. Dr. Ayad F. Alkaim,** Professor of surface chemistry and applications of nano-materials, Babylon University,Iraq
10. **Prof. Dr. Imad Hadi Hameed,** Biomedical Science Department,College of Nursing, University of Babylon, Hillah city, Iraq
11. **Prof. Dr. Amean A Yasir,** Department of Community, College of Nursing, University of Babylon, Hillah city, Iraq

NATIONAL EDITORIAL ADVISORY BOARD

1. **Prof. Sushanta Kumar Mishra,** Community Medicine, GSL Medical College – Rajahmundry, Karnataka
2. **Prof D.K.Srivastava,** Medical Biochemistry, Jamia Hamdard Medical College, New Delhi
3. **Dr Sunil Mehra,** Paediatrician & Executive Director, MAMTA Health Institute of Mother & Child, New Delhi
4. **Prof M.Sriharibabu,** General Medicine, GSL Medical College, Rajahmundry , Andhra Pradesh
5. **Prof Pankaj Datta,** Principal & Prosthodentist, Indraprastha Dental College ,Ghaziabad
6. **Prof Samarendra Mahapatro,** Pediatrician, Hi-Tech Medical College, Bhubaneswar, Orissa
7. **Dr Abhiruchi Galhotra,** Additional Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
8. **Prof Deepti Pruthvi,** Pathologist, SS Institute of Medical Sciences & Research Center. Davangere, Karnataka
9. **Prof G S Meena,** Director Professor, Maulana Azad Medical College, New Delhi
10. **Prof Pradeep Khanna,** Community Medicine, Post Graduate Institute of Medical Sciences, Rohtak , Haryana
11. **Dr Shailendra Handu,** Associate Professor, Phrma , DM (Pharma, PGI Chandigarh)
12. **Dr. A.C. Dhariwal,** Directorate of National Vector Borne Disease Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of India, Delhi.

NATIONAL SCIENTIFIC COMMITTEE

1. **Dr Anju Ade,** Professor, Community Medicine Department, SVIMS, Sri Padamavati Medical College, Tirupati. Andhra Pradesh
2. **Dr. E. Venkata Rao,** Associate Professor, Community Medicine, Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa.
3. **Dr. Amit K. Singh,** Associate Professor, Community Medicine, VCSG Govt. Medical College, Srinagar – Garhwal, Uttarakhand
4. **Dr R G Viveki,** Prof n head, Dept of Community Medicine, BIMS Belgavi
5. **Dr. Santosh Kumar Mulage,** Assistant Professor, Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS) , Karnataka
6. **Dr Gouri Ku. Padhy,** Associate Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
7. **Dr Ritu Goyal,** Associate Professor,Anaesthesia , Sarswathi Institute of Medical Sciences, Panchsheel Nagar
8. **Dr. Anand Kalaskar,** Associate Professor, Microbiology Prathima Institute of Medical Sciences , AP
9. **Dr.Md.Amirul Hassan,** Associate Professor, Community Medicine Government Medical College, Ambedkar nagar, UP
10. **Dr.N.Girish,** Associate Professor, Microbiology, VIMS&RC, Bangalore
11. **Dr BR Hungund,** Associate Professor Pathology, JNMC ,Belgaum.
12. **Dr Sartaj Ahmad,** Associate Professor, Medical Sociology, Department of Community Medicine, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India.
13. **Dr Manoj Kumar Tripathi,** (Associate Professor), Political Science and public administration, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India.
14. **Dr Sumeeta Soni,** Associate Professor, Microbiology Department, B.J. Medical College, Ahmedabad Gujarat, India

Print ISSN: 0976-0245, **Electronic ISSN:** 0976-5506, **Frequency:** Quarterly (Four issue per volume)

Indian Journal of Public Health Research & Development is a double blind peer reviewed international journal. The frequency is half yearly going to be quarterly by 2012. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN)Print ISSN: 0976-0245, Online ISSN: 0976-5506 and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

Contents

Volume 10, Number 7 July 2019

1. Effect of Therapeutic Exercises on Pre-Menopausal Symptoms in Sedentary Life Style Women 1
Aishwarya V. Ahiwale, S. Anandh, Pranjali Gosavi

2. Does Commercially Available Tooth Brushes in India follow Recommended American Dental Association (ADA) Norms? 6
V. Anu, N. SaiSwetha, C. Ramya, N. Ruksana, D. Ranjani

3. Maternal Mortality at a Tertiary Care Hospital in North India: A 4 Year Review 11
Pratima Mittal, Garima Kapoor, Bindu Bajaj

4. Dose Response Relationship of Child Centered Task Oriented Training in Children with Cerebral Palsy- A Randomized Controlled Study. Study Protocol 17
Kovela Rakesh Krishna, Dhanesh Kumar K U

5. Association between Obesity and Elevated Blood Pressure among School Going Adolescents– A Cross Sectional Study 21
Lipilekha Patnaik, Sumitra Pattnaik, Trilochan Sahu, E. Venkata Rao, Saswatika Beura

6. The Effectiveness of Constraint-Induced Movement Therapy and Placing Technique of Bobath on Upper Limb Function in Hemiparetic Individual 25
Manali N. Hanphode, G. Varadharajulu, Suraj Kanase

7. Effect of Manual Positioning as an Adjunct to Intercostal Drainage tn Hydropneumothorax 31
Monali M. Kashyap, Javid Hussain Sagar, G. Varadharajulu

8. Effect of Motor Control Training on Isolated Lumbar Stabilizer and Core Muscle Training in Chronic Low Back Pain Patients 37
Namrata P. Mane, G. Varadharajulu, Sandeep Shinde

9. Enterprise Gamification: A Motivational Drive at Workplace 43
P. S. Buvaneswari, M S Swetha

10. Design and Implementation of Performance Improved Medical Signal Filters with and without Multiplier 49
P.Saravanan, B. Latha, K. Bhoopathy Bagan

11. Effect of Inpatient Physiotherapy Intervention Versus Delayed Outpatient Physiotherapy Intervention in Post Stroke Hemiplegic Individuals 56
Pragati V. Salunkhe, G. Varadharajulu, Suraj Kanase

12. Effect of Therapeutic Intervention and Hand Muscle Training on Pain and Quality of Hand Function in Subjects with Chronic Tennis Elbow 61
Pranali Desai, G. Varadharajulu, Smita Kanase, Sandeep Shinde

13. Assessment of Balance in Children with Developmental Coordination Disorder in Indian Context 67
U. Ganapathy Sankar, R.Monisha

14. A Comparative Study to Determine the Effectiveness of the Taping and Mulligan's Mobilization with Movement Techniques on Pain in Knee Osteoarthritis 71
Balaji R. Pawar, A. Jeganathan, R. Monisha

15. Perception of Undergraduates and Postgraduates of the Scope of Periodontics 76
F. Mariyam Niyas, Radhika Arjunkumar

16. Correlation between the Nature of Toothpaste and the Prevalence of Brushing Habits of Children Residing in Chennai 83
Rinieshah Nair R. Baskran, Deepa Gurunathan, Madhusudhan Vasantharajan

17. Effect of Structured Therapeutic Exercises Protocol on Physical Functional Status in Women with Varying BMI 88
Ruchita R Shah, S. Anandh, G. Varadharajulu

18. Effect of Choice-Based Sensory Stimulation as a Coma Stimulation Technique on Traumatic Brain Injury 94
Sayli D. Deshpande, G. Varadharajulu, Suraj Kanase

19. Knowledge Attitude Practice on the Oral Hygiene Practices in Children Below 12 Years 100
Shivani N, Revathy Gounder

20. Role of Tumour Necrosis Factor Alpha (TNF-α) in Pulmonary Pathophsiology of Chronic Obstructive Pulmonary Disease 105
Smriti Gupta, Ajit Kumar, Vishwajeet Rohil, Anuj K. Bhatnagar

21. Effect of Closed Kinematic Chain Exercises on Distal Muscle Weakness in Post Guillain Barre Syndrome 111
Sneha G. Narlawar, G. Varadharajulu, Suraj Kanase

22. Rugoscopy: An Adjunctive Diagnostic Tool for Malocclusion? 117
Swapna B V, Sheetal Shetty, Smitha S Shetty

23. Effect of McKenzie Approach and Neck Exercises on Forward Head Posture in Young Adults 123
Vishnupriya Deshpande, Khushboo Bathia, Smita Kanase, Amrutkuvar Pawar, Prachi Jain, Gatha Patel

24. Socio-economic, Hygiene and Nutritional Status of Indian Slums: A Scoping Review 128
K. Jansi Rani, S. Kavitha Maheswari, Sebastian Kot, A. Hariharasudan

25. Study of Correlation between Serum Lipid Profile and Thyroid Function in a Tertiary Care Hospital 133
Aryankumar, Ajit Sontakke, Sangita Patil, Dhirajkumar Mane

26. Self Management and Knowledge among People with Type 2 Diabetes 139
Aldrin Vas, Elsa Sanatombi Devi, Sudha Vidyasagar

27. Anti-Inflammatory Activity of Silver Nanoparticles Prepared from Ginger Oil—An Invitro Approach . 145
M. Maajida Aafreen, Roy Anitha, Rachel Christina Preethi, S. Rajeshkumar, T. Lakshmi

28. Comparative Evaluation of Maximum Bite Force and Facial Morphology—A Cross Sectional Study ... 150
Shweta Tiwari, Arathi Rao, Ramya Shenoy, Suprabha BS

29. Comparative Evaluation of Tensile Bond Strength and Shear Bond Strength of Mineral Trioxide Aggregate with Composite Resin and Resin Modified Glass Ionomer 156
Radhakrishnan S, Arathi Rao, Ramya Shenoy, Suprabha BS

30. A Study to Assess the Effectiveness of Planned Teaching Programme on Knowledge Regarding Prevention of Abuse among the Children of 11–14 Years of Age at Selected Schools of Sangli, Miraj, Kupwad Corporation Area 163
Bhavana Cristopher Samson, Manisha Sunil Kulkarni

31. Risk Factors Associated with Overweight and Obesity among Population of Ahmedabad, India 168
Bhoomi Arora, Snehal S. Patel, Banshi Saboo

32. Fast-Food Marketing and Children's Fast-Food Consumption: A Trigger to Childhood Obesity 173
Binkey Srivastava

33. Retina Identification System Using Machine Learning and Multiple Regression Model 178
D. Nagarajan, R. Sujatha, J. Kavikumar, Udaya Mouni Boppana, Dhivyapriya

34. Breast Cancer Prediction Using Ensemble Techniques 183
G. Manikandan, B. Karthikeyan, P. Rajendiran, R. Harish, T. Prathyusha, V. Sethu

35. Effects of Pesticides on Lung Function Test in Farmers of Satara District, Maharashtra, India 186
Gauri Joshi, A. G. Joshi, S. N. Patil, Ajit Sontakke

36. A Study to Assess the Effectiveness of Planned Teaching Program on Knowledge Regarding the Care of Permanent Pacemaker at Home among Patients at Selected OPDs of Sangli and Kolhapur City 192
Jesica Dileep Mali, Sunil. Kulkarni

37. A Study to Assess the Effectiveness of Planned Teaching Programme on Knowledge Regarding Selected Pediatric Emergencies among Mothers of Under Five Children at Selected Anganwadi's of Sangli, Miraj and Kupwad Corporation Area 195
Jesica Prashant Malap, Shaila Mathew

38. Comparative Evaluation of the Effect of Radiation Therapy on Surface Micro Hardness of Three Restorative Materials—An in Vitro Study 200
Karthik Shetty, Mary Byju, Chong Hao Phin, P U Saxena, Challapalli Srinivas

39. Evaluate the Association between Acrochordons and Systemic Diseases 205
Malar Mangai E., Harsha Vardhan K., Bhuvanarachagan A.

40. The Logical Investigation of the Digitalization andits Capacities, Particularly those Influencing Conduct in Human Brain Research on Based on the Psychological Distress 210
Nandita Sikari, K HariKrishnan

41. To Study Behavioral and Socio Economic Factors of Non Communicable Diseases in Northeast India Using NFHS-4 214
Phrangstone Khongji

42. A Study to Assess the Knowledge and Self Reported Practices Regarding Care of Arterio Venous Fistula among Patients at Selected Haemodialysis Units of Sangli City 220
Pratik N Amrao, Swati C. Kurane

43. A Study to Assess the Effectiveness of Topical Application of Honey on LSCS Wound Healing among Postnatal Mothers from Selected Maternity Hospitals of Sangli, Miraj and Kupwad Corporation Area 223
Priti D Khade, Archana Dhanawade

44. A Study to Assess the Level of Burden and Coping Strategies among Caregivers of Patient with Affective Disorders at Selected Hospitals of Sangli, Miraj, Kupwad Corporation Area 228
Ramesh Giramalla Honamore, Narayan K Ghorpade

45. Factors Affecting Awareness and Perception of Youth Regarding the Public Health and Hygiene Related Campaigns though Social Marketing 233
Roktim Sarmah, Dheeraj Nim

46. Three Stepped Approach to Screening of Cervical and Breast Cancer among Rural Women 239
Asha K. Pratinidhi, Radhika Joshi, Vaishali Vhawal, Pandurang Chougule, Sunita Tata, Satish Kakade

47. Single-Visit versus Dual-Visit Endodontics—A Comparative Study 244
Sanjay M Londhe SM, Sonali Sharma, Sheetal Lal

48. A Study to Evaluate the Effectiveness of Ginger Tea on Morning Sickness among Antenatal Mothers in Selected Area of Sangli, Miraj, Kupwad, Corporation 251
Seema D Shiradwade, MS. Regina Satvekar

49. Contraceptive Methods: Knowledge, Practice and their Attitude among the Women of Rural Population in and around Bangaluru City of Karnataka State, India 257
SenigalaKuruba Anusuya, Sudha Patil

50. Comparison Prophylactic Glycopyrrolate, Dexamethasone, Metoclopramide in Control of Nausea and Vomiting after Spinal Anaesthesia for Caesarean Delivery 261
Gautam Malhotra, Suresh Y. V., Anupama Suresh Y, Shaik Gulam Osmani, Kavya Prabhu

51. A Study to Assess the Effectiveness of Eucalyptus Oil on Knee Pain among Osteoarthritis Patients in Selected Areas of Sangli, Miraj and Kupwad Corporation 267
Siddhant N. Shirgaokar, Pravin Dani

52. A Study to Assess the Knowledge Regarding Self-Care Management among the Pregnant Mother with PIH Attending Selected Maternity OPD's of Tertiary Hospitals in Sangli, Miraj and Kupwad Corporation Area 272
Silviya John Gaikwad, Vijaya Kumbhar

53. A Study to Assess the Relationship between Job Satisfaction and Burnout among Staff Nurses Working in Selected Hospitals of Sangli, Miraj and Kupwad Corporation Area 277
Umesh Kisan Rathod, Satish Salvi

54. A Study on Awarness among Employees on Health Care and Appraisal System Adopted in Pharmacy Companies 281
S. Poongavanam, S. Jivita

55. A Study on Impact of Occupational Health and the Changing Business Scenario of Corporate Appraisal 285
S. Poongavanam, S. Jivita

56. An Empirical Study on Employee Health and FIRO-B Relationship 289
S. Poongavanam, K. Viswanathan

57. An Empirical Study on Environmental Hazards and Recruitment Process in Health Care Compnies, Chennai 293
S. Poongavanam, K. Viswanathan

58. Impact of Health Care Laws and Employee Relationship, Policies in Pharma Companies–A Study 296
S. Poongavanam

59. Antioxidants and Antibodies in Structural Thyroid Diseases 299
Anita P Javalgi, B R Yelikar, Kusal Das

60. Enhancement of Facial Aesthetics and Function in Posteriorly Edentulous Mouth: An Orthognathic Surgical Case Report 305
Ashith M. V., Mustafa Khader, Utkarsh Mangal, Mithun K

61. A Study on Development of Processes for Verification and Validation in Medical Device Domain 312
P. Shireesha, P. Niranjan

62. A Technique for Network Design and Requirements for Medical Sensors 317
V. Chandra Shekhar Rao, P. Niranjan, A. Sowmikadurga

63. Breast Self-Examination and Clinical Breast Examination: Knowledge, Practice, and Awareness Towards Breast Cancer among Females in and around Mangaluru 323
Sadhwi, Gayathri M Rao, Aradhana M, Saritha Kamath U

64. Emotional Intelligence Level of Students and Mental Ability Belonging to Rural and Urban Backgrounds 329
Shailaja Sangaraboina

65. Caries Risk Profiles of Rural and Urban 12 Year Old School Children in Mangalore Using the Cariogram 334
Jyotsna Malhotra, Ashwini Rao, Ramya Shenoy, Mithun Pai BH

66. Role of Trust and Privacy Concerns towards Usage of E-Health Services— An Extension of Expectation-Confirmation Model 339
K Anil Kumar, Subhashree Natarajan

67. Risk Factors Associated with Onset of Neck Pain: A Review 346
Neha Gupta, Aparna Sarkar, Deepak Kumar

68. Prediction of COPD Using CT Measurements of Pulmonary Artery and Aortic Diameter 352
Priyanka, Abhijith A, Adarsh Veer Sisoudiya, Saikiran Pendem

69. Acute Anticonvulsant Activity of Diltiazem, Nimodipine and Flunarizine in Wistar Albino Rats by Maximum Electroshock-Induced Seizure 357
Saniya K, BG Patil, Madhavrao, Prakash KG

70. Isolated and Combined Effect of Plyometric and Weight Training on Selected Physical Fitness and Hematological Variables of Football Players 362
K. S. Saran, K. Vaithianathan, Mithin Anand, T. Arun Prasanna

71. Effect of Game Specific Circuit Training and Plyometrics on Selected Physiological and Hematological Variables of Handball Players 365
Mithin Anand, K. Vaithianathan, K. S. Saran, T. Arun Prasanna

72. "A Study to Assess Coping Stratergies among Parents of Mentally Challenged Children at Selected Special Schools of Miraj, Kupwad and Kolhapur Corporation Area" 368
Akshay Bhupal Pawar, Rajesh Gaikwad

73. Effectivness of Curry Leaves Powder on Blood Sugar Level among Diabetic Patients 373
Kunal V Jadhav, Basavant Dhudum

74. A Framework Analysing Patient Adherence Level in Cardiovascular Disease in Delhi-NCR Region 379
Navjot Kaur, Supriti Agrawal, Hemendra Gautam

75. A Study to Assess the Effect of Pineapple Extract on Episiotomy Wound Healing among Postnatal Mothers in Selected Hospitals of Sangli, Miraj and Kupwad Corporation Area 384
Sindhu R.Gaikwad, Nilima R. Bhore

76. Assessment of Clinical Profile of Patients with Blunt Abdominal Trauma Admitting to Emergency Department 389
Ashok Y Kshirsagar, Pratik D. Ajagekar, Ajay Aggarwal, Shekhargouda Deshetti

77. Comparative Study of Semen Analysis in Fertile and Infertile Males 393
Joy A K Ghoshal, Anil Kumar Reddy

78. Recharging Ground Water using Age–Old Traditional Mechanisms 399
Manbeer Kaur, Mona Prashar

79. MRI Image Training and Finding Acute Spine Injury with the Help of Hemorrhagic and Non Hemorrhagic Rope Wounds Method 404
Sk Hasane Ahammad, V Rajesh, N Hanumatsai, A Venumadhav, NSS Sasank, KK Bhargav Gupta, Syed Inithiyaz

80. Cloud Computing Based Diagnosis for Cancer Detection 409
Syed Shameem, Surya Teja S, Anoop P, Pavan Kalyan R, Vijay V, P. S. Srinivas Babu

81. A Cross-Sectional Study to Assess the Knowledge about Prevention and Home Management of Diarrhoea among the Mothers of Under Five Children in an Urban Area of Amritsar, Punjab 415
Amanpreet Kaur, Harpreet Kaur, Harpreet Kaur, Priyanka Devgun

82. A Study to Assess the Parents Satisfaction Regarding Pediatric Care Services Rendered by Staff Nurses from Selected Pediatric Units of Sangi City 421
Karishma D. Mulla, Aparna Kale

83. Effect of Depression on Treatment Outcome in Multi-Drug Resistant Tuberculosis Patients Under Programmatic Management of Drug Resistant TB Services in Amritsar, Punjab 427
Manisha Nagpal, Naresh Chawla, Priyanka Devgun

84. Incidence of Pulmonary and Extrapulmonary Tuberculosis among Jaintia Tribes, Meghalaya: A Hospital based Study 433
Arpita Mitra, Roumi Deb

85. An Automatic Disease Early Prediction and Diagnosis Recommendation Framework for Brain Tumours 438
Nandan Bodapalli, Kunjam Nageswara Rao, Parada Vara Prasad Dora

86. Does Right Hand Second Digit to Fourth Digit Ratio Correlate with Primary Infertility in Males? 444
Narendran Krishnamoorthi, Nikhil Shetty, Nandita Shenoy, Ashok Shenoy, Christopher C Pais, Muralidhara Yadiyal

87. Prevalence and Characterization of Opportunistic Candidal Infection among Patients with Type II Diabetes Mellitus 448
Sandhya Rani T., R. Srikumar, E. Prabhakar Reddy, S. Latha

88. Child Life Program Through Drawing Play Activity as Efforts to Minimize Stress Hospitalization in Children with Leukemia 454
Yuni Sufyanti Arief, IlyaKrisnana, Praba Diyan Rachmawati, Nursalam, IDG Ugrasena, Shrimarti R. Devy

89. The Correlation between Diabetes Status and Hair Loss among Aged Women in Alor Setar Area 459
Thin Thin Aung, Fatin Farhana Binti Shahnon

90. Differences in Caries Prediction Test of Cariostat and Plaque Formation Rate Index (PFRI) on Children465
Prima Nerito, Boy Sandy Sunardhi, Tito Yustiawan

91. Customers' Service Expectations in Dental Hospital: Using Servqual Model 470
Firdauzi Rimadhan, Devita Tintasari, Fredy Mardiyantoro

92. The Nurse's Work Culture Relationship with the Quality of Nursing Service Between the Government Hospital and Private Hospital: Comparative Study in 2018 475
Dilgu Meri, Meri Neherta, Zifriyanthi Minanda Putri

93. Relationship of Hand-Hygiene Compliance Score with Nurse's Engagement in Intensive Care Unit 480
Boy Sandy Sunardhi, Prima Nerito, Tito Yustiawan

94. Development of Management Skills Head of Public Health Center Based on Analysis of Management Skills Theory of Cameron and Quinn 484
Martha Wahani Patrianty, Nyoman Anita Damayanti, Tito Yustiawan

95. Assessment of the Anatomical Causes of Persistent Nasal Obstruction after Primary Septorhinoplasty . 490
Salim Hussain Ibrahim

96. Diagnosis of *Trichomonas Vaginalis* Infection by Detection of Glutaminase (*Glut*) Gene by Nested PCR 496
Faten Ahmed Hassan, Huda Dhaher Al-Marsomy, Suhad Asaad Mustafa

97. Burnout Syndrome among Physicians Working in Primary Health Care Centers in Baghdad, Al-Rusafa Directorate, Iraq 502
Abdul Munem Al Dabbagh, Ali Hassan Hayyawi, Maha Saber Kochi

98. Influence of Low Power He-Ne Laser on the Skin Thickness of Swiss Mice 508
Zainab Abd ALjalil, Ali Kamel Mohsin, Ali Mahdi Mutlag

99. The Effect of Electric Stimulation in the Development of the Explosive and Speeding Ability of the Arms to Achieve the High Snatch of the Weightlifters Karbala Youth Club 515
Alaa M. Dhahir

100. Monte Carlo Simulation to Estimate the Male and Female Effective Dose due to Radon Exposure in Al-Najaf 520
Mokhalad Ali Zbalh, Hussien Abid Ali Bakir, Ali Abid Abojassim, Adhraa Baqir Hassan

101. Impact of Material of Water Storage Tanks on Bacterial Quality in Shualat Al-Sadrain City in Baghdad 525
Amel Mustafa Kamil, Khadeja Shaaban Hasan, Sajad Mahdi Hasan

102. A Descriptive Study on Pulmonary Tuberculosis in Salahaddin Governorate, Iraq 531
Hasan Ismail Sultan, Noor Alhudaa Sadoon Khalaf

103. The Relation between Homocysteine, Oxidative Stress and Atherosclerosis Disease 537
Ekhlas Abdallah Hassan

104. Comparison of the Educational Effect of Two and Three Dimensional Books on Dental Anxiety in Children with Hearing Impairment (Aged 7–9 Years) 543
Eva Fauziah, Selvyra Rachmawati, Aprillia Puspita Rachmadani, Cahyanti Wydiastuti Susilo

105. Effectiveness of an Education Program for School Age Children Related to Management of Growth Hormone Deficiency University of Baghdad-College of Nursing 547
Fatima H. Abbas, Eqbal GH. Ma'ala

106. The Impact of Smart Phones on Musculoskeletal Pain on Students in Tikrit University 553
Firas Tariq Ismaeel

107. Risk at the Educational Laboratory in Indonesia 558
Frida Qurbasari D., Putri Ayuni Alayyannur, Dani Nasirul Haqi, Meirina Ernawati, Fauziah Mukti Sugiharto

108. Split Face Comparative Study of the Efficacy and Outcome of ND: YAG Laser and Intense Pulsed Light System for Hair Removal 563
Haider Al-Sabak, Muhsin Al-Dhalimi, Eman Mohammed

109. C-reactive Protein and its Relationship with Lipid Profile in Suicidal and Non Suicidal Adults with Major Depression 569
Hassam M. Al-Amarei, Suaad Mohammed H. Rasheed, Ali J. Eidan

110. Considered Absorption Spectra for Identification of Blood Constituents 574
Hassan Abdullah Mahdi, A. A. Al-Rubaiee, Muhanad M. Azzawi

111. Evaluation of the Concentration of Some Heavy Elements of Selected Soils from Shatrah City 578
Ibtihaj Ahmed kadhim, Mohammed Abdulabbas Hasan

112. The Effect of Theory of Planned Behavior Models to Behavior of Cadres as the First Aiders of Stroke Attacks 584
Imelda Feneranda Seravia Tambi, Yuyun Yueniwati, Setyoadi

113. Factors Associated with Women's Treatment for Urinary Incontinence in Hasan Sadikin Hospital 590
Indra Gazali Syamsudin, Karina Shasri Anastasya, Benny Hasan Purwara, Edwin Armawan, Jusuf Sulaeman Effendi, Budi Handono, Hadi Susiarno

114. Histopathological Changes in the Liver and Kidney of Albino Mice on Exposure to Zinc Toxicity 596
Ishraq J. Hassan, Ihsan S. Sahi

115. Microbial Inhibition to Water Hyacinth (*Eichhornia Crassipes* [Martius] Solms-Laubach) in Abu Zirk Marsh by Using Selected Fungi 601
Jameelah Wthaij Ogali Al-Yosef, Abdul-Rahman Abduljabbar Al-Kubasi, Ihsan Flayyih Hasan Al-Jawhari

116. Complications and Lipid Parameters Status among 50 Years and above Age Group Hypertension Population at Primary Health Care Centres of Buraidah City 606
Asim Fahad AlKhalifah, K. Chandra Sekhar, Abdulaziz Sulaiman Alsaif, Alya fahad Alkhalifah

117. Cardiac Failure in Misan, Iraq 612
Khalid Obaid Mohsin

118. Dilated Cardiomyopathy in Children 616
Khalid Obaid Mohsin

119. Effect of Exercise and Body Mass Index (B.M.I.) on Fitness 621
Khalidah Nayyef Mustafa

120. Analysis of Related Factors with Anxiety Occurrence in Population with the Risk of Coronary Heart Disease in Indonesia 626
Titin Andri Wihastuti, Fajaruddin Fajaruddin, Tina Handayani Nasution, Kumboyono Kumboyono, Yulia Candra Lestari

121. What are the Staffing Levels and Maternal Outcomes? A Descriptive Study in Referral Hospitals in Java, Indonesia 631
Makhfudli Makhfudli, Ferry Efendi, Anna Kurniati, Retnayu Pradanie, Susy Katikana Sebayang

122. Estimation of Procollagen Type III Peptide (PIIIP) Level in β Thalassemia Patients 637
Maryam Kadhim Al-Shemery, Arshad Noori Al-Dujaili

123. Study Prevalence of Breast Cancer and the Relation it's with Some Risk Factors and Blood Group in Al-Najaf Governorate, Iraq 643
Maysoon K.A. AL-Hadrawi, Noor Ibrahim, Esaam Mohmmed Turky, Noor Ismeal Nasser, Ali k. Meetab

124. Strengthen the Spiritual-Based Family Resilience to Overcome the Family Stigma of Leprosy 647
Nasrudin, Ah Yusuf, Rachmat Hargono, Tjipto Suwandi

125. Association between Socio-economic Status and Breast Feeding Practices in a Group of Women Delivered During the Previous Year in Kirkuk City 653
Nazar Ahmed Mahmood, Qasim Husein Mohammad, Kasim Sakran Abass

126. Quantitative Assessment of Factors Affecting Visual Acuity by Changing the Luminance 658
Osama Q. Abdullah, Fadia W. Al-Azawi, Sara T. Hassan

127. Effect of Adding Probiotic with Different Levels of Citric Acid in Feed Supplementation to Laying Hens on Bacteria Content of Feed, Litter and Egg Shell 663
Rashid H. hameed Al-Dalawi, Qana Hussein ameen, Mahdi Salih Jasim

128. Occurrence of MBLs and Carbapenemases among MDR and XDR *Acinetobacter baumannii* Isolated from Hospitals in Iraq 668
Safa Hasan Radhi, Alaa H. Al-Charrakh

129. The Effect of the Adding *Ganoderma Lucidum* Fungus Powder in the Production Performance for the Brown Japanese Quail Bird 675
Samawal S. Al-Tikriti, Abdul Haq Ismail Al-douri

130. Effect of Non-pharmacological pain Management Methods on Reduction the Severity of Labor Pain in Primigravida Women at AL-Elwyia Maternity Teaching Hospital 680
Sarab Nasr Fadhil, Rabea Mohsen Ali

131. Cholera Outbreak in Iraq, 2017 686
Shakir Mohsen Zgheir, Nabil Mansur Mustafa, Ali Abdalkader Ali, Jawad Al-Diwan

132. White Blood Cell, Procalcitonin, C-Reactive Protein and TNF-α as Prognostic Factors in Pediatric Sepsis 692
SittiAizah Lawang, Idham Jayaganda, Dasril Daud

133. Reactive Thrombocytosis after Caesarean Section and Normal Vaginal Delivery: Implications for Maternal Thromboembolism and its Prevention 698
Suha Abduljaleel Wadi, Ahmed Rifat Shakr, Farah Muayyed Gebriel Shammas Youisif

134. The Impact of Hormonal Replacement Therapy on Herpes Simplex Infection and Gingival Health in Post-Menopausal Women 705
Suzan Mohammed Abdul Raheem, Esra Hassan Abd Ali, Mahmoud M A Elian

135. The Relationship between Neck Pain and Hand Dexterity among Violinists in Kota Kinabalu, Sabah, Malaysia 710
Tay Xin Le, Rajkumar Krishnan Vasanthi, Jim Brown Clement

136. Antibiotics Usage and Their Cost in the Pediatric Wards of Salah Aldin Teaching Hospital 716
Thikra M. Al-Kumait, Emad Maaroof Thakir, Hind Mutar Ibrahim, Alaa H. Alwan

137. Education Conducted By Pharmacist in Improving Hyperlipidemic Patient Adhearance 723
Vidia Arlaini Anwar, Delina Hasan, Sesilia Andriani Keban, Yardi Saibi

138. The Effect of Exercise Technique Altering with Use Heavyweight Rackets in the Development of Concentration (Sodium, Potassium) in the Blood and Smash Skill for Player's Badminton 729
Wissam Salah Abdul Hussein, Abeer Ali Hussein, Ebtighaa Mohammed Qasim

139. Evaluate the Level of Application of Sports Marketing Practices for the First Iraqi Football Clubs 734
Yaseen Ali Khalaf, Ibrahim Younis Waga

140. Knowledge, Attitudes, and Behavior of Pregnant Women in Preventing of Pregnacy Complication and Childbirth: Application Study of Yudhia Model 740
Yudhia Fratidhina, Nina Herlina, Desri Suryani, Yandrizal

141. Intra and Inter-Rater Reliability of Web Plot Digitizer Software in Quantifying Head Posture Angles ... 745
Yughdtheswari Muniandy, Devinder Kaur Ajit Singh, Suresh Mani, Baharudin Omar

142. Proton Pump Inhibitor to the Hepatic Cirrhosis Patients with Hematemesis Melena: A Retrospective Study 751
Zakiyah, Didik Hasmono, Muhammad Noor Diansyah, Christiawan Ardianto

143. Acceleration of Socket Healing by Using Placental Collagen with BDNF: Radiological and Histological Studies 758
Athraa Y. Al-Hijazi, Imad K. Abbas Al-Rifae, Zaid M.Akram, Luay Nafaa Kaka

144. Study the Effect of *Lycium barbarum* Polysaccharide on Bone and Thyroid Gland in Hyperlipidemic Healthy Male Albino Rats 764
Heba A. Abd-Alsalam Alsalame

145. Effect of Exposure Biochinin-A During Gestation Stage on HoxA10 Gene Expression and Histological Change in Uterus of Healthy Female Rats 769
Huda A. Najy, Ayyed H. Hassan

146. Prevalence and Associated Risk Factors of Forward Head Posture among University Students 775
Vinodhkumar Ramalingam, Ambusam Subramaniam

147. Exploration of Patients Value as in Accordance with Bugis Philosophy in Public Hospital at the Sulawesi Selatan, Indonesia 781
Armin, Indahwaty Sidin, Indrianti Sudirman, Harun Achmad

148. Validation of the Emotional Competency Module 787
Asma Perveen, Nurul Ain Hidayah Abas, Hazalizah Hamzah, Pau Kee, Ebru Morgul, Fauziah Binti Mohd Sa'ad, Pavithrah Jaya Kumar

149. Community Led Total Sanitation (CLTS) in Cikupa Village and Teluknaga Village in Tangerang, Indonesia 792
Devi Angeliana Kusumaningtiar, Gisely Vionalita

150. The Prevalence of Explained and Unexplained Subfertility—A Case Study: Kirkuk City (Iraq) 797
Eman I Fathi

151. Cellular Immunity of River Water Consuments and Bandarmasih Municipal Waterworks Consuments 802
Huldani, Bayu Indra Sukmana, Rahmiati, Anindya Pujiningtyas, Eldha Savitri, Fauziah, Ummi Nihayah

152. Role of Sentinel Lymph Node Biopsy in Staging of Early Endometrial Cancer 808
Mohamed Soliman Elmahdy, Gamal Abdelhalim Amira, Mohamed Abdelfatah ElZohairy, Abdelhamid Mohamed ElKalawy, Zeiad Samir Gad, Eman Naguib Khorshed

153. Inorganic Nitrogen Salts in Fibrinolytic Enzyme Production from *Bacillus Megaterium BM 9.1* with Solid State Fermentation 813
Mukti Hapsari, Achmad Toto Poernomo, Amiruddin Prawita

154. Relationship Exclusively Giving Mother's Milk with Growing Baby 819
Mustamin Mustamin, Chatarina Umbul, Shrimarti Rukmini Devy, Rudy Hartono

155. Application of Community Models in an Effort to Control Smoking Behavior 824
Ria Rezeki Sudarmin, Andi Zulkifli, Masni, Suriah, Habibi, Helmy Gani, Muhammad Azrul Syamsul

156. Level of Type L Metacrylate Acid Copolymer as Microparticle Matrix Improves *Lactobacillus casei* Protection against Gastric Acid 829
Ayun Dewi Rahayu, Dwi Setyawan, Sugiyartono

157. The Influence of Tell Show Do Method Based on Individualized Educational Program (IEP) to the Tooth-Brushing Behavioural Change among Slow Learner Children in Bukittinggi, Indonesia 835
Febrian, Ghina Ukhtia Fajrani, Arymbi Pujiastuty

158. Hyperglycemic and Hypertension are Major Component of Metabolic Syndrome that Caused Circulatory Morbidity in Hajj Pilgrims 839
Iche Andriyani Liberty, Nasrin Kodim, Mukaramah

159. The Determinant Factors of Child's Immunization Status: A Cross Sectional Study on the *Dayak Pitap* Tribe in the District of Balangan Indonesia 845
Ida Hastutiningsih, Oedojo Soedirham, M. Bagus Qomaruddin, Boerhan Hidayat

160. The Use of Diuretic Drugs in Heart Failure Patients 851
Lolla Junny Avianda, Didik Hasmono, Meity Ardiana, Ruddy Hartono

161. The Antibacterial Activity of Kersen Leaves (*Muntingia Calabura*) Extracts against *Aeromonas Hydrophilia;* in Vitro Study 857
Onny Kurnia Sari, Wahyu Tjahjaningsih, Sudarno

162. Could the Severity of Infected Gingiva in Pregnant Woman Affect the Quality of Life? 862
R. Darmawan Setijanto, Novia Setyowati, Taufan Bramantoro, Achmad Aghasy

163. Age and Education Distribution Patterns of Working Mothers on Dental Health Behavior in Preschool Children in Mid-Class Society 867
Isnawati, R. Darmawan Setijanto, Taufan Bramantoro, Dinda Dewi Zalinda

164. Relationship between Behavior and the Use of Personal Protective Equipment to Pesticide Consumer Farmers in Tonrong Rijang Village Baranti District Sidenreng Rappang District 872
Zaenab, Ashari R, Nurmin

165. Hazard Identification, Risk Assessment, and Determining Controls in Laboratories 877
Ais Assana Athqiya, Dani Nasirul Haqi, Putri Ayuni Alayyannur, Indriati Paskarini, Fauziah Mukti Sugiharto

166. Risk Analysis of Accidents and Occupatioal Disease in Ohs (Occupational Health and Safety) Laboratory 884
Muhammad Yusuf, Dani Nasirul Haqi, Putri Ayuni Alayyannur, Endang Dwiyanti, Nur Laili R

167. Gluten-Free Diet: Positive and Negative Effect on Human Health 889
Botagoz Kulushtayeva, Maksim Rebezov, Aidyn Igenbayev, Yulia Kichko, Nina Burakovskaya, Vladimir Kulakov, Mars Khayrullin

168. Comparing Lower Grades and Higher Grades Astrocytoma in Three Age Groups: by CD133 Antibody 893
Zainab Zahid Saadoon, Huda Mahdi Al-Khateeb, Khitam Abdul-Razak Alkhafaji

169. Differences in Growth of Children with Autism and Normal in Surabaya, Indonesia 899
Dewi Setyowati, Budi Prasetyo, Dominicus Husada

170. Functional Outcome after Conventional Open Discectomy for Patients with Herniated Lumber Disc: One Year Follow Up 904
Mohammed Hassan Razoki

171. Early Complications Following Bipolar Hemiarthroplasty as Primary Treatment for Displaced Femoral Neck Fracture in Elderly Patients 909
Mohammed Hassn Razoki, Adnan Essa Elkelaby

172. Assessment of the Anterior Talofibular Ligament(ATFL) Thickness in Chronic Stroke Patients by Ultrasound 915
Mohammed Hassn Razoki, Nada Rida Alharis, Haider Kadhim Hussain

173. Classroom Control Patterns and its Relation to the five major Factors of the Personality of Sports Education Teachers in Babil Governorate 921
Aied Kareem Abdaun, AbdulrhmanGhadhab AL-SAADI, Haedar Sami Mohammed

174. Effect of Speed Training Technique in Determining the Effectiveness of Creatine and Phosphorus for Advanced Volleyball Players 926
Amal Sabeeh Salman Al-Tamimi

175. Study of the Effect of Different Intensity and Duration of LED Light on Shear Bond Strength and Adhesive Remnant Index of Metal Orthodontic Brackets 932
Zahraa M. Al-Fadhily, Sattar J. Abdul-Zahra Al Hmedat, Zuha Ayad Jaber

176. Comparative Study between Muscle-Split Versus the Classical Muscle-Cut Subcostal Incision for Open Cholecystectomy 938
Awni Ismail Sultan, Khalid Khairi Hussein

177. Association of Idiopathic IUGR with Placental Histological Morphometry 943
Mohammed E. Ghanem, Samia A. Eleiwe, Nagham K. Tayeh

178. Evaluation of Polycystic Ovarian Syndrome Women as a Result of Clomiphene Treatment 949
Zainab Abdul wahed Naji

179. Variance Analysis of Acute Myocardial Infarction Clinical Pathway in The Era of National Health Insurance 954
Fadlia Fardhana, Kurnia Sari, Atik Nurwahyuni

180. Indoor Particulate Matter (PM_{10}) and Health Risk on Junior High School Students in Depok 960
Sasnila Pakpahan, Bambang Wispriyono

181. Analysis of Typhoid Fever Clinical Pathway Implementation in the Era of National Health Insurance in Indonesia 965
Widia Puspa Hapsari, Atik Nurwahyuni

182. Analysis of Primary Health-Care Resource Preparedness for Implementation of Maternal HIV Screening in Indonesia's Urban Areas 971
MM.Puspitasari, Purnawan Junadi

183. Getting Married to a Suspected Bisexual Man: A Silent Mode of HIV transmission among Married Women in Indonesia 976
Najmah, Sharyn Graham Davies, Sari Andajani

184. mHealth Development for Village Midwives to Improve the Performance of the Maternal Health Program in the Babakan Madang Sub-District, Bogor, Indonesia 981
Rico Kurniawan, Kemal N. Siregar, Nimas S. Martiana, Indriana K. Wardhani

185. The Influence of Dental Health Education on the Gingival Health of Students at STIKES Muhammadiyah Palembang 987
Dientyah Nur Anggina, Resy Asmalia

186. A Smart Nutrition Management System and Nutrition Related Diseases in Humans 992
Kardokh H. Kaka Bra, Eko Supriyanto

187. Dominant Hypertension Factors of Adolescents in West Java, Indonesia 997
Mujahidil Aslam, Trini Sudiarti, Ratu Ayu Dewi Sartika, Engkus Kusdinar Achmad

188. Discogenic Low Back Pain, Diagnostic Criteria 1003
Mahmoud Ramadan Adly, Ahmed Hossameldin Hussein, Omyma Sayed Mahmoud

189. Ultrasound Guided Enhanced Recovery Program in Colorectal Surgery: Kasralainy Modified Protocol 1009
Ahmed FA Farag, Hany MS Mikhail, Hamed H Elsheshiny, Moataz F Mohamed, Osama RM Refaie, Haitham SE Omar, Ahmed MSM Marzouk

190. The Use of Intra-articular Steroid Injection to improve functional outcomes in Tibial Plateau Fractures 1014
Sherif Hamdy Mohamed Zawam, Ahmad Salah Muhammad Abu Taleb

191. Relationship between Hygiene and Sanitation with Coliform Bacteria Contamination in Refill Drinking Water1019
Indah Ananda Jamaluddin, Agus Bintara Birawida, Ruslan

192. Relationship between Work Posture and Musculoskeletal Disorders (Msds) at Processing Workers in PtToarco Jaya, Rantepao City year 2017 1025
Januarty Triani Rimba, Furqaan Naiem, Muhammad Rum Rahim

193. A Study on Frequency of 12-23 Months of Children Visits to Integrated Service Post (Posyandu) 3 Months in a Row against Developments in the Work Areas, Makassar City 1030
Khalis Muliamar, Djunaedi M. Dachlan, Burhanuddin Bahar

194. Analysis of Ability to Pay National Health Insurance Contributions to Communities on Lakkang Island, Makassar City in 2017 1035
Andi Sahriana, Dian Saputra Marzuki, Muhammad Yusri Abadi

195. Factors Associated with Musculoskeletal Disorders (MSDs) Complaint on the Workers of Cargo Unit at PT. Angkasa Pura Logistics, Makassar in 2017 1040
Firmita Dwiseli, Muhammad Rum Rahim, Awaluddin

196. Relationship between Heat Pressure and Age with Work Fatigue among Workers at Department Factory I of Pt. Maruki International, Makassar in 2017 1045
Ulfa Rahman, Masyitha Muis, FurqaanNaiem

197. Relationship of Health Service Quality with Inpatients' Loyalty at RSUD M akassar City 1050
Sri Wahyuni, Nurhayani, H. Indar

198. Relationship of Marketing Mix with Loyalty of Patients of Dental Poly in BatuaPuskesmas, Makassar City in Year 2016 1056
Suciana Aprilia Angraeni, Nurhayani, H. AmranRazak

199. Relationship of Marketing Mix with Return of Outpatients' Interest at Dr.TadjuddinChalid Specialist Hospital, Makassar in 2017 1061
YustiamkaPermana, H. Indar, Nurhayani

200. The Factors Related to Work Fatigue of Block Paving Workers at CV. SumberGalian in 2017 1066
Putri Yanti, Andi Wahyuni, Awaluddin

201. Factors toward Diabetes Mellitus Type II Occurrence among Patients in Tenriawaru Hospital, Bone Regency 2014 1071
Jumriani Ansar, Indra Dwinata, Hardiana

202. Mapping of Dengue Fever Incidence in Majjene Province, West Sulawesi 2016 1075
Jufri, Agus Bintara Birawida, Fajaruddin Natsir

203. Factors Contribute to KB Contraception Equipment Service in Reproductive Age Couples in Tamalanrea Public Health Center 1080
Karmiah, Muhammad Yusran Amir, Muh. Yusri Abadi

204. Factors toward Dengue Haemorrhagic Fever Occurrence in Patte'ne Village, North Wara District, Palopo City 1085
Sari Puspa Bachtiar, H.A. Arusnan Arsin, Dian Sidik Arsyad

205. Factors that Influence Patients in Utilizing Outpatient Services in Hasanuddin University Hospitals ... 1090
Alamsyah, Fridawathy Rivai, Rini Anggraeni

206. Relationship of Marketing Mixes with the Return Interest of Patients at ArifinNu'mang Hospital 1095
Ardiyansah H. Lammade, Asiah Hamzah, Sukri Palutturi

207. Relationship Analysis between the Quality of Health Services and Patients Satisfaction in Kapasa Health Center Makassar City 1100
Fidelia Lolo Pirade, AmranRazak, Nurhayani

208. Factors Related to Complaints of Low Back Pain in Workers in Pt Maruki International Indonesia Makassar City 1105
Ridha Astuty T, Syamsiar S. Russeng, Awaluddin

209. Relationship of Marketing Mixes and Utilization of Dental Poly in KassiKassi Health Center 1110
Sitti Arabiyah Yunus, Darmawansyah, Nurhayani

210. Factors Related to the Fatigue in Workers in the Cargo Unit of Pt. AngkasaPura Logistic Makassar ... 1115
Syur Aulia Jufri, Andi Wahyuni, Muhammad Rum Rahim

211. Relationship of Climate Factors with Diarrhea Evaluation in City of Makassar 1120
Tri Hastuti Handayani, Anwar Daud, Makmur Selomo

212. Analysis of Health Service Quality on Patient Satisfaction in Malimongan 1125
Putri Lisyah Tome, Nurhayani, Darmawansyah

213. Work Fatigue Overview in Female Workers in PT Manakarra Unggul Lestari 1130
Gracella, Awaluddin, Andi Wahyuni

214. Factors Related to the Satisfaction of Patients in Pelamonia Hospital 1135
Andi Nahlah, Sukri Palutturi, Muh. Yusri Abadi

215. Risk Factors of Pulmonary Tuberculosis Relapse in Working Population of Makassar City 1140
Irmawati, Ridwan A, Jumriani Ansar

216. Health Belief Model and Its Association with Cervical Cancer Screening Among Malaysian Women . 1145
Fadzilah Siraj, Md Radzijohari, Nur Azzah Abu Bakar, Faizzudin Sahazudin

217. Level of Spirituality and Demographic Factors among People Living with HIV/AIDS 1152
Rajwani Md. Zain, Zarina Mat Saad, Fatimah Zailly Ahmad Ramli

218. Description on the Quality of Life among Elderly Affected by Dental and Oral Health in Jagir Health Centre Surabaya 1159
Rima Arsyilviasari, Tiara Meilena, Ayu Setyowati, Retta Gabriella Pakpahan, Nur Latifah Zuniati, Alvita Wibowo, Darmawan Setijanto

219. Genetic Diversity of Anopheles sp as Malaria Vectors Who Carries Plasmodium Falciparum and Plasmodiumvivax Which Can Infect Human in Jayapura Municipal, Papua Province, Indonesia 1163
Yohana Sorontou, Henny Sesanti Budi Hastuty

220. The Use of Portable WSD Wound Models to Improve Student Clinical Lab Skills 1169
Pramita Iriana, Ratna Sitorus, Agung Waluyo, Sutanto Priyo Hastono

221. The Role of SOD, Catalase, HSP-27, HSP-70, and TNF-α Expression in Apoptosis of Retinal Ganglion Cells After Intra Ocular Pressure Increase on Rattus Norvegicus 1174
Nurwasis, Gatut Suhendro, I Ketut Sudiana

222. The Relationship Between Nurse Caring Behavior and Patient Satisfaction Level at Inpatient Wards of Bayangkara Hospital Jayapura 1179
Jems K. R. Maay, Ester Rumaseb, Arwam Hermanus

223. Job Satisfaction and Mental Health among Bank Employees of Chidambaram Town 1184
N. Madhavan

224. Neurodevelopmental Screening—A guide for Early Intervention in at-Riskinfants 1188
N. Meena

225. Local Wisdom in Pregnancy, Childbirth, Childcare in Mee Tribe, Papua 1193
Heni Voni Rerey, Cristina Tien Popang, Butet Agustarika, Ester Rumaseb

226. Implementation of Fixed Procedures for Care Action of Archipelago Surgery in the Regional General Hospital of Doc II Jayapura 1198
Demianus Tafor, Jems K. R. Maay, Arwam Hermanus, Ester Rumaseb

227. The Affairs of Anopheles Mosquito in the Working Area 2015 Hamadi Puskesmas Kota Jayapura 1203
Marlin Mayling Jarona, Henny Sesanti Budi Hastuty, Muhammad Abas, Arwam Hermanus

228. Intervention Effect of Ultra Violet and Exhause Lights on Microbal Density Decreasing in Honai in Kurulu District, Jayawijaya District, Papua Province 1208
Frans Manangsang, Ester Rumaseb, Abdul Ganing, Suningsih Suabey, Arwam Hermanus, Jems KR Maay

229. A Model of Malaria in Pregnancy Prevention Counseling in Clinics District of Jayapura, Papua 1213
Ester Rumaseb, Hari Kusnanto, Djaswadi Dasuki, Siswanto A Wilopo, Jems KR Maay, Arwam Hermanus

230. Molecular Docking Studies of a Chalcone Derivative Compound ***p***-hydroxy-***m***-methoxychalcone with Tyrosine Kinase Receptors 1219
Retno Arianingrum, Adam Hermawan, Hari Purnomo, Dyaningtyas Dewi, Edy Meiyanto

231. Clean Healthy Living Behaviours (Phbs) Household Order Kampong Sarmi Regency Bonggo Subdistrict Armopa Papua in 2017 1225
Arwam Hermanus MZ, Ester Rumaseb, Renold M Mofu, Jems KR Maay, DemianusTafor, Zeth Robert Felle, FrengkiApay

232. Global Trend on Incivility Research 1229
Nurul Ain Hidayah Abas, Aidi Ahmi, Mei-Hua Lin, Asma Perveen

233. A New Approach to Detect Macular Hole from Optical Coherence Tomography Images 1235
M. Anand, C. Jayakumari

234. Synthesis and Characterization of Graphene Quantum Dots from Turmeric Powder (*Berberisaristata*) and Its Biomedical Applications 1239
Anooj E. S., V. Suganthi, P. K. Praseetha

235. Development of Novel Classifying System to Identify the Right Sense of Image Sharing in Social Networks Using Deep Convolution Neural Network 1244
P. Nirupama, E. Madhusudhana Reddy

236. Identification and Molecular Phylogenetic Relationship of Selected Medicinal Plants-Ethano Medicinal Importance 1248
Lekshmi Gangadhar, P. K Praseetha

237. Accuracy of Out of Field Photon Dose Calculations by a Treatment Planning System 1253
Silpa AjayKumar, MM Musthafa, JayaPrasad Tripathy, Karthickeyan Duraisamy, Resmi K Bharathan, Suja Cheruliyil Ayyappan, Geetha Muttath

238. Evaluating the Biological Potential of Phyto-compounds from *Myristica fragrans* Seeds 1260
Vibala B. V., P. K. Praseetha

239. Evaluating the Biological Applications of *Myristica fragrans* Seeds for Bactericidal and Cytotoxic Effects 1267
Vibala B. V., V. Suganthi, P. K. Praseetha

240. Elevated Anticardiolipin Titer as a Stroke Factor in Young Patients in Kirkuk City 1273
Raad Hassan Najim, Bilal Jamal kamal

241. ODAP: The Natural Toxin Present in The Lathyrus Sativus (Grass Pea) 1277
Durar Kamil Jabbar, Habeeb Kadhum

242. Safety Disposal of Electrophoresis Gels and PCR Contaminate with Ethidium Bromide and Alternative Methods 1283
Amal Raqib Shamran, Methaq Hadi lafta

243. Enhancement in Segmentation of Brain Tumors on MRI Using Region Growing Algorithm 1286
K. V. Shiny, N. Sugitha, B. Swaminathan, B. Bhuvaneswaran

244. Design of a Prototype System to Determine Ammonia Concentration in Exhaled Human Breath in the Diagnosis of Kidney Failure 1292
Nihitha Rajendran, P Vinupritha, D Kathirvelu

245. Enhancing Blood Cell Images using Denoising Filters for the Detection of Hematological Disorders 1297
Aldrin Karunharan K, Om Prakash

246. Development of Gas Sensor Device for Primary Health Care Monitoring System 1303
Shifa Anas, Gnanavel S.

247. A Descriptive Study on Mental Stress, Time-Management & Worklife-balance among Ph.D. Scholars 1308
Aalim P. N., Ambily R

248. Image Segmentation for Diabetic Retinopathy Using Modified Bacterial Foraging Optimization Algorithm 1313
Hema Rajini N

249. Segmentation of Human Eye Pupil with Novel Grid Based Localization Computing 1320
G. Sumathy, J. Arokiya Renjith

250. Cardiac Tele-care 1326
D. Pavithra, P. Raja Rajeswari Chandni, D. Padmini, S. Vishnu Priya, R. Vanithamani

251. A Map Reduce Framework for Identifying Association Rules between Clinical Traits of Asthma 1329
S. Poorani, P. Balasubramanie

252. A Study on Knowledge, Attitude and Practices towards Breast Cancer among Reproductive Age Group Women in an Urban Area of Coimbatore 1332
Jasmine J Nirmal, Prabhu N J, Sugunadevi G

253. Health Promoting Lifestyle Practices: A Comparative Study on Health and Non-Health Professional Students 1337
Bitty Joys, Sonamtsomu G, Dekey Yanzom

254. Effectiveness of Stress Management Strategies on Occupational Stress in Educational Institution 1343
Jasmine Joseph, C. Lalroluahpuii, Chime Dolkar, Yojna Chettri

255. Effectiveness of Station-based Skill Training Model through Objective Structured Clinical Examination (OSCE): Nursing Students' Skills in Performing the Clinical Procedures 1349
Rinu Mathew, Sujata Regmi, Bombo Ekane Dorothee V

256. Cogency of Aggression Management Training Programme on Competency of Nursing Students in a Selected College in Bangalore 1355
Meenu Cherian, Jenila J, Swetha Sharma

257. To Assess the Knowledge and Attitude Towards the Prevention of Traffic Collisions among College Students 1361
Sowbagya Lakshmi A, Komal Sharma, Monica

258. Classification of Retinal Disorders Based on Fluid Patterns in OCT Images 1367
Venkatraman K., M. Sumathi

259. Analysis of Skin Cancer using K-Means Clustering and Hybrid Classification Model 1371
Bethanney Janney J, S.Emalda Roslin

260. Application of Harmony Search Algorithm in Retinal Biometric System 1379
J. Sivakamasundari, A. Devi Lakshmi, P. Madhumitha, Pallabi Ghosh

261. Application of Clustering Techniques on Statistical Features of EEG Signals for Seizure Detection 1384
P. Grace Kanmani Prince, J. Premalatha, D. Marshiana, Krishnamoorthy Raghavan, Suresh Kumar

262. Face and Finger Vein Recognition for Security Based Electronic Voting Machine Using Raspberry Pi 1390
T. Thaj Mary Delsy, G. Rajalakshmi, D. Jamuna Rani, V. Amala Rani, S. Sidharthan, Praveen K. Pradeep

263. Health Parameter Analyses of Living Organism in Underwater Environment 1394
T. Thaj Mary Delsy, D. Jamuna Rani, D. Marshiana

264. Recent Medical Image Fusion Techniques: A Review 1399
V. Amala Rani, S. Lalithakumari

265. A Literature Study on Detecting Gall Bladder's Wall Thickness for Finding Early Abnormalities using Ultrasonic Images 1404
G R Jothilakshmi, Rubina R, V Rajendran, Y Sreenivasa Varma

266. Skin Reflectance Based Diagnosis and Monitoring of Thyroid Diseases 1408
J.Sofia Bobby, Ralan Barathi E, Srinithi V, Salome G, Jayasurya A

267. Wound Healing Properties and Cytotoxicity of Gold Nanoparticles on MDCK Cell Lines (in Vitro Study) 1412
Najwa Kahtan Aljbory, Nissren Jalal Mohammed, Rana A. Ghaleb

268. Spinal Anesthesia for Knee Arthroscopy without Fluid Preloading 1418
Isra Hamed Saeed

269. Femoral Nerve Block and Adductor Canal Block for Postoperative Analgesia of Total Knee Replacement, Comparative Study 1421
Isra Hamed Saeed, Mohammed Asi Jabbar

270. The Serum Micro RNA-375 Utility to Diagnosis of Men with Prostate Cancer in Iraq 1425
Kadhum J. Mowayeiz, Najat Abudlrazzaq Hasan, Alaa G. Hussein, Estabraq AR. Al-Wasiti, Usama S. Al-Nasiri

271. Anticardiolipin Antibodies in Comparison to B-HCG Titer and Serum Progesterone as Indicator for Ectopic Pregnancies 1431
Wasan Wajdi Ibrahim

Indian Journal of Public Health Research & Development

www.ijphrd.com

CONTENTS

Volume 10, Number 7 July 2019

272. Knowledge Regarding Risk Factors of Hypertension among Young Adult Students 1436
Sanjivani Maral, Muskan Marwah, Sahil Vijaykumar Lahoti, Arindam Das

273. Incidence of Anxiety among First Year College Going Students 1442
Diana Prasad

274. A Study to Assess the Effectiveness of Structured Teaching Programme on Knowledge Regarding Substance Abuse and Its Impact on Health among Higher Secondary Students among Atulya Healthcare, Pune 1446
Tejashri Ligade, Sagar Kulkarni, Aejaz Ahmad

275. Awareness and Assessment of Level of Disaster Preparedness among Nurses of Hospitals 1451
Jasneet Kaur, Sheela Upendra, A. Seeta Devi, Sheetal Barde, Sheetal Waghmare

276. Integrating High Fidelity Simulation with Patient Assessment Using International Trauma Life Support (ITLS) Protocols for Prehospital Scenarios amongst Emergency Medical Services (EMS) Students of Pune, India..... 1454
Parag Rishipathak, Shrimathy Vijayraghavan, Anand Hinduja

277. Assessment on the 'Impact of Nutrition Exhibition 'on Knowledge level among Rural Women in Selected area of Pune District 1458
Sheela Upendra, Jasneet Kaur, Seeta Devi, Sheetal Barde, Shitalwaghmare

278. A Study to Assess the Effectiveness of Structural Teaching Program on Knowledge and Attitude of Nurses Regarding Fecal Microbial Therapy (FMT) in Selected Hospitals of Pune City..... 1462
Deepak Sethi, Shobha Naidu, Maj Kirti

279. Knowledge regarding Total Parenteral Nutrition (TPN) among the ICU Nurses in Selected Hospital of Pune City..... 1467
Manisha Vikrant Mistry

280. Awareness of Students Regarding the Effect of Mobile Phone Usage on Health at an Indian University..... 1472
Milind Chukhare, Sammita Jadhav

281. A Study to Assess the Effectiveness of Structured Teaching Programme on Bio-waste Management with reference to Knowledge among Nurses..... 1478
Ranjana Chavan, Sheela Upendra

282. Effect of Flipped Classroom Teaching on Improvement of Clinical Performance in Labour Room among Nursing Students 1481
Seeta Devi, Sheela Upendra, Jasneet Kaur, Shitalwaghmare, Sheetal Barde

283. Development of Norms for Cardiovascular Endurance Test for Youth Aged 18 – 25 Years.....1486
Amritashish Bagchi, Nayana Nimkar, Rajiv Yeravdekar

284. Analysis of Pesticide Content in Selected Onion Samples by Chromatography and Mass Spectrometry..... 1492
Ankita Kulkarni, Vaishnavi Soman, Avril Jacques, Pratima Jasti, Selvan Ravindran

285. Effects of Dance (Bharatanatyam) on the Body Composition, Nutritional Status, Fitness and Mental Abilities of Children and Adults– A Narrative Review 1497

Effect of Therapeutic Exercises on Pre-Menopausal Symptoms in Sedentary Life Style Women

Aishwarya V. Ahiwale[1], S. Anandh[2], Pranjali Gosavi[3]

[1]MPT, [2]Professor, [3]Assistant Professor, Department of Community Health Science, Krishna College of Physiotherapy, KIMS 'Deemed to be' university, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to check the effect of therapeutic exercises on pre- menopausal symptoms in sedentary life style women.

Method: 65 subjects were included who were having pre- menopausal symptoms with age group between 35-55 years were included in study. These subjects were allocated by simple random technique. During Pre -treatment and post treatment assessment severity of pre- menopausal symptoms assessed by menopausal rating scale and quality of life assessed by SF- 36 questionnaire. These outcome measures were analyzed.

Result: Pre and post treatment protocol was analyzed by using ANOVA test. Data analysis showed extremely significance in menopausal rating scale (p=0.0001) and SF-36 (p=0.0001).

Conclusion: The effect of therapeutic exercise protocol has shown significant improvement in pre-menopausal sedentary life style women with the help of menopausal rating scale and SF-36 questionnaire.

Keywords: *Pre–menopausal symptoms, sedentary life style women, therapeutic exercises.*

Introduction

Menopause: Menopause is defined as a time of cessation of ovarian function resulting in permanent amenorrhea.[1] [2] menopause commonly occurs above the age of 40 years.[2,3] In India 60 millions of women are above the age of 40 years.[2] Many of them menstruate well beyond the age of 50 also.[1] If the Menopause occurs before the age of 40 then it is known as premature menopause.[1] Menopause age not depend upon her menarche, number of pregnancies and lactation or taking oral contraceptives and socio-economic status It may depend upon her nutritional, environmental as well as on genetic factors.[4,5]

Pre–menopause and its symptoms: The phase of Pre-menopause is of 3-4 years before menopause.[1,3] In this period almost 60-70% women go through various pre-menopausal physiological changes such as gradual decrease in the amount of blood loss with each period, gradual increase in the spacing of periods. The most common and noticeable symptoms are hot flushes and sweating which are the main symptom of the climacteric period in 85% women. Hot flushes are commonly seen on face and neck region and these last for 2-5 min each. Headache and severe sweating, disturbed sleep, Palpitation and angina pains may be additional features. In some women mental depression, irritability, and lack of concentration are noticed. Neurological, vasomotor symptoms and paraesthesia take the form of sensation of pins and needles in the extremities. With regard to Urinary tract - deficiency of oestrogen leads to urethral caruncles, dysuria with or without infection, urge and stress incontinence. Genital-Atrophic vagina reduces the vaginal secretion, and dry vagina can cause dyspareunia. Imbalance of Libido (sexual feeling) may increase in some women but in some women it is decreased. [1, 6,7,8,9.]

Physiology of exercise: Exercises help to maintain physical fitness. The physiological effect of exercise is depends on intensity, duration and frequency as well as environmental factors. During exercise there is increased demand of circulatory systems to meet this need of oxygen and nutrients improving metabolism with removal of carbon dioxide. Due to these demands chemical, mechanical, and thermal stimuli affect alterations in metabolic, cardiovascular and ventilatory functions. A recent study on Exercise training has shown significant results with regard to the self - reported frequency and severity of hot flushes.[10]

Thus, it is essential to study effect of therapeutic exercises on pre – menopausal symptoms in sedentary life style women. Also there is a need of study to find out the effect of therapeutic exercise programme on pre–menopausal symptoms as well as to promote women with sedentary life style towards adherence to physical exercises and its effects on health status during their pre–menopausal period.

Method

Population: The subjects which willing to participate in the study was taken. The criteria for inclusion were: Age: 35 to 55 years with pre-menopausal symptoms, non-exercising women excluding daily routine house hold work. Exclusion criteria: Subject associated problem with gynecological conditions such as - Uterine fibroids, Carcinoma, Uterine cyst, Subject undergone with any surgery in past 6 months and any disabled female.

65 pre- menopausal sedentary life style women were selected from Krad. And written consent form was taken. All the subjects were informed about the protocol and gave written consent before their participation. The protocol and the consent form were previously approved by protocol and ethical committee.

Interventions: In this study total 65 subjects were included who were having pre- menopausal symptoms which was confirmed by gynaecology department and those subjects satisfying inclusion criteria with age group between 35-55 years were included in study. The nature of study and interventions was explained to the subjects and those who were willing to participate were included in the study. Before proceeding to intervention, a written consent was taken from individual participant. Pre-treatment outcome measures of menopausal rating scale and SF-36 questionnaire will be recorded on first day. The procedure of therapeutic exercise protocol which includes with warm up exercises, stretching, strengthening exercises, aerobic exercises, relaxation technique and cool down exercises are advised and made to be performed by the subjects under the supervision as per the protocol. Consecutive outcome measures was done every month to know the progress for a period of four months. Pre and consecutive post- test measures was recorded for statistical analysis.

Exercise protocol:

1. **Warm-up:** Low intensity free exercises for upper limb, lower limb and trunk for 8-10 minutes.
2. **Stretching exercises:** Self –stretching was given after instruction and supervision for 30 sec hold and 3 repetition for each.[11]

   Upper limb: Bicep stretch, Triceps stretch,

   Lower limb: Quadriceps stretch, Hamstring stretch, Hip flexor stretch, Gluteus stretch, Hip adductor stretch, Calf stretch.

   Neck muscle: Trapezius stretch.
3. **Strengthening exercises:** Strengthening exercise was given with resistance band for upper limb and lower limb flexors, extensors, adductors, abductors for 3 sets and 3 repetition for each.[11]
4. **Aerobic training:** Brisk walk was given to the subjects for 15 minutes.[11]
5. **Relaxation technique:** Jacobson relaxation technique- Instruct subject to contract any group or series of muscles as strongly as possible and then tell to let go and continue to let go.[12]
6. **Cool down:** Cool down period includes with low intensity free exercises for 5 - 8 minutes.

This exercise programme was given for 4 days per week for 16 weeks.

Measurement Procedure:

Menopausal rating scale (MRS): The MRS scale contains 11 items, with a scores from 0 (none) to 4 (extremely severe). Each subject was asked to mark the box according to severity of their symptoms. The total score of the MRS ranged between 0 (asymptomatic) and 44 (highest degree of complain).The minimal/maximal scores vary between the three dimensions of depending on the number of complaints allocated to the respective dimension of symptoms.

Quality of life (SF – 36): SF-36 which is a self- reported questionnaire consisting of 36 items but in that only 2 domains are taken in this study which includes physical role and functions. Each subject was asked to mark the box according to severity of their problems and the domains are scored separately, and accordingly total score is provided.

Result

Women with sedentary life style having pre - menopausal symptoms and who have undergone a therapeutic exercise protocol showed significant decrease in the severity of pre- menopausal symptoms, with p value was <0.0001 which is statistically significant.

In addition, Post intervention results of quality of life among sedentary life style women has been found significant with p value <0.0001 which is statistically significant.

Statistical analysis: The data was entered into Microsoft office excels 2007 and analyzed using instat software. Descriptive statistics were used to analyze for demographic data: Pre and post treatment protocol was analyzed by using ANOVA test and p value <0.0001 was considered to be statistically significant.

As per the inclusion criteria 65 subjects were included in the study. During 16 weeks of protocol which includes with warm up exercises, stretching, strengthening exercises, aerobic exercises, relaxation technique and cool down exercises was given and Pre and post analysis was done for 65 subjects. In Table.1 and Table. 2

Table 1: Comparison of mean Pre- treatment and post treatment MRS score

Sr. No.	Duration	Mean	SD	Median	F value	p value	Significance
1.	Pre- day 1	31.69	5.33	31	213.5	<0.0001	Extremely significant.
2.	Post- 4 week	31.41	5.33	31			
3.	Post- 8 week	30.72	5.28	31			
4.	Post-12 week	29.93	5.35	30			
5.	Post- 16 week	29.07	5.26	30			

The above table shows comparison of mean values and standard deviation of menopausal rating scores. The values were compared by applying Friedman test. The pre and post treatment values shows that there was extremely significant difference in menopausal rating score after 8 weeks. (p = <0.0001.)

Table 2: Comparison of mean pre-treatment and post-treatment SF-36 score

Sr. No.	Duration	Mean	SD	Median	P value	F value	Significance
1.	Pre- day 1	49.62	11.72	50.00	<0.0001	91.794	Extremely significant.
2.	Post- 4 week	49.89	11.68	50.00			
3.	Post- 8 week	51.10	11.69	50.00			
4.	Post- 12 week	54.17	11.95	53.57			
5.	Post- 16 week	56.25	12.06	53.57			

The above table shows comparison of mean values and standard deviation of SF- 36 (Quality of life). The values were compared by applying tukey Kramer multiple comparison test. Pre and post treatment values shows that there was extremely significant difference in SF- 36 after 12 weeks. (p = <0.001).

Discussion

Pre-menopausal women suffer with many health issues due to various hormonal changes/physiological responses on endocrinal and reproductive systems and they influence the women's quality of life. To overcome this problem a therapeutic exercise protocol was designed to the subjects with reference to their Pre - menopausal risk factors.[13]

This research was conducted with the aim to study the effectiveness of therapeutic exercises on pre-menopausal symptoms in sedentary life style women. 65 participants with the age group of 35-55 years participated in the study. The conclusion was drawn

by the outcome measures which showed significant improvement in their pre- menopausal symptoms and in quality of life.

Outcome measures were taken pre and post interventions of therapeutic exercise program in pre - menopausal sedentary life style women. The following are the outcome measures which were used in this study.

- Menopausal rating scale (MRS).
- SF-36 questionnaire.

The menopausal rating scale is consist with 11 questions scale which was categorized from none to extremely severe score. The correlation of coefficient of the sum score was r = 0.82.

In menopausal rating scale, symptoms such as heart discomfort, sexual problems, bladder problems and dryness of vagina there was no significant changes seen. But in other symptoms such as hot flushes, sweating, sleep problems, depressive mood, irritability, anxiety and musculo - skeletal discomfort there was significant improvement recorded.

The second outcome measure is SF-36 which is a self- reported questionnaire consisting of 36 items out of which 2 domains were considered in the study which includes physical role and functions. The domains are scored separately and accordingly total score is provided. The overall Cranach's α coefficient of the SF-36 questionnaire was 0.791.

The physical activity component of SF-36 is categorized according to intensity of exercises i.e., vigorous activities, moderate activities and daily activities. The results have shown no significant changes recorded in vigorous activities but there was significant changes recorded in moderate and daily living activities.

The pre and post data was analyzed statistically using Friedman test and tukey krammer multiple comparison test. The pre and post intervention values of menopausal rating scale of the group compared by applying Friedman test. The results have shown significant difference in post treatment values (p value <0.0001).

The pre and post intervention values of SF-36 questionnaire of the group compared by applying tukey krammer multiple comparison test. The results have shown significant difference in post treatment values (p value <0.0001).

After giving therapeutic exercise protocol there was significant improvement in both MRS and SF-36. (Pre intervention scores: Mean of MRS - 31.69 and SF-36 - 49.62 & Post intervention scores: Mean of MRS - 29.07 and SF-36 - 56.25).

The results showed that there is significant improvement in menopausal symptoms and quality of life post intervention of therapeutic exercise protocol among females with sedentary life style undergoing the climacteric period towards menopause.

The result of one study reinforce that short term exercise approach is effective on menopausal symptoms, psychological health, and quality of life in post - menopausal women. (Aysegil agil et al., 2010).[14]

Related studies showed that exercise training helps to reduce the acute physiological severity post-menopausal hot flushes with 16 week exercise protocol (Tom G. Baily, et al, 2015).[10]

Effectiveness of a modified version of the applied relaxation technique in treatment 0f premenopausal and postmenopausal symptoms which depicts that 12 week exercise programme of relaxation techniques help to reduce severity of pre-menopausal and post- menopausal symptoms. (Saensak et al 2013).[15]

The study on Effects of Aerobic Exercise on Estrogen Metabolism in Healthy Premenopausal Women has proved that exercise intervention resulted in a significant increase in the 2-OHE1/16αOHE1 ratio, but no differences in other estrogen metabolites or ratios. (Alma J. Smith1, William R. Phipps2 2013 May.)[16]

The impact of exercise protocol was positive among all the participants in the study. Hence the therapeutic exercise protocol was effective to decrease the pre-menopausal symptoms as per their severity status thereby improving quality of life too.

Conclusion

The study concludes that subjects doing regular prescribed therapeutic exercise protocol had significant improvement clinically and shown statistically significant results in sedentary life style women with decrease in severity of pre-menopausal symptoms according to menopausal rating scale and improvement in functional status according to SF- 36(Quality of life).

Hence the alternate hypothesis was accepted.

Conflicts of Interest: There were no conflicts of interest in this study.

Source of Funding: This study was funded by Krishna Institute of Medical sciences Deemed to Be University, Karad.

Does Commercially Available Tooth Brushes in India follow Recommended American Dental Association (ADA) Norms?

V. Anu[1], N. SaiSwetha[2], C. Ramya[2], N. Ruksana[2], D. Ranjani[2]

[1]Reader and Head of the Department, Department of Public Health Dentistry,
[2]BDS, Former Student, Sathyabama Dental College and Hospital, Chennai

ABSTRACT

Objective: To evaluate whether various brands of tooth brushes available in the Indian market adhere to ADA specified tooth brush design norms.

Methodology: 13 brands of tooth brushes which are commercially available in the Indian market were selected for the study purpose. Each single tooth brush was compared for the length of the head, width of the head, number of tufts, number of bristles, diameter of the bristles, and surface area of the brushes with the standard ADA (American Dental Association) specifications.

Result: Tooth brushes which are classified under soft, medium, hard and extra soft tooth brushes did not meet the given specifications.10 out of 13 tooth brushes are in accordance with ADA specification related to length and 1 out of 13 tooth brushes are following related to width, while coming for the number of rows 11 out of 13 are satisfied and 10 out of 13 are satisfied related to number of tufts per row .Finally 13 out of brushes are not in accordance with ADA when compared to number of bristles/tufts. Some manufactures did not even provide with the proper type of bristles as per labelling.

Conclusion: There has been a large violation due to improper quality and worst manufacturing of tooth brushes. Public should get aware of about ADA specifications for the proper tooth brush to purchase and use by them. 99% of the surveyed brushes did not meet the ADA specifications.

Keywords: *ADA specification, Tooth brush design, Oral hygiene.*

Introduction

In the remote past, man needed to find out ways innovatively to clean his teeth and make his breath pleasant to loved ones. It is not known actually who initially developed the idea of tooth cleaning, despite the fact that markings on teeth found in caves going back to the Stone Age put forward the thought that primeval man utilized alternative toothpicks possibly made from wood or bone that helps to be clear out seeds and bone sections from between his teeth. The growth of the initial toothbrush likely goes back to around 3550BC, when the Babylonians and Egyptians created the primary toothbrush by utilizing threadbare twigs [1] As per another source, around 1600 BC, the Chinese arranged "chew sticks" that were produced using the twigs of sweet-smelling trees for refreshing their breaths.

Toothbrush is described as the most classic and principle method in the oral hygiene practice, since ancient times. Chewing sticks were mostly the first tooth brush designed which were manufactured by Babylonians as early as 3500 BC.[1].The predecessor of the toothbrush is the "chew stick". Chew sticks were twigs with frayed ends used to brush the teeth while the other end was used as toothpick. The earliest chew sticks were discovered in 3550 BC and mentioned in Chinese records dating from 1600BC. The Greeks and Romans used toothpicks to clean their teeth and toothpick like twigs have been excavated in 'Qin Dynasty' tombs. Chew sticks remain common in Africa and the rural Southern Indian states till recent past. Modern toothbrush has been originated

Reader and Head of the Department,
Sathyabama Dental college and Hospital, Chennai
Email: pcnanu@gmail.com

in China. The first bristle toothbrush consists of hog bristles. They were attached to a handle manufactured from bamboo or bone, forming a toothbrush.

At present, the market is crowded with multiple varieties of toothbrushes. Some with effective advertising which overstates the size, shape and other features comparing, each superiority over another, which leaves all the consumers in a state of dilemma to purchase and buy which brand of tooth brush. Thus it is very essential to ensure the correct guidelines to both toothbrush manufacturer as well as consumer, so that it will help the public to select a proper toothbrush which helps to maintain a good oral hygiene.

Toothbrushes vary in size, design, length, hardness and arrangement of the bristles. There are several studies, which reports that due to improper tooth brushing technique and improper toothbrush design there is an increase in cervical abrasion of teeth[2,3] and gingival trauma[4]. Toothbrush design is a very important key factor in the maintenance of oral hygiene. If the design is not satisfactory there will be improper cleaning of tooth surface areas which will affect the teeth and periodontal health[5]. Bristles on the other hand , also play a very important role in the function that,if the bristles of the toothbrush are very hard it will lead to bleeding of gums[4,5]. ADA specifications are used for testing the tooth brush quality for the safety use of the tooth brush so that will help to maintain good oral hygiene[6].

Although several studies[1,7] have been done related to tooth brushes, yet there is no confirmation of the toothbrush whether they are following the ADA specification or not. The main objective of the study is to evaluate the commercially available various brands of toothbrushes in the Indian market are similar to the specifications which are advised by ADA.

Methodology

The current study was conducted in the Department of Public health Dentistry, Sathyabama Dental College and Hospital, Chennai. 13 tooth brushes from 4 commonly available brands , which are commercially available in the Indian market were selected for the study purpose. All the tooth brushes have been coded from 1 to 13. The study of tooth brushes consists of soft, medium, hard, and very hard varieties of tooth brushes. Each single tooth brush was compared for the Length of the head (brushing surface), Width of head (using vernier callipers): three trials each, Number of tufts per row, Number of bristles per tuft, Diameter of the bristles-(soft=0.007inch, medium =0.012inch, hard=0.014inch), Surface area of the brushes, with the Standard ADA specifications[8].

The tooth brush was divided into 3 parts - head, shank and handle. The length of head was measured by using the divider, by placing one end of the divider on top of the head and the other end at the bottom of the head. Then the distance between the two end points were transferred on to metal scale for the measurement of length of the head. The width of the head was measured by using the divider method and it was measured horizontally from one end to another end.

The diameter of the bristle was measured by using the vernier callipers and it was set in accordance with the error ±0.1mm. Single bristle from the tooth brush head was taken from the group of tufts and that single bristle was hold in between the upper arm and lower arm of vernier callipers. Now the reading was evaluated. Rows of each tooth brush were calculated for three trails and mean of the three trails was recorded. Group of tufts which is present in the rows was calculated.

The surface area of each tooth brush was calculated by using the formula relating to the shape of the tooth brush design. For the brush code 10,11,12,13 the shape of the head is in oval shape - the formulae used for calculating the surface area is $A = \pi r^2$ where the value of π is taken as 3.14.cFor the brush codes 1, 4 the shape of the head is oval and with rectangle- the formulae used for calculating the surface area is $\pi r^2 + l \times b$. For the brush codes 2,6 the shape of the head is in triangular – the formulae used for calculating the surface area is $2A = \pi r^2 + \frac{1}{2} b \times h$. For the brush codes 3, 5 the shape of the head is triangular - the formulae used for calculating the surface area is $l \times b + \frac{1}{2} b \times h$. For the brush codes 7, 8, 9 the shape of the head is rectangular – the formulae used for calculating the surface area is $A = \pi r^2 + 2 \times \frac{1}{2b} \times h$

The method for calculating the surface is done by observing the tooth brush head and by noting down the related the formulas. Thus the recorded data was noted down in the excel sheet. Average mean and the standard deviation of all the recorded values are then calculated and noted down. The values thus obtained are compared with the ADA specification[8].

Results

Evaluation of bristle diameter gives the information that out of 3only 1 extra soft toothbrushing accordance with ADA specification no(table-2); out of 5 soft tooth brushes none is with the accordance of ADA specification no(table-3); out of 4 toothbrushes in medium none is satisfying(table -4).The ADA standard specification out of 1 hard toothbrush is also not with the accordance with ADA specification(table-5).

On measuring the length and width of toothbrush head in the order of soft ,medium and hard variety(table-1),it was found that 10 out of 13 toothbrushes relating to length meet the ADA specifications, while considering the width 3 out of 13 tooth brushes alone meet the ADA specification. While considering the no.of rows-11 brushes out of13 are following the ADA standard specification. While comparing the tufts only 11 out of 13 met with the ADA specification number and while comparing the no. of bristles only 1 out of 13 follows the ADA standard specification (table-1)

Table 1: Specifications of commercially available tooth brushes

Tooth Brush Code	Length of Head		Width of Head		No of Rows	No of Tufts/Row	No of Bristles/Tuft
			Avg. of 3 trials inches	SD (standard deviation) inches

Discussion

This study has been conducted to compare whether the toothbrushes which are commercially available in the market are meeting the standards which are set by ADA specifications given for toothbrush. Toothbrushes which are classified under soft, medium, hard and extra soft toothbrushes did not meet the specification given by ADA. Few brands failed to reach approximate specifications of ADA. The greatest disparity was seen with regards to diameter and no of bristles.99% of surveyed brushes had less bristles than specification, since it is known that plaque removal procedure is carried out with the brushing technique i.e more based on technique rather than type of bristles and if bristles are not satisfactory adverse changes are observed with brushing like abrasion of tooth surface, Traumatizing the gingival margin, so the need of hand bristled tooth brushes in the market is doubtful. Many toothbrushes did not follow the ADA specification for length ,width of head, all being larger than norms. Small head toothbrushes help in improving plaque removal. Astonishingly none of the evaluated toothbrushes totally satisfied the specifications of ADA. Detailed descriptions of the toothbrushes available in the market are given in this study which is deviated from the normal existing specifications. This findings is similar to studies done by Bhat MK(2006)[1] and Singh Walia S(2016)[8].

Majority of the manufacturers did not specify about bristles per tuft. Some manufacturers did not even provide with proper type of bristles as per labelling. There has been a large violation from ADA specifications due to improper quality check by manufacturers' leading to worst manufacturing of toothbrushes. There are different varieties of toothbrushes available in many colours, designs, packages each claimed to be better than other .The main purpose of using tooth brush with simple design which is following ADA specification is to obtain the best result during brushing. Public should get aware about the ADA specification for the proper toothbrush to follow according to the individual. By proper usage of toothbrush one can avoid many problems faced by the people in day to day life. Good oral health begins from oneself. Good oral health isn't hard to achieve but it does take discipline. Brush your teeth every day to keep the dentist away. But to maintain proper oral condition visiting dentist regularly is not wide of the mark. The main reason for going to the dentist regularly every 6 months is prevention. The goal is to prevent tooth decay, gum disease, and other disorders that put the health of your teeth and mouth at risk. Every tooth in a man's mouth is a diamond. Hence the manufacturer of tooth brushes, despite of business purpose, should keep in mind the ADA specifications while producing toothbrushes and ultimately extend a moral support to the people by showing great concern for their oral health. There should be a regular check and necessary measurements should be taken by the government by seeking the help from the Public Health Dentistry side to have an inspection regarding the manufactures.

Ethical Clearence: This study does not involve any human sample.

Maternal Mortality at a Tertiary Care Hospital in North India: A 4 Year Review

Pratima Mittal[1], Garima Kapoor[2], Bindu Bajaj[3]

[1]Consultant & HOD, [2]Associate Professor, [3]Consultant & Associate Professor, Obs. & Gynae., VMMC & Safdarjung Hospital, New Delhi

ABSTRACT

Worldwide, almost half a million maternal deaths occur every year. Most of these deaths (99%) occur in developing countries. South Asian countries which includes India. Most maternal deaths are preventable as the medical interventions necessary to treat or prevent complications are well established. Even then, the progress made in maternal health so far is unsatisfactory. This study was conducted to determine the causes and epidemiological factors that lead to maternal deaths at a Tertiary care hospital in North India, and henceforth, suggest measures to reduce maternal mortality in the region. It was a retrospective study. The female deaths at the Institution which met the WHO Criteria for Maternal Death during the year 2013-2016, were analyzed for epidemiological factors and causes of maternal deaths. During the study period there were 364 maternal deaths. Maternal mortality ratio in the study period was 358.73, 273.30, 371.45 and 436.61 in the year 2013, 2014, 2015 and 2016, respectively. Majority of the women who died (73.07%) were in the age group of 21-30 yrs. Most of the women (70.32%) were multipara (56.59%) and grand-multipara (13.73%). Most of the women were un-booked(88.46%).Direct causes still contributed to majorly of maternal deaths [hypertensive disorders (28.02%), pregnancy related infections (20.87%), and hemorrhage (12.36%)]. Among indirect causes, anemia and hepatitis were most common (15.93% & 11.53%, respectively). Promoting good quality antenatal care for all, universal iron supplementation, strengthening the infrastructure of peripheral Health facilities and forming a referral network are some of the measures that may help reduce maternal mortality.

Keywords: *Maternal mortality review, retrospective study, tertiary care hospital, North India.*

Introduction

Worldwide, approximately 830 women die every day due to complications of pregnancy or childbirth[1]. This amounts to almost half a million maternal deaths every year. Most of these deaths (99%) occur in developing countries. South Asian countries which includes India, accounts for nearly one- third of the global burden of maternal deaths.[2]

Most maternal deaths are preventable as the medical interventions necessary to treat or prevent complications are well established. Even then, the progress made in maternal health so far is unsatisfactory. United Nation (UN) report card on Millennium Development Goal-5 concluded that the progress shown by the South Asian countries including India is unsatisfactory. These countries have achieved a decline of MMR by around 20 percent against a target of reducing MMR by 75 per cent between 1990 and 2015[2]. For India, it implied that it should have achieved the target of reducing maternal deaths to 109 by 2015. However, it failed to achieve its target, and has only achieved an MMR of 174.[1]

This study, was conducted to determine the causes and epidemiological factors of maternal deaths at a Tertiary care hospital in North India, and henceforth, suggest measures to reduce maternal mortality in the region.

Aims & Objectives

1. To determine & compare the Maternal Mortality ratio at the Tertiary care Hospital for a period of four years.

Corresponding Author:
Dr Garima Kapoor
Associate Professor, Obs. & Gynae.
VMMC & Safdarjung Hospital, New Delhi
Email: garimak79@yahoo.co.in

2. To identify the causes that led to maternal deaths at the Institution.
3. To suggest measures to reduce maternal mortality.

Materials & Method

It was a retrospective study conducted in a tertiary care hospital, in north India, with an annual delivery rate of around 26-27,000. The hospital receives several un-booked patients and referral cases from private and public maternity homes, hospitals and Medical colleges across Delhi and neighboring states. The hospital runs 3 ICU's, an Obstetric HDU. It also has blood bank facility and 2 emergency operation theatres, functional round the clock to provide emergency obstetric services to its patients.

The female deaths at the Institution which met the WHO Criteria for Maternal Death[1] were included in this study: All female deaths, while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of pregnancy, from any cause related to or aggravated by pregnancy or its management but not from accidental or incidental causes [1].

The details of all the maternal deaths for a period of four years, from January 2013 to December 2016 were collected from the Maternal mortality register and the case sheets. This data was analyzed with respect to the following parameters:- age, parity, socioeconomic status, residence, booking status, condition on admission, prevalence of anemia, admission death interval, causes of death and type of delays identified.

Maternal mortality ratio was calculated by using the formula-

$$\text{MMR} = \frac{\text{Total no. of maternal deaths} \times 100,000}{\text{Total no. of live births}}$$

Types of delay according to WHO[3] is summarized as follows-

- **Type I delay:** delay in the decision to access care
- **Type II delay:** delay in the identification of and transport to a medical facility
- **Type III:** delay to the receipt of adequate and appropriate treatment

Results

During the study period, from January 2013 to December 2016 there were 100,631 live births and total of 364 maternal deaths. Maternal mortality ratio in the study period was was 358.73, 273.30, 371.45 and 436.61 in the year 2013, 2014, 2015 and 2016, respectively.

The epidemiological characteristics of the maternal death cases are shown in **Table 1**.

Majority of the women who died (73.07%) were in the age group of 21-30 yrs. Adolescent pregnancy attributed to 3.29% (n=12) of maternal deaths. Most of the women (70.32%) were multipara (56.59%) and grand-multipara (13.73%). Nearly two- thirds of the women (68.68%) belonged to lower socioeconomic strata. Most of the women were un-booked, an alarmingly 88.46%. Nearly 2/3rd of these un-booked cases (64.9%) were referred from other centers, often after life-threatening complications. Many of these women were brought to the hospital in critical (94, 29.12%) and serious (102, 31.67%) conditions, respectively.

Type I (64.28%) and type II (49.45%) delay were the most common delays identified in this study

The causes of maternal deaths were classified according to the WHO Application of ICD-10 to deaths during pregnancy, childbirth and puerperium[4] and summarized in Table 2.

Table 1: Socio-demographic characteristics of women who died

Socio-demographic character	No. of women (%)
Age	
≤ 20 years	46 (12.63%)
20-30 years	266 (73.07%)
31-40 years	46 (12.63%)
> 40 years	06 (1.64%)
Booking status	
Unbooked	322 (88.46%)
Booked	29 (7.96%)
Registered	13 (3.54%)
Status on admission (AHA)[21]	
Good	19 (5.21%)
Fair	54 (14.83%)
Serious	171 (46.97%)
Critical	120 (32.96%)
Prevalence of Anemia	
Severe (<7 gm%)	133 (36.53%)
Moderate (7-9.9 gm%)	129 (35.43%)
Mild/ No (≥10 gm%)	112 (30.76%)
Referral	
Referral	211 (57.96%)
No Referral	153 (42.03%)
Duration of Hospital stay	
≤24 hours	164 (45.05%)
24-48 hours	72 (19.78%)
> 48 hours	128 (35.16%)

Table 2: Causes of Maternal Deaths

Groups according to ICD-10 Code[4]	Type and Group	No. of Maternal Deaths (%)
1	Direct: Pregnancies with abortive outcome	10 (2.74%)
2	Direct: Hypertensive disorders	102 (28.02%)
3	Direct: Obstetric hemorrhage	45 (12.36%)
4	Direct: Pregnancy related infections	76 (20.87%)
5	Direct: Other obstetric complications	
	Obstructed labor	08 (2.19%)
6	Direct: Unanticipated complications of management (eg. pulmonary embolism)	13 (3.57%)
7	Indirect: Non obstetric complications	
	Anemia	58 (15.93)
	Heart disease (with or without pre existing hypertension)	12 (3.29%)
	Gastrointestinal complications	55 (15.10%)
	Respiratory diseases/ARDS/TB	20 (5.49%)
	Neoplasm	02 (0.54%)
	Infections, not direct result of pregnancy	02 (0.54%)
	Epilepsy	02 (0.54%)
8	Unspecified: Unknown/Undetermined	03 (0.82%)
9	Coincidental causes	0

Discussion

Maternal mortality is an index of quality of Maternal Health services and the socio-economic status of a community or a nation. Hence, a high maternal mortality not only reflects poor quality of Health services and referral linkages, but also a lack in the Socio-economic development and infrastructure of a community.

The Maternal mortality ratio in the study period was 358.73, 273.30, 371.45 and 436.61 in the year 2013, 2014, 2015 and 2016, respectively. MMR in our study still remains quite high, more than our national average (174/100,000 live births[1]. Similar high maternal mortality has been reported by other Indian studies as well (Nishu Priya et al[5] at 270/1,00,000 live births, Ashok et al[6] at 345.9/1,00,000 live births, VB Bangal et al[7] at 302.9/1,00,000 live births, Purandare et al[8] at 113/1,00,000 live births, Sundari KPM et al[9] at 559-802/1,00,000 live births.). Only, one Indian study from Kerala has reported a very low MMR of 33.9/100,000 live birth [10]. This is because, Kerala state has the lowest maternal mortality in the country. On analysis of the data, the high maternal mortality in the study, can be explained by the fact that the health facility being a Tertiary care center, receives referrals of several un-booked patients, often with life threatening complications from various hospitals (public and private) in and around Delhi. Pathak et al[11] also reported a high MMR of 428-869.6/ 100,000 live births also due to large number of referral cases. Majority of the women in the study, were un-booked (322, 88.46%) and most of them referred from other public/private facility. Many presented to us in serious (31.67%) or critical condition (29.12%) often with multiple complications and expired within 24 hours of admission to the hospital (45.05%). Also, with the establishment of an Obstetric HDU in the Department, in 2016, there was a significant rise in the number of referred cases from 49.47% in 2015 to 59.48% in 2016. Moreover, the number of patients who presented in a Critical condition at admission, increased from 32.63% in 2015 to 50% in 2016. Many were transferred 62 (29.38%) without adequate life support measures, further aggravating their moribund state. Hence, explaining the rise in Maternal Mortality in 2016.

Many of these patients could have been saved by timely and early access to Health care services. The most common delays identified in this study were Type I and Type II delays. No ANC and delay in deciding to seek care (234, 64.28%) and delay in reaching tertiary care center (180, 49.45%). Another Indian study [12] also reported a high type I (85.89%) and type II delay (10.25%).

Also, lack of availability of blood and blood components/ blood bank, emergency obstetric care facility, trained manpower, ICU facility at various centers across the state and neighboring states have been identified. This often leads to patient being referred from one facility to the other without receiving appropriate medical care. No proper referral linkages also lead to delay in a women receiving access to a referral center.

Most of the women in our study were in the age group of 21-30 years (73.07%); similar to other studies across India[6,7,13] . Adolescent maternal death were seen in 12 cases (3.29% of total maternal deaths), as against a total occurrence of 7% adolescent pregnancies in this Institution. Other Indian studies have reported a higher incidence of mortality in adolescent girls (Vidhyadhar et al.[14] : 15.79%, Jadhav et al[15]: 9.49%, Murthy et al : 5.83%[16],Das R et al.[17] : 30.85%). UN statistics division reported adolescent pregnancy in India as 86/1000 (1995-2010), which is very high as compared 49 globally and 53 in less developed countries. The main causes for teenage maternal deaths in this study were septic abortion (41.66%), pre eclampsia and eclampsia (33.33%), sepsis (23.91%), anemia (16.66%).

Majority of the women who died in this study were multipara and grand-multipara comprised 56.59% and 13.73%, respectively. Hence, highlighting the need to strengthen family planning services. In grand multipara group, 20% deaths were due to hypertensive disorders, anemia and respiratory diseases each.

Majority (69.81%) of maternal deaths were due to direct obstetric causes; Hypertensive disorders (28.02%), pregnancy related infections/sepsis (20.87%), hemorrhage (12.36%), and abortion (2.74%). Other studies from across India have also reported a high incidence of Maternal deaths due to direct causes (Table 3)[,15,16,17,18]. As per WHO (2007 & 2010) 25% of all maternal deaths world-wide are due to hemorrhage. In our study obstetric hemorrhage contributed to only 12.36% of cases, much lower than other Indian studies (Murthy BK et al[16] 26.66%, Ann L. Montgomery et al[18] 27%, Nishu Priya et al[8] 35.05%). This is probably, because the hospital runs blood bank facilities round the

clock with availability of various blood components. Anemia was significant co morbid factor (71.97%) and an indirect cause of maternal mortality in 15.93% in this study which is comparable to study done by Khandale SN et al[12] (14.10%).

Conclusion

Most of the maternal deaths in this study were observed in women from rural areas who were less educated, with no antenatal coverage and belonged to lower socioeconomic status. Maternal death is an avoidable tragedy and most of the causative factors can be prevented to a large extent.

From this study it was c oncluded that Direct causes like Hemorrhage, sepsis & hypertensive disorders of pregnancy, still contribute to majority of maternal deaths. Anemia, Heart disease and Jaundice were the major medical causes of Maternal deaths in this study. Hence, the following measures are suggested to reduce the National MMR to achieve the desired MMR of 100 by the year 2020.

1. Ensuring 100% antenatal coverage for all pregnant women & promoting institutional deliveries.
2. Promoting oral iron supplementation along with dietary advice for correction and prevention of anemia.
3. Measurement of Blood pressure at each antenatal visit to ensure early identification and management of pre-eclampsia.
4. Initiation of Anti-hypertensives at BP above 150/100mmHg and timely referral of these patients to tertiary care facility.
5. Training ANMs at CHC, PHC, to administer intramuscular Magnesium sulfate for prevention/ treatment of ecclampsia
6. Provision of safe abortion services.
7. Strengthening of existing Emergency obstetric care (EmOC) facilities.
8. Implementing Active management of 3rd stage of labor and systematically observing the 4th stage of labor.
9. Promotion of family planning services and spacing of births.
10. Maternal death review and audit
11. Identifying Maternal Early Warning Signs in mothers at referring Centres, (MEOWS Score) to ensure early and timely referrals, easy transport and with adequate life support measures.
12. Sex education to teenagers.

Dose Response Relationship of Child Centered Task Oriented Training in Children with Cerebral Palsy-A Randomized Controlled Study. Study Protocol

Kovela Rakesh Krishna[1], Dhanesh Kumar K U[2]

[1]Assistant Professor, [2]Professor & Principal, Nitte Institute of Physiotherapy, Nitte (Deemed to be University), Deralakatte, Mangalore, Karnataka

ABSTRACT

Background: Growing child has innumerable capabilities which can impact his recovery if utilized appropriately. Physiotherapeutical approaches involve child in the treatment and give importance in framing of goals directed by the therapist. Child centered task oriented training completely gives importance to the child in planning and performing activities useful for his recovery.

Objective: Primary Objective of the study is to establish the dose response relationship of child centered task oriented training in children with Cerebral palsy. Secondary Objectives of the study: To establish dose response relationship of child centered task oriented training on Gross Motor function, Balance and quality of life in children with Cerebral Palsy.

Method: 80 children with Cerebral Palsy will be recruited and will be divided into two groups. Experimental group receives Child Centered Task Oriented Training; Control group receives Conventional physiotherapy. Both groups receive treatment for 45 minutes a day, 2 days a week for 15 weeks**.** Gross Motor Function, Balance and Quality of life will be measured Pre Treatment, at the end of 8 weeks and Post treatment.

Results: The study is expected to begin enrolment in June 2018. We anticipate that the experimental group receiving Child centered task oriented training study will have superior outcomes when compared to the control group. From clinical experience this is especially true for children with cerebral palsy as their will be more functional recovery when we give importance for them to choose what they want.

Conclusion: We believe this will be an important study to assess a novel method to improve the Functional recovery in children with cerebral palsy. It is simple to apply and monitor the progression.

Keywords: *Cerebral Palsy, Physiotherapy, Gross Motor Function, Balance, Quality of life, Rehabilitation, Child centered task oriented training.*

Introduction

Cerebral Palsy(CP) defines a group of permanent disorders of the development of movement and posture, causing activity limitation, that are attributed to non-progressive disturbances that occurred in the developing fetal or infant brain. The motor disturbances of cerebral palsy are often accompanied by disturbances of sensation, perception, cognition, communication and behaviour, by epilepsy and by secondary musculoskeletal problems[1]

Prevalence of cerebral palsy in developed countries is 2 per 1000 live births and neonatal survivors[2]. Cerebral palsy is classified on the basis of topography

into monoplegia, diplegia, hemiplegia and quadriplegia[3]. Common impairments in CP include spasticity, contractures, weakness of muscles, speech and learning problems, cognitive and perceptual skills, impaired trunk control, visuomotor, balance and gait issues.[4]

Balance is defined as the ability to keep the center of mass over its base of support.[5] Children with cerebral palsy (CP) may have impaired muscle tone and abnormal postural control. Both affect functional balance capacity. As balance skills are an integral part of gross motor abilities, poor balance causes difficulties with functional tasks involved in activities of daily living.[6]

Quality of life is usually described as an overall assessment of wellbeing across various domains. It is essential in children with cerebral palsy to assess their life in several aspects, including physical wellbeing, social wellbeing, emotional wellbeing, school, access to services and acceptance by others.[7]

There are various approaches proved to be beneficial in the management of children with cerebral palsy including Neurodevelopmental Therapy (NDT), Roods approach, Proprioceptive Neuromuscular Facilitation (PNF), Constrained induced Movement Therapy and Task oriented approaches etc.

Task oriented training improves muscle strength and motor skill by repeated training of activity tasks of daily life. Child centered task oriented training is a method that supports interesting tasks for children with CP and leads to effective functional movements. Intentional repetitions of activity play's a major role in interacting child with environment. Childhood is the period where a child has to actively involve with the peer group either in school or while playing which enables him identify his caliber.[8]

In the field of physical activity dose refers to the amount of physical activity performed by the person. The total dose or amount is determined by three components. 1) Frequency is commonly expressed in sessions or bouts per day or per week. 2) Duration is the length of time for each session of any specific activity. 3) Intensity is the rate of energy expenditure needed to perform the activity to accomplish the desired function (aerobic activity) or the magnitude of the force exerted during strengthening physical activity.[9]

Physiotherapy plays a vital role in improving child's functional activities. Introduction of ICF into health domain had a great impact on functional disability. Many approaches in recent times focused on active participation of the child in his recovery. Growing child has innumerable capabilities which can impact his recovery if utilized appropriately. Physiotherapeutical approaches involve child in the treatment and give importance in framing of goals directed by the therapist. Child centered task oriented training completely gives importance to the child in planning and performing activities useful for his recovery. Literature suggests that 15 weeks' child centered task oriented training is effective in improving balance in children with Cerebral palsy.[8] There is dearth in the literature which clearly states whether 15 weeks is mandatory or improvement can be achieved by 8 weeks with said protocol in terms of Gross motor function, balance and quality of life.

Study Rationale: If a dose response relationship is established for improving gross motor function, balance and quality of life in children with cerebral palsy, based on the frequency of sessions and duration of each session and overall treatment time, it will have a great influence on disabled children, their families and society in accepting the treatment approach in the recovery of the child. Child enjoys the sessions as there are no restrictions and much commands. Family can involve in the treatment and help their children, Physiotherapist will get time in concentrating on more number of children at the same time.

Materials and Method

Study Participants and Setting: 80 Children with Cerebral Palsy of either gender between 6 to 10 years will be recruited from Justice KS Hegde Charitable Hospital, Mangalore.

Duration: The study will be carried over for a period of 3 years or till the entire sample size is completed.

Objectives

Primary Objective of the study is to establish the dose response relationship of child centered task oriented training in children with Cerebral palsy.

Secondary Objectives of the study: 1)To establish dose response relationship of child centered task oriented training on Gross Motor function in children with Cerebral Palsy.2)To establish dose response

relationship of child centered task oriented training on balance function in children with Cerebral Palsy.3)To establish dose response relationship of child centered task oriented training on Quality of life in children with Cerebral Palsy.

Inclusion and Exclusion criteria: Inclusion Criteria will be Children diagnosed with cerebral palsy,Either Gender with age 6 to 10 years, GMCS LEVEL I, II, III, Pediatric MMSC score of 24 or above. Exclusion criteria will beany structural deformities of spine hip and pelvis,Recent spinal surgeries(3months), Botulinum toxin in last 6 months, Children who are already under physiotherapy treatment or under anti-spastic, anti-epileptic medication.

Procedure: Approval taken from Institutional Ethical Committee of Nitte Institute of Physiotherapy. (NIPT/IEC/Min/014/2017-2018/dated 21-04-2018)

Children diagnosed with CP of either gender between 6 to 10 years will be recruited from physiotherapy department Justice KS hegde Charitable hospital and pediatric community outreach centers associated with Nitte University. Screening will be done for inclusion and exclusion criteria, study procedure will be explained to the parents and children, consent and ascent formswill be taken from parents and children respectively for participating in the study. Demographic data including age, gender, height and weight of children will be taken along with type of CP.

The included subjects will be divided in to two groups interventional group and control group by randomly dividing through computer generated table. Allocation will be done through sequentially numbered opaque sealed envelope.

Before the beginning of the study evaluation of balance through pediatric balance scale(PBS), Gross motor function through GMFM-88 and Quality of Life by CP QOL will be taken. The intervention group will receive child centered task oriented training for 45min per session, 2 times a week for 15weeks. Control group receives Standard Conventional therapy 30 min per session, two sessions per week for 15 weeks. Reassessment will be taken after completing 8th week and 15th week by an assessor with similar experience who is blinded for the intervention in both Experimental and control groups.

Research Design: Assessor blinded Randomized Controlled trial

Treatment: Child-centered task-oriented training program receives Vestibular set, Doing the splits on a hammock with swaying back and forth, side to side. On Swing Lying on one side with swaying back and forth, side to side. Playing quoits. On Roll Moving from side to side, rolling. Lying and rolling on a Physio ball, bouncing while sitting on a physioball. Keep balance while lying down, sitting, and standing on sway board. Activity while standing like Weight bearing, walking while holding a bar. Walking on a balance beam, spinning in one place. Activity on a mat (5 cm thick) like Rolling, weight bearing from side to side while sitting. Movement (pushing a ball), standing up from sitting, walking. Activity of proprioceptive sensibility like Joint movement (extensional movement), pulling toward themselves (tug-of-war, chin-up). Muscular strength of upper/lower extremities (dumbbell exercise).[8]

Participants in the control group receive conventional physical therapy focused on improving walking and balance through facilitation and normalization of movement patterns which involves General stretching, range of motion exercises, weight bearing, Balance and gait training.[9]

Outcome Measures: Gross motor Function Measure (GMFM-88),Paediatric Balance Scale (PBS), Cerebral Palsy Quality of Life (CP-QOL.

Results

The study is expected to begin in the month of June 2018. Ethical approval has been obtained for the study. CTRI registration is under process (already applied). From past literature and clinical experience Child centered Task oriented training may prove beneficial than control group.

Discussion

If the Dose response relationship is proved to be beneficial it can reduce the number of sessions a child has to visit the hospital, it can decrease the load on parent and therapist as the child is active participant. It can motivate the child to do more challenging tasks.

Conclusion

Child centered task oriented training is a simple program where no specific training is required. Child is active participant and will be motivated to perform the activities by himself. As the study is yet to start we are hoping for a good research project as we are going to conduct this study on large population and for 3 years.

Conflict of Interest: None

Source of Funding: The material required for the study will be provided by Nitte (Deemed to be University), Deralakatte, Mangalore.

Association between Obesity and Elevated Blood Pressure among School Going Adolescents–A Cross Sectional Study

Lipilekha Patnaik[1], Sumitra Pattnaik[1], Trilochan Sahu[2], E. Venkata Rao[3], Saswatika Beura[4]

[1]Professor, [2]Professor & Head, [3]Professor, [4]Junior Research Fellow, Department of Community Medicine, IMS & SUM Hospital, Bhubaneswar, Dist.: Khordha State: ODISHA

ABSTRACT

Background: Adolescent overweight and obesity is an issue of epidemic proportions worldwide and it is related to elevated blood pressure among them. Hypertension in the context of overweight and obesity indicates a higher potential for cardiovascular disease (CVD) than is associated with either risk factor alone.

Objectives: To find out the relation between overweight / obesity and elevated blood pressure among school going adolescents.

Method: A school based cross-sectional study was conducted in 1800 adolescents of 10-16 years. Anthropometric parameters like BMI and blood pressure (BP) were measured using standard guidelines.

Results: Prevalence of elevated BP increased with increase of nutritional status. Elevated blood pressure was observed significantly higher among overweight/obese adolescents (P=0.000). As BMI and waist circumference increased, SBP and DBP increased and correlation was significant at 0.01 level.

Conclusion: All overweight/obese adolescents should be screened for hypertension and early intervention measures should be taken for weight reduction and BP control.

Keywords: *Hypertension, Teens, Body weight*

Introduction

Adolescent overweight and obesity is an issue of epidemic proportions worldwide.[1] An increasing number of studies suggest that adolescent overweight has been linked to comorbidities such as dyslipidemia, nonalcoholic steatohepatitis, diabetes mellitus type 2, obstructive sleep apnea, and hypertension.[2] Globally raised blood pressure is a major public health problem of concern because of its association with increased risk of cardiovascular diseases. It is the leading cause of death and disability worldwide and accounted for 9.4 million deaths and 7% of disability adjusted life years (DALYs) in 2010.[3] In India, it is the leading Non Communicable Disease (NCD) risk and estimated to be attributable for nearly 10% of all deaths.[4]

Overweight adolescents with hypertension have a higher likelihood of both elevated weight and BP persisting into adulthood.[5,6] In addition, some complications of obesity are independently related to elevated BP, such as obstructive sleep apnoea.[7] Studies have shown that the level and patterns of blood pressure among children and adolescents may vary from population to population.[8] The prevalence of childhood hypertension in various Indian studies range from 0.96% to 11.4% respectively.[9] Hypertension in the context of overweight and obesity indicates a higher potential for cardiovascular disease (CVD) than is associated with either risk factor alone. Results from the Bogalusa Heart Study demonstrated that multiple risk factors in childhood have multiplicative rather than additive effects on the severity of coronary artery lesions.[10]

Owing to the relation between elevated blood pressure and overweight/obesity among adolescents and availability of limited data from Odisha, an attempt has been made to relate overweight/obesity and elevated blood pressure among school going adolescents.

Method

This school-based cross-sectional study was conducted from July to December 2013, in 12 schools a city of Eastern India. Sample size was calculated as 1800 with an estimated prevalence of overweight and obesity among school-going adolescents of 20%[11] with an allowable error of 10%, and a non-response rate of 10%. It was decided to cover about 10% (12 schools) out of the total 112 schools with random selection of 6 government and 6 private schools. From each school 150 students were selected (30 students from each class VI to X) by systematic random sampling from the attendance register. In case of absentees, the next roll number was included. Ethical clearance was obtained from Institutional ethics committee and permission from Principal/ Headmasters of the schools were taken prior to the study. Data collection was done by taking assent from adolescent students.

Anthropometric measurements *viz.* height, weight were measured. Height was measured by stadiometer to the nearest centimetre without shoes. Weight was measured with light clothing and without shoes to the nearest 100 grams. Blood pressure (BP) was measured with a standard clinical sphygmomano-meter with appropriate-sized cuffs, using a stethoscope placed over the brachial artery pulse. Body mass index (BMI) was calculated by weight in kg divided by height in meter square. All anthropometric measurements and data collection by questionnaire were done by two trained Medical Social Workers and BP was measured by four medical interns. BP was measured 3 times in right arm, sitting position at 0, 5 and 30 minutes and the average of readings was taken.

Adolescents were categorized according to their BMI using BMI percentile curves for Indian boys and girls from 5- 17 years as per recommendation of Khadilkar, *et al*[12] They were classified as: underweight (BMI <3rd percentile), normal (BMI 3rd percentile to adult equivalent of BMI <23), overweight (Adult equivalent of BMI 23 to adult equivalent of BMI 27.99) or obese (adult equivalent of BMI ≥ 28).

Normal BP was defined as SBP and DBP less than 90th percentile for sex, age, and height. Hypertension was defined as average SBP or DBP greater than or equal to the 95th percentile for sex, age, and height on at least three separate occasions. Average SBP or DBP levels that are greater than or equal to the 90th percentile, but less than the 95th percentile, had been designated as "high normal" and were considered to be an indication of heightened risk for developing hypertension.[13] In this study, Blood pressure was measured 3 times at 0, 5 and 30 minutes and the average of readings was taken.

Data were analyzed using SPSS 20.0 licensed to the institute. Independent samples *t* test was applied to compare the means, and the proportions were compared using Chi square test. *P* value of <0.05 was considered statistically significant.

Results

The age of adolescents varied from 10-16 years with a mean age (SD) of 13.03 (1.43) years with almost equal number of boys and girls, 51.7% and 48.3% respectively. Majority, 94.9% were Hindu and 68.94% belonged to general category, 72.6% of study subjects belonged to nuclear families. It was observed that 27.8% of adolescents were overweight/ obese (overweight – 16.4% and obesity – 11.4%).

Table 1: Elevated blood pressure among school going adolescents

Blood pressure status	No. (%)
Elevated SBP	29 (1.6)
Elevated DBP	82 (4.6)
Elevated both SBP & DBP	178 (9.9)
Not elevated	1311 (83.9)

Elevated blood pressure was observed among 16.1% school going adolescents. Among them, elevated SBP was found among 1.6%, elevated DBP among 4.5% and both SBP and DBP in 9.9% adolescents (Table I).

Table 2: Overweight/Obesity among students and elevated blood pressure

Nutritional status	Total Children	Prevalence of Elevated BP	Remarks
Underweight	86	4 (4.7%)	$X^2 = 135.075$ P = 0.000
Normal	1213	135 (11.1)	
Overweight	295	65 (22.0)	
Obese	206	85 (41.3)	

Table II shows that prevalence of elevated BP increased with increase of nutritional status and there is significant difference of elevated BP among different grades of nutritional status.

Table 3: Correlations between BMI and blood pressure

Variable	r	p value
BMI and Systolic blood pressure	.417	.000
BMI and Diastolic blood pressure	.332	.000

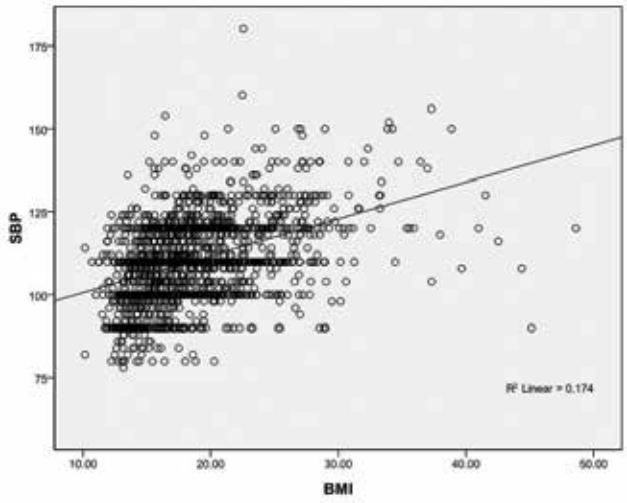

Fig. 1: Correlation between BMI and SBP

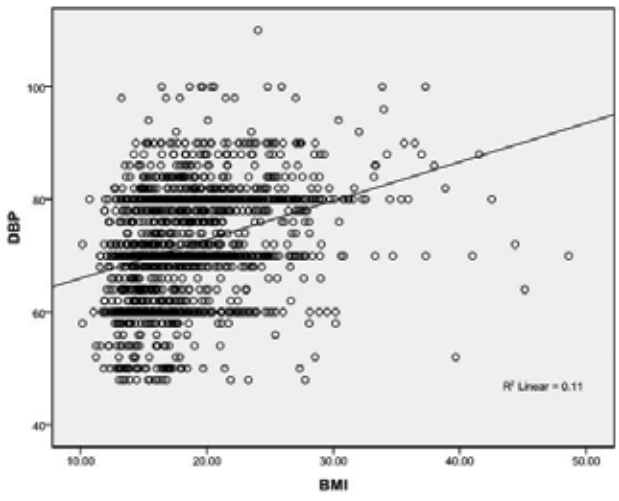

Fig. 2: Correlation between BMI and DBP

Elevated blood pressure was observed significantly higher among overweight/obese adolescents (P=0.000)). As BMI and waist circumference increased, SBP and DBP increased and correlation was significant at 0.01 level (Table III, Fig 1 and 2).

Discussion

In our study, elevated blood pressure was observed among 16.1% of school going adolescents. Among them, elevated SBP was found among 1.6%, elevated DBP among 4.5% and both SBP and DBP in 9.9% adolescents. The present study also revealed that prevalence of elevated BP increased with increase of nutritional status and there is significant difference of elevated BP among different grades of nutritional status. Elevated blood pressure was significantly higher among overweight/ obese adolescents (P=0.000). As BMI increased, SBP and DBP increased and correlation was significant at 0.01 level. In the study by Sundar JS et al in Chennai among 13-17year age group school children, prevalence of adolescent hypertension was 21.5% and one of the major determinants was found to be increased Body mass index.[14] In the study by Xi Lu et al in China BMI is positively correlated with SBP and DBP. Being overweight or obese greatly increased the risk of hypertension in Chinese children and adolescents.[15]

Conclusion

The prevalence of elevated blood pressure was significantly higher among overweight/obese adolescents and BMI was significantly correlated with blood pressure. All overweight/obese adolescents should be screened for hypertension and early intervention measures should be taken for weight reduction and BP control.

The Effectiveness of Constraint-Induced Movement Therapy and Placing Technique of Bobath on Upper Limb Function in Hemiparetic Individual

Manali N. Hanphode[1], G. Varadharajulu[2], Suraj Kanase[3]

[1]MPT, [2]Dean, Professor, [3]Associate Professor, Faculty of Physiotherapy, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to find the the effectiveness of Constraint-Induced Movement Therapy and Placing technique of BOBATH on upper limb function in hemiparetic individual**.**

Method: 44 subjects diagnosed with hemiparesis were included in this study with age group between 40-60 years. Participants with group A (22) were treated with CIMT and placing technique of bobath and group B (22) were treated with CIMT only. Before and after the treatment protocol the subjects were assessed for sensorimotor function by FMS, functional assessment by MAL scale and upper limb-hand co-ordination by BBT. These outcome measures were analysed.

Result: Pre-and post treatment protocol was analysed by using Wilcoxon matched pairs test and paired t test. Data analysis showed significance for FMS ($p=0.0115$) and extremely significance for BBT ($p < 0.0001$) and there is increase in number of subjects with value of 2.5 and 3 in group A than group B for MAL scale.

Conclusion: CIMT combine with Placing technique of Bobath has shown good improvement on upper limb function in hemiparetic individuals.

Keywords: *constraint-induced movement therapy, placing technique of bobath, fugl-meyer scale, motor activity log scale, box and block test, upper limb function.*

Introduction

Stroke or **Brain attack** is the sudden loss of neurological function caused by an interruption of the blood flow to the brain.[1] **Hemiparesis or weakness** is about 80 to 90% of all patients after stroke. It is a major contributor to disability.[2] The force which is necessary for initiating and controlling the movement, the hemiparetic individuals are not able to generate it. The degree of weakness is depending upon the location and the size of the brain injury.[3,4] There are timing abnormalities that contribute to impairment of coordinated motor sequence which prolonged the movement times.[5,6] Also, there is increase co-activation of agonist and antagonists that limits force production during voluntary movement.[7,8]

Constraint-Induced Movement Therapy is designed to promote increased use of the more affected upper extremity. The less affected hand was immobilised in a sling or mitten and emphasizes on intensive and repetitive task-oriented training of the more affected hand involved.[9] This was developed by Taub et al for the purpose of overcoming the learned non-use phenomenon of the affected upper extremity and achieving functional recovery.[10] Neurophysiological basis of CIMT is that, its include overcoming learned non-use and plastic brain re-organization.[11]

Placing technique of Bobath was used to teach the subject to hold his arm against gravity in the three

positions illustrated. He was asked to hold his arm at various points throughout the range of downward motion.[12] This was developed by Berta Bobath. The patient has lost the normal adaptation of muscles against gravity during movements of his limbs.[13]

Recovery of upper limb function is important in quality of life in hemiparetic individuals as stroke can affect the patient's mobility, limits daily living activities, their participation in social activities and also their occupational activities. Paretic side resembles poor muscle strength under influence of synergistic pattern; it greatly affects the performance of functional activities**.** Because of these limitations patient became dependent. These all factors contribute overall low quality of life.[14] Hence, early interventions of the combination effectiveness of CIMT along with placing technique of Bobath on upper limb function in hemiparetic individuals have been explained in detail.

Method

Population: The subjects which willing to participate in the study was taken. Out of 44 subjects, 32 males/12 females participated in this study, written consent form was taken. The criteria for inclusion were: age between 40-60 years, brunnstrom stage 2 and above. Subjects were excluded if they had any other musculoskeletal problems such as shoulder hand syndrome, secondary adhesive capsulitis, Subjects with visual and auditory impairments psychological disorder.

Group A (22) received CIMT and placing technique of bobath and group B (22) received CIMT only. The treatment was given for 2 weeks; 5 sessions per week, ones a day. Post treatment assessment was taken after completion of 2 weeks. The protocol and the consent form were previously approved by protocol and ethical committee. Group A received placing technique was holding arm against gravity at various points throughout range of motion**.** And CIMT was task-oriented training to affected upper limb and restricting use of unaffected limb with help of mitten or glove; pick up the object, move or slide the object, turn on or off the light switch, turn pages of book, pull and push the door etc. Group B received CIMT. Subjects were treated with baseline treatment in addition for the groups; Active assisted exercises and active exercises**,** gripping exercises, strengthening exercises etc**.** each activity 10 repetitions.

Outcome measures:

Fugl-Meyer scale (FMS): The pioneering work of Twitchell and Brunnstrom[15,16] on motor recovery and behaviour following stroke led to the development of the FMA.[17] A three-point ordinal scale is used to measure impairments of volitional movement with grades ranging from 0 (item cannot be performed) to 2 (item can be fully performed). Specific descriptions for performance accompany individual test items. Subtest exists for UE function, LE function, balance, sensation, ROM, and pain. The cumulative test score for all components is 226 with availability of specific subtest score (e.g., UE maximum score is 66, LE score 34; balance score 14).

Motor Activity Log scale (MAL): Daily hand use was measured using the MAL, 28 a semi-structured interview relating to 30 common daily tasks and consisting of two assessment sub-scale for rating the affected upper extremity. The amount sub-scale addresses the amount of use; the how well sub-scale addresses the quality of movement. A six-point rating scale is used in each case (0= no use of affected extremity, 5= normal use).[18]

Box and Blocks test (BBT): Box and block test (BBT) was used to measure promptness in the upper limbs and hand coordination. In general, this test has been used to assess unilateral gross manual dexterity of the upper limbs. BBT verified the ability to reach for and grasp wooden regular hexahedrons (2.54 cm × 2.54 cm × 2.54 cm), and to transport them to the other side of a wooden box (53.7 cm × 8.5 cm × 27.4 cm) with a separation in the middle, releasing regular hexahedrons. The test measured the number of hexahedrons transferred to the other side for 60 seconds.[18,19]

Statistical Analysis

Statistical analysis was done manually as well as using the statistic software INSTAT so as to verify the results obtained. Data was analyzed using Wilcoxon matched pairs test and paired t test for within and between the groups.

Results

1. FUGL-MEYER SCALE:

MOTOR FUNCTION:

Table No. 1: Comparison of pre-pre-and post-post score of Fugl-Meyer scale

Group	Pre-Treatment	Post-Treatment
	Mean ± SD	**Mean ± SD**
A	34.31 ± 7.69	54.13 ± 5.86
B	33.90 ± 6.73	49.45 ± 5.82
'p'	0.4434	0.0115
'r'	0.2595	0.1800

Analysis of pre-and post-interventional data was extremely significant within the group with p value of <0.0001 for group A and group B. Statistics showed that post interventional data in between the group was significant with p value of 0.0115.

B	19.72 ± 6.34	25.18 ± 6.50
'p'	0.0662	< 0.0001
't'	1.983	5.003

Intra group statistical analysis was carried out by paired t test and showed extremely significant difference with p value <0.0001 for group A and for group B. Statistics showed that post interventional data in between the groups was extremely significant with p value of < 0.0001.

Discussion

The present clinical trial was conducted to find out the effectiveness of CIMT and placing technique of Bobath on upper limb function in hemiparetic individuals.

Total 44 subjects who were clinically diagnosed with hemiparesis fulfilling inclusion and exclusion criteria were taken in this study.

Statistical analysis was performed by using Instat-Graph pad. Among them, 24 had right sided hemiparesis (Group A = 10, Group B = 14) and 20 had left sided hemiparesis (Group A = 12, Group B = 8). Out of 44 subjects, 34 subjects had ischemic (Group A = 14, Group B = 20) and 10 subjects had haemorrhagic type of stroke (Group A = 8, Group B = 2).

Wilcoxon matched-pairs test used to analyse the effect of CIMT and placing technique of bobath on upper limb function on FMS within the group which showed that there was significant improvement in upper limb sensorimotor function with ($p < 0.0001$) and in between the groups there was significant improvement with p value of 0.0115 post treatment.

Intra group analysis of MAL (amount and how well) scale showed improvement and Inter group analysis of MAL (amount and how well) scale score, post interventional showed that there is increase in number of subjects with value of 2.5 and 3 in group A than group B.

Some previous study has evaluated the efficacy of modified CIMT in hemiparetic upper limb stroke patients. Rajkumar Yadav et al.[20] performed modified CIMT using FMA and MAL as outcome measures which showed significant improvement with FMA (p value <0.0001) and MAL amount scale (p value 0.0007), how well scale (p value 0.0015) at end of one month after treatment.

Paired t test used to analyse the effect of CIMT and placing technique of bobath on BBT for upper limb and hand coordination within and between the group. This showed there was extremely significant improvement with ($p < 0.0001$). Previous study by Jin A Yoon et al.[21] performed BBT as a one outcome measure which showed improvement with mean and standard deviation (21.88 ± 14.18) and (p value 0.012).

Some studies have evaluated the effects of CIMT combined with other treatments. Hyun Seok et al.[22] performed CIMT combined with visual biofeedback training for subacute stroke patients. Combination group did not show significant improvement than VBT only group. Another study by Yoon et al[21] performed CIMT combined with the mirror therapy for hemiplegic patients after stroke. Combination group showed more improvement than CIMT only group in the fine motor functions of the hemiplegic upper limb. In our study, combination of CIMT and placing technique of Bobath showed significant improvement in combination group as here sample size was larger than previous study.

The above findings were due to, CIMT shows Function-induced recovery (use dependant cortical reorganization) refers to the ability of nervous system to modify itself in response to changes in activity and environment. CIMT supports the concept of redundancy. The generation of new or redundant neuron pathways permits cortical map reorganisation and maintenance of function. This plastic brain re-organization which is effect of CIMT in improvement of hand function.

Placing technique of bobath has effect on the normal adaptation of muscles against gravity during movement of limbs which improves proximal arm control. This is due to; functional activity is not possible unless the patient can hold his arm at shoulder in any position while moving the elbow and hand independently. Placing technique supports the principle of Bobath which is facilitation versus inhibition. The normal postural reactions and normal patterns of movements should be facilitated along with reflex inhibitory movement patterns. Stimulation of proximal key points as a facilitation technique used in Placing.

So, we get independent and controlled movement which improves the overall quality of gross and fine upper limb function in daily living activities with combination of CIMT and placing technique of bobath.

Thus, it is proven that, early physical therapy interventions like placing technique of bobath along with CIMT hasten the prognosis and these are cost effective.

Conclusion

Based on the statistical result and interpretations it was concluded that, the present study provides evidence to support the use of placing technique of bobath with constraint-induced movement therapy which is more effective than constraint-induced movement therapy alone on improving upper limb function in hemiparetic individuals.

Conflict of Interest: There were no conflicts of interest in this study.

Source of Funding: This study was funded by Krishna Institute of Medical Sciences Deemed to Be University, Karad.

Effect of Manual Positioning as an Adjunct to Intercostal Drainage tn Hydropneumothorax

Monali M. Kashyap[1], Javid Hussain Sagar[2], G. Varadharajulu[3]

[1]MPT, [2]Associate Professor, [3]Dean, Faculty of Physiotherapy, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to check the effect of manual positioning in supine lying, side lying, and semi fowler's (45^0)

Method: 30 subjects diagnosed with hydropneumothorax with ICD. were included in this study. These subjects were allocated by convenient sampling method. RR, spo2, CC of all the three levels. (axillary level,2^{nd} intercostal space, xiphistrenum level.) Pretreatment and post treatment assessment was noted down according to the pulse oximeter and with measurement tape. These outcome measures were analyzed.

Result: Pre and post treatment protocol was analyzed by using paired t test. Data analysis showed extremely significance in group C for RR (p=<0.0001) spo2 (p=0.0006) CC axillary level (p=<0.0001) 2^{nd} intercostal space (p=<0.0001) xiphistrenum level (<0.0001).

Conclusion: this study concludes that semi-fowlers position was more improved as compared to the two positions.

Keywords: *chest circumference, inter costal drainage, hydropneumothorax.*

Introduction

Hydropneumothorax is the abnormal presence of air and fluid in the pleural space. The knowledge of hydropneumothorax dates back to the days of ancient Greece when the Hippocratic succession used to be performed for the diagnosis. There have been tremendous advancements in the field of laboratory and radiological diagnosis and therapeutic management for pleural pathologies[1]. However, not many national or international literature are documented regarding hydropneumothorax. patient seen with straight line dullness, shifting dullness, splash, fullness of chest is seen. Causes iatrogenic: introduction of air during pleural fluid aspiration in effusion, presence of gas-forming organism, thoracic trauma.[2] For this purpose an intercostal tube draining is used to collect the fluid, blood, air, to allow the underlying lung to expand. itis a flexible plastic tube that is inserted through the chest wall and into the pleural space from the intrathoracic space. It is also known as a Bülau drain[3]. Pathophysiology if air, fluid, or blood enters the tiny space between the parietal and the visceral pleurae, the negative tendency to recoil will take over and the lung will collapse[4].the patient may experience minimal symptoms or significant shortness of breath.in addition the parietal pleurae are highly innervated with sensory nerves, so any change in the pleural space may be very painful as well. Pleuritic pain is character-sized by a sharp, stabbing pain during inspiration as the pleurae move[1]

Manual Positioning

Manual positioning is prescribed to optimize cardiopulmonary function and oxygen transport is different from routine body positioning[18]. Positioning stimulate normal physiological effect of gravity and

change on oxygen transport are priority that is being upright and moving[19]. The distribution and ventilation in the lungs are primarily influenced by gravity and by manual positioning. Manipulating body positioning however alters both intraregional and interregional determinants ventilation perfusion and their matching. Changing a patient's position may not seem a dramatic technique, but some action often prevents recourse to more time consuming. Positioning is an integral part of all respiratory care. Sometimes knowledge and technology can't save patients complications and the stay in hospital is prolong.so, something simple as giving the patient manual positioning like supine lying, side lying, semi-fowler. Positioning generates significant alterations in arterial oxygenation in patients with unilateral lung diseases[16]. Change in positioning and the consequent change of the gravity effect, among other factors, cause change in respiratory function at different intensities[27]. body position changes to aid in the prevention of skin breakdown, to enhance secretion clearance, and to improve ventilation perfusion[9 10]. Proper positioning is also vital for providing comfort for patients who are bedridden or have decreased mobility related to a medical condition or treatment. Supine is the least helpful position for lung function[7, 8]. For ventilated patients the lateral position increases functional residual capacity and enhances gas exchange compared with supine. Patients who are confined to bed should spend a proportion of time on their side lying well forwards so that their diaphragm is free from abdominal pressure. Compared to supine this position not only increases lung volume, but also improves gas exchange and reduces the work of breathing. Airflow resistance is lower in side lying compared to supine[13]. Optimizing O2 transport is goal of positioning and mobilization[13]. the purpose of this study is to throw light on the effects of various manual body positioning in patients with inter costal drainage in hydropneumothorax. It affects the pulmonary volumes of the lung manual positioning reduces the collapsing of lungs. And improves the gas exchange.

Method

Population: Patients diagnosed with hydropneumothorax with ICD. volunteered participate in the study were taken as patients. Each of the patient was screened as per full filling the inclusion and exclusion criteria. and they were briefed about the study and intervention. Informed consent was taken from the patients. Initial through the assessment of each patients was taken as per the data collection sheet. Out of 30 subjects in group A 10 patients 8M 2F. Group B 10 patients 8M 2F. Group C 10 patients 6M 4F participated in this study, All the subjects were informed about the protocol and gave written consent before their participation. The protocol and the consent form were previously approved by protocol and ethical committee.

Interventions: Subjects who were referred to Krishna Hospital, Karad, and diagnosed as hydropneumothorax as an adjunct with ICD. The nature of study and intervention were explained to the subjects and those who were willing to participate were included. Before proceeding to intervention a written consent was taken from subject. A brief demographic data was recorded. By using random sampling method, the participants were divided into three groups by convenient sampling method.

In group A: Patients in this group were given supine position. But before the intervention base-line values were taken. RR, SpO2, CC measurement was taken. That is axillary level, 2nd inter costal space, and xiphisternum level was noted down. after that supine position was given. treatment was given continuously for 2 weeks,1 session per day. Each position was maintained 2 hours in the morning and 2 hours in afternoon. Post treatment assessment was taken after completion of 2 weeks.in supine lying pre-intervention. RR was 30 breaths per minute, SpO2 was 89%, Axillary level=32.5cm,2ndintercostal space=32cm, xiphisternum level=30cm. post intervention RR was 21 breaths per minute, SpO2 was 90%, Axillary level=32.7,2nd intercostal space=33, xiphisternum level=31.

In group B: Patients in this group were given side lying position. That is the opposite side. But before the intervention base-line values were taken. RR, SpO2, CC measurement was taken. That is axillary level, 2nd inter costal space, and xiphisternum level. Was noted down after that side lying position was given. treatment was continuously given for 2weeks 1 session per day. Each position was maintained 2 hours in the morning and 2 hours in afternoon. Post treatment assessment was taken after completion of 2 weeks.in side lying pre-intervention. respiratory rate was 23 breaths per minute, SpO2 was 84%, Axillary level=34cm,2nd intercostal space=35cm, xiphisternum level=35.5cm, post intervention RR was 22 breaths per minute, SpO2 was 92%, Axillary level=33.8,2nd intercostal space=35.7cm, xiphisternum level=35.2,

In group C: Patients in this group were given semi-fowler's position. But before the intervention base-line values were taken. RR, SpO2, CC measurement was taken. That is axillary level, 2nd inter costal space, and xiphisternum level. Was noted down after that semi-fowler's position was given. treatment was given continuously for 2 weeks 1 session per day. Each position was maintained 2 hours in the morning and 2 hours in afternoon. Post treatment assessment was taken after completion of 2 weeks.in semi-fowler's position pre-intervention. respiratory rate was 28 breaths per minute, SpO2 was 92%, Axillary level=33.5cm,2nd intercostal space=32cm, xiphisternum level=30cm. post intervention RR was 18 breaths per minute, SpO2 was 96%, Axillary level=34cm,2nd intercostal space=32.3cm, xiphisternum level=30.2cm

After 2-week posttest values was taken than by statistical analysis result was calculated.

Measurement Procedure: Respiratory rate is act of breathing, the normal RR is 16-20 breath per min. When patient was given manual positioned in supine lying, side lying, semi-fowler in intensive care unit the RR was noted down pre and post treatment according to the pulse oximetry and was checked by the therapist.

Peripheral oxygen saturation: It is an estimate of the amount of oxygen in the blood. More specifically it is the percentage of oxygenated haemoglobin (haemoglobin containing oxygen) compared to the amount of haemoglobin in the blood (oxygenated and non-oxygenated haemoglobin). when patient was positioned in supine lying, side lying, semi-fowler in intensive care unit the SpO2 was noted down pre and post treatment by pulse oximetry.

Chest circumference: Circumference of chest at the fullest part of the breast region. The measurement of chest was taken when patient was positioned in supine lying, side lying, semi-fowler position pre and post measurement was noted down. Axillary level,2ndintercostal space, xiphisternum level.

Result

Pre and post treatment protocol was analyzed by using paired t test.in group A RR not significant (p=0.2813) spo2 not significant (p=0.0944) CC axillary level significant (p=0.0087) 2nd intercostal space significant (p=0.0414) xiphisternum level significant (p=0.0106) in group B RR not significant (p=>0.9999) spo2 significant (p=0.0016) CC axillary level not significant (p=0.1637) 2nd intercostal space not significant (p=0.7895) xiphisternum level significant (p=0.0212) in group C RR extremely significant (p=<0.0001) spo2 extremely significant (p=0.0008) CC axillary level extremely significant (p=<0.0001) 2nd intercostal space extremely significant (p=<0.0001) xiphisternum level extremely significant (p=<0.0001)

Statistical analysis: The data was entered into Microsoft office excels 2007 and analyzed using instat software. Descriptive statistics were used to analyze for demographic data: Pre and post treatment protocol was analyzed by using paired t test.

As per the inclusion criteria 30 subjects were included in the study. During 2 weeks of protocol program 10 subjects in group A where given supine position .10 subjects group B where given side lying position. 10 subjects in group C where given semi-fowler position. Pre and post analysis were done for 30 subjects. In Table.1 Table.2 Table.3

Table 1: Pre and Post Interpretation of Group A

GROUP A	PRE TREATMENT	POST TREATMENT			INTERPRETATION
	Mean ± SD	Mean ± SD	't' value	'p' value	
RR	24.5 ± 3.171	22.9 ± 1.912	1.199	0.2613	Not significant
SPO2	87.7 ± 3.831	90.1 ± 2.685	1.869	0.0944	Not significant
CC (AXILLAY LEVEL)	34.15 ± 2.925	33.44 ± 2.717	3.339	0.0087	Very significant
CC (2ND INTERCOSTAL SPACE)	34.99 ± 3.044	34.22 ± 2.834	2.377	0.0414	Significant
CC (XIPPISTERNAL LEVEL)	34.85 ± 3.408	34.14 ± 3.157	3.215	0.0106	Significant

We studied three parameters among that axillary level P value was 0.0087 and 2nd intercostal space P value was 0.0414. xiphisternum P value was 0.0106. shows statistically significant except all other variables had no statistical significance

Table 2: Pre and Post Interpretation of Group B

GROUPB	PRE TREATMENT	POST TREATMENT			INTERPRETATION
	Mean ± SD	Mean ± SD	't' value	'p' value	
RR	23.9 ± 2.961	23.9 ± 3.107	0.000	>0.9999	NOT SIGNIFICANT
SPO2	87.3 ± 3.713	92.1 ± 2.079	4.431	0.0016	VERY SIGNIFICANT
CC (AXILLARY LEVEL)	36.35 ± 2.729	35.95 ± 2.689	1.517	0.1637	NOT SIGNIFICANT
CC(2ND INTERCOSTAL SPACE)	36.11 ± 2.786	36.07 ± 2.704	0.2750	0.7895	NOT SIGNIFICANT
CC (XIPPISTERNAL LEVEL)	36.58 ± 3.365	36.14 ± 3.440	2.787	0.0212	SIGNIFICANT

We studied three parameters among that xiphisternum P value was 0. 0212.shows statistically significant except all other variables had no statistical significance.

Table 3: Pre and Post Interpretation of Group B

GROUP	PRE TREATMENT	POST TREATMENT			INTERPRETATION
	Mean ± SD	Mean ± SD	't' value	'p'value	
RR	26.4 ± 2.547	19.4 ± 2.366	7.000	<0.0001	EXTREMLY SIGNIFICANT
SPO2	89.5 ± 3.440	95.7 ± 2.669	5.207	0.OOO6	EXTREMLY SIGNIFICANT
CC (AXILLARY LEVEL)	34.16 ± 2.348	33.3 ± 2.263	8.777	<0.0001	EXTREMLY SIGNIFICANT
CC(2ND INTERCOSTAL SPACE)	35.06 ± 2.875	31.55 ± 2.518	11.296	<0.0001	EXTREMLY SIGNIFICANT
CC (XIPPISTERNAL LEVEL)	34.86 ± 3.625	32.34 ± 3.220	6.978	<0.0001	EXTREMELY SIGNIFICANT

We studied three parameters among that respiratory P value was <0.0001. SPO2 P value was 0.0006 and. axillary level P value was <0.0001. 2nd intercostal space P value was <0.0001 and xiphisternum p value was <0.0001 which shows statistically significant.

Discussion

Hydropneumothorax has been common entity in this country. However, only isolated case reports have been documented on hydropneumothorax and there has been a dearth of large case studies[26].ICD was inserted in all the patients and drainage was required for longer than 30 days. This is usually the case seen in practice where the tube remains for longer time draining some amount of fluid due to underlying TB and most of these patients had bronchopleural fistula by prolonged air leak in ICD.but there are not such cases documented on effects of manual position in patients with hydropneumothorax with ICD. the principal goal of positioning is to optimize proper oxygen transport, to maintain RR, and CC. Our previous study examined the effect of positioning on oxygenation in patients with unilateral pleural effusions[23].in this study when patients are given positioning with ICD that is three positions are given. Ventilation and perfusion matching

and gas exchange can be theoretically augmented in the supine position by an increase in cardiac output. The SpO2 remains president even if the patient is in supine position and is supported by various studies. In all the three-position comparing the lung function in the semi-fowlers and supine positions suggests that the semi-fowlers position could be a therapeutic adjunct for improving gas exchange. Compared with the conventional supine positioning. Side lying positioning is frequently instituted for both medical and surgical patients.in patients after surgery arterial oxygen tensions were greater in the lateral position.in this position RR and SpO2 is not significant the axillary level and 2nd intercostal space is not significant, xiphisternum is significant and comparing side lying position the distribution of the blood flow and ventilation is similar to that of semi-fowlers position, there is two important concepts in this situation. Because the perfusion is gravity dependent the vertical hydrostatic gradient is smaller in the lateral that in semi-fowlers position[19].in regard to ventilation the dependent diaphragm is pushed higher into chest by abdominal contents compared with the nondependent lung diaphragm thus side lying can be used to enhance the efficiency of gas exchange and thereby to minimize or avoid the use of supplemental oxygen, in semi-fowlers position the FRC and tidal volume increase due to lowering of diaphragm and alveolar expansion due to lungs own weight. The semi-fowlers position maximizes lung volumes and capacities the FRC in side lying falls between that is supine position[24]. Semi-fowlers position is found to be better in improving TV and oxygenation in this the RR SpO2 and CC are significant and that's why semi fowlers position is proved to be more effective.

Conclusion

Thus, the above study it concludes that semi-fowlers position was more improved as compared to the two positions that is side lying, and supine lying position. in semi- fowlers position the FRC and tidal volume is increased and oxygen transport is better seen.so semi-fowlers position is significantly improved clinically and statistically in patients with hydropneumothorax as an adjunct with ICD.

So, this study supports the alternate hypothesis

Conflict of Interest: There were no conflicts of interest in this study.

Effect of Motor Control Training on Isolated Lumbar Stabilizer and Core Muscle Training in Chronic Low Back Pain Patients

Namrata P. Mane[1], G. Varadharajulu[2], Sandeep Shinde[3]

[1]Physiotherapist, [2]Dean, Faculty of Physiotherapy, [3]Assistant Professor, Krishna College of Physiotherapy, KIMS 'Deemed to be' university, Karad, Maharashtra, India.

ABSTRACT

Background: The segmental stability of vertebrae of lumbar spine is maintained by contraction of the transverse abdominis, multifidus. Impaired functioning of the deep stabilizers may lead to poor segmental stabilization which inclines to injury. In order to provide spinal stability it has been projected as a key component in controlling of chronic low back pain exercise programs aimed at augmenting strength, retraining these muscles.

Objectives: Present study was undertaken to compare the effect of motor control training on isolated lumbar stabilizer and core muscle training in chronic low back pain patients.

Method: A experimental study was conducted in and around hospitals of karad, following a simple random sampling technique on a sample size of 66. The participants were divided into 2 groups. Group A was given HMP, TENS, Motor Control Training and Group B was given HMP, TENS, Core Muscle Training.All outcome measure were assessed before starting and at the end of treatment. The data were analyzed using Instat Software.

Result: On comparing post treatment scores, there was no statistically significant difference in p values for NPRS and MODQ but was statistically significant difference in p values for Electromyography of transverse abdominis, multifidus.

Conclusion: The study concluded that Motor Control Training was found more effective than Core Muscle Training for patients with chronic low back pain.

Keywords: *Chronic low back pain, Motor Control Training, Core Muscle Training, Electromyography, Transverse Abdominis, Multifidus.*

Introduction

Low back pain is usually defined as pain, muscle tension, or stiffness localized below the costal margin and above the inferior gluteal fold, with or without leg pain[1]. Low back pain is one of the major health problem, mostly accompanied with expensive care, disability and absenteeism[2]. Nearly 10-20% patients suffering from low back pain develop chronic low back pain (LBP more than 3 months)[3]. About 70% world's population will have low back pain at least once in their life.

The segmental stability of lumbar vertebrae is maintained by contraction of transverse abdominis, multifidus[4]. Studies on individuals with LBP shown lack

control of deep trunk muscles[5]. All abdominal muscles control the stability of spine, but some researchers focused on function of deep muscles[6].

Generation of force against lumbar lordosis is because of pressure created by visceral cavity anterior to spine, results in increase the structural spine stability for a various posture, movements[7]. When lumbar spine positioned neutral, abdominal bracing maneuver produces contraction of antagonist muscle which increases spine stability[8].

Osteoarthritis (OA) a common disease of aged population and one of the leading causes of disability. Incidence of knee OA is rising by increasing average age of general population. Age, weight, trauma to joint due to repetiting movements in particular squatting and kneeling are common risk factors of knee OA. Several factors including cytokines, leptin, and mechanical forces are pathogenic factors of knee OA. In patients with knee pain attribution of pain to knee OA should be considered with caution. Since a proportion of knee OA are asymptomatic and in a number of patients identification of knee OA is not possible due to low sensitivity of radiographic examination. In this review data presented in regard to prevalence, pathogenesis, risk factors.

Keywords: Knee, Osteoarthritis, Pathogenesis, Prevalence

Increased superficial back muscle activity may result in limitation of tensile forces, motion of painful structures in back[9]. Multifidus repossession from inhibition related with LBP does not resolve pain, disability[10]. The cross-sectional area of multifidus is decreased in people with acute unilateral LBP from Ultrasound measurement[11]. Impaired functioning of the deep stabilizers may lead to poor segmental stabilization[12].

A major trend in rehabilitation is core strengthening. To maintain functional stability, the muscular control required around lumbar spine. It is a form of rehabilitation used as preventive regimen, performance -enhancing program for lumbar spine injuries. In training for prevention of injury as well as for treatment for various musculoskeletal conditions principle of core stability has been recognized widely[12].

The exercises were developed by Richardson and colleagues which play a major role in stabilizing the deeper muscles. Motor control exercises help to re -instruct the optimal control of the spine[13]. Based on the principle that individual with LBP have a lack of control of the trunk muscles the motor control exercise has been developed. The motor learning approach is used to retrain the optimum control and coordination of spine[5].

Increased activity of superficial trunk muscles in patients with recurrent LBP delays activation of deep muscles[14]. In individuals with chronic low back pain and a delay of the anticipatory postural adjustments of some trunk muscles in line,studies reported an over -activation of superficial para -vertebral muscles[15].

There were very less studies accessible in relation with the short term effect of motor control exercises and core muscle training on subjects with chronic low back pain. This study resulted in better planning and treatment of chronic low back pain. So there was need to study effect of motor control training on isolated lumbar stabilizer and core muscle training in chronic low back pain patients.

Materials and Method

A experimental study was conducted in and around hospitals of karad, following a simple random sampling technique on a sample size of 66. The participants were divided into 2 groups. The study protocol was started after being approved by institutional ethical committee of Krishna Institute of Medical Sciences Deemed To Be University, Karad. Subjects were selected according to inclusion criteria. Written informed consent was taken and the whole study was explained to them. Each subject was assessed for muscle activity, intensity of pain and activity limitation by using Electromyography, Numeric Pain Rating Scale and Modified Oswestry disability Questionnaire. The equipments used were (1)Electromyography machine, (2)Transcutaneous electrical nerve stimulation, (3)Hot moist pack. Inclusion criteria was as follows: (1)Subjects with chronic low back pain (low back pain more than 3 months). (2) Subjects with their pain intensity less than or equal to 5 on NPRS. (3)Age group: 30-60 years. Exclusion criteria

was as follows: (1)Subjects with red flag which suggests serious spinal pathology. (2)Subjects with neurological deficits. (3)Pregnancy. (4)Any past history of fracture in proximal femur or pelvis. (5)Previous medical history of vertebral fracture,congenital spine disorders. (6)Any recent surgery for LBP. (7)Subjects who are unable to go to prone position.

Group A: Motor control training[5], HMP and TENS.

First week: 8 reps: (1)Activation of transversus abdominis. (2)Activation of multifidus

Second week: 15 reps, 5-10 sec hold: (1)Strengthening of transversus abdominis. (2)Strengthening of Multifidus.

Group B: Core muscle training[8,12,22,23], HMP and TENS.

First week: 8 reps: (1)Abdominal hollowing. (2) Abdominal hollowing with leg lifts. (3)Pelvic tilt. (4) Pelvic bridging.

Second week: 15 reps, 5-10 sec hold: (1) Fall out. (2) Modified crunch. (3)Cat stretch. (4)Back extension.

All outcome measure were assessed before starting and at the end of treatment.

Result

NPRS- Intra Group comparison using Paired t- test.

Table 1: Comparison of pre and post NPRS score

Groups	Pre-intervention Mean ± SD	Post-intervention Mean ± SD	P Value
A	4.09 ± 1.04	0.90 ± 0.76	<0.0001
B	4.00 ± 0.93	0.90 ± 0.84	<0.0001

In Group A, the mean NPRS score on pre and post intervention was 4.09 ± 1.04 and 0.90 ± 0.76. P value *<0.0001.*

In Group B, the mean NPRS score on pre and post intervention was 4.00 ± 0.93 and 0.90 ± 0.84. P value *<0.0001.*

NPRS- Inter group comparison using unpaired t- test

Table 2: Comparison of pre- pre and post- post NPRS score

Groups	Pre-intervention Mean ± SD	Post-intervention Mean ± SD
A	4.09 ± 1.04	0.90 ± 0.76
B	4.00 ± 0.93	0.90 ± 0.84
P Value	0.71	0.99

The table shows comparison of mean and standard deviation of NPRS scores in Group A and B. Pre and post intervention shows that there is no significant difference in the NPRS scores.

MODQ- Intra Group comparison using Paired t-test.

Table 3: Comparison of pre and post MODQ score

Groups	Pre-intervention Mean ± SD	Post-intervention Mean ± SD	P Value
A	30.48 ± 10.92	2.78 ± 2.95	<0.0001
B	24.72 ± 11.64	3.39 ± 3.58	<0.0001

In Group A, the mean MODQ score on pre and post intervention was 30.48 ± 10.92 and 2.78 ± 2.95. P value *<0.0001.*

In Group B, the mean MODQ score on pre and post intervention was 24.72 ± 11.64 and 3.39 ± 3.58. P value *<0.0001.*

MODQ- Inter group comparison using unpaired t- test

Table 4: Comparison of pre- pre and post- post MODQ score

Groups	Pre- intervention Mean ± SD	Post- intervention Mean ± SD
A	30.48 ± 10.92	2.78 ± 2.95
B	24.72 ± 11.64	3.39 ± 3.58
P Value	0.04	0.45

The table shows comparison of mean and standard deviation of MODQ scores in Group A and B. Pre and post intervention shows that there is no significant difference in the MODQ scores.

Electromyography- Intra Group comparison using Paired t- test

Table 5: Comparison of pre and post Electromyography score

Electromyography	Groups	Pre- intervention Mean ± SD	Post- intervention Mean ± SD	P Value
Right Transverse Abdominis	A	231.55 ± 107.29	512.06 ± 136.29	<0.0001
	B	244.27 ± 115.17	430.88 ±165.67	<0.0001
Left Transverse Abdominis	A	238.91 ± 123.18	545.30 ± 133.28	<0.0001
	B	255.94 ± 117.69	425.06 ±165.61	<0.0001
Right Multifidus	A	248.21 ± 94.06	539.18 ± 131.16	<0.0001
	B	274.09 ± 121.15	413.27 ±153.10	<0.0001
Left Multifidus	A	306.52 ± 172.95	548.42 ± 161.99	<0.0001
	B	307.06 ± 138.31	445.21 ±149.01	<0.0001

With Electromyography (Right Transverse Abdominis) score, P value *<0.0001* shows that there was significant difference in pre- post intervention scores, in both Group A and B.

With Electromyography (Left Transverse Abdominis) score, P value *<0.0001* shows that there was significant difference in pre- post intervention scores, in both Group A and B.

With Electromyography (Right Multifidus) score, P value *<0.0001* shows that there was significant difference in pre- post intervention scores, in both Group A and B.

With Electromyography (Left Multifidus) score, P value *<0.0001* shows that there was significant difference in pre- post intervention scores, in both Group A and B.

Electromyography- Inter group comparison using unpaired t- test

Table 6: Comparison of pre- pre and post- post Electromyography score

Electromyography	Groups	Pre- intervention Mean ± SD	Post- intervention Mean ± SD
Right Transverse Abdominis	A	231.55 ± 107.29	512.06 ± 136.29
	B	244.27 ± 115.17	430.88 ±165.67
	P Value	0.64	0.03
Left Transverse Abdominis	A	238.91 ± 123.18	545.30 ± 133.28
	B	255.94 ± 117.69	425.06 ±165.61
	P Value	0.56	0.00
Right Multifidus	A	248.21 ± 94.06	539.18 ± 131.16
	B	274.09 ± 121.15	413.27 ±153.10
	P Value	0.33	0.00
Left Multifidus	A	306.52 ± 172.95	548.42 ± 161.99
	B	307.06 ± 138.31	445.21 ±149.01
	P Value	0.98	0.00

With (Right Transverse Abdominis) score, p value less than 0.05 shows that there was significant difference in the post intervention scores of Group A and B.

With (Left Transverse Abdominis) score, p value less than 0.05 shows that there was significant difference in the post intervention scores of Group A and B.

With (Right Multifidus) score, p value less than 0.05 shows that there was significant difference in the post intervention scores of Group A and B.

With (Left Multifidus) score, p value less than 0.05 shows that there was significant difference in the post intervention scores of Group A and B.

Discussion

The aim of this study was to determine effect of motor control training on isolated lumbar stabilizer and core muscle training in chronic low back pain patients. This study was experimental study with Group A subjects were guided to perform motor control exercises and Group B performed core stabilization exercises.

We found that there is reduction in pain, disability and also good improvement in muscle activity. The pain reduction in Group A was not statistically significant when compared to Group B with p value 0.99. The reduction in the disability in Group A was not statistically significant when it was compared with Group B score with p value 0.45. But when activity of muscle is compared in both the groups then there was significant improvement in Group A than Group B with $p<0.05$.

The enhancement in pain, disability may be because of renovation in strength, endurance level in both the groups or because of combination of learning and training[5]. The pain is due to increased activity of superficial trunk muscles and motor control training improves the activity of deep trunk muscles which ultimately reduces this over- activation. Thus we can assume that there is decrease in cortico- spinal drive to motor neurons of superficial MF and helps in to normalize anticipatory postural adjustments[15]. There is change in the trunk muscle behavior during functional task reduces load and enhances quality of movement. Plastic changes at the brain is because of exercising the individual muscle (isolation)[5].

The present study has determined that the rehabilitation of specific muscles with Motor Control exercises on pain and disability has proven to have a superior outcome rather than the Core Stabilization exercise program to diminish back pain and disability in chronic low back pain subjects. Most of all the observations are made in brief period.

Conclusion

Present study concludes that motor control training was found more effective than core muscle training exercise program for patients with chronic low back pain.

Conflicts of Interest: This study can be carried out with motor control exercise in functional activities, periodic assessment of outcome measures, Needle Electromyography and large sample size can also be taken into consideration.

Ethical Clearance: Ethical clearance was taken from institutional committee of Krishna institute of medical science, deemed University, Karad.

Source of Funding: Source of funding is Krishna institute of medical sciences deemed University, Karad.

Enterprise Gamification: A Motivational Drive at Workplace

P. S. Buvaneswari[1], M S Swetha[2]

[1]Assistant Professor of Commerce, [2]Research Scholar, Dept of Commerce, University of Madras, Chennai

ABSTRACT

Gamification, a strategy derived from game design for a non-game environment for specific cause, is the application of elements of game playing to encourage engagement with a product or service. This strategy widely taps the employees' curiosity quotient and it helps in solving huge crises in simple manner. Gamification is thus transforming business models by creating new ways to broaden relationships, making longer-term engagement, and driving customer and employee loyalty. Globally, the concept of gamification is widely adopted in various fields such as marketing, education, medical, human resources and real estate business. Almost every enterprise had tried this concept either for employee management or client management. However in India it is still in its nascent stage and there is a lot of scope to understand the application of gamification in the Indian context. This study would help in understanding the role of gamification as a motivator in the work place with special reference to millennial employees in Chennai which is one of the "IT Hubs" in India. The present study attempted to investigate the perception of the employees on Enterprise Gamification and its impact on employee motivation. The findings of the study reveal that gamification is a vital tool in keeping the millennial employees motivated.

Keywords: *Perception, Enterprise Gamification, Millennials, Motivation*

Introduction

Gamification is the application of typical elements of game playing (e.g. point scoring, competition with others, and rules of play) to other areas of activity, typically as an online marketing technique to encourage engagement with a product or service. Gamification is a strategy derived from game design for a non-game environment for specific cause. It invokes new solution to many problems in business. Its techniques are intended to influence people's natural desires for socializing, learning, mastery, competition, achievement, status and self-expressions as game or play. Gamification is thus transforming business models by creating new ways to broaden relationships, making longer-term engagement, and driving customer and employee loyalty. Gamification can potentially resolve the basic issues encircling employees and employers. The first key issues resolved through gamification are communication among employees. For instance, the communication goals can be specified for each employee and they can be rated in meeting these goals (during customer interactions or communications within teams) per week and those communicating well or scoring high can be rewarded. Secondly**,** Gamification can find a prominent role in measuring productivity and performance. A performance reviewing tool (framed under Gamification) can keep track of the specific employees' performance over a long period of time. It also helps in training and boosting work culture.

Review of Literature

Enterprise Gamification is not just a mechanism that makes workplace more enjoyable. It drives tangible, hard business benefits and is a powerful tool in engaging employees to achieve successful digital transformation[1]. Organizations are now more compelled to ride gamification to bring about a radical change in employee, vendor, and customer experience. Similar to several evidences they had also stated that in the decade to come, several emerging technologies, including gesture

control, head-mounted displays and augmented reality will mature[2].In addition organizations have introduced legal and ethical considerations, and have also provided pointers to other resources to continue the journey in designing gamification that works[3]. It is cautioned that the user engagement in enterprise gamified system is a complex which contains many aspects[4]. Gamification at work has been described as the engagement through innovative interactions, besides the production of competitive knowledge[5].A well designed gamification has had a powerful impact on improving the intrinsic motivation of the employees within the organizations. Gartner Inc had discussed about the "sweet spot" where many companies fail to understand it while designing a gamified application. The sweet spot refers to a situation where in the business objective and player objective if overlaps and the player will automatically get motivated in reaching the goal[6].Deloitte Leadership academy had a gamified application, an online program for training its own employees as well as its clients. It also emphasized that those executives who are interested in implementing this popular new tool should think of gamification as a business improvement initiative and start asking business-related questions such as details about business goals, target audience and the method of tracking the success[7]. Gamification advocates increased engagement as one of the primary benefits of the approach. Students play online games for hours and gamification aim to tap into that same deep and persistent motivation[8]. Gamification is considered as design principle that helps in changing the employees and customer's behavior, which increases the employee engagement[9]. The gamification can be designed based on its six user types such as Philanthropists, Socializers, Achievers, Freespirits, Players and Disruptors. These types of users get motivated for different reasons and this framework of six user is called as Hexad framework[10].While framing gamification strategies for GenY employees it is essential that there must be personalization and should be relevant to their work in addition to creating a meaningful expirence[11]. A successful gamification tool will lead to the stronger relationship between employer and employee to a new level. It is based on feedback, recognition, status and self-fulfillment which go beyond frames of wages and labor contract in a workplace[12].A caution note for strategy makers is that a wrong gamification might create a set of false incentives and can ruin motivation. Therefore implementation of the strategy requires prior research, which is a cost consuming process[13].It is essential to follow a five step process. The Management should gain a positive employee perception, it is essential to assess employees psychological needs, clarity in communicating about gamification to employees before implementation is very important, implementing gamification in relation to the psychological needs assessment, assessing and adjusting gamification if appropriate[14].Gamification implementation thus helps in understanding the behavior of the employees and the dynamics of stress management for the same[15].

Background of the study

Globally, gamification concept is widely spread in various fields such as marketing, education, medical, human resources and real estate business. Almost every enterprise had tried this concept either for employee management or client management. However in India it is still in its nascent stage and there is a lot of scope to understand the application of gamification in the Indian context. *Secondly,* millennial employees have penetrated in the working environments who are generally technology and game lovers. Consequently, HR brains have adopted gamification as a magical wand to solve problems even though it is an expensive strategy. The transformation in workplace through new trends and strategy is inevitable with a contradicting and a challenging phase inbuilt in the system especially in countries like India. In India, the workforce mostly comprises of millennials and within 2020 it will comprise of three different generation cohorts, Hence, an understanding of the gamification and its preference is very essential especially in Chennai which is one of the "IT Hubs" in India . The present study attempts to investigate the perception of the employees on Enterprise Gamification and its impact on employee motivation.

Objectives of the Study

- To identify the perception of millennial employees on Enterprise gamification.
- To investigate on the influence of certain demographic factors in the perception of the employees on Enterprise gamification.
- To explore the impact of Enterprise gamification on the employee motivation.

Materials and Method

Methodology of a research is a structural framework for any research paper which is a combination of

material collected and methods used in a particular research paper. Descriptive research was designed for the study and opportunity sampling was used to select the respondents. The data was collected through a structured questionnaire from 156 millennial employees from various organizations such as Amazon, Accenture, Cognizant, Delloitte, Ernst Young, Oracle, ICICI, RBS, Zoho, HCL, Vodafone, Infosys, Wipro, TCS, and Goldman Sachs. The data collected was coded in SPSS 20.0 version, and then tested for Cronbach's Alpha Reliability (0.8503) which ensured data reliability. KMO test for sampling adequacy (81%) showed that the sample size was adequate. Statistical tools such as descriptive Statistics, Chi-square and Regression were used to analyse the data collected.

Results & Discussion

Demographic Profile of the Respondents: Table 1 reveals that out of 156 respondents, 49% of the respondents were male and 51% female; 58% of the respondents were team members and a minimum of 11% were managers, 82 %were graduates, and 4.5% are professionals; 76.3% of the respondents were with less than 5 years of work experienceand5.8% with more than 10 years of experience.

Table1: Demographic profile

Category	Option	Respondents	Percentage (%)
Gender	Male	77	49
	Female	79	51
Designation	Team Member	90	58
	Team Leader	18	11
	Manager	18	11
	Executive	30	20
Highest Educational Qualification	Diploma	9	5.8
	Bachelor's Degree	128	82
	Master's Degree	12	7.7
	Professionals	7	4.5
Experience (in years)	0-5	119	76.3
	6 -10	28	17.9
	Above 10	9	5.8

Source: Primary Data

Perception of the Employees on Gamification: The data on the perception of the employees on gamification were collected and analysed using descriptive statistics and is presented Table 2.The study revealed that most of the respondents perceive that social media should play an active role in enhancing the usage of Enterprise gamification (mean 4.11).The employees opined that the gamification strategy should have built in challenges and competition in its process (4.04).

Table 2: Employees perception on Gamification

Particulars	Mean	Ranking
I enjoy seeing my name in the scoreboard	3.87	6
Gamification process should have different levels to explore the talents	3.95	5
Rewards in gamification are considered significant for performance	3.86	7
I Prefer for collecting virtual/ online badges	4.00	3
Points should be awarded for different activities in gamification	3.94	4
Preference for built in challenges & competition in the gamification process	4.04	2
Community links with social media should play an active role	4.11	1

Source: Value Computed from primary data

The employees prefer badges (4.00), Points (3.94), and names in the scoreboard (3.87) as rewards fortheir work in the gamification process. They also perceived that gamification process should have different levels to explore their talents (3.95). It can be inferred that the respondents agreed that communities linked with social media should play an active role in the gamification process.

Demographic Factors and Perception on Enterprise Gamification as a Motivational Drive: The association between certain demographic variables and the perception of the respondents on Enterprise Gamification were tested using chi-square analysis.

H_0: There is no association between demographic factors and perception on gamification as a motivational drive

H_1: There is association between demographic factors and perception on gamification as a motivational drive

Table 3: Pearson Chi Square

Demographic variables	Chi square value Gamification–Motivational Drive
Gender	0.002*
Experience	0.000*
Occupation	0.003*
Education	0.304

*significance at 5 % level

The analysis (Table 3) showed a significant association between Gender, Experience and Occupation on the perception that gamification is a motivational drive. There is no association between Education and the perception on enterprise gamification as motivational drive. The employees with different work experience had same kind of perception towards enterprise gamification. Occupation of the employees had association with the perception on enterprise gamification especially when enterprise gamification challenges people's skills. Ultimately there is no association between education and the perception on enterprise gamification. Those employees from different educational qualification have had different opinion on the enterprise gamification. On the whole the association between perceptions on gamification with demographic factors was stronger with gender, experience, and occupation whereas it was weaker with educational factor.

Impact of Gamification in motivating the Millennial employees

Dependent variable: Motivation, Independent variable: Gamification

Multiple R value: 0.758, **R square value:** 0.572, **F value:** 208.555, **P value:** 000.00

Table 4, provides the *R* and R^2 values. The *R* value represents the simple correlation and is 0.758 (the "**R**" Column), which indicates a high degree of correlation. The R^2 value (the "**R Square**" column) indicates how much of the total variation in the dependent variable, Intrinsic Motivation can be explained by the independent variable Gamification which is very large in this case.

Table 4: Model Summary(b)

Model	R	R^2	Adjusted R^2	Std. Error of the Estimate	Change Statistics			
					R^2 Change	df1	df2	Sig. F
1	.758(a)	.575	.572	2.65781	.575	1	154	.000

(a) Predictors: (constant), Gamification

(b) Dependent Variable:Motivation

The multiple correlation coefficient is 0.758 and it measures the degree of relationship between the actual values and the predicted values. This coefficient value of 0.758 indicates that the relationship between (Predictors Constant) Gamificationand Motivation is strong and positive.

Table 5: ANOVA(b)

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	1473.225	1	1473.225	208.555	.000(a)
	Residual	1087.852	154	7.064		
	Total	2561.077	155			

a. Predictors: (Constant), Gamification

b. Dependent Variable: Intrinsic Motivation

From the Table 5, it can be seen that the p value .000 , which is less than 0.05, indicating that, the regression model significantly predicts the outcome variable (i.e., it is a good fit for the data).

Table 6: Coefficients(a)

Model B		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	95% Confidence Interval for B		Collinearity Statistics	
		Std. Error	Beta			Lower Bound	Upper Bound	Tolerance	VIF	
1	(Constant)	3.445	1.035		3.328	.001	1.400	5.490		
	Gamification	.459	.032	.758	14.441	.000	.396	.522	1.000	1.000

a. Dependent Variable: Motivation

The coefficient of determination R-square measures the goodness of fit of the estimated Sample Regression Plane (SRP) in terms of the proportion of the variation in the dependent variables explained by the fitted sample regression equation. Thus, the value of R square is 0.572 which simply means that about 57.2% of the variation in Gamification as Motivator is explained by the estimated SRP that uses the gamification as a motivation independent variable and R square value is significant at the 5% level.

The multiple regression equation is

MOTIVATION = 3.445+ 0.459(Gamification)

The beta coefficient tells how strongly the independent variable is associated with the dependent variable. It is equal to the correlation coefficient between the 2 variables. Thus this regression model shows that there exists a strong impact of gamification in motivating the employees.

Conclusion

Gamification is a strategy that taps employee's potential and acts as the best motivator. Even a passive employee can be transformed into energetic and enthusiastic employee by implementing the gamification strategy. Organizations must come forward to implement gamification for the recognition of employees especially as hard workers and smart workers. Gamification can be related towards personal development and help in self-realization and it can be made a compulsory strategy to bring an interest in the initial stage of implementation. Thus it is important to note that incorporating gamification in the work place shall have strong positive impact in the performance of the employees in the long run.The key objective of this study was to identify whether gamification is motivational factor amongst employees. It was found that gamification is an amazing tool that acts as a motivator and helps in tapping the employees' curiosity quotient. Future researches can correlate a study between gamifications as a stressor or a motivator and also on its application in other areas of management.

Design and Implementation of Performance Improved Medical Signal Filters with and without Multiplier

P.Saravanan[1], B. Latha[2], K. Bhoopathy Bagan[3]

[1]Associate Professor, Department of Electronics and Communication Engineering, [2]Prof & Head, The Department of Computer Science & Engineering, Sri Sai Ram Engineering college, [3]Professor, The Department of Electronics, Madras Institute of Technology, Chennai, India

ABSTRACT

The digital filter can be done professionally with the compact area and reduced power with simplified multiplication arithmetic. More than Decades of years Computer aided analysis of ECG signal is getting with incredible quantity of work being carried out in the earth. This paper is a small work on our part in that track. ECG Electrocardiogram signal is most comely known familiar and used medical signal, the ECG signal is very responsive in nature, and still if small noise combined with actual signal the different properties of the signal changes, Data ruined with noise must either filtered or eliminated, filtering is important issue for design thought of real time health care process. This work presents a better FIR filter which can be designed in VLSI technique, with or without multiplier and has less power and area improvement.

Keywords: *FIR filter design; ARM processor; Multiplier; ECG;*

Introduction

In signal processing, the filter functions to remove the noise from the signal like random noise and also to extract the necessary parts of the signal like components within a precise range of frequency (Quan et al., 2009)[1]The design of the filters for specific application includes the coefficient calculation according to various criteria including sampling frequency, pass band and stop band frequency, filter order etc.

In future, the mobile phones and portable computing systems are anticipated to offer increased services, faster data rates and higher processing speeds at reduced power dissipation levels. This delivers us with an inspiration to explore new methods in low-complexity design of high-performance digital signal processing blocks which operate at lower power levels. Semiconductor technology today provides unprecedented level of device integration where several orders of millions of transistors can be packaged in a single chip using the state-of-the-art. The number is expected to grow steadily for many years.

Human bodies are continuously provides messages about fitness. This messages may be observed through body-structure-related devices that evaluate heart speed, blood stress, oxygen infiltration levels, blood glucose, nerve transmission, brain movement and so forth. Usually in the past, such observations are taken at clearly stated points in time and indicated in patient's chart. Doctors in fact observe a smaller amount than one percent of these values as they make their round and treatment are prepared based upon this chart readings

Bio-medical signal processing includes the study of these observations to offer helpful message upon which doctors can make conclusions. Engineers are finding new techniques to prepare these signals by means of a range of mathematical formulae and sets of computer commands. Functioning with conventional bio-measurement tools, the signals can be figured out by software-commands and provides the doctors , idea about what happening or viewable at present. By using more fancy (or smart) means to carefully study what bodies are saying, we can possibly decide the state of a patient's health through equipments which will not require cutting into the body.

Background

An extensive literature review was carried out on existing digital filters model and the method that are used for enhancing the performance of the digital filters.

Kucic et al.,(2001)[2]suggested a floating-gate technology based on adaptive filter which can be programmed. The author has carried out a basic review on floating-gate techniques and how this technique is programmed into adaptive filter circuits. The author has proposed a program filter method that can extend the capacity of the function and circuits. Furthermore, the author has demonstrated to expand our programmable channels as versatile channels both through weight bother strategies and constantly adjusting relationship rule techniques.

Yamada & Nishihara, (2001)adders and subtracters. The critical path is minimized by insertion of pipeline registers and is equal to the propagation delay of an adder. The number of pipeline registers is limited by using an equivalent transformation on a signal flow graph. The price paid for the 100% speedup is 5% increase in the area. The maximum sampling frequency is 78.6MHz.

Shahramian et al., (2012)[8] proposed Decision feedback equalizer (DFE) architectures with changing quantities of discrete-time taps and continuous time IIR filters are thought about for use in run of the mill wireline filters. For every situation, the DFE coefficients are enhanced to minimize a cost capacity that similarly weights both jitter and vertical eye opening. Notwithstanding when a few reflections are available persistent time IIR taps can be successful if their channel coefficients are appropriately enhanced. Utilizing a DFE engineering with just two IIR channels gives satisfactory outcomes to both a 26-dB misfortune persuade link and a 16 FR-4 back-plane channel at 10 Gb/s while keeping the DFE intricacy low. Moreover, the usage and exploratory aftereffects of a DFE with different (three) IIR channels is accounted for. Generated in a 0.13 μm CMOS handle, the DFE uses17.3 mW from a 1.2 V supply. A BER of 10−12 was accomplished at an information rate of 3.7 Gb/s.

Kamat et al.,(2010)[5] suggested dynamic resistor–capacitor (RC) channels utilizedoperation amps and its alteration by Moschytz are notable to dynamic RC filter designs. This utilization first-arrange all-pass organizes in a negative feedback loop. New present mode all inclusive operational trans conductance amplifier-capacitor (OTA-C) biquad channels in view of the TG dynamic RC channel was considered for this study. Furthermore, the author suggested that these depend on the proposed OTA-C based first-arrange all-passnetwork. Three diverse input plans were explored in the proposed digital filter structure to lessen the Q pole sensitivity. The proposed biquad channels are appeared to execute every single diverse sort of channels like low-pass, high-pass, band-pass, symmetric indent, all-pass, low-pass score and high-pass indent. The amalgamation of the general biquad is completed withnovelty by summoning the relationship with direct-frame advanced filter structures. The unique instance of all-pass digital filter acknowledgment got from the proposed global filter needs extra equipment for understanding the feed forward coefficients. Subsequently elective OTA-C based all-pass filter usage in view of Mitra–Hirano and Gray–Markel second-arrange computerized channel structures are inferred in which the coefficients that are utilized to understand the denominator are partaken in the acknowledgment of numerator. All the proposed circuits are contrasted and alternate structures accessible in the writing. The stimulation aftereffects of the proposed circuits was demonstrated.

Tsividis, (2010)[6]reviewed the event driven analog-to-digital conversion and related to digital signal processing techniques. The author suggests that techniquesare still in the research stage and can possibly lessen the utilization of energy and data transmission assets in a few critical applications.

Azim et al., (2011)[4] suggested most generally utilized digital channels are FIR channels that are typically implemented with the transversal structures. For FIR channel, the signal output is a direct mix of channel coefficients that generates a quadratic capacity (mean-square-error) along with the specific optimal operation point. FIR filter then again be acknowledged for getting changes in examination of transversal channel structure for speed of union, computational multifaceted nature and finite word length properties. IIR separating strategies display solid option for customary FIR sifting. The central favorable position of IIR channels is lesser parameterization to accomplish at standard execution of FIR channels. Moreover, the pole zero structures facilitate their displaying in physical frameworks.

C.Dai (2010)[10] proposed new parallel FIR filter structures, which are valuable to symmetric coefficients as far as the equipment cost, under the condition that the quantity of taps is a multiple of 2 or 3. The proposed parallel FIR structures exploits the innate way of symmetric coefficients lessening a large portion of the quantity of multipliers in sub channel segment to the detriment of extra adders in preprocessing and post handling squares. Trading multipliers with adders is favorable in light of the fact that adders weigh not as much as multipliers as far as silicon region; what's more,

the overhead from the extra adders in preprocessing and postprocessing squares remain settled and do not increment alongside the length of the FIR channel, though the quantity of lessened multipliers increments alongside the length of the FIR channel.

Implementation of FIR Filter

Multiplier based implementatio: A filter is employed to adjust the parameters of applied signal in order to meet our requirement.. A digital filter acts over digital data. (a series of 1&0s, obtained by the sampling and quantizing an analog data) also develops a digital data... These specifications, in linear convolution by the key in sequence provide the required yield. In the Figure.1, the multiplier part is represented with the Line and column bypassing multiplier.

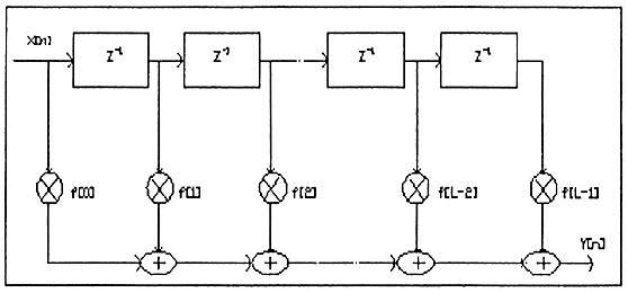

Figure 1: The FIR filter with order L

Comparison of FIR filters with Different multipliers: The Booth multiplier in which the multiplication of one of two pre determined value with a product takes place to get the result .Wallace tree multiplier is one which uses AND , half and full adders.FIR Filter can be constructed with bypassing multiplier instead of other multipliers the figure 2 shows the power consumption performance of different multipliers.

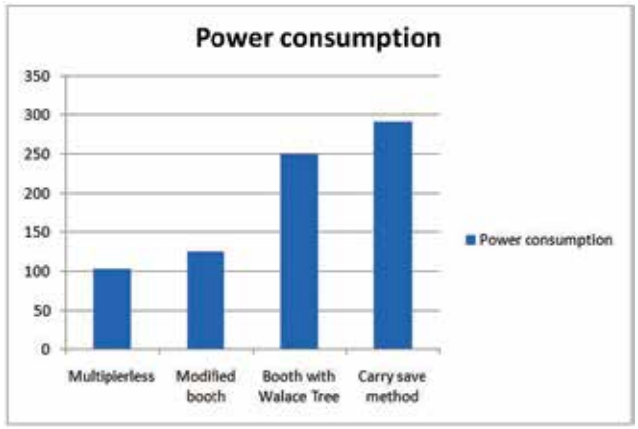

Figure 2: Power consumption Comparison of Multipliers

Multiplier Less Implementation:

ARM processor implementation of Proposed Medical signal filter: ARM Cortex M4 processor have an extremely superior set of multiply-combine commands that can execute more than one integer multiply-combine operation in one clock period (e.g. SMLAD), which leads them to perform better in digital signal processing.

The simple idea for building a digital filter is to employ Micro Modeler DSP, which gives a browser-based, self-sufficient filter design situation. Pull a filter to the function and visually organize the filter's frequency reaction. Once response is organized, copy and paste the robotically developed code into a .c and an h file and add to the project. All of the filters developed by Micro Modeler DSP utilize the equal interface, so it's simple to change to another filter with no change in present function code. It can be chosen to develop a code that uses C, CMSIS DSP libraries or mixed C and ARM Assembly depending on user preference.

This example explains the usage of the Code Replacement Library (CRL) for ARM processor with DSP blocks. The wave form is as shown in figure.3.

Task 1: Setup and Simulate

1. Open the ex_fir_ne10_tut_ml example function, which implements a lowpass FIR filter object.
2. Create two sine wave signals with 1KHz and 3KHz frequency, respectively.

```
sin1 = dsp.SineWave('Amplitude',1,'Frequency',1000,...
'SampleRate',8000, 'SamplesPerFrame', 76,...
'OutputDataType', 'single');
sin2 = dsp.SineWave('Amplitude',4,'Frequency',3000,...
```

‘SampleRate’,8000, ‘SamplesPerFrame’, 76,...

‘OutputDataType’, ‘single’);

3. Create a spectrum analyzer to view the spectrum of the input and filtered output.

scope = dsp.SpectrumAnalyzer(‘SampleRate’,8e3,’ShowLegend’,true,...

‘PlotAsTwoSidedSpectrum’, false, ...

‘RBWSource’, ‘Property’,...

‘RBW’,8000/260, ‘Window’,’Kaiser’, ...

‘OverlapPercent’, 80,...

‘YLimits’, [-76 56], ‘SpectralAverages’,10);

4. Simulate the example

```
NN = 2000;
for k = 1:NN
x1k = sin1(); % generate 1K Hz sine wave
x3k = sin2(); % generate 3K Hz sine wave
n1 = randn(size(x1k), ‘single’)*sqrt(.05); % generate noise signal
u1 = x1k+x3k+n1;
y1 = ex_fir_ne10_tut_ml(u1);
scope([u1,y1]);
end
```

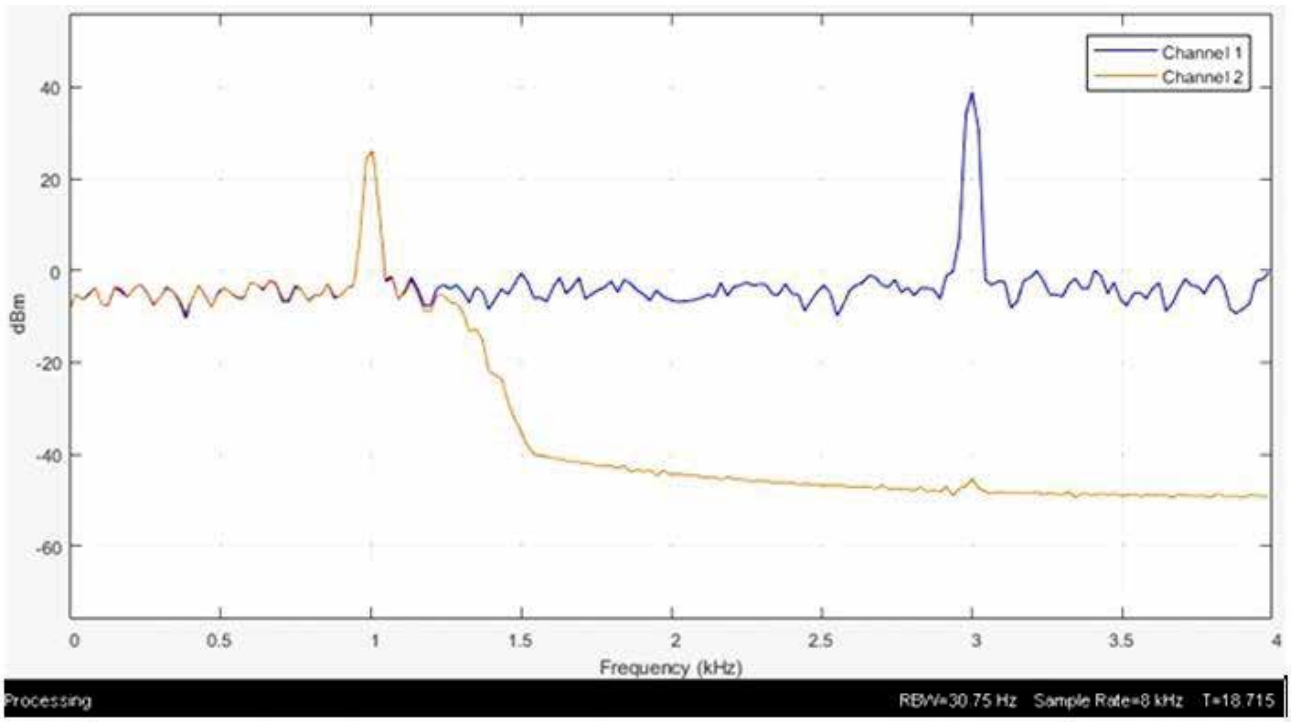

Figure 3. Output signal from Spectrum analyzer.

Task 2: Configure for Code Replacement

1. Create a code generation configuration object for use with codegen when generating a C/C++ static library.

   cfgEx = coder.config('lib');

   cfgEx.CodeReplacementLibrary = 'ARM Cortex-A';

   cfgEx.HardwareImplementation.ProdHWDeviceType = 'ARM Compatible->ARM Cortex';

   cfgEx.GenCodeOnly = true;

2. Open the **Custom Code** panel of the configuration dialog and verify the settings.

   cfgEx.dialog

Task 3: Generate code

1. Change your current folder in MATLAB to a temporary writable folder. Copy the MATLAB file to the temporary folder.

   tempdirObj = armcortexadstexample.dstTempdir('ex_fir_ne10_tut_ml_workflow');

   dstarmsrc = which('ex_fir_ne10_tut_ml');

   dstarmtmpdir = tempdirObj.tempDir;

   type(fullfile(dstarmsrc))

   copyfile(dstarmsrc, dstarmtmpdir, 'f');

   function y1 = ex_fir_ne10_tut_ml(u1)

   % Copyright 2014-2016 The MathWorks, Inc.

   %#codegen

   persistent fir;

   if isempty(fir)

   fir = dsp.FIRFilter('Numerator', fir1(63, 0.33));

   end

   y1 = fir(u1);

   end

2. Generate C code for the MATLAB function ex_fir_ne10_tut_ml.m.

   codegenex_fir_ne10_tut_ml-argssingle(u1)-configcfgEx-report

3. When code generation finishes successfully, click **View report** to display the code generation report.

4. Click on the ex_fir_ne10_tut_ml.c file. Notice the NE10 functions, **ne10_fir_init_float** and **ne10_fir_float_neon** in the ex_fir_ne10_tut_ml function.

Task 4: Verify the generated C code on target

The generated code can be compiled and executed on ARM Cortex-A target by using a user- selected tool chain.

Run the following code to delete the temporary directory.

status = tempdirObj.cleanUp;

Results and Discussion

Comparison with Multiplier based implementations: The improved multiplier less ARM processor implementation having less delay of only 10.2 ns and consumes only 102 mw power as Shown in Table 1and 2.

Tablel 1: Delay Comparison of similar methods

Methods	Delay ns.
Multiplier less method	10.2
Modified Booth	10.22
Modified Booth with Wallace Tree	8.9
Distributed Arithmetic	18.9
Distributed Arithmetic with Partition	16.804

Table 2: Power consumption Comparison of similar methods

Methods Table	Power consumption in mw.
Multiplier less Method	102
Modified Booth	125
Modified Booth with Wallace Tree	250
Carry save method	290

Medical signal Display and Transmission With ARM processor: If this proposed method is used in medical applications like filtering of ECG and other medical signals, due to the presence of ARM controller some other measurement, control ,display and transmission of the signal to some other remote location also can be done without additional processor.

The inputting and the handling of EMG signal is completed using LPC-2103 microcontroller unit. The LPC- 2103 is 32-bit ARM-7TDMIS processing unit, using on-time emulation that associates the microcontroller unit with 32 KB implanted quick flash memory. Owing to unit's miniature dimension and little power utilization, the LPC -2103 is perfect in areas wherever dimension is main constraint.

For monitoring heart activity the ECG signal is used. Our system is divided into three subsystems 1.ECG Acquisition 2.Processing in ARM7 3.GSM.This is real time system. In this project we will design for monitoring of ECG data using ARM7 LPC2148 and GSM module .Here first data is acquired using ARM7 which is further sent wirelessly using GSM. The device will be economical. It will be helpful for the patient and doctor for easy Monitoring. It will be less complex as compared to other technology. Less Power is required for its operation and control of the device. This device is used in Hospital, Military, Homecare Unit, and Sports Training.

The block diagram of this system is as shown in the figure 4.The hardware system consist of ECG acquisition, ARM7 processor and GSM module. In this system, ECG signal are acquired using 3 lead ECG electrodes .This signal are given to ARM7 processor for amplification and filtration.

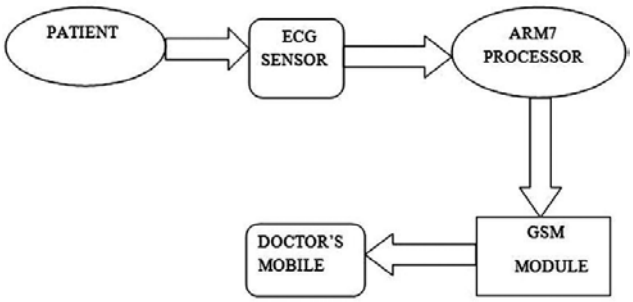

Figure 4: System block diagram

GSM (Global System for Mobile communication or Groupe Speciale Mobile) communications, initiated by the European Commission, is the second generation mobile cellular system aimed at developing .GSM is the world's most popular 2G technology. It was developed to solve the fragmentation problems of the first cellular system in Europe.GSM promised a wide range of network services through the use of ISDN. It also specifies digital modulation and network level architectures and services.

Conclusion

In this work we also projected and implemented a portable filter for real-time and personal purposes. We reduced the hardware complexity by using the digital filter-driven hardware architecture. According to the experimental results, the proposed filter with ARM processor has lower computational complexity than other existing filtering algorithms. The minimized number in hardware of this idea offers the benefit such as less consumption of space and power for overall system including signal transmission and display. As the ARM processor can also be used for signal transmission and display the revised filter has less delay and power.

Effect of Inpatient Physiotherapy Intervention Versus Delayed Outpatient Physiotherapy Intervention in Post Stroke Hemiplegic Individuals

Pragati V. Salunkhe[1], G. Varadharajulu[2], Suraj Kanase[3]

[1]Faculty, [2]Dean, Faculty of Physiotherapy, [3]Associate Professor, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to evaluate the effect inpatient physiotherapy intervention, outpatient physiotherapy intervention and compare inpatient physiotherapy intervention versus delayed outpatient physiotherapy intervention in post stroke hemiplegic individual.

Method: 44 subjects diagnosed with post stroke hemiplegia were included in this study. Subjects were divided into two different groups. Group A was inpatient and group B was delayed outpatient group. These subjects were allocated by convenient sampling method. During Pre and post treatment assessment functional independence and mobility were assessed by outcome measures Functional Independence Measure and Barthel Index. These outcome measures were analysed.

Result: Pre and post functional independence and mobility was analysed by using paired and unpaired t test. Data analysis showed significance for FIM and Barthel Index (p value less than 0.001) for both the groups but comparative to group B (delayed outpatient), group A (inpatient) is more effective.

Conclusion: Inpatient physiotherapy intervention and delayed outpatient physiotherapy intervention is effective in improving the functional independence and mobility in the post stroke hemiplegic individuals but comparative to delayed outpatient physiotherapy intervention, inpatient physiotherapy intervention is more effective.

Introduction

Stroke can be defined as "Rapidly developed clinical sign of focal (or global) disturbances of cerebral function lasting more than 24 hours or leading to death, with no apparent cause other than vascular origin"[1] Stroke may cause a disturbance in the blood supply to the brain and may lead to rapid loss of brain functions. Disturbance in blood supply may be due to ischemia i.e lack of blood flow caused by blockage (thrombosis, arterial, embolism) or haemorrhage (leakage of blood) [3]. About 80% of individuals are affected by ischemic stroke; which is the most common type of stroke.[1]

Stroke is one of the leading causes of death & disability in India. Stroke is the third commonest cause of death according to the statistics.[4] The estimated average prevalence rate of stroke range 84-262/100,000 in rural and 334-424/100,000 in urban areas. The incidence rate is 119-145/100,000 [4]

According to the American Physical Therapy Association (APTA), ''physical therapists are health care professionals who maintain, restore, and improve movement, activity, and health, enabling an individual to have optimal functioning and quality of life, while

ensuring patient safety and applying evidence to provide efficient and effective care. Physiotherapists assess, diagnose, and treated individuals of all age groups who have impairments, activity limitations, and participation restrictions, promoting health.[5]

Stroke can result in a many symptoms and signs but the most common symptom is motor impairment. Which typically affects the control of movement of the face, arm, and leg of one side of body characterized by paralysis (hemiplegia) or weakness (hemiparesis) typically on the one side of body opposite to the side of lesion. Immediately after stroke, there is an initially flaccid paralysis in over 90% of individuals, which is often replaced by spasticity lasting for 24 hours to 12-18 months.[5] In acute phase, about 50 to 80% of stroke patients has various impairments in the body.[6]

Pathophysiology: The pathophysiology of stroke, If presence of prolonged state of hypotension, stenosis of measure cerebral arteries or internal carotid artery following thromboembolism or due to episode of sudden cardiac arrest, the brain cells undergo a state of nutritional deprivement which leads to Ischaemic Hypoxic Cerebral injury and result in formation of acute infarction which initially is soft and swollen but eventually herniates compressing the vital structure in the brain. Acute infarction if not reversed within 3 minutes undergoes a permanent damage and heals in the form of a firm cyst known as gliosis. The dense central core of this region consist of dead neurons referred as penumbra region has a chances to reversal of symptoms if perfusion is established within 3 hours. In neuronal injury resultant of increased cytosolic calcium concentration due to failure of ionic pumps. Ionic leaks changes the sodium and potassium ion gradient which create a state of acidosis with release of free radicals disrupting the Blood Brain Barrier. Following Hypoxia, the brain fails to maintain normal concentration of ATPs. This energy depletion delays the resynthesis of macromolecular proteins essential for endothelial cell structure and function. Proteolysis and lipolysis result in production of arachidonic acid and platelet activating factors which further activates the release of cell adhesion molecules, free radicals resulting in more brain damage.[7]

Warning Signs: Warning signs of stroke are sudden numbness or weakness of the face, arm or leg, especially on one side of the body, sudden confusion, disturbed sleep or understanding, sudden difficulty in seeing in one or both eyes, sudden severe headache with unknown cause sudden difficulty in walking, dizziness, loss of balance or coordination.[2]

Physiotherapy Intervention: The physiotherapy intervention that is exercise is to improve mobility, increase functional independence, relive pain, and minimise limitations due to permanent disabilities. Stroke is a chronic condition, we have to spend the more time of rehabilitation, from the early stage that is inpatient in the acute care hospitals physiotherapy intervention are the primary mechanism by which functional recovery, mobility and functional independence of patient are achieved in stroke.[9]

Conventional Exercises: Conventional exercises are exercises that are traditionally practiced since ancient times and are accepted worldwide. Conventional training for stroke survivors include Passive movement, sustained stretching, active assisted RIMP to both the limbs, bed mobility exercises, Gait training. These exercises can also be performed with the help of various modifications and may help to achieve a faster recovery at least to improve the patient's functional performance.[8]

Timing of Interventions: Patient those who are admitted in a hospital with a stroke are referred to physiotherapy when medical condition is stable. All stroke patient received physiotherapy while they are admitted in wards, so in inpatient the recovery was good. On discharge from the ward, the stroke patients are advised to return as physiotherapy OPD but, a large number of patient deteriorate after discharge from the hospital, so in delayed outpatient the recovery was poor as compared to inpatient. At a global level, many patients with a stroke not attending outpatient physiotherapy intervention, this according to the review study by Thomas and parry. In another study was conducted in United States (Barclay2007), 30% of post stroke hemiplegic individual reported that they were attending outpatient physiotherapy .[9] The more number of patient in the study lived in rural areas. Every day they had to travel long distant from their home for physiotherapy intervention so the flow of outpatient was reduced.[10]

The stroke patient who are admitted in hospital they are taken physiotherapy treatment regularly, but after discharge some of them delay or discontinue the treatment. After some period they realise that there is no functional improvement then they come back to

the physiotherapy department .So there is necessity to create awareness among these people who delay the physiotherapy treatment. It is necessary to note that still there are many regions in our country without any physiotherapy department providing comprehensive stroke rehabilitation.

Method

The subjects which willing to participate in the study was taken. The criteria for inclusion were: clinically diagnosed with post stroke hemiplegia and the age group 30-65 years. Subjects were excluded if any musculoskeletal conditions e.g. fracture, subject with visual and auditory impairment and subject associated with psychological disorder.

44 post stroke hemiplegia survivors were selected from Krishna Hospital Karad. Subjects were divided into two different groups. 22 subjects in each group, group A was inpatient there were 16 male and 6 female and group B was delayed outpatient group there were 17 male and 5 female.These subjects were allocated by convenient sampling method, written consent form was taken. All the subjects were informed about the protocol and gave written consent before their participation. The protocol and the consent form were previously approved by protocol and ethical committee. Group A and Group B was given Conventional training exercises regularly for 4 weeks 6 days a week. After 4 weeks the post treatment assessment for functional mobility was taken with the help of assessment tools (Functional Independence Measure and Barthel Index).

Result

Pre and post functional mobility was analysed by using paired and unpaired t test. Data analysis showed significance for FIM and Barthel Index (p value less than 0.001) for both the groups but comparative to group B (delayed outpatient), group A (inpatient) is more effective.

Statistical analysis: The data was entered into Microsoft office excels 2007 and analyzed using INSTAT software. Descriptive statistics were used to analyze for demographic data: Pre and post treatment protocol was analyzed by using paired and unpaired t test and p value <0.0001 was considered to be statistically significant.

Within Group Comparison

Within group comparison was done by applying 'Paired t-test' to pre and post training values of Functional independence measure.

Table 1: Comparison of Pre and Post-treatment average with Functional Independence Measure

Group	Pre training Mean	Post training Mean	t value	p value
Group A	54.364	69.909	11.984	< 0.0001
Group B	55.955	59.545	10.021	<0.0001

Table 2: Comparison of Pre and post-treatment average with Barthel Index

Group	Pre training Mean	Post training Mean	t value	p value
Group A	30.227	60	18.678	< 0.0001
Group B	31.364	36.818	17.390	< 0.0001

Between Group Comparison: Between groups comparison was done by applying 'unpaired t test'

Table 3: Comparison of Pre and post-treatment average with Functional Independence Measure

Group	Group A	Group B	t value	p value
Pre training Mean	54.364	56.500	0.7822	0.4385
Post training Mean	69.909	59.545	3.517	0.0011

Table 4: Comparison of Pre and post-treatment average with Barthel Index

Group	Group A	Group B	t value	p value
Pre training Mean	30.227	37.045	2.817	0.0074
Post training Mean	60	36.818	6.795	< 0.0001

Discussion

The study "Effect of inpatient physiotherapy intervention versus delayed outpatient physiotherapy intervention in post stroke hemiplegic individual" was conducted to compare the two groups to find out its effects on functional independence and mobility. The inpatient are the acute stroke patient they are taken continuously 4 weeks physiotherapy intervention and the delayed outpatient are the chronic stroke patient they discontinue or delayed the treatment after some period they taken continuously 4 weeks physiotherapy intervention. This study mostly focused on the functional independence and mobility of the individuals and the best possible treatment for it so, the outcome measures for this study were Functional Independence Measure and Barthel index. The subjects were analysed for Functional Independence and mobility.

The loss of motor function because of stroke is caused by cell death in the infarcted area as well as dysfunction the areas surrounding the infarct. The function of brain regions, including the contralateral areas that are connected to the areas of tissue damage, is compromised because hypo metabolism, neurovascular uncoupling, and disrupted neurotransmission, jointly called diaschisis. Some recovery of function occours spontaneously after stroke. It is believed that this functional recovery involves, to some extent overlapping, phases: (1) reversal of diachisis, activation of cell genesis, and repair; (2) changing the properties of existing neuronal pathway; and (3) neuroanatomical plasticity leading to the formation of new neuronal connection. Neuroanatomical plasticity leading to the formation of new neuronal connections. The basic process underlying phases 2 and 3 also involved in normal learning and it has been recognised that functional improvement after brain injury is a relearning process. [15]

In stroke, physiotherapy intervention that is conventional exercise is to minimize the effects of the brain cell damage and optimize re-learning. It is well recognized that for cortical re-organisation to occur post stroke, there is a requirement for high levels of repetition of tasks and exercises that are both challenging and engaging.[16]

Conventional Exercises with patient's following stroke may be a stimulus for making new more effective functional connections within remaining brain tissue. Repetitive exercises appear to be major factors in promoting synaptogenesis and are important in rehabilitation of motor weakness following stroke.

Stroke severity is considered the most powerful prognostic factor because disability is a consequence of the severity of neurological impairment. Similarly, the strong positive relationship between initial and later disability is well known. Shah et al7 reported that initial disability was a powerful predictor of discharge Barthel Index:

(BI) score, and Oczkowski and Barreca14 found that the absolute admission functional independence measure score was the best predictor of outcome disability and place of discharge. The strong positive relationship between increasing age and disability is well established.[17]

Conclusion

Through this study, it is concluded that, inpatient physiotherapy intervention and delayed outpatient physiotherapy intervention is effective in improving the functional independence and mobility in the post stroke hemiplegic individual but comparative to delayed outpatient physiotherapy intervention, inpatient physiotherapy intervention is more effective.

Conflict of Interest: This study can be carried out with large sample size.

Source of Funding: This study was funded by Krishna Institute of Medical sciences Deemed to Be University, Karad.

Effect of Therapeutic Intervention and Hand Muscle Training on Pain and Quality of Hand Function in Subjects with Chronic Tennis Elbow

Pranali Desai[1], G. Varadharajulu[2], Smita Kanase[3], Sandeep Shinde[4]

[1]MPT, [2]Dean, Faculty of Physiotherapy, [3]Assistant Professor, [4]Associate Professor, Krishna College of Physiotherapy, KIMSDTU, Karad-415110, Maharashtra, India

ABSTRACT

Background: Tennis elbow is a form of repetitive injury. It results in pain at the lateral humeral epicondyle on gripping and frequent rotatory motion of the forearm. It leads to reduce hand grip strength and causes functional disability

Objectives: To find and compare the effect of mulligan mobilisation with movement (MWM), phonophoresis, eccentric strengthening exercises and hand muscle training on pain and quality of hand function in subjects with chronic tennis elbow.

Method: 30 subjects diagnosed as chronic tennis elbow were included in the study on the basis of inclusion and exclusion criteria. In the study pre and post treatment outcome assessment was taken on (Visual Analogue Scale) VAS, Hand Held Dynamometer and on (Patient Rated Tennis Elbow Evaluation) PRTEE. Mulligan mobilisation with movement, phonophoresis, eccentric strengthening exercises were baseline treatment for both the group. Group A received baseline treatment and hand muscle training and Group B received only baseline treatment for 3 weeks treatment protocol.

Results: 30 subjects (19 female and 11 male), participated in the study. Intra group comparison results showed statistically significant reduction in post interventional VAS, HHD, and PRTEE score for both the groups ($p < 0.0001$). Inter group comparison results showed Group A was statistically significant in showing improvement in VAS, HHD, and PRTEE score than Group B ($p < 0.0001$).

Conclusion: Group A treated with baseline treatment and hand muscle training showed significant improvement than Group B.

Keywords: *Chronic Tennis Elbow, Mulligan mobilisation, Phonophoresis, Hand muscle training, Hand Held Dynamometer (HHD), Patient Rated Tennis Elbow Evaluation (PRTEE)*

Introduction

Tennis elbow is also known as lateral epicondylitis[1]. Pain in region of epicondyle which can be elicited by giving resistance to either extensor or flexor muscles of wrist. Functional impairment and reduced productivity due to the pain is common symptom[2]. Male and females are equally affected with the peak incidence is between 30-60yr of age [3]. Extensor Carpi Radialis Brevis (ECRB) is most commonly affected structure[4]. The cardinal symptoms of tennis elbow are pain and inflammation. The cause of pain maybe changes in the nervous system as a result of neuronal tissue changes as well as nociceptive and non-nociceptive process[5]. Due to which subjects shows difficulty to perform the gripping activities and exhibit reduced grip strength[6]. In various daily activities hand grip strength is vital[7]. Improve the quality of hand function is essential as it enhance the functional ability and prevent the recurrence.

Among various available physiotherapy treatment options[8] Phonophoresis is a therapeutic method gives combined effect of ultrasound and nonsteroidal anti-inflammatory drug which helps to resolve pain and inflammation[9]. Mulligans mobilisation with movement is relatively quick with active participation of subject in treatment. which results in immediate pain reduction and improvement in function [10]. As there is paucity of literature on combined effect of phonophoresis and MWM and no study has concerted on improving the quality of hand function in subjects with chronic tennis elbow the present study is intended to find out the combined effect of Phonophoresis, MWM and effect of Hand muscle training on the pain and quality of hand function in subjects with chronic tennis elbow to improve the quality of hand function and to avoid functional disabilities.

Materials and Method

Participants: On the clinical screening using special test 30 subjects who diagnosed as chronic tennis elbow based on inclusion and exclusion criteria were selected. Both male and female between age group 35-55 yr, willing to participate were included in the study. Written consent was taken. Inclusion criteria were as follows: 1) more than 3 months symptom duration 2) Pain with gripping at lateral humeral epicondyle 3) Tenderness on palpation over lateral epicondyle of humerus 4) Subjects having pain on resisted extension of third finger 5) Positive mills test 6) Previous physiotherapy treatment for tennis elbow. Exclusion criteria were as follow: 1) Subjects having tenderness within the muscle 2) Cervical radiculopathy 3) Previous fracture or tendon rupture in elbow. Intensity of pain on VAS, hand grip strength on Hand held dynamometer and functional disability on PRTEE SCALE was recorded pre-interventional and post interventional.

Interventions: 30 subjects were divided into two group (n=15 in each group) by simple lottery method. Baseline treatment for both the group was phonophoresis, mulligan mobilisation, eccentric exercises. Group A were given hand muscle training and baseline treatment and Group B were given only baseline treatment for 3 weeks 5days/week. Pre and post treatment assessment were done with VAS, Hand Held Dynamometer and PRTEE questionnaire. Post treatment assessment was taken on Day 7, Day 14 and Day 21.

Baseline treatment:

Phonophoresis: in sitting position. Mode continuous, Frequency 1 MHz, intensity 0.8 W/cm^2 over the area of the lateral epicondyle for 5 minutes.

Mulligan mobilisation with movement: In supine position forearm pronated, lateral glide to the proximal forearm was sustained for 5-10 sec for 3 repetitions progress to 6 repetitions.

Eccentric strengthening exercise: In seated position with elbow in extension, forearm in pronation, and wrist in full extension. subject was asked to slowly lower the wrist into flexion for a count of 30 and again return back to the wrist full extension for 3 sets of 10 repetitions.

Hand Muscle Training:

1. **Exercise With Exercise Ball:** In sitting position with elbow at 90^0 of flexion , wrist in neutral and fingers are spread around the exercise ball . subject was asked to squeeze the exercise ball and then released.
2. **Rubber Band Exercise:** Rubber band was wrapped around the finger and subject was asked to performed extension of finger for 3 sets of 10 repetitions.
3. **Supination with Dumbbell:** In sitting position with elbow resting on plinth holding dumbbell vertically and asked to rotate the arm outword so that palm turns up. Then again rotate the hand inward so the palm faces downward. Repeat 10 times 3 sets.
4. **Twisting a Towel:** Grasp the towel horizontly in the hand. And twist it into the roll. Repeat 10 times 3 sets.

Data Analysis

Table 1: Comparison of VAS score at rest between group

Groups	Pre-treatment	Post- treatment		
	Day 1	Day 7	Day 14	Day 21
		Mean ± SD	Mean ± SD	Mean ± SD
A	5.12 ± 1.460	3.5 ± 1.242	1.8866 ± 0.814	0.7866 ± 0.4833
B	4.4933 ± 1.599	3.8866 ± 1.429	3.3666 ± 1.171	2.22 ± 1.080
U'	126	137	185.50	194.50
P	0.5897	0.3195	0.0026	0.0007
Significance	Not significant	Not significant	Very significant	Extremely significant

The pre-treatment values were 5.12 ± 1.460 for group A and 4.4933 ± 1.599 for group B respectively and post interventional value for group A was 0.7866 ± 0.4833 and in group B was 2.22 ± 1.080. It showed VAS SCORE AT REST between group A versus group B statistically very significant difference. This was done by using unpaired 't' test. (Mann-Whitney test)

Table 2: Comparison of VAS score on activity between group

Groups	Pre-treatment	Post- treatment		
	Day 1	Day 7	Day 14	Day 21
		Mean ± SD	Mean ± SD	Mean ± SD
A	7.8466 ± 0.6823	5.4733 ± 0.8908	3.5266 ± 0.7842	1.58 ± 0.4632
B	8.1066 ± 1.428	7.02 ± 1.372	5.94 ± 1.251	4.5266 ± 1.146
U'	143.50	185.50	210.00	222.00
P	0.2058	0.0026	<0.0001	<0.0001
Significance	Not significant	Very significant	Extremely significant	Extremely significant

The pre-treatment values were 7.84 ± 0.68 for group A and 8.1066 ± 1.428 for group B respectively and post interventional value for group A was 1.58 ± 0.4632 and group B was 4.5266 ± 1.146. It showed VAS score ON ACTIVITY between group A versus group B statistically very significant difference. This was done by using unpaired 't' test. (Mann-Whitney test)

Table 3: Comparison of Hand Grip Strength within group

Groups	Pre-treatment	Post- treatment			p value
	Day 1	Day 7	Day 14	Day 21	
	Mean ± SD	Mean ± SD	Mean ± SD	Mean ± SD	
A	6.6 + 2.613	13.8 ± 3.212	21 ± 2.591	24.46 ± 2.100	p <0.0001, Fr = 42.920
B	6.46 + 2.100	11.8 ± 1.971	15.4 ± 1.804	19.26 ± 2.01	p <0.0001, Fr = 45.040

The pre-treatment values were 6.6+2.613 in group A and 6.46+2.100 in group B respectively, were as post interventional value for group A was 24.46+2.100 and group B was 19.26±2.01. It showed extremely significant INCREASE in HAND GRIP STRENGTH for both the groups. This was done by using paired 't' test (Friedman test with post-test)

Table 4: Comparison of Hand Grip Strength between groups

Groups	Pre-treatment	Post- treatment		
	Day 1	Day 7	Day 14	Day 21
		Mean ± SD	Mean ± SD	Mean ± SD
A	6.6 ± 2.613	13.8 ± 3.212	21 ± 2.591	24.4666 ± 2.100
B	6.466 ± 2.100	11.8 ± 1.971	15.4 ± 1.805	19.2666 ± 2.017
U'	115.00	148	221.00	217
P	0.9336	0.1451	<0.0001	<0.0001
Significance	Not significant	Not significant	Extremely significant	Extremely significant

The pre-treatment values for group A 6.6 ± 2.613 and 6.466 ± 2.100 in group B respectively, were as post interventional value for group A was 19.2666 ± 2.017 and group B was 24.4666 ± 2.100. It showed statistically very significant difference. This was done by using unpaired 't' test. (Mann-Whitney test)

Table 5: Comparison of PRTEE score within group

Groups	Pre-treatment	Post- treatment			p value
	Day 1	Day 7	Day 14	Day 21	
	Mean ± SD	Mean ± SD	Mean ± SD	Mean ± SD	
A	63.13 ± 6.553	49.8 ± 9.147	38.9666 ± 7.763	23.7333 ± 6.397	p <0.0001 Fr= 45.000
B	65.0333 ± 11.889	52.3 ± 7.894	41.3666 ± 6.269	31.4333 ± 4.57	p <0.0001 Fr=45.000

The pre-treatment values were 63.13 + 6.553 for group A and 65.0333 + 11.889 for group B respectively, were as post interventional value for group A was 23.7333 + 6.397 and group B was 31.4333 + 4.57. PRTEE SCORE showed extremely significant increase in functional ability for both the groups. This was done by using paired 't' test (Friedman test with post-test)

Table 6: Comparison of PRTEE SCORE between groups

Groups	Pre-treatment	Post- treatment		
	Day 1	Day 7	Day 14	Day 21
	Mean ± SD	Mean ± SD	Mean ± SD	Mean ± SD
A	63.1333 ± 6.553	49.8 ± 9.147	38.9666 ± 7.763	23.7333 ± 6.397
B	65.0333 ± 11.889	52.3 ± 7.894	41.3666 ± 6.269	31.4333 ± 4.574
U'	136.50	137	145	191.50
P	0.3297	0.3192	0.1842	0.0011
Significance	Not significant	Not significant	Not significant	Very significant

The pre-treatment value for group A 63.1333 ± 6.553 and 63.0333±11.889 for group B respectively, were as post interventional value for group A was 23.7333 ± 6.397 and group B 31.4333 ± 4.574. PRTEE SCORE showed statistically very significant difference. This was done by using unpaired t' test. (Mann-Whitney test)

Discussion

The present study was undertaken with the aim to evaluate the effect of therapeutic intervention and hand muscle training on pain and quality of hand function in subjects with chronic tennis elbow.

Study included 30 subjects. It affects both the sexes commonly and it appears to be more severe and of longer duration in females [11,12]. which correlates in this study.

Tennis elbow is common in age group between 30 and 60 years of age[3]. Subjects of the age group 35-55 were included in the study. The inclusion of sample in this study supports the prevalence rate of above study.

According to study mean value of age for Group A was 40.4 and for Group B was 40.06, which is considered as not significant. Statistical analysis was done using nonparametric unpaired t test for between group analysis and paired t test was used for within group analysis.

Statistical analysis showed that post treatment there was extremely significant difference in VAS score at rest in both the groups(p=0.0007). (Table 1)

Statistical analysis showed that post treatment there was extremely significant difference in VAS score on activity in both the groups (p=0.0001) (Table 2)

Group A was more efficient in improving Hand Grip Strength than Group B post treatment. (Table 4)

Statistical analysis showed that post treatment there was extremely significant difference in Hand grip strength in both the groups (p <0.0001)

Statistical analysis showed that post treatment there was very significant difference in PRTEE score in both the groups (p=0.0011)

Group A was more efficient in improving functional disability than Group B post treatment. (Table 5, 6)

In phonophoresis ultrasound facilitates the passage of some drug into and through the skin and the effects are due to absorption of the drug and also due to the ultrasound[13]

Reduction of inflammation is achieved with the phonophoresis as it causes elevation of the pain threshold and alteration of neuromuscular activity which leading to muscle relaxation, induction of tissue regeneration.

A Paungmali et al (2003)[14] showed there is sufficient recruitment and activation of descending pain inhibitory systems following application of MWM which produces sensory input which results in analgesic effects

Lateral glide to elbow joint helps to reposition the ulna and radius in relation to the humerus[15].

Eccentric strengthening exercises and hand muscle training helps to reduce the pain and improve quality of hand function.

Strength training is type of resistance that induces muscular contractions that results in building the strength and size of skeletal muscles[16].

It improves Strength, grip strength and endurance thus it leads to improvement in hand function.

Recent evidence has indicated that the combination of exercise training with electrotherapeutic modality is more effective than exercise training alone[17]. Which correlates in this study.

The findings in study were consistent with the experimental study. And it showed the significant reduction in intensity of pain and improvement in hand grip strength and functional disability on the outcome measure, VAS, Hand held dynamometer and on PRTEE. Hand muscle training yields better outcome in improving hand grip strength and functional disability.

Result

Based on the results of the present study it is concluded that both the Groups showed significant reduction in VAS and improvement in HHD and PRTEE score. Group A showed extremely significant result than Group B in subjects with chronic tennis elbow.

Conclusion

Results supported that hand muscle training with baseline treatment was more effective than only baseline treatment in reducing pain and improving quality of hand function.

Assessment of Balance in Children with Developmental Coordination Disorder in Indian Context

U. Ganapathy Sankar[1], R.Monisha[2]

[1]Dean, Srm College of Occupational Therapy, Srm Institute of Science and Technology, India,
[2]Assistant Professor, Srm College of Physiotherapy, Chennai, India

ABSTRACT

Background: Children with Developmental Coordination Disorder (DCD) have inability in performing physical activity as like the peer group children of same age and they have deficit in motor control and encounter imbalance when exposed to gait initiation in an unfamiliar environment. It has been shown that imbalance leads to inhibition of gait adaptations which is evident by shorter steps, greater trunk inclination, decreased ankle plantar and dorsiflexion

Methodology: The children who participated in this study were selected from various elementary schools in and around Chennai. There were 100 children in the age group of 8-10 years old. After getting informed consent signed, all children were evaluated using Body Coordination Test for children - BCTC. Initially at the baseline all the 100 children were evaluated with MABC

Discussion: The present study examined the movement difficulties in children with DCD and to examine the balance ability between children with Developmental Coordination Disorder (DCD) and NON-DCD Group. The Body Coordination Test for Children was used in this study since the test examines the assessment of children's coordinative performance.

Result: The results showed that children participating in this study exhibited difficulty in balance along with the motor coordination difficulty indicating the existence of DCD disorder

Conclusion: Children with DCD physically, psychologically and socially avoid participating in physical activities in order to avoid injuries due to their difficulty in balance. Thus, early identification and treatment of balance control difficulties are in increasing need.

Keywords: *DCD, MABC, BCTC, BALANCE, INCOORDINATION*

Introduction

Children with Developmental Coordination Disorder (DCD) have inability in performing physical activity as like the peer group children of same age. This inability is due to poor motor coordination. Children with DCD have difficulties in performing activity of daily living, which makes them isolated from the peer group of same age in school and sometimes at home too. If this isolation continues for a long period of time might leads to long term health and psychological issues[1].

Walking is an essential skill that needs to be acquired by all the children at the age of one. Children with DCD experiences difficulty in achieving this task and they find walking as a difficult and complex task to perform. They experience difficulty in locomotion from place to place without tripping or falling. Majority of researchers have highlighted that these children without evaluation of their gait patterns and reasons of fall during their locomotion will be reported to have the persistent difficulty in adolescence[2].

Teachers and parents commonly call these children as clumsy, awkward in walking. Therapist working with DCD children have identified different gait pattern and they found to have difficulty in walking and loose balance when certain new object has been interfered in their walking space in a familiar environment. They reported to have frequent sway, stumbling and hitting to objects in the pathway. When the Gait pattern of these children has studied in detail, children with DCD walked with shorter steps and at a higher cadence than the typically developing children[3].

It has been known that, DCD is not caused by neurological or any other pathological condition and its prevalence is reported to be 2-3% in southern India. Deficit in proprioception and perception makes these children clumsy, however, it remains unclear how the impairment in motor control contribute to the completion of daily activities[4].

However children with DCD reported to lose balance when they were exposed to new environment and they have a poor visual- proprioception that hampers the gait pattern and increases the incidence of fall. When Obstacle crossing is examined in children with DCD, it has been clear that children lose balance control and fall, because it demands precise balance control using perceptually driven postural adjustments. Previous researches in traumatic brain injury patients and their balance control during obstacles crossing during the initiation of normal walking has concluded that imbalance and postural sway has reported, when the patients encounter hurdles or obstacles in the pathway[5].

Children with DCD have deficit in motor control and encounter imbalance when exposed to gait initiation in an unfamiliar environment. It has been shown that imbalance leads to inhibition of gait adaptations which is evident by shorter steps, greater trunk inclination, decreased ankle plantar and dorsiflexion[6].

Literatures with the established difficulties with balance and visual perception, children with DCD were expected to demonstrate more signs of instability and less accurate foot positioning leading to more unsuccessful Gait initiation. But none of the researchers have documented which activity has imposed a sway and instability in children's with DCD. Hence the study is conducted with the Aim to evaluate balance limitations in Children with Developmental Coordination Disorder (DCD) and typically developing (TD) children[7].

Methodology

The children who participated in this study were selected from various elementary schools in and around Chennai. There were 100 children in the age group of 8-10 years old. After getting informed consent signed, all children were evaluated using Body Coordination Test for children - BCTC. Initially at the baseline all the 100 children were evaluated with MABC. It was found that 20 children out of the total number of 100 children selected in the study shows motor difficulties and identified as DCD disorder. Control group of 20 children with NON-DCD has been randomly selected from the 80 subjects found to have low score on MABC

The 20 students diagnosed with DCD were matched with Non-DCD children according to gender and age to avoid environmental and educational influences causing bias. Enrolled children's have normal IQ documented with WISC and children's with No physical or neurological disorder. Any history suggestive of sensory impairment, epilepsy was excluded from the study[9].

However information regarding the activity of daily living and academic achievements and the impact difficulty in coordination with physical activity and performance has been evaluated and documented. Age and intellectual ability of the children was derived from school reports and records according to the recommendations of APA

Body Coordination Test for Children evaluates the overall body co-ordination and balance control of children from 5 to 14 years old. It is gold standard in assessment of children with DCD. This test measures the overall body coordination by children performing four tasks: retro walking, obstacle jump on one foot, sideways movements with initial position and side jumps. In side jumps children were instructed to jump sideways over a hurdle within a period of 15 seconds.

The instructions provided to each children is similar to avoid influence of motivation in test performance for the four subtests a raw score (RW) is recorded. A Motor Quotient (MQ=100) percentiles is estimated per item as well as for the global test. A score less than 85 indicates coordination difficulty. Balance testing was performed on a pressure platform. All the children were asked to perform one-leg stance and double-leg. They were instructed to stand motionless on the platform. They can adapt the normal posture and arms should hang at the side. Posture should be maintained for 30 seconds[10].

Each task has to be repeated with eyes open and with eyes closed with 2 trails of each test and a five-minute rest was provided between successive trials. The best trial was documented. Children were instructed to stand on the force platform with the dominant leg exactly placed on the reference marking of foot in the force platform. Before making the children to stand on

the force platform, the dominant leg assessment was made by making the children to kick a ball which has been suddenly rolled before him without any instructions on which leg to be used for kicking with the simple instruction like "kick the ball hard". Time in seconds has been recorded and 2 trial has been allowed with the baseline familiarization test for 5 minutes.

A computer program in the pressure platform was used to analyze and document peak-to-peak amplitude and standard deviation of the COP from the mean value of COP in mm, denoted as sway amplitude. In the same way double leg stance time the sway was calculated. The trial has been repeated by making the child to close their eyes during single leg stance and double leg stance and their ability to balance has been assessed.

Data Analysis

Table 1: Peak-to-peak amplitude of the center of pressure (cop) displacement (copmax) and standard deviation of the cop (copsd) in the anterior posterior (a/p) and in mediolateral (m/l) direction

Balance Test	Group A	Group B
Double Leg Stance with Closed Eyes (mm)		
CoP max -M/L	25.00 ± 9.90	10.11 ± 2.00
CoP sd -M/L	4.20 ± 1.00	2.00 ± .00
CoP max-A/P	15.20 ± 3.30	10.44 ± 2.00
CoP sd-A/P	4.00 ± 2.00	2.01 ± .00
One Leg Stance with Closed Eyes (mm)		
CoP max -M/L	40.67 ± 0.80	20.00 ± 2.00
CoP sd -M/L	15.00 ± 2.00	4.11 ± 1.00
CoP max-A/P	40.00 ± 7.00	28.20 ± 4.00
CoP sd-A/P	9.15 ± 1.00	5.52 ± 1.00

Discussion

The present study examined the movement difficulties in children with DCD and to examine the balance ability between children with Developmental Coordination Disorder (DCD) and NON-DCD Group. The Body Coordination Test for Children was used in this study since the test examines the assessment of children's coordinative performance. The results showed that children participating in this study exhibited difficulty in balance along with the motor coordination difficulty indicating the existence of DCD disorder.

Motor skills and balance were still improving till the age of 8, to avoid the bias in balance control and motor performance in younger children, the age group selected in this study is 8 to 10 years of age, and the primary finding of the current research was COP Excursion was decreased in children with DCD. The reduction of ability to maintain balance has been well documented in children's with DCD. **TABLE 1** show that children with DCD have greater postural sway as compared to non-DCD children. This observation was done with closed eyes in children with DCD during balance testing. Proprioceptors play a major role in maintaining balance control rather than on visual afferent impulse.

DCD children have immediate adverse effects on academic and daily living skills because of balance disorder and have significant impacts on academic, psycho-social and vocational outcomes.

Conclusion

Children with DCD physically, psychologically and socially avoid participating in physical activities in order to avoid injuries due to their difficulty in balance. Thus, early identification and treatment of balance control difficulties are in increasing need.

A Comparative Study to Determine the Effectiveness of the Taping and Mulligan's Mobilization with Movement Techniques on Pain in Knee Osteoarthritis

Balaji R. Pawar[1], A. Jeganathan[2], R. Monisha[3]

[1]Student Bachelor of Physiotherapy, [2]Specialist Physiotherapy Practitioner, Cambridgeshire and Peterborough Nhs Trust, [3]Assistant Professor, SRM College of Physiotherapy, SRM Institute of Science and Technology, Chennai

ABSTRACT

Background: There is no cure for knee OA, thus conservative treatment aims to reduce pain and limit functional impairment. Inexpensive Non pharmacological, non-surgical interventions with minimal side effect are desirable. Such as the treatment offered by physiotherapists, there are recommended as the first line of treatment for hip and knee osteoarthritis (OA)

Methodology: 20 Patients took for the research study, they divided into two groups. Group A-10 Patients has given McConnell Patella taping, Group B-10 patients has given mobilization with movement, For both the groups each treatment session may last for 15-20minutes 4 days a week.

Result: As the results indicate, there was statistical significant effects following two techniques i.e. MWM and taping on pain in OA knee patients. Group A (MWM) shows the pre treatment mean of vas 6.1 and post treatment mean value is 2.2. the difference between pre and post treatment is 3.9 with p value <0.0001 i.e. significant

Conclusion: The study also emphasis that mobilization with movement is comparatively more beneficial in reducing pain than taping in OA knee patients

Keywords: *Osteoarthritis, MWM, McConnell patella taping*

Introduction

Life is movement, and movement is life. Live movements takes place at joints. Arthritis hampers joint movement and disturbs normal life. Osteoarthritis, is a joint disorder and most common form of arthritis, it is a deliberating progressive disease affecting 20% of the population, principally the elderly[1]. The commonly affected joints are knees, hips, spine and shoulder. Knee osteoarthritis is a degenerative disease of the knee joint more common in people older than 40 years predominately considered a 'wear and tear' process, where there is a gradual degradation of the hyaline cartilage that covers the articulating surfaces of the bones in the knee joint. It is regarded as the important socioeconomic problem because it is one of the foremost disabling conditions and its treatment entails great expenditures

The high incidence of knee osteoarthritis in India is the result of its prevalence among women who fall victim to it[2]. Menopausal women are especially prone to it. Till the age of 55 it occurs equally in both the sexes; after 55 the incidence is higher in women. It is estimated that approximately four out of 100 people are affected. The incidence of knee osteoarthritis in India is as high as 12 Per cent. Factors such as age, family history, obesity increase susceptibility to OA. In addition to these, local biomechanical factors like congenital anomalies, trauma, and occupational injuries affect the occurrence and localization of OA. Symptomatically, the most common

affected joint in OA is the knee joint[3].Old age cannot be healed or prevented. The common clinical features of knee osteoarthritis are pain stiffness and decreased range of motion. The commonest obstacle for the elderly to carry out ADL is the problem of joint pain and decreased mobility.

Changes in Osteo-Arthritic Knee

Joint Space Narrowing: Osteoarthritis causes deterioration of the joint structures, deterioration of articular cartilage leads to narrowing of the joint space (i.e., the space between the end of bones in a joint). Progressively smaller joint space suggests worsening of osteoarthritis. Joint space loss is usually not uniform within the joint.

Development of Osteophytes: Osteophytes , also called bone spurs, are protrusions of bone and cartilage. The bony projections are commonly seen in areas of a degenerating joint and can be seen on x-rays. Osteophytes, Which typically develop as a reparative response by remaining cartilage, cause pain and limited range of motion in the affected joint

Ligamentous Instability: Anterior cruciate ligament, posterior cruciate ligament, Medial collateral ligament , Lateral collateral ligament

Subchondral Cyst Formation: Subchondral cysts are fluid-filled sacs which extrude from the joint. The cysts contain thickened joint material, mostly hyaluronic acid, Traumatized subchondral bone undergoes cystic degeneration.

There is no cure for knee OA, thus conservative treatment aims to reduce pain and limit functional impairment. Inexpensive Non pharmacological, non surgical interventions with minimal side effect are desirable. Such as the treatment offered by physiotherapists, there are recommended as the first line of treatment for hip and knee osteoarthritis(OA). Given the prevalence of knee OA, its economic and human burden, and accumulating evidence supporting the effectiveness of various physiotherapy interventions for patients with knee OA of the hip or knee, further research is warranted[4]. Two common forms of physiotherapy intervention are patellar tapping and mulligan mobilization with movement recommended by international bodies

Patellar taping was invented by jenny McConnell, a physiotherapist. This intervention involves pushing the patella medially and securing it in this position with tape on the skin/ The acute effects of taping the knee as short term or intermittent treatment for knee pain is believed to relieve pain by improving alignment of the patellofemoral joint and/or unloading inflamed soft tissues.

Benefits of Patella Taping: When used correctly, patella tapping techniques can; decrease pain during sport or activity aid healing of certain knee injuries, correct patella alignment , allow an earlier return to sport or activity following injury , reduce the likelihood of injury aggravation, prevent knee injuries (such as a dislocated patella) during high risk of sports (such as basketball, football etc.,)

Objective of the Study

To study the effect of McConnell patella taping on pain in knee osteoarthritis.

To study the effect of Mobilization with movements on pain in knee osteoarthritis.

To compare the effect of McConnell patella tapping and mobilization with movements on pain in knee arthritis.

Need of Study: Application of mulligan's mobilization with movement techniques produced immediate pain relief after first treatment procedures thus MWM have been found to be feasible and efficacious in individuals with knee osteoarthritis. Taping has been proved cheap and effective method of treatment on pain in knee osteoarthritis. Taping and MWM techniques compared in this study for their effectiveness for treating patients with knee osteoarthritis[5].

Material and Methodology

Sample Size: The samples of the study will consist of 20 patients with knee joint osteoarthritis

Sampling Technique: Simple random technique is used

Population: The population for this study includes all subjects having osteoarthritis of knee.

Sample Selection

Inclusion Criteria: knee pain, age 50 years , body mass index 38, crepitus, bony tenderness , bony enlargement , no palpable warmth

Exclusion Criteria: Allergy to tape, secondary arthritis of kne or inflammatory condition like rheumatoid arthritis,

Body mass index 38(owing to difficulties of taping the knee effectively). Active infection around knee joint, patients who underwent knee surgery (previous 6 months), psychological problems.

Outcome Measures: Pain and functional disability

Measuring Tools: VAS (VISUAL ANALOG SCALE); Knee pain is recorded with VAS before and after each tape application and mobilization with movement.

Methodology

Treatment Protocol: 20 Patients took for the research study, they divided into two groups. Group A-10 Patients has given McConnell Patella taping, Group B-10 patients has given mobilization with movement, For both the groups each treatment session may last for 15-20minutes 4 days a week.

Before starting the study process all participants are informed with the study in general and the study aims and objectives. Consent forms and pre study information sheet has given to them prior to the study. The subjects have been randomly assigned to one of the two groups either the experimental group or control group. The participants were blind to which group they enrolled to.

At the first session, before giving the treatment demographic information was taken after that the participant was asked to use VAS to assess pain. Group A, was given therapeutic knee taping (patella taping) and Group B, was given mulligan's mobilization with movement (MWM) for the knee.

Taping Procedure: Patient is seated in a comfortable position usually supine at an optimal working height .The skin should be cleaned and dried, removing any grease of sweat. Full attention of patient is demanded. The joint is place in a functional position with minimum stress on the joint. It is ensured that the ligaments are in shortened position. The patient is explained about the function of the tape and how it feels.

McConnell Patella taping –Begin lying on your back, with the knee slightly bent, but completely relaxed and a foam roller or rolled up towel under the knee. Start the tape in line with the middle of the knee cap at the outer aspect of the knee. Using your thumb on top of the tape, gently push the knee cap towards the inner aspect of the knee whilst simultaneously using your fingers to pull the skin at the inner aspect of the knee towards the knee cap. Finish this taping technique at the inner aspect of the knee ensuring you have created some wrinkling of the skin at the inner aspects of the knee . repeat this process 1 – 3 times depending on the amount of support required[6].

Removing The Tape: Care should be taken when removing the tape to avoid injury aggravation or skin damage. The tape should be removed slowly, pulling the tape back on itself with pressure placed on the skin as close as possible to the line of attachment of the tape.

Mulligan's Mobilization With Movement (MWM) For Knee: The patient is in standing position and s asked to place the painful leg on the chair. The therapist then places his hands proximally around the lower leg and rotates the tibia medially and hand on the fibular side carries the fibula forward at the same time. sustaining this rotation the patient is asked to forward flex his knee provided there is no pain.

Results and Statistical Analysis

Table 1: Gender Distribution in the Sample Size Selected

Group	No. of Male	No. of Females
Group	No. of Male	No. of Females
MWM	6	4
Taping	7	3
Total	13	7

Table 2: Showing Mean of The Pre and Post Vas Measures of Mobilization with Movement and Taping

Groups	PRE (mean +/- S.D)	Post (mean +/- S.D)	Difference (mean +/-S.D)
MWM	6.1+/-1.595	2.2+/-1.033	3.9+/-1.524
Taping	5.3+/-1.337	2.6+/-1.114	2.7+/-1.059
P Value	<0.0001	0.0001	0.0558

Discussion

Many studies have been carried out to determine the effect of mulligan's mobilization with movement and patellar taping on various joints. Although this topic is widely discussed in earlier studies, the results obtained vary in most of the studies both the techniques have been proved beneficial in decreasing pain in osteoarthritis.

The current study was undertaken to investigate and compare the effectiveness of the mobilization with movement and taping in knee osteoarthritis patients Evgeniya Dimitrova ct al. (2008) conducted a study to provide evidence based recommendations for prescription of mobilization with movement. This study demonstrated that strengthening of knee musculature was more effective after the MWM and was associated with significant improvement in quadriceps strength and function, when compared with controls in reducing pain and improving function in individuals diagnosed with knee osteoarthritis, Wayne Hing ct al. (2006) conducted a stud to evaluate the overall efficacy of MWMs[7]. This study found significant positive results with MWM applications, when compared to placebo or control groups. The most common significant results found were increase in strength reduction in pain levels and increase in pain pressure threshold and Cushnaghan ct al (1994) conducted a study to test the hypothesis that medial taping of the patella reduces the symptoms of osteoarthritis of the knee when the patella-femoral joint is affected. The aims of this study were firstly, to evaluate the symptomatic benefit of knee taping designed to realign the patella in older subjects with knee osteoarthritis and secondly to apply rigorous clinical trail methodology to a physical form of treatment[8].

For the purpose of the study 20 patients were taken which divided in two even groups. 10 patients were given McConnell Patella Taping and 10 patients were given mobilization with movement. VAS was taken pre and post treatment to assess the pain. For both the groups each treatment session last for 15-20minutes 4 days a week.

Study included 13 male patients and 7 female patients out of 20 patients chosen for experiment. In group A, no. of male patients were 7 & no. of female patients were 3. In group B,6 patients were male & 4 patients were females.

As the results indicate, there was statistical significant effects following two techniques i.e. MWM and taping on pain in OA knee patients. Group A (MWM) shows the pre treatment mean of vas 6.1 and post treatment mean value is 2.2. the difference between pre and post treatment is 3.9 with p value <0.0001 i.e. significant

While taping shows pre treatment mean value of vas 5.3 and post treatment mean value is 2.6. The difference between pre and post treatment is 2.7 with p value 0.0558

Statistical analysis shows that mobilization with movement technique is more effective than taping.

Conclusion

Based on statistical analysis, its interpretation and evidence in the present study strongly emphasis that mobilization with movement and taping both are significantly effective in reducing pain in OA knee patients.

The study also emphasis that mobilization with movement is comparatively more beneficial in reducing pain than taping in OA knee patients.

Clinical Implications: The study suggest there is significant difference between in the effects of both the techniques thus more beneficial technique i.e. Mobilization with movement may be used in the treatment of knee OA.

Mobilization with movement may be used to decrease the pain in knee in osteoarthritis patients and improve the quality of life in OA knee patients

Limitations: The study was conducted in a small group of population so cannot be generalized to whole population and large study is required

Ethical Clearance: Taken from institutional ethical committee

Perception of Undergraduates and Postgraduates of the Scope of Periodontics

F. Mariyam Niyas[1], Radhika Arjunkumar[2]

[1]Graduate Student, [2]Reader, Department of Periodontics, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

ABSTRACT

Background and Aim: Periodontology is a fast evolving field where newer insights into existing concepts are changing the face of the traditional periodontal treatment. Constant research is taking place so as to develop a number of newer avenues in the treatment of the periodontal diseases. However, the protocol of management of periodontal diseases in the setup of general dental practice has undergone little change over the last decade. How do dental professionals view the scope of the specialty of periodontology? The aim of this study is to use a rank-order survey to determine the scope of periodontology according to undergraduates and postgraduates.

Method and Materials: Based on a previous study in which respondents were asked to list the answers to the question, ''Who is a Periodontist?'' The results were consolidated into eight statements. The eight statements were placed into a rank-order online survey. The responses primarily came from undergraduate dental students, interns, general dental practitioners and postgraduates of various departments.

Result: Undergraduates defined the scope of this practice by stating that the two most important aspects are surgical treatment of periodontitis and promotion of research towards better understanding of periodontal health and its relation with systemic diseases. The least important statement was that ''Periodontists are educators promoting health.'' Postgraduates perceive the specialty of periodontology differently than undergraduates in that they ranked surgical treatment and the esthetic surgical procedures as the two most important.

Conclusion: This study shows that there are differences between the two groups of respondents. With the information shown here, communication with a periodontist regarding their scope in the field, both undergraduates and postgraduates of other specialties will become knowledgeable and have a high diagnostic acuity.

Keywords: *Undergraduates; Postgraduates; Data analysis; Esthetics, Implant, Periodontics*

Introduction

The specialty of Periodontology is evolving in all aspects ranging from newer advances in diagnosis, to the use of growth factors and regenerative techniques in treatment. These evidence-based advances have given periodontal diagnosis and treatment a level of predictability of success, which was lacking just a decade ago. Quality dental institutes, which incorporate all these advances in their setup and curriculum, have evolved all over the country. Thus, today we see periodontology as a specialty reaching newer heights, and with a very bright future in front of it.

Historically periodontal therapy has been directed primarily at the elimination of disease and maintenance of a functional, healthy dentition and supporting tissues. More recently however it has become increasingly focused on esthetic outcomes, which extend beyond tooth replacement and tooth color to include the soft tissues framing the dentition. [1, 2]

In spite of the developing of quality dental institutes, a majority of the population visits private dental clinics for their dental needs, especially in the urban areas. The development of Internet as a reliable source of knowledge, and the publication of quality journals has made knowledge of periodontal treatment freely accessible to all practicing dentists. However, Periodontists commonly complain that the knowledge of periodontal diagnosis and treatment in the minds of a general dentist is sometimes limited to the level taught in the BDS curriculum at the time of their graduation.

How is the practice of periodontology defined? In today's world, a Periodontist a dentist whose prime therapeutic focus is to help to preserve natural teeth in health, or is the prime focus replacing the natural teeth with esthetically pleasing and functional implants? Should specialists in Periodontology increase time and attention toward the research and techniques of dental implants and ridge preservation/ augmentation, and thus chance the dilution of periodontal research for the natural dentition?

The contrast from the origins of the specialty of Periodontology in 1947 to today is noteworthy. In describing the responsibility and the scope of practice of Periodontics, the American Academy of Periodontology (AAP) presently states:

A Periodontist is a dentist who specializes in the prevention, diagnosis, and treatment of periodontal disease, and in the placement of dental implants. Periodontists are also experts in the treatment of oral inflammation. Periodontists receive extensive training in these areas, in the three additional years of education beyond dental school. They are familiar with the latest techniques for diagnosing and treating periodontal disease, and are also trained in performing cosmetic periodontal procedures [3].

However, replacing missing teeth has always been a concern for dentists, and doing so through dental implantology is not a new phenomenon. History has evidence of Egyptians and Mayans implanting sea-shells[4, 5, 6, 7] and the Romans using metal implants as replacements for lost teeth. [8] In the early 20th century, E.J. Greenfield[9] used a dental implant similar to those later used by Branemark et al. in the mid- 20th century.[10] However, it was the discovery of titanium's biocompatibility and ability to osseointegrate with human bone that exponentially increased the success rate of dental implants.[4] Today, dental implants have become a major part of the periodontist's armamentarium.

In an International Journal of Periodontics & Restorative Dentistry guest editorial dated September/ October 2008, entitled "Where is periodontology heading?" the author's dilemma of "moving away from our primary professional competencies" is discussed.[11] Is periodontology transitioning toward dental implants and implant-related procedures as a prime focus for practice rather than as a subcategory of the overarching core ideals of creating and maintaining a clinically healthy periodontium with the natural dentition? This thought was also stated in 2007 in the preface of Edward Cohen's atlas, in which, regarding dental implants, he stated, "Too often teeth are now prematurely extracted for implant placement."[12, 13]. Case study by Ramesh et al [14] reports placement of implants in generalized aggressive periodontitis where the esthetics and functions had to be restored. After 4 months of placement, the radiographs showed successful osseointegration of the dental implants without any biological complications. Such cases are primarily handled and followed –up by Periodontists for better treatment outcome.

Because of the dynamic history of periodontology and the innovations that have occurred, what is the scope of today's periodontist? The purpose of this research project is to demonstrate how undergraduates and postgraduates view the specialty.

Materials and Method

Based on a pilot study conducted Dr. Paul A. Levi Jr., [3] Department of Periodontology, Tufts University School of Dental Medicine in which respondents were asked to list the answers to the question, "What is a periodontist?" the results obtained were consolidated into eight statements. The eight statements were placed into an anonymous rank-order online survey. The link to the survey form was delivered to the respondents in digital form using an online survey program. The respondents were able to open the link on their mobile devices and fill in the survey at location of comfort. The responses primarily came from undergraduate dental students, interns, general dental practitioners and postgraduates of various departments. All participants were advised of the nature of the study and consented to respond. The

responses were gathered from online forum and tabulated and maintained in a secure file on a PC.

The definitions returned from the pilot were categorized into the following themes: implants, education, advising, cosmetics, research, surgery, oral hygiene, and co-therapists with other professionals. One sentence was created for each theme. These sentences were then labeled as statements and placed into a rank-order survey, which was then distributed, in digital form using an online survey program to widen distribution to undergraduates and postgraduates. The online survey ensured that all eight statements were ranked to complete the survey. Information collected along with the survey responses included: 1) Name; 2) Email address; 3) Designation; 4) Department; 5) Gender.

Inclusive criteria: Dental students, interns, general dental practitioners, post-graduate students, post-graduate practitioners were included in the study.

Exclusive criteria: Dental technicians, dental assistants, dental hygienists, persons of other medical profession, patients were excluded from the study.

Survey response collection was terminated when the two main groups of respondents from Saveetha Dental College, undergraduates(65%) and post-graduates(35%), had provided 100 responses.

Online Survey form

Name:

Email address:

Designation:

Department:

Gender:

Who is a Periodontist? (Rank the statements in order o relevance)

Statement 1: Periodontists perform dental implants and related procedures

Statement 2: Periodontists surgically treat advanced gum and bone infection problems

Statement 3: Periodontists promote research to better understand periodontal disease, their effect on systemic health and their related therapies

Statement 4: Periodontists are advisors to other dental and medical professionals in regards to diagnosis, prognosis and treatment planning

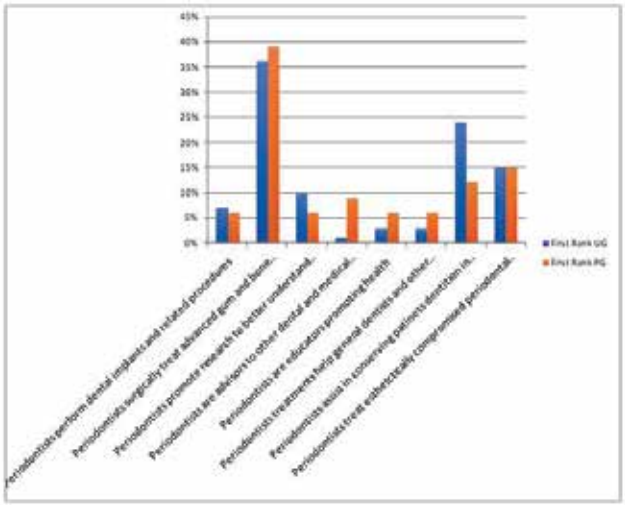
Statement 5: Periodontists are educators promoting health

Statement 6: Periodontists treatments help general dentists and other specialists increase successful therapeutic outcomes with their patients

Statement 7: Periodontists assist in conserving patient's dentition in health by emphasizing the patient's oral hygiene plaque control

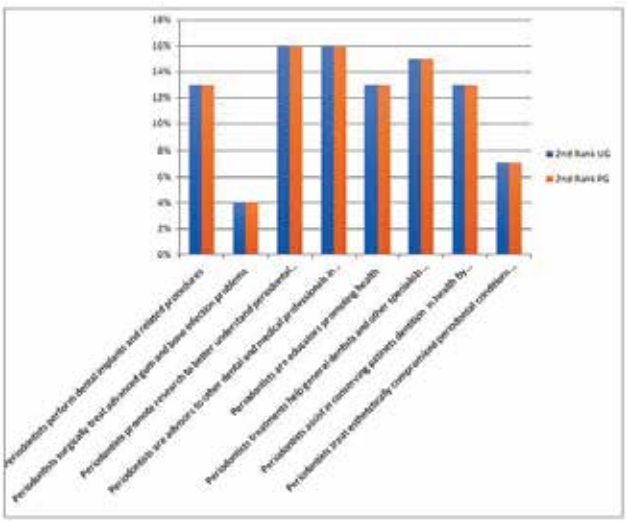
Statement 8: Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures

Data Analyses



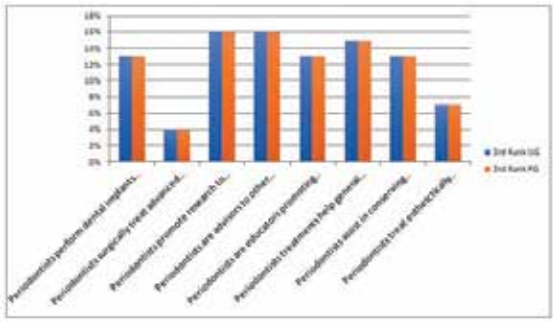
In total, 100 responses were received, and the information was compiled from the occupation variables to establish two general cohorts of responders: undergraduates (general practitioners, dental students), and postgraduates (which includes other specialists including periodontologists).

Descriptive analyses included frequencies and graphical outputs were obtained. The major cohorts were compared using manual data analysis to evaluate whether the rank order was different between the two groups for a specific statement.

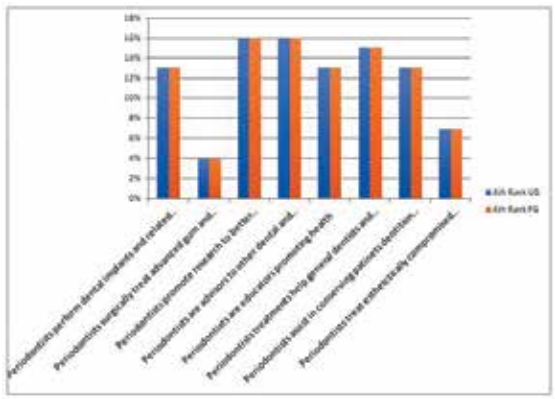


Results

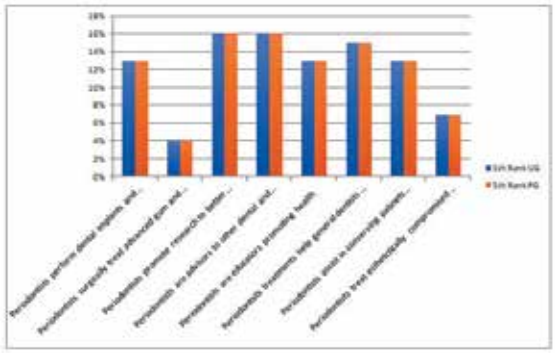
The rank order of the Periodontists' responses shows that statement 2, ''Periodontists surgically treat advanced gum and bone infection problems (36%),'' was considered the most important statement expressing the scope of periodontics by undergraduates. Statements 3 and 8, i.e., "Periodontists promote research to better understand periodontal disease, their effect on systemic health and their related therapies" and "Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures" were the second and third most relevant statements to the undergraduate students. The least relevant statement was found to be statement 1 and 5, that is, "Periodontists perform dental implants and related procedures" and "Periodontists are educators promoting health".



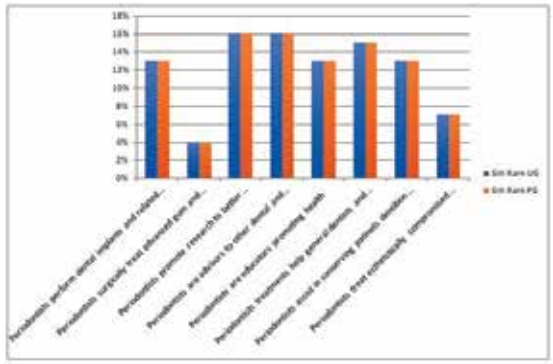
Postgraduates defined their scope of periodontics by stating that the most important aspect is statement 2, which states, "Periodontists surgically treat advanced gum and bone infection problems". The second and third most relevant points to them is statement 8, which states "Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures" and "Periodontists perform dental implants and related procedures. The least relevant statement was "Periodontists are educators promoting health". The results have been graphically represented form graph 1 to 8



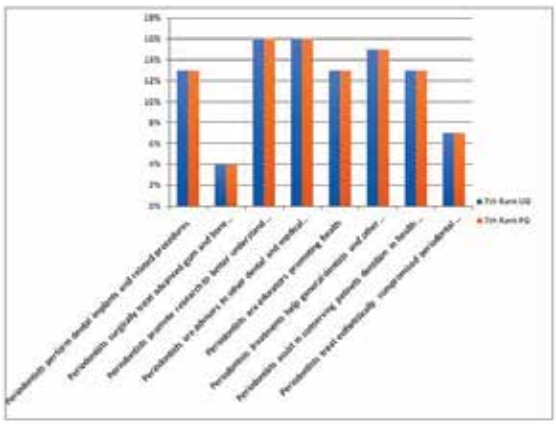
Graph 1: First Rank Given by Undergraduates and Postgraduates



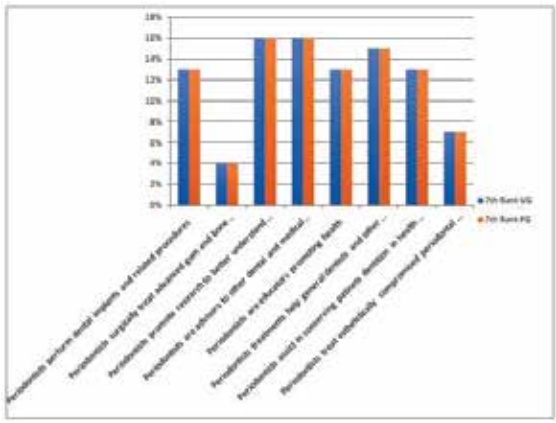
Graph 2: Second rank given by Undergraduates and Postgraduates



Graph 3: Third rank given by Undergraduates and Postgraduates



Graph 4: Fourth rank given by Undergraduates and Postgraduates



Graph 5: Fifth rank given by Undergraduates and Postgraduates

Graph 6: Sixth rank given by Undergraduates and Postgraduates

Graph 7: Seventh rank given by Undergraduates and Postgraduates

Graph 8: Eighth rank given by Undergraduates and Postgraduates

Discussion

The previously conducted study asked the respondents to list answers to the question "Who is a Periodontist?" and eight statements were compiled. All of the statements are important regarding the scope of the specialty; however, the purpose of this study is to determine how current-day undergraduates view the specialty of periodontology and how postgraduates view the specialty. [15]

In total, 100 responses were received, and the information was compiled from the occupation variables to establish two general cohorts of responders: undergraduates (general practitioners, dental students), and postgraduates (which includes other specialists including periodontologists).

Both groups of respondents ranked the statement "Periodontists surgically treat advanced gum and bone infection problems" the most important. This is because all dentists refer patients to Periodontists to have periodontal surgery; hence these results are not surprising. Along the same lines, both undergraduates and postgraduates of all specialties leave surgical periodontal therapy to the Periodontists. This also indicates that both undergraduates and postgraduates have a broad perception of the primary scope of periodontology.

In the past decade advances in implant surface technology and continuous clinical research have provided clinicians with innovative and efficient operative protocols for properly treating increasingly demanding clinical situations.[16]

The statements "Periodontists promote research to better understand periodontal disease, their effect on systemic health and their related therapies" and "Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures" were the second and third most relevant statements to the undergraduate students. This again indicates the importance given by undergraduates to the scope of periodontology with regards correlation of systemic health with periodontal health and in the growing field of esthetic dentistry.

The least relevant statement was found to be statements were, "Periodontists perform dental implants and related procedures" and "Periodontists are educators promoting health". This is a significant finding as it indicates a lack of awareness amongst undergraduates regarding the scope of periodontology in the field of implantology. Periodontists are the primary health advisors when it comes to maintenance of oral hygiene and undergraduates seem to have overlooked the role played by a periodontist in preventive therapy.

Among postgraduates, the second most important statement was considered to be "Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures" again giving importance to the scope of periodontics in esthetic dentistry.

The second and third most relevant points to them is statement 8, which states "Periodontists treat esthetically compromised periodontal conditions through bone and soft tissue (gum) procedures" and "Periodontists perform dental implants and related procedures. So here

we can see how postgradutes are more aware of the role of a periodontist in the placement of implants. The least relevant statement was "Periodontists are educators promoting health".

Thus, it appears that postgraduates feel that next to surgically treating periodontal infection, placing implants and doing implant associated osseous augmentation procedures is third most important in their scope of practice.

The survey provides insight into how undergraduates define the scope of this specialty and how the postgraduates perceive it. The overwhelming accord is that all cohorts feel that the most important aspect of the Periodontists is to surgically treat advanced gum and bone problems.

There are limitations to this study in that the interpretation of each statement is related to individual perceptions, which is influenced by training and experience. A similar study by physicians specializing in HIV found that their convenience sample could not necessarily be generalized to all physicians providing HIV care. The present study had a similar limitation. In addition, the results are limited by the nature of self-reported data just as the data were in the HIV–physician study [17].

Going forward, it would be interesting to see if there were further differences if a wider population of undergraduates and postgraduates were used.

Conclusion

Undergraduates defined the scope of this practice by stating that the two most important aspects are surgical treatment of periodontitis and promotion of research towards better understanding of periodontal health and its relation with systemic diseases. The least important statement was that ''Periodontists are educators promoting health.''

Postgraduates perceive the specialty of periodontology differently than Periodontists in that they ranked surgical treatment and the esthetic surgical procedures as the two most important. Communication by the periodontist to the general dentist is important to provide knowledge of their scope of practice and guidance for their therapies. From this, the undergraduates and postgraduates of other specialties will become knowledgeable and have a high diagnostic acuity.

This study shows that there are differences between the two cohorts. With the information shown here, periodontal care by Periodontists can be specifically targeted to better serve patients and referring dental health professionals.

Correlation between the Nature of Toothpaste and the Prevalence of Brushing Habits of Children Residing in Chennai

Rinieshah Nair R. Baskran[1], Deepa Gurunathan[2], Madhusudhan Vasantharajan[3]

[1]Graduate Student, [2]Professor, [3]Senior Lecturer, Department of Pedodontics and Preventive Dentistry, Saveetha Dental College, Saveetha University, Saveetha Institute of Medical and Technical Sciences, Chennai, India

ABSTRACT

Aim: To correlate the nature of toothpaste used to the brushing habits of children in Chennai.

Objective: To assess the preference of children in relation to the type of toothpaste used by them.

Background: A number of factors should be taken into account when designing toothpaste formulations for children at the different stages of their development. They all contribute to the formation of brushing habits of children. An ideal children's toothpaste formulation should maximise fluoride availability, along with the levels and types of surfactant that will decrease the interference with a child-friendly, pleasant brushing experience. The ultimate goal is to maximise the compliance by providing a more pleasurable brushing experience and oral health benefits.

Reason: To deliberate the nature of the tooth paste in correlation with the brushing habits of children in chennai.

Keywords: *toothpaste, nature, content, children, brushing habits, oral health.*

Introduction

Dental care has consistently persevered to improve the quality of dental health among the public. On the contrary however, children do not really grasp the importance of a well taken cared of dentition. [(1)] Children find brushing their teeth on a regular basis, a cumbersome task. Furthermore, using an oral hygiene aid, commonly associated with toothpaste, to brush their teeth can be challenging as children have unalterable preferences for whatever they put in their mouth[(2,3,4,5)].

Dentists' best efforts to effectively educate their paediatric patients to brush their teeth are only as good as the products introduced. In this case, toothpaste has become the light of the subject at hand[(6,7,8)]. The uncertain nature of the toothpaste used can waver the child's perception towards maintaining a positive attitude in sustaining a healthy environment in the oral cavity[(9,10,11,12)]. Parents also have an influence in proper oral hygiene habits on their children. However, most parents are barely even equipped with basic oral hygiene habits and educate themselves only when the situation turns grave.

Technology on the other hand is always improving. People are always inventing something for the betterment of their community. In the field of dentistry, something as simple as toothpaste has rendered a huge change in terms of oral hygiene. As time went, the nature of toothpaste has been a major influence for the older generation as well as the new, especially children.

This research provides answers to whether the nature of toothpaste in terms of taste[(13)], texture[(14)], smell[(15)], appearance[(16)], colour[(17)], flavour[(18)], foam production[(19)]

and cooling effect affects the tooth brushing habit of children[20]. The queries are made into a set of 10 questions and were distributed to school children between the ages of 7-12. The aim of this survey is to correlate the nature of toothpaste to the brushing habits of children in Chennai.

Materials and Method

A questionnaire consisting of a series of 10 questions was made based on the topic of this survey. This survey was conducted to correlate the nature of toothpaste with the brushing habits of children . It was conducted among 100 school students. The students were randomly chosen, with ages ranging from the ages 9 to 12 years old as the constant variable. An official letter was written to the principal of the schools contacted to aid us conduct the survey at their institution. Each student was given one questionnaire, and was asked to answer the questions honestly. The students were also informed that if they were not able to understand the questions they could ask and they would be given a verbal explanation. The questionnaire was designed to provide adequate information to successfully carry out this survey. The results obtained were then statistically tabulated according to the questions asked. (Table 1)(Figure 1)

Results

Table 1: The results obtained from the questionnaire were tabulated in the table below

No.	Questions	A	B	C
1.	How often do you brush your teeth?	47	23	30
2.	Do you use toothpaste to brush your teeth?	19	11	70
3.	How much toothpaste do you use to brush your teeth?	0	33	67
4.	What is your immediate response after brushing your teeth?	12	0	88
5.	Do you brush your teeth under parental supervision?	40	50	10
6.	Do you like the smell of your toothpaste?	78	12	10
7.	Do you like the colour of your toothpaste?	68	22	10
8.	Does the taste of your toothpaste affect your brushing?	10	20	70
9.	Does your toothpaste taste sweet?	45	11	44
10.	Does the advertisement for the toothpaste you are using affect your preference in toothpaste choice?	50	35	15

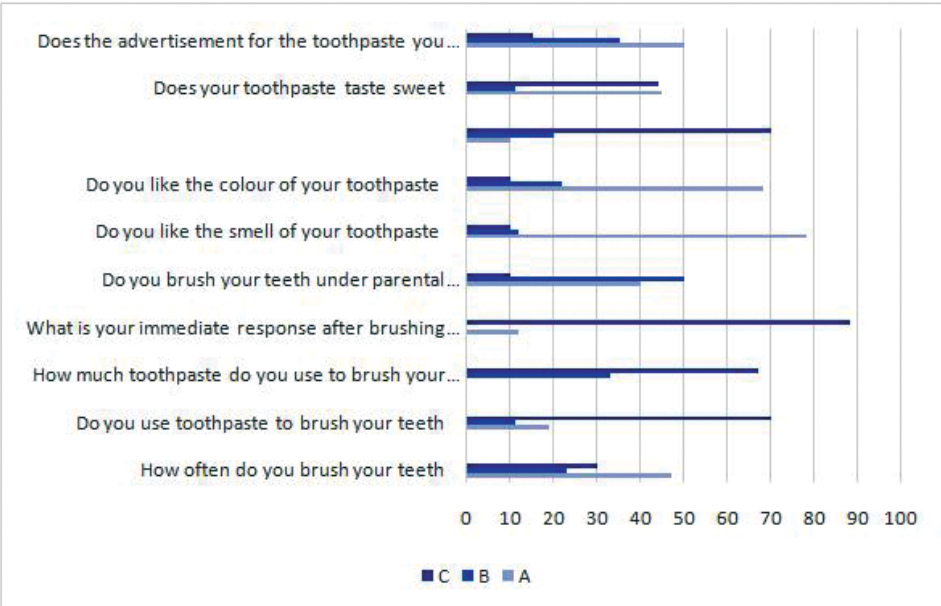

Figure 1: Correlation between the nature of toothpaste and the brushing habits of children in chennai

Table 1 shows 47 people chose option A which is that they brush their teeth once a day. 23 people brush their teeth twice a day. 19 people use toothpaste to brush their teeth while 70 of them occasionally use toothpaste to brush their teeth. 67 people use toothpaste amounting to the full length of the tooth brush while 33 of them use it to only half the length of the toothbrush. 88 people gargle after brushing their teeth while only 12 of them spit it out without rinsing. 50 of them do not brush their teeth under parental supervision while 40 of them still brush their teeth under parental supervision and 10 sometimes brush their teeth under parental supervision.

78 of them like the smell of their toothpaste, 12 of them do not like it while 10 of them do not even notice. 68 of them like the colour of their toothpaste, 22 of them do not like it while 10 do not even notice. 70 of them are unaware that the taste of the toothbrush affects their brushing habits, 20 of them disagree while only 10 agree that the taste of the toothpaste affects their tooth brushing habits. 45 people use sweet toothpaste however, 44 of them do not even notice the taste of their toothpaste and 10 of them do not use sweet tasting toothpaste. 50 people are influenced by the advertisement used to advertise the toothpaste that they are currently suing to brush their teeth. 35 of them disagree with the advertisement used to advertise their toothpaste so it does not affect their preference in the toothpaste they use to brush their teeth and 15 of them are not aware.

In a nutshell, most of the children brush their teeth once a day, and only sometimes use toothpaste to brush their teeth. The amount of toothpaste used is the full-length of the toothbrush. The immediate response after brushing their teeth is to gargle with water. The children seldom brush their teeth under parental. They like the smell of their toothpaste and are attracted to the colour of the toothpaste they use to brush their teeth. However, they do not pay attention to the taste of their toothpaste. Most of them have toothpaste that tastes sweet. The advertisement for the toothpaste they are using affects their preference in toothpaste choice while brushing their teeth.

Discussion

The results obtained shows that the children brush their teeth once with a reasonable amount of toothpaste everyday. This is because parents nowadays, tend to leave home for work very early in the morning and neglect their children. Some parents are homemakers but are unaware of the importance of brushing the teeth of their children twice a day because they themselves do not practice good oral hygiene habits. Ergo, the children do not comprehend that something as simple as brushing their teeth can help them prevent various other health problems that can relate to poor oral hygiene. Parents should get themselves involved in their children's health and hygiene routine to ensure that they are on track.

About 88% of the students gargle with water after brushing their teeth which is preferred as gargling cleans the mouth even more after brushing. The suds formed by the toothpaste will also be bothersome to the child as some toothpaste produce a lot of foam. However, another study showed that gargling after brushing increases the tendency to obtain caries on the teeth. The content of toothpaste, in general has fluoride which basically helps strengthen the enamel of the teeth. Gargling after brushing removes all the fluoride from the teeth leaving only the fresh taste of toothpaste without the needed function.

The sud that is formed is due to the presence of Sodium Lauryl Sulphate (SLS), a chemical that causes foam and sud to form in any product[21]. That chemical is responsible for the foam from the toothpaste during brushing. If the child does not prefer foam while brushing, then getting toothpaste with lesser SLS content will help boost the child's interest in brushing their teeth.

Colour, taste and smell may seem irrelevant when it comes to toothpaste but it actually plays a major role in ones toothbrushing habit especially children. As children, they are drawn to objects with a lot of colour and vibrant animation. The toothpaste designed for children should be colourful and striking to get more children to enjoy brushing their teeth as if it was a leisurely activity. Toothpaste in general has a minty taste and smell to allow the individual to feel fresh and clean after brushing their teeth. Children however have the tendency to develop preference in these matters and have difficulty liking the mint flavour as it may be too strong. Therefore, it is only fair that toothpaste with a variety of flavours is produced to increase the number of children who will enjoy brushing their teeth. The colour of the toothpaste may also help increase the child's preference in brushing their teeth. The probability of a child to brush his or her teeth with a toothpaste of their favourite colour, to a child brushing his with white-coloured toothpaste is almost

too good to be true. Children often overcompensate anything they can control. In this case, the amount of toothpaste they use while brushing their teeth. Children tend to think that more is better and ergo, they use a full-length of toothpaste to brush their teeth. It is up to the parents to educate their children to control the amount of toothpaste used. The more the amount of toothpaste, the higher the amount of foam and sud produced. That doesn't necessarily mean that it is good for the teeth. Too much of anything will cause an adverse effect. Based on this survey conducted, the nature of toothpaste plays a major role in influencing the children to brush their teeth. The colour, taste and smell all stimulate the main senses allowing the child to be more attentive to the nature of the toothpaste, thereby increasing the usage of toothpaste while brushing their teeth.

Based on a study conducted by Alex G. Stovell, Bernie M. Newton and Richard J. M. Lynch entitled Important Consideration in the Development of Toothpaste Formulation for Children[22], good oral hygiene habit can only be encouraged if the products used are appealing. As the child ages, psychological preferences for taste and smell, among other things will start to develop. They tend to compartmentalise the things they like and dislike. When they get used to not brushing their teeth, it becomes a habit and habits, good or bad, are hard to die. Hence, it is really important to start at an early age. Children should be encouraged to brush their teeth twice, every day to prevent caries which will eventually cause the kid pain and discomfort. To encourage oral hygiene habits, a child must be nipped in the bud to ensure positive results. In order to do that, the nature of the toothpaste used has to be child friendly and at the same time provide the child with oral hygiene care.It should allow the child to feel good about their oral hygiene and their efforts in maintaining it. An ideal children's toothpaste formulation should therefore aim to maximise fluoride availability, minimise abrasiveness and use levels and types of flavour and surfactant that will minimise interference with fluoride delivery and deliver a pleasant brushing experience. A pleasant brushing experience throughout the developing years should aid in the establishment of good brushing habits and good oral health for life. In a study by Adair,12 preschool-aged children were seen to use larger amounts of dentifrice, brush for longer periods of time, rinse and expectorate less when using a child-flavored dentifrice than when using an adult-flavored dentifrice[23]. Other studies have also determined that children use more dentifrice when the product is a dentifrice flavoured for children[24]. In conclusion, there are many factors that affect the brushing habits of the children. In this survey, it is derived that children are highly influenced by the nature of toothpaste especially children from a younger age group. Ergo, it can be fairly understood that the nature of toothpaste plays a vital role in the brushing habits of children.

Conflict of Interest: Nil

Statement of Informed Consent: There was no need for any informed consent of the participant as there was no personal information taken during this survey. The identity of the participants remain anonymous.

Statement of Human and Animal Rights: This research was done in accordance with the ethical standards of Helsinki Declaration of 1975, as revised in 2000. No animals or humans were harmed in this process.

Source of Funding: This research was self funded.

Ethical Clearance: Taken from International Committee of Medical Journal Editors.

Effect of Structured Therapeutic Exercises Protocol on Physical Functional Status in Women with Varying BMI

Ruchita R Shah[1], S. Anandh[2], G. Varadharajulu[3]

[1]Faculty of Physiotherapy, [2]Professor, Department of Community Health Science, [3]Dean, Faculty of Physiotherapy, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: To find the effect of exercises on strength, endurance, flexibility and quality of life in women with varying BMI.

Method: The study was conducted at physiotherapy department at Krishna Institute of Medical Sciences Karad. A total 62 participants were includes and divided into 4 groups according to their BMI (underweight (15), normal weight (15), overweight (17) and obese class I (15)). All groups were given same strengthening exercises and stretching for upper and lower limb.

Result: Statistical analysis was done by parametric repeated measures ANOVA test. p values for Bench press, Leg press, YMCA-Step test, Sit and reach test and SF-36 were calculated. While comparing the post exercises values, the result revealed that in all the 4 groups there was significant improvement in strength, flexibility and quality of life with p vale <0.0001 respectively. But for endurance there was significant difference seen in group B with p value < 0.0147 and group C with p value <0.0001.

Conclusion: The study concluded that strengthening and stretching exercises has showed effect in all 4 groups but more marked in group C.

Keywords: *BMI, Strengthening exercises, stretching, Bench press, Leg press, YMCA-Step test, SF-36.*

Introduction

Over the years women are performing high physically demanding tasks with increasing workforce and needs. Striving to achieve the goals they do not consider their well being along with fitness as a whole. Females belong to full time working categories or freelance or farming along with their regular household duties. Their basic health requirement to combat against tiredness and musculoskeletal fitness plays a significant role to overcome their daily activities with ease.

According to recent report done in 2011 published by Census of India, it stated that from total population 48.43% were females, from these 16.96% females are between 30-40 years of age[1].Women in India ignore physical fitness, only few women participate in fitness exercises. A National Study of Physical activity pattern "Physical activity and inactivity patterns in India – results from the ICMR-INDIAB study (Phase-1)" conducted in four states Chandigarh, Jharkhand, Maharashtra and Tamilnadu it states that overall in rural area (n=10054) 59.6% females were inactive, and in urban area (n= 4173) 71.2% females are inactive. In Maharashtra from rural area (n=2656) 56.8% females are inactive and in urban area (n=1248) 68.5% females are inactive [2].

Health status of young and middle aged adult women to be targeted and perfect physical education is important. Many physiological changes occur in human body as we age. Maximum muscular strength and cross sectional area is between the ages of 20-30 years. After 30 years physiological degenerative changes start, the rate of these changes depends on the lifestyle of the individual [3].

Components of health in relative to physical fitness are strongly related to overall health which are characterized by the capacity to carry out activities of daily living with physical strength and are strongly interrelated with lower prevalence of chronic diseases and related risk factors [4].

Body mass index (BMI) is calculated simply by considering two components i.e. weight and height. BMI is weight for height, weight in kilogram and height in square meters (kg/m^2) [5, 6].

Muscular strength, endurance and power are combined into single term "muscular fitness" and it is considered as a vital part of taken as a whole health related fitness based on quality and amount of exercises, to build up and maintain fitness [7].

Cardio respiratory fitness (CRF) is the capacity of the vascular and pulmonary system through constant physical activity to supply oxygen to the skeletal muscle[8].

Flexibility is the competence of the joint to move throughout the range of motion[8].

There is paucity of literature that shows the relation of physical functions across varying BMI categories in adult women and very little is known about exercise performance, well being and physical functional capabilities in women.There exists a need to assess physical functional status in adult women across varying BMI categories. Till today studies are mostly done in general population, but less research work done as per varying BMI categories in women.

So the present study intended to find the influence of therapeutic exercises on women with varying BMI on their physical functional status and quality of life.

Method

The study was conducted at Physiotherapy department of Krishna institute of medical sciences. Ethical permission was obtained from institutional ethical committee, KIMS, Karad. 62 subjects were included and were divided into 4 groups according to their BMI. Subjects were selected according to inclusion and exclusion criteria. Before including in the study they were asked to fill Physical Activity Readiness questionnaire (PAR-Q). It consists of 7 questions which they have to answer in YES or NO. If the answer is yes to any of the questions they were not included in the study. Written informed consent form was taken and the whole study was explained to them. Inclusion criteria were as follows: (1) Age group 30-40 (2) Gender – females (3) BMI categories from under weight to obese classification I. The exclusion criteria were as follows: (1) Arthritic disorder (2) Hypertension or hypotension (3) Hyperthyroidism or hypothyroidism (4) Cardiac condition (5) Diabetes mellitus (6) Surgeries undergone in past 6 months (7) Recent pregnancy.

The nature of the study and intervention were explained to the subjects and those who willing to participate were included in the study. A written consent was taken from the subject. Then according to their BMI they were be allotted in to the respective group.

Group A – less than 18.50 Kg/m^2

Group B – 18.50- 24.99 Kg/m^2

Group C – 25- 29.99 Kg/m^2

Group D – 30-34.99Kg/m^2

Following therapeutic exercise protocol was given to all the groups, 4 times a week–

1. Warm-up - 5-7 minute Low intensity free exercises for 5-7 minutes.
2. Strengthening exercises- Strengthening exercise with dumb bells and sand bag are given for upper limb and lower limb. 3 sets of 12 repetitions with load of 60-70% of 1 RM.

Upper limb: Overhead press, Biceps curl, Lateral pull down, Triceps push-down, Bench press.

Lower limb: Hip extension, Hip abduction, Hamstring curls, Calf raise, Squats.

1. Stretching exercises- Stretching is given to various muscles of upper and lower limb for duration of 30 seconds hold for each stretch with 3 repetitions

Upper limb: Bicep stretch, Triceps stretch, Trapezius stretch.

Lower limb: Quadriceps stretch, Hamstring stretch, Hip flexor stretch, Gluteus stretch, Hip adductor stretch, Calf stretch.

1. **Cool down:** Low intensity free exercises to all the joints for 5-10 minutes.

Primary assessment was done on Day 1 and post exercises assessment was taken at the end of 2nd Week and 4th Week by Bench press, Leg press, YMCA-Step test, Sit and Reach test and SF-36.

Result

Outcome Measure

1. Strength test- 1-RM Test: Bench press and Leg press

Table1: Comparison of pre and post for strength within group

Group	Test	Pre Exercises Day 1		2Nd Week Post Exercises		4Th Week Post Exercises		F Value	P Value
		Mean	SD	Mean	SD	Mean	SD		
GROUP A	Bench press	0.36	0.15	0.36	0.15	0.41	0.14	28.778	<0.0001
	Leg press	1.12	0.16	1.14	0.17	1.17	0.17	26.692	<0.0001
GROUP B	Bench press	0.42	0.16	0.49	0.16	0.57	0.16	172.32	<0.0001
	Leg press	1.10	0.22	1.17	0.21	1.27	0.22	152.05	<0.0001
GROUP C	Bench press	0.40	0.16	0.47	0.16	0.55	0.16	232.70	<0.0001
	Leg press	1.02	0.20	1.11	0.21	1.19	0.22	86.414	<0.0001
GROUP D	Bench press	0.30	0.10	0.30	0.10	0.32	0.10	12.115	<0.0002
	Leg press	0.76	0.19	0.77	0.20	0.77	0.20	12.283	<0.0001

The table shows the comparison of mean and standard deviation of pre and post values of 1-RM strength test Bench press and Leg pressin Group A, B, C and D. The values are compared by applying Repeated Measures ANOVA test followed by Tukey Kramer multiple comparison test. In all 4 Groups there was significant improvement with p value <0.0001 respectively.

2. Endurance test: YMCA-Step test-

Table 2: Comparison of pre and post YMCA-Step test within group

Group	Pre Exercises Day 1		Post Exercises 2Nd Week		Post Exercises 4Th Week		F Value	P Value
	Mean	SD	Mean	SD	Mean	SD		
Group A	112.00	8.05	111.20	6.44	110.73	8.25	1.448	0.2521
Group B	113.00	9.41	110.73	8.42	109.53	9.66	4.924	<0.0147
Group C	114.53	7.27	111.59	6.11	107.29	6.65	12.551	<0.0001
Group D	122.00	6.66	120.33	5.27	121.47	6.01	0.9288	0.4069

The table shows the comparison of mean and standard deviation of pre and post values of Group A, B, C and D. The values are compared by applying Repeated Measures ANOVA test followed by Tukey Kramer multiple comparison test. In Group B and C showed significant improvement with p value <0.0147 and <0.0001 respectively.

3. Flexibility test: Sit and Reach test-

Table 3: Comparison of pre and post Sit and Reach test within group

Group	Pre Exercises Day 1		Post Exercises 2Nd Week		Post Exercises 4Th Week		F Value	P Value
	Mean	SD	Mean	SD	Mean	SD		
Group A	29.70	6.35	30.23	6.29	31.13	6.40	43.314	<0.0001
Group B	33.93	8.18	36.06	8.06	38.12	8.18	145.13	<0.0001
Group C	32.09	5.35	34.44	5.06	36.35	5.61	39.080	<0.0001
Group D	29.13	5.19	30.23	4.89	30.91	4.67	22.260	<0.0001

The table shows the comparison of mean and standard deviation of pre and post values of Group A, B, C and D. The values are compared by applying Repeated Measures ANOVA test followed by Tukey Kramer multiple comparison test. In all 4 Groups there was significant improvement with p value <0.0001 respectively.

4. SF-36 QOL

Table 4: Comparison of pre and post SF-36 within group

Group	Pre Exercises Day 1		Post Exercises 2Nd Week		Post Exercises 4Th Week		F Value	P Value
	Mean	SD	Mean	SD	Mean	SD		
Group A	34.52	7.48	35.95	7.45	39.52	7.57	58.500	<0.0001
Group B	53.57	5.05	57.62	5.54	62.62	5.21	134.67	<0.0001
Group C	51.89	6.45	56.93	5.85	63.45	5.72	98.372	<0.0001
Group D	36.19	6.60	40.24	6.54	45.24	7.95	57.863	<0.0001

The table shows the comparison of mean and standard deviation of pre and post values of Group A, B, C and D. The values are compared by applying Repeated Measures ANOVA test followed by Tukey Kramer multiple comparison test. In all 4 Groups there was significant improvement with p value <0.0001 respectively

Discussion

The study was conducted considering all the mentioned points and the aim of this study was to evaluate the effect of exercises on physical functional status of women according to their BMI categories.

In this study 62 women were selected and were divided into 4 groups according to their BMI. All the subjects were explained about aims and objective of the study. Each group was given same strengthening and stretching exercises. The pre and post exercises data was analyzed statistically using Repeated measures ANOVA (parametric methods) followed by Tukey Kramer multiple comparison test.

Strength of upper limb assessed by Bench Press shows post exercises (4th week) mean and standard deviation for group A is 0.41(0.14), group B is 0.57(0.16), group C is 0.55(0.16) and group D is 0.32(0.10); whereas for lower limb assessed by Leg Press post exercises(4th week) mean and standard deviation as for group A is 1.17(0.17) , group B is 1.27(0.22), group C is 1.19(0.22) and group D is 0.77(0.20) with p value <0.0001.

Step test used to assessed endurance (CRF) shows post exercises (4th week) mean and standard deviation for group A is 110.73(8.25), group B is 109.53(9.66), group C is 107(6.65) and group D is 121.47(6.01) with p value <0.0147 for group B and <0.0001 for group C.

Flexibility assessed by Sit and Reach Test shows post exercises (4th week) mean and standard deviation for group A is31.13 (6.40), group B is 38.12(8.18), group C is 36.35(5.61) and group D is 30.91(4.67) with p value <0.0001.

Quality was assessed by Sf-36 shows post exercises (4th week) mean and standard deviation for group A is 39.52(7.57), group B is 62.62(5.21), group C is 63.45(5.72) and group D is 45.24(7.95) with p value <0.0001.

Overall in GROUP C all study variables shows early and significantly large change and also the same was observed in further follow up times.

In this study an attempt was made to analyze the effect of strengthening and stretching exercises for upper and lower limb on strength, endurance, flexibility and quality of life in women with varying BMI. Though it is known that aerobic exercises improves endurance but in this study the subjects are given strengthening exercises and stretching for upper and lower limb to see its effect on endurance.

Many literature states that muscle strength that can improve and maintain the following[9]

1. Bone mass that is related to osteoporosis.
2. Musculo-tendinous reliability that is associated to a lower risk of injury including low back pain.

3. The aptitude to carry out the activities of daily living, which is related to apparent quality of life and self-efficacy among other indicators of mental health.
4. The Fat Free Mass and resting metabolic rate, which are related to weight management.

Resistance exercises have an effect on improving strength [10] and bone density [11]. Various studies shows benefit of resistance exercises is a significant component for enrichment of health and progress quality of life even when the exercise is done in advance ages[12-15].

The most vital criteria of health related Quality of Life is body weight in women whereas very less data is available on women's functional health status [16], so in this study an effort is made to find the relation of the women's BMI and functional health.

Conclusion

The present study concludes that the therapeutic exercises has a significant improvement in women pertaining to components of strength, flexibility and quality of life, in all four groups; whereas only in group B and group C showed significant improvement in Step Test (endurance). According to mean difference group C has shown more significant improvement then other three groups.

Effect of Choice-Based Sensory Stimulation as a Coma Stimulation Technique on Traumatic Brain Injury

Sayli D. Deshpande[1], G. Varadharajulu[2], Suraj Kanase[3]

[1]Faculty of Physiotherapy, [2]Dean, Faculty of Physiotherapy, [3]Associate Professor, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to check the effect of choice-based sensory stimulation as a coma stimulation technique on traumatic brain injury.

Method: 30 subjects diagnosed with traumatic brain injury were included in this study. These subjects were divided into two groups using convenient sampling method with random allocation. The subjects with Glass gow Coma Scale score 3-8 were included. Pre- treatment and post- treatment assessment for both the groups was carried out by using WNSSP(WNSSP). This outcome measure was analyzed.

Result: The choice-based sensory stimulation showed the significance improvement in arousal response according to WNSSP. The P value was <0.0001, which is statistically significant.

Conclusion: the present study provided evidence to support the use of choice-based sensory stimulation as it is more effective than conventional coma arousal techniques in coma arousal on traumatic brain injury.

Keywords: *Traumatic Brain Injury, choice- based sensory stimulation, Western Neuro Sensory Stimulation Profile (WNSSP).*

Introduction

Traumatic Brain injury is defined as brain damage caused by externally inflicted trauma to the head, may result in significant impairment of an significant impairment of an individual's functioning–physical, cognitive & psychosocial.[1]

Traumatic Brain Injury is known to be a leading cause of morbidity, mortality, disability & socio-economic losses in India.[2]

Traumatic brain injury causes long term effect on an individual's life. About 5.3 million people in United States are living with disability due to brain injury.[3]

Traumatic brain injury secondary to road traffic accidents mainly leads to coma.[4-7]

Most of people are recovered frequently but suffer with altered consciousness and cognitive function for certain time period. If, these alterations persists for longer duration , then it will ultimately affect one's normal life.[8,9]

Patients with coma are been hospitalized for longer duration and a complete bed rest which decreases the sensation perception due to reduced sensory stimulus.[10]

Coma is a state which endure for about months and years that will ultimately affect the quality of life of patient. There is an assumption that implementation of well-planned sensory stimulation program on severe TRAUMATIC BRAIN INJURY patient will have an progressive effect on arousal, recovery and sensory loss.[10-13]

Coma Stimulation Techniques

Various types of sensory stimulations can be applied in patients with coma as a coma arousal technique. They are as follows:

1. **Auditory:** Allow one family member at a time to interact with the subject. Use of radio, TV, tape recordings of familiar voices, etc can also be useful.
2. **Visual:** For visual stimulation, subject must be surrounded with brightly colored pictures, family photo, any familier object and TV. Visual stimuli also include familiar faces (father, mother, brother, sister, husband, wife, friends etc.), familiar object, or a mirror.
3. **Tactile:** Touch senses is either inhibiting or facilitating, e.g. pain, light touch are inhibiting while light strokes to the back area result in facilitating. Face is the most sensitive area. Variety of textures such as, clothing, blankets, lotions etc. Squeezing technique of massage also can be applied. The pressure must be firm and should not hurt the subject.
4. **Olfactory:** In traumatic brain injury, olfactory nerve is most commonly affected. Maximum subjects are intubated (i.e. tracheostomy, Ryle's tube etc.). For olfactory stimulus perfume, coffee powder, shampoo, favourite food etc. can be used. Olfactory senses should not be stimulated for more than 10 seconds as subject may get adapted to that. The stimuli should not touch the skin as subject can adapt and become less responsive to the stimuli. Irritable stimuli must be svoided such as vinegar, ammonia etc.
5. **Gustatory:** Subject must not be prone to the aspiration. Cotton swab is dipped in sweet, salty or sour solution and applied in the subject's mouth. Sweet taste causes more salivation, so, in case of oral secretions, sweet taste must be avoided.
6. **Movement:** Range of motion exercises are used as movement stimulation
7. **Kinesthetic:** Various changes in position such as, rolling, rocking in chair etc. are used as kinaesthetic stimulation.

Choice-Based Coma Stimulation

Choice-based stimulation is applied directly by the family member of the subject. It is an intervention in which family members are directly involved for applying the coma stimulation technique to arouse the subject. This includes the interaction of the respective family member with the subject. The family members had freedom for making their choice in accordance with the subject's need for coma stimulation. The above mentioned techniques are the choices which are available for the family members in concern with the need of the subject. The family member was asked to tell their family stories, speak about the good and happy moments which subject had spent with the family, show the family photo, apply the taste stimulus using cotton swab(taste of subject's favorite food) etc. This stimulus was given by the member who was closest to the subject. Due to emotional attachment between the subject and their family member, the impact of sensory stimulation given by family member may help to gain better arousal response rather than stimulation given by the therapist.

Because of the visiting policies, there is lack of interaction between the subject and family member. So, this study will be the effective measure to establish the good interaction between subject and family member which can be one of the most contributing factor for arousing the subject from coma

Anyhow, little is known about the impact of family involvement in providing sensory stimulation. This study was beneficial, as the family member of the subject had the freedom for making their choice in accordance with the subject's need for coma stimulation

Method

Population: Total 30 patients diagnosed with Traumatic Brain Injury by neurologist of KIMS hospital karad were selected as subjects. Subjects fulfilling the inclusion and exclusion criteria were selected. Written consent was taken from family member of subject before starting the study. Then subjects were divided in two groups i.e. Group A (experimental group) and Group B (control group) by convenient sampling method. Out of 30 subjects there were 21 male and 9 female.

Both male and female with GCS score below 8 and subjects willing to participate in the study were included. Whereas subjects with systemic illness; GCS score 3 and auditory impairment were excluded.

Interventions: 30 subjects were divided into two groups with 15 subjects in each group i.e. Group A (experimental group) and Group B (control group). Pre-treatment

assessment was taken according to WNSSP. Group A received a conventional sensory stimulation whereas Group B received choice based sensory stimulation therapy (auditory stimulation, visual stimulation, kinesthetic stimulation, movement stimulation, gustatory stimulation). The list of the above mentioned techniques was provided to the family member. And, then he/she was asked to make their choice according to the subject's need. After making the choice for stimulation, family members were asked to apply the stimulus under the guidance of the therapist.

Choice based stimulation was given to patient using the information by family member (auditory, visual, movement and tactile) which was prepared by locally available and easily affordable material. Out of 15 relative of the subjects, 5 family members selected auditory stimulus, 7 family members selected visual stimulus, 1 family member selected tactile stimulus, 2 family members selected movement stimulus. The treatment was given for 6 weeks; 5 sessions per week, twice a day. Post treatment assessment was taken after completion of 6 weeks.

Group A (Experimental group) received choice-based sensory stimulation: Group A i.e. experimental group received auditory stimulus, visual stimulus, movement stimulus and tactile stimulus which was totally applied by relative of patient.

Auditory Stimulus: Auditory stimulus was given by the family member, the family member was asked to stand nearby the subject. And he/she was asked to tell their family stories (all the good and happy moments they had spent with the patient). The time duration given to the relative was 10 mins. They were asked to interact with patient throughout the time being given. Each patient received a different stimulus in form of different stories, different incidences, different voices etc.

Visual Stimulus: Initially, the bed of the subject was elevated. Visual stimulus was given by placing the family photo frame, familiar object, brightly colored pictures and mirror in front of the eyes of subject. The subject's eyes were opened passively by the family member. The time duration was same as above.

Tactile Stimulus: For applying tactile stimulus, the subject was turned towards one side. Light strokes on the back were applied. After that subject's face was moistened with help of wet cloth. Squeezing technique of massage was also applied on upper limbs.

Movement Stimulus: Passive range of motion exercises were given to both upper limb and lower limbs. Ten repetitions for each movement were given.

Group B (Control group) received conventional sensory stimulation:

- Group B i.e. control group received auditory stimulus which was applied by therapist.

Auditory Stimulus: This group too received auditory stimulation. The audio was same for all the subjects in this group. An instrumental music was made to hear with the help of earphones. The duration of the audio was 10 minutes. These audio was made to hear for two times a day for 5 days/week for 6 weeks.

The treatment duration was same for both the groups.

Measurement procedure:

WNSSP (WNSSP): For Pre-treatment and Post-treatment assessment was done by using WNSSP (WNSSP). The WNSSP has thirty-three items constituting nine cognitive- function subscales: Arousal attention(4 items), Auditory response (2 items), Auditory comprehension (6 items), Expressive communication (3 items), Visual tracking (7 items), Visual comprehension (5 items), Tactile response (2 items), Object manipulation (3 items), Olfactory response (1 item). The total score range is 0 to 113; low score indicates poorer function.[14]

Result

Statistical analysis of pre and post intervention within group was done by using non-parametric paired test. Statistical analysis of pre and post intervention within group of non-parametric data (WNSSP) was done by Mann-Whitney test. The Choice-based sensory stimulation showed the significance improvement in arousal response according to WNSSP with $P = <0.0001$, which is statistically significant. Among the 4 stimulus used for the choice-based stimulation i.e. auditory, visual, tactile and movement stimulation; visual stimulation showed considerable significance with $p=0.0156$.

1. **Gender Distribution in the Study:** Out of30 subjects 21 were males and 9 were females. Group A had 11 males and 4 females and Group B had 10 males and 5 females.

Table No. 1: Gender Distribution

	GROUP A	GROUP B	TOTAL
MALES	11	10	21
FEMALES	4	5	9
TOTAL	15	15	30

Age Distribution in the Study: In this study, comparison of the age between group A and group B was done. Mean and standard deviation of age for group A was 38.800± 13.143 while for group B it was 31.4000± 10.370. The minimum age which was involved was 17.000 in group A and 14.000 in group B. The maximum age which involved was 60.000 in group A and 50.000 in group B

2. Data Analysis WNSSP (WNSSP):

- Comparison of pre and post score of WNSSP within group A and group B.

Table No 2: Comparison of pre and post score of WNSSP within group A and group B.

	Pre test	Post test	P Value
	Mean ± SD	Mean ± SD	
Group A	17.4 $\pm$ 2.384	45.06 $\pm$ 8.614	< 0.0001
Group B	14.60 $\pm$ 2.798	37.66 $\pm$ 2.093	< 0.0001

The analysis was carried out by Mann-Whitney test with extremely significant p value for both the groups as < 0.0001

- Comparison of pre-interventional and post-interventional scores for auditory stimulation.

Table No. 3: Comparison of pre and post WNSSP for auditory stimulation

	Pre-Treatment	Post-treatment
Mean	16.80	44.60
SD	3.03	5.85
Median	18.000	48.000

- Comparison of pre-interventional and post-interventional scores for visual stimulation.

Table No. 4: Comparison of pre and post WNSSP for visual stimulation

	Pre-Treatment	Post-treatment
Mean	17.85	42.71
SD	1.952	10.73
Median	17.000	45.000

- Comparison of pre-interventional and post-interventional scores for tactile and movement stimulation.

Table No. 5: Comparison of pre and post WNSSP for tactile and movement stimulation

	Pre-Treatment	Post-treatment
Mean	17.33	50.66
SD	2.887	6.028
Median	19.000	50.000

Discussion

In this study, the main focus was on choice-based sensory stimulation on traumatic brain injury subjects as a coma arousal technique.

It is an intervention in which family members are directly involved for applying the coma stimulation technique to arouse the subject. This includes the interaction of the respective family member with the subject.

The aim of the study was to identify better arousal response by seeing the effect of choice-based sensory stimulation as a coma stimulation technique on traumatic brain injury.

Out of 30 subjects, 15 subjects were conveniently included in group A i.e. experimental group and 15 subjects in group B i.e. control group. Pre-treatment assessment was taken according to WNSSP. Group A i.e. experimental group received choice-based sensory stimulation which was applied by family members of the subject while group B i.e. control group received conventional sensory stimulation. Choice-based sensory stimulation was in the form of auditory, visual, tactile and movement stimulation. The family member who was very close to the subject was involved in the study. The time duration for each stimulation given was 10 minutes. This stimulus was applied twice a day for 5 days/week for 6 weeks. Conventional sensory stimulation was in the form of auditory stimulation. This was applied by the therapist. The stimulus was an instrumental music which was made to hear to the subject with the help of earphones by the therapist. The time duration was same for both the groups i.e. for 10 minutes twice a day for 5 days/week for 6 weeks.

The pre-treatment and post-treatment assessment was taken with the help of WNSSP (WNSSP) which was used as an outcome measure. Statistical analysis was performed by using Instat-graph pad. After the analysis of gender distribution was out of 30 subjects, 21 were male subjects and 9 were female subjects.Further analysis was performed to analyse the pre-treatment and post-treatment effect of choice-based sensory stimulation and conventional sensory stimulation on WNSSP (WNSSP). There was one study, Effectiveness of early Interventions of coma arousal therapy in traumatic head injury patients by Mandeep et al, in which experimental group received coma arousal therapy along with physiotherapy intervention (passive movement and chest physiotherapy) and control group received only physiotherapy intervention (passive movement and chest physiotherapy). Among these groups experimental group showed significant improvement on GCS and CRS with (p=0.05) .In present study, experimental group received choice-based sensory stimulation which was given by family members and control group received conventional sensory stimulation which was an instrumental music. Experimental group shows significant improvement on WNSSP with p=0.042.

Coma arousal therapy of sufficient duration arise the brain by improving neuronal organization, increased dendritic branching, increased numbers of dendritic spines; stimulating the reticular activating system and increasing the level of cognitive function. Maximum reorganization occurs within the first few week after brain injury.

Hence, it is proven that choice-based sensory stimulation as a coma stimulation show better arousal in subjects with traumatic brain injury.

Conclusion

The study was concluded as an evidence to support the use of choice-based sensory stimulation as coma arousal technique on traumatic brain injury. Among the 4 stimulus used for the choice-based stimulation i.e. auditory, visual, tactile and movement stimulation; visual stimulation showed considerable significance with p = 0.0156.

Conflicts of Interest: There were no conflicts of interest in this study.

Knowledge Attitude Practice on the Oral Hygiene Practices in Children Below 12 Years

Shivani N[1], Revathy Gounder[2]

[1]Graduate Student, [2]Assistant Professor, Department of Prosthodontics, Saveetha Dental College and Hospital, Saveetha Institute of Medical and Technical science, Saveetha University, Chennai, India

ABSTRACT

The brushing techniques in children are different when compared with those in adults. Children of this age category are more prone to tooth decays. When the primary teeth has decays and is not treated, it may infect the primary teeth and hence this research is important to prevent infection. Two hundred participants aged between 3-12 were recruited through a survey. A questionnaire was administered to generate information on oral hygiene practices. This was an online survey undertaken by using the link https://surveyplanet.com//.Oral hygiene is of major concern and only 43.4% people take proper care. It is also seen that about 72% children use toothbrush to brush their teeth. It is also seen that majority of the children, about 72% use toothpaste. Whereas about 4% people use salt and water or oil for brushing. The level of individuals utilizing oral cleanliness helps other than toothbrush and toothpaste was less. Subsequently, the dental experts need to instruct and inspire individuals about the oral cleanliness support alongside legitimate choice and utilization of the different oral cleanliness helps.

Keywords: *Oral cavity, Plaque, Hygiene, Cleanliness, Brushing techniques.*

Introduction

Oral hygiene is a practice to maintain one's mouth clean and disease free by brushing and cleaning. Oral hygiene should be maintained in children as they're more prone to carries and an infection in primary teeth may cause infection in permanent ones.[1] Oral hygiene is the an effective medium to prevent caries and periodontal diseases. Ideally, brushing should be performed twice a day in order to maintain oral health. An important family level factor is the socio-economic status. Important community level factors are those associated with ease of access to health care.[16]

Individual's oral health-related behaviours and their outcomes are influenced by individual, family and the community.[2] Over the last century, oral health has improved significantly. This improvement, however, has not been experienced equally across the population, being considerably greater among the better off.[3] High economic status alone cannot contribute to better health.[4] Although it is a major factor for improving the health [4,5,6,7] it can be a contributing factor for illness as well, like in the occurrence of coronary heart disease, diabetes, and obesity.

The purpose of oral hygiene is to prevent the buildup of plaque, the sticky film of bacteria and food that forms on the teeth. Plaque sticks to the fissures and crevices of the teeth and generates acids which, when not removed on a regular basis, slowly decay, the enamel surface of the teeth, causing cavities. Plaque also irritates gums and can lead to gum disease, periodontal disease, and tooth loss.[8]

Oral hygiene can be maintained by brushing and flossing. Regular brushing consists of brushing twice a day: after breakfast and before going to bed. Cleaning between the teeth is called interdental cleaning and is as important as tooth brushing.[9]

The primary risks arise from a lack of proper oral hygiene practices. These major oral health problems are plaque, tartar, gingivitis, periodontitis, and tooth decay.[10]

Excessive body weight in children is a major public health problem. One of the main reason for obesity is intake of excess sugar. Sugar containing snacks and soft drinks, is reported to be more common among overweight and obese children/adolescents than those with normal weight. Frequent sugar intake is also a recognized risk factor for dental caries. Sugar acts (and other fermentable carbohydrates such as highly refined flour) as a risk factor in the initiation and progression of dental caries. Sugar acts as a favoured substrate for the cariogenic bacteria that reside in dental plaque, particularly the mutans streptococci, and the acid by-products of this metabolic process induce demineralization of the enamel surface. Thus, the aim of the survey is to create awareness on the oral hygiene practices among children below 12 years.

Materials and Method

A cross-sectional survey was done to assess the oral hygiene habits. The questionnaire included the questions related to the demographic profile and assessment of the oral hygiene habits of the study population.

The questionnaire included information related to the patient's name, age, gender, occupation, and residential area. The oral hygiene habits of the study population were assessed including the use of oral hygiene aid, frequency of cleaning teeth, duration of cleaning teeth, frequency of changing toothbrush, rinsing of mouth with water, use of mouthwash, and tongue cleaning aid used.

Inclusion Criteria:

- Systemically healthy individuals aged between 3-12 years.
- The patients willing to give informed consent were included in the study.
- Patients with history of systemic disease (debilitating disease or any condition having a substantial effect on oral health)
- Pregnancy and lactation
- Undergone oral prophylaxis during the past 6 months.

Ethical Clearance: Informed consent was obtained from the patients who participated in the study.

Statistical analysis: Collected data was entered into Microsoft Excel and analyzed using Statistical Package for Social Sciences version 21.0 software (IBM Inc., Chicago, USA). Descriptive statistics (number and percentage of responses for the questions related to the oral hygiene practices including the demographic information) were calculated for response items.

Table 1: The oral hygiene of children below 12 years has been analysed through questionnaires

Questions	Responses	Number	Percentage
How many times do you brush in a day?	Once in a day	110	54.4
	Twice in a day	80	38.8
	Never	16	7.8
How often do you floss?	Everyday	80	38.8
	Rarely	90	43.7
	Never	36	17.5
How often do you consult the dentist?	Once in a year	73	44.2
	During pain	91	20.4
	Once in 6 months	42	
For how long do you brush?	1 minute	44	21.4
	2minutes	120	58.3
	Less than a minute	42	20.48
How often do you consume chocolates?	Everyday	90	43.7
	Sometimes	82	39.8
	Rarely	34	16.5

Conted…

How often do you face the problem of bad breath?	Everyday	64	31.1
	Sometimes	88	42.7
	Rarely	54	26.2
Do you have any tooth caries?	Yes	70	34
	No	136	66

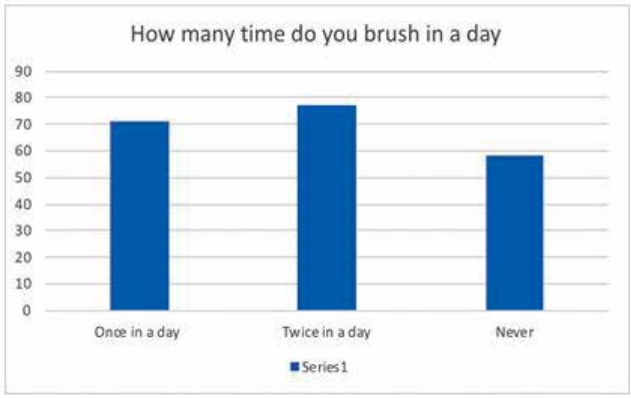

Fig. 1. Graph showing number of times brushing a day

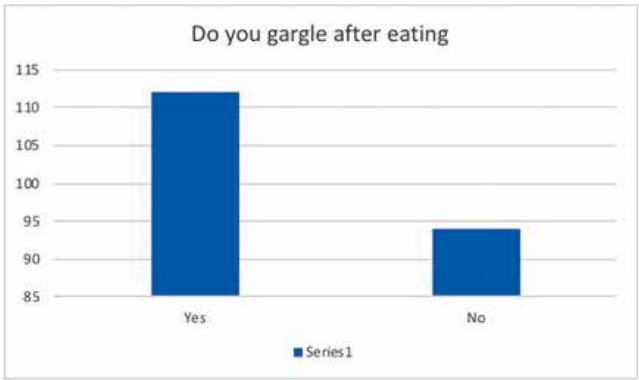

Fig. 2. Graph showing gargle after eating

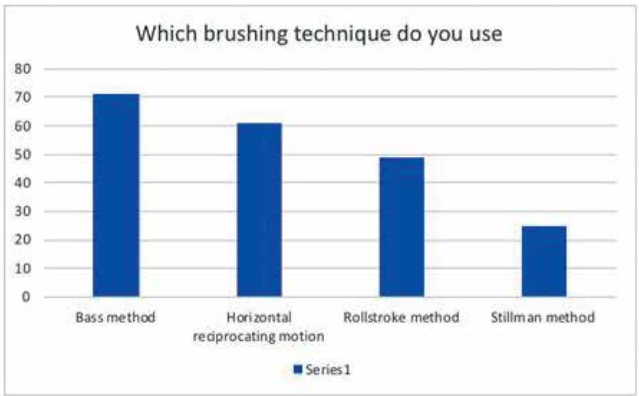

Fig. 3. Graph showing brushing techniques

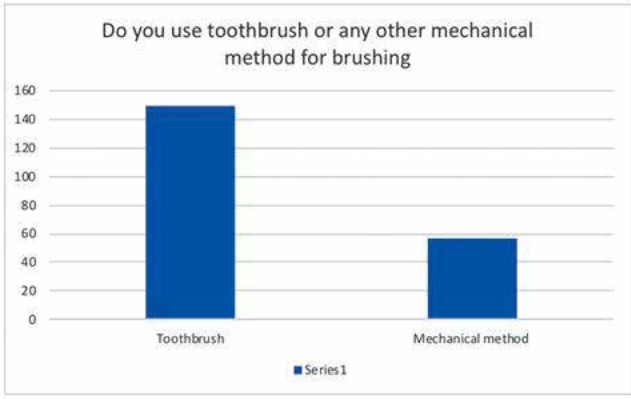

Fig. 4. Graph showing toothbrush usage percentage

Results

Oral hygiene is of utmost importance. In the present study, the oral hygiene of children below 12 years has been analysed (Table 1). Oral hygiene is of major concern and only 43.4% people take proper care. It is also seen that about 72% children use toothbrush to brush their teeth (Fig.1). It is also seen that majority of the children, about 72%, use fluoride containing toothpaste. Whereas about 4% people use salt and water or oil for brushing (Fig.2). The brushing techniques used more commonly is the bass method technique (34.5%), the second most common technique is the horizontal brush technique (29.6%) (Fig.3).

Discussion

This study is done to grow awareness about the healthy practices of oral hygiene. Children who had good knowledge of caries prevention measures had significant increased odds of brushing their teeth twice daily or more.[11- 15]

The toothbrush and toothpaste utilize is the best method for cleaning the teeth and keeping up the oral cleanliness. To amplify the oral wellbeing, the American

Dental Association and US Surgeon General suggest that people brush twice and floss in any event once every day and have customary prophylactic dental visits.

Rinsing of mouth with plain water was accounted by 54% of the kids in the present investigation with larger part washing their mouth after suppers (55%) (Fig.4). This was vastly improved than the investigation of Jain et al. [17] just 29% of the example populace washed their mouth subsequent to eating sustenance. This essential propensity for oral cleanliness was observed to be very among this investigation populace.

Money related contemplations, instructive status, and control of the patient essentially affect oral social insurance in India. The discoveries from the present and different investigations have demonstrated that the lower financial strata have poor oral cleanliness homes which may be identified with low moderateness and low level of mindfulness. This joined with the long working hours may prompt neglection of the oral cleanliness propensities. In this way, the further examination ought to be led to have a top to bottom information of the elements in charge of poor oral cleanliness propensities among this populace. This can shape reason for the appropriate general human services programs focusing on this populace. [18]

Different examinations have demonstrated an effect of SES on the oral strength of a person. It has likewise been demonstrated that there is a noteworthy affiliation exists between the person's oral wellbeing and mindfulness about the same. People with bring down financial gathering have less mindfulness and access to the oral social insurance. People from bring down financial gatherings unfit to utilize the oral cleanliness helps like mouthwash, interproximal brushes, and different sedated toothpaste as a result of their high cost. Nearly people from higher financial status approach all the previously mentioned oral wellbeing helps and furthermore the consciousness of its part in enhancing periodontal wellbeing.[19,20]

Conclusion

The level of individuals utilizing oral cleanliness helps other than toothbrush and toothpaste was less. Subsequently, the dental experts need to instruct and inspire individuals about the oral cleanliness support alongside legitimate choice and utilization of the different oral cleanliness helps.

The SES affects the oral cleanliness practices of the patients as it influences the moderateness of the populace. The advancement and usage of very much organized dental wellbeing training programs on occasional premise are expected to enhance and keep up appropriate oral wellbeing measures among civil representatives with uncommon accentuation on the lower SES strata.

Role of Tumour Necrosis Factor Alpha (TNF-α) in Pulmonary Pathophsiology of Chronic Obstructive Pulmonary Disease

Smriti Gupta[1], Ajit Kumar[2], Vishwajeet Rohil[3], Anuj K. Bhatnagar[4]

[1]Research Scholar, Department of Chemistry & Biochemistry, SRM University, Delhi-NCR-Haryana, & Department of Clinical Biochemistry VP Chest Institute, University of Delhi, Delhi; [2]Associate Professor, Department of Chemistry & Biochemistry, SRM University, Delhi-NCR- Haryana; [3]Assistant Professor, Department of Clinical Biochemistry, VP Chest Institute, University of Delhi, Delhi; [4]Consultant Chest Specialist & HOD (Chest&TB), Rajan Babu Institute for Pulmonary Medicine & Tuberculosis, Delhi, India

ABSTRACT

Tumour Necrosis Factor (TNF-α) is one of the most commonly studied cytokine of TNF superfamily. Patho-physiologically generation of high levels of TNF-α is a development of inflammatory responses for many of the chronic diseases. Simultaneously in pulmonary diseases increased level of TNF-α in blood serum relates with the cytotoxicity. The Study was conducted on 100 patients of Rajan Babu Institute for Pulmonary Medicine & Tuberculosis (RJPIMT) Hospital. Patient diagnosis was confirmed via Spirometry. The result reveals that the serum TNF-α level increases with the COPD severity. The mean values of TNF were significantly increased with the decreased FEV/FVC. The present study showed that serum TNF-α level correlates with severity of airway obstruction in Spirometry among the COPD patients. It is worth mentioning that serum TNF-α level may plays an important role to diagnose chronic obstructive pulmonary disease as a useful marker to monitor the disease severity in addition to spirometric parameters like FVC, FEV1 and FEV1/FVC ratio.

Keywords: *TNF-α, COPD, Exacerbations, Spirometry.*

Introduction

Chronic Obstructive Pulmonary Disease (COPD) is one of the crucial hazardous diseases with an increase in morbidity and mortality rate of life all across the world. It is among one of the disease-causing large amounts of economic burden over the globe. As reported by WHO, COPD will be the fourth largest leading cause of death by 2020.[1,2,3]

COPD is defined as characterized persistent airflow progressive limitation and associated with inflammatory responses in the airway to noxious particles or gases. Another variable of exacerbation and comorbidities contributes towards the severity of diseases.[4] Pathologically COPD consists of two major conditions of Emphysema; shortness of breath [5] and Chronic Bronchitis; production of a chronic cough and sputum for at least three months a year for two consecutive years.[6]

COPD is also associated with systematic oxidative stress, circulatory inflammatory cells and increase level of inflammatory cytokines. [7]. Around 30 million people in India are suffering from COPD [8] and almost half a million people die in India every year due to COPD. [9] One of the study conducted by WHO estimated that COPD was the fifth leading cause worldwide in 2001 with 250 million patients mortality and it is to be the leading cause by 2020. [10] Abe-Gunde *et al.* in his study revealed that out of a total number of deaths taken place in 2005, 7% of these were caused by chronic respiratory diseases and 80% of it occurred in under-developed and developing countries. [11] The world-wide studies conducted showcased that incidences of COPD in stage II or severe cases were 10.1% including 11.8% for men and 8.5% for women. [12] In one of the report of Economic Fabric of India (2001) it was stated that in total of 14.93 million cases of COPD; 5.02 million cases were females and 9.92 million males.

The systematic inflammatory process in the lungs activates the peripheral inflammatory cells by releasing several cytokines and chemokines. [3] TNF-α is responsible for cellular migration and activates the

secretion of various cytokines. [13] TNF-α is known as a factor produced by endotoxin-stimulated macrophages causing necrosis of a tumour. [14] Among various studies conducted all across the world increased serum TNF- α levels were seen from the sample of COPD patients. [15,16,17] The overproduction of TNF-α results into pulmonary emphysema and inflammation [18,19,20] and the counter effects are displayed as stimulation of release of enzymes like macrophage metalloelastase. [21] A meta-analysis study revealed positive association between COPD and inflammatory systemic markers. [22]. In this study, we have made an attempt to measure the TNF – α level in patients with COPD and to correlate with the severity of disease with special reference to Delhi-NCR population.

Methodology

For concise study, detection of the severity of disease complete and comprehensive medical history is required. Patient's detailed information are collected through structured and validated questionnaire.[23]

The study was carried out on patients attending the pulmonary medicine department of (RJPIMT) Hospital, New Delhi. The patients from various age groups were included in the study which was conducted on 100 patients suffering from COPD with or without smoking as a prime factor. The patient Blood samples were collected only after informed consent from each subject included in the study. All inclusion and exclusion criteria were fulfilled.

Inclusion Criteria: All patients who are diagnosed with COPD after spirometry confirmation as defined by the GOLD guidelines are included. Various symptoms are also added on as a key indicator helping in better accessibility of disease.

Exclusion Criteria: Patients, with Sputum positive pulmonary tuberculosis, asthma patients and patients with bronchiectasis, acute exacerbation or with any other co-morbidity like cardiovascular, diabetic or any other disease are excluded from the study.

Spirometry: For diagnosis of COPD, spirometry test is performed. The spirometry test is a technique and a qualitative analysis of post-bronchodilator FEV/FVC.

Serum TNF-α Estimation: Serum TNF-α level assay was conducted using Ray-Bio Human TNF-α Kit. It is an in vitro enzyme-linked immunosorbent assay for the quantitative estimation of human TNF-α in serum. This assay employs an antibody specific for human TNF-α which is coated on a well plate.

Samples and standards were pipetted into the well plate. TNF-α present in the sample binds to the well by immobilized Ab in the incubation period. Wells were then washed and human TNF-α antibody was added. After washing the unbound antibody the HRP-Conjugated Streptavidin was added to the well and colour was developed in amount of the TNF-α bounded. Stop solution was added to stop the reaction which changed the colour from yellow to blue and then plate was read in ELISA reader at the 450 nm.

Statistical Analysis: Data are expressed as mean ±S.D. The comparison of variables between smokers and non-smokers COPD and smoker and non-smoker control were performed using students t-Test. As per value below 0.05 was considered statistically significant. The Pearson's correlation was used to evaluate the relationship between variables.

Results

The TNF-α serum levels were significantly higher in the smoker group of COPD patients compared to the non smoker group of COPD patients ($P<0.05$). It was also identified that a strong negative correlation was seen between FVC/FEV and TNF-α for smoker group whereas weak correlation was seen between FEV/FVC and TNF- α in non-smoker group of COPD patients. The variables of the four study group are shown in **Table 1**.

Table 1: The characteristics of Smokers and Non-Smoker group

Variables	COPD		Non–COPD	
	Smoker	Non Smoker	Smoker	Non Smoker
Age	54.25 (10.47)	54.86 (10.01)	50.669 (9.71)	50.39 (9.47)
Male	100%	78.30%	100%	78%
Female	NA	21.60%	NA,	22%
Pack years	30.16	NA	12.18	NA
FEV/FVC	47%,	52%	83%	85%

The average age is not statistically significant between the smoker and non-smoker group of control and diseased patients. The result reveals that the serum level of TNF-α was significantly elevated in smoker group of COPD and control patients shown in Figure 1. The serum level of TNF-α between diseased smoker and control smoker group was statistically significant (p< 0.005) as shown in Figure 2.

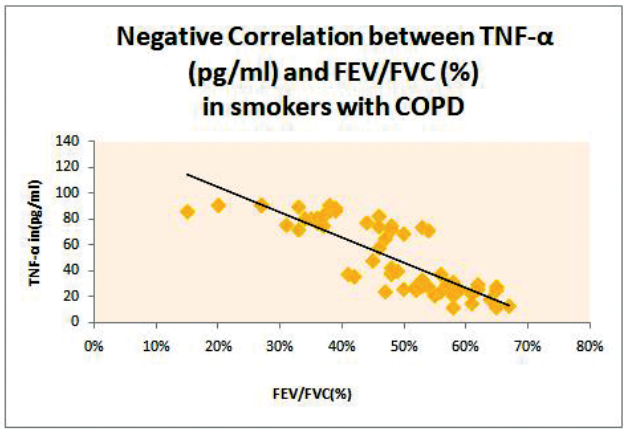

Figure 1: Depicting negative correlation of COPD smokers with TNF-α and FEV/FVC (%)

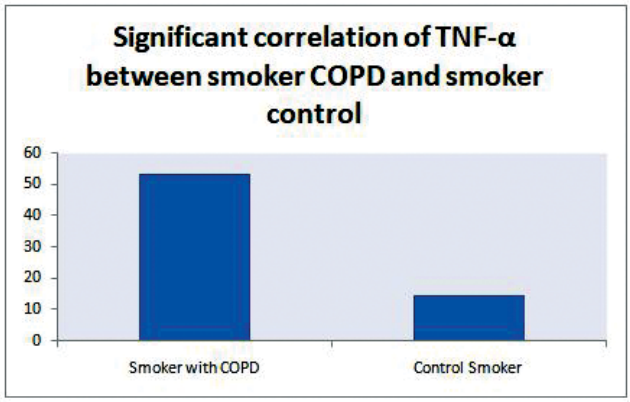

Figure 2: Histogram representing significant correlation of TNF-α between smoker COPD and smoker control

The high levels of TNF-α in the serum of smokers and strong negative relation correlation between efficiency of lung FEV/FVC were found. The TNF- α level value in serum indicates an imbalance between pro-inflammatory and anti-inflammatory factor due to smoke exposure. The study concludes by showing that serum TNF-α is directly proportional to the disease severity and indirectly proportional to the FEV/FVC (airway obstruction ratio) of the patients.

The serum level of TNF-α were significantly elevated in smoker group of COPD and control patients shown in **Figure 1**.The serum level of TNF-α between diseased smoker and control smoker group were statistically significant (p< 0.005) as shown in **Figure 2**.

Discussion

COPD as the disease has taken a challenging role in the medical industry. Total sample population collected were 220, male 206 (93.6%) and female 14 (6.8%). It is because of the smoking as one of the prime risk factors for COPD. 6.8% were females with a history of exposure to smoke either from cooking through biomass fuel or using Hay Stick.

Chapman *et al.* studied occurrence of COPD and showed increase rate of the disease in males than females. [24] Mahesh *et al.* based on his validated structured questionnaire for COPD in rural area of Mysore concluded the prevalence of disease to be more common in males (11.1%) in comparison to females (4.5%).[25] Bednarek *et al.* in his study revealed about the diagnosis of COPD and concluded that degree of post-bronchodilator airflow limitation was mild in 30.6%, moderate in 51.4%, severe in 15.3% and very severe in 2.7%. [26] Mathanraj *et al.* in his studies concluded that majority of the COPD cases were found to have moderate (44.4%) and severe (39.8%) airflow obstruction. [27]

It can be easily related that increasing awareness on health issues in western countries has more emphasizing effect on early diagnosis and detection of disease whereas in developing nations like India due to lack of awareness and overpopulation diseases are generally detected at the tertiary care stage.

Vigg A *et al.* studied the prevalence of COPD in a tertiary care hospital in southern India and concluded that among 946 patients studied 30% has mild and moderate disease and whereas 40% has severe COPD. [28] Haehling V.*et al.* [29] revealed that serum TNF-α was found significantly higher in COPD patients compared to controls.

This confirms previous studies similar to our proposed study i.e. the levels of TNF-α increases with the disease severity. In our study, we were also able to correlate that smoking was somehow associated with higher TNF-α -mediated systematic inflammation in COPD patients.

The main purpose of this study was to measure the TNF-α level in Delhi-NCR subjects and it implication as a biomarker for the early detection and diagnosis of COPD. To the best of our knowledge, this is the first study conducted in Delhi-NCR Population which showcases a clear strong correlation between decreased FEV/FVC and elevated serum TNF α level which indicates the activation of inflammatory responses in COPD. It also shows that levels of TNF-α can be used as an inflammatory marker for smoker group but it has not statistical significant role in non-smoker group of COPD which means that inflammation or poor prognosis of lung in COPD in the non-smoker is because of genetic role.

Furthermore, it was also identified that male smokers had higher TNF-α levels than male non-smokers which signal the presence of a smoke-induced inflammatory process in the lungs of healthy subjects.[30] The smoke-induced inflammatory response could also vary depending upon gender or ethnicity. Our findings also correlate with the observation of Zoppini *et al.* [(30)] who revealed marked increase of TNF with an increase in the number of cigarettes per day. Similar results were also reported by Fernandez-Real [(31)] and co-workers.

Conclusion

Heavy smoking or smoking for long duration significantly affects the efficacy of lungs and induce significant increase in serum TNF –α level in serum of the subject signifying the imbalance between the pro-inflammatory and anti-inflammatory factors. Based on our findings and available literature we speculate that Serum TNF–α can be a useful biomarker for the identification of heavy smoker with a risk of developing a smoke-induced pulmonary disease. However, further large group of study on various other parameters like age gender, ethnic group, genetic factor and other various patient's features needs to be assessed and confirm the validity of TNF-α as a key potential biomarker for detection of COPD as a disease.

Hence it can be used as a potential key biomarker for the detection and diagnosis of the disease. Hereafter further studies are required with large sample group. Furthermore, studies are required to focus on additional potential markers in order to develop a specific biomarker panel for easy detection and diagnosis of pulmonary diseases in susceptibility of smokers.

Conflict of Interest: The authors declare that there are no Conflicts of Interest.

Effect of Closed Kinematic Chain Exercises on Distal Muscle Weakness in Post Guillain Barre Syndrome

Sneha G. Narlawar[1], G. Varadharajulu[2], Suraj Kanase[3]

[1]Faculty of Physiotherapy, [2]Dean, Faculty of Physiotherapy, [3]Associate Professor, Krishna College of Physiotherapy, KIMS 'Deemed to be' University, Karad, Maharashtra, India

ABSTRACT

Objectives: The purpose of this study was to check the effect of closed kinematic chain exercises on distal muscle weakness in post Guillain Barre Syndrome.

Method: 30 subjects diagnosed with post guillain baree syndrome were included in this study. These subjects were allocated by convenient sampling method. The subjects with manual muscle testing grade 3 and above were included. During Pre treatment and post treatment assessment upper limb muscle strength was measured by handheld dynamometer and for lower limb passive dorsiflexion range was measured by goniometer. These outcome measures were analyzed.

Result: Pre and post treatment protocol was analyzed by using paired t test. Data analysis showed extremely significance for handheld dynamometer (p=0.0001) and goniometer (p=0.0001).

Conclusion: The effect of closed kinematic chain exercises for distal muscle weakness has shown good progress in post Guillain barre syndrome subjects with the help of handheld dynamometer and Goniometer.

Keywords: *closed kinematic chain exercises, distal muscle weakness, Guillain Barre Syndrome.*

Introduction

Guillain-Barré syndrome (GBS) is defined as an acute, inflammatory, post-infectious autoimmune polyneuropathy which leads to demyelination of the peripheral and autonomic nerves which results in acute sensory and motor losses.[1, 2] It is also known as acute inflammatory demyelinating polyradiculoneuropathy. Symmetrical motor paralysis occurs due to the demyelination of peripheral nerve axons, which gradually progress and ascends from the lower extremities and leads to tingling, burning sensations and areflexia.[3,4,5] Altered soft-tissue length, muscle weakness, and sensory changes that affect the balance, posture, joint mobility and gait.[1,2,6,7]

GB syndrome occurs at any age. It usually follows viral infection, rarely after surgery or immunization. The most common identified precipitant of GBS is Campylobacterial infection.[8]Symmetrical weakness of muscle present in this syndrome along with some wasting, hypotonia and partial or complete loss of deep tendon reflexes.[9]

Motor symptoms start distally and move proximally, first there is involvement of lower limb than upper limb then progressively it involves trunk and cranial muscles. Variable symptom is pain, tenderness occurs on deep pressure especially to motor points in muscle and nerve trunk and also parasthesia.[9, 10]

Annual incidence is 3.0 cases/100,000 populations throughout the world. Men are about 1.5 times more likely to be affected than are Women. And children < 1 year of age are affected very rare.[11]

Pathophysiology: GBS has complex pathophysiology. Immune system begins to attack the body itself, due to involvement autoimmune responses. Cross reaction is caused between immune responses and the neural

tissue. This disease affects the spinal roots and nerve, primarily the involve the Schwann cell. Initially this results in segmental demyelization of the nerve process and later proliferation of the Schwann cell. The axon remains intact and conduct an impulse with reduced velocity, later axonal degeneration may occur in some subjects which cause complete conduction block.[9] The peripheral nervous system is associated with perivascular lymphocytic inflammatory exudates. Recovery occurs by axonal regeneration and remylienation of peripheral axons. Internodal distance is less because of mylien sheet is thinner and there is increase in number of nodes of Ranvier. Nerve conduction velocity is within the normal limits in less severe cases. However conduction velocity may be permanently abnormal, where axonal damage are occur.[9,10]

Closed kinematic chain of movement: In a moving segment if one end of the joint is fixed(either proximal or distal),movement of one joint if it accompanies the movements are another joint involved with the segment is called as closed kinematic chain movement.

The exercises framed on this basis are called as closed kinematic chain exercises.

Examples; squatting, prone pushups, press up or pull up, lunges

Neurophysiology: Closed kinematic chain exercises stimulate the proprioceptive system by proprioceptive feedback to initiate and control muscle activation pattern.[12,15,16]During the early phase of training, conscious awareness of joint position or movement is one of the important factor of motor learning for neuromuscular control. Closed chain exercises provides greater proprioceptive and kinesthetic feedback than open chain exercises.[13] Because multiple muscle groups are activated which cross multiple joints during CKC . Therefore , more sensory receptors are activated which present in muscle ,intra-articular and extra-articular structures to control motion .The axial loading of CKC causes joint approximation to stimulate mechanoreceptor in muscles and in and around joints which enhance sensory input for movement control . It also facilitate co-activation of agonist and antagonist that is co-contraction of muscle occurs.[14]

Distal muscle weakness is major problem in post GBS individuals. There is delayed recovery in distal muscle weakness; so, we need to strengthen distal muscles of extremity in order to improve quality of daily living activities. Weight bearing position is an important element in distal muscle recovery. The effect of Closed-kinematic chain exercises on distal muscle weakness in post GBS have been elaborate in detail.

Method

Population: The subjects which willing to participate in the study was taken. The criteria for inclusion were: clinically diagnosed with recovery stage of GBS and MMT grade 3 and above. Subjects were excluded if they had any recent fracture, any recent surgery, any cardiopulmonary disorder and acute progressive stage of GBS.

30 post Guillain Barre Syndrome survivors were selected from outpatient department of physiotherapy. Out of 30 subjects 20 males/10 females participated in this study, written consent form was taken. All the subjects were informed about the protocol and gave written consent before their participation. The protocol and the consent form were previously approved by protocol and ethical committee.

Interventions: Subjects who were referred to physiotherapy department and they were diagnosed by Physiotherapist of Krishna Hospital, Karad, as recovery stage of guillain barre syndrome were selected. Further they were screened clinically and diagnosis was confirmed. Considering inclusion and exclusion criteria they were requested to participate in the study. The nature of study and intervention were explained to the subjects and those who were willing to participate were included. Before proceeding to intervention a written consent was taken from subject. A brief demographic data was recorded. By using convenient sampling method the participants was included; the subjects with manual muscle testing grade 3 and above were included. During Pre treatment and post treatment assessment upper limb muscle strength was measured by handheld dynamometer and for lower limb passive dorsiflexion range was measured by goniometer. The treatment was given for 6 weeks; 5 sessions per week.

Protocol was consisting of following exercises for upper limb and lower limb respectively;

For Upper limb:

Prone pushups: Subject was in prone lying position. Then taking weight on both hands and toes .He/she had to lift the whole body and go down.

Wall pushups: The procedure of wall pushups was same as prone pushups, but instead of lying in prone position he/she had to stand opposite to the wall.

Quadruped: The subject position with weight bearing on both hands with extension of both the elbows and on both the knees with hip and knee 90 degree flexion and ankle plantar flexed. Maintaining this position perturbation was given. Along with perturbation, subjects had to tuck in the abdomen and curve and flatten the back alternately to facilitate pelvic tilts that is cat and camel exercises.

Sitting press ups(pull up): Subject was sitting on firm surface. Then place his/her hands on both the sides respectively. Now ask the subject to press both the hands against the firm surface and lift up the pelvis off from the firm surface.

For Lower limb:

Squatting: Subject must stand opposite to wall with back resting on wall. He/she had to do mini squatting by flexing both the hip and knee at minimum ranges and then getting up back to standing.

Lunges: Subject was to stand with one leg in front of another leg and then had to go down with flexing the front leg and do the vice versa for another leg.

Step up and step down exercises: Subject was stand with weight bearing of the both the legs. Then asked to he/she to step one leg forward (i.e. step up) and take it back (i.e. step down), then vice versa for another leg.

Leg press: Subject while sitting on the therapeutic gymnasium sled had to extend the knee while pushing the footboard forwards.

After 6 weeks Post treatment assessment values was taken. Then by statistical analysis result was calculated.

Measurement Procedure:

Handheld dynamometer: Subject were in seated position with the shoulder Adducted and neutrally rotated, the elbow was flexed at 90º, and the forearm and wrist remain in neutral position[17,18] and ask subject to squeeze the hand grip of hand held dynamometer with the maximum efforts which is maintained for 5 sec. and after that the value is recorded. Three reading were taken and average final value is recorded.[19]

Goniometer: Testing position: subject was in supine position with knee flexed at 90 degree.

Goniometer alignment: The fulcrum of goniometer was placed over the lateral malloeolus. The stationary arm was aligned up along the fibula and movable arm with parallel to the fifth metatarsal bone.

Testing motion: The subject was asked to dorsiflex their ankle with the therapist's assistance.

Result

Pre and post treatment protocol was analyzed by using paired t test. Data analysis showed extremely significance for handheld dynamometer ($p = 0.0001$) and goniometer ($p = 0.0001$).

Statistical analysis: The data was entered into Microsoft office excels 2007 and analyzed using instat software. Descriptive statistics were used to analyze for demographic data : Pre and post treatment protocol was analyzed by using paired t test and p value <0.0001 was considered to be statistically significant.

As per the inclusion criteria 30 subjects were included in the study. During 6 weeks of protocol program closed kinematic chain exercises was given for both upper limb and lower limb. Pre and post analysis was done for 30 subjects. In Table.1 to Table.4

Table 1: Comparison of mean and SD pre and post treatment of Handheld dynamometer for right upper limb

Sr. No.	Parameters	Pre treatment HHD		Post treatment HHD		P value	Significance
		Mean	SD	Mean	SD		
1.	HHD	3.53	1.252	5.53	2.446	<0.0001	Significant

The values were compared by applying wilcoxon matched pairs test. Pre and post treatment values shows that there is extremely significant difference in HHD for right upper limb (<0.0001).

Table 2: Comparison of mean and SD pre and post treatment of Handheld dynamometer for left upper limb

Sr. No.	Parameters	Pre treatment HHD		Post treatment HHD		P value	Significance
		Mean	SD	Mean	SD		
1	HHD	3.36	1.37	5.36	2.50	<0.0001	Significant

The values were compared by applying wilcoxon matched pairs test. Pre and post treatment values shows that there is extremely significant difference in HHD for left upper limb (<0.0001).

Table 3: Comparison of mean and SD pre and post treatment of goniometer for right lower limb

Sr. No.	Parameters	Pre treatment Goniometer		Post treatment Goniometer		P value	Significance
		Mean	SD	Mean	SD		
1	Goniometer	3.13	1.306	7.93	2.463	<0.0001	Significant

The values were compared by applying wilcoxon matched pairs test.pre and post treatment values shows that there is extremely significant difference in Goniometer for right lower limb(<0.0001)

Table 4: Comparison of mean and SD pre and post treatment of goniometer for left lower limb

Sr. No.	Parameters	Pre treatment Goniometer		Post treatment Goniometer		P value	Significance
		Mean	SD	Mean	SD		
1	Goniometer	3.0	1.21	7.66	2.35	<0.0001	Significant

The values were compared by applying wilcoxon matched pairs test.pre and post treatment values shows that there is extremely significant difference in Goniometer for left lower limb(<0.0001).

Discussion

In GBS there is delayed recovery happened at the distal part of extremity. So, the recovery of these muscles is important factor on day today activities. In these studies we focus on closed kinematic chain exercise as a key treatment strategy.

The aim of studies was to find the effect of closed kinematic chain exercises on distal muscle weakness in post Guillain Barre Syndrome subjects. According to hypothesis the significant improvement in outcome measures observed after the treatment of closed kinematic chain exercise.

Subjects were included according to inclusion criteria. Both males and females were included. Out of 30 subjects, 20 were males and 10 were females. The closed kinematic chain exercises was given for 6 weeks; 5 sessions per week. Post treatment assessment was taken after completion of 6 weeks.

There was significant improvement in distal muscle strength after the entire treatment programmed. The measurement taken by handheld dynamometer for upper limb and goniometer for lower limb.

Wilcoxon matched-pairs t test used to analyze the effect of CKC exercises on distal muscle weakness on hand-held dynamometer shows extremely significant improvement in right upper limb strength with p value of 0.0001. Pre interventional value of mean and standard deviation was 3.53 ± 1.252 and post interventional value of mean and standard deviation was 5.53 ± 2.446 and also shows extremely significant improvement in left upper limb strength that is p value of 0.0001. Pre interventional value of mean and standard deviation was 3.36 ± 1.37 and post interventional value of mean and standard deviation was 5.36 ± 2.50.

Wilcoxon matched-pairs t test used to analyze the effect of CKC exercises on distal muscle weakness on goniometer shows extremely significant improvement in right lower limb range of motion with p value of 0.0001. Pre interventional value of mean and standard deviation was 3.13 ± 1.306 and post interventional value of mean and standard deviation was 7.93 ± 2.463 and

also shows extremely significant improvement in left lower limb range of motion with p value of 0.0001. Pre interventional value of mean and standard deviation was 3.0 ± 1.21 and post interventional value of mean and standard deviation was 7.66 ± 2.35.

These results from statistical analysis of present study supported the alternative hypothesis which stated that subjects treated by closed kinematic chain exercises improved distal muscle weakness in post GBS individuals. The above findings is due to the pattern of demyelination / remyelination in GBS where clinical recovery follows remyelination at the spinal root level such that the first nerve segments to be demyelinated are the last to be remyelinated.

So, we had seen improve the strength in distal muscles of upper limb and lower limb with closed kinematic chain exercises. Therefore, it's proven that interventions like CKC exercises shows better result with good prognosis in recovery of distal muscle weakness.

Conclusion

These studies shows that, closed kinematic chain exercises was effective for improving the distal muscle strength with the help of handheld dynamometer is extremely significant for upper limb and goniometer for lower limb. Based on the statistical results and interpretations, it was concluded that the closed kinematic chain exercises for distal muscle weakness has shown good progress in post Guillain barre syndrome subjects with the help of handheld dynamometer and Goniometer and thus alternative hypothesis that there is significant effect of closed kinematic chain exercises on distal muscle weakness in post Guillain Barre syndrome.

Conflicts of Interest: There were no conflicts of interest in this study.

ABSTRACT

Context: Palatal rugae (PR) are regularly used in forensic dentistry for identification of individuals. PR gets established early in intra-uterine life and remains stable thereafter, thus considered as a stable land mark. Correlation of PR with different occlusal relations may aid in diagnosing malocclusions at an early stage.

Aims: Identification of distinctive features of PR in different classes of dental malocclusion and to identify the most common pattern in Malaysian students. To explore probability of PR as an adjunctive tool for categorizing malocclusions.

Method and Material: PR in casts of 70 Malaysian students aged 19-23 years demonstrating Class I, Class II and Class III malocclusions were studied. The number, pattern, orientation and strength of rugae both on left and right side of mid-palatal raphe were determined and statistically analysed by anova test for different categories of malocclusions.

Results: Class I malocclusion showed similar bilateral orientation of all the parameters when compared to other two types of malocclusion. PR in all malocclusions showed a predominantly wavy pattern but forking-diverging type was mainly in fragmentary rugae. The number of primary, secondary and fragmentary rugae was greatest in number in Class II malocclusion when compared to class I and class III.

Conclusions: This study provides evidence of a distinct pattern of PR in Class I and Class III patients and but to ascertain its statistical significance, further research may be conducted with a larger sample size.

Keywords: *malocclusion, palate,hard ,diagnosis*

Introduction

Palatal Rugoscopy has developed as an interesting and important method for human identification in forensic dentistry in recent years. Palatoscopy or palatal rugoscopy is the name given to the study of palatal rugae in order to establish a person's identity.[1] The use of palatal rugae was recommended as one of the method of identification in 1889 by Harrison Allen.[2] The term "Palatal rugoscopy" was proposed in 1932, by a Spanish investigator named Trobo Hermosa.[3]

Palatal rugae (Plica palatinae transverse) refer to the ridges on the anterior part of the palatal mucosa each side of the median palatine raphae behind the incisive papilla. Palatal relief design of the dentures may be used to compare and identify the individuals.[4,5] Several studies done in the past have shown and statistically proved that the rugae patterns exhibit hereditary pattern and there are differences between races and gender. [6-8]

Although some longitudinal studies have stated changes in the length and direction of palatal rugae with age [9-11], orthodontic influences like extraction of first premolar [12,13], trauma, extreme finger sucking and persistent pressure with orthodontic treatment [14,15] but stability in shape, direction throughout life have been extensively documented.[16,17,18]

As both malocclusion and rugae pattern exhibit a strong hereditary predisposition, this common feature led to investigate whether palatine rugae can be used as an adjunctive diagnostic tool in categorising malocclusions.

This study was carried out to ascertain whether any correlation exists between pattern of palatine rugae in different classes of malocclusion in Malaysian students thereby helping in diagnosing, intercepting and treating malocclusion in early stage.

Objectives of the study

1. To identify common pattern of PR in the study population
2. To determine the pattern of PR in different classes of malocclusion.
3. To explore the probability of PR as an adjunctive diagnostic tool for classifying malocclusions.

Subjects and Method

The present study was performed on 70 dental and medical Malaysian students between the age group of 19- 23 years in Manipal University following institutional ethical clearance. Informed consent was obtained from the students prior to the participation in the study. Inclusion criteria were complete complement of permanent teeth till second molars, no history of previous extraction of teeth or orthodontic treatment, no deleterious habits. Exclusion criteria included were students with completed orthodontic treatment or undergoing orthodontic treatment. Irrespective of gender, the samples were classified into three groups based on Angle's classification of malocclusion following intra oral examination. Impression of the maxillary arch was made with irreversible hydrocolloid impression material. Casts were poured with type III dental stone and labelled according to type of malocclusion. Landmarks on palatal raphe and PR were marked using black permanent marker pen according to the classification given by Kapali etal [19] The traced palatal rugae were observed for length, orientation, shape and strength.

Length of PR: The length of the rugae was recorded using digital vernier caliper from medial end of rugae to the lateral end (figure 1) and categorised following classification given by Lysell [9] into

1. Primary >5mm
2. Secondary 3 to 5mm
3. Fragmentary < 3mm

The number of rugae falling under the category of primary, secondary and fragmentary rugae was recorded separately for left and right side.

Orientation of palatal rugae: The angle formed between mid-palatal raphe and first, second and third PR were recorded separately for left and right side and categorised using classification given by Hauser as:

1. Posteriorly directed rugae (p) - associated with negative angles.
2. Horizontal/perpendicular rugae (h) - associated with angles of zero degrees
3. Anteriorly directed rugae (a) - associated with positive angle

Shape of palatal rugae: The shape of first, second and third primary rugae were recorded separately for left and right side of each cast from their origin to termination and classified according to classification given by Hauser et al as :

1. **Curved(c):** The curved type had a simple crescent shape which curved gently.
2. **Straight(s):** Straight types ran straight directly from their origin to termination.
3. **Wavy (w):** The basic shape of the wavy rugae was serpentine;
4. **Forking (f):** Unification occurs when two rugae are joined at their origin or termination based on which, they were of two types:

   fd1: Converging: Rugae with different origins which joined on their lateral portions.

   fd2: Diverging: Unifications in which two rugae began from the same origin but immediately diverged.
5. **Island (i):** The rugae that displayed a definite continuous ring formation at the termination was termed as Island.
6. **Irregular (Ir):** Broken, irregular pattern of rugae.

Strength of Palatal Rugae: Based on thickness of first, second and third primary rugae strength of were classified according to Hauser et al as:

a. Strong(s)

b. Medium(m)

c. Weak (w)

Results

Data was collected and statistical analysis was performed in SPSS 17.0 (SPSS, Chicago III). Descriptive statistics (mean and standard deviation) were determined for the number of palatal rugae (primary, secondary and fragmentary) on each side of mid-palatal raphe for each malocclusion group. The most predominant pattern, orientation and strength of primary rugae (first, second and third) in each malocclusion group was studied. P value <0.05 was considered to be statistically significant.

Results of Table 1 showed number of primary rugae in Class I malocclusion on right side being greater in number with mean 4.41 ± 1.04 as compared to left side having mean value of 4.23 ± 1.23. In Class II malocclusion, number of primary rugaes were present more right side with values of 4.5 ± 0.57 and in class III malocclusion it was more on left side with value of 3.65± 0.81. The mean values of secondary and fragmentary rugae were less than 1 in class I malocclusion, however it was more than 1 in class II and class III malocclusion. The average number of rugae taking into account primary, secondary and fragmentary rugaes were greatest in Class II malocclusion but almost similar in rest of the classifications. ANOVA depicted significant p-value for primary rugae on right side in all three types of malocclusion.

Table 2 shows the mean of primary, secondary and tertiary rugaes in different classes of malocclusion.

The results of Table 3 did not depict any uniform pattern, orientation or strength for a particular malocclusion. The trend of orientation pattern in Class I from first to third rugae predominantly shifts from posterior to horizontal while Class II it was mostly posteriorly oriented. In Class III horizontal and posteriorly were two most predominant types. The secondary rugaes exhibited wavy pattern in all three types of malocclusion. The strength of rugae in class I and class III malocclusion showed a similar trend with the first primary rugae being strong gradually becoming weak till the third rugae. However in class II malocclusion all the rugae were weak.

The results of Table 4 depicts that class I malocclusion showed similar bilateral orientation of all the parameters when compared to other two types of malocclusion.

Table 1: Mean Scores of types of Rugae according to different class of occlusion

	Number of casts	Primary Rugae		Secondary Rugae		Fragmentary Rugae	
		Right	Left	Right	Left	Right	Left
Class I Malocclusion	40	4.41 ± 1.04	4.23 ± 1.23	1.35 ± 1.3	0.80 ± 0.8	0.93 ± 1.45	0.76 ± 0.9
Class II Malocclusion	10	4.5 ± 0.57	4 ± 0	0.75 ± 0.5	1.5 ± 1.0	1.75 ± 0.5	1.25 ± 0.9
Class III Malocclusion	20	3.45 ± 1.23	3.65 ± 0.81	1.25 ± 1.06	1.3 ± 1.0	1.25 ± 1.2	0.6 ± 0.8
F		5.704	2.009	0.431	2.364	0.879	0.840
.sig (p value)		0.005*	0.142	0.651	0.102	0.420	0.436

Table 2: Mean scores of Rugae according to malocclusion

	Primary Rugae	Secondary Rugae	Tertiary Rugae
	Mean ± SD	Mean ± SD	Mean ± SD
Class I malocclusion	8.65 ± 1.72	2.15 ± 1.71	1.69 ± 1.92
Class II malocclusion	8.5 ± 0.6	2.25 ±1.2	3 ± 0.82
Class III malocclusion	7.1 ± 1.45	2.55 ± 1.73	1.85 ± 1.42

Table 3: Commonly observed patterns of Rugae according to orientation, strength and shape

		Primary Rugae		Secondary Rugae		Fragmentary Rugae	
		Left	Right	Left	Right	Left	right
Class I Malocclusion	Orientation	P	P	P	H	P	H
	Strength	S	S	S	S	w	w
	Pattern	C,S	S	W	W	W/FDI/FD2	W/FD1/FD2
Class II Malocclusion	Orientation	P	P	P	P	P	A
	Strength	w	w	w	w	w	w
	Pattern	W	C	W	W	C/FD2	W/FD2
Class III Malocclusion	Orientation	P	H	P	H	H	H
	Strength	S	S	S	S	w	w
	Pattern	W	S	W	S	C,S,W/FD2	W/FD1/FD2

Orientation: P – Posterior, H - Horizontal, A – Anterior. Strength: s-strong, w-weak

Pattern: C-curved, W – Wavy, S - Straight, FD1 - Fragmented Anteriorly, FD2 - Fragmented Posteriorly

Table 4: Distribution of casts which have similar orientation bilaterally

	Cast with bilateral Posterior Orientation	Cast with Bilateral Horizontal Orientation	Cast with Bilateral Anterior Orientation
Class I Malocclusion	2	4	1
Class II Malocclusion	1	0	0
Class III Malocclusion	3	4	0

Figure 1: Measuring length of the rugae

Discussion

It is well-established fact that the palatal rugae once formed, do not undergo any change except in length and remain in the same position throughout individual's life time.[20] Palatal rugae pattern may be precise to racial groups facilitating the population recognition.[21] In the present study rugae patterns of the Malaysian population was studied to check if any co relation existed between malocclusion. Thomas and Kotze studied the rugae patterns of 6 South African populations and found that rugae were unique to each ethnic group and that it can be used successfully as a medium for genetic research.[22]

In the present study the average number of primary rugae has been approximately four in number in accordance with previous studies.[23] In the present study the number of primary rugae was seen to be greatest in Class II malocclusion, probably due to difference in degree of development of maxillary basal arch width and transverse morphology. Hauser et al. in 1989 that stated that size of the palate affected rugae development with broader palates showing greater rugae development.[11] Studies have compared maxillary arch width development in normal occlusion and patients with class II malocclusion and found that the order of normal occlusion having greatest, followed by Class II patients. However, the number of class II malocclusion in the present sample size was less as compared to class I and class III. The incidence of class II malocclusion is less in Malaysian population. This can correlated with study done by Arsalan [24] which reported highest incidence of class I malocclusion followed by class III and class II

being the least. However, to attain a conclusive evidence of this specific outcome, a larger sample size of Class II has to be studied.

The age group of sample in the present study was around 19-23 years. Studies have proved that orientation pattern gets established at birth and attain a final feature during adolescence. Any change that occurs thereafter may be in terms of length but not in shape.[25]

In the present study the strength of rugae decreases from first to third primary rugae in class I and class III malocclusion. This is in accordance with previous studies of decreasing regularity of rugae pattern, disappearance of posterior rugae and strength of anterior rugae becoming considerably more pronounced. [23]

PR number, shape as well as orientation have shown genetic predisposition in previous studies, thus supports its correlation with different malocclusions having strong genetic potential.[23] Kapali S et al compared the number and pattern of rugae in Australian Aborgines and Caucasians and found straight forms being more common in Caucasians, whereas wavy forms in Aborgines and emphasized that there was significant association between rugae forms and ethnicity.[19] Studies comparing Indian population with Japanese and Tibetan population have also revealed significant differences in PR pattern.[26] Both Class III and Class II display specific genes leading to a particular skeletal variability caused by polygenic nature of craniofacial traits and these could be explored in forthcoming studies for specific association with PR shape and number.[23]

Thus, prevalent malocclusions in various ethnic populations could also be investigated for a positive association with specific pattern, length and number of PR and serve as an adjunct in intercepting malocclusions at a very early age.

First and foremost limitation of the study is the smaller sample size. Larger sample size is required to validate the observations of this study and also to obtain results that are statistically significant.

Conclusion

1. Class I malocclusion showed similar bilateral orientation of all the parameters when compared to other two types of malocclusion.
2. The number of primary rugae on the right side were statistically significant in all types of malocclusion.
3. The most predominant pattern for first, second and third primary rugae was wavy.
4. The number of primary, secondary and fragmentary rugae was greatest in number in Class II malocclusion when compared to class I and class III, however it is cannot be considered statistically significant as the number of sample size is less.

Effect of McKenzie Approach and Neck Exercises on Forward Head Posture in Young Adults

Vishnupriya Deshpande[1], Khushboo Bathia[2], Smita Kanase[2], Amrutkuvar Pawar[2], Prachi Jain[1], Gatha Patel[1]

[1]Intern, [2]Assistant Professor, Department of Physiotherapy, Krishna Institute of Medical Sciences Deemed To Be University, Karad, Maharashtra, India

ABSTRACT

Objective: To examine the effects of McKenzie approach, Neck Exercises and combination of both on Forward Head Posture in young adults.

Method: 30 subjects between of the age group 18-35 years were randomly allocated into 3 groups to receive McKenzie approach, neck exercise or combination treatment for 3 sessions per week, for 4 weeks. Outcome assessment was recorded at baseline, 2 weeks and 4 weeks post-treatment.

Results: There were significant differences in all outcome measures after 2 and 4 weeks of treatment within all 3 groups ($p<0.001$) except extension, right rotation and right lateral flexion in group A (>0.05), left lateral flexion and Neck Disability Index in group B ($p>0.05$) and left lateral flexion in group C ($p>0.05$). There were significant differences in Flexion, right rotation, CCFT ($p <0.01$) and left rotation ($p>0.05$), between group A and group B , left rotation ($p <0.05$) between group A and C, CCFT (<0.001) between group B and C after 2 weeks of treatment. There were significant differences in flexion (<0.05), left rotation and right rotation (<0.01) between group A and B after 4 weeks. There were significant differences in left and right rotation ($p <0.01$) and CCFT ($p <0.05$) between group A and B, flexion ($p <0.01$) between group A and C, CVA ($p <0.05$), left and right rotation ($p <0.01$) and CCFT ($p <0.001$) from 2nd to 4th week of treatment between group B and C.

Conclusion: Both McKenzie approach and Neck exercises were effective in treating Forward Head Posture but statistically significant difference was found between groups (A) and (B), (B) and (C) but there was no significant difference found between groups (A) and (C).

Keywords: *Forward head posture, McKenzie approach, Neck exercises, Young adults*

Introduction

In the modern era, the prolonged uses of mobile phones and computers have lead to a variety of musculoskeletal disorders, especially related to the neck namely, Forward Head Posture(FHP), rounded shoulders, upper cross syndrome, mechanical neck pain etc. FHP is one in which the upper cervical convexity is increased and the lower cervical convexity is decreased causing anterior weight bearing of the cervical spine[1)]. It is also known as Scholar's neck, Reading neck or Wearsie neck[2)].

The prevalence of FHP using anterior head translation in plain radiographs in neck pain patients was found to be 37%, out of the total subjects having FHP 58% were females and 42% were males [3)]. A review of different observational studies on neck pain around the world showed that its 1 year prevalence ranged from 16.5 to 75.1% for the entire adult population[4)].

To maintain the head in forward position and to counteract the excessive external flexion moment, there is constant isometric contraction of the cervical

extensors[1] that take over the load of the inactive deep neck flexors. This leads to lengthening of the cervical extensors whereas shortening and weakness of deep neck flexors causing muscle imbalance[5] ultimately leading to injury to the soft tissues. This results in reduced range of motion as well as diffused pain in the neck, scapular and head regions[5]. Therefore, it is important to treat FHP to relieve neck pain, improve posture and increase the range of motion.

McKenzie approach is one of the most common therapies used for the management of spinal conditions including dysfunctions like FHP in which patients are managed with an appropriate repeated loading strategy which is progressed according to patient response along with postural correction.

The primary cervical muscles that undergo imbalance are the cervical flexors namely, Deep Cervical Flexors and the cervical extensors namely, Suboccipitals. Literature states that in order to correct the posture and maintain it to prevent recurrence, strengthening of deep cervical flexors and stretching of sub-occipitals is necessary

Methodology

Participants: Thirty subjects (10 men, 20 women) with FHP within the age group 18-35 years, having neck pain since 3 months, anterior weight bearing _>15mm in the lateral view of plain radiograph, Pectoralis minor length ≤ 2cm and falling under Dysfunction syndrome were included while subjects with history of cervical spine surgery, fractures, whiplash injury, rheumatoid arthritis and cervical disc herniation were excluded. All the subjects were provided with informed consent. The subjects were randomly allocated into 3 groups.

Interventions: Group A. The subjects in this group received McKenzie exercises in which exercises were repeated 10 times, 3 times /week for 4 weeks[6]. We used the regimen for the management of dysfunction syndrome under the guidelines of Mechanical Diagnosis and Therapy by the progression of retraction, retraction with overpressure, and retraction mobilization, extension and rotation depending on the patient response. The traffic light guidelines were used for the commencement or the discontinuation of the treatment.

Chin retraction was asked to be performed while the therapist supervised the movement to ensure that the head remained horizontal without any inclination of the head through the movement. Once the end range was gained and held momentarily, starting position was achieved again. Retraction was a precursor to any other cervical movements. When a good retraction range was achieved, progression was made. The subjects were demonstrated and taught self exercises and were advised to perform these exercises every 2-3 hourly.

Group B. The subjects were given neck exercises that included Deep Cervical Flexors strengthening which were performed 10 times, holding each for 20 seconds[7] with the subject in supine, head in neutral; nodding movement was performed while the therapist palpated to check whether superficial neck flexors were activated. Sub-occipitals stretching was done with the subject in sitting position; chin retracted and passively flexed until a stretch was felt, 4 times with hold of 30 seconds were done. The subjects were demonstrated, supervised and taught self exercises and were advised to perform these exercises every 2-3 hourly.

Group C. This group underwent a combination treatment of group A and B simultaneously.

Outcomes: Photogrammetric method. The subject was made to stand with neck and shoulder relaxed and the C7 was marked using a permanent marker to be used in the quantification process in the angles. The digital camera (Nikon Coolpix 7100™) was kept on a tripod stand 1.5m away from the subject and the height of the camera was adjusted. All the subjects were photographed thrice with a 2-week interval between. The photographs were then transferred to the laptop (Lenovo G505™) and the angles were measured by using Kinovea™.

Cranial vertical angle (CVA)**.** The angle was made by drawing a horizontal line passing through C7 which was parallel to the ground, a line passing through C7 and tragus of the ear[8].

Cranial rotation angle (CRA)**.** The angle was formed by the line connecting C7 with the tragus of the ear and the line connecting the tragus of the ear with lateral canthus of the eye[8].

Cervical ROM**.** For flexion, extension and lateral flexion range of motion, the patient was asked to be in sitting position, the Baseline Bubble Inclinometer™ was placed on the vertex of the head. For rotation, with the patient in supine, the inclinometer was placed on the

forehead. The pointer was adjusted to 0 degrees, the respective movement was asked to be performed and the readings were noted accordingly.

Craniocervical flexion test. The subject was in supine with the neck in neutral. The Chattanooga Pressure stabilizer unit™ was placed underneath the cervical lordotic curve. Baseline cuff inflation of 20mmHg was obtained. The subject was instructed to perform neck flexion at 5 different pressure levels progressively (22, 24, 26, 28, 30) and hold each level for 10 seconds. A 30 second rest period was provided between each neck flexion[9]. At the level where the subject could not hold for 10 seconds or the activation of superficial neck flexors was palpated, the test was stopped and the previous level of cuff inflation was taken as the reading.

Neck Disability Index. In this study, the subjects marked the option which was most suited to their symptoms. The total score was transformed into percentage points by using the following formula.

Total score/50 x 100 = %points

Statistical method: The outcome assessment was taken at the baseline prior to the treatment after group allocation, 2 weeks and 4 weeks after the treatment period. Intra-group analysis was done using Repeated Measures ANOVA. Comparison between baseline and 2 weeks, 2 and 4 weeks, baseline and 4 weeks was done by Tukey- Kramer multiple comparison test. The inter-group analysis for parametric data was done using One-way ANOVA while for non-parametric data was done by Kruskal-Wallis test. The inter-group multiple comparison analysis was done using Tukey Kramer multiple comparison test. Statistical significance was accepted for the values of $p<0.05$ at 95% confidence interval. The analyses were performed using SPSS (version 25.0, Chicago, USA).

Results

There were significant differences in all outcome measures after 2 and 4 weeks of treatment within all 3 groups ($p<0.001$) except extension, right rotation and right lateral flexion in group A (>0.05), left lateral flexion and Neck Disability Index in group B ($p>0.05$) and left lateral flexion in group C ($p>0.05$). There were significant differences in Flexion, right rotation, CCFT ($p <0.01$) and left rotation ($p>0.05$), between group A and group B , left rotation ($p <0.05$) between group A and C, CCFT (<0.001) between group B and C after 2 weeks of treatment. There were significant differences in flexion (<0.05), left rotation and right rotation (<0.01) between group A and B after 4 weeks. There were significant differences in left and right rotation ($p <0.01$) and CCFT ($p <0.05$) between group A and B, flexion ($p <0.01$) between group A and C, CVA ($p <0.05$), left and right rotation ($p <0.01$) and CCFT ($p <0.001$) from 2nd to 4th week of treatment between group B and C.

Discussion

Sustained bad posture causes stress as well as structural changes in the soft tissues. Postural correction and appropriate exercises are necessary for preventing further complications as well as decreasing the anterior weight bearing of the head.

In this study, 30 subjects (male to female ratio 1:2) diagnosed with Forward Head Posture were taken. A study reviewed 14 independent cohort studies which showed that development of non-specific neck pain was associated with female gender while another study showed no gender difference in relation with Forward Head Posture[10,11].

In this study, CVA was taken as an outcome measure. This study showed that there was increase in CVA within all the groups, but there was a significant difference in group B and C. A study showed the changes in CVA after incorporating McKenzie exercises on FHP for 4 weeks to be significant [12]. Another study also had a significant difference after giving McKenzie exercises on FHP [13]. In a study, examination of the change in Neck Flexion Angle after neck exercises showed a significant difference post test[14].

There was a significant difference in CRA within the groups. CRA was shown to have no significant difference between the groups in this study.

A study showed that there is a correlation between CVA with NDI and Range of motion, especially cervical flexion and endurance of deep cervical flexors [15]. In the assessment of cervical range of motion, a significant difference seen in group A and B, group B and C in cervical flexion and rotation. It was seen that forward head posture had a relation with reduced cervical range of motion, namely flexion and rotation[16]. Group C showed most improvement in flexion and rotation range due to which there was maximum reduction in CVA.

It was seen that there was improvement in the NDI scores in all the groups but there was no significant difference between the groups. This shows that both the treatment approaches were beneficial when it came to improving quality of life. Supporting this study, it was noted that using neck exercises led to decrease in NDI scores (mean difference 2.2) [17].

A study saw that subjects demonstrating chronic neck pain had a poorer ability to perform the CCFT[9]. The subjects in this study initially had a low CCFT score which may be because of increased upper cervical lordosis being developed due to forward head posture. At the end of 4 weeks, it was seen that there was a significant difference between group A and B, group B and C, concluding that solely relying on neck exercises did not improve the deep neck flexors strength.

Conclusion

It was concluded that McKenzie approach, neck exercises as well as their combination were individually effective in reducing forward head posture. Although not statistically significant, the combination of both the treatments got better outcomes that the former.

Socio-economic, Hygiene and Nutritional Status of Indian Slums: A Scoping Review

K. Jansi Rani[1], S. Kavitha Maheswari[2], Sebastian Kot[3], A. Hariharasudan[4]

[1]Research Scholar, Dept. of Food & Nutrition, Mother Teresa University, Kodaikanal, India and Faculty of Nutrition and Dietetics, The Standard Fireworks Rajaratnam College for Women, Sivakasi, India; [2]Faculty of FSM & D, Government Arts College for Women, Nilakottai, India; [3]The Management Faculty, Czestochowa University of Technology, Armii Krajowej 19B, 42-201 Częstochowa, Poland and Faculty of Economic Sciences and IT, North-West University, Vaal Triangle Campus, PO Box 1174, Vanderbijlpark, 1900, South Africa; [4]Faculty of English, Kalasalingam Academy of Research and Education, Krishnankoil, India

ABSTRACT

In the third millennium, the growth of urbanization is rapid, especially the fast developing country like India move faster towards urbanization, which is lopsided with the expansion of slums. This scoping review aims to present the socio-economic, hygiene and nutritional status of the slums in India. The methodology of the study analyses the previous studies on the selected research problem in back-and-forth method. Through intense and diverse studies, this paper has arrived at the results that the socio-economic status of the Indian slums is very low. The hygiene and sanitation of those slums are in need of an immediate call. Above all, the nutritional status of the slum dwellers, especially the women and children is terrifically low. The authors also report the lack of studies on the selected topic in the southern part of India and also recommend such studies to be carried out in the future.

Keywords: *Slum; Slum Dwellers; Socio-economic Status; Hygiene and Sanitation; Nutritional Status.*

Introduction

In the third millennium, there is a remarkable development in the urban populace [1, 2]. The speed of urbanization has been increasing worldwide [3]. The fast developing countries like India [4] move faster towards urbanization, with the average rate of 2% yearly when compare with 0.5% in more developed countries [5]. This growth, however, is not uniform in terms of urbanization [6]. This rapid urbanization pressures the previously overwrought and dense infrastructure of the cities' and upshots to the formation of slums.

The term slum speaks volumes about the plight of the poor and the deprived [7]. The slum is an overcrowded and squalid portion of a district or city or town usually inhabited by the very poor and downtrodden, who generally inhabit in the debris, dirty and infective areas [8]. Pure air, healthy environment and spacious living places are all denied to them.

According to Article 21 of Indian Constitution, Health is a basic right for every human being, despite their socio-economic and cultural status [8, 9]. The living condition of an individual has its own impact on one's health. Health and nutritious meals is a big question mark for such people, who struggle for their basic needs of the day in and day out, facing all kinds of challenges [9]. Most of the slums are situated in vulnerable locations such as river margins, underneath the over bridges, waterlogged areas and road margins etc [7, 10, 11]. These people are forced to live in such areas because of their economic condition.

The prime objective of this study is to disclose the despairs of the slum dwellers in India. More specifically, the aim of the present study is to explore the different

forms of their deprivations, sufferings and miseries for basic needs including social, constitutional and economic rights by reviewing previously published studies.

Methodology

The study adopts a Scoping Review, which is not a linear process (as typically dictated by the protocol for a systematic review) but a back-and-forth between early studies and new insights and changes in search terms and even questions [12, 13]. The purpose of the scoping review is to analyze all the studies available on the topic without any restrictions on the studies resourced. Considering this approach, the study has analyzed and reviewed the kinds of literature related to slums.

The investigation was done on the review of kinds of literature, methodologies of various studies were understood, the conclusions and interpretation of many studies were collectively reviewed in order to compare and contrast the results of secondary studies. Thus, the methodology was mainly comprised of content analysis. The mentioned analysis was carried out by auditing the journals and identifying and scrutinizing the studies that were related to socio-economic, hygiene and nutritional status of slums of India. The researchers went through the studies and gathered the information on the selected topic. Moreover, from this wide range of searching, it was found that there was no study conducted on the selected topic in the Southern part of India.

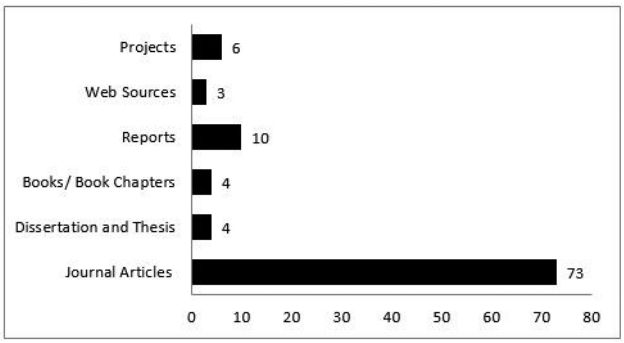

Figure 1: Percentage of various scoping reviewed literatures

(Source: Authors' own design)

From the above figure 1, it is understood that the authors have reviewed various literatures in relation to the selected research problem. Through the diverse study, the authors have identified the handful number of studies. Out of which, 73% of studies are from the journals, 10% of data are from the reports of various studies, 6% is taken from the government and non-governmental projects, books, book chapters, dissertation and thesis comprise of 4%, and 3% of the studies come from the web sources.

Socio-economic Status of Slums: Through the diverse studies, it is unveiled that the slum dwellers' socio-economic condition is very pathetic [14]. Many studies argue that slums are poverty traps and therefore they do not have better financial opportunities. Slum population remains deprived, particularly in health, education and socio-economic aspects [15]. It is disclosed that the financial status of the families in slums is very poor and it influences their health condition and social status too [10]. From many studies, it is profound that 25 per cent of slum families earn less than 2,000 INR and sink below the poverty line [16]. Most of the slum dwellers, men work as skill-based workers, in other words daily waging labors and most of the slum women are servant maids. Low socio-economic status of the slum children is significantly responsible for the specific morbidities of the same [17].

The overall socio-economic status of slum dwellers is in miserable condition. Maximum slum dwellers are deprived of education and almost one-fourth of the slum dwellers is non-literate [10]. The utmost number of women dwelling in the slums is uneducated, illiterate and their status is also lower. Females are less educated than the males in many of the slums. A survey study among the women slum of Vishakhapatnam discloses that the percentage of women who have received undergraduates, secondary education and primary education is just 2%, 28% and 70% respectively [18].

Hygiene and Sanitation in Slums: To any civilized man, the slum is a virtual hell and it is unhygienic for human settlements. These underprivileged people, who live in such unhygienic environments, are vulnerable to infections and prone to all infections and as the consequences easily susceptible to communicable diseases. Any area with the inadequacy of safe water, inadequate access to sanitation and other infrastructures, ghastly housing, congestion and insecure inhabited status is an informal settlement. Children from poorest urban slum are three times more likely to die before the age of five than those from wealthiest urban and rural areas. Worldwide, the slum dwellers do not have the access to such essential requirements [19]. Many studies strongly profound that the slum households lack the following:

- Sturdy home of a permanent nature that gives shelter even in all typical weather conditions
- Adequate living area wherein not more than three people sharing the same room
- Inexpensive potable water
- Sufficient hygiene by means of private or public lavatory shared by the rational number of populace
- Residential protection, which avoids enforced evictions.

The major notorious problems in the slums are: (a) be short of drinkable water (b) no appropriate sanitation and waste discarding, domestic as well as public lavatories (c) mosquitoes and rodents threat (d) lack of health services at the locality (e) lack of monetary prop up for women. A study, which is conducted among the slums of Delhi, reveals that 83 per cent toilets are contaminated with fecal and other waste manners [20]. Admittance to safe drinking water and accessibility to sufficient sanitation are necessary to the health of every individual [8]. Slum population is posing problems such as poor housing conditions, overcrowding, reduced access to safe water and sanitation and lack of personal hygiene[21].

A study in Mumbai slum shows that water-related infection is the root for 30% of all morbidity. But, after inculcating the practice of proper hand washing, there are 25% lesser diarrheal episodes, 15% lesser Acute Respiratory tract Infection (ARI) episodes and 27% lesser sick leave in school [21]. The study carried out on the menstrual hygiene of slum women asserts that more than half of the slum women use and reuse cloth instead of using disposable sanitary pads during menses and the additional fact is those women have more prevalence of STD/RTI (Sexually Transmitted Disease/Reproductive Tract Infection), when compared to those women using disposable sanitary pads [22]. Thus, two things can be understood from the intense review of the diverse studies: Firstly, the hygiene and sanitation condition of most of the slums in the nation is in a dangerous condition with poor livelihoods, which also demeans the ecology. Secondly, though the hygiene and sanitation are worst, it can be reversed by appropriate intervention policies by the governmental and the non-governmental organizations.

Nutritional Status of Slums: The occurrence of under-nutrition is higher among girls than that of boys [23]. Some studies mismatch with these findings by saying that there is higher under-nourished boy children rather girls and some more state that there is no significant gender differential [24], but anyways all the studies significantly accept the presence of under-nutrition among the children of sub-standard settlements. In the scenario of the children less than two years, more than half of the children -- 55.7% are under-weight and 42.6% are stunted and 36.5% suffers from muscle wasting [25]. The whooping fact is that most of the children in the slums experience Protein Energy Malnutrition (PEM), Iron deficiency anemia, Iodine deficiency disorders, and Vitamin A deficiency [26].

The study by Deka et al. (2016) confirms the prevalence of anemia in adolescent girls from ten randomly selected slums and declares that the probable reason for this may be worm infestation and this finding matches with the findings of Vasanthi et al. [27]. The malnutrition and under-nutrition in the adolescence period is the common nutritional problem in the slum, which may lead to different types of life-threatening difficulties during pregnancy. The nutritional status of women is destitute in the poorer socio-economic cluster.

In slums, underweight is concerted among women in the poorer households [16]. Poor nutrition starts before birth and extends into adolescence and adulthood period and as a consequence, continues to next generations too. Evidently, malnourished girl children are more likely to remain malnourished during adolescence and adulthood and when pregnant more likely give birth to low birth weight infants [2].

Results and Discussion

The present study brings the socio-economic, hygiene and nutritional status of the slum dwellers in India into the limelight by analyzing the previous studies using scoping review method. It is understood that slums are without essential amenities, occupied by uneducated and altogether, their state of living is very pathetic. They are not given much consideration towards their health and their children's health and thus, there are more illnesses and sick among slum individuals. Many studies stand as proof for the fact that poor sanitation, the nonexistence of toilets, open poo, debased drinking water, and so forth are the probable explanations behind the sickness of ladies and children in slum ranges. Because of these reasons, the hygiene and nutritional status of Indian slum

regions is a somber issue. Crucially, the authorities need to make essential strategies, because 70% of the slum dwellers respond negatively while asking whether they feel that their families eat a balanced diet and receive proper nutrition and are satisfied or happy with their living condition and livelihood [18]. These people with their eyes opened wide, hands stretched long, waiting for the helping hands from the governmental and the non-governmental agencies.

Through intensive reviewing of many studies on the selected research topic, the authors discover the big gap in the literature, where is the lack of studies undergone in the southern part of India.

Conclusion and Implications

From the keen audit, this work tries to throw light on another side of the coin -- the darker shades of the nation, which really needs to be emphasized and thus, it concludes that the socio-economic, hygiene and nutritional status of slums of India are in very pathetic condition moreover, many studies are not published on the slums of South India, particularly in Tamil Nadu and covering all theses context in a single study. By identifying this gap, the present study motivates the researchers to get interested with more society-oriented studies especially about such underprivileged and the economically downtrodden people. The researchers believe that this study may motivate further researches in socio-economic condition, hygiene and nutritional status of the slums of Tamil Nadu.

Conflict of Interest: The authors declare no conflicts of interest.

Study of Correlation between Serum Lipid Profile and Thyroid Function in a Tertiary Care Hospital

Aryankumar[1], Ajit Sontakke[2], Sangita Patil[3], Dhirajkumar Mane[4]

[1]2ND year M.B.B.S. Student, [2]Professor & Head, [3]Associate Professor, Department of Biochemistry, [4]Statistician, Krishna Institute of Medical Sciences, Karad, Maharashtra

ABSTRACT

Introduction: Hypothyroidism is strongly related to increased risk of cardiovascular diseases due to its potential association with atherogenic lipid profile. Hypothyroidism also can even cause premature atherosclerosis. Untreated hypothyroidism is the most common cause of reversible hyperlipidemia.

Method: Blood samples received from either OPD or IPD in plain and EDTA vacutainer was separated from blood to plain vacutainer by centrifugation at 3000rpm for 10 minutes. For HbA1c EDTA vacutainer samples are used. By using different methods serum urea, creatinine estimated on fully automated analyzerEM360.

Results: Age wise distribution show a more number in <50years group, indicating early occurrence of hypothyroidism, might be because of more stressed lifestyle resulting in deranged thyroid metabolism. Our study shows in gender wise distribution more number for female subjects, since hypothyroidism is more common in females. Regarding VLDL levels, significant correlation was found with T4, indicating changing impact on triglycerides metabolism with severity of hypothyroidism.Since our objective of the study is to establish a correlation between lipid profile and TSH as our finding show negative correlation TSH and total cholesterol and LDL cholesterol.

Conclusion: Since our objective of the study is to establish a correlation between lipid profile and TSH as our finding show negative correlation TSH and total cholesterol and LDL cholesterol. But this need more research work on this aspect of independent correlation of TSH and total cholesterol. This can further help to diagnose early hypothyroidism with only two parameters TSH and total cholesterol, if proved and thoroughly researched.

Keywords: *Hypothyroidism, thyroxin, hyperlipidemia.*

Introduction

Thyroid hormones regulate metabolism of number of biochemical parameters. Because of this, disorders of thyroid gland are the most common endocrine disorders. Diseases of thyroid gland affect lipid metabolism, since thyroxin favors lipolysis and lipid turnover. Hypothyroidism is associated with increased cholesterol levels because of defective transport by HDL.TSH stimulates thyroid hormones synthesis and controls overall metabolism and significantly influences serum cholesterol level.[1] Hypothyroidism is strongly related to increased risk of cardiovascular diseases due to its potential association with atherogenic lipid profile. Since hypothyroidism has a great impact on lipid metabolism, especially serum cholesterol level and other risk factors which can result in complications like atherosclerosis, obesity and hypertension responsible for cardiovascular disease. Thyroid gland is regulated by TSH, which is produced by pituitary gland, present at the base of brain.

This scenario aroused interest for this study to find out relationship of especially TSH with lipid profile and other complications as cardiovascular disease[2].

A number of studies reported that high level of TSH has deleterious effect on serum lipid levels but

Karad, Maharashtra

this study is still in debate because many studies are not supporting this correlation as it is influenced by factors like BMI, age, gender etc. But several studies established well inverse relation between cholesterol with thyroxin but not much research work is available in Indian population. Also there is not much research work available on independent correlation between TSH and cholesterol level.

One study has confirmed that TSH is independent of thyroid hormones, as TSH can up regulate the expression of hepatic 3-hydroxy-3-methyl glutaryl coenzyme A reductase which is a rate limiting enzyme in cholesterol synthesis. This indicates there might be an independent correlation between TSH and cholesterol level[2,3].

Material and Method

This study was conducted in tertiary hospital, biochemistry laboratory after obtaining approval from institutional ethics committee. Since this is a retrospective study, data collected from the records of tertiary care hospital for two months study period.

NAME OF PARAMETER	METHODS USED
SERUM T_3	FUOROIMMUNOASSAY
SERUM T_4	FUOROIMMUNOASSAY
SERUM TSH	FUOROIMMUNOASSAY
SERUM TOTAL CHOLESTEROL	COLORIMETRIC
SERUM TRIACYLGLYCEROL	COLORIMETRIC
SERUM HDL CHOLESTEROL	COLORIMETRIC
SERUM VLDL	COLORIMETRIC
SERUM LDL CHOLESTEROL	COLORIMETRIC

For all parameters, controls from BIORAD run on same machine before analysis to check the quality. Even external quality control program participated, results are excellent. Data for 287 patients, diagnosed cases of hypothyroidism collected during two months study period. Statistical analysis was done by using software INSTA-STAT.

Results

Table 1: Age & Gender Wise Distributions of Subjects

Age (No.)	%	Gender	No. of Participants	%
≤50yrs (158)	55.05	Males	88	30.66
>50yrs (129)	44.94	Females	199	69.33
Total	100	Total	287	100

The total number of subjects included is 287. The number of subjects in ≤50 years group is 158, number is 129 in >50 years group, number of females is 199 while for males it is 88, indicating more number of females suffering from hypothyroidism.

Table 2: Gender wise Comparison of T3, T4, TSH

Study Variables	Gender	N	Mean	SD	t-value	p-value
T3	Males	88	92.06	66.70	-0.23354	0.815501
	Females	199	94.19	75.29		
T4	Males	88	9.22	15.22	-2.04843	0.0414
	Females	199	6.83	4.49		
TSH	Males	88	6.50	20.96	-0.2297	0.818484.
	Females	199	5.90	19.61		

T3- The t-value is -0.23354. The p-value is .815501. The result is not significant at $p < .05$.

T4- The t-value is -2.04843. The p-value is .0414. The result is significant at $p < .05$.

TSH- The t-value is -0.2297. The p-value is .818484. The result is not significant at $p < .05$.

Table 3: Gender wise comparison of Lipid Profile

Study Variables	Sex	N	Mean	SD	t-value	p-value
TG	Males	88	152.55	84.95	0.4760	0.6344
	Females	199	147.48	82.52		
Cholesterol	Males	88	169.61	52.86	0.9027	0.3674
	Females	199	162.75	63.73		
HDL	Males	88	48.23	22.25	0.1533	0.8782
	Females	199	47.86	17.94		
LDL	Males	88	95.09	51.08	-0.3757	0.7074
	Females	199	92.10	68.30		
VLDL	Males	88	30.73	17.81	0.6190	0.4978
	Females	199	29.57	16.46		

TG - The t-value is 0.47602. The p-value is .634411. The result is not significant at $p < .05$.

Cholesterol- The t-value is -0.90271. The p-value is .367414. The result is not significant at $p < .05$.

HDL- The t-value is 0.15337. The p-value is .878208. The result is not significant at $p < .05$.

LDL- The t-value is -0.3757. The p-value is .707413. The result is not significant at $p < .05$.

VLDL The two-tailed P value equals 0.6190 t = 0.4978 The result is not significant at $p < .05$.

Table 4: Correlation between T3 and Lipid Profile

T3 vs. Lipid Profile	T3MEAN 93.53S.D. ± 72.73			
	Mean	S.D. ±	Pearson Correlation	P value

VLDL: The value of R is -0.0908, a negative correlation; the relationship between variables is significant as P-Value is 0.1198 the result is at $p < .05$.

Discussion

Hypothyroidism increases the oxidation of plasma cholesterol mainly because of an altered pattern of binding and due to the increased levels of cholesterol, which presents substrate for oxidative stress. Hypothyroidism is often accompanied by diastolic hypertension that, in conjunction with the dyslipidemia, may promote atherosclerosis. However, thyroxin therapy, in a thyrotropin (TSH) suppressive dose, usually leads to a considerable improvement of the lipid profile [4,5]. From this study it can be concluded that hypothyroidism is associated with lipid disorders that are characterized by normal or lightly elevated total cholesterol levels, increased LDL-cholesterol and lower HDL-cholesterol

Age wise distribution show a more number in <50years group, indicating early occurrence of hypothyroidism, might be because of more stressed lifestyle resulting in deranged thyroid metabolism. Our

study shows in gender wise distribution more number for female subjects, since hypothyroidism is more common in females. In one study, researchers did not find that total cholesterol level was higher in women with subclinical hypothyroidism than euthyroid women[6].

Gender wise comparison of T3,T4, shows decrease in case of females as well as males but within normal ranges with significance in case of T4 ascompared to T3.This indicating severity of hypothyroidism is more in females than males.Comparison of TSH show a rise in both genders but within normal. Lipid profile comparison in males and females show increase in case of males. This might be because of more utilization of cholesterol and other lipids for synthesis of female hormones like estrogen and progesterone.

When T3 correlated with lipid profile it's showing weak positive correlation only with triglycerides,since decrease in T3 is very little and within normal limits therefore not much increase in triglycerides. Remaining all parameters in lipid profile show negative correlation and increase in lipid profile is within normal range. Similarly when T4 correlated with lipid profile its showing positive correlation as decrease inT4 and increase in lipid profile is within normal range.Correlation with VLDL is significant, only HDL showing negative correlation with T4, but within normal limits. TSH show negative correlation with all lipid profile parameters, in case of cholesterol it is significant. This might be because of increased TSH,there is rise in T3,T4 regulating the lipid profile resulting in decreased levels but within normal limits.

Hypothyroidism is a common metabolic disorder. The prevalence of primary hypothyroidism is 1:100, but it may be 5:100 if patients with subclinical hypothyroidism (normal T4, raised TSH). According to a study done by Ajay Arsana [7], hypothyroidism is a common disorder with a prevalence rate up to 20%. In another cross-sectional study on twelve hundred and twelve subjects of both sexes and age 20-60 years, the incidence of subclinical hypothyroidism was 19.7%**.** In our study, mean total cholesterol, LDL cholesterol and triglycerides were found slightly increased whereas HDL cholesterol not decreased in cases of hypothyroidism. JUNG[8] found mean plasma total cholesterol and LDL cholesterol levels elevated in hypothyroid cases than in normal controls. In another study, average serum total cholesterol level was found elevated in primary and secondary hypothyroidism. Keyes &Heimbergfound triglyceride level elevated in hypothyroid patients. So, our study findings were consistent with the previous studies done by other investigators like Keyes WG [9]and Abrams JJ[10]. Venditti P [11]have stated decreased activity of LDL receptors as the main cause of hypercholesterolemia in hypothyroidism. Serum concentrations of high density lipoprotein cholesterol was reported to be higher among newly diagnosed hypothyroid patients (subclinical or clinical) whereas serum concentrations of HDL cholesterol were significantly lower among euthyroid and previously reported hypothyroid cases who were on thyroxin replacement therapy [12]. Studies done by Michalopoulou showed average serum concentration of HDL higher in subclinical or clinical hypothyroidism, similar to our finding. Abrams J J& Grundy S M[13] has shown in their studies reduction of HDL cholesterol in hypothyroidism[13]. So, decrease in HDL cholesterol level in our study might be due to increased activity of CETP and lipoprotein lipase in hypothyroid patients.

There was no significant difference in serum total cholesterol concentrations among the groups, males and females. But the different pattern of decreasing cholesterol with increasing severity of hypothyroidism revealed in this study. This is further supported by our finding of no correlation of HDL with T3, T4.This might be due to our small sample size.

Regarding VLDL levels, significant correlation was found with T4, indicating changing impact on triglycerides metabolism with severity of hypothyroidism. It is claimed that thyroid hormones facilitate the LPL activity [14]**,** but deficiency of thyroid hormones to inhibit LPL probably follows a ceiling point beyond which further reduction of thyroid hormones does not cause further inhibition of LPL. In our study T4 has shown negative correlation with HDL cholesterol level. Positive correlation was found between serum T4 level and serum total cholesterol level, serum triglycerides, LDL and significant withVLDL. Total cholesterol and LDL cholesterol were found to maintain negative correlation with serum TSH. TSH was found to show significant negative correlation with serum cholesterol.Significant negative correlation of TSH with cholesterol level and negative correlation of TSH with triglycerides appear to make a sense of functional disharmony between T4 and TSH and, therefore, a large scale study is recommended to make it clear. Results of our study suggest the findings of mild dyslipidemia in hypothyroid patients.

Since our objective of the study is to establish a correlation between lipid profile and TSH as our finding show negative correlation TSH and total cholesterol and LDL cholesterol. But this need more research work on this aspect of independent correlation of TSH and total cholesterol. This can further help to diagnose early hypothyroidism with only two parameters TSH and total cholesterol, if proved and thoroughly researched. So, our study is consistent with some of the studies and inconsistent with the others. A large scale study on overt hypothyroid patients is recommended to come to a final conclusion. It does however have some limitations; measurements of TSH and T4 and lipid profiles were performed just once. Our results must be cautiously interpreted for the general population. This study is not a prospective study and therefore it demonstrates only association and not causation of various variables.

Self Management and Knowledge among People with Type 2 Diabetes

Aldrin Vas[1], Elsa Sanatombi Devi[2], Sudha Vidyasagar[3]

[1]PhD Scholar, [2]Professor, Manipal College of Nursing, Manipal Academy of Higher Education, Manipal; [3]Professor, Department of Medicine, Kasturba Hospital Medical College, Manipal

ABSTRACT

Purpose: The purpose of the study was to assess the knowledge and self management among people with type 2 diabetes.

Method: This study was carried out among 180 people with type 2 diabetes who admitted to tertiary care hospital at Udupi from June 2015 to January 2016. Data collected were basic demographic information and clinical items like HbA1c and BMI, knowledge, self management among people with type2 diabetes. Self management is assessed with diabetes self management questionnaire.

Results: This study revealed moderate level of self management among 95% participants and moderate level of knowledge was observed among 85% participants.

Conclusion: Considerable number i.e. 15% had inadequate knowledge regarding diabetes and its management which calls for appropriate intervention focusing on enhancing self management ability of people with type 2 diabetes.

Summary Statement:

What is already known about this topic?

- Self management is essential in diabetes management.
- Knowledge is the crux of effective management of diabetes.

What this paper adds?

- This study focuses on various aspects of self management among people with type 2 diabetes.
- Awareness about different dimensions of self management will help to design interventions to improve it.

The implications of this paper

- Shift of focus from symptomatic care to holistic approach where overall quality of life will be the goal of intervention.
- Innovative approaches to strengthen the ability of self management of their condition to maintain a good quality of life of people with type 2 diabetes

Keywords: *Type 2 diabetes; Self management, Diabetes knowledge*

Introduction

New case of diabetes is diagnosed every 40 seconds[1]. Across the world approximately 415 million people are living with diabetes and it may increase to 642 million by the year 2040 Developing countries constitutes 75% of them. About 69.2 million of them live in India and

estimated number for South East Asia is 78.3 million[2]. In India due to diabetes 1.1 million deaths occurred and in South East Asia it is 1.2 million[3].

In urban India about 8.7% is the prevalence rate. 40-59 years is the age group which constitutes majority, which is found to be a decade earlier with comparison of western population. This means young people are affected with diabetes in their productive years of their life[4], which poses a risk of diabetes related complications, since they have to live with diabetes for longer duration. From this perspective self management plays pivotal role in adopting healthy lifestyle and preventing or delaying diabetes related complications and there by leading a good quality of life.

Self management poses a challenge, due to the complex nature of diabetes. However patients need to be supported and empowered to maintain the self management behaviours[5]. Behavioral change oriented patient empowerment will aid them to manage their condition with effectiveness[6]. Self-management programmes acts as a foundation for the empowerment approach[7]. Since people with type 2 diabetes take responsibility in managing their condition, the cost effectiveness of health care may also be evident in self-management.

Knowledge, attitude and self-management ability influences the quality of life of people with type 2 diabetes [8]. Understanding disease and its management are the major factors that influence self-management and glycaemic control[9]. Diabetes education can be effective if we are aware of their knowledge, attitude and practice [10]. Success of management of chronic disease is associated with patient education[11], Self-management education found to be effective in behavior modification[12] and even in old age people in improving knowledge and treatment adherence[13, 14]. Diabetes management can be improved by focusing on self care activities[15]. This study aimed to assess the knowledge and self management among people with type 2 diabetes.

Method

Study Design: A descriptive survey design was used to determine the knowledge and self management among people with type 2 diabetes

Setting and Sample: This study was conducted in Kasturba hospital, Manipal from June 2015 to January 2016. Samples were selected after satisfying inclusion criteria. This study included 180 people with type2 diabetes who were admitted in the medical wards. Inclusion criteria were concerning age 30 years and above, diagnosed at least 3 months or more, language Kannada, voluntary participation in the study, whose HbA1c is 6% and above.

Ethical Consideration: Clearance obtained from institutional ethical committee (IEC) and written informed consent from the people with type2 diabetes who are under study. IEC approval no: ECR/146/Inst/KA/2013

Instruments

Data Collection: Data collection was done thorough questionnaires which were translated to Kannada, the regional language. Instruments used in the study were demographic proforma, diabetes knowledge questionnaire and diabetes self management questionnaire.

Demographic Proforma: Demographic proforma consisted items like age, gender, religion, dietary habit, education, family monthly income, occupation, and clinical items like duration of illness, onset, regular check up, BMI and HbA1c.

Diabetes Knowledge Questionnaire: This questionnaire was developed by the investigator which is made up of 20 multiple choice questions (MCQ's) on diabetes and its management which includes diet, physical activity, foot care and diabetes related complications. Scoring was done as '1' mark for right answer and '0' mark wrong answer. Tool was validated by panel of seven experts i.e. three were from the field of medicine, three were from the field of medical surgical nursing speciality and one was from psychiatric nursing specialty. After validation tool was assessed for its reliability and it was found to be r (20) = 0.88 which was statistically significant. This indicates that the tool was reliable.

Self Management Tool: Diabetes self management questionnaire developed by Andreas Schmitt et.al. was used in the study with authors' permission to collect self care activities associated with glycemic control. Diabetes self management questionnaire consists of four subscales i.e. 5 items about glucose management, 4 items about dietary control, 3 items about physical activity, 3 items about health-care use and one item on overall rating of self-care. Items were scored 0 to 3, maximum possible score was 48 and minimum was 0. The self management scores were categorized into good (33-48), moderate (17-32) and poor (0-16)[16].

All the tools were in English and were translated to regional language Kannada. Translation was done by a professional language translator. Accuracy of the translation was ensured by retranslating it back into English. Pre testing of the Kannada versions of tools were done by administering it to 20 people with type 2 diabetes. No modifications were done as there were no confusions expressed by the participants.

Data Collection

From June 2015 to January 2016 data collection was done in medical wards. It is convenient sampling technique was used to collect the data. Permission was obtained from medical superintendent of the hospital. Informed consent was taken from the study participants. A total of 180 people with type 2 diabetes participated in the study.

Data Analysis

As per the study objectives data analysis and interpretation was done using descriptive and inferential statistics with the use of SPSS 16 version.

Results

Sample Characteristics: Sample characteristics reveals that 50 to 69 years is the age group constitutes the majority (57.8%) of the patients. 67.2% were males, 92.8% were Hindus, for 67.2% participants schooling was not more than high school, 86.7% were married, 5001 to 10,000 Indian Rupees was monthly family income for 58.3% and 60% were non vegetarians.

About 41 to 50 years is the age of onset diabetes for 31.7% and 77.8% of them had diabetes for more than 1 year. 49.4% had thrice or more regular check up in a year, 51.1% had information on diabetes. 8 gm% of HbA1c was observed among 52.2% and 53.3% had BMI more than 25.

Self management and knowledge among people with type 2 diabetes

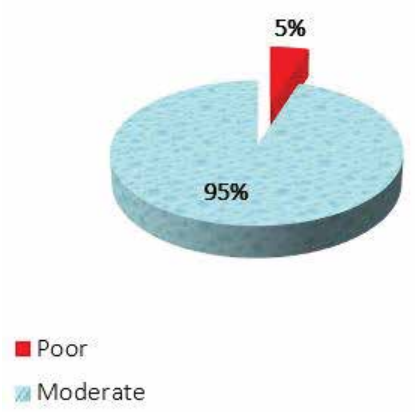

Figure 1: Self management among people with type 2 diabetes n = 180

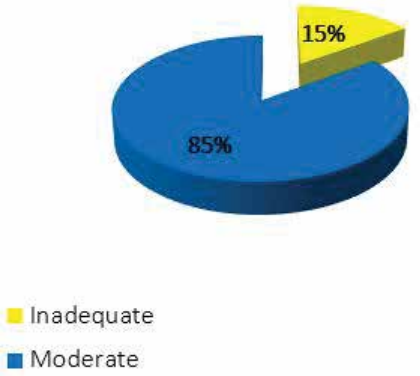

Figure 2 : Diabetes knowledge among people with type 2 diabetes n = 180

Pie chart on self management (Figure 1) and diabetes knowledge (Figure 2) among people with type 2 diabetes.

Table 1: Self management with regard to different domains n = 180

Self management	Minimum	Maximum	Max. possible score	Mean	Std. deviation	Median	Std. error
Glucose management	2	12	15	7.255	2.050	7	0.152
Dietary control	1	10	12	5.838	1.846	6	0.137
Physical activity	0	9	9	4.361	1.726	4	0.128
Health-care use	0	9	9	4.394	1.838	5	0.137
Overall rating of self-care	0	3	3	1.361	.955	1	0.071
Over all self management	13	31	48	23.21	3.892	23.5	0.290

Self management among people with type 2 diabetes was assessed in 4 different domains. Mean and standard deviation of glucose management is 7.255 ± 2.050, dietary control is 5.838 ± 1.846, physical activity is 4.361 ± 1.726, health-care use is 4.394 ± 1.838, self-care rating is 1.361 ± .955 and over all self management 23.21 ± 3.892

found to be moderate among people with type 2 diabetes. About 95% of the study participants had moderate level of self management, for remaining 5% self management was at poor level and no study participants were found with adequate level of self management which stresses the need for an intervention to improve self management.

Table 2: Diabetes knowledge with regard to different domains n = 180

Diabetes knowledge	Minimum	Maximum	Max. possible score	Mean	Std. deviation	Median	Std. error
Diabetes in general	0	5	5	2.25	1.133	2	0.119
Diet	0	4	4	1.61	0.899	2	0.094
Physical activity	0	2	2	0.81	0.644	1	0.067
Management	1	8	9	3.81	1.505	4	0.158
Over all diabetes knowledge	2	13	20	8.48	2.089	8.5	0.217

Knowledge among people with type 2 diabetes was assessed in 4 different domains. Mean and standard deviation of diabetes in general is 2.25 ± 1.133, diet is 1.61 ± .899, physical activity is 81 ± .644, diabetes management is 3.81 ± 1.505 and overall knowledge is 8.48 ± 2.089. Knowledge about diabetes and its management among people with type 2 diabetes is found to be moderate among 85% of the study participants, 15% found to be inadequate and no study participant had adequate knowledge regarding diabetes and its management which calls for an intervention.

Association between self management, diabetes knowledge and selected variables: Significant association was found between self management and regular check up (P=.001) and information about diabetes (P=.029). No association was found with items like age, gender, religion, dietary habit, education, family monthly income, occupation and clinical items like duration of illness, onset, BMI and HbA1c.

Significant association was found between knowledge and gender (P=.017) and family monthly income (P=.024). No association was found with items like age, religion, education, occupation, dietary habit and clinical items like onset, duration of illness, regular check up, HbA1c and BMI.

Discussion

A study conducted by Kueh Y H, 2015 shown diabetes knowledge and self-management essential aspects in maintaining quality of life of people with type 2 diabetes[8].

In present study association was found between knowledge and gender and family monthly income. Similar results were seen in study conducted by Jackson IL, 2014 which revealed association between Self-care knowledge and duration of diabetes, educational level and income[17]. This study revealed that 15% had poor level of knowledge regarding diabetes and its management. Diabetes knowledge was at poor level among people with diabetes and in general population, which calls for immediate educational interventions specially focused on risk factors[18, 19]. Education programmes may be effective in addressing critical gaps in patients knowledge[20]. Contribution of educational intervention was evident in enhancing the quality of life people with type 2 diabetes and their family[21].

Patients' knowledge and practice are the key factors which influence self-care behavior; hence there is a need in developing countries for effective diabetes education[14] and self-management programmes on regular basis[7]. A study conducted by Kumpatla S, 2010 revealed that HbA1c awareness had a positive impact on controlling blood glucose level[22] and better self-management behavior was evident[23]. Better self-efficacy was observed among those who had higher knowledge, attitude, and perception scores and it is resulted in better self care behavior[24].

Conclusion

This study revealed about the level of diabetes knowledge and self management among people with type 2 diabetes with respect to various domains. Understanding knowledge and practice becomes

essential in effective management of diabetes. Strategies to enhance knowledge regarding diabetes and its management and translation of that knowledge into practice specifically self management skills will empower people with type 2 diabetes to lead a good quality of life.

Anti-Inflammatory Activity of Silver Nanoparticles Prepared from Ginger Oil—An Invitro Approach

M. Maajida Aafreen[1], Roy Anitha[2], Rachel Christina Preethi[1], S. Rajeshkumar[2], T. Lakshmi[2]

[1]Graduate Student, [2]Associate Professor, Dept of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, Tamil Nadu, India

ABSTRACT

Background: Ginger(zingiber officinale) is a widely used spice in cooking and is a medical herb in traditional herbal medicine. Ginger is herb which is widely used for treating inflammatory conditions and their associated pain. The utilisation of various plant products for the synthesis of metallic nanoparticles is called green nanotechnology. It is safe and does not utilise any harmful chemical protocols.

Aim: To evaluate the antiinflammatory potential of ginger oil mediated silver nanoparticle.

Materials and Method: The Silver nanoparticles were synthesised using ginger oil and was confirmed by UV- visible spectroscopy. The synthesised silver nanoparticles were evaluated for its antiinflammatory activity by studying the inhibitory effect on albumin denaturation assay.

Result: The present study showed the production of silver nanoparticles at 460nm and was with very good anti inflammatory activity.

Conclusion: Biosynthesis of nanoparticles using ginger oil was eco friendly, reliable and suitable. So may be used for large scale production. It was easy to handle and rapid.

Keywords: *nanoparticles, nanotechnology, zingiber officinale, ginger oil*

Introduction

Nanotechnology is likely to prominently manipulate science, economy and day to day life in this twenty first century and their potential effects are used widespread in both *in vivo* and *in vitro* biomedical applications[(1)]. Nanotechnology is mainly concerned with the synthesis of nanoparticles of variables size, shape, chemical compositions and controlled dispersing for their potential use for human benefits[(2)]. Nano sized particles are basically small objects that act as a whole unit in accordance with their transport and properties[(3)]. As specific surface area of nanoparticles are increased, their biological effectiveness are also increased with increase in surface area[(4)]. The unique feature of nanoparticles may play a crucial role in biomedicine, energy science, optics and other health care sector[(1)]. Although chemical and physical methods may successfully produce pure, well defined nanoparticles, these methods are quite expensive and potentially dangerous to the environment[(2)].

Nanosilver has many important applications. It is used as anti microbial agent; it is applied in textiles, home water, purification systems, medical devices, cosmetics, electronics and household appliances [(5,6,7)]. Silver has been recognised as having an inhibitory effect towards many bacterial strains and microorganisms commonly present in medicinal and industrial processes. The most widely used and known applications of silver and silver nanoparticles are in the medical industry. These include topical ointments and creams containing silver to prevent infections of burns and open wounds[(8)]. Besides their anti microbial features, silver nanoparticles exhibit

Chennai-600077, Tamil Nadu
Email: anitaroy2015@gmail.com

strong optical features making the nanoparticles suitable for biological sensing and imaging. Silver nanoparticles are also used as catalyst in several chemical reactions.[9]

Nanobiotecnology is a promising field especially for biodiversity rich countrified like India. Biological diversity can thus be used as a major resource for biotechnological products and processes, which may be suitable for large scale synthesis. In recent years, plant mediated biological synthesis of nanoparticles is gaining importance due to its simplicity and eco friendliness. Ginger, the rhizome of *Zingiber officinalis* Roscoe, is one of the most widely used spices and a traditional remedy in Indian, Chinese, and oriental medicine against pain, inflammation and gastrointestinal disorders(10). Ginger is used to treat many inflammatory conditions and associated pain(11). The essential oil of ginger has been found to possess antibacterial, antiviral and antifungal properties. In modern usage, particular attention has focused on cyclooxygenase-inhibiting effects of gingerols, phenolic compounds that are responsible for gingers pungent taste, and their potential use in treating inflammatory disorders such as arthritis(12). In this study, ginger oil mediated silver nanoparticles were prepared and further evaluated for its anti-inflammatory activity.

Materials and Method

Preparation of ginger oil: 1 milli molar of silver nitrate solution was prepare by dissolving it in double distilled water. 90 mL of this was mixed with 10 mL of the ginger oil suspension. The solution was kept in magnetic stirrer/orbital shaker for the formation of nanoparticles synthesis for 24 hours. The colour change was observed visually and photographs were taken.

Preparation of nanoparticles: The nanoparticle solution was centrifuged using Lark refrigerator centrifuge at 8000 rpm for 10 minutes and the pellets were collected and washed with distilled water. The final purified pellets were collected and dried at 60 degree Celsius for 2 hours. The powder was finally stored in air tight Ependorff tube.

UV–Vis analysis of Ginger oil mediated silver nanoparticles: The synthesized ginger oil mediated silver nanoparticles was initially confirmed by UV visible spectroscopy. 3 ml of the solution was taken in a cuvette and scanned in double beam UV visible Spectrophotometer from 300nm to 700nm wavelength. The results were recorded for the graphical analysis.

Inhibition of albumin denaturation assay: 2ml of 1% bovine albumin fraction was mixed with 400 µL of plant extract in different concentration(50-150 µL) and the pH of reaction mixture was adjusted to 6.8 using in 1N HCl. The reaction was incubated at room temperature for 20 minutes and then heated at 55 degrees for 20 minutes in a water bath. The mixture was cooled to room temperature and the absorbance value was recorded at 600nm. An equal amount of plant extract was replaced with DMSO for control. Diclofenac sodium in different concentrations was used as standard. The experiment was carried out in triplicate to avoid manual error.

% inhibition was calculated using the following formula:

$$\% \text{ inhibition} = \frac{\text{Control O.D.} - \text{Sample O.D.}}{\text{Control O.D.}} \times 100$$

Result and Discussion

Medicinal plants are the major source of therapeutic agents to cure human diseases. They are widely used in traditional medicine to cure different diseases due to their worldwide availability and fewer side effects. The herbal medicines occupy the distinct position right from the primitive period to present day.. India has a wealth of medicinal plants and most of which have been traditionally used in Ayruveda, Unani systems of medicine, and by tribal healers for generations.

In medicines, silver and silver nanoparticles have many applications including skin ointments and creams containing silver to prevent infection of burns and open wounds. Ginger is widely used as spice in cooking and as a medicinal herb in traditional herbal medicine(13). The oil of ginger is a mixture of constituents, consisting of monoterpenes and sesquiterpenes. Alcohols and aldehydes are also present(14).

In the last decade, biosynthesis of nanoparticles has received increasing attention due to a growing need to develop environment friendly technologies in material synthesis(15). Nanotechnology is becoming increasingly important in the food and health sectors(16). Biosynthesis of AgNPs using plant sources offers several advantages such as cost-effectiveness, eco-friendliness, and the elimination of high pressure, energy, temperature, and toxic chemicals necessary in the traditional synthesis methods. Among the various inorganic metal nanoparticles, AgNPs have received substantial attention

as preservatives, effective antimicrobial and anticancer agents, and biomedical sensors and detectors that exhibit low toxicity for *in vitro* and *in vivo* applications[17,18].

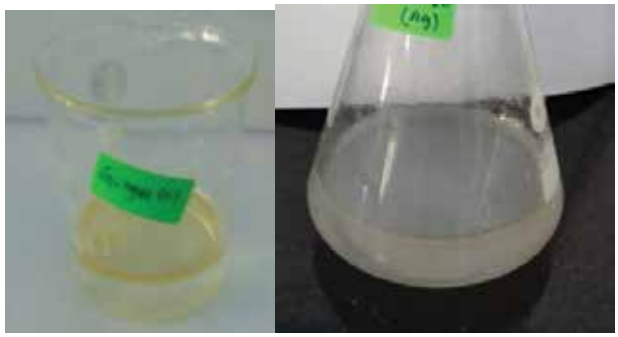

Figure 1: Ginger oil extraction (right) and formation of silver nanoparticles which is identified by the change of colour(left)

It is well known that silver nanoparticles exhibit yellowish- brown colour in aqueous solution due to excitation of surface plasmon vibrations in silver nanoparticles. Reduction of the silver ion to silver nanoparticles during the exposure of the plant extract could be followed by colour change. The reduction process from silver nitrate to silver ions was observed by direct visual observation of the solution. The conversion of pale yellow to dark brown clearly indicated the silver nano particle production.

UV spectroscopy:

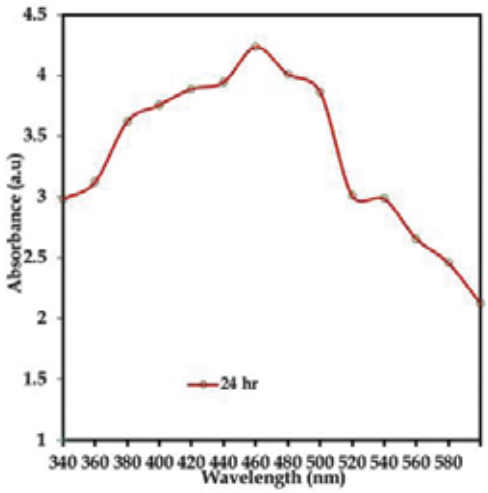

Figure 2: UV spectroscopy from the extract which shows the production of silver nanoparticles after various periods of time

The uv- visible analysis of the silver nanoparticles were analysed in the absorbence range of 340nm to 540nm. The peak was found to be maximum at 450nm. Reduction of aqueous metal ions with the ginger oil indicates the formation and synthesis of the silver nanoparticles.

Antiinflammatory activity: The anti-inflammatory activity of the ginger extract was measured by the inhibition of albumin denaturation assay. Inflammation is the reaction of living tissues to stimuli evoked by inflammatory agents such as physical injuries, heat, microbial infections, and noxious chemical irritations. The response of cells toward inflammation will lead to certain pathological manifestations characterized by redness, heat, swelling, and pain with even impaired physiological functions. Inflammation has been implicated in the pathogenesis of many diseases including arthritis, stroke, and cancer[19].Protein denaturation has been well correlated with the occurrence of the inflammatory response and leads various inflammatory diseases including arthritis[20]. The ability of the material to inhibit the denaturation of proteins signifies the potential for antiinflammatory activity. The synthesised nanoparticles showed maximum anti inflammatory activity with 90% of inhibition at a concentration of 60. The extract showed a greater % of inhibition when compared to the standard diclofenac used in the study.

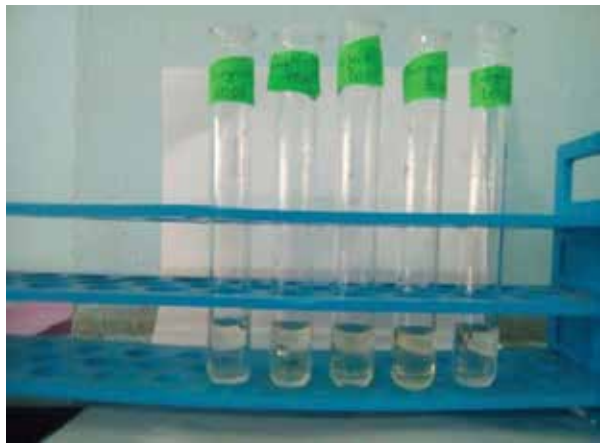

Figure 3: silver nanoparticles of ginger extract in various concentration for anti inflammatory activity

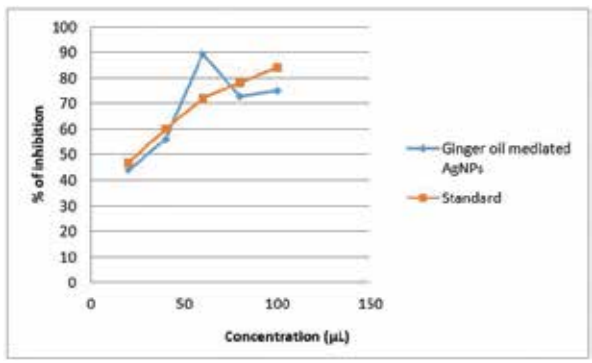

Figure 4: anti inflammatory activity of silver nanoparticles

BAS (Bovine Serum albumin) was used as a reagent for the assay. Bovine serum albumin (BAS) makes up approximately 60% to all proteins in animal serum. It

is commonly used in cell cultures, particularly when protein supplementation is necessary and the components of serum are unwanted. BAS undergoes denaturation upon heating and starts expressing antigens associated with type III hypersensitivity reaction which are related to disease such rheumatoid arthritis, glomerulonephritis, serum sickness and systemic lupus erythematosus.

The most commonly used drugs for inflammation include ibuprofen and diclofenac sodium which belong to NSAID group of drugs. Though these drugs have shown good prognosis, they are routinely associated with adverse effects in the gastro intestinal tract leading to the formation of gastric ulcer and may also cause cardiovascular problems as well. Ginger oil can be used as a natural home remedy as it is readily available and is economic. According to the research silver particles produced from ginger oil showed good antiinflammatory activity and thus can be considered as a potential candidate as an antiinflammatory agent. Thus reducing the risk of gastric ulcers and many other health problems.

Conclusion

The silver nanoparticles were synthesised from the plant *Zingiber officinale* Roscoe. The study proved that sliver nanoparticles produced from ginger oil had potent anti inflammatory property. The present study emphasises the use of plants for the medicinal purposes. Further investigations are required for the development of new classes of analgesics and anti- inflammatory drugs from ginger oil mediated silver nanoparticles.

Acknowledgement

The authors thank Synthite Industries, Kerala for providing the ginger oil to carry out this research project.

Comparative Evaluation of Maximum Bite Force and Facial Morphology—A Cross Sectional Study

Shweta Tiwari[1], Arathi Rao[2], Ramya Shenoy[3], Suprabha BS[4]

[1]Ex.Post Graduate Student, [2]Professor, Paedodontics & Preventive Dentistry, [3]Associate Professor, Paedodontics & Preventive Dentistry, [4]Professor & Head, Public Health Dentistry, Manipal College of Dental Sciences, Mangalore, A Constituent Institution of Manipal Academy of Higher Education, Manipal

ABSTRACT

Purpose: There seems to exist an interaction between craniofacial morphology and bite force. The purpose of the present study was therefore to compare the maximum bite force with various face forms and facial measurements.

Method: A total of 212 samples were included in the study. Bite force was recorded using Flexiforce Sensors. Facial measurements included facial form, height and other measurements. Student t test, ANOVA test and Post hoc turkey test was applied.

Results: The maximum bite force value showed significant increase, with increasing age. A statistically significant negative correlation was found between the maximum bite force to the ratio between lower anterior face height to total anterior face height. Maximum bite force value was recorded for the square face form and the lowest maximum for the tapering face form.

Conclusion: Maximum bite force has significantly positive relationship with transverse facial dimensions, Reduced lower anterior facial height and gonial angle was related to maximum bite force and was significantly higher than subjects with long face.

Keywords: *Bite force, facial form, facial measurements*

Introduction

Understanding masticatory muscle activity and influence of physiological factors on occlusal forces, determining bite force levels, is the emerging new face of dentistry.[1,2]

There exists an interaction between craniofacial morphology and bite force. Several researchers have studied the relation between facial morphology and the strength of the masticatory muscles and its influence on the form of the face.[5] It is concluded that bite force is higher in individuals with normal facial height than the long faced individuals.[6]

There exists to be a relation between bite force and transverse facial dimensions.[9] It is seen that square facial form have higher bite force values as compared to the other facial forms.

Although much effort has been made to analyze interdependencies between bite force and these variables, there still remains a need to more fully understand bite forces in very young children with healthy primary and permanent dentition and appreciate the dynamic interplay of these range of influencing variables.[13] The purpose of this study is therefore to compare the maximum bite force with the demographic details like age and gender and also to study the changes associated with various face forms and facial measurements.

Material and Method

Study Design: The present study was of cross-sectional analytical type.

Sample Selection: Considering the study power of 80% and statistical significance of 5% with the pilot correlation estimate, a total of 212 samples were included in the study. 110 male and 102 female students participated in this study. The age range of the samples comprised of two groups, 5-6 years and 8-10 years. All participants and their parents received written explanation of the research purposes and were informed before the start of the study.

Inclusion Criteria

1. Parents of children who have given consent for the study.
2. Children with healthy teeth present in the maxillary/mandibular deciduous first molar or first premolar region.

Exclusion Criteria

Children with following were excluded from the study

1. Acute symptoms such as pain for any reason in the oral cavity.
2. Malocclusion.
3. Temporomandibular disorder.
4. Any kind of disability

Recording the Bite force: The device used to measure the bite force consists of adapter board, a Phidget interface kit 8/8/8 board and a Sensor (FlexiForce, Tekscan, Inc, USA). (Fig 1)

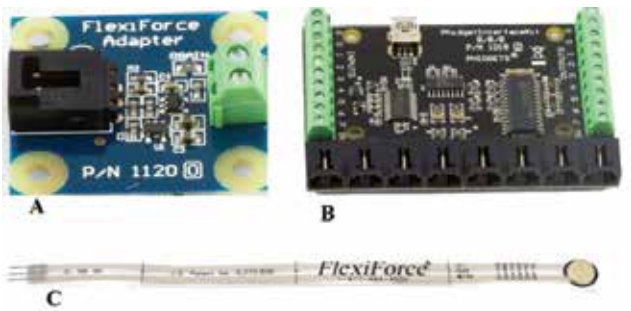

Fig 1: The device used to measure the bite force consists of A) Adapter board, B) Phidget interface kit 8/8/8 board and C) A Sensor

To measure the maximum bite force, the calibrated device was positioned across the arches, corresponding to the maxillary/mandibular first molar or premolar region (Fig 2). Each subject was then instructed to bite in centric occlusion as hard as possible, three times in succession, resting 2-5 seconds, between each bite. The largest value was selected as the maximum bite force value.

Fig. 2: Device in between the teeth

Recording the facial measurements: Standardized frontal photographs were taken. Face forms were defined as square, square-tapering, tapering and ovoid. For standardization, each subject was seated in a chair, so that the spine is erect and the head centered over the vertebral column.

For facial measurement, standardized lateral photographs were taken. Each subject was photographed in profile with the right side of the face towards the investigator. Before the photo was taken, the following landmarks were identified by palpation, and adhesive dots were placed on the subject's face. Landmarks included, Soft Tissue Nasion, Tragion, Menton, Gnathion, Soft Tissue A Point and Gonion. (Fig3)

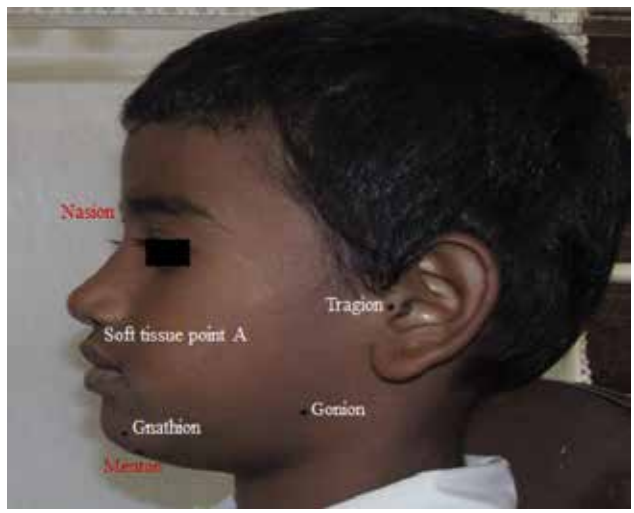

Fig. 3: Soft tissue landmarks

For photographic analysis, indigenous and tested software was used to correct the magnification differences among photographs. This software measured the distance between the two points, by taking into account, the magnification occurring between the camera and the subject.

Facial Measurements: From the photographs, the following was measured.

- Nasion-Menton, for total anterior facial height
- Soft tissue Point A-Menton, for lower anterior facial height
- Angle between lines from Tragion-Gonion and
- Gonion-Gnathion, for gonial angle.

Statistical Analysis

Data analysis was carried out using SPSS version 16.0. The level of significance was kept at $p<0.05$. The analysis of the association between maximum bite force recorded on the left and right side and the demographic details, facial measurements was done using Student t test. ANOVA test was used in analyzing the different facial morphology and their association with the maximum bite force. Post hoc turkey test was then applied to get a detailed relationship.

Results

The maximum bite force on the left side was found to be slightly more than the right side in both the age groups. Gonial angle and Ratio between the lower anterior facial height to total anterior face height was more in the 5-6 year age group. The maximum bite force was more in boys in both the groups. The Ratio between the lower anterior facial height to total anterior face height and the gonial angle was also more in boys. Student t test, ANOVA and Post hoc turkey test was applied to the data. The t' test revealed that for both males and females, the maximum bite force value showed significant increase, with increasing age. This relationship was statistically significant for both right and left side ($p < 0.05$).

Association between gender and maximum bite force in 5-6 years revealed that the maximum bite force value on the right side was significantly higher ($p < 0.05$) for males than females. However, this relationship was not significant on the left side.

The values for ratio and gonial angle were stratified according to age and gender. A statistically significant negative correlation was found between the maximum bite force to the ratio between lower anterior face height to total anterior face height. This signifies that as the ratio decreases, the bite force is seen to increases (Table 1). Thus, in subjects with lesser value of lower anterior face height, depicting a short face, the value of mean maximum bite force was significantly higher than subjects presenting with long face.

Table 1: Correlation between maximum bite force value to the facial measurements

Group	Gender	Bite force	Ratio	Gonial angle
Age group (5-6)	Male	Left maximum	-.416*	-.025
		Right maximum	-.605*	-.050
	Female	Left maximum	-.761*	-.199
		Right maximum	-.749*	-.227
Age group (8-10)	Male	Left maximum	-.724*	-.210
		Right maximum	-.725*	-.211
	Female	Left maximum	-.651*	-.163
		Right maximum	-.628*	-.112

*p value <0.005

On analyzing the face form data, it showed that the highest maximum bite force value was recorded for the square face form and the lowest maximum for the tapering face form.

ANOVA test was then applied to the data to find the association between these groups. ANOVA test showed a statistically significant relationship between the face forms and the recorded maximum bite force values, for both right and left side.(Table 2)

Table 2: ANOVA test results

		Sum of squares	Df	Mean Square	F	Sig.
Left maximum	Between Groups	218606.172	3	72868.724	6.545	.000
	Within Groups	2315888.672	208	11134.080		
	Total	2534494.844	211			
Right maximum	Between Groups	210367.864	3	70122.621	6.268	.000
	Within Groups	2327078.607	208	11187.878		
	Total	2537446.470	211			

Post Hoc Tukey test was then applied to find the detailed relationship. The results of both right and left side showed that the maximum bite force value was significantly higher for square face form followed by square-tapering, tapering but not associated with the ovoid face form. (Table 3)

Table 3: Post Hoc Tukey test

Dependent variable	Face form (I)	Face form (J)	Mean difference (I-J)	Std. Error	Sig.	95% Confidence interval	
						Lower bound	Upper bound
Left maximum	Square	Square-tapering	62.51	2.12	.019	7.57	117.51
		Tapering	98.81	2.26	.000	40.24	157.38
		Ovoid	44.82	3.15	.487	-36.76	126.40
	Square-tapering	Tapering	36.30	1.69	.144	-7.62	80.22
		Ovoid	-17.69	2.77	.920	-89.49	54.10
	Tapering	Ovoid	-53.99	2.87	.242	-128.55	20.57
Right maximum	Square	Square-tapering	62.43	2.12	.019	7.30	117.57
		Tapering	96.92	2.26	.000	38.21	155.62
		Ovoid	44.04	3.15	.504	-37.73	125.83
	Square-tapering	Tapering	34.48	1.69	.181	-9.54	78.50
		Ovoid	-18.38	2.77	.911	-90.36	53.58
	Tapering	Ovoid	-52.87	2.88	.261	-127.61	21.87

Discussion

Age group 5-6 depicts the end of primary dentition and 8-10 mixed dentition, since by 11 years of age, most of the permanent teeth are seen to erupt in the oral cavity.

In the present study, bite force value showed significant gender variation in lower age group with values being higher in boys. However, this can be attributed as a chance finding, since studies done in the past related to gender association, give a wide range of conclusions. According to Braun et al, [12] the gender association becomes significant only during the postpubertal period. Girls are seen to be as strong as boys until puberty. The increase in muscle mass produced by androgenic steroids creates the difference in male and female physiques following puberty.

Another variable considered in the comparison includes the face form and facial measurements. In the present study, higher value of bite force was recorded in children having square face form, and those showing a lesser value of lower anterior face height, depicting a short face. It appears that, for some reason, the children with long-facial pattern stop gaining strength in the elevator muscles of the mandible, while children with normal facial proportions develop considerably more strength as they mature and this may be the reason for children with square face form and short lower anterior facial height having higher bite force.[14] Skeletal growth to a considerable extent is influenced by muscular growth and the parts of bones to which muscles are attached develop in conjunction with the muscle. Ingervall and Helkimo[15] in their study found that higher bite forces correlated with a smaller cranial base flexure, a deeper upper face, a smaller anterior and a larger posterior face height, and a less divergent, broader face. Also, Proffit et al [14] found a similar kind of relationship between bite force magnitude and vertical facial morphology, in 1983.

In the present study, no significant relationship was found between the bite force value and gonial angle measurements. Epker et al [17] has proposed that biomechanical factors can influence both direction and magnitude of growth. In his theoretical formulation, decreased occlusal forces are given an important role in the genesis of the long-face condition. The fact that the long-face condition can be recognized prior to an age at which decreased occlusal forces are present strongly suggests that the decreased forces are an effect of the condition, not a cause.

Conclusion

Based on the inferences drawn from the present study, it can be concluded that maximum bite force value in children is dependent on the age, gender, face form and the various facial measurements. The bite force value tend to increase with age and was significantly more in males than in females, for both the age groups. Facial photographs measurements were reliable in characterizing the facial morphology, in terms of both linear and angular measurements. It was also found that maximum bite force has significantly positive relationship with transverse facial dimensions, with it being maximum for square facial form and minimum for tapering. In subjects with lesser value of lower anterior face height as well as gonial angle, depicting a short face, the value of mean maximum bite force was significantly higher than subjects presenting with long face.

Comparative Evaluation of Tensile Bond Strength and Shear Bond Strength of Mineral Trioxide Aggregate with Composite Resin and Resin Modified Glass Ionomer

Radhakrishnan S[1], Arathi Rao[2], Ramya Shenoy[3], Suprabha BS[4]

[1]Ex. Post Graduate Student, [2]Professor, Paedodontics & Preventive Dentistry, [3]Associate Professor, Public Health Dentistry, [4]Professor & Head, Paedodontics & Preventive Dentistry, Manipal College of Dental Sciences, Mangalore, A constituent Institution of Manipal Academy of Higher Education, Manipal

ABSTRACT

Background: In a vital pulp therapy such as direct pulp capping or pulpotomy, MTA is directly placed over the pulp followed by the restoration with resin modified glass ionomer cement or composite material. An important factor determining the clinical success of such restorations is the bond between MTA and restorative material. Therefore, the aim of the present study was to evaluate and compare the bond strength of MTA with Glass Ionomer and Composite resin interface.

Material and Method: The sample size was calculated as 11 in each group. Tensile and shear bond strength was measured between MTA- Glass Ionomer and MTA- Composite material. Percentage of bond failure for each group was obtained. Average and standard deviations were calculated and the data was analyzed by independent't' test. The level of significance was set at 0.05.

Results: Out of the total 44 samples, 29 samples showed cohesive failures. Maximum numbers of failures, i.e. 17 were in tensile bond strength group which included 8 in RMGIC group and 9 in Composite resin group. Of the 12 failures in shear bond strength, 5 were in RMGIC group and 7 in composite resin group. There was no statistically significant difference between the shear bond strength of RMGIC and Composite with MTA ($p = 0.39$) at confidence interval of 95%. No statistically significant difference was observed between the tensile bond strength of RMGIC and Composite samples with MTA ($p = 0.41$) at confidence interval of 95%.

Conclusion: There was no difference in the bond strengths attained between Resin modified Glass ionomers and Resin Composites with Mineral trioxide Aggregate

Keywords: *Mineral Trioxide Aggregate, Glass Ionomer, Composite Resin, Bond strength*

Introduction

The clinical success of any vital pulp capping procedures is directly related to the control of pathogenic agent[2]. In a vital pulp therapy such as direct pulp capping or pulpotomy, MTA is directly placed over the pulp followed by the restoration with resin modified glass ionomer cement or composite material.

MTA has a multifaceted range of applicability in paediatric dentistry due to its superior biocompatibility and sealing ability and less cytotoxicity than other materials currently used for the same purpose[1]. Composite and RMGIC are the material of choice for restorations in pulp treated teeth, due to its high compressive strength, adhesion to dentine, biocompatibility, good sealing ability and handling characteristics. An important factor determining the clinical success of such restorations is

Email: arathi.rao@manipal.edu

an adhesive system that provides durable bonding of these materials to dentin and the pulp therapeutic agent. [3]

Previous studies comparing the bond strengths between MTA and GIC or composites under two different kind of loading forces have yielded varying results[4].

Therefore, the aim of the present study was to evaluate and compare the bond strength of MTA with Glass Ionomer and Composite resin interface. The null hypothesis was that there is no difference in the bond strength between both Resin modified glass ionomer and Composite resin with MTA.

Material and Method

The present study was an experimental in vitro study conducted after obtaining ethical clearance from the Institutional Ethics Committee.

Sample size: Sample size was calculated based on the formula given below

$$n = \frac{[Z\alpha + Z\beta]S}{d}$$

S, Standard deviation

d, Difference between the two standard deviations

Zβ, 95% Confidence interval CI=1.96

Zβ, 80% Power= 0.84

Hence, At 95% Confidence interval (CI) and 80% of Power, referring Standard deviation (SD) as '2' and the difference between the bond strength between the groups as 3, the sample size was calculated as 11 in each group.

Materials used for the study were Resin modified Glass Ionomer (GC Gold Label Light Cured Universal Restorative, GC Corporation, Tokyo, Japan), Composite Resin (Filtek Z350 Restorative material, 3M ESPE, dental products, St Paul, USA) and Mineral trioxide aggregate (Angelus, Angelus Industria de Productos Odontologicos, Londrina, PR, Brasil).

The samples were divided into 2 groups equally for MTA-GIC and MTA-Composite.

Group I – Shear bond strength measurement group- 22 samples

Group II- Tensile bond strength measurement group- 22 samples

Preparation of Samples

For Tensile Bond strength measurement: Circular acrylic discs of diameter 1cm and thickness of 1-2mm with a hook made of stainless steel wire inserted on one side of the disc. 44 discs were made between which the specimen for tensile strength were stabilized for testing.

For Shear Bond strength measurement: 22 Acrylic blocks (4cm x 2cm x 2cm) were made. A cavity (5mm diameter and 2mm depth) was prepared on one side of the block, 1cm from the top corner.

Cylindrical plastic molds (5mm x 10mm) were used to make specimens with bonded surface area of $5mm^2$. The MTA was first filled into the plastic mold followed by RMGIC or Composite accordingly in each group.

All the materials were manipulated as per manufacturer's instructions. The surface of the MTA was made flat by gently condensing with a flat ended instrument after filling into the mold and all the excess was removed. The material was kept to set for 24hours with a moist cotton pellet placed over its surface before placement of the other material.

Bond Strength Measurement

Tensile bond strength (TBS): The specimen consisting of a pair of circular discs with MTA-RMGIC or MTA-Composite sample were one by one separately loaded into the Universal testing machine (Instron 3366, Instron corp, Canton, MA, USA). After loaded specimen were stabilized, the machine was made to work in tensile mode at a cross head speed of 0.5mm/min until bonded area failed. The load applied at failure point and the TBS value was systematically recorded for each sample. The TBS was expressed in MPa, as derived from dividing the imposed force (N) at the time of fracture by the bond area (mm^2).

Shear bond strength (SBS): The samples were loaded into the acrylic blocks such that the RMGIC or Composite parts were embedded inside the prepared cavity in it. The MTA part of the sample projected out of the block which was subjected to the shear load. The shear bond strength was measured by shearing the bonded specimens on an Instron universal testing machine, using a cross head speed of 0.5 mm/minute. The acrylic blocks were stabilized on shearing apparatus and a wedge blade system applied a shear force on the sample. The readings at failure were recorded systematically.

The compressive load acting on the bonded area on application of shear and tensile force recorded from Instron 3366 was tabulated and the bond strength was calculated by dividing it by the area of bonded surface.

MPa = Force/Area = Newton/mm^2

Area of bonded surface, A = πr^2;

r- radius of the specimen used = 2.5mm.

A = 19.625mm^2

Statistical Analysis

All statistical analysis was carried out using SPSS 20 software. Percentage of bond failure for each group was obtained. Average and standard deviations were calculated and the data was analyzed by independent 't' test. The level of significance was set at 0.05.

Results

The bond strength values of the two groups, has been tabulated with their minimum and maximum values obtained and the mean values of the same in Table No.1.

The shear bond strength values obtained has been represented in a Box plot form, which gives the distribution of the values of the RMGIC and Composite groups. The 50th percentile of the values obtained overlap at the value 5.50MPa. (Fig No.1)

Table 1: Bond strength of RMGIC and Composite with MTA (MPa)

	Group	MIN (MPa)	MAX (MPa)	MEAN ± SD (MPa)
SHEAR BOND STRENGTH	RMGIC (n = 11)	3.65	12.68	7.24 ± 3.64
	COMPOSITE (n = 11)	2.67	10.23	6.06 ± 2.74
TENSILE BOND STRENGTH	RMGIC (n = 11)	.17	1.73	.656 ± .427
	COMPOSITE (n = 11)	.23	1.67	.806 ± .425

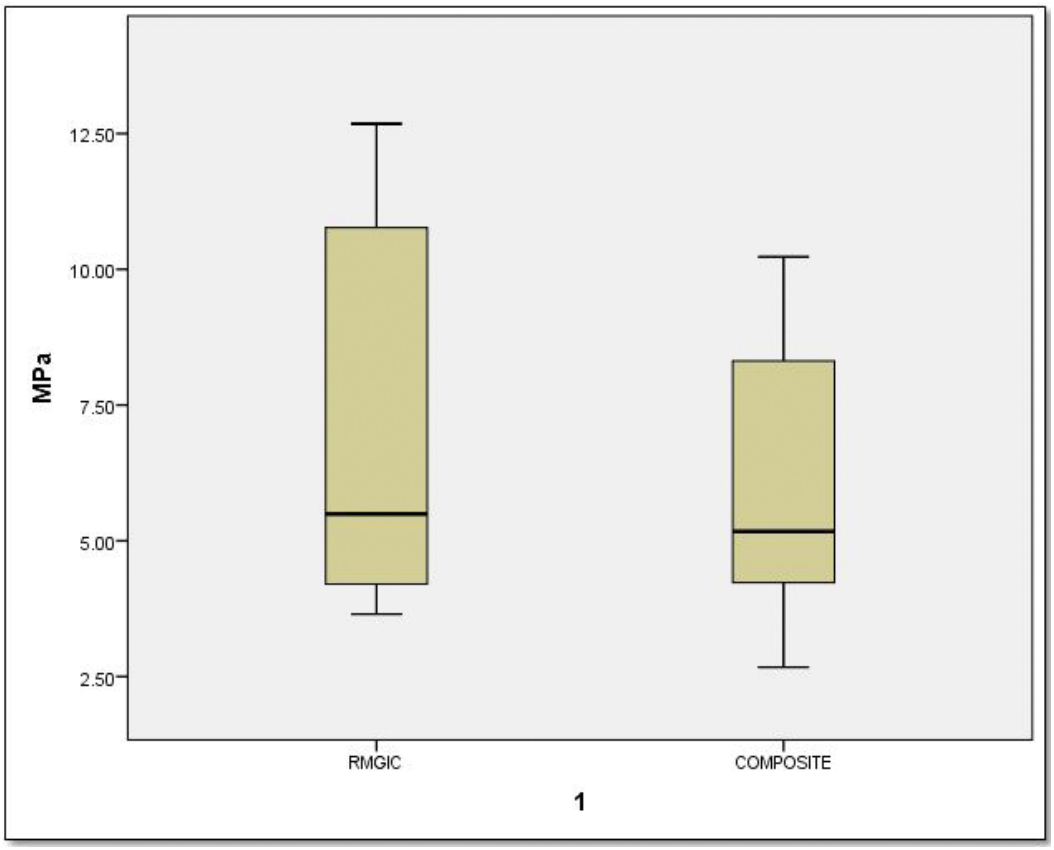

Fig. 1: Box plot form giving the distribution of Shear bond strength values between the groups

The tensile bond strength values obtained has been represented in a Box plot form, which gives the distribution of the values of the RMGIC and Composite groups. The 50th percentile values do not overlap. (Fig No.2)

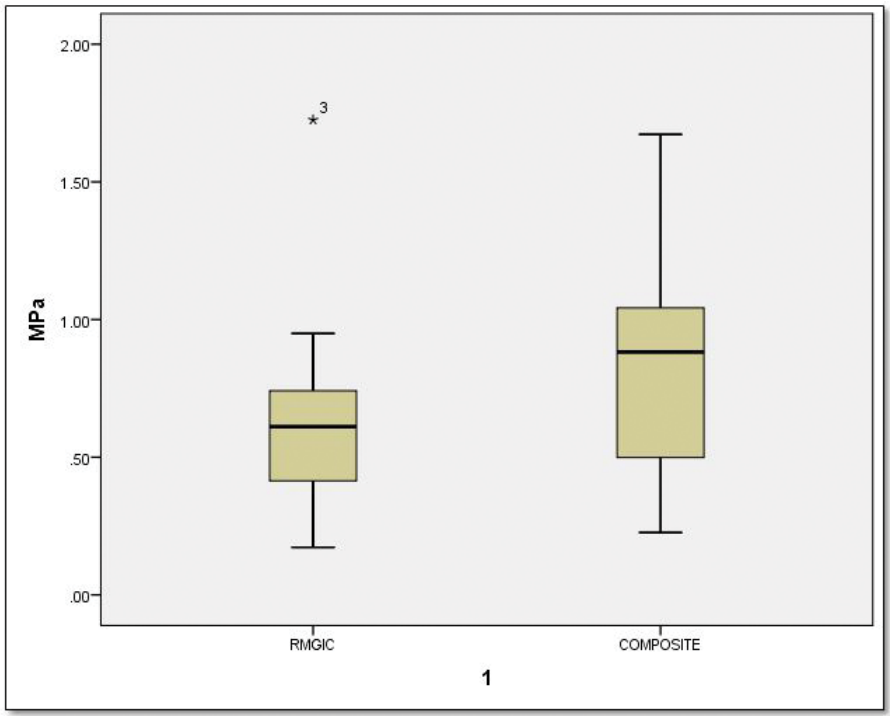

Fig. 2: Box plot form giving the distribution of Tensile bond strength values between the groups

The plot form shows distribution of shear bond strength of RMGIC subgroup towards higher values along the x axis representing the bond strength values in MPa. Whereas in the plot form for tensile bond strength shows distribution of vaues of composite subgroup was found to be higher on the x axis representing the bond strength values in MPa.

Shear Bond strength: There was no statistically significant difference between the shear bond strength of RMGIC and Composite with MTA (p = 0.39) at confidence interval of 95%. (Table 2)

Table 2: Independent Samples Test Comparing Shear Bond Strength

		t-test for Equality of Means			
		Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
				Lower	Upper
MPa	Equal variances assumed	.399	1.18272	-1.68180	4.04725
	Equal variances not assumed	.400	1.18272	-1.69596	4.06140

Tensile Bond strength: No statistically significant difference was observed between the tensile bond strength of RMGIC and Composite samples with MTA (p = 0.41) at confidence interval of 95%. (Table 3). So the Null Hypothesis was accepted as there was no statistically significant difference between the groups.

Table 3: Independent Samples Test Comparing Tensile Bond Strength

		t-test for Equality of Means			
		Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
				Lower	Upper
MPa	**Equal variances assumed**	.419	-.15013	-.52954	.22927
	Equal variances not assumed	.419	-.15013	-.52954	.22927

Type of Failures: Out of the total 44 samples, 29 samples showed cohesive failures. Maximum numbers of failures, i.e. 17 were in tensile bond strength group which included 8 in RMGIC group and 9 in Composite resin group. Of the 12 failures in shear bond strength, 5 were in RMGIC group and 7 in composite resin group. The distributions of failed samples have been tabulated in Table 4.

Table 4: Types of failures

Measurements	Material used	Cohesive Failures (Nos.)	Adhesive Failures (Nos.)
Shear bond strength group	RMGIC (11 nos.)	5	6
	Composite Resin (11 nos.)	7	4
Tensile bond strength group	RMGIC (11 nos.)	8	3
	Composite Resin (11 nos.)	9	2

Discussion

Mineral trioxide aggregate (MTA) has been a versatile revolutionary material in endodontics since its introduction in the 1990[5]. The hydrophilic nature of MTA makes it an ideal material for different endodontic applications in which contact with blood, body fluids, and moisture is inevitable, but it may complicate the bond between MTA and restorative material[6].

A strong bond between the pulp therapeutic agent and the restorative material provides an optimal hermetic coronal seal. Shear bond strength estimates the local stress and integrity of the materials that the bonding layer can withstand. Increased shear bond strength means better bonding between two interfaces and lesser microleakage[4,7].

The current literature contains few studies on bond strength of MTA with RMGIC and Composite resin. GIC was found to bond to MTA, although bond strength values of GIC – MTA was comparatively inferior to that of resin composites – MTA[8,9].

The bond strength between the materials is one of the most critical factors for quality dental filling treatment. A shear bond strength of about 17 to 20 MPa is required to sufficiently resist contraction forces and produce gap-free restoration margins [10-12].

Resin modified Glass ionomer showed better shear bond strength and Composite resin showed better tensile bond strength with MTA but both the results were statistically not significant.

In the present study none of the groups reached the optimal shear bond strength. Since the results showed no significant difference between the shear and tensile bond strength values between the MTA -Composite and MTA-RMGIC groups, the Null hypothesis was rejected. This results are contradictory to the results obtained by Ajami A et al,[13] in which the shear bond strength between MTA and composite was found to be 12.12 ± 2.31 and between MTA and RMGIC was 3.24 ± 0.58.

Acid etching using 37% phosphoric acid affects the morphology of MTA surface. Under SEM analysis, it was found that etching resulted in a selective loss of matrix from around the crystalline structure and due to loss of matrix, the sealing ability and physical properties of MTA was found to be decreased[14].

The use of 10% polyacrylic acid for smear layer removal, results in mildly demineralized dentin and then helps in chemical interaction between the carboxylic groups of RMGIC and calcium of hydroxyapatite crystals from dentin leading to mechanical bonding via hybrid layer formation.

The shear bond strength values between MTA and Composite obtained were found to be similar to the values obtained in the study by Savadi Oskoee, which had a mean value of 4.65Mpa[15].

As the difference in the shear and tensile bond strengths between MTA and the two restorative materials of choice is statistically insignificant, it can be concluded that the both the materials bond well to MTA.

The failure of the bond between two materials may not always result in interface failure but can occur in either of the material used for testing. Rigidity of the material may have a significant influence on the interpretation of bond strength[16].

In the present study failure was largely within the material rather than at the interface. In a study by Shenoy et al[7] 80% of the samples showed cohesive failures

within MTA[8]. The reason for cohesive failure with MTA may be due to its porous nature which may be a matter of concern[7].

Conclusion

The choice of restorative material following a pulp therapy gains as much importance as the pulp therapeutic agents. With advent of adhesive materials the scope of pulp therapy has improved significantly. The knowledge about the bonding mechanisms and the bond strengths of the restorative materials will help a clinician in better treatment planning.

The conclusions of the study are-

- There was no difference in the bond strengths attained between Resin modified Glass ionomers and Resin Composites with Mineral trioxide Aggregate (MTA)
- Both the materials can be used as a restoration of choice following a pulp therapy with MTA after it has reached its initial final set.
- It can be a predictable choice to use RMGIC directly over MTA followed by a composite restoration (Sandwich Restoration) or a full coverage restoration (Stainless steel crown).

A Study to Assess the Effectiveness of Planned Teaching Programme on Knowledge Regarding Prevention of Abuse among the Children of 11–14 Years of Age at Selected Schools of Sangli, Miraj, Kupwad Corporation Area

Bhavana Cristopher Samson[1], Manisha Sunil Kulkarni[2]

[1]Final Year M.Sc. Nursing. (Student), [2]Clinical Instructor, Bharati Vidyapeeth (Deemed to be University), College of Nursing, Sangli, Maharashtra, India

ABSTRACT

Introduction: Child abuse has serious and psychosocial consequences that adversely affect on the general well being of kid. In line with World Health Organization agency "Child abuse or mistreatment represent all sort of physical and emotional maltreatment, sexual offense, neglect or negligent treatment or industrial or alternative exploration ensuing in actual or potential damage to the kid health,survival,development or dignity within the context of a relation of responsibility, trust or power.

Aims: 1) To assess the knowledge regarding prevention of abuse. 2) To evaluate the effectiveness of planned teaching programme on knowledge regarding prevention of abuse**.**

Methodology: One group pre-test post-test Pre- Experimental, study was conducted at Sangli, Miraj and Kupwad Corporation area, quantitative research approach was adopted for this study. The study comprised of 100 samples. Non-probability convenient sampling technique used for selection of samples. Data was analyzed using descriptive and inferential statistics. Theoretical framework in study was based on general systems theory as postulated by Von Bertalanffy (1998).Proposal of tool was presented in front of ethical committee for permission.

Result and Conclusion: Among the 100 children total mean of Pre-test was 12.91 and mean of post-test was 19.33 with P value of 0.000 which is significantly high. This shows that the knowledge score of pre-test was less than post-test knowledge score. Thus null hypothesis is rejected. There is significant change in knowledge in the post-test. The result of this study proved that the planned teaching programme was effective. It was concluded from the statistical test that planned teaching programme on prevention of abuse was effective among children. Analysis of the data showed that there was significant difference between pre-test and post-test knowledge score. Among the children administration of structure teaching course have a major impact on awareness score.

Keywords: *Assess, Effectiveness, Planned teaching, Knowledge, Child abuse*

Introduction

The rate of victimization of kids is 12.3 per 1,000 kids. Kids below 3 years are the foremost probably to experience abuse. They are exploited at a rate of 16.4 per 1,000.79 share. Kids are killed younger than 4 years. The statistics are taken from the administration for kids and Families of the, US Department of Health And Human services, "Kid mistreatment Report." There are nearly 3 million reports of kid abuse created annually. There have been 906,000 maltreatment convictions. The rate of child

abuse is calculable to the 3 times larger than is reported.[1] Due to ill-treatment; most of the kids wants to get into a wrong manner. Therefore it affects the health of the new generations. So as to promote the younger generations, this insisted researcher to carry out analysis upon this. Legal issues are 2.5 million; the numbers of issues are informed annually and are increasing continuously of kid's maltreatment and ignorance. Within which 35% involves bodily maltreatment, 50% involves sex offence and 50% involves ignorance. Studies shows those 1 in 4 women and 1 in 8 boys are sexually abused before they are 18 years of age.[1]

In India Abused kids are 25% more likely to experience adolescent pregnancy. 14, 4 % of all men and 36.7 % of all girls in jail within the US are abused as kids. Sexually abused kids are a pair of 2.5 times additional probably to develop substance abuse and 3.8 times additional probably develop drug addictions. Abused teens are 3 times less probably to practices sexual activity, putting them at bigger risk for STDs.It is known that one third of abused and neglected kids can eventually put-upon their own kids, and nearly two third of the individuals in treatment for habit reportable being abused as kids.[2]

As per the annual publication of the National Crime record Bureau (NCRB), Union Ministry of Home affairs, throughout 2003,374 children within the age group of 10-18 were abducted for illicit intercourse and 57 for being forced into prostitution. And 2,949 children raped that year, a figure that registered 21 % raise in 2004. Abused children are 25 % a lot of possible to experience adolescent pregnancy.14.4 % of all men and 36 .7 % of all women in jail at intervals the United States are abused as youngsters. Youngsters who are sexually abused are a pair of 5 times extra most likely to practices sexual activity, putting them at larger risks for STDs, it had been acknowledged that one third of abused and neglected children will eventually used their own children, and nearly two third of the people in treatment for habit reportable being abused as children.[3]

Materials and Method

One group pre-test–post-test Pre-experimental design was used for the study. The study is quantitative study. The study was carried out in schools of Sangli, Miraj, and Kupwad corporation area among school children with the sample size of 100.Ethical committee approved the Research proposal. For assessing the knowledge and effect of planned teaching programme, on knowledge regarding hindrance of abuse among the children of 11-14 years of age, Quantitative research approach was adopted for this study. Non-probability convenient sampling technique used for selection of samples. Pilot study and final study were conducted after approval of the ethical committee.

The prior permission from concerned authority was taken and informed written consent from each participant parent was taken before conducting the study. Pre-test was taken by using structured questionnaire for 15 minutes. Planned teaching programme was given immediately after pre-test for 45 minutes and after the seven days, post-test was conducted. The data analyzed Based on the objectives of the study, using descriptive and inferential statistics. Frequency percentage, Mean, SD calculated to get the pre-test and post-test knowledge score. Paired 't 'test applied to check the effectiveness of Planned teaching programme between the pre-test and post-test knowledge score mean. Paired't'-test used to compare Pre and Post – test knowledge score.

Results/Findings

The Data Analyses, which was collected from 100 samples regarding prevention of abuse among children of 11- 14 years of age. Section- I, Table no. 1 shows frequency and percentage distribution of selected demographic variables,in that 50 % sample were male and 50 % were female, 53 % sample were belongs to Nuclear type of family and 47 % were belongs to joint family. As data given in the table shows 64 % of father are doing job, and 36 % were doing business. Maximum samples 56 % mothers were Housewife, and 24 % were doing business, 20 % were doing jobs. Maximum samples mothers that is 60 % were taking care at home, and 40 % others were taking care of children,91 % samples belongs to Urban area and 9 % were belongs to Rural area. Maximum that is 62 % of samples were not having any information about child abuse prevention and 38 % sample were having information about child abuse prevention. 92 % samples were given positive response for conducting workshop on the topic and 8 % were not willing to conduct the workshop.

Section–II

Table 1: Frequency and Percentage Distribution of Pre-Test and Post-Test Knowledge Score

N= 100

Knowledge Grading	PRE Test		POST Test	
	Frequency	Percentage	Frequency	Percentage
Poor 0-6	20	20.00	0	0.00
Average 7-12	31	31.00	10	10.00 %
Good 13-18	40	40.00	20	20.00 %
Excellent 19-25	9	9.00	70	70.00 %

Section –II, Table no1.frequency and percentage distribution of pre-test and post-test knowledge score, at the time of pre test, 20% of subjects had poor knowledge, 31% had average knowledge, 40% in good knowledge category and remaining 9% subjects were having excellent knowledge. At the time of post test, 10% of subjects had average knowledge, 20% in good knowledge category, 70% subjects were having excellent knowledge and no one in the poor knowledge category.

Section III

Table 2: Comparison of the Pre and Post Test Knowledge Score (Paired T Test)

N = 100

Group	Frequency	Mean	S.D.	t value	P value
PRE TEST	100	12.91	4.81	16.30	0.000
POST TEST	100	19.33	3.20		

Section III table no. 2 comparison of the pre and post test knowledge score by using paired t test. The pre test average score was 12.91 with standard deviation of 4.81. The post test average score was 19.33 with standard deviation of 3.20. The test statistics value of the paired' test was 16.30 with p value 0.000. Shows that calculated value is more than tab value there was significant difference in the average knowledge score, at significance level of 5%.

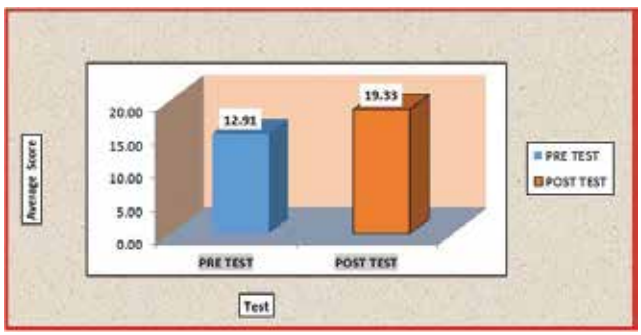

Figure 1: Comparison of the Pre and Post Test Knowledge Score (paired't' test)

Discussion

The present study found that the knowledge of the participants was not up to the mark. The results are similar to several previous studies. In contrast to our findings several studies showed that all the students were having inadequate knowledge and many misconceptions regarding prevention of abuse among children of 11 – 14 years of age were present. Most of the previous study did not provide any planned teaching program. In present study the planned teaching program was given in order to provide appropriate knowledge regarding prevention of abuse among the children and clear the misconception and encourage the student to take appropriate action for prevention of abuse activity in early stage. At the time of pre test, 20 % of subjects were having poor knowledge, 31 % were having average knowledge, 40 % in good knowledge category and remaining 9% subjects were having excellent knowledge. At the time of post test, 10 % of subjects were having average knowledge, 20 % in good knowledge category, 70 % subjects were having excellent knowledge and in the poor knowledge category there was no one. It shows that there is marked increase in post-test knowledge. 12.91 is the mean value of pre-test knowledge score and post-test knowledge score is 19.33, standard deviation score in pre-test phase was 4.81 and in the post-test phase it was 3.20. Calculated' value 16.30 that is more than tabulated 'p' value is 0.000

which is less than tabulated 'p' value (0.05). This suggest that there is statistically significant increase in post-test score so planned teaching programme on prevention of abuse among the school children of 11 to 14 years of age was effective. The findings of the present study with reference to the objectives and hypothesis have been discussed. The finding of the study shows that planned teaching programme was effective.

Similar study was conducted by Ms. Priyanka kadam, Mr. Mangesh Vilinikaran Jabade in pune city they assessed the level of knowledge regarding the awareness and prevention of child abuse among school children As per the findings of the study the mean of post-test knowledge score 15.73 (92.55%) was increased as compare with the mean pre-test knowledge score 9.63 (56.66%) . Where the mean of post-test knowledge score was 19.33 (3.20 %) which was higher than mean pre-test score 12.91 (4.81 %) in the present study.

The test statistics value of the paired't' test was 16.30 with 'p' value 0.000 shows that calculated value is more than table value, there was significant difference in the average knowledge score, At the significance level of 5%. Consequently come to the conclusion so as to structure teaching was effectual.[4]

Conclusion

This research have being carried out to estimate the efficiency of structure lessons plan concerning prevention of abuse amongst the kids about 11- 14 years of age on knowledge, at selected school of Sangli, Miraj, Kupwad corporation area. At the time of presentation of planned teaching programme the samples were found in confusion state. The misconception and unawareness about child abuse and its prevention clearly seen among the children. They require further information regarding child abuse prevention. After the planned teaching the misconceptions of parents and children were cleared, where School children and their parents and school teachers gave positive response about preventive activities and got information about provisions made in legislation by government regarding child safety. Through this they can help to reduce the number of child abuse cases. Significant difference between pre-test and post-test was visible as per the findings of the study in knowledge score of school children regarding prevention of abuse after planned teaching and null hypothesis was rejected.

Conflict of Interest: The authors declare that they have no conflict of interest.

Source of Funding: The authors declare that did not used any source of funding for conducting the research, expenses is done by self.

Ethical Clearance: All procedures performed in studies involving participants were in accordance with the ethical standards of the institutional and/or national research committee. Informed consent was obtained from all participants parents, included in study.

Risk Factors Associated with Overweight and Obesity among Population of Ahmedabad, India

Bhoomi Arora[1], Snehal S. Patel[2], Banshi Saboo[3]

[1]Assistant Professor, SAL Institute of Pharmacy, Ahmedababd, Gujarat, India; [2]Assistant Professor, Nirma University, Ahmedabad, Gujarat, India; [3]Diabetologist, Diabetes Care and Hormone Clinic, Ahmedabad, Gujarat, India

ABSTRACT

Background: Obesity is one of the leading disorders among developing countries. It is associated with many chronic disorders such as hypertension, dyslipidemia and vitamin D deficiency. This study aimed at determining the prevalence of overweight and obesity and its associated risk factors among 12-55 years old participants of Ahmedabad.

Method: This was a cross-sectional study carried out among 2,412 participants of 12-55 years of age of Ahmedabad, Gujarat, India. Blood pressure was measured and fasting venous plasma was drawn for determination of lipid profile, vitamin D level, insulin level and C-reactive protein level.

Results: The prevalence of overweight among 12-17, 18-35 and 36-55 years old participants was 16.23%, 18.51% and 26.22% respectively, whereas obesity prevalence among same age groups was 5.45%, 5.15% and 5.39% respectively. The risk of pre-hypertension, hypertension, hypercholesterolemia, hypertriglyceridemia, low HDL-C level, dyslipidemia, vitamin D deficiency, hyperinsulinemia and elevated C-reactive protein was noted to be significantly higher among overweight and obese respondents than healthy weight respondents.

Conclusion: The results of this study explains that public health programmes are needed to increase awareness on risks associated with overweight and obesity such as hypertension, lipid abnormalities, vitamin D deficiency and elevated C-reactive protein in order to reduce the burden of overweight and obesity as well as obesity associated chronic diseases.

Keywords: *Overweight, obesity, risk factors, lipid profile, vitamin D, C-reactive protein, insulin*

Introduction

Obesity is defined as excess body weight for height, which is also associated with excess adiposity or body fatness. It is a complex, multifactorial, and largely preventable disease [1]. Overweight and obesity has become a public health problem for all strata of the society worldwide. WHO (2016) has reported worldwide prevalence of obesity has increased thrice from 1975 to 2016. According to obesity update (2017), more than one in two adults and nearly one in six children are overweight or obese in OECD countries with the highest in the United States, Mexico, New Zealand and Hungary. If policies for prevention of this preventable disease are not made then by 2030 an estimated 38% of the world's adult population will be overweight and another 20% will be obese [2].

The prevalence of obesity was more than doubled in children and tripled in adults of India between 1980 and 2015 reported in the Global Burden of Disease Study [3]. According to Indian Council of Medical Research-India Diabetes (ICMR-INDIAB) study, the prevalence of generalized obesity was the lowest (11.8%) in Jharkhand (east India) and the highest (31.3%) in Chandigarh (north India) [4]. Overweight and obesity are the fifth leading cause of death estimated by WHO [5].

Overweight and obesity are associated with many non-communicable, chronic diseases such as hypertension, type-2 diabetes, metabolic syndrome, dyslipidemia, coronary heart disease, stroke, several cancers, disability and increased mortality [6-8].

The aim of this study is to determine the prevalence of overweight and obesity among the subjects of 12 – 55 years of age of Ahmedabad city. The study is also aimed to identify the important factors associated with overweight and obesity.

Method

A cross sectional, multi-centric, observational study was conducted in six different regions of Ahmedabad city. The study included a total of 2,412 participants of both genders of age between 12 to 55 years old. The subjects were divided into three age groups; 12- 17, 18-35 and 36-55 years. Study excluded participants with any previously diagnosed chronic ailments, pregnant or lactating women or subjects who are under any drug therapy.

For 12-17 years old children, data was collected from schools of Ahmedabad, by conducting health camps at colleges and of six different regions of Ahmedabad. Before conducting any procedure, the participants were well informed about the purpose of the study and were ensured strict non-disclosure of information. Signed informed consent form was taken from parents/guardians (for 12-17 years) or from participants (18-55 years).

The body weight (kg) and height (m) were measured and body mass index (BMI) was calculated using standard formula: body weight (kg)/height (m^2). Participants were divided into four groups depending on their BMI defined by WHO (1999). Overweight and obesity were considered if BMI is between 25.0 to 29.9 kg/m^2 and BMI greater than or equal to 30.0 Kg/m^2, respectively. Blood pressure of participants was measured by auscultatory method using standard mercury sphygmomanometer. Participants prior to clinical examination were informed not to eat anything after 10 pm. Next day clinical examination of the subjects was carried out by taking their blood samples.

Pre-hypertension and hypertension was defined by the seventh report of the Joint National Committee on prevention, detection and treatment of high blood pressure (JNC 7) criteria. According to guideline NCEP - ATP III (National Cholesterol Education Programme), 2002 for lipid abnormalities; hypercholesterolemia is defined as total cholesterol more than 200mg/dl, hypertriglyceridemia as triglycerides more than 150mg/dl and HDL-C less than 40mg/dl in men and less than 50mg/dl in women. Dyslipidemia is considered by the presence of hypercholesterolemia and low HDL-C levels. Vitamin D deficiency is considered if vitamin D level is less than 20 ng/dL. High sensitivity C-reactive protein (hs-CRP) concentration more than 3 mg/L was considered as having elevated CRP in current study. According to Melmed et al (2011), hyperinsulinemia was defined as fasting insulin level $\geqslant 25 mIU/L$.

Results

A total of 456 school going children of age group 12-17 years old were selected for this study; 16.23% were overweight and 5.48% ware obese. Out of 1,010 participants of 18-35 years old, 5.15% were obese 18.51% were overweight. The prevalence of overweight and obesity among 946 subjects of 36-55 years old was 26.22% and 5.39%, respectively.

The prevalence of pre-hypertension was 17.56% and 24.00% among overweight and obese participants, respectively, which was found higher than healthy weight subjects of 12 – 17 years old. Similarly, 9.45% and 8.00% hypertensive subjects were overweight and obese in the same age group. Children of 12 – 17 years old noted to have no lipid abnormalities as well as high insulin level. Vitamin D deficiency was 70.27% among overweight and 80.00% among obese children, which was significantly higher compared to healthy weight subjects (56.63%). Overweight and obese children found to have elevated C-reactive protein whilst none of the healthy weight children had elevated C-reactive protein.

The current study found significantly greater prevalence of pre-hypertension among overweight (33.15%) and obese (40.38%) subjects of 18-35 years than healthy weight (26.53%) subjects, whilst hypertension prevalence was noted nearly similar among healthy weight (23.64%), overweight (23.52%) and obese (25.00%) subjects. The prevalence of hypercholesterolemia (27.27% and 36.53%, respectively vs 9.54%), hypertriglyceridemia (28.34% and 36.53%, respectively vs 12.96%), low HDL-C (47.05% and 65.38%, respectively vs 21.65%), dyslipidemia (26.73% and 36.53%, respectively vs 8.83%), vitamin

D deficiency (79.67% and 92.30%, respectively vs 63.39%), hyperinsulinemia (35.82% and 36.53%, respectively vs 11.53%) and elevated C-reactive protein (15.50% and 25.00%, respectively vs 9.11%) was noted to be significantly higher among overweight and obese than healthy weight subjects of 18-35 years old.

In present study the prevalence of pre-hypertension (32.66% and 45.09%, respectively vs 27.24%) and hypertension (39.51% and 52.94%, respectively vs 28.40%) was significantly higher among overweight and obese subjects than healthy weight subjects of 36-55 years old. Hypercholesterolemia (46.37% and 60.78% vs 21.76%), hypertriglyceridemia (59.27% and 64.70% vs 30.23%), low HDL-C (69.75% and 80.39% vs 35.21%), dyslipidemia (43.54% and 56.86% vs 19.10%), vitamin D deficiency (79.83% and 92.15% vs 69.43%), hyperinsulinemia (50.80% and 56.86% vs 22.92%) and elevated C-reactive protein (29.43% and 35.29% vs 17.94%) were noted to be higher among overweight and obese subjects than healthy weight subjects of 36 – 55 years old.

Discussion

This study reveals increasing prevalence of overweight with age. Few studies from India on adolescents reported less prevalence of overweight compared to the result of the present study whilst obesity prevalence was as consistent as the current study's findings [9, 10, 11]. Researchers from Punjab, Jaipur and Chennai found 10-15% prevalence of overweight, which is noted to be similar to the current findings whilst they found the prevalence of obesity was as high as 5-11% [12, 13, 14, 15]. In keeping with the studies of Sen et al and Gupta et al, the current study found consistent results on the prevalence of overweight whereas obesity prevalence was lower in current study on adults [16, 17]. Furthermore, the findings of few studies on the prevalence of both, overweight and obesity, documented higher prevalence when compared to the present study [18, 19, 13] whilst another study on subjects of 20-40 years old reported consistent findings [20].

Obesity plays a crucial role in the aetiology of hypertension [21]. The current study reported higher prevalence of pre-hypertension and hypertension among overweight and obese subjects which was supported by Dua et al and Yadav et al [22, 23]. Pre-hypertensive subjects had 1.77% chances of becoming overweight reported by Rahmanian et al [24]. The risk of hypertension among overweight and obese subjects was higher due to increase in mass, causing an inadequate vasodilatation in the presence of increased blood volume and cardiac output [25].

It has long been known that obesity attributes to lipid metabolism abnormalities which results in elevation of lipid stores [26]. Though the current study did not find any lipid abnormalities among children, few studies have shown an association between lipid abnormalities and obesity in children [27]. Supporting the findings of current study, Gayathri et al reported significantly higher value of various lipid parameters like total cholesterol, triglycerides and LDL-C in overweight and obese individuals [28]. Inversely, the results of Sharma et al and Chadha et al showed HDL-C has no significant association with BMI [29, 30].

Vitamin D deficiency is a significant health problem globally. It helps in the regulation of calcium and phosphorus homeostasis and hence plays an important role in the development and maintenance of good bone health [31]. Many studies have supported the current study finding by reporting higher prevalence of vitamin D deficiency among overweight and obese children [32, 33]. Inversely, Bradaran et al noted no significant association between vitamin D level and BMI [34].

In line with the finding of current study, Shrinivasan et al showed temporal relationship between obesity and hyperinsulinemia and supported the role of obesity in hyperinsulinemia in three age groups; children, adolescents and young adults [35].

The current study showed a higher prevalence as well as higher mean level of C-reactive protein among overweight and obese subjects demonstrating the role of inflammation in overweight and obesity. Many studies have supported these findings demonstrating positive association between BMI and C-reactive protein [36, 37, 38].

Conclusion

The results of this study allow us to affirm that an increasing prevalence of overweight and obesity due to unhealthy lifestyle increases the risk of metabolic syndrome and cardiovascular complications. Thus, lifestyle modification including understanding of nutritional behaviour and physical activity decreases the risk factors associated with overweight and obesity.

Fast-Food Marketing and Children's Fast-Food Consumption: A Trigger to Childhood Obesity

Binkey Srivastava

Professor, KIET School of Management, KIET Group of Institutions, Ghaziabad

ABSTRACT

Fast-food marketing to children and their parents is considered a stimulus to trigger childhood obesity. The authors explore the various factors influencing fast food consumption and impact of excessive fast food consumption. The public health distress with fast-food marketing lies in the anticipated relationship between fast-food consumption and obesity in both children and adults, along with the nutritional profile of most fast-food menus.The conceptual framework is designed to understand how does fast-food marketing influence parents' behaviors with respect to eating habits of their children in a manner that promote the development or maintenance of obesity in their children. The random sampling of selected parents of children aged 2 to 12 years from the community health centre and residential localities of children within the age group. The convenience sample included 314 parents of children aged 2 to 12 years. At the end suggested various strategies to reduce the trend of fast food consumption. Fast food intake among children can be reduced by implementation of policies to regulate the marketing of fast foods in Indian market. Label of nutrition contents of food might control the quantity of food ordered and choice of low fat menu among children of educated parents. Further imminent into marketing as an influence on parents' behavior with respect to eating habits of their children to ensure that food marketing plays a positive role in children's health and promotion of healthy eating habits.

Keywords: *Obesity, child health, meals, taste perceptions and fast food.*

Introduction

Childhood obesity has become one of the major societal concerns of the 21st century. The problem is global and is steadily affecting many low- and middle-income countries, specifically in urban settings. Over the past few years the prevalence of child obesity has increased at an alarming rate. Globally, in 2010 the number of overweight children under the age of five is estimated to be over 42 million. Almost 35 million of these are living in developing countries *(Global Strategy on Diet, Physical Activity & Health - WHO 2010)*[1].

Earlier in India, childhood obesity was rarely observed but since past few years as malnutrition has attracted the focus of health workers, childhood obesity is increasingly being observed with the changing lifestyle of families with more and more purchasing power, increasing hours of inactivity due to addiction to television, video games and computer, which have replaced outdoor games and other social activities.

As per the various research studies nearly 16% of children in India are overweight and 31% are in risk of falling in this category[2]. The increased rates of obesity have become a public health concern as obesity is associated with chronic disease and adverse health outcomes[3]. The root cause for such epidemic culture is an emerging trend of fast food culture among the younger generation.

Fast food Marketing: Fast food marketing has been criticized for targeting children through television advertisements and for using promotional characters or favorite cartoon characters and sweepstakes based on frequent purchase[4&5]. Beside parents are a major influence on children's access to food, and parents are also exposed to such marketing[6]. Therefore, the concern is to find the ways that marketing adversely influences children's weight by means of its effects on parents, such as by influencing the types of foods parents buy for their children or allow their children to buy? What strategies are needed and appropriate to address such influences? These questions, related to marketing directed at children, have been a focus of this paper.

Factors Influencing Fast food Consumption: Fast food restaurants are targeted to maximize the speed, efficiency, conformity and sales. The menu is kept limited and standardized so as to reduce the waiting time so that the customers eat quickly and leave. This strategy reveals the emerging fast food culture in India and its impact on children[7].

The fast food chains are further gaining popularity through nuclear families as working parents have less time for meal preparation at home. The great numbers of working parents with school going children are tired with exhausting commutes, other household activities and stress. The children spend most of their time away from home by attending tuition classes after their school hours or engaged in recreational activity. Proximity of fast food chains to households could also influence to increased consumption.

Children usually skipping breakfast at home, find fast food handy in school which results in increased fast food consumption and body mass index. It is observed that children from high socio-economic status have more preference for fast foods over traditional foods irrespective of their better nutritional knowledge[8]. This indicates socio economic status is an important factor related to fast food consumption among children.

Indian Fast Foods: India is known for its rich heritage of foods and recipes. Most common north Indian fast foods include *chole kulchae, chaat*, *pakora*, *chole bhature*, *pav bhaji*, *dhokla*, *samosa, pani puri aloo tikki* and *bhel puri*. The cooking method of this Indian fast food decides its calorie and fat content[9]. Generally most of Indian fast foods are prepared by deep frying in fats specifically transfat and saturated fats. Foods that are baked, roasted or cooked in *tandoor* have lower fat content. *Hydrogenated oil* used in Indian cooking is rich in transfats and have been replaced in many restaurants by refined vegetable oil. Transfat content in Indian fast food are far higher than western foods[10]. Transfat content in *bhatura, parantha* and *puris* is 9.5%, 7.8% and 7.6%, respectively as compared to 4.2% in regular French fries. South Indian foods like *idli* and *uthappam* are better as they are good source of carbohydrates and proteins rather than fat.

Conceptual Framework and Hypotheses: Favourable attitudes or the belief that behaviour is normative in a community may send a subtle message that the behaviour is supported and facilitate the likelihood of the behaviour. Thus, we hypothesize that fast-food marketing not only affects consumption levels in the community of interest (children) but also influences parents' attitudes toward fast food and their beliefs about social norms surrounding fast food consumption. This result in more positive fast-food attitudes and the degree to which parents perceive fast-food consumption as socially normative are associated with children's greater fast-food consumption. Further, parents' attitudes and beliefs about fast food strengthen the relationship between parents' easy approachability to fast-food marketing and their children's fast-food consumption. Thus the two hypotheses identified are

H1: Parents' easy approachability to fast-food restaurants and exposure to fast-food promotion are associated with their children's greater frequency of fast-food consumption.

H2: Parents' (a) beliefs about social norms surrounding fast food and (b attitudes towards fast food strengthen the relationship between parents' easy approachability to fast-food restaurants and exposure to fast-food promotion.

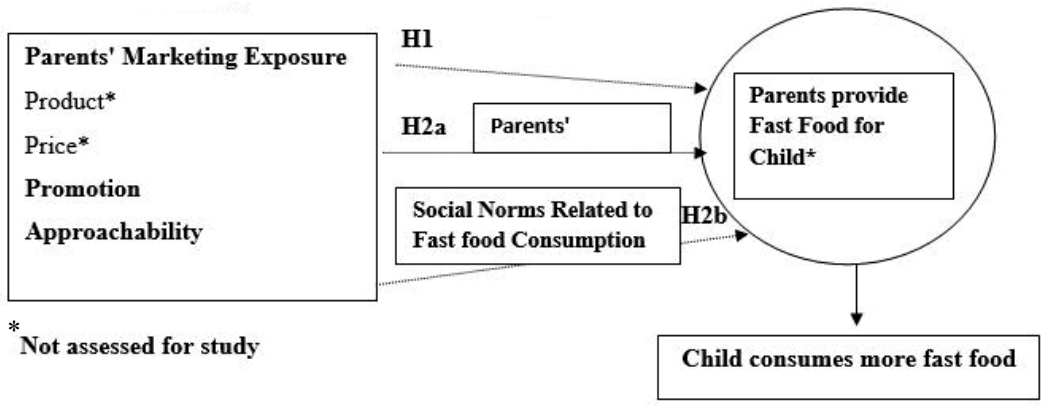

Figure 1: Conceptual Framework for Hypotheses

Method and Measures

For the sampling strategy, we randomly selected parents of children aged 2 to 12 years from the community health centre and residential localities using a centralized file of chart numbers of children within the age group. The convenience sample included 314 parents of children aged 2 to 12 years. The parents' education and income with standard demographic questions were also assessed. (Table 1)

Table 1: Summary of Sample Characteristics

	N	Percentage
Total sample	314	100
Female	163	52
Younger than age 7	184	59
Household Income		
Less than Rs 3,00,000 p.a.	48	15.3
Rs. 3,00,000 to Rs. 5,00,000 p.a.	192	61.1
Rs.5,00,000 to Rs. 8,00,000 or more p.a.	74	23.5
Parents' Education		
12th or less	81	25.8
Graduate	142	45.2
Post Graduate	91	29.0
Urban Residence	204	65
Overweight	158	50.3
At risk of overweight	48	15.2

Discussions

Tests of Hypotheses: To test the hypothesis that parents' higher reported exposure to fast-food promotions is associated with their children's more frequent fast-food consumption (H1; refer Figure1), the multiple regression analysis for ordinal outcomes with the three-category measure of children's fast-food consumption as the dependent variable. Further it was determined whether social norms strengthen the association between fast-food promotion and children's fast-food consumption (H2a). To establish the first path of H2a, a multiple linear regression was performed to test whether parents' reports of higher exposure to fast-food promotion are associated with more positive social norms surrounding fast food, after this study controlled parameters, the child's age, weight status and for the parent's education and income. The analysis supported the relationship ($t = 2.66$, $p = .009$). To demonstrate whether a parent's perceptions of social norms regarding fast food strengthen or account for the relationship between reports of fast-food promotion and fast-food consumption, a second ordinal regression analysis was performed. The model included the independent variable—fast-food promotions, the putative mediator—social norms and the covariates included in the original model. Parents' perceived social norms regarding fast food were directly associated with consumption ($\chi2 = 8.63$, $p = .003$). However, in this model, parents' perceived exposure to marketing promotions was no longer related to frequency of fast-food consumption ($\chi2 = 2.39$, $p = .12$), which suggests a mediation effect.

Exclusively, the results suggest that fast-food promotions affect the frequency of children's fast-food consumption through influences on parents' perceptions about social norms, which provides support for H2a.

The test of the H2b by modelling parents' attitudes toward fast food as a function of reported exposure to fast-food promotions, after we controlled for the covariates discussed in the previous models. We found no association ($t = –.86$, $p = .39$), though attitudes did have a direct effect on consumption ($\chi2 = 10.02$, $p = .002$). Thus, parents' attitudes do not appear to be an intervening variable that explains the relationship between parents' reports of fast food promotions and their children's fast-food consumption. Thus, there is no support for H2b.

Impact of Excessive Fast Food Consumption: The major concerns with fast food consumption in developing countries as India include poor hygiene during preparation storage and handling leading to microbiological contamination. Consumption of diet high in sugar, saturated fat, salt and calorie content in children can lead to early development of obesity, hypertension, impaired glucose tolerance and various other diseases. Fast foods not only have high level of fat and sugars that unhealthy but have addictive creates a vicious cycle making it hard for children to select healthy food. High content of trans fat in commercially available fast foods predispose children to risk of future heart diseases. Energy density of fast food is more than twice the recommended daily allowance for children. Fast food intake leads to higher proportion of calories being derived from total and saturated fat[11]. Moreover, the

micronutrient content (carotene, vitamin A, and vitamin C), calcium and magnesium of the fast food is also low. Such diet can contribute to osteoporosis. Diets rich in free sugars can lead to increased risk of dental problems.

Strategies to Reduce the Trend of Fast Food: The enhanced pattern of fast food consumption and childhood dietary habits forces to think some strategies to curtail it. Strategies could be designed for healthy food intake by availability of healthy standard foods, information campaigns and surveillance of diets and disease burden. Health education and school based intervention programs can improve the dietary pattern of children. Few schools in India have banned the sale of junk foods in the school cafeteria. An NGO in India has introduced school mid-day meal programs[12] in government aided schools, where healthy Indian foods are offered to children.

Another strategy to enhance the purchase of healthy foods among children and teens is price reduction on healthy snacks as fresh fruits and salad. Nutritional labeling of low fat label[13] too indicates significant increase in their consumption among teens population. In a study it was observed that a 10% increase in the cost of fast food meal led to 3% increases in consumption of fruits and vegetables.

Further televisions, newspapers and effective school education campaigns should focus its presentation on healthy lifestyle and eating among children and adolescents. Marketing strategy should be to encourage children to consume foods with high nutritious value like food grains, pulses, legumes, fruits and vegetables. In developing country as India where poverty still prevails in major part of country, government has taken measure to liberalize the international trade to reduce the cost of food grains. However, trade liberalization[14] has led to massive infiltration of Indian market with fast food joints. Policy reforms and imposing heavy tax on imported and manufactured readymade food items might control this intrusion.

Following measure could be adopted by parents to promote healthy food intake among children:

- Aerated beverages should be replaced by fresh lime juice, coconut water and fresh fruit juices.
- Child should be tempted with a plate filled with plenty of brightly colored vegetables, fruits and sprouts.
- Chocolates, candies ice-creams and other heavy desserts can be replaced by low fat fresh yogurt.
- Substitute meat or poultry with baked or boiled items, fried with grilled fresh sandwiches.
- Dough used for preparing *poori*/*pakoras* should be thick and avoid using ghee or oil for making the dough as this might increase oil absorption.
- Avoid ordering combo meal or mega meal offer to limit the quantity of the food ordered.
- In Indian menu go for *tandoori roti* as low fat option breads rather than *bathure, puri or naan.*
- While dining away from home avoid opting for dishes with rich creamy layers and lots of spices.
- Dishes can be shallow fried rather than deep fry to have lesser the fat content.
- Avoid motivating children for their good achievements and academics through chocolate bars.
- Last if too fond of such eating give your children only a single day in a month for this.

Conclusions

Parents' perceptions of more favorable social norms toward fast food mediate the association between exposure to fast food promotion and children's more frequent consumption of fast food. This has made fast foods an important part of dietary menu for most children, adolescents and even adults. Children are lured by convincing marketing strategies and peer pressure. Consumption of diet high in sugar, saturated fat, salt and calorie content in childhood can lead to early development of obesity and cardiovascular risks. Fast food intake among children can be reduced by implementation of policies to regulate the marketing of fast foods in Indian market. Nutritional labeling of food might restrict the quantity of food ordered and choice of low fat menu among children of educated parents. Additional insight into marketing as an influence on parents' behavior with respect to feeding their children to ensure that food marketing plays a positive role in children's health and promotion of healthy eating habits.

Overall, the results of this study show that fast-food marketing influences parents' behaviour with respect to feeding their children. Thus, for a more comprehensive understanding of approaches to reduce childhood obesity

and related cardiovascular risk factors, research that assesses the influence of marketing on children's eating behaviours and policy debates about food marketing to children should consider parents' marketing exposure. Additional insight into marketing as an influence on parents' behaviour with respect to feeding their children will assist researchers, policy makers, and marketers in developing mediate to ensure that food marketing plays a positive role in children's health.

ABSTRACT

In recent year, Macular Degeneration is the leading cause of vision loss. Macular Degeneration is caused by the deterioration of the central portion of the retina, the inside back layer of the eye that records the images we see and sends them via the optic nerve from the eye to the brain. The retina's central portion, known as the macula, is responsible for focusing central vision in the eye, and it controls our ability to read, drive a car, recognize faces or colors, and see objects. The aim of our proposed paper is to detect macular degeneration by using machine learning and regression analysis. This involves segmentation, plotting of histogram, edge detection and singular value decomposition. The results derived from edge detection are used in regression analysis.

Keywords: *segmentation, edge detection, singular value decomposition, multilinear regression, multicollinearity*

Introduction

Eye health assistance of people is an issue of great relevance. In the recent years in Indian societies, it is observed that so many people are facing more challenges to protect their eye. Developing countries like India, face more age related diseases among elderly groups. The most common disease in eye is aged macular degeneration. The primary reasons for this disease are aging and genetic disorder. To overcome these issues, health assistance and monitoring system for early detection of aged maculer degeneration through machine learning prediction algorithm is proposed. This helps in remote interaction with society.

Reason for degeneration is eventually demise of cells in retina. Other cause of degeneration is blockage in vein and diabetic. The degeneration causes blindness, starting with tunnel vision, peripheral sight loss. The main cause of these types of degeneration is genetic disorder and ageing. It is necessary for new approaches involving machine learning to diagnose and detect these effects in time for better health adjunct system. It helps the society. Damage of macula and a little blemish approximately close to the midpoint of eye in the retina leads to retina degeneration and subsequently vision loss. The retina degeneration progress is quick and might lead to vision loss in one eye or both eyes. The general symptom of retina degeneration is blurred region close to the mid of vision.

Method Details

This paper presents a method for detection of macular degeneration using machine learning and multiple regression analysis. Reason for degeneration is eventually demise of cells in retina. Other cause of degeneration is blockage in vein and diabetic. The degeneration causes blindness, starting with tunnel vision, peripheral sight loss. The main cause of these types of degeneration is genetic disorder and ageing. It is necessary for new approaches involving machine learning to diagnose and detect these effects in time for better health adjunct system. It helps the society. Damage of macula and a little blemish approximately close to the midpoint of eye in the retina leads to retina degeneration and subsequently

vision loss. The retina degeneration progress is quick and might lead to vision loss in one eye or both eyes. The general symptom of retina degeneration is blurred region close to the mid of vision.

Machine vision should be a direct method for getting information of surroundings. the human eyes location problem has attracted significant interests in the last decades [1,2,3]. Many efforts have been addressed to seek for eyes. A pupil generally is darker than surround eyeball, therefore algorithms can be designed to search for gray character[4]. For more effective, gray balance or contrast enhancement can be employed. Based on it, precedential knowledge on the facial feature arrangement will be helpful to detect several candidates of eyes [5,6,7]. But, the color of pupil must sharply affect the work of algorithms, as well as lighting condition. For solving these problems, an artificial template could be involved. So, in [8], the correlation coefficient between the template and the eye image can be calculated to decide which eye pair is. In addition, in the interest of reducing disturbance of color, Hough Transform is proposed to find the circle shape of the eye irises and eyelids[9]. As we know, the Hough Transform should lead to heavy load of calculation. Furthermore, NN can be counted on to solve problem well. Bianchini and Sarti [10] refer to the eyes possess strong horizontal and vertical edges, the exploitation of gradient features is particularly suited to repre sent the image content. Therefore, a neural autoassociators can be trained to detect eye region by gradient features. In order to extract gradient features, Sobel filter is utilized. More recently, Gabor wavelets techniques [11], where Gabor wavelet-based linear filters are used for eye corner detection, and non-linear (Gaussian) filters are used for eye location. Moreover, the fractal model provides an excellent representation of the ruggedness of natural surfaces and has served as an image analysis tool for a variety of applications.

A review of the image, machine learning techniques, detection, classification to filter the medical image and to perform disease area segmentation[12,13]. The application of various image processing techniques for automatic detection of glaucoma is presented in [14]. An approach for automatic classification of fundus images using image and data pre-processing techniques to improve the performance of machine learning classifiers [15,16]. In [17], application of singular value decomposition is discussed. Machine learning techniques, detection, classification to filter the medical image[18,19].

Data Base: Retina gallery full sized retina image in fig 1 normal image and diseased retina.

Fig. 1: Normal retina,diseased retina

Methodology

The methodology involves, machine learning, singular value decomposition and multiple linear regression analysis. The images are selected from the database and processed using MATLAB-R2015a. Singular value decomposition is used for comparison of normal iris and degenerated iris. The results of SVD are validated through linear multiple regression analysis. For performing multiple regression analysis, SPSS tool is used. Many methods exist to validate the results, but application of linear multiple regression analysis is a novel approach to validate the results.

The RGB image is converted to grey scale image.

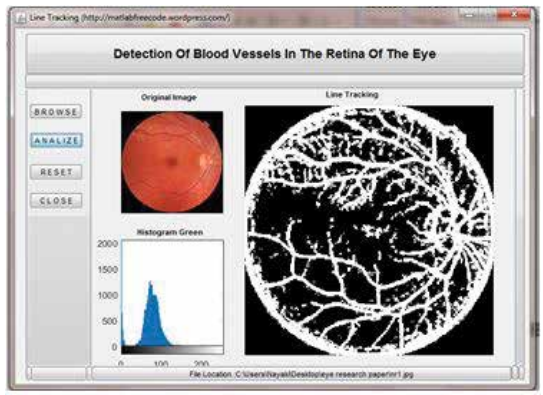

Fig. 2: Detection of blood vessels in the normal retina of the eye

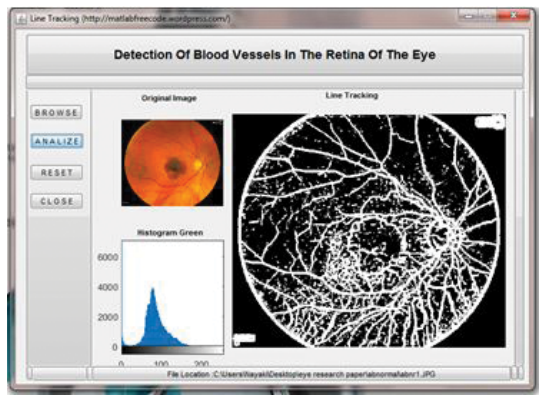

Fig. 3: Detection of blood vessels in the upnormal retina of the eye

Histogram plot of the image is in Fig.2 and 3. The histogram plot reveals the intensity of light distribution and peak of macular degeneration black spot. The histogram of normal eye, Fig.2a is not skewed and the shape of the cur ve is leptokurtic, it shows there is no drusen in the background of the eye. The histogram of diseased eye, Fig.3 is positive skewed, and leptokurtic. It shows small amount of drusen is distributed in the background of the eye. Almost symmetric histograms, we observe high concentration of pixel around the mean value. From diseased eye, Fig.3 is leptokurtic and the distribution allow the existence of small drusen as outlayers and that do not alter the general uniformity of the intensity.

The original image is converted from RGB to Green Channel. Complement structuring Element Morphological operation is done by Median Filter. Removal of background and image adjustment using intensity of the image is performed. Fig. 4, show the segmentation of the retina blood vessels through morphological operation of normal and diseased eye respectively. These allow the ophthalmologist to analyze the blood supply to the retina through cluster centres.

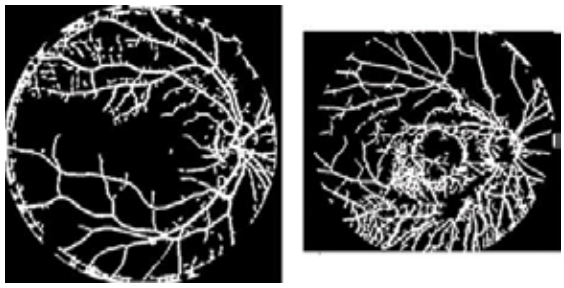

Fig. 4: Segmentation of blood vessels

The singular value decomposition is closely associated to the companion theory of diagonalisation of symmetric matrices. If A is a real symmetric n x n matrix there is an orthogonal matrices U and V and a diagonal matrix S such that.

Here the columns of V are latent vectors for A and diagonal entries of are eigen values of A. Here U is m x m and V is n x n, so that S is rectangular with the same dimensions as A. The matrix S can be formatted to be non-negative and in order of decreasing order. The columns of U and V are called left and right singular vectors of . Any non-square matrix is converted as a square matrix through singular value decomposition in order to calculate the correlation coefficient. Detection is mainly based on the comparison of correlation coefficient normal iris and degenerated iris.

Diagnostic test indicates the presence of disease when the result of the diagnostic test is true positive. The test suggests the disease is absent as well, when the outcome is true negative (TN). In the condition of no information about the disease, the test result is false positive (FP). Similarly, if the result of the diagnosis test reveals that the disease is absent for a patient for sure, the test result is false negative (FN).

In order to correctly identify as normal iris image and to correctly identify diseased iris, true positive is used. While, comparison of the images using SVD and correlation coefficient, a threshold of 80% is set to classify as True positive and True negative. The values of TP and TN are taken as independent variables of multiple linear regression analysis. The dependent variable is formed through AND logic gate.

Multiple regression is a statistical technique that allows us to predict dependent variable or criterion variable on the basis of several independent variables or predictor variables. The general multiple regression is in the form of, where denote the measure of how strongly to each predictor variable influences the criterion variable.

Here, the resulting multiple regression equation is Y= -0.069+0.7245 x1+0.2875 x2. As x1 increases by 72%, the output Y increases and x2 increases by 28%, the output increases. Table 1 reveals that the adjusted value is 0.75, thus our model is fit for dependent independent variable. The reports on ANOVA, which assess the overall significance of our model from p-value is less than 0.05, so our model is significant for analyzing dependent and independent variable in table 1 and table 2. Output from the multiple regression model show that If the variable x1 is increase then the dependent variable is increase. Variable x2 increase then the dependent is also increase. Further analysis the multiple collinearity to check for all variable. Because from multiple collinearity we can analysis the nature of the variable. dependent and independent variable in table 1 and table 2.

Table 1: Model summary and ANOVA

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change	Durbin-Watson
1	.864[a]	.747	.72	.23821	.747	1 43.238	2	97	.000	1.302

Table 2: Collinearity Diagnostics[a]

Dimension	Eigenvalue	Condition Index	Constant	Var 1	Var 2
1	2.1	1	0.08	0.08	0.09
2	.54	2	.08	.17	.89
3	.29	2.7	.84	0.75	.02

Method Validation: Measure the amount of multicollinearity in a set of multiple regression variables. The presence of multicollinearity within the set of independent variables can cause a number of problems in the understanding the significance of individual independent variables in the regression model. Using variance inflation factors helps to identify multicollinearity issues so that the model can be adjusted.

VIF quantifies how much the variation is inflated. Multicollinearity is calculated using

$$R_L = \frac{\sum_{i=1}^{n} VIF_n}{n} \text{ and } VIF = \frac{1}{1-R^2}$$

VIF is 1 means that there is no correlation among the variable. VIF is exceeding 4 warrant further investigations. VIF is exceeding 10 are sign of serious multicollinearity problems.

Here, VIF = 0.27. This indicates, that the model is not seriously affected by multicollinearity .

Conclusion

From the above results are shows that 72 percentage fit for detection of disease. The characteristic of the edge of nerves is perfect for identification of macular. Remaining portion of the 28 percentage is due to the problem with some nerve diseases at the time of checking.

Breast Cancer Prediction Using Ensemble Techniques

G. Manikandan[1], B. Karthikeyan[1], P. Rajendiran[2], R. Harish[3], T. Prathyusha[3], V. Sethu[3]

[1]Senior Assistant Professor, [2]Assistant Professor, [3]Student, School of Computing, SASTRA Deemed University, Thanjavur, India

ABSTRACT

One of the most dangerous types of cancer affecting women across the world happens to be breast cancer. As per clinical experts, detecting this cancer in its first stage is crucial in saving lives. The variables like sample code number, clump thickness, uniformity of cell size, uniformity of cell shape etc., are some of the important risk factors providing information, allowing identification of the recurrence of breast cancer and cure it in the earliest stages.

The factors responsible are obtained as an output from the data mining models. Existing studies and their results have produced good accuracies with minimal error rates in prediction. The medical diagnostic models which are based on data mining techniques can capture delicate designs and dependencies providing promising results. Promising results can be obtained from medically focussed diagnostic models which are based on data mining techniques, which have the capability to interpret ethereal structure and relationships. Single data mining technique may not suffice in providing results which are constant and competent.

Ensemble learning involves the blending of combination rules with input as several selected and generated intermediate risk factors to finally obtain simple selection results as output. The aim of this paper is to analyse the existing standard methodologies and to develop a new ensemble model comprising of classification techniques which will result in higher precision.

Keywords: *Breast Cancer, Prediction, Voting, Stacking, Boosting.*

Introduction

According to government statistics, breast cancer is one of the leading cancers affecting Indian women with a rate as high as 25.8 per 100,000 women and mortality of 12.7 per 100,000 women. [1, 2]The average 5-year survival rate for women with invasive breast cancer is 90%. The average 10-year survival rate is 83%.

The information obtained from this data is analysed from a large existing data, which makes it possible to make the right decision following the important information collected. Due to the rigid, complex nature of data processing, it can still be divided into simple steps. [3] These steps include data classification, data sorting and rearrangement, data summary/aggregation, data calculation, data selection.

Ensemble learning by its name involves the inclusion of more than one entity such as models. It is primarily used to meliorate the performance of a model (classification, prediction, an approximation of a function, etc.), reduce the probability of a poor pick or both. [4, 5] A good model of machine learning on unseen data should be able to perform well. The ordinary methods of machine learning, however, learn from the training data only one hypothesis. Various methods give rise to different hypotheses, but cannot justify completely on its own. Therefore, many hypothesises are learned and combined to form a good hypothesis in order to achieve better results on unseen data. Instead of just one model training and using the combined hypothesis of all the individual hypotheses, many models are trained on the data in ensemble learning, as your final hypothesis. The models which are combined are called base learners. [6,7] Ensemble principally includes Bagging, Boosting, Stacking and voting techniques.

In bagging, various training data subsets are drawn from the entire training dataset in a random manner with replacement. Ensemble decision for any given instance is the predominant chosen class, which is from the combination if respective classifiers by mean of majority vote. Measures such as the usage of a subset of training data to train each classifier or using relatively weak classifiers (such as decision stumps) can be used to enhance diversity. The need for additional measures is due to significant overlapping of training data sets.

Boosting creates a classifier ensemble by resampling the data, later combined by majority vote. Classifiers with the most informative training data are created via resampling, resulting in the three weak classifiers. The ordinal classifier involves training with a randomly chosen subset from the available training data. The most elucidative subset where only half of the training data are properly classified and the other half are misclassified is fed as the training data subset for the second classifier. The third classifier is trained and disagrees with instances. The three classifiers are combined by a majority vote of three ways.

Stacking is to explore the same problem with a space of different models. The idea is that you can attack a learning problem with different types of models which are capable to learn some part of the problem, but not the whole space of the problem. So you can build multiple different learners and you use them to build an intermediate prediction, one prediction for each learned model. Then you add a new model which learns from the intermediate predictions the same target. It is said that this final model is stacked on top of the others. So you could improve your overall performance, and you often end up with a model that's better than any intermediate individual model.

Voting is a technique of aggregation used to combine multiple classifier decisions. Every single classifier contributes a single vote in its simplest form, based on a plurality or majority vote. Summarizing all votes and selecting the highest aggregate class ensues the final prediction.

Proposed System: We used the method of selection of features and assembly techniques in our proposed system. Feature selection process helps in reducing inputs for processing and analysis, improving the quality of the model and also making the modelling process more efficient. On omitting the feature selection method, quality degradation can be observed due to unessential columns resulting in:

1. Noisy or redundant data makes it more difficult to discover meaningful patterns
2. Larger training data set is required by the majority of data mining algorithms, where the data set is defined in higher dimensions.

The objective of our proposed work is to construct an ensemble with K nearest neighbour and Naïve Bayes algorithms. Here we have given Wisconsin dataset as an input to the K nearest neighbour algorithm and the output obtained from this algorithm is given to Naïve Bayes algorithm. Then ensemble methods like Bagging, Boosting, Stacking and Voting are applied to these algorithms. As mentioned in Table 1 we have done this process with a different number of features.

Results and Discussion

For experimental purpose, we have used Wisconsin dataset. It has 683 instances and 9 attributes namely sample code number, clump Thickness, Uniformity of cell shape, Uniformity of cell size, Marginal adhesion, Singe epithelial cell size, Bare nuclei, Bland chromatin, normal nucleoli, Mitosis. From the Table 1, it can be inferred that voting ensemble method results in higher accuracy.

Table 1: Accuracy with different Features

Sl. No.	Techniques	Accuracy				
		All Features	8 Features	7 Features	6 Features	5 Features
1.	KNN	95.07	95.08	94.79	94.64	94.64
2.	Naive Bayes	94.16	94.34	94.19	93.75	94.19
3.	Ada Boosting	95.47	95.46	95.76	95.76	96.05
4.	Grad Boosting	96.35	96.49	96.20	96.50	96.49
5.	Stacking	96.52	96.66	96.52	96.08	96.37
6.	Voting	97.07	97.08	96.49	96.93	96.64

Conclusion

The proposed scheme can provide promising results in the prediction of breast cancer. Our approach intromits multiple independent variables and provides a practical and useful tool for outcome prediction of breast cancer. Here we have used feature selection method and also some ensemble techniques with Naïve Bayes and K nearest neighbour algorithms which help in the best prediction of breast cancer by improving the accuracy. We can infer from the output that voting is the best technique. Our future research endeavours include the practice of medical diagnosis scheme involving proposed machine serving as a foundation for critical dealing with medical problems.

ABSTRACT

Introduction: Indiscriminate use of pesticides like organophosphate, organochlorine, carbamate and pyrethroid poses various health hazards to human nervous, respiratory, endocrine, reproductive and immune systems.

Objectives: To access extent of derangement in respiratory function of farmers who are exposed to pesticide in the Satara District.

Method: 40 pesticide sprayers having age group 25-35 were selected as subjects. 40 age matched healthy farmers who were not involved in spraying activity were taken as control. Lung function was measured in morning by using computerized "HELIOS 701" instrument which includes FVC (Forced Vital Capacity), FEV1 (Forced Expiratory Volume in First second of FVC), FEV1% (FEV1as % of FVC), PEFR (Peak Expiratory Flow Rate in liters/sec), FEF25-75% (Forced Expiratory Flow Rate during 25to75 % of expiration), FEF 0.2-1.2 (Forced Expiratory Flow between 0.2-1.2 liters of expiration) and MVV (Maximum Voluntary Ventilation). After computing mean and SD of both groups comparison was done by using Unpaired t test to find out level of significance.

Results: Impairment of lung function (Predominantly restrictive type) was found in study groups as compared to controls.

Conclusions: Exposure to pesticides causes lung function derangement in pesticide sprayers.

Keywords: *lung function, pesticide sprayers.*

Introduction

Pesticides are profusely used to increase agricultural productivity and to eradicate many vector-borne diseases.[1]Indiscriminate use of pesticides like organophosphate, organochloride,carbamate and pyrethroid poses various health hazards to human nervous, respiratory,endocrine,reproductive and immune systems[2]. In modern agricultural practices use of more pesticides to gain higher cultivation has become major public health problem.[3]Indian agriculture industry is not as mechanized and advanced like other countries and its more labour intensive. There is no use of personal protective equipments (PPE) during spraying, poor housekeeping and storage, improper handling of pesticides leading to increased health hazards. [4] Hence farmers are exposed directly to pesticides.

Farmers are exposed to pesticide mainly by three ways. Firstly, through skin or eyes, secondly through mouth and thirdly through lungs (inhalation).Lung is target organ of inhaled toxicants and affected subsequent pesticide exposure by inhalation.[5]Long term exposure to cholinesterase-inhibiting pesticides those producing vapours, air droplets may cause irritant effects in respiratory tracks, lungs and lead

to narrowing of airways, damage to the alveolar capillary membrane and gas diffusion impairments.[6]There are more deaths due to pesticide poisoning than infectious diseases in the developing world. Pesticide poisoning among farmers and occupational workers is alarming.[7]World Health Organization (WHO) estimated that approximately 20,000 workers die from exposure of pesticide every year, majority in the developing countries.[8]Recently on Wednesday, August 15, 2018, The Times Of India, New Delhi Indian newspaper reported some pesticides were banned by Indian Government as their usage is cause for cancer.

Farmers in developing countries are under impression that pesticides are substitutes for fertilizers and there is need to create awareness at grass root level among the farmers.[9]The researchers till date in some parts of India have studied effects of pesticide spraying on lung functioning of farmers. But they have studied only few parameters of pulmonary function test (PFT). Very less work has been done on PFT of farmers in the Satara District. Therefore aim of present study is to access extent of derangement in respiratory function of farmers who are exposed to pesticide in Satara District.

Materials & Method

In this study, 40 pesticide sprayers having age group 25-35 were selected as subjects. 40 age matched healthy farmers who were not involved in spraying activity were taken as control group. Both groups were having same socioeconomic status. The study was conducted in Satara District during the period from November 2017 to Feb 2018. Approval from Institutional Ethical Committee (IEC) was taken prior of starting research. Sprayers were having pesticide exposure for an average of 7-8 years. A detail history of both groups was taken by use of questions regarding duration of work, smoking habits, diet and present respiratory symptoms. Prevalence of respiratory symptoms was recorded by using questionnaire which is based on British medical research council.[10]The questions were formulated in such a way to get maximum information about respiratory symptoms of pesticide sprayers over the period of last one year. It includes prevalence of upper respiratory symptoms such as sinusitis, rhinitis, sore throat, common cold and fever. Prevalence of lower respiratory symptoms such as dry cough, wet cough, wheeze, heaviness in chest and dyspnoea. Dyspnoea was assessed by using dyspnoea scale of Medical Research Council.[11] It comes under six headings as following.

Category	Symptoms	Dyspnoea grade
0	No any abnormality	No
1	Shortness of breath while walking up slight hill or hurrying on the level.	Slight
2	Walk slower than people of same age on the level due to breathlessness.	Moderate
3	To stop while walking at own pace on the level due to breathlessness.	Moderately severe
4	Stops for breath after walking about 100 yards or after a few minutes on the level.	Severe
5	Too breathless	Very severe

The sprayers having smoking habits, past history of respiratory or cardiac disease were excluded from the study. Institutional Ethical Committee (IAC) approval was taken. Informed written consent from all the subjects and controls was taken. Anthropometric measurements like height and weight were recorded for each participant. Their lung function tests were done preferably in the morning.Lung function was measured by using a computerized "HELIOS 701" (RMS Chandigarh, India) instrument.Spirometry was carried out as per guidelines of American Thoracic Society.[12] Before recording lung functions, subjects were shown a demonstration of the test. Consequently minimum three readings of each test were taken for every subject and the best of three was selected for having reproducibility and validity of the recorded parameters.

Statistical Methods: SPSS version-20 was used for statistical analysis. Mean and standard deviation (SD) of each variable was calculated. Unpaired t test was used to find out level of significance. The difference was said to be significant if $P< 0.001$***, $P< 0.01$**, $P< 0.05$* when compared to control.

Results

Table I: Mean and standard deviation of anthropometric measurements of control and sprayer groups

Group	Control group Mean ± SD (n = 40)	Pesticide sprayer group Mean ± SD (n = 40)	p value
Age in years	30.35 ± 3.06	31.40 ± 2.78	0.11
Height in cms	167.54	165.98	0.22
Weight in kgs	64.22 ± 3.56	62.52 ± 3.76	0.04*

Table II: Prevalence of respiratory symptoms in control group and study group

Respiratory symptoms	Pesticide Sprayers (n = 40)	Control Group (n = 40)
sinusitis	22%	7%
rhinitis	11%	3%
sore throat	12%	5%
common cold and fever	6%	2%
dry cough	38%	11%
wet cough	14%	7%
wheeze	28%	2%
heaviness in chest and	11%	3%
dyspnoea	42%	5%

Compared to control in Pesticide Sprayers higher prevalence of respiratory symptoms observed.

Table III: Mean and standard deviation of PFT findings in control and pesticide sprayers

Haematological Parameters	Control (N = 40)	Pesticide Sprayers (N = 40)	t value	P value
FVC (L)	3.43 ± 0.17 2.91 – 3.79	2.74 ± 0.19 2.37-3.08	16.49	< 0.001***
FEV1 (L)	3.04 ± 0.09 2.88 -3.19	2.42 ± 0.19 2.05 -2.76	17.84	< 0.001***
FEV1/FVC %	84.78 ± 2.68 80.07 – 94.87	90.33 ± 2.88 85.41 -96.93	8.91	< 0.001***
PEFR (L/S)	7.33 ± 0.15 6.87 – 7.54	5.92 ± 0.12 5.52 -6.12	44.05	< 0.001***
FEF 25-75 (L/S)	3.33 ± 0.07 3.12 – 3.43	3.17 ± 0.03 3.09 - 3.22	12.53	< 0.001***
FEF 0.2-1.2 (L/S)	6.01 ± 0.13 5.83 – 6.42	4.98 ± 0.06 4.88 – 5.10	43.27	< 0.001***
MVV (L/Min)	101.76 ± 6.83 89.23 – 115.16	82.29 ± 12.67 55.47 -107.33	8.54	< 0.001***

There was significant decrease observed in FVC,FEV1,PEFR,FEF25-75,FEF 0.2-1.2 and MVV while significant increase in FEV1/FVC in pesticide sprayers as compared to control.

Discussion

From table I it was observed that there was no statistical difference in age and height of control group and pesticide sprayer group (P>0.05).

In present study Table II shows prevalence of upper and lower respiratory symptoms were more in pesticide sprayers as compared to control. Organophosphorus (OP) pesticides are neurotoxic in nature and they inhibit acetylcholine esterase enzyme (AChE) by binding with its serine residue resulting in excess accumulation of acetylcholine (ACh) which over stimulate postsynaptic cholinergic nerves.[13] Action takes place on ACh Muscarinic receptors, either M3 or M2 to affect lung function. M3 receptors are stimulatory which are

present on pulmonary nerves and smooth muscles. Over stimulation of M3 receptors by ACh causes contraction of airway smooth muscles.[14]While M2 receptors are located on the pulmonary prejunctional nerves and smooth muscles which can normally inhibit further release of ACh from prejunctional nerves. It was observed in animal studies on guinea pigs that OP pesticides do not inhibit AChE but have potential to disrupt the autoinhibitory mechanism M2 receptors. [15]So there was uncontrolled release of ACh from prejunctional parasympathetic nerves which cause excessive bronchoconstriction. In present study these reasons might have induced respiratory symptoms in pesticide sprayers. Such respiratory symptoms were found by Chitra GA[16]and Khane RS[17] in pesticide exposed group. Health and hazard surveillance project among Iowa farmers found clear-cut association of respiratory symptoms with pesticides.[18]Absorption of pesticide is more through lungs than skin, stomach and intestine. So lung function impairment in farmers indicates that exposure of pesticides is mainly through inhalation.[19]

Table III shows pulmonary function tests findings in control and Pesticide Sprayers group in which there was highly significant decrease in FVC, FEV1,PEFR,FEF25-75,FEF.2-1.2 and MVV in sprayers compared to controls($p < 0.001$). FEV1/FVC ratio was significantly increased in sprayers compared to controls ($p<0.001$). Out of 40 sprayers 12(30%) had purely restrictive,24(60%) had mixed type and 4(10%) had purely obstructive type of lung dysfunction. These findings suggest that there was restrictive and obstructive lung function impairment among sprayers but restrictive type was more predominant. When FEV1/FVC ratio is normal or higher than normal but both values (FEV1 & FVC) are reduced then it indicate that there was restrictive deficit.[20]In our study similar pattern was observed in pesticide sprayers when compared with control.So in pesticide sprayers there was development of restrictive type of respiratory impairment.Chakraborty S also found restrictive deficit was more predominant in pesticide exposed group when compared with controls.[19] Restrictive deficit mainly occurs in parenchymal lung diseases when expansion of lung is reduced due to pneumonia,ILD,sarcoidosis and in chest wall abnormalities. On the contrary Fareed M et al found decrease FEV1/FVC ratio indicating obstructive deficit.[21]Previous studies also correlate with our findings that there was significant decrease in FVC,[22] FEV1[23,24]FEF25–75%[25]and in MVV.[26,19]Changes in FEV1 and FEV1/FVC ratio are related to large airways disease while changes in FEF25–75% is related to small airways disease.[27]Animal studies revealed that pesticide induces epithelial hyperplasia, thickening of capillary membranes in alveoli which leads to alveolar derangement and neuromuscular changes in respiratory muscles.[28]Some of these findings were also observed in earlier studies in India as well as in abroad.[29,17]

The cause of lung function impairment in present study might be due to various adverse effects of pesticides on lung structure as discussed above. During spraying of pesticides farmers do not use protective devices so there is direct inhalation leading to various respiratory defects. They have lack of knowledge about safety handling of pesticides which is mainly responsible for poisoning. Most of them were consuming food and water in the field during their work. These habits may increase the exposure and contamination risk.[30,31]

This derangement in PFT parameters in pesticide sprayers may also be due to more and longer duration of work practices (7-8yrs) as well as in unsafe manner. In general farmers having low educational level, lack of orientation and technical knowledge about using chemicals and low family income might be responsible for development of adverse effects on health. This scenario strongly points out our social vulnerability to make them aware from careless use of pesticide and higher pesticide exposure. [32,33]

In India about 70% of population is depend on agriculture for survival so use of pesticides is huge. [34]Every year thousands of deaths occur because of pesticides poisoning worldwide.[35]This is more common in developing countries including India. To avoid such mortality it is necessary to educate people and make them aware about pesticide poisoning. For this purpose more and more such type of work is necessarily required.

Conclusions

In present study respiratory status of pesticide sprayers was explored. They were from low socioeconomic status. They were not using PPE during spraying. They had poor knowledge of hazards of unsafe handling and use of pesticides. Majority of them were exposed to pesticides for an average 7-8 years. The chronic exposure without using safety measures has

caused some derangement of their lung function as accessed by spirometry. This scenario strongly point out our social vulnerability to make them aware from careless use of pesticide and higher pesticide exposure. Periodical assessment of lung function by spirometry may be advised for early detection of functional derangement of lungs.

A Study to Assess the Effectiveness of Planned Teaching Program on Knowledge Regarding the Care of Permanent Pacemaker at Home among Patients at Selected OPDs of Sangli and Kolhapur City

Jesica Dileep Mali[1], Sunil. Kulkarni[2]

[1]M.Sc Nursing, [2]Associate Professor, Bharati Vidyapeeth (Deemed to be University), College of Nursing Sangli, Maharashtra

ABSTRACT

Background: A pacemaker is a small electronic device placed just under your skin, above the layer of muscle. it helps pace your heart in order to keep a healthy heart rate. it senses if the heart is beating too slowly or pausing too long between heart beats. if it senses a slow rate or a pause that is too long, it will send electrical pulses to keep your heart rate steady

Methodology: Pre-experimental one group pre test post test was conducted to assess the knowledge of patients having permanent pacemaker in the selected opds of Sangli and Kolhapur city. The reliability coefficient 'r 'of the questionnaire was 0.85, hence it was found reliable. Total 50 samples were selected by Purposive sampling method. A Structured questionnaire of 18 items was administered to collect data. Pre test was given on the 1st day followed by planned teaching and Post-test was administering done 7th day. The conceptual framework based on the general system model theory, developed by Ludwig von bertalanffy (1968).

Result: Before giving planned teaching patient with permanent pacemaker were unaware of the knowledge regarding care of pacemaker. It was found maximum patients had good knowledge regarding care of pacemaker i.e. 10%. The post-test showed that 46% people have good knowledge score. This suggests that there is marked increase in post-test knowledge score, and planned teaching was effective**.**

Conclusion: Thus it was conclude that, of the study clearly indicated that there are changes in pre-test and post-test knowledge score.

Keywords: *Knowledge, Planned teaching, pacemaker*

Introduction

The cardiovascular crisis in India has quadrupled inside a conclusive forty years and WHO assesses that by 2020 close 60% of heart patients worldwide will be Indian. There are unique conditions in which the coronary heart may be incapable to regulate the price causing a slow heart beat or may display blocks within the pathways through which the cutting-edge flows (coronary heart blocks). Sudden loss of life is one of the maximum not unusual motives of death worldwide which can be avoided by using placing a pacemaker[1]. Studies have proved that 60 percent of all unexpected cardiac deaths arise because of arrhythmia. Each year 1-2 million individual's global die because of lack of get admission to pacemakers[2]. The most often used implantable gadgets are cardiac pacemakers. A pacemaker is a small electronic device positioned just below your skin, above the layer of muscle. It helps temporary control your heart to be able to hold a healthful heart rate[3]. It senses if the heart is beating too slowly or pausing too lengthy among heart beats. If it senses a sluggish charge or a pause that is too lengthy, it'll ship electrical pulses to hold your heart

charge steady[4]. This tool can be temporary or everlasting, depending at the patient's condition. Teaching patients the critical points regarding to pacemaker control, can save you the complications. Patients' schooling has grown to be a critical part of the therapeutic technique to help cardiac patients with pacemakers. Home fitness care is a particular vicinity of nursing exercise with its roots strongly located in network fitness nursing. Home fitness care is that constituent of comprehensive health care whereby fitness services are supplied to sufferers and households of their houses to promote, preserve, or repair fitness[5].

Materials and Method

A present study was conducted by using a quantitative experimental research approach with A Pre-experimental, one group pre-test and pos-test design. The conceptual framework was based on general system model with input, process, output and feedback developed by Ludwig von bertalanffy (1968). The reliability was done by using split half method 'r' was calculated by using Karl Pearson's formula coefficient 'r' of the questionnaire was 0.85, which is more than 0.70. Validity was done from 28 experts. Proposal with tool presented in front of ethical committee for permission. Total 50 samples were selected by non probability Purposive sampling method. Pilot study was conducted with 5 samples and the study was found feasible. Final study conducted with same data collection tool. Data collection tool had the questionnaires on care of permanent pacemaker at home.

Results

In the present study of patients Before giving planned teaching patient with permanent pacemaker were unaware of the knowledge regarding care of pacemaker. It was found maximum patients had good knowledge regarding care of pacemaker i.e. 10%. The post-test showed that 46% people have good knowledge score. This suggests that there is marked increase in post-test knowledge score, and planned teaching was effective. The chi square computed between pre-test knowledge and showed that knowledge was dependent on education. But it was not dependent on age, gender, occupation and previous information regarding pacemaker.

Findings

Maximum patients 64% belong to the age group of 51 and above years. 38% of patients had primary education, 56% of patients were male. Maximum patients 42% belong to other occupation, 100% of patient had previous knowledge regarding pacemaker, 44% of the patients were diagnosed with CHB.

Section I: Deals with analysis of data related to assessment of the knowledge regarding care of permanent pacemaker among patients at selected OPDs of Sangli and Kolhapur city in terms of frequency and percentage.

Table 1: Frequency and percentage distribution Pre- test knowledge score

	Groups	Scores	Frequency	Percentage
Knowledge - PRE Test	Poor	0-6	13	26.00
	Average	7-12.	32	64.00
	Good	13-18	5	10.00

The above table shows that in knowledge scores, at the time of pre test, 26% of subjects were having poor knowledge, 64% were having average knowledge and remaining 10% subjects were having good knowledge. Average score at the time of pre test was 8.14.

Table 2: Frequency and percentage distribution Post-test knowledge score

	Groups	Scores	Frequency	Percentage
Knowledge - POST Test	Poor	0-6	0	0.00
	Average	7-12.	27	54.00
	Good	13-18	23	46.00

The above table shows that in knowledge scores, at the time of post test, 54% were having average knowledge and 46% subjects were having good knowledge and no one in the poor knowledge group. Average score at the time of pre test was 12.74.

Discussion

1. The comparative examination was directed in Specialized Medical Hospital in Mansoura University, Trivandrum healing facility. Sample measure was 35.The outcomes discovered that about patients has normal dimension of information in regards to the homecare the board after permanent pacemaker implantation. The examination reasoned that there is no factual connection between information of homecare the executives of permanent pacemaker implantation patients and related factors like age instructive capabilities and year of pacemaker implantation[19].
2. The comparative examination was led in Mansoura University. the investigation uncovered that there was a factually critical contrast in patient's information and practice. Sample estimate was 50.More patients had lacking (learning and work on) with respect to pacemaker pre actualizing instruction program. After Educational program had factually noteworthy beneficial outcome on patient's execution (information and practice) with lasting Pacemaker

Conclusion

The present study concludes with the purpose of finding the effectiveness of planned teaching program on knowledge regarding the care of permanent pacemaker at home among patients at selected opds of sangli and Kolhapur city Findings of the study clearly indicated that there are changes in pre-test and post-test knowledge score.

The design used for the study was A Pre-experimental, one group pre-test and pos-test design was used. The study was conducted at selected opds of sangli and Kolhapur city. The Sample size of the study was 50 patients of permanent pacemaker

The reliability of the tool was determined Split Half Method of Reliability, the tool was administered to 5 samples. Reliability of the knowledge tool was found to be 0.85.

The pilot study was conducted, to assess the feasibility of the study and to decide the statistical analysis and practicability of research. It was found feasible.

Conflict of Interest: Column is Nil.

Source of Funding: Self.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval prior permission from hospital, were taken. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation,purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr.Sripriya and Dr.NilimaBhore mam.

A Study to Assess the Effectiveness of Planned Teaching Programme on Knowledge Regarding Selected Pediatric Emergencies among Mothers of Under Five Children at Selected Anganwadi's of Sangli, Miraj and Kupwad Corporation Area

Jesica Prashant Malap[1], Shaila Mathew[2]

[1]M.Sc Nursing, [2]Assistant Professor, Bharati Vidyapeeth (Deemed to be University) College of Nursing, Sangli

ABSTRACT

A quantitative study was conducted by Mrs. Jesica P. Malap. out with the purpose of increasing awareness of Pediatric emergencies in public thereby reduces the morbidity and mortality in children.

Objectives:

1. To assess the knowledge of mothers regarding selected pediatric emergencies.
2. To assess the effectiveness of planned teaching programme regarding pediatric emergencies
3. To find out the association of pre-test knowledge score with selected demographic variables.

Materials and Method: A quantitative pre-experimental one group pre-testpost-test design was used to assess the knowledge of mothers having under five children in the selected anganwadi's of Sangli, Miraj and Kupwad corporation area. The conceptual framework based on the Goal attainment theory, developed by Modified Imogene king's (1960), with perception, action, interaction and transaction or goal attainment. The reliability was done by using test-retest method 'r' was calculated by using Karl Pearson's formula coefficient's of the questionnaire was 0.9, hence it was found reliable. Validity was done from 25 experts. Total 80 samples were selected by Probability simple random sampling method. A Structured questionnaire of 24 items was administered to collect data. Pre-test was given on the 1st day followed by planned teaching and Post-test was administered on seventh day.

Results and Conclusion: Data were analysed by using frequency and percentage for demographic variables. Compute frequency, percentage, mean, standard deviation used to calculate pre-test and post-test knowledge score. Paired 't' test was used to compare the pre and post-test knowledge score. Chi square test was used to find association between demographic and pre-teat knowledge score. It was found maximum mothers 63.75% were having average knowledge score. The post-test showed that, 82.50% have good knowledge score. This suggests that there is marked increase in post-test knowledge score, and planned teaching was effective. The chi square computed between pre-test knowledge and showed that knowledge was dependent on age and education of mothers. But it was not dependent on monthly income, type of family.

Introduction

Children are not like adults. Physiologic, Cognitive and Psychosocial differences affects a child's perception, reaction to illness or injury, communication patterns and coping abilities. To determine a child's health status and individual needs, knowledge of normal growth

and development, careful observation of behaviour and physiologic cues and listening to the primary care givers are important. To facilitate positive outcomes, health care provider need to understand the unique characteristic of children[2].

Children are a high risk group to encounter accidents and injuries. They are achieving more skills and they want to explore many things as they grow. Most of the time under five children are unaware about the consequence of their activities. A proper first aid management in the right time will save the valuable life of our future generation. Every year huge number of deaths are happening around the globe. A paediatric emergency is a serious condition that threatens the life of an infant, child, teen, or young adult thus require immediate medical attention[3].Pediatric emergencies can be caused by a particular illness, an injury or by ingesting a foreign object or poison. Paediatric emergencies like burn injury, poisoning, foreign body aspiration and epistaxis are few examples where the child needs to be managed immediately and promptly. Each year, among those 0 to 5 years of age, more than 12,000 people die from unintentional injuries and more than 9.2 million are treated in emergency departments for nonfatal injuries. It is widely recognized that children have unique needs, particularly when they require immediate medical attention. The first person to notice that the child requires emergency medical assistance, should administer first aid procedures while waiting for emergency medical personnel to respond. Therefore, adults with children in their homes should be aware of basic first aid procedures and be familiar with the characteristics of an emergency. Managing these emergencies is an important area where the family members should be involved in caring for a child, thereby reducing the mortality rates and lifelong disabilities[4].

Materials and Method

A quantitative pre-experimental one group pre-test post-test design was used to assess the knowledge of mothers having under five children in the selected anganwadi's of Sangli, Miraj and Kupwad corporation area. The conceptual framework based on the Goal attainment theory, developed by Modified Imogene king's (1960), with perception, action, interaction and transaction or goal attainment. The reliability was done by using test-retest method 'r' was calculated by using Karl Pearson's formula coefficient's of the questionnaire was 0.9, hence it was found reliable. Validity was done from 25 experts. Total 80 samples were selected by Probability simple random sampling method. A Structured questionnaire of 24 items was administered to collect data. Pre-test was given on the 1st day followed by planned teaching and Post-test was administered on seventh day.

Results

Section II: Frequency and Percentage Distribution Pre test Knowledge Score

Table 1: Pre- test knowledge score

n = 80

Grading	Frequency	Percentage
Poor (0-8)	27	33.75
Average (9-16)	51	63.75
Good (17-24)	2	2.50

Table no.1 shows that 33.75% mothers have poor knowledge score, 63.75% and 2.50% mothers were having good knowledge score. Minimum score is 2 and maximum is 18. Average score at the time of pre- test was 9.97. It is evident that more efforts are necessary to improve the knowledge regarding pediatric emergencies among mothers of under five children.

Section III: Frequency and Percentage Distribution of Post test Knowledge Score

Table 2: Post-test knowledge score

n = 80

Grading	Frequency	Percentage (%)
Average (9-16.)	14	17.50
Good (17-24)	66	82.50

Table no.2 shows that mother at the time of post-test 17.50% were having average knowledge, 82.50% subjects were having good knowledge and none of the mothers have poor knowledge score. Minimum score is 10 and maximum score is 23.Average score at the time of pre-test was 17.90. This suggests that there is marked increase in post-test knowledge score.

Section III: Comparision between Pre-test and Post-test Knowledge Score

Table 3

n = 80

	Mean	S.D.	S.E.	t value	P value
Pre Test	9.97	3.69	0.41	22.01	0.000
Post Test	17.9	2.61	0.29		

Table no. 3 demonstrates that, mean estimation of pre-test information score is 9.97with standard deviation of 3.69 and post-test information is 17.9 with standard deviation of 2.61. The test insights estimation of the matched t test was 22.01 with p esteem 0.00. This recommends there is factually critical increment in post test score so arranged showing program (PTP) on information with respect to pediatric crises among mothers of under five children was powerful.

Section V: Association between Demographic Varibles with Pre-test Knowledge Score

Table 4: Association with demographic variables and pre -test

n = 80

Sr. No.	Demographic Variable	Chi Square	d.f	p-value	Remark
1.	Age of mothers	19.59	6	0.003	Significant association.
2.	Education	25.36	8	0.001	Significant association.
3.	Monthly income	4.35	6	0.629	No Significant association.
4.	Type of Family	2.27	2	0.321	No Significant association.

Table no. 4 indicates that there is significant association between age of mother and education with the pre-test knowledge score as calculated 'p'value is less than tabulated (0.05) value. There is no significant association between monthly family income, type of family with pre-test knowledge score as calculated 'p' value is more than tabulated (0.05) value.

Discussion

A study was conducted to assess the effectiveness of planned teaching programme on knowledge regarding selected pediatric emergencies among mothers of under five children at selected anganwadi's of Sangli, Miraj and Kupwad corporation area. The findings of the study have been discussed based on the objectives and hypothesis of the study.

It was found that, 36.25% of mothers belonged to the age group of 25-31 years, 30% of mothers belonged to the age group of 33-38 years of age, 22.2% of mothers belonged to the age group of 18-24 years and 11.25% belonged to the age group more than 39 and above. Maximum mothers 38.75% have secondary education, 23.75% mothers were graduates, 22.50% were having primary education, 8.75% were post graduates and only 6.25% mothers had not taken any formal education. As per monthly income most 28.75% was in the income group 15001-20000, 25% were having income of 20001 and above, 23.75% were in 10001-15000 and 22.50% were in the 5000-10000 income group. In type of family most of the mothers,58.75% belongs to nuclear family and rest mothers 41.25% were from joint family[3].

It was the found that maximum children 38.75% were in the age group of 2-3 years of age, 35% of children belongs to the age group of 3-4 years, 20 % children belongs to age group of 5 years and remaining 6.25% were in the age group below one year of age. In the gender of child the maximum, 58.75% were having female children and 41.25% mothers have male children. As per birth order most of the children 45% were second child, 35% were first child and 20% were the third child to their parents.[5]

In the present investigation, the pre-test information score with respect to pediatric crises in children was gathered by organized survey was utilized to gather the information. The overall score was 24 and was separated 0-8 (poor), 9-16 (normal), 17-24 (great). It was discovered that, 63.75% mother were having normal learning score, 33.75% of mother were having poor knowledge score and 2.505 of mothers have good knowledge score. Minimum score is 2 and most maximum score is 18. Normal score at the season of pre-test was 9.97. Around the same time arranged educating was taught to mothers [6].

The equivalent organized poll was utilized to gather the information after arranged instruction with the interim of 7 days post-test were directed. It was discovered that 82.50% of mothers were having great learning score, 17.50% were having normal information score and none of the mothers have poor learning score. Most maximum score was 23 and least score was 10 Normal score at the season of post-test was 17.90. This recommends there is checked increment in post-test information score.

The mean value of pre-test knowledge score is 3.69 and post knowledge score is 17.9, standard deviation score in the pre-test phase was 3.69 and in the post test was 2.61. Calculated 't' value is 22.01 which is more than the tabulated 't' value and calculated value is 0.000 which is less than tabulated ' p' value (0.05). This suggests that there isstatistically significant increase in post test score so planned teaching programme on selected pediatric emergencies in children among mothers of under five children was effective.

The chi-square test was used to find out the association between demographic variables with pre-test knowledge score. In age of mother 'x^2' value is 19.59 and 'p' value is 0.03 which is less than 0.05 so there is significant association between age of mothers with 5825pre-test knowledge score.In education 'x^2' value is 25.36 and 'p' value is 0.001which is lessthan 0.005 so there significant association between education and pre-test knowledge score. This shows that there is increase in level of knowledge respectively with age and level of education.

The demographic variables, like age of mothers, education and age of child was found that there was significant association between demographic variables with pre-test knowledge score at <0.05level.

In Other statistic factors such as month to month pay, kind of family, gender of child and birth order of the child it was discovered that there was no significant association between statistic factors like demographic variables with pre-test information score at >0.05 level. The findings of the present investigation have been discussed about with reference to the objectives and hypothesis. Findings of the investigation demonstrates that planned teaching programme regarding knowledge of pediatric emergencies among mothers of children under five years was useful.

Conclusion

The present study concludes with the purpose of finding the effectiveness of planned teaching programme on knowledge regarding selected pediatric emergencies among mothers of under five children at selected anganwadi's. Findings of the study clearly indicated that there are changes in pre-test and post-test knowledge score.

Conflict of Interest: Nil.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval prior permission from hospital and child development officer, were taken. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr. Sripriya and Dr. Nilima Bhore mam.

Comparative Evaluation of the Effect of Radiation Therapy on Surface Micro Hardness of Three Restorative Materials— An in Vitro Study

Karthik Shetty[1], Mary Byju[1], Chong Hao Phin[1], P U Saxena[2], Challapalli Srinivas[2]

[1]Department of Conservative dentistry and Endodontics, Manipal College of Dental Sciences, Mangalore, [2]Department of Radiotherapy, Kasturba Medical College, Mangalore, (Affiliated to Manipal Academy of Higher Education, Manipal), Light House Hill Road, Mangalore, Karnataka, India

ABSTRACT

Context: Dental restorations in Patients undergoing radiotherapy for the treatment of Malignancies may undergo changes in their physical properties due to the irradiation.

Aims: To investigate the effect of Gamma irradiation applied during cancer radiation therapy on the surface microhardness of Cention N, Zirconomer and 3M Filtek Bulkfil Posterior Packable Composite.

Settings and Design: In-vitro study conducted in a Dental school.

Method and Material: Twenty specimens of each material were prepared within acrylic moulds and these were divided into six groups with 10 of each restorative material per group. Groups 1, 2, and 3 were not subjected to any intervention whereas Groups 4, 5 and 6 were subjected to the radiotherapy protocol which is used on patients with malignancies.

Statistical Analysis Used: Two-way repeated ANOVA and Tukey's test.

Results: After irradiation the comparative changes in the surface microhardness in all the groups were statistically significant. The values of surface hardness of the Filtek group remained the highest followed by the Cention and Zirconomer groups.

Conclusions: The conclusion than can be drawn from this study are that the exposure to Gamma radiation does affect the surface hardness of the materials tested.

Keywords: *Surface micro hardness, Therapeutic ionising radiation, Vickers hardness test.*

Introduction

The physical properties of the restorative materials are of perpetual interest to the restorative dentist. Research in dental materials aims to continuously push the limits and increase the durability of the materials that are in clinical use. The surface Hardness of a dental restorative material is an important property while selecting replacement options for the lost tooth structures such as the enamel as the mechanical role of enamel is crushing food. [(1)]Surface hardness is a factor often used to assess the surface resistance of a material to plastic deformation by penetration. Amalgam has been the gold standard in restorative dentistry and has over the years vindicated its tag as the most durable of restorative materials, but due to its grey color and safety concerns it is being gradually replaced now by newer tooth colored restorative materials. Three recent alternatives to amalgam that claim to have high strength for their use in posterior stress bearing areas are Cention N, Zirconomer and Bulk fill composites.

Direct dental restorations are routinely indicated for restoring teeth with caries prior to head and neck radiotherapy. Radiotherapy of head and neck region can cause changes in the oral environment such as drop in pH, xerostomia and structural changes of organic and inorganic portion of mineralized tissues; degenerative and inflammation processes are also observed.[2][3] The durability of dental materials is influenced by its intrinsic properties and by the environment to which they are exposed to. Studies done by Aoba et al has proved the occurrence of physical and chemical changes that modify the mechanical properties of restorative materials in irradiated teeth.[4] Ideally the material to be used in patients undergoing radiation should bond to tooth structure, check secondary caries, repel dehydration and acid erosion.[5]

The aim of this study is to assess how the impact of gamma radiation affects the micro hardness of three different restorative materials: Cention N, Zirconomer and 3M Filtek Bulk Fill Posterior Packable Composite. The null hypothesis tested was that exposure to the irradiation process will not bring about any variation in the surface microhardness of the three restorative materials being examined.

Materials and Method

Specimen Preparation: Ten specimens of each restorative material were made within acrylic molds in the dental laboratory. The dimensions of each specimen was 6mm in diameter and 3mm in thickness. A polyethylene sheet and a glass slide was positioned over the filled mold after which light pressure was applied. This method provided an even surface on every specimen.

The Specimens were allocated into six groups

Group 1: Cention N without irradiation for 7 weeks (n=10)

Group 2: Zirconomer without irradiation for 7 weeks (n=10)

Group 3: 3M Filtek Bulk Fill Posterior Packable Composite without irradiation for 7weeks (n=10)

Group 4: Cention N with irradiation for 7 weeks (n=10)

Group 5: Zirconomer with irradiation for 7 weeks (n=10)

Group 6: 3M Filtek Bulk Fill Posterior Packable Composite with irradiation for 7 weeks (n=10)

Radiation Protocol: Ten samples of groups 4, 5, 6 were irradiated with 70 Gy of 6 megavoltage radiation using ELEKTA COMPACT linear accelerator, 2 Gy daily, 5 days per week for a total of 7 weeks (35 fractions) at the Department of Radiotherapy and Oncology.The samples were immersed in a water phantom during irradiation. This protocol is the same as the one used in patients under oncogenic treatment for head and neck tumors.

Microhardness Testing: The Vickers hardness test method involves the indenting of the test material with a diamond indenter, in the form of a right pyramid with a square base and an angle of 136 degrees between opposite faces subjected to a load of 1 to 100 Kg. The load is normally applied for 10 to 15 seconds. After the removal of the load the two diagonals of the indentations created on the surface of the materials are measured using a microscope and their average is calculated. The area of the sloping surface of the indentation is then calculated.

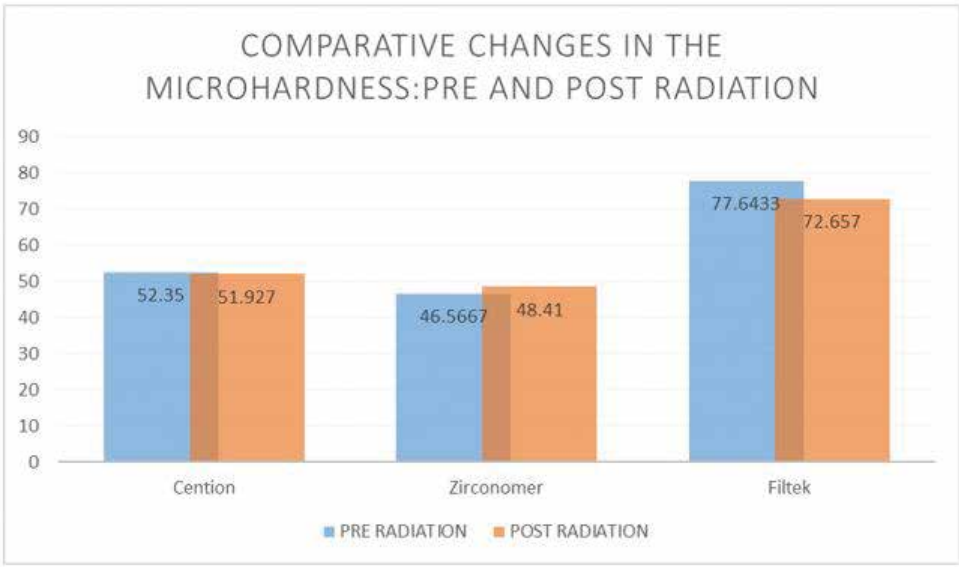
Data Management and Statistical Analysis: The mean values of various materials at different immersing times were compared by one-way analysis of variance (ANOVA), and multiple comparisons of mean were performed using Tukey's test and the level of $p < 0.001$ was regarded as significant.

Ethical Considerations: Ethical clearance to conduct the study was obtained from the Institutional Ethics Committee of the dental college.

Results

In this experimental and comparative in vitro study, all data showed normal distribution. The mean values of Vickers hardness before radiation exposure are summarized in Table 1. Prior to irradiation Group 3 exhibit the highest VHN (Harder) followed by Group 1 and Group 2. The comparative changes in the surface micro hardness of Group 1, Group 2 and Group 3 following the exposure to radiation were statistically significant (p=.011) (Table 2).After irradiation the values of surface hardness of the Filtek group remained the highest followed by the Cention and Zirconomer groups. When the results of the pre and post radiation values were compared against each other, there was a comparative reduction in the Vickers hardness values after radiation in the Cention and Filtek groups, whereas the Zirconomer group showed an increase in the microhardness values following irradiation (Graph 1).

Table 1: The mean and standard deviation values of Vickers hardness before radiation exposure are tabulated



MICROHARDNESS PRE RADIATION

	N	Mean	Std. Deviation	Minimum	Maximum
Cention	10	52.3500	2.85113	47.17	56.13
Zirconomer	10	46.5667	2.91395	43.07	51.40
Filtek	10	77.6433	5.86848	69.27	86.17

Table 2: The mean and standard deviation values of Vickers hardness after radiation exposure are tabulated

MICROHARDNESS POST RADIATION

	N	Mean	Std. Deviation	Minimum	Maximum
Cention	10	51.927	4.302	44.73	58.47
Zirconomer	10	48.410	4.399	42.17	55.53
Filtek	10	72.657	7.164	62.70	83.07

Graph 1: The comparative changes in Vickers hardness value before radiation and after radiation are depicted

Discussion

Therapeutic ionising radiation is used for radiotherapy in the treatment of head and neck cancers. The risk of developing caries is substantially increased for their lifetime in patients of radiation therapy. This is as radiation causes a direct alteration in the enamel and dentin ultrastructure, Chemical alterations in the tissues, Morphological alterations of enamel and dentine structures and decrease in dentinal microhardness[6][7][8][9][10][11][12]. Since radiation produces such structural changes and alterations in the mechanical properties of enamel and dentin, we can also expect some changes to occur in the restorative materials too. The effects of exposure to different sources of electromagnetic fields (EMFs) on animal models and humans have been studied extensively over the years.[13][14][15][16][17][18][19][20] But we did not come across any studies on the effect of Gamma radiation on dental restorative materials in our literature search. In the current study the dosage of radiation which the restorative materials were subjected to was planned to replicate the clinical scenario.

In the present study Filtek exhibited the highest values for surface microhardness in the pre testing before irradiation, followed by Cention and Zirconomer. After irradiation the values of surface hardness of the Filtek group remained the highest followed by the Cention and Zirconomer groups. The comparative changes in the surface microhardness of the groups were statistically

significant. The results showed a comparative reduction in the Vickers hardness value after radiation in the Cention and Filtek groups. But the Zirconomer group showed an increase in the microhardness values following irradiation.

Conclusion

The conclusion than can be drawn from this study are that Filtek bulkfil composite will be the material of choice if strength is desired from the restoration as it continued to be the hardest material even after irradiation. But Zirconomer can be considered as a viable alternative as it showed no regressive changes following irradiation rather an increase in the hardness values of the material was noted.

Conflict of Interest: The authors have no conflict of interest to disclose.

Evaluate the Association between Acrochordons and Systemic Diseases

Malar Mangai E.[1], Harsha Vardhan K.[2], Bhuvanarachagan A.[3]

[1]PG Student of Dermatology, [2]Professor and HOD of Dermatology, [3]Associate Professor of Dermatology, Sri Lakshmi Narayana Institute of Medical Sciences, Puducherry

ABSTRACT

Acrochordons are associated with conditions like pregnancy, intestinal polyps, growth disorders, metabolic syndromes, atherosclerosis and various other syndromes including polycystic ovarian syndrome, Birt–Hogg–Dubé syndrome, and Cowden syndrome. This study was carried out as a cross sectional study in a Teaching hospital. This study was undertaken in the outpatient Department of Dermatology in our Teaching hospital. This study was carried out for a period of seven months between October 2017 and April 2018. Our study demonstrated the association of skin tags with certain systemic conditions. Our study demonstrated statistically significant results with uncontrolled diabetes mellitus. Studies have demonstrated that multiple skin tags are often associated with insulin resistance and obesity. Our study demonstrates the significant relationship between history of cardiovascular diseases, hypercholesterolemia, and the presence of skin tags, which has been substantiated by several other studies. While diabetes mellitus, hypertension and cardiovascular diseases were definitive risk factors, our study could not demonstrate significant association between obesity and acrochordons.

Our study may be taken as the basis for using acrochordons as an effective screening tool for several non-communicable diseases like diabetes mellitus, hypertension, cardiovascular diseases and uncontrolled diabetes.

Keywords: *Acrochordons, Diabetes Mellitus, insulin resistance, Metabolic Syndrome, Obesity.*

Introduction

There are several systemic infectious diseases and syndromes associated with skin tags. Skin tags are associated with conditions like pregnancy, intestinal polyps, growth disorders, metabolic syndromes, atherosclerosis and various other syndromes including polycystic ovarian syndrome, Birt–Hogg–Dubé syndrome, and Cowden syndrome. Some of the infections which correlate with skin tags include human papilloma virus, which is said to occur in 88% of the acrochordons. Certain variations in the estrogen levels and hormones such as IGF-1, Insulin and Transforming Growth Factor (TGF) and Epidermal Growth Factor (EGF)are also implicated in the incidence of skin tags. [1]

Birt–Hogg - Dube- syndrome is characterized by multiple fibrofolliculomas and trichodiscomas. They are similar to acrochordons. Birt – Hogg - Dube- syndrome is caused by mutation of FLCN gene that produces folliculin which is a tumor suppressor protein. There has been significant association between Birt – Hogg - Dube- syndrome and Pneumothorax and renal cell carcinoma. In addition to this, one of the variants of basal cell carcinoma also present with clinical similarities of acrochordons. The fibroepithelioma of Pinkus is a sub type of basal cell carcinoma which often presents as pink acrochordons and form an important differential diagnosis. An increased irritation of the skin due to skin stretching in obese individuals may result in polypoid formations for which several factors are often involved. Some of the factors suggested include hormonal imbalance, since the genetic material from the viral pathogens has been identified in many samples of skin tags.[2]

Acrochordons have been linked to the appearance of malignancies with other organs like kidney and gastrointestinal tract because of abnormal activity of Epidermal Growth Factor (EGF) & Tissue Growth Factor (TGF) which are released by these tumors. The other important biological condition which is associated with Acrochordons is Type 2 diabetes mellitus. This is due to the presence of insulin resistance. Acrochordons in acanthosis nigricans which is a common feature of insulin resistance and type 2 diabetes mellitus.

Metabolic syndrome is a clustering of various pathologies of metabolic origin and are accompanying by increasing risk of cardiovascular diseases and type 2 diabetes mellitus. Metabolic syndrome is commonly presented as obesity, atherogenic dyslipidaemia, elevated blood pressure and raised plasma glucose [3]. The other essential component of metabolic syndrome which affects the skin diseases are oxidative stress. Oxidative stress, is a condition where the relative imbalance between reactive oxygen species and antioxidants. This is believed to play a major role in the pathogenesis of metabolic syndrome. The other factor associated with metabolic syndrome is endocrine abnormality. Intra abdominal fat in endocrine organs capable of secreting proteins such as adiponectin and Leptin promote inflammation, altered glucose metabolism and vascular endothelial biology. Obesity may be defined as an abnormal growth of the adipose tissue due to an enlargement of fat cell size or an increase in the fat cell number or a combination of both. [4] Obesity is also found with mixed color skin tags and has been hypothesized to occur due to interaction of mast cells and melanocytes for post inflammatory pigmentation [5]. Insulin is the hormone that promotes tissue growth and stimulates glucose uptake in tissues at an intensity that varies from individuals. Adult patients with acrochordons should be alerted in risk of development of insulin resistance, hypertriglyceridemia, diabetes mellitus in the light of obesity and overweight. They are at increased risk of developing cardiovascular complication like myocardial infarction, cerebrovascular disease, Peripheral arterial disease, erectile dysfunction, Cognitive decline, fatty liver and reno-vascular diseases. [6]

Overall skin tags occur as a result of impaired carbohydrate or lipid metabolism or liver enzyme abnormalities or hypertension. Studies have proven that skin tags are associated with various components of metabolic syndrome either individually or in combination [7].Metabolic syndrome and several other non-communicable diseases are silent killers with a long latent period and dreadful, morbid complications affecting various systems like heart, brain, kidneys, etc.

There are very few predictors for non-communicable diseases, which help clinically detect the ongoing risk of a non-communicable disease. Studies have implicated that skin tags or acrochordons are potential predictors of the risk of these non-communicable diseases. Acrochordons are easily identified by clinical examination and individuals can be educated to use this as a potent screening tool for detecting systemic diseases. This study is expected to implicate the magnitude of clinical risk of these diseases in the presence of acrochordons. The aim of this study is to clinically evaluate associated factors of acrochordons along with the prevalence of systemic diseases.

Material and Method

This study was carried out as a cross sectional study in a Teaching hospital. This study was undertaken in the outpatient Department of Dermatology in our Teaching hospital. This study was carried out for a period of seven months between October 2017 and April 2018. The study population consisted of all the patients who visited the outpatient department during the study period. Obtained Ethical Clearance from Institutional Ethics Committee, prior to the commencement of the study. Each participant was explained in detail about the study and informed consent was obtained prior to the data collection. The participants were selected using purposive sampling amongst the patients who visited the outpatient clinic of our Dermatology Department.

Inclusion Criteria: Adults above 18 years of age. Both Sexes.

Exclusion Criteria: Children and Patients presenting with generalized skin disease like psoriasis, Erythroderma, Immunobullous disorder, etc.

Statistical Analysis

Data was entered and analyzed using SPSS version 15 software. Percentages and Chi – square were used to describe the prevalence of skin tags and systemic diseases. A p value less than 0.05 was considered to be statistically significant.

Results

This cross-sectional study was carried out among 150 participants visiting the outpatient clinic of our department. The consent form was given to the patients prior to the interview. A structured interview schedule was used to elicit history regarding the medical conditions. Each participant was clinically examined for skin tags. Random blood sugar was estimated to assess the status of diabetic control. Majority of the participants belonged to the age group of >40 years (75.3%). Males were about 104 (69.33%) while females were 46 (30.67%). The body mass index of the participants showed that majority of the participants were overweight (23.7%). (Figure 1).

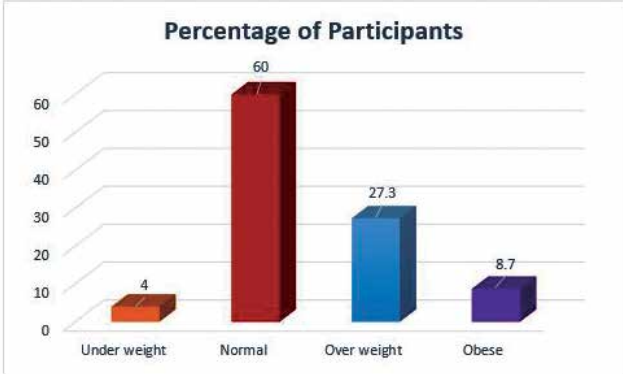

Figure 1: Distribution of the body mass index of the study participants

The association between background risk factors and acrochordons show that males are at increased risk for acrochordons (16.3%). However, the observed difference was statistically not significant. Participants with overweight and obesity were at an increased risk for acrochordons (16.7% and 14.4% respectively) compared to participants with normal BMI. However, the observed difference was statistically not significant. Our study also showed that uncontrolled diabetes mellitus (RBS>200 mg/dl) was not significantly associated with acrochordons (p<0.520). (Table 1)

Table 1: Association between skin tag and systemic diseases

S. No.	Parameters	Acrochordons		N (150)	Chi sq	P value
		Present n (%)	Absent n(%)			
1.	**Age**					
	<40	3 (8.1)	34 (91.9)	37	1.4	0.234
	>40	18 (15.9)	95 (84.1)	113		
2.	**Sex**					
	Male	17 (16.34)	87 (83.65)	104	1.55	0.158
	Female	4 (8.69)	42(91.30)	46		
3.	**Body Mass Index**					
	>30	1 (16.7)	5 (83.3)	6	4.6	0.203
	24-29.9	13 (14.4)	77 (85.6)	90		
	18.5-24	3 (7.3)	38 (92.7)	41		
	<18.5	4 (30.8)	9 (69.2)	13		
4.	**Random Blood Sugar**					
	>200	20 (13.7)	126 (86.3)	146	0.4	0.520
	<200	1 (25.0)	3 (75.0)	4		

The association between history of medical conditions and presence of acrochordons shows that known history of cardiovascular diseases was a significant risk factor (75.0%) for acrochordons compared to participants without history of cardiovascular diseases (12.4%). The observed difference was found to be statistically significant (p<0.05). Moreover, history of hypertension was a significant factor for acrochordons. It was observed that participants with known history of hypertension were significantly associated with acrochordons (29.6%) compared to those with no history of hypertension (10.6%). The observed difference was found to be statistically significant (p<0.05). (Table 2)

Table 2: Association between medical history and Acrochordons

S. No.	Parameters	Acrochordons		N (150)	Chi sq	P value

	Absent	21 (14.2)	127 (85.8)	148		

*statistically significant

Discussion

In our study one of the objectives was to evaluate the association of acrochordons and the risk factors. The association between demographic risk factors and the skin tags was carried out and it was observed that male participants were at an increase the risk of having skin tags compared to female participants. However, the association was statistically non-significant. We also analyzed the evaluated the risk of Body Mass Index as a risk factor for acrochordon. It was observed that participants with overweight and obesity were at increased risk for developing skin tags compared to participant with normal Body Mass Index. However, the observed association was statistically non-significant. It was observed that fasting blood sugar levels > 200mg/dl was a significant risk factor for the development of skin tags the association was not statistically significant (P > 0.005) we also evaluated the association between skin tags and the presences of known history of diabetes mellitus or hypertension or cardiovascular diseases. It was observed that known history of cardiovascular diseases was a risk factor and it increased with prevalence of skin tags (75.0%) compared to patients without history of cardiovascular diseases (12.3%). The observed difference was statistically significant (p< 0.001). Known history of hypertension was significantly associated with the occurrence of skin tags. Participants with known history of hypertension had increased the prevalence of skin tags (29.6%) compared to participants with no history of hypertension (10.6%) The association was found to be statistically significant (p< 0.001)

Our study findings were similar to other studies [8-9] done by Maluki et al BMI, Blood Pressure, and Metabolic Syndrome correlated significantly in the presence of skin tags (p<0.005) and El Safouri et al BMI was found to be a significant risk factor for skin tags (p< 0.05) [10],other study done by El Zawahry et al diabetic status was significant risk factor for appearance of skin tags (p< 0.001), similar to the findings of our study.[11]

Our study demonstrated the prevalence and association of skin tags with certain systemic conditions. Studies have demonstrated that multiple skin tags are often associated with insulin resistance and obesity. [12,13]. Therefore obesity is a significant risk factor for development of skin tags. However, our study could not demonstrate any significant association between obesity and skin tags. The reason for this difference could be because of the innate characteristic differences in the participants who visited the outpatient department. However, our study demonstrates the significant relationship between history of cardiovascular diseases, hypercholesterolemia, and the presence of skin tags, which has been substantiated by several other studies.

Conclusion

Our study demonstrated statistically significant results with uncontrolled diabetes mellitus. Our

study elucidated the clinical pattern of presentation of acrochordons and their association with potential risk factors. While diabetes mellitus, hypertension and cardiovascular diseases were definitive risk factors, our study could not demonstrate significant association between obesity and acrochordons. This could be because of the innate differences in the sampling characteristics present among the study participants. Our study may be taken as the basis for using acrochordons as an effective screening tool for several non-communicable diseases like diabetes mellitus, hypertension, cardiovascular diseases and uncontrolled diabetes.

Ethical Clearance: Obtained from Institutional Ethical committee.

The Logical Investigation of the Digitalization andits Capacities, Particularly those Influencing Conduct in Human Brain Research on Based on the Psychological Distress

Nandita Sikari[1], K HariKrishnan[2]

[1]Research Scholar, [2]Associate Professor, VIT University, Chennai Campus, Tamil Nadu, India

ABSTRACT

Digitalization is a part of portable banking and an administration, giving other financial associations that empowers its customer to lead an extent of budgetary trades remotely using for instance, a phone or Tablet using programming usually called "Applications" gave by a cash related establishment to the reason. Portable Banking is generally accessible for 24x7 and 366 days onwards. Some money related foundations have limitations on which records might be blamed through versatile saving money, and in addition a farthest point of sum that can be executed. In one educational model compact keeping cash described by flexible dealing with a record implies course of action and budgetary organizations with the help of convenience of media transmission contraptions. The degree of offered organizations may join workplaces to lead banks, securities trade and pay charge on the web, etc.

Keywords: *Versatile Accounting, Versatile Brokerage, Portable Financial Information Services, Versatile saving money applications, Plastic money transaction, Psychological distress*

Jel Classification: *B25, C81, F23, F44.*

Introduction

The earliest flexible keeping cash organizations used Short Message Service. The administration known as short message service dealing with a record with the showing of cutting edge cells with wireless application convention, reinforce engaging the use of the compact web in the year of 1999, the essential banks in Europe started to offer m-banking of their customers. The time of 2010 or before was as often as possible performed by short message service on the all-inclusive audit of business inquire about papers from world business association like Australia[6]. The key supportive precedents conceivable in universe of m-banking are following, with the incident to improvement and expanding utilization of front line phones and tablet based contraptions, the utilization of adaptable putting aside additional money esteem would empower client accomplice crosswise over whole client life circle much broadly than in advance. Minimal Banking associations relate with

1. Record Information:

- Mini proclamations and knowing of record history.
- Notifications on record development.
- Observing of Term store.
- Accessibility of credit explanations.
- Accessibility of card explanations.
- Correlative reserves and value explanations.
- Insurance Policy Managements.

2. Trade:

- Funds, trades exchange between client's connection accounts.
- Paying outsiders including charge installments of duties, web based shopping, book lodgings, tickets and so on.
- Outsider store exchange. Bank Check remote stores.
- Cancelling an administration ask.
- Checking the status of administration ask.
- Changing passwords.

3. Ventures:

- Mutual funds, Shares statements.
- Wealth Management Services.
- Notification alarms and warnings on security.

4. Support:

- Status of demand for credit, debit cards including contract endorsement and protection scope with security.
- Check status of cheque-book and requesting for PIN change, activation, chip-based cards etc.
- Exchange of information message and email including objection accommodation and following of banking online requirement.
- Searching of ATM Locations.

5. Content Services:

- Common data, for example, weather notification, news and so forth.
- Earn loyalty related offers through online transactions.
- Search Location of bank branches and ATM's.

According to the US Federal Reserve report discovered sixty eight percent of cell phone proprietors had utilized versatile managing an account over the most recent a year, in light of the study directed by Forrester, portable saving money will be alluring for the most part to the more youthful more "well informed" client fragment.

Platforms of Cashless Banking: The essential use of cashless banking was arranged in Finland. On 1992 as on schedule, customers of European banks could make charge portions and records status, alter using a cell phone. Significantly all the more beginning late flexible money related applications have depended upon the improvement of some key gauges for remote electronic associations and extended to in general markets. With everything considered, the stages utilized have been the Wireless Application Protocol and Short Message Service.

I. **WAP BANKING (Wireless Application Protocol):** Wireless Application Protocol is a typical dimension for taking online substance and impelled regard added organizations to remote contraptions, for instance, phones and Personal Digital Assistance (PDA's). Wireless Application Protocol goals are encouraged on web servers and use an unclear transmission tradition from destinations that is Hypertext Transport Protocol (http). The most basic complexity among web and website is the application condition.

II. **SMS BANKING (Short Message Service):** SMS permits instant messages normally up to one hundred and sixty characters to be sent to and from portable cordless cell phone by means of spared and forward framework. Around five hundred billions SMS were sent in 2001. Despite the fact that ninety five percent of this depends on individual to individual correspondence and phone message, different administrations, for example, e-keeping money are developing in prevalence.

- Verifying the status and changes of their record.
- Verifying the status of the check mobile numbers.
- Resettle the subsidize starting with one record then onto the next.
- View the last trade made.
- Request trade articulation.
- Pay service charges.
- Changes secret personal index numbers.

III. **Other Platforms:** Different stages are accessible or have been proposed for online banking experience. These incorporate the internet mode stage in Japan, which had amazing around ninety four percent supporters in 2015. Commission on membership gives docomo, internet mode's patent organization with yearly incomes of more than $13400 million every year[2]. Aside from remote m-banking various thoughts exist for Point of Sale applications, for instance utilizing short range remote innovation or network facilities in telephones and networks, for example, Bluetooth, clients can't pay charges by associating with the shipper's point of sale terminal by a thing from the candy machine pay a stopping meter and numerous different applications[4].

Part of Mobile-Banking in Customer's as well as Service Provider's Point of View: Portable saving money from the client's perspective, the client needs to get to data, merchandise and enterprises in whenever on his or her cell phone. Individuals can utilize their cell phone to buy tickets for occasions or open transports, pay for stopping, downloading substance and even cash exchange through portable included[8]. These are:

- Mobile ticket
- Mobile cash exchange
- Bill installments
- Online any sort of records opening
- Balance checks
- Tax installments
- Recharge and so forth.

Portable managing an account from the specialist organization's perspective, in PDA versatile biometrics has acquired another measurement to putting money on the go. The PDA has changed the market for biometrics in the portable saving money. The times of booth - based, secret word empowered exchanges will before long be a relic of times gone by. The in-assemble advanced cell cameras, fingerprints sensors, receivers currently let clients utilize their own equipment to catch their facial, unique mark and voice qualities, making ready for what we call "multi-factor" biometrics[1]. Biometric is keeping money as expression paint with enhancements in innovation on a regular schedule, making it a to a great degree convincing alternative for the two banks and their customers[3].

Portable Banking: Advantage and Disadvantage: Favorable circumstances of Mobile Banking:

i. Anytime Banking.

ii. Mobile Banking is Free.

iii. Various saving money administrations gave incorporate
   - Information about account balancing,
   - Credit/Debit card notifications,
   - Payment of bills, recharge notifications.
   - Transactions details.
   - Fund Transfer Facility (FTF),
   - Minimum balance notifications and so on can be gotten to from your convenient.

iv. Fund transactions in a split second to another record in a similar bank utilizing portable managing an account.

v. Secure Banking.

vi. Mobile application innovation accompanies propelled encryption advancements making it protected and secure as Internet Banking.

Demerits of Cashless Banking:

- Making most extreme advantage of versatile keeping money one ought to have advanced mobile phone. A few banks have particular programming for particular portable, for example, I-telephone and Blackberry individuals ought to download distinctive applications in view of the advanced cell they possess[5].
- Many specialists trust that versatile managing an account is all the more anchoring then web saving money as not very many infection or Trojans can exist in telephone. In any case, that does not imply that they are safe to any sort of dangers[7].
- There are likewise exceptionally constrained hostile to - infection programming alternatives for cell phones. Individuals are less watchful with their portable contrasted with PC. You should likewise refresh your hostile to infection on the portable in the event that you are an incessant client of versatile saving money.

Worldwide Scenario of Cashless Banking in Recent Trends: Data on e-exchange of cash are uncommon and differentiates in definitions make cross-country tests troublesome, an essential examination by Nsouli and Schechter (2002) from universal financial store exhibits that online exchange of cash is particularly in all cases in Austria, Korea, the Scandinavian countries like Singapore, Spain, and Switzerland, where in excess of seventy five for each penny of all banks offer such organizations.

Indian Scenario of Mobile Banking in Recent Trends: According to Hawkins (2002), in India, there is a danger of the rise of a 'computerized isolate' as the poor are avoided from the utilization of the web thus from the budgetary framework. Observational proof demonstrates that more extravagant nations have higher convergences of web clients (higher than pay focus) in examination with poorer nations.

Difficulties in Cashless Banking for Developing Countries: UNCTAD, 2002 data has stated couple of problems that makes country, when all is said in done, are relied upon to defeat to fulfill the favorable circumstances that electronic-money activities can achieve the capacity to embrace worldwide innovation to neighborhood necessities and the volume to fortify open help for e-back.

Conclusion

The outcomes introduced in this paper, speak to the network of research which has been the principle enthusiasm of creators as of late and which is coordinated towards finding ideal conditions for utilizing the capability of the versatile communication or portable saving money universally and the specialized security identified with the advancements, yet in addition with the client trust, protection and security as far as social experience. Current individuals even in dream likewise they thing about innovation, consider present day keeping money that is called "Portable Banking".

Conflict of Interest: Exceptionally in India, people are progressively beneficial to use liquid cash and there is no obligation to advance check in future for seeming complete national yield**.**

To Study Behavioral and Socio Economic Factors of Non Communicable Diseases in Northeast India Using NFHS-4

Phrangstone Khongji

Assistant Professor in Statistics, Department of Basic Sciences and Social Sciences, North Eastern Hill University, Shillong, Meghalaya

ABSTRACT

Introduction: This paper investigates the incidence of non-communicable diseases(NCDs) in North-Eastern states of India using NFHS-4 data and correlates with the different proximate and the secondary risk factors.

Method: Descriptive statistics were initially undertaken to understand the incidence of non-communicable diseases with the different proximate and the secondary risk factors. To finally draw statistically inference, logistic regression model was applied to determine the significance and nature of relationship between the predictor and the covariates.

Results: The result reveals that 'age' is a significant factor for both women and men under study in determining the prevalence of non-communicable diseases under study. The findings also shows that among the surveyed population, rural women and men are having high chances of NCDs compare to urban counterparts.

Conclusion: In Northeast, much research is needed to be undertaken for planning on time effective NCD surveillance, to identify the major risk factors and the cost.

Keywords. *Non Communicable Diseases, North east India, Logistic regression, Nutritional Index, Wealth Index.*

JEL classification codes: *I100, I120*

Introduction

Many studies have identified Non-Communicable Diseases (NCD) as increasingly predominant diseases in many regions.

Multi-centre studies have been initiated by the ICMR to find out the genetic factors, in addition to common environmental exposures, tobacco smoking, alcohol consumption etc, which could possibly explain the high prevalence of certain Non-Communicable Diseases (NCD) in Northeast India.

Not many literatures have focused about the Non-communicable diseases especially in the North-East. Therefore, this study will try to address these lacunae in providing information on the various socio economic and demographic risk factors associated with some non-communicable diseases by the used of the recently available data and information from National family health survey 4.

Review of Literature

Current Health Scenario in Rural India**,** as reveals by Patil[(1)], that the country is passing through a phase of double health burden of high incidences of communicable diseases and an increasing trend of NCDs.

Saxena, *et al* [(2)] emphasize that identifying risk factors of non-communicable diseases in rural settings occupies a central place in the surveillance system because of the importance of the lag time between exposure and disease.

The need of surveillance and procurement of details regarding NCD risk factors is essential for

health programs/policy planning and implementation, particularly in a country like India with a rapidly increasing burden of NCDs[3].

Multi-morbidity among older adults in India as reveals by Mini and Thankappan[4] found that more than 30% had multi-morbidity. Older age, women, those in higher socioeconomic status, tobacco users and alcohol users were more likely to have multi-morbidity compared to those with no NCD.

Research Objective

The objective of the present study focuses on investigating the determinants on some Non-Communicable diseases through various behavioral and socio economic and demographic risk factors in states of Northeast India using NFHS - 4.

Sources of Data

The National Family Health Survey 2015-16 (NFHS-4)[5], the fourth in the NFHS series, provides information on population, health and nutrition for India and each State/Union territory. NFHS-4, for the first time, provides district-level estimates for many important indicators. The Ministry of Health and Family Welfare, Government of India designated International Institute for Population Sciences, Mumbai as the nodal agency to conduct NFHS-4. Four Survey Schedules - Household, Woman's, Man's and Biomarker - were canvassed in local language using Computer Assisted Personal Interviewing (CAPI). NFHS-4 fieldwork for India was conducted from January 2015 to December 2016 and gathered information from 601,509 households, 699,686 women, and 112,122 men.

As our study will be concentrated in states of Northeast, India by the use of NFHS-4 in connection with the topic of this research. Hence, the following tables provide an overview of the sample size collected during the survey for the 8 different states.

The data provide information on various non-communicable diseases like D**iabetes, Asthma, Thyroid, Heart Diseases and Cancer** which will be used in the present study. Information's on the various socio-economic risk factors on the above mention NCD's is obtained from the data.

Methodology for Analysis

The study used both MS Excel as well as Statistical Package for Social Sciences (SPSS) for data analysis. SPSS was used for cross tabulation to present relationships between different variables. Logistic regression which is used to predict the risk of developing a given diseases (e.g. diabetes, asthma, thyroid and hearth diseases) based on the observed characteristics of the respondent (i.e. **age, residence, wealth status, occupation** and **educational attainment**).

We have also considered some *behavioral or proximate* risk factors of the selected non-communicable diseases which are collected during NFHS-4; two of these factors are **smoking and drinking**. We also constructed the third proximate factor called the **Nutritional Index**. This index is to determine the nutritional status of the surveyed population and was constructed using the Principal Component Analysis (PCA) in SPSS, base on the following variables: (1) intakes milk or curd (2) intakes pulses or beans (3) intakes dark green leafy vegetables (4) intakes fruits (5) intakes eggs (6) intakes fish (7) intakes chicken or meat (8) intakes fried food (9) intakes aerated drinks. We have divided this index into the three ranges they are: Low Range, Medium Range and High Range where low range implies low status of nutrition.

Data Interpretation: Among the various non-communicable diseases, data only on the Diabetes, Asthma, Thyroid, Heart Diseases and Cancer are available in NFHS-4.

Table 1: Number of women and men interviewed in NFHS 4 by states of Northeast India

States	Number Women interviewed	Number Men interviewed
Arunachal Pradesh	14294	2140
Assam	28447	4191
Manipur	13593	1886
Meghalaya	9202	1236
Mizoram	12279	1749
Nagaland	10790	1596
Sikkim	5293	879
Tripura	4804	878
Total	98702	14555

Source: NFHS 4

Interpretation of Data based on secondary risk factors: Some of the secondary risk factors considered in the present study are Sex, Residences, Educational Attainment, Occupation and Wealth Index. These are considered as secondary for the fact that these factors may indirectly led to incidences of NCDs viz., diabetes, asthma, thyroid, cancer and heart diseases.

The frequency distribution of the above mentioned NCDs by the secondary risk factors reveals that among people who suffer from the stated NCDs, a greater proportion of them are Christian from Arunachal Pradesh, Meghalaya, Mizoram and Nagaland whereas in the state of Assam, Manipur, Sikkim and Tripura, incidences of NCDs is higher among Hindus.

Many literatures reveal that risk factors may be affected by lifestyle choices that are often influenced by economic development and urban living. The data also depicted that among people who suffer from the stated NCDs, there are more proportion of rural people having the diseases compared to their urban counterparts in almost all the states.

The data in the present study reveals that incidences of diabetes is more for people with the middle and richer wealth index groups except for the state of Tripura where the chances of having the diseases is more with people of the poorer wealth index level.

In the case of Asthma incidences is highest for 'middle wealth index' groups in the states of Arunachal Pradesh, Meghalaya and Sikkim whereas the incidences of the disease is high with the 'poorer wealth index' people in the states of Assam, Nagaland and Tripura.

In connection with occupation, the data reveals that from among people who have NCDs viz., diabetes, asthma, thyroid, heart diseases and cancer incidences a significant proportion of them belong to those groups of people who work in agricultural sector.

Thyroid can be seen is high with women of urban residence in the state of Mizoram, Nagaland, Sikkim and Tripura. Heart diseases are found out to be high with the people of rural residence in almost all the states of North East. However, in the some states we have found that people of urban residence are also suffering the most.

Interpretation of Data based on proximate(behavioral) risk factors: Some of the proximate risk factors that are considered in the present study are age, alcohol consumption, smoking and Nutritional Index. These are considered as proximate for the fact that these factors may directly led to incidences of NCDs viz., diabetes, asthma, thyroid, cancer and heart diseases.

Diabetes by the proximate risk factor depicts that in all states and among those who have the disease, highest proportion belong to medium range of the nutritional index both for the men and women, age group of 40+ for both men and women.

In general it is observed that, with increase in age the occurrence of the disease seems more prominent especially in the states of Assam, Mizoram and Tripura.

Among samples having Heart Diseases these, highest proportion of them belongs to medium range of the nutritional index both for the men and women. With age, the incidence of the disease seems to increases and this trend become more pronounce from the age 30+ in all states except in the state of Meghalaya, were the disease is prominent even among younger age group of women.

Interpretation Binary Logistic regression for women: All the risk factors are categorize into various classes, the cross tabulation shows the distribution of NCDs by Age Group, Residences, Wealth, Educational status and Occupational status and also by some of the proximate risk factors as Nutrition, Smoking and Drinking Alcohol.

In order to statistically verify the nature and strength of the associations between the above mentioned NCDs with the risk factors, a **binary logistic regression model** is applied, whereby the risk factors constitute the independent variables and the corresponding NCDs on the depending variable. The model when applied by state does not yield significant result which may be due to the small number of samples of the incidences of the Diseases. Hence the model is on the combine data of North east and the outcome of the model is discussed below.A logistic regression on women with the above mentioned explanatory variables and each of the corresponding NCDs.

The model with **Diabetes** as the dependent variable which is categories as yes or no, reveals that age is one factor that can have significantly determine the risk of incidence and the Table 2 reveals that at less than 0.01 level of significance, the increase in age of the respondent is associated with increased odds of the diabetes diseases.

Table 2: Binary Logistic regression of NCDs with the corresponding risk factors for women

Constant	.001	.008	.004	.004	.000

Source: Authors own calculation. *p < 0.01, ** p < 0.05

In connection to nutritional status, the model depicts that among those who have the diabetes, the odd of the disease is 1.5 times to people who belongs to the low range compare to the people who belongs to the high range group.

As in the case of Diabetes, the Table 2 of the logistic model shows that increase in age is associated with increased odds of the **Asthma diseases**.

The outcome of the regression model as depicted in the table shows that age is again a highly significant (i.e. p<.000) factor with women who is currently having the **thyroid** diseases.. Wealth is another significant factor (p <0.01) in this case in determining the odds of incidences, whereby the odds of women who belongs the poorest, poorer, middle and richer wealth index are less comparing to the people with the richest wealth index.

The regression model further depicts that women who have attended school have less odds of having the thyroid diseases, although internal variation(between educational status) of the incidences of the diseases prevail. Among the proximate risk factors, the table shows that the odds of having the disease among drinking women are 1.5 higher than those who does not drink.

As in the other previously mentioned NCDs, age is a significant factor in the case of **heart diseases** also as depicted in the table 2, showing that an increase in age is associated with increased risk of the disease.

The table 2 shows that drinking alcohol increases the chances of the disease. Further women in the highest nutritional group have higher odds of having the disease compare to middle nutritional group and low nutritional group.

Age is an important factor determining the incidences of **cancer** among women in the reproductive age group. Further women in the highest nutritional group have higher odds of having the disease compare to middle nutritional group and low nutritional group.

Logistic regression on **men** with the above mentioned explanatory variables and each of the corresponding NCDs is depicted in Table 3.

Table 3: Binary Logistic regression of NCDs with the corresponding risk factors for men

Limitation of the Study: The first limitation is that the study was conducted with a limited sample size for men comparing to women and hence many of the risk factors for men were found not to be statistically significant and hence would act as a limitation.

The second limitation of the study is the problem of identifying the various risk factors. If the more data could be collected on biomedical report of those respondents who is currently suffering from the following diseases i.e. diabetes, asthma, hearth diseases, thyroid and cancer than the various risk factors for causing the diseases would be more clearer.

Scope of the further study: Since this study has been compiled at all the state level of Northeast. Therefore, further we can extend this work to the district level also for all the states of the Northeast.

This study can further be complimented with primary data collected from the various sources like hospitals, dispensaries, than the major risk factors which causes the NCDs could identified appropriately.

Policy Recommendations: The study was conducted by taking the data from the NFHS-4 for finding out the issues of adult health which are cause by the different modifiable risk factors due to the common non-communicable diseases in Northeastern states of India. A few suggestions towards policy recommendations of the study are as follows

Since in our study we mostly found that people of rural residence are suffering from the diseases, therefore better diagnostic facilities should be provided in Rural areas.

In the present study we found that people with incomplete secondary education have higher chances of having NCDs. This suggests that higher educational level reduces the risk of NCDs. Thus, in this connection government and policy makers should ensure higher education for the masses.

As we have seen in this study that people who work in agricultural sectors have more chances of having NCDs compare to people from other occupation. Thus, government should take the initiative of ensuring that more awareness of health lifestyle be provided to people who work in agricultural sectors.

A Study to Assess the Knowledge and Self Reported Practices Regarding Care of Arterio Venous Fistula among Patients at Selected Haemodialysis Units of Sangli City

Pratik N Amrao[1], Swati C. Kurane[2]

[1]M.Sc Nursing, [2]Clinical Instructor, Bharati Vidyapeeth (Deemed to be University) College of Nursing, Sangli

ABSRACT

"A study to assess the knowledge and self reported practices regarding care of arteriovenous fistula among patients at selected haemodialysis units of sangli city". Background: A.V.Fistula is referred as gold standard method to carry out the dialysis of client, so the care and appropriate knowledge is most important factor for smooth access. Objectives: 1. To assses the existing knowledge regarding A.V.Fistula care among haemodialysis patients. 2. To assess the self reported practices regarding care of A.V.Fistula among haemodialysis patients. Methodology: A present study was conducted by using quantitative approach with non-experimental descriptive research design. Nola j penders health promotion model was used which is revised in 1996for conceptual framework. Proposal with tool presented in front of ethical committee for permission. Total 100 samples were selected by Probability simple random sampling method. Data collection tool had knowledge questions to assess knowledge and practice were assessed by using likhert scale. Result and conclusion: knowledge scores, 84.00% subjects were having average knowledge, 16% were having poor knowledge and no one in the good knowledge category. In the present study of patients of A. V. fistula, in Practice scores, 37% of subjects identified with inadequate practice score 63% identified with appropriate practice score.Implementation of knowledge regarding A.V. Fistula care and its practices would be beneficial to the patients who are going under haemodialysis treatment for increasing the patency and reducing the complications of A.V.Fistula for reducing the life threatening conditions.

Keywords: *A.V.Fistula, knowledge, self reported practices*

Introduction

National vascular access initiative conducted the physical examination of Arteriovenous fistula in 4 weeks to identify the failure and other complications and recommend it to diagnostic evaluation. For proper identification of the problems related to A.V.Fistula standard protocols were obtained as monitoring, timely check up, education to all care givers as well as patiens to improve the vascular patency(e.g., application of adequate pressure on vascular site, brouchers)[1.] Self management throughout the levels of chronic kidney disease and reeferd vascular access problems, which includes failure to mature of A.V. Fistula and placement. Education helps the patients to live best quality of life. It increases the self confidence of patients to carry out the necessary behaviour to achieve the goal. Self care of A.V.Fistula will help the patient for better management of vascular access. To promote the knowledge and practice on care of A.V.Fistula by giving brouchers. Hence study is needed to this population and this period[2]. proper education regarding care of A.V. Fistula among patient and relatives should be provided. A list is present regarding care of A.V. Fistula at home. Avoid sleeping at site, don't lift up the heavy objects, keep the area clean, these guidelines provides information like how to admire the sign and symptoms of complication.[3]

Materials and Method

A present study was conducted by using quantitative approach with non-experimental descriptive research

design. The conceptual framework was based on Nola J Penders health promotion model revised in 1996 with individual characteristics, activities related effect, commitment to plan of action and behavioural outcomes. The reliability was done by using split half method 'r' was calculated by using Karl Pearson's formula coefficient'r'ofthequestionnairewas0.9. Validity was done from 20 experts..Proposal with tool presented in front of ethical committee for permission. Total 100 samples were selected by Probability simple random sampling method. Pilot study was conducted with 10 samples and the study was found feasible. Final study conducted with same data collection tool. Data collection tool had knowledge questions to assess knowledge and practice were assessed by using likehert scale.

Assumptions: Haemodialysis patients may have some knowledge regarding care of A.V. Fistula.

Results

Section 1: The analysis of data related to assessment of the knowledge regarding care of A.V. Fistula among patients.

Table 1: Frequency and percentage distribution of knowledge score.

n = 100

Groups	Frequency	Percentage %
Poor (0-4)	16	16%
Average (5-8)	84	84%

The above table shows that in knowledge scores, 84.00% of subjects were having average knowledge, 16% were having poor knowledge.

The analysis of data related to assessment of the self reported practices regarding care of A.V. fistula among patients.

Section 2: The analysis of data related to assessment of the self reported practices regarding care of A.V. Fistula among patients.

Table 2: Frequency and percentage distribution of Practice score.

n = 100

Groups	Frequency	Percentage %
Inadequate (0-5)	37	37%
Adequate (6-10)	63	63%

The above table shows that, in Practice scores, 37% of subjects were having inadequate practice and 63% were having adequate practice. So it evident that more efforts are needed to impliment to carryout appropriate practices. Knowledge category.

Discussion

This study revealed that 84% of patients were having average knowledge about AVF care and 16% were having poor knowledge. This results suggest that proper implementation of knowledge regarding AVF care and self-practise is needed to heamodialysis patients in appropriate manner, in Practice scores 37% of subjects were having inadequate practice and 63% were having adequate practice.. In our, the study also reveals the previous knowledge regarding AVF care about 47% patients were having previous knowledge and 57% were having no knowledge about AVF care. This indicates that maximum number of patients lack in knowledge of AV Fistula care. So there is need of providing knowledge regarding AVF care. The study also reveals that 74.42% patients got the information about AVF care from articles, 18.60% patients from the newspaper and 6.98% got the information from the television.

The study also reveals about the number of years on dialysis treatment, it shows that 8% of the patients had A.V. Fistula since last one year, 30% patients had A.V. Fistula since 2 years, 14% of patients have A.V. Fistula since 3 years and since last 4 years 29% had A.V. Fistula and since last 15% had AV Fistula since last 5 years. So the study indicates that maximum of patients have AV Fistula since 2 years as well as 4 years. Which indicates that there is need of implementing education about A.V Fistula care and its importance to reduce the complications and increase the compentancy of A.V. Fistula.

The result of our study suggested the need of introduction to A.V. Fistula care which help to improve the life style pattern of patients in long term. Appel et al stated that intervention from healthcare providers makes good sense, to help patients reduces the controllable AV fistula failure through proper lifestyle choices.

Conclusion

This chapter gives brief description of study as well as summary and the outcome of the study. It also gives appropriate implications and recommendations for further research study.

The main aim of the study was, to assess the knowledge and self reported practices regarding care

of Arterio Venous fistula among patients at selected haemodialysis units of Sangli city. The design used for the study was non experimental descriptive research design. The study was conducted at selected haemodialysis units of Sangli city. The Sample size of the study was 100 patients of Arterio Venous fistula.

The reliability of the tool was determined Split Half Method of Reliability, the tool was administered to 10 samples. Reliability of the knowledge tool was found to be 0.90 and for the practice tool was 0.82.

The pilot study was conducted, to assess the feasibility of the study and to decide the statistical analysis and practicability of research. It was found feasible.

Finding of the present study revealed that significant amount of patients were lacking the knowledge about A.V. Fistula care and proper implementation of healthy lifestyle.. Planning for implementation of knowledge regarding A.V. Fistuala care and its practices would be beneficial to the patients who are going under haemodialysis treatment for increasing the patency and reducing the complications of A.V.Fistula for reducing the life threatening conditions.

Implimentation of knowledge and self care practices would be beneficial to patients under haemodialysis treatment in many ways like it reduces the chances of A.V. Fistula failure,infection and any other severe life threatening conditions llike bursting of A.V. Fistula due to lack of knowledge and practice regarding taking care of it and its importance. Lifestyle pattern changes are recommended to all patients on haemodialysis treatement to reduce the risk factors and improve the patency of A.V. Fistula car study was done in selected hospital on a limited population to generalize the findings.

Conflict of Interest: Column is Nil.

Source of Funding: Self.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval prior permission from hospital and haemodailysis unit were taken. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr. Sripriya and Dr. Nilima Bhore mam.

A Study to Assess the Effectiveness of Topical Application of Honey on LSCS Wound Healing among Postnatal Mothers from Selected Maternity Hospitals of Sangli, Miraj and Kupwad Corporation Area

Priti D Khade[1], Archana Dhanawade[2]

[1]M.Sc Nursing, [2]Assistant Professor, Bharati Vidyapeeth (Deemed to be University) College of Nursing, Sangli

ABSTRACT

The LSCS wound healing was evaluated by using reeda scale to find the LSCS wound healing status among postnatal mothers who undergone LSCS. The intervention was exercised honey application on LSCS wound among postnatal mothers, 5ml twice in a day for 6 days to the subjects of experimental group. The reliability of the tool was determined by using inter-rater method on 10 samples with 6 days of interval. The reliability coefficient "r" was calculated by using Karl Pearson's coefficient formula, which was more than 0.7, hence the tool was found to be reliable.Also, the reputed and eminent 30 experts from the field related to study had validated the tool for its content, Quasi experimental research study was conducted during the month of August 2018 by selecting the 80 postnatal mothers 40 in each group of experimental and control. The subjects were selected by using non probability purposive sampling technique. Analysis was done using frequency and percentage distribution test.

Aim: To assess the condition of LSCS wound before application of honey &.To assess the effectiveness of honey application on LSCS wound healing.

Keywords: *Effectiveness, honey, L.S.C.S.wound, postnatal mothers*

Introduction

Child birth is end of the pregnancy by one or more babies exit a women's uterus by vaginal passage or LSCS. In 2012 about 23 million deliveries occurred by a surgical method recognised as LSCS.[1] Ensuring secure pregnancy and maternity occupies a pivoted responsibility and has been measured as one of the vital issues in the framework of reproductive and child birth programme. Support from study research denotes that there is rise for LSCS deliveries chiefly during complications confronted at the time of pregnancy and delivery.[2] Lower segment caesarean section is optional when vaginal delivery pose a possibility create hazard to the newborn or mother. Worldwide rise in LSCS rate during the previous three decades, source of alarm and request an in depth study. According to the new studies from Oct 2017-2018 over the phase of six months emergency LSCS (72.1%) and primary LSCS (66.5%) were added everday.The commonest sign for LSCS was previous LSCS in 35% followed by foetal distress, breech presentation, severe oligohydraminos and pre eclampsia.[3] Honey is a viscous, supersaturated sugar solution derivates from nectar gathered and customised by the honeybee and has been used since prehistoric period as a remedy in wound care.[4] Honey is non stained low price substance to be made up of CHO, water, pollens organic composite, enzymes and amino acid pigments having antibacterial and opposed to provocative skin texture.[5] The honey works on the body immunity. Honey thousands of years used to be concerned with innumerable harms like wounds and burns.[6]. It gives quick removal of damaged tissues and disinfects the wounds, and stimulated progress of wound tissues as a result of quick curative and initiates the

remedial course of action in resting wounds. Its rapidly decreases the pain.[8] The difference in local antiseptic solution and honey on the wound after the surgery showing the using applying of honey giving the fast result of wound healing; lessen hospital stay, size of the scar and the necessity for antibiotics.

Objectives

1. To assess the condition of LSCS wound before application of honey.
2. To assess the effectiveness of honey application on LSCS wound healing.

Material and Method

Quasi- experimental two group pre-test post-test design was directed to assess effect of honey on LSCS wound healing in selected maternity hospitals. 80 samples are choosed by using non-probability purposive sampling method. In experimental group, the wound dressing done by using honey, in control group simple dressing was used. A standardized REEDASCALE was used to assess the effect of honey application on LSCS wound. The study adopted modified Imogene king's goal attainment model for developing the conceptual framework of present study. Analysis was done using frequency and percentage distribution and't' test.

Hypothesis:

H0: There is no effect of application of honey on L.S.C.S. wound healing**.**

H1: There is effect of application of honey on L.S.C.S. wound healing.

Findings

Section I

Table I: Frequency and Percentage Distribution of Demographic Variables

(n = 40 + n = 40)

Sr. No.	Variable		Experimental		Control	
			Frequency	Percentage	Frequency	Percentage
1	Age in years	Below 20yrs	3	7.50	2	5.00
		21-25yrs	19	47.50	20	50.00
		26-30yrs	17	42.50	17	42.50
		above 30yrs	1	2.50	1	2.50
2	Gravida	Primi	17	42.50	20	50.00
		Multi	23	57.50	20	50.00
3	Diet Pattern	Mixed	22	55.00	22	55.00
		Veg	18	45.00	18	45.00
4	Income	up to Rs. 10000	5	12.50	3	7.50
		Rs.10001-20000	28	70.00	26	65.00
		Rs.20001-30000	7	17.50	11	27.50
5	Weight	46-55kg	12	30.00	11	27.50
		56-65kg	19	47.50	28	70.00
		66-75kg	9	22.50	1	2.50

1. **AGE:** According to the age in the study, highest number of samples i.e.47.50% are from experimental group belongs to age group of 21-25 yrs. Whereas 50% are from control group belongs to age group of 21-25 years.
2. **GRAVIDA:** According to the Gravida in the study, highest numbers of samples i.e. 57.50% from Experimental group are multigravida whereas 50% samples from control group are Primi.

3. **DIET:** According to the diet in the study, highest numbers of samples i.e.55% from experimental group are having mixed diet whereas 55% samples from control group having mixed diet.
4. **INCOME:** According to the income in the study, maximum numbers of samples i.e.70% from experimental group are having 10001-20000 income per month whereas 65% samples from control group having 10001-20000 income per month.
5. **WEIGHT:** According to the weight in the study, maximum numbers of the samples i.e.47.50% from experimental group having 56-65kg weight whereas 70% samples from control group having 56-65kg.

Section II

Table 2: Condition of LSCS Wound Healing between Experimental and Control Group

(n = 40 + n = 40)

Experimental Group					
Group	**Frequency**	**Mean**	**S.D.**	**t value**	**P value**
Day 1	40	12.65	0.89	43.91	0.000
Day 6	40	4.45	0.87		
Control Group					
Group	**Frequency**	**Mean**	**S.D.**	**t value**	**P value**
Day 1	40	12.40	0.90	25.85	0.000
Day 6	40	8.32	1.07		

Above table shows that the comparison of the LSCS wound healing score of the day 1 and day 6 of experimental and control group was done by the paired t test.

In experimental group day 1 score was 12.65 with SD of 0.89 and day 6 score was 4.45 with SD 0.87. The value of the paired t test was 43.91 with p value 0.000.

In control group day 1 score was 12.40 with SD 0.90 and day 6 score was 8.32 with SD 1.07.The value of the paired t test was 25.85 with p value 0.000.shows that there was significant difference in the average LSCS wound healing score, at 5% level of significant.

Section III

Table 3: Assessment of the Condition of L.S.C.S. Wound Healin before and After Application of Honey

(n = 40 + n = 40)

Experimental Group		Day 1		Day 6	
Healing Score		**Frequency**	**Percentage**	**Frequency**	**Percentage**
Good	0-5	0	0.00	37	92.50
Medium	6-10.	0	0.00	3	7.50
Raw	11-15.	40	100.00	0	0.00

Control Group		Day 1		Day 6	
Healing Score		**Frequency**	**Percentage**	**Frequency**	**Percentage**
Good	0-5	0	0.00	0	0.00
Medium	6-10.	0	0.00	39	97.50
Raw	11-15.	40	100.00	1	2.50

The above table shows that, according to the state of LSCS wound healing before and after application of honey, before application in experimental group all 100% were in raw healing category. And after administration

of honey, 7.50% were in medium healing condition and 92.50% in the good healing category.

In control group LSCS wound healing on day 1without administration of honey all 100% in raw healing category and on 6th day 97.50% in medium healing condition and2.50% in raw healing category.

Conclusion

The study was conducted to evaluate the effectiveness of topical application of honey on LSCS wound healing among postnatal mothers. Samples selected in the study were postnatal mothers with LSCS wound. The result shows that honey application on LSCS wound is proven to be an effective on healing of LSCS wound. Analysis of data showed that there was a significant difference between the control group and experimental group.

The quasi experimental design was used and 2 groups were included for this study, experimental and control group. Pre and post test was done for both groups. Each group has 30 samples. The samples were selected on the basis of the sampling criteria set for the study.Pre-test was done before intervention in both the groups, then post intervention was done to evaluate the effect of honey on LSCS wound.

Based on objective and the hypothesis, the collected data was analysed by using descriptive and inferential statistics and the t test was used to find the significance.

Honey is effectiveness on LSCS wound healing and statistically findings shows that it is significant difference in the experimental and control group. Hence it is concluded that there is significant effect of honey on LSCS wound healing among postnatal mothers.

A Study to Assess the Level of Burden and Coping Strategies among Caregivers of Patient with Affective Disorders at Selected Hospitals of Sangli, Miraj, Kupwad Corporation Area

Ramesh Giramalla Honamore[1], Narayan K Ghorpade[2]

[1]M.Sc. Nursing, [2]Assistant Professor, Bharati Vidyapeeth (Deemed to be University), College of Nursing, Sangli

ABSTRACT

Introduction: Interactions with caregivers of patients with severe mental illness like schizophrenia and bipolar affective disorder have revealed negative feelings about the disability status of their relative and burden related to caring for their relative with mental illness. Many caregivers have expressed that the patient's disability status affects the family pattern, roles of family members, prosperity of the family and relationship among the family members. Patient outcome and compliance with treatment are also dependent on optimal care giving and addressing family's needs. Unfortunately these needs are not routinely considered, addressed or met. Addressing the burden perceived by caregiver and improving their coping can assist with good clinical care of patients with severe mental illness and hence these study to assess the burden perceived by caregiver and their coping[6].

Objectives: 1. To assess the levels of Burden among care givers of patients with affective disorders. 2.To assess the coping strategies among the caregivers of patients with affective disorders.

Materials and Method: The researcher used quantitative research approach to assess burden and coping strategies. The research design was descriptive research design. The tool reliability coefficient 'r' of the scale was 0.7, hence it was found reliable. Total 120 samples were selected by non Probability convenient sampling technique. Total two scale namely Zarit burden interview and Rating scale for assessing coping strategies to collect data. The conceptual framework adopted is Sr.Calista Roy's adaptation model(1984) the main concept of this conceptual framework is human being, stimuli, adaptation models and nursing.

Results and Conclusion: In this study found the level burden among the care givers of affective disorders patients have experienced 60(50%)were had moderate to severe level of burden,29(24.17%) were had severe burden, 13(10.83) were had no or little burden and 18(15%) were had mild to moderate burden and levels of coping strategies among care givers, 19(15.83%) were had moderately adequate coping strategies, 93(77.50%) were had adequate coping strategies and 08(6.67%) were had inadequate coping strategies.

Keywords: *Care giver, Burden, Coping strategies*

Introduction

In 1896, Kraeplin according 'manic-depressive psychoses' as a circumscribed illness entity. Ever since, frenzied depressive mental disease, or the present term used nosologically as 'bipolar' mood disorder, has been studied within the Indian perspective. The mood disorders are commonly known as affective disorders. Broadly speaking, the emotions can be described as two main types Affect which is a short-lived emotional response to an idea or an event, and Mood, which is a sustained and pervasive emotional response which colors the whole psychic life[1].Caregivers of patients of schizophrenic disorder and bipolar major affective disorder (BAD) expertise appreciable burden whereas caring their patients. They develop totally different cope methods to cope with this burden. Care giving is a chronic stressor and different

Email: nkghorpade@gmail.com

coping methods are used to handle such a situation. The present study attempts to assess coping in caregivers of Chronic Schizophrenia and Bipolar Affective Disorder and make a comparison between them. The study also tries to assess the relationship between the burdens experienced by the caregivers of both these groups of patients with the coping strategies adopted by them. It was a hospital based cross sectional and comparative study, conducted in the Department of Psychiatry, Assam Medical College and Hospital with a sample size of 30 primary caregivers of equal number of patients of Chronic Schizophrenia and 30 Primary caregivers of equal number of Bipolar Affective Disorder patients. Appropriate statistical tests were used for analysis of obtained data setting significance threshold at p coping (90%) followed by external attribution and magical thinking. Among the caregivers of patients of BPAD the most commonly used coping strategies included help seeking (93.33%) followed by religious coping strategies and external attribution[2].

Materials and Method

The researcher used quantitative research approach to assess burden and coping strategies. The research design was descriptive research design. The tool reliability coefficient 'r' of the scale was 0.7, hence it was found reliable. Total 120 samples were selected by non Probability convenient sampling technique. Total two scale used namely Zarit burden interview and Rating scale for assessing coping strategies to collect data. The conceptual framework adopted is Sr.Calista Roy's adaptation model(1984) the main concept of this conceptual framework is human being, stimuli, adaptation models and nursing.

Assumption 1: The caregivers of affective disorders patients may experience some level of burden 2. The caregivers of affective disorders patients may use some coping strategies.

Results

Section I: Deals with analysis of data related to assessment of the level of burden among care givers in terms of frequency, percentage.

Table 1: Classification of respondents based on levels of burden among care givers of affective disorders

N = 120

Sr. No.	Level of Burden	Score	Frequency	Percentage %
1.	No or little burden	0-20	13	10.83%
2.	Mild to moderate burden	21-40	18	15%
3.	Moderate to severe burden	41-60	60	50%
4.	Severe Burden	61-88	29	24.17%

The above table describes the levels of burden among care givers of affective disorders, 60(50%) were had moderate to severe burden, 29(24.17%) were had severe burden, 13(10.83%) were had no or little burden and 18(15%) were had mild to moderate burden.

Section II: Deals with analysis of data related to assessment thecoping strategies among care givers of affective disorders patients in terms of frequency and percentage.

Table 2: Classification of respondents based on coping strategies among care givers of affective disorders

N = 120

Sr. No.	Strategies	Score	Frequency	Percentage %
1.	Inadequate coping strategies	01-24	08	6.67%
2.	Moderately adequate coping strategies	25-50	19	15.83%
3.	Adequate coping strategies	51-75	93	77.50%

The above table describes the coping strategies among care givers, 19(15.83%) were had moderately adequate coping strategies, 93(77.50%) were had adequate coping strategies and 08(6.67%) were had inadequate coping strategies.

Discussion

The study was descriptive in nature and the population taken for the study was of a low socioeconomic status. An Exploratory study to assess the level of burden and coping strategies among caregivers of patients with affective disorder at selected hospitals of sangli miraj kupwad corporation area.The findings of the study have been discussed with reference to objective and assumption.

Discussion regarding demographic variables: Majority of the caregivers, 30(25%) were between 31-35 years. The majority of care givers were 70(58.30%) were females. With regard to religion, 80(66.7%) were Hindus. Majority 69(57.5%) were graduates. With regard to monthly income, 50(41.66%) were had Rs. 10000 -15000 income per month. In relation to the type of family, 80(66.70%) were from joint family. With regard to duration of care giving, majority 40(33.33%) were giving for 1 to 3 years, In relation to the care givers relationship, 30(25%) were fathers, 30(25%) were son.

Objective 1: To assesses the levels of Burden among care givers of patients with affective disorders: The study reveals that the majority caregivers of affective disorders patient 60(50%) were had moderate to severe burden, 29(24.17%) were had severe burden, 13(10.83%) were had no or little burden and 18(15%) were had mild to moderate burden.

Objective 2: To assesses the coping strategies among the caregivers of patients with affective disorders: The coping strategies among care givers, 19(15.83%) were had moderately adequate coping strategies, 93(77.50%) were had adequate coping strategies and 08(6.67%) had inadequate coping strategies.

Conclusion

This chapter deals with the conclusion, implication, recommendation and data collected from 120 individual samples regarding the level of of burden and coping strategies among care givers of affective disorders. The data was collected by using the Zarit burden Interview and Rating scale for assessing coping strategies. The study was conducted at selected hospitals, Sangli and Miraj,kupwad corporation area. The data analysis was done by descriptive and inferential statistics. The findings of the study are as follows; The study reveals that the care givers of affective disorders patients was 60(50%) were had moderate to severe levels of burden, 29(24.17%) were had severe burden, 13(10.83%) were had no or little burden and 18(15%) were had mild to moderate burden. The mean percentage score was 54.71 with mean and standard deviation of 48.15 ± 2.75. The coping strategies among care givers of affective disorder using 19(15.83%) were had moderately adequate coping strategies, 93(77.50%) were using adequate coping strategies and 08(6.67%) were using inadequate coping strategies.

Factors Affecting Awareness and Perception of Youth Regarding the Public Health and Hygiene Related Campaigns though Social Marketing

Roktim Sarmah[1], Dheeraj Nim[1]

[1]*Associate Professor, Mittal School of Business, Lovely Professional University, Phagwara, Punjab, India*

ABSTRACT

Social Marketing is a universally beneficial relationship between a corporation and a non-profit activity intended to promote the former's sales and the latter's cause. It links economic or in-kind donations to product sales or other consumer action. One of the interesting facts about Marketing which is Social Marketing is the way it connects with corporate level of giving to consumers. Because of this, the Social Marketing initiatives involve agreements in detail and also need to coordinate with non-profit partners involving some important activities like establishing specific advertising offers, developing co-branded campaigns.The aim of this study is to analyze Awareness and Perception of youth regarding the Social Marketing campaigns. Five of the most popular and well known Social Marketing campaigns are shortlisted for conducting the study on the basis of focus group discussions. The campaigns selected are "Say No To Drugs", "Wear a Helmet", "Swatch Bharat Abhiyan", "Tubecolosis" and "Usage of Sanitary Pad". Factor analysis is used to find out the most important factors affecting the Social Marketing. Identified factors show that there is both favourable and unfavourable response when it comes to being aware about Social Marketing.

Keywords: *Social Marketing, Awareness, Perception, Youth.*

Introduction

It is generally acknowledged that Social Marketing is a specialized apparatus for expanding customer loyalty and building brand reputation. The normal change in an organization's picture on account of CRM crusades seems to rely upon a lot upon how customers see the explanations behind an organization's association in Social Marketing projects and the measure of assistance given to the reason through an organization's inclusion[1]. Consumers with a high level of disbelief will be less likely to respond positively to various CRM campaigns as compared to consumers with a low level of distrust.

"Social Marketing is the process of formulating and implementing Marketing activities that are characterized by an offer from the firm to contribute a specific amount to a designated cause when customers engage in revenue providing exchanges that satisfy organisational and individual objectives"[1].

Social Marketing campaigns are formed from various campaigns regarding the social advertisement and their perception and awareness among youth. These include the product featured in any campaigns, the donation promised to be given and the donation received. Government of India and private agencies are running various campaign related to social cause such as "Say No To Drugs","Wear a Helmet", "Swatch Bharat Abhiyan", "Tubecolosis" and "Use of Sanitary Pads".

Literature Review

A cross-sectional survey was applied, with stratification and non-probability, implying both computers as well as paper and pen method to conduct the survey. Findings showed that the target audience was well exposed to the anti-smoking advertisements and not only this but they said that it helps them in the long run in lessening smoking by inculcating more initiatives among youth to quit smoking[2]. Ajike *et al*. (2016)[3] found that there was a significant relationship between green Marketing and consumer buying behavior of fast moving consumer goods in Lagos State.. The study thus recommended that for green products, emphasis

should be placed on pricing strategy in a synergistic manner. Debbie. H (2016)[4] concluded that, within the Social Marketing study arena, product involvement and donation recipient specificity have received limited attention. The previous donation expression format and donation scale findings have been vague and indicative that their effect often occurs in collaboration with other elements. Findings from study[5] showed that Digital India campaign has a visible awareness among youth mainly because of their television broadcasting, followed by Swatch Bharat Abhiyan while the least popular came out to be Tubecolosis campaign. Singh & Rai (2016)[6] found that students were being aware of the Marketing which were telecasted frequently. Also the respondents said that the campaigns in which contribution through purchase is not required are better Social Marketing strategies. Bina (2015)[7] said that research should be done in the field of various elements of Social Marketing strategies. He concluded that Social Marketing has good influence on consumer buying behavior. Choudhary & Ghai (2014)[8] found out that Social Marketing, if done rightly, works as a great differentiator in FMCG as there are so many similar offerings in the market. A well rated & effectively communicated cause Marketing campaign creates a positive impact on buying behavior of the young consumers in favor of the brand. Shah (2013)[9] pointed out that people tend to attract to those companies which dwell with cause- related Marketing. He gave the example that customers will be interested towards those companies which do charity or do research for the societal cause. Mir & Thokar (2013)[10] concluded that consumer purchase intentions are influenced by the charity with Social Marketing campaigns. Correlation and regression analysis was used to test the key hypothesis derived from literature of positioning, brand awareness and charity in connection with the relationship between CRM and purchase intentions. Cheron (2012)[11] found a high brand-cause Marketing efficiency. Japanese female plaintiffs were showing more positive attitudes as parallel to men, endorsing results in previous research lessons conducted in the West. Previous participation in philanthropic activities was also found to increase positive attitudes especially when it comes to brand-cause fit and duration were high. Hunjra et al. (2011)[12] concluded that the Social Marketing campaigns have positive influence on the sale activities of companies. This linkage is also intermediated by product loyalty and buyer purchase intention that ultimately have optimistic effect on auctions. Murukutla (2011)[13] showcased that campaign affected smokeless tobacco users as follows: 63% of smokeless-only users and 72% of dual users (i.e., those who consumed both smoking and smokeless forms) recalled the campaign advertisement, primarily through television delivery. The vast majority (over 70%) of those aware of the campaign said that it made them stop and think and was relevant to their lives and provided new information. Campaign awareness was associated with better knowledge, more negative attitudes towards smokeless tobacco and greater cessation-oriented intentions and behaviors among smokeless tobacco users.

Research Methodology

Sampling Procedure and Participants: The sample of this study involves the students studying in a large Private Indian University (Lovely Professional University, Punjab). Random sampling technique was used for data collection from the respondents. Youth in the age group of 16-35 were taken as target audience in order to study their awareness and perception of regarding the Social Marketing campaigns. Among the vast population of youth a sample size of 600 was taken for the study. The participation of the respondents was entirely voluntary.

Instrumentation & Measurement: Objectives of the research were achieved using a structured questionnaire. The questionnaire was divided into two sections. First part of the questionnaire comprises of questions about the demographic and psychographic characteristics of the respondents related to participant's gender, age, nationality, education. Second part of the questionnaire was designed to measure the awareness towards different social causes by asking respondents to rank these social causes in order of their preference in a similar way as used by Maheshwari & Suresh (2013)[14]. Open ended questions were also asked in this section to know about the reason for the recall of these campaigns individually. The secondary data was also collected from various sources like published articles, research papers, business magazines, journals, periodicals and internet etc.

Selecting Social Marketing Campaigns: In the first phase of the research a focus group discussion was conducted and data was collected from 37 respondents aged between 16 to 35 years having awareness about Social Marketing campaigns being aired by government (NGO) agencies, both state and central and private companies. The main purpose of this focus group was

to generate a pool of cause related causes that could be used for further use.

Before running the whole data analysis sample size conducting a pilot study is important[15]. The same has been done. Say No To Drugs",“Wear a Helmet", “Swatch Bharat Abhiyan", “Tubecolosis" and “Use of Sanitary Pads".

Results and Discussion

Reliability Statistics

Table 1: Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
0.648	0.784	13

The data has a Cronbach's alpha of 0.648. This shows that our data is reliable enough to proceed with factor analysis.

Awareness about Social Marketing Campaigns: According to the study, out of 600 respondents which were surveyed the majority of the respondents were male accounting for 54.3% compared to the females which are 44.7%. Further the age group which showed major interest in filling the questionnaire was between 21-25 followed by the age group (16-20), (26-30), (31-35) respectively. The age group (21-25) accounted 69.4 % of the total 600 respondents.

Factors Affecting Youths Awareness Related to Social Marketing Campaigns

Table 2: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.877
Bartlett's Test of Sphericity	Approx. Chi-Square	2679.177
	Df	253
	Sig.	0.000

From KMO and Bartlett's Table, it can be observed that the KMO registered a 0.877 sampling adequacy. This value strongly suggests that the use of factor analysis is appropriate. KMO and Bartlett's Test of Sphericity both indicate that the set of variables are at least adequately related for factor analysis.

Table 3: Total Variance Explained

Component	Initial Eigen values			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.194	22.582	22.582	5.194	22.582	22.582

22	.421	1.832	98.329			
23	.384	1.671	100.000			

Based on the component matrix the 6 factors and the variables comprised under each factor are stated below:

Table 4: Factor Table

Factors	Variables	Factors Loading
Favorable response of youth awareness towards Cause- related Marketing	These campaigns makes me more aware and learned about Social Marketing	0.695
	Social Marketing provides vast knowledge to me	0.609
Favorable perception of youth towards Social Marketing	The ongoing Social Marketingcampaigns are really popular among youths	0.591
	I believe the ongoing campaigns are benefitting the youths of the country	0.668
Unfavorable awareness and perception towards Cause-related Marketing	The Concept of Social Marketing sounds irrelevant to me	0.521
	I connect mostly through internet and social media	0.625
Product & Price affects perception towards Social Marketing	There must be synchronization between product and campaign	0.709
	Products involved in Social Marketing plays a major role in affecting the perception towards campaigns	0.751
Nature of campaigns a sensitive decisive factor	Free of cost campaigns related to societal causes affects me emotionally	0.505
	Irrespective of the price, product itself and the nature of the campaigns are the decisive factors for me	0.581
Cost of campaigns a decisive factor	Utilization of money at the right place with authenticity of the same is important to me	0.594
	Luxury goods are the most irrelevant inclusion in Social Marketing	0.593

Findings

1. Looking into the awareness of the respective campaigns Say No To Drugs with 87.7% and Swachh Bharat Abhiyan with 87.2% lies in the most popular campaigns followed by Tubecolosis with 81.7% of the respondents being aware about the same
2. Research also reveal that respondents are aware about the government run campaigns more rather than the private run campaigns, as we can see the private campaigns like use of Sanitary Pads has only 22.6% of the awareness while when compared to the govt. run campaign of Swachh Bharat Abhiyan.It is hugely lacking behind as it's not even has covered half of the respondents unlike Swachh Bharat Abhiyan which has covered 87.2% of the respondents.
3. Some identified factors show that there is both favorable and unfavorable response when it comes to being aware about Social Marketing or about the perception of the same. Favorable responses are related to getting vast knowledge through said campaigns and unfavorable responses are like Social Marketing is irrelevant to them.

Recommendations

1. Study showed that most of the youths are being aware by watching commercials on T.V and are aware about Social Marketing campaigns.

However campaigns being run by Private brands are less popular and respondents were not much aware about it, so in order to increase the awareness of these campaigns the private brands should focus more on youth's centricity awareness strategies by incorporating those factors which grabs youth's attention and urges them to know about the cause as well as the campaigns.

2. It is also noticeable from the responses that there is not much concern about the money involved in these campaigns the respondents often finds it a hoax by the private brands as they see these campaigns majorly as another Marketing gimmick. So in order to change the perception of most of the youth's brands require gain the trust of the youths by displaying results and showing the effects of their campaigns in the society not merely through commercials and advertisements but also by providing a real world feel of the change that these campaigns brings.

3. It is also analyzed that Wear a Helmet by Govt. of India is the campaign about which most of the respondents is having awareness. As Govt. of India is spending good amount on promotions to make people aware about the campaign by providing in-depth information in the form of presenting message behind the campaign in subtle manner, catchy slogan and there is a visible effect in the society of the same winning trust of the youths. Survey also reveals that the respondents are loyal towards the campaigns which had a visible effect on the betterment of the society and therefore they are more inclined towards the Govt. campaigns. Even a hint of selfishness or personal excelling motive in such campaigns can turn the campaigns into a failure as causes related to society are everybody's everyday problems and hence they are really sensitive towards the same.

4. Research also indicated that youths are highly affected by the synchronization of the product and campaigns many a times they showed negative response as they were unable to find a sync between the two and hence they withdrawn themselves completely from the campaigns. It is henceforth advisable for strategizing a clear sync between product and campaign in order to attract the youth and convey the Social Marketing to them.

Three Stepped Approach to Screening of Cervical and Breast Cancer among Rural Women

Asha K. Pratinidhi[1], Radhika Joshi[2], Vaishali Vhawal[2], Pandurang Chougule[3], Sunita Tata[4], Satish Kakade[1]

[1]Department of Community Medicine, [2]Department of Obstetrics and Gynecology, [3]Department of Surgery, Krishna Institute of Medical Sciences, Karad (Maharashtra) India, [4]Director of Nursing Services, Krishna Hospital and Medical Research Centre, Karad (Maharashtra) India

ABSTRACT

Introduction: Screening of cervix and breast cancer is not considered a routine activity at PHCs.

Aim and Objectives: To study a three-stepped approach of creating awareness, train ANMs while screening and possibly continue educational and screening activity after withdrawing the mobile team.

Material and Method: A mobile team at KIMS deemed to be University, Karad, Maharashtra was formed of specialists from concerned faculties. Four PHCs were randomly selected from the Satara district. Three selected ASHA workers motivated fifty women >30 years to attend camp at PHC on a prefixed date. Pre-training and post-training assessments of knowledge among women and health care workers, training of two ANMs and Medical Officer per PHC in cervical and breast cancer screenings by VIA, VILI, and CBE respectively while screening was done by the mobile team during intensive weekly activity of three months at each PHC. After withdrawal of the team, PHCs were visited to see continuity of educational and screening activities.

Results: Of 1440 women motivated by 12 ASHA workers from 4 PHCs, 1037 attended awareness programme and 430 got screened. Of the 37 VIA positive and 17 lump in breast cases identified, one cervical and two breast cancers confirmed cases were managed. Nonsurgical treatment was given there. Out of four PHCs, the activity of education and screening was continued satisfactorily at two, sporadically at one and absent at one PHC.

Conclusion: There was significant improvement in knowledge scores of community and health-care workers after the awareness programme. The ANMs could be trained in screening cervical and breast cancer. Education and screening activities continued after one year of withdrawal of the mobile team in 50% of PHCs. An entire district should be studied to find possible solutions of screening cervical and breast cancer as routine activities at PHCs after this pilot project.

Keywords: *Cervical Cancer, Breast Cancer, Colposcopy*

Introduction

Mortality due to cancer is very high in India due to late detection of cancers. Incidence and mortality due to cervical and breast cancer are very high and rank first two sights of cancers among women [1, 2]. The screening tests are available for early diagnosis of both sights of cancers and are routinely used in the developed world and in urban hospital settings in India. In spite of equally high prevalence of cancer in urban and rural areas, no routine screening is undertaken for rural women in Rural Hospitals (RH) or at Primary Health Centers (PHCs). About 70% population of India resides in rural areas where the opportunity to screen the women for cervical and breast cancer is lost only because the health care workers at PHCs do not have the skill for screening and the rural women are ignorant about the possibility of screening and adverse outcome related to late diagnosis of cancer. The rural women rarely come forward on

Krishna Institute of Medical Sciences,
Karad-415110 (Maharashtra) India

their own for screening of breast or cervical cancer and diagnosis of cancer in rural women is often very late and the cancer is too advanced for the life saving interventions.

A strategy of three stepped approach i.e. step I health education of rural women, step II training of health care workers by a mobile team of experts to impart skill of screening of cervical and breast cancer while screening the women above the age of 30 years and step III referral of suspected cases for appropriate management were therefore planned and tried.

Material and Method

Four PHCs namely Kale, Masur, Kole and Umbraj were randomly selected from 11 PHCs of Karad Taluka. Permission from Directorate of Health Services was obtained and the visit schedule of twelve serial weekly visits to each PHC was planned. A mobile team was formed of the specialists from Obstetrics and Gynecology, Community Medicine, resident surgeon and nursing superintendant.

From all available screening tests, tests to be used in the project were identified taking into consideration the efficacy, availability, feasibility, affordability and ease of carrying them out at PHC level. Visual Inspection after application of 5% acetic acid (VIA), Visual Inspection after application of Lugol's Iodine (VILI) and taking of PAP smear were identified as screening tests for cervical cancer screening. For cancer breast, thorough Clinical Breast Examination (CBE) was decided as a screening test.

Three ASHA workers were randomly identified as field level workers; two ANMs were appointed under the project for coordination of the activities and data collection of the project in addition to two ANMs working at each of four PHCs. ASHAs would pay home visits in their respective areas, identify the women above 30 years of age and motivate them to attend the awareness and screening camps organized on specific day of the week at the PHC where they were working.

During every visit to the PHC by the mobile team, pre training questionnaire was filled for HCW and women gathered for the camp. Awareness of women folk was undertaken followed by screening and hands on training of the Medical Officer (MO) and two ANMs designated by the MO of the PHC. Using same questionnaire post tests knowledge scores were determined after 15 days of awareness programme for HCWs as well as women beneficiaries of the camp.

During first visit to the PHC, the standard procedure of VIA and VILI was explained [3] and demonstrated on subjects after seeking their informed consent and giving attention to privacy and confidentiality. Instructions about keeping the place of examination ready, making the instruments including Cusco's speculum sterile and available, preparing 5 % acetic acid from the glacial acetic acid were given and availability of Lugol's Iodine was ensured. Similarly the standard procedure of CBE namely inspection in three positions and palpation of breast and lymph nodes was explained and demonstrated taking care of privacy and confidentiality after informed consent of the women.

From second visit onwards hands on training was undertaken while screening of beneficiaries was done by the specialists. During every visit to the PHCs awareness of women folk followed by screening and hands on training was undertaken. The MO was suggested to keep designated day of the week as "Cancer Detection Clinic Day" and to continue activity of screening after the withdrawal of mobile team.

The project was financially supported from the KIMSDU. Clearance from Institutional Ethics Committee was obtained before commencement of the project. After completion of all twelve visits to each of four selected PHCs, a follow up round of visits was done to know the status of continued cancer detection activities and to give boost to the screening activity by the ANMs under the guidance of MOs.

Results

About 1000 population was covered by each ASHA worker; and there were about 180 women more than 30 years of age. About 50 women were called for the awareness programme at the time of PHC visit by the mobile team from KIMS. The expected attendance of women $\geq$ 30 years at the PHCs was 1440. The attendance for awareness programme was between 20 to 30 women (40 to 60%). Out of them 10 to 12 (20 to 25%) women were ready to get examined themselves immediately after the awareness programme. A total of 430 (41.5%) women above the age of 30 years were examined out of 1037 women attending the awareness programme. There was a significant improvement of knowledge score in

both HCW and women attending the camp. The mean age of 430 women screened was 38.4 ± 8.0 years and average number of children born to them were 2.4 and 14 (3.3%) were nulliporous. The profile of the women who could be screened was as follows.

Table 1: Martial status of 430 women screened

	Frequency	%
Married and staying with their husbands	393	91.4
Widows	34	7.9
Separated/Divorcee	03	0.7

There were 39(9.1%) women VIA/VILI positive and 17(4%) women were detected as having lump in the breast. Pap smear was taken for 210 (48.8%) women.

Table 2: The Pap smear cytology results (TBS 2001)

Histopathological findings	Frequency	%
NILM	202	12.4
ASCUS	04	01.9
LSIL	04	01.9
Total	210	100

NILM: Negative for Intraepithelial Lesion or Malignancy ASCUS: Atypical Squamous Cells of Undetermined Significance, LSIL: Low Grade Squamous Intraepithelial Lesion

Calposcopy was done on 99 women at primary centre by the mobile team. Their colposcopic findings were as follows

Table 3: Colposcopic findings of suspected cases at PHCs

Colposcopic findings	Frequency	%
Normal	63	63.6
Ectopy	09	09.1
CIN	12	12.1
Unsatisfactory	10	10.1
Atrophy	05	05.1
Total	99	100

CIN: Cervical Intraepithelial Neoplasia

All 99 cases undergoing calposcopy were VIA positives. Twelve of them were positive for precancerous lesions by calposcopy.

Table 4: Signs and symptoms present among 430 women screened

Associated findings	Frequency	%
Backache	199	46.3
Leucorrhoea	85	19.8
Abdominal pain	75	17.4
Irregular Menstruation	63	14.7
DUB	28	6.5
Uterine prolapsed	17	4.0
Infertility	14	3.3
Uterine Cervical Polyp	4	0.9
Uterine fibroid	3	0.7
Total	488	100

DUB: Dysfunctional Uterine Bleeding

There were 52 (12.1 %) women who did not have any symptom and on vaginal examination were clinically normal. Number of signs and symptoms were more than one in 60% women. Out of 85 patients in need of management, 12 were suspected cases of cancer cervix and 17 suspected cases of cancer breast, 49(57%) were treated for infection, and 10 had surgery for associated findings not related to cancer cervix like fibriod, polyp, prolapse. Four underwent Loop Electrical Excision Procedure (LEEP), four were treated with cryo cauterization for precancerous lesions and one received chemotherapy. Thus, out of 12 suspected cases of cancer cervix, 8 were precancerous lesions and were treated with excision or ablation and one was treated with chemotherapy for cervical cancer. Three cases were lost for follow up. Out of 17 suspected cases of breast cancer 2(11.2%) were identified as breast cancer and underwent appropriate management and remaining were benign lesions. Two were operated for breast cancer. Out of four PHCs in two centres, the activity of screening was continued satisfactorily, at one centre the activity was not up to the mark and at one centre it was totally absent where the MO was on the long leave.

Discussion

Cancer of cervix and the cancer of breast are best suited for early detection as both sites are accessible; cancer begins as localized lesion after a long period of existence of pre malignant lesions which can be identified by the screening tests.

Screening for cervical cancer by PAP smear is an accepted clinical practice, which requires laboratory

equipments and trained personnel. VIA and VILI are alternative screening tests which are equally effective and sensitive which are less expensive, easy to carry out and the skill can be easily transferred to healthcare workers [4].

SBE, CBE, Mammography, Ultrasonography and thermography are tried for screening of breast cancer. Mammography is the most sensitive and specific method but there is risk of exposure to radiation which is manifold more than the dose received by chest X-ray and increases the risk of development of breast cancer itself [5]. Secondly it requires an equipment of high standard and an experienced radiologist for its interpretation which increases the cost of screening. It may lead to the increased number of biopsies of suspicious lesions with a high possibility of false positive results. Thermography is not associated with radiation exposure but the sensitivity is low [6].

American College of Obstetricians recommended both SBE and CBE. Cochrane review on self breast examination has revealed that SBE has no impact on cancer mortality. There can be poor compliance with follow up and increased number of biopsies performed on benign lesions [7].

In rural India, the women are illiterate and may not be able to learn correct technique of self breast examination. CBE if carried out carefully giving attention to technique and thoroughness may be an effective screening tool. Although no trials are available for comparing CBE alone to no screening but Canadian National Breast Screening Study-2 (CNBSS-2) [8] included randomized screening of 39405 women aged 50-59 years in two groups. Group one was CBE alone and the second group was CBE with mammography. No mortality advantages was seen when mammography was added to annual standardized 10-15 minute breast examination implying that careful CBE may be effective as mammography. Thus for screening of women from rural areas for cancer breast and cancer cervix in developing countries like India at PHCs constrains are with limited resources and skilled manpower. This project can be considered as a pilot project. CBE, VIA and VILI could be considered as appropriate screening tests.

Step I of the strategy was imparting knowledge about cancer of breast and cervix to HCW and women attending the camps. Awareness programme conducted for about 30 women at a time with audiovisual aids resulted in a significant improvement in knowledge scores in both. The women could understand the role of known risk factors like age of women at marriage, early marriage, and possibility of infection with HPV due to multiple sex partners, early menarche, multiparity and lack of cleanliness during menstruation and delivery for cervical cancer as well as family history, age, nulliparity, early menarche and late menopause, high fat diet and obesity, exposure to radiation for breast cancer as risk factors.

The motivation to get themselves screened due to awareness generation was evident by acceptance of screening by 430 (41.50%) women out of 1037 women attending the camp.

Step II was skill transfer. Four MO and 8 ANMs could be trained by mobile team with twelve weekly visits. Out of four PHCs, two PHC continued awareness activity, screening and referral proactively, one PHC was carrying out the activities but did it passively, i.e.; only those women > 30 years who attended the PHC for any reason were screened and referred and at one PHC, no activity related cancer detection was going on where MO was on long leave after end of year of the project. There is a scope for improvement. Now all MOs and ANMs are trained under the cancer component of non-communicable disease control programme. If the MO as a team leader is motivated and ensures the availability of acetic acid and Lugol's iodine, charts are prepared and displayed at the PHCs, field level staff during their routine home visits or for any other health related activity motivates the women above 30 years to come to PHC on a fixed day of week for awareness and screening activity at least 30-40% of the women will get benefit of early diagnosis of cancer cervix and cancer breast.

At present screening for cervical cancer at PHCs is undertaken sporadically as a special health camp in some places near about specialized centres or cancer hospitals but not routinely done as an ongoing activity on a fixed day as cancer detection clinic. There is a possibility of implementing this, three stepped approach in all PHCs for primary and secondary prevention of breast cancer and cervical cancer at PHCs for the rural population by making it as a routine activity of the PHC may be once in a week, once in a fortnight or once in a month.

There are medical colleges public or private in almost all districts of Maharashtra. If advantage is taken

of the expertise of these medical colleges under NCD programme, it will go a long way in preventing and down staging the two most common sites of cancers in females.

Single-Visit versus Dual-Visit Endodontics— A Comparative Study

Sanjay M Londhe SM[1], Sonali Sharma[2], Sheetal Lal[3]

[1]Director General Dental Services, PHDS and Col Comdt AD Corp. Room No 11, L Block, Adjutant General's Branch, IHQ of MOD (Army) New Delhi, [2]Professor and Classified Specialist Conservative Dentistry and Endodontics, Army Dental Centre R and R, Delhi, [3]Dental Officer Ex AD Corps

ABSTRACT

Traditionally root canal treatment was completed in multiple visits so as to eradicate microorganisms and maintain sterility of prepared canals. Currently evidence based studies have shown that there no difference in healing potentiality of single visit as opposed to dual or multiple visits. Modern concepts and protocols in diagnosis, instrumentation, disinfection and obturation systems have made single visit endodontics (SVE) a faster regimen with a predictive outcome. Clinical study aimed to investigate the effectiveness of single visit as compared with dual visit endodontics was conducted. 399 adult patients with pulpal and periapical diseases of endodontic origin who were selected for endodontic therapy in various dental centres in Delhi were included in the study. 201 cases underwent single sitting (Group A) and 198 were treated in two visits (Group B). Endodontic failure rate of 3.68 % was observed in single visit group as opposed to 4.78 % in dual visit. Though statistically there was no significant difference in outcome of both protocols, the advantages of SVE outweigh those of dual visit. Thus single visit endodontics can serve as an acceptable, alternative treatment modality as compared to dual or multiple visit endodontics.

Keywords: *Single visit endodontics, root canal treatment*

Introduction

Single visit endodontics (SVE) is defined as "the conservative nonsurgical treatment of an endodontically involved tooth consisting of complete biomechanical cleaning, shaping and obturation of the root canal system during one visit" [1]. Concept of SVE has been mired in controversy for over a couple of centuries. It was first documented by Dodge in 1887.The primary reason it was not embraced universally was due to unresolved issues like differences in clinical outcomes, microbiological concerns as determined by culture testing and post obturation pain. Endodontic success or end point was till recently solely determined by culture testing which was neither a specific or sensitive tool. Today newer materials, techniques and scientifically proven concepts have refined the end point of endodontic success. This has given the much-needed impetus to SVE [2- 3].

The main indications for single visit endodontics are in vital teeth which are exposed due to trauma or any other mechanical cause. It is also advocated, when intentional endodontics is an inescapable necessity for prosthetic rehabilitation to correct axial inclination of the abutment. It is contraindicated for patients suffering from muscular dystrophy or any psychiatric condition which may prevent them from cooperating for the long duration of the single visit protocol. In cases of anatomical variations or procedural errors it may be difficult to perform endodontics in single visit [3-4].

Material and Method

A study aimed to investigate effectiveness of single visit as compared with dual visit endodontics was conducted. Adult patients with pulpal and periapical diseases of endodontic origin who were selected for endodontic therapy were included in the study. Cases of acute apical periodontitis were not included in the study.

Procedure

Patients fulfilling the inclusion criteria were enrolled in the study and preoperative radiographs were taken by digital radiographic machine. The size of periapical lesion was noted, both in horizontal and verical axis and it served as a baseline record. The anterior and posterior teeth were randomly divided into two groups, Single sitting i.e (GROUP A) and Dual sitting i.e (GROUP B). Some patients had multiple teeth which were indicated for nonvital endodontics, in such a situation each selected tooth of the patient was taken as an unit and referred to as a case. A total of 399 cases were included with 201 cases in Group A and 198 in Group B. In both the groups there were 98 posterior teeth and remaining anteriors. Standardardized endodontic protocol was followed in both groups by three operators. The selected tooth was isolated with rubber dam and disinfected with 2 percent sodium hypochlorite. The access was prepared with cavity access burs. Caries and old restoration was removed at this stage. The patency of the canal was achieved with a 6/8/10/15 nos K FILE of 21mm length for posterior teeth and 25 mm length for long rooted anteriors. The working length was radiographically determined. The cleaning and shaping was done using NiTi Hyflex files as per the advocated sequence by manufacturer. Recapitulation was done sequentially. Canals were irrigated with sodium hypochlorite and EDTA gel was used as a chelating agent. The canals were dried with paper points. The guttapercha point corresponding to the last file used in apical preparation was selected and a master cone selection radiograph was taken. The canal were dried and coated with AH plus sealer. The master cone was also coated with sealer and was placed in the canal. Additional acessory cones were placed in space created by spreaders. The canals were obturated following the lateral condensation method. The access filling was done with either glass ionomer alone or a combination of glass ionomer and composite. High points if any were removed (FIG 1). For Dual Sitting, the same protocol was followed, except that in the first sitting the canal was prepared and an intracanal dressing of calcium hydroxide was given and a temporary restoration placed. In the next sitting the canal was obturated as in single sitting group (FIG 2). The indices used in this study were PAI [(Periapical index) preoperatively and during follow Up] and Strindberg criteria as an evaluation tool. Both Groups were evaluated clinically at 7, 15, 30 days and a 9 month follow up was done. The result were computed, correlated and subjected to statistical analysis. The following models of statistical analysis have been used in this study. The Excel and SPSS 16(SPSS Inc, Chicago) software packages were used for data entry and analysis. The unit of analysis was the tooth and teeth were referred to as cases. Median survival time was compared using Wilcoxon test. At the bivariate levels, the following independent variables were assessed: patient's gender, age and treatment modality. The student's 'T' test was used to determine whether there was a statistical difference between expired and survived in the parameters measured. Chi-square was used to ascertain the association (or independence) between category variables assessed.

Clinical Case—Single Visit

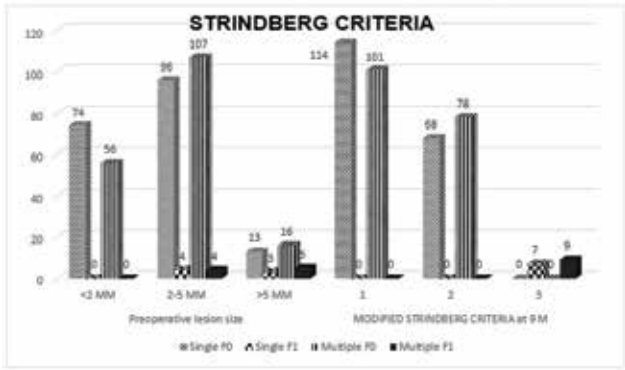
Results



Results are summarized in the graphs (1-3). There was equi gender distribution of cases. The mean age group was 3rd and 4th decade, however age and gender had no bearing on the failure rate. The endodontic failure rate of 3.68 % was observed in single visit group as opposed to 4.78 % in dual visit.

Discussion

Currently with the changing concepts of the endodontic protocol, the use of contemporary endodontic techniques not only reduce the treatment time but also increases the success rate, and this has led to single visit endodontics being revisited [1-4]. However the contemporary question "Is single visit root canal treatment a biologically compromised treatment?" has not been conclusively answered, although numerous studies have addressed various aspects of this clinically

relevant query [1, 3]. This study was undertaken to compare contrast and correlate both the modalities of treatment and to assist clinicians in making informed treatment protocols made on current thought-provoking evidence based scientific data.

Case selection has a definitive bearing on the outcome. Trope et al found that there was no flare – ups in cases without preexisting symptoms [5-6]. Studies have shown that teeth with periapical radiolucency exhibited less pain than nonvital teeth without periapical radiolucency [1-3]. In this study, for uniformity, the inclusion criteria were patients of either gender above 18 years of age exhibiting the following conditions: irreversible pulpitis, chronic apical periodontitis, nonvital/necrotic teeth. Teeth with compromised periodontal status, acute apical periodontitis and acute alveolar abscess were excluded from the study.

Studies by Sathorn et al [4] and Spanberg et al [7] concluded that small sample size would give a skewed statistical analysis. Statistical power is the likelihood that a study will detect an effect when there is an effect there to be detected. If the statistical power is high, the probability of making a Type II error, or concluding that there is no effect when in fact there is one, goes down. Statistical power is affected chiefly by the size of the effect and size of the sample used to detect it. Hence in the present study sample size of 201 teeth were included in Group A – single visit protocol and 198 teeth in Group B - dual visit protocol. The samples were randomly assigned to each group to remove any bias. Observer calibration was conducted by twice scoring a set of 100 case on individual radiographs. The "true score" was by consensus of two dentists involved in the study. Radiographs were independently assessed by two examiners. The size of periapical radiolucency was calculated by measuring with a ruler tool on radiovisiography (to the nearest millimeter) its largest horizontal and vertical width. This methodology was consistent with all radiological studies in field of endodontics [1, 4, 8-9].

One of the major causes of apical periodontitis is attributed to microorganism inhabiting the root canals [10-12]. Cleaning and shaping with meticulous irrigation protocol will only reduce bacterial load by 40-60% [12]. Thus, the use of an antibacterial inter-appointment medicament was advocated. Hence In the present study we used calcium hydroxide in-group II cases without finding any significant difference in healing between the two groups. Studies by Sathorn,and Fava have proved that there is a similar healing pattern in periradicular region in both protocols [4,11]. Complete elimination of bacteria is not strictly necessary and maximum reduction of bacteria and effective canal filling may be sufficient in terms of healing. [7-9]. In the present study we used calcium hydroxide in-group II cases without finding any significant difference in healing between the two groups. Our findings are in agreement with past studies [11-13].

Pain and swelling are the signs that the underlying cause is a diseased tooth. Root canal treatment aims to result in resolution of the disease process and in the bargain the patient is free from the associated sign and symptoms [14]. Lot many dentists believe that postoperative pain is sequelae of single visit endodontics [15-17]. The causative factors of flare-ups encompass mechanical, chemical and or microbial injury to the pulp or periradicular tissues. Of these factors, microorganisms are the main causative factors leading to flare ups [18-20]. Eleazer and Eleazer reported fewer flare-ups for the single-visit group (3.0%) than (8.0 %) for the multiple-visit group [21]. In the present study on reviewing patients soon after the completion of the treatment protocol and reviewing again at seven days and fifteen days, there was no increased incidence of pain with single visit protocol as compared to dual visits. Numerous studies evaluating the postoperative pain after RCT have been published, with the incidence of postoperative pain ranging from 1.9%–48%, and they showed conflicting findings [20-24]. In the present study the incidence of postoperative pain was not attributable to the number of visits. This was in confirmation to study by Hammed et al [25].

In our study outcome of treatment was classified by using modified Strindberg criteria and Periapical Index both preoperatively and postoperatively [Graph1 - 3]. Teeth with symptoms of persisting periapical inflammation were scored as not healed as were cases with increased size of the periapical radiolucency. Teeth with a reduced size of the periapical rarefaction at end of 9 months follow up (sum of horizontal and vertical reduction 2 mm) were judged as healing. Teeth with complete restitution of the periodontal contours were judged as healed. Teeth with unchanged size were registered as uncertain. In teeth with more than one root, the least favorable outcome was registered.

In a Cochrane systematic review of single versus multiple visits endodontic treatment, Sathorn concluded that no detectable difference was found in the effectiveness of root canal treatment in terms of radiological success [4]. In the present study it was found that the failure rate or the rate of healing was more consistent in teeth, which did not have a discernible periradicular rarefaction. It was also found that preoperative asymptomatic teeth with apical periradicular lesion of 2-5 mm in diameter were healing at the end of the follow up in both the groups. But the success rate diminished with increase in size of preoperative lesion (Graph 1, 2, 3). These finding were constant irrespective of the number of visits. Complete resolution of periapical lesion was not recorded; this could be because the follow up time was limited to 9 months. One-year follow up time is the soonest possible to determine whether or not the lesion has healed [9-10]. But marked reduction in lesion size was noted in 60 % of cases in single sitting group as compared to 53.72 % in dual sitting group. Discernible healing was seen in 35.7 % of single visit group as compared 41.4 % in dual visit. Thus there was no statistical difference between healing between the two groups (Graph 1-3). The differences in size of periapical lesion between subjects of treatment groups at entry to end of the study might act as a significant confounder. The differences in severity of apical periodontitis (high PAI score) might affect healing time and/or chance of healing. Healing was judged as a decrease in the PAI score overtime [26-27]. Decrease in PAI values at follow up has been taken as a predictor for healing, as a complete resolution of healing in a short follow up is not possible. A longer follow up of 2- 3 years would be required for evaluating preoperative lesions size of greater than 5mm.

In the present study, the endodontic failure rate of 3.68 % observed in single visit group as opposed to 4.78 % in dual visit, seemed to compare favorably with published values given by Yingying Su [4-7]. Failures are observed more in teeth in which there has been less than acceptable limit of obturation and in which the preoperative lesion is more than 5mm periradicular [3, 9, 25-27]. In the present study it was observed that whenever the lateral seal as well as apical seal was violated, the incidence of failure increased.Teeth that are not satisfactorily obturated show higher rate of failure. Unsatisfactory and incomplete obturation was minimal in this study.

Each study has its limitations and no study is flawless [28], as is envisaged in this study. The most reliable way to assess the clinical impact of a novel technique is through its effect on a well-defined clinical endpoint such as healing of a radiographic lesion. However, this may be impractical, due to a prerequisite of large sample size and a long duration of time required for these clinical endpoints to be achieved. Healing of apical periodontitis, for example, may take many years to show clearly on radiographs [8,9,25-28]. A surrogate endpoint is defined as a biomarker that is intended to substitute for a clinical endpoint [29-30]. A surrogate endpoint is expected to predict clinical benefit based on epidemiologic, therapeutic, pathophysiologic, or other scientific evidence. Thus, correlating our clinical out come over a longer follow up period with a surrogate end point would have made the present study more stringent.

Another limitation of this study is that a patient preference of both the protocols has not been assessed. Various studies have concluded that patients should be involved in treatment decision-making [4, 8-9 28-30]. The introduction of the patient's point of view in quality and effectiveness studies can be considered a further step towards a more comprehensive humanistic approach to the patient.

Conclusion

Though statistically there was no significant difference in outcome of both the protocols, single visit endodontics advantages outweigh those of dual visit protocol : number of patient appointments is reduced leading to increased level of patient comfort, the chances of inter-appointment microbial contamination and associated flare-ups caused by leakage or loss of the temporary seal are reduced, an immediate aesthetic replacement can be given for anterior teeth, there is no need for re familiarization with the canal anatomy at the recall appointment. The therapy is cost-effective as there is reduction in clinical time.

Ethical Clearance: Institutional (ADC R & R) ethical clearance obtained.

A Study to Evaluate the Effectiveness of Ginger Tea on Morning Sickness among Antenatal Mothers in Selected Area of Sangli, Miraj, Kupwad, Corporation

Seema D Shiradwade[1], MS. Regina Satvekar[2]

[1]MSc 2nd Year Nursing, [2]Assistant Professor, Bharati Vidyapeeth (Deemed to be University), College of Nursing, Sangli

ABSTRACT

Quasi experimental research study was conducted during the month of August 2018 with the aim of establishing the effectiveness of ginger tea in reducing the morning sickness. Total of 60 antenatal mothers were selected and grouped into 30 in each for experimental and control respectively. The subjects were selected by using Non probability purposive sampling technique. The level of morning sickness was evaluated by using modified Rhodes index scale among antenatal mothers. The intervention was exercised i.e. Ginger tea 200ml once in a day for 5 days was administered to the subjects of experimental group. The reliability of the tool was determined by using split half method. The reliability coefficient "r" was more than 0.7, hence the tool was found to be reliable. Also, 30 eminent experts from all over India had validated the tool for its content. Data was analyzed using descriptive ie. Frequency and percentage distribution, inferential statistics ie. 't' test, z test.

Study results showed that, the ginger tea is effective on morning sickness and statistically there is significant difference in the experimental and control group. Hence study concludes that there is significant effect of ginger tea on morning sickness among antenatal mothers

Keywords: *Effectiveness, Ginger tea, Morning sickness, Antenatal mothers*

Introduction

During pregnancy every woman have different experience and it is wonderful response when pregnancy is confirmed and maximum woman have experience normally in early pregnancy with Morning sickness that means nausea and vomiting, and slowly adjusted to it.[1] During 9 month of pregnancy period, various physiological changes are experienced by pregnant women. Some physical changes are, growing abdomen size, increasing body weight till 9 months that is, the normal weight is up to 10 to 11 kg, morning sickness and backaches, these changes may be sudden and it occur in some women by unknowingly.[3]

The woman experiences with sudden and dramatic increases in estrogen and progesterone during pregnancy intended to aid the fetal and maternal development. Nausea associated with pregnancy in first trimester because of fast increase in estrogen level.[4]

Seventy to eighty percent of all pregnant woman are encountering NVP. Most of the women have NVP only in 1st trimester whereas, very thin population of pregnant mother's experience a long period of NVP extended until the initiation of labour process. The data of pregnant women affected with NVP in US and shows that, around 4,000,000 and 3, 50,000 women are experiencing the symptoms of NVP each year respectively.[5]

Usually nausea and vomiting begins at 6-7 weeks of gestation, and it peaks at 9-13 weeks, and decreases in most cases by 12-14 weeks with a symptoms of nausea

College of Nursing, Sangli
Email: seemageddugol@gmail.com

and vomiting. Symptoms continue beyond 20 weeks in up to 10% of pregnancies. Estimates that, 1 in 5 women suffer with morning sickness in 2nd trimester and few for the complete duration of their pregnancy.[6] A survey findings reveal that, woman's having nausea and vomiting at 2nd week of gestation, 73 of 409 women (17.8%) were having nausea without vomiting and from 409 (2.7%) in that 11 women's were having nausea with vomiting..[7] It is the most common disorders during pregnancy and affecting almost 80% of pregnant women.[8]

A cross sectional study among Norwegian population shows that, Total of 712 women had nausea and vomiting during pregnancy in that 62% had mild, 439% had moderate, and 210 were having severe nausea and vomiting pregnancy.[9] Eight nine percent of women were nauseous in early pregnancy, in that most commonly, the NVP experienced was mild (48%) moderate (30%) and sever 11% had experienced nausea vomiting during early pregnancy.[10]

Nausea and vomiting is the most common medical condition in pregnancy, affecting 50-90% of women Nausea and vomiting of pregnancy can have a profound effect on a woman and her family's health and quality of life, therefore early recognition and management is important. [6]

As there are increased rates of nausea and vomiting in early pregnancy; the women and health professional's needs to create and adopt the optimal guidance and effective & safe intervention to manage the event.[11]

Traditional Chinese medicine, Ayurveda, traditional Thai medicine, Japanese Kampo medicine, and several other traditional medicines around the world, says that ginger is a basic herbal treatment, ginger can treat numerous disease and further investigations are showing the clue of health related benefits.[12]

Ginger has "Gingerols" and "Shogaols" and that acts as most vigorous elements in ginger are the pungent principles, and related clinical studies have assessed that for nausea and vomiting during pregnancy, ginger as an effective and safe treatment.[13]

Ginger named, the root or the rhizome of the plant 'Zingiber Officinale'. Ginger is considered as herbal medicine and popular spice for thousands of years and it has a long history of use in Asian, Indian and Arabic herbal traditions. Minor health problems like common cold, headaches, painful menstrual periods, flu, like symptoms ginger treatment is helpful. Even nausea and vomiting during pregnancy, ginger is more effective treatment or prevent nausea and vomiting in pregnancy and cancer chemotherapy. And several human research studies say that ginger is most effective treatment for short day use of 1gm daily may decrease nausea and vomiting in pregnant women.[14]

Ginger contains phenolic are known to treat of relieving gastrointestinal irritation, stimulate saliva and bile production, and reduces gastric contractions as food and fluid move through GI tract. Ginger provides variety of vitamins and minerals that are carbohydrates, calories, fiber, protein, sugar, sodium, iron, vitamin-C, vitamin-B_6, Magnesium, Phosphorus, Zinc, Folate, Riboflavin, and Niacin. Ginger root is true storehouse of vitamins and minerals that are necessary during pregnancy.[15]

By considering above all ginger in pregnancy, mode of action of ginger on morning sickness and the scientific evidences I feel that nothing beats morning sickness like cup of ginger tea.so rather than treating (NVP) with anti-emetics it is always better and safe to treat by ginger tea. Hence the investigator felt to select this topic as project in order elicit the usefulness of ginger as home remedies and medicinal benefits while managing the patients with morning sickness, specifically about the ginger tea as to how it helps in pregnant women when they suffer from morning sickness.

Objectives

1. To assess the level of morning sickness before administration of ginger tea.
2. To evaluate the effectiveness of ginger tea on morning sickness after administration of ginger tea.
3. To compare the morning sickness between experimental and control group.

Materials and Method

A quantitative pre-experimental one group pre-test and post-test design was used to evaluate the effectiveness of ginger tea on morning sickness among ANC mothers in selected area of Sangli, Miraj and Kupwad corporation area. The conceptual framework based on the general system theory, introduced by Ludwig von Bertalanffy

(1968) with input, process, output and feedback. The reliability was statistically computed by using split-half method. The **"r"** value **0.86**, which was more than 0.7 hence the tool was found to be reliable. Validity was done from 35 experts. Total 60 sample were selected by non-probability convenient sampling technique was used. A Modified Rodhes Index Scale was administered to collect data.

Hypothesis

H_O: There is no difference in the morning sickness after administration of ginger tea among antenatal mothers.

H_1: There is difference in the level of morning sickness after administration of ginger tea among antenatal mothers

Findings

Section I: Frequency and percentage distribution of demographic variables.

Table 1: Frequency distribution of ANC mothers according to demographic variables

Sl. No.	Variable	Category	Experimental Group		Control Group	
			Frequency	%	Frequency	%
1	Age in year	15-25	18	60	24	80
		26-35	12	40	6	20
2	Education	No Formal Education	Nil	Nil	Nil	Nil
		Undergraduate	22	73.33	19	63.33
		Graduate	07	23.33	09	30
		Post graduate	01	3.33	02	6.67
3	Occupation	Housewife	29	96.67	28	93.33
		Staff Nurse	Nil	Nil	02	6.67
		Clerk	01	3.33	00	00
4	Gestational week	10-20.	17	56.67	24	80
		21-30	11	36.67	06	20
		31-40	02	6.67	Nil	Nil
5	Diet pattern	Vegetarian	06	20	07	23.33
		Non Vegetarian	24	80	23	76.67
6	Gravida	Primi	18	60	15	50
		Multi	12	40	15	50
	Para	Primi	12	40	15	50
		P_1	10	33.33	13	43.33
		P_2	04	13.33	01	3.33

Section II: Asses the level of morning sickness before and evaluate after the administration of ginger tea in experimental and control groups.

This section deals with the effectiveness of ginger tea among ANC Mothers with morning sickness

A. Level of morning sickness before the administration of ginger tea.

Table 2: Level of morning sickness before the administration of ginger tea in both group

N = 3 0 + 30

Level / Groups	Experimental Group (Day-1)				Control Group (Day-1)			
	Frequency	%	Mean	SD	Frequency	%	Mean	SD
Mild	02	6.66	6.5	2.12	03	10	7.33	1.15
Moderate	22	73.33	12.9	2.06	27	90	12.66	3.23
Sever	06	20	17.5	0.83	00	00	00	00
Total	30	100			30	100		

B. To evaluate the effectiveness of ginger tea on morning sickness within experimental group:

Table 3: Effectiveness of ginger tea on morning sickness after administration of ginger tea in experimental group

N = 30

Group	Frequency	Mean	S.D	't' value	'P' value
Before administration on day 1	30	12.80	3.32	11.31	0.000
After administration on day 5	30	5.70	1.82		

Section III: To Compare between experimental and control group

A. Compare the morning sickness in experimental group.

Table 4: Effectiveness of morning sickness in experimental group

N = 30

Experimental Group	Frequency	Mean	S.D.	't' value	'P' value
Day 1	30	12.80	3.32	11.31	0.000
Day 5	30	5.70	1.82		

B. Compare the morning sickness in control group.

Table 5: Compare the morning sickness in control group

N = 30

Group	Frequency	Mean	S.D.	't' value	'P' value
Day 1	30	12.13	3.48	5.80	0.000
Day 5	30	8.73	2.58		

C. Comparison of morning sickness after the day 5 in Experimental and Control Groups

Table 6: Comparison of morning sickness after the day 5 in Experimental and Control Groups

N = 30 + 30

Day 5	Frequency	Mean	S.D.	't' value	'P' value
Experimental	30	5.70	1.82	5.25	0.000
Control	30	8.73	2.59		

Conclusion

Based on objective and the hypothesis, the collected data was analysed by using descriptive and inferential statistics. And the `z test was used to find the significance.

Ginger tea is effective on morning sickness and statistical findings showed that there is significant difference in the experimental and control group. Hence study concludes that there is significant effect of ginger tea on morning sickness among antenatal mothers.

Recommendations & Implications

Nursing Practice: Based on the study findings,

- Nurses can focus their independent nursing intentions towards such natural remedies,
- Nurses can encourage the patients to adopt the consumption of ginger tea, as it is cost effective, safe and natural source.
- Community health nurses and midwives can take the lead in implementation of the ginger tea intervention in reduction of morning sickness.
- Nurses can further brain storm about the effectiveness of ginger tea on morning sickness at large platforms such as conference, workshop, and seminar.

Nursing Education

- Study highlights the knowledge related to usefulness of ginger in management of morning sickness.
- It is impetus to include the information related to the ginger and its uses into higher and/or institution level curriculum.

- Nurses can have educated regarding the role of ginger in reducing morning sickness.
- Student nurses can adopt the techniques and usefulness of ginger tea on management of morning sickness.

Nursing Administration

- Nursing administrators, can frame the proactive policies especially related to remedial benefits of ginger and use during pregnancy.
- Nursing administrator\s should direct the nurses to strategically adopt the topic of usefulness of ginger while caring the antenatal mothers.
- Nursing administrators can allocate the necessary man power, money and material for effective awareness on ginger and its benefits during pregnancy.

Nursing Research

- This study would be handful reference for further investigations on ginger and uses.
- The study can be made available for supplementary reference into the field of natural remedies in relation to the obstetrical conditions.
- This study can be impetus to practice nursing profession as an evidence based practice.
- This study can be a stem for framing the theoretical framework in nursing profession.

The study recommends the following:

- Methodologically similar study can be conducted on large sample size to generalize it at larger population
- The study can be conducted to compare the effectiveness of ginger tea on heterogeneous samples among antenatal mothers such as primigravida and multi gravid mothers.
- The study can be conducted to investigate the other benefits of ginger particularly on Gastro Intestinal Tract disorders.

Conflict of Interest: No any conflict of interest

Source of Funding: Self

Ethical Clearance: Permission was obtained from the research ethical committee of the Bharati Vidyapeet (Deemed To Be) University College of Nursing, Sangli, and permission taken for data collection from Sangli Miraj Kupawad Corporation Area. Informed consent was obtained from individual (samples) who are selected for the study. Ethical clearance was done by head of committee members **Dr. Sripriya and Dr. Nilima Bhore.**

Contraceptive Methods: Knowledge, Practice and their Attitude among the Women of Rural Population in and around Bangaluru City of Karnataka State, India

SenigalaKuruba Anusuya[1], Sudha Patil[2]

[1]Associate Professor, [2]Professor, Department of OBG, Akash Medical College and hospital, Bangalore, Karnataka State

ABSTRACT

The main objective of this study was to assess the knowledge attitude and practice of contraceptives in rural women. this is across sectional study of rural women between 20-45 age groups attending the Outpatient department of obstetrics & gynaecology at AIMS&RC situated at Devanahalli rural Bengaluru, Karnataka. Methodology- 500rural women were interviewed by giving the questionnaire which assesses the KAP of contraception and the various methods like barrier intrauterine contraceptive device, Oral contraceptive Pills' Tubectomy Vasectomy and injectable contraceptive withdrawal technique and emergency contraception. The socio-demographic characteristics like age, parity, educational status and their income were assessed for the awareness of the various contraceptive methods among the rural women residing in and around Bangalore city of Karnataka state. It was found that 95 % women were aware of bilateral tubal ligation, 85% known for condoms and 72% known for IUCD and also other various contraceptive methods. However, lack of knowledge on their usage and attitude to the contraceptive methods, birth control is not reaching its target.

Conclusion: The above results only reaffirms the fact that there is a gap between knowledge and practise due lot many factors discussed in this study.

Keywords: *knowledge, attitude, Practice, rural, contraception.*

Introduction

India is a home to 17% of the world's population – a population of diverse cultures, languages and religions. The relevance and importance of family planning in India has to be understood in the context of the burgeoning population, and the persistence of relatively poor social indicators in spite of a booming economy. India, the second most populous country in the world, is projected to exceed 2billion people by the turn of the twenty-first century. According to the Census of India 2011, the population was nearly 1.210 million, of which 31% are below the age of 15 years and 53% ofwomen are in the reproductive age group (15–49 years)[1-3]. Govt of India along with state Governments launched a family planning programme in 1952, with the objective of reducing birth rate to the extent necessary to stabilise the population at a level consistent with requirement of national economy. Data for India, especially regarding contraceptive use, are a little out of date as no nationally representative surveys have been undertaken following the third round of the National Family Health Survey (NFHS) – India's DHS – in 2005–2006. Due to intense efforts to control population growth in India, the Total fertility rate (TFR) has been steadily declining over the past few decades. The current TFR of 2.4 in 2012 is down from 3.1 children per woman in 2001, but is still above replacement level fertility. In urban areas, the TFR has reached below replacement levels at 1.8, but in rural areas the TFR is 2.6[4-5].

A typical female sterilization in India renders most women permanently infertile. Because many women in India marry in their late teens and quickly experience multiple pregnancies, women who already have two or

Corresponding Author:
Dr Sudha Patil
Professor, Department of OBG,
Akash Medical College and Hospital,
Bangalore, Karnataka State

more children and can't care for more often opt for—or are pressured into—sterilization. Women in rural and semi urban areas have no easy access to medically accurate information, high-quality healthcare from providers who patiently answer their questions, and no clear idea of the risks and benefits of various forms of birth control, and time to weigh their options and give informed consent. Given that the reality in many parts of India today is that women are still being pressured or incentivized to undergo mass sterilization.

In the present study, apart from the sterilization, other contraceptive methods known to the females in around Bangalore city were investigated.

Methodology

This was carried out from 1st March 2018 to 30th Dec, 2108 at Akash Medical College hospital, Bangalore. The study was conducted in the outpatient clinic of Gynaecology Unit. The definition of rural was women residing in Bangalore who have come for lively hood from other rural places of Karnataka. The selection criterion was married women between the ages of 15-45 years, living with their husbands at the time of interview. Women who were pregnant, had a child younger than 2 years or had any medical disorder were excluded from

the study. The questionnaire elicited information regarding their age, educational status, number of children, knowledge and source of contraceptive methods, practicing of either male or female family planning methods. The attitude of females towards contraception was asked, while the attitude of husbands was assessed what their females perceived. To assess the knowledge, the following 8 methods were separately asked: pills, Injectable contraception, Intra-uterine Contraceptive Devices (IUCDs), condoms, tubal ligation, vasectomy, Norplant and withdrawal method. The practice defines the usage of contraceptive methods by either partner. Descriptive analysis was conducted to describe the results in percentages.

Results

The socio-demographic characteristics like age, parity, educational status and their income were analysed.. The age group of 20-30 was the most productive age constitutes 70%.

Less than 50% females were accessible for primary and secondary education and their monthly income varies from 5 to 40%. Table-1 shows the awareness of females to different contraceptive methods Viz vasectomy, natural, IUCD, condoms, bilateral tubal ligation and progesterone pill were known and ranges from 50 t0 95%. Other contraceptive methods like oral, emergency contraception were known by 30 and 2% respectively. However, some of the contraceptive methods are poorly implementing. Bilateral tubal ligation method was practicing by 28% women whereas other methods were n the range of 1 to 18% only (Table-2). The attitude of the women for these methods was also poor and ranges from 2 to 24% (Table 3).

Table 1: Awareness of contraceptive methods among the rural women in around Bangalore

Methods	Numbers	%
Progesterone only pills	-	Nil
Bilateral tubal ligation	475	95%
Condoms	425	85%
IUCD	360	72%
Natural	325	65%
Vasectomy	250	50%
Oral contraceptive pills	120	30%
Emergency contraception	10	02%
None	05	1%

Table 2: Practice of contraceptive methods among the rural women in Bangalore

Methods	Numbers	%
Bilateral tubal ligation	140	28%
IUCD	90	18%
Natural	75	15%
Condoms	70	14%
Oral contraceptive pills	60	12%
None	50	10%
Emergency contraception	05	01%
Vasectomy	05	01%
Injectables	05	01%
Progesterone only pills	Nil	Nil

Table 3: Attitude of the implementation of contraceptive methods among the rural women in Bangalore

Reason	Methods	%
Wants to conceive	12	24%
Fear of side effects	10	20%
Inconvenient	05	10%
Breast feeding	10	20%
Infrequent sex	04	8%
Not staying together	03	06%
Hysterectomy	03	06%
Opposed to family planning	02	04%
Menopausal	01	02%

Discussion

The widespread adoption of family planning, in a society, is an integral component of modern development and is essential for the integration of women into social and economic life. In spite of efforts exerted by the Government of India, the family planning program is not yet as successful especially in rural women as they are practicing the contraceptive methods and also their attitude.

The present study aimed to assess the knowledge, attitude and practice of family planning methods to enhance the contraceptive practice in the rural community in future. Results showed that the knowledge for contraception was 95%. However, similar awareness rate of 81% was found in Pakistan study[6].Women illiteracy is one of the factor that affects the knowledge regarding contraception. Similar results have been reported from Pakistan which has low literacy rate, even lower in rural areas. Literacy level among the women emphasizes the need for education as a key component to combat overpopulation and will encourage the use of contraceptives.

Another factor responsible for knowledge of family planning methods are the exposure of messages through media. Electronic media play an important role in a society where literacy level is low. Women were more likely to use contraceptives when messages of family planning were delivered through effective media or personnel. In India, social circle (70%) and media (39%) were the main sources of information [6]. Similarly, study from rural Nepal also reported an exposure to electronic media messages as the main factor for use of family planning methods among women[7]. An Ethiopian study showed that 80.3% of health personnel contributed in providing information regarding contraception, which is opposite to the results [7]. The positive aspect is that the presently reported contraceptive prevalence rate is high with regard to knowledge, as opposed to Jordan and Nigeria where it was 31.7% and 8.7% with awareness rate of 91% and 85% respectively[10, 11]. Regarding the usage of family planning methods, an important dimension is the type of contraception used. Bilateral tubal ligation was the most common chosen method used by 28% (Table 3) of couples as shown in other studies as well[12, 13]. Oral pills were used by 12% of women in comparison with 32% and 10% in other areas of Pakistan [14 15]. From this study we conclude that the women were aware of most of the contraceptive methods, but lack of implementation and attitude birth control is not reaching its expected results.

Comparison Prophylactic Glycopyrrolate, Dexamethasone, Metoclopramide in Control of Nausea and Vomiting after Spinal Anaesthesia for Caesarean Delivery

Gautam Malhotra[1], Suresh Y. V.[2], Anupama Suresh Y[3], Shaik Gulam Osmani[4], Kavya Prabhu[5]

[1]Associate Consultant, Sri Balaji Action Medical Institute, Paschim Vihar, New Delhi; [2]Professor, Department of Anesthesiology, [3]Associate Professor, Department of Obstetrics & Gynecology, [4]Assistant Professor, [5]Senior Resident, Department of Anesthesiology, Kasturba Medical College Mangalore, Manipal Academy of Higher Education, Karnataka (India)

ABSTRACT

Background: The effects of spinal anesthesia on women in their labour period are different from those observed in non-obstetric patients. The distribution of the anaesthetic drug in cerebrospinal fluid (CSF) is less predictable than non-obstetric patients, Moreover side effects including hypotension, nausea and vomiting are more common.

Aims: To compare the efficacy of inj glyocopyrolate 0.2 mg iv, inj dexamethasone 8mg i.v, inj Metoclorpromide 10mg i.v in control of post-operative nausea and vomiting after spinal anaesthesia for caesarean delivery

Method and Material: All consenting women were explained and women were randomly allocated in to four groups of 20 each, Group A inj.Glycopyrrolate 0.2 mg, Group B, inj. Dexamethasone 8 mg, Group C inj. Metoclopramide 10 mg and Group D (n=20) inj. Normal saline 2m1. Level of spinal block, hemodynemic changes, incidence of intraoperative and post-operative nausea and vomiting were noted in all four groups. The incidences of nausea and vomiting were compared in different groups and the differences were tested for significance by calculating 'z' value. A `p' value <0.05 was considered significant.

Results: The overall (intraoperative & postoperative) incidence of nausea and vomiting which was 20% in group A, 35% in group B, 50% in group C and 60% in group D. Statistical analysis showed that the all three drugs decrease incidence of nausea and vomiting, but glycopyrrolte found to be more effective in preventing nausea and vomiting.

Conclusion: The incidences of nausea and vomiting were high fallowing spinal anesthesia during caesarean delivery. Administration of glycopyrrolate intravenously before spinal in caesarean section effectively control the incidence and severity of intraoperative and early postoperative nausea and vomiting compared to the non-treatment group.

Introduction

Intra-operative and postoperative nausea and vomiting (IONV and PONV) can be distressing to patients undergoing Caesarean section (CS) under regional anaesthesia. The incidence of IONV are common, studies with rates up to 60–80% were reported.[1]

Nowadays, caesarean sections account for about 7% of all surgical procedures worldwide[2] and the majority of

them are performed under spinal anaesthesia. Nausea and vomiting present during the surgical procedure produce discomfort for the parturient, impair surgical conditions for the gynecologist and can lead complications such as aspiration of gastric content.[3] PONV can lead to an increased stay in the recovery room, nursing care, and potential hospital admission- all these contribute to total health care costs[4]. Unpleasant distressing experience for patient and also in severe cases may cause problem such as dehydration, electrolyte imbalance. Suture dehiscence, bleeding and esophageal rupture [5].

Pharmacological attempts to reduce PONV include preemptive therapy with metoclopramide, dexamethasone and prophylactic use of vasopressor. [6] It has been reported that glycopyrrolate could successfully minimize the incidences of PONV during neuraxial anaesthesia for a caesarean without affecting the fetal outcome. [7]

The aetiology of PONV in women undergoing caesarean delivery with neuraxial anaesthesia is multifactorial and no single intervention will eliminate it completely, therefore the aim of this study is to do the comparative evaluation, among glycopyrrolate, dexamethasone and metoclopramide in preventing PONV after spinal anaesthesia in caesarean section, in ASA grade I and II patients

Materials and Method

After obtaining approval from institutional scientific, ethical committee and written informed consent, 80 women (American society of anaesthesiologist grading I & II, between 20 to 35 years of age) at term undergoing caesarean delivery were enrolled for the study.

All the consenting women were randomly allocated into four groups to receive:

Groups	Drugs
Group A (n = 20)	inj.Glycopyrrolate 0.2 mg
Group B (n = 20)	inj. Dexamethasone 8 mg
Group C (n = 20)	Inj. Metaclopramide 10 mg
Group D (n = 20)	Inj. Normal saline

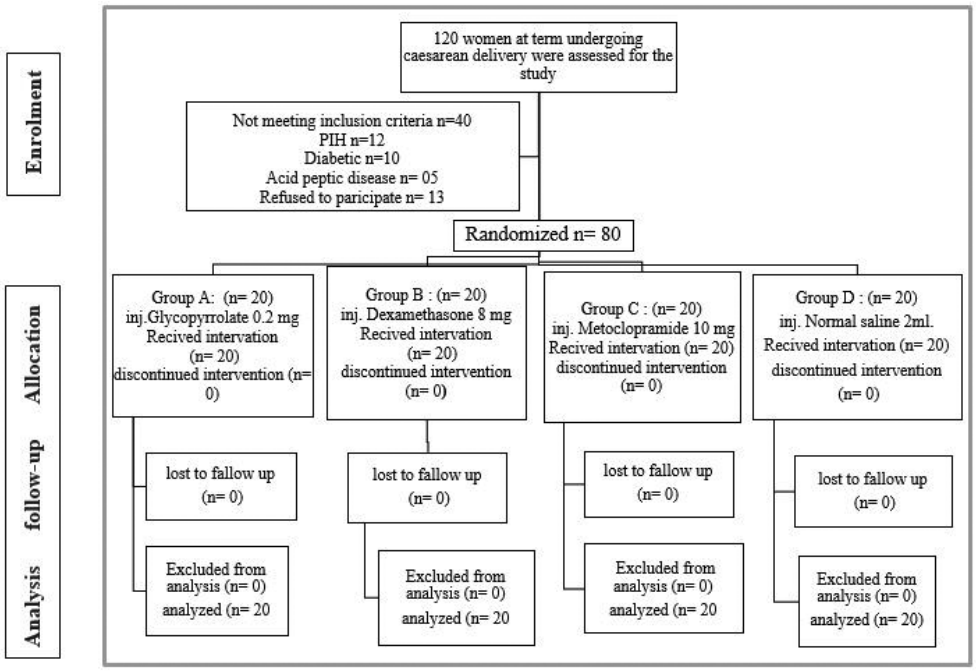
The efficacy and safety of i.v glycopyrrolate 0.2mg, i.v. dexamethasone 8mg, and i.v. metoclopramide 10mg were evaluated and compared for the prevention of IONV and PONV in a randomized double blind placebo controlled study[Table/Fig-1].

Any patient having a history of an acid peptic disease, previous history of PONV or any antiemetic medication, pregnancy-induced hypertension, hepatic dysfunction, diabetes mellitus, and allergies to local anaesthetics were excluded from the study [Table/Fig-1].

All patients vitals were recorded before pre-loading with Ringer's lactate solution 20m1/kg and this followed by intravenously administration of study agents prior to spinal anaesthesia.

Spinal anaesthesia was administered in the sitting position with 0.5% hyperbaric bupivacaine (2.2m1) with 25 gauge Quincke's lumbar puncture needle at the interspace between L3-4. After administration of spinal anaesthesia, women were put in the supine position with a 15° wedge under the right hip for left uterine displacement and supplementation of oxygen 5L flow per minute was administered through poly mask. Following confirmation of spinal block by a loss of sensation to cold and pinprick, to T4-T5 level, surgery was started and oxytocin (20 units) was administered through intravenous infusion at the time of umbilical cord clamping.

Assessment: Oxygen saturation, pulse rate, blood pressure and respiratory rate of each woman were recorded every 05 minutes during the surgery and post-operatively every 20 minutes during the study period. The decrease in systolic blood pressure (more than 20%of baseline value and/or less than 90mm Hg) after spinal anaesthesia was treated by increasing the rate of intravenous fluid administration and 3mg increments of ephedrine administered intravenously (every 3-5 minutes) until resolution of hypotension.



Emetic episodes (nausea and/or vomiting) experienced by women were recorded intra-operatively and up to 4 hours post-delivery period in the postoperative ward by anaesthesiologist who was blinded to the treatment patient had received.

NAUSEA is defined as an unpleasant sensation referred to a desire to vomit not associated with expulsive muscular movement

VOMITING is the forceful expulsion of even a small amount of upper gastrointestinal contents through the mouth. If two or more episodes of emesis occurred in each observation period 0-4 hrs) 4mg inj. Ondansetron intravenously was administered as rescue antiemetic to the patient.

The incidences of nausea and vomiting were compared in different groups and the differences were tested for significance by calculating 'z' value. A `p' value <0.05 was considered significant.

Table/Fig-1: Consort diagram showing flow of participants

Results

The age, weight, ASA status, surgery duration were comparable in all group of patients and level of spinal anaesthesia in different study groups are shown in [Table/Fig-2]. The level of spinal anaesthesia were found statistically insignificant in association with nausea and vomiting.

Table/Fig-2: Level of spinal anesthesia in different groups:

		Group A	Group B	Group C	Group D	Total
Level	T4 N(%)	6 (30%)	10 (50%)	9 (45%)	7 (35%)	31 (38.9%)
	T5 N(%)	7 (35%)	5 (25%)	7 (35%)	8 (40%)	27 (33.8)
	T6 N(%)	7(35%)	5 (25%)	4 (20%)	5 (25%)	21 (26.3%
Total N (%)		20 (100%)	20 (20%)	20 (100%)	20 (100%)	80 (100%)

Blood Pressure: Mean variation in SBP (111.9 mmHg) was least in group A and maximum in group D (104.5 mmHg) after spinal anaesthesia compared to other groups. But this variation in SBP was statistically insignificant [Table/Fig-3]. So variation should not be a contributing factor for nausea and vomiting in a different group.

Table/Fig. 3: Systolic blood pressure (measured after 5 minutes of spinal anesthesia)

	N	Mean	SD	Minimum	Maximum
Group A	20	111.90	13.05	90.00	130.00
Group B	20	107.00	15.16	80.00	130.00
Group C	20	104.70	14.35	80.00	130.00
Group D	20	104.70	11.90	90.00	120.00

Intraoperative Nausea and Vomiting: The incidence of intraoperative nausea which was 15%, 25% 30% and 55% in group A, B, C &D respectively which was statistically Significant, It was lowest in the glycopyrrolate group [Table/Fig-4]. Statistical analysis showed that the incidence of nausea in group D was significant ($p<0.05$) than the other three groups. The intergroup comparison between glycopyrrolate, dexamethasone and metoclopramide showed that all the three reduce the incidence of nausea but the antiemetic effect was least in the metoclopramide group.

The incidence of intraoperative vomiting which was 10%, 25%, 30% and 45% in group A, B, C &D respectively which was statistically Significant, It was lowest in the glycopyrrolate group [Table/Fig-4].Statistical analysis showed that the incidence of vomiting in group D was significantly more ($p<0.05$) than the other three groups. Two Out of three patient complaining nausea in glycopyrrolate group had vomiting, whereas in other groups all complaining of nausea had vomiting.

Table/Fig. 4: Incidence of intraoperative (0-2hrs) nausea and Vomiting among different group

	Nausea		Vomiting	
	Present N(%)	**Absent N(%)**	**Present N(%)**	**Absent N(%)**
Group A	3 (15%)	17(85%)	2 (10%)	18(90%)
Group B	5 (25%)	15(75%)	5 (25%)	15(75%)
Group C	6(30%)	15(75%)	6(30%)	15(75%)
Group D	9(45%)	11(55%)	9(45%)	11(55%)

Postoperative Nausea and Vomiting: On Comparing Incidence of postoperative nausea in four groups, group D was 50%(10/20) compared to group A, B &C which were 15%(3/20), 15%(3/20) & 30%(6/20) respectively[Table/Fig-5]. Compared to intraoperative nausea in dexamethasone group, only 3 out 5 had complained of postoperative nausea.

The incidence of postoperative vomiting in group D was 40% (8/20) compared to group A, B&C which were 15% (3/20), 20% (4/20) & 40% (8/20) respectively[Table/Fig-4]. Statistical analysis showed that the incidence of postoperative vomiting was high in group D but it was not significant. The intergroup comparison between glycopyrrolate, dexamethasone and metoclopramide showed that the decrease in incidence was more in the glycopyrrolate.

Comparing overall (intraoperative & postoperative) incidence of nausea and vomiting[Table/Fig-6].which was 20% in group A, 35% in group B, 50% in group C and 60% in group D. Statistical analysis showed that the overall incidence was significant($p<0.05$) in group D than the other 3 groups.

Table/Fig. 5: Incidence of postoperative (2-4 hours) Nausea and vomiting among different groups

	Nausea		Vomiting	
	Present N(%)	**Absent N(%)**	**Present N(%)**	**Absent N(%)**
Group A	3 (15%)	17(85%)	3 (15%)	17(85%)
Group B	3 (15%)	17(85%)	4 (20%)	16(80%)
Group C	6(30%)	14(70%)	8(40%)	12(60%)
Group D	10(50%)	10(50%)	8(40%)	12(60%)

Table/Fig. 6: Total incidence of nausea and vomiting

		Group A	**Group B**	**Group C**	**Group D**	**Total**
Present	N(%)	4 (20%)	7 (35%)	10 (50%)	12 (60%)	33 (41.3%)
Absent	N(%)	16(80%)	13(65%)	10 (50%)	8 (40%)	47(58.5%)
Total N (%)		20 (100%)	20 (100%)	20 (20%)	20 (100%)	80(100%)

Discussion

Nausea and vomiting during neuraxial anesthesia for a caesarean delivery are high without prophylactic antiemetic. The hypotension due to sympathicolysis during neuraxial anaesthesia is principle underlying mechanisms of IONV and PONV in the obstetrical setting. Bradycardia owing to an increased vagal tone, the visceral stimulation via the surgical procedure, peritoneal traction, exteriorization of the uterus and intravenously administered opioids are other factors contributing for nausea and vomiting [8-10]. The time of occurrence of nausea and vomiting after general anaesthesia for caesarean section is postoperative in contrast to regional anaesthesia which is mainly intraoperative.

The result of our study clearly demonstrates that the total incidence of nausea and vomiting was 20% in group A, 35% in group B, 50% in group C, & 60% in group D. Data of group A, B & C were compared with placebo group D and results in glycopyrrolate group were found statistically significantly less than placebo group. Comparing the incidence of nausea and vomiting in between group it was found that the incidence of nausea and vomiting was significantly reduced in group A as compared to group B and group C.

Biswas BN et al. concluded the incidence of nausea and vomiting in inj. glycopyrrolate 0.2mg group was much less than in, inj. dexamethasone 8mg, in metachlorpramide10mg, inj. normal saline 2m1(placebo). The total incidence of nausea and vomiting were noted in 15% of women belonging to glycopyrrolate as group compared 20%, 30%, 55% in dexamethasone, metoclopramide and saline group respectively. The p value <0.05 was considered significant. [6]

D Ure et al. also concluded that Patients who received glycopyrrolate prophylactically reported a reduction in the frequency and severity of nausea compared to placebo. [7]

The mechanism of action of study drug glycopyrrolate is not clear. The antiemetic effect may be due to the reduction in hypotension episodes because of heart rate mediated increase in cardiac output. The results of our study correlate with the studies mentioned above

Henzi I et al. conducted a quantitative systematic review of randomized placebo-controlled studies of 18 different regimens of metoclopramide, they found in adults the best documented regimen was 10mg I.V. But they concluded that 10mg metoclopramide dose was clinically ineffective as a prophylaxis for PONV. [11]

In our study, the dosage used for metoclopramide was also 10mg which is suboptimal for preventing nausea and vomiting as mentioned in the above studies. This explains the high incidence of 50% in group C as compared to group A (20%) & B (35%).

Wang JJet al. Found that dexamethasone 8mg in laparoscopic cholecystectomy decreased the incidence of nausea and vomiting significantly.[12] In a Similar study, J C Huang et al. found prophylactic i.v.dexamethasone 5mg reduces the incidence of postoperative nausea and vomiting in women undergoing ambulatory laparoscopic tubal ligation, And also concluded, dexamethasone 5mg is more effective than metoclopramide 10mg or placebo. [13]

In our study, the incidence of nausea and vomiting with saline was 60%. But with the administration of dexamethasone incidence of nausea and vomiting was (35%). Above mentioned studies show that dexamethasone is better than saline and metoclopramide and is effective in preventing nausea and vomiting after gynecological surgery.

Antiemetic mechanism of dexamethasone is by inhibiting synthesis and release of serotonin both centrally and peripherally, by inhibiting synthesis of prostaglandins and also by changing the permeability of the blood-brain barrier to serum proteins. Dexamethasone is most commonly used corticosteroid and is integral component of almost all antiemetic regimens in acute and delayed nausea and vomiting [14].

The aetiology of nausea and vomiting in women undergoing caesarean section with spinal anaesthesia is multifactorial, and no single intervention is available to eliminate it completely, it is important to provide adequate aspiration prophylaxis with histamine(H_2), dopamine receptor antagonist along with sufficient infusion of crystalloid or colloid solutions before and during the central neuraxial blockade to preventive hypotension.[1] fall in blood pressure should be corrected liberally with antihypotensive drugs such as ephedrine, phenylephrine. Concomitant measures such as the low-dose local anaestahetics, use of intrathecal opioids to reduce the amount of local anesthetics needed. [15]

Although the incidence of nausea in women treated with glycopyrrolate was reduced, no single antiemetic drug has proved to be a universal solution to postoperative nausea and vomiting. It is not feasible to give very high doses of any single drug because of saturation effects and safety, so combinations of antiemetic drugs are a possibility.

Conclusion

We found that although prophylactic administration of all the three drugs decreased the incidence of nausea and vomiting, the control of nausea and vomiting was better with glycopyrrolate compared with dexamethasone and metoclopramide.

Therefore from the results of this study, we conclude that the administration of glycopyrrolate intravenously before spinal in caesarean section effectively controls the incidence of nausea and vomiting.

A Study to Assess the Effectiveness of Eucalyptus Oil on Knee Pain among Osteoarthritis Patients in Selected Areas of Sangli, Miraj and Kupwad Corporation

Siddhant N. Shirgaokar[1], Pravin Dani[2]

[1]IInd year M.Sc. Nursing, [2]Professor, Bharati Vidyapeeth, (Deemed to be University) College of Nursing, Sangli

ABSTRACT

Background: Osteoarthritis is a progressive disease that occurs due to age and deterioration of joint health thus leading to pain in the joints. It is one of the primary causes for pain and disability across the globe. Osteoarthritis is mainly treated with pharmacological interventions such as NSAID'S. Persistent use of NSAID'S may have adverse effects on multiple essential organs thus exposing the patient to further complications.

Objectives: 1. To assess the level of knee pain among osteoarthritis patient. 2. To assess the effectiveness of Eucalyptus oil application on level of knee pain among osteoarthritis patients.

Methodology: Quasi-experimental pre-test post-test control group design was directed to assess effect of eucalyptus oil application on knee pain among osteoarthritis patients in selected areas. Total 100 samples were selected by non-probability purposive sampling method, (50 experimental group and 50 non-experimental group). A modified Allina pain scale was used to assess the level of knee pain among the osteoarthritis patients. The study adopted the "General System theory" as a theoretical base for framework of the study. Analysis was done using frequency and percentage distribution and ANNOVA test.

Result: The mean pain score in the experimental group on day one was 6.82, on the third day it was 5.66 and on day seven it was 4.42. The mean pain score on day one was 5.72, on the third day it was 5.42 and on day seven it was 5.34. Variation was found in the mean and SD scores in experimental and control group .p value is less than 0.005.The statistical data shows a variation in mean score of knee pain among osteoarthritis patients in experimental and control group.

Conclusion: Thus it was concluded that, on the basis of statistical tests, eucalyptus oil application was efficient in minimizing knee pain in the experimental set.

Keywords: *Effect, eucalyptus oil, knee pain, osteoarthritis*

Introduction

Osteoarthritis (OA) is the disorder related to the degeneration of joints, and it occurs frequently in daily practice, it is one of the primary causes for disability in the elderly.[1] In all of the rheumatic diseases which are chronic in nature, the osteoarthritis of the hip and the knee is the most common one. Osteoarthritis stands in second place as the commonest problem related to rheumatology and is the most commonly occurring illness, in India the incidence rate is of 22% to 39%. About 45% of women who are above the age of 65 years have symptoms, and radiological proof of the disease is found in 70%.[2] Osteoarthritis Is a disease which is of a huge challenge because of the less number of options to treat it with. Regular treatment and therapy such as acetaminophen, NSAIDs, and opioids are helpful to reduce the intensity of pain but they are not able to reverse the progression of the disease and may even cause adverse effects.[1] Non steroidal anti-inflammatory drugs (NSAIDs) are one of the most frequently used type of drug around the globe. Their main effect is that of reducing inflammation

College of Nursing, Sangli-416416
Email: sinish37@gmail.com

and reducing pain in the person consuming them. On the flip side this medicine is potentially harmful as it increases the risk of cardiovascular and gastrointestinal complications. NSAIDs affect the upper and lower gut by harming the mucosa and thus causing topical injury [3] Eucalyptus essential oil is a derivative of the eucalyptus tree.[4] Eucalyptus oil has a variety of medicinal benefits thus unsurprisingly it is a widely used product. It is used as an anti-inflammatory, anti-spasmodic, anti-congestive, disinfectant, antibacterial and antiseptic agent.[4]

Materials and Method

The Quasi-experimental research design- pretest & post test control group design, was adopted to conduct the study. The main purpose of the study was to assess the effect of eucalyptus oil application on knee pain among osteoarthritis patients. The sample size consists of 100 osteoarthritis patients, Out of 100 samples 50 were selected for experimental group and 50 were selected for control group. General demographic variables and the modified Allina pain assessment scale [6] were used as the tool to gather the data. This scale shows reading from 1-10. From 1-3 there is mild pain, from 4-6 there is moderate pain and from 7-10 there is severe pain.

Data Collection was Done in Following Steps

Procedure for data collection

1. **Pre intervention phase:** Osteoarthritis patients as per the criteria were picked and permission was obtained from selected patients after briefing the patient about the study. Gathering and documentation of the Demographic data was done. Determination of the level of pain was done by using the **Modified Allina Pain Assessment Scale** in both groups**.**
2. **Intervention phase:** In experimental group, eucalyptus oil application was done twice a day for 7 days straight. In control group routine checkup was followed.

Steps of intervention:

Articles:

- Eucalyptus oil
- **Modified Allina Pain Scale** Paper scale
- Cotton pad.

Procedure:

- Explain the procedure to patient.
- Explain the intent and how he/she has to cooperate.
- Clean the knee with a cotton pad
- Apply 0.25ml eucalyptus oil on the effected knee.

Post intervention phase: The level of effectiveness on knee pain was assessed with the help of **Modified Allina Pain Scale** after application of eucalyptus oil in both experimental and control group on the 1st day, 3rd day and 7th day one hour after the application

An ethical clearance was obtained from the institution and informed consent was obtained from the participants, samples were selected using the purposive sampling technique. The following hypotheses were formulated for the study

Hypothesis

H_0: There is no effect of Eucalyptus oil application on knee pain among osteoarthritis patients.

H_1: There is effect of Eucalyptus oil application on knee pain among osteoarthritis patients.

Statistical Analysis

Descriptive Statistics: Frequency and percentage distribution were used to analyze the socio-demographic data.

Inferential Statistics: Annova test was used to compare the data within the groups on the 1st, 3rd and 7th day.

Results

Assessment of level of knee pain before administration of eucalyptus oil in Experimental & Control Group

Table 1: Assessment of level of knee pain before administration of eucalyptus oil in Experimental & Control Group

N = 100

Pain (Day 1)		Experimental Group		Control Group	
		Frequency	Percentage	Frequency	Percentage
Mild	1-3	0	0.00	0	0.00
Moderate	4-6	17	34.00	38	76.00
Severe	7-10	33	66.00	12	24.00

Assessment according to level of knee pain before administration of eucalyptus oil, 34% were in moderate category and 66% in the severe and no one in the mild knee pain category in experimental group. According to level of knee pain on day 1 without administration of eucalyptus oil, 76% were in moderate category, no one in the mild and 24% in severe knee pain category in control group.

- Analysis of data related to the effectiveness of Eucalyptus oil application on level of knee pain among osteoarthritis patients in experimental and control groups.

Table 2: Knee pain before and after the application of Eucalyptus oil in Experimental Group

N = 50

Groups	N	Mean	df	F cal value	F table value	p value	Significance
Day 1	50	6.82	2,147	39.39	3.06	0.00	Significant
Day 3	50	5.66					
Day 7	50	4.42					

The above table shows the comparison of knee pain prior and after the application of the eucalyptus oil in the experimental group. The mean pain score on day one was 6.82, on the third day it was 5.66 and on day seven it was 4.42. The 'p' value is 0.00 thus rejecting the null hypothesis.

Table 3: Knee pain without application of Eucalyptus oil in Control Group

N = 50

Groups	N	Mean	df	F cal value	F table value	p value	Significance
Day 1	50	5.72	2,147	1.29	3.06	0.28	Not Significant
Day 3	50	5.42					
Day 7	50	5.34					

The above table shows the comparison of knee pain in the control group. The mean pain score on day one was 5.72, on the third day it was 5.42 and on day seven it was 5.34. The 'p' value is 0.28 for this table.

- Comparison of knee pain in Experimental and Control Group

Table4: Comparison of knee pain in Experimental and Control Group

N = 100

Group (day 7)	Frequency	Mean	S.D.	t value	P value
Experimental	50	4.42	1.26	3.58	0.001
Control	50	5.34	1.30		

The comparison of the average knee pain score of the experimental and control group after 7 days was done by the unpaired t test. The average knee pain score of experimental group was 4.42 with standard deviation of 1.26. The average knee pain score of control group was 5.34 with standard deviation of 1.30. The test statistics value of the unpaired t test was 3.58 with p value 0.001. This shows that there was significant difference in the average knee pain score at 5% level of significance

Discussion

The findings in the study as per shows that in the experimental group the maximum population was from the age group of 51-60 years (40%) while in the control group, the maximum population was also in the age group of 51-60 years (54%). Age is one of the primary reasons of risk to contract osteoarthritis. The increase of incidence of people facing osteoarthritis is

due to the addition of many different factors, physical and physiological factors that occur with the process of aging, thus making the joint less able to cope with various changes and pressures `applied on it [7].

In the gender criteria, most participants were females (70%) as compared to males (30%). In the duration of disease criteria. The readings were found consistent with a study conducted on Epidemiology of knee osteoarthritis in India and related factors, Osteoarthritis of the knees is found to be more common in females as compared in males. This finding was found statistically significant. [2]

The maximum samples (40%) in the experimental group had the knee pain since 2 years and in the control group the maximum samples (36%) are facing the ailment for more than 5 years. The readings were consistent with a study conducted on Knee pain and health-related quality of life among older patients with different knee osteoarthritis severity in Saudi Arabia. In this, the patients with knee osteoarthritis for an average of 7.5 years severe to moderate knee pain than those with mild to moderate knee osteoarthritis for an average of 4 years. [8]

All the samples (100%) in both the experimental and control group were prescribed pain medications for their pain. The findings were found consistent with a study conducted by on Non-surgical treatment of osteoarthritis-related pain in the elderly showed that, doctors rely heavily on NSAIDs to treat the pain faced in osteoarthritis. Acetaminophen is the choice of drug in the initial stages due to its comparative safety. Thus prescribing medications to deal with the pain faced by osteoarthritis patients. [9]

The findings presented in [Table No-2] shows the comparison of knee pain prior and after the application of the eucalyptus oil in the experimental group. There are three total readings taken, i.e. on day 1, day 3, and day 7. The mean pain score on day one was 6.82, on the third day it was 5.66 and on day seven it was 4.42. The 'p' value is 0.00 thus rejecting the null hypothesis.

The findings presented in [Table No-3] shows the comparison of knee pain in the control group on the 1st day, 3rd day and 7th day of observation. The mean pain score on day one was 5.72, on the third day it was 5.42 and on day seven it was 5.34. The 'p' value is 0.28 for this table.

The findings presented in [Table No-4] shows us the comparison of knee pain between the experimental and control group. The mean pain score on the first day in the experimental and control group is 6.82 and 5.72 respectively with a standard deviation of 1.26 and 1.21 in the experimental group and control group respectively. The mean pain score on day 3 in the experimental and control group is 5.66 and 5.42 respectively with the standard deviation for the experimental and control group being 1.52 and 1.23 respectively. The mean pain score on the 7th day for experimental and control group is 4.42 and 5.34 respectively with the standard deviation for experimental and control group being 1.26 and 1.30 respectively.

The findings of the study were compared statistically, it was found that the study findings were consistent with the study conducted by Mr. Yang Jun, (Et al); Seoul assessed the effectiveness of eucalyptus oil on pain in the knee and swelling after total knee replacement.[10] Which showed that eucalyptus oil was effective on knee pain

The findings of this study were consistent with another study conducted by Mr. Basil Varghese; Mandya on the effectiveness of eucalyptus oil on knee pain reduction in osteoarthritis patients. Which also showed that eucalyptus oil is competent to minimize pain of the knee among osteoarthritis patients. [11]

Delimitations and Recommendations

This study is delimited to men and women diagnosed with osteoarthritis of the knee, with the subjects who are having moderate to severe pain only being included.

1. Comparative studies can be done for testing both the difference between pharmacological treatment and treatment with eucalyptus essential oil
2. A comparative research could perhaps be done on a bigger specimen range along with a prolonged time span thus the findings can be relatable to a bigger community.
3. A parallel analysis could perhaps be executed to analyze the effectiveness of eucalyptus oil on joint pain in other bone diseases
4. A contrastive study could perhaps be done to analyze knee joint pain between men and women suffering from osteoarthritis.
5. A identical analysis could be carried out to evaluate the effectiveness of other essential oils with anti-inflammatory properties on pain among osteoarthritis patients.

Conclusion

In the present study, the effectiveness of eucalyptus oil application on knee pain among osteoarthritis patients was assessed. Eucalyptus oil with its anti-inflammatory properties helps in alleviating pain. It is concluded that the use of eucalyptus oil for knee pain among osteoarthritis patients is a safe, cheap and effective method to decrease the pain among osteoarthritis patients having knee pain.

Conflict of Interest: Column is Nil.

Source of Funding: Self.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research ethical committee for approval. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done obtained under the chairmanship of Dr. Sripriya and Dr. Nilima Bhore.

A Study to Assess the Knowledge Regarding Self-Care Management among the Pregnant Mother with PIH Attending Selected Maternity OPD's of Tertiary Hospitals in Sangli, Miraj and Kupwad Corporation Area

Silviya John Gaikwad[1], Vijaya Kumbhar[2]

[1]M.Sc Nursing, [2]Associate Professor, Bharati Vidyapeeth (Deemed to be University), College of Nursing Sangli, Maharashtra

ABSTRACT

Pregnancy is absolutely one of the most pleasurable experiences in a women's life. Pregnancy may be natural, but it does not mean that it is a problem free.[4] PIH is characterized by high blood pressure and the presence of proteinurea accompanied by edema that has a harmful effect equally on both fetus and mother adversely.[5] The purpose is to assess the knowledge regarding self care management and to find the association between knowledge score with selected demographic variables among the mothers with pregnancy induced hypertension. The study was conducted by using quantitative approach with non-experimental, explorative, descriptive research design. The conceptual framework was based on self care theory, developed by Dorothea Orem.[18] The reliability was calculated by using Karl Pearson's formula coefficient. Total 120 samples were selected by Probability simple random sampling technique, lottery method. Data collection tool had knowledge questionnaire to assess knowledge regarding self-care management of PIH. It was found that 62.50% of mothers with PIH were having poor knowledge regarding self care management of PIH. Thus it was concluded that implementation of knowledge regarding self care management of PIH would be beneficial to mothers having PIH in many ways like it reduces the further complications.

Keywords: *Assess, knowledge, mothers with PIH, self care management*

Introduction

Pregnancy is absolutely one of the most pleasurable experiences in a women's life.[4] The news of pregnancy excites the women; she plans everything for the arrival of the new baby with a lot of care and happiness.[2] Pregnancy may be natural, but it does not mean that it is a problem free.[4] On the other hand a lot of health disorders are acknowledged to make this memorable moment difficult and the most imminent one is Pregnancy Induced Hypertension. PIH is characterized by high blood pressure and the presence of protein in urea accompanied by edema that has a harmful effect equally on both fetus and mother adversely.[5] PIH particularly preeclampsia is a key source of maternal and perinatal morbidity and mortality worldwide.[6] The national occurrence of PIH ranges in between 5-15.2% in India.[9] However hypertensive disorders in pregnancy cannot be arrested and progress of complications can be barred by timely detection and eminence self care management of PIH mothers at home.[7] The components of self care management of mothers with PIH includes rest and sleep, positioning, exercise, stress management, weight monitoring, fetal monitoring, recognition of sign and symptoms of complications and frequency of antenatal checkups, which help the mother to reduce PIH and take prompt action in case of emergency in order to reduce the incidence of maternal morbidity and mortality.

Aim

To assess the knowledge regarding self care management and to find the association between

knowledge score with selected demographic variables among the mothers with pregnancy induced hypertension.

Assumptions: Mothers with PIH may have some knowledge regarding self-care management.

Materials and Method

A present study was conducted by using quantitative approach with non-experimental, explorative, descriptive research design. The conceptual framework was based on self care theory, developed by Dorothea Orem, with the concept of theory containing self care, self care agency, therapeutic self care demand, self care requisites. The reliability was done by using split half method 'r' was calculated by using Karl Pearson's formula coefficient 'r' of the questionnaire was0.77. Validity was done from 15 experts, out of which 11 had received. Proposal with tool presented in front of ethical committee for permission. Total 120 samples were selected by Probability simple random sampling technique, lottery method. Pilot study was conducted with 12 samples and the study was found feasible. Final study was conducted with same data collection tool. Data collection tool had knowledge questionnaire to assess knowledge regarding self-care management of PIH.

Results

Section II: Frequency and percentage distribution of knowledge score.

Table 1: Frequency and Percentage Distribution of Knowledge Score

N = 120

Knowledge Score	Frequency	Percentage (%)
Poor (0-6)	75	62.50
Average (7-12)	43	35.83
Good (13-17)	2	1.67

Table No. 2 indicates that in knowledge scores, 62.50% of mothers with PIH were having poor knowledge, 35.83% were having average knowledge and remaining 1.67% mothers with PIH were having good knowledge.

Section III: Association between knowledge score with selected demographic variables.

Table 2: Association between Knowledge Score with Selected Demographic Variables

N = 120

Sr. No.	Variable		Knowledge			Chi Square	d. f.	p value	Significance
			Poor	Average	Good				
1.	Age in years.	< 20	7	2	0	13.53	6	0.035	Significant
		21-25	32	17	0				
		26-30	28	16	0				
		31-35	8	8	2				
2.	Education	Informal	20	3	0	13.82	6	0.032	Significant
		Primary	22	14	0				
		Secondary	19	14	0				
		Higher	14	12	2				
3.	Occupation	Housewife	50	30	0	25.46	4	0.000	Significant
		Private	21	10	0				
		Government	4	3	2				
4.	Family Income in Rs.	below 5000	25	17	2	7.04	4	0.134	Not Significant
		5001-10000	24	18	0				
		above 10001	26	8	0				

Table 3: Association between Knowledge Score with Selected Demographic Variables

N = 120

Sr. No.	Variable		Knowledge			Chi Square	d. f.	p value	Significance
			Poor	Average	Good				
5.	Gravid	Primigravida	41	23	1	0.03	2	0.985	Not Significant
		Multigravida	34	20	1				
6.	Gestational age in weeks	20-24	21	10	0	26.41	6	0.000	Significant
		25-28	39	26	0				
		29-32	11	4	0				
		33 & above	4	3	2				
7.	Family history of hypertension	Yes	50	31	2	1.28	2	0.527	Not Significant
		No	25	12	0				
8.	Previous knowledge regarding PIH	Yes	30	20	1	0.52	2	0.771	Not Significant
		No	45	23	1				
9.	Source of information	Friends and family members	12	10	0	10.49	6	0.105	Not Significant
		Mass Media	3	4	1				
		Health personal	6	5	0				
		Books	9	1	0				

The data in table No. 4 and Table No. 5, represented that there was significant association between age in years, education, occupation and gestational age in weeks with knowledge score as the calculated 'p' value is less than tabulated 'p' (0.0) value. It also indicates that there was no significant association between family income in Rs. gravid, family history of hypertension, previous knowledge regarding PIH and sources of information with knowledge score as the calculated 'p' value is more than tabulated 'p'(0.0) value.

Discussion

Section I: As per the analysis of the study finding it was found that most of the mothers with PIH (40.83%) were between the age group of 21-25 years, 27.50% mothers with PIH were secondary educated, 66.67% mothers with PIH were housewife, 36.67% mothers with PIH were from a monthly family income group below Rs. 5000/- , 54.17% were primigravida mothers, 54.17% were in between the 25-28 weeks of gestation, 69.17% mothers with PIH had a family history of hypertension, 57.50% mothers with PIH had no previous information regarding self care management of PIH, 43.14% mothers with PIH got the information regarding self care management of PIH from friends and family members.

Section II: Assessment of knowledge in terms of frequency and percentage

Data of the mothers with pregnancy induced hypertension was analyzed to assess the knowledge, regarding self care management in terms of frequency and percentage.

In knowledge scores, 62.50% of mothers with PIH were having poor knowledge.

Section III: Association between knowledge score with selected demographic variables.

The chi-square test was used to find out the association between knowledge score with demographic variables. In age in years of mothers with PIH 'p' value was 0.035 which is less than 0.05 so there is a significant association between age of mothers with PIH with knowledge score. In education 'p' value was 0.033 which is less than 0.005 so there significant association between the education of PIH mothers with knowledge score. In occupation 'p' value was 0.000, which is less than 0.05 so there significant association between the occupation of PIH mothers with knowledge score. The 'p' value between gestational age in weeks and knowledge score was 0.00, less than 0.05 so there is significant association between gestational age in weeks with knowledge score.

The findings of the present study have been discussed with reference to the objectives and assumption.

The study results were consistent with the research conducted by Tanya Salim et al in Trivandrum; Kerala assessed the knowledge of gestational hypertension and its self care management among primigarvida women. Non-experimental, descriptive research design was used for the study. The subjects were 240 primigravida women selected by using consecutive sampling technique. A semi structured interview schedule was used to collect data from the patients. The results showed that 70.7% of pregnant women had poor knowledge and only 4.2% had good knowledge regarding gestational hypertension. 36.4% of pregnant women had poor knowledge and 26.4% had good knowledge regarding its self care measures. Significant association was noted between knowledge of gestational hypertension and age and education of pregnant women. There is a significant association of knowledge of self care measures of gestational hypertension with age, place of residence, educational status and use of mass media as a source of information.

Conclusion

It gives brief description of study as well as summary and the outcome of the study. It also gives appropriate implications and recommendations for further research study.

The main aim of the study was, to assess the knowledge regarding self care management among the mothers with PIH. The design used for the study was non experimental, explorative, descriptive research design. The study was conducted at selected maternity OPD's of tertiary hospitals in Sangli, Miraj and Kupwad corporation area. The Sample size of the study was 120 PIH mothers.

The reliability of the tool was determined Split Half Method of Reliability, the tool was administered to 12 samples. Reliability of the tool was found to be 0.77.

The pilot study was conducted, to assess the feasibility of the study and to decide the statistical analysis and practicability of research. It was found feasible.

Finding of the present study revealed that significant amount of PIH mothers were lacking the knowledge about self care management of PIH. Planning for implementation of knowledge regarding self care management of PIH would be beneficial to the PIH mothers and reducing the chance of further complications.

The findings of the study recommended that can be conducted on larger populations, in different settings, among the nurses and by using an observational checklist to assess practices.

Conflict of Interest: Nil.

Source of Funding: Self.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval. Prior permission from hospitals was taken. Informed written consent from each participant was taken which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance was done with the committee members Dr. Sripriya and Dr. Nilima Bhore mam.

A Study to Assess the Relationship between Job Satisfaction and Burnout among Staff Nurses Working in Selected Hospitals of Sangli, Miraj and Kupwad Corporation Area

Umesh Kisan Rathod[1], Satish Salvi[2]

[1]M.Sc Nursing, [2]Associate Professor, Bharati Vidyapeeth (Deemed to be University), College of Nursing Sangli, Maharashtra

ABSTRACT

Registered nurses (RNs) are the largest healthcare industry. Despite several rewards to care for a profession, there are many tensions that affect the nurse.[1] The emotional dimension of the nursing work environment provides new insights into the burning experience. Approximately 30% to 50% of work increases the workload burden, which leads to professional pressure.[2] The effect of burnout is intense Nurse Job satisfaction is combined with performance and quality care. The purpose is to assess the level of job satisfaction, level of burnout and to find the association between job satisfaction and burnout among staff nurses[13]. The study was conducted by using quantitative approach with non experimental, explorative, descriptive research design. The conceptual framework was based on job demand control model developed by Karasek 1979. 110 staff nurses were selected through non probability convenient sampling technique.

Data collection tool was standards tool-maslach burnout inventory (BMI) and The Benjamin Rose nurse's assistant job scale is an 18 item scale or instruments. It was found that 80.91% of professional burnout scores were less than burning. 90.91% of nurses have a low level of personality crash. 48.18% of staff and nurses were less fuelled. 57.27% nurses were satisfied with the assessment of employees' well-being. There is no significant link between work and work satisfaction among employee nurses.[14]

There is no significant connection between the disturbances of employee nurses and work satisfaction. There is a significant connection between employee record and job satisfaction. The study concluded that the key findings of work and job satisfaction studies from workforce and nurses. 90.09% nursing personality disorder and 57.27% nurses are satisfied. In addition, the association showed that among the staff and nurses in the data there is a significant difference between burning and job satisfaction.[8]

Keywords: *Assess, job is satisfied, burnout, employee nurse*

Introduction

A. Burned Out: Burn syndrome (BOS) was found in human service specialists in the early 1970s. It can be described as a way to prevent emotional stress in jobs, or to exacerbate the use of energy and resources that lead to feelings of failure and fatigue.[8] Depression affects nearly every aspect of human life, however Bose also has overall health. Maslach reduces and Jackson Maslach Burnout Invoice (MBI) survey and the intensity of species of mammals. Factors that determine working conditions and workloads in workplace syndrome[13]

B. Job Satisfaction: Nurse Job satisfaction has been coupled to performance and to providing quality nursing care. There have been extensive studies in the USA and Europe on nurse's job satisfaction and to some extent in Asian countries like Japan, Korea and Taiwan.[13]This study can investigate the amount of satisfaction among non public hospital nurses and also the factors with that there glad or discontented.

Aim

To assess the level of job satisfaction, to assess the level of burnout and to find the association between job satisfaction and burnout among staff nurses.

Assumption

There may be relationship between job satisfaction and burnout among staff nurses.

Materials and Method

The present study was conducted by using quantitative approach with non experimental, explorative, descriptive research design. The conceptual framework was based on job demand control model developed by Karasek 1979. Validity was done from 30 experts out of which 25 had received. Proposal with tool presented in front of ethical committee for permission. 110 staff nurses were selected through non probability convenient sampling technique. Pilot study was conducted on 12 staff nurses and the study was found feasible. Final study was conducted with same data collection tool. Data collection tool was standards tool-maslach burnout inventory (BMI) and The Benjamin Rose nurse's assistant job scale is an 18 item scale or instruments.

Result

Section I: Assessment of Level of Job Satisfaction in Terms of Frequency and Percentage: Deals with analysis of data related to assessment of the level of burnout among staff nurses in terms of frequency and percentage.

Table 1: Assessment of the Level of Burnout–Burnout

N = 110

Variable	Burnout	Scores	Frequency	Percentage
Burnout	Low level	< 17	89	80.91
	Moderate	18-29	21	19.09
	High	> 30	0	0.00

The above table shows, the assessment of the burnout of the staff nurses at the work places, in burnout scores 80.91% of staff nurses were having low level of burnout, 19.09% were moderate level burnout and no one in the high level burnout.

Section II

Deals with analysis of data related to assessment of the level of Job Satisfaction among staff nurses in terms of frequency and percentage.

Table 2: Assessment of the Level of-Job Satisfaction

N = 110

Variable	Group	Scores	Frequency	Percentage
Job Satisfaction	Very Dissatisfied	0 -14	0	0.00
	Dissatisfied	14-27	18	16.36
	Satisfied	28-41	63	57.27
	Very Satisfied	42-54	29	26.36

The above table shows, the assessment of the job satisfaction of the by the staff nurses, concludes that 57.27% of staff nurses were satisfied with their job, 26.36% were in very satisfied group, 16.36 were dissatisfied and no one in the very dissatisfied group.

Section III

Deals with analysis of data related to the association between job satisfaction and burnout among staff nurses.

Table 3: Association between Job Satisfaction and Burnout among Staff Nurse

N = 110

Variable	Groups	Job Satisfaction			Chi Square	d. f.	p value	Significance
		Dissatisfied	Satisfied	Very Satisfied				
Burnout	Low level	17	50	22	2.71	2	0.258	Not Significant
	Moderate	1	12	7				
	High	0	0	0				
De personalization	Low level	17	56	27	0.75	2	0.68	Not Significant
	Moderate	1	7	2				
	High	0	0	0				
Personal Achievement	Low level	6	2	15	10.55	4	0.032	**Significant**
	Moderate	1	16	7				
	High	11	15	7				

Discussion

Most researchers and nurses are aged 18-24, that is, 39.09%, the population and nurses are experienced by women, namely 64.55%, and the eligibility criteria that the population and nurses experience ANM 35.45%. Most nurse workers refer to age 90.00, 87 in 87 nurses at ICU, i.e. 79.09%, the maximum nursing monthly income is between 1000-1-15000 rupees, i.e., the marriage rate indicates a maximum of 70.91% of marital marriages. 44.55% No children, 73.64% of nurses are supported by members, and 55.45% of family members are nursing parents the shows.

During the assessment of employees' burning estimates, 90.09% nurse staff showed that the personality disorder and 57.27% nurse workers were satisfied. In addition, the information received from the union showed that there was no significant difference between job loss and job satisfaction between employees and nurses.

Conclusion

An analysis of the relationship between job satisfaction and burning relationships among nurses who work in selected hospitals in Sangli, Miraj and Kupwad. This chapter includes an analysis of key findings of work and job satisfaction studies from workforce and nurses. 90.09% nursing personality disorder and 57.27% nurses are satisfied. In addition, the association showed that among the staff and nurses in the data there is a significant difference between burning and job satisfaction.

The reliability of the Tool is standardized so reliability not done. The tool feasibility, reliability and validity of the proposed research design.

Pilot study is a trial study carried out before a research design is finalized to assist in defining the research question or to test the feasibility, reliability and validity of the proposed research design.

Conflict of Interest: Column is Nil.

Source of Funding: Self.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval. Prior permission from hospitals were taken. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr. Sripriya and Dr. Nilima Bhore mam.

A Study on Awarness among Employees on Health Care and Appraisal System Adopted in Pharmacy Companies

S. Poongavanam[1], S. Jivita[2]

[1]Associate. Professor, [2]Research Scholar, AMET Business School, AMET University, Chennai

ABSTRACT

Performance appraisal has been defined as any personal decision that affects the status of employee regarding their retention, termination, promotion, transfer, salary increase or decrease or admission into a training programme. This study focuses on corporate training give by the company and how it has its impact on the changing business scenario. Data are collected through questionnaire and suggestion were give to improve their appraisal procedure.

Keywords: *Technical, Appraisal, Communication & Training*

Introduction and Review

Once the employee has been selected, trained and motivated, he is then appraised for his performance. Performance appraisal is the step where to find out how effective if has been at hiring and placing employees. If any problems are identified steps are taken to communicate with the employee and to namely them. A "Performance Appraisal is a process of evaluating an employee's performance of a job in terms of its requirements. It is the process of evaluating the performance and qualifications of the employees in terms of the requirements of the job for which he is employed, for purposes of administration including placement, selection for promotions, providing financial rewards and other actions which require differential treatment among the members of group as distinguished from actions affecting all members equally viz., recruitment, selection, placement and indoctrination. The appraisal process begins with the establishment of performance standards in accordance with the organization's strategic goals. These should have evolved out of the company's strategic direction – and, more specifically the job analysis and the job description. The performance standards should also be clear and objective enough to be understood and measured. Too often, these standards are articulated in ambiguous in ambiguous phases that tell us little, such as "a full day's work" (or) "a good job". What is a "full day's work" or a "good job"? The expectations a supervisor has in terms of work performance by the employees must be clear enough in her mind so that she will be able to, at some later date, communicate these Expectations to her employees, mutually Agree to specific job performance measures and appraisal their performance against these established standards.

Improving Performance Management Practices in IT Firms of Pakistan. Results indicated that by implementing steps of performance management processes i.e. setting objectives, training, performance agreement, and performance review and reward[1]. Appraising Performance Appraisal Systems in the Federal Government: A Literature Review, The result suggests analyzing performance appraisal system structures, beyond employee survey data; it provides to the scholars with rich research opportunities [2]. A Study of Effect of Performance Appraisal on the Organization and the Employee. The findings of the research showed that there is a noticeable effect of the performance appraisal on the organization as well as on the Individual [3]. Performance Management System in UK Retail Industry: it is a case Study. Findings showed that, the organization is very powerful in employee performance management, as they are concerned for both poor and high performer with corrective action and reward respectively [4]. Efficacy of Performance Management System: An Empirical Study

at ICICI Bank. This research has attempted to minimize the research gap existing in the field of efficacy of performance management system [5]. An evaluation of the effectiveness of performance management systems on service delivery in the Zimbabwean civil service". It was concluded that the current performance management system was not enhancing the provision of quality [6]. Compensation is given to award the employees for their efforts put in the company and to give guarantee that employees will stay in the same company and are satisfied over a longer period. It is important, as it is a systematic way to plan the compensation for the employees[7]. The significance of the seniors-subordinate rapport and the role of communication system in business are widely discussed in various studies. It highlights the workplace temperature, wetness and airflow in the company and the way it kindle a good relationship between workers, senior and subordinate[8].

Objectives of the Study

- To study whether performance appraisal system is communicated to the employees.
- To study the awareness of health care system in the Pharmacy companies.
- To study the socio-demographic factors of the employees in the Pharmacy companies
- To give viable suggestions.

Research Methodology

Research methodology is a way to solve the research problem systematically it may be understood as a science of studying how search is done scientifically study. We study the various steps that all generally adopted by a researcher in studying problem along with the logic behind them. A study, which wants to portray the characteristics of a group or individual situation, is known as **descriptive study**. The main characteristic of this method are that researcher has no control over the variables. He can only report what has happened and what is happening. The researcher approached the employees individually questions were asked and information was collected. Question were explained so as to around ambiguity. The employees were found co-operative. The data used for this study were both primary and secondary data. Sample size for this study is 100.

Statistical Tools Used:

Percentage and Corelation

Limitations of the Study

- The study is concerned only with in the Pharmacy companies, Chennai.
- The sample size is confined to 100 respondents.
- The result of the study cannot be generalized for the entire organization as it is restricted few employees.
- Some of the employees were reluctant to fill up the questionnaire, as they are feared to give negative aspects against management

Analysis and Findings

Table 1: Department

Department	No. of respondents	Percentage
Technical	44	44%
Non-Technical	56	56%
Total	100	100%

Inference: From above table it inferred that 56% of the respondents fall under the department of Non-technical, 44% of the respondents fall under the department of technical.

Table 2: Designation

Designation	No. of respondents	Percentage
Workmen	64	64%
Supervisor	28	28%
Executive	8	8%
Total	100	100%

Inference: From the above table it inferred that 64% 0f the respondents for under designation of workmen, 28% 0f the respondents fall under the designation of supervisor, 8% of the respondents fall under the designation of executive.

Table 3: Age Group of Respondents

Age	No. of respondents	Percentage
20-30	0	0%
30-35	0	0%
35-40	36	36%
Above	64	64%
Total	100	100%

Inference: From the above table it inferred that 64% of the respondents fall under the age group of above 40, 36% of the respondents fall under the age group of 35-40.

Table 4: Experience Level of Respondents

Experience Level	No. of respondents	Percentage
Less than 10	0	0%
11-20	26	26%
21-30	74	74%
Above 30	0	0%
Total	100	100%

Inference: From the above table it inferred that 74% of the respondents have more than 21-30 years of experience, 26% of the respondents have 11-20 years of experience.

Table 5: Educational Level of Respondents

Educational level	No. of respondents	Percentage
Less than 10 th	0	0%
+2	18	18%
Diploma &ITI	30	30%
Graduate & above	52	52%
Total	100	100%

Inference: From the above table it inferred that 52% of the respondents are graduated & above, 30% of the respondents are diploma or ITI, 18% 0f the respondents have +2 as their holders qualification.

Table 6: Gender

Gender	No. of respondents	Percentage
Male	90	90%
Female	10	10%
Total	100	100%

Inference: From the above table it inferred that majority of the respondents are male i.e. 90% and 10% 0f the respondents are female.

Table 7: Aware of the Employee Health Care System in Your Organization

Description	No. of respondents	Percentage
Fully aware	62	62%
Partially aware	30	30%
Little aware	8	8%
Not at all	0	0%
Total	100	100%

Inference: From the above table it inferred that 62% of the respondents are fully aware of health care system in the organization, 30% 0f the respondents are partly aware to the statement, 8% of the respondents are little aware to above said statement.

Table 8: Performance Appraisal Procedure is Communicated in Advanced to You

Description	No. of respondents	Percentage
Always	0	0%
Often	6	6%
Sometimes	68	68%
Not at all	26	26%
Total	100	100%

Inference: From the table it inferred that 68% 0f the respondents felt that performance appraisal procedure is communicated in advance sometimes only, 26% 0f the respondents says not at all, 6% of the respondents feel often to the above statement.

Suggestions

- The organization may take steps to communicate performance appraisal procedure in advance to employees.
- Mechanisms to identify the employees' potential and to reward based on the potential and performance rather than experience alone.
- Motivate subordinates through recognition and support. Performance appraisal system may help the employee to achieve individual goals and organization's goals.

Conclusion

The study on employee performance appraisal helps to identify the impact on changing business environment. The primary data was obtained through questionnaire. The data are collected from 100 respondents and analyzed using statistical tools like percentage analysis and correlation. Various suggestions had been provided to the organization to improve health care and employees' performance appraisal.

Methods of Performance Appraisal

Traditional Methods:

1. Ranking method
2. Comparison method
3. Grading
4. Graphic rating scales
5. Forced choice description method
6. Forced distribution method
7. Check lists
8. Free from essay method
9. Critical incidents
10. Group appraisal
11. Field Preview method

Objectives of the Study

- To study the regularity of occupational health issues followed.
- To identify the needs of performance appraisal as per the changes conducted in the organization.
- To study the satisfaction level of present method of performance appraisal.

Research Methodology

Research methodology is a way to solve the research problem systematically it may be understood as a science of studying how search is done scientifically study. We study the various steps that all generally adopted by a researcher in studying problem along with the logic behind them. A study which wants to portray the characteristics of a group or individual situation is known as **descriptive study**. The main characteristic of this method are that researcher has no control over the variables. He can only report what has happened and what is happening. The researcher approached the employees individually questions were asked and information was collected. Question were explained so as to around ambiguity. The employees were found co-operative. The data used for this study were both primary and secondary data. Sample size for this study is 100.

Statistical Tools Used: Percentage and Corelation

Limitations of the Study

- The sample size is confined to 100 respondents.
- The result of the study cannot be generalized for the entire organization as it is restricted few employees.
- Some of the employees were reluctant to fill up the questionnaire, as they are feared to give negative aspects against management

Analysis and Findings

Table 1: Undergone Occupational Health Issues

Options	No. of respondents	Percentage
Yearly	34	34%
Half Yearly	10	10%
Quarterly	56	56%
Any other	0	0%
Total	100	100%

Inference: From the above table it inferred that 56% 0f the respondents have undergone health issues quarterly, 34% of the respondents have undergone yearly, 10% of the respondents have undergone half yearly.

Table 2: Satisfaction Level of Performance Rating Scale on Industry Standard

Description	No. of respondents	Percentage
Highly Satisfied	0	0%
Satisfied	34	34%
Dissatisfied	48	48%
Highly Dissatisfied	18	18%
Total	100	100%

Inference: From the table it inferred that 48% 0f the respondents are dissatisfied with the performance rating scale, 34% of respondents are satisfied to the above statement, 18% of the respondents are highly dissatisfied to the above statement.

Table 3: Identifies Development Needs as Per the Changes in Health Issues

Description	No. of respondents	Percentage
Fully identifies	8	8%
Partly identifies	50	50%
Little identifies	28	28%
Does not identifies	14	14%
Total	100	100%

Inference: From the above table it inferred that 50% 0f the respondents felt that, the health issues to partly identify their developmental needs, 28% of the respondents felt it to be little identified, 14% of the respondents feel it does not identify, 8% of the respondents feel it help them to fully identified their development needs.

Table 4: The Most Appropriate Person to Appraise

Description	No. of respondents	Percentage
Supervisors	30	30%
Self	40	40%
Subordinates	16	16%
All of the above	14	14%
Total	100	100%

Inference: From the table it is found out that 40% of the respondents feel that the most appropriate persons to appraise is self, 30% of the respondents feel supervises are opt to the statement, 16% of the respondents feel subordinates to the above statement and about 14% of the respondents feel that all of the above statement.

Table 5: Satisfaction Level with the Present Performance Appraisal

Description	No. of respondents	Percentage
Highly Satisfied	10	10%
Satisfied	56	56%
Dissatisfied	22	22%
Highly dissatisfied	12	12%
Total	100	100%

Inference: From the above table it inferred that 56**%** of the respondents are satisfied with the present method of performance appraisal, 22% of the respondents are dissatisfied to the statement, 12% of the respondents are highly dissatisfied to the statement, 10% of the respondents are highly satisfied to the above statement.

Table 6: The Performance Rating is Based on the Overall Health Behaviour

Description	No. of respondents	Percentage
Yes	67	67%
No	33	33%
Total	100	100%

Inference: 67% of the respondents was accepted about the performance rating based on the overall health issues and its behaviour 33% of them were not accepted with the statement

Suggestions

- The organization may take steps to create awareness among the employee among the health issues.
- Mechanisms to identify the employee's potential and to reward based on the potential and performance rather than experience alone.
- Motivate subordinates through recognition and support. Performance appraisal system may help the employee to achieve individual goals and organization's goals.

Conclusion

The study on employee performance appraisal helps to identify the impact on changing business environment. The primary data was obtained through questionnaire. The data were collected from 100 respondents and analyzed using statistical tools like percentage analysis and correlation. Various suggestions had been provided to the organization to improve employees' performance appraisal.

An Empirical Study on Employee Health and FIRO-B Relationship

S. Poongavanam[1], K. Viswanathan[2]

[1]Associate Professor, [2]Research Scholar, AMET Business School, AMET University, Chennai

ABSTRACT

The Fundamental Interpersonal Relations Orientation–Behavior (FIRO-B) instrument was created in the late 1950s by William Schutz. He developed the FIRO-B theory to aid in the understanding and predicting of how high-performance military teams would work together. This article focus on deterioration of employee's health due to the poor relationship among employees. Convenience sampling techniques is used to collect data for the analysis. The study shows the importance of FIRO B relationship among the employees.

Keywords: *Interpersonal relationship, Policies, Conference and Gaps.*

Introduction

FIRO-B "Fundamental Interpersonal Relations Orientation-Behaviour" was developed by Dr Willis Schultz for the US Government during the Korean War to assess individual's inter-personal needs and how these may affect their behaviour towards others. This instrument has been ethically researched and validated in many countries and is widely used not just in team building in the work-place and management development, but also in individual and family relationship –counselling. FIRO-B "Fundamental Interpersonal Relations Orientation-Behaviour" measures how much people may need others, particularly in terms of: Inclusion and how much contact, attention and recognition you may generally want to give others in your life and receive back;

- Control, and how much influence, responsibility and structure you may seek in your relationships, whether to lead and direct others or to be led;
- Affection, or openness, and how close and warm you are with others and want others to be with you.

Apart from being a helpful coaching and development tool to build deeper self-awareness, FIRO-B "Fundamental Interpersonal Relations Orientation-Behaviour" can also provide helpful insight into an individual's possible compatibility with others in different situations. It is therefore widely used in any situation requiring a measurement of interpersonal behaviour and the likely needs of others, including management development, team building and employee development.

There has been little research on whether providing a range of family-friendly policies raises workplace performance, there is some evidence to link individual practices with enhanced productivity. It was found that employees had greater enthusiasm for their work where they were employed on a part-time basis, which might then be expected to generate higher productivity [(3).] Certainly, some part-time workers believe that they are more productive than when they were previously working fulltime [(1)]. The fact that part-time employees may not require a paid break can also reduce costs for the employer [(5).] The researchers cite evidence that part-time workers experience lower levels of stress than full-time employees do, and have lower absenteeism rates [(2)]. Employers of part-time workers are also able to call on the skills of a larger number of employees, and retain experienced staff who wish to reduce their hours and might otherwise seek alternative employment [(2).] Given that the average cost of labour turnover has been estimated at £3,546 per employee, the savings

made by retaining employees could be significant [4]. Compensation is given to award the employees for their efforts put in the company and to give guarantee that employees will stay in the same company and are satisfied over a longer period. It is important, as it is a systematic way to plan the compensation for the employees[6]. The significance of the seniors-subordinate rapport and the role of communication system in business are widely discussed in various studies. It highlights the workplace temperature, wetness and airflow in the company and the way it kindle a good relationship between workers, senior and subordinate[7].

Objectives of the Study

- To study employees health issues and its impact onf communications system.
- To study satisfaction level of interpersonal relationship and policies exist in the organization.
- To study the opinion of training session on health issues conducted in the company.

Limitations of the Study

- Time and cost factors.
- Study cannot be generalized.
- Employees are not ready to give the correct answer fearing of action from the management,

Research Methodology

Research design is the arrangement of conditions for collection and analysis of data a systematic manner that aims to combine relevance to the research purposes with economic in procedure. Descriptive research design is used to study Interpersonal Relationship of work place in Tirupattur Co-Operative Sugar Mills Ltd. This study includes both primary data and secondary data.

- Primary data
- Secondary data

Primary data are those which are collected a fresh and for the first time and thus happen to be original in character. For this project study questionnaire method is used. The secondary data are those data which have already been collected by some else and which have already been passed through statistical process secondary data be published or unpublished data.

"A sample design is a definite plan for obtaining a sample form a given population". It refers to the technique (or) procedure that researcher would adopt in selecting item for sample, design may be as well lay down the numbers of items included in the sample i.e. the size of the sample.

The size of the represents sample is for 75 out of the total population 338. In this study the researcher has used convenient sampling techniques to select the sample size.

Data Analysis and Interpretation

Table 1: Opinion about respondents on satisfaction level on Employee health is accepted or consider by management

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Highly Satisfied	10	14
2.	Satisfied	38	49
3.	Neutral	15	20
4.	Highly Dissatisfied	8	11
5.	Dissatisfied	4	6
	Total	75	100

The above table shows that 14% of the respondents are highly satisfied, 49% of the respondents are satisfied, 20% of the respondents are neutral, 11% of the respondents are highly dissatisfied, 6% of the respondents are dissatisfied on satisfaction level on employee health is accepted or consider by the management.

Majority of the respondents are 49%

Table 2: Opinion about Respondents on Important Tool Need to Use by the Employees on Faro-B "Fundamental Interpersonal Relations Orientation-Behaviour" Aspect

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Inclusion	14	19
2.	Control	34	44
3.	Affection	27	37
	Total	75	100

From the above table, it is noted that 19% of the respondents need inclusion and 44% of the respondents

need control and 37% of the respondents need affection as an important tool need to employees on firo-b aspect. Majority of the respondents are 44%.

Table 3: Opinion about Respondents of training on Interpersonal Relationship in an Organization

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	On the Job Training	16	21
2.	External Training	24	30
3.	Conference	16	22
4.	Discussion	14	20
5.	Programmed Instruction	5	7
	Total	75	100

The above table shows that 21% of the respondents are favour of on the job training, 30% of the respondents are favour of the external training, 22% of the respondents are favour of the conference, 20% of the respondents are favour of the discussion, 7% of the respondents are favour of on the programmed instruction on health issues on training and development to employees on interpersonal relationship in an organization.
Majority of the respondents are 30%

Table 4: Opinion about Respondents Opinion Regarding the health issues

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Excellent	12	16
2.	Very Good	33	43
3.	Good	20	27
4.	Average	3	5
5.	Poor	7	9
	Total	75	100

The above table shows that 16% of the respondents are excellent, 43% of the respondents are good, 27% of the respondents are average, 5% of the respondents are below average, 9% of the respondents on training session conducting in the organization at present to increase the employee health.

Majority of the respondents are 43%

Table 5: Opinion about the respondents on the general complaints about failure of the interpersonal relationship between employees in an organization

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Take Away Precious Time of Employees by Giving Training	40	55
2.	Too Many Gaps between the Departments	35	45
	Total	75	100

From the above table, it is noted that 55% of the respondents are make the complaints by taking away precious time of employees by giving training and 45% of the respondents are make on the complaints by too many gaps between the departments in an organization on the inter personal relationship between employees.

Majority of the respondents are 55%

- 39% of the respondents were preferred 1-5 years for making betterment on inter-personal relationship with employees in an organisation.

Conclusion

The FIRO-B "Fundamental Interpersonal Relations Orientation-Behaviour" test was conducted to be find out three main interpersonal aspects of human behaviour i.e., inclusion, control and affection with 75 respondents. The study is conducted among the employees of various departments. It is concluded that there is a need to improve the interpersonal relationship between the employees in order to maintain a cordial relationship.

An Empirical Study on Environmental Hazards and Recruitment Process in Health Care Compnies, Chennai

S. Poongavanam[1], K. Viswanathan[2]

[1]Associate Professor, [2]Research Scholar, AMET Business School, AMET University, Chennai

ABSTRACT

Importance of environmental hazard in health care companies are raising year by year, due to the problems faced by the employees in the work sport. Recruitment refers to the process of finding possible candidates for a job or function, usually undertaken by recruiters. It also may be undertaken by an employment agency or a member of staff at the business or organization looking for recruits. Advertising is commonly part of the recruiting process, and can occur through several means: through online, newspapers, using newspaper dedicated to job advertisement, through professional publication, using advertisements placed in windows, through a job center, through campus graduate recruitment programs.

Keywords: *Health care, Recruitment, Expectation & Commitments*

Introduction

Environmental hazards is increasing year by year in few companies, since the management is not considering it an important factors which affects the wellbeing of the employees. Suitability for a job is typically assessed by looking for skills, e.g. Communication skills, typing skills, computer skills. Evidence for skills required for a job may be provided in the form of qualifications (educational or professional), experience in a job requiring the relevant skills or the testimony of references. Employment agencies may also give computerized tests to assess an individual's "off-hand" knowledge of software packages or typing skills. At a more basic level written tests may be given to assess numeric and literacy. A candidate may also be assessed on the basis of an interview. Sometimes candidates will be requested to provide a résumé (also known as a CV) or to complete an application form to provide this evidence.

Recruitment and selection practices of the small and medium enterprises and make them to improve their HR practices[1]. The importance of selection and recruitment activities in the organizations must considered while designing the growth[2]. Among recruitment sources internal source of recruitment is effective compared to the external source[2]. Few researchers say that compared to the traditional recruiting sources the modern sources like referrals, casual applicants and direct approaches will benefit at large[3]. Selection procedure also should be in application to the modern techniques[4]. The literature says that employers are doing the traditional method of recruiting rather than the modern technologies. It is noted in an article that around all the organizations are using traditional recruitment sources and 30% of organizations are screening candidate's honestly[5]. According to SHRM (Society for Human Resource Management) that 15% joined in the organizations are placing false resume[7]. Some of the employers select the candidates with discrimination even though it is not supposed to be done in the organizations[6]. Compensation is given to award the employees for their efforts put in the company and to give guarantee that employees will stay in the same company and are satisfied over a longer period. It is important, as it is a systematic way to plan the compensation for the employees[8]. The significance of the seniors-subordinate rapport and the role of communication system in business are widely discussed in various studies. It highlights the workplace temperature, wetness and air flow in the company and the way it kindle a good relationship between workers, senior and subordinate[9].

Objectives

To study the recruitment practices followed in Health Care Company.

To study the environmental hazards and expectation levels of employees in Health Care company.

To study the opening and employees referrals in the organization.

To give viable suggestions.

Research Methodology

Field of study: The research work was carried out at Health Care companies Chennai.

Research samples: Sample is chosen from the Health care companies as it portrays the needs of the researchers. Research provides an insight into any study top basically evaluate and judge the data or to find the solution to any given problem a simple is representative of a group or population that identifies itself as part of it. The sample chosen for this study is from Health Care Company Chennai.

Data Collection

The data collected contains primary data and secondary data. The primary data has been collected mainly by interviewing and also observation and audit. Secondary data has been obtained from published journals, company broachers, books, internet, etc.

Limitations:

- The study was completed within short span of time that was available.
- The report also suffers from the limitations of exhaustiveness as far as the information is concerned.
- Health Care Company in Chennai only is considered for this study.

Results and Discussion

Table 1: Are you happy with the Recruitment Process?

Recruitment Process	No. of Respondents	Percentage
Yes	68	90.7
No	7	9.3
Total	75	100

The above table shows that 91% of the employees were happy with the recruitment process followed in Health care limited.

Table 2: Did the company meet your expectations on environmental hazards?

Expectation	No. of Respondents	Percentage
Yes	70	93.3
No	--	--
Can't Tell	5	6.7
Total	75	100

It is inferred from the above table that 70% of the respondent feels that the company meet their expectation.

Table 3: Are you happy with the salary offered from the company?

Salary offered	No. of Respondents	Percentage
Yes	24	32
No	51	68
Total	75	100

It is clearly inferred that 68% of employees feels they are happy with the salary offered in the company.

Table 4: Did the company fulfill the commitments given at the time of interview on health issues?

Commitments	No. of Respondents	Percentage
Yes	42	56
No	13	17.3
Can't Tell	20	26.7
Total	75	100

The above table shows that 56% of employees feels that the company fulfills the commitment given at the time of interview, 27% employees selected the option that they can't tell, 18% feels Company does not fulfills the commitments on health issues.

Table 5: How do you come to know about openings?

Opening	No. of Respondents	Percentage
Friends	5	6.7
Internet	23	30.7
News Papers	40	53.3
Others	7	9.3
Total	75	100

The above table shows that 53% of employees came to know about the opening through newspaper advertisement given by the company, 31% feels internet is the major source to know the opening, 7 through friends. % came to know through friends.

Table 6: Do you want to refer more friends on satisfaction of health issues?

Refer friends	No. of Respondents	Percentage
Yes	58	77.3
No	8	10.7
Not Replied	9	12
Total	75	100

77% of employees selected the options that they refer to their friends about the opening and 11% feels that they won't refer to their friends.

Chi-Square Test–Health Care Versus Employee Well Being

Null Hypothesis (Ho): There is no significant relationship between health care and employee wellbeing in the company.

Level of Significance = 5%

Degree of freedom – 9

Calculated value = 34.91

Tabulated value =16.92

Since Calculated value is greater than Tabulated value.

Result

From the above analyses it is inference that the calculated the value is 34.91 greater the tabulated value is 16.92. Hence, null hypothesis is rejected.

Suggestions

- Create awareness among employees on the importance of environmental hazards.
- Increase the competence levels among the employees by giving suitable Training on the use of equipment which causes accidents.
- Provide training to the employee in Health Care company enhances the knowledge, skills and attitude.

Conclusion

Environment hazards, Recruitment and selection plays a important role in the company. The study reveals that the environment practice, recruitment process offered in the organization is very effective. The HR manager of the health care company focus on selecting the right persons through many sources viz., campus placements, internet, private agency, Government employment etc. The selection is done by evaluating the candidate skills, knowledge and abilities which are highly required to the vacancies in selected industries.

Impact of Health Care Laws and Employee Relationship, Policies in Pharma Companies–A Study

S. Poongavanam

Associate. Professor, AMET Business School, AMET University, Chennai

ABSTRACT

Understanding of Health care laws, friendly responsive policies, employee loyalty, social exchange, role, and social justice plays vital role for the satisfaction theory. Gender, age, qualification differences the likely impact of the differences on satisfaction of policies and friendly relationship is discussed. Finally, it also address the likely connections among friendly policies and company policy

Keywords: *Relationship, policies, health care and friendly policy.*

Introduction

Health care plays a major role for the employees working in the factory where more hazardous elements occurs on day to day basis. Fundamental Interpersonal Relations Orientation-Behaviour is to access the employee's inter-personal needs and how it will affect the behaviour of others. This instrument has been ethically researched and validated in many countries and is widely used not just in team building in the work-place and management development, but also in individual and family relationship. It is therefore widely used in any situation requiring a measurement of interpersonal behaviour and the likely needs of others, including management development, team building and employee development.

There has been little research on whether providing a range of family-friendly policies raises workplace performance, there is some evidence to link individual practices with enhanced productivity. It was found that employees had greater enthusiasm for their work where they were employed on a part-time basis, which might then be expected to generate higher productivity [(3).] Certainly, some part-time workers believe that they are more productive than when they were previously working fulltime [(1)]. The fact that part-time employees may not require a paid break can also reduce costs for the employer [(5).] The researchers cite evidence that part-time workers experience lower levels of stress than full-time employees do, and have lower absenteeism rates [(2)]. Employers of part-time workers are also able to call on the skills of a larger number of employees, and retain experienced staff who wish to reduce their hours and might otherwise seek alternative employment [(2).] Given that the average cost of labour turnover has been estimated at £3,546 per employee, the savings made by retaining employees could be significant [(4).] Compensation is given to award the employees for their efforts put in the company and to give guarantee that employees will stay in the same company and are satisfied over a longer period. It is important, as it is a systematic way to plan the compensation for the employees[6]. The significance of the seniors-subordinate rapport and the role of communication system in business are widely discussed in various studies. It highlights the workplace temperature, wetness and airflow in the company and the way it kindle a good relationship between workers, senior and subordinate[7].

Research design is the arrangement of conditions for collection and analysis of data a systematic manner that aims to combine relevance to the research purposes with economic in procedure. Descriptive research design is used to study Interpersonal Relationship of work place in Tirupattur Co-Operative Sugar Mills Ltd. This study includes both primary data and secondary data.

- Primary data
- Secondary data

Primary data are those which are collected a fresh and for the first time and thus happen to be original in character. For this project study questionnaire method is used. The secondary data are those data which have already been collected by some else and which have already been passed through statistical process secondary data be published or unpublished data.

"A sample design is a definite plan for obtaining a sample form a given population". It refers to the technique (or) procedure that researcher would adopt in selecting item for sample, design may be as well lay down the numbers of items included in the sample i.e. the size of the sample.

The size of the represents sample is for 75 out of the total population 338. In this study the researcher has used convenient sampling techniques to select the sample size.

Result and Discussion

Table 1: Opinion about Educational qualification of the respondents

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Sslc	20	27
2.	Hsc	11	13
3.	Diploma	19	27

Conted…

4.	Ug	25	33
5.	Pg	0	0
	Total	75	100

The above table shows that 27% of the respondents belong to the SSLC holders, 13 % of the respondents belong to the HSC holders, 27 % of the respondents belong to the DIPLOMA holders, 33% of the respondents belong to the UG holders, and 0% of the respondents belong to the PG holders.

Majority of the respondents are UG holders 33%

Table 2: Opinion about respondents on marital status of employees

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Yes	73	97
2.	No	2	3
	Total	75	100

From the above table, it is noted that 97% of the respondents are married and 3% of the respondents are unmarried.

Majority of the respondents are married 97%.

Table 3: Opinion about Working Experience of the respondents

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Below 1 Years	2	3
2.	1-5Years	4	5
3.	5-10Years	9	12
4.	10-15Years	11	15
5.	Above 15 Years	49	65
	Total	75	100

The above table shows that 3% of the respondents belong to the below 1 year of experience, 5% of the respondents belong to the 1-5 years of experience, 12% of the respondents belong to the 5-10 years of experience, 15% of the respondents belong to the 10-15 years of experience, 65% of the respondents belong to the above 15 years of experience.

Majority of the respondents are experience 65%

Table 4: Opinions about respondents maintain a friendly relationship with employees in an organization

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Strongly Agree	19	24
2.	Agree	34	45
3.	Neutral	19	26
4.	Strongly Disagree	1	2
5.	Disagree	2	3
	Total	75	100

The above table shows that 24% of the respondents are strongly agree, 45% of the respondents are agree, 26% of the respondents are somewhat agree, 2% of the respondents are strongly disagree, 3% of the respondents are disagree on maintaining a friendly relationship with employees in an organization.

Majority of the respondents are employees in an organization 45%

Table 5: Opinions about respondents on satisfaction about the company policies on health care

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Yes	51	67
2.	No	24	33
	Total	75	100

From the above table, it is noted that 67% of the respondents are satisfied and 33% of the respondents are not satisfied with the policies in the company regarding health care.

Majority of the respondents are policies 67%

Table 6: Opinion about respondents on satisfaction level on opinion on Health laws accepted or consider by management

S. No.	Particulars	No. of Respondents	Percentage (%)
1.	Highly Satisfied	10	14
2.	Satisfied	38	49
3.	Neutral	15	20
4.	Highly Dissatisfied	8	11
5.	Dissatisfied	4	6
	Total	75	100

The above table shows that 14% of the respondents are highly satisfied, 49% of the respondents are satisfied, 20% of the respondents are neutral, 11% of the respondents are highly dissatisfied, 6% of the respondents are dissatisfied on satisfaction level on opinion on health issues is accepted or consider by the management.

Conclusion

The study concludes that implementation of health care law is a must in all the factories. The fundamental Interpersonal Relations Orientation-Behaviour test was conducted to be find out three main interpersonal aspects of human behaviour i.e., inclusion, control and affection with 75 respondents. The study is conducted among the employees of various departments. It is concluded that there is a need to improve the interpersonal relationship between the employees in order to maintain a cordial relationship.

Antioxidants and Antibodies in Structural Thyroid Diseases

Anita P Javalgi[1], B R Yelikar[2], Kusal Das[3]

[1]PhD Scholar, [2]Prof & Head, [3]Professor, Department of Pathology, BLDE University's Shri B M Patil Medical College, Vijayapura, Karnataka

ABSTRACT

Thyroid nodules are a very frequent finding, and their prevalence steadily increases with age. Routinely clinical factors such as age, gender, and radiation history are meaningful for predicting thyroid nodules. There are few studies exploring the association of serum indexes of thyroid hormones or autoantibodies with the risk of thyroid nodules. Hence present study was undertaken with following objectives. To measure the serum markers of FT3, FT4,TSH, anti TPO antibody, anti-thyroglobulin antibody and role of Vitamin E and vitamin C antioxidants in relation with thyroid serum markers in various thyroid diseases. Correlation of these serum markers with cytological diagnosis was done. Serum analysis of thyroid hormones, autoantibodies level and FNAC was done with patients having thyroid swelling.

It was noted in present study that prevalence of positive serum autoantibodies displays geographical heterogeneity, unrelated to goitre prevalence. Autoantibodies levels are raised in autoimmune thyroid diseases and in few variants of thyroid malignancy. And it was also observed anti-Oxidants (vitamin e and vitamin c) levels were variable in thyroid disorders. To conclude autoantibodies are markedly raised in thyroiditis condition and the incidence of autoimmune thyroiditis is increasing in iodine sufficient as well as iodine deficient geographical areas. In present study it was also observed that autoantibodies levels were raised in papillary carcinoma thyroid indicating role of anti-TPO and anti-TG in etiopathogenesis. Antioxidants levels were variable and low in most of thyroid diseases suggesting its role in etiopathogenesis.

Keywords: *auto-antibodies, antioxidants, goitre, papillary carcinoma*

Introduction

Thyroid diseases are among the commonest endocrine disorders worldwide. India too, is no exception. According to a projection from various studies on thyroid disease, it has been estimated that about 42 million people in India suffer from thyroid diseases. Routinely clinical factors such as age, gender, and radiation history are meaningful for predicting thyroid nodules. There are few studies exploring the association of serum indexes of thyroid hormones or autoantibodies with the risk of thyroid nodules. Although thyroid hormones and autoantibodies are reported to be dependently associated with thyroid function and thyroid diseases, little attention has been paid to whether thyroid hormones and autoantibodies are associated with thyroid nodules[2]. Thyroid nodule, as an entity, is one of the most common diseases originating from the endocrine system. Thyroid nodules may be single, multiple, solid, or cystic and may or may not be functional.[3] Most thyroid nodules are benign tumours and 5% are reported as malignant.[4,5] Autoimmune thyroiditis (AT) is a common disorder of the thyroid gland. It is usually diagnosed when thyroid autoantibodies (TPOAbs/TGAbs) are detected in patients with hypothyroidism or goiter.[6]

Autoimmune diseases (AID) appear when the host immune system turns against its own antigens leading to dysfunction or destruction of tissues and organs. AID may develop in mechanisms involving immune deregulation, genetic predisposition and due to influence of environmental factors.[7] Thyroid autoimmune

Email: anitajawalgi@gmail.com

diseases like GD and Hashimoto thyroiditis (HT) affect the thyroid gland and are called autoimmune thyroid diseases (AITD).[8]

Oxidative reactions occur in all tissues and organs, thyroid gland being one, in which oxidative processes are indispensable for thyroid hormone synthesis. Both hyper- and hypothyroidism have been proven to promote cellular oxidative stress by influencing the intensity of oxygen reactions and have been shown to affect concentrations of the vitamins involved in scavenging of free radicals (usually decreasing their concentrations, although study results differ) i.e. vitamins A, C and E.[9]

Therefore, this study was undertaken to determine whether there is an association between thyroid nodules, thyroid hormones levels and thyroid autoantibodies and correlation of these markers with cytological diagnosis. Also an attempt to understand the role of Vitamin E and vitamin C antioxidants in relation in various thyroid diseases was made.

Methodology

This was prospective study carried out in 2016 at out tertiary care hospital. The study group includes patients with thyroid swelling referred to Department of Pathology for FNAC. Patients with thyroid swelling with thyroid hormone therapy or antithyroid drugs were excluded.

Early morning fasting 5ml of venous blood sample was collected in plane vaccutainer and the collected serum sample was run through Vidas biochemical analyzer based on the principal chemiluminescent immunoassay. Serum markers estimation included Free thyroxine(T4), Free tri-iodothyronine (T3), Thyroid stimulating hormone (TSH), Anti thyroglobulin antibody (AntiTG ab), Anti thyroperoxidase (anti TPO), Vitamin C and E levels (HPLC method).

Descriptive statistics as well as 95% confidence interval for a single proportion and a mean was calculated.

Results

In this one year cross sectional study total 54cases with thyroid swelling referred to cytology section were included and all cases we had serum biomarker level estimation. In present study females outnumbered males with 43 females (79%) and 11 males (21%), youngest being 12yrs and oldest age 72yrs.(TABLE I: AGE DISTRIBUTION)

Table I: Age distribution

Sex/age	10-20	21-30	31-40	41-50	51-60	61-70	>70	Total
Female	5	14	10	5	6	2	1	43
Male	1	2	3	3	1	1	-	11

The commonest thyroid disease was colloid goiter followed by thyroiditis. Lymphocytic thyroiditis was common followed by granulomatous thyroiditis and other variants. Papillary carcinoma was commonest malignant lesion affecting females in 3rd and 4th decade.(Table II)

Table II: Various thyroid diseases with sex distribution of disease

Thyroid lesion	Females	Males	Total
Goitre (colloid/nodular/toxic)	13	3	16
Lymphocytic thyroiditis	14	1	15
Granulomatous thyroiditis	2	2	4
Graves disease	7	0	7
Follicular neoplasm			
Follicular adenoma	1	2	3
Follicular carcinoma	0	2	2
Papillary carcinoma	6	0	6
Medullary carcinoma	0	1	1
Total	43	11	54

Thyroid function test (free T3, free T4 and TSH) and autoantibodies level ie anti-TPO and anti-TG levels were measured and mean calculated with SD and observed that most of thyroid disorders were in euthyroid state and auto-antibodies level were raised in autoimmune thyroiditis and few cases of papillary carcinoma. (Table III).

Table III: Thyroid function test and auto-antibodies level in thyroid diseases

Thyroid lesion	Total	TSH 0.4-4.0 muIU/ml	FT3 3.5-7.8 pmol/L	FT4 9 – 25 pmol/L	Anti TG <20 IU/ml	Anti TPO < 35 IU/ml
Goitre (colloid/nodular/toxic)	16	1.62+/-0.76	3.02+/-042	1.22+/-0.24	16.63+/-3.42	35.2+/-3.23
Lymphocytic thyroiditis	15	20.66+/-4.05	1.42+/-0.37	.53+/-0.16	43.25+/-7.46	63.26+/-5.96
Granulomatous thyroiditis	4	2.22+/-0.43	6.24+/-1.56	19.45+/-6.5	26+/-3.50	35.2+/-2.50
Graves disease	7	0.02+/-0.01	13.3+/-3.69	30+/-4.79	34.85+/-6.76	42.28+/-5.92
Follicular neopalsm;						
Follicular adenoma	3	0.83+/-0.16	4+/-1.73	11.3+/-1.67	12.6+/-3.77	25+/-0
Follicular carcinoma	2	2+/-0	3.9+/-0.1	20+/-0	12+/-1.41	17.5+/-2.42
Papillary carcinoma	6	2.1 +/- 0.54	4.65+/-1.16	13.8+/-4.16	30.5+/-14.53	33.3+/-17.93
Medullary carcinoma	1	0.9	4	13	20	39

Also anti-oxidants levels i.e. Vitamin C and Vitamin E were measured and observed that the levels were affected in thyroid abnormality with markedly reduced level in malignancy followed by thyroiditis and then goiter. (Table IV)

Table IV: vitamin C & vitamin E measurements in various thyroid diseases

Thyroid lesion	Total	Vitamin C level 0.2–2.0 mg/dl	Vitamin E level 5–20 µg/ml
Goitre (colloid/nodular/toxic)	16	1+/-0.56	9+/-1.5
Lymphocytic thyroiditis	15	0.1+/-0.01	1.75+/-0.5
Granulomatous thyroiditis	4	0.45+/-0.5	4.5+/-1.2
Graves disease	7	0.5+/-0.06	1.62+/-0.04
Follicular neopalsm;

Follicular carcinoma	2	0.2+/-0.01	3+/-1.2
Papillary carcinoma	6	0.7+/- 0.04	2.18+/-0.56
Medullary carcinoma	1	0.4	2

Discussion

Thyroid nodule is one of the most common diseases originating from the endocrine system.. Thyroid swelling may or may not be associated with functional derangement. The thyroid epithelial cells, induced by random mutations or rearrangements, will grow from a normal state to an abnormal state. This induction of growth exacerbates cellular mutagenesis that generates the nodules. [10,11] Most thyroid nodules are benign tumours and 5% are reported as malignant.[4,5] Various studies like Weimin Xu et al, J Paweł et al, showed female preponderance over males in acquiring thyroid disease, which was also noticed in our study.[3,6]

Most of autoimmune thyroid diseases are accompanied by the presence of anti-thyroid peroxidase (TPO), anti-thyroglobulin (Tg), and anti-thyroid-stimulating hormone receptor (TSHR) antibodies. However autoantibodies association with thyroid malignancy is also noted in few papillary carcinoma of thyroid. Antibodies against thyroid antigens such as carbonic anhydrase, megalin, T3 and T4, sodium iodide symporter (NIS), and pendrin have also been detected, although rarely.[12,13]

Prevalence of the thyroid autoantibody positivity is relatively high worldwide. It is well-known that

in iodine-sufficient areas there is a higher rate of AT prevalence than in iodine-deficient ones.[14] Iodine intake is probably one of the most important factors that affects thyroid autoimmunity and the incidence of AT.[15]

TPOAb and TGAb are two important thyroid autoantibodies which are commonly found in patients with thyroid diseases. [16] As shown in some previous studies, TPOAb is correlated with the severity of lymphocytic infiltration and could induce antibody-dependent cell-mediated cytotoxicity. [17,18] Boelaert K. et al.[19] reported that TPOAb was dependently associated with thyroid diseases, but little attention has been paid to whether measuring other thyroid autoantibodies, in addition to TSH, could help predict thyroid nodules in human populations.[3]

Our results showed raised antiTPO and antiTG in lymphocytic thyroiditis and papillary carcinoma which were similar to the findings of M. Parham et al. [20] in Iran. They indicated that the different prevalence of thyroid autoantibodies might explain the wide range of the reported prevalence of thyroid nodules. In addition, Eun Sook Kim et al.[21] reported that TGAb was associated with an increased risk of thyroid cancer in thyroid nodules. Similarly, other studies[22,23] also showed an analogous association with malignancy by considering positive thyroid autoantibodies as a whole, including TPOAb and TGAb.[3]

Oxidative reactions occur in all tissues and organs, thyroid gland being one, in which oxidative processes are indispensable for thyroid hormone synthesis. Both hyper- and hypothyroidism have been proven to promote cellular oxidative stress by influencing the intensity of oxygen reactions and have been shown to affect concentrations of the vitamins involved in scavenging of free radicals (usually decreasing their concentrations, although study results differ) i.e. vitamins A, C and E[9]. A study done by Salwa H. N. Al-Rubae'i and Abass K. Al-Musawi observed that there are marked variations in vitamin A, E and C in both hypothyroidism as well as hyperthyroidism.[24]

Vitamin A is a potent antioxidant and acts as a scavenger of free radicals either independently or as a part of large enzyme system. Vitamin A deficiency (VAD) has multiple effects on thyroid function in animals.[25] Hyperthyroidism is a hyper metabolic state accompanied by an increase in the total consumption of oxygen, fostering formation of reactive oxygen species and other free radicals, or the occurrence of oxidative stress. [26]

Lowered Vitamin E level is presumably due to its use in preventing free radical damage that seems more extensive in thyroid dysfunction patients.[27] Mano et al found in their study patients with various thyroid disorders that they presented elevated Vitamin E levels in their thyroid tissue.[24] Researchers concluded that Vitamin E acts as a scavenger in thyroid follicular cell dysfunction. Additional studies have demonstrated that active oxygen radicals inhibit the activity of an enzyme responsible for the conversion of T4 to the active hormone T3 and that sufficient Vitamin E levels may mitigate that effect.[28] Present study also detects low vitamin E levels in thyroid disorders.

Vitamin C is considered the most powerful natural antioxidant[29] which is capable of ''scavenging" reactive oxygen species by reducing free radicals to more stable species.[30] Present study were in good agreement with those obtained by Mohan et al.[31] and Alicigüzel et al.[32] as these studies described low levels of Vitamin C in hyperthyroidism and increase oxidative stress at the same time, it also indicate that antioxidant vitamin become oxidized and it is eventually consumed in exerting its antioxidant action.

Conclusion

Present study concludes that autoantibodies levels were raised in thyroiditis and papillary carcinoma thyroid indicating role of anti-TPO and anti-TG in etiopathogenesis. vitamin C and E levels in various thyroid diseases were variable.

ABSTRACT

The goal of orthodontic treatment is to achieve a stable, functional result with enhanced aesthetics. In the discussed case report, a case with skeletal class III malocclusion is presented with compromised periodontal features and a bilaterally posteriorly edentulous mouth in upper and lower jaw. The case report highlights the corrections achieved and their stability without the support and utilization of the posterior teeth, otherwise deemed essential in the orthodontic treatment planning. The case is treated with orthognathic surgery in upper and lower jaw to improve aesthetic balance of the face. With the use of position screws, the case has been concluded displaying a stable occlusion with improved function. A four-year follow-up and an important note on retention and stability is discussed in the following case report

Keywords: *Skeletal Class III, edentulous, Orthognathic Surgery*

Introduction

The goal of an orthodontic therapy is to achieve, a stable, functional and esthetic result. Moderate to severe malocclusion require a combined treatment approach of orthodontic and orthognathic surgery. The basic objective of such malocclusions is to address the patient's complaints, establish optimal functional outcomes, and improve aesthetics.

There are three main treatment options for skeletal Class III malocclusion: growth modification, dentoalveolar compensation, and orthognathic surgery [1]. After growth cessation, treatment of skeletal Class III malocclusion in an adult requires orthognathic surgery combined with conventional orthodontic treatment aiming to improve self-esteem and achieve normal occlusion and improvement of facial aesthetics. [2]

Surgical treatment of Class III malocclusion includes, in most cases, mandibular setback, maxillary advancement, or a combination of both. The effectiveness of the surgical procedure depends on the occlusal stability achieved at the time of surgery and afterwards. In this case, the patient does not have posterior dentition which poses a challenge for the post treatment stability. Therefore, the objective of this paper is to highlight a case of a skeletal Class III malocclusion treated with orthognathic surgery, presenting with bilateral posterior edentulous dentition.

Case History and Diagnosis: A male patient aged 26 years and 1 month reported with the main complaint of poor facial aesthetics associated with mandibular and chin protrusion. On clinical examination, a concave facial profile, maxillary hypoplasia, malar deficiency with an acceptable facial proportion was observed. Family history was also reported by the patient, with a similar facial profile of his grandfather.

Intraoral examination revealed severely proclined maxillary incisors and Class III canine relationships,

posteriorly edentulous areas in all the four quadrants. The retroclined mandibular anteriors showed slight anterior crowding with a deviation of the mandibular midline to the right side by 3mm, and there was a 5 mm of negative overjet and an overbite of 0 mm. [Figure 1]. The above findings were corroborated by cephalometric assessment as seen in Table 1. The skeletal class III malocclusion can be attributed to the inherent (genetic) deficiency of mid face with a prognathic mandible. This deficiency was further worsened by the loss of molars in all four quadrants, due to gross decay over the period, resulting in the bilaterally posteriorly edentulous mouth.

Therefore, the patient was diagnosed as a case of skeletal dysplasia with class III incisor and skeletal relation with severe mid face deficiency, having posteriorly bilateral edentulous dentition with difficulty in mastication.

Treatment Objectives: The primary treatment objectives were to correct the Class III canine relationship, overjet, and overbite and specially to improve facial aesthetics.

The complementary treatment objectives were to establish good functional and stable occlusion and to improve the smile characteristics and dental aesthetics.

Treatment Plan: Control of periodontal disease was required before orthodontic therapy could be started. The aim of the presurgical orthodontic preparation was to correct the dental disharmonies. The presence of severe malocclusion, assessed through clinical examination, displaying marked deficiency in malar prominence, concave profile with steep anterior divergence and a prominent chin projection, the main goals of the orthodontic-surgical treatment were outlined as, maxillary impaction (5.5mm) and rotational advancement(4.5mm) and mandibular setback(8mm), by bilateral sagittal split osteotomy (BSSO). This was corroborated by cephalometric findings. [Table 1]. Once the orthodontic and orthognathic correction was done, the patient will be advised for rehabilitation of the posterior dentition.

Treatment Progress: After the moderate periodontal disease was brought under control. Preoperative orthodontic preparation was conducted with preadjusted 0.022 inch fixed appliances. Skeletal correction in this case planned was mandibular setback and maxillary advancement. The required negative overjet was created by controlled proclination of the lower anteriors. It was done by inverting the lower incisor brackets. Leveling and alignment with Nitinol was done and stainless steel archwires of progressively increasing thickness were performed. After leveling and alignment, 0.019 × 0.025-inch stainless steel rectangular archwires were placed in the maxillary and mandibular arches in preparation for surgery. The presurgical orthodontic phase lasted for 9 months. Following the completion of the orthodontic phase, surgical planning was done and two splints were made. The intermediate splint was fabricated to position the maxilla after the rotational advancement (impaction by 5mm and advancement by 4.5mm) and the final splint to adapt the mandible, following BSSO setback (8mm), in the desired occlusion.

Earlier case reports have discussed surgery in the edentulous mouths with use of implant supported splints and use of modified gunning splints [3, 4, 5]. However, in the present case report due to the support of the premolar and a bilaterally symmetrical occlusal table, a conventional splint design with extent limiting to premolars could be used successfully.

The surgical procedures included LeFort I osteotomy, impaction and clockwise rotation of the maxilla. This was performed to improve the maxillary retrusion, and the clockwise rotation of the maxilla was done to improve the malar deficiency. A set back of the mandible with a bilateral sagittal split osteotomy to improve the mandibular protrusion and establishan Angle Class I canine position with ideal overjet andoverbite. Genioplasty was performed to balance the effect of the other facial osteotomy on the prominence of the chin.

Rigid internal fixation with titanium plates and screws of 2 mm system was used without any intermaxillary fixation. Due to the absence of posterior teeth, to facilitate settling of occlusion by is of elastics, position screws were used. The position screws also aid in enhancing the fixation stability of miniplate systems. [6] After the orthognathic surgery, orthodontic finishing was performed to obtain better teeth interdigitation. The patient was instructed to wear vertical intermaxillary elastics for nearly three months and gradually reducing the wear time. Fixed canine to canine maxillary and mandibular lingual retainers were placed.

Treatment Results: The post treatment photographs show Class I canine relationship on both sides and normal overjet and overbite. [Figure 2] Maxillary retrusion and mandibular prognathism were eliminated, and facial aesthetics was considerably improved and more over the patient was satisfied with his teeth, profile and smile line. The cephalometric measurements also showed maxillary advancement and mandibular set back contributing to improving the patient's profile and his self-confidence level [Figure 3]. A mild midline shift was observed, however as the patient satisfaction and acceptance to therapy was maximally achieved, hence, further improvement was not considered. The case remained stable for four years after treatment with only formation of a mild imbrication due to loss of bonded

lingual retainer in lower arch and failure to follow up with the same. [Figure 4] The super imposition depicted the changes in the maxilla and mandible. [Figure 5]

Figure 2: Post treatment: Extra oral and intra-oral presentation after the treatment

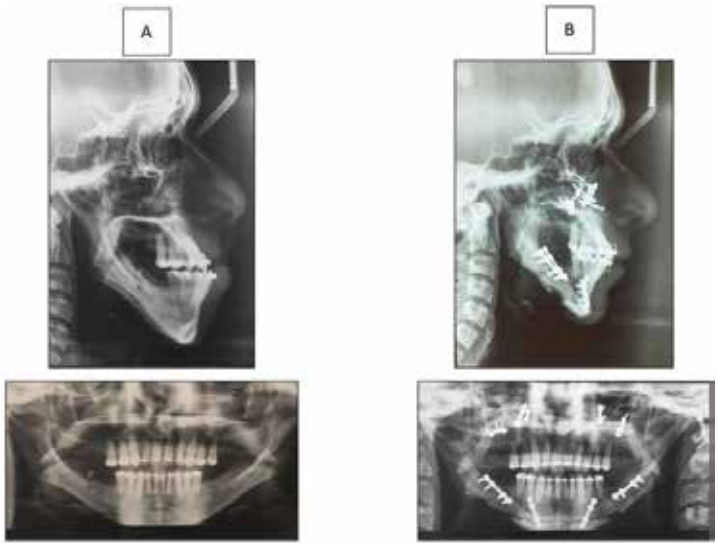

Figure 3: Roentgenographic records before and after treatment.

Figure 4: Follow up: Extra oral and intra-oral presentation 4 years after the treatment.

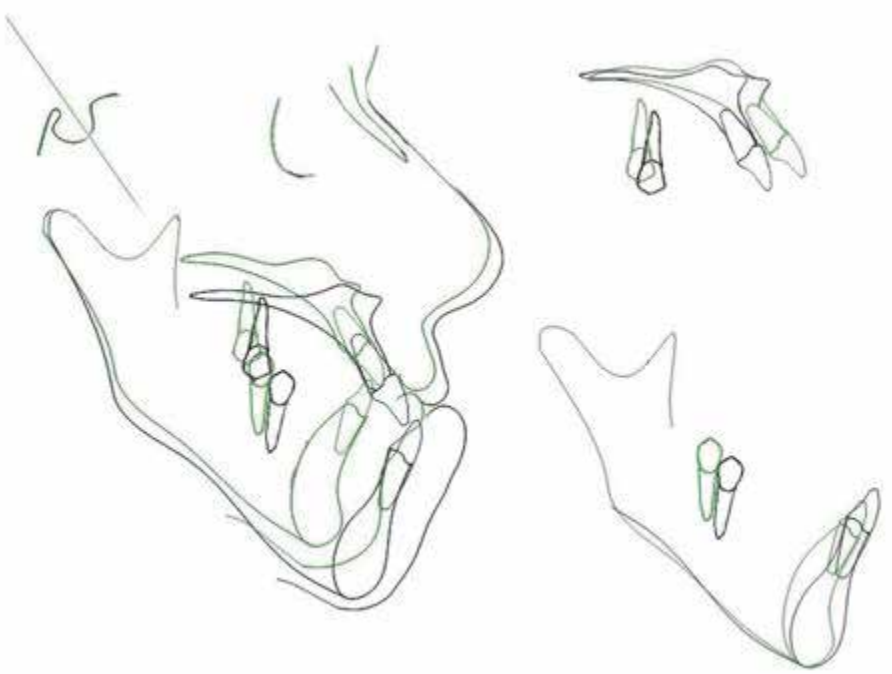

Figure 5: Superimposition tracing is depicting the changes achieved.

Discussion

When the skeletal problem compromises the facial aesthetics, the surgical-orthodontic treatment is the most indicated for patients who do not present facial growth potential. A correct diagnosis and planning, as well as an appropriate execution of the treatment plan, are determinant factors for having success and long-term stability.

From the sagittal standpoint, the parameters that indicate advancement of the maxilla with Le Fort I osteotomy are: flattening of the paranasal areas, accentuated naso-genial fold, moderate flattening of the cheek-bones, obtuse nasolabial angle, maxillary prolabium little in evidence, prominent nose with some degree of hump and tip tilted downwards. Where a larger increase in the middle third is necessary, Bell's high osteotomy may be taken into consideration, because this provides greater filling at the cheek-bones [7].

The relationship between lips and teeth, gummy smile if present, labial competence or incompetence, and the ratio between middle and lower thirds of the face, are the fundamental parameters to take into consideration for correction of vertical dimension. A vertical excess of the maxilla with labial incompetence, gummy smile, and excessive tooth exposure tends to indicate repositioning the maxilla superiorly.[8]

In the present case, the sagittal discrepancy was attended by a high LeFort I osteotomy and rotation of the nasomaxillary complex. The rotational advancement of the maxilla was done to facilitate correction of the midface deficiency. This also contributes to the correction of the inclination between the upper anterior, which tend to be severely proclined in class III skeletal malocclusion. This step, also establishes the necessary overjet for the effective mandibular setback, as required in this case. The mandibular surgical correction was planned with a combination of BSSO setback and an advancement genioplasty. Here, the genioplasty helps to achieve a balance in the vertical and sagittal direction, by establishing an aesthetic curvature, following the mandibular setback.

However, If the maxilla is moved both forward and rotated clockwise as in this case, the vertical component is likely to relapse, although the horizontal component has a good chance of being retained. [9] This can be addressed with the use of rigid internal fixation and post-surgical settling of occlusion.

The severe mid face hypoplasia was attended to by grafting in the malar region, with mandible cortical grafts obtained following BSSO.

But to achieve a stable occlusion in a patient after orthognathic surgery with no posterior teeth is

challenging. Another significant difficulty faced is during the period of orthodontic decompensation. As the support from the posterior teeth is missing, the stabilization of forces, falls largely on the anterior teeth, during the function. Therefore, the maintenance of the stable occlusion was achieved with the help of a combined approach with both surgical and orthodontic treatment, which led to a significant facial, dental, and functional improvement.

Skeletal Class III malocclusion treatment is difficult; however, an orthodontic-surgical approach for the correction of this alteration has wide acceptance among patients [10]. When aesthetics is compromised, only an orthodontic treatment is not enough. In these cases, it is necessary to combine orthodontics and orthognathic surgery to meet the patient's complaints and provide better functional and esthetic results. Another factor that contributes to the stability is the double-jaw surgery, which achieves esthetic correction with a balanced proportion. [11]

Immediately after orthognathic surgery, vertical intermaxillary elastics were introduced to obtain better teeth interdigitation. With a posteriorly edentulous mouth, use of position screws facilitated

Conclusion

Retention, in orthodontic-surgical treatment, serves the dual purpose of stabilizing tooth relationships and contributing to skeletal stability [12]. Although, the latter depends on other factors, such as correct condylar position and condition of the musculature [13]. It is, however, important to stress that good dental retention contributes to maintaining the final occlusion that was achieved surgically, guaranteeing occlusal stability, which will surely have positive repercussions on the final stability in the widest sense. In general, the methods used for retention are those used in traditional orthodontics rather than in surgical treatment. The imbrication in the lower arch seen after four years following the loss of bonded retainer also highlights the significance of a prolonged retention period in a case compromised periodontally and with loss of posterior dentition.

The combined surgical-orthodontic treatment of this case led to a significant facial, dental, and functional improvement. The dental relationship achieved was good. Facially, vertical balance and harmony were obtained, and this is perhaps the most important goal achieved, compliant with the patient's chief concern.

A Study on Development of Processes for Verification and Validation in Medical Device Domain

P. Shireesha[1], P. Niranjan[2]

[1]Associate Professor, [2]Professor, Kakatiya Institute of Technology & Science, Warangal, India

ABSTRACT

Medical device producers are discovering an enhancing demand to integrate the research ideas and results from traditionally separated research study locations such as medicine, software and also system engineering, and also mechanical engineering. In 2006, we carried out a study with greater than 100 firms from Europe and also the US to the present condition of the combination of software engineering modern technologies right into the medical device domain. The first outcomes of this study exist in this paper. Both software designers, as well as the medical device sector, can make use of these searchings for to much better recognize present difficulties as well as future instructions, to attain a much better combination of the areas. This study is based upon an evaluation of readily available literary works in the area of confirmation and also recognition in common software advancement, safety-critical as well as medical device software domains.

Keywords: *Medical device software, Medical device standards, verification, validation*

Introduction

Today, several medical gadgets cannot accomplish their planned usage without the software ingrained within them, which carries out a selection of features and also attributes. Studies of fads in the medical device market suggest that software is just one of one of the most definitive elements for creating cutting-edge items with brand-new capacities, as well as anticipate that the significance of software will just additionally enhance in the future [4] Research studies likewise anticipate that the r & d (R&D) financial investment in software in this market will certainly boost to 33% of the general budget plan by 2015 [2]

As the duty of software in the medical device domain enhances in value, so do the failings as a result of software problems. An evaluation of medical device remembers by the FDA in 1996 [5] discovered that software was significantly in charge of item remembers: In 1996, 10% of item remembers were triggered by software-related problems. This was up from 6% in the years 1983-- 1991. A German study on medical device remembers in the medical field shows that software is the leading reason for threats associated with building and construction as well as layout flaws of medical device items. This evaluation, from June 2006, reveals that 21% of the medical device style failings are triggered by software problems [6]. This is a boosting fad, because of the very same numbers from November 2005 program software in charge of 17% of building and construction as well as layout problems.

Provided this context, and also the basic absence of empirical understanding concerning the state of the technique relating to medical device software advancement, we made a global study. Our goal was to recognize the present objectives as well as problems of business in this market as well as exactly how they pick software methods to resolve the problems that they see. We had an interest in recognizing the level to which the requirements that have actually been created have actually been identified as well as instantiated by sector. In addition, we had an interest in evoking one of the most crucial difficulties relative to creating ingrained software for medical functions. These outcomes can be made use of by scientists as well as specialists to obtain an introduction of the degree of use of different procedures as well as devices in the domain in addition to recognizing beneficial targets for establishing brand-new methods as well as techniques targeted at more boosting software top quality in the medical industry.

The primary tasks of confirmation and also recognition are testimonials and also screening. Software screening cannot be performed up until the software is developed. Given that mistakes require to be discovered early, software examinations are performed prior to the item has actually been executed[6]. The distinction in between recognition as well as confirmation can be discussed by considering the function of the examinations executed. Making use of models to evaluate if demands can be resolved is an instance of a confirmation technique. The examination of a model by the individuals to check if the item meets their demands is an instance of a recognition technique. Simply put, we can state that the confirmation should ask-- Are you satisfying the specific demands? as well as-- Are you constructing the item right? Similarly we can state that the recognition should ask-- Are you satisfying the functional demand? -- Does this item satisfy its designated usage in the designated atmosphere? Are you constructing the best item? [8] ANSI/IEEE Sexually transmitted disease 1012 [9], Criterion for Software Confirmation as well as Recognition Program supplies a collection of minimal V&V jobs for every of the lifecycle stages in a software project.

Verification and Validation in Generic Software Development: 2 crucial referral versions which are extensively made use of in the context of software procedure renovation are the Ability Maturation Version ® Integrated (CMMI ®) as well as ISO/IEC 15504-5. They resolve the software confirmation as well as recognition procedures in the complying with means: CMMI ® according to ANSI/IEEE Sexually transmitted disease 1012-1986 suggests a lifecycle sight for confirmation as well as recognition tasks. It specifies confirmation as-- Verification that function items effectively mirror the demands defined for them. To put it simply, confirmation makes sure that _ you constructed it right' and also recognition as-- Verification that the item, as supplied (or as it will certainly be given), will certainly accomplish its designated usage ‖. As a result, recognition makes sure that you developed the appropriate item'. The confirmation and also recognition procedures become part of the engineering refines group, as well as both, are level 3 procedure locations in the organized version.

The confirmation procedure location in CMMI ® is utilized by a number of the various other procedure locations regardless of the classification they fall under. These procedures consist of Project Preparation, Dimension & Evaluation and also various other assistance procedure locations. The confirmation procedure is made use of to confirm the job items produced from the efficiency of these procedures. Confirmation is additionally made use of thoroughly in the context of the engineering procedure locations that includes Needs Monitoring, Needs Growth, Technical Option and also Item Combination. The version likewise offers assistance in regards to instances of approaches like peer evaluations, declaration protection screening, and also branch insurance coverage screening that might be made use of in this context.

The recognition procedure location incrementally verifies items versus the consumer's requirements. Recognition might be executed in the functional setting or substitute functional setting. Control with the client on the recognition demands is a crucial component of this procedure location. The range of the recognition procedure location consists of recognition of items, item elements, picked intermediate job items, and also procedures. These verified aspects might usually call for re-verification and also revalidation.

Several of the essential distinctions in between safety-critical criteria and also generic-software growth standards/models highlighted in our study were as adheres to.

Recognition tasks can be related to all elements of the item in any one of its desired settings, such as procedure, training, production, upkeep, and also assistance solutions. Like the confirmation procedure location, recognition is additionally executed throughout the training course of the item growth as it relocates from each stage of the lifecycle. As an example in the needs stage, the version recommends an evaluation, simulations, prototyping and also demos as feasible strategies for recognition. Both recognition and also confirmation tasks frequently run simultaneously and also might make use of sections of the exact same setting.

In ISO/IEC 15504-5, the objective of the confirmation procedure is to verify that each software job item and/or solution of a procedure or project correctly mirrors the given demands. The jobs concerning confirmation consist of the growth of a confirmation method, advancement of requirements for confirmation,

doing the task of confirmation, the decision of activities based upon confirmation outcomes and also making the outcomes readily available to the stakeholders.

Risk Management: Risk Management entails the recognition as well as administration of threat. Threat analysis is a feature of influence and also the chance of an event. A danger based strategy to security enables the dangers related to a system to be recognized and also focused on. The danger evaluation entails estimation of degree of threat connected with a danger.

Independence in Verification and Validation: The IEEE Criteria for Software Confirmation and also Recognition state that classic Independent Confirmation and also Recognition (IV&V) is typically needed for the advancement of software systems considered-- important ‖ in nature, i.e., those which can lead to death, objective or considerable social or economic loss. The outcomes of a research [7] highlight the distinction in mistake discovery abilities in between 2 techniques-- non-independent V&V as well as Independent V&V (IV&V). The outcomes suggest that IV&V supplied a considerable value-added element to the software advancement procedure. Self-reliance is a crucial aspect attended to by DO- 178B as well as provides certain support on the topic.

ISO/IEC15504 -5 and also Automotive SEASONING state that-- levels of freedom ‖ is something each project needs to prepare as a component of its confirmation as well as recognition technique. The FDA GPSV addresses freedom in Area 4.9, however, leaves it to the discernment of device producers on just how this is to be accomplished. ISO/IEC 62304 does not mandate self-reliance. Freedom is attended to in ISO 13485 in area 5.5.1 - Obligation as well as Authority, where it mentions:-- Leading monitoring will develop the connection of all workers that handle, execute as well as validate job influencing high quality, and also will make sure the self-reliance as well as authority essential to do these jobs.

Characterizing software development in the organization: Individuals were asked to define the academic history of most of the participants of their software advancement group. These programmers originate from techniques such as electronic devices, medical scientific researches, or electric systems engineering. Just in 36% of the instances in the medical device software developed primarily by computer system researchers. It appears that software is an integral part in several medical gadgets: 98% of the business price software as either an extremely crucial (84%) or essential (14%) element of their items. The number additionally shows that software is security- important aspect of the item in over 75% of the instances. On the other hand, for just 16% of the firms does the software plainly understand non-safety-critical capabilities.

Inquired about several of the viewed difficulties, 64% of our individuals kept in mind that discovering enough software programmers (i.e., personnel with a computer technology history) is an obstacle. At the exact same time, a lot of problems relating to software top quality originate from tasks associated with preparing the software, the capability it ought to achieve, and also exactly how it will certainly achieve it. That is, many obstacles come from needs tasks (63%) as well as style and also layout tasks (16%). In fact, executing the software code is viewed as one of the most difficult tasks by just 10% of the participants. This suggests that financial investments in demands engineering tasks appear to be most appealing to acquire considerable enhancements in the software growth procedure.

Searching in even more information moot that creates troubles for every kind of task, for requirements-related tasks 86% of the business view transforming requirements as the main problem. Missing demands (33%), as well as misunderstanding needs (39%), are likewise viewed as vital.

Connected to style as well as layout, the major obstacle is missing out on details in the layouts (53%) and also incongruities in between the intended style as well as the software (39%). Missing out on possibilities to recycle software code in an organized method (33%) as well as problems in preserving the software code (29%) are regarded as the major concerns throughout an application.

Figure 1 programs that around 50% of the business adhere to a specified procedure to execute the tasks pointed out over often, that is, they stated that they constantly or often adhere to such a procedure. (If the requirements are loosened up to consist of firms that comply with specified procedures in regarding fifty percent of their tasks after that 78% of the participants had actually a specified procedure for execution, 71% had one for style, as well as 69% had one for needs)..

Characterizing the challenges of using notations and tools: For design as well as layout, architectural layouts are one of the most often used symbols for modeling the software. These representation kinds (e.g., course layouts, bundle representations, practical block layouts) are made use of by 64% of the business often (constantly or regularly used). Series and also information circulation representations appear to have a reduced value. These layouts are regularly utilized by 40% and also 36% of the business, specifically. Extra official symbols such as state graphs and/or Time Petri Nets appear to be of reduced relevance in the medical device domain. State graphs are made use of regularly by 23% of the business, while Time Petri Webs are not used on a regular basis by any kind of participant. Just 6% of the firms periodically (i.e., much less after that half the moment) utilize these symbols

In order to record the outcomes of the different tasks associated with creating software, various symbols, as well as languages, can be used. The majority of our participants were utilizing reasonably casual symbols as well as strategies to do so. Official languages (e.g., temporal reasoning, style summary languages) defining software needs or designs were hardly ever used. For instance, for defining software demands in addition to design as well as layout, just 2% of the firms make use of official languages in all of their jobs. In 22% of the firms, official languages are utilized regularly in the demands stage and also in 14% of official languages are utilized regularly for design as well as style.

Subsequently, much less official symbols and also languages are most preferred for usage in all kinds of tasks. Figure 2 reveals the outcomes for needs engineering. There, all-natural language (e.g., English or German) is made use of in nearly all business in all tasks. In 92% of the business, this type of symbols is utilized constantly or regularly.

A comprehensive evaluation of the responses discloses that for 46% of the business all-natural language is the only symbols to define demands. Structured symbols such as usage instances are utilized by 40% of the business often (i.e., constantly or regularly utilized).

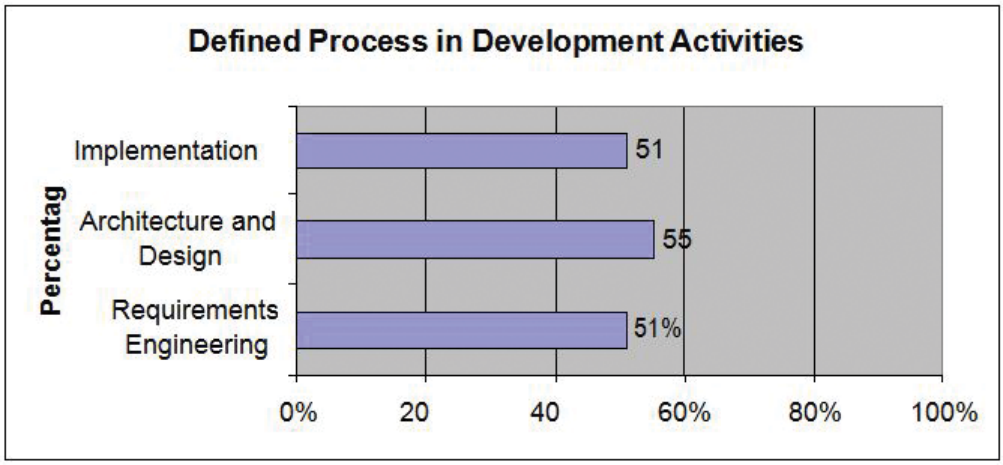

Figure 1: Defined processes for development activities

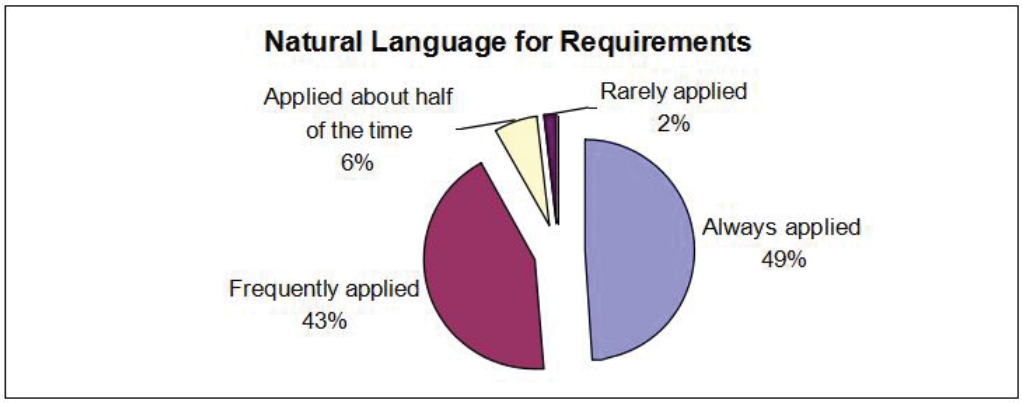

Figure 2: The usage of natural language in the requirements phase

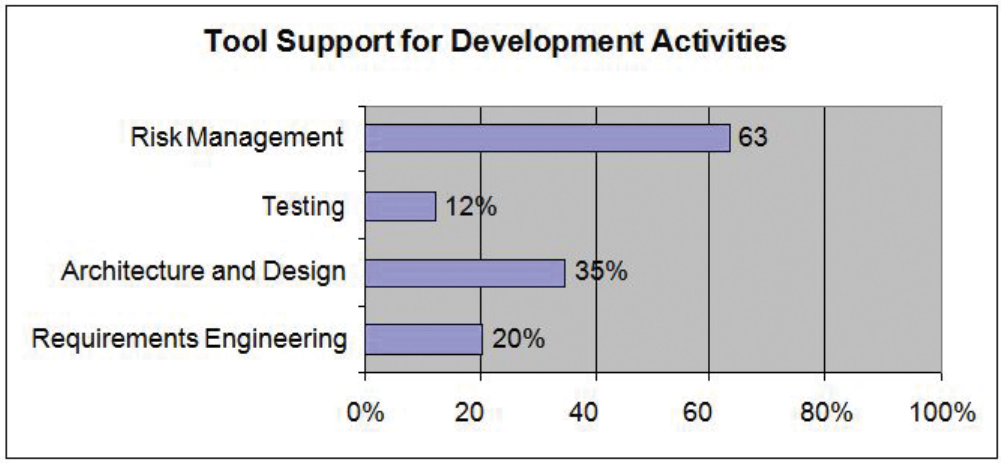

Figure 3: Usage of tools for different activities

Conclusion

Research studies like the study explained in this paper can assist to recognize concentrates for enhancements as well as enable ambitious activities to even more incorporate software engineering techniques, methods, devices, as well as criteria right into the medical device domain. The locations we have actually recognized for enhancement will certainly give advice for the meaning of the V&V procedures in Medi FLAVOR. Better to the meaning of a collection of procedures and also the linked techniques pertaining to V&V, the procedures need to be piloted in companies within the medical device software growth market.

A Technique for Network Design and Requirements for Medical Sensors

V. Chandra Shekhar Rao[1], P. Niranjan[2], A. Sowmikadurga[3]

[1]Associate Professor, Department of CSE, [2]Professor of CSE, [3]M.Tech Scholar, Kakatiya institute of technology and science, Warangal

ABSTRACT

In recent days, a large component of people relies on readily available material in social networks in their choices (e.g. testimonials and also comments on a subject or item). The opportunity that anyone can leave a testimonial supply a gold possibility for spammers to create spam testimonials concerning product or services for a variable rate of interests. Determining these spammers and also the spam web content is a warm subject of research study and also although a substantial variety of research studies have actually been done just recently towards this end, however up until now the approaches presented still hardly find spam evaluations, and also none reveal the relevance of each drawn out function kind. In this research, we suggest a unique structure, called NetSpam, which uses spam attributes for modeling testimonial datasets as heterogeneous information networks to map spam detection treatment right into a classification trouble in such networks. Utilizing the significance of spam attributes aid us to acquire much better cause regards to various metrics explored on real-world testimonial datasets from Yelp as well as Amazon.com internet sites. The outcomes reveal that NetSpam outshines the existing approaches and also amongst 4 groups of functions; consisting of review-behavioral, user-behavioral, evaluation etymological, individual- etymological, the remainder kind of attributes does much better than the various other classifications. It additionally concentrates on providing the current improvements in both wearable and also implantable innovations. In addition, this paper deals with the challenges that exist in the different Open Solutions Affiliation (OSI) layers and also shows future research study locations worrying about the usage of cordless sensors in healthcare applications.

Keywords: *Network, NetSpam, sensors, healthcare.*

Introduction

Online Social network sites play an influential duty in information proliferation which is thought about as a crucial resource for manufacturers in their ad campaign along with for clients in choosing services and products. In the previous years, individuals count a great deal on the composed evaluations in their decision-making procedures, and also positive/negative testimonials encouraging/discouraging them in their option of product or services. Furthermore, composed testimonials additionally assist the company to boost the high quality of their product or services. These evaluations hence have actually come to be a vital consider success of an organization while favorable testimonials can bring benefits for a firm, adverse testimonials can possibly influence integrity as well as create financial losses. The truth that any individual with any type of identification can leave remarks as a testimonial, gives an alluring possibility for spammers to create phony testimonials developed to misguide customers' point of view. These deceptive testimonials are after that increased by the sharing feature of social networks and also proliferation over the internet. The evaluations contacted alter customers' assumption of just how excellent an item or a solution are taken into consideration as spam [10], as well as are typically created in exchange for loan.

Existing System: In Existing work, the job just relies on the discover the spam testimonials and also spammers. None reveal the relevance of each removed function kind. On the various other hands, a substantial quantity of literary works has actually been released on the strategies made use of to determine spam as well as spammers along with various sort of evaluation on this subject. These strategies can be identified right into various groups; some making use of etymological patterns in message which are primarily based upon

bigram, and also unigram, others are based upon behavior patterns that count on attributes removed from patterns in individuals' habits which are mainly metadata based.

Proposed System: We suggest NetSpam framework that is a unique network-based technique which versions evaluate networks as heterogeneous information networks. The basic principle of our recommended structure is to design a provided evaluation dataset as a Heterogeneous Information Network (HIN) and also to map the trouble of spam detection right into a HIN category trouble. Specifically, we design evaluation dataset as a HIN in which testimonials are linked with various node kinds (such as attributes as well as individuals). A weighting idea is after that used to determine each attribute's value (or weight). These weights are made use of to compute the last tags for evaluations making use of both not being watched and also monitored strategies.

Literature Survey: According to RAYMOND Y. K. LAU, S. Y. LIAO, as well as RON CHI-WAI KWOK, ANQUAN XU, YUEQING XIA, YUEFENG LI, Online Social network sites, play an influential duty in information proliferation which is taken into consideration as a crucial resource for manufacturers in their ad campaign along with for consumers in picking services and products. In the previous years, individuals count a whole lot on the created testimonials in their decision-making procedures, and also positive/negative evaluations encouraging/discouraging them in their option of services and products. Furthermore, created evaluations likewise assist the company to boost the high quality of their product or services.

According to Paulo Cortez, Clotilde Lopes, Pedro Sousa, Miguel Rocha, Miguel Rio, In this Mark removal arrange isolates each HTML tag, modifications overall location names to <mytext> and also triggers an academic e-mail representation. Call reordering phase administers early setting to all marks and also determinately signing up with phase sets up the catch established names to create the perfect e-mail factor to consider. The standard emphasis of adding phase is to minimize the possibility that pork is prosperously arranged with exposed spams when the mark size of an e-mail idea is brief.

According to M. Bellare, S. Keelveedhi, as well as T. Ristenpart, Initially, utilizer gets in the location of the motion picture for obtaining the evaluations provided by the apparent detectives or, on the various other hand clients.

1. After going into the job of the movie, API obtains the website of movie testimonial as well as obtain every one of the reviews of the motion pictures providing by the locations.
2. Afterward, packaging figuring is implemented for loading the testimonials in the parties.
3. After coming to cycle the course towards clustering, the ARFF document is created, this ARFF record has the attributes needed for identifying the perfect evaluations and also circumstances of the above top qualities. This ARFF has variety of residential or commercial properties like is enigma show up in the evaluation, Resources word in research study, restriction, signs up with, evaluation, and so on.

Requirements for Wireless Medical Sensors: In order to feel organic information from the body and also send it wirelessly over a brief range, wearable and also implantable sensors are used. These sensors connect the obtained information to a control gadget endured the body or put in an obtainable area. After that, the information constructed from the control tools are communicated to remote locations in a cordless body-area network for analysis and also healing functions by including various other cordless networks for long-range transmissions[5]. Particularly, sensors made use of in cordless networks for healthcare applications need to please the list below demands:

Interoperability: Interoperability in healthcare is the level to which numerous systems and also gadgets can analyze information as well as present it in a user-friendly means. This involves that information exchange techniques will certainly permit information to be shared throughout medical facilities, drug stores, laboratories, medical professionals as well as people, no matter which supplier is made use of. The major purpose behind interoperability is to change the disorderly and also sometimes useless nature of information exchange amongst healthcare facilities. Via interoperability, information ends up being extremely mobile. Individual health and wellness information became part of a system as soon as, appears to clients anywhere they are and also whenever they require it[10].

Dependable Interaction: For medical applications that count on WBANs, the integrity of the interaction web link is of vital value. The interaction restriction ranges nodes given that the tasting prices called for by each

sensing unit are various. For instance, as opposed to sending out raw electrocardiogram (ECG) information from sensors, we can execute attribute removal on the sensing unit, as well as transfer just information concerning the specific occasion. Along with lowering the high needs on the interaction network, the minimized interaction demands conserve complete power expenses, and also subsequently boost battery life. A cautious compromise in between interaction and also calculation is essential for optimum system style [9].

Implementation

Admin Module: Admin is the primary individual of our application after login admin can add/delete items for individual purchasing and also gather the individual's testimonials. After admin can carry out spam detection for utilizing not being watched designs. In not being watched versions admin will certainly do Customer Based, Evaluation Based spam detection designs. Utilizing monitored methods admin will certainly do weight estimations.

User Module: User is the end user of our application, and we can also consider e-commerce user. User can perform search products, buy products, and submit rating and review for products. This data will deliver to admin, and this data will be our dataset to our application.

Heterogeneous Information Network (HIN): This is mapping the issue of spam detection right into a HIN category trouble. Specifically, we design testimonial dataset as a HIN in which evaluations are attached via various node kinds (such as Individual-Based, Testimonial Based). A weighting formula is after that utilized to compute each attribute's value (or weight). These weights are made use of to compute the last tags for evaluations utilizing both without supervision as well as monitored strategies.

Conclusions

This research study presents a unique spam detection structure particularly NetSpam based upon a meta path principle along with a brand-new graph-based approach to identify testimonials depending on a rank-based labeling technique. The efficiency of the recommended structure is examined by utilizing 2 real-world identified datasets of Yelp and also Amazon.com web sites. Our monitorings reveal that determined weights by utilizing this meta path idea can be extremely reliable in determining spam evaluations and also brings about a far better efficiency. Furthermore, we located that also without a train collection, NetSpam can determine the relevance of each function and also it generates much better efficiency in the attributes' enhancement procedure, as well as executes much better than previous jobs, with just a handful of attributes. Furthermore, after defining 4 primary groups for functions our monitorings reveal that the testimonials behavior classification carries out much better than various other groups, in regards to AP, AUC along within the computed weights. The outcomes likewise confirm that making use of various guidance, comparable to the semi-supervised approach, have no visible impact on establishing a lot of the heavy attributes, equally as in various datasets. For a future job, meta path principle can be put on various other issues in this field As an example, a comparable structure can be made use of to find spammer areas. For the finding neighborhood, testimonials can be linked with team spammer functions and also evaluations with the greatest resemblance based upon metapth idea are referred to as neighborhoods. Additionally, using the item attributes is an intriguing future deal with this research as we utilized functions much more pertaining to identifying spammers and also spam evaluations. Additionally, while solitary networks have actually gotten substantial interest from numerous techniques for over a year, information diffusion and also web content sharing in multilayer networks is still a young study. Dealing with the trouble of spam detection in such networks can be taken into consideration as a brand-new study line in this field.

Breast Self-Examination and Clinical Breast Examination: Knowledge, Practice, and Awareness Towards Breast Cancer among Females in and around Mangaluru

Sadhwi[1], Gayathri M Rao[2], Aradhana M[3], Saritha Kamath U[4]

[1]2nd MBBS Student, [2]Associate Professor, [3]Tutor, Department of Biochemistry, Kasturba Medical College, Mangalore, [4]Associate Professor, Dept. of MLT, Manipal College of Health Professions, Manipal Academy of Higher Education, Manipal , Karnataka, India

ABSTRACT

Introduction: Among the Indian women, the second highest cause for cancer related vulnerability is due to breast cancer development. According to the literature survey, though there are several contributing factors underlying the development of Breast Cancer, One of the important causes is the lack of knowledge towards the identification.

Materials & Method: The present study was to reveal the level of knowledge towards Self- breast examination and clinical breast examination, among 214 females belonging to the age group from 18 to 65 years, in around mangaluru, with different levels of literacy, economic status, social exposure and field of occupation using questionnaire. Study report shows that the extent of knowledge is around 36% and shows no relation to the extent of literacy levels.

Results: The results of the study showed that 97% of the participants said that they had heard about breast cancer and their sources of information were mainly health professionals/workers (98.2%), friends/ neighbors (83.5%), TV/Radio (76.0%) and printed materials (60.2%). Of the participants, 12% reported positive family history of breast cancer. 35.68% said that they have heard about BSE, among these, 72.2% were regular performers with complete knowledge of BSE, 27.80% knew the procedure but were irregular in practice. Moreover, 85.5% does not know who has to do Clinical Breast Examination and 71.5% of the participants were unaware of mammogram.

Conclusions: The study points to the insufficient knowledge of the study population about breast cancer and identified the negative influence of low knowledge of the practice of BSE.

Keywords: *Breast cancer, Clinical breast examination, Breast Self Examination*

Introduction

Breast Cancer is the most sensitive and extended issue affecting women globally with expanded rootlets. Researchers are attempting to unravel the causes and consequences of Breast Cancer to reduce the sufferings and mortality rate. Study data shows that the occurrence of breast cancer varies among countries with highest rates in the United States and Canada and the lowest in Asia. Even though it is said that prevalence of BC is more in developed countries, around 50% of breast cancer patients and 58% of deaths seen in less developed countries.[1]

There is a burning need to educate the society to know the risk factors, signs and symptoms of the disease. Because of the diversity in socio-demographic, economic, educational, lifestyle, etc. the exposure towards the knowledge remains divergent. The risk factors includes genetic Consensus document for management of breast cancer. Indian Council of Medical Research 2016. background -family history/genetic mutations, life style,

age, pregnancy/lactation.[2] Along with other pathological/ physiological risk factors, lack of knowledge also one of the important causes to increase the rate of sufferings. Several measures to promote BC control and decrease mortality rate includes programs to develop awareness and knowledge, early detection/diagnosis, treatment ant and palliative care. Long term preventive actions may be the lifestyle modifications. Although many preventive and risk reducing measurements are in action [3], still low and middle income countries have majority of the breast cancer cases.

Education and screening are the major preventive measures under action to control the disease in most developed countries. Earlier the detection, better and effective measures can be taken and which will improve the survival rate also. The early detection includes some screening methods such as performing/practicing BSE regularly. Though mammography is the most reliable method people hesitate because of its high cost. Even in developing countries BSE is recommended [4]. According to the several earlier studies, the % of regular BSE performers is very less [5, 6] which could elevate the burden.

Thus, this project is aimed to work with society, to identify the extent of knowledge towards breast cancer with the help of questionnaire including the risk factors, self-breast examination, clinical breast examination and its significance. Questionnaire was derived from other published studies dealing with the same topic.[7-9] Early detection leads to higher probability of getting treated effectively at the earliest. This study aims at taking the women out of their veils and pay attention to the risk factors and perform screening tests regularly.

OBJECTIVE: To gather information about the knowledge of Breast Cancer, Self breast examination and clinical breast examination among women in and around Mangaluru.

Methodology

A predesigned questionnaire will be used to check the knowledge, awareness, risk factors, screening methods towards breast cancer and other screening methods. A semi-structured questionnaire covering socio-demographic information, knowledge and attitude of the respondent.

A pilot study is carried out with small group (n=20) to improve the clarity, validity and applicability of the questionnaire to improve the outcomes to facilitate the data collection. All information about the individual kept confidential.

Subjects of the Study: Total number of participants were 214.Women between 18-60yrs. with different background including staff and students from educational institutions, Bank employees, house wives and housekeeping staff in and around Mangaluru. Information is collected by distributing the questionnaire after obtaining the informed consent for willingness to participate in the study.

Exclusion Criteria: Those who are diagnosed with breast cancer

All the necessary ethical approvals carrying out the study is obtained from institutional ethical committee, Ref No. IEC KMCMLR 03-18/46.

Statistical Analysis: Data analysis was done by ELR software. Variables were categorized by percentage distribution.

Result

Socio-demographic status of participants showed in the Fig.1& 2.Among the participants, 12% of females were homemakers, all other participants were in different working category, including bank employees, technical workers, teachers and house- keeping staff.

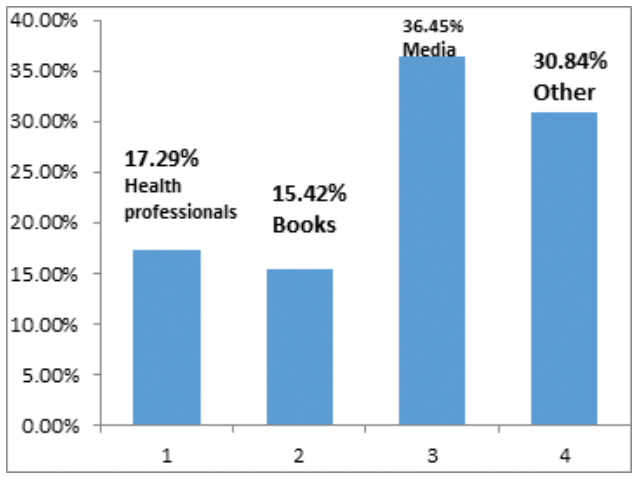

Fig. 1: Source of knowledge

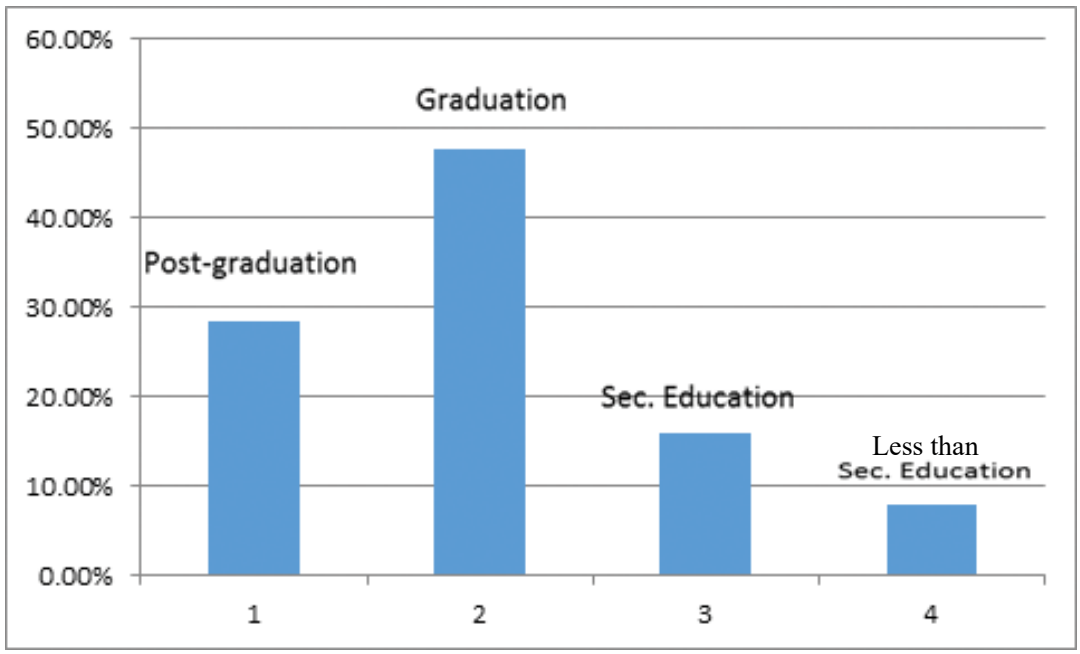

Fig. 2: Educational level

7% had reported the BC cases in their family (2%) & friend circle (5%). Rest of the study results are as follows in Table No.1 & 2

Table No. 1: Awareness, practice and importance of breast self-examination among participants

Knowledge/Practice	Response	Frequency	Percentage (%)
Heard of BSE	Yes	76	35.68
	No	137	64.32
Known it is useful in the detection of BC	Yes	48	22.54
	No	176	77.46

	20yrs	44	10.33
	Yes	18	8.45
	After menopause	3	1.41
	No idea	167	78.4

Discussion

Education and screening are the major preventive measures under action to control the disease in most developed countries. Earlier the detection, better and effective measures can be taken and which will improve the survival rate also. The early detection includes some screening methods such as performing/practicing BSE regularly and is of no cost, non-invasive method. Though mammography is the most reliable method people hesitate because of its high cost. Earlier studies[10] have identified several barriers which will hinder the early detection of BC.

One of the review of literature tells that literacy status the of Indian women regarding breast cancer risk factors is low and is irrespective of socioeconomic and educational status[11].This is one of the outcome of the present study also. Though, BSE is non-invasive, inexpensive method for early detection of breast cancer, earlier study reports support the view that majority of the study population has insignificant level of awareness of BSE and practice [12,13]. It also has been reported that one of the limitations which can lead to increased suffering is lack/limited access to treatment and limited knowledge of health professionals to train the society about cancer prevention and detection in developing countries [14]. In India, elevation in the mortality rate due to breast cancer is attributed to lack of awareness, and is par with recent studies, so it is necessary to explore the drivers of awareness deficits and stigma surrounding breast cancer, both in the general population and among health care professionals, which leads to delayed diagnosis and higher stage of disease during presentation. Several study reports revealed that among the primary health care providers about risk factors, right procedure and precise time to perform the screening. There is a serious need to educate the society to enhance awareness about breast cancer, including health care professionals, as there is increased incidence and mortality rates. [15-16]

Conclusion

The current study reports low levels of knowledge of BSE and clinical breast examination in the study population. Hence, we emphasize the urgent requirement of awareness programs at all health care levels to improve knowledge about BC. Though BSE is not accepted as an early detection method for BC, this technique, if used persistently and skillfully, can serve as a useful adjunct in India since the availability of testing resource is limited. There is awful need for suitable training for health care professionals to enable them to convey the skills for proper performance of BSE to the women in community so that early detection of BC is made possible, especially in resource-constrained settings.

Emotional Intelligence Level of Students and Mental Ability Belonging to Rural and Urban Backgrounds

Shailaja Sangaraboina

Assistant Professor, Department of English, S R Engineering College, Warangal

ABSTRACT

The students originate from different histories such as rural as well as urban areas. The students undertake a great deal of stress to withstand today's competitors, primarily currently of their facility phase in occupation. In order to deal up with the tension as well as stress these days affordable globe, the students must have an equilibrium in their psychological security. Emotional Intelligence is a kind of intelligence that has actually been greatly researched in social scientific researches, psychology and also service field, yet not in the instructional field. The here and now research aids us to learn about the emotional intelligence degrees of students in the message college graduation particularly the students originating from rural and also urban areas. It is relative research of emotional intelligence degrees of students coming from rural and also urban histories, to ensure that it is practical to evaluate the student's emotionality, wellness, sociability as well as self-control.

Introduction

The economic climate has actually ended up being international which is driven by advancements and also innovation and also Organizations need to change themselves to offer brand-new consumer assumptions. Today' economic climate is considerably really unsure with difficult chances. It is based upon ability expertise as well as efficiency driven. To be an effective leader the here and now circumstance needs regard, engagement, empowerment, synergy as well as self-administration. With the above difficulties, a brand-new type of leader is required to lead service via disturbance. Today's Supervisors in their companies do this job. It's being extensively thought by the public that psychological and also social capability is as essential, or perhaps more crucial, than typical measurement of intellectual capability and also individuality[3]. Emotional intelligence is specified as "the composite collection of abilities that make it possible for an individual to handle himself/herself as well as others". The relevance of Emotional Intelligence is significantly being acknowledged and also examines throughout numerous occupations. Taking care of feelings in social contexts are plainly crucial for success in a range of social; in addition to career-related domain names.

An emotional intelligence quotient, or EQ, is the brand-new term which is being made use of a growing number of in the personnel's divisions and also it is additionally making its trip in the direction of the exec board areas. This post will certainly offer necessary info on what EQ is exactly how it is various from individuality, and also just how it has actually confirmed to affect the rural and also urban students in their scholastic efficiency.

Emotional Intelligence (EQ) is the arising principle. There is a debatable inquiry emerging from lots of scientists whether the EI can be found out as well as educated as well as whether this EI will certainly aid the students' to prosper in college and also in life.

EI is the idea which is extremely functional in nature as well as appears to be extremely vital for the growth of human life. The scientists still rely on the ideology that intelligence, as well as success, are symmetrical to each other now they are not seen similarly. The outcomes of the students are not due to the inconsistencies from the essentials. The here and now day concentrate on the success of the student not just on their thinking abilities too on the self-understanding, feelings, and also social abilities.

In the last 20 years, Numerous Knowledge concept was presented by Howard Gardner in 1983 as well as the Emotional Intelligence concept by Bar-On[5]. This concept of emotional intelligence provided a brand-new facet that the intelligence quotient (INTELLIGENCE) is not the only step for success. Emotional intelligence is the middle of estimates with the sight factor of education and learning which highlights the very best in students not only simply in scholastic success. It defines that the EQ proficiencies are required to improve the individual abilities resulting in success in academics. The students that are exceptional academically appear that the education and learning system has actually not supplied them based on lead their life gladly as well as to form them, efficient people. According to this concept finding out the abilities which are essential to operating efficiently in life are more crucial than attaining academically. A number of the EQ optimists think that the students that attain academically have actually not yet created their emotional intelligence and also are not most likely able to accomplish their complete ability The students do execute well unless as well as up until they are participated in creating their feelings, finding out designs, individuality, as well as inspiration concept finding out the abilities which are required to operate properly in life, are more crucial than attaining academically. A lot of the EQ optimists think that the students that accomplish academically have actually not yet established their emotional intelligence as well as are not most likely able to accomplish their complete ability.

Review of Literature

[5] examined the result of emotional intelligence on scholastic efficiency of 246 teenage students. His evaluation records disclose that the students with high degree of emotional intelligence do well fairly with that said of the students having reduced degree of emotional intelligence.

[8] checked out the connection between emotional intelligence as well as scholastic success in non-typical university student. As the students have various cognitive capabilities, the duty of emotional intelligence can be much better comprehended in their scholastic accomplishment His evaluated that emotional intelligence was dramatically relevant with the students Grade Point Average, cognitive capabilities as well as age.

[9] checked out the effect of emotional intelligence on the effective shift from senior high school degree to the college degree. The outcomes of their research disclosed that academically effective students had significantly greater degrees of numerous various psychological as well as social proficiencies. From this research, they determined the significance of emotional intelligence in the effective shift of students from secondary school to college.

Mestre[10] carried out a study on 127 Spanish teens, the capacity to comprehend as well as handle feelings, evaluated by an efficiency action of emotional intelligence (the MSCEIT), and also associated favorably with educator scores of scholastic success and also adjustment for both men and also ladies. The research exposed that the psychological capacities are favorably associated amongst the ladies with peer relationship elections as well as likewise discovered that EI is favorably connected with instructor rankings of scholastic adjustment amongst children and also peer relationship elections amongst students. The example of students was arbitrarily selected. The outcome of the research was that emotional intelligence, self-idea as well as the esteem of the students was favorably related to their scholastic accomplishment.

[7] researched the connection in between the 5 measurements of emotional intelligence i.e., self understanding, psychological monitoring, self-motivation, compassion, social abilities and also scholastic efficiency. The record exposed that there is substantial connection in between self-awareness, psychological monitoring as well as compassion with scholastic efficiency.

[5] has actually carried out a research study as well as checked out that just how Emotional intelligence have crucial medical and also restorative ramifications as it is raised from a combinations of research study searchings for on just how individuals assess, interact and also utilize feelings.

[4] has actually mentioned that there hasn't sufficed research study to plainly recognize the influence of Emotional intelligence on the scholastic success.

[8] performed a study on 500 IX basic students of Kannada language to recognize the influence of emotional intelligence on the scholastic accomplishment.

Emotional Intelligence and Its Origins: The locations of the rate of interest which have actually been examined throughout the human background and also located to be recursive are Human intelligence as well as a sensible idea. There were numerous different analyses of these principles. Thinking about the altering nature of these 2 ideas, the present interpretation of intelligence is a brainpower (or established of brainpower) that allows the acknowledgment, finding out memory for, and also capability to factor concerning a specific type of details". There is no person solitary and also unitary kind of intelligence, yet a collection of them, as well as component of this knowledge, concentrates on the means people see feelings as well as just how they respond to them; this goes to the core rate of interest of EQ.

In 1920's the standard idea behind the EQ was established by Eduard Thorndike while he was collaborating with social knowledge; as a precursor to the detailed concept of intelligence. The social intelligence meaning provided by [6] was as "the capacity to recognize males and females, young boys as well as ladies-- to act intelligently in human relationships".

These were the first actions which led the way for the development of EQ. Thorndike did not develop any kind of academic idea of social intelligence; he utilized this as a picture to expose that the intelligence can be revealed in various means. The suggestion of numerous knowledge was additionally established by [10]. from the instructional viewpoint, he determined 7 elements to intelligence:

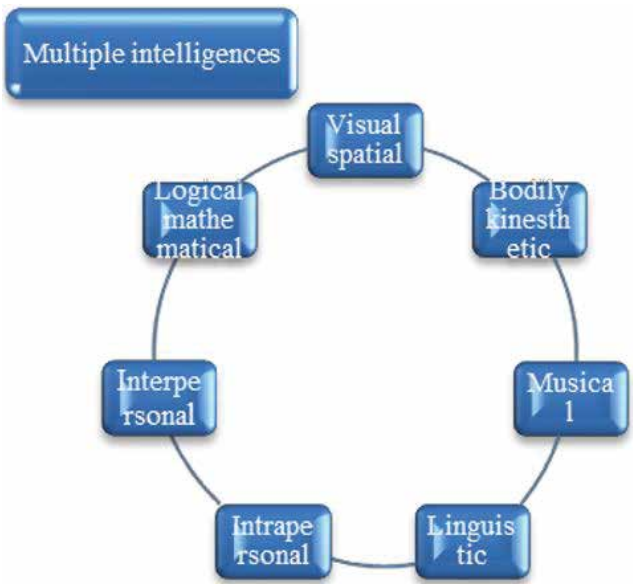

Figure 1: 7 Elements to Intelligence

What Is Emotional Intelligence?: Emotional intelligence is among one of the most extensively reviewed subjects in an instructional job and also business psychology. [9] compete that emotional intelligence is not a solitary quality or capacity instead, a compound of distinctive feeling thinking capabilities. Regarding feelings contain acknowledging as well as translating the definition of numerous moods, along with their connections to various other sensory experiences. Comprehending feelings entail an understanding of exactly how fundamental feelings are mixed to create complicated feelings. Managing feelings includes the control of feelings in oneself and also in others. A person's emotional intelligence is an indication of just how she or he regards, comprehends and also controls feelings. [5]has actually recommended various perception of intelligence, which he calls effective intelligence. Effective intelligence entails 3 unique sorts of brainpower: analytic, innovative and also useful. Emotional intelligence was specified as the capacity to view feeling, incorporate feeling to promote the idea, recognize feelings, as well as to manage feelings to advertise individual development.

EQ is specified as a collection of expertise showing the capability one needs to identify his/her behaviors, state of minds, and also impulses, and also to handle them finest according to the circumstance. Usually, "emotional intelligence" is taken into consideration to entail psychological compassion; interest to, as well as discrimination of one's feelings; precise acknowledgment of one's very own and also others' state of minds; state of mind administration or control over feelings; action with ideal (flexible) feelings as well as practices in different life circumstances (particularly to stress and anxiety as well as tight spots); as well as harmonizing of truthful expression of feelings versus politeness, factor to consider, and also regard (i.e., property of great social abilities as well as interaction abilities)..

Slf-Motivation: Individuals with a high level of emotional intelligence is normally inspired. They want to postpone prompt outcomes for long-lasting success. They're extremely effective, enjoy an obstacle, as well as are really efficient in whatever they do.

Self-Awareness: Individuals with high emotional intelligence are typically extremely independent. They recognize their feelings, and also due to this, they do not allow their sensations to rule them. They're positive-- due

to the fact that they trust their instinct as well as do not allow their feelings to leave control. They're additionally happy to take a straightforward consider themselves. They recognize their toughness, as well as weak points, as well as they, service these locations so they can execute far better. Lots of people think that this self-awareness is one of the most vital parts of emotional intelligence.

Compassion: This is possibly the second-most essential aspect of emotional intelligence. Compassion is the capability to relate to as well as recognize the desires, requires, as well as point of views of those around you. Individuals with compassion are proficient at identifying the sensations of others, also when those sensations might not be evident. Because of this, understanding individuals are normally superb at handling connections, paying attention, as well as connecting to others. They stay clear of stereotyping as well as evaluating as well swiftly, and also they live their lives in an extremely open, truthful means.

Social Abilities or taking care of connection: It's typically very easy to talk with and also like individuals with excellent social abilities, one more indicator of high emotional intelligence. Those with solid social abilities are generally group gamers. As opposed to concentrating on their very own success initially, they aid others to create as well as radiate. They can handle conflicts, are superb communicators, as well as are masters at the structure as well as preserving partnerships.

The today research study has actually utilized the concept of EI which is based upon the concept of EI as recommended by Goleman. The EI design taken on in this research study contains 10 elements. The 10 parts that make up EI are: (i) Self- understanding (ii) Compassion (iii) Self-motivation (iv) Psychological security (v) Taking care of relationships (vi) Worth alignment (vii) Dedication.

Conclusion

It can be evaluated that there is no influence of EI on the scholastic efficiency given that the EI degrees of urban students are high although their Grade Point Average is much less than the rural students Rural students were discovered to have actually obtained extra self- inspiration emotional intelligence as contrasted to urban lady's students. A statistically considerable distinction of psychological security psychological smart of rural and also urban lady's students was discovered. Rural students were discovered to have obtained even more psychological security emotional intelligence as contrasted to urban woman's students. A statistically substantial distinction of taking care of connection psychological smart of Rural and also urban students were located. Rural students were discovered to have actually obtained extra handling relationship emotional intelligence as contrasted to urban students.

Caries Risk Profiles of Rural and Urban 12 Year Old School Children in Mangalore Using the Cariogram

Jyotsna Malhotra[1], Ashwini Rao[2], Ramya Shenoy[3], Mithun Pai BH[3]

[1]Ex-Post Graduate Student, [2]Professor, [3]Associate Professor, Manipal College of Dental Sciences, Light House Hill Road, Mangalore, MAHE Manipal

ABSTRACT

Objectives: This study aimed at determining caries risk profiles of rural and urban 12 years old school children in Mangalore using the Cariogram.

Method: A cross-sectional study was conducted on 100, 12 year old school children in Mangalore. Random sampling technique was employed for sample selection. Data collected from the participants comprised of demographic details, oral hygiene practices, medical history and a 3-day diet diary. Clinical examination was done to determine dental caries experience using the WHO Oral Health Assessment proforma 1997.

Results: In the permanent dentition 60% of the participants had dental caries, whereas 40% of the participants were caries-free. Based on the Cariogram scores, students were classified into four groups High risk (0-40%), Moderate risk (40-60%), low risk (60-80%) and very low risk (80-100%). Mean scores obtained for each category were 33.75 ± 5.82, 52.44 ± 4.69, 68.11 ± 3.818, 86.03 ± 1.81. None of the participants from urban area were in high-risk group, whereas 12% of the rural participants were in the high-risk group. Mean score obtained for urban and rural area were 73.48 ± 15.39 and 58.08 ± 18.94 respectively. The difference in the mean was statistically significant ($p < 0.001$).

Conclusion: The rural population had a higher risk of developing dental caries as compared to the urban population.

Keywords: *Caries risk assessment, Cariogram, Dental Caries, Risk factors.*

Introduction

Dental caries is the most prevalent condition in the world today. Global burden of untreated caries in permanent teeth in 2010 was estimated to be affecting 2.4 billion. In children it is the tenth most prevalent condition, affecting about 621 million children across the globe. The global burden of caries has remained unchanged between 1990 to 2010, but tooth loss due to caries has declined significantly in the past two decades. The peaks of caries burden are observed at 6 years, 25 years and 70 years[1].

Corresponding Author:
Dr. Ashwini Rao

In India, caries prevalence in children aged 5, 12 and 15 years is reported to be 48.11%, 43.34% and 62.02% respectively and mean significant caries index score was 3.30, 2.73 and 3.75[2]. Untreated caries, can progress to severe infection and pain, leading to impaired performance in schools and decreased productivity at work[3].

Various methods have been devised to predict risk of development of caries, and one of them is the Cariogram, developed by Bratthall D[4] in 1996, WHO collaborating centre Malmö University, Sweden. The process of evaluating the risk using Cariogram is called Cariography. Cariogram uses the multifactorial cause of dental caries. It gives the result as "Percent chance to Avoid Caries" by taking into account the interaction of diet, bacteria, host factors and the fluoride availability[4].

Although caries risk assessment has been done in different parts of the world, very few of them have been done in India, with no literature found in this part

of the country. Keeping this in mind, this study was conceptualised to determine the Caries Risk Profiles of Rural and Urban 12 Year Old School Children in Mangalore using the Cariogram.

Materials and Method

This was a cross-sectional descriptive type of study. The present study was conducted among 12 year old school children in Mangalore. Data collection included an interview schedule, clinical examination and salivary analysis. Dental caries was assessed using the DMFT Index[5]. Children were asked to chew a modeling wax made into a form of pellet (0.5 x0.5 centimeters) for 3 minutes to obtain stimulated saliva, which was collected in a sterile bottle and then subjected to analysis.

The various factors/variables were given a score according to a predetermined scale and entered in the Cariogram computer program[4]. A trained recorder accompanied the investigator and helped in recording the data.

Results

A cross-sectional study was conducted on 100, 12 year old school children in Mangalore. There were 50 participants from urban schools and 50 from rural schools. Among the rural participants 58% were males and 42% were females, whereas in urban population 56% were males and 44% were females. In the permanent dentition 60% of the participants had dental caries, whereas 40% of the participants were caries-free. The caries prevalence in rural and urban children was 74% and 46%. The dental caries experience was found to be higher in rural population as compared to the urban population and this was found to be statistically significant ($p<0.001$).

Caries risk assessment was done by using the Cariogram model. Variables involved in the Cariogram were fed into the software and result was recorded as "Chance to avoid new caries". Based on the scored obtained from the Cariogram children were categorized as High risk (0-40%), Medium risk (41-60%), Low risk (61-80%) and very low risk (81-100%). In this study there were no children with 0-20% chance of avoiding caries, so we combined the groups, very high risk and high risk, and reported them together as 0-40% chances of avoiding caries[6].

Distribution of the study subjects based on the risk categories and caries risk factors revealed that none of the participants in the high-risk group had DMFT=0, whereas 37 in the very low risk category had no past caries experience. Eight participants in the high-risk and moderate risk groups had caries experience ≥ 3 versus zero participants in the low-risk and very low-risk groups. The caries experience increased with the likelihood of developing new caries in the near future.

The Lactobacilli count and the *Streptococcus mutans* count was found to decrease as the chance of avoiding new caries increased. About half of them had negligible *Lactobacilli* count, 25% of them belonged to very low risk category, whereas only 3% were from the high-risk category. Only one from the high-risk group had *Lactobacilli* count of over $>10^5$ CFU/ml. The *Streptococcus mutans* count was negligible in one-third of the participants. Of the thirty-three percent *Streptococcus mutans* free, 22% were in the low-risk category versus only one from the high-risk.

Salivary analysis of the participants revealed High buffering capacity of 31% among participants in the low-risk group, whereas only 7% had high buffering capacity (pH>6.0) in the high-risk group. In the high and moderate-risk category 3 participants each had low buffering capacity (pH<4.0). Salivary flow rate obtained was found to have no association with the Cariogram scores.

Chi-square test was applied to test the association between the chance of avoiding new caries and the contributing factors. It was found that statistically significant negative association was seen between the chance of avoiding new caries and past caries experience, *Lactobacilli* count, Diet frequency, *Streptococcus mutans* count and salivary buffering capacity. No statistically significant association was seen between Fluoride programme and amount of saliva secretion.

Among the 100 students selected, there were 12, 32, 18 and 38 in the high risk, medium risk, low risk and very low risk categories respectively. Mean score in each category was calculated to be 33.75 ± 5.82, 52.44 ± 4.69, 68.11 ± 3.818 and 86.03 ± 1.81 respectively. Total mean score of the children was found to be 65.78 ± 18.83. Based on the area of residence, it was found that in the urban area no participant had high risk of developing caries, whereas in the rural area 24% students were classified as belonging to the high-risk group.

The mean Cariogram score calculated for urban and rural children were 73.48 (15.39) and 58.08 (18.94) respectively. For all the categories among urban and rural students mean scores were calculated for the different risk categories. Based on the area of residence the difference between the means of urban and rural areas was found to be statistically significant in low-risk and very low risk categories (p= 0.013 and <0.001 respectively) (Table 1).

Table 1: Cariogram scores of each risk group

	Number	Mean ± S.D
High risk	12	33.75 ± 5.82
Moderate risk	32	52.44 ± 4.69
Low risk	18	68.11 ± 3.818
Very low risk	38	86.03* ± 1.81
Total	100	65.78* ± 18.83

* Comparison is significant at the 0.05 level

There are five sectors in the Cariogram model. Each is affected by a combination of risk factors. The outcomes of these sectors were separately analyzed for both urban and rural study subjects. The means obtained for Chance of avoiding caries, circumstance, susceptibility, bacteria and diet for rural population was found to be 58.08 ± 18.94, 5.08 ± 3.52, 14.80 ± 8.12, 14.54 ± 6.43 and 7.60 ± 4.91 respectively. For urban population means obtained for Chance of avoiding caries, circumstance, susceptibility, bacteria and diet were 73.48 ± 15.39, 2.54 ± 2.25, 10.72 ± 5.51. 9.12 ± 5.69 and 4.56 ± 3.45 respectively. The total means of all the sectors were found to be statistically significant (Table 2).

Table 2: The mean Score of the participants based on the five sectors of the Cariogram

	Total	
	Mean	S.D
Chance to avoid caries	65.78*	18.83
Circumstance	3.81*	3.20
Susceptibility	12.76*	7.19
Bacteria	11.83*	6.63
Diet	6.08*	4.49

*Comparison is significant at the 0.05 level

A statistically significant correlation was found between the risk factors and chance of avoiding new caries (p<0.001), *Lactobacilli* count (p=0.017), Diet frequency (p<0.001), *Streptococcus mutans* count (p<0.001), and salivary buffering capacity (p<0.001). No statistically significant correlation was seen between Fluoride programme and amount of saliva secretion (Table 3).

Table 3: Correlation between Cariogram Sector – Chance to avoid new caries and caries related factors

	Cariogram score	P value
Decayed missing and filled teeth (DMFT)	-0.851	<0.001*
Lactobacilli counts	-0.311	0.002*
Diet frequency	-0.534	<0.001*
Streptococcus mutans counts	-0.738	<0.001*
Fluoride programme	-0.176	0.080
Salivary secretion rate	-0.025	0.804
Salivary buffering capacity	-0.314	<0.001*

*Correlation is significant at the 0.05 level

Discussion

Children of age group 12 years was selected since it is considered as the global monitoring age for dental caries by the WHO[5]. The dental caries prevalence was found to be 60%, but caries expressed as mean DMFT was relatively low. This is in accordance with the study conducted by Hebbal et al[6] and Mascarenhas et al[7]. In the present study prevalence of the decayed and missing teeth in urban children was less as compared to those residing in the rural areas, this finding was in accordance with that reported by John et al[8]. Of the 100 children selected only 38% were classified into very low risk caries. This could be due to low utilization of dental services for prevention, unless they are in pain in India as reported by Harikiran et al[9] and Poudyal et al[10] .The study findings are similar to the findings reported by Hänsel Petersson et al[11], where about 40% belonged to the very low risk category. The risk of the students in the present study was in contrast to the results reported by Campus et al. [12] and Hebbal et al[6] where about 20% and 21% of the students were in the very high-risk group respectively The caries risk factors included in the

evaluation of risk prediction using the Cariogram model patients in high caries risk group had high scores in past caries experience, *Lactobacilli count, Streptococcus mutans* count and diet frequency. Sonbul et al[13] and Campus et al[12] reported similar results in addition to other factors like use of fluoride and plaque amounts.

Mean DMFT increased in the groups as the chances of avoiding new carious lesion reduced (from lowest to the highest groups). This finding was similar to those reported by Tayanin et al[14], and Campus et al[12], who reported increment in DMFT/dmft and DMFS/dmfs with decrease in the chances of avoidance of new caries. Past caries experience is considered to be the most reliable predictor for assessing the caries risk than other risk factors. Studies have been conducted which confirmed the strong prognostic role of past caries experience in predicting dental caries [15,16,17,] but the study conducted by Hausen et al[18] concluded that providing any additional preventive measure to control risk factors does not affect the dental caries formation in the near future.

Among the different sectors of the Cariogram model, the dominant sector was susceptibility (12.76%) followed by bacteria (11.83%), diet (6.08%) and circumstance (3.81%). This indicates that the leading risk factor among the participants is fluoride use, saliva secretion and saliva buffer capacity, followed by mutans streptococci. But, the study done on Swedish children by Petersson et al[19] reported the dominant sectors to be diet, followed by bacteria, susceptibility and circumstances.

In the present study, in saliva samples analysis, significant correlation was seen between chance to avoid new caries and past dental caries experience, *Lactobacilli* count*, Streptococcus mutans* count, Salivary buffering capacity but not for Salivary flow rate. Study conducted by Petersson et al[19] reported caries risk to be significantly associated with *Lactobacilli* counts; *Streptococci mutans*, diet frequency and DMFS. Whereas Hebbal et al[6] reported caries risk to be associated significantly with *Streptococcus mutans* or *Lactobacilli* count but not with salivary flow rate and buffering capacity.

Conclusion

This study showed that the rural population had a higher risk of developing dental caries as compared to the urban population. Educating parents regarding good oral hygiene practices and dietary habits is of utmost importance. In addition to that, co-operation from the school authorities could help in developing school oral health programmes to aid in imparting oral health education to all the children from an early age. Thus, to reduce the caries burden of the population, emphasis should be laid on the prevention of the disease. Spreading awareness about oral hygiene practices, dietary modifications and importance of maintaining oral health among the general population and the children will go a long way in preventing oral diseases and promoting oral health.

Role of Trust and Privacy Concerns towards Usage of E-Health Services—An Extension of Expectation-Confirmation Model

K Anil Kumar[1], Subhashree Natarajan[2]

[1]Teaching-Cum-Research Assistant, [2]Professor and Dean, VIT Business School, Vellore Institute of Technology

ABSTRACT

Electronic health services is extensively employed to build an online platform for healthcare providers and patients. However, there are few studies that have investigated the intention behind why e-Health services are rejected by some of the end-users after their initial experience. There exists a considerable gap between the usage of e-Health services and our understanding of these technologies. Therefore, this study was carried out on the aim to better understand the factors leading hospital consumers' continued usage of e-Health services based on expectation-confirmation model (ECM). To explore the process of continuance usage intention of e-Health services, the study has integrated ECM model with technology acceptance model and two post adoption expectation beliefs (i.e., perceived privacy and security, and perceived trust). With 253 e-Health services users' responses, the proposed research model was empirically tested within the context of e-Health services by applying partial least squares (PLS) method. The main finding from the path analysis indicates that along with perceptual (confirmation, perceived ease-of-use, perceived usefulness), and emotional factor (satisfaction), post adoption expectation beliefs (perceived trust, perceived privacy and security) – also shown a significant association towards continuance intention of e-Health services. The study concludes by discussing theoretical and practical implications, limitations and future scope.

Keywords: *expectation-confirmation model, technology acceptance model, perceived trust, perceived privacy and security.*

Introduction

E-Health refers to application of software that includes the process, tools, and communication systems to support the practices of electronic healthcare. E-Health services helps in transmission and administration of information in healthcare and as an outcome, assist in enhancement of medical practitioner's performance and patients' health. Varshney[15] defines electronic Health as an application of ICT across the various activities involved in practice and delivery of healthcare. These applications accounts in the entire range of information like hospital and employees information, billing and payment information, and patient's medical records. In today's viewpoint of e-Health, it also includes the use of internet for storing, modifying, and accessing the health-related information. Nevertheless, the term e-Health is much broader, that covers digitalization of several tasks and processes of healthcare from basic to advanced level of services that results in innovative terms such as e-appointments, e-records, e-supply, e-payments, and e-billing. Though the application of ICT are numerous in healthcare sector, this research precisely refers to basic e-Health services provided by the private hospitals like e-appointment, e-billing, and e-payments as they are feasible and not much complicated to the end-users (i.e., patients). These basic services helps in saving the end-users time and offers a rapid communication between patients and healthcare professionals[4].

Prior researches have reported that patients' use these e-Health services barely for a short span of time as it is a contemporary experience to them and have less knowledge in it[11], which clearly highlights the lesser understanding of post-adoption behaviours of end-users by the institutions. This recommends a demand to delve intensively into post-adoption behaviour (i.e., continuance usage intention - CUI) of e-Health services usage. With a focus of Indian healthcare customers, this study predicts how a comprehensive set of factors may influence the continuance intention of e-Health services.

To identify the essential factors, this study further integrates ECM with TAM (Technology Acceptance Model) and also incorporates perceived trust (PT) and perceived privacy and security (PPS) to hypothesize a new model. The reason behind the integration is as follows- First, though ECM was proved to be the robust model to study the continuance intention of information system by several studies[4], it employs only three predictors, specifically, confirmation (CNF), perceived usefulness (PU), and satisfaction (SAT) to measure continuance usage intention (CUI). Nevertheless, the users' behavioural intention towards usage of any technology may be influenced by other factors. Second, TAM offers a significant factor perceived ease-of-use (PEOU) to measure the usage intention that affects perceived usefulness, and it act as a precedent factor for PU for ECM. And finally, adding PT and PPS to the integrated model allows to capture the possible element of barriers to the e-Health services CUI.

The existent literature on the viewpoint of ECM has mostly concentrated on PU as the only continuance usage expectation belief[14]. In most cases, incorporating the other beliefs with the existing factor – PU is predominately based on the nature of the specified technology in specified context to enhance the explanatory power of the model. With the background of this tradition, this study focus on integrating perceived privacy and security as a significant post adoption expectation belief to understand the CUI of e-Health services[13]. Prior studies have included PPS as an antecedents to study the post adoption behaviour of consumers in adoption of various e-services likes e-banking and e-government that demonstrates the linkage between satisfaction, PPS, and CUI[2]. Similarly, this study also considers perceived trust that has an exceptional influence on CUI linked through SAT. Although the relationship between PT, PPS, and usage intention is not precisely been modelled in information technology, the association is explicitly inferred in certain studies. Therefore, this study anticipates that it will be significant to examine the role of these two additional variables to predict the post adoption behaviour of e-Health services.

Research framework and Hypotheses

In conceptualizing a continuance model for e-Health services, this study has integrated ECM with TAM factor – PEOU, and two external variables - PT and PPS to predict SAT and CUI. As explained in Fig. I, the research framework has extended ECM viewpoint by including the influence of perceptual factor and two post adoption expectation beliefs in the background of electronic Health services.

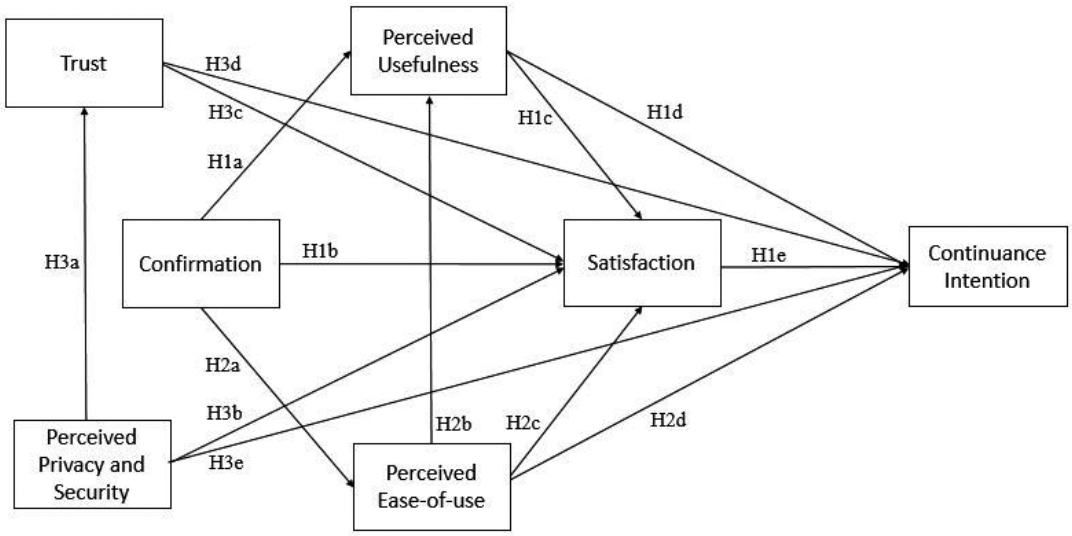

Fig. I: Proposed Model

Hypotheses based on base ECM: The original ECM that was proposed by Bhattacherjee[3] majorly focused on the factor PU of any technology. The concept of ECM states that when the initial expectation of individuals get confirmed with the usage of any technology, then they perceive the technology to be useful for performing any specified task[11]. That is, when the technology allows the user to accomplish the chosen goal in the anticipated way, then their experience towards perceived usefulness is increased. Thus with the base of original ECM, the following hypotheses were proposed:

H1a: CNF of expectation has a significant association with PU of e-Health services

H1b: CNF of expectation has a significant association with SAT of e-Health services

H1c: PU has a significant association with SAT of e-Health services

H1d: PU has a significant association with CUI of e-Health services

H1e: SAT has a significant association with CUI of e-Health services

Integrating ECM and TAM: The base TAM model highlighted the positive association between PU and PEOU on attitude towards technology and finally measuring the behavioural intention to use it. According to Akter[1], satisfaction is a positive and pleasurable state of attitude and emotion. And therefore it is reasonable to hypothesize that perceptual factors like PEOU and PU has a significant effect on individuals' satisfaction with usage of any technology. Prior studies have also highlighted the significant association among PEOU and PU towards SAT and behavioural intention to use e-services[3,12.]. Thus the subsequent hypotheses were proposed:

H2a: CNF of expectation has a significant association with PEOU of e-Health services

H2b: PEOU has a significant association with PU of e-Health services

H2c: PEOU has a significant association with SAT of e-Health services

H2d: PEOU has a significant association with CUI of e-Health services

Perceived Trust and Perceived Privacy and Security: The role of 'trust' and 'privacy and security' in the context of electronic services are robust. The prior study has shown that CNF of expectation has a positive influence with the execution of certain guidelines guided by trusting beliefs[6,14]. Further, extant literature has proven that degree of users' trust has a positive effect towards degree of CUI. Earlier studies have claimed that, in healthcare, higher privacy and security drives the increased satisfaction level of patients' and as a outcome[11], results in repeated usage of electronic Health services[8]. Thus the following hypotheses are posited:

H3a: PPS has a significant association with PT of e-Health services

H3b: PPS has a significant association with SAT of e-Health services

H3c: PT has a significant association with SAT of e-Health services

H3d: PT has a significant association with CUI of e-Health services

H3e: PPS has a significant association with CUI of e-Health services

Data Collection

As the study focuses on the customer perspective of the hospitals, the sample unit opted for this study are patients' and care-givers, who are considered as the major customers of hospitals. The data was collected from the multi-speciality hospitals those are providing basic e-Health services to its customers. The geographical location chosen for data collection of the study is Chennai. The sampling method used for this study is purposive sampling method, as it is a challenging task to precisely estimate the population size of patients' acquiring the treatment or the care-givers who are using the basic e-Health services for the sake of patients' in India. The final sample size of the study resulted in 253. The data was collected through the well-structured closed ended questionnaire.

Data Analysis and Results

The research model was accomplished through two steps: measurement model and structural model. The outer model was executed to establish the reliability and validity, whereas, inner model was carried out to test the study hypotheses.

Table I: Confirmatory factor analysis results

Construct	Item	Standard loading*	AVE	CR	Cronbach's α

	CUI2	.884			
	CUI3	.853			
	CUI4	.819			

Assessment of Measurement Model: The research model was established in two phases. First, the outer model (i.e., measurement model) was analysed to validate the properties of measurement scale, for which confirmatory factor analysis was estimated. This helps in accessing the reliability, discriminant validity, and convergent validity of the scale (Table-I). Secondly, structural model was analysed to validate the path relationship. According to Hair et al, the cut off values for composite reliability (CR) and average variance extracted (AVE) should be equal to or exceed 0.80 and 0.50 respectively. Here, the minimum value of CR is 0.851 for CNF and highest value is 0.938 for SAT; and for AVE, minimum value is 0.768 for PEOU and highest value is 0.841 for PPS which signifies the adequacy of criteria. Further, the value of Cronbach's alpha lies between the range 0.889 and 0.929, which satisfies the recommended threshold value of 0.7.

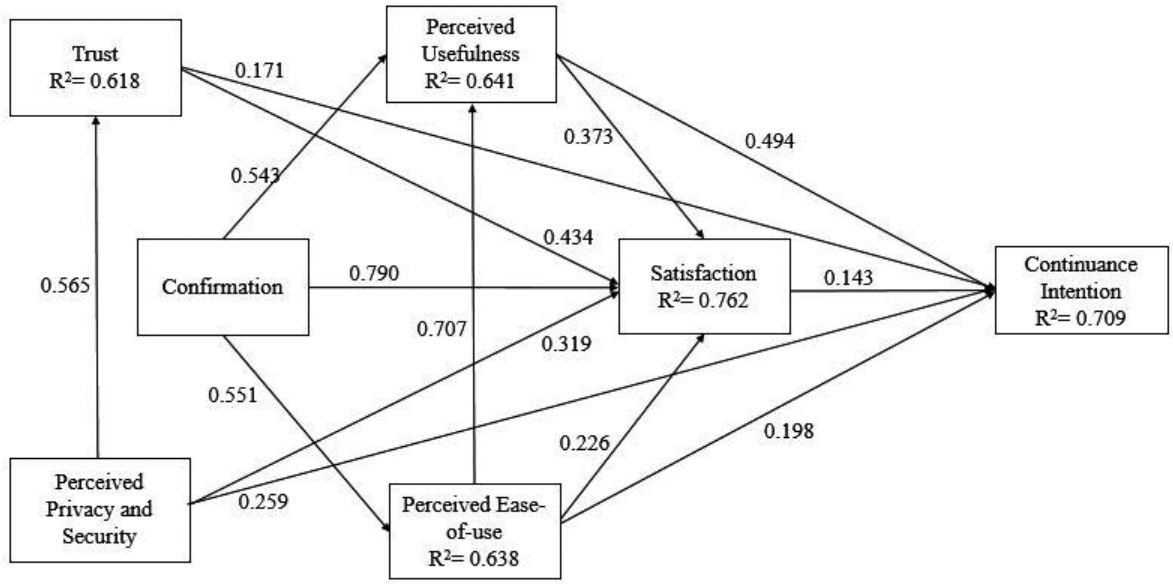

Fig. II: Inner Model results

Assessment of Structural Model: The results of inner model (Fig. II) are summarized in Table- II, which shows the indirect, direct and total effect of the variables. The proposed model is claimed to have the strong prediction power, where R^2 of all the endogenous variables are higher than 0.60 along with CUI (0.709). The outcome of the model shows that all the proposed hypotheses were accepted including the base ECM hypotheses (H1a – H1e) which is considered valid in healthcare context. For example, the association between CNF towards SAT was found to be strongest (t-value-16.814). Further the extended model hypotheses (H2a - H2d and H3a – H3e) has also shown significant. The variables like trust (t-value-8.698), PPS (t-value-4.503), and PEOU (t-value-4.277) are positively associated towards satisfaction. Also the path from PT (t-value-3.015), PPS (t-value-4.721), and PEOU (t-value: 3.541) are significantly associated towards CUI.

Discussion

The main aim of this study is to examine the post-adoption behaviour of users' using the e-Health services. In an attempt to this, the study has developed a research model in the context of healthcare by integrating ECM, which is theoretically reliant on ECT with technology acceptance model. Further the study has incorporated the constructs like PT and PPS to the research model. The main findings of the path analysis has supported all the proposed hypotheses. Along with the theoretical model factors, the additional variables like PT and PPS has shown significant association towards SAT and CUI, and also shown an important role in enhancing the predictive power of the research model. Further, conceptualising and validating their impact on usage intention (via SAT) is a significant contribution of this study. Altogether, this study contributes to the information technology CUI literature by integrating TAM with ECM and confirming the effect of PT and PPS into the perspective of ECM to explain the end-users' post-adoption behaviour in healthcare context.

In terms of practice, the constructs PEOU and PU have statistically shown positive association towards SAT and CUI of e-Health services. But PU has shown greater effect than PEOU. This signifies that PU has a crucial part in defining users' attitude towards any new technology. Though usefulness have a greater influence, PEOU also determines the users' emotional state. This finding states that future research can emphasize on the ways in which the effects of PEOU and PU on emotional states are contextually bounded in healthcare context[11]. However, service providers' needs to focus on making the e-Health services easier and useful. Though e-Health includes several services, it has become clear that an efficient and simple operating system is one of the major factor that determines the marketability of any e-Health services[5]. Perceived trust is an important element in e-services exchange, as the lack of proper rules and regulations in electronic services are not immediately verifiable[7]. Therefore it is essential for the service providers to improve the overall trusting beliefs in order to increase the trusting belief and attitude (i.e., CUI). Further, loss of privacy and security results in loss of trust[10]. If the service provider focus on improving the security concerns, then it directly results in increasing trust which finally influence SAT and CUI[8].

Limitations and Future Scope: First, this research was carried out within the particular field of e-Health services in a single country. As an outcome, applicability of the findings more broadly remains uncertain. It is vital for practitioners and researchers to take a more holistic, learning oriented method to determine the performance of such e-Health services. Second, follow-up research on longitudinal data is required for this study. As the cross-sectional data does not permit for the analysis of post-acceptance model's predictive power in gaining knowledge of continuance intention.

In other words, to examine the fundamental effect of perceptual factors on actual behaviours, it is crucial to conduct longitudinal study as the exogenous variable must precede endogenous variable in order to deliberate as having a causal influence[9]. Specifically, for better understanding, it is recommended for future study to conduct a panel study by gathering longitudinal data from a specific set of e-Health service users' at multiple temporal points. Finally, the study believes that along with TAM and ECM factors, there exists a role of other external variables. For instance, the study of Davis [5] emphasize that the role of social influence significantly influences the perceptual factors like PEOU and PU. Henceforth, future study can investigate the role of social influence towards continuance intention of electronic Health services.

Ethical Clearance: Ethical approval was taken from the respective hospital authorities and from Vellore institute of technology.

Conflict of Interest: The authors declared no potential conflicts of interests with respect to the research, authorship, and/or publication of this article.

Risk Factors Associated with Onset of Neck Pain: A Review

Neha Gupta[1], Aparna Sarkar[2], Deepak Kumar[3]

[1]Assistant Professor, [2]Professor, Amity Institute of Physiotherapy, Noida; [3]Head of Department, Capri Institute of Manual Therapy, New Delhi

ABSTRACT

Objectives: The current review intended to summarize the risk factors responsible for onset of neck pain.

Method: An electronic and hand search along with cross referencing was done on five online databases (Cochrane Library, PEDro, Scopus, PubMed (Medline) and Google Scholar) using the following key words, "neck pain", "nonspecific neck pain", "prevalence of neck pain" and "risk factors associated with neck pain".

Results: Out of 715 papers identified 77 full text papers were reviewed. 12 studies meeting the inclusion criteria were included and were scored for methodological quality (MQ) on the New Castle Ottawa Scale modified for cross-sectional studies. Conclusion the identified risk factors for onset of neck pain include being of female gender, poor working conditions, presence of stress and depression, work overload both for students and professionals.

Keywords: *neck pain, risk factors, prevalence, musculoskeletal disorders.*

Introduction

Neck pain is influencing 14-71% of adults and eventually sooner or later 19-37% of patients will develop a chronic neck pain[1,2]. It is a commonly reported health hazard[3] and is seen in different occupations, in various countries[4,5], becoming an economic burden for a country's urban population responsible for non-attendance from school, college and work[6,7]. Neck pain is encountered by all age groups including children, adolescents, adults and the geriatric population, also its incidence and prevalence is amplifying every year. Numerous studies conducted over the years have identified the exposure variables in different population subgroups and occupations[3,8,9,10]. But still with the changing lifestyle and work habits new studies are required to identify the modernistic up to date associations with the risk factors. The augmenting use of innovative technology which includes the multiplying use of computers, mobile phones, internet for both work and recreation is making our life more convenient but at the same time are jeopardizing the musculoskeletal integrity[11,12]. Further the increasing stress levels at the work place are exposing individuals to the development of neck pain[9].

The current review tries to encapsulate the risk factors identified by recent studies, responsible for onset of neck pain. This review can be useful to healthcare providers, researchers, ergonomists and employers to design interventions reducing the incidence and prevalence of neck pain.

Methodology

The study is approved by the ethical committee of Amity University. To get a thorough search we followed the PRISMA guideline (Fig 1).

Search Strategy: An electronic and hand search along with cross referencing was done on five online databases (Cochrane Library, PEDro, Scopus, PubMed (Medline) and Google Scholar) using the following key words, "neck pain", "nonspecific neck pain", "prevalence of neck pain" and "risk factors associated with neck pain". The period of the search was 1970 to 2018.

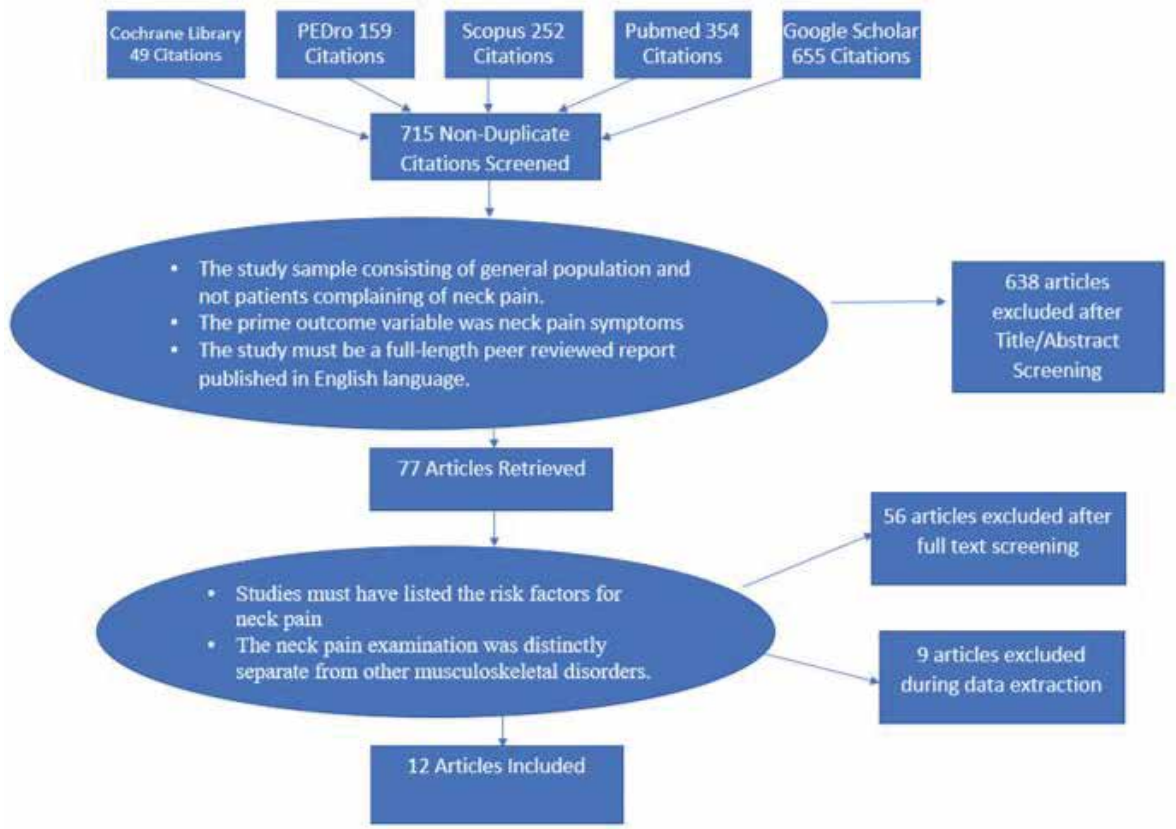

Fig. 1: The Prisma Flow Chart for Selection of Studies

Study Selection: After a meticulous screening of the titles picked by the search strategy, all the papers related to neck pain and non-specific neck pain were listed by the first reviewer. Next the abstracts of the articles having the potential to be included in the study were identified and read by two individual reviewers. Finally, if the abstract connoted that the paper could provide relevant data regarding the risk factors for onset of neck pain, the full text of screened articles were diligently read by both the reviewers individually to be assessed for the inclusion criteria. In case of disagreement, a meeting was held and consensus was obtained for the same.

A study had to meet the following criteria, for it to be eligible to be included in the current review.

- The study sample consisting of general population and not patients complaining of neck pain.
- The prime outcome variable was neck pain symptoms
- Studies must have listed the risk factors for neck pain
- The neck pain examination was distinctly separate from other musculoskeletal disorders.
- The study must be a full-length peer reviewed report published in English language.

Quality Assessment Scoring: The selected papers were scored for methodological quality by the Modified Newcastle Ottawa scale by two independent reviewers. The Newcastle-Ottawa scale consisted of three sections namely selection, where a study can score a maximum of 5 stars next comparability where a study can score a maximum of 2 stars and finally outcome where a study can score a maximum of 3 stars. If the scores of the two reviewers did not meet for an item, then consensus was obtained after a thorough discussion.

Results

Out of 958 studies identified 12 studies [13,14,15,16,17,18,19,20,21,22,23,23] were included in the current review (Fig1).

Methodological Quality: The percentage of agreement between the two independent reviewers was 89.9%. Most of the studies lost a star in the sample size category, as the formula or the methodology for the number of responses was not mentioned. Out of 12 only one study scored 9 stars[19].

The Annual prevalence was evaluated in 8 studies [13,15,16,18,19,20,21,23]. The prevalence percentages ranged from 20.3% to 66.7%.

Discussion

The prevalence for neck pain were found to be inconsistent for different countries. The reason for this could be various like disparity in the study methodology, definition of cervical and neck pain[15,16]. Population differences like socioeconomic status including the family income and education of the people, work culture, practices and lifestyle, human health cognizance, health care standards, exposure time factor[13,15,16].

All the studies included in the current review have collected the data by self-report method via filling of questionnaires. For this review the exposure variables were broadly divided into three categories. First the personal second work related/ergonomic and third psychosocial factors.

Personal: Being of female gender was identified as a risk factor by 9[13,14,17,18,19, 20,21,22,23] out of 12 studies included in the current review. A possible rationalization of the same could be that females are more exposed to home care tasks[18], child and elderly care at home which could be more taxing on the neck musculature. It has been pointed that females have comparatively less muscle mass and they should engage in more physical activity to increase the muscle mass for prevention and treatment of neck pain[14,25,26]. Trogen[27] in his study reported that pain threshold increased with muscle strength[27,18] and Chiu[28] demonstrated that isometric strength was more in men than women[28,18]. In a study[17] it was speculated that reasons for higher prevalence of neck pain in girls could be that they have a lesser pain threshold than boys, hormonal changes during puberty, greater tendency for stress, heritability of neck pain is more in girls[17,18].

Four studies reported age to be significantly associated with neck pain[13,20,21,23]. The possible explanation of which could be degenerative changes in the in the ageing musculoskeletal system[13,18]. Cagnie[20] demonstrated that the neck pain risk intensified till the age of 50 but diminished thereafter. One explanation given for this was that after the age of fifty other chronic diseases were more prominent[20].

As accounted by Ehsani[13] and Cagnie[20] and Chiu[21] in their studies involvement in regular physical activity and sports was an effective deterrent strategy for neck pain, which was contrary to the studies by De Vitta[16], Shan[17] and Diepenmaat[22]. Shan[17] in his study explained that it was difficult to quantify the effect of short duration exercises and long duration exercises are more associated with injuries, he suggested that involvement in regular physical activity predisposes participants to injuries and muscle soreness and later thus more neck pain[17]. One explanation given for the disparity in findings could be differences in objective definition of the physical activity[22].

Genebra[15] in his study has demonstrated that being separated or widowed was related with neck pain. A probable explanation could be that they may be more exposed to house hold and professional work and have less social support in the absence of partner[15]. Inferior grade education and income may deprive people from quality health facilities and prevention strategies. Also, these people are typically more engaged physically demanding tasks exposing them to a greater risk of musculoskeletal system injuries[15].

Work Related and Ergonomics: Ehsani[13] reported in his study that teachers with a longer duration of employment had a higher risk of developing neck pain. Dry air, temperature fluctuations and thermal discomfort were also significantly associated with neck pain[20]. Deficiency of personnel was another factor associated with neck pain[20]. Poor working conditions were reported by 8 studies[13,15,18,19,20,21,23,24]. Research proves that maintenance of prolonged sitting with continuous tiresome neck postures while using computers, correction of examination papers and leaning activities were related with neck pain[13,15,18]. A potential justification could be an increase in neck extensor muscles and sternocleidomastoid muscles activity, simultaneously intensifying the load on the intervertebral disc, neck ligaments joint capsules etc leading to inflammation and pain in the cervical spine structures[15,16]. Neck holding in forward flexed position and working in consistent positions for elongated hours is significantly associated with neck pain as was doing the same motions every minute[20]. When distal upper extremity is at work like at the keyboard, mouse etc. the proximal musculature of neck and shoulders should perform as stabilizers, this activity is heightened when neck movements like rotation and flexion of neck is also added[20].

However, it is denoted that compared to laptop users, desktop users presented with significantly less

neck pain[17]. For which the authors theorised that a more adjustable positioning of the monitor and keyboard separately gave a more congenial posture and thus reduced the occurrence of neck pain[17]. Variation in computer usage could also explain the differences in the observations such as adolescents used computers more for entertainment rather than work and they experienced more of a discomfort than pain, also if they had pain they restricted the computer use as probably the pupils were aware that excessive computer usage could aggravate their problem[22]. But the fact that self-assessed computer usage can be inaccurate at times cannot neglected.

Yeun[14] has postulated that neck pain is significantly associated with mobile phone usage hours. The static neck positions maintained during mobile phone use may lead to muscle soreness[18.]

In an interesting finding it was shown that people using mobile phones had comparatively less neck pain than those using fixed land lines as mobile phones allowed more adjustable positioning of neck and there is no need to stand in fixed positions which might have led to more neck pain[17]. Adolescents may have different mobile phone using habits than the traditional users leading to altered observations[17].

There was only one study which investigated the effects of I pads/Tablet[17], with the changing technology and in this era of automation the effect of new innovations must be studied. Entertainment and work on I pads/ tablets has become more interesting and manageable. It was shown that while using I pads/tablets a person has to maintain a similar posture as adopted in reading, however it might be more of a distorted incorrect reading posture[17,20]. Thus, it has been shown that tablet usage might increase the incidence of neck pain to some extent.

Psychosocial: It is reported that teachers with a lower level of job satisfaction had a higher risk of developing neck pain[13]. Also neck pain was high in those participants who perceived their health as poor[14].

Stress, depression, mental tiredness and anxiety were other factors found to be associated with neck pain[14,17,20,22,23]. Shan[17] showed in his study that students contended with their everyday learning had less neck pain. Poor social and colleague support were other psychosocial factors found to be associated with neck pain.

Findings of our review support the earlier findings and in addition include maintenance of prolong tiring postures may be due to poor ergonomically designed workstations or work demands as in case of nursery teachers, existence of stress and depression, work overload both for students and professionals. For professionals it could be due to shortage of personnel at work place along with poor social and colleague support, for students it could academic pressure of clearing college entrance exams, as risk factors for increasing prevalence of neck pain.

Conclusion

Maximum number of studies identified being of female gender, poor working conditions such as demands for awkward and prolong exhausting postures, presence of stress and depression, work overload both for students and professionals, as risk factors for increasing prevalence of neck pain.

Prediction of COPD Using CT Measurements of Pulmonary Artery and Aortic Diameter

Priyanka[1], Abhijith A[2], Adarsh Veer Sisoudiya[2], Saikiran Pendem[3]

[1]Assistant Professor, MSc. Medical Imaging Technology, [2]BSc. Medical Imaging Technology, [3]Assistant Professor, Department of Medical Imaging Technology, Manipal College of Health Professions, Manipal Academy of Higher Education, Manipal

ABSTRACT

Introduction: Chronic obstructive pulmonary disease (COPD) is group of progressive lung disease which commonly includes emphysema and chronic bronchitis. Among non-communicable disease, COPD is estimated to be second largest cause of death in India. Computed Tomography (CT) of chest and measurements of arteries could be simple and effective modality for diagnostic evaluation of COPD.

Aim: To determine whether CT measurements such as Pulmonary artery and aortic artery diameters are useful in predicting COPD.

Materials and Method: A total of 291 patients was included in this retrospective study who had underwent CT thorax from April 2016 to April 2018. 194 patients with COPD were taken as cases and 97 patients without any history of COPD were taken as controls. Diameters such as Main pulmonary artery (MPA), right pulmonary artery (RPA), left pulmonary artery (LPA), ascending aorta (AAo) and descending aorta (DAo) was measured on an axial CT thorax image. Ratios of MPA/AAo and MPA/DAo were also calculated. Mann Whitney U test was used to compare CT measurements between two groups. Receiver operating characteristic (ROC) curve was used to find sensitivity and specificity of CT measurements in predicting COPD.

Results: The sensitivity and specificity for MPA, RPA, LPA, AAo, DAo, MPA/AAo and MPA/DAo was 77.3% & 83%, 74.8% & 79.5%, 71.8 & 78.8, 56.7% & 42.6%, 30.1 & 60.3, 17.3% & 33.8%, 18.9% & 33.8% respectively. There was significant difference in diameters such as MPA, RPA, LPA, AAo and DAo among two groups (p value <0.001). Whereas no significant difference was found in MPA/AAo and MPA/DAo ratios between two groups (p value >0.001).

Conclusion: In present study, we found significant increase in MPA, RPA and LPA diameters in COPD patients compared to controls. Henceforth, our study concludes that MPA, RPA and LPA diameters could be useful as reliable indicators in predicting COPD.

Keywords: *Computed Tomography (CT), Chronic Obstructive Pulmonary Disease (COPD), Main Pulmonary Artery diameter, Right Pulmonary Artery Diameter, Left Pulmonary Artery Diameter, Aortic Diameter*

Introduction

COPD is characterized by chronic obstruction of lung airflow that interferes with normal breathing and not fully reversible [1]. COPD is leading cause of morbidity and mortality worldwide. It is estimated to be second largest cause of death in India and fifth leading cause of deaths in worldwide [2, 3]. Patients with higher smoking index and exposure to biomass fuels are found to have more likelihood of developing COPD [4].

COPD includes chronic bronchitis and emphysema [5]. Chest computed tomography (CT) is widely performed in patients with respiratory symptoms because of its simplicity and accessibility, although radiation exposure is a concern. In addition, Chest CT is a useful tool for thoracic vascular assessment. It could detect changes of small vessels, enlargements of the vessel and these anomalies are important for clinical implications[6]. The Mean diameter of Pulmonary Artery and Ascending Aorta ratio measured using CT was found to be one. However, the ratio in some COPD patients was not greater than one. Fewer studies have evaluated the role of measurements such as pulmonary diameters, aortic diameters and its ratios measured using CT to predict the COPD. Hence, study was aimed to find sensitivity and specificity of pulmonary artery diameters, aortic diameter and its ratio's in predicting COPD.

Materials and Method

This was a retrospective study conducted in Department of Radio diagnosis and Imaging on subjects who had undergone CT chest from April 2016 to April 2018. The study approval was obtained from Institutional Research Committee and Institutional Ethics Committee (IEC No. - 133/2018). A total of 291 patients with age ranging from 18- 80 years was included in the study. 194 patients (120 males and 74 females) with history of COPD were selected as cases and 97 patients (58 males, 39 males) without any history of COPD were selected as controls. Patients with congenital heart disease, valvular heart disease, aortic aneurysm, pulmonary arterial hypertension were excluded from the study.

The CT Chest was performed by using Philips 64 slice Brilliance CT scanner with the routine protocol. Patients were positioned on the CT couch in supine position, with the area coverage from the apex of the lung to domes of the diaphragm. The scanning protocol was the following: collimation of 64×0.625, rotation time 0.75 seconds, FOV 350 mm, tube voltage of 120 kVp, tube current of 250 mAs, pitch of 1.078, scan time 4.9 seconds, slice thickness of 5 mm, slice increment of 5 mm, a filter of sharp C and resolution standard. The scan of the required area of interest was performed on the acquired scannogram. The images were reformatted in to axial, coronal and sagittal planes and was sent to PACS. The main pulmonary artery, right pulmonary artery, ascending aorta and descending aorta was measured at the level of pulmonary artery bifurcation (Fig. 1). The left pulmonary artery (LPA) diameters was measured at the widest part after main pulmonary artery bifurcation (Fig. 2). All the diameters were measured by using measuring tools in DICOM Imaging software of Mediff technology and were noted in millimeter (mm). The ratio of main pulmonary artery/ascending aorta and main pulmonary artery/descending aorta was also calculated. The measurements were taken by two readers who were blinded to the diagnosis and measured at different time periods. The inter and intra observer variability was calculated.

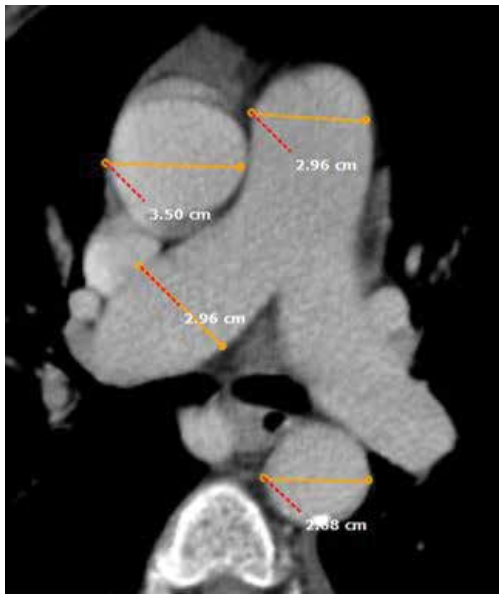

Fig. 1: Axial CT Thorax image showing measurement of main pulmonary artery (MPA), right pulmonary artery (RPA), ascending aorta (AAo) and descending aorta (DAo)

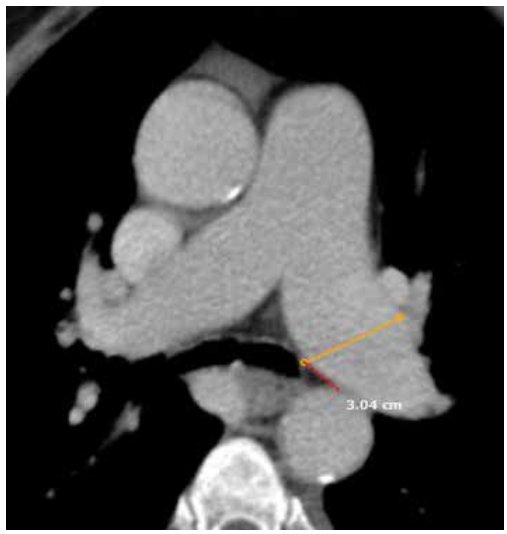

Fig. 2: Axial CT thorax image showing measurement of left pulmonary artery (LPA) diameter

Data Analysis

Statistical analysis was performed using the Statistical Package for the Social Sciences version (SPSS version 22.0). Data were presented by mean ± standard deviation. ROC curve was used to find sensitivity and specificity of pulmonary artery, aortic diameters and its ratio in predicting COPD. Mann Whitney U test was used to compare diameters and its ratio between two groups. Intra observer and Inter observer variability for measurements was using students t-test and kappa value

Findings: A total of 291 patients were included in this study which includes 194 cases and 97 controls. The descriptive statistics for the measured diameters were reported, which shows the mean and standard deviation of both groups (Table 1).

Table 1: Mean and standard deviation of the pulmonary artery, aortic diameter and its ratio for COPD and controls

Diameters (mm)	COPD (n=197)	Control (n= 94)	p value
MPA	26.8 ± 0.47	24.0 ± 0.29	< 0.001
RPA	22.5 ± 0.36	19.7 ± 0.31	< 0.001
LPA	21.4 ± 0.35	19.6 ± 0.27	< 0.001
AAo	32.3 ± 0.41	30.1 ± 0.41	< 0.001
Dao	24.8 ± 0.33	23.6 ± 0.32	0.006
MPA/AAo	0.8387 ± 0.16	0.8080 ± 0.11	0.371
MPA/Dao	1.0961 ± 0.22	1.0310 ± 0.15	0.062

MPA – Main Pulmoary Artery,RPA - Right Pulmonry Artery, LPA – Left Pulmonary Artery, AAo – Ascending Aorta, DAo – Descending Aorta, COPD – Chronic Obstructive Pulmonary Disease.

For Comparison of pulmonary artery, aortic diameter and ratios between two groups Mann Whitney U test was used. There was statistically significant difference in the diameters such as MPA, RPA, LPA, AAO and DAO ($p<0.001$) between COPD and controls. But there was no statistically significant difference in ratios such as MPA/AAO and MPA/DAO between COPD cases and controls ($p >0.001$). Main pulmonary artery, right pulmonary artery, left pulmonary artery diameter, Ascending Aorta, Descending Aorta were larger in COPD group compared to control group. (Fig. 3)

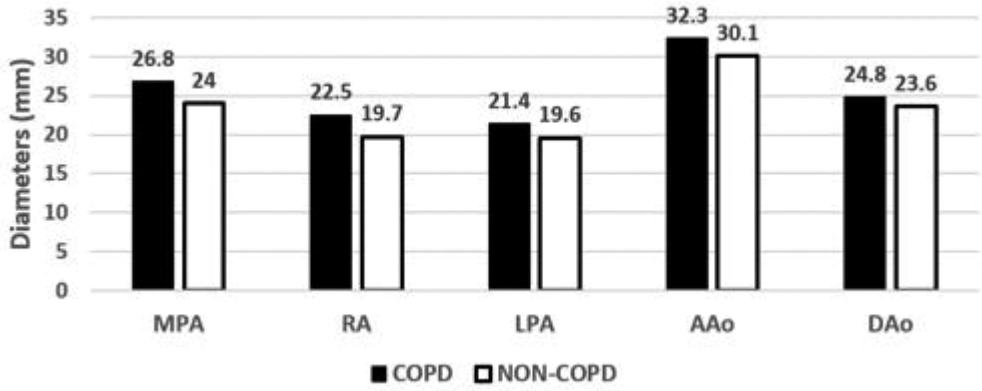

Fig. 3: Comparison of MPA, RPA, LPA, AAo and DAo diameters between COPD and non–COPD

Receiver operating characteristic (ROC) curve was used to find sensitivity and specificity of diameters measured using CT in predicting COPD (Fig. 4). Sensitivity and specificity of measured pulmonary artery, aortic diameters and ratio's for predicting COPD were evaluated (Table 2). MPA, RPA, LPA measured using CT were found to have greater accuracy in predicting COPD. Among the three measurements MPA has highest sensitivity and specificity in detecting COPD

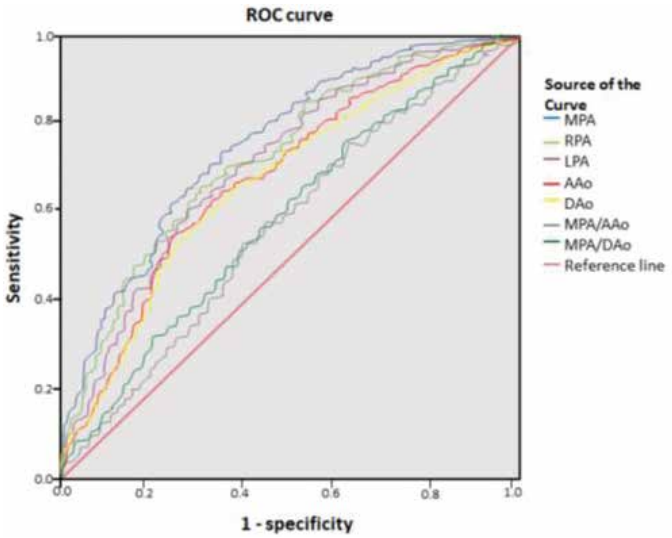

Fig. 4: Receiver operating characteristic (ROC) curves showing the diagnostic accuracy of different CT measurements for COPD

Table 2: Area under the curve, sensitivity and specificity of pulmonary artery, aortic diameters for predicting COPD

Diameters	AUC	Sensitivity(%)	Specificity(%)
MPA	0.681	77.3	83
RPA	0.737	74.8	79.5
LPA	0.682	71.8	78.8
AAo	0.646	56.7	42.6
Dao	0.599	30.1	60.3
MPA/AAo	0.532	17.3	33.8
MPA/DAo	0.568	18.9	33.8

MPA – Main Pulmoary Artery,RPA - Right Pulmonry Artery, LPA – Left Pulmonary Artery, AAo – Ascending Aorta, DAo – Descending Aorta

Intra- observer variability: There was no stastically significant difference between the measurements performed by Reader A and B at different time periods, according to paired student's t-test ($p<0.001$)

Inter-observer variability for the above measurements, the Kappa value was 0.97, suggesting good agreement and reproducibility.

Discussion

COPD is a chronic inflammatory disease which affects the structure and the function of the lung. CT is an important imaging tool to evaluate different characteristics and clinical outcomes in patients with COPD[7].

In our study we found that there was significant difference in pulmonary artery diameters and aortic diameters between case and controls with MPA, RPA, LPA diameters and width of AAo and DAo larger in COPD cases than those in the controls. The ratios of MPA/AAo and MPA/DAo was also calculated but there was no but there was no significant difference between two groups.

Madas et al, reported that the diameters of main pulmonary artery, right pulmonary artery and left pulmonary artery were significant higher in COPD group than the controls, but there was not much of difference in the ascending aorta and descending aorta diameters between the two sets of patients[8].

In a study conducted by Lee SH et al, Main pulmonary artery and Ascending aorta diameter was measured using CT in healthy Korean population. Mean MPA and Ao was 25.9mm and 30.0 mm respectively and the mean MPA/Ao ratio was 0.87 [9]. In our study

mean MPA and Ao was 24.0 and 30.1 respectively and the mean MPA/Ao ratio was 0.80 in healthy individual which is concordant with previous study.

Chen et al, reported that MPA could be used as best index for predicting COPD with threshold value 27.5mm, AUC 0.711, specificity 54% and sensitivity 80%. RPA was selected as best index for predicting COPD-PH with threshold value 23.4 mm, area under the curve 0.806, specificity 67% and sensitivity 76%[10]. However, in this present study MPA, RPA, LPA measured using CT were found to have greater accuracy in predicting COPD. Among the three measurements MPA has highest sensitivity71.3% and specificity 83% in predicting COPD.

Conclusion

Our study concludes that, there was a significant difference in pulmonary artery and aortic diameters between COPD patients and control group. Main Pulmonary Artery diameter measured using CT had highest sensitivity and specificity in predicting COPD. Therefore, Main Pulmonary artery, Right and left pulmonary artery diameter measured using CT could be useful as the indices for the diagnosis of COPD.

Ethical Clearance: The ethical approval for the study was obtained from Institutional Ethics Committee (IEC No. - 133/2018)

Acute Anticonvulsant Activity of Diltiazem, Nimodipine and Flunarizine in Wistar Albino Rats by Maximum Electroshock-Induced Seizure

Saniya K[1], BG Patil[2], Madhavrao[3], Prakash KG[4]

[1]Assistant Professor, Department of Anatomy, Azeezia Institute of Medical Sciences and Research, Kollam, Kerala, India; [2]Professor, Department of Anatomy, Shri B M Patil Medical College, BLDE University, Vijayapura, Karnataka state, India; [3]Professor, Department of Pharmacology, [4]Professor and Head, Department of Anatomy, Azeezia Institute of Medical Sciences and Research, Kollam, Kerala, India

ABSTRACT

Background and objectives: In spite of growing armamentarium of antiepileptic drugs, many patients continue to have seizures. This propels for search of novel and safe drugs for resistant and recurrent convulsions. Calcium channel blockers have been ascribed with anticonvulsant actions. The objective of the present study was to evaluate the anticonvulsant actions of diltiazem, nimodipine and flunarizine among Wistar albino rats in Maximum Electroshock-induced Seizure (MES) model.

Methodology: Thirty inbred Wistar rats weighing 150-200 grams of either sex, divided into five groups containing six rats in each. Group 3, 4 and 5 were pre-treated with diltiazem (20mg/kg), nimodipine (20mg/kg) and flunarizine (10mg/kg) respectively. Group 2 was standard group, received phenytoin (25mg/kg). The groups pre-treated with calcium channel blockers were compared with this standard. Group 1 was negative control and were given normal saline. All groups were subjected to MES. During and after the MES, the duration of flexion, duration of tonic hind limb extension and duration of clonus (in seconds) were noted. Abolition of hind limb extension and reduction (or absence) of the clonus duration after the drug administration were considered as anticonvulsant effect of the test drug.

Results: Rats pre-treated with diltiazem, nimodipine, flunarizine showed statistically significant reduction in duration of hind limb extension phase and clonic seizures. Total duration of the seizures was also significantly lower and comparable to phenytoin pre-treated rats. All rats in all groups survived the experiments indicating the doses used during the study were not lethal

Conclusions: Diltiazem (20mg/kg), nimodipine (20mg/kg) and flunarizine (10mg/kg) have anticonvulsant action among Wistar rats in MES model.

Introduction

In spite of availability of considerable number of anti-epileptic drugs, many patients continue to have seizures that are refractory to treatment defying our understanding and approaches of epilepsy[1]. In the search for a novel anticonvulsant drugs, many plant extracts and old drugs are evaluated for newer indications. With increasing understanding of epileptogenic molecular mechanisms, more avenues are opening.

Many of the currently used anti-epileptic drugs are shown to inhibit calcium channel activity[2,3]. Theoretical considerations and few animal model studies have suggested that calcium channel antagonists may play a role as anticonvulsants[4]. These drugs are postulated to inhibit the positive inward burst firing activating wide range of neurons leading to seizures. To support such theoretical considerations, few animal model studies and clinical studies have shown that nimodipine has anticonvulsant property[5,6]. Combination of calcium channel blockers was shown to have mixed effects. Diltiazem enhances the nimodipine's antiseizure effects. Flunarizine inhibits nimodipine's effects[7]. During last decade of twentieth century, there was heightened interest in evaluation of calcium channel blockers for epilepsy at least in animal model. There were series of research reports pertinent to this area[8–12]. After the introduction of gabapentin, topiramate, tiagibine, levetiracetam and zonisamide, the evaluation of monotherapy for epilepsy has veined[13–15]. However, the evaluation continued as add on therapy both in animal model and in clinical trials[16–19].

There are many animal models have been developed over the previous two decades for evaluation of the novel anti-epileptic drugs. The maximal electroshock (MES) model remains as an important gatekeeper for such evaluation, in spite of the fact that it failed in levetiracetam efficacy[20]. MES model has been successfully used to prove the anticonvulsant action of plethora of plant extracts[21]. However, the evaluation of calcium channel blockers alone was done in limited number of studies. Sahadevan has shown the anticonvulsant action of nimodipine and flunarizine in mice MES model[22]. Diltiazem anticonvulsant effects were hitherto unevaluated in Indian set up in rat MES model.

The objective of the study was to evaluate the anticonvulsant effect of diltiazem, nimodipine and flunarizine in Wistar albino rats using MES model.

Methodology

Experiments were conducted with 36 inbred Wister rats, in 3–4 weeks old, weighing 150-200 grams, of either sex, were used in this study. All rats were obtained from animal house, BLDEU's Shri B M Patil Medical College, Vijayapura, Karnataka state. Animals were group housed in cages of six with water and food supplied ad libitum. The temperature was maintained at 25° ± 1 °C and relative humidity of 41.55%. A 12:12, light: dark cycle was following during the experiment. The experiment was carried out during 1200-1400 hr. Animals had free access to food and water. However, food but not water was withdrawn 8hr before and during the experiments.

Institutional animal ethics committee, BLDEU's Shri B M Patil Medical College, Vijayapura, Karnataka state, (with CPCSEA, India registered) (approval letter number: 32/16, dated-16.01.2016) and also Institutional animal ethics committee, KMCH College of Pharmacy, Coimbatore, Tamil Nadu, (approval letter number: KMCRET/PhD/05/16-17, dated-22.02.2016) approved the study before the start of the study

Evaluation of anticonvulsant activity-Maximum electroshock (MES) model: The rats were pretested prior to the drug administration for the electroshock sensitivity. Convulsions were induced by using electro-convulsiometer (Techno India Ltd). MES stimulation were given using trans-auricular (ear-clip) electrodes from the apparatus. Intensity of MES was at 150mA for 0.2 seconds, with constant voltage stimulators of 250 V. At this intensity and duration all the control group rats exhibited tonic hind limb extension. Only those rates that consistently exhibited the tonic hind lime extension in three trials on three separate days were used for the study[21].

Rats were divided onto five groups of six each. The division and administration of the drugs are tabulated in the Table 1. All groups were subjected to MES.

Table 1: Description of groups and drugs administered during the study (n = 30)

Group	Description	Drug administered
I	Control group	Normal saline equivalent (PO)
II	Standard group	Phenytoin sodium 25 mg/ kg body weight
III	Diltiazem group	Diltiazem 20mg/kg (PO)
IV	Nimodipine group	Nimodipine 20mg/kg (PO)
V	Flunarizine group	Flunarizine 10mg/kg (PO)

During and after the MES, the duration of flexion, duration of tonic hind limb extension and duration of clonus (in seconds) were noted.

Abolition of hind limb extension and reduction (or absence) of the clonus duration after the drug administration were considered as anticonvulsant effect of the test drug.

Statistical analysis: The data obtained was expressed as mean ± standard deviation. Comparison of the data was done by one-way ANOVA, followed by Dunnett comparison. P value of less than 0.05 was taken as significant.

Results

MES induced seizures: Following the ear electrode stimulus, an immediate tonic seizure with hind limb extension was observed in all animals of group I and group II. There were no signs of toxicity in the control groups. The positive control group administered with phenytoin did not show the phase of clonic seizures. The latency of onset of flexion, extension and clonic seizures is tabulated in Table 2.

Table 2: Tabulation of latency and duration of seizures (expressed as mean ± standard deviation in seconds) in all the groups of rats in MES model (n = 36)

Time in seconds					Recovery/ mortality
Group	Flexion	Extension	Clonus	Duration	
Only MES	8.167 ± 0.47	11.167 ± 3.75	20.667 ± 4.35**	107 ± 23.84	Recovery
MES+ Phenytion 25 mg/kg	1.2 ± 0.68	4.83 ± 1.66*	0	43 ± 9.33*	Recovery
MES + Diltiazem 20mg/kg	1.16 ± 0.47	1.5 ± 1.5†	4 ± 2.543*	67.16 ± 14.06†	Recovery
MES + Nimodipine 20mg/kg	1.5 ± 0.67	3.5 ± 2.21†	5.5 ± 3.86*	69 ± 14.66†	Recovery
MES + Flunarizine 10mg/kg	1.02 ± 0.68	3 ± 1.91†	13.6 ± 6.28†	75.66 ± 5.40†	Recovery

Rats pre-treated with diltiazem, nimodipine, flunarizine showed statistically significant reduction in duration of hind limb extension phase and clonic seizures. Total duration of the seizures was also significantly lower and comparable to phenytoin pre-treated rats. All rats in all groups survived the experiments indicating the doses used during the study were not lethal.

Discussion

Calcium channels, both L-type and T-type has been increasingly implicated in epileptogenesis[2–4,23]. It is postulated that calcium channel antagonists have anti-seizure and neuroprotective roles. Many previous studies have demonstrated such anti-seizure actions of calcium channel blockers in rat MES model. Nifedipine (in doses of 10mg/kg), amlodipine (in doses of 1-4mg/kg)[11,12,16], felodepine (in doses of 5-10 mg/kg)[10], verapamil (in doses of 5 mg/kg)[5,15,19], flunarizine(in doses of 5 mg/kg)[17,18], nicardipine (in doses of 5 mg/kg)[17], nimodipine (in doses of 5-10 mg/kg) [5,6,17,18] and diltiazem (in doses of 5-10 mg/kg) have been shown to have anti-seizure actions in animal models. In the present study as well, diltiazem, nimodipine and flunarizine were proven to have anti-seizure actions.

Contrary to our findings, diltiazem was shown to have no anticonvulsant action even with increasing doses among mice MES model[22]. However, diltiazem was shown to have anticonvulsant actions in many other studies in the past[15,19]. In addition, diltiazem has been shown to enhance the actions of oxcarbazepine[14] and topiramate[19]. In the similar way, amlodipine has been shown to be anticonvulsant when used singly[9,11,15]. Amlodipine also enhances the anticonvulsant actions of lamotrigine, gabapentin and topiramate[13,16,19].

With patients continuing to have recurrent episodes of convulsions while on anticonvulsant therapy, the search for novel and safe effective in such resistant individuals endures. In this study an attempt was made to show the anticonvulsant effects of three calcium channel blockers – diltiazem, nimodipine and flunarizine. The effects in MES model, however, need not necessarily translate to the clinical effects in epileptic individuals. Further tests, both animal model and pre-clinical tests, evaluating the neurotransmitter levels in the specific areas of the brain, pathological alterations in the neuronal cells structure and functions as proven at least by histological and immunohistopathological studies shall add to the findings of the present study. The handling of free radicals in the brain and consequent brain inflammation has been postulated as potential epileptogenic mechanism[24]. Studies evaluating the oxidative stress, both in animal model and preclinical set up using these drugs shall make calcium channel blockers potential drugs for epilepsy.

Limitations of the study: Use of multiple animal models nullifies short comings of each other and achieves better clinical correlations in humans. Dose variations during MES model would have provided minimum effective dose (ED50) of the drugs. Use of standard anti-epileptic drug in each group would have evaluated the additive role the calcium blockers. Currently only calcium channel blockers are used – that are rarely clinically used as standalone therapy for epilepsy.

Conclusions

Diltiazem (20mg/kg), nimodipine (20mg/kg) and flunarizine (10mg/kg) have anticonvulsant action among Wistar rats in MES model

Isolated and Combined Effect of Plyometric and Weight Training on Selected Physical Fitness and Hematological Variables of Football Players

K. S. Saran[1], K. Vaithianathan[2], Mithin Anand[1], T. Arun Prasanna[1]

[1]Ph.D. Scholar, [2]Director of Sports, Dept. of Physical Education and Sports Science, SRMIST, Kattankulathur

ABSTRACT

In this research eighty football players were selected as samples from colleges under M.G University, Kottayam. And the variables selected were Physical fitness variables- speed and explosive power and Hematological variables-RBC count and Hemoglobin percentage. After employing 12 weeks of isolated and combined plyometrics and weight training for selected subjects who were divided into four groups, a significant difference was observed in all selected variables. There is also significant difference among the groups after applying Scheffe's post hoc test.

Keywords: *Physical fitness, Speed, Explosive power, Hematological variables, RBC count, Hemoglobin percentage*

Introduction

In ancient times, our ancestors showed extraordinary talent in terms of physical activity in olden days. Sports and games have turned into professional dimension due to the tough competitions in the fields.[1] People have started involving in various sports idea irrespective of their age to be creative and competitive. Participation and practice alone don't help in the success of an individual. The quality of a sports life has been affected through various factors such as physiology, sports training, sociology, computer technology.[2]

Sports training are now one of the most closely watched research streams of all time.[3] Aim to excel in maximum performance and achieving goals at desirable time is always the prime objective. In sports population resistance training has shown to impel a positive hypertrophic, neuromuscular and strength improvement everywhere around the world.[4] Plyometric training which is one of the most effective training to bring up explosive power. [5] Studies have found that resistance training is effective and safe training method to develop hypertrophic increase in youth athletes. Similarly, if done properly plyometric training exhibits greater increase performance variables of an athletes.[6] A combination of these two method training can improve performance to greater extent.

Subjects' Selection: For the purpose of the study eighty football players was chosen as samples from colleges under M.G University, Kottayam.

Selection of Variables

Physical fitness variables: speed and explosive power and

Hematological variables: RBC count and Hemoglobin percentage

Selection of Test: The following standard test will be administrated to collect relevant data from the subjects. Speed-50m Dash, explosive power-standing broad jump,RBC count and hemoglobin percentage laboratory test.

Experimental Design

- The random group design will be experimental design. A random selection of 80 subjects 20 into 4 groups three experimental where combined and

isolated training were given. The last one was considered as control group and no training were given.

- Experimental Group 1 Combined Plyometrics + weight training
- Experimental Group 3 weight training - isolated training
- Experimental group 2 plyometrics training - isolated training
- Group D Control group

Training Protocol

No. of training weeks: 12 weeks

Group 1- Combined training- plyometric and circuit training

Group 2- Isolated training- weight training

Group 3- Isolated training –Plyometric training

Group 4- No workout

Isolated Plyometric training -3 days per week

Isolated Circuit training - 3 days per week

Combined training - 3 days per week

Statistical Technique: The data collected from the subjects after the **12 weeks** of training was analyzed statistically with the analysis of covariance **(ANCOVA)** to evaluate the differences, if occurring, between the groups on chosen dependent variables individually. If attained **'F' ratio** for the post test adjusted was significant, the **Scheffe's test** was used as post hoc test for finding out paired mean differences. The confident level was maintained at 0.05 to determine the significance to be appropriate. The results using Analysis of co-variance and post hoc value are listed in table I and II.

Result

Table I: Computation of Analysis of Covariance

Variable	Group	Pretest		Posttest		Df		F
		Mean	Sd	Mean	Sd	Between	Within	
Speed	Ex 1	7.07	0.15	6.92	0.14	3	76	21.79*
	Ex 2	7.10	0.22	6.55	0.28			
	Ex 3	7.06	0.35	6.93	0.25			
	Ctrl	7.10	0.18	7.09	0.16			
Explosive Power	Ex 1	2.46	0.10	2.67	0.14	3	76	14.70*
	Ex 2	2.35	0.22	2.45	0.21			
	Ex 3	2.31	0.15	2.48	0.12			
	Ctrl	2.29	0.17	2.32	0.16			
RBC count	Ex 1	4.94	0.37	5.85	0.17	3	76	70.43*
	Ex 2	5.16	0.30	5.90	0.09			
	Ex 3	4.90	0.30	5.53	0.28			
	Ctrl	4.86	0.27	4.97	0.30			
Haemoglobin Count	Ex 1	14.63	0.57	15.68	0.59	3	76	17.62*
	Ex 2	14.59	0.59	15.46	0.56			
	Ex 3	14.31	0.50	14.47	0.75			
	Ctrl	14.45	0.52	15.08	0.54			

Table value required for significance at 0.05 confident level for 3 and 76 is 2.728.

Table II: Post-hoc value

Variable	Ex1 & Ex2	Ex1 & Ex3	Ex1 & Ctrl	Ex2 & Ex3	Ex2 & Ctrl	Ex3 & Ctrl	CI value
Speed	0.38	0.02	0.15	0.4	0.53	0.13	**0.57**
Explosive Power	**0.25***	**0.19***	**0.35***	0.06	0.10	**0.16***	**0.15**
RBC count	0.03	0.32	0.87*	0.35	**0.90***	0.55	**0.47**
Hb Count	0.2	**0.78***	**0.73***	**0.58***	0.53	0.05	**0.56**

Significance at 0.05 confident level

Discussion and Conclusion

The results from table I indicated that 'F' value obtained for speed, explosive power, RBC count and haemoglobin count are significant as the values found greater than 2.72 which is the required table value for at 0.05 significant level. Scheffe's post-hoc test indicated the following results

- Speed: no significant difference between adjusted mean between the four group
- Explosive power: significant difference among Group 1 and 2, group 1 and 3, and group 1 and control group.
- RBC count: significant difference among Group 1 and control group; group 2 and control group.
- Hb count: significant difference between Group 1 and 3, group 1 and control group, and group 2 and 3.

Effect of Game Specific Circuit Training and Plyometrics on Selected Physiological and Hematological Variables of Handball Players

Mithin Anand[1], K. Vaithianathan[2], K. S. Saran[1], T. Arun Prasanna[1]

[1]Ph.D Scholar, [2]Director of Sports, Dept. of Physical Education and Sports Science, SRMIST, Kattankulathur

ABSTRACT

To achieve the purpose of this study, 64 intercollegiate level handball players from M.G University, Kottayam were selected as subjects. The variables selected of this research were Physiological variables namely Vital capacity and respiratory rate and Hematological variables like RBC count and Hemoglobin count. After engaging twelve weeks of game specific circuit training and plyometrics for selected subjects, divided into four groups. The findings revealed that there was a difference significantly in all selected variables. After applying the test of Scheffe's post hoc, it was found that there is significant differences between groups were found.

Keywords: *Hand ball, Vital capacity, Respiratory rate, RBC count, Hemoglobin count*

Introduction

Sport is a form of physical activity which involves skills for a competition or entertainment by casual or organized involvement of participants.[1] It is an event that provides physical fitness through joyful activities. The modern civilization gives immense recognition to sports and physical fitness which leads to the good establishments of the organization of sports.[2] The sports play a significant role in contemporary society in terms of awareness about health and fitness, entertainment, profession, money etc.[3]

The present scenario of competitive sports is being portrayed by professionalism at the different levels of competitions. The desires of the athletes for earning fame and wealth is the contributing factor of the professionalism.[4] Scientific preparations of the sportspersons for the competitions play a vital role in the enhancement of the performances. To display the upper hand against the opponent the researchers and coaches develop their techniques and strategies.[5] The frequent breaking of national and international records was possible by these technological and tactical advancements in the sports field. The scientific examinations in the performance by the athletes are playing an imperative role in evaluating the success. The popularity and the place of prominence of sports and games are in fastest pace which it has gained from past decades by the hard works of sportspersons, coaches, researchers, media, organizers etc.[6]

Subjects and Variables Selection: To achieve the purpose of this study, sixty-four intercollegiate level handball players from M.G University, Kottayam were selected as subjects.

The variables selected of this research were Physiological variables namely Vital capacity and respiratory rate and Hematological variables like RBC count and Hemoglobin count.

Selection of test

Vital capacity	Spirometry (using wet spirometer)
Respiratory test	Chest-abdomen expansion monitoring test
RBC count	CBC test (Laboratory test)
Haemoglobin count	CBC test (Laboratory test)

Experimental Design: The comparative group design was the design of the study of this research. The total number of chosen subjects was put to an equal division of four groups. Three experimental groups namely Game specific circuit training group, plyometric training group and a combined plyometric- game specific circuit training group and the fourth group was controlled group.

- Group A– Experimental : Plyometric and circuit training (Combined training)
- Group B – Experimental : Plyometric training (Isolated training)
- Group C– Experimental : Circuit training (Isolated training)
- Group D – Control : No training

Training Protocol

No. of training weeks:	12 weeks
Isolated Plyometric training	-3 days per week
Isolated Circuit training	-3 days per week
Combined training	-3 days per week

Statistical Technique: After the twelve-week training programme, the data were examined statistically by with the analysis of covariance **(ANCOVA)** to evaluate the significant differences. The test of **Scheffe's post-hoc** was used to determine the paired mean differences, if **'F' ratio** for the adjusted post test was found to be significant. The level of confidence will be fixed at 0.05 to evaluate the significance. The results obtained were present in the table I and table II.

Result

Table I: Descriptive statistics and Computation of Analysis of Covariance

Variable	Group	Pretest		Posttest		Df		F
		Mean	Sd	Mean	Sd	Between	Within	
Vital capacity	Ex 1	3356	292.61	4840	257.69	3	60	144.74*
	Ex 2	3378	280.45	4718	248.24			
	Ex 3	3381	292.04	3509	255.09			
	Ctrl	3331	269.49	3359	276.41			
Respiratory rate	Ex 1	15.50	1.46	12.06	1.23	3	60	35.14*
	Ex 2	15.31	1.30	11.68	0.60			
	Ex 3	15.31	1.74	14.87	1.14

RBC count	Ex 1	4.95	0.21	5.65	0.36	3	60	26.90*
	Ex 2	4.96	0.25	5.85	0.18			
	Ex 3	5.03	0.25	5.51	0.28			
	Ctrl	4.95	0.26	4.94	0.38			
Haemoglobin Count	Ex 1	14.56	0.52	15.62	0.64	3	60	11.77*
	Ex 2	14.60	0.58	15.44	0.57			
	Ex 3	14.32	0.51	14.45	0.51			
	Ctrl	14.45	0.52	14.79	0.78			

Required table value for significance at 0.05 confident level for 3 and 60 is 2.76.

Table II: Post-hoc value

Variable	Ex1 & Ex2	Ex1 & Ex3	Ex1 & Ctrl	Ex2 & Ex3	Ex2 & Ctrl	Ex3 & Ctrl	CI value
Vital capacity	125.74	**1335.67***	**1476.84***	**1209.93***	**1351.1***	141.17	**261.30**
Respiratory rate	0.32	2.868	**2.92***	**3.18***	**3.24***	0.06	**1.15**
RBC count	0.2	0.14	**0.72***	**0.34***	**0.92***	**0.58***	**0.31**
Hb Count	0.19	**1.16***	**0.82***	**0.97***	0.63	0.34	**0.65**

Significance at 0.05 confident level

Discussion and Conclusion

From the able I it can be noted that 'F' value obtained for Vital capacity, respiratory rate, RBC count and haemoglobin count are significant as the values found greater than 2.76 which is the required table value required for significance at 0.05 significant levels. Scheffe's post-hoc test indicated the Vital capacity: significant difference between Group 1 and 3, group 1 and control group, group 2 and 3 and group 2 and control group. In Respiratory rate, significant difference was observed between Group 1 and control group, group 2 and 3, and group 2 and control group. Significant difference in RBC are between Group 1 and control group, and group 2 and 3, group 2 and control group, group 3 and control group. In Hb count the significant difference between Group 1 and 3, group 1 and control group, and group 2 and 3.

"A Study to Assess Coping Stratergies among Parents of Mentally Challenged Children at Selected Special Schools of Miraj, Kupwad and Kolhapur Corporation Area"

Akshay Bhupal Pawar[1], Rajesh Gaikwad[2]

[1]Final Year M.Sc. Nursing, [2]Clinical Instructor, M.Sc Nursing (Psychiatric Department), College of Nursing Sangli, Bharati Vidyapeeth (Deemed to be) University

ABSTRACT

A quantitive study was conducted by Mr. Akshay. B. Pawar In partial fulfillment of the requirement for the award of Master of Science degree in nursing, Bharati Vidyapeeth (Deemed to be) University, Pune.

Aims:

1. To assess the coping strategies adopted by parents of mentally challenged children.
2. To find out association between the coping strategies with selected demographic variables

Materials and Method: Non-experimental descriptive research design was used to assess the coping strategies among parents of mentally challenged children at selected special schools of Miraj, kupwad and Kolhapur corporation area. The reliability coefficient "r" of the coping strategy rating scale was 0.9, hence it was found reliable. Total 100 samples were selected by Non- Probability purposive sampling method. A coping strategy rating scale of 25 items was administered to assess coping strategies among parents of mentally challenged children. The conceptual framework based on the Roy's Adaption theory, developed by Sister Callista Roy which consists of four major concepts i.e. Input, Control process, Effectors and Output through which the individual cope with the stressors

Results and Conclusion: The study revealed that the parents of mentally challenged children were using some coping strategies i.e. are watching TV or going for film with family members i.e.(54%); trying to found several alternatives i.e.(53%); reducing household budget i.e.(51%); sharing difficulties with friends and relatives i.e.(55%); doing meditation i.e.(54%) at the maximum level. The chi square computed between coping strategies with selected demographic variables and showed that coping strategy was dependent on, education, monthly income and type of family of parents. But it was not dependent on gender, religion, occupation, Number of family member and duration of child mental illness.

Keywords: *Coping Strategies, Parents, Mentally Challenged Children, Special School.*

Introduction

Background: A parent is a caregiver of the offspring in their own species. In humans, a parent is the caretaker of a child. Parenting is a challenging process. The crucial role of parents and family in caring, nurturing, protecting and socializing young children is well established across the cultures. Strong parent-child connectedness improves child academic outcomes, self esteem, mental health and has later protective effects of reducing the likelihood of alcohol and drug use in adolescence, high risk sexual behavior and involvements in interpersonal

Coressponding Author:
Mr. Rajesh Gaikwad

violence (Lezin et al., 2004)[1]. Parenting can influence children's social, emotion, and academic adjustment, efforts have been made to determine factors that affect parenting behavior. One such factor is parenting stress. Parenting stress can be defined as excess anxiety and tension specifically related to the role of a parent and to parent-child interactions (Abidin, 1995)[2].

Parenting is a highly stressful job, and becoming a parent of a child with a disability is one of the most stressful life events that can occur. According to the centers for disease control and prevention (CDC, 2015), approximately 1 in every 33 babies is born with a birth defect, and about 1 in 6 children is born with a developmental disability[3]. A child born into family is usually received with joy and considered a blessing but when the child is handicapped and blessing is clearly mixed. Acceptance of child with mental handicap becomes difficult to parents and the whole family particularly when competence and achievement are very much valued in modern world. A parent shows a series of reactions after knowing that their child is disabled. These included shock, denial, guilt, sorrow, rejection and acceptance. Questions like 'why me?' 'How can it be?' keep arising without answers[4].

Coping includes behavioral strategies that individuals use to reduce the effect or demands of stress (Khan &Humtsoe, 2016). According to Folk man and Lazarus (1984), coping efforts serves two main functions: management of the person-environment relationship and regulation of associated stressful emotions. Lazarus (1980) defined coping as "the cognitive and behavioral efforts made to master, tolerate, or reduce external and internal demands appraised as taxing or exceeding the resources of the individual"[5].

Coping, defined as action-oriented and intrapsychic efforts to manage the demands created by stressful events, is coming to be recognized both for its significant impact on stress-related mental and physical health outcomes and for its intervention potential. Stress is a negative experience, accompanied by predictable emotional, biochemical, physiological, cognitive, and behavioral accommodations (Baum 1999). Coping is the process of attempting to manage the demands created by stressful events that are appraised as taxing or exceeding a person's resources (Lazarus &Folkman 1984). Coping is an individual's continuous effort in thoughts and actions to manage specific external or internal demands appraised to be challenging and overwhelming to the individual. In addition, coping is considered highly contextual, in that its effectiveness is determined by the ability to change over time and across different conditions (Folkman& Lazarus, 1985)[6].

Material and Method

Non-Experimental Descriptive exploratory research design was used to assess the coping strategies among parents of mentally challenged children at selected special schools of Miraj, kupwad and Kolhapur corporation area. Sample size was 100 and sample was selected by Non-probability purposive sampling method. After clearance by the ethical review committee data collection was started a prior permission was taken from the respective authorities and informed and written consent was taken from the participant. Data collection was done by using coping strategy rating scale and the tool was divided into two sections, section-I consist of demographic variables and section-II consist of coping strategy questionnaire. Questions were related to psychological coping, physical coping, financial coping, social coping and spiritual coping and after each coping strategy one open ended question was kept. The scoring was done on the following points 1=Never, 2=Sometimes, 3=Always. The 25 questions carried maximum score of 75 and minimum score of 3.

Findings

Section I

Table-1, shows Frequency and Percentage distribution of Demographic variables like Age, Gender, Education and Occupation Monthly income of family, Type of family, Number of family members, Family history of mental illness and Duration of child mental illness of parents with mentally challenged children at selected special schools in terms of frequency and percentage.

Section II-Assessment of Coping Strategies among Parents

Table 1: Assessment of the psychological coping strategies among parents

(N = 100)

Sr. No.	Coping Strategies	Never		Sometimes		Always	
A.	Psychological Coping	N	Percent- Age	N	Percen T-Age	N	Percent-Age
1.	Seeking guidance From relatives.	29	29.00	48	48.00	23	23.00
2.	Watching TV or go for movie with the Family.	12	12.00	54	54.00	34	34.00
3.	Trying to see the Positive side of the situation.	4	4.00	48	48.00	48	48.00
4.	Seeking professional Counseling.	9	9.00	44	44.00	47	47.00
5.	Believe that I can Handle my own problem.	8	8.00	49	49.00	43	43.00

Interpretation: In psychological coping strategy, maximum number of parents are using watching TV or going for film with family members i.e. (54%).

Table 2: Assessment of the Physical coping strategies among parents

(N = 100)

Sr. No.	Coping Strategies	Never		Sometimes		Always	
B.	Physical Coping	N	Percent- Age	N	Percent- Age	N	Percent- Age
1.	Taking help from Somebody.	6	6.00	48	48.00	46	46.00
2.	Taking rest or Sleep intermittently.	1	1.00	49	49.00	50	50.00
3.	Eating healthy Diet.	4	4.00	52	52.00	44	44.00
4.	Making plan of Action.	7	7.00	48	48.00	45	45.00
5.	Trying to found Several alternatives.	3	3.00	44	44.00	53	53.00

Tinterpretation: In physical coping strategy, maximum number of parents were using, trying to found several alternatives i.e. (53%).

Table 3: Assessment of the financial coping strategies among parents

(N = 100)

Sr. No.	Coping Strategies	Never		Sometimes		Always	
C.	Financial Coping	N	Percentage	N	Percentage	N	Percentage
1	Working hard to Solve problem.	5	5.00	50	50.00	45	45.00
2	Reducing Household budget.	3	3.00	48	48.00	51	49.00
3	Talking with the Experts.	1	1.00	50	50.00	49	49.00
4	Taking help from Friends and relatives.	3	3.00	49	49.00	48	48.00
5	Taking help from NGO‟s.	0	0.00	49	49.00	49	51.00

Interpretation: In financial coping strategy, maximum number of parents where using reducing household budget i.e. (51%).

Table4: Assessment of the Social coping strategies among parents

(N = 100)

Sr. No.	Coping Strategies	Never		Sometimes		Always	
D.	Social Coping	N	Percent-Age	N	Percent-Age	N	Percent- Age
1.	Sharing difficulties	1	1.00	49	49.00	55	50.00
2.	Seeking encouragement and support	6	6.00	49	49.00	40	45.00
3.	Seeking Information and advice.	3	3.00	50	50.00	47	47.00
4.	Seeking assistance from community Agencies.	0	0.00	48	48.00	52	52.00
5.	Involving in Social activities.	1	1.00	44	44.00	55	55.00

Interpretation: In social coping strategy, maximum numbers of parents were using sharing difficulties with friends and relatives i.e. (55%)

Table 5: Assessment of the Spiritual coping strategies among parents

(N = 100)

Sr. No.	Coping Strategies	Never		Sometimes		Always	
E.	Spiritual Coping	N	Percent- Age	N	Percent- Age	N	Percent- Age
1.	Participating in Religious Activities.	3	3.00	49	49.00	48	48.00
2.	Doing Meditation	2	2.00	46	46.00	54	52.00
3.	Hope That God Will Make Magic.	2	2.00	50	50.00	48	48.00
4.	Seeking Advice from a Spiritual Leader.	1	1.00	46	46.00	53	53.00
5.	Having Faith in God or Higher Power.	3	3.00	45	45.00	52	52.00

Interpretation: In spiritual coping strategy, maximum numbers of parents were using doing meditation i.e. (54%).

Section III: Table- 7: Deals with analysis of data related to the association between coping strategies with selected demographic variables.

Significant Association: Demographic variables like age, education, monthly income and type of family, the p value of the association test with coping strategies was less than 0.05. Concludes that, there was significant association of these demographic variables with the coping strategies among parents of mentally challenged children.

Not Significant Association: Demographic variables like gender, religion, occupation, Number of family members and Duration of child mental Illness the p value of the association test with coping strategies was more than 0.05. Concludes that, there was no significant association of these demographic variables with the coping strategies among parents of mentally challenged children.

Conclusion

The study concluded that the coping strategies used by the parents of mentally challenged children are watching TV or going for film with family members i.e. (54%); trying to found several alternatives i.e. (53%); reducing household budget i.e. (51%); sharing difficulties with friends and relatives i.e. (55%); doing meditation i.e. (54%) at the maximum level.

And the Association depicts that variables like age, education, monthly income and type of family was significant association of these demographic variables with the coping strategies among parents of mentally challenged children.

And variables like gender, religion, occupation, Number of family members and Duration of child mental Illness was no significant association of these demographic variables with the coping strategies among parents of mentally challenged children.

Conflict of Interest: The author declares that they have no any conflict of interest.

Source of Funding: The whole research funding was done by the researcher by self.

Ethical Clearance: A research proposal approved by Institutional Ethical Committee (IEC), meeting was held in Bharati Vidyapeeth (Deemed to be University) College of Nursing, Sangli. The permission for pilot and main study were obtained from selected special schools of Kupwad Kolhapur corporation area to conduct study after IEC.

Effectivness of Curry Leaves Powder on Blood Sugar Level among Diabetic Patients

Kunal V Jadhav[1], Basavant Dhudum[2]

[1]Final Year M.Sc Nursing Student, [2]Assistant Professor, Bharati Vidyapeeth (Deemed To Be) University College of Nursing, Sangli

ABSTRACT

"A study to assess the effect of curry leaves powder on blood sugar level among diabetic patients in selected areas of Sangli Miraj Kupwad Corporation."

The Objectives of the Study:

1. To assess the fasting blood sugar level and post prandial blood sugar level before administration of curry leaves powder among diabetic patients.
2. To assess the fasting blood sugar level and post prandial blood sugar level after administration of curry leaves powder among diabetic patients.

Material and Method: An experimental Research Design was adopted for this study. The study was conducted in selected areas of Sangli Miraj kupwad Corporation. Windenbach's prescriptive theory is used in this study. Sample size was 60 where, 30 samples were included in control group and 30 samples were included in experimental group. Samples were selected using non probability convenient sampling technique.12 gm of Curry leaves powder was administered to the client per day for 20 days. The data collection was done using Glucometer which was noted down in blood level accessing chart. The data was analyzed using descriptive and inferential statistics

Result with Conclusion: In this study 56.67% of clients were between 51 and above age group in experimental group. There were equal no of male and female client in both the group. Experimental and control group revealed that average fasting blood sugar level was 157. 47 with SD 9.54 and in control group were 151.37 with SD 9.10. By using paired T test comparison of average fasting blood sugar and postprandial blood sugar level of first day and 20th day was done. The calculated P value was 0.00 which stated that there was significant difference in average fasting blood sugar level and postprandial blood sugar level at 5% level of significance.

As there was no significant difference in fasting blood sugar level of control group due to extraneous variables there is a significant reduction in blood sugar level in experimental group compared to control group. The P value is > 0.05 which indicate that there was significant difference after the administration of curry leaves powder among diabetic patient hence curry leaves powder is helpful for reducing blood sugar level among diabetic patients.

Introduction

Diabetes's metabolic disease and chronic disease that increase blood glucose level over a long period. If proper treatment is not provided to the diabetic client they may suffer from various complication like chronic foot ulcer heart disease stroke and serious long term complications[1].Diabetic mellitus is a chronic disease

caused due to lack of production of insulin to pancreas or unsuccessfulness of insulin produced so the increase blood sugar level in the body system particularly in nerves and blood vessels[2]. According to the data of International diabetes Federation atlas in India estimated 69.2 million are diabetic clients. WHO suggested that 30.3% people are diabetic patient Diabetes is rapid gaining the status of potential epidemic in India with high rate of 62 million diabetic individuals currently diagnosed with this disease[3].Day to day care of diabetic client like maintaining physical activity food management Keeping weight and tension under control, checking the blood Glucose level, Recording oral medication and insulin. Diabetic patient uses many alternative therapies to reduce the blood sugar level[4].Diabetes to curry leaves loaded with antioxidants like beta acetone and vitamin c curry leaves have the ability to keep most diseases at bay. Especially type 2 diabetes herbal remedies for manually diabetes and how to use it to stable blood sugar level.

Material and Method

A present study was conducted using Quantitative research approach. The research design selected was Pre test post test case control group design. The conceptual frame work was based on Ernestine Wiedenbach's prescriptive theory. Non probability, convenient sampling method was used. Validity was done from 20 experts. Type II diabetic clients were selected for the study from selected areas of Sangli, Miraj, and Kupwad Corporation. Sample size was 60, in which 30 were included in experimental group and 30 were included in control group. Proposal with tool presented in front of ethical committee for permission. Curry leaves in the form of powder was provided in sachets 6 gm each twice a day for 20 days. 6 gm before the lunch with sips of water and 6 gm before dinner with sips of water. Curry leaves powder was administered to the diabetic patients for 20 days. Fasting blood glucose level and post prandial glucose level was checked on 1st day with the help of Glucometer On 10th and 20th day fasting blood glucose level was checked in the morning on empty stomach and post prandial blood sugar level was checked 2 hrs after the lunch. Data was recorded on assessment chart.

Findings

Section I

Table 1: Frequency and percentage distribution of diabetic patients according to demographic variables

n = 60

Sr. No.	Variable	Groups	Experimental		Control	
			Frequency	Percentage	Frequency	Percentage
1.	Age	41-50	13	43.33	15	50.00
		51 & Above	17	56.67	15	50.00
2.	Sex	Male	15	50.00	15	50.00
		Female	15	50.00	15	50.00
3.	Duration of disease	0-5	14	46.67	20	66.67
		6-10	10	33.33	7	23.33
		11-15	6	20.00	3	10.00
4.	Any other illness	Yes	16	53.33	17	56.67
		No	14	46.67	13	43.33
5.	Illness	Arthritis	5	31.25	6	35.29
		Obesity	7	43.75	6	35.29
		Respiratory Disease	4	25.00	5	29.41

Section II: Deals with analysis of data related to assessment of blood sugar level among diabetic patients experimental and control groups.

Day 20	30	208.63	9.72		

Discussion

SECTION I

1. **Age:** In experimental group, most of them 56.67% were between 51yrs and above

   In control group, 50% were between 51yrs and above

2. **Gender:** In experimental group, 50% were female patients and 50% male patients.

   In control group also, 50% were female patients and 50% male patients.

3. **Duration of disease:** In experimental group, most of them 46.67% had the diabetes in group 0-5 years.

   In control group, most of them 66.67% had the diabetes in group 0-5 years.

4. **Any other illness:** In experimental group, to the question have any other illness other than diabetes most of them 53.33% were answered yes. People had other illness like respiratory disease, arthritis and obesity.

Section II

Fig no 1: Assessment of blood sugar level in Experimental & Control Groups revealed that on day 1 average fasting blood sugar level of experimental group was 157.47 with SD 9.54. And in control group it was 151.37 with SD of 9.10.

Average post prandial blood sugar level of experimental group was 212.4 with SD 12.84. And in control group it was 211.17 with SD of 9.87.

Fig no 2: On day 20 average fasting blood sugar level of experimental group was 146.77 with SD 12.94 and in control group it was 150.5 with SD of 8.65.

Average post prandial blood sugar level of experimental group was 198.27 with SD 14.22 and in control group it was 208.63 with SD of 9.72.

Section III

Experimental Group

Fasting BSL: The comparison of the average fasting BSL of the day 1 and day 20 of experimental group was done by the paired t test. The day 1 average fasting BSL was 157.47 with standard deviation of 9.54 the day 20 averages fasting BSL was 146.77 with standard deviation of 12.94. The test statistics value of the paired t test was 5.32 with p value 0.00. Shows that there was significant difference in the average fasting BSL at 5% level of significance

Post Prandial BSL: The comparison of the Post Prandial BSL of the day 1 and day 20 of experimental group was done by the paired t test. The day 1 average Post Prandial BSL was 212.40 with standard deviation of 12.84. The day 20 average post Prandial BSL was 198.27 with standard deviation of 14.22. The test statistics value of the paired t test was 21.4 with p value 0.00. Shows that there was significant difference in the average post Prandial BSL at 5% level of significance

Control Group

Fasting BSL: The comparison of the average fasting BSL of the day 1 and day 20 of control group was done by the paired t test. The day 1 average fasting BSL was 151.37 with standard deviation of 9.10. The day 20 average fasting BSL was 150.50 with standard deviation of 8.65. The test statistics value of the paired t test was 1.37 with p value 0.18.The p value more than 0.05, concludes that there was no significant difference in the average fasting BSL at 5% level of significance.

Various extraneous variables were responsible for the findings to be not significant such as diet pattern, type of work, exercise etc.

Post Prandial BSL: The comparison of the Post Prandial BSL of the day 1 and day 20 of control group was done by the paired t test. The day 1 average Post Prandial BSL was 211.17 with standard deviation of 9.87. The day 20 average post Prandial BSL was 208.63 with standard deviation of 9.72. The test statistics value of the paired t test was 3.87 with p value 0.001. The p value > 0.05, stated that there was significant difference in the average post Prandial BSL at 5% level of significance.

Conclusion

The study revealed that the p value was > 0.05, stated that there was significant difference in the average fasting and post Prandial BSL at 5% level of significance. Effect of curry leaves powder was seen after administrating to client; it reduced blood sugar level after specific time span. Curry leaves powder is helpful for the diabetic clients to reduce blood sugar level without any side effects as curry leaves are easily available and are very cheaper to buy. It can be utilized for medicinal use as well as to reduce blood sugar level. Cardiac patients are not recommended to consume curry leaves powder.

Ethical Clearance: Proposal of research with the data collection tool was presented in the front of research committee for approval. Prior permission from corporator of the area was taken. Informed written consent from each participant was taken, which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr. Sripriya and Dr. Nilima Bhore Mam.

A Framework Analysing Patient Adherence Level in Cardiovascular Disease in Delhi-NCR Region

Navjot Kaur[1], Supriti Agrawal[2], Hemendra Gautam[3]

[1]Research Scholar, Amity Institute of Pharmacy, [2]Assistant Professor, Amity Business School, Amity University, Noida (UP); [3]Director, Future Institute of Pharmacy, Bareilly (UP)

ABSTRACT

The deficit in the patient adherence level is considered to be the most problematic factor in chronic diseases. The cross-sectional study on cardiovascular disease related patients was conducted in hospitals of Delhi-NCR region in the month of July 2018- August 2018. The total respondents taken were about 144 and were selected from cardiovascular diseases such as coronary artery disease, heart attack, abnormal heart beat, heart valve disease, congenital heart disease, aortic disease, vascular disease etc. The respondents were from various age groups and the results were concluded on the basis of the treatment and medications. The reliability of Morisky Medication Adherence Scale-8 was upto 0.78 which is considered to be good and on the basis of adherence scale category, the widely held of patients were categorized under medium adherence level. The chief factors which seems to be responsible for low adherence level were- monotonous life schedule, long waiting times in hospitals, irregular visits, high cost of treatment, forgetfulness etc.

Keywords: *WHO, adherence, cardiovascular diseases, MMAS*

Introduction

The boom of chronic diseases in the previous years has totally changed the attribute in the field of medical science. It has been reported in one of the article in Times of India, 2016, that over 20% of Indian population is suffering from chronic diseases [1]. In the latest report of 2018 by WHO, the chronic diseases or non-communicable diseases enlisted as heart ailments, cancer, respiratory diseases, diabetes etc. kill about 41 million people globally every year [2]. Also, in this report it has been mentioned that the cardiovascular diseases accounted for the highest death rate among the patients that ranges up to 17.9 million people every year, chased by cancer patients up to 9 million, respiratory diseases up to 3.9 million and diabetes patients up to 1.6 million.

Corresponding Author:
Ms. Navjot Kaur
Research Scholar, Amity Institute of Pharmacy,
Amity University, Noida -201313, (UP)

Email: frequentnavjot@gmail.com

The patients used to invest a good amount of cost for the chronic diseases for detection, screening and treatment. In between year 2008-2015 in India, about 1.3% of total GDP has invested in public health and that further increased up to 1.4% in 2016-2017 which is still less than the world average percentage that is 6% [3]. Also, the National Health Policy in 2017 proposed that this expenditure will increase up to 2.5% of GDP by 2025 [3].

The poor medication adherence level is one of the major causes that highly affect the patients in many ways. Poor medication adherence causes many complications towards treatment process, disease progression, disability in case of inappropriate treatment and in some cases death of the patient [4]. In various studies, it have shown that the non-adherence towards diseases like hypertension, diabetes and hyperlipidemia etc, the hospitalization rate increased, medical outcomes get worsened and also on the whole healthcare cost augmented [5,6].

Talking about the overall impact of medication adherence by the patients, it not only improves or reduces the cost of treatment but it also helps to improve the clinical outcomes for particular disease. In one of

the study, it has been proved that patient adherence in case of anti-hypertensive medications resulted in blood pressure control and also shown the long-term beneficial outcomes [6]. There are large numbers of factors that are indulged in the field of medical science to improve the patient adherence level. In the field of healthcare sector, the healthcare providers, government policies, third party players, online services and other related disease management programs helped out the patients to improve the adherence level on large scale [7,8].

For the successful treatment and desired results of any medication, the main thing is the patient's compliance i.e. the patient should follow their medications properly. According to WHO, in the meeting conducted on adherence in June 2001, adherence is defined as "the extent to which the patients follow medical instructions" [9]. It is very essential for the patients to take their medications, with proper diet including lifestyle changes and agreeing the recommendations of healthcare providers. The adherence includes three basic steps i.e. initiation of the treatment, implementation of the prescribed treatment and discontinuation of the pharmacotherapy [10]. The medication adherence level has its own benefit in the field of patient wellness to improve the diseased condition and course therapies and for implementing this it is important to follow the basic steps in adherence.

It is very well said that adherence helps to reduce the whole cost at the time of treatment. In a literature, it has been mentioned that if medication lessen with time then in future the hospitalization rate and total cost of care increases [11, 12]. Thus, it is very essential for the patients to stick with their treatment procedure so as to get desired results. Adherence is like the capability or eagerness of the patients to stick with the therapeutic course of therapy [13]. When the patient doesn't stick to their medications as prescribed by the healthcare provider then it is known as non-adherence or non-compliance. The non-adherence of medications can be due to many reasons such as- taking incorrect dose, delaying in treatment, not following doctor's instructions properly etc. In one of the research, the non-adherence is said to be multi factorial [14] as there are many reasons due to which the patients don't take their medications properly and some of the reasons are as follows-

- Psychological reasons
- Missed the upcoming appointments with physicians
- Intricacy of the treatment provided
- Cost of the medication is not affordable
- Patient and provider relationship is badly chosen
- Lack of belief in the benefit of the treatment
- Side-effects from the treatment taken
- Insufficient follow up by the healthcare provider

In such way, we can analyse that how the patient adherence level towards their medications and treatment is important for chronic type of diseases. This adherence level helps the patients to recover from disease in a better way.

Objectives

The study is done to understand the adherence level of cardiovascular patients and it focuses on following objectives-

1. To study the factors affecting patient adherence towards medications and treatment.
2. To understand the patient perspective towards low medication adherence
3. To develop a holistic framework for better adherence level.

Methodology

The sample size of about 144 patients were selected suffering from cardiovascular diseases such as- coronary artery disease, heart attack, abnormal heart beat, heart valve disease, congenital heart disease, aortic disease, vascular disease etc. The patients who were suffering from above cardiovascular diseases were included in the study and also the communication was done in hindi and english language. Face-to-face interview was conducted in various hospitals of Delhi-NCR region. The cross-sectional study was conducted out in various hospitals of Delhi-NCR region from the month of July 2018- Aug 2018 and the hospitals provided the OPD patients for the survey.

The respondents were taken from various age groups and also on the basis of the treatment and medications for the disease. The patients were asked for the level of agreement on statements of Morisky Medication adherence scale (MMAS-8). For each statement,

they had to anchor Yes or No with the score of 1 or 0 respectively. Also, some additional questions were asked about the type of hospitals, number of medicines in a day, family type, occupation etc.

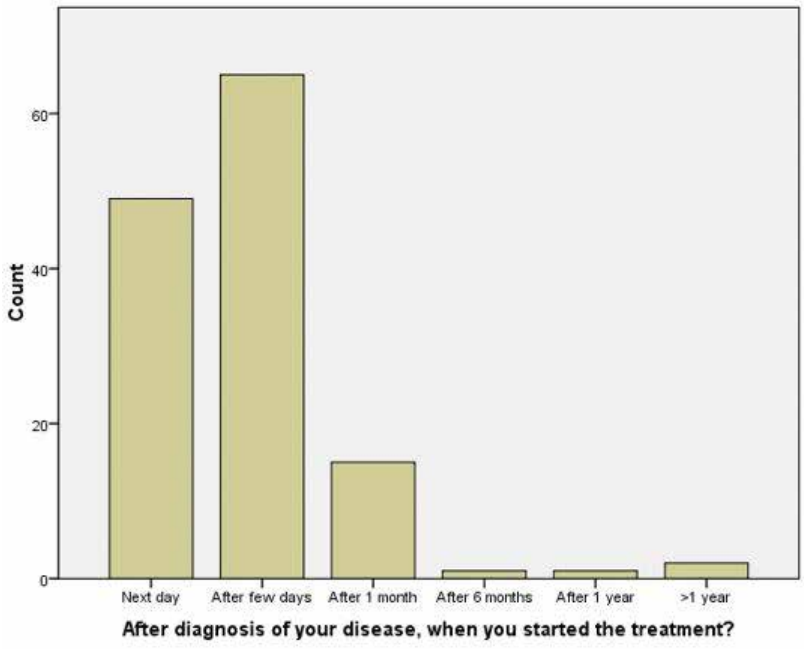
Results and Discussion

Pre-testing of the questionnaire: The pre-testing of the questionnaire was done by taking 35 respondents erratically and they were requested to give the remarks related to language and clarity of the questionnaire. On the basis of the suggestions the changes were done accordingly for cleanness and specificity of the statements.

Reliability of the survey: The data collection also needed reliability analysis for assessing the accuracy in the survey process so for this Cronbach's alpha was the result showed the reliability of 0.78. Table 1 showed the value of Cronbach's alpha for the statements of Morisky Medication Adherence Scale to measure the medication adherence level of patients suffering from cardiovascular diseases. From the table 1, it is clear by the value 0.78 that the statements showed good reliability. Table 2 shows the total item statistics for each statement and which have also shown good reliability for the statements. Talking about the MMAS and its adherence level scale, the MMAS category of high adherence, medium adherence and low adherence was calculated in which the values were 21, 110 and 13 respectively. The score of 0 is categorized as high adherence, score 1-2 is categorized as medium adherence and score 3-8 is categorized as low adherence. The widely held of patients were under medium adherence level suggesting that patients should focus on improving this adherence level towards medications and treatments

The graph 1 below showed that the majority of the patients started their treatment after few days when they were diagnosed of disease which shows that patients are aware about their health. The patients are now emphasizing on their health issues and also they use to have regular discussions with their families or friends.

Table 1: Reliability Statistics



Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items

Graph 1: Showing the time of treatment when started

Conclusion

The study identifies that now-a-days patients are not more adherent towards their medications and treatment due to large number of factors. The inappropriate behaviour towards non-adherence causes patients to have long and sometimes serious illness. The results from MMAS-8 also showed that majority of the patients are low adherent towards their treatment. The major objective of the research was to analyse the factors that affect patient adherence level towards medication and treatment and some of the factors were like- monotonous life schedule, long waiting times in hospitals, irregular visits to doctors, severe symptoms during medications, interaction with healthcare professionals, family support, forgetfulness, high cost of medications and treatment etc.

On the support of improving patient adherence level, there are various factors that may help patients to stick towards medications such as- regular patient counselling, various campaigns by the hospitals or clinics, digital reminders for the patients provided by the medical healthcare professional and family support. Thus, it is very essential for the patients to stick to the treatment and medications for better improvement of the health.

Ethical Clearance: For this study there was no requirement for ethical clearance certificate.

A Study to Assess the Effect of Pineapple Extract on Episiotomy Wound Healing among Postnatal Mothers in Selected Hospitals of Sangli, Miraj and Kupwad Corporation Area

Sindhu R.Gaikwad[1], Nilima R. Bhore[2]

[1]M.Sc 2nd Year Nursing, [2]Dean Faculty of Nursing & Principal, Bharati Vidyapeeth (Deemed to be University) College of Nursing Sangli

ABSTRACT

Pregnancy[1] is a beautiful and natural condition. Nine transformative months full of excitement, planning and peering at the awesome unfolding of life. After delivery, Episiotomy is one of the most important areas of concern. The perineum is highly susceptible to infection due to different secretions like vaginal discharges, feces and urine. Episiotomy wound requires a proper intervention which could otherwise be self - limiting due to high vascularity of perineal area. If not taken care, episiotomy wound may lead to immediate complications like infection, dehiscence or remote complications like dyspareunia, scar endometriosis or chances of perineal lacerations in subsequent labour. Extracts from pineapple helps to improve healing time and would aid outcome. Pineapple is easily available and doesn't cost much. It is crucial to discover the opportunity of using pineapple to enhance episiotomy wound healing.

Aim: To assess the condition of episiotomy wound and assess the effect of pineapple extract on episiotomy wound healing.

Keywords: *Post natal mother, episiotomy, wound healing, pineapple extract.*

Introduction

Pregnancy has some complications[2] which needs specific care. Pregnancy is split into 3 trimesters.[3] in women ages 15-49years the number of pregnancies is 144.7 per 1000 women. About 43% were planned pregnancies, 9%miscarriage from planned pregnancies, 11%were unintended birth, and 33% induced abortion, 5% miscarriage from unintended pregnancy[4].

Vaginal delivery[5] is the most common way of childbirth. Postpartum period[6] is the time of adjustment after child birth when anatomical and physiological changes of consumption are reversed to an almost pre pregnancy level. Early discharge is given to mother and newborn within 48 hours of birth.[7] Midwifery care[8] is strengthened through the world; by monitoring physical, psychological and social well-being of mother throughout the childbearing cycle, providing individualised education to mother, counselling and prenatal care, and minimising technological interventions, identifying and referring women who require obstetrical attention.

Episiotomy[9] performed routinely during childbirth to prevent tears and trauma during delivery. Normal wound healing includes homeostasis, inflammation, proliferation and remodeling...Care of postnatal mothers with episiotomy can be done economically if the nurse is competent with skills to provide various remedial measures for wound healing. Pineapple is used for medical purposes since decades and it also used as a digestive aid and a remedy for skin disorders[10]. From pineapple stem and fruits.[11] a crude, aqueous Bromelain extract is derived. Bromelain is efficient in decreasing inflammation, bruising and pain in women having episiotomy. It helps in faster wound healing.

Objectives:

1. To assess the condition of episiotomy wound.
2. To assess the effect of pineapple extract on episiotomy wound healing.

Materials and Method

A quasi-experimental two group pre-test post-test design was conducted to assess effect of pineapple extract on episiotomy wound healing among postnatal mothers in selected hospitals of Sangli, Miraj and Kupwad corporation area." By using non-probability purposive sampling method 60 samples were selected. A standardized REEDA SCALE was used to evaluate the impact of pineapple extract on episiotomy wound healing. "Widenbach prescriptive theory" was adopted as a theoretical base for framework of this study. Analysis was done using frequency and percentage distribution and paired' test.

Hypothesis:

H_0: There is no change in episiotomy wound healing after application of pineapple extract in experimental group.

Findings

Section I: Frequency and percentage distribution of demographic variables

Table 1: frequency and percentage distribution based on age, parity, education, and dietary pattern
n = 30 + n = 30

Variables		Experimental Group		Control Group	
		Frequency	Percentage	Frequency	Percentage
Age in years	19-23	15	50%	14	46.67%
	24-28	10	33.33%	13	43.33%
	29-33	5	16.67%	3	10%
Parity	1	17	56.67%	14	46.67%
	2	12	40%	15	50%
	3	1	3.33%	1	3.33%
Education	Under graduates	20	66.67%	25	83.33%
	Graduates	9	30%	5	16.67%
	Post graduates	1	3.33%	0	-
Dietary pattern	Vegetarian	12	40%	12	40%
	Mixed	18	60%	18	60%

Above table shows that, maximum number of samples 50% were between 19-23 years of age group, 56.67% were with parity 1, 66.67% were undergraduates and 60% were taking mix diet in experimental group, whereas maximum numbers of samples 46.67% were between 19-23 years of age group, 50% with parity 2, 83.33% were undergraduates and 60% were vegetarian in control group.

Table 2: Frequency and percentage distribution based on weight, family income, occupation and type of episiotomy
n = 30 + n = 30

Variables		Experimental		Control	
		Frequency	Percentage	Frequency	Percentage
Weight in kg	46-55	12	40%	12	40%
	56-65	12	40%	18	60%
	66-75	6	20%	0	0%

Conted…

Family Income in Rs.	<10,000	5	16.67%	7	23.33%
	11,000-20,000	15	50%	16	53.33%
	21,000-30,000	7	23.33%	6	20%
	31,000-40,000	3	10%	1	3.33%
Occupation	Housewife	24	80%	26	86.67%
	Service	6	20%	4	13.33%
Type of Episiotomy	Medio-lateral	30	100%	30	100%
	Lateral	0	0%	0	0%
	Medial	0	0%	0	0%

Above table shows that maximum numbers of samples i.e. 40% of the mothers were in 46-55 kg weight group, 50% were in 11000-20000 family income groups, 80% were housewives and 100% mother had Medio lateral type of episiotomy in experimental group whereas 60% mothers were in 56-65 kg, weight group, 53.33% were in 11000-20000 family income group, 86.67% were housewives and 100% mother had Medio lateral type of episiotomy in control group.

Section II

Table 3: Pre/post observation of episiotomy wound healing parameters in control group

n = 30

Sr. No	Parameters	Pre		Post		t value	p value
		Mean	S.D.	Mean	S.D.		
1.	REDNESS	3.00	0.00	1.60	0.49	15.39	0.00
2.	EDEMA	3.00	0.00	1.96	0.31	17.70	0.00
3.	ECMOSIS	2.70	0.46	1.33	0.47	11.19	0.00
4.	DRAINAGE	2.60	0.47	0.96	0.41	17.40	0.00
5.	APPROXIMATION	3.00	0.00	1.93	0.25	23.03	0.00

Above table shows that pre observation episiotomy wound healing parameters scores of redness, edema, ecchymosis, discharge, approximation in control group are 3, 3, 2.70, and 2.60,3 respectively where as post observation scores are 1.60, 1.96, 1.33, 0.96, and 1.93 respectively.

Table 4: pre/post observation of episiotomy wound healing parameters in experimental group

n = 30

Sr. No.	Parameters	Pre		Post		t value	p value
		Mean	S.D.	Mean	S.D.		
1.	REDNESS	3.00	0.00	1.10	0.30	34.11	0.00
2.	EDEMA	2.96	0.18	1.16	0.37	24.23	0.00
3.	ECMOSIS	2.70	0.46	0.90	0.40	16.16	0.00
4.	DRAINAGE	2.66	0.47	0.36	0.49	21.14	0.00
5.	APPROXIMATION	3.00	0.00	1.60	0.49	15.39	0.00

Above table shows that pre observation episiotomy wound healing parameters scores of redness, edema, ecchymosis, discharge, approximation in experimental group are 3, 2.96, 2.70, 2.66, and 3 respectively where as post observation scores are 1.10, 1.16, 0.90, 0.36, and 1.60 respectively.

Table 5: Mean scores and s.d. of episiotomy wound healing parameters in experimental and control groups
n = 30 + n = 30

Sr. No.	Parameters	Experimental Group		Control Group		t value	p value
		Mean	S.D.	Mean	S.D.		
1.	REDNESS	1.10	0.30	1.60	0.49	4.69	0.00
2.	EDEMA	1.16	0.37	1.96	0.32	8.83	0.00
3.	ECCHYMOSIS	0.90	0.40	1.33	0.47	3.79	0.00
4.	DRAINAGE	0.36	0.49	0.96	0.41	5.12	0.00
5.	APPROXIMATION	1.60	0.49	1.93	0.25	3.27	0.002

Above table shows that, condition of episiotomy wound healing mean score of experimental group are 1.10, 1.16, 0.90,0.36, 1.6 and standard deviation are 0.30, 0.37, 0.40, 0.49, 0.49 .respectively whereas mean score of control group are 1.60, 1.96, 1.33, 0.96, 1.93 and standard deviation are 0.49, 0.32, 0.47, 0.41 and 0.25 respectively. Hence there is significant difference between Mean and SD of episiotomy wound healing parameters in experimental and control group. p value less than 0.005, it shows that pineapple (stem) extract application is effective in episiotomy wound healing.

Table 6: mean scores and s.d. of wound healing in experimental and control groups
n = 30 + n = 30

Group	Frequency	Mean	S.D.	t value	P value
Experimental	30	5.13	0.97	11.79	0.000
Control	30	7.83	0.79		

The average wound healing score of experimental group was 5.13 with standard deviation of 0.97. The average wound healing score of control group was 7.83 with standard deviation of 0.79. The test statistics value of the unpaired t test was 11.79 with p value 0.000. This shows that there was significant difference in the average wound healing score at 5% level of significance.

Conclusion

The study was conducted to assess the effect of pine apple extract on episiotomy wound healing. For this study the quasi experimental pre post test design was used, 60 samples were selected on the basis of the sampling criteria set for the study and samples are divided in two groups, pineapple extract application group and control group.Pre observation of wound was done before intervention in both the groups, post intervention observation of episiotomy wound was done to assess episiotomy wound healing in experimental group with the help of Reeda scale.

The intervention was done i.e. pineapple extract applied to the episiotomy wound twice daily and observation was done according to the REEDA Scale before application of pineapple extract for five days and findings were recorded.The episiotomy wound healing parameters mean scores in experimental group is 1.10, 1.16, 0.90,0.36, 1.6 and standard deviation is 0.30, 0.37, 0.40, 0.49, 0.49, respectively whereas wound healing parameters mean score in control group is 1.60, 1.96, 1.33, 0.96, 1.93 and standard deviation is 0.49, 0.32, 0.47, 0.41 and 0.25 respectively. This shows there is significant difference between Mean and SD in experimental and control group .p value is less than 0.005,

The average wound healing score of experimental group was 5.13 with standard deviation of 0.97. The average wound healing score of control group was 7.83 with standard deviation of 0.79. The test statistics value of the unpaired t test was 11.79 with p value 0.000. This shows that there is a significant difference in the average wound healing score at 5% level of significance. Mean score findings showed that pineapple extract application is useful in episiotomy wound healing and there is statistical significant difference in the intervention group and control group. The application of pineapple extract contains bromelain, which is effective in healing of episiotomy wound Hence it is concluded that pineapple extract application is the best and effective tropical agent in episiotomy wound healing.

Ethical Clearance: Institutional Ethical Committee, meeting was held in Bharti Vidyapeeth (Deemed to Be University) College of Nursing, Sangli and research proposal was approved. Permissions were obtained from Private hospitals of Sangli and Miraj to conduct pilot study and the main study after I.E.C. Permission from Medical Superintendent was obtained for autoclaved materials required for episiotomy wound dressing. Purpose of the study was explained to postnatal mother and informed written consent was obtained from the subject prior to conduct study. Data collected from participants was kept confidential.

Assessment of Clinical Profile of Patients with Blunt Abdominal Trauma Admitting to Emergency Department

Ashok Y Kshirsagar[1], Pratik D. Ajagekar[2], Ajay Aggarwal[3], Shekhargouda Deshetti[3]

[1]Professor, [2]Assistant Professor, [3]Junior Resident, Department of Surgery, Krishna Institute of Medical Sciences deemed to be University, Karad, Satara, Maharashtra

ABSTRACT

Background: Abdominal trauma caused by blunt force is a common presentation in the emergency room seen in adults and children. The management of the patient with blunt abdominal trauma remains in continuous flux. Hence; we planned the present study to assess the clinical profile of patients with blunt abdominal trauma admitting to emergency department.

Materials & Method:A total of 200 patients were included in the present study. Complete clinical details of all the patients were obtained. Chest X-ray was carried out in all the patients. Computed tomography (CT) was also done in all the patients. This was followed by grading of the liver, spleen and gut according to their CT findings.Higher grade indicated higher severity of the trauma.

Results: In the present study, a total of 200 patients were analysed. Abdominal distension was found to be present in 152 patients (76 percent). Chest X ray findings were analysed in all the patients and it was observed that Chest X-ray revealed abdomen with air under diaphragm in 9 percent of the patients. On doing CT liver, it was observed that grade zero was present in 98 patients while grade three and four were present in 30 patients each.

Conclusion: In patients with blunt abdominal trauma, it is comparatively unreliable to diagnose the patient clinically. Rather radiograph and CT evaluation of the patients should be done for finalizing the treatment planning.

Keywords: *Abdominal,Blunt, Trauma*

Introduction

Abdominal trauma caused by blunt force is a common presentation in the emergency room seen in adults and children. The chief cause of blunt abdominal trauma is motor vehicle accidents. Other rare causes include falls from heights, bicycle injuries, injuries sustained during sporting activities, and industrial accidents. Abdominal injuries require surgery in about 25% of cases. 85% of abdominal traumas are of blunt character.[1-3] The spleen and liver are the most commonly injured organs as a result of blunt trauma. Clinical examination alone is inadequate because patients may have altered mental status and distracting injuries.The management of the patient with blunt abdominal trauma remains in continuous flux. The emergency physician cannot place undue reliance on physical examination, and plain radiography of the abdomen rarely adds to patient care. Laboratory tests particularly elevated liver function tests or a large base deficit, may increase our suspicion for intra-abdominal trauma.[4-6] Hence; under the light of above obtained data, we planned the present study to assess the clinical profile of patientswith blunt abdominal trauma admitting to emergency department.

Materials & Method

The present study was conducted in the Department of Surgery, Krishna Institute of Medical Sciences deemed to be University, Karad, Satara, Maharashtra and it included analysis of clinical profile of the patients with blunt abdominal trauma admitting to emergency

department. A total of 200 patients were included in the present study. Ethical approval was obtained from the ethical committee of the institution.Complete clinical details of all the patients were obtained. Chest X-ray was carried out in all the patients. Computed tomography (CT) was also done in all the patients. This was followed by grading of the liver, spleen and gut according to their CT findings.[4, 5]Higher grade indicated higher severity of the trauma. All the results were recorded in Microsoft excel sheet and were analysed by SPSS software.

Results

In the present study, a total of 200 patients were analysed. Mean age of the patients of the present study was 38.4 years. Majority of the patients belonged to the age group of 21 to 40 years. 91 percent of the patients in the present study were males while the remaining were females. Abdominal distension was found to be present in 152 patients (76 percent). Chest X ray findings were analysed in all the patients and it was observed that Chest X-ray revealed abdomen with air under diaphragm in 9 percent of the patients.

In the present study, on doing CT liver, it was observed that grade zero was present in 98 patients while grade three and four were present in 30 patients each.In the present study, on doing CT spleen, it was observed that grade zero was present in 150 patients while grade three was present in 30 patients.In the present study, on doing CT gut, it was observed that grade zero was present in 195 patients while grade one was present in 5 patients.

Table 1: Age-wise distribution of subjects

Age group (years)	Frequency
<20	18
21-40	138

Present	18
Total	200

Graph 1: Distribution of subjects according to CT Liver grading

Graph 2: Distribution of subjects according to CT Spleen grading

Graph 3: Distribution of subjects according to CT Bladder

Discussion

In the present study, a total of 200 patients were analysed. Mean age of the patients of the present study was 38.4 years. Majority of the patients belonged to the age group of 21 to 40 years. 91 percent of the patients in the present study were males while the remaining were females. Davis JJ et al, in their study, highlighted the diagnosis and management of blunt abdominal trauma patients. The records of 437 patients with blunt abdominal trauma were reviewed and computer-analyzed. There was an 80% increase in the incidence of blunt abdominal trauma when compared with the preceding 15-year experience. Forty-three per cent of all the patients presented with no specific complaint or sign of injury. Blunt abdominal injury was usually diagnosed preoperatively using conventional methods including history, physical examination, and routine laboratory tests and x-rays. Abdominal paracentesis via a Potter needle had an 86% accuracy. The incidence and management of specific organ injuries with associated morbidity and mortality have been discussed. Mortality and morbidity continued to be significant in blunt abdominal trauma. Isolated abdominal injuries rarely (5%) resulted in death, even though abdominal injuries accounted for 41% of all deaths. Associated injuries, especially head injury, greatly increased the risk. The insidious nature of blunt abdominal injury was borne out by the fact that more than one-third of the "asymptomatic" patients had an abdominal organ injured.[7]

In the present study, abdominal distension was found to be present in 152 patients (76 percent). Chest X ray findings were analysed in all the patients and it was observed that Chest X-ray revealed abdomen with air under diaphragm in 9 percent of the patients.In the present study, on doing CT liver, it was observed that grade zero was present in 98 patients while grade three and four were present in 30 patients each.In the present study, on doing CT spleen, it was observed that grade zero was present in 150 patients while grade three was present in 30 patients.In the present study, on doing CT gut, it was observed that grade zero was present in 195 patients while grade one was present in 5 patients. Fransvea P et al assessed splenic trauma treatment, with particular attention to conservative treatment, its limits, its efficiency, and its safety in multi-trauma patient or in a severe trauma patient. The variables taken into account were spleen injury and general injuries, age, sex, cause and dynamic of trauma, hemoglobin, hematocrit, white blood cells count, INR, number and time blood transfusion, hemodynamic stability, type of treatment provided, hospitalization period, morbidity and mortality. Assessment of splenic injuries was evaluated according to Abbreviated Injury Scale (AIS). The overall mortality ratio was of 19.1% (13 patients). The average ISS value in patients who died was of 41.92 ± 12.48, whereas in patients who survided was of 23.33 ± 10.15. The difference was considered to be statistically significant ($p < 0.001$). The relashionship between the ISS and AIS values in patients who died was considered directly proportional but not statistically significant (Pearson test AIS/ISS = 0.132, p = n.s.). The initial management was a conservative treatment in 27 patients (39.7%) of them 4 patients (15%) failed, in the other 41 cases urgent splenectomies were performed. Splenic injury, as reported in our statistic as well as in literature, was the most common injury in closed abdominal trauma.[8]

Trauma is one of the most common causes of morbidity and mortality. After the evaluation and resuscitation of trauma patients, a detailed physical examination should be made. As a single physical examination is not sensitive, serial physical examinations are required. For subjects with abdominal injury who were admitted to emergency treatment, ultrasonography (US) and computed tomography (CT) are the most commonly used radiological tests. Sensitivity of US is between 56-97% for determining hemoperitoneum in the intra-abdominal organ injury. CT is the gold standard in the diagnosis of abdominal injuries. CT especially provides utility in planning conservative treatment and follow-up by classifying solid organ injuries in blunt abdominal injuries.[9-11]

Conclusion

Under the presence of above obtained results, the authors conclude that in patients with blunt abdominal trauma, it is comparatively unreliable to diagnose the patient clinically. Rather radiograph and CT evaluation of the patients should be done for finalizing the treatment planning.

Comparative Study of Semen Analysis in Fertile and Infertile Males

Joy A K Ghoshal[1], Anil Kumar Reddy[2]

[1]Professor and Head, [2]Tutor, Department of Anatomy, All India Institute of Medical Sciences, Mangalagiri, Andhra Pradesh

ABSTRACT

Background: Prediction of male fertility potential on the basis of semen quality remains desirable but an elusive goal. There are no objective morphological criteria for defining normal spermatozoa in human semen. The morphometric diversity in the semen sample may be a useful measure of morphologic integrity.

Aim: The present study was undertaken to analyze the various parameters of semen analysis in fertile and nonfertile males and to analyze the role of collective parameters in infertility.

Materials & Method: The study was carried out in the department of anatomy. A total of 200 Semen samples were collected from the patients visiting private pathology laboratories and infertility centers located in and around Vijayawada city.

Results: In the macroscopic examination no significant difference was noted in infertile couples (experimental) for the parameters liquefaction, appearance, volume, viscosity, and pH when compared with a fertile group (control). In the microscopic examination, no significant difference was detected in agglutination and other cells in both groups.

Conclusion: The presence of subnormal values in the semen analysis report should not be regarded as a cause of infertility.

Keywords: *Semen analysis, Spermatozoa, Motility, Microscopic and Macroscopic*

Introduction

Infertility is the problem faced by mankind since its evolution on the earth. According to World Health Organization (WHO) and International Committee for Monitoring Assisted Reproductive Technology, infertility is a disease of reproductive system defined as failure of couple to conceive after 12 months of regular intercourse without the use of contraception in women <35 years; and after 6 months of regular intercourse without the use of contraception in women ≥35 years.[1]

Approximately 72.4 million couples worldwide experience fertility problems, there are no reliable figures for the global prevalence of infertility.[2] WHO estimated that 8-12% of couples worldwide affect infertility.[1] In India, the overall prevalence of primary infertility ranges from 3.9% to 16.8%. It varies widely among Indian states from 3.7% in Uttar Pradesh, Himachal Pradesh, and Maharashtra, to 5% in Andhra Pradesh, and 15% in Kashmir. It was also reported that 40% of infertility cases were related to men, approximately 23% of the malefactor is the cause among the couples seeking treatment for infertility.[2, 3]

Infertility and problems of impaired fecundity have been a concern through ages and is also a significant clinical problem today, which affects 8–12% of couples worldwide. Of all infertility cases, approximately 40–50% is due to "male factor" infertility and as many as 2% of all men will exhibit suboptimal sperm parameters. It may be one or a combination of low sperm concentration,

poor sperm motility, or abnormal morphology.[4] The rates of infertility in less industrialized nations are markedly higher and infectious diseases are responsible for a greater proportion of infertility.[5, 6]

Semen analysis is the most important diagnostic tool for evaluation of the role of males in infertility. Compared to many other tests used in the assessment of the infertile couple, semen analysis has been standardized throughout the world. The semen analysis includes a sequence of steps; collection semen sample, evaluation of the physical properties of the semen such as liquefaction, viscosity, semen volume and seminal pH, determination sperm motility, vitality, counting of spermatozoa, assessment of sperm morphology, counting of other sperm cells, Biochemical assays including the measurement of fructose, zinc and epididymal glucosidase are outlined.[7, 8]

There are scanty reports about the study of all the macroscopic and light microscopic parameters in a semen sample and their correlation in both fertile and infertile groups. The study aimed to analyze the role of various parameters of macroscopic and microscopic examination of semen in infertility and also aims to analyze the role of collective parameters in infertility.

Materials & Method

The present study was carried out on patients visiting private pathology laboratories and infertility centers located in metropolitan cities. A total of 200 semen samples were studied, in which 100 experimental and 100 control groups. The collected data was analysed in the Department of Anatomy, All India Institute of Medical Sciences, Mangalagiri.

The infertile patients were sent to the laboratories for investigations from various clinicians in and around the city. Both wife and husband were investigated for the cause of infertility. After the complete investigation, if the female partner was detected as fertile and the male partner detected infertile were included in the experimental group. If the female partner was detected as infertile then her husband was included in the control group. The history of the subjects and consent form from both partners were taken.

Sample Collection: The subjects were advised to observe abstinence from intercourse for 3-4days and explained the procedure of collection of the sample by masturbation within the laboratory premises in the collection room. Semen was collected in sterile transparent circular glass jars of 7cms height with a diameter of 4 cm at the bottom and 6 cm at the top.

Analysis of the Sample: After liquefaction of the sample, the following parameters were measured;

1. Macroscopic examination– Liquefaction, appearance, volume, viscosity, semen pH
2. Microscopic examination:
   a. Morphology of spermatocytes by examining stained slides
   b. Motility

The motility of each spermatozoon was assessed by grading them into four groups as follows:

a = rapid- progressive motility (> 25u/second)

b = slow- progressive motility (5- 25u/second)

c = non- progressive motility (< 5u/second)

d = immobility

c. Estimation of cells other than spermatozoa

The cells were detected on the basis that they lacked the typical characteristics of spermatozoa, the typical head, midpiece, tail, their presence or absence was recorded. The number of round cells detected during the examination of various fields for counting 200 spermatozoa was noted.

The total number of round cells was calculated with the help of the following formula:

Round cells in millions/mt= Round cells counted/200 sperms x Sperm concentration in millions/ml100

d. Vitality: The test is based on the principle that dead cells with damaged plasma membrane take up certain stains. The number of live spermatozoa is measured during the motility counting test.

e. Total count of spermatocytes: Evaluation of actual sperm concentration was done after dilution, which was decided on the basis of the two averages for the sample recorded during the preliminary estimation of concentration.

Table 1: showing dilutions and conversions factor for the Neubauer Haemocytometer

Initial Microscopic examination		The conversion factor in Haemocytometer		
Sperms/400x field	**Dilution (Semen+Diluent)**	25	10	5
<15	1:5 (1+4)	20	8	4
15-40	1:10 (1+9)	10	4	2
40-200	1:20 (1+19)	5	2	1
>200	1:50 (1+49)	2	0.8	0.4

Preparation of smear and staining: Smears were prepared by placing the drop of semen on pre-cleaned slides by feathering technique and air dried. Smeared slides were stained by modified Papanicolaou staining. The stained slides were examined on the same day with the use of a binocular microscope.

Statistical Analysis: The collected data was entered in excel sheets, Mean, standard deviation, standard error of the difference between two means (Control and Experimental) and 'z' value were calculated using SPSS software. P value is <0.05 considered as significant.

Observations & Results

The macroscopic examination of semen analysis was done in both control and experimental groups to know the Liquefaction time, Appearance, Volume, Viscosity, pH of the semen.

All the samples in both experimental and control group liquefied within thirty minutes. Semen samples in both experimental and control groups of the present study were having a homogenous grey opalescent appearance. All the 200 samples in the present study showed the volume ranging from 2ml to 4.5ml. The mean volume in the experimental group was 3.4 ± 0.38ml and in the control group 3.46 ± 0.46ml. No difference was seen in the median value (3.4 ml) while the mode value for the experimental group was less by 0.06ml than that in the control group, it was statistically insignificant. The viscosity was within normal limits with the formation of thread less than the 2cm length for all the samples in the experimental and control group. All samples in the present study showed pH within the range of 7.0 to 8.0.

2. Microscopic examination:

a. Morphology of spermatocytes: The morphology of spermatozoa was observed in stained slides and categorized into head, neck, mid-piece and tail defects. It was observed that in the experimental group the percentage of morphologically normal sperms varied from 2 to 52%, abnormal sperms varied from 48% to 98%. The percentage of morphologically normal sperms varied in the control group from 80 to 91%, abnormal sperms varied from 9 to 20%. The mean differences in the percentage of abnormal sperms were statistically significant.

Table 2: Shows the Mean differences in abnormal sperms in the experimental and control groups

S. No.	Study groups	% Abnormal sperms			'P' value
		Mode	Median	Mean ± SD	
1.	Experimental	54	54	45.52 ± 6.24	0.001
2.	Control	10	13	13.15 ± 3.08	

*P≤0.05 considered as significant

Even though a various number of defects were categorized for each part of spermatozoa, in the present study four varieties of head defects are seen; those are Tapering, Pyriform, Amorphous, Double Heads. One variety of neck defects, two varieties of a mid-piece defect and two varieties of tail defects were found while examining the stained slides under the binocular microscope.

Table 3: Shows various morphological defects of spermatozoa

S. No.	Type of defects	Group	Mode	Median	Mean ± SD	'P' value
1.	Head defects	Exp.	40	20	20.40+-6.73	<0.001
		Control	3	18	1.25+-0.96	
2.	Neck defects	Exp.	2	2	21.14 ± 1.86	<0.001
		Control	2	1	1.23 ± 0.93	
3.	Mid-piece defects	Exp.	0	0	0.76 ± 2.01	<0.001
		Control	0	0	0.44 ± 0.57	
4.	Tail defects	Exp.	0	0	1.61 ± 2.04	>0.05
		Control	2	2	1.78 ± 0.63	
5.	Cytoplasmic droplets	Exp.	6	6	6.64 ± 3.46	<0.001
		Control	5	5	4.77 ± 2.07	

*P≤0.05 considered as significant

b. Motility: Motility of the spermatozoa was assessed by grading as described in the methodology. The difference between the experimental and control groups was significant in a-grade, b-grade, and c-grade motility and not significant in d-grade motility.

Table 4: Showing mode, median and mean values of the different grades of motility of the experimental and control group

S. No.	Grades of motility	Group	Mode	Median	Mean ± SD	'P' value
1.	a grade	Expt.	20	20	20 ± 0.36	<0.001
		Ctrl.	30	30	28.55 ± 7.40	
2.	b grade	Expt.	30	30	32 ± 9.74	<0.05
		Ctrl.	30	30	29.10 ± 8.05	
3.	c grade	Expt.	30	30	27 ± 10.1	<0.001
		Ctrl.	30	20	22.45 ± 9.49	
4.	d grade	Expt.	10	20	21 ± 13.52	>0.05
		Ctrl.	30	20	19.90 ± 9.67	

*P≤0.05 considered as significant

c. Estimation of cells other than spermatozoa: Round cells were observed in both experimental and control group samples. Round cells less than or equal to one million per ml were found in 83 cases of experimental and 92 cases of the control group. More than one but less than 2 million per ml was seen in 14 cases of the experimental group and 8 cases of the control group. In 3 cases of the experimental group, the number of round cells was more than 5 million per ml.

d. Vitality: The percentage of vital spermatozoa in the control group was more than 74% in control group cases, which was within the normal limits. However, 65 cases out of the total 100 in an experimental group, showed the vitality percentage within normal limits (>74%). In 35 samples of the experimental group, the vitality percentage was in the range of 60 to 73%. The mean differences between the experimental and control groups were statistically significant.

e. Total count of spermatocytes: The mean values were 192.48 ± 71.61 million and 269.03 ± 59.49 million for the experimental and control groups respectively. On comparing the mean differences of total spermatozoa count in control and experimental group was found significant

Table 5: Showing the mean differences between spermatozoa vitality and total count in experimental and control group samples

S. No.	Variables	Study groups	Mode	Median	Mean ± SD ml	'P' value
1.	Vitality	Experimental	80	80	82 ± 6.78	0.05
		Control	85	85	84.45 ± -6.31	
2.	Total sperm count	Experimental	129.2	198	193.48 ± 71.61	0.001
		Control	320	272.8	269.03 ± 59.49	

*P≤0.05 considered as significant

Discussion

Infertility severely affects the couple's psychological harmony, sexual life, and social function. The individual couple desiring a child but unable to conceive one, feel demanded, deprived and bitter. The inability to procreate is thus always perceived as a denial of basic rights, injustice, and a disappointment sometimes bordering on grief.

An internationally accepted method of classification of grades of motility was used in the present work. The percentage of grade wise motile sperms observed in the present study was in agreement with reports of Aitken R J (1982)[6], Bonde J P E (1998)[9], Menkveld R (2011)[10]. While comparing the motility in the present work it was observed that there is no significant difference in the d-grade motility in the experimental group when compared with the respective grade in the control group. This indicates that the presence of rapidly progressive motile sperms in a good number is essential for fertilization.[11] Reduced calcium from the prostate, increased secretion of MIF from the epididymis and decreased MSF from Sertoli cells are the major cause affecting the sperm motility.[12] Cholesterol containing floating vesicles in the semen may inhibit the calcium permeability and thus indirectly the motility.[11, 12]

A recent study was done by Nandini Bhaduri (2015)[13], on sperm morphology in males exposed to higher temperatures showed that occupational exposure to high temperature adversely affects sperm morphology and motility. This leads to oligoasthenoteratozoospermia (OAT). The percentage of sperms with normal morphology is strongly related to the likelihood of pregnancy independent of sperm concentration. Bonde, J.P.E. et al (1998)[9] found the mean proportion of morphologically normal sperms to be 40%. The percentage of morphologically abnormal cells found in the current study is in conformity with Aitken, R. J. et al (1982)[6], Rogers et al (1983)[14]. The results reported by Narayan et al (1981)[15] are higher the percentage of abnormal sperms as compared with current findings.

Analysis of retrospective data indicates that sperm counts may have declined in some parts of the world, but there seem to be geographical variations in the semen quality.[16] The reason for geographic variations in semen characteristics is not clear, but it may be due to environmental, nutritional, socioeconomic, or other unknown causes. The decline in the semen quality coincides with an increased incidence of abnormalities of the male genital tract including testicular cancer and cryptorchidism in various countries.[15, 16]

Conclusion

With the findings of the present work, we propose that the fertilizing capacity of an individual should not be assumed as within normal limits by the mere presence of all the parameters of semen analysis within normal limits. Similarly, the presence of some of the parameters better than the average also fails to conclude the fertilizing capacity of an individual. On the other hand, the mere presence of subnormal values in the semen analysis report should not be regarded as a cause of infertility. The degree of overlap between fertilizers and nonfertilizers for various parameters of the semen analysis is considerable.

We propose that the semen can be further analyzed in cases of unexplained infertility for its biochemical constituents and fertilizing capacity. Some of the newer parameters like sperm length: width ratio, sperm head length: width ratio, acrosome index, sperm deformity index, multiple anomalies indexes, sperm cytochemistry etc should be studied wherever required.

Acknowledgment

The authors are thankful to the fertility centers and laboratories for their assistance in the completion of the present work.

Recharging Ground Water using Age–Old Traditional Mechanisms

Manbeer Kaur[1], Mona Prashar[2]

ABSTRACT

"Give back unto the Earth if water is desired in the coming generations"

"Pawan Guru, Pani Pita, Mata Dharat Mahat" the Gurbani or word of the Gurus as embodied in the holy Guru Granth Sahib has in these words immortalized the relationship of men with Nature by saying that the "Wind is the teacher; Water is Father while the entire Earth is the mother". When this strong bonding of men and Nature had been recognized several centuries ago it stupefied the human senses to think that man had ended up destroying the natural habitat unmitigatedly.

Since earliest times almost all natural resources have been reserved and utilized judiciously by civilizations. The Chinese, Indus valley, Mesopotamian, Roman, Aztec and most other great settlements used water conservatively. Even back then there was concern for wastage of water.

This paper is focused on looking at the systems of conserving, purifying water and utilizing it to the optimum without wasting any part of it. The objective of the paper is to determine the functioning and use of these techniques for present day communities.

Keywords: *Earth, Ma, Nature, habitat, water, purification, conservation, techniques, civilizations, traditional, optimum, communities.*

Problem Statement: Dimensions of Water Access & Excess: India's population is over 1.3 billion. This population inhabits several thousands of villages in each of its states and union territories besides cities and towns. Over this and the past century, water availability to the world's population has been declining rapidly due to increased urbanization and urban populations. In India a large percentage of surface water is contained and unusable. It is a disturbing fact that India as of today uses more ground water than China and the United States put together. Needless to say the ground water levels are rapidly declining all over the country but in some regions they are doing so at an astronomical pace.

The drinking water situation in the country is fast becoming a Pandora's Box. On the one hand populations have been known to face death due to not having sustainable access to clean drinking water and on the other hand there is rampant waste of this precious commodity. The villages at one time had had wells and ponds that hummed with life[1]. These days' wells are obsolete while ponds have become stench holes. Most villages have their waste (solid and liquid) flowing gravitationally into their pond and they do not pay heed to the ominous degradation of this once healthy resource.

"If the villagers do not consider their ponds to be worthy of being saved they will in their lifetimes see the folly of their ways" said an octogenarian in one of the villages of the Doaba region in Punjab. Taking his concerns further it can be deduced that villagers will gradually loose:

(i) A healthy environment to live in

(ii) Be forced to live in a vector infested habitat

(iii) Be prone to diseases all the year round when neither children nor the elderly will be spared.

(iv) Loose the vital lungs of the village

(v) Become bereft of a vital water recharging source that could have replenished their water reservoirs.

(vi) Very few villagers choose to inhabit areas around the villages pond.

(vii) Gain a little bit of extra land for settlers and loose a major village asset like the pond.

In most villages it can be observed that people living near the pond are doing so only under duress. They have no choice, no alternative but to tolerate the harmful, stench saturated and unhealthy environment.

Rejuvenation through Ponds: Once the ponds have optimum content of oxygen in the water special blends of bacteria and enzymes can be introduced into them. These biological blends are successful at breaking down organic matter. They are efficient in consuming water borne pathogens that are causative of pollution and other bad effects of stagnation in the pond.

Access to clean water can affect the performance of milch animals markedly and is therefore very necessary for healthy livestock. With availability of clean water ponds these milk giving animals drink and eat more, and ultimately gain weight quicker. This directly affects their milk yield.

Downing[2] in his paper titled 'Emerging Global Role of Small Lakes and Ponds: Little Things Mean a Lot', presents the concept that little water bodies do a lot for the entire ecological systems. He carefully studied small ecosystems and proposed that ecosystems having small areal extent played a major role in global ecological processes of existence. He continued that the areal extent of continental waters is dominated by ponds and small lakes. They show a large functional intensity of many ecological processes and these can be seen through various seasonal cycles.

Ponds provide sustainable solutions to most of the major issues of water management being faced from the village to the global level. Thus, ponds, therefore, have been recognized as an important functional freshwater habitat[4]. They play a critical role in maintaining the environmental biodiversity. With sensitive planning at the village level these very ponds can bring about major benefits to the resident population in terms of:

(i) Rich, healthy Biodiversity

(ii) Promoting a Healthy Environment

(iii) Pollution alleviation and promotion of a clean environment

(iv) Conducive habitat for domestic animals

(v) Provide flood relief during heavy rains

(vi) Guards the environment against rapid climate change

(vii) Adds to an aesthetically appealing living environment for most villagers

The pond's ecosystem is directly connected with the resident community the people, the decision-makers and the implementers. The ponds also helped maintain, to a large extent, the communities' inherent cultural and economic resources. Ponds with good water quality are economically desirable all over the world.

The National Water Policy of India lays emphasis on the significance of ponds in India. These desirables have been underlined by several world bodies. The United Nation's Sustainable Development Goals (SDGs) have mandated that it is essential to safeguard the planet's water resources. By 2030 AD the world's water requirement is expected to increase by 30%. It is important to realize that ecological and ecosystem security is a prerequisite for human and water security.

No doubt the demand for water has accelerated over the decades because of the escalating population size and unsustainable consumption and production patterns that have began showing their debilitating impact in the current century. Competition for water has severely impacted upon the Earth's ecosystems and biodiversity. Its worst effects are visible on populations in parts of the developing world where natural water resources have been depleted and artificial water recharging mechanisms have proven to be cost prohibitive.

Significance of Ponds in the Village Habitat: There is no universally accepted definition of the term pond. Ponds can be described as a body of still surface water which is either natural or man-made and is quite smaller than a lake. These small water resources are significant contributors to development of local communities, and marginalized lower income households especially in the urban areas. The village ponds are essential receptors and reservoirs for natural rainwater harvesting. They are providential for maintaining groundwater levels, naturally.

According to Dubey[3] who closely examined the biological diversity presented in village ponds and their crucial role in sustainable development established irrefutably that there is an undeniable equation between man and his environment.

Dubey[3] details that the village ponds "conserve and preserve the history, mystery and science of rural realities of developing, underdeveloped and partially developed nations." We continues that ponds are "intricately wedded to biological identities carrying cultural concepts and social strains associated with religious tenets."

Biological Diversity of Indian Village Ponds: The flora and fauna of the ponds protect and preserve a wide variety of organisms and micro-organisms. These include the amphibians, aquatic invertebrates, aquatic plants and some mammals. The smallest pond is normally infested by a huge variety of invertebrates like the dragonfly and damselfly. Species like pygmy damselfly (Nehalennia speciosa) and island darter (Sympetrum nigrifemur) are salient ones inhabiting and surviving in the pond ecosystem. These ponds are home to the medicinal leech (Hirudomedicinalis) and the water beetle (Graphoderus bilineatus) along with a number of other creatures that are determined by the lay of the land, the temperatures and the population pressures. Being a complete ecosystem the pond is home to several commonly sighted birds like the egrets, the pond herons, the red wattled lapwings, the cormorants, the kingfishers, the ducks, the geese, the swans and the cranes alongwith a variety of others. In some areas these ponds are breeding grounds for a large number of migratory birds.

The plants growing in the pond provide food, oxygen and shelter to animals. Ponds in the open are healthier than ponds in the shade because they have access to sunlight to make their food. The smallest plants in a pond are the microscopic phytoplankton which provide most of the food in a pond. The phytoplankton and larger algae form the first part of the pond's food chains. Pond vegetation grows in 'zones'. Plants like the great willow herb and meadow sweet grow in the bank side zone. They like damp places but are not true water plants. The yellow iris and mud-sedge grow nearest the pond edge or the marsh zone. The ponds are potent shelters for several categories of microbes. They comprise bacteria, protozoa, algae and rotifers.

Dynamism of Pond Life and Biodiversity Value: Ponds have a distinctive life in which are featured different kinds of organisms which live in a number of networks that are interdependent and inter reactive. They share the available food to live and reproduce. Different types of foods are found in ponds because each animal eats different things. A pond, thus, may have combinations of three variant food webs. The first one is based on larger plants, the second one is based on decayed plants and the third is based upon algae. Ponds therefore provide significant sources of biological diversity in any geographic landscapes not only for plants and animals but it can be observed that ponds are central to the life and wholesomeness of the entire eco-system in rural India. Since earliest civilizations villages have been known tooriginate around ponds. Rain water gets harvested naturally by the pond. It gets stored up, rechargingthe ground water and indicating the level of the water table in the village. Each pond has its own unique biodiversity, with all participants dischargingtheir specific ecosystem functions.

There is another important aspect that brings forth the socio-cultural significance of ponds. It is an established fact that village ponds have had and continue to have a deeply entrenched cultural andhistorical significance. Since centuries ponds have played a crucial role inmaintaining and encouraging the vital link betweenpeople and wildlife. There are numerous socio-psychological links that have been established between ponds and their resident settlements. Several rituals are associated with ponds. There are several periodic, lesser or major monthly and annual fairs that are held on the banks of ponds. These are a significant salient reality even in the present times. The Biodiversity Value of ponds is reinforced on the basis of three fundamental truths:

(i) Their status as a critical habitat for uncommon and rare species

(ii) Their role as stepping stone habitats for upward or downward mobility of flora and fauna

(iii) Their value as thriving biodiversity hot spots

Threats to Ponds Biodiversity: Severe pollution of ponds is being done by the dumping of wastes, chemical pollutants like the powdery chemical fertilisers having nitrates that are washed off by rain into the nearby ponds. This rich supply of nitrogen causes water plants, like algae to grow rapidly. These plants use up much oxygen during the night and during their decaying processes that virtually none is left for the remaining pond-life forms. This unmitigated growth also prevents sunlight from reaching the organisms below. The past century has seen about forty percent of the old village ponds being choked and filled up for residential or pasture and even cropping purposes. Currently there are several villages in Punjab that are totally devoid of any water body.

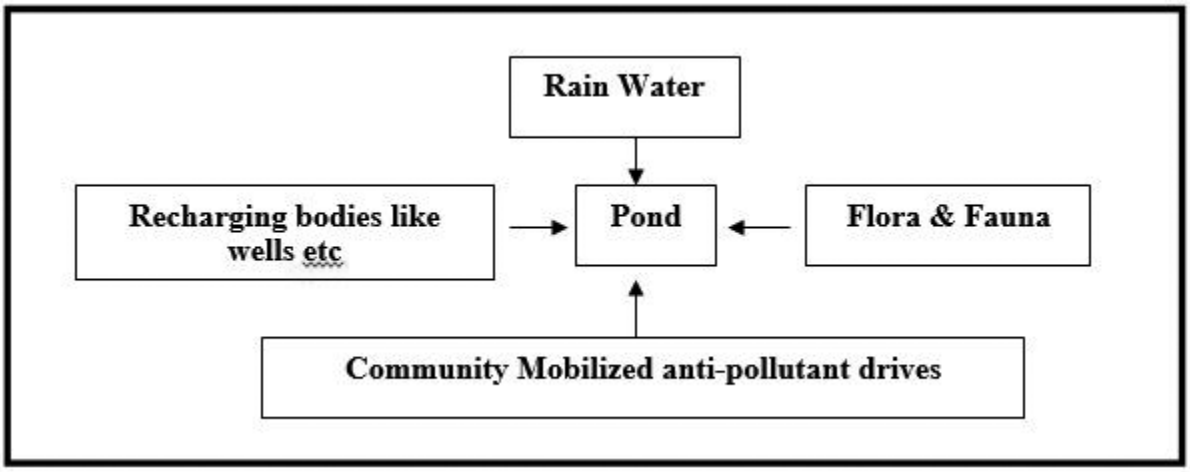

Figure 1: Interactive Relationships of Village Ponds

The above figure gives the almost symbiotic relationship network that develops between ponds and their human, flora and fauna partners. These may be positive or negative depending upon the needs and exploitative overtures of the users of the pond environment.

Government and Community Approach to Pond Restoration: Most village ponds require a pragmatic approach for their eco-restoration. The channelization of free flowing rain water from the village catchments is essential for sustainable eco-restoration of ponds. Another significant task is the stocking of various niches of the pond with native vegetation and animals.

This essential task of systematic eco-restoration and sustained management of ponds requires several collective steps to be taken in tandem by individuals, groups and organisations acting in unison.

The Chief Minister of Punjab, had vide his D.O. letter dated 22nd March, 2012, detailed the problems related to the disposal of waste water and need of rehabilitation of village ponds in Punjab. He appraised the Minister for Rural Development, Drinking Water and Sanitation that some pilot projects using the technology of UNICEF and Government of India had been in Ludhiana and Muktsar districts and should be replicated all over the State.

Subsequently, a team was constituted of various experts to study the situation of ponds and how they could be resurrected. The team looked into the status and survival of ponds in the following villages:

1. Village Mohlan, Mandal Malout, District Muktsar
2. Village Birk, Block Sidhwan Bet, District Ludhiana
3. Village Guru, Block Jagraon, District Ludhiana
4. Village Dewatwal, Block Ludhiana, District Ludhiana

The Waste Stabilization Ponds (WSP) do not require any electrical energy. They are extremely efficient. They efficiently remove excreted pathogens. The success and progress attained by WSPs is largely because the systematic stage-wise implementation of various steps of the process are measureable and standardized on the basis of internationally experimented and implemented procedures.

(i) The first stage of waste water treatment is the removal of large floating particles and heavy mineral particles like sand and grit. This is done by simple screening and grit removal a good duration before the raw waste water enters the other parts of the WSP.

(ii) Secondly, the measurement of the incoming waste water is important. This measurement is essential for determining diurnal flow variations and for constantly evaluating the performance of the treatment system.

(iii) The system comprises three treatment units:

1. Anaerobic pond
2. Facultativepond
3. Maturation pond

The anaerobic and facultative ponds are designed for BOD removal and the maturation ponds are designed for faecal bacteria removal.

a. Anaerobic Ponds: These are 2 to 5 metres deep tanks that receive high organic loading, more than 100 gms BOD/cum. Day. It is equivalent to 3000Kg./ha day, containing no dissolved oxygen and no algae. The primary function of these units is BOD removal.

b. Facultative Ponds: These units are designed for BOD removal on the basis of low surface BOD loading. It is usually in the range of 100-400kg/ha day to permit development of healthy algalgrowth, because the Oxygen for BOD removal by pond bacteria is mostly produced by algal photosynthesis. Liquid depthis usually in the range of 1 – 1.8 mts, 1.5 mts.

c. Maturation Ponds: The main maturation pond reduces the number of excreted pathogens, mainly faecal bacteria and viruses present in effluents from the facultative ponds. These ponds are typically aerobic. The depth of these maturation ponds isabout one metre. Shallow ponds are more efficient due to greater light penetration.

The principal mechanism for faecal bacteria removal in these and facultativeponds are:

(i) Temperature

(ii) HighpH values

(iii) High light intensity

Conclusions and Policy Implications

It has been derived from the foregoing narrative that rejuvenation and resurrection of village ponds is essential for the sustained promotion of human habitation conducive environments. Water is a rare source of life with increased ability to make informed choices. The following are some suggestions that may have policy implications at the state and national level.

(i) Waste Stabilisation Pond[5] technology is the simplest, suitable technology to treat waste water in rural areas.

(ii) Places having high water table may be in danger of ground water pollution.

(iii) A protocol for ground water quality monitoring should be developed to regularly monitor ground water quality near such WSPs.

(iv) Boulders can be used for inner embankment of ponds, up to the waste water level to check soil erosion.

Convergence with various government departments is envisaged, especially the Departments of Rural Development, Health as well as Forests and Environment besides Water and Sanitation. All these departments need to pool their efforts in giving a new lease of life to the stagnating pond wealth of Punjab. Needless to say this would not be practicable without the total participation of the community.

ABSTRACT

Magnetic resonance imaging (MRI) has been assuming an undeniably vital job in the spinal injury patients because of high affectability for discovery of intense delicate tissue and line wounds. An ever increasing number of patients are experiencing M.R.I on behalf of spinal injury in the crisis situations, accordingly requiring the deciphering doctors to subsist comfortable through M/R/I discoveries in spinal injury. In this pictographical survey, we determination initially portray the ordinary life systems of different ligamentous arrangement. Signs of M-R-I in spinal injury just as the job of MRI in makes a diagnosis spinal rope as well as delicate hankie wounds will at that point be examined. Delineated belongings are mostly of cervical backbone injury, however thoracolumbar spine wounds are likewise included where proper in our audit.

Keywords: *Spinal trauma, MRI, Spinal cord, Hemorrhage, Ligamentous injury*

Introduction

Imaging assumes a basic job in analysis of intense spinal injury and aides in starting brief and exact action in these patients. Regular radio-graphs furthermore, Computed/Tomography(C/T) is the underlying imaging modalities utilized in the determination of the majority instances of spinal wounds. Whereas strength of the back might subsist enough evaluated through C/T in support of careful basic leadership viaspinal column specialists, because of its expanded accessibility in the crisis settings and its naturally predominant differentiation goals, M/R/I havebein performance an undeniably critical job in the administration of spinal injury patients. Prominently, M-R-I is the methodology of decision in favor of assessment of ligament us alsoadditional delicate hankieorganizations, circle, spinal rope as well as mysterious bony wounds. In this pictorial audit, we will initially depict the typical life systems of different ligamentous structures including the craniocervicalintersection[1]. At that point, signs of MRI in spinal injury just as the job of M/R-I in make a diagnosis spinal string, delicate bandanna wounds also, mysterious bony wounds will be talked about. Outlined belongings are primarily of cervical spine injury, yet thoracolumbar backbone wounds are additionally integratedsomewhere proper. Different constraints in addition to entanglements of M.R.I in spinal injury imaging motivation likewise subsist talked about.

Indications of spinal MRI: As indicated by American/ College-of/Radiology-(A/C/R) suitability criterion, M,R,I of spine joined among C*T check is proper in the situations of intense spinal injury if:

1. National/Emergency/X-Radiography/Utilization/ Study-(N/E/X/U/S) otherwise Canadian/Cervical-Spine/Rule-(C/C/R) criterion are meetplus there are experimental discoveries of my elopathy.

Email: ahammad@kluniversity.in

2. N-E-X-U-S or C-C-R criteria are met along with there are clinical or else imaging discoveries to propose ligamentous damage.
3. N.E.X.U.S-or-C.C.R criteria show imaging moreover the precisely shaky spine is foreseen.

Specialized deliberationsin favor of M*R*I The commonplace M/R/I convention on behalf of spinal damage incorporates sagittal T/1-weighted-(T/1-W) also T/2-weighted-(T/2-W) turn reverberation groupings, moreover T/2/weighted/(T/2*W) gradient/recalled/echo-(G/R/E) series, processed in addition to sagittal heavy short/tau/inversion/recovery (S/T/I/R) arrangements this methods, just as pivotal T-2/W plus T-2/W GRE groupings[2-5]. T*1/W pictures be fundamentally utilized in support of portrayal of life systems moreover bony cracks. As of late, dissemination/tensor/ imaging (D/T/I) have been utilized to identify injury connectedmodifications in the spinal string which be not seeon ordinary M/R-I procedure. In a perfect world MRI ought to be executed inside 72/hours of damage as the T/2 hyper-intensity delivered through edema get better the conspicuity of the tendons which be viewed as smallflag power in ordinary state. Afterward on, a goal of the edema plus drain lessens affectability of M*R/I to identify ligamentous wounds [6-8].

Normal/Anatomy of the Spine: The backbone essentially comprises of vertebral column balanced out by different tendons together with the anterior/ longitudinal/ligament-(A/L/L), posterior/longitudinal/ ligament-(P/L/L), ligamentum flavum, interspinous tendon, supraspinous tendon, along with the apophyseal combinedcontainers[6-9]. Whereas typical tectorial layer plusoblique tendon preserve be effectively pictured on M/R/I, because of absence of difference from adjoining tissues, the ordinary alar tendons are hard to be envisioned[9-10].

Extra Medullary Hemorrhage also Fluid/Collections: Extradural/hematoma is the popular widely recognized kind of additional medullary accumulations in injury patients. Subdural/hematoma also sub-arachnoid drain are remarkable. Pseudomeningoceles/also/extradural liquid accumulations because of dural/tear befurther unprecedented sequelae of spinal injury. Despite the fact that CT can demonstrate the different kinds of hematomas in the spinal trench, because of pillar solidifying antiques in C/T as well asimproved delicate hankie differentiate goals in M-R-I, MR/I is the methodology of decision for picturinging of these substances. Epidural/hematomas normally show up isointense to marginally hyperintense on T/1-W pictures along with hyperintense on T/2-W pictures. Whole craniocaudal degree of the hematoma preserve be effectively assessed on sagittal M/R/I. Like epidural/hematomas, subdural/hematoma as well as sub/ arachnoid discharge illustrate accumulations among differing indication powers in the subdural subarachnoid/ spaces, separately.

Fig. 1: Axial T2 weighted/mage (a) demonstrates the attendance of position traumatic/vertebral blood vesselanalysisthrough double/lumen (arrow). Following C/T angiogram of the neck (b) verify of the judgment of vertebral/artery/injury/(arrow). Follow-up/angiography of the necklineperforms on the after that day (c) explains the occurrence of pseudo aneurysm (arrow).

Vascular Injuries: Vascular wounds container be brought about by together obtuse also infiltrating injury. In dull vascular wounds in the collar, vertebral veins are additional regularly included than carotid supply routes. Albeit asymptomatic one-sided wounds are of fewerscientific criticalness, they preserve prompt intellectualas well as cerebellar areas of localized necrosis, particularly when two-sided. The Denver

viewingcriterionhavebe utilized to recognize the patients in danger in favor of vascular wounds also incorporates C1– C3 breaks, crack of the cervical spine stretching out addicted to a foramen transversarium,/cervical spine/ subluxation, Le Fort/II before III/facial breaks, basilar/ skull support cracks including the carotid trench, disperse axonal damage, and extending neckline hematoma. In the event of thoracolumbar backbone injury, wounds to the aorta moreover its twigscontainerhappen.

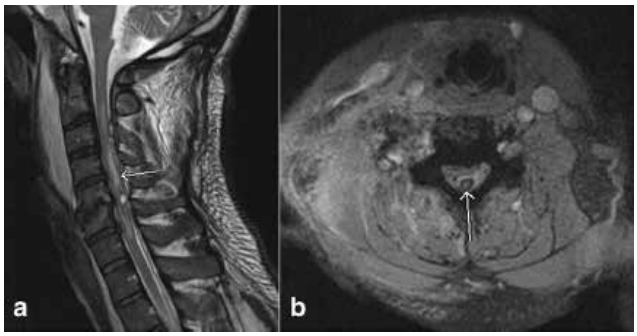

Fig. 2: Sagittal/T/2/weighted/image (a) also axial gradient/recalled/echo/(G/RE) picture (b) proves the occurrence of hemorrhagic/contusion/(arrow, a) in the spinal/cord/characterized through susceptibility/ artifact on G/R/E image (arrow, b).

The imaging discoveries of vascular wounds incorporate negligible intimal damage, representation of intimal fold pseudoaneurysm (Figure-2b),/ dismemberment through intramural/hematoma, absolute impediment, dynamic extravacation, and arteriovenous fistula arrangement.

Spinal Cord Injuries: Clinically, the degree of spinal line damage is characterized through the American/ Spinal/Injury/Association (A/S/I/A) Impairment/Scale (which is adjusted commencing the Frankel/arrangement) utilizing the accompanying classes: A=Complete– no tactile or engine work is protected in sacral sections S4-5; B=Incomplete – tangible, however not engine, work is safeguarded beneath neurologic dimension and stretches out from side to side sacral portions S4-5; C = unfinished – engine work is saved underneath the neurologic dimension, as well asmainlyinputstrength underneath the neurologic dimension contain a muscle/grade < 3; D = engine work is saved underneath the neurologic/ dimension, moreovermojority key muscles beneath the neurologic dimension include a muscle/grade ≥ 3; E = Normal. In M/R/I evaluation of spinal string damage, the pivotal and sagittal/T/2W/pictures, also T/2*W G/R/E pictures are especially helpfuls[11].

Albeit neurological capacity next to the introduction remainder the absolute greatest prescient aspecton behalf ofextended haul guess, nearness of string discharge have been depicted as the majority vital discoveries related amongdeprived visualization. Different discoveries of predictive esteem incorporate the degree of string hematoma as well as rope edema, along with spinal rope pressure by additional hub hematoma. Because of limited spinal trench, osteophytes or clasped ligamentum/flavum mightconsequence in wounds to the focal dim issue together with the focal parts of corticospinal territory of the cervical/string[12].

Pitfalls of MRI: There are couples of confinements of M/R/I in the assessment of spinal injury. Powerlessness relics because of metallic equipment for spinal combination along with dental inserts preserve corrupt the picture superiority particularly on G/R/E grouping. Weakness antiquities can be decreased by utilizing the turn reverberation successions, little T/E which permits fewer instancesin support of dephasing moreover lessens flag misfortune, expansive recipient transmission capacity, STIR instead of synthetically particular fat concealment, in addition toexchange the stage programalong with recurrence encode headings. Immersion beats utilized in MRI can at times cover the prevertebral hematoma. Liquid in throat and fragmented concealment of the prevertebral fat can here and there recreate prevertebral edema. Conspicuous veins in the interspinous district showing elevated flag on S/T/I/R pictures ought not subsist mistaken for edema related amid interspinous wounds which show up as badly characterized zone of high flag, while the veins show up too characterized direct territories of high flag. The affectability of M/R/I is additionally inferior than C/T for recognizing breaks of the back components because of insignificant edema related with separation wounds, and to wounds of the craniocervical intersection.

Main Work

Hemorrhage: The main widely recognized area of posttraumatic spinal string drain is the focal dim matter of the spinal string at the purpose of mechanical effect. The injury regularly speaks to hemorrhagic corruption; genuine hematomyelia is once in a while experienced. The injury shows up as a discrete focal point of hypointensity on T2-weighted and slope reverberation pictures, growing quickly after SCI. Drain

might be recognized in relationship with complete and fragmented wounds, with location of a center > 4 mm long on sagittal pictures regularly characteristic of total neurologic damage.

There is a spectrum of traumatic SCIs from cord/ edema, cord contusion, intramedullary hemorrhage to cord transection. SCI without radiographic abnormality is blunt damage to the spinal cord, usually the cervical cord, without overt osseous injury [14-15]. In such patients, MRI may reveal extraneural (ligament and disc) injury or neural injury. The anatomic and biomechanical characteristics of the pediatric spine make young patients (typically less than 8 years of age) more at risk for this type of injury (Figure 2). In adult patients, the term is not as widely used. If there are neurological symptoms in adults, who are likely to have underlying degenerative change, MRI is routinely used to assess for compressive pathology (ie, disc herniation).56 Cord edema has a potential for neurological recovery, whereas cord contusion tends to be associated with an incomplete SCI. The length of the edema/contusion is directly proportional to the degree of the initial neurological deficit. They found maximum spinal cord compression, spinal cord hemorrhage, and cord swelling are associated with a poor prognosis for neurological recovery, and that the scope of greatest spinal cord density is more reliable than attendance of canal stenosis for predicting the neurological result after SCI[16]. The prognosis of the compression pattern of SCI has been shown to depend on the degree of the initial neurological damage.

Conclusions

All in all, MRI is additional delicate than extra imaging modalities in the analysis of delicate tissue plus spinal string wounds. While C/T is viewed as sufficient for assurance of steady versus precarious spinal wounds, M/R/I be able topresent extra assist because of its capacity to all the more likely determine ligamentous wounds when contrasted with have CT. X-ray is likewise useful in anticipating the guess by exhibiting the hemorrhagic and non hemorrhagic rope wounds.

Cloud Computing Based Diagnosis for Cancer Detection

Syed Shameem[1], Surya Teja S[2], Anoop P[2], Pavan Kalyan R[2], Vijay V[2], P. S. Srinivas Babu[2]

[1]Assistant Professor, Department of E.C.E, [2]Members of Microelectronics Research Group, Koneru Lakshamaiah Educational Foundation, Guntur, India

ABSTRACT

In the Rural Areas the construction/maintenance of cancer testing centre will be difficult. Due to poor maintenance the results at the testing centres are not accurate. There may be noise in the CT/MRI scan reports; there is also chance of blur report. To reduce such issues, we are going to use LabVIEW (Laboratory Virtual Instrumentation Engineering Workbench) a free software. Usually the cancer screening test includes colonoscopy, mammography and pap test all such tests costs more. Instead of simple CT/MRI scans softcopies are analysed and processed through LabVIEW software which reduces the cost. In this paper, Detection and Diagnosis of different types of Cancer is done through image processing techniques through LabVIEW software. The data that obtained in this process of detection is send to the doctors using cloud computing for further diagnosis.

Keywords: *LabVIEW, colonoscopy, mammography, paptest, cloud computing.*

Introduction

Cancer is a unidentified disease which became one of the dangerous of all. Cancer cell grows in a multiple fashion. The cells usually proliferate in human tissues. The death rate due to the cancer is growing rapidly due to no symptoms can be identified for a person who suffers from cancer until one may reach to the higher stages where it becomes incurable. Detection of different types of cancer is a complex process no one can identified easily. One may have found having cancer during some other tests for some other reasons.

Laboratory Virtual Instrumentation Engineering Workbench is shortly known as LabVIEW, a well-defined programming environment which is developed using different programing languages such as C, C++, JAVA. But LabVIEW is beyond coding.

The LabVIEW software can be use in different ways. It can be extended to hardware, where we can detect in real time. The proposed idea is to detect the cancer using the CT/MRI scan images and process them using LabVIEW [3,4] software to get a clear picture of the cancer part. Usually the scan report or the microscopic images of test's may or may not be clear due to equipment they use in the testing centers, for getting clear picture of the reports they are processed in the software. Once the processing is complete then the results are sending to the doctor through "cloud computing".

The cloud computing (CC) [1] is a set of network enabled services, QoS guaranteed, personalized and inexpensive. These days the cloud services are being common, every network, electronics, browsers are providing cloud services. There are several cloud computing technologies such as Artificial Neural Networks (ANN) [5], Back Proportion Neural Networks (BPNN) [6]

This Neural Networking [7-9] is information processing paradigm. The Neural Networks are example of biological system such as human Brain. But the same Cloud Computing (CC) can be achieved through IoT (Internet of Things).

IoT is combination of sensors which makes our environment internet connected. The ESP8266 Wi-Fi module can create a cloud and send data through it.

Detection of Cancer using Lab VIEW:

Cancer: Cancer is not simply a disease it leads to different diseases with enormous cell growth. It can start in any place of the body and can spread to many other parts of the human body. Cancer cells grow rapidly and out of control when compared to normal cells. Normal cells grow periodically and are worn out after their life time, whereas cancer cell form lumps rapidly and outweigh the normal cells [11]

Some cancer types like Lung and gastric have many stages where it can't be identified during early stages but by the time it is identified then it will become beyond curable [13]

Types of Cancer: There are number of cancers which can't be identified in the early stages at which it is curable [12].

Lung Cancer, Bladder Cancer, Blood Cancer/ Leukemia, Breast Cancer, Pancreatic Cancer, Prostate Cancer, Thyroid Cancer, Gastric Cancer, Brain Tumor, Colon Cancer. These are few of such cancers where symptoms stay unknown. When these cancers are in their earlier stages they start to create solid mass of cancer cells that grows in a rapid fashion that kills the organ tissues.

Detection of Cancer Content: In the current technology LabVIEW provides a best Virtual Instrumentation, in this paper the microscopic or scan images are processed in LabVIEW. There are several image processing techniques which enhance the cancer part for the clear idea. Usually any image is made up of pixels, the pixels intensity will be more at cancer part. Using image processing techniques such as thresholding, edge detection, form those techniques we can obtain the edge of the cancer cells (in blood cancer) and the cancer mass (in lung cancer) from that we can clearly detect the presence of cancer in the tissues[10]

Initially the CT/microscopic image is taken and applied with image processing techniques, due to thresholding less pixel values are washed out if there is any cancer mass then it will be remained in the output image. The entire process is depending on pixel intensities.

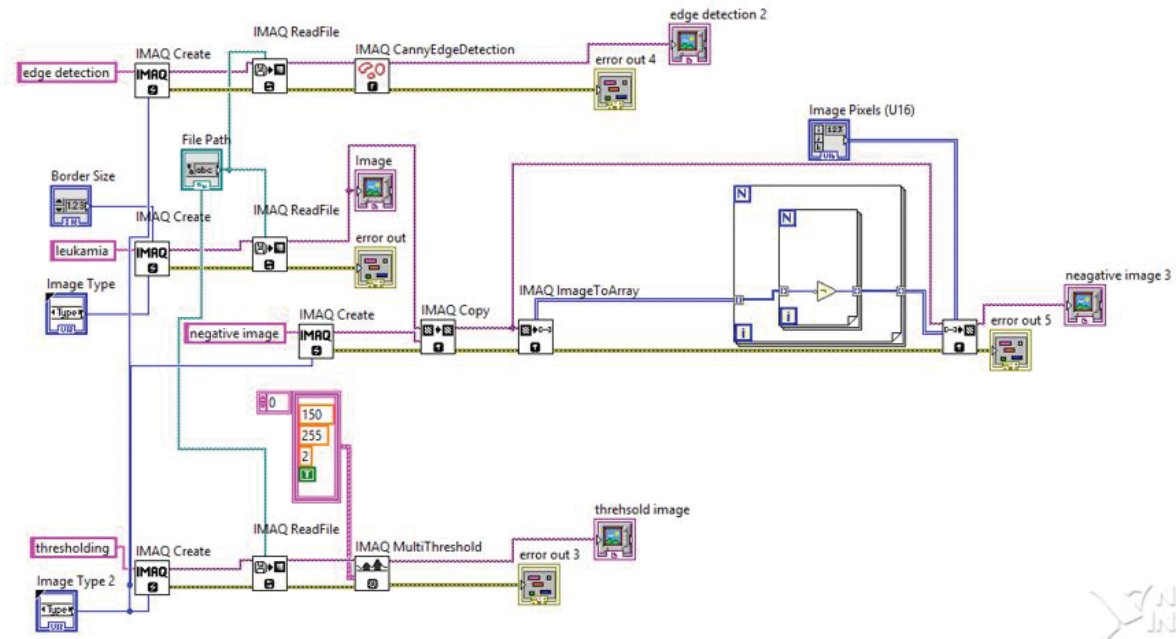

Figure 1: Detection of Cancer using LabVIEW

Figure.1 depicts the construction of cancer detection VI (Virtual Instrumentation). The microscopic image is fed through read image sub VI and then the image is flow through edge detection and thresholding sub VI's. Sometimes the X-Ray image may be not visible clearly but it's negative may provide adequate information for that purpose the image is changed to array and it passed through two for loops which convert 2D array to an element which is then inverted and again converted array to image using sub VI's. These three image processing techniques will help to have a clear vision of diagnosis perspective [3]

Methodology

The proposed idea is to process the image of microscopic report using image processing techniques such as image thresholding, image edge detection and image negative. All these image processing techniques uses pixel manipulation methods. Initially the scan results are converted to grayscale images. Later the grayscale image is threshold, where the particular pixels values are threshold to higher intensity, so all the blood cells or other content will be faded, and the cancer mass will be highlighted. Similarly, in the edge detection technique the edge of all the objects is obtained, due to this the shape is clearly picturized. Negative of the image highlights the cancer mass [4]

Later the results which we got in the LabVIEW are sent to the doctor or any authorized person through Cloud Computing (CC) using Internet of Things (IoT). The ESP8266 Wi-Fi Module helps in achieving Cloud Computing. The person on the other side gets these results, and prescribes medication.

Thresholding: Thresholding is a process of image segmentation usually used to convert a grayscale image to binary (0 or 255). Auto thresholding is a technique where the system itself thresholds lower pixels to 0 and higher pixel values to 255. It provides better visibility of cancer mass. Since the cancer mass in gray scale consists of more pixel values. There also other types of thresholding like multi band thresholding for colour images.

Figure 2: Thresholding of Blood Cancer Cells

Edge Detection: Edge detection incorporates an assortment of scientific techniques that go for distinguishing focuses in an advanced picture at which the picture splendor changes forcefully or, all the more formally, has discontinuities. The focuses at which picture brilliance changes forcefully are normally composed into a lot of bent line fragments named edges. A similar issue of discovering discontinuities in one-dimensional signs is known as step location and the issue of discovering signal discontinuities after some time is known as change identification. Edge detection is a central apparatus in picture preparing, machine vision, and PC vision, especially in the regions of highlight discovery and highlight extraction [2]

There are different types of edge detection techniques: Roberts Edge Detection, Sobel Edge Detection, Prewitt Edge Detection, Laplacian Edge Detection, Gaussian Filter, High Pass Filter, Low Pass Filter, Kirsch Edge Detection, Robinson Edge Detection, Marr-Hildreth Edge Detection, LoG Edge Detection, Canny Edge Detection

Usually all the Edge Detection techniques have their own kernels (3x3 matrix) with which the image is convoluted to get the edge of the image. Some of the edge detection kernels elements sum is non-zero which results in weighted pixels. Due to that the edges of the images aren't perfect enough for few applications such as medical fields. Out of all the Edge Detection techniques the Canny Edge Detection gives the perfect edges of the images. In Figure 2 the results of different edge detection techniques are given.

Canny Edge Detection: It is the most used edge detection technique in industrial level applications, the canny edge detection was introduced by john canny during his master's, MIT 1983. The canny edge detection is most precise edge detection technique of all the other techniques. It is shown clearly in Figure.3

Figure 3: Results of different edge detection techniques

The filters that are used in canny edge detection are exceptionally good at clearing noise from the image before detecting the edges. The approach of canny edge filtering is central difference.

Here's the kernel matrix for canny edge detection technique.

$$\begin{bmatrix} -1 & 0 & 1 \\ -1 & 0 & 1 \\ -1 & 0 & 1 \end{bmatrix}$$

Kernel matrix of canny edge detector

The mask or kernel is convoluted with the image such that every pixel of image is multiplied with the center element of kernel matrix and the final sum will gives the edge of the image. As the sum of the canny edge kernel elements is zero there's no weight in result image (edge detected image) also it all 1's the edge detection in manual way is also a bit easy while compare to the other edge detection techniques.

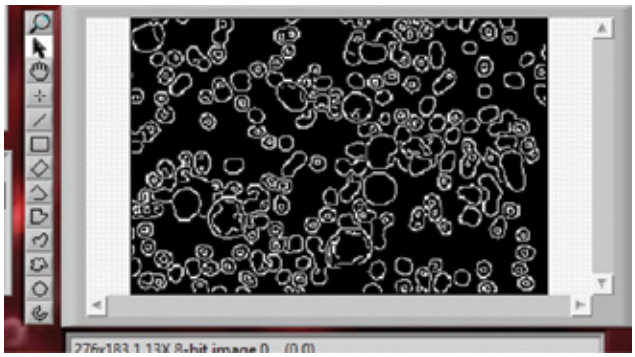

Figure 4: canny edge detection of blood cells

Results and Discussions

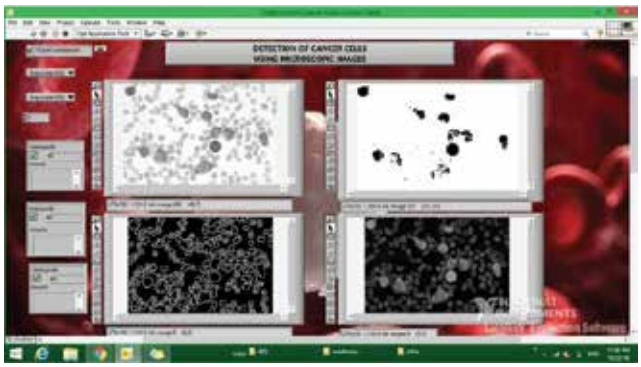

Figure 5: Detection of blood cancer cells

The Figure.5 depicts the detection of cancer cells in the blood, along with the RBC the cancer cells are found in the microscopic image. But the cancer cells have taken similar shape of RBC, so it will be difficult to report the cancer. After image processing through LabVIEW its been sure that the content which is present along with the RBC are cancer cells. After the edge detection the cancer cell content is clearly visible for better clarification the image is thresholded and obtained the presence of cancer content.

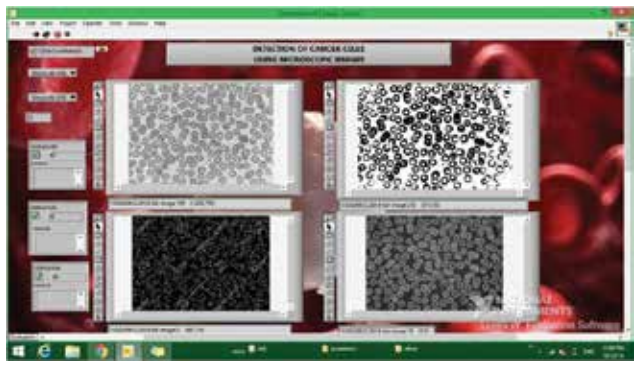

Figure 6: Microscopic image normal blood cells

In the Figure.6 the edge and threshold images of normal blood cells is shown. When we compared the Figure.5 and 6 the excess mass is detected that there is some extra content.

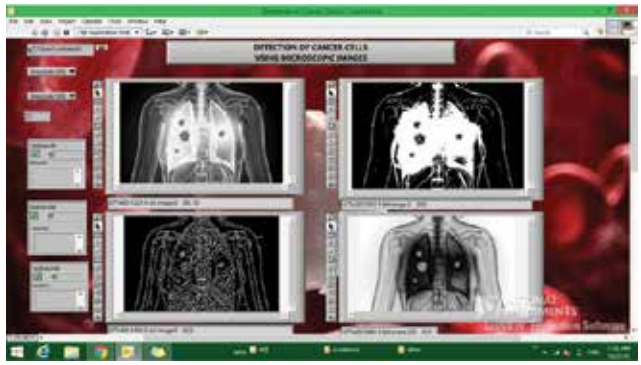

Figure 7: Detection of lung cancer

In this Figure.7 had taken the X-ray of human lungs and given as input to the LabVIEW, in the edge detection the image was so many edges so that we can't predict the extra mass, but if we see the thresholded part then it is clear that the lungs having some excess mass in left and right parts.

Figure 8: X-ray of Normal Human Lungs

When we compare both Figure 7& 8 then it will be clear the X- ray report that we have given containing some excess mass in it. As if it is normal lungs the threshold image will be plain without any disturbances.

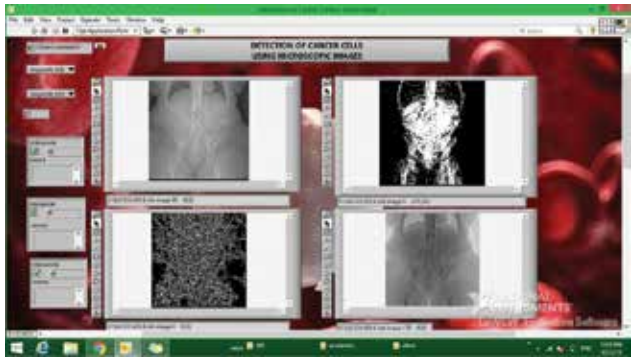

Figure 9: CT scan of human Abdomen

Figure 10: CT scan of Internal abdomen

When the CT scan reports of human abdomen are fed to the system as they are perfect in condition it doesn't shown any excess content which depicts that the logic is working correctly.

Conclusion

Using the LabVIEW assistance, we can process the X- ray, CT, Microscopic images and can find the presence of any excess content. Later the results are send to the doctor or any other authorized person for further tests so that the receiver can prescribe the medication accordingly. Also, sometimes when a person is affected with an accident then there is chance of blood clots in some organs. But the LabVIEW will show us that excess mass, but it may not be cancer content. So, we need to make sure of the content which is displaying is belongs to cancer or not. For that purpose, the given image is needed to compare with database of different types of cancer. By comparing the pixel values, it can be easily detected whether the content is of cancer or not. Also, we can directly display the type of cancer. Also by using this comparison method we can also predict the stages of cancer.

Conflict of Interest: Nil

A Cross-Sectional Study to Assess the Knowledge about Prevention and Home Management of Diarrhoea among the Mothers of Under Five Children in an Urban Area of Amritsar, Punjab

Amanpreet Kaur[1], Harpreet Kaur[2], Harpreet Kaur[3], Priyanka Devgun[4]

[1]Associate Professor, [2]Professor, Department of Community Medicine, Sri Guru Ram Das Institute of Medical Sciences & Research, Amritsar, Punjab, India; [3]Statistician cum Assistant Professor, Department of Community Medicine, Kalpana Chawla Government Medical College,Karnal, Haryana; [4]Prof. & Head, Department of Community Medicine, Sri Guru Ram Das Institute of Medical Sciences & Research, Amritsar, Punjab, India

ABSTRACT

Background: Acute diarrhoeal disease is the leading cause of mortality in children worldwide with the highest burden being in Sub Saharan Africa and in the countries of the World Health Organisation (WHO) South East Asia Region. In India, diarrhoea is the third leading cause of child mortality in India and is responsible for 13% of all deaths annually in children under 5 years of age.

Method: A community based cross-sectional study was conducted and total of 400 mothers of under-five children were interviewed. The mothers were selected by adopting simple random sampling method. A pre-designed & pre tested questionnaire was used to collect the information. House to house survey was done to collect the information. Statistical analysis was done by using SPSS 20.0.

Results: Majority of the mothers (72.8%) were in age group of 21-30 years. Out of total 53% knew that diarrhoea is passage of three or more loose stool in a day. Education status of mother has significant relation with the knowledge about diarrhoea and its spread (p=.000). 71.8% knew that it can be managed at home. Out of 400 females 75.7% knew about sugar salt solution can be prepared at home. 73% of the study participants knew that vaccination can prevent diarrhoea. Role of zinc therapy along with the ORS in treating diarrhoea was known to only 32% of the study participants.

Conclusions: The study concludes that there is a need of health education for mothers about prevention and home management of diarrhoea. Timely management at home can prevent deaths from dehydration caused by diarrhoea. IEC activities should be increased to educate the community about the principles of environmental hygiene.

Keywords: *Diarrhoea, under five, prevention, home management*

Introduction

Acute diarrhoeal disease is the leading cause of mortality in children worldwide with the highest burden being in Sub Saharan Africa and in the countries of the World Health Organisation (WHO) South East Asia Region. Viral diarrhoea is the most common in young children. Rota virus and adenovirus are prevalent in children less than 2 year.[1]

Most deaths from diarrhoea occur among children less than 2 years of age living in South Asia and sub-Saharan Africa. Despite this heavy toll, progress is being made. From 2000 to 2016, the total annual number of deaths from diarrhoea among children under 5 decreased by 60 per cent. Many more children could be saved through basic interventions.[2]

Diarrhoeal disease is the second leading cause of death in children under five years old. It is both preventable and treatable. Each year diarrhoea kills around 5,25,000 children under five. A significant proportion of diarrhoeal disease can be prevented through safe drinking-water and adequate sanitation and hygiene. Globally, there are nearly 1.7 billion cases of childhood diarrhoeal disease every year. Diarrhoea is a leading cause of malnutrition in children under five years old.[3]

In India, diarrhoea is the third leading cause of child mortality in India and is responsible for 13% of all deaths annually in children under 5 years of age. Although there has been decline in total deaths from 2.5 million in 2001 to 1.5 million in 2012, the proportional mortality accounted by the disease still remains high. As per NFHS-3 report, 9% of all under-5 children were reported to be suffering from diarrhoea in the preceding 2 weeks.[4]

A number of interventions have been proposed for preventing diarrhoea in young children, most of which involve measures related to infant feeding practices, personal hygiene, cleanliness of food, provision of safe water, safe disposal of faeces, and immunization. An analysis of the effectiveness, feasibility, and cost of each proposed intervention has shown that some are particularly effective and affordable, whereas others are impractical or ineffective, or require further evaluation.[5]

Home treatment is an essential part of the correct management of acute diarrhoea. This is because diarrhoea begins at home and children seen at a health facility will usually continue to have diarrhoea after returning home. Children must receive proper treatment at home if dehydration and nutritional damage are to be prevented. Mothers who understand home treatment should begin it before seeking medical care. When "early home therapy" is given, dehydration and nutritional damage can often be prevented.[6]

Keeping in mind the importance of prevention and home management of diarrhoea, the present study was designed to assess the knowledge about the same among mothers of under five.

Material and Method

A community based cross-sectional study was conducted in the urban field practice area of the Department of Community Medicine of SGRD Institute of Medical Sciences and Research, Amritsar. The sample size required for the study was calculated as

$$n = \frac{Z^2 p(1-p)}{d^2}$$

Where

n = Sample size

p = expected prevalence or proportion

d = precision rate

Hereby taking

Z = 1.96 (approx. = 2, for level of confidence of 95%)

p = 0.5 (considering knowledge of mothers about diarrhoea as 50%)

d = 0.05

n = 384

So a total of 400 mothers of under-five children were interviewed during the period from June to August 2018. According to the quarterly report there were 1370 under-five children in urban field practice area of Community Medicine. The mothers were selected by adopting simple random sampling method. The mothers who gave consent were included in the study. A pre-designed & pre tested questionnaire was used to collect the information. House to house survey was done to collect information about demographic profile, knowledge about prevention and home management of diarrhoea. Statistical analysis was done by using SPSS 20.0.

Inclusion Criteria: The mothers of under-five who were willing to participate were included in the study.

Exclusion Criteria: The mothers who didn't give consent and those who were not available at the time of study were excluded from the study.

Results

A community based cross-sectional study was conducted in the urban field practice area of the Department of Community Medicine of SGRD Institute of Medical Sciences and Research. A total of 400 mothers of under-five children were interviewed. Out of 400 mothers, 72.8% were in age group of 21-30 years while 14.4% and 12.8% were <20 and >30 years old. 59.5% of the mothers had one child and 37.2% and 3.3% had two and three children respectively. Regarding the educational status of the mothers 43.7%, 22.5%, 15.8% and 1.8% were studied up to matric, middle school, graduation and post graduation respectively. 16.2% of the mothers were illiterate. 90.2% of the mothers were housewives and rest (9.8%) were employed. Education profile of the fathers revealed that 51.7% were educated up to matric, 20.8% up to graduation, 13.8% up to middle school, 3.5 up to post graduation and 10.2% were illiterate. Majority of the fathers (71.7%) were semiskilled worker, 18.5% were unskilled and 9.8% were skilled workers.

It was observed that 53% mothers knew that diarrhoea is passage of three or more loose stool in a day. 15% of the respondents said that it spread by contaminated water and food, 9% said by contaminated fingers and 76% knew about both the methods of spread. Education status of mother had significant relation with the knowledge about diarrhoea and its spread (p=.000). 71.8% knew that it can be managed at home. Out of 400 females 75.7% knew about sugar salt solution can be prepared at home. Regarding other home available fluids 80.7% knew about rice water, 84% knew about yoghurt drink and regarding coconut water 84.3% were aware. While about the harmful drinks in diarrhoea only 23.7% said that carbonated drinks should not be given and 22.2% and 28% discouraged packed juice and sweetened tea respectively (Table 2).

On asking about the prevention of diarrhoea, 63.3% said it can be prevented by not giving bottle feed. All the participants (100%) knew about the role of clean drinking water in preventing diarrhoea. Regular hand washing, keeping environment clean and giving fresh food as a method of preventing diarrhoea was known to 91.5%, 95.7% and 90.3% of the participants respectively.

Regarding vaccination 73% of the study participants knew about that vaccination can prevent diarrhoea, but out of them only 23% knew that measles vaccine can prevent diarrhoea. Role of zinc therapy along with the ORS in treating diarrhoea was known to only 32% of the study participants.

Table 1: Socio-demographic profile of the respondents

		Frequency	Percentage
Age in years	<20	58	14.4
	20-30	291	72.8
	>30	51	12.8
No. of children	1	238	59.5
	2	149	37.2
	3	13	3.3
Education status of mothers	Illiterate	65	16.2
	Middle school	90	22.5
	Matric	175	43.7
	Graduate	63	15.8
	Postgraduate	7	1.8
Occupation of mother	Housewife	361	90.2
	Employed	39	9.8
Education status of husband	Illiterate	41	10.2
	Middle school	55	13.8
	Matric	207	51.7
	Graduate	83	20.8
	Postgraduate	14	3.5

Conted…

Occupation of father	Unskilled worker	74	18.5
	Semi-skilled worker	287	71.7
	Skilled worker	39	9.8

Table 2: Knowledge of the mothers about beneficial and harmful fluids in diarrhoea

Fluid	Frequency	Percentage (%)
Beneficial Fluids		
Rice Water	323	80.7
Yoghurt drink	336	84.0
Coconut Water	337	84.3
Sugar salt solution	303	75.7
Harmful fluids (those who said that it should not be given)		
Carbonated drink	95	23.7
Packed juice	89	22.2
Sweetened tea	112	28.0

Table 3: Knowledge of the mothers about prevention of diarrhea

Preventive Measures	Frequency	Percentage
Not giving bottle feed	253	63.3
Clean drinking water	400	100
Hand washing	366	91.5
Clean environment	383	95.7
Fresh food	361	90.3
Vaccination	292	73.0

Discussion

The study was conducted in the urban field practice area of the Department of Community Medicine of SGRD Institute of Medical Sciences and Research. A total of 400 mothers of under-five children were interviewed. Majority (72.8%) were in the age group of 21-30 years. Similarly in a study done in southern Odisha 74% mothers were in age group of 21-30 years.[7] 59.5% of the mothers had one child and 37.2% and 3.3% had two and three children respectively. Regarding the educational status of the mothers 43.7%, 22.5%, 15.8% and 1.8% were studied up to matric, middle school, graduation and post graduation respectively. 16.2% of the mothers were illiterate. In a study done among mothers in a tertiary care hospital it was found that 11.5% of the mothers were illiterate, 51.5% had studied up to high school level and 12.5% were graduates or post-graduates.[8] In the present study 90.2% of the mothers were housewives and rest (9.8%) were employed. Education profile of the fathers revealed that 51.7% were educated up to matric, 20.8% up to graduation, 13.8% up to middle school, 3.5 up to post graduation and 10.2% were illiterate. Majority of the fathers (71.7%) were semiskilled worker, 18.5% were unskilled and 9.8% were skilled workers.

It was observed that 53% mothers knew about the correct definition of diarrhoea. 15% of the respondents said that it spread by contaminated water and food, 9% said by contaminated fingers and 76% knew about both the methods of spread. Education status of mother had significant relation with the knowledge about diarrhoea and its spread (p=.000). 71.8% knew that it can be managed at home. Out of 400 females 75.7% knew about sugar salt solution can be prepared at home. Regarding other home available fluids 80.7% knew about rice water, 84% knew about yoghurt drink, 84.3% coconut water. While about the harmful drinks in diarrhoea only 23.7%

said that carbonated drinks should not be given and 22.2% and 28% discouraged packed juice and sweetened tea respectively. In another study done among Nigerian mothers it was found that 22.7% of mothers would use salt sugar solution (SSS) to treat their children who had diarrhea, while 9.9% of them would use UNICEF oral rehydration salt (ORS) for the same purpose.[9] Similarly in a study done in Ethiopia only less than half of the participants (42.4%) used homemade solution during diarrheal disease of their child.[10]

63.3% of the participants said it can be prevented by not giving bottle feed. All the participants (100%) knew about the role of clean drinking water in prevention of diarrhoea. Regular hand washing, keeping environment clean and giving fresh food as a method of preventing diarrhoea was known to 91.5%, 95.7% and 90.3% of the participants respectively. In a study done in Karnatka 68% of the participants had knowledge about the preventive measures of diarrhoea.[11]

Regarding vaccination 73% of the study participants knew about that vaccination can prevent diarrhoea, but out of them only 23% knew that measles vaccine can prevent diarrhoea. Role of zinc therapy with the ORS in treating diarrhoea was known to only 32% of the study participants Knowledge about the zinc therapy was significantly assoiciated with the educational status of mother (p=.003). Similar findings were there in a study done by Ogunrinde et al.[12]

Conclusions

The level of knowledge of the mothers of under five regarding the prevention of diarrhea was found to be good but the home available fluids given in diarrhea were not known by many of the participants. Efforts should be made to educate the mothers about the home management of diarrhoea. IEC activities should be strengthened to educate the community about prevention of diarrhoea. Other preventive measures like environment sanitation, hand hygiene, vaccination should also be taught to the mothers and rest of the community.

Acknowledgement

We would like to thank the faculty of the Department of Community Medicine for their valuable suggestions. We would also like to thank the mothers who participated in the study and to all those who contributed to the completion of this proposal in one way or another.

A Study to Assess the Parents Satisfaction Regarding Pediatric Care Services Rendered by Staff Nurses from Selected Pediatric Units of Sangi City

Karishma D. Mulla[1], Aparna Kale[2]

[1]M.Sc Nursing, [2]Assistant Professor, College of Nursing, Bharati Vidyapeeth (Deemed to be University), Sangli

ABSTRACT

A quantitative study was conducted by Ms. Karishma Mulla. out with the purpose of to know the parents satisfaction level towards pediatric care which rendered by staff nurses in the hospital.

Aims of the Study :

1. To assess the satisfaction level of parents regarding pediatric care services.
2. To find out association between satisfaction score and selected demographic variables.

Materials and Method: This study based on quantitative approach and it is a non – experimental descriptive research design was used to assess the parent satisfaction regarding paediatric care rendered by staff nurses from pediatric units of sangli city. Total 110 samples were selected by simple random sampling technique. A likert scale of five domains which includes 30 items were administer to collect data. The reliability coefficient was found to be 'r' value is 0.8 which is more than 0.7 hence, the tool was found to be reliable. The conceptual framework based on the Jean Watson human caring theory.

Result: The result of the parents satisfaction level regarding towards pediatric care were found 98.18% parents are highly satisfied, and 1.82 % of parents were moderately satisfied with the pediatric care which is rendered by staff nurses in the pediatric unit.

As per the domain, The satisfaction level of parents was found towards the environment 94.55 %, information 94.55 %, communication 96.36 %, nursing care 95.45 %, recreation 83.64 %.

This result shows the parents are highly satisfied towards the pediatric care rendered by staff nurses in the pediatric unit.

Keywords: *Assess, Parents, satisfaction.*

Introduction

Now a days more competition occurs in the organization to improve the standard of care as a means to determine particular health care facilities provision auxillaryl portion of the pediatric health care they are very achieve with higher parental predisposition for child care. As a result of wards need to check the parental satisfaction towards the pediatric care which is given by the staff nurses or health (taken) while maintaining a higher level of parents satisfy of child's care than ever before. The everyday care is improved and time and time period recognize as when parental satisfaction requirements should be fulfillment of care it include the word environment receiving the proper information about ward, staff, and care of child, open communication, flexible nursing care and also recreation or entertainment for the children.[2]

Parents after determine satisfaction of care given to the children by analyzing the attitudes of staff nurses and another health care team. Every hospital incidents is special to each and every individual and depends on

Assistant Professor, College of Nursing,
Bharati Vidyapeeth (Deemed to be University), Sangli
Email: baparnakale@gmail.com

other elements. Children are unable to express their needs. So parents to interpret their needs. Assess quality of services on the basis of level of parental satisfaction is essential to an important outcome issue.

Now a days however evaluation and notice the deficiency and standard of intelligibility to the optimum health services as the crucial concern of the guideline makers in health globally. As a result now a days improvement in quality of cares, managers and planners of health care system are much more interested. It is clear out evaluation of present state and designing for further development. This one of the crucial factor an affect on standards of health care services. To improve the quality of health care services, assessment of parents satisfaction level is one of the indicator. Determining the level of health services the researchers believe this one of the important factor

Findings

Section I: Frequency and Percetage Distribution of Demographic Variables

Table 1: Frequency and percentage distribution of demographic variables

Sr. No.	Variables	Groups	Frequency	Percentage (%)
1.	**Age in years**	18-24	48	43.64
		25-31	61	55.45
		32-38	1	0.91
2.	**Education**	Illiterate	11	10.00
		Primary	27	24.55
		Secondary	33	30.00
		Higher secondary	16	14.55
		Graduation	14	12.73
		Post graduation	9	
3.	**Occupation**	Housewife	72	65.45
		Service	25	22.73
		Business	13	
4.	**Monthly Income in rupees**	5000-10000	20	18.18
		10001-20000	55	50.00
		20001-30000	26	23.64
		above 30000	9	8.18

Section II: Assessment of level of parents satisfaction as per domain

Table 2: Assessment of level of parents satisfaction as per domain

N = 110

Sr. No.	Domains	Groups	Score	Frequency	Percentage %
1.	**Ward Environment**	Dissatisfied	06-10	01	0.91
		Moderately Satisfied	11-14	05	4.55
		Highly Satisfied	15-18	104	94.55
2.	**Information**	Moderately Satisfied	11-14	06	5.45
		Highly Satisfied	15-18	104	94.55
3.	**Communication**	Moderately Satisfied	11-14	04	3.64
		Highly Satisfied	15-18	106	96.36

Conted…

4.	**Nurse Care**	Moderately Satisfied	11-14	05	4.55
		Highly Satisfied	15-18	105	95.45
5.	**Recreation**	Dissatisfied	06-10	03	2.73
		Moderately Satisfied	11-14	15	13.64
		Highly Satisfied	15-18	92	83.64

In the ward environment domain there were 94.55% parents were highly satisfied with the ward environment and 4.55 % of parents were moderately satisfied with ward environments, hence result found is parents are satisfied with ward environment which is provided by staff nurses.

In the information domain there were 94.55% parents were highly satisfied with the information 5.45 % were moderately satisfied with information, hence result found is parents are highly satisfied with information which is provided by staff nurses related to children's health.

In the communication domain were 96.36 % parents were highly satisfied with the communication and were 3.64 % of parents moderately satisfied with communication, hence result found that parents are highly satisfied with communication of the staff nurses.

In the nursing care domain were 95.45 % parents are highly satisfied with the nursing care and 4.55 % were moderately satisfied with nursing care, hence result found that parents are highly satisfied with nursing care which was provided by the staff nurses.

In the recreation domain 83.64 % parents were highly satisfied with the recreation and 13.64 % of parents were moderately satisfied, hence result found parents was highly satisfied with recreation which is provided by the staff nurses in the pediatric unit.

Section III: Assessment of satisfaction Level of Parents

Deals with analysis of data related to assessment the level of parents' satisfaction regarding pediatric care services, in terms of frequency and percentage

Table 3: Satisfaction level of the parents' regarding pediatric care services

N = 110

	Groups	Score	Frequency	Percentage (%)
Satisfaction	Moderately Satisfied	50-70	2	1.82
	Highly Satisfied	70-90	108	98.18
	Total		110	100.00

The above table no. 3 shows the satisfaction level of the parents regarding pediatric care services, such a that 98.18% of parents were highly satisfied with their experience about hospital services, 1.82% parents were moderately satisfied. No one was in dissatisfied category.

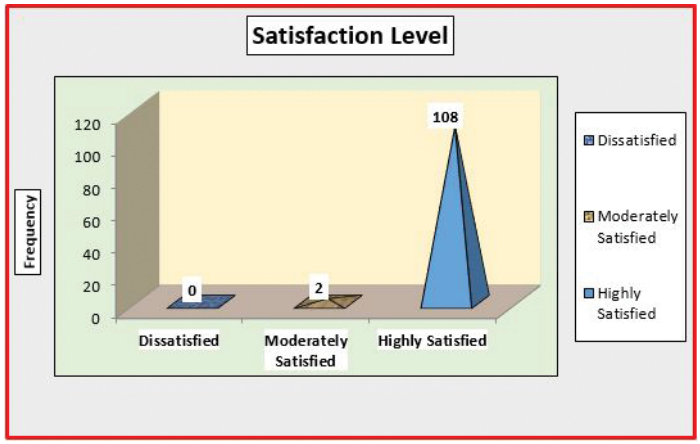

Figure 1: Level of parents' satisfaction regarding pediatric care services

Section IV: Analysis of data related to the association between satisfaction score and selected demographic variables

Table 4: Association between satisfaction score and selected demographic variables

N = 110

Sr. No.	Variables	Groups	Satisfaction		Chi Square	d. f.	p value	Significance
			Moderately Satisfied	Highly Satisfied				
1	Age	18-24	2	46	2.63	2	0.27	Not Significant
		25-31	0	61				
		32-38	0	1				
2	Education	Illiterate	0	11	3.53	5	0.62	Not Significant
		Primary	1	26				
		Secondary	0	33				
		Higher secondary	1	15				
		Graduation	0	14				
		Post graduation	0	9				
3	Occupation	Housewife	0	72	15.19	2	0.00	**Significant**
		Service	0	25				
		Business	2	11				
4	Monthly Income	5000-10000	0	18	9.16	3	0.03	**Significant**
		10001-20000	0	55				
		20001-30000	0	26				
		above 30000		9				

Age and Satisfaction: The p value of the association test between age and parent satisfaction was 0.27 which is, more than 0.05. Concludes that, there was no significant association between age of parents and their satisfaction about paediatric care services which is rendered by staff nurses in the paediatric units.

Education and Satisfaction: The p value of the association test between education and parent satisfaction was 0.62, more than 0.05. Concludes that, there was no significant association between education of parents and their satisfaction about paediatric care services which was rendered by staff nurses in the paediatric units.

Occupation and Satisfaction: The p value of the association test between occupation and parent satisfaction was 0.00, less than 0.05 Concludes that, there was significant association between education of parents and their satisfaction about paediatric care services which was rendered by staff nurses in the paediatric units.

Monthly Income and Satisfaction: The p value of the association test between monthly income and parent satisfaction was 0.03, less than 0.05. Concludes that, there was significant association between monthly income of parents and their satisfaction about paediatric care services

Discussion

Section I: Analysis of demographic data in terms of frequency and percentage distribution

1. **Age:** In this study according to age of parents, most of parents 55-45% were between 25-31 years of age group, 43.64% were 18-24 years of age, 0.91% between 32-38 years, hence maximum parents were 25-31 years of age group.
2. **Education:** In the study according to education of parents, most of them 30% were educated secondary, 24.55% were up to primary, 14.55% up to higher secondary, 12.73% graduates, 10% illiterate and 8.18% were educated up to post graduation, hence it observed that maximum were educated up to secondary education.

3. **Occupation:** In the study according to occupation of parents, most of them 65.45% were housewives, 22.73% doing services, and only 11.82% in the business category, hence the maximum parents occupation 65.45% were housewife category.
4. **Monthly Income:** in the study according to monthly income of parents, most of them 50% from the income group 10001-20000, 23.64% in the 20001-30000 income group, 18.18% from 5000-10000 and only 8.18% in the income group above 30000 per month, hence the maximum monthly family income was between 10001-20000/-.

Section II: Assessment the satisfaction level of parents regarding paediatric care as pr domain

Environment: Assessment of the satisfaction about environment in the hospital of the parents of 1-3 years children's at selected paediatric hospitals shows, 94.55% of parents were highly satisfied with their experience about hospital environment, 4.55% parents were moderately satisfied and 0.91% in the dissatisfied category.

Similar study result reported by Victoria S. Koontz in year 2003, A descriptive study was conducted in USA. To assess the parental satisfaction in a paediatric ICU. The parental satisfaction survey measured 3 domains of caring (a) hospital environment (b) patients care (c) communication. The results of this study found very highly satisfied for ICU environment the p value is less than 0.01.[1]

Information: Assessment of the satisfaction about information provided in the hospital of the parents of 1-3 years children's at selected paediatric hospitals shows, 94.55% of parents were highly satisfied with their experience about information, 5.55% parents were moderately satisfied

Communication: Assessment of the satisfaction about communication service provided in the hospital of the parents of 1-3 years children's at selected paediatric hospitals shows, 96.36% of parents were highly satisfied with their experience about communication, 3.64% parents were moderately satisfied.

Similar study result reported by Hongs and Susan S. in years 2008. a pre experimental research conducted in USA. Parental satisfaction with nurses communication and pain management in a paediatric unit. High satisfaction rating on the communication item.[12]

Nursing Care: Assessment of the satisfaction about nursing care service provided in the hospital of the parents of 1-3 years children's at selected pediatric hospitals shows, 95.45% of parents were highly satisfied with their experience about nursing care, 4.55% parents were moderately satisfied.

Similar study result reported by Naiire salmani et.al. 2015. A Grounded theory study conducted in Yazd, Iran. The process of satisfaction with nursing care in parents of hospitalized children. Sample size was 25 consisted of parents of children. They are used in-depth semi-structured interviews. The result founds parents are satisfied with the nursing care.[13]

Recreation: Assessment of the satisfaction about recreation in the hospital of the parents of 1-3 years children's at selected pediatric hospitals shows, 83.64% of parents were highly satisfied with their experience about hospital recreation, 13.64% parents were moderately satisfied and 2.73% in the dissatisfied category.

Section III: Deals with analysis of data related to the association between satisfaction score and selected demographic variables

Age and Satisfaction: The p value of the association test between age and parent satisfaction was 0.27, more than 0.05. Concludes that, there was no significant association between age of parents and their satisfaction about pediatric care services.

Education and Satisfaction: The p value of the association test between education and parent satisfaction was 0.62, more than 0.05. Concludes that, there was no significant association between education of parents and their satisfaction about paediatric care services.

Occupation and Satisfaction: The p value of the association test between occupation and parent satisfaction was 0.00, less than 0.05. Concludes that, there was significant association between education of parents and their satisfaction about paediatric care services.

Conclusion

In this study results found over all satisfaction of the parents out of the 100 % the 98.18 % of parents were highly satisfied, and 1.82 % of parents were moderately satisfied their experience about the care services in the pediatric unit. Parents were getting clean

ward environment adequate information about the child health, staff nurses communication is also good, meeting all nursing care their children's, only in the recreation the parents were moderately satisfied.

Conflict of Interest: Column is Nil.

Source of Funding: Self.

Ethical Cearance: Proposal of research with the data collection tool was presented in the front of research committee for approval. prior permission from hospital and child development officer, were taken. Informed written consent from each participant was taken. Which included name, number, organization, time duration of participation, termination of participation, purpose of the study, incentives, benefits, and where it was promised that there will be no risk to the clients. Principle of confidentiality was attained by giving code number to data collection tool. The received information also kept confidential. Ethical clearance is done with the committee members Dr. Sripriya G. and Dr. Mrs. Nilima Bhore

Effect of Depression on Treatment Outcome in Multi-Drug Resistant Tuberculosis Patients Under Programmatic Management of Drug Resistant TB Services in Amritsar, Punjab

Manisha Nagpal[1], Naresh Chawla[2], Priyanka Devgun[3]

[1]Associate Professor, Department of Community Medicine, Sri Guru Ram Das Institute of Medical Sciences and Research, Sri Amritsar; [2]MD Chest and TB, District TB Officer, Amritsar; [3]Professor and Head, Department of Community Medicine, Sri Guru Ram Das Institute of Medical Sciences and Research, Sri Amritsar

ABSTRACT

Background: Depression and Multi-drug resistant tuberculosis (MDR-TB) are worldwide public health problems with an immense impact on human health. Depression leads to poor health seeking behaviour and poor compliance which leads to unfavourable treatment outcomes.

Method: This cross-sectional study was conducted on all MDR-TB patients who were registered and being treated under PMDT services in Amritsar district from 1st April 2014 to 31st March 2015. The prevalence of depression and its effect on the treatment outcome was determined. Data management and analysis was done by using Microsoft excel and SPSS.

Results: Out of 87 MDR-TB patients, 57 (65.5%) were males and 30 (34.4%) were females. Depression was significantly associated with the unfavourable treatment outcomes.

Conclusions: On statistical analysis, it was observed that 50.6% of the patients were depressed and unfavourable outcome was significantly associated with depression (p=0.005) in MDR-TB patients.

Keywords: *MDR-TB, Depression, Treatment outcomes, Socio-demographic factors.*

Introduction

Multidrug-resistant tuberculosis (MDR-TB) is a major public health challenge in the twenty-first century. The World Health Organization (WHO) defines MDR-TB as TB that is resistant to two first-line drugs i.e. isoniazid and rifampicin. Worldwide the cure rate is only around 50% in MDR-TB programme settings.[1] The estimated prevalence of mental disorders, including depression among people with TB is between 40% and 70%. This is due to various underlying factors. Patients with mental disorders are at an increased risk of TB exposure due to higher rates of homelessness which leads to their residence in other shelters and group homes. These patients also carry other risk factors for TB like smoking, poor nutrition and co-morbidities such as diabetes and HIV infection.[2]

Depression is considered as a comorbidity of tuberculosis due to the nature of tuberculosis infection, side effects from medications, and other social determinants of health. Depressed patients are less likely to seek treatment or take their medications regularly which results in more cases of default, failure or death. Therefore, depression could be considered as a concerning exacerbating factor in a potential MDR-TB epidemic.[3]

Psychiatric problems such as depression has a significant role to play in patient's quality of life and it also affects the physician's approach toward MDR-TB

therapy. Therefore, effective management of depression is a key for not only the desired patient outcome, but also for patient's overall quality of health and physician's satisfaction while dealing with MDR-TB treatment. [4]

Since there is paucity of such studies in Punjab, the study was undertaken to ascertain the effect of depression in MDR-TB patients on their treatment outcomes.

Material and Method

The study was a cross-sectional study conducted on all MDR-TB patients registered from 1st April 2014 to 31st March 2015 and being treated with second line anti-tuberculosis drugs under PMDT services in Amritsar City.

Inclusion Criteria: All drug sensitivity tested (DST) confirmed MDR-TB cases who signed written informed consent.

Exclusion Criteria: Pregnant females and critically ill patients who needed management in an Intensive Care Unit (ICU).

Data Collection and Analysis: A total of 87 patients registered with DTC (District Tuberculosis Centre) Amritsar and being treated with second line anti TB drugs were included in the study. A pre-designed and pre – tested proforma was administered to the subjects after taking his/her consent. Questionnaire included questions regarding the socio-demographic profile, past history, past duration of treatment, family history and occupational history of the patients. The possible outcomes of the MDR TB patients under DOTS can be: cured, treatment completed, died, failure, defaulted, lost to follow up or regimen changed/shifted to XDR.[5]

Depression was assessed in the study subjects by CES-D-R 10 (Assessment of depression by Centre for Epidemiologic Studies Short Depression Scale during the first 4 months of starting the treatment. This scale is a self-report measure of depression containing 10 items. The reliability and validity of the scale has been assessed by various authors. The 10 items are-

CES-D-R 10 items	Rarely or none of the time (less than 1 days)	Some or a little of the time (1-2 days)	Occasionally or a moderate amount of time (3-4 days)	All of the time (5-7 days)
I was bothered by things that usually don't bother me.				
I had trouble keeping my mind on what I was doing.				
I felt depressed.				
I felt that everything I did was an effort.				
I felt hopeful about the future.				
I felt fearful.				
My sleep was restless.				
I was happy.				
I felt lonely.				
I could not " get going"				

Scoring

	Rarely or none of the time (less than 1 days)	Some or a little of the time (1-2 days)	Occasionally or a moderate amount of time (3-4 days)	All of the time (5-7 days)
Questions 5-8	3	2	1	0
All other Questions	0	1	2	3

The total score is calculated by finding the sum of 10 items. Do not score the form if more than 2 items are missing. Any score equal to or above 10 is considered depressed.[6]

Depression was compared with the treatment outcomes of the study patients and the valid conclusions drawn. Data analysis was done by SPSS version 20. Chi-square test was applied to prove their statistical significance and $p<0.05$ was considered to be significant.

Ethics: The research proposal was approved by the college ethical committee at the time of commencement of the study.

Results

The present study was carried out on 87 MDR- TB cases registered under PMDT services in Amritsar city. The total sample consisted of 57 (65.5%) males and 30 (34.4%) females.

Table 1: Distribution of cases according to their Socio-demographic profile

	Number	Percentage (%)
Age (years)		
15-29	38	43.7
30-44	23	26.4
45-59	23	26.4
>60	3	3.4
Sex		
Male	57	65.5
Female	30	34.5
Marital status		
Married	50	57.5
Single	28	32.2
Widow/Widower	9	10.3
Education		
Above Matric	23	26.4
Matric	23	26.4
Below Matric	19	21.8
No schooling	22	25.3
***Occupation**		
IGA	63	72.4
Non-IGA	24	27.6
Socio-economic status		
High	5	5.7
Upper middle	21	24.1
Lower middle	43	49.4
Low	18	20.7

*IGA- Income generating activity; Non-IGA- Non income generating activity.

Table 1 reveals that majority (43.7%) of the patients were in the younger age group i.e. 15-29 years followed by 26.4% each in the age groups of 30-44 years and 45-59 years. Majority i.e. 65.5% were males. 57.5% of the cases were married, 32.2% were single and 10.3% were in the category of widow/widower. As far as educational status is concerned, 26.4% each were above matric and matric, 21.8% were below matric and 25.3% were illiterate. Out of the total 87 patients, 72.4% were involved in income generating activities and rest i.e. 27.6% were unemployed. As far as socio-economic status is concerned, 49.4% were in the lower middle status, 24.1% in the upper middle status, 20.7% belonged to low status and only 5.7% were from the high socio-economic status.

Table 2: Distribution of cases according to CES-D-R 10 scale

S. No.	*CES-D-R 10 items	Rarely or none of the time (less than 1 day) N (%)	Some or a little of the time (1-2 days) N (%)	Occasionally or a moderate amount of time (3-4 days) N (%)	All of the time (5-7 days) N (%)
1.	I was bothered by things that usually don't bother me.	31 (35.6)	35 (40.2)	15 (17.2)	6 (6.9)
2.	I had trouble keeping my mind on what I was doing.	35 (40.2)	33 (37.9)	13 (14.9)	6 (6.9)
3.	I felt depressed.	29 (33.3)	43 (49.4)	14 (16.1)	1 (1.1)
4.	I felt that everything I did was an effort.	30 (34.5)	35 (40.2)	17 (19.5)	5 (5.7)
5.	I felt hopeful about the future.	3 (3.4)	13 (14.9)	64 (73.6)	7 (8)
6.	I felt fearful.	2 (2.3)	11 (12.6)	65 (74.7)	9 (10.4)
7.	My sleep was restless.	1 (1.1)	14 (16.1)	60 (69.0)	12 (13.8)
8.	I was happy.	1(1.1)	3 (3.4)	48 (55.2)	35 (40.2)
9.	I felt lonely.	20 (23.0))	53 (60.9)	9 (10.8)	5 (5.7)
10.	I could not " get going"	24 (27.6)	50 (57.5)	12 (13.8)	1 (1.1)

*Scoring of items done as explained in Materials and methods.

Table 2 shows that out of the total 87 patients, 40.2% were bothered about things that usually don't bother for some time i.e.1-2 days per week, 40.2% rarely (<1 day) had trouble keeping in mind things they were doing, 49.4% felt depressed for some time, 40.8% think that they did things with effort for some time, 73.4% were hopeful about their future for moderate amount of time, at the same time 74.7% felt fearful also for 3-4 days or moderate amount of time, 69% had restless sleep for moderate time, at the same time 55.2% were happy for the same period, 60.9% felt lonely for some time and 57.5% said that they could not "get going" for some time per week.

Table 3: Distribution of cases according to their treatment outcome

*Treatment Outcome	Number	Percentage (%)
Cured	30	34.5
Treatment Completed	19	21.8
Defaulted	13	14.9
Failure	3	3.5
Shifted to XDR	4	4.6
Died	18	20.7
Total	87	100

*Favourable outcome included Cured and Treatment completed; Unfavourable outcome included Defaulted, Failure, Shifted to XDR and Died patients.

The perusal of table 3 depicts the treatment outcome of the study subjects. Out of the total 87 patients, 30 (34.5%) were cured, 19 (21.8) completed treatment, 18 (20.7%) died, 13 (14.9%) defaulted, 4 (4.6%) were shifted to XDR regime and 3 (3.5%) were failure.

Table 4: Distribution of cases showing the effect of depression on the treatment outcome

Treatment Outcome	Depression		Significance
	Present N (%)	Absent N (%)	
Cured	12 (40.0)	18 (60.0)	$\chi 2=16.753$ df=5; p=0.005
Treatment Completed	5 (26.3)	14 (73.7)	
Default	7 (53.8)	6 (46.2)	
Failure	2 (66.7)	1 (33.3)	
ST XDR	2 (50.0)	2 (50.0)	
Died	16 (88.9)	2 (11.1)	
Total	43 (50.6)	44 (49.4)	

It is observed in the table 4 that 60% of the cured patients and 73.7% of the patients who completed treatment were not depressed i.e. depression was less common in patients with favourable outcome. At the same time 53.8% of the patients who defaulted, 66.7% of subjects with outcome as failure, 50% of who shifted to XDR regime and 88% of the patients who died were depressed. This means that depression was more seen in patients with unfavourable treatment outcome and the results were found to be statistically significant (p-0.005).

Discussion

Table 1 shows the socio-demographic profile of the patients. Our study reveals that out of the total, majority i.e. 43.7% were less than 30 years and 52.8% of the patients were in the age group of 30-59 years which includes the economically productive age group. Kumar A et al in their study also showed that majority (63.1%) were less than 30 years. [7] Studies by Hire et al and Nair et al in Nagpur and Chennai respectively also observed that more than half of the patients belonged to economically productive age group. [8,9] Present study observed that out of total 87 patients, 57 (65.5%) were males and 30 (34.5%) were females. Similar over representation of males was found by Kumar A et al [7] and Thiruvalluvan E et al [10] in their studies. Our study revealed that 57.5% were married, 47.1% were below matric, 72.4% were working (IGA) and 49.4% and 20.7% belonged to lower middle class and lower class respectively. Somewhat similar findings were observed by Thiruvalluvan E et al in Chennai that 78% were married, 36% had education level below secondary school and 76% were involved in income generating activities. [10] Bhatt G et al in Ahmedabad city along with the similar findings observed that majority belonged to upper lower socio-economic status. [11]

Table 2 depicts the distribution of cases according to CES-D-R 10 depression scale. It is evident from our study that more than half (50'6%) of the study patients were depressed according to CES-D-R 10 scale (Table 4). 40.2 % were bothered by things and had trouble keeping things in mind. 49.4% felt depressed and 74.7% were fearful. 69% had restless sleep occasionally and 60.9% felt lonely sometimes. Similar association of depression with the chronic illness like MDR-TB has been observed by KM de Castro-Silva et al [12], Jawad K et al [13], Das M et al [14] and Sharma RC et al [15] in their studies at various places.

Table 3 presents the treatment outcome of the study patients. Favourable outcome was seen in 56.3% cases i.e. cured (34.5%) and treatment completed (21.8%) cases. Unfavourable outcome was observed in 43.7% cases comprising of defaulted (14.9%), failure (3.5%), shifted to XDR (4.6%) and died (20.7%) cases. Similar, treatment success rates 62% and 68.3% and other outcomes were seen in studies in Portugal and China respectively. [16,17]

As is evident from the table 4 that out of the total 87 patients, 43 (50.6%) were depressed and 44 (49.4%) were not depressed according to CES-D-R 10 scale. 60% of the cured and 73.7% of the treatment completed patients were not depressed while 88.9% of the died, 66.7% of failure, 53.8% of the defaulted and 50% of those shifted to XDR regime were found depressed i.e. depression was significantly associated with the unfavourable treatment outcomes (p=.005). Similarly, Ugarte-Gil C in their study on TB patients found that major depressive episodes is significantly associated with negative outcomes. [18] Another study by Ambaw F also stated that untreated depression in people with tuberculosis was independently associated with worse treatment outcomes. [19]

Conclusion

CES-D-R 10 scale was found to be very useful instrument for screening of depression. Depression among MDR-TB is a common entity which should be taken care of on priority bases. Therefore it is recommended that during treatment all the patients should be screened for depression at least once and staff of DOTS centre should be educated about symptoms of depression and the counselling techniques for improving patient compliance.

ABSTRACT

Tuberculosis (TB) is a global public health problem. Pulmonary tuberculosis (PTB) is most common and highly contagious infection, whereas, Extrapulmonary tuberculosis (EPTB) in also an important clinical problem. The present study aimed to evaluate the demographic factors associated with PTB and EPTB patients of Jaintia Hills, Meghalaya. Total 317 patients clinically diagnosed with TB and belonged to the age group 15-50 years were enrolled for the study from different health centres of Jaintia Hills. Out of all the TB patients, 64.4% had PTB and 35.6% were diagnosed with EPTB. Male were more frequently affected by PTB (61.1%), whereas EPTB was more detected among female (57.1%) and found to be statistically significant ($p=0.002$). Significant differences ($p<0.05$) were also observed between other demographic parameters such as religion ($p=0.000$), community ($p=0.008$), marital status ($p=0.000$) and occupation ($p=0.000$) with type of TB. Early detection and appropriate treatment of TB must be started as soon as possible for reduction of this disease with increased awareness among the community.

Keywords: *Tuberculosis, Pulmonary, Extrapulmonary, Jaintia Hills, Meghalaya.*

Introduction

Tuberculosis is public health challenge in almost all developing countries and estimated that almost one-third of the population is infected globally[1-2]. India is the highest TB burden country and accounting for one-fifth global incidence of this disease[3]. More prevalent age group of this infectious disease is 15-54 years. Lack of awareness and negligence towards symptoms and treatment are the major cause of increasing the number of TB patients. Fear of death and social stigma are the other important reasons for hiding of truth regarding the disease[4]. PTB is highly contagious infection. The proportion of PTB and EPTB varies with respect to geographical exposure, social, ethnic and economical parameters[5-6]. The most common sites for EPTB are lymph nodes, pleura, cutaneous tissue, abdomen, gastrointestinal system and bones [1-2,7]. Nearly all organs of the body can be infected by EPTB and it can also have a wide variety of clinical manifestations, thus leading to difficulty and delay in diagnosis[8]. Socio-demographic factors such as age, sex, education, occupation, marital status, life style play a crucial role in etiology and epidemiological situation of TB[9]. Therefore, the present study was conducted focusing on demographic factors associated with pulmonary and extrapulmonary tuberculosis among the Tribes of Jaintia Hills, Meghalaya.

Method

A cross-sectional study was conducted among 317 patients diagnosed with TB at the health centres of Jaintia Hills (East and West), Meghalaya. Since, the present study was a part of ICMR funded project entitled "Prevalence and Risk Factors leading to HIV Infection among the Two Tribes of Jaintia Hills, Meghalaya and Ethical clearance for ICMR funded project was sought from Amity University Research Ethics Committee. Patients belonged to the age group 15-50 years were enrolled for the study. Written permission was sought from District Medical and Health Officer (DM&HO)

and Medical officers (MOs) of all the health centres before conduct the study. Informed consent was obtained from each patient prior to conduct the interview and gathered information kept confidential. To collect the demographic data such as age, sex, religion, community, occupation, marital status, structured schedule was used. Statistical analysis was carried out using SPSS V22. Differences between frequencies were tested using Chi-square test (significance level $p<0.05$).

Results

The study revealed that, of 317 TB patients 64.4% were diagnosed with PTB and 35.6% had EPTB (Fig. 1).

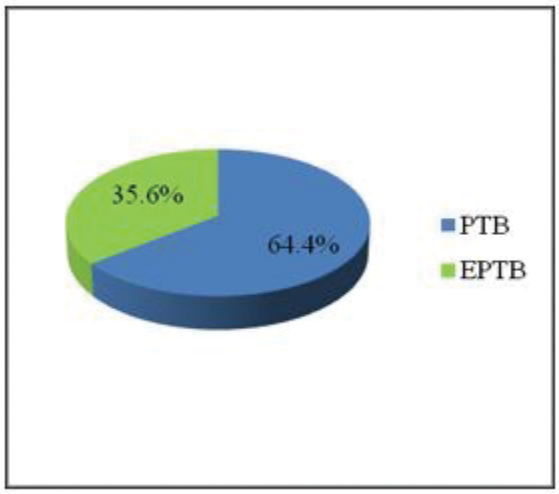

Fig. 1: Distribution of Pulmonary and Extrapulomonary Tuberculosis

Table 1 shows the demographic distribution of TB patients with respect to type of TB. It was observed that, among all the subjects 65.2% were male and 37.5% were female. Amongst all male, majority (61.1%) were infected with PTB; whereas amongst female, 57.7% were diagnosed with EPTB. Distribution of gender with type of TB was found to be highly significant (p=0.002). With respect to age group, patients between 31-40 years of age were more prone to PTB, whereas a different finding was observed for EPTB cases. However, these differences were not found to be statistically significant ($p\geq0.05$). Most of the Christian (69.7%) and Niamtre (85.5%) group were found to be as pulmonary tuberculosis patients. Different scenario was observed for Hindu as majority of them were infected with EPTB (59.8%). Statistical analysis shows a highly significant variation between region and type of TB (p=0.000). Majority of the TB patients belonged to Jaintia community (85.5%), among them 66.6% had PTB. Significant distribution was observed with respect to community and type of TB (p=0.008). Married group in Jaintia hills were majorly affected with PTB (71.2%) as compare to unmarried group which was more prone to EPTB (58.1%) and also found to be statistically highly significant (p=0.000). occupation is an important parameter responsible for exposure of tuberculosis. Around, 40% of the patients were involved with coal mine work, which shows a relevant cause for high prevalence of TB infection in Jaintia hills. Approximately, 86% PTB patients were coal mine workers in the present study. Occupation is also found to significantly associated with type o tuberculosis (p=0.000).

Discussion

The incidence of TB is one of the most important surveillance indicators in public health. The present study revealed that the pulmonary tuberculosis was higher among male (61.1%) as compared to females, whereas, female (57.1%) were more prone to extrapulmonary tuberculosis than male, which showed highly significant differences (p=0.002). These differences could be due to regional, cultural and occupational variations. Similar findings were observed in urban area of Pune, Maharashtra, Nepal and West Africa[9-11]. However, no statistical significance was observed with respect to age and type of TB, but it was found that more than half of the TB patients (55.5%) belonged to the age group 31-40 years. According to WHO (2018), tuberculosis mostly affects adults in their most productive years; however, all age groups are at risk. Around 95% of cases and deaths have been occurred in developing countries[12]. Variables like religion (p=0.000), community (p=0.008), marital status (p=0.000) had highly significant association with PTB and EPTB in accordance with other study[9]. The present study confirmed that nearly 40% patients were working in coal mine areas. Occupation is an important risk factor responsible for active PTB in general population[13]. Findings of the other studies confirmed that patients were exposed to coalmine dust were more prone to tuberculosis, which was a known cause of occupational risk factors for tuberculosis[14-18].

Several social determinants and risk factors are impediments to TB control in high burden countries such as: poverty, malnutrition, HIV, smoking, diabetes mellitus, alcoholism, indoor air pollution, presence of large numbers of undiagnosed or poorly treated infectious pulmonary TB diseased persons in the community, overcrowding and weak health systems[19]. However, TB control efforts are primarily based on early diagnosis and treatment of patients with pulmonary TB disease. Chronic, productive cough is one of the cardinal symptoms of pulmonary TB disease, and therefore it is recommended that all individuals who have a productive cough of two weeks or more in high burden countries be evaluated for TB[20-21].

Conclusion

The present study concludes that the proportion of pulmonary tuberculosis was significantly higher among male than their counter part. Female constituted with majority of the patients with extrapulmonary tuberculosis. Other demographic factors such as region, community, marital status, occupation were significantly associated with tuberculosis in Jaintia hills, Meghalaya. Early detection and treatment of TB along with creating awareness regarding preventive measures for TB patients in various infection prevention programme is necessary in Jaintia Hills. It is also very important to make sure the

availability of anti-tuberculosis regimens in all Health Centres of Jaintia Hills. Tuberculosis control programs must be targeted at specific populations under risk with special care on young and female populations to reduce TB morbidity and mortality.

Acknowledgement

Sincere thanks to ICMR for financial support. We are thankful, to Heads of the Jaintia Hills District Administrative and Health Centers for their support. Heartfelt thanks to the participants of Jaintia Hills for their cooperation in providing the valuable information.

Conflict of Interest: NA.

Ethical Clearance: The present study was a part of Indian Council of Medical Research (ICMR) funded project, so, the Ethical clearance was sought for the project from Amity University Research Ethics Committee.

An Automatic Disease Early Prediction and Diagnosis Recommendation Framework for Brain Tumours

Nandan Bodapalli[1], Kunjam Nageswara Rao[2], Parada Vara Prasad Dora[3]

[1]Research Scholar, [2]Professor, Department of CS & SE, AUCE(A) at Andhra University, Visakhapatnam, AP; [3]MBBS, MD Cardioanesthesia at Omni RK Hospital, Seven Hill Road, Visakhapatnam, AP, India

ABSTRACT

Use of computation techniques in medical research have progressed to a greater extend with the availability of higher order complex and accurate algorithms for detecting diseases. The medical diagnosis processes with human intervention cannot match with the demands from the consumers as the human process is slow and less accuracy as it completely depends on the skills of the individuals. One of the prominent medical diagnosis is detection of brain tumours cells. Human brain being the most important component of the body, can cause multiple other life-threatening diseases. These diseases are caused due to the presence of tumour in the brain cell. Hence, this research attempts to propose a higher accurate tumour detection algorithm. The improved accuracy is achieved due to the novel proposed dynamic intensity-based MR image enhancement algorithm and the proposed adaptive coefficient-based segmentation algorithm. Further, it is also been observed that, the presence of the tumour in the brain cortexes can lead to other diseases as well. These diseases from a large number of possibility space, can take a huge amount of time to diagnose and further propose medications. Hence a reduction of the possibility space and the reduced diagnosis process can give more time for medication to save the precious human life. Thus, yet another objective of this research is to automate the disease early prediction by recommending the diagnosis for reduced number of diseases by applying tumour centroid detection and mapping to human brain cortex functionalities. The work demonstrates a very high 97% accuracy for the detection and early prediction.

Keywords: *Tumour Detection, MR Image Enhancement, Adaptive segmentation, Tumour Region Detection, Disease Early Prediction, Diagnosis Recommendation.*

Introduction

In last few decades, reports from various medical statistics analysis organizations have demonstrated that there is a significant increase in the brain tumour effected patients from various parts of the world. The most recent study by A. S. Mohammad et al.[1] have shown that the nearly over 50,000 reports only in the year of 2017 in different states of USA. These reports and datasets have intrigued the demand for further research and early prediction of brain tumours in the human brain. D. E. Job et al.[2] have reported a processed dataset with nearly 90,000 patient information captured in the form of MR imagining for further analysis. This dataset is a major collection or the major set of BRATs datasets. Similar studies have also demonstrated that, due to the complex symptoms, the detection of the brain tumour and the cancerous growth is highly delayed. Hence, the demand for early detection of brain tumours and diseases might be caused by the tumours cannot be ignored.

The primary source of information processing to detect the brain tumours are the MR images captured during the initial diagnosis. Various research attempts have reciprocated the advantages of using MR images for such diagnosis. One of the most recent work by R. M. Chen et al.[5] have proven the similar believes by showcasing higher accuracy compared with the MR images with other mediums. Though the MR Imagining technique is criticised by some group of researchers due to the presence of noise and additional time complexity for removing and enhancing the image during the pre-processing phases, the work by C. C. Benson et al.[6] and the work by A. Jenitta et al.[7] have demonstrated two newer advantages as possibilities of fractal analysis and easy image data retrieval on MR images respectively. Thus, this research proposes a novel automated framework for Disease Early Prediction and Diagnosis Recommendation for Brain Tumours.

Literature Review

Analysing and detecting the brain anomalies highly relies on tumours and other factors causing the tumours such as injuries to the brain cortex, both external and internal, damages to the brain cell tissues due to multiple effects. The wide variety of the possibilities for tumour formation makes the task to identify the classes of the tumours. The work by P. M. Shakeel et al.[7] is the most recent analytical study to identify the connectivity of these parameters to realise the tumour detection. The capturing or extraction of these interdependent parameters is made possible with the improvements in the medical imaging techniques such as CT scan or the MRI scans. Though, the extraction of the parameters still a highly complex process until the work presented by S. Baskar et al.[8] with the improvisation of error reduction in the brain imaging data. This work is further tested and compared by L. Keinan-Boker et al.[9] with other parallel research works. The conclusion made by various researchers that the recent methods for error reduction is highly complex and cannot justify device related influences during the noise reduction and MR image enhancements. Thus, a demand for higher accurate and higher adaptive model is expected by the research community to improve the complete tumour detection process. This work addresses this issue and proposes a novel image enhancement model.

Further, for classification of the brain tumours, a wide range of the methods were introduced by various research attempts. The most recent outcome reported by K. Usman et al.[10] is to install machine learning components in the detection framework for tumour detection. The machine learning algorithms are expected to perform highly accurate detection and classifications for the tumour detection. Provided, the algorithms are feed with enough training data. The problem arises in case of tumour detection as in case of every subject or patient, the tumour formation is different and lease very less similarity-based detection possibilities, which lead to higher time complexity for each training phase and results into higher time complexity. This phenomenon was established by L. Lefkovits et al.[11]

Henceforth, with the understanding of the parallel research outcomes and the limitations, this work obtains a direction to model the new algorithms for the automated framework.

Brain Function Processing Analysis: In this section of the work, the working paradigm of the human brain is analysed for having better understanding of the tumour detection and subsequently the disease detection.

The human brain cortexes are majorly divided into six compartments to contain Prefrontal Cortex, Amygdala, Neocortex, Hippocampus, Cerebellum and Basal Ganglia.

Prefrontal Cortex: Prefrontal cortex region has been implicated in planning complex cognitive behaviour, personality expression, decision making and social behaviour. It is considered to be orchestration of thoughts and actions in accordance with internal goals.

Amygdala: It is part of the limbic system of the brain, which involved with emotions and other reactions to stimuli. It is highly involved with different emotional responses.

Neocortex: It is part of cerebral cortex. It is involved in functions like sensory perception, generation of motor commands, conscious thoughts and spatial reasoning.

Hippocampus: It is a small organ located within the brain medial temporal lobe and it is part of limbic system, the region that regulates emotion. It is associated with long-term memory.

Cerebellum: It receives information from the sensory systems, the spinal cord and other parts of the brain and regulate the motor movements such as posture, balance, coordination and speech.

Basal Ganglia: It is part of Cerebrum strongly interconnected with cerebral cortex, thalamus and brain stem other brain areas. It includes the functionality like habit learning, eye movement, procedural learning, and cognition and emotion.

Brain Disorder Diseases: In order to map the diseases based on the tumour location, it is important to understand the complications and effects from the diseases. Hence, in this section of the work, the diseases are discussed and finally mapped with the location of tumours.

Motor Memories Dysfunction: It is contextual interference effect resulting loss of short-term and long-term motor memory.

Parkinson's Disease: Nerves in a central area of the brain degenerate slowly, causing problems with

movement and coordination. Early signs are a tremor of the hands, stiffness of the limbs and trunk, slowness of movement and unstable posture.

Huntington's Disease: An Inherited nerve disorder that causes a degeneration of brain cells. Dementia, a decline in cognitive function due to malfunction of nerve cells in the brain, mood swings, depressions and irritability are its symptoms.

Alzheimer's Disease: It is most common form of dementia, causing progressive loss of memory and metal functions and changes in behaviour and personality.

Methodology and Proposed Framework

Firstly, the images captured from the MR imaging devices must be pre-processed, normalized by removing noise and blurriness and then is applied to DIBIE Algorithm to get enhanced images and apply to AICISA Algorithm for segmentation and identify the tumours regions and locations can be identified by TCDCF Algorithm and Finally mapping with Brain cortex with KVBDP Algorithm with useful for Disease Recommendation for doctors. The followings algorithms are described as Tumour Based Disease Prediction Framework as shown in [Fig. 1]

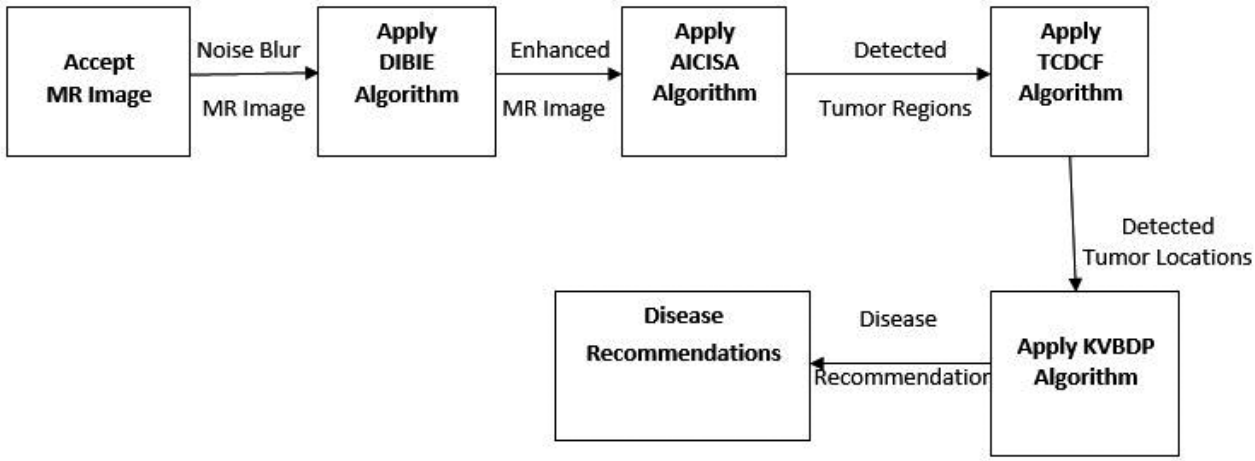

Fig. 1: Tumour Based Disease Prediction Framework

Algorithm 1: **Dynamic Intensity Based Image Enhancement Algorithm** (DIBIE)

Step - 1. Accept the MR Image
Step - 2. For each pixel in the image
- a. Calculate the gray intensity as GI[i][j]
- b. If GI[i][j] > GI[i+1][j+1]
- c. Then
  - i. MaxGI[k(i),k(j)] = GI[i][j]
  - ii. Cord[k(i),k(j)] = i,j
- d. Else
  - i. MaxGI[k(i),k(j)] = GI[i+1][j+1]
  - ii. Cord[k(i),k(j)] = i+1,j+1

Step - 3. End
Step - 4. For each Maximum Intensity Point
- a. Increase the intensity difference as
- b. MaxGI[Cord[k(i),k(j)] = {MaxGI[Cord[k(i),k(j)]] - MaxGI[Cord[k(i+1),k(j+1)]]}. log(MaxGI[Cord[k(i),k(j)]] + MaxGI[Cord[k(i+1),k(j+1)]])}
- c. If MaxGI[Cord[k(i),k(j)]]{t}> MaxGI[Cord[k(i),k(j)]] {t+1}
- d. Repeat Step - 2

Step - 5. End

The Algorithm-1 describes about the dynamic intensity based Image enhancement for remove noise in the image and blurriness and identifies the coordinates of maximum gray intensity level.

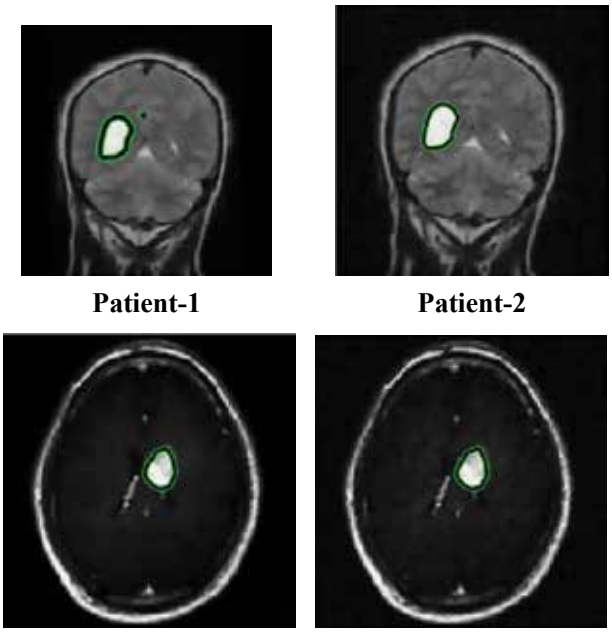
The Algorithm-2 describes about the adaptive intensity coefficient based image segmentation to tumour regions.

Algorithm 2: **Adaptive Intensity Coefficients Image Segmentation Algorithm (AICISA)**

Step - 1. Accept the enhanced MR Image
Step - 2. Calculate the mean intensity
Step - 3. Calculate the intensity variance
Step - 4. Calculate the adaptive intensity coefficient as MaxMember = {Mean,Variance}
Step - 5. For each pixel
  a. Identify the pixels for maximum likelihood
  b. Build classifier for each pixel likelihood
    i. For each class
      1. Mark the region
Step - 6. End
Step - 7. For each marked region
  a. Check for brain cell area and cell volume
    i. If region_cell_volume = brain_cell_area % 10
    ii. Then
      1. Mark the region as Tumour
Step - 8. End

The Algorithm-3 describes about the tumour centroid detection using curve fitting method.

Algorithm 3: **Tumour Centroid Detection using Curve Fitting Algorithm (TCDCF)**



Step - 1. Accept the Tumour regions
Step - 2. For each region
  a. Apply curve fitting method to match the regular geometric shapes
  b. Calculate the centroid for each shape as C[i]
  c. Calculate the composite centroids as CC[K] from C[i]
Step - 3. End

The Algorithm-4 describes about the Key Value Map based disease prediction based on Centroid set.

Algorithm 4: **Key Value Map Based Disease Prediction Algorithm (KVBDP)**

Step1. Build the Key-Value Pair Set for Disease set,D
  a. As <<CS[i],D[j]>>
  b. Accept the Composite Centroid Set, CC[K]
Step - 1. For each CC[K]
  a. Identify the cortex from Cortex Set, CS
  b. If CC[K] belongs to CS[i]
  c. Then
    i. Mark CS[i] as tumour affected Cortex
    ii. Return D[j] for {CS[i],D[j]}
Step - 2. End

The results obtained from the proposed algorithm and the framework is furnished for Patient 1,2,3 &4 for tumour location and Centroid detection [Fig. 2].

Patient-1 **Patient-2**

Patient-3 **Patient-4**

Fig. 2: Patient – 1, 2, 3, 4 Tumour Location and Centroid Regions

Results and Discussion

The results obtained from the proposed framework and the novel algorithms are highly satisfactory and are furnished here.

Firstly, the tumour region size detection results are furnished with brain cell tumour volume and tumour volume. This work usages the BRATs 2010 dataset, which includes 500 patient data. Nevertheless, the work demonstrates the results with 50 patient data.

The proposed framework demonstrates high accuracy. The extracted results are analysed, the diameter of the detected tumour region and the tumour volume to brain cell volume ratio is analysed graphically [Fig. 3]. The table also shows the result regions detection based on the threshold of the ratio and the diameter and centroids for the tumour cells are anlysised.

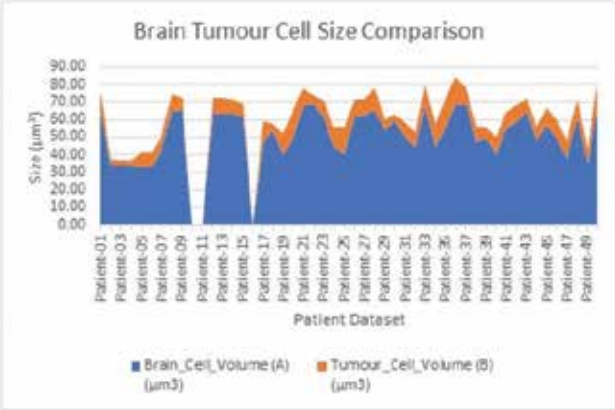


Fig. 3: Tumour Region Extraction Results

Finally, Tumour & Brain Cortex Mapping [Fig. 4] and the disease diagnosis recommendation results are furnished in [Table-1]. Finally, the 97% accuracy analysis is obtained from 100 datasets of tumour data, 97 are correctly identified and 3 incorrectly identified form the proposed framework [Table-2].

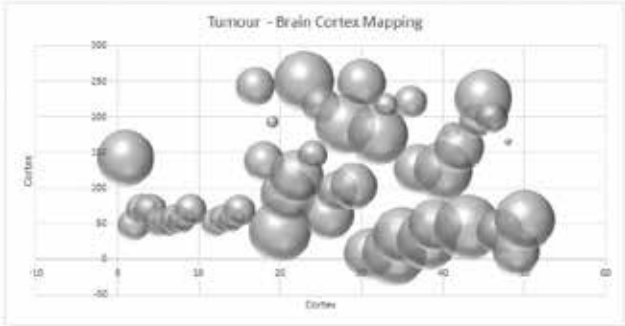

Fig. 4: Tumour & Brain Cortex Mapping

Table 1: Disease Recommendation

Test Run	Brain Cortex	Disease Early Prediction and Diagnosis Recommendation
1	Hippocampus	Episodic Memories recall Dysfunction
2	Prefrontal Cortex	Motor memories dysfunction Short-term memory loss working memory dysfunction
3	Neocortex	Sensory Disperception Irregular Motor Commands Spatial Reasoning Problem Language Interpretation Problem
4	Cerebellum	Fine Motor Control Errors Vestibulo-Ocular Reflex Error
5	Hippocampus	Episodic Memories recall Dysfunction
6	Amygdala	Emotional dysfunction post-traumatic stress disorder
7	Undetected	Undetected

Table 2: Accuracy Analysis

Number of Datasets	Tumour Data	Correctly Identified	Incorrectly Identified	Accuracy
100	100	97	3	97%

Conclusion

This work proposes a novel automated framework for detection of brain tumour with higher accuracy and early recommendation of diagnosis for reducing the possibility space of the medical treatments. Further, the detection of the tumour by accurate location is significant. Hence, this work deploys another novel curve fitting based algorithm to detect the tumour centroid and the radius to map the tumour region to the brain cortexes.

After the successful mapping of the brain tumour to the brain cortex, this work further deploys another key-value map novel algorithm for possible disease mapping. This mapping process significantly reduces the time to diagnosis and start the medication process on the subject. The proposed framework, as explained, demonstrates a higher accuracy of 97% in detection and early prediction of tumour and tumour-based diseases to make this work be considered as one of the benchmark contributions to this field of study.

ABSTRACT

Introduction: Male infertility is one of the areas of prime interest nowadays. There are various causes for Male infertility. Identifying the correct cause and appropriate treatment can improve fertility rate. One such approach is the association of digit ratio (2D:4D) with fertility. In this regard there is paucity of literature in Indian setup. The aim of this study was to correlate the association between digit ratio and Sperm count with testosterone levels.

Materials and Method: In this Case-control study, 79 primary Infertile males with oligozoospermia and 79 age matched controls were selected and their right hand 2nd and 4th digits were measured using Vernier caliper. 2D:4D values are calculated and correlated with sperm count and testosterone levels. Statistical analysis was done to find the significance.

Results: Male Infertility peaks at the age group of 31-40 years. The 2D:4D values are increased in infertile males and it increases with decreasing sperm count and decreasing Testosterone levels and they were found to be statistically significant and shows negative correlation.

Conclusion: The 2D:4D values negatively correlates with sperm count and testosterone levels. This implies that digit ratio can serve as an indicator of testosterone level and sperm count thereby male fertility. It is a promising diagnostic or predictive marker of male infertility.

Keywords: *2d:4d, Male infertility, Hox genes, Sperm count*

Introduction

Infertility is a term applied for couple's who are unable to get pregnancy after a year of unprotected intercourse. In the past female partner was the primary focus of attention and male factors were regarded as a relatively uncommon cause of infertility. But now abnormalities in male are identified as independent cause of Infertility in about 60-80 million couples who suffer from infertility and it is recognized as an important contributory factor in 20-30% couples with reproductive failure.[1] Majority of Male infertility is due to reduced sperm count and accurate diagnosis and prompt treatment can reverse male infertility and thus can avoid costly artificial insemination procedures. The development of a person's fingers and toes begins at the age of 6th week of gestation.[2] Digit ratios are determined during embryonic development and will then remain the same without change after birth. So, any alterations in the intrauterine environment at this embryonic period

such as intrauterine under nutrition or changes in the hormonal levels, in addition to changes in fetal organ structures, the development of fingers and toes of the fetus also will be affected. There is a family of genes called Hox genes which regulate the development of both the genital system and limb development. Hence change in the digit ratio (2D:4D) can reveal defects in Hox gene and indirectly indicate defect in genital system. Based on this concept, we aim to look into the possibility whether 2D:4D digit ratio and fertility can serve as a diagnostic and prognostic tool in male infertility among the South Indian population.

Materials and Method

This study is case control study conducted in Kasturba Medical college and hospitals, Mangalore and Govt. Wenlock hospital, Mangalore. All outpatient cases of primary infertility aged between 21-50 years, who satisfied the inclusion and exclusion criteria were recruited for the above study as subjects and equal number of controls were selected**.** Patients with sperm analysis below the reference value and with normal or increased FSH and LH were taken as Cases and age group matched Males found to have normal sperm count (fertile) during infertility work up were taken as Controls.

Patients with age > 50 yrs and age <21yrs, those with visible gross deformity of hand and fingers, testicular atrophy due to infections, injuries to urogenital system, varicocele, patients on drugs like Chlorambucil, Cyclophosphamide), Anabolic Steroids, Spirinolactone, Flutamide, Ketoconazole, Gnrh analogs, history of substance abuse, excessive alcohol consumption and smoking (those who smoke>10 cigarettes/day) were excluded.

After taking Informed consent, Information was collected from cases with reduced sperm counts and Hospital based controls, and the comparison made between their finger length ratio pattern. Right hand 2nd digit and 4th digit was directly measured with Vernier caliper on the ventral surface of the hand from the basal crease of the finger to the distal tip. When there was thick crease at the base of digit, measurement started from the most proximal crease. Data were entered in Microsoft office excel worksheet and analyzed using statistical software SPSS version 17.0. Descriptive statistics like mean, proportion and standard deviation were used for expressing the Results. For categorical values chi square test used and for quantitative data student unpaired 't' test used and p value < 0.05 was considered statistically significant. Confidence interval is 95% and Power of study is 80%.

Results

Our study subjects and controls were under the age group of 31-40years. The measurement error was ruled out by calculating repeatability values which showed nil significant values with anova calculations. Mean length of second digit was 68.583(SD- 5.758, CI- 67.294 to 69.873) in cases and 67.172(SD- 6.745, CI- 65.661 to 68.683) in controls with t value 1.414 and p value of 0.159. Mean length of fourth digit was 68.622(SD- 6.018, CI- 67.274 to 69.970) in cases and 69.603(SD- 7.405, CI- 67.944 to 71.261) in controls with t value 0.914 and p value of 0.362. The ratio of length of second and fourth digit was calculated and the mean value among cases was 1.000 with 95% Confidence Interval(CI) 0.996-1.003. The mean value among controls was 0.996 with 95% CI 0.956-0.975. It was observed that the mean value of 2D:4D was higher in infertility cases than in controls and it was statistically found to be highly significant with t test p value <0.001. (Table-1). Azoospermic men also showed higher 2D:4D value with 1.009 compared to oligozoospermic men where the 2D:4D value was 0.998. The 2D:4D value in men with normal count was still lower with 0.966. This association was found to be statistically significant with p value of 0.024. The mean value of level of testosterone was calculated as 2.915 (with a SD-1.223, 95% CI of 2.641-3.189) among cases and 7.953 (with SD -2.737, 95% CI of 7.34-8.566) among controls. This shows that the level of testosterone is significantly low among infertility cases compared to normal controls with a p value of <0.001. On correlating the 2D:4D values with level of testosterone among the whole sample, it was found that the value of 2D:4D correlated well with the level of testosterone with significant p value of 0.000 and Pearson correlation of -0.446. (Fig 1).

Table 1: Mean values of 2D:4D in right hand of infertility cases and controls

	N	Mean	SD	95% CI of Mean		t value	p value
				Lower Bound	Upper Bound		
Cases	79	1.000	.016	.996	1.003	7.418	.000
Controls	79	.966	.037	.958	.975		<0.001, HS
Total	158	.983	.033	.978	.988		

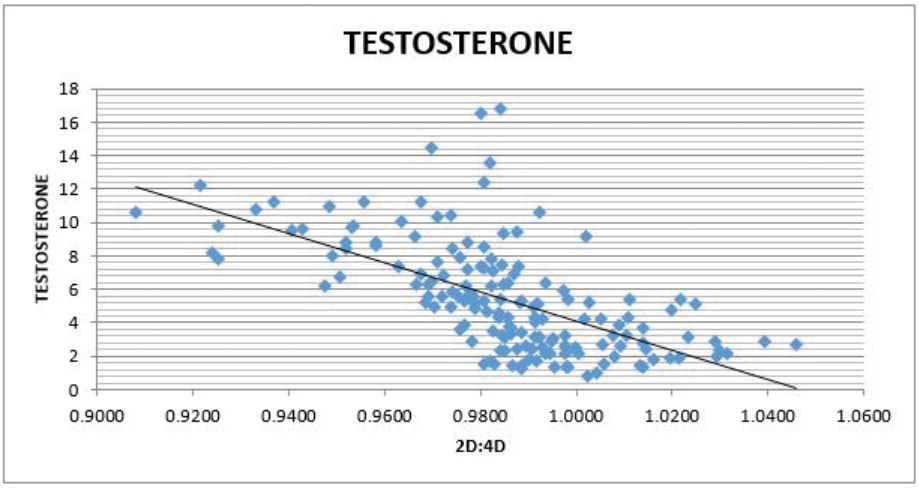

Fig 1: Correlation of 2D:4D values with testosterone levels

Discussion

World Health Organization defines "Infertility is a disease of the reproductive system defined by the failure to achieve a clinical pregnancy after 12 months or more of regular unprotected sexual intercourse[3]. 60-80 million people worldwide are suffering from infertility out of which male infertility constitutes 20-30% cases. Urogenital and limb development are controlled by Homeobox family of genes, the vertebrates Hox genes are required for the growth and patterning of digits and differentiation of genital bud. Homeobox gene sperm is transiently expressed prior to meiosis in germ cells, whereas Hoxa4 is expressed specifically in post meiotic germ cells. Hoxb4 is expressed both in somatic cells and germ cells of testis. Hox1a expressed by leydig cells[4]. The dual control of Hox gene over limbs and urogenital development and the fact that Digit ratio can indirectly indicate the status of Hox gene thereby the genital development and fertility were explained by theories proposed by Denis Duboule and Herfautte and Piechel[5,6]. Hence modulators of Homeobox gene expression and function like positive modulators in case of male infertility and negative modulators in male birth control can serve as future therapeutic goals[7]. Also the peak production of testosterone and fixation of digit ratio occurs at same period of intrauterine life and prenatal testosterone has some influence in fixing digit ratio.[8,9,10] So any insult during this period like hormonal changes, undernutrition influence digit ratio in addition to affecting internal organs and digit ratio can also indicate intrauterine environmental changes. Manning et al compared digit ratio of second and fourth digit in right hand with fertility and found out that low 2D:4D ratio was associated with higher testosterone level and high sperm count. They also proposed that right hand is more sensitive which is explained by the laterality in the association of dermatoglyphic asymmetry and testosterone.[11,12] Wood et al found that lower 2D:4D ratio is correlated significantly with high sperm count and higher levels of testosterone.[13] Lu hong et al[14] done a study on 2d:4d, 2d:3d, 3d:5d, 4d:5d, 2d:5d ratios with relation with infertility and found that 2d:4d ratio compared to other ratios has more relationship with hormonal patterns.(Table 2). By supporting these studies, our study results showed that 2D:4D values are significantly high in infertile men compared to normal males, 2D:4D v alue decreases with increasing sperm count with statistically significant p value, Testosterone levels are significantly low in infertile men compared to normal males, Testosterone level increases with increasing sperm count with significant p value. 2D:4D value negatively correlates with testosterone level with p value <0.001and with Pearson correlation -0.446.

Table 2: Comparison of 2D:4D values in various studies

2D:4D	H.Lu et al[49]	Manning et al[57]	Current study
Infertile cases	0.949	1.00	1.00
Normal controls	0.9478	0.97	0.966

Conclusion

Male infertility is a growing problem, identifying the correct cause and appropriate treatment can improve fertility rate. One such approach is the association of digit ratio (2D:4D) with fertility. This study showed an inverse association between digit ratio, testosterone level and sperm count. The study showed that digit ratio can serve as an indicator of testosterone level and sperm count thereby correlate with primary male fertility. We conclude that digit ratio (2D:4D) can be used as a diagnostic or predictive marker of primary male infertility and that Hox gene modulators can serve as useful future therapeutic modulators, which can avoid costly artificial insemination procedures.

Prevalence and Characterization of Opportunistic Candidal Infection among Patients with Type II Diabetes Mellitus

Sandhya Rani T.[1], R. Srikumar[2], E. Prabhakar Reddy[3], S. Latha[4]

[1]Research Scholar, Department of Microbiology, [2]Research Associate, Centre for Research, [3]Professor of Biochemistry, [4]Associate Professor, Department of Physiology, Sri Lakshmi Narayana Institute of Medical Sciences, Affiliated to Bharath Institute of Higher Education, Pondicherry, India

ABSTRACT

Background and Purpose: Diabetic patients are more susceptible to oral candidiasis infection due to poor glycemic control and therapeutic dentures and Xerostomia, which reduces the salivary flow and a salivary pH disorder. In the current study, we aimedfor Prevalence and characterization of opportunistic Candidal infection among patients with Type II diabetes mellitus.

Materials and Method: Oral washwere taken from the mouth of 400 participants and were cultured on Sabourauddextrose agar (SDA) medium. The study was performed during January to December 2016 in diabetic patients (n=400) admitted in medicine ward. The *Candida* spp. were differentiated by culture on CHROMagar, Sugar assimilation test, Sugar fermentation test and antifungal susceptibility test.

Results: The frequency of *Candida* spp. was higher in diabetic patients. Oral candidiasis more significant in females 129(52%), alcoholic 98(85%), smoker 89(77%) and Denture 174(71%). *C. albicans* was the most prevalent species in diabetics 135(55%) followed by *C. tropicalis* 43(17.6%), *C.* dubliniensis 27(11%) *parapsilosis* 15(6.1%), *C. glabrata* 15(6.1%) and *C. krusei* 9(3.6%). All *C. albicans*were susceptible to fluconazole. Non-*albicans Candida* isolates were shown to have higher azoleamphotericin B, ketoconazole, itraconazolethan *C. albicans*isolates.

Conclusion: Our study clearly showed that diabetes patients are more likely to develop the Candida infection.The scores were slightly higher among the females as compared to males. Furthermore, smoking and denture were are at high risk of being infected.*C. albicans* was the most prominent species followed by C.tropicalis. The knowledge of prevalence species distribution, rapid species identification, antifungal susceptibility testing and the development of newer antifungal drugs are mandatory to achieve a decrease in *Candida* infections

Keywords: *Diabetes mellitus; Oral candidiasis; Fluconazole; Xerostomia*

Introduction

Diabetes mellitus (DM) is a clinical syndrome, which associated with deficiency of insulin secretion or action. It is considered as one of the largest emerging threats to health care in the 21st century. It is estimated that there will be 380 million persons with DM in 2025.[1] DM reduced the T cells, neutrophil function and disorders of humoral immunity. Consequently, DM increases the susceptibility to opportunistic fungal infection such as predisposition to the manifestations of oral diseases like Candidiasis, which is associated with poor glycemic control and therapeutic dentures.[2] Oral candidiasis is one of the superficial fungal opportunistic infection and it mainly caused by *Candida albicans.*

Candida is a genus of opportunistic yeasts, unicellular fungi that can cause oral, vaginal, lung and sometimes systemic infections. Typical colonization

sites in the oral cavity include the mucosal surfaces of the cheek and palate, which are sparsely populated although certain specialized surfaces such as the keratinized stratified squamous epithelium of the palate. It can influence the microbial distribution of the oral cavity as well as the surface of the tongue which consists of saliva-coated desquamated epithelium for microbial adhesion[3]and higher microbial density. The average concentration of oral yeasts in saliva has been reported to be about 300–500 cells/ml. Usually Candida species are present in the oral cavity of almost half of the population without causing disease. Asymptomatic carriage may cause a higher risk of Candida associated complications through yeast infections if they become Immunodeficiency and immunosuppressed.[4]Oral colonization of Candida is more prevalent in people with diabetes mellitusand many studies have shown a higher prevalence of Candida colonization in the oral cavity of diabetics compared with non-diabetic individuals.

The manifestation of oral Candidiasis can occur in median rhomboid glossitis, atrophic glossitis, denture stomatitis, and angular chelitis. Oral candidiasis is associated with a high density of yeasts in the lesions which have been reported in 9% to 65% of the population.[5] In addition to *C. albicans*, Non albicansspp has been commonly isolated from diabetic patients are *Candida glabrata*, *Candida tropicalis*, *Candida dubliniensis*, *Candida krusei*, *Candida parapsilosis*. Therefore, theaim of the present study isto differentiate the Candida species from type 2 DM patientsand todetermine the carbohydrate fermentation and assimilation tests, todeterminethe resistance to azole group.

Material and Method

This study was conducted in the Microbiology Department atSri Lakshmi Narayana Institute of Medical Sciences, Pondicherry. The study was approved by the institutional ethical committee of Sri Lakshmi Narayana Institute of Medical sciences, Pondicherry according Helsiniki 1975 Human ethical guidelines. All the data were collected in a prescribed perform and obtained informed consent form from subjects. All the oral wash samples received in the laboratory from January to December 2016, smear positive for yeast were inoculated on Sabouraud's Dextrose Agar (SDA). Colonies were identified as gram positive budding yeast cells in Gram stain.

Identification of Candida Species: CHROM Agar was prepared as per the manufacturer's instructions. These plates were incubated at 30°C for 24-48 hours. Species were identified on CHROM Agar by the morphology and colour of the colony. The appearances of various Candida species on CHROM Agar were light green- Candida albicans, cream to white- Candida glabrata, purple fuzzy- Candida krusei and blue to purple - Candida tropicalis. Germ tube test, pick a small portion of an isolated colony was suspended in a test tube containing 0.5 ml of human serum then incubated at 37ºC for 2 hours then examined microscopically after 2 hours for the presence of germ tube.

Chlymadosporeformation on corn meal agar (Dalmau plate): Prepare Cornmeal agar in a 90mm plate. Divide the plate into 4 quadrants and label each quadrant. Using a sterile needle, lightly touch the yeast colony and then make 2-3 streaks of approximately 3.5 - 4cm long and 1.2 cm apart. Place a flame sterilized and cooled 22mm square cover glass over the control part of the streak. This will provide partially anaerobic environment at the margins of the cover slip. Incubate the plates at 25C for 3-5 days. Remove the lid of the petriplate and place the plate in the microscope stage and focus the edge of the cover glass under the high-power objective (40X). Observe morphological features of candida species.

Sugar Fermentation: Prepare liquid fermentation medium containing peptone (1%), sodium chloride (0.5%), Andrade's indicator (0.005%). Sterilize by autoclaving at 120ºC for 15 min at 15 pounds pressure. Add filter-sterilized sugar at the concentration of 2% to the medium. Pour into the sterile test tubes and place sterile Durham's tube into each tube. Plug the tubes with colour coded cotton plugs.

Inoculum preparation is done by suspending heavy inoculum of yeast grown on sugar free medium. Inoculate each carbohydrate broth with approximately 0.1 ml of inoculum. Incubate the tubes at 25ºC up to 1 week. Examine the tubes every 48-72hrs interval for the production of acid and gas in Durham's. Production of gas in the tube is taken as fermentation positive while only acid production may simply indicate that carbohydrate is assimilated.

Assimilation Test: Suspend a heavy inoculum of a 24-48 hrs old yeast culture that has been subculture thrice on sugar –free medium in 2ml of Yeast Nitrogen Base. Add

this suspension to the 18ml of molten agar (cooled to 45 °C) and mix well. Pour the entire volume into a 90mm petri plate. Allow agar to solidify at room temperature. Place the carbohydrate-impregnated discs onto the agar surface.Incubate the plates at 37 °C for 3-4 days. The presence of growth around the disc is considered as positive for that particular carbohydrate.

Antifungal Susceptibility Test: The antifungal susceptibility testing of yeast isolates was carried out using the disk diffusion method as per M44-A CLSI guidelines (CLSI document M44-Aet al, 2004.). Mueller Hinton agar supplemented with 2% glucose and 0.5µg/ml methylene blue was used for sensitivity testing. The isolated Candida species were cultured on SDA at 35°C for 24 hours. Inoculums was prepared by picking five distinct colonies with approximately 5mm diameter. Then the colonies were suspended in 5ml of sterile physiological saline and resulting suspension was vortexed thoroughly. The turbidity of the inoculum suspension was adjusted to 0.5 McFarland standard followed by inoculation of plates containing MHA supplemented with 2% glucose and 0.5µg/ml methylene blue with a sterile cotton swab moistened with inoculum suspension.

The plates were allowed to dry for 3-5 minutes and then antimicrobial discs were dispensed onto the surface of inoculated agar plate. The discs tested were Fluconazole (10mcg), Amphotericin B (50mcg),voriconazole (1µg) and Itraconazole (10mcg) with their zone diameters measured as per the instruction manual of manufacturer. All the media and discs were procured from Hi Media Labs, Mumbai.[6]

Results

Table 1: Total Type II Diabetes mellitus and Gender distribution of oral candidiasis in Type II DM

Total sample	Positive	Female	Male
400	244 (61%)	129 (52%)	115 (47%)

Out of total, Candida species were isolated in **244(61%)** patients. It was more significant in females129(52%) than the males115(47%) in Type II diabetes mellitus

Table 2: Oral Candidiasis isolated in Alcoholic and non alcoholic of Type II DM

Male	Alcoholic	Nonalcoholic	smokers	Non smokers
115	98(85%)	1 7[15%]	89(77%)	26(23%)

Oral Candidiasis were higher in Alcoholic 98(85%) than the non alcoholic17[15%] among male Type II DM and also Oral Candidiasis more significant in smoker 89(77%) in type II DM

Table 3: Denture and Non-denture in Type II DM

Total sample	Denture	Non-denture
244()	174(71%)	70(29%)

Oral Candidiasis were higher in Denture among Type II DM

Table 4: Candida species distribution in male and female patients

Spp	Total n = 244	Female n:129	Male n = 115
C.albicans	135(55%)	69(53.4%)	66(57.3%)
C.tropicalis	43(17.6%)	26(20%)	17(14.7%)
C.dubilinesis	27(11%)	13(10%)	14(12.1%)
C.krusei	9(3.6%)	4(3.1%)	5(4.3%)
C.glabrata	15(6.1%)	9(6.9%)	6(5.2%)
C.paralopsis	15(6.1%)	8(6.2%)	7(6%)

Out of 244 samples, 135(55%)C.albicanswas isolated. In females C.albicans more significant followed by non–albicans were C.tropicalis,bC.dubilinesi and C.glabrata.

Table 5: Candida species distribution in alcoholic, nonalcoholic patients, smoker and non smoker patients

spp	Total (n = 115)	Alcoholic (n = 98)	Nonalcoholic (n = 17)	smokers (n = 89)	Non smokers (n = 26)
C.albicans	66(57.3%)	57(58.1%)	9(52.9%)	57(64.0%)	9(34.6%)
C.tropicalis	17(14.7%)	13(13.2%)	4(23.5%)	12(13.4%)	5(19.2%)
C.dubilinesis	14(12%)	11(11.2%)	3(17.6%)	10(19.1%)	4(15.3%)
C.krusei	5(4.3%)	4(4.0%)	1(5.8%)	2(2.2%)	3(11.5%)
C.glabrata	6(5.2%)	6(6. 1%)	0	4(4.4%)	2(7.6%)
C.paralopsis	7(6%)	7(7.1%)	0	4(4.4%)	3(11.5%)

Out of 115, 98 Candida species were isolated in alcoholic Type II DM Patients.C.albicans was higher in both alcoholic and non alcoholic but varied in non albicans. C.glabrata and C.paralopsis not isolated in non alcoholic patients. Out of sixty six C.albicans, 57were isolated in smoker and 9 were isolated in non smoker. Non albicans, C.tropicalis was more significant followed by C.dubilinesi and C.glabrata

Table 6: shows the antibiotic susceptibility of Candida species

Anti fungal drug	C.albicans (n = 135)		C. dubilinces (n = 27)		C. tropicalis (n = 43)		C. krusei (n = 9)		C. galabrata (n = 15)		C. pralopsis (n = 15)	
	S	R	S	R	S	R	S	R	S	R	S	R
Fluconazole (10mcg)	112	23	21	6	32	11	7	2	10	5	12	3
Amphotericin B(50mcg)	42	80	13	12	14	28	1	5	6	9	2	12
voriconazole (1mcg)	59	67	16	9	20	17	5	3	7	6	9	4
Itraconazole (10mcg)	32	70	8	10	7	27	4	4	4	9	2	11

Out of the135 isolates of C. albicans,23 were resistant to fluconazole, 80 wereresistant to amphotericine B,67 were resistant to voriconazole and70 were resistance toItraconazole. Of the 109 isolates of NCA, 66were more resistant to amphotericine B and 61were resistant to Itraconazole.

Discussion

Oral Candidiasis is one of the most common opportunistic mycotic infection which can occur broad-spectrum antibiotics, antihistamines, radiotherapy, diabetes, drug abuse, malnutrition, immune deficiencies and old age.[7] Diabetes mellitus is a major predisposing factor to oral and symptomatic candidiasis.[8]

In present study, prevalence of *Candida* carriers in diabetes was **61%** which is similar to that found in AkpanA and Talabani AN et al reported [9, 10,] that due to most of the microorganisms in the saliva are derived from other parts of the oral cavity. The microvascular changes and possibly increased glucose concentration in the saliva and gingival which might contribute in declining pH of saliva resulting in acidogenic microorganism substrate and plaque formation [Table-1].

Oral Candidiasis was more significant in females 129(52%) in the present investigation. which result similar to the Khosravi AR, et al.study.[11]It has been found that elderly women presented more oral lesions,hormonal factor, iron deficiency in women could be responsible for that disparity and this difference can be women seek dental treatment at a higher rate than men.[12]

In present study,Candida is higher in Alcoholic(85%) than nonalcoholic, this result agrees with L.D. Wilson et al,[13] that Candida itself produces small quantity of alcohol as part of its metabolic. One Fifteen patients enrolled in the study were males,of whom 89were *Candida* carriers in smokers. Therefore, it can be inferred that smoking was a relative risk factor for presence of *Candida* in the oral cavity.[14] [Table-2]

Javed et al. described more significant of oral *Candida* carriage associated with denture 74% with type 2 diabetes. This results correlated in present study71%. Dentures act as an additional reservoir for these organisms through the biofilm formation of *Candida* in the oral cavity.[15][Table-3].

Although, among the *Candida* species, *C. albicans* has the highest frequency in the oral cavity, in the last two decades, the incidence of oral candidiasis with other species such as *C tropicalis*

In present study C.albicans more significant in females followed by non –albicans were C.tropicalis,C. dubilinesi and C.glabrata. According to Pfaller et al,[16] evaluated the use of CHROMagar as a differential culture medium that allows the isolation of yeasts and simultaneously identifies colonies of *C. albicans, C tropicalis*and *C krusei.* They found that more than 95% of the values and clinical isolates of *Candida* species were correctly identified based on colony morphology and CHROMagar pigmentation.Among the *Candida* species, *C. albicans*has the highest frequency in the oral cavity, in the last two decades[Table-4].

In this investigation, the most common association was *C. albicans*and *C. tropicalis*, which was detected in smoker and alcoholic of type II diabetes. In this study, 41 isolates were seen as darkgreen colonies and identified as *C. dubliniensis*. Willingeret al.[17] also reported that some of *C. dubliniensis*isolates yielded a dark green colour[Table-5].

In present study C.albicans more resistant to azoles[Table-6]. These results correlated with Martinez M et al study.[18] because the length of time such antifungal agents were used and Perturbations in the oral microenvironment to help the growth of new *Candida* species which might be one of the terrible consequences of current medical practice in India.

Conclusion

The present study clearly showed that diabetes patients are more likely to develop the candida infection. The scores were slightly higher among the females as compared to males.Furthermore, smoking and denture were at high risk of being infected.*C. albicans*was the most prominent species followed by C.tropicalis.The knowledge of prevalence species distribution, rapid species identification, antifungal susceptibility testing and the development of new antifungal drugs are mandatory to achieve a decrease in *Candida* infections.

ABSTRACT

Background: Leukemia occupies 40% of all malignancies in children. A child who is diagnosed with leukemia will undergo some procedure measures a long and painful. Nurses in nursing care in children with various disorders of the body system of planned activities to minimize the stress of hospitalization that occurs in children. Child Life Program is one of the interventions in nursing care in children to minimize the impact stress of hospitalization and optimize growth and development in children. The purpose of this study was to describe the effect of Child Life Program through drawing play activities to decrease the stress of hospitalization in children suffering from Leukemia.

Method: This study was a quasi-experiment. The study population was children who suffering from leukemia are treated in the pediatric ward Soetomo Hospital.

Result: The result showed there is influence child life program through drawing play activity using "My Activities Book" on the response to the stress of hospitalization of children before and after the intervention with a p-value = 0.001.

Conclusion: Child life program through drawing play activity using "My Activities Book" can affect the stress response of hospitalization in children with leukemia. Child life program through drawing play activity using "My Activities Book" can be an alternative therapy that can be used to minimize the stress of hospitalization in children with leukemia.

Keywords: *Stress, Hospitalization, Child Life Program, Leukemia*

Introduction

[1]Leukemia occupies 40% of all malignancies in children. [1]A child who is diagnosed with leukemia will undergo some procedure measures a long and painful. During the process of hospitalization due to Leukemia, children and parents can experience handling a variety of events or actions that according to various studies demonstrated the experience very traumatic and stressful.[2] Psychological problems experienced by the child is in shock, stress, fear, anger, and depression. Nurses in nursing care in children with various disorders of the body system of planned activities to minimize the stress of hospitalization that occurs in children. Pediatric nurse focuses on the psychosocial development of children,

and promote effective coping strategies for children and their families who are experiencing stress. Child Life Program is one of the interventions in nursing care in children to minimize the impact stress of hospitalization and optimize growth and development children. In the Child Life Program showed individuality in patients, and use a variety of developmentally appropriate activities, including Implementation of play activities, especially drawing on Pediatric ward Soetomo hospital still has not become routine. Drawing activity is expected to reduce the stress of hospitalization of children but until now the effect of drawing activities to decrease the stress of hospitalization in school-age children still unclear.

Based on the observations of researchers during the month of January 2013 in pediatric ward Soetomo hospital obtained the data that 70% of 10 patients aged 1-12 years who were treated at Soetomo Hospital during the month, indicating negative behavior and most of the children showed maladaptive behavior, namely: 100% of children are bored, lonely 75%, 62.5% to be withdrawn 25% whine and complain wants to go home, 25% is angry. From the above data, it was concluded that each preschool and school-age children who were treated in pediatric ward Soetomo hospital experience stress of hospitalization.

Stress hospitalization is very dangerous for the survival of the child if not addressed can lead to impaired growth and development for children. Due to sick and hospitalized, the child will lose the freedom of view egocentric in developing autonomy. This will lead to regression and will eventually withdraw from interpersonal relationships.[3] Increased cortisol in times of stress can inhibit antibody formation and reduce the formation of white blood cells.[4]Decrease in antibody will reduce the body's immunity. As a result, the healing process becomes obstructed, a longer treatment time, and increase the risk of complications during treatment.

There are various efforts in the Pediatric ward Soetomo hospital to reduce the stress of hospitalization, one of them by implementing rooming-in. Activity has also been given to play, but its implementation is still not routine. The flurry of nurses and the lack of equipment is a reason for non-performance play activities. Drawing is one type of play activities that do not require special attention from health workers.

Grown-up children can be asked to draw on their likes and dislikes of hospitalization. Then children were asked to tell the picture and clarification child's sense of the picture Companion more passive, listening, and paper facilities and equipment. Let children draw and repeat this activity for days, until the child unknowingly issuing its cargo amygdala, which express sadness, depression, stress, creating images that make them come back happy, and stir good times ever experienced with their loved ones. Based on the above phenomenon researchers interested in developing the Child Life program through play activities in childhood leukemia as efforts to reduce the stress of hospitalization that occurs in children is leukemia.

Material and Method

The design of the study is quasi-experimental which consists of treatment group and control group. The study population was children who were diagnosed with leukemia are treated in the pediatric ward Soetomo hospital. Criteria for inclusion of children include 1) school-age children diagnosed with Leukemia, 2) get hospitalization over 2 x in the pediatric ward Soetomo hospital and 3) not in a critical condition. The independent variable in this study is child life program through drawing play ("My Activities Book"). The dependent variable is a response to the stress of hospitalization in children diagnosed with Leukemia. The primary data was collected by observing and recording the stress response of hospitalization of children before and after implementing drawing activities. The instruments used in data collection in the form of a checklist observation sheet models and structured interviews. Observation sheet that is used contains 10 points positive response (adaptive) school-age children to the stress of hospitalization modification of the Wong (2009). The questions in the interview had been prepared in advance by researchers. The interview results will help researchers invalidating the results of observations that have been made. The tools used for activities drawing is drawing paper, pencils, and crayons. The process of taking and collecting data in this study carried out after obtaining permission from the Soetomo Hospital to conduct research. As a first step the study, researchers will select respondents based on the predetermined inclusion criteria. After getting approval from the children and parents, carried out preliminary observations in both groups (intervention and control groups) to identify the stress response hospitalization experienced by children (Pre-test). If the pre-test found the child with an adaptive stress response (≥ 50%),

children continue to be included in the study. Later in the treatment group was given intervention in the form of activities drawing made in the "My Activities Book". Themes my activity drawing in the book include the theme of knowledge about animals and plants. At the first meeting of researchers and teams carry out interventions to deliver a game program which is given to children by involving parents. After the first meeting of the researchers provide "activity books" to each respondent to continue doing coloring on "My Activities Book". Independent activity, accompanied by parents was conducted along 2 weeks. At the end of the second-week researchers conducted observations about stress response experienced by the child's hospitalization.

Result and Discussion

Results of the characteristics of respondents by sex show the number of male respondents as many as 6 people (43%) and women of 8 people (57%). Characteristics of respondents by age indicates the number of respondents by age 3 years as many as 6 people (43%), 4 years as many as 8 people (57%). Table 1 shows the characteristics of respondents based on the stress response of hospitalization shows the results of the pre-test assessment maladaptive stress of hospitalization with the interpretation of 8 people (57,14%) and adaptive as many as 6 people (42.8%). While the post-test results of the stress response hospitalization assessment obtained as many as 12 people (85.71%) adaptive response and as many as 2 respondents with interpretation maladaptive (14.28%).

After the analysis, part of this discussion will be reviewed on the Child Life program through drawing play activities against hospitalization stress response toddler and preschool-aged children with cancer in pediatric ward Soetomo Hospital. Based on statistical tests, there is the effect of play therapy using "My Activities Book" on the response to the child's hospitalization. Statistical tests are showing that there was a significant effect of play therapy using "My Activities Book" on the stress response of children.

Before the play therapy using "My Activities Book" do the pre-test to measure the child's response to the stress of hospitalization. Based on pre-test results showed at most have a maladaptive response category as many as 8 people (57.14%). After the play therapy using "My Activities Book" do post-test to measure the child's response to the stress of hospitalization. Based posttest results in Table 1, the result of 12 respondents (85.71%) had an adaptive response category.

Based on statistical results indicate the value of $p = 0.001$, which means $p < 0.05$, then there is the influence of the child life program with play therapy using "My Activities Book" to the child's response to the stress of hospitalization before and after the intervention.

The above in accordance with the expression Alice D. Domar, about the benefits of the diary as a step to express emotions and feelings as well as helping to take care of our minds. According to Piaget (1962) in Tedjasaputra (2001), preschool children are already using objects as symbols. This symbol is getting to be closer to the fact that the exercise of thinking and directing the child to adjust to the environment (Sari, 2013).

The impact on children aged toddler due to hospitalization include separation anxiety, loss of freedom in the development stage, as well as feeling hurt because of injury due to invasive, often arise due to the child's hospitalization.[5] In the two respondents who have a maladaptive response in pre-test increased to adaptively during post-test. Improved balanced and adaptive response in children because children are given daily intervention play therapy by researchers. In therapeutic play therapy nurse to establish communication with the child, in addition to the nurse also meet the needs of children who play more or less disrupted by the impact of the activity book. The user can increase a child's response to the stress of hospitalization in some aspects, aspects of the evaluation sheet wong unchanged from become maladaptive response adaptive response and retain the adaptive response of children to remain to respond adaptively to the stress of hospitalization.

Another aspect examined in this study is the cognitive, affective, psychomotor and language. Daily observation sheets show attendees on the cognitive aspects, there are several respondents who have a low score, it indicates that the respondents were not able to mention the expression as given intervention, this happens because the participants are still in the stage of trust with researchers, when intervention has been running for more than three days almost all participants demonstrated the ability to express his feelings. In the psychomotor aspects of participants has been good, just on some of the participants have a value lower scores. This is because of the short duration of treatment of patients, so when compared to the other participants with a longer duration of treatment relatively low value of some participants. On one of the participants obtained scores on all aspects of this is due to the low physical condition of participants were less good. On some days the intervention patients had a fever thus decreasing the willingness of participants to take part.

Aspects of language have the lowest value among other aspects, the average participant is unable to utter his willingness to follow the activities. There are several things that can affect this, such factors preschool age children who are still in the stage of development and a sense of initiative versus guilty. Children to be afraid and shy to express its readiness to follow the therapy. In addition, the ability of researchers to carry out therapeutic communication also need to be increased to stimulate the child express feeling. The increasing of adaptive response in children given treatment in accordance with the theory of Nursalam (2005) in which the player can reduce the pressure or stress on the environment. Through playing children can express emotions and discontent will be something on the social situation and fears that can not be expressed in the real world. Playing well is something that naturally existing in one's children. At the time of play therapy using a book researcher expression and give trust approach to the child so that the child believed to nurses, the nurse then explores the child's feelings and provide play therapy in the form of coloring, writing and reading fairy tales. It is based on the function of play that has therapeutic value in providing a release of stress and tension, encourage experimentation and testing of a scary situation in a safe manner, facilitate direct communication is not verbal and non-verbal about the needs of fear and desire. Another thing that affects children, namely frequency adaptation response of children with hospitalization average more than 3 times, so that children tend to be more familiar and easier to adapt to the hospital environment. Children become more easily increase their adaptive behavior against the stress of hospitalization.

The results of observations of the children who are given treatment, children tend to be more reliant on nurses. Children are also more cooperative after the play therapy using expression books. According to interviews with the parents of patients, children are given play therapy also became more cheerful and rarely cried. Thus the play therapy with the use of media expression books has an influence on children's level of adaptive responses to the stress of hospitalization.

Conclusion & Recommendation

Conclusion: Child Life program through play activities draw with media "My Activities Book" can affect the stress response of hospitalization in children with leukemia.

Recommendation: Based on the results of the research, advice that can be given is 1) Nurse on duty at Space Bona II is expected to implement a media play therapy with "My Activities Book" in children with cancer to minimize the stress of hospitalization in the room, 2) the field of nursing Hospital Dr. Soetomo expected to meet the appropriate human resources in space Bona II in order to carry out the fullest play therapy because of limited power in the chamber. 3) To further study of child life therapy program developed using variables such research other variables in the development of children with cancer.

Conflict of Interest: The authors declare that they have no conflict of interest.

The Correlation between Diabetes Status and Hair Loss among Aged Women in Alor Setar Area

Thin Thin Aung[1], Fatin Farhana Binti Shahnon[2]

[1]Senior Lecturer, [2]BMS Student, International Medical School, MSU)

ABSTRACT

The aim of this study was to identify the diabetes among aged women in Alor Setar area and to compare association between diabetes and current hair loss condition. Across sectional study was conducted to study the prevalence between diabetes and hair loss among aged women around Alor Setar area. Primarily data was collected using interviewer-administered questionnare consisting of socio-demographic questions for part A-the aged of the women, employment status and diabetes status. Stress level for part B and the hair loss scale for part C.As a part of population based on cross sectional study, the hair status of 112 aged women range 50-60 years was assessed by answering questionare,56 from them suffered with diabetes and another 56 of them non-diabetes. The aged women with yes diabetes status have a highest prevalence of excessive hair loss which is 93.6% compare to non-diabetes aged women with excessive hair loss is 6.4%.Based on the table aged women who are non-diabetes have high prevalence hair loss in moderate hair loss which is 69.7% compared to women with diabetes status and experiencing hair loss which is 30.3%. Besides, the prevalence of non-diabetic aged women with normal hair loss is high which is 93.8% compared to diabetic aged women who experiencing normal hair loss is 6.3%. The result from this table showed that the P value is 0.000. The P value is less than 0.01. So, the null hypothesis for fifth objective rejected. Thus, there is significant relationship between diabetes status and hair loss. The result supports the hypothesis that aged women with diabetic experiencing hair loss.

Keywords: *Aged women, Diabetes, Hair loss.*

Introduction

Diabetes mellitus is a group of metabolic and chronic disease caused by inherited and/or acquired deficiency in production of insulin by the pancreas. It is characterized by hyperglycemia which in turn damage many of the body's systems, in particular the blood vessels and nerves. (American Diabetic Association, 2009) and On World Diabetes Day 2017, WHO joins partners around the world to highlight women's right to a healthy future. Around 8% of women or 205 million women live with diabetes worldwide, over half in South-East Asia and the Western Pacific. During pregnancy high blood glucose substantially increases the risk to health for both mother and child as well as the risk of diabetes for the child in the future. Almost half of women who die in low-income countries due to high blood glucose die prematurely, before the age of 70 years. (World Health Organisation,2017).

There are other causes of hair loss linked to diabetes that could be an issue here, too. For instance, diabetes can affect your circulatory system, making it less effective [(2)]. As certain nutrients and proteins are essential for hair growth, a decrease in the amount of these reaching hair follicles could result in weaker and slower hair growth[(1)] . A simple way to remedy this is to start taking a nutritional supplement which does not have a sugar coating. This will ensure the body is getting a consistent level of nutrients in case diet alone does not provide a sufficient amount. If you're feeling unwell or have other unexplained symptoms alongside your hair loss, you may be suffering from an infection, as

Phone: 01-23767078

diabetes can affect your immune system when the blood contains excess sugar[4]. An infection can disrupt the hair growth cycle, causing hairs to go into their resting phase prematurely, leaving you with weaker hair [22]. (The Belgravian Centre, 2015).

The literature reveals what little is known about nutritional factors and hair loss. What we do know emanates from studies in protein-energy malnutrition, starvation, and eating disorders. In otherwise healthy individuals, nutritional factors appear to play a role in subjects with persistent increased hair shedding [6].

Excessive intakes of nutritional supplements may actually cause hair loss and are not recommended in the absence of a proven deficiency [17]. While nutritional factors affect the hair directly, one should not forget that they also affect the skin [18]. In the management of subjects with hair loss, eliminating scaling problems is important as is good hair care advice and the need to explain fully the hair cycle. Many individuals reduced their shampooing frequency due to fear of losing more hair but this increases the amount seen in subsequent shampoos their fear of going bald and adversely affecting their quality of life[21].(D. H. Rushton,2002).

The research studied 20 premenopausal women with female pattern hair loss and 9 healthy women for serum levels of LH, FSH, estradiol, free and total testosterone, sex hormone binding globulin (SHBG) and dehydroepiandrosterone sulfate (DHEAS) on the first day of their menstrual cycle. it is the estrogen to androgen ratio, as represented by the ratio of estradiol to free testosterone that might be responsible for triggering female pattern hair loss in women[2].(Riedel A,2008).

Materials and Method

Study Design: This is an observational analytical cross-sectional study where all the results are measured concurrently in a given population at a short period of time. This type of study design will be used in determining the diabetic status and hair loss and stress level among Aged women in Alor Setar area.

Sampling Area: This research study had been conducted around the Alor Setar area, from which the data collection will be done, is geographically having a marking of north Malaysia. Alor Setar has some administrative importance, thus it becomes quite busy during weekdays and in the weekends. There are many villages around here and urban area based on the previous research, also they have done. Thus, it had been the solid reason for the study, focusing most intensively on this surrounding area.

Study Population: The option of the calculation formula is based on the objective which is to study the correlation between diabetes aged women and hair loss. The most suitable formula for this objective is "Single Population Proportion" formula. From a previous study by (Jaykaran Charan and Tamoghna Biswas, 2013), the expected prevalence for the results are 50%, so by implicating the formula given, the estimated sample size for this research are approximately 112 people. The sample size is calculated as followed by the formula.

Data Analysis: Data that obtained during the study was entered, sorted and analyzed by using Statistical Package for Social Science (Version 21). The descriptive statistics includes the mean, standard deviation, frequency, and percentage. This descriptive analysis was used to analyze the social demographic, between hair loss and diabetes and between stress level and hair loss among aged women. Later, the results obtained, had been presented in words and depicted in tables as well as graph.

Table 1: Socio-Demographic Studies of Respondents

Variable	Answer	Frequency	
		N	%
Diabetes Status	Diabetes	56	50.0
	Non- Diabetes	56	50.0
Employment Status	Employed	42	38.0
	Unemployed	70	62.0
Stress Level	Normal	96	68.0
	Mild	35	31.0
	Moderate	1	1.0
Hair Loss	Normal	32	29
	Moderate	32	29
	Excessive	47	42

Table II: To Investigate the Correlation between Diabetes Status and Stress Level

diabetes status * stress level Cross tabulation						
Normal mild			stress level			Total
			moderate			
Diabetes status	Yes	Count	33	23	0	56
		% within diabetes status	58.9%	41.1%	0.0%	100.0%
		% within stress level	43.4%	65.7%	0.0%	50.0%

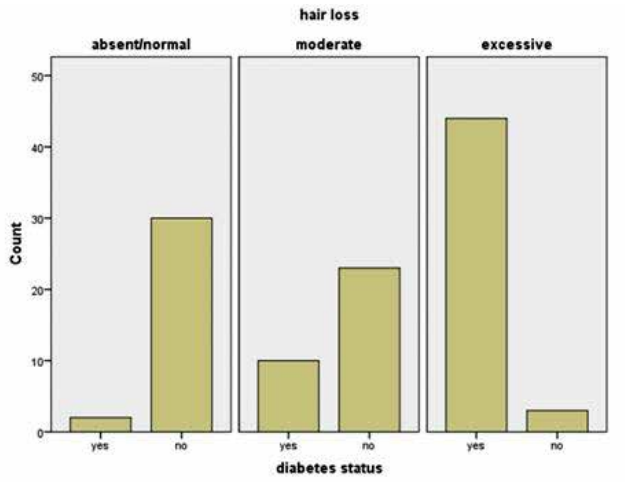

Fig 1: Correlation Between Diabetes Status And Hair Loss Graph

Results

Discussion

Data from this study showed that there was relationship between the correlation of diabetes status and hair loss. These variables associated between diabetes statuses aged women with yes diabetes status have a highest prevalence of excessive hair loss which is 93.6% compare to non-diabetes aged women with excessive hair loss is 6.4%.Based on the table aged women who are non-diabetes have high prevalence hair loss in moderate hair loss which is 69.7% compared to women with diabetes status and experiencing hair loss which is 30.3%. Besides, the prevalence of non-diabetic aged women with normal hair loss is high which is 93.8% compared to diabetic aged women who experiencing normal hair loss is 6.3%The result from this table showed that the P value is 0.000. The P value is less than 0.05. So, the null hypothesis for fifth objective rejected. Thus, there is significant relationship between diabetes status and hair loss.

Furthermore, this research had been proven that this cross-sectional study had linked the diabetes status and hair loss among aged women. Hair usually goes through three phases. During the active growing phase, which lasts for two years or more, hairs grow at a rate of 1 to 2 cm per month. Hair then goes into a resting phase, which lasts for about 100 days. After this phase, some of the resting hair falls out. Diabetes can interrupt this process, slowing down the hair growth. The immune system is affected when blood sugar level rises above normal. As a result, people with diabetes are at an increased risk for developing an infection and the body is less capable of fighting it. (Belgravia Centre, 2011)

To Observe the Correlation Between Employment Status and Stress Level among Aged Women: The results of the analysis confirmed the first hypothesis that the prevalence of employment among aged women is associated with hair loss among aged women. A healthy job is likely to be one where the pressures on employees are appropriate in relation to their abilities and resources to the amount of control they have over their work and to the support they receive from people who matter to them. As health is the absence of disease or infirmity but a positive state of complete physical, mental and social well-being (WHO, 1986). However some abilities, including strength and mental agility decline in most people over a certain age, but much less and much later than many people think.

To Investigate the Correlation between Employement Status and Hair Loss among Aged Women: It was already asked and stated inside the questionnaire where they were prior to answer that question. Therefore, we analyzed the prevalence of each employment status that associated with hair loss. The result is not significant because the respondent that suffers with hair loss not only the employed aged women but also the unemployed experiencing with hair loss. So the result is not significant.

To Investigate the Correlation between Diabetes Status and Stress Level: From this research study, analysis between prevalence of related diabetes status with stress level showed that aged women with non-diabetes status have a highest prevalence of normal stress level compare to diabetes aged women with normal stress level. The result from this table showed that the p-value is 0.056. So, the null hypothesis for third objective failed to reject. Thus, there is no significant relationship between diabetes status and stress level.

To Investigate the Correlation between Stress Level and Hair Loss: The result from this showed that the p-value is 0.286. So, the null hypothesis for third objective failed to reject. Thus, there is no significant relationship between stress level and hair loss because of women with high stress level experiencing hair loss and women with normal stress level also experiencing hair loss.

Conclusion

From this study, it can be concluded that diabetes status had given a variation of results. According to the findings, there was relationship between the correlation of diabetes status and hair loss. These variables associated aged women with yes diabetes status have a highest

prevalence of excessive hair loss which is 93.6% compare to non-diabetes aged women with excessive hair loss is 6.4%.Based on the table aged women who are non-diabetes have high prevalence hair loss in moderate hair loss which is 69.7% compared to women with diabetes status and experiencing hair loss which is 30.3%. Besides, the prevalence of non-diabetic aged women with normal hair loss is high which is 93.8% compared to diabetic aged women who experiencing normal hair loss is 6.3%. Thus, there is significant relationship between diabetes status and hair loss. Furthermore, from this research also, it had been proven that this cross-sectional study had linked the diabetes status and hair loss among aged women. Hair usually goes through three phases. During the active growing phase, which lasts for two years or more, hairs grow at a rate of 1 to 2 cm per month. Hair then goes into a resting phase, which lasts for about 100 days. After this phase, some of the resting hair falls out. (Belgravian Centre, 2011).

Differences in Caries Prediction Test of Cariostat and Plaque Formation Rate Index (PFRI) on Children

Prima Nerito[1], Boy Sandy Sunardhi[1], Tito Yustiawan[2]

[1]Department of Health Administration and Policy, [2]Lecturer of Department of Health Administration and Policy, Faculty of Public Health, Airlangga University, Surabaya, Indonesia

ABSTRACT

Background: Dental caries is an irreversible dental disease. The incidence of dental caries in children was increased by 60-90%. Dental caries can be recognized by various factors. Caries risk status needs to be adjusted so that caries development can be inhibited as early as possible. Methods of caries risk measurement are PFRI and cariostat caries prediction. The aim of this study was looked at the risk factors of childhood caries by using combination of PFRI and Cariostat.

Method: This study was an observational analytic study with laboratory study approach. Based on the time it was the cross sectional study. The samples were 36 children in TK Maryam Jl. Manyar Sambongan Surabaya. This study was used primary data, then the data were analyzed in Microbiology Laboratory of FKG Airlangga University Surabaya. Data analysis was conducted with Kolmogorov-Smirnov and Spearman Correlation.

Results: There were 12 children suffered high dental caries (>5), 12 children suffered moderate dental caries (3-4), 12 children suffered low dental caries (0-2). Measurement of caries risk used Cariostat and PFRI was showed a strong correlation (p>0.05)

Conclusion: The correlation of caries risk test score using Cariostat caries activation test and PFRI that correlated with deft index are has no different results

Keywords: *Dental Caries, Child, Cariostat, PFRI*

Introduction

Dental caries is an irreversible tooth disease. World Health Organization (WHO) in 2007 in Suciari *et al* (2015) states the incidence of dental caries in children increased by 60-90%[10]. The survey conducted by the Ministry of Health of Republic Indonesia on the 3rd and 4th Five-Year Development Plan, shows the prevalence of Indonesian population who suffered dental caries by 80% and 90% whom of them are the group of under-five children. According to Antara News quoted by Maulani and Jubilee (2005), the number of under-five children in Indonesia reaches 30% of 250 million Indonesia's population, so it is estimated that under-five children who suffered dental damages reaches 75 million more[7]. The addition of the sufferer number is really possible. This can be seen from the National Household Health Survey (SKRT) in 1990 by 70% to 90% in 2003[6]. Based on the health survey results, prevalence of dental caries by age group, i.e. 3 years old (60%), 4 years old (85%) and 5 years old (86.4%). Those groups of under-five children are susceptible to dental caries[8].

Prevention of dental caries is more important conducted early. The conducted prevention should be in accordance with the factors that cause dental caries. Factors that cause dental caries in children may come from both of internal and external. Internal factors include plaque quality, caries-causing bacteria such as *Streptococcus mutans*, etc. while external factors such as foods and the ability of children to brush teeth.

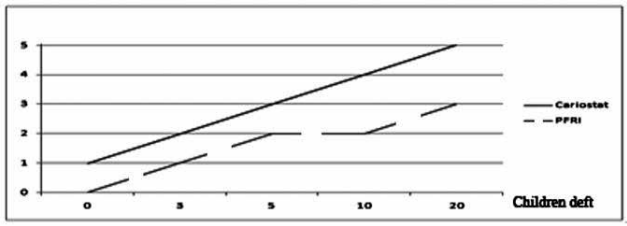
A person's caries risk status is important to conducting measuring so that caries development can be inhibited as early as possible. The available methods to measure the caries risk are various. This shows the existence of development on caries risk measurement method. A measurement method should meet several requirements such as provide accurate results, have high specificity and sensitivity, simple, low-cost, and not require special tools (Hesty, 2007). Methods that can be used in measuring caries risk are Plaque Index, PFRI (Plaque Formation Rate Index), colony calculation of *Streptococcus mutans*, etc. Plaque Index and colony calculation of *Streptococcus mutans* are the calculation of caries risk that are done at any time so they will produce numbers that can be influenced by many things. While the external factors can be controlled by using PFRI. Plaque calculations using PFRI provide an objective number for viewing plaque formation without being influenced by external factors. The combination of caries risk factor measurements PFRI and seeing the amount of *Streptococcus mutans* by using cariostat can provide a more accurate description in determining one's caries risk factors. This study aims to look at risk factors for childhood caries by using combination of PFRI and Cariostat.

Method

The type of research used in this study was analytical observational using cross-sectional research design with laboratory study approach. The research was conducted at Maryam Kindergarten Jl. Manyar Sambongan, Surabaya and the analysis was conducted at FKG Microbiology Laboratory of Airlangga University. The inclusion criteria of respondents consist of children aged 4-5 years, have no permanent teeth, all deciduous teeth have erupted, have no systemic disease, and not consume drugs. Data analysis was done using statistic approach with Kolmogorov-Smirnov normality test, then it continued by correlation test using Spearman Correlation. Statistical data analysis is presented using Statistical Product and Service Solutions (SPSS) 20.0 for Windows.

Results

Clinical examination conducted on 36 children in Maryam Kindergarten Surabaya, it was found 12 children suffering high dental caries (>5), 12 children suffering moderate dental caries (3-4), and 12 children suffering low dental caries (0-2). Measurements of caries risk in 36 children were conducted using cariostat and PFRI. Then the data was tested with normality and correlation analysis test.



Prior to conduct the correlation analysis test, the normality test of data was performed using Kolmogorov-Smirnov. Table 1 shows that data in Cariostat has value greater than 0.05 ($p>0.05$) which means that the data is normally distributed, while the data on deft index and PFRI are less than 0.05 so that the data is abnormally distributed. Then it was proceeded with Spearman correlation test to see correlation between deft index and both of caries risk test i.e. Cariostat and PFRI.

Table 1: Normality Test of Data using Kolmogorov-Smirnov Test

No.	Group	Mean	Deviation standard	Normality test
1	Deft Index	5.6111	5.8665	0.009
2	Cariostat	1.19	0.920	0.051
3	PFRI	2.17	1.159	0.007

Table 2: Value of Significance and Correlation Coefficient between Deft Index with Cariostat and Deft Index with PFRI

No	Correlation	Significance of Correlation Test with Deft	Coefficient of Correlation Test
1.	Correlation between Deft Index with Cariostat Score	0.000	0.857
2.	Correlation between Deft Index with PFRI Score	0.000	0.818

Graph 1: The Relationships of Cariostat and PFRI with Deft Index of Children's Caries Aged 4-5 Years

Table 2 discloses that the significant value between Cariostat and Deft Index is <0.05 that has value p = 0.000 with correlation coefficient by 0.857. This is indicates that Cariostat has strong correlation value. While the significant value between PFRI and Deft Index is 0.000 with correlation coefficient by 0.818. This is indicates that PFRI also has strong correlation. The above calculations show that caries risk measurements using both of Cariostat and PFRI are have strong correlation values.

Discussion

The caries risk is a person's probabilities to having carious lesions in a given time period while the measurement of caries risk is an important preventive steps to get good dental and mouth hygiene by identifying factors of caries etiology[5]. Measurement of caries risk is done as early as possible so that caries prevention can be done. There are various ways in determining factors of caries risk, there which were using specific materials as the tools, and there which were not using certain materials or tools. The way of measuring caries risk that using plaque samples are Cariostat and PFRI that are easy to do in children.

The correlation tests of Cariostat score with deft index and PFRI score with deft index were performed in this study. The result of this research is the correlation between cariostat score with deft index is stronger than PFRI score with deft index.

PFRI using plaque samples that aim to see the growth of plaque on each individual. This index is useful to see factors of caries risk caused by plaque growth. This index includes plaque throughout the surface of the tooth except occlusal which is seen after 24 hours without any cleaning done. Accurate results will be obtained if the subjects' teeth previously cleaned by professionals [2] .This index has the advantage that is it is not need special tools then it can be done with minimal cost. However, measurement of this index is require the cooperation of patients as well as the patient's parents to keep the patient from performing dental and oral cleansing within 24 hours.

PFRI has objective results because cleaning is done by professionals so that initial plaque of each child is standardized from 0. The resulting PFRI value is purely from the plaque growth pattern of each child without being influenced by children's knowledge, how to brush their teeth, etc.

A longitudinal study has been done by Roxana Vacaru in Romania to look at the factors of caries risk by using PFRI. The study was conducted on 139 children who were in the age of 6-14 years whom examined the value of deft and also the value of PFRI. Researchers divide into 3 groups, those are the low risk group that is PFRI 1-2, the risky group that is PFRI 3 and the high risk group that is PFRI 4-5. After 2 years the deft value of the research sample was calculated and it was correlated with the PFRI value. The results of this study are caries prevalence in children was conforming to factors of caries risk calculated by PFRI. Children with low-risk factors of caries had low-prevalence of caries, while children with high-risk factors had high-prevalence of caries. This was indicates that PFRI is effective for predicting caries incidence in children [9].

A longitudinal study was also performed by Perr Axelsson to look at the caries growth across different age groups. This group is divided into ages of 0-2 years, 5-7 years and 11-14 years. Each group was measured PFRI value and deft value. The result of PFRI and deft value show that there are relationship between the high value of PFRI and the prevalence of caries on children. Then Axelsson created a caries prevention program according to the group of caries risk factor. The results of the program were seen 20 years later and a small prevalence score was found in these children. This was indicates that PFRI is effective for used as a predictor for determining caries prevention steps on children [3].

Cariostat is used plaque samples to determine the caries risk in patients. pH of plaques taken on the patient's teeth, incubated 48 hours so that bacteria in the plaque fermented the sugar on the medium. The acid produced by bacteria on the medium will change the color on the medium so that the degree of acidity in the plaque can be measured.

Acid production on dental plaque is an important caries risk factor because dental caries is initiated by demineralization on teeth surfaces by organic acids that were produced by bacteria in dental plaque. Previous studies reported that after rinsing with sugar, dental plaque acquired in active caries patients showed a lower last pH than inactive caries patients. This suggests that examination of pH on dental plaque is one of the steps to measure caries risk (Shimizu, 2008).

A longitudinal study was conducted by Tsubouchi in Okayama, Japan to evaluate predictive value in Cariostat. The study was conducted on 100 children who participated in routine dental checkups at 18, 24, and 36 months. The results of the study were caries prevalence in children aged 18 months by 9%, children aged 24 months by 21%, and children aged 36 months by 70%. Cariostat scores in each age were correlated with the respective deft index. The Cariostat scores on each age show the good validity. This suggests that Cariostat is effective in predicting caries incidence in children (Berg, 2006).

In this study, both of Cariostat and PFRI are have high correlation coefficient to the deft index. The previous research has also shown that both of PFRI and Cariostat can be a tool for predicting factors of caries risk. However, both of these measuring tools have disadvantages and advantages. Cariostat has the disadvantages of requiring special materials that are costly and requiring special tools such as incubator. The results will be seen after 2 days because they require an incubation time to get the test results (Rodis, 2005). Whereas the advantages of Cariostat is the quick and easy application in patients. So that Cariostat is appropriate for the children who are less cooperative or children with special needs, because it does not take a long time or a certain way to take plaque samples.

PFRI also has its own advantages and disadvantages. The disadvantages of PFRI are the operator should clean the patient's teeth on the first day, ensure the plaque value of patient is 0 and then measure the plaque value 24 hours later and re-clean the patient's plaque. This is less appropriate when conducted for non-cooperative children who do not want to open the mouth in the long time. However, the advantages of PFRI are its low cost because it does not require a certain tool or material. In addition, PFRI is also advantageous for patients due to they get dental cleaning that performed by the operator.

Dental caries is a multifactorial disease. Other factors such as dental and mouth hygiene, carbohydrate intake, and amount of *Streptococcus mutans* bacteria were contributed to dental caries. By combining the measurement of caries etiology factor in the patient, then the determination of caries risk would be more appropriate so that caries prevention can be performed effectively although the high cost will be needed [1].

The conclusion of this study is there was no difference between the results of risk test scores by using caries activity test both of Cariostat and PFRI which is correlated with the deft index.

Conclusion

The conclusion of this study is there was no difference between the results of risk test scores by using caries activity test both of Cariostat and PFRI which is correlated with the deft index. PFRI can use as a cheap and easy tool to predict caries in children. Predicting the risk of caries is important to make free caries teeth.

Customers' Service Expectations in Dental Hospital: Using Servqual Model

Firdauzi Rimadhan[1], Devita Tintasari[1], Fredy Mardiyantoro[2]

[1]Student of Health Policy Administration Program Study, Faculty of Public Health, Airlangga University;
[2]Lecturer of Oral and Maxillofacial Surgery, Faculty of Dentistry, Brawijaya University, Indonesia

ABSTRACT

Background: In the health care industry, customer observations are a focal point of service quality. To improve quality, service marketers have to identify the expectation of targetted customers. Pediatric dentistry is well positioned to help ameliorate the Early Childhood Caries (ECC) disease burden. As stated in the Surgeon General's 2000 report, ECC is the most common chronic childhood disease, with a prevalence five times that of asthma. The key to prevention is early intervention and regular preventive dental care based on risk and disease management. In disease management, if perceived service exceeds expected service, the customers are apt to use the service provider again.

Purpose: This study aims to identify factors that affect customers' service expectations using the SERVQUAL model.

Method: The sample was selected using accidental sampling. Service expectations were measured using the five SERVQUAL dimensions questionnaire. A total of 93 participants completed the questionnaire.

Results: The highest customers' service expectations from five SERVQUAL dimensions was reliability (3.97). The relationship of reliability service quality with education level of customers was 2.039 times that of others service quality (OR = 2.039, CI = 0.429 to 9.686). The relationship of reliability service quality with customer has visited other health cares was 2.141 times that of others service quality (OR = 2.141, CI = 00.451 to 10.178).

Conclusion: To make the customers to use the services and improve the quality of service in the department of pediatric dentistry in Airlangga dental hospital, reliability must be provided based on customers' service expectations.

Keywords: *Service Quality; Customers' Expectations; Dental Hospital.*

Introduction

In the 21st century, all successful organizations adopt customer focus as the central pillar of their strategic planning[1]. Top service companies recognize that outstanding quality gives them a potent competitive advantage that leads to superior sales and profit performance[2].

A service is any activity or benefit that one party can offer to another which is essentially intangible and does not result in the ownership of anything[2]. To evaluate a service is more complex than to evaluate a product. To evaluate a product is tangible and its defects can be detected, its functioning assessed and its durability compared. To evaluate a service, it is first purchased and then produced and consumed simultaneously, then the possible nonconformities are produced and experienced, characterizing their inseparability[3].

Similar to other service industries, health care has become a highly competitive and rapidly growing industry worldwide[1]. In the health care industry, customer observations are a focal point of service

quality. To improve quality, service marketers have to identify the key determinants of service quality (that is, the key criteria customers use to judge quality), what target customers' expectations are, and how customers rate the firm's service in relation to these criterias against what they expected[2].

Airlangga Dental Hospital is the first sophisticated hospital in Indonesia and serves patients from all parts of eastern Indonesia. Airlangga dental hospital is required to provide high quality services with adequate facilities. One of the facilities in Airlangga dental hospital is the department of pediatric dentistry.

Pediatric dentistry is well positioned to help ameliorate the Early Childhood Caries (ECC) disease burden. As stated in the Surgeon General's 2000 report, ECC is the most common chronic childhood disease, with a prevalence five times that of asthma. And ECC is an entirely preventable disease. The key to prevention is early intervention and regular preventive dental care based on risk and disease management, but many families only seek dental care when problems occur[4].

Grönroos (1984), defined service quality as matching the expected service towards the perceived service[5]. Parasuraman et al. (1988), defined service quality (SERVQUAL) as the difference between consumers' perceptions and expectations along the 5 dimensions of quality[5]. Kotler et al. (2005), defined service quality as the result of a comparison of what they expect with what they experience. Customers' service expectations are formed from past encounters and experiences, word-of-mouth and the firm's advertising. If perceived service of a given firm exceeds expected service, customers are apt to use the service provider again[2].

Accordingly Parasuraman et al. suggested SERVQUAL's five dimensions, which are described as follows[6]:

1. **Tangibles:** physical facilities, equipment, and appearance of personnel
2. **Reliability:** ability to perform the promised service dependably and accurately
3. **Responsiveness:** willingness to help customers and provide prompt service
4. **Assurance:** knowledge and courtesy of employees and their ability to inspire trust and confidence
5. **Empathy:** caring and individualized attention that the firm provides to its customers

This study aims to identify factors that affect customers' service expectations in the department of pediatric dentistry in Airlangga dental hospital using the SERVQUAL model. To make the customers use the service provider, most hospitals should improve the quality of their services.

Materials and Method

The data was collected in February, 2013. Sampling was done by non-probability sampling with accidental sampling. Samples were taken accidentally, if there have been found visitors who minimum three visits to the the department of pediatric dentistry in Airlangga dental hospital Surabaya, then they will become participants. The participants were asked to participate in a study that measured service expectations towards Pediatric dentistry of dental hospital Surabaya and they were given the expectations of the SERVQUAL questionnaire. The study instrument was based on statements measuring five SERVQUAL dimensions. These dimensions included tangibles (4 items), reliability (3 items), responsiveness (3 items), assurance (4 items), and empathy (3 items). All statements were measured on a 4-point Likert scale from 1 for "strongly disagree" to 4 for "strongly agree." A total of 93 participants completed the questionnaire.

Results

Customers' Demographic Characteristic: According to the survey results, the specific customers' demographic characteristics are shown in Table 1.

Table 1: Result of Demographic Characteristics

Discussion

This study aims to identify what target customers' expectations are in the department of pediatric dentistry in Airlangga dental hospital. Based on the results of this study, the customers' service expectations from five SERVQUAL dimensions in the department of pediatric dentistry in Airlangga dental hospital were ranked as follows (high to low): reliability (3.97), tangibles (3.93), responsiveness (3.88), empathy (3.81) and assurance (3.59). Reliability as the most important dimension, and assurance as the least important dimension. These results differ from patients' expectations of service quality in China which were ranked as follows (high to low): assurance, empathy, responsiveness, reliability, economy, and tangibles[7]. In Eastern Saudi Arabia, the highest and lowest means of patients' expectations were related to empathy and responsiveness dimensions[8]. In Iranian, the highest and lowest expectation score was related to the assurance (4.7) and reliability (4.43)[9]. This is likely due to the differences in political, economic, and cultural factors between countries and statistical methods used by the researchers, all of which contribute to differences in the demand for medical services[7].

The highest customers' service expectation from five SERVQUAL dimensions was reliability on female (3.98), within 21-30 and 41-50 years old (4.00), on education level being school and on customers who have visited other health cares (3.98). The relationship of responsiveness service quality with the gender customers was 2.292 times that of others service quality (OR = 2.292, CI = 0.939 to 5.596). The relationship of reliability service quality with education level of customers was 2.039 times that of others service quality (OR = 2.039, CI = 0.429 to 9.686). The relationship of reliability service quality with customer has visited other health cares was 2.141 times that of others service quality (OR = 2.141, CI = 00.451 to 10.178). These results differ from patients' expectations in Eastern Saudi Arabia, the female expectations are statistically significantly higher compared with male expectations in tangibility (p=0.001) and reliability dimensions (p=0.01). And university graduate patients have statistically significantly higher expectations in tangible (p=0.002) and reliability (p=0.000) dimensions[8]. Reliability includes doing duties in accordance with the commitments, interesting employees in doing tasks and service provision, doing services correctly at the first visit of patients, providing the services on promised time, maintaining records of clients accurately. Hospitals should improve the reliability of their services to increase patients' loyalty[10].

Conclusions

In conclusion, according to the study results, to make the customers use the services and to improve the quality of service in department of pediatric dentistry in Airlangga dental hospital, the department of pediatric dentistry in Airlangga dental hospital have to provide reliability based on customers' service expectations. Reliability refers to dependability and steadiness of service. Thus, the department of pediatric dentistry in Airlangga dental hospital can help prevention and ameliorate the ECC disease.

The Nurse's Work Culture Relationship with the Quality of Nursing Service Between the Government Hospital and Private Hospital: Comparative Study in 2018

Dilgu Meri[1], Meri Neherta[2], Zifriyanthi Minanda Putri[2]

[1]Master Degree of Nursing, [2]Nursing Faculty, Nursing Faculty, Andalas University Padang Indonesia

ABSTRACT

Quality nursing care is something that the patient wants and it is promised by the nurse. However, at this time there are still many complaints of the community, the patient's family and patients on the quality of services provided by the nurse. This study aims to see differences in the relationship of work culture with the quality of nursing service in Muhammad Sani Karimun hospital as a public hospital and Bakti Timah Karimun hospital as a privat hospital in 2018. Design of this research is *Comparative design.* Samples were taken *stratified random sampling* with total of 60 nurses for Muhammad Sani Karimun hospital and 60 nurses for Bakti Timah hospital. The result of statistical test at Muhammad Sani Karimun hospital shows there is a relationship of work culture of nurse (p *value* = 0,006). Likewise in Bakti Timah hospital found a relationship of work culture nurse (p *value* = 0,005) with quality service nursing. Furthermore *Mann Whitney* test obtained service quality variables (p *value* = 0.006) has a difference between Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital. However, for nurse work culture variable (p *value* = 0,570) there is no difference. This research is expected to be an input for the related hospitals so as to improve the quality of nursing service in particular.

Keywords: *Work culture, supervision, quality of nursing service, private hospital, public hospital*

Introduction

Hospital as a health care organization is a part of health resources that are needed in supporting the implementation of health services. One of the health services provided is nursing service. The Institute of Medicine defines the quality of nursing care as the extent to which health services are provided to individuals and communities in improving healthcare with the latest science[(1)].

Ordem Dos Enfeimeiros which presents six categories to determine the quality of nursing service based on nurse perception that are patient's satisfaction, health promotion, prevention of complication, welfare and self-care, and functional adaptation and organization of nursing[(2)].

The inability to inculcate a good work culture will affect the ability to maintain the quality of health care and will negatively impact patient satisfaction and productivity among staff [(3)]. A poor work culture also reduces the involvement of employee and can increase in unplanned absences as well as stress-related occupational health and safety claims, it is alsowill decrease the productivity and quality of service[(4)].

Purpose of his research is to discern relationship and differences of work culture and supervision with the quality of nursing service in Muhammad Sani Karimun hospital and Bakti Timah Karimun Hospital in 2018.

Materials and Method

This research is a kind of quantitative research. The method or design used is Comparative. This study is a research designed to determine the differences and effects of different variables in a population.

The populations in this study were all nurses at the Muhammad Sani Karimun hospital, it is about 170 people and all nurses in Bakti Timah hospital amount to 129 people. So the total number of population from both hospitals amounted to 299 people. Sample of the study in public and private hospitals respectively are 60 respondents. Sampling technique in this research is stratified random sampling.

Additional data to complete the data will be conducted questionnaires about the work culture of nurses and the quality of nursing services. To measure the quality of nursing services, the researchers used the Quality of Nursing Care questionnaire [2]. The researchers modified from several questionnaires to describe the nurse's work culture of Work Of Meaning Inventory (WOMI) by Lee, Attitude Scale Toward Nursing Profession (ASNP), Environment Scale Od The Nursing Word Index (PES - NWI), Nurse- Nurse Collaboration Behavior Scale [5].

Research Finding

The frequency distribution of nursing service quality variable, nurse work culture and supervision as much as 41.7% nurses stated that the quality of nursing service in Muhammad Sani Karimun hospital is good and 66.7% of nurses stated the quality of nursing service at Bakti Timah Karimun hospital is good.

While for nurse work culture variable is 61,7% nurse stated that work culture of nurse in Muhammad Sani Karimun hospital good and equal to 66,7% nurse stated nurse work culture at Bakti Timah Karimun hospital is good.

Table 1: The Relationship of nurse working culture with quality of nursing service in Muhammad Sani Karimun Hospital

Nursing work culture	Quality of nursing service				Total n %		p value
	Not Good		Good				
	n	%	n	%	n	%	
Not Good	19	82,6	4	17,4	23	100	0,006
Good	16	43,2	21	56,8	37	100	

Table 1 can be seen that of 37 respondents who have good work culture as many as 21 people (56.8%) with good nursing service quality and 16 people (43.2%) with poor service quality. While from 23 respondents with bad work culture as much as 4 (17,4%) nurse with good service quality and 19 (82,6%) with poor service quality.

Chi-Square test results obtained p *value* = 0.006 (p <0.05) which means there is a relationship between nurse work culture with the quality of nursing service.

Table 2: The Relationship of the nursing work culture with the quality of nursing service in Bakti Timah Karimun Hospital

Nursing work culture	Quality of nursing service				Total n %		p value
	Not Good		Good				
	n	%	n	%	n	%	
Not Good	12	60	8	40	20	100	0,005
Good	8	20	32	80	40	100	

Table 2 can be seen that 40 respondents who have a good work culture as much as 32 people (80%) with good nursing service quality and 8 people (20%) with poor quality nursing service. While from 20 respondents with bad work culture as much as 8 (40%) nurses with good services quality and 12 (60%) with poor service quality.

Chi-Square test results obtained p *value* = 0.005 (p <0.05) which means there is a relationship between nurse work culture with the quality of nursing services in Bakti Timah Karimun hospitals.

Table 3: The Differences in Quality of Nursing Cares between RS.Bakti Timah and Muhammad Sani Karimun hospital Karimun District

Variables	Hospital Status	n	p value
Quality of nursing services	Muhammad Sani Karimun hospital Bakti Timah Karimun Hospital	60	0,006
Nursing work culture	Muhammad Sani Karimun hospital Bakti Timah Karimun Hospital	60	0,570

The results of the analysis in Table 3 shows that the variable quality of nursing care with respondents from hospitals M. Sani Karimun numbered 60 nurses and the number of respondents from the RS. Bakti Timah Karimun amounted to 60 people got value p *value* = 0.006 (<0.05) means there is a difference in quality of nursing service between Muhammad Sani Karimun hospital with RS. Bakti Timah Karimun.

The results of the analysis in Table 5.3 shows that nurses work culture variable with the number of respondents from hospitals M. Sani Karimun numbered 60 nurses and the number of respondents from the RS. Bakti Timah Karimun amounted to 60 people got p *value*

= 0,570 (> 0,05) means there is no difference of work culture of nurses between Muhammad Sani Karimun hospital with RS. Bakti Timah Karimun.

Discussion

A. Picture of Quality of Nursing Service at Muhammad Sani Karimun and Bakti Timah Karimun hospital.

The results of the research showed the quality of nursing service in RSUD M. SaniKarimun in 2018 that is equal to 41.7% nurses stated good. While the results of research in Bakti Timah Karimun hospital Karimun showed that the quality of nursing services in hospitals. Bakti Timah Karimun in 2018 that is equal to 66.7% nurses stated good.

Davis defines quality as a dynamic condition that deals with products, services, people, processes, and environments that meet or exceed expectations. Research conducted in Muhammad Sani Karimun hospital 19 statements about the disseminated through questionnaires on the quality of nursing services found that all nurses (100%) stated not knowing the hospital policy about minimum service standards to improve the quality of service. Furthermore, more than half (98.3%) of nurses said they were unable to handle a situation that was less conducive for patients who could help improve patients' welfare and daily activities.

The research conducted in Bakti Timah Karimun hospital Karimun where 19 statements about the quality of nursing service based on the questionnaire distributed found that as many as 28.3% nurses said did not improve the ability of patients and invite family members closest to provide therapy that has been prepared for patients. Similarly, as many as 21.7% of nurses said they did not evaluate interventions that help improve patient health and daily activities.

Based on the analysis of questionnaires in Muhammad Sani Karimun hospital can be seen that all nurses as samples in the study did not know the hospital policy about hospital minimum service standards caused by lack of socialization from management related to hospital policy. Lack of nurse knowledge about the policy in Muhammad Sani Karimun hospital about the quality of nursing service is one of the items of the organization of health services.

Based on Law No. 69 of 2014 on hospital obligations in Indonesia which are obliged to provide safe, quality discrimination and effective health services by prioritizing the interests of patients in accordance with hospital service standards. In addition, the hospital is also obliged to formulate a policy conducive to health services in accordance with the code of ethics Hospital

Based on the analysis of questionnaires at Bakti Timah Karimun Hospital it was found that less than half the nurses stated the nurse's ability to improve the patient and family's ability to provide ready-made therapy for patients who were part of functional adaptation. In functional adaptation there are several items used to measure the continuity of the process of providing nursing services, maximizing the use of resources of the patient's family and optimizing the increased capacity of patient and family knowledge of the patient to manage self-care .

B. Work Culture and Its Relation to Quality of Nursing Service at Muhammad Sani Karimun and Bakti Timah Karimun hospital.

The result of research on the correlation between the working culture and the quality of nursing service in Muhammad Sani Karimun hospital illustrates that a good work culture has more proportion for the improvement of good nursing service quality by 21 people (56,8%) and 16 people (43,2 %) results in poor service quality. Statistical test results can be seen that there is a significant relationship (p *value* = 0.006) between the work culture of nurses with the quality of nursing service

The results of the research in Bakti Timah Karimun hospital. Results concerning the relationship of work culture with the quality of nursing service in Bakti Timah Karimun hospital illustrates that a good work culture has more proportion to improve the quality of good nursing service as much as 32 people (82%) and as many as 8 people (20%) produce poor service quality. Statistical test results can be seen that there is a significant relationship (p

value = 0.005) between the work culture of nurses with the quality of nursing service.

The results of this study are in accordance with the concepts put forward [6] where poor culture generally manifests as disruptive behavior, factionalism, or the emergence of counter-culture, actively working against the best interests of the organization as a whole. A poor work culture also erodes employee engagement and may lead to an increase in unplanned absenteeism and occupational health and safety claims related to stress. It can not be denied, the productivity and quality of services will decrease.

The results of the questionnaire analysis found that the lack of cooperation among staff, inflexible work schedules and the lack of *caring* nurses is part of the attitude and behavior of nurses when working as well as the factors causing the nurse's work culture is not good so the quality of nursing service becomes less good. Humans show a variety of attitudes toward work. Attitude is the tendency of the soul to something. This tendency ranges from taking full acceptance or refusing to the utmost. Zulkifli (2014) states that attitudes toward work can also be interpreted as a joy of work compared to other activities or simply to gain satisfaction from his own work or feel compelled to do something just for his life [7] .

However, if nurses are not satisfied with their work and who have less good attitude toward their profession will experience more problems such as stress, tension, and high anxiety. This will deter them in their work. Nurses' attitudes toward their work, profession, organization, and administration will predict the behavior they will show in it [8].

C. Differences in quality of nursing care between hospitals. Bakti Tin with Muhammad Sani Karimun hospital Kab. Karimun 2018.

The results of the analysis in Table 5.3 shows that the variable quality of nursing care with respondents from M. Sani Karimun hospitals numbered 60 nurses and the number of respondents from the RS. Bakti Timah Karimun amounted to 60 people got value p *value* = 0.006 (<0.05) means there is a difference in quality of nursing service between Muhammad Sani Karimun hospital with Bakti Timah Karimun hospital.

These differences shows that private hospitals play a significant role in society, and higher perceived service quality will only increase demand for their services [9].

The result of bivariate data of difference shows that mean value of Bakti Timah Karimun hospital is bigger than Muhammad Sani Karimun hospital. The statistic shows that there is a difference of the quality of nursing service of Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital is caused by the ineffective nurse in giving nursing care which we can see in the distribution of questionnaire answers where as many as 66,7% nurses stated no intervention to prevent complication because nurses are more waiting for therapy from doctors so as to prevent more complications delegated to medical personnel such as doctors.

D. Differences of nurse working culture between RS. Bakti Tin with RSUD M. SaniKarimunKab. Karimun2018.

The results of the analysis in Table 5.3 shows that nurses work culture variable with the number of respondents from hospitals Muhammad Sani Karimun numbered 60 nurses and the number of respondents from the Bakti Timah Karimun hospital amounted to 60 people got p *value* = 0,570 (> 0,05) means there is no difference of work culture of nurses between Muhammad Sani Karimun hospital with RS. Bakti Timah Karimun.

Based on the questionnaire analysis can be seen many similarities between Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital Karimun. The same thing is seen between Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital, where 71% of nurses stated that they have an inflexible work schedule. Many people work long hours, consequently they face conflict between family and work. Especially for women, do not have the time they want for the family because of working hours long and uncomfortable [10].

Working in flexible working hours allows people to manage their daily lives better and reduce family conflicts. Results of research conducted by [10] showed that the flexibility of work has a

positive and significant effect on job satisfaction, work flexibility has a positive and significant effect on employee performance.

Recommendation

This research is very important for management in Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital which is in the scope of nursing service as an effort to improve the quality of nursing service.

Relevance of the Study

This research will produce an overview of the application of nurse work culture, supervision on the quality of nursing services in hospitals, especially in riau islands and Indonesia in general.

Conclusion

Culture work evidently have a significant relationship with quality service nursing in Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital . There is difference quality service nursing between Muhammad Sani Karimun hospital and Bakti Timah Karimun hospital there is difference nurse work culture between two hospitals. The next researchers next could dig factor others that affect quality service nursing and factor cause existence difference quality service nursing between private hospital and government hospital.

Relationship of Hand-Hygiene Compliance Score with Nurse's Engagement in Intensive Care Unit

Boy Sandy Sunardhi[1], Prima Nerito[1], Tito Yustiawan[2]

[1]Post Graduate Student, [2]Lecturer, Departement of Administration and Public Policy, Airlangga University, Surabaya

ABSTRACT

Background: Infectious diseases are still the main cause of the high rate of morbidity and mortality in the world. Hand-hygiene behavior is one factor that has a major influence on prevention of nosocomial infections (INOS) in the hospital.

Objective: the aim of this research is to find the correlation of nurse engagement with the level of compliance of hand-hygiene ICU nurse activity in Surabaya Islamic Hospital.

Method: This research is a quantitative analytic research and use descriptive design with cross sectional research method. The sampling technique used in this research is total sampling technique that is taking data of all nurses who are in ICU.

Result: The results of this study indicate that nurse engagement has a correlation with the compliance of nurses in implementing hand-hygiene.

Keywords: *Compliance, Engagement, Hand-Hygiene, Nurse*

Introduction

Act Number 44 year of 2009 on Hospital states that hospitals must apply the patient safety standards[1]. Patient Safety Program is to ensure patient safety in the hospital through prevention of errors in the delivery of health services. Hospitals are required to provide quality and transparent health services to the public, especially for assurance of patient safety, so hospitals need to improve the services quality, especially in the prevention and control of infections[2].

The prevention and control of infections is become particular concern due to the incidence of infections in hospitals are considered as a serious problem because they threaten the health and safety of patients and health workers globally. In addition, the incidence of these infections are also impacted on the quality of health services and on increased healthcare financing[3]. According to WHO (2011) HAIs are the patient-acquired infections during treatment procedures and medical procedures in health services that occurred after ≥48 hours of treatment and ≤30 days after released from health facility. Based on the French National Prevalence Survey, the frequent locations of nosocomial infections include urinary tract, airway, surgical wound, skin and tissue, ears, nose and throat, eyes, locations of catheter put in and other locations[4].

According to the data from Indonesian Ministry of Health, nosocomial infections rates which occurring in some countries of European and American are low, approximately 1% if it is compared with the incidence in the countries of Asia, Latin America and Sub-Saharan Africa which are high, reaching more than 40%, and according to the data of WHO (2009), the incidence rate of infection in the hospital are about 3-21% (mean of 9%). By seeing these data, the hospital should anticipate to prevent nosocomial infections incidences in the future. One of the efforts is through the application of hand-hygiene 5-moments that are before contact with

patients, before administer aseptic action, after exposure of patient's body fluid, after contact with patient, after contact with the environment around patient.

Data of hand-hygiene compliance score of nurses at ICU in August 2017 was 80% and in September 2017 was 80%. These are still lower than the standards set by the hospital that is 85%. There are many factors that influence nurse compliance in applying hand-hygiene 5-moments, one of them is nurse's engagement to the organization[5].

To evaluate the relationship of nurse's engagement with nurse's compliance of hand-hygiene at ICU of RSIS, it is conducted the scientific approach in order to find the relationship between variables so that the nurse's engagement at ICU of RSIS can be measured through the implementation of hand-hygiene 5-moments. The results obtained will be useful for RSIS management in planning the best strategies for improving or maintaining excellent performance through improvement or enhancement of appropriate infection prevention and control. It is necessary to develop a performance-based nursing policy so as it can improve the nurse's performance in Infectious Diseases Prevention against the prevention of nosocomial infections at RSIS. As a result, the number of nosocomial infections can be decreasing so that RSIS can provide the best service for the patient. This study is aims to analyze the relationship between nurse's engagements with hand-hygiene compliance at ICU of RSIS.

Method

This study is a quantitative analytic research and using descriptive design with cross-sectional method of research. Cross-sectional method of research is one form of the most frequently observational (non-experimental) study. In a broader meaning, the cross-sectional study includes all types of research whose variable measurements were performed only once at one time [6]. This study is to determine the correlation of nurse's engagement with hand-hygiene behavior by means observation approach or data collection, which the data was taken in the form of questionnaire to measure nurse's engagement by using Gallup Survey. The research was conducted at Surabaya Islamic Hospital with the time research was conducted from December 20 until December 27, 2017. The number of respondents used as many as 12 nurses of ICU who the total sampling.

Results and Discussion

Based on surveys given to nurses using Gallup Survey to measure nurse's engagement and secondary data of Committee on Infection Prevention and Control of Surabaya Islamic Hospital, then the following data are obtained.

Table 1: Frequency Distribution of Respondents Based on Nurse's Engagement at ICU Room of Surabaya Islamic Hospital in 2017

Engagement	Frequency (n)	Percentage (%)
Not engaged	5	41.7
Engaged	7	58.3
Total	12	100.0

Source: Primary Data, 2017

Based on Table 1 it can be learned that most of the implementer nurses (58.3%) at ICU Room of Surabaya Islamic Hospital include engaged employees.

Table 2: Frequency Distribution of Respondents Based on Nurse's Compliance in Implementing Hand-Hygiene at ICU Room of Surabaya Islam Hospital in 2017

Hand-Hygiene Compliance	Frequency (n)	Percentage (%)
Non comply	7	41.7%
Comply	5	58.3%
Total	12	100.0

Source: Primary Data, 2017

Based on Table 2 it can be learned that from 12 implementer nurses, most of the nurses at ICU of Surabaya Islamic Hospital are non-comply to implementing hand-hygiene, those are 7 peoples (58.3%).

Table 3: Relationship of Nurse's Engagement with Nurse's Compliance in Implementing Hand- Hygiene at ICU Room of Surabaya Islamic Hospital in 2017

Engagement	Hand-Hygiene Compliance				Total	
	Non-comply		Comply			
	n	%	N	%	N	%
Not engaged	5	100.0	0	0.0	5	100.0
Engaged	2	28.5	5	71.4	7	100.0
Total	7	58.3	5	41.6	12	100.0

Source: Primary Data, 2017

According to Table 3, it can be learned that the more not engaged of implementer nurses at ICU of Islamic Hospital Surabaya, the higher the tendency of the nurse to non-comply in implementing hand-hygiene at ICU of Surabaya Islamic Hospital. The results of cross-tabulation in this study indicate that nurse's engagement are tends to have relationship with the nurse's compliance in implementing hand-hygiene.

Discussion

Based on the observation at ICU of Surabaya Islamic Hospital by using observation sheets and check list, the implementation of hand-hygiene 5-moments has not implemented well that is 80% while the standard set by the hospital is 85%. This is in line with a study of 40 hospitals that reported health worker compliance to hand-hygiene before and after contact to patient are vary between 24% to 89% (mean of 56.6%). The study was conducted after the promotion of WHO program in infection control[7].

From hand-hygiene 5-moments, these are before contact with patient, after contact with patient, before aseptic action, after exposure of patient's body fluid, after contact with patient, after contact with area around patient, then the most often missed is the moment before contact with patient. This is in line with previous study that calculated the value of compliance at the momen 1 is the lowest point by 0% before conducting the training and it was increased to 25% after conducting training [8]. However, contrasting with that study, ICU nurses are had accepted regular training on hand-hygiene so that unreached target of hand-hygiene is not due to low level of education.

Increasing the value of job characteristics, hospital support, supervisor support and rewards and recognitions for the nurses can significantly increase nurse's engagement. Leaders and management of hospital need to consider the importance of growing and improving engagement to increase nurse's productivity and loyalty by giving rewards and recognitions to the nurses through hospital and supervisors support and adjusting job characteristics with nurse's job placements[9].

There are many causes of noncompliance in hand-hygiene, in this study is looking at the relationship with nurse's engagement level. Based on Table 1 shows that 58.3% of nurses are not engaged, this is caused by a lack of supervisor supports at ICU.

Employees' engagement is essential in improving employees' initiatives to implementing hand-hygiene 5-moments. When it is compared to forcing employees through regulations, by improving engagement is proved more successful in increasing employees' compliance score in hand-hygiene[10]. This was support the results of Table 3, where the more nurses are not engaged, the more nurses are non-comply in hand-hygiene.

Conclusions and Suggestions

The results of this study indicate that nurse's engagement tends to have relationship with nurse's compliance in implementing hand-hygiene.

Lack of compliance in hand-hygiene of nurse at ICU is more due to lack of supervisors. To increasing hand-hygiene scores at ICU it can be started by modeling with pear group method. From this pear group then they can remind each other to implement hand-hygiene 5-moments well.

Giving non-monetary rewards can also be done to improve nurse's engagement. Giving rewards to the best employees in this month, giving bonus for achieving the target can be one of steps that can be done.

Development of Management Skills Head of Public Health Center Based on Analysis of Management Skills Theory of Cameron and Quinn

Martha Wahani Patrianty[1], Nyoman Anita Damayanti[2], Tito Yustiawan[2]

[1]Student, Master Program Study Program Administration and Health Policy, [2]Departments of Administration and Health Policy, Faculty of Public Health, Airlangga University

ABSTRACT

Head of Puskesmas as manajer, is required to have managerial skill. This study to assess management skills Head of Puskesmas then develop recommendations based on the description of the results of the assessment. The type of descriptive research, sampling technique total sampling, data retrieval techniques obtained from the instrument that has been filled by the boss, peers, subordinates and yourself. Data analysis techniques using Cameron and Quinn›s Management Skills Assessment Instrument (MSAI). The variables studied are the type of culture in organization and management skill in each organizational culture as sub variable. Used Likert type as a questionnaire scale. Using the total population as respondents. Results from the assessment of superiors, peers, subordinates, show that the culture of adhocracy is more dominant. The next sequence is the clan culture and then the hierarchy culture and market culture. The implementation of management skills is very strong. In sequence, the strength of managing innovation is at the top, followed by energizing employees, managing team, control system, coordination, interpersonal relationship, continuous improvement, managing the future, managing customer service, the development of others, acculturation and competitiveness. As a recommendation, efforts were made to develop management skills in 12 managerial competencies, with a primary focus on the development of lower-level managerial competencies.

Keywords: *Management Skills, Assessment, Instrument*

Introduction

Head of Public Health Center is a manager. To place a person as Head of Public Health Center, it takes lot of consideration. It is necessary a Head of Public Health Center as a manager who can bring Public Health Center to be the means to achieve the goal as well as possible. Head of Public Health Center was appointed by Pasuruan City Government based on proposal from Pasuruan City Health Office. In the proposed names was appointed as head of the Public Health Center, Health Office do not make spesific assessment of the management skills of each candidate.

The purpose of this study to assess the management skills of Public Health Center Head and make recommendations on the development of management skills of Public Health Center Heads in Karangketug Public Health Center.

Culture is a shared perception shared by all members of the organization.[1] Organizational culture emerges as a shared assumption held by an organization, as well as a differentiator or a special feature for the existence of an organization. Cameron and Quinn formulate the types of culture within the organization called The Competing Value Framework.[2] Futhermore, Cameron and Quinn develop two quantitative survey instruments called with the Organizational Culture Assessment Instrument (OCAI) and the Management Skills Assessment Instrument (MSAI). Within the OCAI, identified employee perceptions and aspirations about the current and desired organizational culture, which can be categorized into the following four types:

1. **Clan Culture:** The main task of management is to control and nurture employees to make it easier for them to participate.
2. **Adhocracy Culture:** The main task of management is to support and encourage the creation of entrepreneurial spirit and creativity.
3. **Market Culture:** The main task of management is to control the organization to achieve productivity, results and objectives and benefits.
4. **Hierarchy Culture:** The main task of management is to produce goods and services efficiently so as to achieve prosperity in the company.

Management Skills Assessment Instrumen are tools an assessment that helps managers identify the strengths and weaknesses of organizations realize their desired culture.[2] In this article used the MSAI method because there is more division of management skills criteria which will be combined with OCAI as a complement of management skills analysis for the development of managerial capabilities Head of Public Health Center at Karangketug Public Health Center.

Methode Analisis

Types of research: The type of research used is a descriptive method that aims to collect facts, describe, analyze and interpret data into a clear and precise information. The information obtained is a systematic and factual review of management skills Head of Public Health Center at Karangketug Public Health Center.

Sampling Technique: The sampling technique used in this study is total sampling. This means that the entire population in the Karangketug Public Health Center will be taken as respondents.

Data Retrieval Techniques: Data taken from the instrument that has been filled by the boss (Head of Health Office, Secretary of Health Service, Head of Field), peers (Head of Others Public Health Center in Pasuruan City), subordinate (employee of Karangketug Public Health Center), and self (Head of Karangketug Public Health Center)

Data Analysis Technique: Data analysis technique used is descriptive analysis which started with calculation using Management Skill Assessment Instrument (MSAI) which formulated by Cameron and Quinn that is :

1. Grouping the questionnaire items follows the variable operational table above.
2. Calculate the value of each questionnaire item by :

$$Ni = \frac{\text{The total weight of the respondent's answer}}{\text{Number of Respondents}}$$

Information : Ni = value per item

The weight for each respondent's answer is as follows :

Strongly Agree : 5
Agree : 4
Enough : 3
Less Agree : 2
Disagree : 1

3. Calculate the average value of five items representing each managerial skill
4. Plot the average value of each managerial skill to the MSAI diagram
5. The higher the average value indicates that the managerial skills are stronger by following the rules:
   a. 1,00-1,80 (very weak)
   b. >1,80-2,60 (weak)
   c. >2,60-3,40 (enough)
   d. >3,40-4,20 (strong)
   e. >4,20-5,00 (very strong)
6. Comparing the results of judgment in self with others (superiors, peers, subordinates)

Results Analysis

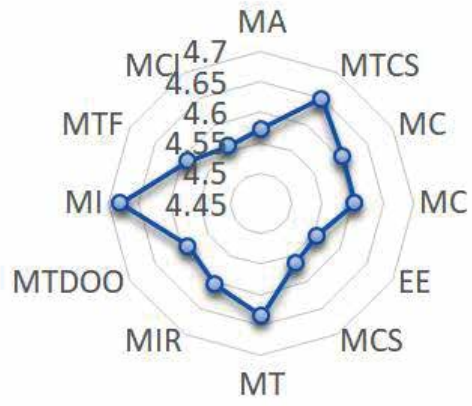
From table 1 it shows that superiors, peers, subordinates assess that the ability to innovate is the most powerfull ability, while the ability to compete get the lowest rating. While from the assessment itself, Head of Public Health Center is very capable of performing managing continuous improvement, energizing employees, managing acculturation and managing coordination. While the ability to compete relatively less than optimal.

Mapping and Managerial Skill Analysis Based on Cameron and Quinn Theory



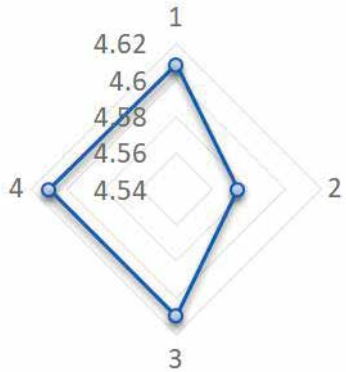


Figure 1: Managerial Skill Mapping from Assessing Superiors, Peer Associates, Subordinates

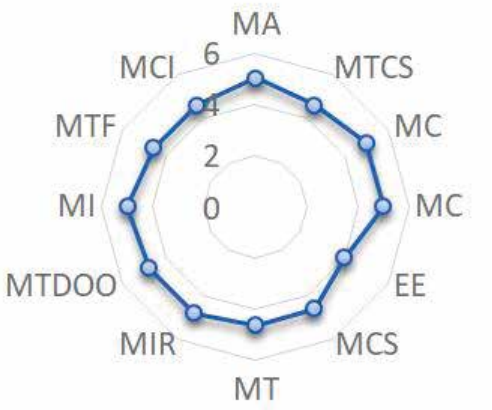
Information: Value for MA (Managing Acculturation) of 4,57241, MTCS (Managing The Control System) of 4,64828, MC (Managing Coordination) of 4,60345, MC (Managing Competitiveness) of 4,60345, EE (Energizing Employees) of 4,55517, MCS (Managing Customer Service) of 4,56207, MT (Managing Teams) of 4,63448, MIR (Managing Interpersonal Relationship) of 4,60345, MTDOO (Managing The Development of Others) of 4,58966, MI (Managing Innovation) of 4,68276, MTF (Managing The Future) of 4,58966, MCI (Managing Continous Improvement) of 4,55862.

Information: Value for hierarchy culture of 4,608, market culture of 4,574, clan culture of 4,609, adhocracy culture of 4,610.

From the mapping above shows that the culture which is dominant is adhocracy followed by clan culture, hierarchy, market. Karangketug Public Health Center has put forward innovation and initiative and also apply family culture in operation of work team culture and needed development in the field of structuring and increasing competition and increasing income.



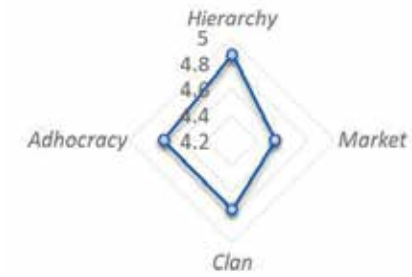


Figure 2: Managerial Skill Mapping from Self Assessment

Information: Value for MA of 5, MTCS of 4,6, MC of 5, MC of 5, EE of 4, MCS of 4,6, MT of 4,6, MIR of 4,8, MTDOO of 4,8, MI of 5, MTF of 4,6, MCI of 4,6.

Information: Value for hierarchy culture of 4,86, market culture of 4,53, clan culture of 4,73, adhocracy culture of 4,73.

From the above mapping shows that the culture which is dominant is hierarchy then followed by the culture of adhocracy then clan terminated market.

There is a clear distinction. Her associates assess the manajer as the weakest in quadrant where managers assess themselves performing quite effectively. The might suggest areas for targeted self-improvement. Most managers judge themselves higher than they are rated by their peers. At present, the assessment is sufficient to help managers gain an overall picture of her managerial streghts and weaknesses. Managers use the feedback data in the report is to identify the competencies that require improvement and competency where changes could facilitate the desired cultural shift.

To improve skills generate employee's energy, Head of Public Health Center need to learn to motivative employees. Motivating employees can be through the provision of incentives, rewards, appreciate what the employee has done.[3] The commitment and the support from the leader is ways to appreciate the contribution, loyalty, dedication and effort of the employees. Motivation to gain training and development opportunities affect employee performance.[3] Managers need to provide working environment, working conditions, interpersonal relationships, organizational policies that are conducive to improving employee performance.[4]

To improve the acculturation capability the Head of Public Health Center needs to use organizational culture as a control management mechanism and to install a trust system among employees.[5]

The Head of the Public Health Center needs to ensure that activities are in line with the plan, objectives are achieved, human and financial resources and material resources are used effectively and efficiently. Therefore the Head of Public Health Center needs to improve her control management. A good management control system should generate motivation for employees.[6]

Head of Public Health Center need to make various innovations for customer. The innovation is a follow up in the competition of health care services. Customer Relationship Management (CRM) includes the methods and technologies companies use to manage their relationships with customers.[7] The information stored for each customer and prospect analyzed and used for personalized automatically based on customer information stored in the system. Rational Unified Process (RUP) is a software development approach that is done repeatedly, focus on the architecture, more directed based on use case (use case driven).[8] The purpose of making use cases is to communicate what is required from the user's perspective. Users who have CCM positions use a management system to perform a reminder that is in the system. Users who have administrative positions CCM use management system to follow up customer after done reminder.

Need to improve managerial skill in managing interpersonal relationships. Management can play a role in promoting friendship and a climate of openness in the workplace, initiate social activities, build a sustainable team, involving employees in the recruitment process, interact with members on a regular basis, talking to everyone, not shouting at one of the employees in public, talking to a team member directly, sit down with the team and help them plan their day.[9] Manager must be accessible to a team member, direct intervention in cases of conflict between subordinates, sitting with the individual, present in informal meeting with subordinates, present for picnic, delegate responsibilities and ask them to take individual responsibility, rewarding employees who perform well, not arrogant, not hurt the team members.

Head of Public Health Center need to improve the future management skills. The development of visionary leadership by motivating employees to produce innovative work, learning to understand about politics, sociology and general managerial techniques, difficult learning, maximize energy to issue quality decisions, thinking and simple logic, dare to take risks.[10]

The Head of Public Health Center need to improve the skill of managing innovation. When innovation is not perceived by the organization as a challenge, there will be no innovation.[11] Innovation should be part of agency activities, must be interesting and useful, the best way to preserve and perpetuate the organization. The importance of the need for innovation and the time frame must be defined and elaborated. There needs to be an innovation plan, with a specific purpose.

The Head of Public Health Center need to improve the skill of managing the competition. Management is actively taking advantage of opportunities and strategically controlling the effectiveness and effectiveness of its activities, observing new trends and will occur in the future, observe and evaluate the economic trends, maximize information technology to strengthen the effectiveness and efficiency of marketing and services, improve employee productivity.[12]

The Head of Public Health Center need to improve skill of continuous improvement. Continuous improvement requires management support,[13] provide evidence of its commitment to the development and implementation of the quality management system and continue to improve its effectiveness, should be included in the quality policy. Also the management review to be done at planned intervals should include assessments of opportunities for improvement and the need for changes to the quality of the management system including quality policy and quality objectives.

The Head of Public Health Center need to improve the coordination management skill. The success of organizational activities depens on the division of labor, how the work will be designed, how the delegation of authority works, every member of the organization must be clear who does what, divided tasks are certainly running toward the goals of the organization.[14] Organize work, coordinate the entire process by dividing it into smaller operations, through work instructions, schedules, specification procedures.

The Head of Public Health Center need to improve the self managing team skill. The role of a leader is crucial to the organization's progress when it comes to providing support for the team's success.[15] The leader must be to build relationships and political awareness among members of the team or organization, guide information and keep up with activities by monitoring both inside and outside the team, invites team members or organization to always attend a meeting of the organization, empowering team.

Conclusion

(a) The implementation of managerial skill for all cultures into the category is very strong.

(b) Application of hierarchy culture managerial skill need to be limited because it will hamper the optimization of the application of market and adhocracy culture.

Suggestion: It takes an increasing application of market culture in order to increase competition and increase revenue.

Ethical Approval: Related departments should be assured about the confidentiality of the results of questionnaires.

Conflict of Interest: The authors report no conflict of interest.

Assessment of the Anatomical Causes of Persistent Nasal Obstruction after Primary Septorhinoplasty

Salim Hussain Ibrahim

Assist. Prof. Otorhinolaryngology, Head and Neck Surgery, Department of Surgery, Tikrit Medical College, Tikrit University, Salah Aldin, Iraq

ABSTRACT

Background: Septorhinoplasty is an operation for improving the appearance of the nose and nasal breathing, but persistent nasal obstruction may occurs and may require revision surgery.

Objectives: To determine the incidence and significance of persistent nasal obstruction after septorhinoplasty with different external nasal deformities. To recognize the anatomical structures that cause persistent nasal obstruction and their surgical correction.

Patients and Method: A prospective case study of 39 patients who have persistent nasal obstruction from a total 230 patients who underwent closed septorhinoplasty at Tikrit Teaching Hospital and Private practice between January 2014 and June 2017. The nasal obstruction was subjectively graded by using Nasal Obstruction System Evaluation (NOSE)scale.

Results: Persistent nasal obstruction was found in (17%) after a minimum one year post operatively. It was common in patients with deviated nose (20.6%). The nasal septal deviation was the common anatomical cause (69.2%),surgical interference was indicated in (66.7%), and revision septoplasty was the common surgical procedure used (66.4%).

Conclusion: There was no statistically significant association between external nasal deviation with occurrence and severity of nasal obstruction,and between severity of nasal obstruction and type of external nasal deviation after septorhinoplasty. The surgical planning for septorhinoplasty must be taken in consideration the improving nasal air way, as well cosmetic outcome, to avoid revision surgery that are challenging operation with risk of septal perforation.

Keywords: *Deviated nose, Nasal obstruction, Septorhinoplasty.*

Introduction

Septorhinoplasty is a cosmetic nasal surgery done to improve the appearance of the nose and nasal breathing. The correction of nasal septum plays a vital role in straighten the deviated nose and improve nasal respiration[1,] Nasal obstruction may be persistent in some patients who have had septoplasty or rhinoplasty [2,3].Despite the cause of the persistent nasal obstruction commonly multifactorial [4], the inadequate correction of the deformities would be the main cause[7]. The reduction rhinoplasty decreases the cross-sectional area of the nasal valve by 25% and the piriform aperture by 13% [2].This is due to hump removal,lateral osteotomy and over resection of the lower or upper lateral cartilage that resulting in nasal valve collapse, So that septoplasty indicated even for simple asymptomatic septal deviation.

This study was designed to determine the incidence and significance of persistent nasal obstruction after septorhinoplasty with different external nasal deformities. To recognize the anatomical structures that cause persistent nasal obstruction and their surgical correction.

Patients and Method

A prospective case study of 230 patients who underwent closed septorhinoplasty during the period from January 2014 –June 2017 in Tikrit Teaching Hospital and private practice in Salah-Eldin Governorate,Iraq. The patients who had persistent nasal obstruction were 39. They were collected when they visited the clinic for follow up or by telephone contact follow-up surveys, when the patient tells us that he has a nasal obstruction, ask him to attend the clinic for clinical examination. All patients are clinically evaluated includes history, date of primary surgery, external nasal examination, anterior rhinoscopy, nasal endoscopy and CT scan for nose and paranasal sinuses. All patients the primary surgery had been done at least since one year ago, and the nasal obstruction was secondary to anatomical nasal deformities. The patients who have nasal obstruction due to nasal mucosal disease alone like (rhinosinusitis, allergic rhinitis,non-allergic rhinitis) were excluded from the study. Preoperative photograph and operative notes of primary septorhinoplasty were reviewed for side and site of anatomical causes for septal deviation, turbinate, nasal valve area, and the operative procedure.

The patients were divided into two groups. Patients who had external nasal deviation were 165 (71.7%), and patients with no external nasal deviation were 65(28.3%).

The subjective sensation of patient about his or her postoperative nasal breathing was assessed by using Nasal Obstruction Symptom Evaluation(NOSE) scale(Table1).The questionnaire was administered to the patient to answer on the items. The NOSE survey consists of 5 items, each have score on a scale ranging from 0 to 4, and these scores were multiplied by 5, generating a balanced scale from 0 to 100. Patients were categorized as having mild (range, 5-25), moderate (30-50), severe (55-75), or extreme (80-100) nasal obstruction[5].

Table 1: Nasal Obstruction Symptom Evaluation (NOSE) scale

Item	Not a problem	Very mild problem	Moderate problem	Fairly bad problem	Severe Problem
1.Nasal congestion or stiffness.	0	1	2	3	4
2.Nasal blockage or obstruction.	0	1	2	3	4
3.Trouble breathing through my nose.	0	1	2	3	4
4.Trouble sleeping.	0	1	2	3	4
5.Un able to get enough air through my nose during exercise or exertion.	0	1	2	3	4

Findings

The study showed that 39 patients (17 %) presenting to the author with complaint of persisting nasal obstruction despite prior septorhinoplasty since more than one year ago. 22 (56%) were males and 17(44%) were females. Patients age ranged from 23-38 years, with a mean of 25.3 years.

The grading of nasal obstruction according to (NOSE)scale was : Patients with mild nasal obstruction 12 (5%), moderate nasal obstruction 23 (10%),and severe nasal obstruction 4 (2 %). No patient with extreme nasal obstruction.

The post septorhinoplasty nasal obstruction were common in patients with deviated nose 34/165 (20.6%) , in S-shape nasal deviation was 7/19 (37%) ,C-shape was 22/110 (20%) , and in deviation to one side was 5/36 (14%) (Figure 1) (Table 2) Patients without external nasal deviation the nasal obstruction was 5/65 (8%) (Table 3).

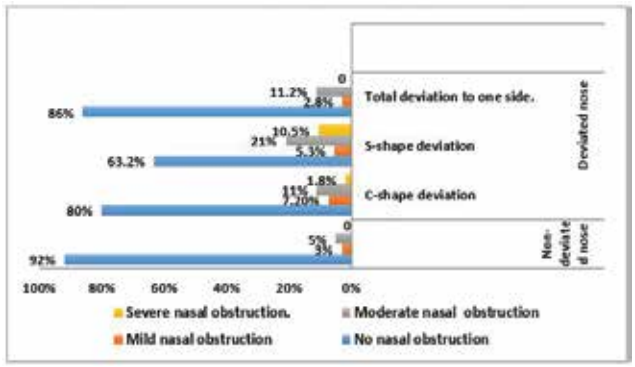

Figure 1: Bar chart shows the severity of nasal obstruction post septorhinoplasty related to the external nasal deviation

Table 2: The relation between type of deviated nose and severity of nasal obstruction

Nasal obstruction	Type of external nasal deviation						Total	
	C-shape deviation		S-shape deviation		Deviation to one side			
	Number	%	Number	%	Number	%	Number	%
No nasal obstruction	88	80	12	63.2	31	86	131	79.4
Mild nasal obstruction	8	7.2	1	5.3	1	2.8	10	6
Moderate nasal obstruction	12	11	4	21	4	11.2	20	12.2
Severe nasal obstruction	2	1.8	2	10.5	0	0	4	2.4
Total	110	66.7	19	11.5	36	21.8	165	100

Chi square(χ^2) = 9.36, d.f.=6, P-value= 0.01, Correlation=0.231

Interpretation: There is no significant association between severity of nasal obstruction and type of external nasal deviation.

Table 3: The relation between external nasal deviation and severity of nasal obstruction

Nasal obstruction	Non deviated nose		Deviated nose		Total	
	Number	%	Number	%	Number	%
No nasal obstruction	60	92	131	79.4	191	83
Mild nasal obstruction	2	3	10	6	12	5.2
Moderate nasal obstruction	3	5	20	12.2	23	10
Severe nasal obstruction	0	0	4	2.4	4	1.8
Total	65	28.3	165	71.7	230	100

Chi square(χ^2)= 5.93, d.f. =3, P-value =0.01

Correlation: There is no significant association between external nasal deviation with occurrence and severity of nasal obstruction.

From a total 39 patients with nasal obstruction,26(66.7%) was treated surgically and 13 (33.3%) with medical treatment (Table 4).

Table 4: Options of treatment of nasal obstruction

Treatment options	Number (n = 39)*	(%)
Medical treatment	13	33.3
Revision Septorhinoplasty	4	10.2
Revision endonasal septoplasty	11	28.2
Extracorporeal septoplasty	3	7.7
Reduction of inferior turbinates.	11	41
Endoscopic resection of lateral border of concha bullosa.	2	5.1
Placement spreader graft.	6 (on 9 sides)	15.4
Division of synechiae.	1	2.6

*The total number of patients in the column is 51 instead of 39,because multiple treatment modalities are implemented in many patients.

The 26 patients who underwent surgical treatment for their nasal obstruction the endoscopic examination and CT scan has been showed that 18 (69.2%) had nasal septal deviation, 11(42.3%) had hypertrophied inferior turbinate ; 6 (23%) had nasal valve collapse; 2(7.7%) had concha bullosa; and one patient (3.8%) had synechiae between septal mucosa and inferior turbinate.(Table 5)

Table 5: Anatomical pathology of persistent nasal obstruction in 26 patients who treated surgically

Obstructive Anatomical pathology	Number (n = 26)*	Percentage (%)
Septal deviation	18	69.2
Hypertrophied inferior turbinates	11	42.3
Nasal valve collapse	6	23
Concha bullosa	2	7.7
Synechiae	1	3.8

*Total number of patients in the column is 38 instead of 26,because several patients have multiple pathologies.

The anatomical locations of septal deviation in 18 patients who underwent revision septoplasty, were caudal septal deviation 6 patients (33.3%), Mid septum bony-cartilaginous junction 4 (22.2%), Dorsal septum deviation 3(16.7%), Bony septum spur 2 (11.1%) (one vomerine spur and one maxillary crest spur),and Multiple sites was in 3 patients (16.7%).

The surgical techniques performed were revision septoplasty for 14 patients (53.9%){ Endonasal septoplasty for 11 and extracorporeal septoplasty for 3 },revision septorhinoplasty for 4 (15.4%),reduction of inferior turbinate in 11 (42.3%), spreader graft placement in 6 patients(23%) on 9sides, Endoscopic resection of lateral border of concha bullosa 2 (7.7%),and synechiolysis in one patient (3.8%) (Table 4).

There were no statistically significant association between severity of nasal obstruction and type of external nasal deviation(Table 2), and no association between external nasal deviation with occurrence and severity of nasal obstruction (Table 3).

Follow up for a minimum 6 months, the nasal obstruction was relieved in all cases. Asymptomatic septal perforation was occur in 2/18 patients (11.1%) who underwent revision septal surgery.

Discussion

The current study is considered the first on persistent nasal obstruction follows closed septorhinoplasty, that compares between the different types of deviated nose and non-deviated nose. Most studies have only focused on persistent or recurrent nasal obstruction after septoplasty or rhinoplasty alone[1,6,7,8].

The nasal septum deviation in the deviated nose is commonly of traumatic cause [9], where multiply fractured bony and cartilaginous septum, and abundant scar tissue,this made septoplasty to be quiet difficult[7]. The patient who have a grossly deviated septum, the persistent septal deviation may be due to failure of correction of original anatomical cause. Sometimes despite a perfectly straight nasal septum was achieved in primary surgery, it may be different one year later [10]. The cartilage memory and scar contracture predispose to recurrence of the deviation [11], if the cartilage memory is not altered sufficiently, it often returns over time to its initial curvature.[4]

However, the observed difference in the occurrence of persistent nasal obstruction between deviated nose than non- deviated nose and between the types of external nasal deviation. (Table 2,3),(Figure 2), these results Interestingly were not statistically significant

Persistent nasal obstruction is one cause that made patients seeking revision surgery. Kathy Yu.(2010) noticed (62%) of patients seeking for revision rhinoplasty were experienced nasal obstruction [12]. Thomson (2007) demonstrated that the Major indication for revision rhinoplasty was air way obstruction in (59.2%) then cosmetic causes [13].Gerhard (2007) reported that breathing problems are the main complaint in 70% of the patients for revision rhinoplasty, and 10% of the patients complain about residual or new breathing problems after primary rhinoplasty[3].

Deviated nose is mostly due to caudal and dorsal cartilaginous deviation.Therefore the surgeon who concentrate on the cosmetic outcomes, may be missed inferior bony spur, hypertrophied turbinate or large concha bullosa. Other reason for missing anatomical nasal obstruction is that the CT scan for the and paranasal sinuses was not routinely performed as pre operative preparation for septorhinoplasty, that may results in a defect nose in preoperative assessment.

The patient's satisfaction about his or her nasal obstruction after septorhinoplasty has variable results according to surgeon's experience from (84%)[14] (90%)[15]and (91.5%)[16]. Foda (2013) [17] was demonstrated that 76% of the patients with crooked nose were reported improved breathing post septorhinoplasty.

The medical treatment includes steroids, decongestants, and antihistamines, that was found to improve nasal obstruction in (33.3%) of patients with mild and moderate nasal obstruction. Despite there are no medications correct anatomical obstruction,but medication can decreasing mucosal swelling due to rhinosinusitis, allergic or non -allergic rhinitis to maximize nasal opening.

The defective nasal septum due to aggressive septoplasty that may be indicated for severely deformed nasal septum, with an unknown amount of cartilage or bone present, and disrupted tissue planes all made revision septoplasty is a challenging procedure as difficult dissection in compromised nasal septum with subsequent septal perforation that occurs in (11.1%). It

is important that in revision septoplasty to palpate the septum to find the areas of excised septal bones and or cartilage before attempting any septal flap elevation. Extracorporeal septoplasty was performed in 3 patients, when the author found that it is difficult to get stable and straight nasal septum by endonasal septoplasty.

Revision functional septorhinoplasty was performed to 4 from 230 patients who underwent septorhinoplasty (1.73%). Emily (2016) reported (2.5%) of revision functional septorhinoplasty was performed because of nasal airway obstruction[18].

Adjunctive turbinate reduction is advisable in patients underwent septorhinoplasty[9],this will increase the cross-sectional area at the nasal valve [7] and will be improve nasal breathing The author used (Out-fracture of the turbinates with microdebrider assisted submucosal turbinoplasty). Although the proper treatment of underlying causes for turbinate hypertrophy are important to obtain good long term results after turbinate surgery[19].

The internal nasal valve obstruction in deviated nose was frequently caused by caudal septal deviation [20],and should be considered in patients with a severe dorsal deflection and a narrowed middle vault [21],if it is not recognized and corrected during the operation, will contributes to post-septorhinoplasty nasal obstruction[4]. Serhan (2016) report alar collapse was seen in 6% of the patients with persistent nasal obstruction follows septoplasty [8]. Khosh (2004) found (79%) of patients who underwent nasal valve reconstruction for nasal valve collapse was due to previous rhinoplasty [22]. The author was used closed (endonasal) approach for all revision septoplaty or septrhinoplasty. The spreader graft has been inserted in 5 sides between upper lateral cartilages and septal cartilage when not divided them, and secured in a tunnel, when the septal cartilage has been separated from upper lateral cartilage,the graft fixated with transcutaneous and transseptal sutures was placed on 4 sides.

A limitation of this study is that many patients encounter difficulty in responding accurately on the NOSE scale survey. The (NOSE)Scale is a valid, reliable, and responsive instrument [23],but the questionnaire required intelligent respondents to give information, the simple patient has difficulty particularly to determine the differences from the very mild, moderate, fairly bad and severe problem for each item on the questionnaire (Table 1), this has made it difficult to determine the grade of nasal obstruction accurately. If the symptoms of each problem have been clarified the answer will be accurate. In this study used the closed septorhinoplasty approach, our future perspective of this study to compare our results with open septorhinoplasty approach.

Conclusion

The study has found that most of patients with nasal obstruction were relieved by septorhinoplasty. There was no statistically significant association between external nasal deviation with occurrence and severity of nasal obstruction ,and not between severity of nasal obstruction and type of external nasal deviation after septorhinoplasty. It was observed that nasal septal deviation was the common anatomical cause of persistent nasal obstruction. The surgical planning for septorhinoplasty must be taken in consideration the improving nasal air way, as well cosmetic outcome, to avoid revision septal surgery that are challenging operation with risk of septal perforation.

Diagnosis of *Trichomonas Vaginalis* Infection by Detection of Glutaminase (*Glut*) Gene by Nested PCR

Faten Ahmed Hassan[1], Huda Dhaher Al-Marsomy[2], Suhad Asaad Mustafa[3]

[1]Children Welfare Hospital, Medical City, Baghdad, Iraq; [2]Department of Microbiology, College of Medicine, Al-Nahrain University, Iraq; [3]Salahaddin University-Erbil, Kurdistan region of Iraq

ABSTRACT

Trichomonas vaginalis (*T. vaginalis*) is a common pathogen with a cosmopolitan distribution. Trichomoniasis is associated with vaginitis, cervicitis, low birth weight, preterm delivery, and infertility. Glutaminase (glut) p3 gene which is a housekeeping gene increases the detection of *T. vaginalis* efficiency when used as a marker of Trichomoniasis. In this study (glut) P3 gene was depended for parasite detection by nested PCR and compared with conventional methods like wet mount and culture in the detection of *T. vaginalis* in vaginal discharge. Two vaginal swab specimens were obtained from 157 cases, of **(**mean age = 31.79 ± 9.21 years), both symptomatic and symptomatic females attending Gynecology OPD of Al-Emamayn Al-Kadhimayn Medical City in Baghdad and Maternity Teaching hospital in Erbil province, Iraq. One swab was immediately examined by wet mount microscopy and then placed in CPLM medium for cultivation, and another swab is placed in PBS buffer for PCR method. A total of 100 samples positive in one or more tests were identified: 20 (12.7%) infections were detected by wet mount microscopy, and 30 (19.1%) positives in culture. P3 nested PCR was positive in 100 (63.7%) samples. PCR appears to be the most sensitive method with high detection rate and method of choice. Furthermore nested PCR increases the sensitivity and specificity of PCR, and Glutaminase (*glut*) p3 gene can be efficiently used for detection of *T.vaginalis*.

Keywords: *T.vaginalis; Glutaminase (glut) p3 gene; nested PCR*

Introduction

T. vaginalis is a globally occurring anaerobic/ microaerophilic protist parasite which settles down the epithelium of the human urogenital tract [1]. *T.vaginalis* infections can cause inflammation in the cervix, the vagina, and the urethra [2]. Based on estimates of the World Health Organization (WHO) from 2016 [3], trichomoniasis constitutes the most prevalent non-viral sexually transmitted disease (STD) worldwide, affecting approximately 160 million people every year. Males and females are infected with comparable frequency, but in male's symptoms are normally mild, and infections are cleared by the host's immune system within weeks [4]. In females, however, infections can persist for many years, and symptoms, mainly pruritus caused by inflammation and odorous vaginal discharge, can attain a severity which is debilitating [5-7]. A large number of studies from the last 30 years or so, however, have shown that underlying T.V. infections increase the risk of adverse pregnancy outcomes and contagion with HIV virus (2 to 2.5) [8]. Diagnosis of trichomoniasis cannot be made solely on the basis of clinical presentation, because the clinical symptoms may be synonymous with those of other STDs [9], so various laboratory methods have been employed for the detection of *T. vaginalis* in vaginal discharge which varies in their sensitivity and specificity [10]. Wet mount microscopy is a simple, rapid, and inexpensive while culture in a microaerophilic condition is more sensitive [11]. There are many cultures used for *T. vaginalis* isolation and detection such as Kupferberg's medium Diamond medium, Feinberg's medium. Cysteine/Peptone/Liver infusion/Maltose (CPLM) and In-pouch TV system. Culture techniques have not been readily available but would be the most effective way

Email: Hudaalmarsome@yahoo.com

of establishing the true epidemiology of *T vaginalis* [12]. Molecular assays provide distinct advantages over other types of diagnostics because screening for Trichomonas has a high potential for identifying previously missed infections. PCR is based on DNA amplification and detection using known primers to *T.vaginalis* specific genes. In addition, Multiplex PCR appeared more useful for simultaneously detect coinfecting pathogens. Real-time PCR assays were used in a number of studies to test for *T. vaginalis* DNA, targeting the β-tubulin genes, revealed that the sensitivity of this technique was more than culture and wet mount [13]. A nested PCR is one in which the product of a PCR is subjected to the second round of amplification using primers internal to those employed for the first round. Nested strategies increase the sensitivity of the assay enormously[14].

Patients and Method

Samples: High vaginal swabs (157) were collected from symptomatic and asymptomatic women (mean age = 31.79 ± 9.21 years) suspected to trichomoniasis and referred to out- patient's gynecology ODP at Al-Emamayn Al-Kadhimayn Medical City in Baghdad and maternity Teaching hospital in Erbil province, Iraq. Clinical manifestations of infected women included purulent vaginal discharge, purities, dyspareunia, leucorrhoea, and dysuria. At the time of per-speculum examination, two vaginal swabs from the posterior fornix and also touching both lateral fornices and middle third of the vaginal wall were taken, using sterile cotton swabs. Specimens collected prior to disinfection or local antibiotic used for routine microscopic examination and to inoculate culture medium, while the second one was placed in 0.5ml of PBS and submitted to the molecular laboratory for PCR testing.

Wet mount preparation: The swab inoculated with vaginal discharge for each patient was gently agitated in one drop of normal saline on a clean slide and then covered with a coverslip. The wet mount was examined with 40 objectives, and the presence of motile *T. vaginalis* was detected by the characteristic twitching motility (Fig.1).

Fig. 1: Wet mount method in detection of T. vaginalis (arrow)

Cultivation: Trichomonas modified cysteine/peptone/ liver-infusion maltose Culture Medium (CPLM).

This medium was prepared as follow:

Fifty-six gram of medium was suspended with 900 ml of distilled water, and then the mixture was sterilized using autoclave at 121 ºC for 15 minutes. The medium cooled down to 50ºC, then 10 ml of inactivated horse serum and 1 ml of antibiotic solution (50 µg of gentamicin/ml, 40 µg of ciprofloxacin/ml, and 50 µg of miconazole/ml) were added before the medium was dispensed into glass containers. Then two of these prepared medium containers were incubated overnight at 37 ºC for sterility testing. Before inoculation of the medium, the culture universal bottles were warmed up to 37C° for 15min. The vaginal swabs were placed into the medium and left to incubate at 37 C° for 7days. The cultures were examined microscopically on days 2, 5 and 7 after inoculation. A positive result is defined as the presence of motile *T. vaginalis* at any time; a negative result was defined as the absence of motile *T. vaginalis* at all readings.

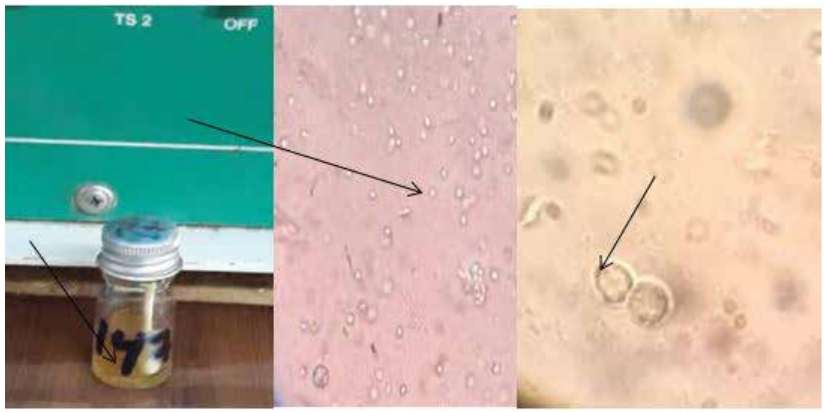

Fig. 2: Culture method in the detection of *T. vaginalis* (arrows)

DNA Extraction: A ready gSYNC™ (Geneaid England) DNA kit (Catalog no. GS100) was used for DNA extraction (according to the manufacturer instructions).

Nested PCR primers: The primers based on *T. vaginalis* (*glut*) p3 gene for PCR identification were used. The sequences of primers were as follows:

Glutaminase (*glut*)P3 (outer):	F	AAACGCTGGTGCCATTACAAC
	R	AAGGTTCTTGCCACGGATTG
Glutaminase (*glut*) p3 (inner):	F	TCGTTAATAGTGGGTAAGGACG
	R	CCAAGTATAGCTCCGCTGAC

PCR protocol: PCR reactions for the first rounds were performed with an automated thermocycler. The total volume of PCR reactions was 25µl, 12.5 µl of the master mix, 3µl of the DNA extracted, 3µl of forward and reverse outer primers and 6.5µl were added to the PCR tube. The amplification was performed in the PCR tubes, and the procedure is as follows:

The first round program

Initial Denaturation: 95°C- 5 minutes.1 cycle.

Subsequent denaturation: 93 C°- 30 seconds.35 cycles.

Annealing: 57C°-30 seconds.

Extension: 72 C°- 1.0 minute.

Final Extension:72C°-10 minutes.1 cycle.

Termination: 4 C° to time end.

The second round program:

Initial Denaturation: 95C°- 5 minutes.1 cycles

Subsequent denaturation: 95 C°- 1.0 minutes.40 cycles.

Annealing: 57C°-1.0 seconds.

Extension: 72 C°- 1.5 minute.

Final Extension:72C°-10 minutes.1 cycle.

Termination: 4 C° to time end.

Gel electrophoresis: PCR amplification products were visualized under UV light (trans illuminator) after electrophoresis on 1.5 % agarose gels in Tris-acetate-EDTA buffer pH 8.5 (30 min at 5 V/cm) and staining with ethidium bromide (0.5µg/ml). The size of the amplified products 451 (bp) was assessed by comparison with a commercial weight marker 100-1000 (bp), Smart Ladder (Bioneer|Korea) and photographed by the digital camera.

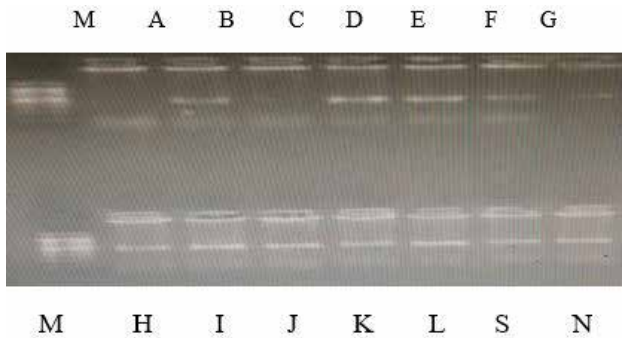

Fig. 3: Gel electrophoresis of glutaminase (*glut*) P3 gene amplified with specific primers. Lane A, negative result while lanes B,C,D,E,F,G,H,I,J,K,L,S and N were positive (451 bp). M: molecular marker.

Sequencing: Gene sequences were analyzed to ensure that the sequences were from *T. vaginalis*. Amplicons

(20 µl) were sent for purification and sequencing to Macrogen (South Korea), using the Big Dye Terminator method. Sequencing was performed bi-directionally using the same primers used in PCR amplification of the (*glut*) p3 gene.

Results

Three laboratory methods were utilized for detection of *T. vaginalis* in this study (Table. 1). PCR positivity for *T. vaginalis*, was considered a gold standard to compare the other methods. Culturing came second with an overall efficiency of 32%. Finally, wet mount came last with an overall efficiency of 20% Accordingly the sensitivity and specificity of culturing, staining and wet mount were 32% and 100%; 26% and 100%; 20% and 100% respectively.

Table 1: Sensitivity and specificity of wet mount and culture in comparison with PCR

Investigation		Total
Wet mount	Sensitivity	20.0%
	Specificity	100%
Culture	Sensitivity	32.0%
	Specificity	100%

Discussion

Rapid and sensitive diagnosis of *T. vaginalis* infection is important for appropriate treatment and to reduce the spread of the disease. Although wet mount is routinely performed for this purpose, this technique has a low sensitivity [15]. The present study showed low sensitivity of wet mount method; it was 20% when compared with PCR, whereas 80 positive samples would have been missed if PCR not had been used. The false-negative test can result from many variables include low parasite load, the time interval between specimen collection and microscopic examination (>10 minutes), and clinician skill [16]. *T. vaginalis* is perishable in external conditions; it loses its motility, retracts its flagella and change its morphology by becoming rounder (may call pseudocysts) and then becomes difficult to be distinguished from similar structures, such as leucocytes [17,18]. Although culture method is more sensitive than wet-mount microscopy, the main limitations for its routine use include the cost, contamination with bacteria (major problem), even with broth cultures spiked with antibiotics to eliminate vaginal flora, causing the transmission from fast growing to slow growth of the parasites [19]. Incubation periods ranging from 2-7 days are required to identify *T vaginalis* in culture, and the need to delay treatment until the results are available [20]. In the present study, nested PCR rather than culturing was considered the gold standard for *T. vaginalis* detection. Accordingly, the sensitivity and specificity of culture, and wet mount were 32% and 100%; 20% and 100% respectively. These results partially agree with the different studies in this regard. In a local study, Kareem M. (2017) [21], investigated 200 women (age range 15-54 years) with abnormal vaginal discharge using two laboratory methods: wet mount, and real-time PCR. The detection rate of *T. vaginalis* was 12.5% and 17% respectively. Similarly, Merdaw M. (2016) [22] used wet mount and culturing method for *T. vaginalis* detection in vaginal swabs from 154 women (age range 15-54 years). Culturing had a priority in the detection of this protozoon (34.41%) compared with wet mount (13.63). In the present study the single copy housekeeping gene, Glutaminase (*glut*) p3 [23], were subjected to two successive rounds of nested PCR, furthermore, the outer and inner sets of primers used in the annealing step of amplification process were retested by NCBI for specificity to *T.vaginalis* Glutaminase (*glut*) p3 gene and not to human, other trichomonads, nor any organisms registered in Genbank. The detection rate was very high, diagnosing one hundred positive *T.vaginalis* infection in (non-cultured) clinical samples obtained from symptomatic and asymptomatic women in comparison to only [7] seven isolates of Merdaw or the 17% detection rate of Kareem. Globally, many studies reported that, PCR appears to have high sensitivities and excellent specificities for vaginal samples than wet mount and culture and it requires expertise and availability [17]. Dr. Kiranmai and Dr. A. Neelima (2016) [24] in India, they analyzed a number of clinical samples by wet mount, culturing in Whittington medium, and conventional PCR based on amplification of *T. vaginalis* β-tubulin gene in 200 females, concluded that none of the diagnostic assays could detect all positive samples, but PCR showed a higher detection rate than others in the detection of *T. vaginalis* in vaginal swab samples. Culha *et al*. (2015) compared the efficiency of three methods (wet mount, culturing on trypticase-yeast extract-maltose (TYM), and conventional PCR) for detection of *T. vaginalis* in clinical samples from 200 symptomatic Turkish women (age 20-50 years). Surprisingly, the detection rate of wet

mount and PCR was equal (42.8%), while the detection rate for culturing method was 32.1%. The authors demonstrated that there was no statistical superiority for PCR over the wet mount. In accordance with the present result is a recent study conducted in an STD clinic in Alabama in which the prevalence of *T. vaginalis* was 19.6% by wet mount and 27% by NAATs (Muzny *et al.,* 2014) [25]. Furthermore, Nathan *et al.* (2015) [26], stated that wet mount is only 40-60% sensitive even among symptomatic women, and the nucleic acid amplification tests (NAATs) became the golden standard for screening and diagnosis of *T. vaginalis.* Thus, it is obvious, that most studies have considered molecular detection as the gold standard for detection which is in accordance with the current study.

Conclusion

The incidence of *T. vaginalis* infection was quite high in symptomatic and asymptomatic infected women. Diagnosis of *T. vaginalis* can be efficiently made by detecting Glutaminase (*glut*) p3 gene other than Actin or Beta-tubulin genes and nested PCR test in this study provides an efficient diagnostic tool for detection of *T. vaginalis* in direct (non-cultured) clinical samples.

Conflict of Interest: The author declares no conflict of interest.

Source of Funding: This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Ethical Clearance: Each patient included in this plan signed an informed consent form, detail of the method and agent used with the possible failure of this option and approved by the Ethics Committee of the Medical Research Institute (ECMRI).

Burnout Syndrome among Physicians Working in Primary Health Care Centers in Baghdad, Al-Rusafa Directorate, Iraq

Abdul Munem Al Dabbagh[1], Ali Hassan Hayyawi[2], Maha Saber Kochi[3]

[1]Professor, Chair of Iraqi Board in Family and Community Medicine; [2]Community Medicine specialist Al-Yarmouk Teaching Hospital, Baghdad, Iraq; [3]Family Medicine Specialist, Baghdad, Iraq

ABSTRACT

Introduction: Burnout syndrome has been one of the most widely discussed mental health problems.

Subjects and Method: A cross-sectional analytic survey conducted in a primary health care centers.

Results: Most of the respondents who had high burnout were working at primary health center (33.3%), General Practitioner (33.3%).

Keywords: *Burnout, Exhaustion, Job stress*

Introduction

The phenomenon of "burnout" emerged as a major social issue in the United States in the mid-1970. Burnout is a potential problem within a wide range of occupations such as medical staff, teacher, and social worker [(1)].

In recent years, burnout syndrome has been one of the most widely discussed mental health problems in modern societies. In a world that faces major socioeconomic challenges people experience ever-increasing pressure in their daily lives, particularly at the workplace [(2)(3)].

Globally many studies had been conducted addressing burnout among "Medical Professionals" like the one conducted in United State [(4)], and in Europe [(5)]. Regionally in Qatar [(6)], in Saudi Arabia [(7)], and in Iran [(8)].

Nationally a study conducted among physicians had documented moderate emotional exhaustion (EE), high depersonalization (DP), and moderate personal accomplishment (PA) [(9)].

Rationale: In Iraq we believe that physicians are over whelmed by the daily workload during the formal working hours this may lead to frustration and psychological distress; in addition, many social and cultural issues contribute to the negative effect of being overloaded by work. And because little is known about professional burnout, job satisfaction, and motivation among physicians working in primary health care centers.

The current study was sought to shed the light on the extent of burnout among physicians working in the primary health care centers, and to find out factors associated with occurrence of burnout syndrome among the selected sample group.

Subjects and Method

A cross-sectional analytic survey. The study was conducted in Primary Health Care Centers (PHC) of six sectors that constitute the central region of Al-Rusafa Health Directorate/Baghdad. Fifty percent of PHCs were selected randomly from a list of each sector. Data were collected from first April till the end of June 2017.

A convenient sample of 134 physicians from the randomly selected PHCs was asked to participate in this study. Six physicians refused to participate in the study gave a response rate of (95.7%). All physicians who had at least one-year work at the center, and available during period of study represented the targeted study population.

Data Collection tool: The data was collected by researchers through previously prepared and validated self-administered questionnaire. The questionnaire used consisted of two Parts: **First part:** concerned with informations about socio-demographic and educational characteristics of study participants; **Second Part:** using Maslach Burnout Inventory (MBI) to assess the burnout status which consisted of three domains: Emotional exhaustion (9 questions); Personal accomplishment (8 questions); Depersonalization (5 questions). Each question is rated according to the frequency of occurrence on seven points Likert scale from zero (never), one (few/year), two (monthly), three (few/month), four (weekly), five (few/week) to six (daily). Burnout syndrome is multidimensional construct therefore the sub-scales are combined to reveal one burnout ultimate score. As a final result the high burnout in this study was defined as high scores of emotional exhaustion high depersonalization and high reversed personal accomplishment. Eventually the scale of burnout was categorized as low when the total score (1-33), moderate (34-66) and high (67-99.9)[10].

Pilot study: was carried out on 10 physicians (who were not included in final study).

Ethical Consideration: A formal clearance was taken from the Ethical Committee of Al-Rusafa Health Directorate/Baghdad, and additional consent was taken from the chosn six health sectors. Moreover, the researchers obtained verbal consent of all participants.

Statistical Analysis: Data were imported to statistical package for social sciences (SPSS) version (23). Assuming that our data was approximating normal distribution, for that we use parametric test of significance but not non-parametric test used usually with data obtained by this scale. Chi-square test was used to explore the existence of a statistically significant relationship between the categorical variable. P value ≤ 0.05 were considered statistically significant. Various multilevel logistic regressions with cross effects to investigate the connection between having burnout and the factor associated with burnout syndrome.

Results

The socio-demographic characteristics of participants are shown in (table 1). The majority of the participants were between (30-39) years of age (47.7%), mostly female (64.8%). Also 82.8% of the study group was married and those who had 1-3 children constituted 79.3% of study group, 64.9% of participants were working at PHC and 83.6% of them had no managerial position. Most of the participants were holding the Bachelor educational level (59.7%). and the majority was nonsmokers (86.6%). More than two third (73.1%) of respondents had no chronic illness.

Table 1: Essential characteristics of respondents

Characteristics		N	%
Age group	<30	12	9.0
	30-39	64	47.7
	≥40	58	43.3
Gender	Male	47	35.1
	Female	87	64.8
Marital status	Single	23	17.2
	Married	111	82.8
No of children	1-3	88	79.3
	≥4	23	20.7
Education level	Bachelor	80	59.7
	Diploma	15	11.2
	Doctorate	38	28.4
Work place	Primary health center	87	64.9
	Family health center	47	35.1
Job title	General practitioner	81	60.5
	Family physician specialist	46	34.3
	Other specialty	7	5.2
Managerial position	No	112	83.6
	Yes	22	16.4
Smoking	No	116	86.6
	Yes	18	13.4
Chronic disease	No	98	73.1
	Hypertension	16	11.9
	Ischemic Heart Disease	12	9.0
	Diabetes Mellitus	8	6.0

Table 2 shows the average scores of subscales of the MBI human service survey (MBI-HSS). Mean scores showed high EE, high PA, and low DP (31.01, 33.17, and 8.66) respectively. Cronbach alpha coefficient for three MBI subscales indicates the reliability of the instrument for measuring burnout syndrome among physicians.

Table 2: Average score of the MBIs subscales

Burnout Domains	Mean	Standard Deviation	Median	Cronbach alpha
Emotional exhaustion	31.01	14.441	31.0	0.895
Personal accomplishment	33.17	10.285	35.0	0.848
Depersonalization	8.66	6.536	8.5	0.701
Burnout syndrome	54.50	23.148	56.0	0.702

Prevalence of burnout based on each subscale of MBI showed that the majority of participants had high EE, high PA and low DP score (68.7%, 41.1% and 45.5%) respectively. On other hand half of participants had moderate burnout (50.0%) (table 3).

Table 3: Prevalence of burnout based on each subscale of MBIS

Burnout domains (N = 134)	Level of burnout		
	Low n (%)	Moderate n (%)	High n (%)
Emotional exhaustion score	26(19.4)	16(11.9)	92(68.7)
Personal accomplishment score	44(32.8)	35(26.1)	55(41.1)
Depersonalization score	61(45.5)	38(28.4)	35(26.1)
Burnout syndrome score	26(19.4)	67(50.0)	41(30.6)

Table 4 illustrates the association between demographic characteristics and burnout syndrome. There were significant association between burnout syndrome and age, marital status. ($p = 0.03$, $p = 0.012$) respectively, but no significant association were found with work place, job title, and managerial position.

Table 4: Relationship of burnout syndrome with some essential characteristics of the study group

* Chi-square test with Bonferroni correction, ** Significant test

Multinomial logistic regression analysis is expressed in table 5; the reference category is the low burnout group. When age increased by one year both moderate and high burnout scores, tend to be decreased by 0.022 and 0.091 (2.2%, 9.1%) respectively.

Job title affected the moderate burnout by a reduction of 0.14 but has no effect on high burnout group.

Age significantly affect high score burnout in relation to low score level when all other variables are set at zero level. Other variables have got p-value more than 0.05, which indicate uncertain role in prediction of getting moderate and high burnout compared to low burnout.

The odds ratio of marital status indicates that being married had about twice more relative risk than single to had moderate burnout score but had no effect on high burnout score.

The highest effect on relative risk to develop moderate burnout score in relation to low score was for the participants who attend managerial position with odds ratio of (3.013). While smoking had odds ratio of 3.8 with nearly four times increase in relative risk to develop high burnout.

Those with chronic diseases have about one and a half relative risk to develop moderate burnout state and nearly three times to develop high burnout in comparison to low burn out as referral categories.

Table 5: Multiple logistic regression analysis for predictors among the study sample

Burnout *		B	SE	Wald	df	P-value	Exp (B)	95% CI

Discussion

Occupational-related burnout is increasingly nowadays recognized as a serious problem affecting particularly health-care workers [11]. Burnout has been associated with absenteeism from work, interpersonal conflicts, lower productivity, job dissatisfaction [12].

The current study showed that prevalence of high burnout syndrome was more than one-quarter this is

close to a study conducted by Oumaya among primary care doctors who found that burnout prevalence was (33%) [13]. While a study conducted among primary health care physicians by Al Dubai and Rampal, who found that burnout was at a rate of (11.7%) [14], another study conducted in Qatar in 2011 concluded that (12.6%) of the physicians experienced burnout [6]. Also study conducted in Saudi Arabia in 2013 showed that the prevalence of burnout syndrome among physicians was (7.3%) [7]. This difference in results between Iraq and other countries may be due to overburdened health-care system in Iraq, lack of resources, difficult work schedules with long hours of work and inadequate security.

In the current study the large share of participants described themselves as high EE (68.7%), high PA (41.1%) and low DP (45.5%). These results are similar to study conducted in Yemen in 2010 [14]. But different from a study conducted among physicians working in Medical City teaching complex Baghdad/Iraq by Mohammed in 2016 who found moderate EE, high DP and moderate PA [9]. Again similar to other study conducted by Hasan et al in Bahrain in 2015 [15]. The difference in the prevalence of burnout syndrome and level of burnout domains can possibly be explained by variation in career aspirations among physicians, the nature of the health systems, patient's attitudes and the role of physicians as health-care providers. It may also be attributed to different assessment scales used, and the study designs used in the various studies.

In the current study the relationship between age group and total burnout was statistically significant. Physicians who were in the age group ≥40 years old had low level burnout (20.7%). Contrary a study by Al Dubai and Rampal in 2010 showed that low level burnout syndrome was significantly associated with age group below 40 years old [14]. This difference may be due to increase in financial security and cultural factors, in our country patients look to older age with more respect and trust.

This study showed no significant relationship between burnout and gender, yet male was more prone to burnout than female which is against the result of a study done in Qatar in 2011 where the female was more prone than male [9]. The variation in result of the two studies may be due to geographical factors, different attitude toward female, and discrepancy in practice toward gender.

Significant association was found between marital status and burnout in current study. Rate of burnout among single is more than its rate among married. These findings were different from the findings of a study conducted in Suez land/Egypt [16]. The result in our study may be attributed to the social support of the spouse which might play buffering effect to protect against burnout.

Burnout among physicians working at primary health care center is slightly higher than that reported among physicians working at family health center. This is similar to the finding of a study conducted by Abdulghafour in 2011 [17]. This result may be related to workload in primary health care centers in our country.

No significant association was found between burnout and Job title in this study which is in congruence with a study conducted by Abdulghafour in 2010 [17]. Also similar to a study conducted among PHC physician in Egypt [16]. This difference in results may be related to different possible stress factors among general practitioner and family physician.

The relationship between having burnout and engagement in managerial position was also not significant. However, there is lower burnout among physicians who had managerial position (22.7%) than those who had no managerial position (32.1%). This unexpected results probably can be explained by that some doctors who work efficiently and believe that they are qualified to take up managerial positions, but they are not assigned to these positions are exposed to burnout at higher rate. On the other side those physicians who had managerial positions may have some privileges such as travels, dispatch, and some financial returns making them happier with their jobs hence lower burnout rate.

Recommendation: Measures should be taken to overcome the stressor in workplace through, occupational training programs, and providing necessary resources.

Conflict of Interest: We declare that there was no conflict of interest.

Influence of Low Power He-Ne Laser on the Skin Thickness of Swiss Mice

Zainab Abd ALjalil[1], Ali Kamel Mohsin[1], Ali Mahdi Mutlag[2]

[1]Wasit University, College of science, Department of Physics; [2]Wasit University, College of Medicine Department of Anatomy and Biology, Wasit, Iraq

ABSTRACT

The application of laser in dermatology and skin therapy is a key issue for numerous developments in future. The helium–neon laser at 632.8nm wavelengths, with the power of 2 and 1.31 mW was applied on the mouse's skin at various time 10, 20 and 30 min for 20 days. The animals were divided into two groups; control group, which didn't radiate while the other group was divided in to three groups each one has two mice where it exposed to the laser. The histological analysis was used only for those groups and studied microscopically. Histological analysis showed a significant effect of laser and numerous differences between the two groups. The thicknesses of the epidermis layer for the control group comparing with other groups showed noticeable increasing. In addition the skin presents enhancing of the features and architecture of layers. So, the low power laser has a good effect and amazing tool to enhance skin layer and cells on it.

Keywords: *low power laser, He-Ne laser, skin enhancing.*

Introduction

The attractive properties of laser make it a useful tool for several applications. Most of lasers are using in biology, medicine and dermatology depends on advanced technology and innovative laser systems for diagnosis and therapy. Therapeutic laser is very special and has a clear picture to illustrate how the radiation interacts with tissues [(1)]. Numerous current therapeutic treatments can be quantified which means simply producing a beam of radiation different from ordinary light in several ways [(2)].

The skin is the largest organ in the human body and comprises about 16% of body weight. The average person can have about (1.8) meter squares of the skin-encased body, which may be introduced to harsh conditions [(3)]. Which shows the low-Powerful lasers effect on the cell. This vitro study focuses on the biostimulation fibroblasts by a low-Power Ga–As-Pulsed laser

Light can be scattered or absorbed when it penetrates the tissue, and the extension of both processes depends on the type of tissue and the excitation wavelength. Absorption is mainly due to endogenous chromospheres, such as haemoglobin, myoglobin, and cytochromes. Scattering is generally the most relevant factor in the determination of light penetration into the tissue. Laser-tissue interaction is interesting due to it's the significant application in biomedical optics in both diagnostic and treatment purposes. Major aspects of the laser-tissue interaction, which has to be considered in biomedical studies, are the thermal properties of the tissue and the thermal changes caused by the interaction of light and tissue. These effects depend on the peak power and wavelength of the laser as well as the thermal properties of biological tissues. The laser can increase the temperature of cells. It results in denaturation of proteins, and collagen that leads to coagulation of tissue and it can necrotic cells [(2)]. Here we present photo-optical method that enables stimulation of skin cells by the low power laser (He-Ne laser, 632.8nm).

Materials and Method

Animals: This study is carried out in physics laboratories from the period of February to June 2018. Fourteen white Swiss mice (four males and ten females) conducted in this work of 14 weeks, were kept in animal house of College of Sciences under condition (25–28 C

°) temperature and control light (12–12 hour) supplied with food and water ad libitum. Mice were maintained in cages (4 mice/cage), after 7 days of acclimatization, the animals were divided randomly into six experimental groups (n=2 of each group) and tow control group. As shown in the table below (2.1).

He-Ne Laser Exposed: Laser system that used in this work was manufactured by Lambda Scientific, class I visible laser (I-Laser, Austerely), as shown figure (1).

Before laser exposed, the animals anesthetized by an injection of ketamine (80 mg/kg body weight). Then the hair of animals has been shaved to increase the power strike the skin. The region was exposed to the He-Ne laser beam (wavelength 632.8nm, power output = 2, 1.31 mW) with a 1mm diameter. The exposure time was 10, 20 and 30 min to achieve the preferred doses at present in table (1). The intensity of the laser was tuned and reduced by a red filter.

Fig. 1: The helium neon laser device 632.8 nm, red filter and laser power meter device (LP1)

Table 1: He-Ne laser (632.8 nm) parameters used for irradiation of the mice skin

Spot size or exposure (cm^2)	Spot diameter (cm)	Energy of laser beam E (ev) x 10^{+13}	Energy density or Dose (J/cm^2)	Power density DE (W/cm)	Exposure time (min)	Power (mW)	Groups
X	X	X	X	X	X	X	Control
0.0079	0.1	2.0833	2.548	0.2548	10	2	Group 1
0.0064	0.09	1.3644	2.047	0.2047	10	1.31	Group 2
0.0064	0.09	0.6825	4.094	0.2047	20	1.31	Group 3
0.0064	0.09	0.4549	6.141	0.2047	30	1.31	Group 4

Histological Procedures: The histological technique done according to Bancroft and Steven [4]. Throughout several steps to form tissue paraffin blocks and sectioning the steps as the following:

1. Fixation
2. Dehydration
3. Clearing
4. Impregnation and embedding
5. Sectioning and cutting

Results

The microscopic examination of the skin tissue for the control group is expected to complete by a light microscope at different magnification (X 40 & x 100). The results show the typical structures of the mice's skin. The sections show the epidermis of skin compose of stratified squamous keratinized epithelium which composed of typical stratum includes from base to apex, which are stratum basale, stratum spinosum, stratum

granulosum and stratum corneum, respectively illustrated in figures (1a). It show also the second layer of skin, the dermis below the epidermis compose of dense connective tissue include collagen fibres and rich blood vessels & nerve supply as showed in figure (1a). There are several hair follicles and sweat glands observed clearly in the dermis of skin as showed in figure (1c).

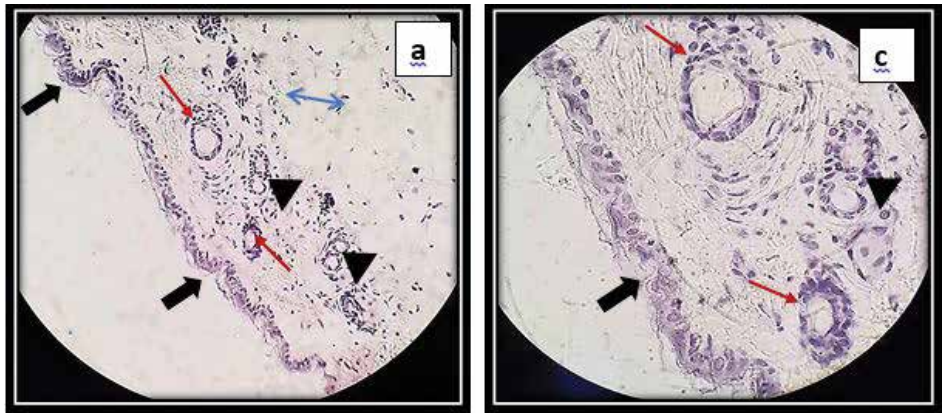

Fig. 1: General view of the skin cross section of the control group. Showing the different thickness of the layer tissue, ➡ (epidermis layer), ↔ (dermis),►(hair follicles),→(blood vessel). H & E stain, a (X 40) & c (X 100)

After skin exposed to laser it shows change in the different layers, but that change never effect on the size of cells and the wall between cells still apparent. So, these test group shows increase the thickness of the epidermis layer comparing with different proportion for the control group, this effect clearly appears in the figure (2a). The first group is illuminate by laser at 2 mW and time 10 minutes, the epidermal thickening on the rate of proliferating cells of superficial layer, with increase the mitotic activity of cells and large size cells appeared different area of epidermis; refer to hyperkeratosis of epidermal layer as show in figure (2a, 2b and 2c).

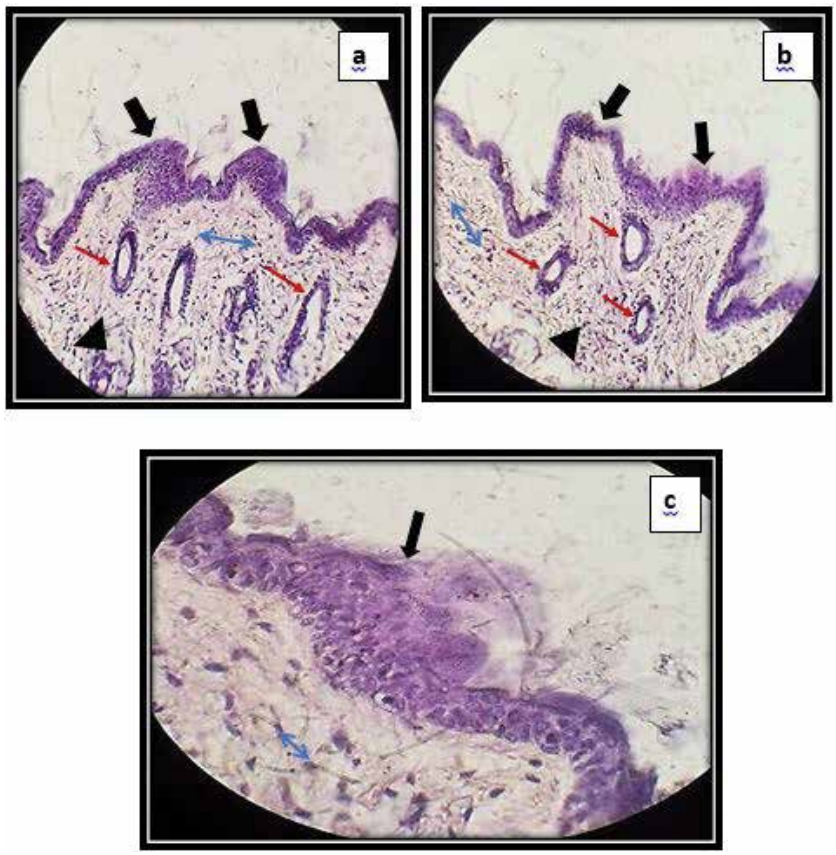

Fig. 2: General view of the skin cross section of the first test group. Showing the different thickness of the layer tissue, ➡ (epidermis layer), ↔ (dermis),►(hair follicles),→(blood vessel). H & E stain, a,b (X 40) & c (X 100)

After reducing the laser power to 1.31 mW and time of exposure 10 minutes (i.e. the second group). The results illustrate slightly modify on epidermal layer and showing increase the thickness of these layer which noticeably in figure (3b), stratum corneum revealed a thickening with deattached cells of superficial layer of epidermis as shown figure (3a) and, a high rate of mitotic activity of epidermal cells at stratum besale as shown figure (3b). Despite of the thickness increase of the epidermis but, the cells kept the same and get a good adhesion between of them of a different stratum. The epidermis and dermis appeared in firm attachment of together as showed in figure (3c).

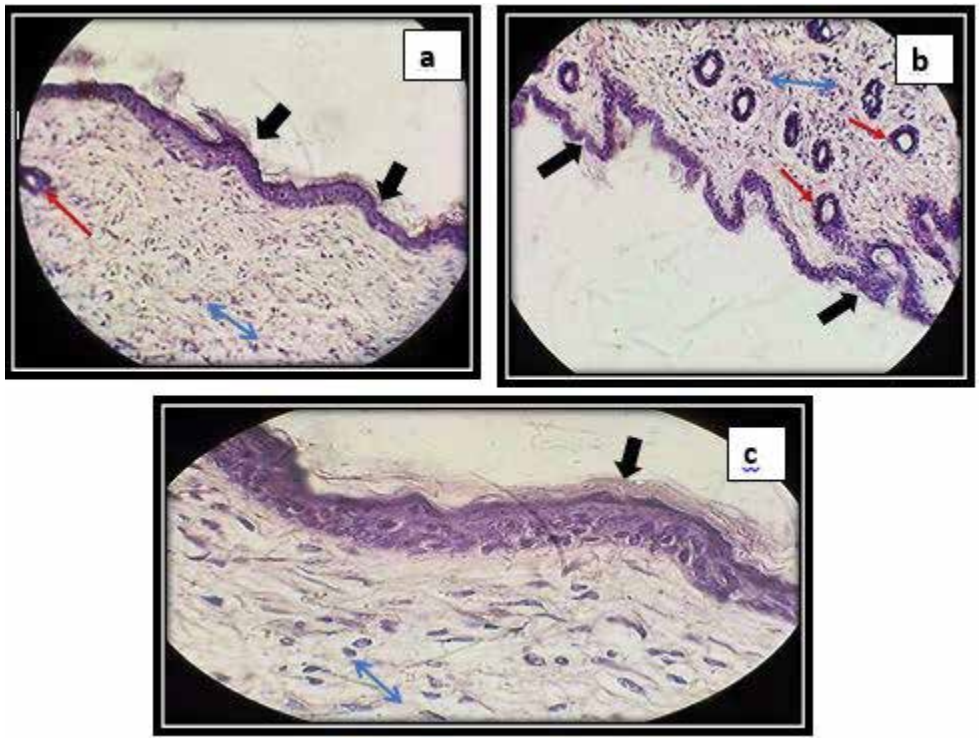

Fig. 3: General view of the skin cross section of the second test group. Showing the different thickness of the layer tissue, ➡ (epidermis layer), ↔ (dermis),► (hair follicles),→(blood vessel). H & E stain, a,b (X 40) & c (X 100)

To get more information about the time exposure we increase it to 20 minutes with the same power, which is called the second group. That result shows significantly enhancing of the skin features comparing with that other groups. However, it shows the slight increases of the epidermis thickness and appearing well architecture of the skin composition. At present the in figure, (4a) epidermis cells of stratum corneum are more danced. The attaching between the epidermis and dermis is good and reflect enhancing the rate of mitotic activity of cells in stratum basale as present in figure (4c).

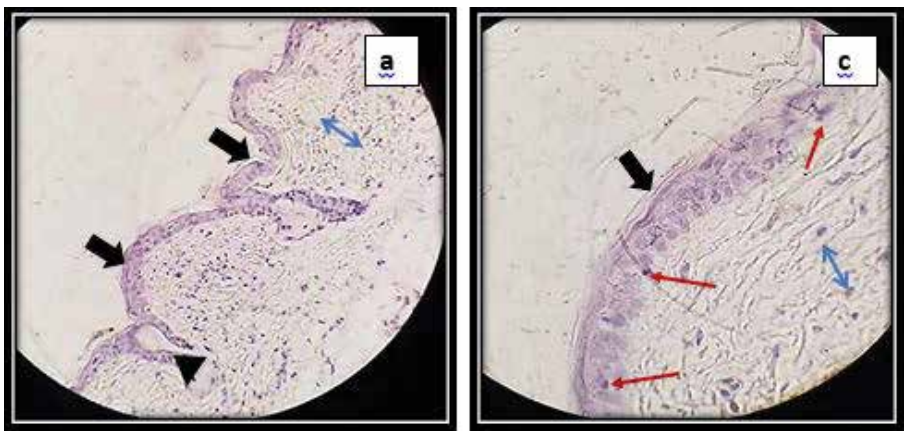

Fig. 4: General view of the skin cross section of the third test group. Showing the different thickness of the layer tissue, ➡ (epidermis layer), ↔ (dermis), ► (hair follicles), → (blood vessel). H & E stain, a (X 40) & c (X 100)

When the time of strike increasing to 30 minutes at 1.31 mW or the third group, there is noticeable effect on the shape of cells and it is found the merging in the cell wall. This effect not good for the tissue cells this merging is the evidence for abnormal cell growth. Furthermore, the vacoulation in cells in the epidermis is referring to precede the cells death as showed in figure (5a). De-attach the cells and sub layers of stratum cornum was clear in this group with irregular increase in thickness of the epidermis and, also found in thickening with spilt part of superficial layer of corneum. A number of inflammatory cells and leukocytes appear spread in the parenchyma of dermis refer to damage of blood vessels and inflammation case, showing a decrease of the activities of epidermal, as showed in figure (5c).

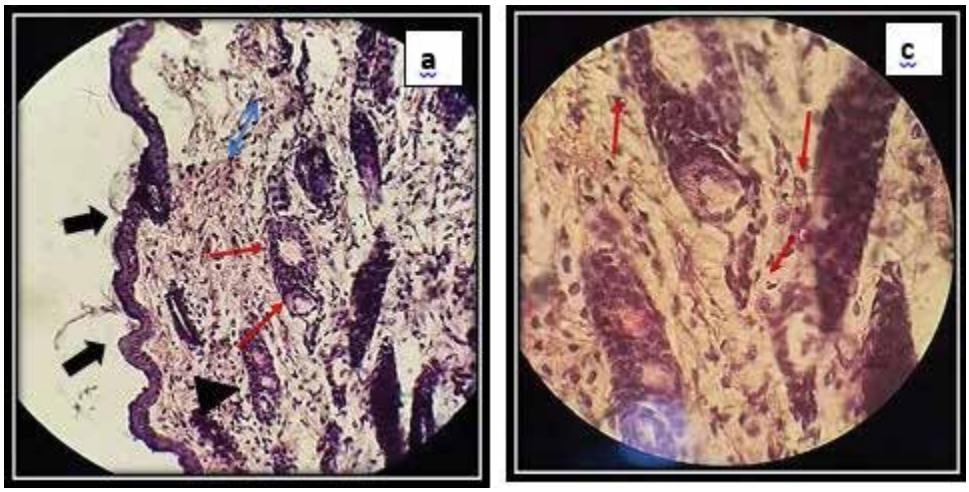

Fig. 4: General view of the skin cross section of the fourth test group. Showing the different thickness of the layer tissue, ➡ (epidermis layer), ↔ (dermis),► (hair follicles),→(blood vessel). H & E stain, a (X 40) & c (X 100)

Discussions

One objective of the present study was to assess the effect of He-Ne laser irradiation on the thickness skin layer of mice therefore we monitor increase of the thickness layers with help of histological measurements of desire and undesired effect obtained. The results suggest that a low dose of red light (He-Ne laser, 632.8 nm) has significant enhancing of the skin features comparing with that doesn't illuminated groups. However, it shows the slightly increases of the epidermis thickness and appearing well architecture of the skin composition specially in figure (1). The attaching between the epidermis and dermis its good and reflect enhancing of the rate of mitotic activity of cells in stratum basale hair growth in Swiss albino mice skin. These results agreement with earlier reports which demonstrate that exposure to low-level laser radiation leads to augmentation in proliferative and synthesizing activity of cells [5, 6].

Our findings suggest that the He-Ne laser was more effective laser, and significant difference was observed in terms of the doses within same laser groups and our results were in line with previous studies. That have shown that wavelength is an important factor in controlling cell growth [7, 8], that explain the cells proliferation in the epidermis of our study, also the He-Ne laser have a positive on healing hard palate wounds regardless of the radiation dose. Low power with He-Ne laser was deemed more effective compared to another laser light in terms of fibroblast proliferation and collagen fiber density. However, further robust randomized clinical studies are required [9, 10].

The significant increasing is found at a dose of 2.548 J/cm2, however, the dose 4.094 J/cm^2 has a little change of the thickness. On the other hand, it is found in the inhibition of hair growth due to increase in follicles with exposure to the He-Ne laser for both doses. That indicates to the enhancement of hair growth related to skin improving. However, exposure to the He-Ne laser at a dose of 4.094 J/cm^2 caused no significant change [11].

Effects of low-level helium-neon laser radiation were compared on thickness skin layers of mice those dosages of 6.141 J/cm^2 during a 30 min exposure every day, 4.094 J/cm^2 during a 20 min and 2.047 J/cm^2 during a 10 min exposure. No significant differences in effect were observed between laser-exposed region and control exposed. He-Ne laser irradiation of increases certain aspects of healing in the early stages, but not to such

a degree as to be clinically applicable. More detailed research is indicated to obtain optimal exposure levels necessary to accelerate effect significantly. These results to similar to Surinchak et.al when they did vitro study[12].

The application of the He-Ne laser 10 mw at 2.548 J intensity for 20 days caused a gradual increase. Furthermore, microscopic examinations revealed that the laser-irradiated skin changed. The release of stratum granule from epidermis to hair follicle, and produced blood vessel thrombosis of the dermal capillary plexus[13]. A previous study report an increase in cell proliferation and collagen production using specific and somewhat arbitrary laser settings with the helium neon (He-Ne) and gallium arsenide lasers, but none of the available studies address the mechanism, whether photo thermal, photochemical, or photomechanical, whereby low power may exerting its effect. Some studies, especially those using He-Ne lasers, report improvements in surgical wound healing in a rodent model; however, these results have not been duplicated in animals such as pigs, which have skin that more closely resembles that of humans. In humans, beneficial effects on superficial wound healing found in small case series have not been replicated in larger studies [14].

Our results showed that a particular laser irradiation stimulates fibroblast proliferation, without impairing of layers skin. These results to similar to Pereira et [15].

The influence of low-intensity polarized visible laser radiation on the acceleration of skin wound healing. Low-level laser therapy (LLLT) at adequate wavelength, intensity, and dose can accelerate tissue repair. However, there is still unclear information about light characteristics, such as coherence and polarization. Some studies indicate that linearly polarized light can survive through long propagation distance in biological tissue Histological analysis showed that the healing of irradiated wounds was faster than that of non-irradiated wounds [16].

Conclusion

The low power helium–neon laser is representing the future of dermatology and the therapeutic application with numerous other applications. The results that found indicate skin tissue can enhanced by using low power laser. The time and power density represent the good tool to make that enhancing. Histological analysis displays the results that group illuminated at time 20 minutes and power 1.13 mW had a good changes in the architecture of skin. That refer to the optical effect of laser on the skin might change the future of dermatology.

The Effect of Electric Stimulation in the Development of the Explosive and Speeding Ability of the Arms to Achieve the High Snatch of the Weightlifters Karbala Youth Club

Alaa M. Dhahir

Al-Furat Al-Awsat Technical University, Technical Institute of Karbala, Iraq

ABSTRACT

In order to reach the rappers to achieve the completion of Snatch, it is necessary to develop muscle strength and integration with the speed of performance, and to achieve this was developed training Program with electrical stimulation to see their impact in explosive power and speed-specific power.

The aim of the research is to prepare a training Program for electrical stimulation to develop the explosive power and the speed of the arms of the weightlifters Karbala youth club, as well as the impact of the training course on electrical stimulation to develop the explosive power and speed of the arms of the research sample.

The researcher reached the most important conclusions that the training Program prepared by the researcher has a positive effect on the development of explosive capability and the speed characteristic and raise the level of achievement in the high Snatch, with a preference for the training Program electric stimulation prepared by the researcher, and that elective stimulation sessions lead to the recruitment of all Muscle fibers to constrict at once and stimulate the backup power of work during performance achievement.

Keywords: *electric stimulation, explosive ability, speeding ability and high snatch.*

Introduction

Training is a major science that contributes to the development of athletic achievement through many means, tools and procedures that have been adopted in the Program to achieve achievement. The training Program depends on the fact of his work on the concerted efforts in the use of different sciences and employing the appropriate tools to reach the desired goal. Trainers to bring about a kind of change and diversification in the vocabulary of the training Program or change the place and form of training In order to increase excitement and suspense, the use of aids in the development of physical and skill capabilities of athletes and shortening time to reach the player As well as the ability of these means to isolate the working muscle alone, which facilitates the process of directing the physical effort to develop the target segment, as the use of electrical stimulation is useful in the development of muscle strength and rehabilitation of injuries as well as use in warm up and is widely used in various fields of sports and factor medical assistant.[1]

In the sport of weight lifting can be developed muscle groups working in lifting through the various training methods as well as the use of methods and techniques to help guide the effort and shortest time to reach the player to achieve the objectives of the training Program. Some researchers used electrical stimulation to contribute to the development of physical abilities, but they did not determine the doses according to the requirements of the muscle and its functional ability rationing doses of stimulation is necessary to guide the work and knowledge of the electrical signal of the contractions caused by the training, which contributes to the development of the ability to achieve the achievement of the platform and scientific principles.[2]

The importance of research in the preparation of a training Program using the electrical stimulation of the muscles working arms to raise the level of achievement by combining the development of explosive capability and increase the speed of performance in the abduction of young adults.

Research Methodology and Field Procedures

Research Methodology: The researcher used the experimental method in two experimental groups with both the pre and the post tests.

Table 1: Shows the experimental design

Groups	Pretest	Experimental Variable	Posttest
First experimental		Training Program + electric stimulation	
Second experimental		Training Program	

Community and Sample Search: The research community is represented by Karbala weightlifters (56 and 69), which consists of (14) quartets. The researcher chose the research society in a deliberate way. They are the weightlifters of Karbala city in weights (56) kg and they numbered (6) players quadruple and (69) the study sample consisted of (12) quartiles, (85.7%) of the research community, randomly distributed to the first experimental and experimental groups. Each group consisted of (6) three-quarters of the weight. The first experimental group used the training course with electrical stimulation Prepared by the researcher and the second experimental group has used the same training Program prepared by the researcher without electrical stimulation.

Search Procedures: Selection of physical and skill capabilities:

1. Test throwing a ball of medicine from the front of the chest back weight (3 kg):
2. Withdrawal of the opening of the abduction to stand within (10) seconds and strongly (70%):
3. Characterization of the test of completion of snatch:[3]

Pretests: The tests were carried out on Monday and Tuesday, 8-9/10/2018, in Karbala Training Center Hall. The tests were carried out. The tests included the throwing of a medical ball weighing 3 kg, (10) seconds. On the second day, the technical tests were carried out, including the test of the completion of the snatch.

Training Program: The training Program was adopted by the electrical stimulation of the first experimental group and the training Program without the electrical stimulation of the second experimental group, both of which were prepared by the researcher. The quartets used the vocabulary of the two methods in the method of repetitive training according to the gradual loading of physical and skill exercises. The total number of training units reached (32) training units and was applied during the special preparation period.

For the first experimental group, the training and electrical stimulation Program was applied in the main section. It takes 60-65 minutes and gave high-level abduction exercises which amounted to (12) exercises which were divided into weightlifters training units during the week. The first part of the main section of the training unit includes exercises for the technical performance of the abduction shield. The second part of the main section includes physical exercise and electrical stimulation. They were coordinated alternately to avoid effort on muscle groups. For the first training using a frequency different from (75-45) Hertz, used during the first (12) units frequency (45) Hertz time (10) seconds and 10 units of the second frequency (60) Hertz time (8) seconds and (10) of the last units (75) Hertz time (6) seconds, and the number of electrical stimulation sessions (32) session.

Posttests: The tests were carried out on Monday and Tuesday, 10-11/12/2018 at 10:00 am as Monday was allocated for physical tests and on Tuesday to test the completion of the snatch.

View, Analyze, and Discuss Results

Table 2: Shows mean, standard deviations, (Z) value, and significance of differences between pre and posttest in physical tests and achievement of the first experimental group

Sl. No.	Tests	Units	Pretest		Posttest		(z) value	Level of significance	Significance of differences
			Mean	SD	Mean	SD			
1.	Throw a medical ball weighing (3) kg back	Meter	7.25	0.326	8.41	0.306	-2.214	0.027	Sig.
2.	With the opening of the snatch, stand up (10) seconds	Second	5.00	0.632	7.50	0.548	-2.251	0.024	Sig.
3.	The completion of the snatch	Kg.	69.17	6.178	80.33	5.645	-2.264	0.024	Sig.

* Level of significance (0.05)

Table (2) shows that there is a significant difference in explosive force of the arms in the test of throwing a medical ball weighing (3) kg between the pre and post testing and for the benefit of the post-test. The researcher attributed the reason to the effectiveness of the training Program and electrical stimulation used within the vocabulary of the training Program, The high-speed exercise is similar to the performance of the abduction to be the most effective and effective, and the electrical stimulation has a positive role in the development of explosive force "The appropriate frequency to develop muscle strength up to (100) Hertz, and the higher the frequency was the field of training in the direction power the duration and duration of the alert shall be according to the training objective ".[4]

As for the strength characteristic of the speed of the arms, there are significant differences between the tests of pre and post for the benefit of the post-test, and attributed the researcher to the effectiveness of the training Program to develop exercises for this ability and was employed with the stimulation of electrical exercises were given with (10) repetitions of one group at high speed and strongly (70) -90% of the maximum performance. "The use of special exercises for the development of speed of lift performance contributes to the reduction of performance time through the development of speed strength." [5]Moreover, electrical stimulation has a positive role, which was used to develop the force explosive with the duration of the continuation of the current up to 10 seconds, it is "the more exciting continuation of the duration differed different training effects as lead for the alarm for (8-10) again to an increase in the speed of muscle contraction arise". [6]

The researcher attributed the reason for this to the integration of physical exercises with electrical stimulation, "as it eliminates the rotation of work between the tissues of one muscle and operates the tissues of the muscle involved in the training once and the adequacy of large and in a single time, Which increases the efficiency of this electrically operated muscle ".[7]

Table 3: Shows mean, standard deviations, Z value, and significance of differences between pre and posttests in physical tests and achievement of the second experimental group

Sl. No.	Tests	Units	Pretest		Posttest		(z) value	Level of significance	Significance of differences
			Mean	SD	Mean	SD			
1.	Throw a medical ball weighing (3) kg back	Meter	7.16	0.307	7.74	0.359	-2.201	0.028	Sig.
2.	With the opening of the snatch, stand up (10) seconds	Second	5.00	0.894	6.00	1.095	-2.121	0.034	Sig.
3.	The completion of the snatch	Kg.	68.00	5.441	70.50	5.577	-2.251	0.024	Sig.

* Level of significance (0.05)

Table (3) shows that there are significant differences between the pre and post tests and for the post-test of the second experimental group. The researcher attributed this to the use of the training Program prepared by the researcher where he used training loads in exercises that were repeated according to scientific and training criteria. The requirements for training this age group that have achieved a comprehensive and balanced development of the physical attributes under consideration and to ensure their continued development "The use of special exercises for the purpose of developing the speed of performance of the lift contributes to the reduction of performance time through the development of speed-specific power". [8]

Table 4: Shows mean, standard deviations, Z value, significance of differences in physical tests, and achievement of the first experimental and experimental groups in the post-test

Sl. No.	Tests	Units	Mean	SD	(z) value	Level of significance	Significance of differences
1.	Throw a medical ball weighing (3) kg back	Meter	8.076	0.472	-2.722	0.004	Sig.
2.	With the opening of the snatch, stand up (10) seconds	Second	6.75	1.138	-2.345	0.026	Sig.
3.	The completion of the snatch	Kg.	75.42	7.416	-2.177	0.026	Sig.

* Level of significance (0.05)

Table (4) shows the post-test of the first experimental and experimental groups, the mean (8.076) was at a deviation of (0.472), and the calculated Z value (-2.722) was at a level of significance (0.004), indicating the significance of differences between the post-test at the level of significance (0.05) and for the benefit of the first experimental group. In the power differential characteristic of the speed of the traction test in the abduction slot to stand within 10 seconds. In the post-test of the first experimental and experimental groups, the arithmetic mean (6.75) has a deviation of 1.138 and the calculated Z value (-2.345) (0.026). This indicates the significance of the differences between the pre and posttests at the significance level (0.05) and for the benefit of the first experimental group.

In the pre-test experiment of the first experimental and experimental groups, the mean (75.42) was a linear deviation of (7.416) and the calculated Z value (-2.177) at the level of significance (0.026). This indicates the significance of the differences between the two tests (0.05) and for the first experimental group. Table (4) shows a significant difference in the explosive force of the test arms and for the benefit of the first experimental group. The researcher attributed the reason to the effectiveness of the training Program and the electric stimulation directed towards the target muscle groups. The appropriate frequency for the development of muscle strength is up to (100) the highest frequency was the field of training in the direction of the explosive force and the duration of the alert will be according to the training target ".[9]

As for the strength characteristic of the speed of the arms, there are significant differences in the post-test and for the benefit of the first experimental group and attributed the researcher to the reason for the increase in the components of the training load of the size of the training increases the frequency of the hands to (10) repetitions of exercises used in addition to the electrical stimulation has a positive role, "The different duration of the continuation of the stimulant arise different training effects as the duration of the alarm for (8 - 10) seconds to increase the speed of contraction of the muscle". [10] As for the variable of completion of the snatch, there are significant differences in the post-test and for the benefit of the first experimental group. The researcher attributed the reason to the effectiveness of the training Program by integrating the physical exercises with the electrical stimulation of the muscles working at the high level of abduction.[11] this contributed to the increase of muscle strength, resulting in an integrated development. The advantage of the use of electrical stimulation is evident in its ability to recruit all muscle fibers to contract at once. This is not the case in the case of involuntary constriction where it remains part of the muscle fibers did not contract and this part is called the reserve force.[12]

Conclusions

1. The training Program prepared by the researcher has a positive effect on the development of explosive capability and the speed-specific force and raising the level of achievement in the high level of snatch.
2. There is a preference for the electrical stimulation training Program prepared by the researcher with the positive effect in the development of explosive force and the strength of speed and raise the level of achievement in the high snatch.
3. The regulated diversity in the values of the electrical stimulation frequencies used by the researcher contributes to the development of the special muscle strength of the muscle groups working at the height of the abduction.
4. Electrical stimulation sessions help to recruit all muscle fibers to constrict at once and stimulate the back-up force to work during performance to achieve achievement.

ABSTRACT

In this article, the concentrations of radon gas (^{222}Rn) in some houses were measured at 10 sites in Al- Najaf city, using RAD-7 radon monitoring system. The effective doses for all samples were estimated using Monte Carlo method. The Visual Monte Carlo code was used to simulate the transport of the radiation as emitted from the ^{222}Rn through the human voxel model. Room geometry of 3×3×4 m^3 was designed to estimate the people radiation dose due to the exposure to the indoor radon. The latter doses were estimated for each of male and female people individually. It is found that the radon concentrations varied from (8.75 ± 1.1 Bq/m^3) to (32.32 ± 4.0 Bq/m^3) with an average (20.57 ± 2.90 Bq/m^3). The resulted data of the Monte Carlo calculations for male reveal that the effective dose was ranged from 2.91E-05 to 1.07E-04 μSv/h while the female effective dose was noticed to range from 2.87875E-05 to 1.06333 E-04 μSv/h.

Keyword: *^{222}Rn, Monte Carlo, effective dose, Al- Najaf city and RAD-7.*

Introduction

Radon gas is a natural radioactive source and is chemically considered as an inert element. It originates from the natural decay of uranium 238 series, with atomic number 86 and mass number 222[(1)]. The major contribution of radon exposure is attributed to indoor or household air[(2)]. In this regards, many houses and buildings are built on top of radon emitting rocks. It should be noted that radon daughters are likely to attach to dust which would result in that people are exposed to them via breathing. However, the radon level in outdoor air is, to large extent, low at about 0.003 to 2.6 picocuries/liter of air. When considering the indoor exposure, such that at homes, schools, or offices buildings, the levels of radon and its daughters are generally higher than that of outdoor levels. Cracks exist in the foundation or basement of the homes can increase the level of the radon. This happens when the radon gas move through these cracks into home. In this context, at some areas of the country the amount of uranium and radium in rocks of different kinds, such as phosphate rock or granite, is high. In areas like these the radon levels in outdoor air is generally expected to be high[(3)]. The radon gas enters the houses from the ground via cracks present in concrete of the floors and walls, then through the gaps between floor and slab, around drains and pipes, and small pores of hollow-block walls. It is important to mention that radon levels usually high in places such as basements, cellars and ground floors. Based on certain factors, the concentration of radon in indoors changes considerably throughout the time of the year, from day to day, and from hour to hour[(4,5)]. As reported in many countries, the radon is taking the second order of being the most important cause of lung cancer after smoking[(6)]. Nevertheless, relevant studies in Europe, North America and China have also confirmed that even at lower concentrations of radon – such as those live in homes – also include health risks and contribute markedly to the occurrence of lung cancers worldwide[(7,8)]. It has been reported that probability of lung cancer incidence can increases by 16% per 100 Bq/m^3 of radon concentration increment. In this regards, the dose-response relation appears to be linear, this means that the lung cancer risk

increases proportionally with increasing radon exposure. The level of the environmental radon is a function of time and climatic conditions. So, on order to monitor the radon level, active and passive techniques can be used. Active method often used for short-term measurements of radon. By contrast, passive method could be suitable for the assessment of radon exposure over long period of time. This enables it to be used for large-scale surveys at a low cost[9]. In active measurement, in general, radon and its decay products are brought either into the vicinity of a detector or into a collector device via forced pumping, while in passive measurements, radon and its decay products are collected through their natural diffusion (or permeation) into the device, containing a detector. The terms active and passive are also used to differentiate those radiation detectors that operate with and without power supply. However, estimation of the amount of dose received by tissues/organs of the body that exposed to radiation source in an environmental medium is an extremely difficult computational task[10]. Therefore, Visual Monte Carlo (VMC) is computerized software that simulates the human body irradiation by an external source of radiation. It uses a voxel phantom designed at Yale University and the Monte Carlo method to simulate the emission of photons by a point, ground, cloud source as well as X-ray source. It therefore simulates the transportation of the photons through the phantom of the human body and estimates the dose to all body regions[11]. Consequently, this permits the estimation of the effective dose. The aim of the present work is to measure the radon concentrations in some houses of Al-Najaf area. Also by using Monte Carlo method the estimates for the effective dose can be provided for both male and female voxel phantoms/models.

Materials and Method

Najaf city situated between coordinates of latitudes of 32°21ǫ N and 29°50ǫ N, coordinates of longitudes of 44°44ǫ E and 42°50ǫ E with a total area of 28,824 km^2 (6.6% of Iraq whole area)[12]. Al-Najaf city, considering the administrative side, includes three qadhaas (administrative units consisting of the governorate, Al-Manatheria, Al-Kufa and Al-Najaf Qadhaas). In the current study, ten sites were selected as fair distribution in Al-Najaf city.

The RAD-7 is a device that provides a real-time and continuous monitoring for radon. The latter would help in observing the variations occur within the radon concentration levels during the measurement period. This might be effective, in turn; in the case that one can check the factors that impacting the radon levels throughout time. To illustrate, these factors may include temperature variation, wind speed, humidity (relative). This could give an insight into movements of the air inside a room[13]. The RAD-7 includes an internal standard sample cell at around 0.7 liter and has a hemispherical shape as can be observed in Figure (1). The inner side of the hemisphere is coated with an electrical conductor that can be changed, with a high power supply, to a potential difference range of about 2000-2500 Volts relative to the detector. This in turn creates an electrical field across the cell. The latter electric field drives the positively charged particles into the detector in the periodic-fill cell.

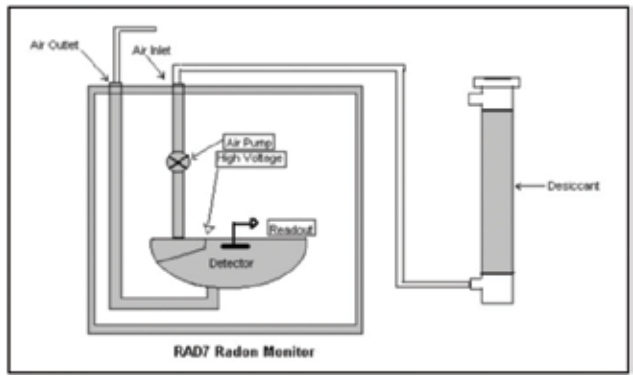

Fig. 1: Schematic diagram of the RAD-7 detector[14]

The method which was adopted to collect the samples can be described as follows: Four samples for the house air were taken from each region. The number of air samples that considered in this work was forty. The sniff mode and circle time was set at 1 hour in accordance with running time of each path of the valve. In order to investigate the amount of radon released from the sample to air, the samples were enclosed into a column, and an airborne radon/thoron was measured with a continuous monitor of electrostatic type (RAD-7, Durridge Company, and USA). The flow rate of the air was 0.7 L min^{-1}. The air of the room was drawn from the, and the radon generated in the air flow system was measured using the RAD-7 device.

The concentration of radon in the inside cell of RAD7 is calculated by the following equation[15]:

$$\frac{dU(t)}{dt} = \lambda U(t) \quad \ldots 1$$

$$\frac{dU_{Po}(t)}{dt} = \lambda_{po}U(t) - \lambda_{po}U_{po}(t) \quad \ldots 2$$

where $U(t)$ represents the concentration of radon in the RAD7 internal cell, λ is the radon decay constant, $U_{Po}(t)$ is a concentration of ^{218}Po, and λ_{po} is decay constant of ^{218}Po and equals to 0.0037s^{-1}.

Once the pumping time has elapsed, the concentration of radon in the inside cell of RAD7 equals that of the environment C_o. Equation 2 can be rewritten as

$$\frac{dU_{Po}(t)}{dt} = \lambda_{po}U_o - \lambda_{po}U_{po}(t) \quad \ldots 3$$

The initial condition is

$$U_{po}(0) = 0 \quad \ldots 4$$

The solution of Eq. (4) is

$$U_{po}(t) = U_o(1 - e^{-\lambda_{po}t}) \quad \ldots 5$$

When the time is much longer than that of the half-life of ^{218}Po, Equation 5 then can be rewritten as (3).

$$U_{po}(t) = U_o \quad \ldots 6$$

The concentration of radon can be calculated using Equation 6, and this is the measurement principle of RAD-7. The RAD-7 utilizes a high electric field over a silicon semiconductor at a ground potential to catch the heavy charged of the polonium daughters, $^{218+}$Po ($t_{1/2}$ = 3.1 min; E_α = 6.00 MeV) and $^{214+}$Po ($t_{1/2}$ = 164 μs; E_α = 7.67 MeV), which are estimated in sample as a measure of ^{222}Rn activity concentration., the RAD7 prints out a summary of the average radon reading at the end of each run (about 30 min for each run). The time required for the process of collecting and analyzing the sample is corrected using equation (3):

$$U = U_o e^{-\lambda t} \quad \ldots 7$$

where U is the recorded concentration, U_o calculates primary concentration next to the decay corrections and t is the elapsed time until collection in day unit, λ = 0.181, $t_{1/2}$= 3.83 days.

VMC Validation: This VMC program was written in the Instituto de Radioprotecão e Dosimetria for simulating the radiation transport via specific voxel model. Basically, this program was written using visual basic, and can be applied to both internal and external dose calculations resulted from photons[16]. The program was later extended to include alpha particle, electron and proton transport through a specified voxel structure. To investigate the validity of this software, it has previously been benchmarked via comparisons with many other models and Monte Carlo software[17].The results of these validation attempts show a good agreement for the effective dose due to cloud immersion obtained using VMC and Federal Guidance Report No.12. In this paper, the program provides coefficients that based on the Monte Carlo simulation to calculate both the organ and effective dose as a result of radiation exposure.

Results and Discussion

The resulted data concerning the level of radon concentrations in houses air and for the 10 sires at Al-Najaf are presented in Table (1). According to Table (1), it can be seen that radon concentrations were varied from (8.75 ± 1.1 Bq/m^3) in location (N10 sample) to (32.32 ± 4.0 Bq/m^3) in location (N1 sample) with an average value (20.57 ± 2.90 Bq/m^3). The variations of radon concentrations which were seen among different regions can be caused by a number of factors. These include things like the geological structure of the sites, different kinds of building materials that used to construct houses, the heating systems together with ventilation level, the aging effect on the building and the social habits of the dwellers. The maximum value of ^{222}Rn concentrations in present study is which is much lower than the recommended ICRP indoor of (200-400) Bq/m^3[18]. Comparing these results with those of the Arabic countries it was found that the range of average radon concentration in Jordan (west of Iraq) building measured is (9.95 – 68.15) Bq/m^3[19] and in Egypt particularly in some region, the average radon concentration in air of buildings was reported to be about 79.505 Bq/m^3 in range from (38.62-120.39)Bq/m^3[20].

Table 1: Results of Radon Concentrations

8.	Saad	N8	14.48	1.8
9.	Asskry Najaf	N9	27.27	3.4
10.	Milad	N10	8.75	1.1
Average ± S.E			20.57 ± 2.90	

Effective Dose: The results of the Monte Calro simulation which was conducted for the room geometry that mentioned above to calculate the effective dose for human exposed to radon at indoor are presented in the Table 2 and 3 for each of the male and female respectively.

Table 2: the male effective dose estimated at room geometry of 3*3*4 m^3

Location Sample	Bq/m^3	Male effective dose (µSv/h)
N1	32.32	1.07E-04
N2	28.26	9.38E-05
N3	27.95	9.28E-05
N4	11.78	3.91E-05
N5	17.17	5.70E-05
N6	28.28	9.39E-05
N7	9.09	3.02E-05
N8	14.48	4.81E-05
N9	27.27	9.05E-05
N10	8.75	2.91E-05

Table 3: The female effective dose estimated at room geometry of 3*3*4 m^3

Location Sample	Bq/m^3	Female effective dose (µSv/h))
N1	32.32	1.06333 E-04
N2	28.26	9.29754E-05
N3	27.95	9.19555E-05
N4	11.78	3.87562E-05
N5	17.17	5.64893E-05
N6	28.28	9.30412E-05
N7	9.09	2.99061E-05
N8	14.48	4.76392E-05
N9	27.27	8.97183E-05
N10	8.75	2.87875E-05

According to the above Tables (2 and 3), it is clear that for male the highest effective dose was noticed to be at Missan site with a value of 1.07E-04 µSv/h whereas the lowest was found to be at Milad site with an effective dose of 2.91E-05 µSv/h. By contrast, when considering the female effective dose, the highest was 0.000106333 at Miasan site and the lowest was at Milad with an effective dose of 2.87875E-05 µSv/h. The reasons behind the above fluctuations in the value of dose can be attributed to the level of radon detected in these sites (see Table 1). Also, it should be mentioned that Missan site as a one of the new neighborhoods in Najaf city is undergoing a marked wave and building using different materials that could arise the level of radon. The rest of the sites reveal different levels of radon and therefore exhibit different radiation absorbed dose.

Conclusions

According the results of the current work, the following conclusions can attained: all the findings of radon concentrations were obtained in this study were less than the allowed level. The highest people effective dose whether for male or female was found to be at Missan Neighborhood of Al Najaf city.

Impact of Material of Water Storage Tanks on Bacterial Quality in Shualat Al-Sadrain City in Baghdad

Amel Mustafa Kamil[1], Khadeja Shaaban Hasan[1], Sajad Mahdi Hasan[1]

[1]Department of Community Health, College of Health and Medical Technics, MiddleTechnical University, Baghdad, Iraq

ABSTRACT

The most important reason for storage water in special tanks in the buildings and houses is an insufficient amount of water. These tanks enhance the causative agent of water contamination through several aspects like its shape, size, color, position, cleaning….etc., therefore,the current study was aimed to investigate the effect of tanks material on the microbial quality of water in Shualat Al- Sadrain region in Baghdad city through four summer months Jun, July, August, and Septembe 2017.

120 water samples were collected from 40 tanks of drinking water, three samples were taken from each tank at the same time. These tanks divided into two groups 20 tanks were made from galvanized iron, and the rest 20 tanks were made from plastic. The temperatures of water were recorded at the time of collection. These entire water samples were undertaken to microbial test in the laboratory of a hospital of Baghdad in the medical city in Baghdad. The results show significant differences in bacterial growth between two types of tanks. Enterobacter contamination involves *E. Coli*, Fecal *E. Coli*, Klebsiella and Proteus among plastic tanks. In the conclusion: A lot of factors affect water contamination in tanks, whereas the most important one is Iraq climate, which leads to conclude that the galvanized iron tank is suitable and has fewer disadvantages than a plastic one in Iraq and hot areas.

Keywords: *water storage tanks, drinking water, microbial quality, plastic tank, iron tank*

Introduction

Water pollution was definedas theaddition of an article or energy to an aquarium environment as a result of human activity or natural sources which lead to negative effects on human health and other organisms. [(1)]70% of fresh water on the ground is altered to being ineligible for consuming [(2)], whereas more than 1 billion of the world population inhabit in a poverty area suffer from this problem[(3)], 80% of diseases are water- borne diseases in the different areas of the world as WHO reported where poor sanitation and unhygienic treatment of drinking water cause 3.1% of death around the world [(4, 5)], One of the most challenges in the world is providing safe water, particularly in the countries which suffer from a shortage in their water stored. Thusled to use tanks in different capacities to keep safe water for daily usage, which varies in their types, sizes, shapes, and colors. As well as theyvary in their position. Numerous factors, physical, chemical and biological rise water contamination in these tanks[(6)] that cause a different health problem. For instance the galvanized tanks cause Zink and Cadmium sedimentation [(7)] While, the poor maintenance of aging Aluminum tanks will affect the nature of stored drinking water[(8)]. Beside organic materials sedimentation may precipitate to the safe water from plastic tanks [(9, 10)] in addition to spread a lot of kinds of bacteria on their surface, causing water contamination[(11)].

Material and Method

The study was conducted between 1 June to 30 September 2017, which considered summer months in Iraq characterized by high temperature. The minimum temperature ranging from 27- 34c (2.93- 6.80 F), while the maximum temperature ranging 43- 47c (116.6- 107.6 F). However, sometimes reaches to 50 c^{o} or more, according to the first report of the ministry of environment in Iraq.

Area of Study: The investigated area located in the west of the capital of Iraq (Baghdad), which occupies the north- west district of it. It is known as Shualat Al Sadrain. It is the second highly populated region in

Baghdad, where almost of them are limited income. This area provides by dinking water from Al- Hussain desalination plant, where chlorine use as disinfectant.

Water Sampling: Sampling was done at 3 a m from 40 roof tanks, by using disposable sterile hand gloves. 20 of those tanks were galvanized iron (cubic shape) water storage tanks and 20 were plastic tanks (halve cylinder shape, white in color), both type tanks were 1000 litters in its capacity. Three samples were taken from each tank by sterilizing bottles of 500 ml and had been transported cooled after adding of 1ml of 10% sterile sodium thiosulfate ($Na_2S_2O_3$) to inhibit the action of chlorine.

Measurement of Temperature: Temperature measurement was carried out at the site of sample collection using a mobile thermometer. This was done by dipping the thermometer into the sample and recording the stable reading.

Bacteriological Analysis: This analysis had done according to [12] on the Baghdad hospital laboratory in the medical city in Baghdad. All three samples per one tank were pooled together to produce one sample for analysis in the laboratory (the total samples number 40 samples were undertaken to microbial analysis). 10 fold dilution of the samples were conducted, and utilized for culturing as the following: 0.1 ml of each dilution were cultured in the Nutrient, MacConkey, SS agar for bacteriological identification and Sabharoud dextrose agar for fungi identification. All plates were aerobically incubated 24 hrs at 37c^o and inspected for the microbial growth. Gram-positive and negative bacteria were identified according to the standard microbiological procedure[13] Bacterial colonies were differentiated in compliance with the colonies characteristics. A series of biochemical tests were carried out to positive cultures. The bacterial colony counter was used to get the number of bacteria/ml of water.

Statistical Analysis

The Statistical Analysis System- SAS (2012) program[14] was used to effect of different factors in study parameters. The Chi-square test was used to significant compare between percentage and T-Test was used to significant compare between means in this study

Results

The results of the current study as shown in the following tables

Table 1: Effect of tanks type in water temperature

Type of Tanks	Mean ± SE of temperature (C)			
	June	July	August	September
Plastic	37.58 ± 0.20	41.83 ± 0.61	42.24 ± 0.19	37.58 ± 0.20
Iron	40.75 ± 0.47	51.30 ± 0.53	51.75 ± 0.44	39.00 ± 0.42
T-Test	2.047 **	3.848 **	2.175 **	1.991 **
** (P<0.01).				

This table shows significant differences (P<0.01) in the effect of type of tanks on the temperature. The high level of temperature in the iron tanks in the four observation months

(40.75, 51.30, 51.75 and 39.00) respectively, while the low level in the plastic one (37.58, 41.83, 42.24, 37.58) for the four months (June, July, August and September) respectively.

Table 2: Effect of tanks type in Bacterial count

Type of Tanks	Mean ± SE of *Bacterial count* (x 10^5)			
	June	July	August	September
Plastic	3.71 ± 2.40	0.00 ± 0.00	0.00 ± 0.00	5.11 ± 3.35
Iron	0.00 ± 0.00	0.00 ± 0.00	0.00 ± 0.00	0.0041 ± 0.002
T-Test	1.918 **	0.00 NS	0.00 NS	1.551 **
** (P<0.01).				

The table shows the effects of tanks material made on the type of bacterial count during four months. There are significant differences (P<0.01) between the two tanks type in the presences of bacterial count. The superiority of bacterial count among plastic tanks in June and September (3.71, 5.11) respectively, while the results of July and August were marked by no significant differences between the two types.

Table 3: Distribution of Bacterial growth type with difference of tanks//June

Bacteria	Plastic		Iron		Chi-Square (χ^2)
	No	%	No	%	
Proteus	2	40.00	0	0.00	10.58 **
E. Coli	2	40.00	0	0.00	10.58 **
Fecal enter Coli	1	20.00	0	0.00	7.94 **
Total	5	100	0	0.00	15.00 **
** (P<0.01).					

The table shows different types of bacterial growth in the plastic tanks which marked by Proteus, E. Coli, Fecal enter Coli (40.00, 40.00, 20.00) respectively during June. While there is no bacterial growth in the iron tanks. Therefor there are significant differences (P<0.01) between the two types.

Table 4: Distribution of Bacterial growth type with difference of Tanks//September

Bacteria	Plastic		Iron		Chi-Square (χ^2)
	No	%	No	%	
Klbsella	2	40.00	0	0.00	10.58 **
Proteus	2	40.00	0	0.00	10.58 **
E. Coli	1	20.00	2	10.0	13.27 **
Total	5	71.43%	2	28.57%	11.46 **
** (P<0.01).					

The table shows different types of bacterial growth in the plastic tanks which marked by Klebsiella, Proteus and E. Coli (40.00, 40.00, 20.00) respectively during June. While 10.0 of the iron tanks contains E. Coli. Therefor there are significant differences (P<0.01) between the two types.

Discussion

The results demonstrate that the abundant contamination of water is Enterobacter genus which agree with [15, 16], particularly E. Cole, that agree with several studies [17, 18]. The existence of minimum level of microbial growth in the drinking water swerves from WHO 2006 permission [19]however, some health agency classifies drinking water to four classes according to the presence of coliform bacteria: very acceptable water when it has 1 or less E. coli/100 ml of water. While acceptable water if it has 1-2 cell/100 ml of water, whereas the suspected water and unacceptable water when it has 3-10 and more than 10 cell/100ml of water respectively [20]. The results show other observation 40% Klebsiala and 40% proteus which agree with [21,17]. Also, 20% of isolates were fecal E. coli that agrees with[22,23], but disagreewith[24].This type of water, inadequate for drinking [25], where the recommended ratio of WHO is0 cfu/100 ml [19].The aged and leakage of pipe distribution system in addition to infiltration of sewage line access into the pipe network of DW were the reasons of these results [26, 27,18].Solid materials loaded water could be deposited within pipes due to low level of providing water in summer season result in accumulation and proliferation of microorganisms depending on their oligotrophic adaptation through their coexist in the drinking water (less than 2 mg of organic matter per liter of drinking water in many cases) which will access the tanks through power of water plumping machine, which uses in tanks filling throughout a day, the usage of plumping machine increases the corrosion and erosion of pipes materialto be focus for saprophytic and opportunistic microbial

attachment and proliferation[28]. Materials of pipeline, whatever it made plastic or metal are corroded and stay spacious colonized by microorganisms through their physical nature[29, 30].

The significant differences in the temperature between the two types explain the ability of bacterial growth in the plastic than iron tanks, since the mean temperature of plastic tanks 37.58c in June and September which considers the ideal temperature for bacterial growth [31], while July and August characterized by high temperature (the hottest months on record in Iraq) that prevents bacterial growth in the two tanks types, while the highly corrosion of iron promotes bacterial colonization[32] However, another contributing factor cooperates water tanks contamination is overnight stagnated water in the pipes (the residents explain) plus plumping usage on the day will aggravate microbial activity[33, 34].This factor is critically important where the stagnation of water enhances microbial metabolism and increase their concentration in the winter months[35, 36]. The current study shows only 10% of the iron tanks (open lid) had E. coli contamination which access through birds feces or soil particles.[37]It should be noted that all tanks have not washedsince 12-15 years, thusincreased the opportunity for growth of bacteria. Studies reported three times cleaning annually decrease the level of *E.coli* in the water stored comparing with less frequent cleaning[38].

Conclusions

The most important factor has revealed in this study is the high temperature of Iraq, which plays a significant role in determining the kind of tanks material that should use in Iraq for stored drinking water. The iron tanks are less bacterial growth comparing with plastic tanks in summer months.

A Descriptive Study on Pulmonary Tuberculosis in Salahaddin Governorate, Iraq

Hasan Ismail Sultan[1], Noor Alhudaa Sadoon Khalaf[2]

[1]F.I.C.M.S, Department of Medicine, College of Medicine, Tikrit University-Tikrit, Iraq; [2]MB. CH. B. Salahaddin General Hospital-Tikrit, Iraq

ABSTRACT

Background: Tuberculosis (TB) remains a leading cause of death in the world. Iraq is considered to be a middle burden country with TB**.**

Objective: is to evaluate patients with pulmonary tuberculosis in Salahaddin Governorate.

Patients and Method: the study included 140 patients with pulmonary tuberculosis, who attended chest diseases clinic in Tikrit during the period from May to August 2018. Pulmonary TB treatment outcomes were evaluated according to WHO definitions as new case, cured, relapsed, failed and defaulted.

Results: A total 140 pulmonary TB patients were included in this study with mean age of them was 42.7 ± 15.7 years. The males represented 51% of patients while the females were 49% of patients. Most of patients in this study were beyond primary school education, low income and displaced families represented as 88.6%, 90.7% and 82.1% respectively. Regarding outcome of treatment with anti TB; 78.6% of patients were cured, 7.1% of patients were relapsed, while defaulted and failed patients presented in 2.9% of patients for each one of them.

Conclusion: Pulmonary tuberculosis is still growing problem in this locality. It is common among low education, low income and displaced patients.

Keywords: *pulmonary tuberculosis, Salahaddin, displaced patients, TB outcome.*

Introduction

Tuberculosis (TB) remains a leading cause of death in the world, nearly one third of the global population is infected with *Mycobacterium tuberculosis* and at risk of developing the disease.[(1)] Furthermore, more than 90% of global TB patients and deaths present in the developing countries, where 75% of patients are in the most economically productive age group (15-54 years). [(2,3)]

Iraq has an estimated population of 33 million and is considered to be a middle burden country with TB, and occupies rank 108 globally and 7 in eastern Mediterranean region among countries with TB burden size. According to WHO report 2015, the estimated incidence of TB in Iraq is 45/100000 population, while the prevalence is 74/100000.[(3,4,5)] Moreover, after the 2003 war with deterioration of security and living condition, the infrastructure and health services to effectively provide TB care were seriously damaged.[(2,3,5)]

The objectives of this study are to evaluate patients with pulmonary tuberculosis and to assess their adherence to treatment in Salahaddin Governorate.

Patients and Method

A cross sectional study, including 140 patients with pulmonary tuberculosis, who attended outpatient clinic of chest diseases in Salahaddin Governorate in Tikrit, during the period from May to August 2018. Patients were selected irrespective of the duration of disease and therapeutic status.

The diagnosis was made according to WHO criteria: A patient was considered as pulmonary TB case if he/ she has symptoms for 3 weeks or more with one of the following: [6,7,8]

- At least 2 direct smears positive sputum.
- One direct smear positive sputum and positive CXR finding.
- 3 consecutive negative sputum smears but strong evidence of pulmonary TB by CXR and clinical features.[6,7,8]

Treatment Outcome: The following definitions were obtained from WHO reports to explain treatment outcome: [6,7,8]

- **New case:** Patient who has never had treatment for tuberculosis.[12, 13]
- **Cure:** Patient who completed treatment and have negative sputum smear in the last month of treatment. [6,7,8]
- **Relapse:** Patient who has been cured from pulmonary TB previously, and now diagnosed with an active disease. [6,7,8]
- **Failure:** Patient who while on treatment remained or become again smear positive 5 months after commencing treatment. [7,8,9]
- **Defaulter:** patient whose treatment was interrupted or stopped as soon as he feel better for two months or more and return to the health services with features of active pulmonary TB. [7,8,9]

The study was accepted by ethical committee of College of Medicine- Tikrit University and Salahaddin directorate of health. All patients were instructed about the study and their agreements were taken.

Statistical Analysis: The collected data was statistically analyzed using statistical package for social science (SPSS) version 18. Chi ($\chi 2$) square test and t- test were used to compare the statistical difference among of variables. P value of ≤ 0.05 was regarded as statistically significant.

Results

The general demographic characteristics of studied patients: The demographic features of present study were shows in table 1. A total 140 pulmonary TB patients with mean age of them was 42.7 ± 15.7 years were included in this study. The males were 71 (51%) patients, while the females represented 69 (49%) patients without significant difference between them. There was significant difference between males and females regarding body mass index (BMI), educational level and economic state. Most of patients in this study were beyond primary school education, low income and displaced families represented as 88.6%, 90.7% and 82.1% respectively. Moreover family history of pulmonary TB present in 13% of patients.

Symptoms of Pulmonary TB in Studied Patients: Moreover, this study showed that the most common presenting symptoms were cough and sputum present in 138 (96.6%) patients, followed by fever 136 (97.1%) patients, sweating 125 (89.3%) patients, anorexia 93 (66.4%) patients, and weight loss 72 (51.4%) patients, as shown in table 2.

Table 2: Frequency of symptoms of pulmonary TB in studied patients

	Frequency	Percent
Cough	138	98.6%
Sputum	138	98.6%
Fever	136	97.1%
Sweating	125	89.3%
Anorexia	93	66.4%
Weight loss	72	51.4%
Hemoptysis	46	32.9%
Dyspnea	29	20.7%
Pleuritic chest pain	11	7.9%
Others (joints pain)	2	1.4%

Chest X ray (CXR) Findings of Pulmonary TB in Studied Patients: Regarding chest X ray (CXR) findings, most of patients had nonhomogeneous opacities presented in 70 (50%) patients followed by cavity lesions in 30 (21.4%) patients, pleural effusion in 17(12.1%) patients then miliary shadowing in 17(12.1%) patients. Moreover, The CXR findings appeared mainly in the right lung rather than the left, as shown in table 3.

Table 3: Chest X ray (CXR) findings of pulmonary TB in studied patients

Chest X ray findings	Site of the lesion						Total	
	Right lung		Left lung		Bilateral			
	No.	%	No.	%	No.	%	No.	%
Nonhomogeneous opacities	51	56.6%	5	29.4%	14	42.4%	70	50%
Cavity lesions	24	26.7%	4	23.5%	2	6%	30	21.4%
Pleural effusion	10	11%	6	35.2%	1	3%	17	12.1%
Miliary shadowing	1	1.1%	0	0.0%	16	48.4%	17	12.1%
Consolidation	4	4.4%	2	11.7%	0	0.0%	6	4.2%
Total	90	100%	17	100%	33	100%	140	100%

Results of Sputum Smears in Studied Patients: Furthermore, early morning sputum samples for Ziehl- Neelsen stain were obtained from all patients, which revealed positive results in 42 (59.2%) males patients and 37 (53.6%) of females patients, The total positive results were 79 (56.4%) patients, this relation was statistically not significant, as shown in table 4. All patients were negative for HIV. This relation was statistically not significant as shown in table 4.

Table 4: Results of sputum smears in studied patients

Test		Males	Females	Total	P value
Sputum for AFB	Positive	42 59.2%	37 53.6%	79 56.4%	>0.05 NS
	Negative	29 40.8%	32 46.4%	61 43.6%	
	Total	71 100%	69 100%	140 100%	

The Outcome of Treatment with anti TB Drugs in Studied Patients: All patients were received antituberculous regimen, 12 (8.6%) patients represented new cases, 110 (78.6%) patients were cured, 10 (7.1%) patients were relapsed, while defaulted and failed patients represented as 4 (2.9%) patients for each one of them, without significant differences between males and females, as shown in table 5.

Table 5: The outcome of treatment with anti TB drugs in studied patients

		Sex		Total	P value
		Males	Females		
Treatment outcome	Total patients	71 100%	69 100%	140 100%	>0.05 NS

Discussion

The General Demographic Characteristics of Patients with Pulmonary TB: The mean age of affected patients in this study was 42.7 ± 15.7 years. A study conducted by Al-Kadhimi HM et al in Baghdad showed that the majority of pulmonary TB patients are belong productive age group.[10] Furthermore, most of patients in this study were beyond low education, low income and displaced families, resulting in a high economic burden for patients (during transportation, hospital stay and reduced working hours) and society.[11] The WHO calculates that an average TB patient loses three to four months of work time, and up to 30% of annual household earnings.[11]

Moreover, the present study revealed that the mean BMI of patients was 21.4 ± 2.4 (Kg/m^2), which is still within lower normal limit. Sultan KS et al and Yen YF et al noticed that low BMI is associated with high risks of mortality during TB treatment.[12,13]

Symptoms of Pulmonary TB in Studied Patients: Moreover, this study showed that the most common presenting symptoms were cough and sputum present in 96.6% of patients, followed by fever 97.1%, sweating 89.3%, anorexia 66.4%, and weight loss 51.4% of patients. Karadakhay K et al in Sulaimaniyah study reports that most common symptoms of pulmonary TB are cough, sweating, fever, fatigue and weight loss, and these symptoms are related to the severity of the disease.[14,15] Achkar JM et al observed that cough lead to an increased exposure of close contacts, and hemoptysis is often associated with cavitary lesions, and therefore could be considered a sign of advanced pulmonary TB.[16] The Infectious Disease Society of America (IDSA) and Centers for Disease Control and Prevention (CDC) recommend that pulmonary TB should be suspected in any patient who has persistent cough for more than 2 weeks with or without other signs and symptoms.[17]

Chest X ray (CXR) Findings of Pulmonary TB in Studied Patients: In this study the most common CXR findings was nonhomogeneous opacities presented in 50% patients followed by cavity lesions in 21.4% patients, pleural effusion in 12.1% of patients then miliary shadowing in 12.1% of patients. The CXR findings appeared mainly on the right lung rather than the left. These findings were consistent with those of AL-Jubouri AM et al a study in Baghdad that most reported radiological findings are nonhomogeneous opacities and cavity lesions as 48% and 37% respectively without significant differences between right and left lung.[18] Jumaah HM et al showed the right lung was affected more frequently than the left lung, which may be attributed to anatomical factors.[19] Furthermore, cavitary pulmonary tuberculosis associated with more sputum smear positivity, more hemoptysis and more infection spread.[20]

Results of Sputum Smears in Studied Patients: In present study, early morning sputum samples for Ziehl-Neelsen stain were obtained from all patients, which revealed positive results in 56.4% patients, however, it was still below that of WHO target, which is 70%.[21,22] A study done by Khattak MI and colleagues, in Pakistan showed 52% of patients had positive sputum AFB results.[23] The finding from Ethiopia revealed low case detection rate achieved as 21.6%.[21]

The Outcome of Treatment with Anti TB Drugs in Studied Patients: This study implies that percentage of new cases was 8.6%, it means that pulmonary TB is still growing problem in our locality. The cure rate was 78.6% which reflects the effective role of TB centers in Salahaddin Governorate in management of tuberculosis, but it is still below the recommended target of 85% by the WHO.[24,25] Relapse rate was 10%, it could be either due to lack of compliance or emergence of multidrug resistance TB, while defaulted and failed patients

represented as 4 (2.9%) patients for each one of them. Karadakhy K et al study in Sulaimaniyha reported that 89% of patients were treated successfully and 3% were defaulted, higher percent of cure in his study is due to application of DOTS strategy.[15] Other studies, from Turkey reveals 93% cure rate and 4% default rate, while from Ethiopia reports a successful treatment rate of 60% and a default rate of 9%. [26,27]

Iqbal Z et al study reported that before application of DOTS the cure rate was only 48.6% which rose to 94.8% after DOTS, while the default rate which was initially 19.8%, declined to less than 1% after DOTS, which means improvement in treatment outcomes after the implementation of DOTS strategy.[28]

Iraqi crises, including armed conflict and population displacement, lead to destruction of basic medical infrastructure, inhibit immunization programs, and cause significant decrement in healthcare services and medicines. Unfortunately, these conditions forced TB patients to interrupt their treatment, faced personal instability and difficult living conditions, which leads to decrease treatment success rate and increase the incidence of multidrug resistant-TB.[29.30]

This study concluded that pulmonary tuberculosis is still growing problem in this locality, it is common among low education, low income and displaced patients.

The Relation between Homocysteine, Oxidative Stress and Atherosclerosis Disease

Ekhlas Abdallah Hassan

Wafaa Sh. Al-Zuhairi, Alzahraa Ibrahim Abdulmajeed, Department of Chemistry, College of Science, University of Diyala, Baquba, Diyala, Iraq

ABSTRACT

Homocysteine(Hcy) may promote atherogenesis through oxidativestress. Malondialdehyde (MDA), which produced through peroxidation of lipid. It is widely used in estimating the oxidative stress. We aimed to evaluate the serum Hcy levelsand serum MAD in atherosclerosis patients and to find whether these variables are associated with the severity of atherosclerosis disease. Sixty patients diagnosed with atherosclerosis diseases were included in our study. Patients were divided to three groups(Low risk= 1.0, moderate risk = 3.55, and high risk= > 6.15) according to the value of atherogenic index. Fifteen healthy individual, as control group.Serum MDA is estimated by methods of Benge (1978). Hcy were quantitatively determined in patients and control subjects by ELISA test. The receiver operator curve (ROC) analysis of the forthcoming variations revealed the descending order of (Hcy = 0.959; MAD = 0.832;TC = 0.609; LDL = 0.594;and Tri = 0.502) that showed significant variation. The rest of parameters (uric acid, HDL and albumine) failed to occupy a significant ROC area.In our study,we found serum each Hcy and MAD was significantly increased in patients than control; it was gradually increased with increase atherogenic index, affected by the severity of disease, and significantly increases in third group than first group of patients. Person linear correlation revealed a significant positive linear correlation with serum Hcy and MAD and increased risk factor of atherosclerosis disease in the three progressed groups of patients. In summary, there is a significant relation between Hcy levels, MDA, and atherosclerosis diseases. This relationship could cause early development of atherosclerosis diseases even in males. So we suggest that Hcy and MAD might be taken into consideration through the evaluation of atherosclerosis patients

Keywords: *Atherosclerosis, homocysteine, malondialdehyde, oxidative stress*

Introduction

Atherosclerosis is a complex and chronic disease involving gradual accumulation of lipids, collagen, elastic fiber, and proteoglycans in the arterial wall.

Pathogenesis of atherosclerosis is becoming better understood [(1)].Because of some studies showed clearly provides now free radical involvement in the pathogenesis of atherosclerosis itself[(2)]. Hcy may promote atherogenesis through oxidative stress the mechanisms by which Hcypromotes atherosclerosis is not fully understood (3).Hcy is nonessential amino acid of molecular weight (268 dalton), formed during the metabolism of methionine [(4)(5)]. Recently, in both clinical and experimental studies it has been discovered that a moderate increase of plasma Hcy level to confer an independent vascular disease risk factor [(6)(7)]. It has also been revealed that hyperhomocysteinemia (HHcy) lead to the hurried process of atherosclerotic in diabetic patients [(8)]. In this study, we aimed to evaluate the serum Hcy levels and serum MAD in patients with atherosclerosis disease and to find whether these variables are correlated with the severity of disease atherosclerosis disease.

Material and Method

This study has been carried out at the consultative clinic in Baquba, for the period from September 2016 to

May 2017. The study included (75) subjects (35 females and 40 males) with age range (59-72) years, (15) healthy individuals as control group and (60) patients(29 females and 31 males) with atherosclerosis. Patients were divided to three groups (Low risk= 1.0, moderate risk = 3.55, and high risk= > 6.15) according to the value of atherogenic index. blood sample was collected from each participant after (12-14) hours fasting. For all participant BMI = weight/(height)^2 was calculated. The enzymatic methods were used to estimate the following variables :triglyceride, total cholesterol (TC) concentrations. LDL-cholesterol concentrations were measured by using the Friedewald formula. Serum MDA is estimated by methods of Benge (1978) [9]. Homocysteine were quantitatively determined in subjects by ELISA test. Atherogenic index is the ratio between total cholesterol/HDL- cholesterol[10]. To calculate Atherogenic index the following equation was used [11]: Atherogenic Index = TC/HDL- C.

Result

Receiver Operator Curve (ROC) Analysis: To discriminate between atherosclerotic patients and controls by employing the forthcoming investigated parameters, the ROC analysis was applied. Such analysis Allows to regulate the parameters according to the ROC area that can occupy and if such occupation is significant or not. The ROC analysis showed the descending order (Hcy = 0.959; MAD = 0.832; TC = 0.609; LDL = 0.594;and Tri = 0.502) of parameters that showed a significant variation. The rest of parameters (Uric Acid, Albumin and HDL-C) failed to occupy a significant ROC area (Table 1)

Table 1: ROC analysis for the investigated parameters in atherosclerotic patients and controls

Parameter	ROC Area	P ≤
Hcy	0.926	0.001
MAD	0.832	0.01
TC	0.609	0.01
LDL-C	0.594	0.05
Tri	0.502	0.05
HDL-C	0.402	(N.S)
Uric Acid,	0.452	(N.S)
Albumin	0.372	(N.S)

Distribution of Patients According to Value of Atherogenic Index: We notice that there have been a highly significant differences (P<0.01) in value of atherogenic index. (73.3 %) of patients have high risk= > 6.15, while (15%) of the patients are considered to be moderate risk having 3.55 and (11.6%) of them are considered to be goals for atherogenic index in patients with atherosclerosis was low risk =1as shown in table 2

Table 2: Distribution of patients according to value of atherogenic index

Value of Atherogenic Index	Gender	N	%	Comparison of Significance by Kruskal-Wallis Test
Lowrisk = 1.0	Males	3	11.6	P<0.01
	Females	4		
moderate risk = 3.55	Males	3	15	
	Females	6		
high risk = > 6.1	Males	25	73.3	
	Females	19		
Total	60		100	

Serum Homocystein (Hcy) and Correlation with Atherogenic Index: Figure (1and 2) Showed the serum Hcy a gradual increased level in Atherosclerosis patients (2.26 ± 0.21,4.09 ± 0.25, and 8.45 ± 0.16mg/ mL, respectively) in the three progressed groups of Atherosclerosis. Such differences were significant in patients (P ≤ 0.05), moreover the r value (0.822) was also significant (P ≤ 0.001) in patients.

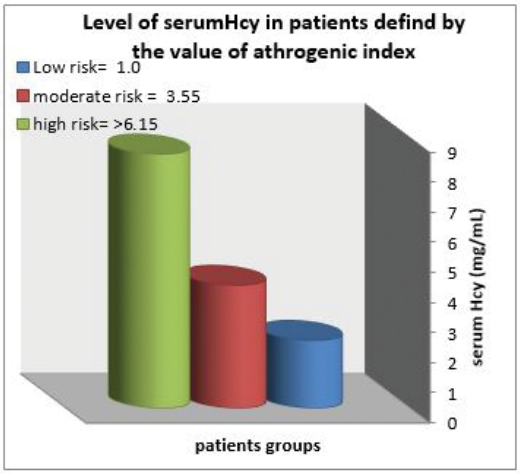

Figure 1: Serum Hcy level in Atherosclerosis patients

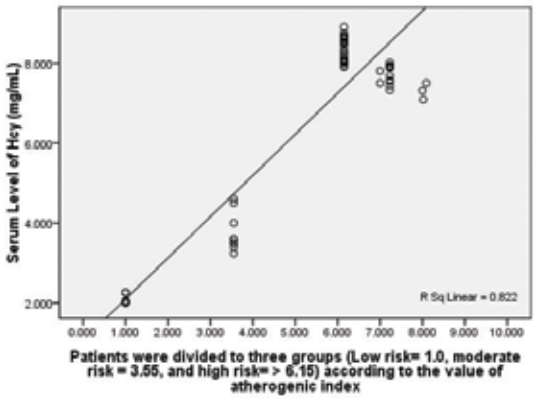

Figure 2: Correlations of Hcy and the value atherogenic index in patients groups

SerumMADand correlation with atherogenic index: The patients group demonstrated a gradual increase of MAD level (0.32 ± 0.12 0.65 ± 0.19M and 1.09 ± 0.23µ mol/L, respectively) in the three groups of Atherosclerosis. Such difference was significant ($P \leq 0.05$), and the r value (0.59) of correlation was also positively significant ($P \leq 0.01$) as shown in figure (3 and 4)

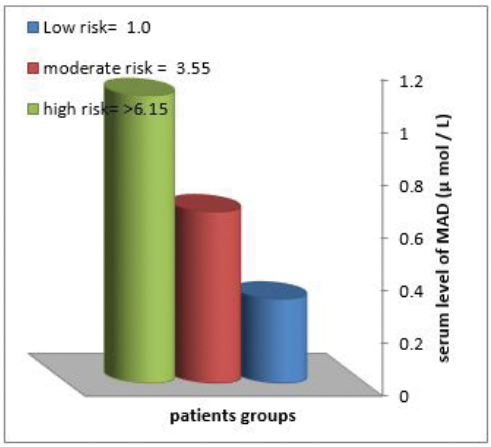

Figure 3: MAD serum level in Atherosclerosis

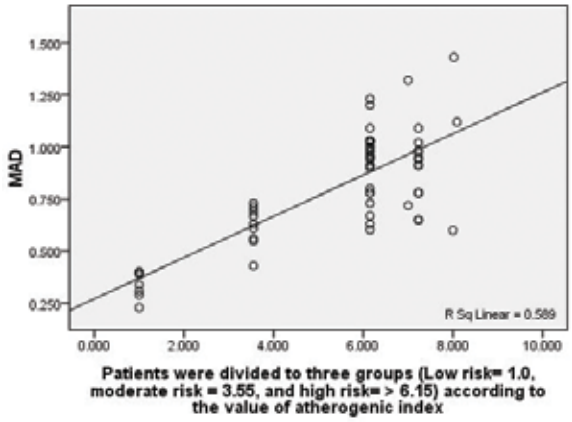

Figure 4: Correlations of MAD and the value atherogenic index in patients groups

Discussion

Over the past three decades, homocysteine has relieved as uncommon risk independent marker for the procession of CVD [12]. Baushey et al. (1995) have found a linear relationship between vascular risk and Hcy levels, that a 5 µmol/L increase in Hcy concentration was correlating with an increase in risk of vascular about thirds one [13]. The relation between CVD and Hcy had investigated by several predictable studies. Many [14][15] but not whole [16][17] get it a positive relation. None of the preceding studies, however, studied the possibility of association between oxidative stress and Hcy with respecting to risk of Atherosclerosis.

The results of the current study propose that serum Hcy is a predictor of atherosclerosis. However, levels of Hcy are correlated with value of atherogenicindex Earlier studies on the serum level of Hcy as a predictor of atherosclerosis are argumentative. Clark et al.(1991), One main property of total Hcy(tHcy) is might to prompt atherogenesis Hcy reason atherogenesis by increasing DNA synthesis of a gene called Cyclin A which in turn prompt replication of an uncontrollable cells in one region within the blood vessels lining [18]. Hcy has been supposed to induce atherosclerosis by the inducement the endothelium of oxidative injury, which is a crucial step in the restraint to injury hypothesis[19] [20] Finally, harmony to Melvin et al. (2004) demonstrated increasing of serum Hcy in atherosclerosis and concluded that homocysteinemia being an independent risk factor for CVD as happens in ischemic disease such as myocardial infarction and stroke and thrombotic events [21].

MAD level was found to be higher in patients compared with the control groups ($P > 0.01$) as shown in table (1). These results are agreement to the some pervious study [22] [23]. Peroxidation of lipid produced MDA which is used widely in estimating oxidative stress therefore; the evaluation of MDA may be used to decide whether a process of lipid peroxidation has taken place [22]. The measurement of MDA has widely been used to detect oxygen free radicals-mediated cell injury. In patients with atherosclerotic disease lipid peroxidation activity is accelerated. So higher MDA level is associated with the clean out of antioxidant and several forms of scavengers. It can be suggested that higher MDA levels might be a biochemical marker for atherosclerotic disease [23].

There is no doubt about the relation between serum lipids profile and the risk of chronic disease including CVD. As well as the metabolic syndrome, which is characterized by obesity, hypertension, glucose intolerance, visceral, and dyslipidemia that increases the risk for CVD. Our investigation agrees with Laaksonen et al. (2002)[24].The propagation of atherosclerosis a gradual increase with age. The aging process may promote modification of lipoprotein metabolic, which lead to an increase in the receptivity oxidation of the LDL-C because of their small size. So it is supposed that LDL are associated with increased atherogenesis[25]. HDL-C is believed to act as cholesterol scavenger. It removes cholesterol first by absorption on its surface, and then facilitates enzymatic conversion to cholesterol esters which moves to the core of the HDL particle and returns to the liver. This property of removing cholesterol from peripheral tissues is thought to give HDL its favorable cardioprotective properties [26][27].So for each 1mg/dL decrease in concentration of HDL-C, the risk for atherogenesis is increased by 2-3%in patients with low levels of HDL-C.

We showed a highly significant differences in value of atherogenic index. Most of patients have high risk, while remind of the patients are considered to be moderate and low risk .unexpectedly high prevalence of coronary atherosclerosis in Iraqi people, atherosclerosis disease is more prevalent in males than females, and it is increasing with age progression, and the prevalence becoming 100% after the age of 40 years old [28]

The level of serum Hcy a gradual increased level in the third progressed groups of Atherosclerosis. Such differences were significant in patients; moreover the r value was also significant in patients. These results are similar to the observations of a number of other investigators [29] [30].Misra et al.(1994) relived that Hcy thiolactone, which forming during complicated rearrangements of Hcy is chemically reactive and acylates free amino groups in protein such as the side-chain lysine groups . In the process of homocysteinylated proteins formation moreover development oxidative stress and homocysteinylated proteins become damaged and may lose their biological activity. Jones et al. (1994), confirmed that oxygen free radicals generated from Hcy by noticing Hcy toxic effects and in the presence of Cu2+, and their association with increased peroxidation of lipid, which was inhibited by catalase and attenuated by desferal[31]. Oxygen radicals have been confirmed to reason injury of endothelial [32]

The patients group demonstrated a gradual increase of MADlevel in the thrid groups of Atherosclerosis. Such difference was significant, and the r value of correlation was also positively significant. There are several previous studies that have studied the relation between MAD and aherosclerosis disease.Kostner et al. revealed higher levels of MDA in patients with coronary artery [33]. Pucheu et al. showed an increase in level of serum MDA following thrombolysis in acute MI patients, but no significant differences they could find between control group and stable angina pectoris patients group [34]. In (2001) Cavalca et al, in their study about oxidative stress and Hcy in coronary artery disease, he observed, higher significant levels of MDA were estimated in patients with coronary artery when compared to the healthy group [35].In our study, we found serum MAD was significantly increased in patients than control; it was gradually increased with increase atherogenic index, affected by the disease severity, and significantly increases in third group than first group of patients. We believed that MDA possibly also be associated with Atherosclerosis involvement.

Conclusion

There is a significant relation between Hcy levels, MDA, and atherosclerosis diseases. This relationship could cause early development of atherosclerosis diseases even in males. So we suggest that Hcy and MAD might be taken into consideration through the evaluation of atherosclerosis patients.

Comparison of the Educational Effect of Two and Three Dimensional Books on Dental Anxiety in Children with Hearing Impairment (Aged 7–9 Years)

Eva Fauziah[1], Selvyra Rachmawati[2], Aprillia Puspita Rachmadani[2], Cahyanti Wydiastuti Susilo[2]

[1]Lecturer, Pediatric Dentistry Department, [2]Resident, Pediatric Dentistry Residency Program, Faculty of Dentistry, University of Indonesia, Jakarta 10430, Indonesia

ABSTRACT

Introduction: Dental anxiety is common in children prior to dental treatment especially in hearing impaired children because of difficulties in communicating their fears. One of the method to overcome dental anxiety is positive image.

Materials and Method: The study was done in 21 children 7-9 years old with hearing impairment. Each children were educated by two and three dimensional book "Aku dan Gigiku". Dental anxiety was assessed by measuring respiratory rate, salivary alpha amylase, and electrodermal activity.

Results: Statistical data were analized with independent t-test and mann-whitney test. There were difference but not significant in delta value between two and three-dimensional book "Aku dan Gigiku".

Conclusion: This study show that two and three dimensional book "Aku dan Gigiku" has positive effect on dental anxiety by decreasing breathing frequency, salivary alpha amylase, and electrodermal activity.

Keywords: *Dental Anxiety, Two Dimensional Book, Three Dimensional Book, Children with Hearing Impairment.*

Introduction

Dental anxiety is common in children prior to dental treatment. Children with communication barriers, such as hearing impairment, are more likely to experience higher levels of anxiety due to difficulties in communicating their fears. Lack of communication between dentists and pediatric patients owing to the doctor's minimal skills in the management of children with anxiety can affect treatment success. Dental anxiety causes uncooperative behavior and introduces various obstacles; thus, treatment will not be optimal because a lot of time is wasted. Dental anxiety is manifested in different ways in each individual, for instance, specific physiological reactions, such as increases in salivary alpha amylase levels, respiratory rate, electrodermal activity, heart rate, and blood pressure can occur.[1,2]

According to the American Association of Pediatric Dentistry, effective communication is essential.[3] For children with hearing impairment, various types of media can be used to communicate, including writing, drawing, and lip-reading [4]. One of the methods to overcome anxiety is positive pre-visit imagery, in which the patient's parents show them positive images of dentistry or dental care in the waiting room prior to dental treatment. The purpose of positive pre-visit imagery is to provide visual information to children and parents regarding procedures performed by the dentist and to provide opportunities for children to ask questions prior to dental treatment.[3]

In the present study, the type of media used to reduce dental anxiety in children with hearing impairment were the two- and three-dimensional versions of the book "Aku dan Gigiku," which contains material on oral hygiene, dentist visits, and an introduction to dental devices that are expected to be used, with a view to reducing dental anxiety in children with hearing impairment.

Materials and Method

The present study was conducted at SDLB Santi Rama Cipete, South Jakarta, and aimed to analyze the differences in the educational effects of two- and three-dimensional versions of the book "Aku dan Gigiku" on the respiratory rate, salivary alpha amylase levels, and electrodermal activity in children with hearing

impairment. This was an experimental clinical study comprising total 42 children with hearing impairment (age, 7−9 years; 26 boys and 16 girls). Subjects were divided into two intervention groups: one using the three-dimensional version of the book and another using the two-dimensional version. Inclusion criteria were children with hearing impairment aged 7−9 years with communication level class 1, 2, or 3 SDLB and an IQ level of >90, and children who had never visited a dentist.

The respiratory rate, salivary alpha amylase levels, and electrodermal activity of the subjects were measured twice in both intervention groups; the first measurement was performed prior to the intervention, whereas the second measurement was performed following the intervention with either the two- or three-dimensional version of the book, Each measurement was performed thrice and the obtained values were averaged; the delta value, which is the value that was analyzed, was taken as the difference between the second and first values.

Results and Discussion

Data for the respiratory rate, salivary alpha amylase levels, and electrodermal activity were tested for normality using the Saphiro–Wilks test (sample size, n = 42). The results of the data normality test showed that the respiratory rate in both intervention groups was normally distributed at $p \geq 0.05$. Furthermore, a parametric independent *t*-test resulted in a significance value of $p < 0.05$.

Table 1: Comparison of the delta value for the frequency of breaths between the two- and three-dimensional book intervention groups

Variable	n	Mean ± SD (breaths per minute)			p
		FN_1	FN_2	Δ	
Three-dimensional book intervention group	21	23.490 ± 2.782	19.654 ± 4.471	−3.837 ± 4.808	0.062*
Two-dimensional book intervention group	21	22.698 ± 2.089	21.016 ± 1.851	−1.174 ± 1.169	

Independent *t*-test *significance = $p < 0.05$; FN_1 = First respiratory rate; FN_2 = Second respiratory rate

Table 1 shows that the mean first and second breathing frequency in the three-dimensional book intervention group were 23.490 ± 2.782 and 19.654 ± 4.471 breaths per minute, respectively, and that the delta value was −3.837 ± 4.808 breaths per minute. These results show that the respiratory rate decreased following intervention with the three-dimensional version of the book "Aku dan Gigiku." Similarly, the breathing frequency in the two-dimensional book intervention group decreased, with a delta value of −1.174 ± 1.169 breaths per minute. An independent *t*-test was used to test the hypothesis ($p = 0.062$). Thus, it can be concluded that there was no statistically significant difference ($p > 0.05$) in the respiratory rate between the two- and three-dimensional book intervention groups.

Table 2: Comparison of the delta value for the salivary alpha amylase levels between the two- and three-dimensional book intervention groups

Variable	n	Median (minimum–maximum)			p
		ASS_1	ASS_2	Δ	
Three-dimensional book intervention group	21	27 (3−170)	11 (2−101)	16 (−7–69)	0.199*
Two-dimensional book intervention group	21	18 (2−44)	10 (3−24)	11 (−11–26)	

Mann–Whitney test, *significance = $p \leq 0.05$; AAS_1: First alpha amylase score; AAS_2: Second alpha amylase score

Table 2 shows that the delta value for the salivary alpha amylase levels of the three-dimensional book intervention group was 16 (−7−69) and that for the two-dimensional book interventional group was 11 (−11−26). These data show that the median alpha amylase levels decreased in both intervention groups. A non-parametric Mann–Whitney test was used to test the hypothesis ($p = 0.199$), which indicates that there was no significant difference in the salivary alpha amylase levels between the two- and three-dimensional book intervention groups.

Table 3: Comparison of the delta value for the electrodermal activity between the two- and three-dimensional book intervention groups

Variable	n	Median (minimum –maximum) (μS)			p
		EA_1	EA_2	Δ	
Three-dimensional book intervention group	21	3.334 (1.121−9.255)	2.358 (0.638−5.702)	−1.346 (−5.386−0.000)	0.001*
Two-dimensional book intervention group	21	1.410 (0.023−4.318)	1.020 (0.849−4.247)	−0.390 (−0.872−−0.071)	

Independent *t*-test *significance = $p< 0.05$; EA_1 = First Electrodermal activity; EA_2 = Second Electrodermal activity; μS: micro Siemens

Table 3 shows that the delta value for the electrodermal activity of the three-dimensional book intervention group was -1.346 (-5.386−0.000) and that of the two-dimensional book intervention group was -0.390 (-0.872−-0.071). These results show that the median electrodermal activity decreased in both intervention groups. A non-parametric Mann−Whitney test was used to test the hypothesis ($p = 0.001$), which indicates that there was a significant difference in electrodermal activity between the two- and three-dimensional book intervention groups.

General anxiety typically occurs in children with hearing impairment owing to barriers in communication, particularly regarding difficulties in conveying emotions. This high level of anxiety affects the complex communication process; thus, information becomes more difficult to understand. Anxiety can lead to uncooperative behavior in children, which contributes to avoidance of dental checkups, thereby leading to dental complications and oral problems.[5,4]

Subjects involved in the present study were children with hearing impairment who had never visited a dentist. Anxiety is an emotional response in the form of fear of an unknown threat or a situation that has not yet taken place.[6] Physiological responses as a result of anxiety include increases in respiratory rate, salivary alpha amylase levels, electrodermal activity, and heart rate, in addition to palpitations, sweating, and abdominal discomfort or pain. An increased respiratory rate can be caused by negative emotions, such as anxiety, as the physiological response of the body changes.[1] The response caused by anxiety occurs due to increased activity of the autonomous nervous system, particularly the sympathetic nerves. Major respiratory controls are performed by the brain stem; however, the end result of breathing may be affected by the amygdala in the limbic system, which is responsible for emotional regulation.[7,8]

The three-dimensional version of the book "Aku dan Gigiku" is about oral health, the conditions of a healthy and unhealthy mouth, the causes of dental caries, and how to maintain good oral health.Pop-up books play a role in providing information prior to dental visits by introducing oral hygiene and dental care in a fun manner. This book has become one of the main tools in the management of mild anxiety in children with hearing impairment. For moderate and mild anxiety, visual or auditory stimuli, such as music sounds, videos, or positive images, are helpful in reducing anxiety.[1] The American Academy of Pediatric Dentistry(AAPD) has stated that attractive images and colors in books can act as a medium in a positive pre-visit imagery approach to decrease dental anxiety.[3]

The results presented in Tables 1, 2, and 3 show revealed no statistically significant differences ($p> 0.05$) between the respiratory rate, salivary alpha amylase levels, or electrodermal activity between the two- and three-dimensional book intervention groups. These results indicate that both types of books are similarly effective as oral health education media in overcoming dental care anxiety in children with hearing impairment prior to oral prophylaxis, as characterized by decreases in the respiratory rate, salivary alpha amylase levels, and electrodermal activity. Education provided prior to dental treatment can inculcate a sense of security in children with hearing impairment through vision, touch, and facial expressions.[4,9,10,11]

The Galvanic Skin Response (GSR) logger sensor is a tool for measuring electrodermal activity. Emotional and sensory stimulation causes sweat production. The GSR logger sensor is used to measure sweat from the sweat glands in the hand.[12] As a result of the stimulation,

the amount of sweat increases and so does the skin conductivity.[13] Electrodermal activity measurement was selected as the parameter to be evaluated in the present study because it is one of the simplest tools to measure the psychophysiological activity of anxiety in a quantitative manner.[14,15] Najafpour et al. (2016) reported that the GSR logger sensor is a reliable and valid measurement tool for assessing dental anxiety in children in clinical settings. The GSR may help identify clinically anxious children prior to dental treatment to provide appropriate interventions.[14]

Conclusion

The two- and three-dimensional versions of the book "Aku dan Gigiku" did not significantly differ in their effect and similarly decreased anxiety in children with hearing impairment aged 7−9 years, as characterized by the decreases in respiratory rate, salivary alpha saliva levels, and electrodermal activity.

Effectiveness of an Education Program for School Age Children Related to Management of Growth Hormone Deficiency University of Baghdad-College of Nursing

Fatima H. Abbas[1], Eqbal GH. Ma'ala[2]

[1]Academic Nurse, Ministry of Health, Iraq; [2]Professor, Pediatric Nursing Department, College of Nursing, University of Baghdad, Iraq

ABSTRACT

Study aimed to determine effectiveness of educational program on children with growth hormone deficiency knowledge at and determine relationship between knowledge and their general information.

Methodology: A quasi-experimental study was carried out at Child's Central Teaching Hospital, Medical City of Al Imamian Al Khadhmain Teaching Hospital, and National Centre for Treatment and Research of Diabetes, Specialized Center for Endocrine Diseases and Diabetes; and Department of Medical City (Children Welfare Teaching Hospital) The study included a purposive sample of (80) children with growth hormone deficiency who were attending to outpatient endocrine clinics and centers. Descriptive statistical analysis procedure (frequency, percentage and mean of score) and inferential analysis procedure (person correlation coefficient, chi-square test, t-test and Z score) were used to analysis data.

Results: The findings of the study indicated that there is an effectiveness of an educational program upon school age children related to the management of their growth hormone deficiency. There is no statistically significant difference between child's knowledge about their management and their demographic data.

The researchers recommended to (1) provide specialized nurses in endocrine centers and clinics to give high quality care, (2) implement the educational program to educate children and their families at schools, nurseries and other institutes, and (3) encourage children with growth hormone deficiency and their care givers about management through initiate of training session as group and incentive for children by educational media like CD, pamphlet, about normal range of height, weight, nutrition, exercise, and medication.

Keywords: *School-age Children, Growth Hormone Deficiency*

Introduction

Growth is a systematic and organized process it is begins at ordered conception. Growth has a sophisticated interaction between hormones, genes and nutrients. The human growth and maturation can be affected and controlled by several hormones, specially growth hormone (GH), which is secreted by the pituitary gland [(1)].

The Growth and development process consider the most important and vital features of a child's life. The great development in the past few decades in sciences of biological work and growth biology at molecular, cellular and serology helps to discover this physical and maturational process mechanisms and the key that controlled it, have participated in the knowledge of the growth disorders pathophysiology. The genetic revolution is re-inventing medicine. This understanding helps us to remake new management like molecular genetic techniques which clarified the etiology of growth disorders. Expression of effective and scheduled of the growth hormone (GH) program is important for growth in stature such as metabolic homeostasis [(2)].

Assessing pediatric wellbeing or growth assessment, through anthropometric measurement (height, weight, head circumference, chest circumference, abdomen

Email: fatima.hatim1983@yahoo.com

circumference, skin fold thickness, body mass index, wrist circumference, bone age and growth chart". Height, weight, and bone age most common for use to detect of growth hormone deficiencies [3-4].

Growth hormone is a peptide hormone that stimulates growth and development. Growth hormone is synthesized in the somatotropic cells, which are found in the anterior pituitary gland. Any disturbance for rate growth hormone effect on growth and development of the children [5].

Nursing management for children with growth hormone deficiencies is very important to improve normal growth and development and reduce burden on the child and their family through the role of nursing education for parent about monitoring early signs and symptoms that appear for the child and indicators for growth deficiencies, education for the children and their caregivers about nutrition of the child, special exercise that help the child, sleep pattern of the child, and psychological status so the knowledge for children and their caregivers is important to improve growth for children and decrease burden of the problem on children and their family and society [6].

Method and Material

Method

Research Design: A quasi-experimental design was followed to conduct this study.

Setting: Study carried out in outpatient endocrine clinics and centers at Baghdad City hospitals.

Subject: A purposive (non-probability) sample of (80) children with growth hormone deficiency agree to participate in this study.

Tool of the Study: A study instrument was designed and constructed by the researcher to measure the variables underlying the present study. A questionnaire format construction through reviewing of literature and related studies. The tool of the study consisted of two parts (Child Demographic Characteristic and their knowledge questionnaire related to management of hormone deficiency)

Part 1: A demographic data sheet, consisted of (2) items, which included age and gender,

Part 2: knowledge questionnaire designed to measure the children knowledge and it consists of (48) items that concerned with: growth hormone replacement therapy dosage, rout of administration and side effects, children knowledge toward nutrition status,child knowledge toward exercises and it is effect on child height and growth, and children knowledge toward sleep disturbance and it is effect on growth.

Method of while the intervention procedure:

1. Approval request provided to the children to obtain their participate agreement of the study.
2. Validity: Content validity for the early developed instrument was determined through the panel of experts (who have had more than 5 years of experiences in their specialty field) to investigate the clarity, relevancy, and adequacy of the questionnaire in order to achieve the present study's objectives. A preliminary copy of the questionnaire was designed and presented to (15) experts. They were (6) faculty members from college of nursing/ university of Baghdad, (6) endocrinologist faculty member from ministry of health (Central child teaching Hospital) (1) Endocrinologist from Babylon College of Medicine, (1) nutritionist from Al-Kindy Collage of Medicine and (1) psychologist from Ibn Rushed Hospital.
3. Determination of the questionnaire was based on test –retest method.

Statistical Analysis: Descriptive and inferential statistical analysis procedure were used to analysis data.

Results

Data analyzed reveal that table (1) show the child's age mean is 10.36 ± 1.75; two-third age 12-years-old (*n = 32*; 40.0%).

Concerning child's gender, more than a half are females (*n = 43*; 53.75%) compared to males (*n = 37*; 46.25%).

Table (2) There are statistically significant differences in children management follow-up (Mean = 47.5625, 53.3275, 69.443) respectively.

Tables (3) show there is no statistically significant difference in children's management of growth hormone deficiency, nutrition, exercise, sleep, and psychological status their demographic data like child's gender groups in the pre-test time.

Table (4) show there is statistically significant differences in children's management of nutrition, exercise, and management of sleep and children's gender groups in the posttest I (p-value = .005).

Table (5) show there is a statistically significant difference in children's management of exercise between children's gender groups in the post-test II (p-value = .005).

Discussion

Concerning the children age, the two third of study sample 57.5% was (11- 12) years old (table1) this result agree with [7] of the study (pattern of short stature attending the growth center in Al-Sulaimaniyah they reported that most frequent of age group was(8-12years), the study agree with [8] (Evaluation of the American-English Quality of life in Short Stature in the United States) show that the (54.5%) of study sample (11-12) years old, the result agree with [9] of the study Causes of short stature in patients referred to the pediatric endocrinology clinic of children Welfare Teaching Hospital reported that ratio between male and female 1.14 and [10] found (22.4%) of study sample (11-12) years who showed in a study (Stunting among primary-school children: a sample from Baghdad, Iraq) conducted in primary-school children in Baghdad.

The Researcher stated that according growth and development this period are conceder acritical period for life of children in this period. Physiologically, the children is attention in the body image and in this stage the bone age density after 12 years old is closed in 11–14 in girls and 13–16 in boys) when the bone is closed. After closed the bone the medication and different aspect

of treatment that not effect on height and weight. Finally, this age of children is a final chance for treated children with growth hormone deficiency.

Concerning the children gender was more than half of study sample are female (53.75%), this result agrees with [11] of their study (Causes of short stature in Iraqi hospital-based study patients in pediatric endocrine clinic of children welfare teaching hospital) found (53.33%) of study sample is female. The study result similar with [12] of his study (Evaluation of The Response of Children with Short Stature to A Six Months Treatment with Recombinant Human Growth Hormone) was found (51.7%) of study sample is female. The result agree with [13] of their study they found 54.3% of study sample were female, This result similar with [8] found (54.5%) in the study sample female. And disagree with [10] who found (54.6%) of this study sample were males and the remaining were females, and similar of [13] of his study (Prospective study of Etiology of Short Stature in Pediatrics Endocrinology, Imam Khomeini Hospital), Faculty of Medicine, Tehran University of Medical Sciences, Tehran, Iran, are found (78 %) of study sample are male.

Successful parent education programs help parents acquire and problem-solving skills necessary to build a healthy family. Research shows that effective parent training and family interventions can change parents' attitudes and behaviours, promote protective factors, and lead to positive outcomes for both parents and children.

Health related causes of impaired linear growth include diverse systemic diseases, nutritional and emotional deprivation, endocrine diseases and a wide range of dysmorphic syndromes, inborn errors of metabolism, and chromosomal abnormalities. Variants of normal growth including constitutional growth delay (CGD) and familial short stature (FSS) are the most common causes of short stature [14]

The study result indicated that the children management toward (growth hormone, nutrition, exercise, sleep and psychological management) domain and sub domain shows that the children management was not accepted before beginning educational program and the improvement in their management was clearly observed through the first and second follow ups that refer to effectiveness of the program sessions (table 2).

The findings indicated that there was significant association between children management and their age (pretest, post 1and post 2) (p-value <0.05) (table 3). The researcher showed that the children knowledge deference according stage of children, children in late stage have more knowledge than early and late stage, knowledge improved developmentally with age, so children were oriented and obeyed to constructions and directions.

The findings indicated that there was a significant association between children management and their gender at (pretest post1 and post 2 of follow up (p value <0.05). There are statistically significant differences between both genders. In posttest I, posttest II male rather than female in some aspect like: sleep, exercise, psychological status this variance depends on attitude of the children and over time the boys contact with peer in the street and school

Conclusion

The study indicated that the most of children were male and the care givers were female, most of children age (12) years. The findings of the present study indicate that the implementation of educational program was effective, the management of children is improved in first and second post-test of follow up as compared with the pre implementation of the program.

Recommendations

1. Provide specialized nurse in endocrine centers and clinics to give high quality care.
2. Implementation the educational program to educate children and their families at schools, nurseries and other institutes.
3. Encouragement of children with growth hormone deficiency and their care givers about management through initiate of training session as group and incentive for children by educational media like CD, pamphlet, about normal range of height, weight, nutrition, exercise, and medication.

Conflict of Interest: The researchers report no conflict of interest.

Source of Funding: This study did not receive any funding from any agency.

Ethical Clearance: A permission to conduct this study was obtained from the ethical committee in the College of Nursing, University of Baghdad.

The Impact of Smart Phones on Musculoskeletal Pain on Students in Tikrit University

Firas Tariq Ismaeel

Department of Orthopedics, College of Medicine, Tikrit University, Salah Aldin, Iraq

ABSTRACT

Background: A Smartphone is a device which is can be holded by hand with computer capabilities, such as internet connections, information storage, video, e-shops, games, and others. Smart phones due its easily handling has a large impact on everyday life activities.

Patients and Method: current study was done during period (November 2017 to February 2018).to evaluate the impact of the smart phones on musculoskeletal system among students of Tikrit university, Total 104 samples(68 male and 36 female) randomly chosen in cross sectional study, data collected by using self administered questionnaire.

Results of current showed the age of precipitations from (18-26)year. The mean age is 22 ± 4 in study, the age (18-20 years) is (No.= 32 ; 30.72%),the age (20-22 years) is the most age included in the study (No.= 40 ; 38.4%), the age (22-24 years) is (No.= 26 ; 24.96%) and the age (24-26 years) is (No.= 6 ; 5.76%)also all samples in this study use touch screen smart phone (102 samples), just (2 samples) use keyboard phones, the duration of use of smart phones during day in the study was high percentage 30.74%(No.= 32) For 2-4 hour followed 22.12% (No.= 23) For 4-6 hour, whilst only (15.39 and 12.51) % for More than 8 hour and hour Less than 2 hour respectively. results of current study showed the males prefer lay down position during use mobile (61.74% of male), While female prefer sitting position(55.56% of female),as well as 32.34% (No. = 22) prefer sitting position, whilst 25.02% (No. = 9) of female prefer lay down position, as well as 4.41%(No. = 3) of male prefer standing position during use phone while 1.47% (No. = 1) prefer walking, and 13.89% (No. = 5) of female prefer standing while 5.56% (No. = 2) prefer walking, so the 77.9% (No. = 81) of use social media while 22.1% (No. = 23) not use social media,as well as the Precipitants in study suffer from neck pain (31.54%) as highest percentage, followed by wrist pain (25.38) %,but low percentage (2.31%) for eye pain and joint pain(8.47%).relief pain 38.47% (40 samples) respondents prefer rest and also the same number prefer change position while 7.69% (8 samples) prefer lay down, 1.92% (2 samples) take pain killer. 13.45% (14 samples) of respondent do nothing to relief pain.

Conclusion: findings of this study is the assessment of effect of smart phones on musculoskeletal system. Smart phones cause pain mainly in neck joint, wrist joint,back and muscle spasm.The pain increase by overuse of phones, and relieved by rest or change position.

Keyword: *smart phones ; musculoskeletal pain ; students and Tikrit university*

Introduction

Smart phones and musculoskeletal system diseases attracted the attention of the media and the clinical literature is being a potential cause for this medical problem[1]. To use the smart phones for sending messages, Internet searching, or playing games or using other functions, the user usually press on the screen repeatedly. These repeated upper-extremity movements in static and bad postures may cause pain, decreases in motor abilities, and feeling of discomfort[2].

Using smart phones for long periods of time well lead to repetitive use of certain group of muscles, which causes muscle fiber injury, cumulative damage from repeated acute injuries, and myogenic tonus, which affects mostly often the neck and shoulder muscles [3]. According to study by Shim and Zhu [3], it showed more load and stress on neck and shoulder muscles that occur during the use of touch screen computers and smart phones more than the usage of desktop devices. This occur more easily due small monitors used for tablets, smart phones and others.

Smart phones usually used in a static positions and without support to arm and neck well cause abnormal alignment of cervical spine and shoulders. Smart phones have small monitors, which is usually held during usage, the users must bend their necks to see the small screens, this well lead to increasing activity in the neck muscles especially the extensor group, overloading the neck and shoulders causing muscle fatigue, decreases muscle capabilities to work and affects the musculoskeletal system[2,4].

The mechanical support given by musculoskeletal system, which is important for providing and permitting movements, is composed of skeletal muscle, bones, tendons, cartilages, ligaments and, joints.Skeletal muscles contain contractile fibers, and are connected to the bone by strong attachments through tendons. Bones act as rigid levers, connecting with other bones through joints, which are kept in relationship by ligaments.as well as a special characteristic of muscle, tendons and joints is the possession of a rich sensory nerve supply, which is responsible for detection of position of the body and the velocity of movement. The integration of this sensory information by the central nervous system is important for the musculoskeletal system to act normally[7].

The main functional characteristics of the bone is its specialized extracellular matrix, which is hardened by calcium deposition,enabling it to function as a rigid lever, The muscles controlling of the head and neck perform many important tasks, including movement of the head and neck, swallowing, facial expressions, and movement of the eye ball. These actions require strong, forceful movements and one of the fastest, finest, and delicate adjustments in the entire human body. The continuous contractions in the muscles of the neck and upper extremities during usage of smart phones resulted in microscopic damage to the muscles. Repeated press on the screen of smart phones in static position lead to accumulation of fluids and an increase in compartmental pressure of muscular tissues[5].

Material and Method

Cross sectional study was done in Tikrit university. the size of sample was (68 male and 36 female)(104), age ranged between (17_27)year.Collection of data was done by using self administered questionnaire, from students only. its conducted in Tikrit university from students during period November 2017 to February 2018.randomly assigned and manually analyzed data represented by figures and tables in result suction by computer using Microsoft excel 2007.

Results

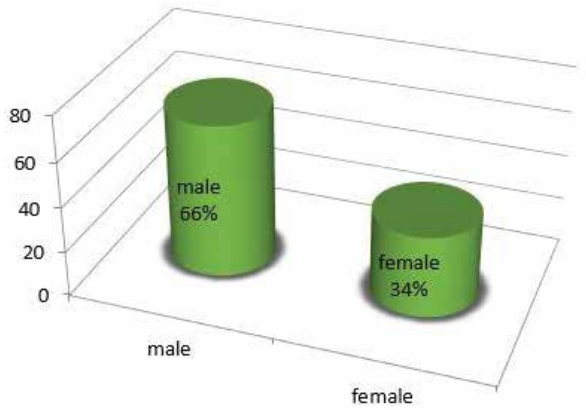

Figure 1: Distribution of group study according to gender

Results in fig.1 showed male (66%) more than female (34%).

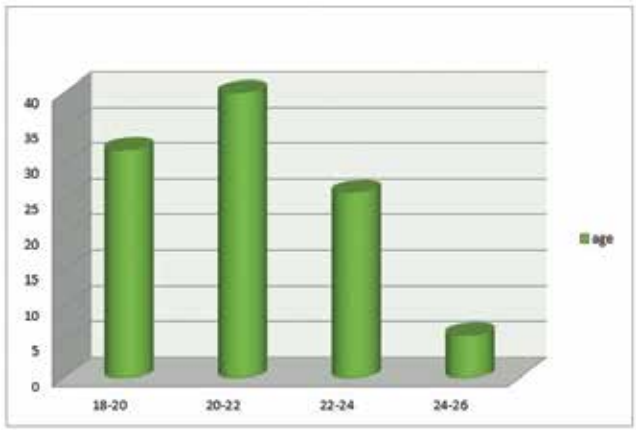

Figure 2: Disruption of study group according to age

Age of precipitations from (18-26)year. The mean age is 22 ± 4 in study, the age (18-20 years) is (No.= 32 ; 30.72%),the age (20-22 years) is the most age included in the study (No.= 40 ; 38.4%), the age (22-24 years) is (No.= 26 ; 24.96%) and the age (24-26 years) is (No.= 6 ; 5.76%)(fig.2).

Table 1: Duration of using smart phones during day

Time (hours)	Number of Samples	%
<2 H	13	12.51
2-4 H	32	30.74
4-6 H	23	22.12
6-8 H	20	19.24
>8 H	16	15.39
Total	104	100

In table (1) showed all samples in this study use touch screen smart phone (102 samples), just (2 samples) use keyboard phones, the duration of use of smart phones during day in the study was high percentage 30.74%(No.= 32) For 2-4 hour followed 22.12% (No.= 23) For 4-6 hour, whilst only (15.39 and 12.51) % for More than 8 hour and hour Less than 2 hour respectively.

Table 2: Positions during use smart phones acceding to gender

Position	Gender			
	Male (No.)	%	Female (No.)	%
Lay down	42	61.74	9	25.01
sitting	22	32.34	20	55.56
standing	3	4.41	5	13.88
walking	1	1.51	2	5.55
Total	68	100	36	100

Results in table (2) showed the males prefer lay down position during use mobile (61.74% of male), While female prefer sitting position(55.56% of female),as well as 32.34% (No. = 22) prefer sitting position, whilst 25.02% (No. = 9) of female prefer lay down position, as well as 4.41%(No. = 3) of male prefer standing position during use phone while 1.47% (No. = 1) prefer walking, and 13.89% (No. = 5) of female prefer standing while 5.56% (No. = 2) prefer walking.

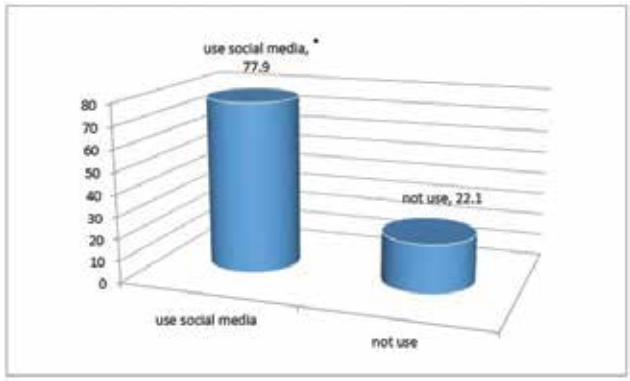

Figure 3: Pie chart show the percentage of use of social media in study

In figure (3) appearance the 77.9% (No. = 81) of use social media while 22.1% (No. = 23) not use social media.

Table 3: Percentage of symptoms in study group

Symptoms	Gender		Total (No.)	%
	Male (No.)	Female (No.)		
Wrist pain	20	13		25.38
Muscle spasm	13	6	40	14.61
Back pain	16	7	40	17.69
Neck pain	21	20	8	31.54
Eye pain	3	0	2	2.31
Joint pain	11	0	14	8.47
Total	84	46	77	100

In table 3 showed the Precipitants in study suffer from neck pain (31.54%) as highest percentage, followed by wrist pain (25.38) %,but low percentage (2.31%) for eye pain and joint pain(8.47%).

Table 4: Disruption of gender according to relief pain

Pain relief by	Gender		Total (No.)	%
	Male (No.)	Female (No.)		
Rest	30	10	40	38.47
Change position	19	21	40	38.47
Lay down	3	5	8	7.69
Drug	2	0	2	1.92
Nothing	14	0	14	13.45
Total	68	39	77	100

To relief pain 38.47% (40 samples) respondents prefer rest and also the same number prefer change position while 7.69% (8 samples) prefer lay down, 1.92% (2 samples) take pain killer. 13.45% (14 samples) of respondent do nothing to relief pain(table 4).

Discussion

The previous studies attempted to investigate whether the use of smart phones is a risk factor that would lead to musculoskeletal disorders and examined changes in pain and muscle fatigue occurring during use of smart phones.

In current study, use of smart phones for long time lead to musculoskeletal system disorder. Respondent in this study suffer from neck pain, wrist pain, back pain, muscle spasm, joint pain and eye pain, These results were consistent with the results of other previous studies that show pain in the neck and shoulders due to use of smart phones the results of a study by Berolo *etal.,*([1]) Also, it was reported that the use of smart phones caused pain in users' necks, shoulders, and arms. Fischer[(5),] Wrist pain is one of the findings in this study (33 samples) and this is also was mentioned in previous study that show the intensive use of the hands,thumbs, and fingers with repeated, static, or extreme finger postures may lead to pain and discomfort, Wrist pain may indicate development of carpal tunnel syndrome so that, these cases need to undergo further investigations to confirm the diagnosis[(6,7,8).]

The respondents suggest that pain due to use of phones can be relieved by rest or change position. Also, some of respondents prefer lay down to relief pain. Some of them take pain killer. But, about 13.45% of sample do nothing to relieve pain. This show in table 4. In this study the questionnaire is self administrated, so that chance of bias increased.

Conclusion

1. Current study conclude the effect of smart phones concentrated on wrist and neck joints. Also, other parts affected like back,muscle spasm and eye problems,this effect is increase with increase use of phones.
2. Signs and symptoms due to the use of smart phones include : neck pain, wrist pain, back pain,muscle spasm, eye problems and other joints pain.
3. The relieving factors of pain are take rest, change position and lay down.

Recommendations

1. Decrease duration and frequency of use smart phone because overuse of phones lead to musculoskeletal system disorder.
2. Counseling people to have comfortable position during use of smart phones.
3. Educate people to do special wrist and neck (most effective parts) exercises to avoid pain, also educate people to avoid abundant use of social media and writing.

Ethical Consideration: All the participants will not be subjected to harm in any way, as well as Precipitants in research will take full privacy for their answers, so the research is clear from any misleading information, also any representation of primary data findings in a biased way is avoided.

Risk at the Educational Laboratory in Indonesia

Frida Qurbasari D.[1], Putri Ayuni Alayyannur[1], Dani Nasirul Haqi[1], Meirina Ernawati[1], Fauziah Mukti Sugiharto[1]

[1]Department of Occupational Safety and Health, Faculty of Public Health Universitas Airlangga, Surabaya 60115, East, Java, Indonesia

ABSTRACT

A laboratory of Audio-Visual Aids (AVA) at the Faculty of Public Health of Universitas Airlangga is one of the education laboratories used as a room for teaching and learning activity related to health promotion implementation and behavioral science that becomes one of the competencies of public health graduates. Laboratory of AVA is equipped with electronic devices, storage cabinets, desks, chairs, and other supported equipment used for the laboratory work that has potential hazards and it can cause risks and impacts. In addition, it can damage either the students or the educational institution if the control is not performed. The objective of this research was implementing the method of Hazards Identification, Risk Assessment, and Determinant control at the Laboratory of AVA as a control effort toward the available potential hazards. The variables of this research were Hazard Identification, Risk Assessment, and Determinant control. Based on the finding toward hazard identification that had been done, it had been collected 6 activities that could lead to hazard potential and 7 sources of hazard that could cause 8 risks of occupational health and safety. Risk Assessment that had been done toward the available 8 risks, there were 7 risks included in low-risk level and 1 risk was included in moderate risk level. The given recommendation was tidying up the electrical cable installation, providing warning signs, repairing the broken or opened window, the lectures or teaching staffs guide the students to use a proper editing method, repairing the position of LCD and projector display, and providing the First Aid Kits and its content.

Introduction

Occupational health and safety according to OHSAS 18001:2007 is a condition and a factor that has a potential towards the health and safety of the workforce and other employees comprising contractual employee, contractor personnel, or other people in work environment[(1)]. Work environment or workplace according to Law Number 1 the Year 1970 is any room on space or field, it is closed or open, moving or stationary for the place for the employee to work, or it is often used by the employees for a business and the place where the sources of hazard exist[(2)]. The potential hazard that is available in the workplace can occur from the use of various devices and technology that are used for supporting the work activity. The devices and technology used for working can give the employees an impact in form of the risk of occupational accident, damage, and occupational disease.

In ILCI theory i.e. Loss Causation Model, it is mentioned that there are two causes of occupational accident i.e. the basic cause and direct cause. The underlying cause of the occupational accident is the human factor and occupational factor. The human factor that can cause occupational accidents including lacking physical, mental, and psychological capabilities, lacking knowledge and skill, stress, and inadequate motivation. Meanwhile, an occupational factor is an environmental condition that does not really support the employee to do their job safely. The direct causes of the occupational accident are unsafe action and unsafe condition [(3)].

One of the controls against the potential hazard is by conducting the management of the risk of occupational health and safety. According to Ramli, the process of risk management is one of the steps that can be done

for realizing a sustainable improvement[4]. This risk management process should be done comprehensively and it should be a part that is not separated from the management process. The processes included in the Risk Management Standard AS/NZS 4360 (2004) are (1) determining the object and the scope of the risk management implementation, (2) implementing risk identification, (3) conducting the risk assessment consisting of risk analysis for determining the possibility and the consequence that will happen, determining the priority scale and comparing the available criteria, (4) conducting the risk evaluation to determine the priority scale and comparing the available criteria, (5) conducting an unacceptable Determinant control, (6) conducting the communication and the consultation that are performed in risk management process, which involves all parties, and (7) determining the monitoring and review toward the risk management program that has been implemented. The overall process of risk management can be called Hazard Identification, Risk Assessment, and Determinant Control (HIRADC)[5].

Universitas Airlangga is a pedagogical institution that extremely supports the teaching and learning process performed by the lectures and the students so that they put their best effort in providing the supporting infrastructures and facilities for teaching and learning activity. One of the supporting infrastructures and facilities for teaching and learning activity is an educational laboratory in form of a Laboratory of Audio-Visual Aids (AVA) existed in the Faculty of Public Health. Laboratory of AVA in the Faculty of Public Health is functioned as a place for conducting a learning process related to the implementation of health promotion and behavioral science that become one of the competencies of public health graduates. The laboratory of AVA at the faculty of Public Health is equipped with electronic devices, storage cabinet, desks, chairs, and other supporting devices that are used for laboratory work activity.

The objective of this research was implementing Hazard Identification, Risk Assessment, and Determinant control (HIRADC) method at the Laboratory of AVA as a preventive effort toward the accident and disease due to the use of the laboratory.

Material and Method

The research was conducted at the Laboratory of AVA Faculty of Public Health of Universitas Airlangga, Surabaya. This research was an observational descriptive with a cross-sectional approach. The data used in this research was the primary data collected using an observation method.

The primary data was collected for identifying the physical and common hazards comprising (1) dust, (2) noise, (3) being hit by falling objects, dan (4) the danger of electricity. The data collection was done with the assistance of observational table to identify and assess the danger related to the occupational accident. The assessment toward the hazards was done by combining the values of likelihood and severity to find out the collected risk level. Thereby, the appropriate Determinant control could be done. The data that had been collected was then being processed in a matrix and descriptive forms and it was also presented in narrative form.

Findings

Table 1: Hazard Identification and Risk Assessment at the Laboratory of Audio-Visual Aids of the Faculty of Public Health of Universitas Airlangga

Activities	Sources of Hazard	Risks	Risk Assessment Matrix		
			L	S	RR
Using the Electricity source as the support for learning activity	Electricity current	Electrical Shock	2	2	4 (Low)
	Electricity cable	Tripping over electrical cable installation	3	1	3 (Low)
General lecturing activity	Dust in the room for storing works	Inhaling dusty air	1	1	1 (Low)
		The available things in the room for storing works can be easily dirty and broken	1	1	1 (Low)
	The dangerous position of LCD and Projector Display	Being hit by falling LCD and Projector	1	2	2 (Low)

Conted…

The lecturing activity in Foundation of Communication Media, Information, and Education	Properties	Being hit by falling properties	1	2	2 (Low)
	Noise (Intermittent Noise)	noise-induced hearing disorder, stress	3	1	3 (Low)
The laboratory work implementation/learning activity at the laboratory of AVA and the incident of minor accidents	No First Aid Kit at the laboratory	The injury cannot be treated by first aids and it can result in severe injury	2	3	6 (Moderate)

Hazard Identification: The hazard identification that was done at the Laboratory of AVA by observing the devices, activities, and the environment of each activity. The best approach used for identifying the hazard was a proactive approach since it could found out the hazard prior to causing the impact. According to Ramli, without recognizing the hazard, the risk could not be determined so that the control effort toward the risk could not be implemented[4]. One of the proactive approaches that could be used for identifying the risk was Job Safety Analysis (JSA) that was conducted at each available work activities.

The first potential hazard was from the activity of using electricity source as the support for the learning activity. The activity had some sources of hazard i.e. the high electric current that risked the people around the source of hazard to get an electric shock and the use of an electrical cable that was not organized well could risk people around the source of hazard to be tripped over the electrical cable installation that was being used. The use of electricity source in the learning activity at the Laboratory of AVA was the primary thing that should be done to support the learning activity since learning activity needed a media such as LCD, projector, and speaker for the lectures in conveying the course material.

The second potential hazard was from the activity of general lecture i.e. the room for storing works used for storing the students' works after conducting the laboratory work on health promotion and behavioral science. The room for storing works was rarely visited by the students, lectures, teaching staffs or the laboratory officer and it caused the room for storing works was rarely cleaned so that there was so much dust stuck on the students' works. The dust sticking on the works might be inhaled by people who visited the room for storing works. Besides, the dust could make the students' works become easily dirty and broken. Thereby, it could not be seen and learned by the visitors of the room for storing works. The activity of general lecture that had a potential hazard was the position of LCD and the projector display that was dangerous. LCD and projector display available at the Laboratory of AVA was placed on the ceiling of the laboratory in hanging position. The position could make people around the LCD and projector display in danger since the object in a hanging position was vulnerable to cause people to be hit by falling objects.

The third potential hazard was from one of the lecturing activities such as Foundation of Communication Media, Information, and Education. Those courses had some outputs in form of making visual, audio, and audio-visual media and conducting the display of audio-visual media as the final project conducted at the Laboratory of AVA. The final project needed some properties used for decorating the laboratory so that it became a proper room according to the students' needs. The use of the properties needed some lifting and transporting processes that needed more than one lifting process, and the installation of the properties at the laboratory. It would result in the risk of being hit by falling properties due to the lifting and transporting processes and the incorrect installation of the properties. In addition, the learning process of Foundation of Communication Media, Information, and Education had other potential hazards such as momentary noise or intermittent noise. This momentary noise happened when the process of presenting the final project occurred since it needed the speaker for the presenter to communicate with the audiences who watched the presentation. Besides requiring the speaker to communicate the presentation, another media used here for supporting this final project presentation was the speaker for music or video presented in the final project. This momentary noise could cause noise-induced hearing disorder and stress

in the students, lectures, teaching staffs, and laboratory officers. The project presentation of Foundation of Communication Media, Information, and Education was conducted 3 times in a week for 7 weeks consecutively.

The fourth potential hazard was from the activity of general lecture or the laboratory work implementation at the Laboratory of AVA. The laboratory work activity or general lecture conducted at the laboratory had a risk at each activity process. The available risk could cause both small and major injuries that needed the first aid. At the Laboratory of AVA, there was no First Aids equipment so that when the injury happened due to the general lecturing activity or laboratory work implementation at the laboratory, it could not be treated immediately. It is not in line with the regulation of Ministry of Manpower and Transmigration of the Republic of Indonesia Number 15 the Year 2008 on First Aid in the workplace; it is stated that each institution should provide the First Aids facilities and the officer. According to the Regulation of Ministry of Manpower and Transmigration of the Republic of Indonesia Number 15 the Year 2008, First Aid in the workplace is the attempt to provide accurate and immediate first aid to the employees/labors and/or other people in the workplace who are sick or injured. The Laboratory of AVA is the workplace for the lectures, teaching staffs, laboratory officers, and the place for the students to study and apply their knowledge.

Risk Assessment: AS/NZS 4360: 2004 explains that the risk can be found through a combination between the severity of risk impact and likelihood and the possibility of the occurrence of the risk[5]. The assessment using the combination between severity and likelihood was used for determining the risk level whether it was low, moderate, or severe.

The result of risk assessment at the Laboratory of AVA found that there were 7 risks out of 8 risks in low level and 1 risk in the moderate level that can be seen in table 1. The risk in moderate level was the injury that could not be treated using the first aids and it resulted in severe injury due to unavailability of First Aids Kits at the Laboratory of AVA. According to AS/NZS 4360:2004, the risk level in the moderate category does not need the top management involvement, but it needs immediate treatment action to reduce the risk[5].

Meanwhile, the risks in low category were electrical shock, tripping over the electrical cable installation, respiratory irritation due to inhaling the dust, the students' works could be easily dirty and broken so that they could not be seen and learned by the visitor of the room for storing works, being hit by falling properties, being hit by LCD and projector display, and noise-induced hearing disorder and stress due to the momentary noise. According to AS/NZS 4360: 2004, the risk level in the low category could be treated using an applicable regular routine[5].

Determinant Control: Determinant control is an important step and it determines the overall risk management.. According to OHSAS 18001: 2007, the Determinant control attempt should be done to prevent and reduce the prevalence of occupational accident and damage; the effectiveness of control should be assessed to know how far the control had been conducted to be able to eliminate or minimize the available potential hazards[1]. Tarwaka explains that the hierarchy of Determinant control as the procedure that should be considered when choosing a method to reduce or decrease the risk such as elimination, substitution, technical engineering, administrative engineering, and the use Personal Protection Equipment (PPE)[6].

The Determinant control efforts that were available at the Laboratory of AVA had been conducted based on the available risk were tidying-up the electrical cable installation, hanging curtains on the broken window to minimize the dust from entering the room, providing warning signs, setting up the intensity of sound, supporting the LCD for a temporary period of time, and curing wounds using the available equipment. From variable Determinant controls that had been done at the Laboratory of AVA, there was still some risks in that the risk category should be degraded so that the researcher recommended some Determinant controls comprising fixing the opened or broken window in the room for storing works, the lectures, teaching staffs, or the laboratory officers guide the students to use the proper editing method, fixing the position of LCD and projector display in a safety place, and providing the first aid kit and its content according to the Regulation of the Ministry of Manpower and Transmigration of the Republic of Indonesia Number 15 Year 2008 on First Aid in the workplace[7].

Conclusions

The hazard identification that had been done against the activity done at the Laboratory of Audio-Visual Aids of Faculty of Public Health of Universitas Airlangga, it had been collected 7 potential hazards from all work

activities that could cause 8 risks related to occupational health and safety.

The result from the risk assessment done at the 8 risks, it had been obtained 2 risk levels i.e. 7 risks in low category and 1 risk in the moderate category. The teaching staffs and the officers of the Laboratory of AVA had performed some initial control efforts to minimize the available risks. The recommendations that could be given to prevent and minimize the impact that could be caused by the available risks were tidying-up the electrical cable, providing warning signs, repairing the opened or broken window, the lectures or teaching staffs guide the students to use the proper editing method, fixing the position of LCD and projector display and providing the first aids kit and its content.

Etichal Clearance: Etichal Clearance is taken from Health Research Committee, Faculty of Public Health, Universitas Airlangga Indonesia.

Split Face Comparative Study of the Efficacy and Outcome of ND: YAG Laser and Intense Pulsed Light System for Hair Removal

Haider Al-Sabak[1], Muhsin Al-Dhalimi[1], Eman Mohammed[2]

[1]MD, University of Kufa, Faculty of Medicine, Iraq, Dermatology; [2]MD, Al-Qhadisia Health Directorate, Iraq, Dermatology

ABSTRACT

A prospective clinical split face comparison study conducted to compare the efficacy and safety of long-pulsed Nd:YAG laser and IPL in the treatment of idiopathic facial hirsutism. A 42 females with idiopathic hirsutism aged16-52 years with skin types II–IV were enrolled. A 38 patients completed the study; IPL applied on the right sides of the face and the ND: YAG on the left sides. They underwent six treatment sessions with 4 weeks intervals. Findings revealed that IPL treatment resulted in longer median hair-free intervals than Long-pulsed Nd:YAG laser therapy. Decrease in hair counts was significantly higher after IPL than Long-pulsed Nd:YAG laser. Hair reduction was 40%, 69% and 86% on IPL versus 32%, 58% and 80% on Long-pulsed Nd:YAG laser (p=0.0001), respectively. Patient satisfaction scores were significantly higher for the IPL when compared with Long-pulsed Nd:YAG laser treated sides at 1, 3, and 6 months. Slight stinging and burning sensation at time of the treatment were recorded in all patients. Erythema was seen on both the treated sides in all cases, which lasted from hours up to 2 days after session. Only 4 patients develop Leukotrichia on IPL treated side and are felt to be due to thermal damage to the melanocytes.

Keywords: *Hirsutism, Idiopathic, treatment, ND: YAG Laser, Intense Pulsed Light System*

Introduction

Hirsutism is defined as excess growth of terminal (coarse, medullated) hair in a female in a typically male distribution[1]. The androgen dependent growth areas affected include the upper lip, cheeks, chin, central chest, breast, lower abdomen, and groin[2]. The term idiopathic hirsutism has been used to describe the circumstance in which hirsutism is present with circulating androgen levels within the normal range[4]. Laser hair removal is accomplished through follicular unit destruction. The ability to remove hair without damaging the surrounding skin is based on selective photothermolysis. Lasers or light sources with wavelengths of about 600–1100 nm are absorbed by melanin and well suited for hair removal[6,7]. The longer Nd: YAG laser wavelength provides deeper penetration, a necessary factor in the attempt to achieve optimal laser hair removal results. In addition, the 1064 nm wavelength is relatively less absorbed by epidermal melanin than are the 694 to 810 nm wavelengths[8].

Patients and Method

This is a therapeutic interventional split face comparative study of the efficacy and outcome of Nd:YAG laser and an intense pulsed light system for treatment of idiopathic hirsutism. It was conducted at the Laser Research Unit, College of Medicine, University of Kufa; for the period from October 2016 to October 2017. The ethical approval was obtained from the Scientific Council of Dermatology and Venereology - Iraqi Board for Medical Specializations. Forty two females were enrolled in this study; four of them defaulted; because of the treatment was interfered with their work. Thirty eight patients completed the treatment, of skin types II–IV. Hormonal assays including follicle stimulating hormone (FSH), luteinizing hormone (LH), serum

testosterone, dehydroepistenedione sulphate (DHEAS), serum prolactin, serum fasting insulin, and abdomino-pelvic ultrasonography were done to diagnose any hormonal abnormality. Any patients with a suspected hormonal causes hirsutism were excluded. Only patients with idiopathic hirsutism were included. Formal consent was taken from each patient after full explanation about nature of study. Exclusion criteria were pregnant women, patients with a history of keloid scars, light sensitivity and using systemic medications known to be photosensitizing.

This study was a split-face controlled trial of facial hair removal comparing the long pulsed alexandrite laser (Quanta system, ITALY) with the IPL system (Quanta system, ITALY). Patients with skin type's II–III were treated using 11 J/cm^2 as a starting fluence increasing up to 15 J/cm^2 as tolerated, with double pulses and a pulse duration of 20 milliseconds. Those with skin type IV were started at 10 J/cm2, increasing to 13 J/cm^2 as tolerated. The Quanta ND: YAG laser (Quanta system - DNA laser technology – ULTRALIGHT, Milan, Italy) used in this study has a wavelength of 1064 nm and 25 milliseconds pulse duration. All patients were treated using 10 mm spot size, 25 milliseconds pulse duration and accompanying Dynamic Cooling Device. Standard starting fluence of 48 J/cm^2 was used, with fluence subsequently increased up to 55 J/cm^2 as tolerated. After explaining the procedure to the patient, the patient was instructed to lie on a comfortable couch, under good light, goggle was worn by the patient, a transparent color gel applied to the area to be treated. The patients divided randomly in to two groups, one group applied IPL on the right sides of the face and the ND: YAG on the left sides and the other group vice versa.

All areas were treated in a sequence with minor overlap in adjacent areas. The fluence was increased gradually when the patient tolerate the pain. The patient was instructed to avoid sunlight for the next two days. The next visit was scheduled 4 weeks later. The patient was told to record any side effects or to call the doctor if she needed. The patients underwent six full treatments with 4 weeks intervals between treatments. Response to treatment on the both sides of the face was assessed at 1, 3 and 6 treatment sessions. Patients were instructed that they should not epilate the hair from the area to be treated for at least two weeks before each session, because epilation will remove the hair follicle with its melanin content; which is the target for the laser and IPL. The patients were also instructed to shave the area to be treated immediately before therapy to minimize the side effects that result from burning and smarting of the hair and to reduce energy absorption by hair shaft. No local anesthesia of any kind was required.

Evaluation: All the patients were evaluated objectively and subjectively regarding their response to the treatment by the following methods:

Objective Methods:

1. **Photographic assessment:** Color photographs for each patient were performed at the baseline and at 1, 3 and 6 months of treatment. Frontal, right and left side of face views were taken using Sony- Digital, high sensitivity, 8 mega pixels, DSC-W30 still camera, in the same place with fixed illumination and distance. All the treated patients were assessed at the end of the study in computer view, blindly by two independent board certified dermatologists by visual analogue scale (VAS) of improvement by scale scores from 0 to 10.
2. **Hair-free intervals (HFI):** HFI in days were recorded following each treatment. HFI were defined as the time to first hair re-growth, as measured by the patient, following each treatment.
3. **Hair Density:** The numbers of hairs in (4cm^2 area) square were calculated, for this a square was drawn on skin with colored pen in fixed area on each side of the face for each patient. Digital camera (Sony, 8 Mega Pixels) was used to take photograph of this area.

Subjective Methods, Which Include:

1. **Patient's satisfaction:** Patient satisfaction questionnaire with laser treatment in terms of hair reduction was recorded on linear analogue scales (LAS) with 0 = not at all satisfied and 10 = extremely satisfied.
2. **Side Effects:** Any incidence of immediate or delayed complications was assessed and recorded at each visit, including: erythema, stinging pain, hypo/hyper pigmentation and blistering.

Statistical Snalysis: Statistical analyses were done through descriptive and analytic statistics by using scientific calculator and SPSS version 10 considering P-value of ≤ 0.05 as significant.

Findings

The patients' age ranged (18-50) years. And patients in both groups were almost matched for age, diseases duration and other demographic characteristics

Objective Method:

1. **Photographic Evaluation:** According to visual assessment of hair reduction on each side of the face for each patient by computer viewing of their photographs before and after treatment by using visual analogue scale.

   At the end of the study, the visual analogue scale (VAS) at IPL system and Nd:YAG laser treated sides were 7.3 ± 1.2 and 6.5 ± 1.2 respectively, P value=0.0001 (highly significant).

2. **Hair–free intervals (HFI):** A gradual increase in time of HFI with the increase in the number of sessions was shown from pretreatment until sixth session. There was no difference in pretreatment of Hair–free intervals between the IPL and Nd:YAG laser sides, 5.79 ± 4.2 and 5.95 ± 5.19 respectively, (p=0.7), (Table 1).

3. **Hair Density:** A gradual decrease in hair density with the increase in number of sessions was shown from pretreatment until sixth session. There was no difference in pretreatment hair density between IPL and Nd:YAG laser sides, given a mean ± SD of 50 ± 21.6 and 41 ± 21.1 respectively p=0.998 (Table 2).

Subjective Evaluation, Which Included:

1. **Patient's satisfaction:** At all stages of follow-up, patient satisfaction with IPL treated side was statistically highly significant P value=0.0001, (Table 3).

2. **Side effects:** Slight stinging pain at time of treatment was recorded in most patients (Table 4) in women with idiopathic hirsutism.

Table 1: Mean and Standard Deviation (SD) of hair free interval

Comparison between pretreatment and first session					
System type	**Pretreatment mean ± SD**	**First session mean ± SD**	**Difference**	**P value**	**Increased%**
IPL	5.79 ± 4.2	13.08 ± 4.2	7.3	0.0001	126%

	IPL	0	3	4	7

Discussion

Unwanted hair growth remains a therapeutic challenge and there is a need for an effective, safe, and non-invasive treatment modality capable of removing hairs on a long term basis [3].

In the present study we conducted a split-face comparison for treatment of hirsutism with Long-pulsed Nd:YAG laser 1064 nm and Intense Pulsed Light System 650-1200 nm in women with idiopathic hirsutism.

The result from this study was that IPL treatment resulted in longer hair-free intervals than Long-pulsed Nd:YAG laser therapy (At sixth session HFI was increased to (55.4%) on IPL versus (23.5%) on Long-pulsed Nd:YAG laser) p-value = 0.0001.

Hair reduction was 86% on IPL versus 80% on Long-pulsed Nd:YAG laser at 6 months duration. When compared between IPL and ND: YAG at sixth session p=0.376 finding was statistically not significant.

Patient satisfaction scores were significantly higher for the IPL when compared with Long-pulsed Nd:YAG laser treated sides.

Kamal et al.2006[11], reported that 20% of patients on Nd:YAG laser and 30% of those on IPL device exhibited excellent hair reduction.

Karaca et al.2012, recorded in Comparison of SHR Mode IPL System with Alexandrite and Nd:YAG Lasers For Leg Hair Reduction, that the mean hair reductions in 6 weeks after three sessions were 50% for the IPL system, 53% for Alexandrite and 39% for the Nd: YAG lasers. However, after 6 months; 40%, 49% and 34% hair reduction were observed, respectively [12]. This study was comparable with the present study as the IPL has higher hair reduction than Nd:YAG laser but statistically not significant.

AL-Hamamy et al.2015, Compared in a split-face study the effectiveness of diode laser 808 nm and the IPL (690 – 1200 nm) in treatment of hirsutism. Results revealed after three sessions that both modalities were effective in hair reduction. For diode laser hair density was decreased by 30%, 45% and 58% compared with IPL in which the hair density was decreased by 38%, 44% and 49% after the first, second, and third session, respectively [13].

Recently Neejra [14], reported in comparative study between Diod, Nd:YAG lasers and IPL, the percentage of hair reductions after eight sessions were 92%, 90% and 70% respectively. This result differs from that of the present study as IPL in this study have lower hair reductions than Nd: YAG laser.

Radmanesh et al [15]. Investigated the side effects of IPL used for hair removal among 1,000 female hirsute patients. Patients were treated every 4–6 weeks for eight sessions or more and followed-up lasted up to 20 months. The authors documented burning as a frequent side effect, followed by post-inflammatory hyperpigmentation (n¼75), bulla and erosion (n¼64), Leukotrichia (n¼40) and finally scar formation (n¼1).

In present study more side effects were noted with IPL than with long-pulsed Nd:YAG. Slight stinging pain at the time of treatment was recorded in most patients. Erythema was seen on both treated sides, which lasted from hours up to 2 days after session. Only 4 patients developed Leukotrichia on IPL treated side and are felt to be due to thermal damage to the melanocytes that is seen more in older patients and in those who already have few white hairs in other areas as the scalp.

The effectiveness of different optical depilation devices varies significantly due to subjects' biological variables such as anatomical location, epidermal pigmentation, duration of the hair follicle cycle, and androgen status [16]. In this study the two used devices were compared in the same subject, at the same anatomical site and at the same time, so, differences in efficacy could be attributed to laser variables and not to the subject.

The present study is comparing between the treatments with long-pulsed Nd:YAG laser and IPL, results revealed that both modalities were effective in hair reduction. These results are expected because the mechanism of action of laser and IPL is the same (destruction of stem cell in hair bulge by the heat produced by the absorption of light energy in melanosomes).

Conclusion

Both Long-pulsed Nd:YAG laser and IPL were effective in unwanted hair removal. However; prolongation of the time for hair regrowth were significantly higher with IPL system.

Ethical Clearance: All ethical issues were approved from the local committee of ethical issues for scientific researches.

Conflict of Interest: None.

C-reactive Protein and its Relationship with Lipid Profile in Suicidal and Non Suicidal Adults with Major Depression

Hassam M. Al-Amarei[1], Suaad Mohammed H. Rasheed[2], Ali J. Eidan[3]

[1]M.Sc. Mental Health Nursing, Faculty of Nursing, [2]Ph.D. Medical Microbiology, Faculty of Medicine, [3]Ph.D. Basic Medical Science, Faculty of Nursing, University of Kufa, Iraq

ABSTRACT

Objectives: We tested whether C-reactive protein and lipid profile might be associated with suicide attempts in subjects with major depressive disorder, after controlling for relevant individual characteristics.

Design And Method: Plasma levels of C-reactive protein and lipid profile; as well as Total Cholesterol (TC), and Triglyceride (TG), were determined in 60 patients meeting DSM-IV criteria for Major depression (22 suicidal attempters and 38 patients without suicidal behavior), and 30 healthy controls. Study participants were evaluated using Hamilton Depression Rating Scale and the Beck's Suicidal Ideation Scale.

Results: At univariate analyses, plasma level of C-reactive protein was significantly higher in suicide attempters (SA) than non-suicidal attempter depressed patients (NSA) and healthy control ($p<0.05$), while the plasma level of TC among SA were significantly lower than those NSA or healthy control subjects ($p<0.05$). Also, TG level was significantly higher in both SA and NSA ($p=0.009$ and $p<0.001$ respectively) compared with healthy control. After adjustment of potential confounders, suicide attempters were still had significantly lower levels for TC than NSA.

Conclusions: Our findings support the hypothesis that CRP, and TG are associated with suicide attempts in patients with major depressive disorder. The identification of valid and accessible biological markers of suicidal behaviors still represents a challenge for future research.

Keywords: *Depression, Suicide, CRP, Lipid*

Introduction

Suicide is a significant public health issue and a major cause of death throughout the world [1]. In Iraq, the suicide rate is a current health problem exacerbated by the fact that it is a country suffered war and destruction in all fields of life. Although most of Iraqi people are Muslim and Islam forbids suicide, it has presented an increase in its suicide rate. For example, between 2015 and 2018 there was an increase in the suicide rate from 1.09 to 3 cases per 100,000 inhabitants [2]. This is a worrying and alarming phenomenon need to strategies of prevention.

Among the underlying biological changes, accumulating studies indicate that a dysregulated immune system could be a contributing factor to depression, and possibly specifically to suicidality [3].

One possible pathway implicating the immune system is through the action of inflammatory cytokines, signaling molecules that mediate important steps in humoral and cellular immunity and that can cross the blood brain barrier and influence complex brain functions[4].

Due to the short half-life of cytokines, CRP is a relevant alternative for research to focus on interrelationships between inflammation and suicide because of its long half-life and detectability at lower levels. CRP is an acute-phase inflammatory protein synthesized by hepatic Kupffer cells signaling other body cells for destruction by the complement system and generated in response to increases in serum IL-6

[5]. Several studies have assessed CRP levels in patients with suicidality, with contradictory results [5-8]. One of these studies was designed an inflammatory index, consisting of CRP, IL-6, IL-10 and TNF-α, in patients with depression. They found that SI was significantly associated with an elevated inflammatory index, and this was independent of both the severity of depression and whether the patients had recently attempted suicide[7].

Alteration in lipid levels has been found not only in medicated, chronic patients, but also in drug-naive patients with first-episode of psychiatric disorders, as demonstrated in a recent meta-analysis comprising 19 studies, which revealed lower levels of TC in patients with MD compared to healthy controls [9]. Although some human studies have investigated a possible connection between low TC and suicidal behavior [10-12], others studies have shown no relationship between suicide and lipid parameters [13, 14]. Because of the conflicting results of the CRP and lipid profile on suicide, we want to focus on these subjects. The aim of current study were (1) to verify whether an alteration in the CRP, and lipid profile increase the risk of suicide in patients with MD or not, and (2) to exam the correlation between these variables in patients with MD. To our best knowledge, this is the first study that has been achieved in Iraq.

Subjects and Method

A. Subjects: After the approval of protocol by the Ethical Review Board for human studies, faculty of nursing/university of kufa/Iraq (No. 4-04/01/2017), a case-control study was conducted in emergency departments and Psychiatric Clinic at two large teaching hospitals (Al-Sader hospital and Al-Hakeem hospital) in Al-Najaf province, Iraq, from October 2017 to July 2018. All patients gave their written informed consent before enrollment.

1. **MD patients with Suicidal Attempter (SA):** 22 patients (16 men and 6 women) were enrolled on admission to emergency departments of two large teaching hospital (Al-Sader hospital and Al-Hakeem hospital) after a failed suicide attempt. Mean age of the patients was 36.91 years (range 18 to 48; standard deviation (SD) 10.3 years) and mean body mass index (BMI) 25.98 kg/m2 (range 16-36, SD 6.34 kg/m2).
2. **Control group I (MD patients with Non-Suicidal Attempter (NSA)):** 38 patients (24 men and 14 women) were recruited during the consultations in the Department of Psychiatry, Al-Hakeem Hospital. Mean age of the patients were 30.76 years (range 18 to 70, SD 14.1 years) and mean BMI 24.24 kg/m2 (range 19-33, SD 4.01 kg/m2).
3. **Control group II:** 30 healthy controls subjects (13 men and 17 women) without any symptoms or signs of MD based on a clinical examination were randomly selected from the municipal population. Mean age of the healthy controls was 31.1 years (range 20 to 67, SD 15.4 years) and mean BMI 24.1 kg/m2 (range 16-35, SD 4.65 kg/m2).

The exclusion criteria were as follows: (1) Patients with self-injurious behaviors were determined to have no suicidal intention or ideation, any past or present major medical or neurological illness, and a current axis I comorbidity and/or comorbid personality diagnosis. (2) Patients with chronic diseases such as hepatic disorders, diabetes mellitus, hypertension, cardiovascular disease, common cold, influenza, or any other inflammation. Finally (3) Patients who receiving anti-inflammatory, statin and/or immunosuppressive therapy.

All study participants went through a structured interview by a specialist in psychiatry and were diagnosed according to the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) and evaluated using Hamilton Depression Rating Scale (HDRS) and the Beck's Suicidal Ideation Scale (BSSI). The scale had acceptable reliability in our sample (Cronbach's $\alpha = 0.93$). Five ml blood sample was obtained between 7.30 and 8.00 by venous puncture from each controls after an overnight fasting period, while for SA, five ml blood sample was collected at the time of admission to the emergency room after the failed attempt. The blood was set in an EDTA tube, and then plasma was separated by centrifugation at (3000 rpm) for 15 minutes. Human CRP were assayed using the DuoSet ELISA Development System (R&D Systems, Minneapolis, MN, USA). Total Cholesterol and Triglycerides were determined by enzymatic CHOD-PAP and GPO-PAP calorimetric method.

B. Statistical Analyses: Numerical data were presented as mean ± standard deviation (SD). Categorical variables were presented as proportions. Differences among SA, NSA, and control group (healthy subjects) were estimated using ANOVA (Kruskall Wallis test for skewed data) for numerical variables with an additional Bonferroni post-hoc test. All statistical analyses were performed using the statistical package SPSS version 20 (SPSS Inc., Illinois, USA). The alpha-level of significance was set at $p < 0.05$.

Results

A total of 60 patients with MD (40 men and 20 women) and 30 healthy controls (13 men and 17 women) were included in the study. The patients were categorized into two groups according to suicide attempts. Means and Standard deviations of CRP and lipid parameters are summarized in (Table 1). The comparative analysis of the CRP and lipid profile among three studied groups showed significant differences in the CRP, TC, and TG (all $p<0.05$).

Post-hoc analysis for CRP, showed that SA had significantly higher CRP production than Non-suicidal MD patients and normal controls ($X2 = 30.921$, df = 2, $p < 0.001$). When examining CRP as a categorical measure [high CRP (=>3) vs. normal CRP (<3)], we did not find any significant differences in the CRP subgroups ($X2 = 2.003$, df = 2, $p=0.367$).

Furthermore, TG level was significantly higher in both SA and NSA ($p=0.009$ and $p<0.001$ respectively) compared with healthy control. No significant difference for TG level was observed between SA and NSA ($p>0.05$).

Table 1: Mean ± Standard deviation for Levels of CRP and lipids in SA, NSA and HC

	SA n=22		NSA n=38		HC n=30				Post-hoc analysis
	Mean ± SD		Mean ± SD		Mean ± SD		Statistics	p value	
CRP	6.41 ± 2.76		2.71 ± 0.48		2.40 ± 0.33		$X^2 = 30.921$, df =2	<0.001	SA>NSA, HC[ab]
TC	155.55 ± 8.65		172.02 ± 7.71		174.07 ± 8.82		F=36.733	<0.001	SA<NSA, HC[c]
TG	166.19 ± 36.77		175.98 ± 29.13		140.90 ± 37.35		F=9.185	<0.001	SA, NSA>HC[c]
	n	%	n	%	n	%			
CRP status									
Normal	12	54.5%	24	63.2%	22	73.3%	$X^2 = 2.003$, df =2	0.367	
High	10	45.5%	14	36.8%	8	26.7%			

Abbreviations: [a]=Those data were analyzed by using the Kruskal–Wallis test; [b]=The Dunnett C method was used for post hoc comparisons; [c] =The Bonferroni method was used for post hoc comparisons; SA=Suicidal attempter; NSA=Non-Suicidal attempter; HC=Healthy control; TC=Total Cholesterol; TG=Triglycerides; and SD=standard deviation.

C. Correlations among CRP, lipid profile, depression symptoms and suicidal severity in SA and NSA: As shown in (Table 2), SA had significantly positive correlations between CRP and total HDRS scores ($r=0.524$, $p=0.012$). Moreover, SA had significantly positive correlations between CRP and BSSI scores ($r=0.610$; $P=0.003$). For non-suicidal MD patients, No correlations were observed among all studied parameters.

Table 2: Correlation among CRP, lipid profile and Clinical scores (HDRS and BSSI)

	CRP	TC	TG
SA			
TC	0.050		
TG	0.143	0.258	
HDRS	0.524*	0.018	0.423
BSSI	0.610**	0.010	0.323

* $p < 0.05$

** $p < 0.001$

Discussion

We measured CRP and lipid profile in plasma of healthy control subjects, non-suicide major depressive disorder and suicide attempters with well-defined

clinical psychiatric profiles. In this study, while the levels of CRP was significantly higher in suicide attempters than non-suicidal MD patients and healthy controls, the level of TC among suicide attempters were significantly lower than those among non-suicidal depressed patients or healthy control subjects. Other studied parameters did not show any statistically significant difference among study groups.

Our finding was agreement with a study showed that depressed patients with suicidal attempter had higher serum CRP levels compared with depressed patients with non suicidal attempter and healthy controls [7]. Although Courtet *et al*. recently reported increased CRP levels in depressed patients with history of suicide attempts, they found no difference in the CRP levels of suicide attempters who had CRP measured within 7 days of the attempt or later [15]. Vargas *et al*. did not find differences in CRP levels between patients with and without history of suicide attempts [8]. However, specific alleles in the CRP gene are more common among depressed patients with history of suicide attempt. Lastly, in psychiatric populations, a CRP level of 5 mg/L differentiated responders and non-responders to anti-inflammatory treatment of depressive disorders (infliximab) [7].

Our second finding of decreased levels of total cholesterols and low density lipoproteins in suicide attempters with MD compared to control depressive patients or healthy control subjects is consistent with a recent study [1] as well as, coincide with the conclusions of a meta-analysis published in 2015, which included a total of 65 different studies, found overall association among lower TC level, and suicidality [12]. However, other reports did not find an association between plasma TC, and suicidality [16].

With respect to triglyceride levels, our results showed higher levels of triglycerides in suicide attempters and non suicidal attempters with MD. Our finding coincides with previous studies, which found a significant association between triglyceride levels and depression [1, 17], but not with other reports that observed decreased levels of triglycerides in subjects with suicidal attempts [11]. However, other authors report conflicting findings, even suggesting a positive association between triglyceride levels and the risk of suicidal behavior [18].

Previous studies demonstrated the imperative necessity of membrane cholesterol in the function and organization of the 5-HT1A receptor [19]. Results from additional studies showed that the fluidity of lipids considerably regulates the binding of serotonin (5-HT) in murine brain membranes. It is therefore expected that decreased levels of cholesterol would increase the fluidity of the cellular membrane. While, at the same time, minimal exposure of the 5- HT receptors would be found in the synaptic cleft [12].

The present findings ought to be viewed as preparatory in light of many limiting factors: First- the small size of the sample limits causal conclusions in regards to the correlation between inflammation and suicidilty. Second- MD Patients in current study were doctor's facility in-patients get upper and other psychotropic medicines and a few members were utilizing calming pharmaceuticals, all of which could have impacted levels of our needy factors [20]. Finally, current study can't represent lifetime stretch introduction or comorbid psychiatric disorders that could have added to our watched example of results.

Conclusions

Our findings support the hypothesis that CRP, and TG are associated with suicide attempts in patients with major depressive disorder. The identification of valid and accessible biological markers of suicidal behaviors still represents a challenge for future research.

Considered Absorption Spectra for Identification of Blood Constituents

Hassan Abdullah Mahdi[1], A. A. Al-Rubaiee[1], Muhanad M. Azzawi[2]

[1]Department of Physics, College of Science, Mustansiriyah University, Baghdad, Iraq;
[2]Laser and Electro-optic Research Center, Ministry of Science and Technology, Baghad, Iraq

ABSTRACT

This research is the first which it contains the considered absorption spectra for identification of blood constituents and biological liquids. The spectrophotometer is used for measuring the absorption spectra of blood constituents and determining the peaks of its absorption. The agreement of the peaks and wavelengths is demonstrated for more clinical analysis. The blood or plasma and some biological liquids are used for detection of clinical constituents from unknown samples. This way is very useful for diagnosis and for clinical analysis. It was prepared a large number of test samples for group persons (female & mate) in different ages. It is measured the results of more analysis that considers absorption spectra for identification of blood constituents.

Keywords: *Absorption spectra, blood constituents, clinical analysis, peak absorption, biological liquids.*

Introduction

The present work is the first that considers the absorption spectra for identification of blood constituents. There are some significant advantages as following[1, 2]:

1. It refers to laser possibility in clinical analysis which locating within the wavelength of laser which it used and compared with the peak absorption which it is corresponds to the magnitude for the wavelength of that laser source.
2. High accuracy in the test samples method and in the added chemical materials, that gave a good evidence for errors detection[3, 4].
3. When adding chemical materials with incorrect ratios, that it refers to wavelength or absorption errors[5-7].

The present work is significant because it is possible to determine known chemical constituents from unknown samples, therefore it is helpful in diagnosis the disease cases.

Spectrophotometer Description: The optical diagram of the spectrophotometer that used for measuring the spectra absorption for test samples is shown in the Figure 1[8]. The spectrophotometer contains tow lamps, one of them is tungsten lamp with wavelength range (322.5-800) nm; and the other is deuterium lamp with wavelength range (190-322.5) nm.

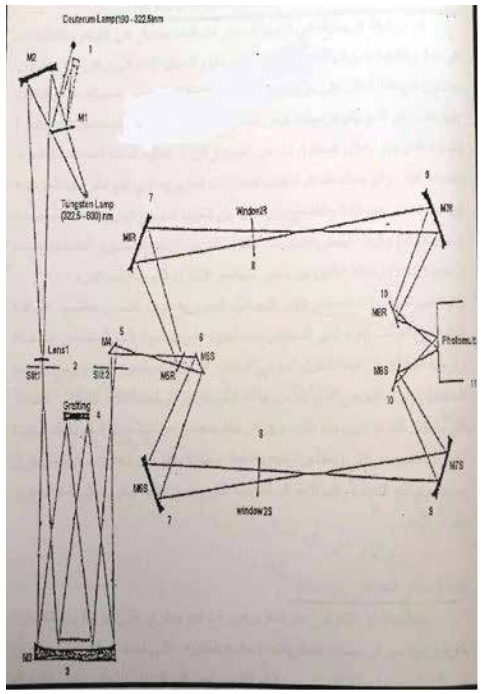

Figure 1: Optical diagram for spectrophotometer[8]

Absorbance Spectroscopy Measurement: The spectrophotometer was used in this research to measure the absorbance spectroscopy for blood constituents and some biological fluids and determine the absorption peaks[9]. A good agreement had been observed between these values and wavelength of used Argon laser (488-514.5) nm. In the approach of the present work, the absorption spectra helped in detection of known constituents from unknown solutions which help to diagnosis the clinical feature of the results that had a significant value. To calculate the concentration or activity for those clinical analyses, one can prepare the test samples for many times and different cases for group of people (male and female) in different ages and putting the samples in the spectrophotometer and measure the absorbance.

Results and Discussion

The present work can be summarized through mixing two or more of known samples with equal amounts for each type after preparing and putting in the spectrophotometer. Through measuring absorption spectra, it was noted that the peak absorption of some types are overlapped because approaching the values of its wavelengths. Also these wavelengths of samples gave an agreement with the deviation in some values such as wavelengths and absorption. In Table 1 was shown the known chemical analysis form unknown samples with one-peak as demonstrated for each type in the figures.

Through figures (2, 3), a good agreement was demonstrated between the absorption peaks and wavelengths. This is positive indicator for measurements of each clinical analysis for appropriate wavelength.

This scientific and experimental fact leads to diagnosis the diseases cases by the specialists after noting the absorption peak with its wavelength which refers to that type of analysis.

& is this lie in normal or abnormal values for concentration or activity.

From Table 1 and Figures (2, 3), one can distinguish known clinical analysis from unknown samples with one-peak because of the overlapping in its wavelengths.

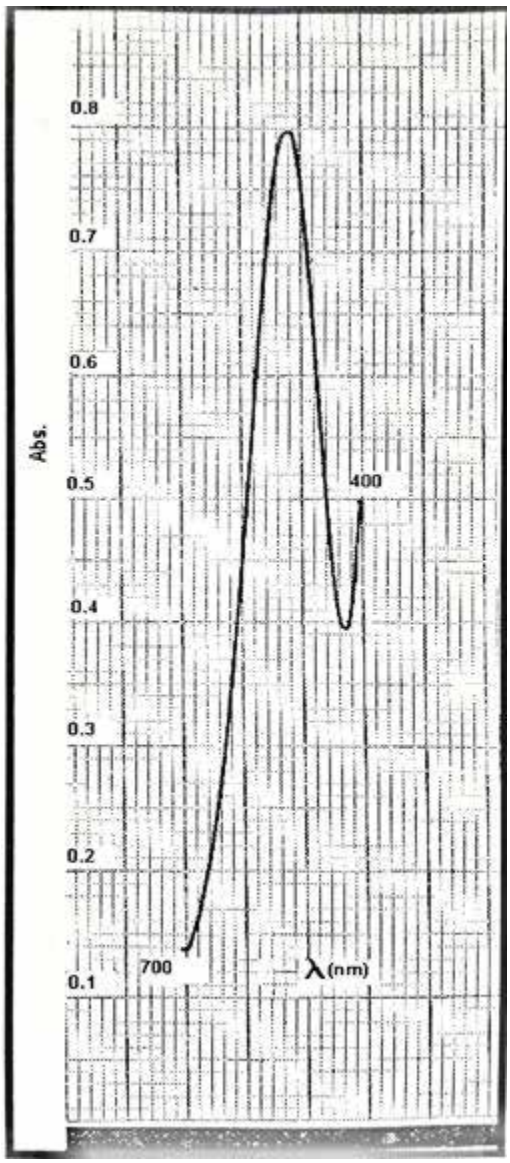

Table 1: Clinical composition from overlap samples (1. Peak)

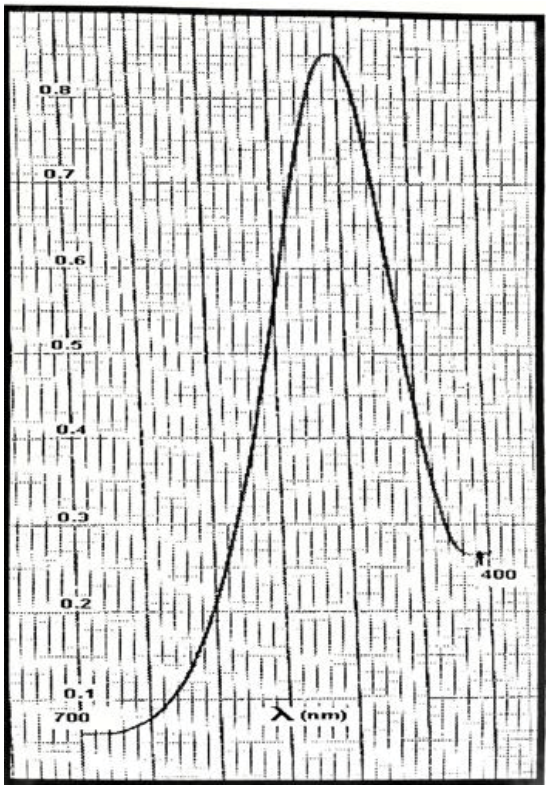
No.	Species Overlap in Situ	Overlapped wavelengths (nm)	The Resulting wavelength (nm)
1.	Sugar, Fluid protein	500, 540	520
2.	Cholesterol, Uric Acid	500, 520	500
3.	Sugar, Uric Acid	500, 520	480
4.	Creatinine, Fluid Protin, Urea	492, 540, 580	600

Conted…

The deviation of the wavelength from its real value is given by two reasons:

1. In case of ($\lambda_1 < \lambda_0 < \lambda_2$), it is called mass shift, which follows the molecular weight.
2. In case of ($\lambda_0 > \lambda_2$ and $\lambda_0 > \lambda_1$), this is leads to new formation.



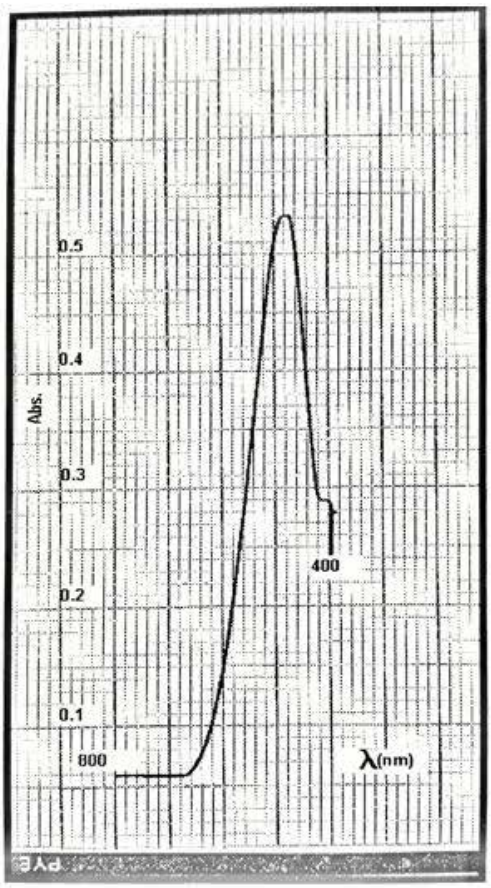


Figure 2: Determination of clinical composition from overlapped samples a: (Sugar, Fluid protein); b: (Cholesterol, Uric Acid)

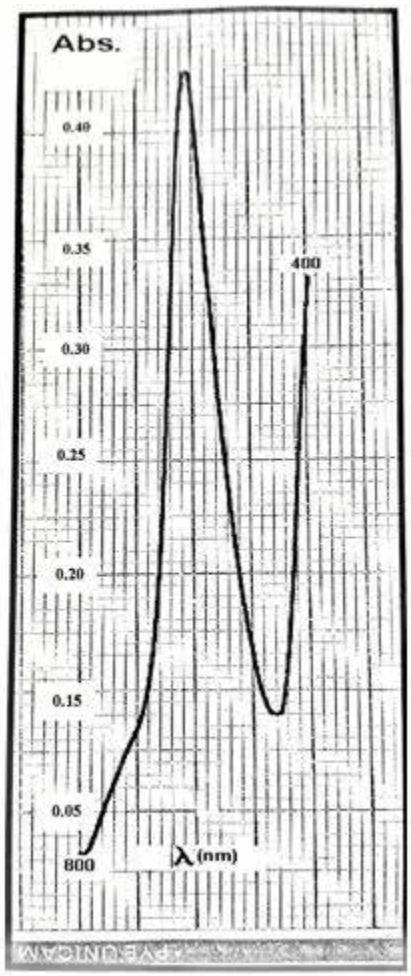

Figure 3: Determination of clinical composition from overlapped samples a: (Sugar, Uric Acid); b: (Creatinine, Fluid Protin, Urea)

Conclusions

The present work can be concluded as follows:

1. Inventing a new method in clinical analysis by considering absorption spectra for identification of blood constituents.
2. It is considered that this method is a basis for constructing a specialized laboratory for clinical blood analysis and some biological liquids.
3. Determining known clinical constituents from unknown samples, which it help to diagnosis the disease cases with high accuracy.
4. The absorption spectra is a conclusive evidence for the correct or incorrect results of analysis, also it is possible to determine the errors when happen by using this method.

5. By using this method, it is not needed to add chemical materials into samples according to the usual ways. Therefore, this way is an economy way because there is no need to add more of chemical materials.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Physics/College of Science/Mustansiriyah University, Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

ABSTRACT

The study aimed to measure the concentration of five heavy elements in the soil of Shattrah City. Attempt to detect the number of pollution levels of heavy metal and make comparisons between this level and international standard determinants.Using Atomic Absorption Spectrophotometer device (Flam Atomic absorption (FAA)) We were selected (7) different stations in the city, including (old crowded residential, industrial, modern crowded residential, Industrial, area exposers bombed in 2003, and areas closed to the busy streets to vehicles) samples were collected during the month of June and July of 2016 -2015, Values were arranged[(171.6857 ppm), (12.27 ppm), (66.4142 ppm), (21.5 ppm), (20.928 ppm)] respectively, the present results indicate that there were high ratio of lead, cadmium and zinc in all study areas and this other evidence of soil contamination.

Keywords: *The Soil, The heavy metals and The Shattrah city.*

Introduction

Heavy metals are among the most dangerous environmental pollutants due to their high toxicity and their easy accumulation in the tissues of different organisms. The continuous increase in these minerals is due to the effluents from sewage treatment plants, power plants, processing, mining and agriculture [1]. Heavy elements include a wide range of elements, including what is necessary for the vital activities of living organisms in fixed proportions, including what is unnecessary and which are substances contaminated and high toxicity of living organisms [2]. Heavy metals are known to have high densities of more than 5 gm/ cm and are very low in living systems and have high stability. These elements can be classified into low toxic elements such as manganese with moderate toxicity such as chromium, copper, nickel and severe toxicity such as uranium and lead And cadmium. [3,4,5]. The toxicity of these mineral elements is related to their physical-chemical composition. Minerals can be found in nature on multiple images, such as the iconic image associated with water or in multiple complexes with organic and inorganic compounds. These compounds are based on electrostatic, [6]. The chemical properties of metals as well as their degree of toxicity are related to the problems caused by the environment closely related to their positions in the periodic table. Their gravity is due to the fact that they are transitional elements and have the ability to form stable complexes with a large group of organic and inorganic compounds in living organisms [7].Soil is one of the major repositories of human waste and the processes that biochemical can be mobilized to contaminate water supplies and the impact on food chains [3]. Heavy metals are released from their sources far from their emission point with the help of the atmospheric (wind). PH is also an important measure in the soil system as it directly or indirectly affects absorption, sedimentation, decomposition, complex formation, oxidation and reduction reactions and is important in determining the behavior of these elements In the soil [7]. As well as the importance of organic matter in the soil, which consists of living organisms and biochemical (amino acids, proteins, carbohydrates and organic acids) and affect these materials on soil construction and water retention [3].

Study Area: The Shattrah is located on a branch of the Gharraf River, which descends from the Tigris River in the central Euphrates region of southern Iraq about 350 Km south of the capital Baghdad at latitude (31,4175) the latitude (46,1777),Its population is (254,000) people

according to the statistics of 2014. The following administratively and geographically in the province of Thi-Qar is located midway between Baghdad and the southern provinces and the Arabian Gulf. This is what enabled it to occupy a vital geographical location for its control of the transportation and road transport between Baghdad and the Arabian Gulf on the one hand and between Baghdad and the rest of the southern city on the other. The district of Shattrah is the second largest district in Iraq, with an area of (2,384 Km^2), administratively bordered by Maysan Province and the west by Al-Nasr. On the north side is the district of Rifai the south is Nasiriyah. The judiciary includes three administrative areas Dawa [8], as illustrated in Figure (1).

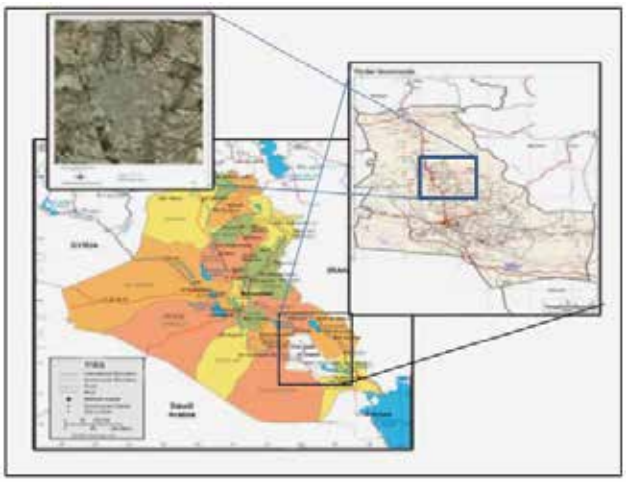

Figure 1: Thi-Qar Governorate Map shows an aerial view of shattrah Cities[9]

Materials and Mode of Pperation: Various samples of the soil for each station for (7) different stations [Industrial neighborhood, Imam Sadiq neighborhood, hospital district, Technical Institute neighborhood, Baghdad district, Mashtal, Imam Hussein neighborhood (p) During the months of June and July of 2016-2015, industrial, residential and commercial areas, the samples were stored in nylon bags after modeling [10] was used to calculate the concentrations of heavy elements in selected soil samples. The following are the basic stages of processing samples and preparing them for final analyzes:

1. Grinding the soil sample using a ceramic mortar after drying in a 100 ° C oven for two hours.
2. Screening of samples using a sieve (0.63 µm)
3. Place (1 g) of the dried sample in a 250 ml clean beaker using a delicate balance
4. Collect the sample by adding 15 mL of hydrochloric acid with 5 mL of concentrated nitric acid HNO3
5. Put in a sand bath for 60-45 minutes
6. Refrigerate the baker to laboratory heat and add 5 ml of hydrochloric acid and heat in a sand bath to dry, for 5-10 minutes.
7. Cool the cup and add 5 ml of hydrochloric acid and 50 ml of hot distilled water
8. Heat the mixture to boiling point for 2-3 minutes
9. filtration with filter paper. 42, located in a bottle size of 100 ml
10. Wash the insoluble precipitation with distilled water and add the washing water to a site and complete the volume to 100 ml and then send it for analysis by Flam Atomic Absorption Spectrometer.

Results and Discussion

The results of the study showed a high concentration of the lead element in the soil samples (7 stations) from different areas in Shatrah compared to the Iraqi determinants of 150 ppm [11], as in Table (1). Where the industrial area recorded the highest concentration of the lead element because of the large number of cars and blacksmith shops and the spread of ice factories. The bombing during the 1991 and 2003 wars also contributed to the explosion of bombs and missiles.[12] [13]. Resulting from the combustion of fuel containing tetraethyl, which uses lead or the fourth generation to reduce the engine helps to increase the lead pollution in the environment of the combustion of fuel used in local power generators deployed in residential neighborhoods is a source only as well as lack of health and environmental services, Resulting in degradation and increased heavy concentrations [Pb, Cd, Ni, Cu, Cr] insisted in soil [14] When comparing the results of the current study with local studies according to Table (2), we noticed that lead concentrations recorded higher results than the Iraqi determinants [15] and higher than recorded [16] in the soil of Kufa and recorded [17] From the record [18] in the soil of Baghdad - Nahrawan and recorded [19] in the soil of Basra and recorded [20] in the

soil of architecture and recorded [21] in the soil of Kut and higher than recorded [22] in the soil of Nasiriyah And recorded by [12] in the soil of Baghdad and recorded [23] in the soil of the city of ancient Ur We also noted the increase in concentrations of cadmium compared to the Iraqi determinants of 5ppm per million [11]. In his study, [24] pointed to the role of temperature rise and wind direction, and the effect of pollutants on it, And [25] That fuel combustion products used in brick factories are working to increase trace elements in the atmosphere and then deposition on the soil surface. According to [26], one of the reasons for increased concentration of cadmium in soil is the burning of plastic materials. Note that the cadmium concentration record highest rate [15.3 ppm] in the industrial zone, which ranks first. This is due to fuel combustion products in transportation and a number of kashi, block, ceramics and fuel combustion products in civil power generators and cadmium concentration in the Baghdad area [14ppm]. As well as the exposure of the region to a US missile strike in 2003, poor sanitation services and household waste Rh on the surface of the soil. When comparing the results of the current study with local studies, we observed that zinc concentrations were recorded [66.4142 ppm], higher than Iraqi determinants [15] and higher than global determinants (50 ppm) [11] and higher than recorded in Jabbar [21] And recorded [22] in the soil of Nasiriyah and recorded [23] in the soil of the ancient city of Ur. We observe the rise of the zinc element in the same areas where the concentration of lead and cadmium increased by the fact that zinc is not available individually but is uniformly present. In areas with poor health and environmental services. [27] The zinc content of the soil is highly heterogeneous and due to the resulting rocks in terms of the concentration of nickel and copper, we note that the current study rates recorded fewer results than the Iraqi determinants [15] Of the recorded [16] in the soil of Kufa and recorded [17].And recorded by [20] in the soil of architecture and recorded [21] in the soil of Kut and higher than recorded [22] in the soil of Nasiriyah and recorded [12] in the soil of Baghdad and recorded [23] in the soil of the city of Ur archaeological and slightly higher than recorded [19] in the soil of Basra. The concentration of this element in the industrial area is confirmed by the fact that the pollution is the result of the burning of fuel used in local electric power generators, which are widespread in the residential areas and constitute a major source of pollution of the surrounding heavy elements, as well as the lack of health and environmental services such as the discharge of wastewater and the accumulation of waste and household waste. Which are complex and heterogeneous and thrown into the soil, leading to their degradation and increased concentration of heavy metals [Pb, Cd, Ni, Cu, Cr] in the soil [14]. The region is located near the filling station of Benzin and was hit by missiles in 2003 and has been suffering from environmental and health neglect for many years.[28] confirmed in their study that the concentration of nickel and copper Is higher in the summer season than in other seasons due to the high temperature and the effect of the effect on the behavior of pollutants if it works to lift pollutants to the upper layers and thus increase the spread to long distances, illustrate the forms (3) Concentrations of heavy elements in the soil of the study areas.

Table 1: Concentration of heavy metals in the study area

No.	Area	Concentration				
		Pb(ppm)	Cd(ppm)	Zn(ppm)	Ni(ppm)	Cu(ppm)

Conclusions

This study shows the increase in lead, cadmium and zinc concentrations in the samples. Due to several factors,mainly the quality of fuel used in cars and local power generators, poor health and environmental services and the accumulation of household waste, which led to deterioration and increased concentration of heavy metals [Pb, Cd, Ni, Cu, Cr] All of which contributed to increasing the concentrations of pollutants on the surface of the soil as well as to the incorporation of chemical fertilizers and pesticides and their role in the pollution of agricultural land,

Recommendations

1. Afforestation of residential areas near the general street with different types of trees, especially environmentally friendly trees because of its beautiful appearance and calm the atmosphere in addition to its work as a wind, reducing the proportion of pollutants and plankton that increase the proportions of heavy elements, as well as their role in preventing soil erosion And stability.
2. To comply with instructions concerning the transfer of waste of solid and liquid power generation operations.
3. Use of scientific and practical methods in the recycling of waste using solid and liquid wastes resulting from the process of generating electricity and allocate areas far from the city for sanitary landfill and removal of construction waste

Conflict of Interest: None of the authors have any conflicts of interest to declare.

Source of Funding: The research was performed independently, there is no funding, influence over study design, analyses, manuscript preparation, or scientific publication.

Ethical Clearance: The project was approved by the local ethical committee (Biology Science Department, College of Education for women/University of The- Qar.

The Effect of Theory of Planned Behavior Models to Behavior of Cadres as the First Aiders of Stroke Attacks

Imelda Feneranda Seravia Tambi[1], Yuyun Yueniwati[2], Setyoadi[2]

[1]Student of Master of Nursing Study Program, [2]Lecturer, Faculty of Medicine, Brawijaya University

ABSTRACT

Background: Identification of stroke patients as early as possible is very important, this can help improve prehospital management and the accuracy of treatment. Public awareness can contribute to increasing the speed of arrival at the hospital after the attack.

Research Objective: to analyze the effect of model-based on the theory of planned behavior training on knowledge, attitudes, subjective norms, perceived behavioral control, intention and behavior of cadres as the first aider in identifying stroke.

Method: This study uses the true experimental method pre and post test control group design. This study included one experimental group (22 health cadres) and one control group (22 health cadres). Sampling uses simple random sampling. Training based on the model theory of planned behavior is carried out for 5 sessions. Data collection was conducted twice, namely before training, 1 week after training and measuring behavior 1 month after training.

Results: Training based on the model of the theory of planned behavior affects knowledge (0,000 < 0,05), attitudes (0,006 < 0,05), perceived behavioral control (0,000 < 0,05), intention (0,007 < 0,05) and behavior (0,000 < 0,05). Training does not affect subjective norms (0.057 > 0.05). Differences in the two groups only occurred in the variables perceived behavioral control (0.002 < 0.05) and behavior (0.000 < 0.05).

Conclusion: Continuous training is very important in improving cadre behavior in carrying out its role, namely the ability to identify and respond to stroke quickly. This is expected to support the success of the prehospital care system in the community.

Keywords: *stroke, first aider, theory of planned behavior*

Introduction

Provision of rapid treatment can be achieved by reducing patient time in making decisions, increasing early identification and rapid examination [(1)]. Lack of understanding of the introduction of stroke symptoms results in delayed treatment [(2)]. The evidence shows that public awareness regarding stroke is less optimal.

According to data from the Malang City Health Office in 2017, 379 stroke patients were found in the Janti Community Health Center work area. Patients with risky diseases, including 1,895 diabetes mellitus and 2,426 people with hypertension. These data indicate that handling prehospital is of particular concern to the community. The presence of a community can increase knowledge about stroke signs and risk factors[(4)].

Increasing prehospital handling can be done by training local residents. Local programs can help nursing staff to work with first aid workers and community health workers. Activities include increasing skills to local residents to recognize disease and doing first aid[(5)]. The right target in implementing community-based education is cadres. Cadres can help professional health workers in areas that have limited resources [(6)]. Cadres have a role in carrying out first aid measures for patients. The obstacles faced by cadres are that the level of education that is still lacking and inadequate[(7)].

The training provided should not only focus on increasing knowledge, but increasing the behavior of cadres as the first aider. One effort to improve health education is to utilize the use of the theory of planned behavior (TBP) [(8)]. This theory can design and implement educational interventions to change behavior. Increased

preparedness for stroke and self-efficacy which are steps needed to increase the speed of treatment of acute stroke[9]. Educational intervention based on the TBP has a significant influence on subjective norms and behavioral intentions [10]. Based on the evidence of the effectiveness of the theory, the research applied training based on the theory of planned behavior on cadres as the first aider in dealing with stroke.

Method

This study uses the true experimental method pre and posttest control group design. There were experimental groups and control groups, each consisting of 22 health cadres. Sampling uses simple random sampling. Data collection was conducted twice, namely before training, 1 week after training and measuring behavior 1 month after training. The questionnaire used was designed based on the theory of planned behavior with a Likert scale of 1 to 7 (not agreeing to strongly agree). Data were analyzed using parametric and non-parametric tests. The training based on the model of the TBP was carried out for 5 sessions with a duration of 10-60 minutes. This research has passed ethical conduct tests at the Ethics Committee of the Faculty of Medicine, Brawijaya University no 345/EC/KEPK-S2/12/2018.

Table 1 shows that all respondents were female (100%). The highest age in this study was in the range of 46-55 years (54%). The most characteristic of education is]junior high school graduates (46%). All respondents have never attended training or education related to the concept of stroke and first aid in stroke.

The results showed that before the training-based model of the theory of planned behavior (TBP) cadres had less knowledge of 60.59 ± 23.05. Inaccurate knowledge is found in questions regarding stroke risk factors, including smoking habits, old age and obesity, stroke signs and symptoms and actions to be taken when meeting patients with stroke. Lack of knowledge related to stroke risk factors and stroke symptoms can be influenced by education level and age[11]. The respondents' knowledge of stroke risk factors that are very low can be related to the status of education as a related factor [12].

Data shows that there is an increase in cadre knowledge after training (p = 0,000). There were no differences in the two groups (p = 0.261). This shows that both training methods can increase knowledge. 90.9% of cadres knew of stroke risk factors, 81.8% of cadres knew the signs and symptoms of stroke and 100% of cadres knew the act of contacting an ambulance. Efforts to increase knowledge in the TBP training model are carried out by brainstorming and group discussion in solving the given cases and demonstrating stroke assessment steps to draw conclusions from the results of the assessment.

This is in accordance with the statement that, knowledge is the result of the process of knowing and happening after someone feels a certain object. This happens through human imagination, namely the senses of sight, hearing, smell, taste and touch [13]. Knowledge or cognitive is domain which is very important in shaping actual behavior.

Understanding signs, symptoms and complications is a part that supports faster and better identification of strokes [14]. This can lead to an increase in attitude and if it is associated with health behaviors it will result in a better improvement in the patient's final condition. Knowledge of risk factors and prevention strategies will be very helpful in reducing morbidity and mortality due to stroke. Interventions to educate the public about the correct response to symptoms of stroke have a high success in helping the community make the right response when finding a acute stroke[15] This finding shows that first aid education must be disseminated in every segment of society.

Model-based training TBP has an effect on cadres' attitudes as the first aider in stroke (p = 0.006). There were no differences in the two groups (p = 0.067). This shows that the two methods used do not have an effect on improving attitudes. The activity in the experimental group aims to ensure the positive outcome as the first aider. The series of activities was carried out by giving the topic a discussion to the cadres regarding the impact of the delay in identifying strokes, how strokes could change the lives of people and family members. This session also provides an opportunity for cadres to share experiences in dealing with patients with stroke.

This activity is based on the findings of Pooreh and Hosseini, that attitudes toward the subject come from one's beliefs about the subject. That is, the beneficial consequences of a behavior will increase the individual's attitude towards that behavior[16]. Attitudes towards stroke are influenced by knowledge and supported by actions taken to prevent and treat stroke. Accurate knowledge of stroke risk factors and stroke warnings, appropriate stroke prevention measures or immediate actions needed to treat stroke patients [17].

Model-based training TBP has no effect on subjective norms (p = 0.057). The two groups did not show differences (p = 0.066), so the two methods in this study did not increase subjective norms. The results of this study are in line with the findings of Skolarus et al, that training related to reducing the delay in stroke care has no effect on subjective norms [9]

There are low and negative perceptions on social support that is felt in their role as the first aider. To increase subjective norms were carried out by forming social media groups by utilizing social media to provide motivation. The formation of subjective norms in their application in the field of education or training is through the practice of forming groups and providing motivation[18]. The lack of support and motivation of cadres was disclosed during the assignment evaluation. The results of this study pay special attention to the quality and motivation of health cadres in carrying out their roles.

The feeling and support of a community is an important influence on the satisfaction of a first aider in carrying out his role. Perceptions about the belief in their performance abilities, feelings of belonging and being bound to a place can be beneficial to the first aider [19]. The lack of recognition and appreciation for achieving health cadres can reduce their motivation. Social acceptance, enthusiasm for serving the community and achieving something useful for the community are the factors that motivate health cadres to continue to play a role in health services[20].

The effect of model-based training on TBP occurs in increasing the PBC (p = 0,000). There were differences in the two groups (p = 0.002). These results indicate that training based on TBP model is more effective in improving PBC. Perceived behavioral control refers to the existence of necessary resources and opportunities for certain behaviors and is influenced by a number of factors, such as previous experience[21]. In this study efforts were made to improve the perceived behavioral control through brainstorming. Provide opportunities for cadres to identify constraints within the group and present the results of the discussion, explain constraints and strengths in carrying out roles as cadres and make collective agreements through the formulation of strategies to overcome these obstacles. Activities that can develop perceived behavioral control are identifying constraints, making collective agreements to make strategies in dealing with these obstacles and providing motivation[18].

Training based on the TBP has an influence on intention (p = 0.007). There were no differences between the two groups (p = 0.087). Increased intention in the experimental group was influenced by high knowledge, attitudes, PBC after being given training based on the TBP. Stability of intention can occur if there is a lag between the measurement of intention and observation of behavior. The difference between the initial and final intentions will occur. After measuring intention, things will be found that can change one's intentions. The greater the intention will change if the longer the time interval[22]. Karimy et al. expressing TBP is useful for changing attitudes, subjective norms, perceived behavioral control and behavioral intentions for healthy lifestyles among patients with myocardial infarction[23].

The theory of planned behavior is one of the key theories in the application of first aid. After training most cadres assessed four to five patients from ten patients. The assessment not only included blood pressure, pulse, breathing, but all respondents assessed their ability to make conclusions and recommend further treatment for patients. Short stroke education interventions have the potential to positively influence stroke recognition and behavioral intention. This behavior contributes to the delay in the treatment of prehospital strokes[24]. Health care providers should emphasize the importance of contacting help if they find signs and symptoms of stroke rather than seeking care at a service provider.

Conclusion

Training of cadres as the first aider based on the theory of planned behavior model can significantly influence knowledge, attitudes, perceived behavioral control, intention and behavior. The results of the study show the importance of ongoing training to improve cadre behavior in carrying out their roles.
