Wound care is a nursing procedure that treats the wound with an aseptic technique that aims to cleanse the wound from debris to speed up the healing process of the wound. The wound care procedure is included in the competencies that must be mastered by students. This action is taught to students through skill lab learning that requires media or wound properties. Portable props are props used in learning that are effective in use and easy to carry (portable) Naismith, et all[15]. Portable teaching aids can create and gain more concrete experience for students so that it will make it easier to understand and play and train their skills. Portable WSD wound models developed by the teaching team on medical surgical subjects to help students get an effective and easy-to-carry lab skill learning experience so that whenever students will train or learn to demonstrate wsd wound care can be done independently.

From the description above it appears that teaching aids are important in the process of learning skills. Portable teaching aids provide opportunities for students to learn lab skills anywhere and anytime independently Kasatpibal, Sawasdisingha, & Whitney[19]. Based on the two factors above, this research was conducted. The purpose of this study is to compare the effectiveness of using portable wsd wound models with the use of wound models that have been used to improve wsd wound care skill.

Method

This is quasi experimental research using pre test-post test with control group design. The treatment for the intervention group, the students practiced the clinical skill lab by using practice model for wound care and a portable wsd wound model made from MBPC 1006 beige-colored synthetic rubber while the control group practiced using non portable WSD wound care and practice module of wound care. Respondents in this study were all 90 students of the Medical surgical course in the third and fifth semester of Academic Year 2013/2014. Stratified random sampling method was uses and respondents were grouped into two. All students are sorted according to the Grade Point Average (GPA) until the semester ended. Using a GPA of 2.75 as cut of point, 77 students' GPA were more than or equal to 2.75 and 13 others were less than 2.75. After this grouping, The groups whose GPA were above 2.75 and groups below 2.75 were included in both the control and the experimental group with equal numbers.

In this study each group underwent three phases, namely pre-test, intervention and post-test (evaluation). In the pre-test phase, students came to the practicum laboratory to be assessed for their basic knowledge of WSD wound care and the psychomotor ability (skill). Pre test was carried out using the prepared instruments consisted of: 1. Instrument related to the assesment of basic knowledge about wound care, 2. Instrument for assesing skills of wound care based on the operational standard procedures. The instruments previously had been for its reliability and validity, The Alpha Cronbach of instrument 1 was 0.831, whereas for instument 2 was 0.909. It means the value of both instruments was greater than the alpha table 0.632.

Next, at the intervention phase, both groups performed the skill lab at the same time. The control group practiced in the basic nursing laboratory while the experimental group practiced in the medical surgical nursing laboratory in a different building for 4 hours of duration time.

Post-tests are carried out immediately right after training on the same day, to avoid exchanging information between the control and experiment groups. The post-test was carried out by the same examiner at the pretest using the same evaluation sheet. The value of 2 was given for every step of the wound care procedure

performed correctly. The value of 1 was given for the steps that were done but incorrectly. And for the steps that were not done, the value was given 0. Then, the value was obtained by multiplying each item statement with the score then divided by the statement so that the maximum value for WSD wound care skills is 4.00. Referring to the the institutional rules, the passing grade is 69% of the maximum value, or 2.76 for laboratory practice skill.

Data were analyzed statistically using a computer program. The dependent t-test was carried out with a significance level of 0.05 to seek the value difference before and after training in each group. Furthermore, to compare the values of the two groups before and after the exercise, an independent t-test with a significance level of 0.05 was carried out. The value obtained by each respondent in each group was confidential. In addition, after the learning evaluation was carried out, to ensure the students achieved the expected learning outcomes, when the average score of one group was lower than the other group, then the group had the opportunity to exercise observed by the supervisor.

Results and Discussion

The mean value of clinical skill obtained before intervention between the experimental and control groups was almost the same. Fundamental changes occur after intervention. There was an increase in the achievement of the intervention group and the control group. Dependent t-test showed a significant difference between the wound care skill of students before and after intervention (table 1).

Table 1: Differences in pretest and posttest scores (T dependent test)

Ability	Group	Mean	SD	95% CI	T	p-value
Score WSD wound care practice	Intervention Pre test Post test Difference	 3.27 3.58 0.31	2.887	 -2.011 -0.145	-2.332	**0.001**
	Control Pre test Post test Difference	 3.31 3.57 0.26	1.330	 -1.063 -0.069	-1.170	**0.001**

n (Control Group) = 45

n (intervention Group) = 45

Furthermore, to find out the difference for the effectiveness between the use of old wsd wound models and the use of portable wsd wound models an independent t test was conducted. Table 2 shows that there was difference in the ability of knowledge and skills of students who used the old wound model (control group) to those studied using the portable wound models (experimental group).

Table 2: Comparison of WSD wound care practice (skill) between groups

Variable	Group	n	Mean	SD	95% CI	F	P value
WSD wound care practice	Intervention	45	-0.466	1.330	-1.716 – 0.716	5.649	**0.021**
	Control	45	-0.166	3.050			

The results of this study provide very important information about the use of portable in improving student skills in WSD wound care. Based on the results of the study it appears that both media (portable or non portable wound model) were proved to help students mastered the psychomotor skills. Both students in the control group and those in the experimental group were able to reach the passing grade determined in the WSD wound care procedure. In practice statistically the skill lab of the experimental group was better than the control group, but all students passed the specified passing grade score (Passing Grade Score= 2.76, mean control = 3.57, mean experiment = 3.58). Thus, the results of this study was supported by the research of Febriana et al[4] who

found significant differences in learning outcomes that use learning media in the form of body or phantom and audiovisual models.

Powell, Canterbury[7] stated that psychomotor skills can be developed through visualization, interaction in repetitive actions and practices. This is the basis of the success of the experimental group in carrying out wsd wound care procedures. Students in the experimental group were given the opportunity to focus on the simulation of the use of the portable models, then independently practised along with the modules provided. Students were also advised to look at the module and drilled the exercises during the training period.

Referring to the literature review, there is no single study which stated that the success of independent learning depends on the level of difficulty of the action Meyer et all[16]. The media used in this study were developed by the research team and firstly used. Based on the results of this study, although there was no difference in the effectiveness of the use of wound models, but both types of models provided significant improvement in both the ability of knowledge of wound care and a significant increase in the skills of performing WSD wound care procedures in both groups of students. Moreover students were able to reach the passing grade score for both abilities. In addition, the lab skill learning method was also more effective given the benefits generated Lassara[17]. First, during this study the autonomy and independence of students for laboratory practice learning increased. Students in the experimental group stated their readiness to be tested without first being asked by the examiner. This is consistent with what was stated by Beeson and Kriing[2] that independent learning methods increase student participation and autonomy. Furthermore, the number of guides needed is less so that efficiency can be increased WHO[18]. In addition to the above benefits, several things must also be considered in using the portable WSD wound model. First, before using this wound media, students were required to take part in the use simulation activities carried out by the instructor and used the use module as a guide when performing WSD wound care procedures. Interaction between students and supervisors was still carried out during training activities. The interaction between students and mentors was believed to be one of the factors that determine the success of students in taking up education programs. Furthermore, for the use of portable wsd wound models when lab skill learning can take place properly it is necessary to prepare a good lab skill learning planned by the supervisor.

Conclusions

Using a portable media (Portable WSD wound model) is more effective than the non portable wound model. Furthermore the portable model was proved in improving students clinical skills in WSD wound care. The portable wound model can help students during laboratory practice learning by learning independently and it can be an alternative in teaching psychomotor skills. This is very beneficial because the students autonomy learning in clinical learning can be improved, students can practice their skills with or without being accompanied by an instructor.

Recommendation

This study showed that the use of portable wound models independently and improved student clinical skills in WSD wound care. Therefore it is highly recommended to develop further studies on the use of more complex learning media. In addition, the respondents who are the current research tend to be homogeneous with relatively similar levels of academic ability so that the abilities achieved are relatively the same. Thus, it is necessary to conduct similar research on groups with more heterogeneous academic abilities so that the results obtained can be generalized. With these studies the existing psychomotor learning methods will be more developed.

The Role of SOD, Catalase, HSP-27, HSP-70, and TNF-α Expression in Apoptosis of Retinal Ganglion Cells After Intra Ocular Pressure Increase on Rattus Norvegicus

Nurwasis[1], Gatut Suhendro[1], I Ketut Sudiana[1]

[1]Faculty of Medicine, Kampus A Universitas Airlangga Surabaya, St. Mayjen. Prof. Dr. Moestopo 47, Surabaya Indonesia 60132

ABSTRACT

The aim of this study is to investigate the involvement of Super Oxide Dismutase (SOD), Catalase, Heat Shock Protein 70 (HSP 70), Heat Shock Protein 27 (HSP 27) Retinal Ganglion Cells (RGCs) and Tumor Necrosis Factor α (TNF-α) microglia in apoptosis RGCs and RGCs survival after transient periode of pressure induced ischemia/reperfussion injury of rat retina.The study design was randomized post test only control groups. Thirty one Sprague Dawley (SPD) rats were divided into 4 groups. 1 control group and 3 experimental groups. Experimental groups were induced by transient elevation of intraocular pressure (IOP) 110-130 mmHg for 45 minutes (7 rats), 60 minutes (7 rats), 75 minutes (7 rats). 28 rats were terminated at day 7 and 3 rats were terminated at first day for histology and immunohistochemistry staining examination. Result from the Expression of SOD, HSP 70 GSRs and TNF-α microglia were significantly different. p=0,046 and B=0.380 for SOD; p=0.030 and B=0,411 for Hsp 70; p=0.007 and B=0,501 for TNF-α. Expression of catalase and HSP 27 GRCs were not significantly different. p=0.203 for catalase; p=0.083 for Hsp 27. The increased expression of HSP 70 indicated strong correlation with increased level of apoptosis RGCs, p=0.046 and B=0,473. In conclusion, the result demonstrated that RGCs apoptosis survival in glaucoma correlates strongly with transient elevated IOP and is significantly associated with IOP induced changes in expression HSP 70 RGCs.

Keywords: *Intraocular Pressure, IOP, HSP 70 RGCs, Apoptosis RGCs*

Introduction

Glaucoma, a progresive optic neuropathy disease, is characterized by loss of retinal ganglion cell and their axons. This condition leads to irreversible visual loss. Death of RGCs in glaucoma human eyes and experimental animal models of glaucoma induced by apoptosis RGCs are still unclear. The elevated intraocular pressure was considered the prime factor for glaucoma[1, 2] Current theraphy that is directed at lowering IOP cannot completely stop the progression of the disease. Blindness caused by glaucoma is an issue in Indonesia and all over the world.

Increased intra ocular pressure 110-130 mmHg for 45 minutes, 60 minutes, and 75 minutes followed by reduction to normal TIO will cause reperfusion ischemia on the retina, in the area which contains cells of the retina and microglia[3]. Cells that undergo stress will promote changes in protein structure and function, so that the cells will be heading toward the death pathway or survival pathway. RGC which experience stress will produce ROS that is radical superoxide (O2-), hydrogen peroxide (H_2O_2) and hydroxyl radical (•OH). Increased ROS will be counterbalanced by an increase in endogenous anti oxidant namely superoxide dismutase (SOD) and catalase (CAT). RGCs which experience stress will also express Heat Shock Protein (HSP) 27 and 70. Microglias that undergo stress will express TNF-α[4,5].

The purpose of this study is to explain the mechanism of RGCs apoptosis in glaucoma following reduction of IOP to normal level.

Methodology

This study is a type of laboratory experimental research with randomized post-test only controls group design. The designs are as follows in Figure 1:

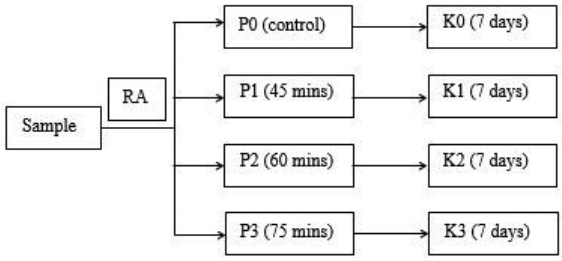

Figure 1: Research design approach

Where:

RA: Random Allocation

K0: Control group, without treatment an increase in IOP (P0), was sacrificed on day 7

K1: Treatment group with IOP increase for 45 minutes was then returned to normal IOP (P1), sacrificed on day 7

K2: Treatment group with IOP increase for 60 minutes was then returned to normal IOP (P2), sacrificed on day 7

K3: Treatment group with IOP increase for 75 minutes was then returned to normal IOP (P3), sacrificed on day 7

This research was conducted in a laboratory that is standard and has complete equipment and adequate experience in experimental animal maintenance, preparation of preparations as well as in immunohistochemical examination techniques under the guidance of doctoral quality consultants. For this reason, the research was carried out in a biochemical laboratory, immunohistochemical laboratory and electron microscope, Faculty of Medicine, Airlangga University. The time of the study was carried out for 6 months including the preparation, materials and tools, treatment, examination, data analysis and preparation of reports.

The sample of this study was male Sprague Dawley (SPD) type adult sex with a body weight of 250-300 grams, healthy condition and no abnormalities in the eye and general conditions.

After obtaining a homogeneous sample through screening with inclusion and exclusion criteria, a homogeneous sample group is divided by random allocation so that each sample member has the same opportunity to occupy its group.

In the process of carrying out the study, a dropout criterion was applied if the research subject experienced illness or death so that it could not fulfil the research procedure which took 7 days. Furthermore, rats were sacrificed and retinal tissue was collected around the optic nerve papillary to be made immunohistochemically preparations and staining. The collected data from histology and immunohistochemistry tests then carried out statistical analysis with the following details:

1. Descriptive analysis of data
2. Test for homogeneity
3. Multiple comparison test results of immunohistochemical examination (IHC) expression of SOD, Catalase, HSP70, HSP27, Apoptosis, Brn3b SGR and TNFα microglia.
4. Regression test to find out the causal relationship between the increase in intraocular pressure with variables SOD, Catalase, HSP70, HSP27, Apoptosis, Brn3b SGR and TNFα microglia.

Results and Discussion

Profile of Expression of Retinal Ganglion Cell Proteins and Microglia: Table 1 indicates that the standard deviation is 0.018 and the average SOD is 0.052, so the coefficient of variation is 0.3. Standard deviation of 0.015 and Catalase average of 0.036, so that the coefficient of variation is 2.4. Standard deviation of 0.017 and mean HSP70 0.031 so that the coefficient of variation is 0.5. Standard deviation of 0.011 and mean HSP27 0.041 so that the coefficient of variation is 0.3. The standard deviation is 0.007 and the average TNF-α is 0.008 so the coefficient of variation is 0.9. Standard deviation of 0.014 and mean apoptosis 0.008 so the coefficient of variation is 1.8. Standard deviation of 0.007 and Brn3b mean of 0.051 so that the coefficient of variation is 0.1 and there are homogeneous variables in the Brn3b variable.

Table 1: Mean and SD values for each variable in each group

	SOD	Catalase	HSP70	HSP27	TNF-α	Apoptosis	Brn3b
Mean	0.052	0.036	0.031	0.041	0.008	0.008	0.051
Standarddeviation (SD)	0.018	0.015	0.017	0.011	0.007	0.014	0.007
Minimum	0.039	0.020	0.021	0.028	0.000	0.000	0.044
Maximum	0.072	0.051	0.051	0.048	0.012	0.024	0.057

HSP70 expression in the treatment group was higher than the control group. HSP27 expression in the treatment group with duration of 45 minutes was higher than the control group, while the group duration of 60 and 75 minutes was lower than the control group. TNFα expression in the treatment group was higher than the control group. SGR apoptosis in the treatment group was higher than the control group. Living SGR in the treatment group with a duration of 45 minutes was higher than the control while the treatment group with duration of 60 and 75 minutes was lower than the control group.

Immunohistochemistry Expression of Retinal Ganglion Cell Proteins and Microglia: Figure 2 depicted the SOD1 Expression Retinal Ganglion cells with 400X magnification. This image shows an incision of retinal tissue with immunohistochemical staining. The red arrow shows a positive reaction to monoclonal antibodies (anti SOD1), while the green arrow does not react with monoclonal antibodies (anti SOD1). In this study there was an increase in SOD1 SGR expression, so as to neutralize the increase in free radicals, no oxidative stress and SGR apoptosis. While the expression of catalase SGR obtained a decrease in expression in the 75-minute group compared to the control group. These conditions indicate that catalase plays a major role in the detoxification of products from SOD, namely H2O2. This is consistent with the research of Goyal et al.[6], there was an increase in levels of SOD and glutathione peroxidase in the serum of patients with open-angle glaucoma compared to cataract patients, whereas the levels of catalase did not differ. In another study conducted by Yuki et al.[7], in experimental animals with SOD1 deficiency can result in SGR death. In other parts also found low SOD1 levels in the serum of normal pressure glaucoma sufferers compared to normal people.

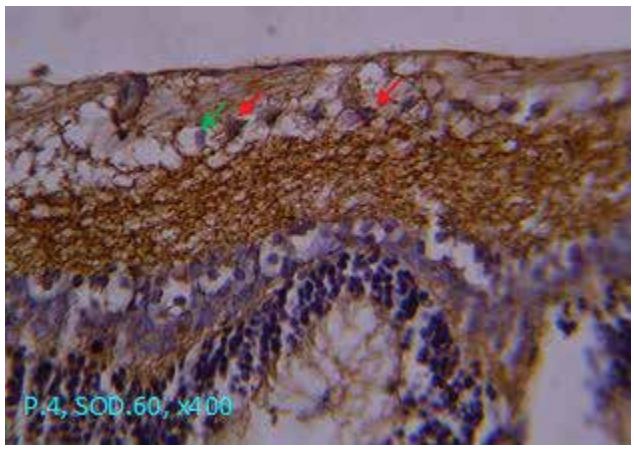

Figure 2: SOD Expression of Retinal Ganglion Cells at 400X magnification

Figure 3 presented the HSP expression 70 retinal Ganglion cells with 400X magnification. This image shows an incision of retinal tissue with immunohistochemical staining. The red arrow shows a positive reaction to monoclonal antibodies (anti HSP 70), while the green arrow does not react with monoclonal antibodies (anti HSP 70).Intracellular HSP 70 enhancement can act as anti-apoptosis by inhibiting the release of cytocrom C from mitochondria, HSP 70 can also inhibit the activation of AIF, APAF, and Caspase 3. Caspase 70 also plays an anti- apoptosis role at the pre mitochondrial level by binding to Bid and inhibiting P53. Intracellular HSP increases are followed by the increase of extracellular HSP which serves as an alarm for pro-inflammatory signals and immunomodulations such as IL 6 and TNF-α. eHSP 70 also acts as microglia activation and stimulates phagocytosis[8].

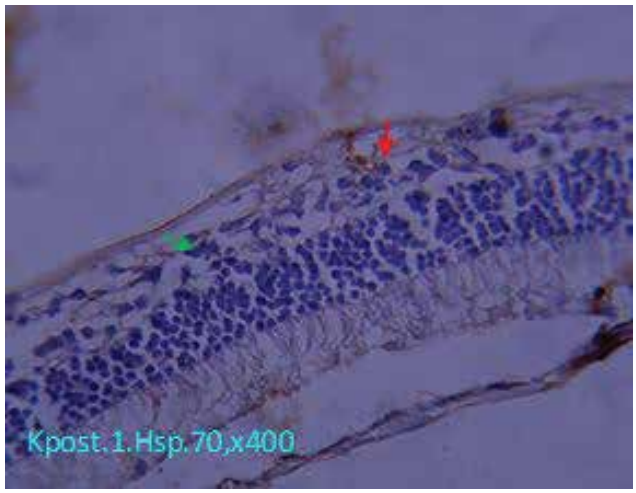

Figure 3: Expression of HSP 70 retinal Ganglion cells

HSP Expression 27 Retinal Ganglion cells with 400X magnification (refer Figure 4). This image shows an incision of retinal tissue with immunohistochemical staining. The red arrow shows a positive reaction to monoclonal antibodies (anti HSP 27), while the green arrow does not react with monoclonal antibodies (anti HSP 27).Schmitt et al.[8], HSP 27 is a protein that functions to maintain cells from stressors and acts as an anti-apoptosis either through intrinsic or extrinsic pathways. Intracellular HSP 70 also acts as an anti-aggregation, helping as transport, folding, and refolding as well as stabilizing filament and sito skeleton. On the other hand HSP 27 can activate the survival pathway through Phosphatidyl inositol 3 kinase (PI3-k). Akt/PKB and Nf-kB. Shields et al.[9], hypothesized that HSP 27 acts as RAMPs, acting as immunomodulation and activating

microglia membrane receptors to produce anti-inflammatory cytokines such as IL-10. From the research data, it can be seen that with the increase in stressors following a decrease in HSP 27 SGR expression, Hsp 27 cannot play a role in SGR protection in both intracellular and extracellular.

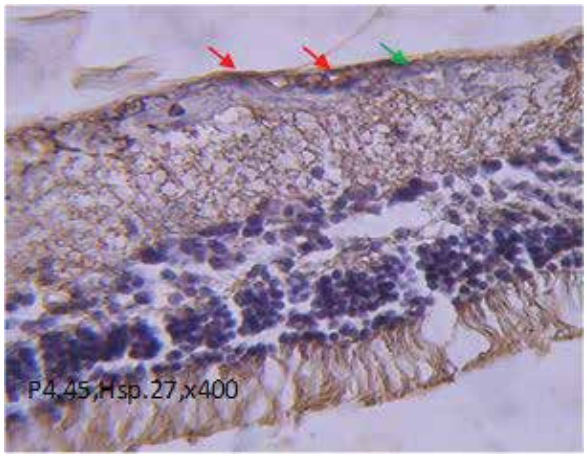

Figure 4: Expression of HSP 27 retinal Ganglion cells

Figure 5 shown the expression of TNF-α microglia with 400X magnification. This image shows an incision of retinal tissue with immunohistochemical staining. The red arrow shows a positive reaction to monoclonal antibodies (anti TNF-α), while the green arrow does not react with monoclonal antibodies (anti TNF-α).In the experimental animal model this study occurred similar to acute glaucoma in humans. At the biomolecular level of increase in TNF-α microglia there were differences in the duration of 75 minutes compared to the control group. TNF-α is known to have various functions as a proinflammatory cytokine, TNF-α can result in cell death through either the apoptosis or necroptosis process. SGR death at duration of 75 minutes may involve a process of necroptosis[10,11].

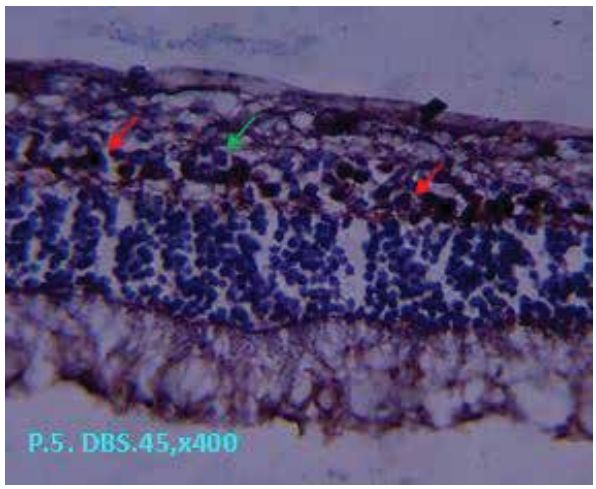

Figure 5: Expression of TNF-α microglia

Apoptosis expression retinal Ganglion cells with 400X magnification is depicted in Figure 6. This picture shows an incision of retinal tissue with immunohistochemical staining using the TUNEL method. Red arrows indicate retinal ganglion cells undergoing apoptosis. Poon et al.[11], in normal adult humans the process of apoptosis is very high, it is estimated that apoptosis of 1 million cells per second (physiological apoptosis) occurs. In this study, apoptosis occurred in the control group and increased in the treatment group. The increase in apoptosis occurred in the 60-minute duration group compared to the control group and the 45-minute treatment group, but there was no difference in SGR apoptosis in the 75-minute duration group compared to the control group.

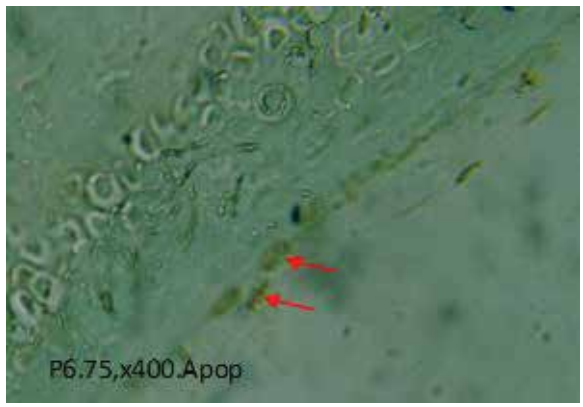

Figure 6: Expression of Apoptosis in retinal Ganglion cells

Figure 7 shown Brn3b expressions of retinal Ganglion cells with 400X magnification. This image shows an incision of retinal tissue with immunohistochemical staining. The red arrow shows a positive reaction to monoclonal antibodies (anti Brn3b), while the green arrow does not react with monoclonal antibodies (anti Brn3b). Brn3b is a marker used to identify SGR that survives. In this study, the lowest survival rate of SGR was 60 minutes compared to the control group (Figure 4.1). The survival decline in SGR occurred significantly at duration of 60 and 75 minutes compared to the control group.

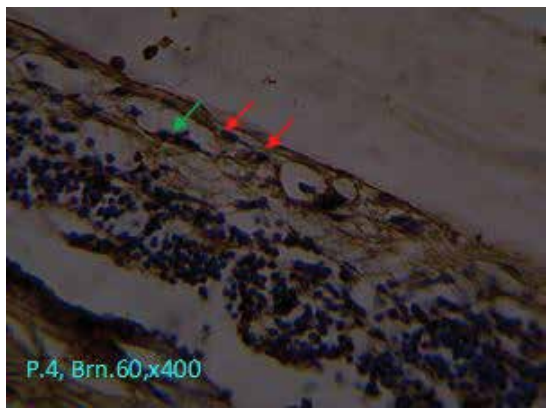

Figure 7: Expression of Brn3b retinal Ganglion cells

Conclusions

In conclusions, after the increase of IOP followed by decrease of IOP to normal level will result in increased expression of SOD, HSP70 RGC and TNF-α RGCs microglia. HSP 70 is the main apoptotic RGC biomarkers.

The Relationship Between Nurse Caring Behavior and Patient Satisfaction Level at Inpatient Wards of Bayangkara Hospital Jayapura

Jems K. R. Maay[1], Ester Rumaseb[1], Arwam Hermanus[1]

[1]Politeknik Kesehatan Kemenkes Jayapura, Jalan Pucang Jajar Tgh 56, Jayapura, Indonesia 60282

ABSTRACT

Patient satisfaction can be influenced by the caring behavior of nurses. Nurses who have a concern in providing nursing care to patients in the hospital are caring nurses. The purpose of this study was to determine the relationship between caring behavior of nurses and the level of satisfaction of inpatients at Bhayangkara Hospital. This research used a descriptive correlation with a cross-sectional study design. The research was conducted at inpatients wards of Bhayangkara Hospital. The population was inpatients with the number of samples of 88 respondents included by accidental sampling technique. Data obtained by using a questionnaire and analyzed by using Chi-Square. The results showed that there were 27 people (30,7%) who had fewer nurses caring behavior in the inpatient ward of Bhayangkara Hospital while There were 61 people (69,3%) with the good category. Patient satisfaction at inpatient ward of Bhayangkara hospital which less satisfied were 12 people (13,6%). Meanwhile, there were 76 satisfied respondents (86,4%). There was a relation between the caring behavior of nurses and patient satisfaction level at inpatient wards of Bhayangkara Hospital (p-value = 0,041)

Keywords: *Caring behavior, nurse, patient satisfaction*

Introduction

Nurse *Caring* behavior is a behavior that underlies nurses' behavioral attitudes in providing nursing services to their patients. The behavior of nurses who are friendly, attention, care, giving explanations to patients and families when conducting examinations and actions, respecting patients, being in a hurry, being calm, gentle, loving and understanding the feelings of patients or families of patients is a caring nurse behavior. Potter & Perry[14].

Patient satisfaction can be influenced by nurse caring behavior. Nurses who care about providing nursing care to patients at the hospital are nurses who have a *Caring* attitude[3]. Patient satisfaction can be assessed from several dimensions which include: *tangibles, reliability, responsiveness, assurance,* and *empathy* Nursalam[12].

Providing nursing services based on nurses' caring behavior can improve the quality of health services. The application of caring integrated with biophysical knowledge and knowledge of human behavior will be able to improve individual health and facilitate the delivery of services to patients[8]. Caring behavior that is carried out effectively can promote health and individual growth[9]. Caring behavior of nurses is not only able to increase patient satisfaction but also can generate benefits for the hospital Abdul et al[1,4,5].

Bhayangkara Jayapura Hospital is a police hospital that is structurally under the guidance of the Papua Police and Medical Sector. The number of nurses serving in the inpatient ward of Bhayangkara Jayapura Hospital is as many as 54 nurses, while the number of patients who get treatment in the inpatient ward of men, women's wards, and pediatric wards in February 2017, as many as 789 patients and the total number of beds 64 inpatients.

The results of a preliminary study conducted by researchers at Bhayangkara Jayapura Hospital in March 2017 concerning the level of patient satisfaction with

health services, obtained data from 10 questionnaires 20% of patients were very satisfied, 30% of patients were satisfied, and 50% of patients felt quite satisfied. While the results of interviews conducted by researchers on 6 inpatients, as many as 50% of patients said they were satisfied, and 50% of patients said that they were satisfied that nurses did not often check the patient's condition and only came when giving medical actions and nurses rarely communicated[17,18]. Based on this, the authors are interested in conducting a study on "Relationship between nurse caring behavior and the level of satisfaction of hospitalized patients at the Bhayangkara Jayapura Hospital[11]".

Aim Research

To determine the relationship of nurse caring behavior to the level of satisfaction of inpatients at Bhayangkara Hospital.

Research Method

This study was a descriptive correlation with a crossectional study design. Research location in the inpatient ward of Bhayangkara Jayapura Hospital. The population is in patients with a total sample of 88 respondents obtained by *accidental sampling*. Data were obtained using a questionnaire and analyzed using *chi square.*

Results and Discussion

Univariate Analysis

Nurse Caring Behavior

Table 1: Distribution of respondents based on Caring Behavior at Bhayangkara Hospital, May 2017 (n = 88)

Caring behavior	Frequency (n)	Percent (%)
Less	27	30,7
Well	61	69,3
Total	88	100

Source: Primary Data, 2017

Based on table 1, it shows that the patient's response to nurses' caring behavior in the less category is 27 people (30.7%) and good as many as 61 people (69.3%).

Patient Satisfaction

Table 2: Distribution of respondents based on Patient Satisfaction at Bhayangkara Hospital, May 2017 (n = 88)

Patient Satisfaction	Frequency (n)	Percent (%)
Quite satisfied	12	13,6
Satisfied	76	86,4
Total	88	100

Source: Primary Data, 2017

Based on table 2, it shows that patient satisfaction in the service category is quite satisfied as many as 12 people (13.6%) and both satisfied as many as 76 people (86.4%).

Bivariate Analysis

Table 3: Relationship between Nurse Caring Behavior and Patient Satisfaction Level in Inpatient Room at Bhayangkara Hospital, May 2017 (n = 88)

Caring behavior	Patient Satisfaction				Jumlah		p-value
	Quite satisfied		Satisfied				
	n	%	n	%	n	%	
Less	7	25,9	20	74,1	27	100	0,041
Well	5	8,2	56	91,8	61	100	
Total	12	13,6	76	86,4	88		

Source: Primary Data, 2017

Table 3, shows that of the 27 respondents who responded to less caring behavior with satisfaction patients were quite satisfied as many as 7 people (25.9%) and satisfied as many as 20 people (74.1%). Whereas 61 respondents who responded to good caring behavior with patient satisfaction were quite satisfied as many

as 5 people (8.2%) and satisfied as many as 56 people (91.8%)[10]. The results of the *chi square* statistical test obtained p-value = 0.041. This means that Ha is accepted which stated that there is a relationship between nurse caring behavior and the level of satisfaction of patients in the Inpatient Room of Bhayangkara Hospital.

Discussion

Caring Behavior: The results of the study showed that the patient's response to the caring behavior of nurses in the less category was 27 people (30.7%) and good as many as 61 people (69.3%). This shows that more than half of patients stated that caring behavior given by nurses was mostly good.

Caring is central to nursing practice because caring is a dynamic approach, where nurses work to improve their care for patients[16]. Caring is the science of humans, not only as a behavior, but a way so that something becomes meaningful and gives motivation to do[7]. Watson also defines curing as a medical term that means healing illness, so that differences can be drawn between nursing and doctors Burhannudin[2].

Most patients respond to good caring behavior, because the nurse listens to all what is conveyed by the patient patiently and gives a sense of comfort by fostering a relationship of trust and meeting all the needs of the patient by maintaining the patient's dignity and dignity. Although after being tested for validation from 88 respondents there were 27 people (30.7%) who still behaved less caring towards patients.

There are differences in the response of patients about nurses caring behavior in receiving a service that is different between each respondent. The factors that influence it are the understanding of respondent service users about the type of service they will receive. In this case communication plays an important role because health care carries the attitude shown by health workers[15].

Patient Satisfaction: The results showed that patient satisfaction in the service category was quite satisfied as many as 12 people (13.6%) and both satisfied as many as 76 people (86.4%).

Kotler in Nursalam[12] states that satisfaction is a feeling of pleasure or disappointment that someone appears after comparing between perceptions or impressions of the performance or results of a product and expectations. Nursalam[12,13] argues that customer satisfaction is an emotional response to experiences related to certain products or services purchased, retail outlets, or even behavioral patterns (such as shopping behavior and buyer behavior), as well as the overall market, customer satisfaction is the result (outcome) that is felt for the use of products and services, the same or exceeding the desired expectations. Whereas states that patient satisfaction is the level of the patient's feelings that arise as a result of the performance of the health service that is obtained, after the patient compares with what he expected.

Relationship between Caring Behavior and Patient Satisfaction: The results showed that there was a relationship between nurses' caring behavior with the level of satisfaction of patients in the Inpatient Room of Bhayangkara Hospital (p-value = 0.041). The results of this study are in line with the research conducted by Tiara[20] in Pringsewu General Hospital.

The results of the analysis showed that caring behavioral responses were lacking with satisfaction of satisfied patients (74.1%). While good caring behavior with satisfaction of satisfied patients (91.8%). This shows that with high caring behavior from the services provided by nurses, patients tend to feel satisfied. The better nurses caring behavior in providing nursing care services, patients or families are more happy in receiving services, meaning the therapeutic relationship of nurse-client is increasingly fostered.

Nurse caring behavior is not only able to increase patient satisfaction, but also can generate benefits for the hospital. Stated that caring behavior can bring financial benefits to the health service industry. Add that caring behavior of health staff has economic value for hospitals because this behavior has an impact on patient satisfaction.

Conclusions and Suggestions

Conclusion: Based on the results of the research and discussion it can be concluded as follows:

1. Caring behavior of nurses in the Inpatient Room of Bhayangkara Hospital in the poor category was 27 people (30.7%) and good as many as 61 people (69.3%).
2. The satisfaction of patients in the Inpatient Room of Bhayangkara Hospital in the category of quite

satisfied as many as 12 people (13.6%) and both satisfied as many as 76 people (86.4%).

3. There is a relationship between nurse caring behavior with the level of satisfaction of patients in the Inpatient Room of Bhayangkara Hospital (p-value = 0.041)

Suggestion

1. **For Hospital Institutions:** Providing service excellence training that aims to provide excellent service provided by nurses to patients so that patients are satisfied in using the services of the hospital in question.
2. **For Nurses, Bhayangkara Hospital:** For the nursing profession these results can be used as input for nursing staff to improve their performance in an effort to maintain the quality of health services related to nurse caring behavior.

Job Satisfaction and Mental Health among Bank Employees of Chidambaram Town

N. Madhavan

Assistant Professor, Department of Business Administration, Annamalai University, Annamalai Nagar

ABSTRACT

Job satisfaction results from the worker's perception that the work content associate degreed context truly gives what an employee values within the work scenario. It is outlined as "a gratifying or positive emotion ensuing from the appraisal of one's job or job experiences". This positive emotion is extremely causative to associate degree employee's physical and mental well-being. Organizationally speaking, a high level of job satisfaction reflects an extremely favorable structure climate leading to attracting and holding higher employees. The current study aims to seek out the work Satisfaction and mental state among Bank staff of Chidambaram city. Samples of one hundred respondents chosen at random were studied. Primary knowledge was collected by employing a structured interview scheduled. All the respondents were asked identical queries within the same fashion and that they were conversant regarding the aim of the study. Descriptive statistics and analysis of variance, t-test and Chi-square analysis were applied. The findings and observations are the result and outcome of the interpretations created throughout the study of research.

Keywords: *Job Satisfaction, mental state, Demographic Variables*

Introduction

Though the premier mills operational space is weaving and knitting, there's an easy alternative for the event of human resources. They supply superb welfare measures like transport, medical facilities, education and recreation facilities. With the exception of this, they exercise special care in impartation coaching and grooming to their staff.

Human Resources Development itself is associate degree structure method. It starts from organization coming up with that identifies comes and fixes targets. Flowing through all aspects of job analysis, manpower, and achievement, the method of human resource development takes place in an exceedingly range of areas.

Job satisfaction is that the advantageousness or disadvantage with that staff read their work. It expresses the quantity of agreement between one's expectations of the work and therefore the rewards that the work provides[7]. Since job satisfaction involves expectations, it relates to equity theory, the psychological context, and motivation.

Job satisfaction could confer with either an individual or a bunch. Associate degree administrator will say either, "Antonio national leader has high job satisfaction" or "Department c has high job Satisfaction". Additionally, job satisfaction will apply to components of a person's job. For instance, though Antonio Ortega's general job satisfaction could also be high, he could also be discontent together with his vacation set up. Job satisfaction is very important as a result of it represents general human conditions. It needs attention, diagnosis, and treatment[2].

Review of Literature

Christopher and Nathan[3] examined the role of worker perceptions of justice within the relationship between job satisfactions of structure commitment. Four competitor models, linking worker satisfaction commitment were known two from the literature (i) job satisfaction is an antecedent to structure commitment (ii) structure commitment is an antecedent to job satisfaction (iii) structure commitment and job satisfaction are reciprocally connected and (iv) structure commitment of job satisfaction are freelance. The four models were then tested using conformity analytic techniques of a sample of 133 monetary services company staff. The results recommend that once considering the role of justice judgment satisfaction and commitment are causally freelance.

Pestonjee and Singh[10] administered the S.D employee's inventory the work involvement scale and a psychological participation index to 250 staff and 250 clerks of a nationalized bank in Republic of India to match job satisfaction with job standing within the banking system. Clerks indicated additional job satisfaction than bank staff World Health Organization showed higher job involvement and additional participation in decision-making than clerks. Implications for job achievement practices are noted.

Objectives of the Study

- To assess the extent of job satisfaction and mental state of staff on the premise of their demographic variables.
- To analyze the impact of welfare measures on the work satisfaction of bank staff.

Methodology

Research methodology could be thanks to consistently solve the analysis drawback. It's going to be understood as a science of finding out however analysis is finished scientifically. The strategies adopted in aggregation the info, choice of the sample, analysis, and interpretation are mentioned below. The study makes an attempt to investigate the work satisfaction among bank staff and connected factors of co-operation, physical, psychological issue to bank staff angle and behavior among employees and therefore the management with special respect to bank staff of Chidambaram city. During this analysis, the stratified sampling methodology was wont to choose the sample. The samples were chosen at random among the bank staff from completely different sections of the various banks, of that samples were chosen from each social control, body employees and coaching and development of the class of the employees. The overall samples collected for this study were one hundred. The info assortment relating this study involves each primary and secondary strategy. The first knowledge was collected victimization associate degree interview schedule through at random chosen samples. The secondary knowledge was collected from sources like manuals, company records, magazines, and journals, etc.

Analysis and Discussions

Table 1: Mean, Standard deviation, Standard error mean and F-ratio of different educational groups of employees on job satisfaction

Groups	N	Mean	SD	SE_M	F-ratio	LS
U.G	52	31.2	5.8	0.5	0.46	NS
P.G.	36	31.4	5.6	0.5		
Above P.G and Other Additional Qualification	12	32.7	7.0	0.6		

The table shows the mean, S.D, SEM and F-ratio of job satisfaction for different educational groups of employees. It is observed that the mean value for bank employees with U.G. Degree qualification is 31.2, the mean value for the employee with a P.G. degree is 31.4. The mean for employees with above PG degree and other educational qualification is 32.7. The S.D value for UG holders and PG graduates is 5.8 and 5.6 respectively, which shows no deviation. Whereas, for the employees with above PG degree and other educational qualifications, the S.D value is 7. It shows that there is room for enhancing the job satisfaction level of employees based on educational qualification. But the ANOVA result indicates that there is no significant level of difference in the job satisfaction among the respondents of different levels of education. Since the calculated F-ratio is not significant. Hence the proposed hypothesis is accepted. It is concluded that there is no statistical proof for variation in job satisfaction based on qualification[4].

Table 2: Mean, Standard deviation, Standard error mean and F-ratio of employees job satisfaction based on their department

Department	N	Mean	SD	SE_M	F-ratio	LS
Accounts	29	30.9	6.3	0.4	1.13	NS
Personnel & Administration	36	31.9	4.4	0.5		
Training & Development	35	31.0	9.2	1.9		

The table shows the mean, S.D, SEM, and F-ratio of employees job satisfaction based on their department. It is found that the mean value of employees in a different department is almost similar and it varies between 30.9 and 31.9. The standard deviation varies widely between 4.4 and 9.2. Personnel & Administration division is with the highest mean value of 31.9 with more job satisfaction and with least S.D (4.4). There is consistency. But in the weaving department the highest deviation is observed (9.2) with less level of job satisfaction. But, there is no significant proof. Since the calculated F-ratio is not significant. Hence it can be concluded that the hypothesis is accepted and that the job satisfaction level does not vary based on the different sections.

Table 3: Mean, Standard deviation, Standard error mean and t-ratio between gender and job satisfaction

Groups	N	Mean	SD	SE_M	t-ratio	LS
Male	68	32.4	5.8	0.5	0.56	NS
Female	32	31.1	6.6	0.6		

The above table shows mean, S.D, SEM and t-ratio of employees job satisfaction on the basis of gender. The mean value for the male employees is 32.4 and for the females, it is 31.1. S.D for males and females is 5.8 and 6.6 respectively. It is found that the male employees have higher job satisfaction than female employees[5]. The S.D value is higher among female respondents and the level of satisfaction is less, and the consistency is better among male respondents. But the 't'-test indicates that the difference among the male and female does not differ significantly. Hence it is concluded that the hypothesis is accepted.

Table 4: Mean, Standard deviation, Standard error mean and F-ratio of different income groups of employees on job satisfaction

Groups	N	Mean	SD	SE_M	F-ratio	LS
10000-15000	42	30.4	6.2	0.5	1.10	NS
15001-20000	33	31.9	6.2	0.6		
20001 and above	25	30.9	6.3	0.9		

The table shows the mean, S.D, SEM and F-ratio for different income groups of employees on job satisfaction. The mean value was higher for the employees with an income level 15001-20000. It is natural that the least income level people are at least a level of satisfaction. At the middle level, their aspiration is more and that might be a reason for the least level of satisfaction compared to others and S.D are found to be almost equal for all three groups. The one-way ANOVA result shows that the F-ratio is not significant. Hence the proposed hypothesis is accepted and it is inferred that the monthly income of the employees is not a considerable factor that influences job satisfaction[8].

Table 5: Mean, Standard deviation, Standard error mean and t-ratio between job satisfaction and number of dependents of employees

Groups	N	Mean	SD	SE_M	t-ratio	LS
Less than 3	55	31.3	6.8	0.5	0.26	NS
More than 3	45	31.0	6.5	0.4		

This table indicates Mean, S.D, SEM and t-ratio of employees on job satisfaction based on the number of dependents. The mean value for employees with less than 3 members as their dependents is 31.3 and 31.0 for those who have more than 3 members as their dependents. The S.D. value is 6.8 and 6.5 which shows no deviation among employees based on the number dependents they have. This is supported by the computed t-ratio, which is not significant. Hence, there is no statistical proof for rejecting the hypothesis. It is inferred that the number of dependents possessed by an employee is not a major factor in determining their job satisfaction[7].

Table 6: Chi-square test-showing the impact of age on medical benefits

Age	Strongly agree	Agree	DisAgree	Total
Less than 30 years	10	25	5	40
31 – 40 years	10	5	5	20
41- 50 years	5	15	5	25
Above 50 years	5	5	5	15
Total	30	50	20	100

Calculated Chi-square value	Degrees of freedom	Level of Significance
27.4	6	0.05

It is observed from the table that employees below 40 years strongly agree with the medical facilities provided by the company, whereas the employees above 40 years are not satisfied with the medical facilities provided by the corporate. This is confirmed by the calculated Chi-square value, which is greater than the table value at a 5 percent level. Hence the hypothesis is rejected, it is inferred that the opinion of employees varies based on their age.

Recommendations

From the results of the present study, the following recommendation has been made:

1. The research reveals that employees who are older by age are more satisfied with their job than young employees. The reason may be that the youth may expect some challenging jobs. The organization must provide some opportunities for the youngsters to take up new projects which are innovative and challenging.
2. The older employees are not satisfied with the medical allowances given by the bank. As the age of the employees grows, they may get more physical problem than the younger ones. So medical allowance should be given as per the need and requirement of the employees.
3. The management must conduct regular motivational programmes to identify key factors of job satisfaction among various categories of employees. A review committee may be constituted to look after the employee's job satisfaction aspects[6].
4. Employees should be invited periodically to contribute by sharing the skills, knowledge, and ability in increasing job satisfaction[9]. This would promote good mental healthy behavior and social interactions among the employees.
5. In order to enhance job satisfaction among various categories of employees, the existing welfare measure is to be reviewed thoroughly. Further, the need-based welfare schemes are to be introduced throughout the staff of the organizations.

Conclusion

The following conclusion was drawn from the present study: Personal variables have significantly contributed to job satisfaction. Employees education did not influence job satisfaction level. Employees age influences their opinion on medical benefits. Employees education and welfare measures influence job satisfaction levels. Employees gender and monthly income did not influence the level of job satisfaction. Employees age and welfare measures influence job satisfaction levels. Employees length of service influences the job satisfaction level. Overall, it is concluded that the result of one way ANOVA indicates that demographic variables like age, sex, educational qualification, marital status and length of past service influence job satisfaction. Further, it is concluded that identifying the key factors like personal variables is insufficient to increase the degree of job satisfaction.

Neurodevelopmental Screening—A guide for Early Intervention in at-Riskinfants

N. Meena

Lecturer in Physiotherapy, Department of Physical Medicine & Rehabilitation, RMMCH, Annamalai University, Annamalainagar, Tamilnadu, India

ABSTRACT

Background: Survival of at-risk infants increased but has not associated with a similar improvement in neurodevelopmental outcomes. The neurodevelopmental status of at-risk infants is used to indicate the functional integrity of the central nervous system.

Objective: To screen the Neurodevelopment of at-risk infants and identifies infants those who are in need of early intervention would be referred for early intervention.

Method: The study included 50 at-risk infants from the pediatric ward and pediatric well-baby clinic of Rajah Muthiah Medical College and Hospital (RMMCH) and was assessed using the Denver Developmental Screening Test (DDST) and the neurological examination was assessed using AmielTison. The DDST has four categories of domains; namely, gross motor, fine motor adaptive, language and personal social. Each domain was scored. When a child fails to perform the items, the child manifests a significant developmental deviation. The neurodevelopment of the babies have been assessed and the results were obtained. The infants deviated from normal development were intervened and compared to their normal age peer group in their level of achievement in developmental domains using DDST.

Results: From the study 26% of at-risk infants were abnormal and 74% of infants were normal. Among 26% of abnormal at-risk infants, prematurity infants deviate major from normal development when compare to other at-risk infants. A combination of certain at-risk infants among was: low birth weight and prematurity (33.3%); low birth weight, prematurity and respiratory distress syndrome (40%). Low birth weight, prematurity, and respiratory distress syndrome infants deviate major from normal development. The level of achievement in the four developmental domains taken individually shows an increasing trend in the case of intervention infants as the period of intervention increases when compared to normal infants.

Conclusion: The study was valuable in the identification of at-riskinfants prone to neurodevelopmental disabilities and also provides a tool for evaluating early interventional protocols.

Keywords: *At-risk infants, Neurodevelopmental assessment, Denver Developmental Screening Test.*

Introduction

Development refers to the maturation of functions and acquisition for optimal functioning of an individual of various skills. Developmental milestones are important, easily identifiable events during the continuous process of development[1]. With the advancement of a modern treatment technique in Pediatric care, morbidity and mortality of at-risk infants have reduced significantly[2, 3]. As the survival rate is increased, at the same time, the number of babies with developmental delay also has increased. Infants who are at risk have an increased likelihood of problems in development that tend to appear gradually over the first few years of life[4-6].

Developmental delay refers to a delay in development rather than a selected condition inflicting

Annamalainagar, Tamilnadu, India
Email: roshmena@gmail.com

that lag. The developmental delay exists when a child fails to reach specific milestones at an expected age in any area of development. A child may have a gross developmental delay or a delay in specific areas[7]. The Objective of the study is to screen the Neurodevelopment of at-risk infants and identifies infants those who are in need of early intervention would be referred for early intervention.

Denver Developmental Screening Test (DDST II) [8] was used to assess the developmental status of the child for detecting developmental delays in infancy[9] and for early identification or prediction of at-risk infants, so that appropriate early intervention can be instituted. Evaluation of muscle tone is a part of the neurological examination by AmielTison[10]. The major advantage of following AmielTison in preference to other neurological evaluation techniques is that there is an individual objective for each baby in terms of monthly evaluations and corrective therapy.

The purpose of the study is, to identify and categorize the at-risk infants who are deviated from normal development. Deviations from normal identify an at-risk group of infants who needfurther evaluation and intervention. Due to the possibility of developmental delay, it is important to periodically screen all high-risk newborn and assesses their developmental status[11] in order to identify the problems[12] and implement early intervention and provide anticipatory guidance.

Materials & Method

A total of 50 at-risk infants from the pediatric ward and pediatric OP well baby clinic of RMMCH were assessed. Infants of Low Birth Weight, Prematurity, Respiratory Distress Syndrome, Jaundice, Neonatal Seizure, Meconium aspiration, Birth Trauma, Intrauterine Growth Retardation, and Birth Asphyxia were included. The Neurodevelopmental assessment comprised of developmental assessment by the Denver Developmental Screening Test (DDST II) and neurological assessment by AmielTisonangles.

DDST IIwas used to assess the developmental status of the child which is the most widely used, available, inexpensive screening test for detecting developmental delays in infancy.[8] The test item has four categories of domains; namely, gross motor, fine motor adaptive, personal social and language. The appropriate items scored as pass, fail, refusal, or no opportunity and interpreted as normal, suspect, untestable and delay[13].

A waxing and waning pattern of neuromotor development from 28 weeks of gestation for the first year of life was reported by AmielTison[10]. The babies are grouped into normal babies, babies with patterns of transient abnormalities and babies with patterns of persistent abnormalities.

The infants deviated from normal development undergone early intervention were compared to their normal infants of the age peer group in the level of achievement until 12 monthswith DDST. The hypothesis: There is no significant difference in the level of achievement between the infants under intervention and normal infants with regard to developmental domains.

Findings

The at-risk infants have been screened as already explained using the Denver Developmental Screening Test. The percentage of normal and abnormal at-risk infants is given in figure 1.

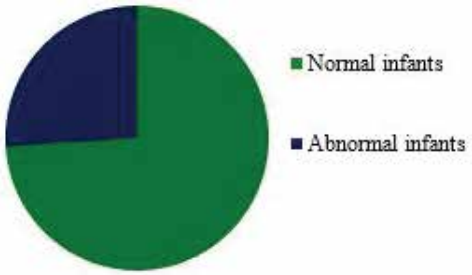

Figure 1: Percentage of Normal and Abnormal at-risk infants

From the screening, among the abnormal at-risk infants, 46.15% infants have prematurity, 15.38% infants have jaundice and low birth weight, and 7.69% infants had birth asphyxia, respiratory distress syndrome respectively was given in figure 2.

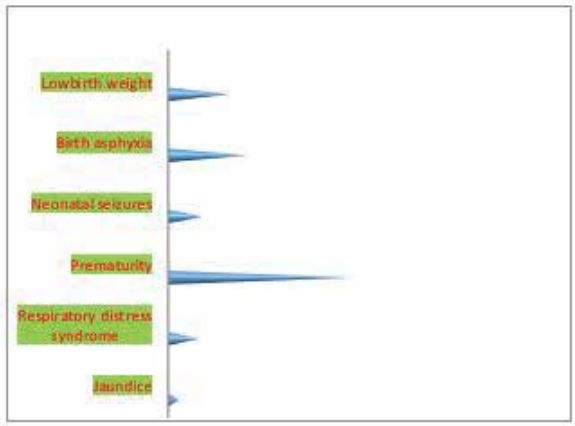

Figure 2: Abnormal at-risk infants

A combination of certain at-risk infants contributes to less performance in the test items are low birth weight and prematurity; low birth weight, prematurity, and Respiratory Distress syndrome. Figure: 3 show the percentage of the combination of certain at-risk infants.

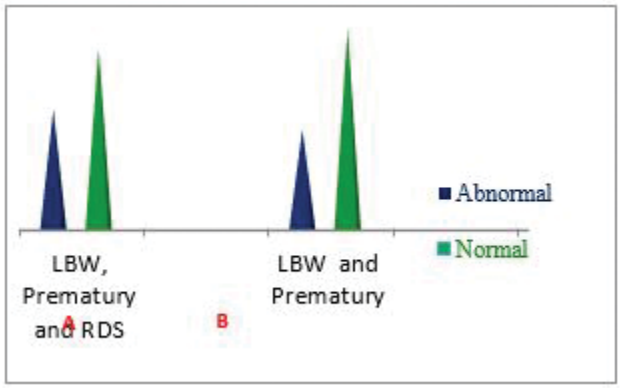

Figure 3: Percentage of the combination of certain at-risk infants with normal and abnormal development

Among this combination: (A) low birth weight, prematurity and Respiratory Distress syndrome infants (66.6%) deviates major from normal development when compared to (B) low birth weight and prematurity infants (33.3%).

DDDST assessment was carried out at 4th, 8th and 12thmonths for intervention infants and normal infants. The values of the descriptive statistics i.e. mean and S.D, of the four developmental domains, is given in table 1.

Table 1: The descriptive statistics of the developmental domains in intervention infants and normal infants at 4th,8th and 12th month

Domains	Intervention infants		Normal infants	
	Mean	S.D	Mean	S.D
4th Month				
Gross motor	1.3500	0.515	3.9219	0.270
Fine motor	1.3250	0.474	3.8594	0.350
Personal Social	1.3167	0.469	3.8438	0.365
Language	1.3146	0.457	3.7031	0.460
8th Month				
Gross motor	2.266	0.634	4.000	0.000
Fine motor	2.250	0.627	3.989	0.293
Personal Social	1.966	0.609	3.937	0.246
Language	1.900	0.573	3.8065	0.320

Conted…

12th Month				
Gross motor	3.083	0.787	4.000	0.000
Fine motor	2.983	0.791	4.000	0.000
Personal Social	2.616	0.691	3.943	0.365
Language	2.483	0.676	3.812	0.393

From the values of the descriptive statistics of the four developmental domains, it is observed that for infants who underwent early intervention the average values of their developmental domains are somewhat smaller compared with that of normal infants.

Discussion

The primary requirement from a physiotherapy perspective was that all infants had to have a neurodevelopmental assessment to identify developmental delays at the earliest and to intervene early. The challenge for the physical therapist is to accurately assess and comprehend the significance of delay that falls outside the limits of normal variability.

Developmental Screening is essential to detect abnormal development. Developmental delay indicates a child is functioning at least 25% below his or her chronological age in two or more of the developmental areas[14]. It has been estimated that only about half of these children's with developmental problems are detected. The isolated macro and micro prevalence surveys have reported5.4% to 15.3% of developmental disorders[15], as these numbers grow; the ability to identify infants with early developmental problems has become a priority. Many of these infants have developmental disabilities that require therapeutic intervention. Identification of risk status leads to early intervention services aimed at prevention of secondary problems for these infants[16, 17].

A developmental screening has a sensitivity of 70% to 80% to detect normal development[18]. The neurological examination of infants, toddlers, and children is an integral part of the screening, infants were intervened accordingly. In this study, the muscle tone was normal in 59.26%, hypertonic in 12.96% and hypotonic in 27.78% of intervention infants.

Denver II differentiates from other screening tests: a) It enables the tester to compare a child's development that was in the standardized population, like a growth

curve b) It consists of items which varied a clinically significant amount from the composite sample c) It provides a quick overview of the child's development. d) It also contains a behavioral rating scale. Test-Retest Reliability of DDST was 95.8% in a study with children between the ages of 2 months and 5 ½ years who were tested twice by the same examiner 80% to 95% with a mean percent agreement of 90%[19].

It is a method valuable in various ways, a) Identify and categorize the at-risk infants who are deviated from normal development b)Identification of at-risk infants who are in need of early intervention c) To improve the development of at-risk infants and minimize the potentials for developmental delay d) To enhance the family to get an awareness of developmental delay.

From the present study undertaken in a sample of 50 at-risk infants, it was found that 26% of at-risk infants were delayed in their development and 74% were normal. Among 13 abnormal at-risk infants, prematurity infants deviate major from normal development when compared to other at-risk infants. A combination of certain at-risk infants contributes to less performance in the test items, where low birth weight and prematurity; low birth weight, prematurity, and Respiratory Distress syndrome. Among this combination: low birth weight, prematurity, and Respiratory Distress syndrome infants deviate major from normal development when compared to low birth weight and prematurity.

From the present study, the average level of achievement in developmental domains of intervention infants is somewhat less when compared with that of normal infants. In addition, the difference between the levels of achievement in each domain decreases between the treated infants and normal infants as the period of intervention increases.

The DDST result showed that the screening test was good at identifying children with low developmental quotients. DDST detects most of the children who were later to show developmental delay[20]. Administration of the DDST provide a systematically observing and documenting significant qualitative aspects of an infant's developmental status particularly for the screener[21].

Early identification also facilitates the provision of anticipatory advice to parents, and caregivers for future planning. Early recognition may prevent severe disability. Some important developmental milestones sheets can be given appropriate guidance that can be provided to the parents.

If the intervention was started early in life before abnormal movement patterns are set in infants, it helps to develop normal movement patterns, because of the 'great adaptability and plasticity of the infant's brain'[22, 23]. The first 18 months of a normal child's life are a period of great and fast development[23]. Systemic and conscientious screening should be included in all infants not just those who are statistically at risk for developmental disabilities because of identifiable factors at birth. Identification of risk infants makes it possible to provide early intervention.

Conclusion

The study was valuable in the identification of infants at risk for neurodevelopmental disabilities and also provides a tool for evaluating early interventional protocols. The method of examination is less time consuming, does not require any special equipment or setting and it is applicable for neonates of all ages.

Local Wisdom in Pregnancy, Childbirth, Childcare in Mee Tribe, Papua

Heni Voni Rerey[1], Cristina Tien Popang[1], Butet Agustarika[1], Ester Rumaseb[1]

[1]Midwifery School, Health Polytechnic of Jayapura, Jalan Padang Bulan 2, Hedam, Districk Heram, Jayapura City, Papua, Indonesia

ABSTRACT

The culture of the Mee tribe in the pattern of child care begins with the process of pregnancy, childbirth and when the child enters school age. This study aims to find the concept of value and wisdom in the Mee tribe community for the developmental strength of the nation's children in Paniai Papua in the process of pregnancy, childbirth, and parenting. This study uses a qualitative approach. This research was conducted on the Mee Tribe in Paniai District, which is in the mountainous region of Papua, Indonesia in May - October 2018. Data collection was carried out by in-depth interviews and observations. Interviews were conducted on 25 informants selected by purposive procedures, which consisted of mothers, pregnant women, nursing mothers, tribal heads and health workers. The Mee tribe marks pregnancy as the initial process of the birth of a new life in the family so it is very important to maintain the health of the baby, mother and family safety. For that, food, equipment, activities, and customs must be considered because it is believed to determine the process of pregnancy. When pregnant, the mother of the Mee tribe consumed a lot of shrimp which was her own catch. In the pattern of parenting, mothers carry out a care procession that strongly emphasizes local wisdom and culture, such as using noken, leaves, stoves and embers and the presence of large events involving large families and villages in welcoming children born.

Keywords: *Local wisdom, parenting, Mee tribe*

Introduction

Parenting is a factor that is very closely related to the growth and development of children under the age of five. Children aged 1-5 years (toddlers) are times when children still desperately need adequate and adequate food and nutrition supplies. Malnutrition at this time can cause developmental disorders physically, mentally, socially and intellectually which are permanent in nature and continue to be brought on until the child becomes an adult. More specifically, malnutrition can cause body growth delay, more importantly, delay the development of the brain and can also decrease or decrease the body's resistance to infectious diseases. At this time also, children are still really dependent on care and care by their mothers. Health and food care in the first year of life is very important for child development[4].

The pattern of parenting is influenced by the culture that exists in the environment because everything that is in the family both in the form of objects and people and the rules and customs that apply in the family is very influential and determines the pattern of child development and parents' education[5,6].

The culture of the Mee tribe in the pattern of child care begins with the process of pregnancy, childbirth and when the child enters school age. Cultural and social themes are inherent in the pattern of people's lives[1]. The command of adat, advice, and abstinence from food to traditional processions is strongly believed to be the main factor in childcare and providing safety to mothers and babies[14]. This study aims to find the concept of value and wisdom in the Mee tribe community for the developmental strength of the nation's children in Paniai Papua in the process of pregnancy, childbirth, and parenting.

Method

This study uses a qualitative approach. This research was conducted on the Mee Tribe in Paniai District in the mountainous region of Papua, Indonesia in May - October 2018. Data collection was carried out at the residence of the Mee tribe to interact in an effort to find

out the Mee tribe's wisdom in the process of pregnancy, childbirth and care child.

Data collection is done through in-depth interviews and observations. Interviews were conducted on 25 informants selected by purposive procedures, which consisted of mothers, pregnant women, nursing mothers, tribal heads and health workers.

Qualitative data analysis is carried out in order to explore the meaning of each phenomenon that appears during the study.

Result and Discussion

Local values and wisdom in pregnancy

1. **Food consumed during pregnancy:** The foods most often consumed by pregnant women of the Mee tribe are shrimp, fish, pork, sweet potatoes, potato, fruits and vegetables. The types of vegetables consumed are cabbage, potato leaves, pumpkin and others. These foods are always consumed by mothers from the beginning of pregnancy to the time of delivery.

   "... so if I get pregnant I usually eat potato, shrimp, sweet potatoes, beans, ordinary carrots... " (Informant GY, 56 years old)

   Most of the Mee tribe work as cassava farmers. Sweet potato is a staple food for the Mee tribe. Sweet potatoes have a very high-calorie content that is good for fetal development and maternal strength. Even though she is pregnant, the Mee tribe continues to carry out her activities as a farmer.

   In the Mee tribe culture, husbands are responsible for providing nutritious food for pregnant wives.

   "... the husband must prepare good food if the wife is pregnant. That must be... "(Informant SJ, 46 years).

2. **A form of family support:** The most important form of support done by the husband is providing nutritious food for a wife who is pregnant.

   "... yes, there are usually women who help - help work at home. Also normal husband... "(Informant GY, 56 years).

   Husbands help complete the heavy work that is usually done by the wife, such as cleaning the garden, lifting potato, and feeding pigs.

3. **The level of family acceptance of health services:** Some of the services received are weighing the body and other health checks, tension, adjusting the position of the head, injections. Take vitamins. However, the majority of mothers come for a pregnancy check-up when entering the 4th trimester and when they feel a physical disturbance is felt by the mother.

   "... Going to the Puskesmas is important because many of us don't know it to be a midwife who knows. I was injected there, checked my head position, not to turn it upside down. Same given vitamins... "(Informant GY, 56 years)

   Mee pregnant women if they do not feel any health problems, then the pregnant woman will not go to the health service. pregnancy is considered a personal matter so that things related to it need not be known by outsiders.

4. **Abstinence in pregnancy:** The Mee tribe community believes that if the mother consumes these foods, it is feared that the fetus in the mother's stomach will be large and this will later complicate the delivery process.

   "... if we are in the Mee tribe, parents often tell us that we should not eat nuts. Like long beans, peanuts, he said later that the children will grow up and it will be hard to give birth... "(Informant HJ, 53 years).

   This prohibition is not only directed at the mother, but there are also restrictions that apply to the husband. prohibition of activities for pregnant women such as mothers may not sit at the door for too long. It is feared that spirits can see pregnant women sitting at the door so that it can provide a negative aura to the mother that can endanger the mother and fetus.

   "... if you are pregnant, you are usually prohibited from sitting at the door. He said, don't let any spirits pass by, he saw that pregnant women were a danger... "(Informant GY, 56 years).

   "... may not pass on Daidah (sacred place) because there is a guardian. Children can die, mother too. Families can not survive. Especially if women who have menstruation are not allowed to pass. Dispose of saliva and urinate should not be there "(Informant KY, 46 years).

Pregnant women also cannot pass through areas that are believed to be sacred places. The sacred place in terms of the Mee tribe is Daidah. Daidah is an area that is sacred by the Mee tribe because it is believed to have a guardian (spirit), so that pregnant women cannot pass through the area especially throw away saliva and urinate.

In addition to the prohibitions that apply to pregnant women, the Mee tribe also knows the prohibitions that are shown to their husbands.

"... if the wife is pregnant, the husband may not shave. That hair, beard especially mustache. If he cuts, the child in the stomach is also cut off. Children can die... "(Informant GY, 56 years).

Local values and wisdom in labor: The unique thing that happened to the Mee tribe tradition community when giving birth was that the Mee tribe chose to do their own labor at home without the help of midwives and midwives. Mothers do their own labor in a lying position or sitting position.

"... I have all the children (9 children) giving birth at home. Only 1 child is the one you helped because I was a little difficult... because if I told my husband, the parents were banned because they could not. Then if other people also already know that the process will be long. Unless I'm weak, I just call my family, ade, brother-in-law... "(Informant GY, 56 years old)

Mee tribe women choose to give birth themselves due to 2 (two) reasons, namely 1) Husbands should not be close - close to the wife who will give birth because it will complicate labor and get bad luck; 2) The process of childbirth cannot be known by others, because it can cause labor to be long. The family (mother and sister) can only accompany the mother of childbirth if the mother experiences physical weakness so that she needs to get help in the process of giving birth.

For the Mee tribe, home care is an option, because living in their own home can provide comfort, calm and not cold (can sleep near embers), use their own language, and have family support and attention (Kayame[10])..

When the mother feels she is about to give birth, the first thing she does is pray, second, she picks up the things that are heavy, bear, holds on to the head. When entering the time of labor, the mother prepares labor kits to help her through her own labor, such as sharp bamboo to cut the umbilical cord, the rope to tie the abdomen, leaves for baby's bedding, cloth, and mats. If the father or mother has a bad past story, then the person concerned must confess, because otherwise, it will disrupt the delivery process. Children and mothers can be victims.

"... At the time of giving birth, the first one was when she had started giving birth, first to pray. Then the second one lifts heavy items, lifts up on the head, sometimes walks. Prepare the bamboo, the rope must also be ready for the umbilical cord, there are leaves - the leaves must also be prepared, Kobe - kobe, noken, then the cloths, if not there can use the leaves... "(Informant KY, 46 years).

The baby's umbilical cord is cut by the mother by using a razor blade and bamboo that has been prepared beforehand. The umbilical cord is dried on coals of fire. Small children are also dried on the fire barah. For this reason, nearing the time of delivery, the husband must prepare a lot of firewood which will be used to dry the baby. The mother took care of herself after giving birth using leaves available in the neighborhood of the Mee tribe, namely onage and Pegey leaves. Onage leaves and pegey leaves are heated on fire and placed on the stomach to clean the stomach. The leaves are also placed on the back of the back, the birth canal (such as sanitary napkins). This is used to accelerate wound healing. After 3 days the mother who has just given birth can go out and work in the garden.

"... for 3 days the mother and child continued, dried on coals. The umbilical cord is also dried in the sun. If it's been 3 days the child is given the noken. So if you want to go out, you can just hang it in noken... "(KY informant, 46 years).

As for baby care, for 3 days after delivery, the baby is dried on the stove. After 3 days, the baby is put in a noken which contains dried leaves such as banana leaves to provide warmth to the baby. Noken is also a baby carrier when the mother is traveling. When the mother left home and did not bring a noken baby containing a baby, she was kept at home by hanging.

Local values and wisdom on parenting (Infants and Toddlers): The mother gives food to the baby from the first month, in the form of porridge mashed with a spoon or food that is mummified by the mother and given to the child. Most Mee mothers give milk to children until the child is satisfied.

"... The milk is given up to 2 years... even up to 4-5 years. The other mothers used to give the milk until they were pregnant again. If you are not pregnant, your child is given ASI and continues... "(Informant GY, 56 years).

Mother stops giving ASI to children when the mother is pregnant again. In some children, mothers give breast milk until the child is 3 years old until the child enters kindergarten. Some children also get immunizations.

When children are sick, the first thing to do is pray to God, using traditional medicine such as using drugs such as using oil. If the child coughs, the mother gives Geos leaves while if the child suffers from diarrhea, the mother uses taro and Yatu (a type of vegetable candle).

This is a form of family independence in preparing family needs.

If the child still does not show an improved condition, the mother will take him to the hospital.

"... Kaka - those who died were due to no medicine. That's the first why I took it to the hospital. Maybe the child also died... "(Informant GY, 56 years).

This study found informants who are currently specialists. The informant was one of the sons of the Mee tribe who managed to get a higher education and now works as a specialist at one of the public hospitals in one of the regions in Papua[7, 8].

"... I have a father who once tied me in a chair all day in the school field because I didn't go to school. He hits in front of people. I was not given food... "(DA informant, 34 years old).

Conclusions and Recommendations

The Mee tribe marks pregnancy as the initial process of the birth of a new life in the family so it is very important to maintain the health of the baby, mother and family safety. When pregnant, the mother of the Mee tribe consumed a lot of shrimp which was her own catch. Shrimp is the main source of protein for mothers in addition to consumption of fish and pork. Without realizing it, this is an important source of protein nutrition for the process of growth and development of babies. Traditional Mee tribes prefer to undergo childbirth alone without anyone's help including their husbands, this is believed to ensure the safety of babies and families. This shows the meaning of independence and great sacrifice for the birth of a child. This spirit will later be passed on to their children later[9].

In the pattern of parenting, mothers carry out a care procession that strongly emphasizes local wisdom and culture, such as using noken, leaves, stoves and embers and the presence of large events involving large families and villages in welcoming children born. The event signifies pride for family members who will later make their family name scent. In parenting, the role of mother and father is very dominant, the mother gives love education while the father teaches about the independence of responsibility[11, 12, 15, 16, 17.]

Local wisdom needs to be maintained in an effort to maintain community culture and strong synergy so that health services are still accepted by the community.

Implementation of Fixed Procedures for Care Action of Archipelago Surgery in the Regional General Hospital of Doc II Jayapura

Demianus Tafor[1], Jems K. R. Maay[1], Arwam Hermanus[1], Ester Rumaseb[1]

[1]Nursing School, Health Polytechnic of Jayapura, Jalan Padang Bulan 2, Hedam, Districk Heram, Jayapura City, Papua, Indonesia

ABSTRACT

Fixed procedure follow-up care is a part of nursing care that has been simplified into a standard form so that all nursing action services can be done professionally both in terms of effectiveness, and efficiency. Application of fixed procedures for wound care at the General Hospital Doc II Jayapura area for each treatment action is very different, this difference is based and adjusted to the type of disease or health problems experienced by the client. Implementation of fixed procedures care actions can be continuously updated and developed along with the development of science and technology in the field of nursing. The challenge that is quite heavy in the world of nursing for nurses at the Regional General Hospital in Dok II Jayapura is how to apply the Procedure for Wound Care in the Regional General Hospital of Dok II Jayapura.

Keywords: *Fixed procedure, wound care*

Introduction

Fixed procedure follow-up care is a part of nursing care that has been simplified into a standard form so that all nursing action services can be done professionally both in terms of effectiveness, and efficiency[1, 17].

Wounds are the breakdown of continuity of skin tissue or tissue below it. The wound is also defined as damage or discontinuation of the skin caused by physical mechanical or temperature trauma.

Fixed Procedure Function: The fixed procedure serves to guide program implementers in maintaining the quality of health services (nursing) so that they can be guided by established standards, as well as the existence of written policies and procedures in accordance with the advances in science and the principles of nursing practice[2, 3, 4, 6, 7, 10].

Wound Classification: Based on causes, related to forensic interests, including:Eczema (abrasions) is an injury to the surface of the epidermis due to contact with a rough surface object; Venus scissum is an incision or an iris that is marked with the edge of the wound in the form of a straight and regular line; Vulnus Laceratum (torn wound) with irregular or tattered edges is usually due to pulling or scratching a blunt object; Julius punctum (stab wound); Julian Morsum is a wound due to animal bites; Vulnus combutio (burn)

Physiology of Wound Healing: The wound healing process can be divided into 4 main phases according to Marison[13]

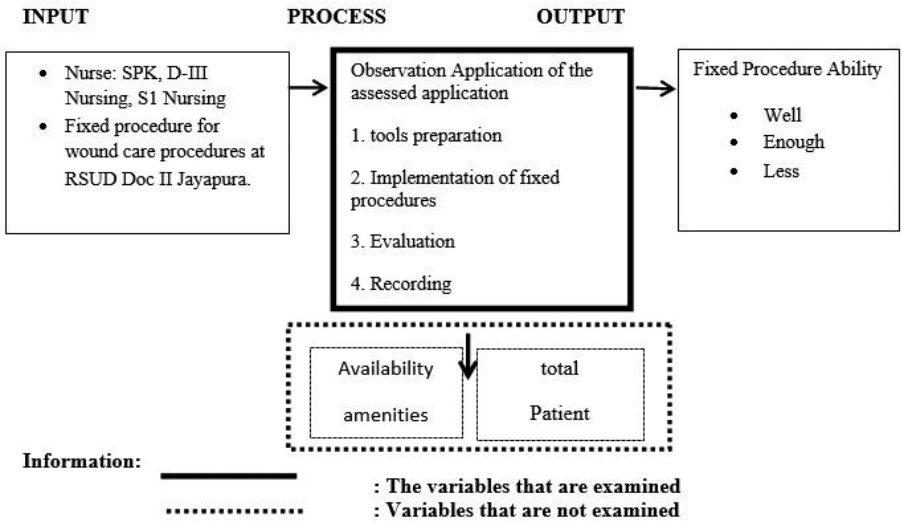
a. **Acute inflammatory response to injury:** A hemostasis process in which blood vessels undergo transient vasoconstriction from damaged blood vessels occurs when platelet blockages are formed and strengthened by fibrin fibers to form a clot. Damaged tissue and mast cells release histamine and other mediators, causing vasodilation in intact surrounding blood vessels and increasing supply of blood in the area, making it red and warm.

   The permeability of the blood capillaries increases and the protein-rich fluid flows into the interstitial space, causing local edema and possibly loss of function over the joint.

b. Destructive Phase: Cleansing of dead tissue and bacteria by polymorphs and macrophages. Polymorph swallows and destroys bacteria. Healing will stop when the macrophage is deactivated.

c. Proliferation Phase: Fibroblasts place basic substances and new collagen fibers and blood vessels begin infiltrating the wound. Once collagen starts to collapse, there is a rapid increase in the strain strength of the wound. Capillaries are formed by endothelial buds undergoing angiogenesis (new tissue growth).

d. Maturation phase: Epithelialization, contraction and reorganization of connective tissue: in each injury resulting in loss of skin, epithelial cells at the edge of the wound and from the sides of the hair follicles, and sebaceous glands and sudorifera glands, defend and begin to migrate over the new grandula tissue. If the tissue meets other epithelial cells that also experience migration, then mitosis stops, due to inhibition of contact.



How is the Application of Wound Care Procedures at the Regional General Hospital of Dok II Jayapura, where the object of this study is the Male Surgery Inpatient Room of the Regional General Hospital of Dok II Jayapura[8].

Writing Purpose: Knowing the Application Process for Wound Care Procedures in the Regional General Hospital of Doc II Jayapura[16].

Research Method: The method to be used in this activity is quantitative descriptive research with a cross sectional design[18].

Location and Time of Research: This research was carried out in the Male Surgery Inpatient Room of the Regional General Hospital of Doc II Jayapura, Implementation of the study in September 2014

Research Variable

Research Result

Table 1: Frequency Distribution of Nurse Personnel Based on Education Level and Working Period in Inpatient Room Male Surgery Regional Public Hospital Doc II Jayapura Papua 2014

Level of education					
Years of service	**(S1) Bachelor of Nursing**	**Nursing Diploma**	**(SPK) health nurse school**	**Total**	**Percent (%)**
> 3 Year	2	7	2	11	55
< 3 Year	-	9	-	9	45
Jumlah	2	16	2	20	
%	10	80	10		100

From the table above, it can be seen that the number of care staff in the Inpatient Room for Male Surgery at the Regional General Hospital of Dok II Jayapura Papua is 20 people, with 2 Nursing Education Levels of 2 people or 10%, and D-III Keperawtan 16 people or by 80%, and SPK as much as 2 people or 10% with a working period of more than 3 years there are 55% and those who have a work period of less than 3 years there are 9 people or by 45%[5].

Table 2: Frequency Distribution of Wound Care Based on Education Level in the preparation phase of the Tool and implementation of Inpatient Male Surgery Regional Public Hospital Doc II Jayapura 2014

Education	Preparation						Implementation					
	Well		Enough		Less		Well		Enough		Less	
	∑	%	∑	%	∑	%	∑	%	∑	%	∑	%
S1 Bachelor of Nursing	2	100	-	-	-	-	2	100	-	-	-	-
Nursing Diploma	16	100	-	-	-	-	16	100	-	-	-	-
SPK	2	100	-	-	-	-	2	100	-	-	-	-

Based on the data from the observations in appendix table 2, it is explained that of 2 people with an educational background in nursing in the preparation stage the tool has a good rating of 100%, and 16 respondents in nursing D-III background, in the preparation stage during observation got a good value of 100%, and for respondents who were educated with SPK as many as 2 people, during the observation obtained a good predicate value or equal to 100%. and for the implementation phase, 20 people have good predicate or 100%.

From the results of the application of wound care procedures based on the level of education[14], especially SPK, in the preparation stage of the tool and the implementation stage predicate good at 100%, but there are still some items that are still under the standard, namely 1% for the tools in item 3, and at the implementation stage item 1 is 67%, and item 7 is 66%.

For the level of education of the D-III nursing in the preparation stage of the tool and the training phase the average ranges from 70% to the predicate of good, for nurses who are educated in nursing S1 both in the preparation stage and the implementation stage have a good rating above 70%[9]. This can illustrate the level of education affecting the success of the implementation of the fixed procedures for wound care in the Inpatient Room for Male Surgery at RSUD Dok II Jayapura Papua Hospital. According to Sedarmayanti.S.[20]. Education is an effort to increase knowledge and work skills so that it can increase work productivity.

Table 3: Frequency Distribution of Wound Care Based on Education Level in Inpatient Room Male Surgery Regional Public Hospital Dok II Jayapura 2014

Predicate	S1 Bachelor of Nursing		Nursing Diploma		(SPK) health nurse school	
	∑	%	∑	%	∑	%
Well	2	100	16	100	2	100
Enough	-	-	-	-	-	-
Less	-	-	-	-	-	-
Total	2	100	16	100	2	100

Observation data attached to table 3 can be explained that the application of fixed procedures for wound care based on the level of education of 20 respondents, there are 2 people with good predicate or 100% with an education background in Nursing S1 besides there are also 16 respondents with nursing D-III background good predicate or equal to 100%, and for SPK education level during the observation obtained good predicate or equal to 100%.

From the results of observations of nursing staff found in the Male Surgical Inpatient Room, in the application of fixed procedures wound care actions with an educational background of S1 Nursing by 10% of 20 people and for nursing education D-III level of 80% of 20 people and for SPK education level of 10% of 20 people, but in the application of fixed procedures wound care measures are all predicate with good or 100% even

though seen from the level of education in which there are 2 nursing undergraduate students[11], 16 nursing D-III and 2 SPK this is supported by theory (Sagala.S[19]) says that the abilities and skills a person possesses are certainly in accordance with the level of education he follows, the higher the education of a person it is assumed that the higher the knowledge, skills and abilities.

Table 4: Frequency Distribution of Wound Care Based on the period of work at the stage of preparation and implementation in the Inpatient Room for Male Surgery Regional Public Hospital Dok II Jayapura 2014

Years of service	Tools preparation						Implementation					
	Well		Enough		Less		Well		Enough		Less	
	∑	%	∑	%	∑	%	∑	%	∑	%	∑	%
< 3 Year	9	45	-	-	-	-	9	45	-	-	-	-
>3 Year	11	55	-	-	-	-	11	55	-	-	-	-

Observation data attached to table 4 can be explained that of the 20 respondents who carried out the procedure for wound care in a male surgical inpatient room based on a work period of less than 3 years in the tool preparation stage, 9 people were well-known as 45%, and for the implementation stage there are 9 people who have good predicate or 45%.

Respondents who have a working period of more than 3 years have 11 people with a good predicate of 55% for the preparation stage and for the implementation stage with a predicate of good for 11 people with a percentage of 55%. overall the application of procedures for face-to-face wound care based on a work period of less than 3 years as many as 9 people both from the preparation stage of the tool and the implementation stage with a good predicate with a percentage of 45%, as well as nurses who have more than 3 years working period of 11 people From the observations both from the preparation stage of the tool and the stage of implementing the action of wound care in the Inpatient Room, male surgery during the observation obtained a good predicate with a percentage of 55%.

According to sedarmayanti[20]. Work productivity is more emphasized on the size of power to carry out work that touches aspects of determination, accuracy, and attitude towards work. Determination and accuracy can be related to methods or methods of work and equipment available, in connection with that work productivity is said to be high if the process takes place according to the procedures and mechanisms of work that are precise and careful.

From the observations of the application of the fixed procedure wound care measures applied by 20 respondents in the Inpatient Room for Male Surgery at the Regional General Hospital of Doc II Jayapura Papua in the preparation criteria of the tool at 87.49% with a good predicate and at the implementation stage the results were 94, 13% with good titles[21].

This illustrates the application of the fixed procedure of Wound Care measures in the Inpatient Room for Male Surgery to the General Hospital of Dok II Jayapura Papua, which was observed to be of good predicate with a presentation of 90.81%[22].

Conclusion

The application of fixed procedures for wound care in the male surgical inpatient room at the Regional General Hospital of Dok II Jayapura Papua, with a total of 20 nurses who could carry out the Good Predicate application or by 90.81%. Inpatient Room for Male Surgery; The criteria for tool preparation were 87.49% or with good predictions, the implementation criteria were 94.13% or with good predictions. The application of the fixed procedure for wound care actions based on the education level of the entire nursing S1 was 2 people with good or 100% predicate, and D- In total III nursing numbered 16 people with good predicate or 100%, as well as nurses with SPK education as many as 2 people with good predicate or 100%, Application of regular procedures for wound care based on work periods of less than 3 years there were 9 people with a percentage of 45% who has a good predicate. For work periods of more than 3 years there are 11. people with 55% percentage are good.

Suggestion

Improving the quality of nursing services in the application of regular procedures for wound care in the

room as well as fostering nurses on an ongoing basis to maintain the quality of hospital services independently as well as completing the equipment and facilities needed in the application of fixed procedures for wound care. Nurses are expected to be responsible for carrying out fixed procedures for wound care actions in the application of antiseptic and aseptic techniques.

The Affairs of Anopheles Mosquito in the Working Area 2015 Hamadi Puskesmas Kota Jayapura

Marlin Mayling Jarona[1], Henny Sesanti Budi Hastuty[1], Muhammad Abas[1], Arwam Hermanus[1]

[1]Health Environment School, Health Polytechnic of Jayapura, Jalan Padang Bulan 2, Hedam, Districk Heram, Jayapura City, Papua, Indonesia

ABSTRACT

Mosquitoes are arthropods that many of us encounter in our lives. One type of mosquito encountered in Indonesia is Anopheles, sp. The genus Anopheles, sp. Is a mosquito transmitting several diseases, mainly malaria. In Papua province, three species of Anopheles, sp, were found to act as malaria vectors, namely: Anopheles farauti, Anopheles koliensis, and Anopheles punctulatus (Elyazar, et al, 2013). The purpose of this study was to determine the density of Anopheles, sp in the working area of the City of Jayapura Hamadi Health Center in 2015. The samples in this study were 429 people with malaria homes.

Based on the results of the study, catching mosquitoes in 429 samples in 3 districts and 2 villages, the density of Anopheles sp mosquitoes perched on the wall was 720 individuals with a density (KN) of 1.67 tails/ person/hour. The results of mosquitoes and mosquitoes were identified at 429 samples of capture location houses consisting of 3 Districts and 2 Villages, the most common type of mosquito was obtained from the genus Anopheles sp, which was 2452 of 3140 mosquitoes caught and identified. For Culex sp mosquitoes, there are 640 tails from 3140 tails and Aedes sp mosquitoes which are 68 tails. Based on the results of the study it was found that the incidence of malaria in the work area of Hamadi Community Health Center was 9.19%, meaning that there were 9.19% of malaria sufferers among 100 residents in the Hamadi Community Health Center working area said the incidence of malaria was high.

The conclusion is that the density of Anopheles sp and malaria cases in communities in the Hamadi Community Health Center density of Anopheles sp mosquitoes with the feed of MHD bodies in the working area of Hamadi Health Center is 0.275 individuals/person/hour. Suggestions that can be given are in preventing the occurrence of malaria, the community will maintain and maintain habits and pay attention to the conditions/ conditions around the yard, if they get sick, immediately go to the doctor or community health service center for treatment so that they know the symptoms illness, sleeping at night must use mosquito nets or mosquito repellent and install wire netting on house ventilation, to prevent entry of mosquitoes into the house.

Keywords: *Anopheles sp. Mosquito Density.*

Introduction

The genus Anopheles, sp. Is a mosquito transmitting several diseases, mainly malaria. In Indonesia there are around 80 species of Anopheles, sp whereas those stated as malaria vectors are as many as 22 species Arsunan[1]. In Papua province, three species of Anopheles, sp, were found to act as malaria vectors, namely: Anopheles farauti, Anopheles koliensis, and Anopheles punctulatus (Elyazar, *et al*, 2013).

The World Health Organization (WHO) estimates that in 2012 there were 207 million malaria cases in 3.3 billion people, and caused deaths in around 627 thousand residents. The highest malaria cases in the world occur in Africa and other poor countries. In Africa 90% of deaths from malaria occur in children under the age of 5 (WHO, 2013).

Based on Indonesia's health profile in 2012, the national figure for Annual Parasite Incidence (API) or the number that shows a positive incidence of parasites in the blood of patients, shows a downward trend although it is still volatile[3]. API in 2007 amounted to 2.89/1000 population, decreased to 2.47/1000 population in 2008, in 2009 decreased again to 1.85/1000 population, but in 2010 it increased to 1.96/1000 inhabitants and then it dropped to 1.75/1000 population in 2011. In 2011 there were 1,321,451 clinical cases and 256,592 were positive for malaria. In the Ministry of Health's strategic plan for 2010-2014 it aims to reduce malaria-related morbidity from 2 to 1/1000 residents Ministry of Health[4-10].

Case Fatality Rate (CFR) data from malaria obtained from hospitals in Indonesia shows that from 2004 to 2006 there was a drastic decline, from 10.61% to 1.34%. However, from 2006 to 2009, the CFR tended to increase to more than double Epidemiology of Malaria[19].

The Annual Parasite Incidence (API) rate of the Papua Province still exceeds the national figure and is the second highest nationally after West Papua province. Annual Parasite Insidence (API) data in the last 5 years, namely: 2007 amounted to 41.66/1000 population, in 2008 amounted to 18.35/1000 population, in 2009 amounted to 9.94/1000 population, in 2010 amounted to 18.03 1000 residents and in 2011 increasedto 23.34/1000 inhabitants Ministry of Health, Republic of Indonesia[4-10].

Research Purposes: Knowing the Anopheles density, sp in the working area of the Hamadi Health Center in Jayapura City[11] in 2015

Research Method

This research is a descriptive study to describe the density of Anopheles, sp and identify species of mosquitoes caught inside and outside the work area of the Hamadi Health Center in Jayapura City with a survey approach.

Research Result

Calculating the density of mosquitoes that bite people/perched on the location or area of capture, namely Hamadi, Argapura, Numbay, village Tahima and village Tobati the mosquito density can be seen in the table below:

Table 1: The amount of density of mosquitoes that landed and caught with people's bait in the house according to the fishing area in the Working Area of the Hamadi Community Health Center in Jayapura City in 2015

No.	Catching point	Total mosquito	Total House	*Anopheles sp*		*Culex sp*		*Aedes sp*	
				Total	MHD	Total	MHD	Total	MHD
1.	Hamadi	1170	138	372	310	93	77,5	7	5,83
2.	Argapura	944	128	281	234,16	64	53,33	5	4,16
3.	Numbay	796	102	243	202,5	53	44,16	4	3,33
4.	Tobati	118	29	23	19,16	7	5,83	-	-
5.	Tahima S	112	32	31	25,83	11	9,16	1	0,83
Total		3140	429	950	791,65	228	189,98	17	14,15

Source: Primary Data, 2015

Based on the table above shows that the number of Anopheles sp mosquitoes caught in the house by bait body starting from the first catching point to the last catching point is 950 mosquitoes, with a total density (MHD) of 791.65 individuals/person/hour.

Table 2: The amount of density of mosquitoes that landed and caught with bait from people outside the house according to the fishing area in the Working Area of Hamadi Community Health Center, Jayapura City in 2015

No.	Catching point	Total mosquito	Total House	*Anopheles sp*		*Culex sp*		*Aedes sp*	
				Total	MHD	Total	MHD	Total	MHD
1.	Hamadi	1170	138	332	276,66	51	42,5	4	3,33
2.	Argapura	944	128	253	219,16	23	19,16	2	1,66

5.	Tahima S	112	32	26	21,66	7	5,83	-	-
Total		3140	429	779	657,45	105	87,48	7	5,82

Source: Primary Data, 2015

Based on the table above, the number of Anopheles sp mosquitoes caught outside the house by bait body starting from the first catching point to the last fishing point was 779 mosquitoes, with a total density (MHD) of 657.45 individuals/person/hour.

Table 3: The density of mosquitoes that perch and caught on the walls of the house according to the fishing area in the Working Area of the Hamadi Health Center in Jayapura City in 2015

No.	Catching point	Total mosquito	Total House	*Anopheles sp*		*Culex sp*		*Aedes sp*	
				Total	MHD	Total	MHD	Total	MHD
1.	Hamadi	1170	138	169	140,83	120	100	14	11,66
2.	Argapura	944	128	217	180,83	87	72,5	11	9,16
3.	Numbay	796	102	252	210	92	76,66	10	8,33
4.	Tobati	118	29	55	45,83	4	3,33	4	3,33
5.	Tahima S	112	32	27	22,5	4	3,33	5	4,16
Total		3140	429	720	599,99	307	255,82	44	36,64

Source: Primary Data, 2015

Based on the calculations in the table above, the number of Anopheles sp mosquitoes caught on the walls of the house from the first catching point to the last arrest was 720 mosquitoes with a density (MHD) of 599.99 individuals/person/hour. While the total number of mosquitoes on the wall was 720 from 429 houses surveyed. So the catch on the wall is (KN) which is 1.67 tails/person/hour.

Table 4: The number of genera of mosquitoes caught in the Working Area of the Hamadi Community Health Center in Jayapura City in 2015

No.	Catching point	Total mosquito	*Anopheles sp*	*Culex sp*	*Aedes sp*
1.	Hamadi	1170	877	264	25
2.	Argapura	944	751	174	18
3.	Numbay	796	642	164	15
4.	Tobati	118	98	16	4
5.	Tahima S	112	84	22	6
Total		3140	2452	640	68

Source: Primary Data, 2015

Based on the table above, the highest number of genera of mosquitoes caught was Anopheles sp, which was 2542 tails, Culex sp mosquitoes as many as 640 tails and Aedes sp mosquitoes as many as 68 tails from the total number of mosquitoes caught namely 3140 mosquitoes.

Source: Secondary data

Conclusion

Based on the results of research and discussion it can be concluded that the density of Anopheles sp and malaria cases in the community in Hamadi Health Center is as follows: The density of Anopheles sp mosquitoes with bait of MHD bodies in the working area of Hamadi Health Center is 0.275 individuals/person/hour who settled on the wall of the house of KN were 1.67 individuals/hour (low density), adult mosquito species in the working area of Hamadi Health Center included Anopheles sp mosquitoes totaling 2452, Culex sp mosquitoes totaling 640 tails, Aedes sp Mosquitoes totaling 68 individuals, malaria incidence Based on the results of the study it was found that the incidence of malaria in the working area of Hamadi Community Health Center was 9.19%.

Suggestion

In preventing the occurrence of malaria, the community continues to maintain and maintain habits and pay attention to the conditions/conditions around the yard. If you get sick, immediately go to the doctor or community health service center (Puskesmas), to get treatment so that you know the symptoms of the disease suffered. Sleeping at night should use mosquito nets or mosquito repellent and install wire netting on house ventilation, to prevent entry of mosquitoes into the house.

Intervention Effect of Ultra Violet and Exhause Lights on Microbal Density Decreasing in Honai in Kurulu District, Jayawijaya District, Papua Province

Frans Manangsang[1], Ester Rumaseb[1], Abdul Ganing[1], Suningsih Suabey[1], Arwam Hermanus[1], Jems KR Maay[1]

[1]Nursing School, Health Polytechnic of Jayapura, Jalan Padang Bulan 2, Hedam, Districk Heram, Jayapura City, Papua, Indonesia

ABSTRACT

Background: The quality of physical environmental factors (lighting, temperature, relative humidity, and room density) and germ density numbers show that more than 91% of germ numbers and 71% -87% of physical environment quality do not meet the health requirements required by the Decree RI Minister of Health No. 1204/MENKES/SK/X/2004. The study took place in Wamena, Kurulu District, Jayawijaya Regency, Papua Province, aimed at: (1) To determine the amount of microbial density before and after the Ultraviolet + Exhause lamp intervention (2) To examine the effects of Ultraviolet + Exhause Lamps on reducing microbial density before and after intervention honai in Kurulu District, Jayawijaya Regency, Papua Province.

Method: This research is a pre-experimental designs in the form of One-group pretest-posttest design. Honai in the Kurulu district of Jayawijaya Regency was intervened on the basis of the design of a cohort study intended to observe the course of bacterial density. Research looks at aspects of problems that occur in the physical environment of Honai. Observations are followed "in the future", ie starting from the Honai target then followed for a certain time/period to see whether there is an effect on Honai after being given intervention or treatment. The sample consists of 32 sample points, sampling until purposive sampling.

Results: The overall effect of the intervention in the first week has decreased the average microbial density of 98.07%, in the second week there has been a decrease in microbial density on average 99.92%, and in the third week there has been a decrease in average microbial density 99.99%. This is confirmed by the results of the Friedman test where the value of p = 0,000 and post hoc analysis where the value of p = 0,000. This gives the meaning that the intervention carried out is very effective in reducing microbial density carried out for 3 weeks or it takes up to 3 weeks to reduce microbial density to reach 99.99%. Therefore, based on the results of this study the intervention of 35 watt + Exhause ultraviolet light which starts at 07.00 CEST until 18:00 CEST is highly recommended for use in Honai.

Conclusion: The effect of the intervention on decreasing microbial density before and after the intervention showed a significant difference in decreasing microbial density.

Keywords: *Honai, Ultraviolet Lights, Exhause*

Introduction

Honai is a home of tribes in the central mountainous region of Papua. Honai is made of wood with a cone shaped roof made of straw or thatch. The honai is intentionally built narrow or small and not windowed with the aim of keeping the mountains of Papua cool. The honai is usually built 2.5 meters high and in the middle part of the Honai is a place for making fires that can warm themselves.

Jayapura City, Papua, Indonesia
Email: fransmanangsang@yahoo.co.id

Honai is divided into three types, namely for men (called Honai), women (called Ebei) and pig pens (called Wamai). The Honai shape is made circular and only has one door with a size of 100 cm x 60 cm so when you want to enter the Honai you have to look down.

Most of the Honai and Ebei do not have Lighting and Ventilation so that circulation does not occur. This makes the Honai and Ebei have a high level of humidity and very potential as a breeding ground for microbes Ministry of Health[4].

Abdullan and Hakim's[1] study showed that the quality of physical environmental factors (lighting, temperature, relative humidity, and room density) and germ density in 5 inpatient rooms (pavilion, class 1, class 2, class 3, and recovery room) measured 3 times (morning, afternoon, and before sunset) at 3 different measurement points per room. The results show that more than 91% of the germ number and 71% -87% of the physical environment quality do not meet the health requirements of the Decree of the Minister of Health of the Republic of Indonesia No. 1204/MENKES/SK/X/2004.

Based on 4 measured physical environmental factors, only relative humidity is directly related to germ density (p = 0.023), even though the linear correlation is very low (Pearson correlation 0.299). In accordance with this level of correlation, the contribution of all physical environmental factors to the germ rate is only 14.6% Abdullah and Hakim[1].

Microbial density assessment (MRA) refers to a structured process used to estimate the possible adverse effects of human health along with exposure to pathogenic microbes (such as certain bacteria or viruses). Exposure can occur directly, such as from air or drinking water, or indirectly, through germ contaminating matrices. Quantitative or qualitative assessments can be carried out to meet broad objectives in the community (for example, establishing regulations relating to prevention of disease transmission). The aim of microbial risk assessment is to protect public health through a policy-making process that is scientifically credible. Microbial density assessment results can be used to set regulatory standards, develop guidelines, support public decision-making processes, educate and inform policy makers and the public, identify differences between risk management choices, and prioritize risks and or research problems.

Materials and Method

Lokasi Penelitian dan Jenis Penelitian: Research on microbial risks to health was carried out in the Kurulu district, Jayawijaya Regency, Papua Province. This research is a pre-experimental designs in the form of a One-group pretest-posttest design based on the design of a cohort study intended to observe the course of bacterial density. Observations are followed "in the future", ie starting from the Honai target then followed for a certain time/period to see whether there is an effect on Honai after being given intervention or treatment.

Research Result

Number of Microbial Density Before and After Intervention in Honai in Kurulu District, Jayawijaya Regency, Papua Province.

Table 1: Air Microbial Examination Results in Kurulu District, Jayawijaya Regency in 2018

No.	Before Intervention Honai	Sample Code	Results (CFU)	Results (CFU) Week intervention

A: Upper Room, B: Bottom Room

Source: Results of Air Microbial Examination in Kurulu District in 2018

Based on Table 1. it showed that there was a significant decrease in microbial density after the administration of Ultraviolet + Exhause intervention in the first, second and third weeks in column 1 A which decreased before the intervention of 172,000 microbial density, after intervention the first week there was a decline to 666, after intervention in the second week it became 6 and after intervention the third week became 0. The decrease in microbial density also occurred in columns 1B, 2A, 2B, 3A, 3B, 4A, 4B, 5A, 5B, 6A and 6B

Effects of Ultraviolet + Exhause on Decreasing Microbial Density Before and After Intervention in Honai in Kurulu District, Jayawijaya Regency, Papua Province

a. Normality Test Results

Table 2: Data Normality Test Results

No.	Time	Before Data Transformation (p)	After Data Transformation (p)
1.	Before treatment	0,005	0,005
2.	Week 1 treatment	0,000	0,000
3.	Treatment Week 2	0,000	0,000
4.	Treatment of Week 3	0,000	0,000

Source: 2018 Primary Data

The normality test before and after transformation shows that the p value is <0.05 so the statistical test used in the data analysis is the Friedman Test followed by Post Hoc analysis using the Wilcoxon test.

b. Friedman Test Results and Post Hoc Analysis

Table 3: Friedman Test Results and Post Hoc Analysis

No.	Treatment	Friedman Test (p)
1.	Before Intervention	0,000
2.	Intervention Week I	
3.	Intervention Week II	
4.	Intervention Week III	

Post Hoc analysis with the Wilcoxon test; Week 1 intervention - before intervention (p = 0,000), intervention week 2 - before intervention (p = 0,000), intervention week 3 - before intervention (p = 0,000), intervention week 2 - intervention week 1 (p = 0,000), intervention week 3 - week 1 intervention (p = 0,000), week 3 intervention - week 2 intervention (p = 0,000).

Source: 2018 Primary Data

Table 3. shows there is a decrease in microbial density and based on Friedman test results (alternative repeated anova test) the value of p = 0,000, this means the intervention gives a significant positive change and it occurs from the first week to the second week and to the third week.

a. The measurement results of microbial density before the intervention differed significantly from after the intervention in the first week (p = 0,000).

b. The results of microbial density measurements before the intervention differed significantly from after intervention in week II (p = 0,000).

c. The results of microbial density measurements before the intervention differed significantly from after intervention at week III (p = 0,000).

d. The results of the first week microbial density measurements differed significantly after the intervention in week II (p = 0,000).

e. The results of the measurement of microbial density in week I were significantly different from after intervention in week III (p = 0,000).

f. The results of measurement of microbial density in week II differed significantly from after intervention in week III (p = 0,000)

Conclusion

The number of microbial densities before and after intervention in the Honai in Kurulu District, Jayawijaya Regency, Papua Province, namely, overall in the first week there has been a decrease in average microbial density of 98.07%, the effect of the overall intervention in the second week has decreased average microbial density - average 99.92%, and the overall effect of intervention in the third week has decreased the microbial density on average by 99.99%.

The effect of the intervention on decreasing microbial density before and after intervention in the honai in Kurulu District, Jayawijaya Regency, Papua Province, was that the intervention was very effective in reducing microbial density carried out for 3 weeks which showed a significant difference in decreasing microbial density between pre-intervention and the first week. pre-intervention with the second week, pre-intervention with the third week, between the first week and the second week, between the first week and the third week and between the second and third week.

Successful intervention was carried out on decreasing microbial density in honai in Kurulu District, Jayawijaya Regency, Papua Province, namely that based on the results of this study the intervention of 35 watt ultraviolet lights starting at 07.00 CEST until 18.00 WIT accompanied by exhause intervention at night was highly recommended on Honai.

Recommendation

For the Jayawijaya District health office, the results of this study can be used as a reference for eradicating microbial diseases, especially those that develop or that occur in Honai. For Scientists to be able to conduct further research related to disease transmission and obstacle eradication in Honai, for example MDR patients TB patients in Honai residents.

A Model of Malaria in Pregnancy Prevention Counseling in Clinics District of Jayapura, Papua

Ester Rumaseb[1], Hari Kusnanto[1], Djaswadi Dasuki[1], Siswanto A Wilopo[1], Jems KR Maay[1], Arwam Hermanus[1]

[1]Nursing School, Health Polytechnic of Jayapura, Jalan Padang Bulan 2, Hedam, Districk Heram, Jayapura City, Papua, Indonesia

ABSTRACT

Malaria is still the health problems in the community, especially in endemic areas like Papua. Malaria in pregnancy is contributing to the high numbers of pain and maternal mortality. One effort decreases the prevalence of malaria is empowering officers and clients or pregnant women by increasing knowledge to do prevention. One effort to increase knowledge with counseling at the time of antenatal. Effective counseling using the picture/media sheets behind a great way make it easier for mothers to understand the information provided. This research was to know relationship counseling using media sheet back toward an increase in knowledge, attitudes and compliance perform prevention of malaria infection. The method used was the stage that is training midwives Next research experiments with design pre-and post test-test, determination of sample with randomized assigment, group counseling is a treatment using media sheet turning 85 mothers and control group counseling without the media as much as 85 mothers. After counseling, conducted observation for 3 months in a row to see malaria prevention practices.

Results: there was a change in the average knowledge of 2.014 ($p < 005$) between the pre and post test-test. Statistically, there is a change of attitude and knowledge difference 2.07 6.68 group treat compared to the kelompk control. Malaria prevention practices as using mosquito nets, do not hang the thrift in the home, use protective clothing when outside the House on the first and second month after statistically meaningful counseling with a value of $p < 0.05$.

Conclusion: turning sheet using media counseling can improve knowledge, attitudes in a positive and pregnant mother dutifully do well compared with malaria prevention counseling without the media. Recommended to maternal and child health services in particular in the territory of Papua to benefit from this feedback sheet when giving malaria prevention counseling to pregnant mothers.

Keywords: *media flipcharts, counseling, pregnant women, malaria, RCT.*

Introduction

Prevalence of malaria still is one of the contributing causes of maternal and child death indirectly in Indonesia. In particular in Papua prevalence and incidence has decreased from year to year. Nationally, according to the report on the achievement of the Millennium development goals in Indonesia in 2011, has decreased from 4.68 per 1,000 inhabitants be 1.75 per 1,000 inhabitants. However, the highest incidence of malaria (63%) is found in the province of NTT, Papua and West Papua. To that end, efforts to reduce the numbers in areas such as Papua is endemic with the prevention and treatment of infection of malaria parasites is a top priority, one of prevention efforts by reducing the transmission through the protection of vulnerable groups such as pregnant women.

Prevention of malaria in pregnancy in Jayapura Regency was no longer using drugs as pecegahan, preferred doing prevention community behavior to avoid malarial mosquito bites. Can be done using mosquito

Corresponding Author:
Jems KR Maay
Nursing School, Health Polytechnic of Jayapura,
Jalan Padang Bulan 2, Hedam, Districk Heram,
Jayapura City, Papua, Indonesia
Email: jemskrmaay@yahoo.co.id

nets while sleeping the night especially at risk groups (pregnant women, infants and children), use protective clothing when being outside the home at night, using the anti mosquitos, hygiene in the home page and from the water puddle.

Prevention of malaria can be done well if health workers provide information clearly to the public. Information can be provided in various ways, and in this study the information given by way of face-to-face counseling using media sheet back specifically for pregnant women. Expected with counseling using media sheet behind it, people especially pregnant women can understand and can apply it well[8]. The results will be compared with pregnant women who are dikonseling without media.

Method of Study

The method of this research uses experimental design pre test – post on two groups of treatment and control group. On the Group's treatment was given counseling and back sheet using the media control group were given counseling without the media. Study area and population. Research conducted in Jayapura on some government health services centre i.e. clinics and posyandu. The population was pregnant women visiting clinics for the first time to checked her pregnancy. Design research studies randomized controlled trial (RCT) design pre test – post in the intervention group and the control group. Record keeping and intervention does is granting counselling using media sheet back and control group counseling without the media. Follow up observations done each month after the giving of the counseling as much as 3 times consecutive observations. Laboratory examination methods on the thick blood drops samples for examination of parasitemia officers conducted by laboratories using microscopes and RDT. The management of data collected using a questionnaire for the assessment of the knowledge and attitude, and sheets of observations for the assessment of compliance. Methods of statistical analysis with its homogeneity test, paired t-test, t-tets to compare the mean results of the pre-and post test-test in the intervention group with a control group, the research hypothesis testing decision based on the significance level $p < 0.05$. The results of statistical tests and analysis results are interpreted to address the research objectives.

Result and Discussion

a. Changes in knowledge and attitudes of respondents

Table 1: The relationship of changes in knowledge and attitudes towards score pre-and post test-test

	Changes in knowledge and attitudes								
		Pre-test		post-test					
	N	Mean	Sd	Mean	Sd	T	P	Δ	CI 95%
Knowledge									
Media	85	8.40	2.09	10.47	2.10	7.04	0.000	2.07	1.48-2.65
Without media	85	7.98	1.92	8.99	1.28	5.48	0.000	1.01	0.64-1.37
Attitude									
Media	85	58.47	5.57	65.15	4.43	14.70	0.000	6.68	5.77-7.58
Without media	85	58.65	4.70	63.39	4.68	10.97	0.000	4.74	3.88-5.60

Sig = $p < 0.05$

Table 2: Independent t-test analysis of the difference between knowledge and attitude change

	Difference in knowledge and attitude change							
	Media		Withoutmedia					
	Mean	Sd	Mean	Sd	T	P	Δ	CI 95%
Knowledge	2.07	2.71	1.01	1.70	3.04	0.002	1.06	0.37-1.74
Attitude	6.68	4.18	4.74	3.98	3.09	0.002	1.94	0.70-3.17

Sig = $p < 0.05$

The table above shows the average score value, pre-test of knowledge and value score average post-test anomaly difference statistically meaningful 2.07, p = 0000 (p < 0.05) at the media group. The difference in the average value of pre-test and post test group without media amounted to 1.01, a statistically meaningless p = 0000 (CI 0.64-1.37). Value score average pre-test attitude and post-test attitude there is a statistically meaningful change p = 0000 (p < 0.05) on media group and a change in attitude in the group without a statistically meaningful also media p = 0000 (p < 0.05). The results of the analysis showed the value of average difference changes post-test and pre-test a statistically meaningful on knowledge with an average value of 2.07 (p = 0.002) and attitude with the average value of 6.68 value p = 0000

1. Paired sample t-test results-test of knowledge, attitudes, and behavior

Table 3: The relationship between the variables are free, beyond and against compliance characteristics

	Compliance				χ^2	p	RR	95% I
	Obedient		Without					
	N	%	N	%				
Counseling with								
Media	58	68.2	27	31.8	9.57	0.002	1.53	1.15-2.01
Without media	38	44.7	47	55.3			1	
Age								
20-35	76	55.5	61	44.5	0.28	0.594	0.91	0.66-1.25
<20 or>35	20	60.6	13	39.4			1	
Gravida								
Multipara	66	58.9	46	41.1	0.80	0.369	1.14	0.85-1.52
Primipara	30	51.7	28	48.3			1	
Age Gravid								
Trimester2	54	56.8	41	43.2	0.01	0.912	1.01	0.77-1.32
Trimester3	42	56.0	33	44.0			1	
Education								
High	84	56.4	65	43.6	0.01	0.947	0.98	0.66-1.46
Low	12	57.1	9	42.9			1	
Distance								
>5 km	31	53.5	27	46.5	0.32	0.567	0.92	0.69-1.22
≤5 km	65	58.0	47	42.0			1	
Economic								
High	59	64.8	32	35.2	5.57	0.018	1.38	1.04-1.83
Low	37	46.8	42	53.2			1	

Sig = p <0.05

Based on the table above, the variable age groups, gravida, gestational age, maternal education and distance not significance statistically (p > 0.05), it means there is no relationship towards compliance. Based on the results of the analysis in the table above, it is seen that the proportion of media group of 42.4% compared to 27.8% media without having links against a statistically meaningful compliance with the value p = 002 (p < 0.05) and the value of RR 1.53 (95% CI 1.15-2.01). This means that the media likely being dutifully 1.53 times as compared to the group without media.

Economic variables with high proportions of 40.3% higher than the low economy, statistically meaningful relationship has p = 0.018 (p < 0.05) and the value of RR 1.38 (95% CI 1.04-1.83). That is, a high level of social possibilities become obedient amounting to 1.38 times in comparison with economy.

2. **Multivariate Analysis:** Multivariable Analysis conducted to see Knowledge relationship counselling, meaningful economic-level variables are statistically against the difference in knowledge by using multiple linear regression.

   a. Test and the result can be seen in the following table:

Table 4: The relationship between economic, social, counselling with difference of knowledge

Selisih p	Coef	Std. Err	Z	p> (z)	CI 95%
Counceling 1	0.656	0.221	2.97	0.003	0.222-1.089
Distance 1	0.260	0.231	1.13	0.261	-193-0.713
Economic 1	0.068	0.221	0.31	0.758	-365-0.502
Cons	2.713	0.207	13.10	0.000	2.307-3.118

Sig = $p < 0.05$

Based on the table 4 above, it is seen that the counseling had a relationship with the media significantly to knowledge difference p 0.05, but clinically meaningless value of CI 0.37-1.74. variable distance and economic level statistically there is no difference in the relationship towards knowledge. It can be concluded that a statistically meaningful counseling in the change of knowledge, whereas the variable distance and economic level as a confounding variable.

a. Attitude Multivariable: Multivariable Analysis done attitude to see the relationship counseling, economic level variables statistically meaningful difference in attitude towards using multiple linear regression test and the result can be seen in the following table:

Table 5: The relationship between economic, social, counselling with difference in attitude

Attitude	Coef	Std. Err	t	P > (t)	CI 95%
Counceling 1	1.75	0.58	3.00	0.003	0.59-2.91
Distance1	1.54	0.61	2.50	0.013	0.32-2.75
Economic 1	2.68	0.58	4.57	0.000	1.52-3.84
Cons	2.86	0.54	5.25	0.000	1.79-3.94

Sig = $p < 0.05$

Based on Table 3 above, seen counseling with the media, distance and level of economic ties is a significant difference in the attitude towards the value of $p < 0.05$. On the value 95% CI clinically meaningful is the economic level (CI 1.52-3.84), while counselling and clinical secaara not meaningful distance.

Compliance: To view the compliance practice prevention of malaria, will be presented in the form of recurrent observations measure results on the second and third month after giving of the counseling. It can be seen in the following table.

Tablel 6: Relationship counselling against malaria prevesssntion practices with 1 month and 2 months after counselling

	Early	Month 1	Month 2	Comparison	Caomparison
	p (CI 95%)	p (CI 95%)	p (CI 95%)	Bl 1-2 (p,CI)	Bl 1-3 (p,CI)
Nets	0.229 -3.620-.868	0.001 1.748-7.148	0.000 4.275-9.157	0.238 -1.728-6.946	0.000 5.435-13.979
Hanging Clothes	0.588 -1.537-2.711	0.014 .580-5.075	0.000 8.670-14.800	0.014 1.011-8896	0.000 4.977-16.360

Sig = 0.05

According to table 6 shows that at the initial visit no statistically meaningful (P > 0.05). After counseling conducted observations then seen that in the first month and two pregnant women who use nets, do not hang the thrift in the home and use protective clothing outside the House statistically meaningful value p each < 0.05, and if the comparison between the initial visits with 1 month after counseling practices look meaningless in statistic (p > 0.05), whereas if compared to the practice in the second month, statistically meaningful. To practice the ANC visit statistically meaningless both from the beginning up to the observation after counseling.

a. Multilevel Analysis: To see the effect of media counseling against the difference between knowledge and attitudes after the analysis is performed in the same crucible with variable control after a midwife.Then it can be assumed the existence of a meaningful relationship. It can be seen in the following table:

Table 7: Effect of media counceling against the difference between Knowledge and attitudes

Attitude	Coef	Std. Err	z	p>(z)	CI 95%
Counceling 1	1.93	0.88	2.18	0.03	0.19-3.67
Cons	4.79	0.62	7.63	0.000	3.56-6.02

LR test vs linear regression: chi2 (2)= 9.60 Prob > chi2 = 0.008

Discussion

a. Based on the results of the t-test analysis, there is a change in the mean score of knowledge and attitude between the pre-and post test-test significantly value t calculate (7.04) greater than t table, meaning that there is a difference between pre-test and post-test that showed an increase in knowledge and attitude between the pre-and post test-test after being given counselling by turning sheets than media without the media.

b. Relationship of the level of knowledge and attitudes toward the economy: Based on the results of the analysis variables outside (distance and socio-economic) of difference in knowledge (table 5), there is a statistically meaningful relations at a high level of socio-economic changes than to economic level of knowledge is low. Socio-economic relationships within the attitude there is a statistically meaningful relationship, meaning that high economic level have a change in the attitude of the average difference is higher than the economic level is low.

c. Relationship counselling, external variables against the difference between knowledge and the difference in attitude is performed with multivariate analysis. Based on the results of the analysis (table 4) indicates the counseling with statistically meaningful and media had influence on the difference of knowledge when analyzed along with the economic level and distance. Likewise on Multivariate analysis against the difference in attitude, stated that the economic level of counselling, and the distance has positive influence to change the difference in attitude. Very meaningful is the level of the economic value of p = 0000 (95% CI 1.53-3.84).

d. Relationship counselling towards compliance: Observations made on malaria prevention practices after the giving of the counseling during the first month and months into two meaningful statistically (P < 0.05), where pregnant women use mosquito nets at night while sleeping, there hung a thrift in the home, use protective clothing when outside home.

Malaria prevention practices in comparison between the initial observations with the month first just practice thrift drape a statistically meaningful. While in the initial observation with month-2 statistically meaningful on users mosquito nets, not hanging in homes, thrift and use clothes covers when outside the home. It can be concluded that pregnant women can practise prevention malaria properly when being in the second month after receiving counselling and followed with periodic observation.

According to some studies say that meaningful counseling against adherence to using mosquito nets while sleeping the night, for various reasons such as the hot, uncomfortable, Chukwocha[3]; Mbonye[4], stating that as much as 40% of pregnant women use mosquito nets

when sleeping the night, due to prevention strategies conducted by officers of the low (14.4%) less got recommendations from health workers.

On the practice of the ANC, a statistically meaningless since the beginning of the counselling up to the last observation. This illustrates that counselling does not affect the frequency of visits of pregnant women to conduct the examination Browning and Shane[1].

Summary

Risk characteristics of respondents include: age, gestational age, gravida, and education. There is no meaningful difference between a score of pre-and post test. Counseling using media sheet behind the statistically meaningful increase knowledge and attitude with the difference in average higher results compared to counseling without the media[6].

Counseling with statistically improve media conducted compliance precautions by using mosquito nets while sleeping at night without hanging the thrift at home, using protective clothing when outdoors. High economic level are statistically meaningful improvement in attitude and compliance malaria precautions. Thus it can be concluded that, with the media counseling sheet behind the positive influence and the result is quite effective to enhance the knowledge, attitudes and compliance to conduct malaria infection, prevention, and action.

ABSTRACT

Chalcone compounds have been studied as therapeutic, especially as antitumor drugs. A chalcone derivate, *para*-hydroxy-*metha*-methoxychalcone (*p*H*m*MC) or 3 - (4'-hydroxy-3'-methoxyphenyl)-1-phenyl-2-propene-1-on, has been studied to explore its potential utilization as chemoprevention in several cancers cell lines. The main objective of the present work is to perform a docking analysis of *p*H*m*MC with tyrosine kinase receptors EGFR, HER2, and VEGFR comparing with ligand ATP. Docking studies were performed using PLANTS (Protein Ligand ANT System) software, while the preparations of protein and reference ligand was used YASARA, and visualizing amino acids was used Molecular Operating Environment (MOE) program. The docking studies indicated that the binding energy of *p*H*m*MC with EGFR (1XKK) and HER2 (3PPO) was higher than the ATP binding energy with the EGFR and HER2. However, the binding energy of *p*H*m*MC with VEGFR (2P2I) almost had the same energy binding compared with the ATP binding on VEGFR. VEGF is a protein that plays a role in angiogenesis. Data from the MOE program showed there were similarities in the amino acids involved in the interaction between *p*H*m*MC and ATP in binding to EGFR, HER2, and VEGFR. The results indicated that *p*H*m*MC has the potential to be developed as an anticancer which might through the mechanism of inhibiting the process of angiogenesis.

Keywords: *molecular docking; pHmMC; EGFR;HER2;VEGFR.*

Introduction

The number of cancer patients and the death rate caused by cancer increases every year. World Health Organization (WHO) reported that in 2018 there were 8.1 million new cases and 9.6 million cancer deaths[1]. Cancer is a disease with very complex molecular mechanisms. In cancer cells the various dysregulations occur in proteins involved in signal transduction so that the proliferation of cancer cells becomes uncontrolled[2]. One protein often dysregulated is tyrosine kinases. These proteins catalyze the transfer of phosphate from adenosine triphosphate (ATP) to a tyrosine residue of a polypeptide. Tyrosine kinases play a role in signal transduction which regulates cellular proliferation, differentiation, function and movement[3-5]. Dysregulations of tyrosine kinase is found in many types of cancer, for example dysregulation of epidermal growth factor receptor (EGFR)[6], human epidermal growth factor receptor 2 (HER2)[7] and vascular endothelial growth factor (VEGFR)[8]. Over expression and mutation in EGFR results in increased its activity so that EGFR is a target in cancer therapy[5]. Amplification or over expression of HER2 has an important role in the development of breast cancer. HER2 is an important biomarker for detecting breast cancer and is a therapeutic target for breast cancer patients[9, 10]. VEGFR plays a role in endothelial cell proliferation, vascular permeability and angiogenesis process. Angiogenesis is the process of forming new blood vessels in the human body and is a natural process that plays an important role in wound healing and reproduction. Angiogenesis plays an important role in the growth and spread of cancer cells. The new

blood vessels produced will feed tumor cells with oxygen and nutrients that make cancer cells urge the surrounding tissue, develop throughout the body and form colonies of new cancer cells (metastatic). Therefore, VEGFR is the target therapy for cancer patients through antiangiogenic therapies[11-13]. Inhibition of protein tyrosine kinase is one strategy in treating cancer. All kinase enzymes share a catalytic domain that contains a cleft where ATP binds. This catalytic cleft is a major focus of small-molecule drug design for protein kinases[14].

Research to develop chemoprevention agents with specific molecular targets has been widely carried out. A derivate chalcone, *para*-hydroxy-*metha*-methoxychalcone (*p*H*m*MC) or 3 - (4'-hydroxy-3'-methoxyphenyl)-1-phenyl-2-propene-1-on, is one the compounds that have the potential to be developed as a chemoprevention agent. The compound was synthesized by reaction between vanillin and acetofenon through cross-aldol condensation reaction in acidic condition. This compound has cytotoxic activity against several cancer cells, including HeLa cervical cancer cells, Raji lymphoblastic cells[15], MCF-7[16] and T47D breast cancer cells[17]. The action mechanism of *p*H*m*MC on T47D and MCF-7 cells is through apoptosis induction by decreasing the expression of Bcl-2 protein and increasing the expression of Bax protein[18]. It has also been reported that the combination of *p*H*m*MC with doxorubicin chemotherapy agents has a synergy effect on T47D[19]. This research aims to study the effect of *p*H*m*MC on influencing the activity of several receptor tyrosine kinases: EGFR, HER2, and VEGR using docking method. The study was conducted by comparing the interaction of these receptors with *p*H*m*MC compared to their interactions with ATP.

Experimental Method

Materials: The *p*H*m*MC compound as a ligand and the target protein are tyrosine kinase receptors (EGFR, HER-2, and VEGFR). The structure of target protein obtained from Protein Data Bank (PDB) (https://www.rcsb.org/) presented in Table 1.

Table 1: The structure of target protein of *p*H*m*MC and its native ligand

Protein	PDB ID	Structure	Native Ligand
EGFR	IXKK		FMM
HER2EGFR	3PPOIXKK		DCK
VEGFR	2P2I		608

Tools: The tools used for this research were a set of computers with Windows 7 32 bit specifications and Linux co-PenDrive program for Linux simulation on Windows, PLANTS (Protein-Ligand ANT-System) Software for molecular docking downloaded from http://www.tcd.uni_konstanz.de/research/plant.php., YASARA version 10.1.8 (C) 1993-2010 by Elmar Kreiger (licenced to Hari Purnomo Universitas Gadjah Mada) for protein visualization and preparation, Marvin Sketch 5.2.5.1 for ligand preparation (*p*H*m*MC), and Molecular Operating Environment (MOE) program for visualizing amino acids.

Procedure: The stages of this research were protein preparation, preparation of test compound (pHmMC) structures, validation, and molecular docking20.

Protein Preparation: Conformation of target proteins (EFGR, HER2, and VEGFR) sought from Proteins Data Bank (PDB) (https://www.rcsb.org/) [21]. Proteins was selected in active form that bind to native ligand (Table 1). Native ligand was then removed by the YASARA program to provide space (pocket/cavity). This space will be used to analysis the interaction of ligand (*p*H*m*MC) and target protein.

Preparation of *p*H*m*MC Structure: Optimization of the *p*H*m*MC structure was carried out using the Marvin Sketch program. The three-dimensional structure of *p*H*m*MC was drawn complete with its hydrogen atom and then conformation optimization was carried out[20].

Validation of Molecular Docking Methods: The validation of binding was done by the calculation of Root Mean Square Distances (RMSD) of heavy atoms (native ligand) with ligand copy. The target protein was removed from the native ligand using the PLANTS program. Native ligand is then paired back to the protein. The RMSD of heavy atoms native ligand with proteins are analyzed. If the RMSD value is less than 2.0 angstroms, the protocol was received and docking of the test compound on the target protein can be carried out. If the RMSD value ≥ 2.0 angstroms, then protein with another code (PDB ID) was used[20, 22].

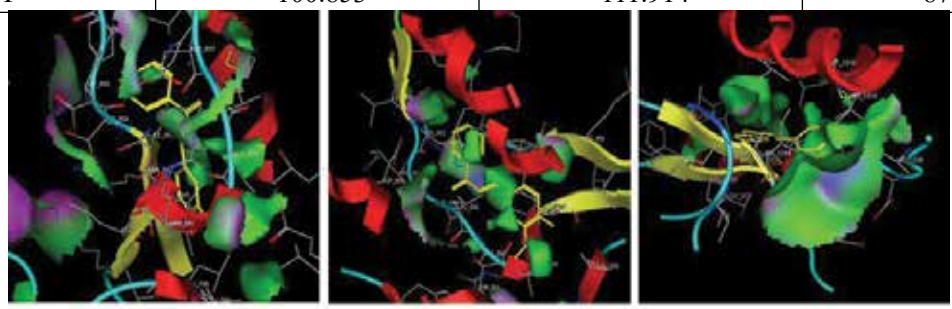
Molecular Docking of *p*H*m*MC on Protein Target: The *p*H*m*MC compound tethered to the protein that has been removed from the native ligand using the PLANTS program. The results of the analysis will show which compound with the lowest conformation to bind to the target protein. Visualization of amino acid residues that interact with the ligand is processed using the MOE program[20].

Results and Discussions

Results

Validation Results: The validation of the docking method was done by observing the RMSD score of the target protein PDB with its native ligand. In this study the RMSD score between target protein PDB and native ligand had less than 2 angstroms (Table 2). The data showed that the protocol was accepted because the validation requirements was met, and then molecular docking can be done[20, 22].

Table 2: RMSD score of target protein and native ligand



Protein	PDB ID	Native Ligand	RMSD (Angstroms)
EGFR	IXKK	FMM	1.96
HER2	3PPO	DCK	1.19
VEGFR	2P2I	608	1.64

Docking Score of ***p*H*m*M*C*** and Target Protein

The docking score of interaction between *p*H*m*MC and ATP with EFGR, HER-2, and VEGFR is presented in Table 3. While the visualization of *p*H*m*MC interaction with receptor kinases is displayed in Figure 1.

Table 3: Docking Score of *p*H*m*MC and ATP with EGFR, HER2, and VEGFR

Compound	Docking score (kcal/mol)		
	EGFR[1XKK]	HER2[3PPO]	VEGFR[2P2I]
*p*H*m*MC	-87.2131	-93.2788	-86.9070
ATP	-100.853	-111.914	-87.4485

***p*H*m*MC-EGFR[1XKK]** ***p*H*m*MC-HER2[3PPO]** ***p*H*m*MC-VEGFR[2P2I]**

Figure 1: The visualization of interaction between *p*H*m*MC with EGFR, HER2, and VEGFR. The *p*HmMC compound is shown in yellow

The visualization of *p*H*m*MC Interaction with Target Protein: The visualization of interactions between *p*H*m*MC as a ligand with target proteins (EGFR, HER2, and VEGFR) were carried out using the MOE program. These results indicated that there were similarities of amino acids involved in the interaction between *p*H*m*MC with target proteins and ATP with target proteins and Table 4.

Table 4: Interaction of *p*H*m*MC with tyrosine kinases receptor, and comparison with ATP

Tyrosine Kinase receptor	Ligand	Amino Acid Interaction/*similar**
EGFR [1XKK]	*p*H*m*MC	Ala 839, Ala 840, Arg841, Asn842, **Leu798***, **Val843***
	ATP	Cys797, **Leu798***, Leu844, **Val843***, Val845
HER2[3PPO]	*p*H*m*MC	**Ala 847***, **Ala848***, Arg849, **Asn850***, Thr911, **Val851***
	ATP	**Ala 847***, **Ala848***, **Asn850***, Ile861, Leu846, Thr862, **Val851***
VEGFR[2P2I]	*p*H*m*MC	Asp1033, Cys1045, **His1026***, Ile1034, **Ile1044***, **Leu1029***, **Met1016***, Val1012
	ATP	**His1026***, **Ile1044***, **Leu1029***, **Met1016***

Discussions

Molecular docking study is one technique that is often used in the discovery of new drugs[23, 24]. In this study, the test compound was *p*H*m*MC (ligand) and the target protein were EGFR, HER2, and VEGFR tyrosine kinase receptors. The structure of the target proteins were obtained from (https://www.rcsb.org/) with PDBID were 1XKK, 3PPO, and 2P2I respectively[20, 21]. Each protein was separated from its natural ligand (FMM, DCK, and 608) using the Yasara program. Then the protein from the separation, native ligand and ligand (*pHmmC*) were prepared by adding H atoms and followed by molecular docking test using PLANTS[20].

In this study, validation was done to calibrate the accuracy of the docking method used. The validation process was done by comparing the native ligand position to the receptors that have been tested experimentally at the binding site of pocket ligands using RMSD. In general predictions in RMSD 2 Å are considered successful, while values higher than 3 Å indicate docking failure[22]. In this study, the RMSD value was below 2A (Table 2) so that the docking method can be used for analysis.

The docking analysis was carried out by comparing docking scores from receptor tyrosine kinase interactions with *p*H*m*MC and tyrosine kinase receptor interactions with ATP. ATP ligand is used as a comparison because tyrosine kinase is a protein that catalyzes phosphate transfer from ATP residues to tyrosine residues.

The score docking (Table 3) is Gibbs free energy (ΔG) which shows the strength of the bond between compounds (ligand) and receptors (kcal/mol). The small ΔG value indicates the bonding of ligand-receptor is strong and forms a stable conformation. Conversely, if the ΔG value is high, the bond of the receptor-ligand complex is weak and the conformation is unstable. A stable conformation of a ligand causes the ligand to become more potent[20, 23, 24].

The studies showed that the docking score between ATP and EFGR[1XKK] and HER2[3PP0] was lower than the *p*H*m*MC docking score with the receptors. These showed the interaction of ATP with EFGR[1XKK] and HER2[3PP0] were stronger and the conformation was more stable than the interaction of *p*H*m*MC with the receptors. An interesting result was the ATP-VEGFR docking score (2P2I) of -87.4485 kcal/mol has almost equal to the docking score of *p*H*m*MC-VEGFR[2P2I] (-86.9070 kcal/mol). VEGFR is a protein kinase that plays a major role in the angiogenesis process. Angiogenesis is a growth process of new blood vessels from blood vessels that already exist in body tissues. The presence of angiogenesis indicates that cancer cells have experienced further growth, namely experiencing metastasis to other tissues[11-13]. The ability of *p*H*m*MC to interact with VEGFR and the bonding strength is almost the same as ATP, indicated that *p*H*m*MC has the potential to be used as an anti-angiogenenic. Several studies of chalcone have shown that several chalcone derivatives have anti-angiogenic activity[25-27].

In the interaction of *p*H*m*MC-EGFR[1XKK] there are two amino acids that similar with the amino acid that involved in interaction and ATP-EGFR. The amino acids

were Leu798 and Val843 (Figure 2). While the *pHmMC*-HER2 [3PPO] interactions there are four amino acids which are similar to the amino acids involved in the interaction and ATP-HER2 [3PPO]. These amino acids are Ala847, Ala848, Asn850 and Val851 (Figure 3). Although the bonding energy between ATP- EGFR [1XKK] and ATP-HER2 [3PP0] are lower than the bond energy between *p*H*m*MC with EGFR [1XKK] and HER2[3PP0], but because of similarities the amino acids involved in this interaction allow *p*H*m*MC to interfere with the interaction between ATP and the target protein.

In the interaction of *p*H*m*MC-VEGFR [2P2I] there are four amino acids which are the same as those involved in ATP-VEGFR [2P2I] interactions, viz Met1016, His1026, Leu 1029, and Ile 1044. This is probably what causes the *p*H*m*MC -VEGFR [2P2I] bond energy to be low and stable, and almost as large as ATP-VEGFR.

The results of this study support previous research that *p*H*m*MC has the potential as an anticancer. Besides that it also provides guidance for further research to explore the mechanism as anti-angiogenesis.

Conclusion

The *p*H*m*MC interfere with the interaction of EGFR, HER2 and VEGFR with ATP which is indicated by the similarity of amino acids involved in their interaction. The docking score of *p*H*m*MC-VEGFR has the lowest and almost the same as ATP-VEGFR, so it has the potential to inhibit angiogenesis in cancer cells. The results of this study can be used to guide the drug mechanism in developing cancer drugs.

ABSTRACT

Public health experts agreed that for the implementation of the health care efforts in the community, these efforts should be implemented through community organizing. This idea is then developed in a variety of health programs and most are activities through the health program community outreach (PKM). The main goal of the program is to change the behavior of the PKM society becomes unhealthy behavior that is healthy (Trangkoso, 1984). From the background of these problems arises the question of the proposed research are: "how the description (profile) of the PHBS household services in kampungArmopa. The Purpose of research is to find out an overview of the health problem in KampungArmopa and special-purpose is to know the profile of life health behavior in kampungArmopa Papua's Sarmi. Research methodology can be described as follows: phases of this research include: (1) the preparatory Stage, (2) the stage of data retrieval (3) data processing. This research in terms of time is cross sectional study. Researchers want to see conditions a life clean and healthy Behaviors (PHBS) in KampungArmopa. Research Time conducted for 3 months from preparation up to his percentage. A place or location of Sarmi of research conducted at KampungArmopa around 150 Km from the provincial capital Jayapura. A technique used to gather the data is (1) interview and (2) and recording of observations. There are two kinds of data sources, namely (1) primary Data and secondary data (2). This research is only one Variable which is free healthy life behavior which includes 2 sub variables namely (1) the order of household and school order (2). Analysis of the statistics used in the processing of data is to use a statistical analysis is quantitative. This research only a survey descriptive.

Keywords: *Clean Healthy Living Behavior, Household*

Introduction

Health status is influenced by four (4) major components, namely: environment, health services, behavioral, and genetic. Of the four components is virtually simultaneously yet rendered its full potential. Indicators used in health status improvement still reflect a situation that is conducive to realizing the optimal health status[7,8].

On health issues, while this transition occurs in the form of health, demographic transition, transition, transition epidemiology nutrition, and transition behaviors. The health transition gives a double load (*double burden)* health problems. Rising life expectancy, on the other hand the problem of babies and toddlers are still piling up, infectious diseases chronic disease hadn't while increasing dramatically, nutrition less everywhere, while increasing more nutritional problems anyway.

Health problems in Indonesia, quantitatively estimated around 15% of the population have the disease, while those between the healthy and sick about 85%. It is these conditions occur during the development of this inequality[6]. Almost the entire allocation of government budget devoted to minority group (15%). While the group that did not get a lot more promotional services. This situation must be changed, with the budget and giving greater attention to more groups, as a human rights enforcement efforts and investments in the field of health. The issue of clean and healthy living behaviors (PHBS) is a very serious problem especially in countries that are increasingly in Papua due to the classic problem

of low education level. Statistical data on Large shows that 70% of the population did not finish elementary school[1,2,3,4,5].

Method

This research in terms of time is survey descriptive. Researchers want to see conditions a life clean and healthy Behaviors (PHBS) in KampungArmopa. Research Time conducted for 3 months from preparation up to his percentage. A place or location of Sarmi Regency research was at KampungArmopa kl. The distance is 150 Km from the provincial capital Jayapura.

Result

PHBS Household Order: On respondents Living clean and healthy Behaviors (PHBS) order of the household respondents are interviewed who was also in pregnant women and housewives are there in KampungArmopa.

The birth of a Baby in you please by health workers and the exclusive breast feeding: The 44 respondents know not having a baby so not done early initiation and birth are rescued by health workers. When we perform data retrieval, many of the residents who are following TRC in Sarmi and stay stay at house Brothers so there is some data on mothers and babies who had noresponse because until we get back the family yet again of sarmi.

Pregnancy Checkups for Pregnant Women: The 44 respondents found the respondent as much as 2 pregnancy women in a state of pregnancy and as many as 1 (2.3%) of respondents checked the uterus during pregnancy, whereas 1 (2.3%) of the respondents of pregnant women without checked content and as many as 42 (95.5%) of respondents found no members who are a pregnancy.

Use Family Planning for couples Ages fertile: The 44 respondents, a total of 10 (22.7%) of respondents age fertile couples use KB, as many as 29 (65.9%) of the respondents in the fertile age Couples don't use KB and 5 respondents (11.4%) is not a fertile women.

The Initiation of Early After the Baby is Born to Suckle: The 44 Respondents, a total of 44 (100%) of the respondents did not do a initiation suckle after her baby was born due to not having a baby.

Members of the Fund Healthy (JPKM): Figure 1 presented the origin of the 44 respondents, a total of 30 (68.2%) KK became a member of the Fund is healthy, and as many as 14 (31.8%) KK don't become members of the Fund healthy.

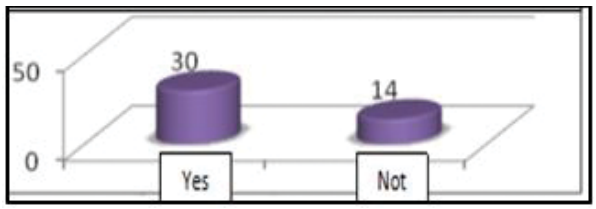

Figure 1: Distribution of respondents became healthy members

Members who Smoke: A total of 29 (65.9%) of the respondents shows that the family members who smoke, and the remainig 15 (34.1%) of respondents family members who do not smoke.

The number of Cigarettes consumed in One day: Figure 2 illustrated the 44 respondents, a total of 13 (29.5%) respondents in 1 day can be spent < 10 cigarettes, as much as 14 (31.8%) of the respondents can spend 10-20 cigarettes, as much as 2 (4.5%) respondents can spend > 20 cigarettes in 1 day, and as many as 15 (34.1%) have family members who do not smoke.

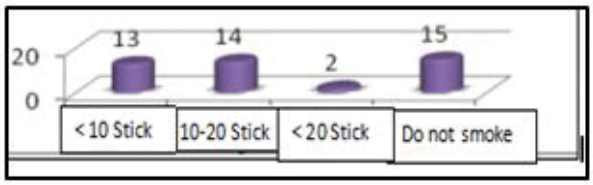

Figure 2: Distribution of the number of cigarettes consumed by respondents in 1 day

Members Who Consume Alcohol: The respondents 44, of as many as 16 (36.4%) of respondents had family members who consume alcoholic beverages, and as many as 28 (63.6%) of respondents have family members who do not consume alcoholic beverages.

The amount of Alcohol consumed in one day: Figure 3 shows that the 44 respondents, a total of 1 (2.3%) of the respondents had a family member that consume alcohol as much as < 1 or 2 bottles, as many as 12 (27.3%) of respondents have a member of family who consume alcohol as much as ½ bottle, as much as 3 (6.8%) of the respondents had a family member consume alcohol as much as > 2 bottles, and as many as 28 (63.6%) of respondents did not consume alcohol (not a drinker).

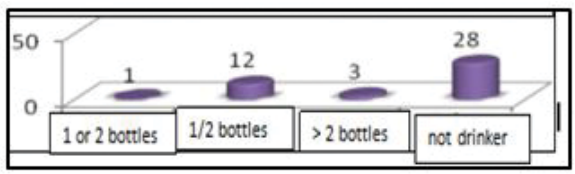

Figure 3: Distribution of the number of alcohol consume by the respondent

Physical activity or sport on a regular basis: The 44 respondents (KK), as many as 20 (45.5%) KK in KampungArmopa do physical activities, and as many as 24 (54.5%) KK more physical activities do not several residents interviewed in time about doing physical activity, they said that either a working in the farm is also physical activity. When lifting the result field is also the replacement exercise physical activity.

Diversified eating habits: The origin of the 44 Respondents, a total of 25 (56.8%) respondents said they eat rich food every day, and as many as 19 (43.2%) of respondents said that they did not eat the food varied each day.

The Use of Clean Water: The 44 respondents, as many as 3 (75.9%) of respondents use clean water for daily needs and a total of 11 (25.0%) did not use clean water for daily necessities.

The Number of Occupants Fit Wide Home: The number of residents in accordance with an area of the house is for 2 adults and 1 baby people require spacious 8 m^2. The 44 respondents, a total of 32 (72.7%) of respondents (KK) number of residents of her home in accordance with the floor area of the house and as many as 12 (27.3%) of respondents (KK) number of residents of her home not according to the floor area of the house.

The floor of the House rather than from the ground: The 44 Respondents, a total of 40 (90.9%) respondents to the floor of his home is not made from the ground and as many as 4 (9.1%) respondents to the floor of his house made of ground.

In The State House Yard Clean: The 44 respondents, a total of 28 (63.6%) of respondents in the Court of the conditions of her house is clean and as many as 16 (36.4%) of respondents in the state court of the condition of her home is not clean.

Garbage Dumps: The 44 Respondents, a total of 24 (54.5%) of respondents have a landfill in his house and as many as 20 (45.5%) respondents have no landfills.

Discussion

Based on the study, we could simplicity explain that:

a. From 44 respondents, a total of 10 (22.7%) of respondents Age fertile Couples use KB, as many as 29 (65.9%) of the respondents in the fertile age Couples don't use KB and 5 respondents (11.4%) is not fertile women.

b. As many as 29 (65.9%) of the respondents have family members who smoke, and as many as 15 (34.1%) of respondents have family members who do not smoke.

c. Of the 16 respondents, 44 (36.4%) of respondents had family members who consume alcoholic beverages, and as many as 28 (63.6%) of respondents have family members who do not consume alcoholic beverages.

d. From the 44 respondents (KK), as many as 20 (45.5%) KK in KampungArmopa do physical activities, and as many as 24 (54.5%) KK more physical activities do not.

e. The origin of the 44 Respondents, a total of 25 (56.8%) respondents said they eat rich food every day, and as many as 19 (43.2%) of respondents said that they did not eat the food varied daily.

f. Of the 44 Respondents, a total of 33 (75%) of respondents use clean water for daily needs and a total of 11 (25%) did not use clean water for daily necessities.

g. Of the 44 Respondents, a total of 28 (63.6%) of respondents in the Court of the conditions of her house is clean and as many as 16 (36.4%) of respondents in the State Court of the condition of her home is not clean.

h. Of the 44 Respondents, a total of 24 (54.5%) of respondents have a landfill in his house and as many as 20 (45.5%) respondents have no landfills.

Global Trend on Incivility Research

Nurul Ain Hidayah Abas[1], Aidi Ahmi[2], Mei-Hua Lin[3], Asma Perveen[1]

[1]Department of Psychology & Counseling, Faculty of Human Development, Universiti Pendidikan Sultan Idris, Malaysia; [2]TunkuPuteriIntanSafinaz School of Accountancy, Universiti Utara Malaysia, Malaysia; [3]Department of Psychology, School of Science and Technology, Sunway University, Malaysia

ABSTRACT

Violation of workplace norms is perceived as incivility and could potentially bring negative consequences to psychological health and organizational attitudes. Given this, abundant research on incivility is conducted to look at the dynamics, causes, and outcomes of incivility and its negative impacts on employees' well-being. Up until this date, no work of bibliometric study has been carried out and published. Therefore, this paper aims to analyze, and reports published works related to incivility based on the data obtained from the Scopus online database. Using standard bibliometric indicators, this article reports the growth rate of publications, analysis of the citation, global trends and research productivity. A total of 594 valid published documents is retrieved and finalized based on selected keywords search results. The results show that there is an increased growth rate of incivility literature, particularly in nursing and health-related area. The plausible reason for this is the high attention given to organizational change derived from cultural differences, as can be seen from the cluster of countries with high and low interests in incivility research.

Keywords: *Incivility, bibliometric analysis, Scopus Database, mistreatment, health*

Introduction

Literature on incivility, which is also referred to as uncivil or antisocial behavior in the workplace, has received a lot of attention nowadays due to the increasing prevalence of academic incivility and the nature and evolution of organizational culture. The incivility as a form of interpersonal mistreatment where the intention to harm and violate norms of mutual respect are ambiguous[3]. In an organization, a moral understanding formed by universal norms and culture of respect allows cooperation and collaboration among its organizational members[15]. The violation of the norms and code of conduct is a starting point where an act is regarded and is perceived as uncivil.

For incivility to occur, instigators often use subtle and disguised forms of mistreatment in which the intention is not apparent. For this reason, it is more challenging to attribute the harm caused by instigators to the targets of incivility[16]. Similarly[10],argued that some instigators intentionally hide discriminatory intentions behind other forms of mistreatments, like bullying or aggression, to retain an egalitarian image and escape sanctions that are posited to them.

The incivility categorized into three types[17]. The first one is top-down incivility, which is an uncivil behavior by a higher-status individual towards someone of a lower status position within an organization. The second category, bottom-up incivility, is directed towards a person in a higher position by someone in a lower position, for example, a subordinate to the supervisor. The third is lateral incivility, which refers to uncivil acts between individuals in positions of equal status within an organization. Most research on incivility focuses on top-down incivility as individuals with power will use their position to mistreat individuals in the lower position. While top-down incivility is the most common type of incivility to occur, bottom-up and lateral incivility could also occur in low rather than high power distance countries.

According to the affective events theory (AET), there is a relationship between employees' internal influences,

Corresponding Author:
Nurul Ain Hidayah Abas
Department of Psychology & Counseling,
Faculty of Human Development,
Universiti Pendidikan Sultan Idris, Malaysia
Email: nurulain@fpm.upsi.edu.my

namely emotions and moods, and their reactions to daily work events[21]. Therefore, it is not surprising that many conceptual and empirical research suggests that any form of incivility is associated with various organizational attitudes and well-being, for example, decreased job satisfaction, burnout, life satisfaction, commitment and turnover intention to other institutions[1,14].

Similarly, the study by[6] extended the literature on interpersonal mistreatment in the workplace by examining the incidents, targets, instigators, and impact of incivility among 1180 public sector employees. They found that uncivil workplace experiences were associated with greater psychological distress from the thoughts of quitting more frequently. In a broader view, this brings a negative impact among the employees in four categories: physical, psychological, economic and social. Distinctively, the physical and psychological impacts are the most prevalent due to its severity that eventually causes financial loss, thus worth to be studied.

As of now, a related study of bibliometric analysis can be found on conflict management research by[4]. It is similar in the nature of violating the common norms by disagreement between two or more employees, and the psychological impacts it has on the victims. The focus of the paper is to propose theoretical foundations of conflict management of the field 2007-2017, specifically on the emerging concepts, themes and relationships of studies by laying out the intellectual structure. The present study, however, explores in wider scope by taking into consideration the geographical relationships, top journals, top authors and the annual growth of incivility. The current paper serves to complement the above-mentioned paper in the understanding of the evolution of interpersonal mistreatment in addition to identifying direction areas of conflict management at the workplace from the identified themes. In general, this study provides a comprehensive review and analysis on all types of publications related to incivility as published in Scopus online databases.

Method

This study used the data obtained from the Scopus database as of15th April 2019. Considering the fact that Scopus contains high indexed peer-reviewed documents[18], the most effective search engine[19], and the largest scholarly works database as compared to Pubmed or Web of Science, this study employs this database as a basis to extract published works on incivility. The focus of all the documents that have the word "incivility" in the title of the document for the period until 2018. As such, the following query has been specified in the search process: (TITLE (incivility)AND(EXCLUDE (PUBYEAR,2019))).This query generated a total of 594 documents for further analysis.

Analysis and Findings

Document and Source Type: The first analysis reports document type and source type of data. The document type can be defined as the original type of the published document, while source type refers to the source of that original document. There are 10 document types published on incivility on the Scopus database. Specifically, documents gathered are in the form of journal articles (468:78.8%), followed by book chapter (41:6.9%), review (24: 4.0%), conference paper (17:2.9%), note (13:2.2%) and article in press (12:2.0%), editorial (7:1.2%), letter (5:0.8%), book (4:0.7%) and short survey (3:0.5%).

For the source type of the documents gathered, most of the published documents are journals with 530 documents (89.23%), followed by books with 45 documents (7.58%), and conference proceedings with 12 documents (2.02%), book series (5:0.84%) and trade publications (2:0.34%). Publishing an article in a journal provides visibility, recognition, and as an excellent communication medium among the scientific community in the area of research. Besides, journal article also works as a stamp of approval than any other published documents as it is peered-review, and hence, gives plausible justifications on the top score.

Top Journal: This paper also presents the top journal based on the 530 journal articles retrieved from 1999 to the present. Since the nature of incivility is related to work of organizational psychology, and it impacts the well-being, it is of no surprise that 26 articles are published in the *Journal of Occupational Health Psychology*. The second top journals articles are published in is *Journal of Nursing Management* followed closely by *Journal of Nursing Administration*, showing that articles on incivility are many studies on nursing area. There are ten articles published each in *Journal of Applied Psychology*, *Journal of Nursing Education* and *Journal of Organizational Behavior.* Other works of incivility that focus on nursing can be seen from eight publication

in *Nursing Education Perspective*, closely follows by *Nurse Education Today*, *Nurse Educator* and *Nursing Management* with 6 published documents each sharing the same level with *Advances* and in *Developing Human Resources*, and *Work and Stress*.

Publication by Year and Annual Growth: Figure 1 shows the first document published on incivility begin in 1992 and grew steadily until 1999. The trend fluctuated between 2000 to 2006 and grew significantly from 13 documents in 2007 (11.62%) to 111 documents in 2018 (18.69%). Bases on Scopus records, [3]is the first published research on incivility. With the growing demands of incivility research, it is expected the number will be increased, aligned with the increasing awareness of mental health among employees.

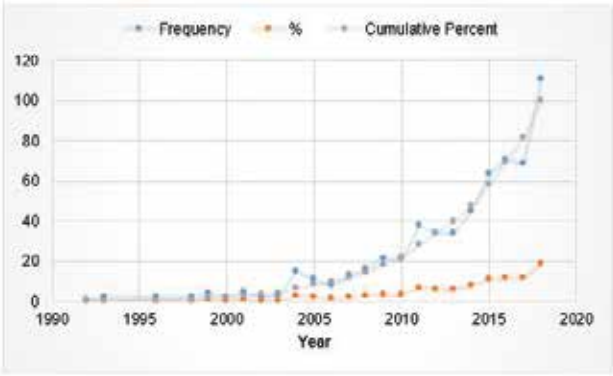

Figure 1: Publication Year and Annual Growth

Subject Area: Table 1 presents the published documents based on the subject area from 1992 until 2018. Most of the documents emerged in the subject area of social sciences with 253 documents (42.59%), followed by psychology with 152 documents (25.59%), and business, management and accounting with 140 documents (23.57%). Other subject areas include medicine, computer science, mathematics, and energy show a diverse range of subject areas. This table also provides an area of subjects that are lacking in incivility research and can be explored more to examine the similarities and differences of findings with another subject area.

Table 1: Frequency and Percentage by Subject Area (N = 594)

Subject Area	F requency*	%
Social Sciences	253	42.59
Psychology	152	25.59
Business, Management and Accounting	140	23.57
Nursing	122	20.54

Energy	2	0.34
Earth and Planetary Sciences	1	0.17
Immunology and Microbiology	1	0.17
Materials Science	1	0.17
Pharmacology, Toxicology and Pharmaceutics	1	0.17
Undefined	2	0.34

*Some documents are categorized in more than one subject area

Keywords Analysis: The network visualization of authors' keywords is demonstrated by color, circle size, font size, and thickness of connecting lines indicate the strength of the relationship among the keywords. The same color is used for related keywords and words that are commonly listed together[20]. For example, incivility, human, female, stress, interpersonal relations and job satisfaction are usually co-occurred together.

It also can be seen from Table 2 that female, male, adult, article, workplace, psychology, interprofessional relations, and public relations are among the keywords with the highest occurrences compare to the keywords specified in the search query, "incivility". However, if we count "human" as a single keyword by combining the keywords "human" and "humans", this keyword will represent more than 60% of the keywords used in the incivility literature.

Table 2: Frequency and Percentage by Top 20 Keywords (N = 1828)

Author Keywords	Frequency	%
Incivility	200	33.67
Human	196	33.00
Humans	161	27.10
Female	125	21.04
Male	119	20.03
Adult	116	19.53
Article	116	19.53
Workplace	95	15.99
Psychology	77	12.96
Interprofessional Relations	73	12.29
Public Relations	73	12.29
Workplace Incivility	66	11.11
Nursing Education	57	9.60
Social Behavior	54	9.09
Middle Aged	53	8.92
Bullying	51	8.59
Questionnaire	51	8.59
United States	51	8.59
Interpersonal Relations	47	7.91
Nursing Student	47	7.91

Geographical Distribution of Publications: Table 3 shows the top ten countries contributed in publishing works on incivility with the highest documents are produced from the United States with a total of 349 documents (58.75%), followed by Canada with 55 documents (9.26%), and the United Kingdom with 31 works (5.22%). With a clear pattern of higher research produced by certain countries, there could be to two plausible reasons. First, the country may be exercising laws on zero-tolerance policy on incivility. Second, cultural differences in power distance could be a factor. Low power distance, in which power between the employees is viewed similar regardless of the hierarchical positions, could be the cause for incivility to occur more frequently as compared to a country with a high-power distance, in which power between the employees is viewed differently.

Table 3: Frequency and Percentage by Top 10 Countries (N = 594)

Country	Frequency	%
United States	349	58.75
Canada	55	9.26
United Kingdom	31	5.22
Australia	30	5.05
South Korea	15	2.53
Singapore	13	2.19
China	11	1.85
Israel	11	1.85
Switzerland	11	1.85
Iran	10	1.68

Citation Analysis: Based on the 594 papers gathered from the Scopus database, there are a total 13663 citations obtained, with 506.04 citations per year. For the past 27 years (1992-2018), 23 citations per paper are reported with h-index of 54. Turning to Table 4 results, the most cited article is “Tit for tat? The spiralling effect of incivility in the workplace” by Andersson and Pearson (1992) with 1034 citations, and with an average of 51.7 per year. For the total of 10 top-cited articles, the total number of citations by Google Scholar is also reported for each of the articles.

Table 4: Top 10 Cited Articles and Citation Metrics

*GS: Google Scholar

Conclusion

The results from the study showed that incivility grabbed the attention of scholars in the field of social sciences, psychology and business, management and accounting. Yet, there are psychologists, for example, social and organizational psychologist, who regard themselves as social science researchers, hence the number of psychology subject area may be bigger than what it is claimed in Scopus. From data generated, researchers would be able to understand the importance of producing quality papers with multiple authors and also, would be able to identify the top authors that have similar interests around the globe. With that information, cross-cultural studies, for example, could be conducted to investigate the dynamic, experience, factors and impact of incivility between two or more cultures.

In spite of the specific nature of the bibliometric analysis, the study also has limitations that should be addressed to improve future research. First, the results only emerged from the specific keyword. The word "incivility" is chosen although there is a possibility that other researchers who use other phrases that carry similar meaning to incivility such as "interpersonal mistreatment" or "subtle aggression/harassment/ bullying". Therefore, there may be existing studies are excluded due to the specific scope of word used in the search query. It is also worth to note that there is no search query, which is 100% perfect[18]. Thus, false positive and negative results should be anticipated. Thirdly, this study is only focused on the Scopus database as the main source of the documents. Although Scopus is among the largest databases that indexes all scholarly works[2,18], it does not effortlessly cover all available sources. Other available databases probably can be included in future research such as Web of Science and Google Scholar. Despite these limitations, this study was among the first to analyze bibliometric indicators of incivility research.

A New Approach to Detect Macular Hole from Optical Coherence Tomography Images

M. Anand[1], C. Jayakumari[2]

[1]Research Scholar, Bharathiar University, Coimbatore; [2]Associate Professor, Middle East College, Oman

ABSTRACT

Introduction: Macular hole is a tear or break in the macula, located in the center of the retina. A macular hole affects central vision of human; the vision will be wavy, blurry and distorted. Macular hole commonly affects aged women.

Aim: Optical Coherence Tomography (OCT) enables accurate diagnosis of macular hole. Existing algorithms available related to finding layers and cyst detection, but identifying macular hole in an accurate manner is still a missing entity. Hence we propose a fully automated system for the accurate macular hole identification.

Method: Ee propose a fully automated system for the accurate macular hole identification. The proposed methodology has six stages in process. The first stage starts with preprocessing the OCT image, then by Nerve Fiber Layer (NFL) detection. The detected NFL layer is then processed using our proposed method.

Result & Conclusion: It helps to identify the macular hole from the OCT images. The proposed methodology is evaluated with the health macula and macular hole OCT images. By experimentation results, the proposed algorithm provides 87% accuracy in finding macular hole.

Keywords: *Biomedical Imaging, Macular Hole, Optical Coherence Tomography (OCT).*

Introduction

Optical Coherence Tomography (OCT) imaging tool can be used to identify variety of retinal diseases, including macular holes, glaucoma, pigment epithelium and macular edema and, by visualizing the retinal layers [1,2]. Several methods have been proposed for identifying the fluid associated abnormalities, intra retinal Cystoid Macular Edema (CME) and automatic retinal layer segmentation from OCT images [3,4]. Although a number of automatic image processing techniques have been proposed to identify anomalies in the macula, there is no technique to identify macular hole from OCT images [5,6].

In this paper, we proposed a new method to automatically detect macular hole from OCT images. In this work, we considered HD-OCT retinal images for macular hole identification. This paper is organized into the following sections: in section two, the proposed methodology is exposed for automatic macular hole detection. The experimental results obtained by the proposed method are analysed in section three and conclusions and future works are presented in the fourth section.

Proposed Methodology

The steps involved in our proposed methodology, in sequence, are: Grayscale conversion, image filtering, binary image conversion, morphological operation, extracting boundary, NFL layer extraction, calculating the depth using the proposed algorithm, macular hole detection [7,8]. The block diagram of the proposed methodology is depicted in Fig.1. From the block diagram of the proposed system presented in Fig. 1, there are six stages:

1. Input OCT image
2. Preprocessing
3. Extracting Layer Boundary

4. NFL layer segmentation
5. Updating Color above NFL layer
6. Macular hole identification

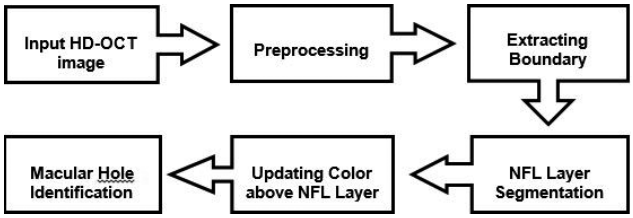

Fig. 1: Block Diagram of Proposed System

The entire stages of the proposed system are implemented in MATLAB version R2013a, MathWorks, Inc. It is a fully automated system the only user input is the HD-OCT image. Each stage of the proposed methodology is described sequentially as follows:

Preprocessing: Initially, the input HD-OCT retinal images are obtained from the Cirrus HD-OCT System as shown in fig. 2. Then, the HD-OCT B-Scan image is loaded into the proposed system. To use the images for analysis, we converted the color image to a grayscale image as shown in fig. 3 and the pixel values are converted to a full range between 0 and 1. This normalized image is then processed and the formation of macular hole is identified using the proposed methodology. To remove the noise, the median filter is applied on the normalized image and obtained the filtered image, fig. 4.

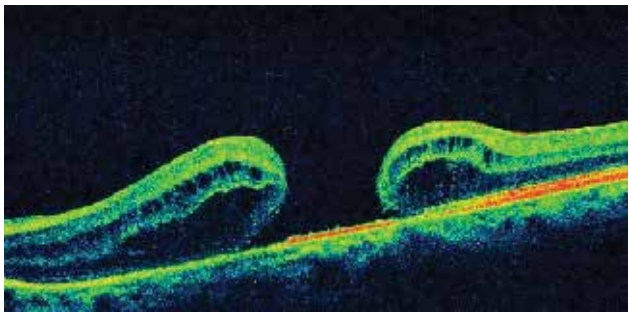

Fig. 2: Input OCT B-Scan image

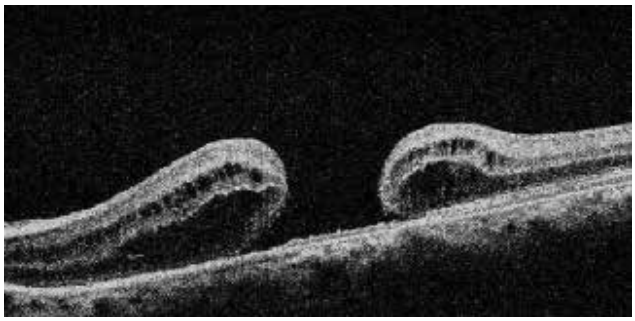

Fig. 3: Gray scale image

Extracting Boundary: Extracting retinal layer boundary is an important process to identify retinal diseases from HD-OCT images. The filtered image is then converted to binary image[9]. The morphological close operation is then performed on the binary image, to close discontinuity of the NFL layer, with disk size 10 and obtained the output image. Then the boundaries are extracted from the output image.

NFL Layer Segmentation: The steps involved in NFL layer segmentation are as follows: retinal layer boundary selection and NFL layer extraction. Discrete numbers of continuous regions are identified from the retinal B-scan image. To detect the NFL layer, at first the valid layer boundary should be identified from the discrete number of contiguous regions in the image. In the discrete number of contiguous regions, the longest length region is the analysis area. So the longest length region is selected from the regions. Then, the NFL layer is extracted from the longest length region.

Updating Color above NFL Layer: The colors above the extracted NFL layer are changed to black on the grayscale image by setting the pixel value to zero. Then, the proposed methodology is applied on the image for identifying macular hole, fig. 4.

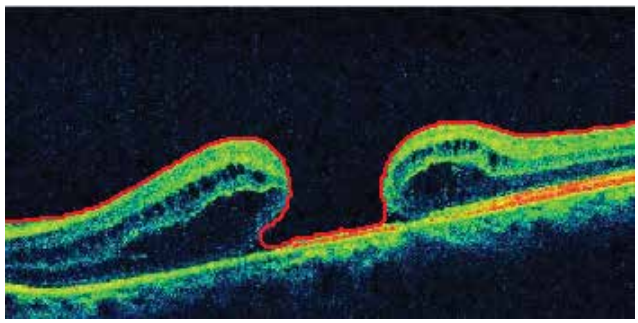

Fig. 4: NFL layer overlying on input image

The pseudo code for updating the color above NFL layer is:

```
Function UpdateColorAboveNFL(Image I)
For each boundary pixels p(x,y) do
For j=1 to y-1
I(x, j)=0
Next j
End
```

Where, x is the column value and y is the row value.

Macular Hole Identification: The proposed algorithm checks the continuous black color of the image from left to right columns. Then the depth difference of two adjacent columns is calculated. If the difference is greater than the threshold value, the counter value is incremented and checks the counter value. The function returns true if the counter value is two true otherwise the process is repeated till the last column and finally returns false. If the function returns true then macular hole is found in the HD-OCT image otherwise macular hole is not found.

```
Function IsMacularHole(Image I)
Count=0
For j = 1 to width(I)
    d1 = Cm
    d2 = Cn
    If (|d1-d2|>20) then
        Count=Count+1
        If (Count==2) then
            Return true
        End if
    End if
Next j
Return false
End
```

Where,

C_m - Number of continuous zeros from the top of the image on j^{th} column.

C_n - Number of continuous zeros from the top of the image on $(j-1)^{th}$ column.

Experimental Results

OCT Data Set: In this research work, we used the local data set acquired from the hospital. This local data set contains 100 HD-OCT images (50 healthy macula and 50 Macular hole).

Evaluation of Proposed System: The proposed system is applied to the B-scan images with the macular hole and healthy macula. The proposed system correctly detects the macular hole in both the cases. Table 1 shows the result of the proposed system on macular hole identification and fig. 5 shows the analysis of the proposed system on macular hole identification.

Table 1: Result of macular hole identification

Input HD-OCT Images	No. of Input Images	No. of Correct Diagnosis	No. of Incorrect Diagnosis
Macular Hole	50	41	9
Healthy macula	50	46	4

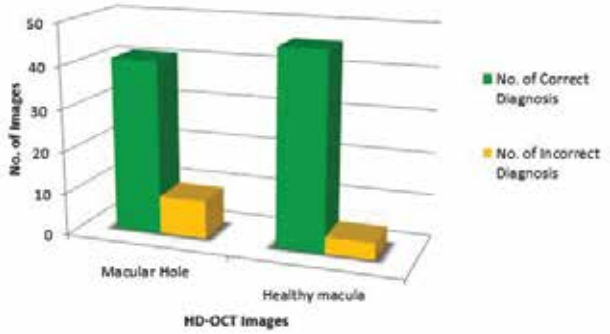

Fig. 5: Analysis of proposed system on macular hole identification

The confusion matrix of the proposed system is shown in Table 2. For evaluation, we used 100 HD-OCT images (50 images with macular hole and 50 healthy macula images).

Table 2: Confusion matrix of proposed system

		Predicted	
	N = 100	Negative	Positive
Actual	Negative	TN = 46	FP = 4
	Positive	FN = 9	TP = 41

Then, the accuracy, error rate, sensitivity, specificity and precision of the proposed system are calculated:

Accuracy = (TN+TP)/N = 0.87

Error Rate = (FP+FN)/N = 0.13

Sensitivity = TP/(FN+TP) = 0.82

Specificity = TN/(TN+FP) = 0.92

Precision = TP/(FP+TP) = 0.91

Thus, the accuracy of the proposed system is 87%, error rate is 13%, sensitivity is 82%, specificity is 92% and precision is 91%.

Conclusion and Future Work

A new efficient, fully automated system for identifying macular hole from OCT images is presented. This methodology is evaluated by applying the method

on healthy macula and macular hole HD-OCT images. All the six modules have been implemented in MATLAB and the proposed system given accurate results for identifying macular hole. This proposed methodology gives 87% accuracy, 82% sensitivity and 92% specificity for identifying macular hole from HD-OCT images. This proposed method gives wrong output if the NFL layer is not identified correctly. In future, this method can be evaluated by applying the method on the retinal HD-OCT images affected with other retinal diseases, such as Central Serous Chorioretinopathy (CSCR), Macular Edema (ME) and Pigment Epithelial Detachment (PED). Machine learning algorithms can also be used to improve the accuracy for identifying macular hole from the OCT images.

Synthesis and Characterization of Graphene Quantum Dots from Turmeric Powder *(Berberisaristata)* and Its Biomedical Applications

Anooj E. S.[1], V. Suganthi[2], P. K. Praseetha[3]

[1]Research Scholar, Department of Nanotechnology, Noorul Islam Center for Higher Education, Kumarakovil, Kumaracoil, Thuckalay, Tamilnadu, India; [2]Assistant Professor, Department of Biotechnology, Sri Sankara Arts and Science College, Ernathur, Kanchipuram, Tamilnadu, India; [3]Professor, Head of the Department, Department of Nanotechnology, Noorul Islam Center for Higher Education, Kumarakovil, Kumaracoil, Thuckalay, Tamilnadu, India

ABSTRACT

Introduction: A facile, eco-friendly and large scale amenable extracellular biological synthesis of GQD was achieved by using the natural products of Berberisaristata (turmeric), as the reducing agents.

Aim: The aqueous silver ions, when exposed to Berberis aristata, Curcumin longa and Curcuma aromaticawere reduced and resulted in the biosynthesis of Graphene Quantum Dots size range from 80 to 195 nm.

Method: The Graphene Quantum Dots were characterized by UV-Vis, XRD, FT- IR, SEM. Synthesized GQDs and biomass of Berberis aristata, Curcuma longa, and Curcumin aromaticawere evaluated for their anti-inflammatory properties.

Result & Conclusion: Carrageenan-induced paw edema animal model evaluations found excellent for GQDs. Decisively, the inevitability of development of these GQDs could be recommended for their further investigations as an effective anti-inflammatory, cytotoxicity therapeutics, biocatalyst and nano particle with drug complex.

Keywords: *Berberis aristata, Curcuma longa, Curcuma aromatica, GQDs, Anti-inflammatory.*

Introduction

Nanotechnology can be well-defined as the handling of atom by atom from the material world by the grouping of engineering, chemical and biological approaches. Solicitation of nano scale material and structures are typicallyreaching from 1-100 nm and is evolving zone of nano science and nanotechnology [1]. Nanotechnology is innovativemeadow just its onset, the tendency in the followingeras being its involvement with the green chemistry approach.[2] Utmost of the recent approaches are generally employed by the use of physical or chemical main beliefs to synthesize metal nanoparticles. Both research methods are not ecofriendly due to many downsides such as the occurrence of noxious organic solvents, manufacture of hazardous by-products and transitional compounds and great energy consumption [3].Though nanoparticles can be synthesized overrange of conventional methods biosynthesis methods are good competent over the physical and chemical techniques. Green principle way of synthesizing takearisen as substitute to stunned the control of expected techniques. Curcumin has constraint for anticancer analysissince of its unfortunate solubility in aqueous solution and its poor bioavailability in complete circulation. Polymer-based nanoparticles consuming chitosan is one of the process which takesexisted to enhance curcumin solubility and

bioavailability.[4] The prepared nanoparticles of curcumin by ionic gelation processby means ofsmallgelatinous chitosan and tripolyphosphat at severalmeditations, Curcumin nanoparticles has characterized for their particle size, zeta potential, morphology and entrapment efficiency. Likewise, curcumin nanoparticles evaluated on behalf of their stability in artificial gastric fluid (AGF) and artificial intestinal fluid (AIF), cytotoxic effect and cellular uptake on HeLa cell lines.[5,6] *Berberis aristata*is also known as tree turmeric. It act as a chillingpurgative to children. The stem is believed to diaphoretic and laxative and beneficial in rheumatism. The dehydrated extract of the roots is applied in ophthalmia. It is also an admirablemedicine in the example of sun-blindness. The bark of its root is a valuedremedy in recurrent and remittent fevers. *Berberis aristata* is widely used in ayurvedic medicines for inflammation, wound healing, skin disease, menorrhagia, diarrhea, jaundice and affection of eyes [7]. This plant have active pharmacological action in anti-diabetic, anti-cancer, anti-microbial, anti-inflammatory [8]. Both Aqueous and alcoholic extract of *Berberis aristata* reportedsignificant anti-inflammatory activity on acute inflammation process [9, 10] the nanoparticles are not yet reported for*Berberis aristata.* In this study, the Graphene Quantum Dotswere synthesized by using and tree turmeric (*Berberis aristata*). It is characterized by UV-Visible spectroscopy, FT-IR, SEM, XRD, HORIBA-the nanoparticle analyzer. Synthesized Graphene Quantum Dots were evaluated for*in vivo* and *in vitro* anti-inflammatory activity.

Materials and Method

Synthesis: The *Berberis aristata* have been cleaned, crushed and arid in a hot-air oven at 80. After drying, 0.1 g of *Berberis aristata* sample is taken with 1 ml of hydrazine hydrate also dissolved in 10 ml of water in an ultrasonic water bath around half an hour. This solution was transferred to a 25 ml Teflon lined stainless autoclave. This was then heated between 150-200 in an electric oven and kept for 6-10 h additionally. This water-soluble GQD product sample was cooled to 37°c and then drained via 0.22 mm micro-porous membrane to expel the insoluble carbon products from the sample. Further, these samples were dialyzed using a dialysis bag for 2 days to expel the un fused small molecules from the sample. These purified black colored GQDs were later dried at 80 with a yield of nearly 33% and moreover utilized for basic portrayal and property measurements.

Characterization of Graphene Quantum Dots

UV – Vis and FTIR spectroscopy analysis: UV-visible spectro photometric analysis was conducted on the *Berberis aristata* extract using a UV-visible spectrophotometer (Perkin Elmer, USA Model: Lambda 950) with a slit width of 2nm, using a 10-mm cell at room temperature. The extract was examined under visible and UV light in the wavelength ranging from 300-800nm for proximate analysis. For UV-VIS spectrophotometer analysis, the extract was centrifuged at 3000 rpm for 10 min and filtered through Whatman No. 1 filter paper. The sample is diluted to 1:10 with the same solvent.

X-Ray Diffraction: The crystallinity and phase purity of the synthesized GQDs was analyzed by using X-ray diffraction (XRD) analysis. X-ray diffraction pattern was observed by using Shimadzu (XRD -6000, Japan) instrument. X-ray pattern equipped with Cu K _ radiation (_ = 1.5406 Å)with the targeted voltage of 45 kV and current of 40 mÅ.

FTIR: Fourier transform infrared (FTIR) was used to identify the characteristic functional groups in the extract. It provides the information about the structure of a molecule could frequently be obtained from its absorption spectrum. A small quantity of the *Berberis aristata* extract was mixed in dry potassium bromide (KBr). The mixture was thoroughly mixed in a mortar and pressed at a pressure of 6 bars within 2 min to form a KBr thin disc. Then the disc was placed in a sample cup of a diffuse reflectance accessory. Fig 2 shows that The IR spectrum was obtained using Bruker, Germany Vertex 70 infrared spectrometer. The sample was scanned from 4000 to 400 cm-1. The peak values of the UV-VIS and FTIR were recorded.

Acute Toxicity Studies: Acute toxicity was carried out according to OECD guideline. Wistar rats (100 ± 10 gm) either sex were divided into four groups with three animals each in a group (n=3). The animals fasted overnight and test compounds were administered orally. The animals were examined daily up to an 8-10th day for the behavioral change or mortality.

Carrageenan-induced Rat Paw Edema Studies: As we reported earlier, Wistar rats (100 ± 10 gm) of either sex were weighed and randomized into 5 groups (n=6). The initial volume of the right paw of each animal was determined using a plethysmometer (UGO Basile, 7140). Animals were starved for 12 h and to ensure uniform hydration, the rats received 5 ml of water by stomach tube. Group I served as control (Vc), Group II received Indomethacin (10 mg/kg), and Group III to VI

was received GQD, GQD+plant biomass suspensions in different doses (5and 10 mg/kg). 30 minutes later, 0.1 ml of 1% w/v freshly prepared λ-carrageenan in saline injected into the plantar side of the left hind paw. The paw volume (Vt) was measured every 30 min up to 2 h (Vigneshwaran N et al. 2008). % inhibition of each group was determined using the following formulae:

$$\% \text{ Inhibiltion} = (Vc - Vt/Vc) \times 100$$

Where, Vc = mean variation of edema for the control group; Vt = mean variation of edema.

Statistical Analysis: All results were expressed as percentage decrease with respect to control values and compared by one-way ANOVA with Dunnett's post test was performed. GraphPad Prism version 7.1 for Windows, GraphPad Software, San Diego California USA, www.graphpad.com was used for statistical analysis. A difference was considered statistically significant if $p \leq 0.05$.

Results and Discussions

Biosynthesis of Graphene Quantum Dots: As depicted in Fig. 1, shows that biosynthesis of Graphene Quantum Dots observed by the color change caused by the reduction in the reaction mixture. The pale yellow to deep green color in solution revealed the formation of GQDs. Evidently, the presence of metabolites in the plant biomass exposed to silver may possibly diminish silver ions, obviously representing that the reduction of the ions happens during electron shuttle or through reducing agents present in the solution.

Characterization of Graphene Quantum Dots

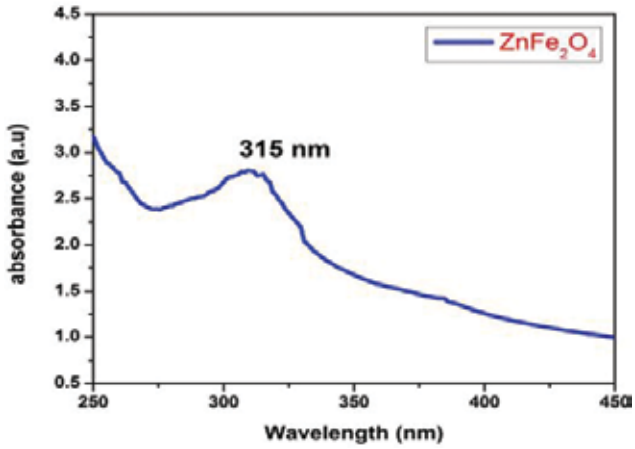

Figure 1: UV-Visible absorption spectra of Graphene Quantum Dots

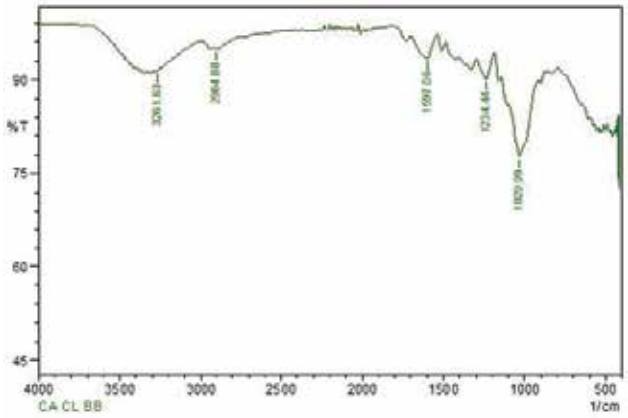

Figure 2: FT-IR Spectrum of Graphene Quantum Dots

X-RAY Diffraction Studies: The biosynthesized silver nanostructure by employing plant extract was further demonstrated and confirmed by the characteristic peaks observed in the XRD image Fig. 3 shows that it showed characteristic peaks near the 2θ value of 38.84°. A Bragg reflection corresponding to (111) sets of lattice planes are observed which may be indexed based on the face-centered cubic (fcc) structure of silver [Dubey et al., 2009]. The XRD pattern thus clearly shows that the Graphene Quantum Dots are crystalline in nature. In addition to the Bragg peak representative of fcc silver nanocrystals, unassigned peaks were also observed suggesting that the crystallization of bio-organic phase occurs on the surface of the Graphene Quantum Dots. XRD results for the GQD found with θ value (degree) of 19.104, d-spacing (Å) 2.352, FWHM (degree) 0.68, intensity (counts per second) 85.81. Crystallite size of Graphene Quantum Dots as estimated from the full width at half maximum (FWHM) of the (111) peak using the Scherrer's formula exhibited average particles size of 20.71 nm.

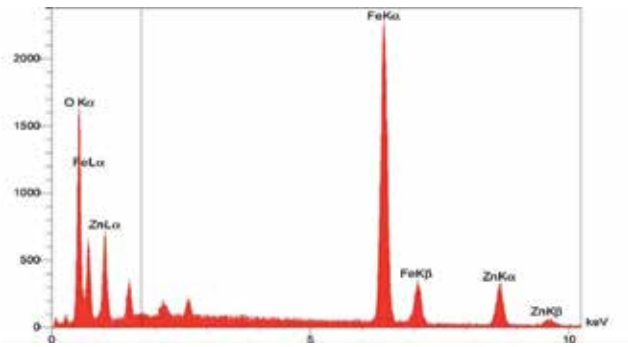

Figure 3: X-ray diffraction of Graphene Quantum Dots

Electron Microscope Studies (SEM): SEM image demonstrates the entity silver particles plus numerous

aggregates. There was no straight contact within the aggregates was found which indicates the stabilization of the nanoparticles by a ceiling agent which are may be the proteins secreted by plant extracts. The existence of secondary materials capping with GQDs may be allocated to bio-organic compounds from plant extracts. Grid shows the cone shaped Graphene Quantum Dots in the range of 80-150 nm in size Fig 4 shows that analysis additionally confirms that the nanoparticles don't comprise any straight contact even within the aggregates.

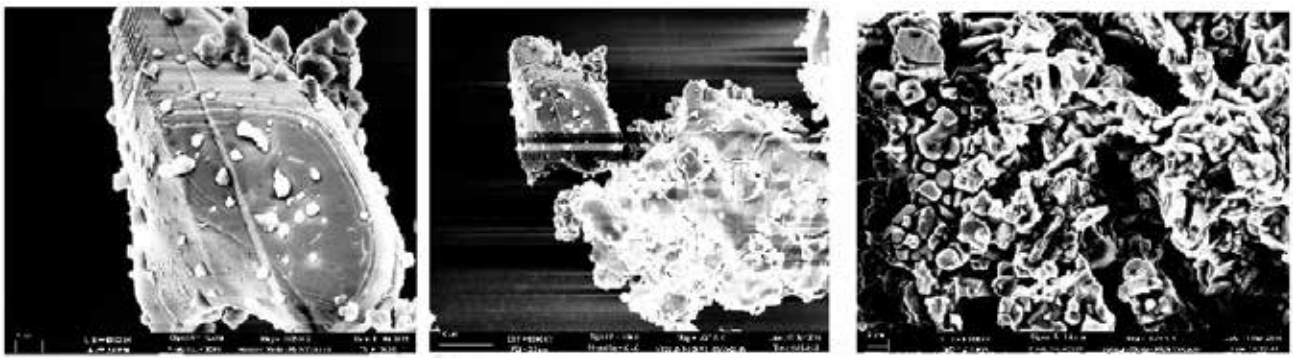

Figure 4: a-d SEM image of Graphene Quantum Dots

Results of carrageenan-induced paw edema studies: From the observations Table 1 shows that GQD and indomethacin results were excellent for anti-inflammatory activity. The average percentage inhibition (Mean ± SD % Reduction) in paw edema after 3 hours was recorded as 73 ± 0.74 for indomethacin and 78 ± 0.88 (GQD). A moderate activity found as 63 ± 1.28 for GQD+ *Berberis aristata*. plant biomass alone was totally inactive for the activity.

Table 1: Effect of indomethacin and 4a-l in the carrageenan-induced rat paw edema

Group	Dose (ml/kg)	Edema Volume in mL Mean ± SD[#] %				
		1½hr	2 hr	2½ hr	3 hr	Reduction
Control	5 ml/kg	0.38 ± 0.01	0.34 ± 0.02	0.40 ± 0.01	0.36 ± 0.01	-
Indomethacin	10 mg/kg	0.23 ± 0.02	0.15 ± 0.01*	0.14 ± 0.01*	0.12 ± 0.01*	73 ± 0.74*
Plant	10 mg/kg	-	-	-	-	-
GQD	10 mg/kg	0.19 ± 0.01	0.17 ± 0.01*	0.11 ± 0.01*	0.12 ± 0.01*	78 ± 0.88*
	50 mg/kg	0.18 ± 0.02	0.15 ± 0.01*	0.13 ± 0.01*	0.11 ± 0.01*	
GQD+plant	10 mg/kg	0.38 ± 0.01	0.37 ± 0.01*	0.31 ± 0.01*	0.21 ± 0.01*	63 ± 1.28*
	50 mg/kg	0.39 ± 0.02	0.38 ± 0.01*	0.20 ± 0.01*	0.20 ± 0.01*	

[#] Standard Deviation, n=3, (one-way ANOVA), statistically significant from control *p<0.001

Results of acute toxicity study: OECD guideline for testing of chemicals (guideline 423) was used to determine the acute toxicity and the results showed that there was no mortality or any significant change in the behavior of the mice recorded up to the dose of 200mg/kg. Based on the results of the preliminary toxicity testing, the doses of the compounds were decided to be 10-100 mg/kg body weight of the rats.

Discussion

Present study targeted the biosynthesized silver nanoparticle (GQDs) as the anti-inflammatory therapeutics. From the literature, anti-inflammatory mechanisms of GQDs' may recognize in evidence through their earlier successful capabilities to decrease lymphocyte and mast cell infiltration, stimulate apoptosis in inflammatory cells, decrease cytokine discharge and matrix metalloproteinase GQDs have evidently distorted the expression of proinflammatory cytokines which are converting growth factor and tumor necrosis factor in dermatitis induced swine model GQDs effectively attenuated nasal symptoms in the allergic rhinitis mice and the inflammatory cell permeation and goblet cell hyperplasia were also inhibited. By not only restricting bacterial growth, GQDs also improved

therapeutic effects of chronic leg ulcers by restricting further inflammation when they are applied through wound dressings. In the carrageenan-induced rat paw edema animal model evaluations, by comparing with a standard drug, GQDs were recognized as precious anti-inflammatory therapeutics. They are bio-originated, feasible for large-scale and only required in nM for their therapeutic usages.

Conclusion

The biosynthesis of nano-material offers a priceless involvement to nanobiotechnology. In the present study, bio-reduction of aqueous Ag+ ions by using *Berberis aristata* extracts has been demonstrated and the biosynthetic methods have been examined as an alternative to chemical and physical methods. *B. aristat* to be a significant biological ingredient for extracellular biosynthesis of stable Graphene Quantum Dots. The reduction of the metal ions by *B. aristata,* extracts leads to the formation of GQDs of moderately healthy distinct dimensions. *In vitro* and *in vivo* biological evaluations of GQDs proved their therapeutic potentials evidently. From these valuable findings, our future desire to evaluate the post-inflammatory expression, pharmacodynamics/ pharmacokinetics (PD/PK) studies after administrating the GQDs prompted. Also desire this nano particles for further biological evaluations.

Development of Novel Classifying System to Identify the Right Sense of Image Sharing in Social Networks Using Deep Convolution Neural Network

P. Nirupama[1], E. Madhusudhana Reddy[2]

[1]Research Scholar, Computer Science, Bharathiar University, India; [2]Professor, Computer Science and Engineering, Guru Nanak Institutions Technical Campus, India

ABSTRACT

Introduction: The use of social networks differs according to the socio-cultural, demographic and psychological aspects of individuals. People share photos and feel that they satisfy their needs of belonging along with the groups they have joined. Social media is not only a domain of freedom where individuals express themselves overtly or secretly, but also an area where several ways of violence emerge or even a means used for some aspects of violence.

Aim: Being an interactive medium and addressing quite a large number of users, social media issue has become rather sophisticated and problematic. Developed a system to identify abusing images shared/ posted by an individual on a people/group based on common language, race, sexual preferences, religion, or nationality.

Method: We investigate a new paradigm from machine learning, namely deep machine learning by examining design configurations of deep Convolutional Neural Networks (CNN) and the impact of different hyper-parameter settings towards identifying the negative aspects in social networks.

Result & Conclusion: Deep CNN automatically generate powerful features by hierarchical learning strategies from massive amounts of training data with a minimum of human interaction or expert process knowledge.

Keywords: *Deep Convolutional Neural Networks (CNN), Social Networks, Softmax, image classification.*

Introduction

We live in a world where the whole thing is an illustration or an illusion. The matrix is real and always with us. Then, who cares what is right or wrong? Despite the use of easiness it provides to share different views and emotions, we can hardly say that social networks has noticeably changed and shaped the real world. Twitter, Facebook and the other social networks function as platforms where individuals express their opinions about anything, anytime. Nevertheless, certainty and continuity of these ideas are quite debatable[1]. Instantaneous approvals and quick transformations with regard to different ideas make us question the reliability of this medium.

Recently, the new trend called internet banging, has been reported by media, in which persons caught up in gangs or neighborhood factions use social media sites such as Twitter and Facebook to make threats of violence which may result in slaughter or ill-treatment. These examples clearly indicate the extremities of the Internet abuses [2]. Cyber-bullying can be defined as harassment which is exercised by using electronic technology including “mobiles, computers, and tabs as well as communication tools including social media, text messages, chat, and websites intractable and recurring damage inflict through the use of electronic devices”.

Social media gives every person the chance to carve their own scenarios and turn into heroes or heroines[3]. The way these people use social networks would naturally differ as these scenarios are written by those having different values. Probably social networks makes everything, either positive or negative, is the world more

conspicuous or normal [4]. A social media produce the associations surrounded by a native structure of meaning and discourse [5]. The main purpose of joining the social networks and surviving in that territory is the need of individuals to express themselves to the others and also expect to be perceived important by them.

Overall, restrictions on freedom inevitably lead to breakup of social values. The members of a society that feels continuous oppression is somehow obliged to express themselves by resorting to violence. By way of social media that provide the placate of getting away from facts, the practice of violence becomes rather easier [6]. Since social networks creates the dilemma of being somewhere and also not really being there, individuals may normalize violence by continually being exposed to loss of values in this hazy reality As violence heightens, more restrictions on freedoms are imposed, which in turn brings about a vicious circle.

Aim and Objectives

The aim of this thesis is to develop novel Deep Convolution Neural Networks system to perfectly identify and classify negative aspects in social networks when an individual or a people/group share/post an abusing images on an individual or a people/group based on common language, race, sexual preferences, religion, or nationality, and notifying them that they are doing wrong as per law of any country with respect to Social Networks. By ensuring these services, we aim at helping an individual or a people/group to overcome the distrust in engaging through Social Networks with others over the Internet and increasing their confidence in Novel Classifying System Using Deep Convolution Neural Network.

In order to achieve this aim, the objectives of this thesis are as follows.

- Proposed an efficient Novel Classifying System.
- Developed a system to extract images from Twitter to know the Purpose behind the usage of social networking sites.
- Designed a system to identify the right sense of conversation of Images in social networks based on common language, race, sexual preferences, religion, or nationality using Deep Convolution Neural Network.
- Designed and developed a fair system to monitor 24 X 7 and identify the right sense of conversation of images in social networks using Deep Convolution Neural Network.

Methodology

The proposed method in this thesis is divided into four main parts: (1) data acquisition, (2) data preprocessing, (3) features extraction and fusion, and (4) pattern classification algorithm. First, collect/extract images from Twitter accounts of some of our friends to know the purpose behind the usage of social networking sites and preprocess the images. Then, the images are extracted by Deep Convolution Neural Network, and these features are merged with the images feature. Finally, the pattern recognition Softmax tool is used for constitution recognition as positive or negative.

Design and Development of a Novel Classifying System: The goal of novel classifying system design is a set of test case inputs that provide consistent coverage across the test space at a known depth. This results a set of test cases that focus on driving the functionality independent of the implementation. A deep CNN with softmax model creation can divide as three steps.

1. Define the scope of the model.
2. Identify the attributes of images and enumerate the values.
3. Apply data using deep CNN with softmax tool and classify the data as normal or abuse.

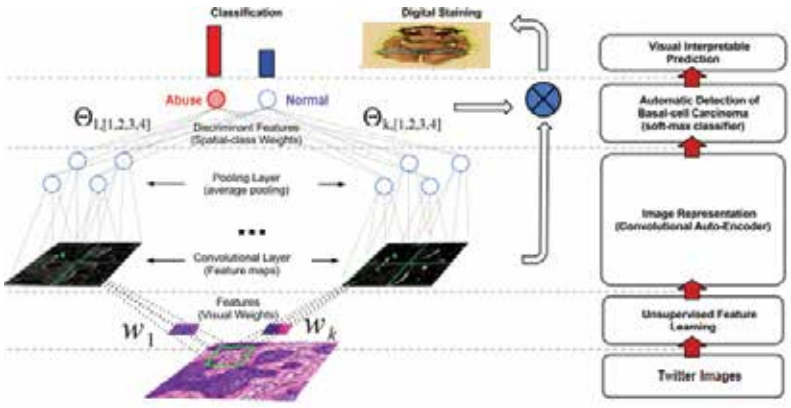

Figure 1: Deep Convolution neural network architecture for social networks image representation Classification

In Figure 1, Automatic image detection and visually interpretable prediction results analogous to digital stain identifying images regions that is most relevant for classifying into Normal or Abuse in social networks.

Case Study and Results

As part of the research work, we took many case studies to know the Purpose behind the usage of social networking sites by an individual or a group, improving the functional coverage and effectiveness of the social networking by identifying and classifying in using the social networking at that instance of time by an individual or a group. One of them was developing a system to extract images from Twitter to know the Purpose behind the usage of social networking sites. The other was designed and developed a system to identify the right sense of conversation of images in social networks based on common language, race, sexual preferences, religion, or nationality using Deep Convolution Neural Network. Another was designed and developed a fair system to monitor 24 X 7 and identify the right sense of conversation of images in social networks using Deep Convolution Neural Network.

Deep Convolutional Neural Network Algorithm: Convolutional neural networks are deep artificial neural networks that are used primarily to classify images (e.g. name what they see), cluster them by similarity (photo search), and perform object recognition within scenes. They are algorithms that can identify faces, individuals, street signs, tumors, platypuses and many other aspects of visual data.

Convolutional networks perform optical character recognition (OCR) to digitize text and make natural-language processing possible on analog and hand-written documents, where the images are symbols to be transcribed. CNNs can also be applied to sound when it is represented visually as a spectrogram. More recently, convolutional networks have been applied directly to text analytics as well as graph data with graph convolutional networks.

Max Pooling/Downsampling with CNNs: The next layer in a convolutional network has three names: max pooling, downsampling and subsampling. The activation maps are fed into a downsampling layer, and like convolutions, this method is applied one patch at a time. In this case, max pooling simply takes the largest value from one patch of an image, places it in a new matrix next to the max values from other patches, and discards the rest of the information contained in the activation maps. Only the locations on the image that showed the strongest correlation to each feature (the maximum value) are preserved, and those maximum values combine to form a lower-dimensional space. Much information about lesser values is lost in this step, which has spurred research into alternative methods. But downsampling has the advantage, precisely because information is lost, of decreasing the amount of storage and processing required.

Activation functions: So what does an artificial neuron do? Simply put, it calculates a "weighted sum" of its input, adds a bias and then decides whether it should be "fired" or not (yeah right, an activation function does this, but let's go with the flow for a moment).

So consider a neuron.

$$Y = S(\text{weight} \times \text{input}) + \text{bias}$$

Now, the value of Y can be anything ranging from -inf to +inf. The neuron really doesn't know the bounds of the value. So how do we decide whether the neuron should fire or not (why this firing pattern? Because we learnt it from biology that's the way brain works and brain is a working testimony of an awesome and intelligent system) .

The first thing that comes to our minds would be ReLu function.

ReLu: First, comes the ReLu function, $A(x) = \max(0,x)$. The ReLu function is as shown above. It gives an output x if x is positive and 0 otherwise. At first look this would look like having the same problems of linear function, as it is linear in positive axis. First of all, ReLu is nonlinear in nature. And combinations of ReLu are also non linear!. Great, so this means we can stack layers. It is not bound though. The range of ReLu is [0, inf]. This means it can blow up the activation. ReLu is less computationally expensive than tanh and sigmoid because it involves simpler mathematical operations. That is a good point to consider when we are designing deep neural nets.

Softmax classification Function: The softmax classification function is often placed at the output layer of a neural network. It's commonly used in multi-class learning problems where a set of features can be related to one-of-K classes. For example, in the CIFAR-10

image classification problem, given a set of pixels as input, we need to classify if a particular sample belongs to one-of-ten available classes: i.e., cat, dog, airplane, etc. Its equation is simple, we just have to compute for the normalized exponential function of all the units in the layer. In such case,

$$S(fyi) = efyi \sum jefj \; S(fyi) = efyi \sum jefj$$

Intuitively, what the softmax does is that it squashes a vector of size KK between 00 and 11. Furthermore, because it is a normalization of the exponential, the sum of this whole vector equates to 11. We can then interpret the output of the softmax as the probabilities that a certain set of features belongs to a certain class.

Conclusion

Social media is supposed to contribute to the maintenance of societies where democracy and multiplicity prevail could be an effective means for structuring, directing and internalizing the given ideology. Although the internet or social media are supposed to create a public sphere emancipating individuals, the fact that the social media networks are under control and surveillance refute the paper that those virtual media are really open forums. Besides, the content incorporating violence does not only produce negative effects on the users but also makes them somewhat dysfunctional.

Nevertheless, unconscious or uncontrolled use of the power of social media may lead to the spread of filthy/abuse images, infringement of personal rights, psychological attacks, symbolic violence, broadcasting private visions without the consent of the interested parties, harassment and insult along with the circulation of malevolent views and information on the Internet.

In this paper, we accomplish image recognition by using deep learning algorithm. We mainly apply the algorithm of deep convolution neural network to excavate the deep information of multi-layer network in the process of face recognition. And we also utilize the algorithm to make parallel computing on the cloud platform for accelerating the process of image recognition, analyzing theoretical acceleration ratio, and experimental verification. Experimental results show that we have achieved good results. Of course, the parallelism we do is coarse-grained, and there are still many modules that can be fine-grained in the algorithm.

Identification and Molecular Phylogenetic Relationship of Selected Medicinal Plants-Ethano Medicinal Importance

Lekshmi Gangadhar[1], P. K Praseetha[2]

[1]Research Scholar, [2]Professor, Head of the Department, Department of Nanotechnology, Noorul Islam Centre for Higher Education, Kumaracoil, Kanya kumari District. Tamilnadu, India

ABSTRACT

Introduction: Correct identification of medicinally essential plant species is priceless for effective utilization for food and treatment.

Aim: The aim of the work is to in fere the Phylogenetic relationships of three medicinal crops sequence and to find out the crucial macro and micro morphological characters for diagnostic purposes.

Method: The sequences (Moringa oleifera, Allium cepa L, Brassica juncea) of the three taxa of out species group have been extracted from the national center for Biotechnology, know-how dwelling web page.

Conclusion: The evolutionary historical past was inferred with the aid of utilizing the neighbor joining approach. The morpho-anatomical characteristics are considered as valuable diagnostic factors for authentication of M. Oleifera. It can be concluded that genus Moringa is a monophyletic crew which are intently related as treated previously in present taxonomic programs.

Keywords: *Phylogenetic analysis, Clustalw, Evolution*

Introduction

Identification of foremost medicinal plant species is a complex undertaking and it desires expert taxonomists. At present 391000 vascular plant species are recognized to science of which about 94% are flowering plants[1]. Nevertheless, colossal quantities of plant species are yet to be identified. About 2000 species are being described every year. As a result, constrained number of species has been recognized by way of traditional identification and classification methods [2]. These medicinal plant species are normally gathered by using the nearby untrained collectors established on the indigenous advantage. During the gathering approach, typically the intently resemblance of undesirable species are additionally collected and sold with the equal name. Consequently, it is critical to acquire proper species with the help of proficient taxonomists from exclusive regions of the country. Moreover, suitable identification and classification would be useful to preserve the threatened or endangered plant species that seem decreasing day by day worldwide specifically in developing country like Pakistan [3].

Moringa oleifera is a multi-purpose plant that has been utilized for enormous variety of competencies that makes use of science by the historic Romans, Greeks and Egyptians [4]. It is cultivated as the source of nutritious leaf, vegetables, high quality of seed oil, pharmacologically active compounds and water clarification agents [5]. Morphological and anatomical characters of plants had been utilized by many authors in plant identification [6]. The major characteristics of the leaf venation pattern of a species are genetically constant by delivering the basis for the use of the leaf venation as taxonomic tool [7]. Leaf epidermal studies have revealed that stomata can provide valuable taxonomic and systematic proof in both living and fossil plants and also play a significant role in framing hypotheses about early angiosperm evolution [8].

The onion (*Allium cepa L.)* is an herbaceous plant belonging to the family Alliaceae order Asparagales composed of 795 species in 20 genera [9]. The Brazilian production of onion in 2010 was 1.7 million tones, with an increased productivity of 17.4 t ha-1 to 24.9 t ha-1 within the last decade, though the development in the planted area during this period was reasonably small (5.9%), from 66,515 ha in 2000 to 70,464 ha in 2010 [10]. Yellow and purple onion are grown in Northeast Brazil; the former used to be offered in the late 1940s in the regions of Cabrobo and Belem do Sao Francisco and is predominantly produced in the Sao Francisco Valley [11]. Great variants in morphological and physiological traits have been available in onion vegetation, which is related to a high rate of cross-pollination. Additionally, extreme selection has aimed to modify the onion characteristics of shape, color retention, scales, bulb size, productiveness, harvest storage, tolerance to pests and infections, adaptation to distinctive soil and climatic variations [12].

Mustard (*Brassica juncea*), a species of the genus *Brassica* belonging to the family Brassicaceae, is an agriculturally and economically important crop generally cultivated in Asia and Europe). All species of mustard are polyploids (AABB), with the chromosome number 2n = 36. China possesses the richest mustard assets, which include greater than a 1000 cultivators distributed everywhere in the country and are generally used as a vegetable and for producing cooking oil [13]. On the lengthy evolutionary period imposed by nature and people, chinese mustard has evolved from the original dwarf style into varieties possessing more variations in root, leaf, stem and seed stalk types. Morphologically, categorized chinese mustard into 16 varieties, which can be largely accepted within the classification of chinese mustards, including *B. Juncea var. Megarrhiza, B. Juncea var. Crassicaulis, B. Juncea var. Gemmifera, B. Juncea var. Tumida, B. Juncea var. Rugosa, B. Juncea var. Foliosa, B. Juncea var. Leucanthus, B. Juncea var. Multisecta, B. Juncea var. Longepetiolata, B. Juncea var. Linearifolia, B. Juncea var. Strumata, B. Juncea var. Latipa, B. Juncea var. Involuta, B. Juncea var. Capitata, B. Juncea var. Multiceps,* and *B. Juncea var. Utilis*.

This article describes about the medicinal plants, *Moringa oleifera, Allium cepa L, Brassica juncea* species which are multiple aligned in Clustalw omega and construct Dendogram and analysis of Phylogenetic evolutionary relationship among these different species.

Methodology

Sequence Retrived: The medicinal plant amino acid (protein sequence) sequences are retrieved from NCBI (National Center for Biotechnology Information).

Clustalw Omega (Multiple Sequence Alignment): Clustalw Omega is a new multiple sequence alignment program that uses seeded guide trees and HMM profile-profile methods to generate alignments between three or more sequences. For the alignment of two sequences, substitute pair is used in sequence alignment tools.

Simple Phylogeny: The first steps are usually where the user sets the software input (Amino acid sequences, NCBI database). Within the following steps, the user has the possibility to change the default instrument parameters. The last step is consistently the tool submission step where the user can specify a title related to the outcome and an e-mail address for electronic mail notification. Utilizing the submit button will simply submit the specified information within the form to launch the tool on the server.

Input Alignment

Input Window: Phylogeny utilizing an alignment can directly enter into the input field in a supported format. Alignment formats supported incorporate Clustal, FASTA and MSF. Partially formatted or unaligned sequences will not be accepted. Adding a return to the end of the sequence could aid the simple Phylogeny tool to recognize the input. By directly making use of data from word processors yield unpredictable results as hidden/control characters.

File Upload: Phylogeny uses an alignment uploaded as a file. Alignment file formats supported comprise Clustal, FASTA and MSF. Partly formatted or unaligned sequences are not accepted usually. Adding a return to the end of the sequence may help the simple Phylogeny tool to understand the input. By directly using data from word processors yield to unpredictable results as hidden/control characters.

Set Parameters

Tree Format: This determines the outputs that the Simple Phylogeny tool produces.

Table 1: Output of the Simple Phylogeny tool

Format	Description	Value
Default	Newick/PHYLIP format tree file	phylip
Clustal	Clustal format file in addition to the PHYLIP tree	nj
Distance Matrix	Distance matrix file in addition to the PHYLIP tree	dist
NEXUS	NEXUS format file in addition to the PHYLIP tree	nexus

Distance Correction: This controls whether simple Phylogeny makes an attempt to correct multiple substitutions on the same site. That is advised to be set 'on' for extra divergent sequences and has the effect of stretching branch lengths. For more divergent sequences the distances are not able to be reliably corrected.

Exclude Gaps: With this option enabled columns, the place of the sequences within the input have a gap that is probably be excluded, forcing the alignment to make use of best positions where information can be integrated from all sequences.

Clustering System: This makes use of the neighbour-joining algorithm to assemble trees from the distance matrix. It makes use of the rapid UPGMA tree construction algorithm.

Submission

Job Title: It is viable to identify the tool result by using giving it a name. This title will be related to the results and would show up in the most graphical representations of the results.

Email Notification: Running a tool is usually an interactive approach, the results are delivered immediately to the browser when they become available. Depending on the tool and its input parameters, this may occasionally take really a very long time. It is feasible to be notified through electronic mail when the job is completed by using effectively ticking the field "Be notified through e mail". An electronic mail with a link to the results might be sent to the email address specified in the corresponding text box. E-mail notifications require valid email addresses.

Results and Discussion

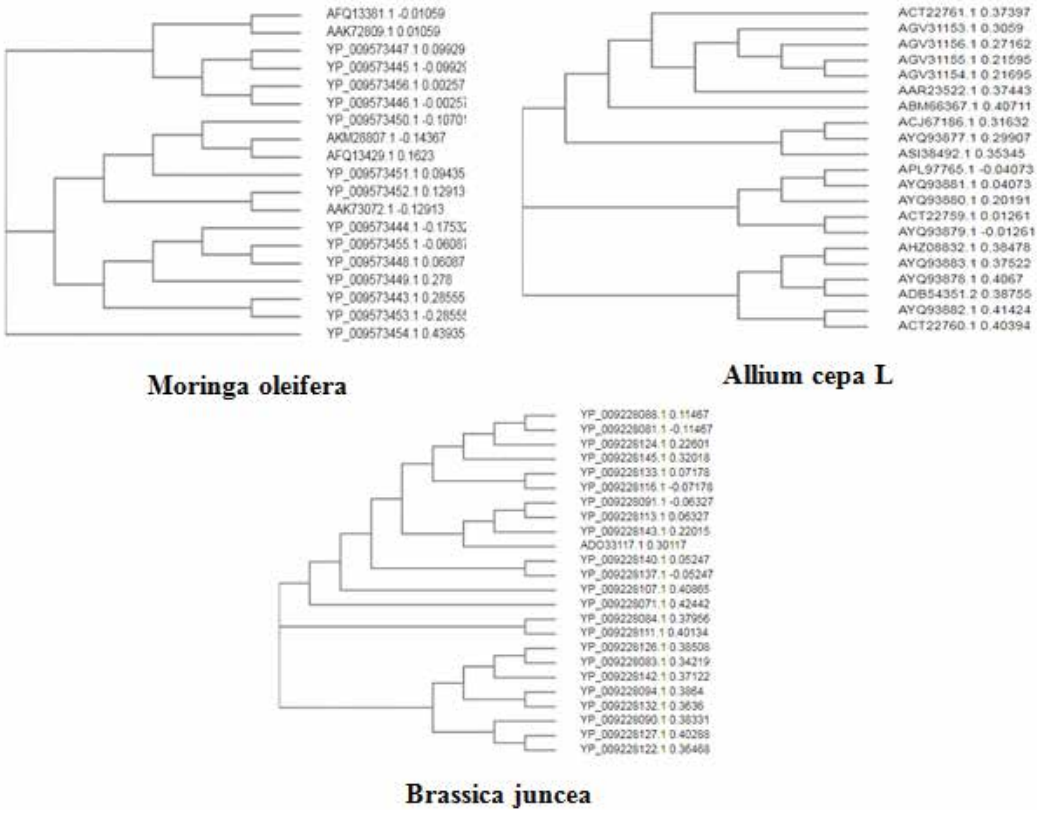

Figure 1: Graphical representation of Phylogenetic tree constructed from 20 sequences of *Moringa oleifera*, *Allium cepa L* and *Brassica juncea*

Graphical representation of Phylogenetic tree constructed from 20 sequences (Various Medicinal Plants) with the hypothetical root of straight line denoted 100% sequence similarity and branch length denoted non-sequence similarity. Dendogram is generated using Neighbor-joining method. This results show evolutionary relationship between the medicinal plant species.

Conclusion

This study is the first of its kind to assess molecular markers based identification and classification of a significant set of medicinal plants. The obtained cladogram based on these three medicinal plants sequence (*Moringa oleifera, Allium cepa L, Brassica juncea*) data is by the use of neighbor-joining method. Comparative analysis of these three medicinal plants are carried out and realized that *Moringa oleifera* is a monophyletic group. *M. Oleifera* and *M. Peregrina* are closely related as treated previously in current taxonomic systems. Further applications studies will be carry on future perspective associated to *Moringa oleifera*. Almost all parts of the plant have been consumed as food and used in traditional medicine for the mitigation of inflammatory-mediated ailments such as cardiovascular and gastrointestinal diseases. The leaves and seeds of plant have been reported for its antitumor, hypotensive, cardioprotective, wound healing activities and used for eye diseases. MO leaves contains sulfur-containing amino acids in higher levels. The extracts can be used as the source of sulphur for the synthesis quantum dot synthesis for widespread applications specifically in nano medicine where they are employed in drug and gene delivery systems, biomedical engineering, tumor detection, bio labeling, bio detection, MRI contrast enhancement, sensors, bio labeling, imaging of living cells and tissues.

ABSTRACT

Introduction: Present study was conducted to compare 2D array detector and Eclipse Treatment Planning System for out-of-field photon dose measurement among patients with pharyngeal cancers treated with Volumetric Modulated Arc Therapy.

Aim: To compare 2Darray Detector and Eclipse treatment planning system for the out of field photon dose measurement among Head and Neck cancer patients treated with Volumetric Modulated Arc Therapy.

Method: Verification plan was created for each treatment plan in Eclipse treatment planning system using the analytical anisotropic algorithm [AAA] with the 2-D array ionization chamber. All the plans were done using 6MV photon energy. Doses were measured along the +X and +Y axes at 5,8,10 and 12 cm distance away from the isocenter. All measurements were performed on a Varian Clinac iX linear accelerator and the results were cross-compared with the fluence measurements obtained at the same points using 2D 729 array detector combined with Octavius 4D phantom. Evaluation of the 2-D array measurements was done using PTW Verisoft software

Result: Good agreement observed between the calculated and measured doses. The deviation increases as the distance increases. A maximum deviation of 28.6% along the Y-axis and 5.1% along X-axis. Out of field dose found to be slightly higher in Nasopharyngeal cancers compared to other pharyngeal cancers due to its large volume.

Conclusion: Study shows good agreement between the measured and calculated Out of field dose.

Keywords: *VMAT, 2D array, SORT IT, out-of-field photon dose*

Introduction

Modern radiotherapy treatment approaches like Volumetric Modulated Arc Therapy (VMAT), 3D-Conformal Radiation Therapy (3D-CRT) and Intensity-Modulated Radiation Therapy (IMRT) are capable of confirming a focused radiation beam within a defined target volume. Despite the high conformity with the current methods, unwanted doses are delivered to untargeted regions of the patient's body outside the primary beam which was referred to as out-of-field doses. They are composed of photons and neutrons at high treatment energies. These arise due to leakage from the linear accelerator treatment head, scatter from collimation devices and scatter from within the patient's body itself [1]. Although the doses delivered out of the field are small relative to the primary-field doses, it can still have long-term adverse effects such as cancer [2]. Therefore, it is useful to measure the out of field dose delivered during radiation therapy. A longer observation of the correlation between out of field doses and secondary malignancy can generate clear idea on the effect of out of field doses. Stathakis et al conclude in his study the OCTAVIUS-4D system has some unique characteristics that can potentially improve the patient-specific pre treatment IMRT QA data collection and analysis [3].

The treatment planning systems (TPS) generates dose distributions as per the measured beam profile and output factors, in accordance with the models generated using statistical methods [4, 5]. It is well accepted that the accuracy of dose prediction by the TPS, away from the treatment field is quite low [6, 7]. So in this study, the accuracy of out of field dose prediction by Eclipse-AAA algorithm, in Volumetric Arc Therapy (VMAT) was compared with the reconstructed doses generated by the OCTAVIUS-4D system. It is also accepted, it includes an uncertainty generated by the dose reconstruction, execution uncertainties, and geometrical missing since this study expecting a correlation between the executed and measured out of field doses,[8,910,11].

Even though new improvements in the Radiation therapy treatment increased the survival rates; on the other hand, these prolonged survivors are raised concern about the secondary cancer risk. It is generally accepted that there is an uncertainty associated with the out of field dose calculated. Due to their limitation of projection into the 3D Dose distribution, the present study is attempted with a 2Darray detector and 4D phantom. In most of the studies the treatment planning system accuracy in calculating the out of field dose had been questioned. Also if we use TPS as the input for secondary cancer risk calculation, there should not have any uncertainty. All these make study important.

Materials and Method

Fifty-one patient diagnosed with pharyngeal cancer and planned for Volumetric Modulated Arc Therapy (VMAT) using the Eclipse treatment planning system was selected for the study. The key study variables include the out of field photon dose (in Gray) using two equipments: (i) 2D array detector with 729 ion chamber and 4D Octavius phantom and (ii) treatment planning system (Eclipse version 10.0) at 5, 8, 10 and 12 cm distances from the field centre along X and Y axes as shown in Figure 1. Other variables collected include age and sex of the patient and site of cancer.

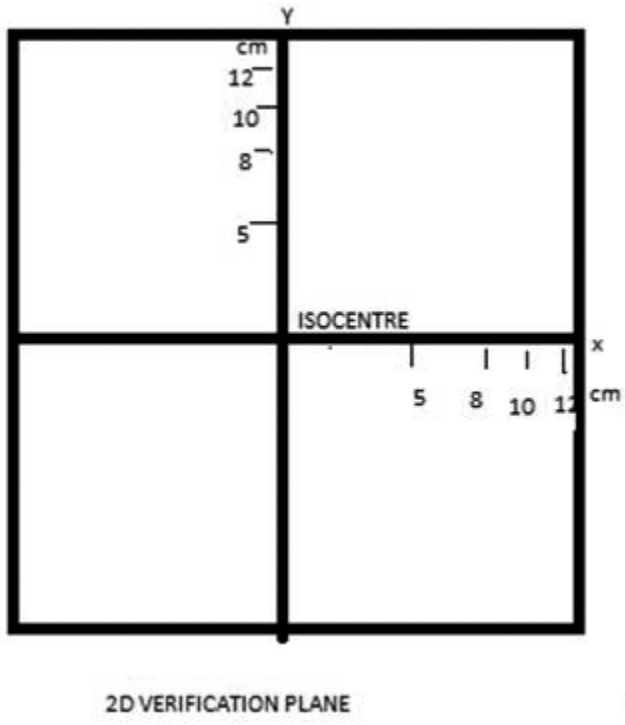

Figure 1: Schematic diagram (not to scale) Measurement plane for pharyngeal cancer planned for Volumetric Modulated Arc Therapy (VMAT)

Collection of Data: Verification plan was created for each treatment plan in Eclipse treatment planning system (version10.0) using the analytical anisotropic algorithm [AAA]) with the 2-D array ionization chamber and the 4D Octavius phantom. All the plans were done using 6MV photon energy.[12, 13, 14]. In conventional radiation therapy treatments, out-of-field organs are defined by the field border. However, for modern radiation therapy techniques like Intensity Modulated Radiation Therapy (IMRT) and Volumetric Modulated Arc Therapy (VMAT)

where fields are defined by modulated beam intensities, it is difficult to definitively define a field border [15, 16]. In the present study, the out of field organs are defined by considering isodose coverage and measuring the distance from the isocenter. Doses were measured along the +X and +Y axes. Measurements were taken at 5,8,10 and 12 cm distances away from the isocenter(centre of the planning target volume) along the above- said axis in the treatment planning system [17,18]. All measurements were performed on a Varian Clinac iX linear accelerator equipped with a millennium 120 leaf collimator (Varian oncology systems, Palo Alto, CA) and the results were cross- compared with the fluence measurements obtained at the same points using 2Darray 729 detectors combined with Octavius 4D phantom as shown in Figure 2 and Figure 3. Evaluation for the 2-D array measurements was done using PTW VeriSoft software by keeping the passing criteria as 3mm Distance to agreement(DTA), 3% Dose Difference(DD), for 95% of the evaluated dose points [19,20].

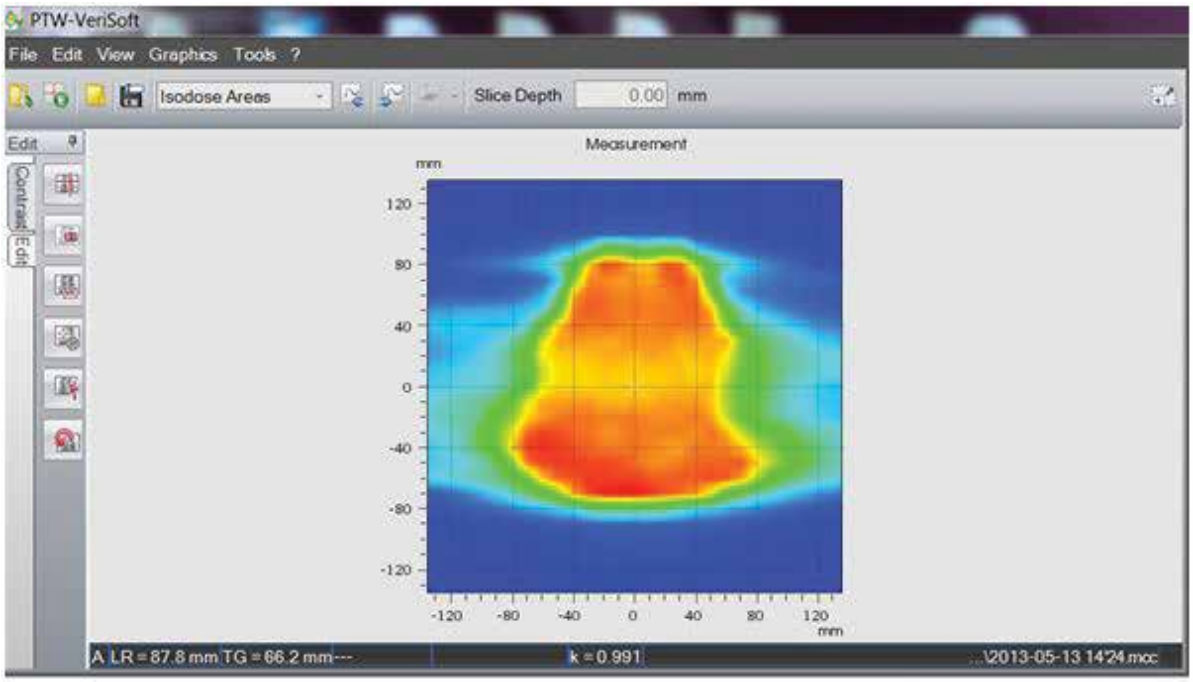

Figure 2: Fluence from Radiotherapy Treatment Planning Systems Measurement of patients diagnosed with pharyngeal cancer and planned for Volumetric Modulated Arc Therapy (VMAT)

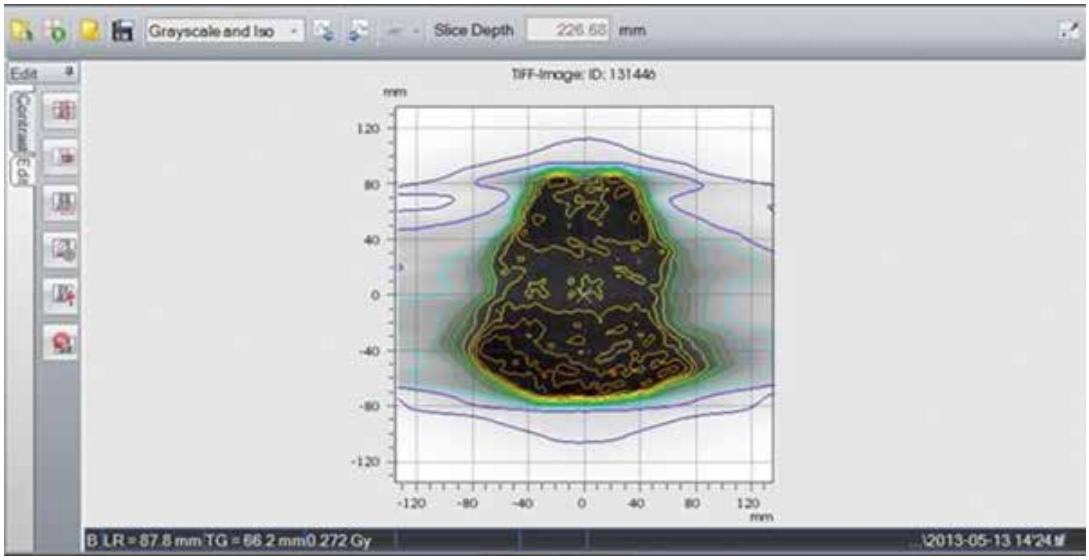

Figure 3: Fluence from 2D array Measurement of patients diagnosed with pharyngeal cancer and planned for Volumetric Modulated Arc Therapy (VMAT)

Measuring Devices

Octavius 4D phantom with a 2D array detector: The Octavius 4D system comprises the Octavius detector 729 arrays and the Octavius 4D phantom. The Octavius detector 729 (PTW, Freiburg, Germany) is a two-dimensional detector array with 729 equally spaced ionization chambers with a distance of 1 cm (centre to centre) and covering an area of 27 × 27 cm2. Each chamber has a size of 0.5 × 0.5 × 0.5 cm3. The physical dimensions of the Octavius detector 729 are 2.2 cm (thickness) × 30.0 cm (width) × 42.0 cm (length) with the effective reference point located 0.75 cm below the surface of the array. Plan verification is done using PTW-VeriSoft software (version 6.0.2.8). The Verisoft software used with the 2Darray is based on the gamma index. This study has used the passing criteria of 3mm Distance to-Agreement and 3% Dose Difference with reference to the selected dose. The gamma index combines dose difference and distance difference to calculate a dimensionless metric for each point in the evaluated distribution. The Octavius4D phantom acquires and stores the 2D array measurements as a function of gantry angle. A 3D dose is reconstructed for each gantry angle and sum of the different angular contributions reconstructed to obtain the total dose.

Treatment Planning System: Volumetric Modulated Arc Therapy or Rapid Arc is a treatment technique in which dose is delivered over a single gantry rotation with dynamically variable Multileaf Collimator(MLC) positions, dose rate and gantry speed. Patient-specific pre-treatment quality assurance for Rapid Arc plans will be analyzed for patients with pharyngeal cancers. Verification plan will be created for each treatment plan in Varian Eclipse Treatment Planning System version 10.0 using Anisotropic Analytical Algorithm (AAA).

Data Analysis and Statistics: Data were entered into EpiData entry version 3.1 and analyzed using EpiData analysis version v2.2.2.182 (EpiData Association, Odense, Denmark). Mean (standard deviation) was used to summarize doses of radiation at varying distances from the field edge. Out of field dose was compared across both methods: the TPS and the 2D array detector using a t-test or Kruskal-Wallis test depending on the distribution of the data.

Ethics Considerations: Ethics approval to conduct the study was obtained from the institutional review board (IRB) and institutional ethics committee (IEC) of Malabar Cancer Centre. Additional ethics approval was also obtained from the Ethics Advisory Group of the International Union against Tuberculosis and Lung Disease (The Union), Paris, France. The present study does not involve any human participant.

Results

Table 1 shows the mean and standard deviation for each of the calculated (μcalc ± σ) and measured (μmeas ± σ) doses at varying distances from the isocenter along the positive X and Y axis. At all distances, the calculated and measured doses were found to being in good agreement. From the table, it is observed that the deviation increases as the distance increases. A maximum deviation of 28.6% along the Y-axis and 5.1% along X-axis was observed at 12 cm. Table 2 shows that the out of field dose (both measured and calculated) is significantly associated with the site of cancer, highest in nasopharyngeal cancer. Figure 4 shows the variation of out of field dose with the distance from the isocenter. The plot clearly indicates that at distances near the isocentre both the 2D array measured dose and TPS calculated dose are in good agreement, whereas there is some variation as we move further away from the isocenter.

Table 1: Mean measured doses (μmeas ± σ) and mean TPS-calculated doses (μcalc ± σ) along both X and Y axes and at varying distances from the isocentre of patients diagnosed with pharyngeal cancer and planned for Volumetric Modulated Arc Therapy (VMAT)

Axis	Distance from isocentre (cm)	Count	μmeas ± σ (2D array detector)	μcalc ± σ (TPS)	Difference (%) [(μcalc-μmeas)/μmeas] *100
X	5	51	1.12 ± 0.29	1.14 ± 0.25	1.8
X	8	51	0.69 ± 0.23	0.70 ± 0.23	1.4
X	10	51	0.50 ± 0.15	0.52 ± 0.14	4.0
X	12	51	0.39 ± 0.12	0.41 ± 0.13	5.1
Y	5	51	1.42 ± 0.25	1.42 ± 0.24	0
Y	8	51	1.01 ± 0.46	1.05 ± 0.44	3.9
Y	10	51	0.44 ± 0.41	0.46 ± 0.39	4.5
Y	12	51	0.14 ± 0.09	0.18 ± 0.17	28.6

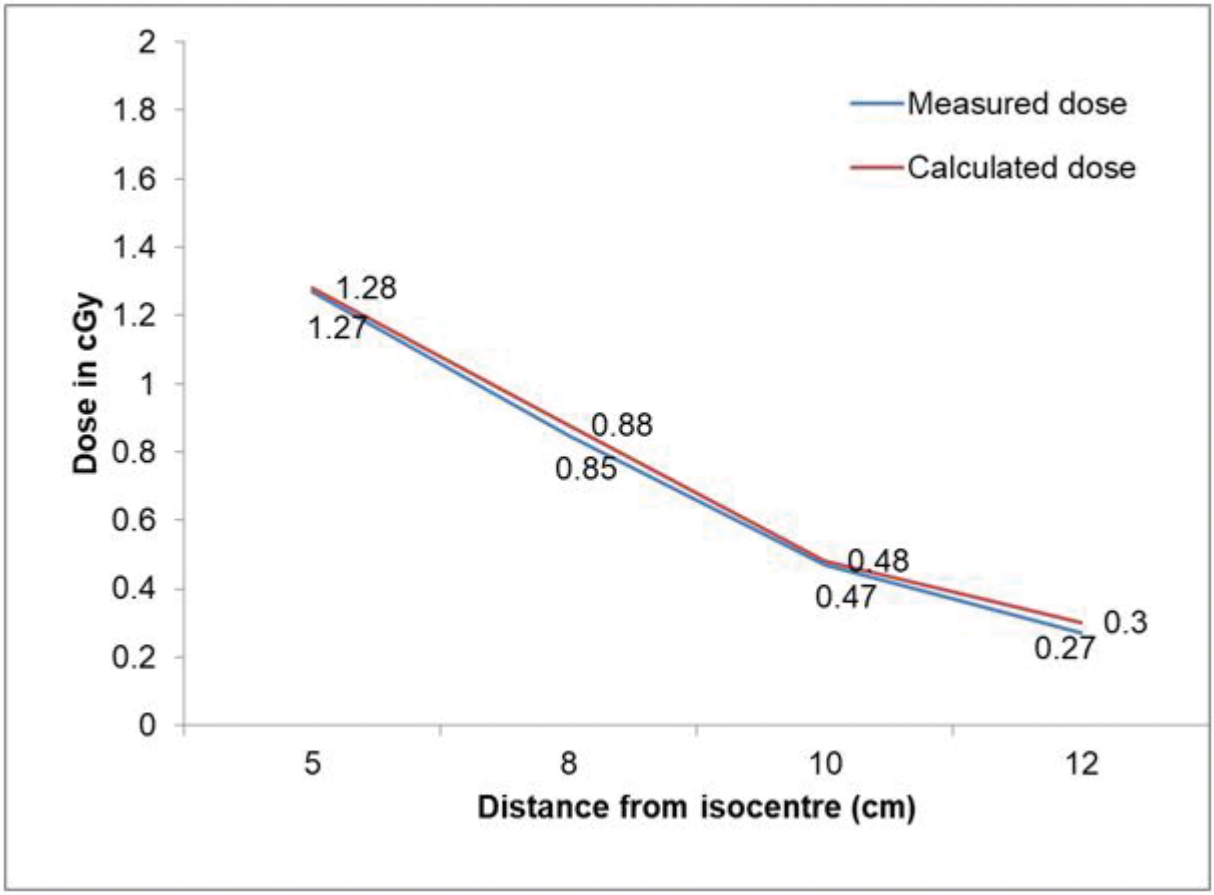

Figure 4: Variation of out of field dose with the distance from the isocentre of patients diagnosed with pharyngeal c ancer and planned for Volumetric Modulated Arc Therapy (VMAT).

Discussion

In this study, we quantified the accuracy of the out-of-field dose calculated by the Eclipse TPS (version 10.0 using AAA algorithm) for a clinical treatment delivered with a Varian Clinac iX linear accelerator. The results show that in comparison with measured data, the calculated dose is in good agreement, although the small difference was observed at large distances (12 cm). This study showed that the TPS variation increased with increasing distance from the isocenter with a maximum of 28.6% at 12 cm distance from the isocenter along the Y-axis. A study by Fogliata et al on the accuracy of the AAA algorithm also showed good agreement with the measured doses [20]. Our study result go well with Fogliata et al results;but there is a clear indication for dose variation as the distance increases from the field edge.

In the present study, we have used 2Darray detector with passing criteria of 3mm 3% which shows good agreement with TPS obtained values. A 2D array consists of 729 ion chamber detectors. Detector characteristics will affect the measurement; like low resolution results in dose points in those regions appearing to have an artificially lower dose than the TPS dose. Energy response and detector position and size are crucial for measurement accuracy in the intensity modulated treatment deliver. After 10cm distance from isocenter, there is a slight variation for the measured and calculated values which may due to the stringent Multileaf collimator movements.

The out-of-field dose was highest in nasopharyngeal cancers probably due to the large volume of cancer compared to the other two cancer types. Out of field doses increases with large field size due to increase in the scattered doses.

Conclusion

2Darray detector shows good agreement between the measured and calculated out of field dose. The limitation of the study using 2D array detector is for the out of field distance to be measured because the available maximum field size of the detector being 27x27 cm^2. Also, since we have opted 2Darray detector for the comparison study, it is difficult to compare with the other TPS studies which have used TLDs and films. The results were specific to the Eclipse TPS version 10.0 (AAA algorithm) and Varian Clinac iX with 2Darray. The amount of out-of-dose with a TPS and linac combination also depends on the particular algorithm used, the commissioning data and the manufacturer. Further research is needed to examine several commercially available TPS and Linac combinations. Considering the limitations of the measurement distance with a 2Darray detector, further studies must be conducted to evaluate the out of field calculation accuracy of treatment planning systems.

Evaluating the Biological Potential of Phyto-compounds from *Myristica fragrans* Seeds

Vibala B. V.[1], P. K. Praseetha[2]

1Research Scholar, 2Professor, Head of the Department, Department of Nanotechnology, Noorul Islam Center for Higher Education, Kumarakovil, Kumaracoil, Thuckalay, Tamilnadu, India

ABSTRACT

Introduction: Bioactive compounds from herbal plants possess a wide range of pharmaceutical activities and one among them is Myristica fragrans (Nutmeg).

Aim: The present study involves extraction of potential phyto chemicals from the seed part of Myristica fragrans and to explore its biological activities.

Method: Different solvents such as aqueous, acetone, ethyl acetate and chloroform were attempted to extract the Phytochemical from the seed. Among them, high yield of the extract was obtained with an aqueous solvent. Preliminary screening tests confirmed the presence of several Phytochemical in the seeds extracted with different solvents.

Result: The analysis of GC-MS represents a variety of potential bioactive products that was extracted from ethyl acetates such as tetradecanoic acid, N-hexadecanoic acid, and oleic acid, Benzene, 1,2,3-Trimethoxy-5-(2-Propenyl), 2-Hydroxy-4-Isopropyl-7-Methoxytropone that to identify anticancer compounds present in the active seed extract.

Conclusion: The analysis of Fourier Transform Infrared Spectrometer instrument and spectra obtained for the Myristica fragrans was interpreted with Characteristics IR absorption frequencies of Hydroxyl functional groups and carbonyl containing functional group.

Keywords: *Myristica fragrans bioactive compounds Thin Layer Chromatography (TLC) Gas Chromatography Mass Spectrometry (GCMS) Fourier Transform Infrared Spectroscopy (FTIR)*

Introduction

Nutmeg family (*Myristicaceae*) involves numerous species i.e. 18 genera and 300 species; these numerous species are broadly available in tropical rain forest across the globe[1, 2]. Steeves, 2011, states, generally this kind of nutmeg plant consists natural and ethno botanical significances and among the more established group presence in Angiospermae, which comprises of newly advanced species [3, 4]. Recognizable proof of nutmeg is expected to alleviate impurities, replacement, and falsification of natural products of herb, as world health organization states that falsification of naturally grown herbs content is a risk to user's protection [5, 6].

The *Myristica* genus is available in India and South-east Asia to Northern Australia and also the presence in the Islands known as Pacific. In this genus, *M. fragrance, M. beddomeii* and *M. malabarica* species are reported to be widely distributed in India [7, 8]. One of the delegates from this family is *Myristica fragrans* was derived from Indonesia (Mollucas and North Sulawesi). Due to its potential medicinal activities, nutmeg is extensively famous in Europe and Indian countries [9,10].The ritual practice of utilization of nutmeg helps to treat cholera, psychosis, rheumatism arthritis, diarrhea, nervousness,

nausea, and anxiety, furthermore it is also used as alternative medicine for aphrodisiac, abortifacient [11,12,13], memory enhancer, antidiarrhoeal [14], mitigating and anticancer drug [15]

The present investigation prefers nutmeg for this study, because of their antimicrobial property has not been extensively assessed [16, 17, and 18]. This impact may be the presence of active dynamic Phytochemical like alkaloids, carotenoids, Flavonoids, ligands, phenols, and terpenoids, in the natural herbal source plants [19, 20, 21]. Therapeutic plants utilized for treatment enclose a large scope of the in gradient which may be utilized to treat infectious harmful disorders; hence medical microbiologist and clinical chemist have shown extraordinary interest for screening Therapeutic plants for modern therapeutics treatment [22].

Myristica fragrans is an important plant contains essential oil and nutmeg butter from its bark and leaves, which have been acclaimed to have a few medical advantages. The secondary metabolites of essential oil are made up of volatile compounds such as terpenoids, lipids, ketones, oxygenated derivatives and phenols [23]. *Encyclopædia Britannica* has announced that pinene, camphene, and dipentene as the significant constituents of *Myristica fragrans* essential oil (7 - 14%) [24]. *Myristica fragrans* consist a large amount of essential oil, which was used for carminatives and in herbal medical practice [25]. Many researchers have differently reported that seed of *Myristica fragrans* contain alkyl derivatives of benzene (Myristicin, elemicin, safrole, and so forth.), alpha-pinene, beta-pinene, myristic acid, trimyristin, terpenes [26], myrislignan and macelignan [27].

The present study focuses on phyto chemical extraction from seed part of *Myristica fragrans*, separation of the phyto chemicals by chromatographic techniques, characterization of bioactive compounds with GC-MS and FTIR.

Materials and Method

Sample Collection: The fresh fruit samples of *Myristica fragrans* was collected; shade-dried and powdered using the mechanical grinding machine. The finely powdered sample was used for the experimental study.

Solvent Extraction of Phyto Chemicals: The seed powder of *Myristica fragrans* was dissolved in different solvents (acetone, chloroform, ethyl acetate, and aqueous [hot and cold]) and the phytoconstituents were extracted by Soxhlet extraction. After extraction, the samples were dried under reduced pressure at controlled temperature (40-50°C) using rotary evaporator.

The yield of the plant extract with different solvents: The percentage (%) of the extractive seed powder sample yield was calculated by the formula, the percentage of yield extract= [W1/W2] x 100 Where W1 represents the mass of seed powder in grams after extraction. The total weight of mass taken for extraction denotes W2.

Preliminary screening of phyto chemicals: 100mgof seed extract powder was taken and suspended in solvents such as aqueous, acetone, ethyl acetate, and chloroform respectively was analyzed by preliminary screening for the presence of phyto chemical constituents-alkaloids, terpenoids, steroids etc.

Thin Layer Chromatographic (TLC) analysis: The TLC method was performed by Badheka et.al., The 20x20 cm glass plated was coated with silica gel with a thickness of 1 mm type (60F254) was used as stationary phase. The solvent system used mobile phase such as toluene, ethyl acetate, acetic acid and methanol with different ratios of 7.5:1.5, 0.5, and 0.5. The dissolved seed extract sample in the solvent was spotted in a silica coated plate and then placed in the mobile phase. When the mobile phase reached 15 cm, remove the plate from the mobile phase and allow them to dry at room temperature. The identified spots were scratched and washed by diethyl ether in order to remove impurities. Then dissolved spots were transferred to Eppendorf tube and then centrifuge at 3000rpm for 20min at 45ºC. After centrifugation, collect the supernatant and evaporate the solvent by rotary evaporator. Finally, the retention factor (R_f) of the sample was calculated using the formula known as the distance moved from the sample/distance moved by the following solvent.

GC-MS analysis: GC-MS (GC Clarus 500 Varian, USA) was performed for the seed extract of *Myristica fragrans* from the ethyl acetate were analyzed for the presence of various bioactive products. The auto sampler AOC-20I of system and gas chromatograph were interfaced to a mass spectrophotometer instrument utilizing the supporting conditions: Column Elite-1 combined silica capillary column with 30mm×0.25mm I.D ×1 µ M df, which is made out of 100% Dimethyl polysiloxane, programming in impact mode of electron at 70 eV; helium (99.999%)

was utilized as transporter gas at a steady stream of 1ml/ min and 0.5 µ l of sample was injected in column(part proportion of10:1), injector temperature was maintained at 250°C and temperature of iron maintained at 280°C. The temperature of the oven was operated at 110 °C (isothermal for 2 min), with an expansion of 10 °C/min, to 200 °C, at that point 5 °C/min to 280 °C, finishing with a 9 min isothermal at 280 °C. Mass spectra were taken at 70 eV; following interval scans 0.5 seconds and fragments from 45 to 450 Da.

FTIR: The IR spectra of the ethyl acetate extract of *Myristica fragrans* seeds were obtained from 400 to 4000cm^{-1} wavelength using infrared spectrophotometer (Bruker, AlphaT, Germany).

FTIR spectra of *Myristica fragrans seeds*: Ethyl acetate extract of the *Myristica fragrans* seeds showed presence of hydroxyl groups (OH)at 3227 cm^{-1}; alkane groups(C-H) at 2920 and 2856 cm^{-1}. Fig 4 shows that A small peak corresponding to carbonyl stretch(C=O) was observed at 1730cm^{-1}. The peak at 1692 cm^{-1}represented amide I group(C=C).Peak recorded at 1509 cm^{-1}representsnitro compounds (N-O). Similarly peaks recorded at 1459 cm^{-1}and 1076 cm^{-1}were attributed to aromatic (C=C) and alcohol (C-O) groups. The results are found to be similar with the IR spectra of aril and mace of *Myristica fragrans* extracted with methanolic solvent (Ajith Kumar et al., 2016).

Results and Discussion

Extraction of plant yield with different solvents: The percentage yield of the extract was quantified and represented in Table 1. Among all the four solvents used in the study, aqueous extract was observed to produce a high yield. This is followed by acetone and ethyl acetate. Chloroform produced a very low yield.

Table 1: Yield of the seed extracts of *Myristica fragrans* with different solvents

Yield (% w/w)	Type of Extract
19.85	Aqueous
13.50	Acetone
6.79	Ethyl Acetate
1.97	Chloroform

Preliminary phytochemical screening of the *Myristica fragrans* seeds: The results of the preliminary phytochemical screening carried out with four different solvents revealed the presence of a wide range of phyto chemicals Table 2. Mayer's test showed the absence of alkaloids in the seed extracted with different solvents. The presence of the different phytochemicals present in the seeds of *Myristica fragrans* confirmed by the different preliminary tests is represented in Table 2.

Table 2: Preliminary tests evaluated with different solvents for the confirmation of various phyto constituents in seed extract of *Myristica fragrans*

Thin Layer Chromatographic (TLC) analysis: The TLC method was performed and result is shown in figure 1. The 20x20 cm glass plated was coated with silica gel with a thickness of 1 mm type (60F254) was used as stationary phase. Fig 1 shows that the solvent system used mobile phase such as toluene, ethyl acetate, acetic acid and methanol with different ratios of 7.5:1.5, 0.5, 0.5. The dissolved seed extract sample in the solvent was spotted in a silica coated plate and then placed in the mobile phase. When the mobile phase reached 15 cm, remove the plate from the mobile phase and allow them to dry at room temperature. The identified spots were scratched and washed by diethyl ether in order to remove impurities. Then dissolved spots were transferred to Eppendorf tube and then centrifuge at 3000rpm for 20min at 45ºC. After centrifugation, collect the supernatant and evaporate the solvent by rotary evaporator. Finally, the retention factor (R_f) of the sample was calculated using the formula known as the distance moved from the sample/distance moved by the following solvent.

Fig. 1: Thin Layer Chromatographic plate of the *Myristica fragrans* seed extract

GC-MS analysis of the *Myristica fragrans* seeds: GC-MS analysis of the ethyl acetate fractions of the seed extract of *Myristica fragrans* seeds showed in figure 2 and 3 and the presence of different acids such as tetradecanoic acid, N-hexadecanoic acid, and oleic acid along with other derivatives as in Table 3.

Table 3: GC-MS analysis of the ethyl acetate extracts of *Myristica fragrans* seeds

S.No	Retention Time(Rt)	Compound Name	Molecular Formula	Molecular weight
1	14.443	Benzene, 1,2,3-Trimethoxy-5-(2-Propenyl)-	$C_{12}H_{16}O_3$	208
2	16.569	Tetradecanoic Acid	$C_{14}H_{28}O_2$	228
3	17.304	Tetradecanoic Acid	$C_{14}H_{28}O_2$	228
4	18.645	N-Hexadecanoic Acid	$C_{16}H_{32}O_2$	256
5	20.095	Oleic Acid	$C_{18}H_{34}O_2$	282

12	25.608	Phenol, 2,6-Dimethoxy-4-(2-Propenyl)-	$C_{11}H_{14}O_3$	194
13	25.668	2-Hydroxy-4-Isopropyl-7-Methoxytropone	$C_{11}H_{14}O_3$	194
14	30.635	Urs-12-En-3-Ol, Acetate, (3.Beta.)-	$C_{32}H_{52}O_3$	468

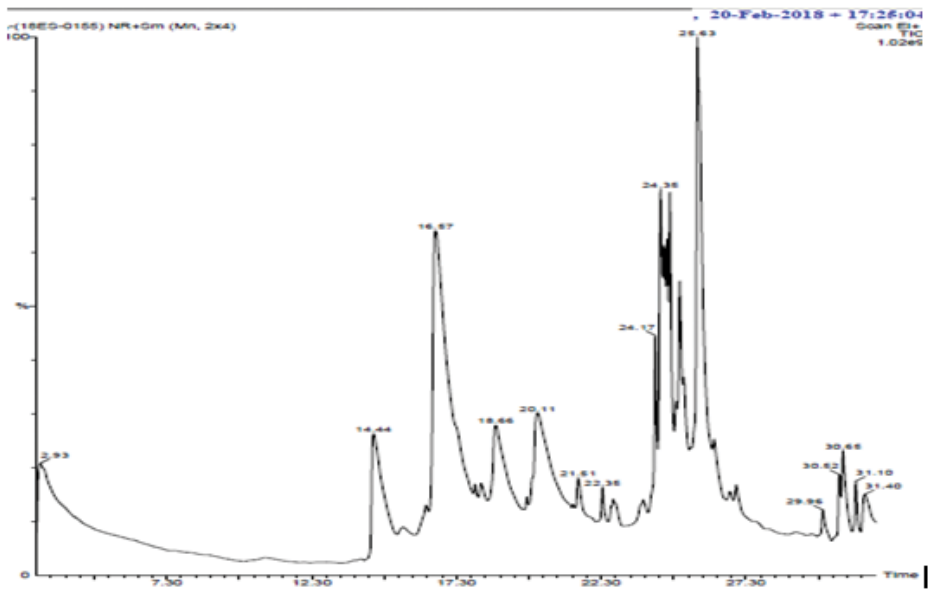

Fig. 2: GC-MS chromatogram and molecular structures of potential bioactive compounds identified in the ethyl acetate fraction of *Myristica fragrans* seed extract

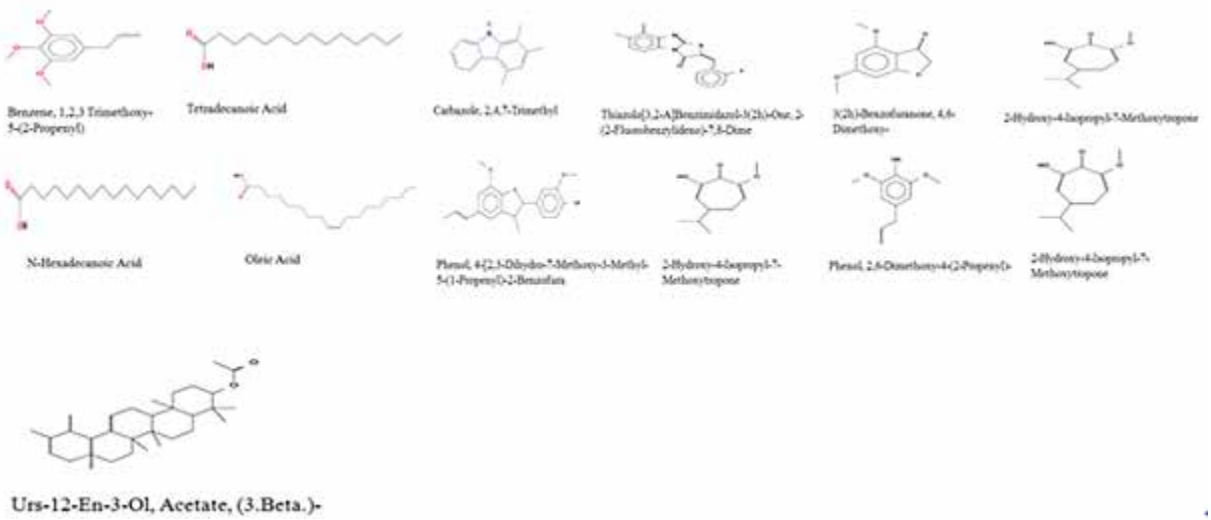

Fig. 3: FTIR spectra of *Myristica fragrans* seeds

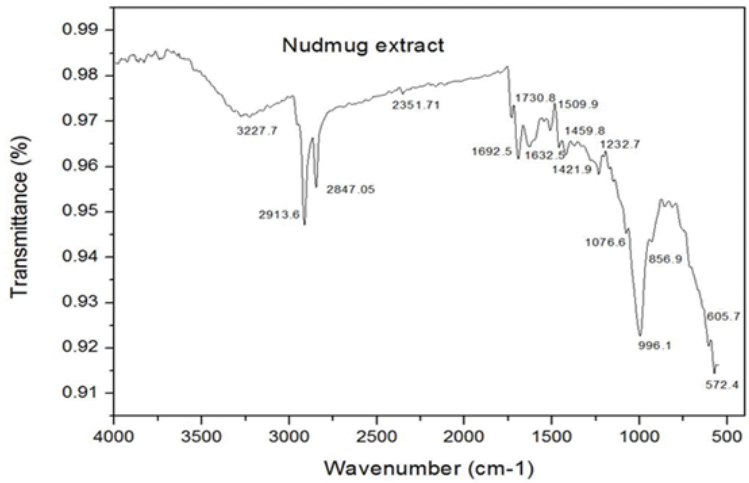

Fig. 4: FTIR spectra of ethyl acetate extract of the *Myristica fragrans* seeds

Conclusion

The seed portion of the *Myristica fragrans* screened by preliminary phyto chemical screening tests confirmed the presence of a variety of potential bioactive compounds. Furthermore the seed extracts were subjected to GC-MS analysis and recognized tetradecanoic acid, N-hexadecanoic acid, and oleic acid, Benzene, 1, 2, 3-Trimethoxy-5-(2-Propenyl), 2-Hydroxy-4-Isopropyl-7-Methoxytropone as major compounds. FTIR shown in figure 4 is used to identified the functional groups are analyzed in the seed. The presence of these compounds may be responsible for the anticancer activity.

Evaluating the Biological Applications of *Myristica fragrans* Seeds for Bactericidal and Cytotoxic Effects

Vibala B. V.[1], V. Suganthi[2], P. K. Praseetha[3]

[1]Research Scholar, Department of Nanotechnology, Noorul Islam Center for Higher Education, Kumarakovil, Kumaracoil, Thuckalay, Tamilnadu, India; [2]Assistant Professor, Department of Biotechnology, Sri Sankara Arts and Science College, Ernathur, Kanchipuram, Tamilnadu, India; [3]Professor, Head of the Department, Department of Nanotechnology, Noorul Islam Center for Higher Education, Kumarakovil, Kumaracoil, Thuckalay, Tamilnadu, India

ABSTRACT

Introduction: Bioactive compounds from herbal plants possess a wide range of pharmaceutical activities and one among them is Myristica fragrans (Nutmeg).

Aim: Antibacterial screening of the different solvent extracted phytoconstituents showed maximum growth inhibitory effect against E.coli and S. mutans. Agar well diffusion sensitivity testing method was adopted for this study.

Method: Acetone extract of the seeds also performed good bactericidal effect against the bacterial pathogens.

Result: MTT assay also demonstrated good cytotoxic effect against MCF-7 cell lines in a dose-dependent manner with inhibitory concentration (IC_{50}) achieved at 62.5 µg/mL.

Conclusion: Based on the findings of the study, seeds of Myristica fragrans could be exploited in developing potential bioactive pharmaceutical drugs for effective treatment of cancer.

Keywords: *Myristica fragrans Anti bacterial MTT assay Cytotoxicity*

Introduction

In the present scenario, the susceptibility of breast cancer is widely noticed by women. As per the data of 2018, the National Cancer Institute reported that 266,120 female are facing issues related to breast disease with mortality count of 40,920. This kind of report emphasizes the importance of breast tumor among the present population. There are a few components related with the breast cancer, for instance, sexual orientation, food diet, utilization of liquor, movement of the body, family ancestry, a way of lifestyle and endocrine features also including both exogenous and endogenous [1].

There are some other essential factors that lead to breast tumor growth, as non-threatening and mammographic concentrations. Though it is not clear, which factor is most vital in breast cancer pathogenesis [2.] Hence, breast malignancy for women has renewed over into the second premier reason for the passing. The chemotherapeutic agents utilized for its treatment are originated from the herb plant source, especially natural products, leaves, seeds, lichens, and fungi. These types of herbal plant sources play a significant role in supporting the health of humans. Today, people show more attention in natural remedies of herbal medicine containing natural bio-active compounds than chemically synthesized compounds [3].

Nutmeg family (*Myristicaceae*) involves numerous species i.e. 18 genera and 300 species; these numerous species are broadly available in tropical rain forest

across the globe [4]. Steeves, 2011, states, generally this kind of nutmeg plant consists natural and ethno botanical significances and among the more established group presence in Angiospermae, which comprises of newly advanced species [5]. Recognizable proof of nutmeg is expected to alleviate impurities, replacement, and falsification of natural products of herb, as world health organization states that falsification of naturally grown herbs content is a risk to user's protection [6].

The *Myristica* genus is available in India and South-east Asia to Northern Australia and also the presence in the Islands known as Pacific. In this genus, *M. fragrance, M. beddomeii* and *M. malabarica* species are reported to be widely distributed in India [7]. One of the delegates from this family is *Myristica fragrans* was derived from Indonesia (Mollucas and North Sulawesi). Due to its potential medicinal activities, nutmeg is extensively famous in Europe and Indian countries [8] The ritual practice of utilization of nutmeg helps to treat cholera, psychosis, rheumatism arthritis, diarrhea, nervousness, nausea, and anxiety, furthermore it is also used as alternative medicine for aphrodisiac, abortifacient [9], memory enhancer, antidiarrhoeal, mitigating and anticancer drug [10].

The present investigation prefers nutmeg for this study, because of their antimicrobial property has not been extensively assessed [11]. This impact may be the presence of active dynamic Phytochemical like alkaloids, carotenoids, Flavonoids, ligands, phenols, and terpenoids, in the natural herbal source plants [12]. Therapeutic plants utilized for treatment enclose a large scope of the in gradient which may be utilized to treat infectious harmful disorders hence medical microbiologist and clinical chemist have shown extraordinary interest for screening Therapeutic plants for modern therapeutics treatment [13].

Myristica fragrans is an important plant contains essential oil and nutmeg butter from its bark and leaves, which have been acclaimed to have a few medical advantages. The secondary metabolites of essential oil are made up of volatile compounds such as terpenoids, lipids, ketones, oxygenated derivatives and phenols [14]. *Encyclopædia Britannica* has announced that pinene, camphene, and dipentene as the significant constituents of *Myristica fragrans* essential oil (7 - 14%) [15]. *Myristica fragrans* consist a large amount of essential oil, which was used for carminatives and in herbal medical practice [16]. Many researchers have differently reported that seed of *Myristica fragrans* contain alkyl derivatives of benzene (Myristicin, elemicin, safrole, and so forth.), alpha-pinene, beta-pinene, myristic acid, trimyristin, terpenes [17, 18], myrislignan and macelignan [19, 20].

Therapeutic drug specialists asserted that seed of *Myristica fragrans* can be utilized as carminative, astringent, hypolipidaemic, antithrombotic, antiplatelet total, antifungal, treatment of dyspepsia [21,22], muscle and joint weakness, stomach problem, kidney stone, liver detoxification, digestion, increase blood circulation [23,] respiration and it additionally has properties of anti-inflammatory diseases [24.] One of the reviews of [25] also stated, that chemically synthesized compound of *Myristica fragrans* has been deductively approved to treat hypolipidemic and hypocholesterolemic, antidepressant, aphrodisiac, antimicrobial, upper, antioxidant, memory-boosting, and hepatoprotective properties. [26, 27] also stated, that *Myristica fragrans* have used for antiparasitic abilities.[28, 29]

The present study focuses on phyto chemical extraction from seed part of *Myristica fragrans*, in-vitro assessment of the Phyto- extract by bactericidal and cytotoxic tests.

Materials and Method

Sample Collection: The fresh fruit samples of *Myristica fragrans* was collected; shade-dried and powdered using the mechanical grinding machine. The finely powdered sample was used for the experimental study.

The Antibacterial potential of various fractions of *Myristica fragrans* seeds: The solvent fractions of the extracted seeds of *Myristica fragrans* were estimated for the activity of antibacterial against bacterial strains such as *Escherichia coli*, *Streptococcus mutans*, *Staphylococcusareaus* and *Pseudomonas aeruginosa* by the agar diffusion methods. The bacterial cultures were swapped on the Petri plates surface contain Mueller Hinton Agar and then with the help of cork borer the holes were made. To those holes, 20 µl of each dissolved extracted solvent in DMSO was inoculated.10 µg of Ampicillin was utilized as the positive control and negative control as DMSO. The inoculated plates were incubated at 37ºC for 24 hours. Finally, the zones of inhibition formation were evaluated.

Cytotoxic effect of the *Myristica fragrans* seed extract by MTT assay: MCF 7 cell line was gathered from the National Center for Cell Sciences, Pune (NCCS). The acquired cells were saved in DMEM enhanced with 10% FBS, penicillin (100 U/ml), and streptomycin (100 µg/ml) in a humidified nature of 50 µg/ml CO2 at 37 °C. Cells (1 × 105/well) were plated in 24-well plates and maintained in an incubator at 37°C with 5% CO2 condition. At the point when the cell achieves the conjunction, various concentrations of the seed residues extending from 7.85 to 1000 µg/ml were inoculated and maintained in the incubator for 24 hours. The incubated sample was expelled from the well and washed with phosphate-buffered saline (pH 7.4) or DMEM without serum. 100µl/well (5mg/ml) of 0.5% 3-(4, 5-dimethyl-2-thiazolyl)- 2,5-diphenyl-tetrazolium bromide (MTT) was inoculated and maintained in incubator for four hours. After4 hours, 1ml of DMSO was added to all the wells. The absorbance at 570 nm was estimated with UV-Spectrophotometer utilizing DMSO as the blank solution. Cytotoxicity estimations were performed and the 50% inhibition (IC50) concentration was concluded graphically. (Mosmann, 1983). The viability of cell percentage was determined by the equation

Cell viability = Treated cell of A570/controlled cells of A570 X 100

Antibacterial activity of the various solvent extract of *Myristica fragrans* seeds: The antimicrobial activity of aqueous, acetone, ethyl acetate, chloroform, ethyl acetate extracts of the seed showed effective bacterial growth inhibition. Among the extracts tested ethyl acetate fraction of the seed showed a maximum inhibitory effect against the bacterial pathogens as in Figure 2 shows that the Maximum zone of inhibition of the ethyl acetate fractions was observed against E.coli (14 mm), *P.aeruginosa* (9 mm), against *S. mutans* (10 mm)and *S. aereus* (11 mm). Similarly, acetone extract of the seeds could be arranged in the following increasing order: *E.coli*> *P. aeruginosa*>*S.mutans*>*S. aereus*. Fig 1 shows that In brief, the maximum inhibitory effect against *S. aereus* was noticed in the acetone extract. Also, chloroform and aqueous extracts showed a bactericidal effect. However, chloroform extract did not show a bactericidal effect against *P. aeruginosa*. The aqueous extract also showed ineffectiveness against *P. aeruginosa* and *S. aureus* respectively. Similarly, aqueous extract of the seed at different concentrations was reported to show a potential bactericidal effect against *E.coli, Staphylococcus aureus, Bacillus and Streptococcus species* (Sylvester et. al., 2018). The zone of inhibition of the extract is represented in Figure 2.

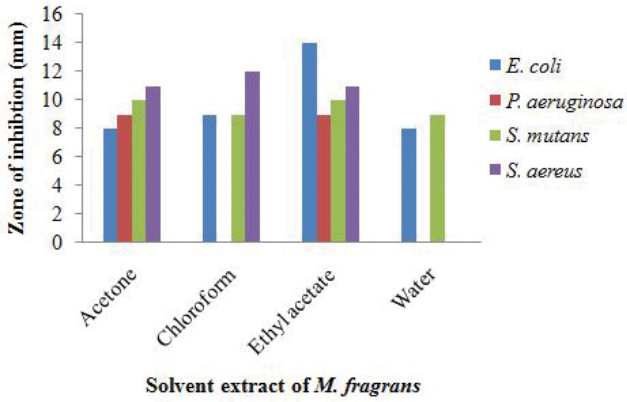

Fig. 1: Anti-bacterial effect of the different solvent fraction of *M. fragrans* seeds tested against bacterial pathogenic strains

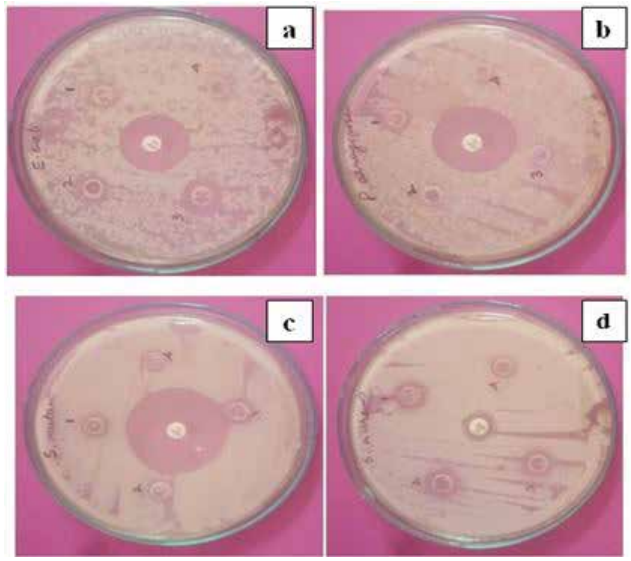

Fig. 2: Growth inhibition activity of the *M. fragrans seed extract* against (a)*E. coli*; (b) *Pseudomonas aeruginosa*; (c) *S. mutans* and (d) *S. aereus*.

Cytotoxic effect of the *Myristica fragrans* seed extract against MCF-7 cell lines: The cytotoxic effect of the seed extract against MCF-7was observed to be dose-dependent manner as in figure 3 and figure 4. The concentration of the extract at high concentration (1000 µg/mL) showed low percentage cell viability. In contrast, low concentration (7.8 µg/mL) tested showed high percentage cell viability. Comparison with the control cells, low percentage cell viability was observed at high dose concentration. The inhibitory concentration (IC_{50}) was calculated to be 62.5 µg/mL. An earlier study

on the Ethanolic extract of the *Myristica fragrans* seeds has proven cytotoxic effect against different cancer cell lines such as colon, liver, and ovary. Also, oil extracted from leaves of *Myristica fragrans* were reported to show an effective anticancer effect against MCF-7and A375 cell lines.

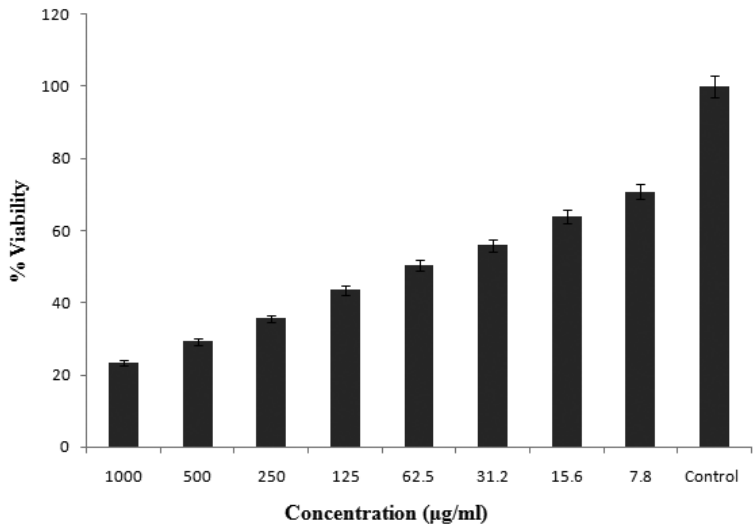

Fig. 3: Cytotoxic effect of the seed extract of *Myristica fragrans* against MCF-7 cell line

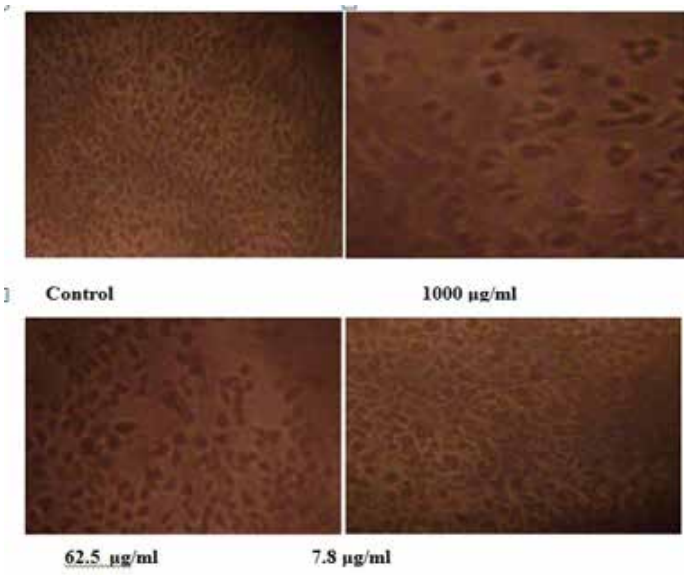

Fig. 4: Microscopic view of MCF-7 cell treated with different concentration of the *Myristica fragrans* seed extract

Conclusion

Plants have emerged as a credible source of new antimicrobials. This study evaluated the antibacterial and cytotoxic efficacy of the extracts of *Myristica fragrans*. The broad spectrum function of the solvent extract of *Myristica fragrans* seeds evaluated in terms of bacterial growth inhibition and cytotoxic effect against MCF-7 cells has proven its potentiality in preventing diseases. Hence it is concluded that *M. fragrans* seeds could be exploited further in the development of pharmaceutical drugs to treat different ailments.

Elevated Anticardiolipin Titer as a Stroke Factor in Young Patients in Kirkuk City

Raad Hassan Najim[1], Bilal Jamal kamal[2]

[1]FIBMS Pathology, Clinical Immunology, MSC Interventional Cardiology, [2]FIBMS Internal Medicine, Kirkuk Medical College, Iraq

ABSTRACT

Introduction: Stroke is a common cause of morbidity and mortality worldwide and it is the third leading cause of medical death in developed countries. Stroke can be classified into ischemic disease (80%) and hemorrhagic disease.

Aim: This study is conducted to assess the ACA titer as a stroke risk factor in young patients in Kirkuk city in Iraq.

Method: This study involved 2 study groups each one of them including 50 patients. The first group (cases) involved 50 patients diagnosed as having ischemic stroke by neurologist their ages was less than 45 years. In another group (control) , 50 patients involved admitted to the same hospital with no history of prior ischemic stroke. Sera collected from both groups and freezed up to -70ºC until Anticardiolipin were measured by using enzyme linked immunosorbent assay with standard commercial lab kit (BIOLABO).

Results & Conclusion: Ischemic stroke according to our findings is more prevalent in those patients with Hypertension with 66% of patients in comparison to 42% of control patients with P-value of 0.0001, diabetic patients with double percentage (72%) to those in control group (36%) with P-value of 0.0001.

Keywords: *Anticardiolipin, BIOLABO, Ischemic stroke, neuromedicine.*

Introduction

Stroke is a common cause of morbidity and mortality worldwide and it is the third leading cause of medical death in developed countries. Stroke can be classified into ischemic disease (80%) and hemorrhagic disease (20%). Ischemic stroke is the result of interruption of blood supply to a part of brain, so brain cells will die due to reduction of oxygen and nutrients supply, and as it is a medical emergency an early action is required to minimize brain damage and potential complications [1, 2].

Stroke occurs in older age more frequently than younger patients, as there are risk factors that play important role in stroke pathology, such as: diabetes mellitus, hypertension, hyperlipidemia, smoking and the aging process [3]. Although, stroke can occur uncommonly in young patients and can lead to serious disability to the victim. Recent studies showed an increased incidence of stroke in young adults [4, 5].

There are special factors that might predispose to stroke in young patients, such as inherited coagulopathies; i.e. Protein C and/or S deficiencies, factor III leaden[6]. A lot of studies revealed significant relationship between auto-antibodies and increased incidence of stroke [7, 8]. Cardiolipin antibodies (ACA) are autoantibodies produced by the immune system that mistakenly target the body's own cardiolipins, substances found in the outermost layer of cells (cell membranes) and platelets and can lead to a clot formation or thrombosis and occlusion of an artery or vein and this can lead to serious complications, such as cerebral infarction [9]. ACA antibodies are quite common in the general population and are not always associated with anti-phospholipids syndrome (APS). Studies indicate that there is a higher prevalence of IgM positives than IgG in the general

population with these isotypes occurring in 9.4% and 6.5% of the population, respectively [10, 11]. This study is conducted to assess the ACA titer as a stroke risk factor in young patients in Kirkuk city in Iraq.

Materials and Method

This is a case-control study done in the period extending from November 2013 to April 2014 in neuromedicine department in Azadi teaching hospital in Kirkuk city in Iraq. This study involving 2 study groups each one of them includes 50 patients. The first group (cases) involved 50 patients diagnosed as having ischemic stroke by neurologist their ages was less than 45 years. In another group (control), 50 patients involved admitted to the same hospital with no history of prior ischemic stroke. Sera collected from both groups and freeze up to -70ºC until Anticardiolipin were measured by using Enzyme linked immunosorbent assay with standard commercial lab kit (BIOLABO).

Anticardiolipin IgM, IgG isotypes were measured, normal expected values were Negative with less than 15.0 MPL Units for IgM isotype and 15.0 GPL units For IgG isotype, 15.0 – 22.9 represented as low positive test, ≥23.0 is categorized as high positive test. Age, Gender, cigarette smoking, and history of chronic diseases such as hypertension, diabetes mellitus, atrial fibrillation, valvular heart disease and coronary arterial disease (defined as patient have ischemic heart disease by form of Myocardial infarction, Angina and percutaneous coronary intervention to revascularize stenosed diseased arteries) For variables with is continuous and distributed non normally Mann whitney test were used while those normally distributed continuous variables Student's unpaired t test were used. In all issues, $p<0.05$ was represented as significant. Fischers exact test and chi square test analysis were used to compare different variables to evaluate first order interaction between risk factors of stroke and anticardiolipin value as positive or negative. All analyses used methods of the Statistical Analysis System, version 6.12 (SAS Institute).

Results

Fifty patients with stroke of ischemic origin and 50 controls included in the study. Table 1 summarize demographic and clinical characteristics of patients and control groups, control were older than ischemic stroke patient with no significant correlation (P-value=0.33). Gender distribution showing significant correlation in regarding female sex in both groups (P-value=0.001). Ischemic stroke according to our findings is more prevalent in those patients with Hypertension with 66% of patients in comparison to 42% of control patients with P-value of 0.0001, diabetic patients with double percentage (72%) to those in control group (36%) with P-value of 0.0001,coronary arterial disease, valvular heart disease and rhythm disease such as atrial fibrillation seen to be more popular in those patients with ischemic stroke with no significant value in regarding to patients having coronary and valvular heart disease (P-value=0.11,0.21) and strongly associated with those patient presented with atrial fibrillation (P-value=0.0001). No significant different appears between both study groups regarding smoking as a risk factor although it is more prevalent in control group (46%) than those in ischemic stroke patients group (32%) (P-value=0.11), sera were collected from all patients in both study groups and serum anticardiolipin titer both for IgM and IgG antibodies measured. Titters are classified into three categories: negative, low titter and high titters. No significant correlation seen in comparison between negative results of both IgM, IgG antibodies between patients and control study groups (P-value:0.66 and 0.8), current study shows significant rise of both low and high positive titters of anticardiolipins among stroke patients group than those control non stroke patients group (P-value:<0.0001,<0.0001,0.001,<0.0001).

Table 1: Demographic and Clinical Characteristic of Stroke Patients and Controls

Parameter	Patients (n = 50)	Control (n = 50)	P-value
Age (mean ± SD)	38 ± 6.1	42 ± 2.2	0.33
Sex(M/F)	(16/34)	(22/28)	0.001
Hypertension	33(66%)	21(42%)	0.0001
Diabetes mellitus	36(72%)	18(36%)	0.0001
Coronary arterial disease	18(36%)	10(20%)	0.11
Valvular disease	6(12%)	2(4%)	0.21
Atrial fibrillation	14(28%)	1(2%)	0.0001
Current smocking	16(32%)	23(46%)	0.11

Table 2: Distribution of anticardiolipins titer among patients and control groups

Anticardiolipin titer	Patients (n = 50)	Control (n = 50)	P-value
Negative IgM	28(56%)	38(76%)	0.66
Low + IgM	12(24%)	8(16%)	<0.0001
High + IgM	10(20%)	4(8%)	<0.0001
Negative IgG	32(64%)	42(84%)	0.08
Low + IgG	10(20%)	6(12%)	0.001
High + IgG	8(16%)	2(4%)	<0.0001

Discussion

Stroke is a common medical emergency in which early diagnosis and management is required, otherwise serious complications and disabilities can occur. In addition to the well-known medical diseases that can predispose to stroke (as DM, HT, dyslipidaemia) there are other risk factors that can jeopardize the young patient to the risk of stroke, one of these is the autoantibodies, and specially the anticardiolipin autoantibodies as it can lead to a hypercoagulable state by interaction with the endothelial cells[12]. This leads to activation of endothelial type of cells, proinflammatory cytokines secretion mainly increased, tissue factor release, and profound activation of the coagulation cascade with formation of clot and an ischemic stroke [13, 14]. Screening for those with positive anti-cardiolipin antibodies and proper assessment of them to exclude anti-phospholipid antibodies syndrome and exclude the presence of other stroke risk factors and proper prophylaxis.

Conclusion

This study has showed that there is statistically significant relationship between the findings of positive titters of anticardiolipin auto-antibodies: IgM and IgG (low and high titters) in the participants and incidence of stroke. Although this auto-anti-antibody also present in the normal control participants, but that was in non-significant number, this finding agrees with many studies published before about this subject[15, 16, 17]. Our finding of the increased incidence of ischemic stroke in that patient with positive anticardiolipin autoantibodies without other risk factors for stroke like: DM, HT, dyslipidaemia, raises important issues, like routine screening for these auto-antibodies and the role of prophylaxis in those who are positive. Elevated anticardiolipin antibodies are seen to be as independent risk factors for ischemic stroke.

ODAP: The Natural Toxin Present in The Lathyrus Sativus (Grass Pea)

Durar Kamil Jabbar[1], Habeeb Kadhum[1]

[1]*Department of Biology, College of Engineering, University of Al–Qadisiyah, Iraq*

ABSTRACT

Introduction: There are number of non-protein amino acids of plant origin considered as neuro-toxic source& pose serious health hazards both to human and animals.

Aim: This Research was designed to studythe natural toxin present in Lathyrus sativus (Grass Pea) that resulted from the neurotoxic amino acids in Lathyrus seeds which are very important because they are of immediate relevance to human health or diseases affecting domestic animals, and they have resulted in findings of several unusual and novel mechanisms of biosynthesis and metabolism.

Method: This research study the toxicity of ODAP and the incidence of neurolathyrism, estimate the concentration of ODAP in seeds, estimate qualitatively the presence of ODAP and DAP in Lathyrus seeds and estimate the protease activity in growing seedlings of Lathyrus.

Results & Conclusion: The results showed that ODAP had inhibitory effect on the growth of the microorganism Pseudomonas indica. However, it showed very little inhibition on E. coli and showed no effect on the others like Klebsiella, Pseudomonas aeruginosa, Staphylococcus aureus

Keywords: *Grass pea, Neurotoxin, ODAP, Lathyrus sativus*

Introduction

The number of amino acids present in proteins is limited to twenty, nevertheless the number of non-protein amino acids that exist in nature far exceeds this number. Further nature has restricted the presence of a large number to these amino acids selectively only to the plant kingdom. Man & domestic animals which are in constant search for new sources of food often have to depend on such plant sources. Plants have opted for such non-protein amino acids for various reasons, the most likely being protection from predators and environmental stresses. Occasionally man & domestic animals become the inadvertent victims of such defense system. It can also be considered as a cruel trick of nature to place in an otherwise valuable food plant, a chemical that has the potential to cause damage to those who are dependent on its consumption. A number of non-protein amino acids of plant origin fall into this category since they posses neuro-toxic properties & pose serious health hazards both to human & animals.Studies with neurotoxic aminoacids have been most rewarding for several reasons, such as

- They are of immediate relevance to human health or diseases affecting domestic animals.
- They have resulted in findings of several unusual & novel mechanisms of biosynthesis & metabolism in the host & victims respectively.
- They have provided insights into newer neurochemical mechanisms.
- They form the basis for rational approaches to therapeutic treatment of neuro-degenerative disorders.
- They have provided suitable animal models for neuro-degenerative disorders.

Materials and Method

Protein Estimation: The total protein content of crushed seed powder as well as the crushed cotyledons was estimated by Lowry method under alkaline conditions using Folin's coloring reagent[1]. The total protein content in *Lathyrus* seeds, thus estimated was used as a confirmation for the presence of ODAP in the seeds and was also used in the calculation Protease activity in the geminating seeds[2].

Qualitative estimation of ODAP in the seed sample: With an idea to confirm the presence of ODAP in the seed sample of *Lathyrus,* electrophoresis and chromatography was performed[3].

Electrophoresis: The qualitative estimation for the presence ODAP and DAP in the seed extract was carried out using horizontal Paper Electrophoresis carried out on a Whatmann no 1 filter paper with a mobile phase of Pyridine: Acetic acid: Water in the ratio of 10: 100: 900,pH 3.6. The apparatus was set up at 400V and was run for 1.5 hours. The steps involved were:

1. Narrow strips of 25cm with Whatmann no.1 filter paper were cut carefully. 5 strips of the same size were prepared.
2. A line was drawn in the centre of the strip to indicate the place of loading.
3. One sample was added on to each of the strip.
4. In the first strip, standard ODAP (1mM) was added.
5. The second strip had Standard DAP.
6. The third had a mixture of DAP and ODAP.
7. The fourth and the last one had the crude seed sample.
8. These strips were then saturated in the mobile phase and were placed in the electrophoretic apparatus.
9. The anode and the cathode chambers were filled with the mobile phase buffer.
10. The apparatus was then set in a horizontal mode at 400V and was allowed to run for 1.5 hours.
11. After the run, the papers were carefully removed and dried. To the dried paper strips, Ninhydrin reagent was sprayed. Since ODAP and its derivatives are derivatives of Amino acids, we looked for the formation of Blue spots.
12. The Rf value of the crude seed extract was calculated and was compared with the standards.

Quantitative estimation of ODAP in the seed sample by OPT method: *Lathyrus sativus* seeds are known to cause the clinical condition of *Lathyrism* due to the presence of a compound called ODAP[3]. The quantitative estimation of this compound in the seeds will give us a vague idea of the occurrence of this incident in areas where this crop is used as a major staple food crop.

Seeds were collected from Bandhra region, India. The ODAP content was estimated by OPT[4]* method (o-phthaldehyde).

1. **Standard ODAP preparation:** 17.61mg of ODAP and about 15mg of $NaHCO_3$ were dissolved in 100ml of distilled water.
2. **Preparation of seed powder for the estimation of ODAP content:** 20mg of de-husked *Lathyrus sativus* seeds were weighed and powdered. To the powdered grain, 2ml of distilled water was added and kept in a boiling water bath for 30'. After cooling the contents, it was centrifuged at 3000 rpm for 3'using a microfuge. The supernatant was carefully collected and stored in the refrigerator till use.
3. **Quantitative estimation of ODAP:** The standard graph was constructed using a range of concentration of the standard ranging from 10µl to 100µl of standard (this accounts to a concentration range of 0.176 – 1.760 of standard ODAP). 20µl and 40µl of the seed sample was taken for its estimation. To all the test tubes, 200µl of 3N KOH was added and was incubated in a boiling water bath for 20'.Following the incubation and cooling, distilled water was added to all the test tubes such that the final volume is 1ml. This was followed by the addition of 2ml of OPT reagent. The contents were incubated at room temperature for 20' for the color to develop. The color developed was read at 420nm in a UV-Vis spectrophotometer.

Enzyme Assay: Lathyrism is a clinical condition where in there is an irreversible neurological degeneration, resulting in the paralysis of lower limbs[5]. This degeneration could be attributed to any kind of enzyme

activity that degrades the proteins of the nervous system. With this sole presumption in mind, enzyme assay[7] was performed to get an idea of the protease activity in *Lathyrus* seeds.

Lathyrus sativus seeds were grown for different time periods of 0, 2, 4, 6, days. The assay was performed using 1 % (w/w) Casein as the substrate. To 1ml of the substrate, 0.5 ml of Tris Hcl buffer (0.05M, pH 7.2) and 0.5ml of the crude enzyme (containing 2.8 mg of protein) solution was added and incubated at 37^0C at different time intervals of 0, 10, 20, 30 minutes.The reaction was stopped at the specified time intervals using 2ml of 10% Trichloroacetic acid. In case of the 0 minute time interval, TCA was added prior to the enzyme assay.

Addition of TCA results in the coagulation of un-reacted casein molecules, which can be removed by centrifugation. Post to centrifugation, 1ml of supernatant was collected, to which 5ml of 0.5M Na_2CO_3 and 0.5ml of 3X Folin's reagent was added. The contents were incubated at room temperature for 30' after which the absorbance was noted for all the test tubes at 720nm using a colorimeter.

Enzyme Activity by Trypsin: Trypsin is a type of protease that is secreted in the small intestine of animals that brings about the breakdown of proteins.A standard graph of tyrosine standards was constructed by taking a range of tyrosine standards from 0.11mM to 1.1mM. This was done by taking 1ml of appropriately diluted tyrosine standard solution to which 5ml of 0.5M Na_2CO_3 and 3X diluted Folin's reagent was added. The contents were incubated for 30' at room temperature.

Meanwhile, an enzyme assay was performed on Casein using tyrosine as the enzyme. To 1ml containing 1 % (w/w) of Casein, 0.5ml of 0.05M Tris Hcl buffer and 0.5ml of trypsin was added. The contents were incubated at 37^oC for 20'. The enzyme reaction was stopped by adding 2ml of 10% Trichloro acetic acid. This reagent coagulates all the un-reacted casein molecules which are removed by centrifugation. To 1ml of the supernatant, 5ml of 0.5M Na_2Co_3 and 3X diluted Folin's reagent was added. The contents were incubated at room temperature for 30'. The color developed was read at 720nm using a colorimeter.

Results

1. Estimation of Protein by Lowry Method

- 10X and 20X diluted seed powder sample showed an absorbance of 0.48 and 0.27 respectively at 720nm in a UV-Vis spectrophotometer.
- This absorbance corresponds to an average concentration of 29g of protein for 100g of the seed sample.

Table 1: Estimation of proteins

Estimation of Protein By Lowry's Method					
Standard	**Concentration**	**Reagent D**		**Folins reagent**	**OD at 720nm**
blank	0	4ml		0.4ml	0
0.1	10	4ml		0.4ml	0.139

Undiluted		4ml		0.4ml	1.812
10x		4ml		0.4ml	0.488
20x		4ml		0.4ml	0.27
50x		4ml		0.4ml	0.17

2. Qualitative Estimation of ODAP in the seed sample

Electrophoresis: The results showed that the seed sample had both the components, ODAP and DAP in it. This is shown by the presence of two bands on the strips. The purple color formed represents the presence of amino acids.

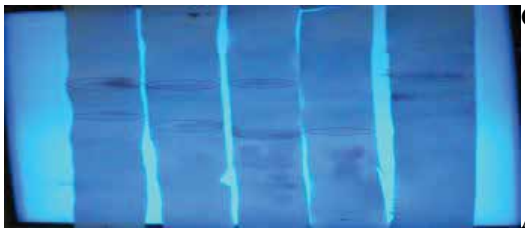

Fig. 1: Electrophoretic running of 5 spots under the voltage of 400V run for 1.5 hours

The spots were crude seed sample 1 (1), crude seed sample 2 (2), Mixture of ODAP and DAP (3), Standard DAP (4), Standard ODAP (5).

Chromatography: The standard ODAP seed was very concentrated (10mg/ml) because of which the resolution of the seed sample is not very clear. But upon a scrutiny, one can find two spots; one representing ODAP and the other representing DAP. There has been a replication of results of electrophoresis in Chromatography. This clearly indicates that the seed sample has both, DAP and OPAP.

3. Quantitative estimation of ODAP in the seed sample: 50X and 25X diluted sample showed an Absorbance of 0.149 and 0.151 respectively at 410nm in a UV-Vis spectrophotometer. Using these values when the ODAP content was calculated, it summed up to be a concentration of 0.49g %.

Table 2: Standardization of ODAP by OPT method

Standard	KOH		Water	OPT reagent	OD at 420nm
Blank	200ul		800ul	2ml	0
10ul	200ul	incubation for	790ul	2ml	0.097

4. Enzyme assay

- Trypsin digested casein assay showed an absorbance of 0.16 which corresponds to a concentration of 90.2µM. The enzyme had an activity of 28.5 Enzyme Units.
- The enzyme activity of protease from *Lathyrus* seed at 20' showed varied activity and it has been tabulated in the table below. The maximum activity was seen in the dry sample when compared to the seedlings, which is 20.9 Enzyme Units.
- The enzyme activity was calculated using the formula: **µ**moles of Tyrosine equivalents released x Volume of enzyme assay/Incubation time x Colorimetrically measured volume x Enzyme volume

Results of Toxic Activity of Odap on Microbes

LB Agar Medium

1. **E.Coli:** A slight inhibition zone at (125 µg of ODAP) was seen, which indicates that the ODAP can inhibit the growth of E. Coli.

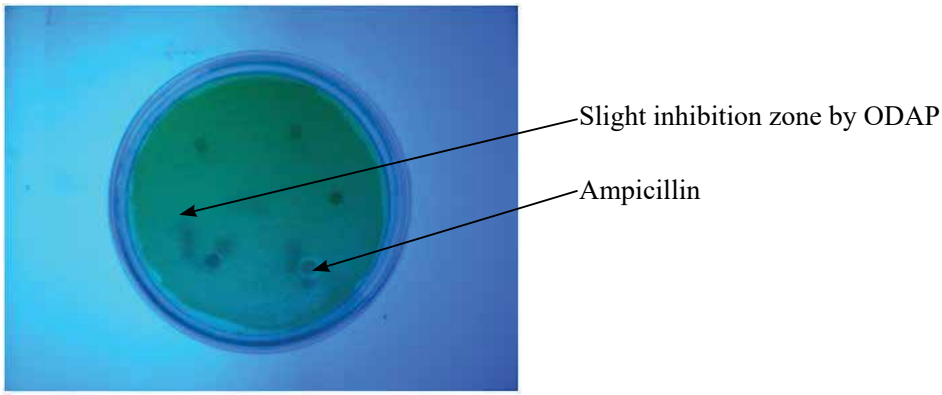

Fig. 2: Growth of E.Coli

2. **Pseudomonas aeruginosa:** No inhibition zone was observed at any concentration of ODAP. A clear inhibition zone was observed with ampicillin.
3. **Pseudomonas indica:** No inhibition zone was observed at any concentration of ODAP. A clear inhibition zone was observed with ampicillin.

Discussion

The disease nuerolatyhrism is thought to affect only a small percentage of human population, which is often less than 5%, even in those areas where *Lathyrus* is used as the sole staple food crop. It is very interesting to know that the same component in the seeds that can cause paralysis in mice, chicks etc have very less impact on human beings. Another interesting study is the effect of *Lathyrus* extract on the growth of microorganisms. At a concentration of 7µg/ml, 50% inhibition was seen on the cultures of *E. coli*[7]. Another probable reason could be a random mutation in these strains of bacteria that have helped them to overcome the toxicity of ODAP. If this intuition is true then one can extend this same study to find out the product of metabolism that has an inhibitory effect on ODAP. This can further be extended to use this as a curative product for neurolathyrism. A comparative study of protease activity in some toxic and non toxic seed can reveal if there is a relationship between toxicity and proteolytic activity (either enhanced or reduced). Since we had the constraint of time and the pressure of semester academics, we could limit our project to just a few aspects of ODAP. Given an opportunity, we would like to extend our research on the above mentioned notes.

Conclusion

The seeds of *L.sativus* showed the maximum concentration of 0.49 g% and it was found that they have both, ODAP & DAP. Maximum protease activity was seen in the dry seed powder which was 20.9 Units as compared to 28.5 Units of Trypsin. It was also shown that ODAP had inhibitory effect on the growth of the microorganism *Pseudomonas indica.* However, it showed very little inhibition on *E. coli* and showed no effect on the others like *Pseudomonas aeruginosa..* However, the exact mechanism of either their inhibition or non inhibition is not known yet.

Safety Disposal of Electrophoresis Gels and PCR Contaminate with Ethidium Bromide and Alternative Methods

Amal Raqib Shamran[1], Methaq Hadi lafta[2]

[1]College of Science for Woman, University of Babylon; [2]Iraqi Ministry of Education

ABSTRACT

Introduction: Electrophoresis gel is commonly used in molecular biology laboratories for the identification of nucleic acid (DNA or RNA) and proteins. This gel will typically be agarose-based.

Aim: The safety disposal of electrophoresis gels and PCR contaminate with ethidium bromide and alternative methods.

Method: The DNA/proteins can be stained by adding the dye to the sample before electrophoresis and the gel can be placed in a dye solution after electrophoresis completed. Waste disposal requirements will vary on the dye used and the methodology used to stain the cells.

Results & Conclusion: Ethidium Bromide, Acridine Orange, SYBR Green I, SYBR Green II, SYBR Gold, Gel Star dyes have been determined to have mutagenic properties. The gel that cast with these dyes in them, unwanted dye stock solutions and all contaminated debris must be collected for disposal by the HWMU. Gels that undergone electrophoresis and staining were destained.

Keywords: *Agarose, Disposal, Electrophoresis, Waste.*

Introduction

Electrophoresis gel is commonly used in molecular biology laboratories for the identification of nucleic acid (DNA or RNA) and proteins. This gel will typically be agarose-based. This electrophoresis process utilized an organic fluorescence dye or inorganic such as Silver (which is an EPA regulated material) to stain DNA or proteins[1]. Waste of the DNA identification process must be managed and disposed in a manner to protect public health and the environment. To ensure safe, prudent disposal as well as reduce the amount of Hazardous Waste material[2]. This can be accomplished by choosing less toxic materials and work practical methods that minimize thquantity of waste generated as well as the toxicity of the waste material itself. In cases where safer materials or work practices cannot be employed, waste collection methods and regulatory agency requirements are to be followed.

Materials and Method

There are a number of different protocols and alternative dyes used in the preparation of electrophoresis gels. Gels can be cast with or without dyes. The DNA/proteins can be stained by adding the dye to the sample before electrophoresis; the gel can be placed in a dye solution after electrophoresis has been completed. Waste disposal requirements will vary on the dye used and the methodology used to stain the cells. The electrophoretic waste of the DNA or proteins product identification process must be managed and disposed in a manner that is consistent with the commitment it has to protect public health and the environment. The following provides lab managers with the proper procedures for managing and disposing electrophoresis-associated gel wastes.

Ethidium Bromide, Acridine Orange, SYBR Green I, SYBR Green II, SYBR Gold, GelStar dyes have been determined to have mutagenic properties[3]. The gel that have been cast with these dyes in them, unwanted dye stock solutions and all contaminated debris must be collected for disposal by the HWMU. Gels that have undergone electrophoresis and staining have been distained where all excess dye has been washed out

the gel (the only dye left in the gel is a trace amount contained in DNA/protein sample material) can be discarded in the trash[4]. Contaminated "non-sharp" lab debris (e.g., gloves, towels, tubes, etc.) should be collected and disposed of the HWMU.

The buffer solutions that have been run through the approved filter should be checked under an appropriate light source for complete removal of the dyes, and if it passes (does not fluoresce), the liquid can be disposed of down the drain with a copious amount of water as long as it contains no other materials that would cause it to be regulated as a Hazardous Waste.

Waste Management of Materials for Disposal is done through the Hazardous Waste Management Unit. The main wastes are Chemicals (room 0114), Risk waste: Blood, cells, viruses and bacteria, sharp or pointed objects (room 0116), Biological waste: Dead experimental animals, etc. (room 0116/freezer room in the waste area), Radioactive waste (room 0115) and chemicals. The safety data sheet will tell you whether the waste is to be classified as hazardous waste. In addition it will provide information about the necessary protective equipment and about any protective devices that must be used.

All waste must be packaged and labelled properly. If possible, use the original packaging if this is suitable. Containers must be in good condition, and caps must be screwed on well. Avoid using packaging material that can be confused with household products – for example coffee jars, soft-drink bottles and the like. The university purchases plastic cans for hazardous waste, labels for marking waste, and polystyrene boxes that can be used to protect glass bottles against impact. These are kept in the waste area in the basement.

Each substance/substance compound must be clearly labelled with: contents (name of chemical and approximate composition), date, name, department and telephone number. If the contents are not known, the container must be labelled "Content not known". Chemical waste, used oil and batteries must be placed in Room 0114 in the basement of Domus Medica. Volatile substances must be place in the innermost part of the waste room with suction removal. The waste must be put on the shelves, away from the floor. Explosive chemicals must not be put in 0114 room. Contact the HSE Coordinator for the disposal of explosives. The room must be kept locked at all times. Hazardous waste is collected by Ragn Sells AS.

Risk and Biological Waste: When handling 'risk waste', adequate protective equipment and, if relevant, protective devices must be used. Read the safety data sheet for information. Risk waste and biological waste can include: biological material, sharps and cutting equipment, substances that may be carcinogenic/ mutagenic and cytostatics[5]. All waste must be packaged and labelled properly. 'Risk waste' is packaged in yellow plastic containers that are labelled with a completed declaration form for risk waste. Yellow plastic containers and declaration forms are available in the waste department in the basement. Yellow toxic waste containers must be placed in the basement of Domus Medica, room number 0116. The room must be kept locked at all times. Risk- and biological waste is collected by Ragn Sells AS.

Radioactive Waste: When handling radioactive waste, adequate protective equipment and if relevant protective devices must be used, such as closed hoods. Read the safety data sheet for more information. All radioactive waste needs to be clearly marked with a label for radioactive waste. These are available in the waste department. Radioactive waste, which is also 'risk waste' and biological waste, must also be packed into yellow plastic containers and be marked with a label for radioactive waste. This also applies to waste that has previously been radioactive but that has become inactive. Please use bequerel as a unit for activity. All radioactive waste, as well as waste that has previously been radioactive, must be logged when it is placed in the waste room. The log is kept inside of room 0115. The waste must be placed in the basement of Domus Medica, Room 0115. The room must be kept locked at all times.

For a pickup, an empty replacement pail will be provided at the time of the collection if needed. Collection and disposal of chemically contaminated sharps (needles, Pasteur pipettes, etc.) must be collected in an approved sharps shelter (NOT RED – use the white/translucent or yellow). It must be labelled (Hazardous Waste – Chemically Contaminated Sharp). Any biohazard labels should be removed or completely defaced.

Procedure for Disposal: All DNA, plasmids etc. must be handled as toxic waste. All pipette tips, tubes etc. that have been used for DNA work must be disposed of in yellow toxic waste containers. Agaro seals with EtBr and SYBR-safe/SYBR-green etc. are disposed of in yellow toxic waste containers. Contaminated glass

equipment must be rinsed well before being put ready for washing. Kits: waste must be handled in accordance with the HSE data sheet that comes with the kit. Small volumes of isopropanol and ethanol waste must be collected in Eppendorf tubes and disposed of in yellow toxic waste containers. Larger volumes must be handled as hazardous waste. Used running buffer must be handled as an absorption medium. Used absorption media must be disposed of in yellow toxic waste containers. Read the safety data sheet that comes with the absorption medium. Examples of absorption media are activated carbon, activated charcoal, C3014-500G, untreated, granular, 20-60 mesh, destaining bags, cat. No: 730-0997 and BondEX 50 Set (5), product code M740703.

Handling GMO (Genetically Modified Organisms) waste: Waste from GMO must be handled as biological waste and regarded as toxic waste. This applies to both solid and liquid waste. Waste from GMO in class 3 and class 4 must be inactivated before it is placed in yellow toxic waste containers. Inactivation takes place by autoclaving for one hour at 121 degrees, or by using Virkon 1-3% or 5% hypochlorite.

SYBR® Safe, GelRed, GelGreen, and EvaGreen dyes determined to be nonmutagenic dyes in testing by independent licensed testing laboratories.All gels and contaminated "non-sharp" lab debris (gloves, towels, etc.) that are processed using this dye can be discarded in the trash.Spent running buffer solutions and destaining solutions that contain the dyes can either be collected and disposed of through the HWMU or collected and run through an approved filter device[6]. The buffer solutions that have been run through the approved filter should be checked under the appropriate light source for complete removal of the dyes, and if it passes (does not fluoresce), the liquid can be disposed of down the drain with a copious amount of water as long as no other materials are present that would cause the material to be a (Hazardous Waste). The filters that have been used up and are no longer effective must be disposed of through the HWMU.

Conclusion

Waste described in this document must be stored in the following manner: 32P is kept in plexiglass shielding containers, 51Cr and 125I are kept in lead containers and 35S, 3H and 14C can be stored without shielding. Mutagenic or Toxic product of (PCR) and Contaminated "Non-Sharp" Lab Debris (e.g., gloves, pads, tubes, etc.) are placed into a plastic container 5 gallon bucket (optimal of volume of waste generated). This container should have a plastic bag as an inner liner. The container must be closed at all times except when immediately adding or removing wastes from the container. Contact the Hazardous Waste Management Unit (HWMU) if you need a 5 gallon bucket to collect your waste. Labelled the container's which waste constituents are present in the pail (e.g., "Hazardous Waste - Ethidium Bromide Contaminated Gels, Gloves, Paper"). Sharp items (e.g., needles, Pasteur pipettes, Tips, etc) are to be placed into the containers or 5-gallon pails. The gel that cast with these dyes in them, unwanted dye stock solutions and all contaminated debris must be collected for disposal by the HWMU.

Enhancement in Segmentation of Brain Tumors on MRI Using Region Growing Algorithm

K. V. Shiny[1], N. Sugitha[2], B. Swaminathan[3], B. Bhuvaneswaran[4]

[1]Research Scholar, Department of Computer Science and Engineering, [2]Associate Professor, Department of Information Technology, NICHE, Kumaracoil, India; [3]Professor, [4]Assistant Professor, Department of Computer Science and Engineering, REC, Chennai, India

ABSTRACT

Background/Objectives: In radiation oncology applications, the detection and segmentation of assorted necrotic and tumor tissue next to the adjacent vessels is a demanding situation. The MRI illustration produces an elevated fluctuate images indicative of usual in addition to unusual tissues that aid to discriminate the overlap into fringe of each tissue.

Method/Statistical Analysis: All habitual seed judgment methodologies might suffer through the difficulty but no development of tumor is there as well as if any small white part or grey part is present there. Segmentation of images by means of multifaceted structures such as magnetic resonance images of brain is tricky using common methods. The region based lively contour models are extensively used in segmentation of brain tumor.

Findings: If the boundaries of tumor is blunt, then the segmentation results are inaccurate i.e. segmentation could be above or beneath that may happen because of primary stage of the tumors. Here a scheme of tumor recognition based on texture of the MRI and the detected tumor is then segmented automatically using automatic seeded region growing technique and is proposed to detach the asymmetrical from the regular neighboring tissue to obtain an authentic detection of concerned and non-concerned area that facilitate the surgeon to discriminate the affected area accurately.

Improvements/Applications: The methods used in this paper are texture analysis and automatic seeded region growing technique and is implemented on MRI of brain to identify the tumor margins in 2D MRI for dissimilar cases.

Keywords: *Brain tumor segmentation, MR Image, region growing, necrotic tissue segmentation, enhancing cell, radio surgery, radiotherapy.*

Introduction

Segmentation of brain tissues within gray matter[2]white matter [3], and tumor [4] on medicinal images is difficult in the radiation oncology application. The brain tumor contour is an upcoming vital step in spatially localizes radiotherapy (e.g., Cyber knife) [6], [7] that are normally completed physically on contrast-enhanced T1-weighted MRI images in contemporary medical observation. This kind of T1 MR Images are taken over behind the administration of a distinction agent (gadolinium), element of the tumor and blood vessels, wherever the dissimilarity will pass the blood-brain barrier are found as hyper intense areas. There are completely different attempt for brain tumor segmentation that utilize as mix multimodalities, single modality and use priors noninheritable from population atlases. Modalities that provide vital data information concerning tumor and edema that embrace insertion Imaging, Diffusion Imaging give minor resolution images difference with T1 or T2 weighted arrangements. The first reason to utilize multimodality images like T2 weighted MRI is to segment infiltration/edema areas that are usually not detectable in T1 images.

These techniques combine region developing and boundary detection designed for magnetic resonance (MR) brain image segmentation. Initializing through a straightforward area growing algorithm that generate an above segmented image apply a complicated merging

process and region growing that handles convoluted image structures. Boundary information is subsequently incorporated to accurate also to substantiate region boundaries. Texture based automated seed segmentation is enforced at this point. The outcome of this method should be precise as well as proficient for MR brain image segmentation.[5] The involuntary segmentation of medical images serve because pc aided diagnosis and quantification studies are the key step in imaging applications for registration of a variety of modalities. Image segmentation with multifarious structures like magnetic resonance image of the brain complicate the use in universal principle technique. Region-based technique frequently not succeed to yield the predictable composition due to the complexity of choosing an affordable starting "seed".

Brain resonance images (MRI) of tumor segmentation may be a difficult method. The Region Growing formula may be a conventional region-based methodology designed for medical image segmentation.

Background

Seeded Image Segmentation: An un-directed graph is given by means of vertices v Є V and edges e Є E, a weighted graph assign as wij to every edge eij between the vertices vj and vi.[1] Vertices are equivalent to the image pixels and also the edge weights are similarity measures between neighboring pixels dependent on image features (e.g., intensities) in image segmentation[7]. Every vertex vi has an attribute xi, that is a marker of the possibility of a label model for back ground and foreground label. With the background B and foreground F seeds are provided via the user. In absolute solution, the vertices having value xi <0.5 as background and xi ≥ 0.5 are marked as foreground. This procedure has proceeded in anticipation of all pixels are allocated to an area.

Region Growing in Image Segmentation: Seeded region growing require seeds as complementary key. The segmentation consequence relates ahead the selection of seeds. Blare inside the image might create seeds to survive imperfectly placed. Un-seeded area emergent may be a personalized set of an algorithm that doesn't need specific seeds. In area growing, the homogeneity[8] condition, as its demand depends in addition on image arrangement property that isn't regard to the client. Highly developed emergent algorithmic program follows homogeneity criterion consequently from the distinctiveness of the area to be divided. The technique is totally based on a duplicate that describe homogeneity and basic outline properties of the region. Parameters of the homogeneity perception are evaluated from sample location within the region. These locations are selected one after another during a random walk starting at the seed position, and therefore the homogeneity condition is updated frequently[9]. These approaches develop into comprehensive, completely automatic with entire segmentation technique through the use of the pixels among the insignificant gradient length within the undivided image section as seed position. The strategy practiced was meant for segmentation scheduled experiment images and structures in MR and CT images. The method to frequently work is the hypotheses model on homogeneity as well as section characteristics are definite. Additionally, the model is straightforward and tough, therefore with an exact amount of divergence from model constraints and influential certain segmentation outcome.

A single region A1 is chosen in the pixel does not considerably impact ultimate segmentation. Each iteration consider the adjacent pixels similarly as the seeded region growing. It is not the same as seeded region growing as the least amount δ is lesser than a pre-described threshold T and then brought to the relevant region Aj. The pixel is measured substainly different from all existing regions Ai and a new region An+1 is formed with this pixel. One alternative of this method is based on pixel intensities. The mean and scatter of the area and power of the pixel is utilized to calculate a test statistic. If the test statistic is insufficient, the pixel is then added to the region and the region's mean and scatter are computed once more. Once the pixel is redundant[10], it can be used to form an additional new section. The Region Growing algorithm is a standard region-based technique for medicinal image segmentation. The most important approach is to begin with n seed points vi, i = 1..n, of voxels. From these seed points, region develop with the help of each seed and adjacent voxels which have comparable properties primarily based on pre-defined criteria. In this progressive rising manner n regions Ri, i = 1..n, will be formed. The comparison criteria to judge a voxel as part of the region Ri is recognized according to the image property. In this execution, let x be a neighbor voxel to several voxel belonging to the region Ri. If the Euclidean space concerning the voxel x and the seed point vi is fewer than a threshold θ then

the voxel x is incorporated to the region Ri. To finish the region of interest is expected for merging each grown region i=1..n of Ri.

Method

In this portion, the necrotic regions in brain tumors and the whole segmentation plan to segment the increasing cells is explained in detail. In the given workspace Segmentation is a method of determining a pattern or object. MRI is examined as a workspace in this project. In this place, tissues abnormality are detected. Really, the MRI produce a good contrast image showing all parts exactly, yet while a problem of segmenting also there. In this situation, anatomical structure observation is an important work of the physiologist. But this route may take more time and the other subsequent results such as volume[11] calculation generate incorrect measurement results when original segment result is incorrect.

Additionally, users never want to choose the seed point manually. so human interaction also not here. In this present study, our expectation is that the brain tumor structure may be of any significant shape and it is grown in impressive size.

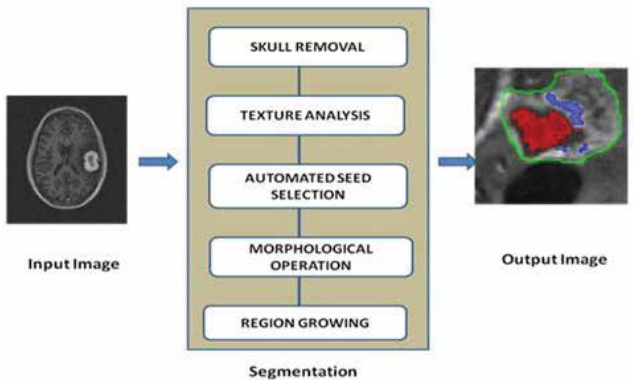

Fig. 1: Block diagram of brain tumor segmentation on MRI using Region Growing method

A. Input Image: The input representation here is the magnetic resonance image of brain. The main reason to utilize MR images such as T2 weighted MRI is to segment edema/infiltration area which is normally not recognizable in T1 images. *Skull Part Removal*

This skull removal process is a kind of pre-processing procedure to produce desirable results. Skull is external component of brain neighboring for the elimination of its non-cerebral tissues.

1. At the first store, the number of columns and rows and determine the size of the image in individual variables.
2. Execute iteration for all rows and half of the columns.
3. Progress half of image convert black pixels from white pixels by fixing the gray value to zero.
4. The above steps are continued for the residual row and column.

B. Texture Analysis: Magnetic resonance images consist of little microscopic information that may not assess visual and texture analysis method and provide a way for getting the information. Texture is of various forms like fine or rude, rough or soft, irregular or regular. A small number of patterns are extremely complicated that they can be specifically explained with texture[12] and can be simply visualized. Texture analysis on the images is performed by the use of the statistical method of the second order that applies gray level co-occurrence matrix and gray level run length measures. Parameters of run length are taken in 135, 45, 90 and 0 directions. Throughout the normalization of gray level, intensities of image were delivered from [$\mu+3\alpha$, $\mu-3\alpha$]. At last, corresponding to allotment, the image abnormality is identified.

C. Automated Seed Selection

1. Transfer specified colored image to the gray image.
2. In the beginning, count the amount of pixels with smaller intensities than hundred along with larger intensities above hundred and keep in individual values.
3. Discover the dissimilarity among each variable where variation is slight, then go to step 4, otherwise transfer the image to negative, yet once more fix as strength of exterior portion of brain to 0 and move toward step 4.
4. Switch the gray image towards binary image

D. Morphological Operation: Morphology primarily deal with outline and construction of tumor. This carry out object removal, noise exclusion, etc. For similar function these operations are applied to improve tumor margin and eliminate the distraction of image pixels

structuring component broaden the previous boundary of the image. The value in these stuffing pixels varies for dilation as well as erosion operations.

E. Seeded Region Growing: Input here is the outcome following morphological procedure. The automatic[15] seeded region growing technique next to the edge detection technique is applied here for identifying mixed necrotic and enhancing tissues in the given MRI. This step for segmentation checks adjoining pixels in primary "seed points" and concludes if the adjacent pixel were supplied to that spot.

Iteration procedure is identical to common data clustering algorithms. Major objective of segmentation is the separation of image as regions. Various segmentation techniques such as "Thresholding" accomplish the target by focusing borders among the region. In region-based segmentation[16], shaping of area is done straightforwardly. Ten samples of brain MRI is used for experimenting with it. This uses linked neighbor region growing technique has been implemented and the results are observed. The Region-Based Segmentation formula is:

(a) $U^{n}_{i=1} R_i = R_0$

This means that the segmentation should be absolute and each pixel ought to be in the area, where R_i is a linked region.

(b) $R_i \cap R_j = \phi$

Equation (b) denotes that the area have to be dislodge so that a clear partition from each other can be recognized.

(c) $P(R_i) = TRUE_{For\ i=1, 2,\ldots,n}$

Means a pixel may fit in to the area which satisfy the situation that gray level of pixel is in the array of region.

(d) $P(R_i U R_j) = FALSE$

Shows regions R_i and R_j are dissimilar in the logic of predicate P.

F. Necrotic Segmentation: Quantification of the necrotic areas inside tumor is an vital problem in processing of the tumor growth. Belated radiation necrosis usually occurs in three months or further after the treatment[18], is a main risk linked with stereotactic radio surgery. Necrosis of the tumor can take place as a consequence of the radio surgery as well as by the tumor progress itself like in gliomas.

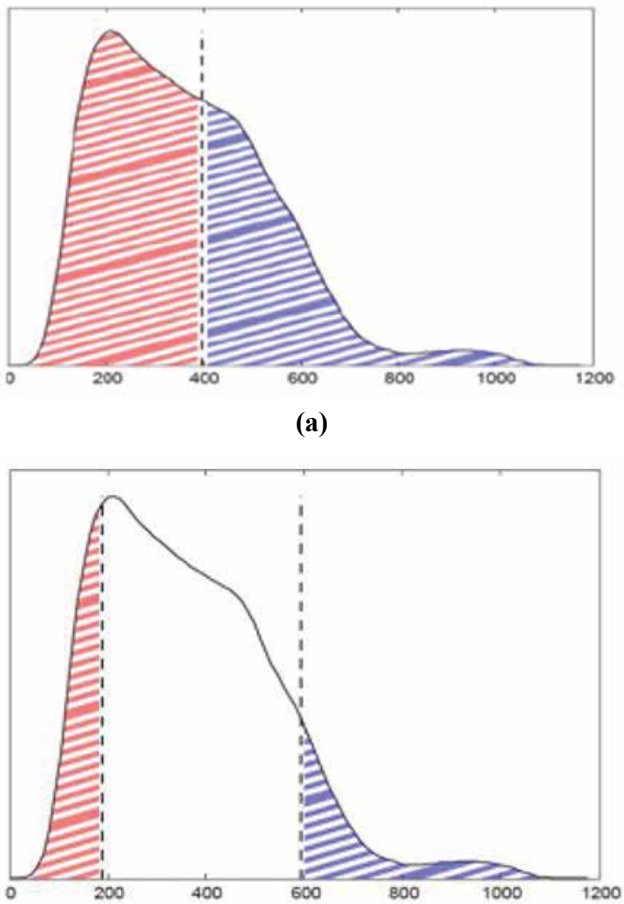

Fig. 2: (a) Segmentation with a single threshold. (b) Necrotic and enhanced thresholds to determine initial seeds

Necrotic class physically arises in segmentation by multi modality intensity[17] classifiers owing to diverse intensity uniqueness. However, the aim of these revise is to enumerate the necrotic and improved portion of the tumor via solely contrast enhanced T1weighted MRI of brain.

Table I : Comparison of Manual and Automatic Brain Tumor Segmentation

Sl. No.	Analysis	Manual Segmentation	Automatic Segmentation
1.	User Interaction	More	Very less
2.	Iteration	More	Less
3.	Accuracy	High	Low
4.	Time Consuming	Yes	No
5.	Shortest Path Problem	Exists	Reduced

Results

We have implemented our work and a group of ten imagery are used to execute all operations. The presence of necrotic tissues is found in the tumor and the observed results for those images are incorporated in the subsequent observation table:

Table II: Results of Brain Tumor Segmentation

Sl. No.	Image No.	Abnormality	Necrotic Tissues
1.	a	Present	Absent
2.	b	Present	Absent
3.	c	Present	Absent
4.	d	Present	Absent
5.	e	Present	Absent
6.	f	Present	Absent
7.	g	Present	Absent
8.	h	Present	Present
9.	i	Present	Present
10.	j	Present	Present

Conclusion

This type of budding segmentation method forrn necrotic and enhancing cell segmentation of brain tumor on MRI and promising to establish abnormality present in the image or not. This is a novel, healthy, rapid and entirely automatic algorithm for necrotic segmentation. This algorithm requires no preceding information or guidance procedure. Both the homogeneous texture appearance and spatial features of MRI were effectively locate the seed points and segmentation outcome obtained are extremely perfect to a great extent. So this technique gives improved outcome compared to various methods. The upcoming effort is to diminish the entire implementation time and to work with segmentation of necrotic tissues to find the accurate size of necrotic and tumor cells.

Design of a Prototype System to Determine Ammonia Concentration in Exhaled Human Breath in the Diagnosis of Kidney Failure

Nihitha Rajendran[1], P Vinupritha[2], D Kathirvelu[3]

[1]M.Tech Student, [2]Assistant Professor, [3]Assistant Professor Department of Biomedical Engineering, SRM IST, Kattankulathur, Chennai, India

ABSTRACT

Background: The air exhaled contains many types of gases and are the indicators of different and various types of disease. These various types of disease are diagnosed by measuring the concentration of the different gases exhaled by breath. Ammonia gas is represented as the biomarker for the kidney failure patients. Kidney failure is a disease which is determined by extremely high ammonia content in human breath and they have disturbed urea balance.

Aim and Objective: The work focuses on developing a breath analyser system to detect the concentration of ammonia level for the patients who are suffering from kidney failure. The aim is to diagnose the kidney failure based on the ammonia concentration exhaled in the human breath.

Materials and Method: The material used in our study to develop a prototype are arduino board, ammonia gas sensor and TFT LCD display. In this study, 20 patients with kidney failure and 20 healthy volunteers were enrolled. The breath samples were collected from each participant by instructing them to blow through the mouth piece.

Results: The creatinine level and blood urea level of kidney failure patients are 7.93 ± 4.50 mg/dL and 160.72 ± 81.85 mg/dL. The range of breath ammonia level for kidney failure patients is 347.6 ± 84.87 ppb and for normal volunteers is 86.35 ± 12.94 ppb.

Conclusion: The results of our current study shows that the gas analyser detected more amount of ammonia in the breath of dialysis patients compared to healthy volunteers.

Introduction

The human breath is a mixture of oxygen, nitrogen, carbon dioxide, water and inert gases. They also have a trace of various components of volatile organic compounds (VOC). The volatile organic compounds reflect physiological and pathological biochemical processes in our body and they are transported via blood stream and they are exhaled through lungs[1]. For diagnosing different types of disease, the analysis of human breath plays a main role. The volatile organic compounds can be measured, identified and analysed using a breath analyser for the early diagnosis of diseases. When compared to other body fluids like blood and urine, the collection of breath sample is safe. The VOC's can be identified by few analytical techniques such as Proton transfer-Mass spectrometry (PTR-MS), Gas chromatography (GC)[2], Ion mobility spectrometry (IMS)[3].

Ammonia gas is represented as the biomarker for the kidney failure. The ammonia present in the humans are maintained via urea cycle and the excess amount of ammonia is converted to urea and excreted through urine[4,5].There is a standard method to evaluate ammonia

by measuring the ammonia levels in blood. But the blood ammonia leads to certain potential errors in processing and collection. The blood samples collected cannot be preserved under room temperature for too long and they must be analysed immediately [6].

Kidneys help in filtering the waste products from blood[7]. The major role of kidney is to filter and produce urine and it purifies blood [8]. The urea levels are disturbed for a person who is suffering from kidney failure. So, the urea level is measured indirectly by measuring the ammonia level concentration in breath[9]. When the kidney losses their ability to function, kidney failure occurs. Kidney failure is also known as end stage renal disease (ESRD) and it is the last stage of chronic kidney disease (CKD). It is caused either by diabetes, uncontrolled hypertension [10]or dietary changes which leads to chronic disorders [11]. The irreversible loss of kidney function leads to kidney replacement therapy by transplant or dialysis [12]. The kidney failure stages can be achieved by measuring the blood urea nitrogen (BUN), creatinine [13], Glomerular filtration rate (GFR) [14]and albuminuria. This can be tested by few standard techniques like blood test, biopsy and urine test [15]. The end stage renal disease is diagnosed when the kidney damage gets worse and the filtration process does not take properly.

This work focuses on diagnosing kidney failure, by detecting the ammonia concentration level in exhaled breath. A prototype device was designed with ammonia sensor, Arduino board and TFT LCD (thin film transistor-liquid crystal display). This device is low cost, unique and immediately detects ammonia gas.

Materials and Method

A. Block Diagram

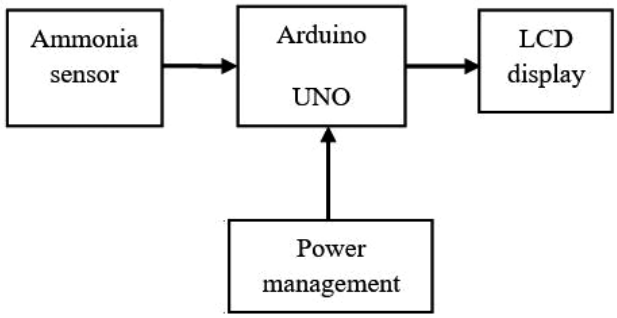

Fig. 1: Block diagram of the design of prototype device

For designing this prototype, both hardware and software implementation is required. Fig.1 shows the block diagram of the design of prototype device. Arduino UNO is connected along with the ammonia sensor and TFT screen. For software implementation, Arduino IDE is used. Arduino IDE helps to compile the code to Arduino board. Fig.2 shows the device setup of the prototype. The ammonia sensor is kept inside the glass chamber to isolate from the environment air. The prototype is powered to PC via USB and the results can either be seen in TFT screen or PC.

Fig. 2: Device setup

B. Materials

Arduino Board: The Arduino is an open source prototyping platform where both the hardware and software is highly approachable and very versatile. Arduino boards shown in fig.3 is based on ATmega 328 microprocessor and it is a micro-controller based board.

Fig. 3: Arduino UNO board

Arduino board have variety of digital input's and output's, analog input's and output's, serial interface and pulse width modulation (PWM) outputs which is shown in fig.4. They have a total of 6 analog

pins, 14 digital input/output pins, 16MHz crystal oscillator, a power jack, USB connection and a reset button. The programs are given to the board through PC via USB port. These programs can be easily updated and changed since the communication is operated by a standard serial protocol.

The power source for the Arduino UNO board is either by an external power supply or via USB connection. The 6 analog pins from A0 to A5, provides resolution of 10 bits to each pin and are used to fetch the signals from sensor. The 14 digital pins from pin 2 to 13 is used as input and output pins. Pin 0 and 1 are used to receive (RX) and transmit (TX) data. 3.3V and 5V pins are used as the output pins for Arduino board. The microcontroller present inside the board is considered as the brain of the Arduino board.

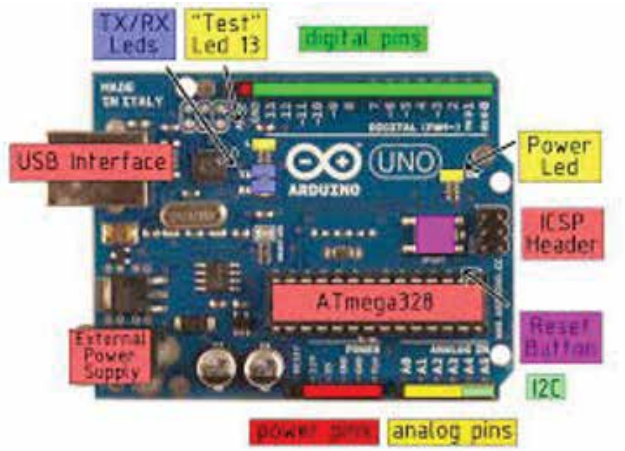

Fig. 4: Arduino board pins

Ammonia Gas Sensor: Gas sensors shown in fig.5, helps to indicate and measure the concentration of certain gases. MQ137 ammonia gas sensor is an electrochemical sensor which is used to measure the partial pressure of gas under atmospheric condition. This sensor gives fast response and is very sensitive to ammonia gas. The gas to be detected reacts with the sensitive layer which is on the top of the sensor. The sensitive layer is composed of tin oxide. This sensor can be used a both analog and digital sensor and the operating voltage is +5V.

TFT Screen: TFT screen shown in fig.6, is a type of LCD where thin film transistor technology is used. This type of technology is used because they provide good resolution and the image qualities can be improved. The special feature of this screen is that they can control individual RGB pixels to get a good and better resolution. This module is operated at a voltage of 3.3V and they have 2 modes- SPI mode and 8-bit mode. Only one mode can be used at a time. SPI mode is very easy to port to other microcontrollers and they can be used only when the speed is not the priority.

Software: The software used here is Arduino IDE (integrated development environment) software which is shown in fig.7 and it is a simplified version of C/C^{++}. This helps in signal processing and data processing. To upload the code, arduino board is connected to PC via USB port. Arduino IDE is divided into 3 main parts: Command area, Text area and Message window area. Command area is the place where we have the main menu items like file, edit, sketch, tool, help and verify icons. Text area is where the codes are written in a simplified version of C^{++} programming language. The message from the IDE is shown in the message window area.

C. Circuit Diagram

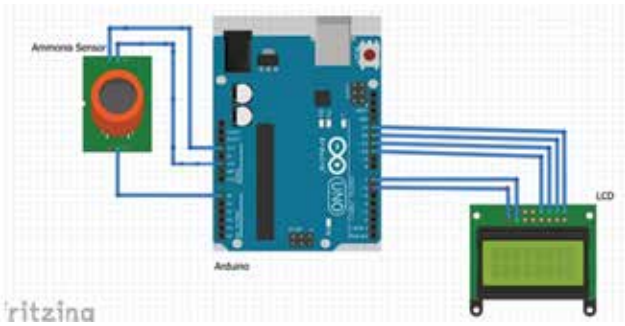

Fig. 8: Circuit diagram

Connect the sensor and the TFT LCD with Arduino board as shown in the fig 8. The 5V of the Arduino pin is connected to the Vcc of the sensor pin, GND is connected to the GND, A0 and D0 of the Arduino pin is connected to the A0 and D0 of the sensor pin. Upload the code to the Arduino board with the help of the Arduino IDE software. Leave the set-up powered for few minutes. This is known as heating time, during which the sensor warms up.

D. Methodology: 20 healthy samples (Normal volunteers) and 20 unhealthy samples (Dialysis patients) were chosen for the analysis. The subjects were asked to blow through the glass chamber so that it interacts with the sensor. The prototype device detected the breath ammonia concentration in parts per billion (ppb).

Results

The average age of normal volunteers was 38.33 ± 5.89 and dialysis patient was 55.1 ± 9.49. The average breath ammonia level was 86.35 ± 12.94 ppb for normal volunteers and 347.46 ± 84.87 ppb for dialysis patients. The gas sensor detected more ammonia concentration for dialysis patients than normal volunteers. For all the participants, serum creatinine level and blood urea level were measured.

Table I: Comparing the Normal Subjects with the Kidney Failure Patients Undergoing Dialysis Treatment

Features	Normal Subjects (n = 20)	Dialysis Patients (n = 20)
Age (years)	38.33 ± 5.89	55.1 ± 9.49
Height (cm)	154.73 ± 2.85	158.21 ± 4.28
Weight (kg)	61.13 ± 7.69	52.33 ± 6.66
Ammonia concentration (ppb)	86.35 ± 12.94	347.46 ± 84.87
Duration of dialysis (years)	-	7.11 ± 3.60
Creatinine level (mg/dL)	0.6 – 1.4	7.93 ± 4.50
Blood urea level (mg/dL)	10 - 50	160.32 ± 81.85

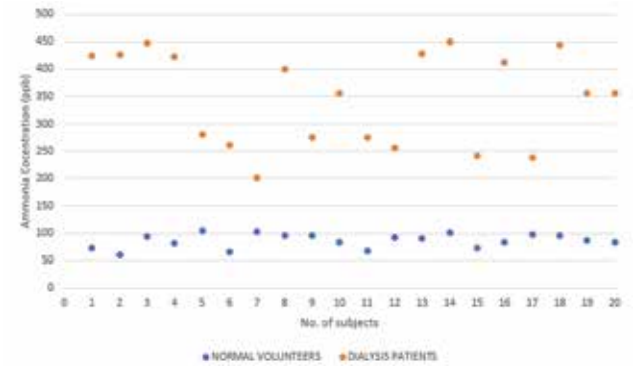

Fig. 9: Ammonia concentration for normal volunteers and dialysis patients

Discussion

Kidney failure has reached an advanced stage in many patients and they are unaware until it is severely affected. Ammonia is a volatile compound which is exhaled in large amounts in kidney failure when compared to normal controls. Ammonia is converted to urea in the liver through urea cycle in healthy individuals. The urea which is converted is transported through the bloodstream which is then excreted as urine by kidneys. The patients with kidney failure who is undergoing dialysis have a high amount of ammonia in their body because of the lower renal excretion of nitrogen compounds and they also have high levels of serum creatinine compared to healthy volunteers. So, designing a breath analyser could be a useful tool for measuring ammonia concentration in human breath.

A prototype device has been developed with the help of electro-chemical sensor which is capable of real time analysis of human breath ammonia. The electro-chemical sensor is capable of generating real time data.

Conclusion

The present study reports on an electrochemical sensor for detecting the ammonia level concentration level in breathing and on the design of a breath analyser prototype device. This device is a fast, inexpensive, convenient and non- invasive monitoring of exhaled human breath for disease diagnosis. The ideal breath ammonia monitoring prototype device is the one which is sensitive to ammonia gas and it is capable of detecting the concentration level with good accuracy and precision. The ammonia level concentration for different age groups where obtained and the results show that the concentration level ranges from 50 to 110 ppb for normal volunteers and 200 to 500 ppb for dialysis patients. The future research involves in developing a device which is capable of real time analysis.

Enhancing Blood Cell Images using Denoising Filters for the Detection of Hematological Disorders

Aldrin Karunharan K[1], Om Prakash[2]

[1]Research Scholar, Department of Electronics and Communication, Shri Jagadhishprasad Jhabarmal Tibrewala University; [2]Professor, Department of Electronics and Communication, Malla Reddy Institute of Engineering and Technology (MRIET), Hyderabad

ABSTRACT

Hematological disorders refer to the diseases caused with the changes in blood cells or blood system such as Leukemia, Anemia, Malaria and Azotemia. Preprocessing of blood cell images is very important step in the detection of these disorders. Hence after image acquis ion from hematologists and oncologists denoising and edge detection are to be done to enhance the image for segmentation of blood cell images and leukocytes, erythrocytes and thrombocytes. Because leukemia can be detected from leukocytes and malarial parasites can be detected from erythrocytes. In this paper we have applied few techniques such as Gabor filter, Gaussian filter, Prewitt filter, Sobel and Canny edge operators for the preprocessing purpose. We have compared the performance of these techniques based on their accuracy and resolution

Keywords: *parasites, smoothing, convolution, granularity and thresholding*

Introduction

Today this is seen a trivial task, with many image acquisition systems being readily available on the commercial market, covering a broad range of performance requirements[1] (high and low resolution, speed, color definition, etc.). Nevertheless, there are a number of general criteria that need to be met for images acquired for computer analysis, to ensure that the images acquired are as useful as possible[2]. These include: Global uniformity, local sensitivity,

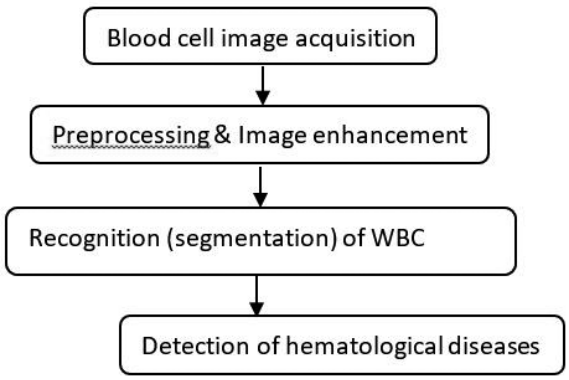

Figure 1: General Steps Involved in Detection of Leukemia

Pre-processing methods use a small neighborhood of a pixel in an input image to get a new brightness[3] value in the output image. As initialization, preprocessing is performed to remove the high frequency noise present in the image followed by edge detection. In order to perform this algorithm a blood cell image will be processed. The approach show that the basic effects of (2D) Gaussian filter are smoothing the image and wiping off the noise. Generally speaking, for a noise-affected image, smoothing it by Gaussian function[4] is the first thing to do before any other further processing, such as edge detection. The effectiveness of the Gaussian function is different for different choosing the standard deviation sigma of the Gaussian filter.

Edges characterize boundaries and are therefore a problem of fundamental importance in image processing. Edges in images are areas with strong intensity contrasts – a jump in intensity from one pixel to the next. Basic idea of canny[5] edge detector is to detect at the zero crossings of the second directional derivative of the smoothed image in the direction of the gradient where the gradient magnitude of the smoothed image being greater than some threshold depending on image statistics.

Gaussian Filter: The Gaussian smoothing operator is a 2-D convolutional operator that is used to `blur' images and remove detail and noise. In this sense it is similar to the median filter, but it uses a different kernel that represents[6] the shape of a Gaussian (`bell-shaped') hump.

The Gaussian distribution in 1-D has the form:

$$G(x) = \frac{1}{\sqrt{2\Pi\rho}} \ell \frac{-x^2}{2\sigma^2} \quad \ldots 1$$

where σ is the standard deviation of the distribution. It is also assumed that the distribution has a mean of zero *i.e.* it is centered about the line $x = 0$. The distribution is illustrated in the following Figure. 2

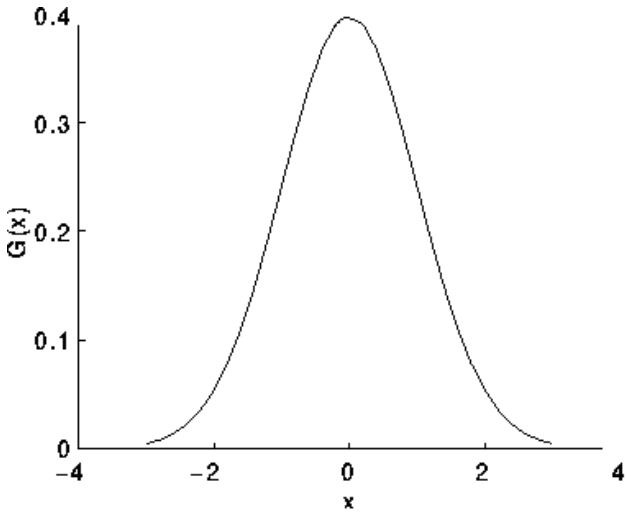

Fig. 2: One dimensional Gaussian distribution

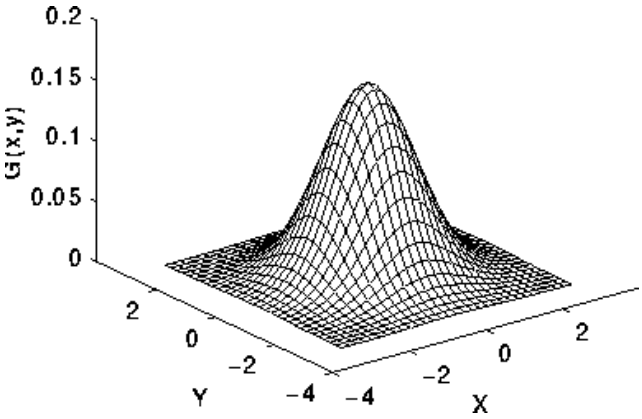

Fig. 3: Two dimensional Gaussian distribution

The idea of Gaussian smoothing[7] is to use this 2-D distribution as a `point-spread' function, and this is achieved by convolution. Since the image is stored as a collection of discrete pixels it is necessary to produce a discrete approximation to the Gaussian function before the convolution can be performed. In theory, the Gaussian distribution is non-zero everywhere, which would require an infinitely large convolution mask, but in practice it is effectively zero more than about three standard deviations from the mean, and so we can truncate the mask at this point.

In a perfect world, filter designers would only have to deal with time domain *or* frequency domain encoded information, but never a mixture of the two in the same signal. Unfortunately, there are some applications where both domains are simultaneously important. For instance, television signals fall into this nasty category. Video information is encoded in the time domain, that is, the shape of the waveform corresponds to the patterns of brightness in the image. However, during transmission the video signal is treated according to its frequency composition, such as its total bandwidth, how the carrier waves for sound & color are added, elimination & restoration of the DC component, etc. As another example, electro-magnetic interference is best understood in the frequency domain, even if the signal's information is encoded in the time domain. For instance, the temperature monitor in a scientific experiment might be contaminated with 60 hertz from the power lines, 30 kHz from a switching power supply, or 1320 kHz from a local AM radio station. Relatives of the moving average filter have better frequency domain performance, and can be useful in these mixed domain applications.

Motion Average Filter: An average filter averages a number of input samples and produces a single output sample. This averaging action removes the high frequency components present in the signal. Average filters are normally used as low pass filters. In recursive filtering algorithm, previous output samples also are taken for averaging. Simple averaging can be used to reduce the effects of noise. Suppose we have *n* measurements of a variable *x*.

X' is the mean or average of the *n* measurements calculated as:

$$X' = \frac{1}{n}\sum_{i-1}^{n} xi \quad \ldots 2$$

The magnitude of s is clearly dependent on the measurements xi which in practice is bounded, that it has lower and upper limits. However, s is also dependent on the number of measurements made, i.e. the number n. Thus for bounded values of xi, it can be deduced that the larger n is, the smaller s becomes. In other words, given a noisy but bounded measurement sequence, we can take a large number of readings of the variable and use its average to give a better estimate of its true value provided there is no systematic error or bias in the measurements.

The moving average filter and its relatives are all about the same at reducing random noise while maintaining[12] a sharp step response. The ambiguity lies in how the *rise time* of the step response is measured. If the rise time is measured from 0% to 100% of the step, the moving average filter is the best you can do, as previously shown.

In comparison, measuring the rise time from 10% to 90% makes the Blackman window *better* than the moving average filter. The point is, this is just theoretical squabbling; consider these filters equal in this parameter. A gating function which had been the basis of modular gating network was used to over the limitation of training data and to yield better result. Magnitude and phase information was derived from each vector.

The biggest difference in these filters is execution[8] speed. Using a recursive algorithm (described next), the moving average filter will run like lightning in your computer. In fact, it is the fastest digital filter available. The sum and differences of histograms of grey levels the neighboring pixels are obtained the signal corresponding to each pixel location was chosen as the random variable.

Multiple passes of the moving average will be correspondingly slower, but still very quick. In comparison, the Gaussian and Blackman filters are excruciatingly slow, because they must use convolution. Think a factor of ten times the number of points in the filter kernel (based on multiplication being about 10 times slower than addition). For example, expect a 100 point Gaussian to be 1000 times slower than a moving average using recursion

Unsharp Mask Filtering: The unsharp mask filter algorithm involves subtraction of an unsharp mask from the specimen[9] image. An unsharp mask is simply a blurred image that is produced by spatially filtering the specimen image with a Gaussian low-pass filter. This filter can be considered as a convolution operation on an image with a kernel mask that is a two-dimensional Gaussian function (g (x, y); as defined in Equation 3.8)**:**

$$G(x, y) = \frac{1}{2\sigma^2} e^{-}(x^2 + y^2)/2\sigma^2 \qquad \ldots 3$$

The size of the Gaussian kernel mask is a function of the parameter □, and the size of the kernel mask determines the range of frequencies that are removed by the Gaussian filter. In the tutorial, the Standard Deviation slider determines the value of □ in pixels. In general, increasing the size of the kernel mask causes the Gaussian filter to remove a greater number of spatial frequencies from the unsharp mask image.

The unsharp mask is then subtracted from the original image according to the equation:

$$F(x, y) = \frac{c}{2c-1} 1(x, y) - \frac{(1-c)}{2c-1} u(x, y) \qquad \ldots 4$$

In Equation 3, the function F **(**x, y) represents the brightness value of a pixel at the coordinate **(**x, y**)** in the filtered image, and I **(**x, y**)** and U **(**x, y**)** represent the brightness values of the corresponding pixels in the original and unsharp mask (blurred) images, respectively. The constant **c** controls the relative weightings of the original [13]and blurred images in the difference equation. In the tutorial, the Weighting Value slider can be used to control the value of **c** within the range of 1 (the zero percent position), to 5/9 (0.556) at the 400 percent filtering level. Similarly, the Standard Deviation slider determines the standard deviation (measured in pixels) of the Gaussian function utilized to generate the kernel mask.

The equation presented above (Equation 2) demonstrates that an unsharp mask filter operates by subtracting appropriately weighted parts of the unsharp mask from the original image. Such a subtraction operation enhances high-frequency spatial detail at the expense (attenuation) of low-frequency spatial information in the image. This occurs because high-frequency spatial detail removed from the unsharp mask by the Gaussian filter is not subtracted from the original image. In addition, low-frequency spatial detail that is passed by the Gaussian filter (to the unsharp mask) is almost entirely subtracted from the original image. This explains why increasing the size of the Gaussian filter mask usually causes the unsharp[14] mask filter to produce a sharper image.

One of the primary advantages of the unsharp mask filter over other sharpening filters is the flexibility of control, because a majority of the other filters do not provide any user-adjustable parameters.

Like other sharpening filters, the unsharp mask filter enhances edges and fine detail in a digital image. Because sharpening filters also suppress low frequency detail, these filters can be used to correct shading distortion throughout an image that is commonly manifested in the form of slowly varying background intensities. Unfortunately, sharpening filters also have the undesirable side effect of increasing noise in the

filtered image. For this reason, the unsharp mask filter should be used conservatively, and a reasonable balance should always be sought between the enhancement of detail and the propagation of noise

Laplacian Filter: The Laplacian of an image highlights regions of rapid intensity change and is therefore often used for edge detection. The Laplacian is often applied to an image that has first been smoothed with something approximating a Gaussian smoothening filter in order to reduce its sensitivity[15] to noise, and hence the two variants will be described together here.

The operator normally takes a single gray level image as input and produces another gray level image as output.

The Laplacian L (x, y) of an image with pixel intensity values I (x, y) is given by:

$$L(X, Y) = \frac{\partial^2 I}{\partial x^2} + \frac{\partial^2 I}{\partial y^2} \quad \ldots 5$$

The input image is represented as a set of discrete pixels. We have to find a discrete convolution kernel that can approximate the second derivatives in the definition of the Laplacian.

Gabor Filter: A **Gabor filter** is a linear filter whose impulse response is defined by a harmonic function multiplied by a Gaussian function. Because of the multiplication-convolution property, the Fourier transform of a Gabor filter's impulse response is the convolution of the Fourier transform of the harmonic function and the Fourier transform of the Gaussian function. Gabor filters are directly[10] related to Gabor wavelets, since they can be designed for number of dilations and rotations. However, in general, expansion is not applied for Gabor wavelets, since this requires computation of bi orthogonal wavelets, which may be very time-consuming.

Therefore, usually, a filter bank consisting of Gabor filters with various scales and rotations is created. The filters are convolved with the signal, resulting in a so-called Gabor space. This process is closely related to processes in the primary visual cortex. The Gabor space is very useful in e.g., image processing applications such as iris recognition. Relations between activations for a specific spatial location are very distinctive between objects in an image. Furthermore, important activations can be extracted from the Gabor space in order to create a sparse object representation. A Gabor function is a Gaussian function modulating a sinusoid.

Experimental Results and Comparison

Upon comparing the performance of Gabor, Gaussian, laplacian, moving average and unsharp filter based on the signal to noise ratio, we found that Gaussian filter provides the best performance toward the enhancement[11] of blood cell images to fulfill our objective of segmenting into white and red blood cells. Color constancy observation was essential because different images with different color characters were chosen and used. Calculation of area granularity, curved and convex region, and morphological properties of background and objects of interest were necessary to the choice of parameters for parasites and species recognition. The outputs are filters are given below.

Fig. 4: De-noised result of Gabor filter

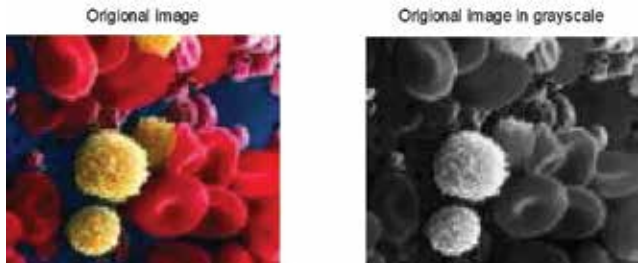

Fig. 5: Gray scale image of the blood cell sample

Table 1: Comparing of performance of denoising filters

Noise type	Laplacian	Moving average	Gabor	Gaussian
Salt and pepper	20.34	22.57	20.45	24.65
Speckle	19.56	19.69	22.56	24.87
Poison noise	21.42	20.04	19.78	19.41
Uniform noise	22.34	18.98	21.00	20.86
Raleigh noise	19.08	22.67	20.98	23.65
Erlang noise	20.09	21.76	19.87	21.89

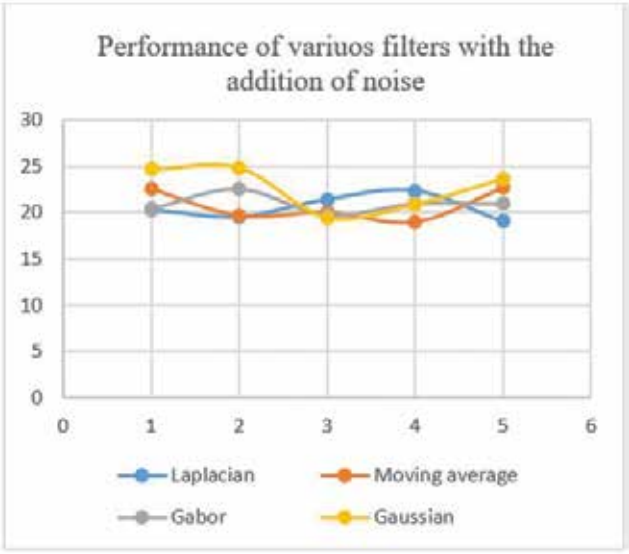

Fig. 6: Performance comparison of filters under various type of noise

Conclusion

The performance of the filters are compared based on PSNR [peak signal to noise ratio] After carefully analyzing the performance of the filters we found that Gaussian filter performs well in the presence of salt and pepper noise as well with the addition of Raleigh noise This noise is resolved, after thresholding, into contiguous white areas, which may be recognized by the system as pseudo-cells. Further noise is associated with non-compact blood cell contours. This results after thresholding, in contiguous cells (cells whose contour area is not compact). Moreover, cell's mean brightness and area will differ considerably from the predefined stored values, resulting in misclassification of the cell. The difficulties of the thresholding can be solved using **a** combined method. An enhanced image undergoes a threshold process called histogram entropy classification for enabling the detection of hematological diseases.

Development of Gas Sensor Device for Primary Health Care Monitoring System

Shifa Anas[1], Gnanavel S.[2]

[1]Student, [2]Asst. Professor, Department of Biomedical Engineering, SRM Institute of Science and Technology, Chennai, India

ABSTRACT

At present many people are suffering from diabetes and cholesterol related diseases. Such disease can occur due to hereditary, food preferences or lifestyle of each individual. Primary checkup or test of such disease is essential in order to maintain the normal level for a person. Blood test are usually done but it is painful and time consuming, whereas testing using individual's skin gas is more reliable and less painful. Skin gas is emanated from skin in particular range for normal individual. But for patient with disease it either exceeds or precedes the particular skin gas level.

Keywords: *Cholesterol, diabetes, nitrous oxide, hydrogen sulphide, skin gas.*

Introduction

Gases are produced in small amount in body to carry out various biological functions. It is mostly used as a signaling molecule, relaxant of smooth muscle, regulation of metabolic activities [1].Hydrogen sulphide is produced in body in small amounts as a signaling molecule. It is a mucous membrane. In respiratory tract it acts as an irritant. It causes pulmonary edema with immediate or delayed effects after exposure to high concentration[2]. Acute exposure symptoms include nausea, headaches, disturbed equilibrium, tumors, skin and eye irritation. In human body this gas is produced from cysteine by enzymes such as cystathionine beta-synthase and cystathionine gamma- lyase. Hydrogen sulphide protects against cardiovascular disease by relaxing the blood vessels. Decrease in concentration of H2S in brain causes Alzheimer's disease. Whereas, increase in production of hydrogen sulphide causes several problems such as Down's syndrome, Type- 1 diabetes and Type-2 diabetes. In diabetes condition due to H2S beta cells of pancreas produce excess of H2S leading to damage of cells and reduced insulin production. It also slows down the metabolic rate of the body by binding with cytochrome oxidase[3]Another gas which is emanated from human skin is nitrous oxide which plays an important role in body functions. Nitrous oxide complicates its direct measurements because it's a high reactive molecule. It is produced at different locations of our body during metabolic reactions [5]. NO is naturally present in food and it helps in lowering the cholesterol level in body by preventing fat deposition in blood vessels. Certain foods that are rich in NO content are beetroot, nuts and seeds, green leafy vegetable, citrus fruits, meat, garlic, pomegranate, dark chocolate, watermelon and red wine[5]. Certain studies have shown that garlic has the ability to increase nitrous oxide levels in body which inturn lowers the blood pressure and has improved tolerance for physical activities such as exercise[6,7.] Another study showed that nitric oxide production increased with the intake of red wine [8]. Heart beat sensor consists of photodiode and IR light emitter. As the heart pumps blood the blood pressure inside increases which inturn rises the amount of infrared light emission from the emitter which gets reflected to detector. This helps us find of heart beat per minute [9].In temperature sensor increase in temperature causes change in resistance[10].Thus a compact device of these respective above sensor makes the work easier for practitioners and is a pain free method for patients who have to undergo a regular checkup.

Materials Required:

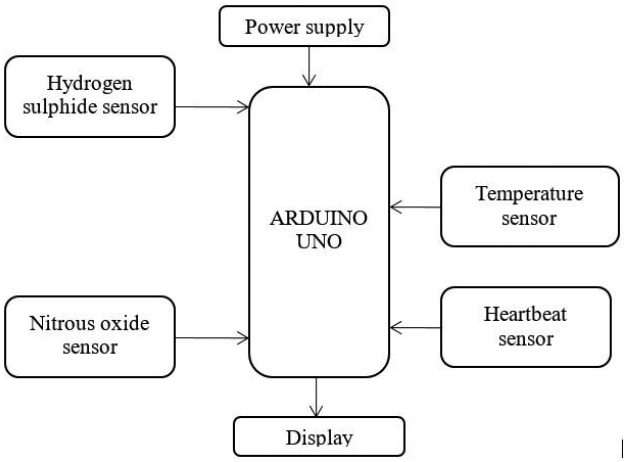

Fig. 1: Block diagram of device

Hardware Used:

(a) Gas Sensor: Gas sensor is used to detect the skin gas emanated from human body. It detects gas at certain voltage when the skin comes in contact with the heating filament of sensor[10]. The sensors are actually kept for pre- heating before the actual work starts. Whenever the sensor is introduced to the gas the concentration of digital pin go high[11] to a certain voltage. Analog pins can also be used instead of digital pins. The analog pins are read using microcontroller in which the values are directly proportional to gas concentration [12].

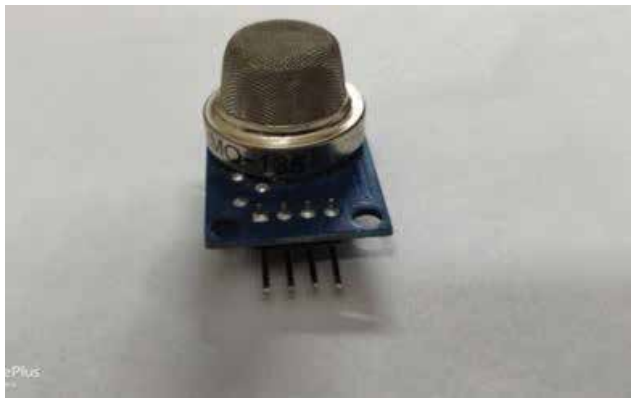

Fig. 2: Hydrogen sulphide gas sensor

(b) Heart Rate Sensor: Heart rate sensor has the principle of photo phlethysmography. In this the light is either transmitted of reflected which is absorbed by the blood which inturn is detected by the detector [13,14].The absorption of light depends on blood volume in tissue. The detector has an electrical signal as output.

Fig. 3: Heart rate sensor

(c) Temperature Sensor: Temperature sensor is based on resistance of material of the sensor. Temperature is proportional to resistance of the material. When the voltage increases it increases the temperature [15]. It generally produces high output voltage. It is more accurate when compared to thermistor.

Fig. 4: Temperature sensor

(d) Arduino UNO: Arduino is a simple microcontroller board along with software for the board. Arduino board shown in fig.6 is based on Atmega 328 microprocessor. Arduino interacts by taking inputs from a variety of switches or sensors, and controls various other physical outputs[18-20].

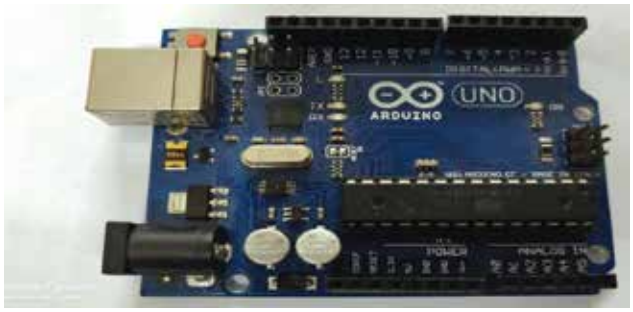

Fig. 5: Arduino UNO

Software Used:

(a) Arduino IDE: The software used is Arduino IDE (integrated development environment) software. This usually used for signal processing and data processing. In order to upload the code the Arduino board is connected to PC through an USB port. Arduino IDE has a command area, text area and message window area. Text area is where the codes can be written in simplified version of C structure programming language. The result from IDE is shown in message window area.

Results and Discussion

The age range of patients whose reading is noted are between 30 to 75 years old. However, irrespective of their age factor the readings are taken. The only factor taken into account is patients suffering from diabetes and cholesterol. The readings of diabetes patient is above the normal range and hence it determined the presence of disease condition of patient. For cholesterol patients the reading is not within the normal range and was below the range and thus this can be taken as a pre-clinical test for patients.

Table 1: Normal patients tested for cholesterol with nitrous oxide sensor

Subject	Age (years)	Heart rate (bpm)	Temperature (◦C)	Nitrous oxide (ppb)
1	47	77	38.5	35
2	39	93	39.3	41
3	52	110	37.6	26
4	45	80	38.5	44
5	32	94	35.4	36

Table 2: Cholesterol patients reading using nitrous oxide sensor

Subject	Age (years)	Heart rate (bpm)	Temperature (◦C)	Nitrous oxide
1	71	72	39.5	15
2	47	98	33.2	19
3	72	75	37.6	21
4	75	89	37.1	18
5	54	72	36.6	17
6	57	77	32.2	17

Table 3: Patients reading using hydrogen sulphide sensor

Subject	Age (years)	Heart rate (bpm)	Temperature (◦C)	Hydrogen sulphide (ppm)
1	53	75	37.6	27
2	54	72	36.1	23
3	64	98	37.1	21
4	51	72	33.2	21
5	75	77	38.0	29
6	67	85	37.2	22

Conclusion

The existing system is an industrial gas sensor which is used to detect leakages in industrial process and operation of machine. The increase in level may cause severe damage to human body, so it is mandatory to check the level of gas emitted in industry for the physical safety as well as the health safety of people working in the particular industry. These gas sensors with increased sensitivity and optimized threshold level can be used for clinical diagnosis of gases emitted from

one's body. Hence gases emanated through skin can be tested to detect the abnormal level in particular person who can have specific disease related to excessive or less level of gas in the body than the actual range.

A Descriptive Study on Mental Stress, Time-Management & Worklife-balance among Ph.D. Scholars

Aalim P. N.[1], Ambily R[2]

[1]P. G. Student, [2]Lecturer, Department of Commerce and Managenent, Amrita School of Arts and Sciences, Amrita Vishwa Vidyapeetham, Amritapuri, Kollam, India

ABSTRACT

Stress is an inevitable and humane fact in the present life's leagues scenario and day to day activities. It is a normal mental psychological reaction by our nervous system when it detects an ultimatum. It brings out an enormous quantity of negative vibes and lends us down physically and mentally. This study anchor on the stress dimensions of Ph.D. scholars and the association of stress with managing the time and work-life balance of respondents. The study was based on 100 samples and questions were scheduled on basis of dependent and independent variables of stress, work-life balance and time management. Statistical tools used were correlation and chi-square analysis with the support of the IBM SPSS processor. The reliability analysis was done and the results were marked on Cronbach alpha .708 means reliable. The statically tests done resulted in the acceptance of hypothesis and hence proved the significance that there is stress for Ph.D. scholars and there is a significant relationship between stress time management and work-life balance.

Keywords: *stress, time-management, work life-balance, PhD scholars, Ha-Alternative hypothesis, H0-null hypothesis*

Introduction

As per the latest regulations made by the UGC, drafts Ph.D. are mandatory for the post of associate professors and for direct instructing enrollment for teaching[1]. And Ph.D. is also not everybody's cup of coffee, the one who pursues Ph.D. must have to publish papers, do research work and only after publishing the final thesis on an open defense and after completing tough they will be awarded Ph.D., and these works and process are not easily achievable one and will take years and it is an expensive[2] one too. One who is pursuing must be dedicated to it; they have to compromise many things family, entertainments, public gatherings, health etc and have to prioritize themselves on their work. These works, deadlines, processes, workloads, and pressure make the work life of research scholar's extreme stressful and this leads to many problems in their personal life as well as in their work life too and it will negatively affect their mental[3] health too. They have to manage their time on the schedule to finish the works on time and not skip the deadline, also to avoid stress and rush on last minute, so the time has to be managed and arranged. And that too by allotting the time for personal needs, family needs and obviously for the work life. And there should always be a balance between the works and the personal life and it is called work-life balance. This research is to conduct a close study and to find the relationship between the mental stresses, time management, the work-life balance among the Ph.D. scholars and to find out the reasons for the stress.

Review of Literature

- Work organization and mental health problems in Ph.D. students (Katia Leveque on Journal of Research Policy-2015): -This study was concerned on the effect and potential impact of the present condition on the academic[4] stress and the health issues related to the Ph.D. scholars. The research was off on a three-phase model. First, the study assessed the prevalence of mental health problems in a representative sample of Ph.D. students in Flanders and Belgium. Secondly, the study made a comparison on the Ph.D. scholars as another three samples: (1) highly educated in the general population (2) highly educated employees and (3) higher education students. Third, the study assesses

those organizational elements connected with the role of Ph.D. students that foresees mental health status. The study shows that 32% of Ph.D. scholars are facing mental disorders that are common in nature, especially depression.

- Impact of time management[5] for IT services management (Heechun Yang on Procedia Computer Science Journal-2016):-In order to cope up with the current trends of the IT sector companies started outsourcing the works in the IT sector. The main objective of this outsourcing was to reduce cost without compromising[6] the service quality. And this study showed various ways of the impact of time management in the IT sector. The company had come up with a time management system by higher authorities approval by a weekly basis with hourly time spent

- Work Life Balance-An audit of staff experience at Oxford Brooks University (Simonetta Manfredi for Center for Diversity Policy Research-2004): the -This report shows us the result of a pan university-wide audit that was conducted in order to find out the experiences[7] of the staffs on the work-life policies on the University. The audit was based on staff survey and highlights the meaning of work-life balance and their values; on the light of employer-employee relationship and the importance of work-life balance.90% of the respondents believe that there should be a balance between paid work and personal life and that enables to make work better and smoother.

- Cause of stress among Ph.D. research scholars with reference to Rashtrasant Tukadoji Maharaj Nagpur University (KDV PRASAD for International Review of Management and Business Research-2017):-This study report makes a close analysis on the cause of stress that is faced by the Ph.D. scholars. The study was conducted among pre-PhD scholars. And on the base of 6 independent stress factors i.e.; work overload, role ambiguity, role overload, psychological factors, behavioral approach[8] and Avoidance strategies and how far it was effective. Stress exists in all forms of life and this survey found out several problems faced by researchers. And there were several questions that were unanswered like (do you consume alcohol, smoke etc).

Methodology

A. Scope of the study, Objectives Hypothesis, Methedology: This study aims to investigating analyzing and observing about the various stress and stages which are undergone by a researcher, and Indian research is hampered by smothering organization, low-quality training at most colleges and lacking financing.

The research is a tedious and time taking process, the present conditions and improper customs and ways which are followed by the universities make the life of researchers little tougher. And as per the recent report by the well known science magazine Nature states and criticize the administration for a substandard activity at enhancing the condition of advancement and research in the nation, isn't probably going to make for simple perusing for the HR Improvement Minister Smriti Irani who has been under fire for attempting to "Indianise" instruction by looking for contributions from conservative ideologues, or notwithstanding for P.M Modi has been urging researchers and analysts to look to the glories of old India.

The geographical scope of the study is limited to the geographical area of Kerala. Specifically the central zone of Kerala including Kottayam, Ernakulam, and Kollam

B. Objectives:

- To find out the correlation between demographic scalar and nominal variables on stress.
- To find out the reason, cause, and solution for stress faced by Ph.D. scholars.
- To find out the effect and relation between time and time management on the stress of Ph.D. scholars.
- To find out the effect and relation between work-life balance on stress among Ph.D. scholars.

C. Hypothesis:

H1: There is a positive and significant relationship between academic, research workload& stress.

H2: There is a positive and significant relationship between stress and work life balance.

H3: There is a positive and significant relationship between stress and time management.

H4: There is a relationship between demographic scalar and nominal variables on stress.

D. Research subject fields and methods: The survey for research was conducted among various groups of research scholars from different universities in Kerala. Sampling methodology adopted was simple random sampling, sample size ranged to 100 samples. The data and the results of the study were analyzed using IBM SPSS.

Findings and Results

This part of the research paper contains data analysis and the interpretation part. And the analysis is done with the use and application of appropriate and suitable statically tools that found suitable for the study and variables being used in the research. The software used for the test is IBM SPSS (Statically Package for Social Studies).

Reliability Statistics

Reliability Statistics 1

Table 1: Model Summary

Model	Chronbach Alpha	NOS
1	.708	17

a. Cause: *stress variables, worklife balance, time management*

b. Dependent Variable: *stress*

The reliability analysis is a scale that reflects the consistency of the study and the variables used in the study.1-5 liker scale was used in this study The Cronbach- reliability statistic measurement was assessed to gauge how every item in the examination of research instrument identified and related to the total of the instrument. Here in our study the Cronbach Alpha is .708 and that is acceptable and good value, it shows that the values in the variables are reliable.

The study was to find the extent of stress and the effect and cause of stress. This part of the research paper shows the effects and cause of stress, the analysis and interpretation of data. The study and the sampling data indicate that most of the respondents are stressed and rarely only a few are not stressed. Chi-Square and correlation study was used, here the independent factor is stress, and the dependant factors are pressure, workload, extra works, institutional rules, and regulations.

Correlation Statistics between Stress and Its Demographic, Scalar & Nominal Variables

Table 2: Correlation

Variables		P Value
1	Age of the respondents	-.91
	Marital status	.097
	Sex	-.97
	Area Of PhD	.231
	Dependants	.50
	Registration Type	.019
	Income	.064
	Expense	.076

a. Dependent Variable: Stress

b. variables:demographic,scalar&nominal variables.

The total number of respondents was limited to 100. In the age group 25-35 most of the respondents are always and often stressed, and many of them are stressed on some point of times too, and the 2nd group i.e. 35-45 they come in second place while considering stress. There were only a few respondents in the 45-55 age group they come 3rd position in stress. Only a few respondents respond that they rarely had and never had stress. We had used spearmen's rank correlation to find out the correlation between the stress level and demographic variab les.

Chi Square Statistics Between Stress and Its Corresponding Variables

Table 3: Chi-Square

Variables		Significance Value	Decision
1	Pressure to do works under certain standards	.000	Accept Ha Reject HO
	Unable to finish works on time due to academic works	.006	Accept Ha Reject HO
	Rules & Regulations causes hindrance	.000	Accept Ha Reject HO
	Tiredness and exhausted due to workload	.000	Accept Ha Reject HO
	Rush and impatientness causes stress	.000	Accept Ha Reject HO
	Physical Stress	.000	Accept Ha Reject HO
	Conflict between values and research work	.000	Accept Ha Reject HO

a. Dependent Variable: Stress

Here we made a close Comparison between the Independent variables and dependent variables that directly and indirectly lead to the stress for the undergoing predoctoral Ph.D. scholars by using chi-square analysis. On the light of survey conducted it was found out that one of many reasons behind the stress is that to challenge of immense pressure from the guide and other factors to do the works under certain standards and a benchmark.

Another factor that leads to stress is rules and regulations of the institution under we work it causes hindrance to work flexibly and lacks the freedom of researcher most of the researchers are facing this issue that leads to stress, Here the significant value is below 0.05 i.e. .000 we accept the Ha that there is a significant relationship between stress and work pressure load and we reject the H0 here.

Correlation between Physical Stress and Its Corresponding Variables

Table 4: Correlation

Variables		P Value
1	Headache	.78
	Anxiety Attacks	.55
	Sleeplessness	.125

a. Dependent Variable: Physical Stress

And the physical stress due to workload also leads to stress among the Ph.D. scholars. Here the significant value is below 0.05 i.e. .000 we accept the Ha that there is a significant, relationship between stress and work pressure load and we reject the H0 here.

Chi Square Statistics between Stress and Work Life Balance

Table 5: Chi-Square

Variables		Significance Value	Decision
1	Compromising of family due to work	.003	Accept Ha,Reject H0
	Inability of balancing work life	.001	Accept Ha,Reject H0
	Staying back late for works	.000	Accept Ha,Reject H0
	Thinking about work when not at work	.002	Accept Ha,Reject H0

a. Dependent Variable: Stress

Here we take in contemplation the variable of work-life balance. The prime cogitation of a human is family; we had checked whether the stress and work-life balance is related to family and compromisation of commitments to the family. Hence it is statically proven that compromisation of family commitments leads to improper work-life balance then it leads to stress among research scholars. Here the significant value is below 0.05 i.e.

Time management is an essential factor for research here we statically test whether time management effects stress by use of chi-square analysis

Chi Square Statistics between Stress and Time Management

Table 6: Chi-Square

Variables		Significance Value	Decision
1	Organizing work to finish research work on time	.007	Accept Ha Reject H0
	Exceeding the deadline	.008	Accept Ha Reject H0
	Proper to do list and time management	.008	Accept Ha Reject H0
	Unable to finish word due to lack of time	.006	Accept Ha reject H0

a. Dependent Variable: Stress

Organizing the works and finish it on time avoids excess of stress to the researcher. Here it is found statically that unorganized works time management and not finishing works cause is another cause of stress. Here the sign value is .007 i.e. less that 0.05 we accept Ha and reject H0 that there is a significant relationship between stress and time management. we accept Ha and reject H0 that there is a significant relationship between stress and time management. And it is evident that improper time management also causes stress

Suggested Recommendations

Managing the time properly in a scheduled work, life balance could reduce stress. Trying to do much more interesting things, do work relaxed and a free mind. Practicing yoga and meditation on a regular basis would bring down the mind under control and thus it will help

to reduce the stress. Doing organizing the works on the basis of priority and deadlines can reduce the last second razor tip sprint and it will reduce the excess stress. Understanding the researcher themselves and managing the mind can bring everything on track and automatically it leads to work management. Some suggested a unique way for stress management that is cooking and trying various food recipes

Integrating works that are relaxingly and similar in nature and do works on a daily nature and make a timetable for finishing the works.

Conclusion

The community of Ph.D. scholars is been facing an immense amount of stress from multiple sources. They are not been able to manage their time, neither able to balance the proportion of their work life and personal life in an appropriate ratio. It is found that both men and women irrespective of age, full time or part time registration are facing the threat of stress mentally and physically too. The unorganized and unscheduled way of doing works leads to excessive workloads and stress, therefore, the external academic works given will divide the productive time for carrying out research works and thus research works remains unfinished leads to stress, anxiety and extra workload. The interference of the researcher's freedom is another threat they need their space to be creative and intellectual the unwanted and some illogical rules and regulations is another threat that is being faced by the researcher. Sometimes there happens a conflict between the personal values principles or ethics followed by the researcher between the researches works they are currently working on. And hence proven by this research that there is immense stress for the Ph.D. scholar and lacks time management and proper work-life balance, and improper time and work-life balance can also lead to stress for research scholars.

Acknowledgement

Firstly, I would like to express my sincere gratitude to my mentor Ambily R for the continuous support of my research study and related study, for her patience, motivation, and immense knowledge. Her guidance helped me in all the time of my work and writing of this paper. I would also like to extend my thanks to my friends and family for their great help and support for this paper.

Image Segmentation for Diabetic Retinopathy Using Modified Bacterial Foraging Optimization Algorithm

Hema Rajini N

Assistant Professor, Department of Computer Science and Engineering,Alagappa Chettiar Government College of Engineering and Technology, Karaikudi, Tamilnadu, India

ABSTRACT

In recent days, investigation of retinal vessels of fundus images is an essential way to screen and diagnose related diseases. Diabetes is a commonly occurring disease and is exponentially rising globally. diabetic retinopathy (DR)is an important reason for blindness. This paper presents a new image segmentation technique forDR. To segment the DR images, a modified bacterial foraging algorithm with Levi distribution. The efficiency of the (BFO-L) method is tested using two benchmark dataset namely DRIVE and STARE. A detailed comparative analysis is also made with the recently proposed methods under various measures. The experimental values imply that the BFO-L method detects tiny blood vessels and locates the edges effectively.While comparing the other methods on the applied DRIVE dataset, the presented method obtains maximum performance with a sensitivity value of 0.8725, specificity value of 0.9314, accuracy of 0.9798 and AUC of 0.9895 respectively.

Keywords: *DR; Image Segmentation; Levi distribution; Retina*

Introduction

Diabetic retinopathy(DR) is a widely occurring retinal issues caused by the complications of diabetes and it leads to complete blindness. The DR occurs in case the diabetes affects the small blood vessels and also damages a certain portion of eye known as retina[1]. The crucial fact is that the human cannot easily identify the existence of diabetes due to the absence of any symptoms at the beginning level. When the DR can be identified at the earlier level, appropriatehealing can be done to avoid the better condition of the patients. Else, it is hard to eliminate the diabetes once the symptoms are observed that is not curable. Diabetes is a commonly occurring disease and is exponentially rising globally. DR is an important reason for blindness. At the earlier level of DR, none of the symptoms exist in the eye and when disease begins, the existence of micro aneurysms (MAs), soft exudates and hard exudates and new damaged blood vessels increases[2]. All the diseases are curable, if any disease is found and controlled appropriately through ophthalmologist who employs fundus camera to monitor and detect the disease. To monitor diabetes, capturing retinal photos throughfundus is general; however, the effects are tedious. Disease diagnosis acts as a significant part in the entire diabetes detection procedure, in that, taking precise photos or high-resolution photos of retina are highly benefitting thing and techniques might aid to derive good outcomes in abnormality detection. Out of fundus images, a novel method or technique is reviewed for effective MA detection. MA is the initial DR marks which does not have the ability to spoil vision. Through a certain tool, the MAs counts are considered that provides diabetic progress in certain individuals. For automatic MA detection, various techniques or algorithms are employed. Both the diabetic and retina structure are demonstrated in Fig.1. Few software are available that are partly robotic and consumes more time. Many of the hospitals employ hardware system for

detection at present time and it gives precise outcomes with high computation time. For abnormal and normal retinal classification, robotic detection systems employ clustering techniques like k-NN classifier. SVM classification methods are used through the proposed method to distinguish among the abnormal and normal retina.With a view to detect illness symptoms, professional physicians recommend that the patient with diabetics requires to be analyzed twice in a year. The detection is time taking and difficult that exhibits high error. Additionally, because of the enormous count of diabetic patients and the absence of medical service in few regions, several DR patients cannot be treated and diagnosed at appropriate time.Therefore, good treatment gradually tends to visual losses that are irreversible and even blindness symptoms. For primary phase patients, the deteriorated procedure can be delayed and monitored if DR might be detected and cured as soon as possible. On the other hand, the physical elucidation is highly based on medical experience

Images[3] and two-dimensional (2-D) color fundus images. Without based on the professional decisions, these techniques might divide robotically and gives trustworthy segmentation

The previous techniques of segmentation might be categorized into unsupervised or supervised[4] In order to inherent blood vessels features, unsupervised methods are modeled without depending on physical labeled map. Through RAdius based Clustering ALgorithm (RACAL), [5]projected an unsupervised method that maps image pixel allocation by distance-based principle. For the task of retinal vessel segmentation,[6] modeled a highly likelihood inversion model. An unsupervised coarse-to-fine algorithm was modeled[7] Depending on the curvature, morphology and spatial dependency, they divide vascular structure in this method. By employing region growing, background normalization and second-order Gaussian filter, [8]projected a contrast-sensitive segmentation technique.

While loss stabilizes, few hard examples had not been examined properly and the model of CNN ends its updation.

Proposed Method

Computational Intuition: Using a two-dimensional array of pixel rates, $I = \{I(s) \in [0, 1]: s \in S\}$, M × N cell image are represented over a rectangular lattice $S = \{(x, y) : 1 \le x \le M, 1 \le y \le N\}$ that is indexed through a coordinate (x, y). The segmentation of cell image focuses to divide the image into two partitions: background I_B and cell region I_C that fulfill the below conditions

$$\begin{cases} I_B \cap I_C = \phi \\ I_B \cup I_C = I \end{cases} \quad \ldots (1)$$

The edge detection idea is to denote the pixels I_E that rely among I_B and I_C, that is, in a tiny closure neighboring region $\eta(e)$ of any pixel $e \in I_E$, there present pixels e_1 and e_2 that fulfills

$$e_1 \in I_B \text{ and } e_2 \in I_C \quad \ldots(2)$$

Commonly, we consider $e_1 \in I_B$ or $e_2 \in I_C$ that result in single-pixel edges. Mostly, the edge detectors finds the entire image pixels many times in order to search pixels which fulfills the Eq. (2), that is always time taking and not appropriate for practical processing of huge images.

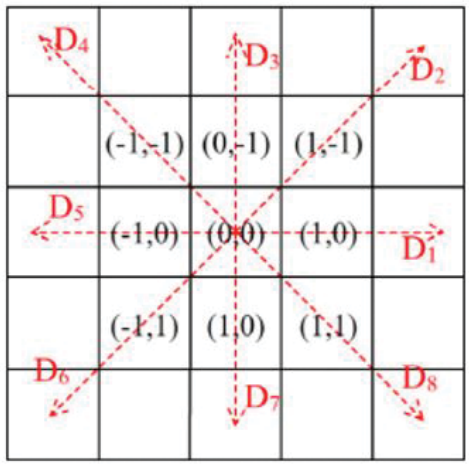

Fig. 1: Searching directions for every bacterium

Nutrient Concentration: Depending on image gradients, nutrient concentration is described. It is commonly complex to estimate the gradients precisely at boundaries because of the interlaced shade and light. We consider that there exists a noticeable discrepancy among the average intensities of cell background and regions. To produce gradient map ∇D, we imply Sobel operator[9] towards density map D subsequently. $\rho(s)$ $\|\nabla D(s)\|_2$ is the expression to denote gradient magnitude and $\varphi(s)$ is used to denote the gradient direction at every location s. Considering every bacteria search over eight direction as demonstrated in Fig. 2, we use gradient $\nabla D(s)$ around every direction D_k and indicate the proposed gradient magnitude through $\rho_k(s)$, k = 1,

2, … 8. The directional gradient magnitude is revised to reduce the non-maximum gradients as:

$$\rho_k(s) = \begin{cases} 0, \text{ if } \rho_k(s) \neq \max\{\rho_k(s^-), \rho_k(s), \rho_k(s^+)\} \\ \rho k(s), \text{ otherwise} \end{cases} \quad \ldots (3)$$

Let $\rho_k(s^-)$ and $\rho_k(s^+)$ demonstrate the gradient magnitude on either sides of s over direction, correspondingly D_k. At the end, we describe at location s the nutrient concentration function value as

$$J(s) = \begin{cases} \rho_k(s), \varphi(s) \in \left[\frac{2k-3}{8}\pi, \frac{2k-1}{8}\pi\right] \\ 0, \text{ otherwise} \end{cases} \quad \ldots (4)$$

Bacterial Foraging: By high nutrient concentration using reproduction, chemotaxis, elimination-dispersal [10]and swarming, the projected method focuses to push foraging of bacteria over pixels and therefore encircling the bacterial tracks as expected edges. It initiates with N population arbitrarily inoculated spores {K = k_1, k_2, …, k_N}, to define bacterial foraging operators, we consider spore k_m as a case study.

Dispersal: If spore location k_m pointed by l_m is a noxious position in order to nutrient concentration map that is

$$J(l_m) < T \quad \ldots (5)$$

Whether a location is nutrient-rich or noxious iass determined by the threshold T, the spore k_m disperses in spite of external circumstances. k_m drift pixel through pixel while dispersal around a arbitrarily initialized direction d_m till achieving nutrient-rich position otherwise employing drifting steps

Reproduction: It initiates reproduction and ends dispersing when k_m locate at a position of nutrient-rich. With similar location $l_{m1} = l_{m2} = l_m$, it might construct into a completely functional bacteria that is called as b_m which splits into two bacteria b_{m1} and b_{m2} and opposite starting directions $d_{m1} = -d_{m2}$ that fulfill $d_{m1} \perp d_m$ and $d_{m2} \perp d_m$.

Chemotaxis: The bacterial movements are simulated through chemotactic procedure. With positions of nutrient-rich, both children bacteria b_{m1} and b_{m2} forages at this stage. It calculates the adjacent ones in neighborhood $\eta(l_{mi})$ counterclockwise and near-to-far for every child bacterium $b_{mi}(i = 1, 2)$ at the location l_{mi}, in order to recognize location t which the concentration of nutrient fulfills

$$J(t) \geq T, t \in \eta(l_{mi}) \quad \ldots (6)$$

Every bacteria searches the direction that might modify at the same time less than $\pi 2$. A nutrient-rich position is met by b_{mi}, it swims to t and modify its chemotaxis direction toward $d_{mi} = t - l_{mi}$ as swimming direction. It ends the chemotaxis when a bacterium l_{mi} location cannot search for a position of nutrient-rich from its adjacent that is,

$$\forall t \in (l_{mi}), J(t) < T \quad \ldots (7)$$

The condition of health is a significant attribute for bacteria instead of location. Bacteria needs some energy for the movement of s_1 to s_2 location and therefore reduces its health as

$$\overrightarrow{H}(s_1, s_2) = \begin{cases} 1, |\rho(s_2) - \rho(s_1)| \geq T_h \\ 0, |\rho(s_2) - \rho(s_1) < T_h| \end{cases} \quad \ldots (8)$$

When moving, the environmental change may give harm to health that is denoted by threshold T_h. The bacteria might consume few nutrient and improves the health one reaching at nutrient-rich location s_2 as expressed below

$$H(s_2) = \begin{cases} 1, \rho(s_2) \geq \alpha T_h \\ 0, \rho(s_2) < \alpha T_h \end{cases} \quad \ldots (9)$$

To find whether a location is nutrient-rich, the parameter α and threshold αT_h are used. The m-th bacterium health at n-th chemotactic step can be estimated through

$$H(m, n) = H(m, n-1) - H(s_{m,n-1}, s_{m,n}) + H(s_{m,n}) \quad \ldots (10)$$

Let m-th bacterium location is denoted $s_{m,n}$ at chemotaxis step, and H (m, 0) = 0. While in the process of chemotaxis, the rate of bacterium's health fulfill the $H(m, n) \geq 0$, it might move, or it must end at present position.

Swarming: Two bacteria draw each other while the distance is large and push each other while it is very near, it is named as bacterial swarming.

Elimination: While a bacteria ends at chemotaxis phase with an arbitrary initial direction, it would be removed after creating one spore, that it initiates the process of dispersal.

BFO algorithm is effectively explores the search space as it works on every dimension

Levy flight is a random walk where the step length of search process is improved using an unpredictable deviation. The Levy Distribution is represented below.

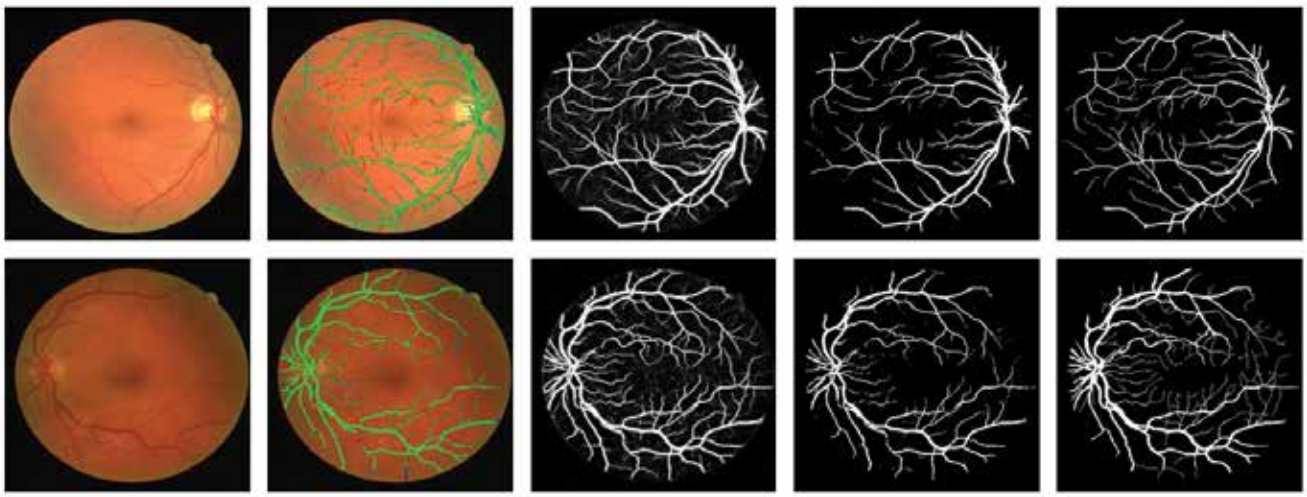
$$\text{Levy}(\beta) \sim t^{-1-\beta},\ 0 < \beta < 2 \qquad \ldots (11)$$

$$\text{Levey}(\beta) = \frac{u \times \varnothing}{|v|^{1/\beta}} \qquad \ldots (12)$$

where u and v are normal distribution values, β is levy exponent and $\varnothing$ is computed by

$$\varnothing = \left[\frac{\Gamma(1+\beta) \times \sin\left(\frac{\pi\beta}{2}\right)}{\Gamma\left(\frac{(1+\beta)}{2}\right) \times \beta \times 2^{\left(\frac{\beta-1}{2}\right)}} \right]^{\frac{1}{\beta}} \qquad \ldots (13)$$

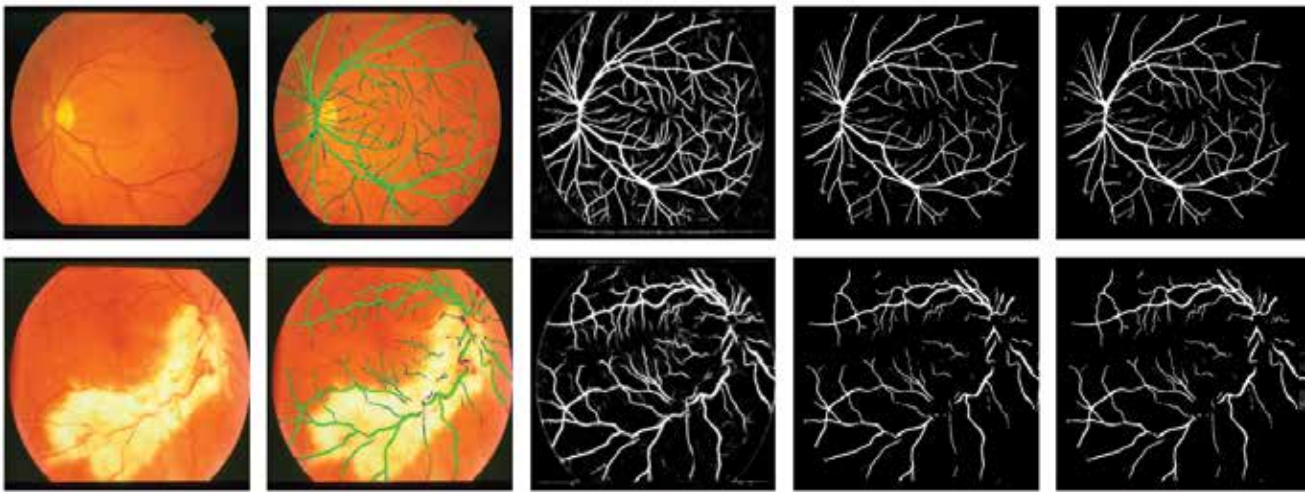
where β value can be assumed as 1.5, u and v are the random values with a mean of 0 and standard deviation of 1 from normal distribution.



Performance Validation

Datasets: The validation of BFO-L takes place on two benchmark image dataset namely DRIVE [11]and STARE [12] retinal vessel segmentation of fundus images. The first DRIVE has a total of 40 images attained at 45° field of view (FOV) at a resolution of 565×584 pixels. Among the 40 images, half of the image set is used to train the model and the remaining half of the image set are employed to test the model. Every training image holds its respective ground truth segmented image done by a physician. A comparative analysis is done with the existing methods such as matched filtering, region growing, infinite perimeter active contour model, conditional random field, artificial neural networks [12]and deep learning methods.

Measures: For validation, a collection of performance measures are used. Each pixel value is segmented properly or not, and hence, the segmentation output falls under four types namely true positive (TP), false negative (FN), true negative (TN), and false positive (FP).



Results Analysis

An extensive experimentation takes place on two dataset to ensure the performance of the presented method. The attained results of the DRIVE and STARE dataset is provided in Table 1 interms of specificity, sensitivity, accuracy and AUC. A comparison is made with the segmentation results of the second observer results by the use of first observer results as ground truths. The results of the presented approach are comparable to the second expert segmentation values on DRIVE dataset with a small variation for different evaluation indicators. In addition, few variations among segmentation values and the expert results on STARE dataset also exists. As the second expert is concentrated on tiny thin vessels, they have high sensitivityOn the applied STARE dataset, a sensitivity of 0.8719 is attained by the expert's value and 0.7543 is obtained by the presented method. Similarly,

(a) Color image (b) Segmented image (c) Probability map (d) Binary segmentation (e) Ground truth

Fig. 2: Segmentation results of DRIVE

Fig. 3: Segmentation results of STARE

Figs. 3 and 4 illustrate the segmented results on the DRIVE and STARE dataset. A set of two images are chosen where one is healthy image and another[13] is lesion image. This approach keenly looks for tiny thin retinal vessels that are mainly assumed less significant in disease identification

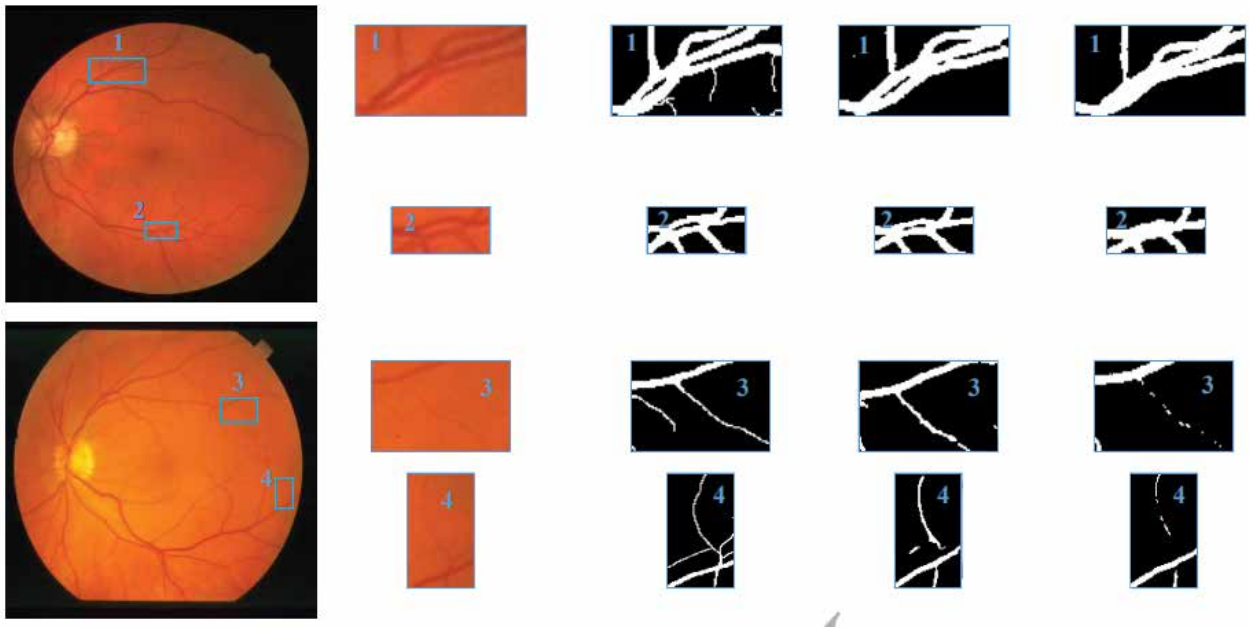

Fig. 4: Comparison of the segmentation effects

A comparative analysis of some local regions are depicted in Fig. 5, where the first row illustrate the vessels edges at the intersection and the second row displays the tiny thin vessels in low contrast area. From this Fig., the base structure[14] cannot identify few information of the vessels. But, the presented method enhances the segmented results of these details to a particular level and concentrates more on hard samples.

Table 1: Comparative analysis on STARE dataset

	Azzopardi et al. [19]	0.8259	0.9818	0.9752	-

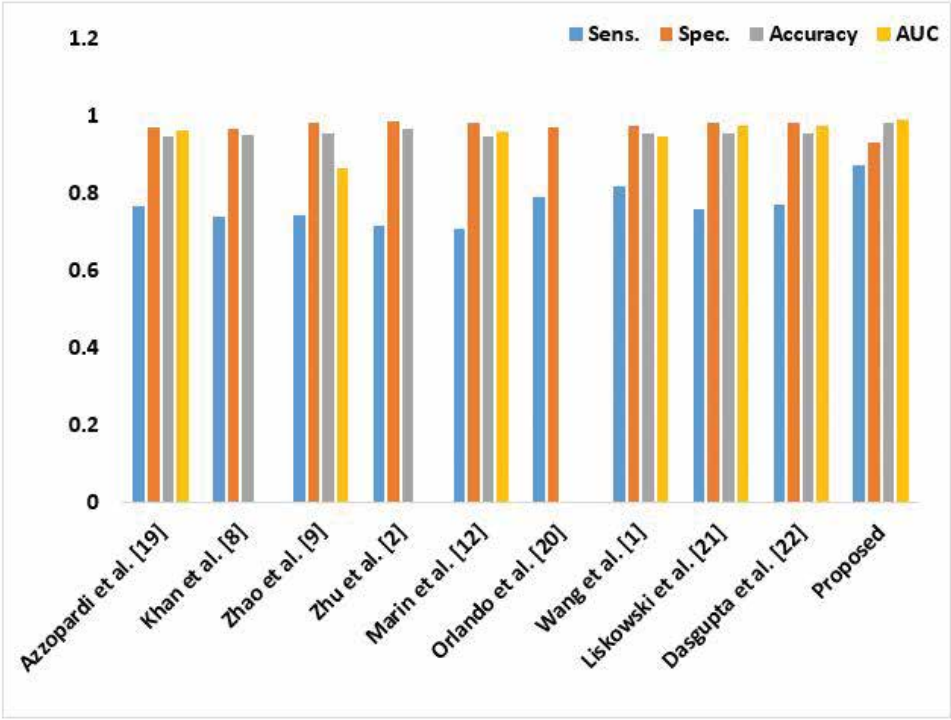

Fig. 5: Comparative results of DRIVE dataset

From the table values provided in Table 2 and Table 3, it is obviously clear that the presented method achieved excellent results over the compared methods on both DRIVE and STARE dataset. As shown in Tables 2 and 3, the results demonstrate that[15] the proposed method outperforms most of the state-of-the-art segmentation methods in DRIVE and STARE datasets whether compared to supervised methods or unsupervised methods.

Conclusion

Presently, the occurrence of DR becomes raising and increasing the human blindness globally. In this paper, we have introduced new image segmentation technique for DR. To segment the DR images, a BFO-L algorithm is devised using Levi distribution. The efficiency of the BFO-L method is tested using two benchmark datasets namely DRIVE and STARE. A detailed comparative analysis is also made with the recently proposed methods under various measures. On comparing the other methods on the applied DRIVE dataset, the presented method obtains maximum performance with a sensitivity value of 0.8725, specificity value of 0.9314, accuracy of 0.9798 and AUC of 0.9895 respectively. At the same time, values shown in Table 3 ensure the maximum results with a sensitivity value of 0.8259, specificity value of 0.9818 and accuracy of 0.9752 respectively.

Segmentation of Human Eye Pupil with Novel Grid Based Localization Computing

G. Sumathy[1], J. Arokiya Renjith[2]

[1]Research Scholar, Department of Computer Science and Engineering, Sathyabama Institute of Science and Technology, Chennai, India; [2]Professor, Department of Computer Science and Engineering, Jeppiaar Engineering College, Chennai, India

ABSTRACT

This paper discuss about grid computing which increase the performance of vision image segmentation. The segmentation process with grid computing identifies the challenging in computation task. Novel grid based method supports image processing technique to circle eye pupil in normal and defective eyes. The procedure of the proposed system use real eye images as data collection for input to grid computing. Image corner and line edge detection is replaced with grid based technique to achieve good segmentation result. Grid with different sizes classified to reach neighbors to form grid segment. Adjacency graph merge the regions of highlighted eye pupil. This grid location points of eye image is noted to identify the eye center localization. The experimental task proves the efficiency of automate segmentation compared with other algorithms.

Introduction

The human eye is an organ which lets us to observe and study more vis-à-vis the surrounding world. Our eyes are utilized in virtually all activities that we do such as reading, writing, working, watching TV and in countless other ways. Soon after the birth, babies are capable of developing the skill of perception through eyes. However, their vision will be indistinct and requires constant exercise to develop acuity that too within a very short time frame. The visual acuity development will be virtually complete by the time the baby attains school age. Immediately after its birth, a child incapable to coordinate the eye movements. Further, their eyes will undergo minor misalignments which may repeatedly occur over a few months, might not be a cause for concern. In addition, the child should master gazing technique during this course of time. However, a major cause for concern should be one eye's constant deviation from the direction of the other's and should be treated at the earliest by an ophthalmologist as conveyed [1].

Cerebral palsy is an illness of movement, muscle position which affected through injury happens to young, emerging brain, furthermost frequently former to birth. Signs, as well as indications, seem throughout early stages or playschool years. In common, cerebral palsy causes impaired movement related through irregular reactions, droopiness or inflexibility of the limbs and trunk, irregular position, instinctive actions, unsteady walking, or a certain mixture of these. People who are suffering from cerebral palsy might possess difficulties absorbing and usually contain eye muscle imbalance that the eyes cannot concentrate on the similar object. Human with cerebral palsy correspondingly might suffer a condensed series of indication at different stage due to stiffness of muscles [2].

Cerebral palsy's result on practical capabilities differs significantly. Particular people who affect with this illness may walk but others couldn't. Certain persons show regular or near-normal intellectual capability; however, others may possess cerebral debilities. Epilepsy, sightlessness or else deafness correspondingly can be existing.

Among eye care advancements, the sight conservation technology has been deliberated most important throughout the previous generation. It was found that frequent challenges by human eyes to overcome refractive errors outcomes in constant fatigue affecting whole physical well-being. Hamel (1997)

therefore it stressed the prominence of early discovery of refractive errors through examination by an eye specialist and correction of the same by glasses or other means3. Soon after the birth, babies are capable of recognizing things with their eyes. On the other hand, their visualization will be unclear and needs continuous exercise to progress insight that too inside a very less duration of time setting. The visual acuity development will be essentially achieved through the time the baby gets to school age. In their initial week of life, a child will still be unable to manage their eye movement, and it will experience light misalignments that might frequently happen over a few months. Meanwhile, the child would also master the gazing method. Nonetheless, the main reason for concern is one eye's constant abnormality from the way of the other's and must be treated at the earliest by an ophthalmologist as stated by Ocampo, V.V.D., and Foster, C.S. (2007) [4].

Eye disorder is has less control of eye movements. The eyes moves when the head position get changed. People with eye disorder have problem to move eyeballs according to head movement and sometimes be stable in one position. Disease like **nystagmus,** cataracts have problem with optic nerve and retina. Nysatgmus, esotropia are some eye disorder which one eye be normal mode and other eye gets affected. Children affected by this are undergone for visual stimulation and improve the eyeball movements.

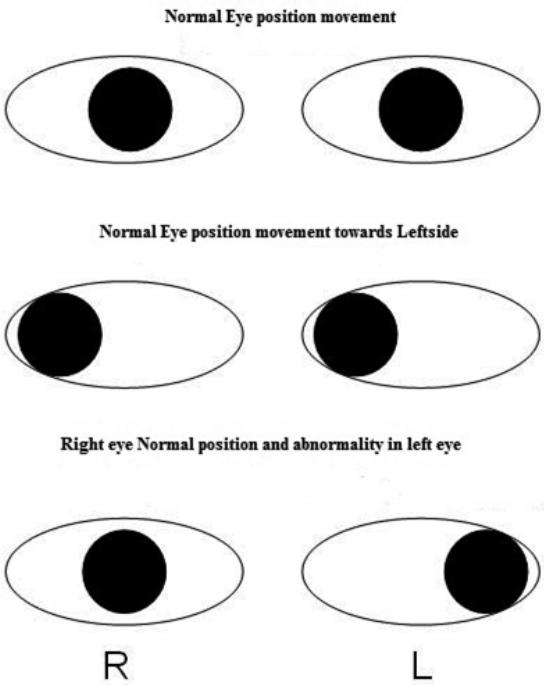

Fig. 1: Normal and abnormality eye

Different abnormality of one eye movement is referred by esotropia, exotropia and hypertropia. It is identified by the physical and perceptible changes in the eye. This checked by moving the eye ball in all direction, covering one eye to focus the object. Above age 5 checked by the alphabet letters with some distance. The examines like retina examination, slit lamp test and cycloplegic refraction helps to identify defective eye. Defectives in eye lens is detected with specs and the problem in nerves can't be corrected as soon as. This is treated as applying vision therapy, Orthoptics, Botullinum toxin (BOTOX) injection, the procedure of suppression and Surgery for severe case of eye nerves damage.

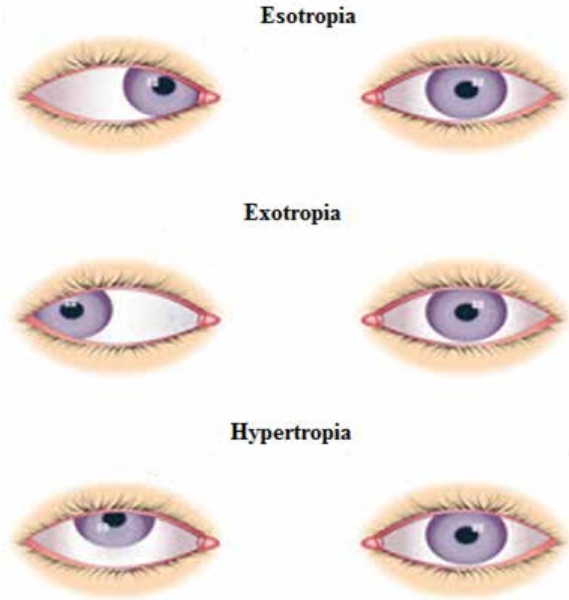

Fig. 2: Eye Strabismus

In previous works, many techniques are suggested for detection and localization of pupil. A distinct approach in iris localization and pupil extraction was explained from eye images in [5]by extracting the edges using fuzzy logic approach resulting into effective edge estimation technique and later use of these inputs to circular Hough Transform for detection of both a novel method for eye center localization was discussed in [6].Advanced performance was attained by focusing the eyes via facial feature regression and then perceiving eye midpoints with a cascade of regression forests through HoG features. A precise and fast pupil localization structure was suggested in [7]which performed fine for eye images attained either by means of the Near Infrared (NIR) or Visible Wavelength (VW) illumination. A robust pupil localization algorithm based on circular Hough transform was proposed in [8].The algorithm was tested on 37 images took from CASIA Iris dataset with various simulated eyelid occlusions.

In this research is planned as: Section 2 contributes an outline of state of the art in pupil segmentation algorithms. Section 3 defines the novel grid-based detection technique: section 4 presents, the concept of detection of segmentation methods and the proposed methodology procedure. Section 5 defines the results and discussion and section 6 give the conclusion part.

Formulation

A. Image Enhancement: It is useful in all fields where images have to be agreed and investigated. For instance, medical image analysis, study of images from satellites etc. Basically image enhancement means, changing an image 'f 'into image 'g' using 'T'. The values of pixels in images 'f' and 'g' are represented by 'r'and's', respectively. As supposed, the pixel values r as well as s are associated by the appearance,

$$s = T(r) \quad \ldots(1)$$

Where T is a transformation that plots a pixel value r into a pixel values. Subsequently, the effects are recorded back into the level [0, L-1], where $L=2^k$, k being the number of bits. The consequences are recorded in to the grey scale level. Therefore, for example, for an 8-bit image the range of pixel values will be [0, 255]. Also, color images can stretched with the similar theory. At the level of 0 to 255 is nothing but pixel values of a digital grey image.

B. Power Law Transformation: Enhancement of image will be achieved in a spatial or else the Fourier domains in addition to a significant parameter essential to see in this background are contrast enhancement. In a spatial domain, techniques utilized could be additionally categorized into gray level conversions, histogram processing and so on. As stated beyond, histogram equalization mourns from the fact that it may every so often decrease the contrast. Histogram specification can be perfect to suit the images but needs several user inputs. Likewise, PLT or else piece-wise linear transformation processes also require several user inputs.

$$s = cr^{\gamma} \quad \ldots(2)$$

Where, s and r are the gray levels of pixels in an output besides input images, individually and 'c' is a constant term. These PLT functions are revealed vividly in below fig. This figure demonstrates the graph of PLT using the input gray level r beside x-axis and output gray levels on y-axis for numerous values of γ. Let r_{max} be the dominant peak in the histogram. If r_{max} has a large value (in the range 150–255), then it is perceived from a below graph that contrast widening happens by means of selecting γ > 1 whereas for dark images (r_{max} lies in the range 0–100), we understand that selecting γ < 1 leads to contrast stretching.

C. Bilateral Filter (BF): It [9] is a nonlinear filter which achieves longitudinal averaging deprived of the smoothing edges. It has made an effectual denoising technique of an image. A significant concern using the BF is filter parameters selection that affects the outcomes meaningfully. One more research concern of BT is computation speed acceleration.

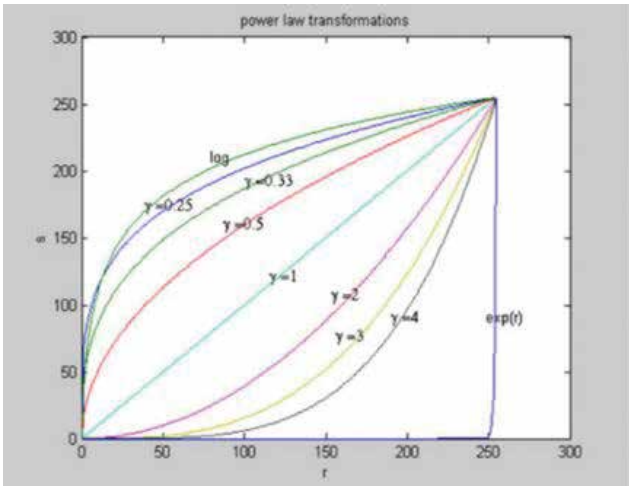

Fig. 3: A plot of PLT with input gray-level along X-axis for different γ and output gray level along Y-axis for different γ.

With some threshold values discovered the localization of the pupil and determined the normal and defective eye.

In 1998, Tomasi et al. primarily offered a BF. The BF theory similarly existed in as a SUSAN filter in addition to in as the neighborhood filter. It is worth stating that Beltrami flow procedure is deliberated as a theoretic derivation of a BF[10] that yields a range of image improving procedures extending from the 2L linear diffusion to 1L non-linear flows. The BF takes in a local neighborhood in a weighted sum of pixels;

Accurately, at a pixel position x, bilateral filter output is computed as follows

$$\tilde{I}(x) = \frac{1}{c}\Sigma_{y\in N(x)} e^{\frac{\|y-x\|^2}{2\sigma_d^2}} e^{\frac{|I(y)-I(x)|^2}{2\sigma_y^2}} I(y) \quad \ldots(3)$$

Where σ_d and σ_y are parameters adjusting the increased level weights off in spatial in addition to intensity areas, correspondingly, N{x) is a spatial area of pixel I{x), and C is normalization constant:

$$C = \Sigma_{y\subset N(x)} e^{\frac{\|y-x\|^2}{2\sigma_d^2}} e^{\frac{|I(y)-I(x)|^2}{2\sigma_y^2}} I(y) \quad \ldots(4)$$

D. Segmentation: It is a fundamental process in image processing, for extract and identify the object region from the image, and it is one of significant image segmentation approaches because it is simple to implement.

The binary image denoted the separate region concerning examined object and background. The transformation procedure from grayscale into a binary image is well-defined in Eq. 4.

$$g(x,y) = \begin{cases} 1(\text{white}) \text{ if } f(x,y) > T \\ 0(\text{black}) \text{ if } f(x,y) \geq T \end{cases} \quad \ldots(5)$$

Where g(x,y) and f(x,y) are binary image pixel values in addition to grayscale image, correspondingly and 'T' isa threshold value.

Initially, the central part of binary images created must be studied to recognize a pixel value[11]. If a pixel value point was not '1', an opposite procedure was obligatory to inverse every pixel in the image from value '1' to '0' and vice versa by executing Eq. 5.

$$g(x,y) = \begin{cases} 1(\text{white}) \text{ if } f(x,y) > 0 \\ 0(\text{black}) \text{ if } f(x,y) \geq 0 \end{cases} \quad \ldots(6)$$

Where g(x,y) is the pixel values of binary image. The inversion procedure was frequently desired for cases where examined objects were dimmer[12] when compared with background. consequently that the background seems black and the investigated image seems white.

Pupil localization using Novel Grid Based Eye Detection: The flowchart is presented in below figure 1. In our proposed work, the grid is used for the pupil position in the eye. The segmentation procedure is a vital phase to get an exact selection of pupil besides the iris region.

This system consists of following stages such as:

1. Load the original Eye image.
2. Filtering of an image using a BF.
3. Power law transformation (exponential).
4. Segmentation of the pupil using a binary method.
5. Using the pupil binary value, detect the pupil in the eye and a circle will be drawn.
6. Determine the pupil center and make the grid in that image.
7. Apply inverse binary segmentation and the pupil is segmented and then the location of the center is determined.
8. Pupil status and eye status are determined using the center value of Pupil in the grid.

Power law transformation (exponential) is used for image enhancement process, and then the segmentation process of the pupil is achieved using the binary method. Then by using the binary value and detection of the pupil in the eye is performed and then mark a circle. Further, the discovery of pupil center is implemented and then makes the grid in the image. The grid is created using the pixel point like row and column. Mark the every 30 and 30 column pixel value changed the grid is created. Also, add the axis label the eye identify as defective eye.

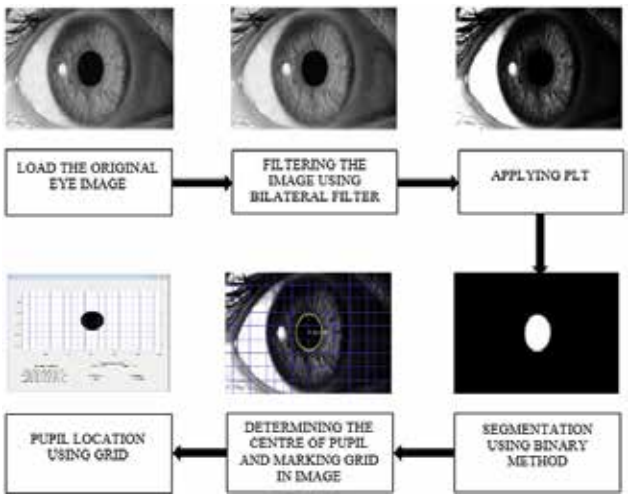

Fig. 4: Flowchart of the proposed method GRID based localization

Results snd Discussion

The suggested technique intended for pupil localization of the exact eye position is key for application

related to iris and pupil localization to excerpt the pupil area appropriately. It was executed using MATLAB software. We collected 45 different images subjects from the Point of Gaze (PoG) Eye dataset, real-time images collected from special schools and eye based hospitals and normal images collected from general public and some images are collected from Internet. The implementation was done in MATLAB software.

Table 2 shows the original image, filtered image, power law transformation image, binary image, marking a circle and the pupil position through the grid method[13]. The size of the grid is 600x270 and the size of each cell is 30x30. The count of the cells is around180 and the size of the eye is 600x270.

Table 1: Boundary conditions

Position of pupil	Boundary condition (in pixel)
Centre	380>X>200 & 210>Y>60
Centre (Vertical view)	210>Y>60
Centre (Horizontal view)	380>X>200

The above figure 3 demonstrates the pupil position when it is positioned in the center. The boundary conditions are given as if the x-axis value lies between 200 and 300, and y-axis value lies in between 60 and 210 then the position of the pupil are in the center. If the boundary condition for x-axis is in between 600 and 380 and y-axis is 0 and 150, then the position of the pupil is at the top right location. If the boundary condition for x-axis is in between 600 and 380 and y-axis is 250 and 150

Table 2: Normal right eye and normal left eye with variation

Person	Right eye (in pixel)	Left eye (in pixel)	Variation
P1	(305,136)	(304,135)	1.4142
P2	(318,144)	(317,142)	2.2361
P3	(334,154)	(332,152)	2.8284
P4	(344,156)	(342,158)	2.8285
P5	(360,164)	(358,166)	2.8248
P6	(362,170)	(360,172)	2.4521
P7	(364,186)	(362,184)	2.8245
P8	(372,194)	(370,192)	2.8248
P9	(378,196)	(376,200)	4.4721
P10	(379,202)	(380,210)	11.313

Conclusion

An innovative technique was proposed for segmentation of the pupil using the integration of power-law transformation for image enhancement and binary filtering for the removal of the noise in the image. The binary technique was considered for the procedure of the segmentation of pupil. The suggested method was implemented by considering 200 different images from Point of Gaze (PoG) Eye dataset, real-time images collected from special schools and eye based hospitals and normal images collected from general public and some images are collected from databases. The implementation was done in MATLAB software. The outcomes showed that this technique delivered precise segmentation. The proposed concept can be utilized in the vision stimulation evaluation system.

Cardiac Tele-care

D. Pavithra[1], P. Raja Rajeswari Chandni[1], D. Padmini[1], S. Vishnu Priya[1], R. Vanithamani[2]

[1]UG Scholar, [2]Professor, Department of Biomedical Instrumentation Engieering, School of Engineering, Avinashilingam Institute for Home Science and Higher Education for Women, Coimbatore, Tamil Nadu, India

ABSTRACT

Electrocardiography is the key aspect to diagnose the cardiac malfunctions. The standard method is still cumbersome, time consuming and labor intensive. Glove based comprehensive remote physiological assessment platform will provide the benefits of telemedicine with less complicated electrode placement. Telemedicine allows patients in remote areas to access medical personnel quickly, efficiently and without travel to get proper prescriptions. This paper aims at providing an end to end IoT platform for cardiac patients that enables seamless data collection of bio-signals from various sensors and transmission of those data for diagnosis purpose.

Keywords: *electrocardiogram, telemedicine, ECG telehealth, Internet of Things, mobile application.*

Introduction

Electrocardiography remains the primary diagnostic procedure for detecting many cardiac problems. It is used routinely for diagnostic purposes by monitoring a patient's condition during pre and post surgery. Wearable technology and telemedicine are considered as the future of health care [1]. E-Health monitoring system allows close monitoring of vital parameters irrespective of the location of patient [2]. The smart sensor platform can be used to retrieve signals from different body sensors and can be monitored on the smart phone [3]. It is possible to calculate the heart rate from the ECG signals using ARM 7 controller [4]. ECG data are sampled according to Nyquist theorem and are packetized to improve the efficiency and to minimize the data loss during transmission [10].

ECG waves are filtered by using instrumentation and operational amplifiers and transferred to PC via audio jack or cable[1]. Wireless transmission can be achieved through Bluetooth, Wi-Fi, Li-Fi, SigFox or LoRa. IoT is the system of interrelated computing devices with exchange of data that are recognized by unique code [5]. The 2 Xbee-pro wireless modules can also be used to transmit signals only upto a range of about five meters[6]. A wireless sensor network monitoring human vital physiological parameters via HC-06 Bluetooth module as proposed in [9] covers only upto a range of 10 meters.

Graphical User Interface (GUI) provides an interactive platform between patient and the doctor which has prescription add-ons[7]. The system model proposed in [8] is a smart sensor system allowing continuous monitoring of patient in conjunction with a smart phone which limits the data access only to the authorized person. The main objective of the work presented in this paper is to acquire bio-signals and transmit it through IoT for diagnosis by the doctor where they can prescribe medications or suggest appointments to the patient.

Methodology

The proposed method incorporates all electrodes and sensors inside the glove thereby eliminating the clutter of separate cables. This provides natural alignment of electrodes positioned on right palm of the patient. The placement of electrodes in the glove is shown in Fig.1. While the user places the right palm on the chest in implacable regional fashion, the palm and lower arm naturally aligns with correct anatomical positions. The pressure of the patient's hand against the body maintains the constant stable skin contact without need for special preparation of skin. In addition to this, oxygen concentration and heart rate are also obtained. These signals are processed and transmitted to cloud and retrieved back in mobile application through IoT.

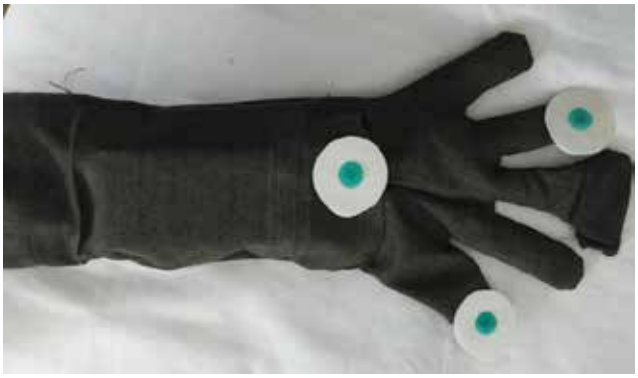

Fig. 1: Electrode placement in glove

A. Block Diagram: The sensing network incorporates SpO_2 sensor and heart beat sensor and ECG electrodes. SpO_2 sensor detects patients' oxygen saturation level by a non invasive method. The mechanism behind the sensor involves passing light wave through fingertip and the reflected light waves are collected to determine the oxygen saturation level. Pulse is an elementary way to indicate the heart rate. Heart beat sensor uses photo-plethysmography technique in which the volumetric changes in blood through the vascular region causes variation in the light intensity that is measured. ECG computes the electrical activity of the heart. Since ECG signals are extremely noisy, an integrated signal conditioning block is required. The outputs from 3-leads are given to Signal Conditioning Unit (SCU) which is devised to extract, amplify and de-noise the bio-potential signals.

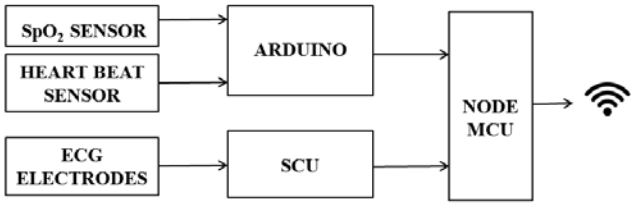

Fig. 2: Block diagram of the proposed system

Arduino is the processor used to collect the signals from SpO_2 and heart beat sensor. Node MCU is an IoT platform that is used to transmit the received bio-signals to the cloud as represented by the block diagram in Fig.2. The data are transmitted in the form of array to avoid data loss during transmission.

B. Mobile Application: Mobile application is developed using Kodular software. It is an open source software wherein various blocks present in the application is created using drag and drop options. It acts as a GUI for the doctor as well as the subject. The vital parameters of a subject is viewed in the doctor's screen in the mobile application where they can add prescriptions as shown in Fig.3. The patient can access the prescription in the mobile application as shown in Fig.4.

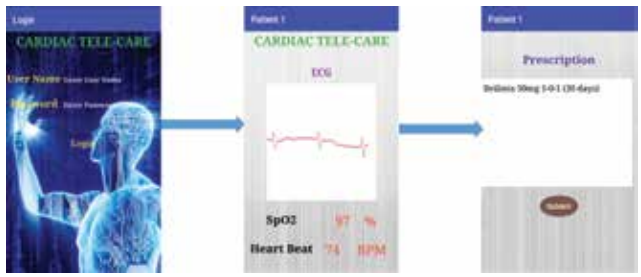

Fig. 3: Doctor's access in mobile application

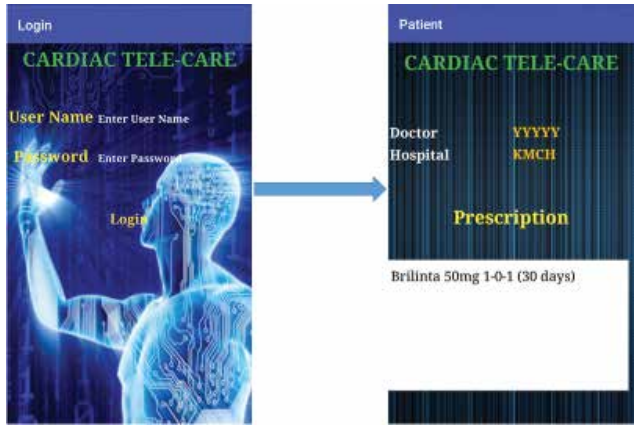

Fig. 4: Patient's access in mobile application

Advantages and Limitations

The main advantage is that it can be used by any personnel with short learning curve. It has user friendly options to use a mobile or a tablet. It possesses a modular design format with the capabilities to upgrade to a multi-parameter measurement system. Another advantage is its compact and cost effective design. Limitation of this system is that the processor has a minimum delay of 5s to 10s to acquire and transmit the signals. This can be overcome by using a high speed processor.

Conclusion and Future Work

The proposed system is complemented by sophisticated user friendly proprietary software, hardware solutions which utilizes touch screen for fast trouble free operation. This technology can serve in any medical institution from small practices to large hospitals. It is a breakthrough in medical community replacing the conventional electrode placement with an easy procedure. It does not require trained technicians

to operate. This can be used by the patients in remote places and can be transmitted through IoT technology for obtaining prescriptions from the doctor. The incidence of cardiac problems is more in rural areas also. Such people are largely ignorant about the problem and the situation often gets out of hand by the time they reach doctors. This system could be incorporated in primary health centers in rural areas thereby providing good contact between the rural people and specialists in urban areas.

A Map Reduce Framework for Identifying Association Rules between Clinical Traits of Asthma

S. Poorani[1], P. Balasubramanie[2]

[1]Assistant Professor, [2]Professor, Kongu Engineering College, Perundurai, Erode, Tamil Nadu, India

ABSTRACT

Asthma is one of the major wide spread and continual conditions worldwide. Ecological features may play vital roles in asthma. In data mining, association rule mining is the appropriate algorithm to identify the relationship between different features of a dataset. Big data Analysis helps in preventing the disease and detecting the disease in advance. MapReduce helps in reducing the time complexity of big data. In this paper, we propose a MapReduce framework with association rule mining technique to find the clinical traits of asthma.

Keywords: *Asthma, Association Rule Mining, Clinical Traits, Apriori Algorithm, Data Mining, Map Reduce, Big Data.*

Introduction

Asthma is a wide spread provocative chronic lungs disorder in which respiratory systems are prone to narrow[1]. Environment factors and genetics are the two main elements which cause asthma [2]. Wheezing, chest tightness, coughing and shortness of breath are main symptoms of asthma [3]. Association rule mining reveals the association between different features of large data[4]. Two steps in association rule mining are[5] (i)Finding all the frequent itemsets that satisfy minimum support threshold and, (ii) Generating strong association rules. Big data is a collection of huge complex data sets. It is difficult to process them using traditional tools[6]. Big data helps in extracting interesting values. Many new technologies and frameworks for bigdata were created to provide high storage parallel processing. The cost for storage and processing also gets dropped. MapReduce is the main concept that supports distributed computing with big data[7]. All the rules generated by the association rule mining algorithm are not useful. So interesting and uninteresting rules has to be identified. In this paper we propose a framework, where asthma dataset is transformed into different partitions using hadoop. In each partition the existing association rule mining algorithm like apriori algorithm can be applied to generate the frequent itemsets. Then a map reduce algorithm can be applied to find consistent and inconsistent rules. This framework can be used to find the clinical traits of asthma.

Related Works

Guneet Kaur et al,[8] applied the classification techniques in hadoop to examine the chronic kidney disease dataset. Dinesh J. Prajapati et al used the frequent pattern mining techniques with map reduce to extract the frequent itemsets in the distributed environment. They also proposed map reduce based algorithm for consistent and inconsistent rule detection. They also compared the efficiency of this proposed method with fast distributed data mining and count distribution algorithms. Botao wang et al[9] proposed a mapreduce based learning machine for online parallel processing. In this work,first the sequential machine's matrix calculation dependency relationships were analyzed. Then the synthetic and real data is used to evaluate POS-ELM. Tajunisha et al proposed a Map Reduce frame work to predict student performance. This technique proposes the high classification accuracy in bigdata and time complexity. Giulia Toti et al[10]used an Associationrule mining based methodology to study and analyze the risk variations and exposures of pediatric asthma.

In all the above works different authors use different data mining techniques with or without mapreduce framework for business and medical applications. But they do not support for asthma dataset. So we propose a Map Reduce with apriori system to handle time complexity and to improve accuracy.

Proposed Methodology

The Association rule mining technique helps in finding the structure that leads to envisage the existence of a particular thing by using the co-existence of any other item. Association rules are used in identifying the relationship between different features of a dataset. In our research, a person with asthma disease has a number of main symptoms and exposures of asthma disease. There may be multiple associations exist among those symptoms and exposures. Association rule mining technique will be helpful in find out those associations. Big data leads to big analysis. If we have more data we can analyse causes and exposures of a particular disease in more effective way. MapReduce framework can be used to process parallel and distributed data. So we propose a MapReduce framework to implement the apriori algorithm to detect the causes and exposures of asthma by processing the big asthma dataset. The flow graph(Figure 1) and steps are given below

Methodology

Step 1: Data collection from hospitals/questionnaire

Step 2: Data pre-processing

Step 3: Partition the data based on age

Step 4: Applying Apriori algorithm locally and parallel in all nodes

Step 5: Apply MapReduce algorithm to find consistent and inconsistent rules.

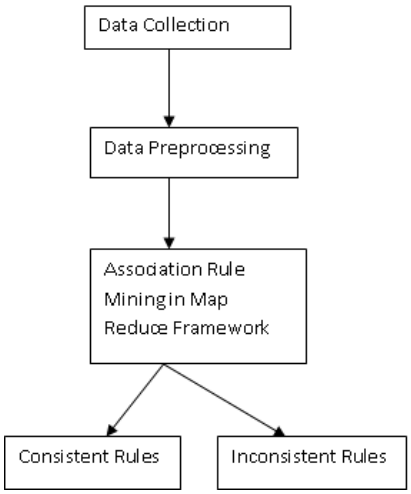

Figure 1: Flow graph of a proposed work

A. Data Collection: For this research data can be collected from various sources like questionnaire from the asthma patients during hospital visits, online questionnaire through social medias and hospital databases. 300 patient records were collected from local hospitals. Some of the features and it's explanations are given in Table I. The symptoms and exposures of asthma can be included as attributes. But our main focus is to identify the major exposure of asthma disease.

Table I: List of Attributes

Attributes	Explanations
DRINKING WATER	Is the person take purified drinking water
TYPE OF FOOD	Vegetarian/Non-Vegetarian
WORKING ENVIRONMENT	Air Conditioning Rooms/ Polluted area
MEDICATIONS	How long a person have medications
ANY OTHER DISEASE	Is the person have any other disease

B. Data Preprocessing: The first step will be integrate all the collected data(from different sources) into a single dataset. Then the dataset can be cleaned and transformed to make them suitable for analysis. This process eliminates the inefficient data.

C. Map Reduce Framework with Apriori Algorithm: MapReduce is a program model to process the data in a distributed environment. Generally MapReduce process is carried out with the help of two different programs. First one is map program and the second one is reduce program.

- **Map Program:** There can be multiple map programs in a MapReduce task. All Mappers do the same work on different partitions or nodes. The data is read and processed with the help of map program. For every partition there will be an output that is produced by the map program
- **Reduce Program:** The reducer is used to collect and combine outputs that were created by map tasks of different partitions.

Here, Apriori algorithm is applied parallelly on different chunks of dataset in the form of different map

tasks.The generated rules are combined and grouped by reduce tasks based on the support and confidence values. All the association rules produced by this algorithm may not be useful. So the rules are again processed by the map task in the second phase to identify the consistent rules as well as inconsistent rules as two reduce tasks.

Conclusion

Data analytic structure is important to develop our perceptive of asthma exposure. From this viewpoint, it is noteworthy to make investment in advancing computational tools to resolve health care problems. This new credible method helps to merge asthma data with big analysis, so that this integrative approach can be used by clinicians and epidemiologists to recognize the exposures and heterogeneity of asthma and allergic disease.

A Study on Knowledge, Attitude and Practices towards Breast Cancer among Reproductive Age Group Women in an Urban Area of Coimbatore

Jasmine J Nirmal[1], Prabhu N J[2], Sugunadevi G[3]

[1]Post Graduate Student, [2]Assistant Professor, [3]Head of the Department, Department of Community Medicine, Karpagam Faculty of Medical Sciences and Research, Coimbatore

ABSTRACT

Background: Breast cancer is the most common cancer representing 25% of all cancers. For every 2 cases diagnosed breast cancer one women dies. Early detection and treatment of breast cancer increases the chance of survival. Breast self -examination (BSE), Clinical breast examination, Mammography are different methods for screening of breast cancer. Only with early detection we can achieve longer survival.

Aims and Objective: To assess the knowledge, attitude and practice towards breast cancer among women of reproductive age group and to suggest necessary recommendations based on the observation to improve awareness of breast cancer in the study population.

Methodology: Using Purposive sampling technique 125 women aged 18-49 years were interviewed to assess their Knowledge, attitude and practice in an Urban area of Coimbatore.

Results: Among the participants 27.2% had family history of gynaecological cancer, 70.4% know about breast cancer, 40% know the methods of Breast Self-Examination (BSE), 36.8% practice BSE.

Keywords: *Breast cancer, Breast self-Examination, Knowledge, Attitude, Practice, Mammography*

Introduction

Breast cancer is the leading cancer in women both in the developed and the developing countries. Breast cancer followed by the cervical cancer are the most common cancers among women in India. Breast cancer is the most common cancer representing 25% of all cancers. For every 2 cases diagnosed of breast cancer one woman dies.[1] Early detection in order to improve breast cancer outcome and survival remains the cornerstone of prevention and control of death due to breast cancer.[2]

Across the world 1 million new cases are diagnosed annually.[3] Incidence in India varies from 7.2 to 33.4/100,000 (annual age adjusted rate).[4] Early detection and treatment of breast cancer increases the chance of survival.[5] Breast self -examination (BSE), Clinical breast examination (CBE), Mammography are different methods for screening of breast cancer.[6] Though theoretically BSE remains the tool for abating mortality due to breast cancer, in real life its application is low. Study among women in United States showed that the monthly breast cancer screening rates ranged from 29- 63%.[7]

There is a paucity of data on the knowledge, awareness of Breast cancer and breast self-examination (BSE) in Urban Coimbatore. This study was done to explore the knowledge, awareness and practice of Breast self-examination and to explore if there is any association between demographic characteristics, knowledge of breast cancer and practice of breast self-examination and so as to plan for awareness campaigns in future.

Aims and Objectives

1. To study the knowledge, attitude and practices towards breast cancer among women in reproductive age group.
2. To suggest necessary recommendations based on the observation to improve awareness of breast cancer in the study population.

Material and Method

Study area	Sundarapuram, Coimbatore
Study design	Community based cross sectional study
Study subjects	Reproductive age group women (18-49 years)
Sampling technique	Purposive sampling
Sample size	125
Inclusion criteria	Women among reproductive age group (18- 49 years) who consent to participate in the study
Exclusion criteria	Known case of breast cancer on treatment
Ethical consideration	IHEC approval obtained. Confidentiality maintained
Study tool	Questionnaire
Analysis	SPSS-23

Methodology

A study on Knowledge, Attitude and Practices towards breast cancer among reproductive age group women was done in Sundarapuram which is an urban area in Coimbatore where the Urban health centre of the teaching hospital is located. After pilot testing using the pre- test questionnaire necessary correction and validation was made and proper study was undertaken.

The women among reproductive age group between 18- 49 years who gave consent were taken up for the study. Data collection was done among 125 women using purposive sampling technique.

The semi structured questionnaire included various knowledge components in breast cancer like if they know about breast cancer, signs and symptoms of breast cancer, breast self-examination (BSE), comprehensive breast examination (CBE), mammography and treatment options. Attitude components like early case detection, breast feeding, risk factors and screening techniques and practice on screening techniques.

Data was collected entered in excel sheet and analysed using SPSS-23 software. Results were tabulated. Study on association and correlation between knowledge, attitude and practice components were analysed using chi- square test and Pearson correlation. p value of < 0.05 was taken as statistically significant. Confidentially was maintained throughout the study.

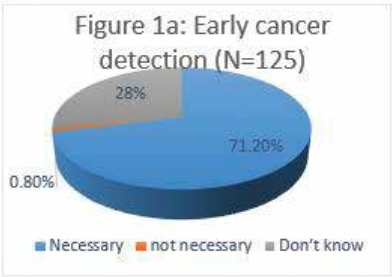
Breast Self-examination: BSE is a screening test to detect breast cancer using inspection and palpation of the breasts in standing in front of mirror, lying and in shower. It is done once in a month using a standard procedure.[8]

Comprehensive Breast Examination CBE: CBE is a technique in screening of breast cancer. It is extensive component of BSE.[9]

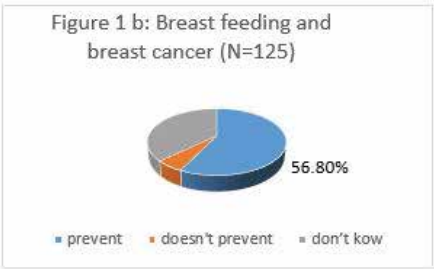
Observation and Results

Table 1: Socio Demographic Characteristics

Socio- demographic characteristics (N = 125)	n (%)
Age distribution	
18-25	52 (41.6)
26-33	26 (20.8)
34-41	19 (15.2)
42-49	28 (22.4)
Occupational status	
Government	27 (21.6)
Self employed	12 (9.6)
Unemployed	21 (16.8)
Socio economic status (Modified Kuppusamy scale for the year 2018)	
Lower middle	66 (52.8)
Upper lower	54 (43.2)
Lower	5 (4.0)
Marital Status	
Married	94 (75.2)
Unmarried	31 (24.8)

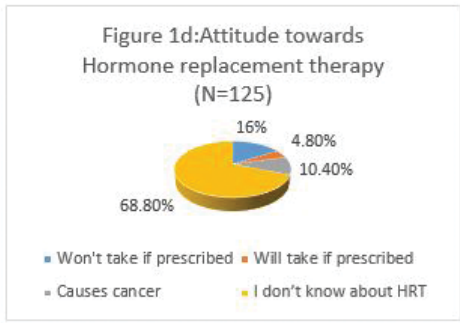


Among the study subjects most of them (41.6%) belong to 18-25 years of age. Among the study subjects, 31.2% of the study subjects were employed. In this study 52.8% were from lower middle class and 43.2% were from upper lower class. In this study, 75.2% of the subjects were married.

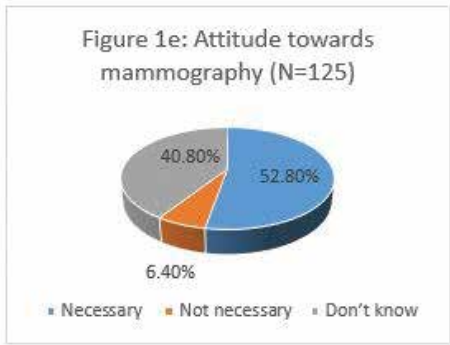


A positive family history of breast/reproductive tract cancers was elicited among 27.2% of the study subjects. None of the women in the study were smokers but 19.2% had exposure to passive smoking and 4.8% of the subjects were tobacco chewers. Hormone replacement therapy (HRT) and Oral contraceptive pills (OPC)were used by 11.2% of the subjects.

Table 2: Knowledge about breast cancer (N = 125)



Knowledge about breast cancer	Responses n (%)
Know about breast cancer	88 (70.40)
Know the signs of cancer	70 (56)
Painless swelling can turn into cancer	83(66.40)
Know Breast self-examination	50 (40)
Know comprehensive self-examination	32 (25.60)
Know Mammography	53 (42.40)
Breast cancer is curable	71 (56.80)
Breast cancer is treatable	81 (64.80)
Breast cancer is Fatal	60 (48)
Breast feeding can prevent cancer	84 (67.20)
Small breast lump can turn into cancer	98(71.20)



As depicted in table 3, 70.4% of the subjects knew about breast cancer, 71.2% of them knew that small lump can turn into cancer, 67.2% said that breast feeding can prevent cancer, about 40% of the respondents knew about breast self-examination, 42.4% knew about mammography and 64.8% said that breast cancer is treatable.

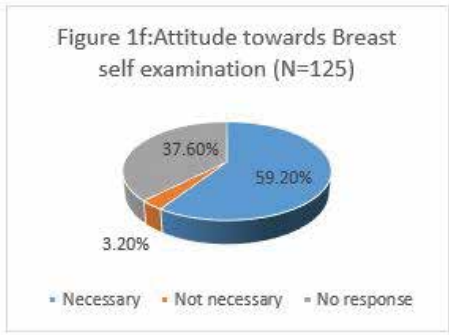


Figure 1a-f: Attitude towards breast cancer

The pie charts (figure 1a- 1f) depicts the attitude of study subjects towards breast cancer- 71.2% said that early diagnosis of cancer is necessary, 56.8% said that breast feeding can prevent cancer, 24% sad that alcohol consumption can cause breast cancer, 58.2% said breast self- examination is necessary and 52.8% said mammography is necessary.

Table 3: Practices on breast cancer prevention

Practice (N = 125)	Response n (%)
Breast self-examination	49 (36.8)
Comprehensive breast examination	28 (22.4)
Mammography	1 (0.8)

Among the study subjects 36.8% practice self-breast examination, 22.4% practice comprehensive breast examination and 0.8% had underwent mammography.

Figure 2: Reason for not practicing Breast Self-Examination (BSE) (N = 125)

Figure 2 shows that 28% don't know about breast self-examination, 29% don't know about the steps of BSE and 40% didn't know the importance of BSE.

*- Statistically significant ($p < 0.05$)

The above table shows the association of factors like age, education, occupation, family history and marital status and KAP towards breast cancer. There is a significant association between age and knowledge and attitude, education and Knowledge, attitude and practice. Higher the literacy level better was the KAP towards breast cancer. Occupational status had significant association between knowledge and attitude while family history of cancer among the study participants showed no significance. Married women had better knowledge, attitude and practice towards breast cancer and it was statistically significant.

There was a significant association between knowledge, attitude and the practice habits of the breast self- examination among the study subjects.

Table 4: Correlation among Knowledge, attitude and practice towards breast cancer screening

		Knowledge	Practice	Attitude
Knowledge	Pearson Correlation	1	0.658	0.548
	Sig.(1 tailed)	NS	0.000*	0.000*
Attitude	Pearson Correlation	0.548	0.374	1
	Sig.(1 tailed)	0.000*	0.000*	NS
Practice	Pearson Correlation	0.658	1	0.374
	Sig.(1 tailed)	0.000*	NS	0.000*

(*Statistical Significance $p < 0.05$)

The above table shows that there is a significant correlation between knowledge with attitude and practice towards breast cancer. Better the knowledge and awareness regarding breast cancer screening better were the screening practices.

Discussion

From our study we found that 70% of the study subjects know about breast cancer which is way better when compared to the study conducted by Siddharth R et al[10] where 81.1% of them were unaware about the Breast cancer and in the study by Somdatta et al[5] half of the study population were aware about the condition. In another Indian study by Agarwal et al[3] the awareness was 47.9%. the high level of awareness towards breast caner in this study population can be attributed to the health education campaigns conducted in the study area.

It was also found that increase in literacy and socio economic status increased the knowledge regarding breast cancer which is similar to our study. Rural and urban women did not differ significantly in their knowledge of breast cancer in this study. However, awareness about breast cancer varied depending upon education, employment, and economic status. Siddharth et al[10]also found that women with higher levels of education had significantly higher knowledge about breast cancer in their study of 300 women in Andhra Pradesh in India.

In our study 40% knew about breast self-examination, compared to Siddharth R et al[10] where 11% of the subjects knew about BSE.

In the present study among the participants who know about breast examination, 36.8% practice BSE. The reason for not practicing BSE was that they don't know about BSE, don't know about the steps of BSE, and few don't know its importance. While in studies conducted by Prankin et al[11] and Singh et al[12] showed knowledge and awareness of early detection measures of breast cancer such as BSE was not consistent.

Conclusion and Recommendation

Education and associated factors like socio-economic status and employment have an impact on early detection of the disease and initiation of treatment in early stages of cancer. Our study also highlights the association of

knowledge and attitude and the BSE practices. More the knowledge about screening techniques better was the practice rate. The teaching of BSE can alert any abnormal changes in the breasts and seek medical attention immediately. Positive health care can go a long way in increasing health awareness amongst the study population and their health seeking behaviour.[13]

This study demonstrates the need for health education programs about risk factors, signs, symptoms of breast cancer, to improve the awareness among women. Female centred clinics and women self- help groups should be organised in appropriate and accessible locations for early detection and practice of BSE. should help them practice screening for breast cancer.

Further periodic researches and surveys about knowledge and practice of BSE are recommended to assess the positive impact of health education. Educating health care workers and nurses to impart training about BSE is also crucially important. We should have major policy changes to increase the screening and health education programmes which would increase the overall positive impact on reducing the burden of the disease.

Health Promoting Lifestyle Practices: A Comparative Study on Health and Non-Health Professional Students

Bitty Joys[1], Sonamtsomu G[2], Dekey Yanzom[2]

[1]Assistant Professor, Department of Medical Surgical Nursing, [2]BSc. Nursing, Krupanidhi College of Nursing,

ABSTRACT

Objective: To identify the health promoting lifestyle practices among health professional (HP) and non-health professional (NHP) students using HPLP (II) scale.

Method: A comparative design was used for the present study. 200 students were selected by using purposive sampling technique. A self-administered questionnaire (HPLP II) was used to assess the healthy lifestyle practices in six domains. The data analysis was done by using descriptive and inferential statistics.

Results: Out of total 200 participants, 100 were health professional and 100 were non-health professional students. The highest mean out of a scale of 4, was 2.96 (SD=0.618) and 2.96 (SD=0.618) for spiritual growth in health professional students and non-health professional students respectively. The lowest mean score was 2.19(SD=0.625) and 2.09 (SD= 0.605) for physical activity and health responsibility in health professional students and non-health professional students respectively. Significant difference between the groups were identified in the sub scales of health responsibility (2.43 Vs 2.09, P=0.005), inter personal relationship (2.85 Vs 2.78, P=0.089) and nutrition (2.29 Vs 2.39, P=0.017). No major difference was observed between other sub scales. The overall performance was moderate among health professional students (2.55) and low among non-health professional students. (2.48)

Conclusion: The study concluded that many of the students were not adopting healthy lifestyle practices. Health professional students had moderate scores and non-health professional students had low scores.Since this study shows moderate and low health promoting lifestyle practices, there is need to develop guidelines and periodic investigation for the students for their good health.

Introduction

Illness can strike anybody at any time at any age. In later decades, way of life has been perceived as the determinant of well-being and has turned into a focal point of expanding research interest around the world[1]. A healthy lifestyle can leave you fit and at decreased risk for sicknesses. A balanced diet, regular workout and proper rest are the major factors for maintaining good health [2.] Health promoting lifestyle practices are the efforts that people follow to remain healthy, to prevent major illness and to lead a better life. Non-communicable diseases are the leading cause of death and disabilities worldwide. Better health practices help to prevent the occurrence of non-communicable diseases [3.]

Globally, non-communicable diseases are responsible for 63% of all deaths and they are responsible for an estimated 80% of the worldwide burden of sicknesses. Records revealed that 53% of the cause of death are associated with poor lifestyle. Unhealthy lifestyle practices lead to non-communicable diseases like obesity,coronary artery diseases, diabetes, musculoskeletal and spinal problems[4]. The World Health Organization (WHO) has said that 60% of a person's fitness and quality of life depends on his/her way of life. Numerous studies revealed that good health practices reduceillnesses and mortality rates.Health related

behaviors in the initial stage of life have an impact on the ailment risks related to lifestyle in later stages of life. Hence it is essential to promote healthy lifestyle behaviors among the youth.[1,5.]

A study had been conducted among medical and non-medical students in University of Malaysia to compare the health risk factors and health promoting behaviors amongst them. The study showed that awareness among medical students is higher than non-medical students. But there is no significance in health promoting behaviors amongst them[6]. Another study was conducted in Pakistan to compare healthy lifestyle and dietary habits in medical and non-medical students. It is predicted that medical students have more knowledge about healthy lifestyle practices than non-medical students. But no data showed that this awareness leads to good habits.[7]One study conducted to analyze the health promoting lifestyles of medical students in Bhopal, Madhya Pradesh showed that health status of medical students is low in Bhopal.[8]

College life is a crucial period for students astheir behaviors are vulnerable to drastic changes. Hence, university and college years represent a critical time for health and nutritional education [7]. It is vital to increase health promoting habits among the youth. In order to do that it is very important to assess their lifestyle habits and behavior. Only few studies have been conducted in India related to this topic. The findings of the study will reveal the existing lifestyle practices among them.[8,9]This will help us to plan in advance and educate the young population about the importance of following healthy lifestyle practices. Hence the investigator decided to assess the lifestyle practices among college students.[7,8]

Materials and Method

Setting and Design: This comparative design study was conducted in selected colleges, Bangalore. This was done to assess the health promoting lifestyle practices among health professional and non-health professional students and to compare among the group.

Participants: This study included 200 students studying various nursing and degree courses in selected colleges in Bangalore. 100 students from nursing college and 100 students from degree college were selected for the study by using purposive sampling technique.

Instruments: Aself-administered questionnaire was used for data collection. The survey of the students was done in two parts. The first part included demographic questions and the second part contained 52 items related to Health Promoting Lifestyle Profile (HPLP II). The revised HPLP II questionnaire developed by Walker in 1987, measures behavior in six sub scales. These sub scales were physical activity (PA-8), spiritual growth (SG-9), health responsibility (HR-9), interpersonal relationship (IPR-9), nutrition (N-9), and stress management (SM- 8)[10,11,12].

The HPLP II questionnaire was composed of 52 items based on six sub scales. The mean score of the scale was divided into 3 levels as high (>3), moderate (2.5–3) and low (<2.5). Many researchers have been used the HPLP II scale for health promotion and have verified it's high validity and reliability. The English version of this overall scale reported a Cronbach alpha of 0.94 and an alpha ranging from 0.79 – 0.87 for the six sub scales. The higher the mean score obtained, the higher is the index of health promoting lifestyle.[8,11]

Data Collection Method: This study was approved by the Institutional Ethical Review Board (IERB). Formal permission was obtained from the college administration, ethical committee and heads of departments. Students were selected based on purposive sampling method. The investigator explained about the study and obtained written informed consent from the participants. Then the investigator allotted the questionnaire to the participants. The inclusion criteria for the study were,

1. Students studying in various nursing courses and various degree courses in selected colleges, Bengaluru.
2. Students who are willing to participate.
3. Students who can read and write English.

Data Analysis

The data collected was analyzed by using descriptive and inferential statistics. The data collected was entered into a master sheet. Descriptive statistics was used to describe the data by using percentage, mean, median, mode and standard deviation (SD). To relate between the variables, Pearson's correlation coefficient was used. SPSS V2 was used for the analysis. An alpha value of 'p' less than 0.05 was used to determine the statistical significance [8, 13, 14, 15].

Findings

Sociodemographic characteristics of the participants: A total of 200 students were studied, among them 28% were males (56/200) and 72% were females (144/200).

Among health professional students, 82% were females and rest 18% were males whereas among non-health professional students 62% were females and 38% were males. (Table 1)

Table 1: Distribution of Students by Gender and Age

Variable		HP	NHP	N	%
Gender	Male	18	38	56	28
	Female	82	62	144	72
	Total	100	100	200	100
Age	18	1	29	30	15
	19	11	27	38	19
	20	40	22	62	31
	21	19	19	38	19
	22	16	2	18	9
	23	9	1	10	5
	24	1	0	1	0.5
	25	3	0	3	1.5
	Total	100	100	200	100

Health promoting life style practices among health professional students: The findings of the present study revealed that the average mean score for health promoting lifestyle practices among health professional students were moderate (2.55). Highest score falls in the sub scales of spiritual growth (2.96) and lowest score for physical activity (2.196). (Table 2)

Table 2: Distribution HPLP II Score and its subscales

Scale	Mean		Standard Deviation	
	HP	NHP	HP	NHP
HPLP II Score	2.550	2.480	0.574	0.599
Physical Activity	2.196	2.173	0.625	0.623
Spiritual Growth	2.960	2.960	0.618	0.618
Health Responsibility	2.430	2.090	0.624	0.605
Interpersonal Relationships	2.850	2.780	0.575	0.629
Nutrition	2.290	2.390	0.518	0.601
Stress Management	2.598	2.542	0.485	0.522

Description of gender and health promoting lifestyle practices among health professional students: The findings revealed that males have the highest score in the sub scales of interpersonal relationships (3.0) and the lowest score in nutrition (2.39), whereas females have the highest score in spiritual growth (2.99), and the lowest score in physical activity (2.19).

Description of gender and health promoting lifestyle practices among non-health professional students: The findings revealed that males have the highest score in the sub scales of spiritual growth (2.89), and the lowest score in health responsibility (1.97) whereas females have the highest score in spiritual growth (3.0), and the lowest score in physical activity (2.06).The findings showed that males have better performance than females in the sub scales of physical activityand stress management, whereas females have better performance than males in the sub scales of spiritual growth, health responsibility, interpersonal relationships and nutrition. (Table 5)

Comparison of health promoting life style practices among health professional and non-health professional students: The findings of the present study revealed that there was significant difference between the groups in the sub scales of health responsibility (2.43 vs 2.09, P=0.005), interpersonal relationship (2.85 vs 2.78, P=0.089) and nutrition (2.29 vs 2.39, P= 0.017). There is no significant difference between the group in the sub dimensions of physical activity, stress management and spiritual growth.(Table 2, 3)

Table 3: Comparison of health promoting lifestyle practices (HP and NHP)

Discussion

The current study was done to evaluate the health promoting lifestyle practices among health professional and non-health professional students and to compare among the groups. The study findings revealed that the overall performance score was slightly higher for health professional students than non-health professional students (2.55 Vs 2.48). According to HPLP II total score, both the groups were not adopting healthy lifestyle practices on regular basis. These findings were consistent with previous studies conducted.[7,8]

The findings revealed that in the areas of health responsibility, interpersonal relationship and nutrition there was a significant difference between health professional and non-health professional students. In the areas of health responsibility and interpersonal relationship, health professional students have higher scores than non-health professional students whereas in the area of nutrition non-health professional students have higher scores than health professional students. There was no significant difference in the areas of physical activity, spiritual growth and stress management.

The findings revealed that overall HPLP score among health professional students were moderate (2.55) and non-health professional students were low (2.48). Health professional students had slightly higher scores than non-health professional students. The overall scores were moderate which was consistent with those found in other studies.[4,15]

The result suggests the need for health teaching for both health professional and non-health professional students. A detailed awareness of the lifestyle and health needs of students is essential and will help to plan more effective interventions.

Conclusion

The main findings of the study revealed that majority of the students do not exhibit healthy lifestyle. It revealed the need for promoting healthy lifestyle practices among both health professional and non-health professional students. Considering these findings and other studies suggestions, we proposed the strategies for healthy lifestyle promotion by developing guidelinesand periodic investigations for the students for their good health. Our findings may help health educators, curriculum planners and faculty administrators in planning guidelines to structuralize a healthier campus and to develop health promotion programs supporting healthy choices among students.

Acknowledgement

The satiation and euphoria that accompany the successful completion of this research would be incomplete without the mention of the people who made it possible. We thank the research team of Accendere Knowledge Management Services, CL Educate Ltd. for their unflinching guidance, continuous encouragement and support to successfully complete this research work.

Conflict of Interest: No conflict of interest.

Source of Funding: No specific grant from any funding agency.

Ethical Clearance: The study was approved by the Institutional Ethical Review Board (IERB). Administrative approval was obtained from the departments of nursing and degree colleges. We informed the students about the study and obtained written informed consent to participate in the study. Subjects were informed that their participation was completely voluntary and were assured of confidentiality of the data.

Effectiveness of Stress Management Strategies on Occupational Stress in Educational Institution

Jasmine Joseph[1], C. Lalroluahpuii[2], Chime Dolkar[3], Yojna Chettri[3]

[1]Principal, [2]Lecturer, [3]B.Sc Nursing, Krupanidhi College of Nursing, Bangalore, Chikka Bellandur, Carmelaram P.O., Varthur Hobli, Bangalore

ABSTRACT

Occupational stress is considered as a level of tension when a person experiences a disagreement between the working environment challenges and their possibilities of coping. The reason for the study was to recognize and compare the various level of occupational stress among working men and women and the findings can be useful to improve the organizational behavior and the employee- employer interaction. A quasi experimental one group pre-test post-test design was used. 109 employees were selected using quota sampling technique from the Group of Institutions. Data was collected using Baseline data and The Workplace Stress Scale. After the first assessment, Informational booklet on Stress Management Strategies was administered and post-test was conducted after 21 days. Majority of the participants were teaching staffs. The investigation shows that the highest level of stress at both data collection times was of Moderate stress. The most utilized stress management strategies were of the Physical and Spiritual domains. The result of the investigation is useful to improve the organizational behavior and the employee- employer interaction.

Keywords: *occupational stress, stress management strategies, working men and women, stress.*

Introduction

Stress is a common problem that affects almost all of us at some point in our lives. Each one of us experience different stresses across our full life span repeatedly which leads to increased incidence of stress problems. Stress is expressed as a reaction to our changing and demanding circumstances. It depends upon each one of us and our capacity to handle the change that stress makes us feel good or bad. Change is the one that never changes and how we react to that change is more important and is the determining factor for stress[1].

Nowadays stress is highly associated with job and work-related pressure is one of the real wellbeing dangers of the cutting-edge work environment. It represents a significant part of the physical ailment, substance misuse, and family issues experienced by millions of blue and white-collar workers. Work related pressure and distressing working conditions have been connected to low efficiency, non-attendance, and expanded rates of mishaps on and off the activity[2].Work and family are the two most vital viewpoints in individuals' lives and, as opposed to the underlying conviction that they are particular parts of life; these spaces are firmly related (Ford *et al.,2007)*. In any case, when work denies individuals a chance to use their imagination, insight, and basic leadership capacity, it causes pressure[6].

The conventional response of management is usually to "blame the victim," considering stress as an individual or "personal" problem that workers bring to work from home. Rather than the act of pointing the finger at individuals for their failure to fit into a heartless workplace, what is more important is to analyze the structure of employment necessities and social connections at work in order to improve the well being and thereby reducing stress[3]. The reason for the study was to determine the level of occupational stress, strategies adopted for management of stress and does the level of stress reduce after adopting the stress management strategies among working men and women in an educational institution.

Occupational Stress: Work related pressure is treated as a condition of strain which happens when a person detects a difference between the workplace challenges and their potential outcomes of adapting. A moderate amount of occupational stress could be motivating and impelling, but the situation becomes serious if the stress is too high or long-term and there are little coping resources[9], using drugs, little movement and sedentary lifestyle and unhealthy diet[9].

Occupational stress also causes certain risk to the organization as well as the societies. The problem which can occur in the organization are low creativity, work ability and commitment of employees, high level of incapability to work, great staff turnover, increased risk of occupational accidents and quality problems that generate costs emanating from the dissatisfaction of customers. If an employee in stress could take it out on their family and co-citizens, increasing the aggressiveness in society[10].

Goal and research questions for the study: The reason for the current study was to recognize and compare the various level of occupational stress among working men and women, type of stress management adopted to cope with stress and the level of stress reduction after adopting the stress management strategies.

The explicit research questions were:

1. What are the degrees of stress at each data collection time?
2. Does the degree of stress reduce after adopting the stress management strategies?
3. What are the strategies adopted for the management of stress?

Materials and Method

Design: A quasi experimental one group pre-test post-test design was used for the study. There were two measures for data collection: Before and after administration of Informational Booklet on Stress Management.

Setting: The study was conducted in a selected group of institutions at Bangalore, Karnataka, India. It is a private institution and it offers different courses such as Nursing, Pharmacy, Physiotherapy, Management, Degree courses and Pre-University College. The staffs working in this institution are primarily teaching faculty.

Participants: The target population for the study was the working men and women of different courses in the Institution. The accessible population was teaching staffs, clerical staffs, librarians and administrative staffs. The inclusion criteria were: (i) working men and women of a selected institution. (ii) employees who are willing to take part in the study. Participants not included were (i) employees who had undergone stress reduction programme. (ii)Grade 4 workers. The eligible sample for the study was selected by Quota sampling technique.

Measure

Demographic Data: Demographic proforma was designed to collect the baseline information of the participants. It includes information regarding characteristics of the participants such as age, gender, marital status, educational qualification, source of family support in assisting with household activities and child rearing, occupation, additional responsibilities, religion, number of hours of work in a day.

The Workplace Stress Scale: The workplace stress scale was developed by The Marlin Company, North Haven and the American Institute of Stress, Yonkers, New York. It includes 8 statements that describe how an employee feels about the current job and how often they have a feeling of stress utilizing 5-point Likert Scale.

Stress Management Strategy Module: This consists of stress symptom checklist which was used to assess the stress level. The participants were able to identify their level of stress based on the scoring key. The stress level varies from low, moderate, high and very high.

Ethical Considerations: Moral endorsement was acquired from the Institutional Ethical Review Board (IERB) before the beginning of the investigation. Intentional interest was underscored for the investigation. The subjects were guaranteed of their entitlement to security, and information was entirely classified.

Data-Collection Method: Data was collected by obtaining formal permission from Authority of the selected educational institution. After explaining about the research and obtaining informed consent, pre-test was conducted using Standardized Work Place Stress Scale to assess the level of occupational stress among the group.

Data Analysis: The key instrument used for this analysis is SPSS (Version 20, IBM: Armonk, New York, United States) was used to analyze the data. Descriptive and inferential statistical tests were utilized to fulfill the goal of the study. The first research question was

analyzed with the use of descriptive statistics such as mean, median, standard deviation, range, frequency, and percentage. The inferential test, paired sample t-test, was used to answer the second and third research question.

Results

Attributes of the study sample: The attributes of the participants are summarized in Table 1. The mean age of the participants was 32.28 years [(SD) = 1.42], with a range of 23–75 years. Majority of the participants were male (n = 75, 68.8%), Hindu (n = 87, 79.8%), unmarried (n = 78, 71.6%). Majority (n=104, 95.4%) of the participants are teaching staffs. The majority of the participants worked for ≤ 8 hours in a day (n=63, 57.8%). Majority of the participants spent ≤ 1 hour to travel to and from the Institution (n = 49, 45%)

Table 1: Attributes of the study sample (n = 109)

Variable	Frequency %	Mean (SD)	Median	Minimum	Maximum
Age		32.28 (8.076)		23	75
Sex					
Female	34 (31.2%)				
Male	75(68.8%)				
Religion					
Hindu	87(79.8%)				
Muslim	4(3.7%)				
Christian	17(15.6%)				
Others	1(.9%)				
Marital Status					
Married	31 (28.4%)				
Unmarried	78 (71.6%)				
Occupation					
Teaching Staff	104(95.4%)				
Clerical Staff	5(4.6%)				
No. of hours of work a day					
≤ 8 hours	63 (57.8%)				
8 - ≤12 hours	25 (22.9%)				
12 - ≤15 hours	12 (11%)				
More than 15 hours	9 (8.3%)				
No. of hrs spent in travel					
≤ 1 hour	49 (45%)				
1-2 hours	26 (23.9%)				
2-3 hours	20 (18.3%)				
>3 hours	14 (12.8%)				
Health Problems					
Yes	33(30.3%)				
No	76 (69.7%)				

Degrees of stress and the sort of stressors

Pre-administration of the Stress Management Strategy Module: The level of stress experienced by the participants before administering the Stress Management Strategy module ranged from 12 to 40 (mean= 22.16, SD= 4.374). When the subscales are considered, the result denotes that adequate control/ input over work duties (mean= 3.21, SD=1.187) and utilization of skills/talents fully (mean= 3.8, SD=1.032) had the most noteworthy means among the workplace stress subscale scores

Post-administration of the Stress Management Strategy Module: The participants reported that the level of stress experienced after the administration of the Stress Management Strategy Module ranged from 9 to 39 (mean= 21.83, SD=4.596). From the Workplace Stress Subscales, adequate control/input over work duties (mean=3.30, SD=1.167) and utilization of skills/talents fully (mean=3.57, SD=1.133) had the most noteworthy means among the workplace stress subscale scores.

Stress Management Strategies utilized by the participants: Different forms of stress management strategies were introduced to the participants in the form of a module. Out of 109 participants, only 17 of them had performed these activities. The information that was received was statistically analyzed and it was found that there was a drastic difference between the pre-test and post-test.

Table 2: Stress Management strategies adopted by participants

	Pre-test		Post-test		Remark
R Squared value	0.549		0.852		A positive impact of the inputs on the outcome
Sig	0.393		0.012		A shift of result from insignificant to significant domain
Variables	**t-value**	**Sig**	**t-value**	**Sig**	**t_2-t_1**
Physical	-2.352	0.046	-2.141	0.065	0.212
Emotional	-1.214	0.260	-5.071	0.001	-3.857
Spiritual	-0.720	0.492	-2.837	0.022	-2.117
Mental	0.830	0.430	3.760	0.006	2.930
Social	1.673	0.133	2.853	0.021	1.180
Duration of activity (Physical)	-0.182	0.860	1.991	0.082	2.173
Duration of activity (Relaxation)	-0.421	0.685	2.869	0.021	3.290
Duration of activity (Spiritual)	0.753	0.473	2.386	0.044	1.633

Shift of result shows that there is a clear indication of the impact of the Stress Management Strategies on the psychology of the participants which is measured by the R squared value. With the significance level of the relationship, there is a clear indication of the impact of the activities on the shift of participant's perception from insignificant to significant. (Table 3).

Changes in level of stress and type of stressors

Table 3: Paired *t* test comparing working men and women's scores in the workplace Stress Scale before and after the introduction of Stress Management Strategies

Scale/ Subscales	Mean SD	t value	df	p-value
Total stress scores				
Pre	22.16(4.374)	.738	108	.462
Post	21.83(4.596)

Pre	3.21(1.187)	-0.666	108	0.507
Post	3.30(1.167)			
Recognition and rewards received for good performance				
Pre	2.77(1.015)	-0.226	108	0.822
Post	2.80(1.025)			
Utilization of skills/talents fully				
Pre	3.81(1.032)	1.787	108	0.077
Post	3.57(1.133)			

Table 4 compares the working men and women's workplace stress scores before and after the introduction of stress management strategies, for the subscale scores,

statistical significance was met only for two subscales. (Table 4).

Degree of stress among the participants: The degrees of stress as calculated on the basis of the scores given in the Workplace Stress Scale. The findings revealed that majority of the participants were having moderate stress in the pre-test (47.7%) and post-test (40.4%). This could be possibly due to health problems that the participants had or of the number of working hours in a day. (Table 5)

Table 4: Degree of stress among working men and women before and after the introduction of stress management strategies

Degree of stress	Pre-Test		Post-Test	
	Frequency	%	Frequency	%
Relatively Calm	4	3.7	9	8.3
Fairly Low	34	31.2	34	31.2
Moderate Stress	52	47.7	44	40.4
Severe Stress	16	14.7	20	18.3
Potentially Dangerous	3	2.8	2	1.8

Discussion

Revealed Stressors: From the investigation, stress from the utilization of skills/talents fully at work and adequate control/ input over work duties were found to be the most prominent source of stress by the participants. This finding is in contrast with a study by Mohamed Taher (2018), who found that the major source of occupational stress was from the nature of work.

Degrees of Stress: The present study found that majority (47.7%) of the participants had *moderate stress* during the pre-test and it significantly reduced to 40.4% in the post-test which also constitutes majority of the participants. This study finding is in consistent with a previous study [10]. The present study findings revealed that the participants reported higher level of stress before administering the stress management strategy module than the after. The level of stress for the total score on the Workplace Stress Scale reduced after administering the Stress Management Strategy module.

Most utilized stress management strategy: Out of the 109 participants, 17 of them had reported to have sincerely adopted the stress management strategies given on the Booklet. It was found that the most utilized stress management strategy was performing physical activity. Performing physical activity was thought to be the only effective strategy to manage stress but the participants also reported that other form of strategies was also helpful such as Mental and Social strategies which are clearly shown in Table 3.

Constraints and future proposals: The present study has few limitations. First of all, the study was conducted in an educational institution and the participants particularly the teaching staffs were not available most of the time as they are engaged with their teaching and other activities. Second, the stress management strategy module prepared required a period of 21 days for the effectiveness to take action. The researchers find great difficulty in convincing the participants to perform the strategies everyday for a consecutive 21 days because of the tight schedule of the teachers.. More descriptive form of study with the use of different scales of measurement may be used in another study. And, lastly out of the 109 participants, only 17 of them sincerely adopted the stress management strategies which made it difficult for the investigators to generalize the study for further use.

Conclusion

The present investigation adds to the information of occupational stress and management strategies among working men and women in an educational institution. The study revealed that the major source of stressors in both the data collection times were utilization of skills/ talents fully at work and adequate control/ input over work duties

Relevance for clinical practice: Findings of this study can contribute towards the development of practice of stress management strategies in the work environment. Stress management strategies adopted in

This study is simple practice guidelines which can be followed by all the staff with little ease and they can help a long way in reducing stress and building positivity in the work place.

Acknowledgement

The satiation and euphoria that accompany the successful completion of this research would be incomplete without the mention of the people who made

it possible. We thank the research team of Accendere Knowledge Management Services, CL Educate Ltd. for their unflinching guidance, continuous encouragement and support to successfully complete this research work.

Effectiveness of Station-based Skill Training Model through Objective Structured Clinical Examination (OSCE): Nursing Students' Skills in Performing the Clinical Procedures

Rinu Mathew[1], Sujata Regmi[2], Bombo Ekane Dorothee V[2]

[1]Lecturer, Department of Obstetrics and Gynecological Nursing, [2]B.Sc. Nursing, Krupanidhi College of Nursing

ABSTRACT

Background: Objective Structured Clinical Examination (OSCE) is "a best way to deal with the appraisal of clinical ability in which the domain of competence are evaluated in a very much arranged structure with consideration being significant to objectivity", or as an assessment of structured clinical skills. An OSCE requires every trainee to exhibit particular abilities and practices in a simulatory setting with institutionalized patients. It comprises short undertakings of tasks and each task is assessed by an analyst utilizing a foreordained scheme of plan. The OSCE has turned into an entrenched strategy for evaluation which is extensively utilized as a technique for appraisal in field of nursing educational program.

Objectives: This study implemented to assess the procedural skills of nursing students using OSCE scales when station-based expertise preparing and to evaluate the effectiveness of station-based skill training model for teaching procedural skills among nursing students.

Method: A pre-experimental one group pre and post test design was used with 30 randomly selected samples. The clinical skills of the students were observed before and after giving the station based skill training. The three selected skill stations were venipuncture, wound dressing and NG tube feeding.

Results: The mean post test scores in all three skill procedures were significantly high indicating that the station based skill training model was effective.

Conclusion: The OSCE acts as a tool in assessing and evaluating the students skills in performing clinical procedures.

Keywords: *Station based skill training, Objective structured clinical examination, nursing students*

Introduction

The learner's clinical capabilities to be assessed, for the most part the area of potency to perform with cogency, turns into a critical need in their learning procedure. Then the learner's increase with different unparalleled encounter that are risky in figuring the result of an individual and the program. Therefore, it is important to utilize different assessment techniques to comprehend nursing trainees' clinical ability and to put more excellence on the strategies that energizes the learning of clinical aptitudes, while at the same time contributing a space for evaluating them. One such space is the Objective Structured Clinical Examination (OSCE)[1].

The OSCE has been broadly and progressively utilized since it was discovered during the 1970s. Successful and legitimate clinical assessment ought to be of worry to all nursing resources and clinical teachers. There is a sensible desire for assessment to be objective, solid, particular, and archived. Clinical aptitudes and practice assume the huge job in preparing different gatherings; the achievement of prentice in these fields relies upon what they realize and progress toward becoming retained with the content. Likewise, students need to know, obviously depicted, the particular

Corresponding Author:
Rinu Mathew
Lecturer,
Department of Obstetrics and Gynecological Nursing,
Krupanidhi College of Nursing
Email: steffi.rinumathew@gmail.com

goals by which they are being assessed. One kind of evaluation, which meets these criteria is an execution based appraisal. A case of an execution based appraisal is the —OSCE. Studies have demonstrated that it is a viable assessment apparatus to evaluate reasonable aptitudesamong the trainees [1].

In numerous examples, the OSCE procedure has been adjusted to test students from various health care delivery services. Additionally, this technique has pulled in impressive consideration in light of abnormal states of unwavering quality, noteworthiness and objectivity, the content, legitimacy of the accomplished aptitudes, reasonableness, making inspiration for learning, and educators' and trainees' fulfillment. In OSCE, Objective means inspectors utilize an agenda for assessing and evaluating the students, Structured means learner sees a similar issue and plays out similar undertakings in a similar time allotment, Clinical means the errands are illustrative of those looked in genuine clinical circumstances. OSCE, as a technique for clinical abilities evaluation has various inborn focal points:

- Firstly, it can incorporate both summative and developmental parts, in which a judgment or assessment of a person's execution is made (summative) trailed by the arrangement of criticism, from which the understudy can learn (developmental).
- On the other hand, every trainee is required to show particular practices in a simulated setting, strict command over the clinical setting is conceivable, while in the meantime, reflecting genuine expert assignments.

This control wipes out the result of pure chance issue that emerges when understudies are surveyed inside this present reality clinical condition with real patients and also the danger of damage jumping out at a patient [2].

Other studies have recommended that larger studies are needed to establish the effectiveness of the OSCE within nursing education [3].

A cross sectional expressive examination uncovered greater part of understudies from the test and control bunches given positive criticism about the OSCE qualities. The examination reasoned that OSCE is an exceptionally helpful and adequate strategy for assessing nursing prentices' clinical abilities [4].

A basic survey was led and results demonstrated that the OSCE has been emphatically evaluated for objectivity in trainee appraisal and gives a 'hands on methodology' to evaluate clinical ability in circumstances where 'this present reality' clinical condition is neither fitting nor possible. The examination inferred that the OSCE can be viewed as an important technique for upgrading nursing student assessment [5].

A relative report uncovered OSCE examination as outstanding amongst other appraisals as it offers an alluring alternative for assessing nursing trainee competency. It gives specific qualities as far as workforce staff objectivity and unwavering quality of the evaluation procedure for all understudies, particularly when contrasted and different strategies for evaluating the practice [6].

Therefore OSCE when is utilized effectively can be an exceedingly fruitful as an instrument to assess and evaluate the clinical skills of nursing understudies in playing out the methods which fosters them to be independent professionals.

Materials and Method

Study Design: A pre-experimental one group pretest posttest design was used to accomplish this study purpose.

Participants and Sample Size: The study participants were male and female nursing students selected via simple random sampling technique. In total 30 students who met the inclusion criteria were invited to participate in the study. Students were eligible to participate if they were pursuing first year B.Sc. Nursing and agreed to give informed consent.

The Study Setting: The study was conducted in Krupanidhi college of nursing at Bengaluru, which is a private institution having various nursing courses with a yearly intake of 60 nursing students.

Instruments: Two questionnaires and one scale were used to collect the data.

A Demographic Performa to collect the baseline information of the samples and a rating scale was used to assess the student's skills in performing the various clinical procedures which included the standard steps which was scored differently for each of the procedures.

Procedure of Data Collection

The study was conducted in two phases.

Phase I: In this phase, permission was obtained from the nursing college authorities and respondents. Informed consent was taken from the participants and the baseline demographic information was collected with the help of a demographic Performa.

Phase II: In this phase, pretest was conducted using a 3 point rating scale for all the three procedures. Followed by, station based skill training for all the three procedures was given to the group of 10 students each day.

After a week, post test was conducted by rating scale for all the three procedures.

Data Analysis

The Statistical package for the social sciences (SPSS) version 20 (IBM: Armonk, New York, United States) was utilized for data entry, tabulation and analysis.

Descriptive statistics were used to describe the demographic variables and data collected. A parametric t test was conducted to explore the effectiveness of station based skill training in performing the clinical procedures among nursing students. A The statistical level of significance was set at $p < 0.05$.

Sources of Data: Data was collected from B. Sc (N) students pursuing their first year in selected nursing college.

Results

Description of sample

Table 1: Description of demographic variables

Variable	Frequency	%
Age		
17-19 years	26	86.7%
19-21 years	4	13.3%
>21years	0	0%
Gender		
Male	14	46.7%
Female	16	53.3%
Religion		
Hindu	16	53.4%
Muslim	6	20%
Christian	8	26.6%
Family		
Nuclear	30	100%
Joint	0	0%
Clinical Performance		
Poor	0	0%
Average	16	53.3%
Good	14	46.7%
Excellent	0	0%

Table 1 : Regarding the characteristics of the entire sample (n=30). The majority of participants were females (53.3%), aged between 17 to 19 years, with Hindu religion (53.4%), the nuclear family (100%) and the majority with average (53.3%) clinical performance.

Effectiveness of station based skill training

Table 2: Description of pretest and posttest scores of level of performance

Scores	Pre Test						Post Test					
	Venipuncture		Wound Dressing		NGTube Feeding		Venipuncture		Wound Dressing		NGTube Feeding	
	F	%	F	%	F	%	F	%	F	%	F	%
Unsatisfactory	29	96.7%	30	100%	28	93.3%	0	0%	0%	0%	0%	0%
Meets Exceptional	1	3.3%	0	0	2	6.7%	14	46.7%	1%	3.3%	4%	13.3%
Exceptional	0	0	0	0	0	0	16	53.3%	29%	96.7%	26%	86.7%

The above table 2 depicts the comparison of the student's skill in performing the procedures. The venipuncture procedure had 96.7% of students receiving an unsatisfactory score and 53.3% scored exceptionally on the post test. The wound dressing showed 100% unsatisfactory in the pretest and 96.7% in the post test with 3.3% meets exceptional.

Table 3: Effectiveness of station based skill training in performing the clinical skills among nursing students

Procedures	Pre test	Post test	Mean difference	t Value	df	p Value
Venipuncture	13.83	37.6	23.76	17.15	29	0.000
Wound dressing	13.3	43.46	30.16	31.89	29	0.000
NG tube feeding	11.3	35.60	24.30	30.38	29	0.000

t = 2

Table - 3 reveals that calculated' values 17.15, 31.89 & 30.38 are higher than the tabulated 't' value 2.00. It shows that the station based skill training was found to be Effective. The result shows that there is a significant increase in skills for performing the clinical procedures on Post Test. Hence, Research Hypothesis (H_1) is accepted.

Discussion

The study results showed that the station based skill training in performing the clinical procedures is highly effective in improving the skills among nursing students.

It is apparent that an extensive variety of evaluative strategies are important to evaluate the understudies clinical capability and more prominent accentuation ought to be put on those techniques which support the learning of clinical aptitudes and simultaneously give a suitable Instrument to evaluate them in this angle. OSCE goes about as a better apparatus in evaluating the potential abilities and competence [7].

These discoveries are in concurrence with previous investigations:

An investigation recommends that OSCE is a helpful and a satisfactory instrument for assessing prentice execution of clinical abilities. Most understudies saw OSCE as a decent appraisal, which secured extension of which enabled them to remunerate in various settings territories and limited their odds of failing [8].

Another investigation recommends OSCE program application before first clinical nursing practice was successful as far as essential nursing abilities learning. It is important to strengthen nursing aptitudes which was depending on the examination after effects of different clinical procedures [9].

There was another report led to contrast the OSCE and customary strategy which generalized that OSCE examination offers an appealing alternative for evaluation process for all trainees, particularly when contrasted and different strategies for assessing the clinical practice [10].

The other investigation was a sum of 49 understudies were assessed on three of six patient reenactment stations and one of two inpatient stationary stations. Both developmental and summative assessment of the learners execution on learning, application, judgment and aptitudes were directed and utilized for individual criticism, and program assessment. The staff, understudies and institutionalized patients observed the OSCE to be an advantageous experience [11].

There was another examination, which indicated halfway devotion recreation utilizing OSCE technique is a helpful preparing system. It empowers small gatherings of nursing trainees to rehearse in a controlled condition on how to respond satisfactorily in a basic patientconsideration circumstance. Subsequently, this sort of preparation is extremely important to outfit scholars with at least specialized and non-specialized aptitudes previously they utilize them to have an extended role in practice [12].

An evaluator considers uncovered that the OSCE is an important and a reasonable type of appraisal. Nursing students distinguished that they felt more arranged for and more sure about the situations which helped them to improve the career 13.

There are lots of studies being conducted using descriptive analysis and critical reviews and this study using the experimental design in conducting the study among nursing students in performing the clinical procedures are very few in the nursing and especially for the first year. As for the results of this study, the students who were having the average performance in their clinical evaluation showed exceptional scores after OSCE training. Hence this study motivates the other universities and the nursing colleges to adopt the OSCE for the beginners to foster them with the best clinical skills and competence.

Implications in Nursing

- The study findings OSCE can be implemented in the evaluation of subjects, not merely the nursing foundation.

- The OSCE can be effectively used in recruitment of staff.
- OSCE helps the novice nurses to foster their clinical expertise and make them competent.

Limitations: The study is limited to nursing undergraduate students of Krupanidhi College of Nursing, Bangalore.

Conclusion

OSCE is a realistic assessment today in nursing education and practice. The OSCE covers a broad aspect of clinical skills of OSCE and measure the essential clinical skills to a great extent OSCE scores are standardized.

The OSCE can identify student's weakness and strengths and help faculty guide students to improve clinical skills. The implementation of OSCE at Faculty of Nursing, Krupanidhi College was a useful experience for students and was considered a valuable and worthy of further development and enhancement.

Recommendations

- A study on clinical assessment of the teaching staff may be made using OSCE covering a wide range of skills.
- A similar study can be conducted on a large sample using true experimental designs to ensure generalization.
- The examiners may use a variety of skill stations to ensure objectivity in clinical assessment.
- Developing standardized and approved OSCE stations for each department.
- Nursing examination boards and universities shall incorporate OSCE to improve standards of nursing education.

Conflicts of Interest: The authors declare no conflicting of interest.

Source of Funding: The funding was done by the KRIC (Krupanidhi Research Incubator Centre) to implement the OSCE.

Author's Contribution: All authors contributed voluminously to this paper. The main author designed the study and interpreted the data. The author and co authors were responsible for data collection and data entry. The main author performed the analysis and interpretation of the data and writing the original draft.

Ethical Approval: Official endorsement and authorizations from the principal of the nursing college and the head of the divisions were acquired. The proposition was exhibited in the institutional ethical board and acquired ethical leeway. Every one of the members was given with satisfactory clarification about the points and targets of the investigation and brought about educated assent. The confidentiality of information was guaranteed through coding all things considered. Moreover, the members were educated that they could deny or pull back from the examination anytime of time without giving reason.

Cogency of Aggression Management Training Programme on Competency of Nursing Students in a Selected College in Bangalore

Meenu Cherian[1], Jenila J[2], Swetha Sharma[2]

[1]Assistant Professor, Department of Psychiatric Nursing, [2]B.Sc Nursing, Krupanidhi College of Nursing

ABSTRACT

Objectives: To investigate the cogency of aggression management training programme on competency of nursing students.

Method: A pre-experimental, one group pre-test and post-test design was utilized. 71 nursing students from one of the biggest nursing colleges in Bangalore were selected by purposive sampling technique. Consent was taken from the subjects and pretest was conducted using self-administered questionnaire and Likert scale to assess the level of knowledge and confidence. Later aggression management training programme was given and post-test was conducted with the same tool in a period of one week. Analysis is done with paired t- test for comparison and Chi square test for association with selected demographic variables.

Results: It shows that the level of knowledge and confidence is significantly higher during the posttest. The comparison of knowledge level (t=13.2, p=0.00) and confidence level (t=5.58, p=0.00) shows that the aggression management training programme was highly effective on competency of nursing students.

Conclusions: A training programme on aggression management can be inculcated in the curriculum of nursing students so that they will have adequate knowledge and confidence to manage patients with aggression. To recapitulate, the present study shows that there is a high cogency of aggression management training programme on the competency of nursing students.

Keywords: *Aggression management training programme, competency, nursing students.*

Introduction

Anger is a typical human feeling that, when taken care of properly and communicated emphatically, can give an individual a positive power to solve problems and settle on choices concerning life circumstances. Outrage turns into an issue when it is expressed forcefully and violence happens when people lose control of their resentment[1]

Corresponding Author:
Meenu Cherian
Assistant Professor,
Department of Psychiatric Nursing,
Krupanidhi College of Nursing,
Email: meenucherian001@gmail.com

Hostility has taken the lives of about 16 lakh people worldwide. For each individual who bites the dust due to rampage, a lot more are traumatized and endure the ill effects of somatic, genital, reproductive and emotional well-being issues. WHO works with accomplices to counteract violence through experimentally sound techniques that are conceived and actualized in connection to cause at the levels of the individual, family, community and society[2]

Aggression emerges from a natural thrust as a protective reaction and is showed either by productive or dangerous conducts specifically towards self or others. Hostile people disregard the privileges of other individuals. They should battle for their own interests and they expect same from others[3]. Self-confidence would essentially lack due to the presence of outrage behavior. Offensive people upgrade their self-esteem by overwhelming others and thereby demonstrating their

dominance and in doing so; they try to conceal their uncertainty and susceptibility[1]

Social psychologists define aggression as "behavior that is intended to harm another individual who does not wish to be harmed"[4]

As indicated by the World Health Organization, violence in a working environment is a deliberate exertion of physical force counter to self, others or to a crowd, which has a greater probability of causing harm, death, abnormal development or deprivation. Work environment viciousness, and especially customer initiated outrage, is a significant issue for psychiatric nurses, as they are one among the most in-danger populations.Incidents of aggressive behavior among patients in mental hospitals varies from 0.07– 0.25 violent episodes for each bed per year[5]. An examination on violence at workplace demonstrated that somewhere in the range of 14% and 61% of psychiatric health workers have been affected by aggressive behaviors of hostile patients[6].

The outcomes of aggressive behavior are numerous, regardless of whether they will be on victims, institutions or on society. A systematic review was done on consequences of aggressionin the working environment of hospitals was conducted and distinguished 68 studies with distinctive sorts of potential consequences. In this, 47 studies determined a few psychological ramifications for workers, 27 disclosedsomatic outcomes, 25 uncovered an effect on emotional well-being, 47 spotlightedon the aftereffects of work functioning, 10 demonstrated a detrimental effect on the patient care and the quality of relations, and 4 announced monetary and social culminations[7].

A few investigations in the health care sector have built up a positive relationship between work environment violence and mental distress and between work environment viciousness and a lesser level of self-confidence to adapt to patient hostility. the conceived intensity of violent nature may diminish after educating, which could be an indication of an expanded certainty to control these situations[8].

In order to nullify the workplace violence in psychiatric hospitals, education and training programs can be implemented at the student level itself. These programs generally help the student nurses for skill development which will aid them to appreciate and respond to savage situations and to cope with its ramifications. They comprise various techniques to enhance knowledge, legal responsibilities, risk assessment and control strategies.

The nursing students are exposed to psychiatric patients and the potential risk to become a victim of aggression or violence. Hence training programme fosters the students in managing the psychiatric patients.

Consequently this study is intended to explore the cogency of aggression management training programme on the competency of nursing students and to associate the competency of nursing students with selected demographic variables. Keeping in mind the end goal, two hypotheses were formulated:

H_1: There will be significant difference in the mean pre-test and post-test scores of competency on aggression management among nursing students

H_2: There will be significant association between the competency of nursing students on aggression management and their selected demographic variables

Materials and Method

Study Design: A pre-experimental one group pretest posttest design was used to attain the purpose of the study.

Subject of the Study: The subjects of the present study were nursing students chosen by purposive sampling technique. Altogether 71 students who met the sample selection criteria were welcomed to take part in the study

Setting: The study wascarried out in one of the biggest nursing colleges in Bangalore, which is a private institution having various nursing courses with a yearly intake of 60 nursing students.

Instruments: Two questionnaires and one scale were used for the data collection.

A Demographic Performa to collect the baseline information of the samples and a structured self-administered questionnaire to assess the knowledge in managing aggressive patients and protecting self in a psychiatric ward. It has 25 items which helps to assess how effective the training session in making a change in the level of knowledge of the participants[9,10]

The Likert scale was used to assess the level of confidence in managing incidents of aggression owing to the training they had received. This is to evaluate the extent to which trainees considered the content of training had practical usefulness and was conveyable to the workplace and their ability to make use of skills learned in clinical practice and also to assess the confidence to work in clinical setting[11].

Data Collection Method: The study was conducted in two phases.

Phase I: In this phase, permissionwas obtained from the nursing college authorities and respondents. Informed consent wastaken from the participants and the baseline demographic information was collected with the help of a demographic Performa.

Phase II: In this phase, pretest was conducted using self-administered questionnaire and rating scale followed by aggression management training programme that was given through lecturing, power point presentations and role play. A module was prepared by the researcher for providing training programme and the module had the components like:

a. Definition & characteristics of aggression

b. Types of aggression

c. Causes and predisposing factors of aggression

d. Observation, communication and therapeutic relationship

e. Prevention and management of aggression

After a week, post test was conducted by using same self-administered questionnaire and scale.

Data Analysis: The key instrumentused for information entry,classification and scrutinization was the version 20 of Statistical Package for Social Sciences (SPSS)

Descriptive statistics were used to describe the demographic variables and data collected. A parametric t test was conducted to explore the effectiveness of aggression management training programme on competencies of nursing students

Findings

Description of Sample: Regarding the characteristics of entire sample (n=71), 49.3% were first year B.Sc & 50.7% were second year B.Sc nursing students. The majority of the participants were females (78.9%), aged between 18 to 20 years, living in rural areas (50.7%), with Hindu religion (46.5%), the nuclear family (80.3%) and never experienced with aggressive patients (94.4%). (Table:1)

Table 1: Description of demographic variables

Demographic variables	Frequency	Percentage
Age		
18 – 20 years	62	87.3%
21– 23 years	08	11.3%
>23 years	01	1.4%

Conted Table 1…

Previous experience		
Yes	04	5.6%
No	67	94.4%

Effectiveness of aggression management training programme: The data analytics reveals that no students were having adequate knowledge during pretest whereas 28.2% were having adequate knowledge in posttest. The mean score of knowledge on aggression management was 11.24 during pretest which was increased to 19.4 during posttest.

Table 2: Description of pretest and posttest scores of level of knowledge

N = 71

Level of knowledge	**Pre test**				**Post test**			
	Frequency	**Percentage**	**Mean**	**Standard deviation**	**Frequency**	**Percentage**	**Mean**	**Standard deviation**
Adequate knowledge	-	-	11.24	2.62	20	28.2%	19.36	4.31
Moderately adequate knowledge	7	9.9%			40	56.3%		
Inadequate knowledge	64	90.1%			11	15.5%		
Total	71	100%			71	100%		

The data scrutinized reveals that only 7% were having high perceived confidence in pretest which escalated to 31% during posttest. It manifested a significant improvement in the level of confidence in managing aggressive patients before and after the training programmeby comparing the pretest (26.1) & the posttest (32.9) mean score. (Table 3)

Table 3: Description of pretest and posttest scores of level of confidence

N = 71

Level of confidence	**Pre test**				**Post test**			
	Frequency	**Percentage**	**Mean**	**Standard deviation**	**Frequency**	**Percentage**	**Mean**	**Standard deviation**
High perceived	5	7%	26.05	8.02	22	31%	32.85	7.69
Moderately perceived	35	49.3%			39	54.9%		
Low perceived	31	43.7%			10	14.1%		
Total	71	100%			71	100%		

The data analysis exhibits that the aggression management training programme was found to be highly effective. Paired't' test was applied to scrutinize the data and it explicit that there was a significant increase in posttest scores of level of knowledge (t_{70} = 13.24, p = 0.00) and confidence (t_{70} = 5.58, p= 0.00). Hence, Research Hypotheses (H_1) is accepted. (Table – 4)

Table 4: Effectiveness of aggression management training programme on competency of nursing students

N = 71

Competency	**Mean Pretest score**	**Mean Posttest score**	**Mean difference**	**t value**	**p value**
Knowledge	11.24	19.4	8.16	13.24	0.000
Confidence	26.1	32.9	6.8	5.58	0.000

t value- 2.00

Table 5 reveals that there is an association between age and type of family with the pretest knowledge score. Other variables are not associated with both level of knowledge and confidence. So the research hypothesis (H_2) is rejected for the entire demographic variable except age and type of family with knowledge.

Discussion

The study results showed that the training programme on aggression management is highly effective on competency of nursing students. This is extensively in accord with a number of studies:

35 studies on the effectiveness of education and training programme on violence at the workplace were systematically reviewed and their outcomes demonstrated that the knowledge and confidence enhanced and positive attitude were expanded[12].

A study was described in acute hospital setting and demonstrated that all nine educations and training programs retrospect direct with enhanced confidence and ameliorated attitude, skills, and cognizance. They observed no remarkable alteration in the incidence of savage deeds in the workplace, yet in light of 38 studies carried on in psychiatric settings, they concluded that the best vantages of instruction programs is related to knowledge, skill and confidence in managing hostility[13].

A quasi-experimental study was done on the consequence of aninstruction program on nursing undergraduate's attitude towards apprehension and self-confidence in handling hostility among patients. Variables were measured three times for both groups that is pre-test, post-test on the last day of intervention, and a follow up after 3 months of training. They concluded that there is a significant increase in the perceived confidence amid interventional group participants only[14].

Education programmes that spotlights awareness of racial, cultural, social, religious and spiritual needs also alleviates disturbed/violent behavior and such training programmes should be conducted appropriately to ensure the effectiveness.

The present study findings are supported by the above discussed studies where all are showing the high cogency of training programme on competency of nurses in managing aggressive patients

Implication for education, practice and research: The study findings have implications for student nurses and staff nurses. An aggression management training programme should be implemented in the nursing curriculum for providing advanced knowledge about managing aggressive patients and also to improve the confidence level of a nurse to handle patients who are potential for aggression. Raising nurses' awareness about the appropriate techniques of managing an aggressive patient is highly recommended as it can relieve the stress and anxiety of a nurse while working in psychiatric setting.

Conclusion

Violence and aggression, the premise of much research in recent years, is a noteworthy professional issue for nurses who work with mentally ill patients. Aggression management is a critical component of an overall strategy to tackle patients with hostility. This study offers an aggression management training program, beneficial to enhance knowledge and perceived confidence among nursing undergraduates. Student nurses accounted an increase in situational and environmental mindfulness as well as improved confidence and technical skills for forestalling and managing aggressive behavior. To hammer the last nail, the results of this study demonstrate a high cogency of aggression management training program on the competency of nursing students.

Recommendations of the Study: Based on the results, the subsequent suggestions are initiated

Further research is recommended to concentrate on the influence of training programs on the behaviour of patients. It can also consider larger samples for better generalization. More research can be focused on staff nurses who directly deal with aggressive patients. Also the use and impact of various health promoting strategies on psychological well-being should be encouraged. Other variables are not associated with both level of knowledge and confidence. So the research hypothesis (H_2) is rejected for the entire demographic variable except age and type of family with knowledge.

To Assess the Knowledge and Attitude Towards the Prevention of Traffic Collisions among College Students

Sowbagya Lakshmi A[1], Komal Sharma[2], Monica[3]

[1]Asst. Professor, Department of Community Health Nursing, [2]III year BSc Nursing, [3]IV year BSc Nursing, Krupanidhi College of Nursing, Bangalore, India

ABSTRACT

Objectives: To assess the knowledge and attitude on prevention of traffic collision among college students.

Method: A Quantitative approach with descriptive survey design was used in the study. The sample of 200 students from a selected degree college were selected by using purposive sampling technique. A structured knowledge questionnaire and attitude scale was used to collect the data from the subjects after obtaining informed consent.

Results: Among 200 respondents, 50% of the respondents possess moderate knowledge, 48% respondents possess inadequate knowledge and remaining 2% possess adequate knowledge on traffic collisions and its prevention. Also the majority (63%) of subjects was having favorable attitude, 34% was having a moderate favorable attitude and 3% were having an unfavorable attitude regarding traffic rules and regulation and use of safety measures. The overall mean knowledge and attitude scores of respondents regarding traffic collision and its prevention was 14.65 and 30.36 respectively.

Conclusion: This study found that only 2% of the respondents are having adequate knowledge, even though 63% demonstrates a favorable attitude. Thus, it can be concluded that the attitude and knowledge may not be positively correlated and even if the knowledge level is low, people tend to have attitude variations due to their experience. It's very important to understanding their level of knowledge, to help in planning effective technology for preventing traffic collisions.

Keywords: *Knowledge, traffic collisions, Rules and regulation, College students*

Introduction

Traffic collisions are a major public health issue faced globally. Every day, there are 1.25 million people that are involved in a traffic collision each year. Somewhere in the range of 20 and 50 million people endure non-deadly wounds, with many suffering disabilities because of their injuries. Traffic collisions cause major economic losses to people, their families, and to countries in general[1].

According to the statistics, the age group between 15 and 44 years account for 48% of deaths due to a traffic collision. From an early age, males will probably be associated with traffic collision than females. Around seventy five percent (75%) of all traffic collision happen among young men (younger than 25 years) and they are just about 3 times as liable to be killed in a traffic collision. Traffic collisions are anticipated to become the seventh leading cause of death by 2030[2].

As per the Ministry of Road Transport and Highways report, 1,50,785 individuals died and another 4,94,624 were harmed in 4,80,652 traffic collisions in India in 2016. This converts into 1317 accidents and 413 deaths every day or 55 accidents and 17 deaths every hour. The number of traffic collisions has expanded by 31% from 2007 to 2017 and that of fatal road crashes have expanded by 25.6% in a similar period. Traffic collision fatalities increased by 3% over the past year (from 1,46,133 in 2015 to 1,50,785 in 2016) and traffic collision severity expanded from 29.1 in 2015 to 31.4

Corresponding Author:
Sowbagya Lakshmi A
Asst. Professor,
Department of Community Health Nursing,
Krupanidhi College Of Nursing, Bangalore-35, India

in 2016. The number of deadly accidents has increased since 2005 and saw a sharp rise from 1,31,726 in 2015 to 1,36,071 in 2016 [3].

The traffic collision incidence rate is commonly seen among the group between 18-45 years (68.6%) and this is due to the negligence, road condition and mobile phone usage. India has the highest traffic collision rate over the globe[4]. One in each 10 deaths is accounted from India. The state of Karnataka was in third place among all the states that represented 86% of the aggregate traffic collision, with a rate offer of 9.2. The state also found at the fourth place in representing the greatest number of fatalities, with a rate offer of 7.4. Bengaluru saw 5,323 traffic collisions in 2016, of which 790 were fatal. As indicated by Bengaluru traffic police information, a year ago (till October) 4,246 traffic collisions have been accounted for, of which 546 were killed, while 3,537 individuals were harmed in these accidents[5].

A cross-sectional study was conducted among 360 higher secondary school students in Chennai. An organized survey and attitude scale was used to acquire information from 360 understudies. Among 360, 186 members (51.7%) had sufficient knowledge and 174 members (48.3%) had inadequate knowledge on the traffic rules and regulation. Among the participating members, the greater part of the members had a positive attitude on traffic rules and regulation. 46.4% members who had been exposed to traffic collisions, pedestrian accidents accounted only 7.2%, the remaining were motor vehicle collisions. The most widely recognized explanation behind motor vehicle accidents was high speed in 58 members (37.4%), followed by overtaking in 41 members (26.5%) and remaining 38 members (24.5%) due to bad road conditions. Traffic collision is the most undesirable thing to happen to road users, however they happen regularly. The most disastrous thing is that we don't learn from our mistakes. The greater part of the road users are very much aware of the general rules and safety measures while utilizing road, but it is just the laxity on the part of road users, which causes collisions[6]. Main causes of traffic collision are due to human errors like over speeding, drunken driving, distractions, red light jumping, avoiding usage of safety measures like seat belts and helmets, negligence of rules and regulation. And its most important to conduct the research studies in different population to find out gap in preventive measures.

An investigation was held among the understudies of Management and Science University, Malaysia. The questionnaire was distributed randomly to the 109 understudies with the mean age of 20.94 ± 1.89 years of the Faculty of Health and Life Sciences. Around 39 (35.7%) members had been associated with at least one or more than one traffic collision. Around 93.6% of them were strongly/emphatically persuaded of safety belts importance. Multiple linear regression method demonstrated that age and attitude were significantly connected with the exposure to the collision[7]. The investigation concluded that members had moderate knowledge about traffic rules and regulation and majority of them said that high speed, drivers' lack of knowledge about traffic rules and laws. All understudies were very strong/emphatically persuaded of safety belts importance. Age and attitude were essentially connected with the exposure to the collision.

A cross sectional study was done at Amal school, a private sector organization in Tulspura. An organized poll was utilized to get information from 100 youngsters in class four to ten. Results among the respondents, 58% were males and 90% were between the ages of 9-13 years. Major representation was from classes 4 (22%) and seven (21%). The greater part of the members participating in the investigation (88%) had driven bicycles while motorbikes were utilized by only 27%. The understudies of class 4, 5, 6 were not able to recognize road signs (56%) but rather whatever is left of the understudies effectively recognize the road sign. The awareness in regards to road signs was 52% among males and 51% females. The knowledge level of study members with respect to road signs was impressively high, especially what to do with the traffic signal indicates (94%), not to horn (79%) zebra crossing (95%) and pedestrian prohibited (75%). Students agreed that driving without a valid license is an offense (69%) and possibility of traffic collision when driving bikes and motorcycles without a helmet (89%) and using mobile phones while driving (92%). Among the respondents, 86% had driven a cycle and 27% had driven a motorcycle only 10% wore a head protector while riding. Valid license was available with 4% understudies and 29% of school youngsters had been associated with a roadside collision. Good knowledge about road rules and regulation did not convert into the students[8].

Road Safety Awareness in India is exceptionally poor in this manner and there is a need to teach and

make individuals aware of the road security through different occasions and projects such as shows, classes, social projects, portable displays through vans, and follow road safety weeks, giving on the spot help and medical aid to road users, circulation of road safety and security pamphlets and handouts etc., on a regular basis. This should be possible with the assistance of schools, universities, RWA (resident welfare associations), NGOs, transport and exchange associations. It is essential to teach about the measures to be taken to limiting the event of traffic collision among school kids, undergrads, drivers of business vehicles, auto drivers, transport drivers, truck drivers, bike drivers, cyclists and so on.

Method

Study Design: The current research study was a quantitative study with descriptive survey design conducted among college students in Krupanidhi group of institutions, Bengaluru.

Sample Size Technique: The sample size was 200 students of Krupanidhi group of institutions. In this study, purposive sampling technique was used to select the sample falling under inclusion criteria. The selection criteria includes students who are present during the time of data collection.

Instruments used for the study: In this study instrument was developed based on study design by 2 sections:

- A structured knowledge questionnaire regarding prevention of traffic collision It is designed to elicit the knowledge of students regarding prevention of traffic collision, it consists of 30 items.
- Likert scale to assess the attitude regarding prevention of traffic collision it consists of 10 items

Statistical Method: We used descriptive statistics in the form of Frequency, mean, percentage and standard deviation will be used for the demographic data. Chi square test was used to test the association between the knowledge and attitude score regarding prevention of traffic collision among the college students. We used IBM, SPSS statistics 20 for windows 7 to analyze the data. The results were considered statistically significant if the p-value was more than 0.05.

Result

Table 1: Socio demographic details of the participants

(N = 200)

Characteristic	Category	Frequency	Percentage
Age of the participants	17-18 years	47	23.5
	19-20 years	80	40.0
	20-21 years	51	25.5
	above 21	22	11.0
Gender	Male	79	39.5
	Female	121	60.5
Education level	PUC	12	6.0
	Degree	171	85.5
	MBA	5	2.5
	Physiotherapy	12	6.0
Experience of driving	1 year experience	22	11.0
	2 years experience	20	10.0
	more than 2 years	76	38.0
	no experience	82	41.0
Own vehicle	Yes	77	38.5
	No	123	61.5
Exposure to any traffic collision	Yes	52	26.0
	No	148	74.0

The above table depicts that majority of participants 80 (40.0%) fall in age group between 19-20 years. Among 200 participants, 121 (60.5%) were female and 79 (39.5%) were male. Majority of the participants was from degree - 171 (85.5%). 82 (41%) participants were not having driving experience whereas 76 (38%) participants had more than 2 years experience in driving, 77 (38.5%) participants having their own vehicle remaining 123 (61.5%) were not having their own vehicle and 52 (26%) participants were exposed to the traffic collision.

Table 2: Distribution of participants according the level of knowledge on prevention of traffic collision among college students

(N = 200)

Sl. No.	Knowledge level	Classification of participants	
		Number	Percentage (%)
1.	Inadequate (≤50%)	97	48%
2.	Moderate (51-75%)	100	50%
3.	Adequate (>75%)	3	2%
4.	**Total**	200	100%

The above table demonstrates that among 200 participants, 50% of the participants possess moderate knowledge, 48% participants possess inadequate knowledge and only 2% possesses adequate knowledge on regarding traffic collision. (Table 1)

Table 3: Distribution of participants according the level of attitude on prevention of traffic collision among college students.

(N = 200)

Sl. No.	Level of Attitude	Classification of participants	
		Number	Percent (%)
1.	Unfavorable attitude (≤50%)	5	3%
2.	Moderate favorable attitude (51-75%)	68	34%
3.	Favorable attitude (>75%)	127	63%
	Total	200	100%

Data presented in table 2 shows that majority 63% of participants were having favorable attitude, 34% of participants having moderate favorable attitude and 3% were having unfavorable, regarding traffic rules and regulation and use of safety measures.

Table 4: Description of knowledge and attitude frequencies on traffic collision and its prevention among degree students

N = 200

Area wise	No. of items	Range	Median	Mean	SD
Knowledge	**30**	17	15.00	14.65	2.860
Attitude	**10**	21	31.00	30.36	3.615

The above table reveals that the overall mean score of knowledge and attitude regarding traffic collision and its prevention was 14.65 with SD 2.860 and 30.36 with SD 3.615 respectively. (Table 3)

Table 5: Association between level of knowledge with selected socio demographic variable

N = 200

Variable	Knowledge score		
	χ^2	Df	Inference
Age	5.726	8	NS
Gender	1.147	4	NS
Family mIncome	4.578	6	NS
Education	13.784	6	S*
Experience in driving	14.191	6	S*
Ownership of vehicle	3.208	4	NS
Exposed to any road traffic collision	3.486	4	NS
Previous information regarding traffic collision	5.040	6	NS

S*= significant, NS= not significant

The Chi square value shows that there is an association between level of knowledge with education and Experience in driving on the level of 0.05.

Table 6: Association between attitude with selected socio demographic variable

N = 200

Variable	Attitude score		
	χ^2	Df	Inference
Age	9.151	8	NS
Gender	.543	4	NS
Family Income	7.602	6	NS
Education	6.622	6	NS
Experience in driving	15.614	6	S*
Ownership of vehicle	4.823	4	NS
Exposed to any road traffic collision	3.837	4	NS
Previous information regarding traffic collision	9.786	6	NS

S* = significant, NS = not significant

The data presented above shows that there is a significant association between level of attitude on Experience in driving with road traffic collision.

Discussion

Traffic collisions have emerged as an important public health issue which needs to be tackled by multi-disciplinary approach. The trend in road accident injuries and death is alarming in countries like India. Therefore, assessing knowledge and attitude regarding traffic collision and its prevention among the college students.

The mean age of the study participants fall in the age group between 19-20 years 80 (40.0%) and majority 121 (60.5%) were female and 79 (39.5%) were male. Where 76 (38%) participants had more than 2 years experience in driving, 77 (38.5%) participants having their own vehicle and 52 (26%) participants exposed to the traffic collision, Similar findings were reported by the research study were 37.6% participants mean age below 20 years remaining 62.4% was 20 years and above. 79.8% participants having their own vehicle among 35.7% involved one or more traffic collision[7].

These findings were supported by a study conducted among Higher Secondary School Students on December 2014 in Chennai revealed that half of the participants had positive attitude towards road safety and regulation[6].

The findings of the present study depict that there is a significant association between levels of knowledge with education and experience in driving whereas the attitude score is significantly associated only with experience in driving. Similar research study findings reported that year of experience in driving associated with road collision[9].

Conclusion

This study found that only 2% of the respondents are having adequate knowledge, even though 63% demonstrates a favorable attitude. Thus, it can be concluded that the attitude and knowledge may not be positively correlated and even if the knowledge level is low, people tend to have attitude variations due to their experience.

Recommendations: On the basis of the findings of the present study, the following recommendations have been made:

- A similar study can be conducted on a larger sample for generalization of study findings.
- Further research is recommended for other age groups and public in backward districts, taluks, villages etc.
- A comparative study can be conducted on adolescents of urban and rural schools.
- An Experimental study can be conducted with randomization and control groups.
- A correlative study to assess the relationship between knowledge and attitude regarding traffic collision

Acknowledgement

The satiation and euphoria that accompany the successful completion of this research would be incomplete without the mention of the people who made it possible. We thank the research team of Accendere Knowledge Management Services, CL Educate Ltd. for their unflinching guidance, continuous encouragement and support to successfully complete this research work.

Classification of Retinal Disorders Based on Fluid Patterns in OCT Images

Venkatraman K.[1], M. Sumathi[2]

[1]Research Scholar, [2]Professor, School of Electronics and Communication Engineering, Sathyabama Institute of Science and Technology, Chennai, India

ABSTRACT

Optical Coherence Tomography (OCT) being one of the vital diagnostic tool in early detection of Blindness, is most commonly used in analysis of fluid based abnormalities that are caused in the retinal layers. As the need for automations in OCT Image analysis has elevated presently, the proposed system focuses on automated classification of the input retinal image based on the fluid pattern as Normal, Cystoid Macular Edema (CME), Choroidal Neo Vascular Membrane (CNVM), and Macular Hole (MH). The system analyses the images from TOPCONN and ZEISS Equipment, totally 114 in numbers. Median Filters have been implemented for preprocessing / noise removal, followed by active contour segmentation for retinal boundaries. Various Marphological (HOG) Features have been extracted and used for classification with k-NN Classifier. The developed system shows an accuracy of 89.29% with significant Diagnostic Odd Ratio of 2.0.

Keywords: *Retinal Disorder, Optical Coherence Tomography, Fluid pattern*

Introduction

Optical coherence tomography is an imaging modality widely used in ophthalmology to identify earlier stages of blindness caused due to variations in the fluid levels within the layers of retina. From the retinal physiology it could be understood that any abnormality in the retinal layers shall have a severe impact towards causing blindness if left undiagnosed. For this kind of medical and ophthalmic criticalities an additional expertise suggestion for an automated system shall serve an inevitable tool in timely diagnosis of disorder and hence reduces the dependency on doctors whose availability may not be so easier.

OCT uses ultrasound sources to image the human eye. The received informations from the transmitted ultrasound waves are reconstructed (tomography) to obtain a detailed idea on the actual conditions of the retina[1]. Abnormalities in retina due to fluid pattern variations are of several types namely Cystoid Macular Edema (CME), where excess of fluid is accumulated in macula, Choroidal Neo Vascular Membrane (CNVM), where new blood vessels originate in the choroidal layers, or Macular Hole (MH), which is caused due to deficit of fluids in the macular layer of retina. The setup used to acquire the retinal images using a Topcon OCT Device is shown in Fig 1.

Fig. 1: Topcon OCT Device

Existing ideas of automations in analysis of OCT retinal imageseither focus on disorders of excess fluid accumulation or fluid deficiency. The proposed algorithm aims at an expert system to classify both excess fluid

Email: venkat.biomed@gmail.com

disorders, say, CME, CNVM as well as fluid deficit disorder say macular hole. The proposed methodology is described in section 2 followed by results in section 3 with corresponding conclusions in Section 4.

Materials and Method

Distinguished from the existing systems, the proposed algorithm is designed to identify both excess/ deficitfluid conditions and differentiate the same from normal retinal images. The flowchart of the proposed algorithm is shown in figure 2.

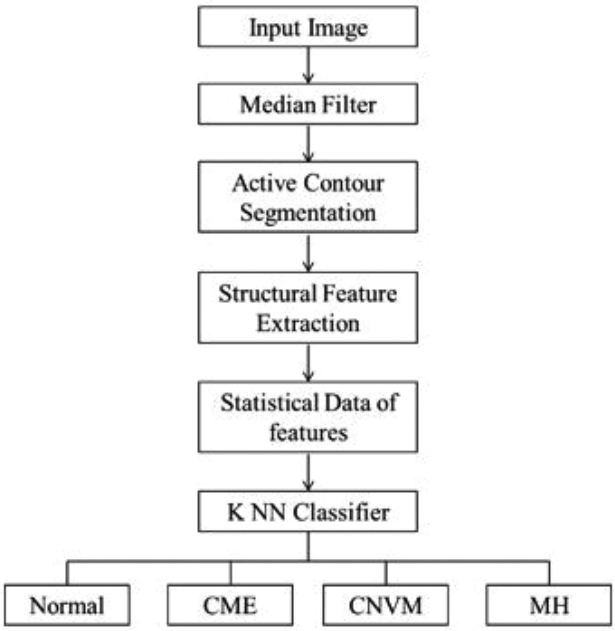

Fig. 2: Overall Process flow

Input images were acquired from Topcon and Zeiss OCT devices. A total of 114 images where acquired among which70 percentage of the images where utilised for training and 30 percentage where used for testing and validations. As OCT utilizes ultrasound as a prime source of imaging, the OCT images are more prone to speckle noises, which are multiplicative in nature [2-4]. Though there exists various filters in Literature for speckle noises, optimal smoothening of images seems to be sufficient as the devices itselfhas inbuilt algorithms for noise suppressionduring image acquisition. For this purpose of optimal image smoothening, median filter, which is non linear in nature was used to eliminate spikes and unwanted specklesby optimally retaining the edges as required. Further to pre-processing the retinal boundary was identified by segmentation method [5-7]. The algorithm was equipped with active contour segmentation, which is optimal at 3,000 iterations. As the pattern of fluid collection altered the overall morphology of retina, morphological features sayHistogram of Oriented Gradient (HOG) features where extracted. HOG Features are very commonly used as shape or object detectors in image processing. The gradients/edges orientations are used to describe the shape of the object. The retinal layer boundary is isolated and it is identified by means of these features, which could be used as input for the further steps of operations. Statistical measures like mean, standard deviation and variance of these features were estimated. This data set was used as the training data setand the same waspresented to a simple KNN classifier to evaluate the overall system efficiency. The Overall system efficiency is evaluated by statistical analysis with the True Positive, True Negative, False Positive and False Negative results of classification [8-9].

Results and Discussion

This section focuses on the various results and their significance, obtained from the proposed system. A sample CME image which was used in the entire process is displayed in Fig 3. After being converted to gray image, the input image is subjected to removal of speckle noises using a median filter, and the output of the same could be seen in fig 4.

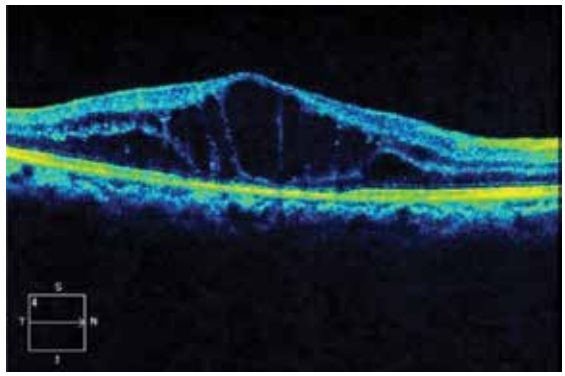

Fig. 3: Original Input Image–CME

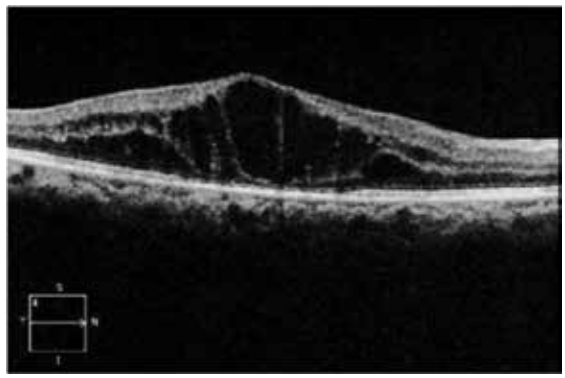

Fig. 4: Median Filtered CME Image

As the aim of segmentation algorithm is to isolate the retinal layers, the active contour segmentation methodology was adopted and the result of the same could be seen in fig 5.

Fig. 5: Segmented CME Image

Not restricting the overall process to CME Images, the same was also done for images of CNVM and MH disorders. The overall procedure was also done for a set of normal images and HOG features of all these segmented images were tabulated for constituting the training dataset. Instead of taking the entire HOG Features, the variations in these features were taken into consideration. Statistical parameters like Mean, Standard deviation and Variance of these HOG Features were taken for the entire training dataset. The minimum and maximum values obtained for several images could be seen in table 1, which displays the samples of features which were utilised for the purpose of classification.

Table 1: Sample Features of Classification

	Mean	SD	VAR
Norm 1	0.010802	0.059476	0.003537
Norm 2	0.017939	0.073965	0.005471
CME 1	0.01565	0.070719	0.005001
CME 2	0.025765	0.087104	0.007587
CNVM 1	0.029488	0.088195	0.007778
CNVM 2	0.028956	0.090073	0.008113
MH 1	0.013567	0.06502	0.004228
MH 2	0.022016	0.08110	0.006577

Clustering the above data set, to form a mean data for training the k-NN Classifier, the algorithm also evaluated the test data for each of the abnormalities focussed. The True Positive (TP), False Positive (FP), True Negative (TN), False Negative (FN) of the entire system was used to estimate the overall system accuracy towards classifying each disorder and Diagnostic Odd Ratio (DOR) was also estimated to evaluated the system performance.The efficiency of the developed system could be understood from Table 2.

Table 2: Overall performance of the system

Disorder	TP %	FP %	FN %	TN %	Accu.	DOR
CME	88.9	4.0	96.0	11.1	92.44	2.57
CNVM	87.5	7.7	92.3	12.5	89.90	1.54
MH	77.8	8.0	92.0	22.2	84.89	2.35
Normal	87.5	7.7	92.3	12.5	89.90	1.54
Mean					89.29	2.00

Conclusion

The System showed significant performance with an accuracy of 89.29%, and DOR of 2.0. The Diagnostic Odd Ratio value obtained infers that the system is more dependable as the value is significantly higher than unity. Though the existing works [7] [10-11] restricts to few disorders, the developed systems ensures to classify a wider range of ophthalmic disorders. The Performance metrics show that the developed system is on standard with the existing tools and techniques in automated analysis of OCT Images.

Analysis of Skin Cancer using K-Means Clustering and Hybrid Classification Model

Bethanney Janney J[1], S.Emalda Roslin[2]

[1]Research Scholar, [2]Associate Professor, School of Electrical and Electronics, Sathyabama Institute of Science and Technology, Chennai, Tamilnadu, India

ABSTRACT

Skin cancer has become the most common form of cancer and most well-known disease of the human. Early identification of skin cancer is important for improving prognosis, as patients with specific conditions can treat these diseases properly when distinguished in the initial stages. Therefore, computer- aided diagnostic systems must be developed to assist early detection of skin cancer. The most critical problem in skin cancer image evaluation is the process of segmentation. The basic idea of image segmentation is to consider equality as important criteria for dividing an image into important regions. Hence this proposed system aims to enhance a portion of the current strategies and new procedures to provide the correct, fast and reliable automated diagnosis of skin cancer. This paper proposed an early detection algorithm for skin cancer using k- means clustering and texture analysis of Local Binary Pattern, Red, Green, Blue Channels and Gray Level Cooccurence Matrix techniques. The image classification is carried out using the hybrid classification model. The Genetic Algorithm - Artificial Neural Network is a hybrid method used to classify the given dataset into a cancerous or non-cancerous image. This system is tested using a dermoscopic image dataset. The result of the proposed framework is compared to certain existing methods to achieve accuracy and performance. It results better in the process of segmentation and extraction of features. And combinations of extraction techniques also provide effective results for classifying the image of cancer and non- cancer.

Keywords: *Pre-Processing; K means clustering; Feature Extraction; GLCM (Gray level co-event Matrix); GA-ANN (Genetic Algorithm – Artificial Neural Network).*

Introduction

Nowadays, skin cancer rate is rising in human, early detection and treatment is becoming more essential. Related to last few years survival rate of melanoma, the majority deadly skin cancer is 9-15% only on stage 4, while if it is 85-99% at early stage of 2. Normally Skin cancer is identified as a one type of dangerous cancer in human around the world and can be categorized into melanoma and non-melanoma [1, 2].

Currently dermoscopic and histopathology images are used to analyse skin diseases. Histopathology slides give a cellular-level vision of the diseased tissue and these histopathology images are inspected under a magnifying instrument by pathologists [3]. Images taken from dermatoscope are called dermoscopic images and it is a method of obtaining an exaggerated and clarified image of an area of skin for increased clearness of the spots on the skin [4, 5]. Recognition of skin growths is troublesome because of the confusing appearance of a wide variety of skin injuries. Melanomas and nevi are particularly hard to separate. Indeed, even with dermoscopy, which utilizes an amplifying glass with a polarization channel and also a uniform source of light, the precision of melanoma finding by master dermatologists stays at around 75% to 84% [6, 7].

A Neural Network is a huge parallel conveyed processor made up of straightforward preparing units which have the characteristic propensity for putting away experiential learning and making it accessible for utilizing [8, 9]. Many image segmentation techniques,

Research Scholar, School of Electrical and Electronics,
Sathyabama Institute of Science and Technology,
Chennai, Tamilnadu, India.
Email: jannydoll@gmail.com

edge detection, histogram features, region growing, or pixel classification has trained using ANNs [10]. In this paper, Genetic algorithm consolidates with the ANN to give more precision on arrangement result on the dermoscopic image [11].

Methodology

The image database used in this research is a collection of skin images gathered from different main sources: DermIS.net, The International Skin Imaging Collaboration (ISIC Archive) and University do Porto and Dermatology service of Hospital Pedro Hispano (PH2). The technique developed is tested on a group of 1090 dermoscopic images containing 663 cancerous and 427 non-cancerous skin images. There is a wide range of clinical and dermoscopic images for all databases, followed by an annotation, which was used in our analysis as the ground truth. The reason why different databases are used is to assess the performance of our technique [12].

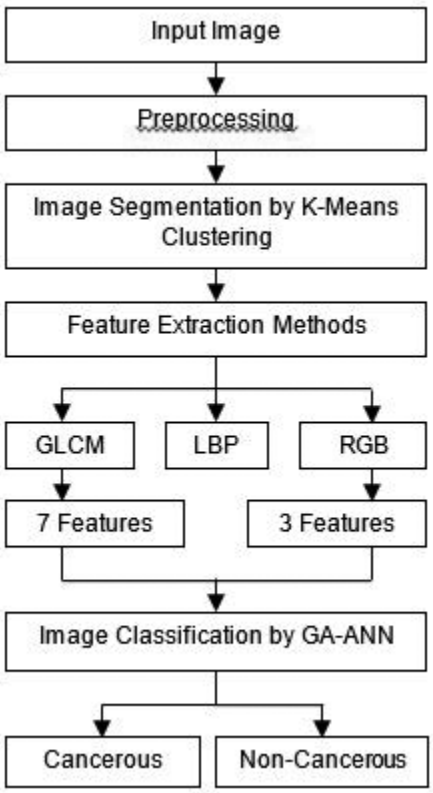

Figure 1: Proposed Architecture

The steps involved in the proposed skin cancer detection technique are illustrated in Figure 1. The key elements of the proposed system are the acquisition of images, pre-processing, segmentation using K- means clustering, feature extraction using LBP, RGB and GLCM techniques and classification using the GA-ANN hybrid model.

Preprocessing: Preprocessing is one of the preparatory advances that filters the noise and different antiquities in the image and sharpens the corners of an image. The procedure is utilized to the maximum to decrease human skin noise, for example, air bubbles, oiled, skin lines etc [13]. The Median kernel is employed to recover the image from clamor, blur and discard the undesirable features. It is also used to dispose of the exception without lessening the sharpness of an image and thereby enhances the standard of the image.

Image Segmentation: Image segmentation is a procedure for dividing an image into disjoint areas that are homogeneous with deference picked as a property, for example, luminance, color, and surface. From the different techniques of image segmentation, one of the most effective methods is the clustering method. A standout amongst the most used clustering algorithm is k-means clustering. It reduces the computational cost, execution faster and simple than the other clustering. The results obtained from the segmentation make it workable for shape examination, recognizing volume change, and making an exact radiation treatment plan [14].

K-means is a clustering algorithm that classifies a given group of image based on different attributes into numerous clusters, in view of separations between every pixel and all cluster centroid [15]. The segmented result of 10 sample images is shown in Figure 2.

Feature Extraction Methods: Feature extraction methods extract the specific element from a partitioned image. The skin area influenced by cancer is dominated by color and texture hence it is important to extract color and texture features independently. Feature extraction is based on the LBP, GLCM and RGB techniques.

Local Binary Pattern: Local binary pattern (LBP) is one of the beneficial techniques for element extraction, this method compares gray level between one pixel with its neighboring pixel [16].The output of the segmentation is the binary image format. In LBP, the operator compares each pixel with its eight neighborhood pixels and the value of the center pixel is referred as the threshold limit. If the pixel value is above the threshold limit the pixel is recognized otherwise it is denied. The features are extracted by way of partitioning the segmented areas

into numerous same subregions. The local textures of the images are gotten because of LBP operation [17]. In the given pixel (x_c, y_c), LBP is formally communicated in decimal shape:

$$LBP_{P,R(x_c,y_c)} = \sum_{p=0}^{p=1} s(i_p - i_c)2^p \quad \ldots(1)$$

Gray Level Co-Occurrence Matrix (GLCM): Gray Level Co-occurrence Matrix (GLCM) is a second-order statistical technique which is used for extracting texture features from images. It is used as a part of the field of surface examination to find the spatial dependence of brightness values and explains the different combinations of gray levels co-exist in an image [18, 19].

Figure 2: Research Database (Sample of 5 images)

The meaning of co-occurrence matrix P of an image I of size M*N is given beneath,

$$P(i, j) = \sum_{x=1}^{M} \sum_{y=1}^{N} \begin{Bmatrix} 1, \text{if } I(x,y) = i \text{ and } I(x + \Delta_{x,y} + \Delta_y) = j \\ 0, \text{otherwise} \end{Bmatrix} \quad \ldots(2)$$

Here, the separation between the reference pixel and its neighbor pixel is characterized as the balanced (Δ_x, Δ_y). At that point, it can remove seven distinct elements from GLCM. The formula for the components of Entropy, Contrast, Energy, Homogeneity, Mean, Skewness and Kutosis are given beneath:

$$\text{Entropy} = \Sigma_i \Sigma_j P[i, j] \log P[i, j] \quad \ldots(3)$$

$$\text{Energy} = \Sigma_i \Sigma_j P^2[i, j] \quad \ldots(4)$$

$$\text{Contrast} = \Sigma_i \Sigma_j (i - j)^2 \; P[i, j] \quad \ldots(5)$$

$$\text{Homogeneity} = \Sigma_i \Sigma_j \frac{P[i, j]}{1 + [i - j]} \quad \ldots(6)$$

$$\text{Mean } (\mu) = \frac{\sum_{i=1}^{M} \sum_{j=1}^{N} P(i, j)}{M \times N} \quad \ldots(7)$$

$$\text{Skewness} = \sum_{i=1}^{M} \sum_{j=1}^{N} \frac{(P(i, j) - \mu)^3}{M \times n \times \sigma^2} \quad \ldots(8)$$

$$\text{Kurtosis} = \frac{\sum_{i=1}^{M} \sum_{j=1}^{N} (I(i, j) - \mu)^4}{M \times n \times \sigma^4} \quad \ldots(9)$$

RGB color model (Red, Green and Blue): The color feature technique is used to identify the color variation in the segmented area and the rise of difference in the color is the early indication of skin cancer. The standardized red, green, blue chromaticity esteems are procured with aid of following equations [20].

$$R = \frac{R}{R+G+B} \quad \ldots(10)$$

$$G = \frac{G}{R+G+B} \quad \ldots(11)$$

$$B = \frac{B}{R+G+B} \quad \ldots(12)$$

R, G, B are the standardized Red, Green, Blue color features.

Hybrid GA-ANN Classifier: The hybrid GA-ANN classifier is used for predicting the image as cancerous and non-cancerous. The designing procedure of ANN is difficult and it has several limitations such as selecting an optimal network, learning algorithm, learning rate, more training time and etc. Hence to eliminate the limitations of ANN, a Genetic algorithm has been hybridized with the artificial neural network. The Genetic algorithm initializes and optimizes the weights of the neural system to enhance the classification execution. In this proposed system, totally ten features are given to the input layer. The system has three hidden layers and one output layer. The Hidden and output nodes activation function are Log sigmoid function, which provides a decision value in the vicinity of 0 or 1, where the value equivalent to one shows cancerous condition and zero indicates non-cancerous condition[21]. The genetic algorithm based optimization of weight factor is explained in the following steps.

Algorithm for GA based weight optimization of neural network [22]

Step 1: Extract the features from the skin images

Step 2: Create Input and target for non-cancerous and cancerous cases

Step 3: Initializing and weight optimization of ANN are done by Genetic Algorithm is as follows

Step 4: Develop arbitrary populace of n chromosomes and assess the fitness esteem f(x) of every chromosome x in the populace. Generate a new populace by the procedure such as

- Selection: From the populace choose two parent chromosomes as indicated by their fitness function.
- Crossover: The parents produce a new generation with the assistance of cross-over operant. The offspring of new generation consists of monotonous features
- Mutation: The resultant chromosomes from cross-over undergo mutation operation and a new generation produced
- Make use of recently produced populace for a further keep running of the algorithm
- If the end circumstance is fulfilled, stop and restore the finest arrangement in the present populace
- Go to fitness function assessment stride once more.

Step 5: Output node predicts the right class (i.e.) non-cancerous and cancerous

Using the above algorithm the weight can be optimized on target esteems for the effective skin.

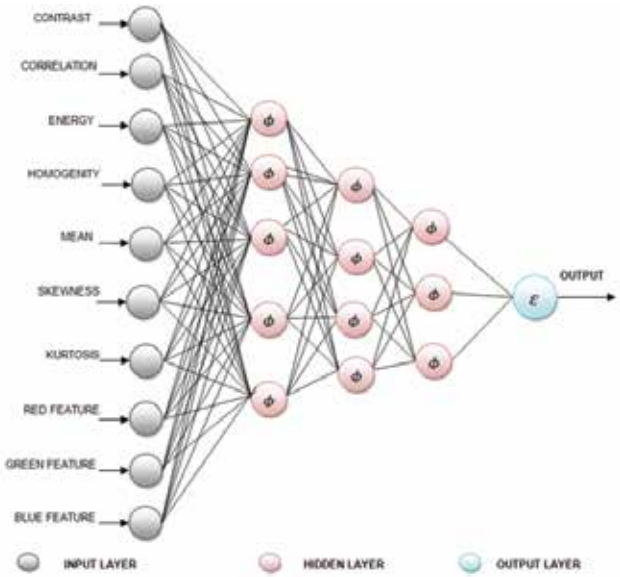

Figure 3: Hybrid GA-ANN classifier structures

Results and Discussion

Dermoscopic image datasets were used to check the performance of the proposed method. For the automatic diagnosis of the skin cancer, 1090 images containing cancerous and non-cancerous images with varying resolutions have been selected. The dermoscopic images are filtered with a median filter and the segmentation of filtered images for further processing was obtained by K means clustering. The technique used to extract features

is the combination of LBP, GLCM and RGB features. Both texture features and color features were given as input to the classifier. The Hybrid Genetic Algorithm-Artificial Neural Network Classifier accurately identified 663 images as cancer and 427 images as non- cancerous from the dermoscopic image dataset. The tests showed significant results for the proposed methodologies compared to existing systems.

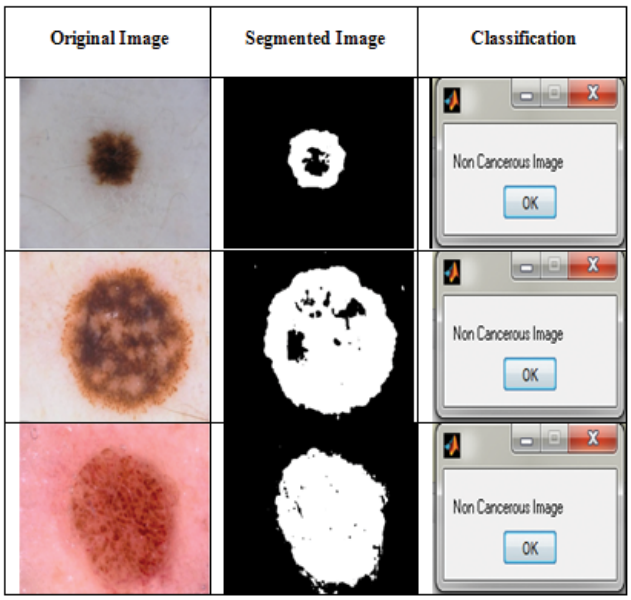

Figure 4: Classification of Non-cancerous Images

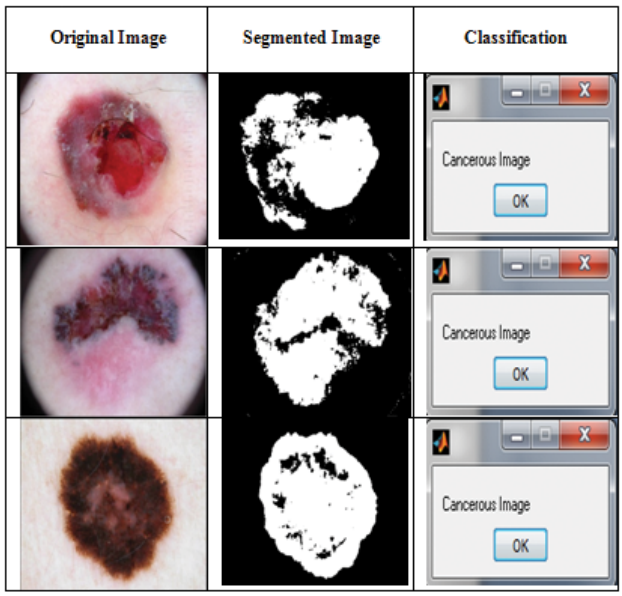

Figure 5: Classification of Cancerous Images

Table 1 shows the statistical parameters of the feature extraction and the classifier findings. Our method used 10 features to differentiate the cancerous and Non-cancerous skin lesions. The obtained result demonstrates the procedure of accuracy and briefly explains the merits when compared with existing approach. The segmented images and classification results of Non-cancerous and Cancerous skin images are displayed in Figure.4 and Figure.5.

Feature Extraction and Classification: Three different metrics have been selected to evaluate the feature extraction and classification results. The performance analysis is done based on these three quality metrics like accuracy, specificity and sensitivity [23].

Accuracy = (TP + TN)/(TP + TN + FP + FN)

Sensitivity = (TP)/(TP + FN)

Specificity = (TN)/(TN + FP)

Where

- True Positive (TP): the Cancerous image is correctly predicted as Cancerous
- True Negative (TN): the Non-cancerous image is correctly predicted as Non-cancerous
- False Positive (FP): the Non-cancerous image is falsely predicted as Cancerous
- False Negative (FN): the Cancerous image is falsely predicted as Non-cancerous

Table 2: Performance Results for Different Feature Sets

Feature Extraction Techniques	Accuracy (%)	Specificity (%)	Sensitivity (%)
GLCM	83	80	85
LBP	85	83	87
RGB	87	85	83
Proposed Method	92	89	90

The Table 2 demonstrates and compares the execution of feature extraction techniques of GLCM, RGB, LBP and proposed feature extraction method. This extraction technique gives effective outcome and the performance validation is done using metric values like accuracy, specificity and sensitivity.

The Figure.6 shows the classifier procedure compared with SVM and ANN, the improved classifier GA-ANN system has better execution in identification of skin malignancy.

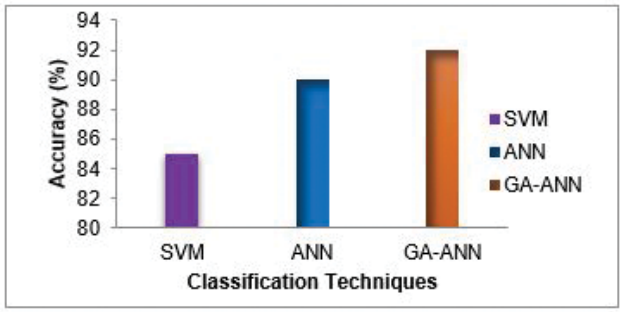

Figure 6: Comparing between existing and proposed system classification techniques

Conclusion

In this paper, the proposed hybrid model of GA-ANN is used to identify the skin cancer in early stage in human. The proposed technique of k-means clustering provides better result on segmentation of skin lesion. And also for achieving better feature extraction on segmented skin image GLCM, LBP and RGB based combination methods are proposed. This combination of feature extraction method improves accuracy of classification result. Finally hybrid model of GA-ANN provides more accuracy result on classification process on different classification rate. Also this hybrid model performance is evaluated with SVM and ANN classifiers and proposed GA-ANN classifiers outperforms among others with same no of feature set. In future a property oriented research can be achieved that can take in features of dermoscopic images and use them for identification of skin cancer image from other skin disease.

Ethical Clearance: Since, the data was collected from a publically available online database; there was no requirement of ethical clearance from institutional review board (IRB).

Source of Funding: It is one of the Self-funding projects of Research scholar of Department of Biomedical Engineering.

Conflict of Interest: Authors declare that they have no conflict of interest.

Application of Harmony Search Algorithm in Retinal Biometric System

J. Sivakamasundari[1], A. Devi Lakshmi[2], P. Madhumitha[2], Pallabi Ghosh[2]

[1]Associate Professor, [2]Third Year Students, Department of Biomedical Engineering, Jerusalem College of Engineering, Chennai, India

ABSTRACT

The retinal biometric system uses automatic segmentation of vasculature in retinal images. The Harmony Search Algorithm (HSA) combined with conventional Multilevel Thresholding (MLT) methods are used to produce continuous vasculature information for the application of retinal biometric system. Publically available retinal image database is employed for this work. The preprocessed retinal images are subjected to HSA based Otsu MLT methods by the best objective functions. The validation is carried out with segmented images against its ground truth images using binary similarity measures. From the segmented images features like statistical, textural and structural are analyzed. The matching is carried out for query images with already enrolled images using Euclidean Distance measures and decision is made. This system gives 96% matching efficiency. Hence this algorithm could be recommended for retinal biometric system.

Keywords: *Braille; retinal biometric system; retinal fundus image; blood vessels; harmony search algorithm; multilevel thresholding; segmentatione*

Introduction

Biometrics is the measurements and calculations of individual's physiological or behavioral characteristics. It is a realistic authentication used for identification and access control under surveillance[1]. Retinal biometrics is a technique that uses person's unique patterns of a retinal vasculatures. It is different from iris recognition and eye vein verification.

Human retina present in the posterior portion of the eye. It is unique because of its complex vasculatures pattern that supplies blood to the retina. Hence, the retina appears to be the most accurate and consistent biometric. It gives good security in authentication, cannot be forged, less number of false positives and comparatively quick verification time. Degenerative retinal disorders such as diabetic retinopathy, cataracts and glaucoma affects the vasculature or it remains unchanged from birth until death[2, 3].

Digital retinal fundus image consists of the retina, optic disk, blood vessels, macula and fovia that holds the optic nerve and sends information to the brain. The pattern of different retinal vasculatures are digitized and stored in a database which helps in biometric system[4].

There are several literature exists on a variety of vessel tree extraction methods[5, 6]. Threshold based segmentation is an important technique used in many medical image applications. In bi-level thresholding, the image is segmented into two classes by a threshold value. Multilevel thresholding divides the pixels into several classes. The non-parametric bi-level threshold selection techniques such as Otsu and Kapur methods are used for image segmentation and are extended to multilevel thresholding[7,8,9].

An evolutionary optimization combines with multi-level thresholding provides better results in vessel segmentation. Numerous evolutionary approaches have been employed to improve accuracy, speed and robustness of segmentation task. Genetic algorithm, bacterial foraging, particle swarm optimization and artificial bee colony have been used[10] The Harmony Search Algorithm is combined with Otsu MLT segmentation methods to effectively identify the threshold values of general images within a reduced number of iterations[11].

In this work, the original retinal images are preprocessed. HSA combined with Otsu MLT to determine the optimal threshold values for segmentation of vasculatures. Validation of segmentation is carried out. Statistical textural and structural features are obtained from the segmented images and are analyzed. Matching is carried out between the features of query and database images using Euclidean Distance measure. Matching performances of the retinal biometric system is evaluated.

Methodology

Framework of retinal biometric system is shown in Fig. 1. It is divided into two main subsystems namely, enrollment and verification subsystem. The retinal images present in the database are preprocessed segmented and its feature vectors are stored in the enrollment subsystem. The user's query image is applied through the query subsystem. Images from the retinal image database which are close match with the query image are identified.

Image Database: Retinal images considered for the analysis are obtained from the database such as Digital Retinal Images for Vessel Extraction (DRIVE), Diabetic retinopathy database1 (DIARETDB1), Structured Analysis of the Retina (STARE) and High Resolution Fundus (HRF)[12].

Preprocessing: Random samples of 50 retinal images are subjected for training and testing. Green channel extraction is employed for the improvement of vessel contrast from its background. Morphological enhancement using top-hat and bottom-hat transformation is carried out for the removal non-uniform illumination and background.

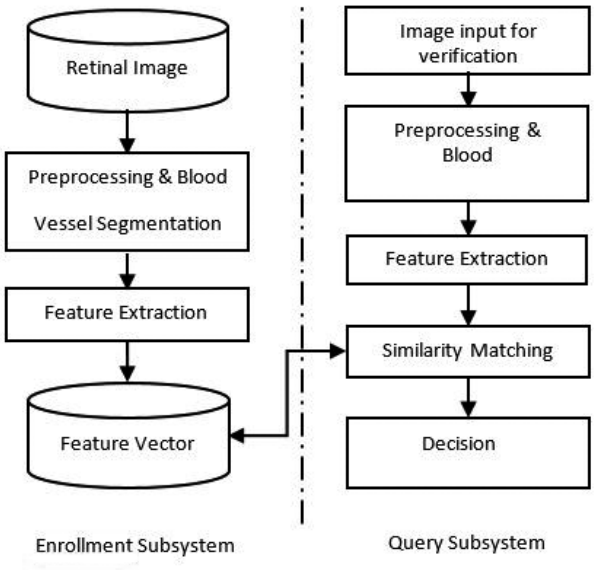

Fig. 1: Retinal Biometric System

Segmentation using HAS Based on Otsu's MLT: Otsu's Between-Class Variance Method: In bi-level thresholding of an image, the pixels are partitioned into two classes such as C_1 with gray levels (1,…., t) and C_2 with gray levels (t+1, …., L). A global threshold value is selected by maximizing the separability of classes in gray levels. The number of pixels at gray level i is denoted by ni. It is the frequency of occurrence in the total number of pixels $N = n_1 + n_2 + \ldots\ldots + n_L$, where L is the number of gray values in the histogram. Then the gray-level histogram is normalized and the probability of occurrence with gray level i is given by:

$$P_i = \frac{n_i}{N} \quad \ldots(1)$$

The optimal threshold or the objective function, J(t) for bi-level thresholding is obtained by maximizing the between-class variance σ^2_{BC} and is given by:

$$J(t) = \arg \max_{1 \le t \le L} \{\sigma^2_{BC}(t)\} \quad \ldots(2)$$

where t is the threshold value. The bi-level thresholding is extended to multilevel thresholding of an image by assuming the pixels that are partitioned into M-1 thresholds levels, $\{t_1, t_2, \ldots t_{M-1}\}$, which divide the image into a suitable number of M classes or levels. The class C1 for $(1,\ldots t_1)$, C_2 for $(t_1+1,\ldots.t_2),\ldots C_i$ for $(t_{i-1}+1,\ldots,t_i)$….and CM for $(t_{M-1}+1,\ldots\ldots, L)$ are considered. The optimal thresholds or the objective function J(T) is a vector contains multiple thresholds $\{t_1^*, t_2^*, \ldots.. t_{M-1}^*\}$ is obtained by maximizing σ^2_{BC} given as:

$$J(T) = (t_1^*, t_2^*, \ldots, t_{M-1}^*) = \arg \max_{1 \le t_1 < 2, \ldots, < t^*_{M-1} < L} \{\sigma^2_{BC}(t_1^*, t_2^*, \ldots, t_{M-1}^*)\} \quad \ldots(3)$$

The between-class variance σ^2_{BC} is used to measure the separability among all classes [9].

In harmony search algorithm, every new candidate is named as harmony and it is marked by M decision variable which represent a different threshold points T. HSA consist three main steps, Harmony memory (HM) initialization, improvisation of new harmony vectors, updating the HM. Initially the population of harmony vectors are randomly generated and stored in HM. New candidate's harmony is generated by the elements of HM using memory consideration operation either by random re-initialization or a pitch adjustment operation.

HM is updated by comparing the candidate's harmony and the worst vector in HM. The worst vector is replaced by a new candidate vector, when latter provides better solution in HM. Until a certain termination criterion is satisfied the process is repeated. Finally the best HM vector is selected and is considered as the best

solution to the problem. The best objective functions are maximized in order to consider the optimal threshold values for multilevel thresholding[11].

The parameters consider for HSA are The harmony memory size which is the number of solution vectors lying on the HM, harmony memory consideration rate, pitch adjusting rate, distance bandwidth, number of improvisations which represents the total number of iterations and the threshold levels. The performance of HSA is highly influenced by the values assigned to the parameters which are given in Table I.

Validation of Segmentation Techniques: Validation of segmentation is carried out by comparing the segmented blood vessels with its corresponding ground truth using binary similarity measures. The similarity values close to one is the greatest matching measure[13].

Feature Extraction: The statistical texture features such as energy, entropy, contrast, homogeneity, maximum probability, standard deviation and structural feature namely, ratio of vessel to vessel free area are obtained from the segmented blood vessels. Statistical analysis is performed on all the features using t-test [14].

Similarity matching and Decision making: The matching of retinal image is carried out using similarity matching between the features of query and enrolled database images using Euclidean Distance (ED) measure and is given by:

$$ED_{(r,s)} = \sqrt{\sum_{i=1}^{N}(r_i - s_i)^2} \quad \ldots(4)$$

where r_i and s_i represent the feature vectors of database image and query image respectively and N is the number of elements of the descriptors[14]. Image with shorter distance is decided as higher matching.

Result and Discussion

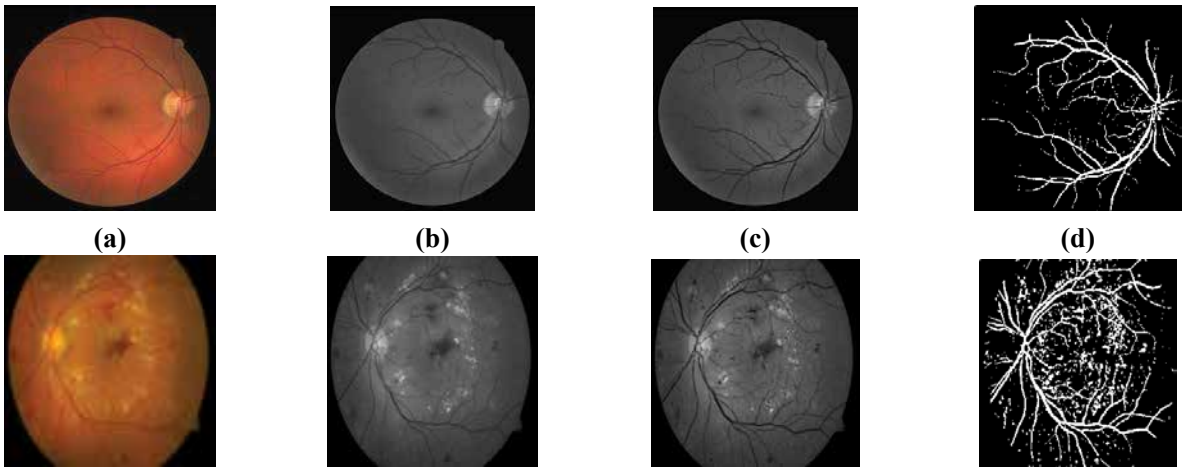

Table I: Values of Parameters Assigned

S. No.	Parameters	Values
1.	Threshold Levels	4
2.	Harmony memory size	50
3.	Harmony memory consideration rate	0.95
4.	Pitch adjusting rate	0.5
5.	Total number of iterations	2500

Typical normal retinal image from DRIVE and abnormal retinal image from DIARETDB1 database are shown in Fig. 2 (a) and 2 (e). The preprocessing step for vessel contrast of the original image is improved in green channel image as shown in Fig. 2 (b) and 2 (f). The non-uniform illumination is eliminated by top hat Morphological Operation (MO). The bottom hat MO improves the contrast of primary and thin vessels further as shown in Fig. 2 (c) and 2 (g).

The values of parameters assigned for the blood vessel segmentation are given in Table I. Preprocessed retinal images are subjected to HSA based Otsu MLT segmentation and the results are shown in Fig. 2. From fig. 2 (d) it is observed that the HSA based Otsu MLT method identifies most of the major and small blood vessels in normal images. It is also observed from Fig. 2 (h) that the HSA based Otsu MLT method identifies major blood vessels with abnormal conditions such as lesions, exudates and hemorrhages.

The segmentation results are validated by comparing the segmented blood vessels with its ground truth using significant binary similarity measures. The similarity values close to one are represented in Fig. 3 using box plots.

(a) (b) (c) (d)

(e) (f) (g) (h)

Fig. 2: Retinal image preprocessing steps (a) original normal, (b) green channel (c) morphological preprocessed normal, (d) HSA based MLT segmented (e) original abnormal, (f) green channel (g) morphological preprocessed abnormal and (h) HSA based MLT segmented images

It is observed from Fig. 3 that the similarity measures such as Sokal and Michener, Sokal-Sneath-2 and Goodman Kruskal Lambda exhibits higher similarity values (above 0.96) and the other measures such as Rogers and Tanimoto, Hamann, Kulczynski I, Sokal and Sneath 4 shows higher similarity values for HSA based Otsu MLT. Average values of similarity measures are given in Table II.

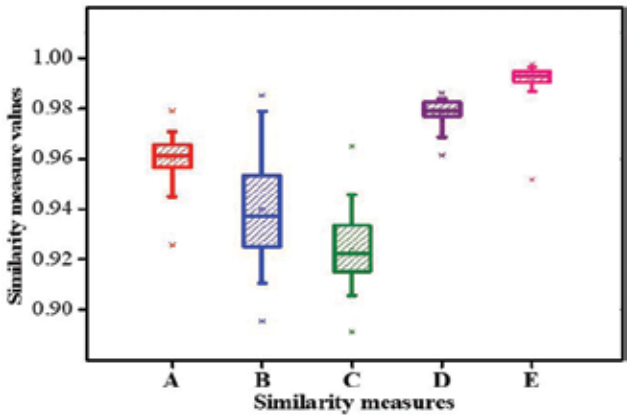

Fig. 3: Variation of similarity measures (A-Sokal & Michener, B-Rogers & Tanimoto, C-Hamann, D-Sokal & Sneath-2, and E- Goodman & Kruskal Lambda)

The statistical texture and structural features are obtained and stored in the feature vector database are given in Table III. HSA based Otsu MLT method provides high average difference and is found to be of high statistical significance ($p<0.0001$) for all features.

Matching is performed by comparing features of enrolled images and query image. The matching efficiency for HSA with Otsu MLT based method is obtained as 96%.

Table II: Average Values of Similarity Measures

S. No.	Similarity Measures	Average Values

Conclusion

Retinal biometric is a significant among all other biometrics because it uses unique retinal vasculature pattern for each individual and almost impossible to forge. In this work, retinal images are taken from the public database. These images are preprocessed to improve the vessel contrast and vasculatures are segmented using EMOA based Otsu MLT method. Then, the validation of segmentation is carried out against the ground truth images. The performance metrics of segmentation are compared with other methods. Statistical, textural and structural features are obtained from the segmented images and analyzed. Similarity matching between query and enrolled images are carried out.

The HSA based Otsu MLT selects t he best optimized threshold points with less number of iterations. It identifies most of the blood vessels visually better in normal retinal images. This algorithm retains more pathological structures along with blood vessels in abnormal retina. The validation of segmentation achieves higher binary similarity measure values of 0.97. This method provides a high degree of mean segmentation accuracy of 0.974 and 0.979 for normal images in the DRIVE and HRF database respectively. Statistical texture features are used for verification process to match the query image with already enrolled images. Matching provides 96% of accuracy. Hence, this method could be used for the automatic retinal biometric system.

ABSTRACT

Epileptic seizure is the most predominant brain disorder that has affected at least 1% of the world's population and higher numbers are affected in the underdeveloped countries. The best marker for diagnosis of seizure is to analyse the EEG signals. The statistical parameters of EEG signals vary when there is an occurrence of seizure. In this paper the statistical parameter interquatile range and Mean absolute deviation are taken as features and are classified using unsupervised learning algorithms (clustering techniques). K-Mean, K-Centers, Parzen Classifier, K- Nearest Neighbour, Gaussian mixture model, and Naive Bayes classifier are put to test to find out the best suited algorithm. Among the methods used K-Nearest Neighbour gives the maximum accuracy of 100%, sensitivity and specificity of 1 for the given data followed by Parzen classifier with 98.02% of accuracy, and has a sensitivity of 0.96, specificity of 1.The Naieve bayes classifier with 96.71% of accuracy is the fastest algorithm with 0.019 ms and hence can be used for real time applications.

Keywords: *Clustering, unsupervised learning, EEG signals, Epileptic seizure, statistical features.*

Introduction

More or less fifty million people are affected by epileptic seizure worldwide of which 80% are from developing countries. The percentage of children affected by seizure is more when compared to that of adults. The definition for epileptic seizure formulated by International Bureau for Epilepsy and International League Against Epilepsy given in the study of Fisher et al[1]. It is a transient occurrence of signs and symptoms due to abnormal and excessive synchronous neuronal activity in the brain. The exterior expression of seizure could be vibrations observed in the extremities, loss of awareness, and loss of memory for a short duration of time, extreme sweating and rapid increase in heart rate. Seizure may occur due to genetic disorders, head injury, trauma in the head, tumor in the brain and stroke. Some children who have very high fever also exhibit the symptoms of seizure.

The epileptic seizure can be detected using Electroencephalogram (EEG) signals. For proper diagnosis of epileptic seizure, long hours of EEG signals have to be acquired from the affected persons and have to be reviewed by the doctor which proves to be strenuous.

The study of EEG signals has been carried out since late 1960s'. The major breakthrough came in the early 1980s'. Gotman (1982) has been the trailblazer for automatic detection of seizure. He has given the idea of breaking down the EEG signals into small waves and detection of spastic rhythmic activity whose frequency ranges between 3 to 20 Hz[2]. Here online seizure detection was done automatically by identifying the spikes caused by seizure activity. Qu along with Gotman in 1993 have developed an automatic seizure detection using artificial intelligence which can aid in the reduction of false positive rate which occurred due to artifacts and muscular movements etc[3]. Gotman et al. in 1997 have identified the spectral changes occurring in the seizure EEG signal. Liu et al. have performed autocorrelation

to detect the quasi periodicity of EEG signals occurring during the seizure. Patrick and Paul have concluded that the proposed method has a lesser false detection rate[4].

John O' Toole et al. have proposed a method in which quasi-linear frequency modulated parameter has been chosen. This parameter is found only in patients at the time of occurrence of seizure. Hence it proves to be an important marker[5]. Mohseni et al. have tried various methods and compared it with variance method and have come to a conclusion that variance method provides best results up to cent percent results[6]. Tzallas et al. have come up with a novel method using time- frequency analysis where smoothed pseudo-Wigner-Ville distribution is applied to the EEG signal and Hamming 64 window is used[7]. Features from this window are used to segregate normal and abnormal signal and is classified using Artificial Neural Network. Six ictal morphological features have been identified by Ralph Meieret et al. [8]. They are Alpha, Beta, Theta and delta activities which are rhythmic, depression in amplitude and poly spikes.

Yuedong Song and Pietro Liò have come up with a novel approach to classify the signal into ictal, interictal and normal EEG signals. Statistical based parameters are taken as sample entropy for extracting the features[9]. Back propagation and extreme learning machine are used for classification. Shantha Selva Kumari and Prabin Jose have decomposed the signal using wavelet transform into different types of EEG waves using the sub-band technique and features are extracted from each type and classified using support vector machine[10].

Abduljalil Mohamed et al. have used various classifiers like K-nearest neighbor, support vector machine Bayesian classifier etc and have used the output obtained from the classifiers. A weight based on their accuracy and precision has been generated and combined using Dempster's rule[11]. Mark G. Frei et al. have given a detailed explanation on seizure detection algorithms. They have concluded that patient specific algorithm would give much better results when compared to generic approaches[12].

Chia-Ping Shen et al. have also used multi-channel EEG signals both in unipolar and bipolar modes. Variance, standard deviation and energy are the statistical features that were selected and support vector machine has been used for classification[13].

Thus many approaches are present to detect the seizure. But the most effective and simplest method is the study of statistical variation in the EEG signals during episodes of seizure. This paper presents an in depth analysis of various clustering techniques that uses statistical parameters as features that can be effectually used for seizure detection.

Methodology

Clustering Algorithms: The unsupervised learning algorithm groups together the data which are similar. It does not need the label or target data. Here groups of data with a shorter distance between them that is which have similarity measure closer to each other are clustered and thus they can be used for classification depending on which cluster the data point is present. The features that are taken into consideration are Interquartile range and Mean absolute deviation. In the previous work by Grace. P,et.al[14]. the features, Interquartile range and Mean absolute deviation have been proved to be more resourceful when compared to other statistical features.

K-Mean Clustering: K-Mean clustering algorithm follows a straight forward method for clustering of data. The number of clusters to be formed is given previously. The foremost initiative is to find the centroid for each cluster. The centroids of each cluster have to be separated from each other with maximum distance from each other. Each of the data points have to be associated to the nearest centroids that are available This procedure continues until there is no reassignment of the centroids. The main objective is to reduce the distance between the centroids and the data points. The objective function is given by equation (1).

$$J = \sum_{j=1}^{k} \sum_{j=1}^{n} \left\| x(i) - \mu(j) \right\|^2 \quad \ldots(1)$$

Here J is the objective function, x denotes the data and μ denotes the centers. There are 'n' number of data points and 'k' number of clusters.

K-Center Clustering: The centroid that is chosen is also a data point within the cluster. Each cluster has a group of data points which are at a particular distance 'd' from each other or it lies within the distance of 'd/2' from the centroid data point of the cluster. The expression for distance 'd' is given by equation (2).

$$\max_{nn=1\text{to K}} d_k \quad \ldots(2)$$

Where dk denotes the maximum distance within each cluster.

The K-Center is expressed as given in equation (3)

$$J = \max_{k=1 \text{ to } K} \left\| x(i) - c(j) \right\|^2 \quad \ldots(3)$$

Where J is the objective function, x is the data, c is the cluster center and K is the number of clusters.

K-Nearest Neighbour: The data point is classified based on the classes of k number of neighbouring data points. The number of data points surrounding the data point to be classified is fixed and the window dimension is varied to accommodate these data point. The unknown data point takes on the class of the maximum number of data points within the selected region.

The estimate for K-Nearest Neighbor is given by the expression (4).

$$p_n(x, \varphi_i) = \frac{k_i / n}{v} \quad \ldots(4)$$

Where k is the number of samples present within the window and ki denotes the total count of samples that are tagged as *v*.

The probability that the given sample belongs to the class ωi is given in equation (5).

$$p_n(x|\varphi_i) = \frac{k_i}{k} \quad \ldots(5)$$

The ratio of ki and k is the fraction of data points present within the window. The most recurrent class within the defined region is assigned as the class for the given data point.

Parzen Classifier: The Parzen classifier works on the principle of probability density estimation. The probability estimate is shown in the equation (6).

$$P(x) = \frac{m / n}{D} \quad \ldots(6)$$

Where n is the total number of data points, m is the number of the data points present within the area A defined by a window function. D is the dimension or volume of the region covered by A. The Parzen window probability estimate is given by the equation (7).

$$P_\varphi(x) = \frac{1}{n} \sum_{i=1}^{n} \frac{1}{h^k} \varphi\left(\frac{x - x_i}{h} \right) \quad \ldots(7)$$

Where n is the number of samples present, h is the length of the window and k refers to the dimension of data. If the data is a 1D data k takes the value of 1. For classification of EEG signals, 2D data are taken into consideration. x is the sample to be estimated and xi is the data point that is present at the center of region. The Parzen window function uses the Gaussian window φ which is given in the expression (8).

$$\varphi(v) = \frac{1}{\sqrt{2\pi}} e^{-v^2/2} \quad \ldots(8)$$

The samples inside the region have higher weights when compared to other samples.

Gaussian Mixture Model: The Gaussian mixture model assumes that the data present have a set of Gaussian distribution for each cluster present in the data set. The Gaussian mixture model comprises of k number of weighted sum of probability density functions. The weight w depends on the distribution of data. Individual Gaussian distribution has μi as its center and Σi represents the covariance of the data. The membership of each data point is determined. The Gaussian distribution for the data with a dimension D is given in equation (9).

$$N(x|\mu, \Sigma) = \frac{1}{2\pi^{D/2} \sqrt{|\Sigma|}} \exp\left(-\frac{1}{2} (x - \mu)^T \Sigma^{-1} (x - \mu) \right) \quad \ldots(9)$$

The probability of the data point belonging to a particular class is given by the expression (10) and (11).

$$p(x) = \sum_{i=1}^{k} w_i \cdot N\left(x \,|\, \mu_i, \Sigma_i \right) \quad \ldots(10)$$

$$\sum_{i=1}^{k} w_i = 1 \text{ and } 0 \leq \text{wi} \leq 1 \quad \ldots(11)$$

The Gaussian mixture model gives soft decisions, that is, a data point might have fractional membership in many clusters.

Naive Bayes Classifier: The basis for Naive Bayes classifier is that it considers each variable as independent to each other. In this method, the posterior probability is calculated using prior probability. The prior probability represents the information about the data even before the samples are collected. The posterior probability is the probability of interpretation of the label to which the set of given data may belong to. The expression for Naïve Bayes classifier is given in equation (12).

$$p(\theta|x) = \frac{p(x|\theta)p(\theta)}{p(x)} \quad \ldots(12)$$

where $p(\theta|x)$ is the posterior probability of the given data to belong to a particular class, $p(\theta)$ is the prior probability and $p(x)$ is constant of normalization for selection of the Bayesian model. It is given by the equation (13).

$$p(x) = \int p(x|\theta)\, p(\theta)\, d\theta \quad \ldots(13)$$

This method of classification can also be used during streaming of data.

Assessment of Clustering Techniques for Seizure: The two major parameters are sensitivity and specificity. Sensitivity is expressed in the equation (14) and specificity is expressed in equation (15). Accuracy of the algorithm is given in equation (16).

$$\text{Sensitivity} = \frac{TP}{TP + FN} \quad \ldots(14)$$

$$\text{Specificity} = \frac{TN}{TN + FP} \quad \ldots(15)$$

$$\text{Accuracy} = \frac{TP + TN}{TN + TP + FN + FP} \quad \ldots(16)$$

Where TP is true positive which detects the occurrence of a seizure, TN is true negative which classifies a signal as normal in the absence of a seizure, FP is false positive where the algorithm classifies a normal signal as a seizure signal and FN is false negative where the algorithm fails to detect the occurrence of a seizure.

Results

The EEG signals data set for normal and abnormal EEG signals are taken and applied to the classifiers. The samples in a two dimensional feature plane clustered with the help of K-Mean, K-Centers, Parzen Classifier, K-NN, Gaussian mixture model, and Naive Bayes classifier are displayed in figures 1 to 6. The features selected are Interquartile ratio (iqr) and Mean absolute deviation(mad). The purple(dark) region in the feature plane indicates that if the sample is present in it then the algorithm classifies it as a normal seizure free EEG signal. If the samples are present in the pink(lighter) region then it is classified as seizure signal. The data points marked in blue are samples of normal EEG and red points indicate samples of seizure EEG. The classification accuracy, sensitivity, and specificity for various clustering methods are found and validated to find the best suited method for EEG seizure detection and classification. The computational time is also noted for each algorithm. perClass machine learning tool was used for this study. A total of 152 samples of EEG signals were taken out of which 76 were normal EEG and the other 76 were abnormal[15].

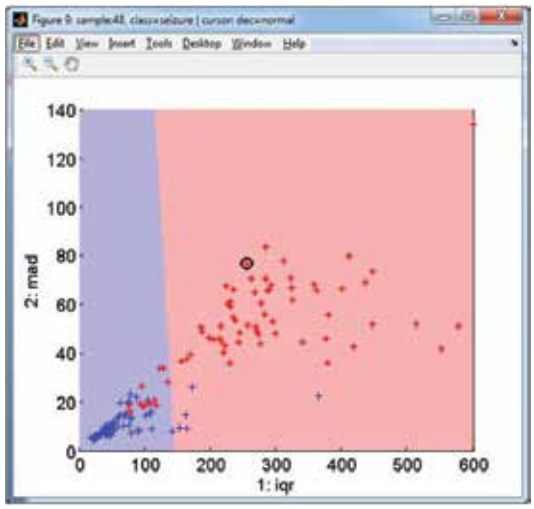

Fig. 1: K-Mean clustering

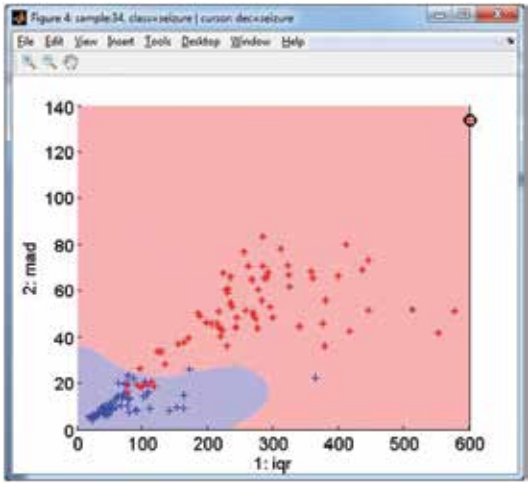

Fig. 5: Gaussian Mixture Model

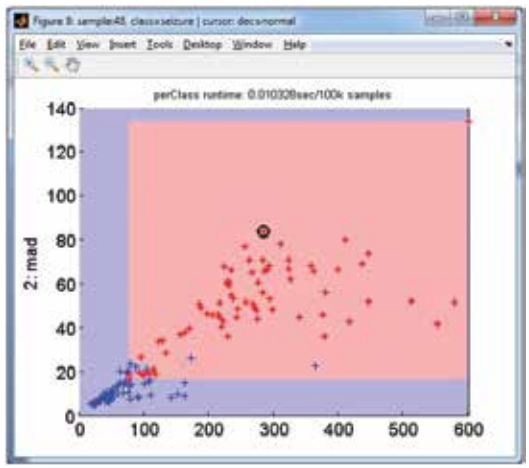

Fig. 6: Naïve Bays classifier

Discussion and Conclusion

Comparative Assessment of Clustering Algorithms: The normal signals have a narrow range and the statistical parameters of the seizure signals have a broad spectrum. The classification of the EEG data using these algorithms has been analysed using the statistical assessment parameters. The comparison chart for the performance of various clustering algorithms using the statistical parameters is shown in Figure 4. Sensitivity, specificity, accuracy and time taken for computation of all the given clustering algorithms are given in table no 1.

Table 1: Statistical measures of clustering algorithms used

Algorithm	Sensitivity	Specificity	Elapsed time Milli seconds	Accuracy (%)
K-Mean Clustering	0.842	0.907	0.026	87.5
K-Centers Clustering	0.820	0.986	0.140	90.78
K-Nearest Neighbor	1	1	0.110	100
Parzen Classifier	0.96	1	0.450	98.02
Gaussian mixture model	0.89	0.93	0.036	91.44
Naive Bayes classifier	0.973	0.96	0.019	96.71

It has been noted that K-Nearest Neighbor algorithm has produced the highest accuracy of 100 %. The elapsed computational time of K- Mean Clustering 0.019 ms is the least when compared to other algorithms. Parzen classifier and Naïve Bayes algorithms have given a high-rated accuracy of 98.02 % and 96.71 % respectively. The Parzen classifier consumes a lesser time of 0.450 ms for classification of the given data set. K-Mean, K-Center and Gaussian mixture model clustering algorithms have accuracies of 87.5 %, 90.78 % and 91.44 % respectively for the distribution of the given data set. The false negative rates were much higher for K-Centre, K-Mean and Gaussian Mixture model with 15.78 %, 17.1 % and 10.52 % respectively. False positives are much higher K-Mean and Gaussian mixture model clustering methods with 9.21 % and 6.57 % respectively. Hence it

is concluded that K-Nearest Neighbor is the best-suited algorithm for seizure detection followed by Parzen classifier and Naïve Bayes algorithm.

Ethical Clearance: This Study does not require Ethical Clearance since it uses online data.

Source of Funding: It does not require any funding.

ABSTRACT

The assist device for blind people is much needed in recent days. The gadgets in recent trends are digitized that the blind people are not capable of handling digitized applications hence in our project we design text to voice converter, that converts the eBooks, audiobooks to voice format. In this project the audiobook eBooks are fed into SD card reader after that the sd card reader is interfaced and the Arduino UNO converts the text file to Audio output. The audio books can be heard in headphone\speaker using Arduino UNO. This project is low cost it will be more useful for blind people. Secure voting must be necessary to avoid the fake voting. The problem of fake voting can be solved by using Face detection and Finger vein based Electronics Voting Machine (EVM) system. In electronic voting system the details of the voters are stored; the voting date is recorded and processed digitally. Most of the existing Electronic voting machines has been developed using Radio Frequency ID. In developing countries RFID for each person is not possible due to high cost efficiency. Image processing based EVM also introduced, but it not provides accurate results for the twin persons. The EVM with finger print also not providing the accurate results. So the modified EVM with face and finger vein was introduced to obtain the satisfied result. The Raspberry Pi plays major roll in this project. It is act as a on board CPU work on the operating system called rasbian OS. The necessary hardwires like, camera, finger vein scanner, EVM are connected with Rasperry Pi. The datas of all the voters along with the images of the face and the finger vein are already stored in the system. The camera capture the picture of the person then compare with the stored data and find whether the person is authorized person or not. Once the person is authorized then the next section scan the finger and compare with the data and inform to the system that whether known or unknown. If both face and finger vein are recognized then the voter can register their vote. The fake voting can be completely avoid using this voting method.

Introduction

India is the world largest democracy country. The protected right conceded by the Indian constitution to its whole national is Right to Vote. Due to high populations it is an extremely trouble and hard to utilizing the paper ballot system for election purpose. To overcome this, the paperless method voting machines were developed and commonly known as Electronic Voting machine[1]. The EVMs reduce the time in both casting a vote and declaring the results compared to the old paper ballot system. But the security is the big issue in EVM. The EVM follow the principle of "one person, one vote"[2,3]. The EVM is programmed to record only five votes in a minute so that avoid the entry of additional or repetition in vote[4].

Electronic Voting Machines (EVM) are being used in from the year 1999. EVMs have replaced paper ballots in local, state and parliamentary elections in India. The major advantages of EVM are, there are no external communication paths which make it difficult for the hackers to hack the machine and tamper the count numbers, EVM with touch base Screen are proven to be advantageous for the physically challenged people by giving their vote in private without others help and these are cost effective. But the major disadvantages are, most of the electronic voting machines used in the country do not have any mechanism by which the voter can verify their identity before casting the vote due to which fake voters can cast numerous fake votes[5]. The EVM also do not generate a slip confirm the candidate one voted post pressing the button. The hackers can manipulate the vote in easier way.

The two main units of the EVM are control unit and balloting unit. These two units are generally joined by using a cable of length upto five meter. The voters can vote by the Balloting unit using labeled buttons, where the control unit controls the ballot units. The control unit stores voting counts and displays the results on 7 segment LED displays. The permanent program is embedded on the controller during the manufacturing of the controller chip which is made up of silicon. The embedded program cannot be changed by anyone including the manufacturer. EVMs are powered by an ordinary 6 volt alkaline battery, since this design enables the use of EVMs throughout the country without interruptions because several parts of India do not have power supply or erratic power supply. It is used for maximum of 3840 votes and caters of 64 candidates. There is provision for 16 candidates in a single balloting unit and the maximum of 4 units can be connected in parallel at a time. The conventional ballot method of polling is used if the number of candidates exceeds 64. It is not possible to vote more than once by pressing the button again and again. As soon as a particular button on the balloting unit is pressed, the vote is recorded for that particular candidate and the machine gets locked. The vote corresponding to the second press will not be recorded. This is called one person - one vote.

The Raspberry Pi is the Broadcom system on a chip with an integrated ARM of well-suited Central Processing Unit with on-chip Graphics Processing Unit . The Processor speed ranges from 700 MHz to 1.2 GHz for the Pi 3 and on board memory range from 256 MB to 1 GB RAM. The Secure Digital cards are used to store the operating system and program memory in either SDHC or Micro SDHC sizes. The boards have either a single USB port or up to four USB ports depending on the model. The system supports the HDMI and composite video, with a standard 3.5 mm phono jack for audio output. Lower level output is provided by a number of GPIO pins which support common protocols. The B-models have an 8P8C Ethernet port and the Pi 3 and Pi Zero have on-board Wi-Fi 802.11n and Bluetooth.

Overview

The figure.1 shows the overview of the work progress. Rasperry PI is main part in which the camera with MATLAB flat form is connected[6]. The photo taken by the camera is compare with the data base image, if the image matches then it produces the authorized message and it receive the finger vein corresponds to that person. The message 'unauthorized' is display for the wrong image. For the identified image, the scanned finger vein also compared. If the finger vein matches then the system unlock the voting machine and allow the person for voting and give the message in the screen as 'enter your vote'. If the finger vein mismatches then the voting machine still in the locked mode and the message 'unauthorized' is displayed.

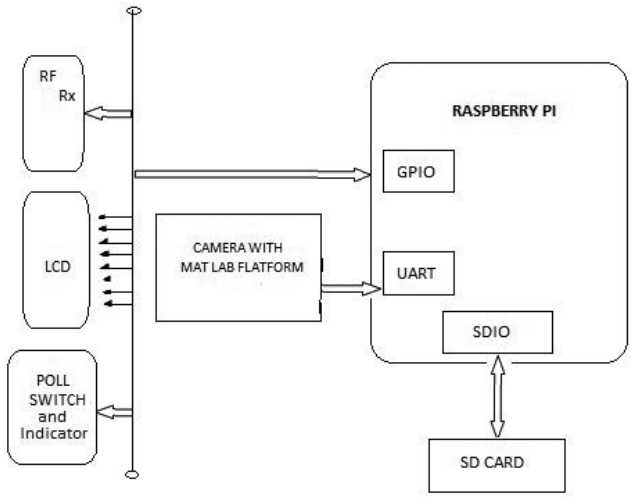

Figure 1: Block Diagram

Results and Discussion

The figure 2 shows the working model of the project. In the initial stage, the photo taken by the camera is loaded and train using the MATLAB software. Once the training is over then it stored in the second part of the MATLAB window. Using the weber law the stored data of the person is found and converted into a gray code image. Both the captured and the stored data are compared and gives the authorized message for the correct image[9].

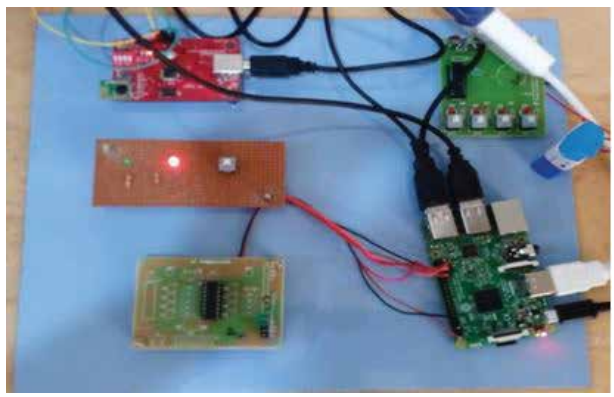

Figure 2: Working model of the EVM

The figure 3 shows the main panel of the matlab window. The button options given in this window like train, person, weber law, data base and clear buttons. The train button for load the image in the data base. Person button for capture the real time picture. Weber law button for convert the image in to gray code and compare with the stored data[10]. If the both the real and stored images are matches then it generate the authorized message and continue process for the finger vein verification.

Figure 3: window for comparison of images

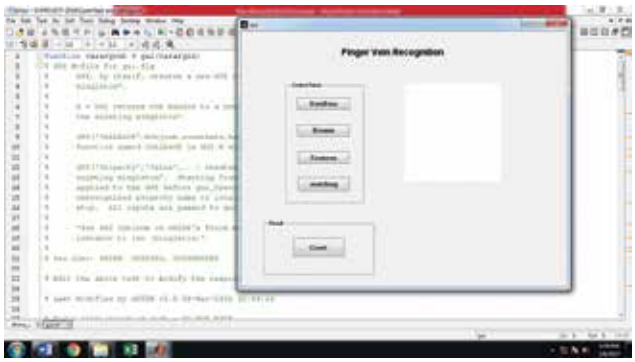

Figure 4: Finger vein scanning processes

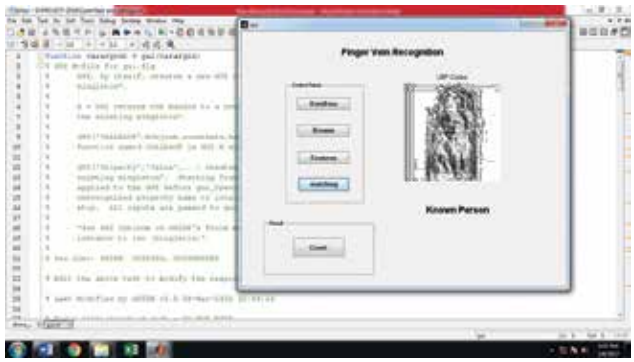

Figure 5: Identification of the Finger Vein

After the confirmation of the person with photo and the finger vein, the voting machine get unlocked and allow the person to vote. The voted information were recorded with the green LED. If any other person try to vote then the red LED glows.

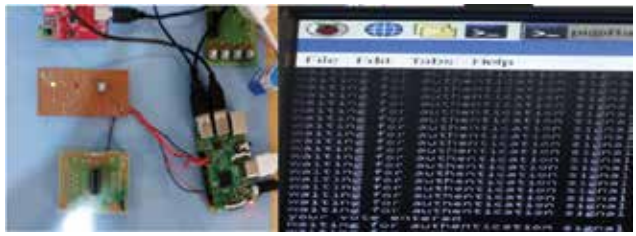

Figure 6: Indication of authorized person

Conclusion and Futurework

The two level security system was introduced for the voting system. The Corruption can be minimized through honesty and sincerity. This system is a small contribution for a fair election. But corruption in voting system cannot be completely erased through this system if there is no sincerity. This project was used to enhance security by eliminating bogus voting and vote repetition using finger-vein and face recognition based authentication. As an additional security measure photo and details of the voter are displayed from remote server and results are viewed at central server by an authorized person. In future, the security of finger vein voting machine can be enhanced using the data from the centralized server. The Raspberry PI module can be replaced with the TIVA board for the better secure and large amount of data processing.

Health Parameter Analyses of Living Organism in Underwater Environment

T. Thaj Mary Delsy[1], D. Jamuna Rani[2], D. Marshiana[3]

[1]Assistant Professor, Department of Electronics and Instrumentation Engineering, Sathyabama Institute of Science and Technology, Chennai-India

ABSTRACT

Health monitoring of any living organism can be done easily through various wireless techniques in air medium. Whereas in the water medium, it is very difficult to monitor the health parameter of the living animals such as fish, rare species like Dolphins and even the human beings working underwater. This is because of the high attenuation and severe multipath effects. To overcome this in this paper, a dolphin signal is used as carrier signal for communication purpose. The error rate is calculated and compared with the standard modulation scheme Binary Phase Shift Keying (BPSK). The simulation results evident that the underwater communication by the low frequency signals like human voice and Dolphin signal performs better and gives an error rate equals to the one-tenth of the error rate caused by the BPSK scheme in water medium.

Keywords: *Dolphin Clicks, Attenuation factor, Binary Shift Keying, Ray Tracing.*

Introduction

Dolphins use sounds to communicate in underwater world. They produce different sounds and it vary in frequencies according to their moods. Whistle for lost dolphin, pulsating sound to show its Angry/Excited moods, Blast sound to show its good mood. Squeal and whistle sound are excited for Sexual excitement and Mother to lost child. These sound frequency ranges from 1 to 150 kHz. Mainly dolphins use whistles and clicks for their communication purpose. Clicks work on the principle of echolocation, its frequency ranges from 40-150 kHz. The frequency range of whistle is 17-25 kHz. In underwater, low frequency signals travel over a long distance whereas the high frequency limits the distance.

The Dolphins are categorized into Bottle nose, Commerson, Hector, Black, Atlantic Hump Backed, Haeviside, Indo-pacific Hump Backed, Southern Right Whale, Atlantic spotted, Stripped, Rough Toothed, Spinner, Risso's, Clymene, Fraser's, White Beaked, Peale's, Atlantic White Sided, Hourglass and Dusky dolphin. In this paper, a underwater channel is modeled using Ray Tracing Method. The various factor considered in the channel design are Ambient Noise, Attenuation loss and Multipath effects. The data is encoded and then convolved with the impulse response of the channel in the transmitting section. In the receiving section, error rate is evaluated by comparing the data with te decoded data. The above process is done using three different methods.

In the first method, BPSK scheme is applied. Dolphin and Human Voice signals are used as carrier signals in the second and third method. For all these methods, Error rate are calculated and comparison between them are analyzed and studied in detail. Using this principle, we can study and analyze the health parameter of living organism in underwater environment.

Literature Survey: In [1], authors discussed about the basic modulation techniques available in the underwater communication. The various error coding techniques like Cyclic[2], Reed Solomon[3] and Turbo codes[4] are applied to the modelled underwater channel and its performance are analysed. The channel is modelled using multipath fading with additive white noise. The performance of convolution code[5] with different polynomials are analysed by the authors [6]. Mainly code rate of ½ and 1/3 with all possible polynomials are simulated and best five polynomials and its error rates are discussed in detail. Simulated results are compared with the standard coding schemes like Pseudo Noise Sequence[7] and Orthogonal Frequency Division Multiplexing[8].

The image transmission [9] is carried out in underwater. The image data is converted into binary format, then it is transmitted using Orthogonal Frequency Division Multiplexing technique[10]. Authors maintained the guard interval is less than 25% of the encoded data. The result proven that if the guard interval is less than

25%, then the error rate increases significantly. The performance of the adaptive equalizer and Decision Feedback Equalizer[11] in underwater communication is studied in detail[12]. The four channels are modelled with respect to the Doppler shift and distance between the transmitter and receiver. The optimal step size of an equalizer[13,14] was obtained by allowing the encoded data to pass through the channels in the step size of 0.01 ranging from 0 to 1. Authors showed that the optimal stop size obtained from this technique gives an error rate in the order of 10^{-3}.

In [15], authors modelled the dolphin clicks and encoded the data using the modelled clicks. The performance of the Dolphin clicks[16,17] in underwater was compared with the adaptive equalizer in the channel. Simulation was done with different transmission range, one at a distance of 500 meters and another one at 1 km.

Author achieved error rate in the order of 10^{-3} for short distance communication and maximum error in the order of 10^{-1} for long distance communication. A sample MRI image was also taken and allowed to pass through the channel for the validation of the simulated result. An efficient error code Low Density Parity Check (LDPC) is modified by the authors [18] and tested the efficiency in the underwater environment. In this technique, the data is encoded using series of convolution code and decoding is done using Viterbi algorithm[19]. Authors obtained the error rate is same as LDPC[20] code with less processing time.

Methodology

Underwater acoustic channels is characterized by three major factors. Attenuation that increases with signal frequency, varying multi path propagation, and low speed of sound (1500m/s). The channel capacity depends on the distance and may be extremely limited. Impulse response of the underwater channel is computed and shown in the Figure 1. As acoustic propagation is best supported at low frequencies. Although the total available bandwidth may be low below, an acoustic communication system is actually wide band in sense that the bandwidth is not negligible with respect to its centre frequency. The channel has a scattered impulse response where each physical path acts as a low pass filter, and motion brings about Doppler spreading and shifting.

Underwater communication is one of the challenge medium for data transmission. The reason behind this is in underwater the speed of light is about 1500m/s and in air medium the speed of light is 3*10^8m/s. High frequency signals can be used in air medium for long distance with minimal attenuation. In water medium to carry out long distance communication low signals will be used. Mammals like dolphin uses low frequency sound signals to communicate with each other. In this paper, dolphin sound signals and human voice signals are taken as the reference signals. The data is modulated using these signals and error rate is calculated. The various constraints of the channel are multi path propagation, dispersion of signal in time and frequency domain.

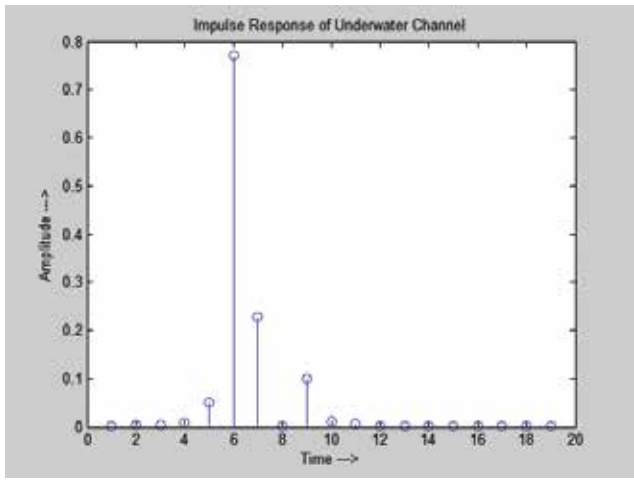

Figure 1: Impulse response of the channel

The underwater communication is opaque to electromagnetic radiation except in the visible band and so the acoustic propagation has a limitation that it is supported only at low frequencies. The underwater channel is designed using Ray Tracing technique. The time and frequency dispersion of signal is overcome by the dolphin sound signals. Finally the performance of the dolphin sounds is compared with the Binary Phase Shift Keying in the underwater channel. This will be usual for the research people for better understanding of the use of dolphin sounds in underwater communication. In our work we have taken the signal of dolphins and made a comparative study with human signal in air medium. The analysis is carried out using the voice source of different types of Dolphins voice source is taken in MP3 format [21]. According to the study made using the sample of the dolphin sounds we could infer that the frequency of the dolphin signal is not more than 1 kilo hertz. For example we have shown below a graph, is obtained from processing the dolphin sound signal. The figure 3 to 5 shows time and frequency spectrum of Dolphin Squeal, Chatter and Rissos Dolphin sounds. In the Figure 6, human voice is recorded and spectrum is plotted. It is observed that all these signals are having low frequency signals less than 150 kHz.

Result and Discussion

Table 1 to 3 compares the error rate between the different methodologies. For simulation purpose word 'biomedical' is taken as input data. It is converted into binary data then it is send to the air and water medium. The table list the error rate along with the decoded data for different methods. In the table 1, comparison is carried out between the BPSK modulations with the Low frequency Dolphin signal in the water environment. It shows that the Dolphin signal performs well compared to the BPSK modulation scheme. As the Signal strength increases, the error rate using Dolphin sound signal decreases drastically and attains in the order of 10^{-2}. Whereas for the BPSK scheme it reached in the order of 10^{-1} which is only one tenth of the former method.

Table 2 compares the human voice signal communication with the dolphin sound signal. It is found that both gives least error as the signal strength increases. In the table 3, the comparison of BPSK scheme in air and water medium is carried out. It is evident that the BPSK in air medium gives a least error rate compared with in the water environment. In the water medium, the attenuation caused by the environment is high compared to the air medium. It is concluded that the Dolphin and Human Voice sound are low frequency signal and results in the least error rate compared to the BPSK modulation scheme in the air and water medium.

Conclusion

The paper thus concludes that the BER for the modulated data sent through the UAC the channel in three different formats namely the BPSK, voice signal, dolphin signal. It is evident that the BPSK in water medium has high bit error rate than that of the BPSK in the air medium and also the BPSK in air and dolphin signal in water medium are abruptly having the low BER rates.

Thus it is concluded that the dolphin signal is more effective for communication in underwater medium. It is recommended that to monitor health parameter of person underwater or any other living organism, either Dolphin Sound signal or Human Voice signal can be used as carrier signal for better error rate.

Recent Medical Image Fusion Techniques: A Review

V. Amala Rani[1], S. Lalithakumari[2]

[1]Assistant Professor, [2]Associate Professor, Department of Electronics & Instrumentation Engineering, Sathyabama Institute of Science and Technology, Chennai-India

ABSTRACT

Image fusion technique has been widely in use in many applications such as computer vision, surveillance, robotics, medical imaging, remote sensing etc. Medical image fusion plays a vital role to deal with medical issues reflected through images of human body, organs and cells. It is necessary to preserve the fused image in order to keep the relevant information of input images. It is also necessary to keep the fusion process away from introducing any artifacts or inconsistencies. More over image fusion techniques must provide a good quality and must enhance the applications of recent data. This paper elucidates the survey of recent literatures, which dealt medical images like magnetic resonance imaging (MRI), Computed Tomography (CT), Single Photon Emission Computed Tomography (SPECT) and Positron Emission Tomography (PET) of brain. This paper reviews some of the recent medical image fusion algorithm such as Non Sampled Contourlet transform, Directive Contrast, Daubechies complex wavelet transform, Shift-invariant Shearlet transform etc. The merits and demerits of the various image fusion algorithm which developed by the authors is described in the paper. The survey emerges out the optimum fusion algorithm.

Keywords: *image fusion; image fusion techniques;medical image*

Introduction

Image fusion is the method of developing a single image by combining relevant information from many images. In order to obtain a more absolute and accurate description of the same object, it is necessary to integrate information from many images. The final fused image could provide more information than any of the single image. This information could be used for different purposes like identification of diseases, detecting the tumor, treatment for surgery and so on. Hence the negative aspect of single modality medical image has been paved the way for the process of combining different modality images into a single image. Therefore, the combining process of multimodality images into a single fused image can be done using image fusion techniques. The fused image would be more suitable for human or machine perception than any other individual source image. The additional information obtained from the fused images could be well utilized for more precise localization of abnormalities.

The structural images like Magnetic Resonance Imaging (MRI) and Computed Tomography(CT) give high resolution images with anatomical information and functional images like Positron Emission Tomography(PET) and Single Photon Emission Computed Tomography(SPECT) give functional information with low spatial resolution [1]. CT is used to visualize dense structures like bones and it cannot detect physiological changes [2]. PET is used to provide improved information on blood flow and flood activity with low spatial resolution [1]. It could also provide functional eloquent brain areas such as motor or speech regions by using specific activation tasks. A SPECT image reveals the metabolic change that has significant clinical values [3]. A single medical image could not provide more information for medical diagnosis and clinical requirement. Hence the anatomical and functional medical images are required to be combined for an understandable view for medical diagnosis of diseases and treatment. With quick advancements in technology, it is now feasible to obtain information from multisource images to produce a high quality fused image with more spatial and spectral information.

Image Fusion Methods

Various image fusion techniques have been developed for multimodality medical images. Some of the image fusion techniques are discussed as follows.

L.Yang et.al developed a pixel level fusion algorithm for multimodality medical image based on contourlet transform for CT/MRI images of brain. Contourlet offers better anisotropy, multiresolution, directionality and localization properties for 2-D signals. The perfectly registered source images were decomposed using contourlet transform. Different fusion rules such as local energy, weighted average and also region based contourlet contrast were adopted as the fusion measurement for coefficients combination in lowpass and high subpass subbands [2]. As Contourlet offers a much richer subband set of different directions and shapes, it can capture geometric structures in images more efficiently. Due to the non-subsampled process, frequency aliasing was caused, so that it creates larger change in the decomposition coefficient distribution by means of a small shift in the input image.

C.T.Kavitha et.al proposed an image fusion method based on Integer Wavelet Transform (IWT) and Neuro-Fuzzy. In IWT, no information is lossed through forward and inverse transform. Integer wavelet based on lifting scheme has many advantages such as high computational efficiency, less memory and accurate reconstruction [6]. Here,MRI and CT images of brain were decomposed using IWT. The attained IWT coefficients were fused by using thneuro-fuzzy rule. In this method Trimf membership function was used for fusing the coefficients.

Huimin Lu et.al projected maximum local energy method for image fusion in beyond wavelet transform domain. Beyond Wavelet is normally consists with wedgelet transform, bandelet transform, ridgelet transform, curvelet transform and contourlet transform[7]. Here,image fusion is performed by obtaining the coefficients of two different types of images through beyond wavelet transform. Low-frequency coefficient is selected by maximum local energy and high-frequency coefficients are obtained using sum modified Laplacian method. It is found that MLE-contourlet transform is better in processing CT/MRI images and from the subjective visual analysis, texture of fused image was outstanding.

Maruturi Haribabu et.al proposed a method for image fusion using wavelet transform with spatial frequency method for mild Alzheimer disease affected MRI and FDG-PET images of brain. Spatial frequency is used for measuring clearness of image blocks and completes activity level in an image [1]. The obtained DWT coefficients of MRI-PET intensity values are fused based on average and spatial frequency method. This method eliminated the influence of image imbalance and blurred phenomenon. This improves the clarity and provides more information for doctors.

Gaurav Bhatnagar et. al proposed a novel fusion work for multimodal medical images based on non-subsampled contourlet transform(NSCT) for two groups of CT/MRI and two groups of MR-T1/MR-T2 images of brain. Two fusion rules were introduced for combining low and high frequency coefficients based on phase congruency and directive contrast [3]. This method enhances the details of fused image also provide improved visual effect with much less information distortion. This work were also carried out for the images of persons affected with Alzheimer, subacute stroke and recurrent tumour by preserving crucial features exist in both original images but also improves color information. NSCT has large computational difficulty and constrained number of directions. Periyavattam Shanmugam Gomathi et.al also proposed a novel fusion work using nonsubsampled contourlet transform. Lowpass and highpass subbands are fused by using mean based and variance based fusion rules. The edges of image were preserved by this method as variance scheme is used[8]. Mehta et.al proposed a modified fusion method for multimodality medical images in NSCT. The fusion of high frequency coefficients were being done by guided filter for preserving edges and for fusion of low frequency coefficients by phase congruency as it is insensitive to illumination contrast[19]. The soft tissue and bony structure details were shown well in fused image by this method.

Anjali A.Pure et.al introduced a new image fusion method based on the integration of wavelet and fast discrete curvelet transform that describes the curved shapes of images and analyses feature of images better. MRI and CT images of brain were fused using this method. The coefficients were fused using the maximum selection rule that selects maximum valued pixel [9]. The fused image preserves the high spatial resolution and also high spectral quality, visually.

Liu Shuaiqi et.al introduces an image fusion algorithm based on Nonsubsampled Direction Filter Bank Dual-Tree Complex Wavelet Transform(NSDFB-DTCWT) for the complexity of fusion rules based on the multiscale multi-resolution transform for MRI and CT images of brain. [10]. The maximum of the absolute

value of all the frequency coefficients of decomposition is selected to construct the fusion image. The fusion strategy is simple and low computation cost. This method simplifies the complexity of calculation. This make effective use of the contour information of source images and preserve the details of source images.

Zhiping Xu proposed a new fusion algorithm for multi-modal medical images based on MLE in order to avoid the computational complexity, manual parameterization in multi-resolution analysis and long iteration time of Artificial Neural Network based fusion for MRI and CT images of brain. This method emphasis that the input images were decomposed into coarse and detailed layers in the MLE schema, and uses local energy and contrast fusion rules for the coefficient selection in different layers.The coarse layer was obtained by averaging local minima and maxima envelopes, whereas detailed layers could be regarded as the vibration between these envelopes[4]. However noise in input image affects the detailed layer.

Rajiv Singh et.al introduced a new multimodal medical image fusion using Daubechies Complex wavelet transform(DCxWT) at multiple levels based on multiresolution principle to avoid the problem of shift sensitivity, lack of phase information and poor directionality of real valued in wavelet transform. DCxWT is being approximately shift invariant and provides phase information. DCxWT preserves multiscale edges information and provides phase information that is highly immune to noise and contrast distortions [5]. The complex wavelet coefficients of source images are fused using maximum selection rule.

Zhaodong Liu et.al introduced multimodal medical image fusion approach based on compressive sensing. This method reduces the computation complexity and removes the problems of blocking artifacts and also the poor fidelity. A novel fusion rule based on average gradient and mutual information is used for fusing the high frequency information to obtain the salient regions and edges, and pulse coded neural networks(PCNN) fusion rule is used for fusing the low frequency coefficients [11]. PCNN model has the superiority of closer to the mode of human visual processing. CS based medical image fusion approach could significantly reduce the sampling and computational costs. It provides accurate diagnosis for doctors with the following properties of high stability, good flexibility and low time consumption. In this, skull based, semi-oval centre and brainstem of CT and MRI images of brain were used for fusion.

Yu Liu et. al proposes a general image fusion method for overcoming the inherent defects of multiscale transform (MST) and sparse representation (SR) based fusion methods by combining the advantages of MST and SR.Low-pass bands are merged with SR-based fusion approach and high-pass bands are fused with max absolute rule using absolute values of coefficients as activity level measurement[12]. By using this method the contrast of the fused image and computational efficiency can be improved.

Sneha Singh et.al introduces a new fusion method for CT and MR medical images which utilize both the features of Nonsubsampled Shearlet Transform (NSST) and spiking neural network. The NSST is the expansion of wavelet transform in multidimensional and multidirectional case which could combine the multiscale and direction analysis, separately [13]. Initially, images are decomposed by NSST into one low frequency subband and a series of high frequency coefficients. The regional energy is utilized for fusing the low frequency coefficients. Maximum selection rule is applied for choosing the coefficients that have highest activity measure. High frequency coefficients were also fused using a pulse coupled neural network model. It could also retain the edges and detail information from the source images.

S.S Chavan et.al proposed a novel feature based medical image fusion method using nonsubsampled rotated complex wavelet transform. The features of CT and MRI images extracted by this method were fused by average and maximum value selection rule [14]. This method provides better directional selectivity and edge related features could be well identified. The lesions location and stage of the disease could be well visualized in the fused image.

Meenu Manchanda et.al proposed a novel method for multimodal medical image fusion using fuzzy transform. Entropy and select maxima based fusion rules are used in this domain. Fuzzy transform has advantages of noise removing abilities, smoothing abilities and preserving true image edges[15]. It is shift invariant. It produces a simple and unique reconstruction of original image. By this method, the image is very much enhanced with clarity and better contrast[15]. The execution time is small.

Talari Tirupal et.al proposed a new method of medical image fusion based on Sugeno's Intuitionstic fuzzy sets. Here images are fuzzified. The optimum values for membership, nonmemebership and hesitation degree were calculated using exponential intuitionistic fuzzy entropy[16]. The edges of soft invisible tissue parts and shape of tumour were clearly visible and fused image is of high contrast.The uncertainities were removed.

YinFe et.al developed a new fusion mechanism for medical image fusion based on sparse representstion and decision map to overcome the problems in sparse representation. To retain more energy and edge information three decision maps such as structure information map,energy information map and structure and energy map were designed[17]. The computational speed was improved by adding the decision map to the normal sparse representation based method. The contrast of the image was being enhanced and the structure and energy information were more extracted by this method.

Yuanyuan Li et.al projected an image fusion framework for multimodal images based on NSCT and SR to elucidate contrast loss, difficulties within the selection of decomposing level, imperfection of representation ability in multi scale transforms and sparse representation methods. Using principal component analysis(PCA) dictionary learning, low frequency coefficients are fused through sparse representat Sum Modified-laplacian (SML) rule[18].This method gives better performance in structural similarity and fine details were preserved in fused image. The gray scale discontinuities were eliminated here.

JingmingXia et.al proposed a fusion method for multimodal medical image of brain by combining sparse representation and pulse coupling neural network. The fusion method based on sparse representation was being used to fuse low frequency subband, and PCNN simplified model to fuse t high frequency subband after the decomposition of source image using NSCT domain[20]. The resultant image preserves edge and detailed information of source image.

Conclusion

Medical image fusion helps the clinician to diagnose thedisease and as well as to detect the stage of disease. The survey clearly indicates that fusion of medical images leads to the diagnosis simpler and accurate. Even though, many image fusion algorithms have been used yet a significant image fusion method could be developed for the early stage detection of various diseases without any artifacts and preserving edges and shape. In this more papers of recently used medical image fusion algorithms were reviewed. So in future, detection and severity analysis of diseases with simple retrieval for real time medical applications could be done.

A Literature Study on Detecting Gall Bladder's Wall Thickness for Finding Early Abnormalities using Ultrasonic Images

G R Jothilakshmi[1], Rubina R[2], V Rajendran[3], Y Sreenivasa Varma[4]

[1]Associate Professor, [2]PG Scholar, [3]Professor and HOD, Department of Electronics and Communication Engineering, Vels Institute of Science Technology and Advanced Studies, Chennai, India; 4Medical Director, Varma Nursing Home and Research Centre, Chennai, India

ABSTRACT

This paper is regarding the literature study that has been conducted for the purpose of analyzing the ultrasonic images of gall bladder of the patients having abnormalities. In general most of the paper it has been found that in order to find abnormalities in gall bladder they consider the accumulation of stones. The study has been made clear that the densities, thickness of the stones, shape of the gall bladder are detected in most of the paper. Biological characteristics are given much importance than physical characteristics. A new approach is developed in this paper, that is gall bladder wall has to be considered in order to find the abnormality depending upon the thickness of the wall. Hence the Region of Interest is considered as wall of the gall bladder. The normal thickness of the wall of the gall bladder is less than 3mm. The pathogenesis in gall bladder is observed by the walls of the gall bladder as it gets enlarged in case if there is any abnormalities like presence of stones in the form of solid, liquid, or semi solid. Later on this physical characteristic like reflection coefficient, acoustic impedance and dynamic modulus are considered rather than biological characteristics and its mapped with the Region of Interest to find the changes and to analyse whether any intervention can be done in it.

Keywords: *Ultrasonic Image,Region of Interest(ROI), Thickness*

Introduction

In present scenario the most common biliary disease is the gall bladder problems. There are two types of Gallstones in gall bladder, the first one is the Cholesterol stone, the stone is said to be cholesterol stone if the content of cholesterol is more than 70%. The second is the Pigment stone, the stone is said to be pigment stone if the cholesterol content is less than 70%.The common problems in Gallstones are gallbladder inflammation, biliary pain, bile duct obstruction, and pancreatitis.

Email: jothi.se@velsuniv.ac.in

There is a marked geographic variation in gallstone prevalence (Figure 1). In developed countries, more than 85% of gallstones are cholesterol stones. About 20 million people in the USA (15% of the population) have gallstones ·An extraordinarily high prevalence was found in American Indians.In Europe, ultrasound studies revealed a prevalence of 9 - 21% and an incidence of 0.63/100 persons/year.

Literature Survey

The below given description is the literature study made on different papers related to the gall bladder problem. These papers have followed different methodologies and have compared all those methodology. Most of the approach describes the study of gall stones rather than gall bladder walls. Few of the papers of gall bladder are covered under literature survey and are described below:

Shivi Agnihotri et al [3] in 2009 used automated gallstones segmentation techniques for the purpose

of automatic detection of gall stones. In ultrasound images a noise called speckle noise is present; in order to suppress the noise a technique called anisotropic diffusion technique has been employed. The image is segmented by NCUT technique. Finally the segmented image of gallstones with the gall bladder is obtained using closed form matting technique.

Bertan Karhoda el at [4] in 2009 method plays a vital role in biomedical analysis edge detection. Initially to improve the quality of gall bladder image two methods were proposed. The main function of histogram equalization is it performs a transform function on the ultrasonic image in order to scatter the gray scale values. The second method is used which is considered as digital filtering method which results in approximate coefficients, diagonal, horizontal and vertical coefficients. The histogram equalization methods shows better CPU time performance

J Zang el at [5] in 2010 a new method was developed for the gall bladder modeling for laparoscopic cholecystectomy simulation. In this the gall bladder image is segmented from clinical CT images.A multilayer model has been constructed for this purpose. This model have produced satisfactory results in both perception and time performance

Marcin Ciecholewski el at [6] in 2010 two active contour models was proposed for extracting the shape of the image. The methods are Edge based and Region based models which make use of morphological methods for the purpose of extraction of Gall bladder shapes. This contour model was applied to ultrasonic images without lesions and also specific disease units like turns of gall bladder, polyps and gallstones. The Edge based model as produced a precise result of extraction of the shape of gall bladder rather than the morphological model which has also put an advantage.

Ravi K Smalal el at [9] in 2011 image a semi-automatic method is used. A technique for computing feature images in ultrasound that is based on the hessian computed within a multi-scale framework is used. Active contouring method is done followed by the gradient vector flow energy.The main advantage of the method is it is robust which is able to handle the challenges like speckle noise, missing of boundaries, presence of gallstones.

W Huang el at [10] in 2011 have constructed a deformable gall bladder. In this multi layer mass spring method is used. The inner layer of this method is constructed based on the surface mesh of the gall bladder. The parameters of the springs were configured based on the biological properties.

Weiying Xie el at [11] in 2013 a validation is done to detect the gall stones present in the gall bladder. The reason for the inducing the validation is due to the presence of speckle noise, luminous in-homogeneity and low contrast which fail to detect the gall stones. Hence for the purpose of segmentation to obtain precise result Level set method is used.

Weiying Xie el at [12] in 2014 used a method for validation for proper identification of gall stones. This identification is done using level set method. This method is robust to extract gall stones from the ultrasound images. This method is helpful to the clinicians as a decision support tool.

Neha Mehta el at [14] in 2015 a new method was developed for segmenting 3D gallbladder from CT images, which is nothing but a semi automatic method. To extract the gall bladder region a classifier called support vector machine is used. For the purpose of segmentation active contour and level set methods are employed for precise results. The main drawback in this method is it failed to extract the gall bladder region containing stones and inflammation with high density.

Wang Hong-yan el at [15] in 2015 used a lore based algorithm for the gall stone segmentation from the CT images. This method overcomes the drawback of the FCM algorithm. In this a penalty term is used to enlarge the range of specified class and achieve higher segmentation. This method is more efficient than the FCM algorithm.

Jing Lian el at [16] in 2017 uses a novel method to segment the gall bladder and gall stones in ultrasound images. In this different algorithms are used. Otsu algorithm is used to reduce the speckle noise and also enhance the image contrast. Second, global morphology filtering is used for acquiring a fine gall bladder region. PA-PCNN is employed to obtain high intensity regions. This method is potential to assist physicians for diagnosing the gall bladder disease rapidly and effectively

These are the various papers that have been studied for making a new intervention in early detection of gallbladder. Comparing all the above papers it's clearly identified that gall bladder wall thickness is not considered to study the abnormality. Hence an algorithm is proposed for the purpose of identifying the abnormality in wall of gall bladder.

G.R.Jothilakshmi et al [18] in 2018 discussed a novel method to calculate the size of microcalcification, the physical characteristics were calculated, and 3D projection of the binned image was obtained and the preferred bin was expressed in its size and using the 3D projection the size of microcalcification was calculated. G.R.Jothilakshmi et al [17] in 2018 proposed a technique to segment the RoI in sonomammogram image, the peaks of 3D binned images were calculated in order to identify microcalcifications

Proposed Work

The developed smart cane with receiver band is tested in Real time. The subject is artificially made blind and deaf and asked to notify the object direction by using the smart cane.

This paper proposes design for smart walking cane that supports the people with blind as well as deaf people which detects any kind of obstacles including water, fire. Since ultrasound sensor detects 270 degree obstacles from any direction can be detected by the subject. The objective is to provide an aid to visually impaired and deaf people which will assist them everywhere they go. This system is more reliable and efficient than other proposed system.

A real time ultra sonic image of gall bladder is considered. These images are obtained by passing ultra sound signal through abdominal area. Ultrasounds are sound waves with higher frequencies which are higher than the upper audible limit of human hearing. Below show is the flowchart for the proposed work

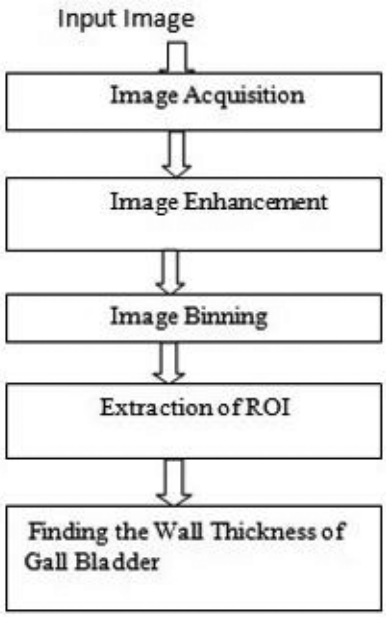

Fig. 1: Flow chart of the proposed work

Image Acquisition: Ultrasonic image is obtained from database. It contains normal and abnormal images. Each image is of varying pixel ranges. The images which are collected is of either defect or normal. The place where abnormalities are indentified is known as the Region of Interest (ROI). Hence the image is of varying pixel it is necessary to standardize the pixel value, thus we resize the image to 500*500.

Image Enhancement: Raw ultrasonic image are complex to understand hence, the image are subjected to enhancement. So Order statistic filtering is used to eliminate the blurring effect and speckle noise.

Image Binning: The whole image is binned initially with x rows and y columns. Each bin represents its own matrix. The bin which contains the RoI is identified and again subjected to further binning with x1 rows and y1 columns. Each bin has its own matrix. In our work we have binned the image with each block of 100*100 and hence there is 25 blocks of 5 rows and 5 columns

Finding ROI using Reflection Coefficient: From the proposed work we consider the gall bladder wall as the Region of interest as it is necessary to find the wall thickness. Hence the Region of Interest is considered as the gall bladder wall region. The region of interest will be identified using the calculation of reflection coefficient. Any image can be formed based on multiplication of illumination and reflectance components. So based on the equation (1), the reflection coefficient matrix could be obtained for the required bin. By fixing range of reflection coefficient, ROI is segmented out.

$$f(x,y) = i(x,y)\, r(x,y)$$

i(x,y) = illumination component, r(x,y)= reflectance components

Finding the Thickness

Thickness can be determined by using the below formula

$$\text{Thickness} = 2*\text{mean}(d) \qquad (1)$$

Where d is the Euclidean distance which is computed automatically using a Matlab function.

Conclusion

From the above papers it is common that the shape of the gallbladder is extracted by segmenting using

various contouring and morphological methods. Most of the paper they have focused on retaining the biological characteristics to study any abnormalities in gall bladder Hence a new approach has to be developed for finding the early abnormality in gall bladder. This is done by considering the gall bladder wall as region of interest to find any abnormalities basis on the wall thickening. Based on the wall thickening images abnormalities can be classified.

Skin Reflectance Based Diagnosis and Monitoring of Thyroid Diseases

J.Sofia Bobby[1], Ralan Barathi E[2], Srinithi V[2], Salome G[2], Jayasurya A[2]

[1]Associate Professor, Department of Biomedical Engineering, [2]Students, Jerusalem College of Engineering, Chennai, India

ABSTRACT

About 42 million people suffer from thyroid diseases in India. The thyroid gland is a vital hormone gland which plays a major role in the metabolism, growth and development of the human body. It helps to regulate many body functions by constantly releasing a steady amount of thyroid hormones into the blood stream. If too much hormones is produced, it is called hyperthyroidism, if less amount is produced, it is called hypothyroidism. If these diseases are left untreated, the symptoms become severe therefore it is crucial to diagnose it at earliest. In this paper, a non invasive method is proposed to diagnose thyroid diseases through skin reflectance as well as to monitor the physiological parameters. Laser diode is used to measure the skin reflectance, as thyroid hormone causes changes in the skin. The light is emitted on to skin surface and the reflected light is measured by the infrared detectors. Based on the values from the detectors, it is classified as hyperthyroidism, hypothyroidism or euthyroidism. It has the advantage of being non-invasive compared to the invasive blood test, it can also be used to monitor the patient continuously in duration of treatment for every six weeks using Zigbee module. The proposed system is compact, cost effective, and easy to use at home environment

Keywords: *Hyperthyroidism, Hypothyroidism, Zigbee, Skin Reflectance.*

Introduction

The thyroid gland is an endocrine gland in the neck. It makes two hormones that are secreted into the blood they are thyroxin (T4) and triiodothyronine (T3). Thyroid disorders are very common and tend mainly to occur in women, it may also occur in men, teenagers, children and babies, too. A thyroid disease is a medical condition that affects the function of the thyroid gland and it is due to the abnormal production of thyroid hormone. There are five general types of thyroid disease, hypothyroidism-not having enough free thyroid hormones, hyperthyroidism-having too much free thyroid hormones, goiter-enlargement of the thyroid gland, tumours-which can be benign or cancerous, abnormal thyroid function test-without any clinical symptoms [1]. Among these hypothyroidism and hyperthyroidism are the two major thyroid diseases. Hypothyroidism results from insufficient secretion of thyroid hormones. It can be due to a variety of abnormalities and can be subdivided into primary, secondary and tertiary hypothyroidism. Primary is due to a disease of the thyroid gland itself, secondary is due to a disease of the pituitary and tertiary is due to a disease of the hypothalamus**.** Hyperthyroidism refers to over activity of the thyroid gland, with resultant excessive secretion of thyroid hormones and accelerated metabolism in the periphery. [2] Thyroid hormone has many roles in body metabolism. These include its involvement in the embryonic development of mammalian skin, the initiation and maintenance of hair growth, determination of epidermal thickness, and secretion of sebum. These skin alterations depend on the type of thyroid disease that occurs. [3] The skin characteristics associated with thyroid hormone are classic. The name “myxedema” refers to the associated skin condition caused by increased glycosaminoglycan deposition in the skin.

Corresponding Author:

Associate Professor,
Department of Biomedical Engineering,
Jerusalem college of Engineering, Chennai, India
Email: send2sofia@yahoo.co.in

Generalized myxedema is still the classic cutaneous sign of hypothyroidism. It is caused by deposition of dermal acid mucopolysaccharides, notably hyaluronic acid. Some associated symptoms of hyperthyroidism are smooth, soft, thin, warm, moist skin, fine, soft hair, plummer's nails, hyperhydrosis, telangiectasia, pruritus pretibial myxedema, thyroid acropachy.

Overview of Thyroid: The objective of the project is to design a system which is capable of determining the thyroid status such as euthyroid, hyperthyroid or hypothyroid. The system developed can also help in continuous monitoring of the temperature and heart rate through Zigbee module.

Need of this Project: On June 5, 2014, delegates at a national workshop on the advanced management of thyroid disorders held in Chennai, India, heard that 42 million people in India have thyroid disorders. Hypothyroidism, specifically, is the most common of thyroid disorders in India, affecting one in ten adults. After the diagnosis of thyroid, medications are administered by the physician. The patient need to be tested frequently every six weeks to monitor, which can be uncomfortable.

Hardware Design

A. ARDUINO UNO: It is a microcontroller board based on the ATmega328P. It has 14 digital input/ output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz quartz crystal, a USB connection, a power jack and a reset button

B. Laser Diode: It is a semiconductor device similar to a light emitting diode (LED). It produces a narrow beam of laser light in which all the light waves have similar wavelengths. It emits a light of wavelength 650nm.

C. Temperature Sensor: The LM35 has an output voltage that is proportional to the Celsius temperature. The LM35 temperature sensor provides an output of 10mV per degree Celsius. It can be powered by any DC voltage in the range 4 – 30v. The operating range is –55°C to +150°c.

D. Heart rate sensor: The heartbeat sensor is based on the principle of photo phlethysmography. It measures the change in volume of blood through any organ of the body which causes a change in the light intensity through that organ (a vascular region).

E. Liquid crystal display: A 16x2 LCD means it can display 16 characters per line and there are 2 such lines. In this LCD each character is displayed in 5x7 pixel matrix. Supply voltage; 5V (4.7V – 5.3V).

f. Zigbee module: ZigBee is a wireless technology developed as an open global standard to address the unique needs of low-cost, low-power wireless M2M networks. The ZigBee standard operates on the IEEE 802.15.4 physical radio specification and operates in unlicensed bands including 2.4 GHz, 900 MHz and 868 MHz.

Methodology

The hardware design consists of Laser diode, temperature sensor, heart rate sensor, Arduino UNO, Zigbee Module. It is based in a modular approach. [4] The hardware design consists of following modules: sensor module, detection module and base station module

Circuit Description:

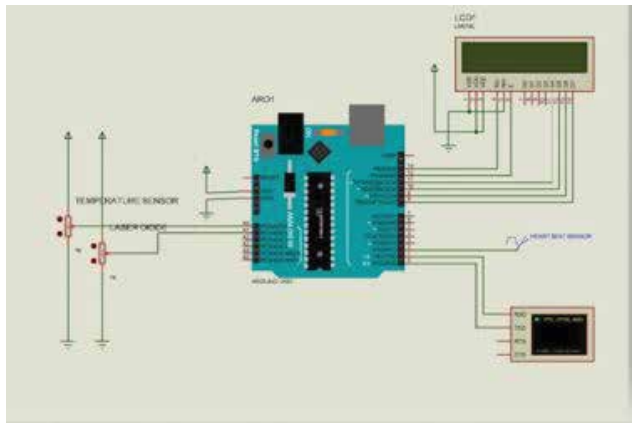

Fig. 1: Circuit Diagram

The Arduino UNO Board is connected to the power supply of 12V. The temperature sensor LM35 is connected to A1 analog pin of the Arduino board through a resistor of value 1k to restrict the flow of current to the sensor.The laser diodes l1,l2,l3 of 650nm each are given to the pins Ao,A2,A3 respectively of the Arduino board. The heart rate sensor is given to the digital pin 2.The Tx of the Zigbee module is connected to the digital pin 0 while the Rz of Zigbee is connected to the digital pin 1 of the Arduino board.The LCD input is given as series of connections from digital pins 8 to 13.The LCD has 8 digital I/O pins.The pins rs, en, d4, d5, d6, d7 are connected to the digital pins 8,9,10,11,12,13 in the Arduino board. Vss and rw are grounded. Vcc and Gnd pins are commonly connected to all the sensors for power supply and to ground the circuit respectively.

Experiement Analysis

In our work it was identified by the skin surface reflectance of the emitted laser diode. Laser Diode and six photo diodes were arranged in the cuff, in order to prevent the escape of the reflected radiation. Depending on the characteristics of skin and tissue around the absorption and reflection vary. [5,6,7]The output is displayed by the Liquid crystal Display under programming of the Arduino UNO. Laser diode is used to emit the light and the reflected light absorption is detected by the infrared detectors, its particular value is displayed in LCD based on the count value the classification is done. As well as the temperature value, heart rate value is displayed in LCD

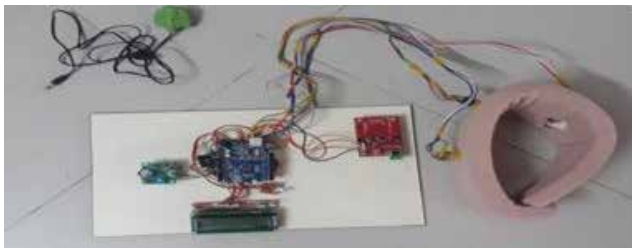

Fig. 2: Proto type of proposed system

Results and Discussions

The skin reflectance, temperature and heart rate values from euthyroid and hypothyroid subjects were observed and analysed. The following is the tabulation of the same.

Table 1: Readings from Euthyroid Subjects

S. No.	Subject ID	Age (Yrs)	Laser diode (Neck)			Temperature (°C)	Heart Rate (Beats/Min)
			L1 Cd/m2	L2 Cd/m2	L3 Cd/m2		
1.	EU1000	24/M	2	2	3	32	76

Fig. 3: Reading being taken from Subject

The wireless transmission of the readings to the computer is done through Zigbee transmitter and receiver. It is also displayed in the serial monitor of the Arduino software and Liquid crystal display(LCD). [8,9,10]Based on the study, it was observed that the euthyroid subjects showed readings ranging from 1-5

and hypothyroid subjects showed readings in the range 6-9. The temperature and heart rate readings were also taken. This would greatly help to monitor continuously the thyroid disease before and after treatment.[11,12,13].

Fig. 4: Reading through Zigbee Module on Screen

Conclusion

The readings can be further used to classify between hypothyroid and hyperthyroid subjects.This can be used at home environment by subjects having thyroid from time to time to check the thyroid status before and after treatment.The collective data over a period of time is recorded in the Zigbee software which can be viewed for analysis later

Ethical Clearance: The Study is based on the Digital Sensor and Signal Processing and does not require Ethical Clearance.

Wound Healing Properties and Cytotoxicity of Gold Nanoparticles on MDCK Cell Lines (in Vitro Study)

Najwa Kahtan Aljbory[1], Nissren Jalal Mohammed[1], Rana A. Ghaleb[3]

[1]Dept. of Pharmacolgy, College of Medicine, University of Babylon, Babylon, Iraq; [2]Clinical Pharmacist, Ministry of Health, Babylon, Iraq; [3]Dept. of Anatomy and Histology, College of Medicine, University of Babylon, Babylon, Iraq

ABSTRACT

The research study was aimed to investigate the effect of Gold nanoparticles(AuNPs) at different concentration on the wound healing of Madin-Darby Canine Kidney epithelial normal cell line in comparison with control group. Gold nanoparticles were prepared in chemicals methods with diameter of 23-26nm. The cytotoxic effect of gold nanoparticles was tested on the (MDCK) cells. The AuNP concentrations of (500, 250, 125, 62.5, 32.25)µg/ml inhibit the proliferation of MDCK cells. The enhancement concentration was chosen for this research study. The wound was made on Madin-Darby Canine Kidney epithelial (MDCK) cell lines at diameter of 250 pixel. The wound size was measured at different time every 3hours starting from (12afternoon, 3h, 6h, 9h, 12midnight). The results observed there was a significant decrease ($p \leq 0.001$) in the size of wound at the concentration of Au NPs (15.6, 7.8)µg/ml respectively in comparison with control group.

Keywords: *MDCK cells _ Wound _Healing _ AuNPs_ Cytotoxicity*

Introduction

Wound healing is defined as a process which has three main stages: secretion of pro-inflammatory cytokines, migration of keratinocytes, fibroblasts and endothelial cells that led to final stages and initiate the tissue remodeling [(1)(2)]. The treatment of wound remains as a challenge due to increases in obesity and diabetes and an aging population[(3)]. Collagen synthesis is the main component during the remodeling of tissue in wound healing phase, at which an extracellular matrix (ECM) is created. The synthesis of collagen starts on the rough endoplasmic reticulum (RER) in addition to the formation of three pro-α-chains, which are then hydroxylated, and glycosylated in the Golgi[(4)]. The successful of classical means of drug delivery system was obtained by using nanotechnology in biomedical application and pharmaceutical science. Nano-pharmaceuticals enhances drug delivery in specific tissues as drug carriers in a variety of dosage forms[(5)]. Au NPs has more broad-spectrum against both Gram negative and Gram positive bacteria such as antibiotic-resistant bacteria, eukaryotic microorganisms, and other viruses due to their tiny size that can penetrate the microbial membrane and thus results in the loss of integrity for the membrane of microorganisms[(6)]. Au NPs have a potentially via the anti-inflammatory and antioxidation that promote wound healing [(7)]. The cytotoxic effect of AuNPs because to their small physical dimensions and surface chemistry. AuNPs acts as a category to the size-dependent toxicity([8]). Au NPs have antioxidative effects, this can helpful in the treatment of wound. From this point our study aimed to study the cytotoxic and accelerating wound effect of AuNPs on MDCK cells.

Materials and Method

Gold Nanoparticles (Au NPs) Preparation: The Gold nanoparticles were synthesized as by chemical procedure as a liquid solution known as Turkevich method. It used to obtain spherical Gold nanoparticles. Scanning Electron Microscope (SEM) was used to test nanoparticles. A stock solutions from Chloroauric

acid(2%) and Trisodium citrate dehydrate(1%) were used to prepare the Gold Nano particles([9]).

Cell Culture: Madin-Darby Canine Kidney epithelial (MDCK) cell lines (model for mammalian epithelial tissue) were used as experimental design for study the effect of AuNPs. It grows as a monolayer in a tissue culture flasks (T-flask 25cm^2). The media was RPMI-1640 supplemented with 1% antibiotics (penicillin/ streptomycin) and 5% of fetal bovine serum. The cells were incubated at 37C° for 24h[(10)].

Crystal violet assay: Madin-Darby Canine Kidney epithelial (MDCK) cell lines cultured with a concentration of 5x10^5 cells/ml in 96 well plates. A two hundred µl of cells seeded in each well and incubated at 37°C. Fixation of cells were achieved at 10% formalin at room temperature, after washing of cells for three times with PBS. Fixation solution was added to the cells for 15 minutes. The fixation solution was removed. One hundred µl of aqueous crystal violet solution for 30 minutes was added. Spectrophotometer at a wavelength 540 nm was used to measure Optical density. The results showed after been normalized to the control([11]).

Wound Scratch In Vitro: Wound was created by using a sterile micropipette tip on the middle position of plated cells[(12)].

Measurement of Wound: The morphological change in the wound area was captured using a digital camera (Sony). During capturing the plate was fixed under Inverted microscope and the area of wound were photographed by digital camera on 0 hours, 3h, 6h, 9h and 12 hours respectively. Wound area was measured by using "Image J" software [(13)].

Statistical Analysis: Statistical analyses were performed by using Sigma Plot version 12 software. The student T test was applied for descriptive statistical documentation. We considered values of $p<0.05$ and $p<0.01$ to be significant**.**

Results and Discussion

The Effect of Gold Nanoparticles (Au NPS) on Cells Proliferation: Cells proliferation was measured after Incubation period for 24h at 37C°at concentration of Au NPS (500, 250, 125, 62.5, 31.25, 15.5 and 7.8)µg/ ml. The results showed there was a significant decrease in the viability of cells percent ($p\leq0.01$) for AuNPs at higher concentration ((500, 250, 125, 62.5 and 31.25) µg/ml. While the low concentration (15.6 and 7.8)µg/ ml showed there was an increase in cells viability as showed in Figure 1.

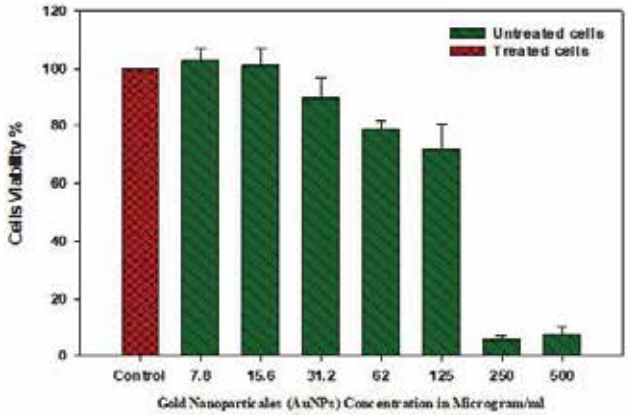

Figure 1: Normalized cells viability percentage of MDCK normal cell line at different concentrations of Au NPs after incubation for 24 hours

The cytotoxic effect Au NPs on cells may be due to the higher level concentration of Au NPS which can interact with other component in the growth media. Cellular media contains vitamins, serum proteins and antibiotics and other chemicals. The high concentration of gold nanoparticals will change their properties such as size, surface chemistry, shape, aggregation state, and surface charge[(14)(8)]. AuNPs at high concentration induce damage to cell membrane, plasma membrane, cellular metabolic activity, mitochondrial activity and a LDH leakage that led to the damage of cells[(15)]. Another reason may be due to the oxidative stress as a results of increasing reactive oxygen species(ROS) in mitochondria which is consider toxic to the cells and cause damage to cellular molecules such as DNA, lipids and proteins[(16)]. The cytotoxic mechanism of Au NPs include damage of normal morphology resulting in rounded cells, cell cycle arrest at G1 phase, increased expression levels of proapoptotic genes caspase-9 and caspase-3 and generation of ROS[(17)]. Au NPs induce change in the structure of cellular cytoskeleton network due to high concentration which effect on cells morphology and cause change in energy metabolism, cell adhesion and signal transduction to the cells [(18)]. It was shown that Au NPs have many cytotoxic interaction with cell membrane, mitochondria, proliferation related gene and nucleus. Previous study has shown toxicity of Au NPs to be dose dependent, area and surface charge.

The surface charge is one of the major reasons that lead to increase Au NPs toxicity. The authors found that interaction of a positive charge on the ammonium species with a negative charge on the lipid bilayer of cell membranes can cause cytotoxic effect to cells [19].

The Effect of Gold Nanoparticles (Au NPS) on Wound Healing: The results showed that low concentration of gold nanoparticles (7.8,15.6)µg/ml showed a significant decrease in the wound($p \leq 0.001$) in comparison with control groups as observed in Figure 2. The low concentration of Au NPs (7.8) µg/ml showed a highly less in wound in comparison with the (15.6) µg/ml of Au NPs as observed in Figure 3A,3B,3C in comparison with control groups.

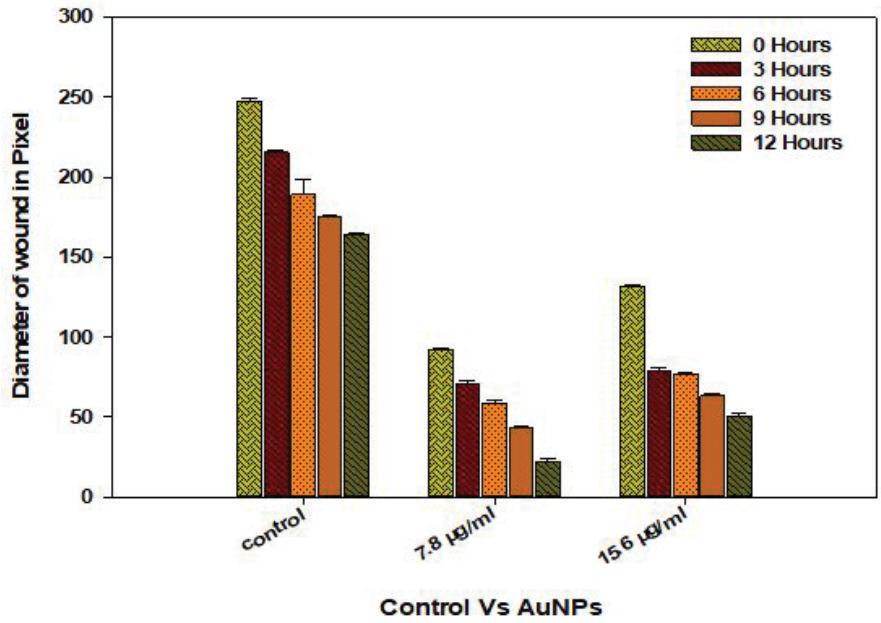

Figure 2: The Effect of Au NPs on wound healing of MDCK Normal cell line after incubation for 12 hours

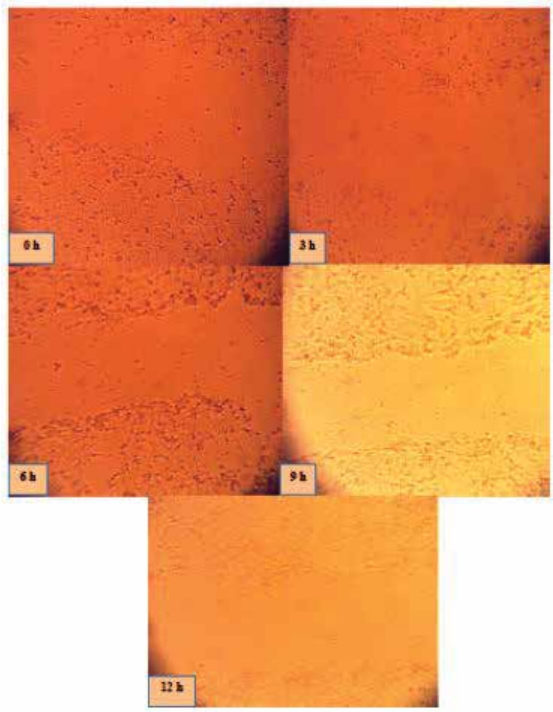

Figure 3 (A): The wound healing of MDCK Normal cells line (control groups) after incubation for 12 h.

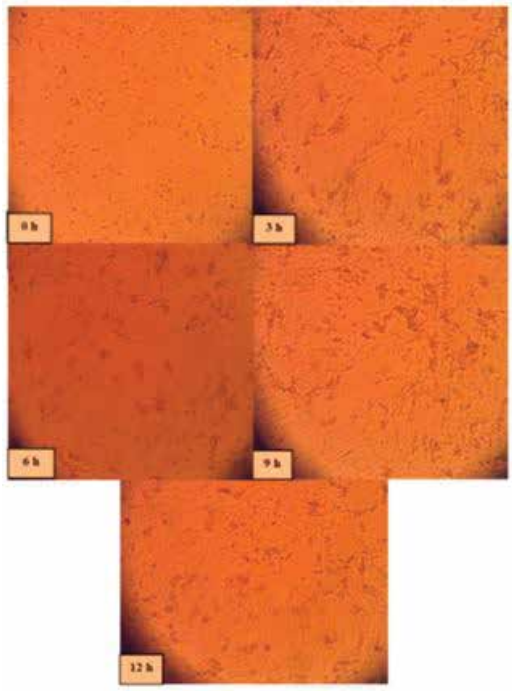

Figure 3 (B): The Effect of 7.8 µg/ml of Au NPs on wound healing of MDCK Normal cell line after incubation for 12 h.

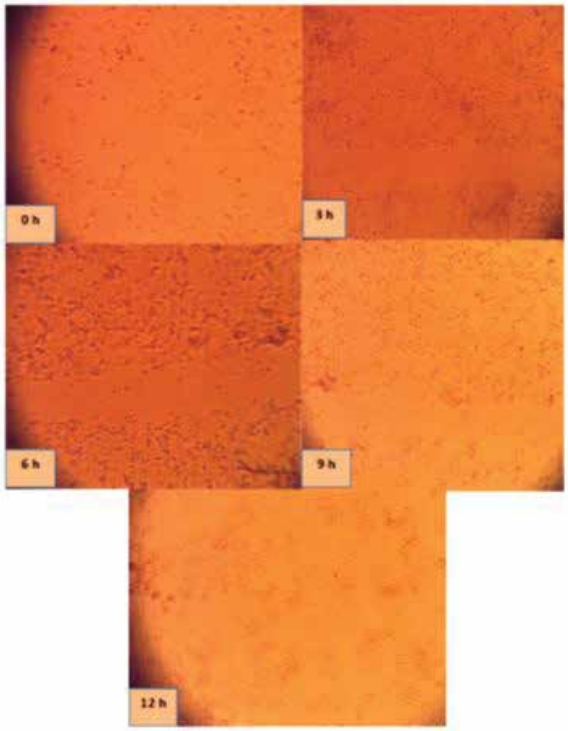

Figure 3 (C): The Effect of 15.6 µg/ml of Au NPs on wound healing of MDCK Normal cell line after incubation for 12h.

The response of MDCK cells line to low conce tration of Au NPs was observed in this research study. It increases the wound healing for the two lower concentration in comparison with control groups. These results are agreement with Lau P*, et al* 2017 [20]. This may be due to enhance epithelialization and collagen deposition. Another reasons may be due to the stabilize shape and size of Au NPs at low concentration starting from (1-15µg/ml) and small diameter which promote the cells proliferation and differentiation[21]. While other study suggested that the low concentration reduce the charge surface when it suspended in culture media due to protein absorption on the surface of Au NPs[22]. The low concentration of NPs was able to enhance the gene expression of cells [23]. It has a positive effect on CAR which is transmembrane protein. CAR is characterized in epithelial cells and it is important in tight junction and regulates cells proliferation. Au NPs can interact with p-38 receptor protein which is found in CAR. The interaction of Au Nps is a trigger point for signal pathway that stimulate the proteins in cells membrane and starting point for cells differentiation to form fibroblast. While some author found that Au NPs inhibits the formation of extracellular matrix and cells migration in cancer cells by affecting adhesion of cells [24][25].

The effect of Au NPs on cells proliferation is still understood. The stabilizing aqueous of Au NPs is an important to prevent agglomeration and enhancement of wound healing in cells. The serum in culture media also act as stabilizing agent and reduce the cytotoxic effect of gold nanoparticales [26].

Conclusion

Gold nanoparticles has widely used in biomedical applications. In this study our finding is the effect of Au NPs was a dose dependent. It has a cytotoxic effect at high concentration and proliferative effect at low concentration. The low concentration enhanced wound healing after 12h incubation period. These results can be used for more research study to improve the wound healing In Vitro and In Vivo.

Spinal Anesthesia for Knee Arthroscopy without Fluid Preloading

Isra Hamed Saeed[1]

[1]*Department of Anesthesia, Al-Shaheed Ghazi Al-Hariri Hospital, Baghdad Medical City, Baghdad, Iraq*

ABSTRACT

Objective: Investigate that spinal anesthesia can be given safely without fluid preloading

Method: 30 patients were given spinal anesthesia, all of them were class I ASA (American Society of Anesthesiologists), and a comparison was done between the blood pressure before and after block for each patient. all of them were class I ASA, age 20-40 years, body weight 70 ± 6.8 kg.

Results: At baseline mean systolic blood pressure (SBP) was 135 mm Hg, after 6 minutes blood pressure reduced by 18.5%, after that the reduction of SBP did not decrease below 30% up to 30 minutes. Immediately after block the increase in the blood pressure could be due to tension and anxiety, then decreased in the first 10 minutes, but never below our standard value which was 30% decrease from the baseline (below 100 mm Hg).

Conclusions: spinal anesthesia can be given safely without fluid preloading, if special technical steps are considered.

Keywords: *spinal anesthesia, fluid preloading, knee arthroscopy, hypotension, blood pressure*

Introduction

Spinal anesthesia, performed easily with low dose local anesthetic agent is used for lower extremity surgery, because of rapid onset of action[1]. It provides early ambulation with effective postoperative analgesia and reduced nausea and vomiting[2]. On the other hand, hypotension after spinal anesthesia remains a major clinical problem. Fluid preloading regimens with crystalloid or colloid solution, vasopressor agent, physical methods to increase venous return by elevating the patient ' s legs or head down position are the methods used in combination or separately for the management of hypotension various success. The optimal forms of hypotension management is contradictory[3, 4]. Each method has its advantages: ephedrine, is the traditional first choice of vasopressor, administered intravenously in a dose of 3-6 mg, the effect of this drug is more β-adrenergic agonist than α-agonist and produce an increase in heart rate rather than an increase in peripheral resistance. This is can be disadvantageous in patient with heart disease[5, 6].

Volume expansion with crystalloid (500-1000 ml), large amounts can lead to tissue edema which can impair oxygen transport and delay tissue healing. Also it can increase incidence of urinary retention[1]. Postoperative urinary retention is associated with risk of over distension and inability to void urine 6-12 hours after surgical procedure or experiencing discomfort because of being unable to void[7]. Although smaller volumes of colloid solution decrease these problems, some of them could be antigenic[4]. The current work aimed to find a method to decrease hypotension after spinal block by physical and technical measures avoiding the use of fluid preloading

Method

30 patients underwent knee arthroscopy, all of them were class I ASA, age 20-40 years, body weight 70 ± 6.8 kg. Starting blood pressure was 110-140/60-80 mmHg. The patients were not premeditated, monitored by lead II ECG, pulse oximetry and noninvasive blood pressure

Email: israhamed2010@yahoo.com

by Eagle 1000 (Hellige) monitor. Two I.V. cannula G22 inserted on the dorsum of the hands, Ringer ' s solution and ephedrine ampoules were ready to be used immediately if hypotension occurred after spinal block. Spinal block was done by lumber puncture for the patients in sitting position at the level L3-L4 intervertebral space with spinal needle Quincke G22. 3ml (15mg) of 0.5% hyperbaric bupivacain was injected slowly. Then return the patient to head up position with 40-45 º angle. Starting intravenous fluid infusion with the starting of the puncture. After positioning we started monitoring blood pressure immediately and then every 3min. for the first 10min., then 5min. for the last 20 min. Hypotension considered by 30% below the base line (preblock) value, which is about 100 mm Hg in our study(9).

Result

Mean age was 30 ± 8 years, with mean weight of 70 ± 6.8 kg, as illustrated in table 1.

Immediately after block the increase in the blood pressure could be due to tension and anxiety, then decreased in the first 10 minutes, but never below our standard value which was 30% decrease from the baseline (below 100 mm Hg), as illustrated in table 2.

Table 1: Patient's characteristics

Variables	Value
Number	30
Age (years), mean ± SD	30 ± 8
Weight (kg), mean ± SD	70 ± 6.8
Systolic blood pressure (mmHg), mean ± SD	125 ± 10

Table 2: Changes in systolic blood pressure

Time period (minutes)	Systolic blood pressure	% Reduction
Pre-puncture	135	-
Immediately after puncture	150	-
3 minutes	125	7.4%
6 minutes	110	18.5%
9 minutes	116	14.1%
15 minutes	122	9.6%
20 minutes	127	5.9%
25 minutes	133	1.5%
30 minutes	130	3.7%

Discussion

Our objective in this study was to find a method to decrease hypotension after spinal block by physical and technical measures avoiding the use of fluid preloading. Rout et.al. failed to confirm the advantage of crystalloid fluid infusion from the prevention of hypotension[8]. In addition to that, the preoperative hydration is time dependent and can provoke hypothermia should the solutes be not warm enough[9]. So to prevent hypotension by using physical and technical methods, to avoid the disadvantages of the usual methods.

Level of the block: it is clear that low spinal block (i.e. T10 or lower) carries different physiologic impact than does a block performed to produce high block, because high block causes more hypotension due to dilatation of splanchnic vessels and decrease of catecholamine release by medulla[10]. The cardiac sympathetic out flow emerges from C5-T5 level with the main supply to the ventricles from T1-T4[11].

Conclusion

Spinal anesthesia can be given safely without fluid preloading.

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Department of anesthesia, Al-Shaheed Ghazi Al-Hariri hospital.

Femoral Nerve Block and Adductor Canal Block for Postoperative Analgesia of Total Knee Replacement, Comparative Study

Isra Hamed Saeed[1], Mohammed Asi Jabbar[1]

[1]Department of Anesthesia, Al-Shaheed Ghazi Al-Hariri Hospital , Baghdad Medical City, Baghdad, Iraq

ABSTRACT

Objective: assessment of femoral nerve block (FNB) and adductor canal block (ACB) for postoperative analgesia of total knee replacement

Method: Forty patients aged from 50 to 68 years old were involved in this study, all the patients received general anesthesia. After completion of surgery and fully awakening from the anesthesia, the patients were randomly divided into two equal groups (20 patients in each group). First group received FNB, and second group received ACB.

Results: There was no significant no age, gender, and BMI between both groups, at 1, 6, 12, and 18 hours the Quadriceps muscle weakness was significantly higher in FNB group.

Conclusions: ACB provides comparable analgesic efficacy and facilitates earlier mobilization by sparing quadriceps strength compared with FNB.

Keywords: *knee replacement, femoral nerve block, adductor canal block, analgesia, Quadriceps muscle weakness*

Introduction

Total knee replacement (TKR) involves extensive bone and soft tissue manipulation that causes severe pain in the early postoperative period[1, 2]. Appropriate pain management after TKR allows for faster recovery, reduces the risk of postoperative complications, and improves patient satisfaction. The recent pain management after TKR includes oral analgesics, periarticular injection, peripheral nerve blocks (PNBs), and intravenous patient- controlled analgesia[3, 4]. PNBs are considered to be an essential part of the current multimodal pain management protocol following TKR[5]. FNB has good analgesic effect, but it leads to significant decrease in quadriceps muscle strength, resulting in delayed mobilization, which is associated with risk of falling[6-8]. So, a good alternative for FNB is ACB because it is a pure sensory block with minimal motor involvement[9].

Under ultrasound guidance, a high frequency linear transducer up was placed transverse to the longitudinal axis of extremity at the mid-thigh, approximately midway along the distance between the iliac spine and the patella. Next, the femoral artery was found underneath the sartorius muscle with the vein at the short axis. At this level, the SN, which was shown as a hyperechoic structure, was placed lateral to the artery in the adductor canal, 15 ml of 0.5% bupivacaine was infiltrated around the SN[10, 11].

Under ultrasound guide, pulsation of femoral artery was identified at the level of inguinal crease. Immediately lateral to the vessel, and deep to the fascia iliaca is the femoral nerve, which is hyperechoic triangular or oval in shape, underneath the fascia iliaca. 15 ml of bupivacaine was infiltrated around the femoral nerve[12].

Method

Forty patients aged from 50 to 68 years old were involved in this study. Class I or class II according to American Society of Anesthesiologists (ASA I, II) from either sex were scheduled for elective TKR at Al-Shaheed Gazee al- Hareery hospital over a period of one year. Any patient with hypersensitivity to local anesthetics, infection around the area of injection, bleeding disorders and peripheral neuropathy were excluded from the study.

All the patients received general anesthesia. After completion of surgery and fully awakening from the anesthesia, the patients were randomly divided into two equal groups (20 patients in each group).

First group received FNB, and second group received ACB. The nerve blocks were performed using Sonoflex Stim cannula from Pajunk (21G x 100mm), and ultrasound (eZono3000). All the patients received 15 ml of 0.5% bupivacaine under real time ultrasound guide. Successful nerve block was defined as complete loss of pinprick sensation in the region that is supplied by the nerves along with adequate motor block 30 minutes after the injection. The patients were monitored for heart rate, blood pressure and oxygen saturation. Assessment of analgesia and quadriceps strength and ambulation on the first postoperative day, for analgesic assessment was according to opioid consumption.

Statistical Analysis: Discrete variables presented using there number and percentage, chi square test used to analyze the discrete variable (or Fisher exact test when chi square not valid; due to low sample size <20 and if 2 or more with expected frequency less than 5). Two samples t test used to analyze the differences in means between two groups (if both follow normal distribution with no significant outlier). GraphPad Prism version 8.0.0 for Windows, GraphPad Software, San Diego, California USA, software package used to make the statistical analysis, p value considered when appropriate to be significant if less than 0.05.

Result

There was no significant no age, gender, and BMI between both groups as illustrated in table 1.

Table 1: demographic data of patients

Variables	FNB	ACB	p-value
Number	20	20	-
Age (years), mean ± SD	56 ± 5	60 ± 10	0.118
Gender, n (%)			0.525
Female	8 (40%)	10 (50%)	
Male	12 (60%)	10 (50%)	
BMI (kg/m^2), mean ± SD	27 ± 4	30 ± 3	0.011

At 1, 6, 12, and 18 hours the Quadriceps muscle weakness was significantly higher in FNB group as illustrated in table 2.

Table 2: Quadriceps muscle weakness in hours postoperatively

Time (hr.) post-op	FNB (n=20)	ACB (n=20)	p-value
1	18 (90%)	4 (20%)	<0.001
6	12 (60%)	1 (5%)	<0.001
12	10 (50%)	0 (0%)	<0.001
18	6 (30%)	0 (0%)	0.020
24	2 (10%)	0 (0%)	0.487

Table 3: Time for first analgesic requirement

Time (hr.) post-op	FNB (n=20)	ACB (n=20)	p-value
1	0 (0%)	0 (0%)	1.0
6	2 (10%)	2 (10%)	1.0
12	4 (20%)	5 (25%)	0.999
18	6 (30%)	8 (40%)	0.741
24	10 (50%)	10 (50%)	1.0

Discussion

For TKR, pain management and early ambulation is important. Given the excellent analgesic effect, FNB is a commonly used as a part of TKR pain control, however, it may reduce quadriceps strength, which is essential for early mobilization. Thus, ACB is a good alternative to FNB and because it is predominantly sensory block with greater quadriceps preservation. ACB is one of the useful analgesic modalities in contemporary perioperative management protocols that focus on rapid recovery after knee surgery[13-15]. Multiple recent studies showed that ACB offered satisfactory analgesic effect with well- preserved mobilization ability in patients who had undergone arthroscopic surgery or TKR[9].

Another study shows that ACB results in greater preservation of quadriceps muscle strength, although did not detect a significant reduction in fall risk compared with FNB[16]. ACB preserved quadriceps muscle strength better than FNB without significant difference in postoperative pain[17].

Conclusions

ACB provides comparable analgesic efficacy and facilitates earlier mobilization by sparing quadriceps strength compared with FNB

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Department of anesthesia, Al-Shaheed Ghazi Al-Hariri hospital.

The Serum Micro RNA-375 Utility to Diagnosis of Men with Prostate Cancer in Iraq

Kadhum J. Mowayeiz[1], Najat Abudlrazzaq Hasan[1], Alaa G. Hussein[2], Estabraq AR. Al-Wasiti[1], Usama S. Al-Nasiri[3]

[1]Department of Chemistry and Biochemistry, [2]Department of Clinical Pathology, College of Medicine, Al-Nahrain University, Baghdad, Iraq; [3]Scientific Council of Urology Iraqi Board of Medical Specialty

ABSTRACT

Objective: quantify the level of miRNAs (375) in serum of men with prostatic carcinoma in relation to different Histopathological grade (Gleason score)

Method: This case control study 140 of males with an age range of 40 – 85 years was conducted divided on Prostate cancer newly diagnostic 35 cases and 35 of Prostate cancer patients under hormonal therapy cases and 35 benign Prostate hyperplasia (BPH) newly diagnosed patients and 35 apparently healthy control subjects.

Results: There were a statistical trend towards increased in serum levels of Prostate specific antigen (tPSA, fPSA) also decreased %FPSA ratio in both Pca patients and HT-Pca as compared with BPH, control samples ($p<0.001$). And increased in miR-375 expression in both Pca patients and HT-Pca when compared with benign prostatic hyperplasia and control groups ($p<0.001$). The median fold change level of serum exosomal miR-375 expression were significantly highly (up-regulated) in Pca patients when comparable whit BPH group and healthy control ($p<0.001$).

Conclusions: The miRNA levels are a direct reflection of their expression in Pca. There was Positive correlation between miRNAs expression in serum samples and clinicopathological parameters such as tumor TNM stage and Gleason score and biochemical marker as prostate specific antigen (tPSA and fPSA).

Keywords: *miRNA, prostate cancer, PSA, Gleason score, marker*

Introduction

Prostate cancer (Pca) is the most common cancer among men in the western world with a high mortality[1]. The related mortality rates of Pca are extremely high. The primary tool for prostate cancer diagnosis is the widely used prostate specific antigen (PSA) test. However is a number of important limitations of this popular serum marker, including the modest ability to accurately distinguish patients with cancer than those without Pca and those who harbour an aggressive form of the disease[2].

Pca management in the last three decades has been dependent on the holy trinity of PSA, histological Gleason score (GS) and clinical stage. However, this triad is challenging in daily practice Regarding sensitivity and specificity[3] leading to overdiagnosis and overtreatment. Therefore, the need for more specific and sensitive biomarkers in Pca management is still inevitable. Since its discovery three decades ago, microRNA (miRNA) has shown quite promising results as a biomarker in biology in general, and particularly in cancer diseases[4]. MiRNAs are non-coding, single-stranded RNA molecules comprising about 19-24 nucleotides in length that regulate gene expression, not only post-transcriptionally but also at the transcriptional level[5].

The objective of the current study to quantify the level of miRNAs (375) in serum of men with prostatic carcinoma in relation to different Histopathological grade (Gleason score), stage and check the accuracy, specificity

and sensitivity of these miRNAs in comparison to the benign Prostate hyperplasia and healthy volunteers also the serum values of traditional biomarkers (PSA) in prostate cancer receiving hormonal therapy, Prostate cancer patients benign Prostate hyperplasia and healthy volunteers to compare their levels to that of MicroRNAs.

Method

This case- control study a total 140 male Iraqi patients at the age of more than 40 years, who achieved at the Department of Uro-surgery at Al-Imamain Al-Kadhumain Medical City and Al-imam Aljwad Medical Center in Baghdad. Conducted during the period from March 2017 to November 2018. Following diagnosis, patients where send to transrectal ultrasound-guided biopsy. The specimens with malignant diagnosed as prostate cancer **(Pca)**, Gleason scoring was performed by the microscopic pattern of the cancer. The Pca group included 70 patients (35 patients with newly diagnosed Pca and the **35** patients with prostate cancer under hormonal therapy) and 35 patients with benign prostate hyperplasia (BPH). The control group comprised 35 healthy men volunteers who do not suffer from any chronic illness, and were matched with age to the patients groups.

Patients with previous diagnosis of **Pca** or a family history record of **Pca** were excluded. Patients with symptoms of urinary tract infection, immunodeficiency disorders, patients under medical treatment for prostate hyperplasia, were also excluded.

The whole blood samples was taken prior to surgery for prostatectomy or fine needle aspirate or TURP biopsy 6 milliliters (ml) of venous blood samples were aspirate from all patients and control group. The aspirated blood sample allows clotting and centrifuged at 3500 rpm to 5 minutes, the first parts (3 ml) of sera was transferred to DNAase, RNAase free eppendorff tube to centrifuged at 10000 rpm up to 10 minutes at 4 °C then serum distributed into nuclease free eppendorff tube and keeps it at liquid nitrogen container at –190 °C for subsequent extraction of exosomal microRNA (miR) 375 and 103a[6].

The second parts (3 ml) of sera was transferred eppendorff tube to measure the Prostate specific antigen PSA (free, total) for all participants by enzyme-linked immunosorbent assay (ELISA) kit.

RNA and miRNA Isolation and amplification: Both RNA and miRNA were Isolated and purification of exosomes from the samples using Exiqon miRCURY™ Exosome Kit according to the manufacturer's guideline, cDNA was generated from RNA and miRNA using Universal cDNA synthesis kit II (Exiqon, Denmark).

The qualitative estimation of miRNAs, gene expression using threshold cycle (Ct) was performed by real time-PCR using the Sybr green master mix kit ExiLENT (Exiqon, Denmark) and the forward primers and reverse microRNA specific primers. The miR-103a used as endogenous controls for gene and miRNAs the gene and miRNAs expression levels were obtained by relative quantification using $2^{-\Delta\Delta ct}$ method.

Statistical Analysis: A statistical study using SPSS version 21 statistical software (SPSS Inc., Chicago IL, USA). Was performed to indicate the presence of significant differences and correlation between the studied parameters, with the p-value of < 0.05 were considered significant. And all data was expressed as the mean ± standard error of the mean (SEM).

The diagnostic accuracy of the biochemical and molecular markers were performed by the receiver operating characteristic curve analysis (ROC) also the cut off values and area under the curve was determined[7].

Results

The clinical and pathological data of the patients were collected and are listed in table 1

Table 1: Clinical features of patients

Variables	Pca Mean ± SEM N=35(%)	HT-Pca mean ± SEM N=35 %	BPH mean ± SEM N=35 %	Control mean ± SEM N=35 %	p-value

Table 5: the circulating miRNAs are correlated with clinicopathological Parameters

Marker	pT3 Vs. Pt2	Gleason score 6 Vs. 7	Gleason score 7 Vs. ≥ 8
MiR-375	p<0.01	p<0.001	p<0.001
PSA	p<0.05	p<0.001	p<0.001
%fPSA	p<0.05	p<0.003	p<0.001

Discussion

In our study, 140 serum specimens of miR-375, miRNAs expressed are selected to evaluation of the diagnostic potential specimens from Pca patients, HT-Pca, BPH and controls groups to evaluation of the diagnostic and to be a novel, stable, non-invasive biomarker and markedly improved specificity and total diagnostic accuracy of the PSA-test even in the diagnostic grey zone of prostate cancer. The median fold change level of serum exosomal miR-375 was significantly highly (11.4) times (up-regulated) in Pca patients than in healthy control and significantly highly (9.6) times (up-regulated) in Pca patients when comparable whit BPH group and the fold change in the expression level of miR-375 was significantly higher (11.62, p <0.001) in HT-Pca patients than in controls and is (9.8) time higher than BPH group. The Circulating MiR-375 are showed significant upregulated in patients of prostate cancer, HT-Pca patients when compared with BPH and control

groups ($p<0.001$). This result agreement with[8-10]. ZEB 1 can suppress the transcription of miR-375 that leads to inhibit epithelial mesenchymal transition (EMT), EMT-elicited cell migration and invasion via targeting YAP1[11]. The overexpression of miR-375 powerfully inhibited the invasion and migration of multiple Pca-lines. The transcription factor YAP1was found to be a direct target of miR-375 in prostate cancer. The knockdown of the transcription factor YAP1- phenocopied miR-375 overexpression and overexpression of YAP1 are save the anti-invasive effects mediated by miR375[10, 11].

The overexpression of miR-375 will decreased tumor growth and tumorigenesis and led to decreased proliferation. Generally, miR-375 is well known as a tumour suppression and thus is characterised by reduced expression in various tumours; however, it's up-regulation has been shown in breast and prostate cancer[12, 13].

In our study, the level of Circulating MiR-375 are correlated with clinicopathological Parameters and the high level of circulating miRNAs are correlated with pathological stage, Gleason score, TNM stage (Pearson $r = 0.85$ $p < 0.001$) in Pca and HT-Pca patients with tumour of lower stage of patients with (pT2, pT3) was significantly highly ($p<0.001$). Previous studies suggest that miR-375 are significantly higher expression levels were depicted in patients with higher GS and more advanced pathological stage, as well as with regional lymph nodes metastases and detect its suitability for non-invasive diagnostics[14].

When analyzed the circulating miRNAs in comparison to the PSA levels in Pca patients and HT-Pca patients circulating miRNAs showed significant result with a low Gleason score were compared to patients with intermediate level Gleason score) and distinguish between Gleason score 7 and Gleason score 8. This finding of our results is agreement with the previous studies[2, 3, 15].

Conclusions

The miRNA levels are a direct reflection of their expression in Pca. There was Positive correlation between miRNAs expression in serum samples and clinicopathological parameters such as tumor TNM stage and Gleason score and biochemical marker as prostate specific antigen (tPSA and fPSA).

Anticardiolipin Antibodies in Comparison to B-HCG Titer and Serum Progesterone as Indicator for Ectopic Pregnancies

Wasan Wajdi Ibrahim

College of Medicine, Department of Gynecology and Obstetrics, University of Baghdad, Iraq

ABSTRACT

Objective: to assess the level of anticardiolipin antibodies in comparison to Beta human chorionic gonadotropin titer and serum progesterone as indicator for ectopic pregnancies

Method: A case control study carried out in obstetrics and gynecological department of Baghdad teaching hospital/medical city complex for about six months, One hundred fifty women were enrolled in the current study and divided into two groups case group (Seventy five patients) and control group (Seventy five healthy pregnant).

Results: the mean age of ectopic patients was 32.1 ± 5 years and 34 ± 3.7 years for the controls. A highly significant association between mean of Anticardiolipin-IgM in women with ectopic pregnancy than that in control ($p<0.001$), highly significant association was observed between lower mean of Beta-human chorionic gonadotropin in women with ectopic pregnancy than in control ($p<0.001$). Mean serum progesterone level was significantly lower among women in ectopic pregnancy than control.

Conclusions: The level of Anticardiolipin antibody has nearly the same accuracy to serum progesterone and b. HCG titer as indicator for ectopic pregnancy

Keywords: *Anticardiolipin, IgM, ectopic pregnancy, Beta human chorionic gonadotropin, progesterone*

Introduction

Ectopic pregnancy is one that the blastocyst outside the uterine cavity. Implantation occurs in the fallopian tube in 95% to 99% of patients[1]. The fallopian tube is a carefully controlled environment to facilitate oocyte transport, fertilization, and migration of the early embryo to the uterus for implantation[2]. Most data suggest tubal EP stems from both abnormal embryo transport and an alteration in the tubal environment, which enables abnormal implantation to occur[3].

Anti-cardiolipin antibodies (ACA) are antibodies often directed against cardiolipin and found in several diseases[4]. Anti-cardiolipin antibodies can be classified in several ways : as IgM, IgG or IgA, as β2-glycoprotein dependent or independent[5, 6].

The anticardiolipin antibody is known to be inflicted in recurrent pregnancy loss and other adverse outcomes of pregnancy. However their role in intra uterine pregnancies is unknown. It is thought that inflammatory events associated with some cases of ectopic pregnancies it is due to increase level of anticardiolipin and elevated level of ACL auto antibodies may give clue to pathogenesis so determination of IGM antibodies may help discriminate ectopic pregnancies with auto immune pathogenesis from those caused by other factor[7, 8]. The current study aimed to assess the level of Anti-cardiolipin antibodies in comparison to Beta human chorionic gonadotropin titer and serum progesterone as indicator for ectopic pregnancies.

Method

Setting: A case control study was carried out in gynecological and obstetrics department of Baghdad teaching hospital/medical city complex for about six

months. One hundred fifty women were enrolled in the current study and divided into two groups:

Cases Group: Seventy five patients with acute ectopic pregnancy between (6-10 weeks) of gestation presented to emergency room diagnosed by U/S and BHCG titer and confirmed by histopathology.

Control Group: Seventy five women with healthy intrauterine pregnancy between (6-10 weeks) of gestation, who consult out clinic for antenatal care.

Exclusion Criteria:

1. Auto immune thyroid disease
2. Auto immune skin disease
3. Inflammatory bowel disease
4. SLE
5. No history of infertility
6. No history of recurrent abortion
7. No surgical history

Inclusion Criteria: Both groups have gestational age between 42-64 ± 6 days

Procedure: 5 ml of blood taken by venipuncture, then centrifuging done, then 1-2 ml of serum separated and putted in red-top tube, and storage at room temperature and tested for ACL, IgG, IgM, IgA. The investigation was done in privet lab. The method for semi-quantitative determination of auto antibodies of IgM class direct against cardiolipin is an indirect chemi luminescence immunoassay (CLIA).

A complex between highly purified cardiolipin and B2- glycoprotein 1 is coated on the magnetic particle (solid phase) and a mouse monoclonal antibody to human IgM is linked to an isoluminol derivative (isoluminol-antibody conjugate). The presence of B2 glycoprotein 1 as a cofactor is mandatory. Because cardiolipin antibody are mainly directed against a complex between B2 glycoprotein 1 and cardiolipin rather than against cardiolipin alone.

During the first incubation, cardiolipin antibodies present in calibrators, samples or controls bind to the solid phase cardiolipin. During second incubation, the antibody conjugate reacts with cardiolipin IgM already bound to the solid phase. After each incubation, the unbound material is removed with a wash cycle.

Subsequently, the starter reagents are added and a flash chemi-luminescence reaction is thus induced. The light signal, and hence the amount of isoluminal-antibody conjugate, is measured by a photomultiplier as relative light units (RLU) and is directly proportional to cardiolipin IgM concentration present in calibrators, samples or controls.

For all cases of ectopic pregnancies and normal intrauterine pregnancy HCG titer and serum progesterone were done.

Statistical Analysis: All patients' data entered using computerized statistical software; Statistical Package for Social Sciences (SPSS) version 21 was used. Descriptive statistics presented as (mean ± standard deviation) and frequencies as percentages. Kolmogorov Smirnov analysis verified the normality of the data set. One way ANOVA analysis was used to compare between more than two means. ROC curve was used to clarify validity tests. In all statistical analysis, level of significance (p value) set at ≤ 0.05.

Result

Table 1: Assessment of demographic and various markers

	Ectopic	Control	p-value
Number	75	75	-
Age (y), mean ± SD	32.1 ± 5	34 ± 3.7	0.009
Gestational age (w), mean ± SD	7 ± 1.3	7.9 ± 1.5	<0.001
ACL-IgG, mean ± SD	4.6 ± 2.1	3.9 ± 2.5	0.06
ACL-IgM, mean ± SD	12.3 ± 12.9	4.7 ± 2.6	<0.001
ACL-IgA, mean ± SD	13.1 ± 15.4	3.7 ± 3	<0.001
ß-hCG, mean ± SD	1927.2 ± 1060.3	37018.5 ± 13345	<0.001
Progesterone, mean ± SD	5.9 ± 6.4	31.5 ± 9.4	<0.001

Table 2: ROC analysis for predicting ectopic pregnancy

Predictors	Cutoff point	SN	SP	PPV	NPV	Accuracy
ACL-IgM	≥2.6	93%	74%	81.3%	90%	81%
ß-hCG	≤2500 IU/L	87%	92%	84%	75%	86%
progesterone	≤10.2 ng/ml	82%	88.4%	90%	81%	85%
ACL-IgA	≥3.1	87.0%	82%	78%	68%	80%
SN: sensitivity, SP: specificity, PPV: positive predictive value, NPV: negative predictive value						

Table 3: Distribution of investigations results of EP and pregnant women according gestational age

Gestational age	6-8 week	8-10 week	p-value
Ectopic			
ACL-IgG	4.7 ± 1.5	4.5 ± 2.9	0.7
ACL-IgM	12.6 ± 13.1	10.9 ± 12.6	0.5
ACL-IgA	13.4 ± 15.9	12.6 ± 14.6	0.8
ß-hCG	1842.4 ± 1168.8	2087.1 ± 815	0.3
Progesterone	4.4 ± 5.5	7.7 ± 7.3	0.03
Control

ACL-IgM	4.7 ± 2.6	4.7 ± 2.6	0.9
ACL-IgA	3.6 ± 2.9	3.8 ± 3	0.7
ß-hCG	26864.5 ± 6125.1	42730.1 ± 12926.6	<0.001
Progesterone	32.9 ± 9.7	30.8 ± 9.2	0.3

Discussion

Ectopic pregnancy is the leading cause of pregnancy related deaths in the first trimester. It results in significant morbidity for the mother and inevitable loss of the pregnancy. The rate of ectopic pregnancy is constantly increasing because of poverty, delay in diagnosis, poor referral system, quackery, poor health awareness and coordination between health care providers leading to delay in diagnosis. Apart from fetal wastage, maternal mortality and morbidity, ectopic pregnancy is also associated with repeat ectopic gestation and impairment of subsequent fertility[9, 10].

Regular confirmation of the diagnosis comes from the ultrasound and/or beta-hCG. Elevated levels of antibodies against cardiolipin may provide additional guidance for the immunological process associated with the etiology of some specific cases of ectopic pregnancy[7]. A meta-analysis suggested serum progesterone<5ng/mL had good prediction for non-viable pregnancies, but was unable to differentiate EPs from abnormal IUPs[11]. This is not in agreement with our finding in which the serum progesterone is > 5ng/ml, this may be due to difference in sample size collection. Moreover, a high progesterone level did not rule out the probability of an EP. Thus, progesterone can aid in identifying those at risk for EP, but its optimal utility for predicting EP will likely be in combination with other markers.

The main finding in the current study is that all ACL titer was increased, with statistically significant difference between ACL-IGM, ACL-IGA of the ectopic patients than in control, but not for ACL-IgG (increase without significant). And this in agreement with Jacob-M et al[7], study (Anticardiolipin antibodies in ectopic pregnancies), when mentioned that mean level of IGA and IGM were significantly increase in patients with ectopic pregnancy than those without ectopic.

Thus this auto antibodies may lead to increased risk of ectopic pregnancy which explained by two mechanism in pathogeneses of ectopic, first mechanism is auto antibodies against cardiolipin and other phospholipid are mostly associated with thrombotic event which lead to disturbed circulation and lead to tubal dysfunction or

inflammatory event associated with some cases of ectopic pregnancies that lead to elevated levels of anticardiolipin antibodies may give clues to pathogenesis.

Regarding to the ACL antibodies in the current study, the validity test of ACL-IGM was (93% sensitivity, 74% specificity, 81.3% PPV, 90% NPV and accuracy 81%), and for ACL-IGA was (87% sensitivity, 82% specificity, 78% PPV, 68% NPV and accuracy 80%), as shown by current study that accuracy of both IgA and IgM nearly resample that of BHCG titer and serum progesterone. Routine confirmation of diagnosis comes from U/S and/or HCG test elevated antibodies levels agenized cardiolipin may give additional hints for the immunological process involved in the etiology of some particular cases of ectopic pregnancy.

The evidence that IgM determination additional to single progesterone measurement may improve the discrimination between ectopic pregnancy and non-ectopic pregnancy. Such discrimination from measurement of progesterone alone is not sufficient. A recent report shows that even measurement of HCG give not in every case conclusive evidence for ectopic pregnancy[12].

Yetman D et al, in his study concluded that there is a link between anticardiolipin antibodies and the unfavorable course of pregnancy, but not an absolute relationship. Even in cases of repeated pregnancy loss, only 17% had positive anti-cardiolipin antibodies[13].

Conclusions

The level of Anticardiolipin antibodies was increased in ectopic pregnancy and there is a significant association between ectopic pregnancy and ACL-IGA and ACL-IGM

Knowledge Regarding Risk Factors of Hypertension among Young Adult Students

Sanjivani Maral[1], Muskan Marwah[2], Sahil Vijaykumar Lahoti[2], Arindam Das[3]

[1]Assistant Professor, [2]B.Sc. Medical Technology (Cardiac Care), [3]Associate Professor, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed University), Pune, Maharashtra, India

Abstract

Globally Hypertension (HTN) is an important cause of morbidity & mortality. It is easy to diagnose HTN at an affordable cost. Timely diagnosis will have positive impact on preserve & protect the ill health effects. The prevalence of hypertension is high in India varying from 22.2% in Meghalaya to 44.0% in Punjab and is rising among young population. Cardiovascular risk is reduced through awareness & simple modification in life style like quitting smoking, healthy dietary habits, exercise and managing stress. Present study was conducted on 454 student participants belonging to the age group of 16-29 yrs of age. The objective of the study is to find out knowledge about HTN & its association with family history & demographic characteristics amongst the young students. Data were collected using pretested questionnaire for demographic characteristics & awareness about HTN, its reasons & health effects. The data analysis showed that the participants had good knowledge pertaining to the causes and complications of hypertension and lack of physical activity as an important risk factor. However, they lack in knowledge of stress being a risk factor for developing hypertension in future. Chi-square test showed that both academic background and gender were having statistically significant association with knowledge regarding reasons for hypertension whereas only academic background was having statistically significant association with knowledge regarding effects of hypertension. Therefore, timely screening and adequate medical and dietary interventions will not only help to reduce prevalence of hypertension but also reduce the risk of developing related health implications.

Introduction

According to the Joint National Committee (JNC) 7, normal blood pressure (BP) is a systolic BP < 120 mmHg and diastolic BP < 80 mm Hg. Therefore, Hypertension (HTN) or High Blood Pressure is the persistent elevated arterial BP which is defined as systolic BP level ≥140 mmHg and/or diastolic BP level ≥ 90 mmHg. It is a major public health problem due to its high prevalence all around the globe[1] and takes III position in the list of most important risk factors responsible for the burden of disease in South Asia (2010).[2] HTN is a chronic condition of concern because in long run, it leads to Coronary Heart Disease (CHD), Stroke, and other vascular complications.[3] It is referred to as a silent killer as very rarely any symptom can be seen in its early stages until it leads to any of the above mentioned severe medical crisis.[1] Other than these primary complications, some of its secondary complications includes Heart Failure, Peripheral Vascular Disease (PVD), Renal Impairment, Retinal Haemorrhage and Visual Impairment.[2] Researches suggest that worldwide 10.5 million deaths occur annually due to HTN.[8] Also, on a global basis approximately 54% of Stroke and 47% of CHD cases were recorded due to HTN,[4] therefore it is one of the major risk factors for cardiovascular mortality accounting for 20-50% of all deaths. According to National Family Health Survey (NFHS) – 4 data, every 4th individual in India >18 years has raised BP and the prevalence has increased by 10% from 2010 to 2014.[3] There are several risk factors predisposing to HTN that vary from country to country and even there is difference

Corresponding Author:

between urban and rural regions of the same place.[1] The risk factors for HTN can be divided into two parts namely Non-modifiable and Modifiable risk factors. Non-modifiable risk factors include F**amily History, Age**, G**ender**, R**ace and Chronic Kidney Disease (CKD) whereas Modifiable risk factors include Lack of Physical Activity, Unhealthy diet pattern (especially one high in Sodium), Overweight or Obese, Heavy Alcohol Drinking, Sleep Apnea, High Cholesterol levels, Diabetes, Smoking, Tobacco use and Stress.**[7] **Although,** most studies are conducted describing the knowledge of HTN and its risk factors among older adults and the elderly patients whereas there is lack of such data among teenagers and young adults because conventionally they are considered to be at a lower risk of developing HTN. Due to the increasing prevalence of HTN worldwide, a concern towards young adults of developing HTN is also rising whereas cases among this age group are not detected because of inadequate screening.[5] Therefore, knowledge of the predisposing risk factors responsible for the development of HTN is of utmost importance leading to the modification of lifestyle behaviours for a good cardiovascular health among the young adults. Studies shows that HTN reports 50% among overweight and obese patients and it increases further with higher grades of obesity.[6] On the other hand, almost 70% of hypertensive patients have been reported to be overweight, with more than 30% being obese.[6] In present fast pace world, students of late adolescents and young age group (16 – 29 years) are most exposed to the risk factors responsible for developing HTN. Many of the students are migrated from their native places for higher education and may not maintain a healthy lifestyle which they usually do at their homes. Therefore, measuring and spreading knowledge of the modifiable risk factors at an early age can be considered as an essential preventive educational approach in reducing the prevalence of HTN worldwide. Strategies to achieve even a slight lowering of the levels of BP among the young adults can lead to important public health goals.[5] An attempt is made in the present study to assess the knowledge pertaining to hypertension among the young adults so that the preventable risk factors like Personal Habits, Type of Diet and Lack of Physical Activity can be eliminated to the most possible extent.

Objectives

The paper aims to find out:-

1. The knowledge regarding hypertension among young adults of an urban setup of India.

2. How many students are at a higher risk of developing hypertension in future, as first blood relation of their family is having history of hypertension?

3. The association between knowledge of hypertension and socio – demographic characteristics amongst the young students.

Materials and Method

The study was a cross-sectional study in nature. Total 454 participants were selected according to the convenience of the researchers. However, the respondents were not from one city or a specific place rather were from different places like Pune, Washim, Aurangabad, Mumbai, Goa and others. A specially designed semi – structured questionnaire was used for this research. The respondents themselves filled the questionnaire. The tool includes questions on socio-demographic characteristics like gender, age, height and weight of the respondents. In addition, knowledge regarding hypertension like causes and future complications of hypertension; personal habits of the respondents such as smoking and alcohol consumption, their lifestyle for example the type of food consumption, frequency of junk and preserved food consumption, physical activity and reasons for stress according to them. In addition, a few questions were asked on their family history pertaining to hypertension. The participation of the respondents was voluntary.

Inclusion criteria:- Students pursuing graduation & post-graduation in diverse fields like Medical Technology, Radiotherapy, Pharmacy, Physiotherapy, Nursing, Health and Hospital Management, Engineering, Commerce, Arts, Architecture, Event Management, Masters of Business Administration and belonging to the age group of 16 and 29 years.

Exclusion criteria:- Students less than 16 years of age and more than 29 years of age.

Data Entry and Analysis:

All the collected information was scrutinized before entry to take care of unknowingly omission. Secondary editing of data was also conducted. The data was doubly entered to overcome the problem of error during data entry. Entered data was analysed using software namely Statistical Packages for Social Sciences (IBM SPSS

Version 23.0).

Results and Discussion

Analysis was carried out to find the characteristics of the respondents. The results of the same are being presented in table 1.

Table 1: Characteristics of the Respondents (N = 454)

Sr. No.	Characteristics	Percentage
1.	**Academic Qualification:-** Medical Non – Medical	 46.0 54.0
2.	**Gender:-** Male Female	 62.6 37.4
3.	**Age:-** Teenagers 20 and above	 25.7 74.3
4.	**Place of Residence:-** Pune Others	 64.8 35.2
5.	Accommodation (Stay):- Hostel Hometown Paying guest	 44.0 34.9 21.1
6.	**BMI:-** Below normal Normal Above normal	 17.6 64.7 17.7

Table 1 show that forty-six per cent of the respondents were from medical background whereas the rest were from non-medical background. Nearly 63% respondents were male, the remaining were female. Besides one-fourth (26%) respondents were teenagers, whereas the remaining were in between 20-29 years. Around two-third (65%) respondents were from Pune whereas remaining are from other cities. Forty-four per cent respondents found residing in hostel; another 35% replied that they were staying in their hometown whereas 21% mentioned that they stayed as a paying guest. Body mass index (BMI) was calculated as weight in kilograms divided by height in meters squared. Normal BMI was considered as 25. It is calculated that around 18% respondents found having below normal BMI. Another 18% were having more than normal BMI whereas 64% respondents found having normal BMI.

Table 2: Knowledge of Hypertension by the Respondents (N = 454)

Sr. No.	Characteristics	Percentage
1.	Do You Know What Normal Blood Pressure Is?	57.3
2.	What Is Hypertension (HTN)?-	78.0
3.	Causes of Hypertension*:- Obesity Smoking Unhealthy Diet	 62.6 54.8 68.3
4.	Effects of Hypertension*:- Heart Attack Stroke Kidney Failure	 82.4 51.5 26.7

* Multiple Responses, addition may not be equal to 100.

Table 2 suggests that more than half of the respondents (57.3%) found having the knowledge of normal blood pressure and the analysis revealed that more than three-fourth (78%) of the respondents knew what hypertension is. Unhealthy diet (68.3%) and obesity (62.6%) were quite known amongst the respondents for being cause of hypertension whereas smoking (54.8%) was not. Heart Attack (82.4%) was emerged out as one of the most known complications of hypertension to young adults. Surprisingly, only one-fourth young adults knew about kidney failure (26.7%) as a probable complications pertaining to hypertension.

The analysis with regard to family history of hypertension revealed that out of 37 per cent of respondents who had a family history of hypertension, 11 per cent had hypertension of first blood relation (mother and father) in their family. Thus, are at a higher risk of developing hypertension in future.

Table 3: Personal Habits of the Respondents (N = 454)

Sr. No.	Characteristics	Percentage
1.	DIET:- Vegetarian Non – vegetarian Eggetarian Both vegetarian and non – vegetarian	 41.0 03.8 07.0 48.2
2.	NON-VEG FOOD:- 2 – 3 days in a week Weekly Daily Not applicable	 20.5 25.6 4.6 49.3
3.	JUNK FOOD:- 2 – 3 days in a week Weekly Daily Not applicable	 24.4 46.4 5.2 24.0
4.	PRESERVED FOOD:- 2 – 3 days in a week Weekly Daily Not applicable	 30.9 39.4 08.8 20.9
5.	PHYSICAL EXERCISE (ever):-	67.6
6.	ENGAGE IN PHYSICAL EXERCISE:- Everyday 2 – 4 days in a week As in when you feel like Never	 35.2 19.4 34.4 11.0
7.	DO YOU SMOKE:-	07.0
8.	FREQUENCY OF SMOKING:- 2 – 3 days in a week Weekly Daily Never	 0.9 2.9 03.5 92.7
9.	EXPOSURE TO KIND OF SMOKE*:- Cigarettes Vehicles Factories Hukka	 23.8 51.8 10.1 07.3
10.	FREQUENCY OF SMOKE EXPOSURE:- 2 – 3 days in a week Weekly Daily Never	 08.6 09.5 37.2 44.7
11.	ALCOHOL:-	15.9
12.	FREQUENCY OF ALCOHOL CONSUMPTION:- Occasionally 2 – 3 times in a week Weekly Daily Never	 14.5 0.2 0.5 0.9 83.9

Cont... **Table 3: Personal Habits of the Respondents (N = 454)**

* Multiple Responses, addition may not be equal to 100.

Table 3 shows the statistics related to personal habits of the respondents'. Almost half (48.2%) of the respondents were omnivorous whereas only seven per cent of the respondents were found eating egg. Amongst the respondents, around one-fourth 25.6% eat non-vegetarian food on weekly basis whereas the number of respondents consuming non-vegetarian on a daily basis was very less (4.6%). Almost half (46.5%) of the respondents eat junk food on weekly basis. Thirty-nine per cent respondents found consuming preserved food on weekly basis, 31% consumed 2 – 3 days in a week, nine per cent consumed on a daily basis and rest did not eat preserved food at all. More than two-third of the respondents (67.6%) engaged themselves in physical activities ever, of which 35% do it on a daily basis. Very few (7%) respondents smoke as a part of their personal habit. Vehicles are the primary source of exposure to smoke with cigarettes and factories being a moderate source. Thirty-seven per cent respondents say that they get exposed to smoke on a regular basis. It was found from the analysis that around 16% respondents consume alcohol occasionally.

Table 4: Reasons for Stress (N = 454)

Reasons For Stress	Percentage*
Peer Pressure	27.3
Academics Pressure (Stable Career Building)	66.1
Family expectations	43.6
Relationships	31.7

* Multiple Responses, addition may not be equal to 100.

In Table 4, an attempt was made to understand the perception of the major reasons for stress amongst the respondents. It was observed from the analysis that main cause of stress for young adults was academic pressure (stable career building) accounting around two-third (66.1%) of the respondents. Family expectations and personal relations were emerged out as other reasons for stress along with peer pressure.

Table 5: Association between Knowledge regarding Reasons of Hypertension and Background Characteristics of the Respondents

Obesity:-

Sr. No.	Characteristics	Percentage	Number	p value
1.	**Academic Background*:-**			
	Medical	59.4	145	0.0
	Non – medical	40.6	99	
2.	**Gender*:-**			
	Male	56.1	137	0.0
	Female	43.9	107	
3.	**Place of Residence:-**			
	Pune	70.9	173	0.7
	Others	29.1	71	
4.	Accommodation (Stay):-			
	Hostel	42.6	104	0.3
	Hometown	27.5	67	
	Paying guest	23.8	58	
5.	**Age:-**			
	Teenagers	20.1	49	0.4
	20 and above	79.9	195	

* $p<0.05$

An attempt was made to find out the association between knowledge regarding reasons of hypertension and background characteristics of respondents. A chi-square test was performed to understand this association. It was observed from analysis that academic background and gender was having statistically significant association with knowledge regarding reasons for hypertension (Table 5).

Further, an attempt was also made to find out the association between knowledge regarding effects of hypertension and background characteristics of the respondents. Chi-square test was used to understand this association. It was found from analysis that academic background was having statistically significant association with knowledge regarding effects of hypertension whereas gender of the respondents was statistically significant for knowledge regarding stroke

but not for kidney failure which was also given as an option for the effects of hypertension.

Conclusion

Analysis of the data received from the respondents concludes that more than half of the respondents did not have knowledge about normal blood pressure. More than three-fourth of the respondents found aware of hypertension. However, the participants had good knowledge pertaining to the causes and complications of hypertension. In addition, respondents also found aware that lack of physical activity as an important risk factor. More than one-fourth of the respondents replied that they engaged themselves in daily physical activity. Respondents also had knowledge regarding some other risk factors of hypertension like smoking and consuming alcohol. In current fierce competitive world, the respondents found suffering from stress in order to build a stable career and thus being exposed to stress at a large scale at such a young age. Also, the respondents found having less knowledge of stress being a risk factor for developing hypertension in future. It was also found that that both academic background and gender were having statistically significant association with knowledge regarding reasons for hypertension whereas only academic background was having statistically significant association with knowledge regarding effects of hypertension. Therefore, timely screening and adequate medical and dietary interventions will not only help to reduce prevalence of hypertension but also reduce the risk of developing related health implications.

Limitations:

The current study is a purposive study because the samples were not randomly selected & the study is restricted mainly to state of Maharashtra. Hence, the results of this study cannot be generalised to the population.

Scope of Future Research:

The study can also be conducted by using the variables like the quantity of alcohol consumed per drink and the number of cigarettes smoked etc...This study can also be conducted for different states /regions.

Conflict of Interest: The author has none to declare.

Source of Funding: None

Ethical Clearance: Not required.

Incidence of Anxiety among First Year College Going Students

Diana Prasad

Tutor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra

Abstract

Anxiety refers to the brain response to danger, stimuli that an organism will actively attempt to avoid Adolescent age is a period of critical transitions in the life span and is characterized by a tremendous pace in growth and change. It is characterized by some reshuffles at both somatic and psychological levels, these modifications are unavoidable for the transition between childhood and the adult state. The statement of the study was to assess the incidence of anxiety among first year college going students in selected colleges in Kottayam district,Kerala.The objectives of the study were to assess the incidence of anxiety disorder in first year college going students in selected colleges Kottayam District, Kerala and to find the association between anxiety and selected sociodemographic variables. The tool consisted of two sections**.** A structured questionnaire to assess the sociodemographic data and Screen for Childhood Anxiety Related Disorders. (*SCARED)* was administered . A total of 100 students were selected using stratified random sampling. 52% of the students were found to be anxious and out of which only 26% had indications of some form of specific anxiety disorders. There was a significant association between birth order and anxiety. Perceived family income and staying at hostel during school did not have a significant relationship with anxiety.

Keywords: *Anxiety, First year college students.*

Introduction

Anxiety refers to the brain response to danger, stimuli that an organism will actively attempt to avoid. This brain response is a basic emotion already present in infancy and childhood, with expressions falling on a continuum from mild to severe[1].

Adolescent age is a period of critical transitions in the life span and is characterized by a tremendous pace in growth and change. It is characterized by some reshuffles at both somatic and psychological levels, these modifications are unavoidable for the transition between childhood and the adult state. Especially when a child starts a new academic life from school to college, a transition is very exciting as well as tiring. This period of transition brings about a certain level of anxiety among them. The developmental changes which occur from preadolescent childhood to adulthood bring about symptoms of anxiety and to some extent end up in anxiety disorders. And thus anxiety disorders are increasingly being recognized as important psychiatric disorders in adolescents

According to National Institute of Mental Health (2011) prevalence of any kind of anxiety disorder in adolescents is 25.1%.And among these 5.9 % had severe anxiety disorder.

According to a clinical study on anxiety disorders in children and adolescents conducted by King George medical University, Lucknow in the year 2013, 14.29% of adolescents suffered from generalized anxiety disorders[2].

A study conducted among higher secondary school students in 2011 in Trivandrum, Kerala shows a prevalence of 56.8%[3].

When anxiety is no longer temporary and begins to interfere with the child's normal functioning or do harm to their learning, the problem may be more than just an ordinary anxiousness .When people suffer from a severe anxiety disorder their thinking, decision-making ability, perceptions of the environment, learning and concentration get affected. They not only experience fear, nervousness, and shyness but also start avoiding places and activities. Anxiety also produces physiological symptoms like nausea, vomiting, stomach pain, ulcers,

diarrhea, shortness of breath etc. It may also give rise to frequent self-doubt and self criticism, irritability, sleep problems, and in extreme cases, thoughts of not wanting to be alive.

Improper coping to anxiety often results in high risk behaviors in adolescents. Studies show that anxious adolescents end up in various kinds of addiction in their adulthood.

The present investigation makes an earnest attempt to find out the incidence of anxiety disorders among adolescents. Thus the present investigation helps to make the society aware of the mental health of the young adults and take necessary steps for the proper development of the same.

Aims and Objectives

To assess the incidence of anxiety disorder in first year college going students in selected colleges Kottayam District, Kerala.

To find the association between anxiety and selected sociodemographic variables.

Methodology

Research Approach: Quantitative approach

Research Design: Descriptive design

Dependent variable: Anxiety

Independent variable: Sociodemographic factors

Sample : The sample for the present investigation is selected by using stratified sampling technique. The Sample consisted of a total of 100 first year degree students from different colleges.

Inclusion Criterion:

1. First year college students' upto 18 yrs. of age.

2. Both male and female students were included.

Exclusion Criterion

1 Students above 18 yrs of age.

2. Students who refuse to give consent for the participation.

Materials and Method

The tool consist of 2 sections.

Section 1: A structured questionnaire to assess the sociodemographic data

Section 2: Screen for Childhood Anxiety Related Disorders.(***SCARED)***[4] . It is a self-report questionnaire used to assess social anxiety and other related anxieties. It consists of 41 items rated on a 3 point Likert-type scale .It can be used for the age group from 8 to 18 yrs. A score of ≥ 25 indicates presence of anxiety disorder. The inter-rater reliability was 0.87 and test-retest reliability was 0.90.

Data collection:

The Performa was given to 100 students as well as their parents, in the first year of their college. The students were explained regarding the purpose of the study and the informed consent was taken and time of 45 minutes was allotted to the students..Any student who faced any difficulty in filling up the performa was helped and encouraged to fill the complete performa. The performa was collected from the students after 45 minutes. Incomplete performa, if received, the student was encouraged to complete it, and otherwise, the performa was discarded and not included. The statistical analysis was done using SPSS statistical software using appropriate statistical tests.

Findings

Description of sociodemographic data:

A total of 100 students were selected out of which 50 males and 50 were females.

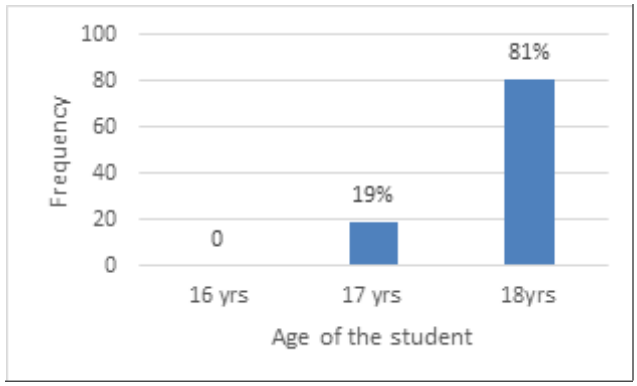

Fig 1: Distribution of students according to age.

Fig 1 describes the distribution of students based on the age .Majority of them 81 % were of 18 yrs. of age.

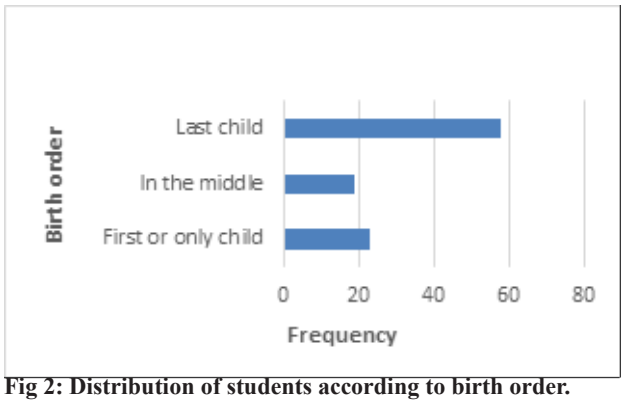

Fig 2: Distribution of students according to birth order.

Fig 2 explains the distribution based on birth order. Majority (58%) were the last child .23 % were the first born or only child.

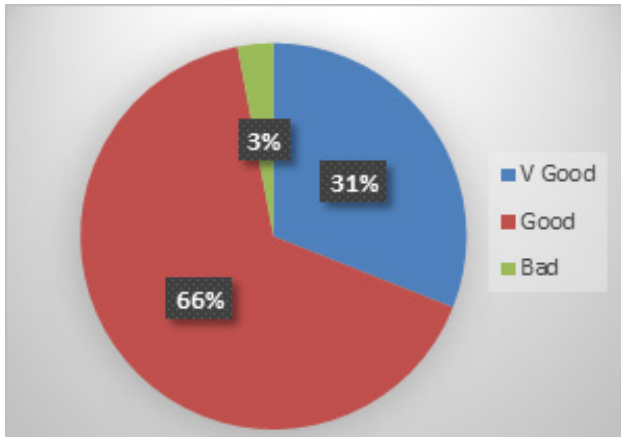

Fig 3: Distribution of students based on perception of family income

Fig 3 describes distribution of students based on perception of family income. Majority (66%) believed that their family income is good.

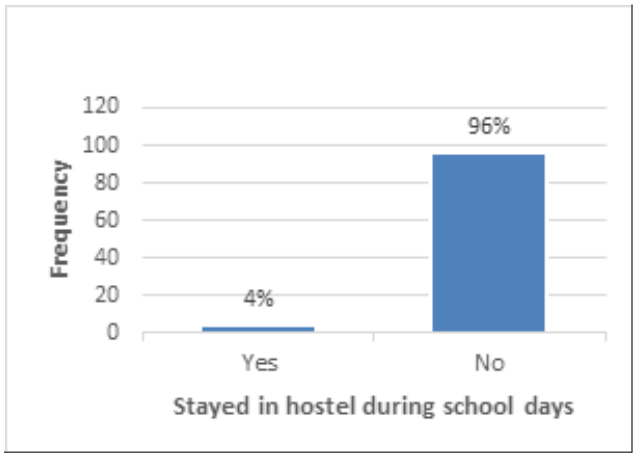

Fig 4: Distribution of students who stayed at hostel during their school days.

Fig 4 explains distribution of students who stayed at hostel during their school days. Only 4 % of the students stayed in hostel during their school days.

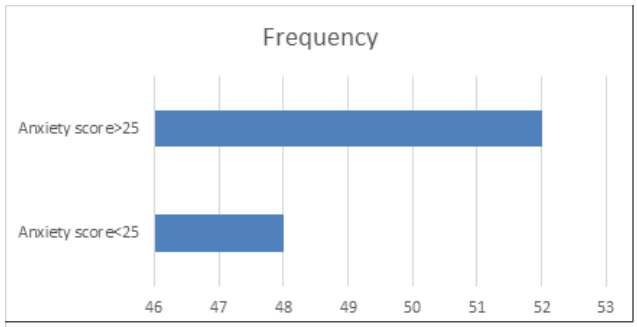

Fig 6:Distribution of students based on presence of anxiety.

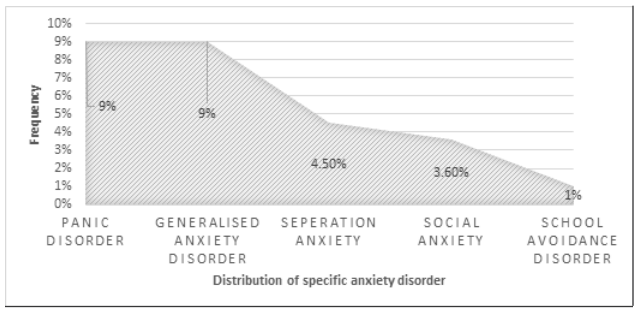

Fig 7: Distribution based on specific anxiety disorder

Fig 6 explains the presence of specific anxiety disorder .Only 27 % of the students had score corresponding to specific anxiety disorders. Out of which 9 % of students were prone to panic disorder and generalized anxiety.

Association between anxiety and sociodemographic data:

- Spearmans correlation was done to identify association between birth order and social anxiety and it was found to be $r_s = 0.43671$ and it was considered to be statistically significant
- The association between perceived family income and anxiety was calculated using chi square and found to be 0.6425. The *p*-value is .725233. The result is *not* significant at $p < .05$.
- Association between hostel stay during school life and social anxiety was found to be 0.0067 using chi square. The p-value is .934873. The result is not significant at $p < .05$

Conclusion

The present study aimed at finding out the incidence of anxiety among first year college going students. During the initial years at the college adolescents find it difficult to adapt with new circumstances. Hence the institutions should identify measures to help students to holistically adapt

Conflict of Interest: Nil

Source of Funding: The present study is self-funded.

Ethical Clearance: Ethical clearances obtained from the colleges and informed consent was taken.

A Study to Assess the Effectiveness of Structured Teaching Programme on Knowledge Regarding Substance Abuse and Its Impact on Health among Higher Secondary Students among Atulya Healthcare, Pune

Tejashri Ligade[1], Sagar Kulkarni[2], Aejaz Ahmad[3]

[1]Tutor, Symbiosis College of Nursing, S. B.Road, Pune, [2]EMT Trainer, Atulya Healthcare, Pune, Maharashtra, [3]OT Trainer Atulya Healthcare, Pune, Maharashtra

Abstract

Healthcare professionals are crucial in the identification and accessibility to treatment for people with substance abuse. The objective of the study was to assess students' knowledge towards substance use disorders and examine the consequences of these on health.[1] Substance abuse is a social problem, not in India alone, but the entire world. The use of drugs has its own culture and history, which varies from country to country. The problem of substance abuse is growing at an explosive rate and in just little over a decade it has spread its malevolent tentacles to almost every part of the globe surmounting almost all barriers of race, caste, creed, religion, sex educational status, economic strata etc. As the first experience of substance abuse often starts in adolescence, and studies have shown that drug use is mainly related to cigarette and alcohol consumption, an initial exploration of substance abuse prevalence, including cigarette and alcohol, seems to be the first step in preventing and controlling drug consumption.[3]

Keywords*: knowledge, substance abuse, impact on health.*

Introduction

Alcohol is only drug whose self-induced intoxication is socially acceptable.[1] Worldwide alcohol accounts for 3.3 million deaths yearly which represent 5.9% of all deaths.[2] Use of alcohol depends upon many environmental factors such as economical development, culture, ease of availability and alcohol policies of the area. This phenomenon is palpable in India, as its on road of rapid transition economically and socially. This transition can easily be noted by surge in figures of per capital alcohol use, as it has increased from 3.6 liters in 2003 – 05 to 4.3 liters in 2008 – 10 of which almost half of alcohol comes from unregulated market. If their experimentation could be prevented by making them aware about the abuse and its consequences, the prevalence of the substance abuse can be reduced.[2] Substance abuse has become a global phenomenon. It has affected almost every country, although its extent and characteristics differ from region to region. It is said, that at least 40 million people throughout the world are regular substance or drug abusers. The problems of drug abuse are seen in semi-urban and along the border areas of India. The period of adolescence is a vulnerable period in the life of an individual. The increased vulnerability in this period related to psychological factors like curiosity, poor impulse control, run away from reality, psychological distress and so forth. The social factors like peer influence, lack of clear identity, and self or intra-familial conflict also expose the adolescent to substance abuse.[4]

Statement of the problem

"A study to assess the effectiveness of structured teaching programme on knowledge regarding substance abuse and its impact on health among higher secondary students at Atulya Health Care Pune."

Objectives of the Study

To assess the pre- test knowledge regarding substance abuse and its impact on health among adolescent students.

1. To evaluate the effectiveness of structured teaching on knowledge regarding post-test score.
2. To find out association between selected demographic variables and study findings.

Operational Definitions

Knowledge: In this study knowledge refers to the correct response and understanding of the knowledg regarding substance abuse and its impact on health as measured by structure knowledge questionnaire.

Substance Abuse: Substance abuse refers to the harmful or hazardous use of psychoactive substances, including alcohol and illicit drugs.

Population:

The study population for this study is higher secondary students.

Sampling and Sampling Technique:

Sample:

The samples for the study were the higher secondary students studying Atulya healthcare, Pune.

Sample Technique:

Sampling is the process of obtaining information about on entire population by examining only a part of it.

A purposive sampling technique was used to select the sample for the present study, which will meet the purpose of the study.

Inclusive Criteria: Students who are,

Studying in Atulya healthcare, Pune, willing to participate in this study.

Present at the time of data collection.

Will be able to read and write Marathi and English.

Exclusive Criteria:

Students who are not present at the time of data collection.

Not willing to participate in the study.

Not able to read and write Marathi and English**.**

Tool:

The instrument used by data collection was self-administered closed-ended questionnaire which consist of two sessions.

CONTENT VALIDITY AND RELIABILITY:

The content validity of the instrument was assessed by obtaining opinion from 8 experts. The experts suggested simplification of language, reorganization and addition of certain items. Appropriate modifications were made accordingly and the tool was finalized.

Reliability was assessed using Pearson's coefficient correlation and found reliable.

Data Collection:

SECTION I

DEMOGRAPHIC DATA:

It consists of demographic variables like sex, religion, family type, occupation of parents and socioeconomic status.

SECTION II

STRUCTURED SELF ADMINISTERED QUESTIONNARIE:

It consists of 25 closed ended questions to assess the knowledge regarding "substance abuse and its impact on health". This includes introduction, definition, prevalence, etiological factors of substance abuse, commonly used psychotropic substances and its impact on health.

RELIABILITY

The reliability of the tool was established by test method using a correlation coefficient method. The reliability was found to be significant (r=1).

Table No.: 1 depicts the demographic variables in terms of numbers and percentage

SR. NO.	DEMOGRAPHIC VARIABLES	NUMBER	PERCENTAGE
1)	Sex a)Male b)Female	 13 17	 43.33% 56.67%
2)	Religion a)Hindu b)Muslim c)Christen d)Other	 30 - - -	 100% - - -
3)	Family Type a)Single b)Joint c)Nuclear d)Other	 9 13 8 -	 30% 43.33% 24.67% -
4)	Occupation of Parents a)Labor b)Government employee c)Farmer d)Private employees	 3 10 15 2	 10% 33.33% 50% 6.67%
5)	**Socioeconomic Status** a)Less than 10,000 b)20,000-30,000 c)30,000-50,000 d)More than 50,000	 - 8 9 13	 - 26.67% 30% 43.33%

SECTION II

Assessment of level of knowledge regarding substance abuse and its impact on health among higher secondary before the implementing of structure teaching program Area, wise comparison of mean , SD , and mean percentage of pretest knowledge scores about substance abuse and its impact on health among higher secondary college students.

Table No. 2 : Depicts comparison of mean, SD , and mean percentage of pretest knowledge scores

Area		Max Obtainable Score	Pre-test		
			Mean	SD	Mean (%)
Introduction		3	1.9	0.64	63.33
Definition		1	0.17	0.70	17
Prevalence		2	1.1	0.64	55
Causes		5	3.33	1.3	66.6
commonly used psychotropic substance abuse		9	4.8	1.5	53.33
Impact on health		5	2.6	1.14	52
Overall		25	13.9	5.92	55.6

Table no. 2 shows that the highest mean score [4.8± 1.5(SD)] which is 53.33% of the total score obtained in the area of "knowledge on commonly used psychotropic substance abuse" whereas lowest mean score [0.17± 0.70(SD)] which is 17% of the total score was in the area of "knowledge on definition of substance abuse"

It reveals that the students had average knowledge in the area "knowledge on commonly used psychotropic substance abuse" and below average knowledge in the area "knowledge on definition of substance abuse".

Further the overall mean was 13.9 ±5.29(SD) which is 55.6% of the total mean score, which reveals that the students had poor knowledge in the area "introduction, prevalence, etiological factors and impact on health of substance abuse".

Comparison of pre-test and post-test level of knowledge on substance abuse and its impact on health among higher secondary students.

Table No. 3. Depicts Comparison of pre-test and post-test level of knowledge scores.

Sr. No	Level of knowledge	Pre-test score		Post-test score	
		Number	Percentage	Number	Percentage
1	Adequate (17-25)	9	30	29	96.67
2	Moderate (9-16)	20	66.67	1	3.33
3	Inadequate (0-8)	1	3.33	-	-

Tableno.3 shows that during pre-test 66.67% of higher secondary students had moderately adequate knowledge, 30% of higher secondary students had adequate knowledge and 3.33% of higher secondary student had inadequate knowledge whereas , during post-test 99.67% of student had adequate knowledge and 3.33% of student had moderate adequate knowledge.

Conclusion

The present study access the knowledge level of higher secondary students at Atulya healthcare, Pune. Regarding the, "substance abuse and its impact on health" and found that the students having 29 (96.67%) had adequate knowledge, and 01(3.33%) of students had moderate knowledge regarding "substance abuse and its impact on health".

Awareness and Assessment of Level of Disaster Preparedness among Nurses of Hospitals

Jasneet Kaur[1], Sheela Upendra[2], A. Seeta Devi[1], Sheetal Barde[1], Sheetal Waghmare[1]

[1]Asst. Prof, [2]Assoc. Prof, Symbiosis College of Nursing, Symbiosis International (Deemed University)

Abstract

Background: A disaster is a serious disruption, occurring over a relatively short time, of the functioning of a community or a society involving widespread human, material, economic or environmental loss and impacts, which exceeds the ability of the affected community or society to cope using its own resources.

Purpose: The main purpose of the study is to Awareness and Assessment of disaster preparedness among Nurses of emergency departments of hospitals

Methodology: Quantitative research design has been employed to study the awareness and assessment of level of disaster preparedness. A questionnaire was used to assess the awareness among nurses regarding disaster preparedness. An observational checklist was used to inspect the disaster preparedness Convenience sampling approach has been utilized to recruit the participants of the study. Sample size was 100. The questionnaires were distributed among the Nurses, seeking information regarding the, awareness about disaster and its preparedness, emergency response plan of hospital design, policy of the hospital to control the disaster, Security management plans, and other relevant patient security information. The questionnaire was based on 3 response options i.e. trichotomous A trihotomous checklist was used to assess the level of preparedness.

Result and Discussion: More than 70% of the hospital nurses well-aware about the hospitals' emergency response plan in department. Only 55 % of staff were aware about the hospital design and structure regarding disaster preparedness. 52% of staff were fully prepared for disaster management whereas 22% are partially prepared. Rest have no idea about the disaster management. There was a significant association between placement of ward of nurses in the hospital and their level of awareness about the disaster. Emergency department (p value at the level of 0.05%)

Conclusion: It is believed that there is great requirement of complete and comprehensive strategy for disaster response and a complete training requirements of individuals. The awareness of emergency preparedness among the hospital staff nurses was moderate. All the hospital staff should be involved in different aspects of disasters that include mitigation, planning, response, and recovery from any disastrous situation.

Keywords: *Disaster, Disaster Preparedness, Nurses , Hospitals*

Background

A disaster is a serious disruption, occurring over a relatively short time, of the functioning of a community or a society involving widespread human, material, economic or environmental loss and impacts, which exceeds the ability of the affected community or society to cope using its own resources.([1]) Understanding the importance of disaster nursing enables nurses to take part in all stages of a disaster, and to actively and effectively participate in disaster management plans made in all fields, included in the health system. The hospital staff especially the back bone of the health system i.e. nurses needs to be capable of utilizing the resources and training

to cope up with an emergency situation.[2]

Preparedness assessment for disaster management is considered as a critical competency, which is required by the experienced nurses as well as fresh graduates. Preparedness for disaster management is termed as the knowledge, abilities, and skills, which are required for preparing and responding towards worst situations; such as nuclear or explosive incidents, man-made incidents, and natural disasters (flood, drought).[3]

Even, if the nurses are well trained in the community health education on natural disasters, they are still not efficient in managing bioterrorism and mass emergency events. Nurses have basic knowledge and skills to manage a mass casualty incident. The assessment of training requirements is a significant step towards the implementation of specific training programs for the nurses.[4]

Aim of the study

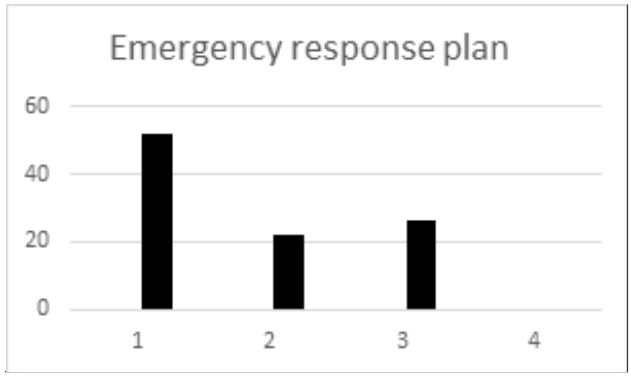
1. To determine the awareness of the nurses regarding disaster preparedness.

3. To assess the level of preparedness of Nurses regarding disaster preparedness.

3. To associate the findings with selected demographic variables

Material and Methods

Quantitative research design has been employed to study the awareness and assessment of level of disaster preparedness. A questionnaire was used to assess the awareness among nurses regarding disaster preparedness. An observational checklist was used to inspect the disaster preparedness Convenience sampling approach has been utilized to recruit the participants of the study. The time period consumed for the data collection process was three months, Sample size was 100. The setting was hospitals under PCMC. The questionnaires were distributed among the Nurses, seeking information regarding the, awareness about disaster and its preparedness, emergency response plan of hospital design, policy of the hospital to control the disaster, Security management plans, and other relevant patient security information. The questionnaire was based on 3 response options i.e. trichotomous (Yes, No and not known). A trihotomous checklist was used to assess the level of preparedness.(fully prepared, partially prepared, not prepared)



Results

Majority of Nurses who have experience more than 5 years have 61%. Half of the staffs were having experience less than 5 years.

Table 1 shows that More than 70% of the hospital nurses well-aware about the hospitals' emergency response plan in department

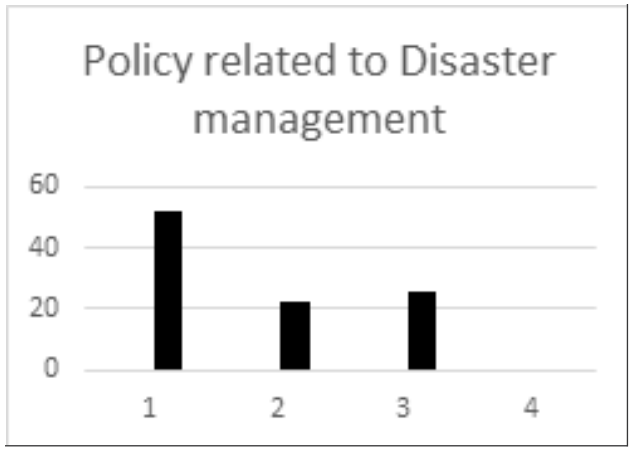


Table 1: Awareness of emergency response plan

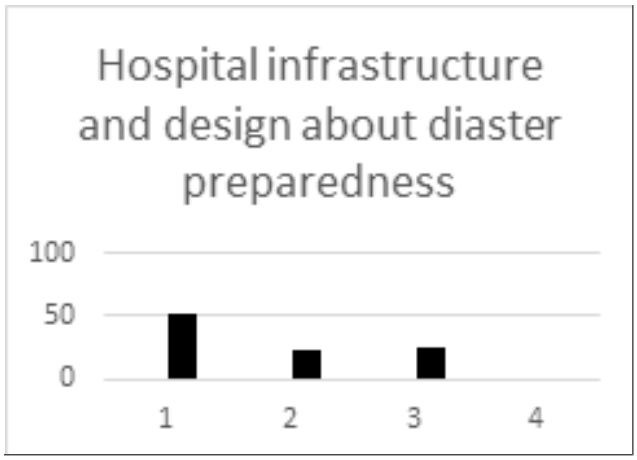
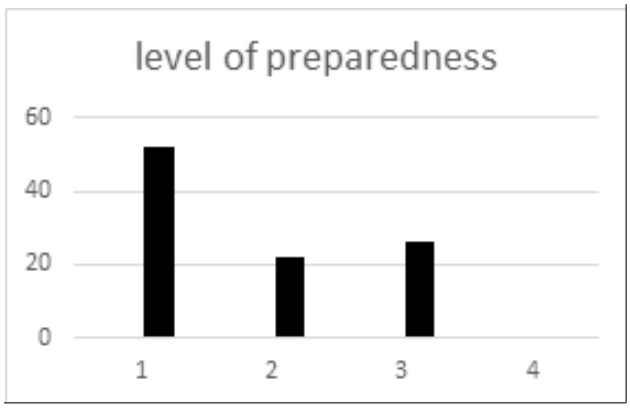
N=100



Only 20% staff were aware of the policies available at hospital regarding disaster and its management whereas 60% staff don't know about the policy

Table 2: Awareness of policy related to disaster management N=100



Only 55 % of staff were aware about the hospital design and structure regarding disaster preparedness

Table 3: Awareness of policy related to disaster management N=120

52% of staff were fully prepared for disaster management whereas 22% are partially prepared. Rest have no idea about the disaster management

Table 4: Assessment of level of disaster preparedness

There was a significant association between placement of ward of nurses in the hospital and their level of awareness about the disaster. Emergency department (p value at the level of 0.05%) has shown a significant association with the disaster preparedness like oxygen outlets, air condition duck etc. inexperienced hospital staff was mainly not aware of emergency response plans; although, the differences among the results were statistically insignificant.

Conclusion

It is believed that there is great requirement of complete and comprehensive strategy for disaster response and a complete training requirements of individuals. The awareness of emergency preparedness among the hospital staff nurses was moderate. All the hospital staff should be involved in different aspects of disasters that include mitigation, planning, response, and recovery from any disastrous situation.

Integrating High Fidelity Simulation with Patient Assessment Using International Trauma Life Support (ITLS) Protocols for Prehospital Scenarios amongst Emergency Medical Services (EMS) Students of Pune, India

Parag Rishipathak[1], Shrimathy Vijayraghavan[2], Anand Hinduja[3]

[1]Director, Symbiosis Centre for Health Skills, [2]Medical Officer, Academics, Symbiosis Centre for Health Skills, [3]Adjunct Faculty Symbiosis Centre for Health Skills, Symbiosis International, Deemed University, Pune, India

Abstract

Introduction: Prehospital settings are frequently associated with a high degree of mortality and are challenging situations for training purposes. Assessment of the critically ill-injured patients needs to be both accurate and timely. This can significantly improve the chances of survival of the patients. The ITLS patient assessment protocol is a valid and reliable assessment tool for trauma emergencies. The study attempts to integrate high fidelity simulation with trauma assessment using ITLS patient assessment protocol.

Objective: To utilize High fidelity Simulation to assess the preparedness of EMS students in executing ITLS patient assessment protocol.

Methodology: 80 students of Post Graduate Diploma in Emergency Medical Services (PGDEMS) participated in High fidelity simulation scenarios for patient assessment using ITLS Protocols. A high fidelity manikin METIMAN was programmed for running clinical scenarios. On the day of Simulation, Twelve groups of seven students each performed one simulated clinical scenario and were evaluated using patient assessment protocol checklist of ITLS.Each simulation session lasted for 10 minutes each followed by a structured debriefing for 20 minutes. The entire simulation session was video recorded with consent of the students.

Conclusion: The study concludes that there should be proper understanding and knowledge regarding when to apply the cervical stabilization and need for more hands on practice for critical life threatening emergencies using High fidelity simulation manikins.

Keywords: *High fidelity Simulation, ITLS, patient Assessment, Prehospital management, Emergency medical Services.*

Introduction

EMS is defined as a system that organizes all aspects of care provided to patient in prehospital or out of hospital environment.[1]

The Post Graduate Diploma in Emergency Medical Services (PGDEMS) program trains medical professionals in the basics of Emergency medical Services inclusive of Basic Life Support, Airway Management, Intubation Techniques, Cardiac Case scenarios, Arrythmia recognition, Emergency drugs, use of Defibrillator, Spinal Immobilization, triage and other life saving skills.

Prehospital settings are frequently associated with a high degree of mortality and are challenging situations for training purposes.[2] Prehospital management has to ascertain initial treatment strategies and be priority Oriented[3].Providing training to EMS students in real life prehospital setting is challenging to unstable patients[2].

It is therefore rational to use high fidelity simulation to train EMS students for real prehospital events through

scenario dynamics and limited realism.[4]

Simulation facilitates both the initial learning and deliberate practice in the management of critical emergency scenarios.[2] A study in 2007 by Berkendanst[5] *etal* described the possible roles of simulated patients, skill trainers, computerized patient simulators and web based teaching in trauma training.

Assessment of the critically ill-injured patients needs to be both accurate and timely. This can significantly improve the chances of survival of the patients.

It is very difficult to assess the performance of the EMS students in a real life emergency due to paucity of time and prioritization towards saving the patient. Simulation offers an excellent alternative for objective assessment of the ITLS protocol and can be administered in a safe environment.

A study by Christine[6] *etal* has conclusively shown that trauma simulation training increases confidence levels in prehospital personnel performing lifesaving intervention in trauma patient.

The ITLS patient assessment protocol is a valid and reliable assessment tool for trauma emergencies.

The study attempts to integrate high fidelity simulation with trauma assessment using ITLS patient assessment protocol.

Objective:

To utilize High fidelity Simulation to assess the preparedness of EMS students in executing ITLS patient assessment protocol.

Methodology

80 students of Post Graduate Diploma in Emergency Medical Services (PGDEMS) participated in High fidelity simulation scenarios for patient assessment using ITLS Protocols. . The students were briefed regarding ITLS Patient assessment protocol through didactic lectures and videos in the week preceding to the session.

A high fidelity manikin METIMAN was programmed for running clinical scenarios. The topics covered included Hemorrhagic Shock following Trauma, Tension Pneumothorax, Head Injury and Cardiogenic Shock.

On the day of Simulation, Twelve groups of seven students each performed one simulated clinical scenario and were evaluated using patient assessment protocol checklist of ITLS.

Each simulation session lasted for 10 minutes each followed by a structured debriefing for 20 minutes.

The entire simulation session was video recorded with consent of the students.

The videos were reviewed by two simulation educators to avoid bias and scored using ITLS checklist consisting of 9 items which formed the Primary Survey.

The participants were awarded 1 point for performing the action as per ITLS patient assessment checklist and the maximum possible score was 9 thus evaluating their adherence to ITLS patient assessment protocol.

Result

Table 1. Patient Assessment as per ITLS Protocol

KEY: Y indicates critical actions performed as per ITLS protocol

N indicates the critical actions not performed as per ITLS protocol

Critical Action	Group											
	1	2	3	4	5	6	7	8	9	10	11	12
Scene Size Up	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

Cont... **Table 1. Patient Assessment as per ITLS Protocol**

General Impression	N	Y	Y	Y	Y	Y	N	Y	Y	Y	Y	N
Level of Consciousness	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Manual Inline Stabilization	N	Y	Y	N	N	N	N	Y	N	N	N	N
Initial Assessment -Airway	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Initial Assessment -Breathing	Y	Y	Y	Y	N	Y	Y	Y	Y	Y	Y	Y
Initial Assessment -Circulation	Y	Y	Y	Y	N	Y	Y	Y	Y	Y	Y	Y
Rapid Trauma Assessment	Y	y	Y	Y	Y	Y	Y	Y	N	Y	Y	Y
Cervical Collar Applied After Neck Examination	N	N	Y	Y	N	Y	Y	Y	Y	Y	Y	Y
Total Score out of 9	6/9	8/9	9/9	8/9	4/9	8/9	6/9	9/9	6/9	7/9	7/9	6/9

Table no. 1 describes the adherence of the participants to the critical actions required to be performed as part of the patient assessment.

All twelve groups assessed the scene safety, mechanism of injury, and Level of Consciousness, which could point towards multiple life threatening injuries.

Eleven Groups performed the Initial Assessment accurately, which includes immediate recognition and management of life threatening injuries related to Airway, Breathing and Circulation.

Ten Groups performed Rapid Trauma Assessment after completing the initial assessment in which they did complete Head to Toe examination of the patient and came to a correct diagnosis.

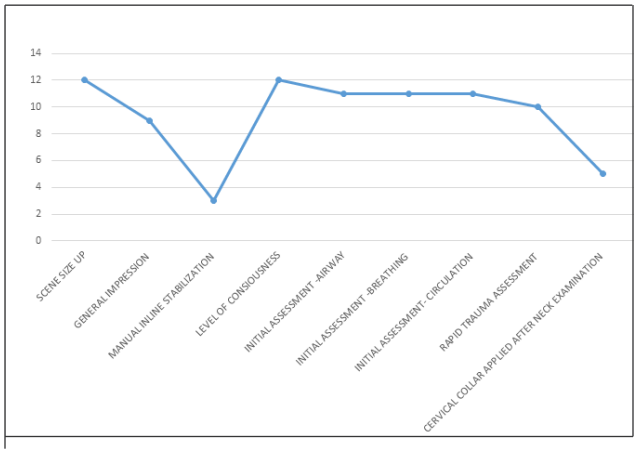

Figure 1

As shown in Figure 1. Significant dip in adherence is seen in performance of Manual Inline Stabilization, which was performed only by 3 groups out of 12 and in application of Cervical Collar which was performed by only 5 groups.

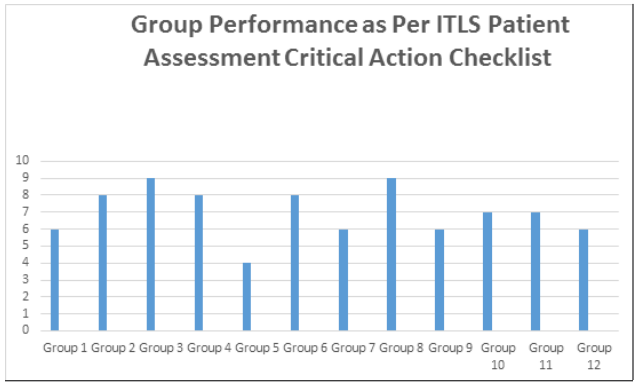

Figure 2

Figure 2. Depicts each group's performance in terms of performing the critical action during patient assessment.

The highest score obtained is 9/9.

The lowest score obtained is 4/9

Discussion

The participants in the study were briefed through traditional lectures and Videos regarding the ITLS patient Assessment protocol. Yet when confronted with a realistic simulation scenario on a high fidelity manikin, only two groups out of twelve were able to perform all

the steps of the ITLS checklist.

An objective assessment of the critical action performance showed that the students failed to provide appropriate manual inline stabilization as well as application of cervical collar after neck examination.

The early management of a patient with a potential cervical spinal cord injury begins at the scene of the accident. Since there is no other way of confirming cervical injury, in cases of significant mechanism of injury, potential cervical spinal injuries must be anticipated and cervical immobilization should be done. If the patient is not transported in a correct manner, neurologic function may be impaired. So cervical spinal immobilization becomes a critical aspect of patient assessment protocol.

This emphasizes the fact that there should be proper understanding and knowledge regarding when to apply the cervical stabilization and need for more hands on practice for critical life threatening emergencies using High fidelity simulation manikins.

It was encouraging that most groups performed the assessment of Airway, Breathing and Circulation accurately and meticulously. They also successfully completed the sizing up of scene and rapid trauma assessment.

High fidelity simulation offers the opportunity to observe and critically appraise the students during their training period. The debriefing examines the reasons behind noncompliance to assessment protocols thereby improving the performance of the students in real clinical situations.

Rigorous adherence to the patient assessment protocol significantly improve patient outcomes. Hence, High fidelity simulation should be utilized for evaluating and improving student performance.

Conclusion

Though participants performed the initial assessment accurately and managed the scenarios as per ITLS protocol, they were lacking in the knowledge of when to apply the skills component.

The study concludes that there should be proper understanding and knowledge regarding when to apply the cervical stabilization and need for more hands on practice for critical life threatening emergencies using High fidelity simulation manikins.

Assessment on the 'Impact of Nutrition Exhibition 'on Knowledge level among Rural Women in Selected area of Pune District

Sheela Upendra[1], Jasneet Kaur[2], Seeta Devi[2], Sheetal Barde[2], Shitalwaghmare[2]

[1]Assoc. Professor, [2]Asst. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Rural women have poor level of knowledge in terms of nutrion practice for self and even to the family members regarding nutrition practices. The present study were focused with objective to assess the existing level of knowledge on Nutrition among rural women and to evaluate the impact of Nutrition exhibition on knowledge level among rural women **Method:** Quantitative Research approach, Pre-experimental one group Pre test - Post test research design was adopted for the study. The samples were 40 rural women. Non-probability purposive sampling technique was used. Tool were developed in two Sections: Demographic Proforma of the sample, self-administered structured questionnaire was used with 40 statements. Relevancy, objectivity and appropriateness in tool was validated by experts . Reliability of tool was calculated by Cronbach's alpha method and was 0.87 . After taking the consent from the subjects, the investigator has administered pre-test to respondents following which Nutrition exhibition was put up followed by administration of post-test from same respondents was collected. **Result:** Majority of 84 % of the women had poor knowledge score (0-13), 14% of them had average skill score (14-27) and only 2% of them had good skill score (28-40). Paired t-test applied ,T-value was found to be -12.427 with 39 degrees of freedom. Since the p-value is very small (< 0.05), the null hypothesis H_0 is rejected and hence H_1 is accepted. This indicates that the nutrition exhibition had significantly improved the knowledge of the rural women regarding nutrition. **Discussion:** The Present study findings reveals that the nutrition exhibition had significantly improved the knowledge of the rural women regarding nutrition.. Similar findings were observed in study where the knowledge of rural women was found poor.

Key words: *Nutrition exhibition; Rural women; Impact; Assessment.*

Introduction

The proportion of undernourished people in the overall population has fallen from 21.5 per cent in 2004-06 to 17 per cent in 2011-13 according to International Food Policy Research Institute (IFPRI) estimates [1] .

For the health of children aged 0-5 years , nutritional awareness of mothers plays an important role. The type of care mother provides depends to a large extent on her knowledge and understanding of some aspects of basic nutrition and health care. Education of mother, health and nutritional status is central to the quality of life and prime important of child's health , nutritional status, behavioral and other aspects of child welfare in developing countries. Study report displays that incidence of under nutrition among children fell monotonically with the education of mothers. This is of particular alarm for India due to a low literacy level of 56 per cent for females , emphasize census 2011 report.

Study report of Nivedita and Shanthini concluded that knowledge about food rich in iron was poor among the participants. (74.36%) of participants taken iron

Corresponding Author:
Dr. Sheela Upendra
Assoc. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra, sheelaupendra@scon.edu.in

supplementation regularly whereas (9.8%) had not taken iron supplementation. On hemoglobin estimation it was found that (62.97%) of the participants were anemic taking 11 grams as the cut off for anemia. The only significant determinants of hemoglobin levels were regular intake of iron supplements (p value 0.006) and timing of iron consumption (p value 0.0262). All respondents had knowledge about the items as „all food items should be included in diet of pregnant women" and „pregnant women should eat anyone fruit daily" and „pregnant women should consume more water as compare to other women".97.5 per cent of the respondents also disagreed with the items as „breast feeding should not be given to the newly born baby". This shows that rural women were aware of importance of breast feeding.[2]Thus a study was felt need by investigator to impart nutrition exhibition to rural women .

Statement of the problem

Assessment on the 'Impact of Nutrition Exhibition 'on Knowledge level among Rural Women in Selected area of Pune District

Objectives

1. To assess the existing level of knowledge on Nutrition among rural women
2. To evaluate the impact of Nutrition exhibition on knowledge level among rural women

Hypothesis:

$\mathbf{H_0}$- There is no significant impact of nutrition exhibition on knowledge level among rural women.

$\mathbf{H_{1-}}$ There is significant impact of nutrition exhibition on knowledge level among rural women.

Methodology: Quantitative Research approach was accepted in the study. Pre-experimental one group Pre test - Post test research design was adopted for the study. The samples were 40 rural women. Non-probability purposive sampling technique was used. Tool was developed in two Sections: Section I: Demographic Proforma of the sample ; included age, education, marital status and exposure to nutrition exhibition previously. Section II: Self administered structured questionnaire was used with 40 statements. Relevancy, objectivity and appropriateness in tool was validated by experts . Reliability of tool was calculated by Cronbach's alpha method and was 0.87 . Section

The period of data collection commenced from first week of Feb 2018 to third week of Feb 2018. After taking the consent from the subjects, the investigator has administered pre-test to respondents followed by nutrition exhibition was put up and then administration of post-test from same respondents was collected.

Findings: Based on the hypothesis and the objectives the data was analysed using both descriptive and inferential statistics.

Section I: Description of demographic variables in terms of frequency and percentage

Table 1: Shows the demographic variables in terms of frequency and percentage N=40

Demographic variable		Frequency(n)	Percentage (%)
Age (Years)	21-35 yrs.	24	60
	36 and above	16	40
Education	Literate	36	90
	Illiterate	04	10
Marital status	Married	32	80
	Unmarried	08	20
	Widowed	Nil	0
Exposure to nutrition exhibition previously	Yes	Nil	0
	No	40	100

Section II: Analysis of data related to the existing level of knowledge on Nutrition among rural women

Majority of 84 % of the women had poor knowledge score (0-13), 14% of them had average skill score (14-27) and only 2% of them had good skill score (28-40)

Section III: Analysis of data related to evaluate the impact of Nutrition exhibition on knowledge level among rural women

Table 2: Shows the data related to evaluate the impact of Nutrition exhibition on knowledge level among rural women N=40

	Mean	Std Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
				Lower	Upper			
Pre test	12.32	6.164	1.317	-16.732	-11.741	-12.427	39	.001
Post test	29.13	5.147						

Paired t-test applied for comparison of pre-test and post-test knowledge scores among rural women on nutrition exhibition. T-value was found to be -12.427 with 39 degrees of freedom. Corresponding p-value was found to be very small (of order of 0.001). Since the p-value is very small (< 0.05), **the null hypothesis H_0 is rejected and hence H_1 is accepted.** In Pre test, average knowledge score was 12.32 with standard deviation of 6.164 whereas in post-test average knowledge score was 29.13with standard deviation of 5.147. This indicates that the nutrition exhibition had significantly improved the knowledge of the rural women regarding nutrition.

Discussion

Present study findings reveals that the nutrition exhibition had significantly improved the knowledge of the rural women regarding nutrition.

Study findings of Suchitra and Ravindra Kumar emphasized that the knowledge of "Basics of food and nutrition" bring out that items „green leafy vegetables contains nutrients as vitamins and minerals" and „nutrient required for body building and maintenance is protein" were not answered correctly . Nutrition knowledge was limited to familiar practices in the actual diet. Attitudes toward complications of pregnancy and illness tended to be fatalistic. Awareness of the importance of maternal nutrition and the harmful effects of insanitary living conditions was evident. Beliefs regarding protein- calorie malnutrition in infants were based on superstition. The overall knowledge, attitude and practices regarding utilization of underutilized green leafy vegetables in selected rural women that is 43.12 percent, 46.12 percent and 49 percent respectively[3]

Findings of Rani et al., revealed their ethnic traditional knowledge treasure which they possessed. In-spite of their traditional knowledge 50%and 57.14 %of women were not aware of the scientific role and importance of iron and folic acid during pregnancy and about regular vaccines respectively.

Recommendation

A comparative study can be conducted among rural and urban Women.

A similar study can be undertaken in domain like attitude of Nutrition exhibition.

A similar study can be replicated on a large sample size.

Conclusion

It is concluded from the study findings that the knowledge of rural women was poor before the putting up the Exhibition on Nutrition. The Nutrition exhibition helped rural women to enhance the knowledge which was evident in the post test knowledge score. There was a statistical significant difference between pre test and post test knowledge scores. Hence the exhibition been proved to be an effective strategy for enhancing the knowledge of rural women. Women, regardless of education, should receive health education to enhance knowledge.

A Study to Assess the Effectiveness of Structural Teaching Program on Knowledge and Attitude of Nurses Regarding Fecal Microbial Therapy (FMT) in Selected Hospitals of Pune City

Deepak Sethi[1], Shobha Naidu[2], Maj Kirti[3]

[1]Asst. Prof. Symbiosis College of Nursing, [2]Assoc. Prof. Symbiosis College of Nursing, [3]Nursing Officer MH Kirkee, Symbiosis College of Nursing (SCON), Symbiosis International (Deemed University), Pune

Abstract

The rapidly emergent field of microbial research, i.e. studies of the diverse microbial communities, their genomes and interactions within and on the human host, has increased our vision for the impact of microbial community composition and function on a variety of human diseases ranging from metabolic to organ dysfunction. Recent advances in sequencing methods have revealed that the gut microbiota have an important role to play in health and disease. The most novel discovery identified regarding use of fecal microbiota transplantation (FMT) as an "ecological" therapy for several gut diseases

Present study has done on 50 samples selected randomly in hospital of Pune city. The population consists of staff nurses who are working with Medical and Surgical department in tertiary care hospital. The sample were selected by using random sampling. Pretest was given to all 50 participants followed by planned teaching program on Fecal Microbial Therapy (FMT). After a period of 2 week, post-test was given to same participants and results. The group were undergone pre-test and Effectiveness of teaching plan on Fecal Microbial Therapy (FMT) was determined by using T-Test (post-test comparison). Chi- square test was used to determine the association between socio-demographical variables and poste test score.

Results showed that, out of 50 subjects, 80% were female and 20% were male. Majority of subjects (84%) were in age group of 25 to 30 and 16% were in age group of above 40 years. Even the selected hospital has NABH accreditation but none of any staff has received in service education related to medication error. Independent T-Test results showed that there is significant difference between the pre and post test score ($p < .005$).

Key words: *Fecal Microbial Therapy (FMT)*

Introduction

Human beings are one of God's marvelous creations on this earth. The anatomy and physiology of internal structure of human body is another most remarkable and incomparable display of His unbeatable creativity.

Most of the ailments in human body can be cured by use of dietary substances but the gastrointestinal tract, which harbours a large microbial ecosystem, housing several trillion microbial cells named the gut microbiota, is vulnerable to many disease conditions. To name a few of these gut disorders, are Inflammatory Bowel Diseases, Ulcerative colitis etc.

Recent advances in sequencing methods have revealed that the gut microbiota have an important role to play in health and disease. The most novel discovery identified regarding use of fecal microbiota transplantation (FMT) as an "ecological" therapy for several gut diseases has brought in diverse acceptance of the therapy in view of not only its medical value but also the aesthetic perception, understanding and acceptance(1).

Recent attempts made in this field suggest that FMT could be an ideal treatment option for a disturbance in the gut microbiota which could be responsible for the initiation and persistence of symptoms in patients with irritable bowel syndrome [2].

Fecal Microbiota Transplantation (FMT) is presently an under-researched procedure that could probably be a viable alternative to the current treatment standards for chronic diseases of the intestines (CDI). FMT is a procedure whereby fecal matter obtained from a healthy donor is administered to an individual suffering from CDI, as an end-goal/ last option of correcting the imbalance of gut microbiota[3].

The process of stool transfer from healthy donors to the sick is not really a novel attempt but has an ancient history attached to its discovery [1]. However, only recently researchers started investigating its applications in an evidence-based manner. Although Researchers have studied the effects of FMT on various gastrointestinal and non-gastrointestinal diseases, but could not precisely pinpoint the exact strain of bacteria which could be responsible for the observed clinical improvement of the process. Results from clinical studies are conflicting, which reflect the gap in knowledge of the microbiome composition and function, and highlights the need for a more defined and personalized microbial isolation and transfer [4].

Being a part of the health team, the nurses have an equal responsibility to get abreast with the knowledge regarding this upcoming therapy for the specific gut disorders. But what is most demanding in this therapy is the knowledge and attitude towards the treatment modality, ability to inform the client and his relatives in a convincing manner regarding the advantage of the therapy and seek their consensus for the same.

The history of fecal microbiota transplantation (FMT) dates back even to ancient China[4]. Recently, scientific studies have been looking into FMT as a promising treatment of various diseases, while in the process teaching us about the interaction between the human host and its resident microbial communities.

In modern medicine, the use of fecal enemas for the treatment of 'pseudomembranous colitis' was first reported in 1985 by the surgeon Eiseman. Over the last three decades, faecal transplant has received increased scrutiny after numerous studies proved that stool is a biologically active complex mixture of living organisms with therapeutic potential, and the intestinal microbiota was recognized as the biologically active component of stool [5]. Thus, the process of stool transfer from a healthy donor to a person suffering from physical illness or symptoms is now termed fecal microbiota transplant (FMT).

Objective:

To assess the pretest knowledge regarding FMT among the staff nurses of selected hospitals of Pune city.

To assess the effectiveness of structural teaching program on FMT among the staff nurses of selected hospitals of Pune city.

To assess the association between selected socio-demographical variables with post test score.

Hypothesis

H_0: There is no difference in pre-test and post-test score after implementing structural teaching program regarding Fecal Microbial Therapy (FMT).

Methodology:

Research Approach: Pre-Experimental

Research Design: One group Pretest post-test design

Variables: Structural teaching program **(Independendant variable),** Knowledge and attitude **(Dependent variables).**

Target population: Staff Nurses working in secondary and tertiary care hospitals

Assessable population: Staff Nurses of Sahyadhri Hospital

Sample size: 50

Inclusive criteria:

Staff nurses with B.Sc., P.BSc and M.Sc. Nursing

Staff nurses who have able to understand English and Hindi

Staff nurses who give consent to participate in study

Exclusion criteria:

Staff nurses who have attended in service education on FMT

Sampling technique: Judgmental sampling

Tool:

Section I: Sociodemographical data

Section II: Knowledge based Structure Questionnaire

Section III: Likert scale for attitude assessment

Results and Finding

Table 1: Table 2 represents the overall demographical data of the study

Statistics							
		GENDER	EDUCATION	WORK SETTING	WORK EXPERIENCE	PREVIOUS KNOWLEDGE	HAVE YOU EVER ENCOUNTER ANY CASE OF FMT
N	Valid	50	50	50	50	50	50
	Missing	0	0	0	0	0	0
Mean		1.280	1.780	1.000	2.700	1.120	1.000
Median		1.000	2.000	1.000	3.000	1.000	1.000
Std. Deviation		.4536	.4185	.0000	.8864	.3283	.0000

Table 2: Table 1 depicts the work settings of staff nurses. Majority of staff were working in general ward (72%) and only 28% staff were working in infection control even they still participate in study.

Work Setting					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	General ward (1)	36	72.0	72.0	72.0
	Infection Control (2)	14	28.0	28.0	100.0
	Total	50	100.0	100.0	

Pre-test and post test

Table 3: **Shows the Mean knowledge difference between pre and post-test with df, 49 and at 5% level of significance, the results shown to be rejection of Null (H_0) hypothesis as p> .05. So the teaching plan was effective to increase the level of knowledge of staff nurses regarding FMT.**

One-Sample Test						
	Test Value = 0					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
Pre test	78.335	49	.000	35.6000	34.687	36.513
Post test	152.622	49	.000	39.8800	39.355	40.405

Attitude score

Table 4: Table 6, depicts that 20% staff felt agree in Difficulty in handling the odour of treatment, 32% felt strongly agree in same and majority (48%) disagree that the handling FMT treatment is not a big deal for them.

Difficult to handle the odour of treatment					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Agree	10	20.0	20.0	20.0
	Strongly agree	16	32.0	32.0	52.0
	Disagree	24	48.0	48.0	100.0
	Total	50	100.0	100.0	

Table 5: Table 7, depicts the attitude of staff nurses on look and aesthetics of donor's stool. Majority (36%) staff felt disagree when asked about the unappealing to look for donor. (32%) were strongly disagree for the same and only 16% were strongly agree that it bothers them to look for stool donor.

It look awkward to discuss the FMT with donor					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Agree	1	2.0	2.0	2.0
	Strongly agree	1	2.0	2.0	4.0
	Disagree	3	6.0	6.0	10.0
	Strongly disagree	31	62.0	62.0	72.0
	Can't say	14	28.0	28.0	100.0
	Total	50	100.0	100.0	

Table 6: Table 8 depicts the attitude of staff nurse for awkward factors for FMT.

Unappealing to look for stool donor					
		Frequency	**Percent**	**Valid Percent**	**Cumulative Percent**
Valid	Strongly agree	8	16.0	16.0	16.0
	Disagree	18	36.0	36.0	52.0
	Strongly disagree	16	32.0	32.0	84.0
	Can't say	8	16.0	16.0	100.0
	Total	50	100.0	100.0	

Majority of staff (62%) were strongly disagree that it look awkward to discuss the FMT with donor and only 2% were in favor of this.

Conclusion

Despite increasing interest in fecal microbial therapy (FMT), its full therapeutic potential has yet to be determined. Since its increase in popularity, FMT has been shown to be highly effective in the treatment of both *Clostridium difficile* infection (CDI). The training and education to health care professionals regarding FMT is very essentials. The study over all showed that rejection of Null **(H_0)** hypothesis as p> .05. So the teaching plan was effective to increase the level of knowledge of staff nurses regarding FMT.

In term of attitude towards FMT, 20% staff felt agree in Difficulty in handling the odour of treatment, 32% felt strongly agree in same and majority (48%) disagree that the handling FMT treatment is not a big deal for them. the attitude of staff nurses on look and aesthetics of donor's stool. Majority (36%) staff felt disagree when asked about the unappealing to look for donor. (32%) were strongly disagree for the same and only 16% were strongly agree that it bothers them to look for stool donor.

Conflict of Interest: In the present study there was no conflict of interest among the health care professional and researcher.

Source of Funding: The present study is self-funded.

Ethical Clearance: The Ethical clearance was taken from SCON Institutional Research Committee (IRC) on January, 2019

Knowledge regarding Total Parenteral Nutrition (TPN) among the ICU Nurses in Selected Hospital of Pune City

Manisha Vikrant Mistry

Asst. Professor, Symbiosis College of Nursing (SCON), Symbiosis International (Deemed University), Pune

Abstract

Aims and Objectives. This study was conducted to assess the knowledge regarding Total Parenteral Nutrition (TPN) among the ICU nurses

Background. Although there is increasing awareness about the Total Parenteral Nutrition (TPN) it is an area that needs exploration.

Design. This study was descriptive with quantitative approach.

Methods. 22 staff nurses were selected using non-probability purposive sampling and were administered with a structured questionnaire

Results. The nurses had adequate knowledge about the TPN.

Conclusions. This study indicates that regular in-service education will keep the nurses updated and make them more competent in dealing with the clients requiring TPN.

Relevance to clinical practice. The study re-iterated that Nurses are suitable team members for continuous nutritional care and therefore must be always involved in direct patient care.

Key words: *Knowledge, Total parenteral nutrition, TPN, Nurses, ICU.*

Introduction

"All deaths are hateful to miserable mortals. But the most pitiable death of all is to starve" - HOMER ODYSSEY

Health is wholeness and balances an inner resilience that allows meeting demand of living without being overwhelmed. For being healthy nutritional status has to be maintained. Nutrition is a vital for life and health. Poor nutrition can seriously decrease one's level of wellness. Total parenteral nutrition is a method of giving concentrated solutions intravenously to maintain or supplement a patient's nutritional balance when oral or enteral nutrition is inadequate or not possible.[1]

The need of nutritional therapy has been emphasized in the patient care, especially for hospitalized patient, where malnutrition related complication is on rise. Nutritional support is not merely administering calories and proteins; it also includes the provision of all nutritional substrates to facilitate the biological process of inflammation and healing.[2]

Dr. Stanley Dudrik invented total parenteral nutrition in 1968. The role of nutritional support in clinical care has burgeoned over the past forty years. Since the introduction of total parenteral nutrition, its use has become a vital clinical practice to prevent and reverse malnutrition in individuals with various disease and conditions.[3]

For maintaining nutritional status parenteral feeding is the only option in patients whose gastrointestinal tract function is impaired. It is the responsibility of the nurse to maintain the total parenteral nutrition and prevent complications and provide close and rational management and follow up of the patients receiving total parenteral nutrition. Hence the student nurse must be prepared to meet the emerging needs of patient with

total parenteral nutrition through the art and science of nursing.

Total parenteral nutrition is a miracle, in that it keeps people alive where they cannot eat to sustain themselves.

Need for Study

In this era of evidence based medicine, total parenteral nutrition has been highly scrutinized .Many hospitalized patient receive dextrose or amino acid solutions by parenteral method. Total parenteral nutrition supplies all daily nutritional requirement. Parenteral nutrition is a complex form of therapy designed to provide daily nutritional requirement by intra venous route.[4]

Many clinical investigations and reports have shown that the newly developed intravenous nutritional regimens are adequate alternatives to the ordinary diet. Total parenteral nutrition has been to be of very great clinical importance to prevent and treat starvation often related to high morbidity and mortality.[5]

Morten Mowe conducted a study on "Insufficient nutritional knowledge among health care workers?" where a questionnaire about different aspects of nutritional practice was answered by 4512 doctors and nurses in Denmark, Sweden and Norway. Results revealed that the most common cause for insufficient nutritional practice was lack of nutritional knowledge. Twenty-five percent found it difficult to identify patient in need of nutritional therapy, 39% lacked techniques for identifying malnourished patients, and 53% found it difficult to calculate the patients' energy requirement and 66% lacked national guidelines for clinical nutrition. Twenty-eight percent answered that insufficient nutrition practice could lead to complications and prolonged hospital stay. Those that answered that their nutritional knowledge was good had also a better nutritional practice. The self-reported nutritional knowledge was inadequate among Scandinavian doctors and nurses. Increased nutritional knowledge seems to improve the nutritional practice. A combination of an integrated nutrition curriculum during the education, together with post-graduated education for both physicians and nurses should be established.[6]

Annette M, et al conducted a study on "Development of Evidence-Based Guidelines and Critical Care Nurses' Knowledge of Enteral Feeding" where she mentioned that full-strength formula is started at a rate of 25 mL/h, and the head of the bed is elevated to a minimum of 30°. Although our guidelines suggest increasing the rate of enteral feeding every 4 hours, no research evidence was available to support this frequency. However, every 4 hours was common practice in other institutional protocols and the literature.[7]

In an investigation by McClave et al,[8] only half of the critically ill patients in the study received their calorie goals, and 66% of cessations in enteral feeding accounted for 19.6% of the potential feeding time. Expert opinion suggests that enteral nutrition be maintained until the start of medical or diagnostic procedures and restarted within 1 hour after a procedure unless specifically contraindicated; in addition, periods longer than 4 hours without nutrition should be avoided.[9] According to anesthesia guidelines,[10] refraining from liquids for 2 to 4 hours before surgery is adequate. Furthermore, in another study,[11] starting nutritional support more than 3 days after admission to the ICU was associated with an increased length of stay.

This study is very much needed among nurses in particular areas to understand the harmful effects of malnutrition on the overall health of a patient are well documented. Poor nutrition is associated with slowed or impaired recovery from illness and surgery. For wound healing, tissue maintenance, and faster recovery, patients need optimal nutritional intake.

When a patient is unable to take in enough food on his own, there are two options. Enteral feeding is preferred because it is less invasive, has a lower risk for infection, and is safer than the parenteral method. Though enteral feeding is the preferred route of nutritional intake, parenteral nutrition plays an important role in many clinical situations.

Patients who cannot consume enough nutrients on their own, or who cannot eat at all because of an illness, surgery, or an accident, may be fed through an intravenous line. The need of this study is to know or assess the knowledge regarding parenteral nutrition among nurses. Parenteral nutrition is most required in critical areas so this study is needed to detect any problem regarding parenteral nutrition among nurses. To check any malfunction in critical areas by nurses as it's a very important procedure for patient. This procedure is important along with the treatment given to the patient.

Statement of the problem

"A study to assess the knowledge regarding Total Parenteral Nutrition (TPN) among the ICU nurses in selected hospital of Pune City"

Objectives of the study

To assess the knowledge level of ICU nurses regarding Total Parenteral Nutrition (TPN).

Methodology

Research approach used in this study was Quantitative in nature and Design used was Descriptive. The study was conducted in an ICU of the selected hospital which is kept confidential. The hospital is 500- bedded, multi-specialty Hospital in Pune City. 22 nurses working in the ICU were selected using non-probability purposive sampling who fulfilled the selection criteria. A structured questionnaire was used to assess the knowledge among the registered staff nurses working in ICU department of the selected Hospital of Pune City. Based on the research problem and objectives of the study, the following steps were undertaken to select and develop the data collection tool. The tool consisted of final 15 questions related to the knowledge level regarding TPN. The tool underwent a rigorous validation process where 9 experts from the field of medicine and 5 experts from the field of Nursing validated the tool.

Data Analysis & Results

The cases were selected on the basis of purposive sampling technique. The information was gathered by questionnaire fill by nurse. The data was tabulated according to various parameters like age, sex, qualification, education of the participant. Data was represented by using various graphical devices like bar diagram, pie diagram, etc.

A descriptive study approach was adopted in order to assess the knowledge regarding TPN of 22 nurses in a selected Hospital, Pune A structured questionnaire schedule to assess the knowledge about TPN was prepared. Data was collected from the sample after obtaining permission for the concerned authority. Collected data analyzed using descriptive statistics and presented in the form of tables and graphs.

Section I: Description of the sample characteristics

Baseline data containing sample characteristics would be analyzed using frequency and percentage.

1. AGE n=22

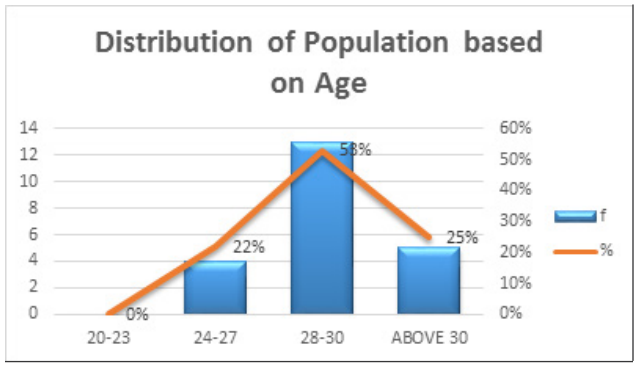

Fig: 1; Distribution of population based on age

2. GENDER **n=22**

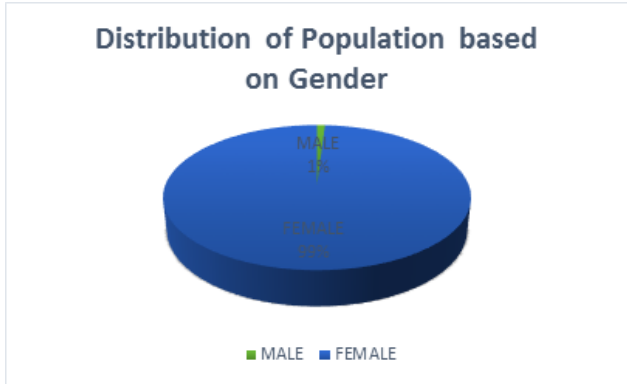

Fig: 2; Distribution of population based on gender

3. QUALIFICATION **n=22**

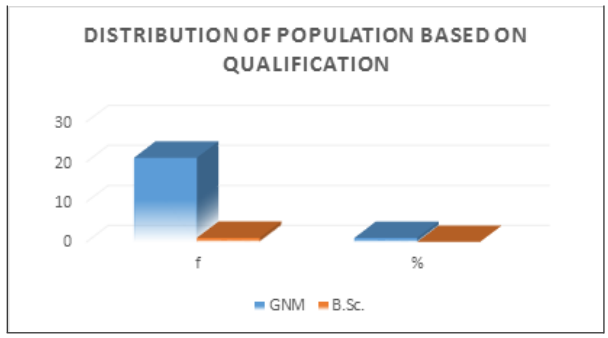

Fig: 3; Distribution of population based on qualification

4. EXPERIENCE **n=22**

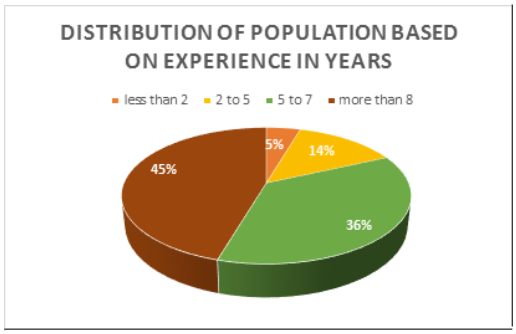

Fig: 4; Distribution of population based on experience

Section II: Level of knowledge of Nurses regarding TPN.

Nurse knowledge regarding TPN was analyzed using mean and standard deviation.

Table: 1: Over-all knowledge of the staff nurses regarding TPN

Over-all knowledge of the staff nurses regarding TPN			
	SCORE	**f**	**%**
good knowledge	16 to 22	16	72.73%
moderate knowledge	11 to 15	6	27.27%
poor knowledge	1 to 10	0	0%

Summary & Discussion

This chapter dealt with the analysis and interpretation of findings of the study. Data were analyzed by applying descriptive statistics. Demographic variables in categorical /dichotomous were given in frequencies with their percentages. Knowledge scores in quantitative form were given in frequencies with their percentages.

Many Health Professionals have conducted studies to understand the level of Knowledge regarding TPN of nurses. These studies on TPN serve to enrich the population under study by raising level of understanding in them. This study too has done the similar effect on the population where the response was overwhelming. Sample characteristics depicted that maximum 13 (53%) nurses were in the age group of 28-30 years. Most 21 (99%) of them were females. 21 (99%) were qualified GNM nurses and total of 10 (45.50%) nurses had experience of more than 8 years. There is good Knowledge in 16 (72.73%) of the study population, 6 (27.27%) having moderately adequate knowledge, and no one has inadequate knowledge.

Similar results were revealed in a study conducted by Ke LS, on "Knowledge, Attitudes, and Behavioral Intentions of Nurses Toward Providing Artificial Nutrition and Hydration for Terminal Cancer Patients in Taiwan", that nurses' knowledge about palliative care was high (accurate-answer rate, 96.75%); knowledge about providing ANH for terminal cancer patients was lower (accurate-answer rate, 53.67%). Although nurses' attitudes about providing ANH for terminal cancer patients viewed ANH as having more burdens (mean [SD], 14.12 [3.62]) than benefits (6.35 [2.19]), nurses' behavioral intentions still favored providing ANH (3.21 [0.95]). In subjective norms, "attending physicians and/or superiors" (45.3%) and, secondarily, "patients" (38.4%) were important influencing persons on nurses' support for ANH. Other influencing factors were communication difficulties with patients and/or family members (3.40 [0.83]), staff disagreements (3.01 [0.78]), and fear of medical dispute (3.42 [0.95]). Study results suggest that reinforcing in-service education to enhance nurses' knowledge of providing ANH for terminal cancer patients and building up positive attitudes and behavioral intentions may strengthen nurses' efforts to actively communicate and cooperate with physicians in assisting patients and families to make the most appropriate medical decisions.[12]

Conflict of Interest: Nil

Source of Funding: Self-funded

Ethical Clearance: Study was approved at Institute Ethical Sub- Committee. Study was started after obtaining permission from the Hospital. Informed consent from each Nurse was taken.

Awareness of Students Regarding the Effect of Mobile Phone Usage on Health at an Indian University

Milind Chukhare[1], Sammita Jadhav[2]

[1]Assistant Professor, [2]Professor, Symbiosis Institute of Health Sciences, Symbiosis International University, Pune

Abstract

Background: Mobile phones form an integral part of day-to-day communication system in every individual life [1]. Billions of people use mobile phones globally, which implies that even a small adverse effect on health can lead to long-term public health implications. Health related risk get enhanced due to factors like the number of calls per day, the duration of the call and the amount of internet usage on cell phones[2] Mobile phones emit radiofrequency energy, which get absorbed by fleshy tissue when brought close to the phone[1]. Long exposure to radiofrequency can causes adverse health effects that includes changing brain activity, DNA, cell structure, response time, and sleep configurations[3][4].

Objective: The study seeks to assess the pattern of mobile phone usage amongst students at an Indian university and aims to assess their perception and knowledge regarding the effect of excessive mobile phone use on the health of an individual.

Methodology: A descriptive survey was conducted among 103 students studying at an Indian university. The students were invited to participate in the study by means of an email containing Google Document form and the data were collected. The questionnaire consisted of 16 questions related to the topic, which suitably covered the data related to the cell phone devices and the impact that it creates on the health of an individual. In addition, the questionnaire collected demographic data (age, sex, and university degree) of the participants.

Results: Majority of the students 96 (93%) feel that use of cell phones causes health problems. The study indicated that 51.2% of students use cell phones for long duration of time, of more than 3hours per day. The respondents felt that health risks due to excessive mobile phone usage could be reduced by self- discipline and setting limits to the usage of mobile phones. Moreover, reducing the internet usage and adopting recreation activities that are physically engaging could reduce the usage of cell phones.

Conclusion: With the help of organizing various awareness programs regarding ill effects of prolonged mobile phone usage will make the student population more responsible for their own health.

Introduction

Cell phones form an essential part of present day communication system in every individual life [1]. Billions of individuals use mobile phones globally, which implies that even a small adverse effect on health can lead to long-term public health implications. Health related risks get enhanced due to factors like the number

of cell phone calls per day, the length of each call and the amount of time people use cell phones [2]

Mobile phones emit radiofrequency energy, a form of non-ionizing electromagnetic radiation, which are absorbed by tissues close to the phone [1]. Long exposure to radiofrequency can causes adverse health effects including changes in brain activity, DNA, cell structure, reaction times, and sleep patterns [3][4]. The impact of mobile phones has been documented in various studies impacting various aspects of human health including physical, mental, psychological and sociological health.

RADIOFREQUENCY EFFECT AND IMPACT ON HUMAN HEALTH AND LINKED DISEASES

Mobile phones are find wider applications across the globe due to wireless mode of communication, ease of access and availability. Mobile phones receive and transmit data over the radiofrequency waves, which is a form of electromagnetic radiation. These radiations can penetrate through the tissue and change the characteristic parameters of the cell structure and DNA. The mobile radio waves communication frequency ranges between 3 kiloHz to 300 GigaHz[4].

There are numerous types of electronic devices, which uses these harmful electromagnetic radio waves for communication purpose like smart phones, wireless modems/router, wireless hotspot units, tablet phones, mobile tower, wireless hand free cordless phone, Bluetooth electronic devices, wireless audio play devices, laptops connected to the wireless modems etc. Long-time exposure to radiofrequency (RF) waves may lead to diseases like brain tumour, infertility and hearing loss, affects foetus, alzheimer's, parkinson's, insomnia, high blood pressure, birth defects, reduction of body immune system, and rheumatoid arthritis. Few symptoms observed by prolonged exposure include headache, sleep troubles, fatigue, and so on [4].

Research has proved the brain region with highest amplitude of radiofrequency electromagnetic waves exposure shows regional increase in metabolic activity. Further studies are going to understand whether these effects shows long term harmful consequences [5]

A recent study carried out at Denmark, investigating effects of cell phones, proves no risk of any tumour or disease in the central nervous system or in temporal glioma region of the brain [6]. There is no danger of glioma or meningioma observed with use of mobile phones [7]. Research in cancer incidence study also proved no association between mobile phone use and risk of brain cancer, leukaemia, salivary gland cancer, or other site-specific cancers [8]. This implies effect of prolonged use of smart phones require further investigation [7]

MOBILE PHONE IMPACT ON ROAD TRAFFIC ACCIDENTS

Research has shown increased road traffic accidents due to reduced attention, decreased reflexes, and distractions caused by cell phone use [3,9] .A growing number of countries have prohibited usage of phones while driving [10]. Moreover, research has found phone owners are more prone to fatal accidents then the once without cell phone. [11]

EFFECT ON EDUCATION& LEARNING PROCESS

The study carried out at Philippines and Mongolia projects substantiates that mLearning offers greater flexibility of schedule, ease of access and reduces the barriers to education. It also facilitates participants to stay at home and in their schools during the training process and quality education gets imparted at an affordable price[12]

Participants in Thailand project experienced technological issues such as screen size as a barrier to effective mLearning process [12]

But apart from the negative aspects, mlearning facilitates more positive, operative and entertaining learning experience to the younger generation. Learning has become more engaging, cooperative, participative, portable and effective. Students can read the textual assignments, post questions, give feedback to peers, share contents and opinions, get socialized, obtain good communication skills, improved computer efficacy and enjoy inquiry based learning capability[13]. The students can practice their personal mobile phone usage as a learning tool anytime and anywhere with a powerful internet web support. Mlearning through mobile phone has enabled classroom experience at the click of a button.

EFFECT ON SOCIAL LIFE

Communication through mobile phones has become conventional, widespread diffused and adaptable all over the world. Researchers have analysed higher degree

of mobile communication impact in almost all facets of life whether it is socializing, politicizing, psychological aspects or even trading [14].The communication technology finds iconic shift from just a hand handled device ordinary device to a more personalized and new form of powerful sociotechnological networking utility. Thereby forming a cohesive personal communication society in itself[15].Apart from the positives the communication strategy among teens faces problems of sleep depreciation, cheating during exams, bullying with each other, bunking of classes, reduction of attendances in classroom, informal social interactions, poorer social cohesion with parents and friends. It has lowered the threshold of communication and emphasized emancipation among teenagers [16]

Methodology

The study gathered all information from the responses of participants with a structured questionnaire. College students were invited to take part in the present study by means of an email containing Google Docs form and the data were collected. The survey questionnaire consists of 16 questions covering the data related to the mobile phone devices and the effect that it creates on human physical structure.

Participants

The questionnaire was distributed among all the hospital & healthcare management, biomedical instrumentation and medical technology programs students of undergraduate and postgraduate level. Informed consent was taken from the participants before conducting the survey. The secondary data was collected through the research journals, websites and reading material. The participants had to answer multiple-choice questions (click on a check box type) to give their assent and short answer type to obtain opinion on the topic. The participants did not receive any economic or academic reward for their participation.

There are two sections of the study. First section enquires about collection of sociodemographic data of the participants like their educational qualification, email id, gender and age. Second section is series of questions related to student's opinion toward effect of smart phone usage on health. Each participant was given the same questionnaire consists the same questions. The participants gave responses to each question. The contents of the second section consist of the student opinions and experience. Types of questions asked are as follows:

To check students' awareness about the effects of smart phone use following questions were asked:

Q 1: Can cell phone cause health problems?

Q 2: Is there any relationship between mental health and addiction to mobile phones

Q 3: Can being on your phone cause anxiety?

Q 4: Do cell phones cause negative impact on society?

Q 5: Have you ever thought about negative effect of mobile phones?

Q 6: The use of the phone while driving is one of the main cause of road accident; Can you suggest some measures in order to prevent those accidents?

To check the pattern of mobile phone use amongst students following questions were asked:

Q1: What is your primary purpose on using internet on your mobile phones?

Q 2: Which type of mobile phones do you use?

Q 3: In 24h how many hours do you spend using your phone?

Results & Discussion

The survey questionnaire was circulated amongst 150 students. Total 64 students (including 43 female and 21 males) of Medical Technology, Radiotherapy, Biomedical Instrumentation and Hospital & Healthcare management programs participated in the study. The qualification of the participant was graduate (59.3%) in B.Sc. Medical Technology (3.1%) in B.Sc. Radiotherapy, Diploma (1.6 %) and postgraduates (21.9%) in HHM and 14.1% in M.Sc. Medical Technology.

The Education qualification, gender and age of the participant are enlisted under Table No.1

TABLE No.1: Qualification, Gender and Age distribution of the participants.

Sample size	N=64	Percentage
Education Qualification		
Diploma	5	7.81
Graduate	36	56.25
Post Graduate	23	35.93
Gender		
Male	21	32.8
Female	43	67.2
Age		
18-23	53	82.81
23-26	11	17.19

The survey results shows (96.9%) of young students feel use of cell phones causes health problems. Many of them have given suggestions to reduce this health risk. About (78.1%) of students have reported anxiety due to mobile phone use (Figure 1). Total (31.3%) percent of the students agreed that cell phones cause negative impact on the society. More than (43.8%) of students use the cell phone for more than 3hours per day.

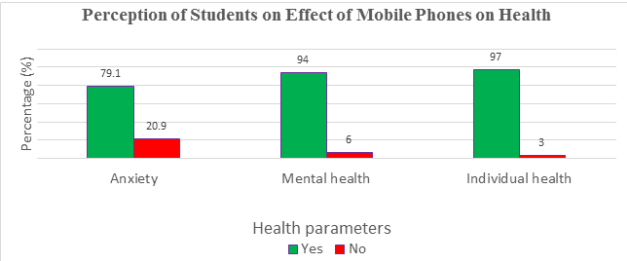

Figure No. 1: Perception of students on effect of mobile phone on health

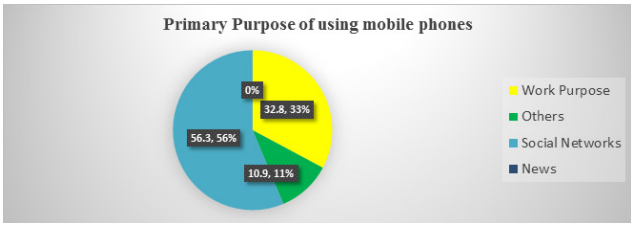

Figure 2: Primary purpose of using internet on mobile phones

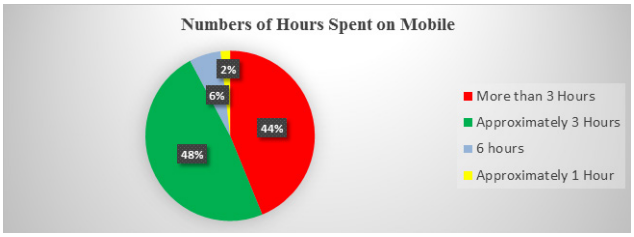

Figure 3: Number of hours spent using mobile phone

Pattern of usage: The study results shows 22 (34.37%) students look at their mobile phone as soon as they wake up from sleep. Regarding type of smart phones, 60 students have smart phones with android operating system and four were having iphones. Primary purpose of the students were to browse social media.

Recommendations: Following are the recommendations given by participants to stop the ill effect of mobile phone use:

- Engage more in other activities
- Not using social networking sites
- Setting limit and reducing the internet usage
- Setting discipline for mobile usage
- Creating awareness about ill effects of mobile phones

Discussion

Mobile phone usage gives positive as well as negative impact on the society. Our survey results show teenagers studying in colleges experience deterioration in health due to excessive use of mobile phones. Most of them are aware about the addictive nature of using hand held mobile technology (96%). Many students have demanded a need for having health education activities regarding the cell phone addiction and about (79.1%) students have approved that use of internet on mobile phone would get better in future. They have raised a concern to intensify outdoor activities. Few students (25.4%) have asked for intervention from parents to stop giving mobile phones to children's at an early age and to curb the menace of amusing mobile addictiveness. Suggestions have also come to use mobile phones only for work purpose and to create a plan for its usage with self-control.

Perception and Knowledge Check

The questionnaire were premeditated and sequenced to assess the physical, mental, sociological and psychological parameters of the health. To understand the degree of agreement on the research survey, questions like 'Can cell phone cause health problems', 'Is there any relationship between mental health and addiction to mobile phones' were asked.

To check habitual usage statistics of cell phones, questions asked were like 'What is the first thing you do when you wake up', 'Where do you keep your mobile while sleeping?' Opinions and suggestions were invited by asking open ended questions like 'How can we work further to reduce the addiction of phones to the younger generation', 'How can we prevent the extra usage of mobile', 'The use of the phone while driving is one of the main cause of road accident; Can you suggest some measures in order to prevent those accidents', 'Do you think Internet on mobile would get better in future?' and so on. Majority of the participants in the study were (67.2%) females who have agreed that mobile phone use causes anxiety and mental impairment. Only few have shown agreement on negative influence on the society (34.3%). About 26 students check their mobile phones early morning immediately after waking up. Although there are many accidental cases due to mobile phone use while driving still many students use, headphones and Bluetooth ear plugs on bike. This implies the necessity that continuous sensitizing training on ill effect of mobile phone while driving must be administered. Failure to educate the masses can have heinous consequences on the road.

Conclusion

The study concluded that use of mobile phone causes significant harm to the health of an individual. The results indicated that younger generation is aware of the harmful effects but they are not disciplined and not sensitized about precautions that must be taken to reduce the addictive nature of electronic devices with internet capability. Results also indicates there is need to increase experiential learning and outdoor activities (sports, outbound events, field visit, quizzes, debates, role plays etc) in the teaching learning process which will keep them busy and engaged thereby reducing mobile phone usage. Furthermore, considering the effective role of radiofrequency radiation in mental health, it is recommended to maintain distances from the phone and keep it away from the brain region. It is recommended that the mobile phones must only be used for shorter duration of time and with the help of organizing, various awareness programs regarding ill effects of prolonged mobile phone usage will make the student population more responsible for their own health.

A Study to Assess the Effectiveness of Structured Teaching Programme on Bio-waste Management with reference to Knowledge among Nurses

Ranjana Chavan[1], Sheela Upendra[2]

[1] Asst. Professor, [2]Assoc. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra

Abstract

Introduction: Biomedical waste management has recently emerged as an issue of major concern not only to hospitals, nursing home authorities but also to the environment. the bio-medical wastes generated from health care units depend upon a number of factors such as waste management methods, type of health care units, occupancy of healthcare units, specialization of healthcare units, ratio of reusable items in use, availability of infrastructure and resources etc **Method:** Quantitative Research approach was used in the study. Pre-experimental one group Pre-test - Post-test research design was accepted for the study. The samples were 60 Nurses. Non-probability convenience sampling technique was used. **Result:** Result of study indicate that T-value was found to be 9.63 with 59 degrees of freedom and tabular t value was 2.004. Calculated value is more than t value. Corresponding p-value was found to be very small. Since the p-value is very small (< 0.05). This indicates that the structured teaching programme had significantly improved the knowledge of nurses regarding Bio-waste management. **Conclusion:** The Structure Teaching Programme on biomedical waste management improves the knowledge of Nurses and it impacts practices of appropriate waste disposal to prevent health hazards and environment as well.

Key words: *Structured teaching programme; Bio-waste management; Effectiveness; Nurses*

Introduction

The waste produced in the course of healthcare activities carries a higher potential for infection and injury than any other type of waste. Inadequate and inappropriate knowledge of handling of healthcare waste may have serious health consequences and a significant impact on the environment as well.[1]

As per Bio-Medical Waste (Management and Handling) Rules, 1998 and amendments, Government of India, any waste, which is generated during the diagnosis, treatment or immunization of human beings or animals or in research activities pertaining thereto or in the production of testing of biological and including categories mentioned in schedule 1 of the Rule, is bio-medical waste [2]

Biomedical waste management has recently emerged as an issue of major concern not only to hospitals, nursing home authorities but also to the environment. the bio-medical wastes generated from health care units depend upon a number of factors such as waste management methods, type of health care units, occupancy of healthcare units, specialization of healthcare units, ratio of reusable items in use, availability of infrastructure and resources etc. [3]

Day to day activities in health institutions generate a lot of waste which is biological in nature and are potential sources of infection transmission, especially hepatitis B and C, HIV, and tetanus.[4]

High-income countries generate on average up to 0.5 kg of hazardous waste per hospital bed per day;

Corresponding Author:
Mrs. Ranjana Chavan,
Asst. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra, E-mail: ranjanachavan@scon.edu.in

while low-income countries generate on average 0.2 kg. However, health-care waste is often not separated into hazardous or non-hazardous wastes in low-income countries making the real quantity of hazardous waste much higher. Wherever, generated, a safe and reliable method for handling of biomedical waste is essential. Effective management of biomedical waste is not only a legal necessity but also a social responsibility.[5]

Statement of the problem

"A Study to Assess the Effectiveness of Structured Teaching Programme with reference to Knowledge on Bio-waste Management Among Nurses "

Objectives:

1. To assess the existing level of knowledge of Nurses on Bio-waste Management
2. To evaluate the effectiveness of Structured teaching programme on Bio-waste management with reference to knowledge among Nurses

Hypothesis:

H_0- There is no significant effectiveness of structured teaching programme on knowledge level among Nurses.

H_1- There is significant effectiveness of structured teaching programme on knowledge level among Nurses.

Methodology: Quantitative Research approach was used in the study. Pre-experimental one group Pre test - Post test research design was accepted for the study. The samples were 60 Nurses. Non-probability convenience sampling technique was used. Tool was developed in two Sections: Section I: Demographic Proforma of the sample ; included age, professional qualifications, clinical experience and exposure to any other educational programme on Bio Waste Management. Section II: Self administered structured questionnaire was used with 60 items under five domains. The teaching plan was developed relevancy, objectivity and appropriateness in tool was validated by experts . Reliability of tool was calculated by Cronbach's alpha method and was 0.86 .

After taking the consent from the samples, the investigator has administered pre-test to samples followed by structured teaching programme and post-test was administered following 15 days of the teaching programme.

Findings: The data was analysed using both descriptive and inferential statistics.

Section I: Description of respondents in terms of demographic variables

Table 1: Depicts the demographic variables in terms of frequency and percentage N=60

Demographic variable		Frequency(n)	Percentage (%)
Age (Years)	21-30 years	36	60
	31- 40 years and above	17	28.3
	41years and above	07	11.7
Professional Qualifications	G.N.M	29	48.3
	B.Sc. Nursing	11	18.3
	Post Basic B.Sc. Nursing	20	33.4
	M.Sc. Nursing	Nil	0
Clinical Experience	0- 2 years	28	46.7
	3-5 years	18	30
	5-10 years	10	16.7
	11years and above	04	6.6
Exposure to any other educational programme on Bio Waste Management	Yes	18	30
	No	42	70

Section II: Analysis of data related to the existing level of knowledge on Bio-waste management among Nurses

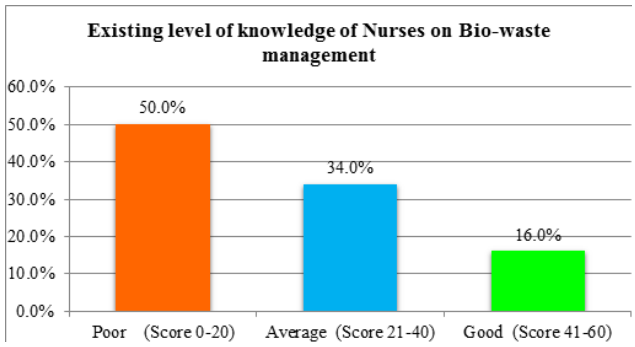

Fig1 : Bar diagram showing existing level of knowledge of Nurses on Bio-waste management

Section III: Analysis of data related to effectiveness of structured teaching programme on knowledge level regarding Bio-waste management among nurses

Paired t-test used for the effectiveness of structured teaching programme on the knowledge level of nurses. T-value was found to be 9.63 with 59 degrees of freedom and tabular t value was 2.004 Calculated value is more than Tabular t value . Corresponding p-value was found to be very small. Since the p-value is very small (< 0.05), the null hypothesis H_0 is rejected and hence H_1 is accepted. This indicates that the structured teaching programme had significantly improved the knowledge of nurses regarding Bio-waste management.

Discussion

The safe and sustainable management of biomedical waste (BMW) is social and legal responsibility of all people supporting and financing health-care activities. Effective BMW management (BMWM) is mandatory for healthy humans and cleaner environment.

Paired t-test used for the effectiveness of structured teaching programme on the knowledge level of nurses. T-value was found to be 9.63 with 59 degrees of freedom and tabular t value was 2.004. Calculated value is more than t value. Corresponding p-value was found to be very small. Since the p-value is very small (< 0.05), the null hypothesis H_0 is rejected and hence H_1 is accepted.

Same result was reveled in Manish Patidar et al study the result was, T-value was found to be 22.56 p-value = 0.000 < 0.01 , the difference between the Pre-test and Post-test scores is highly significant at 1% level of significance.[6]

Conclusion

The Structure Teaching Programme on biomedical waste management improves the knowledge of Nurses and it impacts practices of appropriate waste disposal to prevent health hazards and environment as well.

Effect of Flipped Classroom Teaching on Improvement of Clinical Performance in Labour Room among Nursing Students

Seeta Devi[1], Sheela Upendra[2], Jasneet Kaur[1], Shitalwaghmare[1], Sheetal Barde[1]

[1]Asst. Professor, [2]Assoc. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Background: The flipped class is an alternative to the traditional learning has been increasingly attracting the attention of researchers and educators. The advancement in technological tools such as interactive videos, interactive in-class activities and video conference systems covers the way for the widespread use of flipped classrooms.

Methodology: In the present study quantitative research approach used and one group pretest posttest quasi experimental research design was executed. Total sample was 30, they were selected using purposive sampling technique. The following clinical aspects were used , they are setting of labour trolley, conduct of second stage labour including partogrpgh, third stage labor, neonatal resuscitation by using checklist clinical performance was measured. The independent variables of the research are flipped classroom and traditional classroom teaching approaches while the dependent variable is students' performance at clinical area. The study has included two groups of participants. First group (15 samples) was the experimental group who was taught using FC Model, the second group (15 samples) was taught in a traditional learning environment classroom teaching activities.

Results: To analyze the data, paired t test was used, results showed that, there were no statistically significant differences between the mean scores of the group one and group two, but there is statistical significant difference was noticed among group three students. The results showed that there were no statistically significant differences between the scores of the first and second groups.

Conclusion: It is concluded that to make our teaching and learning experiences to be effective, it is suggested to use both FC and face to face class room teaching.

Keywords*: flipped class room teaching, improvement, clinical performance , labour room , nursing students*

Introduction and Background

In recent years, it is witnessed that, there is a rapid and sequential changes are taking place in educational system at global level. Structured advanced new strategies need to bring in the classroom in learning and teaching process. Students are also highly engaged with new technology using computers and mobiles. It is very easy for them to access the huge information about anything in the world. In the traditional teaching and learning process, teacher comes the classroom with a particular topic, discusses for 45 minutes to 1 hour. She spends this time only to discuss the topic there is no time remained for activities related teaching and learning.

Therefore, majority of the institutes attempted to plan and make structural modifications and implement new strategies in order to face new changes in the education system. These changes may require comprehensive

Corresponding author:
Mrs Seeta Devi
Asst. Professor, Symbiosis College of Nursing
Symbiosis International (Deemed University),
Pune 411004

review is required at global, it will help to assess the new approaches and methodologies in teaching learning process and also helps to evaluate the consequent results after implementation of these new strategies. These approaches mainly focuses on role of leaner in classroom rather than teacher and student is center in the teaching learning process rather than the teacher. Teacher will be mentor and she assert the that each student in the class will learn and reach at the proficiency level , by adopting the learning activities or methods according his or her interest, abilities and needs [1]. Evaluating some of the new modern teaching and learning methodologies, researchers has pointed the flipped classroom.

In the traditional learning the teaching is done at class room, in the classroom teaching will be completed at home. The material of content will be given to the student outside the class room in the form of videos and modules, which will be planned and created by a concerned teacher by using various technology such as Google class room, Moodle and MOOCS [2]

Furthermore, the information of content is presented to the student outside the classroom period information related to the lesson. Alzwekh [2] mentioned that flipped classroom is a form of modern teaching methods that uses the advanced techniques smartly and funnily in order to meet the needs of students at the present time. In addition, the idea of flipped classroom is based upon flipping learning assignments between classroom and home by increasing the role of effectiveness of modern technological tools in teaching and learning processes[3]

Based on the review and current literature, researcher has decided to execute a small research to assess the effectiveness of flipped classroom on improvement of skills among nursing students by using modern evaluation methods in selected hospitals of Pune.

Operational Definitions:

Flipped classroom:

is a modern strategy in which the teacher provides the content of subject for students in several forms such as recorded lectures, videos, and electronic readings, so that students can review such materials and understand information before attending the classroom

Google classroom

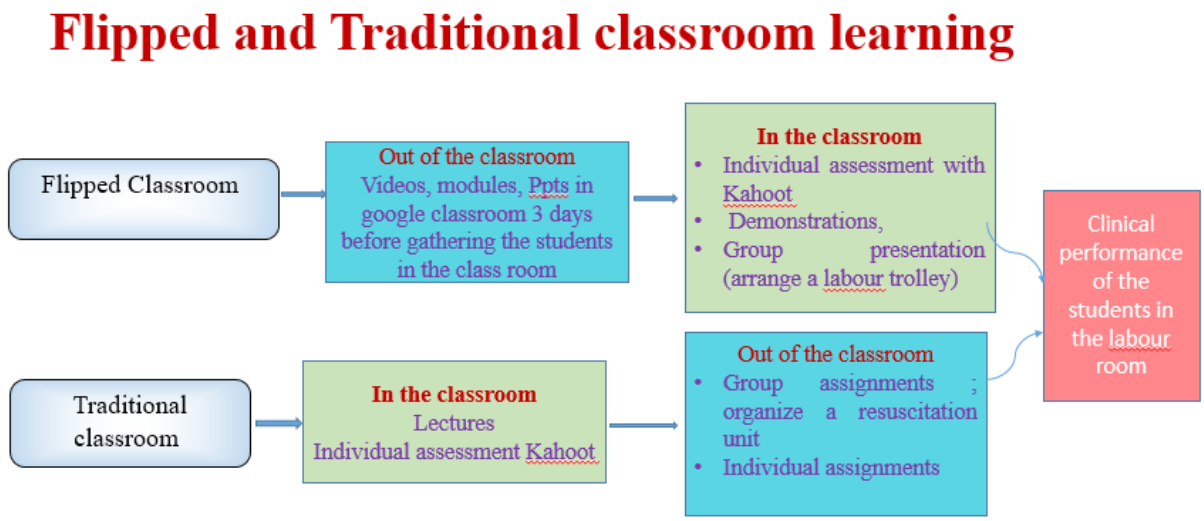
Google Classroom is a free collaboration tool for teachers and students. Teachers can create an online classroom, invite students to the class then create and distribute assignments.

Kahoot: is a tool for using technology to administer quizzes, discussions or surveys.

Objectives:

1. To assess the effect of flipped classroom teaching on improvement of clinical performance among Nursing students
2. To assess the amount of time and number of the activities performed within the given time in both experimental and control group.

Hypothesis: HO – There will be no significant difference between flipped classroom teaching versus traditional classroom teaching on improvement of clinical performance among nursing students



Methodology

In the present study quantitative research approach was used and one group pretest posttest quasi experimental research design was executed. Total sample size was 30 from 1st year PBBSc Nursing, they were selected using purposive sampling technique. The following clinical aspects were used, conduct of second stage and 3rd stage labour, neonatal resuscitation. Clinical performance was measured by using checklist given by Indian academy of pediatrics and Govt. of India. The independent variables of the research are flipped classroom and traditional teaching approaches while the dependent variable is students' performance at clinical area. The study has included three groups of participants. First study group had 15 samples and who was taught using Flipped class room Model, the second group had 15 samples and was taught in a traditional learning environment .

Procedure of conduct of study:

Researcher has used the Google classroom to make the conversation between students and researcher where the researcher has uploaded the videos and modules on management of labour and neonatal resuscitation. The content was uploaded before three days of the lass room activities. **Group 1** students were instructed to learn the topic that was uploaded in the classroom. Next day students made to learn the topic proficiently with different activities like demonstrations and brain mapping

Group 2 students were taught directly in the classroom. These students have not provided information priorly. Only limited activities could be executed.

Performance evaluation test:

- Management of 2nd stage and 3rd stage was evaluated by check list given by Govt of India in Dakshata Midwifery training programme (modified) . It has 20 items . Scoring yes/no. yes carried 1 mark and no carried 0
- Neonatal resuscitation was evaluated by clinical performance check list given by IAP (slightly modified). It had 17 items. Scoring yes/no. yes caries 1 mark and no carries 0
- Kahoot was used to assess the clinical performance of the students.

Results

Flipped classroom	24.9975	18.976	24.9975	16.11	10.87	<0.0001
Traditional classroom	24.995	18.56	**25**	14.79	7.71	<0.0001

Section 2

Table 3: Available time and activities performed

	Flipped classroom		**Traditional classroom**	
	Time available for CR activities	**Number of the activities performed**	**Time available for activities**	**Number of the activities performed**
1st day Management of 2nd stage and 3rd stage of labour	50 mins	1. Individual assessment by kahoot 2. Demonstrations- conduct of 2nd and 3rd stage of the labour and performed by all students 3. Group presentations- setting of a trolley for normal labour	40 mins (Lecture: 30 mins)	Individual assessment by Kahoot in the class room (10 MCQs were asked) Demonstrations performed by only a few students
2nd day Neonatal resuscitation	50 mins	Individual assessment- kahoot Demonstrations - PSSR Group presentations- NICU unit setup Mind mapping – Pneumonic to remembers the steps of neonatal resuscitation such as , PSSR, MRSOPA etc	40 mins (Lecture: 30 mins)	Demonstrations on some part of the NRP by a few students

Discussion and Conclusion

The main purpose of this study is to investigate the effect of the flipped classroom on nursing students' clinical performance in the labour room. To this end, two study groups were formed: an experimental group including students learning through the FC Model, and second group including participants taught through traditional classroom. The t-test was run, and it was found out that there were no statistically significant differences between the groups. There is a slight difference is observed in the Mean scores of pretest and posttest among experimental group and control group. But in the flipped classroom teaching, teacher has got good amount of time to implement many classroom activities, in which the student was very active and teacher has got an opportunity to ensure to check the proficiency of clinical performance of all 15 students by using modern evaluation methods while in case of traditional classroom , teacher has got very limited time to ensure the proficiency of the students regarding the topic as it has taken 30 minutes to clear the concept of the topic. While the results of other related studies in the relevant literature reflect that the Flipped classroom Model increases students' academic success [4,5,6]

This study is limited in the sense that it was carried out with a small number of students taking only two

topics. Similar research should be conducted with a larger sample, in different topics , and at different levels of education, so that it will be possible to generalize the findings. Moreover, using different data collection tools in addition to the pretest, posttest, and focus group interview may yield a more in-depth and multi-faceted analysis of the students' opinions and academic achievements. Furthermore, it is recommended that students' motivation and readiness level to learn outside the classroom be identified and necessary arrangements be done before applying the FC Model. Lastly, rich content videos should be chosen and produced specifically for students to consult for out-of-class studies.

Conflict of Interest – Nil

Source of Funding- Self

Ethical Clearance – Ethical clearance was obtained from ethical committee of symbiosis college of nursing.

Development of Norms for Cardiovascular Endurance Test for Youth Aged 18 – 25 Years

Amritashish Bagchi[1], Nayana Nimkar[2], Rajiv Yeravdekar[3]

[1]Assistant Professor, [2]Director, Symbiosis School of Sports Sciences, [3]Dean, Faculty of Health & Biological Sciences, Symbiosis International University, Pune, Maharashtra, India

Abstract

Introduction: Cardiovascular endurance is the most important fitness component which shows the efficiency of the heart and lungs to supply oxygen-rich blood to the working group of muscles. Improving the overall exercise capacity with cardiovascular endurance will increase life expectancy and significantly reduce the chances of several heart diseases. Correct measurement of such fitness component is very vital for all.

Objective: To develop the norms for cardiovascular endurance test for Indian youth aged 18 – 25 years.

Novelty: To the best of our knowledge none of the studies has been done before for the development of the cardiovascular endurance test norms for the Indian population. There is a paucity of literature on development of the cardiovascular endurance test norms for the Indian population.

Materials and Method: For the purpose of the study a sample of 3845 male (19.97 ± 1.81 years) and 3393 female (20.11 ± 1.9 years) university students were selected for the study. Beep test was used for measuring cardiovascular endurance. Different statistical methods were opted for analysing the relationship between the variables, normalization and visualization of data and the development of norms.

Results and Discussions: The results of the study shows that variables age and gender have a significant relationship with the results of the beep test. Although the R^2 value is very less, the model developed by including both the variables was found to be significant. Norms were developed for the Indian youth aged 18 – 25 years.

Applications: Norms are necessary to test, compare, analyze and evaluate one's strengths and weaknesses. The norms will guide and direct the Indian youth about their cardiovascular fitness status. It will also help coaches and trainers to design a training plan accordingly.

Conclusion: The developed norms for measuring cardiovascular endurance has a direct linear relationship with age and gender. Age has an inverse relationship with beep test performance. Due to the physiological differences, cardiovascular endurance for male participants was greater than the female participants.

Keywords: *Cardiovascular Endurance, Beep test, Age, Gender*

Introduction

Cardiovascular diseases are a major public health issue and about 33% of all deaths globally. Most of these cardiovascular diseases are results of physical inactivity and poor diet. Improving the overall exercise capacity with cardiovascular endurance training will increase life expectancy and significantly reduce the chances of several heart diseases. Even studies show that there is a higher inverse relationship between cardiorespiratory fitness and mortality as compared to physical fitness and mortality[1,2,3,4].

Cardiovascular endurance has been a standout amongst the most generally inspected physiological factors, especially as it relates to human performance and functional capacity. Cardiovascular endurance is the most important fitness component which shows the efficiency of the heart and lungs to supply oxygen-rich blood to the working group of muscles. Correct measurement of such fitness component is very vital for all. Generally, for improving the cardiovascular fitness among athletes, training is given for moderate-to-vigorous intensity with variations depending upon the type of sport they play. Whereas, chronic moderate-intensity exercises are primarily related to health and are also applicable to the general population [5,6,7].

There are several tests to measure cardiovascular endurance such as Beep test (Pacer test or Multistage fitness) or Yo-Yo test which are similar types of test with some variations. These tests are highly popular and most widely used field test for estimating cardiovascular endurance. Both these tests does not require any sophisticated equipment, and a large number of individuals can be tested simultaneously. Beep test is less time consuming, simple, easy to administer and mostly used for general population as compare to yo-yo test [8,9].

Beep test is standardized tests with high validity and reliability, but norms for Indian population for this test are not available. The norms that are available for the fitness test are normally made for the population of a specific region (other than India) with some age range. After an intense literature review, it has been found that none of the studies has been done before for the development of the cardiovascular endurance test norms for the Indian population. The normative standards for measuring cardiovascular endurance will increase the utility of the test and improve the efficiency in the interpretation of the test score in several ways. It will help the individual to measure and compare his/her cardiovascular fitness level with others. It may help the coaches and trainers to design a training schedule according to the requirement. It will also help to understand the pattern (rate of change) of beep test results in accordance with different age and gender.

There are two objectives of the study, first to develop the cardiovascular endurance test norms for youth aged 18 – 25 years and second to investigate the relationship between age and gender with performance in the cardiovascular endurance test.

Methodology

Selection of the participants: The data was collected as a part of the annual wellness checkup, which each student undergoes at the University. A total of 7238 (3845 male and 3393 female) healthy students at an Indian University were enrolled for the study. The age of all the participants ranged from 18 to 25 years (Male 19.97 ± 1.81 years; Female 20.11 ± 1.9 years). The participants had no history of any major disease and also had no injury prior to the test. Convenience sampling technique was used to select the participants. Informed consent was obtained in accordance with the policy set forth by the university where the data was collected.

Selection of the variables: For the purpose of the study, the performance in the beep test (number of levels and shuttles reached before the next beep) was selected as a dependent variable along with age and gender as independent variables.

Data Collection: The participants were instructed to do 10 mins of group warmup before the test. Participants were also instructed to take light meal 2-3 hours before the test and refrain themselves from any energetic physical activity for that period. The entire test protocol was well explained to all the participants to allay apprehension. Beep test is a standardized test to measure cardiovascular endurance with high reliability (0.95) and validity (0.90) [10,11].

Statistical Technique: Descriptive statistics such as mean, Standard deviation, skewness, kurtosis, CV etc were used to summarize the nature of data. Box plot, scatter plot and line graph with mean value as a part of descriptive statistics were used for data visualization. For the relationship between the variables, linear regression was used and finally, the stanine scale was used for the development of norms. Assumptions were taken care of before running the analysis. All the statistical analysis were done in SPSS version 24. The level of significance was set at 0.05.

Results and Discussion

The study group consisted of 3845 male and 3393 female participants, out of which outliers and extreme scores were removed in the later stage. After removing the extreme scores and outliers, the final data set which was used for the development of the norms were 3279

male and 3179 female participants. Before removing the outliers and extreme scores a two-step approach for transforming continuous variables to normal method has been used. In step one, all the data for the selected variables were transformed into fractional rank/ percentile rank for getting the uniformly distributed probabilities. The second step consisted of applying the inverse-normal transformation to the results of the first step to form a variable consisting of normally distributed z-scores [12]. The descriptive statistics such as mean, standard deviation, skewness and kurtosis with their standard error are shown in the below table. It can be seen from the standard deviation value in table 1 that, the beep test data points are spread out over a wider range of values. Even it can be seen from the table that female participants have higher variability (CV) in the beep test as compared to male participants. After the transformation of data and removing the outliers and extreme scores, the data set for the beep test became normal as the skewness and kurtosis values were less than twice their standard error.

Table 1: Descriptive Statistics for beep test score converted to the total number of shuttles reached by each of the participants

Gender	Male (n = 3279)	Female (n = 3179)
Mean	31.8515	26.5377
Std. Deviation	20.69837	18.66235
Coefficient of Variation (CV)	.649921	.70322
Skewness	-.007	.007
Std. Error of Skewness	.043	.043
Kurtosis	-.293	-.283
Std. Error of Kurtosis	.085	.087

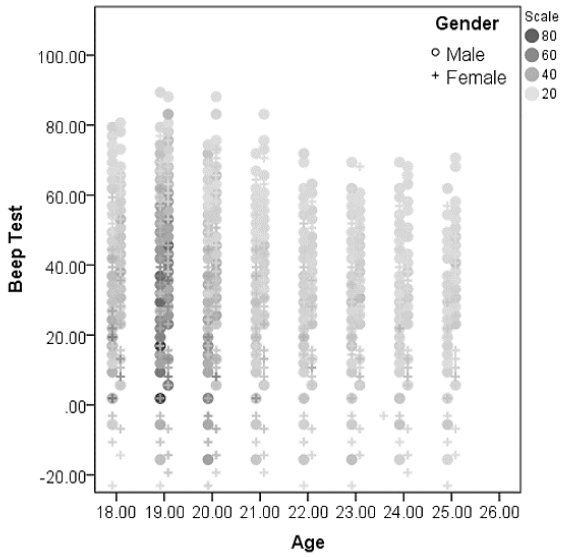

Figure 1: Scatter plot showing the age (in years) wise distribution of beep test data in relation to gender

Due to the large data set, we couldn't use a simple scatter plot as the data points were very congested and we were unable to distinguish between the data points of male and female. Bin elements feature was used to display a marker for every data point. Colour intensity (Scale) was used to reflect the number of observations in a particular data point [13]. It can be seen from figure 1 (above) and 2 (below) that there is a negative slope of the beep test scores from lower to a higher age.

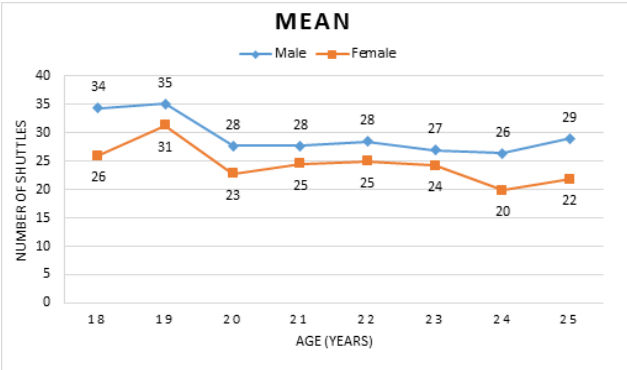

Figure 2: Line graph for visualizing the gender wise mean value of beep test over time

To see the actual relationship between the beep test as the dependent variable and Age & gender as independent variables, linear regression was used. The variable gender is nominal in nature, we transform the variable into a dummy variable (0 and 1) so that it can be used for linear regression analysis. Normalization has been done for the variable age by transforming the data from the same two-step approach in SPSS. All the other assumptions were met before running linear regression.

In the model summary of linear regression adjusted R^2 value was .033, which means only 3.3% of the variability in the dependent variable is explained by the selected independent variable in the model. The F ratio for the selected model was significant as the p-value is less than .05. Hence, it can be concluded that the developed regression model has a significant predictive capability.

Table 2 Regression coefficient of the selected variable in the model

Model B		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		Std. Error	Beta			
1	(Constant)	61.116	2.887		21.167	.000
	Gender	-5.114	.487	-.128	-10.492	.000
	Age	-1.462	.143	-.125	-10.207	.000

a. Dependent Variable: Beep test

The above table shows the unstandardized and standardized regression coefficients of the model. The value of unstandardized coefficients ("B" coefficients/ raw coefficient) was used to develop the regression equation. For explaining the relative importance of independent variables in terms of their contribution to the dependent variables in the model, standardized regression coefficients ("β" - Beta) were used. The t – statistic tests the null hypothesis that the value of b is equal to zero [14]. Therefore, it can be seen from the table that in this case, we reject the null hypothesis and conclude that the predictor variables (Age and Gender) make a significant contribution to predicting the outcome.

Regression equation:

Using regression coefficients (B) of the model shown in table 2, the regression equation was developed which is as follows:

Beep test Shuttles = 61.116 – 5.114 (Gender) – 1.462 (Age)

Table 3 Percentile values for Male and Female participants

Percentiles	Male			Female		
	Transformed Score	Raw Score	Beep test (level/ shuttle)	Transformed Score	Raw Score	Beep test (level/ shuttle)
4th	-6.0523	9	2/2	-7.1285	6	1/6
22nd	16.8472	16	3/1	10.9817	11	2/4
76th	46.0142	42	6/1	39.9009	36	5/4
96th	68.2956	79	9/7	59.3408	69	8/8

For the testing purpose and for the correct statistical analysis, all the data of the original beep test score (number of levels and shuttles reached in time) was changed to the total number of shuttles (Raw Score). This is because of the reason that after level 5, the number of shuttles in all the levels is more than 9. That means if a participant's final beep test score is 6 level and 1 shuttle, it will be written as 6.1 in the score sheet. Similarly, if another participant final beep test score is 6 level and 10 shuttles, then the score will be recorded as 6.10. But while entering the data into SPSS both the scores will be considered as 6.1 by the software, which will result in an error. This error will reduce the actual performance of many participants selected for the study. Hence, will affect the norms. To remove this kind of error we have decided to use the number of shuttles (Raw Score)

instead of original beep test score. For example, if the beep test score (according to the beep test scoring sheet) for any participant is 2.2 (i.e. 2 levels and 2 shuttles) then it will be counted as 9 shuttles (i.e. adding 7 shuttles from level 1 and 2 shuttles from level 2).

Later on after the statistical analysis and for the development of norms all the raw scores (number of shuttles) were converted back to the original score (number of levels and shuttles reached in time).

Table 4 Beep test norms for youth aged 18-25 years

Gender	Age	Very Poor	Poor	Average	Good	Very Good
Male	18-25	< 2/2	2/2 – 3/1	3/2 – 6/1	6/2 – 9/7	> 9/7
Female	18-25	< 1/6	1/6 – 2/4	2/5 – 5/4	5/5 – 8/8	> 8/8

It can be seen from the above table that in all the categories (Very poor, Poor, Average, Good and Very good) the beep test level and shuttles are higher in male participants than female participants this is due to the sex-specific and age-specific differences [4].

Conclusion

The purpose of the study is to develop the cardiovascular endurance test norms for youth aged 18 – 25 years and to investigate the relationship between age and gender with performance in the cardiovascular endurance test. The developed norms for measuring cardiovascular endurance has a direct linear relationship with age and gender. Age has an inverse relationship with beep test performance. Due to the physiological differences, the cardiovascular endurance for male participants was greater in all terms than the female participants. Standardized norms are necessary to test, compare, analyze and evaluate one's strengths and weaknesses. The developed norms will guide and direct the Indian youth about their cardiovascular fitness status. It will also help coaches and trainers to design a training plan accordingly. More research needs to be carried out in the development of norms, as the population in India is very diverse in nature. In this study, we have only focused on the age range of 18-25 years. There is a scope to develop norms for other age range with similar characteristics of the population.

Conflict of Interest – Nil

Source of Funding – Self

Ethical Clearance – Necessary permissions and approval for conducting the research were taken from Internal Research Committee, Symbiosis School of Sports Sciences, under the Faculty of Health and Biological Sciences (FoHBS) and from the Department of Sports and Recreation Wellness, Symbiosis International (Deemed University).

Analysis of Pesticide Content in Selected Onion Samples by Chromatography and Mass Spectrometry

Ankita Kulkarni [1], Vaishnavi Soman[1], Avril Jacques[1], Pratima Jasti[2], Selvan Ravindran[3]

[1]M.Sc (Student) Symbiosis School of Biological Sciences, Symbiosis International (Deemed University) Lavale, Pune, India, [2]Previously Assistant Professor in Symbiosis, Currently Nutrition & Regulatory affairs manager in Cosucra, Belgium,[3]Associate Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University) Lavale, Pune, India

Introduction

Human health is always promoted by vitamins and minerals derived from vegetables and fruits. However, increased usage of pesticides for high yield poses a significant threat to public health. Pesticides lead to environmental contamination and can also cause various health issues by entering in the human food system. **Objective:** Pesticides usage has increased in the past several years to improve the agricultural yield and cater the needs of population explosion. This has lead to contamination of vegetables and fruits to a great extent. Pesticides are hence a major threat to both health and environment. The present investigation is focussed on analysis of selected onion samples grown in pune region for pesticide residues. **Method:** Samples of fresh onions (*Allium Cepa)* were procured by random sampling from various markets in Pune. Onions have a potential threat from pesticides being sprayed. Whole onion samples were crushed, homogenized and pesticides were extracted using suitable solvents. Quantity and nature of pesticides from these homogenized samples were determined using Gas Chromatography- Mass Spectrometry (GC-MS/MS) and Liquid Chromatography-Mass Spectrometry (LC-MS/MS). **Results:** Totally 229 pesticides were screened (77 in GC-MS/MS and 152 in LC-MS/MS). A few exceeded the permissible limits (100ppb). GC-MS/MS is used to detect low molecular weight pesticides that are volatile in nature. LC-MS/MS is used to characterize the stable pesticides. About fifty percent of the onion samples consist of pesticide cypermethrin I and three samples consist of pesticides TFNA-AM (Flonic amid). **Conclusions:** Pesticides present in onions suggest the precautions and care to be taken to protect crops. Knowledge generated from this study will help farming community to judiciously choose and use the pesticides to prevent its entry in to the food chain and thereby promoting public health.

Keywords: *GC-MS/MS, LC-MS/MS, Fruits, Vegetables, Pesticide residues, Risk assessment, Contamination.*

Introduction

India produces diversified grains, pulses, vegetables and fruits. India is an agriculture based country with fluctuating climatic conditions with wide variety of soils required for growth of vegetables and fruits [1]. "Green Revolution" brought changes and improved agricultural practices in India [2,3].

Fruits and vegetables along with carbohydrates occupy a major component of the Indian food plate as they provide essential nutrients such as vitamins, minerals required for various metabolic reactions in our body[4]. Due to its increase in demand for the growing population, production of fruits and vegetables has to be increased. But, factors such as pests, insects and various diseases limit the agriculture production in India[1].

India's vegetable production was 92.8 million tonnes which accounts for 3% of overall cropped area in the year 2000[2]. India is the leading producer of potatoes i.e. 20% of its total production and second largest producer of onions in the world[2]. India also leads in the production of brinjal, cauliflower and peas. The demand for fresh

produce has increased from 16.1 million MT in 1995 to 42.9 million MT in 2010 for fruits and 65.7 million tonnes (MT) in 1995 to 117.2 million MT in 2010 for vegetables respectively. The growing demand for fruits is estimated to be 168 million MT for vegetables and 81 million MT for fruits by 2020[3]. Therefore, it is important to protect these fresh produce from various insects, rodents, pests, insects and diseases[5-7] during the production and storage period[2].

Wide ranges of pesticides are used to protect the crops[5]. Pesticide is a substance intended for destroying, preventing, mitigating, repelling or any pest. A pesticide may be a chemical substance, biological agent such as virus or bacteria, an antimicrobial agent, a disinfectant or a device used against pest[8]. Pesticides are broadly classified into six categories namely, insecticides, fungicides, herbicides, rodenticides, fumingants and insect repellents[8]. Pesticides upon spray protect the plants from infestation, but excessive spray of pesticides leads to its penetration through vegetable skin. Prolonged exposure of humans to such pesticides lead to disorders like cancers, respiratory failure, autoimmune disease and many more. Pesticides, herbicides and fungicides are used in excess to increase the yield of crops. Overall usage of pesticides increased from 0.55 kg per hectare in 1950 to 90.12 kg per hectare in 2001-2002.

In one of our recent studies chromatography and mass spectrometry were utilized to analyze pesticides in chlli samples[9]. Chromatography interfaced with mass spectrometry is extensively used to analyze drugs and metabolites in preclinical and clinical research[10-12]. Food and drug administration recommend qualitative and quantitative analysis of organic compounds such as formulations, drugs and metabolites using liquid chromatography and mass spectrometry[13-15]. Recently chromatography is also used for purification of nanoparticles[16,17]. Nanomaterials have several applications in agriculture and agribiotechnology. Chromatography also helps to separate the mixture of compounds such as drugs, metabolites, pesticides and other organic compounds. Mass spectrometry confirms the identity of separated organic species. Therefore in the present study LC-MS/MS and GC-MS/MS is used to qualitatively and quantitatively confirm the identity of the species[18,19].

Materials and Method

Sample collection

Ten samples of onion were procured from pune market by random sampling.

Reagents

Water (HPLC Grade), Methanol (HPLC grade), Ethyl Acetate, Anhydrous Sodium Sulphate: - pre-heated for 3 hrs at 500 degree Celsius to remove excess water absorbed in the sample, Sodium acetate (HPLC Grade) was used to maintain the pH and Primary Secondary Amine (PSA).

Apparatus

Micro centrifuge tube- 2 ml, Centrifuge Tube (FEP) 50 ml (Tarsons test tube), Volumetric Pipette- 10 ml, Micropipette- 1 ml and Vials -2 ml

Equipments

Homogenizer, Blender, Balance 16, Centrifuge, LC-MS/MS (Agilent Technologies 6460 triple quadrupole), GC-MS/MS Triple Quadrapole (Agilent Technologies 7000 C).

Homogenization

One kg of onion was crushed. The apparatus was rinsed with water and with isopropyl alcohol:methanol in 1:1 ratio. Once the samples were crushed, it was washed again with water before using it for further crushing.

Extraction

10 gram (± 0.1g) of the homogenized sample was weighed in 50 ml of centrifuge extraction tube.10 ml of HPLC grade water was added. To this homogenised sample 10ml of ethyl acetate was added. Then 10 g of sodium sulphate was added to remove the excess water from the sample and 1.5 g of sodium acetate was added to maintain the pH. Once the desired pH is obtained, homogenization was continued for 5 minutes and centrifuged at 7000 rpm for another 5 minutes.

Purification of samples for LC-MS/MS

Three millilitre of the supernatant was taken in test tube containing 50 mg of primary secondary amine (PSA) followed by vortexing and placed aside to settle the PSA (Primary Secondary Amine). Two millilitre of

supernatant was pipetted out in another test tube and 0.2 ml of 10% DEG (Diethylene Glycol) in methanol was added and evaporated to dryness under nitrogen. Residue was dissolved in 0.5 ml of 0.1% acetic acid,1.0 ml of 0.1% acetic acid was added and transferred in 2 ml micro centrifuge tube and vortexed for 30 seconds followed by centrifugation at 13000 rpm for 5 minutes. Then the supernatant was taken out, filtered through 0.22µ membrane filter and 5 µl was injected into LC-MS/MS from chromatography vials.

Purification of samples for GC-MS/MS

1 ml of supernatant was taken in 2 ml of micro centrifuge tube, which contained 50 mg of PSA (Primary Secondary Amine). The contents were shaked vigorously for 30 seconds, vortexed and centrifuged at 13000 rpm for 5 minute followed by filtration and injection.

Materials and Method

LC-MS/MS

LC Parameters

Column used was reverse phase C-18 column. Dimension of the column was 50mm X 4.6mm with particle size 1.8 micron. Mobile Phase A was 5mM ammonium formate in water and mobile phase B was 5mM ammonium formate in methanol. Flow rate was 0.8 ml/min. Electrospray ionization source was used in positive ion mode and the column temperature was maintained at 40 degrees. Mobile phase A was composed of 5mM ammonium formate in water and mobile phase B was composed of 5mM ammonium formate in methanol. Flow rate of mobile phase was maintained at 0.8 ml/min.

Mass spectrometry (MS) Parameters

Ion source of MS was operated using electrospray ionization source in positive ion mode. Source temperature was set to 450 degrees and injection volume was 5 microliter.

GC-MS/MS

GC Parameters:

Column used was DB-5MS with 30 metre length and 0.25mm diameter. Film thickness was 25 micron with oven temperature was maintained at 70 degrees for 1 min-50ºC/min.-150ºC-0.0min-6ºC/min-200ºC-0.0min 8ºC/min-280ºC-5.5 min.- 100ºC/min.- 300ºC- 1.0 min. Injector was PTV and temperature programmed at 70ºC-0.08min-600ºC/min-250ºC-10min.

MS Parameters:

Ion Source was electron impact (EI) in positive ion mode. Carrier gas used was helium with a flow rate of 1.2ml/min.

Results

Analysis of Onion Samples by GC-MS/MS

Seventy seven pesticides were screened for each onion sample. Total ion current from GC-MS for one of the onion sample is shown in figure 1.

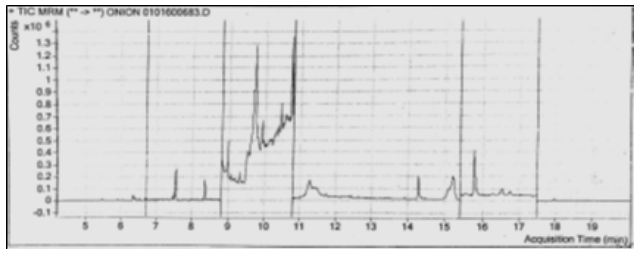

Figure 1: Total Ion Chromatogram of a onion sample from GC-MS/MS.

Analysis of the chromatogram reveals the presence of pesticide cypermethrin I. Molecular weight of cypermetrin I is 416.3 g/mol. Pesticide cypermethrin I was identified at the retention time of 16. 8 min. Mass spectral fragmentation pattern of cypermethrin I is shown in figure 2 and its chemical structure in figure 3.

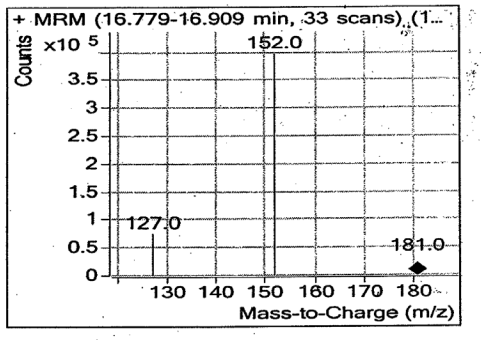

Figure 2: Mass Spectrum of Cypermenthrin I.

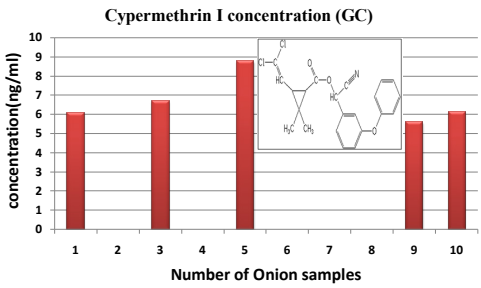

Figure 3: Concentration of Cypermethrin I and its structure

Ten onion samples were analyzed. Samples 1,3,5,9 and 10 showed significant amount of cypermethrin I (Figure 3). Almost fifty percent of the onion samples confirmed the presence of cypermethrin I. Concentration of cypermethrin I ranges from 8.7754 ng/mol to 5.5956 ng/mol. Concentration was obtained using calibration curve generated for standard compound cypermethrin I. FSSAI recommends 10 ng/ml of pesticide as allowed limit.

Analysis of Onion Samples by LC-MS/MS

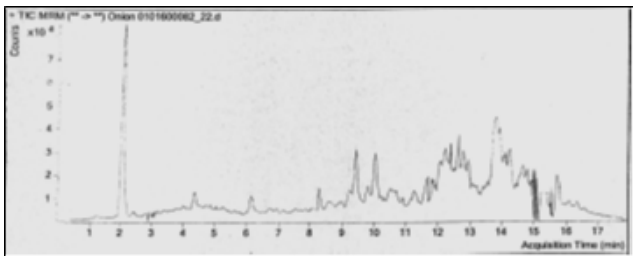

Figure 5: Total Ion Current of a onion sample from LC-MS/MS.

Analysis of LC-MS/MS chromatogram (Figure 5) reveals the presence of pesticide flonic acid (molecular weight = 191.1 g/mol) in 3 samples (Figure 6). Flonic acid could be the hydrolysis product of flonic amid (molecular wt = 229.16 g/mol).

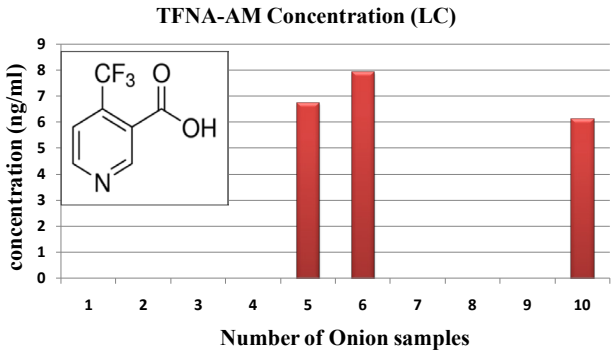

Figure 6: Concentration of TFNA-AM and its structure.

Discussion

Fresh onion samples procured from market were analysed for various pesticides. GC-MS/MS and LC-MS/MS technologies were used to screen 229 pesticides available in the market. Pesticides such as cypermethrin I, chloropyrifos, ethion, imidacloprid, Acephate, monocrotophos, bifenthrin, myclobutanil, fipronil etc were predominantly found in various vegetables and fruits. Pesticides are increasingly used to prevent crops from attack of pests, mites and other infections. In the analysed samples, pesticides cypermethrin I and TFNA-AM (Flonic amid) were detected in onion samples.

Onion (*Allium cepa)* is an herbaceous biennial in the family *Liliaceae* grown for its edible bulb. Ten samples of onion were randomly selected and analysed for pesticide residues. The results for onion samples are as follows. Cypermenthrin I (molecular weight 416.3g/mol) is the pesticide detected in Gas Chromatography (GC-MS/MS). It belongs to pyrethyroid group. The concentration of Cyermenthrin I is high in five samples among ten samples i.e. 50% of the samples. Highest concentration was found to be 8.7734 ng/ml while lowest was 5.5956 ng/ml. However, there were some samples which did not show traces of Cypermenthrin I.

TFNA-AM (molecular weight 229.162 g/mol) is the pesticide detected by HPLC. The concentration of TFNA-AM is high in three samples with highest in sample six with concentration of 7.93 ng/ml while the lowest was observed in sample 10 with concentration of 6.1 ng/ml. However remaining samples did not show any presence of the pesticide.

Conclusion

Onion samples were screened for 229 pesticides using gas chromatography/mass spectrometry (GC-MS/MS) and liquid chromatography/mass spectrometry (LC-MS/MS). Two pesticides Cypermethrin I and TFNA-AM are identified and quantified in onion samples. Cypermethrin I was found in 50 percent of the samples at or near the permissible level. Identified pesticides above the permissible level can cause serious health issues for humans. There is a need for educating farming community to use these pesticides with caution. Identified pesticides should be used within the permissible limit. Cut pieces of raw onions should be subjected to thorough washing and new methodologies are essential to reduce the pesticide content.

Conflicts of Interests: None declared

Acknowledgement: The authors thank TUV India private limited for assisting in the analysis of pesticides The authors also thank Symbiosis International (Deemed University) for necessary facilities and funding. Effects of Dance (Bharatanatyam) on the Body Composition, Nutritional Status, Fitness and Mental Abilities of Children and Adults– A Narrative Review

Apoorva Rao[1], Sneha Majumder[2], Kavitha Menon[3]

[1]Master student, [2]PhD Scholar, [3]Professor, Symbiosis School of Biological Sciences, Symbiosis International University, Lavale, Pune, Maharashtra

Abstract

Bharatanatyam, one of the oldest classical Indian dance forms that involves high intensity aerobic activity. As the use of dance to improve health and wellness is gaining momentum over physical activities, Bharatanatyam dance could be used as an alternative. Literature search was conducted in three databases and information on the effects of Bharatanatyam dance on physical and mental health. Based on the inclusion and exclusion criteria, six studies were identified and narrative review was prepared. The findings showed that regular dancer practice had beneficial effects on the body composition, fitness and mental abilities. The number of studies were limited and of low quality, and hence, the results should be carefully considered. There were no studies that comprehensively evaluated the nutritional status of dancers. Further well designed studies are needed to understand the effects of Bharatanatyam on health, nutrition and quality of life.

Keywords*: Dance, Body composition, Obesity, Stress, Women, Nutritional status, India*

Introduction

Dance consists of purposefully selected sequences of movement that are performed to a piece of music-a cultural expression uniquely placed to achieve health and wellbeing outcomes[1]. From time immemorial, dance has been a part of human culture, rituals and ceremonies and considered as a recreational activity[2]. Bharatanatyam, one of the oldest classical Indian dance forms, historically named as Sadir originated in Tamil Nadu and remains the most commonly learnt classical dance form in India.

Over the years Bharatanatyam dance was used primarily for recreational purposes and was not considered as a means to improve health and wellness which recently gained attention. Regular practice of Bharatanatyam dance could impart body flexibility, agility, strength, stamina, aerobic fitness, balance, posture, concentration, coordination of body parts, endurance, body weight maintenance and cognitive development considering the same as a high intensity aerobic activity[3].

The majority of research focused on the effects of western dance forms, sports and physical activities on health and wellbeing of English and Caucasian populations[4,5]. Evidence from these studies reported physical and neurocognitive benefits[1,6]. Regular dance practice has shown to improve aerobic fitness and strengthen the heart and lungs[7,8], increased muscular strength and endurance[9], and better coordinated movements of limbs. Physiologically, dance has shown to help in weight management and aid in strengthening bones[10]. Additionally, an improvement in mental functions including concentration and focus has been reported[11].

Literature on the effects of Bharatanatyam on physiological, metabolic fitness and mental abilities of regular dancers quantify the same and promote traditional dance as tool to reduce risk of chronic diseases

and mental disorders in Indian population. Additionally, there are few studies that assessed the nutritional status of Bharatanatyam dancers. Literature from New Zealand reported that professional dancers have an increased risk of micronutrient deficiencies due to decreased caloric intake and higher energy expenditure[12]. There is paucity of data from the Indian scenario; therefore, the present review aims to investigate the effects of regular practice of Bharatanatyam on the body composition, fitness, mental abilities and nutritional status of Indian children and adults.

Materials and Method

The present review was conducted to comprehensively assess the impact of dance on the nutritional status, body composition, fitness and stress levels of young adults. The review followed the guidelines of Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA). A literature search was conducted on three journal databases - ScienceDirect, Pubmed and Google Scholar - for published articles between January 2009 and April 2019. The first systematic search was completed in December 2019 and the final search was completed in April 2019. The search for published articles was conducted either singly or using a combination of Medical Subject Headings (MeSH) terms (i.e. nutrition, diet or nutritional status, body composition, mental abilities etc.) and text words (i.e.Bharatanatyam, Bharatanatyam dance etc.). The following combinations of MeSH terms and test words were used to identify the articles to be included in the review: "Bharatnatyam/Bharatanatyam dance" AND "Nutrition", "Bharatnatyam/ Bharatanatyam dance" AND "Body composition", "Bharatnatyam/ Bharatanatyam dance" AND "Mental abilities", "Bharatnatyam/Bharatanatyam dance" AND "Body composition", "Bharatnatyam/Bharatanatyam dance" AND "Nutrition", and "Bharatnatyam/Bharatanatyam dance" AND "Fitness".

Eligibility Criteria

The eligibility criteria for studies to be included in the present review were: trials/ studies where Bharatanatyam dancers were evaluated for their body composition (i.e. body fat percentage, body weight, waist and hip circumferences, height, Body Mass Index (BMI), subcutaneous fat), nutritional status, fitness (i.e. balance and VO_2 max) and stress levels in young adults. The review included studies conducted on healthy children and adults, and published in English. Only original research articles (cross-sectional, observational, randomized controlled trials, previous published reviews) published in peer-reviewed journals were considered for the current review. Editorials, conference proceedings, abstracts, conference posters and e-books were excluded.

Selection Process

The articles obtained from the selected databases were screened for duplication and duplicate articles were excluded. Using the inclusion and exclusion criteria, citations were screened for abstract and title by two reviewers independently. Full text articles of the eligible citations were retrieved and reviewed to determine eligibility for inclusion in the review preparations. Any disagreements on inclusion of studies were to the final analysis were resolved by the third author through independent review and consensus. The extracted data from the included studies are presented in Table 1. The information on author, year of publication, place where the study was conducted, sample size (intervention and control arms), data collected and important results were extracted and summarised.

Findings

Data on the selection of studies from different databases are presented below (fig 1). The original search presented 65 citations, of which 17 were excluded for duplication. Further screening based on the title and abstract yielded 30 articles excluding 18 citations from the potential list of citations. Full text review of these articles were conducted for the outcome parameters, appropriate study design, other inclusion and exclusion criteria. Out of the selected 30 articles, 24 studies which had an international context was excluded and only 6 Indian context studies were included.

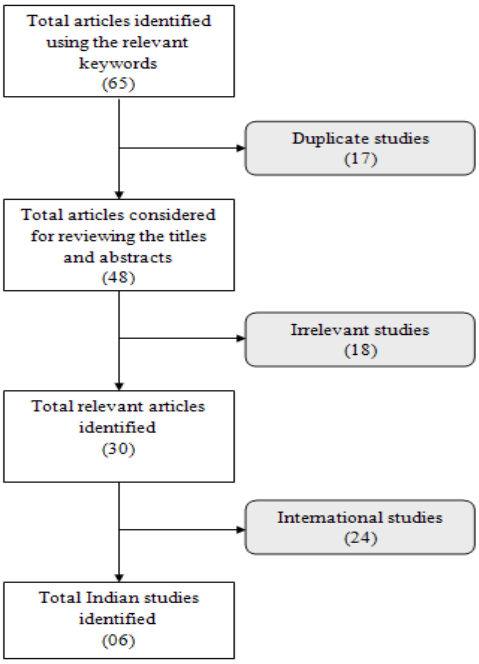

Fig.1. Article selection process for the current review

Study Characteristics

Out of the six Indian studies, four were case-control studies and two were cross-sectional design. The six included studies focused on body composition (n=4), fitness levels (n=2) and mental abilities (n=1) of children and adults who performed Bharatanatyam dance on regular basis (Table 1). The body composition parameters presented in the studies included body weight, body mass index (BMI), body fat percentage, subcutaneous fat, waist circumference and waist-hip ratio (WHR). Also, two selected studies presented effects on fitness indicators such as balance and flexibility. One included study reported effects on body composition, fitness and mental abilities (cognition). However, no study evaluated the effects of Bharatanatyam dance on the comprehensive nutritional status of these dancers.

Effects of Bharatanatyam dance on the body composition

The reviewed studies primarily studied the effects of dance on body composition in dancers and non-dancers. Of all the four studies that assessed the effects of dance on body composition two showed a significant impact on absolute body fat percentage[13] [13,14], one on BMI[3], and one on waist circumference, waist -hip ratio apart from body weight, BMI and absolute body fat[15]. The studies included dancers who practiced dance for a minimum of six hours a week and who had been dancing for the last five years. The mean difference of body weight across these studies varied, however, showed a positive impact of dance on the indicators of body composition. Additionally, the studies compared the effects either to participants with low physical activity or light activity, which could potentially overestimate the benefits than compared to participants with similar physical activity levels. Furthermore, no studies assessed the impact of dance on visceral fat, sub-cutaneous fat and inflammatory markers to understand the metabolic benefits of dance on participants.

Effects of Bharatanatyam dance on fitness and mental abilities

Only two studies evaluated the effects of dance on fitness parameters such as flexibility and balance. One study reported significantly lower scores on flexibility and balance in dancers compared to yoga performing individuals[16,17](Table 3). However, another study reported significantly higher scores for balance and flexibility in Bharatanatyam dancers compared to sedentary individuals[3]. In addition, one study reported higher VO_2 max (i.e. the measurement of the maximum amount of oxygen uptake during exercise that is used to establish aerobic endurance) than non-dancers, although this was not statistically significant[14]. Together these three studies indicate the fitness benefits for dancers, however, further studies are required to appropriately quantify the metabolic fitness benefits with rigorous assessments using specific fitness indicators. Further, dose-response estimation of the potential benefits of Bharatanatyam dance practice, which is a prominent Indian dance form, could potentially used to improve the metabolic and physical fitness in children and adults.

Chatterjee et al.[12] in his study on Kolkata based Bharatanatyam dancers assessed the mental abilities of Bharatanatyam dancers using Mini Mental State Examination (MMSE) and Reaction Time (RT). The dancers showed higher MMSE scores and RT (minutes) over non-dancers indicting the potential benefits on mental abilities in dancers (Table 3). Although the studies on the effects of Bharatanatyam dance on mental abilities are sparse, the benefits of dance training over physical exercise in mental abilities including cognition and the neurological benefits are available[18]. However, a majority of the studies are conducted using western dance forms and the benefits of Bharatanatyam or other Indian classical forms over the western dance forms

are unavailable. The information on the effects of the Indian dance forms would benefit Indians to engage more productively in traditional dance not only as a recreational activity but also a preventive therapy for chronic and debilitating mental disorders.

In addition to the aforementioned observations we report important lacunae for undertaking in-depth future studies. The studies included in the present review were primarily conducted in Kolkata while Bharatanatyam is widely practised in India regardless of its origin. There were no studies from the Southern parts of India. Although there is a preponderance of females as Bharatanatyam dancers, male dancers are integral. Information on the effects of dance on physical, nutritional and mental abilities of male dancers would be useful to understand the impact of physiological variations between the two genders.

Table 3 : Fitness and Mental Abilities related articles included in the revie

Sr. No.	Author, Year and Place	Age group	Sample size (Intervention and Control)	Inclusion/ Exclusion Criteria	Results	Findings
1	Jagadeeswari, (2017) Puducherry, India(16,17)	10-15 years	Group I: Yoga Practicing Students (YPS) (n=20) Group II: Bharatanatyam Practicing Students (BPS) (n=20).	Not mentioned	**Mean Balance Scores** YPS : 5.1945±4.23 BPS : 2.498±1.77 ($p<0.05$) **Mean Flexibility Scores** YPS :101.2±9.13 BPS : 83.35±13.15 ($p<0.05$)	Yoga practicing students were significantly superior in balance and flexibility than Bharatanatyam students.
2	Chatterjee et al (2018) Kolkata, India(3)	18-30 years	Control Group (CG): (n=35) (Sedentary activity) Bharatanatyam Dancing Group (BDG): (n= 33)	Inclusion : Minimum training of 6 years in Bharatanatyam for sedentary females Practice minimum 6 hours a week Exclusion : Under self-reported medical treatment.	Data unavailable	BDG had significantly higher balancing ability than CG. BDG had significantly higher MMSE scores and RT (minutes) than CG.
3	Jaywant (2013) Mumbai, India(14)	Middle Aged Women	Group I (Aerobic dancers) : (n=60) Group II (No physical activity): (n=60)	Inclusion : Practicing aerobic dance at least for 6 months Practices 1 hour thrice a week	**Mean VO_2 Max** Group I: 38.88±5.33 Group II: 35.19±5.48 ($p=0.002$)	VO_2 max values were higher in Group I than Group II, the result was not statistically significant.

MMSE:Mini Mental State Examination, RT:Reaction Time

Conclusion

The use of Indian dance, Bharatanatyam, as a physical activity for improved health (i.e. physical, mental and spiritual) and well-being could be beneficial. The effects of dance on body composition, stress and fitness in the Indian scenario remain unclear. The present review, although has limited number and low quality of studies, indicated the positive benefits on body composition, fitness parameters and mental abilities. Further well designed studies are required to understand the effects on nutritional status, reduction in risk of chronic and neuro-cognitive disorders.

Prevalence and Determinants of Vitamin-D Status in Subjects with Type II Diabetes Mellitus

Arti Muley[1], Uma Iyer[2]

[1]Assistant Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed) University, Symbiosis Knowledge Village Lavale, Pune, Maharashtra, India, [2]Professor, Department of Foods & Nutrition, Faculty of Family & Community Sciences, The Maharaja Sayajirao University of Baroda, Fatehgunj, Vadodara, Gujarat

Abstract

Background: Vitamin-D deficiency (VDD) is more evident in diabetic subjects as evidence shows its role in regulating some pathways related to diabetes development. It is hypothesized that vitamin-D influences glucose homeostasis by modulating inflammatory response. Hence the present study aimed to map the prevalence of VDD and identify associated determinants among type-II diabetic subjects.

Methods: One-hundred fourteen type-II diabetic subjects (30-65 years) who gave written consent were enrolled from a diabetic clinic for this cross sectional study. Background information was collected using a pre-tested semi-structured questionnaire. Anthropometric measurements were done by standard procedures. Serum 25(OH)D and other biochemical parameters were estimated in an NABL accredited laboratory using fasting blood samples. Data was analysed using SPSS version 20. Prevalence was reported as percentages. Pearson correlation was applied to find the association between determinants and multivariate analysis was performed to identify the predictor variables of vitamin-D status. Results were considered significant at $p<0.05$.

Results: About 89% of the subjects were vitamin-D deficient (serum 25(OH)D <20ng/ml). Significant higher values were observed for waist-stature-ratio and %body fat in the low vitamin-D group (<20ng/ml) when compared with the high vitamin-D group (≥20ng/ml). A significant negative correlation was observed between the vitamin-D levels and waist-circumference, waist-stature-ratio, BMI, %body fat, total-cholesterol and LDL-C. Hypercholesterolemia (OR 7.5, 95% CI 0.9-60.3) and inflammation (OR 3.95; 95% CI 1.2-13.2) was significantly high among the low vitamin-D group. WSR, total T4, duration of diabetes, total proteins and LDL-C were identified as predictor variables of vitamin-D status through the regression model.

Conclusion: Vitamin-D deficiency was highly prevalent among the diabetic subjects. Anthropometric measurements and lipid values emerged as modifiable risk factors for poor vitamin-D status. This calls for positive behaviour change and lifestyle modification among the diabetic subjects.

Introduction

Type 2 diabetes mellitus (T2DM) is not a trivial illness but a major medical condition that affects the quality of life of developed as well as developing countries. Asia is a major area of the rapidly emerging T2DM global epidemic, with China and India as the top two epicentres.[1] India being a tropical country receiving

ample sunlight almost throughout the year is thought of being spared of vitamin-D deficiency (VDD). But there is growing evidence supporting the fact that vitamin D status is important to regulate some pathways related to diabetes development, thus making VDD more evident in diabetic subjects. In a cross-sectional study among 210 south Asian type-2 diabetic subjects in UK aged >40 y, VDD was more common in diabetic compared to control.[2] In a meta-analysis of 16 studies, the odds ratio for type-2 diabetes was 1.50 (1.33-1.70) for the bottom vs top quartile of 25(OH)D, thus confirming the association of low plasma 25(OH)D with increased risk of type-2 diabetes.[3]

It is hypothesized that vitamin-D could influence glucose homeostasis by modulating inflammatory response, since the activation of inflammatory pathways interferes with normal metabolism and disrupts proper insulin signalling. The concern with the incidence of chronic-degenerative diseases is increasing worldwide, and many studies have shown that insufficiency of vitamin-D can be linked to several metabolic disorders.[4] Epidemiologic studies have also recently linked VDD with increased risk of major adverse cardiovascular events.[5] Few earlier studies have also reported that the rates of coronary heart disease, diabetes, and hypertension, like VDD, increase in proportion to increasing distance from the equator. VDD activates the renin-angiotensin-aldosterone system and can predispose to hypertension and left ventricular hypertrophy.[6]

The cited literature does show that there is association between vitamin-D and T2DM and other metabolic disorders. However data regarding this association is not available on all populations especially for the Indian continent. Therefore, the present work was carried out in a city situated in western India, with the objectives to map the prevalence of VDD in T2DM subjects and to identify the determinants of poor vitamin-D status among them.

Material and Method

Selection of the participants and description of the study

This is a cross sectional study using purposive sampling technique. A diabetic clinic in Vadodara city was selected. One-hundred fourteen subjects with confirmed T2DM in age group 30-65 years were enrolled. Subjects with gestational diabetes i.e. pregnant women, type-I diabetes and those taking vitamin D supplements were excluded. Written informed consent was taken from all the participants in English as well as local language (Gujarati).

Data Collection

Socio-demographic information and medical history was collected using a pre-tested semi structured questionnaire. Weight was measured using calibrated Salter electronic bathroom scale. Height, waist and hip circumference were measured using non-stretchable fibre glass tape to the nearest 0.1cm. The waist was defined as the point midway between the iliac crest and coastal margin; while hip circumference as the widest circumference over the buttocks and below the iliac crest.[7,8] Percentage body fat was calculated using the Omron body fat monitor (Model HBF-306). All measurements were taken by the trained researcher. Body mass index (BMI) was calculated by standard formula of weight in kg / height^2 in meters.

Blood pressure was measured usually in the morning hours when the subjects visited the clinic by clinically validated digital BP meter (Omron HEM-7203 model). An average of three readings was taken. For the biochemical profile, after an over-night fast, venous blood samples were collected by a trained technician. 25(OH)D for vitamin-D status was estimated by Chemiluminescence Immunoassay (CLIA) technique using kits by Simens – ADVIA Centaur. The serum concentration of 25(OH)D is widely regarded as a "gold standard" indicator of vitamin-D status as it is a good reflection of cumulative exposure to sunlight and dietary intake of vitamin-D.[9] VDD was defined as serum 25(OH)D concentration of <20ng/mL and categorized as insufficiency (20-≤30 ng/mL) and sufficiency (>30 ng/mL).[10] Lipid profile was analysed by Photometry using kits by Aggape and Rapid Diagnostics. The high sensitivity assay of C-reactive protein (hs-CRP) in the serum was done using nephelometry on a BN-II automated nephelometer (Dade Behring/Siemens). Detection Technology used for the estimation of TSH is ultrasensitive sandwich chemiluminescent immuno assay by Advia centaur CP and XP systems. These biochemical analyses were performed in a laboratory certified by ISO 9001:2008, NABL (India) and CAP (College of American Pathologist).

Statistics

Data was entered in Microsoft Excel 2007 and verified by the researcher. Statistical Package for Social Sciences (SPSS) version 20 was used for statistical analysis of the data. Prevalence was reported as percentages. Pearson correlation was applied to find the association between determinants and multivariate analysis (stepwise linear regression) was performed to identify the predictor variables of vitamin-D status. Results were considered significant at $p<0.05$.

Findings

The results presented are for the enrolled one-hundred fourteen subjects; 62 males and 52 females. The mean Vitamin-D value for the subjects was found to be 14.2 ng/ml; males 15.2 ± 10.1 ng/ml and females 13.0 ± 6.9 ng/ml. The subjects were categorised into deficiency, insufficiency and sufficiency groups based on their serum 25(OH)D levels (Table 1). It was seen that almost 89% of the subjects were vitamin-D deficient having levels less than 20 ng/ml. The subjects identified as vitamin-D deficient when further classified into sub-category of mild, moderate and severe deficiency (Figure 1), showed that about 60.5% subjects were mildly deficient and 28.1% had moderate deficiency. Both categories had higher number of females as compared to males.

To get a clarity regarding the determinants responsible for low serum vitamin-D levels among subjects were segregated based on their serum 25(OH) D levels into two groups- less than 20 and more than or equal to 20 ng/ml. About 92.3% (n=48) of the females and 85.5% (n=53) of males had vitamin-D levels less than 20 ng/ml. The univariate analysis revealed that the prevalence of hypercholesterolemia (Figure 2) and inflammation (Figure 3) was significantly high among the low vitamin-D group.

To test the direction and extent of association between Vitamin-D levels and the anthropometric and biochemical parameters the correlations between each of these were computed (Table 2). A significant negative correlation was observed between the vitamin-D levels and anthropometric measurements-WC, WSR, BMI & % body fat, suggesting that reducing them would lead to rise in vitamin-D levels or vice versa. The correlations between vitamin-D levels and biochemical parameters revealed that total cholesterol and LDL-Cholesterol were negatively correlated while T4 was positively correlated with vitamin-D levels, suggesting that if vitamin-D is low in body more aberrations are expected in their levels leading to clinical conditions.

A multivariate analysis was carried out to investigate how multiple variables in this study synergistically predicted variations in the vitamin-D status of the subjects. The stepwise forward linear regression model that explained maximum amount of variation (23.3%) consisted of five variables. Duration of diabetes and high levels of total T4 had positive coefficients while total proteins and LDL-C had a suppressive effect on the vitamin D levels (Table 3).

Table 1 Vitamin-D Status of the Subjects (n, %)

Serum 25(OH)D ng/ml	Females (n=52)	Males (n=62)	Total (n=114)	χ^2 value
Deficiency (<20)	48 (92.3)	53 (85.5)	101 (88.6)	2.197
Insufficiency (20-≤ 30)	3 (5.8)	4 (6.5)	7 (6.1)	
Sufficiency (>30)	1 (1.9)	5 (8.1)	6 (5.3)	

Values in parenthesis indicate percent

LDL-C		-0.190	**0.031***

p<0.05*, <0.01**, NS – Non Significant

Conclusion

Intra cellular vitamin-D receptors and the 1-α hydroxylase enzyme are distributed ubiquitously in all tissues suggesting a multitude of functions of vitamin-D in the body. Keeping this in mind, the major objective of the study was to map the prevalence of this very important nutrient among the T2DM subjects. The mean serum 25(OH)D levels of the diabetic subjects were much below the optimum requirement of more than 30 ng/mL, signalling a high prevalence of deficiency. About 89% of the subjects were found to be vitamin-D deficient, with females showing a non-significant higher prevalence as compared to males. Similar high prevalence has been reported by many authors worldwide. Taheri et al,[11] reported a prevalence of 83.3% among T2DM subjects as compared to 75.6% among the healthy subjects aged 20-80 years in Iran. Subramanian et al,[12] among Asian Indians reported a prevalence of 57.6% among the diabetic subjects with suboptimal serum vitamin D levels among them (11.0±7.5 ng/mL). Tiwari et al,[13] reported that 57.3% of T2DM subjects (mean age 51 years) had vitamin D deficiency (<50 nmol/l) and about 17.6% of them had severe vitamin D deficiency (<25 nmol/l). Fortunately in the present study no subject was detected with severe deficiency.

Vitamin-D plays an indirect but an important role in carbohydrate and lipid metabolism as reflected by its association with T2DM, metabolic syndrome, insulin secretion, insulin resistance and obesity. Cross-sectional, observational, and ecological studies have reported inverse correlations between vitamin-D status with hyperglycemia and glycemic control in T2DM patients.[14] Our study also looked at the presence of medical conditions among the subject with respect to their vitamin-D status. It was seen that hypercholesterolemia and inflammation were significantly high among subjects with low levels of vitamin-D showing its involvement in lipid metabolism.

Barbalho et al,[4] also reported a remarkable prevalence of low concentrations of Vitamin-D in patients with cardiovascular risk factors. Patients with altered values for vitamin-D presented significantly higher values for glycemia, HbA1c, Total cholesterol, LDL-C, triglycerides, Body Mass Index, waist circumference and non-HDL-c. Vitamin-D correlated negatively with glycemia, HbA1C, triglycerides, atherogenic indices, Body Mass Index, and blood pressure.

A recently conducted meta-analysis analysed an overall inverse relationship between serum vitamin-D status and body mass index (BMI) in studies of both diabetic (r = −0.173, 95% = −0.241 to −0.103, p= 0.000) and non-diabetic (r = −0.152, 95% = −0.187 to −0.116, p = 0.000) subjects.[15] Another investigation aimed to study gender based differences in cardiovascular risk factors of adult population with type-2 diabetes mellitus (T2DM) and to check the correlation between serum HbA1C, lipid profile and serum vitamin-D levels, in T2DM patients of Riyadh, Saudi Arabia also showed that vitamin-D concentration decreased significantly ($p < 0.001$) in diabetic patients than the healthy individuals in both the genders. Vitamin-D and HbA1C were negatively correlated in both males and females in T2DM patients and significant at $P < 0.05$. The study concluded that dyslipidemia remained one of the major risk factors of CVD in T2DM. In addition to dyslipidemia, decreased levels of vitamin-D associated with increased HbA1C alarms the early diagnosis of Type 2 Diabetes.[16] Our results are in line with the ones discussed above as we also found inverse correlation between vitamin-D levels and WC, WSR, BMI, % body fat, total and LDL-cholesterol.

Hence to conclude though a large number of observational studies support improving T2DM, obesity, and metabolic syndrome with vitamin-D adequacy, there is a lack of conclusive evidence from randomized control trials that, these disorders could be prevented after optimization of serum 25(OH)D levels by supplementation. Thus, specifically designed, new clinical studies are needed to be conducted in well-defined populations, following normalizing the serum vitamin-D levels in deficient subjects, to test the hypothesis that hypovitaminosis D worsens these disorders and correction would alleviate it. Also the importance of maintaining a healthy lifestyle needs to be propagated among the diabetic population to keep their biochemical profile at desirable levels.

Conflict of Interest: The authors declare no conflict of interest.

Source of Funding: The study was funded by University Grants Commission (UGC), New Delhi in the form of research fellowship to corresponding author.

Ethical Clearance: The study was approved by the *Institutional Ethics Committee for Human Research* (Reference No. IECHR/2013/04) which is responsible for ethical issues in all research projects involving human subjects conducted by the department.

Management of Complete Placenta Previa – A Case Study

Deepa Patil[1], Manisha Vikrant Mistry[2]

[1]Nursing Tutor, [2]Assistant Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Placenta previa affects approximately 0.5% of pregnancies. After four cesarean sections, however, it affects 10% of pregnancies. Rates of disease have increased over the late 20th century and early 21st century. Such a case was witnessed where a 36 year-old female (G4P2L1D1A1) with 25 weeks of gestation came to the OPD with complains of breathlessness. She is known case of RH incompatibility and was administered Anti-D immunoglobulin injection during previous pregnancy, yet was advised to take Anti-D immunoglobulin injection after 28 weeks of gestation.

Treatment advised was Inj. Taxim 1gm and Inj. Aciloc 25mg-IV, Tab. Aciloc 150mg, OD; Tab. Ferrous Sulphate and MVBC BD, Tab. Cal-D, 500mg-OD and Tab. Vitamin-C, 500mg-OD. A strict protocol of observation was carried to check if she had any spotting to rule out vaginal bleeding and was advised plenty of oral fluids along with regular FHS monitoring.

Key words: *Placenta Previa, Low lying, Bleeding per vagina, Antepartum hemorrhage*

Introduction

Placenta Previa defined as a condition that occurs in pregnancy when the placenta is abnormally implanted in the lower uterine segment, partially or totally covering the internal cervical os. The rising incidence of cesarean sections in the last 50 years is partially a causative factor to the increasing number of cases of placenta Previa.[1] The overall prevalence of placenta Previa reported is approximately 4.0 per 1000 births. Managing a case of placenta Previa during pregnancy poses a great challenge to every obstetrician in present day obstetrics due its increased risk of maternal and perinatal complications.[2] The distinction between placental abruption and Previa was based on the ability to palpate the placenta through the cervical os; the difference was important because the treatment of Previa involved rupture of the membranes, internal podalic version, and use of the fetus as a tamponade. In women with a persistent low-lying placenta or placenta Previa at 32 weeks of gestation who remain asymptomatic, an additional TVS is recommended at around 36 weeks of gestation to inform discussion about mode of delivery.[3,4]

Case Presentation, Management & Outcome

Day 1

A 36 year-old female (G4P2L1D1A1) with 25 weeks of gestation came to the OPD with complains of breathlessness and dry cough on 07/02/19. Her vitals recorded were Pulse - 88/min, Resp. – 14 breaths/min and BP -120/70 mmHg. She is known case of RH incompatibility and was administered Anti-D immunoglobulin injection during previous pregnancy. The physician advised strict bed rest, FHS monitoring and PV bleeding. Treatment advised was Inj. Taxim 1gm and Inj. Aciloc 25mg-IV. She was advised to get her screening done for hematology (CBC) and Ultrasonography.

Day 2

The client's vitals recorded were Pulse - 86/min, Resp. – 14 breaths/min and BP -120/70 mmHg. Client was advised screening for sr. electrolytes, HIV, HbsAg, Urinalysis, TSH, Glucose Tolerance Test (GTT) samples. She was advised to have normal diet with plenty of oral fluids. She was advised strict bed rest along with Tab. Aciloc 150mg, OD; Tab. Ferrous Sulphate and MVBC BD. A strict protocol of observation was carried to check

if she had any spotting to rule out vaginal bleeding. Ultrasound reports revealed that placenta completely covered the internal os.

Day 3

On 3rd day, also there were no signs of PV bleeding. Same treatment was continued on Day-03. Plenty of oral fluids, FHS monitoring and observation for PV bleeding was carried out. Vital signs were normal.

Day 4

There were no signs of PV bleeding. Same treatment was continued on Day-04 along with a new drug Tab. Cal-D, 500mg-OD. Plenty of oral fluids, FHS monitoring and observation for PV bleeding was carried out. Vital signs were normal.

Day 5

There were no signs of PV bleeding. Same treatment was continued on Day-05 along with Tab. Cal-D, 500mg-OD. Plenty of oral fluids, FHS monitoring and observation for PV bleeding was carried out. Indirect Comb's Test (ICT) screening was advised for the client. Vital signs were normal.

Day 6

There were no signs of PV bleeding. Same treatment was continued on Day-06 along with Tab. Vitamin-C, 500mg-OD. ICT test was found negative and the physician advised her to take the Anti-D immunoglobulins at 28 weeks of gestation. She was encouraged to have plenty of oral fluids and to be on strict observation for PV bleeding. Vital signs were normal.

Investigations:

Hematological Investigations

Table: 1 - Investigations

SN	Test	Patient values	Reference Values
	Liver Function Test		
	Total Protein	7.4 g/dL	6.0-7.8 g/dL
	Albumin	4.0 g/dL	3.5-5.5 g/dL
	Globulin	3.5 g/dL	2.5-3.5 g/dL
	(Albumin/Globulin) Ratio	0.4	0.8-2.0
	SGOT	16 IU/L	7 – 21 U/L
	SGPT	14 IU/L	8 – 32 U/L
	Urea	24 mg/dL	48 8 – 25 mg/dL
	Sr. Creatinine	0.6 mg/dL	0.9 0.2 – 0.6 mg/dL
	Platelets	200000	140,000 – 450,000/ml
	Hemoglobin	11.9 g/dL	11 – 16 g/dL
	WBC	10.9^3 / mm3	3.8 – 11.0 10^3 / mm3
	GTT 1st Hour 2nd Hour 3rd Hour	 181 mg/dL 175 mg/dL 180 mg/dL	 120-200 mg/dL 60-140 mg/dL 60-110 mg/dL
	BSL	99 mg/dL	60-110 mg/dL

HIV & HbsAg: The results were non-reactive

Ultrasound report on 09/02/19: The USG report revealed that there is a single live intra-uterine fetus is present. It beautifully represented the fetal cardiac activity and fetal movements with adequate amniotic fluid. Placenta lies posteriorly more towards the maternal left which is evidently over the internal os. Growth parameters: BPD-49mm, Head circumference- 151mm, Arm circumference-157mm, and Femoral length-32mm. The fetal weight was 370gms and fetal maturity – 20 weeks.

Etiology

The exact cause of placenta previa is unknown. It is hypothesized to be related to abnormal vascularisation of the endometrium caused by scarring or atrophy from previous trauma, surgery, or infection. Old age groups, smoking and clients with prior caesarean are at high risk.[5]

Pathophysiology

Placenta previa is the complete or partial covering of the cervix. A low-lying placenta is where the edge is within 2 to 3.5 cm from the internal os. Marginal placenta previa is where the placental edge is within 2cm of the internal os. Nearly 90% of placentas identified as "low lying" will ultimately resolve by the third trimester due to placental migration. The placenta itself does not move but grows toward the increased blood supply at the fundus, leaving the distal portion of the placenta at the lower uterine segment with relatively poor blood supply to regress and atrophy. Migration can also take place by the growing lower uterine segment thus increasing the distance from the lower margin of the placenta to the cervix.

Discussion

Placental extension of ≥40 mm beyond the internal os, in the setting of a placenta previa is a valid predictor of women who will require a peri-partum hysterectomy. As a result, these women have longer surgery time. Fortunately they do not have increased operative or postoperative complications.[9]

A study revealed that overall, among 59 women, the mean ± SD gestational age at ultrasound was 30.7 ± 2.7 weeks and the cervical length was 36.9 ± 8.8 mm. Cesarean delivery was performed in all cases, at a mean gestational age of 34.7 ± 2.3 weeks. Twenty-nine (49.1%) of the women presented pre-partum bleeding and 12 (20.3%) required an emergency Cesarean section prior to 34 completed weeks due to massive hemorrhage. Cervical length did not differ significantly between cases with and those without pre-partum bleeding (35.3 ± 9.3 mm vs. 38.4 ± 8.2 mm; P = 0.18), but was significantly shorter among patients who underwent emergency Cesarean section < 34 weeks due to massive hemorrhage compared with patients who underwent elective Cesarean section (29.4 ± 5.7 mm vs. 38.8 ± 8.5 mm; P = 0.0006).[6]

Another similar study was conducted where placenta previa was detected during 940 ultrasound examinations in 714 pregnancies. Of those with placenta previa at 15–19 weeks, 20–23 weeks, 24–27 weeks, 28–31 weeks, and 32–35 weeks, previa persisted until delivery in 12%, 34%, 49%, 62%, and 73%, respectively. At each interval, complete previa was more likely to persist than incomplete previa, all $P < .001$. Prior cesarean delivery was an independent risk factor for persistent previa among women diagnosed with previa in the second trimester, $P < .05$.[7]

Ethical approval: Written informed consent was obtained from the patient and hospital authority for publication of this case report and accompanying images/tables.

Conflict of Interest: There is no conflict of interest.

Effect of Educational Intervention on Menstrual Hygiene on Knowledge, Perception and Practices of Adolescence Girls

Dipali Dumbre[1], Seeta Devi[2]

[1]Tutor, [2]Asst. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Background: Menstruation and menstrual practices are still concerned by taboos and socio cultural limitations subsequent in adolescent girls remaining unaware of the scientific practices, facts, and hygienic health practices, which sometimes result into adverse health outcome.

Objective: To assess the effectiveness of educational material on menstrual hygiene.

Methodology: In the present study, quantitative research approach was applied and the research design was Quasi-experimental one group pre-test and post-test. The setting of the study was selected urban community areas of Pune. The sample size 60, selected by using simple random sampling technique. The structured questionnaire was administered. In order to establish the reliability of the tool inter rater method was used. The scores were calculated and the reliability was established by Kappa method, which was 0.90.

Results: Researcher has applied the paired t-test to check the effectiveness of educational interventions. Score was 3.8, which increased to 9 in posttest. T-value for this test was 27.4 with 99 degrees of freedom, corresponding to p-value of 0.003.

Conclusion: Formal as well as informal channels of communication need to be emphasized for the delivery of information on menstrual hygiene through distribution of information booklets among adolescent girls. .

Keywords: *Educational intervention, menstrual hygiene, knowledge, perception , practices, adolescence girl*

Introduction

Adolescence is viewed, as a unique phase of human development and among adolescent girls, menarche is an significant landmark in the process of growth and maturation[1]. The onset of menstruation is one of the most important physiological change occurs among the girls during the adolescent years[2]. The first menstruation occurs between 11and 15 Years with a mean of 13 years. Though menstruation is a natural and normal physiological process for all healthy adult women, as ever it has been surrounded by secrecy and myths in many societies[3].

Corresponding author:
Mrs Seeta Devi
Asst. Professor, Symbiosis College of Nursing
Symbiosis International (Deemed University),
Pune 411004

Menstruation and menstrual practices are still clouded by taboos and socio cultural restrictions resulting in adolescent girls remaining ignorant of the scientific practices and facts and hygienic health practices, which sometimes consequence into adverse health outcome[4]. Hygienic practices of women during menstruation are of substantial importance ,as it has a health influence in terms of augmented vulnerability to reproductive tract infections (RTI).[5]

Adolescent girls constitute a vulnerable group; particularly in India where female child is neglected one [6]. Mothers may not educate their daughters about various aspects of menstruation such as age of its onset, its duration and healthy practices during menstruation. The girls are not motivated to take the event lightly[7]. Therefore the inadequate knowledge, misconception and wrong ideas lead to undue fear, anxiety and undesirable attitudes in the minds of adolescent girls. It is known

that attitudes to menstruation and menstrual practices developed at menarche may persist throughout life[8].

Pubertal hygiene is rarely discussed at home or in schools. This is a major issue in poorly educated people and low income families due to cultural restrictions. This is leading to superstitious perceptions and beliefs about dysmenorrhea and menstrual hygiene.

Based on the review of literature and experience in the clinical and community settings, the researcher felt that, it is very important to disseminate the knowledge and improve the practices regarding menstrual hygiene among adolescent school girls, and planned to distribute the information booklets to improve the self-care ability and follow healthy and hygienic practices among adolescent girls .

Title: "Effect of educational intervention on menstrual hygiene on knowledge, perception and practices of adolescence girl residing in selected area of Pune city."

Objectives of the study:

To assess the knowledge, perception, practices regarding menstrual hygiene among adolescent girls.

To assess the effectiveness of educational material on menstrual hygiene.

To find out the association between knowledge and perception on menstrual hygiene with selected demographic variable.

Hypothesis:

H_0- There is no significant difference in knowledge, practices and perception before and after intervention

Methodology

In the present study quantitative research approach was used and the research design was Quasi-experimental one group pre-test and post-test research design. The setting of the study was selected urban community areas of Pune. The sample size 60 , selected by using simple random sampling technique. The data was collected from the participants who were willing to participate in the study, and who were able to understand the English and Marathi. The structured questionnaire was administered. Questionnaire had four sections ; Section I had demographic data of the residents , Section II had knowledge, regarding menstrual hygiene, Section III had perception and practices regarding menstrual hygiene. In order to establish the reliability of the tool inter rater method was used. The score were then calculated and reliability was established by Kappa method which was 0.90. To the tool was validated by 13 experts in the field of specialty. The data was collected in two months duration. The informed consent was taken from participants followed by the pretest and distribution of information booklet on menstrual hygiene and posttest was administered after 15 to 20 days of pretest and processed the data for analysis.

Results

n= 60

Table 1 : Distribution of the participants based the knowledge score in pretest and posttest in frequency and percentages:

	Pretest		**Posttest**	
	Freq	**%**	**Freq**	**%**
Poor (0-10)	33	55%	25	41.66%
Average (11-20)	14	23.33.%	10	16.66%
Good (21-30)	13	21.66%	25	41.66%

Table 2: Paired t-test for the effectiveness of the educational intervention

	Mean	**SD**	**t**	**Df**	**p-value**
Pretest	3.8	1.9	27.4	99	0.003
Posttest	9.0	0.2			

Researcher has applied the paired t-test to check the effectiveness of the educational interventions. Score was 3.8, which increased to 9 in posttest. T-value for this test was 27.4 with 99 degrees of freedom., corresponding p-value was of the order of 0.003, which is small (less than 0.05), the null hypothesis is rejected.

Table 3: Distribution of the participants based the perception of adolescent girls regarding menstrual hygiene:

	Pretest		Posttest	
	Freq	**%**	**Freq**	**%**
Yes	25	41.66%	30	50%
No	35	58.33%	30	50%

Perception of participants regarding menstrual hygiene in pretest was 41.66% as it increase to 50%

Table 4: Distribution of the participants based the practice of adolescent girls regarding menstrual hygiene in percentages:

	Pretest		Posttest	
	Freq	**%**	**Freq**	**%**
Poor (0 – 5)	20	33.33%	16	26.66%
Average (6 – 11)	24	40%	19	31.66%
Good (12 – 16)	16	26.66%	25	41.66%

In pretest, 33.33% of the adolescents had poor practices, 40% of them had average practices and 26.66% of them had good practices regarding menstrual hygiene. In posttest, most of them had good practices regarding menstrual hygiene. This indicates that the practices of the menstrual hygiene among adolescent girls improved after education.

Discussion

Purva Shoor conducted a study on knowledge, attitude, and practices of menstrual health in 2017 , results showed that only 37.39% girls knew that infection would occur if they do not clean their vagina regularly during menstruation. Only 34.1% girls had the right perception about menstruation as a normal physiological process. A large proportion of the girls used sanitary pads during menstruation. 35.32% of girls said that they were scared when they first attained menarche. Only 11.08% girls said that they had no restrictions during menstruation. Similar finding findings are in the present study [9]. In present study, also majority of girls in the pretest had poor practices of menstrual hygiene. In posttest, the knowledge and practices improved regarding menstrual hygiene.

Conflict of Interest – Nil

A Study on Prevalence of Metabolic Syndrome (M.S.) and Associated Risk Factors among Rural Women at Rural Block of Pune District

S G. Joshi [1], Mangesh V. Jabade[2], Shital V Waghmare[3], Ranjana Chavan[3]

[1]Professor, [2]Tutor, [3]Assistant Professor, [4]Assistant Professor, Community Health Nursing Department, Symbiosis College of Nursing, Symbiosis International (Deemed University), Senapati Bapat Road, Pune, Maharashtra, India

Abstract

Background: Metabolic Syndrome is group of risk factors, which predisposes to increased risk of diabetes and cardiovascular diseases. Its prevalence is more in India. As there was dearth of rural studies in Pune District, the present study was undertaken. **Objectives: T**o determine the prevalence of metabolic syndrome in women in the rural area of Pune district. 2. To identify the risk factors associated with metabolic syndrome. **Method:** community-based cross-sectional study was done from February 2016 to March 2017, total 246 women were studied during physical examination. **Results:** The overall prevalence of metabolic syndrome was estimated by using criterion given by international diabetes federation. Metabolic syndrome was found in 24.39% women. Age, tobacco consumption, dietary habits were significantly associated with Metabolic Syndrome. **Conclusion:** The study highlighted the need for aggressive health education activities in rural area to reduce risk of non-communicable diseases.

Keywords: *community health; lifestyle factors; metabolic syndrome; obesity; overweight; public health; risk reduction*

Introduction

Currently India is at risk from non-communicable diseases such as obesity, hypertension and diabetes. Metabolic syndrome is a group of conditions that are associated with increased blood pressure, high blood sugar, excess body fat around the waist, and abnormal cholesterol or triglyceride levels which occur together, increasing 2-fold risk of heart disease, stroke and 5-fold risk of diabetes.[1] One must have at least three metabolic risk factors to be diagnosed as metabolic syndrome. The risk of having metabolic syndrome is closely linked to overweight, obesity and a lack of physical activity. Abdominal obesity is linked with fatty acid utilization and which may lead to type 2 diabetes mellitus [2] obesity affects all socioeconomic groups which increases the risk of metabolic syndrome, a leading cause of death worldwide.. Aggressive lifestyle changes can delay or even prevent the development of serious health problems. [3]

In 2014, According to World Health Organization (WHO), found that 44% diabetes, 23% ischemic heart disease and about 40% of cancer cases worldwide were due to overweight and obesity[4]. People with metabolic syndrome are likely to develop cardiovascular disease, type 2 diabetes mellitus compared to the people without metabolic syndrome [5]

Obesity, Hypertension and diabetes are growing health problems in India. There were 20 million obese women in India in 2014 compared with 9.8 million obese men[4] Obesity has been linked to a host of illnesses including diabetes, cardiovascular disease and breathing disorders. Rapid urbanization along with rising income and sedentary lifestyles has all been associated with rising levels of obesity. Recent data indicate that the prevalence of metabolic syndrome in India is 31% yet some overweight and obese individuals have normal metabolic profile. 2010 study in southern state of TN suggest that one in every 10 Tamilians is diabetic

and another eight % of the population is pre-diabetic. Cardio Vascular ailments have displaced communicable diseases as the biggest killer in India.[6]

In Indian subcontinents dietary factors responsible for development of metabolic syndrome among the population. The dietary changes combined with a trend toward a more sedentary lifestyle, as factors in the rising prevalence of metabolic syndrome and associated diseases such as diabetes, cardiovascular diseases and gout.[7] India is undergoing rapid urbanization. Rising income, increased consumption of tobacco and alcohol, unhealthy dietary pattern and adoption of unhealthy life style contributes to increase in the metabolic syndrome in rural India[8]. Females were three times more likely to have metabolic syndrome compared to males[9]. Recently many studies were conducted in urban set up and very few studies have been conducted among rural community[9]. Therefore, this study was conducted to assess risk factors and its association with metabolic syndrome among rural women of Pune district of Maharashtra.

Prevalence of Metabolic Syndrome

The prevalence of obesity and metabolic syndrome is increasing in Indian subcontinents. According to Mohan V Rao prevalence of metabolic syndrome in urban population in South Asian population is around 33% and insulin resistance was observed in 30% of population. A high prevalence of metabolic syndrome also observed in rural India belonging to lower socioeconomic group.

Method

Study design: The aim of the study was to assess the risk factors & its association with metabolic syndrome among the rural women at Pune district of Maharashtra (India). Researcher also studied prevalence of various risk factors leading to metabolic syndrome for example: Diabetes mellitus, Hypertension, CVD, Obesity etc. A cross sectional study was conducted during community-based physical examination from February 2016 to March 2017 in 4 villages in Pune district. The head of each village was communicated and written permission was sought. A total 246 samples attended community based physical examination. All women older than 20 years were eligible for inclusion. Pregnant women were excluded from the study. A written informed consent was obtained after explaining objectives and procedures of the study. Among 246 samples all women were from 20 years to 65 years old. Reliability of the tool was 0.92. The research proposal was duly approved by institutional ethical committee.

Measures: Each participant was interviewed and completed standardized questionnaire to collect participant's demographic data, clinical data, and life style behaviours, which includes regular exercise, dietary habits, use of tobacco etc.

Demographic data includes age, marital status, education level, family history of diabetes (DM), Hypertension (HTN) and obesity, parity and previous history of gestational diabetes Mellitus in women.

Presence of any three following traits in the same individual would meet the criteria for Metabolic Syndrome: [10, 11]

1. Waist circumference of women more than 80 cm.
2. BP 130/85 mm of Hg or history of anti hypertensive drug consumption.
3. Fasting blood sugar 100mg /dl history of DM or using anti diabetic drugs
4. Reduced HDL – Cholesterol <50 mg/dl
5. Hypertriglyceredimia more than 150 mg/dl

Anthropometric data - Blood pressure, weight, height; body mass index (BMI) abdominal and waist circumference. Measurements were taken after removing shoes and wearing light clothes. Weight and height were measured according to the standard chart. Waist circumference was measured at the midpoint between the lowest rib and the upper lateral border of the right iliac crest and hip circumference at the point of hip diameter. BMI was calculated by using formula: BMI = Weight (kg)/ Height^2 (m)

1. Blood pressure was measured by a standard sphygmomanometer after 15 minutes rest in sitting position.
2. **Bio-chemical profile:** Plasma glucose, triglyceride level (for serum glucose level researcher referred ADA guidelines[10]. Samples with random glucose level less than 100 mg/dl was considered normal blood glucose level.
3. **Risk Factors –** questions regarding smoking,

alcohol consumption, exercise and dietary habits were included in the data**.**

Data Analysis

Data were analysed using SPSS statistics software SPSS version 20. Descriptive statistics was used to provide figures and tables. Chi-square test, logistic regression was used for correlation assessment p=0<0.05 was considered as significant.

Table 1: Study variables for baseline data

SN	Parameters	Study variables
1	Demographics	Age
		Family History of DM,HT, CVD,
2	Risk Factors	Use of Tobacco
		Smoking
		Alcohol Consumption
		Dietary habits in last six months
3	Anthropometrics	Height
		Weight
		BMI
4	Biochemical tests	Fasting Blood Glucose
		Triglyceride Level in Blood Serum

Results

Demographic Characteristics From total 246 participants of women, mean age of all women participants was 40.22 with standard deviation (SD) 18.34. the age of the subjects ranged from 20 to 65 years, majority of the women 76 (30.89%) were from age group of 40-49 years, followed by 64(26.01%) from 30-39 years old. More than half of all participants have completed their secondary education 136 (55.28%). Total married women were 187976%), regarding diet 147(60%) participants were taking regular fruits in the diet.

Risk factors among women – out of 246 women only 57(23%) women doing regular exercise. 128(52.03 %) women consuming non-vegetarian diet having high fat contents. Only 123(50%) women were taking fruits in their diet. In spite of large health education programmes, still 30(12.19 %) women still consumes tobacco and its products in the form of chewing, applying tobacco on the teeth.

Prevalence

Overall prevalence rate of metabolic syndrome among rural women having 3 components was 24.39 % (n=246) in a selected four villages of Pune district. Data analysis revealed that 118 (47.96%) participants were found normal weight, 68 (27.64%) were overweight, and 60 (24.39%) were obese. The prevalence of metabolic syndrome in normal weight, overweight and obese was found to be 9.34%, 41.4 % and 64.1% respectively.

Age wise distribution of prevalence of metabolic syndrome found significantly less in 20 to 30 years of age (10%). Among 60 years and above prevalence was (60 %). It was found that history of hypertension & diabetes increases as age advances. History of diabetes was significant in females over the age of 45 years (p=0.15) prevalence of hypertension was significant in 45 to 65 years. (P<0.001) The details of the same is mentioned in Table 2 & 3

Table 2 Overall Prevalence of Metabolic Syndrome

S.N.	Characteristics	Mean	SD
1	Age in (years)	40.22	18.2
2	Weight (kg)	54.25	13.1
3	Height (cms)	151.02	8.06
4	BMI(kg/m^2)	24.39	5.1
5	WC (cms)	92.47	10.45
6	HC (cms)	93.23	11.02
7	WHR	0.894	0.075
8	TBF (%)	25.36	6.14
9	Systolic BP (mmhg)	128	19.67
10	Diastolic BP (mmhg)	88	12.94
11	Blood Sugar (mg/dl)	148	86.49
12	Triglycerides (mg/dl)	147.90	74.5
13	HDL (mg/dl)	37.70	8.4
14	LDL (mg/dl)	112.17	32.8

SD: Standard deviation, BMI: Body mass index,

WC: Waist circumference,

HC: Hip circumference, WHR: Waist-To-Hip Ratio, TBF: Total body fat

The study also showed significantly higher rates of metabolic syndrome in older age groups.

The prevalence of major risk factors of CVD was (42%) over weight was (32%) obese was (30%) elevated BP was found in 10% of samples.

Table 3: Prevalence of metabolic syndrome according to age group

Age (years)	Present n (%)	Absent n (%)	Total n (%)
20-29	6(10)	54 (90)	60
30-39	8(12.5)	56 (87.5)	64
40-49	24(31.57)	52 (48)	76
50-59	16(44.44)	20 (53.56)	36
60 & above	6(60)	4 (40)	10
Mean	60(24.39)	186 (75.59)	246

χ^2 – 168.07 ($p<0.01$)

The highest prevalence of metabolic syndrome was 60 % that was seen in age group 60 and above. Prevalence of each component of MS in studied population was

Table 4. Prevalence of Metabolic Syndrome According to Education

Education	Present n (%)	Absent n (%)	Total n (%)
Illiterate	7 (12)	53(88)	60
Primary	26 (35)	64(65)	90
Secondary	10 (20)	20 (80)	30
Higher Secondary	12(46)	14 (54)	26
Graduation	2 (8)	22 (92)	24

χ^2 – 67.07 ($p<0.012$)

Table No 5 Prevalence of Metabolic Syndrome According to Risk factors

Life style factors	Present n (%)	Absent n (%)
Exercise	58 (23%)	188 (76.42)
Vegetarian	198 (80.48)	48 (19.51)
Non-vegetarian	128 (52.03)	118 (47.96)
Salt Restrictions	122 (49.59)	124 (50.40)
Consuming fruits	124 (50.40)	122 (49.59)
Tobacco use	30 (12.19)	216 (87.80)

χ^2 – 112.07 ($p<0.016$)

Lifestyle-related risk factors for metabolic syndrome in overweight or obese participants- statistical test was applied to find association of life style risk factors and metabolic syndrome, the result of χ^2, Fisher exact test analyses showed significant differences with regards to use of tobacco, dietary consumption of fat and non vegetarian diet. The participants who were overweight but having favourable life style behaviours found no metabolic syndrome. In the obese group, there was no correlation among exercise regularly, fruit consumption. Logistic regression analyses were conducted to find out overweight and obese participants, it was found that in the overweight group metabolic syndrome was found less in women not consuming tobacco (p=0.014). Participants who reported eating enough vegetables and fruits were also less likely to have metabolic syndrome than those who did not (P=0.005). in the obese group, participants who exercised regularly were significantly less likely to have metabolic syndrome than who did not (P=0.014).

Abdominal obesity showed highest prevalence age group 50-59 years (45.76) the highest prevalence of high blood pressure and abnormal FBS seen in age groups 60-69 years

In total population studied 22% were normal no any complaints of MS 31.67 % had one component, two 24% three 11.3 and 2.5% have five components of metabolic

syndrome

Conclusion

All the above findings highlight the need for screening the apparently healthy population through regular health checkups so that health education and promotion programme may be implemented for prevention of metabolic disorders. The data demonstrated that anthropometric, clinical and biochemical parameters plays a significant role in the development of metabolic disorders. The study highlighted the need for aggressive health education activities in rural area to reduce risk of non-communicable diseases.

Discussion

The prevalence of obesity and metabolic syndrome is rapidly increasing in India and other South Asian countries, leading to increased mortality and morbidity due to CVD and T2DM metabolic syndrome and obesity track into adulthood, these clinical entities need to be recognized early in the life-course for effective prevention of T2DM and CVD high prevalence of metabolic syndrome and associated cardiovascular risk factors compared with other study.

Hu FB, Manson JE, Stampfer MJ., et al documented 3300 new cases of type 2 diabetes. Overweight or obesity was the single most important predictor of diabetes even after adjustment for the body-mass index. As compared with the rest of the cohort, women in the low-risk group (3.4 percent of the women) had a relative risk of diabetes of 0.09 (95 percent confidence interval, 0.05 to 0.17). 91 percent of the cases of diabetes in this cohort (95 percent confidence interval, 83 to 95 percent) [17[. Similar result was found in our result is matching like From total 246 participants of women, mean age of all women participants was 40.22 (SD, 18.34) the prevalence of metabolic syndrome found significantly less in 20 to 30 years of age (10%) were as 44.44% in 60 & above age group. History of diabetes was significant in females (p=0.15) prevalence of hypertension was significant in 45 to 65 years.

Jing Xiao, Chuan-Li Wu, et al reveled that overall prevalence of MS in 2013 was 42.6%. The prevalence was significantly higher in elder people in both genders, and was higher in elder women than in elder man (above 50 years) in both stage I and II. We found that current smokers in women and familial history of hypertension, diabetes, hyperlipidemia, CHD and stroke in both genders were associated with the prevalence of MS[18]. Similar result was found in our study that's 20 to 30 years of age (10%) were as 44.44% in 60 & above age group. It was found that history of hypertension & diabetes increases as age advances. History of diabetes was significant in females (p=0.15) prevalence of hypertension was significant in 45 to 65 years. (P<0.001) prevalence of family history of CVD was observed in 30% of samples.

Study on Acute Respiratory Diseases among Children of below Five Years in India

Rohit Singh Tomar[1], Parag Rishipathak[2]

[1] Assistant Professor (Sr.), Symbiosis Institute of Health Science, [2]Director, Symbiosis Centre for Health Skill, Symbiosis International University, Pune, India

Abstract

Introduction: India is a country of large children population, with a very high children mortality rate. Acute Respiratory Infection (ARI) is one of the biggest killer of infants and children in India. **Objective:** current research is conducted to find out the difference in the mortality of Neonatal, Post neonatal and Children under five years of age due to ARI. Further we are interested to find out the relationship between per capita gross national income and mortality of children under five years of age due to ARI. **Originality:** Very few studies have been conducted to find out the difference in mortality due to ARI across different age groups of infants/children. **Material & Method:** Secondary data is analyzed by using ANOVA, Tukey Post hoc and partial correlation.

Results & discussion: There is a significant difference between the mortality due to ARI of children across Neonatal, Post neonatal and under five years of age in India. Post hoc test suggests that mortality due to ARI of children is not significant for Post neonatal and children under five years of age. There is very strong and negative correlation has been found between per capita gross national product of India and mortality due to ARI in children. **Applications:** Current research would help policy makers to make effective policies in public health domain. Further it gives idea to improve economic condition to reduce mortality due to ARI. **Conclusion:** To fight against Post neonatal and children under five years of age mortality due to ARI, government in India can frame similar but effective policies.

Keywords- *Neonatal, Post neonatal, Children Mortality Rate.*

Introduction

India is a country with largest children population, as per the report of Children in India 2018, 13.59% of its total population is in the age group 0-6 years, which is 16.45 Cr. 69% of India's population lives in rural areas, whereas 74% of children (0-6 years) belongs to this region, meaning young India lives in villages [1]. Sex Ratio in the age group (0-6 years) is 918, which is less than the overall sex ratio of the country which is 943[1]. Gender wise and area wise skewed population distribution of this age group is a matter of concern, but in long run health of this sector is the prime concern for all civilizations. Infant mortality rate (IMR) is 34 per 1000 birth, this is even adverse for females, which is 36 per thousand [1]. However there is a decrease in the IMR from year 2011 onwards, but yet we have to travel a long distance, as almost all developed countries has very less IMR than India. Indian government and researchers are continuously framing policies and executing the same to decrease IMR.

Neonatal death has been defined by the World Health Organization (WHO) as "deaths among live births during the first 28 completed days of life" [2]. Neonatal Mortality Rate in India was 24 in year 2016, with the distribution of 27 in rural areas and 14 in the urban areas. Indian states of Odisha and Madhya Pradesh has highest Neonatal death rate of 32, while Kerala has least which

is equal to 6[3].

Infant Mortality Rate (IMR) is 34 in India, whereas it is 38 in rural areas and 23 in urban areas. In Madhya Pradesh it is 47 and in Kerala it is 10 per thousand live births. Under five years mortality rate (U5MR) is 39 and it is 43 and 25 respectively in the rural and urban areas [3].

Many factors are responsible for the high mortality rate of children under five years of age in India. Poor medical facilities in rural India, malnutrition, improper vaccination, congenial diseases, poor hygiene and sanitation, lack of awareness regarding medical aid and communicable diseases are some of the factors responsible for the high mortality rate in India.

23% of the deaths have been reported from the Acute Respiratory Infection among total deaths by communicable diseases an India during 2017 (January to December) across all age groups. Children of our country has also been victimized from this disease and their condition is no better than the entire population of our country.

Prima facie we can see that, there is a difference in the number of children death across three categories namely Neonatal, Postnatal and under five years of age. However we need to explore whether this difference is significant or not.

Material and Method

This exploratory research is based on the secondary data procured from the UNICEF and WHO websites, journals, newspapers, conference publications, reports of Government of India etc. Data is related to the mortality number and rate, due to ARI, of children below five years of age of India.

Null Hypothesis: There is no significant difference in the mortality of children across three age groups (Neonatal, Post neonatal and under five years) in India.

Alternative Hypothesis: There is a significant difference in the mortality of children across three age groups (Neonatal, Post neonatal and under five years) in India.

Statistics used: One way ANOVA is used to analysis the data with the help of software SPSS 23.0. Later, Tukey post hoc test is applied to find actual difference between the mean values.

Further we want to test the impact of the children mortality rate due to ARI on the per capita gross national income of the society. This objective is chosen to prove that poor health conditions due to ARI may reduce per capita gross national income of the society. To fulfil this objective partial correlation is applied on the data.

Results and Discussion

ARI is among the various communicable diseases reported by the States/UTs during 2017[3]

Neonatal death rate due to Acute Respiratory Infection (ARI), Post neonatal deaths due to Acute Respiratory Infection, and Under five deaths due to Acute Respiratory Infection from 2000 to 2016 table shows decreasing trends at all levels but these numbers are still high[4].

Table I shows descriptive statistics where mean value of mortality and variance in mortality is highest among children of below five years of age:

Table I Descriptive Statistics of Mortality in India

Age Group	N	Mean	Std. Deviation	Minimum	Maximum
Neonatal	17	57173.2353	17637.79866	32843.00	86337.00
Post neonatal	17	254871.8824	87196.44568	125333.00	398757.00
Under five	17	312045.1765	104820.09026	158176.00	485094.00
Total	51	208030.0980	134946.90913	32843.00	485094.00

Source: SPSS output

Table II suggests probability value as 0.000 which is less than 0.05, therefore null hypothesis is not accepted while alternative hypothesis is accepted. Therefore there is significant difference in the mortality of children across three age groups (Neonatal, Post neonatal and under five years) in India.

Table II ANOVA

	Sum of Squares	**df**	**Mean Square**	**F**	**Sig.**
Between Groups	608108399713.216	2	304054199856.608	48.259	.000
Within Groups	302425014449.294	48	6300521134.360		
Total	910533414162.510	50			

Source: SPSS output

Table III gives us more information regarding mortality rate and its relationship among various age groups. There is no significant difference in the mean value of mortality between Post neonatal and under five age groups of children as probability value is 0.101, which is more than 0.05. However Post hoc test suggest significant difference in the mean mortality value of the other two groups.

Table III Multiple Comparisons
Dependent Variable: Mortality due to ARI

(I) group	**(J) group**	**Mean Difference (I-J)**	**Std. Error**	**Sig.**	**95% Confidence Interval**	
					Lower Bound	**Upper Bound**
Neonatal	Post neonatal	-197698.64706*	27225.682	.000	-263543.6227	-131853.6714
	Under five	-254871.94118*	27225.682	.000	-320716.9169	-189026.9655
Post neonatal	Neonatal	197698.64706*	27225.682	.000	131853.6714	263543.6227
	Under five	-57173.29412	27225.682	.101	-123018.2698	8671.6816
Under five	Neonatal	254871.94118*	27225.682	.000	189026.9655	320716.9169
	Postnatal	57173.29412	27225.682	.101	-8671.6816	123018.2698

*. The mean difference is significant at the 0.05 level.

Source: SPSS output

Table IV shows us the partial correlation between per capita gross national income and various children mortality rates. There is negative and strong correlation between mortality rates due to ARI and per capita gross national income.

Table IV Correlations

		GNI	**Neonatal**	**Post neonatal**	**U5MR**
Pearson Correlation	GNI	1.000	-.991	-.990	-.990
	Neonatal	-.991	1.000	.999	.999
	Post neonatal	-.990	.999	1.000	1.000
	U5MR	-.990	.999	1.000	1.000
Sig. (1-tailed)	GNI	.	.000	.000	.000
	Neonatal	.000	.	.000	.000
	Post neonatal	.000	.000	.	.000
	U5MR	.000	.000	.000	.

Source: SPSS output

Conclusion

It is observed that mortality of children under five years of age is maximum because of ARI. However mortality at neonatal is minimum because of ARI. Neonatal mean value of mortality is significantly different from post neonatal and mortality under five years. But post neonatal mean value and mortality mean value under five is not significant. Same but effective policies are required to reduce under five children mortality rate on the other hand children of neonatal age group required policies from other two groups. It can be inferred that per capita gross national income gets reduced if there is high mortality rate found among children of various selected age groups and vice -versa. Probably there is low children mortality rate in developed countries as they have high per capita gross national income.

Conflict of Interest – This study is an exploratory research based upon secondary data therefore conflict of interest is hard to find out. But the study can be extended for the other socio-economic variables putting an impact or getting influenced by high children mortality rate because of the Acute Respiratory Infections (ARI). Comparative study with other nations having similar economic conditions could be conducted to find out India's status against the children mortality rate.

Source of Funding – Not required.

Ethical Clearance – As secondary data has been used for the research, available on public domain, therefore ethical clearance in not required. However references required for the data has been mentioned in the study.

The Effectiveness of use of Electronic Medical Record System at University Health Centre

Alaka Chandak[1], Rajesh Shinde[2]

[1]Associate Professor, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed University) Pune, India and Director, Symbiosis Centre of Health Care, [2]Officer HR, IT & Finance, Symbiosis Centre of Health Care.

Abstract

Objective: To study the effectiveness of the use of the Electronic Medical Record (EMR) system & use by doctors, healthcare administrators & beneficiaries at University Health Centre.

Method: An e-questionnaire including consent was circulated using Google form to the doctors, healthcare administrators & beneficiary to record their experiences & perceptions on EMR.

Result: 85% doctors agreed EMR resulted in a reduction in errors while maintaining data, 100% doctors mentioned the use of EMR improved data management & report generation. 98% healthcare administrators were satisfied with the efficiency of the software, 100% administrators agreed that EMR improved coordination with beneficiaries. 74% beneficiaries wanted to receive their health information through electronic mode (i.e. 67% beneficiaries wanted to receive health information on email, 5% through portal & 2% through a mobile application) and 90% beneficiaries reported that health information to be easily and readily available and accessible due to EMR.

Conclusion: EMR is easily accessible and effective for maintenance of health information of beneficiaries at the university health centre. The enablers for the technology outweighs the disablers for the EMR. With regular training of the users & creating awareness amongst the beneficiaries, the effectiveness of the use of EMR can be improved further at the university health centre.

Keywords: *Beneficiaries, Electronic Medical Record, Healthcare Administrators, Doctors, University Health Centre*

Introduction

Use of Electronic Medical Records (EMRs) contribute towards improving the quality of healthcare services. [1,2,3] The improvement in the quality of care can be attributed to having the most updated and recent clinical information, easy storage and retrieval of information, ease of sharing of health data amongst healthcare practitioners, better follow-up of treatment and continual monitoring of the data.[3,4] Digital Technologies play an important role in improving public health as per The World Health Assembly in 2018. Technologies such as EMRs are becoming significantly important in the healthcare setup in developing countries like India. Health Informatics (HI) is still in a budding stage in India.

A study on the use and outcome of Electronic Health Records (EHR) for health insurance dealt with an information system, which was employed in a university setting, found that automation of the health insurance system resulted in ease of use, better confidentiality of records, better flexibility and reliability of use resulting in an improvement in resulting in overall efficiency and user satisfaction. [5]

One potential benefit of electronic records is the facility of sending reminders to doctors to record the use of tobacco, give advice to smokers on quitting the habit and refer such patients to counselors. [6] The use of EMR also has a positive impact on improving quality of care. [7, 8] The findings of a study on clinical benefits of electronic records revealed the benefit of accessibility of a patient's record from a remote location and enhanced

patient communication. [8] Electronic records increase access of appropriate healthcare services, reduction in medical errors and an improvement in chronic disease management.[9]

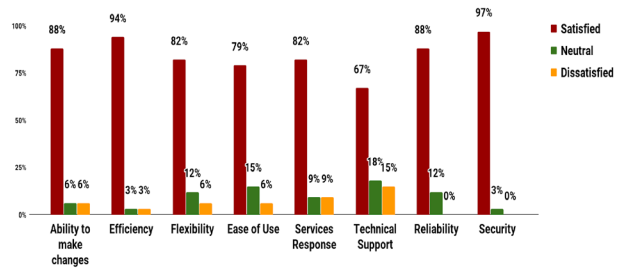
A review article published in 2016 [10] mentions that despite the State & Union Governments efforts to exploit the opportunities provided by the implementation of Information & Communication Technology (ICT), the adoption of automated health records is still lower in India compared to developed countries. The Ministry of Health & Family Welfare (MoHFW) has revised EHR standards for adoption by healthcare providers in India in 2016. The revised standards highlight the importance of the availability of longitudinal health records for provision of evidence-based care, accurate & quick diagnosis, avoidance of repeat investigations, reduced cost of care, etc.

A case study conducted to understand challenges & strategies for successful adoption of EMR at a large hospital in India concluded that lack of IT skills and skepticism by end users may affect the success rate of adoption of EMR. [11]

A research study studying the factors affecting the adoption of automated health records by nurses in private medium-sized hospital set-up in Tamil Nadu, India cited lack of training as the major setback in the adoption of the technology. [12.] A study conducted to understand the potential & challenges to EMR adoption in India cited lack of computer literacy, lack of trained staff as few barriers towards adoption. The study also highlighted that the adoption of EMR is slow in India due to lack of a Government mandate on the adoption of EMR systems. [13]

The adoption & implementation of EMR is trailing behind in rural areas. Regular training & reinforcement is required to enable the sustainability of the implementation of the technology. [14] Offering consistent support to doctors results in better adoption of the technology amongst Physicians. [15] Skill development courses on EHR may also result in better adoption. [16] A systematic review [17] conducted on patient satisfaction with automated health records demonstrated a positive patient satisfaction with the technology.

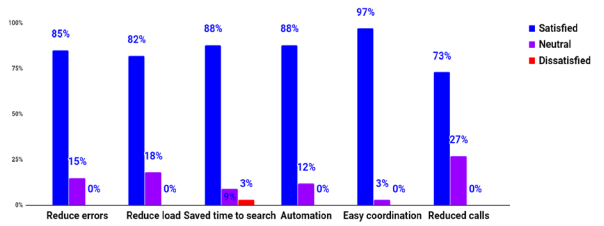
The benefits accrued from maintaining EMR are multifold; however, a need is felt to understand the stakeholder perspective on EMR. The current study studies the perspective of users (healthcare administrators & doctors) & beneficiaries (students on the university campus) towards EMR. It is felt that this multi-perspective study will highlight the potential enablers & disablers for this important health information technology. This study however has tried to precisely quantify the perceptions of multiple stakeholders.



With an understanding of various stakeholders (beneficiaries, doctors & healthcare administrators) perspectives towards EMR, the study aims at studying the effectiveness of the use of EMR at the University Health Centre.

Methodology

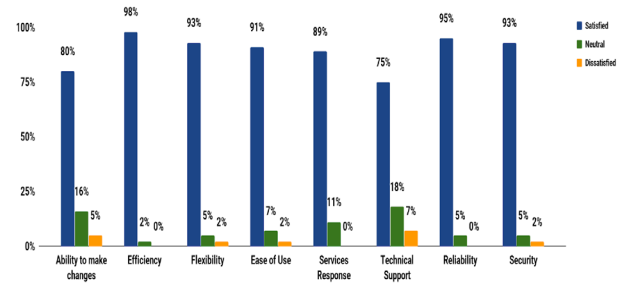
An e-questionnaire including consent was circulated during academic year 2017-18 using Google form to the doctors, healthcare administrators & beneficiaries to record beneficiary knowledge of EMR, time required to receive e-health record, beneficiary choice of mode to receive health record, perceived benefits of electronic medical records. A separate e-questionnaire was circulated to doctors as well as healthcare administrators to study their satisfaction as user of IT application as ability to make changes, efficiency, flexibility, ease of use, services response, technical report, reliability and security. Moreover the agreement of doctors and healthcare administrators was studied on use of IT application to maintain electronic health record on reduces error, reduced load, saved time to search, automation, easy coordination, reduced calls & efficient record management system. The survey took 45 min to complete. Only doctors, healthcare administrators and beneficiaries of the university health centre were eligible for participation. 812 beneficiaries' responses were analyzed and 34 doctors & 43 healthcare administrators' experiences as a user of IT application were studied.



Results

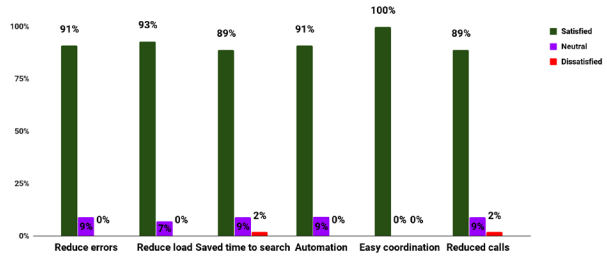
A. Doctor's opinion on use of software to maintain Medical Record

Graph 1: Doctor's Satisfaction with the use of Software to maintain Medical Record



88% doctors were satisfied with the ability to make changes, 94% were satisfied with the efficiency of the software, 82% were satisfied with the flexibility offered by the software, 79% found it easy to use, 82% were satisfied with the service response, 67% doctors were satisfied with the technical support provided by the technical team, 88% were satisfied with reliability & 97% doctors were satisfied with security provided by the software for maintenance of medical records.

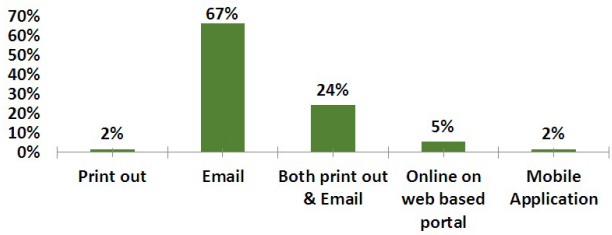
Graph 2: Agreement rate of Doctor's as per experience of use of Software to maintain Medical Record



Agreement rate was 85% doctors for reduction in errors of health record maintenance, 82% for reduction in workload due to use of software, 88% for saving on time taken to search health records, 88% agreed with automation of health records, 97% felt the software made coordination with beneficiaries easy and 73% doctors opined the software reduced beneficiary calls on health records.

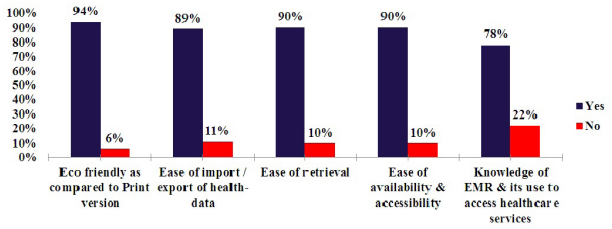
B. Healthcare Administrator's experience about maintaining EMR

Graph 3: Healthcare Administrator's satisfaction of use of Software to maintain Medical Record



80% healthcare administrators were satisfied with the ability to make changes, 98% were satisfied with the efficiency of the software, 93% were satisfied with the flexibility offered by the software, 91% found it easy to use, 89% healthcare administrators were satisfied with the service response, 75% were satisfied with the technical support provided by the technical team, 95% were satisfied with reliability & 93% were satisfied with security provided by the software for maintenance of medical records.

Graph 4: Agreement Rate of healthcare administrator's for the use of Software to maintain Medical Record



Agreement rate was 91% healthcare administrators for reduction in errors of health record maintenance, 93% for reduction in workload due to use of software, 89% for saving on time taken to search health records, 91% agreed with automation of health records, 100% felt the software made coordination with beneficiaries easy and 89% opined the software reduced beneficiary calls on health records.

C. Experiences of beneficiaries on Electronic Medical Records (EMRs)

Graph 5: I would prefer my health information by

2% beneficiaries showed preference for receiving printouts of the health information, 67% preferred to receive their health information by email, 24% wanted their health information both on email and as print out, 5 % wanted their health information to be available on online web based portal and 2% beneficiaries preferred to receive their health information through a mobile application.

Graph 6: Experience of beneficiaries on EMR

94% beneficiaries found the EMR as an eco-friendly option, 89% mentioned that EMR facilitates faster, easier import/ export of health data between clinics/ hospitals thereby facilitating better patient care. 90% reported that the EMR made their health information easily and readily available and accessible. 90% cited that EMR has made retrieval of their health information easy whereas 10% beneficiaries mentioned that EMR has not made the retrieval of their health information easy. 78% were knowledgeable about the importance of EMR and its use to access healthcare services. 22% beneficiaries were not knowledgeable about the importance of EMR & its use to access healthcare services.

Discussion

Amongst the study group, 12% doctors were using the software from 4 to 6 years, 33 % since 2 to 4 years & 55 % doctors have been using the software for 6 months to 2 years. Similarly, 43% healthcare administrators of the study group were using the software since 4 to 6 years, 34 % since 2 to 4 years & 23 % have been using the software since 6 months to 2 years.

Contrary to the literature found by the researcher [16], there seems to be no skepticism in the study group towards EMR. Furthermore, if the users are adequately trained then EMR comes up as a reliable & secure solution for maintaining the health information of patients [8]. Besides the study also found that the beneficiaries are aware of the benefit of the EMR as an ecofriendly option over paper records. The problems associated with loss and storage of paper records can also be overcome by use of EMR. A financial comparison of the cost of maintaining EMR vs paper health records was also done by the researcher which demonstrated that the cost of maintaining EMR is less than similar cost of paper health card per beneficiary.

EMR also ensures availability of longitudinal health records for provision of evidence based care, accurate & quick diagnosis, avoidance of repeat investigations, reduced cost of care etc.

94% doctors were satisfied with efficiency of the software, 85% doctors agreed that the software reduced errors associated with health record maintenance. 82% doctors cited reduction in workload due to use of software as consultants were provided with a dedicated team of doctors for maintaining the EMR. 100% doctors agreed that use of software had a positive impact on record management, file management and report generation.

80% healthcare administrators were satisfied with ability to make changes through the technical team based on suggestions given by consultants. 91% healthcare administrators agreed with automation of health records. 100% healthcare administrators mentioned that use of EMRs contributed to efficient record management, 98% mentioned EMRs resulted in efficient file management & 93% opined the efficiency of report generation increased due to EMR.

78 % beneficiaries opined that the ability to send frequent e-reminders through software for schedule of health checkup or treatment resulted in better patient care. Any follow up of treatment can also be done more thoroughly if reminders are sent through EMR.

90% beneficiaries reported that the EMR made their health information easily and readily available and accessible. The traditional way of maintaining paper health record can prove to be a handicap if the beneficiary shifts location from one city to another or one state to another. Further, a beneficiary may not remember all the details of his/ her health record if he/ she shifts to another location. Having the EMR on the convenience of a single click has enabled dissolving the geographical boundaries, yet not compromising on the quality of care

An interesting fact brought forward by this study was that 74% beneficiaries wanted to receive their health information through electronic mode (i.e. 67% beneficiaries wanted to received health information on email, 5% through web based portal & 2% through mobile application). Only 2% of beneficiaries (16 out of a total 812 respondents) wanted to receive their health information on paper copy. 78% beneficiaries (636 respondents out of 812 respondents) were knowledgeable about importance of EMR & its use to access healthcare services. This statistics could be due to the fact that the respondents were university students/ staff who were aware about the latest technology.

53% beneficiaries accessed their health records electronically and 47% did not access their health records electronically. Furthermore, 68% beneficiaries were aware about process for accessing their e health information, 32% beneficiaries were not aware on how to access their e health information. Beneficiaries need to be trained about the process for accessing their health records electronically. The beneficiaries can be trained during their induction into the university, at the time of their health checkup. Moreover, a system-generated message is sent to beneficiaries after their health checkup, which reminds them to check their mail inbox for health information.

Conclusion

EMR were effective for maintenance of health information of beneficiaries at the university campus. The enablers such as ease of accessibility, ease of retrieval, eco-friendly nature, efficient record management thereby resulting in overall quality care to beneficiary outweighs the disablers for the EMR.

With regular training of the users & creating awareness amongst the beneficiaries, the effectiveness of the use of EMR can be improved further. This could be the scope for further study.

Limitation:

1. This study focused on the effectiveness of use of EMR at one University Health Centre in India.
2. The penetration of EMR in the rural, rur-urban area and other Universities in India was beyond the scope of this study.

Ethics Approval: The ethics approval was not required, as the article does not contain medical information of any identifiable living person.

Source of Funding: Funding was not required to support this research.

Conflict of Interest: The researcher has no conflict of interest to report.

Hypertension and its Association with Low HDL and High LDL in Cardiovascular Disorders

Jenu Maria Thomas[1], Sammita Jadhav[2]

[1]Assistant Professor, [2]Professor & Deputy Director, Symbiosis Institute of Health Sciences, Symbiosis International University, Pune

Abstract

Introduction: Cardiovascular complications are a leading cause of mortality worldwide. It has been observed that hypertension, increased serum cholesterol, metabolic syndrome, low HDL and high LDL cholesterol are contributing factors for cardiovascular disorders. However, the association of each of these cholesterol levels with hypertension as a cumulative factor in the development of cardiovascular disorders is not fully elucidated. This review explains the risk factors associated with hypertension and cardiovascular disorders in an attempt to explore if the association of hypertension with low HDL or high LDL as a fatal concern in the development of cardiovascular disorders and if there exists a scope for research on same. **Methodology:** Based on keywords, the published literature search was done using databases like PubMed, EBSCO, Emerald, Scopus, ProQuest and internet sources like WHO, NIH and WebMD. Many articles (105) articles were screened and 42 were selected for review. **Conclusion:** The review identified that the association or correlation of hypertension with low HDL or high LDL-cholesterol as a major risk in the development of cardiovascular disorders remains a concern in the Indian Public Health scenario.

Keywords: *Hypertension, cardiovascular disorders, atherosclerosis, HDL, LDL.*

Introduction

WHO defines cardiovascular disorders (CVDs) as the category of diseases affecting heart and blood vessels[1] which includes diseases like coronary heart disease, cerebrovascular accident, peripheral arterial disease, and aortic disease[2]. It has been documented that increased blood pressure causes CVDs that are responsible for high mortality rates globally. It is accounted that hypertension has caused 54% of cerebrovascular accidents and 47% of coronary heart diseases worldwide[3]. Yet another contributing factor for coronary artery disease is atherosclerosis [4] i.e. the arterial wall thickening due to lipid deposition, calcification or chronically elevated blood pressure [5]. This can lead to a more serious condition called the myocardial infarction[1], which is characterized by irreversible death (necrosis) of heart muscle due to prolonged hypoxia (ischemia). Besides hypertension[6], high serum cholesterol[7], low HDL cholesterol [8] and high LDL cholesterol [9] also contribute to cardiovascular disorders. However, the association between each of these cholesterol levels and hypertension as a cumulative factor in the development of cardiovascular disorders is not yet well explained. This review is an attempt to elucidate the factors associated with hypertension and CVDs and identify if the association of hypertension with low HDL or high LDL is a fatal concern in the development of cardiovascular disorders.

Methodology

A systematic search was conducted using databases like PubMed, EBSCO, Emerald, Scopus, ProQuest and internet sources like WHO, NIH and WebMD, with the objective outlined under three broad themes namely

Cardiovascular disorders- to seek information on the factors concerned with the pathogenesis of CVDs.

Hypertension- to identify the factors involved in hypertension and the role of hypertension in CVDs.

Lipid profile and atherosclerosis- to identify the correlation of lipid metabolism with atherosclerosis and hypertension.

Thus, 105 articles were screened, the research gap was identified and 42 were selected for review.

CARDIOVASCULAR DISORDERS

Risk factors and pathogenesis of CVDs

Cardiovascular disorders (CVDs) are the disorders of heart and blood vessels[1] and includes diseases like coronary heart disease, cerebrovascular accidents, etc. [10]. CVDs, the major cause of death worldwide are accounted for the highest annual mortality rate. Around 31% of deaths reported worldwide in the year 2016 corresponds to cardiovascular disorders. Among this 31% reported, 85% were due to myocardial infarction and cerebrovascular accidents[11]. The incidence of CVDs can be reduced by adopting certain lifestyle modifications. Early prognosis and diagnosis are essential to effectively prevent and manage CVDs[12].

Risk factors for cardiovascular disorders

Metabolic Syndrome (MS)

Adult Treatment Panel III defines MS as a cluster of metabolic complications of obesity that includes "abdominal obesity, determined by increased waist circumference, raised triglycerides, reduced HDL, elevated blood pressure, and raised plasma glucose"[13]. Obesity, dyslipidemia (increased plasma cholesterol and/or triglycerides, or decreased HDL cholesterol) and impaired glucose tolerance (IGT) causes hypertension. Takase H et al (2008) studied the predictive value of obesity, dyslipidemia, high normal blood pressure and IGT whereby they observed that the number of factors involved in MS were directly proportional to the risk for hypertension. Early prediction of hypertension can help in the effective prevention of hypertension and associated CVDs[14].

2. Diet

Diet rich in plant protein sources reduces the development of CVDs[15].

3. Genetics

Family history is observed to have a strong association with the development of CVDs[16].

4. Lifestyle

Lifestyle is associated with the occurrence of CVDs and lifestyle modification can reduce the risk of CVDs[17].

5. Gender

There exists a later onset of CVDs in women as compared to men[18] and the associated mortality rate is also higher in men[19].

6. Age

Age is an unalterable risk factor for CVD[20]. As the age increases the risk for CVD also increases and intensifies with the existence of other lifestyle risk factors.

HYPERTENSION

Etiology of hypertension and its associated risk for CVDs

"American College of Cardiology and American Heart Association 2017 guidelines define blood pressure as:

Normal- if the Systolic Blood Pressure (SBP) / Diastolic Blood Pressure (DBP) is ≤ 120/80 mm Hg

Elevated- SBP/DBP is 120-129/ ≤80.

Stage 1 hypertension- SBP 130-139 or DBP 80-89

Stage 2 hypertension- SBP/DBP ≥ 140/90.

hypertensive crisis- SBP ≥180 and/or DBP ≥ 120[21]. Thus, for all age groups, the cut-off for hypertension is ≥130/80 mm Hg[22].

It has been studied that smoking, obesity, increased alcohol intake [23], sedentary lifestyle, excess salt intake, stress, family history, and chronic kidney disease are few contributing factors in the development of hypertension[24]. In a study by Lu Y et al (2015), of the 1009 patients enrolled in the cohort, the obese subjects were 1.83 times at risk for hypertension[25].

Pathophysiology

The pathogenesis of hypertension is complex. Few of the factors concerned with the genesis of hypertension

are:

1. Cardiac output and peripheral resistance.

Peripheral resistance is detrmined by the arterioles that contain smooth muscles. Prolonged smooth muscle contraction stiffens the arteriolar vessel wall and thus causes structural changes in vasculature. This leads to an irrevocable increase in peripheral resistance[26]. The equilibrium between cardiac output and total peripheral vascular resistance is essential for the regulation of BP[27].

2. The Renin-Angiotensin System (RAS)

Angiotensin II is a vasoconstrictor. Angiotensin Converting Enzyme (ACE) generates it from angiotensin I. Angiotensin I is synthesized by the action of renin on angiotensinogen. Any imbalance in RAS increases the blood pressure[26].

3. The Autonomic Nervous System (ANS)

The interaction of ANS with RAS is considered responsible for hypertension[26].

4. Endothelial dysfunction

Vascular endothelial cells regulate cardiovascular action by producing vasodilators (eg: nitric oxide) and vasoconstrictors (e.g.: endothelin). Endothelial dysfunction is studied to be involved with hypertension due to the imbalance in these factors[26].

5. Hypercoagulability

Studies reveal that hypertensive patients exhibit endothelial damage and blood constituent abnormalities suggesting that hypertension is associated with thrombosis and hypercoagulability[26].

6. Genetic factors

Hypertension shows a strong association with family history[26].

7. Dyslipidemia

Dyslipidemia can cause atherosclerosis[28] and it is a strong predictor for hypertension as well as cardiovascular disorders. Studies reveal that there exists an association between plasma lipids with subsequent hypertension[29]. According to a 14.1 year follow-up study conducted by Halperin RO et al (2006) on 3110 male subjects, men who had increased total cholesterol (TC), non-HDL-cholesterol, and TC/HDL-C ratio exhibited an increased risk for hypertension (23%, 39%, and 54%, respectively). Men in the category of high HDL-cholesterol had a 32% reduced risk for hypertension[29]. This study is strong evidence that dyslipidemia can cause hypertension.

ASSOCIATION OF LIPID METABOLISM WITH ATHEROSCLEROSIS

Hypercholesterolemia, the presence of elevated plasma cholesterol levels due to high low-density lipoprotein (LDL) levels with normal plasma triglycerides, can cause coronary heart disease. High LDL levels cause cholesterol deposition in arterial walls. It is well known that a high LDL forms plaques with the resultant plaque build-up causing atherosclerosis[30]. The arterial wall infiltration initiates inflammatory response within the arterial wall triggering atherosclerotic events[31].

Formation of plaque

Endothelial dysfunction is observed in hypertension[26]. The LDL in dysfunctional endothelium undergoes oxidation due to the action of macrophages and smooth muscle cells. Growth factors, cytokines, and activated adhesion molecules attract monocytes. Foam cells aggregate and smooth muscle cells proliferate and thus plaque develops[32].

Association of LDL with vascular resistance

When smooth muscle cells in the blood vessels relax, it causes vasodilation and thereby decreases the vascular resistance and increasing the blood flow[33]. However, with an atherosclerotic plaque the arteries narrow (vasoconstriction) reducing the blood flow[34], increasing vascular resistance and thus increased blood pressure.

Role of HDL in CVD

HDL inhibits the process of atherosclerosis. It checks the formation of atherosclerotic plaque by foam cell cholesterol extraction, LDL oxidation prevention, atherosclerotic stimulatory reaction control and thrombus formation inhibition[35]. Although studies reveal that low HDL levels are associated with risk for CVDs, it is a cluster of lipid profile abnormalities that serve as a potential risk factor for CVD[28]. However, it is understood that elevating the levels of HDL alone does

not confirm cardioprotective effects.

It has been observed that MS increases the risk of cardiovascular morbidity[36]. Thus, hypertension and reduced HDL are definite risks for cardiovascular disorders but it is to be determined if the association of hypertension with high LDL cholesterol or low HDL cholesterol is a major risk for CVDs.

ADDRESSING THE RESEARCH GAP

Association of hypertension with LDL and HDL

Though studies on HDL, LDL, hypertension and their effect in the development of CVDs have been reported; there is scarce data available on the association of low HDL with hypertension and high LDL with hypertension[37] and their subsequent impact on cardiovascular disorders. In a study conducted by Shimizu Y et al (2017), HDL positively correlated with hypertension in subjects having increased circulating CD34-positive cells[38]. Another study by Choudhary KN et al (2014) stated that hypertensives possess increased levels of TC, TG, and LDL but HDL levels were reduced[39]. However, this study did not reveal the association between low HDL and hypertension and high LDL and hypertension. In addition, which amongst the two associations could be a stronger contributor for CVDs is not studied. Kim NH et al (2011) observed that the association of low HDL and high-normal blood pressure exhibited a two times greater risk of CVD associated mortality[40]. In another study conducted by Lee SJ et al (2017), subjects with high TG and low HDL levels had a 1.32 times increased risk for CHD[41]. Ueda P et al (2018), investigated 16-year CHD risk with various levels and durations of exposure to LDL-cholesterol and observed that the period of exposure to high or moderate LDL levels was associated with risk for hypertension and cardiovascular disorders[42].

Score for CVD risk

Various approaches were made to address the risk of cardiovascular disorders. The existing scoring criteria as the "The Framingham risk score" is an old scoring system based on US population with different lifestyle and dietary habits. Though recently a number of ethnicity-specific scoring models like "The Joint British Societies (JBS) score" have been developed, it demands an extensive set of patient data to arrive at a conclusion. "The European score chart, SCORE (Systematic Coronary Risk Evaluation)", was designed such that it could be used in normal individuals. The chart targets factors like smoking, diet, physical activity, body weight, blood pressure, lipid levels, and diabetes to calculate the CVD risk.

Conclusion

Scope for research

Though literature gives tremendous data on hypertension, low HDL and high LDL with cardiovascular diseases, there exists a scope in identifying the association of hypertension with low HDL or hypertension with high LDL as a potent risk for cardiovascular disorders in the Indian scenario. Identifying the association would help to develop simple, user-friendly, low cost and early detection scoring model for detecting risk for CVDs. Grading the subjects based on scoring extends the scope of the study to nutrition and dietetics aspects suggesting a diet plan specific for each grade among indian subjects. Addressing the issue as a public health concern can augment the implementation strategies for lifestyle modification and thereby reducing the morbidity and mortality associated with cardiovascular disorders.

Perception of Healthcare Education Ecosystem among International Students Pursuing Medical Technology Specialisation in Western India

Sammita Jadhav[1], Neelam Redekar[2], Jagdish Jadhav[3]

[1]Professor and Deputy Director, Symbiosis Institute of Health Sciences, Symbiosis international university, Pune, [2] Symbiosis Institute of Health Sciences, Symbiosis international university, Pune, [3]Officer on Special Duty, Symbiosis University Hospital and Research Centre, Symbiosis International University, Pune

Abstract

Introduction: The Medical Technology specialization is an evolving healthcare discipline in India [1]. There are few academic institutions imparting Medical Technology education to both the Indian and the International students. Limited published data is obtainable regarding the perception of the quality of Medical Technology education by the international student community[2]. **Objective:** The purpose of this study is to investigate the perceptions of International students about the Healthcare education ecosystem in the specialized field of Medical Technology using the DREEM (Dundee Ready Educational Environment Measure) survey method. **Materials and Method:** A total of 58 students pursuing the three year graduate programme in Medical Technology at an educational institute in Western India were administered the DREEM Questionnaire of which 29 International students and equal number of their Indian counterparts participated in the study. The data was analysed by SPSS version 23.0 software. **Results:** The mean (95% CI) for overall DREEM Score for International students pursuing Medical Technology specialization was 158.75 and for Indian students was168.06; which showed an excellent scholastic environment for both the International students as well as their Indian counterparts. **Conclusion:** The DREEM Score, a tool used worldwide for evaluation of education environment at institutes imparting healthcare education depicts the level of excellence in conducting education programs and providing an optimum learning environment by academic institutes. This study encourages international students to have linkages in the Indian Healthcare education system making India a preferred destination of choice for Healthcare education. DREEM survey method for assessing healthcare education environment in Medical Technology specialisation on international student community is a novel approach to study the quality of education environment.

Keywords: *Healthcare, Education, Medical Technology, International, Perception.*

Introduction

Educational environment is indispensable to determine the success or breakdown of educational institutions. The spirit of instruction and development of scholarship is the main determining factor of evolving motivation in students in an educational environment. Evaluation of learning has developed into an integral practice of any education institute towards an enriched and value based learning experience [5, 22, 24] .The "educational environment" (EE) well defined as everything that transpires within the university, classroom, department or measured by faculty interaction is crucial in configuring the success of healthcare education [5, 6]. There is a growing awareness and concern about the role of the education milieu in healthcare education in recent years [10, 12-14]. Assessment of the learning ecosystem is critical in delivering high-quality, student-centric curriculum that has become expensive [11,15,16,18,26-28]. Teaching and

achieving scholarship in clinical situations is a matter of importance in para-medical institutes as clinical training has a robust stimulus integrated amongst theory and clinical practice, for acquiring balanced learning outcomes. The Dundee Ready Education Environment Measure (DREEM), a reliable tool was used to measure the undergraduate educational environment of many Healthcare Professional Institutes [10, 11, 13, 15, 17-19, 21].

Since the last decade, there has been a steady influx of the international students landing on the Indian shores seeking professional educational programs [3, 4-6]. India is progressively emerging as a favorite destination for cross-border students, predominantly from the South Asian region. The growth in the magnitude of foreign students studying in India is increasing. The latest data for 2011-12 demonstrates that within a year, India welcomed 5625 additional students, an upsurge of nearly 20.43% from the preceding year [7]. During the year 2011, India received international students from almost153 countries. India is gradually expanding in relation to not only the numerical value of students, but correspondingly to the number of nations from which these learners arrived. In terms of foreign students crossing the border for pursuing studies, 88% registered for studies at under-graduate levels [8] and 18% for post-graduate education [9]. Problems faced by foreign students in **overcoming the language barrier,** cultural diversity, financial instability, homesickness**, new learning styles,** academic expectations, aspiration to lead an independent lifestyle and social isolation are a cause of concern to the offshore population [5,25] .

The aim of this study is to assess the International Medical Technology students' perceptions regarding their educational ecosystem. This study also benefits in identifying problems in the education milieu that could be mitigated. Additionally, the institutions could compare their performances and education throughputs with their peers, making such a study pedagogically insightful.

Materials and Method

DREEM scoring system, a 50-item account originally established at Dundee is a widely utilised, reliable and validated tool to collect evidence regarding the educational ecosystem in several healthcare education establishments, "consisting of 5 subscales as follows:

1. Students' Perceptions of Learning (SPL)
2. Students' Perceptions of Teachers (SPT)
3. Students' Academic Self-Perceptions (SASP)
4. Students' Perceptions of Atmosphere (SPA)
5. Students' Social Self-Perceptions (SSSP)".

"Each item is scored 0-4 on a 5-point likert scale (4=strongly agree, 3=agree, 2=unsure, 1=disagree and 0=strongly disagree). Nine negative items (numbers 4, 8, 9, 17, 25, 35, 39, 48 and 50) scored in reverse manner. The total score for all subscales is 200". The DREEM score is utilised to identify additional precise fortes and flaws in the learning environment.

In this study, the total respondents considered were 58 students pursuing the three-year graduate programme in Medical Technology at Symbiosis International University. The distribution of the total participants under this study were 29 Indian students and 29 International students. They received a descriptive statement specifying the research and were made aware that all data collected from the respondents would remain anonymous. Participants' informed consent was taken.

The questionnaires were circulated to students pursuing the Medical Technology program towards the conclusion of an academic session where a faculty member enabled the process and received the completed surveys. Data was analysed by SPSS version 23.0 Software.

Results

Table 1: Comparison of National and International Students' Perception of Medical Technology Education Ecosystem

DREEM subscales	Maximum DREEM Score	Sample Score Mean±SD (National students) (N=29)	Sample Score Mean±SD (International students) (N=29)
All Items	200	168.06±10.33	158.75±10.27
Student's Perception of Learning	48	40.10±14.63	39.27±7.06
Student's Perception of Teachers	44	35.86±13.30	35±7.72
Student's Academic Self Perception	32	27.89±5.74	25.93±5.47
Student's Perception of Atmosphere	48	40.62±7.67	39.58±3.74
Student's Social Self - perception	28	22.62±14.27	21.86±8.97

Results

Results show the mean scores of the DREEM tool collected from the Medical Technology students pursuing their education at Symbiosis International University. The findings of the study regarding international students' perception of the education environment of the Medical Technology programme at Symbiosis International University is listed in Table 1. The perception scores were reported as Mean ± SD (158.75 ± 10.27) for international students and 168.06±10.33 for Indian students.

For the Students' Perceptions of Learning (SPL), the score of international students in (SPL) is 39.27 and of national students is 40.10.

Students' Perceptions of Teachers (SPT), the score of international students in (SPT) is 35 and of national students is 35.86.

Students' Academic Self-Perceptions (SASP) the score of international students in (SASP) is 25.93 and of national students is 27.89.

Students' Perceptions of Atmosphere (SPA) the score of international students in (SPA) is 39.58 and of national students is 40.62.

Students' Social Self-Perceptions (SSSP) the score of international student in (SSSP) is 21.86 and of national students is 22.62.

Discussion

The DREEM inventory was used as a means to assess the perceptions of the Medical Technology students regarding their Education Environment. The international students were well acclimatized to the learning environment, which was quite similar to the Indian students' score. The student's perception regarding their teachers for Indian as well as for international students was adequate, however could be improved by introducing quality learning and innovative pedagogy. Students had better and positive perceptions of learning and had strong clarity about their education objectives.

Students were encouraged to contribute during learning sessions, and could advance the preferred competencies required for professional development.

The international students learning healthcare courses alongside with hospital postings were more passionate about acquiring clinical knowledge. These students perceived the Education Environment more positively. The results of the study throws light on the well-established mentoring program developed for the Medical Technology students at Symbiosis International University that supports students with informal interactions with counsellors who mentor them in overcoming tense situations with guided interactions and resolve learning difficulties. There is a necessity to intensify the training of trainers regarding the altering learning patterns in healthcare students, with a paradigm shift from old-fashioned to groundbreaking pedagogy where teachers serve as facilitators rather than knowledge providers. The DREEM scoring system in its prevailing design may not be appropriate to ensure all characteristics of healthcare education. A local version that is more suitable to the setup of the present study is desirable. This is the base evaluation of the Medical Technology students' perception of the education ecosystem at the institute conferred; thus, this reference point data will be valuable in monitoring the effects of the evolving transformation of the Medical Technology curricula and the learning milieu over a longer period. The overall perception of Medical Technology students about the education system provided at the institute was positive. The study identified that international student's perception was comparable to that of the national students. The encouraging aspects found in this study were that the faculty were knowledgeable; students had worthy friends; and they felt assured about success at their examinations. The suggestions emerging because of this study conducted on Medical Technology students include the requisite creation of a reassuring educational environment, in addition to crafting and applying interventions remedying unacceptable elements in the learning environment aimed at effective and fruitful teaching and learning experience for both domestic and international students.

Conclusion

The DREEM Score, a generally accepted tool world over for assessment of education environment at institutes imparting healthcare education depicts the level of excellence in conducting education programs and providing an optimum learning environment by academic institutes. DREEM survey method for assessing healthcare education environment in Medical Technology specialisation on international student community is a novel approach to study the quality of education environment. This study encourages international students to have linkages in the Indian Healthcare education system making India a preferred destination of choice for Healthcare education.

Impact of Dietary Interventions on Anxiety, Depression and Stress – A Narrative Review

Gayatri Shanbhag[1], Pooja Panchal[2], Kavitha Menon[3]

[1]Master student, [2]PhD Scholar, [3]Professor, Symbiosis School of Biological Sciences, Symbiosis International University, Lavale, Pune, Maharashtra

Abstract

Recently multiple studies focused on the role of nutrition in mental health. The present narrative review aimed to assess the impact of dietary interventions on depression, anxiety and stress. Articles were searched in three journal databases and selected using standard protocol to select 12 articles for the current review. A narrative review was prepared based on the data available from the selected articles. The findings indicated that dietary interventions (i.e. supplementation of fish oils and multiple micronutrients, and dietary intake of plant-based foods) had beneficial effects and reduced depression, anxiety and stress. The studies were primarily from developed countries and further studies from developing countries are needed.

Keywords: *Nutrition, mental health, stress, depression, anxiety, nutrients, diet interventions*

Introduction

Mental health is a major concern worldwide and has an impact on personal, psychosocial and financial sectors[1,2]. The WHO reported globally 322 million people suffer from depression, the most common mental health disorder[3]. One in five Indians suffer from depression in their lifetime, equivalent to 200 million people[5]. Depression in India has its prevalence in both rural(6.9%) and urban(13.5%) areas[4].

Diet plays an important role in physical and mental health. Recent studies have established an association between diet and depression. A diet rich in fruits and vegetables, olive oil, whole grains, lean protein, fish, and legumes has shown to be protective against depression[6] due to its high antioxidant and anti-inflammatory properties[7]. Further, the risk of depression is increased with a dietary pattern including high consumption of processed food and sugary products[6,8].

The intake of Eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), are found to be beneficial in reducing depression. These nutrients are essential to maintain cell membrane function, the release of neurotransmitters and to provide anti-inflammatory, neuroprotective effect against depression[3]. EPA and DHA must be obtained from the diet through the use of fish, shellfish and seafoods[3,11]. In addition, individual supplementation studies on B vitamins, Vitamin D, S-adenosyl methionine in the treatment of depression and anxiety have shown modest benefits. Multimineral-vitamin supplementation together with dietary interventions may help in the treatment of depression[12]. Evidence indicate the importance of diet quality and its possible protective effect against depression[8]. A meta-analysis of epidemiological studies has reported positive association between Mediterranean diet and low risk of depression[2]. The present narrative review aimed to assess the impact of dietary interventions on depression, anxiety and stress.

Materials and Method

The study aimed to review literature that study the impact of nutrition interventions on adult (>15years) mental health. An electronic literature search was conducted on PubMed, Web of Science, and ScienceDirect for the articles published between

January 2009 to May 2019. The following keywords were used for search of literature: "Diet intervention" or "Nutrient intervention" or "Nutrition" or "Diet" or "Diet quality" AND "Mental health" or "Mental rehabilitation" or "Depressive disorder" or "Mental disorder" or "Depression" or "Psychological stress" or "Depressive symptoms" AND "Systematic review" or "Cross sectional" or "Randomized control trial" or "Case-control study" or "Intervention study". Articles were limited to human studies published in the English language. The title and abstracts of all the included articles were retrieved in the initial search and articles not meeting the inclusion/ exclusion criteria were excluded based on the population, intervention and outcomes. Furthermore, full-text of the selected articles were retrieved and screened for the eligibility prior to inclusion in the present review. The literature search, and the title and abstract screening from studies were conducted independently by two researchers. In case of disagreements a third researcher made the decision.

Inclusion and exclusion criteria

Studies that met the following inclusion criteria were selected to be in the present review:studies conducted in adults (>15 years)and the studies examined the effects of dietary interventions (i.e. food-based interventions, supplementations, and dietary counselling) on mental health, mental health rehabilitation, stress, depression, anxiety. Articles were excluded on participants with chronic diseases, young children, and adolescents.

Data extraction

The extracted data was entered into a predefined EXCEL based data extraction forms. The data extracted were: first author, publication year and country, study design, sampling frame, sample size, dietary assessment tools, methods of dietary intake assessments, diet quality indices, and impact of interventions. The extracted data were analyzed as a narrative review.

Results

Study selection

The studies were retrieved from three databases between 2009 and April 2019. A total of 1772 articles were generated, and 25 were excluded for duplication. From the remaining 1747 articles 1689 were excluded based on the title and abstract screening and 58 full-text articles were retrieved. Based on the eligibility full-text articles were screened and 46 were excluded to have the final 12 articles included in the present review(Fig.1)

Characteristics of the selected studies

Out of the 12 selected studies from USA(n=4), Australia(n=4), Japan, Canada, England and Malawi(n=1 each) (Table 1). Malawi was the only Low-Middle income country in the selected studies included in the review. The type of studies included Randomized Control trials(n=5), cohort studies(n=3), experimental studies(n=2), cross-sectional(n=1)and observational studies(n=1). Age of the participants (males and females) ranged between 18–95 years with a total number of 21,721participants. Sample sizes were between 15-16,020.The intervention groups were diagnosed with either depression, or anxiety or stress. The dietary interventions included food-based interventions(n=7) and supplementation(n=5).

Methodological differences across the selected studies

The methods used for dietary intakes varied across the studies(Table 2). Out of seven studies that used different methods of dietary data interventions, studies used food frequency questionnaires (FFQ)(n=3), food diary(n=2), 24-hour recall(n=1),andfood record(n=1) of varying durations.A few studies used indices such as healthy eating index(n=1), Mediterranean diet score (MDS)(n=2) and Diet quality score (DQS)(n=1). Heterogeneity in the use of methodology and the diet quality indices limited the inter study comparison with respect to the quantity of nutrients, quality of diets and food groups.

Effects of dietary interventions on depression, anxiety and stress

There were six studies that evaluated the impact of dietary interventions in depression. In addition, four studies focused on the milder forms of mental disorders such as anxiety, stress and mild depression(Table 3). The study designs, interventions, methods of data collection and tools used for data collection varied across these studies resulting in heterogeneity and limitinterstudy comparison. The study duration varied between 6 weeks to one month.In total, ten studies focused on dietary interventions- supplements(n=8), diet (n=2) and nutrition education(n=2). The interventions primarily usedomega-3 fish oils, fish, plant-based foods and micronutrients.Overall, dietary interventions were found beneficial topatients with depression (n=10), anxiety and stress. The studies were primarily from developed countries and focus on less developed countries with a greater proportion of population with mental and mood disorders should be emphasized. The challenges could be higher in less developed countries with poor micronutrient and fish oil intakes. Hence, further studies are needed to provide nutrition support to these patients to improve their quality of life.

Conclusion

The present review summarizes the impact of dietary interventions on mood and depression disorders. The results showed a reduction in depression, anxiety and stress in patients who were on dietary interventions. Our review observed beneficial association between the use

of multiple micronutrients/ fish oils/ Mediterranean diets and depression, stress and anxiety. Finally, the majority of the studies were from developed countries and evidence for populations living less developed countries are pertinent considering the greater proportion of people with micronutrient deficiencies and poor intakes of fish oils/ fish or the potential sources of PUFA.

An Exploratory Pilot on Body Composition and Nutrient Intake Associated With Premenstrual Syndrome among Young Women

Harshada Thakur[1], Priyanka Pareek[2], Suhas Otiv[3]

[1]Research Scholar, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Pune, [2]Assistant Professor, MGM School of Biomedical Sciences, MGMIHS, Navi Mumbai, [3]Consultant, Department of Obstetrics and Gynaecology, KEM Hospital and Research Centre, Pune

Abstract

Introduction: Premenstrual syndrome (PMS) is a cyclic occurrence of symptoms which affects many women of childbearing age. Several biological and lifestyle related factors have shown association with occurrence and severity of PMS. Objective of this pilot study is to explore the occurrence of PMS among young women with specific focus on body composition and nutrient intake.

Method: In this pilot study a total of 62 women participated. Their information on menstruation, and nutrient intake was collected using structured questionnaire. Moose's questionnaire were used for the diagnosis and categorization of PMS. Body composition analysis was done by measuring 4-site skinfold thickness and bioelectrical impedance analysis.

Results and Discussion: About 87% women were found to have PMS. Out of these 46.8% had mild PMS, 37.1% had moderate and 16.1% had strong PMS. The most common symptoms reported were anxiety and irritability. Though mean basic metabolic index (BMI) was within normal range (22.27±5.08Kg/m^2), the mean body fat percentage was 32.9±5.63% which is above the normal cut-off for young women. Body fat percentage, total body water, muscle mass and waist circumference correlated significantly with incidence and severity of PMS. Intake of energy, protein and micronutrients (calcium, iron, vitamin B12 and C) were significantly low than recommended dietary allowance (RDA) in the studied group of women. To the contrary intake of fat was significantly higher.

Conclusion: It was observed that there is an inter-alia relation between parameters of body composition and nutrient intake with PMS among young women.

Keywords: *Premenstrual Syndrome, Body Composition, Nutrient Intake*

Introduction

Premenstrual syndrome (PMS) is a medical condition that affects many women of child bearing age. PMS is a periodic event in which a combination of corporal, neurological and psychological disorders cause disturbance in individual's social adaption, normal activities and interpersonal relationships, which negatively affects the quality of a women's life[1]. The American College of Obstetrics and Gynaecology have defined PMS as "the cyclic occurrence of symptoms that are sufficiently severe to interfere with some aspects of life and that appear with consistent and predictable relationship to the menses."[2]. About 80-95% of females of child bearing age have experienced some form of PMS symptoms. Around 3-8% of menstruating women have a more severe form of PMS which is termed as

Email: harshada.alurkar@gmail.com

Premenstrual Dysphoric Disorder (PMDD)[3,4,5]. It is an extreme and predominantly psychological form of PMS. PMS was originally seen as an imagined disease of women and often referred as 'all in their head'[6]. Although the symptoms of PMS have been well defined, the etiology of PMS remains unknown. It may be multifactorial as well as complex.Pathophysiology of PMS may include an interaction of ovarian hormones with brain neurotransmitters[7]. Many experts believe that it is caused by a combination of psychological, hormonal, genetic, nutritional and behavioural factors[8]. Common psychological symptoms of PMS are irritability, tension anxiety, mood swings, lack of concentration, insomnia etc. Varied physiological symptoms include weight gain, bloating, breast tenderness, pelvic discomfort, tiredness, increased or decreased appetite, food cravings etc.[2,3,9]

Body composition, nutritional status and various lifestyle factors influences women's health and issues associated with menstruation including PMS. This pilot study was undertaken with an aim to explore incidence of PMS and it's relation with body composition and nutrient intake of the studied group of young women.

Materials & Method

This cross-sectional study was carried out among young women aged 18-25 years studying at the University. The sample size of this pilot study was (N=62). The inclusion criteria consisted of female students from the university between the specified age group and unmarried. Students suffering from any disease such as diabetes mellitus, hypertension, polycystic ovarian syndrome, any organ related disease and those taking any hormonal therapy or medications were excluded from the study. Study objectives were explained to the willing participants and their consent was obtained prior to the enrolment.

Premenstrual syndrome assessment and menstrual history:

PMS assessment was carried out by using Rudolf Moose's Menstrual Distress Questionnaire (MDQ) which consist a list of 47 symptoms of PMS[10]. Each symptom was rated on the severity of occurrence on likert scale and total score of each participant was calculated. Menstrual history of the participants included age of menarche and interval between two cycles.

Body composition analysis:

Body composition analysis was done using TANITA (BC-601) body composition analyser. The analyser principle states the use of advanced bioelectrical impedance (BIA) technology. When a subject stands on TANITA monitor it passes safe electric signal by electrodes through feet to legs, arm and abdomen, this electrical signal passes through water and meets resistance where it meets fat tissue. The resistance is known as impendence which is measured and measurements are displayed.Total body fat percentage, total body water, muscle mass, mineral mass and visceral fat were recorded. Fat mass and fat free mass were calculated.

Anthropometric measurements:

Height – Height was measured using a stature meter (Seca213 portable stadiometer). Participants were asked to stand at stature meter without shoes and head held in the Frankfurt plane. Height was recorded to the nearest 0.1 cm.

Weight – Weight was measured while measuring body composition analysis on the analyser.

Basic Metabolic Rate (BMI) – BMI was calculated using the standard Quetlet's formula[13] BMI = Weight (kg)/Height $(m)^2$ and participants were categorized into various BMI categories.

Waist and Hip Circumference – Waist and hip circumference were measured using non-stretchable Seca tape and waist to hip ratio (WHR) was calculated.

Skinfold thickness (SFT) –4-site Skinfold thickness were measured at tricep, bicep, subscapular and suprailiac region. SFTs were measured using Harpenden calliper and readings were recorded at nearest 0.2 mm. Sum of skinfolds was calculated and body fat percentage was calculated using Durnin's formula[11].

Nutrient intake:

A 24-hour diet recall was used. It comprised of information of foods and beverages consumed 24 hours before the interview with specific details such as time of consumption, number of meals and quantity of each food item in standard measures were recorded. Further the nutrient intake was calculated using DietCal version 5.0 software.

Statistical analysis:

Statistical analysis was carried out in SPSS software version 16.0. The data was analysed using descriptive statistics. Pearson's correlation was used to test the association between variables. ANOVA was used to compare the means of variable. The data was considered to be significant if $p < 0.05$.

Results & Discussion

Participant's mean age was 20.17±1.24 years. About 54 (87.1%) subjects reported to have some form of PMS.

Anthropometry and Body composition: Mean height and weight of the participants was 154.2±5.64 cm and 52.9±12.53 kg respectively. Their mean BMI was 22.2±5.05 kg/m^2.

Table 1: Anthropometric measurements and body composition parameters

Measurement	Mean (SD)	Range
Anthropometric measurements		
Waist circumference	74.89±11.06 cm	52 – 106 cm
Hip circumference	94.39 ±9.24 cm	74 – 114.6 cm
Mid upper-arm circumference (MUAC)	25.63±4.26 cm	18.2 – 39.2 cm
Tricep skinfold	16.77±5.80 mm	5.4 – 31.0 mm
Bicep skinfold	9.08±4.22 mm	2.8 – 21.4 mm
Subscapular skinfold	21.27±8.2) mm	7.6 – 38.2 mm
Suprailiac skinfold	32.24±9.25 mm	10.0 – 45.0 mm
Sum of skinfolds	79.37±24.74 mm	28.8 – 131.6 mm
Estimated body fat percentage	32.79±5.08 %	19.08 – 41.1 %
Body composition parameters using BIA		
Body fat percentage	32.90±5.63 %	18.20 – 51.6 %
Total body water	49.04±4.31 %	37.6-61.8 %
Muscle mass	37.20±4.26 Kg	29.9 – 44.1 Kg
Visceral fat	4.40±1.76 %	1 – 12 %
Fat free mass	39.30±4.35 Kg	30.4 – 46.1 Kg

For the measurement of body fat percentages, two methods were used viz. traditional method of measuring skin fold thickness and BIA technology using analyser. When fat percentages from both methods were compared, there was no statistical difference found, which denotes that fat percentages from both methods were equivalent.

There is significant positive correlation of PMS score with body fat percentage, weight and WHR ($p<0.01$) of the participants. Also a significant correlation was observed between PMS score and fat mass ($p<0.01$) and fat free mass ($p<0.05$) respectively. Similar finding have been observed in the study of Japanese population[12]. However there is very scanty research data available on of comparison between PMS and body composition parameters.

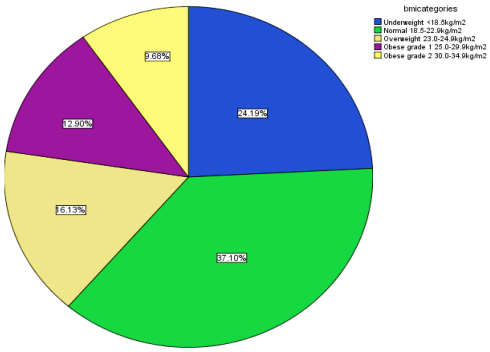

Figure 1: Distribution of participants across BMI categories

According to World Health Organization (WHO) cut-offs of BMI for Asians about one third of the subjects (37.1%) were normal, 24.19% underweight, 9.68% overweight, 12.9% obese grade I and 16.13% were obese grade II[13]. Though mean of BMR falls under normal category, body fat percentage is higher than the standard cut-offs and WHR is at borderline of cut-offs (WHR <0.07) recommended by WHO[14].

Menstrual history and PMS:

The reported mean age of menarche was 13.3±1.24 years. The number of days of menstrual bleeding was 2.3±0.73 days (range 1-3 days). Majority of the subjects (51.6%) had interval between their menstrual cycle was 28-35 days, 34.6% had interval more than 36 days and only 12.9% had reported of shorter menstrual cycles.

Around 87% (N=54) reported to have PMS, whereas on the basis of MDQ[10] scores 46.8% had mild PMS, 37.1 had moderate PMS and 16.1% had strong PMS. The most commonly reported symptoms of PMS were anxiety, irritability, mood swings and fatigue. Physiological symptoms such as weight gain and breast tenderness were less reported as compared with psychological symptoms. These findings are similar to few Indian studies where participants showed psychological symptoms more prevalently[15,16].

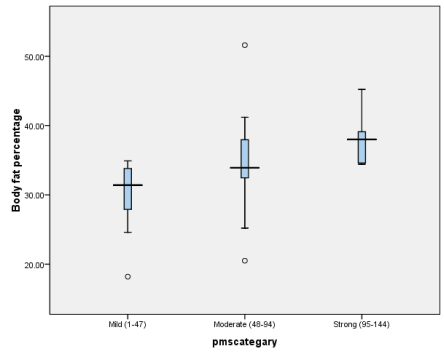

Figure 2: Body fat percentage across PMS categories

Figure 2 depicts the body fat percentage across three PMS categories viz. mild, moderate and strong on the basis of scores on MDQ PMS scale[10]. Subjects who had higher body fat, have higher scores on MDQ PMS scale[10]. Body composition parameters viz. body fat percentages, total body water percentage, fat free mass were significantly different across the categories of PMS. Similarly weight, mid upper arm circumference and 4-site skin fold thickness were significantly difference across categories of PMS. Subjects with mils PMS were leaner and had smaller circumferences and skin folds as compared to those in PMS moderate and PMS strong category.

Nutrient Intake:

When food habit of the subjects was assessed, 53.2% reported to be non-vegetarians, 27.4% were lacto-vegetarian and 19.4% ovo-lacto-vegetarian. Detailed intake of macro-nutrients and micro-nutrients is explained in the following table.

Table 2: Nutrient intake across the participants

Nutrients	Intake	Recommended Dietary Allowance#	Percentage Deficit
Energy (Kcal)	1537±475	1900	-20.2%
Protein (gm)	48.24±15.77	55	-12.72%
Fats (gm)	59.43±23.79	30	+10.8%
Carbohydrates (gm)	201.74±60.70	200-275	---
Dietary fibre (gm)	16.03±7.80	28	- 42.75%
Calcium (mg)	447.49±225.6	600	-25.4%
Iron (mg)	12.79±5.95	21	-39%
Vitamin C (mg)	35.37±3.6	40	-11.5%
Vitamin B 12 (µg)	0.52±0.1	1	-50%

#Recommended Dietary Allowance (RDA)[19]

Table 2 describes the actual nutrient intake of the subjects as compared to the RDA for Indians. Deficit in the consumption is observed in most of the nutrient's intake however consumption of fat is higher than the recommended amount. Though there is significant association observed in intake of nutrients and PMS, the consumption of salads across PMS categories was significantly different ($p<0.05$). Subjects with higher consumption of salad had mild PMS symptoms. Several studies have supported the fact that diet and nutrients does play important role in PMS. Healthier choice of foods is associated with fewer occurrences and less severity of PMS symptoms[17,18].

Conclusion

Body composition and nutrient intake contributes to the women's health; both being important factors in the gynaecological health of the women as well. This pilot study has demonstrateda substantial incidence of PMS among young women. The body composition analysis have demonstrated that though women had normal BMI, body fat percentage and WHR (which are risk factors for several metabolic diseases) are higher than the cut-offs. These parameters also correlated significantly with severity of PMS symptoms. Overall the studied population is deficit in important micro-nutrients such as calcium, iron, vitamin B12 and also their diets are deficit in protein.

This pilot study has shown association of PMS with body composition parameters than nutrient intake. More in depth study is required to further explore the PMS in the light of nutritional status as well as lifestyle factors.

Conflict of Interest: None

Pocrescophobia: It's Influence on Eating Habits

Leeja Bonny Thomas[1], Shital Barde[2]

[1]Tutor, Shital Barde [2]Asst. Professor, Symbiosis College of Nursing (SCON), Symbiosis International (Deemed University), Pune

Abstract

Adolescence has long been recognized as a period of heightened risk-taking and, accordingly, a stage that requires special oversight from adults. Most adolescents progress to adulthood with relatively little difficulty, experiencing excellent physical health and strength and not engaging in behaviors that put themselves or others at risk. Many adolescent risk behaviors—particularly poor driving, either with or without concomitant use of alcohol or illicit substances, and crime—also put others at risk. One of the latest risk behavior is pocrescophobia mostly seen in adolescent girls and all of these factors together make the prevention of risk behaviors in adolescence an important public health issue.[1]

The result shows that 28% adolescent girls have moderate fear of weight gain, 9% of them have severe, mild and very mild comprises of 16% and 15%, whereas 2% has no fear of weight gain and has no influence on their eating habits.

Keywords: *Pocrescophobia, eating habits, adolescence*

Introduction

More than 10 million adults suffer from phobia according to national institute of mental health. All phobias are anxiety disorders. Pocrescophobia is the irrational fear of obesity or overwhelming fear of becoming fat. Pocrescophobia could also lead to the develop of various psychological disorders, such as bulimia (eating food and throwing it up). This phobia is listed as a rare disease by the Office of Rare Diseases of the US National institutes of health. Those afflicted are obsessed with the negative effects excess fat could have on their health. A fear putting on extra weight can become life threatening if it is not identified and treated.[2]

Often, pocrescophobia can result from a distorted self-image. Food may not itself cause them to panic in any way and there are other Procrescophobia symptoms that can show obsession regarding body weight and weight loss programs, guilt about over-eating, not feeling hungry and body dimorphism. Pressure from the society, changes the way a child thinks about him or herself. These pressures come especially from television programmes, magazine and the social media. These media affect most adolescent girls so much that they develop pocrescophobic and the best thing to do is to understand how much these societal pressures affect the girls. The early adolescent girls are spectacular group of people who unfortunately are having increased eating disorder and they need serious medical attention.[3]

Need for Study

Pocrescophobia is a compulsive desire to avoid all things that could result in weight gain. An affected person may have light meals. Their pocrescophobia may cause them to slip away from the eating table into the restroom to force out & empty stomach contents. [4]

The stage of adolescence especially adolescent girls is one that could be described as a time of big social and emotional changes. This stage comes with the feeling of confusion, inferiority complex, self-consciousness and peer pressures. However, apart from the emotional changes, there are hormonal changes and neurological metamorphosis which are factors behind the physical, mental, emotional and psychological changes that appear in adolescents.[5]

Structured questionnaire will give a quick indication of whether this phobia is serious to help you decide what action, if any, you should take.

When left untreated, it can lead to chronic medical condition. The vital organs of the body like the brain, liver, kidneys, heart, GI tract, bones, teeth, skin and hair are prone to be affected in this stage.[6]

Statement of the Problem:

'' A study to assess pocrescophobia and its influence on eating habits in early adolescent girls at selected nursing colleges of Pune, Maharashtra''

Objectives of the Study:

- To investigate the fear of weight gain among early adult girls.

- To assess the factors influencing fear of weight gain.

- To find the association between fear of weight gain and eating habits.

Methodology

Research approach

The research approach adopted for this study was a qualitative approach to find fear of becoming fat and its influence on eating disorders in early adulthood girls.

Research design

- The research design used in this study was Non-Experimental Descriptive survey.

- In Non-Experimental Descriptive survey the investigator selected the simple random sampling technique.

- The tool will comprise of following parts

1. Demographic variables

2. Objective type questionnaire.

The tool will be a structured objective type questionnaire in English.

Variables

Dependent variable: - Eating habits of the early adult girl's eating disorder.

Independent variable: - pocrescophobia i.e. fear of weight gain.

Extraneous variables: -The demographic variables of the early adult girls such as age, year of study, dietary pattern, type of family, habitat, source of information, BMI

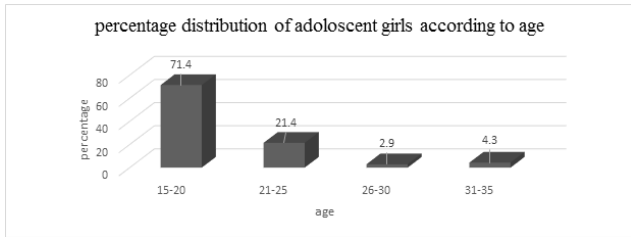

FIGURE 1: Percentage distribution of adolescent girls according to age.

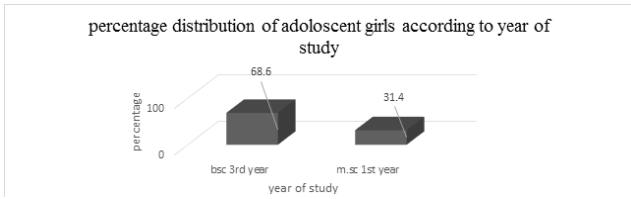

FIGURE 2: Percentage distribution of adolescent girls according to year of study.

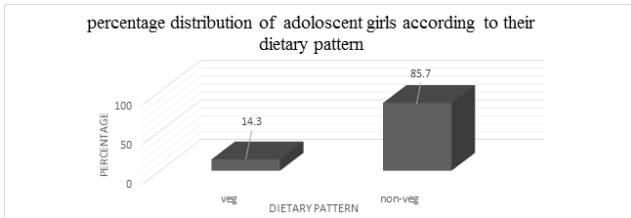

FIGURE 3 : Percentage distribution of adolescent girls according to dietary pattern.

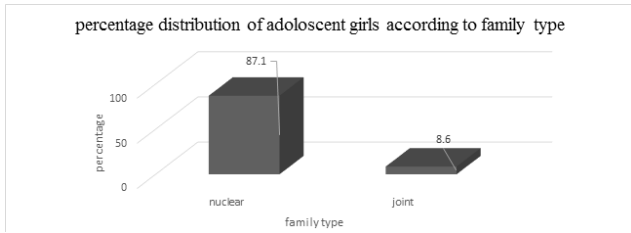

FIGURE 4: Percentage distribution of adolescent girls according to family type.

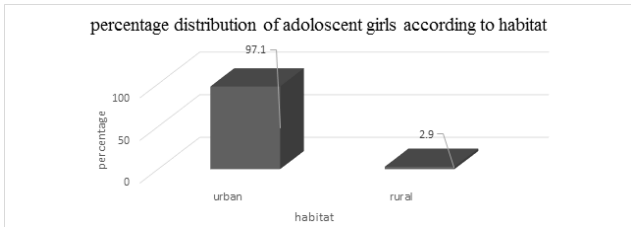

FIGURE 5: Percentage distribution of adolescent girls according to habitat.

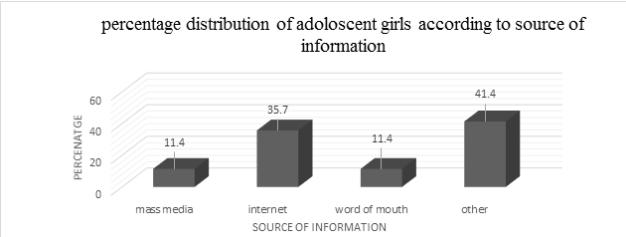

FIGURE 6: Percentage distribution of adolescent girls according to source of information

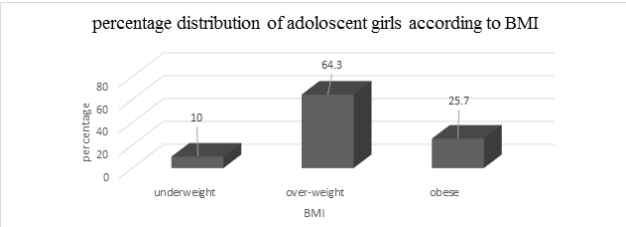

FIGURE 7: Percentage distribution of adolescent girls according to BMI

Setting of the study

The setting was chosen on the basis of feasibility in terms of availability of the subjects, who were the students in selected colleges of Pune.

Sample and sampling technique

70 students were selected by using simple random sampling technique.

Sample size

A sample size of 70 students were selected based on the inclusion and exclusion criteria.

Inclusion criteria:

The study includes early adulthood girls who are:

- present in selected College of nursing, Pune.

-Willing to participate in the study.

- Able to communicate freely in English.

Exclusion criteria:

The study excludes early adulthood girls who are:

- Does not include minimum outcomes.

- Not available during data collection.

Development and description of tool

In this study, structured objective type questionnaire was prepared to assess pocrescophobia and its influence on eating. A structured objective type questionnaire was developed by the investigator in order to obtain exact and complete response from the students.

The following steps were carried out while preparing the tool.

• Review of literature

• Based on expert opinion

Description of the tool

The tool consists of two sections:

Section A- Demographic data. It includes items of demographic variables (age, year of study, dietary pattern, type of family, habitat, source of information, BMI)

Section B- Structured objective type questionnaire to investigate fear of weight gain.

Section C- Structured objective type questionnaire to assess factors influencing weight gain.

Section D- Structured objective type questionnaire to assess psychological factors affecting eating habits among respondents

Aspect

Number of items

- Demographic data 7

- To investigate fear of weight gain. 13

-To assess factors influencing weight gain . 8

- To assess psychological factors affecting eating habits among respondents 7

-There were totally 35 items of objective type questions. Every response is given a score of one.

Result and Interpretation

Section A: Description of the demographic Variables of samples.

Table 1: frequency and distribution of sample according to demographic variable (n=60)

S.no	Demographic Variables	Frequency	Percentage
1	Age (in years)		
	15-20	50	71.4
	21-25	15	21.4
	26-30	2	2.9
	31-35	3	4.3
2	Year of study		
	B.Sc 3rd year	48	68.6
	M.Sc 1st year	22	31.4
3	Dietary pattern		
	veg	10	14.3
	Non-veg	60	85.7
4	Type of family		
	nuclear	61	87.1
	joint	6	8.6
5	Habitat		
	Urban	68	97.1
	rural	2	2.9
6	Source of information		
	Mass media	8	11.4
	Internet	25	35.7
	Word of mouth	8	11.4
	other	29	41.4
7	BMI		
	Underweight	7	10
	overweight	45	64.3
	obese	18	25.7

Table 1: shows that maximum percentage (71.4%) of subjects were from the age group of 15-20 years wherein (2.9%) of them were in the age group of 26-30 years. Majority (68.6%) of subjects are from b.sc 3rd year and (31.4%) are from M.Sc 1st year. (14.3%) of the subjects are vegetarian and (85.7%) of the subjects are non-vegetarian. (87.1%) belongs to nuclear family and (8.6 %) belongs to joint family. Maximum percentage (97.1%) are from urban area and (2.9%) from rural.

Other Source of information has highest percentage (41.4%). BMI shows the highest percentage of overweight category, underweight (10%) and obese shows (25.7%).

Descriptive statistics

• The data was organized in master coding sheet. Frequency and percentage distribution was used to analyze the demographic variables of staff nurses such as age, year of study, dietary pattern, type of family, habitat, source of information, BMI.

• Frequency, percentage distribution, mean and standard deviation were used to analyze the pocrescophobia and is influence on eating habits.

Result

Majority of early adolescent girls have moderate (28%) fear of weight gain and has its influence on their eating habits.

Severe comprises of 9% of early adolescent girls.

Mild symptoms are seen among 16% of adolescent girls.

Very mild i.e. 15% early adolescent girls have fear and has influence on eating habits.

Result shows that 2% has no pocrescophobia and it does not affect their eating habits.

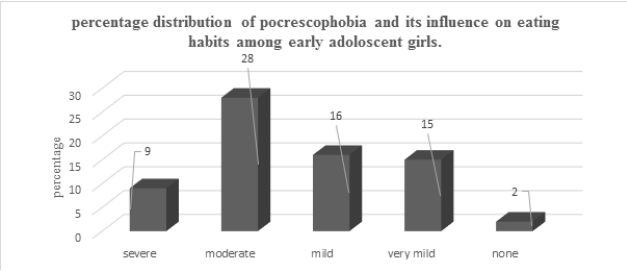

Figure 8: Percentage distribution of pocrescophobia and its influence on eating habits among early adolescent girls.

Discussion

Pocrescophobia is commonly found in women, although men's do show symptoms for the same. These can be pressure to be fit also. Nurses are the workers, whose main responsibility is to identify the symptoms and provide safe and effective care within constantly evolving health care systems because this often occurs alongside an eating disorder, such as Bulimia or Anorexia.

The present study was conducted to see the level of pocrescophobia in early adolescence girls and its influence on eating habits. The problem stated is "A study to assess pocrescophobia and its influence on eating habits in early adolescent girls at selected nursing colleges of Pune, Maharashtra"

The data was collected from 70 students by structured objective type questionnaire.

The findings of the study have been discussed with reference to the objectives, hypothesis.

Conclusion

In today's society, beauty is marked by how thin someone is. For those people who really buy into these messages, they will be terrified of gaining weight in relation to the fear of being deemed "undesirable" Causes of Pocrescophobia can be very tricky, and will be different from one individual to another.

Simple random sampling technique was used to select the samples. The data was collected from 70 students with the help of structured objective type questionnaire. On the basis of the findings the following conclusions were made. The findings of the study revealed that Majority of early adolescent girls have moderate (28%) fear of weight gain and has its influence on their eating habits and severe comprises of 9% of early adolescent girls. Mild symptoms are seen among 16% of adolescent girls, very mild i.e. 15% early adolescent girls have fear and has influence on eating habits and 2% has no pocrescophobia and it does not affect their eating habits.

Ethical Consideration: For the current study, the investigator took in to consideration the ethical issues. There were no ethical issues confronted while conducting the study.

Conflict of Interest: Nil

Source of Funding: Self

A Study to Assess the Effectiveness of Self-Instructional Module on Knowledge and Practices of Needle Stick Injury among the Nurses Working in Selected Hospitals of Pune City

Mangesh V. Jabade[1], S G. Joshi[2], Ranjana Chavan[2]

[1]Tutor, [2]Professor, [3]Assistant Professor, Community Health Nursing Department, Symbiosis College of Nursing, Symbiosis International (Deemed University), Senapati Bapat Road, Pune, Maharashtra, India

Abstract

Introduction Needle stick injuries present single greatest occupational hazards and contributing to the overall burden of the health care worker. Since most of the time, it is a matter of sheer negligence due to which the need for in depth study arises. Design-Quasi Experimental Study Setting Results- The random sampling technique used to collect information from 40 participants working in emergency departments as well as General ward. Majority of nurses i.e. 57.5% never undergone any In-service Education about needle stick Injury. 20% participants sustained needle stick injury and out of this, only 12.5% reported needle stick injury. Pretest score of Knowledge revealed that 52.5% samples possess good knowledge whereas 45% samples had average knowledge about needle stick injury. Mean pretest knowledge score was 13.6 and practice score was 7.57. Posttest findings revealed that 85% of participants had good knowledge and 15% had average knowledge. Mean posttest knowledge and practice score was 16.07 and 8.9 respectively. Test of correlation revealed moderate positive correlation between knowledge and practice score. Conclusion- The findings indicate the need for formulating SOP regarding needle stick injury ,conduction of training programme and refresher training on regular basis to create awareness regarding preventive measures and post exposure prophylaxis.

Keywords: *Occupational Hazards, Needle stick Injury, Self- Instructional Module*

Introduction

A needle stick injury is a percutaneous piercing wound typically set by a needle point, but possibly also by other sharp instruments or objects.[1] Commonly encountered by people handling needles in the medical setting, such injuries are an occupational hazard in the medical community.[2] These events are of concern because of the risk to transmit blood-borne diseases through the passage of the hepatitis B virus (HBV), the hepatitis C virus (HCV), and the Human Immunodeficiency Virus (HIV), the virus which causes AIDS. Needle stick injuries are a common event in the healthcare environment.[3] When drawing blood, administering an intramuscular or intravenous drug, or performing other procedures involving sharps, the needle can slip and injure the healthcare worker.[4]

WHO reports in the World Health Report 2012, that of the 35 million health-care workers, 2 million experience percutaneous exposure to infectious diseases each year.[5] It further notes that 37.6% of Hepatitis B, 39% of Hepatitis C and 4.4% of HIV/AIDS in Health-Care Workers around the world are due to needle stick injuries.[6]

Needle stick injuries are contributing to the overall burden of healthcare worker injuries.[7] Estimates indicate that 600,000 to 800,000 such injuries occur annually, about half of which go unreported.[8] To minimize the risk due to sharp objects and NSI, safety protocols need to be in place, including work practice and engineering controls at all hospitals and healthcare facilities.[9] Adequate training to handle sharp objects and good reporting mechanisms can be useful in minimizing events like NSI and other injuries to healthcare HCW's.[10] The reporting of such injuries is a critical step in initiating early prophylaxis or treatment.[11] Many institutions in India, have a staff student health service

facility in place, which maintains records, and registers the incidence of NSI and has protocols for management and follow-up of NSI cases.[12]

Objectives

1. To assess the level of knowledge of the nurses regarding needle stick injury .
2. To assess the practices of the nurses regarding needle stick injury.
3. To assess the effectiveness of "Self-Instructional Module "on needle stick injury

Hypothesis

$H_0$1 - There is no significant difference in the pre-test and post-test knowledge scores of nurses

$H_0$2 - There is no significant difference in the pre-test and post-test practice scores of nurses

Methodology

The experimental study was conducted in the Hospitals where Nurses were participated through random sampling technique. The self-administered structured questionnaires and check list were used. The collected data were analyzed by using descriptive and inferential statistics

Analysis and Interpretation

Description of subject characteristics

It is observed that the majority of the participants (75%) were under the age group of 20-25 years and the remaining were comes under 45 years of age group.

Male participants were least in numbers i.e. 20% as compare to female participant's i.e.80%

Out of 40 participants selected for the study majority ie 20 were GNM which is 50%,16 ANM participated in the study which is 40% rest 4 nurses were B.Sc (N) which is 10%.

31 are having experience between 1-5 years.5 participants have 10-15 years of clinical experience.5% participants have less than one year of experience in the clinical areas. Only 2.5% of participants have more than 20 years of experience and between 5-10 years of experience.

Majority of participants i.e. 45% were posted in ICU, CCU and Cath Lab.40% were working in the General Ward, Day care and Pediatric Ward.7.5% were working in OPD and casualty area.

Only 17 participants ie 42.5 % have attended clinical teaching regarding Needle stick Injury and remaining 23 participants ie 57.5 % have not attended any type of clinical teaching which brings out the need for conducting teaching in these areas.

Only 8 participants i.e. 20% were exposed to Needle Stick Injury and 32 participants i.e. 80% were not exposed to any kind of needle stick injury.

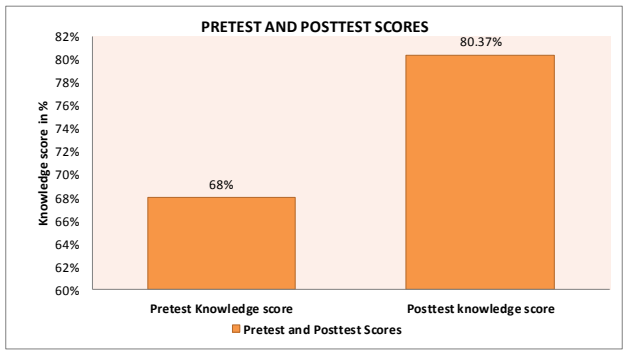

Figure No-1: Comparison of mean pretest and post test knowledge

After the analysis of data is seen that the mean pretest knowledge score was 13.6 and after giving self-Instructional Module the mean posttest knowledge score was 16.0 .It can be clearly seen that there is an increase in the knowledge score of participants after administration of SIM.

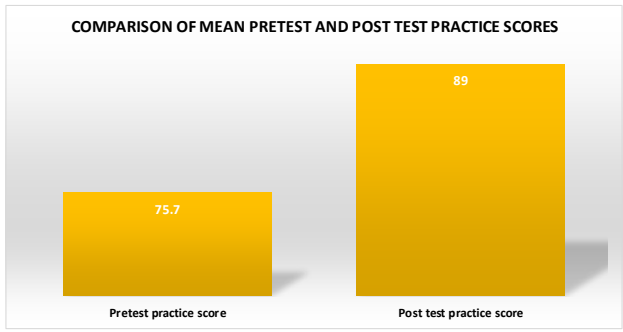

Figure No-2: Comparison of mean pretest practice scores

After the analysis of data is seen that the mean pretest practice score was 7.57 and after giving self-Instructional Module the mean posttest practice score was 8.9.It can be clearly seen that there is an increase in the practice score of participants after administration of SIM.

Discussion

In this study, the 40 nurses participated but only 22.5% nurses could correctly define Needle stick injury.50% of nurses were aware of the fact that it is an occupational hazard.95% of nurses knew that health care workers are the persons who are at greater risk of NSI.

50% nurses were aware of the risk of HIV/AIDS transmission by needle-stick injury, but only 25% of nurses were aware of the risk of transmission of Hep-B virus through a Needle Stick Injury. A study from UK quoted the risk associated with transmission of HBV to a non-immune health care workers to range from 2% if the source patient is hepatitis B antigen (HBeAg) negative to 40% if the patient hepatitis B e antigen (HBeAg) positive5.Prospective studies of health care workers exposed to HCV through a needle-stick or other percutaneous injury have found that the incidence of anti-HCV sero-conversion averages 1.8% (range 0%-7%) per injury.[13]

On being asked the average number of needle stick injuries occurring in their ward 87.5% nurses gave the correct answer. Needle stick injury can be caused in various ways but the most common ways are while giving injections and collecting blood, in our study 92.5 nurses were aware of the fact that these are the most common ways to sustain needle stick injury.

Needle Stick Injury can result in various blood borne diseases such as Hep-B,Hep-C and HIV-AIDS, our study revealed that only 62.5 nurses knew about the risk of transmission of these diseases through an NSI.On being asked what kind of needles result in Needle Stick Injury 72.5 % gave the correct answer.

Disposal of sharps and waste is a very important aspect in the prevention of needle stick injury; our study revealed that 85% nurses knew that they have to be disposed in a white puncture proof container. On being exposed to needle stick injury the first line of treatment is washing hands with soap and water ,92.5% nurses were aware of this step in our study. Reporting is an essential part which is usually neglected in our study 85% nurses believed that reporting to the higher authority is essential. [15] PEP (Post exposure prophylaxis) is the treatment to be given after sustaining NSI, 82.5%nurses in our study knew about it and 85% knew that the drug to be taken is Zidovudine. PEP should be taken ideally within 24 hrs but in our study only 15% knew this protocol. HIV testing is also mandatory, 80% were aware of the fact that it is to be done at 3.6 and 12 months.

Of the 8(20%) nurses with a history of needle stick injuries, 7(87.5) never reported the incident to hospital authority to get post-exposure treatment because they were not aware of the importance of post-exposure prophylaxis. In the US, 800,000 of the approximately 5.6 million health care workers suffer needle-stick injuries each year. Data from EPINet system suggest that at an average hospital, workers incur approximately 30 needle-stick injuries per 100 beds per year. About 80% of HCV positive surgical operation room personnel in a hospital in Pakistan had more than four needle-stick injuries per year in five years. It is believed that only one out of three needle-stick injuries are reported in the US, while these injuries virtually go undocumented in many developing countries.[14] The incidence of infection with HBV has declined in health care workers in recent years largely due to the widespread immunization with hepatitis B vaccine.

The circumstances leading to needle-stick injury depend partly on the type and design of the device and certain work practices. It is documented that 10%-25% injuries occurred while recapping a used needles.[15] In our study 47.5% nurses were recapping the needles after use which is a wrong practice.37.5 nurses were completely filling the sharps container before its final disposal, this practice often leads to Needle stick injury. Squeezing the injury site is the common practice being followed by most of the health care workers but it causes more harm, in our study also 95% of nurses were practising this.

The recapping of needles has been prohibited under the Occupational Safety and Health Administration (OSHA) blood borne pathogen standard.[16] In our study 47.5% were of the impression that needle should be recapped after use. In 1985, in order to increase awareness among health care workers of the dangers of sharp injuries and other types of disease transmission, the Centre for Disease Control (CDC) and the Occupational Safety and Health Administration (OSHA) in the United States introduced the “Universal Precaution Guidelines”, which have been the worldwide standard in both hospital and community care settings. An increasing number and variety of needle devices with safety features are now available.[20] Needleless or protected needle IV systems have decreased the incidence of needle-stick injuries by

62%-88%19. Health care workers can help the employer in the selection and evaluation of such devices. In the present study 87.5% nurses were using self-locking cannulas which are needle device with safety features.

Conclusion

The findings indicate the need for formulating SOP regarding needle stick injury, conduction of training programme and refresher training on regular basis to create awareness regarding preventive measures and post exposure prophylaxis.

Conflict of Interest: In the present study there was no conflict of interest.

Source of Funding: The present study is self-funded.

Ethical Clearance: Ethical clearances obtained from the institute review committee

Understanding Reasons for Rise in Conflict Situation in an Indian Hospital and Suggesting Measures to Minimize Them

Meenal Kulkarni

Asst. Professor, Symbiosis Institute of Health Sciences, Symbiosis Institute of Health Sciences, Pune, Maharashtra

Abstract

Health care has a conspicuous place in the community, and as an environment mandated to serve and care for its public and to endorse the overall physical, psychological and social health, it has a special responsibility to create a healthy workplace. Conflict and multiplicity are intrinsic characteristic of health care. With large number of people forming part of healthcare, come from varied background conflict becomes inevitable.

Conflict can arise due to technical differences related to work, or due to interpersonal differences. If not solved in timely manner such situations may lead to major disruptions and requires extra time and unnecessary effort that could be used more positively and productively otherwise.

A study was conducted to understand reasons for conflict that takes place amongst varied levels of healthcare staff in a 150 bedded multispecialty hospital in an Indian city over a period of three months. Survey of 200 respondents (Healthcare as well as managerial staff) revealed lack of appreciation; job stress and competition within the department (32%) were the major reasons for differences amongst the employees. With respect to approaches adopted, compromising and collaborating methods scored more (38% and 38.6% respectively). The results indicate, that the managers are familiar with conflict resolution techniques and believe in motivating their staff to increase their levels of performance and retain them with the hospital. However, there is need to make the Human Resource system more robust. Moreover, adhering to national & international requirement of conflict management like the one mandated by Joint Commission International (JCI) should very much be the part of entire system.

Keywords: *Conflict, Healthcare, Resolution, Workplace*

Introduction

Healthcare is distinct in several ways. At the same time, it is alike to other enterprises in the ways in which people act or behave, and this is where conflict emanates from, where it is one of the most common issues faced by healthcare team members across [1]. There are a countless incidences and characteristics in the healthcare system that leads to generate misunderstandings and disputes amongst the workforce [2].

Hospitals exists as a multi-level and multifunctional unit. As the bed strength goes up so does the number of employees in the system, this leads to misunderstandings and conflict. It usually involve several different parties and occur at multiple levels (vertical and horizontally across the organizational hierarchy). In hospital setup there exists an inequality that involves the wide disparity of knowledge, power and control due to variety of human resource involved (from senior consultants to a housekeeping staff). The ethnic diversity at workplace too can create possible barriers to helping parties create solutions [2]. Additionally, specialization and organizational grading which is typical to a hospital set up often add to the territorial conflicts in hospitals which is the most mutual cause of disagreement.

The major types of conflict can be described as: interpersonal, intrapersonal, intragroup and intergroup. The differences are largely due to how people perceive the relationships, values, interest and also the leadership. Though a rational extent of conflict in the form of competition can contribute to a higher level

of performance and a conflict-free work environment is an exception, addressing conflict in positive light is also essential [3]. Conflict within any organization is an unavoidable and obvious occurrence and has an undesirable outcome on the individual and the organization, unless appropriately managed. In addition, these conflicts take up many of manager's time at all managerial levels to delve into the issue, understand and come to a solution. It has been seen that managers spend approximately 25% of their time dealing with conflict as reported by Elmagri in his work. In fields such as hospital administration and management of municipal organizations, managers can spend as much as 50% of their time managing conflict. Manager's rate conflict management as equal to or higher in importance than planning, communication, motivation, and decision making [4].

The anticipated benefits of conflict include better understanding of the task, team development, and quality of group decision-making particularly in inter and intragroup conflict. [5]. The other line of thought suggests that conflict diverts one from the task at hand and wastes resources and efforts on conflict resolution unnecessarily. Whether or not it is seldom helpful, it is clear that many cases of conflict are harmful and nonproductive in nature leading to major loss to the organization as well as to the individual [6].

Subsequently, it is important for healthcare professionals and administrators to understand the origins of conflict and to develop strategies to manage the conflicts that they will experience. Hence, a study was conducted to explore the diversity of roles and responsibilities of the employees and their perspective towards the tasks assigned, group work, their professional values and morals and the way they are treated by the hospital for the work done. Thereby analyze how conflicts manifest in different dimensions at the hospital in a typical Indian corporate set up.

Objectives

The objectives for the study were as follows:

- Examining a variety of different perspectives of the employees and the managers, and identifying underlying work stress, disputes and dilemmas
- To find the source of conflicts
- To understand approaches used to mitigate conflicting situation.
- To suggest certain measures to overcome the issues leading to conflicts and thereby improve the working environment at the Hospital.

Methodology

A cross sectional descriptive study was conducted over a period of three months at a tertiary care 150 bedded multispecialty hospital in Mumbai. To initiate, permission was obtained from the administration department and HR department of the hospital. Post which, an informal interaction was done with the employees and managers at the hospital to understand their perspective, this interaction helped in developing the questionnaire.

A structured questionnaire was designed and distributed to 200 employees which included clinical, non-clinical and managerial staff working at low, middle level from nursing, diagnostic, emergency and administrative department and units.

Questions pertaining to employment, level of job position, expanse of job role, issues encountered, and reasons for conflict situations and approaches to minimize was included along with the demographic details. As it was an interviewer-based survey, all the questionnaires received were 100 percent complete.

Data entry and statistical analysis were performed using the Statistical Package for Social Sciences (SPSS) version 23. The data are presented using descriptive statistics in the form of frequencies and percentages for the qualitative variables.

Findings

Interdepartmental and intragroup conflicts are the most common source for the conflict situations at the hospital. As this was a simple study to understand, why conflicts take place and approaches to minimize, inferential statistics was not performed.

At first the distribution of 200 employees was known, which is shown as per fig.1

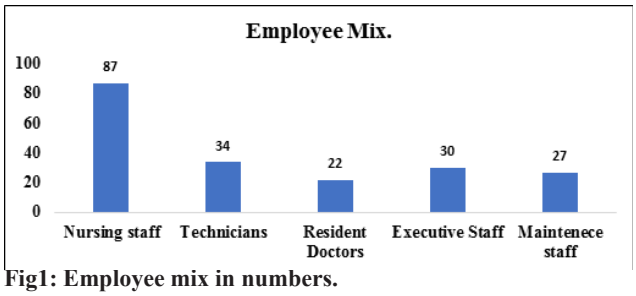

Fig1: Employee mix in numbers.

Greatest frequency of conflict situation:

Further to employee mix, it was found out that conflicts were most often attributed to resident doctors (59%), followed by nurses (over 19%), technicians (10%), executive staff (8.2%) and maintenance staff (3.8%).

Health care is a complex system that requires effective collaboration and cooperation to function well to deliver best possible patient care. Frequent causes of conflict include lack of clarity with expectations or guidelines, poor communication, lack of clear authority, personality differences and many which may result in affecting overall quality of services and dissatisfaction amongst the stakeholders [6].

Following these major reasons for conflicts were asked to the participants, which are depicted in fig.2.

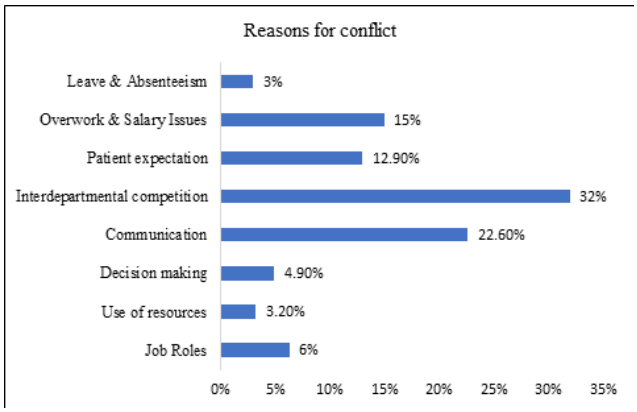

Fig 2. Reasons of conflict

Most employees are dissatisfied with their workload, timing, and salary issues (15%). In addition, (3%) of them showed a dissatisfaction and disagreement towards the, leave policy and health assistance provided to them. Further, it was also noted that there is lack of enough experienced staff and lack of training to the new and old employees. Majority of the employees also face lack of appreciation, opportunity to grow and develop which adds up to their job stress and dissatisfaction resulting in competition within the same department or between departments (32%). When given a group task, they were mostly not satisfied with individual roles (6%) as some felt that menial job but labor intensive are always given to nurses while resident doctors and other executive staff do not contribute more. They are also asked to work on very limited resources which doesn't aid in fulfilling their work requirement as it should be resulting in many displeasure interaction with each other, petty fights etc. (3.2%). On the other side, few managers also show dissatisfaction towards work productivity of their employees due to which patient expectations are affected (12.9%). For any work to be successful, communication should be transparent and comprehensive enough to develop clear understanding, if communication is not proper it creates lot of misunderstanding and thus giving rise to conflicting situation , which in this case too as reported by (22.6%). However, conflict resolution is important for all the managers for which they mentioned discussing and resolving the situation and orally motivating their employees.

Approaches taken to resolve the Conflict:

It is reported that resolving and managing conflicts takes away 25 % to 40% of time of managers and senior officials. Many studies and literature available on conflict management suggests five approaches to deal with the same [7]. It includes:

Accommodating: The goal with this method is to yield – to preserve harmony and relationships at all costs.

Compromising refers to a bargaining process that often results in a less-than-ideal solution as concessions are made

Collaborating: The goal is to find a mutual solution when both sets of interests are too important to be compromised.

Avoiding: This tactic can be used strategically, for example to create a delay that allows people to cool down or gather more information.

Competing is generally a negative way to manage conflict. The goal is to "win" at all costs and the style is characterized by high assertiveness and low cooperation

Depending on the above, responses was taken from respondents to highlight generally, which approach is usually used in conflict management situation in

hospital, which is shown in table 1.

Table 1: Approaches for conflict resolution:

S.No	Approaches	No.of Response (n=200)	Percentage Responses
1	**Accommodating**	23	11.4%
2	**Compromising**	76	38%
3	**Collaborating**	77	38.6%
4	**Avoiding**	24	12%
5	**Competing**	0	0%

It is apparent that that compromising and collaborating are the two most sought after approaches with almost equal responses of (38.6%) and (38%) respectively. (11%) of the respondents felt that mostly accommodating approach is adopted by seniors to settle the issue and (12%) are of the opinion that in some instances avoiding is also adopted as moderating measure. It is a good sign to see that none of the respondents has agreed on competing approach being adopted, this shows, that the hospital management takes care of negative situation and resort to adopt other positive approaches rather than this negative one. The Joint Commission's leadership standard for conflict management in hospitals, LD.02.04.01, states, "The hospital manages conflict between leadership groups to protect the quality and safety of care." This standard is one of numerous standards and alerts issued by The Joint Commission that address conflict and communication [8]. Conflict competence of people in leadership positions should also be adjudged. This in turn will help in identifying what works in an organization as a conflict management system.

Discussion

The findings of the study and informal interaction has revealed that variables such as the opportunity to develop, levels of job satisfaction, job stress, able to perform well with team and staff relations was seen to have a significant influence on job satisfaction. If the managers ignore these kinds of complaints, it could lead to potential conflict.

Conflict arises in any situation where more than one person is involved. The causes of conflict range from logical differences and contrasting goals to power disparities especially in the field of medicine where varied levels of work force involved in patient care. Poorly managed conflicts generate a cessation in trust and lost in productivity. This is clear from the results where majority of the conflicts are attributed to clinical staff than non-clinical staff.

The right management of these kinds of conflicts gives an opportunity for the manager to increase the productivity of their employees. The results have shown that in general, managers are familiar with conflict resolution techniques and believe in motivating their staff to increase their levels of performance and retain them with the hospital. However, there is need to make the HR system more robust. There are also suggestions given in many similar studies, that efforts to avoid unhealthy and personal conflicts arising should be avoided. Regular updating in knowledge, practices and training to help all the levels of employees to understand conflict and those factors causing conflict in an organization, is highly useful followed by understanding of use of appropriate strategies to manage [9].

The results also suggest that underlying factors like working conditions at the hospital are unable to meet the values and aspirations of the employees on certain occasions. While the conditions under which jobs are performed can have as much impact on people's effectiveness, comfort and safety as the intrinsic details of the task itself. Since job satisfaction has a strong correlation with job performance, conflicts and disputes, it is important to reinforce relevant human resources polices, improving working conditions, appraising, compensation and motivation.

Moreover, conflict does not remain unsolved, as when avoiding, there are no apparent winners at the expense of others as with Competing. While, accommodation strategies with doctors, might be appropriate for the nurses if they did not feel that their goals was so important. This feeling might be due to low self-confidence amongst few cadres of employees, or a feeling that the other party of the conflict is stronger than them as the responses to approaches used in conflict resolution suggests.

From informal interaction, many of the executive staff said, "In any of the given situation of difference or disagreement, the morale and success of the organization should not be compromised". Thus summing up the serious attitude hospital management has towards this issue.

Conclusion & Recommendations

Conflicts in one's job can affect not only motivation at work but also career decisions, relationships with others and personal health. Conflict management minimizes the negative outcomes of a conflict and promotes the positive outcomes with goal of improving learning in an organization. Those who work in a profession that is extremely demanding and sometimes unpredictable can be susceptible to feelings of uncertainty and reduced job satisfaction.

Following recommendations can be adopted to maximize the benefits:

Empowering employees to make decisions about their work and Strong emphasis on participatory approach between Clinical and Non-clinical staff

Continuous service evaluations and monitoring of job satisfaction along with surprise audits

On-job and Off-job training and appointment of Training Manager

Reducing number of shifts and extension of insurance to other hospitals

In certain cases avoiding can serve as a profitable conflict management strategy

Many midterm short studies/ surveys can be conducted to check on causes, factors and resolution strategies on regular basis. Role of mid and high level managerial staff in conflict resolution is highly important. Given the pivotal role that healthcare professionals play in determining the effectiveness, efficiency and sustainability of health care systems, it is imperative to understand what causes conflicts, what motivates them and the extent to which contextual variables and the organization satisfy them.

Back Stretch Exercise Vs Pelvic Tilt on the Backache among Antenatal Mothers

Pallavi Shinde[1], Merlin Suji[2]

[1]Tutor, Tehmi Grant Institute of Nursing Education, 3 , Tadiwala Road, Pune, Maharashtra, [2]Tutor, Symbiosis College of Nursing, Symbiosis International (Deemed University), SB Road, Pune, Maharashtra

Abstract

Back pain is a very common discomfort during pregnancy The reasons are weight gain, expanding sacroiliac joints and Mal-position of the fetus[1]. The present study aimed to compare the effect of back stretch exercise versus pelvic tilt on the backache among antenatal mothers in selected hospitals of Pune. Pre experimental two group pretest and post test design was used for the study for 30 antenatal mothers with the back pain in selected multispecialty hospital. To select the samples Non-Probability purposive sampling technique was used. After Pretest both exercises were taught to different samples and the post test was carried out after 7 days. Result shows that back stretch exercises were more effective than the pelvic tilt exercise.

Key Words: *Back stretch exercise and Pelvic tilt exercise*

Introduction

During the childbearing year, woman's body undergoes extensive changes which frequently necessitate many adaptations. While back pain during pregnancy interfere with work and daily activities[2]. A strong back is essential for good posture and for proper balance during pregnancy; it can be achieved by Stretching exercise which helps in improving range of motion, flexibility, circulation, decreases stress, and releases tension. While experiencing pregnancy back pain, gentle exercises, such as stretching and light movement will decrease spasm of the muscles, and help decrease back pain[1]. Throughout the pregnancy this exercise release endorphins (naturally occurring chemicals in brain) which relieves backaches improve posture by strengthening and toning the muscles in back, buttocks, and thighs. It reduces constipation by accelerating movement in intestine, Prevent wear and tear of joints and which become loosened during pregnancy due to normal hormonal changes by the lubricating fluid in joints, and help to sleep better by relieving the stress and anxiety.

Many women feel uncomfortable with the idea of working out during pregnancy. By doing exercise, women likely to have an easier labor and get back into shape more quickly after giving birth[4].One way to strengthen the pelvis is to do pelvic tilt exercises regularly. These easy pregnancy exercises strengthen abdomen muscle, soothe backaches during pregnancy and labor, improve posture, and ease delivery[5] .

Statement of the problem

A comparative study to assess the effect of back stretch exercise vs pelvic tilt on the backache among antenatal mothers in selected hospitals of Pune

Objectives of the study

1. To determine the level of backache among antenatal mothers.

2. To determine the effect of back stretch exercise on backache among antenatal mothers.

3. To determine the effect of pelvic tilt exercise on backache among antenatal mothers.

4. To correlate between selected demographic variables and backache among antenatal mothers.

Operational Definitions

Back Stretch Exercise: In this study it refers to the activities performed to pull tightly and releasing the back muscles in sitting position to reduce the pain and increase the flexibility. This activity will be carried over

for 20 to 30 sec and repeated twice per day for a period of 1 month.

Pelvic tilt exercise: In this study it refers to the activity performed to pull tightly and releasing the back muscles in standing position to reduce the pain and increase the flexibility. This activity will be carried over for 20 to 30 sec and repeated twice per day for 1 month.

Assumption

- Antenatal mother may suffer from backache
- Back stretch exercise may have significant effect on backache among antenatal mothers.
- Pelvic tilt exercise may have significant effect on backache among antenatal mothers.

Research design

The selection of research design is the most important step as it provides the framework for the study.

O1	X	O1
O2	X	O2

Keeping in view the objectives of the study, the researcher selected for the study was pre experimental two group pretest and post test design (O1 x O1),(O2 x O2). In the present study, the base measure will be the assessment of pain on numerical pain scale and the experimental variable will be the demonstration of back stretch exercise and pelvic tilt exercise depicted as 'X'.

In this study the independent variable is the back stretch exercise and pelvic tilt exercise.The dependent variable in the study is backache among antenatal mothers. **Setting of the study** is multispecialty hospital in PCMC Area.

Population: The population of this study comprises of women who are suffering from backache among antenatal mothers of selected hospital of Pimpri, Pune.

Sample and sampling technique

A non probability - purposive sampling technique was used for selecting 30 postnatal working women who met the set criteria during the period of data collection.

The following criteria were set for the selection of samples:

Inclusion Criteria:

1. Antenatal mothers in second and third trimester
2. Antenatal mothers who were suffering from backache
3. Antenatal mothers who were willing to participate in this study

Exclusion Criteria:

1. Antenatal mothers who were at high risk due to medical and surgical condition.
2. Antenatal mothers who were in 1st trimester.

Data collection technique and instruments

A study aimed at assessment of comparison of back stretch exercise vs pelvic tilt exercise on backache among antenatal mothers. Hence, numerical pain scale and observational checklist was used for collection of data.

Development of the tool

Observational checklist was prepared to assess the effect of back stretch exercise vs pelvic tilt exercise on backache among antenatal mothers

Description of the tool

SECTION I: Socio demographic profile which consist of age, education, occupation, gravida and monthly income.

SECTION II: (numerical Scale) Standardized pain scale to assess intensity of back ache.

SECTION III: Profile for back stretch exercise which contains the profile of the exercise step wise.

SECTION IV: Observational checklist for profile for back stretch exercise.

SECTION V: Profile for pelvic tilt exercise which contains the profile of the exercise step wise

SECTION VI: Observational checklist for profile for pelvic tilt exercise.

Content validity

To ensure content validity of the tool it was submitted to 24 experts. Twelve from Obstetrics and gynaecological nursing, four from Obsterics and gynaecology department, three from community health nursing departments, three from medical surgical department and two from physiotherapy. The experts were selected based on their clinical expertise, experience and interest in the problem being studied. They were requested to give their opinion on the appropriateness and relevance of items in the tool. As a whole the suggestions and comments of experts included grammatical corrections of the sentences. The modified tool contained 10 items after incorporating the suggestions.After validation of content, an expert in Marathi language translated the tool from English to Marathi.

Reliability

Reliability was assessed using inter-rater method. Cohen‘s kappa was found to be 0.80.Hense the tool is reliable.

Data Collection:

On day one (pre-test day) the purpose of the study was explained to each antenatal mother and the confidentiality of her response was assured. After pre-test on the same day back stretch exercise to 15 selected samples and pelvic tilt exercise to selected 15 samples was administered to the subjects. Post-test was taken on the 7th day using the same tool, and again post-test was taken on 7th day using the same tool.

Table 1: Description of demographic variables

Sr. No.	Demographic variable	Back Stretch exercise		Pelvic tilt Exercise	
		Frequency	%	Frequency	%
1.	Age				
a.	Below 20years	2	13.3%	2	13.3%
b.	21years-25years	5	33.3%	7	46.7%
c.	26years-30years	6	40.0%	5	33.3%
d.	30years and above	2	13.3%	1	6.7%
2.	Education				
a.	Illiterate	2	13.3%	1	6.7%
b.	Primary	8	53.3%	6	40.0%
c.	Secondary	4	26.7%	8	53.3%
d.	Graduate and above	1	6.7%		
3.	Occupation				
a.	Employed	5	33.3%	6	40.0%
b.	Unemployed	10	66.7%	9	60.0%
4.	Gravida				
a.	Primigravida	8	53.3%	6	40.0%
b.	Multigravida	7	46.7%	9	60.0%
5.	Monthly income				
a.	Below Rs. 5000/-	1	6.7%	3	20.0%
b.	Rs.5001-10,000/-	9	60.0%	6	40.0%
c.	Rs.10,001 -20,000/-	5	33.3%	6	40.0%

Description of level of backache among antenatal mothers:

In back stretch exercise group, majority (66.7%) had severe pain while in pelvic tilt exercises group, all the antenatal mothers had severe pain (Score 7-10) in first session.

Table 2: Description of effect of back stretch exercise on backache among antenatal mothers.

Sr no.	Level of Pain	1st session		2nd session		3rd session	
		Freq	%	Freq	%	Freq	%
1	No pain(Score0)	0	0.0%	0	0.0%	0	0.0%
2	Mild(Score1-3)	0	0.0%	0	0.0%	8	53.3%
3	Moderate(Score4-6)	5	33.3%	12	80.0%	7	46.7%
4	Severe(Score 7-10)	10	66.7%	3	20.0%	0	0.0%

Table 3: Description of effect of pelvic tilt exercise on backache among antenatal mothers

Sr No.	Pain	1st session		2nd session		3rd session	
		Freq	%	Freq	%	Freq	%
1	No pain (Score0)	0	0.0%	0	0.0%	0	0.0%
2	Mild (Score 1-3)	0	0.0%	0	0.0%	0	0.0%
3	Moderate (Score 4-6)	0	0.0%	0	0.0%	12	80.0%
4	Severe (Score 7-10)	15	100.0%	15	100.0%	3	20.0%

Analysis of data related to comparison of effect of pelvic tilt exercise vs back stretch exercise on the backache among antenatal mothers.

Two sample t-test for comparison of effect of pelvic tilt exercise vs back stretch exercise. Mean change in pain score in back stretch exercises group were 1.4 and 3.4 in session two and session three. For pelvic tilt exercise group, the mean effect was 0.7 and 2 in second and third sessions. T-values for this comparison were -3 and -5.1 with 28 degrees of freedom. Corresponding p-values were 0.003 and 0.000, which are small (less than 0.05), the null hypothesis is rejected. The pain scores decreased significantly better for back stretch exercise group as compared to that of pelvic tilt exercise group. hence the back stretch exercise proven to be more effective than pelvic tilt exercise in reducing backache among antenatal mothers.

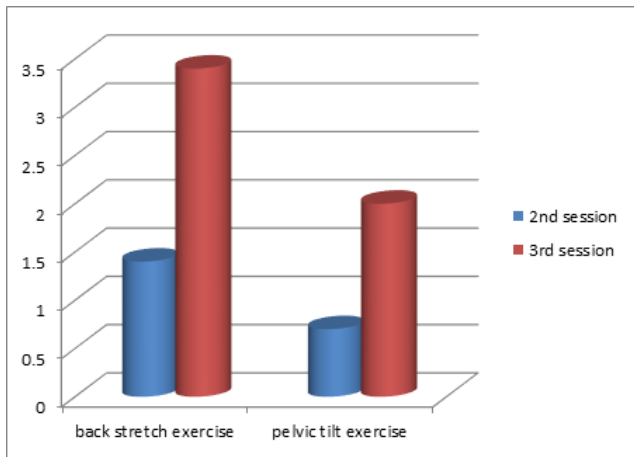

Figure no.1: Two sample t-test for comparison of pelvic stretch exercise vs back stretch exercise group

Table No 4: Association between level of backache among antenatal mothers and demographic variables Fisher's exact test for significance table.

Sr. no	Demographic variable Moderate Severe			Pain		p- value
1	Age	a.	Below 20years	1	3	0.531
		b.	21years- 25years	1	11	
		c.	26years-30years	3	8	
		d.	30years and above	0	3

		c.	Rs. 10,001 - 20,000/-	3	8	

Since all the p-values are large (greater than 0.05), there is no evidence against null hypothesis. None of the demographic variable was found to have significant association with backache among antenatal mothers.

Ethical Clearance : Ethical clearance was taken from Symbiosis College of Nursing, Internal Ehical Committee (IEC) authorities before conducting a study. Personal consent was taken from the antenatal mothers before conducting the study.

Source of Funding: Self .

Conflict of Interest: There is a genuine need for continuing education for nurses, particularly for those who are working in Hospital departments dealing with antenatal care. There is a need for Extensive and Intensive Nursing Research in this area so that strategies for educating people on the exercises which can give a better motherhood. The Nurse researcher should be able to conduct the research on various aspects of awareness

about the maintenance of body postures which will help to prevent or reduce the backache.

Recommendations:

•A similar study may be replicated on large samples; thereby findings can be generalized for a large population.

•A comparative study may be conducted using different antenatal exercises for backache.

•A similar study may be conducted to find out the knowledge regarding effects of different exercise on backache.

•A similar study may be conducted to find out attitude towards antenatal exercise.

Conclusion

The result shows , pain scores decreased significantly better for back stretch exercise group as compared to that of pelvic tilt exercise group hence the back stretch exercise proven to be more effective than pelvic tilt exercise in reducing backache among antenatal mothers.

Effectiveness of Demonstration on Neonatal Resuscitation Practices among the Nurses

Manu Acha Roy

[1]*Tutor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra*

Abstract

The purpose of the study was to assess the effectiveness of demonstration program on neonatal resuscitation among the nurses at Pediatric and Obstetric and Gynecology departments of selected hospitals in Pune. A quasi experimental non-randomized pretest post-test control group design was used in the study. Population of the study comprise of all nurses working in the Pediatric and Obstetrics and Gynecology departments of selected hospitals in Pune. Purposive sampling technique was used to select 120 samples, 60 in the experimental group and 60 in the control group. Non standardized self-structured multiple choice questionnaire (Demographic Performa, Observation Checklist) was used to collect data. Descriptive statistics (Frequency, Percentage, Means and Standard Deviations) and inferential statistics (Chi square, Independent t-test, Correlation coefficient, and Paired t-test) were used to summarize the data and to test the hypothesis. There was a highly significant difference in the practices of nurses regarding neonatal resuscitation between the experimental and control group at P<.001 level. The study concluded that demonstration program is an effective method to increase the practices of nurses relating to neonatal resuscitation.

Keywords – *Effectiveness, Neonate, Resuscitation, Obstetrics, Gynecology, Pediatric*

Introduction

One of the most awe-inspiring and emotional events that can occur one's life time is the birth of a newborn. The parents and also for the other family members would be excited for the neonate after the anticipation and preparation for nine months. But if the neonate is not the healthy or well infant who was expected, it creates a problem. The health care providers who are working in the labour room should be well trained and should be proficient in their neonatal resuscitation practices. Approximately 10% of newborns require some assistance to initiate breathing at birth. Less than 1% require extensive resuscitation measures, such as cardiac compressions and medications. Although most newly born infants successfully transition from intrauterine to extra uterine life without special help, because of the large total number of births, a significant number will require some degree of resuscitation[1]. In India, 81% of all babies are born in nonteaching, non-affiliated hospitals, In such hospitals, the volume of delivery service may not be perceived as sufficient economic justification for the continuous in-hospital presence of personnel with high risk delivery room experience[2].

Readiness for neonatal resuscitation requires assessment of perinatal risk, a system to assemble the appropriate personnel based on that risk, an organized method for ensuring immediate access to supplies and equipment, and standardization of behavioral practices that help assure effective teamwork and communication.

Every birth should be attended by at least 1 person who can perform the initial steps of newborn resuscitation and PPV, and whose only responsibility is care of the newborn. In the presence of significant perinatal risk factors that increase the likelihood of the need for resuscitation, additional personnel with resuscitation practices, including chest compressions, endotracheal intubation, and umbilical vein catheter insertion, should be immediately available. Furthermore, because a newborn without apparent risk factors may unexpectedly require resuscitation, each institution should have a procedure in place for rapidly mobilizing a team with complete newborn resuscitation practices for any birth[3].

The resuscitation efforts after the birth of a baby are developed to promote the newborn make the respiratory

and circulatory transitions that must be accomplished immediately after birth: the lung expands, fetal lung fluid is cleared, effective air exchange is established, and the right – to- left circulatory shunts never exists. Although, antenatal care can detect many potential foetal difficulties, it helps for the maternal transfer to the referral center for care. Many women who experience preterm labour are not identified prospectively and, therefore are not referred to a tertiary maternity care center. Consequently, the number of premature deliveries occur in primary and secondary care hospitals. Hence, all health care professionals involved should be trained adequately in all the aspects of neonatal resuscitation. Additionally, even if the institution does not care for preterm or intensive care infants, equipment that is needed to resuscitate neonates should be intended in all delivering institutions. The practitioner who is performing the neonatal resuscitation not only should have necessary practices but also a good knowledge regarding the transitional adaptation and physiology, and the infant's response to resuscitation. Along with the grounded knowledge about the physiology, good practices of assessment, a systematic list of technical practices is also required[8]. According to WHO statistics, in each year the estimated birth of infants is 130 million, out of which 4 million dies in the first 28 days of life. Three quarter of neonatal deaths occur in the first week, and more than one quarter occurs in the first 24 hours; an almost equal number survive with squeals such as cerebral palsy and mental retardation[4]. Neonatal deaths accounts for 40% of deaths under the age of 5 years worldwide. Resuscitative measures will be needed for the neonates at birth by practiced practitioners. The above statistics along with the personal clinical experience motivated the researcher to teach the hands on training on neonatal resuscitation for nurses, helping them to give quality care to their clients; so that the mortality and morbidity of the neonates can be reduced[5].

Materials and Method

Objectives:

1. To assess the practice of neonatal resuscitation among nurses in the experimental and control group.
2. To determine the practice of neonatal resuscitation after the interventions in experimental and control group.
3. To find out the association between neonatal resuscitation practice score with demographic variables

Hypothesis:

H_0: There will be no significant effect of demonstration on neonatal resuscitation among nurses.

H_1: There will be significant effect of demonstration on neonatal resuscitation among nurses.

Research design -A quasi experimental non randomized pretest posttest control group design was used in the study. The study consisted of 120 nurses.

Inclusion Criteria: included all the male and female registered nurses working in paediatric wards, neonatal ICU, pediatric casualty, antenatal, postnatal, gynaec wards, labor rooms of selected hospital. Nurses who are qualified with GNM, BSc Nursing and MSc Nursing programs and nurses who are willing to participate in the study were included in the study.

Exclusion Criteria - nurses who are not available in the wards during the data collection period.

Sampling: Purposive sampling technique was used.

Instruments: Subject data sheet had a set of questions that was oriented to the demographic data of subjects. Practice was assessed using an observational checklist.

Data Collection Procedure: Data collection was started after getting ethical committee permission and permission from hospital authority. The nurses who are present and scheduled for the day and evening shift during the data collection period were considered to be the experimental group and those nurses in the night shift were selected as the control group. Purpose of the study was explained to the subjects. Written informed consent was taken from all the study subjects. Each nurse was given the Demographic Performa to be filled up by them. The nurses were given situations related to neonatal resuscitation and were asked to demonstrate their actions during each situation. The practice of each sample regarding neonatal resuscitation was assessed using performance checklist. After the pretest, the nurses in the experimental group were given demonstration program regarding neonatal resuscitation. Return demonstration was done at the same time. No interventions were given

to the samples in the control group. Post test was done after seven days with the same performance checklist.

Data Analysis: Data on categorical variables were expressed as frequencies and percentages. The comparison of the categorical variables between the groups was carried out by using Chi-square test. The data on practices has been expressed as mean with standard deviation and compared between the groups by using independent student t test. Association between the different demographic variables with the practice of nurses was analysed with independent student t test.

Fifty one percent of the total study subjects in the experimental group and 46.66% of the total participants in the control group were <30 years of age and the groups were homogeneous. The proportion of females was significantly higher in the experimental and control group when compared to the males.

Among the 120 samples, 45 samples had a General Nursing and Midwifery qualification while 75 samples had either a B.Sc. Nursing or a M.Sc. Nursing degree qualification. The distribution of the study participants in relation to the year of experience indicated that the majority of the study participants in the experimental group (55%) and the control group (45%) had an experience of less than 5 years which indicates that the groups are homogenous in relation to the experience.

Twenty five percentage of the participants in the experimental and 21.6 % in the control group had attended some forms of Inservice education in neonatal resuscitation and majority of the samples in the experimental and control group have performed neonatal resuscitation in their own clinical experience. The percentage distribution of the participants in the Paediatrics& Obstetrics and Gynaecology departments were almost the same in both the intervention and the control groups.

The average practice score in the experimental group (66.00+6.065) was higher than the control group (25.57+7.205). This clearly showed that the demonstration programme was effective in improving the practices among the nurses.

Regarding the association between the practices and the demographic variables, there was no relationship between the practices and the demographic characteristics in the experimental group or the control group.

Table 1: Comparison of the Mean Difference Score in the Experimental and the Control group (N=120)

Variable	**Experimental group Difference (Post-pre)**		**Control Group Difference (post-pre)**		**Independent t value**
	M	SD	M	Sd	
Practice	38.75	7.223	2.82	4.91	t=31.053

Table 2: Association between the practices of the Nurses in the Experimental Group towards Neonatal Resuscitation and the Demographic Characteristics of the Nurses (N=60) **Characteristics pretest post test**

	n	**M**	**SD**	**t value and p value**	**M**	**SD**	**t value and p value**
Age							
<30 years	31	13.70	3.48	t=0.146	27.64	2.289	t=1.024

Inservice education received							
Yes	15	15.12	3.988	t=2.191	27.67	2.146	t=0.540
No	45	14.29	3.064	p=0.155	27.17	2.478	p=0.387
Resuscitation performed							
No	17	14.02	3.521	t=1.24 5	26.00	2.828	t=1.696
Yes	43	13.81	3.320	p=0.640	27.41	2.343	p=0.967
Department							
Paediatrics	39	13.27	2.279	t=0.214	15.86	2.154	t=0.764
Obsteric and gynae-cology	21	14.26	2.672	P=0.942	15.32	2.627	P=0.483

The practice score has no significant association with the demographic variables in the control group.

Discussion

The present study findings showed that the practice scores were significantly higher in the experimental group than in the control group.

The above findings were supported by the following studies:

A study was conducted on the demonstration program on Neonatal Resuscitation for the nurses working in the Primary Health Centres in Sudan . One hundred and thirty-five of 150 participants were included in this study with a response rate of 90.0%. The overall mean scores of knowledge and practices of midwives, nurses and residents were 19.9 (SD=3.1) and 6.8 (SD=3.9) respectively. The mean knowledge scores of midwives, nurses, pediatric residents and obs-gyn residents were 19.7 (SD=3.03), 20.2 (SD=2.94), 19.7 (SD=4.4) and 19.6 (SD=3.3) respectively. Whereas the mean scores of practices of midwives, nurses, pediatric residents and obs-gyn residents were 7.1 (SD=4.17), 6.7 (SD=3.75), 5.7 (SD=4.17) and 6.6 (SD=3.97) respectively[6].

A quasy experimental study was conducted in Mullana**,** India on Practices of Nursing Personnel Regarding Neonatal Resuscitation in 2015 .Establishment of spontaneous breathing after birth is most crucial for the survival of a newborn baby. Many babies do not receive proper resuscitative care which leads to high neonatal mortality which is preventable. So, the neonatal resuscitation performed by practiceed nursing personnel is necessary in reducing the mortality and morbidity among neonates. To evaluate the effectiveness of Neonatal Resuscitation Program in terms of practices of nursing personnel regarding neonatal resuscitation. An observation checklist regarding neonatal resuscitation was developed and used for data collection and nurses were educated as per Neonatal Resuscitation Program-2005 guidelines. A quasi experimental approach was used with Time-series design with multiple institution of treatment. Pre and post-implementation data was collected from 30 purposively selected nursing personnel from Labour room of General Hospital, Ambala Cantt and General Hospital, Naraingarh, Ambala, Haryana and upto 5 subsequent reinforcements were given[9]. Findings of the study revealed that majority of the nursing personnel (90%) had professional qualification of Diploma in Nursing and majority of nursing personnel (73.33%) have attended an in-service education related to neonatal resuscitation. The mean 5th post-implementation practice score of nursing personnel regarding neonatal resuscitation (39.37+2.73) was higher than pre-implementation practice score

of nursing personnel (30.10+2.35) as evident from the calculated 't' of 19.63 (29) which was found to be statistically significant at 0.05 level of significance. The practices of nursing personnel were significantly associated with number of resuscitations performed previously (=30.0). Conclusion: The study concludes that neonatal resuscitation program was effective in improving the practices of nursing personnel regarding neonatal resuscitation[7].

Conclusion

Majority of the nurses have a poor knowledge and skill regarding neonatal resuscitation. Structured teaching programme is an effective method to increase knowledge and to promote the skills of nurses relating to neonatal resuscitation. The level of knowledge of nurses is not influenced by any of the demographic characteristics of the nurses. Neonatal resuscitation has the potential of altering the outcome of intra-partum and post-partum events. In order to ensure intact survival of newborns, it is desirable that the labour room should be provided with necessary equipments, staffs and facilities.

Conflict of Interest: Nil

Source of Funding: The present study is self-funded.

Ethical Clearance: Ethical clearances obtained from the hospitals and informed consent was taken.

Serving Vegan Palates Nutritiously: Fortification of Vegan Cake with Garden Cress Seeds and Rose Petal Preserve as Functional Ingredients

Neelam Giraje[1], Radhika Hedaoo[2]

[1]M.Sc Nutrition and Dietetics, [2]Assistant Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Lavale, Pune

Abstract

Background: Vegan lifestyle is gaining impetus all over the world in view of its health benefits and environmental impact. With the growing diet trends a demand for vegan bakery products are rising.

Aim: The aim of the study was to develop whole wheat vegan cake by enriched with local plant derivatives and assess its overall acceptability compared to vegetarian cake available commercially.

Method: Vegan cake was standardized and enriched with garden cress seeds and rose petal preserve against a commercially available vegetarian cake .Sensory trails on flavor profile were conducted using 9 point hedonic scale on 30 semi trained panelists .Minimum good acceptance range considered was 70% and above. Nutritive value of the cake was determined by proximate analysis. Shelf life of the developed product was checked by microbial analysis. The overall acceptability of the developed product was checked against the control product statistically using paired t test.

Result: The experimental and the control product had sensory acceptability of 84% and 83 % respectively. There was no significant difference between the overall acceptability scores of two products ($p > 0.05$). The proximate analysis suggested the experimental cake was high in calories, proteins iron and fibre compared to control per 100 grams of the product. The shelf life of control and experimental product was two days at room temperature.

Conclusion: The developed product has a good scalability as a nutritious alternative to the contemporary vegan cakes available in the market.

Key Words: *Fortified vegan cakes, Rose petal preserve, Garden cress seeds.*

Introduction

Vegan diets and vegetarianism are one of the most established diet trends due to evidenced based researches on health effects of non vegetarian diets and global environmental concerns projected by non vegetarian diets.[1]India is a leading vegetarian country with 31 – 42% vegetarians which includes vegans.[2] *Vegan diets are defined as diets which completely exclude animal based products and all flesh foods. Scientific literature defines vegan diets as having only plant derived foods such as grains, seeds, legumes, nuts and vegetable fats[3].*The trends in bakery and confectionary are also changing with inclusion of functional vegan bakery products.[4] Functional foods are either basic natural foods or modified through various biotechnological processes or growing conditions, to which either a favourable ingredient has been added or removed which serve a special health benefit apart from nutritional significance.[5,6] Garden cress seeds (Lepidiumsativum Linn) are a lesser used plant seed in bakery and confectionary for fortification however hold a significant nutritive value for proteins, iron, zinc and a good fatty acid profile.[7] Garden cress seeds act as diuretic, aphrodisiac, antibacterial, gastrointestinal stimulant, expectorant and a potential galactogogue.[8]Similarly

various studies have incorporated dates (Phoenix dactylifera) in bakery and confectionary products such as cakes, cookies, toffees etc[9].Dates being a good source of carbohydrates and iron are an appropriate ingredient for bakery and confectionary items.[10] Rose petal preserve "Gulkand" has been used traditionally as a tonic against hyperacidity, dysmenorrhoea, fluid retention and fatigue and is evidenced for a good antioxidant activity.[11,12] The purpose of the study was to explore the potential of fortification in cake using garden cress seeds and rose petal preserve.

Materials and Method

Approvals: Approvals for the study was taken from Institutional Research Advisory Committee. Informed consent was collected from the panellists.

Study Locale: Nutrition Laboratory, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Pune, India.

Formulation and standardization of the product

Procurement of Raw Ingredients: All the raw ingredients as mentioned in Table 2 were brought from the local wholesale market of Pune.

Standardization of the cake recipe: USDA defines Standardized recipe *as one which has been tried, adapted and retried to produce the same yield and taste every time when same equipment, procedures and quantity and quality of ingredients is used.*[13]

Individually the ingredients were reviewed for weight and volume with baking temperature and time. 5 informal trails were conducted using varying ingredients percentages. Recipe yield and serving size of the cake slice was calculated. Sponge cake method was applied for preparation of vegan cake.[14]

Rationale for selecting ingredients: The main base ingredient selected for the cake was whole wheat flour considering benefits of added fibre and complex vitamins which the refined flour lacked. Coconut cream, coconut milk and dates in pureed form were added to impart softness to the cake. The rose petals jam "gulkand" was selected for a distinct sweet flavour and health benefits. Garden cress seeds were selected as functional ingredients for its rich micronutrient profile apart from distict sweetness and flavour. The calcium content of seeds is 317 mg/100g and iron (17 - 33 mg/100g) and zinc (4 - 5 mg/100g) [15]. Baking powder and baking soda are essentials for the leavening of cakes.[16]

The rose petal preserve preparation: The petals were procured from local market, washed, drained and dried on a paper. A dry airtight jar with a lid was taken for making the rose petal preserve *Gulkand'* .Layers of rose petals (50gm) and sugar (25 gms) were added .The airtight lid was closed and kept in sunlight for a period of seven days. The preserve was mixed everyday using a clean spoon. The preserve was later refrigerated.

Steps involved in making vegan cake

Mix the whole wheat flour, baking soda and baking and Sieve the mixture

Add dry dates powder and rose petals preserve and powdered sugar

Add coconut milk, coconut cream and refined sunflower oil

Addition of roasted Garden cress seed powder

Blend to make a cake batter and pour in greased pan

Addition of pureed dates.

Pre-heating of oven for 10 minutes on 180 degree C

Baking for 25 minutes at 180 degree C

Demold and cool for 10 minutes

Store in clean dry place.

Yield Factor: The recipe yield is an important step of recipe standardization. As it avoids wastage of products by over production or underproduction[17].The yield factor was calculated based on ratio of baked cake to cake batter and was expressed in serving size per slice.

Sensory Evaluation

The sensory evaluation was done by comparing vegan cake formulated as experimental sample and commercially available vegetarian cake as control sample using 9 point hedonic scale for overall acceptability, volume, colour, taste, texture, odour/ aroma, moistness.[18]The minimum acceptability range of 70% and more was considered as standard for sensory acceptance of the product.

Statistical analysis

The data for experimental and control was entered and analysed in SPSS version 20 using paired t test to check the flavour profile.

Proximate composition and mineral estimation

Standard methods given by FSSAI were followed for proximate analysis of the sample[19]. The testing was conducted on 200 gms of the product in triplicates at ISO certified, NABL accredited lab. The nutritive value estimation methods have been presented in Table 1. The nutritive value of the control cake was taken from nutrition label.

Table 1 Nutritive value estimation using standard methods was performed.

Sr.no.	Parameters	Method Used
1	Moisture	Hot air oven drying
2	Total ash	Muffle furnace combustion
3	Fat	Soxhlet Extraction
4	Protein	Kjeldal
5	Carbohydrate	IS:1656:2007 (RA 2012)
6	Energy	AFWTL/SOP/C-06
7	Total sugars	FSSAI Manual 2017
8	Total iron	FSSAI Lab. Manual

Percent contribution of Nutritive value of cake to Recommended Dietary Allowances (RDA)

The nutritive value estimated for the product through proximate analysis was calculated for percent contribution to the RDA[20]. The percent contribution of Nutritive value of cake to RDA and percent daily value were calculated based on 2000 K.calories diet for adults and children above 4 years of age .[21]

Cost Estimation: Cost estimation of the product included the direct and indirect costs such as the raw ingredients cost. Power or energy cost, other miscellaneous costs.[22]

Shelf Life studies

Storage stability: Staling of cakes was checked by evaluating the moistness and softness of texture in cake at room temperature and under refrigeration.

Microbial Analysis:

The microbial analysis of cake was carried out for 2 days in two different experiments i.e. on day 1 (the day product was prepared) and on day 3rd The samples were analyzed for total viable count, yeast and mold count and staphylococci counts.[23] Twenty five grams of the sample in duplicate was homogenized in 225 mL of saline. The homogenate was further subjected to 10 fold dilutions in saline. For total viable count 1 mL of the diluted sample was plated on plate count agar. For yeast and mold count 100 µL of the diluted sample was spread on yeast and mold agar. For staphylococci count 100 µL of the diluted sample was spread on Baird-Paker agar. The plates were incubated at 37°C for 24 h.

Packaging: The cake was cooled completely and put in a paper tray .Tray was covered with plastic foil and kept in cool dry place. Another sample was kept under refrigerated conditions in the tray covered with plastic foil.

Results

Table 2 Standardised Recipe ingredients

Sr.No	Ingredients	Quantity (gm/ ml)
1.	Whole wheat Flour	100
2.	Sugar	30
3.	Rose petal preserve	25
4.	Coconut Milk	100
5.	Coconut cream	45
6.	Garden cress seeds	10
7.	Dates	30
8.	Sunflower oil	30
9.	Baking powder	0.5
10.	Baking soda	0.5

Recipe yield: The total yield of the cake was 350 grams. The serving size was expressed as one slice of 55 grams. Total slices from the cake yield were 6 slices.

Sensory evaluation

The mean scores of control vegetarian cake and experimental vegan cake obtained through the flavour profiling done on hedonic scale is as shown in figure 1.

Figure 1 Sensory evaluation of control and experimental cake using 9 point hedonic scale.

The experimental cake had comparatively more moistness compared to the control cake. It was observed that the scores of both the samples were 70% and above. The statistical test suggested that there was no significant difference between the two products ($p > 0.05$). It showed that the both the products were accepted in terms of sensory analysis.

Preference test: It was observed that experimental product was preferred by 57% of the panellist and the control sample was preferred by 47% of the panellist (n=30).

Nutritive Value Estimation

The Table 3 shows the nutritive value comparison between control vegetarian and experimental vegan cake per 100 gms of the product.

Table 3: Nutritive value of control and experimental cake/100 grams

Sr. No	Nutrients	Control	Experimental
1.	Energy (K.Calories)	244	326
2.	Carbohydrates(gms)	40.82	53.8
3.	Total sugars(gms)	21.22	22.94
4.	Proteins(gms)	2.8	4.55
5.	Total Fats(gms)	12.00	10.28
6.	Iron(mg)	0.4	1.7
7.	Moisture(gms)	23.1	29.8
8.	Ash(gms)	1.1	1.4

It was observed that the experimental cake was high in calories compared to control cake. However the total sugars were almost same compared to control. The experimental cake was higher in proteins compared to control and was low in fats compared to control. The experimental product was high in iron.

Percent contribution of nutrients to RDAs.

Percent nutrient contribution of macronutrients and iron towards recommended dietary allowances across age groups are shown in table 4 along with the percent daily values based on 2000 K.Calories diet .

Table 4 Percent contribution of nutrients to RDAs and Percent Daily Value

Sr.No	Nutrients	Nutritive Value of Product	% Of RDA						% Daily Value
			Boys (10-12 years)	Girls (10-12 years)	Boys (13-15 years)	Girls (13-15 years)	Sedentary Woman	Sedentary Man	2000 kcal diet
1	Energy(kcal)	326	15%	16%	12%	14%	17%	14%	16.3
2	Proteins(gm)	4.55	11%	11%	8%	9%	8%	13%	9.1
3	Fats (gm)	10.28	29%	29%	23%	26%	51%	51%	15
5	Iron(mg)	1.78	8%	7%	6%	7%	8%	8%	9%

**The carbohydrate values calculated varies based on RDAs and the product contributes to 18% of the percent daily value.

Shelf life studies

Storage stability: The product was rendered unacceptable due to staling observed from 3rd day onwards revealed by loss of moistness in the cake.

Microbial analysis

No growth in the bacterial count was detected on day one and day 3. However, on day 3 the staphylococci growth was 67 CFU/g. Hence the shelf life of the product was 2 days.

Cost Estimation

The table 5 shows the cost estimation for control cake and experimental cake

Sr.No	Item	Cost for control sample in rupees	Cost for experimental sample in rupees
1.	Raw Material	40	50
2.	Energy cost	0.5	0.7
3.	Labour cost	9	*Nil
4.	Other Production Cost	0.5	0.7
5.	Total cost	50	51.4

**The labour cost not included as it's a laboratory based experiment.*

Discussion & Conclusion

The present food product development research study focused on adding a vegan cake with functional ingredients to the existing range of vegan bakery items. The vegan cake had an equally good volume compared to control. The principle behind the volume observed in cakes is presence of carbon dioxide gas trapped in the starch of the batter which expands during the baking process[24]. In cakes gluten development is discouraged as it makes the cake dry and stiff. Hence, sufficient care was taken while mixing to incorporate enough air in the batter by cut and fold method. The preference test suggested an inclination towards experimental cake. The reason for preference was the distinct caramelised flavour of rose petal preserve and better moistness. The presence of sugars and fats is relative to moistness in cakes as shown by the combination of oil, coconut cream, garden cress seeds, dates and sugar. The shelf life of product was concluded to be 2 days as on day 3 the staphylococci growth was 67 CFU/g indicating contamination during the handling. Further studies could be conducted to minimize the staphylococci counts. The raw material cost was low for control commercial cake due to whole sale rates applied. The product has a good scalability for commercial vegan bakeries.

Assessment of Patient Safety Culture in a Tertiary Care Hospital In Pune

Neha Ahire[1], Kurapatti Ambika Shrinivas[2]

[1]Assistant Professor, Symbiosis Institute of Health Sciences, A Constituent of Symbiosis International (Deemed University) (SIU) Senapati Bapat Road, Pune [2]Business Analyst, Allscripts, Pune

Abstract

Introduction - Patient safety is a critical component to the quality of health care. As health care organizations endeavor to improve their quality of care, there is growing recognition of the importance of establishing a culture of patient safety. With growing awareness of accreditations like NABH and JCI, the focus on safety culture is rising. Safety culture plays a vital role and it is the responsibility of the management to ensure safety of not only patients but also the staff members.

Aim & Objectives- In this study, the Hospital Survey on Patient Safety (HSOPSC) questionnaire by AHRQ (Agency for Health Research & Quality) was used to assess the culture of patient safety in the tertiary care hospital in Pune.The HSOPSC is used to measure the 14 dimensions of the patient safety culture in the hospital. The survey received 833 respondents out of 1500 staff including physicians, nurses and non-clinical staff etc. The overall response rate was 55.53%. For analysis basic Microsoft excel tools were used.

Findings - The results showed that hospital staff of this hospital feel positively toward patient safety culture in their organization. One of the dimension that received the highest positive response rate was "Teamwork within units". One of the existing discrepancies with high percentage was "frequency of incident reporting".

Conclusion - The result showed that in general, hospital staff in the hospital feel positively towards patient safety culture within their organization.

Keywords- *Safety culture, patient safety.*

Introduction

Patient safety is a critical component to the quality of health care. As health care organizations endeavor to improve their quality of care, there is growing recognition of the importance of establishing a culture of patient safety. With growing awareness of accreditations like NABH and JCI, the focus on safety culture is rising. It is a challenge for any healthcare organization to implement new practices to improve the quality of the overall system, as well as patient care and/or patient safety. The biggest challenge is complexity of healthcare organizations, which tends to be more complex than other organisations.[1,2,3]

Several studies stated that essential safety practices of healthcare employees are often compromised upon. Secondly, there is a need for major changes in individual behaviour to shift from the culture of 'blame' to an objective response to errors.[4,5] This means shifting the blame toward the systems that allow such errors, rather than blaming the individual. Thirdly, healthcare staff's fear of losing others' confidence and trust, and thus, fear of damage to personal reputation, need to also be alleviated.[6, 7]

Patient safety, if not measured, cannot be improved. Changing the culture, or even a few practices and policies, requires health-care professionals and especially the

top-level administrators and their employees to share a common vision. A good safety system depends on having a culture that supports and encourages employees to report their errors and near misses.[7]

Measuring the safety culture will help managers understand its impact on the occurrence of errors. It will help to identify the relative contribution of causal factors to errors[8,9] All managers should consider the importance of encouraging and supporting the people they supervise when errors are

Reported.[10,11.]

Promoting a culture of reporting errors is applicable to the patient care environment so that staff members learn from each other and help to avoid the occurrence of future errors[12,13,14.] When addressing safety within one particular health care organization, measuring the existing safety culture may help enlighten management regarding issues that impede making progress in improving safety [15.]

Measurement of the patient safety culture has been carried out in several ways, one of which is the use of surveys. Some surveys used have assessed patient-safety features and evaluated the health-professional's perceptions of actions and behaviours in their work environment. The results may help to determine which actions and behaviours, relative to safety requirements and regulatory goals, should be prioritized for process improvement programmes. The Hospital Survey on Patient Safety Culture (HSOPSC) was developed by the U.S. health department's Agency for Healthcare Research and Quality (AHRQ) and has been widely used in the U.S., the current measurement of safety focuses on counting errors and incidents that occur. As an alternative, a proactive approach would provide the hospital's management with the status of the safety culture in the hospital as well as a baseline measurement to guide strategies to improve the safety culture related to increased patient safety. The survey offers the opportunity to measure health-staff perceptions of the safety culture in hospital.[14]

As hospitals continually strive to improve patient safety and quality, hospital leadership increasingly recognizes the importance of establishing a culture of safety. Achieving such a culture requires leadership, physicians, and staff to understand their organizational values, beliefs, and norms about what is important and what attitudes and behaviors are expected and appropriate.

Patient Safety is currently of primary interest in healthcare and is in part based on numerous reports raising concern about such areas as medical errors, medication errors, and error reporting. The survey is intended to measure patient safety culture from a hospital staff perspective and therefore is best suited for hospital staff having direct contact with patients or for hospital staff whose work directly affects patient care. This study will provide these hospitals with an empirical baseline measurement of the safety culture and an important quantitative outcome by which future safety improvements can be evaluated.[14]

Aim & Objectives

Aim –The aim of the study is to study the patient safety culture and associated factors in a tertiary care hospital in Pune. Objectives – The objectives are to1. To diagnose & assess the status of patient safety culture2. To identify areas for patient safety culture improvement. 3. To promote staff awareness about patient safety.

Materials and Method

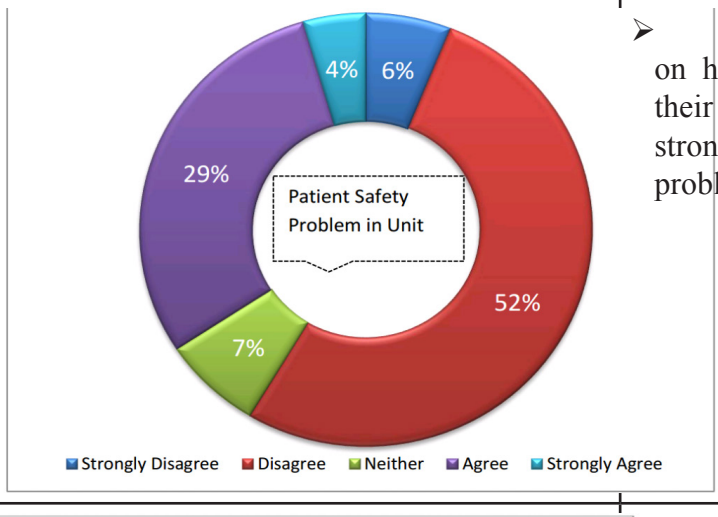
The setting for the study was a tertiary care hospital in Pune. The questionnaire was circulated online via portal on clinical & non clinical departments of the hospital. The duration of the study was one month. (5th July – 5th August 2017) The tool used was HSOPSC survey (2009 version). The Hospital Survey on Patient Safety Culture (HSOPSC) was developed by the U.S. health department's Agency for Healthcare Research and Quality (AHRQ) and has been widely used in the U.S.,the current measurement of safety. It focuses on counting errors and incidents that occurs. A survey was used to measure the dependent variable of health-staff perceptions about the safety culture in their respective hospital departments. Multistage-stratified simple random sampling was used. Staff subgroups working in each hospital that had direct contact with patients, or whose work directly affected the patients, were stratified by work group into:1. Physicians,2. Nurses 3. Pharmacists 4. Dieticians5. Physiotherapists 6. Laboratory specialists and technicians 7. Radiologists and technicians, Housekeeping staff etc.

The survey places an emphasis on patient safety issues and on error and event reporting. The survey

measures seven unit-level aspects of the safety culture:

1. Supervisor/Manager expectations and actions promoting safety (4 items)
2. Organizational learning—continuous improvement (3 items)
3. Teamwork within units (4 items)
4. Communication openness (3 items)
5. Feedback and communication about error (3 items)
6. Non-punitive response to error (3 items)
7. Staffing (4 items)

In addition, the survey measures three hospital-level aspects of the safety culture:



1. Hospital management support for patient safety (3 items)
2. Teamwork across hospital units (4 items)
3. Hospital handoffs and transitions (4 items)

OUTCOME VARIABLES

1. Overall perceptions of safety (4 items)
2. Frequency of event reporting (3 items)
3. Patient safety grade (of the hospital unit) (1 item)
4. Number of events reported (1 item)

Analysis & Discussion

Fig 1 Issues with patient safety

☐ **Unit specific patient safety issues:**

➢ 52% of the respondents disagreed on having patient safety problems in their unit. However, 29% agree and 4% strongly agree about have patient safety problems in their unit.

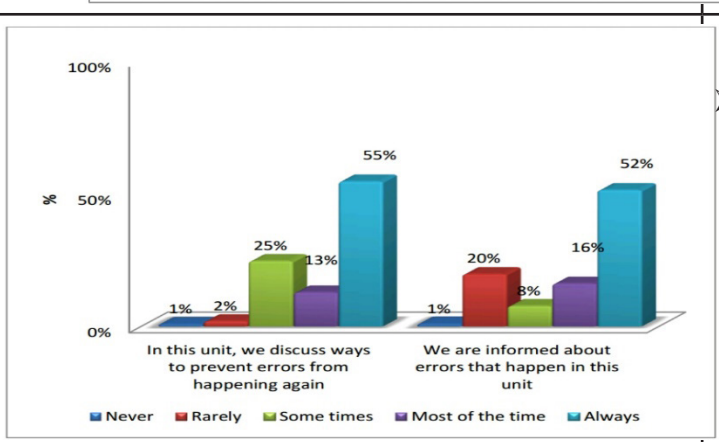


Fig 2 Communication related to patient safety

➢ 55% state that ways to prevent errors are always discussed in their unit; 52 % state that they are always informed about the errors that happen in the unit; 20% of the respondent's state that they are rarely informed.

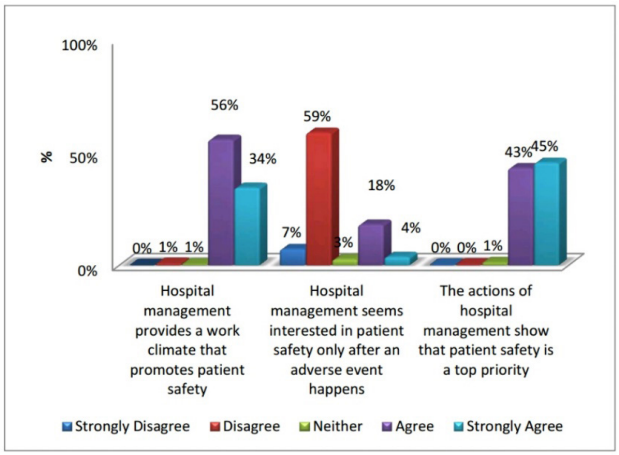

Fig 3 Managements perspective regarding patient safety

· **Hospital management and their inclination to safety from staff's perspective:**

- 56% agree and 34% strongly agree on management providing a work climate that promotes patient safety.
- Majority of the respondents i.e. 59% disagree that management seems interested in patient safety only after an adverse event, however there are 18% of the respondents who agree and 4% who strongly agree about the same.
- 45% strongly agree and 43% agree that patient safety is a top priority for the management.

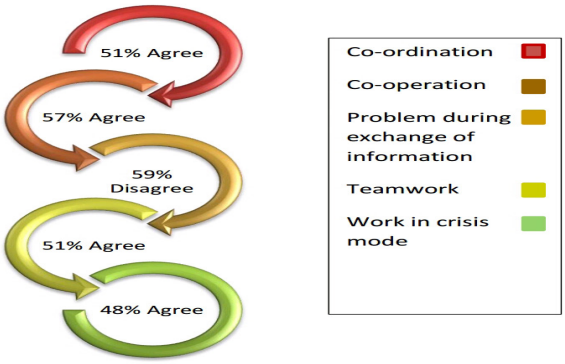

Fig 4 Cooperative approach towards patient safety

· **Co-ordination between units:**

- 51% of the respondents agree that there is co-ordination between the hospital units.
- 57% of the respondents agree that there is co-operation in between staff when they need to work together.
- 59% of the staff disagree on having problems during intra-departmental and interdepartmental exchange of information.
- 51% agree and 46 strongly agree on having team-work in place in the hospital.
- 48% of the respondents agree and 8% strongly agree on working in 'crisis-mode'.

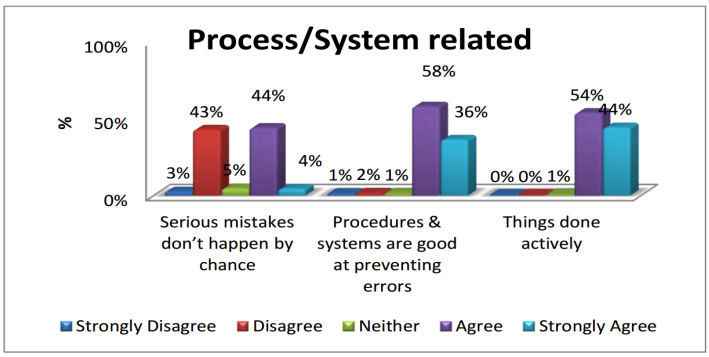

Fig 5. Process/System related safety issues

- **Process/System related:**

- MMajority i.e. 44% agree that more serious mistakes don't happen just by chance in this hospital, however there is an equivalent number 43% of the respondents who disagree in the same.

- Majority i.e. 56% agrees and 40% strongly agree that procedures are in place to avoid errors from happening.

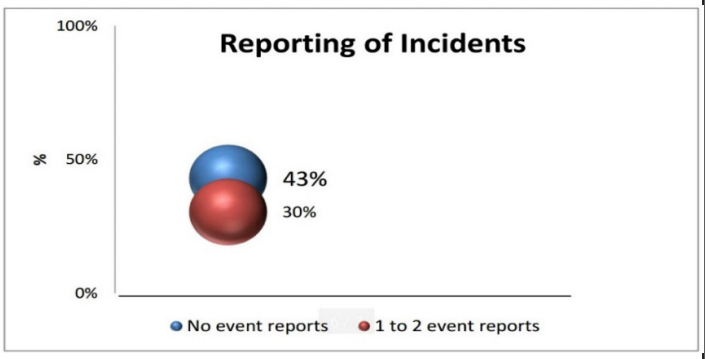

Fig 6. Incidence reporting

- **Incident reporting system:**

➢ Reporting of Incidents: From the graph below it is evident that majority of the respondents have not reported any incidents during their tenure in the hospital. Thus, it is clear that staff should be encouraged to report more incidents.

Discussion

Currently major hospitals are aiming towards quality and safety by establishing a culture of safety through various means. The study deals with assessing the patient safety culture in a tertiary care hospital in Pune. Also, the study tries to understand the perception of hospital staff and how management takes care of this issue of safety. The study tries to bring forth the flaws in the system and the processes rather than finding faults in the individual. Patient safety culture is a complex framework, which involves commitment all categories of staff ranging from the top management to all healthcare workers. According to the Agency of Healthcare Research and Quality (AHRQ) developing patient safety culture requires an understanding of the values, beliefs, and norms and should be aimed towards identifying the processes flaws rather than the person specific flaws.

Safety culture is important for both patients and staff so that the highest quality of healthcare can be delivered. Maximum number of participants (56%) agreed that management provides a work climate that promotes patient safety. This is very significant finding and highlights management's commitment toward not only patient safety but also Although 51% of the respondents disagree that their mistakes are held against them, however there is some considerable amount 32% respondents agree and 2% strongly agree for the same. Majority of the staff 49% worry that mistakes are kept in their personnel file; also 42% of the respondent's state that it feels like the person is being written about and not the problem.

This can be concluded by saying that, there is currently a major effort to improve patient safety in this hospital and healthcare providers have been encouraged to assess the current state of their safety culture. Patient safety culture assessment tools provide an avenue to understand what staff think and how they act towards patient safety. This survey assessed the patient safety culture in this hospital. The overall response rate was 55.53% towards the patient safety survey.

Conclusion

This survey had helped hospital in assessing the patient safety culture of the hospital. In establishing a culture of safety, the hospital management should aim at improving the system and process rather than blaming individuals.

Intelligence Quotient and Nutritional Status of 4-6 Year Old Children from Fishermen Community of Goa, India

Neha Sathe[1], Devaki Gokhale[2]

[1]M.Sc. Student, [2]Assistant Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Pune

Abstract

Infancy, upto the period of 6 years of age, is a crucial phase for cognitive, social, emotional and physical development. Various factors related to health and nutrition can result in significant changes in cognitive abilities while the child is growing. The objective was to assess nutritional status and intelligence quotient of children from fisherman community. Thus healthy children(n=100) belonging to fishermen community in age group 4-6 years whose either parent's occupation was fishing were included from schools and communities across Goa. Assessment of intelligence quotient using Draw-a-man test was undertaken. Data on socio demography, anthropometry and dietary habits was also collected. Statistical analysis using chi-square, Pearson's correlation and t- test was performed. The mean IQ score among the children was (105.5± 11.6) under the moderate average IQ category. There was a significant association between occupation and education of the father and IQ (X^2=14.5 p=0.02, X2= 23.9, p=0.02).The anthropometry of the children, height and MUAC had positive correlation with IQ (p=<0.05). The difference of means of Height, MUAC and foods (Soybean and Mackerel) with IQ scores were higher in moderate to above average IQ category. Increased consumption of soybean and fish correlated with better anthropometric measurements and higher IQ scores (p=<0.05). Factors such as socio demographic status of the parents, anthropometry, nutritional status and fish consumption affected the IQ of children.

***Key words**: IQ, Anthropometry, Fishermen community, Nutritional status*

Introduction

Early childhood, spans upto the period of 8 years of age. It is critical for cognitive, social, emotional and physical development. As per UNICEF guidelines, during these years, a child's newly developing brain is highly plastic and responsive to change as billions of integrated neural circuits are established through the interaction of genetics, environment and adequate nutrition. (1) Their physical development, what they eat and the habits they develop around food when they're young, set the pattern for the rest of their lives in terms of personality development, learning process, socio-economic development and health.(2) A joint statement on vitamin and mineral deficiencies says that the severity of deficiencies can lead to impairment of hundreds of millions of growing minds and the lowering of national IQ (3) Brain development is modified by the quality of the environment which consists of maternal health, parental education, anthropometry, malnutrition geographical location, socioeconomic status, genes, the emotional and learning environment and nutrition which is a major component. Several research studies indicate that adequate nutrition helps in neuron proliferation and myelination whereas poor nutrition such as micronutrient deficiencies can cause permanent cognitive deficits and reduced productivity throughout the school years and adulthood.(4) Nutrition is there by an important contributor to cognitive development.(5) Goa is the smallest state in India with population of 1,458,545 and its100 kilometers of coastline and 250 kilometers of inland waterways rich in marine life, Goa and fish are undoubtedly inseparable.

Devaki Gokhale
Assistant Professor, Symbiosis School of Biological Sciences, Pune-412115,
Email: devakijgokhale@gmail.com

[6]Due to recent advances in technology the traditional fishermen communities in Goa are decreasing which have an impact on their socioeconomic status and diet but fish remains to be a main component of their diet which can impact child's IQ levels.[4] Under 5years of age there are about 23.8% of children who are underweight, 20.1% of children who are stunted and 21.9% who suffer from wasting.[7] Studies show that fishermen spend less time towards nutritional care of their children as most of their time is spent in continuous work these results in inadequate nutritional status and show less aptitude in intelligence tests, poor reading.[8] Many studies so far have been carried out to identify association between IQ and nutrition in developed and developing countries. However only few studies have been carried among the fishermen community in India. [8]

Materials and Method

A cross-sectional study was conducted across North Goa and South Goa among fishermen communities. Healthy children (4-6 years) whose either parent's occupation was fishing were included and children with any congenital, genetic or acquired diseases related to nervous system were excluded. The sample size was (n=100) with 53 boys and 47 girls belonging to fishermen community recruited from schools and communities who voluntarily agreed to participate. The data was collected using structured questionnaire through an interview method with the children's mothers. In communities, a day prior to data collection all the households were informed and the following day data was collected from all the fishermen community households. A written consent was taken from children's parents. Anthropometric measurements (Height, weight, MUAC) were measured using standard procedure and calibrated scales, WHO charts were used to study the growth parameters. The dietary intake of the children were taken using 24 hour diet recall to study the diet diversity and food frequency questionnaire(FFQ) with 7 food groups and a special response section for commonly consumed fishes in Goa. IQ was assessed using The Draw-a-Person test [9] (DAP test, or Good enough–Harris Draw-a-Person test) wherein children were given pencil and paper and they were asked to draw a man, or their friend or father. It is a psychological projective personality or cognitive test used to evaluate children on "the nature and spontaneous drawings of children are dependent primarily upon intellectual development which reveals his intellectual ability to think, express himself and also eye-hand coordination and learning differences." The score of the figures according to the standard manual were considered to analyze the Intellectual ability of the child and were classified into IQ categories as below average- 80-89, Average- 90- 99, moderate average- 100-109, above average- 110-120. [10]. The data was entered into SPSS 23 for analysis. Microsoft excel was used to calculate consumption of particular foods. The normality of data was tested .Descriptive statistics were used for identifying percentages, frequencies and standard deviations of socio demography, anthropometry of the child, IQ scores, food frequency and daily consumption of micronutrients. Pearson's correlation test for assessing relation between IQ and child's anthropometry. To find statistical differences of means between parameters t-test was used.

Results

The results depict relation between Intelligence Quotient and nutritional status of children from the fishermen community. The IQ distribution according to the gender indicated that most of the children belonged to above average group and the mean IQ score derived was 105± 11.6. It was also seen that that out of ones who were above average IQ scores 28(51.9%) were girls whereas 6(60%) of boys fall under moderate average category. Most of the boys i.e. 12(54.5%) had an below average IQ score (Figure 2)

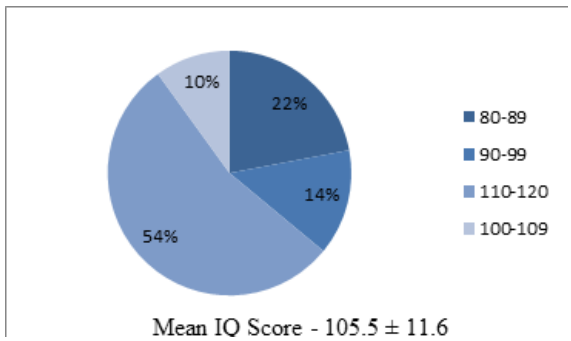

Figure 1- IQ score

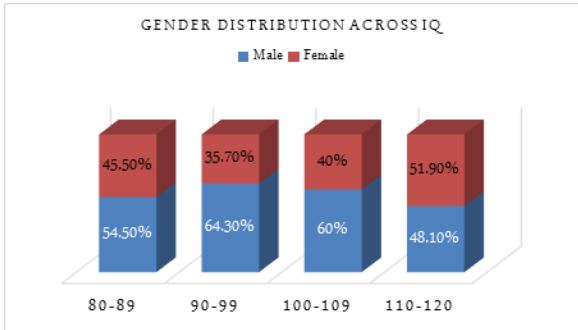

Figure 2: Gender Distribution across IQ score categories

Table no 1: Anthropometric data of children (Mean)	
Measurements	**Mean (± SD)**
Weight (kg)	17.24 ± 2.90
Height (cm)	106.50± 6.74
MUAC (cm)	15.67 ± 2.23

Table 4.2.2 shows anthropometric data of children, the mean weight was 17.2 ± 2.90 kg, whereas the mean height was 106.50± 6.74 cm and the MUAC was 15.6 ± 2.2m.

Table no 2: Correlation of IQ and anthropometry			
IQ	Height(cm)	Weight(kg)	MUAC(cm)
	.055 .027	.056	

* p value of ≤0.05 is considered significant

Table no.2 illustrates that the IQ of child was positively correlated to anthropometric measurements of height and MUAC. [11]

Table no.3 Association of IQ and Socio-demographic factors		
Chi- square Test	(X^2)	p value
Education of father and IQ scores of the child	23.9	.020*
Occupation of father and IQ scores of the child	14.5	.024*

(*p value ≤0.05 is considered to be significant)

A positive association was found between education of father and IQ levels of children (x^2=23.9, p= 0.021) .Also there was a significant positive association between occupation of the father and IQ levels in children (x^2= 14.5, p=0.02), it was seen that 30(55.6%) of children of fishermen had significantly above average IQ scores whereas10 (71.4%) of children had an average IQ score. About 14(63.6%) of children belonged to below average category which shows that occupation especially children of fishermen have a better IQ score. 5(50%) of children had a moderate average were the fathers involved in other occupations such as service, laborer, fish drying.

Table no. 4 Diet Diversity Scores		
Diet diversity score	**Frequency (%)**	**Mean ± SD**
4	8(8.0)	
5	23(23.0)	
6	41(41.0)	
7	18(18.0)	5.99 ± 1.06
8	10(10.0)	

Table no.4 shows the diet diversity scores which denote that about 41% of children were consuming almost 6 food groups and only 10% children were consuming all 8 food groups. The mean of diet diversity score showed 5.99 ± 1.06 which was considered to be poor.

Table no 5 Daily micronutrient intake for 4-6 years		
Daily Micronutrient intake A	±	RD
Iron - 6.7 mg/d	6.30mg/d	13mg/d
Folic acid + 27 µg/d	127µg/d	100µg/d
B12 + 0.1µg/d	1.1µg/d	Upto 1µg/d
Zinc - 3.6 m/d	3.4mg/d	7mg/d

(RDA- Recommended Dietary Allowances for Indians suggested by ICMR- 2010)

Table no.5 illustrates daily micronutrient intake for 4-6 years, the amount of iron consumed by children through various iron rich foods was 6.30mg/d, however the RDA indicated 13mg which was double which shows the amount of iron consumption by the children was deficient(6.7 mg/d). The amount of folic acid consumed by the children (127 µg/d) was more than the RDA(100 µg/d hence it can be stated that the folic acid intake was adequate(27 µg/d). The amount of B12 consumed by the children (1.1µg/d) was more than the RDA (1µg/d adequate) which is very positive result. The reason for better consumption of sources of B12 was more consumption of non-vegetarian products as majority of the people in Goa are non-vegetarians. The amount of zinc by the children (3.4 mg/d), however the RDA indicated 7mg/d which is almost double the intake

which shows that the intake of zinc was deficient in these children.

Variable	Table no 6. Mean ±SD across IQ Score category		t value	p value
	(IQ Score 80-99)	(IQ Score100-120)		
Height(cm)	104.58± 7.91	107.57±5.77	-2.16	.033*
MUAC (cm)	15.99± 1.37	16.90±1.97	-2.44	.016*
Soybean(g)	1.08±.28	1.28±.54	-2.019	.046*
Mackerel(g)	2.89±1.22	3.36±1.17	2.24	.027*

(*p value≤0.05 is considered to be significant)

Table no.6 indicates the difference of means of Height, MUAC and foods (Soybean and Mackerel) with IQ scores were higher in moderate to above average category, which shows that increase in anthropometric measurement and consumption of soybean and fish can increase IQ.

Disscussion

Various studies across the globe have reported on assessment of nutritional status and IQ of children with learning disabilities. [12] The present study has focused only on normal children from the fishermen community and taken into consideration how nutritional status and fish consumption can affect their IQ status. The results of the present study shows that IQ of the children was positively correlated to the height and MUAC of the children which was comparable to many such studies which have indicated that stunted children had low IQ and low nutritional status.[13] In the present study it was seen that girls belonging to the fishermen community have a better IQ score than boys unlike other studies which showed that males have a faster reaction time than female in IQ tests.[14] The socio demographic data also had been linked with IQ as studies were in accordance with the present study which stated that fathers had a higher level of education than mother thus the IQ score of child was more ,also as the level of education in both the parents increases the IQ of the child improves.[15] However some studies also report that the IQ of a child can be dependent on hereditary.[16] Looking at the dietary pattern it was seen that the iron intake was less than the RDA in most of the children. Studies show that there is a significant decrease in the IQ of children and they have a low scholastic performance due to deficiency of iron.[17] The folate intake of these children was more than the RDA. Similar results have been seen in other studies which indicate that higher folic acid intake can lead to subsequent increase in IQ level and cognitive performance. [18] The B12 intake was adequate due to large consumption of non-vegetarian items. The literature shows that B12 has a major role in cognitive development of the child and deficiency of this nutrient can lead to failure to thrive and poor intellectual outcome. [19] The zinc intake was almost half of the RDA which coincides with a study which suggests zinc a trace element often called as intelligence mineral can cause developmental and intellectual delay due to its deficiency and can have an negative effect on IQ.[20] Statistical mean differences was found between IQ ,with height and MUAC. A study observed that mean scores of IQ were higher in well-nourished children which shows that improved nutritional status has a direct and positive impact on IQ levels.[21]It was found that consumption of foods such as soybean and a particular fish mackerel can increase IQ levels. Studies show that fish consumption by children once a week can lead to an increase average of 4.8 scores and is also termed as a brain food. [22] However no statistical association was found between breastfeeding and IQ of the child. Studies indicate that early breastfeeding has a positive impact on the IQ of the child influenced by mother's knowledge, attitude and practices which has been reported to be poor in few studies.[23-24]In the present study however majority the mothers were educated upto ninth standard and hence probably poor initiation of early breastfeeding thereby showing no association with IQ.

Conclusion

The study showed that most of the children of fishermen community belonged to moderate IQ category. Nutritional status in terms of better height, MUAC, mackerel consumption can affect IQ. The limitation of study was that the draw-a-man test does not give a complete picture of the mental IQ of the child. Nutritional education and evaluation of family welfare programs to enhance nutritional status and intelligence in children should be implemented to prevent the intellectual deficit from a young age for better future of the country.

Acknowledgement: The authors thank Dr. Namita Joshi, Clinical Psychologist for analyzing the IQ scores of the participants and to the participants from the fishermen community of Goa. .

A Review of the Nutritional Quality of School Canteen Foods in South Asia

Purva Sharma[1], Surabhi Singh Yadav[2], Kavitha Menon[3]

[1]Master Student, [2]PhD Scholar, [3]Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Lavale, Pune, Maharashtra

Abstract

In Schools, canteens play a crucial role in ensuring nutritional well-being of adolescents. Regular consumption of unhealthy food items purchased from the school canteens may add to the existing burden of malnutrition in children, especially adolescents. A narrative review was conducted to comprehensively summarize the nutritional quality of food products served in South Asian school canteens. Three electronic scientific databases were searched for articles and selected articles were analyzed. Literature review indicated the absence of school food policy/ guidelines, unhygienic school canteens, high availability and accessibility of unhealthy foods in school canteens and lack of awareness regarding healthy school food environment among parents, teachers, students, and principals. Further, well-designed studies to assess the nutritional quality of foods served in school canteens using appropriate indices are required.

Keywords: *School canteen, Nutrition quality, South Asia, Adolescence, Food policy*

Introduction

Schools act as primary settings to promote healthy diet and physical activity habits in adolescents. The World Health Organization (WHO) identified schools as in crucial access point to promote good nutrition environment among adolescents. In order to improve health and nutrition of the School children the WHO formulated Nutrition-Friendly Schools Initiative (NFSI). The objective of NFSI was to provide a framework for school-based programmes to address the double burden of nutrition-related ill-health and serve as a mechanism for inter-connecting on-going school-based programmes. NFSI has a strong focus on developing supportive school environment which promotes nutritional well-being and physical activity. Importantly, School canteens play a crucial role in ensuring nutritional well-being of adolescents.

School canteens provide a variety of food products and contribute to the health and nutritional status of children. Often parents provide money to buy foods or snacks from the school canteens. In recent years, the School canteens are gaining popularity especially among adolescents who prefer foods outside over homemade foods. Evidence indicates a preponderance of fried foods, unhealthy snacks, finger foods, soft drinks, fast and junk foods in South Asian School canteen menus. These food items are usually deep fried and are rich in fat, salt, and sugar (HFSS). Antony et al.,physical and economic consequences of childhood obesity. The aim of the study was to assess the prevalence of junk food consumption and knowledge of adolescents regarding its ill effects and also factors contributing towards this public health concern 1. Methods: 208 students from four English medium schools in Pune District of Maharashtra (India stated an increase in consumption of junk foods by children, 23.52% children purchased junk foods for themselves as they were easily available in School canteens[1]. Regular consumption of junk, fast and fried foods leads to overweight and obesity, dyslipidemia and hypertension that increases risk for earlier onset of chronic diseases[1].

Considering the larger implications of unhealthy eating practices and poor food hygiene in School canteens, and the wide promotion of NFSI globally, it was important to understand the existing South Asian scenario to further enunciate policy frameworks. The present narrative review aimed to summarize South Asian studies that investigated the nutritional quality of the School canteen foods, implementation of food or

nutrition policies/ guidelines in Schools, and information of food hygiene and sanitation of the School canteens.

Materials and Method

A narrative review was conducted to comprehensively summarize the nutritional quality of food products served in South Asian school canteens. Three electronic scientific databases, namely PubMed, ScienceDirect and Google Scholar were searched for articles published in English language between the timeframe of 1st January 2009 - 30th April 2019.

The key words used were "School canteen", AND "Nutrition quality and India", "School canteen", "Nutrition quality", "South Asia" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "South Asia" AND Adolescents", "School canteen", "Nutrition quality of Food Products", "Afghanistan" AND Adolescents", "School canteen", "Nutrition quality of Food Products", "Bangladesh" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "Nepal" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "Bhutan" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "Maldives" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "Pakistan" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "Sri Lanka" AND "Adolescents", "School canteen", "Nutrition quality of Food Products", "India" AND "Adolescents", and "Nutrition", "School canteen menu", "Nutritional quality of food products", "Adolescents", AND "South Asia".

Inclusion and exclusion criteria

Inclusion criteria included studies that investigated nutritional quality of foods served in the school canteens from South Asia on the adolescent age groups.

Data extraction

The data extracted from full-text articles were entered into EXCEL data extraction forms. Information extracted included first author, publication year and country, population, study design, sample size, information on diet quality of foods served in School canteens and parents' perception of the canteen foods. The extracted data was analyzed.

Findings

Selection of the articles for the review

The search using individual and a combination of technical terms and key words of three databases was conducted. Initial search yielded 7054 citations from the three databases. After removing duplicates (1529), 5525 studies were considered for title and abstract screening. Subsequently, these articles were screened based on the inclusion-exclusion criteria, which yielded 12 studies. The full-text of the 12 articles were retrieved and checked for eligibility by two independent reviewers, two not relevant articles were excluded. Finally, ten articles were included in the review (Fig. 1).

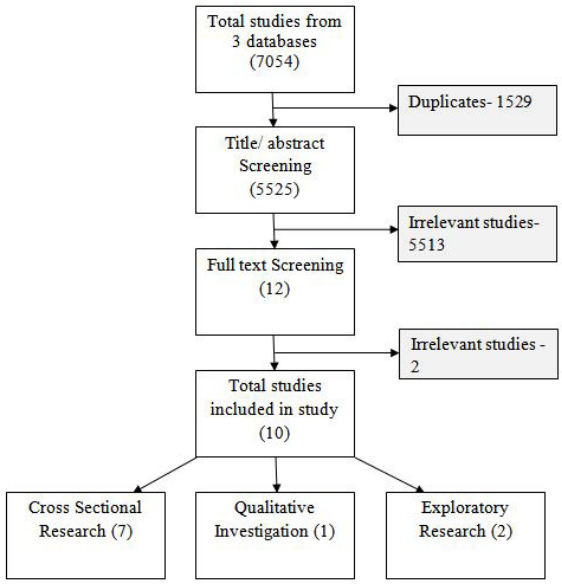

Figure 1: Process of selection of studies for the review.

Characteristics of the selected studies

There were six studies from India, two from Pakistan, one each from Bhutan and Maldives (Table 1). Out of 10 studies 9 were school canteen-based, 4 discussed regarding School food/nutrition policy, 3 discussed about hygiene and sanitation practices, and all studies discussed regarding the quality of foods in the school canteens.

The nutritional quality of School canteen foods in South Asia

Researchers collected information from the School students on the nutritional quality of foods served in the canteen using questionnaires and interviews (n=5) (Table 2). Out of five, four studies reported the sale of unhealthy foods (i.e. fried snacks, foods rich in sugar,

trans fats, fast foods and junk foods, foods containing FDA prohibited colours and carbonated soft drinks) over the School canteen[6-9]. Additionally, two studies reported limited availability of healthy foods for consumption in School canteens[2,3]. The Bhutan study reported that 66.9% of adolescents consumed food products with FDA prohibited artificial colours, of which 43.2% of these food products were consumed from school canteens[8]. Indian adolescents reported the availability of wide variety of unhealthy foods (42.4%-90.4%), lack of healthy foods, inadequate knowledge of teachers about healthy diet, and absence of any written food policies as barriers of nutrition promotion in schools[4].

Another Indian study reported sale of pre-cooked and pre-packed snacks rich in trans fats and sugars in the School canteens[6]. Together with these snacks, adolescents eating lunch at school canteen spent more money on carbonated beverages[6]. Goyal et al found that risk of overweight and obesity was high in adolescents consuming carbonated drink daily and more than three times per week[9]. Conversely, a Pakistan study stated that 28.6% students who consumed meals from Federal Government School canteens appeared healthier than who did not. This could be attributed to the fact that children were served healthy breakfast and lunch under government supported scheme in these Schools[10].

Rathi et al. reported unhygienic food sanitation and hygiene practices in School canteens and stated that only a few adolescents were satisfied with freshness of food products (10.3%), nutritional content of food items(3.6%) and availability of fresh fruits(5.5%)[2,3,4].

Parents' and teachers' perceptions of the nutritional quality of School canteen foods

The selected studies reported parents', teachers', and principals' perceptions regarding the nutritional quality of School canteen foods(n=4; 3 Indian and 1 Maldives). Studies used perceptions of participants on the quality of foods served in school canteens through questionnaires. Parents and teachers of private schools in Kolkata, India(59.9%) stated availability of unhealthy foods and 53.8% agreed that there was limited availability of healthy foods[2]. Additionally, 81.7% parents and teachers reported adolescents preferring unhealthy food as a barrier to improve school food environment[3]. Conversely, the study from Maldives that involved 28 Schools reported unavailability of School canteens in 20 Schools(71.4%). Six Schools(21.4%) provided only healthy foods and two Schools(7.1%) provided a combination of healthy and unhealthy foods[11].

South Asian countries neither have implemented any school food/nutrition policy nor adopted the WHO NFSI. Studies (n=4) that discussed regarding the School food policy, only a few Schools in Maldives(10.3%) reported to have updated school health programme. In Indian studies 39% parents and teachers claimed that their schools had a written food policy, and 61.9% perceived the lack of government school policy as a barrier in promoting school nutrition environment[2,3]. The WHO's NFSI can be used as a reference framework to build a policy[5].Food Safety and Standards Authority of India has draft guidelines for making wholesome and nutritious foods to school children, which could be adopted by Indian schools to ensure basic nutrition and hygiene practices[12].

Food quality analysis of the School canteen foods

Food sample-based study carried out in Karachi investigated the use of synthetic colors in food samples collected from School canteens and vendors nearby. They found that out of 841 food samples 11% branded food items, 44% unbranded food items, 4% branded beverages, 30% unbranded beverages were unfit for human consumption[13]. Studies from Bhutan and Pakistan indicated the presence of synthetic colours in a majority of food samples from School canteens, which could potentially have health implications in children[8,10].

Branded- 431; Unbranded- 410	Food samples collected from school canteen and outside vending carts	Food items (branded: 11%; unbranded: 44%)and Beverages (branded: 4%; unbranded: 30%) unfit for human consumption due to no quality control hightoxic levels of quantity of colors and additives * Branded: having labels and trade names ** Unbranded: no labels either packed or unpacked by vendors.

Conclusion

There are limited number of studies in South Asia that evaluated the nutrition quality of foods served in school canteens using specific indices such as HFSS or other. Lack of awareness about nutrition was seen among teachers, parents, adolescents, and principals. Hygiene and sanitation were often ignored. Literature indicated the absence of food or nutrition guidelines in the South Asian schools. Additionally, adopting the WHO NFSI would enhance the nutritional status of School children in South Asian countries.

A Study to Assess the Social Functioning Level of Alcohol Dependents in Selected Rehabilitation Centre

Roma Sunil Shinde[1], Sheela Upendra[2]

[1]Tutor, Assoc. [2] Professor,Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra

Abstract

Introduction : The pattern of cognitive deficits and their time-dependent recovery were investigated in a cohort of 50 male alcohol-dependent patients using a repeated measurement design with 50 healthy male controls matched for age, education, and marital status. Duration of dependency and length of abstinence prior to testing had no essential effects on neuropsychological functions. Our results provide evidence for the well-established fact that chronic alcoholism has detrimental effects on cognitive performance, but that performance improves with neuropsychological recovery which occurs rapidly within weeks when abstinence is maintained. Cognitive deficits seem to be similar across different studies and cultures. **Method:** Quantitative non – experimental approach was adopted in the study. The sample of study was 50 males conducted at the in-patient treatment unit for alcohol-dependent patients at the Rehabilitation centre Tool was developed in two Sections: Section I: Demographic Performa of the sample ; included age, education, occupation , Religion, marital status and Income. Section II: the modified Paul Clifford and Isobel Morris social functioning questionnaire. To find the association of social functioning score of alcohol dependents and selected demographic variables. **Result:** Majority of (44%) of adolescence age between 18 to 35 are more prone for alcohol-dependent social functioning score is very low (0-28) is 4% the low social functioning level of (29-46) is 62% .Therefore the null H_0 hypotheses is rejected and H_1 is accepted. This shows the social functioning of alcohol – dependence patients in rehabilitation centre. **Discussion:** The present study findings significantly reveals that there was improvement in social functioning of the group aged from(18-35) and similarly study promotes the low social functioning of alcohol dependants.

Key words: *Social functioning level; Alcohol Dependence; Rehabilitation centre*

Introduction

Neuropsychological impairment in alcoholics is found across different cultures. have shown deficits in cognitive flexibility, problem solving, verbal and non-verbal abstraction, visuo-motor co-ordination, learning, conditioning, and memory Studies in the US support [1] Substance dependence affects large number of people, They may use alcohol drugs to cope up with certain (or, in some cases, most of) their problem are with their problems. Through repeated experience of apparent short term benefits of drinking and drug use, they may be become a preferred way of coping, especially in the absence of coping skills. [2] This guideline is concerned with the identification, assessment and management of alcohol dependence and harmful alcohol use in people aged 10 years and older. In 2008, alcoholic beverages were consumed by 87% of the population in England, which is equivalent to 36 million people (adults aged 16 years or over). Drinking alcohol is widely socially accepted and associated with relaxation and pleasure, and some people drink alcohol without experiencing harmful effects. The physical harm related to alcohol is a consequence of its toxic and dependence-producing properties. Ethanol (or ethyl alcohol) in alcoholic beverages is produced by the fermentation of sugar by yeast. It is a small molecule that is rapidly absorbed in the gut and is distributed to, and has effects in, every

part of the body. Most organs in the body can be affected by the toxic effects of alcohol, resulting in more than 60 different diseases. [3]

Statement of the problem"A Study to Assess the Social Functioning Level of Alcohol Dependents in Selected Rehabilitation centre"

Objectives:

To assess the social functioning levels of alcohol dependents.

To find the association of social functioning score of alcohol dependents and selected demographic variables.

Hypothesis:H_0- There is no significant associations of social functioning score of alcohol dependents and selected demographic variables

H_{1-} There is significant associations of social functioning score of alcohol dependents and selected demographic variables

Methodology

Quantitative non – experimental approach was adopted in the study. Descriptive research design was adopted for the study. The sample size was 50 alcohol dependents from rehabilitation centre. Non probability purposive sampling technique was used. Tool was developed in two Sections: Section I: Demographic Performa of the sample ; included age, education, occupation , Religion, marital status and Income. Section II: the modified Paul Clifford and Isobel Morris social functioning questionnaire. Tool validity was done by experts

The permission to conduct the study was taken from the administration department of rehabilitation centre. After taking the consent from the subjects, the investigator has administered the tool to each respondents.

Findings: Based on the objectives and the hypothesis the data was analysed using both descriptive and inferential statistics.

Section I: Description of demographic variables in terms of frequency and percentage

N=50

Demographic variable		**Frequency(n)**	**Percentage (%)**
Age (Years)	18-35 years	22	44
	36-50 years	10	20
	51 years and above	18	36
Education	12th Std	11	22
	Graduate	26	52
	Post graduate and above	13	26
	Illiterate	Nil	Nil
Occupation	Govt service	02	04
	Private service	40	80
	No job	08	16
	Others (specify)	Nil	Nil
Religion	Hindu	38	76
	Christian	09	18
	Muslim	03	6
	Others (specify)	Nil	Nil

Cont... **Section I: Description of demographic variables in terms of frequency and percentage**

Marital status	Married	36	72
	Unmarried	12	24
	Divorced	02	04
Income (Per month in Rs)	Upto Rs 10,000	13	30.9
	Rs 10,001- Rs 25,000	20	47.7
	Rs 10,001- Rs 30,000	04	9.5
	Rs 30,001 and above	05	11.9

Table No 1: Description of demographic variables in terms of frequency and percentage

Section II: An analysis of data related to the social functioning score among alcohol dependents N=50

Social functioning score	**Frequency(n)**	**Percentage (%)**
Very Low (0-28)	02	4%
Low (29-56)	31	62%
High (57- 84)	15	30%
Very High (85- 112)	02	4%

Table No 2: shows the data related to the social functioning score among alcohol dependents

Majority of 62% of the alcohol dependents had low social functioning skill score (29-56), 30% of them had High social functioning score (57-84) , 4 % of them had Very Low social functioning score (0-28) and 4 % Very High social functioning score(85- 112)

Section III: Analysis of data related to association of social functioning score and selected demographic variables N=50

Demographic variable	**p value**
Age (Years)	0.325
Education	0.065
Occupation	0.23
Religion	0.16
Marital status	0.35
Income	0.43

Table No 3: shows the data related to association of social functioning score and selected demographic variables

Education status is significantly associated with social functioning score of respondents. Since the p value is less than 0.05 ($p<0.05$) hence null hypothesis $H_{0\ is}$ rejected and H_1 is accepted. No other demographic variables are significantly associated with social functioning level

Discussion

Study findings shows the social functioning levels of alcohol dependents are low and below average.

Similar findings shows the relations between social functioning and severity of alcohol dependence of 40 male patients from Dependence Treatment Ward in Bydgoszcz were studied and done by Ziolkowski M and Rybakowski. The demographic and social data of patients from both groups did not differ significantly. Social functioning was evaluated by use the Scale of Social Roles taking into consideration the set of basic roles which consists role of guardian, family support, educator, superior, subordinate, member of social group,

patient, and the role of child. Results proved that subjects more dependent on alcohol are significantly less active in the role of family support educator, subordinate, and they hold significantly less dispositions to the role of educator and superior

Similar findings been found by the study of Wormichon Ngasainao and Sheela Upendra , revealed that post test, results show that (0%) of alcoholic dependents have very low social functioning score (0-28), (0%) alcoholic dependents have low social functioning score (29-56), 12% of alcoholic dependents have high social functioning score (57-84), 88% of alcoholic dependents have very high social functioning score (85-112). It is concluded that didactic therapy was effective on social functioning of alcohol dependents.[5]

Conclusion

Study findings shows the social functioning levels of alcohol dependents are low and below average. It is also been found that education status of alcohol dependents is significantly associated with social functioning level of respondents.

Conflict of Interest: Nil

Source of Funding: Self-funded

Ethical Clearance: Study was approved at Institute Ethical Committee. Study was started after obtaining permission from rehabilitation centre Authority. Informed consent from each subjects been taken.

Perspectives of Service Users While Choosing a Clinical Laboratory for Testing

Sanjivani Maral[1], Suvarna Joshi[2], Ashish Banerji[3], Snehal Kale[4]

[1]Assistant Professor, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed University), Pune, [2]Associate Professor, Dept. of Microbiology, BJGMC Pune, [3]Associate Professor, [4]Medical Technology, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed University), Pune

Abstract

Background: Critical role of laboratory tests in diagnosis, prognosis and treatment, demands that client receives a quality report. The clients lack knowledge about reliability of the reports and role of accreditation in quality measures. **Objective:** To study perception of users regarding services availed at clinical laboratory. **Method:** Data were collected from 537 users through pretested structured interviews. The interview schedule elicited information on socio-demographic characteristics, factors influencing the choice of laboratory, quality of laboratory services, awareness about accreditation and its impact on laboratory services. Perception of the users were recorded using 5-point Likert scale. **Result:** The factors that influenced the decision of the users included treating physician's referral (52.7%), proximity of the laboratory (39.1%), good quality services (35.0%) and quality of the report (32.0%). Convenient timings, provision of home services (10.8%) and internet review (7.3%) were less important factors. Cost and turnaround-time are not the major concerns in decision-making. Over 75% of the users rated the laboratories as good to excellent on the parameters; quality of report, services provided at laboratories, staff behaviour, time required and overall impression about laboratory. Around 31% of the users were aware about accreditation. Majority (90%) of patients feels that accreditation should be mandatory. They believed that accreditation will increase reliability of the report (77.6%). 27% and 17.1% of the users feel that accreditation will decrease the cost of testing and turnaround time, respectively. **Conclusion:** Decision of the users regarding selection of laboratory is influenced by the advice of the treating physician. The present survey highlighted ignorance regarding accreditation among the laboratory users. Efforts shall be taken to generate demand among general population for accurate and precise diagnostic report.

Key Words: *Clinical laboratory, Quality Service, satisfaction, accreditation*

Introduction

Diagnostic services play significant role in evidence based decision making regarding diagnosis and management of disease. Quality in laboratory medicine guarantees that values are correct and assures valid medical decision making and effective patient care. Reports from the developed countries indicated that diagnostic services play an important role in clinical practice, as they influence 60 to 70 % of clinical decision-making.[1] Similarly, in the developing country like India, the referrals for laboratory investigations from doctors and hospitals are increasing over time.

The focus of healthcare is shifting from curative to preventive to promotive approach, which will eventually lead to growth in the utilisation of laboratory services. This growth can be attributed to increased healthcare awareness and preventive health check-ups.[2] Simultaneously, the diagnostic industry is also experiencing revolution. They are trying to provide more customer-centric services. They are exploring various options to engage and render the service such as Hub and smoke model to provide easy access to collection centres, booking for laboratory tests from home, digitizing records, improved turnaround time. However, there is a need to look at influence of these

efforts on selection process of the laboratory by the users.

With the changing scenario of service delivery system of diagnostic laboratories, it is imperative to maintain the quality of the reports. National Accreditation Board for Testing and Calibration Laboratories (NABL) has brought clinical laboratory accreditation as a benchmark of quality and accreditation is considered as a hallmark making these laboratories comparable with international standards. Accreditation is a third party assessment to give formal recognition of competence for laboratory that provides particular testing. In many countries, accreditation is mandatory for the clinical laboratories but in India it is voluntary. In India, proportion of non-accredited laboratories is more compared to accredited laboratories and large chunk of patients are using the services provided at non-accredited laboratories. It will be helpful to assess the perception of these users regarding quality of the reports and awareness about accreditation among them.

Clinical laboratory is a service organization, the patients are customers or stakeholder of the laboratory as the laboratory produces a product for its customers. Therefore, diagnostic testing is viewed as a "commodity" rather than a medical service. Customer service is an integral part of a quality management system. Patients' satisfaction is an indicator to assess quality of the services. Several studied are available at national and international level assessing patient satisfaction with quality of care in a hospital system.[3] These studies have considered laboratory services as part of the health care services. International studies have reported that more than 60% of the patients were satisfied with services provided at the clinical laboratory.[4,5] The quality of the medical service and professionalism of the staff is the main reason for the patients' preferences and satisfaction. Indian study conducted among laboratories attached with hospitals recorded that 67.3% of the patients were satisfied with the services availed at the laboratory mainly due to behaviour of the technicians and privacy and the confidentiality of the reports.[6]

In recent times clinical laboratories are emerging as standalone centres, independent of the hospital set up. Therefore, selecting an appropriate testing centre providing newer testing offerings with reliability is the matter of concern for its user. In general the concept of customer service has often been overlooked in the laboratory practice.[7] Marketing experts are aware that consumers make their decision about utilization of services based on their perception of the service. Users' preference while choosing the laboratory and their satisfaction with services available at clinical laboratories is rarely reported. Community based study is required to understand perception of users of clinical laboratories regarding quality of services provided at these centres.

Laboratory users are important stakeholders of the healthcare delivery system. Through the present research, we are making an effort to understand their perception regarding quality of services provides at clinical laboratories and awareness about accreditation among them. The findings of the research will be helpful to design awareness program among laboratory users and generate demand for good quality clinical laboratories.

Material and Method

A cross sectional survey study was conducted in Pune city, Maharashtra, India. Patients' satisfaction with laboratory service was studied by means of an anonymous inquiry of 586 individuals who had visited clinical laboratory for diagnostic testing at least once in a past year. However, data on 537 respondents who have completed the interview were analysed in this study. Individuals who are working with medical field / pursuing education in medical stream were excluded from the study.

Trained investigators administered pretested structured interview schedule. Data were collected on socio-demographic information like age, gender, educational background, profession, the factors influencing their decision to choose a particular laboratory, quality of clinical laboratory services, awareness about accreditation and its possible impact on laboratory services. A 5-point Likert scale was used to rank quality of services received at laboratory as well as perception of users on effect of accreditation on services given by the laboratories.

Respondents were briefed on the study and written consent was obtained for participation in the study.

Data were analyzed using IBM SPSS 21.0 for Windows (SPSS Inc, Chicago, IL, USA). All the variables were either nominal or ordinal in nature so, data were reported in frequencies and percentages.

Results

The majority (61.8%) of the participants were young (18–29 years), 67 (12.5%) of the participants lie in the age group 30–39 years, 81 (15.1 %) people in the age group 40-49 years, and 57 (10.6 %) were aged 50 or more years (Table 1).

Of the 537 respondents, 293 (54.6 %) were male. Majority of the participants have attended college level education; graduation (61.3 %) and post-graduate (16.8 %). Around 59.4 % of the respondents belong to the working class; they were in either service or self-employed.

Table 1: Characteristics of the participants

Characteristics		Frequency	Percentage
Age (yrs)	18–29	332	61.8
	30–39	67	12.5
	40–49	81	15.1
	50+	57	10.6
Gender	Female	244	45.4
	Male	293	54.6
Education	<10th grade	39	7.3
	Grade 10–12/ diploma	79	14.7
	Graduate	329	61.3
	Post graduate	90	16.8
Marital status	Unmarried	296	55.1
	Married	241	44.9
Occupation	Service	224	41.7
	Self employed	95	17.7
	Retired	13	2.4
	Home maker	113	21.0
	Other	92	17.1

The respondents were asked to rank the factors that they consider while selecting the laboratory. While preparing the figure (Figure 1), data on top three factors reported by each of the respondents were analysed.

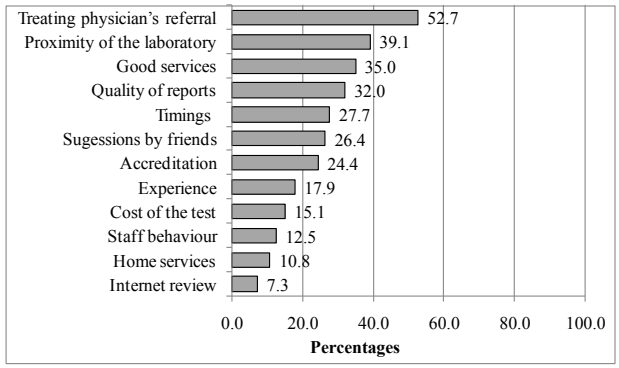

Figure 1: Proportion of the users by factors influencing selection of clinical laboratory

Treating physician's referral was among the top three factors considered by 52.7 % of the respondents. Further, proximity of the laboratory (39.1%),good services provided at the laboratory (35.0%) and quality of the report (32.0 %) were other important factors which influence the selection of the laboratory. Convenient timings, Provision of home services (10.8 %) and internet review (7.3 %) were less important factors (Figure 1).

More than 3/4th participants rate the laboratories as good to excellent on the parameters mainly; quality of report, services provided at laboratories, staff behaviour, time required and overall impression about laboratory. Variation in responses was noticed for cost of the tests; 25.7 % of the respondents feel the cost is average whereas 42.5 % reported that the cost is high (Table 2).

Table 2: Distribution of the users based on rating given to laboratories on various parameters

Sr. no.	Items	Poor	Average	Good	Very good	Excellent
		1	2	3	4	5
1	Quality of report	1.9	2.6	9.5	67.4	18.6
2	Quality of services	0.9	4.1	6.1	68.5	20.3
3	Staff behaviour	1.9	10.2	12.3	54.0	21.6
4	Time taken to give reports	2.2	7.8	13.4	58.3	18.2
5	Impression of laboratory	1.3	3.7	8.4	67.4	19.2
6	Cost of tests	2.8	25.7	29.1	36.7	5.8

Table 3: Users perception regarding effect of accreditation on services availed at the laboratories

Parameters	Decrease significantly				Increase significantly
	1	2	3	4	5
Reliability of the laboratory	2.0	4.6	15.8	52.6	25.0
Cost of the tests	4.6	22.4	27.0	40.1	5.9
Turn around time	3.9	13.2	39.5	34.9	8.6
Services to patients	1.3	2.6	15.8	52.6	27.6

Awareness about accreditation of a laboratory was present in 31% of patients; majority (90%) of patients feels that accreditation should be made mandatory. Patients has perception that accreditation will increase reliability (77.6 %) and services offered (80.0 %) by these laboratories. However, 27 % and 17.1 % patients feel that accreditation will help to decrease the cost of testing and turnaround time, respectively (Table 3).

Discussion

The present study is conducted among clinical laboratory users residing in urban areas of Pune, India. The factors which are considered by the users while selecting the laboratory mainly included referral from treating physician and convenience. Conventionally, diagnostic industry is depending on doctor and hospital referrals. Even in the present study it was observed that most influencing factor in selecting the laboratory is referral from treating physician. Around 52.2% of the users follow the advice of treating physician. This finding differs with the data reported in study conducted in Verna, where 74% of the people choice laboratory on their own and only 20 % of the patients followed doctor's advice.[5] Convenience mainly proximity from the home and suitable timing influences decision of 39.1 % and 27.7 % of the users, respectively.

Most of the users make their decision about utilization of services on the basis of their perception about the delivery of the services. Good delivery of the services and behavior of the staff influences decision of 35.0% and 12.5% of the users, respectively. Around 32.0% of the users make their decision based on their perception about quality of report. Other studies have reported that mouth-to-mouth publicity and personal referral is the most common and influential cause of using a particular health facility.[8] In the present study 26.4% of the users reported that the suggestion from friends and relatives is one of the top three factors which influence their decision.

For correct and early diagnosis quality of the report is more important. Accreditation of a laboratory assures the quality of total testing cycle, increase precision in testing and insures patient safety. The process of NABL accreditation is gaining momentum in recent years. Maximum laboratories are accredited from states of Maharashtra.[9] The study explored awareness about accreditation of a laboratory among users residing in urban areas of Pune city, Maharashtra. The study also examined the influence of accreditation status on selection of laboratory. Quality features such as accreditation status of the laboratory was comparatively less influencing factor as only 24.4% of the users consider accreditation status during selection of the laboratory. Around 31% of users were aware of accreditation of laboratories. However, majority (90.0 %) of the users reported that accreditation of laboratories should be mandatory. More than 75 % of the users believe that accreditation will increase the reliability of the reports as well as services provided by the laboratory. At the same time 46.0 % and 43.5 % of the users think,

that accreditation of laboratories will increase cost of the test and turnaround time, respectively.

Diagnostic tests obviously add up to significant expenditures in treatment of health problem. Accreditation increases the operating cost of the laboratories which might put pressure on their users. The studies have reported that adaptation of quality measures increases the cost per test.[10] However, the results of the present study revealed that cost was not the major influencing factor in selection of the laboratory since only 15.1% of the users considered cost as important factor while selecting clinical laboratory.

Social media and online review is increasing its influence on consumer behavior. Review tracker survey is indicating that large proportion of consumers are likely to check the internet review before visiting any business and they trust these reviews as much as personal recommendation.[11] However, the findings of the present study are contradictory to these data. Only 7.3% of the respondents considered internet reviews among top three factors which influence their selection of the laboratory. For convenience of users, the diagnostic industry has started rendering the services through home visits. Yet, this ease provided by the laboratories could influence only 10.8 % of the users enrolled in the study.

The study recorded evaluation of laboratories done by the users. Users' perceptions about quality of services received at laboratory are recorded on five point Likert scale. More than 75% of the users given very good to excellent rank to the laboratory on the parameters viz. quality of report, quality of services, staff behavior, time of reporting, overall impression of laboratory. The data indicate that the users were satisfied with the services provided by the clinical laboratory. In the present study it is observed that the proportion of the users (75%) who have rated the services as good to excellent is higher for independent laboratories as compare to the hospital attached laboratories.[5,6] Around 67% of the patients reported that the test facility availed at hospital attached laboratory was good.[6]

Conclusion

Decision of the users regarding selection of laboratory is largely influenced by the advice of the treating physician. So their perception about selection of the laboratory is important. Further study can be carried out among clinical practitioners to understand the parameters on which they make their advice and their method of assessment of quality of the report. Users themselves are less keen in selecting the laboratory based on quality measures taken by the laboratory. The present survey highlighted unawareness regarding accreditation of the laboratories. Awareness regarding accreditation need to be increased in the general population. Clinical laboratories can be motivated to provide the information regarding quality measures to their users. So that, they will be sure about the accuracy and precision of the report.

Limitation: The study is limited to the urban population working in non-medical fields. To Similar study can be carried out among people residing in other geographical areas and people working in medical stream.

Time Line Practice of Yoga on the Level of Depression

Sharadha Ramesh

Director Cum Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune

Abstract

Background: Yoga is an ancient practice; it has been associated with cultural, religious and physical activity for more than 2,000 years. Its practitioners have asserted its effect on balancing emotional, physical and spiritual health for decades, but only recently has there been a move to substantiate these claims through research

Purpose: The main purpose of the study is to assess the correlation of time line practice of yoga on the level of depression among middle aged women

Methodology: A quantitative research approach was used with one group pretest and posttest with time series design. Total 125 middle aged women participated in the study. Yoga Technique Shawasana, Artha Halasana, Artha Padmasana, Parvathasana, Pranayama, Dhyana was practiced for 6 weeks and 3 months. The level of depression was assessed by CDRS scale both before the intervention and after the intervention of Yoga practices. The assessment was done twice, one at 6 weeks and then after 3 months of yoga practices. The Setting was Thiruvallur District. Population consist of the middle aged women between the age group of 45 to 60 years

Result and Discussion: One of the majority finding was that the Artha Halasana posture played a significant role in alleviating the depression level at 3 months with $P<0.002$. There is strong association of yoga practices with demographic variables except age which has a significant association with practice score $P<0.01$.

Conclusion: Yoga appears to be a promising intervention for depression; it is cost-effective and easy to implement. It produces many beneficial emotional, psychological effects. These observations may help guide further clinical application of yoga in depression and other mental health disorders, and future research on the processes and mechanisms.

Keywords: *Yoga, Depression, Middle aged women, Artha Halasana,*

Background

Yoga is an ancient practice; it has been associated with cultural, religious and physical activity for more than 2,000 years. Its practitioners have asserted its effect on balancing emotional, physical and spiritual health for decades, but only recently has there been a move to substantiate these claims through research. So far, the result has been definitive, significant evidence of the broad-ranging benefits of yoga, both as a treatment and as a preventive form of medicine and health care. Numerous studies have shown yoga to benefit those with depression.

One study on participants with major depression found that 20 sessions of yoga led to an elevation of mood and reduction of anger and anxiety. [(1)]

Another study on young adults with mild depression found that biweekly yoga classes resulted in improved mood and reduced anxiety and fatigue. There are many mechanisms that may be responsible for yoga's antidepressant effects.[(2)]

Doing yoga causes an increase in the calming neurotransmitter GABA (gamma-aminobutyric acid) that helps ease the symptoms of depression. [(3)]

One study found that practicing yoga 12 minutes a day for eight weeks decreased inflammation, a risk factor for depression. [4]

Preliminary findings support the potential of yoga as a complementary treatment of depressed patients. The purpose of this study is to present further data on the intervention, by correlating the time line practice of yoga on affecting treatment outcome for depression among middle aged women.

Objectives:

1. To assess the pre and posttest level of depression with CDRS scale among yoga group middle aged women

2. To compare the level of yoga practice in 6 weeks and 3 months among the yoga group women.

3. To correlate the level of depression and yoga practice in the 6 weeks and 3 months among the yoga practicing middle aged women.

3. To associate the selected demographic variables with the yoga practice score of 6 weeks and 3 months among the middle aged women.

Material and Method

A quantitative research approach was used with one group pretest and posttest with time series design. Total 125 middle aged women participated in the study. Yoga Technique Shawasana, Artha Halasana, Artha Padmasana, Parvathasana, Pranayama, Dhyana was practiced for 6 weeks and 3 months. The level of depression was assessed CDRS both before the intervention and after the intervention of Yoga practices. The assessment was done twice one at 6 weeks and then after 3 months of yoga practices. The setting was rural area, Thiruvallur District. Population consist of the middle aged women between the age group of 45 to 60 years.

Results

Majority of women were in the age group of 45 to 50 years, Hindus, married and living with spouse, were housewives and hailed from nuclear families though a rural area. Maximum women were having education up to Primary Standard and belongs to low income group.

Table no 1: Frequency and Percentage Distribution in Level of CDRS Scores among women during Pre Test n=125

Level of CDRS Scores	YG (n =125)	
	n	%
No Depression (0)	0	0
Mild Depression (1 – 22)	125	100.0
Severe Depression (23 – 88)	0	0.0

Table no. 1 shows the Frequency and Percentage Distribution in Level of CDRS Scores among YG women during Pre Test which shows all women 125 (100%) were in mild depression as measured by CDRS scale.

Table no 2: Frequency and Percentage Distribution in Level of CDRS Scores among women after 3 months n=125

Level of CDRS Scores	YG (n = 125)	
	n	%
No Depression (0)	0	0
Mild Depression (1 – 22)	125	100.0
Severe Depression (23 – 88)	0	0.0

Table no 2 depicts Frequency and Percentage Distribution in Level of CDRS Scores among YG women after 3 months which concluded that depression level after 3 months was 125 (100%) in mild depression

category.

Table no 3 Frequency and Percentage Distribution of Level of Performance of yoga at 6 weeks and 3 months among Women n=125

Duration of study	Level of Performance					
	Poor Performance (< 50%)		Moderate Performance (50-75%)		Good Performance (>75%)	
	n	%	n	%	n	%
6 weeks	1	0.8	11	8.8	113	90.4
3 months	1	0.8	14	11.2	110	88.0

Table no 3 reveals the level of performance in 2 durations of yoga practice. The data presents only 1(0.8%) at all 2 durations had a poor practice. Majority of the women had good performance at 113 (90.4%), and 110(88%), in 3 months

Table 4: Mean and Standard Deviation of steps in Practice of yoga at 6 weeks and after 3 months among women n=125

Steps of Yoga	Practice score for 6 weeks		Practice score after 3 months	
	Mean	S.D		
Pre performance	7.27	1.17	7.38	1.21
Shawasana	4.75	0.43	4.81	0.42
Artha Halasana	6.60	1.03	6.76	1.09
Artha Padmasana	5.23	0.96	5.25	0.94
Parvathasana	4.50	0.86	4.54	0.84
Pranayama	5.66	0.61	5.62	0.63
Dhyana	8.10	1.18	8.07	1.33
Total	42.12	4.19	42.43	4.58

Table 4 illustrates the Mean and Standard Deviation of steps in Practice of yoga at 6 weeks and after 3 months among women and reveals a slightly higher mean in the total practice at 42.43 and S.D. at 4.58 after 3 months of yoga practice by women

Table 5: Changes in Mean and Standard Deviation with Level of Significance in Practice of yoga scores between 6 weeks to 3 `months in women (n =125) (Paired t- test value) n=125

Steps in Yoga	Changes in Practice Scores 6 weeks to 3 months		Paired t value and P value
	Mean	S.D	
Pre performance	0.11	0.84	t = 1.483, P=0.141 Not Significant
Shawasana	0.056	0.41	t = 1.536, P=0.127 Not Significant
Artha Halasana	0.16	0.57	t = 3.119, P=0.002 Significant
Artha Padmasana	0.016	0.36	t = 0.498, P=0.619 Not Significant
Parvathasana	0.032	0.28	t = 1.268, P=0.207 Not Significant
Pranayama	0.032	0.22	t = 1.644, P=0.103 Not Significant
Dhyana	0.032	0.66	t = 0.543, P=0.588 Not Significant
Total	0.31	1.56	t = 2.240, P=0.027 Significant

Table 5 shows the changes in Mean and Standard Deviation with Level of Significance in Practice of yoga scores between 6 weeks to 3 `months in women (n =125) (Paired t- test value) which reveals that Artha Halasana and total practice score at 3 months show a high level significance with P<0.002*** and P< 0.027*** respectively in paired t test value.

Table 6: Correlation Coefficient between Scores of CDRS with Practice Scores of yoga among women

n=125

CDRS Scores		
	6 weeks	**3 months**
Pre	-0.043	-0.043
r – value	0.632	0.630
P - value		
3 months	-0.172	-0.189*
r – value	0.055	0.035
P - value		

Table 6 shows that there was a significant negative correlation between scores of CDRS and practice score of yoga in 2 durations of practice. The P value showed a high level significance with P<.000***, reflecting as the practice improves the depression scores decreases.

Association with demographic variables with the practice score in 6 weeks shows except age of the women with P<0.01 level all other variables were not significant with practice as outcome measurement.

Association between Practice Score with related study Demographic variables after 3 months among women reveals except age which has a significant association with practice score at P<0.01 all other variables were non-significant.

Conclusion

It is concluded that yoga practices in 2 time durations has played a significant role in lowering and alleviating the dysthymia among middle aged group women. Among the different yogasanas Artha halasana posture contributed significantly in lowering the dysthmia in both time durations.

Effectiveness of Music Therapy on Anxiety among Elderly Residing at Selected Geriatric Homes at Pune City

Sheetal Barde[1], Sheela Upendra[2], Kalpana Sawane[1], Shital Waghmare[1], Seeta Devi[1]

[1]Asst. Professor, [2]Assoc. Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University), Pune, Maharashtra

Abstract

The present study tries to explore the effect of Music Therapy on Anxiety among Elderly residing at selected Geriatric Homes. Anxiety is a normal emotion. All human beings develop it as a means of Protection from danger and threat when we perceive danger. The present study aims to investigate the Effectiveness of music therapy on anxiety among elderly residing at selected geriatric homes at pune city. For this study data was collected randomly from an Old age Home, of pune from 150 Elderly. "Geriatric Anxiety Scale" was used to assess the Anxiety level of Elderly. Initially Anxiety in Elderly was assessed using the scale followed by Interventions to Music Therapy group for 7 days and no interventions to control group and again posttest was taken using the same scale. The result of the present study revealed some significant findings that Music Therapy is effective to relieve anxiety.

Keywords: *Music, Anxiety, Elderly, Geriatric Homes, Therapy, Old Age Home*

Introduction

Anxiety is a normal emotion. All human beings develop it as a means of Protection from danger and threat when we perceive danger. Human body undergoes a number of autonomic physiological changes such as perspiration, restlessness, discomfort, palpitation and tightness in the chest.[1]

Anxiety is defined as a danger signal felt and perceived by the conscious portion of the personality with or without stimulation from external situation.[2]

According to Gross (1969) anxiety reactions carry an unpleasant emotional tone, which may perhaps have survival nature, in predisposing the individual to avoid circumstances, which evoke the reaction.[3]

Psychotherapy is indeed effective. The theoretical bases of the techniques used and the strictness of adherence to those techniques are both not factors. The therapist's strength of belief in the efficacy of the technique is a factor[4].

Too little anxiety or too much anxiety can cause problem. Individuals who feel no anxiety when faced with an important situation may lack alertness and focus. On other hand, individual who experience an abnormal high amount of anxiety often feels overwhelmed, immobilized and unable to accomplish the tasks at hand[5].

It is estimated that about 25% of the population will experience an anxiety disorder at some stage of their life. Women are twice more likely to suffer from an anxiety disorders than men. Unfortunately, only 50% of people receive treatment for their disorder. Anxiety problem often leads to mental disorders. People with anxiety disorders are also at higher risk of being affected by substance abuse. So it needs to be addressed before an anxiety disorder can be effectively treated.[6]

Horne-Thompson A, Grocke D conducted a study on effectiveness of a single music therapy session in reducing anxiety for terminally ill patients. Results demonstrated a significant reduction in anxiety for the experimental group on the anxiety measurement of the ESAS ($p = 0.005$). The study supports the use of music therapy to manage anxiety in terminally ill patients.[7]

The aim of this study is to reduce the anxiety of the elderly persons by the number of the health team members. The mental health nurse should understand the nature of the anxiety among the elderly person and can play an important role in reducing the anxiety of the elderly persons by practicing Music therapy and to find out if it is effective in reducing anxiety.

Materials and Method

Objectives:

1. To assess the baseline level of anxiety among elderly persons in experimental and control group.
2. To determine the anxiety level in elderly persons after the interventions in experimental and control group.
3. To compare the difference in anxiety between experimental and control group.

Hypothesis:

1. H_0: There will be no significant effect of Music Therapy on Anxiety in Elderly.
2. H_1: There will be significant effect of Music Therapy on Anxiety in Elderly.

Sample:

A Sample of 150 Elderly people from Janseva foundation's Old Age Home, Pune, Maharashtra were chosen through simple random sampling method.

Research Design:

The design which is used to intellectualize the study and analyses the data is Experimental design in which scores of the subjects before and after intervention are compared using t-test.

Tool Used:

For this study data was collected randomly from Janseva Foundation's Old Age Home, Pune on 150 elderly through Geriatric Anxiety Scale (GAS).

Results

Section I:

Baseline proforma would be analyzed using frequency and percentage.

N= 150

Distribution of samples according to their gender shows that the majority of participants 52.67 % were Male and 47.33% were Female.

Distribution of samples according to their professional Qualification depicts that 56.67 % were High School educated, 27.33 % were Graduates, 3.33 % were Post Graduate, and 12.67 % were from other category like done certificate courses or ITI.

Distribution of samples according to type of Family depicts that 42% of participants belongs to Nuclear family, 40.67% belongs to Joint family, 8.67% belongs to extended family and 8.67% belongs to other types like single no other person in family.

Distribution of samples according to duration of stay in Old age home depicts 46% of participants are here from less then 5 Years and 54% of them are from more than 5 Years.

Distribution of samples according to Medical illness depicts 29.33% of participants suffer from Diabetes Mellitus, 32.67% of them have Hypertension, 5.33% of them are only diagnosed with anxiety and 32.67% of them have other illnesses like Factures, Joint pain and vision problem etc. Distribution of samples according to working status depicts 100% of the participants are not working anywhere.

Distribution of samples according to their source of financial assistance shows that 17.33% of the participants gets pension, 13.33% of them are self-dependent, 58% are supported by family and 11.33% are staying free of cost.

Section II:

Data on baseline Anxiety level was planned to analyze in terms of mean, mean percentage and standard deviation.

Table 1: Descriptive statistics of Baseline Anxiety in the Study Groups

Group	Mean	SD	SE Mean
Experimental group	11.940	4.740	0.670
Control group	13.620	3.050	0.431

It shows that before the intervention in control group the mean average of anxiety is 13.62 where as 11.94 in experimental group. The standard deviation for the control and experimental groups are 3.050, 4.740 respectively.

Section III:

Data on Anxiety level after intervention was planned to analyze in terms of mean, mean percentage and standard deviation.

Table 2: Descriptive statistics of Anxiety after intervention in the Study Groups

Group	Mean	SD	SE Mean
Experimental group	4.220	2.566	0.363
Control group	13.800	2.740	0.388

It shows that after the intervention in control group the mean average of anxiety is 13.800 where as 4.220 in experimental group. The standard deviation for the control, and experimental groups are 2.740, 2.566 respectively.

Section IV:

Data on comparing the difference in anxiety between experimental and control group was planned to analyze in terms of mean, mean percentage and standard deviation.

As the mean anxiety of groups is not same we consider difference in anxieties of control and experimental groups. Now,

μ_1: Mean of difference in pre anxiety score and post anxiety score of control group.

μ_2: Mean of difference in pre anxiety score and post anxiety score of experimental group.

Table 3 Comparison of Anxiety in the Study Groups after intervention

H0	H1	T-value	P-value	df	Conclusion
$\mu1 = \mu2$	$\mu1 > \mu2$	2.35	0.011	98	Reject H0 at 5% level of significance

Conclusion

Anxiety is an unpleasant emotional state, which mainly has two components, the physiological component and the psychological component. Elderly is a crucial period where they can be more vulnerable to develop physical and psychological trauma. They are said to be suffering from chronic diseases due to physical, psychological and emotional problems and how the nervous system inter communicate anxiety has been shown to alter susceptibility to various mental disorders. Therapeutic use of relaxation and Music Therapy responds positively in anxiety related disorders.

A Comparative Electromyographical Investigation of Latissimus Dorsi and Biceps Brachii Using Various Hand Positions in Pull Ups

Shiny Raizada[1], Amritashish Bagchi[1]

[1]*Assistant Professor, Symbiosis School of Sports Sciences, Symbiosis International University, Pune, Maharashtra, India*

Abstract

Introduction: Pull-ups is one of the most popular and traditional exercises that involves one's body weight which acts as a resistance against gravity. The exercise focuses mainly on upper back muscles (Latissimus Dorsi, Rhomboid), Posterior Deltoid and Biceps Brachii.

Objective: This study aimed at investigating the effects of different hand positions (grips) on the electromyographic (EMG) activity of Latissimus Dorsi (LD) and Biceps Brachii (BB) muscles during pull-ups.

Novelty: To the best of our knowledge none of the studies has analyzed the muscle activation of Latissimus Dorsi (LD) and Biceps Brachii (BB) muscles with the selected exercises.

Materials and Method: Ten healthy men performed 1 repetition of six different grip pull-ups. The maximum voluntary contraction (MVC) was recorded with the help of biograph infinity software (EMG). Surface ElectroMyoGraphy (SEMG) was used for measuring muscle electrical activity that occurs during muscle contraction.

Results and Discussion: The results of the study shows that, in case of muscles activation in Biceps Brachii, all the exercises reveal significant differences with the Supine Narrow Grip pull-ups (SNG). Similarly, Prone Narrow Grip pull-ups showed a significant difference in Latissimus Dorsi with Prone wide Grip pull-ups and Prone Extreme wide Grip pull-ups, suggesting that other pull ups exercises may be similarly effective in activating Latissimus Dorsi.

Application: It will help the professional trainers and coaches to design training schedule for all level of Athletes which may consist of different variations of pull-ups.

Conclusion: Supine Narrow Grip pull-ups is the best exercise to activate the Biceps Brachii as compared to other pull-ups variations. Similarly, Prone Wide Grip pull-ups found to be a more effective exercise for the activation of upper back muscle - Latissimus Dorsi.

Introduction

There are several standardized tests which are used to measure performance in various sports. Each sport demands different parameters to be tested for achieving excellence. These parameters could be tested

through different types of equipment, depending upon the demands of the Coach, Trainer or Athlete. The reason to use various kinds of exercise equipment for performance measurement is that every equipment and protocol measure different responses in the human body. Most of these equipment are found in human performance laboratory and are related to biomechanical, physiological and psychological parameters. Out of these areas, the physiological responses of the muscles are quite common, especially at the time of rehabilitation. The different physiological responses depend upon the shapes and densities of muscles. In this very respect, the electromyographic measurements gain great importance [1, 2].

Even while performing resistance exercise for strengthening, muscle activity can be measured through EMG. According to Baechle and Earle, "Resistance exercise is a specialized method of conditioning, involving progressive use of resistance to increase one's ability to exert or resist force" [3].

Pull-ups is one of the most popular and traditional exercises that involves one's body weight which acts as a resistance against gravity. The exercise focuses mainly on upper back muscles (Latissimus Dorsi, Rhomboid), Posterior Deltoid and Biceps Brachii. The act of pulling the arms down to the sides from an overhead position does not play a major role in most sports. But, to swimmers swimming freestyle, breaststroke, and butterfly; to hit home run in Baseball; to improve throwing efficiency in cricket; gymnasts performing on the rings, horizontal, parallel, and uneven bars; basketball players pulling down a rebound; and wrestlers executing specific holds and takedowns, this movement of the arm is important [4,5]. These sports contain movements, which rely heavily on the muscles that produce adduction of the shoulder joint [6]. A few studies have been done on the acute effects of lat-pull down exercises by examining the electromyography (EMG) responses of muscle groups responsible for the movement [6,7,8,9,10]. But none of the research has been done to analyse the effect of variations in Pull-ups.

The purpose of the study was to investigate the effect of different hand positions (grips) on the electromyographic (EMG) activity of Latissimus Dorsi (LD) and Biceps Brachii (BB) muscles during the performance of the pull-ups exercise.

Materials and Method

Participants

Healthy (n = 10, age = 20.3 ± .95 years, height = 176.8 ± 1.93 cm, weight = 72.6 ± 2.17 kg) volunteers were recruited as a sample from Lashimibai National Institute of Physical Education (Gwalior, M.P) to be included in the study. Purposive sampling technique was used for the selection of the subjects. Participants were required to have a minimum of 1 year of experience with the selected exercises. Each participant provided informed consent prior to participation in any testing procedure. As part of the selection criteria, the participants were expected to perform six or more proper pull-ups.

Experimental Approach to the Problem

To compare the EMG response between variations of pull-ups, subjects performed 1 repetition of 6 techniques (different grips) of the exercise, with surface electrodes positioned over the 2 muscle bellies (Latissimus Dorsi and Biceps Brachii). A familiarization session was carried out 1 week before testing. During this session, the participant's grip width was determined by measuring the distance between the participant's seventh cervical vertebrae (C7) and the first metacarpophalangeal joint in a flexed position whilst the elbow was fully extended and the shoulder joint was in an abducted position [6]. These anthropometric measurements were used to standardize the grip width between six different pull up exercises with the forearm orientation in a pronated and supinated position on the bar. The six different grips pull up techniques were Supine Narrow Grip (SNG), Supine Shoulder Width Grip (SSWG), Prone Narrow Grip (PNG), Prone Shoulder Width Grip (PSWG), Prone wide Grip (PWG) and Prone Extreme Wide Grip (PEWG). Surface ElectroMyoGraphy (SEMG) was used for measuring muscle electrical activity that occurs during muscle contraction and relaxation cycles. The MyoScan-Pro sensor's active range is from 20 to 500 Hz. It can record SEMG signals of up to 1600 microvolts (μV), RMS. A/D Converter (Encoder; ProComp Infiniti) has 2 channels (C and D) sampling at 256 samples per second.

Data collection

A standardized pull-up bar was used for the purpose of data collection. The participants performed 1 repetition of six exercises one by one. Sufficient recovery

time (5 minutes) was provided to the participants after completing each exercise.

On the testing day, maximum muscle activation was recorded with the help of Biograph infinity version 5.0 (Electromyography Software). After shaving and applying the abrasive cream to the electrodes, the EMG electrodes were placed parallel to the muscle fibre on two locations (i.e. channel C for Latissimus Dorsi and channel D for Biceps Brachii). Raw EMG signals were recorded using a 15-foot optic fibre wire that was directly connected to A/C encoder. 20 megapixels extended video camera was synchronized with the EMG software (Biograph infinity version 5.0), to find out the maximum voluntary contractions (MVCs) of the selected muscles at the time of performing the exercises. Myoscan-pro sensor with triode electrode was used.

Statistics

The descriptive statistics (mean, standard deviation, skewness, kurtosis etc.) histograms, normal probability plots, and Shapiro–Wilk's test was used for testing the assumption of normality and to know the nature of data. All data are presented as mean with standard deviations. A repeated measure analysis of variance (ANOVA) was used to detect the mean differences between each four different freehand exercises. For this purpose Statistical Package for Social Science (SPSS) version, 24.0 was used. The level of significance was set at 0.05.

Results and Discussion

Descriptive Statistics along with a test of normality was used to summarize the basic features of the data set. The skewness and kurtosis values were found to be less than twice the value of their standard error, hence the data for all the variables were symmetrically distributed [11]. Further for testing the normality Shapiro – Wilks test was used. Here from the table – 1 we can see that none of the variables p-value was less than .05, hence the data were normally distributed.

Table 1: Descriptive Statistics and Test of Normality

	Supine Narrow Grip Pull Ups		Supine Shoulder Width Grip Pull Ups		Prone Narrow Grip Pull Ups		Prone Shoulder Width Grip Pull Ups		Prone wide Grip Pull Ups		Prone Extreme Wide Grip Pull Ups

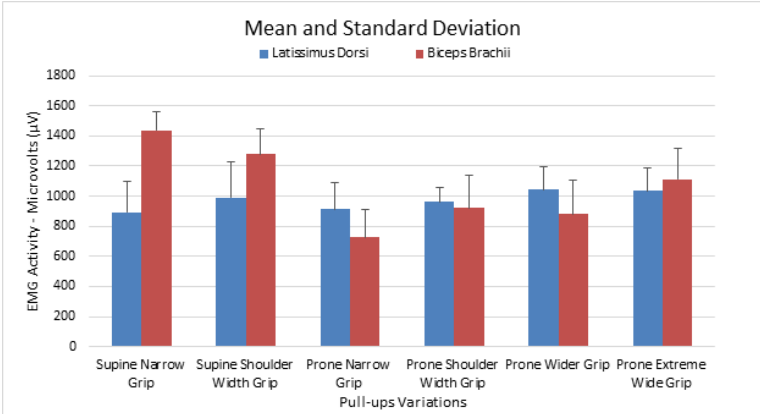

Figure 1: mean value of muscles activation (Latissimus Dorsi and Biceps Brachii) in six different grip pull-ups.

Figure 1 shows that in prone wide grip the muscles activation of Latissimus Dorsi is more than the other five grip variations of pull-ups. In case of supine narrow grip, the EMG response of Latissimus Dorsi muscle is lower than other five grip variations of pull-ups. Similarly, the Biceps Brachii muscle shows higher muscle activation in supine narrow grip and lower muscle activation in case of prone narrow grip.

Various studies have investigated the EMG responses of different pull-ups, Chin-ups, and/or lat pull down exercises [4,6,7,9,10,12,13,14]. However, there is limited data on the EMG responses of pull-ups even though all the six types of pull-ups appear to have similar movement patterns. Subsequently, this study compared the EMG responses between six different grip pull-ups and examined whether the characteristics of muscle activity (Latissimus Dorsi and Biceps Brachi) were dependent on the different grip of pull-ups.

Different handgrip positions change the degree of external/internal rotation abduction/adduction and horizontal abduction/adduction about the glenohumeral joint during the execution of the lat pull-down exercise. This, in turn, affects the relative contributions by the muscles involved in the performance of the pull-down movement [6].

Sphericity assumption has been fulfilled by the researcher. In the case of Biceps Brachii, Mauchly's test of sphericity has been used which is found to be insignificant. Wheres, due to the significant value of Mauchly's test in Latissimus Dorsi, Greenhouse-Geisser correction was applied (epsilon is < .75).

Table 2: A summary of within-group repeated measure analysis of variance of six different exercises with regard to muscles activation in Latissimus Dorsi and Biceps Brachii

Muscles	Groups	Type III Sum of Squares	df	Mean Square	F	Sig.
Latissimus dorsi	Greenhouse-Geisser	189216.985	2.557	73989.389	3.984	.004
	Error	427416.676	23.016	18570.273		
Biceps Brachii	Sphericity Assumed	3539751	5	707950.2	33.135	.000
	Error	961452.1	45	21365.6		

The results of the above table show that both the muscles i.e. Latissimus Dorsi and Biceps Brachii found to be significant in relation to all the six techniques performed. In the above table, the p-value is less than .05. Hence the F-ratio for Latissimus Dorsi and Biceps Brachii is significant at 5% level. In this case, the null hypothesis is rejected; therefore at least one of the means will be different. Since the summary table of ANOVA does not tell us where the difference lies; Bonferroni's post hoc test was used to get the clear picture.

Table 3: Summary of Bonferroni's post hoc test

Pull-ups Variations Supine Narrow Grip		BICEPS BRACHII					
		Supine Shoulder Width Grip	Prone Narrow Grip	Prone Shoulder Width Grip	Prone wide Grip	Prone Extreme Wide Grip	
LATISSIMUS DORSI	Supine Narrow Grip		*	*	*	*	*
	Supine Shoulder Width Grip	ns		*	*	*	ns
	Prone Narrow Grip	ns	ns		*	ns	*
	Prone Shoulder Width Grip	ns	ns	ns		ns	ns
	Prone wide Grip	ns	ns	*	ns		*
	Prone Extreme Wide Grip	ns	ns	*	ns	ns	

* – Significant Difference ns – No Significant Difference

The result of Bonferroni's post hoc test shows that in case of Latissimus Dorsi muscle activation, Prone Wide Grip and Prone Extreme Wide Grip pull ups reveals significant differences with Prone Narrow Grip Pull-ups. Other variations of pull-ups have not shown any significant differences. Whereas, in case of muscles activation in Biceps Brachii, Supine Narrow Grip pull-ups reveals significant difference with all the other variations of pull-ups. There was no significant difference found between Prone Wide Grip with Prone Narrow Grip and Prone Shoulder Width Grip Pull-ups. Similarly, no significant differences were found between Prone Extreme Wide Grip with Supine Shoulder Width Grip and Prone Shoulder Width Grip Pull-ups. Other variations of pull-ups exercises for the activation of Biceps Brachii muscles show significant difference with each other.

Table 4: A summary of Paired t-test

Pull-ups Variations	Muscles Mean	Paired Differences			t	df	Sig. (2-tailed)
		Std. Deviation	Std. Error Mean				
Supine Narrow Grip	Latissimus Dorsi Biceps Brachii	-542.38	269.85	85.33	-6.356	9	.000
Supine Shoulder Width Grip	Latissimus Dorsi Biceps Brachii	-286.63	322.14	101.87	-2.814	9	.020
Prone Narrow Grip	Latissimus Dorsi Biceps Brachii	185.50	273.60	86.52	2.144	9	.061
Prone Shoulder Width Grip	Latissimus Dorsi Biceps Brachii	42.00	238.56	75.44	.557	9	.591
Prone wide Grip	Latissimus Dorsi Biceps Brachii	159.70	338.95	107.19	1.490	9	.170
Prone Extreme Wide Grip	Latissimus Dorsi Biceps Brachii	-76.80	256.35	81.06	-.947	9	.368

For comparing the muscle activation between Latissimus Dorsi and Biceps Brachii in each of the variations of pull-ups, a paired t-test was used. It can be seen from the above table that, when the participants are performing pull-ups with supine grip there is a significant difference in muscle activation between both the muscles. Also, it can be seen that the muscle activation of biceps brachii is significantly greater than the Latissimus Dorsi, which makes Biceps Brachii a primary muscle for both the exercises. In other studies, it was found that the Biceps Brachii and Latissimus Dorsi are the prime movers while performing chin-ups and lat pull down exercises and concluded that the activation of biceps brachii as compared to latissimus dorsi is higher in case of chin-ups[6,7,8,14].

Conclusion

The study compared muscle activity (Latissimus Dorsi and Biceps Brachii) of six different grips pull up exercises. Prone wide grip (PWG) produced the maximum voluntary contraction and maximum muscle activation in Latissimus Dorsi as compared to other five pull-ups. But the significant differences were found only between Prone Wide Grip pull-ups with Prone Narrow Grip pull-ups & Prone Extreme Wide grip pull-ups with Prone Narrow Grip pull-ups, suggesting that other pull up exercises may be similarly effective in activating the primary mover (Latissimus Dorsi). Supine narrow grip pull-ups found to be the best exercise to significantly activate the Biceps Brachii as compared to other pull-ups variations. The results of the study will help the professional trainers and coaches to design training schedule for all levels of Athletes which may consist of variations of the Pull-ups. It may also help the physiotherapist and other medical professionals to prescribe exercises for rehabilitation.

A Protocol for Improving Nursing Performance Towards Placental Examination among Staff Nurses at the Labor Room in Selected Hospitals of Pune City

Shital V Waghmare, Sheela Upendra[2], Seeta Devi A[1], Jasneet Kaur[1], Sheetal Barde[1], S.G Joshi[3]

[1]Assistant Professor, [2]Associate Professor, [3]Professor, Symbiosis College of Nursing, Symbiosis International (Deemed University) Pune, Senapati Bapat Road, Pune

Abstract

Objective: The placenta is derived from both maternal and fetal tissue with approximately one fifth derived from fetal tissue patterm. The placenta should be examined, as it reflects disease in the mother and the fetus. Aim: The aimis to implement protocol for improving nursing performance. Objective: 1) To assess the knowledge regarding the placenta and placental examination .2) To assess the effectiveness of teaching program on protocols to be implemented in labour unit regarding Placental examination. Methods: Design: A quasi experimental design was adopted. Setting: The current study was conducted at the labor unit at selcted hospitals of Pune city. Sample: 42 nurses who were affiliated to labor units.Tools: Two tools were used for data collection; structured interview questionnaire and an observation checklist. Results: There was no significant difference between both groups in general characteristics. The majority of the studied nurses from selcted hospitals of Pune city, respectively, did not attend any training related to placental examination before conducting the study. Mean while, there was asignificant improvement in nurses' performance towards placental examination after implementing the program. Conclusions: The placental examination program was effective inimproving the nurse's performance at labor units. Recommendation: Policy makers should formulate an actional plan of continuing education to help nurses already in the labor force to retainand update their knowledge and clinical skills especially in such topic placental examination and encourage nurses to participate in programs in order to maintain a high level of health care in maternity hospitals.

Keywords: *Protocol, Improving Nursing Performance, Placental examination.*

Introduction

The placenta is a fetal organ consisting of an umbilical cord, membranes, and parenchyma. Maternal or fetal disorders may have a placental sequel since the mother and fetal surface on its site. The placenta is derived from both fetal and maternal tissues with about one-fifth derived from fetal tissue at term. It comprises a large number of functional units called villi which are branched terminals of the fetal circulation, allowing transfer of metabolic products.[1]

The placental examination is an essential component of the autopsy in cases of fetal or neonatal death. This examination additionally aids in adjudicating a number of difficult situations, such as legal issues regarding the presence of acute versus chronic perinatal stresses and insults,and the timing of these insults.It additionally supports the diagnosis of specific etiologies associated with adverse gestation outcomes.[1]

According to World Health Organization (WHO) 2015, maternal mortality is unacceptably high. Ninety-nine percent of all maternal deaths occur in developing countries. Everyday, around 830 women die from preventable causes related to pregnancy & childbirth. As itis well documented, the health care solutions to avoid and/or manage complications include universal access to antenatal care throughout pregnancy, skilled care throughout childbirth, and care and support in the postnatal period. [11]

Materials & Method

A quasi experimental design was adopted. Setting: The current study was conducted at the labor unit at

selected hospitals of Pune city. Sample: 42 nurses who were affiliated to labor units. Tools: Two tools were used for data collection; structured interview questionnaire and an observation checklist.

Findings of the study: The findings of this study are presented in three parts:

Part- I: General characteristics of the study sample

Part-II: Knowledge of the study sample regarding the placenta and placental examination

A highly statistical significant difference ($p \leq .001$); Paired (t_1): Before program and immediately after; Paired (t_2): Before program and after 3 months; Paired (t_3): Before

Part- III: Performance and satisfaction of the study sample regarding placental examination (see Table 1 and Figures 1)

Tables 1: Pretest-posttest Nurses' knowledge regarding the placenta

Items	Pre-test (n = 42)						Post-test (n = 42)						*p*
	Correct		Correct Incomplete		Incorrect		Correct		Correct Incomplete		Incorrect		
	Number	%	Number	%	Number	%	Number	%	Number	%	Number	%	
Define corpus luteum	7	16.7	25	59.5	10	23.8	42	100	0.0	0.0	0.0	0.0	>.05
Time of placental formation	11	26.2	16	38.1	15	35.7	42	100	0.0	0.0	0.0	0.0	<.001
Site of implantation	16	38.1	15	35.7	11	26.2	42	100	0.0	0.0	0.0	0.0	<.001
Site of implantation	16	38.1	11	26.2	15	35.7	42	100	0.0	0.0	0.0	0.0	<.001
Define placental barrier	7	16.7	10	23.8	25	59.5	40	95.2	2	4.8	0.0	0.0	<.001
Characteristics of placenta	8	19	14	33.3	20	47.6	42	100	0.0	0.0	0.0	0.0	<.001
Recent benefits of it	10	23.8	13	31	19	45.2	39	92.9	3	71	0.0	0.0	<.001

*** highly statistically significant

Tables 2 :Illustrates that the studied nurses have a lack of knowledge regarding the placenta in the pretest. Approximately 60% of them can't define the placental barrier, or the placental general characteristics (47.6%) and 45.2% of them can't mention the recent benefits or uses of it. Additionally, illustrates that the studied nurses have a lack of knowledge regarding the placenta in the pretest. Approximately 60% of them can't define the placental barrier, or the placental general characteristics (47.6%) and 45.2% of them can't mention the recent benefits or uses of it. Additionally, 26.2% of them couldn't determine the site of placental implantation. A similar percent, 35.7% couldn't determine the time of placental formation and its functions. While in the post-test they achieved a high level of knowledge regarding all the previously mentioned items.

Discussion

As nurses comprise the greatest group of health care providers and are the ones responsible for the quality of care provided to the patients, their perspectives on the effectiveness of their care are very important, they should possess a wide variety of holistic skills and there is evidence of nursing interventions.[16–18] Additionally, they should collaborate with other different health professionals to determine the effectiveness of therapy

[19] They should also have the basic necessary knowledge and skills to offer the care safely, be trained accurately in practical and technical procedures to be able to use this knowledge effectively[20] As the nursing care is the main critical component of therapy in labor unit, Nurses' Knowledge deficit and poor manipulation of the third stage of labor surely will interfere with their ability to achieve positive prgnancy care outcomes.[21] So, the aim of this study was implement a protocol for improving nursing performance towards placental examination at labor units. The nurse should ensure that the woman is comfortable following the birth and should monitor the blood loss and check the uterus is well contracted. The examination of the placenta and membranes should take place as soon as possible following this in order to ensure that no further actions are required before the woman is discharged or transferred to the ward.[22] According to the results of the current study, more than half of the study sample had a secondary level of nursing education and the majority of them had a low level of knowledge and performance toward placenta and placental examination before participation in the protocol. This is in agreement with the findings of Farag M.[23] who found 3 types of nursing education relating to three types of nurses in Egypt today. The first level is carried out within high schools for nursing education akin to a sort of vocational education that takes place in lieu of high school (referred to as secondary level school in Egypt). The second level is carried out within a technical institute of nursing education (two years of after high school nursing education). The third or highest level is attained via a University college of nursing (students are trained over four years plus a one-year internship within a post-secondary school education or technical institute of nursing).

As mentioned above, the majority of the study nurses had a low level of knowledge toward placental examination prior to implementing the protocol. This result is not congruent with the results of the study conducted by the Royal Hospital for Women[25] who stated that benefits of placental examination include: clarification of the reason for several adverse pregnancy outcomes, improvement in the risk assessment for future pregnancies and ascertainment of newborn risk factors for long-term neurodevelopmental sequelae. Additionally, information on placental abnormalities reveals the presence of chronic fetal insults and allows their differentiation from acute stresses. It is also supported by a study of stillbirths where 12% of causes of intrauterine fetal death (IUFD) were found in the fetus, and 88% of causes were found in the placenta, cord, and membranes.[26]

Conclusion

Based on the results of our present study, it can be concluded that implementing a program of systematic placental examination significantly improved nurses' knowledge and performance at labor units in both hospitals.

Low Doses Ionizing Radiations: A Risk for Cancer and Cardiovascular Diseases

Yogita Dhas[1], Neetu Mishra[2]

[1]Ph.D. Scholar, [2]Associate Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Lavale, Pune, Maharashtra, India

Abstract

Low doses of ionizing radiation (IR) deriving from various sources are a major cause for human's health problem for those who are continuously exposing to it. Recently, radiation has become associated with a much broader spectrum of age-related diseases, including cancer and cardiovascular disease (CVD). Recent studies have examined the risk of cancer and CVD in humans exposed to various sources of IR. These studies indicated the linear dose-response relationship of low doses IR and oxidative stress, resulted in increased risk for cancer and CVD. Previous studies indicated that there is a strong association between prolonged exposure to low doses IR with cancer and CVD.

Keywords: *ionizing radiation, cardiovascular disease, cancer.*

Introduction

Continuous exposure to low doses of ionizing radiation (IR) adversely impacts on human health and increases the probability of incidence of degenerative diseases such as cancers[1] and cardiovascular diseases (CVD)[2]. The various sources of exposure to low doses IR include medical diagnostic, nuclear weapon testing, natural background radiation (radon gas, UV light), space flights and occupational exposure[3]. The prolonged exposure and subsequent absorption of low doses of IR will result in oxidative damage and cellular dysfunction[4,5]. Oxidative damage generates reactive oxygen species (ROS) and reactive nitrogen species (RNS), either endogenously or exogenously. These ROS/RNS can damage lipids[6], proteins[6,7] and nucleic acids[6,8,9], which is implicated with a number of human diseases such as cancer[1], CVD[2], eye cataract[10] and neurodegenerative diseases[11].

Sources of low doses of IR:

Humans are exposed to low doses of IR through various natural and artificial sources. The impact of IR exposure is measured in terms of millisieverts (mSv) which expresses the amount of exposure and its potential health damage. The following are the main sources of IR exposure (table 1).

Table 1: Sources of radiation exposure

Natural sources	Artificial sources
Cosmic radiations	Medical procedures
Radon gas	Nuclear reactions
Terrestrial sources	Use in consumer products

Direct and indirect cellular effects of IR on macromolecules:

Exposure and absorption of IR by living cells for longer duration directly alter atomic structures of macromolecules (lipids, proteins, DNA) and produces biological and chemical changes. However, indirectly it damage to macromolecules through radiolysis of cellular water and increased generation of reactive species by stimulation of oxidases and nitric oxide synthases, further resulted in increased oxidative stress[12,13,14].

IR induced DNA Damage:

Acute exposure to low doses of IR can results in

Corresponding author:
Dr. Neetu Mishra:
Associate Professor,
Email Id: nitumishra2007@gmail.com

oxidative stress, further leads to permanent changes in the genome[2]. The oxidative DNA damage predominantly includes apurinic/apyrimidinic DNA sites, oxidized purines and pyrimidines, single strand and double strand breaks[15], cross-linking, oxidative base modification[16], clustered base damage[17], sugar modifications and deaminated bases[18]. In human atherosclerotic plaques, increased amounts of oxidatively modified DNA and 8-OHdG were observed[11,19].

IR induced lipid peroxidation:

Upon exposure to IR, free radicals generated in large amount which shows detrimental effects such as lipid peroxidation. Lipid peroxidation is a destructive cellular process which linked to a various physiological process; include inflammation, atherogenesis and aging[20]. It alters the structure, permeability and fluidity of the cellular membrane, inactivation of membrane-bound proteins, enzymes and receptors, alters respiratory functions, causes loss of -SH groups from membrane-bound proteins and alters nuclear transport[6]. Peroxidation results in the radiation cell killing and damages major unsaturated lipids are present in the cell membranes, including phospholipids, cholesterol and sphingomyelinase which initiate an apoptotic cascade[21-24]. Lipid oxidation produces many secondary products such as malondialdehyde, 4-hydroxy-2-nonenal, isoprostanes and cholesterol oxides. Malondialdehyde is mutagenic, carcinogenic, and highly toxic, which reacts with DNA and proteins to form adducts and inhibits protein functioning[6,24].

IR induced protein oxidation:

At the cellular level, when proteins are exposed to ROS, modifications of amino acid side chains occur and it alters protein structure. These modifications lead to functional changes that disturb cellular metabolism. In addition to the modification of amino acid side chains, oxidation reactions can also undergo fragmentation of polypeptide chains, intra-molecular and intermolecular cross-linking of peptides and proteins, loss of catalytic activity, carbonyl group formation and increased susceptibility to proteolysis. The accumulation and damaging actions of oxidized proteins observed in several pathological conditions such as diabetes, atherosclerosis and aging[24-27].

The majority of studies on protein oxidation confirm that the accumulation of oxidized proteins is a characteristic feature of aging in cells. Increased amount of oxidized proteins has been reported in many experimental aging models, as measured by the level of intracellular protein carbonyls or dityrosine, or by the accumulation of protein-containing pigments such as lipofuscin and ceroid bodies. There is a strong indication that protein turnover in cells and tissues tends to decline with age, and some evidence demonstrated an actual decline in the activity of the major cytosolic protease-the proteasome[24-28]. Loseva *et al*. stated that chronic exposure of human fibroblasts to low doses of IR, induced premature senescence and early induction of senescence-associated markers[27].

An improved understanding of protein oxidation, proteasome inhibitors, and proteasome regulation could be beneficial in several "age-related diseases." For example, reaction of the lipid oxidation product 4-hydroxynonenal with the amyloid-peptide generates a powerful proteasome inhibitor that could be important in Alzheimer's disease[31]. Thus, changes in protein oxidation status appear to be a combination of complex biochemical changes and are considered as a good indication of the aging and age-related complications[24,25,28].

Association between duration of exposure to low doses of IR and cellular damage:

Numerous radiation research studies have focused on events occurring concerning the time of exposure; days, weeks and months to the years. These studies include experimental studies on radiation damage such as DNA damage and cellular damage such as changes in the gene, protein modification, chromosomal rearrangements and genomic instability[29-32]. Sawant *et al.,* suggested that oxidative damage occurs for several months to years after exposure to a further generation of ROS/RNS. These modifications occur in the exposed cells and will be transmitted to their progeny or it may also spread to non-targeted cells[32]. Furthermore, the progeny of cells undergoes modifications in their biochemical characters and metabolism such as protein and lipid peroxidation, mutations and neoplastic transformations. It also stimulates signal transduction pathways and leads to activation of key transcription factors which resulted in altered gene expression pattern[32-35].

Low doses of IR and cancer:

The health risk associated with low doses of IR to cancer depends on age, sex, radiation dose quality and rate, and some other factors such as genetic, epigenetic

and lifestyle factors that determine the exposure to the individual. Previous evidences stated that a latency period for leukemia and solid cancers is of 4 to 8 years and more than 15 years respectively. Various types of cancer observed due to low-doses of IR exposure are head, neck, lung, colorectal, breast, gastric, benign prostatic hyperplasia (BPH), cervical, renal cell carcinoma (RCC), nasopharyngeal, liver, and bladder cancers also several types of leukemia, such as acute myeloid leukemia and acute lymphatic lymphoma[36-39] (Figure 1, Table 2).

Low doses of IR and CVD:

Previously published data on population exposed to low-dose IR from various terrestrial sources suggested that radiation exposure significantly increased the risk of developing CVD (Table 2). Furthermore, patients who had received low doses of IR approximately 2Gy during radiotherapy for peptic ulcer, breast, head and neck cancer showed significant increase in the risk of CVD such as chronic inflammation, stroke, ischemic heart disease, endothelial dysfunction, localized atherosclerosis, conduction failure, myocardial fibrosis and muscular dysfunction more than 10 years after irradiation[40-41]. Moreover, some changes observed such as linear increase in systolic and diastolic blood pressure, increased amount of aortic arch calcification, dose-related increase in serum cholesterol levels and inflammatory markers such as sialic acid, C-reactive protein (CRP) and interleukin-6 (IL-6), decreases in proportion of CD^{4+} T cells which proposed the role of radiation-induced immunity in development of inflammation[40-41]. Emerging evidence suggests that low doses of IR exposure may increase the risk of CVD and cancer, but the mechanisms involved are still unclear. Also, there is no direct geriatric study of radiation-induced health defects in humans, although animal studies suggest that they might occur (Figure 1, Table 2).

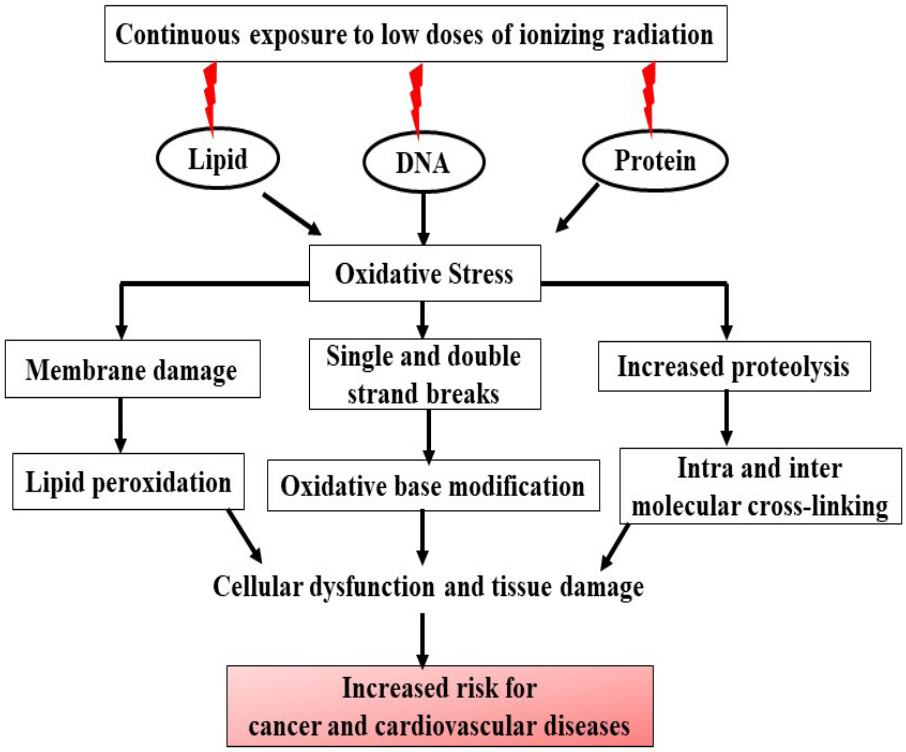

Figure 1: Exposure to IR and increased risk for cancer and cardiovascular diseases

Table 2: Previous studies on the exposure to IR and increased risk for cancer and CVD

Subjects	Country	Reference Population	Endpoint	Reference
2698 Radiologists	United Kingdom	General population	Overall and cancer mortality	42
146022 Radiologic technologists	United States	General population	Overall mortality	43
46970 Radiation workers	United States	Non-radiation workers	Overall and cancer mortality	44
45634 Radiologic technologists	United States	Psychiatrists	Overall mortality	45
Radiologists	United Kingdom	Other doctors	514 deaths in 2698 exposed	42

Conclusions

Recent studies suggested the association between risk of cancer and CVD and prolonged exposure to IR. The subsequent elevation in free radical level and its associated cellular redox imbalance play an important role in the pathogenesis of cancer and CVD. Additional research is needed to understand the mechanisms involved in radiation-induced cancer and CVD in terms of their initiation and transmission for many generations after cell division.

Molecular Epidemiology of Japanese Encephalitis Virus in India

Azima Khan[1], Sammita Jadhav[2]

[1]Assistant Professor, [2]Professor and Deputy Director, Symbiosis Institute of Health Sciences, Symbiosis International University, Pune

Abstract

The global reach of Japanese Encephalitis Virus (JEV) with an estimated 3 billion people at risk makes this virus a severe threat to the public health. Since its first detection in 1955, this virus has managed to spread throughout the country. Understanding the molecular epidemiology of Japanese Encephalitis Virus in India will help in designing vaccine strategies for preventive initiatives necessary to control the Acute Encephalitis Syndrome (AES) the main implication of the infection caused by the Japanese Encephalitis Virus (JEV).

Keywords: *JEV, AES, Molecular Epidemiology*

Introduction

Japanese encephalitis (JE) is an infection of the central nervous system caused by a zoonotic mosquito-borne JEV which is related to Dengue, West Nile and Yellow Fever Virus[1]. JEV is transmitted by the zoophilic mosquito *Culex tritaeniorrhynchus*, that breeds in irrigated rice paddies and its reservoirs are the water birds but the virus regularly moves over into pigs, equines and even humans. However, in humans and other vertebrates are the dead-end hosts as the virus fails to multiply to an extent to infect the mosquitoes [2,3].

In Asia, JEV is the most cause of encephalitis with its prevalence affecting major areas of the South East Asia including China, India and even[4]. Approximately 3 billion people of these countries are at significant risk with at least 700 million potentially being susceptible children. World Health Organization (WHO) estimated the incidence rate of JE cases of 5.4 per 100,000 in children in the age group of 0-14 years which account for 75% of the total cases i.e., approximately 67,900 cases in 24 endemic countries. Of the total JEV infections only 1% of the infected host suffer from AES and it has been reported that approximately 30-50% of survivors develop neurologic or psychiatric sequelae[3]. The statistics depicting the JEV burden globally should be construed carefully as the spread of this virus is highly dynamic and the global estimates show drastic fluctuations.

The past 50 years has seen the expansion of JEV in Asia and its prevalence in Northern and Central India and Nepal has increased exponentially since the 1970's[5]. The high fatality rate of JEV with combined effects of climatic change, altered migratory bird patterns, increasing human movement, deforestation exhilarates the dispersion of this virus heightening the threat[6].

Methodology

A systematic search was conducted using databases like PubMed, EBSCO, Emerald, Scopus, ProQuest and internet sources like WHO, NIH and WebMD, with the objective outlined under three broad themes namely;

Geographic Distribution of Japanese Encephalitis in India was searched for to identify the virus distribution globally to identify the endemic regions.

Transmission of JEV to identify the spread of this pathogen with varying host involved.

Antigenic Variations Genetic Mutations in JEV to identify the genetic mutations of the pathogens

influencing

Thus, this review was designed to highlight the molecular variations of the JEV. 224 articles were screened and 48 were selected for review.

Jev Structure

Japanese Encephalitis Virus is belongs to the family Flaviviridae under the genera of Flavivirus and it is a member of JE eponym serogroup which includes other 10 antigenically related virus such as Murray Valley encephalitis Alfuy, Kokobera, Kunjin, Japanese Encephalitis, Stratford, Usutu, West, Koutango and St. Louis Encephalitis Virus[2].

Structurally JEV is similar to other flaviviruses by possessing a small enveloped virus with single stranded 11kb RNA genome enclosed in a nucleocapsid that is surrounded by a lipid envelope[7]. The RNA molecule is responsible for the infectious nature of the virus. The RNA genome has a positive sense strand with 5' type I cap, but this doesn't have the 3' poly (A) tail. This [16]. It has a single coding region i.e., single open reading frame flanked by 2 non coding regions at the 5' and 3' ends. The single open reading frame codes for polyproteins of approximately 3400 amino acids[8].

The viral genome consists of two set of genes namely the structural and the non-structural genes. The structural genes are the N terminal C, prM and E which are responsible for the virus antigenicity as they code for capsid formation i.e., the core (C), pre membrane (prM) and the virus envelope (E). In addition to these, there are seven non-structural genes i.e., NS1, NS2a, NS2b, NS3, NS4a, NS4b, NS5 and these are involved in virus replication, innate immunity invasion and virus assembly[9]. The RNA replication of JEV is managed by two largest NCR's possessing enzymatic activity [10].

Clinical Manifestations

The CDC has reported that only 1% of the JEV infected individual develop clinical symptoms of encephalitis.In children, the disease often starts with symptoms similar to that of gastrointestinal infections such as nausea, vomiting and abdominal pains[11]. Additionally, it can also include extended symptoms such as paralysis, confusion, coma and seizures. The repeated seizures are poor prognostic factors which can prove fatal. In certain cases, JEV infections can be mistaken for poliomyelitis because of flaccid paralysis. In adults and older children, the prognosis is even more difficult as abnormal behaviour becomes the only symptom leading to wrong diagnosis as mental illness. However, there are few identified signs of encephalitis such as paralysis, muscular rigidity and typical mask like face. The abnormal beahaviour in older children and adults was first seen in Korean war where the American soldiers infected with JEV and were known to be suffer from "War-neurosis"[12]. The fatality of this infection ranges from 20-30% showing signs of cerebral edema but in some cases the infection enters the period of convalescence. This sequelae phase involves complete recovery in mild cases while others there are around 30-50% of the cleared cases develop serious neurological sequelae such as epileptic seizures, altered sensorium and mental retardation [2,13,14].

Transmission of Jev

The life cycle of the JEV involves mosquitoes, a few vertebrates, ultimately humans as the deadend hosts. Multiple studies have identified different species of the mosquitoes responsible for transmitting the JEV in the endemic regions. However, regional variations influence the vectors such as *C. tritaeniorhynchus* is main vector in South East Asia while *C. annulirostris* is the main vector in Northern Australia. Even though there are several vectors that have been identified for JEV such as *Mansonia and Anopheles* in addition to *Culex* species, the major vectors belong to the *Culex vishnui* complex *(Culex tritaeniorhynchus , Culex vishnui and Culex psedovishnui*).

The infection cycle of JEV starts with infected mosquitoes that account for approximately 3% of the total mosquito population that infect domestic animals, birds through bites. Once a human host is infected, the viral replication initiates in the local and regional lymph nodes followed by invading the central nervous system through blood[15]. The virus enters the host through the mosquito bite and replicated in the skin from which it is transported to the nearest lymph node. The Langerhans dendritic cells are known to support the viral replication which is often noticed in all flavivirus infections like Dengue and West Nile Virus infections[14]. The virus replicates to generate viremia enough to infect the central nervous system through T lymphocytes. Once in the CNS, the JE virus particles attach to the CNS endothelial surface which are then consumed by endocytosis.The JEV uses

the fatty acid cellular pathways i.e., the cholesterol and clathrin mediated pathways of endocytosis occurring at the vascular endothelial cells to spread to hypothalamus, hippocampus and medulla oblongata[16]. Once into the CNS, the virus replicates in the neurons and matures in the neuronal secretary system causing neurocysticercosis (NCC) which accounts for nearly 33% of deaths in JE patients[17.] . Pathological changes have been reported in other lymphoid organs and cells like the Kupffer cells and the spleen[14,18].

Molecular Evolution of Jev in India

First isolated in Tokyo in 1935 from human brain and the cerebrospinal fluid, the JEV was thought to have no antigenic variants. However, in 1954 Hale and Lee reported the variations in the antigenic nature of the virus of the Malayan origin and the Nakayama strains and further differentiated it into 3 serological types[19,20]. Using the polyclonal antibodies, the JEV was further subtyped the JEV isolated from Nothern Thailand and represented the strains as KE-093/83, Subin, ThCMAr6793 and ThCMAr4492 but these strains were serologically distinct from the Nakayama strain. Although polyclonal antibodies started the strain differentiation, the discovery of monoclonal antibodies (Mabs) presented with more specific classification of JE virus. The cross reactivity of the strains with MAbs against one strain led to 5 different antigenic subgroups namely Nakayama, Kamiyama, Beijing 1, 691004 and Muar. Of these, 691004 and Muar only had 1 representative prototype strain in each respective group. The MAb analysis based on Hemagglutination Inhibition (HI) activity proposed that the cross reactivity across 25 JEV strains isolated from Japan was result of 5 different epitopes present on the virus surface however, combined study of Hemagglutination Inhibition Test, Neutralization Test and ELISA data suggests 8 different epitopes. The difference in the epitope highlighted the structural separation of the viral proteins[21-24].

The first sequencing exercise of the JEV in 1987 by Sumiyoshi commenced more detailed research of the structural genes of the virus. On the basis of the studies conducted by Chen et al in 1990 where of the 58 isolates, 240 nucleotides of the prM gene were sequenced to result in 12% nucleotide divergence thereby dividing the virus into 4 genotypes [4,25].

Majorly, all the virus strains studied belong to the Genotype III including the Muar strain which is serologically distinct and was isolated in Singapore in 1952 [Williams et. al. 2000]. In addition to prM gene, other structural (E) and non-structural (NS5, NS3) genes have been used to draw up the phylogenetic tree to establish relation with its geographic source point. In another set of experiments conducted by Paranjpe and Banerjee, the phylogenetic studies using limited number (20nt) of JEV envelope sequences identified 4 genotypes similar to the groups proposed using prM sequences [25,27,28].

The gene coding for the E protein was reported to be the conserved region free of selective pressure of virus evolution thereby making it ideal for phylogenetic analysis [29-31]. With 107 envelope (E) gene sequences, JEV was classified into 5 distinct genotypes. The four genotypes of the E gene differentiation match with the 4 genotypes proposed by prM gene differentiation except for genotype III which had a lot of shuffling while the genotype V comprised only of the Muar strain [27,32].

In India, Genotype III was found to be more prominent until 2007 after which the GI strains have been reported in the subcontinent as reported by Sarkar and Fulmali[33,34]. These genetic shifts in the pathogen sets an alarm with public health view point as it will hamper the disease control strategies. It is astonishing to see that even though there is less than 1% difference in the protein structure corresponding to only 30 amino acid changes in a 3432 long amino acid sequence, the Gentoype I has effectively replaced the Genotype III strains.

In 1973, the very first outbreak of JE was recorded in Bankura and Burdwan districts of West Bengal with approximately 700 cases resulting in 300 deaths. Annually, JE is responsible for causes 2000 to 3000 clinical cases with around 600 deaths. In 2011, the JE case fatality rate (CFR) was noted to be 7% with 844 deaths reported in India. There have been nearly 6000 death of children in North India alone since the first case detected in the country. The spread of the disease is no longer restricted to North India or the West Bengal but it has spread throughout the country covering all major states and metro and according to the Ministry of Health and Family Welfare, India, in certain areas like the southern India and North eastern Regions get sporadic outbreaks are constant through the year.

Conclusion

With a total of more than 597,542000 people

residing in JE endemic regions it is extremely important to understand the molecular epidemiology of the viral strains of JE which pose a major public health concern with high epidemic potential and fatality rate. This review in discusses the changing trends of JEV genetically which in turn influences the virulence and pathogenesis of the virus. Detailed understanding of the molecular structure, variations at genomic level will help in developing vaccine strategies that would aid in eliminating this virus in similar fashion of small pox and polio virus.

Neglected Bacterial Foodborne Pathogens in India

Azima Khan[1], Sammita Jadhav[2]

[1]Assistant Professor, [2]Professor and Deputy Director, Symbiosis Institute of Health Sciences, Symbiosis International University, Pune

Abstract

Food is one of the most important aspect of life needed for growth, survival and sustenance of human beings. This makes it a key focus for government and health agencies to maintain its quality and safety to prevent illness associated with consumption of contaminated food. This review focuses on the pathogens that are not included in routine studies thereby are often under reported. This will help us get a better understanding of the emerging foodborne bacterial pathogens that are nurturing under the roof of other highly fatal pathogens.

Keywords: *Foodborne infections, India, Emerging pathogens*

Introduction

Foodborne infections affects nearly 600 million people accounting for 42,000 deaths annually around the globe[1]. The major symptom of foodborne infections are vomiting, fever, watery diarrhea and dysentery, fever, chills etc. However the most common symptom of food borne disease is diarrhea and so often these are referred to diarrheal diseases**.** The severity of these symptoms varies and ranges from short bouts of a day that self-heal while others can prove to be fatal. It is difficult to calculate the exact incident rate globally, there are around 1.8 million people that died from diarrhea in 2005 itself. This number was attributed to the consumption of contaminated food and water. The global burden of infectious diarrhea involves 3-5 billion cases and nearly 1.8 million deaths annually, with the vast majority in children of age <5 years. The percent of people suffering from foodborne infections annually has been reported to be 30% in developed countries. According to Centre for Disease Control and Prevention, annually in USA there are approximately 48 million cases of foodborne diseases (FBD) with 1,28,000 hospitalizations and 3000 deaths [2,3].

More than 250 FBD's have been recognized which includes etiologies such as bacteria, viruses, parasites and chemical contaminants[4]. Although foodborne diseases are caused by chemical and/or biological contaminants natural toxins or anti-nutritional factors, most of the cases are thought to be implicated with causes of microbiological cases[2]. Bacterial contaminants are the most common cause of FBD's responsible for nearly 66% of foodborne illness[5,6]. According to CDC there are 8 top bacterial pathogens primarily responsible for foodborne pathogens such as *Salmonella, E.coli, C.botulinum, C.perfringes, Vibrio* species, *L.monocytogenes, C.jejuni* and *S. aureus*[4]. Some foodborne diseases are well studied however are now emerging as a global threat by increase in their sporadic outbreaks. Emerging food borne pathogens are those causing illness that have only recently appeared or been recognized in a population or that are well recognized but are currently implicated in rapidly increasing incidences or wider geographical range.

Methodology

For this review, national and international research databases such as Emerald, Scopus, PubMed, ProQuest and EBSCO were screened with the objective for themes namely;

I. Neglected Foodborne Pathogens in India was searched to identify the existing pathogens in India causing infections

II. Diarrheal incidences in India to identify the reported cases of diarrhea in India.

Thus, this review was designed to highlight the emerging foodborne pathogens that are often neglected in India with 108 articles being screened and 44 selected.

Neglected Foodborne Pathogens in India

Diverse demography of India where the food is greatly influenced not only by regional boundaries but also by religion makes food quality monitoring a mammoth task. In addition, the lack of in depth analysis of the outbreaks in the country results in bias information on foodborne diseases. Majority of FBD's go unreported or uninvestigated as they get noticed only in cases of outbreaks with severe consequences[7]. Until recently the surveillance system in India did not separately categorized the outbreaks of foodborne diseases let alone identify the causative etiology. The foodborne disease outbreaks were included under acute diarrheal diseases (ADD) section with no record of trends of individual foodborne pathogens. The high morbidity causing infections caused by *V.cholerae, Enteropathogenic E. coli* and *S.typhi* take precedence leading to neglect of other potential pathogens thriving and going unnoticed under the focus of these pathogens. The National Center for Disease Control, India has reported the top etiologies of FBD's over the period of 1980 to 2016. These were reported to be *Salmonella, E.coli, Shigella, Vibrio spp., Yersenia enterocolitica and S. aureus*[8]. In addition to this, there are several other pathogens that are emerging and re-emerging that have been discovered in the last few decades.

1. Aeromonas hydrophila

Past few years have seen the emergence of *A.hydrophila* as an important foodborne pathogen[9]. . Several studies have isolated *Aeromonas* from food samples in India[10,11]. Das *et. al.,* isolated it from nearly 20% of meat, dairy, raw vegetables, beverages and bakery products in Tamil Nadu region in India[12]. A similar study conducted in Andhra Pradesh by Didugu *et al.,* 2016, reported 30-44% of mutton and carabeef samples were contaminated [13]. *Aeromonas* establish infections by production of several toxins like hemolysins, enterotoxins, cytotoxins and adhesins. One of the most important virulence factor of *A. hydrophila* is a cytotoxic enterotoxin called as "aerolysin" which is known to have hemolytic activity that aids in establishing gastrointestinal infection[14]. Sharma *et. al.,* studied fish, mutton meat, chicken, pork and chevon for presence of *A.hydrophila* and 40% of the samples were found to be positive for the *Aeromonas*, while 92% of the isolates obtained were found to be *Aeromonas hydrophila*[15]. Being ubiquitous in nature *Aeromonas* have been isolated from various food items in India such as untreated and chlorinated water, milk, vegetables, ice cream and various meats like chicken meat, mutton, carabeef and pork.

2. Arcobacter butzler

First discovered in 1977 by Ellis from aborted bovine fetuses, the genus *Arcobacter* has become important recently as they have been categorized as emergent enteropathogen[16]. In addition, International Commission on Microbiological Specifications for Foods (ICMSF, 2000) have categorized *A.hydrophila* as a "Serious Hazard" to human health. These Gram negative curved rods cause infection that are self-limiting and doesn't require antimicrobial treatment, however, the increasing number of incidences and outbreaks are making them a public health concern[17]. In India, *A.butzleri* has been isolated from meat, seafood, and water samples with high prevalence in shellfishes which can be as high as 25% [18,19]shellfish and the aquatic environment. In the present study, we analyzed fish, shellfish and water samples for the presence of Arcobacter spp. by conventional isolation as well as by direct PCR on the enrichment broth. Of 100 samples comprising of 42 finfish, 34 shellfish and 24 water samples analyzed, Arcobacter spp. was isolated from 8 (19%. A study by Mohan *et. al.,* reported the prevalence of *Arcobacter* in chicken meat, beef and pork as 10%, 5% and 5% respectively. This study also reported isolation of *A.butzler* from diarrheal samples from humans with isolation rate of 2%[20]. However another study by Sekhar, the prevalence of *Arcobacter* was found to be 13.3%, 8% and 6.6% in stool samples of farm workers, veterinary students and diarrheic human's respectively[21]. Thus the occurrence of *Arcobacter* is notably higher in chicken meat, beef and pigs and the further studies on diarrheal patients have validated the role of this pathogen in causing food poisoning in India.

3. Bacillus cereus

A widely distributed bacterial species B. cereus is not only a food spoilage organism but also is responsible for causing food poisoning22. This pathogen is widely distributed in environment which makes it easier for it to enter the food cycle23. It causes two different

forms of infections depending upon the type of toxin produced by the pathogen i.e., emetic syndrome and diarrheal syndrome. The diarrheal syndrome is a result of enterotoxin produced, like the diarrheal syndrome is a result of production of heat labile enterotoxins in the small intestine of the host, while the emetic syndrome is a result of a emetic toxins produced in the food which on consumption initiates the symptoms24 . Additionally, the spore forming abilities make this pathogen highly resistant to sterilization, pasteurization temperatures often used in food processing industries. In India, cases of B. cereus food have been reported in several individual studies such as one reported by Yusuf et al., where the prevalence rate was found to be 28.3% in dairy products in state of J&K. Similar results were observed for prevalence of B.cereus in meat products in Uttarakhand with prevalence rate of 30%. In certain regions like J&K, the prevalence rate of B.cereus in meat and meat products was reported to be 43.7% by Bashir et. al.,25,26. However, there is very limited data available on the current status of this pathogen in the country irrespective of the fact that there are reports on development of antimicrobial resistance in the strains.

4. Brucella species

Brucella species are responsible for causing brucellosis a zoonotic infections transmitted either through direct contact with contaminated animals or their products like meat, milk etc. With approximately 70% of India resides in rural sector making them highly susceptible to Brucellosis. This infection often misdiagnosed because of the overlapping symptoms like fever, weakness, lethargy, chills, weight loss, and in some cases psychological symptoms[27]. The main species circulating in India are *B.melitensis* and *B.abortus* with the former being more virulent commonly causing severe and prolonged infections[28]. The Indian studies have limited reported data on occurrence of *Brucella* species like the states of Kashmir, Varanasi, Gujrat, Assam, Andhra Pradesh, Maharashtra and Ludhiana showed a varied range of prevalence rate of 0.8%, 6.8%, 8.5%, 10.53%, 11.51%, 19.38%, 26.6% respectively[29,30]. A recent study in Karnataka reported the *Brucella* prevalence rate of 5.1%[28]. Another pressing matter despite of the low occurrence rate, the increase in antibiotic resistance in the strains isolated from domestic lifestyle which will eventually pose a major threat to public health[31].

5. Cronobacter skazakii

Formerly known as *Enterobacter skazakii,* it causes severe necrotizing enterocolitis and infection of the central nervous system and bloodstream. The mortality rate of this pathogen ranges from 40-80%[32]. It is widely distributed throughout the environment[33]. Studies have reported the presence of this pathogen in variety of food items such as spices, herbs, pet food etc.[34]. However, major incidences have been noticed in infants resulting because of contaminated infant feeds leading to premature deaths and retarded neurological growth[33]. In India a recent study by Mahindroo *et. al.,* studied the incidence of *C.skazakii* in North India to gather data on the presence of this pathogen in Indian subcontinent. The overall incidence rate was reported to be 7.1% with 3.37%, 9.4% in mutton, 11.1% in goat feces, 11.5% in environment, 7% in pig stool and 6.7% in chicken stool. Additionally the strains were resistant to all the prime antibiotics such as ampicillin, ciprofloxacin and carbapenem that are often used in its treatment[35].

6. Yersenia enterolitica

It is 3rd most common zoonotic infection and mainly associated with consumption of pig meat[36]. In addition to pork meat, vegetables and untreated water can also be a source of *Y. enterocolitica*[37]. In India, several individual studies have reported the incidences of *Y. enterocolitica* with incidence rate ranging from 2 to 18%[36,38]. Boral *et. al.,* reported the resistant to erythromycin and ampicillin[39]. The lower incidence rates of this pathogen can be because of the fastidious nature and complex growth requirements resulting in under estimation of this pathogen in the India.

7. Plesiomonas shigelloides

This Gram negative, facultative anaerobic bacteria inhabit the freshwater bodies and marine environments thereby making the seafood their prime vector for causing food infections in humans[40]. *P.shigelloides* causes gastroenteritis with vomiting, abdominal pain, however the major concern are neonatal encephalitis, meningitis, septic shock and sepsis[41]. In India, not a lot of data is available on this pathogen except for few studies reporting the presence in seafood[42]. Hence further detailed surveillance study of this pathogen is needed to understand its prevalence in the country.

Conclusion

With the changes climatic conditions, increase global travel and trade the movement of pathogens is easier resulting in introduction of newer more resistant strains. These neglected pathogens are often opportunistic in nature occurring in combination with the other pathogens like *V. cholera, Salmonella, E.coli* etc. These neglected foodborne pathogens are emerging worldwide and the emergence of multidrug resistant strains makes it important to understand their prevalence, occurrence trends, antibiotic resistance and transmission in the country.

Utility of High Fidelity Simulation Training in Improving Adherence to Critical Actions During Cardiopulmonary Arrest

Parag Rishipathak[1], Monesh Bhandari[2], Anand Hinduja[3]

[1]Director, Symbiosis Centre for Health Skills, [2]Medical Officer, Academics, Symbiosis Institute of Health Sciences, [3]Adjunct Faculty Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

Abstract

Introduction: Cardiopulmonary resuscitation (CPR) is emerging as a viable rescue strategy for refractory out-of-hospital cardiac arrest. Effective CPR implementation requires intensive and repetitive training foe Emergency Medical Service (EMS) providers. Adherence to ACLS protocols throughout an event is associated with increased revival rate of cardiac arrest patients. Using high fidelity simulation for BLS ACLS training improves the quality and confidence of EMS providers, students to abide by the AHA guidelines.

Objective: To utilize high fidelity simulation training in improving adherence to critical actions during cardiopulmonary arrest.

Methodology: A high fidelity manikin was utilized to create four unique clinical simulation scenarios based on cardiac arrest. 80 students of the Post Graduate Diploma in Emergency Medical Services (PGDEMS) program participated.

Each simulation session lasted for approximately 10 minutes followed by structured debriefing lasting for 20 minutes. The video recorded sessions were analyzed by two independent facilitators to avoid bias.

At the end of 8 week period, the students underwent post intervention simulation session structured in the same format as the pre-intervention session.

Result: The study focused on critical performance steps to be followed as per AHA 2015 guidelines.

Discussion: As per AHA 2015 guidelines, there are some critical performance steps to be followed while giving Basic Life Support (BLS) to a cardiac arrest patient. These steps if followed correctly, not only provide help to the patient immediately but also increase the chance of survival of the patient.

The drastic increase in the total score obtained from pre-intervention to post-intervention underscores the importance of regular simulation sessions, to inculcate better assessment practices in a safe and non-threatening environment.

Conclusion: Though participants performed the critical actions and managed the scenarios as per AHA 2015 guidelines, few actions, which superficially seemed to be insignificant were not performed.

Keywords: *cardiac arrest, critical actions, performance measures, CPR*

Introduction

Cardiopulmonary resuscitation (CPR) is emerging as a viable rescue strategy for refractory out-of-hospital cardiac arrest. Effective CPR implementation requires intensive and repetitive training foe Emergency Medical Service (EMS) providers. A study in the U.S. has shown that limited training of emergency medicine providers is a barrier to widespread implementation.[1]

EMS providers and resident doctors do not always apply proper resuscitation guidelines in hospitals.

Hence, there is a need for continuing training in basic and advanced resuscitation for all according to the guidelines.[2]

The American Heart Association (AHA) Advanced Cardiac Life Support (ACLS) algorithms are the standard of care for patients suffering from cardiac arrest. Adherence to ACLS protocols throughout an event is associated with increased revival rate of cardiac arrest patients.[3]

Correctly following ACLS protocol has improved post – code mortality but institutions should train EMS providers in implementing ACLS protocols to improve revival of patient.[4]

Along with proper implementation of ACLS protocols and guidelines, non-technical skills including leadership, communication skills, adaptability, handling stress etc. are responsible for successful and effective resuscitation.[5]

For improving and developing updated guidelines regularly, it is necessary to conduct research on resuscitation, based on cases who were treated as per the existing AHA guidelines.[6]

As a result, the lack of organized simulation practice results in deficient knowledge and skills because of deliberate practice. Using high fidelity simulation for BLS ACLS training, improves the quality and confidence of EMS providers and students to abide by the AHA guidelines. Numerous studies have shown that high fidelity simulation should be utilized for deliberate practice of students.[7]

Objective

To utilize high fidelity simulation training in improving adherence to critical actions during cardiopulmonary arrest.

Methodology

A high fidelity manikin was utilized to create four unique clinical simulation scenarios based on cardiac arrest i.e. Ventricular Fibrillation (VF), pulseless Ventricular Tachycardia (pVT), Asystole and Pulseless Electrical Activity (PEA). The scenarios underwent dry run by facilitators before the student sessions. 80 students of the Post Graduate Diploma in Emergency Medical Services (PGDEMS) program participated in the study. The students were initially taught the assessment and management of cardiac arrest through didactic lecture method and case study discussions. For the pre-intervention simulation session, the students were divided into eight groups and prebriefed on the features of high fidelity simulation manikin and the background of their respective cases. Informed consent was taken from students to record the sessions.

Each simulation session lasted for approximately 10 minutes followed by structured debriefing lasting for 20 minutes. The video recorded sessions were analyzed by two independent facilitators to avoid bias. The student groups were rated on 15 assessment parameters as per AHA 2015 guidelines. The maximum score that could be obtained by a group was 15. The shortcomings of these students were discussed during debrief.

Over the next 8 weeks, students were trained on various cardiac arrest scenarios using High fidelity simulation. Each simulation training session lasted for four hours and the students were provided real time feedback on their performance on various critical actions to be taken in a cardiac arrest scenario. At the end of 8 week period, the students underwent post intervention simulation session structured in the same format as the pre-intervention session. Critical actions performed were again recorded for the 4 case scenarios during the test. The pre-intervention vs post-intervention data was tabulated and analyzed for difference in means.

Result

The study focused on critical performance steps to be followed as per AHA 2015 guidelines.

The pre and post intervention values have been tabulated below:

Table 1: Critical actions performed (Pre-intervention vs Post-intervention)

Cardiac rhythm	Mean of Number of Critical actions performed (Pre-intervention)	Mean of Number of Critical actions performed (Post-intervention)
Ventricular fibrillation	8.5	13
Pulseless Ventricular tachycardia	8.5	14
Pulseless Electrical Activity	6.5	11
Asystole	7.5	11.5

Table 2: Mean Score

	Mean Score obtained
Pre intervention	5.2
Post intervention	12.3

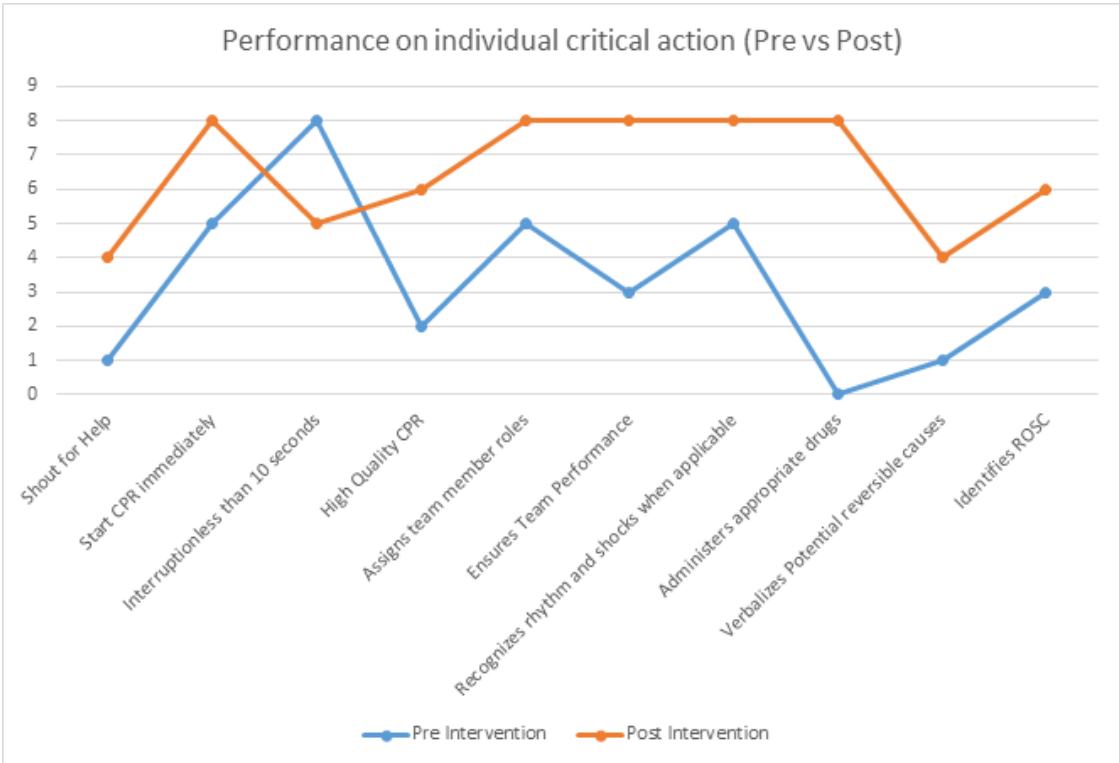

Figure 1: Performance on individual critical action

Discussion

As per AHA 2015 guidelines, there are some critical performance steps to be followed while giving Basic Life Support (BLS) to a cardiac arrest patient. These steps if followed correctly, not only provide help to the patient immediately but also increase the chance of survival of the patient.

The critical steps have been categorized under Assessment, Team Leader and Management.

During pre-intervention session, during assessment of clinical simulation scenario majority of the groups failed to perform "shout for help" step when cardiac arrest was recognized. But for post intervention four groups out of eight performed the step. It is important to perform this step to initiate chain of survival and for additional help to arrive.

For a Team Leader, steps like ensuring high quality CPR at all times, assigning team member roles and ensuring that team members perform well are critical. During pre-intervention session, only two out of eight groups ensured high quality CPR at all times, but improvement was observed in the post intervention sessions. The team leader from all groups assigned team member roles in pre –intervention as well as post – intervention test. During pre-intervention session, 5 out of 8 groups did not monitor the team members' performance but significant improvement was seen in post intervention session.

During the pre-intervention session the students performed poorly in areas of intervention including maintaining appropriate cycles of drug-rhythm check/ shock CPR, administrating appropriate drugs and doses, verbalizing potential reversible causes (H's and T's). This was found to be corrected in the post intervention session. The drastic increase in the total score obtained from pre-intervention to post-intervention underscores the importance of regular simulation sessions, to inculcate better assessment practices in a safe and non-threatening environment. High Fidelity Simulation sessions offer a chance to provide real time feedback on the critical actions that are required to be preferred during cardiac arrest. Simulation also allows to create a variety of clinical scenarios on cardiac arrest to acclimatize students to possible real clinical simulation.

Conclusion

Though participants performed the critical actions and managed the scenarios as per AHA 2015 guidelines, few actions which superficially seemed to be insignificant were not performed.

EMS students should have proper understanding and knowledge regarding each critical action to be performed in a cardiac arrest. There is a need for more research to study the Human Factor in case of cardiac arrest using High fidelity simulation.

Clinical Diagnostic Marker for Early Detection of Epithelial Ovarian Cancer: Classical biomarkers and MicroRNAs

Joyita Banerjee[1], Neetu Mishra[2]

[1]Ph.D. Scholar, [2]Associate Professor, Symbiosis School of Biological Sciences, Symbiosis International (Deemed University), Pune, India

Abstract

Epithelial ovarian cancer (EOC) is one of the poorest prognostic types of all gynecologic cancers. In this type of cancer, more than 70% of women are diagnosed at an advanced stage. The asymptomatic nature of ovarian cancer is the main impediment in the early detection of the disease, which invariably increases the mortality rate. The current screening modalities of EOC include transvaginal ultrasound, pelvic mass examination, and detection of serum biomarker CA125 which lack higher accuracy in diagnosing ovarian cancer at an early stage. The recent studies emphasize the use of combinations of multiple biomarkers which increase the sensitivity and specificity for early diagnosis of this cancer. Much attention and importancenow days has been given on studying the involvement of microRNAs (miRNAs)in different cancer pathogenesis and also as a prognostic marker. Recent researches emphasize on identifying several miRNAs to be associated with the specific EOC stage and the EOC histotypes. This review summarizes the importance and current challenges in the screening of ovarian cancer by biomarkers such as CA125, HE4, and miRNAs with particular emphasis on diagnosis of the disease at an early stage.

Keywords: *Epithelial ovarian cancer, early diagnosis, biomarkers, CA125, HE4, microRNAs*

Introduction

Ovarian cancer is one of the most lethal gynecologic cancers affecting women mostly in their postmenopausal life and is the fifth most common causes of cancer deaths among women in the USA with an estimation of 14,070 death cases in 2017[1]. In India, ovarian cancer ranks fourth among the common types of cancersin women[2]. Epithelial ovarian carcinoma (EOC) which accounts for about 90% of ovarian cancers is a prime cause of death in women among all gynecological cancers[3]. EOC is further divided into five major subtypes such as high-grade serous carcinoma (70%), endometrioid carcinoma (10%), clear-cell carcinoma (10%), mucinous carcinoma (3%), and low-grade serous carcinoma (<5%)[3].

Women with a family history of ovarian cancer in their first-degree relatives or if they inherit mutations in Breast cancer type 1 and type 2 susceptibility gene(BRCA1 or BRCA2) are more prone to ovarian cancer[4]. Based on the International Federation of Gynaecology and Obstetrics (FIGO) grading system, ovarian cancer can be graded from stage I to stage IV depending on its malignancies[3]. The early prognosis of ovarian cancer remains challenging due to the absence of clinical symptoms at the first stage of the disease, which invariably increases the mortality rate. The five-year survival rate critically depends on the stage at which the cancer is being diagnosed. If diagnosed and treated at early stages, the five-year survival rate can reach over 90%[5]. Unfortunately, due to its asymptomatic nature, most of the ovarian cancer cases are diagnosed at advanced stages (stages III and IV) where five-year survival is less than 30%[6-8]. Moreover, the development of chemoresistance to platinum-based compounds has worsened the survival rate. The incompetent disease diagnosing strategies and resistance to chemotherapeutic compounds are the significant constraints forthe successful treatment of

ovarian cancer[9]. Thus, identification of useful diagnostic biomarkers for early detection of ovarian cancer remains most promising and challenging.

MicroRNAs (miRNAs), the novel class of non-coding RNAs, have been extensively studied in recent years for their aberrant expression in various cancer pathogenesis[10]. They have significant roles in vital processes such as cell growth, differentiation, and apoptosis. MiRNAs were first used for cancer diagnosis in 2008 in blood serum or plasma ofhumans and various animal models[11]. This, review aimedto focus on current challenges, traditional biomarkers routinely used and recent advances on miRNAs as the novel biomarkers for early diagnosis of ovarian cancer.

Current challenges in the screening of ovarian cancer

The current diagnosing modalities involve transvaginal ultrasonography (TVU), pelvic examination, and measuring serum Cancer Antigen-125 (CA125) leveleither alone or in combinations[12]. Owing to the high cost of screening strategies, unsatisfactory specificity, and low positive predictive value of TVU, it is not considered as the ideal screening strategy for ovarian cancer[13]. The pelvic mass examination is also not suitable for distinguishing between early and premalignant lesions from the normal ovary due to low sensitivity and specificity[14]. The results of the PLCO (Prostate, Lung, Colorectal, and Ovarian cancer) trial which involved 34,261 healthy women, did not show much reduction in mortality rate on screening the population with CA125 and TVU, and observed an increase in unnecessary morbidities due to use of invasive medical interventions[15]. The major challenge in early detection of ovarian cancer is due to the occurrence of this cancer among women predominantlyat postmenopausal lifewhen the ovaries have practically no physiological role[16].

Classical Biomarkers of Ovarian cancer

CA125 serum biomarker

Cancer Antigen 125 (CA125) or Mucin 16 (MUC16), the most studied and traditionally used biomarker for screening ovarian canceris primarily considered as the best-known biomarker to monitor EOC, and the differential rises of pelvic masses[17]. It is a large transmembrane glycoprotein, first recognized by murine monoclonal antibody OC-125 as an antigenic determinant in ovarian cancer cell lines in 1981[18]. The serum level of CA125 under normal condition remains below 30-35U/mL whereas in case of EOC, the level of CA125 rises more than 35U/mL[19]. Although, the level of serum CA125 remains elevated by 80% in EOC cases but lacks in 20% of cases of ovarian cancer with no rise in CA125 level[19].

HE4 serum biomarker

Human epididymis protein 4 (HE4) belongs to whey acidic protein (WAP)-type four-disulfide core family proteins, overexpresses in specific subtypes of EOC viz. 100% in endometrioid, 93% in serous, and 50% in clear cell carcinoma[20]. In several studies, HE4 has been found to be superior biomarker compared to CA125 in detecting ovarian cancer at early stages and also in differentiating between benign tumors and borderline ovarian tumors[20,21]. The cut-off level of HE4 in serum is > 70pmol/L[21]. Holcomb *et al*. reported a comparative study of CA125 and HE4 in 229 premenopausal women, where, the sensitivities of CA125 and HE4 for detecting epithelial ovarian cancer cases were 83.3% and 88.9% respectively[22]. Moore *et al*. in a study involving preoperative 233 ovarian cancer patients with an adnexal mass, where the sensitivity of HE4 as a single biomarker was found to be 72.9% at 95% specificity in detecting ovarian cancer as stage I[21]. However, HE4 concentrations were increased among healthy women above 40 years and in their 8th and 9th decade of life resulted in false positives[23]. The sensitivities and specificities of combinations of multiple biomarkers for diagnosing EOC were summarized in table 1.

Table 1: Sensitivities and specificities of combinations of multiple biomarker panels in diagnosing EOCat stages I and II

Biomarkers of ovarian cancer	n(N) *	Menopausal status (Number of EOC patients)	Sensitivity(%) at Stage I & II	Specificity (%) at Stage I & II	Reference

MiRNAs as novel biomarkers

MiRNAs are short stretches of noncoding RNAs (22-25 nucleotides), regulate gene expression post-transcriptionally, and suppress the translation of target mRNAs by forming hybrids with 3'UTR (Untranslated region). MiRNAs were first discovered in *Caenorhabditis elegans*[32]. They are found to be very stable against temperature and pH changes, resistant to RNases, incorporated in membrane-enclosed vesicles, and circulated through blood[33]. For these remarkable characteristics, miRNAs can be considered as the reliable clinical diagnostic and prognostic biomarkers.

The potential need to improve the survival rate of ovarian cancer patients, more specific and more sensitive biomarkers should be found out to diagnose this cancer at an early stage accurately. MiRNAs recently have been recognized as the novel biomarkers for different cancers. They are known to modulate the cancer pathogenesis by playing essential roles in cancer-associated cellular pathways, carcinogenesis, cancer progression, invasion and metastasis, response to therapeutic drugs[34].There is a significant difference in the microRNA expressions in the healthy and cancer tissues, and cancer subtypes[35]. The very first study on miRNA expressions and cancer reported downregulations of miR-15 and miR-16 in chronic myelogenous leukemia[36].

MiRNAs in EOC pathogenesis, diagnosis or prognosis

The miRNAs have been observed to play critical roles in ovarian cancer pathogenesis, diagnosis or prognosis. Calura*et al*. studied the miRNA expression profiles of all histotypes of EOC at the stage I and revealed higher expression of miR-30a-5p and miR-

30a-3p in clear cell histotype whereas the expression of miR-192 and miR-194 upregulated in mucinous type[37]. Iorio*et al*., observed only 4 miRNAs of 29 (miR-141, miR-200a, miR-200b, and miR-200c) were upregulated and 25 miRNAs (especially miR-199a, miR-140, miR-145, andmiR-125b-1) were downregulated in ovarian cancer tissues/cell lines[38].

According to the Cancer Genome Atlas (TCGA) data, ovarian cancer could be divided into three miRNA subtypes[39]. The mesenchymal subtype was found to be associated with eight miRNAs (miR-25, miR-29c,miR-101, miR-128, miR-141, miR-182, miR-200a, andmiR-506) with poor survival rate[40]. The other subtypes included eight upregulated miRNA signatures (miR-183-3P, miR-15b-3p, miR-15b, miR-590-5p, miR-18a, miR-16, miR-96,and miR-18b), and nine downregulated miRNAs (miR-140-3p, miR-145-3p, miR-143-5p, miR-34b-5p, miR-145,miR-139-5p, miR-34c-3p, miR-133a, and miR-34c-5p)[41,42].

The early detection of EOC has been long sought for successful therapeutic implications. Early detection will ensure better management of cancer and also increase the survival rate. The miRNA signaturesassociated with the early stages of EOC can be considered as the early diagnostic markers of EOC. Several studies elicited the novel miRNA profiles for early-stage diagnosis of EOC, such as Lee*et al*.,reported that significantly higher expression of miR-370 could be found in early stages of EOC[43]. Marchini*et al*. in a retrospective study revealed that miR-200a and miR-449b highly expressed in stage I than stage III ovarian carcinoma[44]. Further,the studies on differential expression of miRNAs in EOC patients have been listed in Table 2 along with their association with the specific stage of ovarian cancer.

Table 2: Alterations in miRNAs expression and different stages of EOC

Conclusion

There is a growing number of evidences of miRNA expression patterns associated with pathogenesis, diagnosis, and prognosis of EOC which depict the significant role of miRNAs in therapeutic implications and to consider as the ideal diagnostic biomarkers of EOC at early stages. Ovarian cancer remains asymptomatic at early stages which deliberately makes it as the most lethal type of gynecologic cancers. Therefore, suitable screening tests for this type of cancer require the involvement of novel biomarkers having higher sensitivities and specificities to correctly diagnose the disease at early stages. The screening tests with a combination of multiple biomarkers exhibited higher sensitivities rather than screening with a single marker. The identification and validation of more genetic markers and miRNAs specific to ovarian cancer may overcome the current challenges in early detection.The technological advancements may improve the identification of prospective biomarkers with higher sensitivities and specificities particularly suitable for screening out ovarian cancer in asymptomatic women. Lastly, earlier the diagnosis will significantly result in reduced mortality rate due to this cancer.

Abstract

Background: The World Health Organization reports 60-90% of school children worldwide have experienced caries, with the disease being most prevalent in Asian countries. As there was dearth of school children studies in Pune City the present study was undertaken. **Objectives:** 1. To assess the knowledge of school children regarding prevention of dental caries. 2. To find out the association between the knowledge score regarding practices of dental hygiene among selected demographic variables **Method:** a descriptive survey approach as well as descriptive design was adopted **Results:** Majority of school children having 46.6% (14) had Average knowledge & 23.3% (07) had good knowledge. **Conclusion:** The study highlighted the Knowledge of school children were not adequate for the prevention of dental caries and it is concluded that continuous educational program, awareness programme should be carried out in all schools regarding prevention of dental caries.

Keywords: *Knowledge, Prevention, Dental Carries, School children*

Introduction

Dental caries is considered to be a major public health problem globally due to its high prevalence and significant social impact.[1] The World Health Organization reports 60-90% of schoolchildren worldwide have experienced caries, with the disease being most prevalent in Asian countries.[2]

It is a well-known fact that while a majority of dental diseases can be prevented by proper dental care, the lack of it can lead to a major dental problems especially in children and ultimately it affect their proper growth and development.[3] Dental caries is one of the most common chronic diseases that affect human beings at all ages. It is a principal problem in children and adolescents.[4] Dental caries, if

Untreated results in total destruction of teeth oral health, the first goal is the 50 percentage of the five to six years old children should be caries free and the second goal is that the global average should not be more than three decayed, missing or filled teeth at twelve years of age.[5,6] Prevention and early diagnosis are just as important in managing dental diseases, specifically dental caries as in managing any other infectious diseases.[7]

The prevalence of dental caries in pre-school and school going children was high and having increasing trend.[8] Hence, the prevalence of dental caries indicates that the oral health of the children was not adequate, which indicate urgent need to increase dental and oral hygiene educational programs in schools. The present study helps in increasing awareness regarding dental caries among children and reduces the prevalence the dental caries.

Statement of Problem:

A study to assess the knowledge of school children regarding prevention of dental carries in selected English medium school of Pune city with view to develop an health education module.

Objectives of the Study:

To assess the knowledge of school children regarding

prevention of dental caries.

To find out the association between the knowledge score regarding practices of dental hygiene among selected demographic variables.

Hypothesis:

H1: These will be a significant association between the levels of knowledge score regarding prevention of dental caries among school children with the selected demographic variables 0.05 level of significance.

Assumptions

The school children have some knowledge regarding prevention of dental caries.

Health education module will improve knowledge regarding prevention of dental caries among school children.

Research Methodology

Research Approach:

In order to accomplish the objectives of the present study, a descriptive survey approach was adopted.

Research Design:

Descriptive design was adopted for the present study to carry out the present study.

Research setting:

Based on the geographic proximity, feasibility to conduct the study and familiarity with the setting, the investigator selected English medium schools of Pune city. **Population:**

In the present study, the population comprises of school children studying in selected English medium schools of Pune city.

Sample: Sample size of the present study consists of 30 school children studying in selected English medium schools of Pune city, who were able to read and write English.

Sampling Criteria: The sampling technique used for the study was a Simple Random Sampling technique

Results & Discussion

Findings related to socio-demographic variables.

The maximum number of subjects 15(50%) belongs to the age group of 11 years and 02(14%) belongs to the age of 10 and 13 years.

The maximum number of subjects 17(56.6%) are male of 11 years and 13(43.3%) are female.

With respect to ordinal positions respondents majority 13(43.3%) found first ordinal position and 05 (16.06%) as third ordinal position.

Majority of the respondents 15(50.0%) with two siblings and 04(13%) were three sibling respectively.

The maximum number of subjects 27(90%) were residing in urban area and 3(10) were residing in rural area.

The educational level status of both parents. 73.3% Studied PUC and above and 00% were illiterate

Mean, Median, Mode, standard Deviation and Range knowledge score of school children.

Table 1: Depicted that overall Mean is 15. Median is 16.6, Mode is 19.5, S.D is 3.8 & range is 15

n= 30

Area of Analysis	Mean	Median	Mode	S.D	Range
Knowledge test (x)	15	16.6	19.5	3.8	15

Table 2: Revealed that in test majority of school children having 46.6% (14) had Average knowledge & 23.3% (07) had good knowledge.

Knowledge score	Frequency(f)	Percentage (%)
Good	07	23.3%
Average	14	46.6%
Poor	09	30%

Frequency & Percentage distribution of knowledge scores on prevention of dental carries among school children. n= 30

Association between the existing pre-test knowledge of school children and demographic variables.

The calculated chi-square value for Type of Family (44.1), Education of the parents (11.8.), is more than table value.

Hence H_1 is accepted, there is association between the socio demographic variables and knowledge.

Conclusion

On the basis of the findings of the study, reveal that the knowledge of school children were not adequate for the prevention of dental caries and it is concluded that continuous educational program, awareness programme should be carried out in all schools regarding prevention of dental caries. Many dental problems can be prevented if children and parents are well informed of the causes of dental diseases, prevention and awareness of the importance of regular dental care.

Conflict of Interest: In the present study there was no conflict of interest.

Source of Funding: The present study is self-funded.

Ethical Clearance: Ethical clearances obtained from the institute review committee

Call for Papers/Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialties. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper; A general invitation is extended to authors to submit papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article an attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your affiliation (designations with college address)
- Abstract
- Keywords
- Introduction or background
- Material and Method
- Findings
- Discussion
- Conclusion
- Interest of conflict
- Source of Funding
- Ethical Clearance
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file.

All articles should be sent to: **editor.ijphrd@gmail.com**

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic-ISSN:** 0976-5506, Frequency: Monthly

Indian Journal of Public Heath Research & Development is a double blind peer reviewed international Journal. The frequency is Monthly. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialties concerned with research and development for the masses. The Journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.
