EXECUTIVE EDITOR
Vidya Surwade
Associate Professor, Dr Baba Saheb Ambedkar Medical College & Hospital Rohiniee, Delhi

INTERNATIONAL EDITORIAL ADVISORY BOARD

1. Dr Abdul Rashid Khan B. Md Jagar Din, Associate Professor, Department of Public Health Medicine, Penang Medical College, Penang, Malaysia
2. Dr V Kumar, Consulting Physician, Mount View Hospital, Las Vegas, USA
3. Basheer A. Al-Sum, Botany and Microbiology Dept, College of Science, King Saud University, Riyadh, Saudi Arabia
4. Dr Ch Vijay Kumar, Associate Professor, Public Health and Community Medicine, University of Buraimi, Oman
5. Dr VMC Ramaswamy, Senior Lecturer, Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur
6. Kartavya J. Vyas, Clinical Researcher, Department of Deployment Health Research, Naval Health Research Center, San Diego, CA (USA)
7. Prof PK Pokharel, Community Medicine, BP Koirala Institute of Health Sciences, Nepal
8. Sajjad Salim Issa AL-Musawi, supervisor for student of the Arab board in family medicine
9. Prof. Dr. Ayad F. Alkaim, Professor of surface chemistry and applications of nano-materials, Babylon University, Iraq
10. Prof. Dr. Imad Hadi Hameed, Biomedical Science Department, College of Nursing, University of Babylon, Hillah city, Iraq
11. Prof. Dr. Amean A Yasir, Department of Community, College of Nursing, University of Babylon, Hillah city, Iraq

NATIONAL EDITORIAL ADVISORY BOARD

1. Prof. Sushanta Kumar Mishra, Community Medicine, B.J. Medical College, Ahmedabad, Gujarat, India
2. Prof. D.K.Srivastava, Medical Biochemistry, Jamia Hamdard Medical College, New Delhi
3. Dr Sunil Mehra, Paediatrician & Executive Director, MAMTA Health Institute of Mother & Child, New Delhi
4. Prof. M.Sriharibabu, General Medicine, GSL Medical College, Rajahmundry, Andhra Pradesh
5. Prof Pankaj Datta, Principal & Prosthodontist, Indraprastha Dental College, Ghaziabad
6. Prof Samarendra Mahapatro, Pediatrician, Hi-Tech Medical College, Bhubaneswar, Orissa
7. Dr Abhiruchi Galhotra, Additional Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
8. Prof Deepthi Pruthvi, Pathologist, SS Institute of Medical Sciences & Research Center, Davangere, Karnataka
9. Prof G S Meena, Director Professor, Maulana Azad Medical College, New Delhi
10. Prof Pradeep Khanna, Community Medicine, Post Graduate Institute of Medical Sciences, Rohtak, Haryana
11. Dr Shailendra Handu, Associate Professor, Phraha, DM (Pharma, PG Chandigarh)
12. Dr. A.C. Dharwal, Directorate of National Vector Borne Disease Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of India, Delhi.

NATIONAL SCIENTIFIC COMMITTEE

1. Dr Anju Ade, Professor, Community Medicine Department, SVIMS, Sri Padamavati Medical College, Tirupati, Andhra Pradesh
2. Dr. E. Venkata Rao, Associate Professor, Community Medicine, Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa.
3. Dr. Amit K. Singh, Associate Professor, Community Medicine, VCSG Govt. Medical College, Srinagar – Garhwal, Uttarakhand
4. Dr R G Viveki, Prof n head, Dept of Community Medicine, BIMS Belagavi
5. Dr. Santosh Kumar Mulage, Assistant Professor, Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS) , Karnataka
6. Dr Gouri Ku. Padhy, Associate Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
7. Dr Ritu Goyal, Associate Professor, Anesthesia, Sarswathi Institute of Medical Sciences, Panchasheel Nagar
8. Dr. Anand Kalaskar, Associate Professor, Microbiology, Prathima Institute of Medical Sciences, AP
9. Dr. Md. Amirul Hassan, Associate Professor, Community Medicine Government Medical College, Ambedkar nagar, UP
10. Dr. N. Girish, Associate Professor, Microbiology, VIMS&RC, Bangalore
11. Dr BR Hungund, Associate Professor Pathology, JNMC, Belgaum.
12. Dr Sartaj Ahmad, Associate Professor, Medical Sociology, Department of Community Medicine, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India
13. Dr Manoj Kumar Tripathi, (Associate Professor), Political Science and public administration, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India
14. Dr Sumeeta Soni, Associate Professor, Microbiology Department, B.J. Medical College, Ahmedabad Gujarat, India

Print ISSN: 0976-0245, Electronic ISSN: 0976-5506, Frequency: Quarterly (Four issue per volume)

Indian Journal of Public Health Research & Development is a double blind peer reviewed international journal. The frequency is half yearly going to be quarterly by 2012. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN)Print ISSN: 0976-0245, Online ISSN: 0976-5506 and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

| 7. Internet Addiction Prevalence and Quality of Life-A Cross-Sectional Study among Adolescents | Lalita Sisodia, Rahul Bansal, Anuradha Davey, Arvind Shukla | 31 |
| 8. Customer Perception towards Adoption of Mobile Payments–A Study | Monisha D, S. Gurusamy | 37 |
| 10. Prevalence of Pre-Hypertension, Blood Pressure Variables and Cardiovascular Risk among College Students | D. Ezhil Bhavani, R. Monisha | 51 |
| 11. Assessment of Health Literacy Rates and Implementation of Teach Back Method in a Tertiary Care Teaching Hospital in South India | Faraz Numan Mohammed, Rajesh Kamath, Somu G, Bryal D Souza | 56 |
| 12. Economic Impact of FDI on Indian Biotechnology Sector | S. Chandrachud, M. Thiyalnayaki | 62 |
| 13. Integrated Ancient Medicine Practice and Treatment For Obesity-A Holistic Approach | Mouthu Kumarasamy, S. N. Sugumar | 66 |
| 14. Impact of Farm Technology on Agricultural Production– A Study with Special Reference to Madurai District of Tamilnadu | S. Thangamayan, V. Thirunavukkarasu | 71 |
15. Assessing WHO’s IYCF Indicators in Mangalore Taluk-A Cross sectional Study .............................................. 76
   Sandhya Rani Javalkar

16. Reaching the Unreached–A Retrospection of the Nine Year long Oral Rehabilitative Program in the Tribal Hamlets of Kerala ................................................................. 81
   Mathew Anil, Janakiram Chandrashekar, Sanjeevan Vinita, Keepanaserril Arun, Joseph Joe, Rajan Saranya Raj, Sreeprabha G Mohan

17. Periodontal Disease and Its Influence on Systemic Disease–A Survey among Non-Medical Professionals85
   Divya Kohli, Santhosh Kumar, Ramprasad Vasthare Prabhakar, Rashi Okandiar, Bhavana K V, Anjali

18. Role of Residential Indoor Dampness and Mold as Determinants of Respiratory Symptoms among Adults 91
   Saraswathy Manivannan, Vidhya Venugopal, Anupma Jyoti Kindo, Thyagarajan Ravinder

19. Study of Postpartum Depression and its Associated Factors in Women Attending Tertiary Care Hospital, Raichur ................................................................. 98
   Sujatha N, Arshiya Taranum

20. Linking EHR and ERP Adoption with Flexibility in Care-Delivery and Operational Performance:
    A Conceptual Review in Hospital Supply Chain ................................................................. 102
    Tulika Chakravorty, Karunakar Jha, Sunil Barthwal

    V. Anu, D. Bharathi, Atchukola Sailakshmi Triveni, B. Bensa

22. Brand Resonance: Concept and Influence of Relationship Marketing Dimensions with Reference to Online Shopping Portals ................................................................. 118
    V. S. Divyasre

23. Community Health Diagnosis in a Tribal Hamlet–A Case Study from India ........................................ 123
    Venkitachalam Ramanarayanan, Chandrashekar Janakiram, Vinita Sanjeevan, Joe Joseph, Bobby Antony, Naveen Varghese, Vineetha K, Heljo Joseph, Sravan Kumar Yeturu

24. A Study on the Horrendous Industrial Mass Disaster at Union Carbide Plant of Bhopal in Light of Ethical Dimension ................................................................. 128
    Shailendra Kumar, Sanghamitra Choudhury, Vineet Pandey

25. A Review on Root Canal Irrigants ................................................................................................. 133
    Alagarsamy Venkatesh, Dhakshinamoorthy Malarvizhi, Arunajatesan Subbiya, Venkatachalam Prakash, Paramasivam Vivekanandhan, Sherin Banu

26. Correlative Study Prolactin Level and Hypothyroidism in Both Primary and Secondary Infertility in Females of Uttar Pradesh ................................................................. 138
    Ambri Agarwal

27. Comparative Evaluation of Efficacy of Electronic Apex Locators in Determining the Working Length of the Canal Which is Used During a Routine Root Canal Treatment-In Vivo Study ........... 142
    Annapoorna Kamath, Aravind R Kudva, Shravan Kini

28. A Cross Sectional Study to Assess Sociodemographic Profile and Sanitation Practices in a Rural Village in Western Maharashtra ................................................................. 146
    Ashturkar MD, Majumdar R, Dandekar A
29. Antenatal Health Care Seeking Behavior & Health System Response– A Cross Sectional Community Based Study ................................................................. 150
   Baliga Kiran, Baliga Shantharam, Anupama Nayak P, Moideen Faheem, Ravikiran SR, Rajesh SM

30. Validation of Newly Developed and Simplified Scoring Methods of Hirsuitism ......................... 154
   Inthu Madeswaran, Sivasundari Maharajan

31. Comparison of Marginal Discrepancy between Simulated Crowns Cast with Imported and Indigenous Alloy—An In Vitro Analysis ................................................................. 160
   Ganesh Ramesh, Ramu M Reddy, Padmanabhan T V, Bhuminathan S, Krishna Prasanth B

32. L-ascorbic Acid Supplementation Ameliorates Sodium Fluoride Induced Alteration of Cardiac Autonomic Functions in Hypoxic Rats ................................................................. 165
   Jaya simha Reddy, R Chandramouli Reddy, Raju H.Talkikar, Kusal K Das

33. Comparative Evaluation of Shear bond Strength of Composite Resin Bonded to Acid Etched and Lased Primary Enamel (Er, Cr:YSGG) ................................................................. 171
   Jeeverathan J, I. A. Aravind, Ponnudurai Arangannal, Pramila Sugathan

34. Modified Cantilever Bridge; A Novel Approach towards the Replacement of Missing Primary Anterior Teeth ................................................................. 176
   Kalyani Rathi, Nilesh Rathi, Nilima Thosar, Sudhindra Baliga

35. Hybrid Encryption for Medical Applications Using Advanced Algorithms in Internet of Things .......... 179

36. Non-Syndromic, Non-Familial Hyperdontia of both Maxillary and Mandibular Region—A Case Report 185
   Amudhan A, Pushpa V C, Manigandan T, Sarumathi T, Krishna Prasanth B

37. Antibacterial Efficacy of Essential Oil of Two Different Varieties of Ocimum (Tulsi) on Oral Microbiota—An Invitro Study ................................................................. 188
   Kush Kalra, Ramprasad Vasthare, Padmaja Ananth Shenoy, Shashidhar Vishwanath, Deepak Kumar Singhal

38. Study of Correlation between HbA1c and Renal Dysfunction in Type-2 Diabetes Mellitus ............... 194
   M. T. S. Sri Vaishnavi, Sangita Patil, Ajit Sontakke, Dhiraj Mane

39. The Psychological, Social and Political Measures, How Clients Think About the Utilization of Plastic Money Using in India ................................................................. 200
   Nandita Sikari, K. Harikrishnan

40. A Comparative Study on Leisure Activity Status of School-going Adolescents in Urban and Rural Lucknow 205
   Neha Shukla, Mallicka

41. Implant Supported Overdenture for Resorbed Mandibular Ridge Opposing Partial Fixed Prosthesis .... 211
   Pankaj Kumar Ritwal, Vikas Dhull, Sumit Singh Phukela, Puja Malhotra, Bhupender Yadav, Manoti Sehgal

42. Prevalence and Causes of Visual Impairment in an Area of Western Uttar Pradesh ............................ 215
   Prerana Agarwal, D. J. Pandey

43. Association of Myo1h Gene Polymorphism in Mandibular Retrognathism in South Indian Dravidian Population ................................................................. 219
   Priya Chatterjee, S. Kishore Kumar, V. G. Abilash, M. S. Kannan, Shoba T., D. P. Yogamaya
44. Oral Lichen Planus-A Review .......................................................... 224
Priyadarshini Karthikeyan, Ramesh Kumaresan, Ravi Shankar Babu Yelamanchi, Deepthi Mandava, Neeraja Turagam, Durgaprasad Mudrakola

45. The Politics Behind the Reproductive Health in India: Special Reference to Abortion Law ............. 228
Pyali Chatterjee, Komal Vig

46. A Study on Employee Performance Appraisal System in Hospitals—
With Respect to Hospitals in Vellore City ................................................................. 233
Ramila Devi Ram Sing, S. Vadivelu

47. Assessment of Pre-analytical Errors in Clinical Laboratory at a Tertiary Care Hospital of Southern India 238
Asha Patil, Saleena Ummer V, Anju M, Kiran Chawla, Mridula Madiyal, Mamatha, Thejaswini Prabhu

48. Assessment of Knowledge, Awareness and Practice of Interdental Dental Aids as an Adjunct
Oral Hygiene Tool among Dental Professional Students .............................................. 242
Sana Chawla, Sangeeta Umesh Nayak

49. Invitro α-Glucosidase and α-Amylase Inhibitory Activities of Heartwood of Pterocarpus Marsupium .. 247
Sajita Pradhan, Santosh K. Sahu, Sangeeta Mukhi, Sudhansu Sekhar Mishra, Prafulla Ku. Chinara

50. To Compare the Efficacy of Dexamethasone with Levobupivacaine versus Fentanyl with
Levobupivacaine on Duration of Analgesia after Supraclavicular Brachial Plexus Blockade .......... 251
Ashish Aby Mammen, Shaila S Kamath

51. Anti-Microbial Activity of Psidium Guajava Leaf Extract ................................................... 257
Sharada T Rajan, Malathi N, Chamundeeswari D, Rose C

52. Aesthetic Correction of a Single Tooth with Calcific Metamorphosis with Minimally
Invasive Porcelain Veneers—A Case Report ................................................................. 263
Roma M, Shreya Hegde, Isha Gupta

53. Assessment of In-Patient Satisfaction Using Importance-Performance Map Analysis ..................... 267
Swathi K. S., Gopal Krishna B., Somu. G.

54. A Study Review of the Adverse Drug Reaction Monitoring, Documentation, and Reporting at
Tertiary Care Multi-Specialty Hospital in South India ..................................................... 272
T. Martha Mary, G. Neelakshi, Julius Xavier Scott, T. G. Beula, K. P. Sagaya Mary, A. Janet

55. Assessment of Pre-surgical Perception of Pain and Post-Surgical Pain in Patients Undergoing
Dental Implant Placement Using Modified VAS Scale: A Clinical Study .............................. 277
Pallak Razdan, Umesh Y Pai

56. Comparison of Bacterial Prevalence in Saliva of Edentulous Patients with or without
Complete Dentures by 16S rRNA Gene Based Metagenomic Analysis Identifies a Novel Bacterial
Signature in Denture Patients ....................................................................................... 282
V Sreedevi, M. S. Kanan, Aravind Ramanathan

57. A Study on Customer Intention to Pay a Premium Price for Organic Food ............................... 287
Mohd Farhan, Harvinder Singh, Deepak Pandey, Gurdip Singh, Nikhil Monga, Mohammad Asif

K. Chitra, C. Shanthi, K. Sharmila
59. Excessive Weight Loss and Quality of Life after Laparoscopic Sleeve Gastrectomy—A Correlational Study
K T Moly

60. Knowledge and Attitude of Married Women towards Contraceptives Residing in Selected Slums of Udupi District
Sowmya, Ansuya, Vishish V

61. Correlation of Lipid Profile with CD4 Count in HIV Treatment Naïve Patients
Pavan M R, Jayakumar Jeganathan, Rachuri Suresh

62. Health Care Arrangement System for Doctor-Patient Communications
Angulakshmi M, Sudha Senthil Kumar, Brindha K

Sharma Rohita

64. Effects of Birth Weight on Cord Blood Thyroid Stimulating Hormone
Krishnaji L. Garud, Ajit V. Sontakke, Anuja A. Pawar, Dhirajkumar Mane

65. Nutritional Status and Anaemic Assessment of Female Stone Crushers of Manipur Valley
Ibohal Laishram Meitei, Soibam Jibonkumar Singh

66. Interplay between Attitude and Purchase Intention: An Empirical Survey on Over-the-Counter (OTC) Drugs Consumer Behaviour
Manu Sehgal, Amit Mittal

67. Assessing Patients’ Satisfaction for Polyclinics, Empanelled Hospitals and Drug Supply Chain Management in Punjab-India
Parminder Pal Singh

68. Study of Prevalence of Peripheral Neuropathy in Newly Diagnosed Type 2 Diabetic Patients in and around Mallareddy College, TS
Visala V. Nanduri

69. Study of Different Clinical Spectrum of Hypothyroidism in Telangana Population
Vishal Nanduri

70. Study on Presence of Pathogenic Bacteria in Serving Cutleries from Food Outlets in and Around a Medical College
Amita Shobha Rao, Shobha K. L., Vishal Bhat, Shanthini Murugan, Gautam Hariish A/L Ratana Vallo, Madhuri Muniandy, Vishal Jayabala

71. Screening of Methicillin Resistant Staphylococcus Aureus Carriers among Food Handlers
Shobha K. L., Amita Shobha Rao, Ullas Kamath, Thivyashini A/P B. Rajenthiran, Ee Hui Yin, Lim Yu Ern, Quek Chia Wei

72. Effectiveness of Structured Teaching Program on Knowledge and Practice Regarding Breast Milk Expression among Postnatal Mothers of Newborn Admitted in Neonatal Intensive Care Unit at a Tertiary Care Hospital
Jagjit Singh Dalal, Hunney Parbha, Leela Rathee

73. The Prevalence of Cardiorespiratory Fitness Level (V̇o2max), Socio Demography, Risk Factors and Diseases among Hajj Pilgrim of Indonesia 2016 (1437H)
Zolaiha, Nasrin Kodim, Krisnawati Bantas
74. Creating Knowledge Using Seci Model as a Knowledge Management Stage to Improve Nurses’ Ability in Undertaking Parenteral Therapy ................................................................. 374
   Tatin Wahyanto, Nyoman Anita Damayanti, Stefanus Supriyanto

75. MicroRNA-146a Gene Polymorphism is Associated with an Increased Susceptibility to Lung Cancer Disease: A Case-control Study ......................................................... 379
   Jamsheed Javid, Rashid Mir, Abu-Duhier F M

76. Potential Impact of TP53 Gene Polymorphism rs1042522 G>C in Leukemia Patients of Saudi Arabia . 385
   Osama Al-Amer, Rashid Mir, KF Alsharif, FM Abu-Duhier, Abdulaheem Almalki, Wayil Yassen

77. Analysis of Human Resources Performance Measurement by Human Resources Scorecard Method at Hospital in Surabaya ................................................................. 391
   Amelia', Prima Nerito, Nyoman Anita Damayanti

78. Modeling the Number of Cases of Tuberculosis Sensitive Drugs (TBSD) in East Java using Geographically Weighted Poisson Regression (GWPR) ............................................. 398
   Linda Augustien Makalew, Kuntoro, Bambang Widjanarko Otok, Soenarnatalina M., Semuel Layuk

79. Determination of Platelets Count and Platelets Indices in Neonatal Sepsis at Khartoum State .......... 404
   Aadil Yousif, Emtinan Arki, Rufaida Abdelgader

80. Analysis of Correlation between Toluene Exposure and Health Risk Characterization on Printing Worker of Plastic Bags Industry ......................................................... 411
   Jihan Faradisha, Abdul Rohim Tualeka, Noeroel Widajati, Mulyono

81. Nutrition Contents and Sensory Characteristics of the Instant Papeda Enrich with Laor (Polychaeta) as Supplementary food for Pregnant Woman ........................................ 416
   Ety Yuni Ristanti, Soetjipto, Annis Catur Adi

82. Analysis of Internal Factor Characteristics Influencing the Safety Driving Behavior among Inter-City bus Drivers in East Java–Indonesia .................................................. 421
   Dewi Kurniasih

83. The Analysis on Dental and Oral Health Services based on “Rater” Service Quality Dimension to Patient Satisfaction at Natural Esthetic Clinic Makassar ................................ 427
   Badai Septa Wahyuadhi, Setya Haksama

84. Interleukin-8 (IL-8) Role in Children with Dengue Hemorrhagic Fever ...................................... 432
   Ayling Sanjaya, Diana Takumansang Sondakh, Hesti Lestari, Sri Poeranto

85. Correlation between Waiting Time of Pharmaceutical Service and Patient Satisfaction in Hospital ...... 438
   Juliyana Puspa Sari, Vica Aulya Rivera, Nyoman Anita Damayanti

86. The effect of Sodium Chloride and Trehalose Sugar in Some Chemical Characteristics of Date Palm Phoenix dactylifera L. cv. Um-Aldehine in vitro ................................................ 443
   Ahmed D. Khaleef Al-Asadi, Batool H. Falih Al-Zubaidy

87. Evaluation of Healing Process of Periapical Defect Filled by Platelet Rich Fibrin Using Cone Beam Computed Tomography–Comparative Clinical Study ......................... 448
   Ahmed Mahdi Sahib, Sahar Shakir Al-Adili

88. Association between Female Breast Cancer and Different ABO Blood Groups & Rh Factor in the Sulaymaniyah Province of Iraqi Kurdistan ...................................................... 454
   Ahmed Mjali, Anwar Sheikh, Hazha Abdullah Amin, Mohammed Jawad Al-Anssari, Zahraa Dheyaa Azeez Aljawdah, Saja Khudhair Abbas
89. The Role of Laparoscopic Drilling in the Treatment of Polycystic Ovarian Syndrome
Aqeel Meer Al-Zamily, Ali Abdul-Hussein Handoz

90. Evaluation of the Performance of Sports Management According to a Standard Scale for
Teachers of Physical Education in Najaf Governorate
Ali Mohammed Jawad Al-Sayegh, Ayman Hani Abed Al Gburi, Fadel Kurdi Shalakha

91. Effect of Adding Cinnamon Cassia in Diet on Productive Performance and Some Blood
Measurements for Broiler ROSS308
Ammar Qahtan shanoon, Osama Ahmed latif, Qana H Amin

92. Comparison of the Risk of Type 2 Diabetes Mellitus in Men and Women with Obesity in Indonesia
Andini Wisdhanorita, Syahrizal Syarif

93. Prenatal Yoga Program on Primigravida 3rd Trimester Reducing Complaints in the First Stage and
Self-Efficacy in the Labor
Anna Veronica Pont, Olkamien Jesdika Longulo, Rafika, I Putu Suiraoka

94. Analysis of Chronic Disease Management Program (PROLANIS) for Referral Control on
Public Health Center in Bengkulu
Darwis, Yenni Okfrianti, Desri Suryani, Diah Eka Nugrahani, Yandrizal, Efrizon, Putri Hidayati

95. Obesity as a Predictor of Hypertension in Adult Population: A 14-Years Retrospective Cohort Study
Dewi Kristanti, Nurhayati Prihartono

96. Short Term Effect of Spilled Bile & Gallstone During Laproscopic Cholecystectomy on Clinical Outcome
Asaad Mohammed Kadhim, Madhi Hashim Otaiwi Altaraikhim

97. Identification of Periodontitis Bacteria and Resistance Test on Amoxicillin Antibiotics in
Patients of RSGM Kandea Makassar
I E Rieuwpassa, Harun Achmad, Anggriani Susanti

98. Comparison of Self-Directed Video and Simulation Method on First Aid Knowledge among
Indonesian Students: A Randomized Control Trial
Eky Madyaning Nastiti, Siswanto, Yulian Wiji Utami

99. Influence of Increasing Consuming of Whey Protein Supplement on Reproductive system in Rats
Fatima Aziz Mahdi Al-badry

100. Indonesia Towards Universal Health Coverage: Indonesia Health Card Holders Satisfaction on
Pharmaceutical Service at Primary Health Cares
Muhammad Rizky Putrajaya, I Nyoman Wijaya, Gesnita Nugraheni

101. A Study on the Organization, Job Environment and Service Quality of Elderly Friendly
Industrial Facilities based on Healthcare
Il-Hyun Yun

102. Mediated Moderation Effect of Organizational Culture and Social Support in the Emotional
Labor and Employee Turnover of Health Care Workers
Il-Hyun Yun

103. The Effect of Dhikr before Bedtime on Sleeping Duration and Weight among Primary School Children
Jamil Anshory, La Ode Ismail Ahmad
104. The Influence of Strategic Foresight on Hospital Financial Performance: Mediating Effect of Continuous Quality Improvement

Khalidiya Mostafa Atta Abd, Sajjad Mohemmed Atiyah, Anaam Abdulzahra Meteab

105. Lipid Profile Improvement of Overweight-Obese Adults after High Antioxidant Tomato and Rice Bran Drinks Intervention

Lilik Kustiyah, Mira Dewi, Evy Damayanti, Cesilia Meti Dwiriani, Deni Alamsah

106. A Comparative Study Between S. aureus, Methicillin Resistance S. Aureus and Pseudomonas Aeruginosa Carriage in Diabetic’s Patients in General and Those with Foot Ulcer in Baquba City, Diyala Province

Burooj M. Razooqi Al-aajem

107. Early Detection of Increased Pulmonary Pressure in Hypertensive Patients Using

Mahasen M. Abd Al-Majeed, Najeeb Hassan Mohammed, Ghazi Farhan Haji

108. Assessment of Hormonal Changes in Female Patients with Migraine

Mufeed Akram Taha, Esraa Abdulkareem Mohammed

109. Evaluation of the Incidence of Abortion in Babylon—An Epidemiological Study

Nada Kadhum Kareem, Nagham K. Tayeh

110. A Morphological Comparative Study for the Species of Caryophyllaceae in Middle and North of Iraq

Najlaa M. Al-Abide, Abbas N. Al-Tememe

111. Evaluation of the Main Minerals in Osteoporosis Patients: Calcium, Phosphorus, Vitamin 25 (OH) D and Alkaline Phosphatase as a Case Study

Najlaa Kadhim Ali

112. Evaluation of Food, Health and Sports Systems for Fitness Centers in the Center of Najaf Governorate for Females

Nizar Hussain Jafar al-Nafakh, Rehab Aref Mahdi Al–Kalabi

113. Syrian Mesquite (Prosopis Farcta) as a Potent Maintainer for the Overall Health

Ismael Hasan Mohammed, Ismail Salih Kakey, Mahdi Moridi Farimani

114. The Correlation of Some Heavy Metals in Recurrent Pregnancy Loss in AL-Yarmouk Teaching Hospital

Olaa Riad Kadim, Shatha M J Al-Khateeb, Esraa. H. Humadi

115. Wilson’s Disease: Laboratory Evaluation and Clinical Presentation of Iraqi Sample

Omar Qahtan Yaseen, Mohammed Qais Al-Ani, Yasin Hamad Majeed

116. Outcome of Low Birth Weight Infants in AL-Zahraa Teaching Hospital in Kut; Iraq (Comparison between 2003 and 2008)

Qasim Dawood Yasir Altameemi, Mohannad Khadim Mohammed Ali

117. Ultrasonographic Study to Evaluate the Healing of Achilles Tendon Defect in Rabbits

Saddam Khalid Humadi, Ahmed Abdullah Sultan, Hiba Abdulaziz Shekho

118. Assessment of Patients Fear from Cancer in Basra Oncology Center

Sajjad S. Issa, Afkar F. Kareem, Samira M. Ibrahim

119. Dental Hygienist Awareness Level and Preference Image on Health and Non-Health College Students

Se-Yeon Kim, Jung-Eun Ha, Min-Ji Kim
120. Stress Ulcer Prophylaxis in Patients with Brain Injury: Retrospective Study ................................. 631
    Yuliaty Retta Hutahaean, Sumarno, Joni Wahyuahadi, Elfi Padolo

121. Modern Lifestyles and Overnutrition among Undergraduate Students in the Northeast of Thailand ….. 637
    Surasak Thiabritthi, Wongsa Laohasiriwong, Teerasak Phajan

122. Dietary Diversity and Nutritional Status of Female Residential Students in University of Dhaka, Bangladesh .............................................................................................................. 644
    Marjia Sultana, Towhid Hasan, Nazma Shaheen

123. Effect of Sponge Cylinder Exercises on The Rubber of Working Muscles to Perform Human Wheel Skill in Technical Gymnastics ........................................................................................................ 650
    Wajdan Saeed, Fatimah Abed-Maleh, Hoda Shehab Jary

124. Seroprevalence of CMV Infection in Multi-Transfused Adult Patients with Haematological Malignancies: Single Iraqi Hematology Center Experience ............................................................................................. 656
    Zaman I.L Al-Kaabi

125. The Effectiveness of Counseling on Knowledge and Compliance Patients of Diabetes Mellitus is Measured Through HbA1c ........................................................................................................................ 662
    Anisyah Achmad, Hananditia Rachma Pramestutie, Anis Kusumawardani, Raden Putra Joddy Sutama

126. Protein Kinases A (PknA), a Good Target for Vaccine Design against Tuberculosis ............................... 668
    Asra’a Adnan Abdul-Jalil, Samer N. Khalaf

127. The Role of Myocardial Performance Index in Assessment of Left Ventricular Function in Patients with Valvular Mitral Regurgitation ........................................................................................................... 674
    Sameerah Rashid Jabbar, Noori Odah Madhee, Muthanna H. Al-Quraishi, Hayder Adnan Fawzi

128. Lived Experiences of Egyptian Women with Breast Cancer Receiving Chemotherapy ........................ 678
    Sanaa Loutfy Abdel-Ghany, Bassamat Omar Ahmed, Safaa Mohammed Hassanain, Abeer Saad Zaghloul Esawi

129. Influence of Swallowing Exercises, Thermal Tactile Stimulation and Neuromuscular Electrical Stimulation in Treatment of Patients with Dysphagia Caused by Stroke ........................................ 683
    Emmy Bucyana, R. Dhanalakshmi, Sankar Ganesh

130. Lived Experience as Perceived by Patients with Implanted Cardiac Devices: A Phenomenological Study 687
    Shaimaa Ramadan Abdelwahab, Warda Youssef Mohamed, Hanaa Ali Elfeky, Nefissa Mohamed Abdel Kader, Khaled Mohamed Taema

131. Effect of Buerger Exercises on Improving Peripheral Circulation of the Lower Extremities among Patients with Type 2 Diabetes Mellitus at Selected University Hospital–Egypt ........................................ 692
    Hanan Saber A. El-Fattah, Amal F. Garas, Nawal E. Hanna, Naglaa M. Elsayed

132. Knowledge of Female Students About Breastfeeding Issues: A School-Based Study in Wasit Province/2017 ................................................................................................................ 698
    Taqi Mohammed Jwad Taher, Hasanain Ali Abdulridha Al-Saeedi, Issam Salim Ismail

133. Association between Eating Habits and Body Mass Index in a Sample of Medical College Students in Wasit University ........................................................................................................ 704
    Taqi Mohammed Jwad Taher

134. Factors Related to Chronic Obstruction Pulmonary Disease in Indonesia: Analysis of Indonesian Family Life Survey-5 Data ........................................................................................................ 710
    Bima Uramanda, Nurhayati A. Prihartono
135. The Effectiveness of Environmental Health Behavior in the Community through Coastal Community Empowerment Program in Kendari City Southeast Sulawesi Province, Indonesia ........................................ 716
La Dupai, Ruslan Majid, Syawal Kamaluddin, Rahman, Yusuf Sabilu, Junaid

136. Factors Related to Good Glycemic Control among Type 2 Diabetic Patients at Jimma Medical Center and Shanan Gibe Hospital, Jimma, Ethiopia ................................................................. 721
Million Abera Berhie, Abiru Neme Negewo, Tabarak Malik

137. Pathological Fractures: Main Causes, Sites and Outcomes a Prospective Clinical Study in Najaf City .. 727
Wejdi A. Al–Fattlawy

138. Effects of Biomass Fuel Smoke on Pulmonary Functions in Rural Women of Southwest Ethiopia ... 733
Samuel Tadesse Abebe, Tabarak Malik

139. Clinical Manifestation of Singleton Pregnancy Complicated by Diabetes Mellitus ..................... 739
Thikra Najim, Weyar Akram H, Yousef Abdelraheem

140. Association between SES, Health behavior and Periodontal Disease ............................................. 745
Eun-Sil Choi, Young-Soo Lee

141. The Effects of Job Satisfaction on Organizational Commitment in Korea Dental Hygienist: Organizational Communication Mediation Model ................................................................. 751
Young-Soo Lee, Marcia Lorentzen, Eun-Sil Choi

142. Effectiveness of the Otaria’s Postpartum Gymnastic Model and Caregiver Assistance on Decreasing of Uterine Fundal Height in Postpartum Mothers .................................................. 758
Emy Rianti, Elina, Mugiati, Yudhia Fratidhina, Suparman, Agus Triwinarto

143. Legal Protection of Health Rights for Indonesian Migrant Workers Abroad .................................. 764
Wafda Vivid Izziyana, Absori, Harun, Kelik Wardiono, Fatkhul Muin, Khudzaifah Dimyati, Bahtiar

144. Elaboration of the Joint Community Forest Management Policy with the Policy of Managing Forest Village Community Health Insurance in Ngawi District ........................................... 769
Sigit Sapto Nugroho, Absori, Harun, Rahmanta Setiahadi, Suparji, Arief Budiono

145. Clinicopathological and Immunohistochemical Study of Fascin-1 Expression as a Predictive Factor for Invasiveness in Transitional Cell Carcinoma of Urinary Bladder ......................................................... 774
Ro,aa Sadiq Obaid, Haider Abdul Ridha Alkafaji, Mohammad Ridha Jodi

146. Effects of Infrared Radiation on Escherichia coli Isolated from Appendectomy .............................. 780
Ibrahim Mohammed Saeed Hussein, Sameerah Hasan Abdullah, Sameen Fadel Mohammed

147. Isolation and Identification of Some Bacterial Strains Isolated from Throat Infections in Hilla Province, Iraq 784
Ilham A. Bunyan, Safaa S. Najj, Haider H. Aljooda

148. Appraisal of Iraqi Women’s Knowledge Related to Breast Cancer and their Performance of Breast Self-Examination in Al-Diwanyia City ................................................................. 790
Fadia H. Ali, Atheer M. Motasher, Mohammed Abdul-Hassan Jabarah, AL-Zobaidy

149. Molecular Detection of RIF Resistance in Pulmonary and Extrapulmonary Specimens in Misan Province–South of Iraq ................................................................. 797
Zainab Mohammad Edi, Sanaa Basheer Kadhem, Mayssa Ghazi Jumaa
150. Effect of Laser Diode 820Nm on the Levels of Lactate Dehydrogenase, Creatin Phosphokinase, and Lactic Acid in Muscles of Students ................................................................. 801
Mahdi Ali Sukkar Al-Farawn, Zahida Miran Hussein, Wafaa Sameer Abdullah

151. Genotypic Study of Hepatitis Type B in Al-Diwaniya Province, Iraq ........................................... 806
Wisam S. Abbood, Hazim S. Atiyah Al-Mhanah

152. Immunological and Molecular Detection of Hepatitis E Virus in AL-Samawah City, Iraq .......... 812
Mouna Akeel Hamed Al-Oebady

153. Comparison of High Molecular Weight Beta Trace Protein and Low Molecular Weight Beta Trace Protein for the Assessment of Kidney Function in Patients with Chronic Kidney Disease ............... 816
Mudher Kidher Mohammed, Amer Hamza, Mufeed Jalil Ewadh

154. A Comparative Study of Serum Levels of the Anti-inflammatory Cytokines IL-35 in Allergic Asthma and H. pylori Infected Patients ......................................................... 824

155. Association of Arginase I Gene Polymorphism with the Risk of Atherosclerosis in a Sample of Iraqi Patients ............................................................. 830
Suhad A. Ibrahim, Hameed M. Jasim, Jwan A. Zainulabdeen

156. Study of the Association between Prolidase Enzyme Kinetics and Severity of Asthma in Children ...... 836
Seham A. Muhsen, Hassan H. Al-Saeed, Areej Abdul Abass AlOmranri

157. The Effect of Environmental Temperature on Semen Characteristics of Three Breeds of Rams at Different Seasons and Locations in Iraq ........................................ 843
Sabah A. Hameid A. Rahman, Haleem Hamadi Issa Al-hashmi

158. Human Metapneumovirus in Patients with Respiratory Infection Negative for Influenza Virus (H1N1, H3N2, Influenza B) ................................................................. 849
Luma Ghaeb Al-Saadi, Hadeel M Fayyadh, Eman Natiq Naji, Iman M Aufl

159. Do Dental Arches Lengths, Widths and Perimeters Affect Bolton’s Ratios? .................................... 855
Nadia Basim Al-Ansari, Suha Ali Abdul Ameer, Mohammed Nahidh

160. Persistently Elevated Levels of Serum Autoimmune Inflammatory Markers after Total Thyroidectomy for Hashimoto’s Thyroiditis. An Indicator of Prevailing Autoimmunity ...................... 861
Adil Shaker Al-Tamimi, Israa A. Dheeb

161. Assessment of Non-technical Skills Using High Fidelity Simulation among Emergency Medical Services (EMS) Students in Pune, India ..................................................... 866
Parag Rishipathak, Monesh Bhandari, Anand Hinduja

162. Impact of First Exposure to High Fidelity Simulation on Self-Reported Psychological Stress Levels amongst EMS Students in Pune, India ........................................ 870
Parag Rishipathak, Shrimary Vijayraghavan, Anand Hinduja

163. The Impact of Teaching the Creative writing by FOCUS Strategy to Develop ................................ 876
Hawraa Hafudh Kareem, Sabeeha Hamza Dehham, Muhataram Abid Al-Wahid

164. Certain Hematological Denotations in Chronic Renal Failure Patients ......................................... 881
Wasan Adual Wahab Alsiadi, Majid M. Mahmood, Abed Sultan Hassan
165. Effectiveness of the Problem Tree Strategy in the Development of Multiple Intelligences among Preparatory School Students ................................................................. 885
   Laith Al-Janabi, Mohammed H.

166. Gender-Specific Impact of Maternal Obesity on Birth Weight ......................................................... 890
   Shahla O. Al-Ogaidi, Sura A. Abdulsattar, Hameed M. J. Al-Dulaimi

167. Interplay between EBERS and P27 Tumor Suppressor Proteins in Molecular Transformation of Nasopharyngeal and Sinonasal Carcinomas ................................................................. 894
   Marwa Mohammed Ali Jassim, Majid Mohammed Mahmood, Saad Hasan Mohammed Ali, Mohammed Sobhi Kamal

168. Nosocomial Bacterial Strains Isolated from Patients Who Reside in Different Health Facilities in Duhok City with Their Antibiotics Resistance Patterns ......................................................... 901
   Zahraa Kamaz, All’a’ Miyasar Ahmed, Haval Abdulkhalik Hamadamin

169. Prevalence and Risk Factors of Low Back Pain among Nurses in Kirkuk General Hospitals .............. 905
   Omed Hamarasheed Mohamad-Ameen, Nashwan Nadhim Hasenb, Suhailah Mohammed Ali

170. Quality of Life among Caregiver of Children with Thalassemia in Al-Najaf Governorate ................. 911
   Wameedh Hamid Shaker

171. The Impact of Teaching on the Skills of Visual Thinking and the Development of the Tendency of Pupils in the Fifth Grade Primary ................................................................. 915
   Olfat Kazem Omran, Mahdi Jader Habib, Qais Hatem Hani

172. Uric Acid Correlates Negatively with Anti-Mullerian Hormone in Chronic Kidney Disease and/or Polycystic Ovary Syndrome Patients ................................................................. 920
   Samal Hakeem Kareem Al-Jaff

173. The Cytotoxic Effects of Lipopolysaccharide Extracted from a Local Isolate of Salmonella enteritidis on Breast and Ovarian Cancer Cell Lines ................................................................. 925
   Rihab Abbas Sabeeh, Ahmed Jasim Neamah, Alaa Abdelkadhim Jawad

174. Assessment of Knowledge for Pregnant Women toward Risk of Pregnancy in Al-Amara Primary Health Care Centers at Southern of Iraq ................................................................. 931
   Ghazwan Abdulhussein AlAbedi, Aqeel Aziz Arar, Thani Asmar Radhi

175. Assessment of Level of Depression in Patient with Osteoarthritis at Handicap Center in Al-Nasiriyah City 936
   Qasim Ali Khasal, Amer Muhasin Naser, Hussein Abdulmohsin Dabis

176. Assessment of Quality of Life in Patients with Brain Tumor after Surgery ........................................ 941
   Shatha Saadi Mohammad, Raheem Malalla ABADi, Mohamed igrish, R. N. Kadhim Hussein Jassim

177. Assessment of Senior Students’ Knowledge Concerning Nursing Diagnosis at Southern of Iraq Nursing Faculties ................................................................. 945
   Aqeel Azeez Arar, Ghazwan Abdul Hussein AlAbedi, Thani asmar radhi

178. Bullying and Its Relation to Obesity and Overweight among School Age Children at Hilla City ........... 951
   Nuhad Mohammed Kassim, Hussien Jassim Mohammed, Musadaq Abdulkadhim Dohan, Salma K. J, Kathim Hussein Jassim, Abdul Rahim Mkhif Hassan

179. Effectiveness of an Instructional Program of Nurses Knowledge Concerning Management of Anaphylactic Shock at Emergency Units in Babylon Teaching Hospitals .................................. 957
   Hussain Khalif Kitab AL-Sultiny, Hussein Hadi Atiyah
180. Environmental Impact Assessment of Medical Wastes Shredding Machine in Al-Hila Teaching Hospital-Babylon Province, IRAQ ................................................................. 963

181. Immunohistological Study of ER, PR, and Her2/neu Status in Breast Carcinoma ........................................ 968
Ali Hassan Al-Timimi, Ahmed Obaid Hossain

182. Impact of Nurses’ Burnout Upon Quality of Oncology Nursing Care in Pediatric Teaching Hospital in Baghdad City ............................................................. 974
Mustafa Salim Hassan, Mahdi Abid Neema

183. Physiological Aspects of Osmolality and Cations of Young University Adults Suffer from Blood Glucose, Blood Pressure and Smokers ........................................ 980
Nada Saad Naji Al-Taee

184. Prevalence of Meningitis among Children under Fifteen Years for the Period of 2014 to 2018 in Hilla City 986
Nada Khazal Kadhim Hindi, Mohammed Malih Radhi, Mohammed Talib, Sadeq Hamid Jassem, Saad Noman Abd ALSadh, Ali Salman Dawod, Ali Hussein Ajeel

185. Prognostic Importance of Some Hormones in Menopausal Women in Babylon City-Iraq ....................... 991
Reem Abdul Raheem Mirdan Alsaad

186. Role of Nurse in Reducing Stress among Female Patients Performing Magnetic Resonance Imaging ... 996
Younus Khudhur Baeez, Abid Salih Kumait AL-Jumaily, Nazar Ahmed Mahmood, Qasim Hussein Mohammed

187. Role of Toll Like Receptor-9 Gene Polymorphism among Patients with Exacerbation Chronic Obstructive Pulmonary Disease in Holy Karbala, Iraq ................................................................. 1001
Zainab Abed Alftah Alhabeeb, Abeer Thaher Naji AL-Hasnawi, Huda Hadi Al-Hasnawy

188. The Effect of Hidden Arrangement in Creative Thinking .......................................................................... 1007
Hussein Rajeh Nemma Makhif, Bassim Abd Al-Khaliq Abaas, Thaar Sameer Hassan

189. The Efficacy of 6 Weeks Course of 0.05 % Topical retin-A in the Treatment Molluscum Contagiosum:
A Cohort Study ............................................................................................................................................. 1012
Suhad Jassim AbdAlkadhim, Akeel Hamed Jabur, Farah Saleh Abdul-reda

190. A Study of Risk Factors and Associated Symptoms among Patients with Bronchial Asthma Attending Al-Hillah Teaching Hospital ................................................................. 1016
Fakhria Jaber Mubabes, Salma Kadum Jehad, Hussien Jassim Mohammed, Dia S Abdul-Hadi

191. Assessment of Nurses’ Knowledge Concerning Management of Fractures in Orthopedic Wards ........ 1022
Bashar R. Mohammed Ali

192. Assessment of the Midwives, Knowledge toward Management and Prevention of Postpartum Hemorrhage at Delivery Rooms in Holly Karbala and Hilla City Hospitals ................................................................. 1027
Manar M Hameed, Salma K Jihad

193. Developing Women’ Information Towards their Hemophilic Children at Hereditary Blood Disease Center in Al-Nasiriya City ................................................................. 1032
Oday Faris Washeel, Ali Hussein Abbas, Sameer Razak Olivi

194. Evaluation of Pruritus Self-Management among Hemodialysis Patients in Baghdad Teaching Hospitals 1037
Widad K. Mohammod
195. Screening of Obesity, Blood Pressure and Blood Glucose among Female Students Athletes at the College of Physical Education and Sport Sciences in the University of Baghdad ................................. 1041
   Suhad Q. Saeed, Mohammed F. Khalifa, Mawahb H. Noaman

196. Study to Diagnose the Entamoeba histolytica Parasite from Patients with Diarrhea Attended to General Education Hospital in Al-Qadisiyah Province Use PCR Conventional for Detecting ....................... 1045
   Saafa Ressan Abdullah Al-Kaeebi

197. The Histological Study of Proventriculus Stomach in Iraqi Black Francolin
   (Francolinus francolinus) and Common Teel (Anas Crecca) ............................................................... 1050
   Alaa Najee Salih, Osamah Nassir Wali, Ali Fayadh Bargooth

198. The Significance of p53, Bcl-2, and HER-2/neu Protein Expression in Iraqi Females
   Breast Cancer Cell Line (AMJ13) ........................................................................................................... 1055
   Doha F. Alawsi, Ahmed Majeed Alshammari, Maha F. Majeed

199. Use Siphoviridae Bacteriophage as a Treatment for Mice Infected with MDR
   Pseudomonas aeruginosa and Histopathology Study .............................................................................. 1060
   Mays B. Jalil, Maha Khalil, Zainab R. Abdul-Hussien, Hayder A. Al.Hmudi

200. Vitamin D Insufficiency is a Risk Factor for Infertility: Case Control Study ..................................... 1065
   Lina Muhsen Atyia

201. Congenital Heart Diseases in Consanguineous Marriages in Tikrit-Iraq ............................................. 1070
   Mejbil Ahmed Abd, Rikan sulaiman, Ashoor R Sarhat

202. Decrease the Severity of Spasticity Symptom for Patients with Multiple Sclerosis after
   Performance of Structured Self-Management Training Program (Theoretical Framework) .................. 1073
   Sahar Adham Ali, Hassan Alwan Baiee, Hayder Ibrahim Ali

203. Determination of Daily Living Activities of School Age Children with Sickle Cell Anemia in
   Al Nasiriya City ....................................................................................................................................... 1077
   Adil Ali Hussein, Mohammed Baqer Hassan, Amer Abdullah Sachit

204. Determine of Osteoporosis Knowledge among Female Students at Institutes in Middle Al-Furat at Iraq 1083
   Ridha. M. Lefta, Mohammad Abdulbaqi Abdulmohsin, Ahmad Ali Khesbak

205. DNA Genetic Recombination based Image Encryption using Chaotic Maps ....................................... 1088
   Dina Riadh Alshibani, Narjis Mezaal Shati, Nada Thanoon Ahmed

206. Effectiveness of Structured Educational Symptoms Management Program upon
   Muscle Strength for Patients with Multiple Sclerosis .............................................................................. 1094
   Hayder Ibrahim Ali, Sahar Adham Ali, Hassan Alwan Baiee

207. Epidemiology of Congenital Heart Diseases in Tikrit Teaching Hospital ............................................ 1097
   Ashoor R Sarhat, Rikan sulaiman, Mejbil Ahmed Abd

208. Evaluation of Nurse Role in Management of Patients with Heart Attack ............................................. 1102
   Younus Khudhir Baeez, Qasim Hussein Mohammed, Abid Salih Kumait, Yousif Mohammed Younis,
   Dara Abdulla Qadir

209. Prevalence of Hypertension and Myocardial Infarction in Relation with Blood groups in
   Open Cardiac Center at Al-Najaf City .................................................................................................... 1106
   Wijdan Dhaidan Shnain, Fatima Wanas Khdair, Ohood Aqeed Radhi
210. Prevalence of Serratia Species Isolated from Children with Diarrhea and Studying their Virulence Factors ................................................................. 1111
   Gulbahar F. Karim

211. Some Functions of the Lungs and Emotional Arousal and their Relationship to Achieve the Effectiveness of Running 1500 m for Young Players ................................................................. 1117
   Ali Bukheet Hassan, Mahmoud Nasser Radi

212. Synthesis and Characterization of New Heterocyclic (Triazoline) Anticancer Compounds .................. 1121
   Hayfaa A. Mubarak, Kadhum Jwad Al-Hamdayani

213. The Effect of Teaching on the Skills of Logical Thinking in the Achievement of Student’s Achievement in Biology .......................................................... 1125
   Hawraa Qusay Jawad, Moshrak Majwall, Abass Hussen

214. The Effectiveness of a Specimen Collection Edilson in the Fifth grade Unqualified Biological Material in Biology and Thinking Contemplative .......................................................... 1130
   Ghadah Shareef AbdulHamza, Riyam Rashid Hameed. J, Ausama Abde AlKadhum Alajeely

215. The Impact of Challenge Strategy on Student Achievement of fourth-grade Students in Biology ...... 1135
   Hassanein Fawzi Latif, Arif Hatem J., Anma Kazem

216. The Impact of Nedham’s Structural Model in the Reflective Thinking to Develop the Habits of Mind for Students .............................................................................................. 1140
   Yasser Salman Hamza, Mohamed Hadi Shnein, Abtisam Jafar Jawad

217. Analysis and Measurement the Standards and its Impact the Reflective Thinking to Develop the Habits of Mind for Students ................................................................. 1145
   Riyadh Kahdum Azouz, A. Saad Abdul Razzaq Al-Khorsan, Salah Mahdi Saleh

218. Assessment of Secondary School Female Students’ Knowledge about Reproductive Health in Basra City1150
   Aliaa H. Ali, Ezedeen F. Bahaaldeen

219. The Impact of the Pairs Check Strategy on Achieving Fourth Grade Students to Develop the Habits of Mind for Students ................................................................. 1156
   Khamael Mohammed Merzah, Ibtisam Jaafar Jawad alKhajji, Sana Salim Najm

220. Effectiveness of Training Program of School-Age Students about First Aid by Videos Techniques on their Safety Practices in Al- Ashar District Schools at Basra City ................................. 1161
   Nuha Saeed khadhim Al-Mansuri, Iqbal Ghanim Ali Ma’ala

221. Health Nutrition and its Relation to the Mental Skills of Primary School Students in Science .......... 1166
   Suzan Kadhim Mussttaf, Ausama AbedALKadhim, Abtesam Jafar Jawad

222. Medicinal Applications of Organotin (IV) Complexes and Its Important Place as Effective Antitumor Agents .................................................................................. 1171
   Angham G. Hadi, Khudheir Jawad, Emad Yousif

223. The Impact of Daniel Model on the Fifth Grade Students for Development the Skills of Students’ Science 1178
   Saif Hamed Sarhan Al-Sayegh, Mohammed Hamid Mahdi Al-Masoudi, Mohammed Rasan Daman

224. The Impact of the Content of the Science for the First Stage for Development of the Curriculum and its Effects on the Mental and Emotional Aspects of the Students ................................................ 1183
   Widian Jawad Kadhim, Ghadah Shareef Al-Sheikh, Mohammed Hadi Shinen
225. The Impact of Using Chunking Technique on Developing Reading Skill and Perception of Intermediate School Students ................................................................. 1186
   Zahra’a Mohammed Hussein, Sabeeha Hamza Dehham, Abd Ali Nayif Hasan

226. Comprehensive Learning Strategies for the Development of Mind Theory for Deaf Children and Hearing Impaired .................................................................................................................. 1190
   Baraa zuheir abd alkreem, Abdul Salam Jawdat, Nahida Abdel Zaid Al Dulaimi

227. Scolicidal Effect of Ethanolic Extract for Cydonia oblonga Seeds in the Viability of the Protoscolices of the Echinococcus granulosus Parasite In Vitro ................................................................. 1195
   Zaid Nadhim Mohammed, Zainab Ali Hussein, Jameel Jerri Yousif

228. The Association between Abnormal Body Mass Index and First Trimester Spontaneous Abortion in Iraqi Women: Case Control Study ................................................................. 1199
   Suad Abdulzahra Mutar Al-Gassar, Nibras Naser Hasan, Lina Muhsen Atyia

229. The Effect of the Strategy (Mental and Informational) on the Ability of Pupils in the Fifth Grade in Primary School in Reading Material ...................................................................................... 1204
   Ameerah Ghanim Akkar Al-Delfi, Aref Hatem Hadi al-Jubouri, Saad Hassan Alawi

230. An Evidence for Ability of Malassezia Species to Experimentally Induce Pityriasis Versicolor in Various Skin Layers by Using Periodic Schiff Stain(PAS) ................................................................. 1209
   Farqad M. Al-Hamdani, Maha K. I. Almallak, Ihsan E. AlSaimary, Khalil I. Al Hamdi, Muslim A. Muhammad

231. Citric Acid Production Using Wheat Bran by Aspergillus niger ...................................................................................... 1213
   Aiden M. Hussain

232. Effect of Olea europea L Extraction and TiO2 Nanoparticles against Pseudomonas aeruginosa ........ 1218
   Hiba Qasim Hameed, Anaam Abdulqader Hasan, Rana Mujahid Abdullah

233. Evaluation of the Midwives, Practices toward Management and Prevention of Postpartum Hemorrhage at Delivery Rooms in Holly Karbala and Hilla City Hospitals ...................................................................................... 1224
   Manar M Hameed, Salma K Jihad

234. Evaluation the Effect of Gentamicin on Fertility of Male Rats & Probable Protective Role of Lipoic Acid 1230
   Kawther Yahya, Ayyed Hameed Hassan, Haydar Nadhem

235. Introducing 5P’s Methodology as Healthcare Marketing Plan: Using 5P’s Healthcare Marketing Plan in Diabetic Foot Care Management ................................................................. 1235
   Salama Jabbar Raji

236. New Ruthenium Metal Complexes for their Activity with DNA and Cells of Cancer/DFT-B3LYP Calculations ................................................................. 1240
   Asmahan Asaad Muhmood, Faeq A. Al-Temimei

237. Pioneer Data for Initiating Prostate Cancer National Screening Program in Baghdad ......................... 1245
   Bashar Mohammed Hobi, Alaa Al-Deen Al-Dabbagh

238. Psychological Study of Ethics, Values and Functionality for understanding Attitudes, Habits, Beliefs, Functional Skills in a Staff of University of Babylon ................................................................. 1249
   Mohhe Arak Uleywi, Mohamed Shaker Hamza

239. Role of Toll-Like Receptor Gene Polymorphisms in Patients with Type 2 Diabetes and Diabetic Foot Ulcer 1254
   Furqan Naeem Al-karawi, Abeer Thaher Naji Al-Hasnawi, Thekra Abd Jebil Al-Kashwan
240. Safety Measurement among Pregnant Women with Anemia at Babylon Teaching Hospital ..................1258
   Wafaa Ahmed Ameen

241. The Effect of Maternal Level of Mother Education on the Prevalence of Dental Caries in
   School Aged Children ............................................................................................................................. 1264
   Wissam Hamid Al-Janabi, Hassan Faleeh Farhan AL-Sultani

242. The Impact of a Strategy Roaming Exhibition in the Skills of Logical Thinking in the
   Second Grade Student’s Average in Science ........................................................................................... 1269
   Anwar Kamel Flaeh Alsultaay, Gada sharef, Hani mahmood

243. The Impact of Scamper’s Strategy in Developing Creative Thinking and Achievement for
   Fifth Graders in the Field of Eloquence and Application ........................................................................ 1274
   Ibtisam Sahib Mussa AL-Zuwainy

244. The Impact of Teaching Critical Thinking Skills in Achieving Fourth Grade Students ....................... 1280
   Ahmed Samer, Mohamed Kazem Mintoub, Mohammed Rassin Al-Sultani
245. Influence of Occupational Safety and Health Training toward Staff Practices at Fast Food Restaurant in Malaysia ................................................................. 1285
   Sarimah Ismail, Siti Zuhaili Samsudin, Arif Kamisan Pusiran

246. Does University Students’ Stress Have an Impact on their Psychological Well-Being? .................. 1290
   Halimah Mohd Yusof, Rabeatul Husna Abdull Rahman, Nurul Farhana Mohd Noordin, Salwa Abdul Patah, Wan Mohd Azam Wan Mohd Yunus, Goh Chin Fei

Estimation of C-Reactive Protein Levels in Chronic Periodontitis

Prashaanthi N₁, Anitha Roy², Savitha G³

₁Graduate Student, ²Associate Professor, Dept. of Pharmacology, ³Senior Lecturer, Dept. of Biochemistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

ABSTRACT

Aim: The aim of the study was to assess the level of C-reactive protein in patients with chronic periodontitis.

Introduction: Periodontal disease is marked by chronic infection and inflammation in periodontal tissues resulting in the destruction of alveolar bone with subsequent tooth loss. C-reactive protein (CRP) elevation is a part of the acute phase response to acute and chronic inflammation. Periodontal sub-gingival pathogens affect native and general immune and inflammatory response and causes the liberation of cytokines, this result in periodontal destruction and initiation of acute phase systemic inflammatory response marked by the release of C-reactive proteins.

Materials and Method: Patients were selected from those attending the outpatient department of a private hospital and divided into two groups (n=30) Group I – Normal healthy individuals and Group II – Chronic periodontitis individuals. Informed consent was obtained from the patient before sample collection. 3ml of venous blood was collected in plain collection tubes and centrifuged at 3000rpm for 10 minutes. Then serum was separated and analysed to estimate the CRP by Turbilatex Method using ERBA CHEM 5 plus analyzer. Student t test was used for statistical analysis of the data.

Results: The study group showed a significant increase in mean CRP level 7.7 ± 1.25 compared to control 3.12 ± 1.25 (p = 0.001)

Conclusion: The increase in CRP level associated with patients with chronic periodontitis compared to individuals with healthy periodontium may be indicative of the inflammation and hence, CRP may be used as a inflammatory marker for diagnosing periodontitis.

Keywords: biomarker, CRP, inflammatory response, periodontal disease, saliva.

Introduction

Periodontal disease is marked by chronic infection and inflammation in periodontal tissues leading to destruction of alveolar bone with subsequent tooth loss. Periodontal infections are the result of an interaction between tooth associated microbial biofilms and the host defences. Periodontal pathogens can affect local and systemic immune and inflammatory responses.¹,²

C - reactive protein (CRP), plasminogen-activator inhibitor 1 (PAI-1) and fibrinogens are the most important factors in the acute phase of inflammation. CRP is a protein synthesized in the liver and the major protein of plasma. Its half-life is approximately 4-6 hours. The serum levels of this protein increase rapidly within 24 to 72 hours in conditions of inflammation or tissue damage and will subside after the removal of inflammation or infection.³,⁴ It is a pattern recognition molecule, that is extremely sensitive and non-specific acute-phase marker for inflammation, produced in response to many forms of injury other than binding to specific molecular configurations that are typically exposed during cell death or found on the surfaces of pathogens. It is regulated by cytokines like interleukin-6 (IL- 6), interleukin-1β (IL-1β) and tumour necrosis factor-α (TNF-α).⁵,⁶

A biomarker is an objective measure that has been evaluated and confirmed either as an indicator of physiologic health, a pathogenic process or a pharmacologic response to a therapeutic intervention. Biomarkers can be studied in various body fluids like serum, GCF, saliva, CSF, urine etc. There have been innumerable attempts over the years to establish methods of diagnosis or prognosis for oral disease by the analysis of saliva. Oral fluid/saliva, called the ‘mirror of the body’, is a perfect medium to be explored for health and disease surveillance. Positive correlation between CRP and periodontal disease severity was proved by many studies and levels of CRP decrease after nonsurgical periodontal therapy, but most studies have focused on CRP levels in chronic periodontitis, and very few are conducted on patients with aggressive periodontitis. Epidemiological associations between periodontitis and CVD have been reported.

The findings conducted by Rangbulla et al .,2017, suggest that salivary IgA, Interleukin-1 and MMP-8 might be potentially useful in distinguishing health from disease with early diagnosis, monitoring periodontal disease activity, and response to therapy. The systematic review by Fintoni et al,2017, showed higher IL8 gene expression and IL-8 protein levels in gingival tissues from individuals with chronic periodontitis compared with periodontally healthy patients. There are conflicting evidences regarding IL-8 levels in saliva. Moreover, although the results of the studies were highly heterogeneous, many studies reported higher IL-8 levels in the gingival crevicular fluid of patients with chronic periodontitis as compared to healthy controls.

The Periodontal disease may lead to atherogenesis by two different pathways: A direct invasion of the arterial wall as evidenced for chlamydial organisms and P.gingivalis and some other periodontal pathogens. The release of some systemic inflammatory mediators and acute phase reactants with atherogenic effects. E.g.: TNFα, IL-1, IL-6, CRP, and serum amyloid-A. The total volume of inflamed periodontal tissue may also play a role and there is tendency for higher CRP levels in generalized periodontitis compared to localized periodontitis. It has been established that the extent of bacteremia is directly related to the severity of the periodontal inflammation. Subsequently, the systemically dispersed bacteria and lipopolysaccharide (LPS), as well as cytokines from the periodontal lesion, may stimulate hepatocytes and circulating leukocytes to produce CRP and IL-6, respectively. The presence of periodontal pathogens Porphyromonas gingivalis, Prevotella intermedia, Campylobacter rectus and Bacteroides forsythus in subgingival samples was positively associated with elevated CRP levels.

Present studies have demonstrated that the extent of increase in CRP levels in periodontitis patient depends on the severity of disease and that the elevation of CRP is associated with the presence of periodontopathic bacteria. It should be noted that CRP levels of patients tended to be higher at baseline and declined at reassessment, suggesting that destructive periodontal diseases are treatable and that it may be possible to lower the CRP value through effective management of destructive periodontal disease. This study was done to assess the levels of C-reactive protein in patients with and without periodontitis.

Materials and Method

Patients were selected from those attending the outpatient department of a private hospital and divided into two groups (n = 30). Group I – Normal healthy individuals and Group II – Chronic periodontitis. The criteria included were individuals with the age group of thirty five to sixty five years and patients with Chronic periodontitis. The exclusion criteria includes individuals with other systemic illness like obesity, Cardiovascular disease, Renal failure, Stroke, endocrine illness, Individuals with acute illness like fever and immuno-compromised individuals.

Sample collection: Informed consent was obtained from the patient before sample collection. 3ml of venous blood was collected in plain collection tubes and centrifuged at 3000 rpm for 10 minutes. Then serum was separated and analysed to estimate the CRP by Turbilatex Method using ERBA CHEM 5 plus analyser. All the data were analysed by using SPSS package. Student t-test analysis was done to find out significant differences between the two groups.

Results

The study group showed a significant increase in mean CRP level 7.7 ± 1.25 compared to control 3.12 ± 1.25 ( p = 0.001) ( Table 1)

Discussion

The present study revealed a statistically significant increase in the C-reactive protein in the study group with chronic periodontitis compared to control group. CRP represents a reliable marker of the acute phase response to infectious burdens and/or inflammation. Recent evidence has indicated that patients with severe periodontitis have increased serum levels of CRP compared to unaffected control population.16

Periodontal diseases involve chronic inflammatory processes resulting from interaction of selected gram negative bacterial species with the host defense in disease susceptible individuals. The host responds to microbial challenge, with a high inflammatory response with increased levels of cytokines like IL-1, IL-6, TNF-α. These mediators promote activation of the acute phase reactants resulting in elevated serum levels of CRP, α1-acid glycoprotein, ceruloplasmin, serum amyloid A.17-21

In 2015, Podzimek et al compared and evaluated the systemic levels of CRP in the peripheral blood samples of patients with chronic and aggressive periodontitis, gingivitis, and gingival recessions. Their study results show that CRP levels increase subsequently with the severity of the periodontal disease. There was a positive correlation of CRP levels increasing in patients with gingivitis and patients with chronic periodontitis.15 In 2017, the study conducted by Chandy et.al, showed that there is an increased level of serum CRP and plasma fibrinogen in study groups when compared to healthy controls. An increase in level of mean serum CRP and plasma fibrinogen were observed in chronic and aggressive periodontitis group when compared to control group and this was found to be statistically significant.2

In this study, CRP level of patients with periodontitis was significantly high compared to healthy patients. They are in accordance with the study of Podzimek et al. There is positive co-relation between high CRP levels with periodontitis. Hence, the present concept is that periodontitis affected subjects have association between periodontal conditions and systemic CRP and periodontal infections may be one of the factors contributing to systemic inflammation. Podzimek et al, have also demonstrated that periodontitis affected subjects have association between periodontal conditions and systemic CRP levels.15

According to study conducted by Salzberg et.al, patients with aggressive periodontitis have statistically significant elevations in serum CRP levels compared to subjects with healthy periodontium. Elevated CRP in these subjects might represent a contribution of periodontal infection to systemic inflammation in relatively young individuals.18 Factors that place individuals at high risk for periodontitis may also place them at high risk for systemic diseases such as cardiovascular disease. Among the environmental risk factors and indicators shared by periodontitis and systemic diseases, such as cardiovascular disease, are tobacco smoking, stress, aging, race/ethnicity, male gender, and history of Periodontitis. It seems likely that the polymorphisms in the IL-1ß and TNF-α gene family are likely to be associated with cardiovascular disease as well as with periodontitis.19 The result of this study showed that the patients with high CRP levels are affected with periodontitis and on the other hand they are prone to other systemic diseases. Healthy patients with normal CRP levels or decrease in the CRP levels have healthier periodontium.

Conclusion

This study highlights the association between the CRP levels and chronic periodontitis. CRP can be used as a serum biomarker for the diagnosis of chronic periodontitis. Studies can be conducted on a larger sample size which may confirm the association of CRP levels in chronic periodontitis.

Conflict of Interest: Authors report that there is no conflict of interest of any kind.

Statement of Informed consent: Informed consent was obtained from the concerned authorities and from the subjects before the study.

Statement of Human and Animal Rights: No harm was inflicted on any humans on conduction of this study.

Does Accreditation Improves Quality of Care Perceived by Healthcare Providers?

Arif Raza
Assistant Professor, Healthcare Management Programme, Goa Institute of Management, Goa

ABSTRACT

The study is aimed at understanding whether the accreditation of hospital in India (NABH) has any effect on its quality, as perceived by the healthcare providers. Primary data was collected from healthcare providers working in accredited and non-accredited hospitals, on their rating of Infrastructure, process and outcome of care at their hospital. The data was statistically analysed to determine if there is any significant difference in the rating given by accredited hospital’s healthcare providers from non-accredited hospital’s healthcare providers.

The study found that except infrastructure component, the mean rating and percentage of high rating were significantly higher for process and outcome component. The overall rating was also significantly higher by accredited hospitals healthcare providers.

Keywords: Hospital Accreditation, Quality, Patient Safety, NABH

Introduction

Accreditation of hospitals is considered as one of the most successful mechanism to achieve improvement in quality and safety of healthcare. In healthcare, accreditation recognize and certifies the capability of a healthcare organization in delivering an acceptable standard of healthcare services, which is based upon good and safe practices.

Accreditation is gaining prominence amongst healthcare organizations in India. Accreditation by National Accreditation Board for Hospitals and Healthcare Providers (NABH) is the most sought after accreditation by Indian hospitals. After the advent of NABH accreditation in India in 2006, the number of hospital achieving NABH accreditation has been consistently increasing. The process of getting accreditation by NABH involves application, pre-assessment, final assessment and grant of accreditation. In between these stages the HCO is required to prepare itself as per the requirements of accreditation standards.

Since its inception the NABH board has promoted accreditation of hospital as an effective mean to improve quality and patient safety. Several benefits of accreditation for different stakeholders of the hospital have been mentioned. Several other organizations specifically who are in business of providing consultancy support to hospitals also promotes accreditation on similar lines.

However, the recognition of accreditation as a means to healthcare quality have not been sufficiently verified scientifically. Although there have been various researches and systematic literature reviews conducted in other parts of the world, in India no such study has been done till date.

Existing studies on healthcare accreditation shows differential result with different accreditation system. Also, as different accreditation system has its own set of standards, assessment and accreditation method, generalizing result of study of on one accreditation system
on other may be limited. Several studies have also found contradicting findings even with same accreditation system. This explains that while accreditation may have sufficient association on some parameters it may not be associated with other parameters.

While most studies observed and compared accreditation’s impact on clinical care components8,9,10,11,12,13,14, very few shows an overall impact on hospital as an organization15,16,17. Clinical care although is a vital component of healthcare the non-clinical aspects also play an important role in overall healthcare quality. Things like infrastructure, human resource capability, patient care processes, client satisfaction etc. constitutes an important part of overall quality and whether or not accreditation has any effect on them, is not reflecting from literatures reviewed.

There are very few literature on NABH. In one intra-institutional experience study that was conducted to evaluate the change of attitude toward acceptance of NABH guidelines by medical practitioner, it was reported that medical staff had a positive attitude and improved knowledge about accreditation after 6 months working in a hospital on the way to NABH22. However, no link with healthcare performance, quality, safety or outcome were made. Accreditation requires significant amount of financial resources and efforts on part of the hospitals. Financial implications for accreditation are both direct and indirect4. Since these expenditure and efforts are being done primarily to improve patient care quality6, it is imperative to have an evidence to ascertain the same.

Methodology

Framework of the study: Modelling the healthcare is a considered as a highly complex task25. After reviewing the popular models, Donabedian’s conceptual model of quality of care has been chosen for this study. The model is arguably the most popular to understand the dimensions of healthcare quality19,20,21. It proposes that healthcare quality consists of three categories: “structure,” “process,” and “outcomes.”. This study utilizes Donabedian’s quality of care model to describe and assess quality in healthcare organization.

Study design: The study uses cross sectional exploratory study design. The data from sample belonging to accredited and non-accredited hospitals were compared. Statistical analysis done to determine significant differences.

Samples: The samples were sourced from 2 NABH accredited and 2 not accredited hospitals. Refer table 1 for hospitals details.

Inclusion and Exclusion Criteria: The healthcare providers working in the above hospitals were randomly sampled using the following inclusion and exclusion criteria

● Inclusion: Staff employed in any of the above hospitals and are directly providing healthcare to patient (such as doctors, nurses, therapists)

● Exclusion: Staff that are employed for less than 1 year or are under resignation and serving notice period

Data collection: Data was collected using the structured instrument created on the basis of Donabedian’s model. The instrument was validated and pilot testing
was carried out. The instrument was prepared in two languages, English and Hindi.

**Hypothesis:** The hypothesis which were used for statistical analysis are

**H01:** There is no significant difference in the rating given to *infrastructure* component of the hospital, by healthcare providers from accredited hospital (HCP-Ac) and healthcare providers from non-accredited hospitals (HCP-NAc)

**H02:** There is no significant difference in the distribution of ‘high’ and ‘not high’ rating given to *infrastructure* component, by HCP-Ac and HCP-NAc

**H03:** There is no significant difference in the rating given to *process* component of the hospital, by HCP-Ac and HCP-NAc

**H04:** There is no significant difference in the distribution of ‘high’ and ‘not high’ rating given to *process* component, by HCP-Ac and HCP-NAc

**H05:** There is no significant difference in the rating given to *outcome* component of the hospital, by HCP-Ac and HCP-NAc

**H06:** There is no significant difference in the distribution of ‘high’ and ‘not high’ rating given to *outcome* component, by HCP-Ac and HCP-NAc

**H07:** There is no significant difference in the rating given to *overall* hospital, by HCP-Ac and HCP-NAc

Testing of null Hypothesis H01: Null hypothesis ‘There is no significant difference in the rating given to infrastructure component of the hospital, by HCP-Ac and HCP-NAc’ was tested using two tailed t-test. The P value (P(T<=t) two-tail = 0.907017) was found to be greater than alpha (α = 0.05), hence the result is **not significant**.

Testing of Hypothesis H02: Null hypothesis ‘There is no significant difference in the distribution of ‘high’ and ‘not high’ rating given to infrastructure component, by HCP-Ac and HCP-NAc’, was tested using Chi square test. The Chi-square value was found to be 1.230 at corresponding P value of 0.267, hence the result is **not significant** at p < 0.05.

(Note: rating of 4 and 5 is taken as ‘high’ rating and rating below 4 as ‘not high’ rating.)

Testing of null Hypothesis H0-2e: Null hypothesis ‘There is no significant difference in the rating given to outcome component of the hospital, by HCP-Ac and HCP-NAc’ was tested using t-test – two tailed. The P value (P(T<=t) two-tail = 5.946E-06) was found to be less than alpha (α = 0.05), hence result is **significant**.

Testing of Hypothesis H0-2f: Null hypothesis ‘There is a significant difference in the rating given to outcome component of the hospital, by HCP-Ac and HCP-NAc’ was tested using Chi square test. Chi-square value was found to be 15.520 and corresponding P value is 0.000, the result is **significant** at p < 0.05.

Testing of null Hypothesis H0-2g: Null hypothesis ‘There is no significant difference in the rating given to overall hospital, by HCP-Ac and HCP-NAc’ was tested using t-test two tailed. The P value (P(T<=t) two-tail = 0.000634) was found to be less than alpha (α = 0.05), result is significant.

Testing of Hypothesis H0-2h: Null hypothesis ‘There is no significant difference in the distribution of ‘high’ and ‘not high’ rating given to overall hospital’ was tested using Chi square test. The Chi-square value was found to be 15.520 and corresponding P value is 0.003, hence the result is significant at p < 0.05.

Conclusion

The data and its analysis shows following result

- The mean rating given to infrastructure component by healthcare providers of accredited hospital do not significantly differ from healthcare providers of non-accredited hospital. The distribution of high and not high rating also do not differ between healthcare providers of accredited and non-accredited hospital
- There is a significant difference in ratings given by healthcare providers of accredited and non-accredited hospital on process component
- Differences in mean rating of outcome by respondents from accredited and by respondents from non-accredited hospitals was also found to be statistically significant, with rating by respondents from accredited group being significantly higher
- The analysis of overall rating has shown significant difference in ratings by respondents from accredited and non-accredited hospital in both the categories. The distribution of ‘high’ rating was also found to be higher in accredited group respondents

Thus, it could be concluded that except for infrastructure, the other components of quality, i.e. process and outcome, has been perceived better by healthcare providers from accredited hospital in comparison to non-accredited hospitals. The overall response on hospital was also better for accredited hospitals.

Recommendation: While the accreditation system do seem to improve process and outcomes in view of healthcare providers, the infrastructure component is not effected. As infrastructure is also a basic component of quality of care, the accreditation system must focus more on improving this component of the hospital.

Limitation: The study has some limitations which should be taken into consideration while interpreting the results

- The effect on quality has been measured by the rating given by healthcare providers. This may differ from the technical data on infrastructure, process and outcome.
- The study is based on a cross sectional data and do not features in time series data. Hence study cannot comment upon whether the data collected at the time of collection holds true across the time.

Managing Technology and Innovation among Entrepreneurs in Tamil Nadu

R. Bharathi Rajan¹, C. Jayamala¹, V. Vijayalakshmi², R. Lakshmi²
¹Assistant Professor; ²Associate Professor, Dept. of Commerce, Vistas, Chennai

ABSTRACT

This study highlights the importance of technology-based entrepreneurship as a strategy for industrialization and technological development. Exploratory in nature, the study describes the general context for entrepreneurship in the evolving economies of State of Tamil Nadu in India. Specifically it probes the positive engagement of the private sector in sustaining the drive toward technological entrepreneurship in the region. Using the scheme developed by the Organization for Economic Cooperation and Development (OECD) of classifying industries according to their degree complexity and knowledge intensity, the study suggests another way of looking at the issue of technological development. The study revealed that entrepreneurship and technological developments are attracting increasing attention in the region, but that the necessary supportive educational measures are either absent or weak. The evidence is that the private sector is as active as the public sector in the processes of industrialization and technological development Decision-makers are called upon to boost public and private innovation initiatives, and to place an appropriate emphasis on entrepreneurship learning for all. This study heads some light on the efforts of the private sector in Tamil Nadu to close the technological gap with other states in the Country.

Keywords: Technological entrepreneurship, technological innovation, development.

Introduction

“An entrepreneur searches for change, responds to it and exploits opportunities. Innovation is a specific tool of an entrepreneur hence an effective entrepreneur converts a source into a resource.” –Peter Drucker, Entrepreneurship is the lifeblood of any economy.

Entrepreneurship is the ability to bring these innovative ideas into new real successful products, by means of deeply assessing multidisciplinary aspects surrounding the new idea, well before becoming a real product. Furthermore, it is an inevitable step for any successful product in the market. This competence helps innovating and having great ideas while teaches keeping the feet on the ground and be realistic. Innovation is a key element in any successful company. Although the skills to foresee improving opportunities can rest on any employee’s abilities, usually this task lies on the shoulders of its R&D engineers. By having deep knowledge in the company product technologies, engineers create and engender new ideas which increase business opportunities. Indian entrepreneurs are more about overcoming barriers, obstacles, inspiring & surmount in their fields. Entrepreneurship is one of the important segments of economic growth. Innovation is a key factor that an entrepreneur brings in an overall change through innovation for the maximum social good. The growth of entrepreneurship particularly in the small scale sector can be traced to the Second World War boom which brought many enterprising people from various walks of life. As someone said failures are the stepping Stones for Success. If we observe the way any entrepreneur, their life is not a bed of roses. They faced many obstacles in the way of entrepreneurial achievement. Furthermore, women can tell the condition of a nation, she acts as a central cohesive source of support and stability, not only to her family but also to whole nation. There is saying where women are respected, dwells God. Similarly where women are there in the industry dwells progress and prosperity. The bottom line for all the entrepreneurial life taught the first lesson for success; and that is failure.
Review of Literature and Theoretical Framework

The Knowledge Spillover Theory of Entrepreneurship:
Resolution to the Innovation Paradox came after rethinking not the validity of the model of the knowledge production function, but rather the implicit assumptions of independence and reparability underlying the decision-making analytical units of observation—the established incumbent firm and the new entrepreneurial firm. Just as the prevailing theories of entrepreneurship have generally focused on the cognitive process of individuals in making the decision to start a new firm, so that the decision-making criterion are essentially internal to the decision-making unit in this case the individual, the model of the knowledge production function generally limited the impact of the firm’s investments in creating new knowledge to that decision-making unit in this case the firm.

That these decision-making units the firm and the individual might actually not be totally separable and independent, particularly with respect to assessing the outcome of knowledge investments, was first considered by Audretsch (1995), who introduced The Knowledge Spillover Theory of Entrepreneurship 1.

The expected value of any new idea is highly uncertain, and as Arrow pointed out, has a much greater variance than would be associated with the deployment of traditional factors of production. After all, there is relative certainty about what a standard piece of capital equipment can do, or what an unskilled worker can contribute to a mass-production assembly line. By contrast, Arrow emphasized that when it comes to innovation, there is uncertainty about whether the new product can be produced, how it can be produced, and whether sufficient demand for that visualized new product might actually materialize.

But what is the appropriate unit of observation to be used to frame the context and observe the entrepreneurial response to knowledge investments made by incumbent organizations In his 1995(Audretsch) proposed using the industry as the context in which knowledge is created, developed, organized, and commercialized. The context of an industry was used to resolve the paradox concerning the high innovative output of small enterprises given their low level of knowledge inputs that seemingly contradicted the Griliches model of the firm knowledge production. After reviewing the literature on location, innovation is analyzed in a modified production function approach following Griliches (1979), in which innovative output depends upon inputs. U.S. Small Business Administration (SBA) data from 1982 is used, consisting of innovation citations containing information on 4,200 product innovations. Small firms (those with fewer than 500 employees) were found to make better use of university research, despite fewer formal relationships, though this may be due to less developed internal R&D departments2.

The reason for challenging the assumptions of independence and reparability between (potential) entrepreneurs and firms emanates from a fundamental characteristic of knowledge that differentiates it from the more traditional firm resources of physical capital and (unskilled) labor. Arrow (1962) pointed out that knowledge differs from these traditional firm resources due to the greater degree of uncertainty, higher extent of asymmetries, and greater cost of transacting new ideas3.

The empirical evidence supporting the knowledge spillover theory of entrepreneurship was provided from analyzing variations in startup rates across different industries reflecting different underlying knowledge contexts (Audretsch, 1995). In particular, those industries with a greater investment in new knowledge also exhibited higher startup rates while those industries with less investment in new knowledge exhibited lower start up rates, which was interpreted as the mechanism by which knowledge spillovers are transmitted.

In applying the model of the knowledge production function to spatial units of observation, theories of why knowledge externalities are spatially bounded were needed. Thus, it took the development of localization theories explaining not only that knowledge spills over but also why those spillovers decay as they move across geographic space.

Feldman (1992) confirmed that the knowledge production function represented equation held at a spatial unit of observation using a direct measure of innovative activity: new product introductions in the market. Feldman (1994) extended the model to consider other knowledge inputs to the commercialization of new products. The results confirmed that the knowledge production function was robust at the geographic level of analysis: the output of innovation is a function of the innovative inputs in that location4.
Studies identifying the extent of knowledge spillovers are based on the model of the knowledge production function applied at spatial units of observation. In what is generally to be considered to be the first important study re-focusing the knowledge production function, Jaffe (1989) modified the traditional approach to estimate a model specified for both spatial and product dimensions. Empirical estimation of Equation (1) essentially shifted the knowledge production function from the unit of observation of a firm to that of a geographic unit. Implicitly contained within the knowledge production function model is the assumption that innovative activity should take place in those regions where the direct knowledge-generating inputs are the greatest, and where knowledge spillovers are the most prevalent. Jaffe (1989) dealt with the measurement problem raised by Krugman (1991a) by linking the patent activity within technologies located within states to knowledge inputs located within the same spatial jurisdiction.

**Methodology of the Study**

The data and information has been collected from secondary sources magazines, business newspapers, journals, periodicals, reports, text books and websites. Further, interviews, lecturers on related area were also taken into consideration for the study.

**Objectives of the Study:**

- To analyze the future of entrepreneurship in India.
- To elucidate the role of technology and Innovation on Entrepreneurship in India

### Importance of Innovation in Entrepreneurship:

The rules and principles are similar for every entrepreneur who owns large or small enterprise. Only the difference is, The starter face toothache and hick ups at the early stage, where as existing business face different problems, limitations, management problems and constraints in the market etc. Both the cases it needs to learn many things and should be innovative for the survival in the business market. The daily crisis cannot be postponed; it has to be dealt with right away. And the existing operation demands high priority and deserves it. It thus takes special effort for the existing business to become entrepreneurial and innovative. As Drucker says, The enterprise that does not innovate inevitably ages and declines. And in a period of rapid change such as the present, an entrepreneurial period, the decline will be fast. Innovation requires major effort. It requires hard work on the part of performing, capable people the scarcest resource in any organization.

### Innovation and Entrepreneurship:

The conceptual relationship between entrepreneurship and innovation has been discussed in the literature for many years. According to Nelson (1993, p.4), innovation encompasses “the processes by which firms master and get into practice product designs and manufacturing processes that are new to them.”

Such a broad understanding of innovation is particularly meaningful within the context of innovative entrepreneurship insofar as upgrading technology or improving skills may lead to more efficient uses of resources or higher-quality outputs, but not necessarily to new products or patents. That is why Lundvall (2007) emphasized that it is important to avoid a high-tech bias when thinking about innovation.

Findings and Discussion

- Innovation always an important component of entrepreneurship but it is not essentially part of it. Innovation term is developed from innovation. So if something is new is innovative, whereas the entrepreneurship always does not require innovation.
- It is necessary to be the typical characteristics that define the leading cross-business incubators are very busy and the ability and aspiration to success. And we can define these properties as follows
  - Autonomous capacity to take decisions has the ability to control the work and results
  - Higher energy level working diligently and found the extraordinary efforts in order to succeed.
  - Big need for achievement: stimulates to accomplish, and looking up to achieve the goals that are challenging.
  - Self-confidence have the ability, and very self-reliance and confidence.
  - Leadership comes in a lot of cases, new innovation, which changes in the area where he works in full, and this type of entrepreneurs is relying on them in the development of the entire country’s economy, and the source of the change engine the structures of the industry.

Conclusion

Entrepreneurial and innovative organizations studied in this research are facing problems with the implementation of entrepreneurship and innovation. Because entrepreneurship and innovation are systematic behaviours, systematic efforts are required to incorporate them into the operations of organizations.

Innovation in Entrepreneurship must be regarded as continues, everyday practice in all organizations, and this study has contributed to enlightening the innovation attitude of some entrepreneurs in the state. It is also apparent that cultural issues should be addressed when examining the level of entrepreneurship and innovation in Tamil Nadu. Moreover, more systematic and comprehensive studies are required in the future to study how innovation culture might influence firm’s performance

Prevalence of Dental Caries among 9 to 13 Years School Children of Tiruvallur District-Chennai Tamil Nadu

Indhulekha Vimalakshan1, Deepa Gurunathan2, Pradeep Kumar3
1Graduate Student, 2Professor, Department of Pedodontics, 3Professor, Department of Community Dentistry, Saveetha Dental College, Saveetha Institute of Medical Technical Sciences (SIMATS), Saveetha University, Chennai

ABSTRACT
Oral health plays an important role in general health of body. Poor oral hygiene can also lead to many systemic diseases. Dental caries is a disease with multifactorial causes. The prevalence and occurrence of dental caries in a population is influenced by many factors such as sex, age, socioeconomic status, dietary patterns and oral hygiene habits. Hence, the present study was designed to assess the prevalence of dental caries in Tiruvallur district Chennai, Tamil Nadu.

Material and methods: The survey was carried out among school going children of age 6 years and 13 years. 399 healthy subjects including 219 boys and 129 girls from 7 different schools were examined in day light with the help of basic diagnostic instruments like mouth mirror and probe.

Result: In this study it was observed that the 9 and 10 age group of children had high percentage of caries when compared to 11 to 13 years age group of children. The mean dmft score was also high in was also high in 9 and 10 age group of children. In total dental caries was observed in 253(72.21%) study population. Restoration is the most required treatment in both the group.

Conclusion: The result of this study reveals that there are still large amounts of population that lack awareness on the effect of poor oral hygiene and oral health status and also are ignorant on the advantages of having a good health.

Keywords: oral hygiene, dental caries, school children, prevalence, mouth mirror, probe

Introduction
Health is a basic human right and oral health is a significant component of general health. Although oral diseases are mostly not life-threatening, they are important public health problems. Dental caries is a multifactorial disease where many risk factors are involved, and it occurs because of an imbalance between the environment and external factors. Accumulation of bacteria especially cariogenic streptococcus mutants, diet, oral hygiene and time play an important role in carious lesion. However, dental caries is not a typical classical infectious disease.

Dental caries is specifically increasing in children. 80 to 85% children suffer from this disease and the average number of decayed, missing and filled teeth per child at the age of 12 years is about 4 in rural areas and 5 in urban areas of India with almost no dental restorative help available particularly in the rural areas. Carlos and Gittelsohn (1965) were among the first to group the teeth from most susceptible to least susceptible. According to them the mandibular molars were the most susceptible and the lower incisors were least susceptible. The most frequently affected site is the occlusal surface of first and second molars. Molars are susceptible to dental caries, not only because of their location but also because of their anatomy.

DOI Number: 10.5958/0976-5506.2019.01231.2
The prevalence of dental caries was of great interest for long and is a principal subject of many epidemiological researches being carried out worldwide. This significant but a preventable public health problem interferes with normal food intake, speech, self-esteem, and routine activities affecting overall health status of the children. [1] The prevention of dental caries has long been considered as an important labor for health profession. The world health organization (WHO) recognizes dental caries as a pandemic and reports that the prevalence of dental caries among school going children is about 60 to 90%. The risk factors for dental caries are many and they can be classified into oral and non-oral risk factors. Oral risk factors include anatomy of the tooth, composition of dental plaque, restoration and oral hygiene status. Non-oral risk factors include age, irregular tooth brushing, dietary habits and medication history. [6] School years cover a period that runs from childhood to adolescence. These are influential stages in people’s lives where lifelong substantial oral health-related behaviors, as well as beliefs and attitudes, are being developed. Children are particularly receptive during this period, and the earlier habits are established, the long-lasting, and the impact. [7] Children who suffer from poor oral health are 12 times more likely to have more restricted activity days including missing schools than those who do not. [8]

Studies have reported missed school hours, toothache, and several impairments of daily life activities associated with a high decayed component in both primary and permanent dentition. [9] Similar findings have been reported in Brazilian preschool children and in a school survey of American native children. [10]

Voluminous literature exists on the status of the dental caries in the Indian population. In 1997, 22.7% of Indian population was estimated to be 5 to 14 years. This being such a high proportion of the population, the prevalence of dental caries among this age group needs to be assessed. It has been observed that during 1940 the prevalence of dental caries in India was 55.5%, during 1960 it was reported to be 68%. Overall the general impression is that dental caries has increased in the prevalence severity in urban and cosmopolitan population over the last couple of decades. However there is no definite picture as yet regarding the disease status in rural and backwards areas of the country in the comparison where 80% of the population inhabits. [11]

The “Prevalence” of dental caries in an individual is obtained by calculating DMFT, which is the most common index used and for deciduous dentition dft index is used. An epidemiological study was planned as very few studies have been conducted in Chennai city. Hence, this present study was conducted as a part of the screening, to assess the prevalence among school going children of Tiruvallur district using DMFT index

**Materials and Method**

The study received the approval from university review board (STP/SD 12 BDS 103).

A study of prevalence of dental caries among school going children of Tiruvallur district Chennai was undertaken by the Department of Public Health Dentistry, Saveetha Dental College and Hospitals, Chennai to evaluate prevalence of dental caries in relation to various risk factors.

The survey was conducted in 348 school children residing in Tiruvallur district, Chennai. Out 139 government schools in Tiruvallur district 7 schools were selected for the survey. The sample consisted of 348 individuals of both gender (219 were male and 129 are females); their ages ranged from 9 to 13 years. Age of 12 years has been universally accepted as a global monitoring age for caries since all permanent teeth except third molars would have been erupted by this age. Consent for examining of the children was obtained from the respective head master. The criteria for selection of the study subjects were that the children should be permanent residents of Tiruvallur.

Depending on the physical condition of the school, the exact arrangement for conducting the examination was determined. The school children were examined under daylight with the help of plain mirror and standardized dental probes. Examination of the child was done by only one examiner to avoid interexaminer variability. Recording of data was done by a trained person who assisted throughout the study. Dental caries was evaluated and the DMFT indices were recorded respectively. [12]

**Results**

This study aims to measure the distribution of dental caries among school going children from 9 to 13 years old in Tiruvallur district. The sample size was 348 school children of different age groups.
Table 1 shows the distribution of sample according to source of population, age and gender. The sample is divided into four groups according to age and also was divided into groups according to gender in which each group has both the gender.

Table 2 shows the prevalence of dental caries in which the highest is seen in the age group of 9 with a percentage value of 88.24%. Comparatively the other age group had a percentage value of 85.28%, 74.24%, 52.78%, 60.32%, and 72.21% respectively. Table 2 also shows the mean DMFT for the study subject which was 3.24 while the mean DMFT for different age groups (9-13 years) was 5.03, 4.76, 2.20, 2.18, 2.06, and 3.24 respectively.

Table 3 shows the prevalence of dental caries in different age groups (9-13 years old) for females. The highest percentage of dental caries prevalence was found in the age 10 and the lowest percentage of was found in the age 12.

Table 4 shows the prevalence of dental caries in different age groups (9-13 years old) for males. The highest percentage of dental caries prevalence was found in the age 9 and the lowest percentage of was found in the age 12.

Discussion

Untreated oral diseases in children frequently lead to serious general health, significant pain, and interference with eating and loss of school time.[13] Despite incredible scientific advances and the fact that caries is preventable the disease continues to be a major health problem. The World Health Organization (WHO) has ranked dental caries, as number three among all chronic noncommunicable diseases that require worldwide attention for prevention and treatment and the fact that caries One of the factors to be considered when planning for the required growth in dental in dental facilities is the prevalence of dental diseases and their treatment need in the population. A Who Health Organization of global DMFT for 12-year-old children reported that in the 188 countries included in their database, that on global basis, 200,335,380 teeth were decayed, filled or missing among just that age group. This was based on the data available in 2004 from the WHO Oral Health Database, Country/Area Profile program (CAPP) [13]. Therefore, WHO continues to advocate that efforts to improve the overall situation are still highly indicated[9][14]
The use of DMFT and dft indices has been accepted practice for assessing the prevalence and severity of caries in a population. Hence an attempt has been made in the present study which was conducted as a part of the outreach screening to assess the prevalence of dental caries among primary school going children of Chennai using dft/DMFT index.

In this study, the prevalence of dental caries has increased with age from group 9-13 years. Oral health is an integral part of our health. Lack of awareness and limited access to dental specialist has made the children in Tiruvallur district to be more prone to disease. The 9-13-year age group was chosen for the study as it is the global monitoring age for dental caries, for international comparisons and monitoring of disease trends. [15] In this study it was observed that the caries prevalence of 11 to 13 years old children was lower as compared to 9 and 10 years old age group. This shows that as age advances prevalence of dental caries decreases. This finding corresponds with the study conducted by Misra F.M (1979) [16] among 6-16 year old children in urban area of South Orissa. He observed an increase in caries level between 5 to 12 year (56% to 81%) and a decrease in caries level in 13-15year (41.4%). Similarly in the study conducted by Peterson P.E, et al (1991)[17], Retna Kumari N (1999)[18], Dash J.K (2002)[19], Saravanan S, et al (2003)[20] The increased prevalence of caries in boys compared to girls confirms the view that there is a marked preference for sons regardless of the socio-economic class, which manifests itself in the longer feeding of sons compared to daughters.[11]

With the limitation of this study, further studies are required to correlate dental caries prevalence in the target population with parent’s literacy level and other socio behavioral factors. Although severity of dental caries is not assessed separately in the present study; the data regarding treatment need gives a glimpse of the severity of dental caries in the study subjects.

Hence oral hygiene education and motivation are the pertaining goal to achieve proper oral hygiene health among school going children. Oral health consciousness programs should be administered by dental college and association to increase consciousness of oral and dental health. The government should provide oral health through primary health-care system and appoint dental surgeons up to primary health center level in this region.

A preventive program including pit and fissure sealant application and topical fluoride application which would be an ideal measure in the prevention of dental caries in the permanent dentition of schoolchildren would aid in protecting the permanent dentition which has to remain lifelong[1]

Conclusion

1. The prevalence of dental caries was high in 9-11 years of age group with highest prevalence seen in 9 years.

2. Caries prevalence showed variation in relation to sex in which male population had high prevalence of dental caries compared to female population

Planning & Designing Reproductive Health Intervention Framework for Young Married Couples in India: Using Systematic Review

Jagannath Behera¹, Sunil Mehra², Sumitra Dhal Samanta³, Anjum Shaheen⁴
¹Regional Manager, ²Executive Director, ³Regional Manager, ⁴Senior Programme Manager;
MAMTA Health Institute for Mother & Child; B-5, Greater Kailash Enclave-II, New Delhi

ABSTRACT

Background: A community intervention framework was developed based on systematic reviews of existing evidence showing what is working in the low and middle income countries for improving reproductive and sexual health of young married couples. The systematic review helped us to design intervention framework for young married women in India in a comprehensive manner targeting early and repeated pregnancies and utilization of antenatal, delivery, post-partum, contraception and abortion services.

Methods: The focus was on research studies and evaluation reports of different community level initiatives in improving access to contraception, pregnancy care and safe abortion services by young married couples, where women were in the age-group of 15–24 years in low and middle income countries.

Results: The findings from the systematic reviews shows engaging husband, mother-in-law, sister-in-law, community leaders and community health workers are effective in enhancing young women’s reproductive health outcomes. This finding helped to plan and design the intervention framework according to Indian setting. Further, the newly designed intervention framework was implemented in the rural areas of India to improve sexual and reproductive health of the young married women.

Conclusion: The systematic review helped to design intervention framework targeting empowering individuals, mobilizing families and communities, and sensitizing community health workers to improve access to reproductive health services among young married couples in LMICs in a comprehensive manner.

Keywords: young married couple, intervention framework, systematic reviews, reproductive health

Introduction

Our world is home to 1.8 billion young people and their share is growing fastest in the developing countries¹. India is home of more than 211 million young people (15-24 years) accounting for nearly half of the country’s fertility. Despite consistent efforts to improve age at marriage, a large number of women are married at an early age and continued to face adverse effects of early and repeated pregnancies². National family health survey (2005-06) reports indicate that one in four attain motherhood before the legal age of marriage; because young mothers with less knowledge about reproductive health and contraceptive use in comparison to elder women⁵-⁷. Adolescents age 15 through 19 are twice as likely to die during pregnancy or child birth as those over age 20; girls under age 15 are five times more likely to die³,⁴,¹². Proportion of contribution of Young married women mortality to total maternal mortality is quite significant⁸. Lack of proper knowledge about reproductive issues among young married women results in early and low interval pregnancies¹⁵.

Henceforth, it is important to know highs and lows at the community level before deciding the intervention framework to be carried out. For this purpose, a Systematic Review (SR)⁶ of effectiveness of interventions delivering
The current paper discusses the development process of an intervention framework for an effective community-based intervention for improving the reproductive health outcomes of young married couples (aged 15–24 years) that can be delivered in a resource-constrained setting.

Methodology

An intervention framework was developed through the following steps. First, a systematic review of effective programmes was carried out on this subject. After systematic review, a theory of change model was developed for our proposed project intervention. Further, based on the theory of change, intervention logic model and programme implementation plan was developed for an effective intervention design.

The intervention framework was applied in the rural setting through a multi-stakeholder approach. Three sets of strategies were adopted to help young married couples improve their reproductive health choices and outcomes. The intervention worked directly with (i) young married couples (wife aged 15-24 years and her husband) and (ii) key family members (mother-in-laws) at the community and (iii) supporting system strengthening through advocacy and training to frontline functionaries and doctors to address the reproductive health needs of young married women.

Results

Development of Implementation Framework: We developed an intervention protocol based on systematic review that was used to guide the implementation of the project activities. The intervention protocol was guided by the evidences from the SR and grounded in the Theory of Change. The implementation framework was developed through the following phases.

Phase 1: Searching appropriate literature through systematic review: An extensive search strategy was developed to identify peer-reviewed publications and reports of research studies and project evaluations in which interventions were delivered by community workers to improve maternal health outcomes among young married couples in resource-poor settings. The systematic review was done by using PRISMA checklist. The relevant articles were identified through databases of PubMed, Popline, MEDLINE, JSTOR, Cochrane databases, LILACS, IMSEAR, as well as the regional databases of country-specific websites of Ministry/Department of Health, and World Health Organization. Additionally, search engines such as Google and Google Scholar and relevant papers and reports of national and state/province governments were also used. In some cases, authors were contacted whose studies were included for the review. Finally, 8 studies were selected and findings/evidences of these studies were used for the design of intervention model, out of 20,333 abstracts/papers reviewed.

Phase 2: Intervention model includes theory of change, logic model and intervention design of the programme.

Development of theory of change: Following systematic review, we developed a new theory of change model for the project to empower women and mobilize families and communities for better utilization of health services (figure 1). Theory of change suggests that educating newlyweds and young mothers about self-care and danger signs in pregnancy will create awareness and they further intend to seek help from the health facility at the time of their need. Similarly, mobilizing husbands and their families on this issue will lead to accompany young married women to the health facility by the husband/ or mother-in-laws.

Figure 1: Empowering individuals & mobilizing families and communities to seek reproductive health care in time among young married women
Development of intervention logic model: The intervention logic model was built upon the rationale of inputs and its effect on output through different processes. Intervention includes mobilizing husbands and other family members of the women so that they can accompany pregnant young married women to the health care facility. Bringing change in health care seeking behavior among young married women will lead to reducing maternal mortality. The following intervention logic model (Figure 2) clearly presents the problems and the needs in the community, and further presenting influential factors and strategies to address this problem, which will achieve the desired results.

**Figure 2: Intervention Logic Approach**

**Development of intervention design:** The intervention design was developed based on the systematic review result as well as advocacy with different system level for understanding their perception and opinion regarding the need of young married couples. Mention below is the advocacy efforts at different level to develop intervention framework and support sought from different stakeholders at local and national level.

**A. At the state and national level:** The project was carried out with strategic advocacy to engage
stakeholders working in the field of young people and maternal and child health at National and state level. Consultation meetings were organized with the district/state officials from the department of women and child development and Health for getting support and guidance during program implementation.

B. At district level: Advocacy and Trainings were carried out at the district level with important stakeholders to focusing and reaching to young married couples. Further, the trained district and block level functionaries trained to the frontline functionaries to reach young married couples and sub population through regular systematic intervention, IPC and BCC.

C. At the community level: The project target to reaching to the young married women, their husband, mother/sister-in-laws, local and influential community leaders and frontline workers.

Intervention Design

Phase 3: Programme implementation: The main strategies of the project were advocacy, Information Education and Communication (IEC), capacity building of frontline functionaries, interventions around young married women, their spouses and other family members and community stakeholders.

Programme Description: The project ‘Strengthening district health care facilities for improving the sexual reproductive health choices of young married couples’ was implemented by MAMTA with funding support from MacArthur Foundation for a period of 3 years (2011-2014) to improve the sexual and reproductive health and choices of young married women (15-24 years) in selected districts of Saharanpur(Uttar-Pradesh) and Sri-Ganganagar (Rajasthan). The study area comprised 27 villages in Saharanpur and 47 villages in Sri Ganganagar. In total, 4000 young married women were targeted to reach directly through the intervention.

The overall goal of the project was to improve the reproductive health choices of young married women
by engaging family and community members and strengthening the district health care facilities.

**Process outcome:** The project was successful in reached out 3396 young married women in both the districts through various community based interventions. In total, 750 group meetings were conducted among the young married women. Total numbers of group meetings held with husbands of young married women were 277 along with 138 meetings organized for mother in law and sister in law of young married women. Various cluster level meetings (121) were held with the members of community institutions (Panchayat Raj Institution) and service providers for institutionalization of their needs and sustainability.

**Key Achievements:** During three years of time the project achieved positive changes in its major indicators. An increase in uptake of three ANC check-ups increased from 70% to 82% in Sri Ganganagar and 62 % to 74% in Saharanpur during project period. Institutional delivery increased from 59% to 97% in Sri Ganaganagar and from 56% to 79 % in Saharanpur from baseline to end-line.

**Conclusion**

The systematic review helped to design the implementation framework for young married women in an effective manner. The key achievement of the programme showed that, intervention design was successful in bringing desired health outcomes among young married couples in the rural settings of India. Given the positive findings of the intervention among young married women, an integrated approach for improving sexual and reproductive health choices among young married couples (15-24 years) could lead to significant gains for improving overall reproductive health in a larger segment. At the same time, taking the learning to policy positioning has been a significant aspect of this project. The reproductive health issues of young married women have been incorporated into the state and district PIPs for designing new implementation plan.

Based on our project implementation experience and result findings, further we scaled-up the program for strengthening and capacitating health and ICDS service providers to reach out young married women. In addition, we incorporated pre-conception care in line with RMNCH'A guidelines within continuum of care approach in context to young married women which would improve pregnancy and reproductive health outcomes in an inclusive manner.

Usage of CBCT in Detection of Vertical Root Fractures

Sahana Kritivasan¹, Jayanth Kumar Vadivel²
¹Graduate Student, ²Reader, Department of Oral Medicine and Radiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, Tamil Nadu, India

ABSTRACT

Aim: A review to evaluate the use of cbct in recognising vertical root fractures.

Background: The usage of cbct in dentistry is vast. Determining the bone density, width, height and its surrounding structure is of at most importance while doing any procedure. Cbct aids in providing such information and helps in delivering better treatment. Vertical root fracture involves either partial or complete rupture of the tooth root structure that extends along the vertical root axis. They can be internal or external origin and also enter through the periodontal space. It also involves the whole length of the root or only a section of it involving only one or both sides of the root. Early detection of vertical root fracture is important to prevent extensive and Additional damage to the periodontal tissues and also unnecessary treatment costs. Radiographic examination is limited to 2 dimensions leading to overlap of adjacent structures that commonly masks the fracture and also aids in false negative diagnosis. Cbct is a 3-dimensional imaging modality that is very accurate in detecting vertical root fractures. It solely focuses on the presence or absence of the fracture and also I. Determine the fracture line pathway. It helps in better Visualization of the landmarks and improves treatment regime. But it lacks the ability to detect in the presence of radio opaque materials like root canal materials. Hence a systematic review of usage of cbct in detection of vertical root fracture is to be done by using articles from PubMed and Scopus database.

Keywords: CBCT, vertical root fracture, endodontically treated tooth, detection, longitudinal

Introduction

Vertical root fracture (VRF) is defined as the incomplete or complete fracture or a longitudinal crack extending along the tooth root which is the most common cause of Endodontic failures and third most common cause of tooth extraction. Diagnosis of a vertical root fracture is a challenging task as they may not manifest pathognomic radiographic or clinical signs and symptoms.¹ The conventional techniques for detection of vertical root fracture includes bite test, observation and examination using a surgical microscope and further the use of radiographs can be used to examine the tooth as there is a fine radiolucent line showing the fracture of the tooth, but the disadvantage is that superimposition and presence of periapical lesion will make the fracture undetectable. Hence these methods have there limitations as they are radiographical detected only when fracture line is parallel to the path of beams.² The advent of Cone Beam Computed Tomography (CBCT) imaging has opened a new diagnostic paradigm in the detection of vertical root fractures.

CBCT when compared to (Computed Tomography) CT carries the unique advantage of being less harmful to the patient as it requires lesser radiation to produce superior quality images. But the technique has a limitation wherein the post and core or the obturating material produces streak artefacts on the image mimicking root fracture.³,⁴ There are various ways to reduced the metal artifacts, primarily by confining the imaging to the FOV which significantly reduces patient radiation dosage and metal artifacts despite several studies it is still debate able about the the use of CBCT to detect VRF comparing the dosage and cost effiency of the imaging technology.

The aim of this review is to assess the reliability of CBCT in detection of vertical root fractures.

**Materials and Method**

A systematic search of the literature was made in the popular databases mentioned below and studies with below mentioned criteria were chosen.

**Types of Studies:** A systematic search of the literature was initiated which included case reports, case series, clinical studies, in vitro and in vivo studies, comparative studies and systemic reviews.

**Literature search strategy:** The electronic databases searched included PubMed and Google Scholar. Keywords used in search were “CBCT and VERTICAL ROOT FRACTURE” or “DIAGNOSIS”. An assessment of the methodological quality was performed using a modified version of the quality assessment of diagnostic accuracy studies tool to remove duplicate and unrelated studies.

**Selection criteria**

**Inclusion criteria**

- Studies that mentioned CBCT as a diagnostic tool in detection of vertical root fracture’s both in in-vitro and in-vivo models
- Clinical studies that showed the verification of vertical root fracture by conventional radiographs and CBCT
- Studies in which accuracy parameters such as sensitivity or specificity were used.

**Exclusion criteria**

- Studies were the CBCT exposure parameters were not clearly stated
- Studies on tooth fractures other than vertical root fractures.

The search yielded a total of 35 articles from which 27 were chosen as they were matching the aforementioned criteria.

**Target condition:** The target condition was to detect vertical root fracture in any permanent, endodontically treated tooth. From the 27 selected articles 3 favoured using CBCT for detecting vertical root fracture as compared to periapical radiographs (PR), whereas 2 reported no differences between the two methods.

**Vertical Root Fracture:** VRF offer several diagnostic challenges. The lack of consistent signs and symptoms as well as the low sensitivity of conventional radiographs make the detection of VRF difficult. Mild pain may be the only symptom in most of the cases of vertical root fracture. Periodontal type of abscesses maybe one of the clinical findings in certain cases of vertical root fracture, which may result from chronic inflammation at the fracture line. They may also be detected during obturation of root canal by a sharp cracking or popping sound, a sharp sting of pain, bleeding within the canal or enlarged canal paving way for large number of accessory cones - any one of these could be the signs/symptoms or a combination maybe present that could be suspected for vertical root fracture. It is rare to find all the findings present in a single case of vertical root fracture. Therefore, each of these clinical findings should be carefully observed and correlated with the radiographic findings and interpretations, to get conclusive evidence of vertical root fracture. Staining with dyes, trans-illumination using fibreoptic light and surgical exposure are some of the other methods to delineate fracture lines. The prognosis of VRF is poor. In a 5-year follow-up study of non-surgically endodontically treated teeth, root fracture was the untoward event in 32.1%, and the elected treatment was extraction.

The various parameters of CBCT were taken into considerations when assessing the usefulness of CBCT in vertical root fractures. Parameters noted are

- Volume and size
- Resolution
- Tube current
- Voxel size
- Influence of root canal filling material

**Volume and Size:** The size of field of view describes about the FOV and its volume depends on the various attributing factors like the shape and size of the detector, beam projection geometry and the ability to collimate the beam. Beam collimation limits the radiation exposure to a certain region so that optimal FOV can be achieved. Hence smaller scans provide an image that is relatively having lesser artefacts. Providing a holistic treatment in endodontics completely relies on detecting
disruption in tooth, periodontal ligament spaces, alveolar bone, the optical resolution measuring approximately 200 micrometer is optimum.\(^7\). So CBCT is preferred over CT in Endodontics because

1. Increased spatial arrangement due to improve the accuracy of detected minute things such as vertical root fracture.

2. Decreased radiation exposure to patient

3. Time saving due to small volume

Tooth without root filling material requires lesser milli amperes when compared to those filled with gutta percha and metal post. The tube current does not significantly play a major role in detection or vertical root fracture.\(^8\)

**Dosage consideration:** There has to be maximum effort taken to reduce the radiation dose to the patient while performing Endodontic specific task. The measures by which the dosage can be reduced are by using a small FOV there will be an increase in the resolution and increase in the clarity of the image, less exposure and pulsed exposure mode of acquisition is recommended.\(^9\) CBCT has an advantage over CT as radiation doses that are commonly used to diagnose these vertical root fractures is very minimal compared to that of medical CT and the accuracy of CBCT is also increased because of the isotropic voxels.\(^10\)

**Influence of exposure:** There are numerous studies highlighting the impact of exposure parameters on CBCT. According to Pinto et al, exposure parameters does not influence the detection of vertical root fracture and it is independent of the root canal restorative status. If there is a decrease in kVp/\(m\)A then the probability of biological effect to radiations might be reduced without losing the diagnostic accuracy.\(^11\) When the voxel size is 0.125mm the best resolution is achieved without increasing the radiation levels for the patient. 0.300 and 0.400mm voxel size should be avoided as they produced a high range of radiations.\(^12\) The size of the voxel of the CBCT plays a major role in determining and demarcating the fracture line CBCT has 93% sensitivity, 75% specificity and 88% accuracy when it comes to the detection of vertical root fracture as reported by a study by Safi et al\(^{13}\). The periapical radiograph has shown poor results in detecting the vertical root fracture due to their lower sensitivity and they also failed to detect the alveolar fractures which were more promptly detected by cbct.\(^{14,15}\) Despite all this both the imaging modalities have their own limitations when it comes to detecting the vertical root fracture. The detection accuracy was influenced by the width of the vertical root fracture as found in simulated studies.\(^16\) If the width was around 50-300 um the accuracy of detection in vivo was significantly lower to that in in vitro.\(^17\)

**Influence of root canal filling material:** When different endodontically treated tooth were subjected to CBCT for the detection of vertical root fracture there were studies showing that there was no influence of the root canal filled material in aiding to the detection as well as being the causative for the vertical root fracture to happen.\(^18\) Metal post interfered with the diagnosis of vertical root fracture and influence of filters did not prove to improve the diagnosis of vertical root fracture while using CBCT. Hence early detection of the vertical root fracture was difficult in such cases.\(^19\) It should be noted that approximately 90% of teeth with Vertical root fracture have root canal filling materials and approximately 61.7% of them have posts like metal post, gold post. These materials tend to cause line-like artefact’s in the CBCT images and significantly decrease the diagnostic accuracy of vertical root fracture, since the dark or radiolucent lines could be mistaken for fractures and the light lines may be masking the actual fracture lines and that account for the cases of false positive and false negative results. In a study by Costa et al., in the presence of a metallic post the specificity and sensitivity of diagnosing vertical root fracture was significantly reduced.\(^20\)

**Discussion**

The results of the present review shows significant proof that CBCT proves to better in the diagnosis of VRF compared to PR. However the diagnostic accuracy of CBCT was found to be affected by the Voxel size, exposure parameters, FOV, slice thickness. his may be mainly due to the differences in applied inclusion and exclusion criteria of various authors’ and also their opinions on the statistical tests used. However, there is, adequate support to the use of CBCT for the detection and diagnosis of VRF. However there is no available standardised exposure parameters which could be used as a standard for the diagnosis of VRF using CBCT. There are several researches which interestingly reveal a
potentially new issue in detecting vertical root fracture’s. That is, the detection of the vertical root fracture may not only be better for one type of imaging modality over another; rather, the detection may also depend upon the specific characteristics of the tooth. The clinician has to choose the type of imaging depending upon whether the tooth has been previously treated or not. The need to cautiously use CBCT because of its expense and higher radiation when compared to PR seems to be a sensible counter to the notion that CBCT has to be preferred in all instances.

**Conclusion**

Thus CBCT proves to be worthy in diagnosis of VRF, but has to be used judiciously in diagnosis in combination with the other clinical tests. It is preferable to weigh the pros and cons before recommending the use of CBCT in diagnosis of VRF. The need of the hour by the researchers would be to develop standard set of exposure parameters and resolution which will aid in better diagnosis of vertical root fractures. The potential of this imaging has to be explored fully as it eliminates needless surgical exploration to confirm the diagnosis.

Internet Addiction Prevalence and Quality of Life-A Cross-Sectional Study among Adolescents

Lalita Sisodia¹, Rahul Bansal², Anuradha Davey³, Arvind Shukla⁴

¹Postgraduate Resident, ²Professor & Head, ³Associate Professor, ⁴Assistant Professor,
Department of Community Medicine, Subharti Medical College, Meerut

ABSTRACT

Background: Internet has made our lives extremely easy, as well as on the other hand there are also many problems associated with it, its excessive usage and misuse can produce pathological behavioural problems in its users. This uncontrolled usage of internet has been defined as internet addiction disorder

Objectives: to assess the level of internet addiction among adolescent and to assess the impact of internet use on quality of life of adolescent.

Methods: A cross-sectional study was conducted in 525 school going adolescent of Meerut district with the help of semi structured questionnaire consisting of questions related to demographic information and Young’s Internet Addiction Test Scale, consisting of 20-item, based upon five-point Likert scale was used and subjects were classified into normal users (score <20), mild (score 20-49), moderate (score 50-79) and severe (score 80-100) internet addiction.

Results: The mean age of adolescents was seen to be 14.8 (±1.3) years. Prevalence of Internet Addiction was found to be 63.1%. Of which; 48.8% were mild, 13.7 % were moderate and 0.6% were severe addicts of Internet, Male students were found to be more addicted than females. Total IAT mean was 1.44 with ± SD of 0.87.

Conclusion: Internet addiction is growing menace in adolescent and its prevalence is increasing drastically, a special attention has to given on adolescent mental health which can be deteriorate by excessive use of internet.

Keywords: internet addiction, adolescent health, internet addiction test, quality of life

Introduction

Internet is a young technology but it had a profound impact on the world in the few decades that it has been around. It has converted the whole world into a global information society. Internet has made our lives extremely easy, as well as on the other hand there are also many problems associated with it, its excessive usage and misuse can produce pathological behavioral problems in its users.¹

Studies show that children especially of adolescent age group and students are more liable to get affected by internet menace because of their friable social structure, peer pressure and non-stagnant psychological demand of their mind.²,³ Also, in today’s time there is free and unlimited access to high speed internet at almost all public places besides the place where they study. Studies today are also demanding and hence require frequent internet use. Peer pressure, alluring applications and advertisements of smart phones, tablets and other gadgets have increased the love for internet among adolescents.⁴

In India internet has become one of the most widely accessible media and is a significant part of everyday life,
especially among adolescents. However, excessive use of the internet may instigate potential adverse psychosocial effects and there is a risk for developing internet addictive behavior, which is now considered a serious public health issue globally. There is, however, no consistent definition and there is a limited understanding of the psychopathology cause by internet addiction in adolescent. Therefore, our study try to find out how various domains of quality of life is affected by use of Internet among adolescents. Objective of our study is to assess the level of internet addiction among adolescent and to assess the impact of internet use on quality of life of adolescent.

Material and Method

The present cross-sectional study was conducted on 525 school going adolescents of urban Meerut, Uttar Pradesh, India. The methodology adopted for the study was Multistage sampling technique. Wherein one government and one private school were purposively selected from the registered schools of urban Meerut. Study population was adolescents of 12-18 years of age group. Selection of class sections of 9th and 11th classes was done by simple random method and 3 sections of each classes from both the schools were selected and all the students of these sections were interviewed.

For data collection following tools were used: A pre-tested, pre-validated, semi-structured interview based questionnaire consists of question like age, sex, class of study, type of family and socio-economic status and The Internet Addiction Test scale (IAT; Young’s scale 1998). Internet Addiction Test (IAT) is a reliable and valid measure of addictive use of Internet, developed by Dr. Kimberly Young. It consists of 20 items that measures mild, moderate and severe level of Internet Addiction. IAT is a 20-item and 5-point likert scale i.e;( 0 points Does Not Apply, 1 points Rarely, 2 points Occasionally, 3 points Frequently, 4 points Often, 5 points Always)

Total internet addiction scores are calculated, with possible scores for the sum of 20 . items ranging from 20 to 100.

According to Young’s criteria, total IAT scores 20-49 represent average users with complete control of their internet use, scores 50-79 represent over-users with frequent problems caused by their internet use, and scores 80-100 represent internet addicts with significant problems caused by their internet use.

IAT Subscales

Internet addiction test scale consists of 20 items which was divided into six sub scales i.e.to assess quality of life.

1. Compromised social quality of life
2. Compromised individual quality of life
3. Compensatory usage of the Internet
4. Compromised academic/working careers
5. Compromised time control
6. Excitatory usage of the Internet

Mean scores was obtained by subjects (n = 525) in the total internet addiction test (IAT) scale and in the six IAT subscales, and was calculated by averaging the scores obtained by subjects in each of the considered items.

Data entry and data analysis was done in Statistical Package for Social Sciences (SPSS) version 19.0 by using proportion, chi-square test and other appropriate tests.

In our study three fourths (72.8%) of the study participants were of 14-16 years of age, The mean age of adolescents was seen to be 14.8 (±1.3) years. There were more male students in both government as well as private school. Majority of participants were in class 11th (70.7%) and rest were in class 9th. The distribution of participants were equal in both government and private school.

P value was not significant for age, sex and class of students in government and private school.

57.9% students belonged to nuclear families and 42.1% to joint families. Most of students were from nuclear family in both government and private school. i.e. 60.6% in government school and 55.2% in private school.

Majority of the participants belongs to either upper class (39.4%) and upper middle (57.7%) class of socio economic status in both government and private school respectively. 61.7% of students belongs to upper middle class and 35.2% to upper class in government school, while 53.6% of students were seen to be in upper middle class and 43.7% in upper class in private school. Statistically the variation in socio economic status among government and private school adolescents was not significant.

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Total mean of IAT was seen to be 1.44 with ± SD of 0.87
Compared with the total mean of IAT, the mean of Compromised academic/working careers and Excitatory usage of the Internet was found to be statistically significant (P<.05).

Discussion

In present study the adolescent were in the age group of 12-18 years and the mean age of adolescents was seen to be 14.8 (±1.3) years in both the schools which was similar to finding of Jang et al.(2008) in Korea study in which the mean age found to be 13.9. and a study of Norway by Johansson A, et al.(2004) the mean age of the study participants was seen to be 14.9 years of age. In present study there were more male students in both government as well as private school, Similar distribution was seen in a Indian study conducted by Malviya A et al.(2014) where 164 (67.8%) were males and 78 (32.2%) were females.

In our study level of internet addiction was assessed using young internet addiction test and prevalence of internet addiction was found to be 63% of which; 48.8% students were mild addicts, 13.7 % were moderate and 0.6% were severe addicts of Internet. Similar kind of high prevalence was reported by some researchers in studies done in India, prevalence of 58.87% was reported by Chaudhari B L et. al. (2015) in Maharashtra, in their study out of 282 students - 116 (41.13%) students were not having any internet addiction while 166 (58.87%) students were having internet addiction, out of which 145 (51.42%) were mild addicts while 21(7.45%) were moderate addicts, there was no severely addict student. Duraimurugan, et al.(2015) in their study among college students from South India reported 56.6% prevalence of internet addiction, they found that 41.3% to be mild addicts while 15.2% to be moderate addicts. it shows that Internet addiction prevalence is showing rising trend and adolescents are the higher risk to get addicted due to their social and friable behavior.

In our study Total mean of IAT was seen to be 1.44 with ± SD of 0.87 wherein study done in Italy by Giovanni Ferraro et al. found total IAT mean of 2.7 with ± SD of 0.8.

In present study the IAT subscales calculated revealed Compromised social quality of life had mean of 1.41 with ± SD 1.06, Compromised individual quality of life was 1.38 with ± SD 1.04, Compensatory usage of the Internet had mean of 1.37 with ± SD 1.04, Compromised academic/working careers was seen to be 1.18 with ± SD 1.15, Compromised time control was 1.52 with ± SD 1.18, and Excitatory usage of the Internet was 1.79 with ± SD 1.29.

Compared with the total mean of IAT, the mean of Compromised academic/working careers and Excitatory usage of the Internet was found to be statistically significant (P<.05) which was similar to findings of Giovanni Ferraro et al. in Italy where Compromised social quality of life had mean of 2.73 with ± SD 0.8 , Compromised individual quality of life was 1.93 with ± SD 0.7 , Compensatory usage of the Internet had mean of 2.24 with ± SD 0.8 , Compromised academic/working careers was seen to be 1.77 with ± SD 0.9, Compromised time control was 2.26 with ± SD 0.7, and Excitatory usage of the Internet was 1.8 with ± SD 0.8.

Hence it shows that internet addiction influence the quality of life in different domains, the quality of (real) life hypothesis predicts that IA prevalence is related to a poor quality of real life. In the present cyber age, people may immerse themselves into the virtual world of the Internet to escape from stress they experience in the real world. As the boundaries of the virtual and the real worlds become blurred, individuals who encounter more frequent real life problems have a greater motivation to use the Internet as a coping mechanism. It is thus reasonable to infer an inverse link between IA and the quality of (real) life.

Conclusion

Internet addiction is a threat which is penetrating into various domains of life of adolescents. The major domain affected in our study was academic performance and their excitatory or impulsive use of Internet. Impulsive use has increased their frequency to be on Internet surfing and live in the virtual social networking; which might have affected their academic performance. Though, it is an initial warning signal but cannot be ignored. So further exploration for its association and causation need to explore for timely intervention.

Customer Perception towards Adoption of Mobile Payments
–A Study

Monisha D¹, S. Gurusamy²
¹IPE/ICSSR Doctoral Research Fellow, Department of Commerce, ²Professor and Head, Department of Commerce, Dean –Academic, University of Madras, Chepauk Campus, Chennai

ABSTRACT

Mobile payments revolution has made it possible to provide ease and flexibility in banking operations for the benefit of customers. Technological innovations in mobile payments have also helped in bringing the customer online. Indeed mobile payments have become one of the most significant factors that support people lifestyle. Many services are now being offered through mobile devices which offer more channels for the businesses to interact with their customers. The banking sector has also foreseen the essential usage of mobile banking. It has been considered as a salient system because of the beneficial attributes of mobile technologies such as ubiquity, convenience, and interactivity. Mobile banking today offers a variety of services which can be accessed in real time, and these indeed balance inquiries, fund transfer, payment etc. In this study, an attempt has been made to explore the role of demographics in the adoption of mobile payments and to identify the factors influencing the mobile payments adoption. It is made at from this research that certain factors are significant in determining the adoption of mobile payments and these includes perceived usefulness, self-efficacy, and compatibility, perceived ease of use, perceived risk, credibility, security, demonstrability, and relative advantage etc. The study reveals that increased use of technological products in a mobile payment industry its helps to work in efficient and better way.

Keywords: Mobile payments; Mobile banking; Mobile technologies; Convenience.

Introduction

Mobile payments have changed the way the business is conducted in everyday life. Business transactions of all types are payments a service provides in mobile payment. Mobile payments involve transactions between consumers and merchants that facilitate direct purchase of goods and services both under the account-based and mobile payment. Mobile devices in particular, mobile payments are in wide use and consumers are becoming increasingly familiar with using mobile payments for various purposes such as “secure” financial transactions via a web banking site. A newer opportunity is emerging for service providers and merchants, the use of mobile payments as a mobile wallet. Considering the success of mobile content services such as ringtones, games and other applications, it is becoming apparent that consumers are willing to utilize mobile phones for payment purposes. Mobile phones are also providing an unprecedented opportunity for expansion of financial activity in developing countries where the number of phone users can exceed the number of those having bank accounts.

Mobile payment indeed has become an inevitable business trend in the recent part. Customers are becoming early adopter and are using mobile payment services with more and more comfort and expediency. Digital push with technological innovation is all set to transform the banking and financial services sector in India. Structural growth drivers such as smart phone penetration, increasing awareness about mobile payments preference for hassle-free transaction and secured payment solution are driving growth for mobile payments. Mobile payment system which is a store house for financial value as well as personal identify such
mobile payment systems empower a customer to pay online for the good and services, including transferring an incorporated hardware and software systems.

Types of Mobile Payments

Mobile payments can be categorized based on the technology used as either one of two types those are proximity or remote. These types drive the nature of the payment service model, the value proposition for both the consumer and merchant, and the relevant technologies and infrastructure considerations required to realize the type of mobile payment.

Proximity Payment: Proximity payment generally refers to contactless payments in which the payment credential is stored in the mobile phone is used by the consumer at the storefront to pay for goods or services via a contactless reader or via text-based or personal identification number-based (PIN-based) methods using Near Field Communication (NFC) technology involving communication between the consumer’s device, the payment scheme operator, and the retail merchant at the storefront. All NFC-compatible mobile devices can send as well as receive data so NFC phones can also act as card readers. It is a technology highly aligned with the use of trusted computing media such as subscriber identity module (SIM) cards and Trusted Platform Modules (TPM).

Remote Payment: Remote payment solutions also can be used for transactions such as face-to-face and vending machine transactions. The mobile phone is used by the consumer in combination with the network messaging service such as Short Message Service (SMS) or Unstructured Supplementary Service Data (USSD) to pay for services or digital content. Credit/debit cards-based payment by entering user information via a secure Wireless Application Protocol (WAP) interface eWallet/stored-value account-based payment via a secure WAP interface.

Review of Literature

Abhiseshek and Hemchand (2016)[1] in their research on adoption of sensor based communication for mobile marketing in India explored the applications of sensor-based found the different ways used to build and sustain customer engagement in mobile payments. Madan and Yadav (2016)[6] investigated the behavioural intention to adopt mobile wallet. The study aimed to understand the factors that affected consumers’ adoption of mobile wallet as alternative methods of making payments to purchase goods and services. Upadhyaya and Chattopadhyay (2015)[7] in their research examined the mobile based payment services adoption issues. It highlighted the influencers of usage intention of mobile-based payment by incorporating the technical characteristics and technology specified characteristics. The GHSOM model has influenced by factors like innovativeness, discomfort and system quality and structural assurance. Tan and Lau (2016)[2] the examiner examined the intention of adopting mobile banking services among the millennial generation. Unified theory of acceptance and Use of technology (UTAUT) model was used to adopt mobile banking Upadhyay and Jahanyan (2016)[9] examined the factors affecting the usage of mobile-based payments services that found that the factors like perceived usefulness, perceived ease of use, system quality, connectivity and discomfort which have significant impact on the usage intention of mobile money services.

Objective of the Study

- To explore the role of demographics in the adoption of Mobile Payments
- To identify the factors for Mobile Payments adoption
- To identify the users risk on using mobile payments

Research Methodology

The current study has used a well-defined and a structured questionnaire to collect the primary data to find the reason for the adoption of mobile payments. Convenience sampling technique has been used for the collection of data in Chennai, Tamil Nadu. Sample size of the study is 200, which included respondents of both the genders varying in age from around 18 years to above 50 years. The respondents were taken from varied occupation sectors with a wide range of salary to give an appropriate sample. Both primary and secondary data were collected and used for this study. The primary data were collected by means of personal interviews with the help of a structured questionnaire which was first pretested and then finalized for the actual study after a few modifications. The secondary data were collected
from various journals, magazines, newspapers, books and reports. The questionnaire consisted of 3 main parts. The first part comprised questions about the demographic profile of the respondent along with a few practices the followed while mobile payments. In the second and third part, the respondents were given 5 options for each statement. The five options were: Strongly Disagree (SD) - 1, Disagree (D) - 2, Neither Agree nor Disagree (NAND) - 3, Agree (A) - 4 and Strongly Agree (SA) - 5. The second part of the questionnaire included questions related to the reasons for adoption of mobile payments while the third part included the questions related to the risks the respondents felt while mobile payments. Statistical tools like Frequency Distribution, factor analyses and t test analysis were used to get conclusive results with the help of SPSS V21 and MSExcel software. To check the validity of a model is reliability. The reliability is measured by using Cronbach’s α which is widely used in social science studies. The current study’s Cronbach’s α is 0.78 which exceeds 0.6 and implies the reliability of the data (Hair et al., 2016)[4]. Also, KMO value is 0.66, from which the sample size can be inferred to be adequate and the research can be considered to be as a valid study on the topic of customer perception towards adoption of mobile payment, providing appropriate results.

**Limitation of the Study**

- The study is confined only to the sample size of 200.
- The study has been conducted in Chennai city.
- It was observed that some of the respondents were reluctant to give correct information, so as a result there may be bias in the information provided by them.

</tbody>
</table>

The table 2 show that the majority (51.5%) of the respondents use their mobile numbers for signing for payments through mobile phone, (51%) of the respondents get the information regarding the mobile payments through friends, Most (38.5%) of the respondents use the mobile payments once in a week, (36.5%) of the respondents are using mobile for payments for the period of 1-6 months, (31%) of the respondents download the mobile payment apps on a yearly basis.

**Factor Analysis**

Thirty five mobile payments usage purpose variables have been reduced into 9 aspects and the factor analysis has been applied on those nine reasons adoption of mobile payments aspects to understand the dominant dimensions in them. The extraction method of principal component analysis and rotation of varimax with Kaiser Normalization have been applied and the result are shown table 3 and 4.

**Table 3**

From table 4 it is found that value of the respondents view on the adoption of mobile payments ranges of .836 to .416 that factors are significant in determining the adoption of mobile payments those includes perceived usefulness, self-efficacy, and compatibility, perceived ease of use, perceived risk, credibility, security, demonstrability, relative advantagewere found to be significant in the adoption of mobile payments. The respondents’ are adoptions of mobile payments were analyzed using factor analysis by principal component method. The findings reveal that factors are significant in determining the adoption of mobile payments. These reasons are behind the influenced the customers’ adoption of mobile payments.

**T-TEST ANALYSIS**

To identify the respondents risk on using mobile payments t test was used to analyze the data and the result are presented below.

</table>

From table 5 it is found that the mean values of the respondents’ views on the risk of using mobile payments ranges from 3.74 to 3.44. The standard deviation of most of the variables less than 1 (0.955 to 0.008) and the standard error mean (0.68 to 0.80). The significant value reveals that the respondents are aware of the risk of using the mobile payments while making online transaction of purchasing a product or services.

**Suggestions of the Study**

With the country marching towards cashless economy, it has become inevitable for digitization. There is a need to bring awareness among the people in India about mobile payments and its advantages. The mobile applications should be designed in such a way that it is more users-friendly. The security and privacy of the information provided must be protected to ensure confidence of the people using Mobile Payments applicationsand the same should be designed developed according to the existing requirements and constraints.

**Conclusion of the Study**

Mobile payments are an evolving area of digitization, where customers can utilizes the service providers through a mobile and wireless network, using mobile devices for information retrieval and transaction processing. Mobile payments services and applications can be adopted through different wireless and mobile networks, with the aid of several mobile devices. Mobile payments services and applications need proper identification of mobile users’ requirements, as well as mobile devices and technologies constraints. Mobile payments work in a paperless environment, thus saving time and are convenient for use by the customer through their mobile phone at any point of time as form of mobile application.

Establishment of Reference Tables for Fetal Abdominal Circumference by Ultrasonographic Measurements in Local Population, Karnataka, India

Pranita R. Viveki¹, Veereshkumar S. Shirol²

¹Tutor, Department of Anatomy, Belagavi Institute of Medical Sciences, Belagavi;
²Professor, Department of Anatomy, J. N.Medical College, Belagavi, Karnataka, India.

ABSTRACT

Background: Fetal Abdominal circumference (AC) is an important and most reliable individual parameter, which can be used not only for determining fetal age, fetal growth and the type of growth restriction.

Objectives: 1) To establish a reference table for fetal AC in normal pregnant women from 20 to 38 weeks of gestation from local population 2) To find out the predictive accuracy of GA (Gestational Age) determined by fetal AC with that determined by last menstrual period (LMP) method.

Materials and Methods: The data was collected by using predesigned pretested questionnaire from September 2016 to January 2018. Total 768 singleton pregnant women with minimum 30 cases for each gestational week from 20 to 38 weeks of gestation, fulfilling inclusion and exclusion criteria were studied.

Statistical Analysis: The data was analyzed using Statistical Package for Social Sciences (SPSS) version 20. Percentages, mean, standard deviation and range, standard error, percentiles and regression equation etc. were performed for AC for each gestational week.

Results: The regression equation derived was GA = 4.677 + (1.007 X AC in cm) with correlation coefficient (r) of 0.979 and proportion of variation in dependent variable (R²) of 0.959. By this regression equation, the accuracy in prediction of GA by AC measurements was ranging from 99.75% at 32 weeks to 94.61% at 38 weeks of gestation. The mean AC values of Hadlock’s study were greater than that of the present study except at 20 weeks.

Conclusion: The present study findings confirmed that generation of population specific reference tables and regression equations for various fetal biometric parameters by a large scale study at national level is required for more precise reporting of GA and expected date of delivery (EDD) by ultrasonography.

Keywords: Abdominal circumference, Gestational age, Ultrasound

Introduction

Ultrasound measurement of fetal biometry is an important and commonly used tool in antenatal care. It measures biometric parameters such as biparietal diameter (BPD), head circumference (HC), abdominal circumference (AC) and femur length (FL).¹ Measurements of fetal AC were first used to estimate fetal weight by Campbell and Wilkin in 1975.² Since then AC has become the main fetal parameter used to estimate fetal weight before birth. It is widely used to detect and monitor fetal intrauterine growth restriction (IUGR) or fetal macrosomia in diabetic pregnancies.³ Various studies have also demonstrated that AC and estimated fetal weight (EFW) are preferred parameters to diagnose fetal growth restriction.⁴ The ethnic factor shows to interfere in the fetal growth pattern, impossible that reference ranges of fetal biometric parameters from

homogeneous population could be applied in other populations. There are a lot of reference charts for fetal biometric parameters established for different populations, i.e. European, African, Asian and Latin American. All these reference charts were unconditional (cross-sectional) studies, because they are more appropriate for the quantification of fetal size. There is a unique unconditional study with 31,476 singleton Brazilian pregnant women which established reference charts for fetal biometric parameters. However, because of a lot of miscegenation of Brazilian population with great ethnic differences among its regions, it is not possible to establish reference charts for fetal biometric parameters to the whole Brazilian population. Hence, each particular population or ethnic group should have their own reference tables for the different fetal anthropometrical variables in order to provide the most accurate fetal assessment.

Therefore, the present study was designed to establishment of a reference table for AC and to find out the predictive accuracy of GA determined by AC with that determined by LMP method in normal pregnant women from 20 weeks to 38 weeks of gestation from Belagavi District, Karnataka, India.

**Aims and Objectives**

1. To establish a reference table for fetal Abdominal circumference in normal pregnant women from 20 to 38 weeks of gestation from local population
2. To find out the predictive accuracy of gestational age determined by fetal Abdominal circumference with that determined by LMP method.

**Materials and Method**

A random case series study was done from September 2016 to January 2018 among the antenatal cases referred to the Department of Radiology, Belagavi Institute of Medical Sciences (BIMS), Belagavi by Department of Obstetrics and Gynaecology (OBG) for routine antenatal scanning after clearance from Institutional Ethics Committee. Antenatal cases with knowledge about exact date of LMP with regular menstrual cycles of 26-33 days for at least 3 cycles before conception, with delivery of a live baby with birth weight more than or equal to 2500 grams, fundal height corresponding to duration of pregnancy as per obstetricians finding, who delivered within one week of the expected date of delivery (EDD) and who delivered a newborn baby without any congenital abnormality were included in the study for analysis. Exclusion criteria were - pregnant women with age below 18 and above 35 years, with height below 140 cm, history of drug abuse, tobacco / gutkha use, smoking before and during pregnancy, oral contraceptive pills for 3 months prior to conception, and previous baby with low birth weight. women with Diabetes mellitus, hypertension detected during examination or developing later during pregnancy, women with multiple gestations, oligohydromnios, polyhydromnios, intrauterine growth retardation, or intrauterine death, women with uterine abnormalities like fibroids, bi-cornuate uterus, etc.

Of the total 1037 cases initially included for the study, 269 cases were excluded after their follow up at delivery for various reasons as mentioned above in inclusion and exclusion criteria. Thus, finally present study included 768 cases for data analysis with minimum 30 cases for each gestational week from 20 to 38 weeks.

**Method of collection of data:** A predesigned, pretested, structured proforma was used for each subject separately. The ultrasonographic examination of each pregnant woman fulfilling inclusion criteria, was done after submission of completely filled ‘Form F’ in compliance to Pre-Conceptional and Pre-Natal diagnostic Techniques (PCPNDT) Act, duly signed by the women undergoing ultrasonography and the radiologist conducting ultrasonography. The ultrasound examination was done by a single radiologist on one ultrasound machine - iU22 Philips make real-time machine with 3.5 MHz electronic curvilinear transducer. AC was measured in the correct cephalocaudal plane where the right and left portal veins were continuous with one another with symmetric appearance of the lower ribs with depiction of the shortest length of umbilical segment of the left portal vein with ellipse fitting to the skin edge.

The patients or close relatives were contacted for information about delivery like date of delivery, onset of labor (spontaneous or induced), mode of delivery (vaginal or caesarean section or assisted one), place of delivery, birth weight of the baby, any congenital anomaly detected in newborn baby, etc. The data was analyzed by using Microsoft Excel and Statistical Package for Social Sciences (SPSS) version 20.

Graph 1: 5th, 50th and 95th percentile values of AC measurements
Results

The present study included total 768 cases between 20 to 38 weeks of gestation for analysis ranging from 34 to 51 cases per gestational week. The average age of the study subjects was 23.59 ± 3.28 years ranging from 18 to 35 years. The mean height observed was 151.13 ± 3.43 cm. Majority of the subjects (53.65%) were educated up to secondary school, followed by higher secondary school (20.05%) with average education status of 9.14 ± 3.14 standard. 42 subjects (5.47%) were illiterates. Almost all (99.61%) were housewives/home makers and around 2/3rd cases were from rural area. 42.97% cases were primigravidae and 427 (55.60%) were from below poverty line family. Majority (79.30%) of the cases delivered in a government health institutes and 89.19% cases delivered normally. 47.79% newborns were females and 62.89% newborns were weighing between 2500 to 2700 gms with average birth weight of 2712.22 ± 181.66 gms.

The average GA for AC measurements from 14.5 to 33.9 cm is as shown in Table 1. Average GA went on increasing with increase in AC measurements. For an AC of 14.5 to 14.9 cm, the average GA found was 20.49 ± 0.46 weeks, whereas it was 38.57 ± 0.20 weeks for AC value of 33.5 to 33.9 cm.

Table 2 shows descriptive statistics for AC measurements like mean ± SD, Minimum and maximum value, standard deviation (SD) and lower and upper limits at 95% confidence intervals. The difference in minimum and maximum AC values went on increasing with increasing GA. However, the difference in lower and upper limits at 95% confidence interval ranged from 0.29 cm at 20 weeks of GA to 0.84 cm at 36 weeks of GA. The regression equation for GA estimation derived was $GA = 4.677 + (1.007 \times AC \text{ in cm})$ with correlation coefficient (r) of 0.979 and proportion of variation in dependent variable ($R^2$) of 0.959. By this regression
equation, the accuracy in prediction of gestational age by AC measurements was ranging from 99.75% at 32 weeks to 94.61% at 38 weeks of GA.

Graph 1 shows the graph of 5th, 50th and 95th percentile values of fetal AC values according to gestational week which shows increasing AC values with advancing gestational age. Graph 2 shows box plot of the mean, first quartile, third quartile and extreme measurements of AC for each gestational week from 20 to 38 weeks of gestation by LMP in study subjects. Graph 3 shows the Scatter plot of predicted GA in weeks with reference to AC in cm.

**Discussion**

Accurate gestational age estimation is one of the most important functions of antenatal ultrasonography. AC measurements are more appropriately used in the assessment of fetal growth, especially in the second half of pregnancy than in the assessment of GA. However, it is an appropriate parameter to demonstrate normal fetal proportions in the mid trimester\(^1\). Similar to other studies, the present study also found progressively increased AC variability with increasing menstrual age and was shown to be related to the predicted AC value\(^2\). AC has generally largest reported variability than other fetal biometry parameters like head circumference, femur length and bi-parietal diameter as it is more acutely affected by growth disturbances than the other parameters \(^11,14,15\). In early pregnancy and in normally growing fetuses, the AC is only slightly accurate on average than other parameters. However, the variability in predicting GA based on AC increases as pregnancy advances\(^11\). A study by Hadlock FP et al\(^15\) demonstrated prospectively that the use of multiple parameters in estimating fetal age offers a significant advantage over any single parameter used alone and that the regression equations developed from a middle-class white population appear to be applicable to fetuses from a population with different socioeconomic and racial characteristics.

As seen in Table 3, the mean AC values of Hadlock’s study\(^14\) were higher than that of the present study except at 20 weeks. The observed difference in mean AC values in present study and that of Hadlock’s were 0.37 cm, 1.76 cm and 1.68 cm at 28, 37 and 38 weeks of gestation respectively. The mean AC measurements of the present study were also found to be different from the observations of other similar studies\(^12,16\).

The reference charts developed by Hadlock et al\(^14\) are used for assessment of GA and fetal well-being in the local area, but there are more chances of over-diagnosis of intra-uterine growth retardation and wrong prediction of expected date of delivery especially at advancing gestational age. This mandates for use of reference tables prepared from local population for more accurate and reliable estimation of gestational age and determination of fetal growth and development and also for deciding expected date of delivery.

**Conclusion**

There is strong possibility of overestimation or underestimation of GA and EDD when the fetal biometry parametric measurements of one population is used for other racial or ethnic groups. So generation of population specific reference tables and regression equations for various fetal biometric parameters by a large scale study at national level is required for more precise reporting of GA and EDD by ultrasonography.

Prevalence of Pre-Hypertension, Blood Pressure Variables and Cardiovascular Risk among College Students

D. Ezhil Bhavani\(^1\), R. Monisha\(^1\)

\(^1\)Assistant Professor, SRM College of Physiotherapy, SRM Institute of Science and Technology, Kattankulathur, Chennai, India

ABSTRACT

Introduction: Pre-hypertension is defined as a systolic blood pressure (SBP) of 120-139 mmHg or a diastolic blood pressure (DBP) of 80-89 mmHg in adults. Pre-hypertension has become a major public health concern due to its strong association with increased risk of hypertension and cardiovascular or cerebrovascular events. It affects 25-50\% of adults worldwide, and increases the risk of incident hypertension.

Objective: Aimed to investigate the prevalence of pre-hypertension and cardiovascular risk factors among college students and to evaluate the blood pressure variables.

Methods: 500 students were evaluated with sphygmomanometer, initial measurements include height, weight and the evaluation has been repeated in students with persistent elevated BP. Blood pressure variables include Systolic blood pressure, Diastolic blood pressure, Mean arterial pressure, Pulse pressure were recorded.

Results and Conclusion: Result will be revealed after completion of this study

Keywords: Systolic blood pressure, Diastolic blood pressure, Body mass Index, Heart rate

Introduction

The major predictor of cardio vascular and cerebrovascular events lies in the analysis of pre-hypertensive subjects. However, there is a conflicting evidence that a single measure of systolic and diastolic blood pressure recordings is not sufficient to predict the cardiovascular risk, hence there is a need to analyze the blood pressure variables on determining the prognosis on cardiovascular events, there has been a continuous uncertainty persisting on the relative importance in predicting risk. Lot of research evidence highlights on the fact that SBP and DBP recordings can rule out the risk factor for cardiovascular events. RCTs shows greater evidence on SBP can alone sufficient to document the risk of cardiovascular events. Subsequently, pulse pressure (PP) was conjointly shown to be a crucial predictor of the danger of CVD, significantly in old and older people, a lot of analyses conducted in a very younger population have steered that a mix of BP indices may well be superior to single parts for predicting the danger of CVD. Age-related changes in BP indices are represented across populations, with SBP rising unendingly throughout life, whereas DBP tends to stay constant, or maybe decline, once the fifth and sixth decades.16 As a result, PP additionally rises unendingly, with some acceleration in later life. Information from a pair of massive meta-analyses of cohort studies have shown a homogenous attenuation of the association between BP indices and vas risk with increasing age, they need additionally incontestible that SBP alone was slightly a lot of informative compared with the opposite BP indices, that PP was less informative than SBP, which this was notably true in those aged <50 years. But studies are lagged in the age group of 19-25 years.

Objective of the Study

Blood pressure recording is frequently used for identifying patients with cardiovascular risk. However, there is contradictory evidence to support this. The study objective was not to examine the single measure of systolic or diastolic Blood pressure recording, there is a need to analyze the blood pressure variables and its correlation in predicting the cardiovascular risk.

Methodology

A. Sample Design: Non probability randomized sampling.

B. Sample Size: Totally 500 students with are included in the study and 200 students were excluded out of the study because of their engagement in regular practice of Surya namaskar.

C. Study Duration: 4 weeks

D. Study Setting: SRM College of Physiotherapy, SRM Institute of Science and Technology, Chennai

Selection criteria:

A. Inclusion Criteria:

- Students with age group 17 to 23 years.
- Students who are not under any medication
- Both male and female students

B. Exclusion Criteria:

- Students who were not willing to participate

Assessment Parameters:

- Systolic blood pressure
- Diastolic blood pressure
- Mean arterial pressure
- Pulse pressure
- CVD risk factors

Method

The study was designed to relate BP and blood pressure variables, this is not have been detailed elsewhere. In brief, BP and PP, Mean arterial pressure on the incidence of cardio vascular events among individuals with the age group 19-25 has been studied. Participants had to be ≥19 years of age at entry and to have ≥1 other risk factor for CVD. A total of 300 students participated in the study, recruited from SRM Institute of science and technology was analyzed for the cardiovascular risk.

Baseline Assessment

The baseline systolic and diastolic readings and blood pressure variables were recorded initially. 5 minutes of rest has been provided in between the test, three consecutive recordings of BP were recorded with the participant in a seated position. PP was measured as the difference between systolic and diastolic BP and mean arterial BP as the sum of diastolic BP and one third of PP. In the baseline data the details on medical history, current medical treatment family history of cardiovascular risk factor were identified, and any major risk factors were noted. cardiovascular disease (CVD) exists primarily because of the increased risk of the presence of hypertension. According to the Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC-7), pre-hypertension is marked as a systolic blood pressure (SBP) of 120-139 mmHg or a diastolic blood pressure (DBP) of 80-89 mmHg in adults. hypertension and its risk has been strongly associated in patients who are pre- hypertensive. Thus pre-hypertension is one of the public health concern nowadays because of its interrelationship with cardiovascular complications. However, JNC-8 guidelines on hypertension do not focus on the concept of pre-hypertension. Investigation the prevalence of pre-hypertension and connected risk factors may facilitate to forestall cardiovascular disease and CVD and end-organ damage. But none of the study has done in Chennai so far estimating the prevalence rate of pre-hypertensive. Differences in the prevalence of pre-hypertension is because of various factors and geographical constraints Higher waist circumference and body mass index have been considered to be potential risk factors of pre-hypertension. The objective of the current study was to investigate the prevalence of pre-hypertension and potential risk factors associated with the progression of pre-hypertension among a represented student population in chennai.
Blood Pressure Measurement: Blood Pressure was measured in the right arms, with the subjects in sitting position at 10.00am to 11.00am each day with a minimum of five minutes of rest. Measurement was done using standard mercury sphygmomanometer with appropriate cuff sizes. Three BP readings were recorded consecutively with at least 15 minutes interval and the average of three readings was documented. This procedure was repeated, to measure the BP, for another four days. Finally, the minimum value among the three day readings was taken to be the blood pressure of that student.

Statistical Analysis: Statistical analysis was performed by SPSS 12.0 software.

Table 1: Spearman Correlation- Age and Systolic Blood Pressure Recording

</tbody>
</table>

When age and systolic blood pressure recordings have been compared. Students in the age group of 17 - 21 years have increased chances of getting hypertension as the age progresses. There is a statistically significant value obtained in Chi-Square Tests (.000) students age and its association with elevated systolic blood pressure recordings shows there is a chance of developing Hypertension as most of the college students are pre-hypertensive.

Table 2: Spearman Correlation - Age and Diastolic Blood Pressure Recording

However the students with the age group of 19 to 21 have elevated diastolic blood pressure. There is no statistically significant value obtained in Chi-Square test and there is no correlation exist between age and diastolic blood pressure recording. So it is proved that age is not a factor influencing diastolic blood pressure recording.

When family history and systolic blood pressure recording of college students has been compared there is no correlation exist between these two variables.

**Discussion**

The current study revealed that the overall prevalence of pre-hypertension was 89.7% in Chennai among college students. The prevalence of hypertension was already elevated of the population already in the age group of 55-60 years. Higher prevalence of pre-hypertension was reported in male -87 out of 132 have elevated systolic blood pressure when comparing female students -73 out of 168 have elevated systolic blood pressure.

Moreover, age, gender, BMI, Family history were important risk factors for pre-hypertension in the population under investigation. Previous studies have proved that For every 10 years increment in age, the risk of pre-hypertension increased 50 times. The risk of pre-hypertension was about 5 times higher among subjects in the age group of 21 years compared to those aged below in the recent prevalence study done among college students.

Higher prevalence of pre-hypertension in the northern population might be due to higher salt intake. Further studies should be carried out in order to rule out the etiology behind the higher incidence of hypertensive and pre-hypertensive recordings documented in male population. The prevalence of pre-hypertension has been noted to be significantly higher in male individuals in this current study too. Significant difference in the prevalence of prehypertension was observed among different age groups in our study 19 to 21 years of age are in greater risk of developing CVD as they documented under pre-hypertensive systolic and diastolic blood pressure recordings and with the positive risk factor and family history. In contrast with our study, Zhao et al. suggested that the prevalence has decreased along with the age increment. These findings might be explained by cross researches.

Individuals with pre-hypertension have an increased risk of hypertension, college students in the age group of 21 are documented as pre-hypertensive. Pathophysiology and etiology behind this must be investigated in future by proper follow up of these subjects and measures have been taken out to reduce the impact of these elevated systolic and diastolic blood pressure recordings among students.

High BMI was the predictor of pre-hypertension. This finding suggests that being overweight or obese has a statistically significant association with the development of pre-hypertension. Therefore, to prevent pre-hypertension, weight loss may be necessary for all individuals with high BMI. However, the mechanisms underlying increased risk of pre-hypertension in individuals with age group of 21 years need to be investigated further.

The study aims to identify the of pre-hypertension among college students of age 17-23 years and management remains an important method of preventing the development of hypertension and other CVD risk. Multiple risk factors are responsible for the onset of pre-hypertension, including age, gender and higher BMI and heredity. Most of these risk factors of pre-hypertension are closely associated with lifestyle factors. At most attention should be paid to the identification of pre-hypertension even in the healthy population. Active management of blood pressure, timely and effective treatment of lifestyle modifications, and increasing physical activity, yoga, stress reduction may help to slow down the progression of pre-hypertension. However, evidences for the treatment of pre-hypertension are still lacking, life style modification and basic exercises to avoid sedentary living must be included in regular practice.

**Conclusion**

The study conclude that non-modifiable CVD risk factors are associated with PHT. Among them Age, BMI and blood pressure variables are the predictors of
PHT in our study population. This study declare that recording of more than one blood pressure variables is needed to analyze the prevalence of pre-hypertensive individual. Follow up of this student population is planned to execute physiotherapy treatment protocol in risk reduction among pre-hypertensive subjects.

ABSTRACT

Improving health literacy levels would empower people to improve their capacity in using health related information effectively. The study period was six months: this included the collection of data, the analysis of the collected data, and the reporting of the results. The sample size was calculated to be 104. Each research subject was scheduled 4 appointments which included the pretest and posttest of the subject as well as the teaching part of the teach back program. The scores were graded accordingly into three grades. On the first visit the patient was administered a tool, newest vital sign, which has a nutrition label and a questionnaire. The subject would be explained about the label. After the explanation, the subject would be administered the questionnaire which has 6 questions. For every correct answer, an award of one point is made. A score between 0 and 1 points to a high probability of the patient having a literacy level that could be labelled as limited literacy. A score between 2 and 3 points to a medium probability of the patient having a literacy level that could be labelled as limited literacy. A score between 4 and 6 points to a level of literacy that could be labelled as sufficient to competently traverse the healthcare system. After the collection of pretest results, the teach back method of educating patients about health literacy will be implemented for two sessions and follow up will be done for the next two consecutive visit. The assessment of health literacy will be done on the fourth visit and analysis of results will be done to see the improvement if any. Out of 104 patients who attended the pre and the post-tests, the health literacy status was found to be higher among females compared to males in the pretest scores. With relation to age it was found that the people in the age group of 18-25 lacked knowledge on health literacy. The age group above 35 had higher literacy levels.

Keywords: Health Literacy, Teach back method

Introduction

Health literacy (HL) is the capacity to acquire, assimilate and comprehend knowledge of healthcare services at a basic level. This capacity is required to make accurate and relevant decisions in health seeking behavior. Health literacy has been proven to be as important a determinant of health seeking behavior and health as general literacy. By improving health literacy we can empower people to improve their capacity in using health related information effectively.¹²
It is clear that very significant proportions of populations do not have levels of health literacy that could be characterized as sufficient to successfully traverse a healthcare environment that is becoming increasingly difficult to comprehend.\textsuperscript{4,5,6}

**Low levels of health literacy are linked to:** Lower scores on health status,\textsuperscript{7} increased frequency of hospitalization and mortality, increased length of inpatient stay, increased rates of repeat inpatient admissions within one month of being discharged, a reduction in capacity to manage chronic disease, a decrease in the ability to recall information after doctor appointments, a higher likelihood of medication errors, increased intensity of illness when seeking medical care, poor levels of knowledge of illness management, inadequate use of preventive services, heightened cost of care, and a significantly higher probability of missing appointments. A significant proportion of the population with poor health literacy skills remains unvaccinated. People with poor levels of health literacy are at greater risk of being unvaccinated when compared to people with levels of health literacy that could be termed as adequate.\textsuperscript{10}

In teach-back, the healthcare provider takes full accountability for the level of understanding of the patient. The patient is encouraged to discuss and question openly.\textsuperscript{11,12} In the beginning, the health professional attempts to teach the patient (or the patient caregiver) the new skill. After this, the health professional asks questions like “I want to be certain that I have got this across to you correctly. Can you please tell me how you would go about administering this medication once you are back home?” Next, the patient/caregiver do one of two things: repeat the instructions in their own words or do a practical demonstration of the skill. Thus, the health professional can make a clear assessment of whether the patient (or the patient caregiver) has understood what the health professional was trying to teach or get across. The teach back is complete when it is clear that the information has been conveyed and assimilated as intended. Repeated iterations might be needed for the teach back method to be completed satisfactorily.\textsuperscript{13}

**Aim of the Study**

To improve the health literacy of patients so as to enable access to health information.

**Objectives of the Study**

1. To assess the health literacy rates of patients visiting the general medicine OPD in a tertiary care teaching hospital.

2. To measure the improvement in the health literacy rate post the teach back method implementation.

**Methodology**

The study was conducted in the general medicine outpatient department in a tertiary teaching hospital in a coastal city of Karnataka state. The study duration was six months. This study duration included the collection and analysis of the data.

Then the sample size for the study was determined using the following formula:

\[
\begin{align*}
  n &= \frac{p(1-p) \left( z_{1-\alpha/\beta} + z_{1-\beta} \right)^2}{(p_1 - p_2)^2} \\
  \text{Where } p_1 &= 0.45 \text{ and } p_2 = 0.3 \text{ and the values from the standard normal table was taken as } 2.32 \text{ for } z_{1-\alpha/\beta} \text{ and } 0.84 \text{ for } z_{1-\beta}.
\end{align*}
\]

After applying the required values the sample size was determined to be 104. The sample size was assessed by the principal investigator for a period of 4 months at the outpatient department of the general medicine unit. And the participants who understand English or kannada as language were selected as research subjects. Each research subject was scheduled 4 appointments which included the pretest and posttest of the subject as well as the teaching part of the teach back program. Scheduled appointments were given for the subjects taking into consideration the availability of the research subject. A log book was also maintained to keep a note of the scheduled appointments. After the collection of the pre and post test results, the scores were statistically analyzed in SPSS version 20. The scores were graded according into three grades. Wilcoxon signed ranked test was used to assess if the scores were statistically significant.

On the first visit the patient was administered a tool, newest vital sign, which has a nutrition label and a questionnaire. The subject would be explained about the label. After the explanation, the subject would be administered the questionnaire which has 6 questions. For every correct answer, an award of one point is made.
A score between 0 and 1 points to a high probability of the patient having a literacy level that could be labelled as limited literacy. A score between 2 and 3 points to a medium probability of the patient having a literacy level that could be labelled as limited literacy. A score between 4 and 6 points to a level of literacy that could be labelled as sufficient to competently traverse the healthcare system. After the collection of pretest results, the teach back method of educating patients about health literacy will be implemented for two sessions and follow up will be done for the next two consecutive visits.

**Results**

The total number of subjects for which the results were analyzed were 104. The frequencies of the subjects based on the demographic variables like age and gender is given below.

</table>

From the above table, we understand that out of the total percent of people who scored in likelihood of limited literacy, 11.1% were from age group 18-25, 11.1% were from age group 30-35 and 77.8% were from above 35 age group. Out of the total percent of people who scored in possibility of limited literacy, 17.1% were from age group 18-25, 8.6% were from age group 25-30, 11.4% were from age group 30-35 and 62.9% were from above 35 age group. Out of the total percent of people who scored in adequate literacy, 25% were from age group 18-25, 13.3% were from age group 25-30, 11.7% were from age group 30-35 and 50% were from above 35 age group.

**Based on gender of patient:** Out of the 104 subjects’ 54.8 percent were males and 45.2 were females.

**Based on age:** Out of the total 104 research subjects, 21.2% were in the age group of 18 – 25, 10.6% were in the age group of 25 – 30, 11.5% were in the age group of 30 – 35 and 56.7% were in the age group of above 35. A trend was noticed that as the age increased the people scored more on health literacy. Both in the pretest and the posttest it was found that the people who had adequate literacy skills were more in the age above 35.

Cross tabulations were performed to find out the relationships between the pretest and posttest scores and the demographic variables like the age and the gender. The details are given below.

From the above table, we understand that out of the total percent of people who scored in possibility of limited literacy, 20.8% were from age group 18-25, 12.5% were from age group 30-35 and 66.7% were from above 35 age group.

Out of the total percent of people who scored in adequate literacy, 21.2% were from age group 18-25, 13.8% were from age group 25-30, 11.2% were from age group 30-35 and 53.8% were from above 35 age group.

Table 3: gender of patient * Total score of patient pretest Crosstabulation

Cross tabulation between the gender of the patient and the pretest and posttest scores: From the above table, we understand that out of the total percent of people who scored in likelihood of limited literacy, 44.4% were males and 55.6% were females. Out of the total percent of people who scored in possibility of limited literacy, 54.6% were males and 45.7% were females. Out of the total percent of people who scored in adequate literacy, 56.7% were males and 43.3% were females.
From the above table, we understand that out of the total percent of people who scored in possibility of limited literacy, 50% were males and 50% were females. Out of the total percent of people who scored in adequate literacy, 56.2% were males and 43.8% were females.

Next, Wilcoxon signed ranked test was applied, the p value was obtained to be <0.001 which shows that it is statistically significant as mentioned in table 5. The median along with the quartiles were obtained. The minimum and the maximum scores along with the means were obtained for both the pretest and posttest.

### Discussion

Torwane et al enumerate the ill effects of low levels of oral health literacy. Kim et al report regarding the beneficial effects of the Chronic Disease Self Management Program (CDSMP) that proved that health literacy is important in self-management of chronic diseases.

Cunha et al report that for the relationship between Health Literacy (HL) and Body Mass Index (BMI), it was found that Health Literacy had a positive association with the BMI, suggesting a significant relationship between both. Given that the increase in literacy for health represents a decrease in BMI values, we may infer that better literacy for health also corresponds to a better nutritional status. Aydin et al report that individuals have an active role in personal health decision making. Information technologies and the internet have become potent sources of health information. In this scenario, health literacy is one of the most important factors that affect individuals.

The questionnaire has a nutrition label and a set of six questions. Depending upon the scoring, respondents were divided into three categories which portrayed the health literacy knowledge they had. After the pre-test, the teach-back method was implemented. The participants were briefed about different good dietary habits which would benefit them in terms of health and wellbeing. After the teaching part was completed, the respondents were reassessed again with a post-test.

Out of 104 patients who attended the pre and the post-tests, the health literacy status was found to be higher among females compared to males in the pretest scores. The reason for this difference could not be identified. A similar gender difference was observed in a study carried out in the rural population in another tertiary teaching hospital in southern India. With relation to age it was...
found that the people in the age group of 18-25 lacked knowledge on health literacy. The age group above 35 had higher literacy levels.

More interventions must be planned by the hospital to improve the health literacy status of the patients; which would in turn reduce health care costs as it will reduce readmissions in hospitals.

Economic Impact of FDI on Indian Biotechnology Sector

S. Chandrachud¹, M. Thiyalnayaki²

¹Professor, Department of Economics, ²Professor and Head, Department of BBA, VISTAS

ABSTRACT

Number one Sector of producing Hepatitis b Vaccine recombinant in the world is Indian Biotechnology Sector. India has the potential to become a major producer of transgenic and various Generic Modified (GM) or Engineered Vegetables for the global food requirement. The modus operandi of this study is exposes the strength, Weakness, Opportunities and Challenges of Biotech sector in connection with Foreign Direct Investment. Chapter one provides a basic idea about the Indian Biotechnology sector. Chapter two enlists the review of literature. Chapter three envisages the role of FDI on Indian Biotechnology sector. Chapter four portrays the current status of Indian Biotechnology sector. Chapter five depicts the SWOT analysis of Economic Impact of FDI on Indian Biotechnology sector and last chapter concludes the scope of Indian Biotechnology sector and Discussion on future prospects of Indian Biotechnology sector.

Keywords: FDI, Economic Impact, Biotechnology, BIRAC, Generic Modified Technology

Introduction

Indian Biotechnology sector has the twelfth position at world level and got the third rank in Asian Pacific region. After espousing Product Patent Regime (PPR) in 2005, India has became the second largest number of approved plants of U.S. Food and Drug Administration (USFDA). In order to Fund, mentor, handhold and facilitate in the Biotechnology sector, including infrastructure for the enhancement of biotechnology sector, “Biotechnology Industry Research Assistance Council (BIRAC) was incorporated. It is proud to propagate that India is the world’s leading supplier of affordable vaccines, especially, largest producer of recombinant Hepatitis B vaccine. The twin advantages of this sector is the availability of intellectual, highly skilled and trained manpower in Biotechnology field and massive domestic market with huge consumer base for the development and growth medical and Bio-organic field. Indian Biotechnology sector consist of five Bio-components such as Bio-pharmaceutical sector, Bio-Service sector, Bio-agricultural sector, Bio-Industrial Sector and Bio-Informatics sector.

Review of Literature

There are several studies relating investment on Biotechnology sector. Few of them, are

Alexius A. Pereira¹ suggests that the “collaboration” or “adaptive partnership” between governments and TNCs can be understood as follows. Governments need to be pro-active (via policy interventions) to create opportunities for TNCs to enhance their own business competitiveness. However, governments should expect policy competition for FDI and they should also expect TNCs to be selective. Hence, there will be a great deal of interaction and transaction - not just between the two sides but also within each side (e.g. states in policy competition) - that will ultimately determine FDI flows.

Pedro I. Bustamante ² concluded that The “High-TECH SMES” of the biotechnology industry should be identified as a key industry sector responsible for developing high-wage research and development jobs, and thus an important target in the tax incentive legislative proposals.

R. Himachalapathy³ The government is establishing a biotech park in Chennai to tap the abundant availability of highly skilled manpower in biotechnology & biochemistry from eminent institutions. Furthermore, the state is very rich in herbs and a major exporter of herbal products to Europe, East Asia, and the United States.

Deepak Ranjan and Shuchi Jaiswal⁴ According to them, the fast growth rate and increasing number of licensing and collaboration deals in the biotech industry is attracting growing levels of investment, not only from
pharmaceutical companies but also from stock market investors due to the future prospects within the industry.

Ramamohan Rao T V S 5 This book deals with the organizational mechanisms to accelerate developments in biotechnology, the patents and IPRs necessary to obtain the requisite R&D and compensate the entrepreneurs and the emerging markets for products of biotechnology and their pricing.

Giovanni Lagioia, Annarita Paiano, Teodorolo Gallucci6 they concluded that This study shows that in Apulia few biotech innovations could be applied. Without any doubt, the possible development of biotechnology in the territory of Apulia depends on the successful transfer of technological know-how from research centres or universities to local businesses, especially because of their small size.

Role of FDI on Indian Biotechnology sector: The Foreign Direct Investment in India, has been enhance after the liberalization policy and the structural changes made in foreign trade policy. As far as FDI inflow in India with respect to biotechnology are, 100% Foreign Direct Investment (FDI) is allowed under the automatic route for greenfield pharma, 100% Foreign Direct Investment (FDI) is allowed under the automatic route for brownfield pharma in up to 74% FDI is under automatic route and beyond 74% is under government approval route and FDI up to 100% is allowed under the automatic route for the manufacturing of medical devices. India was the first Asian country, has recognized the importance of biotechnology as a tool of upgrading the economic system. In continuation with this, India initiated the first Export Processing Zone in Kantla. Integration of agricultural sector and pharmacy sector, for the purpose of accelerating the economic growth in the field of Information technology resulted in incorporation of “Biotechnology Sector”. The Indian biotechnology sector has inheriting power of low operational costs for running the unit, low cost for the technology, availability of skilled human resource, IT enhanced network of life science research laboratories along with abundance of raw material inputs such as plant, animal and human genetic diversity. Due to the enormous flow of Foreign Direct Investment, the transformation of Indian Biotechnology sector from share of 2 percent global requirement in 1999 to position of top 12 largest destination of Biotechnology product supply. The current study is witnessing the significance of FDI on Indian Biotechnology sector.

Current Status of Indian Biotechnology Sector: The post liberalization era has witnessed that Indian Biotechnology sector has grown in leaps and bounds. The current study throws light on the current position of Indian biotechnology sector. According to government report under Make in India statistics that the Indian biotech industry is expected to grow at 30.46 percent CAGR to reach US $100 billion by 2025. It has grown from US $ 1.1 billion in 2005 to US $ 7 billion and is expected to reach US $ 11.6 billion in 2017. The emerging trend of biotechnology sector in Indian scenario, a positive hold in the macro economic variables especially, the employment opportunities, as it the sector supported with 104 new startups, 346 biotechnology based companies, more the 500 projects, out of which 115 collaborative projects through BIRAC, a Public sector unit of Government of India. Further, more than 100 Intellectual properties are facilitated through TRIPS and TRIMS. In addition to that bio-incubation space has been created to enhance the performance bio-incubators. As on now, 1,75,000 square feet of bio-incubation space has been provided and the sector is planning to incorporate 50 world class bio-incubators by 2020. The Indian biotechnology sector gains its importance as it encourages all three sectors simultaneously. Raw material from the plants (Bio-agriculture), production of drugs and other healthcare products (bio-industry) and using information technology and enhance the medical field (bio-service). The Special Economic Zones are the catalyst of Indian Biotechnology growth, as the SEZ act, 2006, in its amendments encouraged that the minimum land requirement for starting a SEZ unit from 100 acres to only 10 acres and 100% deduction of profits for 3 out of 5 years for startups setup during April, 2016 to March, 2019. MAT will apply in such cases 10% rate of tax on income from worldwide exploitation of patents developed and registered in India by a resident. Custom single window project have been announced and would be implemented at major ports and airports from the beginning of next financial year

SWOT Analysis for Economic Impact of FDI on Indian Biotechnology Sector: The leading sector of Indian industry, the Biotechnology sector needs a critical analysis, as its scope on economic development is comparatively high. The current discussion enriches the knowledge of possible further improvement in biological economic field. The strength of Indian Biotechnology sector includes 12th largest biotech destination, 2nd highest approved plants (USFDA), leading supplier
of Hepatitis B vaccine recombinant, availability of skilled man power, Connectivity of all economic sectors (agriculture, Industry and Service sector, Larger demand for biotech products, Enhanced academic resources to create a strong pool of scientists, well developed base industries (Pharmaceuticals), Extensive clinical trials and rich biodiversity. However, this sector has certain hurdles, such as, Commercializing the biotech products, creation of economic inequalities, Problems of economies of scale, Foreign competitors and High import duty for asset acquisition, unfavorable balance of payments. As far as the opportunities are concerned, huge domestic market, Biotechnology Industry Partnership Programme (BIPP), Small Business Innovation Research Initiatives (SBIRI), Biotechnology Industry Research Assistance Council (BIRAC), Special Economic Zones and IPR policies. The Indian Biotechnology sector is facing number of challenges, especially the problem of anti-biotech propaganda, increasing brain drain, Unfair Trade Practice, loss of natural resources, initiation of new type of diseases, Cost competitiveness and political, social, economic and cultural value deterioration.

**Strength**
1. 12th largest biotech destination,
2. 2nd highest approved plants (USFDA),
3. Leading supplier of Hepatitis B vaccine recombinant,
4. Availability of skilled man power,
5. Connectivity of all economic sectors (agriculture, Industry and Service sector,
6. Larger demand for biotech products,
7. Enhanced academic resources to create a strong pool of scientists
8. Well-developed base industries
9. Extensive clinical trials and rich biodiversity.

**Weakness**
1. Commercializing the biotech products,
2. Creation of economic inequalities,
3. Problems of economies of scale,
4. Foreign competition
5. High import duty for asset acquisition,
6. Unfavorable balance of payments
7. Problem of IPR

**Opportunities**
1. Huge domestic market,
2. Biotechnology Industry Partnership Programme (BIPP),
3. Small Business Innovation Research Initiatives (SBIRI),
4. Biotechnology Industry Research Assistance Council (BIRAC),
5. Special Economic Zones and
6. IPR policies
7. Low operational costs for running the unit,
8. Low cost for the technology

**Threats**
1. The problem of anti-biotech propaganda,
2. Increasing brain drain, Unfair Trade Practice,
3. Loss of natural resources,
4. Initiation of new type of diseases,
5. Cost competitiveness and political, social, economic and cultural value deterioration,
6. Clinical strikes

Source: Prepared by Author

**Fig. 1: SWOT Analysis–Economic Impact of FDI on Indian Biotechnology Sector**

**Conclusion**

The Economic Impact of FDI on Indian Biotechnology results in initiation of Current Good Manufacturing Practices (CGMP) Plant was started with world class infrastructure for the manufacture of phyto-pharmaceuticals in 2016. This industry influences all three economic sectors and its macroeconomic variable, including national income elements, GDP, Investment, Employment, Health sector and so on. The success of biological economics relies on the development of Biotechnology sector.
Discussion

The initiation of Bio-economic models may provide lead to growth and development in the manufacturing sector. The right choice of model, can be induced from the biotechnology sector. This sector is the right destination for MSME (Micro, Small and Medium Enterprises) as it generates more employment opportunities. The Government of India has already announced number of schemes and project to improve the growth and export promotion of Biotechnology sector. The Indian economy expects many more developments in Biotechnology industry in the days to come.

Integrated Ancient Medicine Practice and Treatment For Obesity-A Holistic Approach

Mouthu Kumarasamy¹, S. N. Sugumar²
¹Research Scholar, ²Professor and Head, Department of Economics, VISTAS Chennai

ABSTRACT

In the current intellectual world, the power of Human capital of the respective country decides its strength of the country in the future. Hence it is extremely important for progressive Governments to foster and sustain human development which is the part and parcel of its social fabric and civic society. Human development does not rain down from heaven but it is by the people and for the people. This is also applicable to development of human health. The Human health influences the both economic development and economic growth. The human ailments like non communicable disease especially obesity leads to weaken the man power which in turn slow down the productivity of manpower and progress of the economy. Balancing the demand for and supply of health care products and services lead to optimal human development. Therefore the health care providers and destinations should understand the demand pattern of patient-centered plans and clinical decision-making under the existing health care system

Keywords: BMI, Lifestyle disorder, Indian Health Care Economy, Obesity, Indian Medicine

Introduction

Nowadays Obesity is common health issue among the people irrespective of their ages and economic status. Majority of the people are not giving importance for this ailment. Actually it looks as simple as a life style disorder but it leads to serious and complicated health issues and impair human development. Most of the developed countries are providing a huge investment or medical facilities to protect and maintain the human health, as it is an economic indicator of the standard of living. This indicates that there is a strong association between the health and economic development.

Objectives

To examine and analyze the causes and consequences of lifestyle disorders ailments – Obesity, obesity related issues, its economic impacts and measures to overcome obesity.

Review of Literature

M laxy, C teuner, R Holle and C Kurz¹ stated that the BMI- HRQL (Health Related Quality of Life) is the highest in white people and it is linear negative slope in black women among the Hispanics.

Cilia mejia-Lancheros, John Mehegan, Celine M. Murrin, Cecily C. Kelleher² Concluded in their studies that “The smoking habit from the paternal line is associated with grand-children’s adiposity measures during their early childhood, which might be epigenetically transmitted through male-germ line cells”.

Ahmad Jayedi, Sakineh Shab-Bidar³ found in their research work that “There is strong evidence which confirms existence of obesity paradox in patients with hypertension. However, owing to the observational nature of included studies, these findings should be interpreted with caution”.

Corresponding Author:
Dr. S. N. Sugumar
Professor and Head, Department of Economics, VISTAS, Chennai–600 117 Tamilnadu, India.
Mobile no: 9884448037
Email: profsukumar@gmail.com
S. N. Sugumar pointed out that the health education and its awareness on alternative medicine are useful to overcome the lifestyle disorder human ailments, such as cardiovascular disease, Blood Pressure, Cancer etc.,

F Ofei According to author, there is the need now, more than ever, to set up a multi-sectoral taskforce to assess the national prevalence, trends, determinants and impact of obesity and its related NCDs on the society as a whole and on health care provision in the country. The recommendations from such a consultation could show the way in which our environment can be made more enabling for adults and children to eat more healthily and be more physically active on a regular basis.

Kevin M. Fitzpatrick et.al. The study concludes that one of the element for the cause of obesity is the “Place”. The multivariate analysis also confirms that the ploace-chronic health has a positive connection with the longitude and latitude position of the globe. The continuing burden of zip code in the western side for the marginalized population leads to place-focused medical care.

J Nurse Pract Naturopathy is medical treatment which involves diet, correcting imbalance, making changes in lifestyle in order to achieve the long-term sustainable health optimization.

Obesity

Obesity means an increase in body weight caused by excessive accumulation of fat, a person is Obese when his/her Body Mass Index (BMI) is higher than 26 and is considered overweight when their Body Mass Index is between 25 and 30. Obesity is a serious and chronic human syndrome which affects multiple organs of our body.

Obesity in Global context: According to Obesity Rates by Country–2017, Renew Bariatrics, there are nearly 650 million adults and more than 125 million children and adolescents are suffering from obesity in the world, based on Body Mass Index (BMI) estimation. This indicates nearly 10.5 percent of world population (7.5 Billion) are suffering with obesity.

Obesity in Indian Context: India is positioned 3rd globally in terms of number of Obese people and nearly 44.3 million people are obese and as a percentage 5% of its population. Obesity in Indian adults appears to be disproportionate with 22 percent of women found to be obese compared to 16 percent of men. This may be accounted for by traditional Indian values, in which men work and the women remain at home. In addition, the technology improvement in home-aids leads to lesser physical work for the house maker which results in obesity. In modern times, the increasing percentage of women employment also leads to many life style disorders that causes obesity

Obesity related health issues: The human ailments such cardiovascular disease, cancer, diabetes, joint pains, and chronic kidney disease and Blood pressure etc., may be caused by Obesity. Many empirical studies have revealed that the obesity is the main reason for fall in life expectancy when it is unchecked in time. The rise in obesity among children is symptom of health deterioration, since it has the potential to sap human development and thereby future economic growth.

Johns Hopkins University and Global Nutrition Report CoChair. “A well-nourished child will learn better in school, be healthier and grow into productive contributors to their economies. Good nutrition provides the brainpower, the ‘grey matter infrastructure’ to build the economies of the future” and “A well-nourished child is one-third more likely to escape poverty”, says Jessica Fanzo,

Economic Impact of Obesity: The Human capital is the integral part of Gross Domestic product, as it directly influences the total productivity of the nation. However the human capital depends on public health which is highly affected by the health disorders particularly the Obesity. Therefore, there is a direct proportional linkage between the obesity and GDP. Obesity and human productivity are inversely related which also results in negative economic growth and more medical expense.

Reasons for Obesity in India: There are many reasons for the rise in obesity at global level. Some of the reasons are enlisted as

Urban Area Clusters: Expansion of urban areas to accommodate growing population has muted human physical movement to a very large extent since the required living amenities are available close by.

Increased Affluence: Increase in purchasing power of households across Urban and Rural areas has led to consumption of aspirational foods more regularly leading to Obesity.
Mechanization: The shift from manual labor to mechanized labor and continuous invention of modern household and industrial gadgets also has reduced the necessity for strenuous physical activity which is needed to burn fat.

Digitalization: With the three screens to one human syndrome the entire entertainment to adults and to large extent of children are being delivered through Television, Mobile Phones and Laptops. This is one of the primary reasons for restrictions and lack of interests in outdoor activities instead focuses on vicarious pleasures thereby leading to sedentary and inactive lifestyle.

Fast Food culture: This could be labelled as the number one culprit for increase in obesity across the spectrum since calories are available over the counter readily, easily and it’s much easier to buy delicious foods without looking at the health quotient this coupled with western food cultural influence which India is rapidly adapting in recent past.

Smoking: India has 11.2% of the world’s total smokers. Deaths attributable to smoking increased by 4.7% in 2015 compared with 2005 and smoking was rated as a bigger burden on health, moving from third to second highest cause of disability.

Reduction in DALY: Disability Adjusted Life Years measure the number of years that are lost or rendered economically unproductive due to disease including obesity. Of the DALYs lost to obesity across the world, around 71 percent are due to premature mortality and 29 percent to disability that has prevented individuals from making their full economic contribution.

Medical and Health Impact of Obesity: Obesity has a far-ranging negative effect on health.

Diabetes: Obesity is the major cause of type II diabetes. Obesity can cause resistance to insulin, the hormone that regulates blood sugar. When obesity causes insulin resistance, the blood sugar increases. Even moderate obesity can shoot up the risk of diabetes.

Respiratory and Lung Disorders: Sleep apnea, which causes people to stop breathing for brief periods, interrupts sleep throughout the night and causes drowsiness during daytime. It also leads to heavy snoring. Respiratory problems associated with obesity occur when added weight of the chest wall squeezes the lungs and causes restrictive breathing. Sleep apnea can also be associated with high blood pressure.

High Blood Pressure: Extra fat tissue and cells in the body needs oxygen and required nutrients to survive, which requires the blood vessels to circulate more blood to the fat tissue and cells. This increases the workload of the heart because it must pump more blood constantly. More circulating blood also means more pressure on the artery walls. Higher pressure on the artery walls increases the blood pressure. Apart from that extra weight can raise the heart rate and reduce the body’s ability to transport blood through the vessels.

Cardiovascular Disease: Atherosclerosis (hardening of the arteries) is present 10 times more often in obese people compared to those who are not obese. Coronary artery disease is also more prevalent because fatty deposits build up in arteries that supply to the heart. Narrowed arteries and reduced blood flow to the heart can cause chest pain (angina) or an imminent heart attack. Blood clots can also form in narrowed arteries and cause a stroke.

Joint Problems: Obesity can affect the knees and hips because of the stress placed on the joints by increased weight. Joint replacement surgery, while commonly performed on damaged joints, may not be an advisable option for an obese person because the artificial joint has a higher risk of loosening and causing further damage to already existing problem.

Cancer: Overweight Women contribute to an increased risk for a variety of cancers including breast cancer, colon, gallbladder, and uterus. Men who are overweight also have a higher risk of colon cancer and prostate cancers.

Metabolic Syndrome: Metabolic syndrome is a complex risk factor for cardiovascular disease. Metabolic syndrome consists of six major components: abdominal obesity, elevated blood cholesterol, and elevated blood pressure, insulin resistance with or without glucose intolerance, elevation of certain blood components that indicate inflammation, and elevation of certain clotting factors in the blood.

Societal and Psychological Effects: With the advent of Facebook, Instagram culture there is a constant peer pressure to be physically good looking almost leading to anorexia. Overweight and obese persons are often branded for their condition as lazy or weak -willed.
Teasing of overweight persons expressed by some individuals may progress to bias, discrimination, and even torment and no romantic relationships.

**Health Economics to Healthy Economics:** Health Economics is an applied field of study that allows for the systematic and rigorous examination of the problems faced in promoting health for all. By applying economic theories of consumer, producer and social choice, health economics aims to understand the behavior of citizens, health care providers, public and private organizations, and governments in decision-making.

Health economics is used to promote healthy lifestyles and positive health outcomes through the study of health care providers, hospitals and clinics, managed care and public health promotion activities. Efficiency is not the only objective in choosing how health care resources should be allocated we also need to think about equity, or the fair distribution of resources and benefits especially in a country like India and which is also an objective in health care decision-making. Economics provides an information framework in which the objectives of both efficiency and equity may be pursued accordingly. It’s important to take into consideration the welfare state model while delivering health care using the principle of Health economics.

**Obesity-Control and Reduction through Integrated Ancient Medicine Treatment:** To control obesity effectively body needs to do two of its primary functions really well first it has to flush toxins and effortlessly remove waste second it has to increase digestion to improve metabolism. Both these are very effectively achieved by the below ten Ancient Medicine treatment and practices which has given marked and improved weight reduction for more than 20 obese patients over a period of 6 months. The programme was titled fight obesity which was designed as a holistic and integrated offering which could work with majority of Obese patients to produce optimum results enabling them to lead healthier life’s. It was observed that on an average there was a reduction of 7 to 9 kgs. The minimum course duration of 21 days amongst the patients for both the sexes. Purgation or Viresanam is provided through Siddha Medicine with one day guided fasting and diet restrictions.

**Varmam Sarvaanga Thadaval Massage:** Delivered by an experienced Varmam Asan to activate internal metabolism by stimulating the key energy points situated across the body vigorously and in an orchestrated manner applying medicated herbal powder mix to induce fat burn. It’s a 60-minute procedure recommended for fourteen days.

Nasal and Ear Drops or Nasiyam Process is administered with Siddha Medicine. It is a package of 15 minutes procedure recommended once in 15 days as two sittings during the course.

**Herbal Steam Bath:** Herbal decoction steam bath to stimulate opening of pores in the skin, this is done after the Varmam Sarvaanga Thadaval Massage to enable elimination of toxins. This is suggested as a fifteen minutes procedure recommended for 14 days.

**Internal Medicines:** Siddha medicine formulations in the form of tablets and powder are provided to aid in waste elimination and to increase absorption and digestion. This is recommended for 21 days.

**Yoga:** Pranayama including Anulom - Vilom (Alternative Nostril Breathing) and Kapal Bhatti (Fore head shiner) along with Sarvangasan (Plough Pose), Vajrasan (Bolt Pose), and Shavasan (Corpse pose or Yoga Nidra) poses and techniques are taught and advised to be practiced every day for 30 minutes in the morning as an ongoing life style change.

**Acupuncture:** Stomach, Spleen, Kidney and Liver Meridians XI cleft and Jing well points are stimulated for toxin removals, digestion, absorption and excretion. This Acupuncture practice of 30 minutes is recommended weekly for 21 days.

**Sujok:** Pituitary, Thyroid glands, Stomach, Kidney, Sigmoid colon and Liver are stimulated using seeds and color therapy through standard correspondence systems. This is recommended for 30 Minutes over a period of 21 days.

**EFT (Emotional Freedom Technique):** The tapping method works at the mind level to provide the patients the needed mental support by helping them to clear their fear, uncertainties and doubts about the fight against obesity and for their overall wellbeing. This is administered 30 minutes every week for 21 days.

**Naturopathy:** Detailed individualized diet chart based on the body dosha (constitution) is prepared and given in consultation with the patient to accommodate their food preferences and allergies. This is recommended for 21 days and a repetition of another course and as an ongoing life style change.
Discussion

The current study has paved way for many future research studies, like whether obesity is based on hereditary, bio magnetism, life style disorder or Food habit.

Conclusion

To combat Obesity globally there are systemic changes which need to be brought in including higher taxes on smoking and strict and tighter regulations around non-healthy food products focused on the ready to eat segment. The state should more actively embark upon prevention activities such as weight management programs and public health campaigns to promote active life style leading to better health. Government and private healthcare providers, social-sector organizations and other stakeholders should fight against the obesity problems with integrated and holistic approach. Given the seriousness of the obesity issue, the need of the hour is to educate the public that the obesity is not only preventable but also curable.

ABSTRACT

Agriculture in India is undergoing transformation. Traditional technology is slowly giving way to modern technology. The ‘New Strategy’ for agricultural development, which was initiated in 1966, in essence called for the implementation of High Yielding Varieties Programme (HYVP) in all districts selected under Intensive Agricultural District Programme (IADP) and allied schemes. The strategy was concerned with higher productivity of crops but with multiple cropping, the HYVP had assumed ‘crucial importance’ in the Planning Commission’s agricultural development strategy. A three dimensional approach towards agricultural development was chemical technology that guaranteed minimum paddy as an incentive to agricultural production. Technological change or the new strategy proposes to make a new technological breakthrough in India which comprises the introduction of new and HYV of improved seeds, increased application of the recommended dose of fertilizers and extension of the use of pesticides that can save crop from destruction by insects. The increase in production of food grains recorded after 1966-67 is described as Green Revolution. The rapid introduction of HYV of paddy and wheat and their multiplied effects on other crops justify the name Green Revolution. To study the characteristics of sample farmers, labour utilization, input and output structure, cost and returns for small and large farmers cultivating High Yielding Variety and Traditional Variety of rice.

Keywords: Agriculture Production, Farm Technology, High Yielding Varieties.

Introduction

Agriculture in India is undergoing transformation. Traditional technology is slowly giving way to modern technology. This transformation to new technology and techniques brings to the fore new problems and thus offers new opportunities and new avenues of research to agricultural economists. The ‘New Strategy’ for agricultural development, which was initiated in 1966, in essence called for the implementation of High Yielding Varieties Programme (HYVP) in all districts selected under Intensive Agricultural District Programme (IADP) and allied schemes. The strategy was concerned with higher productivity of crops but with multiple cropping, the HYVP had assumed ‘crucial importance’ in the Planning Commission’s agricultural development strategy. The most interesting feature of the new agricultural strategy was that the movement for scientific agriculture and programmes for research and extension received fresh stimulus.2 a three dimensional approach towards agricultural development was chemical technology that guaranteed minimum paddy as an incentive to agricultural production. Technological change or the new strategy proposes to make a new
technological breakthrough in India which comprises the introduction of new and HYV of improved seeds, increased application of the recommended dose of fertilizers and extension of the use of pesticides that can save crop from destruction by insects. This technological change brought spectacular changes in the agriculture production of our country. The increase in production of food grains recorded after 1966-67 is described as Green Revolution. The rapid introduction of HYV of paddy and wheat and their multiplied effects on other crops justify the name Green Revolution. To study the characteristics of sample farmers, labour utilization, input and output structure, cost and returns for small and large farmers cultivating High Yielding Variety and Traditional Variety of rice. Indian Government has been emphasizing the importance of agricultural development. The New Agricultural Strategy (NAS) was initiated in 1966. Accordingly, policies were formulated to utilize and promote high yielding varieties of food grains in all districts selected under the IADF and IAAP schemes. Madurai district in Tamil Nadu State is one of the most important districts where there has been a significant progress for adopting high-yielding varieties of rice. Rice is mainly cultivated in almost all the seven taluks in this district and the 68 per cent of ayacut is double cropped land. For the purpose of analysis, High Yielding Variety is expressed as HYV and Traditional Variety is expressed as TV.

(i) Characteristics of sample farmers
(ii) Cost and returns structure

Objectives of the Study

1. To analyse the cost and return structure of Traditional and High Yielding Variety technology of and of small and large farmers producing Traditional and High Yielding Variety of rice.
2. To identify and analyse the determinants of yield and factors causing yield gap with regard to farmers cultivating two varieties of rice and of small and large farmers group.

Statement of the Problem

The new farm technology adopted since the mid sixties has helped in revolutionizing Indian agriculture. Technological change in agriculture is characterized by the use of pesticides, irrigation, machinery, improved implements, soil conservation and the like. The successful adoption of these components of new strategy has resulted in the increase of agricultural production. The introduction of above mentioned components of new agriculture strategy depends upon factors like irrigation, size of farm, capital, institutional credit, and extension services. There are many regions with better factor endowments. The new agricultural strategy was the first to adopt modern inputs and derive the benefits as a sequel. The production performance of the rice production is of critical importance in improving the efficient use of resources. The cost of production and net returns obtained per unit would determine the profitability of the Agriculture production.

Table 2 reveals that in high yielding variety, nearly 65.34 per cent of the operational holding was below 5 acres and remaining 34.66 per cent were above 5 acres. Among small farmers, the dominant operational holding was between 2-5 acres (38.67 per cent) while in the large farm, it was 5-8 acres (28.00 per cent) to the total. In the case of traditional variety, nearly 68.66 per cent of the operational holding was below 5 acres. The remaining 31.34 per cent belong were above 5 acres. Among small farmers, the dominant operational holdings were between 2-5 acres (45.33 per cent) while in the large farms, it was 5-8 acres (27.34 per cent) to the total. Comparing their two varieties, high yielding variety is low in operational holding below 5 acres (65.34 per cent) while traditional variety is high in operational holding below 5 acres (68.66 per cent) respectively.

Source: Survey Data. Figures in bracket represent percentages to total.

It is observed from Table 3 that in high yielding variety 24.00 and 62.00 per cent of the farmers have had the experiences of 5-10 years and 10-15 years respectively. While 9.33 per cent of farmers had the experience of less than 5 years and only 4.67 per cent of farmers have experience of 15-20 years. In traditional variety 28.00 and 58.00 per cent of the farmers had experience of 5-10 years and 10-15 years. While 8.00
per cent of the farmers had experience between 15-20 years and only 6.00 per cent had experience less than 5 years. Comparatively, traditional variety has 58.00 per cent of farmers with experience of 10-15 years, whereas in High Yielding variety only 62.00 per cent of farmers had experience between 10 to 15 years.

Source: Survey data

Table 4. reveals that there was a direct proportion between the size of the farm and the human labour and total labour cost in the case of High Yielding variety. The total labour cost increased with the increase in size of the farm. The total labour cost per acre was Rs. 5927.79 for small farmers and Rs.5906.41 for large farmers. In the total labour cost, the cost of human labour constituted 79.15 per cent for small farmer, 78.98 per cent for large farmers and 78.33 per cent for overall farmers. Bullock labour constituted for 20.85 per cent on small farmers, 21.02 per cent on large farmers and 21.67 per cent on overall farmers. In the case of traditional variety, the total labour cost per acre was from Rs.4716.45 for small farmers and Rs.4932.41 for large farmers. In the total labour cost, the cost of human labour constituted 85.13 per cent, 84.37 per cent and 85.00 per cent for small, large and overall farmers respectively. Bullock labour accounted for 14.87 per cent for small farmers, 15.63 per cent for large farmers and 15.00 per cent for overall farmers.

Total – Cost C (total) 12,200.41 12,053.28 11,973.91

Yield per acre in kg 2,466.36 2,241.41 2,316.41

Gross Returns (Rs.) 16,961.22 16,999.26 16,361.15

Net Returns (Rs.) 4,760.81 4,945.98 4,387.24

Source: Survey data.
It is understood from Table 5 that the small farmers produced 2,466.36 kgs of rice and earned Rs.16,961.22 per acre while their net returns per acre were Rs.4,760.81. In the case of large farmers, the yield per acre was 2,241.41 kgs and they realized Rs.16,999.26 per acre as gross returns while their net return per acre was Rs.4,945.98. In overall yield per acre, gross returns and net returns earned were 2,316.41 kgs, Rs.16,361.15 and Rs.4,387.24 per acre respectively. It indicates that the small farmers were getting higher yield and thereby higher net income than large farmers in the case of HYV. The cost analysis reveals that the per acre total cost, that is operational cost of cultivation for small farmers, worked out to Rs.10,590.04, whereas it was Rs.10,435.81 for large farmers. It in observed that total cost incurred was found higher in the case of large farmer compared to small farmers. The cost of human labour forms the major component of the total cost of production for both small and large farmers. Next to human labour, the amount spent on the use of chemical fertilizers occupied the major portion in the total cost of production. It came behind the cost of farm manure, cost of irrigation, pesticides, seed cost and bullock labour. the costs of all the inputs except bullock labour were found to be higher for large farmer than for small farmers. Thus, it is inferred from the analysis that the small farmers were found more efficient than the large farmers, both cost-wise and return wise.

**Conclusion**

Thus, it is concluded from the analysis that small farmers are economically more efficient than large farmers irrespective of varieties of rice cultivation in the study area. This could be due to the better supervision and more efficient farm management favoured by the smaller size of operational holdings. This indicated that apart from efficient allocation of inputs, direct supervision and farm management are crucial determinants of economic efficiency.

Assessing WHO’s IYCF Indicators in Mangalore Taluk- A Cross sectional Study

Sandhya Rani Javalkar
Assistant Professor, Department of Community Medicine, JJM Medical College, Davangere, Karnataka

ABSTRACT

Introduction: Infant and Young Child Feeding Practices are a set of well-known and common recommendations that includes guidelines on breastfeeding practices and timely introduction of complementary foods.

Objectives: To assess the WHO’s IYCF indicators among the urban and rural population in Mangaluru Taluk, Karnataka.

Methods: A community based cross-sectional study was conducted among mothers of children in Mangalore Taluk, Karnataka. Data collected by personal interview among 408 mothers using a predesigned pretested questionnaire.

Results: Indicators like Exclusive breast feeding under 6 months (47.8% in urban and 45.6% in rural), Introduction of solid and semi solid foods (90.0% in rural and 92.0% in urban) and minimum meal frequency (83.3% rural and 81.9% urban) were almost same in both urban and rural areas. Early initiation of breast feeding (50% in rural and 42.8% in urban), Continued breast feeding (60.4% in rural and 50.7% in urban) was better in rural compared to urban area. Indicators- minimum dietary diversity (21.3% in rural and 37% in urban), and minimum acceptable diet (20% and 31.9%) were poor in both the areas.

Conclusion: Few indicators performed better in urban areas and few indicators performance was better in rural area. The poor performance of indicators can be reduced by providing right knowledge to the mothers and family members at right time and counseling them about the common low cost nutritious foods that are locally available.

Keywords: Infant and young child feeding, breastfeeding, Minimum acceptable diet.

Introduction

Infant and Young Child Feeding Practices is a set of well-known and common recommendations that includes guidelines on breastfeeding practices and timely introduction of complementary foods at 6-8 months. Optimal IYCF practices are essential for child’s growth and development. A child’s first two years of life are considered a “critical window of opportunity” for prevention of growth faltering. Of all proven preventive health and nutrition interventions, IYCF has the single greatest potential impact on child survival.

Global statistics of IYCF Indicators show that 43% have initiated Breastfeeding within one hour after birth, 37% of children received exclusive breastfeeding, were as 60% of children were initiated with complementary feeding by 6-8 months of age and breastfeeding was continued for 2 years by 55% of the individuals. In India, NFHS 4 reveals that exclusive breastfeeding to be only 54.9% up to 6 months and the initiation of breastfeeding within one hour of birth was 41.6%. Introduction of complementary feeding along with continued breastfeeding in 42.6% children 6-9 months of age.

Infant and young child feeding practices in children 0-23 months of age are critical to improve nutrition, health and development of children. Hence WHO and
UNICEF’s global recommendations for optimal infant feeding as set out in the Global Strategy are: Exclusive breastfeeding for 6 months (180 days), nutritionally adequate and safe complementary feeding starting from the age of 6 months with continued breastfeeding up to 2 years of age or beyond 3 years.6

The difference in feeding practices is still prevalent in urban and rural areas even today, which are influenced by various factors.7 Though there are many studies related to this subject, there are very few studies assessing the WHO’s Core indicators in rural and urban areas. Hence this study is designed with the objectives to assess the WHO’s IYCF indicators among the population in urban and rural areas of Mangaluru Taluk, Karnataka.

Method

A Community based cross-sectional study was conducted among mothers of the children aged 12 months – 36 months. The study areas were a part of field practice area of Department of Community Medicine, Yenepoya Medical Colleges in Mangalore Taluk.

Sample size calculation: Using WHO methodology of Lot Quality Assurance Technique6, considering desired level of confidence interval as 95% and desired level of accuracy as 5%, the initial sample size is 384. The starting point of the study was anganwadi centre (ICDS Block). There are 227 Anganwadi centre in urban Mangalore area and 447 anganwadis in rural Mangalore area.6 10% of the anganwadi centres were selected randomly in the defined study area. Thus total number of lots were 68 (23+45). Initial sample size is 384, and there are 68 lots. Hence each lot sample size is 384/68 = 5.64 that is 6 mothers from each lot were selected by simple random method. Thus total number of mothers (study participants) would be 68 X 6 = 408. Thus the revised sample size became 408.

Data collection: A predesigned pretested questionnaire was designed based on IYCF module on feeding practices for Infant and Young Child.7 The data was collected by personal interview sessions. The Questionnaire consisted of questions regarding demographic profile, socio-economic status, breastfeeding practices, complementary feeding practices, choices of foods etc. Information regarding per capita income in (rupees/month) was collected and socio economic status was assessed using Modified B G Prasad classification.10

Inclusion criteria of the study consisted of the mothers of the children aged 12-36 months, who were willing to participate in the study, this age group was considered as the information of both breastfeeding and complementary feeding along with continued breastfeeding can be collected.

Ethical considerations: The study was initiated after obtaining approval from the Institutional Ethics Committee, Yenepoya University. Written informed consent was obtained from the study participants after explaining them the nature of information that will be collected from them and explaining the objectives of the study in the local language.

Data analysis: Data was collected and entered in Microsoft (MS) Excel work sheet and analyzed using SPSS (Statistical Package for Social Sciences) software version 16.0. Descriptive statistics were reported as mean (standard deviation) for continuous variables and frequencies (percentage) for categorical variables.

Operational definitions of Indicators for assessing infant and young child feeding practices9

- Early initiation of breastfeeding: Proportion of children who were put to the breast within one hour of birth;
- Exclusive breastfeeding under 6 months: Proportion of infants who are fed exclusively with breast milk till 6 months of age;
- Continued breastfeeding at 1 year: Proportion of children aged 12 months who are fed breast milk;
- Introduction of solid, semi-solid or soft foods: Proportion of infants who receive solid, semisolid or soft foods between 6 to 8 months of age;
- Minimum Dietary Diversity (MDD): Proportion of children who receive foods from 4 or more food groups between 6 to 12 months of age;
- Minimum Meal Frequency (MMF): Proportion of children who receive foods from 4 or more food groups between 6 to 12 months of age;

The seven food groups included grains; roots and tubers; legumes and nuts; dairy products (milk, yogurt, cheese); flesh foods (meat, fish, poultry and liver/organ meats); eggs; vitamin-A rich fruits and vegetables; other fruits and vegetables.

- Minimum Meal Frequency (MMF): Proportion of breastfed and non-breastfed children aged 6 to 12 months, who receive solid, semi-solid, or soft foods the minimum number of times or more.
times for breastfed children 6–23 months, 4 times for non-breastfed children 6–23 months);

- **Minimum Acceptable Diet (MAD):** Proportion of children 6 to 23 months of age who had at least the minimum dietary diversity and the minimum meal frequency.

**Results**

In this study, 270 (66.2%) belonged to the rural area and 138 (33.8%) belonged to the urban area as described in the methodology. The mean age of mothers was 25.9 ± 3.67 years, range of 18 to 35 years. Majority of the mothers were literate i.e., 387 (94.9%), and among them 48 (11.8%) were graduates; only 21 (5.1%) were illiterate. Majority of the women 319 (78.2%) were homemakers. Based on the mean per capita income of these families (per month INR) according to Modified B G Prasads Socio Economic Classification nearly half of participants belonged to socioeconomic class II i.e., 207 (50.7%). The average Family size was 3.87 +/- 1.03 members, with a range of 3-8 members. The mean age at marriage of the mothers was 20.54 +/- 2.15 years, with a range of 17 to 29 years. Mean age the child was 21.37 +/- 7.01 months; among them 229 (56.1%) were male and 179 (43.9%) were female. The birth order of the child varied from 1st - 5th, Majority of them being 2nd order 222 (54.4%) individuals. Table 1 Shows the status of Infant and Young Child Feeding Practices indicators.

</tr>
</tbody>
</table>

Indicators like Exclusive breast feeding under 6 months (47.8% in urban and 45.6% in rural), Introduction of solid and semi solid foods (90.0% in rural and 92.0% in urban) and minimum meal frequency (83.3% rural and 81.9% urban) were almost same in both urban and rural areas. Early initiation of breast feeding (50% in rural and 42.8% in urban), Continued breast feeding (60.4% in rural and 50.7% in urban) was better in rural compared to urban area.

Indicators- minimum dietary diversity (21.3% in rural and 37% in urban), and minimum acceptable diet (20% and 31.9%) were poor in both the areas but however better in urban when compared to rural area.

**Discussion**

In this study, the age of the mothers ranged from 18 to 35 years. Similarly, Indian studies conducted by Sujatha P et al11 and Mondal T et al12 the range was 16-37 & 17-35 years respectively. In the present study, 5.1% of mothers were illiterate. Other similar studies conducted by Madhu K et al13 and Mondal T et al12 reported 52% and 44% illiterate mothers. Majority of the women i.e., 78.2% in this study were housewives. Similarly a study conducted by Das N et al14 in West Bengal showed that 82.5% mothers were housewives and a Kashmir study by Fazilli15 showed that 61.53% mothers were housewives.

In this study 50.7% of mothers belonged to socio-economic class II, according to Modified B G Prasads Socio Economic Classification. An Indian Study, having same classification reported 46.5% belonged to class II socio-economic status respectively16. In another study done in Karnataka by Garg M et al17 64.2% belonged to Lower middle class of socio economic status of Modified Kuppuswamy Classification.

In this study there were 408 children studied among them 229 (56.1%) were male and 179 (43.9%) were female. A similar study reported, 54% were boys and 46% were girls.17

In this study, the Proportion of children who were initiated with breastfeeding within one hour of birth was
194(47.5%), which was 50% in rural area and 42.8% in urban area. In a similar study 40.0% mothers had initiated breastfeeding within one hour,\textsuperscript{17} the delay in the initiation of the breastfeeding can be attributed to the recovery of the mother post delivery or C section.

Another study conducted by Ashwini et al.\textsuperscript{18} reported Initiation of breast feeding was delayed beyond 4 h by 24.5% urban and 33.6% rural mothers; the most common reason quoted by urban mothers for delayed initiation of breast feeding after delivery was their physical inability like pain or tiredness. Whereas, in rural area it was because of elders who advised not to initiate breast feeding early.

The Proportion of infants who were exclusively breastfed upto 6 months of age were 45.5%, i.e., 47.8% in rural and 45.6% in urban area. According to the NFHS IV data\textsuperscript{4}, the exclusive breastfeeding practice was found to be 52% in urban and 56% in rural areas, the better performance of this indicator in the rural area compared to urban can be attributed to the working status of the mother, if the mother has to join to job (working women more in urban area), depending on the working condition, she will have to start formula feeds or complimentary feeds.

Continued breastfeeding upto 12 months is the indicator that refers to Proportion of children aged 12 months who are fed breast milk along with complimentary feeds. This study reported 57.1%, which was 60.4% in rural and 50.7% in urban areas. However a study conducted by Ashwini et al.,\textsuperscript{18} reported Continued breast feeding rate at 1 year was 100% in urban and 99.21% in rural area.

Proportion of infants who receiving solid, semisolid or soft foods between 6 to 8 months of age was 90.6%; 90% in rural and 92% in urban area, A similar study reported that 62.5\%\textsuperscript{19} of the children were taking solid, semi-solid, or soft foods. This was found to be higher than that reported by NFHS-4 fact sheet national level data 42.7\%.\textsuperscript{4}

Minimum dietary diversity (MDD) indicator is the proportion of children 6–23 months of age who receive foods from 4 or more food groups from a total of 7 food groups. In this study we observed MDD to be 26.9%; 21.3% in rural and 37% in urban area. A similar study reported MDD to be 32.6% between 6 and 23 months.\textsuperscript{19} This indicator shows us if the child is receiving nutritious and balanced diet.

Minimum meal frequency (MMF) indicator Proportion of breastfed and non-breastfed children aged 6 to 12 months, who receive solid, semi-solid, or soft foods the minimum number of times or more. (3 times for breastfed children 6–23 months, 4 times for non-breastfed children 6–23 months). This study reported MMF to be 82.8%; 83.3% in Rural, 81.9% in urban area. A M Khan et al.,\textsuperscript{19} reported MMF was observed to be 48.6%.

Minimum Acceptable Diet (MAD) indicator is the proportion of children aged 6–23 months who receive at least the MDD as well as at least the MMF according to the definitions mentioned above. Our study observed MAD to be adequate among 24%; i.e., 20% in rural and 31.9% in urban area. A M Khan et al.,\textsuperscript{19} MAD indicator to be adequate only in 19.7% of children. However it was observed to be better than the NFHS IV data reported which showed 9.6%.

Conclusion

The WHO indicators on IYCF practices as Early initiation of breast feeding, Continued breast feeding and Minimum meal Frequency were better in rural area. Though the indicators as Minimum dietary diversity and minimum acceptable diet were poor in both urban and rural area, they were comparatively better in urban area. Over all the poor performance of indicators can be reduced by providing right knowledge to the mothers and family members at right time and counseling them about the common low cost nutritious foods that are locally available.

ABSTRACT

Following is a description of an oral rehabilitative program–Amrithasmitham which has aimed at improving the poor quality of life experienced as a result of edentulousness among the indigenous populations of Kerala. It has been running for nine years in the tribal belts of Wayanad, Kerala since 2008. It thrives on the sense of social responsibility and accountability of the medical profession. This paper highlights the lessons learnt and aims to provide a model which may be replicated in unreachable locations or in geographically reachable yet physically challenged geriatric populations.

Keywords: oral rehabilitative program, tribal populations, community health

Introduction

Indigenous populations across the globe continue to remain one of the poorest and marginalised groups¹. Studies have shown that the health indicators of this population are poor and warrant attention²,³. Compounding this problem is the severe dearth of doctors serving the tribal belts. With a wide poverty gap existing, it may be stated that the tribals face the brunt of the 3As – availability, accessibility and affordability of healthcare as compared to the mainland population.

The tribal populations of Kerala are a group of geographically isolated, extremely deprived and marginalised community⁴. Respiratory infection, diarrheal disorders, skin infections, malnutrition, anaemia and degenerative disorders like diabetes are some of the conditions common among them⁵. Oral diseases are widely prevalent particularly with poor oral hygiene practices and rampant tobacco abuse common to them⁶. Coping with the burden of more life-threatening diseases, oftentimes leads to poor priority of oral health. Hence the need to seek care for basic dental problems is negligible. As a result of plethora of problems faced and the lack of awareness, the end point of most of these dental problems is the extraction of teeth and thereafter a compromised life resulting from edentulism.

Among the tribes, edentulism has long been accepted as a way of life and a part of the natural process of ageing. Difficulties associated with mastication of food, clarity of speech or the aesthetics are often buried under the load of such beliefs⁷. Access to dental care does not exist and many may have not approached a dentist in their lifetime⁸. It is also known that the disability caused by severe tooth loss is larger than moderate heart failure⁹.

Following is a description of an oral rehabilitative program that has aimed at improving the poor quality of life experienced as a result of edentulousness among the tribal populations. Amritasmitham a tribal outreach program is an initiative of the Amrita School of Dentistry. It has been running for nine years in the tribal belts of Kerala.
since 2008. It thrives on the sense of social responsibility and accountability of the medical profession and thereby offers a replicable model to make available rehabilitative services to the unreachable populations.

Mission and vision of the program: The mission of this program is to reach the unreached populations of Kerala, who often are geographically isolated and economically poorly equipped to seek treatment for dental ailments.

The program also aims to provide dentist as well as the student dentist with an opportunity to have a lived-in experience of the health disparity faced by those belonging to the other end of the spectrum. A first-hand experience, working conditions are often suboptimal and participation purely voluntary. This way the program paves for many more such programs to be conducted by doctors experiencing this. The program envisions to be able to provide basic level of oral care to all tribals.

Need of the program: The prevalence of edentulism among the indigenous populations of Wayanad is 40.2% in females and 59.8% in males. Most of the elderly among the tribes refrain from seeking care for numerous reasons. As part of its philanthropic contributions, the School of Dentistry runs a yearly oral rehabilitative program in the tribal belts of Kerala. The proportion of edentulous patients seeking complete denture prosthesis was observed to increase and one of the patient’s is quoted here:

“I wanted to replace my missing teeth since three years. I never thought I would be able to do that. I don’t have the money for it. This (program) is my luck.” Said a patient who had arrived at the camp site.

Method

Project Planning

- A location is identified based on the treatment needs of the population and the practicality of conducting a denture camp. The camp site is assessed for its nearness to the tribal colonies and presence of basic facilities for the conduct of the program.

- A meeting is held with the local bodies in the area which includes representatives and officials from the government [forest officers, panchayat members and local leaders]. These meetings were held to enable collaboration with the government bodies and receive support from them, in terms of facilities like transport of the tribals to camp site, accommodation of the dental team, advertisement of the program etc.

  - A screening is carried out at a minimum of four locations and possible cases are identified and registered to the program.

  - Initial diagnostic procedures are carried out.

  - Following this, treatment plans for individual patients are charted out and initial lab works are completed in the institution (Amrita School of Dentistry).

  - An exhaustive list of all supplies (in terms of manpower, equipment and materials) is created.

  - A call for interested doctors within the institution is put out. It is clearly informed that the camp is a service with no remuneration and sub optimal working conditions. Only volunteers are involved.

  - The participating doctors are oriented towards the camp.

  - The entire workforce is divided into Individual units composed of dentists and technicians and patients are assigned to each of these units.

  - The entire team travels to the camp site. Necessary supplies and equipment are carried alongside.

  - Following this, the units work round the clock for three continuous days at the camp site. These sites most often have limitations of poor lighting and inadequate space. Working conditions are suboptimal.

  - All the lab work is carried out at the field with the help of skilled technicians.

  - On the third day of the camp dentures are delivered to patients free of cost.

  - Reviews are carried out for the delivered dentures at the interval of 15 days and then again at one-month interval.

Project Funding: An estimate of possible expenditure towards the camp is presented and funds are provided by the Amrita Institute of Medical Sciences (AIMS). AIMS has taken initiative for this program which is in line with their basic charitable mission of providing health care to all. Consistently, over last 8 years, 3000 USD have
been allocated to this program. Besides this, support has been extended by Attapady Hill Area Development Society (AHADS), Forest Department, Government of Kerala, Amrita Seva Sangam, a Non-Governmental Organisation and various dental material suppliers.

**Personnel:** On an average 30 to 40 members comprise the dental team. This team is constituted by interns, post graduates and faculty of the dental school. A team of technicians is also involved. The entire dental team is then divided into units. One faculty member guides around two to three units. Each unit is assigned patients, who are followed till delivery of the denture by the same team.

### Results

**Achievements:** The sustainability of this program for nine years reflects its perceived need among this population. Over nine years the program has been able to attract volunteer doctors to work in such settings. While there are constant efforts from the government to deploy doctors to work in these areas, camps of this nature definitely do contribute in alleviating a fraction of the health issues faced by the people in this region. We also believe that the voluntariness to participate in the program has ensured that the quality of the program is not compromised. An overview of the camps held has been provided in table 1.

**DISCUSSION**

**Lessons Learnt:** In order to scale the challenging landscape of tribal health, a public health program needs to focus on the following:

**Building relations:** The tribes are generally a closed community. Initiating and sustaining a program needs efforts to build a rapport. This has to be done by finding an anchor (a person belonging to the community or one who is trusted by the community) at the site of work and building the program with their inputs.

**Working together:** Establishing open communication and identifying common ground and common goals is the first step toward working together effectively. The social environment within a tribal community may vary largely from the general population. There is a need to work alongside them to ensure community participation which is critical to sustain the program.

**Building skills:** This step equips the members of these tribal communities to learn practical skills. For eg: the initial discomforts of a denture are transient, and the patient needs to be motivated to persevere until he gets accustomed. Identifying and educating individuals from the community who may act as facilitators of the much-needed reinforcement among patients even in the absence of the doctor is critical.

**Employing the Horizontal approach:** The program may be used as a platform for dissemination of knowledge. While this program was rehabilitative in nature, it was utilised to create awareness about prevention and early treatment of disease. A common risk factor approach was employed.

**Domino effect:** Every positive interaction between the patient and doctor serves to bridge the barrier between the healthcare provider and the community.

**Conclusions**

This program aims to create a model which may be replicated in unreachable locations or in geographically reachable yet physically challenged geriatric population. Similar programs may be planned for institutionalised elderly or elderly at day care centres and contribute to one of the emerging public health challenges of provision of geriatric care. Such models offer improved accessibility and cater to geriatric needs sensitively, ensure life with greater dignity for the elderly population. To ensure its self-sustainability, we propose for public private partnership and ensuring autonomy to the program.

As dentistry takes strides forward in technological advancement there is a need to extend a helping hand to
those who are deprived of basic dental care. Healthcare providers and trainees must be sensitive to the needs of the underprivileged and be able to offer services with care and compassion.

**Source of Funding:** This program was supported by the Amrita Institute of Medical Science, Kochi, Kerala.

**Conflict of Interest:** The authors are a part of the Amrithasmitham tribal outreach program.

**Ethical Clearance:** The program is approved by the Management of the Amrita Institute of Medical sciences. Individual patient consents have been sought prior to treatment.

Periodontal Disease and Its Influence on Systemic Disease—
A Survey among Non-Medical Professionals

Divya Kohli1, Santhosh Kumar2, Ramprasad Vasthare Prabhakar3, Rashi Okandiar4, Bhavana K V4, Anjali4

1Postgraduate Student, Rutgers School of Dental Medicine, NEW JERSEY, US; 2Associate Professor, Department of Periodontology; 3Associate Professor Dept of Public Health Dentistry; 4Undergraduate Student, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education, Manipal, Udupi, Karnataka, India

ABSTRACT

Aim: To determine the knowledge of periodontal disease, the influence of periodontal disease on systemic disease and the attitude towards treatment for periodontal disease among non-medical professionals.

Objectives: The objective of the above study is to determine the knowledge of periodontal disease, its influence on systemic health and disease and to evaluate the knowledge and attitude towards the treatment for periodontal disease.

Materials and Method: A cross-sectional survey using self-administered questionnaire was conducted among the non-medical professionals during 2016 – 2017. Participants visiting the outpatient of the department were selected by simple random sampling. A total of 282 subjects participated in the study. Amongst these 267 were selected. The included subjects were 39 medical professionals’, 228 non-medical professionals. The subjects were introduced to the questionnaire and requested to fill their socio-demographic details and also to answer the questionnaire related to the effect of periodontal disease on the systemic health and disease. The scores that were obtained was considered adequate if the participants answered at least 50% of the questions correctly.

Results: Out of the 282 questionnaires distributed a total of 267 were selected. 15 questionnaires were improperly filled and so were excluded. The 267 questionnaires included were filled by 39 medical professionals’ and 228 non-medical professionals. The medical professionals have better knowledge about periodontal disease compared to other groups. The non-medical professionals’ knowledge was inadequate compared to all the other parameters.

Conclusion: The overall results of the study showed the knowledge of the influence of the systemic disease on periodontitis and also about the treatments available for this disease was inadequate among the non-medical professionals compared to that of the medical professionals.

Keywords: attitude, non-medical professionals, periodontitis, systemic health, treatment, questionnaire.

Introduction

The rise in the prevalence of periodontal disease and its association with the complex etiology of this has raised the concern for oral health care. Hence it is necessary to control this infection at the population level and the individual level. It is essential to scientifically reason the requirement for the improvement in the oral condition which in turn helps in the growth of the oral health behavior. There is a necessity to increase the awareness among the general public to understand the influence of systemic health and disease on periodontitis and also to understand the treatment of periodontal...
disease. There is also growing evidence of the association of increased systemic illness such as cardiovascular diseases, stroke, peripheral vascular diseases, diabetes and pregnancy outcomes.3, 4

Patients suffering from Atherosclerotic, cardiovascular disease should receive a periodontal evaluation, and patients with moderate to severe periodontitis should be informed about their potential increased risk of atherosclerosis.5

The access to the oral health and care is instrumental in the prevention and the control of the disease. The availability of the resources in high income countries has made health care system to be available for this group and absence in low-income, middle income countries. The approach to prevent periodontal disease is provided mostly for the financially well to do subjects6. Hence in such situations the knowledge and proper attitude towards these diseases are crucial, and it is necessary for the promotion of health and prevention of disease. It is essential to gain information on views and values related to periodontal health and illness.7 Thus, the purpose of the present study was to explore perceptions of periodontal health and disease and to examine attitudes and beliefs regarding prevention of periodontal diseases among Indian non-medical professionals.

Aim: To determine the knowledge and attitude of non-medical professional towards periodontal disease and its influence on systemic health.

Objective:

1. To determine the knowledge of non-medical professionals about periodontal disease
2. To assess the knowledge about the influence of periodontal disease on systemic health and disease
3. To evaluate the knowledge and attitude about the treatment of periodontal disease

Material and Method

This cross-sectional survey was conducted among the nonmedical professionals visiting the dental outpatient of the department of Periodontology. The patients were randomly selected to complete the questionnaire. A self-administered questionnaire was distributed to the subjects interested to participate in the study. The website, http://writingtester.com was used to determine the reading level to ensure that the language used in the questionnaire is understandable at or below the tenth-grade reading level.

The questionnaire was divided into four sections. The first section gathered information about the subject’s sociodemographic data. The second section included ten questions about the knowledge of the periodontal disease. The knowledge of the bidirectional relationships between periodontal disease and different systemic conditions was also assessed. This subsection assessed the respondents’ knowledge of the effects of variation in glucose level and diabetes status and the influence of diabetes on periodontal disease as well as the knowledge of periodontal disease as a risk factor for preterm low birth weight. The final section included four questions that explored the knowledge and attitude about treatment of the periodontal disease.

The scoring criteria for the four questions assessing the knowledge of periodontal disease was based on score 1 for each correct response, and score 0 for wrong answers. Experts in a related field established the face validity of the questionnaire. The procedure was by first giving a draft of different questions assessing the knowledge of periodontal disease/systemic illnesses to experts in the field of periodontology. They determined the appropriateness of the questions and some were modified subsequently based on their recommendations. The study was approved by the Institutional Ethical Committee of the Kasturba hospital bearing the ethical clearance number 371/2016. The procedures followed were in accordance with the ethical standards of the responsible committee on human experimentation (institutional and national) and with the Helsinki Declaration of 1975, as revised in 2000.

Results

Out of the 282 subjects attempting the questionnaire a total of 267 were selected. This was due to the improperly filled 15 questionnaire. The 267 questionnaire included were filled by 39 medical professionals’ and by 228 non-medical professionals.

Demographic characteristics: Of the 267 questionnaires that were completely filled females represented 57.3% and males represented 42.7% of the sample, the overall mean age was 35.4 years. There were 106 Males and 122 females in the non-medical professional subjects. Male
non-medical professionals had an average age of 36.6 years (Age range of 15 to 72 years) and were older than female counter part with an average age of 34.3 years (Age range of 15 – 68 Years). The subjects included 6 volunteers with a PhD (2.2 %), 52 postgraduates (19.5 %), 120 graduates (40.4 %) and rest of the subjects were Pre-university or high school educated students and adults (36.6%). There were 31 females and 8 males in the medical professional subjects. The medical professionals subjects had an average age of 21.9 years (Age range of 19 to 48 years). The subjects included 28 graduates (71.8%), 10 Pre-university or high school educated adults (25.6%) and 1 subject with post graduate education (2.56%).

Knowledge about the periodontal disease: The subjects included had adequate knowledge of periodontal disease that progresses as the painless gum disease and causing the tooth mobility. The scoring criteria for the ten questions assessing the knowledge of periodontal disease were based on the score 1 for correct response and 0 for the wrong response. This gave a score of 1-10. This was then dichotomized to 0-5 (inadequate) and 6-10 (adequate).

All the subjects had adequate knowledge about the cause of periodontal disease and its effect. More than 90% of the nonmedical professionals convincingly answered the questionnaire regarding the knowledge of the periodontal disease (Figure 1). But amongst these subjects, only 17% of them responded correctly that there is no relationship between periodontal disease and skin rash this was almost similar to the medical professionals (23%). But the overall knowledge of periodontal disease was greater than 90% (Table 1).

![Figure 1: Percentage of subjects answering the questions on knowledge of periodontal disease correctly](image)

Knowledge about the influence of periodontal disease on systemic disease: Periodontal disease is a risk factor for systemic diseases like diabetes mellitus, arthritis, heart disease and blood pressure. The scoring criteria for the eight questions assessing the knowledge of the association between periodontal disease and systemic disease were based on the score 1 for correct response and 0 for the wrong response. This gave a score of 1-8. This was then dichotomized to 0-4 (inadequate) and 5-8 (adequate).

The knowledge of each parameters on the influence of periodontal disease on systemic disease was less than adequate among the non-medical professionals (Figure 2).

The knowledge of the influence of periodontal disease on systemic health and disease shows a large variation of greater than 38% between the non-medical professionals and the medical professionals (Table 2).
Knowledge and attitude towards the treatment for the periodontal disease: Greater than 63% of the subjects showed adequate knowledge and a positive attitude towards treatment for periodontal disease (Table 3). But the knowledge of the treatment for periodontal disease was inadequate in terms of no of appointments for the complete treatment (Figure 3).

Table 3: Knowledge and Attitude towards the treatment for the periodontal disease (nonmedical professionals)

Educational level was defined according to years of education as 6 – 10 years, 11–15, and ≥16 years. The results show that the education on the knowledge of periodontal disease, its systemic influence and the treatment for the disease were similar for all the three categories of education level. The overall results showed that there was a lack of understanding of the influence of periodontal disease towards systemic health and disease. Further there was a lack of understanding of appointments that is necessary for treating periodontal disease amongst the non-medical professionals.

Discussion

The attitudes towards the periodontal health improves overall health. The motives to seek prompt preventive periodontal treatment could be the belief and the acceptance that periodontal treatment is beneficial to overall health. It has also been seen that the compliance with oral health care regimens is better among well-informed patients.8

Periodontal disease can be a risk factor for systemic disease. There are certain misconceptions or incorrect knowledge about oral health/ disease or periodontal health/disease and may lead to harmful behavior. The socioeconomic status, attitude, periodontal awareness, habits, and oral health behavior are the factors that determine the level of periodontal health and oral health in an individual.9 Further the health behavior models are complex involving different aspects such as self-efficacy expectations, decisional balance, perceived susceptibility and normative beliefs.10

Knowledge is one of the factors affecting these issues. However, it can be considered as one of the preconditions for additional measures to improve oral health behavior. Hence, most interventions aimed to improve oral health include measures to improve oral health-related knowledge.11 The signs and symptoms of the periodontal disease are rather mild, and the progression of the disease is often slow in chronic but can be rapid in cases of aggressive periodontitis.

The overall limited knowledge displayed by the nonmedical professionals in this study determines that there is a need for the periodontal specialist to undertake the regular screening of the disease. At a minimum, our findings suggest that dental schools should provide more knowledge and comprehensive training in oral/periodontal health. Further it is also necessary to explain about the consequences of the periodontal disease and its influence on systemic health and disease. It is also necessary to explain the duration and various types of modalities of treatment that are available for subjects suffering from periodontal disease. Our study had a limitation that the study was a self-reported and anonymous but was done in single center, and findings may not be generalizable.

Conclusion

The knowledge regarding the cause of periodontitis among the non-medical professionals was adequate, but the knowledge of its influence on systemic disease and the treatment for the disease was inadequate. Hence there should be an emphasis on providing knowledge to the non-medical professionals on the systemic influence of periodontal disease conversely its systemic influence and also various treatments to curb this disease.

Role of Residential Indoor Dampness and Mold as Determinants of Respiratory Symptoms among Adults

Saraswathy Manivannan1, Vidhya Venugopal2, Anupma Jyoti Kindo3, Thyagarajan Ravinder4

1Research scholar, 2Professor, Department of Environmental Health Engineering, 3Professor, Department of Microbiology, Sri Ramachandra Medical College and Research Institute, Chennai, Tamil Nadu, India, 4Professor of Microbiology, Government Kilpauk Medical College, Chennai, India

ABSTRACT

Adverse Respiratory health was found to be one among leading risks factors of the deaths globally and in India. As conditions are favorable for dampness, and indoor mold in low and middle income countries, studies associating them with respiratory health are much needed. Dampness, demographic profile, housing characteristics, and respiratory symptoms were assessed as cross-sectional measurements using validated questionnaires. Mold in indoor air were assessed using Standard Settle Plate technique using Malt Extract Agar as nutritional medium. Association of indoor mold and indoor dampness with respiratory symptoms was found using Multiple Logistic regression analysis. After adjusting for potential risk factors, Indoor mold, Cladosporium was found to be significantly associated with any one of the respiratory symptoms (AOR 5.0; 95% CI 2.7, 9.3), breathlessness (AOR 9.7; 95% CI 1.31, 71.3) and rhinitis (AOR 2.5; CI 1.2, 5.1). Self-reported indicators of dampness were found to have significant association with respiratory symptoms with reported ‘visible mold’ being associated with most of the respiratory symptoms. The findings identify the potential risk of dampness and indoor mold in provoking respiratory symptoms among the residents in a tropical developing country.

Keywords: Indoor Dampness, Indoor mold, Respiratory symptoms, India

Introduction

Respiratory illnesses are the well-recognized risks ranking third and fifth position respectively causing global DALYs (Disability Adjusted Life Years). These risks are projected to be one among the leading causes of death globally in 2030. In India, COPD and Lower Respiratory disease were two among the five leading causes of change in DALY in 2016 with Air pollution being the second leading risk factor contributing to above diseases. Among the Four million premature deaths occurring annually as a result of indoor air pollution in the world, around 1.04 million occurs in India alone. Indoor air quality is a significant health risk factor, as people spend most of their time inside buildings. A series of WHO guidelines on indoor air quality has been prepared to identify physical, chemical and biological contaminants that pollute indoor air but estimating the causative agent for the adverse respiratory health is highly complex.

Recent studies in India, reported higher prevalence of respiratory symptoms among the adults. But, the association between all possible causative agents and the adverse respiratory symptoms among the residents were not explored. Previous studies worldwide identified several household and demographic characteristics to influence adverse respiratory health and indicated a strong association between Dampness and respiratory symptoms among all age group.

Dampness in buildings is influenced by various factors such as inadequate ventilation, insulation, climatic change, indoor temperature, relative humidity, and poor building materials. Existing literature identified that home dampness initiates colonization of fungi
Dampness remains to be an important problem among low-income countries, due to economic constraints in the remediation and improvement of housing standards. In a developing tropical country like India, climatic conditions; diversified housing characteristics such as high relative humidity, housing type, cooking fuel; lack of awareness on housing conditions such as leaky water pipelines, improper drainage, poor building construction, poor ventilation; and unhygienic practices are favorable for dampness and mold proliferation but research on this field is limited and much needed in India.14

This study reports the association between the indoor mold/indoor dampness and respiratory symptoms from a subset of rural and urban households that were enrolled in a cohort study in Tamil nadu, The Tamil Nadu Health Effects of Air Pollution (TAPHE) cohort study that examined the exposure-response relationships between particulate matter and maternal-child and adult respiratory outcomes.15 Participants enrolled in this TAPHE study were from around 110 villages (in Tiruvallur) and 10 urban zones (in Chennai) providing a wide range of household configuration to maintain unbiased representation for the present study.

Method

Study area: The present study was conducted in Tamil nadu between the years 2011-2013 with Sri Ramachandra medical college and research institute (SRMC) as the study centre. Tamil nadu, with approximately 79.8 million population belonging to varied Socio-economic status, equally distributed between urban and rural locations, making the state suitable for this study. SRMC is situated in the borderline of the Tiruvallur district and Chennai city provided practically feasible conditions to conduct the study in rural villages and urban zones respectively.

Study design and Participants: This is a Cross-sectional study, approved by Institutional Ethics committee. The participant was screened for eligibility, explained about the study and informed consent was obtained before the interview. Pregnant mothers, people in dusty occupation, people with dreadful disease conditions were eliminated during screening. All men and women between the age group 18-60, living in the same building for atleast two years were recruited in the study. In some of the houses, two participants were recruited as per the recruitment criteria of the TAPHE study. Assessment of dampness and mold exposures were made in 710 households at the same time and 916 participants were interviewed for their demographic, housing characteristics, and respiratory symptoms.

Dampness Assessment: Dampness in the house has been assessed as participant’s self-reported information using a set of questions derived from previous studies16,7 as retrospective information for the preceding twelve months. Dampness indicators were positive response to questions on “Moisture stains on wall and other surfaces”, “Water leakage”, “Slow drying of cloths”, “Floor oozes”, “Flooding”, “Dampness in sleeping area”, “Mold Odour”, “Visible Mold”.

Mold Assessment: Duplicate plates of Malt Extract Agar17 were exposed at a height of 1.5 meters (normal breathing zone) and 1 meter away from walls in the living room of the household for 20 minutes. After sampling, they were sealed with parafilm and shipped back to the microbiology laboratory under aseptic conditions in a cold pack for further cultivation and analysis. The plates were incubated at a temperature of 20-25 °C for about 5 days and observed the growth of the fungal colonies. The fungi were then isolated and characterized both macroscopically and microscopically. The four important mold genera that were consistently associated with adverse respiratory health such as Aspergillus, Penicillium, Cladosporium and Alternaria18-20 were identified.

Respiratory Symptoms: Respiratory Symptoms were assessed using INSEARCH (Indian Study on Epidemiology of Asthma, Respiratory Symptoms and Chronic Bronchitis in adults) questionnaire developed and validated for assessing prevalence of asthma, chronic bronchitis and respiratory symptoms for the preceding twelve months period of the interview. As the study has been already established in Tamil nadu (as one among its twelve centers) with SRMC being its regional centre, the reliability tested regional version (Tamil) was readily available.
Statistical Analysis

Adjusted odds ratio for Respiratory symptoms was calculated for indoor dampness and indoor mold after adjusting for potential risk factors such as demographic and housing characteristics by Multiple Logistic regression analysis using SPSS software version 23.0.

Results

The demographic profile of the study participants were given in Table 1. The overall rural and urban ratio was 0.73. The participants were almost equal in gender. Majority of the population comes under lower and middle in Socio-economic status. Even though there are fewer smokers in this group, around 16% of people are passive smokers. Around 5% and 10% of people have family history of asthma and atopic symptoms respectively.

Prevalence of seventeen Respiratory symptoms of the study population classified based on location and gender of the population is represented in Figure 1. Differences were found between the prevalence of various respiratory symptoms among the study population, but could not recognize difference based on age or gender for each symptom.

Figure 1: Population prevalence of various Respiratory Symptoms in Rural (right panel) and Urban (left panel) locations among Total population (dark coloured bars), Men (light coloured bars) and Women (empty bars).
Similarly, the frequencies of the indicators of dampness were given in **Figure 2**. Around half of the study Participants reported moisture stain on their wall surfaces and all other indicators were less reported comparatively.

**Figure 2**: Frequencies of the indicators of dampness (self-reported) in percentage for the study house.

General household characteristics were broadly similar across rural and urban households were given in **Table 2**. Use of biomass as primary cook-fuel was reported in a higher proportion of rural households. Around 50% of buildings belong to the age group of 11-30 years. Majority of the houses were in ground floor. Use of Air-conditioner in the study houses was very less.

Discussion

We provide a comparison of results obtained with other studies examining the association between indoor mold/dampness and respiratory symptoms and discuss potential implications of the findings for future studies. After adjusting for the demographic and household variables, in the current study, Self-reported dampness showed highly significant association with respiratory symptoms similar to previous studies21-23 and indoor mold, Cladosporium were found to be significantly associated with any one of the respiratory symptoms. This may be due to resistance of the spores of Cladosporium in indoor air to varied climatic and housing conditions in a tropical country, making it fit for survival to provoke respiratory illnesses. Many previous aeromycological studies reported Cladosporium to be the most abundant mold all over the world24, 25 with its spore having structural configuration (small size, smooth wall) facilitating easier transportation26 and resistance to hot climate.27

Conclusion

As there are very less research undergoing in tropical countries related to dampness and indoor mold, the assessment of the association between indoor mold/dampness and respiratory symptoms in the present study will provide baseline information for further research in India. As recommended by WHO guidelines, Proper Ventilation, renovation, and hygienic conditions in the houses would arrest the growth of indoor mold and dampness.

Financial support for this study: Author, Saraswathy Manivannan was financially supported through funds provided by Indian Council of Medical Research (ICMR) for the SRU- ICMR Center for Advanced Research on Air Quality, Climate and Health (SRU-CAR).

Study of Postpartum Depression and its Associated Factors in Women Attending Tertiary Care Hospital, Raichur

Sujatha N¹, Arshiya Taranum¹

¹Assistant Professor, Community Medicine Department, Navodaya Medical College, Raichur

ABSTRACT

Introduction: Depression is very common, yet a neglected problem in new mothers, that can affect their own health as well as that of their children. The present study was carried out to evaluate the association of different socio-demographic and risk factors with postpartum depression, so that these women can be screened in their early puerperium while in the hospital and can be provided with special care.

Objectives: 1. To assess the prevalence and risk factors associated with postpartum depression. 2. To evaluate the association of antenatal and postnatal risk factors with postpartum depression.

Materials and Method: A descriptive cross-sectional study conducted in the postnatal ward of Tertiary Care Centre, Raichur. A pre-designed and pretested questionnaire was used to interview the patient, after taking verbal consent. It was one-to-one type of interaction. Depression was assessed using Edinburgh Postnatal Depression Scale (EPDS). The duration of the study was 6 months (1st March – 31st August, 2017) with 264 sample size.

Results: Out of 264 patients 60(23%) had postpartum depression, among them 31(51.67%) had mild depression, 22(36.67%) had moderate depression and 07(11.67%) had severe depression. Depression was significantly associated with antenatal and postnatal risk factors (p < 0.05), however complaints during antenatal period and mode of delivery had no association.

Conclusion: Routine screening for postpartum depression to be done in high risk cases.

Keywords: Postpartum depression, Risk factors, Prevalence, Postpartum women.

Introduction

Depression is very common, yet a neglected problem in new mothers, that can affect their own health as well as that of their children. (1) Postpartum depression is a non-psychotic depressive episode of mild to moderate severity, beginning in or extending into the first postnatal year. (2) The incidence of postnatal depression is observed in 10-20% of mothers. (3) A Meta analysis of studies mainly based in the developed world found the incidence of postpartum depression to be 12-13%; (4) with higher incidence in developing countries. (5,6) The present study was carried out to evaluate the association of different socio-demographic and risk factors with postpartum depression, so that these women can be screened in their early puerperium while in the hospital and can be provided with special care.

Objectives

1. To assess the prevalence and risk factors associated with postpartum depression.

2. To evaluate the association of antenatal and postnatal risk factors with postpartum depression.

Materials and Method

A descriptive cross-sectional study was conducted in the postnatal ward of Tertiary Care Centre, Raichur. A pre-designed and pretested questionnaire was used...
to interview the postpartum women, after taking verbal consent. It was one-to-one type of interaction. Depression was assessed using Edinburgh Postnatal Depression Scale (EPDS). This is a questionnaire comprising of ten questions. Mothers who score above 13 were taken to be suffering from depression. The women were also classified according to their age, marital status, parity, literacy, mode of delivery and obstetric outcome. Mothers in the 1st month of puerperium were included; mothers and babies with serious postnatal complications and mothers with diagnosed history of depression were excluded from the study. 264 postpartum women were enrolled in the study who visited the hospital during the study period of 6 months (1st March – 31st August, 2017). Results were analyzed using Chi-square test to evaluate the significance of association of antenatal and postnatal risk factors with postpartum depression. The study was conducted after obtaining the ethical clearance from the institutional ethical committee.

The postpartum depression was found to be associated with the antenatal risk factors like unplanned pregnancy, difficulty for the mothers in carrying out their daily activities and mothers having more number of girl children. There is no association found between postpartum depression and complaints during pregnancy.
There is highly significant association of postpartum depression with these antenatal risk factors at p < 0.05, except with complaints during pregnancy.

The postpartum depression is associated with postnatal risk factors like complications to the newborn and trouble during breastfeeding. No association was found between postpartum depression and mode of delivery. There is highly significant association of postpartum depression with postnatal risk factors at p < 0.05, except with mode of delivery.

Discussion

Postpartum depression is a widespread disorder which engulfs numerous women into its darkness and despair. The prevalence of postpartum depression varies from region to region but its occurrence is a known fact and also its debilitating effects. It is very important to know its prevalence in our society so that appropriate measures can be taken to avoid its occurrence and treat the affected.(8)

In our study, the majority of the postpartum women (52.3%) were in the age group of 26-30 years which is consistent in the studies conducted by Maria Ahmad et al(8) and Sumitra Melinamani.(13) Majority of the postpartum women (52.3%) were employed in the present study whereas in the study conducted by Desai Nimisha(2) and Giri et al(10), majority of the postpartum women were unemployed. Majority of the postpartum women (38.6%) belonged to upper middle class of socio-economic status, while in the studies conducted by G Maria Ahmad et al(8) and Giri et al(10), majority of the postpartum women belonged to middle class of socio-economic status.

The prevalence of postpartum depression in the present study is 23% which is consistent with the studies conducted by Patel V et al(5) and Budhathoki N et al.(11) In the studies conducted by Desai Nimisha et al(2) and Gupta et al(9) showed low prevalence that is 12.5% and 15.8% respectively. The prevalence was higher in the studies conducted by Giri et al(10) and Nepal M et al(12) that is 30.3% and 11-40% respectively. The high prevalence of depressive symptoms reported in this study might be because of lower cut-off point of EPDS score (≥10).

In the present study, the postpartum depression is assessed in the scale of mild, moderate and severe depression. Out of 264 postpartum women, majority 31(51.67%) had mild depression, followed by moderate depression (36.67%) and severe depression (11.67%) whereas in the study conducted by Sumitra Melinamani et al(13), majority of the mothers had severe depression (35%) followed by moderate and mild depression.

The present study noted that postpartum depression was associated with low education and similar results were noted from the studies conducted by Ghosh A et al(1), Gupta et al(9) and Sumitra Melinamani et al.(13)

In our study, the postpartum depression is significantly associated with the risk factors like unplanned pregnancy, difficulty for the mothers in carrying out their daily activities and mothers having more number of girl children, complications to the newborn and trouble during breastfeeding. Similar findings were noted in the previous studies for factors such as mothers having difficulty in carrying out their daily activities,(14) mothers having more number of girl children,(2,5,6,9,14) complications to the newborn(2,14) and trouble during breastfeeding.(14)

There was no association found for complaints during pregnancy and mode of delivery in our study. Similar findings for association with mode of delivery was noted in the study conducted by Ghosh et al(1) whereas in the study conducted by Musleh et al(14) suggests that those women who underwent delivery by caesarean section were at higher risk of suffering from postpartum depression.

Conclusion

The present study provides useful information about the prevalence of postpartum depression and risk factors associated with its occurrence. Since the prevalence is high, efforts should be made to improve the condition of postpartum women by identifying the risk factors at the
earliest during the antenatal period. Measures to be taken to improve their education and socio-economic status. Effective measures like appointment of counsellors at the level of primary health care to provide routine screening and counselling for postpartum depressive women and their family members should also be motivated in identifying and helping the postpartum women. This will help to improve the quality of care to the women to reduce maternal morbidity due to depression which is required under National Rural Health Mission.

Ethical Clearance: The study was conducted after obtaining ethical clearance from Institutional research ethical committee, Navodaya Medical College, Raichur.

Linking EHR and ERP Adoption with Flexibility in Care-Delivery and Operational Performance: A Conceptual Review in Hospital Supply Chain

Tulika Chakravorty1, Karunakar Jha2, Sunil Barthwal3

1Doctoral-Scholar, Dept. of Logistics and SCM, 2Professor, Department of Marketing, 3Sr. Associate-Professor, School of Business, Kandoli, Knowledge-Acres, University of Petroleum and Energy Studies(UPES), Dehradun, Uttarakhand, India

ABSTRACT

Healthcare-sector has gained prominence over decades and managing healthcare-records, healthcare-verticals and hospital-supplier linkages have emerged as focal-points of discussion. Electronic-health-records(EHR) and Enterprise-resource-planning(ERP) platforms are being adopted by hospitals frequently for reducing paper-based approach and better hospital-supplier sync; aiming at extending flexible and responsive patient-care-delivery; thereby boosting operational-performance. EHR and ERP adoption literatures have been evolving ever since. Well-grounded in literature and drawing logical support from two theories (Cybernetic-control-theory and Resource-based-view), this study puts forward rationally linked antecedent-consequence relationships, aimed at eliciting a nuanced view of how EHR and ERP adoption in the hospitals, adds to patient-care-flexibility. Contribution of this study lies in proposing the conceptual framework with overarching goal of achieving better operational-performance by technology-adoption(EHR and ERP), through facilitating care-delivery-flexibility as gains of EHR and ERP-implementation in hospital-network.

Keywords: EHR-adoption; ERP-implementation; Healthcare; care-delivery-flexibility; operational performance.

Introduction

Healthcare involves goods-services aspects. Goods aspect involve medical-supplies, pharmaceutical-supplies, medical-devices, etc., while services aspects include patient-care-processes, treatment-delivery and care-service-operations. The input materials in a healthcare supply chain are diseased patients, treatment care processes, pharmaceutical formulations/medications and care-delivery-schedules. With the evolving healthcare scenario, a major differentiating factor for hospitals is having an edge on services rendered towards their patients. Any processes and/ or techniques helping in synchronous process flows are vital intermediary inputs as the process of services flow downstream. Outcomes of a hospital-supply-chain are cured-patients, flexible-care-delivery propositions and efficiently managed operational performance; building competitive advantage over other hospitals. Technology has a pivotal role in development, modernization and automation of various sectors like telecom, retail, etc. and even healthcare is shifting towards technology-digitalization. However technology-adoption as antecedents to superior care-flexibility and hospital operational-performance remains unexplored.

Technology-enabled healthcare remains nascent and needs to bridge the lack of understanding of technology-adoptions towards achieving flexible patient-care and performance related aspects in hospitals. In hospital-supply-chain, major obstacles exist in communication, integration, patient-records-management, patient-data-processing, etc. This creates functional barriers among
the stakeholders\textsuperscript{13}. Feeble health-integration systems, improper patient-records management, poor connectivity, expectation-mismatch of performance-outcomes, lack of confidence on providers towards technology-adoptions, inadequate preparedness for technology-enablement have been quoted as major obstacles in achieving better care-delivery-efficiency, care-effectiveness and flexible-patient-care for hospitals\textsuperscript{9,14,15}. Shifting focus towards digitalized healthcare has triggered technology-enabled care-delivery and trending research findings indicate high potential of academic research\textsuperscript{16}.

Digitalization of health-records and enterprise-wide digitally-integrated platforms have become standardized-practice and more common in the current digitally synchronized healthcare-networks; thereby enhancing integration among various healthcare stakeholders\textsuperscript{11,17}. Technology resources like ERP (Enterprise-Resource-Planning) and EHR (Electronic-Health-Records) are making more leeway into healthcare domain\textsuperscript{4,17}. The technology resource EHR are referred to as digitalized systems functionally providing patient-history, patient-demographics, registration-details, patient-problem lists, physician clinical-notes, diagnostic-reports, comprehensive patients’ lists, medications/allergies, computerized prescriptions, laboratory and imaging results electronically\textsuperscript{18,4}. The other technology resource-Enterprise resource planning (ERP) systems are platforms/programs forming tools for providing integrated software for multiple business-facets and various stakeholders\textsuperscript{11,5,19}.

This paper aims at linking EHR-adoption and ERP-implementation with care-delivery-flexibility and operational-performance outcomes in hospital-supply-chain. Current industry-practices lack the understanding of the impacts of EHR and ERP adoption on patient-care flexibility and how they can improve the ultimate operational performance outcomes\textsuperscript{14}. This detailed conceptual review aims at providing linkages between EHRs & ERPs with care-delivery-flexibility and operational-performance outcomes of hospital-supply-chain; adding substantial clarity and justification to hospital-managers.

\textbf{Material and Method}

\textbf{Theoretical-Underpinning:} This study draws logical support from two theories- Cybernetic control theory and Resource-based-view. Linkages from cybernetic control theory and resource-based-view; contributes towards highlighting the impacts technology-resources like EHR and ERP and links their adoption-effects on care-delivery-flexibility and operational performance of hospital supply chain. First, ‘\textit{Cybernetic control theory (CCT)}’ justifies adoption/usage of cyber-technology-resources (EHR and ERP) in providing effectiveness and efficiency in hospital-process-operation; effectively developing hospital care-service-delivery capabilities\textsuperscript{20}.

Thus CCT support ERP-implementation and EHR-adoption, aimed at capturing, processing and delivering flexible and effective patient-care-delivery. Second, ‘\textit{Resource-Based-View(RBV) theory}’ asserts that firms’ compete based on bundle of resources that are valuable, rare, difficult-to-imitate and non-substitutable(VRIN) by competitors; facilitating firms to achieve competitive-advantage and superior long-term performance\textsuperscript{21}.

\textbf{Literature-Review:} This section reviews extant literature of the constructs of research interest in this paper aiming at establishing the detailed view on
application of EHR and ERP on healthcare-supply-chain context and aspects of care-delivery flexibility and operational performance in hospital-context.

**EHR-Adoption:** EHR is the process of electronically storing patients’ medical records, involving continuous collection, storage and utilization of digitalized patient health-information including demographics, progress-notes, problems, medications, vital-signs, medical-history, immunizations, laboratory-pathology-data, etc. in the form of easily retrievable files/records aiming at superior patient-care-services. Contrary to paper-based record-keeping, EHRs reduce human-errors and repetitions of diagnosis and treatment delays; fostering continuity and care-quality. EHR helps in information-standardization; thereby improving coordination among healthcare-providers. EHRs harness flow of health-related information, providing healthcare-organizations with competitive-advantage by significantly improving care-quality, efficiency, cost-containment and productivity. EHRs have capabilities of intra and inter organizational information-sharing fostering clinical-operations forming a potent tool for achieving coordinated care by overcoming long-waiting-times in hospitals; improving safety, quality and operational efficiencies. EHRs connect hospitals and patients by synchronizing patients’ clinical-record online; providing faster data-access, easier retrieval, greater collaboration, high-quality workflow and electronic-reporting mechanism through process-automation.

**ERP-Implementation:** ERP forms an enterprise-wide-package, functionally integrating the individuals, departments and multiple-stakeholders of firms by integrating various operational facets including product-planning, development, manufacturing, sales and marketing into single platform-based application-user-interface. ERP is reported as key digital-resource enabling the firms to adapt, configure, and integrate information-flows and business-processes; acting as integrated umbrella system facilitating real-time information-sharing along varied verticals like procurement-supplies, shop-floor control, etc. besides amalgamating management functions and complex heterogeneous networks across geographies, providing seamless network-wide connectivity across business silos.

ERP in healthcare has aided synchronized connectivity and real-time information-interchange among healthcare-stakeholders, improving patient-care-quality and service-flexibility; reflecting a significant impact on information-sharing, real-time tracking and supplier-hospitals integrated interaction. Major ERP benefits in healthcare are highlighted as: faster, reliable and agile medical information distribution reaching doctors, suppliers and key stakeholders on real-time basis enabling monitoring of warehouse-stocks, medical-supplies’ status and managing order lead-times; thereby minimizing stock-out situations. Further extant studies highlight healthcare-ERP benefits attributing to patients’ satisfaction, stakeholders’ satisfaction, operations-efficiency, strategic performance management of healthcare organisations.

**Care-delivery-flexibility:** Care-flexibility is referred as the extent to which healthcare-systems can adapt to dynamic process environment and be flexible in addressing variable customer (patient/hospital) complaints/requirements, concerning delivery of care/order. Care-flexibility in daily task-scheduling process promotes autonomy among staffs; allowing higher staffing-levels, lower staff-turnover and more life experiences for residents. Delivery-flexibility is essential in healthcare to continuously adapt to dynamic environment fostering patient-centric care-delivery, adapting to patient-demands, providing dependable and reliable care; besides aiding hospitals to offer customized, innovative, adaptive value-based patient-care services. Integrated, sharable and reusable technology resources effectively provide foundation fostering healthcare flexibility in dynamic environment. Network-wide IT-platform-resources have been shown effective on intangibles like enhanced flexibility and care-quality besides tangible outcomes like productivity, efficiency and cost-savings.

**Operational-Performance:** Operational performance is referred as firms’ ability to manage operational goals or services. Challenges in healthcare-network come from criticality, operational challenges and high level of operational dependencies. Operational characteristics like cycle-time, on-time-delivery, reduced lead-time, etc. form key contributors to enhanced cost-saving and resource-utilization; being even more important in healthcare due to battling between cost and quality-care along with achieving greater patient-satisfaction and loyalty. The principle attributes of operational performance are: reduction in service cycle-times; improving service processing accuracy; improved on-time-delivery of service; and improving service forecasting accuracy which is of primary focus in hospital supply chain along with focusing on patient-care-services and hospital-supplier coordination management to achieve operational success.
Table 1: Conceptual Construct Definitions

Methodology

This paper is a systematic review of the impact of EHR and ERP technologies adoption in healthcare-sector focusing its implications on care-delivery flexibility and operational performance. This study details the literature review conducted to provide the antecedent-consequence linkages between EHR & ERP adoption in the hospital supply chain. Based on detailed literature-review and theoretical-supportings, the proposed research-model is structured and research propositions are derived. While reviewing literature, it was found that EHR & ERP applications in healthcare are at a very nascent stage with limited findings towards patient-care-flexibility and also limited research on innovative technology adoptions in healthcare and implications on operational-performance. This gap in body-of-knowledge offers ample scope of research. Literatures for review and analysis are taken from Google Scholar, Elsevier, Jstor, Proquest, IEEE, Emerald-Insight, Research-Gate, EBSCO, etc. Search was refined based on keyword search priority to obtain the research articles and information about EHR; ERP; Healthcare; Flexibility; Care-delivery; Operational Performance and Patient care. In this study, various caveats of healthcare systems have been identified and analyzed and a logical framework proposed.

Findings: Proposition-development

Linking EHR & ERP with Care-delivery-flexibility:
EHR is a platform for electronic storage of patient-health-data accomplishing information standardization, proper storage and access of all records by the healthcare stakeholders; thereby improving coordination among healthcare providers\(^3\). Care-flexibility based on care-design-time, care-deployment-time and actual care-run-time are primary focus areas in flexible healthcare delivery context and can be helped by technology involvement and electronic data exchange\(^3\). EHRs provide personalized system to track, manage, and interpret the patients’ health-history and help in advising both patients and providers having a potential of offering improved functionalities, robustness, reliability and care-flexibility in the system\(^1\). So we propose: Proposition-1: EHR-Adoption has a positive relationship with Care-delivery-flexibility in hospital-supply-chain.

ERP is an integration platform help in real-time information-flow across hospital-departments and hospital-suppliers, reducing gaps among disconnected hospital-silos; fostering flexibility in patient-care-delivery system\(^1\). ERP has been considered as a driving technology for business-process-management, bringing in flexibility and standardization by integrating the care functionalities in minimum possible time; thereby fostering better care-delivery coordination, care-delivery process-redesign, care-process risk-reduction and providing efficient and effective care-delivery in hospital care-delivery supply-chain\(^29,5\). Synchronization between external and internal flexibilities through ERP-systems implementation is needed for bolstering flexibility in patient-care-delivery\(^2\). Mobile-devices and technology-integrated platforms like ERP improve sensor-based-integration and user-navigation thus positively impacting flexibility\(^3\). So we propose:
Proposition-2: ERP-Adoption has positive relationship with Care-delivery-flexibility in hospital-supply-chain.

Linking Care-delivery-flexibility with Operational Performance: Collaboration and coordination across silos of healthcare supply chain facilitates flexible value-delivery driving towards patient-centered care. Flexible service is the fundamental requirement for capability-driven service and flexible availability of staffs to serve patients and provide care can largely generate better operational performance. Healthcare processes being complex, require lots of information-exchange, interaction and coordination among the physicians and hospital-staffs; necessitating a flexible system for boosting the operational performance; therefore vertical integration among the hospital supply chain stakeholders are essential for enhancing the delivery-flexibility and operational performance of the hospitals and their suppliers. Studies highlight that IT applications predominantly fosters patient-care flexibility and tangible outcomes like productivity, efficiency, cost-savings and organizational-performance. So we propose:

Proposition-3: Care-delivery-flexibility has positive relationship with Operational-Performance in hospital-supply-chain.

Conclusion and Implications: Based on extant literature and practitioner-studies, this paper proposed a conceptual framework linking EHR and ERP adoptions with care-delivery-flexibility and operational performance; leading to the development of three key propositions in healthcare context. These conceptual linkage and review-based propositions will significantly contribute to healthcare-research; providing clear understanding of implications and outcomes linked to EHR & ERP adoption, besides prompting hospitals about avenues to improve flexibility and operational performance; aimed at providing value-based care. The proposed framework, specific for healthcare-sector context, emphasizes the advantages of technology adoption/implementation; aimed at helping the hospital managers to get enhanced clarity regarding EHR and ERP adoption/implementation, besides enlightening them about proposed impact of such adoptions. From the managerial perspective this framework can be adapted in other sector-contexts; however care must be taken before indiscriminate generalization of the framework. Further scope of empirical validation through formulation of testable hypotheses remains.

Self Assessment of Oral Health and Risk Factors among Elderly in Tamilnadu, India

V. Anu¹, D. Bharathi², Atchukola Sailakshmi Triveni², B. Bensa²
¹Reader and Head of the Department, ²Former Student, Sathyabama Dental College and Hospital, Chennai

ABSTRACT

Background: The aim of the study was to self-assess the oral health and risk of the elderly population living in affordable and non-affordable old age homes in South India.

Methodology: A cross-sectional study was carried out among elderly people of 65 years and above and 600 samples (330 from affordable homes, 270 from non-affordable homes) were selected using cluster random sampling. Self assessment was done using WHO oral health questionnaire form for adults, 2013. The data were compiled in Microsoft excel sheet based on the coding of WHO oral health questionnaire for adults and transferred to version 20 SPSS software.

Statistical Analysis: Descriptive analysis and Chi-square test was done. Level of significance was set as 0.05.

Result: 35% had more than 20 teeth in their mouth. 37.3% had experienced pain or discomfort in their teeth or mouth during past 12 months. Majority (78%) of them graded themselves having good and very good gums and teeth respectively. 418 clean their teeth once a day. 82.3% use toothbrush. 87% use toothpaste for brushing their teeth. Less than 25% visited dentist in past years. Of those majority of them visited for pain/trouble with teeth gums or mouth. Less than 26% of elderly had experienced difficulty in biting, chewing foods and speech. Almost 90% reports that they have not experienced any daily activities affected because of their state of teeth or mouth. Majority (>90%) doesn’t use tobacco or alcohol.

Conclusion: The present study clearly shows that amidst all the oral health condition, the oral health related quality of life among elderly is found to be satisfactory.

Keywords: Self-assessment; Oral health; Risk factors; Ageing population; Quality of life; Questionnaire survey.

Introduction

Human beings whose age near or surpasses the average life span constitute elderly or old age. By 2050 India may have 20 percent of elderly among the total population, which is around 323 million. About 65 percent of the aged had to depend on others for their day-to-day maintenance. The possibility of being isolated from the society, employment related stress and depression might influence the health and oral health of elderly. Health can be measured by two methods, clinical examination by the medical professionals and self-assessment by the individuals. Self-assessment data are useful in determining the health needs of the population and identifying the target groups. With the self-assessment of the health status, it has become easier to control the risk factors in elderly population. Self-assessment of oral health has been shown to be of possible value for adult communities, providing reasonably valid estimates for the numbers of remaining teeth, for fillings and for root canal therapy experiences and for the presence of fixed and removable prostheses and for screening of urgent dental care. With the self-assessment of oral health status, it has become easier to control the risk factors in elderly population. By self-assessing the oral health status of the elderly population the characteristic discrepancy among elderly residing in affordable and non-affordable old age homes can be determined and programs can be planned to create awareness in eradicating the risk factors causing oral health discrepancies. Literature.
shows an increase in the number of studies related to self-assessment of general health and there is scarcity in literature based on the oral health assessment of adults. Thus, this study was undertaken with the aim to self-assess the oral health and risk factors among elderly population in Tamil Nadu, India.

Methodology

The present cross-sectional study was carried out among elderly aged above 65 years living in affordable and non-affordable old age homes in Tamil Nadu, South India. As per the old age home directory of India, there were 246 registered old age homes in Tamil Nadu. Sample size determination was done using the formula

\[ n = \frac{Z^2pq}{d^2} = \frac{(1.96)^2 \times 37.6 \times 62.4}{(4)^2} = 563 \]

(approximately 600)

Where, \( Z \) (confidence interval 95%) = 1.96; \( p \) (prevalence) = 37.6% (prevalence was taken from previous studies conducted among elderly in Chennai); \( q = 1-p = 62.4; d \) (allowable error) = 4%

The study sample was selected using a cluster random sampling method. 150 elderly residing in affordable and non-affordable old age homes from Chennai, Kanyakumari, Hosur, Coimbatore who were willing to participate was selected. Subjects who are diseased were excluded. The Study was conducted between October 2017 – December 2017. The study was conducted after obtaining ethical clearance (Ref.No: Sathyabama University/IHEC/Study No 18) from the Institutional Human Ethical Committee of Sathyabama Dental College and Hospital, Chennai. Prior permission to conduct the study was obtained from the authorities of the respective old age homes in Tamil Nadu. Informed written consent was obtained from the participants of all the old age homes.

Self assessment was done using a WHO oral health assessment form for adults. WHO oral health assessment for adults is used for the collection of information on self-assessment of oral health status, oral health habits, risk behavior, quality of life and social position and modifiable factors of oral health such as diet/nutrition, tobacco use and excessive alcohol consumption. This provides a conceptual and practical basis for linking oral health to relevant chronic assessment. The Questionnaire was described and explained in local language of the participants for their enhanced understanding of the study and to get accurate justification for the Questionnaire. The data were compiled in Microsoft excel sheet based on the coding of WHO oral health questionnaire for adults and transferred to version 20 SPSS software. Descriptive analysis and Chi-square test was done to know the significant difference between the affordable group and Non-affordable group. Level of significance was set as 0.05.

Results

The present study was conducted among 600 (Affordable-330, Non-Affordable-270) elderly aged 65 years above living in affordable and non affordable homes in Tamil Nadu. Table 1 shows the demographic details of the study population. Table 2 shows self-assessment of general oral health among elderly. 47.27% of elderly from affordable homes suffered more pain or discomfort for the past 1 year when compared to non-affordable homes (p<0.05). From table 3 it is evident that elderly living in affordable homes have dentures when compared to non-affordable homes. Table 4 indicates that the respondents of non-affordable group had better state of teeth and gums compared to affordable group. Table 5 indicates almost 102(37.77%) elderly living in non-affordable homes have not visited a dentist. Table 6 indicates almost 50% to 80% of the respondents has no difficulty in chewing and biting food or had a speech trouble while affordable group encounter less difficulty than non-Affordable group. Table 7 indicates both Affordable and Non-Affordable group will consume coffee or tea several times a day or everyday while fresh fruits are consumed in highest numbers by the Affordable group. Table 8 shows majority(>98%) does not use Tobacco/Alcohol.

Discussion

Self-Assessment of oral health questionnaire for adults have been pilot tested in different parts of the world and can be done either by self-completion or completion by means of interview of which Self-completion brings forth higher response rates. The aim of the study is to gather data by focusing on socio-economic status, risk factors of oral health and also information about environmental exposure to fluoride, oral hygiene practices and use of available oral health services. Oral Health Related Quality of life is considered as an important outcome10.

Majority (96%) of the elderly have not utilized dental services in our study. This is in concordance with study conducted by Rani et al11 and Talajia et al12. The reason might be lack of transportation and lack of insurance which is a must for expensive dental treatments are the obstacles in utilizing dental services and people visit dentists only when they suffer from pain and they are not concern about the follow up treatment. About 35% have more than 20 teeth in their mouth and majority have the habit of brushing once a day using toothbrush and toothpaste. This highlights that our study population are aware of oral health maintenance. Talajia et al12 in his study states that age, education and income are associated to oral health risk factors. Hardly 50% of the population has completed High school of which Non-Affordable group has a lower level of education than Affordable group.

From the present study it is found that felt need of oral health among elderly with regards to oral condition is less in their perspective resulting in good Oral Health Related Quality Of Life. The present study concludes that the elderly population self assessed their oral hygiene status as good and oral health status does not bother their quality of life and Self assessing affirms good state of oral health in elderly inspite of the difficulty they experience with teeth or mouth. Though the oral hygiene is maintained lack of awareness in utilizing dental care and poor education system may be the major cause of the rundown in Non-Affordable group than Affordable group.

Conflict of Interest: NIL

Source of Funding: Self

Ethical Clearance: The study was conducted after obtaining ethical clearance (Ref.No: Sathyabama University/IHEC/Study No 18) from the Institutional Human Ethical Committee of Sathyabama Dental College and Hospital, Chennai.

Brand Resonance: Concept and Influence of Relationship Marketing Dimensions with Reference to Online Shopping Portals

V. S. Divyasre
Part-time Research Scholar, University of Madras College of Arts and Science, (University of Madras Constituent College), Nemmeli

ABSTRACT

Technology has penetrated into every field of operation and most of the businesses today are executed online. In this context, the competition is intense in online shopping portals. With the advent of internet and the ease of accessibility of Internet at anytime and anywhere has increased the number of online shoppers. The online shopping portals are finding it difficult to retain the customers and establish a long term relationship with them. Focusing this issue of online shopping portals, the study elaborates the concept of Brand Resonance, a powerful tool for the portals to have a long sustenance in the market. The correlation between the various factors of Brand Resonance such as Brand Loyalty, Brand Attachment, Brand Engagement and Brand Community is explained and the influence of Relationship marketing dimensions on Brand Resonance is analyzed theoretically. The four Relationship Marketing Dimensions Trust, Satisfaction, Empathy and Conflict handling has been considered for the study.

Keywords: Brand Resonance, Relationship Marketing Dimensions, Brand Loyalty, Brand Engagement, Brand Community, Brand Attachment.

Introduction

The Internet Revolution has created opportunity for Businesses and thus many services are offered online. Among the services, online shopping has taken a predominant position with a huge customer base (Richa.D, 2012). As the cost of doing business online is less compared to conducting a business with physical store formats, it has attracted the interest of many entrepreneurs. The cost of inventory is less and the choices available to the customers is varied compared to physical stores.

Due to this the competition is also intensifying where the businesses struggle to retain its customers. It is because customers switch to other shopping portals when the price of the same product is offered at a slashed rate. To tackle this situation, businesses need to focus on ways to retain their customers. Brand Resonance should be the goal of every marketer. The marketer needs to drive their customers to this state of high psychological connection towards the brand. Once the customers feel emotionally connected with the brand, they do not easily switch over to other brands. Though Brand Resonance is an ideal state to be achieved, businesses find success when they choose this path to travel. They realize huge profits when they get closer to this state.

Relationship Marketing plays a crucial role in influencing Brand Resonance. The impact of these dimensions in creating Brand Resonance is very high and thus are considered as antecedents for this study. The four main relationship marketing dimensions trust, satisfaction, conflict handling and empathy which are paramount for online shopping portals are considered for examination.

Objectives

- To trace the linkage between Relationship Marketing Dimensions and Brand Resonance.
- To determine the levels of correlation between the factors of Brand Resonance.
- To determine the correlation levels between Relationship Marketing Dimensions and Brand Resonance.
- To discern the concept of Brand Resonance with respect to Online Shopping Portals.
**Materials and Method**

The study has employed descriptive type of research using primary and secondary data. The primary data from 515 respondents using online shopping portal have been collected and analyzed in order to determine the correlation between Brand Resonance and between Brand Resonance and RM dimensions. Convenience Sampling has been employed in the study. The Secondary data is collected from various online journals like ebscohost, proquest, newspaper sources and internet sources.

**Brand Resonance: Overview**

Brand Resonance is defined as the type of relationship the consumers share with the brand and the level of sync they establish towards the brand. It is also characterized by depth of psychological bond the consumers share with the brand. The four dimensions of Brand Resonance are exhibited in Fig 1.

![Fig. 1: Sub dimensions of Brand Resonance](image)

The Behavioral loyalty or Brand Loyalty refers to the frequency of purchase and quantity of purchase made by the customers. The repeat purchases are measured in order to determine the behavioural loyalty. The more the purchase is higher is the level of loyalty. Though loyalty forms a crucial component to achieve Brand Resonance, customers should establish a personal attachment towards the brand. They should feel that their brand is very special beyond just possessing a positive image for the brand and love their brand. This is termed as Brand Attachment.

Another important dimension is Brand Community where the customers identify themselves within a community and feel affiliated with other members linked to the brand. A strong assertion towards brand loyalty happens when the customers beyond the purchase time are ready to invest energy, time and money for the brand which is Brand Engagement (Keller, 2001). These four factors constitute the Brand Resonance and every factor is significant and contributes majorly towards the brand resonance.

**Correlation between the Factors of Brand Resonance**

The various levels of Brand Resonance have interactive effects. They are correlated and interrelated to one another. When the levels of Brand Attachment increases it leads to an increase in engagement levels. Ultimately, in order to boost Brand Resonance, the intensity and activity levels of loyalty should be improved (Wasib, 2014). In order to determine the correlation between the various factors of brand resonance, a study was conducted among 515 online shoppers and the result of the correlation is exhibited in the table.

<table>

</tbody>
</table>

*** indicates the significance of correlation at 1% level

From the above table it can be inferred that the correlation is high between Brand Attachment and Brand Engagement with a value of 0.677. So an increase in one factor leads to an increase on the other factor. The correlation is least between Brand Attachment and Brand Community with a value of 0.474. It is observed from the correlation values that all the values are above 0.5 and thus every factor of Brand resonance is very closely and positively related to one another. Hence it can be concluded that the factors of Brand Resonance are closely related to each other.
Relationship Marketing Dimensions and Brand Resonance-Interdependance

Relationship Marketing and brand Resonance is closely knitted to each other. Every RM (Relationship Marketing) Dimension very strongly influence Brand Resonance.

Brand Community and RM Dimensions: Trust, a paramount factor of Relationship Marketing Dimension is strongly associated with Brand Community (ie) online communities in the case of online shopping portal. When a user of the shopping portal is long associated with the community, he develops greater trust for the shopping portal and enjoys a very comfortable shopping experience. The customer’s feeling of risk in shopping hits the rock bottom (Zhu, 2012)4.

Brand Communities benefit the customers to a large extent. Online shoppers in the recent times depend on the reviews and comments of other shoppers, mainly because it is a virtual shopping and the physical assistance is absent. A report suggests that 84% of US online shoppers trust the perceptions of other shoppers which is a sign of credibility and thus the risk factor is reduced (Anderson, Swaminathan and Mehta, 2013)5. In general, customers have certain shopping characteristics and in online community, they search for shoppers with similar characters. Once the search is successful, the opinion of these persons are very powerful because the customers selection depend on their favorite shopper to decide which particular seller to opt for (Van den bulte and Wuys, 2007)6. At times a new product purchase decision may also depend on this favourite shopper as the customer believes that they share the same wavelength with respect to tastes and preferences. Empathy and Conflict Handling dimensions of RM has a greater impact on Brand Community compared to satisfaction and trust. When the shopping portals express high levels of empathy, the gratitude is expressed by good word of mouth in online communities.

Brand Loyalty and RM Dimensions: As the competition among the online shopping portal gets intensified customer satisfaction acts as a crucial differentiator and thus has gained a pivotal position in business strategy. The psychological factors strongly influence the customer’s loyalty towards the online shopping portal (Pai and Tsai, 2011)7. Hence, Customer Satisfaction plays a critical role in building Brand Loyalty among the customers who later turn as customer evangelists and spread good word of mouth about the brand. Though there are many metrics like market share which measures the performance of the company in the market, customer satisfaction is the most significant indicator which decides on the likeliness of the customer to do repeat purchase which is brand loyalty (Tripathi, 2014)8.

The basic principle to have intensified levels of loyalty is immense degree of trust which minimizes the reliability on various monitoring mechanism and thereby reducing the transaction costs (Gefen,2003)9. Supporting this view, the framework developed by Harris and Goode (2004)10 emphasized that trust is paramount in developing long term relationship with the customer that enables further purchases.

Sere De Lanauzn (2006)11 suggests that the integrity and credibility components of trust form the predictors for brand loyalty. So as the sensibility of trust increases, the loyalty of the customers towards the brand also increases. Thus Brand Loyalty is very closely associated with Relationship Marketing Dimensions.

Brand Engagement and RM Dimensions: Brand Engagement focuses on the level of importance the customers place on their favourite brands and the extent to which consumers strongly bond with their preferred brands (Sprott, 2009)12. The RM dimensions trust and satisfaction are antecedents for Brand Engagement particularly for old customers (Linda, 2011)13. On the road of achieving long term relationship with the customer, customer satisfaction is the first stage and engagement of the customer towards the brand is the pinnacle of long term relationships. Customers who exhibit higher levels of engagement towards the brand or company are invested emotionally with respect to brand since they believe that the organization has invested emotionally on the customers (Tripathi, 2014).

Brand Attachment and RM Dimensions: Brand Attachment is defined as “Inalterable, long lasting, affective reaction for the brand, exhibiting psychological proximity towards the brand” (Lacoeuilhe, 2000)14. Thus Brand Attachment exhibits a customers interest to establish a wistful relationship by means of consumption or usage of a brand. Though RM dimensions does not form a definite pre requisite for Brand Attachment, the
presence of trust enhances the bonding of Brand Attachment. As far as the satisfaction is concerned, the evidence of the relationship with Brand Attachment is not explicit but however affective component of satisfaction is positively related to Brand Attachment (Samy Belaid, 2010)\(^1\)

**CORRELATION BETWEEN BRAND RESONANCE AND RELATIONSHIP MARKETING DIMENSIONS**

The following table illustrates the correlation between the brand resonance and relationship marketing dimensions:

<table>
<thead>
<tr>
<th>Factors</th>
<th>Brand Attachment</th>
<th>Brand Engagement</th>
<th>Brand Community</th>
<th>Brand Loyalty</th>
<th>Overall Brand Resonance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trust</td>
<td>0.484***</td>
<td>0.352***</td>
<td>0.230***</td>
<td>0.384***</td>
<td>0.427***</td>
</tr>
<tr>
<td>Empathy</td>
<td>0.569***</td>
<td>0.543***</td>
<td>0.420***</td>
<td>0.484***</td>
<td>0.598***</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>0.517***</td>
<td>0.424***</td>
<td>0.299***</td>
<td>0.413***</td>
<td>0.488***</td>
</tr>
<tr>
<td>Conflict Handling</td>
<td>0.553***</td>
<td>0.393***</td>
<td>0.424***</td>
<td>0.379***</td>
<td>0.527***</td>
</tr>
<tr>
<td>Overall Relationship Marketing</td>
<td>0.644***</td>
<td>0.516***</td>
<td>0.4217***</td>
<td>0.501***</td>
<td>0.617***</td>
</tr>
</tbody>
</table>

*** indicates the significance of correlation at 1% level

From the above table it can be inferred that for Brand Attachment, the correlation is strong with Empathy with a value of 0.569, Brand Engagement has high correlation with Empathy (0.543), Brand Community has high correlation with Conflict Handling (0.424) and Brand Loyalty has highest correlation with Empathy (0.484). Among all the factors of brand resonance Brand Attachment has got the strong correlation with the overall RM dimension (0.644) and among all the RM dimensions, Empathy has the strongest correlation with the overall Brand Resonance (0.598). The least level of correlation exists between Brand Community and Trust (0.230). Focusing on the bigger picture the correlation levels are generally high except a few intercepts with low levels of correlation.

**Findings**

It is evident from the literature that Brand Resonance is one of the strong levels to be reached by the marketers to have a prominent position in the market. Though Brand Resonance is an ideal state to be reached, the closer the businesses travel higher are the benefits to be enjoyed. From the correlation values of Brand resonance, it is apparent that the 4 factors are closely related to each other and a rise in one component leads to the rise in other components. Tracing the relationship between RM Dimensions and Brand Resonance, the RM Dimensions have a strong influence of Brand Resonance and the earlier studies support the view that RM dimensions are antecedents for Brand Resonance. With the correlation values between both, overall a strong level of correlation exists between RM dimensions and Brand Resonance with a coefficient value 0.617.

**Conclusion**

The Marketers can use Brand Resonance as one of their Business Strategies to stand apart from the competitors. Relationship Marketing has always been a term of strategic importance from time to time. But however the dimensions have got different ranking and priority through different marketing ages. As the customer’s mind set changes and also with the advent of new ways of doing business, marketers need to place more emphasis on the changes and formulate their strategies which is concomitant with the needs of the customers. Though RM Dimensions have got a direct influence on Brand Resonance, it is imperative to focus on the dimensions that contribute the maximum towards Brand Resonance and place higher importance for these factors which will directly have a strong impact on sales and profits.

ABSTRACT

This is an account of a Community Health Diagnosis program conducted in a tribal hamlet in Kerala, India. The goal of the program was to identify factors affecting health of this population and determine the availability of resources within the community to address these factors. The program identified the felt needs of this marginalized population and developed a causal loop diagram to identify the social and cultural factors affecting their health. Actionable recommendations were proposed to the local political leader. It was concluded that addressing social determinants is key to delivering health care in low resource settings.

Keywords: Community health diagnosis; Social determinants; Tribal

Introduction

India is the land of many diversities, home to more than 1.2 billion of the world’s population, a colossal assortment of various cultures and diversities. The indigenous groups (tribals or adivasis as they are locally addressed) constitute about 8.2% of the total population[1]. Being a marginalised and disadvantaged community, the tribals in India face a plethora of health issues calling for urgent attention. A burgeoning volume of research identifies social factors at the root of health problems especially among the disadvantaged groups. The Commission on Social Determinants of Health proposed that social determinants are relevant to communicable and non-communicable diseases alike[2]. Hence identifying of social determinants is key to addressing most health issues.

The Community Health Diagnosis (community health assessment) is the foundation for improving and promoting the health of the people of a community. The goal of community assessment is to identify factors that affect the health of a population and determine the availability of resources within the community to adequately address these factors[3]. According to the WHO definition, it is “a quantitative and qualitative description of the health of citizens and the factors which influence their health. It identifies problems, proposes areas for improvement and stimulates action”[4].

It starts with collecting basic data about community beginning from geographical characteristics of the community, to analysing the health condition of its inhabitants thereby presenting an overall profile of the community. The World Health Organization endorses this concept by defining health as a state of complete physical, mental and social well-being and not merely the absence of any disease or infirmity[5].

Purpose of community diagnosis

- To act as a tool to bring out the hidden issues that are not tangible to the community or policy makers but are directly or indirectly affecting their health.
To reach out to underprivileged people who are unable to utilize the available facilities due to poverty, prevailing discriminations or other social causes.

To determine genuine problems of the community, that the community itself may not have perceived as problems.

To suggest priority areas for intervention and solutions for the same.

To identify and communicate these problems from the local level to the state and national level.

To serve as baseline data for assessing the effectiveness of any intervention or program implemented.

Appraising the findings to policy makers who in turn can implement the suggested solutions for community betterment. This process is better known ‘as advocacy’; one of the core functions of a public health professional.

It should be understood that community diagnosis is not a one-time affair rather a continuous and dynamic process. It requires constant monitoring and follow-up to enable significant changes in the community.

As mentioned earlier, there is a need to dispel the myth that ill-health is merely caused due to bio-medical reasons. The advancements in medical technologies and advent of super-specialties have cocooned medical professionals to the four walls of a hospital. Community diagnosis program provides an opportunity to sensitize medical professionals to diagnose the exact ‘cause’ of a disease by reflecting on the social, cultural and economic aspects of a disease/illness as well.

Community diagnosis programs has been successfully implemented in many countries as a part of routine medical curriculum[6-8]. This training in early years of medical education could have a wider impact in shaping the thought process of the professional.

**Community health diagnosis program in a tribal hamlet in Wayanad, Kerala**

**Need for the program:** The purpose of this program was to highlight the view health needs and problems cannot be viewed in isolation. It has been observed that in deprived communities, health is often not a priority. An approach to identify their felt needs and addressing them becomes vital in improving their general health. Hence, a community health diagnosis program was designed and implemented to identify the key social and cultural factors governing health related behaviour of a tribal community in the state of Kerala, India.

**Methodology**

Information was elicited through primary data availed from household surveys in the form of structured interviews, group discussions and analysis of health care providers, community leaders and community representatives’ perspectives and from secondary data (previous studies, newspaper reports and government publications).

A total of 28 houses belonging to Madakunnu tribal colony were surveyed by a nine member team comprising of faculty and postgraduates scholars of Public Health Dentistry, Amrita School of Dentistry. Health care providers of two hospitals frequented by tribals were interviewed.

As an attempt to orient and improve their attitudes towards basic hygiene and sanitation, households were provided with a basic health kit consisting of bathing soap, toothpaste and toothbrush, shampoo, band-aids and nail clippers.

**Findings**

**Community profile:** Madakunnu is a tribal hamlet in the hilly regions of Wayanad district in Kerala. The geography of the hamlet is presented in the form of a social map (Figure 1) developed with the help of a preceptor. Social map is a two-dimensional cartographic representation showing relative households and social institutions.
Community characterization: We found that on an average five persons lived together in a single room kuchha house. Majority of them were manual labourers working for daily wages in nearby agricultural lands drawing a remuneration of Rs 400 (for men) and Rs 250 (for women) per day. They usually worked for a maximum of 10 days per month. Literacy rates were found to be poor with most of the females educated upto 4th grade and males till 8th grade of schooling.

Prioritization: Identifying felt and normative needs required weighing and prioritizing the various community problems. The following observations were made in the process.

Fever and cough were the common health issues expressed by the community for which care was sought from a nearby government primary health center and two charitable hospitals. From the health provider’s perspective, tuberculosis, under-nutrition and anaemia were the most common health issues. This could predominantly be attributed to their living conditions like poor housing, overcrowding, lack of potable water and inhalation of firewood fumes. Consumption of the alcohol and use of tobacco were the other major problems affecting this community.

The foremost barriers in seeking care were difficulty in reaching the health care facility during need due to rough terrain, poorly motorable roads, lack of frequent public transport services and financial issues. Commuting was difficult in the dark and during rainy seasons. Lack of electricity compounded the problem leading to a situation where sick and needy were left to suffer till next twilight to access health care.

The primary concern was housing. Roofs built of hay and plastic sheets gave way during rainy seasons leading to perennial leaks and dampness and associated illnesses like fever and infectious diseases. The problem of overcrowding in a single room house, cooking using firewood in the same room and lack of ventilation were aggravating factors for development and spread of infections. The other concern raised was the lack of potable water. Majority of the households drew water from a man-made pit on the river bank. This pit was not covered and exposed to a variety of litter and debris affecting the quality of water. Boiling of water before
consumption was practiced only during rainy seasons. Community leaders and doctors opined that awareness levels regarding health and disease were generally poor.

**Detailed analysis of the identified problems:** The foremost objective of a community diagnosis program is to view health from a wider perspective. One of the methods to obtain a comprehensive picture is by developing a causal loop model. It is a model to understand the complex systemic nature of health and identify key variables affecting it.

At the end of data collection, a brainstorming session was conducted among the investigators to develop a causal loop diagram from data obtained during household visits, on-field observations and expert opinion from various stakeholders. Key variables were identified, relationship of one variable to others was established and in the event of conflicting views, a consensus was reached based on majority vote. The final diagram was developed using Vensim software (Figure 2).

![Causal loop diagram](image)

**Figure 2: Causal loop diagram**

**Actionable Recommendations:** The following recommendations were proposed:

1. Improving access to health care by converting the present rough terrain paths to motorable roads.

2. Provision of electricity at least in the form of public lighting source (like street lamps and high mast lights).

3. To address the problem of respiratory infections and TB, provision of LPG cylinders as a part of ongoing central government schemes is suggested.

Continued emphasis on education and initiation of sustainable health programs was highly recommended as a long term strategy. Over a period of time, this could translate into the creation of skilled labourers and widening the scope of employment opportunities. These recommendations, if implemented, could have a positive impact on the health and overall development of this marginalised community.

**Advocacy:** The report of the program was handed over to Member of Legislative Assembly (MLA) of the constituency to appraise the actionable changes who assured to look into the findings.
Conclusion

There is a constant tussle between the normative need from a health professional’s perspective and the felt needs of a marginalized community. Though medicine has seen rapid strides in terms technological advancements and treatment modalities, it has not translated into better health outcomes especially in disadvantaged populations. So, it can be argued that it is the non-medical factors like social and economic environment that increase the vulnerability to diseases. There is a poor realization on the part of health professionals to think beyond biomedial reasons to ensure optimum health.

Addressing health disparities requires an upstream approach. It is obvious that addressing poverty and other social determinants will ensure improvement in health outcomes. Unless these determinants are addressed, improving access and providing health care through isolated efforts will only partially alleviate but never substantially reduce the burden of diseases.

Thus, through community health diagnosis, we call for a change in approach to tackle health problems through the lens of social determinants.

Source of Funding: This community diagnosis program was conducted and funded as a part of tribal outreach initiative of Amrita Institute of Medical Sciences, Kochi, Kerala

Ethical Clearance: The program was approved by the management of Amrita Institute of Medical Sciences, Kochi, Kerala.

A Study on the Horrendous Industrial Mass Disaster at Union Carbide Plant of Bhopal in Light of Ethical Dimension

Shailendra Kumar1, Sanghamitra Choudhury2, Vineet Pandey3

1Assistant Professor, Department of Management, 2Assistant Professor, Department of Peace and Conflict, Central University of Sikkim, Gangtok, Sikkim; 3Associate Professor, NIMS Institute of Management, NIMS University Rajasthan, Jaipur India

ABSTRACT

The Bhopal Gas tragedy, considered as one of the most horrendous industrial mass disaster, is unparalleled in its magnitude and devastation in the history of mankind.1 The incident occurred on the night of 2-3 December 1984 when a highly toxic chemical named Methyl Isocyanate (MIC) leaked into the atmosphere from the plant of Union Carbide (India) Limited(UCIL). Methyl Isocyanate (MIC) usually written as CH3CNO is an extremely toxic, volatile and flammable gas whose density is more than the density of air and has no possible antidote.2 The US Defense Department also tested MIC as a warfare agent in 1944.3 Since the density of the gas is more than that of air, its leakage into the atmosphere led to the formation of toxic gas clouds, very close to the ground level which eventually spread into the entire city of Bhopal. Thousands of people lost their life. As per Times of India Report 16177 death claims were filed and 7000 death case compensation were awarded till November 27, 1994.4 The government of Madhya Pradesh confirmed 3787 deaths.5 In an affidavit filed in the Supreme Court by the Government of India on 26th October, 2006 the government stated that the gas leak led to 5,58,125 injuries.6

Keywords: Bhopal Gas Tragedy, Union Carbide India Ltd.(UCIL), Union Carbide Corporation

Union Carbide India Limited

The Union Carbide India Limited was a majority owned subsidiary of Union Carbide Corporation (UCC), USA. Union Carbide Corporation, USA was established in 1917 and soon rose to become one of the most influential and renowned chemical companies of United States . Union Carbide Corporation (UCC), USA established one of its subsidiary named, Union Carbide (India) Limited in India in 1934, with 50.9% holdings and the remaining 49.1 percent of shares were held by the Government of India through Unit Trust of India (UTI) and Life Insurance Corporation of India (LIC) and many private investors. However in Charanlal Sahu vs. Union of India7 case the Supreme Court of India held that Central Government of India did not hold any shares in UCIL because UTI and LIC are statutorily independent organizations. The shares of UCIL were listed at Calcutta Stock Exchange and the company’s annual sales were nearly $200 million.8 UCIL started its operation in India by making dry cell batteries under the trademark “Eveready.” This trademark “Eveready” was also used by Union Carbide Corporation (UCC) for its dry cell batteries in USA. The state government of Madhya Pradesh allotted land to the company in its capital city Bhopal, for a period of 99 years on a very favorable lease. The UCIL factory of Bhopal started the phase of its operation in 1968-69 and the project took approximately eight years to complete fully in 1980. UCIL made pesticides at its Bhopal since 1969 and obtained the license to produce upto 5,000 tons of “SEVIN”, a carbaryl pesticide produced by reacting Methylamine with Phosgene to form Methyl Isocyanate (MIC). The financials position of the company went down and it paid the compensation of $470 million in 1989 to settle the litigations against it. In 1994, Union Carbide Corporation sold entire stake in UCIL to Mcleod Russel India Limited, Calcutta which decided to rename UCIL as Eveready Industries India Limited (EIIL). In 1999, Dow Chemical announced the purchase of Union Carbide Corporation for $8.89 billion in stock and the deal was finally signed in 2001.9

DOI Number: 10.5958/0976-5506.2019.01251.8
UCIL Plant of Bhopal: Though the UCIL plant at Bhopal was established with great enthusiasm and fervor, but soon both UCC and UCIL realized that the plant is economically unviable because, the main chemical produced by the plant was “SEVIN” which is a carbaryl pesticide and this chemical became obsolete after the discovery and production of new generation “carbofuran pesticides” in US and Europe. The local Indian farmers were more inclined towards using local and organic products. Even though, the plant was in modest profit till 1981, yet it always operated below its capacity and started posting losses from 1982 onwards. By 1984 the plant was operating at only 25 percent of its capacity.

The continuous losses and low production volumes led to the massive reduction in the workforce and also employment of less skilled and low wages employees. For example; in the Methyl Isocyanate unit, the workforce was reduced from the recommended 3 supervisors and 12 workers on each shift to 1 supervisor and 6 workers in each shift.10

Earlier Gas Leaks Incidents Reported at the Plant: The safety and security of the Bhopal Chemical Plant had always been a matter of concern. There had been continuous accidents happening in the plant since its operation. In 1976 some local trade union groups complained about very high level of pollution within the plant premise.11,12 In 1981, a worker died when he removed his gas mask in panic and inhaled phosgene gas while repairing a leakage in the supply pipe. The January 1982 phosgene gas leak caused the hospitalization of 24 workers. None of them were instructed to wear protective mask for safety. The February 1982 MIC leak affected 18 workers. In August 1982 a chemical engineer suffered 30 percent burn when he accidently came into contact with liquid MIC. There were similar reported leaks in October 1982, 1983 and 1984.

The Major Gas Leak Incident and the Day when Tragedy Struck: UCIL Bhopal had three underground MIC storage tanks; E610, E611 and E619 with the storage capacity of 68,000 liters each. However, tank E619 was not in order. The last batch of producing SEVIN was under progress and MIC of 62 tons was produced by mixing Phosgene and Methylamine. 22 tons of MIC was put in tank E611 and remaining 40 tons were put in E610. The UCC safety regulation provided that no storage tank should be filled with more than 50 percent of its capacity and each tank should be pressurized with the inert nitrogen gas. This pressurization kept the impurities out of tank and also helped in pumping out MIC out of the tank.13 The plant operation remained shut for many days due to the curfew clamped down by the state government after the assassination of the then Indian PM Indira Gandhi. At the eve of December 2, 1984 the second shift supervisor ordered the workers to perform the periodic washing of pipes in the MIC storage area. The washing continued till 10:30-10:45 and it was at this time when the third shift started. Due to washing the water is said to have leaked into the dysfunctional E610 tank storing 40 tons of MIC. Around 1 pm the nearby residents felt the gas leak in the atmosphere but due to lack of any information and training in dealing with such type of emergency situation they became panicked and started fleeing. People who inhaled gas started complaining about burning sensation into their respiratory tract, breathlessness, vomiting, stomach pains and suffocation. Thousands humans and animals died and thousands were injured. The soil and air around the region was heavily and defoliation of the trees happened. Union Carbide Corporation (UCC) Chairman Warren Anderson travelled to India along with a team of experts but upon his arrival he was placed under house arrest and was asked to leave India within 24 hours.

Legal Proceedings: After the aftermath, the legal proceedings started both in India and US. The Government of India passed the “Bhopal Gas Leak Disaster Act” that entitled the government to represent all the Bhopal gas victims in cases running in India or abroad. This act was challenged in the Supreme Court, but in the Charanlal Sahu vs. Union of India case, the Supreme Court of India allowed the Government of India to represent the Bhopal Gas victims stating that the Bhopal gas victims could not be considered as any match to the MNCs and therefore they cannot look after their own interest effectively.14 In June 2010, seven former employees of UCIL namely: i. Keshub Mahindra, former non executive chairman of UCIL ii. Keshub Mahindra, former non-executive chairman of Union Carbide India Limited; V. P. Gokhale, managing director; Kishore Kamdar, vice-president; J. Mukund, works manager; S. P. Chowdhury, production manager; K. V. Shetty, plant superintendent; and S. I. Qureshi, production assistant, were awarded 2 year imprisonment and Rs.1,00,000 fine each for death due to negligence. All of them were soon released on bail. Warren M Anderson, the then CEO of UCC died a natural death at the age of 92 in Sept 2014.
In 1987 the U.S. Court of Appeals for the Second Circuit dismissed the Bhopal gas disaster litigation in the U.S.: “In short, the plant has been constructed and managed by Indians in India.” The Court found that “UCC’s participation was limited and its involvement in plant operations terminated long before the [1984] accident.”

With respect to alleged pollution at the Bhopal plant site, the Second Circuit Court concluded in its 2013 decision that individuals “living near the Bhopal plant may well have suffered terrible and lasting injuries from the wholly preventable disaster for which someone is responsible. After nine years of contentious litigation and discovery, however, all that the evidence in this case demonstrates that UCC is not that entity”16

**Ethical Dimensions: There are series of ethical lapses evident in this case, like:**

**(i) No Risk Assessment:** Lack of risk assessment was the root cause of this whole disaster. UCIL plant was located merely 4.8 km from the main city, and the government not only allowed the illegal settlements near the dangerous plant but also regularized those settlements to appease the voters keeping forthcoming assembly elections in mind. Even though, the master plan of the Bhopal city was formed in 1975 and it laid down provisions to establish the hazardous industry 15 km away from the city yet, the UCIL plant was not asked to relocate. The plant was also accorded with the status of general industry rather than hazardous industry in order to avoid its relocation.

**(ii) India’s Economic ambition and Red Tapism:** The mixed economy had provisions for the growth of both public and private sector industries. We see that both centre and state government were very eager to promote rapid industrialisation but with certain curbs and limits. Permit was required to be taken for every small little thing. UCIL was invited to establish a factory at Bhopal at a very favourable lease of 99 years but the company had to face lot of bureaucratic hurdles in running its operation. For example; UCIL plan of producing carbaryl pesticides using alpha-naphthol process was developed by its own local chemists in 1969. This was done because the government of India highly stressed upon local production and discouraged imports. UCILs process of producing carbaryl pesticides soon became an obsolete and costly affair which forced it to import alpha-naphthol from Union Carbide Corporation (UCC), US and after reviewing the production cost in 1981, UCC further suggested that UCIL should also import Methyl Isocynate (MIC) as well from it but, the import application was rejected by the Indian government which wanted the companies to focus on getting local production.

**(iii) Economic condition of the chemical plant:** The economic condition of the UCIL plant in Bhopal was not very sound. The company realized that the change in market conditions have made the plant economically unviable and accepted the recommendation of UCC to sell its plant. The process of producing carbaryl pesticides at UCIL plant Bhopal was very costly and time consuming and many of its units like alpha naphthol producing unit failed to work properly. Though the Bhopal plant was in moderate profit until 1981 yet it never failed to operate in its full capacity and by the fall of 1984 the plant was operating at about 25 percent of its capacity. The company resorted to cost cutting due to its deteriorating economic health and even compromised with safety while doing so. The safety standards of UCC recommended 3 supervisors and 12 workers in each shift for the MIC unit but due to cost cutting the number was reduced to 1 supervisor and 6 workers. The other sections of the plant were also affected by the cost cutting. The repairing and maintenance of the plant was also not done properly due to cost cutting and this is evident from the fact that many of the pipes used in the chemical process were corroded and not repaired.

**(iv) Lack of Skilled workforce:** The first batch of management and supervisory staff of UCIL plant Bhopal, received training at the Union Carbide’s West Virginia plant in US in 1982 but when the economic condition of the UCIL Bhopal plant deteriorated then most of these employees left their job for better prospects. These employees were replaced by less skilled workforce who was not very adept in their job. They even failed to read the safety manuals because they were written in English. Their casualness is also evident from
the fact that the washing of the plant was carried on despite knowing the fact that the pipes are corroded and the washing may lead to leakage. The supervisors didn’t take the initial gas leaking very seriously and even when a major gas leak was discovered around 11:45 pm night, then also, it was decided to fix the leakage only after the 12:15 am tea break. By that time the situation aggravated and went out of control.

(v) Violation of Safety Standards: The safety standards were badly compromised and grossly violated. It really surprises to see a chemical plant producing and storing extremely poisonous and harmful chemicals being run so casually, keeping all the safety measures aside. The safety standards were compromised at all the levels.

(vi) Poor Medical facilities: People were rushed to the city’s Hamidia Hospital but the health care facilities were not very good. There were only around 300 doctors and approximately 2000 beds available in the Bhopal city hospitals and many of the medical practitioners were not well aware about the treatment that is likely to be given in such types of incidents. Inquiries with UCIL medical officers also yielded very little relevant information. Furthermore, no antidotes were available to treat the victims which made the doctors even more helpless.

(vii) Legal Actions: The government and judiciary failed to provide timely justice to the victims of Bhopal Gas Tragedy. UCC proposed a settlement amount of $350 million which was rejected by the Indian government but on the intervention of Supreme Court of India the final settlement amount was fixed to $470 million. Madhya Pradesh Government allocated us $ 14 million for victim relief in July 1985 and started paying US $ 3.2 per month initially as widow pension which was later on increased to US $14 per month. The average sum paid out to the victims was US $ 980 for death and US $ 400 for personal injury. Only seven people, all Indians were convicted and that too only for a period of 2 years. They were soon granted bail and the case is still going on. The then CEO of the company Mr. Warren M Anderson died in US as a free man at the age of 92 in September 2014.

Conclusion and Suggestions: Bhopal Gas tragedy is an explicit example of extreme corporate greed and corruption. The victims feel betrayed by the bureaucratic, political and judicial stands taken in this case. Warren M Anderson was arrested but was allowed to leave India without facing any charges. Later on the effort to extradite him and face trial in India was seen as an eye wash and political drama by the victims. The judiciary failed to deliver timely justice and all the accused are moving free. Cases related to the incident are still pending in many lower courts and some people are still struggling to get relief funds.

A Review on Root Canal Irrigants

Alagarsamy Venkatesh¹, Dhakshinamoorthy Malarvizhi², Arunajatesan Subbiya³, Venkatachalam Prakash¹, Paramasivam Vivekanandhan¹, Sherin Banu⁴
¹Professor, ²Associate Professor, ³Professor and Head, ⁴Former Post Graduate Student, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College, Chennai

ABSTRACT

Three essential steps in root canal therapy are proper instrumentation, irrigation and obturation of the root canal. Elimination or significant reduction of irritants and prevention of recontamination of the root canal after treatment are essential elements for successful outcomes. The common belief that inadequate obturation is the major cause of endodontic failure has been proven to be fallacious as obturation reflects the adequacy of cleaning and shaping. The primary endodontic treatment goal must thus be to optimize root canal disinfection and to prevent reinfection.

Keywords: Root canal irrigants, endodontic irrigants, NaOCl, EDTA, MTAD, CHX

Introduction

Bacteria is been recognized as the primary etiologic factors in the development of pulp and periapical lesions. Chemomechanical debridement of pulpal tissue, dentin debris, and infective microorganisms ensures success of root canal therapy. Irrigants can enhance mechanical debridement through flushing out of debris, dissolving the organic tissue, and disinfecting the root canal system. Complex internal anatomy such as fins or other irregularities that might be missed by instrumentation can be treated by chemical debridement

Classification of commonly used irrigation solutions

I. Chlorine Releasing Agents
   1. Potassium hypochlorite
   2. Sodium hypochlorite

II. Oxidizing Agents
   1. Hydrogen peroxide
   2. Urea peroxide

III. Chelating Agents
   1. EDTA
   2. EDTAC

IV. Organic Acids
   1. Citric acid
   2. Maleic acid

V. Herbal Alternatives–Green tea, Triphala

Sodium hypochlorite–NaOCl

History: Introduced by Henry Drysdale Dakin and Alexis Carrel

Antimicrobial Property–Concentration and Time:
The most effective irrigation regimen is reported to be 5.25% at 40 min; irrigation with 1.3% and 2.5% NaOCl for this same time interval is ineffective in removing E faecalis from infected dentin cylinders. NaOCl when used is moderately effective against bacteria but less effective against endotoxins in root canal infection.

Effect on Biofilm
- Complete dissolution of cells with absence of visual evidence
- Bacterial cells are disrupted from the biofilm and are nonviable.
- Bacterial cells are disrupted from the biofilm but are viable
Effect of NaOCl in Tissue Dissolving Capacity: Its effect depends on concentration, temperature and time of application.

Biofilm: Biofilm interferes with efficacy of NaOCl when they grow on predentin.

Effect on Dentin: The effect of the NaOCl on dentin is limited when used as the first irrigant because of the hydroxyapatite coating on collagen which protects the collagen fibers. When decalcifying solution is used prior, the hydroxyapatite is quickly dissolved exposing the underlying collagen fibers and NaOCl can directly attack the proteins and cause considerable destruction of the collagen of surface dentin.

Ultrasonic: Passive ultrasonic irrigation with a NiTi tip produced superior dissolving ability when compared to sonic irrigant activation.

Influence of NaOCl on Bond Strength: NaOCl causes decreased bond strength between dentin and resin cements and may require a reversal agent such as ascorbic acid or sodium ascorbate, because of its ability to affect the polymerization of the resin sealer.

Final Rinse: Not recommended as it causes dentinal erosion.

Interaction of NaOCl and Chlorhexidine: Kuruvilla et al. suggested that 2.5% NaOCl and 0.2% chlorhexidine (CHX) used in combination had greater antimicrobial effect than used separately. The reaction between NaOCl and CHX produces parachloroanaline (PCA) of molecular formula NaC6H4Cl, which has carcinogenic effect. This PCA occludes the dentinal tubules and affects the seal of the root canal.

EDTA–Ethylene DiamineTetraacetic Acid: EDTA was introduced into endodontics as an aid in preparation of narrow and calcified canals by Nygaard-Ostby in 1957 who recommended use of 15% EDTA at PH 7.3.

Time Duration for Smear Layer Removal: According to Saito et al. the 30-sec or 15-sec groups had lesser smear layer removal than in the 1-min EDTA irrigation group.

Effect on Tooth Surface Strain: When 5% NaOCl is used alone or in combination with 17% EDTA (used in 30-min cycles) it causes increase in tooth surface strain. This alternating use of NaOCl and EDTA causes greater changes in tooth surface strain than when NaOCl used alone.

EDTA with Ultrasonics: A 1-min application of 17% EDTA combined with ultrasonics is efficient for smear layer and debris removal in the apical part than the coronal and middle third of the root canal.

Chlorhexidine: Chlorhexidine has excellent antimicrobial activity but it completely lacks tissue dissolving capability.

Antibacterial Activity: Basson and Tait compared the ex vivo effectiveness of calcium hydroxide, iodine potassium iodide (IKI), and CHX solution in disinfecting root canal systems that were infected with Actinomyces israelii and concluded that only CHX was able to eliminate A. israelii.

Effect of CHX on Dentin: CHX binds the anionic molecules such as phosphate present in the structure of hydroxyapatite, leading to release of small amounts of calcium from the root canal dentin.

Interaction of CHX and EDTA: When CHX and EDTA interact, a white precipitate is formed by electrostatic neutralization of cationic CHX by anionic EDTA.

CHX and Biofilm: Spratt et al. have evaluated the various irrigants in different concentrations of 2.25% NaOCl, 0.2% CHX, 10% povidone iodine against monoculture biofilms of P intermedia, P miro, S intermedius, F nucleatum, and E faecalis. The results indicated that NaOCl was the most effective antimicrobial agent, followed by the iodine solution. Clegg et al. evaluated the ex vivo effectiveness against apical dentine biofilms of three concentrations of NaOCl (6%, 3%, and 1%), 2% CHX, and Mixture of Tetracycline acid and detergents (MTAD). The results concluded that 6% NaOCl and 3% NaOCl were capable of disrupting and removing the biofilm, the 1% NaOCl and the MTAD were capable of disrupting the biofilm. Its efficacy in eliminating bacteria was not known, and the 2% CHX was not capable of disrupting the biofilm.

Substantivity: White et al. reported that CHX has a substantivity of 72 hours. Khademi et al. found that induction of 5-min application of 2% CHX solution prolonged substantivity for up to 4 weeks. Rosenthal et al. reported that when irrigated for 10 min CHX was antimicrobiologically effective for up to 12 weeks.

CHX and Dentine Bonding (Anticollagenolytic Activity): Human dentin contains various collagenases
like (MMP-8), gelatinases MMP-2 and MMP-9, and enamelysin MMP-20. Dentine collagenolytic and gelatinolytic activities can be suppressed by protease inhibitors. It indicates that MMP inhibition could be beneficial in the preservation of hybrid layers. On the whole, because of its broad-spectrum MMP-inhibitory effect, CHX can significantly improve the resin–dentine bonding and enhance stability.[22]

Cytotoxicity of CHX: CHX when tested for cytotoxicity on canine embryonic fibroblast and Staphylococcus aureus showed that it was toxic in bactericidal concentrations whereas non-cytotoxic in concentrations which dint show antimicrobial activity. Ribeiro et al. evaluated the genotoxic effects (potential damage to DNA) of formocresol, paramonochlorophenol, calcium hydroxide, and CHX against Chinese hamster ovary cells. Results showed that none of the abovementioned agents contributed to DNA damage. Thus, in the clinically used concentrations, CHX is biocompatible.[23]

Allergic Reactions to CHX: Contact dermatitis is a common adverse reaction.[24] CHX may have a number of rare side effects, such as desquamative gingivitis, orangish discoloration of the teeth and tongue, or dysgeusia.

MTAD: Torabinejad et al. developed a newer irrigant, a mixture of 3% doxycycline, 4.25% citric acid, and detergent (Tween-80).[25]

Smear Layer Removal and Its Antibacterial Activity: MTAD is composed of three constituents that act synergistically against bacteria. The bacteriostatic effect of MTAD was inferior to 1%-6% NaOCl against E faecalis biofilms. The buffering effect of dentin and the serum albumin present in the root canal inhibits the antibacterial activity of MTAD. MTAD has been reported to be effective in removing smear layer. In the MTAD preparation, the citric acid removes the smear layer thus enabling doxycycline to enter the dentinal tubules and exert an antibacterial effect.

Bond Strength: A final rinse with MTAD might have a negative effect on the bonding ability of both resin-based and calcium hydroxide–based sealers due to the precipitate formation.[26]

Citric Acid and EDTA-T: Citric acid in concentration of 10% when used as final irrigation has shown good results in smear layer removal. In vitro studies have shown their cytotoxicity, and 10% citric acid has proven to be more biocompatible than 17% EDTA-T and 17% EDTA[27].

Scelza et al concluded that 10% citric acid showed less aggressive in inflammatory response. 25% citric acid was ineffective in effectively removing biofilms of E faecalis after 1, 5, and 10 min of exposure[28].

Maleic Acid: Maleic acid is used as an acid conditioner in adhesive dentistry and it is the milder form of organic acid. Ballal et al. reported that 7% maleic acid when used as final irrigant for 60 seconds was effective than 17% EDTA in the removal of smear layer from the apical third of the root canal system.[29]

HEBP: HEBP (1-hydroxyethylidene-1,1-bisphosphonate), also known as etidronic acid or etidronate, has been proposed as a potential alternative to EDTA or citric acid because this agent shows no short-term reactivity with NaOCl. HEBP is not lethal and is used to treat bone diseases. Both 9% HEBP and 18% HEBP promoted demineralization kinetics and were significantly slower than those of 17% EDTA. De-Deus et al. reported that the soft chelating irrigation protocol (18% HEBP) optimized to improve the bonding quality (3.1–6.1 MPa) of Resilon/Epiphany[30]

Chlorine Dioxide: Chlorine dioxide (ClO2) the familiar household bleach is chemically similar to chlorine or hypochlorite. An In-vitro study comparing the organic tissue dissolution capacity of NaOCl and ClO2 concluded that both are equally efficient in dissolving organic tissue[31]. ClO2 produces little or no trihalomethanes[32] which is a potential animal carcinogen and a suspected human carcinogen[33, 34]. Therefore ClO2 can be a better dental irrigant than NaOCl.

Herbal Irrigants

Triphala: Triphala consists of dried and powdered fruits of three medicinal plants Terminaliabellerica, Terminaliachebula, and Emblicaofficinalis. Triphala achieved 100% killing of E faecalis at 6 min. This is due to formulation of three different medicinal plants in equal proportions; in such cases different compounds may help enhance the potency of the active compounds, producing a synergistic effect. Triphala bears fruits rich in citric acid, which may aid in removal of the smear layer. The major advantages of using herbal extracts as irrigants are easy availability, cost-effectiveness, longer shelf life, low toxicity, and lack of microbial resistance.[35]
**Green Tea:** Green tea, the traditional drink of Japan and China is prepared from the young shoots of the tea plant *Camellia sinensis* and is rich in polyphenols and antioxidants. Green tea polyphenols showed statistically significant antibacterial activity against *E. faecalis* biofilm when formed on tooth substrate. To achieve 100% killing of *E. faecalis* it takes approximately 6 mins.\(^{[36]}\)

**Morinda citrifolia:** *Morinda citrifolia* (MCJ) has a wide range of therapeutic effects, including antibacterial, antiviral, antifungal, antitumor, antihelmintic, analgesic, hypotensive, anti-inflammatory, and immune-enhancing effects.\(^{[37]}\) MCJ is rich in the antibacterial compounds L-asperuloside and alizarin. Murray et al. proved that when morinda is used as an intracanal irrigant to remove the smear layer, the efficacy of 6% MJC was similar to that of 6% NaOCl in conjunction with EDTA\(^{[38]}\). Therefore its use as an irrigant might be advantageous being a biocompatible antioxidant and posses no potential risk as might occur through NaOCl accidents.

**Conclusion**

Any endodontic situation warrants a correct combination of irrigants. Choosing the right combination is essential to prevent misuse or overuse of these chemical adjuncts.

Future of irrigants lie in a single irrigant possessing the tissue dissolving capacity, smear layer removal property, along with antibacterial efficacy and also being biocompatible.

Correlative Study Prolactin Level and Hypothyroidism in Both Primary and Secondary Infertility in Females of Uttar Pradesh

Ambri Agarwal  
Assistant Professor  
Department of Obstetrics and Gynecology  
G.S. Medical College, NH24, Near Petrol Pump, Peeplabandapur, Pilkhuwa, (UP)

ABSTRACT

In the present study, 40 females of primary infertility and 40 females of secondary infertility aged between 18-40 years were studied, primary infertility females grouped as group - A and secondary infertility females grouped as group - B. In group A, the duration of marriage of 21 (52.5%) was 1 to 5 years, 12 (30%) had 6 to 10 years, 7(17.5%) had more than 10 years. In group B, 11(27.5%) had 1-5 years of marriage duration, 16(40%) had 6-10 years and 13(32.5%) had more than 10 years of marriage period. The menses history in group A was: 13(32.5%) had regular menses, 19(47.5%) had oligomenorrhea, 5(12.5%) had amenorrhea and 3(7.5%) had menorrhagia. In group B, 12(30%) had regular menses, 17(45.5%) had oligomenorrhea, 9(22.5%) had amenorrhea and 2(5%) had menorrhagia. In group A, serum prolactin level in 17(42.5%) females was 0-20mg/ml, 23(57.5%) was 21-100mg/ml. In group B, 26(65%) had 21-100mg/ml and 1(2.5%) had >100 mg/ml. In group A, TSH level in 3(7.5%) was <0.4, 27(67.5%) females had 0.4-4.7, 10(25%) females had >4.7 µIU/ml. In group B 2(5%) females had <0.4 µIU/m, 33(82.5%) females had 0.4-4.7 µIU/m, 5(12.5%) females had >4.7 µIU/ml. This correlative study of S. prolactin and TSH hormones will be quite useful to obstetrics and gynecologist, endocrinologist, to rule out proper cause and treat the infertility efficiently, because due to increased rate of infertility majority of couples are finding surrogate mothers which are quite expensive and may lead to legal complications.

Keywords: S. Prolactin = Serum Prolactin, TSH= Thyroid stimulating Hormone

Introduction

Infertility is defined as the failure of a couple to achieve conception (regardless of cause) after one year of unprotected and adequately timed intercourse (1). It could be primary i.e. a couple has never conceived despite cohabitation and exposure to sexual activity over a period of years, secondary infertility is when couples have achieved a pregnancy, previously but regular unprotected sexual intercourse has not resulted in second pregnancy (2). Human infertility is a complex problem, which has numerous consequences depending on the society and cultural background, gender, lifestyle, sexual history of the people it affects. Infertility is a global public health concern. This is partly due to complexity in aetiology as well as difficulty in preventing, diagnosing and treating it.

Hormonal disorder of female’s reproductive system is comprised of a number of problems resulting from aberrant dysfunction of hypothalamic-pituitary-ovarian axis. These relatively common disorders often lead to infertility (3). Measurement of prolactin and thyroid hormones especially TSH has been considered an important component of infertility work up in females.(4)

Hence attempt was made to study these both hormonal assays and correlate their profile in both primary and secondary infertile females.

Material and Method

80 infertility woman aged between 18 to 40 years who were regularly visiting Obstetrics and Gynecology...
department, G.S. Medical College, NH24, near petrol pump, Peepulabandapur, Pilkhuwa-245304(UP) were selected for study. Among 80, 40 were primary infertility and 40 were secondary infertility hence primary infertility females were, grouped as A and secondary infertile were grouped as B group.

Complete haemogram, ESR, USG perineum and abdomen, chest x-ray, thyroid function test, serum prolaction test, Histosalpinography and diagnostic laparoscopy was carried out whenever indicated.

Blood examination was done for hormone probably on 3rd day of menstrual cycle. TSH and prolactin assay levels were measured using Beckman coulter Access-II Immune assay analyzers.

Male factor infertility - congenital anomaly of urogenital tract, diabetes mellitus patients with cardiac and neurological disease were excluded from the study.

The duration of study is about two years (from September 2016 to December 2018)

For the patients of group A and group B, duration of marriage, menses history, hormonal level assay were classified in percentage and studied.

Observation and Results

Normal TSH is 0.5-4.7 µIU/m
Group-A (Primary infertility)- 3(7.5%) had < 0.4 μIU/m, 27(67.5%) females had 0.4 to 4.7 μIU/m, 10(25%) had >4.7 μIU/m

Group-B (secondary infertility)- 2(5%) had < 0.4 μIU/m, 33(82.5%) females had 0.4 to 4.7 μIU/m, 5(12.5%) females > 4.7 μIU/m.

Discussion

In the correlative study of prolactin level and hypothyroidism in both primary and secondary infertility females of Uttar Pradesh, in group A, the duration of marriage of 21 (52.5%) was 1 to 5 years, 12 (30%) had 6 to 10 years, 7(17.5%) had more than 10 years. In group B, 11(27.5%) had 1-5 years of marriage duration, 16(40%) had 6-10 years and 13(32.5%) had more than 10 years of marriage period (Table-1). The menses history in group A was: 13(32.5%) had regular menses, 19(47.5%) had oligomenorrhea, 5(12.5%) had amenorrhea and 3(7.5%) had menorrhagia. In group B, 12(30%) had regular menses, 17(45.5%) had oligomenorrhea, 9(21.5%) had oligomenorrhea, 9(22.5%) had amenorrhea and 2(5%) had menorrhagia (Table-2). In group A, serum prolactin level in 17(42.5%) females was 0-20mg/ml, 23(57.5%) was 21-100mg/ml. In group B, 26(65%) had 21-100mg/ml and 1(2.5%) had >100 mg/ml (Table-3). In group A, TSH level in 3(7.5%) was <0.4, 27(67.5%) females had 0.4-4.7, 10(25%) females had >4.7 μIU/ml. In group B 2(5%) females had <0.4 μIU/m, 33(82.5%) females had -0.4-4.7 μIU/m, 5(12.5%) females had >4.7 μIU/ml (Table-4). These findings were more or less in agreement with previous studies (5)(6)(7).

Hyper prolactinemia resulting from long standing primary, hypothyroidism has been implicated in ovulatory dysfunction ranging from inadequate corpus luteal progesterone secretion when mildly elevated to oligomenorrhea or amenorrhea when circulating production levels are high Amenorrhea occurs in hypothyroidism due to hyper prolactinemia resulting from a defect in the positive feedback of estrogen on LH and because of LH and FSH suppression (9).

However many infertile females present with normal or regular menses despite of raised serum prolactin level pituitary hormone such as TSH, prolactin or growth hormone may act synergistically with FSH and LH to enhance the entry of non-growing follicle into the growth phase (9). Even in the absence of hyper prolactinemia, hypothyroidism itself may contribute to infertility since thyroid hormones may be necessary for the maximum production of both estradiol and progesterone (10). In the areas with endemic goiter, the major contributor of thyroid dysfunction is iodine deficiency. Infertility associated with thyroid dysfunction in these areas is not uncommon (11). Treating such thyroid dysfunction with low dosage of thyroxin slightly increased the FT4 levels leading to inhibition of TSH secretion within normal range resulting in subjecting improvement in health status, normalization menses, abnormalities and restoration of normal fertility.

Hyper prolactin adversely affects the fertility potential by impairing pulsative secretion of GnRH and hence interfering with ovulation(12). This disorder has been implicated in menstrual and ovulatory dysfunctions like amenorrhea, oligomenorrhea, anovulation, in adequate corpus luteal phase and galactorrhea.

Summary and Conclusion

The present correlative study of serum prolactin level and hypothyroidism in both primary and secondary infertility of females in Uttar Pradesh will be quite useful for obstetrics and gynecologist endocrinologist physician to treat such infertility. Hence assessment of serum TSH and prolactin levels must be mandatory in the treatment of infertile women especially those presenting with menstrual irregularity. But this study further warrants, genetics nutritional, neurological, endocrinological study because exact quantum of hormonal secretion, mechanism of stimulating factors which exactly increase or decrease the hormonal secretion is still unclear.

Comparative Evaluation of Efficacy of Electronic Apex Locators in Determining the Working Length of the Canal Which is Used During a Routine Root Canal Treatment-In Vivo Study

Annapoorna Kamath1, Aravind R Kudva2, Shravan Kini3
1Assistant Professor, Department of Conservative Dentistry and Endodontics, Srinivas Institute of Dental Science, Mangaluru, Karnataka; 2Reader and Guide, 3Reader, Department of Conservative Dentistry and Endodontics, Yenepoya Dental College, Mangaluru, Karnataka

ABSTRACT

Aim: The aim of this study was to evaluate the clinical efficacy of four electronic apex locators i.e Dentaport ZX, Raypex 6, Propex pixi and I-Root in comparison with the standard radiographic technique.

Methodology: A total of 20 patients diagnosed with apical periodontitis with no periapical lesions scheduled for root canal therapy were selected for the study and the working length of palatal canal were determined using the four apex locators and standard radiographic technique.

Results: Statistical analysis was done using PRISM 5.0 Software. Intra-group comparison was done using repeated measures one way ANOVA with post-hoc tukey test and inter group comparision was done using Independent sample t test. No significant differences were detected between the apex locators (P=0.531).

Conclusions: The result in this study showed no significant difference among the groups, indicating they were as good as the radiographic method.

Keywords: Apical constriction, Apex locator, working length, radiograph, radiographic apex.

Introduction

The accuracy and predictablility of working length assessment has been enhanced since the evolution of electronic apex locators. The development of the electronic apex locator has helped make the assessment of working length more accurate and predictable.[1] Although radiographs are a critical and an integral part of endodontic therapy (Vertucci 2005) there is an ongoing need to reduce exposure to ionizing radiation whenever possible.[2] The significance of the apical constriction in the root canal treatment is well recognized. It is generally accepted that the preparation and obturation should be at or short of the apical constriction.[3] A new equipment called Apex locator was introduced by Sunada. The main benefit of apex locators are that these analyse the working length to apical foramen and not the radiographic apex. They are easy and fast to operate, and have a good accuracy. Radiation to the patient can also be reduced.[4] Dentaport ZX (J. Morita Corporation, Tokyo, Japan) is the latest version of the Root ZX (third generation), one of the most evaluated EALs that is often used as the ‘gold standard’ to which other EALs are compared.[5] Propex Pixi™(dentsply) and I-Root (E-Magic finder series) (s–denti seoul korea) are two fifth generation apex locators. The consistency of a device describes the regularity of its function. A measuring device that is able to give a reading each time used is considered to function consistently regardless of the quality of the performance.[6] The purpose of this study is therefore to compare the efficacy of above mentioned electronic apex locators in determining the working length of the root canal during the routine endodontic therapy along with radiographic measurement.

Methodology

A total of 20 patients diagnosed with apical periodontitis with no periapical lesions scheduled for root canal therapy were selected for the study. Intact maxillary first molars with carious lesions involving pulp and without any metallic restorations were included. The patients were informed about routine endodontic procedures and an informed written consent in compliance with ethical principles was obtained from each patient before the treatment was initiated. Patients with cardiac pacemakers, teeth with no apical patency and with the radiographic signs of resorption were excluded from the study.

Local anesthesia was administered and isolation with rubber dam was done, followed by caries removal. Standard access cavity preparation was done using a high speed diamond round bur (Dentsply Maillefer) and a straight line access was done with Endo Z bur. The palatal canal was explored using a no.10# k file followed by coronal enlargement using Gates Glidden drills (#1, #2, #3). The pulp tissue was then extirpated with #15 - #25 broaches and the canals were thoroughly irrigated with normal saline and 5.25% sodium hypochlorite solution. The working length in palatal canal was estimated using 5 different methods. Which were further divided into following groups,

- Group I (control) – Determination of working length using radiovisuography (rvg)
- Group II- Determination of working length using Dentaport ZX
- Group III- Determination of working length using Raypex 6
- Group IV- Determination of working length using Propex pixi
- Group V- Determination of working length using I-root

Recording of working length using RVG, Dentaport ZX, Raypex 6 , Propex pixi and I-root Apex locators

**Working length using Dentaport ZX:** The working length was recorded using #15, #20 or # 25 file depending on the canal size. The contrary electrode (the lip clip) was placed into the corner of the mouth then the file holder was attached onto the shaft of the hand file and then the Apex locator Dentaport ZX was switched on. The file was then progressed until “00” appears on the screen as per manufacturer’s instructions indicating at the apex. The silicone stop on the file was set to the reference point. The distance from the file tip to the silicone stop was then measured and similar procedure was repeated for Raypex 6, Propex pixi and I-root. The readings were measured as the file progressed to “00” on the screen.

**Working length measurement using Raypex 6:** The similar procedure was done as done for Dentaport except the recording of working length measurement technique in case of raypex was according to the the colour where blue indicated approaching the apex where as green to yellow section showing projection of apical constriction to apical foramen region relevant section to determine the working length and red beyond the apex. Also beeps sound when approaching the apex.

**Working length measurement using Propex pixi:** Here as the file is inserted the display shows a reading of 2.0 with blue colour and also a beep sound indicating the file is 2mm from the apex,so as the file approaches apical position i.e 0.0 the colour changes to yellow and also the beep sound increases indicating the apex. Thus estimating the working length.

**Working length measurement using I-Root:** The measurement was done by turning on the device and placing the lip clip in the oral cavity following placement of the file holder on to the file. The file is slowly inserted in the canal at this point the device starts to beep and as the file reaches around 0.5mm from the apex the intensity of the beep sound increases and also “APEX” is displayed on the device.

**RESULTS**

Statistical Analysis was done using PRISM 5.0 Software. Intra-group comparison was done using repeated measures one way ANOVA with post -hockey test and inter group comparision was done using Independent sample t test. When compared with Group I, Group V showed higher mean difference followed by Group III ,Group IV and Group II. The result in this
study showed no significant difference among the groups, indicating they were as good as the radiographic method.

**Discussion**

The present in vivo study was done to evaluate the efficacy of four electronic apex locators when compared with the radiographic working length measurement.

Nguyen et al in one of his study concluded that the Root ZX located the apical constriction even when the anatomic constriction was eliminated stating, the file size did not influence the accuracy of EALS.\(^7\) Whereas Herrera et al pointed out that the file size should be as close as possible to the apical diameter for the accuracy of the results.\(^8\) Thus Standardization of working length measurement was done by using the same file type and size, irrigant concentration and reference point to have comparable conditions.

Sodium hypochlorite was used as an irrigant for efficient cleaning of the canal before estimating the working length. A study reported that the presence of sodium hypochlorite did not influence the accuracy of EALS.\(^9\)

Intraoral Digital Radiography was incorporated in the study. It has been reported that there is 60% reduction of ionizing radiation in comparison with conventional radiography\(^10\) However, the working length measurement performed radiographically presents several limitations, namely radiation exposure, it is also time consuming and the image formed will be a two dimensional which is often overlapped with anatomic structures\(^11\) prompting a dentist to embrace electronic apex locator over radiography.

The EALS used in the present study had no significant difference when compared with the radiographic measurements. Dentaport ZX is a third generation EAL which is a frequency based EAL Which measures the impedance values in 2 frequencies 8 and 0.4 kHz, and hence calculates the quotient by ratio method. The latest version of root zx is Dentaport ZX, \(^12\) considering the total number of measurements obtained, Root ZX revealed more precise measurements as confirmed by a lower mean difference when compared with the value obtained through radiographic evaluation.

Raypex 6 is a fourth generation EAL which uses two separate frequencies. A significant disadvantage of the fourth generation apex locators is that they need to perform in relatively dry or partially dried canals. \(^13\)

In this study there was a mean difference of 0.55 when compared with radiographic method and also the reason may have been the presence of irrigants during the measurement which hindered the results.

The study also included, two Fifth generation apex locators which worked on dual frequency type and it is considered best in any root canal condition. In addition to calculating the root mean square (RMS) values of the electric signals. The RMS represents the energy of the electric signals, and therefore it is claimed to be less affected by electrical noises affecting other physical parameters.\(^14\) The Propex Pixi is a new EAL, and not many literatures are available to compare its working length accuracy with the present study. The results of the present study did demonstrate that it has a similar accuracy to Dentaport ZX. Where as I – root showed the highest difference when compared to all the methods.

There is no study in literature comparing the reproducibility of all the 4 groups of EALs used in this study, whilst Wrbas et al. 2007 compared two apex locators root zx and raypex 5 and concluded there was no significant difference.\(^15\) Similarly somma et al 2012 compared three EAL.\(^16\)

**Conclusion**

Under clinical conditions the tested Electronic apex locators had no significant differences statistically.

Within the limitations of this study, it is suggested that EALS were found to be depicting similar results as did the radiographic methods. However role of radiographs cannot be completely eliminated and has been advised to use this devices in conjunction with radiographs.

A Cross Sectional Study to Assess Sociodemographic Profile and Sanitation Practices in a Rural Village in Western Maharashtra

Ashturkar MD1, Majumdar R2, Dandekar A3
1Associate Professor, 2Professor, 3Tutor, Dept of Community Medicine, MIMER Medical College, Talegaon (D), Pune, Maharashtra

ABSTRACT

Introduction: Access to water supply and sanitation is a fundamental need and a human right. The effects of poor sanitation seep into every aspect of life including health, nutrition, development, economy, dignity and empowerment. So, the present study was carried out to assess sociodemographic profile and sanitation practices in rural area of Maharashtra.

Objectives: 1) To study sociodemographic profile of families in the village population 2) To assess sanitation practices among the families in the village population.

Material and Method: A Cross-sectional study was conducted in a village in western Maharashtra including household as Unit of study. Total 201 households were included in the study. Pre- tested semi-structured questionnaire was used for collection of data. The questionnaire consists of socio-demographic profile, water and sanitation practices in households. The data collection was done by interview and observation method.

Results: Data of 192 households was analysed with Microsoft Excel and Epi-Info Version 7 Software. Average family size was 5.4, total population was 1044 out of which 567 (54.31%) were males and 477 (45.68%) were females. There were 52.60% nuclear families and 47.4% joint families. Overcrowding was present in 32.29% of households. There were 146 (76%) households had tap water from Grampanchayat, 22 (11.45%) had dual water supply i.e. from tap water and well. 48 (25%) of households were carrying refuse disposal by collection van of Grampanchayat while 144 (75%) of households were doing refuse disposal by throwing indiscriminately. There were 184 (95.83%) of households had latrine facility among them, 146 (79.34%) were private while 38 (20.65%) were public latrines.

Conclusion: As the village is located near industrial area, better socio-economic development is seen in the area. There were 95 % households with either private or public toilets but still practices of open – air defecation is persistent in the village.

Keywords: Open–air Defecation, Sanitation, Household

Introduction

Environment is a basic need for all living beings. Protection of environment is vital for existence of life on the earth1. Access to water supply and sanitation is a fundamental need and a human right. It is vital for the dignity and health of all people 2. Sanitation includes, Safe disposal of human and animal excreta, safe storage and handling of drinking water, personal hygiene, safe disposal of waste water, safe disposal of solid waste, food hygiene.
Poor sanitation leads to various communicable diseases, high infant mortality, high under-five mortality rate and reduced resistance and immunity among children. The effects of poor sanitation seep into every aspect of life including health, nutrition, development, economy, dignity and empowerment.

A study by the World Bank says that absence of toilets and conventional sanitation cost India 6.4% of its GDP in 2006. The economic impact of poor sanitation for India is at least USD 38.5 billion every year under Health, Education, Access time and tourism.

The Prime Minister of India launched the Swachh Bharat Mission on 2nd October, 2014 to achieve Universal Sanitation coverage which includes Solid and Liquid Waste Management activities and making society Open Defecation Free (ODF), clean and sanitised. The practices of open-air defecation, improper solid and liquid waste disposal are persistent in rural areas.

So, the present study was conducted to assess sociodemographic profile and sanitation practices in rural area of Maharashtra.

Objectives

1. To study sociodemographic profile of families in the village population
2. To assess sanitation practices among the families in the village population

Material and Method

The present study was carried in the Urse Village, in Taluka Maval, District Pune. This village is near National Highway Four, Bangalore Mumbai express highway and 8 kilometres away from Talegaon (D), Pune.

This was a cross sectional study to find out sociodemographic profile and sanitation practices among study population.

Household as unit was selected as sample for the study. Families residing Urse village for more than 6 months were included in the study. Families who were residing in the village for less than six months were excluded from the study.

As per Census 2011 data, there were total 805 households in the village out of which 25% (201) households were selected by simple random sampling. Pre-tested semi-structured questionnaire was used for collection of data. The questionnaire consists of sociodemographic profile, water and sanitation practices in households. The data collection was done by interview and observation method. The interview was conducted for the person who was present at the time of interview in the household. Respondents were housewives in the reproductive age group. Interviewer introduced himself/herself to the respondent and explained the purpose of study. Informed written consent was taken from the respondent. Institutional Ethical Committee approval was taken for conduction of the study.

Results

The data collection was done for 201 households. For the purpose of analysis, total 192 households were included in the study. Nine were excluded from the analysis due to incomplete information. The analysis was done in Microsoft Excel and Epi-Info Version 7 Software.

Average family size was 5.4, total population was 1044 out of which 567 (54.31%) were males and 477 (45.68%) were females. The Sex ratio i.e. number of females per thousand males was found to be 841 per 1000 males.

There were 67.7% households living in Pakka house followed by 18% in Kaccha-Pakka house and 14% were living in Kaccha house. There were 52.60% nuclear families and 47.4% joint families. Overcrowding was present in 32.29% of households. As per Modified BG Prasad Socio-economic classification, 74% were in Class I and II, 19.27% in Class III followed by 6.6% in Class IV and V Socio-economic status. There were 52.6% were nuclear families and 47.4% were joint families.

In the housing condition, lighting and ventilation were adequate in 114 (59.37%) and 101 (52.6%) respectively. There were 107 (55.72%) mosquito breeding places and 81 (42.18%) rodents present in the households. Cattles in vicinity of households were 31.77 percent.

There were 152 (79.16%) households with separate kitchen with kitchen platform out of which 115 (75.65%) were having smoke outlet. Fuel for cooking was LPG among 110 (57.3%) households and 20 (10.4%) were using Chulha for cooking and 62 (32.3%) were using both LPG and Chulha for cooking.
There were 146 (76%) households had tap water from Grampanchayat, 22 (11.45%) had dual water supply i.e., from tap water and well and 24 (12.49%) households had water supply from well water. Almost in all households, drinking water was stored in clean containers with covering.

It was observed that 48 (25%) of households were carrying refuse disposal by collection van of Grampanchayat while 144 (75%) of households were doing refuse disposal by throwing indiscriminately. There were 184 (95.83%) of households had latrine facility among them, 146 (79.34%) were private while 38 (20.65%) were public latrines. Out of these 71 (38.58%) had continuous water supply in latrine.

Table 1: Relation of presence of latrine in household and use of latrine

</tr>
</tbody>
</table>

Chi square value with Yates correction = 27.7776
p value = 0.0000014
P<0.05

This table shows the relation between presence of latrine and use of latrine. The findings were statistically significant with chi square test with p value <0.05. This means that, people from households were not using latrines inspite of presence of latrine. The practice of open-air defecation is still practiced in rural area.

Discussion

As per census data 2011', for Urse village, total households were 805 with population 3635 of which 1964 (54%) were males and 1671 (46%) were females. In the present study, 192 households were included with 54.3% were males and 45.68% were females. The findings are consistent with the distribution of population.

Sex ratio for the sample population was observed to be 841 per 1000 males comparatively less than Census data 2011, it was 892 per 1000 males. The reason may be composition of population studied.

There were 67.7% households living in Pakka house followed by 18% in Kaccha- Pakka house and 14% were living in Kaccha house. There were 52.60% nuclear families and 47.4% joint families. The findings are coherent with study conducted by Swaroop (N) et al² which shows 50% were nuclear families. The family structure of joint families is persistent in rural areas.

As per Modified BG Prasad Socio-economic classification, 74% were in class I and II, 19.27% in Class III followed by 6.6% in Class IV and V Socioeconomic status. The observations are consistent with Swaroop N Study ². The reason of higher socioeconomic status in the study population may be village is located near express highway and industrial area, more job opportunities and agricultural land.

In the present study, 76% of households had tap water supply and 11.45% had dual tap water and well water supply. As per NFHS4 survey for Maharashtra (Rural) area ⁸, drinking water facility was 85.6% with well water and tap water. The findings are consistent with Study carried out by Ravi Pachori ⁹. The biggest change has been increase in piped water supply over a period of time and reliance on surface water is reduced in villages. In the study conducted by Anjana Kuberan ⁴, 92% households were with piped water supply.

In the present study, 79.34% were with private and 20.65% were with public toilets. Total 184 (95.83%) sanitary toilets were present among the study population out of which 38.58% toilets were having continuous water supply in the toilets. As per NFHS 4 survey 44.2% sanitation facility available in rural Maharashtra. Study carried out by Ravi Pachori shows 72% were private and 4.6% were public toilets present. Study done by Anjana, 25% households were not having access to toilets. Study done by Swaroop, 72% were having the facility of toilets among which 62% were improved and 10% were public toilets. Toilets are built up in rural areas also with the Swachh Bharat Mission Scheme, Government of India but there is comparatively less utilization of toilets.

Conclusion

As the village is located near industrial area, better socio-economic development is seen in the area. There were 95% households with either private or public toilets but still practice of open-air defecation is persistent in the village.
**Recommendations:** Awareness and change in practices regarding use of toilets, hazards of open-air defecation, sanitation of household and village among rural people for betterment of quality of life.

**Conflict of Interest:** Nil

**Ethical Considerations:** Institutional Ethical Committee approval was obtained for conduction of the study.

Antenatal Health Care Seeking Behavior & Health System Response–A Cross Sectional Community Based Study

Baliga Kiran1, Baliga Shantharam2, Anupama Nayak P3, Moideen Faheem4, Ravikiran SR5, Rajesh SM6

1Associate Professor, 2Professor, Department of Paediatrics, Kasturba Medical College, Mangalore, 3Assistant Professor, Department of Paedodontics and Preventive Dentistry, Manipal College of Dental Science, Mangalore, 4Assistant Professor, 5Professor, Department of Paediatrics, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal

ABSTRACT

Introduction: Maternal and child health services have potentially critical role in improvement of reproductive and neonatal health thereby, reduce infant mortality rate (IMR). Delay in access to the health care involves problem in decision making and availability of health services. Health care seeking behavior (HCSb) is an important component of Health Systems Research (HSR) which is necessary for planning health policies. Aims and Objectives: To study (1) Antenatal HCSb of mothers. (2) Source of healthcare sought during antenatal period (3) Pattern of initiation of breast feeding among mothers. Methodology: This was a cross sectional community based study wherein, 1903 mothers of under 5 (U-5) were interviewed. Data were coded, analyzed using SPSS package, results expressed as rates and proportions. Predictors of HCSb was estimated by odds ratios (OR) calculation and 95% confidence intervals (CIs) and a P value of less than 0.05 was considered significant. Results: All mothers in study had at least one Antenatal Checkup (ANC). Most of the mothers, 1629 (85.6 %) were informed regarding importance of breastfeeding during ANC and 1668(87.6%) had at least one antenatal ultra-sonogram done. Private Health Care System (PHCS) was most preferred for delivery and 1884 (99%) were hospital delivery. 1693(88.9%) of mothers had breast fed their babies within first 2 hours of life and 376 (19.7%) gave pre lacteal feeds on day one. Conclusions: Large section of the society are still dependent on PHS for antenatal services. Realistic formulations of health policies are needed based on utilization of health care services.

Keywords: Antenatal health, care seeking, Heath system Response

Introduction

Maternal and child health services have potentially critical role in improvement of reproductive and neonatal health thereby reduce IMR. WHO estimates that seeking prompt and appropriate health care could reduce child deaths by 20%1. Health interview surveys appear to offer the best vehicle for analyzing care seeking behavior. Delay in access to health care involves problem in disease recognition, decision making and availability of health services2. Realistic formulation of health policies and programs requires inputs from Health System Research (HSR), which is scarce in our country3. Better understanding of Health Care Seeking Behavior (HCSB) is needed both in terms of utilization of different sources of care and expenses on treatment for optimization of health care delivery4. Maternal mortality and morbidity continue to be high despite the existence of national programs for improving maternal and child health in India5. This could be related to several factors, an important one being non-utilization or under-utilization of maternal health-care services, especially among the rural poor and urban slum population due to either lack of awareness or access to health-care services.

Thus, the purpose of this study was to study mother’s antenatal and HCSB for under five (U-5) childhood illness and study the health system response in Public Health Care system (PHC) and private Health Care System (PHCS).

**Methodology**

This was a cross sectional survey conducted in all 5 taluks of Dakshina kannada district (IMR of 10.9). Target sample size of 1980 mothers of U-5 children were considered for the study. 66 clusters around anganwadis were randomly selected by cluster random sampling method. UNICEF multi-indicator survey questionnaire was adopted, modified, pretested and used. Health care workers were trained to administer the questionnaire to mothers of U-5 who volunteered for the survey. All data of family, antenatal care sought, symptoms and illness in child and care sought and expenditures in the past 1 month were recorded. Data were coded and analyzed using the SPSS package. Results were expressed as rates and proportions. Outcome variables were compared with sociodemographic characteristics of families. Predictors of care seeking behaviour were estimated by calculation of odds ratios (OR) and 95% confidence intervals (CIs) and a P value of less than 0.05 was considered significant.

**Results**

1903 mothers of U-5 children were recruited in the study. 917 (48.3%) were below Poverty line (BPL) card holders out of which 229(24.9%) had a monthly income of less than Rs.1000 and 437 (47.6%) had income of more than Rs.3000. 32(12.2%) of people with income less than Rs.1000 did not have BPL card. PHCS was most preferred for delivery and 1884 (99%) were hospital delivery (Table 1). Most mothers, 1629 (85.6 %) were informed regarding importance of breastfeeding during ANC and 1668 (87.6%) were hospital delivery (Table 1). Most mothers, 1629 (85.6 %) were informed regarding importance of breastfeeding during ANC and 1668 (87.6%) were antenatal ultra-sonogram done (Table 2 ). 1693(88.9%) of mothers breast fed their babies within first 2 hours of life and 376 (19.7%) gave pre lacteal feeds on day one. Out of 1903 surveyed, illness episode was reported in 431 (22.6%) children in past 1 month. Among them 299 (69.4%) had ARI, 64(14.8%) had ADD, 15(3.5%) had infectious diseases and 53(12.3%) had other diseases. When it came to Child health care PHCS was most common source of health care, 335(77.7%) as compared to PHS 75 (17.4%). There was no difference in most aspects of health care response in either systems (Table 3).

**Discussion**

Health seeking trends of mothers irrespective of sociodemoographic factors is a good indicator reflecting effective utilization of health care delivery system both PHCS and PHS. Most mothers had undergone ANC, ultrasonography and health services were available within short distances, indicating good accessibility to healthcare. Significant percentage of needy families with monthly income <Rs.1000 do not have BPL cards and are deprived of benefits, while 47.6 % of BPL cardholders came from higher income group availing benefits meant for, contributing to “impoverished care”. Majority of poorer mothers in society seek health from PHS, and significant number from PHCS. This underlines the need for healthcare provision strategies to take account of both sectors. There is “impoverished” care in spite of overall progress in the district. Poorer section of population is seeking health care from PHCS probably due to financial burden experienced at PHS coupled with loss of income for the day.

As there is no difference in most aspects of health care response in either systems, measures to reduce the expenditure for OPD services, timing of OPDs to suite daily wagers and ensuring constant drug supply at various levels of PHS would result in increasing utilization of PHS. However good HCSB in the community of the district is reflected by IMR (10.9). Hence it is not right to blame the community for deficiencies in the system. Data on personal health care expenditure should be useful for ascertaining the capacity of people to pay for medical services, thereby curtailing impoverished care. There are very few studies regarding HCSB in the community and this behavior is probably under-utilized by the policy makers.

**Conclusion**

Large section of the society are still dependent on PHS for antenatal services. Realistic formulations of health policies are needed based on utilization of health care services. Significant percentage of needy families with monthly income <Rs.1000 do not have BPL cards and are deprived of benefits, while 47.6 % of BPL cardholders came from higher income group availing benefits meant for BPL families, contributing to “impoverished care.”

Validation of Newly Developed and Simplified Scoring Methods of Hirsuitism

Inthu Madeswaran¹, Sivasundari Maharajan¹

¹Department of Obstetrics & Gynecology, Sri Ramachandra Institute of Higher Education & Research (Deemed to be University), Porur, Chennai, India

ABSTRACT

A multiple linear regression model was used to evaluate body areas and their combinations to find which subset could serve as a best predictor of the full modified Ferriman Gallwey score. Among the selected five reliable areas namely upper lip, chin, chest, lower abdomen and thighs, combinations were obtained to further reduce the number of areas. A total score of seven in the upper lip, chin, lower abdomen and thigh is better area to evaluate hirsutism than using three areas upper lip, abdomen and thigh with the total score area of eight though reducing the scoring areas to three areas is less cumbersome. In this study we showed that the number of areas used for examination of hirsutism scoring is reduced to four areas, compliance of the patients will be good and this method can be applied for epidemiological studies.

Keywords: Hirsutism; Ferriman Gallwey scoring system; polycystic ovary syndrome (PCOS)

Introduction

Hirsutism is dermatological condition arise due to growth of male pattern of terminal hair in women¹. Unfortunately majority of women with hirsutism still believed this abnormality is primarily due to cosmetic disturbance and frequently seek help from a beautician, or cosmetologist rather a gynecologist². In order to diagnose and to follow up patients, study required quantification of hair growth¹, and then it becomes important to have reference range to define the regions yielding the best discrimination for distribution of hair in normal and hirsute women. In 1961 Ferriman and Gallaway was the first to develop a scoring system. It as the subjective tabulation of terminal hair growth on body parts³. This involves the scoring of eleven body areas including the lip, chin, chest, upper abdomen, lower abdomen, forearm, upper arm, thigh, lower leg, upper back, and lower back.

Ferriman Gallwey scoring system was later modified and used as very common method for scoring the terminal hair growth in the extent of body and facial⁴. This modified system involves only nine areas excluded of forearm and lower leg as these two areas do not get affected with androgen excess. A score of more than eight points is regarded as the cutoff value in original score system but later Ferriman modified cutoff score to five or more when defining hirsutism⁶. Later it was Knochenhauer modified it again and the score higher than six as the diagnostic criteria was set up⁷.

As previous scoring system require full body examination though makes patients feel uncomfortable most of time there is requirement to simplify this scoring system⁶. Considering the potential significance of hirsutism, this study was undertaken to deserve a simpler, less invasive and more widely applicable scoring system for hirsutism. Study assess whether the extent of hair growth in a specific body part can provide more simpler predictor of total body hirsutism and to derive a simpler method of scoring system in evaluation of hirsutism.

Materials and Method

Ethical Consideration: This study was conducted from November 2013 to October 2015 after approval from Sri
Ramachandra University Ethics Committee approval and after informed consent from the patient. The Sampling method is done by simple random sampling of a sample size, three hundred and seventy nine patients. The sample size was derived on the basis of statistical analysis (Figure 1).

**Subjects and Selection Criteria:** Patients with evidence of hirsutism without parlor activity were included in the study. Those with recent parlor activity, premenarchal, postmenopausal, patients who had gone under hysterectomy or bilateral oophorectomy prior to this study, or otherwise were on hormonal treatment for three months at least, were excluded from the study.

**Clinical Examination:** Scoring system includes the eleven areas as described earlier and each body area was evaluated virtually on scales which have a score of zero indicating no terminal hair growth, and a score of four indicating full male pattern terminal hair growth.

**Developing New Simplified Scoring System:** All examination was performed by a medical preactioner and data were recorded in SPSS 16.0 version, prospectively. Unpaired t-test was used to find the significant difference in Independent groups between the bivariate samples. A multiple linear regression model evaluated the all body areas used for scoring system and their combinations to find a better subset as a best interpreter of the modified Ferriman Gallwey score. The under influenced variable were eliminated step wise by backward elimination method and regression analysis was done for complete scores of six, seven, and eight. Specificity, Sensitivity, positive and negative predictive valve was calculated. Number of combinations possible with eleven variables will be two thousand and forty six. Eleven single areas, fifty five combination of two areas, hundred and sixty five combination of three areas, three hundred and thirty combination using four areas, four hundred and sixty two combinations with five areas, four hundred and sixty two combinations with six areas, three hundred combinations with seven areas, hundred and sixty five combinations with eight areas, fifty five combinations with nine areas, eleven combinations with ten areas. By backward elimination method, multiple regression analysis was generated by SPSS software. Variables entered in the first set of regression analysis were all eleven areas for which criteria set up by the software for this statistical analysis is \( \geq 0.1 \). By backward elimination method, the under influenced variable is eliminated one by one.

**Findings**

**Anthropometric and Demographic Variables:** Present work had 347 women patients enrolled in the study with minimum age of 18 years and maximum age group of 41, mean age was 26.5 years. More than 80% were aged below 35 years (Figure 2).

![Figure 1: Derived the sample size of 347 derivations by multiple linear regressions](image1)

![Figure 2: The age distribution of the study population](image2)
Clinical Diagnosis and Family History: Among participants, 283 (81.6%) were married and rest unmarried. 50.1% were nulliparous, and 49.9% were multiparous ranging children up to four (Figure 3). Body mass indexed indicates people were equally distributed in three categories normal (31.4%, 109), over weight (36.9%, 128) and obese (31.7%, 110).

Figure 3: Parity Distribution of Population

History of Hirsutism: Total number of study participants who had history of hirsutism were fifty six and total number of participants who came for other complaints than hirsutism were two hundred and ninety one. Out of which two hundred and eighty study people had hirsutism. Six out of those who had hirsutism complaints were not included under present cut off value of total score of 7 in the three body areas. Eleven out of the other presenting complaints did not fit into the cut off value and were not considered as having hirsutism.

Evaluation of New Simplified Scoring System: By backward elimination with a criteria of >=0.1 each area were further reduced done. The final result obtained is with a cut off score of 6, 7, and 8 for three variable three combinations and four combinations were obtained. Using backward elimination, F7 for (Upper lip, chin, lower abdomen and thigh) has an R VALUE of 0.706 and R SQUARE value of 0.495. The formula derived out of these 4 areas is upper lip x 0.15 +chin x 0.32 + lower abdomen x 0.178 +thigh x 0.146 – 0.172 which is equal to the total Ferriman Gallwey scoring.

Table 4 shows the presence of hirsutism for a cut off value of seven in the four areas in patients with and without history of hirsutism. Using backward elimination, a cut off value of F8 has R VALUE of 0.608 and R SQUARE value of 0.495. The formula derived out of these 3 area is upper lip x0.9 + lower lip x 0.9 +lower abdomen x 0.28+ thigh x 0.118- 0.112 which is equal to the total Ferriman Gallwey scoring. Present study compare the R values of the combination of four areas (chin, upper lip, lower abdomen and thigh which is R VALUE = 0.706 and R SQUARE = 0.495 has a better R value than upper lip, lower abdomen and thigh which is R VALUE –0.608 and R SQUARE – 0.369.

**Conclusion**

In present study entire three hundred and forty seven patients had PCOS diagnosed by Rotterdam’s criteria and all of the patient had a scan picture of polycystic ovary syndrome, which is similar in studies conducted by Meifong et al\(^8\) with eight hundred and fifty study participants, DeUgarte et al\(^9\) had forty eight percentage of their study group with hirsutism had polycystic ovary syndrome. Azziz et al\(^2\) and William et al\(^10\) had eighty five percentage of polycystic ovary syndrome in their study on grading hirsutism. The single most reliable predictor of hirsutism was lower abdomen, upper lip and thigh but their correlation coefficient is low and hence cannot be used for large population epidemiological study. Among the three areas for predictor of hirsutism, upper lip, chin, thigh or upper lip chin and lower abdomen is equally reliable predictable. By computing the area under the curve either four areas with F7 or three areas with F8 score, both has the same sensitivity of 71.4%, specificity of 5%, positive predictive value of 4.6%, accuracy of 38%. It most important to note that in contrast to the higher degree of sensitivity and the PPV of this screening method was relatively low. Knochenhauser\(^7\) had a positive predictive value of fifty eight percentages and heather et al had 92.5%. By computing the area under the curve in present study, either four areas with F7 or three areas with F8 score, both has the same sensitivity of 71.4%, specificity of 5%, positive predictive value of 4.6%, accuracy of 38%.

The number of areas used for examination of hirsutism scoring was reduced to four areas, compliance of the patients will be good and this method can be applied for epidemiological studies\(^11\). Examination of four areas for the diagnosis of hirsutism with cut off score of greater than seven is a better predictor of hirsutism than the modified Ferriman Gallwey scoring\(^12\). This study discovered that while assessing unselected population a confirmatory full body scoring to be done. The new scoring system can be beneficial in inhabitants with high incidence of hirsutism, the predictive value is higher compared to population with lower prevalence of hirsutism. This study will help to consider the hirsutism prevalence impact in such population while evaluating the predictive ability of the new screening method.

Comparison of Marginal Discrepancy between Simulated Crowns Cast with Imported and Indigenous Alloy—An in Vitro Analysis

Ganesh Ramesh¹, Ramu M Reddy², Padmanabhan T V³, Bhuminathan S¹, Krishna Prasanth B⁴
¹Professor, Department of Prosthodontics, Sree Balaji Dental college & Hospital, Bharath University; ²Professor, Department of Prosthodontics, Kamineni Institute of Dental Sciences; ³Professor & Head, Department of Prosthodontics, Faculty of Dental Sciences, Sri Ramachandra University; ⁴Assistant Professor, Department of Epidemiology, Sree Balaji Dental College & Hospital, Bharath University

ABSTRACT

Various factors are responsible for the success of a Ni-Cr prosthesis. Marginal fit or Integrity is one. The close adaptation of the margin of the prosthesis with the finish line of preparation leads to good Marginal Integrity

This study compares the marginal integrity between an imported Ni-Cr alloy and an indigenous Ni-Cr alloy.

There is no significant difference in mean values of vertical marginal opening between Indigenously and Imported alloy at “As-cast-fit” stage.

The mean value of vertical marginal openings of both alloys after opaque, Body-enamel and Glaze firings are comparable (No significant difference).

Keywords: Marginal Integrity, Marginal Fit, Metal Ceramic Restoration

Introduction

The metal-ceramic restoration was introduced to the dental profession in 1956, and since that time it has become one of the most widely used restoration in dentistry¹. Scientific studies and clinical practice have led to improvements in materials and techniques that have resulted in restorations of greater strength with esthetic qualities which were impossible to achieve previously. But one problem that persisted over these years is the achievement of excellent marginal adaptation of metal-ceramic restorations.

It has been widely observed that the “as-cast” fit of metal ceramic restorations deteriorates during the high temperature firing cycles employed for porcelain veneer application². Many investigators have indicated that firing shrinkage (12 - 15%) of the porcelain is largely responsible for distortion and loss of fit is associated with high temperature firing cycling of the metals.

Regardless of the specific factor involved, the common denominator is elevated temperature. It, therefore follows that, the higher the melting temperature of ceramic alloy, the more resistant it must be to temperature-related distortion.

At present, Ni-Cr alloys have received much attention in fixed prosthodontic procedures as they exhibit wide range of physical and mechanical properties, like, high yield strength, moduli of elasticity and porcelain-to-metal bond strength. However, the properties vary with alloy type and fabrication details.

Recently, a type of Ni-Cr alloy has been developed and manufactured indigenously by NFTDC (Non Ferrous materials Technology Development Centre), Hyderabad, the properties of which have not been studied so far.

Hence, the present study was taken up to compare the vertical marginal discrepancy that occurs at “As cast fit” stage and during each porcelain firing cycle, between
the already existing, imported (Kulzer Ni-Cr) alloy and the indigenously made Ni-Cr metal alloy by NFTDC (Non Ferrous materials Technology Development Centre), Hyderabad.

**Materials and Method**

The purpose of this study is to compare the vertical marginal adaptability between foreign made alloy Kulzer (Ni-Cr) and indigenous alloy (Ni-Cr alloy) manufactured by NFTDC (Non Ferrous materials Technology Development Centre) Hyderabad. The test samples twenty in number were divided into two groups of ten each.

**Test for Marginal Adaptation:** Test for marginal discrepancy was done at 4 stages by an optical microscope on four predetermined locations which were earlier marked.

1. “As cast fit” stage
2. After opaque firing stage
3. After body and Enamel firing stage
4. Glaze firing stage

The porcelain that was used for opaque, body and enamel is vita

**Results**

Discussion

The concept of porcelain – fused to – metal restorations dates back to nineteenth century. Since that time, these restorations have gained much importance in the field of fixed prosthodontics. The metal-ceramic restorations combine the property of strength and accuracy of cast metal, with esthetic appearance of porcelain. However, these restorations have not produced excellent marginal adaptation as full metal cast restorations. Literature has documented several factors responsible for these marginal discrepancies.

Many investigators have indicated that firing shrinkage of the porcelain is largely responsible for the distortion.

An absolute requirement for fabrication of the metal ceramic restoration with minimal marginal discrepancy is that the metal coping must not melt when porcelain is fused to it.

With the development of improved investment material (which can withstand high temperature and produce sufficient expansion of the mold) and reliable casting technique for producing dental castings, many alloys have been developed to fabricate metal-ceramic restorations with very minimal but clinically acceptable marginal discrepancy

At present, high-fusing alloys (base metal alloys) have gained considerable interest, Ni-Cr alloys being the most common. These alloys have high melting temperature and therefore exhibit resistance to temperature related distortion during high temperature porcelain firing cycles.

Statistical Analysis was Done to

1. Compare the Mean, Standard Deviation and Test of Significance of mean values of marginal...
discrepancy between the simulated crowns cast with Imported (Kulzer) Alloy and Indigenous alloy, at “as cast-fit” stage.

The mean and standard deviation values for imported alloy crown and indigenous alloy crown are found to be 25.98 ± 2.17 and 25.42 ± 2.09 respectively. Suggesting, no significant difference of marginal opening between the crowns of two alloys at “as cast-fit” stage (p value obtained 0.56 ; p ≤ 0.05 was considered as the level of significance) (Table – 1)

From this study, it was found that, there was a minor difference in the marginal discrepancies (0.56 mm) between the two alloys. This could be due to compositional variations between the alloys as other parameters are kept constant during the study.

Elements like Chromium, Beryllium and Silicon have influence on the castability of alloy and even on marginal adaptation. Presence of chromium in alloy over 30% causes difficulty in casting. Imported alloy has 23.8% of chromium where as indigenous alloy has about 12.70%, the slight increase in marginal discrepancy of imported alloy over indigenous alloy might be due to presence of increased amount of chromium in imported alloy.

Presence of Beryllium in 1-2% in an alloy decreases the melting point the 100ºC, thereby increases the castability. Indigenous alloy has about 1.95% of Beryllium, where as, imported alloy was without Beryllium. This could also be the other reason for increased in marginal adaptation of indigenous alloy.

2. Compare the Mean, Standard Deviation and Test of Significance of mean values of marginal discrepancy between the simulated crowns of Imported Alloy and Indigenous Alloy after opaque, enamel-body and glaze firing.

After firing cycles (opaque, body-enamel and glaze firing) there was no significant differences in the marginal openings between the crowns cast with two alloys.

The mean marginal openings in crowns of imported alloy during opaque, body enamel and glaze was found to be 36.8mm, 46.85mm and 50.71mm respectively. Similarly, for indigenous alloy crowns it was 36.27mm, 47.52 mm and 51.8mm indicating no significant difference between the values. (Table – 2)

From this study it was determined that there is similar increase in marginal opening in both the alloys from ‘as cast fit’ stage to the end of opaque firing, (10.82 mm for imported alloy and 10.85 mm for indigenous alloy). This increase in marginal opening may be due to high fusion temperature required for opaque material and also might be due to release of residual stresses that resulted from casting and polishing process during the first firing cycle. Likewise, there is also considerable increase in marginal opening after body enamel firing (10mm for imported alloy and 11.26 mm for indigenous alloy). Gemalmaz et al suggested that the increase in marginal opening after body enamel firing might be due to porcelain contamination on the inner surface of the crowns. However, at the end of glaze firing. Both the alloys have shown less increase in marginal opening. 3.86 mm for imported alloy and 3.66 mm for indigenous alloy. The reason for less increase at the end of glaze firing may be due to release of all residual stresses during earlier firing cycles.

3. Compare the mean changes between marginal openings of simulated crowns cast with imported alloy and Indigenous alloy at two stages

- Opaque to enamel firing and
- Enamel to glaze firing

The mean change of marginal opening in imported alloy crown from opaque to body-enamel was found to be 10mm and for indigenous alloy crown it was 11.26 mm with p value 0.35 indicating no significant difference in change between the two alloys.

Similarly, the mean change of marginal opening in imported alloy crown from body-enamel firing to glaze firing was 3.86mm it was 3.66mm for indigenous alloy crown, p value 0.9 indicate no significant difference.

Hence the above statistical analysis indicates that indigenous alloy is well comparable to imported alloy at “As-cast-fit” stage as well as after firing cycles.

The total of the average changes from As-cast-fit stage to end of porcelain cycle did not exceed 30mm
for both alloys (Imported alloy, the average change was
24.75 mm. Similarly, for indigenous alloy it was found
to be 26.77 mm) which was similar to reported in studies of
Deniz Gemalmaz et al and others. Investigations
on the marginal distortion of metal ceramic crowns have
concluded that this value of marginal distortion, or 39
mm as suggested by Christensen was with in clinical
acceptability.

Conclusions

The following conclusions was drawn from the
study

1. There is no significant difference in mean values
of vertical marginal opening between Indigenously
and Imported alloy at “As-cast-fit” stage. (Table 1)

2. The mean value of vertical marginal openings of
both alloys after opaque, Body-enamel and Glaze
firings are comparable (No significant difference).
(Table 2)

Since, there is no significant difference of marginal
adaptation between the two alloys it is concluded that
Indigenous alloy can well be substituted for Kulzer alloy.

L-ascorbic Acid Supplementation Ameliorates Sodium Fluoride Induced Alteration of Cardiac Autonomic Functions in Hypoxic Rats

Jaya simha Reddy1, R Chandramouli Reddy2, Raju H.Taklikar3, Kusal K Das4

1PhD Scholar, 2Junior Research Scientist, Laboratory of Vascular Physiology and Medicine, Department of Physiology, Shri B.M.Patil Medical college, Hospital & Research Centre, BLDE (Deemed to be University), Vijayapur, Karnataka, India, 3Department of Physiology, Navodaya Medical College, Hospital & Research Centre, Raichur, Karnataka, India, 4Professor, Laboratory of Vascular Physiology and Medicine, Department of Physiology, Shri B.M.Patil Medical college, Hospital & Research Centre, BLDE (Deemed to be University), Vijayapur, Karnataka, India

ABSTRACT

Introduction: Long term exposure to fluoride is toxic to bones and organs like heart, liver, lung and kidney. Fluoride toxicities induced by oxygen sensing cell signal pathways, hence low oxygen microenvironment and fluoride exposure might have similar toxic manifestation in physiological system and a possible protective mechanism by antioxidant like l-ascorbic acid supplementation.

Aim: To investigate the supplementation of l-ascorbic acid on hypoxia or sodium fluoride (NaF) alone or in combination in cardiovascular electrophysiology of male albino rats.

Materials & Method: Male albino rats were divided into 8 groups (n= 6/group), group I(control), group II (l-ascorbic acid, 50 mg/100g b.wt), group III (hypoxia, 10%O₂), group IV (NaF ;20 mg/kg b.wt/day ; ip), group V (NaF + hypoxia, 10% O₂), group VI (l-ascorbic acid + hypoxia, 10% O₂), group VII (l-ascorbic acid + NaF) and group VIII (l-ascorbic acid + NaF + hypoxia, 10% O₂). The treatments were carried for 21 days. Gravimetry, electrophysiological parameters like noninvasive blood pressure (NIBP), mean arterial pressure (MAP), heart rate (HR), respiratory rate (RR), LF (low frequency), HF (high frequency) and LF/HF ratio were measured. Histopathological evaluations were done to identify changes in myocardial tissue (ventricle).

Results: Electrophysiological evaluation showed significant alteration in MAP in rats treated with hypoxia (group III), NaF (group IV) and NaF with hypoxia (group V). In case of l-ascorbic acid supplementation in group VI, VII and VIII showed remarkable improvement of altered MAP levels. Alteration in heart rate, LF, HF, LF/HF ratio and histopathology in myocardial tissue (ventricle) in rats treated with hypoxia, NaF and hypoxia with NaF indicate cardiac autonomic dysfunctions, but simultaneous supplementation with l-ascorbic acid were found to be beneficial against fluoride and hypoxia induced alteration of cardiovascular functions.

Conclusion: The study indicates a protective role of l-ascorbic acid on cardiovascular pathophysiology in rats treated with NaF, hypoxia and in combination of both.

Keywords: sodium fluoride, hypoxia, heart rate, sympathovagal balance, left ventricular myocardium

Introduction

Long term exposure to fluoride is toxic to bones and organs like heart, liver, lung, spleen and kidney1. Fluoride induces oxidative stress through low oxygen cell signal transduction pathways like hypoxia. Fluorosis is irreversible but preventable by appropriate timely intervention. Antioxidants and antioxidant rich food supplementation acts as antidote in the fluorosis management and fluoride intoxication 2,3. It is important
to know how low oxygen microenvironment influences cardiovascular autonomic malfunctions in presence of fluoride and a possible protective mechanism by antioxidant like l-ascorbic acid supplementation.

Hence the present study was designed to assess the possible protective role of l-ascorbic acid, a potent antioxidant on NaF and hypoxia or in combination on cardiovascular pathophysiology in male albino rats.

**Materials and Method**

Healthy adult male albino Wistar rats weighing about 150 -180 grams were procured from animal house. Acclimatized for one week to the laboratory conditions at 21-25°C and fed with laboratory stock diet and water *ad libitum*.

**Experimental Groups:** Male albino rats were divided into 8 groups (n= 6 in each group), group I (control), group II (l-ascorbic acid, 50 mg/100g. b.wt), group III (hypoxia, 10%O₂), group IV (NaF ; 20 mg/kg b. wt/ day ; ip), group V (NaF + Hypoxia, 10% O₂), group VI (l-ascorbic acid + hypoxia, 10% O₂), group VII (l-ascorbic acid + NaF) and group VIII (l-ascorbic acid + NaF + hypoxia, 10% O₂). The interventions were carried for 21 days.

NaF was dissolved in distilled water and injected intra peritoneally at a dose of 20 mg/kg body weight/day for 21 days⁴. L-ascorbic acid was administered orally by using force feeding needle with syringe for 21 days (50mg/100g body weight).

**Exposure of Rats to Hypoxia:** Rats in cage were kept in acrylic chamber and given mixture of 10% oxygen and 90% nitrogen to induce chronic normobaric hypoxia for 21 days. Soda lime granules were used to absorb carbon dioxide. Temperature was maintained at 22-27°C ⁵.

**Gravimetry:** Animals of all groups were weighed on the starting day of protocol and on the 21st day i.e. on the day of sacrifice using digital weighing balance. Percentage of body weight gain was determined. Heart was weighed after sacrifices at the end of experiment and further cardio somatic index was determined by using the following formula:

$$\text{Cardio somatic index} = \frac{\text{Weight of heart} \times 100}{\text{Body weight}}$$

**Electrophysiology:** Animals were anaesthetized with an intra peritoneal injection of Ketamine (60 mg/kg b.wt) with Xylazine (6 mg/kg b.wt) after the intervention period of 21 days. Heart rate variability (HRV) analysis were done by using Kubois software version 3.0.2. Heart rate (bpm), MAP, Respiratory rate, LF (low frequency), HF (high frequency) and LF/HF ratio for finding of sympathovagal balance were recorded by using Biopac MP45 instrument attached to PC with BSL 4.1 software.

**Histopathology Procedure:** Animals of all groups were sacrificed by cervical dislocation after electrophysiological analysis at the end of 21 days. The heart was carefully collected, isolated immediately and fixed in freshly prepared 10 % formalin for 24 hours. All the fixed tissues were embedded in paraffin and thin sections were taken. Staining was done with hematoxylin and eosin. Histopathological evaluations were done to identify changes in myocardial tissue (ventricle) for treatment groups and compared with control⁵. CPCSEA guidelines were carefully followed during experiments.

**Statistical Analysis:** SPSS software version 16.0 was used. One-way ANOVA followed by “Tukey” test were done to find out intergroup significant differences. All values were represented as mean ± SD. p ≤ 0.05 considered as statistically significant.

**Results**

Table-I shows significant decrease in % of body weight gain, heart weight and cardio somatic index of rats exposed to hypoxia (group III), NaF (group IV), hypoxia and NaF (group V) as compared to control (group I) at the end of 21st day. However simultaneous treatment with l-ascorbic acid showed greater % of body weight gain, heart weight and cardio somatic index in group VI (l-ascorbic acid + hypoxia), group VII (l-ascorbic acid + NaF) and group VIII (l-ascorbic acid + NaF + hypoxia).
Table 1: Effect of l-ascorbic acid supplementation on sodium fluoride and hypoxia induced changes in gravimetry. Group I (control), group II (l-ascorbic acid), group III (hypoxia), group IV (NaF), group V (hypoxia + NaF), group VI (l-ascorbic acid + hypoxia), group VII (l-ascorbic acid + NaF) and group VIII (l-ascorbic acid + hypoxia + NaF), values expressed as Mean ± SD, p ≤ 0.05 is significant, values with different superscripts a, b, c, d, e are significantly different from each other.

Discussion

In this study protective role of l-ascorbic acid on cardiac autonomic functions were studied in hypoxia, sodium fluoride and in combination of hypoxia and sodium fluoride in experimental rats through evaluation of HRV, blood pressure and cardiac autonomic functions along with histopathology of cardiac tissues.

Results of our study are indicative of decrease in body weight and % of body weight gain, heart weight and cardio somatic index in hypoxic and NaF administered rats or in combination of both. This decrease in body wt (%) and cardio somatic index may be due to fluoride induced decrease of food and water consumption with altered growth rate 6. Supplementation with l-ascorbic acid showed % of body weight gain, heart weight gain and increased cardio somatic index due to cardio-protective actions of l-ascorbic acid in hypoxia and NaF induced alteration of growth rate 7.

In our study hypoxia induced alterations of sympathovagal balance in experimental rats are indicative of cardiac autonomic dysfunctions with possible sympathetic dominance 8. Our results on supplementation of l-ascorbic acid in cardiovascular electrophysiology of hypoxic rats corroborated with the findings of Kane et al 9.

Hypoxia alters the neuronal effector pathways controlling the heartbeat. Oxidant tone and nitric oxide within the medulla alter sympathetic and vagal outflow. L-ascorbic acid increases parasympathetic outflow at the level of nucleus ambiguous.

The present study also showed parasympathetic dominance in NaF treated rats which clearly indicates altered autonomic functions. These observations on NaF treatment in present study was found to be contrary to other previous study 10. Decrease in heart rate, MAP in case of NaF treated rats in present study may be due to vasodepressor action of NaF by combined depression of the vasomotor center of the brain and of vascular smooth muscle 11.

Improvement of all the electrophysiological parameters and ventricular histopathology in l-ascorbic acid supplemented hypoxia exposed or NaF treated or in combination of hypoxia exposure and NaF treatment indicate protective effects of l-ascorbic acid on cardiovascular pathophysiology. This could be due to potential antioxidant property of l-ascorbic acid against low oxygen microenvironment due to fluoride exposure in vivo in experimental rats.

Conclusion

Observations from the present study indicate amelioratic effects of l-ascorbic acid on cardiac autonomic functions in rats exposed to fluoride and hypoxia or in combination of both hypoxia and fluoride.

Comparative Evaluation of Shear Bond Strength of Composite Resin Bonded to Acid Etched and Lased Primary Enamel (Er, Cr:YSGG)

Jeevarathan J, I. A. Aravind, Ponnudurai Arangannal, Pramila Suguthan

1Professor, Sree Balaji Dental College, Pallikarani, Chennai; 2Assistant Professor, Government Hospital, Tirunelveli, TamilNadu; 3Professor and Head of the Department, Sree Balaji Dental College, Pallikarani, Chennai; 4Private Practice, Chennai

ABSTRACT

Aim: In vitro evaluation of shear bond strength of composite resin bonded to primary enamel which is pretreated using acid etching and E,Cr:YSGG Laser. Qualitative morphological changes in enamel surfaces were observed under a scanning electron microscope.

Materials and Method: Sixty extracted human teeth were divided into two groups of 30 each (Groups A and B). In Group A, prepared surface of enamel was etched using 35% phosphoric acid (Scotchbond Multipurpose 3M ESPE). In Group B, enamel surface was etched using Er,Cr:YSGG Laser beam (Waterlase MD, biolase, San Clemente,USA). Bonding agent (Adper, single bond 2, 3M ESPE) was applied over the test areas on 20 samples of Groups A and Groups B each light cured. Composite resin core (Filtrek z350 XT, 3M ESPE) was made in increments and light cured. The samples were tested for shear bond strength. Remaining 10 samples from each Group were observed under SEM.

Results: The mean shear bond strength with standard deviation values of Group A (18.39 ± 4.75 MPa) and Group B (6.37 ± 2.71 MPa) respectively.

Conclusions: Mean shear bond strength of Group A (Acid etching) was significantly higher than the mean shear bond strength of Group B (Laser etching). SEM observations of laser pretreatment showed micro-retentive surface with the presence of elevations and depressions not adequate to improve the bond strength as compared to Acid etching.

Keywords: Primary teeth, Acid Etching, Er,Cr:YSGG, Shear Bond Strength, Laser

Introduction

Enamel surface preparation was first introduced by Michael Buonocore in 1955 using phosphoric acid and since then it has changed substantially. Numerous investigations about acid etching onto enamel and dentin surface and shear bond strength, carried out in the past 35 years have resulted in a marked reduction in phosphoric acid concentrations and application times with no significant reduction in shear bond strength. Nowadays, 37% phosphoric acid conditioning for 15 to 20 sec is the standard procedure. An acid etch technique results in bonding of composite resin with enamel resulting in increased bond strength and decreased microleakage. The effects of conventional enamel conditioning using phosphoric acid is an unintentional demineralisation of the enamel surface with an irreversible loss of the mineralized surface of approximately 10µm. Alternative methods of enamel conditioning include air abrasion and laser application. Air abrasion has been successfully applied to bands, brackets and lingual retainers. Air abrasion technology makes use of a high speed stream of aluminium oxide particles propelled by air pressure. However, results for enamel conditioning seem to be controversial.
In 1960, Maiman developed the method of Light Amplification by the Stimulated Emission of Radiation, now commonly known by its acronym, LASER. Since then the use of lasers in dentistry has increased especially over the past few years. Goldman et al., (1965) investigated the application of the laser beam on dental hard tissues. The first dental lasers cleared by the FDA was used exclusively for soft tissue procedures which included carbon dioxide (CO2) laser, Neodymium-Yttrium-Aluminum-Garnet (Nd:YAG) laser, argon laser, and the semiconductor diode laser. Unfortunately argon, CO2 and Nd:YAG lasers have been reported by many researchers to produce major thermal effects, including melting, carbonization, the creation of fissures and cracks in the surrounding tissues, as well as an increase in pulpal temperature. Other approved systems include the Erbium-Chromium-Yttrium-Scallium-Gallium-Garnet (Er,Cr:YSGG) laser and the Erbium doped, Yttrium-Aluminum-Garnet (Er:YAG) laser.

The potential applications of Er,Cr:YSGG laser for dental hard tissue treatment have been tested by a number of investigators. This laser uses a pulsed beam system, from a fibre and a sapphire tip bathed in a mixture of air and water vapour. It has been shown to be effective for soft tissue surgery as well as for cutting enamel, dentin and bone. Er,Cr:YSGG laser was recommended for minimal invasive purposes due to its precise ablation of the enamel and dentin without any side effect to the pulp and surrounding tissues. It has a 2780-nm wave length and is absorbed strongly by both water and hydroxyapatite. These lasers are ideal for caries removal and tooth preparation when used with a water spray.

Laser etching has been evaluated as an alternative to acid etching of enamel and dentine. Literature search did not reveal any study done in primary teeth on shear bond strength comparing acid etching and laser etching using Er,Cr:YSGG, hence the present in-vitro study was done to evaluate and compare the same and also to observe qualitative surface changes in enamel under scanning electron microscope.

Materials and Method

Maxillary and mandibular primary canine teeth extracted for orthodontic purpose were collected, thoroughly cleaned using an ultrasonic scaler and were stored in distilled water and 0.2% thymol solution at room temperature until subjected to study. Sixty teeth which fulfilled the following inclusion criteria were selected:

- Teeth should be without any cracks.
- Teeth should be free from caries.
- Atleast one third root present.

They were divided into 2 groups, of 30 each Group A (Acid etching group) and Group B (Laser etching group).

The teeth were mounted in a self cure resin using an aluminium square block (3cmx1cm) leaving the crown exposed. Different colours were added to self cure acrylic to differentiate between the groups, Group A (RED) and Group B (YELLOW). Samples in each group were numbered from 1 to 30 for proper identification.

In Group A samples, enamel in the mid-labial surface was etched using 35% phosphoric acid (Scotchbond, Multipurpose, 3M ESPE) for 15s and rinsed with distilled water for 15s and the tooth surface dried with oil free compressed air for 10s. On the first 20 samples (no 1-20) bonding agent (Adper, Single bond 2, 3M ESPE) was applied with a brush, gently air thinned and a plastic straw (3mmx3mm) was placed on the enamel surface and light cured as per manufacturer’s instructions. Then a composite resin core (Filtek Z350 XT, 3M ESPE) was made in increments and light cured for 40s on each layer as per manufacturer’s instruction. The plastic straw was then cut and removed with the help of 11 size BP blade. The samples were then stored in distilled water for 24 hours. Then prepared samples were subjected to shear bond strength in a Universal Instron machine (FIE, UNITEK 94100) (Fig.1) in a direction perpendicular to the resin core, at a crosshead speed of 1mm/min (Fig. 2). The stress failure was recorded and tabulated as shear bond strength (Table 1). The bond strength values obtained were in KiloNewtons, which were converted into MegaPascals (MPa). Remaining 10 samples (no 21-30) were subjected to scanning electron microscopy at a magnification of 1000x to observe the etched pattern on the enamel surface.

In Group B samples, enamel in the mid-labial surface were lased for 15s with Er,Cr:YSGG laser (Waterlase MD, Biolase, San Clemente, USA), operating at a wavelength of 2780nm with a power output of 2.5W in a free running pulse mode at a repetition rate of 50Hz and 80mJ/pulse energy. Air and water spray from the handpiece was adjusted to a level of 60% air and 50% water. The laser beam was aligned perpendicular to the surface and moved in a sweeping fashion by hand during the exposure period. The tooth surface was then dried with oil free compressed air for 10s. Out of 30 samples, 20 samples (no 1-20) resin core build up, and storage was done as in Group A. The samples were subjected to shear bond strength and SEM observation as done in Group A.

**Results**

Table 1 shows the shear bond strength of Group A and Group B samples. Table 2 shows the values of Group A and Group B samples statistically analysed using student’s t-test. The mean shear bond in Group A (18.39 MPa) is significantly higher than the mean shear bond strength of Group B (6.37 MPa). SEM observations at 1000x magnification of Group A samples showed that the acid etched enamel surface had porosity and honeycomb like appearance (fig 3). Group B samples had surface irregularities and micro cracks/fissures (fig 4).

Figure 3: SEM picture (1000x) showing honeycomb-like enamel surface after acid etching

Figure 4: SEM picture (1000x) showing surface irregularities and micro cracks/fissures after laser etching

Discussion

Composite resin restoration gained popularity after Buonocore’s work on acid etching of enamel. It is now used to replace enamel and dentin lost due to dental caries, fracture and to change the shape and shade of anterior teeth. Many researchers have studied adhesion to enamel and at present, acid etching is probably the best method of bonding resins to enamel.\(^\text{14}\) However, it has certain disadvantages like removal of a surface layer of enamel, variability in etch depth, contamination of the etched surface with water or oil, and inadequate washing or drying affecting bond strength adversely and also make enamel surfaces more susceptible to caries, especially if resin impregnation is incomplete or defective.\(^\text{15}\) Hence an alternative modality like laser was explored to pre-treat the enamel surface to achieve resin bonding.

The erbium laser, originally developed by Zharikov et al in 1975, was approved by the FDA in 1997 for caries removal, cavity preparation and modifying dentin and enamel prior to etching.\(^\text{16}\) Er,Cr:YSGG laser etching is painless and does not involve either vibration or heat but it’s easy handling of the apparatus makes this treatment highly attractive for clinical use.\(^\text{17}\) Er,Cr:YSGG is well absorbed by haemoglobin and water. It has high affinity for hydroxyapatite when used along with water spray. Hossain et al in 1999 found usage of water along with Er,Cr:YSGG resulted in increased ablation depths compared to those irradiated without water.\(^\text{18}\)

In our study 20 samples from each Group were subjected to shear bond strength using universal testing machine. The mean shear bond strength of acid and laser etch Group are 18.39 and 6.37 MPa respectively. These values when subjected to statistical analysis (Student’s t test), the acid group was found to be statistically significant than laser group with (P value < 0.0001). Similar study was done by Mridula Goswami et al in 2011 in enamel of permanent teeth using Nd:YAG Laser. The results were similar to our study which showed a statistically significant difference in mean values between acid etch and laser etch group (P value < 0.0001).\(^\text{19}\)

Scanning electron microscope observations of Group A samples showed regular honey comb pattern, thus increasing the surface area manifolds and offering better mechanical retention to resin tags. Similar appearance was also reported by Goswami and Singh in 2011 on permanent teeth using phosphoric acid. Group B samples showed surface irregularities and micro cracks/ fissures on the lased surface under SEM. This may have been produced as Er,Cr:YSGG laser has high affinity for water and hydroxyapatite, utilizing an interaction phenomenon that refers to as the hydrophotonic process. The laser energy from the Er,Cr:YSGG is able to interact with water droplets at the tissue surface to create water molecule excitation. This in turn cause water droplet microexpansion and propulsion. The laser impact site showing areas of indentation and bubble-like cavities was reported by Goswami and Singh in 2011 while using Nd:YAG laser on permanent teeth.\(^\text{19}\) Brauchli LM in 2011 stated that Er:YAG laser produces a network of microfissures on enamel lased surface which is also seen in our samples.\(^\text{20}\) Yu J et al in 2003 evaluated the morphological changes of Er,Cr:YSGG laser irradiated dental hard tissues and reported a scaly and rough surface appearance similar to our samples.\(^\text{21}\) These type of pattern offers less mechanical retention, hence lower shear bond strength as obtained in our study.

It can be concluded that Er,Cr:YSGG laser pre-treatment of enamel, with the parameters used in this study, did not result in higher shear bond strength of composite resin to enamel as compared to acid etching pre-treatment. Further studies with varying Er,Cr:YSGG laser parameters are recommended to evaluate its effect on primary teeth.

Modified Cantilever Bridge; A Novel Approach towards the Replacement of Missing Primary Anterior Teeth

Kalyani Rathi¹, Nilesh Rathi², Nilima Thosar³, Sudhindra Baliga⁴
¹3rd Year PG Student, ²Associate Professor, ³Professor and Head, Department of Pedodontics and Preventive Dentistry, ⁴Professor and Dean, Sharad Pawar Dental College

ABSTRACT

Early childhood caries or dental trauma may lead to premature loss of primary anterior teeth which might lead to unaesthetic appearance, psychological impairment and speech abnormality. Pediatric dentists face great challenges in the aesthetic rehabilitation of these young children. Parents are becoming more concerned about the esthetic appearance of their child which needs immediate replacement of the missing teeth. These case reports highlight a specific design for the replacement of anterior missing tooth which can be used successfully in day to day clinical practice.

Keywords: Aesthetics, Fixed space maintainer, Missing primary teeth.

Introduction

The common causes for premature loss of primary anterior primary teeth in infants and toddlers are Early Childhood caries (ECC) and dental trauma.¹ Pediatric dentist face the greatest restorative challenge for the replacement of such premature loss of primary anterior teeth.² Untimely loss of anterior primary teeth has a far reaching psychological impact as well as it reduces the level of confidence in the growing child.¹⁻² It can also lead to development of parafunctional habits, malocclusion and abnormal speech (Phonetics).³

A removable or fixed type of prosthesis may resolve the problem. Major difficulty faced with the removable prosthesis is the children’s compliance, cooperation and desirability to wear.⁴ While replacing the anterior primary teeth clinician should take into consideration that it should not interfere with eruption process of the underlying permanent teeth² and growth and development of jaw. Therefore esthetic prosthesis with limited extension on dentoalveolar tissue should be preferred. Till date very few fixed space maintainer design are available for the replacement of anterior primary teeth.

Thus, the modified cantilever bridge, a newer modality is discussed for the management of missing primary anteriors in the following case report.

Case Report

A 3 year old boy reported to the Department of Pedodontics and Preventive dentistry, Sharad Pawar Dental College, Sawangi with the chief complaint of missing and discolored upper front teeth since 4 months. Past dental and medical history was not contributory. On intraoral examination 51 was found to be absent and discoloration seen with 61. On taking thorough history it was revealed that the tooth got avulsed due to the traumatic fall 4 months back. On sensibility test, 61 was found to be non vital and therefore was indicated for pulpectomy. After considering patient’s mother wish and clinical situation fixed esthetic space maintainer was planned. Mother was explained about the treatment procedure and consent was obtained.

After completing oral prophylaxis, conservative tooth preparation was done with 61. Incisal tooth preparation was done incisally by 1.5mm for the incisal clearance using wheel bur WR 13 (Mani,Japan). Buccal, lingual and proximal preparation was done by using tapered fissure bur TR 12 (Mani,Japan) for the passive fit of the abutment tooth. The palatal preparation was done with flame shaped bur FO 32 (Mani,Japan). The two parallel groves were prepared on palatal side of the crown with TF 12 bur (Mani,Japan). After the tooth preparation putty impression was taken. The working cast was then sent to the laboratory along with the shade selected prior to the start of the tooth preparation.
Metal framework included the metal wing (extension) on the palatal side of 52, porcelain crown with 51 (pontic) and full coverage porcelain crown on 61. Trial fitting of the metal framework was done to check for the passive fit, esthetic and retention. After proper isolation, the appliance was cemented using adhesive resin cement (RelyX -3M ESPE). (Figure 1) (Figure 2) Mother was satisfied with the esthetic appearance of her child. Post operative instructions were given to maintain the proper oral hygiene. Recall visit was scheduled after every 3 months. The removal of prosthesis was informed at around 6-7 years of age to prevent the interference of erupting succedaneous permanent teeth.

Discussion

The requirement of esthetic in mutilated primary dentition is strongly demanded by parents. There is no strong evidence stating that the early loss of the maxillary incisors will hamper the growth and development of the child. Consideration for replacement of anterior teeth is mainly given to improve the speech, masticatory function and to prevent the parafunctional habits rather than the space loss. Absence of anterior teeth mainly affects the phonetics which is being produced by touching the tongue on the lingual side and labial side of the tooth.

In this case, considering the age of patient and patient compliance the fixed esthetic space maintainer was planned to restore the esthetics and function. Premature loss of the anterior teeth can be socially harmful for the child older than 3 year of age who started their preschool; immediate replacement of teeth might minimize the trauma. Removable space maintainer has certain advantage such as it can be easily worn, easy to fabricate, cost effective and can be clean easily. But the patient cooperation in preschool group with removable space maintainer is difficult. Removable space maintainer has certain disadvantage such as it is bulky, easily breakable and unpleasant.

In contrast the fixed esthetic space maintainer having less chance to damage the soft tissue by reducing the coverage area and can be worn for longer period of time. Various option are available with fixed space maintainer such as Groper appliance, Fiber reinforced composite for replacing the primary anterior teeth. But the selection of the appliance depends on the condition of the anchorage tooth, missing tooth, patient’s age and condition of the adjacent tooth. The adjacent tooth to the missing area was indicated for the tooth colored crown therefore no intentional tooth preparation was done in this case. The modified cantilever bridge is easy to fabricate and the patient can maintain the oral hygiene properly as there is no palatal extension of wire and banding on the molars. Appliance gave adequate retention because of the full coverage restoration one side of missing tooth and palatal extension on another side. In this case the pontic used was porcelain fused to metal which has longer life as compare to tooth colored acrylic and composite which gave the additional factor for pleasant esthetic. It provides both mechanical as well as chemical retention for the missing tooth. The prosthesis is having good strength and allows undisrupted growth of the jaw.

This fixed esthetic space maintainer provides adequate retention and esthetic which make it an preferred alternative for the replacement of missing anterior primary teeth by the pediatric dentist. The esthetic and
functioning of this appliance found satisfactory till the last visit of the child.

**Conclusion**

Careful selection of case, minimum preparation and proper design determines the success rate of the fixed anterior prosthesis in the toddlers. Clinician should focus on the replacement of anterior teeth to enhance the quality of life, esthetics, speech and function in the growing children.

**Ethical Clearance:** Prior approval to conduct the study was obtained from the ethical committee of the institutional review board.

Hybrid Encryption for Medical Applications Using Advanced Algorithms in Internet of Things

M Krishna Sai1, P Lakshma Reddy1, N Siva Rama Krishna1, P Venkata Naga Sai Ravi Teja1, Kolla Bhanu Prakash2

1B.Tech, 2Professor, Computer Science and Engineering, Koneru Lakshmaiah Education Foundation, Vaddeswaram

ABSTRACT

Internet of things is connected for some reasons in medical life in restorative and human services, transportation, building and home mechanization and the modern applications, for example, fabricating, farming, framework application, metropolitan scale organizations, vitality the executives, natural observing and so on. In this way, taking the protection and security as a criteria we have to give a safe calculation to shield the correspondence over the web from the cryptanalyst. One of security calculation to scramble the information is RSA calculation. Authentication of login credentials using RSA algorithm is done. In this, the comprehensive survey of message/data security using SHA algorithm is explained. The protocols that are developed for IOT in terms of security goals, network models and computation overhead are presented. Based on the protocol, issues and research directions are identified and proposed.

Keywords: RSA, SHA-512, Encryption, Decryption, Security, Medical

Introduction

Internet of Things (IoT) is a system of devices, machines, objects and people provided with unique ID’s and to transfer the data over the network without involving H2H/H2C interaction. A thing (in IOT) is an entity, that as a unique ID, to transfer data over a network.

IoT systems are separated into two main categories:

1. **Commercial IoT**– IoT devices communicates only with the local devices. The communication was either Bluetooth or Ethernet.

2. **Industrial and Medical IoT**– IoT devices connects with IP network to the global network.

IoT platform is a technology that enables management, straightforward automation of connected devices within the IoT universe. It provides a set of features that speeds up the development, scalability and compatibility for connected devices. IoT Middleware, functions as a mediator between application layers and hardware, includes collection of data over different network topologies and protocols. There are many companies that are built in IoT platform like Microsoft Azure, AWS, Google cloud etc...

Sensor is a contrivance that detects transmutations in an environment and measures physical phenomenon (like temperature, pressure etc) and transforms into an electric signal. There are variants of sensors to quantify virtually all the physical properties around us. The most important properties for sensor are:

- **Range**– Sensor can measure the maximum and minimum values of phenomenon.
- **Resolution**– Sensor can detect the minimum change in the phenomenon.

IoT Security is the act of securing devices and network that are connected. It is main role to retain the customer’s trust on security to fulfill the IoT promise.

The three essential pillars to secure the IoT data are:

- Securing the device
- Securing the cloud
- Lifecycle Management

The drawbacks of IoT security are:

- New threats to data or Physical Security
- Inability of IoT systems to keep pace with change
- Regularity or Compliance challenges

Security Attacks are of two types: Active and Passive.

Active attacks modify the data or create the false statement. Hacker (third party) tries to change the data on target or en routes the data to target. Types of active attacks are:
- Masquerade
- Replay
- Modification of messages
- Denial of Service (DoS)
- Distributed DoS

Passive Attacks make use of information from the sender but don’t modify the data. The nature of passive attacks is monitoring the transmission of data from sender to receiver. Passive attacks are of:
- Traffic Analysis
- Release of message content

Cryptology involves both Cryptography (writing) and Cryptanalysis (solving). Cryptography means science writing which deals with network security. It classified into Symmetric, Asymmetric and Hashing. Encryption and Decryption are two important roles in Cryptography. Encryption encrypts the sender message using key and Decryption decrypts the encrypted message to get the original one. There are many algorithms to provide the message security like RSA, Elgamal, AES&DES, Reilience etc.

Cryptanalysis is the science art of breaking the cipher text without using the key that is used in Encryption. During the design of incipient cryptographic techniques to test the security, Cryptanalysis is utilized.

**Literature Survey**

The mechanism of encryption and protection of data is drawn. The security of communication between layers is also drawn. Mostly, the cryptographic algorithm is chosen here. [1] They have introduced three phases for transferring the message to secure. Using playfair cipher, the encryption of plain text with secret key is done. Next, XOR operation and RSA algorithm is processed. [2] The role of IoT in India is drawn. The comparison between IoT markets from Global to India is improved. They surveyed the most important risks and challenges in IoT. [3] It talks about the security and testing the methodology of IoT network and device and also showcased the applications of IoT. This paper also includes the firming cracking, a part of testing methodology. [4] Here, the secure feature is the elimination of $n$ from the RSA algorithm; instead, the incipiently engendered algorithm for $n$ can be utilized in both keys it is a prone to mathematical factorization attacks this issue making the algorithm more secure with a light increase of time involution. [5]

They presented the IoT security with the challenges, concerns and trends based on wide range of literature. It also presents the generations of IoT security with the variations. [6] By the results of Zone Routing Protocol, SHA3-512 is much better than SHA3-256. By comparing hash code of both the algorithms, SHA3-512 gives higher speed half of the SHA3-256. As length of the hash code in SHA3-512 is more, it requires more storage. [7] The routing approach in mobile networks is considered and attacks that are against routing protocols are analyzed. Secure routing requirements are presented. [8] The architecture done a multiple operation that performs all three SHA2 standards. Further, the performance of hardware implementations is lesser than the performance of proposed algorithm. It offers high secure length strength. [9]

**Method**

**RSA Algorithm**: RSA is a calculation utilized by the cutting-edge PCs to encode and unscramble messages. It is a lopsided cryptographic calculation. Halter kilter implicatively insinuates that there are two diverse keys. [11] This is open key cryptography, since one of the keys can be given to anybody. The other key must be kept private. [12] The calculation is since finding the components of a substantial composite number is troublesome, when the whole numbers are prime numbers; the issue is called prime factorization. It is a key match generator. [13] RSA includes both open key and personal key.

General society key will be famous to everyone; it’s utilized to cipher messages. Messages encoded utilizing the final population key should be unscrambled with the personal key. The keys for the RSA calculation are produced in the accompanying way:
1. Choose two diverse vast arbitrary prime numbers \( p \) and \( q \).

2. Calculate \( n = pq \), where \( n \) is the modulus for general society key and the private keys.

3. Calculate the totient: \( \text{Totient } n = (p-1)(q-1) \)

4. Choose a whole number \( e \) with the end goal that \( 1 < e < \text{totient } (n) \)

Where \( e \) is discharged as the general population key example

Alice gives her open key \((n \text{ and } e)\) to weave and keeps her private key mystery. Bounce needs to send her message \( 'm' \) to Alice to discover the figure content \( 'c' \)

\[ C = m^e \mod n \]

Where \( m = \text{messages} \), \( c = \text{cipher content} \).

**SHA:** It is driven by the slowness of RSA. The main aim of the SHA Algorithm is to achieve the speed in encryption and sign that. It was the initiation from the Message Digest 1 and 2 algorithms.

This algorithm is robust and fast secured algorithm. It is basic to secure the computer transactions. The Secured Hash Algorithm includes the different formats like SHA1, SHA2 and SHA3, Where SHA1 is a cryptographic algorithm which takes the input and gives the output of 160 bit hash value. It forms various security protocols and implementations by which includes secured shell protocol, Transport layer security protocol, pretty good privacy protocol, secure/multipurpose internet mail extension protocol. After a particular changes has been made in SHA1 algorithm the new algorithm has been raised for the security purpose known as SHA2 algorithm.

The SHA 2 group has 6 hash functions having 224,256,384 or 512 bits. The SHA 256 and SHA 512 is the similar algorithm in structure but they are distinct rounds. Due to less support from the windows XP SP2 or even earlier system while running in them the SHA2 was not successful initially irrespective of security that it will provide more efficient than the SHA1.SHA-3 is distinct from SHA1 and SHA2 algorithms where it utilizes sponge construction. In the process of sponge construction the data is first immerse into the sponge and clutched out.

**SHA-512:** SHA-512 is a capacity in cryptographic calculation SHA-2 which is a propelled variant of SHA-1. SHA resembles SHA-256. The message is broken into 1024-piece, the underlying hash esteem and round constants are explained to 64 bits. There are 8 adjusts in SHA-512. The message plan cluster has 80-64 bit. To expand the message plan exhibit, the circle is from 16-79. The word estimate is utilized for counts are 64 bit long. The additional length of the message in bits is a 128-piece whole number, the move and pivot capacities utilized are unique.SHA-512 is a near SHA-256 expect that it is utilized 1024 bits “squares”. What’s more, acknowledge as info a 2^128 bits most extreme length string.SHA-512 additionally has others algorithmic changes in examination with SHA-256.

**Findings**

In first step, the user authentication will take place, so we have to first enter our own password which we have to stay with us. Then some variable length size of string is added to our typed password.
In next step, the authentication takes places that mean we will have to login using the valid credentials, once if it is satisfied they are on the bridge. In next step, the RSA algorithm will comes to picture; here the encrypting is done by the public and private keys.

Here the message we are going to enter will undergo through the most secured hash algorithm and it encrypts the message by using the SHA-512 and it sends the encrypted message and then at the receivers end he will decrypt the message.

The overall view of our proposed algorithm is that first we are going to authenticate which will happen only through the correct login credentials and then the message is double encrypted using the RSA and SHA 512 algorithm. We have chosen SHA because it is the most trending secured hash algorithm which is widely used by the great companies like Google, Microsoft.
Discussion

Test case 1: The password input takes place, here the user needs to enter his liked password then the password will be appended to some other text and then it will add to the file automatically. The user added password along with then automatically generated password will be appended to the user password and will be stored in the file.

Then the password validation phase takes place, which means the user should need to get the password credentials from the text file and he needs to enter this in this phase in order to authenticate. The commands will be present like True or False; True command will be saved when the user has given the correct credentials. False command will be saved when the user given the wrong credentials. Here the command is true that means the user is a valid user.

Based on the commands that are present in the valid file the program executes. If the command present in it is true that means the user is the valid user and hence the program will execute successfully. Here the user has used the correct login credentials so the program executes and hence the exchange of messages takes place.

Test case 2: As in the above test case the user gives the input password and the program will take that as an input and it will add the password automatically of some variable length. The user generated password is authenticated with the automated randomly generated password and is texted into this text file.

Here in this validation phase the user is not the right user so the user enters some random password to check with the algorithm thinking that it might work. We can see that the command that is shown is false that means he is not the right user.

As we discussed earlier this phase depends on the valid text file so we can see that this is false in the above figure and we can clearly see that this the program failed to execute and displays the message as “Sorry, we are not able to authenticate”.

Conclusion

In this paper, we proposed a hybrid algorithm that makes the message even more secure. We have used already pre-defined algorithms and we have modified with our own algorithms and we made a hybrid algorithm. According to this, we can take care that the message are within the correct receiver. This can enhance the protection as we have a tendency to use the foremost wide used SHA-512 rule that is employed in major corporations like Google. The uniqueness about our proposed algorithm is the variable length key that means the cryptanalyst doesn’t knew the length of the key. It makes the cryptanalyst difficult if he tries brute force attack. This will improve the security of the various real time applications like a social media, secure texting in an android mobiles etc., it takes bit time more than the normal RSA algorithm because we have added two modules to it to increase the security so, by integrating this approach to both algorithms the security and confidentiality is improved.

Non-Syndromic, Non-Familial Hyperdontia of Both Maxillary and Mandibular Region—A Case Report

Amudhan A1, Punitha V C2, Manigandan T3, Sarumathi T3, Krishna Prasanth B4

1Associate Professor, Department of Oral Medicine and Radiology, Sree Balaji Dental College & Hospital, BIHER, Chennai; 2Assistant Professor, Department of Community Medicine, Meenakshi Medical College & Research Institute, Chennai; 3Professor, Department of Oral Medicine and Radiology, 4Assistant Professor, Department of Epidemiology, Sree Balaji Dental College & Hospital, BIHER, Chennai

ABSTRACT

Hyperdontia had been reported with certain syndromes but hyperdontia in a non-syndromic individual are not commonly found and reported. The etiology of non-syndromic hyperdontia was not clearly known. This paper reports a case with multiple supernumerary and Supplementary teeth presents bilaterally.

Keywords: Supplementary Teeth, supernumerary teeth, non-syndromic hyperdontia

Introduction

A supernumerary tooth or hyperdontia is one that is additional to the normal series and can be found an excessive but organized growth of the dental lamina of unknown cause.[1, 2] Supernumerary may happen isolated mostly although some may be familial and others may be syndrome associated (Gardner’s syndrome, Cleidocranial dysplasia, Apert and Crouzon). Tomes suggested nomenclature for teeth in excess, they were defined as “supplementary” if they were present with a normal morphology and as “supernumerary” if they were present with morphologic and volumetric variations. [2] Depending on the position, a supernumerary tooth can have different names, such as a) mesiodens- located between central incisors, b) distomolar- a fourth molar erupts distal to third molar, c) paramolar it may be fully developed or hypomorphic, small in size. paramolar are found buccal or lingual to maxillary molars, preferably in relation to the first molar. The most common site is the maxillary incisor region, followed by maxillary fourth molars and mandibular fourth molars, premolars, canines, and lateral incisors. Supernumerary mandibular incisors are very rare [1]

The clinical situations that may indicate the presence of supernumerary teeth are [3]

- An absence of permanent teeth in the maxillary/mandibular arch
- Malposition of erupted permanent teeth
- Malocclusion
- Wide interincisive diastema
- Reabsorption of roots of the adjacent teeth with loss of their vitality and symptomatology
- Tumefaction on the vestibular or palatine/lingual area.
- Agenesis (confirming radiographically)

Clinical Case: A 21-year-old male reported to our outpatient department for correction of his misaligned teeth. Familial, medical and dental history was non-contributory. General examination and extra-oral examination showed no abnormality. Dental examination revealed the absence of 23, 34 and presence of one miniature tooth next to 16 teeth region. OPG revealed the congenitally missing 23, impacted permanent 17,18,28,38,48 and 6 additional teeth, and these
resembled premolars and molars (Fig 1). The patient was advised for CBCT (cone beam computed tomography) for further evaluation, but unfortunately, the patient did not turn up for further follow-up. Based on the dental findings and the absence of any associated disorder or syndrome, the present case represents those rare forms of bilateral non-syndromic hyperdontia.

Fig. 1: OPG reveals congenitally missing 23, impacted permanent 17, 18, 28, 38, 48 and six additional teeth, resembling premolars and molars.

Discussion

An intervention was advised only if these teeth showed any pathological changes or a tendency for cyst formation. These patients were educated and adequately counselled.

Tooth anomalies can result from a complex interference of genetic factors and developmental processes of odontogenesis. A second theory known as dichotomy suggests that the tooth bud is split to create two teeth, one of which is the mesiodens. The third theory stating localised and independent hyperactivity of the dental lamina is the most widely supported. According to this theory, remnants of the dental lamina or palatal offshoots of the active dental lamina are induced to develop into an extra tooth bud, which results in a supernumerary tooth [4,5,6,9]. The occurrence of non-syndromic supernumerary teeth is more often in maxilla than in mandible, in male than in female, in permanent dentition than in primary dentition [6] and unilaterally than bilaterally. [6] In our case we have both supernumerary as well as supplemental teeth and present in both maxillary and mandibular dental arches. Patients with non-syndromic supernumerary teeth might be related to heredity factor; therefore familial history should be carefully examined. [7]

Hypercoria is usually associated with developmental disorders or syndromes like supernumerary teeth developing such as Gardner’s syndrome, cleidocranial dysplasia, Down syndrome, Apert syndrome, and cleft lip and palate. An occurrence of multiple supernumerary teeth in the absence of any associated syndrome or condition is very uncommon. In such non-syndromic cases, mandibular premolar region is the preferred site of occurrence.

Classification: Hyperdontia teeth are classified into [1,13]

Supplemental: Normal size and shape. The most common supplemental tooth is permanent maxillary lateral incisor, not rarely premolars and molars present as supplemental teeth.

Rudimentary: Abnormal shape and smaller size types

Rudimentary supernumerary teeth are classified further into

Conical: Small, peg-shaped, malformed additional teeth most frequently form in the incisor or molar region. It develops with root formation ahead of or at an equivalent stage to that of permanent incisors and usually presents as a mesiodens [9].

Tuberculate: Barrel-shaped anterior with more than one cusp, tuberculate additional teeth are often paired and are commonly located on the palatal aspect of the central incisors

Molariform: Small premolar-like or molar-like.

Odontomas: Odontomes are the fourth in the category of a supernumerary tooth. Odontomes are considered hamartomas and could be placed within this classification, but these lesions are traditionally included in the list of odontogenic neoplasms. Two types of odontomas have been identified the complex type presents as a mass of disorganized odontogenic tissues and the compound odontoma presents as an appearance of well-organized tooth like structures.

Problems Associated with Supernumerary Teeth [10, 11]

- Failure of Eruption/dysodontiasis of permanent teeth
- Displacement/malposition
- Crowding
- Pathology- impacted supernumerary teeth are the cause of follicular cysts
Management of Hyperdontia\cite{12}: Treatment depends on the type and position of the supernumerary tooth and its effect or potential effect on adjacent teeth. The management of hyperdontia should form part of a comprehensive treatment plan and should not be considered in isolation. Removal of the hyperdontic tooth is recommended where:

- Central incisor eruption has been delayed or inhibited;
- Altered eruption or displacement of central incisors is evident;
- There is associated pathology;
- Active orthodontic alignment of an incisor in close proximity

Indications for monitoring without hyperdontia removal

Extraction is not always the treatment of choice for hyperdontia. They may be monitored without removal where:

- A satisfactory eruption of related teeth has occurred;
- No active orthodontic treatment is envisaged;
- There is no associated pathology;
- Removal would prejudice the vitality of the related teeth.

Antibacterial Efficacy of Essential Oil of Two Different Varieties of Ocimum (Tulsi) on Oral Microbiota—An Invitro Study

Kush Kalra¹, Ramprasad Vasthare², Padmaja Ananth Shenoy³, Shashidhar Vishwanath³, Deepak Kumar Singhal⁴

¹Senior Lecturer, Department of Public Health Dentistry, Santosh Dental College, Santosh University, Ghaziabad, India; ²Associate Professor, Department of Public Health Dentistry, Manipal College of Dental Sciences, Manipal, ³Associate Professor, Department of Microbiology, Kasturba Medical College, Manipal, ⁴Associate Professor, Department of Public Health Dentistry, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education, Manipal, India

ABSTRACT

Introduction: Ocimum (Tulsi) is an Indian sacred plant which has immense medicinal values. There are various varieties of Tulsi grown in India most common being Ocimum sanctum and Ocimum basilicum.

Objectives: To test in-vitro the antibacterial efficacy of commercially available essential oil extracts of different varieties of Ocimum (Tulsi) on common oral pathogens.

Methodology: Commercially available essential oil of two varieties of Ocimum i.e. Ocimum sanctum and Ocimum basilicum were procured and checked for their antibacterial activity in-vitro. Five common oral pathogens were selected (two aerobic and three anaerobic). The organisms were incubated on respective culture media. Agar well diffusion method was used to check their activity. The oils were tested undiluted form and 1 in 10 dilutions. The activity of oils was compared with chlorhexidine.

Results: Both the oils showed antimicrobial activity against all the test strains. The zone of inhibition produced by Ocimum sanctum oil was maximum for Porphyromonas gingivalis (55 mm) followed by Prevotella intermedia (48 mm). The zone produced was much wider than that of chlorhexidine. For Fusobacterium nucleatum, the zone was equivalent to control. For aerobic bacteria, Ocimum sanctum, showed almost equal efficacy as of chlorhexidine but the effect produced by Ocimum basilicum oil was lesser than control.

Conclusion: The essential oil of two varieties of Tulsi showed good antimicrobial activity against the common anaerobic and aerobic organisms of the oral cavity. The activity was more pronounced against anaerobes and was found to be better than chlorhexidine. Ocimum sanctum oil produced a wider zone of inhibition as compared to Ocimum basilicum for all the test strains.

Keywords: chlorhexidine; Ocimum basilicum; Ocimum sanctum, Porphyromonas gingivalis, Prevotella intermedia

Introduction

India since time immemorial is a land where natural herbs and derived products have been used to cure various disease. Ocimum or commonly known as Tulsi is an aromatic plant in the family Lamiaceae which is native to the Indian subcontinent and is a widely cultivated plant throughout the Southeast Asian tropics. The plants are predominantly herbs or shrubs annuals or perennials inhabit. They possess glandular hairs or sessile glands secreting strongly scented volatile oils.

About 160 species of Ocimum genus are reported to be distributed throughout the world. Of the known species Ocimum sanctum, Ocimum basilicum, Ocimum canum, Ocimum gratissimum and Ocimum americanum are widespread in India. Tulsi is an important symbol in many Hindu religious traditions, which link the plant with Goddess figure and hence is grown very common in many households.
Medicinal plants are part and parcel of Indian society to combat diseases since the dawn of civilization. Tulsi also known as the “Queen of Herbs.” is an important medicinal plant and has been traditionally employed in hundreds of different formulations for the treatment of a wide range of disorders like common colds, headaches, stomach disorders, inflammation, heart disease, various forms of poisoning and malaria.\(^4\) It has also been used in treating many chronic non-communicable diseases like diabetes, hypertension and hyperlipidemia.\(^5\)\(^7\)

Dental diseases like dental caries and periodontal disease have affected human race throughout history and are considered one of the most prevalent diseases in the world. Although the nature of the disease and the methods of treatment have advanced tremendously during the past century, it is still not controlled worldwide.\(^8\)

Chlorhexidine is a widely used drug for control of dental disease. The proof of its efficacy in plaque control is beyond dispute. Almost three decades of its use by the dental professionals, chlorhexidine is now recognized as the gold standard against which other antiplaque and antigingivitis agents are measured.\(^9\)

However, use of chlorhexidine for dental disease prevention has been controversial owing to its various side effects like dry mouth, irritation, teeth staining and taste disturbances.\(^10\)

Use of herbal products offers a valuable alternative to chlorhexidine owing to their medicinal values and no side effects. A thorough literature search revealed that few studies had shown the antibacterial properties of various species of Ocimum on oral pathogens, but no comparative studies have been done on essential oil extracts. Hence the thrust of this study was the lack of literature comparing the effect of essential oil extract of different varieties of Tulsi on oral microorganisms as compared to chlorhexidine.

**Materials and Method**

This study used an in vitro experimental design. Ethical clearance to conduct the study was obtained from the Institutional Ethics Committee, Kasturba Hospital, Manipal with registration number IEC 470/2016. The study was carried out between January 2017 and April 2017 at Department of microbiology, KMC Manipal. Commercially available essential oil of two varieties of Tulsi i.e. *Ocimum sanctum* [Pure Holy Basil (Tulsi) Essential Oil - Ocimum Santum, dève herbes, New Delhi, India] and *Ocimum basilicum* [Basil Tulsi Essential Oil (Ocimum basilicum), Kazima Perfumers, New Delhi, India] were procured from market retailers. The oil used was 100% pure oil (as per manufacturer’s instruction). Commercially available chlorhexidine mouthwash 0.2% [Plakil mouthwash, Vishal Dentocare Pvt. Ltd. Gujarat, India] was also procured and used as a control.

**Bacterial Strains used in the Study:** The in-vitro antimicrobial activity of the tulsi extracts was tested on the bacterial isolates of *Staphylococcus aureus*, *Streptococcus mutans*, *Porphyromonas gingivalis*, *Prevotella intermedia* and *Fusobacterium nucleatum*. These isolates were obtained from clinical samples of patients diagnosed with periodontitis and dental caries.

**Inoculum Preparation:** *P. gingivalis, P. intermedia, F. nucleatum* and *S. aureus* isolates were grown on 5% sheep blood agar and *S. mutans* was grown on Brain Heart Infusion (BHI) agar. The anaerobic isolates were incubated in the anaerobic workstation (Don Whitley, Yorkshire, UK) for 72h. *S. aureus* plates were incubated aerobically for 48h at 37°C while *S. mutans* was incubated in the CO2 incubator (NuAire, Inc.) for 48 h. After checking for the bacterial purity, the colonies of anaerobic isolates were inoculated in thioglycollate broth, *S. mutans* in BH1 broth and *S. aureus* in peptone water, and the broths were incubated for 4-6h under appropriate incubation conditions. The turbidity of *S. mutans* and *S. aureus* was adjusted to 0.5 McFarland, turbidity for anaerobic isolates was adjusted to 1 McFarland.\(^10\)

**Product Inhibition Assay:** The antimicrobial susceptibility was determined by agar well diffusion (punch well diffusion) method. For agar well diffusion method, lawn culture of test organism was made on respective media. A sterile cotton swab was dipped into the inoculum and rotated against the wall of the tube above the liquid to remove the excess inoculum. The entire surface of agar plate was then swabbed three times with the cotton swab by rotating the plates by approximately 60° between streaks to ensure even distribution. The same procedure of inoculum preparation and inoculation of culture media was performed for all the bacteria tested. Following the lawn culture of test organisms, individual 9 mm wells were cut in agar plates with sterile borer and 100 µl amounts of oil extract or control were dispensed into these wells.
To avoid bias, the oils were transferred into same color bottles and were marked as oil 1 (Ocimum basilicum) and oil 2 (Ocimum sanctum) respectively. The essential oil extracts were tested in two concentrations, undiluted and 1 in 10 dilutions in ethanol. The microbiologist involved was unaware of the oil codes during the experiment.

Chlorhexidine gluconate (0.2%) was used as a control and its antimicrobial activity was determined against all the bacterial isolates. Vancomycin 30µg discs were used as a procedural control for S. aureus and S. mutans. Metronidazole 5µg (Hi Media Labs, Mumbai, India) discs were used as the procedural control for anaerobic bacteria. The culture plates with anaerobic organisms were incubated in the anaerobic workstation (Don Whitley A35 Anaerobic workstation) for 72h at 37°C. Mueller Hinton agar with S. aureus and BHI agar with S. mutans were incubated aerobically at 37°C for 48 h. All the procedures were performed under strict aseptic conditions and experiments were repeated in duplicates.

After the desired incubation period was over, the zone of inhibitions for the extracts was measured using a Vernier callipers. The diameters of the clear inhibition zones were measured to the nearest millimetre.

Results

The essential oil extracts were tested in two concentrations, undiluted and 1 in 10 dilutions. Vancomycin 30µg discs were used as a procedural control for S. aureus and S. mutans. Metronidazole 5µg discs were used as the procedural control for anaerobic bacteria.

The zone of inhibition produced by both the oils was better against anaerobes as compared to aerobes. The activity of Ocimum basilicum oil was comparatively less as compared to Ocimum sanctum oil for all the test strains.

Table 1: Activity of essential oils against test organisms

</table>

For S. aureus the zone of inhibition for Ocimum sanctum (1 in 10 dilutions) was 27mm which was more than chlorhexidine. For S. mutans both the oils had a lesser zone of inhibition as compared to chlorhexidine. The plates with the zone of inhibition are shown in Fig 1 for S. aureus.

Ocimum sanctum oil undiluted produced the highest zone of inhibition of 55 mm against P. gingivalis followed by 48 mm and 36 mm for P. intermedia and F. nucleatum respectively.

For F. nucleatum, Ocimum sanctum oil (undiluted) showed similar activity as chlorhexidine. For P. intermedia both the oils (undiluted) had a wider zone of inhibition as compared to chlorhexidine. For P. gingivalis, Ocimum sanctum oil (undiluted) showed a wider zone of inhibition as compared to chlorhexidine. The zone of inhibition for P. intermedia after 72 hours of incubation is shown in Fig 2.
India is a land of beautiful natural flora and has abundant medicinal plants growing throughout the country. Few plant extracts are known to possess antimicrobial activity, especially against bacterial pathogens. *Ocimum* (Tulsi) is one such plant which is predominantly present in the Indian subcontinent. The medicinal values of Tulsi extracts have been well documented in the literature. It has been described as the sacred and medicinal plant by Charaka in the Charaka Samhita and is frequently mentioned as one of the main pillars of herbal medicine.

The present study was carried out to test antibacterial activity of commercially available oil of two species of Tulsi against common oral gram positive and gram negative organisms. The oils were tested as undiluted and 1 in 10 dilutions. Ethanol was used as a diluent because the essential oils were more soluble in alcohol when compared to distilled water.

Although both the oils showed promising results against the various bacterial strains; the effect of *Ocimum sanctum* oil was much more pronounced than *Ocimum basilicum*. The active constituent present in *Ocimum* species is Eugenol and perhaps is primarily responsible for the therapeutic potentials of Tulsi.13

Few studies done in India have reported antibacterial activity of Tulsi. A study was done by Pai RK et.al to analyze the efficacy of *Ocimum sanctum* extract against various oral microorganisms. Maximum activity of the extract was seen against *S. mutans* and *S. sanguis*.14

Another study done by Agarwal P et.al showed that at 4% concentration of Tulsi extract, a zone of inhibition of 22 mm was obtained against *Streptococcus mutans*.15 An in-vitro study done by P Eswar et.al showed 6% w/v concentration of *Ocimum sanctum* extract was effective against the periodontal microorganism.16 However a study done by Mallikarjun S et.al showed that tulsi extracts exhibited resistance to *P. gingivalis* and *P. intermedia* which was in contrary to our results.17

*Ocimum sanctum* has also been tested against few other gram negative bacteria. A study was done by Goyal P et.al showed that Gram-negative *Salmonella typhi* was completely resistant to all the tested extracts of *Ocimum* however it was effective against Gram-positive strains.18

The current evidence obtained from this study shows a significant inhibitory effect of essential oil on aerobic and anaerobic microorganisms. The effect produced was better than that produced by chlorhexidine in the case of anaerobic bacteria. However, for aerobes, it was somewhat equivalent or less than that of chlorhexidine.

Since the essential oil obtained from Tulsi is a natural product, there are no associated side effects when compared to chlorhexidine. Also being native to the country and of religious importance, it has a better chance of being accepted by the people. These finding indicates the possibility of using the essential oil of *O. sanctum* in oral health care products for reducing microbial load in the oral cavity.

This study being an in-vitro provide just a preliminary evidence of antibacterial efficacy of essential oil of different varieties of Tulsi. Five major pathogenic

---

**Fig. 2: Zone of inhibition against *Prevotella intermedia* after 72 hours of incubation**
bacteria were tested in this study. However, many other microorganisms have been implicated in the causation of oral disease.

The MICs of the purified active components from the Tulsi extracts against the common pathogenic oral microorganisms needs to be determined. Future clinical trials should be carried out to demonstrate its effect on the various microorganisms further and to elucidate its effects on other aspects.

Conclusion

The essential oil of two varieties of Tulsi showed antibacterial efficacy against the common anaerobic and aerobic organisms of the oral cavity. The activity was more pronounced against anaerobes. *Ocimum sanctum* oil produced a wider zone of inhibition as compared to *Ocimum basilicum*.

Study of Correlation between HbA1c and Renal Dysfunction in Type-2 Diabetes Mellitus

M. T. S. Sri Vaishnavi1, Sangita Patil2, Ajit Sontakke3, Dhiraj Mane4
12ND year M.B.B.S. Student, 2Associate Professor, 3Professor & Head, Department of Biochemistry, Krishna Institute of Medical Sciences, Karad, Maharashtra; 4Statistician, Krishna Institute of Medical Sciences deemed to be University, Karad, Maharashtra

ABSTRACT

Objectives: With the rising prevalence of type 2 diabetes it has come to pose a heavy burden on healthcare systems worldwide. Diabetic nephropathy is the most common cause of end-stage renal disease could have a seriously negative impact on the economies of developed as well as developing nations. Diabetic nephropathy can lead to tissue scarring, urine proteins loss and chronic kidney disease, requiring sometimes dialysis or even kidney transplantation. Since the aim of the study is to recognize the importance of measurement of HbA1c in renal dysfunction which might help for the application of appropriate drug regimens and to regulate and monitor glucose levels to improve health conditions in the care of type2 diabetic patients.

Method: Blood samples received from either OPD or IPD in plain and EDTA vacutainers was separated from blood to plain vacutainer by centrifugation at 3000rpm for 10 minutes. For HbA1c EDTA vacutainer samples are used. By using different methods serum urea, creatinine estimated on fully automated analyzer EM360

Results: The correlation coefficient as Pearson’s correlation coefficient is 0.333 between HbA1c and blood urea level with p value <0.0001 which is highly significant and between HbA1c and blood urea level it is -0.026, p value is 0.6484, indicating this negative correlation is significant. Serum creatinine and HbA1c shows positive correlation, p value is 0.4459 showing this correlation is significant. Correlation between HbA1c and serum creatinine in all three age groups is positive.

Conclusion: These findings may provide the basis for the application of appropriate drug regimens and to regulate and monitor glucose levels to improve health conditions in the care of diabetic patients. Since HbA1c is a important measure to assess the micro vascular complications and plasma glucose.

Keywords: HbA1c, serum creatinine, diabetic nephropathy, blood urea, renal failure

Introduction

Diabetes mellitus describes a metabolic disorder with different aetiologies which is characterized by a chronic hyperglycemia and disturbances of carbohydrates, fat, and protein metabolism resulting from defect in insulin. Since diabetes is the most common reason for renal dysfunction resulting in rise in level of serum urea and creatinine. This hyperglycemia in diabetes is associated in process of damage and failure of various organs including kidneys. Hyperglycemia causes the excess of glucose to combine with tissue proteins including hemoglobin. This results in increased amount of glycosylated hemoglobin (HbA1c) which indicates poorer control of blood glucose levels in past 3-4 months. Till date HbA1c is a useful parameter of how well blood glucose levels has been controlled in past 3-4 months. Increased levels of HbA1c might be associated with cardiovascular diseases, nephropathy, neuropathy and retinopathy.

Tests to measure glucose in blood were developed 100 years ago and hyperglycemia the sole criteria for diagnosis. Before 2010 virtually diabetes society recommended blood glucose analysis as the exclusive
method to diagnose diabetes. Notwithstanding these guidelines over the past few years many physicians have been using HbA1c to screen and diagnose diabetes because of its advantages 1.

Many factors can affect the interpretation of HbA1c measurement in patients with chronic renal failure 2. Also to recognize the ranges of HbA1c in diabetes, tracing back complications of diabetes and its control 3, 4, 5.

Since the aim of the study is to recognize the importance of measurement of HbA1c in renal failure. Proper glycemic control can decrease the incidence of diabetic nephropathy and earliest markers of nephropathy are serum creatinine and blood urea. With these circumstances this study is being carried out to measure the levels of HbA1c, serum urea, serum creatinine along with fasting blood sugar. A few researches carried out to find out the cut off values of HbA1c screening however focusing on the high risk groups. A study determined the normal range of HbA1c in a sample of non diabetic 6. Since HbA1c is an important measure to assess the micro vascular complications, also to find out the correlation between HbA1c and serum urea, serum creatinine.

**Materials and Method**

This study was conducted in a tertiary hospital after obtaining approval from institutional ethics committee. Since this is a retrospective study, data collected from the records of tertiary care hospital. All subjects were diagnosed cases of type 2 diabetes mellitus of the age group ranging from 20-80 years attending the OPD and IPD’S of the hospital. Patients of type 1 diabetes are excluded from the study and also patients below 20 years and above 80 years are also excluded because they are less in number. The biochemical parameters estimated for all these subjects in clinical biochemistry laboratory by the use of fully automated analyzer EM360 from Transasia. Blood samples received from either OPD or IPD in plain and EDTA vacutainers was separated from blood to plain vacutainers by centrifugation at 3000rpm for 10 minutes. For HbA1c EDTA vacutainers samples are used. Following methods were used for investigating different biochemical parameters.

</tbody>
</table>

Correlation between HbA1c and serum creatinine in all three age groups is positive and also significant. Mean for serum creatinine in age groups 20-40 years is 1.75, 41-60 years is 1.92, 61-80 years is 2.02 indicating age wise there increase in serum creatinine levels.
Discussion

Glycated hemoglobin (HbA1c) was before recognized as an “unusual” hemoglobin of diabetes over 40 years ago 7. HbA1c was introduced into clinical use in the 1980’s and subsequently has become a cornerstone of clinical practice. HbA1c reflects average plasma glucose over the previous 8-12 weeks 8. It can be performed at anytime of the day and does not require any special preparation such as fasting. Because of this convenience HbA1c become a preferred test for assessing glycemic control in people with diabetes. In recent days this is becoming a diagnostic test for diabetes and also screening test for persons at high risk of diabetes 9.

HbA1c has now been recommended by an international committee and by the ADA as a means to diagnose diabetes (9). Many studies have reported nephropathy as a complication due to long standing duration of diabetes and correlated it with microalbuminuria, hypertension but there are few studies which have correlated levels of serum creatinine and urea 10. Experimental evidences identify urea as a putative culprit of reduced insulin sensitivity and defective insulin secretion. Keeping in mind all these circumstances.

We collected data for 300 diagnosed cases of type 2 diabetes for HbA1c, BUL, and serum creatinine. Our results provide age wise distribution as in our last group 61-80 years more numbers of cases indicate, as the age increases there is an increase in incidence of type 2 diabetes (11). Relationship between HbA1c and BUL is coming negative and also it is significant. Lower than expected levels of HbA1c can be seen in patients of chronic renal diseases 11. As per American Diabetes Association results of HbA1c affected during kidney failure (uremia), chronic excessive alcohol intake and hypertriglyceridemia 11, 12, 13. In our study also, there might be interference with the estimation of HbA1c resulting in negative correlation with BUL. Renal failure can have complex influences on HbA1c formation and measurements14. The reason being the fact that urea derived isocyanate can lead to formation of carboxylated Hb, which can be indistinguishable from HbA1c during the time of estimation 15, 16. In diabetic patients with end stage renal disease erythrocytes lifespan tends to decrease. This may result in part form of iron deficiency anemia, recent transfusions or other effects of kidney disease on erythrocytes survival. Uremic patients with high blood urea levels also develop significantly high levels of carbamylated hemoglobin, which interferes with some HbA1c assays17. This might explain the negative correlation between HbA1c and BUL. HbA1c and serum creatinine show positive correlation with significance indicating creatinine increases with increase in HbA1c.

Serum creatinine is significantly associated with impaired glucose regulation independent of known metabolic risk factors.17. Nephropathy is the leading cause of chronic renal failure worldwide and also in India which is responsible for renal failure in about one–third of the patients who undergo dialysis18. The exact cause of diabetic nephropathy is unknown, but various postulated mechanism are hyperglycemia, advanced glycation products and activation of cytokines. Although it has been stated by various authors that poor glycemic status is one of the key factors responsible for diabetic nephropathy 19,20.

Persistent elevation in blood sugar and therefore HbA1c increases the risk of long term vascular complications of diabetes such as coronary disease, heart attack, stroke, kidney failure, blindness, neuropathy etc. poor blood glucose control also increases the risk of short term complications of surgery as poor wound healing (20). HbA1c causes an increase of highly reactive free radicals inside blood cells. Radicals alter blood cell membrane properties. This leads to blood cell aggregation and increased blood viscosity which results in impaired flow.

The use of HbA1c can avoid the problems of day to day variability of glucose values and importantly it avoids the need for the person to fast and to have preceding dietary preparations. These advantages have implications for early identification and treatment which have been strongly advocated in recent years. However, HbA1c may be affected by a variety of genetic, hematologic and illness related factors. The most common important factors worldwide affecting HbA1c levels are hemoglobinopathies (depending on the assay employed), certain anemia and disorder associated with accelerated red cell turnover such as malaria.

However negative correlation between HbA1c and BUL indicates that we should not rely on HbA1c assays when it is end stage renal damage.
Keeping in mind all the limitations as well as usefulness of HbA1c, we can say practice of assay methods has changed profoundly in recent years. The least reliable methods have been superseded by standardized procedures. Assays based on chromatographic or immunological techniques have strongly contributed to improve the quality of the results supplied to the clinicians. Therefore HbA1c is a useful indicator of how well the blood glucose level has been controlled in the recent past (over two to three months) and may be used to monitor effects of the diet, exercise and drug therapy on blood glucose regulation in people with diabetes. Since HbA1c measurement is ubiquitous it seems advisable for providers to become familiar with factors affecting the test in general and the limitations of the assays offered in their laboratory in particular.

**Conclusion**

In our study, there might be interference with the estimation of HbA1c resulting in negative correlation with BUL. Renal failure can have complex influences on HbA1c formation and measurements. The reason being the fact that urea derived isocyanate can lead to formation of carboxylated Hb, which can be indistinguishable from HbA1c during the time of estimation. (20). Therefore HbA1c is a useful indicator of how well the blood glucose level has been controlled in the recent past (over three to four months) and may be used to monitor effects of the diet, exercise and drug therapy on blood glucose in people with diabetes. Since HbA1c measurement is ubiquitous it seems advisable for providers to become familiar with factors affecting the test in general and the limitations of the assays offered in their laboratory in particular. These findings may provide the basis for the application of appropriate drug regimens and to regulate and monitor glucose levels to improve health conditions in the care of diabetic patients. Since and monitor glucose levels to improve health conditions in the care of diabetic patients. Since HbA1c is a important measure to assess the microvascular complications and plasma glucose.

The Psychological, Social and Political Measures, How Clients Think About the Utilization of Plastic Money Using in India

Nandita Sikari¹, K. Harikrishnan²
¹Research Associate, ²Associate Professor, VIT University Chennai Campus, Tamil Nadu, India

ABSTRACT

Background: In this review article explain how India is adopting using of plastic money in psychological-behavioural-social aspect.

Aims: How customers consider use of plastic money, which is clarifying broadly. Indian business exchanges are commonly done by generally utilizing of liquid money.

Materials and Method: This article is a review paper, based on literature survey, reports, case study has prepared.

Result: This change has proposed individuals to start the usage of plastic cash instead of the fundamental hard money for doing exchanges once dependably which additionally connects with them the upside of credit buys and a post-reimbursement elective for the level of credit used on these cards.

Conclusion: Government needs to see how to improve and constantly secure area sections with high-security fix up programming which does not give a lead to information robbery or hacking of money related subtleties of the clients. Banks should train individuals through pondered the occupations of plastic and the usage headings to the monetarily botching masses proportionately as the present clients and to support a once in a while extending number of individuals to utilize plastic cash.

Keywords: Plastic money, Psychological Political Social approximation, IT industrialization, Buy-today-pays tomorrow option, Digitalisation in Indian economy.

Introduction

Plastic money is a system of cashless trade where credit, debit, charge, shopping and smart cards, (EMV) cards, etc. are considered to use in the customer day by day presence to small scale associations¹. Plastic money is used in procuring any tradable things instead of using paper cash which isn’t always available at any time and situations of one’s life. In India, in psychological, social and political approximation, how clients think about usage of plastic money that is explaining in a broader way. Indian business trades are generally done by mostly using of liquid cash. Still individual’s trust in liquid money close by¹. Financial organizations like Visa, Master, Maestro, and Ru-Pay (in India) empower electronic hold trade through the plastic money that does 24x7 and 366 days works. In India plastic money has ended up being pervasive by the customers of 719.51 million as demonstrated by 2016 measurements where 2017 database has revealed 860.17 million of such customers accounting 33.45% of enhancement of customers taking a glance at the consecutive years. In June 2018, 944 million Visa cards being used in India join as individual and corporate cards². The estimation of MasterCard and Visa card trades widely inclusive length of June 2018 accomplished more ₹46,629 crore, moderately growing from a year sooner. Platinum card trades the period went up by 33 percent to ₹3, 15,627 crores. This endeavour suggestion is to address the reason for such increased value in India or it’s the most part high enlargement interestingly with the prior years’ database. The endeavour also focuses the effect of the industrialization of information technology (IT) on plastic money customers in India.
With the rapid advancement and exponential refresh in the enhancement field, the utilization of plastic money and the essentials for a cashless society has progressed. The cashless society, where more and expensive to-control (direct) coins and notes are replaced by instigating electronic bits begun by various sorts of plastic cards is a charming prospect for the twenty-first century. The enlightened was the progress of the use of the plastic cash (money) at the offer of POS (Point of Sale) and has influenced cases that the UK could be the first central cashless society by International Journal of Retail and Distribution Management in 2001. Bank for International Settlement in 2001 demonstrated that plastic money has boated checks as the most totally saw non-money disperse and nations like South Korea and Australia was relied on to mastermind after an in every convenient sense gravely depicted perspective. All through late decade’s plastic money have wound up being sensibly open to the family as MasterCard fortify have stretched out credit to clients. Indirect focuses on the examination of individuals, gatherings, or affiliations and the structures they use to pick secure, use, and dispose of things, affiliations, experiences, or contemplations to satisfy needs and the impacts that these methods have on the customer and society (Professor Lars Perner, 1999)\textsuperscript{14}. The lead parts of the buyer are to an incredible degree touchy all around with the stores added to them and in that limit if all else fails their decisions are standoffish concerning their veritable bits of information\textsuperscript{28}. They may not keep running about concerning their inside motivations and may react to changes affecting their affinities finally stated\textsuperscript{30}. It is critical to search for after and think the gaining propensity as customers can’t be put down and have passed on the parts that influence their purchase. Moreover, he intertwines specific elements, for instance, social, political and psychological as basic determinants of purchaser facilitate\textsuperscript{4}. So India also makes digitalized by use of plastic money and e-transactions.

**Review of Literature**

Again, in claim to fame stores with over $1 million in deals, Visas represented 10% of the dollar deals volume in 1978. Year of 1980, Visas deals had expanded drastically to seventeen percent of the dollar deals volume. There is no uncertainty that IT systems for influencing trades can break even with, or enhance, money in certain regards, and for certain reasons. The speed of culmination is for the most part as quick, or some of the time quicker, with a plastic card or e-cash; (Zellekens and Rueter1996)\textsuperscript{21}. The charge card was at first utilized as a typical instalment mode for extravagances, for example, travel, and settlement. Be that as it may, it’s right now dynamically utilized for getting small things of comfort in our day by day lives beginning from the complex to the everyday (Lee, 2000)\textsuperscript{19}. People must have convincing motivations to change their instalment propensities. Else, they keep misuse recommends that of instalment, they’re most familiar with buyer fulfilment from the buy depends intensely on the season of lining and the season of undertaking an exchange at the counter. In Visa proprietorship and use conduct in Botswana examined the impact of Master-cards and administration experience interface was examined. They proposed that time is the greatest influencer pursued by a conviction that all is good and certainty\textsuperscript{4}. Limits and card offices and the effect were considered. In the social examination of Credit Card Users in a Developing Country: A Case of Bangladesh. This paper takes a gander at a developing economy where the vast majority of the statistic variables may not huge in driving the utilization of cards. An apparently less vital factor like limits and office is by all accounts a noteworthy choosing variable. World study report just as Indian statistics investigate Plastic Money (Especially on charge and Master-cards) taken from Forex Bonuses, Times of India, Medianama report, October 2018.

**Measures of Plastic money on psychological-political and behavioural aspect:**

**Psychological Aspect:** In India, the banking reforms have made the market greater aggressive and attractive. There is a want to look at the purchaser and how do they behave closer to the use of plastic money, specifically thru using credit cards, debit cards, smart cards and many more\textsuperscript{5}. As in comparison to the rest of the economies, credit score card has no longer been a driving supply for the Indian financial system. The development of economic services advertising has been sluggish and for a long time, the industry becomes primarily product led. According to
banks has awareness on geographical, socio-cost-effective and psychological characters to section the marketplace for economic services, although this isn’t always the proper predictor of the shopping for conduct7.

Political Aspect: On November 8, 2016, government cope with to the state and rupees 500 and rupees 1000 notes invalid. Govt. said it’ll diminish the deep-rooted ailment of corruption and black money. Furthermore, the Indian economic system has long gone a reset with large high-quality implications for liquidity, inflation, monetary and external deficit inside the brief term. With this flow, India’s function on transparency and corruption will improve on inside the international level, therefore including to its investor attraction. As the technique of demonetization comes into pressure, the state has to additionally look closer to plastic money as a new alternative to cash. India in urgent want for breaking thru the limitations of corruption can take a good deal and intention to fast adoption of plastic money10. Plastic money can get rid of the need for sporting large cash, which is also volatile and inconvenient. It additionally minimizes the danger of loss or theft as within the case of plastic cash like a debit/credit card, can record any be counted of robbery or loss to the financial institution and block the card for fending off misuse14. One of the specific benefits it could provide is the convenience of the use of it anywhere even overseas. Money exchanges were another device for deceitful gatherings to abstain from making good on the important government expenses and obligations19.

Social Aspect: The governing body recognizes, in any case, that the most ideal approach to ask people towards such a change is by making it less difficult and, even more fundamentally, engaging6. They are accordingly endeavouring to give inspiring powers to the client and shipper alike so they vivaciously make the required move towards ‘plastic money’. Purchasers can likewise get tax benefits as pay assess refunds relying upon the bit of their use that is made through computerized implies14. This implies more the utilization of plastic cash, more will be the salary assessment forms – an offer that is difficult to disregard. Banks usually charge 0.75 to 1 percent of payment on debit cards and up to 2 percent on credit cards as a convenience fee. To encourage increased electronic payments, CAIT plans to advise banks to cease these charges and instead offer cash back rewards for such payments. Mobile banking to takes up charge 1.50 per transaction as Unstructured Supplementary Service Data (USSD) charge which can be reduced by telecom companies. The memorandum also looks to increase the reportable limit on credit cards, allowing consumers greater flexibility to use credits for more transactions.

Recent trends in plastic money after digitalization in India:
- At present, there is a Merchant Discount Rate (MDR) of 0.75% on check card trades up to rupees 2,000 and 1% on all trades above rupees 2000. The probability of a decline in the MDR and the legitimization of the movement of the MDR across over different accomplices will be examined17.
- Tax reductions to the extent compensation survey limits to be considered to customers for paying an explicit degree of their utilization through electronic techniques.
- The affirmation necessities for different classes of trades could be re-examined subject to the danger profile and security requirements.
- Consider an interest of an apparent cash managing charge on trades more unmistakable than a foreordained measurement.
- Requesting settling of high regard trades of, state, more than rupees 1 lakh, just by electronic procedures (Transactions).
- At present, banks need to report the aggregate of all parts made by a view cardholder as one trade, if such a whole is rupees 2 lakh in a year. To help high regard trades, the most raised inspiration driving rupees 2 lakh could be related with state rupees 5 lakh or more11.

Information Technology (IT) Industrialisation influenced plastic money: IT industry has progressed significantly to its present shape where it is assuming an extremely predominant job in our every circle of life. It has rolled out progressive improvements in data social event and scattering just as in worldwide correspondence. It is making a for all intents and purposes paperless workplace and 24x7 work times. Technological advance unavoidably makes reliance on innovation. As without a doubt, as the world is currently reliant on its electronic frameworks, it will be subject to the developing data infrastructure18. The increasing portrayal of a wide
assortment of substance in advanced shape results in simpler and less expensive duplication and conveyance of data. This mixed affects the arrangement of substance. From one viewpoint, the substance can be disseminated at a lower unit cost. Especially in financial sectors has made a huge impact on information technology and creates industrialization.

Buy today- pays tomorrow (later) option in credit cards: The plastic money considers – Buy today, pay tomorrow (later), is perceived to be a present solace mantra. This is a 40 percent enhancement from charge 85,800 crores the prior year. According to a report by the Internet and Mobile Association of India (IAMAI), factors like making Internet entrance, improvement in electronic business and the simplicity of online bits have induced this movement. The upsides of a charge card are bewildering and join convenience, better security, and logically essential flourishing when meandered from cash. You can develop the benefits of your MasterCard by following these three key advances:

1. Become a whole plan customer by an enormous bit of the time using your charge card. The more you use it adequately, the more grounded its beneficial outcome on your budgetary evaluation. In line way, your chances of getting pushes from money lenders end up more grounded.

2. It is a not too horrendous practice to utilize the limit of your credit limit towards the beginning of your credit cycle. For example, if your charging cycle is from, express, the tenth of constantly, attempt to make the most preposterous use of your card closer to this date. This will empower you to benefit the most extraordinary free credit.

3. Try to keep up a basic division from littlest parts on your brilliant total. It is reasonable to pay 100 percent of your Visa charges past what many would think about conceivable. Keep yourself orchestrated to pay all your heavenly right on time as this reflects unfathomable credit lead. This again will genuinely affect your FICO rating.

Conflict of Interest: Uniquely in India, individuals are increasingly advantageous to utilize fluid money and there is no responsibility to promote check in future for appearing total national output.

A Comparative Study on Leisure Activity Status of School-going Adolescents in Urban and Rural Lucknow

Neha Shukla¹, Mallicka¹

¹Assistant Professor, Department of Community Medicine, Mayo Institute of Medical Sciences, Gadia, Barabanki, U.P.

ABSTRACT

Background: In the last few decades, the Indian society has been witnessing rapid transformation in the environmental, social, and economic arenas of life under the impact of globalization. A major consequence of this has been the emergence of newer leisure opportunities for the younger people. Leisure activities should be novel and should provide arousing experience. A suitable balance among individuals’ daily activities, self-maintenance, work, leisure time activities, rest and sleep is important for remaining in good mental health. Adolescence is an important milestone in terms of personal development. It is during this critical period that later attitude towards life are formed. Leisure pursuits have an important role in adolescent’s personal development.

Method: This was a cross sectional study conducted in one school of urban and one school of rural Lucknow. A pre-defined semi-structured mixed questionnaire was used as a study tool to collect data. Teachers were requested to help students who could not understand a particular question. A total of 200 students from 2 schools participated and responded to the questionnaire. The data was entered in Excel spreadsheet and results were evaluated using SPSS 19.0 version.

Conclusions: The present study provides a picture of emerging scenario of leisure time activities in different segments of adolescents. In view of relevance of leisure time use to health, we need to acknowledge that leisure time is developmentally a valuable activity, and therefore it should be utilized to acquire and enhance competencies and wellness and not for burdening with health problems.

Keywords: Leisure time activity, Adolescents, Physical activity, Urban-Rural

Introduction

In the last few decades, the Indian society has been witnessing rapid transformation in the environmental, social, and economic arenas of life under the impact of globalization. Concomitant to these changes, the life tasks are being reorganized by the introduction of various time-saving gadgets, home appliances, entertainment devices, and communication instruments (e.g. laptop, mobile, videogames, iPod, iPad, television, and Internet). Taken together, they tend to reorganize the pattern of time use and engagement with physical exercise. A major consequence of this has been the emergence of newer leisure opportunities for the younger people.¹

“All work and no play make jack a dull boy” old saying poses importance to leisure among children. Leisure activities should be novel and should provide arousing experience. Leisure is defined as a “non-obligatory activity that is intrinsically motivated and engaged in during discretionary time, that is, time not committed to obligatory occupations such as work, self-care, or sleep” (Parham & Fazio, 1997).²

A suitable balance among individuals’ daily activities, self-maintenance, work, leisure time activities, rest and sleep is important for remaining in good mental health.
Passive leisure activities such as watching television, playing video games etc. leads to negative impacts like social isolation, sense of boredom and reduced physical activity. So it is not only necessary to include interesting leisure activities but it’s also more important to consider and encourage an active leisure activities.2

Adolescence is an important milestone in terms of personal development. It is during this critical period that later attitude towards life are formed. Leisure pursuits have an important role in adolescent’s personal development.3Indian adolescents’ use of free time, influenced by both tradition and modernization, varies according to class, setting (urban versus rural), and gender.4

Leisure in school children is influenced by time availability, freedom of stress, lack of available resources or materials, due to over load of student ratio, provision of novelty and opportunities to make choices etc. self-consciousness, too much challenge, limited choices and excessive competition are inhibitory to leisure interest and their participation.

Lack of leisure and inappropriate time use may lead to certain issues such as drug abuse, addicted habits, psychosocial problems which may influence their physical and mental well-being and thereby affecting academic achievements.2

Aim & Objectives

1. To assess the type of Leisure time activities.
2. To assess the pattern of Leisure time activities in Urban& Rural School going children.

Materials & Method

Study Design: Cross-sectional Study

Study Area: 1 School of Urban & 1 School of Rural Lucknow

Study Population: School-going Children

Study Duration: January 2019 – February 2019

Sample Size: 100 Urban & 100 Rural School-going Children

Sampling Technique: Purposive

Inclusion Criteria:

1. Students willing to participate.
2. Students present at the time of study.
3. Students coming under adolescents age criteria (10-19 years)

Exclusion criteria:

1. Students <10 years or >19 years of age.
2. Students absent during the time of study.
3. Students who do not give verbal consent to participate in the study.

Methodology

This was a cross sectional study conducted in one school of urban and one school of rural Lucknow. The students belonging to eco-education school were included in this study on the basis of a predefined inclusion and exclusion criteria.

The School authorities were explained about the need of the study and due permission was taken from concerned authorities. A pre-defined semi-structured mixed questionnaire was used as a study tool to collect data. The teachers in each school were briefed about the project and given the questionnaire to read for the knowledge and understanding. Teachers were requested to help students who could not understand a particular question. A total of 200 students from 2 schools participated and responded to the questionnaire. The questionnaire after completion were recollected by the teachers and submitted to the investigator.

The data was entered in Excel spreadsheet and results were evaluated using SPSS 19.0 version.

Operational Definitions:

Physically Active: children involved in at least 60 minutes of moderate to vigorous intensity physical activity like, dancing, brisk walking, running, fast cycling, fast swimming, competitive sports and games.5

Cultural Activities: include involvement in local festival or community events, local sporting event, local museum or zoo, volunteer activity for a charitable organisation, parades’, bowling, parties.6

Adolescent: WHO defines ‘Adolescents’ as individuals in 10-19 years age group.7,8
Results

Participants, recruited for this study, constituted a sample of 100 Urban school children and 100 Rural school children out of which in Urban school category there were 48% Male and 52% Female participants; 55% children were between 11-14 years of age and 45% were between 15-17 years of age and maximum number of children from urban school were from grade 7th (34%). In Rural school category there were 51% Male participants & 49% Female participants; 38% children were between 11-14 years of age and 62% were between 15-17 years of age and maximum number of children from rural school were from grade 6th (38%).

In this study, we found that more number of children from urban school (24%) was using laptop/desktop as compared to children of rural school (4%). Children from urban school were more involved in cultural activities (68%) as compared to children from rural school (30%).

Marked difference was found in the physical activity status of children from rural school as compared to urban school children. Children from rural school were more involved in physical activities like performing yoga and going to field regularly for outdoor games (54% & 80% respectively) as compared to urban school children (14% & 30% respectively). 56% children from rural school performs vigorous physical activity on daily basis for at least 60 minutes while only 12% children from urban school performs vigorous physical activity on daily basis.

Almost equal proportions of children from rural & urban school (56% & 60%) were found to take sleep of 6 hrs a day. Similarly, 30% children from urban school & 34% children from rural school spend time with their
parents for more than 1 hour per day. Having a walk with family members in free time was found to be the most common interest in both urban & rural school children (46% & 44%) followed by watching cinema (26% & 28%), gardening (26% & 24%) and riding scooty/bike/cycling (1% & 4% respectively).

Maximum number of children from both urban & rural school (68% & 62%) preferred playing in the field during their games class, 32% children from rural school preferred studying while 24% children from urban school preferred chatting. Main interest of children from urban school was found to be in music (60%) followed by sports (22%), computer (10%) & literature (8%) while main interest of children from rural school was found to be in music (44%) followed by literature & computer (24% each) and sports (8%).

![Fig. 1: Types & Pattern of Leisure Time Activities](image)

Fig. 1 shows various types of leisure time activities adopted by rural & urban school children. It was found that 70% children from urban school spend more than 60 minutes per day in watching television while 46% children from rural school spend more than 60 minutes per day in watching television. 26% children from rural school spend at least 30 minutes per day in playing videogames, 8% spend at least 60 minutes per day on laptop/desktop and 12% use mobile phone for more than 30 minutes per day while only 8% children from urban school spend 30 minutes per day on videogames, 18% spend time on laptop/desktop for at least 30 mins per day and 42% spend more than 30 minutes per day on mobile phones.

Apart from the above mentioned activities, few activities in which children were actively involved during their leisure time were dancing, skipping, jogging and walking. 28% children from urban school and 24% children from rural school spend their leisure time in dancing for at least 15 minutes per day. Children from rural school were more interested in skipping (36%) as compared to children from urban school (18%). Half of the children from rural school (50%) goes for jogging in their leisure time for at least 15 minutes per day while only 30% children do the same. 42% children from rural school and 34% children from urban school goes for walking for 30 minutes per day in their leisure time.

**Discussion**

This study sought to investigate the types of leisure time activities and their patterning among school-going adolescents’ of urban and rural schools. The results indicated a substantially greater engagement in sedentary leisure particularly watching television and mobile laptop/desktop use in urban school children and playing video games and watching television in rural school children. Similar findings were observed in the study conducted by Singh Et. Al, wheremore than half of the participants reported sedentary involvement (i.e. bike riding, mobile chatting, Internet, fast music, videogames, watching TV/cinema). Urban adolescent participants’ leisure time was distinguished by a greater use of the Internet than their counterparts from other two more playing of videogames, listening to fast music but less cultural participation.

In this study rural school children were found to be more involved in physical activities like yoga,
playing outdoor games, walking, skipping and jogging while children from urban areas were more involved in dancing, watching cinema, involving in cultural activities and sports.

Contrary to these findings, in a study conducted by Singh et al., rural adolescent participants displayed greater watching of TV/cinema, listening to fast music, involvement in religious behaviours but lesser practice of different types of sports and games in comparison with adolescent participants from metro cities. Urban adolescent participants’ leisure time was distinguished by a greater use of the Internet than their counterparts from other two more playing of videogames, listening to fast music but less cultural participation, in comparison to metro adolescents.

In this study, the most common interest of children from both urban and rural school was found to be in music. Similar findings were found in the study conducted by Fitzgerald et al., where about 76% of adolescents main interest was in music.

In our study we found out that most of the children from both urban and rural school spend more than 1 hour per day with their family. Similar findings were seen in a study conducted by Fitzgerald et al., where majority of the adolescents spend a lot of time with their families.

Conclusion

The present study provides a picture of emerging scenario of leisure time activities in different segments of adolescents. It indicates the continuance of narrowing of rural–urban divide, and several implications for leisure time use among Indian school adolescents for their health and well-being. In view of relevance of leisure time use to health, we need to acknowledge that leisure time is developmentally a valuable activity, and therefore it should be utilized to acquire and enhance competencies and wellness and not for burdening with health problems.

Recommendation

- Leisure time planning and management are important concerns related to overall wellbeing for adolescents. The well-being of adolescents is associated with choices made during leisure time. Apart from time spent in academic activities in college, physical activity can be addressed only during leisure time. More and more adolescents should be told regarding the importance of leisure time.

- Participation in organized recreation and physical activities/sports might help in skill development, stress reduction and constructive use of free time, thereby also reducing the future risk of NCDs.

Limitations:

- Leisure time spent and physical activity were self-reported thus had limited reliability and validity.

- The conclusions from this study may also be limited due to a possible selection bias in the sample.

- Some factors might have confounded the findings, such as parental socioeconomic status, etc., had not been assessed.

- Lack of research material on the study topic made it difficult for comparison with different studies, hence limiting the generalisability of the results.

Implant Supported Overdenture for Resorbed Mandibular Ridge Opposing Partial Fixed Prosthesis

Pankaj Kumar Ritwal¹, Vikas Dhull², Sumit Singh Phukela³, Puja Malhotra⁴, Bhupender Yadav⁵, Manoti Sehgal⁶

¹Senior Lecturer, ²Post Graduate, ³Professor, ⁴Professor and Head of Department, ⁵Reader, ⁶Department of Prosthodontics, SGT University, Gurugram

ABSTRACT

The most frequently encountered clinical situation in a dental practice is the completely edentulous mandibular arch for which implant supported overdentures has been the predictable procedure over time. The greater flexibility of implant position and the enhancement of retention, support, stability of the overdenture make it an ideal treatment modality to begin a learning curve in implant dentistry. The following case deals with the successful rehabilitation of resorbed edentulous mandibular ridge using a overdenture supported and retained by two implants placed in the interforaminal region with ball abutments opposing the partial fixed prosthesis. Thus, implant supported overdenture turns out to be much simpler, affordable and minimally invasive procedure to treat majority of the patients.

Keywords: Implant, Overdentures, Edentulous, Ball abutments, Retention.

Introduction

Traditional mandibular dentures have limited retention and stability as they rest on the moving foundation provided by the mandible and its associated musculature. In the maxilla, the ability to cover a broader foundation presents the opportunity to fabricate a more retentive and stable denture.

Implant-supported overdentures are mainly useful for mandibular ridges, as they have undergone resorption and offer better retention than traditional dentures. However, the cost of implants is quite high; hence, the use of fewer implants (2 instead of 4) offers a less expensive option for an edentulous patient. There is a high success rate of mandibular implant supported over dentures. Van Steenberg et al has Mericske Stern et al and Jemt et al reported success rates 98%, 97% and 100% respectively.

Placement of the implants for overdentures in the mandible should be planned explicitly, as masticatory load transmission in mandibular implant-supported overdentures differs substantially from that of implant-supported fixed restorations.

In this case report, two ball retained attachments are used in mandibular arch in which each implant holds onto the metal attachment (male) that fits passively with another attachment (female) on the intaglio surface of the denture contributing to the maximum prosthetic stability for the patients.

Thus approach was undertaken to meet up the expectations of the patients by conceptually visualizing the patient first, later in wax, and finally in acrylic dentures.

Case Report

A 60 year old female patient came to the Prosthodontics Department with the chief complaint of loose ill fitting lower denture with difficulty in mastication and speech. On examination, patient had resorbed mandibular ridge which lead to inadequate retention of the lower denture prosthesis and patient is known to be a previous denture wearer for past 6-7 years. Patient was having partial fixed prosthesis in maxillary arch with two edentulous spaces. (Figure 1)
The Orthopantomograph findings showed resorption in mandibular arch. Thus implant supported overdenture was planned with two implants along with independent ball type attachments.

Blood investigations and informed consent were taken after discussing the treatment procedure with the patient. Irreversible hydrocolloid impression was made and pre-surgical diagnostic casts were prepared. Interocclusal distance was measured in the diagnostic casts. The implant location was marked at B and D positions independent of each other.

**Surgical Phase:** Under antibiotic prophylaxis and standard aseptic protocol, preparation of the patient was done by anaesthetizing the mandibular anterior segment with inferior alveolar nerve block using local anaesthesia of 2% lignocaine with 1:80,000 adrenaline. After the region was anaesthetized, full thickness Crestal incision was made with surgical blade number 15 extending from first premolar on right side to first premolar on left side. The mucoperiosteal flap was elevated and bone was exposed. A pilot drill was introduced into the bone and two osteotomy sites were created using piezosurgery device without causing any damage to the adjacent anatomical structures.

Two surgical implants (3.3 x 13 mm) were inserted ([Figure 2](#)) using motor driver. After the implant seating tip has reached the adequate depth, cover screws are placed. Later flaps are approximated, suturing done using 3-0 vicryl suture material. Patient was prescribed with antibiotics and anti-inflammatory coverage.

Patient was recalled after 7 days of surgery and suture removal was done.

**Post operatively after 3 months, osseointegration was evaluated clinically and radiographically ([Figure 3](#)) and the implants were well prepared to receive the prosthesis.**

The second stage surgery was performed in which cover screws were removed and healing abutments were inserted into the implants. After a time period of two weeks, peri-implant soft tissue healing was examined, and existing denture was relined after relieving at the abutment site. Later, the healing abutment is removed...
hex driver. Internal portion of the implant is irrigated and dried to make sure it is free of debris and soft tissue. Selected ball abutments were placed onto each implant using hex driver and 30 Ncm torque wrench.

![Figure 4: Placement of attachment housings along with the processing insert onto each abutment](image)

A transferable mark with an indelible pencil is placed on top of each ball abutment and denture is seated to ideally determine the location for attachment housings. Denture was fabricated along with metal base to aid in sufficient strength to the denture. It is followed by preparation of recesses in the intaglio surface of the denture to accommodate the housings. Lingual vent holes are made for escape of excess acrylic. Placement of nylon processing insert into each of the housings is done with insert seating tool. Seating of the attachment housing onto each ball type abutment is done. Undercuts are blocked out under the housing and soft tissue to prevent acrylic resin from locking the denture onto the abutment. (Figure 4)

![Figure 5: Placement of attachment housings along with the processing insert onto each abutment](image)

Application of self curing acrylic is done into recessed area and around titanium housings for bonding of the housings to denture. Insertion of denture was done and guiding the patient into proper occlusion with the opposing arch. After the curing of acrylic, denture is removed. Excess acrylic is removed around the housings and lingual vent hole later it is polished. Replace nylon retention insert instead of processing insert into the housings. The insert must seat securely in place and be in level with the housings rim. Overdenture is seated over the ball abutments (Figure 5). Proper instructions have been given to the patient on insertion and removal of prosthesis. The patient was recalled at 1 week, 3 weeks, 3 months, 6 months follow up appointments.

**Discussion**

For atrophic mandibular ridge, implant supported overdentures proves to be the most efficient of all. Considering the financial resources of the patient and also the presence of inferior quality of bone in posterior region compared to anterior of the same arch creates the need for the placement of two implants with ball attachments in the anterior region of mandibular arch which is located anterior to foramen.3

The use of two implants has shown to be biomechanically sound which provided better prosthetic stability and prevented rotational forces of the components.4

By placement of two independent implants at the same height, equidistant from the midline and parallel to each other with proper angulation prevents wearing away or disengagement of the attachments.5,6

Though nowadays, single piece implants have become popular due to its innumerable benefits, correct angulation is the most catastrophic mistake thereby achieving parallelism becomes crucial. So in this case conventional two piece implants were chosen over the single piece implants.

**Conclusion**

Edentulous patients often do not get used to wear conventional dentures. Their support is compromised by progressive bone resorption that will increase patient’s instability, insecurity and discomfort. Overdentures constitute a predictable and secure therapeutic alternative affording a great patient’s satisfaction due to simpler hygiene and good chewing efficiency. Overdenture use represents a cheaper treatment than fixed prostheses and, in some cases as those with lip support loss or with an interocclusal space larger than 15 mm, their use will prevent future aesthetic or phonetic problem.

Prevalence and Causes of Visual Impairment in an Area of Western Uttar Pradesh

Prerana Agarwal¹, D. J. Pandey²
¹Assistant Professor, ²Professor, Department of Ophthalmology, Saraswathi Institute of Medical Sciences, Hapur U.P. (India)

ABSTRACT

Introduction: It has been recently estimated by the World Health Organization (WHO) that there are 285 million visually impaired people worldwide, among whom 39 million are blind.

Aims and Objectives: To study Prevalence and causes of visual impairment in an area of western Uttar Pradesh.

Methodology: This was cross-sectional study in the 3217 Patients attending eye OPD in Saraswathi Institute of ophthalmology Hapur from Jan 2018 to October 2018. Patients above 30 years of age were enrolled for study. 2234 patients fit the inclusion criteria. 2016 participated in study. Detailed ocular examination was done. visual impairment was defined as visual acuity less than 6/18 in better eye. The details of patients and all routine investigations were carried out. The causes of visual impairment were found out. Data entered to excel sheet and analyzed by Excel software for windows 10.

Result: In our study we have seen that the majority of the patients were in the age group of 60-70 (39.14%), followed by 50-60 in 28.42%, 40-50 were 12.40%, >70 were 11.66%, 30-40 were 8.38%. The majority of the patients were Male i.e. 55.85% and Female were 44.15% Out of 2016 patients 665 i.e. 33% were having visual impairment. The most common cases were Cataract - 39%; Uncorrected refractive errors-21%; Retinal diseases like diabetic retinopathy and age related macular degeneration- 13%; Trauma- 9%; Glaucoma- 8%; Iridocyclitis- 6%; Corneal opacity -4%.

Conclusion: It can be concluded from our study that majority of the patients were in the age group of 60-70, the majority of the patients were Male. The prevalence of VI was 33% and most common causes were Cataract, Uncorrected, refractive errors, Retinal diseases, Trauma, Glaucoma, Iridocyclitis, Corneal opacity.

Keywords: Visual Impairment (VI), Cataract, Refractive errors, Retinal diseases, Corneal opacity, Glaucoma

Introduction

It has been recently estimated by the World Health Organization (WHO) that there are 285 million visually impaired people worldwide, among whom 39 million are blind. In India, 62 million people are estimated to be visually impaired, 8 million of them being blind.
ophthalmologist. All individuals with visual disability of 40% or higher are entitled to various concessions and job benefits according to guidelines issued by the Ministry of Social Justice and Empowerment of the Government of India. According to the 58th round data from the National Sample Survey Organization (NSSO) in India, blindness and visual impairment were found to account for 10.88% and 15.27%, respectively, of all categories of disabilities. So we have found out causes of visual impairment in an area of western Uttar Pradesh.

Methodology

This was cross-sectional study in the 3217 patients attending Eye OPD in Saraswathi Institute of ophthalmology Hapur from Jan2018 to October 2018. Patients above 30 years of age were enrolled for study. 2234 patients fit the inclusion criteria. 2016 participated in study. Detailed ocular examination was done. Visual impairment was defined as visual acuity less than 6/18 in better eye. The details of the patients and all routine investigations were carried out. The causes of visual impairment were found out. Data entered to excel sheet and analyzed by Excel software for windows 10.

Result

3217 Patients attended Eye OPD in Saraswathi Institute of ophthalmology Hapur from Jan2018 to October 2018. Patients above 30 years of age were enrolled for study. 2234 patients fit the inclusion criteria. 2016 participated in study.

Graph 1: Distribution of as per the patients as per the Visual impairment

Discussion

Eye diseases, vision loss and resulting disability remain major public health concerns. It has been
estimated that globally 253 million people are visually impaired out of which 36 million are blind and 217 million have moderate to severe visual impairment (VI). Though there has been a decline noted in prevalence of blindness over recent times, blindness has actually increased in absolute terms owing to increase in numbers of older people with rise in life expectancy. Much of this global burden is distributed unevenly and some regions have higher burden compared with others. The south Asia (that includes India) region contributes maximum to global blindness and moderate or severe visual impairment burden. It is estimated that south Asia has 12 million blind people and 61 million people with moderate or severe Visual Impairment. The age standardised prevalence of moderate or severe Visual Impairment in South Asia is three times higher than high-income regions. Much of the load of blindness (80%) has been attributed to avoidable causes that can be either prevented or corrected easily. The maximum Visual Impairment is seen in older adult population that is after 50 years of age. 86% of those blind and 80% of those with moderate or severe Visual Impairment are older than 50 years. The global eye health action plan 2014–2019, endorsed by the 66th World Health Assembly, charted out broad eye health programmatic components. A vital target was set to achieve reduction in prevalence of avoidable Visual Impairment by one-quarter until 2019 against baseline values in year 2010. One of the key objectives included under this plan was to undertake epidemiological surveys on Visual Impairment at regular intervals nationally and subnationally, so as to generate evidence about magnitude and causes of Visual Impairment. According to recent global estimates, India records one of the highest prevalence of Visual Impairment. The age-standardized prevalence of blindness and moderate or severe VI in India is 4% and 17%, respectively, among adults aged 50 and more. The last nationwide blindness assessment undertaken in India was published way back in 2008.

In our study we have seen that the majority of the patients were in the age group of 60-70 i.e 39.14%, followed by 50-60 (28.42%), 40-50 (12.40%), >70(11.66%), 30-40 (8.38%). Majority of the patients were Male i.e. 55.85% and Female were 44.15%. Out of 2016 patients 665 i.e. 33% were having visual impairment. The most common causes were Cataract - 39%; Uncorrected refractive errors- 21%; Retinal diseases like diabetic retinopathy and age related macular degeneration- 13%; Trauma- 9%; Glaucoma- 8%; Iridocyclitis- 6%; Corneal opacity -4%.

Sumit Malhotra et al found Visual Impairment to be 24.5% (95% CI 21.1 to 26.3) in their study. This is almost similar to recent population-level estimates from southern states of India. The reported prevalence of Visual Impairment in adults aged >50 years in a newly formed southern state of Telangana was 23.5% (95% CI 22.1 to 25.0). The Andhra Pradesh Rapid Assessment of Visual Impairment study that included both rural and urban clusters estimated prevalence of Visual Impairment as 23.1% (95% CI 21.8 to 24.5). They also found 87% of Visual Impairment was contributed by two causes—uncorrected refractive errors (50%) followed by cataract (37%). The most common causes for blindness (57%) and severe Visual Impairment (70%) was cataract. This is consistent with other studies where 80%–90% of Visual Impairment is attributed to these two causes. Globally, majority of Visual Impairment is contributed by uncorrected refractive errors followed by cataract. Cataract and uncorrected refractive errors combined contributed to 55% of blindness and 77% of vision impairment in adults aged 50 years and older in 2015. Also, globally in 2015, the leading causes of moderate or severe Visual Impairment in those aged 50 years and older were uncorrected refractive errors (52%) followed by cataract (25%).

**Conclusion**

It can be concluded from our study that majority of the patients were in the age group of 60-70yrs of age and majority of the patients were Male. The prevalence of Visual Impairment was 33% and most common causes were Cataract, Uncorrected, refractive errors, Retinal diseases, Trauma, Glaucoma, Iridocyclitis, Corneal opacity

Association of Myo1h Gene Polymorphism in Mandibular Retrognathism in South Indian Dravidian Population

Priya Chatterjee¹, S. Kishore Kumar², V. G. Abilash³, M. S. Kannan⁴, Shoba T.⁵, D. P. Yogamaya⁶  
¹Post Graduate, ²Asst. Director(R&D), Professor, Department of Orthodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Chennai; ³Asst. Professor, Department of Biomedical Sciences, VIT, Vellore; ⁴Professor and Head, Department of Orthodontics, Sree Balaji Dental College and Hospital, Chennai; ⁵Asst. Professor and Head, Department of General Pathology; ⁶Ph.D Scholar, Department of Biomedical Sciences, VIT, Vellore

ABSTRACT

Recently Myosin 1H gene has been implicated in mandibular retrognathism. But the quantitative influence of Myosin 1H polymorphism on mandibular retrognathism is yet unexplored. This study was conducted to understand the role of Myosin 1H single nucleotide polymorphisms in mandibular retrognathism using South Indian Dravidian population as samples. Lateral cephalograms were obtained from retrognathic and normal individuals and related to genotype to study the power of association between them. Definite influence of gene make up is seen on muscle growth and in turn mandibular retrognathism but quantitative association could not be determined due to possible over shadowing influence of cybernetics. In future studies considering gene- environment interactions should be investigated to estimate the overall risk of a large sample size to clarify the association of MYO1H gene in causing true mandibular retrognathism.

Keywords: Mandibular retrognathism, MYO1H gene, Gene Association

Introduction

Heritability of a particular physical feature or trait requires a consideration of the relationship between the genotype and phenotype.¹ The interaction between genetic and environmental factors controls the process of growth and development and to determine the morphological and physiological traits of an individual.² Mandibular growth and neuro-cranial growth are a combination of morphologic effect resulting from both capsular and periosteal matrices.³ Genetic alterations that affect muscle would also affect the adjoining skeletal areas.³ ⁴ Muscle function is characterized by the composition ratio of these types of muscle fibers. The composition ratio of muscle fibers is greatly influenced by genetic factors and rarely by environmental factors.⁵ Myosin heavy chain (MyHC), is one of the most important proteins expressed in skeletal muscle, both structurally and functionally⁶ and is expressed primarily in skeletal muscle located in human chromosomes 11 and 17.⁷

An understanding of the normal growth and development of the face enables the orthodontist to assess the effects of orthodontic and orthopedic forces that can modify the growth. Recent theoretical and experimental studies have fundamentally altered the understanding of both the functional anatomy as well as the growth process of the mandible.⁸ ¹⁰ Studies have been done on the polymorphism of Myosin 1H (MYO1H) gene in mandibular prognathism,¹¹ but not much emphasis has been laid on polymorphism of MYO1H gene in true mandibular retrognathism. The implication of Myosin 1H gene in case of mandibular retrognathism and/or retro positioning is now known, but there is clarity given by Richards et al., in its specific role in mandibular

retrognathism or retroposition. Hence, there is paucity in the literature in this regard. Further, there is a need for larger independent investigation on this gene. Though phenotypic manifestation of genotype is well known, the quantitative influence of Myosin 1H polymorphism on mandibular retrognathism is yet unexplored. Hence, this study was aimed to understand the role of Myosin 1H single nucleotide polymorphisms in mandibular retrognathism using South Indian dravidian population as samples.

**Materials and Method**

The study design and protocol was approved by the ethical committee of Sree Balaji Dental College & Hospital, Chennai. (Reference number: SBDCH/IEC/01/2018/19 dated 20th March 2018). The subjects were explained the purpose of the study and an informed consent was obtained from them. In the event of subjects those below 18 years of age, informed consent was obtained from their respective parents/guardian. Subjects were clinically examined before the study. Sample Size of the study was 54, with 27 subjects in the study group and 27 subjects in the control group.

From each study group, lateral cephalograms were obtained. Tracings of the lateral cephalograms were done manually on acetate matte tracing paper. Different angular, linear, and planar values were measured on the tracings of both study and controls. For the genotyping, 4mL of blood was obtained from all the participants.

**Inclusion Criteria:**

- Patients having orthognathic maxilla and retrognathic mandible- Study group.
- Patients having orthognathic maxilla and orthognathic mandible- control group.
- Age- 13-29years
- Both the genders
- 27 patients having orthognathic maxilla and retrognathic mandible (SNA= 82° ± 2, SNB ≤ 78°) were selected as the study group,
- 27 patients with an orthognathic maxilla and orthognathic mandible (SNA= 82° ± 2, SNB = 80° ± 2) were selected as the control group from the outpatients of the department of orthodontics, Sree Balaji Dental College and Hospital, Chennai, India.

**Exclusion Criteria**

- Patients with retrognathic or prognathic maxilla.
- Patients with other genetic disorders.
- Patients with retropositioned mandible.
- Patients with prognathic mandible.

**Cephalometric Analysis:** Lateral cephalograms were obtained from each study subject. Cephalometric tracings were done manually on acetate matte sheet and standard reference points were traced.

**Clinical Sample:** 4ml of venous blood was collected in EDTA coated vacuum tubes and were transported on ice packs to the laboratory and stored at 4°C until used.

**Gene Extraction:** Genomic DNA was isolated as per standard protocol. MYOSIN 1H gene was amplified using gene specific PCR. Qualitative analysis of DNA was carried out by 0.8% agarose gel electrophoresis and quantification of DNA by using a Biophotometer (Eppendorf).

**Molecular Studies In Myosin 1h Gene**

Three single nucleotide polymorphisms of the MYO1H gene rs10850110 (promoter polymorphism), rs11611277 (Exon 1; Ser-37-Arg), and rs3825393 (Exon 30; Leu-1001-Pro) were genotyped using polymerase chain reaction and restriction fragment length polymorphism (PCR-RFLP).

**Pcr-Rflp Analysis:** PCR Amplification of MYO1H gene was carried using forward and reverse primers in a thermal cycler (Eppendorf Master Cycler gradient) using standard protocol.

**Statistical Analysis:** Within every gene sequence, the mean values of cephalometric parameters among every genotype were individually analyzed using one way ANOVA. The cephalometric measure was tested for significant difference among the control and test groups by Independent student t-Test (two tailed). SNP analysis was tabulated and analyzed for Odds ratio under 95% confidence interval and probability of error was found. Concordance of Allele frequency with Hardy Weinberg distribution was tested using Chi-squared distribution (degree of freedom = 1). All tests were performed within an error of 5%. All analysis were done using Microsoft excel version 2013.
Results

Comparison of these cephalometric values like SNB, SND, articular angle, Gonial angle and sum of all angles showed statistically significant differences between control and study groups except for SNA and saddle angle which did not show statistically significant differences.

MYO1H rs10850110 polymorphism and mandibular retrognathism: Of the 27 samples analysed, 16 (59%) were GG, 1 (4%) were AG and 10 (37%) were AA. Among 27 controls, 14 (52%) were GG, 6 (22%) were AG and 7 (26%) were AA. Hardy Weinberg p-value showed statistically significance in the study group. The major homozygote as reference genotype the calculated odds ratios and 95% confidence intervals were found. The frequency of AG genotype was different in both controls and study group with OR (95% CI) 0.16 (0.0518-0.495) and p value of 0.015 which shows significance. The AA mutant homozygous genotype was equally distributed in both controls and study groups with OR (95% CI) 0.472 (0.25-0.87) and p value of 0.178. The AA mutant homozygous genotype was equally distributed in both controls and study group with OR (95% CI) 0.25 (0.097-0.65) and p value of 0.0049 and showed significant association. The genotypes in the dominant model also have showed association with mandibular retrognathism with OR (95% CI) 0.408 (0.231-0.72) and p value of 0.002. Also, the single frequency allele A showed significant association in mandibular retrognathism with OR (95% CI) 0.4412 (0.23-0.82) and p value of 0.00

MYO1H rs11611277 polymorphism and mandibular retrognathism: Of the 27 samples analysed, 15 (55%) were CC, 8 (30%) were AC and 4 (15%) were AA. Among 27 controls, 20 (74%) were CC, 4 (15%) were AC and 3 (11%) were AA. Hardy Weinberg p-value did not show any statistical significance in study group. The major homozygote as reference genotype the calculated odds ratios and 95% confidence intervals were found. The frequency of AC genotype was different in both controls and study group with OR (95% CI) 2.69(0.31-5.58) and p value of 0.0064 and shows significant difference. The genotypes in the dominant model also showed significant association with mandibular retrognathism with OR (95% CI) 2.27 (1.25-4.13) and p value of 0.0069.

MYO1H rs3825393 polymorphism and mandibular retrognathism: Of the 27 samples analysed, 17 (63%) were GG, 8 (30%) were AG and 2 (7%) were AA. Among 27 controls, 11 (41%) were GG, 11 (41%) were AG and 5 (18%) were AA. Hardy Weinberg p-value did not show any statistical significance in study group. The frequency of AG genotype was different in both controls and study group with OR (95% CI) 0.472 (0.25-0.87) and p value of 0.178. The AA mutant homozygous genotype was equally distributed in both controls and study group with OR (95% CI) 0.25 (0.097-0.65) and p value of 0.0049 and showed significant association. The genotypes in the dominant model also have showed association with mandibular retrognathism with OR (95% CI) 0.408 (0.231-0.72) and p value of 0.002. Also, the single frequency allele A showed significant association in mandibular retrognathism with OR (95% CI) 0.4412 (0.23-0.82) and p value of 0.00

Discussion

The influence of genetics on maxillofacial skeleton is well described in the literature, the combination of cybernetics and genetics play a complimenting game to achieve the final adult facial skeleton. In this regard Myosin 1H gene is associated with mandibular growth and an investigation of its expression and its correlation to dentofacial deformities is going on.13 MYO1H is a class I myosin which is a protein coding gene and are found in various skeletal muscle sarcomeres. Myosins institute a superfamily of motor proteins that bind to actin and use the energy of ATP hydrolysis to generate force and movement along actin filaments.14 There is an association of MYO1H with mandibular prognathism which suggests that it may have a putative role in musculoskeletal development and sagittal jaw deformation and consequent malocclusion.11, 12 Various genetic studies have reported that the genetically altered size of muscle has marked secondary effects on the anatomy of bony attachment sites. Moreover, masticatory muscle resection or transposition has proven the correlation between craniofacial morphology and the force of masticatory muscle contraction in the model of experimental animals. There are various myosin family members which have been associated with mandibular growth since these molecular motors are mainly known to intermingle with each other. Thus, functions of jaw muscles are dependent on the correctly formed craniofacial skeletal structures.15

Studies revealed that mandibular prognathism and retrognathism may have a similar vertical facial phenotype but they have a different masseter muscle gene expressions.16 Gedrange et al., in their study showed that there are higher levels of myosin heavy chain (MyHC) in the anterior part of masseter muscle
MYO1H gene is present in chromosome no 12. There are various syndromes related to chromosome no 12 such as Achondrogenesis type II, where faces becomes flat and show under developed mandible. True mandibular retrognathism is a facial type where the corpus is narrow, symphysis is narrow and long and the ramus is narrow and short. Mandibular retrognathism is identified by measuring SNB angle cephalometrically which confirms the relation of mandible to the cranial base. Angles such as saddle angle assess the positional relationship of the mandible. The Gonial angle expresses the form of mandible and its growth direction.\textsuperscript{18, 19}

In order to facilitate early diagnosis, it is necessary to know the power of association of various genotypes in mandibular growth and development. If such a diagnosis can be made by blood test at an early age, it is a great advantage whereby right time of initiation of treatment can be programmed by the clinician. Nevertheless, retro-positioning have to be separately analysed for correlation with genotypes in the future studies.

Results showed that presence of GG genotype indicates mild predilection to retrognathism in the group rs10850110. Presence of A and G appears to move the mandibular growth towards normalcy whereas AA genotype shows predilection to retrognathism. In the group rs116121277 indicated presence of A genotype shows more predilection to retrognathism and presence of C genotype appears to be more towards normalcy. In the group of rs3825393, Presence of G genotype appears to favor mandibular retrognathism and A genotype appears to favor normalcy.

Thus, genetics play an important role in conferring risk for true mandibular retrognathism. In future studies considering gene- environment interactions should be investigated to estimate the overall risk of a large sample size to clarify the association of MYO1H gene in causing true mandibular retrognathism.

**Conclusion**

Since the Single Nucleotide Polymorphisms of MYO1H rs10850110 showed significant Hardy-weinberg distribution, definite influence of gene make up is seen on muscle growth and in turn mandibular retrognathism but quantitative association could not be determined due to possible over shadowing influence of cybernetics. Nevertheless, comparatively small sample size may have predisposed the role of true mandibular retrognathism and MYO1H gene polymorphisms. Moreover, only one particular gene has been taken into consideration in this study. In future, studies should include all the genes related to Myosin and having large number of controls to statistically eliminate the effect of cybernetics.

Oral Lichen Planus-A Review

Priyadarshini Karthikeyan¹, Ramesh Kumaresan², Ravi Shankar BabuYelamanchi³, Deepthi Mandava², Neeraja Turagam³, Durgaprasadmudrakola²

¹Lecturer, ²Associate Professor, ³Senior Lecturer, Faculty of Dentistry, AIMST University

ABSTRACT

Oral lichen planus is a chronic T-cell mediated disease of unknown etiology with diverse clinical manifestations. Several local and systemic factors are known to be associated with it. Both antigen specific and non-specific mechanisms are involved in the pathogenesis of lichen planus. The article discusses both these mechanisms of pathogenesis along with diagnostic criteria, differential diagnosis and treatment.

Keywords: oral lichen planus, T-cells

Introduction

Oral lichen planus, the mucosal counterpart of cutaneous lichen planus is a chronic inflammatory disease with a wide range of clinical manifestations. It affects women more than men (1.4:1) and frequently occurs in the fourth decade.¹ The oral lesions may be present alone or along with the skin lesions. It presents clinically as reticular, papular, plaque-like, erosive, atrophic or bullous types. The most commonly affected intra-oral sites are buccal mucosa, tongue and gingival.²

Etiology: Oral lichen planus is a chronic T-cell mediated disease of unknown etiology. Several systemic and local factors may be associated with it.³,⁴

Systemic Factors

1. Genetic Predisposition
2. Autoimmunity
3. Immunodeficiency
4. Drugs
5. Infectious agents
6. Diabetes and hypertension
7. Bowel’s Disease
8. Stress

Local Factors

1. Dental materials
2. Trauma
3. Habits
4. Food allergies

Pathogenesis: The pathogenesis of oral lichen planus can be studied under two broad headings- antigen specific and non-specific mechanisms.

Antigen Specific Mechanisms: The lichen planus antigen is unknown, although the antigen may be a self-peptide, thus making lichen planus a true autoimmune disease. Lesional keratinocytes present MHC Class I and MHC Class II restricted antigens. There is migration of T lymphocytes into the epithelium followed by their activation thus leading to keratinocyte apoptosis.

Two hypotheses have been proposed for the migration of T cells into the epithelium-

- Chance encounter’ hypothesis – CD8+ cytotoxic T cells may enter the oral epithelium on routine surveillance and encounter the antigen by chance.

- Directed migration’ hypothesis – according to this, cytokines secreted by the keratinocyte direct the T cells to migrate into the epithelium.

DOI Number: 10.5958/0976-5506.2019.01271.3
Cytotoxic T cells secrete TNF-α which triggers keratinocyte apoptosis. The other mechanism may be the binding of T-cell surface CD95L (Fas ligand) to CD95 (Fas) on the keratinocyte surface. Granzyme B secreted by T cells enters the keratinocyte via perforin induced membrane pores and can thus lead to keratinocyte apoptosis.4,5

Non-Specific Mechanisms14: Many non-specific mechanisms may be involved in the pathogenesis of OLP, including

(i) mast cell chemotaxis and degranulation stimulated by T-cell RANTES
(ii) endothelial cell adhesion molecule expression stimulated by mast cell TNF-a
(iii) T-cell MMP-9 activation by mast cell chymase
(iv) epithelial basement membrane disruption by mast cell proteases or T-cell MMP-9
(v) keratinocyte apoptosis triggered by epithelial basement membrane disruption
(vi) intra-epithelial CD8+ T-cell migration through basement membrane breaks
(vii) inflammatory cell survival prolonged by T-cell RANTES
(viii) non-specific T-cell recruitment by keratinocyte-derived chemokines

Diagnostic Criteria8

Clinical Appearance

Lesions consist of radiating white, gray, velvety, thread-like papules in a linear, annular and retiform arrangement forming typical lacy, reticular patches, rings and streaks.

A tiny white elevated dot is present at the intersection of white lines called as striae of Wickham.

The lesions are asymptomatic, bilaterally/symmetrically anywhere in the oral cavity, but most common on buccal mucosa, tongue, lips, gingiva, floor of mouth, palate and may appear weeks or months before the appearance of cutaneous lesions.

Clinically it can be divided into six types:

- Reticular
- Erosive
- Atrophic
- Plaque-like
- Papular
- Bullous

Histopathologic criteria8,10: The main histopathologic characteristic of OLP are:

- Liquefactive degeneration of the basal cells with apoptosis of the keratinocytes.
- Dense band-like lymphocytic infiltrate at epithelium and connective tissue junction.
- Focal areas of hyperkeratinized epithelium as well as few areas of atrophic epithelium with saw tooth rete ridges.
- Eosinophilic colloid bodies known as Civatte bodies represent degenerating keratinocytes are present in the lower half of the surface epithelium.
- Histologic clefts known as Max-Joseph spaces may form and blisters on the oral mucosa (bullous LP) may be seen at clinical examination. B cells and plasma cells are uncommon findings.

When the histopathologic features are less obvious, the term “histopathologically compatible with” should be used

Final diagnosis OLP or OLL

To achieve a final diagnosis, clinical as well as histopathologic criteria should be included:

- OLP - A diagnosis of OLP requires fulfillment of both clinical and histopathologic criteria
- OLL - The term OLL will be used under the following conditions:
  1. Clinically typical of OLP but histopathologically only compatible with OLP
  2. Histopathologically typical of OLP but clinically only compatible with OLP
  3. Clinically compatible with OLP and histopathologically compatible with OLP.11

Differential Diagnosis: Interlacing white striae appearing bilaterally on the posterior buccal mucosa is often pathognomonic of lichen planus. The difficulties in diagnosis arise when there is superimposed candidal
infection. The differential diagnosis can include frictional keratosis, lichenoid reactions, leukoplakia, pemphigus, mucus membrane pemphigoid, lupus erythematosus, erythematous candidiasis and chronic ulcerative stomatitis.12

Lichenoid drug reaction patients present with a unilateral lesion and give a history of a new drug intake. Such case resolves when the use of drug is withdrawn, thereby helping in diagnosis. Dental restorative material induced lichenoid reactions can be identified when OLP like lesions are confined to areas of the oral mucosa in close contact or proximity to restorative materials, usually amalgam.13

Treatment

Up to now unique treatments are portrayed for OLP including drug treatment, medical procedure, laser and psoralen with bright light A (PUVA). Utilization of novel medication treatment is the most well-known strategy for treatment of OLP. Distinctive medications have been utilized as topical and systemic application for the treatment of OLP.14

Drugs utilized in topical shape are corticosteroids, immunosuppressives, retinoids, and immunomodulators. Medications which are utilized systemically are thalidomide, metronidazole, griseofulvin, and hydroxychloroquine, some retinoids and corticosteroids. Little and open erosive injuries situated on the gingiva and sense of taste can be treated by the utilization of a follower glue as a custom plate, which takes into consideration precise authority over the contact time and guarantees that the whole lesional surface is presented to the medications.12

Careful surgical excision, cryotherapy, CO 2 laser, and ND:YAG laser have all been utilized in the treatment of OLP. As a rule, medical procedure is held to expel high-risk dysplastic zones.

Photograph chemotherapy is another technique in which clinician utilizes UVA with wavelengths extending from the 320 to 400 nm, after the infusion of psoralen is additionally utilized.15

Conclusion

OLP is an exceptionally basic oral dermatitis and is a standout amongst the most successive mucosal pathoses experienced by dental experts. It is basic that the injury is distinguished definitely and appropriate treatment be controlled at the soonest. An appropriate comprehension of the pathogenesis, clinical introduction, conclusion of the infection winds up critical for giving the correct treatment.

The Politics Behind the Reproductive Health in India: Special Reference to Abortion Law

Pyali Chatterjee1, Komal Vig2
1Research Scholar, ALS, 2Associate Professor, Amity University, Noida

ABSTRACT

Abortion is considered to be as one of the essential reproductive right of the women irrespective of the caste and creed. Even in many international conferences like in International Conference on Population and Development it has been repeatedly said that “Governments should take appropriate steps to help women avoid abortion, which in no case should be promoted as a method of family planning, and in all cases provide for the humane treatment and counseling of women who have had recourse to abortion. Abortion was considered to be as essential and basic right of the women”. Though women has to struggle for this right long back. But still in some parts of the world this right is not so easy to get. In India also, though Abortion is allowed under certain conditions. But many loopholes are there in the abortion law of India. One of such loopholes is that Indian Abortion law failed to consider the situation which may cause anguish to women if abortion is not allowed. Many situation are their where women were denied abortion in India. Like in the case of Dr. Nikhil Datar & others – vs – Union of India, (2008) 110 Bom L.R. 3293. Although it is mentioned in many international conferences that Abortion should not be used as Family Planning Methods. But in India Abortion is used as Family Planning methods which one can found from the language of Section 3 of MTP Act. 1971.

Through this research paper researcher will discussed about the politics behind introduction of Abortion law in India and about its drawbacks.

Keywords: Abortion, Indian Penal Code, Reproductive Right, Right to Privacy

Introduction

Before 1970s abortion was not legal except under certain conditions and it was punishable offence under Indian Penal Code. Abortion in India was legal from 1971 that too under stringent conditions. All this conditions were laid down by politician after the report submitted by Shantilal Shah Committee. As we know that, India was the first nation in the world to introduce the Five year family planning program that too in 19521. The Five year family planning program was introduced with an objective of “reducing birth rate to the extent necessary to stabilize the population at a level consistent with requirement of national economy.”2 So after the independence it was felt that there was an urgent need of controlling population. Also before MTP Act maternal mortality was also high due to illegal abortion. It was during August 25, 19643 the Central Family Planning Board recommended the Ministry of Health to constitute a committee for the study of abortion laws and its effectiveness in family planning programme. The most important part of this committee was that the committee was headed by a male remember. Their task was to make a law by which woman can safely accesses the abortion service. But present scenarios speaks something different story about the population and illegal abortion. Though MMR has been reduced 77%, from 556 per 100000 live births in 1990 to 130 per 100 000 live births in 20164. During 2010-11 the number of reported abortions in India was around 6, 20,472 where as the unreported was estimated to be 10 times higher than the reported one5.
where women can claim abortion on demand during First Trimester which is another drawback of current MTP Act. The current abortion law in itself is bias in nature as the entire law speaks about the power, duty and protection of physician. The MTP Act hardly gives any right to women for abortion. The Abortion law in India has given full authority to medical practitioner to decide whether to perform abortion or not.

**Material and Method**

This research is purely doctrinal in nature. Researchers have used both Primary and secondary sources available for this research like Gazettes of India, Acts, Books, Journals, and Newspaper etc.

**Prior to MTP Act, 1971:** Section 312- of Indian Penal code deals causing miscarriage which states that “Whoever voluntarily causes a woman with child to miscarry, shall, if such miscarriage be not caused in good faith for the purpose of saving the life of the woman, be punished with imprisonment of either description for a term which may extend to three years, or with fine, or with both; and, if the woman be quick with child, shall be punished with imprisonment of either description for a term which may extend to seven years, and shall also be liable to fine. Explanation- A woman who causes herself to miscarry, is within the meaning of this section”. As per this provision abortion is allowed only to save the life of the mother when continuing of pregnancy will be harmful for her health. Abortion for the cases of rape victim was allowed. Only therapeutic abortion was allowed. This was the reason that MMR was high during that time. Also as per this provision a women will be guilty if she cause herself to miscarry [Re Ademma, (1886) ILR 9 Mad. 369)]. Before MTP Act the law relating to abortion in India was strict in nature.

**Medical Termination of Act, 1970:** It was only after the MTP Act, 1970 the law relating to abortion become liberal but with conditions.

Section 3 of the MTP Act, speaks about that When Pregnancies may be terminated by registered medical practitioners.

“(1) Notwithstanding anything contained in the Indian Penal Code (45 of 1860), a registered medical practitioner shall not be guilty of any offence under that Code or under any other law for the time being in force, if any pregnancy is terminated by him in accordance with the provisions of this Act.

(2) Subject to the provisions of sub-section (4), a pregnancy may be terminated by a registered medical practitioner,-

(a) where the length of the pregnancy does not exceed twelve weeks if such medical practitioner is, or

(b) where the length of the pregnancy exceeds twelve weeks but does not exceed twenty weeks, if not less than two registered medical practitioners are.

Of opinion, formed in good faith, that,-

(i) the continuance of the pregnancy would involve a risk to the life of the pregnant woman or of grave injury physical or mental health ; or

(ii) there is a substantial risk that if the child were born, it would suffer from such physical or mental abnormalities as to be seriously handicapped.

Explanation 1.-Where any, pregnancy is alleged by the pregnant woman to have been caused by rape, the anguish caused by such pregnancy shall be presumed to constitute a grave injury to the mental health of the pregnant woman.

Explanation 2.-Where any pregnancy occurs as a result of failure of any device or method used by any married woman or her husband for the purpose of limiting the number of children, the anguish caused by such unwanted pregnancy may be presumed to constitute a grave injury to the mental health of the pregnant woman.

(3) In determining whether the continuance of pregnancy would involve such risk of injury to the health as is mentioned in sub-section (2), account may be taken of the pregnant woman’s actual or reasonable foreseeable environment.

(4) (a) No pregnancy of a woman, who has not attained the age of eighteen years, or, who, having attained the age of eighteen years, is a lunatic, shall be terminated except with the consent in writing of her guardian.

(b) Save as otherwise provided in cl.(a), no pregnancy shall be terminated except with the consent of the pregnant woman”.
Section 3 provides full immunity to doctors for doing abortion in women. Doctor has full authority to decide that whether to perform abortion or not. As women request for abortion will be entertained by the doctors only when their case will fall under the section 3 of the MTP Act.

Previously in IPC only therapeutic abortion was allowed. But now after the MTP Act, apart from therapeutic the following are the conditions where abortion will be allowed:

1. **Rape victim**: In cases of rape, victims will be allowed to go for abortion.

2. **Married**: In cases of any contraceptives failure used by the couples.

3. **Minor**: Minors will be allowed to go abortion under this Act.

Rest other cases of were not included in the Act like abortion right for unmarried, widow, divorcee. Thus if any of this women cause her abortion, then they will be punished according to the penal provisions of India because government is not at all concerned about the right of the women. In 21st century when living relationship is allowed in India after the judgment of Supreme Court, but abortion right for the living relationship women is not allowed because of their unmarried status. So here I can say rather that this law discriminates between Married women with unmarried women. This law clearly violates the Reproductive and Privacy Right protected under Article 14 and 21 of Indian Constitution. Law should not discriminate women on the basis of marital status.

**Politics behind Indian Government**: Abortion law and population control both are two different topics but somewhere they are interlinked to each other. In various family planning program Government speaks about the role of the abortion controlling or preventing the birth of unwanted child. According to Dr. Rodhinorton, “Family planning means activities of determining the time period between the birth of children and the number of required children for the couple themselves along with the health and family welfare”. Thus, family planning is a method for population control.

Following are the passage taken from different Family Planning program:

1. As per the paragraph **3.5.8 of 9th Five year plan i.e.1998-2002** “At the time of Independence the health care services in India were predominantly urban, hospital based and curative. General practitioners well versed in maternal child health and pediatricians and obstetricians provided health care to women and children who came to them. They did provide comprehensive, integrated, good quality services but technology available for detection and management of health problems was limited and outreach of services was poor. Majority of the population cially those belonging to the poorer segment and those residing in rural areas did not have access to health care. Consequently the morbidity and mortality rates in them were quite high. Many women died while seeking illegal induced abortion to get rid of unwanted pregnancy because they did not have access to contraceptive care for preventing pregnancies. Conceptions that were too early, too close, too many and too late resulted in high maternal and infant mortality rates. Antenatal, intrapartum, postnatal and contraceptive care were not readily available to women who required these services desperately.”

2. Again in the paragraph **3.5.13** of 9th Family Plan says that “The census of 1971 showed that population explosion was no longer a potential threat but a major problem to be tackled. The government gave top priority to the Family Planning programme and provided substantial funds for several new initiatives. Sterilization, IUD and condoms were made available through the Primary Health Centers. The hospital based Postpartum Programme provided contraceptive care to women coming for delivery. The MTP act enabled women with unwanted pregnancy to seek and obtain safe abortion services.”

3. Again in the paragraph **3.5.30** of 9th Family Plan says that “The National Family Health Survey indicated that in 1992-93: (a) 40.6% of currently married women used contraceptives; b) awareness about contraception was universal indicating that the IEC efforts in this direction had succeeded in reaching the population; c) in all States the wanted fertility was lower than the actual fertility; d) there was an unmet need for contraception (11.0% for birth spacing and 8.5% for terminal methods) (Table 3.5.4). Other studies have estimated that about one sixth of all pregnant women seek abortion because they do not want continuation of pregnancy. Illegal induced abortion continues to be a major cause of maternal morbidity and mortality.”

4. Again in the paragraph 3.8.9 of 9th Family Plan says that “As could be seen above, the highest number of maternal deaths in 1995 were due to bleeding of pregnancy and Puerperium which are preventable through better reproductive health care. Abortion which is the second high accounted for 17.6 per cent of total maternal deaths in 1995, although abortion was legalized as early as in 1972 as a health measure through the Medical Termination of Pregnancy (MTP) Act, 1971. Despite this special sanction, illegal abortions still continue to be performed by the unauthorized persons like the local quacks and untrained persons under unhygienic and unsafe conditions because of the non-availability of MTP services within the easy reach of most of the rural population. Further, about 47.5 per cent of deliveries were performed by untrained persons during 1995-96.”

5. Again in the paragraph 3.8.33 of 9th Family Plan says that “The other effective measures proposed in this direction include identification and management of high-risk mothers, appropriate management of anaemia, hyper-tension disorders and provision for emergency obstetric care. Further, steps will also be taken to close the gender gaps in the existing rates of both mortality and morbidity. Also, considering the fact that more than 50 per cent of the deliveries and a large number of illegal abortions are being performed by unqualified persons, particularly in the rural areas, special efforts will be made to promote ready access to medical termination of pregnancy and intra-partum care at Primary Health Centres. In areas where institutional delivery rates are low, focused TBA training will be undertaken.”

6. The sixth five year plan(1980-1985) laid down the long term demographic goal of reducing the net reproduction rate (NRR) to one by 1996 for the country as a whole and by 2001 in all states. See reference no.2

7. Again the 8th Five year plan i.e. in 1992-1997 laid down the long term demographic goal of reducing the net reproduction rate (NRR) to one by 2011-2016. See reference no.2

From point number 1 to 5 it is clear that Abortion was considered to be as one of the essential tool to tackle the problem of population growth and also to control the MMR of India. But one thing which Government failed to consider that abortion is important to prevent the unwanted pregnancy and it should not be limited for married couple only. A pregnancy can be unwanted for a woman in cases of live in relationship. In Payal Sharma v. Nari Niketan, 2001 (3) AWC 1778 : AIR 2001 All 254 the court held that a man and woman can live together if they wish without marrying. This may be regarded immoral by society but it is not illegal. We may mention there is difference between law and morality, as the British jurists, Bentham and Austin pointed out. Hence, merely because the petitioner lived with a woman voluntarily who was not his wife for seven months, this in our opinion, does not amount to the misconduct of bigamy, as there was no marriage.

Also in point number 6 and 7 the term NRR means “The Net Reproduction Rate (NRR) is a synthetic demographic rate that measures the average number of daughters per woman who survive to average reproductive age” Here in 6th Family Planning Government of India asked to maintain the NRR of 1 which means one woman can give birth to one living girl child only. This was done only to control the population and because of this step of the Government sex-selective abortion was increased resulted female feticide and skewed sex ratio at the end.

Conclusion and Suggestions

From the above discussion it is very clear that Abortion law in India was introduced as a political agenda for the purpose of controlling the population of India. This law was not introduced as a right for women to get free from unwanted pregnancy nor this law concerned with women reproductive health because the abortion law is discriminatory in nature on the basis of marital status. There is an urgent need of amendment in MPT Act, 1971. All women should get the right of abortion as their fundamental right under Article 21 of Indian Constitution.

Conflict of Interest: Pyali Chatterjee and Dr. Komal Vig declare that they have no conflict of interest.

Source of Funding: No funding for this research.

Ethical Approval: The study does not require the approval of Institutional Ethics Committee. As the study is the combination of socio-medico-legal issue. No field study is done for this research.

A Study on Employee Performance Appraisal System in Hospitals—With Respect to Hospitals in Vellore City

Ramila Devi Ram Sing¹, S. Vadivelu²
¹Research Scholar, ²Professor & Head, Dept of Management Studies, Bharath University, Chennai

ABSTRACT

Health care system and professional has become more involved in performance management as hospitals organize to increase their effectiveness towards various growth sectors. Although they are hospital employees specialized in their health care professions, they are subject to performance appraisals because the hospitals are accountable to patients and the community for the quality of hospital services. The necessity for having a performance appraisal program in hospital is to direct the employee’s performance, motivate staff and improve hospitals self esteem growth. The performance of a health care professional may be appraised by the appropriate departmental manager, by other professionals in a team or program, based on prior consistency. Appraisal approaches may vary in different ranks. They include behavioral approaches such as rating scales, peer rating, ranking or nomination and outcome approaches such as management by objectives and their achievements. Yes, professionals should give and receive timely feedback on a flexible schedule. There are various parameters to measure the efficiency and capabilities of the employee and their dedication towards the organization. Where, in this article an attempt has been made to study the Performance Appraisal systems in hospitals especially in vellore city and to offer suggestions for their growth and improvement.

Keywords: Employees, Performance appraisal, Human resource management, Organizations.

Introduction

Performance appraisal is one of the important components in the rational and systematic process of human resource management. The information obtained through performance appraisal provides foundations for recruiting and selecting new hires, training and development of existing staff, and motivating and maintaining a quality work force by adequately and properly rewarding their performance. Without a reliable performance appraisal system, a human resource management system falls apart, resulting in the total waste of the valuable human assets a company has.

The British Association of Medical Managers (BAMM, 1999) has defined appraisal as “the process of periodically reviewing one’s performance against the various elements of one’s job”. Certainly this paper will describe the purpose & developmental criteria of an appraisal program that will regularly assess the performance of hospital employee.

Necessity of Performance Appraisal System in Hospital: The primary reason for having a performance appraisal program in hospitals is to monitor employee’s performance, motivate staff and improve hospital morale. In the hospital, monitoring employee performance requires routine documentation, which is accomplished through completing a performance appraisal form¹. When employees are aware that the hospital is mindful of their performance and they could be rewarded with increment and promotions, they will work harder. Confidence is enhanced when employees get acknowledgment or reward for their work. A powerful performance appraisal program will help the hospital and assist in accomplishing its objectives and goals². Not just, preparing necessities will be recognized and tended to amid performance appraisal survey; yet in addition concealed talent and approach to patients can be found too. Through distinguishing these preparation needs, staff can play out their positions at the great level and be in a superior position to address customers, individuals and clients concerns and questions³. A best and active staff is bound to be proactive, beneficial and ingenious, all of which helps give the hospital an aggressive edge, from enhanced customer relations to expanded profits and benefits.
Who Will Appraise Performance?: Physicians, nurses, social workers, clinical pharmacists and other professionals often work interdependently to care for patients; but during performance appraisal, they have formal input into each other’s appraisals. As hospitals increasingly focus on care delivery processes, physicians may be appraised by other professionals who share the responsibility for patient care and outcomes. Ensuring the quality of medical care is the responsibility of both regulatory bodies and hospitals. The way an organization is structured has a direct bearing on who conducts the appraisal. Hospitals generally use a combination of functional and, team or program approaches. In a functional approach, professionals focus on performing their own functions under the direct supervision of one boss. Teams or programs comprise individual professionals who also belong to traditional functional departments. In this case, however, professionals may have two supervisors - one in the department and one in the team or program.

What Performance Will Be Appraised?: Health Services Research Group (1992) wrote an article in CMAJ and reviewed the challenge of developing standards, guidelines and clinical policies as well as defining “quality” in relation to performance. Performance measures often include both process expectations (how the work gets done) and outcome expectations (the results of the process). Simon, L. (1992) suggested the following criteria to assess the performance of department head in the hospital: quality of service in the specific department, operational efficiency and effectiveness, and budget responsibility and accountability.

How Performance is appraised?: To date, health care organization literature on performance appraisal methods has tended to focus on employee-employer relationships instead of the practitioner-organization interface. Although, in the new era, most of the doctors are not hospital employees, their performance will be examined in the light of the strategic direction of health care organizations. McAuley, R.G., Paul, W.M & Morrison, G.H. et al (1990) conducted a peer assessment program in the College of Physicians and Surgeons of Ontario that is mainly covering the office practices. Kilshaw, M.F., (1992) said that these programs are traditionally based on peer review and include a welldefined committee structure involving medical staff representatives.

The specification of performance appraisal criteria is a recurring problem (Leatt, P. & Fried, B., 1988). One of the central issues is whether to evaluate traits, behaviors or outcomes of work. The trait approach, which is now outdated, evaluated such items as appearance, selfconfidence, alertness and ambition rather than job-related behaviors, productivity or quality of work.

The behavioral approach can be used in conjunction with peer evaluation. Three types of peer evaluation have been described: peer rating, peer ranking and peer nomination (Stone, T.H. & Meltz N.M., 1993). In peer rating, group members rate each other; in peer ranking, group members assign rankings to one another; and in peer nomination, each member of a well-defined group designates a number of group members as highest (and sometimes lowest) in an aspect of performance. The third type has been shown to distinguish with a high degree of reliability and validity group members whose performance is very good or very poor in the particular area (Kane, J.S., & Lawler, E.E., III, 1978).

Methodology

The study covered about 400 employees across 5 hospitals in Vellore.

1. Christian Medical College
2. Sri Narayani Hospital and Research center
3. Scudder Memorial Hospital
4. Schieffelin Institute of Health and Research
5. Kumaran Hospital

These hospitals approximately suited with 500 to 1000 bedded multi-specialty facilities providing comprehensive care to patients - Gynecology, general medicine, general surgery, pediatrics, ENT division, Ortho, Anastasia, physic Therapy, Ultra Sound Scanning, Endoscopy, Urology, Nephrology, Rheumatology and others.

The data’s were collected from employees through questionnaires which were based on random analysis and the sampling techniques. Discussions and informal interviews of the personnel revealed the first hand data. This data collection method can come out with good quality data. Questionnaires was based on Cascio et al., (1988)
Sampling Units: Employees of Hospital and senior employees
Sampling Technique: Convenience and Judgment
Sampling Research Instrument: Questionnaires and Interviews

Performance Appraisal Process in Hospitals:

The performance appraisal system forms an essential part of the employee development process in any organization. It reflects the aptitude of an organization to define goals and expectations from employees. An upright and consequential performance appraisal process is essential for the hospitals prosperity and at the same manner it plays a significant role in bringing out the best in workers. Salary revision following a performance appraisal is a great motivating factor and an upright performance appraisal process goes a long way toward reducing effectiveness rates.

The hospitals are applying 180 degree appraisal system. 180 degree performance appraisals mean that employees are appraised by two people (self and Boss/Manager). The time interval for performance appraisal is six months to one year. The performance appraisal system holds up both employees and organizational management and leaders benefit from a well-structured performance appraisal system which helps to built successful organization. These systems offer feedback and rewards to employees who perform well, while at the same time holding employees accountable for their performance. Where, each report will describe the purpose, benefits, and elements of a good performance appraisal system and outline a unique performance appraisal system for a human service organization.

The purpose of a performance appraisal system is to provide an evaluation and feedback on an employee’s performance. Most hospitals perform appraisals yearly and may call the appraisal by other terms such as a review. Even if appraisals are performed annually, management should have weekly consultations or meetings with staff to ensure each employee is kept up-to-date with policies and each employee knows what is expected of him or her. A manager should not wait until the end of a year to let an employee know that there has been a performance problem for the last eight months. Problems should be addressed as they arise to prevent any surprises during the appraisal process. The evaluation portion of an appraisal system is normally performed by management.

During this portion, management evaluates an employee’s performance to determine if there are any areas that need improvement. Ideally, all employees should meet or exceeding organizational standards. If an employee is not meeting standards, or has not met standards at some point within the previous year, his or her appraisal may have suggestions for improvement or there may be other consequences as a result of poor performance.

The feedback portion of an appraisal system normally takes place between management and the employee who is being apprised. Then management provides counseling. But many of the employees don’t understand the counseling purpose. So that should be in methodical and systematic manner. The main procedure for hospital is that first appraise fill the form, where they rate for themselves. Appraise writes his view over the actual achievement for the task and target assigned to him. Comments on fulfillment of task and target are written by the HOD. Both appraise and HOD sits together. Comment over strengths and weaknesses and areas for development are written which is undersigned by both. Then compilation of ratio with the target is done. But the main problem occurs with this 180 degree performance appraisal is compilation, collation of data and it is time consuming process. This method is useful if done in a methodical and systematic manner.

Data Analysis

1. Are you aware about your performance appraisal system or any evaluation done by your superior?
   a. Yes  b. No
2. A performance appraisal technique makes you eligible for promotion, demotion and transfer?
   a. Yes  b. No
3. Do you think performance appraisal is useful or just a waste of time?
   a. Useful  b. Waste of Time
4. Does the proper and adequate performance appraisal play crucial role in your career development?
   a. Very important  b. Important  c. Maybe in future  d. Useless
5. Performance appraisal system is most of the time fair and unbiased, is it right?
   a. Yes b. No

6. Does the organization provide counseling after appraisal?
   a. Yes b. No

**Results**

Table 1: Shows that 100% employees among (400 out of 400) in the individual organization is aware about performance appraisal system and evaluation done by their superiors in the organization.

![Graph showing performance appraisal system](image1)

Table 2: Shows that 100% employees think performance appraisal system in the hospital is more beneficial for promotion, demotion & Transfer.

![Graph showing performance appraisal benefits](image2)

Table 3: Shows that 85% employees think performance appraisal is useful.

![Graph showing performance appraisal usefulness](image3)

Table 4: Shows that 60% employees think current performance appraisal plays a crucial role in career development. So there should be more improvement in performance appraisal system than current system.

![Graph showing performance appraisal results](image4)

Table 5: Shows that 40% employees think performance appraisal system is biased. So management has to take care of it.

![Graph showing performance appraisal bias](image5)

Table 6: Shows that organization provides 62% counseling. But that should be formal so other employee also get counseling.

![Graph showing counseling provision](image6)

**Recommendations**

- Performance appraisal should be transparent, timely and effective for employees.
- People should be made more understood about appraisal process and benefits.
• Performance appraisal should be 360 degree appraisal.
• They should provide appropriate training or counselling after appraisal.
• Employees should be given feedback regarding their appraisal. This will help them to improve on their weak areas.

Conclusion

Health care organizations depend greatly on a professional strategy; concerned with their effectiveness they must pay attention to employee and physician performance. For an essentials and effective performance system a upright thing should be followed up priory which preferably includes documentation, standard goals, practical and simple format, evaluation technique, communication, feedback and personal bias. The main challenges lies in developing performance appraisal systems are the demand of flexible and appropriate system to the professional staff. This paper has suggested that performance is improved when outcomes or expectations are defined, goals are set and timely feedback is given. These principles also apply to physicians, nurses and other staff of hospital, particularly as their roles are affected by the restructuring of health care.

Assessment of Pre-analytical Errors in Clinical Laboratory at a Tertiary Care Hospital of Southern India

Asha Patil1, Saleena Ummer V2, Anju M3, Kiran Chawla4, Mridula Madiyal5, Mamatha6, Thejaswini Prabhu6

1Assistant Professor, 2Associate Professor and Head, 3Assistant Professor, Department of Medical Laboratory Technology, School of Allied Health Sciences, 4Professor and Head, 5Associate Professor, Department of Microbiology, KMC Manipal, 6Intern, Department of Medical Laboratory Technology, Manipal Academy of Higher Education, Manipal

ABSTRACT

Background: Majority of the laboratory error occurs in the pre-analytical phase which affects the diagnostic accuracy. This study was done to examine the frequency of pre-analytical errors classify them and to identify quality indicators which will further help in minimizing the occurrence of errors.

Method: A two-month study was done to identify the pre-analytical errors occurred in the microbiology laboratory from February 15th 2016 to April 15th 2016 (n= 42079). We documented the types and frequency of errors.

Result: Improperly/Incompletely filled request form was the major pre-analytical error observed. The total percentage of pre-analytical errors observed was 0.9%

Conclusion: Pre-analytical phase in clinical laboratories should be continuously monitored and should be avoided by proper application of quality control.

Keywords: Pre-analytical phase, Errors in Clinical laboratory, quality control, Quality Indicator

Introduction

Laboratory medicine plays an important role in the diagnosis and management of diseases. Laboratories are now an essential component in the organization of modern health care sector.1 Accurate laboratory reports are very essential for the diagnosing the disease and also for the patient safety.2 60-70% of crucial decisions of patients affirmation, release, and medicine depend on laboratory results.3 The laboratory operation is divided into three stages pre-analytical, analytical and post-analytical phases. Pre-analytical phase starts from the time a laboratory investigation is requested by the clinician till the sample is ready for analysis. This includes the process of sample collection consisting of proper patient identification, selection of appropriate sample collection tubes or containers, proper labelling of specimen with patient name, age, sex and unique hospital number with barcode and time of sample collection.4 Analytical phase includes various diagnostic processes and procedure that eventually provides the results. The final phase of laboratory testing is the post-analytical phase that ends up with the production of the final result or diagnostic report. The combination of these three stages constitutes the “total testing process”. The total testing process (TTP) is the entire process from the ordering a test to the interpretation of test result. It starts and ends up with the patient.5,6 Services rendered by the laboratory should be accurate and precise as errors might happen throughout the process.

According to ISO, laboratory errors are defined as any flaw occurring at any part of the laboratory cycle from requesting a test to delivering laboratory reports, interpreting, and respond to results.5 Errors can occur in

pre-analytical, analytical or post-analytical phase further leading to delay in diagnosis or wrong diagnosis. According to several studies, pre-analytical errors accounts for up to 70% of total errors. Errors due to analytical issues are less when compared with post-analytical (18.5-47%). Quality indicators are objective measures the critical areas in TTP.

We conducted a study to examine the frequency of pre-analytical errors occurring at Microbiology laboratory of the Kasturba Hospital, Manipal and to rule out the cause of the error and to identify quality indicators of pre-analytical errors.

**Materials and Method**

A prospective observational study to assess the frequency of pre-analytical errors occurring in Microbiology was conducted at Microbiology lab, Kasturba Medical College, Manipal. The study was done for a period of 2 months from February 15th 2016 to April 15th 2016. All Samples received in the microbiology lab were included in the study. All inpatient and outpatient samples received along with the request forms were screened for preanalytical errors. Daily errors and type of errors were registered.

**Sample Collection:** Outpatient samples were collected at sample collection Centre in the hospital by the laboratory staffs and transported to the laboratory by hand by the housekeeping staff. Samples from the inpatient were collected by the nursing staffs and immediately transported to the corresponding laboratory. Blood samples were collected in colour coded vacuum tubes and biological fluids collected in sterilized plastic collection bottles. Once the samples reach the Microbiology laboratory, it was cross-checked by the laboratory staffs for appropriate containers, adequate sample volume, properly labelling, whether the test requisition sheet is properly filled and sample leakage. The time when the sample was received was also noted. Further, the barcode was generated for each sample and then send for analysis. If any errors were identified it was recorded and informed to send a proper repeat sample.

The following are the various quality indicators used to detect pre-analytical errors.

a. Doctor signature/name unreadable or missing: The sample was rejected if concerned Doctor’s name and signature ordering the test was not mentioned legibly. For Serological test like HIV requires consent form filled by patient along with doctor’s signature.

b. Inadequate quantity of sample: if the quantity of the sample provided is not sufficient to conduct the test procedure the sample was rejected.

c. Improperly/Incompletely filled request form: Failure to provide all information required on the test request form or improper labelling lead to rejection of the sample.

d. Invisible patient ID: If the Patient name, age, sex, hospital number, that was lightly labelled and can’t readable was rejected.

e. Wrong specimen: When the type of specimen provided is not suitable for the test requisitioned.

f. Leaking sample: This could be due to the containers being small or could also be due to loosely attached caps. Overfilled samples.

**Result**

A total of 42079 specimens were (21549 in the first month and 20530 in the second month) received in the microbiology laboratory. Preanalytical errors as per the above-mentioned categories were found in 382 samples (0.9%). The most common error was observed in Improperly/Incompletely filled request form (113 samples), Doctor signature/name unreadable or missing (107 samples). Inadequate quantity of sample (67 samples), Invisible patient ID (45 samples), Wrong specimen (31 samples), Leaking sample (19 samples) [Table 1]. The highest pre-analytical error is occurred by request form errors such as request form without doctor sign/unreadable and improperly or incompletely filled request forms.

**Discussion**

Laboratory medicine plays an important role in delivering health care. Accurate and precise laboratory results are instrumental in the decision making by doctors. Most of the studies have reported that the majority of the laboratory errors occur in the pre-analytical phase.

In the present study, we have considered only those quality indicators that we thought were important in our laboratory setup. We studied seven quality indicators and observed the frequency of pre-analytical errors. Test requisition forms were the source of highest error followed by sample collection. Our findings emphasize the importance of regular monitoring of these preanalytical variables to minimize the errors. Hence control over the preanalytical phase will ensure a satisfactory performance of laboratory services.

Quality improvement in the laboratories by controlling the lab errors can be achieved by spreading awareness among nursing staff, laboratory personals and health care providers. By recording all errors and their causes by monitoring regularly with corrective action will help in reducing these pre-analytical errors. With proper training to the staffs, better communication with clinical staff, clinicians at all phases will minimize the sample rejections and thereby provide reliable test results within the shortest possible time.

To conclude that quality indicators are powerful tools for monitoring the TTP. Introduction of advanced laboratory information system can efficiently control many of these preanalytical errors.

Assessment of Knowledge, Awareness and Practice of Interdental Dental Aids as an Adjunct Oral Hygiene Tool among Dental Professional Students

Sana Chawla¹, Sangeeta Umesh Nayak²
¹BDS, ²MDS, Associate Professor, Department of Periodontology, Manipal College of Dental Sciences, Mangalore, Manipal Academy of Higher Education, Manipal

ABSTRACT

Background: Daily oral hygiene is must for overall good health. The Dental professionals play vital role in maintaining a good and sound oral health.

Aim: To evaluate the knowledge and practice of interdental aids among dental students.

Methodology: Undergraduate and postgraduate students (351) of private dental college were included by simple random sampling method. Demographic information, knowledge and attitude about inter-dental aids were collected using specially designed pre tested questionnaire.

Result: Statistical analysis was done. Chi square test was used for comparison between groups in relation to use knowledge about interdental aids. P value of < 0.05 was taken as statistically significant. 78.6% of students had knowledge regarding interdental aids. Clinical students had good knowledge regarding interdental aids compared to pre-clinical students. 143 students practice interdental aids.

Conclusion: There was a gradual increase in the knowledge as well as usage of interdental aids with progression from preclinical to clinical education. A disparity has noted between the prevalent knowledge and its application in daily life has been noticed.

Keywords: Dental plaque; Interdental aids: Oral Hygiene

Introduction

Oral diseases constitute public health problem in developing countries due to their high prevalence, economic consequences, and negative impact on the quality of life of affected individuals. Dentaltotals] Dental caries, and periodontal diseases are the two most prevalent oral diseases and which largely preventable through a combination of professional and self-care activities. Oral care, as part of general health self-care, comprises wide spectrum of activities ranging from care, prevention, and diagnosis to seeking professional care.

It is proved that self-care is a deliberate action that individuals should engage in to maintain good health. It is emphasized by the World Health Organization (WHO) as the key strategy for health promotion and disease prevention. It comprises of a wide spectrum of activities ranging from maintenance, prevention and diagnosis of any presenting ailment upon seeking professional care. At an individual level, such practices are known to be effective preventive measure against various oral diseases.

The people’s attitude and behavior play an important role in development and prevention of oral diseases. ADA has advised that dental visits should be made on a regular basis.

Epidemiological surveys have indicated that bacterial plaque is the dominant etiological factor in
periodontitis. Furthermore, it has been convincingly demonstrated that gingivitis is most frequent and most severe in the interproximal areas. [4] Though tooth brushing is considered as the most vital part of oral hygiene. But, any toothbrush regardless of the brushing method used, does not completely remove oral biofilms from the interdental spaces.[5,6] Inefficient removal of plaque and debris from these highly inaccessible areas between the teeth can trigger periodontal disease, a common oral ailment. With this shortcoming in view, several other materials have been devised to supplement the toothbrush. Hence, use of interdental aids is crucial factor for maintaining overall oral health.[3]

In contribution to Oral health promotion, one’s knowledge and attitude towards it plays a key role in determining the oral health conditions of the general population. It acts as a prerequisite for health-related behavior. The behavior of oral health providers like dental students and their attitude towards their own oral health reflects their understanding of the importance of improving the oral health of their patients.[7] They are expected to be role models for their patients, friends and family by utilizing the knowledge and experience they gain in their dental curriculum and employing it in life. [8]

Most studies conducted thus far have focused on the behavior of dental students towards routine brushing aids and knowledge regarding general brushing practices. This study highlights and assesses the existing knowledge and use of interdental aids among a group of undergraduate and postgraduate dental students while emphasizing on increasing the awareness among the dental student community.

Materials and Method

The cross-sectional questionnaire-based survey was conducted among undergraduate and postgraduate students of private dental college. A total of 380 students were included by simple random sampling method. The study protocol was approved by institutional ethical and review board. A participant consent was obtained prior to data collection.

A specially designed pre-tested questionnaire was used which was validated by subject experts. The questionnaire consisted of two sections, of which, the first section contained questions pertaining to demographic information such as age, sex, year of the study oral hygiene habits and practices, regularity of cleaning the teeth and the aids used and the second section contained questions regarding knowledge and attitude of inter-dental aids. An informed consent form along with a brief description of the study was attached along with the questionnaire.

The collected data were subjected to statistical analysis and chi square test was used for comparison between groups in relation to use knowledge about interdental aids. P value of < 0.05 was taken as statistically significant. Few questionnaires were not included in the statistical analysis due to errors in completion of questionnaire.

Results

A total of 351 dental students (267 female and 84 male) ranging from the age of 18 years to 30 years completed the questionnaire. The sample description of students by year of study is given below (Figure 1). 29 questionnaires were not added in the data due to incomplete filling or multiple answers were ticked. Incompletely filled forms were not subjected for statistical analysis.

Figure 1: Sample distribution among the study participants

The findings regarding tooth brushing habit of participants was 100%. There were no significant differences in tooth brushing behavior between academic years. 43.3% of the respondents claimed to brush their teeth once daily while 56.7% claimed to brush twice daily.

It was reported that a considerable number of students faced dental and gingival problems with the most common being food lodgment and dental decay. The pie chart below shows the percentage of these problems experienced by them (Figure2).
Regarding the information on interdental aids, it was observed that 78.6% of students were aware about it. 84% students knew that interproximal area of teeth is the most difficult to clean with brush alone and hence needs to be cleaned with interdental aids. Dentists were the source of information for 44.7% of the students. Upon comparing the Statistical data it was observed that Clinical students had good knowledge regarding interdental aids compared to non-clinical students (P < 0.001) (Table 1 & 2, Figure 3).

The common reasons given for non-usage of interdental aids included that it was difficult to use or that it required extra time an effort.

**Discussion**

As a major part of their role in the oral-health-care provision, dentists are considered experts in the field of oral-health education and promotion. The first step in establishing a positive oral-health habit is to provide significant knowledge to the patients and to raise their awareness regarding the ways to prevent oral diseases. Dental students should be a good example of positive oral health attitudes and behavior to their families, patients and friends. In general, they have been found to be motivated about maintaining a good oral health. In this manner high awareness regarding oral self-care among dental students enables them to assess their patients’ oral health condition and to motivate their patients and may help them to spread oral awareness in the general population [9-11]

The removal of inter-proximal plaque is considered to be important for the maintenance of gingival health, prevention of periodontal diseases and reduction of caries. Unfortunately, the toothbrush is relatively ineffective at removing inter-proximal plaque and therefore patients need to resort to additional home care techniques such as interdental aids. [12] In the present study majority of the participants brush their teeth twice daily this is in accordance with earlier studies. [13,14] This is in contrast to study by Anisha et al. 2017. [12] In that article authors felt lack of awareness may be the prime reason for these results.

The results of the present study indicated that the percentage score for oral-health knowledge, attitude, and behavior of clinical students were significantly higher than that of the preclinical students, which agrees with the results of some previous studies by Kawamura et al. 2000 [11,15] preventive dentistry and periodontology are taught in the 3rd year of dental studies, so the difference in the knowledge, attitude, and behavior percentages of preclinical and clinical dental students appears to reflect the variation in the student’s educational level.

Knowledge about interdental aid was around 76% and 84% of participant felt interdental area is difficult to clean by routine brushing techniques this was in contrast to study by previous study by Bennadi et al 2013.[16]

Oral health education needs to be provided in these areas in accordance with several studies where study results confirmed that knowledge and practice of interdental aids improved with increasing levels of education. [16] This improvement in personal oral health among dental students has been shown to be linked to their dental education experience. Knowledge and practice of inter dental aids seem to increase significantly in the fourth and fifth years of dental education. Additionally, the responses of the students in the fourth and fifth years were very similar.[11,16]

**Conclusion**

The study conducted observes that although the knowledge among dental students about interdental aids is good, there is a considerable gap in the implementation of this knowledge. There seems to be a gradual increase in the knowledge as well as usage of interdental aids with progression from preclinical to clinical education in the dental curriculum.

A small number of students experienced dental problems which can be attributed to the non-usage of
interdental aids. A disparity has been noted between the prevalent knowledge and its application in day to day life for which motivation seems to be the key to overcome this gap. This will enable the future dental health providers to ensure good oral hygiene among patients, family and themselves.

**Clinical Relevance:** Tooth brush regardless of the brushing method used, does not completely remove oral biofilms from the interdental spaces. Use of interdental aids is crucial factor for maintaining overall oral health. The behavior of oral health providers like dental students and their attitude towards their own oral health reflects their understanding of the importance of improving the oral health of their patients. They are expected to be role models for their patients, friends and family by utilizing the knowledge and experience they gain in their dental curriculum and employing it in life.

Invitro α-Glucosidase and α-Amylase Inhibitory Activities of Heartwood of *Pterocarpus Marsupium*

Sujita Pradhan, Santosh K. Sahu, Sangeeta Mukhi, Sudhansu Sekhar Mishra, Prafulla Ku. Chinara

1Tutor, Department of Anatomy, IMS and SUM Hospital, Siksha ‘O’ Anusandhan University, K8, Kalinga Nagar, Bhubaneswar, Odisha, India; 2Assistant Professor, Department of Anatomy, SCB Medical College, Cuttack, Odisha, India; 3Lecturer cum Research Associate, School of Pharmaceutical Sciences, 4Professor, Dept. of Pharmacology, 5Professor, Dept. of Anatomy, IMS and SUM Hospital, Siksha ‘O’ Anusandhan University, K8, Kalinga Nagar, Bhubaneswar, Odisha, India

**ABSTRACT**

Objective: Diabetes is the most prevailing disease of today’s world. Many complementary and alternative medicines are being used to treat diabetes mostly derived from plant sources. *Pterocarpus marsupium* is one such drug. Many works are being done to inhibit α-glucosidase and α-amylase enzymes there by controlling post prandial hyperglycemia. The present study was undertaken to see the anti enzymatic action of *Pterocarpus marsupium* against α-glucosidase and α-amylase enzymes.

Method: Invitro assessment was done to see enzymatic inhibition. The Ic50 was calculated using linear regression equation.

Result: The Ic50 value for α-amylase was found to be 31.03 µg/ml and the Ic50 value for α-glucosidase was 39.97 µg/ml.

Keywords: *Pterocarpus marsupium*, antidiabetic, α-amylase, α-glucosidase

**Introduction**

Diabetes mellitus is a chronic metabolic disorder. It may be defined as a disease of elevated blood glucose level with absent or inadequate pancreatic insulin secretion. It may be associated with or without concurrent impairment of insulin action. It is characterized by hyperglycemia and carbohydrate, protein and fat metabolism disorder. About 40.9 million people are diabetic in India which would rise up to 60.9 million by 2025. There are many types of diabetes out of which Type I and Type II diabetes are more common. Among the above said types, Type II diabetes which is also referred as non-insulin-dependent diabetes is more prevalent. It is mainly due to abnormal rise in blood sugar following a meal also known as postprandial hyperglycemia. Many works are being conducted to regulate postprandial glucose level. α-amylose and α-glucosidase are responsible for postprandial glucose level. So the use of carbohydrate digesting enzyme inhibitors can control postprandial hyperglycemia by reducing the intestinal absorption of glucose. The α-amylase are the calcium metalloenzymes which can’t function in the absence of calcium. This enzyme helps in the hydrolysis of the alpha-1,4 glycosidic linkages of the starch, amylopectin, amylose, glycogen, and numerous maltodextrins and is responsible for starch digestion. α-glucosidase or maltase catalyzes the final step of the digestive process of carbohydrates mainly starch by acting upon 1,4-alpha bonds and producing glucose as the final product. Due to excess activity of amylase enzyme and insulin deficiency or insulin resistance, level of blood glucose arises which might result in hyperglycemia. To control hyperglycemia several studies on inhibition of amylase enzyme activity is being studied. Inhibiting these two enzymes will help to control postprandial hyperglycemia. Many drugs are being used to treat diabetes mellitus. Acarbose is one of them which acts by inhibiting both α-amylase and α-glucosidase. This drug causes GI irritation which involves abdominal distention, flatulence, meteorism and possibly diarrhea. To overcome this problem many complementary and alternative medicines are being used to treat diabetes. These are generally derived from plant sources. World
health organization (WHO) is also promoting the use of traditional plant for diabetes for to its effectiveness and less or no sideeffect. \( \textit{Pterocarpus marsupium} \) is one such traditional plant used as antidiabetic. \( \textit{Pterocarpus marsupium} \) is a long deciduous tree which belongs to Leguminaceae family. It is mostly found in evergreen forests of India. This plant is commonly known as Indian Kino in English, also known as Vijayasar in Sanskrit, Bijsal, Bibla etc. are its other synonyms. Its anti diabetic effect is known from ages. In ayurveda it is described in a group called rasayana or immunomodulators.

**Materials and Method**

\textbf{Preparation of extract of \textit{pterocarpus marsupium}:} The heartwood of \textit{pterocarpus marsupium} was collected from local market. It was dried properly in shade at room temperature. Then the woods were cut into small pieces and grinded in electric grinder. The powder obtained was soaked in equal amount of water for 24 hrs. The macerated pulp was filtered through coarse sieve. The filtrate was dried in water bath at temperature ranging from 40°C to 60°C. A sticky consistency of filtrate was obtained. This filtrate was completely lyophilized by continuous freeze drying operation to obtain a dry powder.

\textbf{In vitro \textit{α}-amylase inhibitory assay:} 0.5ml of extract (1mg/ml) was mixed with 0.5ml of \textit{α}-amylase solution (0.5 mg/ml). \textit{α}-amylase solution was made by mixing 0.5mg of amylase in 1ml of 0.02M sodium phosphate buffer (pH 6.9 with 0.006M NaCl). This mixture was incubated at room temperature for 10mins. Then 0.5ml of starch solution (1%) 0.02M sodiumphosphate buffer (pH6.9 with 0.006MNaCl) was added to it. The resulting mixture was incubated at room temperature for 10 min, and the reaction was terminated using 1 ml of dinitrosalicylic acid as colour reagent. Then the test tube was placed in water bath at 100°C for 5 min and was cooled until room temperature was attained. The mixture was then diluted with 10 ml of distilled water, and absorbance was determined at 540 nm. The absorbance of blank (buffer instead of extract and amylase solution) and control (buffer instead of extract) samples were also determined.

\textbf{In vitro \textit{α}-glucosidase inhibitory assay:} 2.0 ml of 0.1 mol·L\(^{-1}\) potassium phosphate buffer (pH 6.8), 0.1 ml of sample solution or extract (1mg/ml), 50 µl of reduced glutathione (1 mg·ml\(^{-1}\)) and 0.1 ml \textit{α}-glucosidase solution (0.57 U·ml\(^{-1}\)) were taken and mixed well. The solution was then incubated for 15 min at 37°C. 0.2 ml of 4nitrophenyl-\textit{α}-D-glucopyranoside (PNPG of 20 mmol·L\(^{-1}\)) was added. It was incubated for 15 min at 37°C. the reaction was stopped by adding 10 mL of 0.1 mol·L\(^{-1}\) Na\(_2\)CO\(_3\). The amount of 4-nitrophenol was measured spectrophotometrically at 400 nm.

**Calculation of percent inhibition:** it was calculated using the formula

\[
\% \text{Inhibition} = \left( \frac{\text{Abs Control} - \text{Abs Sample}}{\text{Abs Control}} \right) \times 100
\]

**Calculation of IC50:** The IC50 was calculated using linear regression equation in which the concentration of the sample as the x-axis and percent inhibition as the y-axis. From the equation \( y = a+bx \), IC50 values was calculated.

**Result**

The In vitro \textit{α}-amylase and \textit{α}-glucosidase inhibition study demonstrated that the \textit{Pterocarpus marsupium} has an inhibitory action on both the enzymes. There was dose dependent increase in percentage inhibitory activity against both enzymes. The \% inhibition for alpha amylase was found to be 29.56% and 68.29% at concentration 10 \( \mu g/ml \) and 50 \( \mu g/ml \) respectively (table - 2). The \% inhibition for alpha glucosidase was found to be 24.43% and 61.45% at concentration 10 \( \mu g/ml \) and 50 \( \mu g/ml \) respectively (table - 1). The IC50 value for \textit{α}-amylase was found to be 31.03 µg/ml (fig.2) and 39.97 µg/ml for \textit{α}-glucosidase (fig.1).

| Table 1: (\textit{α}-glucosidase inhibitory effects of extract of \textit{pterocarpus marsupium}) |

Discussion

α-amylase and α-glucosidase are responsible for carbohydrate digestion. Inhibition of these enzymes helps to control post prandial hyperglycaemia in type II diabetic patients. There is delay in digestion of carbohydrate as a result of which there is low sugar level in blood which in turn reduces post prandial glucose level. The delay of carbohydrate digestion with a plant-based α-amylase and α-glucosidase inhibitor is a better option for management of type 2 diabetes mellitus. In clinical practice today many α-amylase and α-glucosidase inhibitors like acarbose, voglibose and miglitol are being prescribed. But these drugs are not cost effective as well as having many side effects. Pterocarpus marsupium is being used as an antidiabetic drug for ages from the time of charaka and susruta(charaka samhita).this study aims to investigate the enzymatic inhibition property of this plant using aqueous extract of its heartwood. The present study proved the inhibitory effect of the drug against α-amylase and α-glucosidase which is similar to some previous worker. They investigated taking account of the plants leaves and latex. From the above data it was found that this drug is a strong inhibitor of amylase than α-glucosidase as the Ic50 value for α-amylase was found to be 31.03 µg/ml and 39.97 µg/ml for α-glucosidase. It can be inferred that the heartwood is more potent than leaves as done by previous author.

Conclusion

From the In vitro study it can be inferred that the antidiabetic effect of Pterocarpus marsupium is also influenced by enzymatic inhibition of α-amylase and α-glucosidase including other factors. It can be positively used to decrease the post prandial hyperglycaemia.

To Compare the Efficacy of Dexamethasone with Levobupivacaine versus Fentanyl with Levobupivacaine on Duration of Analgesia after Supraclavicular Brachial Plexus Blockade

Ashish Aby Mammen¹, Shaila S Kamath²
¹Post Graduate, ²Professor and HOD, Department of Anesthesiology, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal, India

ABSTRACT

Objective: Supraclavicular brachial plexus block is one of the easiest and the most consistent method for anesthesia and perioperative pain management in surgeries below the shoulder joint. In this randomised control trial, we aimed to compare the analgesic efficacy of 0.5% levobupivacaine with 4mg dexamethasone and 25 mcg fentanyl as adjuvants for brachial plexus block (supraclavicular approach) in upper extremity surgeries.

Method: Ninety patients were randomly divided into 3 groups of 30 each. Group L: 25 ml 0.5% levobupivacaine + Normal Saline 1 ml. Group D: 25 ml 0.5% levobupivacaine + dexamethasone (4 mg). Group F: 25ml 0.5% levobupivacaine + fentanyl (25 mcg). Time of onset of sensory block, time of onset of motor block, duration of motor block and total duration of sensory block were noted. Postop analgesia and VAS score was recorded for 24 hours.

Results: Onset of sensory and motor block was 6.10+2.51 min and 11.57+3.19 min in Group D, 9.67+3.61 min and 15.73+3.83 min in Group F, 13.87+3.83 min and 21.57+3.53 min in Group L respectively.

Conclusion: Addition of 4mg dexamethasone to 0.5% levobupivacaine for supraclavicular plexus block shortens sensory, motor block onset time and motor block durations, extends sensory block, and analgesia durations

Keywords: Dexamethasone, fentanyl, levobupivacaine, supraclavicular brachial plexus block.

Introduction

The main aim of anesthesia is to ease the pain and anguish of the patient, so that surgical procedures can be performed without any distress. Pain is a physiological reaction in response to tissue injury. In recent times, intra-operative and post-operative pain relief has attained significance, in view of the immunological, central and peripheral stress response to tissue injury [1].

Patients experience severe, unendurable pain in the post-operative period [2]. This warrants the need for extended analgesia devoid of any side effects [3].

Regional blocks are based on the concept that pain is conveyed by nerve fibres, which are amenable to interruptions anywhere along the pathway [4].

One of the most commonly employed regional nerve block procedure for peri-operative anaesthesia and analgesia for upper extremity surgery is brachial plexus block [5]. The undesirable effects, of general anaesthetic drugs and upper airway manipulations can be avoided [6].

Supraclavicular approach is the most simple and reliable method for anaesthesia and peri-operative analgesia in upper limb surgeries [7]. In recent times, different adjuvants have been used along with local anaesthetics in brachial plexus block to achieve rapid, intense and extended block [8-9].

DOI Number: 10.5958/0976-5506.2019.01277.4
Adjuvants such as magnesium sulfate [10], clonidine [11], epinephrine [12], buprenorphine [13], midazolam [14], dexmedetomidine [15-16], etc. have been used but these have adverse effects like sedation, respiratory depression and psycho-mimetic effects. Previous studies have shown that dexamethasone as an adjuvant, have no significant neurotoxicity and elevation of blood glucose concentrations [17]. The usage of opioids as adjuvants in brachial plexus block enhances success quotient and post-op analgesia [18]. Dexamethasone is widely believed to augment the characteristics and duration of peripheral nerve block as compared to local anesthetic alone [19].

Levobupivacaine was found to have lesser cardiac and neurological adverse effects. Levobupivacaine has a better safety profile. Hence, the S (−) enantiomers of bupivacaine, levobupivacaine and ropivacaine were launched [20]. In India, levobupivacaine has been introduced recently and is being used in various health sectors [21].

Therefore the intention of this study was to evaluate the effectiveness, duration and characteristic of motor blockade and sensory blockade between patients receiving plain levobupivacaine and its combination with adjuvants like dexamethasone and fentanyl.

**Material and Method**

After the approval of the institutional scientific and ethics committee, 90 consenting patients fulfilling the inclusion criteria was considered for our study. A pre-anesthetic checkup was done for all patients which included a detailed history, general physical and systemic examination. Patients were randomly divided into three groups of 30 each. All the patients were subjected to brachial plexus block with supraclavicular approach with all aseptic precautions with a nerve locator needle, immediately lateral to subclavian artery. After eliciting motor response in the fingers using a nerve stimulator, drugs were administered as follows:

**Group L:** 0.5% levobupivacaine 25 ml + Normal Saline 1 ml

**Group D:** 0.5% levobupivacaine 25 ml + dexamethasone 1 ml (4 mg).

**Group F:** 0.5% levobupivacaine 25ml + fentanyl 1ml (25 mcg)

Time of onset of sensory block, time of onset of motor block, duration of motor block and total duration of sensory block were noted. Intraoperatively, all the patients received adequate intravenous fluids. Pulse rate (PR), blood pressure (BP), respiratory rate (RR) were monitored till the patients were shifted from operating table. Patients were watched for signs of pneumothorax, like tachypnea and respiratory distress. Intraoperatively and postoperatively side effects like nausea, vomiting, itching, dryness of mouth and sweating were observed.

After completion of surgery, patients were shifted to the recovery room. All analgesics and sedatives were withheld in the postoperative period, unless the patient complained of pain. Postop analgesia was recorded for 24 hours.

Evaluation of pain and pain relief was done according to visual analogue scale. When patients complained of pain (>3 VAS), parenteral analgesic (Inj. Diclofenac Sodium 50 mg in 100ml infusion over 10 min) was given.

**Parameters:**
- Sensory block: using pin prick method (assessment using 3 point scale)
- Motor block:
  - Radial nerve: Thumb abduction, extension at elbow and wrist
  - Median nerve: Thumb opposition
  - Ulnar nerve: Thumb adduction
  - Musculocutaneous nerve: Flexion at elbow

Haemodynamic parameters: heart rate, blood Pressure, SpO2, Respiratory rate at 5 min, 10 min, 15 min, 30 min, 45 min, 60 min, 75 min, 90 min, 120 min

Intra operative and postoperative monitoring of sensory block, motor block and visual analogue scale(VAS) at 30 min, 1hr, 2 hr, 4 hr, 6 hr, 12 hr, 24 hr

The primary outcome of the study was to compare the onset time and duration of sensory block between the 3 groups. The secondary outcome was to compare the onset and duration of motor block between the 3 groups.

**Sample Size:** The sample size required for correctly rejecting the null hypothesis with the power of 90% and 95% confidence interval was calculated and was determined that 90 participants were required who were randomized into three groups using computer generated randomization:
\[ n = \left( \frac{Z_\alpha + Z_\beta}{d'} \right)^2 \sigma^2 \]

\[ Z_\alpha = 1.96 \text{ at 95% confidence level, } Z_\beta = 1.28 \text{ at 90% power} \]

Statistical Analysis

The data was analysed using the following tests

- Chi-square test
- ANOVA test
- Bonferonni t test
- SPSS 17.0.

Result was considered statistically significant if P value <0.05

Findings

As shown in table 1, demographic variables such as age, weight, height and gender were comparable in all 3 groups

Discussion

In our study, the duration of sensory block in Group-D was found to be 1334.87±157.75 min vs 533.60±114.28 in Group-L and duration of motor block was found to be 1214.50±160.87 min vs 449.50±121.29 min in Group-L. Jasminka Persec [17] et al studied the effect of dexamethasone on analgesia, when added to levobupivacaine in ultrasound-guided supravacular blockade. Duration of motor (1,200 min. in group 1 vs 700 min. in group 2) and sensory (1,260 min. in group 1 vs 600 min. in group 2) blockade were significantly increased in group-1 (P<0.05) which was comparable to our study. In our study the time of onset of sensory block was 6.10±2.51 min in Group D vs 13.87±3.83 min in Group L which was highly significant whereas in their study, the onset of sensory block was 5 min in study group vs 3 min in control group which was not clinically significant (p= 0.72). In our study the time of onset of motor blockade in Group D was11.57±3.19 min vs 21.57±3.53 min in Group L which was found to be highly significant. In the study done by Jasminka Persec[17], time of onset of motor block was 8 minutes in study group versus 8 minutes in control group which was clinically insignificant. Kim YJ et al[19] showed that on administering 5mg dexamethasone as an adjunct in interscalene block, it was found to have a good pain control period extending up to 48 hours, without specific adverse effects in comparison to adding equal volumes of adjuvant normal saline or epinephrine (1: 40000) which is in confirmation with our study.

In our study, the duration of sensory block was 761.83±77.89 min in Group F and 533.60±114.28 min in Group L, which was highly significant(p =0.000). Time of onset of sensory block was 9.67±3.61 minutes in Group F vs 13.87±3.83 min in Group L and time of onset of motor blockade 15.73±3.83 min in Group F vs 21.57±3.53 min in Group L which was highly significant (p=0.000). Shirish G. Chavan et al [2] studied effect of addition of 50mcg fentanyl to 0.5%bupivacaine in brachial plexus block on duration of analgesia. The duration of sensory blockade was 623 ± 96 min in the study group vs 450 ± 79 min in control group which was comparable to our study.

Moharari R et al [22] have shown that addition of 75 mcg of fentanyl to 1.5% lidocaine solution in an interscalene brachial plexus blockade accelerates the onset time of sensory and motor blockade, which is in accordance with our study. Karakaya D et al[23] has shown that mean duration of sensory block, motor block and analgesia was increased when 100mcg fentanyl was added to 0.25% bupivacaine in comparison with local anesthetic alone in supravacular block which is comparable to our study.

Conclusion

Hence we conclude that addition of 4mg dexamethasone and 25mcg fentanyl to 0.5% levobupivacaine in supravacular brachial plexus block shorten the onset time and prolongs the duration of sensory and motor block in comparison to 0.5% levobupivacaine alone. It was also found that onset of sensory and motor block was shorter and duration of sensory and motor block was prolonged with dexamethasone in comparison to fentanyl.

Anti-Microbial Activity of *Psidium Guajava* Leaf Extract

Sharada T Rajan¹, Malathi N², Chamundeeswari D³, Rose C⁴

¹Associate Professor, ²Professor & Head, Department of Oral Pathology, Faculty of Dental Sciences, SRIHER, ³Principal/Professor and Head, Department of Pharmacognosy, Faculty of Pharmacy, SRIHER, Porur, Chennai; ⁴Chief Scientist and Head (Retd.), Department of Biotechnology, CLRI, Chennai

**ABSTRACT**

**Objective:** To assess the antibacterial and antifungal activity of *Psidium guajava* leaf extract.

**Method:** Two concentration of alcohol extracts were obtained by Soxhlet method and another extract was prepared with aqueous extraction method. All three extracts were assessed for antibacterial and antifungal activity using well-diffusion method.

**Results:** 70% ethanolic extract (S3) showed more antibacterial efficacy when compared with 100% ethanolic (S1) and aqueous extracts (S2) of *Psidium guajava*. Antifungal activity screening showed inhibitory zone of 13 mm with S1, 14 mm with S3. Aqueous extract (S2) could not show any effect on *Aspergillus niger* growth inhibition. Candida albicans inhibition was comparable among the three extracts. Higher concentration 1024 ug/ml of S3 showed superior efficacy of 17 mm when compared to other two extracts S1 and S2.

**Conclusion:** The findings of this study revealed the antibacterial and antifungal properties of the Psidium guajava leaf extract.

**Keywords:** Antibacterial activity, Antifungal activity, Quercetin, Psidium guajava, Polyphenolic flavonoids.

**Introduction**

Many natural products have shown to possess antimicrobial activity that includes various parts of different plants. This has given a scope to research on the plants that have antimicrobial activity and produce phytochemicals that are responsible for anti-microbial actions¹². Mechanism of antimicrobial action by plant extracts includes rupturing the cell wall, membranes and destroying intracellular matrix¹. The *P. guajava* plant products were used in folk medicine for treating various ailments like vomiting, dysentery, gastroenteritis, sore throat, malaria, tooth ache, inflamed gums, ulcers, wounds ³⁴. This plant was also reported for its beneficial activity against obesity, diabetes and hypertension⁵⁻⁷. *Psidium guajava* belonging to the Myrtaceae family, originated from South America. Among 150 species under genus *Psidium* only 20 species are good food crops and among these the most commonly grown plant is *P. guajava* L ⁸, Guava fruit today is considered minor in terms of commercial world trade, but it is widely grown in the tropics, enriching the diet of hundreds of millions of people in those areas of the world. This is a deciduous plant and its leaves measure about 2-6 inches in length and 1-2 inches in width with characteristics like coriaceous, stiff, aromatic and dull green in colour⁹. The phytochemical components in the leaf of this plant like cineol, flavonoids, tannins, malic acid, triterpenes, resins, were known to possess antibiotic, anti-diabetic and anti-obesity properties¹⁰. The common methods of plant extraction are maceration, infusion, percolation, digestion, decoction, Soxhlet extraction, aqueous-alcoholic extraction by fermentation, counter-current extraction, microwave-assisted extraction, ultrasound extraction, supercritical fluid extraction, and phytomic extraction. Maceration extraction was considered as simple extraction in which solvents diffuse and
solubilise compounds of plant material with similar polarity\textsuperscript{11}. Extract quality depends on various factors like origin, season, extraction method and secondary metabolite composition. Factors affecting extraction method includes time of the extraction period, solvent used, temperature and the solvent-to-sample ratio\textsuperscript{12}. The antimicrobial activity of various extracts from guava leaves were previously reported by Gonçalves et al., describing the phytochemical properties of essential oils in this plant\textsuperscript{13}. In their study, the extraction procedure included Soxhlet extraction and rotary evaporator using Clevenger type doser and Gottlieb et al., method was used for obtaining essential oils\textsuperscript{14}. Antimicrobial screening was done by many researchers with essential oil and solvent extract of guava leaves\textsuperscript{1, 4, 5, 16}. The mechanism of action for antimicrobial activity of essential oils in guava leaves is that they penetrate lipid layer of microbes’ cell membrane destroying its impermeable nature and causing leakage of vital cell contents\textsuperscript{17}. Antibacterial activity of ethanolic and aqueous extracts of various parts of guava plant were studied by Sanches et al., and found that ethanolic extract was more effective than aqueous extract against \textit{Staphylococcus aureus}\textsuperscript{18}. Gnan and Demello reported antimicrobial activity of \textit{Ps. guajava} leaf extract against nine different strains of \textit{Staphylococcus aureus}\textsuperscript{19}. Arima and Danno isolated four flavonoids and studied their inhibitory properties against Salmonella enteritidis and \textit{Bacillus cereus}\textsuperscript{20}. The other most active component found in the leaves of \textit{P. guajava} is Quercetin, a polyphenolic flavonoid molecule along with quercetin-3-o-glucopyranoside and morin\textsuperscript{21}. Quercetin showed antibiotic activity against some bacteria and also was reported as synergist when used with other antibiotics.

**Materials and Method**

**Plant Extract:** The powdered crude extract was processed using 100 \% ethanol and 70\% ethanol in Soxhlet apparatus and aqueous extraction method. The extract thus obtained was freeze dried and stored in sterile containers. The final extract obtained with 100\% ethanol, aqueous and 70\% ethanol were named as S1, S2 and S3 respectively.

**Panel of Microorganisms:** A group of microorganisms were selected which included \textit{Escherichia coli} (Ec), \textit{Bacillus subtilis} (Bs), \textit{Staphylococcus aureus} (Sa), \textit{Shigella flexnari} (Sf), \textit{Proteus vulgaris} (Pv), \textit{Micrococcus luteus} (Ml) and fungi like \textit{Candida albicans} (Ca), \textit{Aspergillus niger} (An) to evaluate the extracts against the growth of these organisms. Prior to sensitivity testing, each of the bacteria strains were cultured onto nutrient agar plates and incubated for 18 to 24 h at 37\textdegree C to obtain colonies, then selected with a sterile disposable inoculating loop and transferred to a glass tube of sterile physiological saline and vortex thoroughly. Each bacterial suspension turbidity was then compared to that of the 0.5 McFarland standard solution (containing about 1.5 \times 10^8 CFU/mL).

**Antibacterial Activity:** Antimicrobial evaluation was done using the well-diffusion assay according to the standard of the National Committee for Clinical Laboratory Standards\textsuperscript{22}. Nutrient agar was prepared and poured in the sterile Petri dishes and allowed to solidify. The 24 hours growing bacterial culture of bacterial pathogens was swabbed on it. The test sample in different concentrations was loaded in the wells made using cork borer. Tetracycline (10µL) was used as positive control. The plates were then incubated at 37\textdegree C for 24 hours and the inhibition diameter was measured in units of mm.

**Antifungal Activity:** This activity was screened using well diffusion method\textsuperscript{23, 24}. Potato dextrose agar was prepared and poured in the sterile Petri dish and allowed to solidify. 48 hours growing fungal cultures of \textit{Aspergillus niger} and \textit{Candida albicans} were swabbed on it. The test sample in different concentrations was loaded in the wells made using cork borer. Fluconazole was used as positive control. The plates were then incubated at 37\textdegree C for 48 hours and the inhibition diameter was measured using zone scale in mm.

**Results**

Ethanolic extract (S1) showed inhibition of Ec at higher concentration of 1000 µg/ml with 13 mm of inhibition zone in comparison to control (tetracycline (10µL)) 29 mm of inhibitory zone. S1 showed inhibition of Bs growth from 500 µg/ml in a dose dependent manner. The inhibitory zone increased from 10 mm to 14 mm at a dose range of 500 µg/ml to 1000 µg/ml while the control inhibition of Bs was 24 mm. Inhibition of Sa was seen at higher dose of S1 1000 µg/ml which was 12 mm and that of control was 30 mm. S1 could not show any inhibition on growth of Sf and Pv. Inhibition of Ml growth by S1 was seen from 250 µg/ml, in a dose
dependent manner. The inhibition increased from 11 mm to 14 mm at a dose range of 250 µg/ml to 1000 µg/ml and it was 27 mm with control (Figure 1). Aqueous extract did not show any inhibition in growth of the selected bacteria (Figure 2). Hydro alcoholic extract (S3, 70% ethanol) showed inhibition of Ec at dose from 500 µg/ml in a dose dependent manner. The inhibition was <11 mm to 14 mm at a dose range of 500 µg/ml to 1000 µg/ml, while that of control was less than 11 mm. Inhibition of Bs with S3 at a dose range of 250 µg/ml to 1000 µg/ml was comparable to control. Inhibition of Sa by S3 was between 10 mm and 11 mm at doses of 250-1000 µg/ml while that of control was 30 mm. S3 showed inhibition of Sf from 750 µg/ml in a dose dependent manner. It showed inhibition of 12 mm - 13 mm at dose range of 750 µg/ml to 1000 µg/ml. Control showed an inhibition of < 11 mm. S3 did not show any effect on growth of Pv. A dose dependent increase in inhibition of Ml growth was observed with S3 from < 11 mm to 16 mm at a dose range of 500 µg/ml to 1000 µg/ml, while control inhibitory zone was 18 mm (Figure 3) (Table 1). Antifungal activity against *Aspergillus niger*, assessed by well diffusion method revealed 15 mm of inhibitory zone with control (fluconazole), 13 mm with S1, 14 mm with S3. Aqueous extract, S2 could not show any effect on fungal growth inhibition (Figure 4). Candida albicans inhibition was comparable among the three extracts. Higher concentration 1024 ug/ml of S3 showed superior efficacy of 17 mm when compared to other two extracts S1 and S2 (Figure 5) (Table 2).

NA-not applicable, S1 - Ethanolic extract, S2 - Aqueous extract, S3 - Hydro alcoholic extract of *P. guajava*.

Discussion

The ethanol extracts of *P. guajava* was shown to possess triterpenoids, tannins, glycosides, phenols and flavonoids as phytoconstituents. The aqueous extract contained all the phytoconstituents of alcoholic extract along with saponins. Tannins exhibit antibacterial activity by interacting with proline which is essential for protein synthesis. An *in-vitro* study revealed antimicrobial property of Flavonoids through interaction with cell wall proteins. One such flavonoid reported in *P. guajava* leaf extract was Quercetin. Saponins, which were shown as phytoconstituents in aqueous extracts, were reported to inhibit gram-positive organism like S. aureus. But in this study aqueous extract could not inhibit the growth of this organism. Therefore, the phytochemical analysis in this study revealed the superior efficacy of S3 extracts in comparison with S1, S2 with additional control against few other organisms.
Antifungal activity was better with S3 extract in comparison to other two extracts of *P. guajava*.

**Conclusion**

Hydro alcoholic extract S3 showed better efficacy in antifungal and antibacterial activity when compared to other two extracts S1 and S2 of *P. guajava*. This can be further characterised and investigated for the clinical efficacy in clinical trials as it is a natural product with less side effects.

Aesthetic Correction of a Single Tooth with Calcific Metamorphosis with Minimally Invasive Porcelain Veneers—A Case Report

Roma M1, Shreya Hegde2, Isha Gupta3
1Assistant Professor, 2Associate Professor, 3Post Graduate, Department of Conservative Dentistry and Endodontics, Manipal College of Dental Sciences, Mangalore, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

Dental practitioner undergoes significant challenges during the management of traumatized permanent teeth. Young adults are prone to calcific metamorphosis as a result of trauma. Calcific metamorphosis is more common in the anterior region of the mouth and can totally or partially obliterate the pulp space radiographically. The pulp space therapy is not always intervened unless a periapical pathology is detected and/or when the concerned tooth becomes symptomatic. This case report presents a single anterior teeth with calcific metamorphosis treated with porcelain veneers.

Keywords: Discoloration, Dental trauma, Calcified canal, Porcelain veneers.

Introduction

Calcific metamorphosis is termed as pulpal response to trauma, commonly seen in the anterior teeth which can be recognized within couple of months after injury. Calcific Metamorphosis is characterized as rapid dentin deposition within the canal space.1 The other synonyms for canal metamorphosis are Dystrophic Calcification, Diffuse Calcification, Calcific Degeneration and Canal Obliteration.2

A lot of researches has suggested that the calcific metamorphosis is bound to be a pulpal response to traumatic injuries which can result in dentin deposition within the pulp space.3 The etiopathology for pulp canal obliteration remains unclear, but injury to the neurovascular bundle of the pulp is considered to be one of the reason.4 The treatment planning for calcific metamorphosis has been a controversial issue for a very long time.5 This case report outlines the conservative management of a single tooth with calcific metamorphosis with minimally invasive porcelain veneer.

Case Report

A 32-year-old female patient came to the department of conservative dentistry and endodontics with a chief complaint of discolored front tooth since 15 years and unfavorable esthetics. [Figure 1] After communicating with the patient for an elaborate history, the patient reported to have a trauma to the permanent teeth when she was 17-years-old. Intraoral clinical examination revealed discolored upper right central incisor. Pulp sensibility tests were performed on 21. Thermal and electric pulp testing reported to give negative response for 21 indicating the non-vital status of the pulp. Tenderness on percussion was absent with respect to 21. The radiographic examination using intra oral periapical radiograph revealed presence of calcified canal with respect to 21 with no periapical changes and Cone beam computed tomography (CBCT) was taken to confirm the presence of calcified canal. [Figure 2] Final diagnosis was confirmed as calcific metamorphosis with respect to 21.
Treatment planning was established after taking various factors into consideration such as amount of the tooth structure to be preserved, occlusion, esthetics, and economic status of the patient. At the initial appointment, oral prophylaxis was carried out. Tooth preparation for veneer was performed. Deep chamfer finish line were planned, super-coarse, round end taper diamond point burs (SC850-018, IQ Dental Supply Inc.) were used for preparing the finish line. Deep chamfer finish lines were kept at the equigingival level and window preparation was done. Tooth reduction of 1 mm was done on the labial aspect to provide space for the ceramic material. [Figure 3]

Vinyl polysiloxane impression material (Dentsply Caulk, USA) as putty and hydrophilic vinyl polysiloxane impression material as light body (Dentsply Caulk, USA) was used for impression making. [Figure 4] Pressable all ceramic material (Cergo Kiss, Dentsply, India) was used for the veneer. The prepared tooth was polished with pumice and thoroughly cleaned to free it from debris, if any. The final veneer was checked for occlusion and cemented using resin cement Rely XTM veneer cement (3M ESPE, Puerto Rico). [Figure 5] The prepared crown margin was then polished using ceramic polishing kit (Shofu, Inc., Japan). Follow-up of six months was done and the crown margins were in satisfactory condition. [Figure 6]
Discussion

This case report highlights the problem faced by the practitioner in negotiation of calcified canal in endodontic therapy. This report also addresses the challenges faced by the patient due to esthetic concerns. The traumatic injuries to the primary or the permanent dentition usually result in two types of pulpal pathologies - calcific metamorphosis or internal resorption. The incidence rate of calcific metamorphosis due to trauma usually ranges from 4-24%.6,7

Since calcific metamorphosis is bound to have dentin deposition within the canal space, the rate of deposition varies in permanent and deciduous dentition. Research has shown that, the average rate of dentin deposition in majority of the cases of anterior teeth is around 3.5μm/day. The average dentin deposition for deciduous teeth is bound to be 2.8μm/day when compared to permanent teeth which is around 1.5μm/day.8,9

The most important step for calcific metamorphosis is to rule out various treatment options based on radiographic and clinical analysis. Radiographic changes reveal absence of canal chamber. Radiographically, it is found that there is no presence of periapical lesions and the lamina dura remains intact in majority of the cases. But, some of the case reports have also shown that the teeth with calcific metamorphosis, can be symptomatic with periapical infection.7 Teeth affected with calcified canals, showing complete pulp obliteration with no periapical changes can be treated as conservatively as possible.10,11 This is in accordance with the present case report.

Pulp sensibility tests performed in the present case scenario confirmed the non-vitality of the involved tooth. This indicated the need for root canal treatment. CBCT taken in this case confirmed the presence of complete obliteration of the pulp chamber, which concluded that the endodontic therapy need not be instituted. As a matter of rule, before attempting any kind of treatment, continuous recall and follow-ups are made mandatory to check for any changes in the periapex. Studies have shown that development of periapical pathology with respect to calcified teeth is around 1 -16%.9

Based on the esthetic concern and preservation of tooth structure, ceramic veneer was planned in this case. The basic criteria in the treatment planning of a ceramic veneer in the initial treatment phase, should include clinical examination and radiographic interpretation, with the aim of ruling out all the etiological factors associated with the discoloration of the involved tooth.12

In this case scenario, history of trauma at an early stage of life was considered as an important tool to arrive at a proper diagnosis and treatment planning. With this case report, the involved tooth following traumatic exposure underwent one year follow-up and the presented tooth was completely free of any signs of periapical infection, however, drastic esthetic changes were observed. Oginni-e-Adekoya-Sofowora et al (2009) in his study, revealed that teeth following traumatic exposure, presented with severe discoloration.13 With the above observations made, the tooth involved was rendered free from pulp space therapy as the recall visits did not result in aggression of the existing problem.12,14,15

The dentin formation in calcific metamorphosis is presented with an irregular manner and as a result there is decrease in translucency and presentation of the yellowish color, due to which ceramic veneers were planned as the treatment modality. Cvek and Lundberg in their study revealed that following trauma in permanent maxillary incisors, the collagen content increases with markedly reduction in cell number.16

Research has shown that the treatment intervened for teeth with calcific metamorphosis may not improve the properties of the tooth, like wear resistance and micro-hardness.17,18 With this case report, after a thorough diagnosis and treatment planning, ceramic veneer was planned for the involved tooth. This procedure attempted made a conservative treatment approach, was well executed and gave satisfactory results. The patient consented to perform treatment as planned and the prognosis of treatment was also informed. The patient was kept on periodic recall visits to check for the changes in periapex, so as to observe the incidence of periapical pathology.

Conclusion

The desired treatment outcomes depend upon the patient acceptance and with skillful professional involvement. In this particular case report, the treatment for calcific metamorphosis is kept as conservatively as possible without pulp space therapy as there was no presence of periapical pathology. The esthetic management in this particular case was dealt using ceramic veneers.

ABSTRACT

In recent decades, hospital management has emphasized on measuring quality of healthcare services. Assessing healthcare service quality provides an insight for hospital managers and administrators to improve their service quality and patient satisfaction. The purpose of this study is to assess the hospital service quality and its effect on inpatient satisfaction in private hospitals.

A cross-sectional study was conducted comprising of 204 patients from two private hospitals in coastal Karnataka. A structured questionnaire was used to gather the patients’ perception on quality of health care services and satisfaction. SmartPLS was used for testing the reliability and validity of the instrument and for analyzing the data. Importance performance map analysis was done for exploring the importance of various dimensions of hospital service quality that effects inpatient satisfaction.

Findings revealed that quality of clinical and administrative services are the two important factors that determine patient satisfaction. However, healthcare managers should focus on all the dimensions of hospital service quality with a special focus on quality of clinical services and supportive services for enhancing patient satisfaction. The findings of the study provide an insight to hospital administrators and mangers in terms of a better understanding of preferences and perceptions of patients in meeting or exceeding their expectations. Hence adds value in terms of sustaining and improving patient-centered care in healthcare organizations.

Keywords: Patient satisfaction, Clinical services, Administrative services, Importance –performance map analysis, Hospital service quality

Introduction

Quality of health care services has become a major concern for both patients and hospital management. Hospitals now a days have become very different from what it was a couple of decades back¹. Health care industry has witnessed an increased competition. More aware and better educated patients consider the quality of services while selecting hospitals for fulfilling their health care needs. Increased patients’ perception about service quality has makes it difficult for hospitals to provide services that meet their satisfaction¹. Service quality provides a sustainable competitive advantage and is an important factor that decides patient satisfaction². Thus it increases service demand, referrals and reputation of hospitals³. Providing high quality services improves efficiency and effectiveness that results in cost savings, increased market shares and profitability⁴.

Patient satisfaction is a key parameter that reflect quality of care. It is as significant as conventional outcome measures such as mortality or functional status of individuals⁵. Therefore, healthcare organizations recognize patient satisfaction as a factor that plays a vital role in a highly competitive healthcare market. It offers an evidence on the provider’s achievement at meeting the expectations that are most relevant to the patient⁶. Therefore, measures of satisfaction are central tools for research, administration planning and management. Hence this study aimed to identify the important factors that healthcare managers need to focus on for improving patient satisfaction using importance-performance map analysis.
**Literature Review**

Several researchers stated that patients’ perception of actual services provided decides the service quality of a hospital. Identification of determinants of healthcare service quality and evaluation of patients’ satisfaction are the most significant steps in quality improvement process. Several studies on measurement of hospital service quality emphasized on the need of continuous attention on quality related issues in hospitals. Such practices serve hospital managers in tackling the potential problems related to quality management in hospitals.

Usually, it is argued that hospital service quality construct is multidimensional in nature. Several researchers used either SERVQUAL or modified SERVQUAL instrument for measuring healthcare service quality. The instrument SERVQUAL was also employed for the development of scale for measuring healthcare service quality in various studies such as in the studies. Additionally, instruments were developed for measuring service quality for hospitals such as Aagja and Garg “Pub Hos Qual” for public hospitals; Ramsaran-Fowdar “PRIVHEALTHQUAL” for private hospitals. Lawthers et al. used instruments designed by Picker Institute as well as Consumer Assessment of Health Plans study. Butler et al. used Hospital Quality Trends (HQT), trademark surveys of Hospital Corporation of America. Camilleri and Callaghan designed based on framework of Donabedian. Zineldin expanded the technical – functional quality model of Gronroos and SERVQUAL quality models in to a framework of five quality dimensions such as quality of object, processes, infrastructure, interaction and care atmosphere. Choi et al. introduced an integrative model consisting of service quality and value, patient satisfaction and behavioural intention. A study by Raftopoulos stated that food, nursing care, medical care, room characteristics and medical treatment affects service quality. Baalbaki et al., professed that support services influence patients’ perception of quality. Duggirala et al., reported seven dimensions of health care quality such as infrastructure, personnel quality, clinical care process, administrative process, safety practices and overall satisfaction. Evaluation of patient satisfaction by Ghosh identified four dimensions such as clinical care, internal environment, communication and administrative that significantly and positively affected patient satisfaction. Thus researchers have developed patient satisfaction constructs from different perspectives and it appears such that there is some degree of agreement as well as disagreements on the dimensions identified. These differences could be because of diverse culture and environments across countries.

**Methodology**

The present cross-sectional study is exploratory and descriptive in nature. The study was conducted in two multi-specialty tertiary care hospitals. The study adopted a judgmental sampling method. The inclusion criteria were the inpatients who have stayed in hospitals for more than 48 hours and about to get discharged. The data were collected from 204 patient respondents using a self-administered structured questionnaire. Face and content validity of the questionnaire was confirmed through subjecting it for the review of healthcare administrators and subject experts. The questionnaire consisted of two parts; first part included the questions regarding the demographic details of the respondents such as age, gender, educational level and financial status. The second part of the questionnaire consisted of 33 items that measure the perception of patients regarding hospital service quality and satisfaction. The questionnaire was designed based on five dimensions of hospital services quality such as clinical services (CLS), administrative services (ADS), supportive services (SS), communication with patients (PC) and outcome of care (OTC) provided. A five point Likert scale was used with the scores ranging from 1 to 5, where 1 being strongly disagree and 5 being strongly agree. In total, 300 questionnaires were distributed among the inpatients of both hospitals, out of which 246 filled questionnaires were received and 210 responses were found usable for data analysis. Thus a response rate reached at 70 per cent. The data analysis was done using SmartPLS3.

**Analysis and Findings**

Reliability test is performed to ensure that the instrument used in the study is reliable that it measures the constructs consistently. The traditional criterion for internal consistency is Cronbach’s alpha for all the constructs in the questionnaire is much higher than the acceptable value 0.7 and indicates very good internal consistency as given in table I. The composite reliability values of all the constructs are greater than 0.8 which is much higher than the threshold value 0.7 that indicates good reliability of the constructs.
The Average Variance Extracted (AVE) values for all the constructs are greater than the threshold value 0.5, and that shows the adequacy of the model\textsuperscript{23,25} and ensures the extent to which a measure correlates positively with alternative measures of the same construct.

The adequacy of structural model is measured based on the R-square value and here in this study the R-square value is 0.70 that is greater than the cutoff value 0.67 that confirms it as substantial model\textsuperscript{25}.

**Importance-Performance Map Analysis (IPMA):** The researchers verified fulfillment of the three requirements for carrying out IPMA analysis such as measurement scale, variables coding and indicator weight estimates. IPMA is mainly useful in prioritizing constructs to improve the specific target construct. The total effects of the constructs and performance values are shown in the table III below.

### Table III: Data of the importance-performance map for patient satisfaction

</tr>
<tr>
<td>SS</td>
<td>0.16</td>
<td>77.81</td>
</tr>
<tr>
<td>Mean Value</td>
<td>0.19</td>
<td>80.30</td>
</tr>
</tbody>
</table>

Among the five factors, administrative services (ADS) has the highest total effect (importance) with a value of 0.31, and the construct communication with patients has the least total effect with the value of 0.10. However, the performance value of ADS is lowest among all the five constructs and is much lower than the mean performance value 80.30.

The X-axis in the importance-performance map depicts the importance of the predecessor factors for explaining the target construct patient satisfaction, while the Y-axis represents the performance of the five constructs in terms of their average rescaled latent variable scores. The five constructs have a mean importance of 0.19 and a mean performance of 0.80 (Table III). These two mean values divide the importance-performance map into four different quadrants (Figure I).
The importance-performance map shows that administrative services has a relatively low performance of 74.24. In comparison with other four constructs, the performance value of ADS is slightly below average. On the other hand, with a total effect of 0.31 this construct’s importance is relatively high. Therefore, a one-unit increase in the administrative services construct’s performance from 74.24 to 75.24 would increase the performance of patient satisfaction by 0.31 points from 73.757 to 74.067. Hence, when managers aim at increasing patient satisfaction, their first priority should be to improve the performance of aspects of administrative services as this construct has the highest (above average) importance, but a relatively low (below average) performance. The construct clinical services are performing well with both importance and performance values above average the mangers need to emphasize on keeping up the good work. The other aspects such as supportive services, patient communication and care outcome follow subsequent priority.

Discussion and Conclusion

Measuring patient satisfaction is an important strategy for healthcare managers wanting to improve services. Existing literature argued that the patient satisfaction construct is multidimensional in nature. Many researchers used different dimensions for measuring patient satisfaction. Important dimensions of patient satisfaction construct, as found from this study, provide empirical support for a number of patient satisfaction dimensions described in the literature. However, this study emphasized on the performance of these aspects considering their significant importance in determining patient satisfaction. The study revealed that healthcare mangers have to focus on improving performance of administrative services as patient perceive it as important. Though, hospitals are doing great in terms of performance of clinical services, mangers should also focus on keeping up the good work as these are the core services of health care organizations.

Importance-performance map analysis empowers hospitals and healthcare managers to better understand patients’ perceptions and expectations. Based on the mean values of importance and performance of patient satisfaction constructs an X-Y coordinate plane could be divided into four-quadrant matrix, the results can be plotted so that each point indicates the strengths and weaknesses of the constructs of patient satisfaction. Results can help the decision makers to improve quality of healthcare services and patient satisfaction emphasizing healthcare consumers’ perceptions in each quadrant. The main limitation of the study is that data were mainly collected from patients of two multispecialty hospitals which may not represent the entire population. Therefore, further studies are recommended to endorse our findings and support generalizing them to the entire population.

ABSTRACT

Background: The present study assesses the ADRs monitoring, documentation and reporting at a tertiary care multi-specialty health care in South India.

Method and Material: A non-experimental descriptive study design was used to collect all the necessary and relevant data from patient’s case notes, treatment charts, and ADRs notification forms, patient’s interview and reporter’s interview, who was admitted at the hospital with developed adverse drug reaction after the first dose of any medication administration.

Results: Majority of patients were in the age group of 19-40 years and 17 (33%) patients were 41-60 years of age. Male to female ratio was 0.92:1. Majority, of patients developed itching, followed by patients with rashes and erythematous purpura. The severity levels of ADR depicts that only 13 (25%) patients had a mild level of severity and 39(75%) patients had a moderate level of severity after measures taken. Appropriate nursing documentation was found for 52(100%) patients.

Conclusion: The study concludes that majority, patients developed itching, rashes, and ciprofloxacin caused allergies 16 times. Documentation was appropriate and maintained related to ADR, but still, need to improve their documentation system. Regular monitoring of ADRs is very essential to avoid unnecessary exposure of patients to drugs.

Keywords: Adverse drug reaction; monitoring, documentation, and reporting; Tertiary Care Multi-Specialty Hospital; South India

Introduction

Adverse drug reaction (ADR) is defined by world health organization (WHO) as any response to a drug which is noxious and unintended, and which occurs at doses normally used in human for prophylaxis, diagnosis, therapy of disease, for the modification of physiological function ¹. The classification proposed by Rawlins and Thompson (2012) was used to establish the potential for predicting suspected adverse drug reactions ². The reactions were defined as Type A-When they were predictable, expected due to the drug’s pharmacological characteristics and Type B- When they were unpredictable.

ADR is a frequent cause of hospital admissions, and constitute a significant economic burden. The majority (75-80%) of adverse drug reactions are caused by predictable nonimmunological effects, remaining 20-25% of adverse drug events are caused by unpredictable effects that may or may not be immune-mediated. Immune-mediated reactions account for 5-10% of all drug reactions and constitute drug allergies falling in this category. The number and severity of ADRs reported in a given organization or setting would vary with the organization’s size, type, patient mix, drugs

DOI Number: 10.5958/0976-5506.2019.01281.6
used, and the ADR definition used as an allergic reaction an immunologic hypersensitivity, occurring as result of unusual sensitivity to a drug and an idiosyncratic reaction it is an abnormal susceptibility to a drug that is peculiar to the individual are also considered ADRs 3, 4, 5.

An ADR-monitoring and reporting program should include the following features: 1. the program should establish A. An ongoing and concurrent (during drug therapy) surveillance system based on the reporting of suspected ADRs by pharmacists, physicians, Nurses, or patients. B. A prospective (before drug therapy) surveillance system for high-risk drugs or patients with a high risk for ADRs. C. A concurrent surveillance system for monitoring Alerting orders. 2. Alerting orders include the Use of “tracer” drugs that are used to treat common ADRs e.g., orders for immediate doses of antihistamines, epinephrine, and corticosteroids, Abrupt discontinuation or decreases in a dosage of a drug, or stat orders for laboratory assessment of therapeutic drug levels. Prescribers, caregivers, and patients should be notified regarding suspected ADRs. 3. Information regarding suspected ADRs should be reported to the pharmacy for complete data 6, 7.

In this present prospective surveillance, we did a study to assess the adverse Drug Reaction monitoring, documentation and reporting at a tertiary care multi-specialty health care in South India. This study aimed to assess the symptoms occurred due to use of drugs, the number of ADR occurred and analyze the measures taken to manage ADR as per protocol and its effect on recovery level through the documented report. We also assess the level of severity of ADR and audit the documented report maintained by the ADR Protocol.

Method and Material

The study was designed to assess the ADR monitoring, documentation and reporting at Sri Ramachandra Medical Center, Tertiary Care Multi Specialty Hospital, Chennai. This hospital facility has more than 2000 beds and 150 Intensive care units, provides healthcare treatment for over 35,000 inpatients and 2,50,000 outpatients every year.

**Study Population:** Fifty-two patients were included in this study, who was admitted to the hospital with developed adverse drug reaction after the first dose of any medication administration.

**Inclusion Criteria:** A patient who was having documented with complaints of drug allergy, signs of adverse drug reaction, confirmed the report of a physician on adverse drug reaction and measures was taken against adverse drug reaction

**Description of the Tool:** A purposive sampling technique was used in this study. The tool of the study has three parts- Part A: Demographic variables include section 1- personal data on includes age, sex, and vulnerable group and section 2- clinical data includes types of adverse drug reaction, name of the drugs caused ADR, route of administration of drugs, measures taken and duration of allergy symptoms subsides. Part B: Drug severity assessment scale was used to categorize the severity like of ADRs in mild, moderate and severe. Part C has documentation audit form includes patient’s case notes, treatment charts, nurses notes, ADRs notification forms, patients interview, and reporters interview.

**Data Collection Procedure:** All the necessary and relevant data were collected from patients case notes, treatment charts, ADRs notification forms, patients interview, and reporters interview. ADRs alert form was framed and implemented in each and every ward of the hospital. The assigned nurse noted in the ADR alert form if they found any ADR during their routine patient care. The noted ADRs were assessed by using Hartwig and Seigel’s ADR severity assessment scale; the noted ADRs were into definite, probable, possible and unlikely. The patients were classified or categorized according to their demographics, diseases status, and disease severity. The collected ADRs data were reported to the quality improvement and patient safety team and pharmacy & therapeutic community. The types of reactions are classified and a causal relationship is established using an algorithm. This method is chosen
based on the study by palanisamy and co-workers (2009). Total score for a particular drug- ADR combination is calculated using severity assessment scale (Hartwig et al scale), and the association is termed - highly probable, probable, possible or doubtful depending on the score.

Finally, the data obtained were analyzed and results were formulated. Notification of adverse drug reaction was informed to the patient and obtained signature after explained about the adverse drug reaction to prevent the future risk and same was documented in the software and discharge summary of the patients. Specified allergy sticker was pasted on the patient’s case sheet. Descriptive statistics were used to assess the frequency and percentage distribution of demographic variables, ADR symptoms. Number of ADRs occurred, measured taken to manage ADR as per protocol, documentation of symptoms described after measure taken, and level of severity of ADR and audited the documentation report maintained by the ADR team.

Findings

The findings from the study are tabulated, analyzed and interpreted below. In relation to demographic variables, the majority of (n=25; 48%) patients were in the age group of 19-40 years and 17 (33%) patients were 41-60 years of age. Male to female ratio was 0.92:1.

Majority, of (n=22; 42%) patients developed itching, followed by patients with rashes (n=15; 28%), and erythematous purpura (n=6; 12%). Other minor symptoms included anaphylaxis, nausea, vomiting, pruritis, urticaria, fever, facial swelling and lymphadenopathy after the first dose of medication or injection (Table 1). Ciprofloxacin (n=16; 31%), omnipaque (n=6; 12%), Piperacillin and Tazobactum (n=5; 10%), and ceftriaxone (n=3; 6%) caused ADRs most frequently (Table 2). Upon development of ADRs, 31 (60%) patients discontinued medications and 21 (40%) patients antidote was administered as per the prescription soon after the drug allergy was noted and reported. For 43 patients the average time taken to subside the reactions was around 30 minutes after the measures were taken and took one hour for nine patients. The severity levels of ADR depicts that only 13 (25%) patients had a mild level of severity and 39(75%) patients had a moderate level of severity after measures taken.

**Discussion**

The present study was done to assess the ADR monitoring, documentation and reporting at Sri Ramachandra Medical Center, Tertiary Care Multi Specialty Hospital, Porur, Chennai. ADRs can have a determinant effect on the patient’s wellbeing and the overall health care system. Data were analyzed from 52 documented reports maintained by the inpatient patient care team (doctors and nurses). This study was carried out for a period of 6 months from Feb 2016 to Aug 2016. The data for the study was taken from ADR notification form, case sheets of patients who had an ADR treatment charts, Investigation reports.

Naranjo’s causality assessment scale shows 39.80 % (41) of ADRs were definite, 34.95 % (36) of ADRs were probable, 22.33% (23) of ADRs were possible and 2.91% (3) were unlikely. WHO probability assessment scale shows 39.80% (41) cases were certain, 34.95% (36) ADR were probable, 17.47% (18) were possible, 2.91% (3) were unlikely, and 4.85% (5) were unassessable. Severity Assessment by Modified Hartwig and Siegel Scale showed that 56.31% (58) ADRs were moderate, 38.83 % (40) ADRs were mild and 4.85% (5) ADRs were severe. No lethal effects were observed. Many of the ADRs were reported from the general medicine department (33.98%), it is followed by the dermatology department (14.56%) and others. Most commonly identified ADRs was maculopapular skin rashes 28 (27.18%).

The study concludes that majority, patients developed itching, rashes, ciprofloxacin caused allergies for 16 times, discontinued the drug for 31 patients and for 21 patients administered antidote to subside ADR reactions, followed that 39 patients developed a moderate level of severity, through the measures taken by the assigned nurse and inpatient department medical doctors. It indicates that they had maintained the document related to ADR, but still need to improve their documentation system for the fullest level to achieve zero level ADR reaction. The study concludes that regular monitoring of ADRs is very essential in the day to day life to avoid unnecessary exposure of patients to drugs and chemicals. All healthcare professional should actively participate in the regular monitoring and reporting of ADRs to maintain the good quality of patient’s life.

The implication drawn from the study is of vital concern to the field of nursing including service, administration, education, and research. Nurses who are working in the hospital must be trained enough to handle the adverse effects occurred due to use of drugs, assess and measure taken to manage ADR as per protocol, to assess the duration of symptoms subsided after measures taken and documentation of the event appropriately and to report ADR on time to medication safety team. Nurse educator of both from the college of nursing & hospital and also the medication safety team needs to take the initiative to identify the adverse drug reaction, monitoring, documentation, and reporting by the nurses inappropriately. Thereby we can avoid fatally or any adverse events to the patients. The nursing administrator should know the impact of adverse drug reaction and the need for the training of medical staff and nursing staff about the adverse drug reaction monitoring, reporting and documentation to prevent further impact on the patient. Need to conduct a training program to update the knowledge, practice, and attitudes on ADR compliance. The nursing researcher needs to define a systematic, objectives process of analyzing the phenomenon of ADR and its consequences on the quality of patients care. Evidence-based practice improves the quality of care and reduces the risk of complication. This research finding directs the nurse researcher to conduct retrospective and prospective research studies.
Conclusion

This study was done for the period of only six months and at a single center at the Sri Ramachandra Medical Centre, Chennai, India. A multicentric study with large samples across the hospitals among outpatients and inpatients would be more to know the exact prevalence of ADRs in Indian hospitals. Continuous monitoring of patient outcomes and patterns of ADRs is imperative for evaluation of ADRs patterns, monitoring practices, and the effect of ADR program on overall and individual patient outcomes.

Assessment of Pre-surgical Perception of Pain and Post-Surgical Pain in Patients Undergoing Dental Implant Placement Using Modified VAS Scale: A Clinical Study

Pallak Razdan¹, Umesh Y Pai²
¹Intern, Manipal College of Dental Sciences, ²Associate Professor, Dept. of Prosthodontics, Manipal College of Dental Sciences, Mangalore, Mangalore, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

Implants are the most preferred choice of treatment options for replacement of missing tooth or teeth for all age groups. Excellent long term survival rates make it a viable option for both simple and complex dental rehabilitations. Involvement of a surgical procedure for implants makes the patient anxious and develops a rejection towards the procedure. Research has shown anxiety to play a role in pain perception prior to surgical procedure. This study analyses the role of pain perception to actual pain experienced by subjects undergoing elective dental implant procedure and the role of age and gender in this assessment using a modified visual analog scale.

Keywords: Pain, Dental implant placement, Visual analog scale

Introduction

Pain is considered to be a complex sensory and emotional experience, closely associated with factors, such as stress and anxiety. Generally, with anxiety, one is more sensitive to the stimulus of noxious events. Klingberg and Broberg described dental anxiety as a state of apprehension that something dreadful is going to happen in relation to dental treatment or certain aspects of dental treatment¹. This can also change one’s perception of a given situation and influence the final interpretation of the stimulus as painful or enjoyable.

Furthermore, the nature of the setting in which the stimulus is applied, ex: a dental clinic, can act as a pre-potent cognitive mediator of pain behavior ². Oral surgery is a common procedure that is rarely life threatening and has a relatively short recovery period, however, its physical and psychological impact makes it a stressful experience.

Dental Implants are fast becoming the most sought after treatment modality in today’s day and age. Survival rates of dental implants have been proved to be 94.6% over a two decade follow up period³. As a result, this treatment option continues to develop popularity amongst patients and clinicians alike⁴. Having stated that, it also happens to be one of the most feared and dreaded procedure for patients merely due to the mention of the word “surgery” in course of explaining the protocol to the patient. It is thus, always assumed that “unbearable pain” will be a part and parcel of the same.

The aim of this study was to record both subjectively and objectively the perception of pain levels in patients undergoing placement of dental implants, evaluating perception of pain before and after the surgical procedure. The fear experienced by a patient is a subjective phenomenon that varies from patient to patient. Scales such as the Wong-Baker’s facial pain scale (Visual Analog Scale) has been used to measure the patient’s experience of pain. Reliability of the VAS for acute pain measurement as assessed by the ICC appears to be high. Ninety percent of the pain ratings were reproducible within 9 mm. This data suggest that the VAS is sufficiently reliable to be used to assess acute pain⁵.

DOI Number: 10.5958/0976-5506.2019.01282.8
The *Wong-Baker Faces Pain Rating Scale* (styled *Wong-Baker FACES Pain Rating Scale*) is a numerical pain scale that was developed by Donna Wong and Connie Baker. It is a scale from 0-10. The scale shows a series of faces ranging from a happy face at 0 which represents “no hurt” to a crying face at 10 which represents “hurts worst.” Based on the faces and descriptions, the patient chooses the face that best describes their level of pain.6

This pain scale was originally developed for children, however it can be used for all ages and children as young as 3 years old. It is a useful pain scale for children because many children may not understand rating their pain on a scale of 0-10, but are able to understand the cartoon faces and the emotions they represent and point to the one that best matches their level of pain. This pain scale is also appropriate for patients who do not know how to count and those who may have impaired brain function. Cultural sensitivity of the scale was also assessed to determine its applicability and acceptance across different cultures.7

Methodology

41 patients above the age of 20 years were chosen to be a part of this study. The following criteria was adhered to:

**Inclusion Criteria:**
- Patients must be fit to undergo implant surgery
- Patients must have normal systemic health status

**Exclusion Criteria:**
- Patients not physically or mentally fit to undergo surgery
- Smokers and chronic alcoholics
- Uncontrolled diabetics.
- Recent history of cardiac conditions
- Patients unwilling for implant placement.

The Wong Baker facial pain scale (VAS) was provided to the patient just before the dental procedure, right before the commencement of the surgery, to evaluate the perceived pain levels and the same form was provided to the patients when they came for suture removal.

The Wong baker pain scale readings were then analyzed and the results interpreted.

**Discussion**

The purpose of carrying out this study was to assess the perception of pain in patients undergoing a dental implant placement and comparing it to the actual pain felt by the patients as per their recorded responses on the VAS scale. As has been discussed before, pain is a sensory emotion that is affected by several factors. Anxiety before any surgical procedure big or small, conditions the human mind to believe in a higher sense of pain perception. The reality of the situation however changes on response to the actual stimulus.⁸

In this study it is seen that on comparison of the mean values of Perception of pain and Post-op actual pain, the mean values of Perception of pain is higher with a difference of 3.05, and is statistically significant with a p value of <0.001.

It is also seen that the perception of pain is higher in individuals below the age of 40 as compared to those above that age range, however, the level of actual pain felt is higher in individuals below the age of 40 than above. Eltumi H et al has reviewed effect of age, sex and gender on pain sensitivity and has reported that acute pain is more prevalent in the younger generation while chronic pain is mostly reported in the elderly population.¹⁰

Gender of the patient has also affected pre and post op scores with females having a higher perception of pain both before and after the surgical procedure as compare to their male counterparts. The results are similar to a study conducted by Kim et al where 89 subjects were assessed and it was reported that the pain perception was higher in the female counterparts at various stages of assessment.¹¹

Going by the parameters stated above, it is now imperative for dentists to establish ways in which he/she can bring down the anxiety in patients and reason with them about the long standing benefits of Implant treatment. Many patients shun the idea of an implant due to their assumption that they will be in pain. There is a behavioral management required for these patients not only for the betterment of the patients oral health but also for the progressive future of Implant Dentistry.

A few ways in which a patient can be convinced to take up the treatment without any hidden fears is as follows:

1. By providing a description of the procedure with the help of audio visual aids, thereby bringing down the apprehension of the patient and giving them an accurate idea of the procedure.
2. Scheduling appointments earlier in the day so as to complete the procedure without much fatigue on behalf of the doctor. This also helps in taking care of any untoward complications that might develop during the day and can be tended to before the clinic closes or the doctor is unavailable. It also helps to provide the patient convenient stress-free appointment timing.
3. Avoiding the use of the term ‘Surgery’ thereby making the process sound less daunting and more patient friendly.
4. Using long acting anesthesia and administering it using the right technique thereby making the procedure pain free and comfortable for both the patient and the surgeon.
5. Administering a pain killer and anti-inflammatory shot to the patient post the surgery to avoid pain and swelling that is due to develop in the first 24 hours.
6. Prescribing safe and effective medication only on eliciting correct medical history and encouraging the patient to take them on time and stressing on the importance of completing the dosage.
7. Making the clinic environment more suitable and patient friendly by incorporating music, thereby soothing the patient’s anxious nerves.
8. Deep breathing exercises also help to relieve the patient’s anxiety.
9. In patients with extreme paranoia, the use of conscious sedation can help in conducting a smooth procedure; however, this practice must only be undertaken after proper training as it is very technique sensitive.

**Conclusion**

Under the Limitations of this study, it can be concluded that:

a. There is a statistically significant difference in the perceived pain and post-operative pain experienced.
b. Pain perception and actual pain experienced is higher for individuals below the age of 40 years.

c. Females had higher ranges of pain perception and pain experienced compared to their male counterparts.

Comparison of Bacterial Prevalence in Saliva of Edentulous Patients with or without Complete Dentures by 16S rRNA Gene Based Metagenomic Analysis Identifies a Novel Bacterial Signature in Denture Patients

V Sreedevi1, M. S. Kanan2, Aravind Ramanathan3
1Reader, 2Professor, Sree Balaji Dental college and Hospital, Chennai; 3BDS Msc Phd Human Genetics Laboratory, Sree Balaji Medical and Dental college and Hospital, Chennai

ABSTRACT

Objective: The aim of this study was to investigate the bacterial flora in the saliva of edentulous patients with or without complete dentures, and relate the occurrence of bacteria with denture biofilm.

Material and Method: Saliva samples from four edentulous patients who had been wearing denture (EdD) for at least 10 years and four edentulous patients who had been so without complete dentures (Ed) for at least 10 years were collected in a sterile 1.5ml microfuge tube. Biofilm samples from the mucosal surface of both upper and lower complete dentures from two of the above patients were scrapped with a disposable synthetic swab and collected in a 1.5ml microfuge tube containing lysis buffer. All the samples were processed simultaneously to extract total genomic DNA, and were subjected to 16S rRNA gene sequencing analysis on a next generation sequencer, the PGS-Ion Torrent. Those bacterial genera with read counts greater than 1000 were considered as significant in the respective subjects and used to associate the occurrence in other subjects.

Results and Conclusion: Metagenomic analysis identified a higher prevalence of Streptococcus, Veillonella, Rothia, Lachnospiraceae, Prevotella and Alteromonas in the saliva of EdD patients. Four other bacterial species namely, Actinomyces, Haemophilus, Neisseria and Vibrio showed comparative pattern in the saliva of both EdD and Ed patients. Comparison of the read counts of bacteria identified in the saliva of two EdD patients with the biofilm bacterial population in their respective complete dentures showed a relatively higher prevalence of all the six bacterial species in the biofilms than in saliva. These findings clearly indicate that: 1) bacterial flora still exists, albeit at a lower level, in edentulous patients even in the absence of complete dentures, and 2) the biofilm on mucosal surface of complete dentures serve as niche areas for bacterial species.

Keywords: Oral flora in edentulous, Bacterial flora in edentulous, Bacterial flora in denture wearers, Denture biofilm, Denture bacterial flora.

Introduction

Diverse species of bacteriae populate and colonize soft tissues of oral cavity such as tongue and buccal mucosa both in dentulous and edentulous subjects besides colonizing natural dentition or complete dentures respectively. [1,2] Although saliva is bacteria-free while being secreted, it soon acquires bacteria from biofilms deposited on several oral sites. As a result, bacterial profile of saliva is often considered as a read out of oral biofilm bacterial population and used to evaluate the relative prevalence of oral bacterial flora.[3]

Hence the present study was designed to specifically investigate the bacterial prevalence pattern in edentulous patients with or without complete dentures by 16S rRNA gene based metagenomics analysis. 16S metagenomics analysis was employed, as the technique preferentially amplifies a hypervariable but highly genus specific 16S ribosomal RNA coding gene region that as a result, identifies the complete profile of bacteria at genus level in a given sample. The application of technique has broadened our understanding of the prevalence of both culturable and non-culturable bacteria with relative ease in diverse range of samples,[6, 7] including saliva.
samples of patients with dental caries.\cite{8} By applying this
technique on saliva samples of edentulous patients with
or without complete dentures, we hoped to understand:
1) the relative bacterial prevalence pattern in the two
groups, 2) bacterial prevalence in denture biofilms, and
3) associate bacterial prevalence in denture biofilm with
salivary bacterial prevalence.

Materials and Method

Patient Samples and DNA Extraction: Eight edentulous
patients – four patients who had been wearing denture
for at least 10 years and four patients who had chosen
not to use complete dentures and been edentulous for
at least 10 years were selected. The age of patients in
the either of the groups were in the range of 60 to 70
years. The patients who had been wearing complete
dentures were designated as EdD group, while those
without complete dentures were designated as Ed group.
The saliva samples were collected in 15ml pyrogen free
tubes (Tarsons, India) and were stored at -20°C until
being processed. Biofilm on mucosal surface of upper
and lower complete dentures were collected by scraping
with a synthetic swab in the presence of bacterial lysis
buffer from bacterial genome extraction kit (Cat #
NA2110-1KT, Sigma-Aldrich). Bacterial lysate from
both upper and lower complete dentures were pooled and
collected in a single 1.5ml microfuge tube. All samples
were then processed for DNA extraction simultaneously
as described earlier.\cite{8}

16S rRNA amplification, sequencing and sequence
selection parameter: PCR amplification and deep
sequencing of the 16S rRNA hypervariable region
was performed on all samples with five nanograms of
total DNA simultaneously, as described earlier.\cite{8} The
high confident sequences were selected as mentioned
earlier, and 16S rRNA Operational Taxonomic Units
(OTUs) were clustered independently at 95% identity
threshold using QIIME and a reference dataset from
the Ribosomal Database Project.\cite{9} Assignment and
hierarchical clustering of OTUs as most common and
abundant taxa was performed using UPGMA clustering
(Unweighted Pair Group Method with Arithmetic mean,
also known as average linkage).

Results

Bacterial flora in saliva of edentulous patients: The
total genomic DNA extracted from the saliva of four
EdD and Ed patients were investigated by 16S rRNA
gene sequencing. A higher prevalence of six bacterial
genera namely, *Streptococcus, Veillonella, Rothia,
Lachnospiraceae, Prevotella* and *Alteromonas* were
identified in the saliva of EdD group relative to Ed group
patients (Table 1.1). Of the above six bacteria, the read
count of *Streptococcus* was greater than 10,000 in each
of the patient in both EdD and Ed groups. However in
EdD patients, the *Streptococcus* read count was at least
two-fold higher than Ed group patients that indicated
a higher prevalence of *Streptococcus* in EdD patients
(compare individual patients between the two groups).
Similarly, the read count of *Veillonella* was higher by
at least three-fold in EdD group patients, while those of
*Rothia, Lachnospiraceae, Prevotella* and *Alteromonas*
were several fold higher in EdD group relative to Ed
group patients (Table 1.1) (compare individual patients
between the two groups). Interestingly, the read count
of *Alteromonas* was either insignificant (read count = 2)
or absent in the saliva of Ed patients (Table 1.1). Four
more bacterial species - *Actinomyces, Haemophilus,
Neisseria* and *Vibrio* with read counts greater than 1000
were also detected in both EdD and Ed patients, but
showed mixed pattern without a clear bias towards any
group (Table 1.1). In order to estimate the fold difference
in the occurrence of bacteria in these two groups, the
read counts of each of the bacteria identified in either of
the groups were pooled and difference in the read count
was calculated. This analysis indicated greater than 3
fold difference between the two group of patients, with
a definite preclusion of *Streptococcus, Veillonella,
Rothia, Lachnospiraceae, Prevotella* and *Alteromonas*
in the EdD group patients (Table 1.2). All bacteria with
read counts greater than 1000 belonged to four phyla
namely, Firmicutes, Actinobacteria, Bacteroidetes, and
Proteobacteria (Table 2).

Table 1: Read counts of salivary bacterial genus in edentulous patients with or without complete dentures
Comparison of bacterial community in saliva of EdD and biofilm on their complete complete dentures: The higher prevalence of Streptococcus, Veillonella, Rothia, Lachnospiraceae, Prevotella and Alteromonas in the saliva of EdD patients strongly suggested for the presence of a niche. The palatal and alveolar ridge (PAR) surface of complete dentures served as niche areas, as the contour of these areas follow closely that of supporting bone surface. Scraping of the biofilms from the PAR surface of complete dentures of EdD-1 and EdD-4 patients was carried. The biofilm lysates were first processed to extract genomic DNA and quantify to see whether the samples actually carried genomic DNA or not. Presence or absence of DNA would reflect the presence or absence of biofilm, and hence this step was considered very critical. Quantification of the biofilm samples showed at least five nanograms of DNA in both EdD-1 and EdD-4 samples, which indeed confirmed for the presence of biofilm on the PAR surface of complete dentures (data not shown). 16S rRNA gene sequence analysis of biofilm DNA along with their respective saliva samples indicated a definite higher occurrence of all six bacteria in the biofilm samples, albeit by slightly greater than 1 fold only, relative to saliva (Table 3). This indicated that the mucosal surface of complete dentures does indeed serves as niche for bacterial population.

Table 1.2: Fold difference of pooled read counts of salivary bacteria from all four patients in both groups indicate several fold higher presence of Streptococcus, Veillonella, Rothia, Lachnospiraceae, Prevotella and Alteromonas in edentulous patients with complete dentures relative to those without

Discussion

The present study describes the prevalence and compares the bacterial flora in the saliva of edentulous patients with or without complete dentures, and then associates the prevalence in denture wearers with bacterial flora in biofilms on the PAR surface of complete dentures by 16S rRNA gene sequencing technique. The occurrence of *Streptococcus* and *Veillonella* is consistent with findings from other studies, where in both these bacteria were detected as dominant genera in geriatric edentulous persons wearing dentures.[5] It is important to note that both *Streptococcus* and *Veillonella* play a vital role in the early stages of development of biofilm.[10, 11] Hence the occurrence of these two bacteriae at higher read counts strongly suggests for their role in the development of biofilms on the denture surfaces, which also explains higher occurrence of the six bacteriae in the denture biofilm than saliva. While *Streptococcus*, *Veillonella*, *Rothia*, *Lachnospiraceae*, *Prevotella* and *Alteromonas* showed a definite predilection in EdD patients, four other bacteria - *Actinomyces*, *Haemophilus*, *Neisseria* and *Vibrio* did not exhibit such predilection towards neither of the two groups. The occurrence of these bacteria in both EdD and Ed groups suggests that the bacteriae may represent normal bacterial flora in edentulous mouth irrespective of denture usage and that the bacteriae may be populating the mucosal biofilms such as those that occur on the tongue and buccal mucosa as described in other studies.[13] Mucosal biofilms are known to harbour bacteria, but whether the mucosal biofilms of the patients investigated in the present study harbour the above bacteria needs to be investigated.

In order to identify the source of higher read counts of *Streptococcus*, *Veillonella*, *Rothia*, *Lachnospiraceae*, *Prevotella* and *Alteromonas* in EdD group patients, we analyzed the biofilm on the PAR surface of complete dentures from two patients as these surfaces have a higher propensity for biofilm formation.[13] During routine clinical observations we have noticed that the PAR surfaces are often less carefully cleansed than exposed areas of complete dentures by the patients, a chief factor that determines development and maintenance of biofilms, and hence was investigated in the present study. Metagenomic analysis of the genomic DNA extracted from these biofilms along with their respective saliva samples indicated a further higher prevalence of *Streptococcus*, *Veillonella*, *Rothia*, *Lachnospiraceae*, *Prevotella* and *Alteromonas* in the denture biofilm. The data is consistent with our hypothesis that the PAR surface of complete dentures may be acting as niche areas for bacterial population, which accounts for the higher prevalence of the above bacteriae in the saliva of EdD patients. The biofilm lysate from the complete dentures were prepared after gently washing off the residual saliva with phosphate buffered saline as described in the methods section, and hence the DNA extracted from biofilms may be expected to represent true bacterial population of denture biofilm. Although it is logically not possible to rule out altogether any bacterial contamination from saliva as the PAR surface of complete dentures and saliva often remain associated at any given point of sample collection. However, the higher prevalence of the above bacteria in the denture biofilm than saliva strongly advocates for a true representation from denture biofilm.

The findings of the present study have considerable clinical significance, as majority of atherosclerotic plaques are known to harbour *Streptococcus* and *Veillonella*, which have been associated with higher prevalence of the bacteria in oral cavity.[14] Besides the above two bacteriae, *Rothia* associated infective endocarditis and peritonitis and *Prevotella* associated ulcerative colitis have been reported in a few patients.[15, 16] Although the higher prevalence of these bacteria per se in patients investigated in the present study does not indicate future development of the associated diseases, it does project the importance of maintaining oral hygiene as elderly subjects are often prone to immune compromised conditions.[17, 18] A combination of routine maintenance by the patients combined with photodynamic therapy may reduce the bacterial population in the edentulous elderly subjects as such therapy has been shown to reduce oral bacterial population in other studies.[19]

Conclusion

The 16S rRNA gene based metagenomics study has identified for the first time the relative prevalence of bacteriae from four phyla in the saliva of edentulous subjects with or without complete dentures and associated the prevalence with denture biofilm.

A Study on Customer Intention to Pay a Premium Price for Organic Food

Mohd Farhan¹, Harvinder Singh¹, Deepak Pandey¹, Gurdip Singh¹, Nikhil Monga¹, Mohammad Asif²

¹Mittal School of Business, Lovely Professional University, Phagwara, Punjab, India; ²Assistant Professor, College of Administration and Finance, Saudi Electronics University, Dammam, Kingdom of Saudi Arabia (KSA)

ABSTRACT

The aim of this research is to contemplate the intention of the customers to give a high amount of money for organic food. This study represents the information gathered from the organic food customer of Punjab state of India, in 2018. Data of 500 respondents were collected from supermarkets, organic food shop and departmental stores in different areas of Punjab. The collected information was examined by using factor analysis, multiple regression and descriptive statistics. The outcome of this research shows that the health and food safety are the two most significant factors behind the intention to give a high amount of money, followed by product attribute, promotional activity, income level, awareness level, lifestyle, education level, environment consciousness.

Keywords: organic food, health, environment, lifestyle, awareness, promotion

Introduction

Excessive usage of chemicals and fertilizers destroying the environment and human being’s health. This is one of the big threats in leading a healthy life for the customer. So the customer is shifting towards high quality and chemical free foods¹. “Organic foods refer to food raised, grown and store and/or processed without the use of synthetically produced chemicals or fertilizers, herbicides, pesticides, fungicides, growth hormones and regulators or generic modification”². Price of Organic food is generally higher in comparison to conventional food items because it has higher production cost and high fees to obtain certified eco-labels³.

India emerged as a highest growing market for organic food⁴. Indian organic food market is approximately USD $813 million and expected to rise at a compound annual growth rate (CAGR) of over 25% during 2016-2020.

Review of Literature

Sriwaranun et al. (2015)⁵ studied that the customers are agreeable to give an extra amount of money for purchasing organic food if they are health conscious and if they have a strong environmental & ethical concern and realize the better quality and health benefits of it. Sujatha et al. (2013)⁶ examined that the customer is ready to pay 20 % extra price for organic food due to its benefits for health. Mohamad et al. (2014)⁷ explored that demand for organic food will increase with the increase of awareness about its nutritional values and health benefits. Customers are ready to pay a high price because they think that these products are good for the environment⁸. Rezai et al. (2013)⁹ examined that factors like food safety; environmental friendliness, perception, intention, motivation, income, geographical area, income and gender notably have an impact on customer’s readiness to pay a premium price for organic foods. Ramesh and Divya (2015)¹⁰ examined that the lack of trust on the authenticity of food and high price is the main obstacle in the expansion the market share of organic food. Higher income of the respondents increases the intention to give an extra amount of money for organic food¹¹. But in contrast to this study (Fotopoulos and krystallis 2002)¹² described that higher
income household does not essentially agree to pay a high amount of money for organic food. Some low-income segments of the society are more enthusiastic buyers. Premium prices of organic food are the major obstacle for further expansion of the marketplace for organic food products.

Research Gap

The impact of quality, price, health consciousness, environmental consciousness, awareness, lifestyle, product attributes has been studied in different studies. But these studies did not explain the impact and strength of all these factors on consumer’s intention to give a high amount of money for organic food. Hence, this research examines the relationship of these factors with the intention to pay a high amount of money for organic food.

Objectives of the Study

1. To analyze the attitudes of customers for organic foods.
2. To analyze the important factors that influences the decision to pay a high amount of money for organic food.
3. To explain the relationship between intention to pay the extra price with other influencing factors.

Research Methodology

Purposive sampling technique has been used for this research. Information was gathered in grocery stores, organic food shop and departmental stores in various zones of Punjab. This investigation concentrated on organic food items like Juices, Fruits, Processed Food, Rice, Tea, Honey, Dry fruits, Cereals, Spices, Coffee, Vegetables, etc. A sum of 500 respondents was covered through a structured questionnaire and information was collected on 5 points likert scale. The collected information was analysed by SPSS 22.0. Factor analysis was used as a data reduction technique to find the important factors. Multiple regression analysis uses to explain the relationship between the intention to pay high price with independent variables.

Data Analysis

Amongst the respondents, 63% of the respondents were among the age group between 21 to 40. 54.6% respondents are male and 45.4% are female.43.4% respondents have their income between 0 to 20,000.34.4% of the respondents are private employees and 23.8% are self-employed. 57% of the respondents are unmarried and 41.0% of the respondents are married.59.4% of the respondents are educated up-to graduation level and 22.8% are post graduated.

Factor Analysis

KMO and Bartlett’s Test: Value of Kaiser-Meyer-Olkin, in table 1 is 0.829. Bartlett’s test of sphericity value for p is 0.00. So the sample is adequate for factor analysis and a relationship present between the variables.

Table 1: KMO and Bartlett’s test

| Kaiser-Meyer-Olkin Measure of Sampling Adequacy | .829 |
| Bartlett’s Test of Sphericity | 9014.085 |
| Approx. Chi-Square | 741 |
| df | .000 |

Results of factor analysis gave eight important factors. These factors are food safety, health consciousness, environmental consciousness, promotional activities, lifestyle, awareness level and product attribute.

**Research Model**

A conceptual model has been developed in figure 1, to examine the factor that affects the intention to give a high amount of money for organic foods. Intention to pay was taken as a dependent variable and demographic characters (like age, income and education level) and factor coming out from factor analyses like food safety, health consciousness, environmental consciousness, promotional activities, lifestyle, awareness level, product attribute were considered independent variables.

a. Dependent Variable: intention to give a high amount of money

On the basis of table 3, the equation for intention to give a high amount of money in this study is given below:

\[
\text{Intention to give a high amount of money} = 1.537 + 0.482 (\text{Health consciousness}) + 0.415 (\text{Food safety}) + 0.398 (\text{Product attribute}) + 0.251 (\text{Promotional activity}) + 0.249 (\text{Income Level}) + 0.230 (\text{Awareness level}) + 0.167 (\text{Lifestyle}) + 0.156 (\text{Education Level}) + 0.137 (\text{Environment consciousness}) - 0.076 (\text{Age})
\]

**Findings**

Health consciousness with the maximum beta value (0.482) is the most important factor that highly affects the consumers’ intention. Food safety is the second most significant variable with the beta value of 0.415. Product attributes like appearance, taste etc. came on the third position, followed by income level, awareness level, lifestyle, education level, environmental consciousness. Age has a significant negative association with the intention to give a high amount of money.

**Conclusion**

This research examined the determinants that affect customer intention to give a high amount of money for organic food. It was found that Health consciousness is the main factor that highly affects the consumers’ intention to
give a high amount of money for organic food. Food safety is the second most important variable. Product attributes like appearance, taste etc. came on the third position, followed by Income Level, Awareness level, Lifestyle, Education Level, Environment consciousness. The analyses demonstrate that demographic factors like income and education have a significant positive association with the intention to give a high amount of money.

A Real-Time Road Traffic Congestion Detection Model Using Big Data

K. Chitra¹, C. Shanthi², K. Sharmila²
¹Research Scholar, ²Assistant Professor, School of Computing Sciences, VISTAS

ABSTRACT
This abstract identifies the road traffic events and analyse the delay in the estimated routes. The congested areas will be traced and identified with the help of big data techniques. The aim is to understand traffic patterns in the particular City. In cities, massive population and large number of vehicles cause problems, like congestion and accidents. A number of efforts to address these problems have been proven effectively. The new techniques road traffic model was named as Trafficshare which is used to find the unusual traffic events on the roads. The model shows the travel route, travel time, weather delays, road work alerts, emergency road blockage and traffic event messages will be notified. Traffic data refer to datasets generated and collected on moving vehicles and objects. The alert messages were correlated with real-time traffic. Using the detection model will detect the exact delays in the particular road of the city in case of blockage in the road. Based on the detection techniques the user can choose the alternate route. The observations that are tracked through GPS and Geotracker will be providing the traffic detection analysis using the model.

Keywords: Big Data, TrafficShare, Alerts, event, Map reduce

Introduction
This goal of this paper is to provide such a system where real-time traffic-flow data is monitored and the occurrence of accidents is detected before any official accident notification arrives from the area. This would help the city governments to dispatch emergency teams to prospective accident-prone areas, prevent accidents by taking extra-measures and manage costs efficiently.

Disruption of normal traffic flow results in wasted time, fuel costs and lost productivity. Officials are working around the clock to finish the regular maintenance activities as quickly as possible to keep the roads open and provide safe traffic flow. The traffic accidents and road work are among the most important causes that disrupt the normal traffic flow. Preventing an accident is important and it is very difficult to provide an accident-free road transportation system. It will be well prepared for future events in general. The paper is to analyse traffic events for the city and to provide a visual dashboard for analysing traffic patterns. The captured data are used from remotely sensed and information passed to data sources.

The prediction of travel time and delayed traffic event messages will be notified to the end-users in case of accident, road work or emergency block. The model allow the user compare inbound and outbound travel time is for any hour of any day and shows the alternate route travel time also if any events occurred in the road.

Workflow Process: GPS (Global Positioning System) is navigation software that works on and tablets or phones with the help of network support. It provides turn-by-turn navigation information and user-submitted travel times and route details, while downloading location-dependent information over a mobile telephone network. The traffic live updates will be tracked and alerted based on the congested area and the same time the end-user can also comment the road traffic status through the TrafficShare model.
The model states that the data from objects sources such as Semi-structured and unstructured. The flow shows the traffic alerts are shown only when traffic events occurred in their location. To avoid the traffic zone, alternate route is rerouted in case of emergency, road blockage or construction work.

We are applying this concept in finite dataset. Big data is a big part of the today’s business. With the rise of big data, the end-user may also be able to use real-time monitoring and alerts to the problems. Each route map location generates terabytes of data that requires real-time analysis to optimize traffic operations, maintain safety and meet all the compliance requirements. Traffic compensate for delays by adding slacks to the system. They usually delay during the winter or depend on the climatic condition. In order to evaluate the time factor, we need to know the probability of the incoming vehicle being too late and taking into account the incompressible time necessary to wait and delayed to be notified. Models already exist to estimate the delayed time. The existing model does not show any delay reasons whether climatic factor, road work or any accidents met. To overcome that situation we are using big data to share alert messages with the registered users.

Review of Literature

Kapileswar Nellore et.al. 1 the current study found that Wireless Sensor networks (WSNs) have gained increasing attention in traffic detection and avoiding road congestion. WSNs are very trendy due to their faster transfer of information, easy installation, less maintenance, compactness and for being less expensive compared to other network options. There has been significant research on Traffic Management Systems using WSNs to avoid congestion, ensure priority for emergency vehicles and cut the Average Waiting Time (AWT) of vehicles at intersections.

Siuli Roy, et.al.2 the current research study has made an attempt to analyse real time traffic congestion, detection and management using Active RFIS and GSM Technology3. It support the GSM and geolocation are the right methods to detect the congestion to traffic.

D.Fisheret.al. in this study, the interaction of Big data are analysed with basic sources. i.e., dataare in the form of emails, photos, videos, monitoring devices and audio which can be easily handled in big data. The features contain capturing the real information of data, data storage, analysis, sharing, search, visualization, querying, updating and privacy.

The objective of this paper is to analyse and under the traffic patterns for a particular city and to provide a visual dashboard for analysing the traffic data. The initial data sets used vary from remote sensed data and events updated from open-data sources. One of the challenges this paper achieve is the Big Data three V’s (volume, velocity, variety).

As mentioned earlier, such pieces of information are often generated by the company but consume a lot of money and time to load into an appropriate database for scrutiny. Therefore, such pieces of facts must be partitioned prior to examining them. It is well known that road traffic congestion causes of money in extra hours of travel and extra fuel. Since traffic congestion that may have an impact on delays in travel time is normally related to traffic incidents, which is usually nonrecurring in nature, it is important to proactively assess the emergence of traffic anomalies as an early warning incident signal, which might prevent or minimize the impact duration of traffic. The data is refreshed every 10-30 seconds providing congested area in the exact position. The display is an easy to use map with arrows showing the route that any chosen vehicle has taken.

Related Work: A static control system may block emergency vehicles due to traffic jams. Wireless Sensor networks (WSNs) have gained increasing attention in traffic detection and avoiding road congestion. WSNs are very trendy due to their faster transfer of information, easy installation, less maintenance, compactness and for being less expensive compared to other network options.

Recently, many efforts have been made to develop more efficient Inter-Vehicle Communication (IVC) protocols for on-demand route planning according to observed traffic congestion or incidents, as well as for safety applications. Because practical experiments are often not feasible, simulation of network protocol behavior in Vehicular Ad Hoc Network (VANET) scenarios is strongly demanded for evaluating the applicability of developed network protocols.

In this work, we discuss the need for bidirectional coupling of network simulation and road traffic micro simulation [2] for evaluating IVC protocols. As the selection of a mobility model influences the outcome of
simulations to a great extent, the use of a representative model is necessary for producing meaningful evaluation results. Based on these observations, we developed the hybrid simulation framework Veins (Vehicles in Network Simulation), composed of the network simulator OMNeT++ and the road traffic simulator SUMO.

With our developed methodology, we can advance the state-of-the-art in performance evaluation of IOT and provide means to evaluate developed protocols more accurately. GPS devices and webcam, Radar technology etc. congestion can also be detected. But these technologies have several drawbacks, such as installation problems and cost. Radio Frequency Identification (RFID) is an emerging technology that is still remains largely unexplored in the area of automatic congestion detection [3]. Vehicle detection and counting can be done effectively using RFID technology.

**Proposed System**

The predictive analytic tools presents traffic events information as data visualizations to help users to receive alert messages how to maximize network capacity as well as the choices made by travellers. To achieve this first we need to simulate the traffic flow of process and collect the data as traffic parameters instead of real data. The congestion to be evaluated and predicted for each and every route bases on the average calculation to be obtained. Every time period will be noticed with respect to traffic events. The architecture works as such GPS collectors feed traffic and information into the model. It is collecting information for each 10-meter of roadway and sometimes individual areas are tracked by a Geousers.

**Data Collection**

The datasets used in the K-means clustering algorithm are given in table 1,

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timestamp</td>
<td>Date time of observation YYYY-MM-DD-HH:MM</td>
</tr>
<tr>
<td>Route</td>
<td>Road with 1 or more observed links</td>
</tr>
<tr>
<td>Link</td>
<td>Segment of road between 2 control sites</td>
</tr>
<tr>
<td>Direction</td>
<td>Direction of flow of traffic</td>
</tr>
</tbody>
</table>

With the help of clustering algorithm is used to track the exact point of location. K-means clustering is a type of unsupervised learning, which is used to have unlabelled data (i.e., data without defined categories or groups). The goal of this algorithm is to find groups in the data, with the number of groups represented by the variable K.

**Algorithm:** AdvancedK-Means clustering

1. Compute the distance between the path /* the congestion area points */.
2. Initialize the centroids with m random data /* number of clusters to be found */
3. Initialize \{u_i\} i^k = 1
4. FOR: Each cluster C_j
5. REPEAT:
6. Cluster the points based on the congestion area from the Detection centroid points.
7. Compute the centroids for each of the clusters.
8. UNTIL;

The algorithm works iteratively to assign each data point to one of K groups based on the features that are provided. Data points are clustered based on feature similarity.

The centroids of the K clusters which can be used to label new data. Labels for the training data (each data point is assigned to a single cluster). The interpolator fills in the rest and sends its information to both Google Big Query and to traffic flow, weather condition, congestion detection, and prediction algorithms methods such as relational databases. With the help of NoSQL database to overcome the challenges of the three V’s the approach stored volumes of data that on a single machine system would have been problematic. This iteration time for the big data cluster to analyze the data stored was set at 5 min. This 5-minute interval was determined simulation using different time intervals, concluding 5 min is sufficient time to obtain data of traffic events. The results were simulated by 64 traffic congestions in different division of streets and at different times. The table shows the results of two simulated data where the first row contains the first test results and the second row
contains the second test results. The first results indicate that 63 alerts were generated by the big data cluster, with one false alert and two alerts which were not generated. The test presented a traffic detection accuracy based on the traffic congestion algorithm.

The significance of this process has been achieved by addressing and presenting the following:

- Analysing the large size of traffic data sets to test its robustness and effectiveness.
- Selecting the most relevant attributes, to reduce the processing time and increase the prediction accuracy.
- Select the optimal algorithms that have the lowest processing time with the highest accuracy.
- Tackle the problem of class imbalance distribution in both accidents.
- Tracking the event occurred based on the event and noticed on the alerts.

According to real-time big data platform, NOSQL which aims to integrate and analyse real data feeds. High-performance systems such as transport are able to transform volume of raw GPS data into real-time actionable information. The transformation took place in the form of ETL Connector for Google Big Query.

Need of Big Data: Big data has various dimensions like Volume, Velocity, and Variety each one is described below. Datase in the form of emails, photos, videos, monitoring devices and audio which can be easily handled in big data. The features contain capturing the real information of data, data storage, analysis, sharing, search, visualization, querying, updating and privacy.

Volume: Volume refers to the enormousness of data. The size of Big Data is reported in numerous terabyte to petabyte. Report states that Facebook processes up to one million photographs per second. One petabyte is equal to 1024 terabytes of data can be stored and retrieved from the database.

Velocity: Velocity refers to the rate at which data are generated and the Speed at which it should be analyzed and acted upon. Unprecedented rate of data has been created from sensors and smart phones, which are needed for real time analytics and evidence-based planning.

Variety: Variety refers to different type of data like structured, semi-structured and unstructured data. The data available in spread sheets or relational databases in the form of tabular data is structured. Images, audio, video, text (chat messages) is unstructured. Extensible Markup Language (XML), textual language used for exchanging data on web is semi-structured.

Mongo DB: It’s a NoSQL database called Not only SQL with storage, index support and high Availability. It finds the traffic events in the time of driving, and checking if any blocked roads or delayed flow of traffic. It is an approach to data management and database design used for very large sets of distributed data.

Map Reduce: It is an open-source framework system that allows to store and process big data in a distributed environment across clusters of computers using simple programming models. Hadoop is an Apache managed software framework derived from Map Reduce and Big table.

Alert Management Phase: Big Data Analytics using Hadoop plays an effective role in performing meaningful real-time analysis on the huge volume of data and able to predict the emergency situations before it happens in real time. Traffic information system processed with massive and complex traffic data with the process of collecting real-time original GPS (Global Positioning System) data, matching positions to a map and generating traffic flow data, which predicts even-worse traffic condition in city.

The results validate the efficiency of the traffic detection system and its positive impact in detecting, reporting and rerouting traffic when traffic events occur. The classification approach worked as a proof of concept.

Conclusion

This paper provides an overview of relevant visualization techniques in the context of traffic analysis, and presents the common flow in traffic. An analysis of these phases to deal with traffic prediction and recognizing the problem with dashboard will display the different elements of the visualizations. The map is elegant and informative. Based on the traffic event prediction, emergency road block or accident alerts will be received to the users’ device and to further proceed with the alternate route.

Excessive Weight Loss and Quality of Life after Laparoscopic Sleeve Gastrectomy—A Correlational Study

K T Moly
Professor cum Principal, Amrita College of Nursing, Amrita Vishwa Vidyapeetham, Kochi

ABSTRACT

Background: Laparoscopic Sleeve Gastrectomy (LSG) is the latest method of bariatric surgery used to treat clinically severe obesity. Percentage of excess weight loss (EWL) is commonly used as a marker of success or failure of LSG affecting the quality of life (QoL) of obese.

Objective: To find out the relationship between EWL and the QoL of patients after LSG.

Materials and Method: A descriptive cross sectional study of 100 patients who have completed at least six months after LSG were selected using convenience sampling technique. 50% of the sample was obtained from the GI Surgery OPD in a tertiary care hospital, Kerala and 50% through telephonic interview. Data on QoL was collected using SF-36 questionnaire.

Results: The mean weight of the subjects before surgery was 115.99Kg +/- 22.97, while the mean weight after surgery was 84.02Kg +/- 17.75. The mean percentage of EWL was 63.31Kg +/- 26.20. The mean BMI before surgery 42.46 Kg/m² +/- 6.02 came down to 30.76 Kg/m² +/- 5.04 after surgery. A positive correlation was found between QoL and EWL (p =0.768).

Conclusion: There is agreement that weight loss leads to better QoL. However, the need for longitudinal studies with multiple check points on the determinants of QoL including weight loss cannot be neglected.

Keywords: EWL, BMI, QoL, LSG

Introduction

Laparoscopic sleeve gastrectomy (LSG) is the recent bariatric surgery performed to reduce excess weight and improve quality of life (QoL) in morbidly obese. Percentage of excess weight loss is commonly used as a marker of success or failure of bariatric surgery. Studies have shown that QoL can improve as soon as 3 months after surgery. This may be probably due to the reason that most of the disabilities and co-morbidities are associated with the excess weight itself. However, the amount of excess weight loss (%EWL) among obese patients after bariatric surgery varies greatly in studies.

The amount of excess weight loss as a percentage (%EWL) was commonly used as a marker of weight loss success (EWL ≥ 50%) or weight loss failure (EWL < 50%)(1). %EWL is calculated using the following formula: 

\[ \text{%EWL} = \frac{\text{postoperative weight loss}}{\text{preoperative excess weight}} \times 100 \]

However, the dichotomous classification into success versus failure, with an arbitrarily defined cut-off at 50% EWL, does not reflect the considerably wide individual variation in postoperative weight loss that has been described in previous studies(3). Approximately 15% to 20% of all bariatric surgery patients fail to achieve adequate %EWL(4); inadequate weight loss is considered to be EWL < 25% according to the Reinhold criteria(5). The present study was aimed to find correlation between % of excess weight loss (EWL) and quality of life (QoL) in patients after Laparoscopic Sleeve Gastrectomy.

Surprisingly little is known about the factors that promote or hinder weight loss after bariatric surgery. Though studies have highlighted the influence of the severity of excess weight on QoL, changes in QoL were not associated consistently with the amount of weight loss.

Materials and Method

A descriptive cross-sectional study with 100 patients after LSG taken through convenience sampling technique. Sample included only patients who have completed a minimum of six months after LSG. Ethical clearance was taken from the Institutional Ethical committee and informed consent obtained from each subject. The preoperative weight, BMI and date of operation were verified with the electronic medical record of the hospital. 50% of the patients were interviewed in the GI surgery OPD of a tertiary care hospital and 50% of the patients were interviewed through telephone as per prior appointment with them. The Short Form SF-36 questionnaire (RAND 36-Item Health Survey 1.0.) was used to collect data.

Results

</table>

The above table shows there is a statistically significant association between EWL category and time after surgery and age. It is worthy to note that 2 patients did not have weight loss after 5 years of surgery instead there was a gain in weight.

Discussion

In the present study nearly half of the study subjects (44%) were belonging to the age group of 31-42 years and 32% were belonging to the age group of 43-55 years. Most of the study subjects were females (61%). The mean weight of the sample before surgery was 115.99 + 22.97 which was reduced to a mean weight of 84.02 + 17.75 after LSG. The percentage of EWL was 63.31 + 26.20 and actual weight loss mean was 31.97 + 15.27. Nearly half of study subjects (46%) came down to the overweight category however the remaining 54 % were in the various categories of obesity (class 1- 36%, class 2- 14% and class 3- 4%). The percentage of EWL was 63.31 + 26.20 and actual weight loss mean was 31.97 + 15.27.

In India most of the patients undergoing weight-loss surgery lose 60-80% of their excess weight within 12 months. In another study done in Kerala (2017) among 70 patients the mean preoperative weight was 114.1 kg which was reduced to 86.47 kg at six months post LSG. It was found that the mean % EWL was 49.73% and the mean % EBMI loss was 58.95%. In the present study %EWL was higher (63.31 + 26.20) yet conforming to the previous studies among Indian patients. This may be probably due to the inclusion of subjects Post LSG six months to seven years in the present study while the former study included only subjects six months post LSG.

The results of the present study are also comparable to rates reported by other published studies like Lee et al. who reported the highest EWL of 83% at two years; Rawlings et al an % EWL of 86% and Piotr Major et al 58.8 % post LSG at one year follow-up. Lemanu et al also reported a % EWL of 56% at one year post LSG.

Himpens et al. reported the percentage excess weight loss (EWL) after sleeve gastrectomy as 77.5% and 57.3% at 3 and 6 years, respectively. Among super obese patients, the reported mean EWL was 52%, 43% and 46% at 72, 84 and 96 months follow up, respectively. The Fourth International Consensus Summit on Sleeve Gastrectomy in New York, 2012 included a survey of 46,133 sleeve gastrectomy cases, among 130 surgeons, at an average of 5 years after surgery. Excess weight loss was 59% at 1 year, gradually falling to 50% at 6 years.
The mean BMI before bariatric surgery was 42.46 + 6.02 which was reduced to 30.76 + 5.04 after surgery. The percentage of EBMI loss was 63.31 + 26.20.

In a single-center study in Switzerland, patients who underwent the procedure lost an average 57.4% of excessive BMI over 5 years as reported by Ralph Peterli and colleagues\(^{(14)}\). Overall, Peterli and colleagues found that the average excessive BMI lost after 1 year was 61.5%, and then 61.1% after 2 years. By 5 years, average excessive BMI lost was 57.4%. Those losses correspond with a BMI reduction of 12.6 kg/m\(^2\), 12.4 kg/m\(^2\), and 11.2 kg/m\(^2\), respectively. In the Brazilian study BMI differed between the pre and post-surgery groups (52.3 ± 8.3 kg/m\(^2\) vs. 32.5 ± 6.4 kg/m\(^2\), \(p < 0.001\))\(^{(15)}\). In the present study the mean BMI of 42.46 + 6.02 before bariatric surgery was reduced to 30.76 + 5.04 after surgery.

Although there has been effective weight loss outcome in clinically severe obese patients after surgery\(^{(16)}\) a subset of patients, perhaps as great as 20% fail to lose a significant amount of weight which has been attributed to poor adherence to the post surgical diet.\(^{(8)}\). In the present study also four patients were still in the category of class-3 obesity and 14 in class-2 obesity and 36 in class-1 obesity after bariatric surgery, probably because of similar reasons. It is worthy to note that 2 patients did not have weight loss after 5 years of surgery instead; there was a gain in weight ie. One patient did not show any weight loss at the time of the study and another gained 15 kg from his previous weight (from 110kg pre surgery weight to 125kg).

Most of the studies done in India and abroad available to the investigator had clearly shown more than 50% of excessive weight loss and excessive BMI loss though there were variations pertaining to time after bariatric surgery. In the present study also statistically significant association was found between EWL category and %EBMIL 12 months after surgery (\(p<0.001\)) showing better results in younger patients. The study concluded that patients younger than 45 years lose greater amount of excess BMI than older patients after bariatric surgery\(^{(16)}\).

A statistically significant association was found between EWL category and age in the present study. In a study done among 337 patients (both Roux-en-Y gastric bypass and sleeve gastrectomy) There was significant difference between age group and %EBMIL 12 months after surgery (\(p<0.001\)), showing better results in younger patients. The study concluded that patients younger than 45 years lose greater amount of excess BMI than older patients after bariatric surgery\(^{(16)}\).

The purpose of the study was to search for any correlation between EWL and QoL in patients after LSG. The present study have proved a statistically significant positive correlation between EWL and QoL in the sample (\(r = 0.768\)). The overall QoL assessed through SF36 was found to be quite good (80.93 ± 18.18). The study finding is in congruent with several previous research findings. Some studies indicate that weight reduction in the severely obese is accompanied by improvements in health related QoL (HRQL) and that a dose-response relationship exists between the magnitude of weight loss and HRQL benefits.

Karlson et al. examined trends and effects of weight loss treatment on HR-QoL in severely obese of SOS intervention Study over 10 years, and showed that long-lasting weight reduction in the severely obese has a general long-standing positive outcome on HR-QoL and the peak improvement was located between 6 months and 1 year after surgery.\(^{(7)}\)
Sarwer et al. assessed changes in quality of life and body image in the first 92 weeks following gastric bypass surgery in 200 individuals. Participants reported significant improvements in several domains of health- and weight-related quality of life, as well as changes in body image, following surgery which was correlated with percent weight loss.

Individuals who undergo bariatric surgery experience durable weight loss, at least for the 3 years period of follow-up. The present results are in line with other studies that also reported an improvement in HR-QoL after a weight loss of more than 30% after bariatric surgery.

Conclusion

There is agreement that weight loss leads to better quality of life. However, the fluctuations in weight loss after crossing certain threshold needs further longitudinal studies with multiple check points on the issue. Researches on determinants of weight loss- pre and post bariatric surgery- would be useful for better control of results of QoL.

Knowledge and Attitude of Married Women towards Contraceptives Residing in Selected Slums of Udupi District

Sowmya¹, Ansuya², Vinish V²

¹Lecturer, Udupi College of Nursing, Udupi, Karnataka, India; ²Assistant Professor, Department of Community Health Nursing, Manipal College of Nursing, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

Contraceptive use allows couples to determine and ascertain the desired number of children as well as the spacing of their child births. It has a direct impact on health, wealth and well-being of people.

Objectives: To assess the knowledge and attitude towards contraceptives. To find the association between knowledge, attitude and selected demographic variable. To find the relationship between knowledge and attitude towards contraceptives.

Methodology: A cross sectional descriptive study was carried out among 323 married women between the age group of 18 – 45 years residing in slums of Udupi district. The Five slums were selected by simple random sampling from Udupi district. Data was collected through interview method by using structured knowledge questionnaire and attitude scale towards contraceptives.

Results: The study result shows that majority 192(59.5%) of women had average knowledge, 122 (37.7%) had poor knowledge, only 9(2.7%) of women had good knowledge. Majority 321 (99.4%) of women had positive attitude towards contraceptive use. The number of living children (χ² =9.205 p=0.008) has significant association with attitude towards contraceptive use. There was weak positive correlation between knowledge and attitude which was statistically significant (p=0.256, p=0.001).

Conclusion: There is a need to create awareness among women of reproductive age group regarding contraceptive use.

Keywords: Birth control methods, awareness, view point, cross-sectional study

Introduction

In India population explosion is a major problem since independence. According to 2011 censes India’s population was 1.21 billion. India is the first country which has started the family planning programme in the year 1952, later which extended to cover health of mother, child, family welfare and nutrition. The objective of family planning programme is to decrease the birth rate to steady the population, consistent with the requirements of the national economy¹.

Family planning is not only restricted to controlling birth, it is also essential for improvement of socio economic status and health of the members of whole family. Spacing between births for at least 2 years is the main highlight of the family planning. Keeping the gap of 5 years between two children helps to improve the health of mother and children. Giving birth to more number of children increases medical expenditure and affects the socio economic status and parents will not be able to provide food, clothing, shelter, education for their children. If couples are using contraceptives and reducing the number of children in family helps them to promote health and stabilize the economic status².
According to National Family Health Survey-4 Total Fertility Rate in India is 2.2, children under 5 years of age whose birth was registered was 79.1%, only 53.5% married women aging between 15-49 years are presently using one or the other methods of contraceptives, total unmet need for contraception is 12.9%, unmet need for spacing is 5.7%.

A descriptive study was conducted to determine the knowledge, practice and attitude about the birth control measures among the women residing in Udupi district. About 136 samples were selected through Purposive sampling method. The study findings revealed that 67.60% of subjects had moderate knowledge, 14.70% had adequate knowledge, 17.60% had very little knowledge and most of the women had favourable attitude towards utilization of contraceptives.

A cross sectional study conducted to assess the attitude of married women of selected villages in Harayana. Purposive sampling method was used to select 200 samples. The tools used for data collection was attitude scale. Out of 200 samples 37% of women had unfavourable attitude and only 19% of women had favourable attitude. 44% of them had moderately favourable attitude regarding use of contraceptive methods.

Many of the studies were conducted in villages to assess the knowledge and attitude of married women towards contraceptives but in the slums only few studies were undertaken and also the researchers personal experience during the interaction with the women of slums made the investigator to feel that it is necessary to know whether the married women residing in the slums are aware about the contraceptives.

Materials and Method

This cross sectional descriptive study was carried out in the selected slums of Udupi district in the month of December 2017 and January 2018 among married women of reproductive age group. The sample size was calculated as 323 based on the findings of previous study. The slums were selected by simple random sampling method; subjects were selected using purposive sampling method.

Ethical committee clearance and administrative permission was obtained before data collection. CTRI registration was done (CTRI/2018/01/011572).

The house to house survey was conducted and the data was collected from married women who met inclusion criteria. The data was collected through interview technique using demographic proforma, structured knowledge questionnaire, five point likert’s scale developed by the investigator.

Knowledge questionnaire consisted of 26 items each question had four responses. Blue print for the tool was prepared under 3 headings such as types of contraceptives, instruction to use contraceptives, benefits and side effects of contraceptives. Correct responses were scored has 1 and wrong answers were scored has 0. Attitude scale had 20 items. It is a five point scale where each item was rated as either strongly agree (5), agree (4), uncertain (3), disagree (2), strongly disagree (1) for positive items and strongly disagree (5), disagree (4), uncertain (3), agree (2), strongly agree (1) for negative items. The the tools were validated by 7 experts and Pretesting of the tool was done by administering it to 5 married women. The reliability of knowledge questionnaire was calculated by split half method. The reliability co-efficient was r=0.789, attitude scale was calculated by Cronbach’s alpha. The reliability was r=0.798. Thus the tool was found reliable. Both the tools were translated to Kannada by language expert.

The data was collected after explaining the purpose of the study, the meaning of their participation in the study and a written consent was obtained from them. The women were assured that anonymity would be maintained throughout the study and the data would be used for research purposes only.

Statistical Analysis: The data was analyzed by using Statistical Package for the Social Sciences (SPSS) for Windows version 16.0 The statistics used for data analysis was frequency and percentage distribution of demographic variables, knowledge on contraceptives, attitude towards contraceptives. Association between knowledge on contraceptive and selected demographic variables and between attitude and selected demographic variable was done by chi-square. Spearman correlation co-efficient was used to analyze the relationship between knowledge on contraceptives and attitude towards contraceptives. A p-value of < 0.05 was considered to establish the statistical significance.
Result

A total 323 married women in the reproductive age group willing to take part are included in the study. The interview on barriers for non-utilization of contraceptives was conducted to those who are not using any contraceptives.

Section A: Description of Sample Characteristics:
Result shows that out of 323 participants 129 (39.9%) of women were in the age group of 25-31 years, majority 308 (95.4%) belongs to Hindu religion, 159(49.32%) had a primary education, 154 (47.7%) husbands had primary education, 176(54.5%) women were unskilled worker, 315(97.5%) of husbands were unskilled workers, 162 women had monthly family income is >15000 rupees, 126 (39.0%) women duration of marriage is 6-10 years,110(34.1%) of women had two children, 190(58.8%)of women belonged to nuclear family, 286(88.5%) of women had previous information about contraceptives. (47.4%) had got information about contraceptives from doctors, 23.5 % from nurses, 10.5 % from relatives and 3.4% from the ASHA worker.

Section B: Knowledge on Contraceptives

![Fig. 1: Frequency and percentage distribution of knowledge score on contraceptives](image)

Fig. 1 depicts that majority 192(59.5%) of women had average knowledge, 122 (37.7%) had poor knowledge, only 9(2.7%) of women had good knowledge.

Section C: Description of attitude towards contraceptives

| Table 1: Frequency and percentage distribution of attitude of married women towards contraceptives |
|----------------------------------------|------------------|-----------------|
| Attitude | Score range | Frequency (f) | Percentage (%) |
| Positive attitude | 50-100 | 321 | 99.4 |
| Negative attitude | <50 | 2 | 0.6 |

Table 1 shows that 321 (99.4%) of women had positive attitude towards contraceptives, 2(0.6%) had negative attitude towards contraceptive use.

Section D: Description of association between knowledge on contraceptives and selected demographic variables

| Table 2: Association between knowledge on contraceptives and selected demographic variables |
|-----------------------------------------------|------------------|-----------------|
| Demographic variables | χ² | p-value |
| Age in years | 2.37 | 0.30 |
| Education status of women | 1.03 | 0.91 |
| Occupation of women | 4.37 | 0.37 |
| Monthly income in rupees | 7.08 | 0.13 |
| Type of family | 1.14 | 0.60 |
| Duration of marriage | 5.58 | 0.43 |
| Number of living children | 7.66 | 0.41 |
| Previous information on contraceptives | 2.35 | 0.25 |
Fisher’s exact test was used to find the association between knowledge and selected demographic variables. There was no association found between knowledge and selected demographic variables.

**Section E: Description of association between attitude towards contraceptives and selected demographic variables**

**Table 3: Shows association between attitude towards contraceptive use and selected demographic variables**

<table>
<thead>
<tr>
<th>Demographic variable</th>
<th>$\chi^2$</th>
<th>P value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age in years</td>
<td>.801</td>
<td>.382</td>
</tr>
<tr>
<td>Education status of women</td>
<td>4.074</td>
<td>.667</td>
</tr>
<tr>
<td>Occupation of women</td>
<td>1.852</td>
<td>1.000</td>
</tr>
<tr>
<td>Monthly income</td>
<td>4.814</td>
<td>.502</td>
</tr>
<tr>
<td>Duration of marriage</td>
<td>3.752</td>
<td>.142</td>
</tr>
<tr>
<td>Number of living children</td>
<td>9.250</td>
<td>.008*</td>
</tr>
</tbody>
</table>

The fisher’s exact test value depicts that number of living children ($p=0.008$) has significant association with attitude towards contraceptives.

**Section F: Relationship between knowledge and attitude towards contraceptives**

**Table 4: Depicts relationship between knowledge and attitude towards contraceptive use and selected demographic variables**

<table>
<thead>
<tr>
<th>Variables</th>
<th>$\rho$ value</th>
<th>P value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>0.256</td>
<td>0.001*</td>
</tr>
<tr>
<td>Attitude</td>
<td>0.256</td>
<td>0.001*</td>
</tr>
</tbody>
</table>

The spearman correlation co-efficient value shows weak positive correlation between knowledge and attitude which is statistically significant ($p=0.256$, $p=0.001$). It infers that knowledge has influence on their attitude towards contraceptives.

**Discussion**

Contraceptive method that help the couples to avoid unwanted pregnancy, helps to keep space between pregnancies, controls the time at which birth occurs in relation to the age of parents and determines the number of children in the family.

The present study result shows that out of 323 participants 129 (39.9%) of women were in the age group of 25-31 years, majority 308 (95.4%) belongs to Hindu religion. 159(49.32%) had a primary education. 286(88.5%) of women had previous information about contraceptives. (47.4%) had got information about contraceptives from doctors, 23.5 % from nurses, 10.5% from relatives and 3.4% from the ASHA worker.

Similar study conducted in Haryana in 2014 shows the mean age of the participants was 32.76 ± 4.6 years. Among the study participants, more than three-fourth have gone to primary school or above to seek education. More than 90% of the participants belonged to Hindu religion. (70.4%) of the participants got information about family planning methods were mainly from doctors/multipurpose health worker/anganwadi worker.

The present study revealed that majority 192(59.5%) of married women had average knowledge about contraceptives, 122(37.7%) of the women had poor knowledge about contraceptives, only 9(2.7%) of women had good knowledge.

The findings of the study is supported by a cross sectional comparative study conducted in Punjab with the aim to compare the knowledge of married women regarding contraceptive method among 100 married women of which 50 married women of Rural and 50 married women of urban was taken by non-probability convenience sampling technique. They found that 82% of the urban women had good knowledge and 18% had average knowledge.

The findings of the study is contradicted by a study conducted in 2009 on Knowledge and utilization of contraceptives among Racha Koyas of Andhra Pradesh, which showed that 81% had a high level of knowledge on different contraceptive methods.

The findings of the study are supported by the study conducted among 200 married women of reproductive age group residing in a rural area of Karnataka. In which 76% of study participants had positive attitude for contraceptive use.

The findings of the study are supported by a cross sectional study conducted to determine the view point of the married women.
of married women of selected villages in Harayana. 200 samples were selected by purposive sampling method. Out of 200 samples 37% of women had unfavourable attitude and only 19% of women had favourable attitude, 44% of them had moderately favourable attitude regarding use of contraceptive methods. It is also found that level of attitude of women was found to be statistically significant with age (χ²=13.6), educational status (χ²=89.5), occupational status (χ²=20.2), family income per month (χ²=17.2), duration of marriage (χ²=19.7), number of children (χ²=17.9).3.

Limitations of the Study: Use of Purposive sampling in the present study limits the generalization of the findings to the study samples

Conclusion

There is a wide gap between knowledge and utilization of contraceptives; hence an awareness programme should be conducted to motivate the married women to utilize contraceptives.

Conflict of Interest: There is no conflict of interest between the authors.

Source of Funding: Self-funded project. No other source of funding.

Ethical Clearance: Ethical clearance is made from the Ethical Committee. CTRI registration also done.

Correlation of Lipid Profile with CD4 Count in HIV Treatment Naïve Patients

Pavan M R¹, Jayakumar Jeganathan¹, Rachuri Suresh²
¹Associate Professor, ²Junior Resident, Department of Medicine, Kasturba Medical College Mangalore, Manipal Academy of Higher Education

ABSTRACT

Introduction: Dyslipidaemia is more common in HIV patients especially in patients on Protease inhibitors. Coronary artery disease and cerebrovascular disease are also more prevalent in HIV patients. However, there is not much literature on lipid abnormalities in treatment naïve HIV patients. Hence we aim to correlate the lipid profile with CD4 count in untreated HIV patients.

Material and Method: This was a cross sectional study of 97 newly diagnosed HIV patients who were not on anti-retroviral drugs. Their total cholesterol (TC), LDL, HDL and Triglycerides (TG) were compared with the CD4 count levels and with the stage of HIV infection.

Results: Total cholesterol and HDL did not show any significant correlation with CD4 count or with the stage of HIV. There was significant negative correlation between LDL and CD4 count as the Pearson’s correlation coefficient was -.201 (p value 0.04). The level of CD4 count of 373 had a sensitivity of 62% and specificity of 65% in predicting an abnormal high LDL level. There was significant positive correlation between triglycerides and CD4 count as the Pearson correlation coefficient was .202 (p value 0.004). The CD4 count of 479 and above had a sensitivity of 61% and specificity of 63% in predicting high triglycerides.

Conclusion: In treatment Naïve HIV patients, LDL cholesterol had negative correlation with the CD4 count whereas Triglycerides had positive correlation with the CD4 count.

Keywords: Dyslipidaemia, HIV, Treatment Naïve, Lipid profile, correlation,

Introduction

There are around 2.4 million Indians affected by HIV. There have been many studies that have looked at Dyslipidaemia in HIV patients on ART.¹ Many of the ART drugs especially Protease inhibitors are known to cause dyslipidaemia. With the longer lifespan of HIV individuals due to ART treatment, cardiovascular disease has become one of the most common noncommunicable disease that contributes to the morbidity and mortality in these individuals. Dyslipidaemia is an important factor in cardiovascular disorders. There are not many studies that have looked at this entity in treatment naïve HIV individuals in this part of the world. Among the few studies that have been done, some show high lipid values whereas some show low values.

Materials and Method

The main Aim of this study was to correlate the lipid profile with CD4 count in untreated HIV patients. The other objectives were to detect proportion of dyslipidemia in untreated HIV patients and to correlate the observed dyslipidemia with WHO defined stage of disease in untreated HIV patients. This was a cross-sectional descriptive study. The study was initiated after obtaining clearance from the institutional ethics committee. Informed consent was obtained from all the participants. The sample size when calculated for 95%
confidence level and 90% power came to 97. A total of 97 adult patients who were diagnosed to have HIV but not started on ART were included in this study.

**Exclusion Criteria:** People with uncontrolled diabetes (HbA1c > 8), on lipid lowering drugs, end stage liver and kidney disease, BMI < 15 and > 30, family history of familial hypercholesterolemia and already received ART were all excluded. The data collected included a detailed history and examination, co-morbidities, opportunistic infections, Blood investigations of CD4 count and fasting lipid profile were done. They were staged according to the WHO clinical stages for HIV.

**Statistics:** Data was analyzed using SPSSv11.5. Correlation between stages of HIV and lipid profile was analyzed by using Anova and p value <0.05 was considered as statistical significant. Correlation between CD4 count and lipid profile was analyzed by Pearson’s correlation coefficient and p value <0.05 was considered significant.

**Results**

In our study, most of the patients (59.79%) belonged to Category I of WHO Staging, 9.28% to Category II, 5.15% to Category III and 25.77% to Category IV.

**Total Cholesterol:** It was observed that 19.6% of the patients had high cholesterol. In patients with CD4 count less than 250 the mean total cholesterol was 177mg/dl and the mean total cholesterol in patients with CD4 count > 250 was 176mg/dl. The mean CD4 count in patients with normal total cholesterol was 461.50, and in patients with high total cholesterol was 382. The total cholesterol did not have statistically significant correlation with CD4 count as the Pearson coefficient was -.154 with a p value of 0.131. On applying the ANOVA it was noted that the total cholesterol did not have any significant correlation with the staging of HIV with a p value of 0.383.

**HDL:** In this study low HDL was found in 36.1% of the patients. The mean HDL was 45.5mg/dl in the patients with CD4 count <250, and the mean HDL in patients with CD4 count >250 was 42.5mg/dl. Mean CD4 count in people with normal HDL was 436 whereas the CD4 count in people with low HDL was 463.60. Both of these were not statistically significant. There was no significant correlation between HDL levels and stages of HIV disease either.

**LDL:** In this study LDL cholesterol was found to be higher in 40.2% of the patients. As seen in Table 1. The mean CD4 count in patients with normal LDL was 511, and mean CD4 count in high LDL group was 349 which was statistically significant. Pearson’s correlation was -.201 (p value 0.04) showing that there was significant negative correlation between LDL and CD4 count. When ROC curve was plotted, the level of CD4 count of 373 had a sensitivity of 62% and specificity of 65% in predicting an abnormal high LDL level. There was no significant correlation between LDL level and the stages of HIV.

**Triglycerides:** In our study 40.2% of patients had high triglycerides. In patients with CD4 counts less than 250, the mean triglyceride was 135mg/dl. In patients with CD4 counts more than 250 the mean triglyceride was 159mg/dl. As seen Table 2. The mean CD4 count in patients with normal triglyceride was 378.79 and was 546.10 in patients with high triglycerides. Pearson coefficient was .292 (p value 0.004) suggesting there was positive correlation between Triglyceride and CD4 count. When ROC curve was plotted, at the CD4 count of 479 and above the sensitivity and specificity of predicting high triglycerides was 61% and 63%.

**Discussion**

The total cholesterol did not show any significant correlation with either the CD4 count or with the staging of HIV in our study. Similar observations were made by Devanath A et al. Whereas, a study by Rose H et al. found that the total cholesterol levels were lower in treatment naïve HIV individuals. In our study there was no significant correlation of HDL level with either the CD4 count or with the stage of HIV disease. However in the study done by Devanath A et al. they found significant decrease in HDL levels, especially in stage 2 and 4 of HIV and also in people with CD4 count less than 500. In our study there was a significant negative correlation between LDL and CD4 count. Whereas, Tang AM et al. in their study found that the LDL levels were low as the CD4 counts dropped especially below a CD4 count of 400. In our study a significant number of patients had high triglyceride levels. Similar observations were found in a study by Adewole OO et al. In our study there was positive correlation between CD4 count and Triglyceride levels, especially above CD4 count of 479. Mondy K et al. in their study found that a high CD4 count was a good predictor of high Triglyceride. There was no correlation between Triglyceride levels and Stages of HIV disease. However in a study by L Khiangbe et al. Triglycerides were found higher in only later stages of HIV.

**Conclusion**

In treatment naïve HIV patients: LDL cholesterol showed negative correlation with the CD4 count. Triglycerides showed positive correlation with CD4 count. Total cholesterol and HDL did not show any correlation.

**Ethical Clearance:** Taken from the institutional local ethics committee before the start of the study.

Health Care Arrangement System for Doctor-Patient Communications

Angulakshmi M¹, Sudha Senthilkumar², Brindha K²
¹Assistant Professor (Senior Grade 2), ²Associate Professor, School of Information Technology and Engineering, Vellore Institute of Technology

ABSTRACT

The Doctor-Patient Communication System which deals with providing health care solutions to the patients. In this Application new feature is Patients can communicate doctor by using Text, Audio, and Video. Real time communication is new feature in this application by doctor can select communication type at time of doctor registration. Users can access medical tools (BMI, BMR, and HEART RISK) after login in to the Application. This is a secured and scalable application that hides all complexities from the patients (users). There is lot of methods to verify users and doctors by phone verification, email verification, background verification for doctors through third party agencies. users can search doctor by city and specialties then application list out doctors with their communication features based on user input and users can search medical store by entering city in input box then application will shows all stores of cities with maps. This project provides scalability, reliability and a high amount of security for the users and doctors which make the system very unique from other applications. Thus it is highly user friendly portal which helps the patients and doctors to communicate easily.

Keywords: BMI, BMR, Doctor-Patient Communication system, Email verification.

Introduction

There are many healthcare products available in market by which patient book appointment. the problem in all this products is that user cannot communicate with doctor[1].Main feature of this product is to provide best real time communication to patients in web. Users can select communication type (EMAIL, TEXT, AUDIO, VIDEO) based on their emergency. Moreover there are two ways for communicate provided in CALL DOCTOR.

- User can communicate through registration in CALL DOCTOR.
- User can also communicate without registration.

This is the new extraordinary feature by which client can impart to specialist without making his record. The record will be consequently made by CALLDOCTOR and the id and secret word will be sent to his/her enlisted email id. Utilizing these certifications, client can login into application[3].While first time login into application, clients and specialists email id and telephone number are confirmed through OTP and random secret key will sent to the mail of enlisted email. After the email and telephone number are checked, the client can login into application. When user wants communicate to doctor. We need a basic information is Name, Email Id, Problem description then based communication type amount is calculate when payment done by user through the PayPal payment gateway communication will be establish. To stop extortion specialists in application, different securities are given by which client can safely apply for convey to specialist. The specialist’s endorsements are confirmed by outsider foundation check groups. The proposed application is advanced on the basis of reliability, flexibility and security. The users can communicate to doctor after search doctors by city and specialty. The diagram shows flow of application.
Software Requirement Specifications

**Purpose:** This Software Requirements Specification (SRS) indicates the necessities of the call specialist which will be utilized by the client as a part of procedure getting treatment. This report will be utilized by the clients to guarantee all particulars are right and checked by the product specialist to outline the framework.

**Scope:** As rivalry has heightened and client needs have additionally expanded, so too have the difficulties confronted by numerous applications. The weight on edges has expanded, frequently determined by new market participants with lower cost bases, and the torrential slide of new directions and consistence appears to accumulate pace day by day. We can see long lines of patients in doctor’s facilities to get arrangement consistently. This line is the last aftereffect of the moderate preparing speed (Due to manual sections). In this way, a very intuitive and easy to use arrangement ought to be produced. With the execution of Call Doctor. When he is a Call specialist client, every one of the offices are associated under Call specialist. In this we are giving Audio, Video, Email and Text Consultations to the client. This anticipate is essentially in light of possibly building up an open source answer for every one of the clients to show signs of improvement treatment arrangement which would help the client with less push overhead.

BMI: Body Mass Index

BMR: Basal Metabolic Rate

User: The person who will be using the Application to get treatment.

**Proposed System:** In this application we are giving more offices to the client to get arrangement effortlessly by various meeting sorts, paying cash through web managing an account.

Our Product comprises for the most part of two sections i.e. Specialist and the Patient. The Patient would manage Medical apparatuses, demand for Appointment, and inside saving money capacities like booking arrangement. The booking arrangement would be only for the clients, who could take treatment from Doctors. Those two interface with a primary database server. The client interface is a standout amongst the most essential parts of any system since it decides how effectively you can make the project do what you need. An effective project with an ineffectively composed client interface has little esteem. In this we gave GUIs that utilization windows, symbols and pop-up menus have ended up standard on PCs and mobiles.

**Equipment Interfaces**

- 128MB or more RAM (256 prescribed)
- No less than 500 MB Hard circle space.

**Programming Interfaces**

- This item is produced chiefly utilizing open source innovations like apache, cakephp, and so on.
- Frontend: Ajax, JQuery, HTML, CSS, Bootstrap, CakePHP, JavaScript
- Backend: MySql
- Web Server: Apache
- Programming interface: Google Maps, WebRTC, Payment Gateway

**Correspondences Interfaces**

- Email, Text, Video, Audio, Appointment
Operations

- Counsels, Booking Appointment, Payment

Site adjustment necessities

- Needs to bootstrap and most recent form of program.

Product Functions

- Login System
- New Account Creation
- Search for specialists
- Administrator endorsement
- Administrator Removal
- Modify Appointment Rate
- Display Information
- Updating Personal Profile
- Change User Password
- Change Doctor Password
- View Doctor points of interest
- Request for Appointment
- Approve or cross out the solicitation
- Services-Mail, Voice Call, Video Call and Web Chat
- User evaluations for Doctor
- Track Clinics
- Online Medical Shop
- Logout System

Client Attributes

- IP address - The IP location of the client.
- Area - Where the client is physically found
- Profile fields - the fields of a client profile can be connected just to enlisted clients.
- Seek watchwords - the hunt catchphrases that the client has used to hunt down your site
- Gone to page - A page that was gone by the client
- Time of day - The time interim when the client has utilized your site

Constraints

- Enhancements to the security components may prompt execution overhead
- Recommended transmission capacity is 64 KBps
- Central Server ought to be all day, every day online

Assumptions and Dependencies: We have made the accompanying suspicions: The call specialist will be associated with the web amid the all day, every day hours of the day. The principle server could never go disconnected from the net.

Apportioning of Prerequisites: In future variant we need to add shopping office for clients to get pharmaceuticals. It will mostly comprise of the login screen which would request the username and secret key of the client or utilizing social logins. On fruitful confirmation, it would exchange the client to the client landing page. In the client landing page, there would be very much planned menus and submenus (and also catches) for performing a particular activity. On tapping on the fancied catch or menu thing, the client will be demonstrated the individual screens. The client would then enter the required information for handling and press the ‘Proceed or Done’ catch, after which the preparing would be done and the client would be come back to the client landing page. There would likewise be a sign out catch which would help the client to end his session and he will be exchanged back to the Login screen. It will fundamentally comprise of the login screen which would request the username and watchword of the Doctor. On fruitful check, it would exchange the client to the Doctor landing page. In the Doctor landing page, there would be all around planned menus and submenus (and in addition catches) for performing a particular activity. Specialist can redesign accessibility plan and can see his surveys given by the client. There would likewise be a sign out catch which would help the client to end his session and he will be exchanged back to the Login screen. This item utilizes a web association with interface with the fundamental database server. The Classes for the Call Doctor adequate for communicating the prerequisites are Consultation Types, Payment, Verification, and Booking Appointment. The most imperative component in the working of the entire venture is its Connectivity with the Server and the Mode of Connection\(^4\). In the event that the association is a 64 Kbps one then the execution of the Product would be greatly improved than that with a 10 Kbps association\(^5\).
Framework execution commonly benefits by irregular condition of client consideration and organization support\[6\]. Framework usage points of interest the client to impart and take up with various modules with more adaptability and security\[11][12\]. It covers the complexities from the clients and gives authentic client interface to basic section. Moreover it in like manner helps the client to clarify diverse inquiries related to their issue.

**CDRA Call Doctor Relevance Algorithm**

Call Doctor is on a stage to make mankind live more beneficial and longer. This starts with Doctor Search – our item that helps you locate the right specialist.

The Call Doctor Relevance Algorithm (CDRA\[7][8\]) is central to our search product and determines the order in which the search results are shown to each consumer for his/her specific query.

**How We Decide Relevance**

CDRA decisions are governed by a variety of parameters\[9][10\], some of which are detailed below.

1. **Location**: Since each listing on Call Doctor has been physically verified by trusted third party, we usually have the accurate location for each of them. When you put a search query, our system recognizes the city and assigns higher importance to give you choice, we also automatically show popular doctors in the neighboring area.

2. **Specialization**: We list doctors from over some recognized specialties and sub-specialties. These are matched with recognized specializations provided by governing bodies, again making sure that you see the specialists only relevant to your query.

3. **Appointment Experience**: This will measure by analyzing your consultation, availability of the Doctor, and of course, patient feedback.

4. **Patient Feedback**: We will consider patient feedback extremely seriously. Patients can provide feedback who already verified.

**Implementation**: This home page of application user can begin with search doctors here
**Email Conversation:** Here we showing doctor list with their available features. Available features list are showing in blue color and remaining are showing in grey color. After click on email conversation it going user basic data form. It will ask patient Name, Age, Problem type, problem description, occupation, weight, height, email. He/she can add previous medical history to form as images files. After click submit button it will check in db. if already register with email. It will redirect to payment gateway page otherwise it will ask some basic information (email, phone number). Account will be create automatically in background then it will redirect to payment page. After successful payment it will generate email and pdf file it send to respective email id. then after saw email by doctor. Doctor can direct reply to patient. This basic feature for general questions of patients. After click on booking appointment button. It renders timeslot layout of doctor at bottom of doctor record. It will shows all available times of doctors. When user picks timeslot from layout. It will redirect to confirmation page. Here it will asks name, age, appointment reason, email.

When click on submit button email is checking in users table in database then if it is exits redirect payment otherwise it will ask basic information for create account for transaction. After successful payment application creates appointment letter and it sends user email and doctor can see his appointments in his dash board.

![Fig. 3: Email conversation with doctor](image3)

![Fig. 4: Booking Appointment with doctor](image4)

**Booking Appointment:** Here we showing doctor list with their available features. Available features list are showing in blue color and remaining are showing in grey color. Based user emergency they selecting feature. Lets click on email Booking Appointment.

![Fig. 5: Appointment confirmation with doctor](image5)

**Conclusion & Future Work:** This paper is the Healthcare arrangement which helps the specialist and patient Real Time Communication. The framework is extremely secured than other accessible Health care arrangements. It incorporates more usefulness that are not accessible in any of the accessible medicinal services arrangements. Here the subtle elements of the specialist are exceedingly secured and it is checked physically by Product official. Accordingly there is zero chance that the points of interest of specialists are fake. Though there are some issues identified with execution speed as a portion of the work is completed physically, however it will be redressed in future. The task legitimizes itself on the premise of security and adaptability. In addition, the utilization of BOOTSTRAP makes the framework extremely responsive so that the perspective and appearance changes according to the screen size. The future extent of the framework is to make it completely programmed and to evacuate manual work. Likewise need to include new functionalities, for example, Face Recognition, Online Doctor Verification for more security and soundness of the framework.

Changing Trends of Color Application in Hospitals (Assessing the Impact of Hospitals’ Interior Color on Patients’ Well-being)

Sharma Rohita
Assistant Professor, Fine Arts Department SJFCA, Lovely Professional University, Jalandhar Punjab, India

ABSTRACT

Background: This paper is based on the comparative assessment of color application in old and new hospitals in India and its effect on the well-being of patients and professionals, and to examine how colors’ are being used in hospitals at present time.

Method: A qualitative study was conducted; the study includes three case studies comprising two hospitals from different places. The views of twenty patients are scrutinized regarding their preference of healing color scheme in hospitals.

Results: The importance of painting of walls adds not only the physical appearance to the constructed abode but it also helps waving psychological gesture of inhabitants and healing of patients in the hospitals. The study however shows that India has a growing trend of attractive colour application in the hospitals. The hospitals which used poor design have negative impact on physiological indicators of wellness however the hospitals which used a good colors design on its walls have effective healing of its patients.

Conclusion: After recognizing the importance of color application in hospitals the hospitals use to apply such colours that help in the healing of wellbeing. Constructed environment of a hospital undoubtedly needs such considerations in creating hospital’s visual healing environment by colors.

Keywords: Hospitals, Colors, Healing effects, Patients

Introduction

Colors are considered as universal non verbal language. People use colors’ in many ways in their life, such as to get aesthetic, inspirational, physiological, and other psychologically motivated energy from different shades. its impact may be differs at different stages.

In last fifteen years, a substantial number of research papers based on hospital’s color-scheme suggest that colors do influence on the psychology of the patient and triggers the healing of patients considerably. Therefore adopting the color pattern based upon what the researches have been carried out, many health institutions reported that a visual environment had produced improved faster recovery rates. As Harris et al. 2002 describe that there are three dimensions of the physical healthcare environment that can have impact on health and well being. If we consider patients’ point of view, we would certainly grade the interior design features most due to its direct linkages with patients’ immediate environment, and thus the color of the wall and roof draw more attention.

It has been emphasized through research that Poor wall design or color application in hospitals leads to such negative consequences on patients like Anxiety, Delirium, High Blood Pressure, and increased intake of painkiller drugs (12).

The colors of a building affect our behavior and mood. Color and lighting can have an impact on people’s perceptions and responses to the environment (2) and also affect patient’s recovery rates improving the quality and overall experience of patient, staff and visitors (9).
This paper however aims to study the impact of colors on patients’ sense of well being. It also brings forth a comparative assessment of color application in old and new hospitals in India in order to analyze the changing trends of color application in the interior and exterior of hospitals. It includes three case studies comprising two hospitals from Delhi and one from Saharanpur. In this innovative project, the views of twenty patients have been scrutinized regarding their preference of healing color-scheme in hospitals. The study intends to show the color’s influence on the health and well-being of patients and professionals, and to examine how colors are being used in hospitals at present time.

The history of color has its roots in ancient Egypt. Ancient Egyptians and ancient Greeks built healing temples of light and colors. The Egyptians were the first civilization to research color healing. They created “color halls” within their great temples, such as Karnack and Thebes, in which they explored the impact of color on an individual’s ability to heal. Healing is a survival mechanism and represents an attempt to maintain normal anatomical structure and function. Several chemical and natural ways are adopted for healing. One of the way recommends the use of colors as a healing tool, this techniques was in use from ancient times. The early beliefs behind the healing power of color were fairly simple. Colors were associated with disease because disease produced color. Pythagoras was a great philosopher around 500 BC he also believed to have used music, poetry and color to cure diseases. Use of color became deeply embedded in Chinese and Indian medicine. Throughout history, color has been assumed to have an effect on health. The Assyrians, Babylonians, and Egyptians all used forms of color and light therapies in healing.

Laboratory research studies have shown that color can have a direct effect on a person physically as well as mentally. It is not compulsory that if a person feels better or like a color, he would be able to use the same color when he fall ill. As a person who likes red or orange color to get energy but the same color can be harmful at the time of his sickness or his eyes would not be able to see these colors. So there is no absolute definition of psychological effects of colors on human being. Kurt Goldstein is a recognized Psycho-neurologist he wrote, “It is probably not a false statement if we say that specific color stimulation is accompanied by a specific response pattern in the entire organism”. His studies have documented the effects of specific colors on Individuals having certain diseases. Graham believes that the human response to color falls within six categories, which are shown in table 1.

During the past 30 years, there are very few studies that have been focused on how color affects patients in a hospital setting. However, 84 studies have examined how other environmental factors have been shown to impact well-being. The Center for Health Care Design stated that color is an important environmental feature in the design of hospitals that needs to be further explored. Although the human response to the application of color on walls within the interior hospital environment has not been thoroughly explored, the application of colored lights has been explored. Studies have been able to show that colored lights can have impacts on concentration, alertness, aggression, stress, and even dyslexia. The use of applying colored lights to relieve illness is known as chromo therapy.
The Purpose of Colors in Old Hospitals: Hospital is a complex institution and contains within itself many things. The architect has the task of designing a highly complex structure for a very complex organization but his design has to have sufficient clarity of form to be understood by all who use it. In addition he has to design individual territories, the departments for each of the groups whose successful interaction is the basis of the work of the hospital. It is same in the color scheme of hospitals. As it is concern that it is a public property and link to all kind of patient.

Prior to 1918 color scheme in hospitals was limited. Earlier the thinking was that the color should not be dirty soon, it should be for many years so they whitewashed walls above dado height and dark brown below. In the 1920s the introduction of washable paints did not produce variation in hospital colors but instead of whitewash white gloss paint was used and dado height some somber dirt concealing color a dark green or a brown. In 1930s all white became a vogue and in more progressive hospitals white tiled walls it dado height replaced the somber colors. But it was in some hospitals and mostly hospitals were using white with dark brown and dark green. But as the time beyond same new shades introduce in the market but technique is the same till today.

The operation theater was mostly in white paint as it has been thought that there should be full light in the room and white is a color which reflects the light.

The purpose of Color application in today’s Hospitals: The Apollo Indraprastha Hospital is a collaborative project of the renowned “Apollo hospitals” and the “Delhi Development Authority”. It spreads over 15 acres of prime land in South Delhi. It was completed in 1996 by Hafeez contractor. This is a hospital which fulfills the needs of the users and establishes an environment that is more human, pleasant and full of relaxation.

The hospitals of present time create a soothing and calming atmosphere by the use of bold, vigorous and animated colors and patterns, thereby establishing a cheerful environment and a feeling of a home away from home. The color scheme of hospital is cream, subtle orange & subtle brown is applied on the front façade that gives a very welcoming effect. All these colors convey solace, protection and warmth. Patients need this kind of environment for quick recovery. The external expression of the modern structure aims to break down the complexity normally inherent in such large institutional spaces. Externally, the simplistic geometry oriented form is an incredibly powerful expression of technologically advanced facility.

The second hospital is “Fortis Hospital Noida, India” designed by architect K C Kothari. This is a renowned hospital with compassionate feelings. The colors are soothing and full of healing fragrances. The lobby, corridor and waiting area are in light greenish yellow shades, which is the symbol of freshness, cooling, soothing youth, life and hope. The maternity ward is in the pinkish shade which reflects the feeling of happiness and delicacy of feminineness. The patient’s rooms are painted according to color therapy as the two walls in one color and the other two walls in another color scheme by mixing of lots of tints. All colors are looking very refreshing and soft. In some patients room lighting of different colors tries to change the atmosphere. Rooms are also decorated with the murals and beautiful curtain and bed sheets. The whole ambiences create a homely atmosphere feeling. There are some pictures of patient room showing the color of the walls.

Patients’ Opinions about the application of Colors in the Hospital: Patients willingly gave their opinions about the various colors applied in their rooms during their stay. Many of the male patients did not care for the color. They claimed that it made the room feel too dark. Some women really enjoyed the purple color. They said that it was very soft and made them feel comfortable. Overall, the opinions regarding the purple color varied with approximately an equal number of patients liking and disliking the color. The green color also produced various opinions. Some of the male patients claimed that they liked the color. They claimed that it probably wouldn’t be a color that they would put in their homes, but that they didn’t mind it in the hospital rooms. The majority of the women did not care for the green color. They stated that it reminded them of a “hospital green.” Upon investigation about what they believed a “hospital green” was, it was discovered that it referred to the color associated with a typical pair of scrubs. The patients’ opinions were very similar in regards to the orange color. The patients all claimed that they had noticed the color upon entering the room. Many said it was a surprise to see color on the wall. The patients felt that this color of orange brightened up the room and gave a welcome relief to the beige throughout the
majority of the hospital. Overall, more female patients than male patients enjoyed the purple color. The one main complaint was that it made the room feel dark. Regarding the green color, more male patients seemed to like, or at least not mind the color, than female patients. The female patients said the green color made the room feel too much like a hospital. Lastly, both the male and female patients enjoyed the orange color. Overall, the patients in the beige rooms appeared disappointed that their rooms did not contain colors on the wall.

**Conclusion**

The findings of the study are that all the colors have psychological effect good or bad. Sometimes which is good for someone at the same time it may be bad for others so it is not compulsory that every color has same affect on patients. As color red it is highly stimulating and exiting color and the pink is from the group of red which is cooling, pleasant and refreshing color on the other hand blue is so depressing if anybody looks continuously that colors more than 20 minutes it will be depressing, but mostly in the coronary and Intensive Care Unit (ICU) blue color is using it is planned as to avoid over stimulating or depressing effect from certain colors and lighting. Likewise in the psychiatric ward the light paint décor should be thoughtfully chosen to provide a desirable, therapeutic effect as these things may easily affect the mood and attitude of psychiatric patients.

The entrance of the hospital may be in welcoming colors. These colors play very vital role at the time of entrance in the hospitals. The lobby/corridor is the most important part of two contacts with hospital for a patient and visitor. It sets the tone for their visit. It is the place from where the people make their first opinion about the hospital. Many architects and experts say that the color chosen for the lobby should be calm, quiet, restful and dignified such as rose tones or pecan grey. Usually lobbies are always dark (without sun light) lots of tints can create light as well as lively. The color scheme of corridor walls should reflect light and create a cheerful atmosphere. Honey yellow, grey green and light cedar raised all some of the choices. Patients spend twenty four hours of the day in their room, for them the hospital is their temporary home. The taste of color scheme can be different from man to man. It can be according to age factor and sex factor as men, women child or old person. The most preferred colors for hospitals are melon grey dusty rose tone aqua pecan grey and honey lemon have been used with a great deal of success. The bright color like bright blue soft purple lavender tones bright yellow or strong should be avoided in patient’s room.

Now, the problem is that most of patients in the lying position tend to see more of the ceiling than any other place in the room. It is advisable that the ceiling should not be in white but in the same color as the side walls. Designers have invented to decorate the room with two complementary colors two walls in one color and the other two walls in one color. Operating and delivery room/surgery room/intensive care unit (ICU) etc., these rooms need maximum light, so these places should always be white and with a touch of the colors that would be restful to the eyes. A color that has been proved to be the ideal is little bit of grey-green. The kids section should be decorated in pink or blue or a combination of the two colors. Kids always get attracted to primary colors (R, B, Y, G). A small amount of these colors to be used in form of painting murals, having lamp, quilt, curtain, carpet etc.

Effects of Birth Weight on Cord Blood Thyroid Stimulating Hormone

Krishnaji L.Garud1, Ajit V. Sontakke2, Anuja A. Pawar3, Dhirajkumar Mane4

1Assistant Professor, 2Professor and HOD, Department of Biochemistry, Krishna Institute of Medical Sciences, Karad, Maharashtra (India), 3Tutor, Department of Biochemistry, Krishna Institute of Medical Sciences, Karad, Maharashtra (India), 4Statistician, Directorate of Research, Krishna Institute of Medical Sciences “Deemed To Be University”, Karad, Maharashtra (India)

ABSTRACT

Background: There is a possibility of an association between birth weight and Cord blood Thyroid Stimulating Hormone (CbTSH) level. Congenital hypothyroidism (CH) is most common preventable cause of mental retardation in neonates. CbTSH level is a well known screening tool for CH.

Materials & Method: Cross sectional study was designed. A total of 462 neonates were studied for TSH levels by Chemi-Luminescence Immuno Assay (CLIA) technique.

Statistical Analysis: Comparison among birth weight outcome was done by using unpaired t-test. Pearson correlation was calculated to find out significance within groups of birth weight.

Results: In this study the mean birth weight (grams) of the neonates was 2810.62 S.D). 365 neonates had birth weight more than 2500 g and 97 neonates had low birth weight of less than 2500g. There was no significance between birth weight and CBSh.

Conclusion: Birth weight does not affect TSH values of term neonates.

Keywords: Cord blood thyroid stimulating hormone, congenital hypothyroidism, newborn screening

Introduction

In most cases, Congenital Hypothyroidism (CH) is permanent and results from an abnormality in thyroid gland development (dysgenesis or agenesis) or a defect in thyroid hormone synthesis. Less commonly, the hypothyroidism is transient which can be caused by transplacental passage of maternal medication, maternal blocking antibodies, or iodine deficiency. In rare cases, CH may result from a pituitary or hypothalamic abnormality.1

The fetus is entirely dependent on maternal thyroid hormone (TH) during the first half of the pregnancy. Despite the critical importance of TH on multiple organs, especially brain, most infants with CH appear normal at birth.2-3 The previous study was conducted to find the effect of mode of delivery on cord blood Thyroid Stimulating Hormone (TSH).4 Also there is no consensus on effect of birth weight on TSH values in neonates. High incidence of raised TSH has been documented in lower birth weight infants,5,6 whereas some studies document that birth weight has no effect on neonatal TSH levels.7,8,9 Many factors like mode of delivery, caesarean section vs. vaginal delivery, gestational age, birth weight and the day of sample collection may influence TSH levels in a screening program. The data on the possible influence of these factors on neonatal TSH is scarce and is with conflicting results. We undertook this study to find the effect of birth weight on neonatal TSH.

Material and Method

Study Design: A cross-sectional study of neonates born in KIMS Hospital Karad from Dec 2013 to February 2015 was done. Blood samples were collected from
the cord at birth and 24 hours sample collected from peripheral veins while observing all safety and aseptic precautions. Blood samples were analyzed for TSH using Lumax, based on Chemi-Luminescence Immuno Assay (CLIA) technique. A total of 462 samples were collected and all were included in the study. Descriptive statistics with respect to TSH values and birth weight were studied. Neonates were divided into groups on the basis of their birth weight. The relationship of TSH with birth weight was evaluated statistically.

**Statistical Methods & Analysis**

Descriptive statistical analysis was carried out in this study. Results on continuous measurements are presented as Mean SD (Min- Max) and results on categorical measurements are presented in Number (%). Significance was assessed at 5 % level of significance. Student t test (two tailed, independent) was used to find the significance of study parameters on continuous scale between two groups (Inter group analysis) on metric parameters. SPSS (Statistical Pacakages for Social Sciences) 20.0 software was used for the data and Ms-Excel have been used to generate graphs, tables etc.

**Results**

In this study 462 neonates were included based on inclusion and exclusion criteria. Samples for TSH were collected at birth. In our study the mean birth weight (grams) of the neonates was 2810.62 S.D). 365 neonates had birth weight more than 2500 g and 97 neonates had low birth weight of less than 2500g (Table 1 and Graph 1)

The correlation between birth weight and TSH was positive, but it was not statistically significant. (Table 2)

**Discussion**

There is no consensus on effect of birth weight on TSH values in neonates. Julie Herbstaman et al in a cross sectional study of 300 newborns observed that infants who were born with low birth weight (<2500 g) had higher cord blood TSH. Similar results were found by JE Frank et al 11 and Aidan McEIduff et al 3 in two separate studies. TSH was measured from blood samples collected on filter paper and they found values correlates inversely with birth weight.

However Chan LS et al 11 in their study to investigate the effect of various perinatal factors on the cord blood TSH found an independent positive association between cord blood TSH values and birth weight.

In our study the mean birth weight (grams) of the neonates was 2810.62 S.D). 365 neonates had birth
weight more than 2500 g and 97 neonates had low birth weight of less than 2500g (Table 1)

The mean TSH value in neonates with low birth weight (<2500 grams) was 5.35±1.82 (mean±S.D) and mean TSH value in neonates normal with birth weight 5.60 value is 1.354 (Table 1) which is not statistically significant indicating that birth weight has no effect on measured TSH values in samples collected.

Also we did a correlation test (Table 2) between birth weight and TSH values and there was no correlation found between birth weight and TSH values (Pearson correlation coefficient of -0.020).

This is in agreement with results found in three separate studies done by Fuse Y et al 6, R C Franklin et al 9 and Susan Uhrmann et al 10.

Fuse et al in their study measured cord blood TSH, FT4 and FT3 from 124 healthy term neonates and found that birth weight had no effect on cord serum TSH and free thyroid hormone levels.6

R C Franklin et al in their study measured T4,T3,FT4,RT3,TBG and TSH concentrations in 229 healthy term neonates at birth and at 5,10 and 15 day of age using radio immunoassay. They concluded that birth weight should be taken into account when interpreting neonatal T4 values however it need not be considered when TSH is measured for screening neonates for CH.

Similar results were found by Susan Uhrmann et al in their study of low birth weight infants in which they found high incidence of transient hypothyroxinemia with serum low T4 values but normal TSH values in low birth weight infants. Serum TSH values were normal in all low birth weight neonates. In our study, birth weight had no effect on measured TSH values in samples collected from neonates from the cord at birth.

Conclusion

There is no significant correlation between birth weight & TSH values in term neonates. So, it can be concluded that birth weight does not affect TSH values of term neonates.

Nutritional Status and Anaemic Assessment of Female Stone Crushers of Manipur Valley

Ibohal Laishram Meitei¹, Soibam Jibonkumar Singh²
¹Research Scholar (UGC-SRF), ²Professor, Department of Anthropology, Manipur University, Canchipur, Imphal, Manipur

ABSTRACT

Life Style, Standard of Living and Occupational Environment may directly influence the condition of one’s health condition. The present study aims to determine the health status of female stone crushers of Manipur valley. A total of 290 subjects from different 46 stone crushing units are considered for the present study. They were interviewed and followed by measurement of haemoglobin level, body-height, body-weight, total body water percent, waist girth and hip girth. Mean values of Haemoglobin level, Body Mass Index, Total Body Water% Waist Hip Ratio are found to be 11.66 ± 5.12 g/dl, 22 ± 3.33 kg/m², 57.57 ± 3.14% and 0.85 ± 0.06 respectively. Deviation from the normal range is revealed in some of the parameters resulting to a negative impact on their health status. Uses of International BMI Cut off in place of Asian Cut off by NFHS-4 can lead to inaccurate nutritional status. Higher content of total body water can be a contributing factor for normal as well as overweight category of BMI leading to false health condition. Higher prevalence of high waist ratio and higher prevalence of anaemia as observed in the present study can be considered as an indicator for the presence of public health problem in the studied population.

Keywords: Body Mass Index, Haemoglobin, Total Body Water, Waist Hip Ratio.

Introduction

Environment Protection Agency (EPA) report-2001 affirms that hundreds of stone crushing units are crushing stones round the clock in the vicinities of various cities¹. Different types of health hazardous fumes, gases and heavy dust concentration are released in the working environment of such crushing units that may affect the health of workers. Poor economic condition of workers compelled themselves to work there even though they know some ill effects of the occupation. Our societies doesn’t pay any attention towards them and seems to be neglected. It’s high time to pay our attention towards this deprived section. Keeping this in view, the present study aims to examine the prevalence of body mass index, waist hip ratio, haemoglobin status for assessing the health status of female stone crushers of Manipur valley.

Materials and Method

All the procedures of data collection and data analysis employed in the present study are carried out only after getting approval of “Ethical Clearance” from Ethical Clearance Committee, Manipur University. Details of inclusion-exclusion criteria, sample size, parameters considered, and relevant reference values are discussed below.

Inclusion Criteria:

a. Subjects must be an 18 years and above females only.
b. Must have at least a minimum exposure of 6 months in the working environment.
c. Those who are currently working and willingly give the informed consent.
d. Subject must be able to provide their actual Date of Birth from reliable documents like Horoscope, birth certificate, etc.
Exclusion Criteria:

a. Those female stone crushers who fail to fulfill any of the inclusion criteria as mentioned above will be excluded from the present study.

b. Workers having particular diseases like TB, HIV-AIDS, Hepatitis-B, etc. will be excluded.

c. Alcohol users.

d. Pregnant Women.

Sample size and Parameters considered: For a better reliable outcome, the present study attempted to reach all the available female stone crushers of Manipur valley by collecting relevant data from all the stone crushing units of Manipur valley. However, after going through the above inclusion and exclusion criteria, a total of 290 subjects from different 46 stone crushing units are found to be eligible for the present study. They were interviewed and followed by measurement of haemoglobin level, body-height, body-weight, waist girth and hip girth. Haemoglobin level, BMI, Waist-Hip Ratio and Total Body water are collected for assessing the health status. Height, weight, haemoglobin estimation, waist circumference and hip circumference are measured by using the most accepted standard techniques specified by Weiner and Lourie (1969)2 and WHO 3.

Reference Values:

a. Body Mass Index (BMI): Clinical classification of obesity is established on Body Mass Index (BMI). Therefore, the values of BMI were calculated for each subject using the following formula,

\[ \text{BMI} = \frac{\text{Weight (Kg)}}{\text{Height}^2 (m)} \]

The World Health Organization (WHO) has prescribed different BMI cut off for Asian people from the International Classification of BMI. National Family Health Survey-4 2015-2016, govt. of India use WHO’s international classification of BMI, even though the people of India are Asians. However, both Asian and International cut off of BMI will be worked out in the present study and a comparison will made a comparison with national and state prevalence reported by National Family Health Survey-4. The cut off values of BMI for International and Asian population are shown in the table 1 and 2 along with the prevalence.

b. Anaemia:

Definition of Anaemia: Female whose haemoglobin is less than 12 g/dl (Hb < 12g/dl). Haemoglobin, the respiratory pigment of human beings present in the blood carries oxygen from the respiratory organ, lungs to the rest of the body tissues for metabolic functioning. Deficiency of human respiratory pigment leads to a condition known as anaemia characterized by quick tiredness, weakness, shortness of breath, loss of consciousness, or increased thirst, etc7.

c. Waist-Hip-Ratio (WHR): According to the World Health Organization (WHO), a healthy WHR is 0.9 or less in men and 0.85 or less for women. In both men and women, a WHR of 1.0 or higher increases the risk for heart disease and other conditions that are linked to being overweight9,10. A chart of waist-hip ratio showing different categories of health risk with respect to sex for Asian population prescribed by WHO is given in table 4 along with the result.

d. Total Body Water: Total body water percentage (TBW %) is the total amount of fluid in the body expressed as a percentage of our total body weight10. Our body needs water for a wide variety of reasons including transportation of nutrients around the body and for waste products carried out of the body in the form of urine10. It also allows organs to function, regulates body temperature, aids digestion and helps our muscles to contract and relax. Being well hydrated will help concentration levels, performance and general wellbeing8. Standard TBW % of adult males and females are given in table 3 with the observed frequency. The average TBW % ranges for a healthy adult are, Females – 45 to 60% and Males – 50 to 65%.

</table>
It is evident that 71.72% of the population are nutritionally fit whereas remaining 28.27% are unfit. Only 7.93% of the population are chronic energy deficient, 17.93% and 2.41% are overweight and obese. Overweight and obese altogether constitute 20.34%. Observed range of BMI is 16.2 - 35 kg/m² with a mean value of 22 ± 3.33 kg/m² (Table 1).

Table 2: BMI Status as per Asian Cut off

</tr>
</tbody>
</table>

On applying the BMI cut off for Asians, the prevalence of normal category decreases from 71.72% (International Cut off) to 50.34 % (Asian cut off) whereas the prevalence of overweight and obese collectively increases from 20.23 % to 42.41%. In Asian cut off overweight alone accounts 31.37% (17.93 % international cut off) and obese shows 10.34 % (2.41 % international cut off) as observed in Table 1 and Table 2.

Table 3: Total Body Water Status

<td>High</td>
<td>100</td>
<td>34.48%</td>
</tr>
</tbody>
</table>

Table 3 reveals the Total Body Water percentage of the workers. It is observed that 64.48 % of the studied population possess healthy water content i.e. most of the workers are free from dehydration. The overall average Total Body Water % content of the workers is 57.57 ± 3.14 which is in the normal level of 45-60%. The minimum and maximum observed Total Body Water percentage of the workers is 43.64 and 80.46 respectively. It is revealed that 34.34% of the population belongs to high water content category and only 1.03 % of the population are found to be associated with dehydration (low total body water content).

Table 4: Waist Hip Ratio Status

</tbody>
</table>
Table 5 reveals that majority of this working population i.e. 53.44% are found to be Anemic of which 35.17% falls under Mild anaemia, 15.51% and 2.75% belong to Moderate and Marked anaemia respectively. Observed range of Hb level is 6 – 15 g/dl with a mean value of 11.66 ± 5.12 g/dl.

Discussions

The prevalence of overweight and obese among the Indian women is reported as 20.7% (NFHS-4, 2015-16) whereas 26% of prevalence is observed in Manipur12. According to NFHS-4 report 35.35% of the Indian females of 15-49 years are below normal category of BMI < 18.5 kg/m².

Here, in this present study, the high prevalence of normal BMI category, 71.72% (Table 1), International cut off and 50.34 % in Table 2, Asian cut off, are observed which seems to reflect that the health condition of female stone crushers of Manipur is healthy. In case of overweight and obese, the present study shows 20.34 % prevalence which is almost equalled to the national (20.7%, NFHS-4) but less than state level (26.00 %, NFHS-4) prevalence12.

But on applying the BMI cut off for Asians, the prevalence of overweight and obese collectively increases from 20.23 % to 42.41%. In Asian cut off overweight alone accounts 31.37% (17.93 % international cut off) and obese shows 10.34 % (2.41 % international cut off) as observed in Table 1 and Table 2. The proportion of overweight and obese in the present study comprising 41.41% is quite large. If the NFHS-4 were supposed to use the Asian BMI cut off, obviously, there will be higher prevalence of overweight and obese among Indians.

The prevalence rate as per two different cut off greatly varied and we know that WHO recommends to use separate lower BMI cut off for Asian population for better nutritional assessment from 2004 onwards. But the National Family Heath Survey -4, 2015-2016 remained used the international BMI cut off although the Indians belongs to Asian population which can lead to an inaccurate results at the time of nutritional assessment.

The higher prevalence of normal BMI category BMI (71.72% or 50.34 %) observed in the present study seems to reflect that the health condition of the majority of the female stone crushers of Manipur is healthy.

However, on crossed examining with other relevant parameters, 34.48% of the population has high total body water percent (Table 3). Total body water percentage (TBW %) is the total amount of fluid in the body expressed as a percentage of our total body weight10. It is one of the major component of fat free mass that affects the total body weight. Therefore, higher content of total body water may obviously be the reason which help those comparatively lower weight individuals get sifted to normal BMI status and normal BMI status individuals to overweight category. In short, higher content of total body water can be a contributing factor for normal as well as overweight category of BMI leading to give false health condition.

Therefore, in assessing the health status of a population, it is necessary to consider other biological parameters like Total Body Water (TBW), Waist Hip Ratio (WHR), Haemoglobin (Hb) content, etc.

Though general obesity reveals high prevalence of normal BMI (71.72% or 50.34 %), Waist Hip Ratio shows contrasting findings displaying 52.75% of the population in the high risk category (Table 4) which is also higher than prevalence of overweight and obese (20.34 % or 41.41 %). From the above discussion and many reported literatures, it is evident that BMI can lead to inaccurate health risk category and there are also various literatures reporting that WHR predicts better than BMI13, 14. Therefore, it is better to interpret the health status on the basis of WHR estimation, revealing that majority of the workers, 52.75 % are likely to have moderate risk to high risk of developing heart disease, high blood pressure, stroke and diabetes. Hence, the health status of the population is not healthy. It is also reflected by the higher prevalence of anaemia (53.44% in Table 5, ≥ 40.0 %). According to WHO global database on Anaemia, Worldwide prevalence of Anaemia 1993–2005, prevalence of anaemia ≥ 40.0 % is considered as severe public health problem8. Hence, the high prevalence of Anaemia observed in the present study indicates the presence of severe public health problem in the studied population and the majority of the workers comprising 53.44% are likely to face quick tiredness, weakness, shortness of breath, loss of consciousness, or increased thirst.
Conclusion

Uses of International BMI Cut off in place of Asian Cut off by NFHS-4 can lead to inaccurate nutritional status. Higher content of total body water can be a contributing factor for normal as well as overweight category of BMI leading to give false health condition. Higher prevalence of high waist ratio and higher prevalence anaemia as observed in the present study can be considered as an indicator for the presence of public health problem in the studied population. Further in-depth study is necessary to find out the underlying factors for the high prevalence of anaemia.

Interplay between Attitude and Purchase Intention: An Empirical Survey on Over-the-Counter (OTC) Drugs Consumer Behaviour

Manu Sehgal¹, Amit Mittal²
¹Research Scholar, ²Professor, Chitkara Business School, Chitkara University, Punjab, India

ABSTRACT

Over-the-Counter drugs (OTC) segment is rapidly growing within the pharmaceutical sector in India. In 2009, the Indian OTC market exhibited a growth of US$1.8 billion however as per the estimates by PwC India is likely to witness a growth of US$11 billion - a CAGR of 18% by 2020. As OTCs are self-medicated it is essential to evaluate the stimulus that triggers a particular behaviour¹. In recent past, India has also witnessed an increase in OTC drugs purchase of health supplements². An empirical survey was conducted based on a validated questionnaire to assess the consumer behavioural intention towards OTC purchase. The survey involved assessment of key variables like “perceived behavioural control, attitude and subjective norm as per the theory of planned behaviour (TPB)”³. As per the survey the TPB model exhibited a variation of 39.4% in the purchase intention, wherein attitude appeared as the most important driver of intention closely followed by perceived behavioural control. Findings indicate that the TPB based model appropriately explains the interplay between the key variables influencing purchase intention of OTC drug products. Attitude was attributed to having the strongest influence ($β = 0.401, p = 0.000$) on intention among the variables studied. Perceived behavioural control was identified as the next most important variable.

Keywords: Consumer Behaviour, India, OTC, Theory of Planned Behaviour, Demographic

Introduction

The OTC segment is rapidly growing within the pharmaceutical sector in India. The Indian OTC market exhibited a growth of US$1.8 billion in 2009 and as per the estimates by PwC it is likely to grow up to US$11 billion - a CAGR of 18% by 2020. The primary reasons for this growth are believed to be the availability of broader distribution channels, direct consumer advertising, low price controls and increased customer consciousness⁵. OTC products contributed an approximately 4.2 billion USD of revenue in the year 2015⁶.

OTC products in India include:
- Pain Rubs like: Moov, Iodex balm, Zandu balm & Amrutanjan balm
- Pain killers & cold preparations like: Dcold, Disprin & Crocin
- Antacids like: Eno & Pudin Hara
- Skin therapies like: Itch Guard & Krack cream
- Cough drops like Strepsils & Honitus
- Ayurvedic products like chawanprash from Dabur, Zandu and Patanjali.

Consumer behaviour of OTC purchase: Loudon et al.⁷ defines “consumer behaviour as the decision process and physical activity individuals engage in when evaluating, acquiring, using or disposing of goods and services.” p.5 On the other hand attitude is defined differently per different concepts and “one conception is that attitude is how positive or negative, favorable or unfavorable, or pro or con a person feels toward an object.” (7:p.422-423)
Research Methodology

An empirical survey was conducted on a sample of 466, among the residents of three residential societies in the town of Zirakpur, Mohali, Punjab. The survey was conducted based on a validated questionnaire that was based on the recommended approach per “Theory of Planned Behaviour questionnaire”.

Questions were designed to cover three key components of the model i.e. attitude (behavioural norm), subjective norm (normative beliefs) and the perceived behavioural control (control beliefs).

Tested Hypotheses

Attitude
H1. The more positive an individual’s attitude towards an OTC product, greater is the intention to purchase the product.

Subjective Norm
H2. The more positive the perception of friends, family and healthcare professionals towards an OTC product, greater is the intention to purchase the product.

Perceived Behavioural Control
H3. Perceived behavioural control over using OTC products has a positive influence on the intention to purchase OTC products.

Attitude, subjective norm and PBC
H4. Attitude, subjective norm and PBC are equally important determinants of behavioural intention

Review of Literature and Theoretical Framework

A literature review was performed to identify evidence around OTC purchase behaviour and consumer attitude towards OTC drugs/products. The below section highlights evidence from individual studies identified in the review.

In UK a survey involving 118 consumers concluded that determinants like direct experience with the brand, price tolerance, brand trust and the subjective opinion of others triggered repeat purchase. Price sensitivity was considered as the primary factor in determining an individual’s attitude and intention to repurchase from a brand.

Nguyen investigated the drivers of repeat use of OTC anthelmintic medications to predict the behaviour and intention of mothers of young school going children in Vietnam. The study showcased attitude as the most important antecedent of behaviour and intention.

A study in Dutch population reported that the OTC users were quite confident of their skills to buy OTC products. People aged above 65 and less educated had significantly less confidence than younger and more educated people.

In a Polish study, the authors evaluated three major determinants: demographic determinants including age, gender, place of residence, number of children; socioeconomic determinants including salary compensation, pension benefits, status of employment, level of education, and behavioural determinants including assessment of health condition, patient’s behaviour in time of sickness, discomfort or pain, frequency of medical visits, consultation with doctor/pharmacist on first time use, reading the leaflet and views on the possibility of harmfulness. The study found all the determinants to be statistically significant except the place of residence, level of education and employment status.

A study in Hungary reported that 44% of the OTC consumers consulted a pharmacist while 21.7% made decisions based on information from the internet, parents, friends, or advertisements. Among factors affecting medication purchase, intended effect was the most important factor.

A survey by Ladha in West Vancouver, Canada concluded that with direct consumer advertising, awareness in the minds of consumers would be vital. Price and subjective norms were considered important drivers of OTC purchase behaviours.

A cross-sectional study involving 600 urban families living in the city of Jammu, concluded that the key factors influencing self-medication were patient satisfaction with the healthcare provider, cost of drugs, educational status, socioeconomic factors, gender and age.

A survey based on structured interviews was conducted across shopping centers in Belfast, Northern Ireland. The questionnaire assessed attitude towards community pharmacy, attitude towards the use of OTC medicine, views on OTC medicines in terms of safety, potency and effectiveness and knowledge around improper use. Thirty-two percent participants reported purchasing non-prescription medicines. Females and people below the age of 60 bought OTC medicines more
frequently. Pharmacists were considered as the most frequently influencing choice of OTC 15.

Another study reported that between the year 2001 and 2009, there was an increase in consumer awareness around potential risks consideration prior to OTC analgesic consumption. It was also concluded that healthcare professionals play an important role in the decision making 16.

A review on self-medication in India concluded that information from the pharmacist, family product leaflets friends and advertisements were key sources of information for OTC products 17.

Another study in the US compared the differences in behaviour and involvement of older people compared to young adults while making decisions around OTC purchase. Older people were reported to be more involved and were more frequently seeking help from the pharmacist in the decisions making process. Also label, package, and availability of advice from the pharmacist were vital to the elderly. However, safety of the OTC product, strength, and price were considered extremely significant by both older people and young adults 18.

A cross-sectional study conducted in India on 180 consumers from the rural and urban field practice areas of A. C. S. Medical College in Thiruvallur concluded that 51.7% of the population utilized self-medication. Moreover, cold was the most frequently reported underlying indication and financial constraints was a potential reason for self-medication 19.

Another cross-sectional study assessed the use of OTC products in Mandya city, India involving 800 participants. 77.50% urban and 68.25% rural population reported the use of OTC drugs. Aches and pain were the most frequently reported indication for the use of OTC products followed by fever 20.

The evidence thus indicated that OTC purchase was dictated by factors ranging from personal, societal to economic and the interplay could vary based on the differences on these perspectives.

**Theoretical Framework**

The evidence identified through keyword search was then utilized to perform bibliographic search of the included evidence. The identified evidence substantiated TRA and the TPB frameworks either being directly explored or pertinent variables assessed indirectly.

According to TRA (theory of reasoned action), a framework developed by Ajzen and Fishbein 21, the most important element of behaviour is intention. TRA hypothesized that the intention to execute a behaviour was a combination of attitude towards performing the behaviour and subjective norm 22,21.

Ajzen 23 suggested that “TRA was extended to include a measure of perceived behavioural control to form TPB”. Perceived Behavioural Control (PBC) is held to influence both intention and behaviour. Addition of PBC was expected to allow prediction of behaviours that were not under complete voluntary control.

The theory of planned behaviour hypothesizes three independent determinants of intention. The first is the attitude i.e. favorable or unfavorable assessment of the behaviour in question. The second predictor is subjective norm i.e. the social perception around the behaviour. The third antecedent is the degree of perceived behavioural control 23.

**Results of the Survey**

Among the surveyed population of 466, 81.8% of the population was in the age group of 18 to 50 years. Approximately 65.7% of the surveyed population were males while 34.3% were females. A majority of the respondents i.e. 42.9% held a bachelor’s degree while 37.8% held a post graduate degree. About 35.8% of the respondents reported an annual income between 5 to 10 lakhs followed by 28.1% with a household income of up to 2.5 lakhs.

Multiple regression analysis was used to test all four hypotheses. Three independent variables exhibited influence on the dependent variable, intention at the 0.05 significance level, supporting the tested hypotheses.

**Table 1: Correlations**

<table>

Cramer’s $V = .198$, $p = .000$

Similar statistics when applied to gender demonstrated no association with intention while income was observed to have strong association with intention.

Survey respondents in the income group of 5 to 10 lakhs had the highest likelihood of OTC purchase at 39.6% followed by those in the income group of 0 to 2.5 lakhs at 35.4% and 18.8% for those in the income group of 2.5 to 5 lakhs. Only 6.3% of those with income more than 10 Lakhs reported likelihood of OTC purchase.

Major Findings & Conclusion

In the present study the TPB model explained for 39.4% of variance in intention which is in line with 39.0% of the variance in intention from a meta-analysis of 195 studies by Armitage et al.$^{24}$, 40.9% of the variance in intention is in cohesion to another meta-analysis of 56 studies by Godin et al.$^{25}$ and 32.3% variance that reported in the study by Nguyen$^9$. 
The results from the survey conclude that attitude is the most important predictor of intention compared to other variables of the TPB model i.e. subjective norm and perceived behavioural control. The same is aligned to the results reported in the literature involving application of the TPB model.

**Research Implications and Expected Contributions:**
TPB in practice offers interventions to influence the behaviour in question. The findings imply interventions that could be applied by OTC drug and marketing companies to explore this growing market.

**Key Interventions Include:**

**Altering attitude:** Based on the findings, attitude comes out as the most important determinant of behavioural intention. The manufacturers and marketing companies should thus focus on effective messaging around the product and advantages of its use to build positive attitude.

**PBC based Interventions:** Control beliefs emerge from the beliefs around feeling equipped to make the decision around OTC purchase. This involves both knowledge of & access to the product through appropriate channels.

**Limitations of the Current Evidence Synthesis:**
The current survey was conducted only in the town of Zirakpur and broadly covered only the educated and urban population. Furthermore, due to the nature of the study only the intention to purchase OTC products was assessed as opposed to the actual behaviour which would have required us to revisit the surveyed population.

**Conflict of Interest:** This survey was conducted as part of doctoral research. Among the authors, Manu Sehgal is an employee of a private healthcare consultancy company and Dr. Amit Mittal is Professor at Chitkara business school, Chitkara University, Punjab.

**Source of Funding:** No private or government organization funded this consumer survey.

**Ethical Clearance:** This is a consumer behaviour survey and was conducted by directly asking consumers to fill the questionnaire. The participation in the survey was voluntary and the survey did not involve administration of any intervention or enrollment of any hospital or healthcare institute.

Assessing Patients’ Satisfaction for Polyclinics, Empanelled Hospitals and Drug Supply Chain Management in Punjab-India

Parminder Pal Singh
Lovely Professional University, Phagwara, Punjab, India

ABSTRACT

Purpose: The study aims to focus on impact of drug supply chain management and treatment provided in empanelled hospitals and polyclinics of Public healthcare systems. These issues are of tremendous significance to developed as well as to not so developed countries. India being a highly populated and tropical country has its own inherited challenges in healthcare systems. The Public sector is one of the largest standing employers of human resources, regularly contribute sizeable numbers of highly motivated and disciplined peoplepost-retirement to society. The present study endeavoured to find the gaps and suggested remedial measures.

Methodology: Descriptive research is carried out by giving questionnaires to the patients visiting empanelled hospitals and polyclinics by having personal interviews with respondents about their opinion on drug supply and treatment being provided in empanelled hospitals and polyclinics. Responses of 100 patients were recorded for the 22 questions. The patients were selected randomly from major cities as well as from smaller cities. SPSS and MS Excel were used to analyse the data for this cross-sectional study.

Findings: It is observed that there exist significant differences in expectations and observations in some of the factors for which patients were not satisfied like maintenance of medical records, delivery of medical services at promised time, provisions of medicines, post-treatment and services, inadequacy of modern test equipments and doing right things very first time. However, their expectations exceeded in solving individual issues, paying adequate individual attentions and convenient working hours of empanelled hospitals.

Keywords: Drug Supply chain, Expectations, Hospitals, Policy, Satisfaction.

Introduction

An effective Drug supply management is to ensure that products or drugs should be available and supplied accordingly to the customers at the right time and the right place when they are required, in the correct amount for proper utilization. The effective management will be helpful not just for the organization but also for the consumers. The main purpose of this study to identify the factors influencing customer satisfaction with regards to treatment in polyclinics and empanelled hospital and to understand the respondent’s opinion on drug supply management,

Patient expectations have been recognized as a factor for patient satisfaction in medical consultations. Although various studies explored the relationship between patient expectations and patient satisfaction in developed countries, there is a lack of research evidence in public healthcare systems in developing countries like India where the meeting of patient expectations could relate to satisfaction.

There is a significant difference between pre consultation expectation and post-consultation expectation. Post consultation expectation impacts patient satisfaction. Health care service providers should emphasize the actual experience of consultation. The responses from patients of central government health schemesand Ex-servicemen health schemes have been analyzed in this research paper.

Drug Supply Management: Many countries have recognized the need for sound Drug Supply Management systems. Drug Supply Management divided into four stages are as follows:

- Selection: The careful choice of medicines, diagnostics and other items according to need and
to national or international guidelines e.g., of the World Health Organization.

- **Procurement:** Purchasing the necessary items, of proven quality, in appropriate quantities and at the best possible price.

- **Distribution:** Bringing the goods through continuous and secure systems to the point of use.

- **Rational Use:** Prescribing and using the items to obtain the best health outcomes.

**Patient Expectations and Satisfaction:** Patients have specific expectations when visiting the health service providers, which usually reflects concerns and problems they want the health service providers to address during the consultation. It might also include their desires for specific services. Interestingly, most of the patients’ expectations are mainly focused on the health care provider’s ability to show interest like, listening to patients’ concerns, which is reported to be the general nature of expectation.

Healthcare organizations have endorsed patient experience measurement as an important component of a data-driven, comprehensive model for improving service and creating long-term value. Health care organizations use patient experience data to identify best practices and define process improvement opportunities.

There is uncertainty about the usefulness of ‘after-visit’ patient experience surveys to measure satisfaction and identify opportunities to improve service or health care quality. However, in-visit surveys would provide immediate feedback which allows patients to more accurately recall the experience they had during their appointment, whereas, post-treatment responses are more pronounced in the analysis of satisfaction.

The aim of this observational study was to compare patient satisfaction among those who rated the patient expectations at the conclusion of their outpatient appointment, to that among those who rated the patient experience after their outpatient treatment.

**Challenges:** Outdated national guidelines for testing, diagnosis and treatment that are inconsistent with recent international guidelines and best practices often cause health care managers to make unwise choices. Lack of accurate data and information about the quantity and quality of the products required also undermines their work.

1. There are three main challenges to rational procurement are poor quantification, corrupt procurement and tender practices and procedures, and poor financial management and payment methods. Inaccurate quantification is common in the absence of reliable data on illness and usage.

2. The distribution includes storage and inventory management, physical distribution and tracking of products. The distribution is frequently handicapped by inadequate infrastructure, excessive centralization, lack of effective management information system, shortage of warehouses, transport vehicles, poor roads and clinics without secure storage space.

3. Lack of accurate data to bridge the gap between patients expectations and experience in respect of healthcare services of public hospitals.

**Literature Review**

Public sector healthcare systems design and institutionalized to provide primary, secondary and tertiary health facilities to the organized sector employees. Most of the organizations have their own polyclinics and general hospitals to provide primary and secondary healthcare facilities, in case they are unable to provide requisite advanced treatment they opt for private empanelled hospitals.

The related literature has been reviewed to analyse the issues which have not been addressed hitherto. Brown, Franco, Rafel and Hatzell described nine quality dimensions of health service delivery that lead to patient satisfaction. These dimensions are effectiveness, efficiency, technical competence, interpersonal relations, and access to service, safety, continuity, and physical aspect of health care. The purpose of the study by Brody et al., was to regulate the relation between patient satisfaction with their physician. The study has been analyzed before and after the care encounter. It was noticed the patients with less work and treatment were highly satisfied with their physicians. This study by Hall and Dorman reviewed the relationship between patient satisfaction and patient characteristics using quantitative meta-analytic techniques. Authors claimed that patient satisfaction is associated with age, education, social and marital status. Fitzpatrick suggested that some sound measures of patient satisfaction are psychometric.
Williams and Calnan\(^5\) cited the satisfaction rating to general aspects of the healthcare experience. Specific aspects of the experience were problematic because of the personal nature of their physician. The researchers also found overall satisfaction over professional competence and patient health care provider relationship. Williams and Calnan\(^5\) observed that the most consumers give high ratings to general aspects of the health care experience and noticed that certain level of satisfaction with health care are relevant and regardless of the type of medical settings. Guyatt et al.,\(^6\) found with the help of the scale that most of the patients are satisfied with the health care providers who give full attention to the patients and their families. Kane et al.,\(^7\) revealed that patients had more positive health care experience with their treatment and follow-up in the hospitals. Sitzia and Wood \(^8\) found that patient’s satisfaction could be evaluated by measuring the degree to which patients care possesses certain attributes and the patient’s evaluation of those attributes. They suggested that satisfaction must be interpreted in the context as compared to the measure of the quality of care. According to Li et al.,\(^9\) SCM practices impact not only overall organizational performance but also the competitive advantage of an organization to achieve its market-oriented goals as well as its financial goals for drug supply management amongst others. Shah et al. \(^10\) used a field approach of study to examine how a particular health care supply chain was able to increase performance by decreasing service time and increasing service quality in a decentralized network of healthcare providers. There are studies which have linked organisational performance to leadership. Soodan and Pandey \(^11\) attributed the success of organisation to the style of leadership style being adopted. Gupta and Rokade\(^12\) found that it is very important for the hospital to keep an eye on their services as such it is an essential part of their growth to know which area needs improvement and whether patients are satisfied or not. The main motive should be on attracting new customers and retain their existing customers for the long run.

**Research Methodology**

The patients were selected randomly from major cities as well as from smaller cities. Descriptive research is carried out by giving mailing questionnaires to the patients visiting the empanelled hospitals and polyclinics by having personal interviews with some of the respondents about their opinion on drug supply and treatment. Responses of 100 patients were recorded for the 22 questions based on Likert Scale. The numbers of males were 60 and females were 40 in the total sample size. Data analysis and interpretation of results were carried out through suitable parametric and non-parametric tests with the help of SPSS and MS Excel. Gap Analysis, Cross-tabulation, chi-square test and ANOVA were used for further interpretation.

**Hypotheses:** Three hypotheses have been framed to find the relationship between adequate quality of drugs and satisfaction level of patients for polyclinics and empanelled hospitals.

- \(H_01\): There is no significant difference for expected and observed responses in providing treatment to the patient in polyclinics and empanelled hospitals.
- \(H_02\): Infrastructure of polyclinics and empanelled hospitals does not have negative impact on customer satisfaction.
- \(H_03\): The expectations and observations have no relation for patient satisfaction in culture of hospitals and drug supply management.

**Analysis of Data:** All the 22 questions of questionnaire were divided broadly into three segments, viz., drug supply management, satisfaction level in polyclinics, general hospitals of the organisations and empanelled hospitals. It is evident from the table below that there was maximum variation in drug supply management for expectations and observations followed by satisfaction levels in general hospitals.

**Source:** Compiled data from respondents treated in general and empanelled hospitals.

It is established that there is a strong and positive correlation in expectations and observations. The F test of ANOVA also indicates that the null hypothesis of no relation between expectations and observations to be rejected. However, only four questions related to treatment in polyclinics, adequacy of staff and drug supplies in polyclinics observations have exceeded the expectations, two related to differential treatments in general hospitals for serving and retired patients and delivery of medicines within promised time frame have expectations equal to observations. 14 questions related treatment at empanelled hospital, infrastructure of polyclinics and quantity/quality of medicines respondents have more expectations than observations.

Results and Discussion

The responses of 100 patients were analyzed for important issues like drug supply chain management, infrastructure, organization culture and behaviour of medical professionals towards the patients. The results of the analysis indicate that patients are highly satisfied and agreed with the following issues like When a patient has a problem, general hospitals/clinics show a sincere interest in solving it. Patients of general hospitals/clinics feel safe in dealing with the general hospital/clinic. Patients are empowered to select the hospital for their treatment out of listed empanelled hospitals. Empanelled hospitals have operating hours convenient to all their patients.

However, they are rather discontented with the issues like General hospitals/clinics do not insist on error-free records and they are not providing their services at the
time they promise to do so. Empanelled hospitals do not have adequate modern diagnostic equipment and they are not getting things right the first time. Chi-square tests were applied to find the difference in perceptions of males and females for important aspects of hypothesis testing. It indicates that the null hypothesis for a significant difference in infrastructure, quality of drugs, organization culture and services provided before and after the treatment at polyclinics/empanelled hospitals be rejected. It also indicates that both males and females have similar responses to the above questions.

Significance and Implication of Research: This study will assist the administration to take corrective steps to reduce the gap between expectations and realities of the treatment as well as administrative aspects of the healthcare systems. This first-hand information will definitely go a long way to improvements in the behavior of the administrators and medical staff towards the patients. In case hospitals are lacking in basic facilities and infrastructure then their administration will be intimated for corrective actions. The results indicate that patients are not too happy with the services provided by the empanelled hospitals vis-à-vis General hospitals/polyclinics. Patients desired medical staff should be increased in polyclinics.

The quantity of the medicines should be increased as it is difficult for the aged patients to visit polyclinics. There should be a provision to procure medicines from the local market in case of emergency and expenses can be reimbursed at a later stage. The patients are satisfied for the option to choose an empanelled hospital out of the recommended pool of hospitals. The medicines for the first month should be provided by empanelled hospitals and later on patients can get these medicines from polyclinics of their organisations. The after services of treatment and infrastructure need to be improved.

Conclusion

The public health schemes were launched with the aim to provide quality health care to public servants, pensioners and their dependents through a network of general hospitals/polyclinics. Private empanelled and Government hospitals are spread across the country. The schemes are structured to provide cashless treatment, as far as possible, for the beneficiaries. All out efforts have been made by the public hospitals to cater for the needs of the servicemen and their dependents. Continuous improvements and developments have been taking place to ensure maximum satisfaction of the patients. The present study is therefore useful to gauge gaps in in patient satisfaction which will assist in further improvements in healthcare systems in the country. The research results can help the governing bodies to select the appropriate time limit for effective service delivery of healthcare to the patients.

Ethical Clearance: Present study is restricted to analysis of satisfaction level in patients and therefore doesn’t involve any medical trial on humans. Necessary approval was taken from Institutional Review Board (IRB) for this study in accordance with the guidelines laid down by COPE.

Source of Funding: The study received no financial support for research, authorship and/or publication of this article.

Conflict of Interests: Author declare that there is no conflict of interest.

Study of Prevalence of Peripheral Neuropathy in Newly Diagnosed Type 2 Diabetic Patients in and around Mallareddy College, TS

Visala V. Nanduri  
Assistant Professor, Department of General Medicine, Mallareddy Medical College for Women (MRMCW), Jeedimetla, Hyderabad, Telangana

ABSTRACT

Background: Diabetic peripheral neuropathy (DPN) predisposes to foot ulceration and gangrene. It has been reported that DPN is lower in Indians relative to Caucasians. Studies among recent onset patients with type 2 diabetes mellitus (T2DM) are very few. We studied the prevalence and risk factors of DPN in patients with newly diagnosed T2DM.

Materials and Method: We prospectively studied 80 consecutive patients over age 30 with a duration of diabetes ≤1 year. All underwent a clinical and biochemical evaluation and were screened for DPN using TCSS scale (Toronto clinical scoring system) and Leeds Assessment of Neuropathic Symptoms and Signs (LANSS) pain scale.

Results: The cases had a mean age of 60.28 years and duration of symptoms of DM is <1 year prior to presentation. The overall prevalence of DPN was 12.5%. The prevalence of DPN showed an increasing trend with FbS (trend chi-square= 3.517, \( P = 0.0304 \)). A logistic regression analysis showed that DPN was independently associated with Fasting Blood Sugar (\( P = 0.0304 \)), Body mass index (\( P = 0.0389 \)), HbA1c (\( P = 0.0451 \)), family history (\( P = 0.0426 \)) and physical activity (\( P = 0.0219 \)) but not with age, sex and education.

Conclusions: Our study showed high prevalence of PN in recently diagnosed patients with T2DM, which was independently associated with age and duration of symptoms of diabetes prior to the diagnosis. FBS, HbA1c, BMI, were found to be risk factors for prevalence of Diabetic Neuropathy.

Keywords: Diabetic Peripheral Neuropathy, Newly Diagnosed, Type 2 Diabetes Mellitus.

Introduction

India has one of the highest prevalence of type 2 diabetes mellitus (T2DM) in the world.\(^1\) It is estimated that by the year 2030 there are are will be nearly 80 million Indians with T2DM in the country.\(^2\)\(^3\) The disease constitutes a substantial burden for both the patient and health care system, mainly due to macrovascular and microvascular complications.\(^1\)\(^2\) In contrast to patients in industrialized countries, Indians with T2DM have an earlier age at onset of the disease and fewer resources for achieving optimal metabolic control, potentially predisposing higher prevalence of complications.\(^4\)\(^5\)\(^6\)

The prevalence of diabetic peripheral neuropathy (DPN) varies greatly in different studies, ranging from 8% to 59%\(^7\)\(^8\)\(^9\)\(^10\). DPN significantly increases the risk of complications such as foot infections, deformities, gangrene, and amputations.\(^11\) In India, the adverse effects of peripheral neuropathy (PN) are compounded by poor foot hygiene, improper foot wear, and frequent bare foot walking. In such circumstances, complications
of foot infections and gangrene are a common cause of hospital admissions.\cite{1},\cite{12}

T2DM is characterized by a long asymptomatic phase (ranging from 4 to 7 years) between the actual onset of hyperglycemia and clinical diagnosis which may explain the relatively high prevalence of microvascular complications in newly diagnosed patients with T2DM.\cite{13} The prevalence of DPN at diagnosis of type 2 DM ranges from 10% to 48%, depending upon the population studied and method used to evaluate neuropathy.\cite{14},\cite{15},\cite{16}

In view of the poor awareness and lack of regular screening programs, the initial presentation to the physician is frequently delayed. This may predispose to an increased rate of microvascular complications at onset. Ethnic differences in the prevalence of various diabetes-related complications have also been documented.\cite{17}

There is a paucity of reports on DPN in Indians. In a study comparing European and south Asian subjects with T2DM in United Kingdom, the prevalence was lower in the latter. However, in surveys in Indian patients, the prevalence has ranged from 26% to 31%.\cite{18},\cite{19} In these studies, no controls were studied. Since PN is present in a significant proportion of healthy individuals, especially among the elderly, this fact needs to be taken into account before ascribing the PN to hyperglycemia.\cite{11},\cite{20},\cite{21}

Its end-stage complications such as foot ulceration and amputation are associated with substantial health care costs, socioeconomic consequences including loss of work time and reduced quality of life.\cite{22}

### Patients and Methods

**Patients and Controls:** Over a period of 6 months (January 2016 and June 2016), we studied 80 consecutive patients with newly diagnosed T2DM. Inclusion criteria included age ≥35 years, Patients willing to co-operate, Patients detected with Type 2 DM recently (within 1 YEAR) and Patients with FBS- > 120 mg/dl, HbA1c- > 6.5%. Patients diagnosed with DM for more than 1 year, Patients with preexisting complication like Diabetic foot, Patients with Type 1 DM, Patients with Gestational Diabetes Mellitus, patients with acute illness or chronic diseases such as leprosy, those with disability and patients taking medications known to impair nerve function were excluded from the study. The protocol was approved by the institutional ethics committee. Informed written consent was obtained from all subjects.

Screening for peripheral neuropathy and case definition of diabetic neuropathy

a. Tests were performed in a random sequence among different patients. Patients were screened for DPN using TCSS scale (Toronto clinical scoring system). This scale was used to assess for the presence of painful Peripheral Neuropathy. In short, for TCSS, symptoms like pain, tingling, numbness, weakness, ataxia, upper limb symptoms as symptom score, knee reflex and ankle reflex as reflex score and pin prick, temperature, light touch, vibration sense, position sense as sensory score were taken into account. Scoring was based on symptoms, reflexes, sensory tests. Depending upon the abnormalities, a point of 0 or 1 was given. Score of 0-5= no peripheral neuropathy; 6-8= mild PN; 9-11= moderate PN; 12-19= severe. The TCSS have been previously been validated against electro-diagnostic studies.\cite{24}

b. Leeds Assessment of Neuropathic Symptoms and Signs (LANSS) pain scale was used to assess the severity and pain score of the subjects. This pain scale can help to determine whether the nerves that are carrying the pain signals are working normally or not. Scoring was given. Total score (maximum 24) If score < 12, neuropathic mechanisms are unlikely to be contributing to the patient’s pain and If score ≥ 12, neuropathic mechanisms are likely to be contributing to the patient’s pain.\cite{25}

### Statistics

Continuous data have been expressed as mean ± SD and 95% confidence interval (CI) were determined for the variables. The Student’s t-test was used for comparison of continuous variables if found to be normally distributed while chi-square test was used to compare categorical variables. Variables associated with PN were tested using univariate logistic regression analysis. Variables shown to have a significant association by this analysis were tested by multivariate logistic regression to determine the variables independently associated with PN. A P value <0.05 was considered significant. Statistical analyses were performed using the SPSS software package (version 15.0; SPSS Inc., Chicago, IL, USA).
Results and Discussion

85.1% of the patients agreed to participate in the study when informed about the purpose and importance of the study.

Table 1 shows, on recruitment; the patients newly detected with DM belonged to age group above 60. HbA1c % of most of the patients on recruitment was above 10%. FBS levels of most patients were less than 200 mg/dl. PLBS of most of the patients was seen to be higher than 250 mg/dl. RBS of most of the patients was seen to be above 180mg/dl.

We detected a high frequency of DPN in newly diagnosed patients with T2DM. DPN was independently associated with increasing age and duration of symptoms of diabetes prior to diagnosis. In various Caucasian populations, the prevalence of DPN in newly diagnosed T2DM varies widely from 10% to 48%. This may be due to different methodologies employed for detection of neuropathy as well as variability in patient ages and time elapsed before diagnosis. However, ethnic differences in DPN may also be relevant.[17] Interestingly, it has been previously reported that both DPN and foot ulcers are lower in Indians compared with European Caucasians.

We detected a high frequency of DPN in newly diagnosed patients with T2DM. The prevalence of newly diagnosed patients was 19.5% and 27.8% in those with known diabetes.[18] However, the frequency of DPN in the subjects without diabetes was not studied.

Prevalence of mild neuropathy was found to be 15%, moderate Neuropathy was found to be 8.75% and severe Neuropathy was found to be 6.25% based on the TCSS and LANSS criteria (Fig 1). High FBS (>200mg/dl), HbA1c (>10%), BMI (>30 kg/m²), were found to be risk factors for prevalence of Diabetic Neuropathy.

Since PN is found in a proportion of healthy individuals, especially in the elderly, comparison with a matched control group is essential. We noted PN in 30% of age- and sex-matched control subjects, which increased with advancing age. This fact should be taken into account.

Monofilament sensation is a measure of protective sensations in the foot and is strongly associated with risk of foot ulceration.[28] The prevalence of impaired monofilament sensation was 6%, considerably lower than that of DPN. This low frequency may be reflective of the fact that the 10-g (5.07) monofilament testing is appropriate for the clinical assessment of risk for foot ulceration[28] but not a sensitive means to detect prevalence of neuropathy. In the latter case, a monofilament of 1g or less may be more appropriate.[29]

Previous studies have identified several risk factors for DPN such as age, poor glycemic control, increasing duration of diabetes, gender, height, body mass index, retinopathy, hypertension, smoking, and alcohol consumption.[14][15][16][18] In the current study, FBS, HbA1c, BMI, family history and physical activity were significant risk factors for Diabetic Peripheral Neuropathy. The prevalence of DPN showed an increasing trend with FBS (trend chi-square= 3.517, P= 0.0304). A logistic regression analysis showed that DPN was independently associated with Fasting Blood Sugar (P = 0.0304), Body mass index (P= 0.0389), HbA1c (P = 0.0451), family history (P= 0.0426) and physical activity (P= 0.0219) (Table 2). Since elderly patients have other risk factors for foot ulcerations, such as vision abnormalities and vascular involvement, neuropathy screening assumes an even greater importance in this age group.

The strength of our study is that it was a prospective design; patient evaluation was done by a single physician, and the use of both qualitative and quantitative mode of assessment of neuropathy. It has a few limitations; it was clinic based and may not reflect the actual prevalence of DPN in the community. We did not investigate metabolic causes of PN other than diabetes.

Summary and Conclusion

In summary, we detected a high prevalence of PN in recently diagnosed patients with T2DM. The neuropathy was independently associated with age and duration of symptoms of diabetes prior to the diagnosis. Screening for DPN using simple clinical examination is cost-effective means to prevent foot ulceration and infections in Indian patients with T2DM.

Study of Different Clinical Spectrum of Hypothyroidism in Telangana Population

Vishal Nanduri
Assistant Professor, Department of General Medicine, Mallareddy medical college for women, Jeedimetla, Quthbullapur, Hydarabad, Telangana

ABSTRACT

85 patients (63 females and 22 males) aged between 20 to 50 year were selected for study. The clinical manifestation were, 22(25.8%) had weight gain, 7(8.23%) had fatigue, 5(5.88%) had body pain, 4(4.7%) had loss of appetite, 6(7.05) had neck swelling, 3(3.52%) had constipation, 5(5.88%) had tingling sensation of feet, 3(3.52%) had hair fall, 4(4.70%) had increased somnolence, 5(5.88%) had puppy face 7(8.23%) had dyspnea, 4(4.70%) had cold intolerance, 6(7.05%) had depression. The manifestations related gynaecology were, 11(17.4%) had primary infertility, 18(28.5%) had secondary infertility, 13(20.6%) had DUB, 5(7.93%) had fibroid uterus 12(19%) had PID, 4(6.34%) had utero-vaginal prolapsed. The TSH levels were. 69(81%) patients had 4.2-99 (µiu/ml) 16(18.8%) had > 10 (µiu/ml). This pragmatic study of different clinical spectrum will be quite helpful to physician endocrinologist and Gynaecologist. Because hypothyroid is common and under diagnosed.

Keywords: TSH = Thyroid stimulating Hormone, DUB = Dysfunctional uterine Bleeding. PID= pelvic Inflammatory Disease. Telangana

Introduction

Hypothyroidism as a clinical syndrome was described for the first time in London in 1870. It was named myxedema. In 1888 it was widely accepted that cretinism myxedema, post thyroidectomy changes were loss of TSH function of the body.

Hypothyroidism is characterized by underactive thyroid gland where there is reduced synthesis and secretion of thyroid hormones by the gland. The prevalence of hypothyroidism between 8-12% population and the palpable goiter was observed in south Indian population was about 12%, signs and symptoms of the hypothyroidism helps in early diagnosis of the disease. Hypothyroidism has wide clinical spectrum because it involved multi organ dysfunction. Although oral iodine and iodized salt will be effective strategy to prevent iodine deficiency and hypothyroidism. Hashimoto’s Thyroiditis is the commonest cause of hypothyroidism in places where the iodine intake is adequate. The diagnosis and treatment of hypothyroidism is very often considered to be simple when clinical features are established with the estimation of TSH (thyroid stimulating Hormone) but due to multi factorial symptoms like depression infertility, PID, will be have differential diagnostic values hence attempt was made to study the every clinical spectrum in both sexes of different age groups.

Material and Method

Out of 85 patients 63 females and 22 males aged between 20-50 years. Who were regularly visiting Mallareddy college for women Jeedimetla, Quthbullapur, Hyderabad- 500055. (Telangana) selected for study.

Majority of the patients belonged to middle socioeconomic status every patients history was recorded, All the necessary investigation were carried
out Blood Exam included RbS ESR TC DC CBC, and TSH, (Thyroid stimulating Hormonal assay)

The patients detected as Malignancy of thyroid, and HIV patients were excluded from the study.

The ratio of female and male patients was 2:1.

The patients having similar signs and symptoms were segregated with percentage. The duration of study was about 4 years.

**Observation and Results**

Table-1 clinical manifestation of hypothyroid patients 22(25.8%) had body weight gain, 7(8.23%) had fatigue, 5(5.88%) 4(4.70%) had loss of appetite, 6(7.05%) had neck swelling 3(3.52%) had constipation 5(5.88%) had tingling sensation of feet 3(3.52%) had hair fall, 4(4.70%) had dry skin, 4(4.70%) had increased somnolence, 5(5.88%) had puffy face, 7(8.23%) had dyspnea 4(4.70%) had cold intolerance, 6(7.05%) had depression (or mood disorders)

**Discussion**

The present study of different clinical spectrum of hypothyroidism in Telangana population. The clinical manifestation were, 22(25.8%) had weight gain 7(8.23%) had fatigue 5(5.88%) had body pain, 4(4.70%) had loss of appetite 6(7.05%) had neck swelling, 3(3.52%) had constipation 5(5.88%) had tingling sensation of feet, 3(3.52%) had hair fall, 4(4.70%) had dry skin, 4(4.70%) had increased somnolence, 5(5.88%) had puffy face, 7(8.23%) had dyspnea 4(4.70%) had cold intolerance, 6(7.05%) had depression. (Table-1) The manifestations of Gynecology were 11(17.4%) had primary infertility, 18(28.5%) had secondary infertility, 13(20.6%) had DUB 5(7.93%) had fibroid uterus, 12(19%) had PID, 4(6.34%) had utero-vaginal prolapsed (Table-2) the TSH levels were, 69(81.1%) had 4.2 to 9.9(µiu/ml). 16(18.8%) had > 10(µiu/ml) (Table-3). These findings were more or less in agreement with previous studies$^{(5)(6)(7)}$. 
As hypothyroidism has multiple clinical manifestation hence to establish the diagnose biochemical tests should be routine to confirm the hypothyroidism.\(^{(8)}\) It was also reported that incidence of spontaneous hypothyroidism observed in 3.5/1000 people/year in females and 0.6/1000/year in males.\(^{(9)}\) Moreover hypothyroidism mainly implicated in broad spectrum of reproductive manifestations ranging from menstrual irregularities to pregnancy loss infertility, DUB, PID,\(^{(10)}\) Apart from this depression cretinism, increased somnolence puffy face, weight gain hoarseness of voice like presentations of hypothyroidism leads to social with draw and inferiority in the patients suffering with hypothyroidism. Hence hypothyroidism is not only a clinical problem but social problem too, especially observed in the adults, who has to lead the family and society as well.

**Summary and Conclusion**

The study of different clinical spectrum of hypothyroidism will be useful to physician, endocrinologist, Gynecologist. To treat such patients with proper diagnose and treatment, but this study demands further genetic, his to-pathological, biochemical, nutritional, hormonal study because exact mechanism, quantum of secretion of TSH hormone is still un-clear.

ABSTRACT

Objective: To isolate and identify pathogenic bacteria present on the serving cutlery items in restaurants and food joints in and around a medical college premises. To create awareness about the hygienic practices among food handlers.

Method: A cross sectional study. Collected 100 samples from restaurants and food joints in and around a medical college premises. Sterile swabs moistened with sterile saline was used to collect samples which were then streaked on MacConkey’s agar and incubated overnight at 37°C. The colonies were identified by standard methods.

Flyers regarding the importance of hygienic practices was distributed to the food handlers as a step to create awareness among them.

The statistical method applied was convenient sampling method and the data was analysed in the table form.

Results: In total sample of 100, 33% of the samples were found to have bacteria. The samples from the food joints had slightly higher number of bacteria compared to the samples collected from restaurants. The data collected showed highest number of Klebsiella sp. (4%) followed by Citrobacter (3%) in the samples collected from restaurants. Citrobacter (10%) and Staphylococcus aureus (4%) were seen in the samples collected from food joints. Escherichia coli was identified from one of the samples collected from restaurants.

Conclusion: Pathogenic organisms were found in the serving cutleries, screening the cutleries periodically can reduce the spread of food associated infection. Further study is needed to confirm the findings.

Keywords: Food handlers, Cutleries, Klebsiella species, Staphylococcus aureus

Introduction

Food is the prime necessity of life, and in recent times, food businesses have become widespread, in response to the changing life style and food consumption of people [1]. The importance of eating safe food containing optimal quantities of nutritions is a major precondition for good health and is now a days widely recognized[2]. There is also an awareness of using naturally produced antimicrobial agents like bacteriocin as preservatives in food[3].

Food contaminated by microorganism is of major health issue worldwide. Contamination with pathogenic organism can occur due to unhygienic practices within food processing environment, thereby making food risky, in terms of safety of the consumers[4]. The number of factors which contribute to food contamination are storage room, equipment, utensils, knives, wooden boards, the tables and other surfaces which come in contact with food, the food ingredients, water, air, cutlery, serving dishes used in food preparation and service. The source of infection for food borne disease which is acquired in hotels and restaurants is mainly through contaminated dishes and other kitchen equipments[5].

Email: shobha.kl@manipal.edu
Research on the significance of bacterial contamination started four decades ago. In early studies, it was observed that uncooked material was the major source of contamination in kitchen. Foodborne diseases remain a global challenge with higher rates of incidence in the developing nations [6].

Studies have been done to determine the effect of cross contamination of microorganism via chopping board, cutlery, and hands on the prepared meal ready to eat [7,8,9,10]. The presence of Escherichia coli (E. coli) is considered as an indicator of faecal contamination, which in addition, might contain pathogenic parasites, bacteria or viruses [11]. E. coli lives in the enteric tract of humans. E. coli infection can lead to food borne diseases which ranges from bloody diarrhoea to haemorrhagic colitis and haemolytic uremic syndrome [12]. Studies have indicated that the organism can survive for long time on stainless steel surface and domestic plastic cutting boards. Contamination of these surfaces may cause infection [13]. Bacteria can be present in large numbers on the surface of the equipments which look sparkling clean in the kitchen [14].

Food safety has to be guaranteed to prevent food poisoning. Wholesomeness of the food product has to be maintained through all stages of processing, until it is served. Hence, it is important to make sure dishes, spoons and cutlery are kept clean [15].

This study determined the bacterial profile in plates, spoons, forks, knife and cups used in restaurants and food joints in and around a medical college premises and also to create awareness about the hygienic practices among food handlers.

**Materials and Method**

**Sample Area:** The study sites were various restaurants and food joints located in and around a medical college premises.

**Sample Size:** This cross sectional study was conducted to know about the presence of pathogenic bacteria in serving cutleries. A total of 100 samples was collected from plates, spoons, forks, knives and drinking cups.

Five (5) samples were collected from each of the ten (10) restaurants and food joints were taken and all the samples were labelled properly. These restaurants and food joints were popular among students in terms of availability and affordable cost of food.

**Sample Collection:** Sterile swabs moistened with sterile saline was used to collect samples. The sample was collected by rolling the moistened swab over the various parts of cutleries. Precaution was taken to collect the sample in a sterile environment. The container was sealed with adhesive tape and labeled after placing the swab inside it.

**Inoculation of the Culture Media:** The samples were transported to the laboratory and it was then streaked on MacConkey’s agar and incubated overnight at 37°C.

**Identification of the Isolates**

**Gram Staining:** Based on Gram reaction bacteria isolated were grouped into Gram positive and Gram negative.

**Biochemical Identification:** After performing the Gram staining of the isolates, the colonies were also subjected to various biochemical tests for the identification of bacteria isolated. The colonies were identified by standard methods.

Biochemical test employed were: coagulase test, oxidase test, catalase test, indole test, citrate utilization test, urease test, motility test and triple sugar iron test

**Statistical Analysis**

The statistical method applied was convenient sampling method and the data was analysed in a tabular form.

Flyers regarding the importance of hygienic practices was distributed to the food handlers as a step to create awareness among them.

**Findings**

In total sample of 100, 33% of the samples were found to have bacteria.

The samples from the food joints had slightly higher (17) number of bacteria compared to the samples collected from restaurants (16).

The data collected showed highest number of Klebsiella sp. and Staphylococcus epidermidis (8%) followed by Citrobacter sp. (6%) in the samples collected from restaurants (Figure 1).
E. coli was identified from one of the cup samples collected from restaurants. Staphylococcus aureus was isolated from spoon and knife from different restaurant. (Table 1)

Staph. aureus (Staphylococcus aureus), Staph. epidermidis (Staphylococcus epidermidis), E. coli (Escherichia coli), No growth (-)

Citrobacter sp. (20%), Staphylococcus aureus (8%) and Klebsiella sp. (6%) were seen in the samples collected from food joints. (Figure 2).
Staphylococcus aureus was isolated from spoon, fork, knife and plate from different food joints (Table 1).

When compared between the different serving cutleries from restaurants and food joints, spoons had the highest number of bacteria isolated (Figure 3).

![Figure 2: Percentage of Pathogenic Bacteria Found in Serving Cutleries from Food Joints](image)

![Figure 3: Bacteria Found in Serving Cutleries from Restaurants and Food Joints](image)

**Discussion**

There has been increased number of food borne disease outbreak in recent years. The potential causes for these outbreaks include cross contamination, improper storage temperature, inadequate thermal treatment, poor hygiene conditions of processing facilities and contaminated food contact surfaces [16, 17].

The presence of Staphylococcus aureus which is a normal flora of skin and nose is mainly due to human contact and it suggests poor hygiene practices of the operators [18, 19].

The presence of these organisms on crockery and cutleries will create health hazard when they are ingested, or when they come in contact with the human skin. Maori L et al [5] also had isolated these organisms from crockery and cutlery. In our study also we had isolated the organisms. Orogu et al [4] study showed ranges of the bacterial densities found in spoons, knives and forks. Our study also was in concordance with the above.

It is necessary that foods must be free from contaminations to the possible extent. The presence of pathogenic Escherichia coli, Staphylococcus aureus strains indicates a potential health risk, as they are and have been implicated in food borne diseases [20, 21]. By good hygiene practices like Good Manufacturing Practices (GMP) and Hazard Analysis Critical Control Point (HACCP) application in the chain of food production and processing we can prevent food borne illness. It is necessary that the food handlers/food vendors
must be educated about the food safety practices. A close stringent supervision should be carried out by authorities to prevent contamination of food\textsuperscript{[22, 23]}.

**Conclusion**

Since pathogenic organisms were found in the serving cutleries, screening the cutleries periodically can reduce the spread of food associated infections. Further study is needed to confirm the findings.

Screening of Methicillin Resistant *Staphylococcus Aureus* Carriers among Food Handlers

Shobha K. L.¹, Amita Shobha Rao¹, Ullas Kamath², Thivyashini A/P B. Rajenthiran³, Ee Hui Yin³, Lim Yu Ern³, Quek Chia Wei³

¹Dept of Microbiology, ²Dept of Biochemistry, ³MBBS Students, Melaka Manipal Medical College, Manipal Academy of higher Education (MAHE), Manipal, Karnataka, India

ABSTRACT

Objective: Food handlers play an important role in the transmission of food borne diseases and spread the disease worldwide. *Staphylococcus aureus* infections acquired in the community has been increasing with the emergence of strains resistance to methicillin.

In this study assessment was done among food handlers to know the carriers status of *Staphylococcus aureus* from nasal cavity and skin at a Coastal town in Karnataka

Method: A total of 56 food handlers consented for the study. Out of which 112 samples were collected from anterior nares and palms from these food handlers. The analyses was done by using standard conventional methods for isolation and identification of *Staphylococcus aureus*. Antibiotic susceptibility of the isolates was done by Kirby-Bauer disc diffusion method. Food handlers harbouring *Staphylococcus aureus* as carriers were advised to decolonize with topical mupirocin ointment.

Results: Out of a total of 56 food handlers, fifty were males. Majority of the food handlers were in the age group of 18 to 30 years. Methicillin resistant *Staphylococcus aureus* (MRSA) was isolated from four samples and eight samples grew methicillin sensitive *Staphylococcus aureus*. All the strains were susceptible to vancomycin.

Conclusion: Food handlers can harbour MRSA in the nasal cavity or skin, and can spread the disease to consumers. Effective prophylactic measures like health education, wearing of proper protective gadget while handling food, maintaining personal hygiene, decolonization with mupirocin ointment and periodic screening of food handlers for MRSA can increase the measures of food safety.

Keywords: Food handlers, MRSA carriers, MSSA, anterior nares, skin

Introduction

Transmission of food borne diseases by food handlers are recognized to contribute significantly to the incidence and spread of diseases worldwide. *Staphylococcus aureus*, which is the primary microorganism in food microbiology causing hazards.

Food handlers harbouring the virulent strains of *Staphylococcus aureus* can be the source of bacteria in the transmission of disease. Food handlers are considered as the primary source for contamination of the food, causing food poisoning by this bacteria. Staphylococcal food poisoning causes gastroenteritis, presenting with vomiting and with or without diarrhea [1,2]. Recently it has been noted that emergence of Methicillin Resistant *Staphylococcus aureus* (MRSA) infections has occurred in healthy individuals in community [3]. Despite the fact that the incidence of MRSA colonization in healthy persons in the community is rather low, it has raised concern since it indirectly reflects that there might be a reservoir of people with asymptomatic MRSA carriage that could act as a source for transmission in

Email: amitarao@rediffmail.com
the community [4]. Hence infections caused by MRSA are now classified as community-associated MRSA (CA-MRSA) and health care-associated MRSA (HA-MRSA) [6,7]. Both these strains differ in antigenicity, antibacterial susceptibility, epidemiology and clinical manifestations [5]. Community-acquired MRSA colonization varies from 0 to 9.2 percent [6]. Colonization is mainly seen in the nasal cavity and skin areas having breach in the skin surface (wounds and device exit sites) [8]. Recurrent MRSA infection and transmission is mainly because of individuals harbouring the organism in the nasal cavity [9]. MRSA a prime pathogen, associated with foodborne illness has recently been listed as one of the high-priority antibiotic-resistant pathogens by World Health Organization. The emergence of resistance to methicillin and resistance to non-beta-lactam antibiotics has resulted in narrowing the treatment options for the MRSA carriers. Since there was lack of information on the prevalence of MRSA carriers among food handlers, we screened the food handlers in and around a Coastal town in Karnataka and advised decolonization for the carriers of Staphylococcus aureus.

**Method**

Institutional ethical clearance was taken (IEC 891/2016) for the study. After taking consent from 56 food handlers, who were working in and around the coastal town of Karnataka, a total of 112 samples were collected from them. Sterile cotton swabs was used for the sample collection. These swabs were moistened with sterile normal saline before collecting the samples. Samples were collected from the palms and both the nostrils. Different swabs were used for palms and anterior nares. Swabs were then immediately inoculated into the brain heart infusion broth and kept overnight at 37°C in an incubator. Next day it was sub-cultured into blood agar and MacConkey’s agar and culture plates were incubated for 16-18 hours. Identification of Staphylococcus aureus was done according to the standard procedure [10]. Colonies showing Gram positive cocci in clusters and colonies with lactose fermented colonies on MacConkey’s agar were subjected to biochemical tests like catalase test, coagulase test, urease production and mannitol fermentation to confirm Staphylococcus aureus [11]. Screening of the isolated strains of Staphylococcus aureus for methicillin resistance was done by modified Kirby-Bauer method using cefoxitin (30 μg) disc on Mueller-Hinton agar (MHA) [12]. Cefoxitin disc was placed on the MHA and incubated aerobically at 37°C for 18 to 24h. It was considered as MRSA strains if the isolates had an inhibition zone diameter ≤21 mm around cefoxitin disc [13]. Vancomycin disc (30 μg) on MHA was used for screening vancomycin susceptibility.

Vancomycin-resistant was confirmed by VITEX 2 System (Bio Merieux, Inc Durham NC). Antibiotic susceptibility to all the strains of Staphylococcus aureus isolates against other antibiotics such as erythromycin 15μg and ampicillin10μg were determined by the Kirby-Bauer method. Colonies from Mueller-Hinton agar were picked and inoculated into Mueller-Hinton broth and incubated for 4-6 h. The density in the Mueller-Hinton broth was equivalent to a 0.5 McFarland turbidity.

Controls strains such as S. aureus ATCC 43300 and ATCC 25923 were used. Antibiotic discs were purchased from Hi-Media Laboratories Pvt., Ltd., Mumbai, India. Antibiotic susceptibility testing and interpretation of the result were done according to CLSI guidelines [14]. Food handlers with Staphylococcus aureus as carriers were advised decolonization with topical mupirocin ointment (2%) for 2 weeks and also advised hygienic instructions like frequent washing of bed linen, clothes and towels. Repeat samples after 2 weeks could not be collected as the food handlers could not be reached.

**Findings**

Out of a total of 56 food handlers, 50 were males and the rest six were females [fig 1]

![Gender-wise distribution among food handlers](image)

**Fig. 1: Gender-wise distribution among food handlers**

Age wise distribution of food handlers showed that maximum number of food handlers were in the age group of 18 to 30 years of age [Fig 2]
Out of the total 112 samples collected, four samples were MRSA, these samples were obtained from three carriers. One carrier had MRSA in nasal cavity and also on the palms, eight were MSSA isolated from seven carriers. [Table 1]

Table 1: Isolation of carriers and non-carriers of Staphylococcus aureus among food handlers
All the eight Methicillin sensitive Staphylococcus aureus (MSSA) strains were susceptible to ampicillin (100%) and erythromycin (100%). Both MSSA and MRSA strains were susceptible to Vancomycin (100%) [Fig 3.]

**Fig. 3: Antibiotic susceptibility testing**

**Discussion**

Our study showed that number of male food handlers were more than the females (89% & 11%) and large number of food handlers were in the age group of 18 to 30 years of which 88.88% (32/36) were males and 11.11% (4/36) were females. Similar study conducted by Dagnew M. et al [15] from North West Ethiopia among food handlers showed large group of profile were from the age group of 21-30 years (54.28%) of which females were more than males (15/19 females and 4/19 males).

Study conducted by Alsamarai A M. et al [16] in Iraq had only male food handlers, there were no females. Study conducted by Castro A. et al [17] showed 19.8% carriers of Staphylococcus aureus in the nasal cavity and 11.1% in the palms, in our study we had Staphylococcus aureus in the nasal cavity and from the palms 3.57% (4/112) with MRSA of 3.57% (4/112) with a total Staphylococcus aureus carrier rate of 17.87% (20/112). Study conducted earlier from the same place from the anterior nares of the health care professional did not show any Staphylococcus aureus, they were carriers of Coagulase negative Staphylococcus species[18]. Another study conducted in the same place where samples were collected from the anterior nasal cavity of students from different ethnic groups showed 23.7% Staphylococcus aureus [19]. Study conducted by Christophe J. et al [20] researched that the general population of 20%-30% are S. aureus carriers harbouring in the anterior nasal cavity and skin. In our study, MSSA was susceptible to ampicillin (100%) and erythromycin (100%). All the Staphylococcus aureus strains, both MRSA and MSSA were susceptible to vancomycin. Study conducted by Dagnew M. et al [15] showed 64.23% resistance to ampicillin and 46.15% resistance to erythromycin. Study conducted earlier from the same place had showed that all the strains of Staphylococcus species were susceptible to vancomycin[18]. Topical mupirocin is the drug of choice for decolonization in MRSA carriers [20-22] which was in concordance with our study, where in mupirocin was advised for decolonization of carriers. Carriers were also advised hygienic instructions like frequent washing of bed linen, clothes and towels apart from educating. Face mask were advised to use for personal hygiene while handling food products. Repeat samples after 2 weeks could not be collected as the food handlers could not be reached. In other studies MRSA was controlled by screening, decolonization of carriers, isolation of the patient, hand decontamination and protective clothing [20]. Study conducted by Sukandar EY et al [23] showed MRSA can be cured by synergistic action of ampicillin and Curcuma xanthorrhiza and not by ampicillin alone. Divyashanthi CM et al [24] in their
study showed treatment option of MRSA was either teicoplanin, linezolid or vancomycin.

**Conclusion**

Our findings suggested that food handlers might be the source of contamination with MRSA that can spread the disease to consumers since Staphylococcus aureus is a human pathogen colonizing in the anterior nares and the skin. These food handlers may be asymptomatic but can be a potential source of food contamination. With only a few limited number of antibiotics like Vancomycin or Teicoplanin for the disease treatment or mupirocin ointment for topical use, these drugs has to be used with caution. Food handlers have to be screened periodically and MRSA carriers to be decolonized immediately. These measures can increase the food safety. Since the sample size were few, the data warrant a more comprehensive surveillance of MRSA among food handlers.

Effectiveness of Structured Teaching Program on Knowledge and Practice Regarding Breast Milk Expression among Postnatal Mothers of Newborn Admitted in Neonatal Intensive Care Unit at a Tertiary Care Hospital

Jagjit Singh Dalal¹, Hunney Parbha², Leela Rathee³
¹Associate Professor, Department of Neonatology, ²M Sc Nursing, ³Lecturer, College of Nursing, Pt. B. D. Sharma University of Health Sciences Rohtak, Haryana

ABSTRACT

Introduction: The health benefits provided by breast milk are significant. The very preterm newborn babies and those with any deformities and not able to suck the breast are given expressed breast milk (EBM). Knowledge of proper technique and timely expression of breast milk is the first step towards adequate and successful milk expression for preterm babies. This study was done as a part of quality improvement initiative to improve the knowledge and practice of expression of milk for preterm newborns

Objectives: (1) To assess the knowledge and practice regarding breast milk expression among postnatal mothers of newborn admitted in neonatal intensive care unit (NICU).

(2) To assess the effectiveness of structured teaching program on knowledge and practice regarding breast milk expression among the postnatal mothers of newborn in NICU

Method: A study was conducted using quantitative approach and pre-Experimental one group pre-test and post test design on 50 postnatal mothers in selected areas of NICUs of a tertiary care hospital by purposive sampling technique. Structured interview and observational checklist was used to collect the relevant data regarding expression of breast milk.

Results: A total of 50 postnatal mothers were enrolled. The mean (SD) of pre-test knowledge score was 10.02 (3.22) and mean (SD) of post-test knowledge score was 18.3 (1.87), which was significantly improved. The mean (SD) value of pre-test expression of breast milk practice score was 7.12 (2.07) and mean (SD) of post-test practice score was 13.62 (1.13) which significant increase. The knowledge and practice of postnatal mother regarding breast milk expression were significantly improved after the structured teaching program.

Conclusions: The multidisciplinary structured teaching program was effective in promoting the proper breast milk expression by improving relatively simple and modifiable factors

Keywords: Expressed breast milk, Structured teaching program, postnatal mothers, Neonatal intensive care, knowledge, practice

Introduction

Human milk is the preferred food for all infants, including sick newborns and preterm infants. Breast milk is the best nutritious food, provided by the nature for neonates. Expression of breast milk is a way to maintain breast milk feeding when mother and infant are separated or baby is very preterm to suck at the breast. The newborn may not be able to suck or there may be
poor coordination between swallowing and sucking. The prematurity is the most common cause of admission in neonatal intensive care unit. The breast milk expression has proven to be helpful in establishing and continuing the breast milk feeding. In the United States now use breast pumps and bottles to provide human milk to their infants, with many doing so soon after delivery or at high frequency.3

But in India the practice of Expression of breast milk remains low.4 One of the main reasons for this may be the lack of adequate information and appropriate knowledge about expression of breast milk leading to inadequate milk for their newborns. It is thus of importance that all mothers should have adequate scientific knowledge about expression of breast milk so that she will be able to prevent the problems if any and increase the milk supply for their sick infants.

Present study was planned to study the level of knowledge and practice of mothers towards expression of breast milk and to study the pattern of expression of breast milk in them.5

Expression of breast milk is way to maintain breast milk feeding when mother and infant are not together due to illness.6 Expression of breast milk usually done by two methods: Manual or with an electronic breast pump. In developing countries where 96% of the world’s approximate 5 million annual neonatal deaths occur. In 2016 of the 26 million babies born in India. Every year one million babies died before the age of one month accounting for 30% of the total neonatal deaths. Importance of breast milk feeding indicates that both timing of initiation and type of breastfeeding pattern exert independent influences on neonatal mortality. Interventions to improve early infant feeding practices can result in considerable reductions in neonatal mortality.

Neonatal mortality could be reduced if all infants initiated breastfeeding on day 1 of life, by 16.3% and by 22.3% if initiation took place within the first hour. The risk of neonatal death is increased approximately fourfold if milk-based fluids are given to breastfed neonates.7 Expressing milk by hand can be done to relieve engorged breasts or to stimulate let down of milk when you are ready to begin nursing, which help to reduce the neonatal mortality.8

Hand expression of milk can be easily taught to postnatal mothers and they can follow that at their home if needed. Some Authors showed the video of hand expression of milk and it was quite effective.9

Breast milk is unquestionably the best milk for the newborn. Exclusive breast milk feeding for the high risk babies will help to reduce the neonatal mortality rate. Manual Expression of Breast milk with the help of structured teaching program might help the postnatal mothers to express the breast milk correctly and in adequate amount for their preterm and high risk babies. This will avoid formula feeds which has been identified as one of the risk factor for the development of necrotizing enterocolitis, sepsis as well may others morbidities in low birth weight babies. So we planned to study the effect of structured teaching program on knowledge and practice regarding breast milk expression among postnatal mothers of newborn admitted in NICU.

Objectives of the Study

1. To assess the knowledge and practice regarding breast milk expression among postnatal mothers of newborn in NICU.

2. To assess the effectiveness of structured teaching program on knowledge and practice regarding breast milk expression among the postnatal mothers of newborn in NICU

Material and Method

Study was conducted using quantitative approach and pre- Experimental one group pre-test and post test design on 50 postnatal mothers in selected areas NICUs of PGIMS, Rohtak by purposive sampling technique. The study was cleared by the institutional ethical committee. Structured interview, booklet, posters, videos and demos were shown to mothers and pre and post test observational checklist were used to collect the relevant data from samples regarding Expression of breast milk. Lecture cum focused group discussion was selected as an appropriate method of teaching. The data was collected on day 5 of comprehensive structured teaching program.

Criteria to assess knowledge level of the postnatal mothers of newborn admitted in NICU: Structured questionnaire is developed to assess the knowledge of postnatal mother of newborn admitted in NICU containing 24 items (web table). According to the total score obtained by each subject knowledge was classified into three sections (Maximum score: 24):
Criteria to assess Practice score of the postnatal mothers of newborn admitted in NICU: Observation check list is developed to assess the Practice score of breast milk expression of postnatal mother of newborn admitted in NICU containing 17 items of practice techniques. According to the total score obtained by each subject practice was classified into three sections (Maximum score 17):

- Poor practice 0-6
- Good practice 7-12
- Excellent practice 13-17

Validation of the Tool: The tool was validated by the research committee, College of Nursing, Pt. B. D. Sharma, P.G.I.M.S. Rohtak. The experts in addition to judging each item were also requested to identify any area that has been missed from the tool. The clarity, relevance and appropriateness were judged by experts and suggested amendments were done by the researcher in the tool.

Reliability of the Tool: Reliability is the degree of consistency and accuracy with which an instrument measures the attribute for which it is designed to measure.

The pre-test was done to establish the reliability and to determine the language clarity and using split half method with accessed feasibility of the tool reliability of knowledge questionnaire and observational checklist used as a tool for the study.

Results

A total of 50 postnatal mothers were included in the study. Detail of the mothers regarding age, education, occupation, type of family, per capital income, parity are given in Table 1. Majority of postnatal mothers (72%) lie in the age group of 18-25 years. Majority of postnatal mothers about (42%) were illiterate. Majority of postnatal mothers (82%) belongs to joint family. Most of the postnatal mothers (60%) related to rural area and (88%) mothers were housewife. Majority of postnatal mothers (54%) mothers were primigravida. Majority of postnatal mothers (66%) having the family income less than 10000Rs.

Table no.5 inferred that there is a significant difference between the pretest and posttest practice of the postnatal mother regarding breast milk expression.

**Discussion**

The present study suggests that a simple and feasible structured teaching program can lead to improved techniques and knowledge in mothers of preterm neonates admitted in NICU. There is persistent need of improved strategy to reduce the time to first milk expression and to increase frequency of expression as well as night time expression of milk in postnatal mothers. According to Kishore et al. 39% of the mothers had satisfactory knowledge about the breastfeeding. Chaudhury et al. found that only 10% of the mothers had the good knowledge regarding initiation of breastfeeding. In a Delhi study that only 15% of the mothers initiated breastfeeding within 2 h. In Vadodara city, study has shown 32.6% of the mothers initiated breastfeeding within 1 h of delivery in a tertiary care hospital. Mangalgi et al. study 50.5% knew about expressed breast milk and its technique was known to 49.5% mothers. Our study 50% of postnatal mother had inadequate knowledge and 46% had moderate knowledge and 4% had adequate knowledge in the pretest score. After administration of structured teaching program 84% postnatal mother had adequate knowledge and 16% had moderate knowledge regarding expressed breast milk. The assessment of knowledge and practice and use of the acquired data in changing our existing program is essential to improve care of newborn and neonatal mortality rates.
Health care professionals should educate the mothers and counselling must start before delivery or just after delivery. Most of the Postnatal mothers got benefitted with structured counseling program and were able to start expressed breast milk timely and with proper technique. This concept can be practiced by community health nurses and the health workers can be educated by the nurses subsequently. Continuing nursing education program to acquire advanced knowledge regarding the expression of breast milk can be the key of this quality improvement initiative.

A similar study can be replicated on a large sample to generalize the findings with including additional demographic variables. Intervention can also be given to the community through mass media, role play, and class room teaching etc to enhance the knowledge and practice of breast feeding.

**Conclusion**

There was lack of knowledge and practice among postnatal mothers regarding breast milk expression. Structured teaching program was found to be effective in enhancing the knowledge and practice of the postnatal mothers regarding breast milk expression. Mothers gained significant knowledge and practice about breast milk expression resulting in improved breast milk feeding of their newborns. Health care professionals should ensure proper technique and timely initiation of breast milk expression.

The Prevalence of Cardiorespiratory Fitness Level (Vo2max), Socio Demography, Risk Factors and Diseases among Hajj Pilgrim of Indonesia 2016 (1437H)

Zolaiha1, Nasrin Kodim2, Krisnawati Bantas2

1MPHM, is Epidemiology Doctorate Candidate, 2PHD, is affiliated with the Epidemiology Departement, Faculty of Public Health, University of Indonesia, Depok, West Java, Indonesia

ABSTRACT

The aim of this study is to describe the prevalence of Cardiorespiratory fitness level (CRF), Socio demography characteristic, risk factors and diseases of Indonesia hajj pilgrim 2016. Methods: all secondary data of cardiorespiratory fitness was collected from Siskohatkes 2016 – Computerized system of hajj health data - MOH with STATA 13 version. Descriptive analysis was used to find the risk of hajj pilgrims. Results: A total of 71686 completed all physical fitness from 152429 participant. Prevalence of cardiorespiratory fitness good level = 33.43%, Moderate level= 54.79%, and Poor level was 11.78%. Discussion: The fitness prevalence of Indonesian hajj pilgrims in 2016 found for fitness level = 33.43% good, 54.79% moderate, and 11.78% poor. In addition, 44.66% hajj pilgrims were employees, who were likely to have good physical activity. Similar what WHO founding (2015) Cardiorespiratory endurance is the ability of the heart and blood vessels to function optimally in rest and exercise to take oxygen and distribute it to active tissue for use in the process of body metabolism (Permaesih, 2001). Table 4 above shown prevalence for obesity was 12.8% and overweight was 35.46%. Conclusion: the proportion of most fitness status is Moderate level (54.79%), age 50-59 (35.55%), Medium Education level (35.46%), Households/employees (44.66%), female gender (54.82%). Hajj pilgrims with IMT overweight (35.46%), hypertension (71.34%), Anemia (21.53%), hyperglycemia (43.76%), Hajj pilgrims with high cholesterol (59.46%), waist circumference (59.46%), hajj behavior with smoking (13.23%). For pre-existing, circulatory disease rank was the highest (31.94%). For outpatient, respiratory diseases was the highest (53.20%), and inpatient rank (0.41%).

Keywords: Hajj pilgrim, prevalence, cardiorespiratory fitness, risk factor, diseases

Introduction

Risk factors among hajj pilgrim comprised namely Internal risk factors and external risk factors. Internal risk factors such as hypertension, heart disease, asthma, COPD, diabetes, stroke, etc. external risk factors come from during hajj pilgrim done ritually in Saudi Arabia, include: (a) Tawaf (around the Ka’ba seven times.); (b) Sai (walking back and forth as many as seven times from Safa hill to Marwa); (c) Wukuf at Arafah for one day (depart from Mecca the day before, and sleep under a tent on the night before wukuf); (d) Overnight at the Musdalifah; (e) Jumroh once a day for three days. The journey to Jamarat is 2-5 km. During this season, physical fitness is needed for Hajj pilgrims to carry out physical activity during Hajj pilgrimage is in holy land (Saudi Arabia). One component of physical fitness associated with health is Cardiorespiratory by assessing the consumption of the maximum amount of oxygen (\(\text{VO}_{2\text{max}}\)). (3-5) \(\text{VO}_{2\text{max}}\) indicates the oxygen consumed during the move. Physical fitness is an important thing in performing the pilgrimage, good physical condition is needed in order to run all series of activities in performing the pilgrimage properly and can be a hajj mabrur. Good physical fitness should be supported by other health factors such as: Hemoglobin, blood sugar, blood pressure, BMI, cholesterol, Waist circumference, and lifestyle behavior (smoking).
About 312000 pilgrims underwent outpatient treatment, both at airport clinics, Madinah, Makkah, Arafah Muzdalifah, and Mina during hajj season.

**Material and Method**

Descriptive study was carried out among pilgrims seeking medical checking ups before depart to Saudi Arabia. Sample size of 71868 pilgrims was used to determine the risk factors of cardiorespiratory fitness level. Data were analyzed using Stata version 13.0. The sample size study was 71868 hajj pilgrims.

**Results**

In association between cardiorespiratory fitness level (VO2\text{max}) (expressed with 1.6 walking test duration per minutes rock pot), of 71868 study sample of their physical activity and CRF level was measured as presented respectively at table 1.

Notes for Province abbreviation: NAD = Nangro Aceh Darussalam; Babel = Bangka Belitung; DIY = Yogyakarta Special Region; DKI = Daerah Jakarta Special Region; Jabar = West Java; Jateng; Central Java; Jatim= East Java; Kalbar= West Kalimantan; Kalsel= South Kalimantan; Kalteng = Central Kalimantan; Kaltim; East Kalimantan; Kepr = Riau Island; Malut= North Molucas; NTB= West Nusa Tenggara; NTT= North Nusa Tenggara; Sulbar= West Sulawesi; Sulsel= South Sulawesi; Sultra= South-East Sulawesi; Sulut= North Sulawesi; Sumbar= West Sumatera; Sumsel= South Sumatera; Sumut= North Sumatera.

The fitness prevalence of Indonesian hajj pilgrims in 2016 found for fitness level = 33.43% good, 54.79% moderate, and 11.78% poor. For provincial category, Gorontalo is the lowest good prevalence (16.91%), while Central Kalimantan is the highest good prevalence one (69.91%). Still for provincial category but for moderately good fitness level, Maluku province is the lowest prevalence (14.22%), while NTB province is the highest prevalence one (69.23%). For provincial category on low fitness, Banten province is the lowest prevalence (2.38%), while Gorontalo province is the highest prevalence one (17.62%). If we like to know the Cardiorespiratory Fitness level (VO2\text{max}) of hajj pilgrims, from which province as the highest one? So, the answer is from Moluccas Province, due to they in the highest position of prevalence with totally 7 hajj pilgrims (85.71%), while Gorontalo Province with totally 32 pilgrims (16.58%), it called the lowest CRF level. See Table 1.

The statistics and calculation resulting from demographic characteristic (table 2) above shown the highest proportion of fitness status is moderate (54.79%), age 50-59 (35.55%), middle education level (35.46%), civil servants (44.66%) , women (54.82%).

Risk factors for Haj pilgrims, such as BMI, blood pressure, hemoglobin, blood sugar, cholesterol and waist circumference and risk behavior are the main problems that can threaten the health of hajj pilgrim.

Table 4 above shown patient rank with Circulatory pre-existing diseases was higher (31.94%), and
Metabolic pre-existing diseases was secondly higher (31.24 %). Meanwhile, patient rank with outpatient of respiratory disease was highest (53.20%), whereas in the case of inpatient of circulatory disease was highest (0.41%).

**Discussion**

The CRF level prevalence of Indonesian Hajj pilgrims in 2016 found for fitness level = 33.43% good, 54.79% moderate, and 11.78% poor. For provincial category, Gorontalo is the lowest good prevalence (16.91%), while Central Kalimantan is the highest good prevalence one (69.91%). Still for provincial category but for moderately good fitness level, Maluku province is the lowest prevalence (14.29%), while NTT province is the highest prevalence one (69.23%). For provincial category on low fitness, Banten province is the lowest prevalence (2.38%), while Gorontalo province is the highest prevalence one (17.62%). If we like to know the Cardiorespiratory Fitness level (VO2max) of hajj pilgrims, from which province as the highest one? So, the answer is from Moluccas Province, due to they in the highest position of prevalence with totally 7 hajj pilgrims (85.71%), while Gorontalo province with totally 32 pilgrims (16.58%). it called the lowest CRF level. See Table 1.

The present study highlight high hajj pilgrims CRF level during Hajj 2016, it was a large descriptive report with 33 provinces distributed in Indonesian archipelago included in this study analysis. This study provides information that will be useful in planning the health care services for Hajj health decision makers. From the results showing good level fitness data on Indonesian Hajj pilgrims 33.43% is different from the prevalence of fitness of the population in Indonesia, the level of physical fitness is 4.07 for the good category and this means more than 95% public health conditions are less good or even very bad (6). Almost all Indonesian Hajj pilgrims have an upper middle economy, so the possibility of Hajj pilgrims has a good level of fitness when compared to the entire population of Indonesia. In addition Jemaah 44.66% Jemaah are employees, who are likely to have good physical activity. According to WHO (2015), in high-income countries there are 26% of men and 35% of women whereas in low-income countries there are 12% of men and 24% of women who are less physically active. From the data above shows that women activity level is lower than men. Cardiorespiratory endurance is the ability of the heart and blood vessels to function optimally in rest and exercise to take oxygen and distribute it to active tissue for use in the process of body metabolism (9).

Table 3 above shown prevalence for obesity was 12.8% and overweigh was 35.46%. The population of Indonesia who are experiencing obesity is now more and more. National Health Research Data (Riskesnas) in 2016 shows adult population aged over 18 years who are overweight or obese by 20.7 percent. That figure shows a rapid increase from 2013 when the overweight population reached 15.4 percent. Table 3 above shown frequency distribution of hajj pilgrims risk factor for hypertension was 71.34%. The prevalence of national hypertension based on National Health Based Research Data (Riskesdas) 2013 was 25.8%, the highest in Bangka Belitung Islands (30.9%), while the lowest in Papua (16.8%).

Table 3 above shown the glucose in categories: hypo (17.01%); normal (39.23%) and hyper (43.76%). Estimated International Diabetes Federation (IDF), there are 382 million people living with Diabetes in the world by 2013. By 2035 that number is expected to rise to 592 million people. According to the World Health Organization (WHO, 2015) the prevalence of DM in adults in 2014 is estimated at 9%, whereas according to International Diabetes Federation (IDF, 2015) the global prevalence of DM in 2014 is 8.3% with 387 million persons (10).

Table 3 above shown risk behavior from smoking habit 13.23% and not smoking 86.77%. The proportion of people aged ≥15 years who smoked and chewed tobacco tended to increase in Riskesdas (34.2%),
Riskesdas 2010 (34.7%) and Riskesdas 2013 (36.3%). The highest proportion of xii in 2013 was East Nusa Tenggara (55.6%). Compared with the Global Adults Tobacco Survey (GATS) study on the population of ≥15 years age group, the proportion of male smokers is 67.0 percent and in Riskesdas 2013 of 64.9 percent, whereas in women according to GATS it is 2.7 percent and 2, 1 percent according to Riskesdas 2013. The proportion of tobacco chewing according to GATS 2011 is for men 1.5 percent and women 2.7 percent, while Riskesdas 2013 shows the proportion of men 3.9 percent and 4.8 percent in women.(13)

Table 4 above shown Respiratory diseases was highest (53.20%) as most of hajj pilgrim illness. Promotive and preventive strategy need to be focused to every hajj pilgrim.

Limitation of this Study

All data gathered from as the result of siskohatkes figures related with Hajj pilgrims 2016 year profiles, comprises results from conducting primary health check up in Community Health Centre (Puskesmas), patient visiting to BPHI (Indonesia health central in Saudi Arabia) and Saudi Arabia hospital (in and out patients) during hajj season. From 152,429 pilgrims only 71,686 pilgrims who participated in CRF test, remains of these numbers of pilgrims were noted as not participated in CRF test without clear reason.

Conclusion

The proportion of most fitness status is moderate level (54.79%), age 50-59 (35.55%), Medium Education level (35.46%), civil servant (44.66%), Households (33.27%). Hajj pilgrims with IMT overweight (35.46%), hypertension (71.34%), Anemia (21.53%), hyperglycemia (43.76%), Hajj pilgrims with high cholesterol (58.96%), waist circumference (59.46%), hajj behavior with smoking habit (13.23%). In pre-exixting diseases, circulatory disease was highest (31.94%). For outpatient, respiratory diseases rank was highest ranked (53.20%), while in the case of inpatient, circulatory disease was highest (0.41)

Conflict of Interests: We have no conflict of interest to declare.

Creating Knowledge Using Seci Model as a Knowledge Management Stage to Improve Nurses’ Ability in Undertaking Parenteral Therapy

Tatin Wahyanto1, Nyoman Anita Damayanti2, Stefanus Supriyanto2

1Muji Rahayu Hospital, 2Faculty of Public Health, Universitas Airlangga, Indonesia

ABSTRACT

Muji Rahayu Hospital is a private hospital with 50 beds. The frequent incidence is phlebitis nosocomial infection in adult in-patient wards at Muji Rahayu Hospital from January to June 2011 as high as 5.19%. According to hospital minimal service standard, in-patient service indicator on the incidence of phlebitis must be below 2%. The result of this study reveals that on the factor of individual nurses: (a) The education level of some respondents (management and nursing staff) is nursing academy; (b) The level of knowledge on nursing care with parenteral therapy, parenteral therapy nursing documentation, correct and safe hand-washing, and standard operating procedure before the training is inadequate and after the training is very good; (c) The nurses’ skills in undertaking the nursing documentation with parenteral therapy and parenteral therapy treatment before the training is inadequate and after the training is very good. As for the process of creating knowledge using SECI model, the result reveals that: (a) 70% of the respondents have implemented socialization activities; (b) 30% of the respondents have not implemented the externalization activities; (c) as many as 40% of the respondents have not implemented the combination activities; (d) whereas 40% of the respondents have not implemented the internalization activity. Therefore, the recommendation is to encourage individuals or nurses to learn and share knowledge, to document their experiences and expertise, and to give communication trainings.

Keywords: Hospital, Nursing Care, SECI Model, Knowledge Management.

Introduction

Knowledge plays an important role in achieving competitive advantages. Companies that are able to create new knowledge, in particular have an advantage in innovation. Innovation is the result of the accumulation of knowledge from outside the company which is then shared widely into the company, stored part of the company’s knowledge base and implemented in the development of new technologies, products and methods. It is precisely said that these internal and external forces become a force for continuous innovation within the enterprise and in turn will result in competitiveness for the company. When companies innovate, the company is actually creating new knowledge and information from within the company in an effort to define the problems and solutions. Creation of organizational knowledge in question is the ability of the company as a whole to create new knowledge which is the result of the conversion between tacit knowledge and explicit knowledge realized through the process of socialization, externalization, combination and internalization (SECI model).

The tacit knowledge of the individual is very personal and difficult to formulate because it is subjective and attached to the expertise and experience of each individual. In this case, it is often the case that a company loses its lead because the valuable knowledge that is inherent as the experience and individuality of the employee is carried out along with the discharge of the employee. Therefore, it is necessary to change the culture to always create new knowledge through learning and sharing knowledge among members of the organization. Individual knowledge is then converted with explicit knowledge through the SECI model so that the knowledge organization that is then applied to generate creativity and innovation.

Therefore, looking at the importance of knowledge creation for the improvement of the performance and success of the organization in a series of knowledge
management systems, research is undertaken to try to express the application of such knowledge creation. Research on the creation of such knowledge is done at Muji Rahayu Hospital which is one of the private hospital located in West Surabaya area. The total number of nurses in Muji Rahayu hospital is 30 nurses, consist of Diploma Program in Nursing 21 people (70%), Diploma Program in midwifery 6 people (20%) and Senior High School in Health Specialist of 3 people (10%). Based on data obtained from the monthly report at the inpatient unit of Muji Rahayu Hospital obtained information that there are still many incidences of phlebitis nosocomial infection in Muji Rahayu Hospital adult ward. Table 1 illustrates the incidence of phlebitis nosocomial infections in the Muji Rahayu Hospital adult ward from January to June 2011.

Table 1 shows the number of incidence of phlebitis nosocomial infections in the Muji Rahayu Hospital adult ward. For six months, from January to June 2011, the average number of phlebitis cases per month 12 cases of 228 patients or 5.19%. According to the hospital minimum service standards, on the inpatient service indicators the phlebitis incidence rate should be less than 2%. The event can actually be avoided by performing nursing care in accordance with procedures or parenteral standard operating procedure therapy. The purpose of this research is to make recommendation to increase the knowledge and skill of the nurses in the inpatient ward of Muji Rahayu Hospital in carrying out parenteral therapy based on the SECI model.

Method

This research is an operational research because of intervention or treatment on population. In this study also conducted observations or observations using descriptive data from the results of checklist, focus group discussion in the inpatient room and indepth interview with the management of Muji Rahayu Hospital. The place of this research is in Muji Rahayu Hospital in inpatient unit especially VIP room and Class II room. This study was conducted from 1 April to 7 July 2011. The population in this study is the management and nurses in the inpatient room Muji Rahayu Hospital. The sampling technique used purposive sampling, with criteria for sample from management consist of Head of Medical Service, Nursing Coordinator and Inpatient Coordinator while for sample of nurse with education criterion of Diploma Program in Nursing and assigned to install infusion in adult inpatient room of VIP class and class II amounted to 10 people.

For the process of knowledge creation carried out the following stages. First, socialization (socialization), which is the process of socialization to nurses in the inpatient room. The result of the measurement is the change of knowledge and skill after being given socialization. Second, externalization (externalization), which is analyzing the process of externalization by measuring the presence or absence of dialogue to create an explicit new from the hidden tacit knowledge. Third, the combination (combination), namely by exchanging, adding or mengsortir new knowledge in the form of nursing process either in the assessment process by individual nurses or in cooperation with patients. Simultaneously analyze whether the new knowledge has been applied in performing parenteral therapy measures. Fourth, internalization (internalization), which is the process of internalization by looking at the new standard operating procedure formed and has been done by all nurses so that through this mechanism can expand and deepen tacit knowledge already owned by members of the organization.

Findings and Discussion

Socialization Process: According to Nonaka and Takeuchi socialization is a tacit knowledge conversion activity into tacit knowledge through the process of sharing experiences and social interaction between individuals within the organization. To be a conversion process requires a stimulus. Training is one form of stimulus for the socialization process can run. The management should hold regular and periodic training. The change of nursing knowledge and skills after
training is an indicator that this socialization has been running even though in fact there are still nurses who have not done this socialization. Based on the research on this socialization activity that has been implemented, it can be indicated that the nurse is in a work environment that succeeded in nurse awareness raising about the importance of dialogue, discussion and sharing of tacit knowledge among nurses to support the smooth implementation of the task.

Socialization has an important role because in accordance with the duties that must be done by nurses in implementing nursing care which is the backbone of integrated services in health services in hospitals. The quality of nursing service is determined by the nurses who are competent in their field, therefore the duty of the nurses relies heavily on the tacit knowledge possessed by the individual or the nurse. This is because the formation of tacit knowledge is based more on nurses’ experience and know-how in implementing nursing actions. Through discussions, sharing of on-the-job experiences and on-the-job training will occur the dissemination of tacit knowledge to other nurses. Management should facilitate this socialization process to work. In addition, leaders play an important role in this socialization process in order to run well. According Suarli leaders should be able to provide inspiration to others in order to cooperate with others so as to create a communication among nurses. This can support the activity or sharing process among fellow nurses.

However, exchanging ideas with other nurses who have different skills, dialogue to discuss the completion of the work needs to be given attention so that the conversion of tacit knowledge can be a culture for sharing knowledge. Based on the research results obtained information that there are still nurses who have not conducted socialization activities. The reason is there is no policy that requires the nurse to do sharing if new knowledge gets. In addition, the nurse is still affected by the old pattern, if it gets or uses the knowledge just kept private or put in the room only and the lack of awareness to learn and share knowledge.

**Process Externalization:** Externalization is the process of converting tacit knowledge into explicit knowledge that is more real or can be articulated. According to Nonaka and Takeuchi externalization plays an important role in the process of knowledge creation because it creates a new concept that explicit of tacit knowledge. Without the externalization of tacit knowledge will not be much benefit to the organization if not codified more real or explicit to be more easily communicated. In this case it is the duty of the leader to document the experience and capabilities in each individual, in order to be disseminated to other individuals and made as knowledge of the organization. And also for this process to be done well, it is necessary to have a clear and defined procedure so that nurses can formulate their knowledge.

Based on research on externalization activities, there are still individuals who do not express their ideas into a more explicit form, so that what is obtained in practice is still stored in individual minds. The role of leader or leader is crucial in order for individuals to put their ideas or ideas into an explicit form. So for nurses who still store the knowledge in their minds need to get support from the leadership or management to be motivated to express ideas to other individuals in a form that can be seen and read other individuals. For nurses who already carry out externalization activities, it can be indicated that the nurse is in a working environment that nurses awareness of the nurse about the importance of articulating experience, ability, knowledge, opinions or ideas that belong to the record and the concept of explicit knowledge that can be read and understood by other nurses and distributed to all nurses in Muji Rahayu Hospital to be the knowledge of the organization.

Nevertheless, against some of the execution of externalization activities that have not been implemented such as the submission of ideas in writing, make a personal note of something that is considered important from the discussion should be given attention to the conversion of tacit knowledge into explicit knowledge more often or even done to support the process creation of organizational knowledge. Based on the research results obtained information that there are still nurses who have not done externalization activities. The cause is lack of motivation and facilities or infrastructure, has not created a good communication between staff or between rooms, and not all nurses want to share knowledge.

**Combination Process:** According to Nonaka and Takeuchi, the combination is the activity of converting explicit knowledge into new explicit knowledge as a process of conceptualizing into the knowledge system. Conducted by interchanging, combining and categorizing different explicit knowledge through the discussions,
meetings, telephone conversations to generate new knowledge\textsuperscript{6}. In this case the coordinator or leader plays an important role in the combination process. Based on the result of research on conversion of knowledge of combination form at Muji Rahayu Hospital, which has been implemented by nurse, it can be indicated that the nurse is in a working environment that has grown the nurse awareness about the importance of using new information and knowledge in Muji Rahayu Hospital.

Based on the observation that individuals or nurses who do not perform the combination activities, indicate that the motivation to do this activity is still lacking, in addition if the individual experience is still lacking, the combination activities are also not running. In the process of knowledge creation, the combination form also has an important role besides externalization. Combination is a broader activity that is to combine information and knowledge both from within and outside the organization, while externalization is more internal and is a translation of ideas that exist in members of the organization\textsuperscript{7}. This externalization and combination of information and knowledge will then generate new knowledge which is then implemented in a better and more complete work. Based on the research results obtained information that there are still nurses who have not done a combination of activities. The cause is lack of experience, knowledge, communication and limitations of authority\textsuperscript{8}.

**Internalization Process:** Internalization is the process of realizing existing explicit knowledge into a new tacit part of the individual. According to Nonaka and Takeuchi, the form of internalization is done by altering, deepening and expanding the tacit knowledge possessed by the individual\textsuperscript{2}. When experience through socialization, externalization, and combinations is internalized into individual tacit knowledge base through sharing experiences, technical knowledge, these individuals become valuable assets for the organization. Knowledge that is embedded in each individual is further socialized to other individuals resulting in a new spiral in the process of knowledge creation\textsuperscript{9}.

Based on the research on the internalization process that has been frequently implemented, it can be indicated that the nurse is in a working environment that has grown the nurse awareness about the importance of using standard operating procedure, provisions, documents and current information owned by the organization as a means to expand their knowledge base and improve the quality of their work. In the process of knowledge creation, internalization has an important role because it is the deepening of knowledge that has been created by the organization. The successful internalization process of transforming, deepening, and expanding tacit knowledge into each individual nurse will be an invaluable intellectual asset for the organization\textsuperscript{10}.

However, the internalization indicators whose implementation has not been implemented, namely the use of work guidelines that have been mutually agreed upon, learning by doing should receive special attention. This is so that the tacit knowledge of the nurse develops and becomes a valuable intellectual capital for the organization. Based on the results of the study obtained information that nurses who have not done internalization activities. The reason is lack of communication so that new information is only known by the staff of the room only. In addition, although already submitted but still do the previous habit.

**Conclusion**

The result of knowledge creation using SECI model in Muji Rahayu Hospital room is as follows. At the socialization stage, 30\% of respondents have not yet shared knowledge, so the knowledge gained after training is still stored in the minds of individuals. At the externalization stage, 30\% of respondents are not actively involved in externalization activities (in terms of delivering ideas) and have not implemented standard operating procedure that have been made during the training. In the combination stage, 40\% of respondents have not done a combination activity that is adding, reducing and combining standard operating procedure that has been made into new standard operating procedure of combination result, respondent just follow it. At the internalization stage, 40\% of respondents have not implemented standard operating procedure maximally.

MicroRNA-146a Gene Polymorphism is Associated with an Increased Susceptibility to Lung Cancer Disease: A Case-control Study

Jamsheed Javid¹, Rashid Mir¹, Abu-Duhier F M¹

¹Department of Medical Lab Technology, Faculty of Applied Medical Sciences, Prince Fahd Bin Sultan Research Chair, University of Tabuk, Kingdom of Saudi Arabia

ABSTRACT

Background: Genetic variability in miRNA-146a (rs2910164C>G) has a significant influence on the expression and secondary structures of the miRNA-146a. Presently, very limited evidences are available to associate the miRNA-146a (rs2910164C>G) polymorphism and susceptibility to lung cancer. In the present study, we aimed to find out the association of miRNA-146a (rs2910164C>G) polymorphism with the susceptibility to develop lung cancer.

Material and Method: Present case-control study included histopathologically confirmed lung cancer patients (n=80) and healthy controls (n=80). Genotyping of miRNA-146a (rs2910164C>G) polymorphism was done by allele specific PCR technique.

Results: It was observed that there was a statistically significant difference in the frequency of miRNA-146a (rs2910164 GG, CG and CC) genotypes between lung cancer patients and healthy controls (p=0.0097). Among the two groups, homozygous miRNA-146a CC genotype was overrepresented by lung cancer patients than healthy controls (40 % vs. 18.75% respectively). Compared to miRNA-146a GG genotype, odds ratios of 4.3 (95%CI=1.24-14.69, p=0.036) was observed for the homozygous miRNA-146a CC genotypes. In addition, it was observed that all the lung cancer stages (I to IV) and histological grades (Grades 1 to 3) represented higher miRNA-146a C allele frequency. Squamous cell carcinoma patients represented much higher frequency of miRNA-146a C allele than adenocarcinoma patients (SCC=0.78 & ADC= 0.63).

Conclusion: In conclusion, the genetic variability in miRNA-146a gene may be associated with the susceptibility to lung cancer disease. The risk of developing lung cancer disease was 4.3 times more in association with the CC genotype of the miR-146a (rs2910164C>G) polymorphism.

Keywords: Lung Cancer, susceptibility and miRNA-146a gene polymorphism.

Introduction

Lung cancer is one the most common malignancies worldwide and despite recent advances made in early diagnosis and treatment, lung cancer patients still remain the disease with poor prognosis¹,². Lung cancer is majorly classified into two types; Non small cell lung cancer, which constitutes 85 percent and small cell lung cancer, which constitutes the remaining 15 percent of lung cancer cases ³. Exposure to smoke is the major established risk factor for lung cancer; however only a small fraction of smokers develop the disease of lung cancer, indicating the involvement of individual’s genetic susceptibility to develop lung cancer.

Recent studies had observed the involvement of some small, non-coding RNA molecules known as microRNAs in the development and progression of various malignancies including lung cancer ⁴,⁵. These microRNAs are encoded by specific microRNA genes and function in regulation of gene expression at the post-transcriptional level. Dysregulation of miRNAs has been
observed in a number of diseases, including malignancies such as lung cancer\(^6\). Single nucleotide polymorphisms (SNPs) among miRNA genes have been recently shown to significantly alter the functionality of the respective miRNAs either by influencing the expression and/or secondary structures of the miRNAs\(^7-9\).

Micro RNA-146a have been observed to regulate the functionality of several important genes such as TNF receptor-associated factor 6 (TRAF6), IL-1 receptor associated kinase (IRAK1), nuclear factor kB (NFkB) genes and epidermal growth factor receptor (EGFR) etc. that play an important role in lung cancer development\(^10\). It has been observed that the genetic variability in miRNA-146a (rs2910164 C>G) has a significant influence on the expression and secondary structures of the miRNA-146a\(^10\). Presently, very limited evidences are available to associate miRNA-146a (rs2910164 C>G) polymorphism and susceptibility to develop lung cancer. In the present study, we aimed to find out the association of miRNA-146a (rs2910164 C>G) polymorphism and the susceptibility to develop lung cancer disease.

### Material and Method

**Study population:** The present study was approved by the Research Ethics committee at the University of Tabuk, Ministry of Health, Kingdom of Saudi Arabia and the Institutional Review Board (IRB) of King Hussein Cancer Center, Jordan. The study included histopathologically confirmed Lung cancer patients and healthy controls. Study subjects were collected from King Fahd specialist hospital, Tabuk, Saudi Arabia, and King Hussein Cancer Center, Jordan. Blood samples were withdrawn from each participant after obtaining the written informed consent.

**Genotype analysis:** Genomic DNA was extracted from peripheral blood samples from each participant by following manufacturer’s protocol of DNeasy Blood kits (Qiagen,USA). The quantity and quality of the extracted DNA was measured by using Nanodrop 8000 spectrophotometer (Thermo scientific, USA). miRNA-146a gene (rs2910164 G>C) polymorphism was analyzed by using Allele-specific polymerase chain reaction. PCR was performed in a reaction volume of 25uL containing 12.5 uL of GoTaq® Green Master Mix, 2X (Promaga,USA), 2.5 uL of 50 ng of genomic DNA and 0.25 uL of 25 pmol/L of primers (forward and reverse) and the final volume was adjusted by nuclease free ddH\(_2\)O. Allele specific primers used for miRNA-146a rs2910164 G>C polymorphism are described in table 2. PCR program included an initial denaturation at 95\(^\circ\)C for 10 minutes, followed by 40 cycles (denaturation at 95\(^\circ\)C for 45s, annealing at 62\(^\circ\)C for 45s, extension at 72\(^\circ\)C for 45s) and a final elongation step of 72\(^\circ\)C for 10 minutes. PCR products obtained were analyzed on 2.0% agarose gel (Figure 1), stained with ethidium bromide and visualized under Gel Doc XR\(^+\) (Bio-Rad USA) system.

Statistical analysis: Graph Pad version 6.0 and SPSS version 16 statistical software’s were used to analyze the data. Hardy-Weinberg equilibrium tests and Chi-square/Fisher Exact were used for genotype analysis. miRNA-146a (rs2910164 G>C) gene variants and risk of lung cancer were estimated by computing the odds ratios (OR) with 95% confidence intervals (CIs). A p value < 0.05 was considered significant.

Results

Study population: A summary of the baseline characteristics of the lung cancer patients and healthy controls are presented in Table 1. Present study included 80 lung cancer patients and 80 healthy controls. Among the patient group, 60 were adenocarcinoma and 20 were squamous cell carcinoma. Lung cancer patients were diagnosed in different stages (Stage I=2.5%, Stage II=8.75%, Stage III=32.5% and Stage IV=57.5%) with varying histological grades (Grade 1=2.5%, Grade 2=41.25% and Grade 3=28.75%). Majority of the lung cancer patients were males (72.5%) and the overall mean age for the patient group was 57.6 years in the range of 28 to 87 years.

Genotype distribution: Compared to healthy controls it was observed that there was a statistically significant difference between the frequency of miRNA-146a (rs2910164 GG, CG and CC) genotypes of lung cancer patients (p=0.0097). Among the two study groups miRNA-146a CC homozygous genotype was significantly overrepresented by lung cancer patients than healthy controls (40% vs. 18.75% respectively). Upon estimating the allele frequency, it was observed that lung cancer patients represented higher miRNA-146a C allele (0.67) frequency than the miRNA-146a G allele (0.33) frequency (Table 3).

Genotype and risk of developing Lung cancer: Odds ratios (OR) with 95% confidence intervals (CIs) was used to estimate the risk of developing lung cancer in association with different miRNA-146a (rs2910164 G>C) gene variants. Compared to miRNA-146a (rs2910164 GG) genotype, Odds ratios of 4.3 (1.24-14.69, p=0.036) for the homozygous CC genotypes was observed, suggesting a possible dominant effect of the miRNA-146a (rs2910164 CC) genotype in the risk of developing lung cancer (Table 4).

</tbody>
</table>

Genotype distribution among clinical parameters: It was observed that the all the lung cancer stages (I to IV) represented higher frequency of miRNA-146a C allele. In the advanced stage with distant metastasis (stage IV), the frequency of miRNA-146a C allele was 0.64 and the frequency of miRNA-146a G allele was only 0.36. Both the histological types showed higher frequency of miRNA-146a C allele; however, the squamous cell carcinoma patients represented much higher frequency of miRNA-146a C allele than adenocarcinoma patients (SCC=0.78 & ADC= 0.63). With respect to the histological grades of lung cancer patients (Grade 1, 2 & 3), all showed higher frequency of miRNA-146a C allele compared to that of miRNA-146a G allele frequency (Table 5).

Discussion

MicroRNA 146a has been observed to regulate the functionality of several important genes which are involved in cancer development, such as TNF receptor-associated factor 6 (TRAF6), IL-1 receptor associated kinase (IRAK1) and nuclear factor kB (NFkB)\(^{(10)}\). MicroRNA-146a act as tumor suppresser gene and play an important role in reducing cell proliferation, increasing apoptosis, and enhancing chemosensitivity\(^{(11)}\). Increased miRNA-146a expression has been shown to negatively regulate the release of the proinflammatory chemokines IL-8 and RANTES among human lung alveolar epithelial cells\(^{(12)}\). MicroRNA-146a targets FADD mRNA thereby plays an anti-apoptotic role during T-Cell activation \(^{(12)}\). A considerable reduction in epidermal growth factor receptor (EGFR) protein has been observed in the MDA-MB-231 cell line on transduction with miRNA-146a\(^{(13)}\). In-vitro analysis studies had observed a significant role of miRNA-146a in suppression of breast cancer metastasis \(^{(13)}\). MicroRNA-146a targets insulin receptor substrate 2 (IRS2) thereby inhibits epithelial mesenchymal transition in non-small cell lung cancer \(^{(14)}\). Jia Y et al observed that the expression of miRNA-146a was significantly decreased among lung cancer patients \(^{(15)}\). It has been observed that the genetic variability in miRNA-146a (rs2910164C>G) has a significant influence on the expression and secondary structures of the miRNA-146a \(^{(7)}\). In the present study, we aimed to find out the association of miRNA-146a gene polymorphism with the risk of developing lung cancer disease.

Present study provides the evidence that the genetic variability in miRNA-146a gene is associated with the susceptibility to develop lung cancer disease. Lung cancer patients represented significantly higher percentage of miRNA-146a CC homozygous genotype as compared to that of healthy controls. It was observed that the risk of developing lung cancer disease was 4.3 times more in association with miRNA-146a CC genotype. Interestingly, it was observed that all the lung cancer stages (I to IV) and histological grades (Grades 1 to 3) represented higher frequency of miRNA-146a C allele. Squamous cell carcinoma patients represented much higher frequency of miRNA-146a C allele than adenocarcinoma patients. Our results are consistent with the findings of Zhihua Yin et al \(^{(7)}\); it was observed that the individuals carrying miRNA-146a CC genotype had more risk of developing lung cancer compared to that of individuals carrying miRNA-146a CG or GG genotypes\(^{(7)}\).

In conclusion, it was observed that the genetic variability in miRNA-146a gene may be associated with the susceptibility of lung cancer disease. In order to confirm our findings, large studies with different ethnic populations are required.

ABSTRACT

Background: The TP53 protein functions by regulating cell cycle arrest, DNA repair, apoptosis, and gene transcription to mediate cellular responses to DNA damage. Many studies have reported that the p53 codon 72 polymorphism is associated with Leukemia susceptibility; however, the conclusions are inconsistent. Therefore this study was aimed to investigate the association of TP53 Arg72Pro gene variations with leukemia susceptibility in Saudi Arabia.

Methodology: This population-based case–control study was done on 68 clinically confirmed Leukemia patients and 102 matched healthy controls with no history of any type of cancer. The TP53 (rs1042522 G/C) genotyping was detected by using Allele specific PCR.

Results: We observed a statistically significant difference in the frequencies of TP53 GG, GC and CC genotypes among patients and healthy controls (p=0.004). The higher frequencies of GG (26, 50%), CC (13.20%) genotypes were reported in leukemia patients than the health controls GG (22.54%) and CC (01%) whereas the higher frequencies of GC genotypes (76.47%) was reported in healthy controls compared to cases GC genotypes (60.30%). Our findings showed that the TP53 (rs1042522 G/C) variant was associated with an increased risk of leukemia in codominant inheritance model (OR=11.50, 95%CI= (1.33-99.3); RR=5.60 (0.85-36.7), P=0.020 GG vs CC and in recessive inheritance model (OR=15.5, 95%CI= (1.92-125.8), RR (6.33(0.98-40.8) P=0.010 (GC+ CC) vs CC. There was no significant difference in dominant inheritance model (OR=0.80, 95% CI= (0.39-1.64); RR=0.91(0.67-1.24),P=0.55 (GC+ CC) VS GG. This study indicates that TP53 CC the GG+GC combination may be risk factors for Leukemia patients in our Saudi population.

Conclusion: Our findings indicated that TP53 CC and (GC+CC) genotype are associated with an increased susceptibility to leukemia in Saudi Arabian population. It can be used as a predisposing genetic marker for Leukemia. Further studies with larger sample sizes are necessary to confirm our findings.

Introduction

The leukemia was present in 2.3 million people and caused 353,500 deaths in 2015⁽¹⁾. The Leukemia was diagnosed among new cases of about 352,000 (2). In Saudi Arabia the age-standardized incidence rate (ASIR) for leukemia was 3.0 per 100,000 populations as reported by The International Agency for Research on Cancer (IARC) (2008) whereas the age-standardized mortality rate (ASMR) was 2.6 per 100,000 populations⁽⁴⁾. From

1975 to 2011 the registry of King Faisal Specialist Hospital and Research Center recorded 6216 cases of leukemia admitted to the hospital. The Saudi Cancer Registry (SCR) reported that leukemia ranked third in cancer incidence among the male population, and fifth among females\(^5\). The ASIR of leukemia in Saudi Arabia is slightly low in comparison with other Arabian Gulf countries in 2008.

The TP53 is a tumor suppressor gene and is located on chromosome 17p13. TP53 plays a pivotal role in the maintenance of genomic stability through encoding of the TP53 protein.\(^6\) This gene encodes a tumor suppressor protein containing transcriptional activation, DNA binding, and oligomerization domains. The encoded protein responds to diverse cellular stresses to regulate expression of target genes, thereby inducing cell cycle arrest, apoptosis, senescence, DNA repair, or changes in metabolism.\(^7\) Mutations in this gene are associated with a variety of human cancers, including hereditary cancers such as Li-Fraumeni syndrome\(^8\). Additional isoforms have also been shown to result from the use of alternate translation initiation codons from identical transcript variants\(^9\). The TP53 protein functions by regulating cell cycle arrest, DNA repair, apoptosis, and gene transcription to mediate cellular responses to DNA damage\(^10\). Frequent mutations and differential expression of TP53 in various cancers highlight the significance role of p53 in carcinogenesis and tumor progression\(^11\).

A functional single-nucleotide polymorphism (SNP) at codon 72 of TP53 gene (rs1042522), encoding a transversion of G to C (Arg to Pro), has been demonstrated to be associated with interindividual differences of TP53 expression to malignant tumors, including leukemia\(^12\). In addition, it has been reported that the Arg72 variant induces apoptosis markedly better compared to the Pro72 variant\(^13\). Thus, this genetic polymorphism holds promise as a potential biomarker for leukemia. The tumor protein p53 (TP53) plays a key role in preventing tumor formation through orchestrating a diversity of pathways such as DNA repair, regulation of cell cycle progression and activation of cell signaling transduction responses and apoptosis.\(^14-15\) Generally, TP53 mutations are thought to be associated with carcinogenesis\(^16-17\). Many studies have found that the TP53 played an important role during the development of leukemia.\(^18\) Among known TP53 polymorphisms, Arg72Pro (rs1042522), an amino acid substitution of arginine (Arg) to proline (Pro) at position 72, is one of the most widely studied polymorphisms.\(^19\) It was reported that the allele A1 (proline residue, Pro72) was more frequent in patients with leukemia than in controls, and among leukemia patients who had no cytogenetic response than among responders\(^20\).

However, subsequent studies showed different results about TP53 Arg72Pro polymorphism and leukemia susceptibility. To date, numerous studies have investigated the relationship between the TP53 Arg72Pro polymorphism and predisposition to leukemia, but the impact of TP53 Arg72Pro polymorphism on leukemia was still conflicting due to inconsistent findings in individual studies therefore this study was aimed to investigate the association of TP53 Arg72Pro gene variations with leukemia susceptibility in Saudi Arabia.

**Materials and Method**

**Sample collection:** This population-based case–control study was done on 68 clinically confirmed Leukemia patients and 102 matched healthy controls with no history of any types of cancer and not related to the patients. After assessing the clinicopathological findings, a 4ml sample of peripheral blood was collected by venipuncture in EDTA tubes from each patient and healthy control.

**DNA extraction:** The DNA was extracted by using DNeasy Blood Kit (cat 69506) from Qiagen (Germany) as per the manufactures instructions. The extracted DNA was dissolved in nuclease-free water and stored at 4°C until use. Quality and integrity of DNA were checked by NanoDrop™ (Thermo Scientific, USA).

**Genotyping for TP53 Arg72Pro or G/C allele (rs1042522 C) polymorphism:** The TP53 Arg72Pro or G/C genotyping was detected by using Allele specific-PCR. The or AS-PCR primers were designed by using Primer3 software as depicted in Table 1.
Table 1: Allele specific-PCR primers used for analysis of TP53 (rs1042522 G/C) gene variation

<td>65°C</td>
</tr>
<tr>
<td>Reverse primer R2</td>
<td>5’-CTGTTGACGGGGCCACGC-3’</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AS-PCR was performed in a reaction volume of 25uL containing template DNA (50ng), F1 -0.20uL , R1 -0.20uL , F2-0.20uL , R2 -0.20uL of 25pmol of each primers and 10uL from GoTaq® Green Master Mix (cat no M7122) (Promega, USA). The final volume of 25 uL was adjusted by adding nuclease free ddH2O .Finally 2ul of DNA was added from each patient. The AS –PCR was converted to AS-PCR.

**Thermocycling conditions:** The amplification conditions used were at 95°C for 10 minutes followed by 40 cycles of 94°C for 35sec, 58°C for 40 sec for Proline and 65°C for 40 sec for arginine, 72°C for 40 sec followed by the final extension at 72°C for 10 minutes. The amplification products were separated by electrophoresis through 2% agarose gel stained with 0.5μg/mL ethidium bromide and visualized on a UV transilluminator. Primers F1 and R1 amplify a wild-type allele (G allele), generating a band of 238 bp, and primers F2 and R2 generate a band of 178bp from the mutant allele (C allele) as depicted in figure 2.
**Statistical analysis:** Differences in the TP53 (rs1042522 G/C) allele and genotype frequencies between groups were evaluated using Chi-square test. The associations between TP53 (rs1042522 G/C) gene and risk of Leukemia were estimated by computing the odds ratios (ORs), risk ratios (RRs) and risk differences (RDs) with 95% confidence intervals (CIs). All statistical analyses were performed using Graph Pad Prism 6.0 or SPSS 16.0.

**Results**

**Study population:** This population-based case–control study was done on 68 clinically confirmed Leukemia patients and 102 matched healthy controls. This research study was approved by the Research ethics committee, University of Tabuk and written informed consent was obtained from all the subjects before enrollment.

**Genotype distribution of TP53 G/C gene variation in Case-control:** We observed a statistically significant difference in the frequencies of TP53 GG, GC and CC genotypes among patients and healthy controls (p=0.004) as summarized in Table 2.

<table>

</tr>
</tbody>
</table>

This study reported significantly higher percentage of GG (26.50%), GC (60.30%) and CC (13.20%) genotypes in patients compared to controls GG (22.54%), GC (76.47%) and CC (01%) as depicted in figure 3. The higher percentage of CC genotype (13.20%) was reported in patients compared to healthy controls (1%) as depicted in table 2.

**Allelic distribution of TP53 (rs1042522 G/C) gene variation in Cases-controls:** The frequency of C allele (fC) was found to be higher among the leukemia patients (0.43) than the healthy controls (0.39) whereas, the higher frequency of G allele (fG) (0.61) was observed among the controls than the leukemia patients than (0.57) as depicted in table 2.

**Risk of Leukemia patients with TP53 (rs1042522 G/C) gene polymorphism:** A multivariate analysis based on logistic regression like odds ratio, risk ratio and risk difference with 95% confidence intervals were calculated for each group to estimate the association between the TP53 (rs1042522 G/C) variant and risk of Leukemia patients in Saudi patients as depicted in table 3. Our findings showed that the TP53 (rs1042522 G/C) variant was associated with an increased risk of leukemia in codominant inheritance model (OR=11.50, 95%CI= (1.33-99.3); RR=5.60 (0.85-36.7), P=0.020 GG vs CC and in case of and recessive inheritance model (OR=15.5, 95%CI= (1.92-125.8), RR (6.33(0.98-40.8) P=0.010 (GC+ CC) vs CC .There was no significant difference in dominant inheritance model.
(OR=0.80, 95% CI= (0.39-1.64); RR=0.91(0.67-1.24), P=0.55 (GC+ CC) VS GG However, we did not find any relationships among tumor grade and metastasis status and this polymorphism. This study indicates that the TP53 (rs1042522 G/C) polymorphism CC genotype and the GG+GC combination may be risk factors for Leukemia patients in our Saudi population.

**Discussion**

Disruption of the p53 tumor suppressor pathway is a primary cause of tumorigenesis. There is clear discrepancies between ethnicity and geographic area regarding the peak age incidence and mortality of Leukemia. Underlying variances include genetic, environmental, and socioeconomic factors. The wild-type p53 codon has two common polymorphic variants from a single-base-pair substitution at codon 72, where either C-C-C encodes proline (p53-p72) or C-G-C encodes arginine (p53-R72). The TP53 codon 72 polymorphism Arg72Pro (rs1042522), an amino acid substitution of arginine (Arg) to proline (Pro) at position 72, is one of the most investigated polymorphisms. Bergamaschi et al.\(^{[20]}\) reported that allele A1 (proline residue, Pro72) was more frequent in patients with CML than in controls, and among CML patients who had no cytogenetic response than among responders. However, the subsequent studies did not achieve the same or similar results, and the association between TP53 Arg72Pro polymorphism and AML susceptibility is still controversial. Our results indicated that the higher percentage of GG (26.50%) and CC (01%) as depicted whereas the higher percentage GC (76.47%) heterozygosity was reported in leukemia patients than the healthy controls GC (60.30%). When stratified by ethnicities, a protective effect of the TP53 codon 72 Pro allele was found in Asians even with a small number of studies (331 cases and 437 controls). The association was calculated for each group by multivariate analysis. The significant correlation was reported between the TP53 genotypes and risk of Leukemia patients in our population. The TP53 genotypes was associated with an increased risk of leukemia in codominant inheritance model (OR=11.50, 95%CI= (1.33-99.3); RR=5.60 (0.85-36.7), P=0.020 GG vs CC and in case of recessive inheritance model (OR=15.5, 95%CI= (1.92-125.8), RR (6.33(0.98-40.8) P=0.010 (GC+ CC) vs CC. The current study confirmed the relationship of TP53 (rs1042522 G/C) gene polymorphisms and the risk of Leukemia in the Saudi Arabian population. Similar results were also found in stratified analysis according to ethnicity and source of controls. Lastly, since the leukemia onset involves multiple genetic and environmental factors, although TP53 Arg72Pro polymorphism showed no independent significant association with the susceptibility of this disease, it may have influence on leukemia susceptibility in combination with other elements.
Conclusion: Our findings indicated that TP53 CC and (GC+CC) genotype are associated with an increased susceptibility to leukemia in our Saudi Arabian population. It can be used as a predisposing genetic marker for Leukemia. Further studies with larger sample sizes are necessary to confirm our findings.

Analysis of Human Resources Performance Measurement by Human Resources Scorecard Method at Hospital in Surabaya

Amelia¹, Prima Nerito¹, Nyoman Anita Damayanti²

¹Departement of Administration and Public Policy, ²Lecturer on Departement of Administration and Public Policy, Airlangga University, Surabaya, Street of Dr. Ir. H. Soekarno, Mulyorejo

ABSTRACT

Numerous of hospitals in Surabaya have not yet implemented systematic employee performance measurements. So the hospitals have not yet able to know the success rate of the human resources division strategy in realizing the company’s vision, mission, and strategy. The Human Resources Scorecard (HRSC) is a form of human resource measurement that correlating people-strategies-performance to be measured the extent to which they contribute to the achievement of the company’s vision, mission and strategy. The strategy of mixed methods in this research is the sequence of qualitative and quantitative analysis. The objective of this strategy is to design the strategy map of human resource and identify success indicators of each strategy objectives through qualitative data analysis, and further quantitative data analysis to find out the process of HR performance measurement by Human Resources Scorecard method based on Analytical Hierarchy Process (AHP) and Traffic Light System.

Keywords: Performance Measurement, Human Resources Scorecard, AHP, Traffic Light System

Introduction

Human resources are one of the main factors that determine the level of a company’s performance in achieving the objectives, and they are one of the important tangible assets in the company. The companies are need employees who are fostered and educated to serve a good performance. By having qualified and capable employees will improve the company’s performance. A company that loses all its equipment but still has the skills and knowledge of its employees will be able to get back into business competition in a relatively quick time while a company that loses its skilled employees but retains its equipment will be difficult to recover². It can be seen from these situations that human resources is very important assets in a company, especially in a hospital. So it is necessary to measure the performance of human resources in order to know the success rate of the hospital.

Performance measurement is an assessment process of the work progress on goals and objectives in the management of human resources to produce goods and services, including information on the efficiency and effectiveness of actions in achieving organizational goals¹¹. Measurements on performance need to be performed to determine whether during the performance execution there were deviations from predetermined plans, or whether the performance can be performed within the specified time schedule, or whether the performance results have been achieved as expected.

Robert S. Kaplan and David P. Norton in 1992 introduced performance measurement techniques involving measurement of financial and nonfinancial aspects, known as Balanced Scorecard. The Balanced Scorecard translates missions and strategies into different objectives and measures, which were prepared into four perspectives: financial perspective, customer perspective, internal business process perspective, and learning and growth perspective. Based on the Balanced Scorecard model introduced by Kaplan and Norton, it was developed a new tool in human resource management and employee performance measurement, i.e. the Human Resources Scorecard. This model was introduced by

DOI Number: 10.5958/0976-5506.2019.01304.4
Brian E. Becker, Mark A. Huselid, and Dave Ulrich in 2001. Human Resources Scorecard tries to measure HR by correlating people-strategy-performance to create excellent companies, and also outlines vision, mission, and strategy, into human resources action that their contribution can be measured. The target achievement will depend on the other resources (machine, material, method, and finance), where the resources will be moving if the human is moving. To assess the effectiveness of employees contribution is not only seeing the lagging indicator, but it is also necessary to consider the leading indicator as well. Lagging indicator is the result of company performance, while leading indicator is the performance expected to achieve a final result to be achieved by the company.

Performance measurement system that conducted at Hospital in Surabaya mostly do not use standard format as KPI or Scorecard. In this research, human resource performance analysis is performed in hospitals that focus on human resources by using Human Resource Scorecard. So in this research, the design will be conducted on human resources performance measurement system by Human Resources Scorecard approach.

Material and Method

This study used a sample of employees at Emergency Unit at one hospital in Surabaya. The study was conducted in three stages, which are preliminary survey, data collection, processing and analysis. Data collection is an important part of the research that will be used as the material for preparing the research report. Sources of data obtained in this research are primary data and secondary data source. Primary data was obtained directly from the hospital by conducting observations and interviews on hospital employees. The interviews were explained the implementation of company’s vision, mission and strategy, strategic objectives, employee’s behaviors that support strategy, company systems, performance indicators, strategic goals and initiatives. And the questionnaires were distributed to the expert respondents, those are the Head of Human Resources and the Head of Emergency Unit to get the priority weight. Secondary data was collected in the processed form. In this case the secondary data includes documents and reports, such as company’s mission, vision, strategic objectives, employee turnover, employee’s performance score, employee’s productivity, etc.

Findings

1. Strategy Map: In HRSC measurement it is important to firstly make a strategy map of human resource division. Developing a strategic map should define clear, measurable, and achievable targets that lead to improvements in company efficiency. In each of HRSC perspective, the goals should be determined from human resource behavior.

The company’s targets are the preferred company, cost optimization, improve profitability, and customer-oriented. These are in line with hospital’s vision and mission that are committed to optimize the life quality of the people with loving, trustworthy and customer-focused services. Based on the vision and mission, the strategic goals of this hospital are to provide trusted and customer-focused service, increase profits, and minimize the work risks.

The successful of strategic goals achievement is greatly influenced by the role of human resources as the driving wheel. Therefore the strategy must be appropriate on target, and the following is the strategic map of human resources that shown in Figure 1.

![Figure 1: Strategic map of hospital](image)

2. Key Performance Indicator: Each strategy objective has a success indicator. KPI is a set of quantitative measures that companies used to measure performance in accomplish their strategic and operational objectives. Identification of strategy objective KPI of Human Resource Division on Emergency Unit is shown in Table 1.
Table 1: Identification of strategy objective KPI of Human Resource Division on Emergency Unit

3. Weighting by AHP Method: Analytical Hierarchy Process (AHP) is a weighting method introduced by Thomas L. Saaty. The first step is spreading the weighting questionnaires to resource persons. This weighting is perception or opinion in nature, so it must be done by people who understand the vision, mission, condition and strategy of the hospital. After that the second step is giving weight based on the importance of each strategy objective. Weighting results are shown in Table 2.

4. **Score Calculation**: The performance calculation is performed after the KPI is made and the weighting has been given. The first step is to determine the maximum and minimum score of each indicator. Then enter the reality score that occurs in the field, so it can be seen how the position of the reality score and the targeted score.

Analysis of Performance Calculation Result: Analysis of the KPI data table is using Traffic Light System. Traffic Light System is closely related to Scoring System. Traffic Light System is functioned as a sign whether the score of a performance indicator requires improvement or not and it will be presented by three colors, these are:

a. **Green color**: It is interpreted that the achievement of a performance indicator has been achieved and it is given for the performance score at the level of eight to ten.

b. **Yellow color**: It is interpreted that the achievement of a performance indicator has not yet achieved, although the score is closely to the target. The yellow color is given for the performance score at the levels of four to seven. So the management must be careful with each possibility that will arise.

c. **Red color**: It is interpreted that the achievement of a performance indicator is really under of the target set and it is requires immediately improvement. The red color is given for the performance score at the level of zero to three.

The followings are the result of analysis using traffic light system:

| Table 4: KPI’s Traffic Light System of Lagging Indicator |
|----------------------------------|-------------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|

| Weight | 0.524 | 0.142 | 0.334 | 0.096 | 0.161 | 0.277 | 0.466 | 0.141 | 0.082 | 0.254 | 0.113 | 0.430 | 0.137 | 0.239 | 0.824 |
| Value | 4.716 | 0 | 3.34 | 0.192 | 0 | 1.662 | 1.864 | 0.705 | 0.620 | 2.54 | 0.452 | 4.300 | 0.528 | 0.717 | 3.744 |
The results of performance measurement of lagging indicator are greater than the leading indicator. However, this is not a problem because the formed performance balance is close to balanced conditions and both of them are in the green category. Lagging indicator got 8 score and leading indicator got 8.18 score.

If the performance of lagging indicators are much better than the performance of leading indicators it is indicates that the achievement of lagging indicator is more based on luck or coincidence factors, because that achievement is not accompanied by good achievement of performance leading indicator. While, the companies cannot depend continually on the luck factor, because it wouldn’t accompany them in each time and each efforts. Therefore, if this condition was occurred then the company must improve the performance process to support the outcomes of expected results by the company.

If the performance of leading indicators are much better than the performance of lagging indicator it is indicates that the process to achieve the expected results of the company has not yet appropriated on target, because the achievement of lagging indicators is bad or under of the target. The conditions like this is too injuring the company, because this means that the process undertaken by the company to achieve the company’s target is feels vainly because the end result that expected by the company cannot be achieved. Therefore, if this condition is experienced by the company then the company must think about the appropriated process of target to be done so that the end result is achieved.

**Conclusion**

The results of this study indicate the hospital strategy map in conducting human resource management activities to achieve strategic goals is a description of the vision and mission of the hospital. The causing and the effect factors of this hospital has been running in balance so that the company has made the appropriated process in achieving the targets to be achieved. It is needs the improvement in some indicators that still provide red results on HRSC analysis results.

ABSTRACT

Tuberculosis lungs attacked the most productive age group (15-50 years), social economy is weak and low education. Estimated a patient TB adult will lose the average time it works 3-4 months. This resulted in the loss of annual revenue run their house around 20-30%. In addition to harm economically, TB also provides other negative impact socially, even excluded by the community. In this research will be discussed about the factors that were supposed to affect many cases for TBSD which occurred in East Java with Poisson regression. But because they found the existence of the case of overdispersi so that need to pay attention to the factors location from the point of observation and used GWPR. From the results of the analysis and discussion, obtained the result that GWPR model more appropriate to analyze the patients TBSD in East Java because it has smaller AIC value. The dominant factor in influencing TBSD in all districts in East Java is the percentage of poor families (X1), except in Ngawi district and Magetan. For bTA+ (X2), the number of HIV/AIDS (X3), numbers genesis diabetes mellitus (X4), the percentage of the population density (X5) and rasio health workers (X6) affect TBSD patients in 7 groups of districts in East Java.

Keywords: TBSD, Poisson Regression, GWPR

Introduction

The Disease TB lungs is the cause of the death of three number after cardiovascular disease and respiratory disease in all age groups and the number one from the infectious diseases. Roughly estimated each 100,000 inhabitants of Indonesia there are 115 new patients TB positive lung. The Disease TB lungs attacked the most productive age group (15-50 years), social economy is weak and low education¹. Estimated a patient TB adult will lose the average time it works 3-4 months. This resulted in the loss of annual revenue run their house around 20-30%. In addition to harm economically, TB also provides other negative impact socially, even excluded by the community. The main cause of increasing the burden of the problem of TB among others is poverty on various community groups such as in the countries of developing, changes it conveys demographics due to the rising world population and changes in the structure of the age of population; the impact of the HIV pandemic.

The problem of treatment TB become an important public health problem and need to be solved soon. The incidence of drug resistance increased since the introduction of the treatment of TB that first time in 1943. Tuberculosis Case Sensitive drugs continues to increase. Mok, et al² write that from 378 respondents with TB of Internally throughout the year 2010 with 7 Hospital Education in Korea, obtained 57.1% patients with TB of primary SD. Clinical managements TB uses drugs anti-TB lini I and II causing the problem of tolerance and side effects. Patients with TB that have undergone treatment for the first time, feel himself back healthy, they really very infeksius until they assigned no longer as patients through a number of test.
The results of research done in West Nusa Tenggara (NTb) by Erawatyningsih, et al, The type of the work of patients with TBSD that on the move, make the desperate patients continued treatment, which impact with the prolonged especially more resistensnya against *Mycobacterium tuberculosis* so that patients become very infeksius source.

The status of the economy very closely also with contracting TB, because the small income make people could not live worthy to meet the conditions of health. Patients with TB of internally with low economic level, find difficulties in the requirements of healthy house or balanced nutrition, this is in line with the research, Who wrote as much as 34.4 percent of respondents with BTA+ and resistant to Drugs Anti Tuberculosis, is derived from the economic level below.

Kizito, et al in The Journal of Tuberculosis and Lung Disease, wrote in Kampala, Uganda, there are patients with TB of Internally that “limits been notified and waiting treatment” in 2013 as much as 100 people who are all located living in a shantytown and densely populated with personal hygiene bad, which is the source of infection *Mycobacterium tuberculosis*.

Patients with HIV/AIDS vulnerable to continued for 2 nd shot TB of the Lung directly in stages TB of Internally supported this research (*MDR). Similarly with Diabetes Mellitus, backer DM will experience of the weakness of the immune system that is causing the sufferers have the possibility of 3 times higher to suffer TB, this written by Laurentia, et al. Which in the period of ten years obtained screening result DM (*Diabetes Mellitus*) in patients with TB shows a high prevalence of around 5.4 % - 44.0 %, instead of diabetes mellitus as a risk factor makes TB resistant (OR:1.5 - 8.9). So that patients with HIV-AIDS and disabilities DM if to patients with TB is very infeksius. So in this research, want to obtained the relationship between the number of cases of patients with TB of internally in East Java with the variables predictors which allegedly influence with how to get the best relationship model using poisson regression analysis.

**Material and Method**

This research using secondary data obtained from the profile data the health of the province of East Java 2015 and Reporting Data P2TB East Java Provincial Health Office 2015. The variable data is examined in the form of the address and the date the enactment of respondents as patients with TB of internally in East Java Province. The variables used in this research consists of one response variable (Y), the number of patients with TBSD and 6 predictors variables, the percentage of poor families (X₁), BTA+ (X₂), the number of HIV/AIDS (X₃), numbers Genesis Diabetes Mellitus (X₄), the percentage of the population density of (X₅) and the ratio of health workers (X₆) and the layout of the latitude south (ui) and East longitude layout (vi).

The steps done in the analysis of the data to achieve the goal of research covers

1. Do multikolinieritas detection against the variables predictors
2. Get the best model Poisson Regression on the number of patients with TBSD modeling in East Java
3. Get the best model GWPR on the modeling the number of patients with TBSD in East Java with some analysis phase

**Results**

Before done multiple regression analysis which contains more than 1 free variable test needs to be done in the variable multikolinearitas predictors. Multicolinearity check on this research based on based on the correlation between and the value of VIF each of which is shown in table 1.

</tbody>
</table>

The results of the parameter estimation value reached convergence after iteration 4. Next, test is done simultaneously parameters to know is whether or not the influence of the independent variables against the dependent variables with the hypothesis as follows:

H0 : \( \beta_1 = \beta_2 = \beta_3 = \beta_4 = \beta_5 = 0 \)

H1 : most no one \( \beta_j \neq 0, J = 1, 2, 3, 4, 5, 6 \)

The value of the deviance on this analysis of 3023.5 and \( \chi^2_{(31; 0.05)} = 44.9853 \), Then reject H0 because \( \hat{D}(\hat{\beta}) \text{hitung} > \chi^2(v; \alpha) \) So it can be concluded that there are at least one independent variables that affect the significant impact on the dependent variables. Then the test is done partially parameters to know the influence of each independent variables.

H0 : \( \beta_i = 0 \) (Variables to-I do not affect significant)

H1 : \( \beta_i \neq 0 \) (Variables to-i give significant influence)

Using the MLE method obtained the estimation of parameters as follows:

<td>0.000</td>
</tr>
</tbody>
</table>

Table 3. Show that \( |Z_{\text{hitung}}| > Z_{(0.025)} \), Where \( Z_{(0.025)} \) By 1.96, so that on a significant level 5 percent decline H0 which means a variable BTA*, the number of HIV/AIDS, numbers Genesis Diabetes Mellitus, the percentage of the population density and the ratio of health workers influential significant on the number of patients with TB of contraction 2015. While for the variable the percentage of poor families is not significant in affecting the number of patients with TBSD 2015, because the value of Z smaller than 1.96 or p-value = 0.144 greater than 0.05, in get the poisson regression model obtained is as follows:

\[
\hat{\mu} = \exp(5.956 + 0.00247 \times X_1 + 0.00080 \times X_2 - 0.00057 \times X_3 + 0.00008 \times X_4 + 0.04966 \times X_5 - 0.00125 \times X_6)
\]

Increase or decrease the number of patients with TB contraction each district in East Java 2015 depending of the value of the coefficient of each variable
that influence. Furthermore done overdispersi case examination on poisson regression model is Value of Deviance 3023.5, Db 31, is 97.532 greater than 1 so that it can be concluded on poisson regression model number of patients with TBSD each district in East Java 2015 happened overdispersi.

The analysis using the GWPR method aims to know the variables that affect the prevalence of TB Disease occurrence in each of the location of the observation in Regency/City of East Java Province. Following the modeling the number of patients with TB using GWPR method.

The first step is done to get GWPR model is to determine the coordinates of the point latitude and longitude on each location to count the distance euclidean, and determine the optimum bandwidth values based on the criteria AICc. The next step is to determine the matrix pembobot with kernel function.

The matrix weights obtained for each location and then used to form a model, so that obtained the model vary in each location of observation. The estimation of model parameters GWPR served in table 4 below

<table>
<thead>
<tr>
<th>The Parameters</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\beta_1$</td>

</tr>
</tbody>
</table>

Modeling the number of patients with TB in Regency/City of the province of East Java using Geographically Weighted Poisson Regression approach to while is a model that better if compared with the poisson regression model.

Testing the hypothesis GWPR model consists of two test, namely suitability test GWPR model and test the significance of the parameters GWPR model. The following is the results of the hypothesis testing GWPR model:

$H_0 : \beta_k(u, v) = \beta_k, K = 1, 2, ..., 12$ (there is no significant difference between the poisson regression model (global) and GWPR model)

$H_1 : \beta_k(u, v) \neq \beta_k$ (no difference between significant poisson regression model (global) and GWPR model)

Table 5: Test the suitability of the GWPR Model

<table>
<thead>
<tr>
<th>Source</th>
<th>Deviance</th>
<th>DOF</th>
<th>Deviance/DOF</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Model Global</td>
<td>3.023.533</td>
<td>31</td>
<td>97.533</td>
</tr>
<tr>
<td>Model GWR</td>
<td>5.035</td>
<td>0.067</td>
<td>75.344</td>
</tr>
<tr>
<td>Difference</td>
<td>3.018.497</td>
<td>30.933</td>
<td>97.581</td>
</tr>
</tbody>
</table>

Table 5 shows that the value of deviance/DOF difference of 97.533 and , Then Reject $H_0$ because $B(\hat{\beta}^2)_{hitung} > \chi^2(v; \alpha)$so it can be concluded that on the model of the number of patients with TB of Internally each district in East Java 2015 is GWPR

The next step is testing the significance of model parameters GWPR partially to know any parameters that affect the number of patients with TB in each location of observation. The hypothesis that is used is as follows:

$H_0 : \beta_k(u, v) = 0$

$H_1 : \beta_k(u, v) \neq 0; I = 1, 2, ..., 31; k = 1.2, ...., 12$

With equal significance ($\alpha$) of 5%, value $t_{0.025;32} = 2.037$. The following variables predictors which affect significantly on each observation location that is served on the table 6

Table 6: The value of T-statistic on the variables in each District Using Adaptive Guassian

Discussion

There are several variables that indicate the relationship of almost no correlation that meets the requirements of poisson regression and 2 predictor variables assessing VIFs over 10 percentage of poor people in each district in East Java and the average of school population variables in each district in East Java.

Based on table 6, with bandwidth size = 9 it can be seen that all observation locations identify variables that significantly influence in all districts in East Java province to group 7. Being the reference of handling pulmonary tuberculosis disease.
Conclusions

Based on the results of the analysis and discussion, can be concluded that the model of the GWPR more appropriate to analyze the patients TBSD in East Java because it has smaller AIC value. The dominant factor in influencing TBSD in all districts in East Java is the percentage of poor families, except in Ngawi district and Magetan for BTA+, the number of HIV/AIDS, numbers genesis diabetes mellitus, the percentage of the population density and rasio health workers affect TBSD patients in 7 groups of districts in East Java.

Determination of Platelets Count and Platelets Indices in Neonatal Sepsis at Khartoum State

Aadil Yousif¹, Emtinan Arki², Rufaida Abdelgader²
¹Department of Medical laboratory technology faculty of Apply Medical Sciences, University of Tabuk, Saudi Arabia; ²Alamal Hospital, Bahri-Sudan

ABSTRACT

Aims and Objective: The present study aims to investigate the changes in platelets count, Mean platelet volume (MPV) and Platelet Distribution Width (PDW) in preterm and full term proven diagnosed as septic neonates and their correlations with birth weight and gestational age.

Material and Method: After taking approval from ethical committee of Ministry of Health (Sudan). The attending nurse collected peripheral blood samples under aseptic precautions in EDTA blood container at bedside in the period from June 2016 to March 2017. A complete hemogram was performed using ABX Micros ES60 haematology analyser.

Results: 200 cases included in this study, 113 (56.5%) males and 87 (43.5%) females. Full term babies account for 78 (39%) while premature babies account for 122 (61%). Thrombocytopenia was present in 115 (57.5%) cases, in which 83 (72.2%) had mild and moderate thrombocytopenia, and just 32 (27.8%) had developed severe. 76 (66.1%) of the cases of thrombocytopenia are premature babies and 39 (33.9%) are full term babies. There was significant difference in platelets count between full term and preterm p value 0.008. In platelet indices, MPV and PDW were significantly increased in all cases, but there was insignificant difference in platelets indices between the preterm and full term babies p value 0.125 and 0.958 respectively.

Conclusion: Variation in the degree of thrombocytopenia and platelet indices was seen in neonatal sepsis. Severe degree of thrombocytopenia associated with proven sepsis. MPV and PDW was significantly increased in in all cases with sepsis.

Keywords: Sepsis, Mean Platelet Volume (MPV), Platelet Distribution Width (PDW), Platelets Count

Introduction

Platelets are only about 20% of the red blood cells diameter, the most numerous cell of the blood. The normal platelet count is about 150,000-450,000 per micro liter of blood, because of the platelets are so small, they make up just a tiny fraction of the blood volume and the principal function of platelets is to prevent bleeding. They stimulate the shape change and platelets then aggregate onto the fibers, providing the primary plug to prevent bleeding, the leak of red blood cells and plasma through the vessel injury.

The various Platelet indices are- Mean Platelet Volume (MPV), Platelet Distribution Width (PDW) and Plateletcrit (MPV× platelet count). The values of MPV and PDW were studied in relation to sepsis in all three categories. The findings of investigations were entered in preform. The data were analyzed using standard statistical software. Automated analyzer provide platelets count and generate the MPV and measure of their size variability (PDW). The great dispersion of platelet volume (log-normal distribution) depends on the process of platelet formation by fragmentation of plasma megakaryocyte and pro platelet formation. Platelet volume appears to be correlated with megakaryocyte ploidy, although the

DOI Number: 10.5958/0976-5506.2019.01306.8
exact mechanism is not completely known. The increase of MPV in conditions with increased platelet turnover is probably mediated by several cytokines (interleukins 6&11 and thrombopoietin) that affect megakaryocyte ploidy and result in the production of larger and more reactive platelets. Platelet indices are very useful markers for the early diagnosis of thromboembolic diseases. An increase in both mean platelet volume (MPV) and platelet distribution width (PDW) due to platelet activation, due to platelet swelling and pseudopodia formation.

The MPV reference intervals should therefore be expressed as a function of platelet concentration. In the differential diagnosis of acquired thrombocytopenia, we can recognize forms with increased MPV (of peripheral origin with increased platelet production and normal megakaryocyte function: immunologic thrombocytopenic purpura and disseminated intravascular coagulation) from those with normal or decreased MPV (in which there is a defect in platelet production such acute leukemia, bone marrow aplasia and chemotherapy or radiation therapy).

Increased MPV might be associated with neonatal sepsis, Platelets considered active participants in the host defense, and the thrombocytopenia seen during sepsis episodes may be caused, in part, by the consumption of platelets directly in these processes. Activate platelet volume is related to platelet function and activation as well. Generally, platelet production increases as platelet count decreases. An increased number of young platelets is also functionally more active than older platelet. The PDW can also be useful in differentiating reactive thrombocytosis from the essential type, especially when it is combined mathematically with the MPV and platelet count to obtain a discriminant function. The recommended anticoagulant for a complete blood count (CBC) determination including platelet indices is K2 or K3- EDTA. When blood is exposed to EDTA, platelets immediately change their shape from disks to spheroids covered with filamentous extensions. The platelet spherical transformation is initially is volumetric, but within 1 or 2 hours the volume is progressively changes to reach equilibrium condition even if not definitive. As a consequence of this the MPV increases (from 7.9% within 30 minutes to 13.4% over 24 hours). Various attempts to correct this phenomenon have failed owing to the unpredictable behavior of individual samples in terms of intensity and time to equilibrium. With the use of EDTA, the MPV is therefore, not a very reliable index.

Neonatal sepsis:

Neonatal sepsis is defined as the presence of symptoms of sepsis in the neonatal period combined with bacteriological isolation of an infectious agent from blood or cerebrospinal fluid (CSF). Neonatal sepsis is a clinical syndrome characterized by signs and symptoms of infection with or without bacteremia in the first month of life. It encompasses various systemic infections of the newborn such as septicemia, meningitis, pneumonia, arthritis, osteomyelitis, and urinary tract infections. Superficial infections like conjunctivitis and oral thrush are not usually considered under neonatal sepsis. Sepsis is a prevalent complication in the neonatal intensive care unit and is a major cause of infants’ mortality. Neonatal sepsis may be classified according to the time of onset of the disease: early onset (EOS) and late onset (LOS). A few papers distinguish between very early onset (within 24 hours), EOS (24 hours to six days), and LOS (more than six days) sepsis. In EOS the transplacental and hematogenous transmission of bacteria is an uncommon route of EOS and occurs mainly with Listeria (L. monocytogenes). The most common route of EOS in preterm and term infants is via an ascending amniotic infection. Members of the maternal genital flora, like Group B Streptococcus (GBS) and Escherichia coli (E. coli), the organisms responsible for the most cases of EOS, may ascend through the birth channel to the amniotic fluid either through intact amniotic membranes or, more commonly, after rupture of membranes. Once infected amniotic fluid is aspirated by the fetus, pathogens may infiltrate through immature mucosal barriers, causing the pneumonia and bacteremia, and may penetrate the blood-brain barrier, leading to meningitis. Bacteria have been implicated as a major cause of premature rupture of membranes and, consequently, of premature labor and delivery. In LOS is mostly occurs via horizontal or nosocomial transmission, but it may occur via vertical transmission at birth, resulting in colonization and, later, to infection. Skin or mucosal colonization with potential pathogens may be occurred from the hands of health care workers or family members, from water used in incubator or ventilator humidification systems, or may be from contaminated fomites like stethoscopes, which may carry organisms directly from one patient to another. In LOS most common clinical manifestations are meningitis (30-40%), bacteremia (40%), and septic arthritis (5-10%). Sepsis is the commonest cause of neonatal mortality, and it is a common complication in the neonatal intensive care unit. Hemostatic system
is adversely affected by sepsis, Thrombocytopenia is a very common hematological abnormality found in newborns. No previous study was published in Sudan concerning this subject.

**Materials and Method**

**Case control study:** This study was hospital and laboratory-based case study, has done in 200 cases of preterm and full term babies had proven diagnosed as septic neonates. About 2.5 ml of peripheral blood samples were collected under aseptic precautions in EDTA. The samples analyzed for platelet count, MPV, PDW and Platelet crit within 2 hours from venipuncture to minimize changes by using ABX Micros ES60 hematology analyzer (Horiba ABX - India).

**Statistical analysis:** Data analysis was performed using Statistical Package for Social Science (SPSS16.0) computer program. T Test was used to determine the statistical differences between these tests. All reported values were considered significant at a level of p <0.05.

**Results**

The study was done in 200 Sudanese neonates previously diagnosed and proven with sepsis or had symptoms of sepsis (male ,female) their age range from (1 to 30 days ) demitted to El Sewedy Paediatric Charity Hospital – Sudan that specialized in neonates’ intensive care unit (ICU) , samples are analyzed to estimate platelet count, mean platelet volume, platelet distribution width.

**Study population:** Two hundred 200 cases included in this study, 113(56.5%) males and 87 (43.5%) females. Full term babies account for 78 (39%) while premature babies account for 122 (61%) figure (1). None of the cases included in this study had fungal infection on presentation.

**Thrombocytopenia:** Thrombocytopenia defined as platelets count < 150000/mm3. Thrombocytosis defined as platelet count above 450000/mm3. Thrombocytopenia was present in 115 (57.5%) cases mean value 87.5×(10) 9/L, 83 (41.5%) had the normal platelet count mean value 235×(10)9/L and 3 (2.4%) had thrombocytosis mean value 515.5×(10)9/L figure (2), the most of thrombocytopenia 50 (41.4%) had mild thrombocytopenia mean value 125.9×(10)9/L,37(32.1%) had moderate thrombocytopenia mean value 72.5×(10)9/L, and 30 (26.5%) had developed severe thrombocytopenia mean value 25.5×(10)9/L figure (5), thrombocytopenia most common in premature babies.
The percentage of patient with thrombocytopenia defined as platelets count <1500/mm3 during sepsis episode, is shown for two groups.
The 76 (62.2%) of the cases of thrombocytopenia are premature babies mean value 75.6×(10)9/L, {30(39.4%) had mild decreased mean 121.4×(10)9/L, 24(31.6%) had moderate decreased mean 64.4×(10)9/L, 22(29%) had severe decreased mean 22×(10)9/L} and 39 (50%) are full term babies mean value 99.5×(10)9/L, 20(46.2%) had mild decreased mean 130.4×(10)9/L, 13(33.3%) had moderate decreased mean 80.7×(10)9/L and 8(20.5%) had severe decreased 29×(10)9/L} figure (2) Figure (3).

45 (36.8%) of cases of normal platelets are premature babies mean 252 × (10)9/L and 37 (47.4%) are full term babies mean 232 × (10)9/L figure (2), and Figure (3). 1 (0.8%) of cases of thrombocytosis are premature mean value 558× (10)9/L and 2(2.5%) of cases of thrombocytosis are full term mean value 474× (10)9/L.

There was significant difference in platelets count between full term and preterm (p value 0.008). MPV and PDW in the most the cases included in study increased, there was insignificant difference in platelets indices between the preterm and full term babies p value 0.125, 0.958, respectively. Mean value for MPV of all the cases included in this study was 9.30 fL. Mean MPV of the cases full term and full term were 9.20 fL and 9.45 fL respectively, the difference between the MPV values of the full term and preterm term was found to be insignificant (p=0.125, Table 1). Mean PDW value was 12.30. Mean PDW value for the cases full term and preterm were 12.25 and 12.50 respectively. The difference between the PDW values of the full term and full term was found to be non-significant (p=0.958, Table 1).

Discussion

In the study there was thrombocytopenia with significant difference in platelets count between full term and preterm p value 0.008 which agreed with other studies done by (Guclu E et al in 2013), (Ahmad in 2012), (Eslami Z et al in 2011), (Kim JY et al in 2010), and (Abdalla et al in 2008). In addition, there was no statistical significance difference in MPV and PDW in premature and full term babies p value 0.125, 0.958 respectively.

Thrombocytopenia is a common complication of neonatal sepsis, and common in preterm neonates. Another finding of the study revealed insignificant difference in MPV and PDW between the preterm and full term babies p value 0.125 and 0.958 respectively, MPV and PDW were higher in tow agreed with (Guclu E et al in 2013), (Kim JY et al in 2010), and (Abdallah et al in 2008).

In study done by (Tripti K. Karne1, Deepa D. Joshi1 et al. 2017) reported that 45 out of 103 cases (43.69%) of proven and probable sepsis showed increased PDW value.

Conclusion

The study concluded that there was Thrombocytopenia was present in nearly quarter of septic neonates and increased both mean platelets volume and platelets distribution width. There was significant difference in platelets count between full term and preterm and there was no statistical significance difference in MPV and PDW between the preterm and full term babies p value 0.125 and 0.958 respectively, MPV and PDW were higher in tow agreed with (Guclu E et al in 2013), (Kim JY et al in 2010), and (Abdallah et al in 2008).

Analysis of Correlation between Toluene Exposure and Health Risk Characterization on Printing Worker of Plastic Bags Industry

Jihan Faradisha1, Abdul Rohim Tualeka1, Noeroel Widajati1, Mulyono1
1Departement of Occupational Health and Safety, Faculty of Public Health, Airlangga University, Surabaya, Indonesia; The Indonesian Association of Occupational Health and Safety, Jakarta Pusat, Indonesia

ABSTRACT

The production process of plastic bag industry have always hazards and risks. Chemicals is one of the hazard that used in this industry. That is toluene, one of chemicals used in printing process. Toluene can cause several occupation health risk and effect. This study aimed to determine the correlation of toluene exposure and health risk characterization (RQ) in printing workers PT X Sidoarjo. This study was an observational study with cross-sectional approach. The sample in this study was a total of 32 respondent. The concentration of toluene measured by using gas chromatography as the instrument. The health risk characterization (RQ) calculated by dividing intake dose value with reference concentration. The result showed the concentration of toluene in location 2 was 31.54 ppm and above threshold limit value based on ACGIH (2011). There was 40,6% printing workers had RQ ≥ 1 and there was a significant correlation between toluene exposure and health risk characterization (RQ).

Keyword: toluene, health risk characterization, printing worker, plastic bag industry

Introduction

The production process of plastic bag industry have always hazards and risks. Chemicals is one of the hazard that used in this industry. One of the hazardous chemicals used in the plastic bags industry is toluene. Toluene is usually used as a solvent of paint on the printing process of plastic bags. Toluene is a volatile, colorless and commonly used as a paint solvent, a mixture of gasoline, nail polish, and as a solvent in the printing business. Workers using toluene as a solvent could have health problems, such as dizziness, vertigo, eye irritation, skin irritation, respiratory problems, liver, kidney, and central nervous system disorders. 1,2

Toluene entry into the body can be through 3 paths, in addition to the main path of inhalation, toluene can enter the body through the path of ingestion and skin contact. Toluene is declared safe for the environment and health if it does not cross the threshold. According to ACGIH (2011) the threshold limit value of toluene is 20 ppm for 8 hours/day 40 hours per week.3,4

Some cases of toluene exposure recorded in ATSDR (2015) include study by Yin et al (1987) reported by 44 men and 57 women exposed to TWA concentrations of 46 and 41 ppm toluene repetitively, during shoe-making, printing and audio equipment increased complaints headaches, dizziness and difficulty sleeping compared with 127 control groups. Similarly, the study by Ukai et al (1993) reported an increase in subjective complaints against neurologic symptoms both during and after work in 452 workers exposed toluene (geometric mean 24.7 ppm) compared with 517 control groups.1

This study aimed to determine the correlation of toluene exposure and health risk characterization (RQ) in printing workers to see if toluene exposure has a health effect on the worker’s body.
Material and Method

This study aimed to determine the correlation of toluene exposure and health risk characterization (RQ) in printing workers PT X Sidoarjo. This study was an observational study with cross-sectional approach. The sample in this study was a total of 32 printing workers. The concentration of toluene measured by using gas chromatography as the instrument. The health risk characterization (RQ) calculated by dividing intake dose value with reference concentration.

FINDINGS

The Concentration of Toluene

<table>
<thead>
<tr>

<td>40,6%</td>
</tr>
<tr>
<td></td>
<td>RQ &lt; 1</td>
<td>59,4%</td>
</tr>
</tbody>
</table>

The results of Risk Quotients (RQ) calculations show the level of health risk due to exposure to toluene in the work environment. If RQ ≥ 1, this means the printing workers exposed to toluene exposure has health risk effects and if RQ < 1, this means the printing workers exposed to toluene exposure has no health risk effects. Table 2 showed that 40,6% printing workers has health risk effects caused by toluene exposure and 59,4% printing workers has no health risk effects.

The Correlation Between Toluene Exposure and Health Risk Characterization

<tr>
<td>9.67</td>
<td>33,3%</td>
<td>66,7%</td>
</tr>
</tbody>
</table>

Table 3 showed the highest percentage 90,9% printing workers in Location 2 (31,54ppm) has RQ ≥ 1. The correlation between toluene exposure and RQ has a significant correlation with the p-value is 0,00.

Discussion

The Concentration of Toluene: The result showed one of all printing locations has the concentration of toluene above the TLV. The result of study in informal workshop Karasak showed that the average of toluene concentration is 71,29 ppm. Study in paint industry in Iran showed the concentration of toluene is 105,82 ppm. Another study in printing company in Jakarta showed that the concentration of toluene is 100,38 ppm.

The amount of exposure to toluene vapor depends on the workplace (opened or closed), and physical factors, such as wind direction, temperature, humidity, and air pressure. Based on the observation in the workplace, the location of printing process is a closed hall and has 12 blowers near all printing location. With the temperature about 30°C toluene will more easily evaporate in the air.

Workers who use toluene as a solvent may have health problems, such as dizziness, vertigo, eye irritation, skin irritation, respiratory problems, liver, kidney, and central nervous system disorders. Toluene exposure can lead to acute and chronic poisoning symptoms. The early acute poisoning symptoms have been observed in experimental study conducted volunteers with the concentration of toluene about 750 mg/m³ for 8 hours or 1.125 mg/m³ for 20 minutes may cause respiratory irritation and eye irritation.
Furthermore the chronic poisoning symptoms may appear with the concentration levels about 200-400 mg/m³ continuously for 8 hours every day or 40 hours a week. The concentrations of toluene above the threshold limit value may cause neuropsychological symptoms, as the study by Darwati (2004) the results showed that workers exposed to toluene exposure have a 7.12 times higher neuropsychological symptoms compared with workers not exposed to toluene exposure.1,11

The Health Risk Characterization: The results of Risk Quotients (RQ) calculations showed 40.6% printing workers have RQ ≥ 1 which means the printing workers have health risk effects due to toluene exposure. Another study by Prihartini (2010) showed 8% of respondents in finishing process have RQ ≥ 1, this may caused by the finishing location has the concentration of toluene higher than other location.12

Based on the result, every location has its own health risk effects depends on the level of toluene concentration, the result of calculations showed that the higher toluene concentration the higher health risk effects in the work environment.

1. Location 1: Location 1 has RQ < 1 which means printing workers has no health risk effects due to toluene exposure. Several factors influence the RQ value such as the concentration of toluene, worker’s weight and worker’s working period. The concentration of toluene at location 1 is lower than that of other sites, that is 8.93 ppm.

Based on observation, most of printing workers in Location 1 is not wearing protection equipment such as mask and gloves, in view of the most absorption of toluene is through respiration then skin contact and oral, printing workers may have more risk to have health effects caused by toluene exposure when they are not wearing standard personal protective equipment.

2. Location 2: Location 2 has RQ ≥ 1 which means printing workers have health risk effects due to toluene exposure. This result showed that toluene exposure may cause adverse health effect which needs risk control to reduce the health effects. Near to location 2 there are some pile of toluene cans for production process, to reduce the concentration of toluene in location 2, it needs to rearrange it. Moreover, it needs to have ventilation for air exchanges. There was 9.1% printing worker have RQ <1 this can be caused by working period that only about a year until the study.

3. Location 3: There were 85.7% printing workers have RQ < 1 which means printing workers have no health risk effects due to toluene exposure and 14.3% printing workers have RQ ≥ 1 which means printing workers have health risk effects due to toluene exposure. Working period of 14.3% printing workers influence the value of RQ. Study by Lundberg in Gamble (2000) workers with at least 10 years of work with high levels of organic solvent exposure have an adverse health risk. Lundberg also believes a 10-year work period with organic solvent exposure is considered a criterion for diagnosing chronic toxic encephalopathy. 13 Furthermore one printing worker in this category has excess body weight. Toluene compounds are lipophilic (fat soluble) the fat will bind toluene into residue in the body. In other words, the more obese respondents exposed toluene it will have a health risk higher due to toluene exposure.

4. Location 4: There were 66.7% printing workers hav RQ < 1 which means printing workers have no health risk effects due to toluene exposure and 33.3% printing workers have RQ ≥ 1 which means printing workers have health risk effects due to toluene exposure. Working period of 14.3% printing workers influence the value of RQ. By this condition, not only the concentration of toluene, weight and working period influence the RQ value, but there are some factors such foods (some foods may influence the absorption of toluene), life style and others.

The Correlation Between Toluene Exposure and Risk Characterization: The result showed that there was significant relationship between toluene exposure and risk characterization. Study in shoe craftsmans worker showed that the workers exposed to toluene exposure have health risk effects, 20% workers have headache, 18.2% workers fatigue and 18.8% workers caugh.14 Other study in gas station in Thailand showed that the workers have RQ ≥ 1, 61% workers have headache, 29% workers fatigue and 11 % workers throat irritation.15 Study by Martha (2012) on sole shoe worker at Cibaduyut Bandung, where the most content of glue compound contained is toluene, many workers have
health complaints synonymous with toluene exposure symptoms, including dizziness, nausea, weakness and shortness of breath.\textsuperscript{16}

Based on interview 31.3\% printing workers have headache and 37.5\% workers fatigue. At exposure close to 50 ppm will occur symptoms of drowsiness and headache. At concentrations of 50-100 ppm will occur irritation of the nose, throat and respiratory tract. At concentration of about 100 ppm may cause fatigue (fatigue) and dizziness.\textsuperscript{1}

One effort that can be done to reduce health risk effects is to reduce the concentration of toluene in the air. Thus, the toluene vapor inhaled by the workers will also decrease its concentration so as to minimize the health risk effects due to toluene exposure. To minimize the health risk effects caused by toluene exposure, the management can make a good ventilation system so that toluene vapor can be distributed with the air outside the production area. Toluene is a volatile compound, with a good ventilation the concentration of toluene in the printing location can be reduced. And the last thing can be done is to wear standard personal protective equipment, management must have the standard personal protective equipment and give it free to the workers. Beside that, management have to inform the workers about the hazard of toluene and advise the workers to wear personal protective equipment during work.

**Conclusion**

1. From the four location of toluene measurement obtained the lowest concentration of toluene is 8.93 ppm and the highest concentration of toluene is 31.54. The level of concentration in each location causes different levels of risk for the workers

2. The results of Risk Quotients (RQ) calculations 40.6\% printing workers have health risk effects caused by toluene exposure and 59.4\% printing workers have no health risk effects

3. There was a significant correlation between toluene exposure and health risk characterization

Nutrition Contents and Sensory Characteristics of the Instant Papeda Enrich with Laor (*Polychaeta*) as Supplementary food for Pregnant Woman

Ety Yuni Ristanti¹²*, Soetjipto³, Annis Catur Adi⁴

¹Doctoral Student Faculty of Public Health, Airlangga University, Surabaya; ²Polytechnic of Health, Maluku; ³Faculty of Medicine, Airlangga University, Surabaya; ⁴Department of Nutrition, Faculty of Public Health Sciences, Airlangga University, Surabaya, Indonesia

**ABSTRACT**

Papeda is a traditional Maluku food made from sago flour and is usually consumed with fish and yellow sauce. The addition of laor flour (*Polychaeta*), one of the most distinctive biota of Maluku water which is greatly demanded by the people, will enrich the nutritional value of papeda. This study aims to analyze the effect of adding laor (*Polychaeta*) on papeda toward the nutrition content and evaluation of sensory. Skipjack tuna is substituted by Laor (*Polychaeta*) with a ratio of 100%:0% (PI); 80%:20% (PIKL1); 70%:30% (PIKL2) and 60%:40% (PIKL3). Parameters measured are protein, carbohydrate, fat, energy, iron and zinc. Sensory evaluation (hedonic) performed by untrained panelists. Statistical analysis of nutrition content by One Way Anova test 95% CI and Friedman for sensory evaluation. A significant addition of laor (*Polychaeta*) in papeda increases the energy, protein, Fe and Zn as well as sensory evaluation toward the flavor and aroma. Papeda with 40% laor substitution gives the highest energy, protein, Fe and Zn distinguished from color, flavor, aroma and texture. Papeda with laor (*Polychaeta*) substitution meets the requirements of supplementary food for the pregnant women so it can be used as an supplementary food for them with local food-based.

**Keywords:** Papeda, laor, supplementary food, the pregnant women

**Introduction**

*Scaling Up Nutrition* (SUN) Program in Indonesia or called as National Nutrition Movement is a program to accelerate the improvement of the nutrition in The First 1000 Days of Life (The First 1000 Days of Life Movement). This program begins with focusing on the nutritional status of the pregnant women, since the child’s life begins in the womb of a mother (¹). Providing the supplementary food or iron tablets to the pregnant women is the national program of malnutrition prevention to decrease the number of low birth weight babies. The manifestation of distributing Supplementary Food Feeding to the pregnant women can be in the form of supplementary food manufacturer or local food based (²).

Sago, Skipjack Tuna and Laor (*Polychaeta*) as the energy and protein sources are the local food from Maluku Province. In 2015, Maluku Province has the potential area of sago approximately 36,723 hectares with a large amount of production of 9,683 tons (³). Sago is a potential source of carbohydrate which calories are not much different from rice (⁴). Skipjack tuna is a source of protein produced in Maluku Province. In 2012 the total of skipjack tuna amounted to 51.318,6 tons, in 2013 it amounted to 51.237,4 tons and in 2014 it amounted to 51.705,2 tons. Laor is a typical biota of Maluku waters, which in March or April, on a full moon or a few days later, *swarming* in abundance around the water surface (⁵). Laor contains high protein and also contains Fe and Zn which is required for the fetal growth (⁶).

The research aims to develop instant papeda formula enriched with laor (*Polychaeta*), analyze the protein, fat, carbohydrate, energy, Zn, Fe and analyze the sensory evaluation of instant papeda with laor koya (*Polychaeta*).

**Materials and Method**

Formulation of instant papeda with laor koya (*Polychaeta*) used the experimental design CDR (Completely Randomized Design) consisting of four treatments and four repetitions. The materials used were skipjack tuna and laor (*Polychaeta*). Previously, the materials were examined to check the proximate assessing and metal contamination in the Laboratory of Nutrition, Department of Nutrition, Faculty of Public Health, Airlangga University, Surabaya. Laor (*Polychaeta*) was formulated as koya by washing, drying in a temperature of 60 °C for 12 hours, roasting, grinding and sifting. The skipjack tuna with yellow sauce was produced by cutting the fish into pieces, cleaning, boiling with the spices, and then pasteurizing and sterilizing.

The instant papeda with laor koya was produced by mixing sago with 60 ml of boiled water while stirring, then adding slowly 450 ml of boiled water while stirring to form Papeda porridge and setting aside. After that, 200 ml of water was boiled and added by the skipjack tuna along with the ingredients, simmer for 3 minutes. Then the fish with yellow sauce was served with papeda porridge and sprinkled by the laor koya.

The protein was determined by the method of Kjedahl (7), carbohydrates was determined by Luff Schoorl method(8), fat was determined by Soxhlet(9) method, energy was determined by atwater factor (10). Fe and Zn was determined by atomic absorption spectrophotometry (AAS). Sensory evaluation (hedonic) was conducted to determine the level of consumers’ acceptance to the color, texture, aroma and taste of instant papeda with laor koya by 30 untrained panelists. Assessment given was as follows: score 1: dislike; score 2: rather like; score 3: like and scores 4: really like.

Statistical analysis was examined to check the nutritional content with One Way Anova test CI 95% while the sensory evaluation was analyzed by Friedman.

**Results**

The use of locally available food needs to be generated especially in the developing countries where nutrition problems are mostly triggered by the inability of parents and families to get adequate and proper food (especially food originating from animals). Choosing and combining the right food can be used to formulate multi-mixed meal which can be used as home-based supplementary food (11).

Papeda is the traditional food of the people of Maluku and Papua made from sago flour and fish with yellow sauce. The production of Papeda added by laor (*Polychaeta*) flour to escalate the protein and mineral turns to be an alternative.
meal for the pregnant women. The use of locally available food to formulate supplementary meals especially for the pregnant women is highly recommended provided that perhaps, it is accepted by the pregnant women(12).

Values are shown as mean ± standard deviation. Different superscript letters in the same row indicate significant differences between groups (p<0.05).

Table 2 shows that PIKL 3 group contains the highest energy level equally 390.66 kcal. PIKL 2 group averages out 385.85 kcal, PI group averages out 383.66 kcal and the lowest energy level is showed by PIKL1 group of 379.51 kcal. Furthermore, PIKL 3 group contains the highest protein equally 21.11 g. PIKL 2 group averages out 20.38 g and the lowest is the control group (PI) equally 18.98 g. The highest carbohydrate rate is showed by the control group (PI) equally 48, 35 g and the lowest is PIKL 3 group of 46.76 g. The highest fat rate showed by PIKL group 3 of 13.24 g and the lowest is the PI group of 12.30 g. The highest Fe rate is showed by PIKL group 3 of 5,343 mg. PIKL 2 group averages out 4,643 mg and the lowest is control group (PI) of 2.938 mg. The highest Zn rate is PIKL group 3 equally 3.703 mg and the lowest is control group (PI) of 1.853 mg. Based on the analysis of One-Way Anova, it is showed that there are significant differences in energy, protein, carbohydrate, fat, Fe and Zn containing in papeda formula.

The substitution of laor with Skipjack tuna can increase the level of energy, protein, Fe and Zn in papeda. The greater the concentration of laor the higher level of energy, protein, Fe and Zn could be achieved. The proportion of energy, protein, carbohydrate, fat, Fe and Zn in instant papeda with laor koya meets the requirements of food supplementary needs of pregnant women (10-15% RDA), it is feasible to be consumed by pregnant women. Additional energy is required for pregnancy to support the needs of metabolism in pregnancy and fetal growth. 15% of metabolism increases in pregnancy. The amount of energy consumption for pregnant women is the most important nutritional factor regarding the birth weight of the baby (13).

High protein in papeda instant with laor koya comes from skipjack tuna and laor. Protein content in dried laor averages out 48, 86 % and skipjack tuna averages out 24, 5%. Fish and laor are high quality and complete food originating form animals by reason of the essential amino acid sequence, easily digested and absorbed. In addition, it is also a great source of minerals (14)(15). The needs of additional protein is required by the pregnant women for fetal growth, placental growth, producing amniotic fluid, increasing maternal blood volume and supporting maternal and fetal tissue synthesis. Protein needs is increased during pregnancy and maximally needed during third trimester of pregnancy (13)(16).

The main carbohydrate source of the instant papeda formula is from carbohydrate of sago starch. Carbohydrate in sago is higher than rice as well as sago starch contains 3, 69 – 5, 96% food fiber (17). The main role of carbohydrates for the body is to provide glucose for body’s cells, which are then converted into energy. The crucial role of carbohydrates role determines the calorie due to its highest amount (18).

Fat is an important part of the nutrition obtained from food. Fat is the source of energy, essential fatty acids, and fat soluble vitamins (A, D, E, and K). In addition, diet fat has a major role in promoting good health and improving the sensory quality of food (19).

During pregnancy the need for absorbed Fe increases gradually from 0, 8 mg/day in the first trimester of pregnancy to 7.5 mg/day in the third trimester. Most
absorbed Fe is utilized to replace the Fe loss, increase red blood cell mass, provide Fe for fetus and placenta and replace blood loss when delivering the baby\textsuperscript{(16)(20)}.

Zn plays a crucial role during pregnancy including embryogenesis, growth and development of the fetus. It is estimated that the need of Zn increases twice during the third trimester rather than the women who are not pregnant\textsuperscript{(21)(22)}. The increase of Zn is crucial to prevent the premature birth and for growth of brain for the fetus\textsuperscript{(16)}.

</table>

Values are shown as mean ± standard deviation. Different superscript letters in the same column indicate significant differences between groups (p<0.05).

Sensory evaluation of instant papeda is considered as one of the crucial tests affected most of the admissions\textsuperscript{(23)}. Table 2 displays the average of instant hedonic papeda sensory values. In food products, consumers often assess the initial quality products by the color and appearance. Appearance and the color of this product is a key indicator of perceived quality\textsuperscript{(24)}. The lowest assessment toward the highest color in the group of PI (3,50) in the category between likes and dislikes is PIKL group 3 (3,13) in the category of likes.

Flavor is a crucial parameter in evaluating the sensory of a food product. An attractive food product contains high energy on the other hand, it is tasteless. There is the possibility which the products are unacceptable\textsuperscript{(25)}. The highest rate of the taste is displayed by the PIKL group 3 (3,67) followed by PI (3,63) in the category between likes and very likes. Laor flour adds a savory taste to instant papeda.

Aroma is an integral part of the taste and is a general acceptance of a food before it is eaten. Therefore, this parameter plays a crucial role when testing the formula of the meal\textsuperscript{(25)}. The highest average value of sensory of aroma is displayed in the PIKL 3 group, 3.63 in the category between likes and dislikes. The distribution of laor presents a significant difference to the instant papeda aroma. The average value of sensory of instant papeda texture between the PI and PIKL 3 groups is similar, (3,33) in the category of likes. Based on the result there was no significant difference to instant papeda texture in all four groups. The addition of a laor does not affect the texture of instant papeda.

The total score of panelist reception on color, flavor, aroma and taste is highly perceived in PIKL 3 group amounted to 13.77, followed by the control group amounted to 13.5. PIKL2 group amounted to 13.27 and the lowest is PIKL 1 group amounted to 12.53

### Conclusion

The substitution of laor (Polychaeta) in papeda increases the energy, protein, Fe and Zn. Papeda with 40\% (PIKL3) laor substitution provides the highest energy, protein, Fe and Zn meets the requirements of supplementary food for the pregnant women.

The results of the sensory evaluation show that instant papeda with laor koya (PIKL 3) is obtained in color, flavor, aroma and texture. Consequently, it can be used as an alternative food supplement for the pregnant women with the local food-based.

Analysis of Internal Factor Characteristics Influencing the Safety Driving Behavior among Inter-City Bus Drivers in East Java–Indonesia

Dewi Kurniasih

Occupational Health Departement, Surabaya Shipbuilding Institute of Polytechnics, Indonesia

ABSTRACT

Background and Aims: The objective of this present research is to evaluate internal characteristic factors coming from an individual consisting of age, level of education, work period as bus driver, marital status, the number of the dependents, wife’s job, ethnic group, how to get a driving license, how to get driving competence, experiences of accidents in last one year, condition of accidents in the last one year. They can be used to predict the safety driving behaviors of the inter-city bus research to take the buses entering into the terminal each here where the data on the drivers were determined as the sample.

Finding: If the internal characteristics of the bus drivers interact with the factors of the engine and the road environment, it will contribute to the safety driving behavior that may cause accidents.

Results: A systemic random sampling was employed in this present research to take the buses entering into the terminal each here where the data on the drivers were determined as the sample. The criteria of the drivers who had been taken as the sample would be substituted by the bus drivers with the order of the fifth interval for the next sample.

Conclusion: From the results an analysis, it is known that the variables of age, ethnic group, and experiences of 3-4 accidents in the last one year contribute to the safety driving behavior.

Keywords: Internal characteristics, safety driving, inter-city bus, driver

Introduction

The global mortality rate reaches 1.24 million per year. It is estimated that the mortality rate will increase three times, namely 3.6 millions per year in 2030. According to the data from Global Status Report on Road Safety, at present, Indonesia occupies the first rank in the increase of road accidents with the death rate of 40,000 persons per year.

Such a high death rate in road accidents happens because of the automatic driving behavior caused by repetitive driving actions. It means that a single driving action such as changing the gear or navigation is decided unconsciously. Changing driving behavior, from disobedience to obedience to rules, needs a great effort since drivers should change their unconscious behavior into conscious and controlled behavior. For example, they usually do not use their safety belt when they drive their vehicles in the road, but they use it when they drive in the protocol road. Besides external factors such as the condition of the vehicles and the environment of the road, individual characteristics play important roles in causing road accidents. This present research would describe individual characteristics of inter-city bus drivers in East Java that may be used as the predictors of road accidents.

Material and Method

A systemic random sampling was employed in this present research to take the buses entering into the terminal each here where the data on the drivers were determined as the sample.
determined as the sample. The criteria of the drivers who had been taken as the sample would be substituted by the bus drivers with the order of the fifth interval for the next sample. The questionnaires returned and analyzed were 204 drivers from the total population of 516 drivers.

**Results and Discussion**

Cross tabulation of age showed that safety driving under good category existed at the adult age range namely 36-45 years (18.5%) and it decreased with the increasing age. It means that the older the drivers, the lower their safety driving would be. Dealing with relation between the level of education and safety driving, the drivers in a high category are those who did not finish their elementary school (23.9%), those in less category are those who passed their Senior High School (13.8%).

High safety driving action tended to be made by respondents with work period of 25-30 years (26.9%), because the longer the work period, the higher the experiences and competences the drivers posses to avoid road accidents than those with shorter work period where they usually do not know much about how to drive safely\(^{[5,7,11]}\). According to Mulen, one of the reasons why ones behave safely is that they should fulfill their families’ needs and also they are afraid of losing their jobs\(^{[12]}\). The results of this present research is different with those made by Machado et all. That drivers with higher incomes did not pay attention to the speed limit, did not respect the safe distance and the prevailing regulations\(^{[6]}\).

In Indonesia there are 1,340 tribes that may be grouped into 31 ethnic groups. Respondents in this present research were divided into Java, Sumatera, Madura and other ethnic groups (Bali, Kalimantan, Sunda). The research results showed that respondents from Sumatera ethnic group had the high category (66.7%) in their safety driving behavior than those from Java and Madura, who dominated the Inter-City bus drivers in East Java. As a whole, no certain pattern was found between the ethnic group and the safety driving behavior.

The drivers who got their driving license for the first time through official processes tended to show good safety driving (15.94%) than those getting their driving licenses through unofficial process, namely through brokers. It happens because the drivers with driving licenses obtained through formal process felt that they should work very hard to get the licenses.

Inter-city bus drivers experiencing 3-4 accidents in the past one year tended to show their safety driving under good category and this category reduced in other experiences. It may happen because the experiences may result in traumatic feelings. For complete information, see Table 1.

</table>

The categorization of age in this present research is made in accordance with the categorization of age of the Department of Health of the Republic of Indonesia year of 2009. Dealing with safety driving behavior, the low category was mostly made by the respondents under the age category of late mature (36-45 years) and this driving safety driving tended to decrease in line with the respondents’ increasing age. Hobs’s, who divides age in line with WHO, states age is divided into three namely adulthood, old age and the elderly. It can be stated that productive age (18-40 years) has a lower risk than unproductive age (>40) for accidents [2,13]. It is because at unproductive age, one will experience the decrease in sight and hearing and in reactions than the productive age. Bus drivers with mature ages have more capability in controlling the emotions when driving buses so that it is expected to give effects on their safety driving. It is in line with the results of the research in Tehran, Iran that there is a negative correlation between age and accidents of bus drivers. The older the drivers, the lower their safety driving would be, therefore the higher the number of accidents occur [8]. These various patterns of tendency show that the age indicators did not influence the safety driving behavior.

The respondents who obtained the driving licenses for the first time through official test showed a high category in their safety driving behavior. This also applied for those getting driving competences by joining in official driving courses. When joining in driving courses, ones would be taught a good driving technique by experienced instructors, as a result the candidate drivers will have more knowledge in safety driving behavior. The results from the unstructured interviews showed that there were many drivers who got their driving competences by serving as sopir kain lap. (Sopir kain lap is the driver who at first worked as bus washer in the terminals or in bus garages). During their work they should drive forward or backward the buses, so that at last they may be able to drive buses and become bus drivers after getting driving licenses illegally (through brokers). In this case, special requirements such as theoretical and practical tests as stipulated in the Law No. 22 year of 2009 regarding Land Transportation and Traffic Rules, article 77 is not fulfilled [9]. The driving license ownership is the evidence of registration and identification made by the police to someone who has fulfilled administrative requirements, has been healthy mentally and physically, has understood traffic regulations and skills in driving motor vehicles. These requirements indicate that one driving a motor vehicle has experienced a series of tests conducted by the Police and is stated to pass the test, so that he or she has right to drive the motor. This sentence itself has been stipulated in the Law No. 22 year of 2009 in Article 1 word 23 that a driver is the one who drives a motor vehicle on the road who has had a driving license. The test itself consists of general and traffic knowledge aspects as the basic knowledge standard such as traffic signs, age as the psychological control and the level of one’s self control ability, the health aspect and passing the practice test to confirm the readiness of a candidate driver [9]. Based on the Government Regulation No.43 in the year of 1993 on the traffic infrastructures and facility,
a traffic accident is an accidental and unintentional event on the street that involves a vehicle with or without other road users, resulting human victims or property losses [10]. The accidents a respondent has experienced during the past one year is the number of accidents a bus driver has experience. The respondents identified to have 3-4 accidents in the past one year showed the safety driving behavior under high category, meaning that their safety driving behavior is better. It means that accidents may give effects on the City Transport bus drivers’ driving behavior.

Actually in his first career, each bus driver drives his bus well, meaning that he is trying to obey traffic regulations. He drives his bus everyday and finds much traffic violations, so that he often becomes “victims” of the violations. It is this at last that changes his behavior, and he also shows bad behavior in the street. It is conducted as a mechanism of his self-defense as a bus driver.

Conclusion

From the descriptions above, it be concluded that the percentages of the good internal characteristic factors City Transport bus drivers in East Java in safety driving are as follows: age (36-45); elementary school; work period (25-30 year); marital status (widower); the number of the dependent; Sumatera ethnic group; the way in obtaining driving competence officially; the way in obtaining the the driving license through legal process; the 3-4 accidents experienced in the past one year; and the condition of accidents experienced in the past one year with the victims from the passenger, other drivers and car damages.

Conflict of Interest: None

The Analysis on Dental and Oral Health Services Based on “Rater” Service Quality Dimension to Patient Satisfaction at Natural Esthetic Clinic Makassar

Badai Septa Wahyudadi¹, Setya Haksama²
¹Department of Dental Health, Polytechnic of Health, Makassar; ²Social Security Study Center

ABSTRACT

The growth of Clinic of Dental Health Service is currently increasing rapidly in the City of Makassar South Sulawesi Province. Quality is a dynamic condition associated with products, services, human resources, processes, and environments that meet or exceed expectations, where the relationship between products and services or services provided to consumers can meet their expectations and satisfaction. The purpose of this research is to analyze the dimension of service quality that consist of reliability, assurance, tangible, empathy, and responsiveness, frequently abbreviated as RATER, to patient’s satisfaction level in Natural Esthetic Clinic (NEC) Makassar. This research is a survey of cross sectional study approach with the number of samples as many as 74 visiting patients. The result shows that the total value of patient satisfaction (gap) obtained in the analysis is -0.44 on the average and belongs to Medium category, It means that the quality of services in NEC Makassar is ordinary classified and has not met patient’s satisfaction. The result of statistical analysis shows that the dimensions of reliability (0.000) assurance (0.004), tangible (0.001), and responsiveness (0.000) have significant effect on patient satisfaction, except empathy (0.060) which does not give significant difference to influence patient satisfaction level. The possible advices are the need for increasing attention and communication; giving a high sense of care; and establishing a clinical management information system (CMIS) to provide efficient, effective, and accurate services.

Keywords: Dimension of Quality, Satisfaction, Dental Clinic, City of Makassar

Introduction

The growth of dental health clinic is currently increasing rapidly in The City of Makassar South Sulawesi Province so it benefits people because of various options for them to obtain high quality of dental and oral health services. Tjiptono (2008) reveals that quality can be interpreted as “dynamic conditions associated with products, services, human resources, processes, and environments that meet or exceed expectations”, it means that the relationship between products and services or services provided to consumers can meet their expectation and satisfaction.¹ While Gaspersz (2002) mentions that quality is often interpreted as everything that satisfies customer or conformity to requirements or needs. The quality of totality of characteristics of goods and service products that support the ability to meet the specified needs.²

Zeithaml in Yamit (2005) states that five dimensions of characteristics used by customers in evaluating the quality of services are 1). Reliability, namely the ability to provide satisfied and immediate services as promised; 2). Assurance, It is the ability, courtesy and credibility of the doctor/staff, free of danger, risk or uncertainty/doubt; 3). Tangibles (direct evidence), which includes physical facilities, equipment, employees, and means of communication. 4). Empathy, it is the ease of doing relationships, good communication, and sincere attention to the needs of patients; and 5). Responsiveness, It is the desire of nurses /dentists to help patients and provide responsive services.³ It is also stated by Parasuraman as quoted by Tjiptono (2007) revealing that service quality includes the five dimensions mentioned above.⁴

Customer satisfaction is a condition to meet customer’s desires, expectations and needs. If the customer is not satisfied with a service provided, then
the service must be ineffective and inefficient. This is especially important for public services. The purpose of this research is to analyze service quality dimensions which include reliability, assurance, tangible, empathy, and responsiveness which is often abbreviated as RATER to patient satisfaction level in Natural Esthetic Clinic (NEC) Makassar.

**Material and Method**

This research is a survey with cross sectional study approach. The sample size obtained in this research are 74 respondents by implementing accidental sampling. The data is collected by observation, interview, and documentation study. Research instrument takes the form of questionnaire. Measurement of indicators in each variable of clinical service quality based on the perception of patient satisfaction using the likert scale. To test the validity of the questionnaire, it is used the Product Moment Pearson correlation test, and test the reliability with Alpha Cronbach. The statistical analysis used in this study is multiple linear regression analysis which is conducted on dependent and independent variables with the test model as follows:

\[
Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + e
\]

Where \( Y \) = patient satisfaction; \( X_1 \) = reliability; \( X_2 \) = assurance; \( X_3 \) = tangible (physical evidence); \( X_4 \) = empathy; \( X_5 \) = responsiveness; \( b_0 \) = constant (intercept); \( b_1 - b_5 \) = regression coefficient; and \( e \) = Error random.

**Findings**

**Perception of Patient Satisfaction on Service Quality at NEC Makassar:** The level of patient satisfaction to the quality of services provided in NEC Makassar can be described as follows.

**Table 1: Perception of Patient Satisfaction on Service Quality**

<table>
<thead>
<tr>
<th>Dimension of Quality Service</th>
<th>Perception of Patient Satisfaction</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Belief</td>
</tr>
<tr>
<td>Reliability (X₁)</td>
<td>3.70</td>
</tr>
<tr>
<td>Assurance (X₂)</td>
<td>3.72</td>
</tr>
<tr>
<td>Tangible (X₃)</td>
<td>3.91</td>
</tr>
<tr>
<td>Emphaty (X₄)</td>
<td>3.63</td>
</tr>
<tr>
<td>Responsiveness (X₅)</td>
<td>3.78</td>
</tr>
<tr>
<td>Average</td>
<td>3.75</td>
</tr>
</tbody>
</table>

For the perception of patient satisfaction above, there are categories with value intervals as follows: <1.8 Very Low; 1.8-2.6 Low; > 2.6-3.4 Medium; > 3.4-4.2 High; and > 4.2 Very High. Based on these criteria, patients who visited NEC Makassar gave good assessment to the health services provided, but the confidence perception score compared to patients’ expectations perceptions are still below expectations. The gap between the perceptions of belief and expectation explains the level of patient satisfaction.

The average perception of patient satisfaction based on the patient confidence perception is 3.75 (3.63 - 3.91), the perception of patient expectation has a value of 4.19 (4.10 - 4.23). As for the overall average assessment of patient satisfaction use the category of Rahmulyono (2008) as follows: -4.0 to -2.4 Very Low; <-2.4 to -0.8 Low; <-0.8 to 0.8 Medium; > 0.8 to 2.4 Height; and> 2.4 to 4.0 Very High. The total value of patient satisfaction (gap) obtained in the analysis with an average of -0.44 (-0.53 s / d -0.28), can be categorized as the Medium category of patient perception. This shows that the quality of service in NEC Makassar is quite common and has not given maximum satisfaction to the patient.

**Statistic Analysis**

The result of statistical analysis for service quality dimension to patient satisfaction are described as follows.
Table 2: Statistical Analysis For Service Quality Dimension To Patient Satisfaction

<table>
<thead>
<tr>
<th>Model</th>
<th>Coefficient of regression correlation (R)</th>
<th>Coefficient of determination (R²)</th>
<th>Improved coefficient of determination (R² Improved)</th>
<th>Durbin-Watson</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.784</td>
<td>0.615</td>
<td>0.587</td>
<td>1.950</td>
</tr>
</tbody>
</table>

Table 2 informs that the dimension of service quality has a strong positive correlation to the level of satisfaction of patients who visit NEC Makassar. This is reflected from the correlation value (R² corrected) of 0.587 which means that the change in the level of patient satisfaction is caused by the service quality dimension of 58.7%, while other changes (41.3%) caused by other variables outside the research analysis.

The result of multiple linear regression (F test) of the influence of service quality dimension to patient satisfaction level in the table below shows that F test result obtained by F count value equal to 21.742 and significance equal to 0.000. If the significance value obtained is compared with the 1.0% confidence level, then the significance (0.000) <0.01, which means that the variable dimension of service quality has a significant effect on patient satisfaction. Therefore, it can be concluded that the dimensions of service quality in the form of reliability, assurance, tangible, empathy, and responsiveness simultaneously provide a very significant influence on the level of patient satisfaction.

</table>

The result of partial test between service quality dimension shows the significance and tcount value respectively on the dimensions of (4.777 and 0.000), assurance (2.991 and 0.004), tangible (3.522 and 0.001), empathy (1.911 and 0.060), and responsiveness (5.788 and 0.000), while in t table, it is obtained the value of t tabel = 1.966 for df = 68 and confidence level 5 %. On the dimensions of reliability, assurance, tangible, and responsiveness, it was obtained tcount value between 2.991 - 5.788 and significance between 0.000-0.004. If compared to the result of t count and significance with the t table and confidence level of 5 %, the four dimensions obtain t count (2.991-5.777)> t table (1.966) and significance (0.000-0.004) <5%, it is concluded that the acceptance of dimensions of reliability, assurance, tangible, and responsiveness in service quality have a significant effect to patient satisfaction. Meanwhile empathy dimension has t count < t table and significance> 5%, so it has no a significant effect to patient satisfaction. It means that statistically the empathy dimension does not give significant difference to affect the level of patient satisfaction.
Based on the statistical results, it is obtained the result that the dimensions of reliability and responsiveness are more dominant to provide significant differences to influence the level of patient satisfaction than other service quality dimensions. From the test results is obtained equation model as follows:

\[ Y = -18.512 + 1.019X_1 + 0.748X_2 + 0.772X_3 + 0.464X_4 + 1.133X_5 \]

The above equation shows that the level of patient satisfaction is directly proportional to all dimensions of service quality. This means that the ability of each service quality dimension gives positive influence of 1.019 (reliability), 0.748 (assurance), 0.772 (tangible), 0.464 (empathy), and 1.133 (responsiveness), so on the condition the dimension increases 1 score, it causes patient satisfaction for each constant.

**Discussion**

Measuring customer satisfaction is an important element in public services to provide better, more efficient and more effective services. Such as the measurement of service quality in NEC Makassar simultaneously has a strong positive correlation and significant effect on the level of patient satisfaction. The accumulation of added-value provided in the service dimension at NEC Makassar is a reinforcing factor of beliefs and expectations of patients so that the patient will give a satisfied perception. The results of this study support Rahmulyono’s finding (2008) and Marsuli et al. (2005) which states that the value of patient satisfaction is triggered by the accumulated value of conformity that can meet the wishes or expectations of patients in obtaining a service. Rahmulyono (2008) explained that the value of satisfaction as a sense of satisfaction is a fact of perception of patient confidence that maximally meet the expected value of patients in service, so on the condition that the services provided by NEC Makassar can create an accumulated value of satisfaction in the implementation of reliability, assurance, tangible, empathy, and responsiveness, it will have an impact on the fulfillment of the expected value or the value of patient satisfaction in the acceptance of service in order that the perception of patient satisfaction will increase.

**The Influence of Service Reliability to Patient Satisfaction:** Service reliability dimension simultaneously and partially give significant influence to patient satisfaction level in NEC Makassar with p-value = 0.000 in F test and T test smaller than \( \alpha = 0.005 \). The quality of service on the dimension of reliability shows a moderate value based on the patient’s perception of - 0.53. This indicates that the service provided by NEC Makassar to patient is still not maximal due to such factors as the accuracy of implementing promise, reliability and accuracy in recording the patient’s documents, although this dimension gives the dominant influence on patient satisfaction level.

**Influence of Assurance Service to Patient Satisfaction:** Service assurance dimension simultaneously and partially give significant influence to patient satisfaction level in NEC Makassar with p-value = 0.000 F test and p-value = 0.004 in T test smaller than \( \alpha = 0.005 \). The dimension of service assurance provided by NEC Makassar has a significant effect on patient satisfaction. This is because during service, dentists and dental nurses act in accordance with Standard Operating Procedures (SOPs) in handling patients such as wearing masks, disposable gloves, disposable syringes and sterile tool kits. In addition, the physician at the of the action always provides anti-pain medication (analgesic) and informs the patient; if you still feel pain after returning home you can contact your dentist or clinic phone number for consultation, and if the clinic is still open you can go to the clinic immediately. The action of dentist and dental nurse at NEC Makassar is to meet the wishes and expectations of patients so that it raises the patient’s satisfaction to the services provided. The results are in accordance with the research of Rahmulyono (2008) which explains that the health services provided at the Puskesmas Depok I Sleman Yogyakarta in the hope that the patient still has a gap on the level of satisfaction, because it has not fully meet the expectations of patients even though the service provided is good enough.

**Effect of Physical Evidence (Tangible) on Patient Satisfaction:** The physical service dimension simultaneously and partially give significant influence to patient satisfaction level in NEC Makassar with p-value = 0.000 F test and p-value = 0.001 T test, where both values are smaller than \( \alpha = 0.005 \). This is revealed by Gronroos ang quoted by Tjiptono (2007) who states that service is a process consisting of a series of intangible activities which usually but not necessarily occur in the interaction between consumer and service employee, physical resources, goods, or a service provider system provided as a solution to consumer problems. From this definition, it can be said that service is an activity
given to the consumer and is essentially intangible. It is provided as a solution or a consumer problem. In order that patients can assess the embodiment, it needs to show various means and equipment so that patients can see directly the tangible ones.

**Influence of Concern (Empathy) Service to Patient Satisfaction:** Based on statistical analysis with F test, it shows that the dimension of concern (empathy) gives significant effect to patient satisfaction at NEC Makassar $p$-value $= 0.000$ smaller than $\alpha = 0.005$. Nevertheless from T test, it shows that the partial caring dimension has no significant effect where $p$-value $= 0.060$ is greater than $\alpha = 0.005$. The results of this study are also in line with Hennig-Thurau et al. (2002) that satisfaction significantly affects commitment. With the high level of satisfaction customers will get the power back to make a purchase that will create a commitment and shows the existence of an emotional bond. Boonajsevee (2005) also found that there is a positive correlation between satisfaction and commitment.

**The Influence of Responsiveness (Responsiveness) Service to Patient Satisfaction:** Based on statistical analysis with multiple linear regression test (F test) and partial test (T test) showed that the service responsiveness dimension simultaneously and partially give significant influence to patient satisfaction level in NEC Makassar where each $p$-value $= 0.000$ is smaller from $\alpha = 0.005$. From the quality of services provided by NEC Makassar, it describes the significant influence of dimension of responsiveness to patient satisfaction. This is because dentists and dental nurses act swiftly in dealing with patients who need quick treatment to ease the pain of patients by maintaining a sense of justice and togetherness. This is in line with the research of Padma, et.al (2009) which reveals that the assessment of service quality is reflected as an overall patient assessment of the quality of service provided with specific thing specific is patient satisfaction which assesses the process and outcome, without ignoring the cognitive and emotional factors.

**Conclusion**

This research can be concluded as follows:

1. The dimensions of quality of service reliability, assurance, tangible, and responsiveness have a positive correlation and simultaneously and partially give significant effect on patient satisfaction level in dental health services at NEC Makassar.

2. The Dimension of quality of service care (empathy) has a positive correlation and simultaneously has a significant effect, while partially has no significant effect on the level of patient satisfaction in dental health services at NEC Makassar.

3. The Oral and dental health services provided at NEC Makassar are in moderate or medium condition.

ABSTRACT

Background: Dengue hemorrhagic fever (DHF) is an infectious disease caused by dengue virus and still become a health problem in Indonesia. Interleukin-8 (IL-8) has been widely accepted as a factor correlated with severity of DHF. However, its role in Dengue Haemmorhagic Shock Syndrome (DHSS) was still poorly understood. This study was conducted to elucidate correlation of IL-8 and DHSS in children.

Objective: To determine the correlation between IL-8 and DHF in children.

Methods: We conducted across sectional study in pediatric ward general hospital of Prof.Dr.R.D.Kandou Manado in March until August 2011. Fourty children aged 1-13 years old was conducted consecutively and divided in to shock and without shock DHF. IL-8 was examined in each group and the correlation with DHF was analyzed with Spearman rho test using SPSS software with P<0.05.

Result: The mean of IL-8 level in DHF children without shock was 45.63 (95% CI 31.88 to 59.37) ng/ml and in DHF with shock was 411.13 (95% CI 311.46 to 510.80) ng/ml. The correlation between IL-8 and DHF was statiticaly significant (r_s = 0.774 , p<0.001).

Conclusions: The IL-8 level in DHF in these two groups were increase, and higher in severe DHF (with shock). Higher level of IL-8 correlated with increasing severity of DHF.

Keywords: IL-8; DHF; children, interleukin, hemorrhagic fever

Introduction

Dengue hemorrhagic fever (DHF) is an infectious disease caused by dengue virus and still become a health problem in Indonesia including North Sulawesi. All of Indonesian region has a risk infected by DHF from mild until severe Dengue Hemmorhagic Shock Syndrome (DHSS) which tends to bring about shock and death.(1-3) According to clinical manifestation and laboratorial examination, DHF classified into four grade from unsymptomatic into the most sever DHSS. However its pathogenesis of DHSS was still clearly unknown. Many theories had tried to explain DHF pathogenesis but the main determinant not clearly known.(4-6)

The dengue virus is a single-stranded RNA virus with the primary target being monocyte or macrophage cells. Dengue virus envelope proteins are capable of binding endothelial cells, thus endothelium is also a target for dengue virus.(7-9)

Recent research has reported that disharmony of immune system seems has role in the pathogenesis of DHF. Many immunological mechanism has been considered involved in tis pathomchanism. Interleukin 8 (IL-8) as poten immunologic cytokine has been proposed have a role in pathogenesis of DHF and severity of DHF as previous studies in adult.(3,10-12) Then, many symptom base therapy has been tried to applied in DHSS treatmet, however DHSS is still a dangerous situtation problem in children and it maignt be IL-8 suspected as a main...
factor that contribute in DHSS severity. This study was conducted to explain the correlation of IL-8 and DHF in children.

**Method**

This study was an observational analytic with cross-sectional approach. The sample of 40 children aged 1-13 years with the diagnosis of DHF without shock on the degree I and II and DHF with shock in degrees III and IV treated in the nursery / Irina E at BLU. RSUP Prof. Dr.R.D. Kandou Manado. The diagnosis of DHF was confirmed by WHO criteria 1997 and confirmed by Dengue NS1 examination for hot ≤ 3 days or rapid test anti-dengue IgG and IgM in heat >3 days.

The inclusion criteria was included age of 1-13 years, diagnosed as dengue hemorrhagic fever based on WHO 1997 criteria and confirmed with serological examination, parents approved and filled out the study form. Exclusion criteria suffered from viral infections rather than dengue or acute bacterial infections, received treatment with corticosteroids, and received blood transfusions, suffered from pneumonia, sepsis, bronchiolitis, and typhoid fever. The study was conducted by examining blood samples including hemoglobin, hematocrit, leucocytes, platelets, Dengue NS1 or IgM IgM anti-dengue and IL-8 levels.

This study had obtained the approval of ethical clearance from the ethical committee of RSUP Prof. Dr.R.D. Kandou Manado. Data analysis used hypothesis test correlation coefficient analysis Spearman rho. Statistical analysis was found to be significant if p <0.05. The data collected had processed by using SPSS program version 17. (SPSS.Inc. Chicago, IL)

**Result**

**Characteristics of Respondents:** Sex distribution of the respondents was 14 (35%) boys and 26 (65%) girls suffering from DHF. Where in dengue without shock was 10 (71,43%) boys and 19 (73,08%) girls, whereas in dengue fever with 4 (28,57%) boys and 7 (26, (Table 1) The age range of 29 children with unobtrusive DHF ranges from 2.0 years to 13.0 years with mean age of children of 7.6 years and standard deviation (SD) of 3.1 years. The age range of 11 dengue fever children ranged from 3.0 years to 12.0 years with mean age of children 6.8 years and SD 3.3 years. (Table 2)

DHF patients who have hepatic enlargement had a range of 1-1 centimeters (cm) below the arcus costae (bac) to 4-4 cm in the bac. In dengue fever patients there were 11 (37.9%) felt liver 1-1 cm in bac, there were 16 (55.2%) 2-2 cm in bac and 2 (6.9%) with 3-3 cm in bac. In dengue hemorrhoids there was 1 (9.1%) felt liver 1-1 cm in bac, 5 (45.5%) at 2-2 cm in bac, 4 (36.4%) at 3-3 cm in bac and 1 (9.1%) at 4-4 cm in bac.

A description of routine blood laboratory results beside the WHO 1997 criteria of hematocrit and platelets. The hematocrit in children with DHF without shock had the lowest value of 30.50% and the highest value of 45.30% with mean of 39.13%, whereas DBD with shock the lowest hematocrit value of 34.30% and the highest value is 55.60% with average 45.20%. Thrombocyte picture of children with dengue fever dengue DBD 22,000/mm³ and highest 218,000/mm³ with platelet average 90.482.76/mm³, while for dengue fever with the lowest value 16,000/mm³ and highest value 167,000/mm³ with platelet average 52,000/mm³.

Interleukin-8 levels in children with dengue hemorrhagic fever: The results of the examination on 40 children with DHF such as the lowest IL-8 levels were 7.00 ng/ml and the highest IL-8 level of 674.50 ng/ml, with mean IL-8 concentration of 146.14 ng/ml. Examination of 29 children with unobtrusive DHF where the lowest IL-8 score range was 7.00 ng/ml and highest 168.20 ng/ml with mean of 45,63 ng/ml, while 11 children with dengue fever were found in IL-8 lowest 211.80 ng/ml and highest of 674,50 ng/ml and average 411,13 ng/ml. (Table 4) The relationship between IL-8 with dengue hemorrhagic fever in children was analyzed by Spearman rho correlation analysis. Based on this test, the correlation coefficient is obtained by rs = 0.774 with p <0.001.

Discussion

Dengue hemorrhagic fever was still become a health problem in Indonesia including North Sulawesi. All of Indonesian region has a risk infected by DHF from mild until severe grading which tends to bring about shock as well as death. Dysregulation of immune system seemed to constitute the pathogenesis of DHF. Variates mechanism considered involved, i.e. virus virulence, antigen-antibody, complement and its products, all mediator soluble including IL-8 as cytokine which was suggested a role in pathogenesis of DHF.

The distribution of dengue fever shown that girls were more than boys, 26 (65%) girls and 14 (35%) boys. But overall there was no difference between the sexes in DHF patients, although deaths were more common in girls than boys.
In established the diagnosis of DHF based on the WHO (1997) criteria of sudden and persistent high fever for 2 to 7 days. Dengue hemorrhagic fever was preceded by sudden fever accompanied by non-specific clinical symptoms, this fever was the main symptom in all cases. A sudden high fever was an early clinical symptom of DHF and this was found in all the cases studied. In this study, the heat in diagnosing dengue fever treated in the hospital had a range in dengue fever without shock minimal day second and maximum fifth day with the average value of day to 3.76. In DHF with shock ranged from a minimum of fourth day and maximum of fifth day with the average value of day to 4.64. In general, this study was hot in the diagnosis of DHF ranging from 2-5 days with the average day to 4.20.\(^{(17, 19, 20)}\)

Hepatomegaly as one of the benchmarks for clinical diagnosis of DHF in WHO criteria was reported to vary. In this study all subjects had hepatomegaly with a range of 1-1 centimeters (cm) below the arcus costae (bac) to 4-4 cm in bac. In dengue sufferers without shock hepatomegaly at least 1-1 cm in bac and maximum 3-3 cm in bac. In DHF with hepatomegaly shock was palpable at least 1-1 cm in bac and max 4-4 cm in bac.\(^{(4, 19, 21)}\)

Hematocrit and thrombocyte examination were a very helpful examination in the diagnosis of DHF. The value of hematocrit usually was begin to increase on the third day of illness and reaches the highest value during the shock or shock phase. In this study, hematocrit in patients with DHF without shock had the highest value of 45.30% with mean of 39.13%, while dengue hematocrit with shock was 55.60% with mean of 45.20%. This was in accordance with other studies that have been conducted in several countries.\(^{(21-23)}\)

The number of DHF thrombocyte was the lowest dengue fever with 22,000/mm\(^3\) and the highest 218,000/mm\(^3\) with the mean of platelet 90482.76/mm\(^3\), while for the DBD with shock had the lowest value 16,000 / mm\(^3\) and the highest value 167,000/mm\(^3\) with platelet average of 52,000/mm\(^3\). The decrease in platelet counted in dengue hemorrhagic fever might be below 100000/mm\(^3\) usually found on the third and eighth day, often before or simultaneously with a change in hematocrit.\(^{(4)}\) The lowest platelet value to watch out for was 20,000-50,000/mm\(^3\). The lowest platelet was value less than that range tended to be more shocked than in other cases. Platelets were secretory cells that have granules containing various mediators. Endothelial dysfunction would result in aggregation of activated platelets and thrombocytes that release histamine like substance and 5-hydroxytryptamine which may lead to increased capillary permeability.\(^{(16)}\) Research conducted in Manado states there was a significant relationship between low platelet values and DHF remediation.\(^{(24, 25)}\)

This study showed that there was an significant correlation between IL-8 and DHF in children analyzed with Spearman rho test used SPSS 17 \((r_s=0.774, p<0.001)\) Thus, it conceivable that high levels of IL-8 in DHF children may correlate with risk of DHF severity. Similar result from previous study of Wihandani in 2009 concluded IL-8 level was correlated with severity of dengue virus infections. This study concluded too that there was a significant difference of IL-8 level in health patient as control with mild and severe DHF.\(^{(26)}\)

Interleukin-8 is a cytokine with potential proinflammatory effect and a chemotactic molecule with chemoattractant activity, is able to activate eosinophil, neutrophil and naive T cells to the surface of the endothelium.\(^{(11, 27)}\) Similar with previous study held by Juffrie in 2000 found IL-8 are increased in most patients with dengue virus infection and correlate with degranulation of neutrophyl as well as with some clinical and hemodynamic variables.\(^{(27)}\) Talavera in 2004 stated IL-8 modulates endothelial cells permeability and play an important role in immunopathogenesis and severity of DHF by tight junction and actin cytoskeleton functional and neutrophil degranulation.\(^{(28)}\)

**Conclusion**

There was an increase in IL-8 levels in children with DHF. Patients with dengue fever without shock had a lower value range of IL-8 levels than dengue without shock. There was a statistically significant relationship between IL-8 levels and dengue hemorrhagic fever in this study which means that the higher the IL-8 the more severe the dengue.

Correlation between Waiting Time of Pharmaceutical Service and Patient Satisfaction in Hospital

Juliyan Puspa Sari¹, Vica Aulya Rivera¹, Nyoman Anita Damayanti²
¹Student, ²Lecturer, Health Policy Administration Program Study, Faculty of Public Health, Airlangga University, Indonesia

ABSTRACT

The waiting time for prescription service is still a problem in hospital which ultimately leads to dissatisfaction to the quality of health service. According to the Minister of Health Regulation no. 129 of 2008, the prescribed waiting time for drug concoctions is 60 minutes and for prescription of finished drugs is 30 minutes. Based on the data from Gotong Royong Hospital Surabaya, related to the waiting time of pharmaceutical service, there were 2.3% of drug concoctions that exceeded the standard of pharmaceutical service (> 60 minutes) and 1.8% of finished-drugs prescription that exceeded the standard of pharmaceutical service (> 30 minutes). It led to patient dissatisfaction which could be seen from the number of incoming complaints. This research aims to analyze the correlation between the waiting time of pharmaceutical service and patient satisfaction. The research was conducted at the Outpatient Pharmacy Installation of Gotong Royong Hospital. This research is an observational research using cross-sectional approach. Samples were taken randomly as many as 54 outpatients who received pharmaceutical service at Gotong Royong Hospital Surabaya. The data were analyzed by univariate and bivariate analysis using chi-square test. The findings of the research indicated that 83.3% of the waiting time for pharmaceutical service had been standardized and 66.7% indicated patient dissatisfaction. The conclusion of this research is that there is no significant correlation between the waiting time of pharmaceutical service and patient satisfaction to pharmaceutical service at Gotong Royong Hospital.

Keywords: waiting time of pharmaceutical service, patient satisfaction

Introduction

Currently, hospitals are required to meet the needs and satisfaction of patients as their customers. Improving the quality of the service is a top priority for hospital management, one of which is a service marked by fast patient waiting time¹. Waiting time of service is a common problem and is the cause of patient dissatisfaction. The aspect of patient waiting time in obtaining health services is one of the important things that determines the quality of health services and can reflect how a hospital manages service components according to the patient’s situation and expectations. The length of service waiting time can degrade service quality and is considered unprofessional which ultimately leads to patient dissatisfaction¹.

The amount of time patients spend queuing can affect their satisfaction and result in long-term loss of profits due to the decrease of customer retention and visits². Reducing waiting times are proven and are important to consider in order providing excellent service.

At Gotong Royong Hospital, there are still patients that are waiting long to get outpatient pharmaceutical service. It can be seen from some patients who make some complaints. This kind of issue will have an impact on patient dissatisfaction.

According to the research that has been conducted previously, it mentions that the majority of patient’s dissatisfaction in pharmacy units is caused by long waiting time³. Another research reveals that there is a correlation between waiting time and the value of outpatient satisfaction. Time spent with doctors is a better way to satisfy the patients than the time spent in the waiting room⁴.

The formulation of the research problem is “How is the correlation between waiting time of outpatient pharmaceutical service and patient satisfaction at Gotong Royong Hospital”. The objective of the research is to analyze the correlation between waiting time of outpatient pharmaceutical service and patient satisfaction level at Gotong Royong Hospital.
Pharmaceutical service is a direct and responsible service to patients related to the availability of pharmacy in order to achieve a definite result to improve the quality of patient’s life. Pharmaceutical services of hospitals must comply with the applicable standards according to the Minister of Health Regulation of the Republic of Indonesia. The Minister of Health Regulation of the Republic of Indonesia states that the standard of pharmaceutical services is a benchmark that is used as a guide for pharmaceutical personnel in carrying out the pharmaceutical services.

In addition, pharmaceutical services are also associated with the Minimum Service Standards in hospitals according to the Minister of Health Decree of the Republic of Indonesia, which explains that:

1. Minimum Service Standards are provisions on the type and quality of basic services which are mandatory regional affairs that are entitled to be obtained minimally by every citizen. It is also a technical specification of the minimum service benchmarks provided by the Public Service Board to the public.

2. The waiting time of pharmaceutical service is the period to get pharmaceutical services starting from the incoming recipes to delivering the drug to the patients; i.e. waiting time of drug service < 30 minutes and drug concoction < 60 minutes.

Customer satisfaction is the level of one’s feelings after comparing performance or perceived results based on the expectation. The level of satisfaction is a function of the difference between the perceived performance and expectation. If the performance is below the expectation, the customers will be very disappointed. If the performance is in line with the expectation, the customers will be satisfied. If the performance exceeds the expectation, the customers will be very satisfied. Customer expectations can be formed by past experience, comments from relatives, and promises and information from various media.

Aspects that may affect hospital outpatient satisfaction include the appearance of the building, clean, comfortable and orderly hospital environment, beautiful gardening, the availability of parking spaces, clear directions and room names, the appearance of medical and non-medical personnel that is neat and clean, and deit attitude in providing help, and so on.

Assessment of satisfaction on 5 dimensions of service quality includes tangibility, reliability, responsiveness, assurance, and empathy.

There are four aspects of patient satisfaction including:

1. **Convenience**: It is about the aspect of enjoyable thing in all conditions, hospital location, cleanliness, the convenience of the room, layout, electricity, cleanliness of the bathroom, landfills, freshness of the room, and so forth. Convenience is the aspect of patient satisfaction that is not directly related to clinical effectiveness but is related to obtaining subsequent services.

2. **Patient relationship with hospital personnel**: It is about the aspect of the personnel who have good personalities that can support the service including the hospitality, information provided, the level of communication support, personnel responses, ease of contacting the personnel, and so forth relating to the interaction between the hospital personnel and the patient.

3. **Technical competence of the personnel**: It deals with the skills, knowledge, and qualifications of good hospital personnel such as the speed of the service, skills in the use of technology, the experience of the personnel, and so on.

4. **Cost**: It relates to the price to be paid for the services that have been obtained such as the fairness of the cost, the clarity of cost components, the cost of services, the comparison with other similar hospitals, and the availability of relief for the underprivileged.

Patient satisfaction is a subjective value of the patients that is affected by patient’s past experience, education, current psychological situation, and family and environmental influences.

**Material and Method**

This research is an analytic observational research using cross-sectional approach. The population of this research is all customers of outpatient pharmacy unit in December 2017 at Gotong Royong Hospital Surabaya. Samples were taken using accidental sampling with a large sample of 54 respondents.
The data of this research are primary data obtained using the instrument of observation of prescription waiting time and questionnaire which contains questions related to patient satisfaction. Patient satisfaction was assessed based on the aspects of satisfaction assessment on 5 dimensions of service quality consisting of tangible, reliability, responsiveness, assurance, and empathy.

The data obtained would be processed using SPSS. After getting the score of each dimension, the scores would be tested by using chi-square test.

**Results and Discussion**

**Results**

**Characteristics of the Respondents:** Based on the data obtained from the questionnaire distribution to 54 respondents, the findings on characteristic showed that the majority of the respondents were female as many as 34 people (63%), aged 27-30 years and above 30 years, respectively as many as 17 people (31.5%), last educational background of high school or equivalent as many as 26 people (48.1%), and occupation other than self-employed and civil servants as many as 43 people (79.6%). This data can be seen in Table 1.

Based on Table 2, it can be seen that the waiting time of the standard pharmaceutical service is 83.3%. The waiting time of the pharmaceutical service is the waiting time of pharmaceutical service for concoction and finished medicine. According to the Minister of Health Regulation, the prescribed waiting time for prescription is <30 minutes and for drug concoctions is 60 minutes.

**Level of Outpatient Satisfaction on Pharmaceutical Services in Outpatient Unit:** Measurement of satisfaction level was performed on patient or their family in outpatient pharmacy unit based on questionnaire distribution containing 25 items of questions that have been collected, tabulated and conducted by using statistical analysis.

The majority of respondents, as many as 66.7%, stated that they were not satisfied with the pharmaceutical services in the Outpatient Pharmacy Unit of Gotong Royong Hospital Surabaya. Based on the average value of outpatient satisfaction on pharmaceutical services in Outpatient Pharmacy Unit, 61% of the results were found to be included in not-satisfied category. It can be seen in Table 3.

Discussion

Correlation between Waiting Time and Satisfaction Level of Pharmaceutical Service in Outpatient Unit:

Based on the results of statistical test analysis using chi-square, it was obtained asymp. sign value or p value of 0.126. It showed that p>0.05 then Ha is accepted. Thus, the result of decision making of this research was that there is no significant correlation between waiting time of pharmaceutical service and patient satisfaction to pharmaceutical service in Pharmacy Unit of Gotong Royong Hospital Surabaya.

The distribution on correlation between waiting time and satisfaction level of pharmaceutical service can be seen in Table 5. Based on table 5, the majority of respondents stated that they were not satisfied (57.4%) although the waiting time of pharmaceutical service is in accordance with predetermined standard.

Based on the research findings, it could be concluded that the waiting time according to the standard of Minister of Health Regulation was <30 minutes for the finished drug and <60 minutes for drug concoction as many as 83.3%. Meanwhile, the waiting time that should be within the standard was 100%.

Based on the findings of this research, it was found that the majority of respondents, as many as 66.7%, expressed dissatisfaction to pharmaceutical services in the Outpatient Pharmacy Unit of Gotong Royong Hospital Surabaya. It indicated that it is necessary to improve the quality of pharmaceutical services in the Outpatient Pharmacy Unit of Gotong Royong Hospital Surabaya.

Based on statistical tests by using chi-square, it was found that there was no significant correlation between waiting time of pharmaceutical service and patient satisfaction. The findings of this research were not in line with the findings of the previous research conducted by other researchers which mentioned that there is a correlation between the waiting time of pharmaceutical service and patient satisfaction.

The majority of the respondents mentioned that they were not satisfied even though the waiting time of pharmaceutical service had been in accordance with the standard that had been previously determined. It proved that patient satisfaction to pharmaceutical service was not influenced by waiting time of pharmaceutical service, but was influenced from other supporting aspects perceived or experienced by the patient while waiting for the completion of pharmaceutical service. Other supporting aspects that might influence patient satisfaction are in 5 dimensions of service quality. These dimensions consist of tangible, reliability, responsiveness, assurance, and empathy.

Another more effective way of reducing waiting times is by simplifying some procedures. It is like what has been mentioned by the previous research conducted by other researchers where different employees perform the same task (for instance: processing drug prescription) with a variety of ways.

Other research has shown that interpersonal relationships between patients and service providers are also important in influencing patient satisfaction.

Conclusion

The conclusions of this study are:

1. There is no correlation between waiting time of pharmaceutical service and outpatient satisfaction receiving pharmaceutical service at Gotong Royong Hospital Surabaya.

2. Patient satisfaction on pharmaceutical service is not influenced by the waiting time of pharmaceutical service but by other aspect.

The effect of Sodium Chloride and Trehalose Sugar in Some Chemical Characteristics of Date Palm *Phoenix dactylifera* L. cv. Um-Aldehine *in vitro*

Ahmed D. Khaleaf Al-Asadi¹, Batool H. Falih Al-Zubaidy¹

¹Department of Horticulture and Land Escaping, College of Agriculture and Marshes, University of Thi-Qar, Iraq

**ABSTRACT**

The salinity is one of the most important problems facing agriculture in the world, especially Iraq. This study is concerned with examining the effect of four sodium chloride concentrations (0, 25, 50 and 75 mM) and four trehalose sugar concentrations (0, 5, 10 and 15 gm. L⁻¹) in some chemical characteristics of somatic embryos of date palm c.v Um – Aldehine in vitro. The results showed: That the increasing in sodium chloride concentration in culture media had a significant increase in the concentrations of carbohydrates and proline. In addition, the treatment (75 mM) of sodium chloride achieved the highest averages, also it has led to a significant decrease in proteins percentage. The effects of increasing trehalose sugar concentration in culture media has significantly increased the carbohydrates, proline and proteins. However, the treatment of (15 g. L⁻¹) resulted the highest averages. The interaction treatment between sodium chloride (75 mM) and trehalose sugar (15 g.L⁻¹) has significantly increased the carbohydrates and proline. The added concentrations of trehalose sugar to the culture media contributed to decreased the effects of salt stress, therefore, increased the tolerance of somatic embryos of date palm to the salt stress.

**Keywords:** Sodium chloride, Trehalose sugar, Somatic embryos, Date palm, In vitro.

**Introduction**

Date palm *Phoenix dactylifera* L. a monocotyledonous dioecious plant is one of the most cultivated palms around the world¹. Date palm trees are cultivated in different regions worldwide, especially in the Middle East, North and South America, North Africa, Southern Europe, Pakistan and India²³⁴⁵. One of the most environmental stress (abiotic) is salt stress which appears when increasing the concentrations of soil salts solution about (2.5 ds. m⁻¹). This concentration is considered the optimal concentration of salts that required to growth tropical crops⁶. There are two kinds of salt stress effects, primary effects (reduction of medium water potential and ion disequilibrium) and secondary effects (reduction of cell expansion, photosynthesis, inhibition of cell metabolism, production of reactive oxygen species, hormonal imbalance and protein metabolism)⁷⁸⁹¹⁰. Carbohydrates, in addition to its role in metabolism and plant structure, contribute significantly and effectively in regulation growth, development of plant, and plant responses to conditions of salt stress¹¹. The role of carbohydrates in plant engage many researchers to study this sugars as the pathway of biosynthesis and response to trehalose sugar knowing as mycose or tremalose¹². Trehalose sugar reduces protein accumulation through stress conditions and it is considered a source of energy and protect the proteins membranes¹³¹⁴. The vast majority of plants contain a little amount of trehalose sugar so that, its role in prevention or reduction the stress is unlikely in such plants¹⁵, while plants that contain a large amount from trehalose sugar, it seems to has a role to play in protecting environmental stress (abiotic stress) by prevention of denaturation cellular proteins¹⁶. However, many strategies and methods followed to improve plant salt tolerance, one of this methods breeding and genetic engineering of plants¹⁷. On the other hand, tissue culture was used to improving or increasing salt tolerance of plant, as the
exposure of cells or plant tissues to different levels of salt stress maybe useful in selecting cells tolerance of saline stress from cells originally sensitive to saline stress that means the genetic information which is necessary to growth in salt environmental maybe existent in sensitive plant cells by it is none gene expression by plant. In addition, selecting tolerance cells by tissue culture will increase our information about plant salinity tolerance on cellular level. Because of the few studies about addition trehalose sugar to nutrient mediums in tissue culture, and it’s important to improve the tolerance saline stress of plants especially date palms, this study was conducted to known the effect of sodium chloride and trehalose sugar and their interactions in some chemical characteristics of somatic embryos of date palm c.v. Um-Aldehine in vitro to achieve the purpose of this study to improve plant salt tolerance.

Materials and Method

The present investigation was carried out at the plant tissue culture laboratories, Date palm research center, Basra University, Iraq. This study was implemented by using somatic embryos which formed of embryogenic callus with three months old for date palm um Aldehine growing on nutrient medium. The nutrient media was known as MS salts which support by the following materials on basic g. L⁻¹(30 Sucrose, 0.200 Sodium hydrogen ortho phosphates, 0.0005 Thiamine -HCl, 0.040 adenine Sulphates, 0.030 NAA, 0.003 Isopentenyl adenine (2-ip) and 7 Agar). For execution this study nutrient medium (MS) and the above materials were used except the addition of activated charcoal. The treatments were four concentration of each of sodium chloride (0, 25, 50, 75 mM) and trehalose sugar (0, 5, 10, 15 g. L⁻¹). After adding the components of the nutrient medium regulated acidity (pH) on 5.7 and adding the agar and then heated by magnetic starrier on 95°. The nutrient medium is distributed by 25 ml in measuring tubes 2.5 x20 cm and blocked by cotton and Aluminum foils. The tubes and culture tools sterilized evaporated in steam sterilization using auto clave (121°C, 1.05 Kg.cm²) for twenty minutes. Then, the tubes shake for the purpose of harmonizing the nutrient medium and left to cool and kept in the refrigerator until the culture, 50 mg from somatic embryos culture in each tube, the cultivated tubes were placed at 27 ± 1 °c and light intensity 3000 Lux and then reculture was implemented one time every month. The period of the experiment was 8 months. The experimental measurements were studied as follow:

**Total Soluble Carbohydrates:** The method of phenol-Sulfuric acid used to measure soluble carbohydrates as mentioned by.

**Free Proline Content:** Free proline content was measured according to.

**Proteins:** The micro Kjeldhal was used to measure proteins as proteinases nitrogen by steam distillation method.

Statistical analysis of the results was done for a factorial experiment with two factors in completely randomized design and each treatment was replicated 10 time. The means scores were tested according to the Least Significant Difference (LSD), and the probability level (0.05), the GenStat 12 was used to analyze the results.

**Result and Discussion**

**Carbohydrate:** Results presented in table 1. showed that the effect of sodium chloride and trehalose sugar in total soluble carbohydrates of somatic embryos for date palm c.v. Um-Aldehine In vitro. The increasing of Sodium chloride Concentration in media increased significantly the carbohydrates concentration. In addition, the treatment 75 mM of sodium chloride achieved the highest averages of carbohydrates concentration which was (31.42 mg. g⁻¹) compared to control treatment (26.56 mg. g⁻¹).

**Table 1: Effect of Sodium Chloride and trehalose sugar and interaction between them on total soluble carbohydrate ( mg. g⁻¹) of somatic embryos of date palm Um-Aldehine in vitro.**

The effects of increasing the trehalose sugar concentrations in media were increased the carbohydrates a significantly, and the treatment of 15 g·L⁻¹ resulted the highest average (32.15 mg·g⁻¹) compared to control treatment (26.24 mg·g⁻¹). Interaction results showed a significant effects in carbohydrates concentration, and the treatment of 75 mM with trehalose sugar 15 g·L⁻¹ achieved the highest averages (33.70 mg·L⁻¹), while the treatment of interaction between (0 mM) of sodium chloride and trehalose sugar (0 g·L⁻¹) achieved the lowest averages (23.59 mg·L⁻¹). The increase in carbohydrates under salt stress condition might be related to the cell undergoes many changes and adaptations that occur under salt stress conditions, which are reflected to increasing the process of carbohydrates synthesis and other compounds. The increasing in carbohydrate concentration due to increase trehalose sugar concentration in the culture media and its interaction with sodium chloride, as a result of absorption by cells and accumulating on it, thus increasing the carbohydrate concentrations in cells as well as trehalose role as osmoprotectant for proteins and cellular membrane structures, which contributing effectively to increasing cell tolerance of salt stress.

**Proline:** The results table 2. appeared indicated that an increasing in sodium chloride concentration in culture media increased a significantly the proline concentration of somatic embryos especially the treatment of sodium chloride (75 mM) achieved the highest averages (8.55 mg·g⁻¹) compared to control treatment (5.28 mg·g⁻¹). The effects of increasing trehalose sugar concentration has a significant increase of proline concentration by the treatment (15 g·L⁻¹) resulted the highest averages (7.41 g·L⁻¹) compared to control treatment which gave the lowest averages (5.84 mg·g⁻¹). The interaction treatment of (75 mM) and (15 g·L⁻¹) appeared the highest averages (8.97 mg·g⁻¹), compared to the (0 mM) by (0 g·L⁻¹) which resulted the lowest level (3.54 mg·g⁻¹). The increasing in proline with increase in sodium chloride concentration in culture media might be related to the salt stress reduced protein synthesis which caused ammonium accumulation because of enzyme activity (Nitrate reductase). Nitrate reductase is reduced nitrate to ammonium, therefore, ammonium is used to proline synthesis to reduce its toxic effect on cells. In addition, lack in enzyme activity (proline oxidase) when the plant is exposed to salt stress maybe as a reason of proline accumulation.

**Table 2:** Effect of sodium chloride and trehalose sugar and interaction between them on proline (mg·g⁻¹) of somatic embryos of date palm Um-Aldehine *in vitro*

The increasing in proline concentration of somatic embryos because of increasing the trehalose sugar and the interactions of sodium chloride due to trehalose accumulation in cells response to salt stress conditions in many plants. This fact led to increase somatic embryos tolerance to salt stress. One of the most important indicators of cells tolerance to salt stress is increasing the proline concentration because of its physiological roles in the process of adjustable osmotic and the protection of cellular organelles from the harmful effects of salt. Besides, its contribution in the damage of free radicals which regard the response of the initial defense by the cells to maintain the water potential on cells.
Proteins: Results presented in table 3. showed that the effect of sodium chloride and trehalose sugar in proteins of somatic embryos. The increase in sodium chloride concentration in culture media decreased proteins percentage a significantly. In addition, the treatment 75 mM of sodium chloride achieved the lowest averages (7.19 %) compared to control treatment (10.08 %). The effects of increasing the trehalose sugar concentration in culture media has a significantly increased the proteins percentage, and the treatment (15 g. L⁻¹) resulted the highest averages (9.57 %) compared to control treatment (7.41 %).

Interaction results showed a significant effects in protein percentage and the treatment of (0 mM) with trehalose sugar (15 g. L⁻¹) achieved the highest averages (11.17 %), while the interaction between sodium chloride (75 mM) and trehalose sugar (0 g. L⁻¹) achieved the lowest averages (6.08 %). The decrease in protein percentage of somatic embryos under salt stress might be related to a reduction in protein synthesis and further degradation. The protein degradation due to salinity led to the accumulation of the amino acids especially, proline as demonstrated by the current study in table 2. The reason for the increased concentration of protein percentage by increasing the concentration of trehalose sugar in the culture media and its interactions with sodium chloride may be attributed to its role as an osmoprotectant of proteins and membranes structures.

Evaluation of Healing Process of Periapical Defect Filled by Platelet Rich Fibrin Using Cone Beam Computed Tomography–Comparative Clinical Study

Ahmed Mahdi Sahib1, Sahar Shakir Al-Adili2
1Ministry of Health, Al-Hilla Teaching Hospital, Babil, Iraq; 2College of Dentistry, University of Baghdad, Baghdad, Iraq

ABSTRACT

Objective: evaluate the efficacy of PRF on bone density after enucleation of periapical lesions, and to compare the degree of bone density value without the use of PRF postoperatively after 4 months using cone beam CT scan.

Method: 32 patients included in this study from October 2017 to October 2018, they undergo periapical surgery for periapical pathosis in the maxillary anterior teeth. After surgical removal of periapical pathosis, the participants divided into two groups, the study group was treated with PRF in the bone defect after surgical removal of the periapical lesion while the control group conducted without PRF. After 4 months, we measured and compared the bone density formed in the defect after surgical removal of the periapical lesion in both groups using CBCT.

Results: The value of the Bone density of PRF group collected postoperatively after 4 months was significantly high at superior limit 680.2 ± 137.56, middle limit 452.1 ± 143.14, inferior limit 629.6 ± 82.11 and average density 587.3 ± 57.47 as compare to control group, 470.8 ± 78.99 for the superior limit, 313.2 ± 57.21 for the middle limit, 449.6 ± 84.94 for the inferior limit and 411.2 ± 55.50 for the average bone density.

Conclusions: The usage of PRF in the treatment of bone defect post-operative removal of periapical pathosis seems to be an innovative therapeutic method promoting faster bone regeneration within 4 months.

Keywords: platelet, bone density, teeth, periapical pathosis, fibrin

Introduction

The aim of any surgical procedure is maintenance of optimum health, comfort, function and esthetics of the patient. Repair and regeneration are two aspects of healing after any uncompromised surgery. Repair is defined as the wound healing by tissue that has not fully restored the architecture or function of the part. While, Regeneration is defined as the reproduction and reconstitution of a missing or injured part to restore the architecture and function of the tissue.

Periapical pathology occurs as a sequelae of microbial insults from the root canal. When the infection within the canal remains, it progresses to the periapical region, leading into excessive osteoclastic bone resorption circumscribing the root. This is evident radiographically, as a radiolucent lesion and determined histologically, as a cyst or granuloma.

The initial treatment for such pathology is root canal treatment. If the treatment fails to resolve the pathology, surgical intervention needs to be delivered. The apical surgical procedure removes the pathology and the granulation tissues surrounding the tooth. This procedure creates a surgical defect in the area. Platelet-rich fibrin (PRF) has been used to accelerate the healing of the bony defect. PRF protocols require neither the use of anticoagulants nor bovine thrombin. It is simply the centrifuged blood that contains fibrin clots; where
growth factors and cytokines are abundantly trapped in a fibrin meshwork. The growth factors present in PRF are biologically active substances that are involved in the mechanisms of tissue repair such as chemotaxis, cell proliferation, angiogenesis, extracellular matrix deposition, and remodeling.

According to histomorphometric investigation and histological analysis conducted by Tatullo et al., the good osteoconductive capacity of PRF leads to the production of new bone. Also, The histological analysis shown the use of PRF formed a significant neoangiogenesis acting as a good support to the newly-formed bone tissue. Lately CBCT which provides three-dimensional images of dental and maxillofacial structures, started being announced for the evaluation of periapical bone lesions, and their repair after surgical endodontic treatment. The hypothesis of this study is based on the ability of local application of PRF to improve the bone healing after surgical removal of periapical lesion.

**Method**

**Setting:** A prospective clinical study was conducted from December 2017 to October 2018 at the Department of Oral & Maxillofacial Surgery, college of dentistry Teaching Hospital, Baghdad University; and Al-Sadr Specialized Health Center for radiographic work.

A total of 32 Iraqi patients aged 18-53 years, 20 females & 12 males diagnosed with periapical pathosis based on clinical and radiographic findings who met the eligibility criteria participated in this clinical study for surgical removal of periapical pathosis. These were selected randomly and allocated in two groups, Study group in which the periapical pathosis was removed surgically and PRF was applied in the defect and Control group in which the periapical pathosis was removed without application of PRF.

**Data Collection:** A case sheet form was filled containing the following data:

1. General information including name, age, gender, occupation, address and mobile number.
2. Chief complaint.
3. History of present illness.
4. Medical history.
5. Extra oral examination.
6. Intra oral examination.
   - Oral hygiene.
   - Presence of swelling, infection and sinus tract.
   - Periodontal status of the concerned tooth/teeth if any pocket is present and mobility grade.
7. Radiographic examination is provided by a periapical radiograph.

**Inclusion Criteria:**

1. Maxillary anterior teeth with radiographic periapical pathosis.
2. Failed RCF or failed previous apicectomy.
3. Age ≥ 18 years

**Exclusion Criteria:**

1. Nonrestorable tooth.
2. Unsatisfactory periodontal health (mobility more than grade 2 or pocket depth more than 5 mm).
3. Medically compromised patients with blood disease or those who take any medication that affect blood coagulation, uncontrolled systemic disease that affecting normal tissue healing like uncontrolled diabetes mellitus, autoimmune diseases, or patients on corticosteroid therapy.
4. Patient with Systemic disease that effect on bone metabolism which include hyperparathyroidism, thyrotoxicosis, liver and renal disease and long-term use of bisphosphonate medications.
5. Smoking.
7. Patient with a history of take chemotherapy or radiotherapy.

**Study Design:** Prospective randomized clinical study, the steps are summarized in the following sequential flow chart (Figure 1).
PRF Preparation and Application: In the study group, blood collected to prepare the PRF initiated. Rubbing the puncture site with a gauze sprayed by medical alcohol after identifying the appropriate vein for venipuncture by palpation (mostly the median cubital vein in the antecubital fossa and in the absence of this vein, the cephalic or basilic vein were utilized). Five-ml of the collected blood used as a standardized amount for each patient, the venous blood was collected using 10 mL disposable syringe with needle gauge 21. The obtained blood was immediately transferred to a plain 10 mL blood collecting tube and centrifuged at 3000 rpm for 10 minutes. A tube filled with normal saline about 5 mL or identical weight to the blood was placed in an opposite direction for the purpose of balancing during centrifugation. At the end of this process, the yellow shiny gelatinous part in the middle of the tube was the PRF. Using tweezers gently the PRF were pulled out and placed in a sterile wet gauze mesh, scraping the bulk of RBC layer carefully by surgical scalpel leaving the buffy coat intact. When the centrifuge rotation nearly reach its ending, the bone was smoothed and the defect was irrigated to receive the PRF. The PRF was compressed gently inside the defect, then the flap closed by simple interrupted suture using 3/0 non-absorbable black silk suture.

Bone Density: Bone density among the area of the defect was measured and measurement represent the mean of density as shown in figure 2. This study was conducted to assess bone density values formed in the defect postoperative removal of periapical lesions by using CBCT. To standardize the study, we enrolled patients with lesions measuring 8–15 mm in diameter. All of the bone density values were performed and measured by the same radiologist.
Statistical Analysis

Discrete variables presented using their number and percentage, chi square test used to analyze the discrete variable. Two independent samples t test used to analyze the differences in means between two groups. SPSS 22.0.0 (Chicago, IL), GraphPad Prism version 8.00 for Windows (GraphPad Software, San Diego, California USA), software package used to make the statistical analysis, p value considered when appropriate to be significant if less than 0.05.

Result

There was no significant difference between control and study group in their age and gender, additionally total mean age for the subjects was 28.8 ± 12.2 years, as illustrated in table 1.

Discussion

Periapical inflammatory lesions are local bone responses around the apex of a tooth that occur after necrosis of the pulp tissue caused by dental caries, mechanical or thermal trauma and chemical agents. Recent periapical surgery aims to remove periapical lesions to achieve complete wound healing and aid regeneration of bone and periodontal tissue. Since natural healing takes a relatively long period of time for the bone to fill the residual cavity, regenerative methods that help restore missing tissue and speed up regeneration have been announced. Regeneration is the procedure of reproduction or reconstitution of a missing or injured part of the body in such a way that
the architecture and function of the missing or injured tissues are completely reestablished, and it is a natural procedure of wound healing. The ultimate objective of reconstructive surgical techniques in the treatment of intra-bone defects is a regeneration of missing bone tissue. Many regenerative procedures, applying bone grafts and barrier membranes, were introduced to help the optimum healing of the residual defects after the removal of intra-bone lesions, especially large cysts. Recently, the use of platelet-rich fibrin (PRF) presented favorable results in regenerative surgical procedures.

Clinical studies have revealed that PRF promotes soft tissue and bone regeneration, in addition to periodontal tissue regeneration. Together, these studies have established PRF as a highly biocompatible and inductive scaffold useful for a wide range of tissue engineering uses.

PRF contains a large variety of growth factors and some of them play an important role in osteoblast activity, modulating their response. Through this complex process, it could be explained the effectiveness of PRF in improving bone healing.

Radiographic analysis of the bone defect after 4 months revealed that the defect filled with the PRF showed more bone density than the defect without PRF, and that the quality and quantity of the regenerated bone was superior when PRF were used postoperatively which is evaluated by CBCT because of the mean density in the superior limit of the defect was significantly higher in the study group (680.2 ± 137.56) compared to control group (470.8 ± 78.99), the mean density in the middle limit of the defect was significantly higher in the study group (452.1 ± 143.14) compared to control group (313.2 ± 57.21), the mean density in the inferior limit of the defect was significantly higher in the study group (629.6 ± 82.11) compared to control group (449.6 ± 84.94), also the mean for average bone density of the defect was significantly higher in the study group (587.3 ± 94.47) compared to control group (411.2 ± 55.50).

In this prospective clinical study, 16 patients were treated using PRF after surgical removal of periradicular lesions to evaluate the efficacy of PRF in osseous regeneration of defects left after enucleation, which showed promising, progressive, predictable, and significant radiographic osseous regeneration in all the cases, as was reported by Meshram et al. Also, this was in agreement to the result obtained in previous study in which fifteen patients aged between 20 to 50 years, were selected for the study. The patients had been diagnosed with periradicular lesion of endodontic origin based on clinical signs and symptoms, radiographically all patients showed complete bone regeneration at the end of six months.

In another study, 20 cases of cystic lesions were treated using PRF after cystic enucleation. Follow-up radiographs (orthopantomogram) were taken 1st, 3rd, and 6th months postoperatively. Bone density was measured with grayscale histogram using Adobe Photoshop 7.0 software. The subsequent follow-up examinations revealed progressive, predictable, and significant radiographic osseous regeneration.

Conclusions

The usage of PRF in the treatment of bone defect post-operative removal of periradicular pathososis seems to be an innovative therapeutic method promoting faster bone regeneration within 4 months.

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Department of Oral & Maxillofacial Surgery, college of dentistry teaching Hospital, Baghdad University.

ABSTRACT

Background: Worldwide, breast cancer is the most frequent malignant tumor in women. Many factors are known to have important roles in this high incidence, ABO Blood groups has emerged recently as another risk factor and its association with breast cancer has been validated. In this study we tried to find out if this relationship could be validated in cancer patients of the Sulaymaniyah province of Iraqi Kurdistan.

Patients and Method: This study was conducted at the Hiwa hematology/oncology hospital in Sulaymaniyah province. Blood groups of all breast cancer patients were retrospectively documented from the charts of all patients that had been registered with the hospital from the opening of the center at around mid 2007 until August 2015. As for the control ABO blood group status data was obtained from 500 age-matched females.

Results: Data obtained were correlated and comparison was made between the 500 evaluable breast cancer patients and the 500 available control blood groups. Association between ABO blood groups & breast cancer was found to be highly significant statistically ($p < 0.001$). There was also a significant association between blood groups & and histopathological status, ER & PR.

Conclusions: We found that there is a statistical association between female breast cancer and ABO blood groups & Rh factor.

Keywords: Breast cancer, ABO blood groups, Sulaymaniyah, Iraq.

Introduction

Breast cancer is the most commonly diagnosed cancer among women and second only to lung cancer as the leading cause of cancer-related deaths in women. Worldwide 1.5 million women will get a diagnosis of breast cancer and about half a million will die globally from breast cancer.¹² Family history of breast cancer, age of menarche, duration of lactation, parity, age of menopause, diet and hormonal levels are known risk factors for the development of breast cancer.³⁴

ABO blood group system, identified in 1900, classifies human blood based on the presence or absence of the antigens A and B carried on the surface of erythrocytes. As an easily accessible factor in an individual’s genetic makeup, ABO blood groups have been statistically associated with many diseases.⁵⁻⁹

The frequency of the common ABO phenotypes varies among different populations. Populations with a high frequency of the A phenotype are found mainly in Northern and Central Europe. The B phenotype is most frequent in Central Asia. Blood group O is the most frequent phenotype globally, with parts of Africa and Australia showing highest frequencies. The reasons for the observed differences among populations are not well understood, although several theories have been proposed.¹⁰
Blood group antigens represent the major antigens in humans which are present on the surface of red blood cells and different epithelial cells; alteration of these blood group antigens is associated with variant types of cancers.\textsuperscript{11, 12} During the past several decades, numerous studies have shed light on the relationship between ABO blood groups and risk of cancer at different sites including gastric cancer, pancreatic cancer, and breast cancer. On other hand, blood groups antigens on the surface of cancer cells can be used as useful prognostic markers in different types of human cancers.\textsuperscript{13-17}

**Patients and Method**

This case control study had been performed on 500 patients who were diagnosed as breast cancer according to histopathological diagnosis. All the materials and information were collected from the Hiwa Hematology/Oncology hospital in Sulaymaniyah, Iraqi Kurdistan. The control sample was 500 age-matched healthy females. Our attempt was to choose the controls in which they can be the representatives of the population from which the patients were drawn. The percentage of ABO blood group frequencies has been estimated in both cancer patients and healthy control samples to explain the correlation of ABO blood group with breast cancer. This study lasted from December 2014 till August 2015. Each patient was interviewed separately during their routine visit to hospital for treatment and follow up.

Blood groups of all breast cancer patients were retrospectively documented from the charts of all patients that had been registered with the hospital from the opening of the center at around mid-2007 until March 2015. The collected patients data also included clinicopathological assessment. Control subjects were selected among healthy people (volunteers, medical students, paramedical and health workers) with no history of cardiovascular disease, cancer, chronic degenerative neurologic disease, chronic obstructive pulmonary disease, and hepatitis or alcohol abuse.

**Data Analysis:** The data were analyzed for descriptive statistics using SPSS(Statistical Package for Social Science) software. A series of comparisons undertaken to reveal possible statistically significant relations between those variables. Probability of less than P 0.05 was considered statistically significant.

**Results**

Five hundred cancer patients and 500 healthy controls were enrolled. The mean age of studied sample was 47.37 years old, with minimum 24 years and maximum 77 years old. The mean age in healthy control was 48.5 years old with maximum 78 years and minimum 20 years as shown in (Tables 1).

![Table 1: Age Distribution in Cases & Controls](image)

When we compared the distribution of blood group among the patients with breast cancer and the healthy control the result was highly significant P value < 0.001. There was a proportional rise of blood group (O+) which was 31.8% in normal subjects and 48.8% in cancer patients, while (O-) was higher in control 2.8% than normal subject 2.2%. Also we found that there is proportional reduction of blood group (A+) from 38.6% in normal subject to 24.8% in cancer patients. Interestingly (AB-) blood group was representing 80% of cases while only representing 20% of healthy control as shown in (Table 2).

![Table 2: Distribution of Blood Groups in Cases & Controls](image)
Blood groups significantly associated with histopathological status (P value<0.001). Invasive ductal carcinoma is commonly observed in patients with blood group (O+) & (A+), while all cases of (A-) & (AB-) are invasive ductal carcinoma. Among lobular carcinoma blood group (O+) represents the majority of cases while blood group (B+) represents more than quarter of cases (Table 3).

Discussion

The association of breast cancer and the blood type has had different degrees in various studies although some previous studies have reported significant associations between ABO blood group or Rh factor and breast cancer risk; overall the literature is inconsistent. The result of this study showed that association between ABO blood group and breast cancer was highly significant statistically (p< 0.001).

Blood group O showed highest rates, compared to the control group. That result is consistent with studies done by Majupuria KC, et al. and Adam A, et al, both of them showed a positive association between type O and breast cancer risk. But study done by Haswani L, et al suggested majority of breast cancer patients belonged to group O and group B.

Two studies reported from Kirkuk governorate by Zaki S, et al and AL-Nassyria governorate by Mehdi L, et al, suggested that A blood group was more susceptible to have breast cancer.

There are other studies that suggested positive associations between blood group A and breast cancer done in Egypt, Tunisia, Malaysia and in Punjab India. While many other studies in Iran, India and United States suggested no association between blood groups and breast cancer. So this topic seems to remain unresolved.

Stamatakos et al suggested that in Rh (+) patients; ductal breast cancer is differentially distributed and is commonly observed in patients with blood group A. But in our study invasive ductal carcinoma is commonly observed in patients with blood group (O) & (A+).

The results of our study suggested significant association between blood group (O+) and ER, PR positive status. ER positive and PR positive cases were commonly distributed in blood group (O+) patients. But in study done by Gates M, et al suggested that there is no relationship between ABO blood group and hormonal status.

Conclusion

ABO blood group could provide a genetic susceptibility to develop breast cancer. The identification of genetic and environmental factors among racial and ethnic groups should offer some insights into the observed epidemiological data and advanced opportunities to better understand the control and development of cancer.

The Role of Laparoscopic Drilling in the Treatment of Polycystic Ovarian Syndrome

Aqeel Meer Al-Zamily1, Ali Abdul-Hussein Handoz1
1College of Medicine, University of Al-Qadisiyah, Iraq

ABSTRACT

PCOS patients diagnose by having two of the following criteria: first oligo- and/or anovulation, second hyperandrogenism (by clinical picture with or without biochemical features), and lastly ultrasound findings of polycystic disease. The underlying cause of PCOS is unknown. Theories about cause may include genetic predisposition. The role laparoscopic drilling for ovaries show advancing in treatment of PCOD in form of restore ovulation specially those patients in whom there is resistant to clomiphene citrate or incompliant for long term therapy. The current study was aimed to describe the role of laparoscopic ovarian drilling (LOD) as an effective and successful treatment for infertility in those patients with PCOD in whom medical treatment fail.

This study includes 50 patient’s female, age between (22-35) years old. Inclusion criteria including period of infertility of 1–10-year duration, body weight increase with (BMI 29–35 Kg/m2), gynecological problems with abnormal menstruation, clinical pictures go with high level of androgen hormone like acne vulgaris and hirsutism. The results revealed that 50 patients were studied here. In 40 patients (80%), they show no menstrual cycle changes. Follow up period was 12 months. 30 of patient (60%) had pregnancy; the mean time for the first pregnancy was 3.5 months after operation. As a second line treatment for infertility treatment in patients with PCOD, LOD has good and successful results that lead to increase using specially for patients with failure of medical treatment and poor compliance. It’s beneficial as less pelvic adhesion and minimal ovarian trauma making it with fewer side effects. The results postoperatively in regarding hormone assay and conception rate are favorable.

Keywords: laparoscopic drilling; polycystic ovarian syndrome; hyperandrogenism

Introduction

There is a great development in understanding the pathology and physiology of polycystic ovary syndrome and this knowledge has a progression especially in the last century. The incidence of PCOD in many studies range from 5% to 14% in women within the years of fertility, 1 this prevalence makes the PCOD as one of the important and common endocrine disorder that affect women in their reproductive life.2 The main and important features of PCOD include first high level of androgen (hyperandrogenism) with abnormal cycle and irregularity, and this will eventually result in infertility.3 PCOD is a disease of exclusion so that other causes of oligo or anovulation should be excluded such as congenital adrenal hyperplasia, tumors secreting excess androgen, and hyperprolactinemia.4 The abnormality of the CYP11a gene in patients with PCOS may has a major effect in the progression of the disease as this suggested by many studies that perform in vitro on selected theca cells from human ovaries. The CYP11 thought to be responsible for the encoding the cleavage enzyme of the cholesterol side chain which play a significant role in the steroid production as a rate limiting step.7 The menstrual abnormalities in PCOS characterized by multiple abnormalities that ranged between irregularity, sometimes absent or infrequent. These disturbances usually has history since the first postmenarchal bleeding and the monthly cycle never stable.8 Inappropriate secretion of gonadotropin-releasing hormone (GnRH)
causing increase level of luteinizing hormone (LH) compared with follicle-stimulating hormone (FSH). The presence of hyperinsulinemia now becomes well documented in patient with PCOD this is due to insulin resistance. The incidence of hyperinsulinemia due to insulin resistance range between 25% to 45%. The prevalence of insulin resistance is mostly found in obese patient making this wide incidence range. Insulin resistance represent low glucose absorption in related to a given amount of insulin. Insulin and LH will play a significant role in stimulating ovarian theca cell to secrete more androgen and causes the ovaries to secrete high levels of testosterone and androstenedione. The obesity in many studies was found I around 50% of cases with PCOD. The increase in body fat was mainly in upper part of body or in the center that will lead to increase the ratio between waist and hip in comparison to women with obesity without PCOD. The distribution of fat in this pattern is regarding as android type of obesity and similar picture can be seen in states with hyperandrogen, patients with diabetic and in cases of hyperlipidemia.

This distribution of peripheral fat may be associated with visceral fat that may causing increase in insulin resistance in those patients. While women with gynecoid type of obesity will have increase in amount of normal fat in thighs, buttocks and hip areas. At early times of discovery the PCOS around 1935, the treatment in many centers was the wedge resection in the hope to resume the ovulation. The effect of this procedure was to excise the thick and hyperplastic central ovarian stroma. This method was used in the treatment of infertility due to anovulation until the time were the medical treatment that casing stimulation of ovulation was discovered (clomiphene citrate, gonadotropins). These drugs and inspire of its effectiveness, but they may have associated with significant problems including the risk of hyperstimulation syndrome of ovary and risk of multiple pregnancies. The first use of electrocautery in PCOD treatment was in 1984, that were during laparoscopic surgery by cauterezation of ovarian capsule and this result in a high rate of ovulation and also increase the likelihood of pregnancy. For penetration of capsule of ovary is done either by cautery or sometimes laser, the laser associated with less risk of adhesion on pelvis postoperatively. The procedure includes develop multiple punctures in ovarian capsules by using electrocuttary or by laser the number of puncture usually 3-6 and their depth about 5-10 mm. Usually the procedure performs on both ovaries even in many studies may show the drilling has the same rate of ovulation in both unilateral and bilateral ovarian. What is the exact mechanism by which the LOD causes induction of ovulation is still unknown. Many theories and authors suggest that a falling in androgen level and steroids during the procedure and this will cause disturbance in negative feedback mechanism of estrogen hormone on gonadotropin pituitary and this will lead to decrease of intraovarian level of androgens and this will inhibit the development of follicle, or stimulation of growth factors in ovary which eventually cause follicle growth. The aim in this study is to describe the role of laparoscopic ovarian drilling (LOD) as an effective and successful treatment for infertility in those patients with PCOD in whom medical treatment fail.

Patients and Method

This study includes 50 patient’s female, age between (22-35) years old. Diagnosis of PCOD based on ultrasound findings of PCOD, elevated levels of androgenic hormones and oligo or anovulation (Rotterdam criteria). Clinical features included infertility of 1–8 years’ duration, abnormalities in menstruation (oligo/amenorrhea), increase in body weight (BMI 29–36 Kg/m2), pictures of acne and hirsutism indicating high levels of androgens. The assay of hormonal levels showing low level serum FSH and an elevation in LH hormone level with LH/FSH ratio >2. All investigation was done for those patients include thyroid function test, ovarian hormone assay, ultrasound examination in order to exclude other secondary causes for infertility than the PCOD. In addition, seminal fluid analysis was done for their husbands to exclude male causes. All patients were on medical treatment for period between (6months to one year), treatment include clomiphene citrate dose of 100mg/day starting from day 2-day five of the cycle. The normal values in this study for biochemical assay show as follow: glucose 80–115 mg/dl; FSH - 3-12.4 mUI/ml; LH - 2.3-12 mUI/ml; total testosterone - 0.1-1.2 ng/ml; free testosterone - 0.6-6.8 pg/ml. The procedure was done in our laparoscopic department under general anesthesia, three port using for camera and two working ports. The procedures include punctures of ovarian capsules using eclectocutary hook for perform 5-8 holes in each ovary with a contact time between 3-5 seconds. All patients were discharged the hospital on second day.
postoperatively and follow up period was one year for regular ovulation and pregnancy.

**Statistical Analysis:** SPSS version 16 and Microsoft Office Excel 2007 was used as an analysis of these data, the Chi-square test, and Fisher exact test was used to study the association between any two nominal variables. P-value of less than or equal to 0.05 was considered significant.

**Results**

Fifty patients were studied here. In 40 patients (80%), they had regular menstrual cycles. Follow up period was 12 months. Thirty of patient (60%) had pregnancy; the mean time of the first pregnancy was 3.5 months. From those thirty pregnancies 4 ended in abortion (mean period was 2.5 month) and one case diagnose as ectopic pregnancy. No significant change was noted regarding the weight and body mass index after the procedure. The changes in hormone assay and a clinical picture was reordered before and after doing the laparoscopic ovarian drilling. There are significant changes in the levels of FSH, LH, the LH/FSH ratio and testosterone.

Abnormalities of menstruation in the form of oligo or amenorrhea which is most frequent symptoms showing improvement in about 40 cases (80%), as shown in table 1.

**Discussion**

There is great change in the definition of polycystic ovary syndrome that evolved along decades but it is always refers to a multi-system reproductive metabolic disorder. In patients with PCOD, the ovaries have a certain specific shape and texture that can be detected by ultrasonography even this appearance may be found in women without clear clinical picture. Metabolic disorders that may associated with the disease include resistance to insulin, obesity (with a high incidence in the United States) and dyslipidemia. Several studies show that there is family tendency in PCOD mainly in first-degree relatives. The menstrual abnormality in PCOD is mainly characterized by irregularity with infrequency and sometimes absent. The complete absence of the menses may reach 20% in some women while 5-10% of cases may show normal ovulation. Women with PCOS classically show increase in ovarian size with multiple small antral follicles on periphery with increase stromal thickness in the center. The exact mechanism that cause this specific morphological change is still vague, the possible explanation that the normal cycle of follicles development may progress until the midantral stage, then the growth will cease and after that the main numbers of follicles end with atresia.

The incidence of miscarriage shows increase frequency in women with PCOD, the exact explanation is still unclear. In some series the percentage of recurrent abortion in women with PCOD may reach 55%. Some studies show high incidence of endometrial carcinoma in PCOD patients this may be related to long period of anovulation and chronic effect of unopposed estrogen. The relation between levels of androgen hormone and gonadotropin with obesity now is understudy mainly in adolescents. McCartney and colleagues in 2001 had a cross sectional study of obese girls at puberty, the study had showed a significant elevation in the level of testosterone hormone in comparison with none obese girls also there is decrease in the level of LH hormone. Also there increase in insulin level in obese compared to normal controls. The effect of hyperinsulinemia and resistance to insulin as a major cause for PCOD is still not well documented. There may be evidence that high insulin levels may cause alteration in the normal metabolic and reproductive physiology of this syndrome. Some studies had shown that hyperinsulinemia lead to stimulate androgen production, by effect of LH hormone, from ovarian normal theca cells. The first notice for the effect of LOD was reported in 1984 when using elecrocattary on the capsule of ovary during laparoscopic surgery which result in induce ovulation and pregnancy. The resulting ovulation after LOD has
variable duration, in some studies show that spontaneous ovulation after LOD may persist for multiple years. The penetration of ovarian capsule was done by using either the elecrocuttary or laser which associated with less complication post operatively. Nowadays the introduction of harmonic device also improve result and decrease post-operative complication in LOD. Farquhar et al. study discusses the difference between LOD and medical treatment with gonadotropin therapy in patient diagnose with PCOD and infertility. Study shows no significant difference between surgery and medical therapy except that LOD show lower rate of multiple pregnancy. we assume that LOD has the benefit on medical therapy from the economic view and in those patients in whom the drug compliance is weak and can’t withstand long term treatment in addition to the side effect of drug from the pharmacological view. LOD has a role in stimulate ovulation when we decide that clomiphene citrate therapy show failure of ovulation rate may reach 75-80% and pregnancy rate may, therefore reach 60-70%. As summary, the laparoscopic drilling is indicated in patients with young age group, poor compliant to CC therapy, resist treatment, elevated levels of LH hormone and abnormal response to gonadotropins with excessive side effects.

**Conclusion**

As a second line treatment for infertility treatment in patients with PCOD, LOD has good and successful results that lead to increase using specially for patients with failure of medical treatment and poor compliance. It’s beneficial as less pelvic adhesion and minimal ovarian trauma making it with fewer side effects. The results postoperatively in regarding hormone assay and conception rate are favourable.

**Conflict of Interest:** The author declares no conflict of interest.

**Source of Funding:** This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

**Ethical Clearance:** Each patient included in this plan signed an informed consent form, detail of the method and agent used with the possible failure of this option and approved by the Ethics Committee of the Medical Research Institute (ECMRI).

Evaluation of the Performance of Sports Management According to a Standard Scale for Teachers of Physical Education in Najaf Governorate

Ali Mohammed Jawad Al-Sayegh¹, Ayman Hani Abed Al Gburi², Fadel Kurdi Shalakha²

¹Ministry of Education, Al-Najaf Education Directorate, Fine Arts Institute for Boys, Iraq; ²University of Kufa, The Faculty of Physical Education and Sports Sciences, Iraq

ABSTRACT

The weakness in the administrative aspects reflected on the teacher within the school and during the participation in the competitions and tournaments which are within the curriculum of the Directorate of sports activity, and this also reflected on the ability of effective leadership in coordinating the work and follow-up and direct supervision and organization of the efforts of the workers, which gave the impression of the lack of effectiveness and which rises to the level And the extent required for the Directorate of sports activity, which in turn leads to the failure to achieve the objectives of the administrative performance of the Directorate, and hence the researcher to prepare a study for specialists in those departments and schools to see the extent to achieve these goals that correspond to the changes and interact with the community.

The objective of the research is to build and standardize the performance measure of sports administration for the teachers of physical education in Najaf Governorate. The research community determines the (280) physical education teachers of the secondary schools in Najaf Governorate. After collecting the data, they were processed statistically to obtain the results through which the conclusions were built.

Keywords: Evaluation, standard scale and physical education.

Introduction

The scientific progress witnessed in the modern era has cast its shadow on the various fields of work and the most recent changes and developments. The main focus of this work is the scientific progress and development in human beings with the enormous potential and unlimited potential if they have the means to progress and modern development.

Physical education and sports sciences are one of the fields that have received a large share of this development because of its progress and effective renewal in development in various distances. The teacher of sports education is one of the most important axes through which the educational goals are achieved for its great influence in the formation of students and others in a way that makes them able to serve their country with love, dedication, sincerity and high spirits.¹

The weakness in the administrative aspects reflected on the teacher within the school and during the participation in the competitions and tournaments which are within the curriculum of the directorate of sports activity, and this also reflected on the ability of effective leadership in coordinating the work and follow-up and direct supervision and organization of the efforts of the workers, which gave the impression of the lack of effectiveness and which rises to the level And the extent required for the directorate of sports activity, which in turn leads to the failure to achieve the objectives of the administrative performance of the Directorate, and hence the researcher to prepare a study for specialists in those departments and schools to see the extent to achieve these goals that correspond to the changes and interact with the community.²

Today’s administration is an essential aspiration for any progress for people and nations all over the world regardless of their share of natural resources, geographical area or population. Success or failure at the state or institution level is due to the extent to which the Department can use and the more the society has progressed and developed, the greater the responsibility for management. Accordingly, management is in fact an
influential factor in modern life and a means of achieving a better life for the peoples.

Research Methodology and Field Procedures

Research Methodology: The researcher used the descriptive method in the survey method and the normative studies, due to its relevance and the nature of the current study.

Research Community and Samples: The research community determined the teachers of physical education for secondary schools in Najaf Governorate (280) teachers distributed in schools of education in Najaf governorate. The sample of the research was randomly selected. The sample of building the scale was (100) teachers working in secondary schools. (150) teachers.

Tools, Devices and Devices Used in Research: In order to solve the research problem and achieve its objectives, the researcher used the following tools and devices:

Means of Data Collection:
- Questionnaire
- Observation.
- Test and measurement.
- Sources and references.
- Dry pens, leaves.
- Electronic Calculator Type Pentium 4 Number (1).
- Study halls.

Field Research Procedures:

Performance Management Procedures:
1. Determination of the objective of the scale: a measure of the performance of sports management for teachers of physical education in the province of Najaf.

2. Determine the scale areas: (Planning, organization, decision-making, coordination, communication, supervision and guidance), and was approved by agreement (100%).

3. Preparation of the preliminary version of the performance measure of sports management:

A. Preparation of the paragraphs of the measure of the performance of sports management the researcher reviewed the previous standards and related studies, as well as the researcher’s personal experience and agencies: Standards and related studies

1. The measure of the administrative behavior of the heads of sports clubs in Iraq. 3

2. The administrative performance of the deans of the faculties. 4

3. Administrative processes for schools of sports activities. 5

B. Determination of the method of drafting the paragraphs of the scale: was based on the method (Light) developer in the formulation of alternatives to the paragraphs of the scale

C. Formulation of the paragraphs of the scale: The paragraphs of the sport management scale were formulated according to their field in its initial form, with a total of 84 paragraphs, measuring five areas in the form of positive paragraphs and negative paragraphs, and three alternatives to answer the scale (always, Weights (3-2-1) were given positive paragraphs respectively and vice versa for negative paragraphs and Table (1) shows this.

D. Determination of the validity of paragraphs of the scale: Presented to the experts and specialists to indicate their validity and identify the positive and negative paragraphs, as well as if they need to be amended and after the analysis of the views of experts and specialists statistically excluded (23) paragraphs for lack of statistical significance and maintain (61) paragraph, In Table (2). Experts also agreed on the alternatives and their weights.

Value (T) Tabular = 3.84 degrees Freedom = 1 Level of significance = 0.05

Pilot Study: The scale was applied to a sample of (10) teachers who are outside the sample of the research on Thursday and Friday, 3-4/2/2017. It has been shown from the exploratory experiment that the instructions and paragraphs of the scale are clear and understandable from the sample and the average time taken the answer to the scale is (18) minutes.

Basic Experiment of the Scale: The scale was applied to the sample of the building (127) teachers. The basic experiment was carried out through the application of the scale (Appendix 5) on the purpose of conducting statistical analysis of the scale in the period from 1/3/2017 to 1/4/2017.

Correction of the Measure of Sports Management: Be the highest score obtained by the player in the scale (183) degree and the lowest degree (61) the higher the degree obtained by the player, the higher the higher the level of sports management.

Statistical Analysis of the Paragraphs of the Sport Management Measure:

A. The Discriminatory Power of the Paragraphs:
The researchers verified the ability of the paragraph to excel using the two groups of terminals through the sample statistical analysis of (120) teachers, and for the purpose of calculating the strength of the parity of the paragraphs have followed the following steps:
1. Ranking the players on the scale from the highest degree to the lowest degree.
2. 27% of the forms with the highest grades and 27% of the forms that have the lowest grades, and each party has (32) teachers
3. To identify the distinct ability of each paragraph by using the t-test for two independent samples to test the differences between the upper and
lower group scores in each paragraph, and (10) paragraphs were rejected because they were not distinctive. The value of $t$ is calculated below the tabular value. Thus, the number of valid paragraphs after this step (31) paragraph.

### B. Internal Consistency Coefficient:
Internal consistency has been ascertained by calculating the following:

**First, the relation of the paragraph to the total degree of the scale:** The TR test was used. It was found that all the paragraphs were significant except for four paragraphs bearing the numbers (54,47,45,44) because their $T$ value is less than the tabular value of (1.980) (0.05) and the degree of freedom (118), thus the number of paragraphs accepted (27) paragraph,

**Second, Relationship of the degree of the paragraph to the degree of the field:** The significance of the correlation was determined using the TR test, as all the paragraphs were statistically significant because the calculated value was greater than the tabular value of (1.980) at the level of significance (0.05) and the degree of freedom (118).

The correlation coefficient of Pearson was calculated between the total score of the scale and the field. The significance of the correlation was determined using the (t) test. It was found that all correlation coefficients were statistically significant because the correlation coefficients were greater of the value of (1.980) at the level of significance (0.05) and the degree of freedom (118).

### The Standard Characteristics (Psychometric) of the Scale:

**First, The validity of the content:** The researcher used this kind of honesty when taking the opinions of experts and specialists in the validity of the fields and paragraphs of the scale.

**Second, Structural honesty:** This was ascertained when the discriminatory power of the paragraphs was calculated in the style of the two terminal groups, as well as the internal consistency calculation.

### Regulation:

**Apply the Metric:** (150) teachers representing the physical education teachers at the Najaf Secondary Education Directorate during the period between (15/4/2017 - 15/5/2017).

The total score of the teachers was found on the scale. (46-81), with mean (70.293), and a standard deviation (7.062). Table (22) shows the repetitive distributions of teachers’ grades on the sport scale and table (4).

### Derivation of Standards for the Sport Management Scale:
Thus, the raw grades obtained by applying the scale were converted to a sample of 147 teachers. The standard score of the scale was extracted using the following equation, and Table (5) shows its results.

Determine the levels of the sports management scale:
In order to achieve the required research, the researcher determined the levels of the measure for the sample of the sample of rationing (147) teachers, and so the levels were determined is based on the real extent of the scale, and the measure consists of (27) paragraph and alternatives to answer triple, the highest value can get The teacher is assigned a grade of 81 and a minimum score of (27).10 The upper value of the minimum value divided by the number of levels is extracted by the length of the class. Thus, three levels, as shown in Table (6).

Table 7 shows the importance of the teacher of physical education in achieving balanced overall growth among students, Its objectives are to follow the scientific method in organizing its activities, and use the method of planning, organization, direction and follow-up through decisions and procedures put in place, which defines the general framework of the work to achieve the goals, the teacher of physical education, which achieves the objectives of the curriculum will be able to correct planning, In order to achieve the objectives, the process of planning and organization facilitates the teacher to achieve the objectives, and also helps to determine the stages of the implementation of the work easily and move from one stage to another without the emergence of unexpected problems resulting from the absence of planning and organization, does not meet the abundance
of material potential to achieve the establishment of its objectives unless.\textsuperscript{11}

The administrative individual is able to define the objectives of the organization and the best way to access it and distribute the students in the work and coordination between different efforts and the good exploitation of the material and human resources available to achieve the goals set and here we note the sample of the research has achieved its objectives through the process of This is in line with the Yunus study (1991) that “the teacher of physical education is the man of relationships who organizes the various interactions and communication processes, and makes the students understand their practical needs and help them satisfy them, so as to lead to the growth of a pure, Their competence increases and their ability to develop themselves increases, or through the teacher, so that their achievements and achievements will be transferred from good to better, which makes them understand their responsibilities and duties”.\textsuperscript{12}

Ethical Clearance: Taken from Al-Najaf education directorate

Source of Funding: Self

Conflict of Interest: None

Conclusions

Through the results produced by the researcher to the conclusions of the machines:

1. The teachers of physical education appeared at the level of high administrative performance, which increased their level of ambition in the administrative process.
2. The teachers of physical education appeared at the level of administrative performance average, which increased the level of ambition in the administrative process.
3. Setting three standard levels for teachers of physical education working in secondary schools.

Effect of Adding *Cinnamon Cassia* in Diet on Productive Performance and Some Blood Measurements for Broiler ROSS308

Ammar Qahtan shanoon1, Osama Ahmed latif2, Qana H Amin1

1College of Agriculture, University of Kirkuk; 2College of Agriculture, University of Dayala, Iraq

**ABSTRACT**

This experiment was conducted to study the effect of different levels of cinnamon (*Cinnamomum cassia*) Powder Supplementation in productive performance and some blood Characteristics for broiler chicken. Three hundred and sixty unsexed broiler chicks one day old Rose 308. The chicks were given a ration without any additive for the first week and at the beginning of the second week of age chicks were feed one of four level of cinnamon powder 0, 0.4, 0.8 and 1.2% it’s represents T1, T2, T3 and T4 which was distributed by the chicks randomly and three replicates per treatment (30 chicks/treatment). Results of the experiment showed that the addition of cinnamon to the diet has led to a significant increase (P <0.05) for body weights and feed conversion efficiency and production index compared with control treatment. Significant differences did not appear in the feed intake, mortality percentage, dressing percentage and carcass between experimental treatments. The treatment showed Add cinnamon significant decrease in both the percentage and the level of abdominal fat and cholesterol in the blood serum compared with the control treatment, while its impact was not significant to the total protein and uric acid level in serum of birds.

**Keywords:** Broiler, Cinnamon cassia, Productivity, Blood Characteristics

**Introduction**

The using of medicine rejected now by many countries because the present study improves a relationship between some kinds of cancer and using of antibiotic in poultry industry, therefor the resent researches try to found a natural additives to keep a good health of chicken and to avoid diseases and now have more attention in feeding and breeding of poultry (1,2). Cinnamon consider from the important herbal medicine because it content 4% oil called Cinnamon aldehyde which have a many biological effects, also its contents eugenol, Cinnamylacetate, Cinnamyl alcohol, Methoyl cinnamal dehyde and have an acid called cinnamic acid (3,4). It content a Chemical compound has in effect like insulin called Insulin Potentiating Factors (IPF). Some studies in cinnamon showed in effect on blood cholesterol by reduced it and take place as antioxidants by break down free radical (5).

**Material and Method**

The experiment was conducted by using of 360 chicks ross308 one day old and 40gm average of body weight. The bird were randomly classified in bens distinction 2*1.5 m. the treatments were treatment 1 without any additive as control, treatment 2, 3 and 4 feed diet with cinnamon cassia 0.4, 0.8 and 1.2 %. The performance characteristics were study and it the end of experiment 6 birds were slaughter after individual weighting and carcass characteristics were measured. The blood sample were collected from jugular vein by tube and the sample but in centrifuge in speed 3000 rpm/m for 15 mints and the serum used to calculate total cholesterol, total protein and uric acid (6). The experiment was design as complete random design CRD and the data was analyses by (6) and the different was tested by using Duncan’s multiple range test(7).

**Results and Discussion**

The results in table 1 show the effects of cinnamon cassia in body weight, it seen that the effect was a very clearly in 3 weeks after addition and have a significant differences (P<0.05) in age 4 and 5 week, the best result give by T4, T3 and T2, the occur 2238, 2150 and 2100 gm respectively compared to 2068 for T1. The weekly gain curve was similar to weight results in table 1 and the T4,
T3 and T2 give the highest results and have a significant differences in total gain compared with control (table 2). Feed consume wasn’t effect by treatments and there were just a numeric different (table 3).

Discussion

Effects of adding cinnamon cassia to broiler diet can by explain by knowing the theory of choice it. Cinnamon have a very variety of natural chemical in it composition which give a different result in body of bird, therefore we see the different in body weight as outcome for the improvement of other characteristics and when the treatments improve in feed consumption and feed conversation the body weight must become heaver\(^{(9, 4)}\) and the results of feed conversation refer to that, the enhance maybe came from the cinnamon have a polyphenol called insulin like effect factor and it caused Appetite to feed and the essential oils especially Cinnamaldehyde (4%) the body use it as source of energy and it Contains substances improve appetite, digestion, absorption and immunity in poultry and the evidence that the treatments have significant differences in abdominal fat compared with control\(^{(2,9)}\) and This was reflected in the percentage of mortality and production index especially for T3 and T4 this results maybe came from the Cinnamon inhibiting free radicals and reduce cell damage and give a better health performance \(^{(3,5)}\) and that was clearly in serum analysis especially for cholesterol and that mean cinnamon cassia have ability to reduced it and linked with triglyceride and prevent it from being free in blood vessels \(^{(11,9,2)}\).

Conflict of Interest: None of the authors have any conflicts of interest to declare.

Source of Funding: The research was performed independently, there is no funding, influence over study design, analyses, manuscript preparation, or scientific publication.

Ethical Clearance: The project was approved by the local ethical committee in University of Kirkuk.

Comparison of the Risk of Type 2 Diabetes Mellitus in Men and Women with Obesity in Indonesia

Andini Wisdhanorita¹, Syahrizal Syarif²
¹Master of Epidemiology, ²Departement of Epidemiology, Faculty of Public Health, University of Indonesia, Depok, Indonesia

ABSTRACT

Background: The prevalence of type 2 diabetes mellitus continues to increase. Obesity as one of the risk factors also continues to increase. This study aims to look at a comparison of the risk of type 2 diabetes mellitus in obese men and women.

Method: This study uses a cross-sectional design whose data is taken from the Indonesia Family Life Survey (IFLS) 5. The number of samples in this study was 5,763 respondents. The analysis in this study used logistic regression.

Results: BMI was associated positively with type 2 diabetes mellitus. The highest risk was found in BMI which was included in the obesity category (POR 3.483, 95% CI 2.774 - 4.373). Obese men have a higher risk (POR 4.441, 95% CI 3.163 - 6.235) than obese women (POR 3.112, 95% CI 2.266 - 4.274).

Conclusion: There are differences in the risk of type 2 diabetes mellitus between obese men and women. Efforts to reduce weight in men can be a priority in prevention and control programs for type 2 diabetes mellitus.

Keywords: Type 2 diabetes mellitus, body mass index, sex, gender

Introduction

The global prevalence of diabetes in adults over 18 years increased from 4.7% in 1980 to 8.5% in 2014.¹ According to IDF estimates in 2017, more than 424 million people worldwide have diabetes mellitus and 4 million die from this disease. While in Southeast Asia, the estimated prevalence of diabetes in 2017 is 10.1%.² Meanwhile, based on the results of the 2013 Basic Health Research (Riskesdas) it was found that the prevalence of diagnosed diabetes or diabetes mellitus was 2.1 percent in 2013. Compared to the results of the 2007 Riskesdas, the prevalence of diabetes mellitus increased from 1.1 percent (2007) to 2.1 percent (2013).³

Obesity is one of the risk factors of diabetes mellitus.⁴⁻⁶ According to WHO, in 2016 there were 39% of the population aged 18 years and over are overweight and 13% were obese. Meanwhile, the results of the 2013 Riskesdas stated that the prevalence of obesity in men aged > 18 years increased by 30.2% from 13.9% in 2007 to 19.7% in 2013, while the prevalence of obesity in women age > 18 years increased by 41.7% from 13.9% in 2007 to 18.1% in 2013.³

Type 2 diabetes mellitus is a result from a combination of low amounts of insulin produced by pancreatic β cells and insulin resistance. Insulin resistance causes an increase in fatty acids, thereby reducing glucose transportation to muscle cells and also increasing fat production which leads to increased glucose production. A person who is overweight or obese is likely to experience insulin resistance, but diabetes only occurs if a person also has a lack of insulin.⁷

Case-control studies in the United States found that there was a relationship between body mass index (BMI) and the risk of type 2 diabetes mellitus, the higher the BMI
the higher the risk for type 2 diabetes. Cohort studies in India also found a positive association between BMI and fasting blood glucose. In the UK a cohort study focused on women with results that overweight and obesity are risk factors for type 2 diabetes mellitus.

Several studies have shown that there is a relationship between obesity and the incidence of diabetes mellitus, but there are still few studies that try to compare the differences in risk in men and women who have the same BMI values. Therefore, researchers want to see whether there are differences in risk for type 2 diabetes mellitus between obese men and women.

**Method**

**Study Population:** This study uses a cross-sectional study design drawn from data from the Indonesia Family Life Survey (IFLS) 5 which was conducted in 2014/2015. IFLS is a survey conducted in collaboration between RAND and Survey Meter. IFLS has been carried out since 1993/1994. There were 7,524 respondents aged 0-110 years who were examined for glycosylated hemoglobin levels (HbA1c). The researcher then excluded 98 pregnant women so that the number of respondents became 7,426. Then restriction was carried out at the age of ≥ 18 years, so the number of samples became 6,259. After being combined with BMI data and physical activity, the total number of samples was 5,763, so the number of samples used in this study was 5,763 respondents.

**Type 2 Diabetes Mellitus:** The prevalence of type 2 diabetes mellitus in this study was obtained through the examination of glycosylated hemoglobin (HbA1c). HbA1c was obtained through blood collection which was then examined in a clinical pathology laboratory, Gadjah Mada University. HbA1c was one of the ways to diagnose diabetes mellitus recommended by WHO. Respondents were classified as people with type 2 diabetes mellitus if HbA1c levels were 6.5% or more, and were classified as not diabetics if HbA1c was less than 6.5%.

**Body Mass Index (BMI):** Body Mass Index (BMI) is obtained from the results of the calculation of body weight divided by the results of the square of the height (kg/m2). Respondents’ body weight and height were obtained through anthropometric measurements. Height measurements using SECA plastic board model 213 which can measure up to the nearest millimeter.

Measurement of body weight was carried out using the Camry model EB1003 which can measure up to 0.1 kg. Body Mass Index is categorized using WHO criteria for Asia, which is underweight (<18.5), normal (18.5 - 22.9), overweight (23-24.9), and obese (≥ 25).

**Statistic Analysis**

This study was analyzed using logistic regression with risk measures using prevalence odds ratio (POR) with a confidence level of 95%. The analysis was stratified by sex and controlled by potential confounder. Confounding tests were carried out by comparing POR crude with adjusted POR. If the difference between the two PORs is more than 10%, then the variable is considered confounding and included in the multivariate analysis. The variable that is suspected as potential confounder is age and physical activity. Age is divided into 2 categories, namely > 45 years and ≤ 45 years. While physical activity is divided into 3 categories based on IPAQ namely less (<600 MET minutes/week), moderate (600-3000 MET minutes/week) and high (>3000 MET minutes/week).

**Results**

The prevalence of diabetes mellitus is 8.7% with a proportion of 69.4% at the age of more than 45 years. The proportion of diabetes mellitus in men and women is not too much different, 42.3% in men and 57.7% in women. Respondents with moderate physical activity were having the highest proportion compared to other physical activity categories (43.5%). Obese respondents also had the largest proportion among other BMI categories at 58.1%. The complete proportion can be seen in Table 1.

**Table 1: Proportion of Type 2 Diabetes Mellitus Based on Respondents Characteristic**

Multivariate analysis was carried out by controlling the variables of age and physical activity for respondents with underweight, excess, and obesity, each compared to normal body weight. The results of the analysis obtained a POR value of 0.726 (95% CI 0.475 - 1.110), 1.434 (95% CI 1.045 - 1.968), and 3.483 (95% CI 2.774 - 4.373). The results of the analysis show that obesity has the highest risk of causing type 2 diabetes mellitus (Table 2).

</tbody>
</table>

A stratification analysis conducted to compare the risks in each sex. Obese men have a POR value of 4.441 (95% CI 3.163 - 6.235), while obese women have a POR value of 3.112 (95% CI 2.266 - 4.274). This means that obese men have a higher risk of developing type 2 diabetes mellitus compared to obese women (Table 3 and Table 4).

Discussion

The results of this study indicate that BMI is associated positively with type 2 diabetes mellitus. The higher the BMI, the higher the risk of type 2 diabetes mellitus. This is because BMI has a strong relationship with diabetes and insulin resistance. Someone who is obese, the number of non esterified fatty acids (NEFAs), glycerol, hormones, cytokines, and other substances that cause insulin resistance, increases. Diabetes can also occur if the β-islet cells in the pancreas are disrupted, causing reduced control of blood glucose. The development of diabetes cannot be avoided if the failure of β-islet cell function in the pancreas together with the occurrence of insulin resistance occurs. The results of this study are also in accordance with the results of other studies that have been done before. The meta-analysis conducted in India found that there was a significant relationship between obesity and type 2 diabetes mellitus (OR = 1.14, 95% CI: 1.04 to 1.24). H E Bays, R H Chapman, and S Grandy in their research in America found that the higher the BMI, the higher the prevalence of type 2 diabetes mellitus.

This study also revealed that there were differences in risk between men and women in respondents who were obese. Men have a greater risk than women. This is due to biological differences, culture, lifestyle, environment, and socio-economic status. The genetic effects and epigenetic mechanisms, nutrition, and lifestyle also affect risk in both sexes. In addition, hormones also affect energy metabolism, body composition, vascular function, and inflammatory reactions. Both biological and psychosocial factors influence differences in diabetes risk in men and women. Research in the United Kingdom found that the prevalence of type 2 diabetes mellitus in obese men was higher than in obese women. Despite the overall proportion of women who suffer from diabetes more than men, when seen only in respondents who are obese, men have a greater risk than women.

The prevalence of pre diabetes syndrome, such as impaired fasting glucose (IFG) and impaired glucose tolerance (IGT), is different for men and women. IFG is more in men, while IGT is more in women. The cause of this difference is not yet clear, but it is likely that this occurs because of smaller muscle mass or physical conditions in women that can reduce insulin function to stimulate glucose removal and cause IGT to be higher. The prevalence and pathophysiology of diabetes are also different. In the case of idiopathic diabetes, a type 2 type of diabetes mellitus with a tendency towards acute insulin deficiency, it was found that 75% of sufferers were men. Women will be protected in this type of diabetes except in women who are deficient in estrogen.

The limitation in this study is that this study uses a cross sectional study design, so that temporality is unknown. In addition, not all potential confounders are included in the analysis, so the results obtained may still be influenced by confounders. However, because the results of this study have a quite narrow of confidence interval, the role of chance in this study is quite small. In addition, this study is also consistent with the findings of other studies and the results can be explained biologically, so according to researchers the results of this study are still acceptable.

Conclusion

The existence of a positive relationship between BMI and the risk of type 2 diabetes mellitus, shows that intervention is needed to reduce weight in an effort to prevent type 2 diabetes mellitus. However, there are differences in risk in obese men and women, indicating that different interventions are needed in efforts to reduce weight in men and women so that the results are more optimal. Reducing the prevalence of obesity in men can be a priority program in preventing the occurrence of type 2 diabetes mellitus.

Ethical Clearance: This Study used data from Indonesia Family Life Survey (IFLS) 5. IFLS 5 has been approved by IRBs (Institutional Review Boards) in the United States (RAND) and Gadjah Mada University (UGM) in Indonesia. All informed consent was also approved by the IRBs before the survey was carried out.

Source of Funding: The research is at its own expense.

Conflict of Interest: Both author declared that no conflict of interest.

ABSTRACT

Data from the Sangurara Health Center in Palu city at 2017 the number of participants was primigravida 42 and multigravida 149. Primigravida pregnant women feel a concern about the labor that will be passed because this is the first labor. The method to relieve and help pregnant women in preparation for labor is to do the Yoga Prenatal Program. Analysis the effectiveness of prenatal yoga programs on primigravida trimester III in reducing complaints in the first stage of labor and self-efficacy. This study was an experimental study with two group design randomized controlled trial. The study was conducted from July to October 2018 in the Class of Pregnant Women at the Sangurara Health Center. Subject were taken based on consecutive samples, samples were 36 primigravida Trimester III: 18 controls, 18 interventions. The average value of complaints of labor in the first stage of 4cm cervical opening was 6.55. The Mann-Whitney test results obtained a significance value of p = 0.00, at 8cm cervical opening obtained a mean number of 7.19 and value of p=0.00, self-efficacy in 4cm cervical opening obtained 110 self-efficacy rate with value of p=0.00, the average self-efficacy of labor opening at 8cm 107 and p value<0.05. Prenatal Yoga Program is effective for primigravida trimester III in reducing first stage complaints and self-efficacy at the first stage of labor. Prenatal Yoga Program is standard in Antenatal Care.

Keywords: Prenatal Yoga, First Stage, Complaints, Self efficacy
before prenatal yoga namely frequent urination of 31 (91.1%), while excretion that is not felt after yoga prenatal is 0% muscle spasm. Yoga pregnancy exercise is effective in reducing the abundance of third trimester pregnant women.10

Multipara had higher self-efficacy than those who gave birth for the first time. Several studies have found that yoga practices during pregnancy can facilitate self-efficacy during the first active phase and second stage of labor.11 Yoga during pregnancy can increase the mother’s expectation in preparing the birth of a baby so that the mother becomes more skilled in relaxation and learns to be confident in facing childbirth.12

During the Prenatal period primigravida pregnant women need preparation in the face of labor so that labor can take place well, mother and baby are healthy.

**Method**

This study was an experimental study with a randomized controlled trial, single blind, two group design.13, 14 The sample consisted of 36 primigravida Trimester III pregnant women consisting of 18 treatment groups and 18 control groups, taking samples with the consecutive sample technique. Prenatal Yoga is done in the treatment group for 8 times every week 2 times. When prenatal yoga is performed in one session 60-minute, divided by: Meditation, Warming up, Prenatal Yoga Movement (Restorative posture, standing posture, Pelvic Rocking) and relaxation. And then during labor interviews were conducted at the opening cervix of 4cm and 8cm in the intervention group and the control group during the relaxation phase. Univariate analysis use mean, frequency distribution. Bivariate analysis of the Wilcoxon test and Mann Whitney statistical test with a 95% confidence interval.

</table>

The results of the statistical test in table 6 it can be conclude that The Prenatal Yoga Program is effective in first-stage self-efficacy of 4cm cervical opening. And self-efficacy at the opening cervical of the first 8cm were significant differences between the control group and the intervention group. Prenatal yoga is effective in labor self-efficacy.

Discussion

1. Effectiveness of Prenatal Yoga Program on Primigravida Trimester III in Reducing Complaints in the First Stage Labor: Age can determine the physical readiness of primigravida women facing labor. In the opinion of Rochjatithe young or old primigravida is one of the risk factors that can cause harm and the possibility of complications during labor and thus require preparation in the prenatal period.

Research Rafika that more pregnant women with low education, underlie respondents not yet aware of prenatal yoga because previously they were not exposed to information given health services, especially prenatal classes. Respondents who work outside the home are the most housewife. This is a burden of increasing physical complaints because of the many burdens of work done at home, while the condition of his body is getting heavier with increasing gestational age and body position (mechanical body) of pregnant women when working improperly.

The results of this study are consistent with the research of Chuntharapat et. al., yoga can improve comfort during labor. The duration of the first stage of labor becomes shorter than the total time period I. Research Thakur, Sharmaeena and Masand, regular yoga during pregnancy can help pregnant women to be healthy during pregnancy and prepare for labor, avoid improper posture during pregnancy. The technique of breathing and meditation can make a pregnant woman healthy and relaxed to prepare her mentally in facing labor.

The results of a review from Stillman, yoga are comprehensive, holistic and have long been used to reduce stress, pain, and negative results from high-risk pregnancies. Another study conducted by Beddoe, that every pregnant woman is recommended to start pregnancy in the second trimester to do yoga and is significant in decreasing physical pain. In the third trimester, there is a decreased stress and anxiety reaction after yoga. Yoga improves the metabolism of the body and helps relaxation of the nervous system, regulates diaphragm contractions and relaxation that are used to improve blood circulation and are very helpful when waiting for the birth of a baby.

Prenatal Yoga very effective role to prepare in reducing labor pain, the location of muscles in the vaginal area, uterine cavity, rectum bearing heavy burden during pregnancy, contraction and relaxation that increases joint mobility, extends pelvic diameter, maintains circulation throughout the area and labor takes place, experiences pain decreases during labor, this is related to the pelvic floor muscles. In the intervention group, pain decreased compared to the control group. The control group feels pain during labor.

Hawrelak and Stephen, agrees with this point, if pregnant women practice 30 minutes of yoga, three times a week starting at 10-12 weeks of pregnancy, reducing pain during pregnancy, effective in facilitating comfort during labor and
after childbirth. The duration of labor is shorter\(^2\). Yoga reduces labor pain and reduces the need for analgesia\(^2\). Labor pain is felt if pregnant women are afraid and inadequate labor preparation\(^2\).

2. Effectiveness of Prenatal Yoga Programs on Third Trimester Primigravida Self-Efficacy: Age greatly affects women in facing pregnancy and childbirth both physically and psychologically. According to Sriwenda and Yulinda, women <20 years old are not psychologically prepared to face pregnancy or childbirth. Labor readiness is influenced by 3 factors, namely physical, mental, economic readiness\(^2\).

According to the theory that at the opening of 4 contractions it starts every 10-20 minutes lasting 15-20 seconds with light intensity\(^2\). Uterine contractions in labor are unique, physiological muscle contractions that cause pain in the body. Contractions are under the influence of intrinsic nerves so that women do not have physiological control over the frequency and duration of contractions\(^2\)

Chuntharapat, et. al., research that yoga during pregnancy can facilitate self-efficacy during labor when active phase and second stage of labor. Yoga during pregnancy can increase the mother’s expectation in preparing the birth of a baby so that the mother becomes more skilled in relaxation and learns confidence in facing labor\(^2\). Self-efficacy can also increase trust or the ability to go through labor properly. This is an important factor that influences the motivation of women to give birth normally.

Mothers have good efficacy shown by their ability to adapt to labor pain, appear calm, be able to control themselves, are able to follow the advice of labor helper with their own strength, regulates breathing as long as there are mules (contractions) and can divert attention.

The results of this study are in accordance with Sindhu that practicing yoga during pregnancy is a useful solution as a self-help medium that will reduce discomfort during pregnancy, assist the labor process and even prepare mentally for the early postpartum period and when raising a child\(^2\). According to the Sun et. al., yoga programs can reduce discomfort during pregnancy and increase trust in labor\(^9\).

Conclusion and Advice

Prenatal Yoga programs are effective against Primigravida in reducing complaints of labor in the first stage and Prenatal Yoga Program are effective for Self-efficacy in labor at the first stage.

Sugestion

The Prenatal Yoga Program is the standard for Antenatal care services, The midwife responsible for Prenatal class services activates the Prenatal Yoga Program. Promotion and education of Prenatal Yoga Programs independently at home. Need to do further research on the effectiveness of Yoga on fetal growth and development.

Conflict of Interest: All of the authors contributed to writing this paper and declare no conflict of interest.

ABSTRACT

Public health is service facility in order to build healthy society by accentuating the promotion and prevention. Most public health center in Indonesia have not yet been effective in curing noncontagious disease. There must be specific treatment in preventing and maintaining it from intervening the national healthcare government program. Puskesmas in Bengkulu have implemented the capital number policy and commitment fulfillment-based capital payment on First Level of healthy Facility. One of indicators is routine prolanis ratio visiting it. The purpose of this study was to understand the effect of Chronic Disease Management Program (prolanis) on referral controlling and chronical disease service efficiency.

Exploratory design on case study was conducted using quantitative method for understanding the implementation of chronic disease management policy. The sample population was taken from participant of prolanis which was held in Public health center in Bengkulu. Sample was obtained by accidental sampling. Data was analyzed by correlation and regression between Prolanis and referral frequency.

This statistical analysis found there was negative correlation between prolanis and referral with r=0.228 and p value= 0.04 on weak correlation. Conversely, there was significant correlation between prolanis implementation and referral on r=-0.135 with weak correlation and p value of 0.167.

Reduction of referral frequency to first healthcare center level (FKTL) can improve the efficiency on cost of healthcare in FKLT. Prolanis also improves people awareness, willing and capability to behave healthier including controlling hypertension and DM.

Keywords: Prolanis, Referral maintaining, FKTL

Introduction

Public health center (Puskesmas) is the first service facility which provides the healthcare service to the society. There must be specific treatment in preventing and maintaining noncontagious disease from intervening the national healthcare government program1.

Social health Insurance administration organization has tried to improve the efficiency and effectivity in healthcare system by developing quality control system through capital payment pattern and regulation of capital decree also commitment-based fulfillment on First Level of healthy Facility (FKTP). The indicator of it is contact number (AK), referral ration of special treatment nonspecific (RRNS) and routine-visiting prolanis member ratio.

According to the result of capital policy implementation and commitment-based fulfillment in Bengkulu. The number of visitation of a monthly number of sickness in 2017 was ranging from 7.76%-11.86% and 9.56% annually from the number of
application. Healthy visiting in puskesmas monthly was from 10.27% to 14.29% with annual percent of 11.63. Besides, the referral number was slightly higher (13.76%-18.05% monthly and 16.22 annually) based on visiting of sickness. From this value, it indicates that Puskesmas is suggested to develop the management for implementing society endeavor regarding healthy lifestyle in preventing, maintaining, controlling the disease.

Puskesmas is also strived to be able to integrate social healthcare with basic medical service and regulating referral number with people contribution through prolanis. From all things considered, we investigated the analysis of prolanis role for referral controlling. This study was aimed to determine the correlation of prolanis in controlling referral in Bengkulu.

Material and Method

An exploratory design on case study was conducted using quantitative method for understanding the implementation of chronic disease management policy. The sample population was taken from participant of prolanis which was held in Public health center in Bengkulu. Sample was obtained by accidental sampling. Data were analyzed by correlation and regression between Prolanis and referral frequency.

Result

Prolanis Realization: Prolanis is held in every puskesmas in Bengkulu which participated by patient who suffers chronically (Type 2 Diabetes Mellitus and hypertension). Prolanis activity is including medical education, sport, and healthy status observation. According to the patient statement:

There are several activities involved in prolanis including blood tension check, consultation/and hypertension control explanation (Hypertension patient)...

From the patient of type 2 DM, activities are held in prolanis including blood tension check, index glycemic measurement, hypertension control explanation...

Prolanis participants found it useful to take part in prolanist activities organized by the Puskesmas, based on interviews with all participants statement:

Most patients felt the positive effect of prolanis namely feeling healthier, weight body controlling, improve the understanding of disease treatment, and etc

Based on the interview we found that counseling and explanation which has been applying in life from most participants including nutrition intake, healthy diet, physical exercise in 30 minutes at least every day, prescribe consumption right on the proper time, yet most often emotion out of control. More importantly, by joining prolanis can reduce the number of hospitals visiting sickness. The correlation and regression analysis of the positive effect of prolanis is listed in Table 1.

| Table 1: Correlation of Prolanis Realization on Referral from Puskesmas in Bengkulu |
|---------------------------------|------------------|
| Variabel                        | Referral Score Frequency |
| Score of prolanis policy implementation | r = -0.228  
|                                 | p = 0.04  
|                                 | n = 60 |

Table 1, the statistical analysis with r=-0.228 shown negative correlation between prolanis realization and referral frequency with weak correlation on p-value =0.04. interestingly, there was significant correlation between prolanis with the referral.

Attending analysis of prolanis activity with referral to FKTL from Puskesmas in Bengkulu is presented in Table 2.

| Table 2: Correlation Analysis of Prolanis Attending with Referral in Puskesmas Bengkulu |
|---------------------------------|------------------|
| Variabel                        | Referral score |
| Score of prolanis policy implementation | r = -0.135  
|                                 | p = 0.167  
|                                 | n = 60 |

In Table 2, based on statistical analysis with r=-0.135 it was observed that the significant correlation between prolanis and referral with weak correlation, p-value=0.167.

Discussion

Prolanis Implementation: Prolanis has been held it every puskesmas which joined by patient who suffers chronical disease (DM and hypertension). Most
participants felt the positive effects of this activity also applying it to their lifestyle. Based on previous study, the innovation of people contribution showed that when patients take a big apart and able to control their self. According to WHO (2015), integrated healthcare service is health facility which guarantees continual service including health promotion, disease prevention, diagnosis, treatment, disease management, rehabilitation on different level of health system following the requirement.

Prolanis activities are ranging from education of health, medical checkup. Health Belief Model (HBM) suggested that healthy style is based on two cognitions namely disease threatening perception and prevent action evaluation. The most probable person to follow certain healthy treatment once they believe the purpose is bigger than the cost to defeat the health threatening. The active participant who joined the program will able to get knowledge to prevent, maintain and understand the effect of noncontagious disease which in turn will motivate people to behave healthier and avoid DM and hypertension. HBM is a kind of best preventive strategy also cancer and primary hypertension detection relevant to intervention to reduce the risk factor of cardiovascular disease.

Prolanis activity covers many aspects of health including education about hypertension and DM or special concealing for participating who is interested. Additionally, monthly activity was blood tension measurement and education. The purpose of doing these was preventing and controlling hypertension or DM to reduce referral frequency to FKTL. The activeness in following this program was related to insight of nutrition and obedience level of diet on DM patient. The more active the patient is the more obey in doing proper diet. Integrated Health Education Center for Non-communicable Disease (Posbindu PTM) members who suffer from hypertension and actively come every month can control blood pressure down to 74.1% of patients in the fifth month. The role of Posbindu PTM by measuring blood pressure, height, body weight, conducting counseling/education, counseling for members with indicated hypertension can increase knowledge and healthy behavior to control active hypertensive patients. This will be related to lowering the frequency of hospital visiting.

The chronical disease approach predicted from group, the susceptible person around 3-5% patient with chronic condition is requiring special management, 15-27% need treatment management and 70-80% could be controlled with sporting individual curing Jones 2006 in Australian Government 2009. The result has shown the society-based intervention of lifestyle explained by medical apparat might be the potential solution to defeat hypertension and DM in every element of society.

**Service Cost Efficiency:** The goal of prolanis is to control referral by keeping life quality through positive activity including improving knowledge and healthy lifestyle in order to maintain disease. There is the number of promising intervention which capable of improving effectiveness and efficiency of out-patient care, including easy contact, especially for doctor. There must be special strategy to improve the skill primary doctor through either education or consult with patient. Public health service through health promotion may support long-term infestation in healthcare service system which focusing on efficient prevention and controlling. Indonesian nowadays facing the challenge particularly in effective realization from Universal Health Coverage (UHC) in broader scope. These ranging from noncontagious disease and chronic requiring efficient treatment. Promoting health to support in a healthy lifestyle and reduce the number of referral in hospital influencing in service efficiency.

**Prolanis Policy:** Prolanis is one of the indicators from capital payment policy based on Social. Security Agency for Health No 2 the year of 2015 about capital number stipulation and payment of service commitment on FKTP, Ministry of Health and Social Insurance Administration Organization the year of 2017. The prolanis activities including 1) medical consultation, 2) education to prevent disease, 3) reminder through SMS Gateway 4) Home visit.

Service commitment-based capital payment on FKTP is part of the developmental system of quality control to increase the efficiency and effectivity of healthcare service. This can be valued according to indicator achievement, one of the routine participants who get monthly health service everywhere without considering the visiting frequency per month. Perolanis is one of facility which can be able to support healthy lifestyle for people (Germas). This is the systematic and well-organized action by every element in the society based on the awareness, willing and capability to start healthy life. This action should be primarily started from family by doing series of activity namely physical activity improvement, healthy lifestyle, healthy food supply, and nutrition awareness, disease prevention and cure, environmental quality improvement, healthy life education which are also implemented in prolanis.
Puskesmas as the public healthcare service acts like gatekeeper in formal health service and referral control. This can be facility in curing noncontagious disease thereby optimize the prolanis. Primary service of health is important component of health service with costless. Healthcare system which necessary to plan an effective way to strengthen it since most countries are still uneducated about the role and position of primary in-system healthcare service\(^{13}\).

**Conclusion**

Prolanis participant was actively taking part to improve chronical patient to achieve good quality of life and reduce the referral frequency to FKTL. This circumstance could be able to improve the efficiency of health service on FKLT. Prolanis activity can increase the success of Gernas on lifting awareness, willingness, and capability of people to start a healthy life.

**Source of Funding:** Thanks to Human Resources Development and Empowerment Agency (BPPSDM) for the facility provided.

Obesity as a Predictor of Hypertension in Adult Population:
A 14-Years Retrospective Cohort Study

Dewi Kristanti¹, Nurhayati Prihartono²
¹Master Study of Epidemiology, ²Department of Epidemiology, University of Indonesia

ABSTRACT

Background: Hypertension is one of the main health problems due to increasing numbers of incidence and its complications. However, cohort studies that evaluate the risk of hypertension among obese people are very limited. This study objective was to assess the risk of obesity associated with hypertension within 14 years of follow-up period in Indonesia.

Method: Study design was cohort retrospective used a sample of Indonesia Family Life Survey/IFLS wave 3, 4 and 5. A total of 11,167 non-hypertension subjects in the year 2000 were evaluated in the year 2014 to assess the status of their hypertension. Data were collected by interview and blood-pressure measurement. Hypertension was defined using the JNC 7th criteria. The data were analysed by Cox-regression.

Results: The total case number of hypertension in 14 years was 3655 cases, the cumulative incidence was 32.7%, and the hazard rate was 29 per 1000 person-years. The risk of hypertension in subjects with obese was 1.84 times compared with non-obese subjects (95% CI: 1.68 – 2.01) adjusted by other covariates. Based on the degree of obesity, subjects with obese II and obese I increased the risk of hypertension with HR were 2.43 (95% CI: 1.99 – 2.96) and 1.73 (95% CI: 1.57 – 1.91) respectively.

Conclusions: The risk of hypertension in obese people was significantly increased than the non-obese people, with an exposure-response relationship.

Keywords: incidence of hypertension, hazard ratio, Indonesia Family Life Survey (IFLS)

Introduction

Hypertension is one of the health problems at the global and national levels because the incidence and its complications are increasing from year to year. Based on WHO data, by the year of 2015 there was an increased blood pressure (BP) in 1.13 billion people worldwide, 20% in women and 24% in men¹. In the US, one in three adults had hypertension². Whereas in Indonesia, the prevalence of hypertension in 2013 was 25.8%³.

Hypertension becomes the main risk factors for global death as well⁴. In a cohort study about the impact of hypertension, it was found that there was an increased risk of cardiovascular death in the subject with stage-1 hypertension of 1.46 times and stage-2 hypertension of 1.89 times compared to normotensive subjects⁵.

Multicausal factors has stated as the determinant of hypertension. Some factors such as old ages, low education, overweight or obesity, and smoking are associated with the presence of hypertension⁶. Obesity itself can be related to hypertension independently but can also occurred due to unhealthy diets and lack of physical activity. Some studies show that about two-thirds of the incidence of primary hypertension is related to obesity⁷. The risk of hypertension in overweight and obese subjects raised from 1.6 times to more than 4 times compared with non-obese subjects⁸⁻¹¹.

Several studies related to obesity and hypertension have been carried out in some countries. However, those studies have involved a relatively small number of samples (<5000 subjects) and relatively short time of follow-up period (<10 years). Therefore, this study was conducted to assess the role of obesity as a predictor of
hypertension in a larger number of samples and longer
time of follow-up period.

Method

The study design was a retrospective cohort that
analysed data of the Indonesian Family Life Survey
(IFLS) data, from IFLS-3, 4 and 5. The IFLS was a
household survey with a cohort design conducted from
1993 (IFLS-1), then continued in 1997, 2000, 2007 and
2014.12

The study population was Indonesian residents aged ≥
18 years who participated in IFLS-3, then re-participated
in IFLS-4 and 5, or one of this. While the sample was a
hypertensive-free subject at the beginning of the study
(IFLS-3), both obtained from interview results (history
of hypertension and taking medication), or from the
results of BP measurements. The inclusion criteria were
subjects who attended IFLS-3 for interviews, underwent
anthropometric and BP measurement completely. While
the exclusion criteria were subjects diagnosed with
hypertension based on medical history or measurements
in IFLS-3, pregnancy, and subjects who had incomplete
important variables.

As the main exposure in this study was obesity.
Obesity was determined based on the 1998 WHO criteria
for the Asia-Pacific population: the body mass index
(BMI) ≥ 25 kg/m². Obesity consists of two degrees,
obese I which BMI of 25 - 29.9 kg/m², and obese II
which BMI of ≥ 30 kg/m². Some other risk factors
determined in the study were socio-demographics and
behavioral risk factors.

Some sociodemographic and behavioral information
were collected by questionnaire which included
questions on area of residence, educational level, marital
status, working status. The behavioral risk factors were
level of physical activity and smoking habit. Physical
activity was assessed through a modified of International
Physical Activity Questionnaire (IPAQ) questionnaire,
smoking habits and degree of smoking that were
expressed by Brinkman Indexes that calculated the
number of cigarettes smoked every day multiplied by
years of smoking.14

The outcome of the study was hypertension based on
the criteria of the 7th Joint National Committee: an average
of systolic BP ≥140 mmHg or an average of diastolic BP
≥ 90 mmHg. Subjects with raised BP according to the
criteria and subjects with normal BP but they took anti-
hypertension were declared as hypertension subjects. An
analysis was carried out on hypertensive-free subjects at
the start of the study (IFLS-3).

BP measurement was performed one time in the
baseline, and three times with a 5-minute pause on
each examination in follow-up, using Omron digital
tensiometer on the left arm and in a sitting position.
While the anthropometric measurements were carried
out through measurements of the height with the Shorr
board, the weight with scale of the Seca floor model
developed in collaboration with UNICEF, and the
abdominal circumference used a measuring tape. BP
and anthropometric measurements were carried out by
trained nurses.12

Data analysis were carried out with life-table and
Cox regression to obtain the incidence and hazard rate
of hypertension within 14 years of follow-up, and the
risk of obesity in hypertension after controlled by other
covariates that expressed with adjusted hazard ratio and
its 95% CI. Statistical criteria were used to determine
confounders.

Ethical Consideration: The IFLS surveys have
properly reviewed and approved by IRBs (Institutional
Review Boards) in the United States (at RAND) and
by the University of Gadjah Mada for IFLS-3, 4 and 5.
All requirements for consent for subjects were met and
approved by those IRBs before fieldwork could begin.16

Results

The flowchart illustration of sample selection was
shown in figure 1. Total sample of adult subjects aged
18 years and above at a baseline was 15,092. Of these,
subjects who were pregnant, didn’t complete BP or
anthropometric measurement, and had hypertension at
baseline were excluded. During 14 years of follow-up,
subjects experienced loss to follow up were excluded.
Subjects who had incomplete data other than the BP
and anthropometric variables and subjects who only
attended one-time follow-up were still included in the
analysis. The number of subjects to analyse was 11,167,
A total number of hypertension that occurred in 7 years was 2001 cases and occurred until 14 years was 3,655 cases. The cumulative incidence was 32.4%, with the incidence of hypertension in women was higher than men. (figure 2).

Subject Characteristics: Table 2 showed subject characteristics based on sociodemographic, biological, and behavioural factors. According to region, Kalimantan and Java regions experienced the highest proportion of hypertension. Urban and rural status have almost the same proportion. In the age group, more than 60% of highest age group had hypertension. Female subjects, had a low level of education, worked and currently married, had a
higher proportion of hypertension than the opposite group. Based on biological characteristics, more than 40% of subjects with overweight and obese had hypertension, and almost 60% of subjects with central obesity also had hypertension. Based on behavioural characteristics, subjects with lack of physical activity has a higher proportion of hypertension. Former smokers experienced a higher proportion of hypertension than non-smokers and active smokers. For the degree of smoking stated by the Brinkman Index, the group of heavy smokers had the highest proportion of hypertension than the other groups.

### Discussion

This study found that the total case number of hypertension in 14 years was 3655 cases, with the cumulative incidence was 32.7% and the hazard rate was 29 per 1000 person-years. The risk of hypertension in subjects with obese was 1.84 times compared with non-obese subjects (95% CI: 1.68 – 2.01) adjusted by other covariates. Based on the degree of obesity, subjects with obese II and obese I increased the risk of hypertension with HR 2.43 (95% CI: 1.99 – 2.96) and 1.73 (95% CI: 1.57 – 1.91) respectively.

This study finding was similar with a study of 1009 young adults 20-45 years old in China, they stated that obesity had increased risk of hypertension with HR 1.83 for obese I and HR, 2.62 for obese II 10. As for some longitudinal studies abroad, for example from the Golestan Cohort Study (2013), it was found that the risk of hypertension in the obese group increased 3 times in rural areas and 2.93 times in the urban area17. Other study in Portugal(2015) stated that the increased risk of hypertension in the obese group was 2.44 times compared with the normal group7. Other results of a recent study in China (2017) based on follow-up for 2 years, found that the increased risk of hypertension occurred significantly in the group of subjects who were overweight/obese without metabolic disorders with OR: 1.78 and in the group of subjects who were overweight/obese accompanied by metabolic abnormalities with OR: 3.35, compared to the normal group8. A meta-analysis results of 2018 in India, found that pooled OR hypertension in the obese group was 3.820 compared to the non-obese group18.
Other risk factors found in this study and considered as confounder were gender, age, educational level, marital status, smoking habit, and level of physical activity. Most of these findings had similar results when compared with other studies, except for gender. In this study, the female has a higher risk of hypertension, it also stated in other paper about prevalence of hypertension on adults over 40 years that using data of IFLS-5. These gender findings were similar to another study in South West Ethiopia but different from other findings in Europe countries and China, which state that male has a higher risk of having hypertension. On the other hand, data from the National Health and Nutrition Examination Survey, 2011–2012 stated that the prevalence of hypertension was similar for men and women at nearly one-third.

Conclusions

This study found that obesity significantly increase the risk of hypertension and there was an exposure-response relationship between obesity and hypertension. These findings can be beneficial for government to make effective weight control programs to prevent and control hypertension. This study also will help the researchers to uncover the critical areas of obesity-related hypertension in a large population-based within long time period of follow-up.

Short Term Effect of Spilled Bile & Gallstone During Laproscopic Cholecystectomy on Clinical Outcome

Asaad Mohammed Kadhim¹, Madhi Hashim Otawi Altaraikhim²

¹Ass. Professor. (C.A.B.S.) Consultant General & Laproscopic Surgeon Basrah University (Alfayhaa Teaching Hospital); ²(C.A.B.S) General & Laproscopic Surgeon, (Al Mawanee General Hospital)

ABSTRACT

Background: Accidental gallbladder perforation during laparoscopic cholecystectomy is on the rise because of increased attempts at minimally invasive surgery. There have been a number of studies attempting to determine the effect of spilled bile and gallstones on the clinical outcomes, but the results are still conflicting.

Aims: This is a randomized prospective study to evaluate the short term effect of spilled bile and gallstones on clinical outcome in patients who sustained a gallbladder perforation.

Method: This study was carried out in Department of General Surgery at Alsader Teaching Hospital and Al-Fayhaa General Hospital in Basrah, Iraq from September 2015 to October 2017 included 396 patients of either gender and different age groups who underwent laparoscopic cholecystectomy.

Results: Sixty-six patients sustained a gallbladder perforation (16.7%), and it primarily occurred during dissection of the hepatic fossa in 42 patients (63.6%). The mean operative time and duration of postoperative hospitalization were longer in the perforated group (P=0.015 and P=0.001). Visual analog scale scores for pain on the first and second postoperative days were higher in the perforated group (P=0.009 and P=0.034). Complications such as ileus and port site infection developed more frequently in patients with a gallbladder perforation (P=0.001 and P=0.004).

Conclusion: Accidental gallbladder perforation can cause more postoperative pain, increase operative time, ileus, and port site infection, which consequently increases the total duration of hospitalization, undermining the advantages of Laparoscopic cholecystectomy. Based on these interesting results, surgeons should make every effort to prevent gallbladder perforation by performing careful and precise dissection during the operation.

Keywords: laparoscopic cholecystectomy, spillage bile& gall stone, outcome

Introduction

Gallstone disease constitute a major health problem throughout the world.¹² Its prevalence in the United States adult population is around 10%, rising to 30% in the last two decades.³

Cholecystectomy is the treatment of choice for gallstones disease.⁴ Carl August Langerbach performed first open cholecystectomy in 1882, while Philippep Mouret performed first laparoscopic cholecystectomy in Lyon, France in 1987.⁵

Laparoscopic cholecystectomy has become the standard treatment for gallstone disease and has replaced open cholecystectomy.⁶⁷ In US alone out of 600,000 operations performed annually for gallstones disease, 75% are performed laparoscopically.⁷⁻¹⁰

Laparoscopic cholecystectomy offers the patient the benefits of minimally invasive surgery (MIS) including cosmetic operative scars, better postoperative recovery and early return to work.¹⁰⁻¹¹

However, it is associated with certain complications that have rarely been reported with open cholecystectomy.

Complications of laparoscopic cholecystectomy include complications due to port entry,⁸ bleeding,¹³ and biliary complications including spilled bile and gallstones,¹⁴ biliary leaks and bile duct injuries.⁸,¹⁵
Perforation of gallbladder and spillage of gallstones during laparoscopic cholecystectomy is a frequently observed phenomenon. Its estimated incidence is reported to be between 3% and 33%. 14,16

Moreover, gallbladder perforation is increasing in frequency because of increased efforts to perform minimally invasive surgery, which has limited the visual field and mobility of the surgical instruments.

A number of studies have demonstrated the effect of intraperitoneal contamination with spillage of bile juice and gallstones. Previously the majority of surgeons believe that gallstone spillage during laparoscopic cholecystectomy is a benign complication and it does not justify conversion to laparotomy, even if a large number of gallstones remain in the abdomen. 18-22

However, there are also some reports that have demonstrated the complications of gallstone spillage, such as intraperitoneal abscesses, adhesions, small bowel obstruction, cutaneous fistulas, and septicemia. 15,23

Aim of This Study

Aim of this study is to evaluate the short term effect of spilled bile and gallstones on clinical outcome in patients who sustained a gallbladder perforation.

Patients and Method

This is a randomized prospective study, was conducted in department of General Surgery at Al-sader Teaching Hospital and Al-Fayhaa General Hospital in Basrah, Iraq from September 2015 to October 2017.

The study included 396 patients of either gender and different age groups who underwent laparoscopic cholecystectomy.

Those patients with gallbladder neoplasms, patients with coexisting stones within the common or hepatic duct, were excluded from the study.

All patients were fully informed and a written consent was taken. And also a predesigned proforma which included: age, gender, stage at which gallbladder perforation occur, operative time post-operative pain, postoperative complications( fever, vomiting, ileus, port site infection ) and duration of hospital stay was made for all patients.

A detailed history, clinical physical examination and investigations included complete blood count, blood urea, serum creatinine, blood glucose, liver function test, electrocardiography, chest X-ray and ultrasound of abdomen were done for all patients.

Operative time ( in minute): mean time start from skin incision till finishing the skin closure.

Postoperative hospital stay: means number of days spent in the hospital from the day of operation till discharge of the patients to their home.

Port site infection is diagnosed based on clinical findings such as increased redness and pain with pus discharge.

Post-operative pain was assessed by the VAS(Visual Analogue Scale).

Visual Analogue Scale (VAS) : is a measurement instrument that tries to measure a characteristic or attitude that is believed to range across a continuum of values and cannot easily be directly measured for pain. VAS ranges from no pain (0) to the most severe pain (10). As shown in fig (1).

![Figure 1 : Visual analogue scale](image)

A patients who underwent laparoscopic cholecystectomy were operated on nearly by same team of surgeons.

All patients received dose of one gram Third generation cephalosporin intravenously at time of induction for prophylaxis ( single dose ) and twice daily for 3 days postoperatively.

Surgical Technique: All operations were performed with the patient under general anesthesia. The umbilical port using an 10-mm trocar was introduce by closed method and CO₂ gas was insufflated to establish a pneumoperitoneum with an intraperitoneal pressure of 12-15 mmHg. Under visual confirmation, an Epigastric port was inserted into the right border of the falciform
ligament with a 10-mm trocar, Midclavicular port 5-mm and Anterior axillary line port 5-mm was made. The operating table was placed in the reverse Trendelenburg position and tilted to the left.

We used the technique of critical view of safety by releasing lateral peritoneal attachment of gallbladder for better dissection of calot’s triangle. Then dissection was continued from posterior aspect of calot’s triangle to identify the cystic artery and cystic duct. Clipping and division of cystic duct then cystic artery were achieved. Gallbladder was dissected off its bed in the liver with monopolar cauterization of any bleeding points.

In case of perforation of the gallbladder, prompt aspiration of bile spillage and retrieval of residual stones were done by using endobag and then abundant irrigation. Also put a drain according to the operative field.

The surgeons assessed the suitability for discharge, considering the clinical symptoms. And continue follow up the patients for 2 week from day of admission.

All the data were analyzed by using SPSS system version 20 with P-value of < 0.05 regarded as significant.

Results

This study included 396 patients who underwent laparoscopic cholecystectomy, 66 patients sustained a gallbladder perforation (16.7%).

The age distributions and number of patients who sustained gallbladder perforation are shown in table(1), and the figure shows sex distributions in which most of the patients are females (325 (82%)), while only (71 (18%)) are males.

Gallbladder perforation primarily occurred during dissection of gallbladder from the hepatic fossa in 42 patients (63.6%). There were also 12 cases perforation occur during traction of gallbladder, 10 cases perforation occur during dissection of cystic duct and two cases during extraction of the gallbladder through a port site. (Table 2).

Table (3). Shows a short term effect of spilled bile and gallstones on clinical outcomes. The mean operative time and the duration of the postoperative hospital stay were significantly longer in the perforated group (P = 0.015 and P = 0.001).

All patients used the same components of analgesia but the VAS scores for pain on the first and second days after surgery were higher in patients with a gallbladder perforation (P = 0.009 and 0.034).

The postoperative complications, such as fever, vomiting, were not different between groups. While, ileus (the patient complains of abdominal discomfort with symptoms of constipation) and port site infection, were significantly more common in the perforated group (P = 0.001 and P = 0.004).

**Discussion**

During the past decade, laparoscopic cholecystectomy has become the standard surgical procedure for gallbladder disease. Laparoscopic cholecystectomy offers a variety of advantages, such as decreased postoperative morbidity, shorter hospital stay, quicker return to normal activities and work, and improved cosmesis, compared with open cholecystectomy.19

In our study, the rate of gallbladder perforation was 16.7%, which was similar to the average rate reported by others. 19-21

The wall of the gallbladder may be torn by traction and repetitive grasping, and it may also be inadvertently entered during dissection from the hepatic fossa with cautery, which was the most common cause of gallbladder perforation in the present study.

Some studies have reported that intraperitoneal contamination with bile and gallstone does not affect the clinical outcomes.20,22,24,25

However, there are also many cases of postoperative complications, such as intra-abdominal abscesses and wound infections, and one study reported that complications occur in about 1.7 per 1000 laparoscopic cholecystectomy with gallbladder perforation.23,26,27

Gallbladder perforation and spillage of bile and gallstones leads to prolongation of the operative time and postoperative hospital stay and consequently an increase in the total hospital costs, which reduces the advantages of laparoscopic cholecystectomy compared with open cholecystectomy.

The mean operative time was longer in the perforated group, and it was likely to be due to the time required for abundant irrigation to obtain a clear aspiration and retrieve the gallstones.

The postoperative hospital stay was also longer in the perforated group, which may be due to increased pain and ileus, including constipation which may result from irritation of the peritoneum due to the spillage of bile juice and gallstones.

There were ten cases of significant port site infection in the perforated group, but the result could have been affected since we had used prophylactic perioperative antibiotics in all patients.

Sometimes the spilled gallstones mimic a malignancy, requiring the patient to spend time and money for unnecessary examinations, as well as the psychological trauma associated with the incorrect diagnosis of malignancy.15 Therefore, the surgeon should inform the patient about the possible consequences of spillage of bile and gallstones and should not hesitate to record the events.

Closing the perforated part of a gallbladder with application of a clip or an Endoloop is a possible solution to prevent spillage after gallbladder perforation, but it is ineffective in many cases because the clip or Endoloop may slip or loosen during traction.

**Conclusion**

In conclusion, short term effect of gallbladder perforation during laparoscopic cholecystectomy causes more postoperative pain, more operative time, ileus,
and port site infection, which consequently leads to an increase in the duration of hospitalization, thereby reducing the advantages of a laparoscopic procedure.

We should remember the interesting finding that careful and precise dissection should be performed during operation to prevent gallbladder perforation.

In addition, the surgeons should not hesitate to record the intraoperative events of spillage bile and gallstones and inform the patient about the possible consequences.

Identification of Periodontitis Bacteria and Resistance Test on Amoxicillin Antibiotics in Patients of RSGM Kandea Makassar

I E Rieuwpassa¹, Harun Achmad², Anggriani Susanti³
¹Lecturer, Oral Biology Dentistry Department, ²Lecturer, Pediatric Dentistry Department, ³Clinical Student, Faculty of Dentistry, Hasanuddin University, Makassar, South Sulawesi, Indonesia

ABSTRACT

Background: Porphyromonas gingivalis and Agregatibacter actinomycetemcomitans are bacteria found in periodontitis and Amoxicillin is a bactericidal antibiotic that is often used by periodontitis patients.

Objective: to find out whether the bacteria that causes periodontitis has been resistant to the antibiotic Amoxicillin

Method: This study was conducted at the dental and mouth hospital of Hasanuddin University in October 2018 with a total sample of 20 people suffering from periodontitis. In the subjects of the study, it was taken subgingival specimens with cotton swabs and excavators, then cotton swabs containing specimens were put into the transport medium that had been prepared and AA and PG bacteria were obtained from the swab of periodontitis patients in RSGM, Kandea then cultured on 20 petri dishes, then tested the sensitivity of Amoxicillin antibiotics to bacteria AA and PG. Data analysis was done using SPSS version 22.0 for Windows.

Results: The resistance test results from bacteria that caused periodontitis, namely bacteria Aa and Pg, there were 2 (15.4%) Aa bacteria and 2 (50%) Pg bacteria were resistant to Amoxicillin antibiotics. While those that was sensitive to Aa were 11 (84.6%) bacteria and Pg 2 bacteria (50%).

Conclusion: In the results of the study it is found that AA and PG bacteria are still sensitive to the antibiotic amoxicillin

Keywords: Periodontitis, Amoxicillin, Resistance

Introduction

Periodontal disease is one of the most common dental and oral diseases in the world community, especially in Indonesia. Periodontal disease that is often found is inflammation of the gums or gingivitis and periodontitis. Periodontal disease is different from dental caries, in periodontal disease it is more chronic and does not cause severe pain. Even at an early condition, there are no complaints of pain. This disease is caused by bacterial plaque that begins with gingivitis or gum inflammation. At present periodontal disease is often found at a young age, one of the causes is the presence of calculus in the teeth. Inflammation of the gums or gingivitis can become periodontitis, but not all gingivitis can develop into periodontitis.¹

Periodontitis is an inflammatory disease that occurs in teeth supporting tissues caused by specific microorganisms, which can cause damage to the periodontal ligament and alveolar bone, increase in probing depth, recession, or can occur both. Clinical features that occur include gingival color changes, contours, consistency, bleeding on probing, all of these are signs of periodontal disease. Histological picture of periodontal tissue shows an infection due to bacterial colonization of the periodontal pocket. Inflammatory characteristics of periodontal tissue are damage to the supporting tissues of the teeth, including the alveolar bone and periodontal ligament.²³

Based on the 2013 Basic Health Research Data (Riskesdas) the Indonesian population experienced dental and oral health problems of 25, 9%, among these dental and oral problems were caries and periodontal disease [3]. By province in 2013, those with high dental and mouth problems were South Sulawesi (36.2%), South...
Kalimantan (36.1%), and Central Sulawesi (35.6%), among dental and oral problems are dental caries and periodontal. Based on data from the RISKESDAS (2013) for the Southeast Sulawesi province there were dental and mouth problems with a percentage of 28.6.4

Antibiotics are substances produced by a microorganism (bacteria, fungi, actinomycetes) that can inhibit the growth of other types of microorganisms. The use of antibiotics as a basic therapy in infectious diseases must be done wisely and rationally to avoid an increase in antibiotic resistance and unwanted side effects that cause infectious diseases to be increasingly difficult to eradicate. Drugs used to eradicate microbes, the cause of infection in humans, are determined to have the highest possible selective toxicity.5

Several studies have described resistance to amoxicillin from several germs in the oral cavity. Amoxicillin shows a rate of resistance up to 30–80% against Prevotella and Porphyromonas.6

Based on this, the writer was interested in conducting research on "Identification of bacteria causing periodontitis and antibiotic amoxicillin resistance testing in RSGM Kandea patients”

**Research Method**

The type of research used was descriptive. The sample used in this study was patients diagnosed as periodontitis. This research was conducted at the dental and oral hospital Dentistry Faculty, Hasanuddin University in October 2018. A total sample of 20 people who suffered from periodontitis. In the research subjects, subgingival specimens were taken with cotton swabs and excavators, then cotton swabs containing specimens were put into the transport medium prepared. Data analysis was done using SPSS version 22.0 for Windows.

**Research Results**

The results of the research conducted on 20 samples obtained 10 kinds of microbes consisting of Aa Bacteria as many as 13 (65%), Pg as many as 4 (20%), Propionibacterium as many as 3 (15%), Klebsiella as many as 2 (10%), Enterobacter agglomerous as many as 2 (10%), S. pneumoniae as many as 1 (5%), Fusobacterium as many as 1 (5%), Staphylococcus as many as 1 (5%), and E. coli as many as 1 (5%) and Candida sp. as many as 5 (25%)

The lack of Pg bacteria identified in this study was probably due to the process of identification specimens were taken deep enough thus the possibility for Pg bacteria contained in subgingival specimens was relatively smaller. This was evidenced from the Pg bacteria identified 3 out of 4 bacteria obtained from a sample of periodontitis patients whose teeth were removed and specimen collection by inserting a cotton swab into the tooth socket. While another bacterial periodontitis was obtained from subgingival specimens from patients who were to be treated for teeth with periodontitis.

The lack of the type of bacteria obtained in each sample was probably due to the process of identification
with the bacterial culture method in the petri dish was less effective than the identification using PCR.

### Table 2: The resistance test results of Aa and Ph bacteria on amoxicillin in Patients at RSGM Kandea

</tbody>
</table>

The resistance test results from bacteria that cause periodontitis, namely bacteria Aa and Pg, there are 2 (15.4%) Aa bacteria and 2 (50%) Pg bacteria are resistant to Amoxicillin antibiotics. While that is sensitive to Aa are 11 (84.6%) bacteria and Pg 2 bacteria (50%).

### Table 3: The relationship between the history of antibiotic use against the Aa bacterial resistance test

<table>
<thead>

<td>%</td>
</tr>
<tr>
<td>No</td>
<td>2</td>
<td>100</td>
</tr>
<tr>
<td>Once</td>
<td>9</td>
<td>81.8</td>
</tr>
</tbody>
</table>

In the table above, it can be seen the relationship between the history of drug use and bacterial resistance Aa. Patients who never took antibiotics are 2 people and all are sensitive, while patients who took antibiotics were 11 people, who are still sensitive to Amoxicillin antibiotics are as many as 9 people (81.8%).

A history of antibiotic use has an effect on the level of resistance of Aa bacteria. This is shown in the table above, but in the statistical test conducted there was no significant relationship between antibiotic use and the level of bacterial resistance Aa. This can be caused by the small number of samples that cannot show a significant relationship.

### Table 4: The relationship between the history of the use of antibiotics against Pg bacterial resistance testing

<table>
<thead>
<tr>
<th>History of antibiotic use</th>
<th>Resistant Test</th>
<th>p value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sensitive</td>
<td>%</td>
</tr>
<tr>
<td>Once</td>
<td>2</td>
<td>50.0</td>
</tr>
</tbody>
</table>

Whereas the relationship between the use of antibiotics against Pg bacteria was found that all patients who had Pg bacteria had taken Antibiotics and who were still sensitive to Amoxicillin antibiotics as many as 2 (50%).

The history of antibiotic use against Pg bacterial resistance in this study cannot be detected because the number of samples that was very lacking can be characterized by Pg bacteria that were not found in patients who have never taken antibiotics..

The relationship of regularity with Pg bacterial resistance was not significantly obtained in the SPSS program. Of the four Pg bacteria, patients who were not regularly taking medication are 2 people and those who were resistant are 2 bacteria (100%), while those who regularly took medicine are all sensitive.

For the dosage relationship there were three patients who took the drug less than the dose and there was one sample that was resistant, and who took the drug according to the dose of 1 person and was resistant.

## Discussion

This study used the most dominant bacteria in periodontitis, Actinobacillus actinomycetemcomitans with Porphyromonas gingivalis. The antibiotic used in this study was Amoxicillin which is a derivative of the penicillin group because this type of antibiotic is most widely used by people for infectious diseases such as periodontitis.

AA and PG bacteria were obtained from the swabs of periodontitis patients at KandGM RSGM, then cultured on 20 petri dishes, then tested the sensitivity of Amoxicillin antibiotics to AA and PG bacteria seen through inhibitory zones formed on petri dishes. AA bacteria were found in 13 petri dishes with the results of Amoxicillin sensitivity as many as 11 petri dishes so it can be concluded that AA bacteria were sensitive to amoxicillin. PG bacteria were found in 4 petri dishes with amoxicillin sensitivity results in 2 petri dishes so it was concluded that PG bacteria was also sensitive to amoxicillin.

The mechanism of amoxicillin in inhibiting bacteria AA and PG does not kill directly but by preventing bacteria from forming a kind of layer attached to the whole body. This layer is very vital for bacteria to protect bacteria from environmental changes and to keep
the bacterial body from scattering. Bacteria will not be able to survive without this layer, therefore in this study AA and PG bacteria in periodontitis were sensitive to amoxicillin [6].

Based on research by Rahmiati Muhtar in 2017, amoxicillin antibiotics had a sensitive level of 0%, intermediates at 6.25% and resistance at 93.75%. This shows the antibiotic amoxicillin resistant to bacteria isolated from dental plaque of patients at Ranotana Weru Health Center Manado. The results obtained are in accordance with the study, where the isolated bacteria have experienced resistance to antibiotics amoxicillin. Resistance to amoxicillin which is a penicillin group antibiotic is caused by several resistance mechanisms, namely: the formation of enzymes that damage penicillin namely the enzyme β-lactamase wherein this enzyme will cause the opening of the β-lactam ring in penicillin and cephalosporins which damage antimicrobial activity, autolisin enzyme germs do not work thus the germ-tolerant properties of the drug arise, germs do not have cell walls (eg mycoplasma), and PBP or drug changes cannot reach PBP [7].

| Table 5: The relationship between regularity of taking medication and antibiotic doses of Aa bacterial resistance in periodontitis patients at RSGM Kandea |
|---------------------------------------------|----------------|
| Description                  | Sensitive | Resistant |
|                              | Total | %    | Total | %    | Significance (p) |
| Regularity                   |       |       |       |       |                   |
| No                           | 3     | 60.0  | 2     | 40.0  | 0.087             |
| Regular                      | 6     | 100.0 | 0     | 0.0   |                   |
| Dosage                       |       |       |       |       |                   |
| Less                         | 3     | 60.0  | 0     | 0.0   | 0.338             |
| Less                         | 6     | 75    | 2     | 25    |                   |

The results of this study indicate that the relationship of regularity with the level of resistance of Aa bacteria to Amoxicillin antibiotics has a significant significance (p <0.05). This is because patients who were not regularly consuming drugs were as many as 5 people while those who are resistant are 2 people (40%), while patients who regularly took medicine are as many as 6 people while those who have been resistant to antibiotic amoxicillin were not obtained.

For the relationship between dosage and resistance there was no significant relationship (p> 0.05), from 3 patients whose dosage was lacking and there are no patients who are resistant. While patients with appropriate doses were 8 people and those who are resistant are 2 people (25%)
Penicillin is bactericidal with work activities damaging bacterial cell walls. Penicillin is known as the first line antibiotic because penicillin has the ability to fight most bacteria that cause infection. Many bacteria are sensitive to penicillin, except the bacteria that produce the enzyme β-lactamase, because β-lactam ring contained in the chemical structure of penicillin is damaged by the enzyme thus penicillin becomes inactive. The study conducted also compared between regular and irregular people consuming amoxicillin against resistant and sensitive conditions to PG bacteria and then analyzed and obtained p value of 0.046 (significant p <0.05) which means that there are significant differences between people who are organized and not regularly taking amoxicillin against resistance, this study also compared adequate doses of amoxicillin and less doses to resistant conditions and obtained a p value of 0.505 (significant p <0.05) which means that there was no significant difference between the group taking the right dose and less dose.

While the comparison between people who are regular and irregular in consuming amoxicillin against conditions of resistance and sensitivity to bacterial AA obtained a p value of 0.087 (significant p <0.05) which means that there was no significant difference between the groups consuming amoxicillin and resistance. Then to compare adequate doses of amoxicillin and less doses to resistant conditions and p value 0.338 (significant p <0.05), which means that there were no significant differences between the groups taking the drug with the right dose and the less dose.

**Conclusion**

There are Aggregatibacter Actinomycetemcomitans and Porphyromonas Gingivalis in patients with periodontitis. In the results of the study it is found that AA and PG bacteria are still sensitive to antibiotic amoxicillin because amoxicillin inhibits bacteria AA and PG not by killing directly but by preventing bacteria from forming a kind of layer attached to the whole body. As for the history of antibiotic use affects the level of bacterial resistance, if the use of drugs that are not rational then resistance will occur.

**Suggestion**

It is expected that the results of this study can provide an overview for further researchers to conduct more samples of research to obtain more effective results and it is hoped that more subgingival swabs will be taken to obtain more Porphyromonas Gingivalis bacteria.

Comparison of Self-Directed Video and Simulation Method on First Aid Knowledge among Indonesian Students: A Randomized Control Trial

Eky Madyaning Nastiti1, Siswanto2, Yulian Wiji Utami3
1Postgraduate Program of Nursing, School of Nursing, 2Department of Public Health, Medical Faculty, 3Department of Basic Nursing, School of Nursing, Universitas Brawijaya

ABSTRACT

Injuries are a health issue that needs quick treatment and relates to the high number of mortality and morbidity. School-age is one of the most vulnerable groups of injuries due to the low level of understanding about hazard and first aid concepts. The solution required is the importance of initiating first aid education for students. This study aims to analyze the effectiveness of self-directed and simulation method in increasing first aid knowledge among students. This study used randomized-postest control group design. The population of this study was students aged 13-14 years old coming from two different schools in Jember, East Java, Indonesia. 80 respondents were selected using a simple random sampling technique, then divided into two groups: self-directed video and simulation method. Data of the knowledge variable was collected for 7 days after administering the treatment using a questionnaire. The collected data of this study were analyzed using Wilcoxon and Mann Whitney test (α = 0.05) with SPSS 20 program. There was significant difference in first aid knowledge between two groups before and after treatment. Both groups showed the increasing of first aid knowledge, where score of self directed video group was (from 8.43 ± 1.430 to 12.5 ± 1.432, p = 0.000) and score of simulation group was (from 7.95 ± 1.50 to 11.90 ± 1.21, p = 0.000). Furthermore, the comparison results of the knowledge among two groups showed that a mean difference in the self-directed video group = 4.07 while the simulation group = 3.95 (p = 0.022). It means that there was a significant difference in knowledge between the self-directed video and simulation method, with a higher difference of self directed video methods of 4.07. The self directed video method showed better results in increasing knowledge among students aged 13-14 compared to the simulation method after 7 days follow up.

Keywords: knowledge, first aid, simulation, self directed video, injury

Introduction

An injury is now known to have a high prevalence rate and require serious treatment because it is associated with mortality and morbidity. The injury that occurred in Indonesia is quite high reaching up to 9.2% with the most incidents including: bruises, sprains and torn wounds. School-age children become one of the age groups that are vulnerable to have an injury with an increased prevalence in the last 5 years reaching 12.1 percent. This increase is related to several factors including the condition of the school environment that is not safe, low understanding of first aid and hazard concepts. The basic knowledge of students regarding the first aid procedure is still low and therefore it is necessary to provide first aid education.

First aid education can be initiated since school age because besides being a vulnerable group of injury, this group also has the ability to learn enthusiastically so that they can teach and practice with others. Some studies found basic first aid can be started and taught at the age of 13-14 years. A systematic review stated that children at age of 5-18 years is able to learn first aid.
First aid techniques, while children the age of 11-18 years shows a willingness to provide assistance. This first aid education is needed to increase their confidence.

So far, the first aid education provided to students is delivered through traditional methods, one of which is often used is the simulation method. This method has some advantages such as learning about original problems in the form of illustrations, building critical thinking and gaining clinical experience. From the aforementioned advantages, a study stated that training participants with simulations experienced a decline in knowledge after three months afterwards. This indicates that this method had limitation related to the unavailability of media to review the material provided. For this reason, another method is needed as an alternative, especially with the development of globalization and current technology. The self-directed video is one of the technology-based methods that is repeated training in nature to empower individuals to learn new abilities independently in accordance with their needs. In addition, this method has advantages, especially its ease to be accessed with a wider time and flexible nature. The aims of this study were to analyze the differences in the increase in knowledge of students aged 13-14 years about first aid for injuries between self-directed video and simulation methods.

Method and Material

The method used in this study was true experimental with randomized pretest-posttest control group design. The research was conducted in November 2018 at SMP Muhammadiyah 1 Jember and SMP Darus Sholah Jember, East Java, Indonesia. The population in this study were 269 students and 80 respondents were selected using simple random sampling technique with inclusion criteria: age 13-14 years, sitting in class 8, never received first aid education before the study, owning a smartphone and being willing to become respondents. Then the respondents were divided into two groups, namely: self-directed video group and simulation group.

Each group has a different treatment. In the self-directed video group, respondents were given five videos with total of duration nine minutes, discussing the concept of first aid as well as the demonstration of injury sent to the respondent’s smartphone while the simulation group used a module. Both consist of material content: emergency calls, injuries, fire wound, bleeding and bone, muscle, and limb joint injuries developed by researchers based on the International Federation of Red Cross and Red Crescent Societies (IFRC) and first aid curriculum guidelines. Informed consents were given to all participants prior to the study. The stage of data acquisition is divided into three stages. First, the pretest was performed in both groups. Second, the intervention stage. At this stage, the self-directed video group was given a video containing first aid material which could be studied independently in their smartphones and during this process, the researchers were not allowed to give direction while the respondents were allowed to study videos without time and frequency limits. For the simulation group, the provision of first aid education using module media and an instructor is in charge of delivering oral material followed by a 60 minute demonstration.

The research instrument used a knowledge questionnaire of 15 questions. Validity and reliability test of questionnaire were conducted involving 25 respondents with the same characteristics as the research subject. Validity and reliability test are indicated by corrected item-total correlation > r table (0.3809) and Cronbach’s alpha value of 0.901. The data were tested by the Wilcoxon Sign Rank test and Mann Whitney test, because data is not normally distributed even though data transformation has been done. Statistical analysis was carried out using the SPSS 20 program.

Results

This research involved 80 respondents (40 respondents in the self-directed group and 40 respondents in the simulation group). All respondents have attended the research since beginning and none was lost to follow up.

### Table 1: Characteristics of respondents by age

<table>
<thead>
<tr>

<td>Posttest 11.90 (± 1.21)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 3 shows the difference of first aid knowledge in both groups before and after receiving first aid education. The statistical test reveals that both self-directed video and simulation group’s knowledge show different mean scores before and after intervention with p = 0.000. Furthermore, it is known that self-directed video group has a higher increase (4.07) compared to the simulation group.

Table 4: Knowledge differences tests on self directed video and simulation group

<table>
<thead>
<tr>
<th>Variable</th>
<th>Group</th>
<th>N</th>

<td></td>
</tr>
</tbody>
</table>

Table 4 shows the differences in the increased of first aid knowledge among groups given the self-directed video and the simulation method. The result of Mann Whitney test show that p = 0.022 (p-value <0.05), it reveals that there is a significant difference in the increase of first aid knowledge between two groups with a higher increase in the self-directed video group.

Finding

The statistical test results showed a significant increase of knowledge in both groups before and after getting first aid education. This shows that both self-directed video and simulation methods can be useful in increasing the knowledge about first aid for 13 to 14-year-old kid. Furthermore, based on the mean difference test in increase of the knowledge score between self-directed video and simulation method, there is a significant difference between those two methods, where the mean difference in the self-directed video group showed a higher score than the simulation method. This shows that first aid education given to 13 to a 14-year-old student using the self-directed video method is better in improving knowledge than that of the simulation method.

These research results are consistent with other studies comparing the increase in resuscitation knowledge by a bystander with the help of technology in which there are video features compared to simulation methods17. The level of knowledge obtained through video-based methods shows better results than through face-to-face methods with the instructor while giving an impact on the ability to learn independently18. Self-directed video method combining with technological approach can stimulate the human brain and later it increases the first aid knowledge. The use of technology in the education process has the effect of increasing the activation of the frontal and parietal contexts that trigger cognitive stimulation and strengthen a person’s memory to remember what has been learned 19, 20.
The self-directed video method used in this research can be used as one of the effective learning methods because it is able to provide better levels of knowledge compared with the simulation methods. This is possible to happen because in the simulation method, respondents only focused on the instructor and the simulation was only given once. First aid education process with self directed video provides the better appearance of features in the form of a combination of writing, images and videos, thus it became something more interesting and made respondents more enthusiastic in learning. In addition, the principle of self learning becomes an advantage in the self directed video method and then it will lead to active learning. In a learning process, respondents tend to respond positively to a new and interesting educational method. This positive response will have an impact on the motivation of respondents in the learning process in line with their willingness to learn new material and it is expected to increase the opportunity to apply their new knowledge in dealing with the surrounding injury events. By using the self directed video method, the respondents can also focus on learning videos on their smartphone anywhere and anytime independently so that it is possible to review material repeatedly. Self-directed video method design innovations can be an effective choice in providing first aid education as an application of the modality method. So the self-directed video method is recommended as an effective and efficient method in the first aid education process as an effort to prevent and handle injury conditions.

Conclusion

There is a significant difference in increase of first aid knowledge among students aged 13-14 after receiving first aid education using the self directed video and simulation method, where the results show that the self-directed video method is better at increasing knowledge compared with simulation method. This finding proves that the self-directed video method can be used as an alternative and effective method of first aid education by taking into account the advantages possessed. It is recommended to do further research to investigate the knowledge retention with a period of 30 or 60 days follow up

Influence of Increasing Consuming of Whey Protein Supplement on Reproductive system in Rats

Fatima Aziz Mahdi Al-badry

Biology Department, College of Education for Pure Sciences, University of Thi-Qar, Iraq

ABSTRACT
The current study was conducted to evaluate the harmful effects of increasing consuming of nutritional supplement (whey protein) on reproductive system of laboratory rats. Thirty two of rats were randomly divided into two main groups. The first group control group was not treated with whey protein, the second group was divided into three subgroups which administrated the whey protein 300 mg/kg body weight for (one, two and three month) respectively. Reproductive performance was measured by determination of count sperm, malformations, motility, dead sperm, weights of (testes, epididymis, prostate glands and seminal vesicles) and testicular structure was studied.

The results referred to receiving of whey protein for long periods led to significant decreasing (P≤0.05) in total count of sperm, motility and significant decreasing (P≤0.05) in weights of all studied organs included (testes, epididymis, prostate glands and seminal vesical) while significant increasing (P≤0.05) was observed in sperm abnormalities and dead sperm. Also, the results showed that the nutritional supplement caused many abnormalities of sperm included lacking, quirky, starched and hooked tail while the malformations of head encompassed lacking, elliptical and global head. The histological changes in testicular structure manifested by destroyed and increasing thickness of interstitial tissue, congestion of blood vessels, necrosis and reduction numbers of spermatocytes in all supplemented groups.

Keywords: Nutrition Supplements, Whey Protein, Reproductive system.

Introduction
Nutritional supplements are compounds extracted from animal or botanical natural dietary constituents, these include minerals as iron and calcium, amino acids, enzymes, vitamins like D and E. Nutritional supplements are traditional products in many forms powders, drinks, capsules and tablets which taken by athletes and adults (1). Dietary supplements have variety types such as protein supplements contain high protein increase the weight and carbohydrates supplements that featuring by fast absorption, digestive and oxidation for releasing energy (2,3).

Eating of these supplements has important benefits by energy, immunity and metabolism increasing, preserve and earn muscular strength for muscles (4). Sensitivity, liver damage, renal insufficiency, gastric disorders and diarrhea are harmful effects of dietary supplements for its consumers when taking irregular and large doses (5). Whey protein is one of powders dietary supplements, it contains 90 % of protein which has health benefits for stimulate synthesis of muscles protein, improvement of anti-oxidant activity and adiposity control (6). There are three types of whey protein concentrate, isolate and hydrolyzed whey protein, these include immunoglobulins, lactoferrin, lactalbumin which present a source of branch chained amino acids(7).

The current study was aimed to investigate influence of nutrition supplement (whey protein) in some physiological and histological parameters of reproductive system in rats.

Materials and Method
Animals and Experimental Designed: Albino male rats (Rattus norvegicus) had been used, these rats obtained and treated in the animal house of biology department, university of Thi-Qar. All animals were kept under temperature 22 ± 2 °C and 12:12 hours light: dark cycle. Thirty two male rats aged (10-13 weeks) and weighted (200 -220 grams) divided into main two groups:
First group: (Control group) (n = 8): Animals were without any treatment and administrated distilled water and feed.

Second group: (Supplemented group): This group divided into three subgroups (n=8) in each group as:

Group A: Animals were administrated whey protein supplement (300 mg/kg body weight) for one month.

Group B: Animals were administrated whey protein supplement (300 mg/kg body weight) for two month.

Group C: Animals were administrated whey protein supplement (300 mg/kg body weight) for three month.

Sperm Characteristics: The method of Soto (8) was used to determination the sperm count while the percentage abnormalities of sperm was carried out according to Wyrobek and Bruce (9). Sperm motility was evaluated according to Robb et al. (10) while the dead sperms was assessed according to Chemineau et al. (11).

Measurement the Weights of Organs: After ending the period for each treatment, (testes, epididymis, prostate glands and seminal vesicles) were weighted by using sensitive electronic balance. The weights compared among all groups.

Histopathological Study: After dissection of animals in all groups, testes were separated and fixed in10% formalin solution then histological sections were prepared according to method of Bancroft and Gamble(12).

Statistical Analysis

Data in tables are presented mean ± standard deviation that analyzed by SPSS (version 20). The differences among means were measuring for ANOVA at significant (p≤0.05) by Duncan test.

Results and Discussion

Different letters indicate to significant difference (P ≤ 0.05) among groups: Some of sperm characteristics were observed in table (1). These results demonstrated a significant decrease (P≤ 0.05) in total count and motility of sperm in supplemented groups which treated with whey protein for all periods compared with control group while the percentage of sperm abnormalities and dead sperm increased significantly (P≤ 0.05) in supplemented groups compared with control group. These results may be linked to effect nutritional supplement (whey protein) on concentration of testosterone hormone which important in spermatogenesis. Christensen (13) noted the testosterone hormone necessary for initiation and maintenance of spermatogenesis, this agree with Jawad et al. (14) who revealed to significant reduction in concentration of testosterone in smokers and non-smokers athletes after receiving a nutritional supplements.

A significant increasing (P≤ 0.05) in percentage of abnormal sperm, malformations of sperm included lacking, quirky, starched and hooked tail and lacking, elliptical and global head (picture 2-7) were found in supplemented groups, this could be related to effect of whey protein supplement on activity of testosterone which influence on spermatogenesis. William (15) reported to disorder in secretion of gonadotropins from anterior pituitary gland that interfere with spermatogenic processes. The spermatogenesis in testes is depend on hypothalamus-pituitary- testis hormone axon, GnRH is release from hypothalamus which induce releasing of LH and FSH. LH has important role in induction testosterone releasing from leydig cells (16,17). So, the reduction of count sperm belong to decreasing testosterone. This agreement with Jawad et al. (14) who found nutritional supplements caused a significant decline in testosterone.

Oxidative stress was resulted from eating of nutritional supplements may be regarded to reduction
of count sperm, occurrence and their abnormalities by production free radical especially ROS. Tinkel et al. (18) revealed to oxidative stress causes cellular damage by ROS, this free radicals are responsible for main causes of infertility (19). This finding is accepted with Garge et al. (20) who exhibited generation of ROS by exposure for whey protein supplements. Also, many abnormalities were occurred in sperm may be due to effect of free radicals which resulted from whey protein supplement on DNA of sperm, this accordance to Trivedi et al. (21) who noted the damage of DNA lead to abnormalities in head sperm. Lipid peroxidation (LPO) may be interfere with DNA causing destruction of DNA (22) subsequently effecting on sperm characteristics.

</tbody>
</table>

Different letters indicate to significant difference (P≤ 0.05) among groups: Weights of sex organs (testes, epididymis, prostate gland and seminal vesicles) in table (2) detected a significantly decreasing (P≤ 0.05) in means weights of all supplemented groups when compared with control group. This decreasing may be due to diminution of testosterone level by exposure for whey protein supplement. Chowdhury and Steinberger (23) reported role of testosterone in augmentation the weight of sex organs especially testes and seminal vesicles. This similar to Jawad et al. (14) who mention to reverse relationship between administration nutritional supplements and testosterone hormone subsequently affect on weight of reproductive organs, or this result related to decrement production of seminiferous tubular fluid, that participate in weight of testis (24).

The histopathological changes which observed in testes of supplemented groups included destroyed and increasing thickness of interstitial tissue, congestion of blood vessels, necrosis and reduction numbers of spermatocytes (pictures 9-16), these may be associated to treatment with whey protein supplement by ROS. Mitra et al. (25) suggested to that ROS in testes causes histological hazards in testicular structure and the free radicals disables membrane safety leading to occurrence these changes. Necrosis and some other histological damages which found in testes may be belong to oxidative stress and ROS which resulted from exposure for whey protein supplement. This identical with Mohamed et al. (26) who reported the imbalance between ROS production and antioxidants induce oxidative stress led to damages of biological molecules as protein, lipids and DNA causing apoptosis and cellular necrosis.

Reduction of spermatocytes may be due to role of nutritional supplements in generation of free radicals, Mohamed et al. (27) revealed to free radicals cause shrinking spermatocytes and breakdown of tubular epithelium.

Figure 16: Showed section in testis of supplemented group (Three month) showing congestion (H&E) (100 X)

Conclusions

Our finding revealed to health hazards of reproductive system by elevated consumption of nutritional supplements especially whey protein. Although this nutritional supplements are mentioned to have benefits, their toxic damages were observed during usage for long term.

Indonesia Towards Universal Health Coverage: Indonesia Health Card Holders Satisfaction on Pharmaceutical Service at Primary Health Cares

Muhammad Rizky Putrajaya¹, I Nyoman Wijaya¹, Gesnita Nugraheni¹
¹Department of Pharmacy, Faculty of Pharmacy, Universitas Airlangga, Jl. Airlangga No.4 - 6, Airlangga, Gubeng, Surabaya, Jawa Timur

ABSTRACT

Background: Primary Health Care is the most visited health care by people who use National Health Insurance by Indonesia Government for medical treatment. But in practice, many visits are not equivalent with patient satisfaction on primary health care service.

Purpose: Identify patient satisfaction to pharmaceutical service at Puskesmas as primary health care.

Subjects and Method: This is a cross sectional descriptive study with 100 selected respondents using accidental sampling. Respondents filled out a likert scale questionnaire. Data analysis use service quality (servqual) and customer window method. Data analysis compare patient perceptions to service performance and patient expectation.

Results: Servqual method shows that patients are not satisfied to pharmaceutical services performance at Puskesmas. Customer window method shows that pharmaceutical services performance (Quadran A) that inadequate and must be improved are waiting room; ensuring the reciever of the drug is patient or patient’s family, not others; confirmation of patient’s allergy history; and confirmation of patient’s drug history.

Conclusion: National Health Insurance by Indonesia Government is unable to satisfy patient on health care service especially pharmaceutical service at primary health care (Puskesmas). Many things about pharmaceutical service need to be improved to create a good and comprehensive health service for all levels of society.

Keyword: Pharmaceutical services, patient satisfaction, Primary Health Care, BPJS Kesehatan, Universal Health

Introduction

Public welfare of a country can be assessed by how the people accesses existing health care. Indonesia is one of the developing countries that seek to provide easy access for all levels of society to health services. Now, Indonesia is at the middle level in providing comprehensive health service with index of 56% (¹). To reach the country’s index for comprehensive health service, ease of access to health services for the community is not enough. The government must also ensure that the quality of health services provided is good, effective and efficient (²). One of important aspect in health service is pharmaceutical service that involve providing pharmaceutical products or appropriate health care products and the right information, at the right time, in the amount and quality needed (³).

In order to make it happen, Indonesia initiated a National Health Insurance program managed by the Social Security Organizing Agency of Health or better known as BPJS Kesehatan. This program helps people get the best service with affordable costs. The card holder pays a premium which nominal value matches the class taken each month. The health care system implemented by BPJS Kesehatan is a referral system where health services are carried out in stages according...
to medical needs. At the first stage, members of National Health Insurance can go to primary health care such as Puskesmas. Primary health care strategy that has been implemented to improve the effectiveness of the health care system (4).

Puskesmas (Pusat Kesehatan Masyarakat) is a technical implementation unit of Health Department of City/District that responsible to organizing health development in work area (5). As a primary health care provider for people, Puskesmas need to be supported by good pharmaceutical services to achieve individual health efforts and public health efforts (6). The number of Puskesmas visitors was the highest number of visitor compared to other primary health care, which 18,929,689 visitor (7). Community has been developing perception that Puskesmas is a low-level health care for community with middle to lower economic condition. This perception due to the lack of availability of health workers, the drug and the lack of a good relationship between patients and health workers.

The number of visits to puskesmas develops perception that patient has recieved a good service. But this number of visits is not equivalent with patient satisfaction. Therefore, this study aims to determine the level of patient satisfaction with one type of health service in the primary health care, pharmaceutical service. Quality of health service measured using servqual method which includes direct evidence, reliability, responsiveness, assurance, empathy. While, patient satisfaction measured using customer window method.

Materials and Method

This is a cross sectional descriptive study which is using accidental sampling method to collect data. This research instrument use Likert scale questionnaire that has been tested for validity and reliability (8). Likert scale is a general ranking format for surveys. Respondents are ranked from high to low or best to worst quality (9). Data were collected in July 2016 until August 2016 and January 2017. The study participants were 100 respondents across 10 primary health care in the north of Surabaya.

Data Analysis

Analysis Servqual: Servqual method can be used to assess patients’ satisfaction on pharmaceutical services because the servqual method is universal and can be used for a variety of services to assess the quality of services provided (10). The servqual score for each item statement in the questionnaire can be calculated using formula below (11):

\[
\text{Servqual score} = \text{performance score} - \text{expectation score}
\]

Analysis Customer Window: Customer Window Analysis Quadrant is used to measure the level of priority according to the patient’s perceptions in relation to what should Puskesmas do in order to produce high-quality pharmaceutical services (12). Importance Performance Matrix Analysis is a matrix consisting of 4 quadrant (13).

Results

Demographic data of respondents and the number of respondents in each primary health care: The demographic data in this study were used as an illustration to find out the data of puskesmas visitors who were used as respondents in this study. Most of the respondents are women aged 25-44 years, high school education or equivalent, have the category of private sector/entrepreneur, and housewife.

The Results of research received 113 respondents who met the inclusion criteria. Among the 12 puskesmas in the north of Surabaya, the Puskesmas Dupak has highest number of respondents. Total respondents who filled out the questionnaire were 113 respondents but 3 questionnaires could not be processed due to incomplete filling, so only 100 questionnaires could be analyzed.

a. Servqual method and Customer Window method: Data in this following table is based on a questionnaire filled out by respondents. It
determines the level of patient satisfaction to pharmaceutical service and customer window services to measure the level of priority according to patient perception in relation to what should *Puskesmas* do in order to produce high-quality pharmaceutical services.

</table>
If results of calculations on servqual method are positive gaps, then it concludes that patients are satisfied with pharmaceutical services in puskesmas, and the other way around. Overall, the tangible variable shows that patients are not satisfied, but several indicators show that patients are satisfied. Those several indicators are: drug condition is good; drug is well packed; and officer write instruction manual clearly. Overall, the reliability variable shows that patients are not satisfied with health services, but several indicators shows that patients are satisfied. Those several indicators are officer explained information about instruction manual to take a drug both verbally or written; officer explained information about time and period of taking the drug both verbally or written.

Assurance variable shows that patients are not satisfied with health services and no indicators in this variable are positive. The responsiveness variable shows that patients are not satisfied and all indicators in this variable are negative. Last variable is empathy. Overall, patients are not satisfied but one indicator in this variable is positively satisfying. The indicator is officer using easy to understand language. Overall, sum of servqual method is -8.10 and it shows that patients are not satisfied with health services.

Data analysis with customer window quadrant shows indicators that included in A, B, C, or D Quadrant. A quadrant shows indicators that need to be improved and become a priority because they performances are low while expectations from respondents are high. Quadrant A indicators are: the comfortable waiting room; availability of health promotion media for drug information or counseling efforts; availability of drug locket which is adequate for drug information service; Officer explained information about food and drink that must be avoided when taking medicine; information about drug storage; information about if patients forget to take the drug; officer confirmed the recipe receiver; officer confirmed medical record and medicine record; officer solves patient problems related to drug and officer serve quickly.

B Quadrant shows indicators that need to be maintained because both performance and expectation are high. B Quadrant indicators are: drug’s condition is good; drug is well packed; and officer write instruction manual clearly; information about drug’s use; information about instruction manual of drug, time and period of taking the drug; and easy to understand language. C Quadrant shows a low priority because performances and expectations are low. C Quadrant indicator is monitoring drug use. D Quadrant shows exaggerate indicators because performances are high but expectations are low. Nothing indicator is in D Quadrant.

**Discussion**

National Health Insurance is health insurance managed by government that has not been providing satisfaction for patient. This is evidence that patients are not satisfied with health services especially pharmaceutical service. In practice, tangible variable shows that patients had felt less comfortable with the chairs in waiting room because the number of chair were not comparable with the number of patients who was waiting. Patients were standing up when they took the drug. Other variable, reliability shows that officer should explain some information to patient such as side effect of the drug, food that must be avoided, and period of taking the drug. Then, other thing that becomes the focus of patient is the health worker did not ask about the history of allergies, history of patient’s disease so assurance variable got a negative response and was not as expected. In responsiveness variable, patient had felt that service of drug acceptance took a long time, this is caused by poor health condition and uncomfortable waiting room. In empathy variable, overall, this variable shows that patients were not satisfied with monitoring of patient drug use. This is caused by the officers often did not ask about medicine record. Monitoring of patient’s medicine record is one of important aspect for patient who was suffering from degenerative disease. So not all patients got the same treatment because if this aspect is applied to all patients it can increase the waiting time of other patients.

In term of improving the quality of services, related parties can see table 2 which shows important aspect that need to be improved in A Quadrant; and things which already exist and got positive response and need to be maintained in B Quadrant. There are not many categories in C Quadrant, this quadrant is not very important so factors in this quadrant can be ignored if the officer wants to evaluate the services for patient. There are no categories in D Quadrant.

Case mentioned above are motivated by a better level of community education so they become more critical and sensitive to what is happening, as most respondents have high school or equivalent.
Previous studies have shown that this program is not good and unsatisfactory such as study which is describing the differences satisfaction between National Health Insurance’s patients and non-National Health Insurance patients. Non-National Health Insurance patients more satisfied than National Health Insurance (14). The drugs given to National Health Insurance’s patient are generic drugs listed in the National Formulary (Fomularium Nasional). The paradigm which develops in the community believes that generic drugs are not a good drug. This paradigm may cause patients dissatisfaction to pharmaceutical services. Study conducted at the RSUD DR. Soediran Mangun Sumarso Wonogiri showed the same results. The study also stated that non-National Health Insurance patients are more satisfied than National Health Insurance patients (8). The study explained that patient dissatisfaction is caused by a non-transparency amount of drug and type of drug. Study conducted at Puskesmas in Magelang District described patients dissatisfaction (15). The study showed that patient expectation is more than officer performance. From 18 questions items related to pharmaceutical services at the health center, only 3 questions items showed that the patient was satisfied.

Limitation of study is this study cannot be generalized because this study only describes patient’s satisfaction at time and in place when/where study was conducted. Other limitation is this study did not review the level of patient’s need and patient’s mindset which are supporting the background of the level of patient’s satisfaction and dissatisfaction.

Conclusion

Patient who was treated using National Health Insurance in Puskesmas are not satisfied with pharmaceutical services provided by puskesmas. Patient dissatisfaction can brought a bad impact to the sustainability of this program such as withdrawing their participation. This possibility can be impacted to mission of Indonesia for being a country that provide a comprehensive health care and to public’s life expectancy.

Ethical Clearance: The current study was carried out in correspondence with the research principles. It is implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice. The research process entangles participants in the survey using a compatible questionnaire that was in accordance with the ethical research principle based on the research ethics committee’s regulation.

Conflict of Interest: The author reports no conflict of interest of this work.

Source of Funding: This study is completed with individual funding.

A Study on the Organization, Job Environment and Service Quality of Elderly Friendly Industrial Facilities Based on Healthcare

Il-Hyun Yun
Professor, School of Social Work, Gwangju University, 277 Hyodeok-ro, Nam-gu, Gwangju 61743, Korea

ABSTRACT

This study was conducted on workers in elderly friendly industrial facilities based on healthcare. Those who worked directly in the services sector were the target. As a fusion study on the effects of organizational environment and job environment variables on service quality, we analyzed the mediating effects of organizational support perception. The service quality of the provided directly to the elderly was studied. 582 workers were analyzed. Gender and facility type group. A fusion study was conducted using latent mean analysis. The conclusion is as follows. First, organizational environment, job environment, and organizational support recognition were identified as significant factors affecting service quality. Second, the mediating effect of organizational support awareness has been confirmed. Third, gender was found to be a significant path in the inter - group path coefficients. The type of facility was not significant. Fourth, as a result of verifying the inter - group path coefficients, the male group and the use facility group were significant in the organizational environment path. In the work environment path, the female group and the living facilities group were significant. This study confirms that the organizational environment and job environment are important for service quality of the facility. In order to improve this, it was confirmed that it is necessary to improve the awareness of the organization support.

Keywords: Healthcare, Elderly Friendly Industrial, Organizational Environment, Job Environment, Organizational Support, Service Quality

Introduction

The rapid growth of the elderly population, the increased interest in wellness for health promotion, and the introduction of long-term care insurance system, the healthcare-based elderly friendly industrial facilities are growing rapidly. Elderly friendly industrial facilities based on healthcare have living facilities that include the concept of residency such as cure and care for elderly people. It can also be divided into facilities for health care and prevention. It is aimed at various projects such as business for well-being, preventive and therapeutic business for health, old-age residence business, public senior health-related business. Facility service adopts consumer support method based on needs assessment. In addition, user fees are imposed, and the rights and options of users are guaranteed1. The elderly friendly industrial facility based on health care has rapidly increased with social change and has changed into an active countermeasure to take a competitive advantage with the facilities. In order to cope with such a demand, there is a growing interest in organizational performance factors in order to operate the facility efficiently. Service quality has been attempted as one of the important components to measure the important performance of an organization2. Service quality is an overall evaluation of user service. Service quality can be affected by organizational environment and job environment. The organizational environment of facilities can have a significant impact on the attitude of the organization3. If satisfied with the organizational environment, the quality of service provided to the client changes. The organizational environment is defined through an approach to organizational behavior theory that is studied in terms of organizational attitudes. In terms of organizational attitudes, sub - variables of organizational behavior are job satisfaction and organizational commitment. In the case of professionals providing human services in the facility, the service quality is substantially influenced by the degree of job
satisfaction. Organizational commitment is an expanded future-oriented concept that includes both attitudes and actions to accept organizational goals and to work hard for the organization. Organizational commitment is an important factor in improving service quality. Because human services provide services directly to employees and clients, the ability of employees can have a significant impact on organizational performance. The ability of a worker is also an individual factor, but it can affect the work environment. The more positive the job environment the employees perceive, the higher the satisfaction and service quality of the client. The job environment of the employees affects the service quality, which is the performance of the organization. When facility workers are praised or recognized by the facility, they become more immersed in the facility and have a positive impact on job performance. Organizational support awareness is the belief that facilities value the efforts or contributions of workers and are interested in the welfare of workers. Organizational support awareness plays an important role in shaping the attitudes of facility workers. In the elderly friendly industrial facility based on healthcare, facility workers show different characteristics according to their gender and facility type because their organizational environment and job environment are different. Therefore, empirical studies are needed to confirm whether factors affecting service quality are different depending on gender and facility type. It is necessary to identify factors that can improve the quality of service through fusion empirical analysis.

**Method**

**Subjects of Investigation:** The subjects of this study were 582 employees of elderly friendly industrial facility based on healthcare. The gender was 154 (26.5% for male) and 428 (73.5% for female), 250 (43.0% for facilities and 332 (57% for living facilities).

**Measuring Tools:** Potential variables in this study are service quality, organizational environment, and organizational support awareness. All questions consist of five points, a Likert scale (not at all = 1 and very yes = 5). Service quality was revised and supplemented by the SERVPERF measure of Cronin and Taylor (1992), which modified the SERVQUAL measure of Parasuraman et al (1988). Questionnaire consists of a total of 22 questions. The organizational environment was revised and supplemented the scales of Smith et al (1969) and Allen and Meyer (1990). Questionnaire consists of a total of 12 questions. Job environments were revised and adjusted for the scale of Hackman and Oldham (1980), the scale of Cook. J and Toby wall (1980), and the scale of Quinn (1988). Questionnaire consists of a total of 22 questions. Organizational support perceptions have been revised by Wayne et al (1997). Questionnaire consists of a total of 9 questions.

**Data Analysis:** This study was carried out a correlation analysis using the SPSS 23.0. Using AMOS 23.0 was applied to the average group analysis and potential analysis. The structural equation model through the RMSEA, TLI assessed the fit of the model. If the value is less than 0.05 RMSEA good fit, 05-.08 is the right fit. If the value is 0.90 or more TLI good fit. Use the structural equation model to perform empirical analysis using control variable validation, multi-group analysis, and latent mean analysis.

**Result**

**Descriptive Statistics:** In the structural equation model, distorted results can be derived if the variables to be measured are not satisfied with the normal distribution condition. As a result, the skewness was -.211 - -.712 and the kurtosis was .367 - 2.703. This result satisfies all of the normal distribution conditions (skewness <2, kurtosis <4), which is a requirement to apply the structural equation model of the main variables.

Correlational relationships between the variables used for the causal structure set out in this study were analyzed. All the variables were significant at .01. All latent variables showed statistically significant Correlational Relationship (.427 ~ .589).

As a result of the analysis of the research model, the fit of the research model was found to be good.
fit was TLI = .929 and RMSEA = .080. Overall, it was found to be good. The structural model of this study can be assessed to an acceptable level.

The path coefficients estimated from the study model are shown in Table 2. All were statistically significant.

The higher the perception of organizational environment, the higher the organizational support (β = .430, p <.05) and the service quality (β = .100, p <.015). The higher the perception of job environment, the higher the organizational support (β = .432, p <.001) and the service quality (β = .177, p <.001). The higher the organizational support, the higher the quality of service (β = .149, p <.01). Organizational environment, job environment, and organizational support are significant variables affecting service quality. Organizational support has been shown to mediate the relationship between organizational and job environments that affect service quality.

Comparison of measurement models and Latent mean analysis: For the latent mean analysis, all the model’s configural invariance, metric invariance, and metric and scalar invariance should be established. Correlational relationships between all potential variables were allowed for the verification of the measurement model. The fit of the model was compared. As shown in Table 3, all of them were satisfactory. This shows that measurement tools and intercepts in gender and facility types function in the same way. The observed mean difference between the two groups reflects the actual difference in potential variables.

The mean of the factors in the latent mean analysis is not directly estimable. The potential average of the measurement organization was estimated assuming that the potential average of one group was zero in gender and facility type (gender: female, facility type: use facility). A common standard deviation is applied when the variance of potential variables is the same. The fit of metric, scale, and factor variance invariance (model 4) was compared with metric and scalar invariance (model 3). As a result of comparison, there was almost no change. Metric, Scale and Factor variance invariance were secured. Thus, the effect size values were calculated using a common standard deviation. According to Cohen’s criteria, there was no significant difference in gender between groups. In the facility type, the difference in the service quality was significant. And the use facilities were relatively higher than the living facilities.

Comparison of inter-group path coefficients: The test of structural model invariance across the groups is to analyze the difference in path coefficients between measurement models in a structural equation model. The analysis was done through the process of metric invariance constraints and cross-group equality constraints.20 Metric invariance constraints are used to verify that the results of each group response are identical in the study model. The fit of the path model with the same fixed standardized estimates of all factors for each latent variable was measured. The analysis showed satisfactory fitness. Table 5 shows the inter-group path coefficients.

The results of the path coefficient check are shown in Table 6. First, the gender path was statistically significant in the organizational environment -> organization support -> service quality path. The type of facility was not significant. However, in the specific path, the male group and the use facility group were identified as statistically significant. Second, job environment -> organization support -> service quality path was significant in gender path. However, in the specific path, it was confirmed that the female group and the living facilities group were statistically significant.

2. job environment->Organizational Support->service quality

Conclusion

The purpose of this study is a social worker in charge of medicine. Analyzed the relationship between organizational and job environment variables and service quality through the recognition of organizational support in social welfare facilities. In order to identify the significant pathways to service quality, the potential average analysis was conducted by dividing into gender and facility type. The conclusion is as follows. First, organizational environment, job environment, and organizational support recognition were identified as significant factors affecting service quality. Second, the mediating effect of organizational support awareness has been confirmed. Third, gender was found to be a significant path in the inter-group path coefficients. The type of facility was not significant. Fourth, as a result of verifying the inter-group path coefficients, the male group and the use facility group were significant.
in the organizational environment path. In the work environment path, the female group and the living facilities group were significant. This study confirms that the service quality of social welfare facilities is important for the organizational environment and job environment of social welfare facilities. In order to improve this, it was confirmed that it is necessary to improve the awareness of the organization support. Suggestion for follow-up research. Development and research should be carried out on programs that enhance the quality of service and awareness of organizational support among workers in social welfare facilities.

Mediated Moderation Effect of Organizational Culture and Social Support in the Emotional Labor and Employee Turnover of Health Care Workers

Il-Hyun Yun
Professor, School of Social Work, Gwangju University, 277 Hyodeok-ro, Nam-gu, Gwangju 61743, Korea

ABSTRACT
This study investigated the relationship between emotional labor and Employee turnover. The Mediated Moderation Effect, which includes the mediating effect of organizational culture and the moderating effect of social support, was verified. In this study, 658 healthcare workers were surveyed. Data were analyzed using SPSS 25.0 and SPSS Macro. The mediated control model is an integrated model with mediating effect, so it verifies the mediating effect, the moderating effect, and the mediated moderation effect. The results of the study are as follows. First, the mediating effect of organizational culture has been verified in relation to emotional labor and employee turnover. Second, the relationship between emotional labor and employee turnover was controlled by social support. Finally, the overall mediated modulation effect was confirmed using SPSS Macro. The mediated moderation effect of social support was found to be statistically significant in the way that emotional labor and organizational culture influenced turnover. This study confirms the comprehensive path that emotional labor affects employee turnover. Through the route, confirmed the employee turnover of healthcare workers more interactively. Explored the variables that could be practically intervened and confirmed the mediating effect and the moderating effect.

Keywords: Healthcare, Emotional Labor, Employee Turnover, Organizational Culture, Social Support, Mediated Moderation Effect.

Introduction
The healthcare industry has been expanding due to social and technological changes based on environmental factors such as the aging population, government policies, and technological development. The expansion of the healthcare industry market has expanded the market for competition. Recognition of the importance of full-scale human services has raised the issue of quality of care for healthcare facilities, the provision of medical personnel for treatment, and the securing and management of human resources for providing and managing services. The healthcare service environment requires quality manpower while increasing patient care and quality care as well as patient care. The role of the workers became important. Particularly, the roles of the employees became more important because they have to win the competition between the healthcare and the public service. In this process, the turnover rate of the healthcare workers is increasing due to various reasons such as the competent facility management system and the emotional labor in relation with the patient and the workplace. In the case of nursing staff, which occupies the largest portion of healthcare, the turnover rate is as high as 70-80%. The rate of turnover of nurses varies according to the number of operation beds of the medical institutions. In the case of less than 200 beds, 27.4%, 200-399 beds 23.7%, 400-599 beds 18.8%, 600-799 beds 12.5%, 800-999 beds 12.9% And 8.1% for over 1,000 beds. In addition, the turnover rate of new nurses was 42.7% and 43.2% in general hospitals and hospitals, which is higher than the average of all new nurses 38.1%. In the health care industry, the average turnover rate of care workers in the year 2011-212 was 41%. This is higher than the average turnover rate of 20 ~ 30% in other countries. The high turnover rate of the workers lowers the stability of the organization. Lack of a skilled workforce degrades the expertise of the workforce. It is a factor that increases the workload and stress of the remaining colleagues. One of the reasons why the turnover rate is high is due to the characteristics of the employees’ emotional laborers in the nature of...
the health care industry. Understanding and mediating the organizational culture of nurses within hospital organizations has become an essential management strategy for effectively operating hospital organizations. In the organizational culture study of nurses, the lower the relationship culture and the adhocracy culture, the higher the hierarchical culture, the higher the Employee turnover. Hierarchical culture is partly understood by the nature of hospitals. However, if the organizational culture continues, it will be necessary to consider this because it increases of the nurse employee turnover. Personnel management of healthcare workers is very important, and continuous research is needed to identify the multidimensional influences that affect them. The research problems are as follows.

First, Is there a mediating effect of organizational culture in relation to emotional labor and employee turnover perceived by healthcare workers?

Second, does the social support show a moderating effect in the emotional labor and the employee turnover of health care workers?

Third, is there a mediated moderation effect of social support?

**Method**

**Research Model:** This study examines whether the interaction term (the moderating effect) between the emotional labor and social support of healthcare workers affects employee turnover through a parameter. Emotional labor is an independent variable, Employee turnover is a dependent variable, Social support is a controlling variable, and Organizational culture is a parameter. The research model is shown in [Figure 1].

![Figure 1: Research model](image)

**Data Analysis:** The collected data were analyzed using SPSS 25.0 and SPSS Macro. First, using SPSS 25.0, descriptive statistics and correlation analysis were conducted for each variable. In order to verify the research model, we analyzed the mediating effect of organizational culture in relation to emotional labor and employee turnover through hierarchical regression analysis using the same analysis tool. Respectively. In order to verify the research model, we analyzed the mediating effect of organizational culture in relation to emotional labor and employee turnover through hierarchical regression analysis using the same analysis tool. In addition, bootstrapping through SPSS Macro was performed to verify the statistical significance of the mediating effect. In addition, the interaction effects of emotional labor and social support through regression analysis were verified using SPSS 25.0 and SPSS Macro, and the significance was verified. Finally, using the SPSS Macro, the emotional labor according to the level of social support confirms the mediated moderation effect that influences the employee turnover through the organizational culture respectively.

**Result**

**Correlational Relationship:** Analyzed the correlations of factors affecting employee turnover extracted through exploratory factor analysis. There is a statistically significant correlation between all the factors of emotional labor, social support, organizational culture, and employee turnover.

*p < .05, **p < .01 ***p < .001

Mediating Effect: In order to investigate the mediating effect of organizational culture in relation to emotional labor and employee turnover, the mediating effect verification process proposed by Baron and Kenny (1986) Were used. The mediating effect is shown in Table 2. Emotional labor had a significant effect on organizational culture in the first stage (β = .480, t = 14.013, p < .001). In the second stage, the overall effect of emotional labor on turnover intention was significant (β = .468, t = 13.576, p < .001). This indicates that the higher the emotional labor, the more the employee turnover is affected. In the third stage, the influences of the organizational culture, which is a parameter, on the employee turnover were confirmed while controlling the influence of the emotional labor. As a result, significant pathways were identified (β = .468, t = 13.422, p < .001).

The direct effect of emotional labor on employee turnover was .244 (p < .001), considering the effect of parameters. The effect of emotional labor on employee turnover when not considering parameters was .468 (p < .001). When the mediation. Direct effects taking parameters into account were less than those without parameters. However, when considering the parameters, the path from emotional labor to employee turnover showed statistical significance because the organizational culture, which is a parameter, is the emotional labor, this implies partial mediation of the impact on employee turnover. The indirect effect coefficient of emotional labor on Employee turnover was .225.

3. Dependent variable: Employee turnover, Independent variable: Emotional labor, Organizational Culture

* p < .05, ** p < .01, *** p < .001

Used bootstrapping to determine whether the magnitude of the mediating effect on the emotional labor turnover was statistically significant. To verify the statistical significance of this study, the number of samples re-extracted by bootstrapping was 5,000. The lower limit of the mediating effect coefficient obtained from the 95% confidence interval was .327 and the upper limit was .487. As shown in Table 3, there is no 0 between the lower limit and the upper limit in the 95% confidence interval. It can be seen that the mediating effect of Organizational Culture is not the result of statistical random errors. Therefore, we confirmed that organizational culture is partly mediated in relation to emotional labor and employee turnover.

Moderating Effect: The moderating effects were analyzed in three steps proposed by Aiken and West (1991)\(^{15}\). The effect of interaction terms was analyzed by calculating the mean centering of independent variables and control variables to reduce the multi-collinearity problems that may occur in the moderating effect verification. Emotional labor was introduced in the first stage. As a result, emotional labor had a significant effect on turnover intention (\(t = 13.576, p <.001\)). Explanatory power was 21.9%. In the second stage, emotional labor and social support were added. As a result, emotional labor (\(t = 10.592, p <.001\)) and social support (\(t = 9.392, p <.001\)) had a significant effect on each, respectively. Explanatory power was 31.2%. In the third stage, the interaction terms between emotional labor, social support, emotional labor and social support were introduced. As a result of the analysis, there was a significant moderating effect (\(t = -2.167, p <.05\)). The Variation in \(R^2\) was statistically significant (\(\Delta R^2 = .314, p <.05\)). Explanatory power was 31.7%. These results indicate that there is a moderating effect of social support in the relationship between emotional labor and employee turnover.

Table 4: Mediating effect

Mediated Moderation Effect: Based on the data used in Muller et al. (2005)\(^{16}\), Mediated Moderation Effect was analyzed. The results of the analysis are summarized as shown in Table 5. First, analysis of Phase 1 revealed that \(\beta_{43}\) was significant. In other words, social support has a moderating effect. Second, In the second step analysis, organizational culture was selected as a dependent variable. Emotional labor and social support, and interaction term (emotional labor * social support) were selected as independent variables. In the second step analysis, \(\beta_{51}\) was significant but \(\beta_{53}\) was not significant. Third, for the three-step analysis, the dependent variable was Employee Turnover. Emotional labor, social support, and interaction term (Emotional labor * social support) were used as independent variables. Also, organizational culture, interaction term (Organizational Culture * social support) were also introduced as independent variables. Three-step analysis showed that both \(\beta_{61}\) and \(\beta_{65}\) were significant.

Fourth, comprehensive analysis shows that \(\beta_{43}\) is significant through the first step analysis. In addition, \(\beta_{51}\) and \(\beta_{65}\) showed significant mediated moderation effect through two step analysis and three step analysis. And \(\beta_{51}\) and \(\beta_{65}\) were significant, indicating a moderating effect between the parameters and dependent variables.

Conculsion

This study has implications for understanding the emotional labor and employee turnover of healthcare workers and exploring the control strategies for helping employee turnover. For this purpose, we examined the mediated moderation effect of emotional labor, organizational culture, social support, and employee turnover. Emotional labor has a significant effect on employee turnover through organizational culture. In this connection, confirmed that social support plays a role as a control variable. Based on the verification of the integrated model, its implications are as follows. First, there was a significant correlation between emotional labor, organizational culture, social support, and employee turnover. All showed a positive (+) correlation. The relationship between organizational culture and employee turnover was relatively high. Second, organizational culture has a significant partial mediating effect on the relationship between emotional labor and employee turnover. The emotional labor of healthcare workers has a direct impact on employee turnover. And, organizational culture indirectly has a significant influence through mediation. Organizational culture was found to be an important factor in job turnover. Third, the moderating effect of social support was found to be significant in the effect of emotional labor on employee turnover. The emotional labor of healthcare workers was found to control the behavior of employee turnover according to the influence of social support. Social support was identified as an important moderating effect variable. Fourth, mediated moderation effect including the moderating effect of organizational culture and mediating effect of social support have significant results. In the relationship between emotional labor and employee turnover, the higher the level of social support, the more significant is the effect of organizational culture on turnover. This study has limitations in the generalization of healthcare practitioners. It is suggested that further studies should be carried out to increase the external validity of research by securing various regions and various levels of sample.

ABSTRACT

The duration of sleeping for children <7 hours has twice the risk of obesity and was associated with health problems. At present, school-age children lack an average sleep duration of 20-25 minutes each day than their parents at their age. This study aimed to determine the effect of dhikr before bedtime on sleeping duration and weight among primary school children. A quasi-experimental design was conducted at SDN Kompleks IKIP Makassar for 3 months. Total 28 samples met the inclusion and exclusion criteria. Samples were divided into two groups, dhikr before bedtime (Db) and control (CT). Each group consists of 14 students. At baseline, showed that there were no significant differences in general characteristics, sleeping environment, sleeping duration, and weight between the intervention and control groups. The results of the analysis after the intervention showed that the intervention dhikr before bedtime significant effect on sleeping duration increased +0.92 minutes, but dhikr before bedtime but no significant effect on body weight, but there was a tendency of decreasing in weight about -0.22 kg. Intervention dhikr before bedtime can be used for the prevention of sleep disorders in children with short sleep duration. Further study, it is recommended that interventions for dhikr before bedtime with longer and be sustained.

Keywords: Dhikr before bedtime, sleeping duration, weight, primary school children

Introduction

Sleep was a basic need of every human being that was instrumental in improving the stability of endurance1. The benefits of sleep can be felt optimally if the sleep has good quality and quantity2. The need for sleep for children varies, according to the age stage, the average school-aged child needs around 9-11 hours a day3. Factors affecting the quantity and quality of children’s sleep habits before the child were sleeping, the sleep environment, drinks and food, lifestyle, physical activity, and stress factors4. Sleep duration of children <7 hours had twice the risk of obesity and related health problems5. Less sleep (2-4 hours a day) may result in an increase in appetite by 23-24%, have an impact on the lack of an increase in caloric intake and contribute to the accumulation of fat in children6. Meta-analysis of 700,000 children from 20 countries found that the average child was currently less sleep 20-25 minute a day compared to their parents at the same age7. The bed was very favorable to growth and development was fast asleep for about 7-8 hours without halting, without feeling restless and dreamless. Children were in desperate need of adequate and quality sleep because optimal growth and development depend heavily on adequate sleep. GH (Growth hormone) during sleep as much as 75%. High levels of GH affects the child’s physical condition because this hormone serves to stimulate the growth of bone and tissue, as well as regulate the body’s metabolism of children8.

Problems that occur to sleep were called sleep disorders. The sleep disorder was a collection of symptoms of the form of quantity and quality. Approximately 46% of sleep disorders in elementary school children have a type of disturbance in starting and maintaining sleep9. Sleep disorders in normal children and children with special needs were divided

DOI Number: 10.5958/0976-5506.2019.01330.5
The sleep disorder is not a disease but a symptom of a variety of physical, mental and spiritual. Efforts to overcome sleep disorders can be given pharmacological and non-pharmacological therapy. Long-term pharmacological therapy has dangerous side effects. Non-pharmacological therapy can be done with behavioral and environmental modifications. Dhikr was a non-pharmacological therapy that was widely practiced and effective to improve sleep quality, especially in patients hospitalized with various diseases, in remembrance Islamic religion was a form of surrender to Allah SWT. Dhikr relaxation was an attitude and passive behavior and surrender by saying words or sentences that were repeated so that it will cause a relaxation response before going to sleep, but there is no dhikr therapy before bedtime at school-age children that have sleep disorders. So this study aims to determine the effect of dhikr before bedtime on sleep duration and weight among primary school children.

Material and Method

The research design used was quasi-experimental. The study was conducted at SDN Kompleks IKIP Makassar, South Sulawesi. School selection done purposively, the subjects involved in the study were 28 students in grade 5A and 5B, each group consisting of 14 students who met the inclusion and exclusion criteria. The inclusion criteria of the subjects in this study were the 5th-grade students (Ages 10-11 years), Muslim, who had been screened overweight, had a sleep duration of <7 hours, were willing to be given intervention, approved and supported by student guardians of informed consent. Subject exclusion criteria were not experiencing pain, consuming certain drugs which can cause respondents to have trouble sleeping within a month before data collection.

Intervention in the form of dhikr before bedtime (DMT) material according to the Sunnah of the Prophet which reads the Surah Al-Fatihah, Al-Baqarah: 255, Al-Baqarah: 284-286, Al-Ikhlaş, Al-Falaq, and An-Naas then rubbed from the head, face and front body as much as 3 times, and last pray to sleep. The material was given through the media power point and pocketbooks. Pocketbook also comes with a sleeping child development control sheet filled out by the parents every day. The DB group was given an intervention in the form of dhikr before bedtime material given 40 minutes a week for 10 sessions in 3 months, until all the memorized dhikr. Technical dhikr before bedtime that has been taught at school was carried out by the subject and controlled by each parent. The CT group as a control group did not receive treatment. Interventions were carried out directly by researchers. Weight measurement using digital scales.

Mann Whitney tests results in table 1 showed no significant differences in the general characteristics of the subject between DB and control groups. The majority of subjects were male (53.6%), 10 years old (57.1%), every day was given a 5,000-15,000 allowance (85.8%), consume caffeine (25%), exercise only once a week (50%), and have overweight nutritional status.

p°^1 Mann Whitney between DT and Control groups
p^2 Wilcoxon between before and after each group
Δ^3 After - Before

The results of the Mann Whitney test for table 3 showed that the subjects' sleep duration before intervention had no significant difference, but after the intervention, there was a significant difference between the DB and CT groups (p = 0.040). Wilcoxon test showed that there was a significant effect of sleep duration in the group with delta DT +0.92 minutes, this suggests that the form of therapeutic intervention dhikr before bedtime significant effect on the increase sleeping duration subject. Table 3 showed that the weight of the subject before and after intervention there was no significant difference, the CT group had a significant effect on weight. The DB group has no effect after the intervention, but there was a tendency to decrease the subject body rate by -0.22 kg. This indicates that the intervention in the form of dhikr before bedtime tends to reduce the weight of children was overweight.

Discussion

The quantity and quality of sleep of a child were influenced by several factors^4. In this study shows boy have shorter sleep duration than girls. This was consistent with research in Australia because boys spend more time on sedentary activities such as watching television and the internet. This can cause boys to have shorter sleep duration than girls^10. The results of the interviews before the intervention, 85.8% of subjects were given an allowance of 5,000-15,000 per day, the money given was used to buy food and drinks at school, a small portion was used to buy school supplies. Some foods and drinks consumed by the school cafeteria contain caffeine; such as tea, soft drinks, chocolate bars, and coffee-flavored ice cream. The effect of consumption of food and caffeinated drinks can begin to be felt 15-20 minutes after drinking even up to 4 hours later. Research in the United States found that the relationship between diet caffeine and sleep duration of children, children who consume caffeinated drinks experience shorter sleep duration than children who do not consume caffeinated drinks^11. Snacks in school children have been shown to increase calorie intake of children, consumed more quickly and produce a higher calorie intake^12.

Children’s lifestyle can lead to a decreased quality of sleep, exposure monitor screen ≥2 hours per day can cause sleep disorders in children^13. Electronic media can have an adverse impact on sleep quality, improper use of time and the brightness of the light emitted can cause changes in sleep patterns. Light emitted by electronic media to the retina signals the hypothalamus and interferes with the production of melatonin in the body, thereby changing sleep quality^14. Factors in the child’s sleep environment can increase and decrease the quality of sleep, the presence of external stimuli can inhibit sleep efforts such as uncomfortable temperatures and poor ventilation. A good temperature to provide
good sleep quality was around 24°C–26°C. Children who experience fatigue intermediate level tends to get a good night’s sleep, especially when fatigue derived from physical exercise, increase the amount of sleep, and reduce awakened during sleep.

Conditions before the intervention, some parents reported sleep disturbances in their children, some subjects found it difficult to start sleeping, often had nightmares, talked and walked while sleeping, and were difficult to wake up. Sleep duration subject after doing dhikr before bedtime for 3 months duration of sleep affects the subject, the subject was easier to initiate sleep, rarely woke up at night and feel more refreshed when you wake up in the morning. Relaxation condition caused by the pronunciation of words to remember God can provide the stimulus stimulation activity on the system and the hypothalamic pituitary adrenal sympathoadrenal, which can inhibit the secretion of adrenocorticotrophin hormone which can inhibit the production of a hormone that triggers the physiological changes include changes in the child’s sleep quality. Dhikr can affect one’s relaxation due to melatonin hormone secretion that was affected by a decrease in one’s brain waves down on the delta wave. When the brain delta surge will produce human growth hormone which was serotonin which was good for health. By the time someone reaches the pineal gland delta waves would change the substance serotonin into melatonin, which affects the quality of sleep was important to a person, so it feels good night’s sleep.

Short sleep duration causes changes in hormonal regulation of appetite and increased hunger and food intake, increases the body fatigue and reduced activity during the day so as to spend more time to settle down at home of adequate energy expenditure, often accompanied by irregular eating habits and increased calorie intake by tending to eat high energy dense. Increased calorie intake that was not offset by energy consumption causes weights to gain. Sleep also involves metabolic functions, namely hormones that regulate appetite and energy consumption. Sleep duration increased from 2-4 hours a day to 7 hours a day leads to weight loss, whereas sleep duration <7 hours per night increases the risk of obesity.

**Conclusion**

This study summarizes that dhikr before bedtime has a significant effect on increasing the child’s sleep duration, but dhikr before bedtime has no significant effect on the child’s body weight. But there was a tendency for weight loss.

The Influence of Strategic Foresight on Hospital Financial Performance: Mediating Effect of Continuous Quality Improvement

Khalidiya Mostafa Atta Abd¹, Sajjad Mohemmed Atiyah², Anaam Abdulzahra Meteab³

¹Assist. Prof. Dr., Iraqia University, College of Administration and Economics, Iraq; ²Lect. Dr., University of Kufa, College of Administration and Economics, Iraq

ABSTRACT

The aim of this study is to explore the mediation influence of continuous quality improvement between the strategic foresight and the financial performance of the hospital, with the intention of applying it to a specific medical service in the hospital. Through indicators that can be formed as a tool for assessment, monitoring, and control. The increasing pressure on health organizations in Iraq has led to a continuous increase in spending, an increase in population expectations and the need to get the most out of the invested resources, which require continuous quality improvement. These conditions require effective strategic tools such as strategic foresight tools that have proved as successful on a large scale. This study was applied in the health sector in Iraq. The questionnaire was adopted as a main instrument for the study. It was found that the adoption of strategic foresight and continuous improvement were necessary to improve hospital financial performance.

Keywords: Strategic Foresight, Competitor Foresight, Technology Foresight, Customer Foresight.

Introduction

Before the era of wars in the country and the subsequent sanction against the country, Iraq had a very high standard of healthcare when compared to other countries in the Arab region. Healthcare in the country was free by then, administered centrally through the ministry of health and well equipped with necessary equipment and the appropriate number of personnel¹.

Research conducted by Valeria Cetorelli and Nazar between 2003 to 2014 ², reveal that after a decade of war, the Iraqi government embarks in the strengthening of private firms after years of sanctions. The government of Iraq for the preceding period after the war and a series of several sanctions that negatively affected the health system focused on the development of the old system ³. The national statistics of the country reveal a positive and promising healthcare system concerning the demographics ⁴. For instance, the country consists of life expectancy of above 70 years for both male and female ⁵. The projection of the Iraqi private healthcare market is expected to proliferate as the country continues to stabilize political and civil matters. The country has a total population of 37.6 million people according to World Bank statistics ⁶. The Iraqi healthcare systems are projected to be dominated by the private sector after the political and economic conditions ⁷, especially in light of the troubled financial performance of the health sector in the country. The hospital financial performance aims to increase the efficiency and effectiveness of hospitals performance, thus improving the medical and health services provided to the customers in general ⁸, and this requires a set of strategic tools that accurate and guaranteed to achieve success by diagnosing the strengths and weaknesses by adopting a set of general indicators that efficiency control and corrective action.

Hence, the health sector needs to employ strategic tools that contribute to the process of continuous quality improvement. The concept of strategic foresight has emerged as a successful strategic tool ⁹, which can...
contribute to continuous improvement of quality and improve hospital financial performance.

Accordingly, this study aims to identify the mediation role of continuous quality improvement between strategic foresight and hospital financial performance.

**Literature Review**

**Strategic Foresight:** The awareness of the future and its anticipation and the identification of challenges and opportunities is an important factor in having a clear vision for the future, especially in the current era, which has great challenges, so strategic foresight has become an important strategic tool. The strategic foresight represents the planning discipline associated with future studies, and it is used to gather relevant information in the future and to predict the correct future picture. Strategy foresight activities focus on customers, competitors and technology, these activities are carried out through the company’s product and innovation unit.

**Competitor Foresight:** The competitor foresight is carried out by the home production unit and aims to identify and anticipate the movements of competitors. This activity is supported by a radar product and service tool for its classification and visualization.

**Technology Foresight:** Technology foresight is implemented by the technology exploration unit, which uses radar technology as a tool for classification and visualization, similar to radar products and services.

**Customer Foresight:** The prospective role of the client is assumed by user-driven innovation, which uses five tools to identify emerging needs (exploratory interviews, daily research, day life visits, vision clinics, and major studies) and make them quantifiable.

**Hospital Financial Performance:** The concept of performance is mainly related to the resources used to achieve a particular outcome and subsequently obtained, and here the performance is related to profit, financial benefit and financing. Financial performance represents the profit that is realized through the investment or through the benefit obtained later on after a certain period. In other words, financial performance is linked to the profitability obtained through the resources used. And the liquidity that is achieved. Profitability is an economic activity through which a series of materials, means, and human and financial resources have collected that aim at obtaining a series of results. That is, profitability is the yield generated by a series of capitals in a given period of time. Liquidity is the quality of assets that are converted into cash immediately without a significant loss of value. In a way that makes it easier to convert the asset into money.

**Continuous Quality Improvement:** Continuous improvement is an effective method of achieving total quality, also called excellence, which is the evolution that has experienced the concept of quality. Quality is good quality and good value.

In recent times the concept of quality assurance has been taking a lot of force, which can be defined as a stage that allows guaranteeing the continuous level of the quality of the product or service provided by the organization, which gives greater prominence and importance to the continuous improvement. The Continuous quality improvement consists of Assess, plan and improve, Assessment of performance begins with research and asses of staff strengths and identification of areas to be remedied and process. The plan aims to improve as a primary objective, the sequence of the plan evaluation identifies a supportive system for continuous improvement.

---

**Material and Method**

**Sampling:** The population of this research is physicians of Iraqi hospitals, random sampling is used as a method of selection. 130 questionnaire were distributed and 114 were retrieved, 109 were valid to the analysis with 83.8% response rate, and is considered highly adequate for analysis because it was above 70% which is recommended as adequate. Cronbach alpha was used in this study to determine the reliability of the measures and its exceed 0.70 which is an acceptable range as shown in Table 1.

| Table: 1 Cronbach Alpha |

Research Hypothesis: After review of the literature, the conceptual framework was formulated as in Figure 1 to discuss the hypotheses as follows:

H1: Continuous quality improvement has a mediation role in the relationship between competitor foresight and hospital financial performance.

H2: Continuous quality improvement has a mediation role in the relationship between technology foresight and hospital financial performance.

H3: Continuous quality improvement has a mediation role in the relationship between customer foresight and hospital financial performance.

Findings

Confirmatory Factor Analysis: In order to identify the components of the variables, the confirmatory factor analysis is performed as shown in Table 2 the CFA exceed 0.5 and refer to that the items relating to each factor of SF which was composed of three dimensions (SF1, SF2, SF3) and CQI which was composed of three dimensions (CQI1, CQI2, CQI3) Each of the dimensions is measured through four questions and HFP is measuring through eight questions, the results indicate that the questions are adequate to measure its dimension. Also, the fitting indicators are expressed in Table 3 which refer to acceptable values.

Hypotheses Testing: After analyzing the internal and external consistency, the internal model was tested for hypothesis testing. However, direct and indirect effects were examined in this part. In direct effect, all direct hypotheses were examined without the mediator. In indirect effect, mediation hypotheses were tested. Table 4, Figure 2 shows that the direct effect of SF1 on HFP (-0.089) is not significant at the level of (P < 0.05), and the direct effect of SF1 on CQI (0.218) is significant at the level of (P < 0.05), also the indirect effect of SF1 on HFP (0.214) is significant at (P < 0.05), these results support H1 hypothesis. The direct effect of SF2 on HFP (0.020) is not statistically significant at (P < 0.05), and the direct effect of SF2 on CQI (0.514) is significant at (P < 0.05), also the indirect effect of SF2 on HFP (0.506) is statistically significant at (P < 0.05). these results support H2 hypothesis. Additionally, the direct effect of SF3 on HFP (-0.073) is not significant at (P < 0.05), and the direct effect of SF3 on CQI (0.186) is significant at (P < 0.05), also the indirect effect of SF3 on HFP (0.183) is statistically significant at (P < 0.05). these results support H3 hypothesis.

Health institutions work in a rapidly evolving environment that requires compatibility between their various available resources and capability and those imposed by this external and internal environment \(^2\) (including changing in meeting needs and health services to patients) \(^2\) so they have to find all the means and methods that assist in achieving their objectives efficiently and effectively \(^2\). The literature review discusses the earlier studies done on the above topic and the main reason for this review is to take an in-depth insight on how to improve the Iraqi hospital financial performance by using strategic foresight and continuous quality improvement. This article aims to determine the effort that strategic foresight takes to improve the quality and performance which will enable the hospital to compete on the same level as other hospitals in this country.

The results proved that strategic foresight does not affect the financial performance directly, but it has a positive influence when there is a continuous improvement as a mediator between the relation. The results showed that the influence of competitor foresight is a positive, this result is supported by literature \(^2\) which have shown that competitive planning has a positive impact on performance improvement.

The influence of customer foresight has a positive influence on performance, and this result has been consistent with multiple studies, and the perception of the customer positively affects the improvement of performance\(^2\), as the orientation of customer trends leads to the improvement of strategic plans and thus reflected on the efficiency of performance \(^2\).

Conclusion

In light of the findings of the study, it can be seen that the strategic foresight have a positive indirect influence on the dependent variable hospital financial performance and therefore hospital management should try to use of these strategies.

ABSTRACT

This study aimed to evaluate the consumption benefits of tomato juice-rice bran drink and tomato juice-rice bran oil emulsion drink on serum lipid profile picture of obese adults. This study used a preexperimental design parallel two group pretest-posttest design involving 13 obese subjects each group for a total of 26 people. The main phase consisted of 4 weeks-intervention. Intervention was performed by giving two glasses of tomato drink and two drinks beverages of rice bran oil every day which is equivalent to 42 mg of lycopene and 57.2 mg of γ-oryzanol, respectively. The results showed that tomato juice, rice bran powdered and oil emulsion drink lowered the level of total cholesterol and LDL cholesterol significantly (p<0.05), whereas triglyceride and HDL level were not changed.

Keywords: rice bran powder, rice bran oil emulsion, tomato juice, lipid profile, obese adults

Introduction

Based on data by World Health Organization (WHO), in 2016 more than 1.9 billion (39%) adults aged 18 years and older were overweight1. Based on basic health research (BHR) 2013 by Indonesia Ministry of Health (MOH), national prevalence of adults overweight was 28.9%, prevalence of women (32.9%) was higher than men (19.7%)2. Raised BMI is a major risk factor for non-communicable diseases as well as abnormalities of lipid profiles. Overweight and obesity, as well as their related non-communicable diseases are largely preventable1.

One of many ways of overweight and obesity intervention is food-based intervention. Many researches have shown that component of food such as phytonutrient has been found to be effective in controlling obesity3. Two of important sources of phytonutrient were tomato and rice bran. Blended or boiled tomato seemed to be better source of lycopene than the whole or raw one, because there was isomerization and oxidation during heat processing4. There is bioactive compound in rice bran, such as vitamin E (tocopherol and tocotrienol), oryzanol and pangamic acid. Bioactive compound, as antioxidant, can scavenge free radical so can decrease blood cholesterol level, prevent cancer, and increase hormone secretion5. Rice bran oil can decrease significantly blood total cholesterol and LDL level. Those decreasing effect was caused by bioactive compound, i.e. γ-oryzanol, but not by fibre content6.

Previously, effect rice bran in addition to plant sterol combination on blood lipids in healthy overweight-obese adults was studied7. Thus, this study aimed to evaluate the consumption benefits of tomato juice-rice bran powder drink (TRP) and tomato juice-rice bran oil emulsion drink (TRO) against obesity complications as assessed by serum lipid profile picture of obese adults.

Material and Method

This research was intervention of combination high-antioxidant tomato and rice bran drinks. Location of this research was Bogor Agricultural University, Indonesia and being held from May to November 2013.
Subjects: Subjects of this research were adults which inclusion criteria were BMI 25-35 kg/m², age 24-56 years, fasting glucose level ≤ 126 mg/dL, and voluntary participating which proved by informed consent. Exclusion criteria were chronic disease history; consuming supplement of antioxidant; pregnant or breast feeding, postmenopausal, and hormone replacement therapeutic for women, chronic inflammation diseases; and/or unbearable to consume intervention products.

Minimal sample size was counted based on minimum sample size for estimating difference mean between groups. Based on that formula, minimal sample size were 12 subjects for each group. By purposive sampling, these subjects were allocated into TRP or TRO group. Based on screening, which met the inclusion and exclusion criteria, the total of samples were 27 (14 for TRP and 13 for TRO).

Intervention: Period of intervention was four weeks, i.e. the first 2 weeks was provision of tomato juice and the following 2 weeks was provision of rice bran powder or rice bran oil emulsion drink. Tomato juice should be consumed twice daily, each was 240 mL. Rice bran powder should be dissolved in water before consumed and consumed twice daily, each was 15 gram. Rice bran oil emulsion was given in the form of ready to drink and should be consumed twice daily, each was 220 mL.

Preceeding period of intervention, there was run-in period for two weeks. In this period, subjects did not allow to consume high antioxidant content of food and/or supplement. In the end of each of tomato juice, rice bran powder or rice bran oil emulsion provision, blood lipid profile were analyzed.

Statistical Analysis

The data were analyzed using Microsoft Excel for Windows and SPSS. The data were analyzed using descriptive analysis, comparative analyses independent sample t-test and paired sample t-test.

Findings

During intervention, one subject from TRP group was dropped because she could not consume rice bran powder. Therefore each group consisted of 13 subjects. The age range involved in this study was 26-55 years. The highest level of education was high school education level (48.1%) and the lowest at the primary education level (7.4%). Most of the respondents were married (88.5%).

All lipid profiles were decreased on both intervention groups, except triglyceride on TRP group which increased at week-4. After intervention, total cholesterol level of both groups decreased significantly (p<0.05), i.e. 77.8 mg/dL (39%) and 64 mg/dL (33%) for TRO group and TRP group, respectively.

Both TRP and TRO provision tended to decrease High Density Lipoprotein (HDL) level at the first two weeks of intervention. The last two weeks intervention showed that administration of both TRP and TRO tended to increase HDL level even though TRO was more powerful in increasing HDL level than rice bran powder. In TRP group, HDL level increased but not statistically significant and in TRO group, HDL level significantly increased from 35.6 mg/dL to 42.5 mg/dL (p<0.05).

Serum Low Density Lipoprotein (LDL) level decreased significantly (p<0.05) after intervention of either TRP or TRO. TRO was more powerful in decreasing LDL level (74.1 mg/dL) than TRP (65.7 mg/dL). After period of intervention, provision of TRO had inconsistent effect on TG level. However provision of TRO decreased triglycride level but not statistically significant (p>0.05).

**Discussion**

Result indicated that provision either tomato juice-rice bran powder drink (TRP) or tomato juice - rice bran oil emulsion drink (TRO) were both effective in decreasing total cholesterol level. However, TRO intervention had better effect than TRP provision, each after tomato juice provision.

Damayanthi *et al.* showed that provision of tomato juice and rice bran powder with the same of dosage and period tended to decrease total cholesterol level of high cholesterol women with or without breast cyst. Phytosterol of rice bran oil as part of margarine ingredients which consumed by normolipidemic person as much as 2.1 gram per day could decrease their total and LDL cholesterol by 5% and 9%, respectively.

Another research showed that in comparison with the control group, the results of treatment with rice bran oil, total cholesterol level significantly decreased by 10.3% (*P* < 0.05) 11. Study by Hongu *et al.* showed decreased total cholesterol among subject who received rice bran treatment. Result showed average decrease in total cholesterol was significantly higher in the rice bran and plant sterol group than in the pigmented rice bran group (difference 36 ± 25 g/dL vs 7 ± 16 g/dL; *p* = 0.044)7. Study by Choudary *et al.* among 60 moderately hyperlipidemic patients who received blended rice bran and olive oil showed that the level of TC decreased by 3.7 even though not significant statistically12. Children received 1 ml/kg/day of rice bran oil showed significant declining in serum cholesterol levels at 4 weeks from initiation of treatment13. Consumption of 18 g rice bran oil modified milk daily significantly decreased total serum cholesterol concentrations by 3.6% (from 184.3 mg/dL to 177.6 mg/dL)14.

In human macrophages, lycopene dose dependently reduced intracellular total cholesterol. Such an effect was associated with a decrease in cholesterol synthesis through a reduction of 3-hydroxy-3-methylglutaryl coenzyme-A reductase activity and expression, a modulation of LDL receptor and acyl-coenzyme A:cholesterol acyltransferase activity. An increase in cholesterol efflux through an enhancement of ABCA1 and caveolin-1 expression was also observed. In animal models of atherosclerosis, lycopene and tomato products decreased plasma total cholesterol, LDL cholesterol and increased HDL cholesterol15.

Mechanism of decreasing cholesterol level as a result of provision of rice bran oil, γ-oryzanol, and pherulic acid in hypercholesterolemic Golden Syrian hamster (*Mesocricetus auratus*) was via increasing excretion of cholesterol and its metabolite through feces16. Another mechanism of decreasing cholesterol level by rice bran oil in hyperlipidemic rats was via 7α-hydroxilase cholesterol of liver, liver receptor-LDL, and hydroxyl-3-methylglutaryl coenzim A reductase mRNA of liver. High content of γ-oryzanol and γ-tocotrienol in rice bran oil could increase neutral sterol of feces and excretion of bile acid through upregulation of synthesis and metabolism of cholesterol17. Since oryzanol has a closely related structure to cholesterol, it may compete for the binding sites of cholesterol and thus may inhibit dietary cholesterol absorption. Oryzanol may affect cholesterol metabolism by altering dietary cholesterol absorption18.

Higher HDL level after treatment was desired. However, this research showed that in both treatment groups, HDL decreased at 2nd week and increased at 4th week. In TRO group, HDL level significantly increased from 35.6 mg/dL to 42.5 mg/dL (*p*<0.05). Tazakori *et al.* conducted double blind non cross-over trial to 60 diabetic patients who were given 10 g soluble rice bran and showed that HDL level increased significantly (*p*<0.05) from 46 mg/dL to 53 mg/dL19. Tabassum *et al.* showed that HDL level increased after treatment with rice bran but not statistically significant13 and some studies showed that HDL level decreased but not statistically significant after rice bran treatment11,12,14,18.
In subjects whom consumed control diet or defatted rice bran diet were no decrease in total, LDL, or HDL cholesterol as reported by Most et al. But, the rice bran oil diet lowered total and LDL cholesterol significantly more than did the control diet. Furthermore seemed that the reduction in cholesterol was likely due to other components present in the rice bran oil. He showed that the effect of rice bran oil on serum cholesterol concentration is due to the unsaponifiable present in it and not to its lipid profile.

Hongu et al. showed the decrease in low-density lipoprotein (LDL) cholesterol (difference 22.3 ± 25.2 g/dL vs 4.4 ± 18.9 g/dL; p = 0.062) among healthy overweight-obese adults who received rice bran and plant sterol treatment compared to only rice bran treatment. Study by Choudary et al. among 60 moderately hyperlipidemic patients who received blended rice bran and olive oil showed that the levels of LDL cholesterol decreased by 9.0 % even though not significant statistically. Children received 1 ml/kg/day of rice bran oil showed significant declining in LDL levels at 4 weeks from initiation of treatment. Consumption of 18 g rice bran oil modified milk daily significantly tended to decrease LDL cholesterol concentrations by 2.7% (from 11.9 mg/dL to 108.0 mg/dL).

The treatment group of hyperlipidemic patients received rice bran oil (30 g/day) showed that in comparison with the control group, the results of treatment with rice bran oil, LDL level significantly decreased by 7.1% (P < 0.05). High levels of unsaponifiable material are found in rice bran oil. This is composed of phytosterols (γ-oryzanol), triterpene alcohols, and vitamin E isomers (tocopherols and tocotrienols). Rice bran oil contains up to 20% SFA and equal amounts of MUFA and PUFA.

Damayanthi et al. indicated that antioxidant activity of tomato juice and rice bran powder were 1.87 AEAC and 28.74 (mg/100 g), respectively. Rice bran oil and oryzanol can inhibit human LDL oxidation (in vitro) that indicated by relatively lower the level of malonaldehyde LDL in which plasma was supplemented with rice bran oil than control. Percentage of human malonaldehyde β-VLDL and LDL decreased significantly (p=0.05), each was 39-56% and 15-41%, respectively.

Provision of TRP had inconsistent effect on TG level. However provision of TRO decreased triglyceride level but not statistically significant (p>0.05). Tazakori et al. conducted double blind non cross-over trial to 60 diabetic patients who were given 10 g soluble rice bran and showed that triglyceride level decreased significantly (p<0.05) from 294 mg/dL to 237 mg/dL. Kennedy et al. conducted single-blind crossover study to test effect of rice bran and sunflower oil blend (RSBO) on 48 hyper-and normo-lipidemic subjects. RSBO produced significant reduction in serum triglyceride level in hyperlipidemic by 15%. When subjects were crossed over to control oil, the serum lipid values were not statistically different from baseline values. Serum triglyceride level was more likely due to food consumption, such as quantity of fat, kind of fat and/or fatty acid and dietary fiber. Another research showed that after the intervention of ready to drink rice bran oil-chocolate beverage, triglyceride levels remained unchanged.

**Conclusion**

Tomato juice, rice bran powdered drink (TRP) and rice bran oil emulsion drink (TRO) lowered the level of total cholesterol and LDL cholesterol significantly, whereas triglyceride and HDL level were not changed. Drinking tomato juice, rice bran powder, and/or rice bran oil emulsion regularly is recommended to maintain of blood lipid profile in normal range.

A Comparative Study Between *S. aureus*, Methicillin Resistance *S. Aureus* and *Pseudomonas Aeruginosa* Carriage in Diabetic’s Patients in General and Those with Foot Ulcer in Baquba City, Diyala Province

**Burooj M. Razooqi Al-aajem**

*Assistant Prof., M.Sc. Department of Microbiology, College of Medicine, Diyala University, Diyala, Iraq*

**ABSTRACT**

**Introduction:** Diabetes mellitus is a serious public health problem that’s rapidly expanding worldwide. Increase the risk of *S. aureus*, MRSA and *P. aeruginosa* carriage in patients with diabetes may reflect association between diabetes and bacterial carriers.

**Aim of the study:** Study was to compare prevalence *S. aureus*, MRSA and *P. aeruginosa* carriage in diabetics’ patients in general and those with foot ulcer with rates in healthy carriers.

**Materials and Method:** The study was conducted on (450) diabetics’ patients, attended the out patients clinic in Baquba Teaching Hospital, their ages ranged from (15-65) years, and 150 healthy group, during the period from May 2016 to April 2017, patients were classified into two groups according to type of diabetes. Swabs were taken from anterior nares, toe and axillae for each patient, identified based on standard bacteriological methods.

**Results:** The results showed rates of bacterial carriage in anterior nares of diabetic patients type-1 were (9.7%), (1.6%), (0.5%), respectively for *S. aureus*, MRSA and *P. aeruginosa*. In healthy group the rate of *S. aureus* carriage were (4.8%), and (0.5%) for each MRSA and *P. aeruginosa*. in toe were (5%), (0.8%), (5.8%), respectively for *S. aureus*, MRSA and *P. aeruginosa*. In axillae of diabetic patient’s type-1 were (3.7%), (1.8%), (10.1%), respectively for *S. aureus*, MRSA and *P. aeruginosa*.

**Conclusion:** We concluded an increasing rate of *S. aureus* nasal carriage and *P. aeruginosa* toe, axillae carriage in diabetic patients in general and those with foot ulcer compare with healthy carriers.

**Keywords:** Diabetes type 1 and 2, *S. aureus*. nasal carriage, Foot ulcers, *P. aeruginosa*.

**Introduction**

Diabetes mellitus is a serious public health problem that’s rapidly expanding worldwide (1). Infections with diabetes is one of the leading causes of human mortality and morbidity. It represents a severe complication of diabetes and the most common cause of diabetes associated hospital admissions (2). Diabetes is a chronic infection occurs when pancreas receive sufficiently amount of insulin and may when the body cannot efficiently use the insulin (3). Several abnormalities of the host defense system might result in a higher risk of infections, from these abnormalities immunological impairments such as impaired migration, phagocytosis, intracellular killing and chemo taxis in leukocytes (4). *Staphylococcus aureus* and *Pseudomonas aeruginosa* are the most common bacteria isolated from ulceration of diabetic patients (5). The presence of *S.aureus* carriage increased the risk of subsequent hospitalization with an *S.aureus* infection by over five-fold (6). chronic leg ulcers affect 1–2% of the general population and are related to increased morbidity and health costs (7). *S. aureus*
was the most frequent pathogen(25.6%) in diabetic patients, and a high proportion of *S. aureus* isolates were MRSA(63.4%) (8), and almost two-thirds of *S. aureus* isolates were MRSA in diabetic patients with foot ulcers (9,10). The pathology resulting from *S. aureus* and *P. aeruginosa* infections is of great importance due to the ubiquitous nature, growing resistance to antimicrobial agents, increasing prevalence and ability to delay healing (11,12). Multiple studies have also detected the presence of bacteria and the polymicrobial nature of chronic, non-healing wounds, and the frequency of *S. aureus* and *P. aeruginosa* infections has been shown to be high (13,14). *S. aureus* is able to produce biofilms and to express antimicrobial resistance and a variety of virulence factors such as surface proteins, exoenzymes and endotoxins, which enhances its virulence especially MRSA (15), colonization of the anterior nares is an important risk factor for infection and cross-sectional surveys of healthy adult populations have reported nasal carriage rates that are typically 20-55% (16). Diabetes has been associated with increased *S. aureus* nasal carriage in some mostly studies(17,18), but not others(19,20,21). The increased carriage in patients with diabetes may reflect association between diabetes and risk factors found in the general population such as, bacterial carriers among diabetic patients (22). This study aimed to determine and compare prevalence *S. aureus*, (MRSA) and *P. aeruginosa* carriage in diabetics’ patients in general and those with foot ulcer with rates in healthy carriers.

**Materials and Method**

The study was conducted on 450 diabetic patients ascertained from a variety of sources, attended the outpatient clinic in Baquba Teaching Hospital, their ages ranged (15-65) years, with mean age of 36.15 ± 9years, and 150 healthy non diabetic as control group who were randomly selected, during the period from May 2016 to April 2017 in Baquba city in Iraq. Patients were classified into two groups according to type of diabetes, group 1 included: (184) type 1-diabetes, and group 2: included (266) type 2-diabetes, (97) patients with foot ulcers. Swabs were taken from anterior nares, toes and axillae for each patient in the present study, the specimens were inoculated on Blood agar, MacConkey agar and Mannitol salt agar plates by streaking methods for isolation of aerobic bacteria, incubated aerobically at 37°C for 48 hour, the isolates were identified based on standard bacteriological methods(23). Isolates of *S. aureus* were inoculated on Muller–Hinton agar to isolate Methicillin resistance *S. aureus* by using Cefoxitin(30 µg and Oxacillin(1) µg. (24). Patients found to be colonized were asked to return for follow-up swabs and those with MRSA carriage.

**Statistical Analysis:** SINGLE SAMPLE Z SCORE:

This tool calculates the z score of the mean of a single sample. It can be used to make a judgment about whether the sample differs significantly on some axis from the population from which it was originally drawn.

**Results**

Patient was considered to be an *S. aureus*, MRSA and *P. aeruginosa* carrier when positive bacterial swab was cultured from the anterior nares, axillae and toes at least two separate occasions. Heavy carriage was defined as a positive direct culture, a negative culture was defined as when the microorganism could not be isolated by either direct or enrichment culture, the results as showed in Table -1/Fig1 Positive bacterial growth in type-1 diabetes were 136(22.5%), in type-2 diabetes without complications were140 (23.17%), in type-2 diabetes with complications were77 (12.74%), and 61 (10.09%) in healthy group. Table-2 explain distribution of positive bacterial growth from different regions in type-1,2 diabetes and healthy group’s. Rates of bacterial carriage in anterior nares of diabetic patients type-1 were 18(9.7%), 3(1.6%), 1(0.5%), respectively for *S. aureus*, MRSA, *P. aeruginosa*, and 40(21.6%) for other types of bacteria. Rates of bacterial carriage in type-2 diabetes with complications were 16(8.6%), 4(2.1%), 2(1%) and 12 (6.4%) respectively for *S. aureus*, MRSA, *P. aeruginosa* and other type of bacteria. Rate of positive growth of *S. aureus* carriage in healthy group were 9 (4.8%), 1(0.5%) for each MRSA and *P. aeruginosa*. In type-2 diabetes without complications were 8(6.7%), 3(2.5%), 11(9.2%) respectively for *S. aureus*, MRSA, *P. aeruginosa* and 5 (4.2%) for other types of bacteria. Rates of bacterial carriage in axillae of diabetic patients type-1 were 4(3.7%), 2(1.8%), 11(10.1%), respectively for *S. aureus*, MRSA, *P. aeruginosa*, and 25(22.9%) for other types of bacteria, where in type-2 diabetes without complications were 6(5.5%), 5(4.5%), 13(11.9%) respectively for *S. aureus*, MRSA, *P. aeruginosa* and 18 (16.5%) for other types of bacteria, Rates of bacterial carriage in type-2 diabetes with complications were 2 (1.8%), 1(0.9%) for each MRSA and *P. aeruginosa*, 3(2.8%) for other type of
bacteria. Rates of positive growth of *S. aureus*, MRSA, *P. aeruginosa*, and other type of bacteria carriage in healthy group were 3 (2.7%), 1(0.9%), 5(4.5%) and 9(8.5%) respectively as explain in table-5 and figure-1. A rate of bacterial carriage in healthy control group explains in table-6.

Discussion

Diabetes and its complications were chronic and non-healing due to several factors such as bacteria were the predominant pathogens in the diabetic infections especially ulcers (25). Our study revealed the high prevalence rate of bacterial carriage was observed especially in type-2 diabetes with complications. S. aureus was the most common bacteria of community and hospital-acquired infections that can cause morbidity and mortality, S. aureus and MRSA nasal carriage vary between diabetic patients but increased in type-2 diabetes (26,27,28). Increase risk of S. aureus and multidrug resistance bacteria especially MRSA carriage in patients with diabetes may association with many factors such as obesity, old age, in appropriate previous
antibiotics treatment and prolonged hospital stay, and state for several months, patients with MRSA frequently colonization at readmission. Almost 50% of bacterial isolates from diabetic patients with foot ulcers were *S. aureus* and two-thirds (63.4%) of *S. aureus* isolates were MRSA. 25-28 MRSA nasal carriers had previous hospital admissions for medical problems such as chronic renal failure and diabetic ulcers. Toe and axillae *P. aeruginosa* carriers was significantly higher than rate of *S. aureus* and MRSA carriers in type-2 diabetes.

**Conclusion**

We concluded increasing rates of *S. aureus*, MRSA nasal carriage and *P. aeruginosa* toe, axillae carriage in patients with type-2, may lead to a significantly increased risk of infections and complications association with diabetes type-2. The infection rates and clinical outcomes were secondary to the *S. aureus*, MRSA and *P. aeruginosa* carriers. We showed that the chance of *S. aureus*, MRSA and *P. aeruginosa* infection was significantly higher in bacterial carrier compared to non-carrier.

**Acknowledgment**

The Scientific Ethical Committee in the College of Medicine, University of Diyala and Baquba Teaching Hospital was approved that the research proposal submitted by Assistant prof. Burooj Mohammed Razooqi Al-ajjem, entitled (A comparative study between *S. aureus*, MRSA and *Pseudomonas aeruginosa* carriage in diabetic’s patients in general and those with foot ulcer in Baquba city, Diyala province). Under the scientific research with the necessary rules and regulations governing the ethics of scientific research, scientific ethical committee decided to approve the research project and give the ethical number (MD42 January 2016BMR).

ABSTRACT
Systemic hypertension is one of the causes of pulmonary hypertension (PHT) who developed heart failure with preserved ejection fraction (HFpEF). Development of PHT in HFpEF is considered as a poor prognostic factor, calls for early detection that plays an important role in decreasing morbidity and mortality in those patients. This study aimed to identify whether the global left atrial strain (GALS) % could serve as a predictive factor for increased pulmonary pressure in hypertensive patients. One hundred essential hypertensive patients of either sex with preserved left ventricle ejection fraction (LV EF% > 55%) with a mean age of (48.6 ± 6 years) classified into 74 patients with reversed E/A ratio on PW Doppler with normal tissue Doppler image (TDI) (group I) and 26 patients with normal E/A ratio on PW Doppler and reversed Eprime/Aprime on TDI (group II). One hundred sex and aged-matched healthy individuals as control (group III). These groups were subjected to detailed history, blood pressure measurements, ECG, a list of investigations and echocardiographic study considering LV EF%, LV diastolic function using PW Doppler and TDI, left atrial volume index (LAVI) calculation, LA speckle tracking and mean pulmonary artery pressure(MPAP) calculation using right ventricular outflow tract acceleration time(RVOT-AT). The results revealed that there were significant negative linear correlations between GALS% with that of E/A, E/E prime, LAVI. In addition to significant negative linear correlations between GALS% with the estimated MPAP (r= −0.47, p=0.001). Moreover, GALS% could be served as a predictor factor for the development of pulmonary hypertension in hypertensive patients since it is strongly correlated with increased pulmonary pressure.

Keywords: Pulmonary hypertension; Systemic hypertension; Speckle tracking echocardiography.

Introduction
Pulmonary hypertension (PH) is a pathological hemodynamic condition defined as an increase in mean pulmonary arterial pressure (MPAP) ≥ 25mmHg at rest1. One form of PH is post-capillary PH which is most commonly results from left heart disease (LHD) which accounting about 65–80% of the cases2. Systemic hypertension (HT) is one of the causes of PH due to LHD in patients with heart failure with preserved ejection fraction (HFpEF)3. Patients with longstanding hypertension having HFpEF, the diastolic dysfunction can trigger pulmonary hypertension4.

PH can develop in LHD in response to a passive backward transmission of the effect of elevated filling pressure, mainly driven by left ventricle (LV) diastolic function and its outcome on left atrial (LA) compliance5.

Reason for LA dysfunction in hypertensive patients is explained on the bases of chronic pressure exposure of the LA. In early hypertensive disease, LA stretching causes a temporary enhancement of LA pump function. When compliance is lost and contractility decreases the LA pressure rise with the reduction of reservoir and conduit functions6. In a later stage, the LA mechanics depressed with the resultant backward pressure on the pulmonary circulation the causative factor for the development of pulmonary hypertension in hypertensive patients7.

One of the new sensitive techniques in the evaluation of LA function is Speckle tracking echocardiography (STE) that may provide additional data in pulmonary hypertension and in the preclinical detection of high-risk patients8.
This study aimed to identify whether the global left atrial strain (GALS) % could serve as a predictive factor for increased pulmonary pressure in hypertensive patients with preserved ejection fraction.

Subjects and Methods

This case-control study was conducted at Department of Echocardiography and Catheterization/Baghdad Teaching Hospital – Medical city, Baghdad, Iraq. It included one hundred patients with essential hypertension of either sex with an age range from 35 to 55 years old (48.6 ± 6 years) with preserved EF% (EF) > 55%). The patients classified into two groups according to the PW and TDI results. One hundred sex and aged-matched healthy individuals were recruited as a control group III. Patients with diabetes mellitus, ischemic heart disease, valvular heart diseases, primary pulmonary disease, renal failure, thyroid diseases, LV systolic dysfunction, infiltrative cardiac disease, SLE, smoking, obesity, cardiomyopathy, hyperlipidemia, atrial fibrillation and Patients with poor echocardiographic images were excluded. Medical history, recent CXR and ECG were evaluated in addition to the blood pressure measurements according to the American Heart Association guideline for blood pressure measurements9 using Rossmax MG150f Digital blood pressure monitor sphygmomanometer.

A standard 2-D and Doppler echocardiogram was performed according to standardized protocol of American Society of Echocardiography (ASE) and the European Association of Echocardiography recommendations 2015 using a 3.5 MHz transducer with commercially available equipment (Philips CX 50 ultrasound, USA machine). The LV ejection fraction was calculated according to the Teichholz M-mode formula10. Transmitral PW Doppler and TDI of the lateral mitral annulus was considered to calculate (E), (A) and (E prime) velocities11. While, the LA volume was measured by the biplane area-length method, then the reading was indexed to body surface area to calculate LA volume index12. Whereas the mean pulmonary pressure (MPAP) was calculated by using Right ventricular outflow tract acceleration time (RVOT-AT) using the following formula:

$$MPAP = 90 - (0.62 \times RVOT-AT)^{13}.$$  

LA Speckle-tracking echocardiography was obtained from apical four and two-chamber views during end-expiratory breath-hold and stable ECG recording using offline QLAB-CMQ software program14. The endocardial surface of the LA was traced manually by a three-point-and-click approach. The region of interest was thus created, and this was manually adjusted. The LA myocardium divided into six segments and the global longitudinal strain calculated for each view. However, the strain values are averaged and the measurements were obtained through three consecutive cardiac cycles15.

Results

The studied samples were categorized into three groups with a mean age of 48.6 ± 6 years according to PW Doppler and PW-TDI results as:

Group I: Consist of 74 (74 %) hypertensive patients of either sex; 31 men and 43 women with reversed E/A ratio on PW Doppler and normal E prime/A prime ratio on PW tissue Doppler.

Group II: Consist of 26 (26%) hypertensive patients of either sex; 10 men and 16 women with normal E/A ratio on PW Doppler and reversed E prime/A prime ratio on PW tissue Doppler.

Group III: Consist of 100 healthy subjects of either sex; 39 men and 61 women served as a control group.

Table 1. reveals that the studied groups were matched regarding age, BMI and BSA (P > 0.05). Moreover, the higher percentage of hypertension were reported in females (61%) in respect to males (39%) while, there were significant difference regarding the duration of hypertension ((P = 0.005) with a longer disease duration (8.5 ± 4 years) and a higher percentage of uncontrolled hypertension (84.6 %) recorded in Group II. In addition, there were a significant difference within groups in the systolic blood pressure (155 ± 15) mmHg in group II. Whereas there were significant differences between the diseased groups and the control regarding diastolic blood pressure being higher in group II (89 ± 7) mmHg.

Table 3 shows a significant difference within the groups being the largest LAVI (32 ± 1ml/m²), the shortest acceleration time (93 ± 6 ms) and a highest MPAP (31 ± 4 mm Hg) reported in group II.

In addition, the correlations show significant negative linear correlations between GALS% with that of E/A (r= -0.55, p=0.001), E/E prime (r= -0.573, p=0.001) and LAVI (r= -0.57, p=0.001). Moreover, figure 1 demonstrates a significant negative linear correlation between GALS% with that of estimated MPAP (r= -0.47, p=0.001).

LAVI=Left atrial volume index, RVOT-AT=right ventricular outflow tract acceleration time and MPAP=mean pulmonary artery pressure; GALS=Global atrial longitudinal strain.
In this study hypertension reported the higher percentage in female patients (61%) is correlated with the findings of other studies \textsuperscript{16,17}. In contrast to the study of Hajjar I. et al\textsuperscript{18} where they reported only 28.7% among females in respect to the higher percentage of the disease in males. These differences may be attributed to several factors such as race, obesity, socioeconomic status, level of education, and lifestyle modifications.

The systolic, diastolic blood pressure were correlated to Xu et al\textsuperscript{16} while both systolic and diastolic being higher in this study when compared with Maryam et al\textsuperscript{19}. These differences may be attributed to that most of the patients in this study were with uncontrolled blood pressure (more than two- thirds of group I and 84.6% of group II).

The diastolic function of group I patients revealed that a reversed E/A ratio with normal E/E prime ratio (signs of Early diastolic dysfunction (DD)) while in group II patients, the higher E velocity and E/E prime ratio (further worsening of diastolic function). These differences in the diastolic function could be attributed to hypertension that affects LV relaxation and the decreases in LV compliance too. In addition to longer duration of the disease that worsens the diastolic function where the duration of hypertension in group I was (5.5 ± 4 y) while in group II (8.5 ± 4 y) which was matched with other studies\textsuperscript{16,20,21}.

These DD were significantly correlated with GALS % which were comparable with the Miyoshi et al\textsuperscript{22}, where they found that there was a significant correlation between LV diastolic dysfunction E/E prime and reduced LA systolic strain (P < 0.001). These finding can be attributed to the negative impact of LV diastolic dysfunction on the LA function.

The increasing LA volume index in the diseased groups being higher in group II are matched with Chen et al\textsuperscript{23}. These changes in LA volume reflects sub-acute or chronic DD that occurs in parallel with the degree of LV diastolic dysfunction which results in increasing the filling pressure and its effect on LA function and volume.

The results in this study revealed reduced GALS% value despite the normal LA volume measurements which was in similar with the other studies\textsuperscript{16,24,25}. These findings reflect the valuable usefulness of LA speckle tracking echo technique in detecting early LA changes. Furthermore, the results of GALS% in this study (32 ± 1.5% in group II) were better than that reported by Hennawy et al\textsuperscript{24}(24.00 ± 6.92%). This could be explained on the bases that the patients in this study are younger and without risk factors like smoking and diabetes mellitus.

The result of this study revealed that the shorter the acceleration time the higher the MPAP. Furthermore, the GALS% correlated well with MPAP in this study which was in concordance with other studies\textsuperscript{26,27}.

**Conclusion**

The GALS% could be served as a predictor factor for the development of pulmonary hypertension in hypertensive patients since it is strongly correlated with increased pulmonary pressure.

Assessment of Hormonal Changes in Female Patients with Migraine

Mufeed Akram Taha¹, Esraa Abdulkareem Mohammed²

¹MBChB, FIBMS Neurology, Department of Medicine, ²MBChB, CABOG, FICOG, Head of Gynecology and Obstetrics Department, College of Medicine, University of Kirkuk, Republic of Iraq

ABSTRACT

Background: Migraine is a common neurovascular disorder in Iraq. Hormonal effect in migraine headache and severity is proved by many authors although the mechanism of hormonal effect in pathogenesis of migraine in women is still unknown.

Objectives: To find out the role of hormonal changes in development of different types of migraine among women.

Materials and Method: The design of current study was cross sectional which carried out in outpatient clinics of Neurology and Obstetrics & Gynecology departments of Teaching Hospital in Kirkuk city for duration of 1st of January to 31st of December, 2018 on sample of 100 women with migraine. Fourteen women were diagnosed as migraine with aura (MA) and 86 women were diagnosed as migraine without aura (MWA). The estradiol, progesterone, leutinizing, follicular stimulating and prolactin hormones were assessed and according to menstrual phases.

Results: The progesterone hormone mean in both phases (follicular and luteal) was significantly higher among female patients of MWA. The estradiol hormone level at luteal phase was significantly higher among female patients having MWA. The estradiol hormone level at follicular phase was significantly higher among female patients with mild MWA. The mean prolactin hormone was significantly increased with increase in severity of MA and MWA.

Conclusion: The changes in reproductive hormones had a prominent role in development and severity of migraine in women, mostly migraine without aura.

Keywords: Hormonal role, Migraine with aura, Migraine without aura.

Introduction

Migraine is defined as a common neurovascular disease in which the trigeminovascular system is affected mainly. It is a predominant disorder of women with more prevalent migraine symptoms, severity and complaining than men with incidence rate in women of 43% and in men 18% ⁴. Migraine is highly related to sex hormones ⁵,⁶. In Iraq, the main reported risk factors for migraine are psychological upset, stress and excessive physical activity with no profound effect for sex hormones ⁷. However, current Iraqi literature reported significant correlation between sex hormones and migraine ⁶. The onset and severity of migraine in early adulthood of women are dependable on hormonal changes. Migraine attacks women are mostly observed 48 hours prior menstrual bleeding in earlier 72 hours of menses⁸,⁹. The menstrual migraine attacks are explained by decline of estrogen level at late luteal phase ⁹. The migraine is very severe with long duration attacks and not easily treated in younger age women ¹⁰ and about 60% of women with migraine had exacerbated headache attacks around menses time ¹¹. The migraine attacks related to menses are called menstrual migraine.

which are MWA that represented 10-15% of cases, while migraine with or without aura occurs during other times of the cycle 12, 13. The definite mechanism of migraine and role of sex hormones is unknown. It was shown that alterations in cerebral perfusion were related to sympathetic nervous system 14. The effect of estrogen and progesterone hormones is obvious through expression of their receptors in cortical and subcortical regions of the brain 15. The estrogen withdrawal theory is explaining decreased serotonin level as subsequently, the cranial vessels may be dilated and trigeminal nerve may be stimulated that would influence attacks of migraine 14, 16. The pregnancy lead to high levels of estrogen and progesterone with less incidence except for migraine with aura which worsens during pregnancy 14. During the period of perimenopause and menopause, the hormones alterations affect migraine without aura 17. The incidence of migraine attacks are increased during this period. Estrogen levels are variable and increased with high receptor expression than normal in this period. After menopause, the migraine attacks decreased and sometimes diminished. This decrease is might be related to declined levels of estrogen 14. The migration attacks observed at postmenopausal period are often related to hormone replacement therapy 13. The steadily increase in number of women with migraine attending to public health clinics with high application of health care facilities represent a big burden on health status in Kirkuk city. The objective of current study was to find out the role of hormonal changes in development of different types of migraine among women.

Material and Method

The design of present study was cross sectional that was carried out in outpatient clinics of Neurology and Obstetrics & Gynecology departments of “Azadi Teaching Hospital in Kirkuk city” in duration of 1st of January to 31st of December, 2018. Study population was all women in reproductive age group (15-45 years) presented with migraine attended to Neurology outpatient clinic. Women in reproductive age group (15-45 years) presented with migraine were the inclusion criteria. The exclusion criteria were patients on chronic hormonal therapy, oral contraceptive pills, pregnant or puerperal period, patients with premature menopause, patient with polycystic ovarian syndrome and women with irregular menstrual cycle. A sample of 100 women with migraine was included in the study. Fourteen women were diagnosed as migraine with aura and 86 women were diagnosed as migraine without aura. Ethical considerations were obtained from Helsinki Declaration by informed consent taken orally from the women before inclusion in the study, approval on study was acquired from hospital authorities and the researcher was responsible in monitoring and managing selected women. After full neurological history and examination, the diagnosis of migraine was carried out according to International Headache Society 2004, 18 and migraine cases were classified to MA women and MWA, then they had been sent for Gynecologist to determine the phase of menstrual cycle and for evaluation of hormonal assessment. All women were assessed for migraine severity by Migraine Disability Assessment (MIDAS) Questionnaire 19. A Blood sample 10ml was withdrawn from all women during migraine attack after taking history of which phase of menstrual cycle, and then sent for serum Estradiol, Progesterone, LH, FSH and Prolactin hormone. Progesterone, Prolactin, Estradiol, FSH and LH blood levels were measured by Cobas e 411 which is trade mark of Roche. Normal value for Progesterone (Follicular 0.2-1.5ng/ml, Luteal 1.7-27.0ng/ml, Ovulation 0.8-3ng/ml, Menopause: 0.1-0.8ng/ml). Normal value for Estradiol(E2) (Follicular phase:173-315pg/ml, Ovulation phase:317-525pg/ml, Luteal phase:294-752pg/ml, menopause:51.6-314pg/ml. Normal value for FSH (On follicular =3.5-12.5mlU/ml, and on ovulating =4.7-21.5mlU/ml, while for luteal =1.7-7.7mlU/ml, menopause: 25.8-134.8mlU/ml). Normal value for LH (On follicular=2.4-12.6 mlU/ml, on ovulating =14.0-95.6 mlU/ml, while for luteal =1.0-11.4mlU/ml, postmenopause:7.7-58.5mlU/ml). Normal value for Prolactin in women:4.79-23.3ng/ml. The data collected were analyzed statistically by SPSS software version 20. Fischer’s exact test, independent sample t-test and one way ANOVA analysis were applied for analyzing the data as suitable. Level of significance (p value) was regarded statistically significant if it was 0.05 or less.

Findings

This study included 100 female patients with acute attack of migraine; 14 female patients had MA and 86 female patients had MWA. The age of patients for both migraine groups was not significantly different (p=0.7); prevalent age for women with MA was 30-39 years (35.7%), while prevalent age of women with MWA was 30-39 years and ≥40 years group (41% and 41%, respectively). (Table 1)

As shown in Table 2, the progesterone hormone mean in both phases (follicular and luteal) was significantly higher among female patients of migraine without aura (p<0.001 and p=0.001, respectively). At follicular phase, there was no significant differences between women having MA and those women having MWA regarding
estradiol (p=0.1), LH (p=0.7) and FSH (p=0.8). The estradiol hormone level at luteal phase was significantly higher among women having MWA (p<0.001). In same direction, the LH level at luteal phase was significantly higher for women with MWA (p=0.01). At luteal phase, THE FSH level was no significantly different between women having MA and women having MWA (p=0.5). The prolactin hormone level was significantly higher among women having MA (p<0.001).

As shown in Table 3, the reproductive hormone levels (progesterone, estradiol, LH and FSH) at both phases were not significantly related to different severity classifications of MA. The mean prolactin hormone was significantly increased with increase in severity of MA (p=0.01).

Reproductive hormone levels (progesterone, LH and FSH) at both phases were not significantly related to different severity classifications of MWA. The estradiol hormone level at follicular phase was significantly higher among women with mild MWA (p=0.006), while estradiol hormone level at luteal phase was not significantly different according to severity classification of migraine without aura (p=0.7). The mean prolactin hormone was significantly increased with increase in severity of migraine without aura (p<0.001). (Table 4).

Discussion

In recent literatures, it was shown that headache features, anatomical picture of central nervous system and functional magnetic resonance imaging findings differ according to sex of patients. Despite the multifactorial causes of sex differences in migraine, an acceptable evidence confirms the role of hormones in development of migraine. Present study showed significantly higher progesterone, estradiol and luteinizing hormones levels for migraine patients without aura specifically at luteal phase. These findings are consistent with results of Sacco et al study in Italy and Brandes study in USA which documented the relationship between sex hormones migraine without aura specifically at luteal phase. Many authors indicated that headache particularly in migraine is more common among women in reproductive age period. The effect of sex steroid hormones on development and severity of migraine extended to men also; as a study conducted in Netherlands found that estradiol sex hormone was increased in normal weight males with migraine with evidence of androgen deficiency. Gupta et al stated that although the steroid sex hormones were not obviously involved in development of migraine in women, these hormones were proved to act as modulators for multiple mechanisms lead to enhancing and increasing intensity of migraine such as neuronal stimulation by increasing calcium ions and decreasing magnesium levels, the synthesis with release of nitric oxide and neuropeptides and vessels dilation caused by receptors influence. Our study showed a significantly lower level of prolactin hormone among women with MWA as compared to women with MA. Current study carried out in Iraq by AlGawwam found a significantly higher prolactin hormone level in women with migraine as compared to women but with no significant difference in prolactin level between aura and without aura migraine types. This inconsistency from our findings is explained by low number of enrolled women in AlGawwam study (20 women) as compared to our study. Higher levels of prolactin hormone among migraine patients with aura interfere and inhibit estradiol and progesterone hormones. Regarding severity of migraine, current study showed that prolactin hormone level was significantly increased with increased severity of both migraine types (with and without aura). This finding coincides with results of Cavestro et al study in Italy which reported that

prolactin hormone is adjunctive worsening factor for migraine but it could be easily eliminated. Higher level of estradiol hormone in present study showed a significant relationship with mild severity of migraine patients without aura. Consistent with our findings, MacGregor study in UK which reported that lower level of estradiol hormone in perimenopausal women with migraine lead to severe symptoms 30.

**Conclusion**

The changes in reproductive hormones had a prominent role in development and severity of migraine in women, mostly MA. The estradiol had a profound effect on severity of migraine without aura while prolactin hormone was effective on severity of both migraine types.

Evaluation of the Incidence of Abortion in Babylon—
An Epidemiological Study

Nada Kadhum Kareem¹, Nagham K. Tayeh²

¹Department of Gynecology and Obstetrics, Al-Mahaweel General Hospital, Babylon, Iraq; ²Department of Gynecology and Obstetrics, Fatima Al-Zahraa Administrative Hospital, Baghdad, Iraq

ABSTRACT

Objective: study the incidence of abortion in Al-Mahaweel General Hospital, and determine it types.

Method: A cross sectional study was conducted from January 2018 to December 2018 at the Department of gynecology and obstetrics, Al-Mahaweel General Hospital, Babylon directorate. A sample of 230 patients included in this study.

Results: During the follow-up period a total of 1256 cases was admitted, leading to incidence of 183.12 (95%CI: 180.98–185.26) cases with abortion per 1000 women, the most common age group was 21 – 30 years (50.9%), the majority of cases came from rural residency (77%), and incomplete abortion was the most common with 89.9% of the cases.

Conclusions: The incidence of abortion was 183.12 per 1,000 pregnancy, indicating a higher rate of abortion in Babylon directorate, the majority of abortion due to incomplete abortion.

Keywords: abortion, incidence, age, residency, Babylon

Introduction

Uterine evacuation is an integral part of obstetric and gynecologic care, not only for elective pregnancy termination, but also in the management of spontaneous abortion, intrauterine fetal demise, retained products of conception, and gestational trophoblastic neoplasia. The choice of technique for uterine evacuation depends more upon uterine volume and operator experience than the underlying indication for the procedure¹².

The estimated worldwide rate for abortion from 2010 to 2014 was 35 per 1000 women ages 15 to 44; the rate in developed countries was 27 per 1000 and in developing countries was 37 per 1000³. The highest rate was in the Caribbean (65 per 1000) and the lowest rate was in North America (17 per 1000) and Northern or Western Europe (18 per 1000). An estimated 25 percent of pregnancies worldwide ended in induced abortion⁴.

First-trimester aspiration abortion is a safe procedure, with an overall complication rate of 9.05 per 1000. Major complications (suspected perforation, ectopic pregnancy, hemorrhage, sepsis) are very rare (0.71 per 1000)⁵. The overall mortality rate associated with legal abortion in the United States is 0.7 per 100,000, with markedly reduced rates at lower gestations (0.1 per 100,000 at <8 weeks, 0.2 per 100,000 at 9 to 10 weeks, and 0.4 per 100,000 at 11 to 12 weeks). In the first trimester, infection is the most common cause of abortion-related mortality (31 percent), with anesthesia complications accounting for 22 percent and hemorrhage accounting for 14 percent of deaths⁶.

In Iraq legal indications for induced abortion were either certain severe maternal diseases or fetal anomalies that are incompatible with life and in the absence of such legal indications, abortion is called illegal induced abortion which is regarded unsafe, even when it is performed by clinical practitioner⁷. The objective of the current study to study the incidence of abortion in Al-Mahaweel General Hospital, and determine it types.

Method

Setting: A cross-sectional study was conducted from January 2018 to December 2018 at the Department of gynecology and obstetrics, Al-Mahaweel General Hospital, Babylon directorate. A sample of 230 patients included in this study who attended Al-Mahaweel General Hospital due to abortion. Maternal age, residency, and type of abortion were collected from the patients.

Physical examination and ultrasound

Physical examination includes:
- Vital signs
- Gestational age estimated by uterine size on pelvic examination
- Uterine flexion assessment by pelvic examination and/or ultrasound
- Cardiac and pulmonary physical examination

Ultrasound is also used if ectopic pregnancy or early pregnancy loss is suspected, if uterine tenderness is present on physical examination, the clinician should evaluate for uterine infection and treat appropriately.

Antibiotic Prophylaxis: All women offered antibiotic prophylaxis to prevent infection for patients undergoing first-trimester uterine aspiration abortion, the regimen consisted of Metronidazole (500 mg IV three times per day), with Gentamicin (5 mg/kg IV) with or without vancomycin (15 mg/kg IV), and after discharge Metronidazole (500 mg orally) and ciprofloxacin (500 mg orally)8.

Statistical Analysis

Discrete variables presented using there number and percentage, 95%CI of the prevalence was calculated using the formula:

$$95\% \, CI = p \pm Z\sqrt{\frac{p(1-p)}{n}}$$

In which $p =$ prevalence of the disease, $q = 1 - p$, $z$ is normal score distribution, $\alpha = 95\%$, $n =$ total sample size. SPSS 22.0.0 (Chicago, IL), software package used to make the statistical analysis, $p$ value considered when appropriate to be significant if less than 0.05.

Result

During the follow-up period a total of 1256 cases was admitted, leading to incidence of 183.12 (95%CI: 180.98 – 185.26) cases with abortion per 1000 women, the most common age group was 21 – 30 years (50.9%), the majority of cases came from rural residency (77%), and incomplete abortion was the most common with 89.9% of the cases, as illustrated in table 1.

Discussion

Abortion whether it is spontaneous or induced, is one of the determinants of pregnancy wastage. In Iraq abortion was the fourth most common cause of hospitalization in 2005 and ranked as the fourth disease in the list of the top ten leading causes of morbidity in 20077.

In the current study the incidence of abortion was 183.12 (95%CI: 180.98 – 185.26) cases with abortion per 1000 women, which was in agreement with previous Iraqi study with 177.6 abortion per 1000 pregnancy7, it was slightly higher than the incidence reported in India in 2015 with a rate of 144·7 pregnancies per 1000 women aged 15-49 years8. However it was higher than the incidence reported in US in 2014 the abortion rate was 14.6 abortions per 1,000 women aged 15–44, while in 1995 it was 22.5 abortions per 1,000 women10. And lower than Malawi, in 2015 the incidence was 38 abortions per 1,000 women aged 15-4911, and also higher than reported in Congo with abortion rate of 56 per 1,000 women aged 15-4912.
involved 1069 country-years the incidence for 1990 to 2014 of abortion the incidence was 35 abortions (90% uncertainty interval [UI] 33 to 44) occurred annually per 1000 women aged 15-44 years worldwide in 2010-14\textsuperscript{3}.

In the present study the most common age group was 21 – 30 years, our finding was in agreement with Jones and Jerman study which showed that women aged 20 to 24 years accounted for the largest share of abortions and also had the highest abortion rate: 28.0 per 1000. The second highest abortion rate was among those aged 25 to 29 years: 22.8 per 1000\textsuperscript{13}, and in agreement with Alvey et al with more than half of all abortions (58%) were obtained by women aged 25 years or older, followed by women 20 to 24 years old (31%)\textsuperscript{14}.

**Conclusions**

The incidence of abortion was 183.12 per 1,000 pregnancy, indicating a higher rate of abortion in Babylon directorate, the majority of abortion due to incomplete abortion.

**Conflict of Interest:** None

**Ethical Clearance:** Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the gynecology and obstetrics, Al-Mahaweel General Hospital.

A Morphological Comparative Study for the Species of Caryophyllaceae in Middle and North of Iraq

Naglaa M. Al-Abide¹, Abbas N. Al-Tememe¹
¹University of Tikrit, College of Education for Pure Sciences, Department of Life Sciences

ABSTRACT

In this study, 12 species were studied within 8 species belonging to the Caryophyllaceae family in central and northern Iraq. The study examined the similarities and differences in the morphological characteristics of the roots, stems, leaves, flowers, fruits and seeds. The study showed that Stellaria media was the longest species with a length of 74.6 cm. The longest roots appeared in the type Spergularia rubra was 26.35 mm and the lowest root length was in the type Stellaria media of 5.6 mm. The parasites in the legs was the most in the type of Saponoaria officinalis and 10.3 cm, and characterized the papers in the species under study being simple. Simple Blades Not divided or fragmented. Cauline leaves, in the form of sessile leaves, do not have a pregnant and arranged opposite. The opposite of the two bases is the two sides of the joint, which are bound together with a part of the salami containing the enzymes. The leaves differed in terms of blade shapes, peaks and base, but they were similar on the edge of the blade. As it was flat and smooth. Entire and the highest rate of the length of the blade in the type Spergulariarubra was 52.7 mm and was the lowest in the type Sagina petala and 11.8 mm, and resembled flowers in all species under study in terms of forms, consisting of 5 leaves petals composition, and varied in colors. Solitary or massively aggregated. The difference in the shape of the fruits in the species under study was elliptic in Cerastium perfoliatum, Sagina petala, Sagina saginoides, Spergularia rubra and Stellaria media capsule in Cerastium dichotomum, while the seeds showed clear differences in dimensions and shapes and inscriptions was the longest in Vaccaria Hispanica and 148.9 micrometres in Sagina saginoides, 33.5 micrometers. The seed of the Cerastium perfoliatum was characterized by a seeded wing that was not observed in other species. Its surface inscriptions were fine-reticulate in Saponaria officinalis, Stellaria media, Telephium imperatic and Sagina saginoides and Spergularia rubra Vaccaria hispanica and free of inscriptions in Vaccaria saginata.

The study included 12 species of pink family spread in central and northern Iraq:

Cerastium dichotomum, Cerastium perfoliatum, Minuartia picta, Sagina petala, Sagina saginoides, Saponaria officinalis, Spergularia marina, Spergularia rubra, Stellaria media, Telephium imperatic, Vaccaria hispanica, Vaccaria saginata.

Keywords: phenotypic study, plant, pink family

Introduction

The Caryophyllaceae family is one of the most widespread plant families whose plants grow in the temperate regions of the North and South Iraq. Their spread extends towards the poles and in the Mediterranean basin.¹⁾ It has an annual, double or perennial herbaceous plants, rarely in the form of trees or shrubs.²⁾ The family of the pink family is divided into three sub-families namely Paronychioideae, Alsinoideae and Caryophylloideae, comprising 11 clans.³⁾ Globally, 88 species and 2200 species and they have in Iraq ⁴⁾ 23 genera and 145, and the plants of the family pink is part of the trade of flowering cultured in the world, including varieties of flowering plants such as plant Stellaria media, known as chickpeas, and Cerastiumerastoides plant known as grass. The mouse and the spp plant Saponaria and is known as soap plants ⁵⁾, and noted ⁶⁾ Stellaria media L. Medical used to stop the secretion of milk and diuretic and tonic and healing wounds and housing for pain and rheumatism and treatment of itching, such as eczema and respiratory infections as medical countermeasures. For asthma, I found ⁷⁾ through the chemical survey in the root, leaves and flowers of the type Stellaria media L. contained (Vaccaria hispanica)⁸⁾, while (Vaccaria hispanica) contain flavonoids in Spergularia marina and Vaccaria hispanica... ⁹⁾
Materials and Method

The morphological study was based mainly on the soft plant samples collected through field trips to central and northern Iraq, including Arbil, Sulaymaniyah, Kirkuk and Tikrit, which reached 30 trips in all between November 2017 and June 2018. Many plant samples were collected during flowering and composition and in neighboring countries. The soft samples were stored with a FAA solution consisting of one volume of foams and three volumes of cell acid. The sample was analyzed using the dissecting microscope and the Olympus composite microscope and it was also analyzed using the ocular microscope and the stage microscope.

Results and Discussion

The study showed that, the nature and durability of the studied species which are of annual nature except Telephium imperatic and Saginasaginoides which were perennial. However, while the, Spergularia marina was of a biennial nature.

The detailed study of the root, stem, leaves, surface covering, floral systems, flowers, fruits and seeds are presented in Table 1 and Figure 1.

The study showed the roots of the tap root system, varied in length and secondary roots, and differed in the nature of the branches were very forked in Telephium imperatic and short in the types Saginasaginoides and Spergularia marina and Vaccaria hispanica while the highest rate of length F.

The roots of Spergularia rubra were 26.35 mm in length and the lowest in Stellaria media which was 5.6 mm. The other species ranged between the two extremities. The dimensions of the legs legs showed variations in the types studied in dimensions as shown in Table 1. With the previous characteristics ranging from 2.4 cm in Minuartiapicta and 10.3 cm in the type Saponoaria officinalis and between these two values in the other species, and in the direction of growth of the stem were all types studied upright and Erect list except the types Stellaria media and Saginasaginoides.

The overcoat on the leg was all booed Glabrous except the species Spergularia rubra, Saponoaria officinalis, Cerasiumdichotomum and Cerasiumperfliatium which were of the villous type.

The variability of capillary variability in the species under study according to its prevalence, nature, density, color and dimension according to species is, as shown in (Table 2).

The Table, showed two groups in the species: Glandular species in dichotomum Vaccariasagetalis, Cerasiumperfliatium, Spergularia rubra, Saginaapetala, and Telephium imperatic Saponoaria officinalis and Cerasiumdichotomum and Saginasaginoides and Cerasiumperfliatium and Saginaapetala and Spergulariamarin. as showed variation in its dimensions, it was found that more hairs in length were leg of the type Cerasiumdichotomum reached 73.3 micrometers and the shortest was in the bristles leg of the type Telephium imperatic reached 10.5 Micrometer while its length ranged In other types between these two extremes, with the largest diameter of the filament was in full swing type Saginasaginoides reached 2.8 micrometers and less in diameter were Rite leg type Spergularia rubra 0.7 micrometers.

The leaves were generally different in terms of dimensions, peaks and base, and their leaves were stemmed in Spergularia rubra, Vaccaria hispanica, Telephium imperatic, Stellaria media, Saginasaginoides, Saginaapetala, Vaccaria Sagetalis, Cerasiumperfliatium and Spergularia marina. But, they differed at its peak and they were between sharp in Spergularia marina and Vaccaria hispanica and pointed in Cerasiumperfliatium and Saginasaginoides and ovarian in Stellaria media and Saginaapetala, while the basal leaves were in the forms of blades Blades were Oval Ovate in Cerasiumdichotomum and Saponoaria officinalis and Telephium imperatic and Stellaria media and bar Liner in Cerasiumperfliatium and Saginaapetala and MottiPectinate in Minuartiapicta, Saginasaginoides and elliptic in Spergularia rubra, Vaccaria hispanica, Vaccariasagetalis and cylindrical in Spergularia marina.

The flowers in all the species under study were characterized by a pediculate of the two species of Hermaphroditic. The floral systems in the studied species had a determinate system of four groups. One was simple-determinate in Cerasiumdichotomum, Saginaapetala, Spergularia rubra, Cerasiumperfliatium, Monoclonal antibody, spergulariamarin, Saginasaginoides, monocytogenes, Boragoid cyme, Saponoaria officinalis, Minuartiapicta, simple dichasium cyme in Telephium imperatic, and bioluminescence compound dichasium cyme in the Vaccaria hispanica and Vaccariasagetalis..
The fruit of the species under study was Table 3 as dry-Dehiscent and a capsule from a high ovum composed of three carbels united by Teeth at the top, while different shapes, dimensions and colors were formed between elliptic fruits in Cerastiumperfoliatum Saginasaginoides, Spergulariarubra, Stellaria media, extensive ovarian species in Minuartia Picta, the fruits of Urceolate in Vaccariahispanica, Spergularia marina, cylindrical Vaccaria Sagetalis, capsule fruits in Cerastium dichotomum, and fruit of Sorosis in Telephiumimperatic, officinalis, and for its dimensions has reached its longest 33 mm in the type Telephiumimperatic and was the shortest in the type Cerastiumperfoliatum and reached 6.4 μm and the rest of the species between these two dimensions, the presentation was the highest recorded in the type Minuartiapicta of 18.6 mm and 2.7 mm in the type Saginasaginoides and ranged in other types between These two values, while the fruit contained the coating properties in Cerastiumperfoliatum, Saginaapetala, Saponoariaofficinalis, Cerastiumdichotomum, Telephiumimperatic and Spergulariarubra, was not observed in other species under study.

The fruits were showed a difference in color in the dark green color of Spergularia marina, Spergulariarubra, Telephiumimperatic, olive oil in Saginaapetala, Cerastiumdichotomum, Cerastiumperfoliatum, reddish green inSaponoariaofficinalis, Stellaria media, yellowish green in Saginasaginoides and Vaccariahispanica and pale green in Minuartiapicta And Vaccariasagetalis, but the pale green color is the most common in the species under study before the season of open fruit season and will soon to change color with environmental conditions.

The seeds were in miniscule species with different shapes and dimensions depending on the species (. Table 4), in addition to the differences in the nature of the seed surface and color from one species to another. Seed forms are important diagnostic traits. Ovoid ovals appeared in Saginasaginoides and Spergulariarubra, Stellaria media, Circular Circulation in Cerastiumdichotomum, Cerastiumperfoliatum, Minuartiapicta, Telephiumimperatic, Vaccariahispanica, Reniform in Saginaapetala, Saponoariaofficinalis, Spergularia marina and iglagic in Vaccariasagetalis..

The colour was showed a difference in color was the color of light brown to yellowish orange - in Stellaria media and Cerastiumperfoliatum and Telephiumimperatic, light yellow to in brown-yellow in Vaccariasagetalis and dark yellow color of orange in Minuartiapicta and Saponoariaofficinalis and olive green-olive in Spergulariarubra, dark-brown color in Spergulariamarain and Saginaapetala in red-light red in Vaccariahispanica, Cerastiumdichotomum and Saginasaginoides.

Vaccaria Hispanica was the longest in the world, with a length of 148.9 μm followed by Spergularia Marina with 105.3 micrometers, while the Saginasaginoides were the shortest and were and 33.5 micrometers in length. The other seeds ranged between these two extremes. The seeds were wider in Stellaria media, (165.4 micrometers),Telephiumimperatic, (96.3 micrometers),and the lowest in saponoariaofficinalis, 13.05 micrometers, and the other species ranged between these two extremes.

Conclusion

Our results concluded that, the Caryophyllaceae family that cultivated in central and northern Iraq that contain many species that, we can differentiated between this species from the characters of the roots, leaves, legs, stems, flowers, fruits and seeds. and its shape that have characters differ from species to another species.

Evaluation of the Main Minerals in Osteoporosis Patients: Calcium, Phosphorus, Vitamin 25 (OH) D and Alkaline Phosphatase as a Case Study

Najlaa Kadhim Ali

College of Medicine, Department of Physiology, University of Kirkuk, Kirkuk, Iraq

ABSTRACT

Background: Osteoporosis is a growing public concern of elderly persons. It is a disease characterized by low bone mineral density (BMD) which is a direct consequence of fractures. Therefore, Osteoporotic is the primary cause of disability. However, despite being studied intensively throughout the past decades, there still many concerns about its etiology that need to be investigated.

Method: 100 female patients aged 40-80 years old are enrolled in this work. Separately, all these patients are those who referred to rheumatology units/Azadi teaching hospital in the Kirkuk city for eighteen months (from February 2015 to July 2016). Half of them had osteoporosis confirmed by Dual Energy Xray Absorptiometry (DEXA-Scan), whereas the remaining patients were controls. We measured the mineral vitamin D, calcium (Ca), phosphorus and alkaline phosphatase in the sera of the entire participant.

Results: One hundred women participated in this work with the mean age of (61.0 ± 10.2) years were studied. 50% of them were in the control group, and 50% of them had osteoporosis. Age of osteoporosis group (61± 10.2) was significantly higher than control groups (56 ± 9.0) years. Additionally, Body Mass Index significantly higher (p < 0.001) in osteoporosis (29.1 ± 5.9) compared to the control group (28.9 ± 3.4).

Conclusion: We conclude that there is no greater association among serum Calcium, Phosphors and alkaline phosphates with BMD. Additionally, the results showed a positive association between vitamin 25 (OH) D levels and age.

Keyword: Osteoporosis; Vitamin 25 (OH) D; Calcium; Phosphorus; Alkaline Phosphatase.

Introduction

Osteoporosis disease, by definition, is deemed as a common metabolic bone issue. As mentioned earlier, it is qualified by BMD, microarchitectural disruption of bone tissue and loss of bone mass. As a consequence, increases the risk of fractures which are the primary outcome of this illness (1)(2). Fractures of osteoporotic, the vertebra mainly, are common in the elderly and result in grief morbidity and mortality following minimal trauma (3). Consequently, this disease became a significant public health concern which is rapidly prevailing, particularly among Asians elderly persons as they live longer (4),(5). Osteoporosis mainly caused by lack of physical stress applied to bones which typically occurs because of different reasons, such as reduced activity (6).

Typically, osteoporotic fractures take place at forearm, vertebra and hip. Furthermore, fracture of rib, pelvis and humorous are also common (7). So far, vitamin D is deemed to a common medical condition in the world (8). The abnormal serum vitamin D is associated with heightened PTH secretion, in consequence, increased renal calcium excretion and bone resorption (9). It has been experimentally verified that vitamin D is essential for calcium metabolism, thus, fractures prevention. Recent experiments have demonstrated that the serum 25 (OH) D is optimal within the region of (50 - 80 nmol·L⁻¹). It was suggested and thought that there is a strong relation between fracture development and vitamin D deficiency. Accordingly, significantly heightened in mortality and morbidity rates of fracture patients (10)(11). Typically, vitamin D status can be evaluated by measuring the level of serum 25-hydroxy-vitamin D (25 (OH) D) (12)(13). Sufficient intake of calcium is important for adequate bone mineralization and healthy growth, in consequence, teeth and skeletal system development (14)(15).
On the other hand, phosphate has been found experimentally to be an essential dietary source of acid phosphate. It was supplied in a generous amount in the diet through grains products and meat (16). Although phosphate is considered the primary mineral component of hydroxyapatite, the primary structural element of bone the acid-ash hypothesis posits that dietary phosphate. Additionally, detrimental to bone is a marker of metabolic production of acid is (17)(18)(19). Calcium intakes (which can be limited or insufficient) may affect the relationship among bone health, the diet acid load and phosphate (20)(21). Lastly, the authors in (22) showed that 50% of the total Alkaline Phosphatase (AIP) activity arises from the bones, while the other 50% originates from the liver. Therefore, our goal is to study the main minerals in osteoporosis patients. In consequence, the objectives of this study are as follows:

- Exam vitamin D and to show its effect on bone loss.
- Measure calcium ion and determine its role in bone loss.
- Lastly, calculate phosphate and alkaline phosphatase to identify their effect on bone loss.

**Case Study**

This study was conducted on 100 subjects (42-80 years) at the Rheumatology Unit at Azadi teaching hospital at Kirkuk city from February 2015 to July 2016. We included women attended the outpatient clinic at Azadi teaching hospital for screening for osteoporosis by DEXA scan. A particular questionnaire form was constructed which included patients details, such as name, age, sex, weight and height. Special attention was paid to collect valuable information about the patients’ previous history (e.g., hip replacement, smoking, glucocorticoids intake, rheumatoid arthritis, alcohol drinking, drinking milk, coffee, tea).

We started the experiments by collecting five millimetres of venous blood in plain tubes. After that, the blood centrifuged at 3000 rpm for 5 mins. Then, the serum was kept in the deep freezer (-20 C) until analysis. Total Calcium and Phosphorus were measured in serum samples using a spectrophotometer-based method using kits provided by Biomeurx (France). We measured AIP using Reflotron plus machine (Roche). Therefore, vitamin D nutritional status can be obtained by measuring 25 (OH) D instead of 1,25 (OH) D because it is the main circulating form of vitamin D (23). Vitamin D estimation was carried out in a private laboratory using Mini Vidas machine from France. The 25 hydroxy cholecalciferol levels were categorized as deficient (≤ 10 ng/ml), insufficient (11 - 29 ng/ml) and sufficient (≥ 30 ng/ml) (24). As mentioned earlier, 25 (OH) D measurement of BMD was performed by DEXA-Scan (25).

**Results**

In this study, data were analyzed with SSPS version 25 (Chicago, IL). A standard two-sided t-test was carried out to compare the mean value of the biochemical tests in different groups. Additionally, the Pearson correlation coefficient was also used to show the correlation with age, biochemical parameters and BMD. In the entire statistical analysis, the p-value was less than 0.05 which means that they were considered statistically significant.

One hundred females were involved in this work have a mean age of (61.0 ± 10.2) years. of them 50 were controls, and the rest of the study population were confirmed to have osteoporosis. Figure 1 illustrates the mean and Standard Deviation (SD) of Age, BMI, serum Alkaline phosphatase, calcium, phosphorus, Vitamin D2 (OH) and DEXA ray in both osteoporosis patients and controls group. Firstly, the BMI of the osteoporosis group (28.9 ± 3.4) was significantly (p <0.001) lower than control groups (29.1 ± 5.9). Secondly, the calcium levels were significantly higher in control (8.89 ± 0.564 mg/dl) than osteoporotic group (8.776 ± 0.496 mg/dl). Thirdly, phosphorus levels in control groups were (3.34 ± 0.53) significantly lower than osteoporotic group (3.78 ± 0.4). Fourthly, both control and osteoporosis women had serum calcium and phosphorus level within normal range. Lastly, serum of alkaline phosphatase was significantly higher in osteoporosis (96.89 ± 8.00) than control groups (81.0 ± 12.4), yet it is still within normal range.

![Fig. 1: The mean and SD of the parameters of each group](image-url)
According to the experiments, the level of serum vitamin 25 (OH) D in study group women appeared there were (34) of them below ≤10 (ng/ml) had deficient the Mean ± SD (8.712 ± 0.756). On the other hand, the number of women was ranging between (11-29 ng/ml) was (59) Mean ± SD (4.455 ± 5.269) had insufficient. The last ones had sufficient their number was (7) and Mean ± SD was (33.114 ± 6.201). The results in Figures 2 and 3 show the correlation of age with BMD, vitamin D, and phosphorus in both groups. It is worth mentioning that in both figures the symbol \( \chi^2 \) represents Chi test, and DF is the abbreviation of the degree freedom. Furthermore, in Figure 2 and 3, the p-value was less than (0.005). However, in Figure 2, it showed (non-significant) significant in (Ca and AIP) BMD, vitamin D and P. On the other hand, in Figure 3, it showed non-significant in all parameters except BMD.

### Discussion

The data also showed no significant difference in the level of serum Calcium between osteoporosis group (8.89 ± 0.569 mg/dl) and control group (8.77 ± 0.496 mg/dl). Similarly, there was no relation between BMD and calcium ion \((26) (27)\). Our work agrees with Rana A. Hmadi \((28)\) who found no significant difference in calcium level in osteoporotic women (2.19 ± 0.11 mmol/l) and in control group (2.24 ± 0.14 mmol/l) the normal range in mmol/l (2.1 - 2.6). Additionally, serum phosphorus showed significant difference between osteoporosis groups (3.78 ± 0.4 mg/dl) and control groups (3.34 ± 0.53 mg/dl). Furthermore, it showed no significant difference in the level of serum phosphorus for study women groups (6.39 ± 1.14 mg/dl). It is worth mentioning that a study done by Rana A. Hmadi \((28)\) found that osteoporotic group is (1.13 ± 0.19 mmol/l) whereas control is (1.15 ± 0.17 mmol/l) and the normal range in mmol/l (0.8 - 1.6).

Serum alkaline phosphatase showed a significant difference between osteoporotic groups (96.89 ± 8.00 mg/dl) compared to the control group (81.0 ± 12.4 mg/dl). Nevertheless, their value within a normal range that means there was no significant relation between osteoporosis and alkaline phosphatase. However, our results disagree with Ramesh et al. in \((29)\) who showed raised the level in alkaline phosphatase.

Evaluating the vitamin D status in our work showed that (59%) of women had vitamin D insufficient which agree with Wei et al. \((30)\) (64.7%) of women had vitamin D deficient. Besides, in our study (34%) of the women had a deficiency which agrees with experiments done by Francisco \((31)\) (24%) of their study groups below <25.
Ramesh et al. (29) found that 25 (OH) D levels revealed (62%) of their patients had vitamin D deficiency, and four subjects had vitamin D deficiency strongly. In work done in Saudi by Abdulla A (32) found that (36.4%) had insufficiency moderate to (8.6%) severe vitamin D deficiency. However, Pedro et al. found that no significant difference between vitamin 25 (OH) D, age group and BMD (33). The decrease in serum vitamin D levels occurred due to several reasons. Firstly, less outdoor activities of the women. Secondly, with a decrease in exposure to sunlight or by wearing a long dress and may consequently prevent vitamin D in the skin to induce and convert to the active form(34).

Conclusion

In this paper, we evaluated Vitamin D and Ca to identify their effect on bone loss. Therefore, one hundred women participated in the mean age of (61.0 ± 10.2) years were studied. 50% of them were in the control group, and 50% of them had osteoporosis. To implement our goals, the SSPS was used to analyze the data. Accordingly, we conclude that the BMD significantly related to age and BMI which the elderly women with low BMI were had more risk factor to osteoporosis and fracture than those younger and normal BMI. Additionally, serum calcium, phosphorus, and alkaline phosphatase were not significantly be affected by BMD.

Recommendation

The BMD significantly related to age and BMI. The elderly women with low BMI have more risk factor to osteoporosis and fracture than those younger and normal BMI. Furthermore, the main minerals in Osteoporosis patients (like Calcium, Phosphorus, Vitamin 25 (OH) D and Alkaline Phosphatase) were not significantly be affected by BMD.

Evaluation of Food, Health and Sports Systems for Fitness Centers in the Center of Najaf Governorate for Females

Nizar Hussain Jafar al-Nafakh¹, Rehab Aref Mahdi Al–Kalabi¹

¹Department of Physical Education and Sports Sciences, College of Education for Girls, Iraq.

ABSTRACT

This research contains a number of axes, which came from the importance of food, health and sports programs and the right ways to eat with the use of sports programs. In addition to the use of human transportation convenient helped him to be very lazy, making little movement and does not perform any sports activity where he is suffering from health problems and suffers from several diseases. The importance of research lies in finding ways and means to evaluate and evaluate the food, health and sports systems through the study of the prevalence of fitness centers and fitness, which has become obsessed with many researchers to identify the positive effects and tuberculosis.

And where the problem of research came as most of the centers deployed in the province of Najaf does not follow the correct methods and devoid of medical supervision with a lack of specialized training staff that the reasons for the spread of centers back to several things, for example, the following things:

1. High rates of obesity, especially women
2. The desire of most women to maintain the aesthetics of the body
3. The desire of some women to maintain public health and get rid of some diseases

After discovering the reality of the spread of these centers, it became clear that the centers differ among themselves after them points, especially in terms of the requirements of the center’s equipment, as well as follow the food, health and sports programs, as the researcher learned about the staff and workers in the centers of sports and medical cadres.

The researcher found a great difference between the center and the other in terms of providing services in general, so the researcher decided to study and evaluate these centers so that they can evaluate the food, health and sports systems for females, the content of the title and problem of this research.

Keywords: Food systems, nutrition and sports programs.

Introduction

With the development of life in accordance with modern technologies and the proliferation of means of technology and rapid pace of life and the abundance of work and concerns of the human be dependent on fast food and away from eating healthy as well as most people do not have a culture and the knowledge of nutrition ((Nutrition and methods of eating The food properly as well as the use of human transportation convenient helped him to be very laziness, which made him little movement and does not perform any sports activity where he has suffered from health problems and suffers from several diseases and perhaps the most prominent obesity and other diseases such as (sugar, pressure, Hormones) where it became difficult to get rid of his eating habits As well as epidemiological studies and studies of modern age diseases indicate that the rate of diabetes in individuals who exercise less than those who do not exercise

The importance of research is to find ways and means to evaluate and evaluate the food, health and sports systems used in the fitness and fitness centers, which have become obsessed with many researchers to identify their positive and negative effects.

Common customs and traditions in the Arab countries in general and in Iraq in particular have a major role in the spread of obesity as their national and
religious suitability is linked to different types of food. Psychological work is one of the most important factors leading to obesity. Obesity is affected by the emotional state of the person. Some people resort to frustration, failure or loneliness to eat large quantities of food, and there are individuals who are on the contrary, where they increase their ability to eat in cases of happiness and success. The psychological state has an important role in determining the amount of food consumed by the person and affected the body weight.\(^3\)

The practice of eating habits and reducing the number of meals eaten by the individual to one meal per day only leads to the mobilization of metabolic methods in the body with fats and carbohydrates and increase the proportion of triglycerides in the blood and the body moves in the process of conversion this crowd of energy taken into stock energy in the body and begin the process of fat formation and sedimentation and lead to the secretion of the hormone insulin to counter the rise of glucose in the blood, which triggers the process of building fat. Hypertrophic adipocytes are also resistant to insulin secretion and are more sensitive when these fat cells are reduced and body weight decreases. The natural ability to fully metabolize carbohydrates decreases.\(^4\)

**The Study Aims**

1. To identify the number of centers deployed in the center of Najaf.
2. To identify and evaluate the food, health and sports systems used in these centers.
3. To identify the effect of some of the systems in question (weight, body mass, body fat percentage, water percentage in the decomposition, level of physical fitness) of the members of the research sample.

**Field Research Procedures**

**Field visit to fitness centers in question:** Before selecting the procedures, the researcher conducted field visits and a comprehensive survey of all fitness centers in Najaf city center for females. The purpose of this field survey is to identify: \(^4\)

1. Number of centers in the city of Najaf for females and their places and locations in the city.
2. See the establishment and halls for each center.
3. Access to the equipment and sports equipment used.
4. See the administrative, sports and medical staff.
5. Access to the food, health and sports systems prepared by the centers.
6. To see the numbers of women and their ages and their social status, health and sports.

In light of the points mentioned above, and through the field survey, the researcher conducted the following field procedures:

**First:** Design the form of collecting information about the participants in the centers see Appendix (11).\(^6\)

**Second:** Designing a form for collecting information about the food, health and sports systems of the participants is considered Appendix (12).\(^6\)

**Tests used in research:**

1. Measuring weight and length: (in kilograms and meters).
2. Measurement of body components: The measurement of the body components through the use of devices to measure (the environment of the body, skin folds).
3. Measurement of physical fitness: The 30-D walk test was selected using the electric walk-in device and calculating the distance traveled for easy implementation of this test. This test was determined by presenting the expert questionnaire form to show the physical competence of the members of the sample, where the test achieved 85% of the opinions of experts.

**Pretests:** The tests and Pre measurements were carried out in all the research variables (weight, height, body components, physical efficiency, and physiological measurements) on 10/11/2017 for all members of the research samples. The measurements were made at the Ghada Fitness Center and Al Sadr Teaching Hospital in Najaf.

**Posttests:** The researcher carried out dimension measurements for all the above mentioned search variables on 15/11/2017 at the same place Ghada Center for Fitness and Fitness and Al-Sadr Teaching Hospital.
Results and Discussed

For the purpose of knowing whether the objectives of the research were achieved or not?

The researcher processed the data by some statistical means and in light of the methodology used and came out with the following results:

View and analyze the results of the research sample the first experiment that applied the sport system of Ghada Center for fitness and fitness for the variables of research.

Table 1: Shows the mean and standard deviations of the variables of the first experiment

Discussions

The researcher finds that these results are consistent with the results of the study of Hiba Shaker Mahmoud (2012) in terms of the need to balance the nutrients in the individual proportions required by the body, and when this balance, it affects positively on the components of the body, which leads to increase muscle mass, The percentage of body fat decreases and therefore the body weight decreases.7

The researchers believes that the system of sports followed by the center has a positive effect on the mass of muscles, but in small percentages due to the lack of this system of balanced nutrients, this study agrees with the study of Hiba Shaker (2012), which states that the chemical system lacks nutrients Despite the increase in the proportion of proteins in the body, but does not increase the mass of muscle to a large extent, due to low weight to the low proportion of water in the body, which is contrary to the recommendations of health food that urges the individual not to reduce the proportion of water in the body than the normal rate Adversely affect the mass This is because water represents a large part of the weight of the muscles and is involved in building the cell and the chemical reactions that occur within it.8

Low body fat percentage in both systems as follows: The rate of change in body fat percentage in the sports diet was prepared by the researcher (7.668), and the percentage of change in the mathematical system prepared by the researcher was (3.609). It is clear that the percentage of body fat decreased for the three groups and the athlete’s diet is the best percentage of decline, followed by the athlete’s system prepared by the researcher.9

The researchers found that these results are consistent with the results of the study conducted by Hiba Shaker Mahmoud (2012), which states that it must be a weight...
loss of body fat while maintaining the natural water in the body. The researcher finds that these results contradict with the study conducted by Hiba Shaker Mahmoud (2012), which refers to the importance of water in the body but at the natural rate of about 70% of the body weight and to do many processes such as: digestion and absorption, And the formation of body cells.\textsuperscript{11}

The change in the percentage of water in the body as it reached in the athlete’s system prepared by the researcher (2.368) and it is clear that the sample lost the excess proportion of water in the body only, which led to access to the normal rate, and this has a positive effect on low body weight And increase muscle mass.\textsuperscript{12}

The researchers finds that these results are consistent with the study conducted by Hiba Shaker Mahmoud (2012), which states that the best food systems that maintain the proportion of water needed for the body as it works to expel harmful substances outside the body,\textsuperscript{13} and the transfer of food intake to plasma blood and Carbon dioxide is caused by metabolism in muscle cells, which positively affects low body weight and increases muscle mass.\textsuperscript{14}

**Conclusions**

1. The sports diet has a positive effect on the variables of research, especially (weight variable, muscle mass, body fat percentage, body water percentage, muscle mass, level of physical fitness). The results were the increase in muscle mass by 2.81% And the decrease in the body fat percentage by 4.8%, and decrease the proportion of water in the body by 1%, which led to a small percentage to reach the normal rate for each person, so the diet sports may give the best results that correspond to the search variables.

2. The sports system adopted by the centers has positive effects on some variables Research: The percentage of body fat decreased to 0.9% as it has negative effects on some of the research variables, including muscle mass increase by 1.09%, but in the proportion of water in the body led to a 2.5% drop.

3. The positive effects of the research variables in the mathematical system prepared by the researcher are: The system increased muscle mass to 2.55% and reduced body fat to 2.4%.

4. The athlete’s diet system prepared by the researcher led to a decrease in weight by 10.57% and a rise in the level of physical fitness to 4,727%. This corresponds to the nutritional health recommendations by 100%.

5. In the sports system followed by the centers, this led to a decrease in weight by 6.04% and a high level of efficiency to 1.238%. This corresponds to the health food recommendations by 40%.

6. In the sports system prepared by the researcher led to a decrease in weight by 6.95% and a high level of physical fitness to 1,508% and this corresponds to the health food recommendations by 85%.

Syrian Mesquite (*Prosopis Farcta*) as a Potent Maintainer for the Overall Health

Ismael Hasan Mohammed¹, Ismail Salih Kakey², Mahdi Moridi Farimani³  
¹Department of Medical Microbiology, ²Department of Biology, Faculty of Science and Health, Koya University, Kurdistan Region, Iraq; ³Department of Phytochemistry, Medicinal Plants and Drugs Research Institute, Shahid Beheshti University, G. C., Evin, Tehran, Iran

ABSTRACT

Objectives: Choosing of Syrian mesquite (*Prosopis farcta*) as potent oral hypoglycemic and anti-oxidant agents for the maintenance of overall health is the purpose of the present study.

Method: The inhibitory effect against α-glucosidase and anti-oxidant activities for n-hexan, ethyl acetate and methanol extracts of roots and stalks of Rhubarb (*Rhubarb ribes*) and roots, a bark of roots, leaves, and fruits of *P. farcta* have been studied. Different concentrations of extracts were subjected to α-glucosidase inhibitory assay and the percentage of α glucosidase inhibitory activity was calculated. A method of Folin-Ciocalteu was applied to measure the total phenol content, aluminum chloride method with modifications was used to measure total flavonoid content and free radical scavenging activity of the extracts was analyzed using 2,2-diphenyl-1-picryl-hydrazyl (DPPH) with a finding of the IC50.

Result: The methanol extract of the bark of roots for *P. farcta* (7.8125 mg/ml) gave the highest percentage (88.52604) of α-glucosidase inhibition out of all extracts. Methanol extract for roots of *P. farcta* showed the highest content of total flavonoid comparing with all extracts. Ethyl acetate extract for leaves of *P. farcta* showed stronger ability to scavenge DPPH comparing with all extracts.

Conclusion: Possessing properties of hypoglycemic and antioxidant may qualify *P. farcta* extracts to use as a potent antioxidant and sugar regulator for the maintenance of overall health.

Keywords: *Prosopis farcta*, α-glucosidase, health, hypoglycemic, inhibition.

Introduction

There is no enough information about the role of Syrian mesquite (*Prosopis farcta*) in inhibition of α-glucosidase as well as antioxidant activity, although, the local administration of *Prosopis farcta* fruit dusk powder and root aquatic extract showed accelerates healing in diabetic rats ¹. Although there is a report indicating that the Rhubarb extracts can improve oral glucose tolerance in diabetic animals ², but there is no enough information about their role in inhibition of α-glucosidase as well as antioxidant activity.

Inhibitors of α-amylase and α-glucosidase delay the breaking down of carbohydrates in the small intestine and diminish the postprandial blood glucose excursion ³. The functions of all systems in the body depend on the equilibrium between free radicals and antioxidants. Oxidative stress will happen when free radicals become higher than the ability of antioxidants. Therefore, use an external source of antioxidants can help in coping this oxidative stress ⁴.

Several plants contain components that have the ability to reduce reactive oxygen species (ROS) induced oxidative damage. There are many assays in vitro use to measure the antioxidant potential for the plants and most of these assays revealed potent antioxidant activity ⁵.

Because, there are no sufficient studies about *P. farcta* role in inhibition of α-glucosidase as well as antioxidant activity, so the purpose of this study is evaluate their activities compared with *R. ribes*, which is also considered as cheap, available, and good antioxidant.

Material and Method

Plant Material: The roots, leaves, and fruits of *P. farcta* and *R. ribes* were collected from Koya in Erbil
Governorate, Iraq. Dr. Ali Sonboli identified the plants and voucher specimens have been deposited in the Herbarium of Medicinal Plants and Drugs Research Institute, Shahid Beheshti University, under the herbarium codes of MPH-1296 and MPH-1342, respectively.

**Extraction:** Two plants have been collected from Kurdistan of Iraq; the first was Syrian mesquite (P. farcta) and the second was Rhubarb (R. ribes). Fruits, leaves, roots and their barks of Syrian mesquite and roots and stalks of Rhubarb were used in this study. The plant materials were dried at room temperature and ground into fine powders in a mechanical grinder. A 10 g portion of each plant was weighed accurately in a digital balance and successively extracted with n-hexane (3×50 mL), ethyl acetate (3×50 mL) and methanol (3×50 mL) by maceration on a magnetic stirrer for 1 h at room temperature. The extract of each solvent was evaporated to dryness under reduced pressure at 45 °C to obtain solvents n-hexane, ethyl acetate, and methanol extracts.

**Determination of alpha glucosidase inhibitor activity:**
Alpha-glucosidase inhibition was analyzed by using a kit (Sigma Aldrich Chemical Co, USA) and ELISA reader. Dimethyl sulphoxide was used to obtain different concentrations of extract samples, which included 125mg/1ml for 1st test, 62.5 mg/ml for 2nd test, 31.25 mg/ml for 3rd test, 15.625 mg/ml for 4th test, 7.8125 mg/ml for the 5th test.

The % inhibition has been obtained using the formula: % inhibition = (1- an average of sample slope/ average of enzyme slope) ×100.

**Anti-oxidant activity assays:** The dried extract was dissolved in dimethyl sulfoxide 99% and different concentrations of each extract were used for getting suitable concentration. The calculation has been done based on 1000 ppm of the extract samples. Method of Folin-Ciocalteu was applied to measure the total phenol content (TPC) in each extract with some modifications. Different concentrations of gallic acid were used as equivalent to be standards. Aluminum chloride method with modifications was used to measure the total flavonoid content besides using of Quercetin as standard.

The free radical scavenging activity of the extracts was analyzed using 2,2-diphenyl-1-picryl-hydrazyl (DPPH) (Sigma –Aldrich – Germany) according to . BHT (Butylated hydroxytoluene) (Sigma –Aldrich – Germany) in different concentrations was used as a standard. These measurements were performed in duplicate and percentage of inhibition (Pi) was calculated using the following equation:

\[ \text{Pi} = \left( \frac{A_b - A_s}{A_b} \right) \times 100 \]

\( A_b \) is the absorbance reading of control and \( A_s \) is the absorbance reading of the extract. The IC50 values were calculated using linear regression analysis for indicating antioxidant capacity.

**Statistical Analysis:** Determination of assays was done in triplicates. The value for each sample was calculated as the mean ± standard deviation (SD). The results were evaluated by using the SPSS and one-way ANOVA. Differences among samples were considered to be statistically significant if \( p<0.05 \).

**Results**

**A-glucosidase Inhibition Assay:** At the 1st test, the abstracts of n-hexane (125mg/ml) which included six abstract samples showed very low inhibition so they have ignored in next tests. In 2nd test (62.5 mg/ml) and third test (31.25 mg/ml) a number of samples were unclear in the results because their slopes were negative which means low or lack of inhibition effect, so they had to repeat in more dilute for some extracts and ignored others in next test.

The competition for inhibition was close between the sample of methanol extract for roots of P. farcta and the sample of methanol extract for the bark of roots of P. farcta, although the sample of methanol extract for the bark of roots of P. farcta was the better (Table 1). 5th test (7.8125 mg/ml) was conducted to confirm the best sample extract that does greater inhibition among these three samples. The sample of methanol extract for the bark of roots of P. farcta was the best one (Table 2).

Data are presented as mean ± SD values of triplicate determination. Different letters for a given value within a column are significantly different from each other (P<0.05). S.D.: Standard Deviation; IC50: Half-maximal inhibitory concentration.

**Discussion**

Inhibition of α-glucosidase by *P. farcta* extracts may be done by competing with the binding of oligosaccharides with alpha-glucosidase and prevent their breaking down to monosaccharides. That leads to prevent entrance of monosaccharides to the blood circulation thereby lowering the glucose level. Herbal agents have the most strong alpha-glucosidase inhibiting components since they show maximum inhibition even at low quantities and may without side effects.

The highest value of phenolic content was showed by ethyl acetate extract for leaves of *P. farcta*. Strong antioxidant activity mostly related to existing phenolic compounds in many plants. Stabilizing lipid oxidation depends on the antioxidant activity of phenolic compounds through hydroxyl groups that are considered as main groups in phenolic compounds. These hydroxyl groups have the ability to scavenge the free radicals by binding with them. Reduction-oxidation reaction is the main reason for this scavenging activity through binding with oxygen (singlet) and triplet oxygen forms, neutralizing and absorbing free radicals or decomposing peroxides.

The highest content of total flavonoid was with methanol extract for roots of *P. farcta*. Flavonoids have many important activities such as antidiabetic, anti-inflammatory, antibacterial, antiviral, anticancer and antiallergic activities. These activities of flavonoids are related to many mechanisms, and the direct and indirect antioxidant action is the dependent one among them. The antioxidant action of flavonoids comes from the phenolic hydroxyl groups attached to ring structures that can scavenge the free radicals also they are considered as reducing agents and metal chelators.

Ethyl acetate extract for leaves of *P. farcta* showed stronger ability to scavenge 2, 2-diphenyl-1-picrylhydrazyl DPPH comparing with all extracts. DPPH radical is used for detection of antioxidant activity of plant extracts because it is stable free radical. The plant extract that doing more reduction for this DPPH radical is considered as a strong antioxidant. This reduction is occurred through the donation of hydrogen atoms or electrons to capture the free radicals. The positive result for this test represents with change the purple colored 1, 1-diphenyl-2-picrylhydrazyl (DPPH) to yellow colored complex because of the reduction. This DPPH assay is the most important test for the in vitro determination of Antioxidant activity.

**Conclusion**

This study shows that parts of Syrian mesquite (*P. farcta*) have potential antioxidant effect as well as potent inhibitory action against alpha glucosidase and they are more potent than Rhubarb (*R. ribes*). This result enhances *P. farcta* to use as a potent antioxidant and sugar regulator for the maintenance of overall health.

ABSTRACT

Recurrent pregnancy loss is define as the spontaneous loss of three or more successive pregnancies before 24 weeks of gestation. Heavy metal may play a role in recurrent pregnancy loss. Case control study included 90 women, thirty of them were patients diagnosed with recurrent pregnancy loss between (7-20) weeks of gestation and the other sixty controls were (30 ongoing pregnant women and 30 non-pregnant ). Serum levels of Chromium (VI) and Manganese was measured by using graphite furnace atomic absorption spectrometer technique. While total serum iron was measured by colorimetric method. The result were expressed as mean ± standerd error of mean. P value of < 0.01 was considered to be statistically significant. The levels of serum chromium and manganese were significantly higher in patients with recurrent pregnancy loss compared to control groups, while the concentration of total serum iron was significantly lower in patients with recurrent pregnancy loss compared to control group. As conclusion, it can be concluded that high levels of chromium (VI), manganese and low level of iron increase the risk of spontaneous pregnancy loss in Iraqi women.

Keywords: Recurrent pregnancy loss, Chromium, Manganese, Iron, Graphite Furnace Atomic Absorption Spectrophotometry

Introduction

Miscarriage is defined as fetal loss before 24 weeks of gestation (1). 1–3% of losses are recurrent miscarriage, which defined as three or more consecutive early pregnancy losses (2,3). Trace elements, are essential for human health and are involved in various metabolic and biological functions. Deficiencies or excesses in these trace elements are usually related to human diseases (4). Micronutrients support maternal health and fetal development throughout gestation through processes that are integrated across maternal, placental and fetal compartments (5). Chromium (VI) has strong oxidation properties with greater toxicity than Chromium (III) (6). Both can cause adverse effects on fertility and subsequent embryonic development (7). Manganese(Mn) is an essential mineral nutrient in humans, is required for normal metabolism, it can act by activating certain enzymes which is essential for proper immune function the body’s defense against free radicals, blood sugars control, reproduction and bone growth(11). Mn may affect development and functioning of the brain as it acts as a cofactor of several enzymes involved in neurotransmitter synthesis and metabolism(12). No clear effects of deficiency or excess of manganese on the developing human fetus or pregnancy outcome (13). Women at increased risk as it absorbed more Mn than male Mn concentration increase progressively throughout pregnancy (14-16). This might explained by increase in Mn intestinal absorption (17) or differences in tissue manganese mobilization related to increased estrogen and progesterone concentration during pregnancy (18,19). Iron (Fe) is an essential nutrient, it is a cofactor for many enzymes and it is essential for oxygen transport (in hemoglobin) and electron transfer (20). Intestinal absorption of Mn is up-regulated when iron stores are low and increase in blood manganese concentrations can be demonstrated with lower ferritin concentrations (21-23). Around 23% of all pregnant women
suffering of anemia in industrialized countries\textsuperscript{(24)}, so intestinal absorption of Mn increase during in pregnancy\textsuperscript{(25)}. Mn easily passes through the placenta, the elevated gastrointestinal absorption during pregnancy may lead to excess fetal exposure, and potentially toxicity, in highly exposed mothers\textsuperscript{(26,27)}. Even active transport is saturated at excessive Mn exposure, but simple diffusion of Mn across the placenta may still occur, indicating that there may be a risk of excess fetal exposure\textsuperscript{(28)}. Aim of the present study was to evaluate some minerals in Iraqi women with recurrent abortion.

**Material and Method**

This study protocol was approved by the Ethical Committee of the Collage of Medicine/AL-Mustansiriyah University/Department of Clinical Biochemistry. Samples were collected from out Patients Department & AL- Yarmouk Teaching Hospital (Obstetrics & Gynaecology) between (11-2017 to 3-2018). Ninety (90) Pregnant women included in this study were between 7-20 weeks of gestation, their age was (18-40 years),they were divided into three main groups: Group1 : ( Unexplained recurrent pregnancy loss) includes pregnant women with missed miscarriage with a history of three or more consecutive missed miscarriage, No=30. Group2: Pregnant women with single viable fetus without history of miscarriage, No. =30. Group 3: non- pregnant women without history of miscarriage, No. = 30. RH immunized patient, patients with medical disease like diabetes mellitus and thyroid disease, congenital abnormality of uterus, thrombophilia screen (+ve), antiphospholipid syndrome, twin pregnancy, fetus with congenital abnormality all have been excluded from this study. Serum chromium and manganese were measured by Graphite Furnace Atomic Absorption Spectrophotometry (GFAAS)\textsuperscript{(29)}. Serum iron (Fe\textsuperscript{2+}) was measured by colorimetric method\textsuperscript{(30)}.

**Results**

Table (1) show the mean of Chromium was significant highest value in recurrent pregnancy loss group compared with non-pregnant and ongoing pregnancy groups, while in ongoing pregnancy was higher than non – pregnant women.

Discussion

In this present study, serum Chromium level was found significantly higher in group 1 in comparison with other groups. 86.7% was reported in this study, while 1.60% was reported by study in Nigeria to chromium (31). Another study showed increased risk of spontaneous miscarriage by 2.31 or 20.47 times in worker women with occupational chromium exposure, which is considered a public health concern (32), adverse reproductive effects of Chromium observed by other study (33-35).

Additional adverse pregnancy outcome as Intrauterine growth restriction, low birth weight was associated with high levels of Cr in the blood, urine, and umbilical cord blood and in the neonate (36-38). It unclear whether exposed before or during gestation affect pregnancy outcome, however most studies demonstrated Cr(VI) accumulates in maternal tissues and crosses the placenta during pregnancy as increase in chromium levels in the placenta has been demonstrated (39) this high level of chromium might affect glucose tolerance or due to effect of chromium on sperm viability, motility, and morphology in exposed male workers with history frequent spontaneous miscarriage in their families as reported by others (40). In this study the Manganese concentration was significantly higher in group with recurrent pregnancy loss compared to other groups, similar findings are noted by other study (41). One possible explanation for the effect would be oxidative stress caused by high manganese levels leading to impairment of cellular function and growth (42). In addition, manganese caused DNA damage and chromosomal aberrations and was toxic to the embryo and fetus (43). The data of current study indicates statistically significant lower iron in the material with recurrent pregnancy loss as compared with other groups in agreement with other study in (2015) (44), showed that iron levels gradually decreased as the pregnancy progressed. One third of pregnant women have iron deficiency during the first and second trimester. A study showed that Iron, manganese, lead, and cadmium have similar mechanism of absorption (45) and low dietary intake of iron can lead to excess absorption of manganese (46-50) and the subsequent accumulation of manganese in the central nervous system as showed by many studies in adult (51), it effect infants and children need further investigation (52,53).

Conclusion

In conclusion, it can be concluded that high levels of chromium (VI), manganese and low level of iron increase the risk of spontaneous pregnancy loss in Iraqi women.

Wilson's Disease: Laboratory Evaluation and Clinical Presentation of Iraqi Sample

Omar Qahtan Yaseen1, Mohammed Qais Al-Ani2, Yasin Hamad Majeed3

1MSc. Biotechnology, General Directorate of Biology Department, 2University of Anbar, College of Science Anbar Education, 3Consultant in Internal Medicine Gastroenterology, Assistant Professor Lecturer in the Department of Medicine, College of Medicine, University of Anbar

ABSTRACT

Wilson's disease (WD) is an inherited defect in copper metabolism that causes accumulation of copper in various body organs. It is treatable if it is diagnosed promptly and treated consistently. In this study, the mode of hepatic presentation constituted (57.14%), The neurological presenting problems in this study was (28.57%). Routine biochemistry testing was recorded for all study patients, So Mean values of serum level of ALT, AST, ALP and bilirubin in patients with WD were 136.83 ± 34.770 U/L, 111.86 ± 32.343 U/L, 174.51 ± 25.897 U/L and 6.629 ± 1.6063 mg/dl respectively which differed significantly from their counter parts in asymptomatic group that were (26.36 ± 3.370 U/L, 31.53 ± 1.645 U/L, 76.04 ± 2.698 U/L and 0.780 ± 0.0510 mg/dl respectively), Mean values of serum level of copper 145.29 ± 24.427 μg/dl despite that many cases exceeded the normal range (70-155 μg/dl), this average does not differ significantly from that of Asymptomatic (their families) with a Mean values 74.40 ± 3.145 μg/dl. On the other hand, mean serum levels of ceruloplasmin in patients 9.20 ± 2.745 mg/dl compared with 73.60 ± 2.258 mg/dl in Asymptomatic (their families) significant difference (Table3). The serum AST to urine cu mg/24 hrs Positive correlation (the other variable has a tendency to also increase) (0.951**), total bilirubin Positive correlation (0.795*), S.CU mg/dl Positive correlation lower (0.691). In this study Majority, part of Wilson disease patients had hepatic presentations. the patients were with below 20 years age of onset. The majority part of Wilson disease patients of positive consanguineous parents. A significant association exists between the serum AST, billirubin, 24 hr- urine copper. Serum cooper and 24-hr urine copper levels were significantly lower.

Keywords: Wilson disease, Copper, Ceruloplasmin, Hepatic, Bilirubin

Introduction

Wilson’s disease (WD) can be defined as the excessive deposition of copper in many organs like the liver and brain. It is one of those rare genetic disorders that benefit from effective and lifelong treatments that have dramatically transformed the prognosis of the disease. In Europe, its clinical prevalence is estimated at between 1.2 and 2/100,000 but the genetic prevalence is higher, at around 1/7000. The difference between the numerous genetic prevalence and how many patients diagnosed with WD in Incomplete penetrance of the gene and modifier genes may play an important role1. Hepatolenticular degeneration also called to Wilson disease (WD), mutations in copper transporter gene ATP7B due to occur copper metabolism disorder is a rare inherited autosomal recessive disorder, therefore resulting in hepatic and neuropsychiatric manifestations2,3. Remains incompletely understood because it is close century described.WD patients can be controlled by specialist medicines if it is diagnosed earlier. Many patients are not diagnosed, however, the patients who are not diagnosed are various symptoms and dysfunctions are often neglected1,3. If patients remain undiagnosed, they are often fatal with WD1. Patients with WD may have a broad spectrum of clinical symptoms5. The common organs in WD are liver and brain, and because of the great variable of both types of hepatic as well as neurological symptoms and often delaying diagnosed, they may face a hard diagnosis of WD5. Difficulty speaking, excessive salivation, ataxia, masklike facies, clumsiness with the hands and personality changes are the early appearances of symptoms, while dystonia, spasticity, grand mal seizures, rigidity, flexion contractures, and psychiatric features which occur in 10-20% of patients are regarded the late symptoms5.
Method

**Sampling:** The sampling method was a convenient nonrandom one, carried out through consecutive pooling of all WD patients. Five families with WD (patients, n=9; families, n=25) are recruited from already Hospital, Anbar University School of Medicine (al-Anbar, Iraq) from April 2018 to October 2018. We also recruited 25 family members from these families, including 10 parents (male, n=5; female, n=5;) and 15 siblings (male, n=11; female, n=4). Patients with WD were measured at the time of diagnosis and before therapy. Informed consent was obtained from participants included in the study. The study was approved by the Ethics Committee of ALramady’s Hospital of ALanbr University School of Medicine. A data of patients were collected by direct interviews, full clinical assessment, medical records analysis, and by doing some required laboratory investigations. Patients who accepted to participate in the study, completed the required parameters and fit the inclusion criteria during the study period were included in the study. The patient age should be fulfilling at least three of the above criteria and the last criterion is a definite diagnosis. These diagnostic standards had been proposed basing on Sternlieb’s criteria. The exclusion criteria were; age above 60 years, evidence of coexisting liver diseases including; viral hepatitis A, B C or E, chronic liver disease with cholestatic component, Alpha one antitrypsin deficiency, Coomb’s positive hemolysis, history of Alcohol intake, pregnancy, history of use of copper-containing intrauterine devices (IUCD) or oral contraceptive, history of intake of medications that may cause extrapyramidal side effect such as antipsychotic drugs and Metoclopramide and/or history of chorea.

**Clinical Examination:** The diagnosis of WD was based on clinical examination. The inclusion criteria were; history and clinical examination findings suggestive of WD as hepatic manifestations, neuropsychiatric manifestations, family history of WD, the presence of K–F rings. No symptom of clinical symptoms was typical for Wilson’s disease diagnosis, clinical symptoms that appeared in individuals were very difficult to occur immediately. The brain, which can cause less neurological and psychiatric neuroscience, which also promotes hepatic symptoms, is a family history of hepatic infections, So liver symptoms are hallmarks of Wilson’s disease and hepatic symptoms can precede neurological symptoms. For the rings, they did not appear in the infected sample, because the rings gradually disappear with physical therapy.

**Biochemical Tests:** The diagnosis of WD was based on biological tests such as (low serum ceruloplasmin level and increased 24-hour urinary copper excretion, serum ceruloplasmin level below 200 mg/L, if the liver copper concentration more than 250μg/g dry weight, serum copper level below 70 μg/dl “below 11μmol/L”, 24-hr. urinary copper excretion more than 100μg/24-hr., and/or positive Penicillamine challenge test (if 24-hr. urinary Copper more than1600μg/24- hr., more than 25mmol/L). The Statistical Package for the Social Science (SPSS) version 23.0 software had been used for all computerized statistical analysis. Numerical; normally distributed variables were expressed as mean ± standard deviation; while categorical variables were expressed as frequency, range and percentage. Continuous variables were compared by T-test for the variance analysis. P-value equal or less than 0.0001 was considered as a statistically significant.

Results and Discussion

**Modes of Presentation:** In this study, the mode of hepatic presentation constituted (57.14%), which is early similar to Auday’s study (70.83%), and also near similar to Bushra’s study (69.69%). The neurological presenting problems in this study was(28.57%), which is nearly similar to Auday’s study. Table(1).

The current study showed a significant increase in liver enzymes in patients. These findings indicate that the liver was injured. Damage to liver cells is an indication of the severe untreated rate of WD. These will result from the accumulation of free copper which will come in the stages of sulfhydryl and is given in the work of enzymes such as glucose 6-phosphate and glutathione yeast16. In addition, the interaction between free copper and oxygen species (such as superoxide anions and hydrogen peroxide) may encourage the formation of toxic hydroxyl radicals17. On the other hand, high levels of bilirubin in the extremities may be dangerous. Anemia is still unknown in red blood cells (RBCs).

The hypothesis is confirmed by spherocytes, which are characteristic of this type of anemia.

Serum Levels of Copper and Ceruloplasmin: Mean values of serum level of copper 145.29 ± 24.427 μg/dl despite that many cases exceeded the normal range (70-155 μg/dl), this average does not differ significantly from that of Asymptomatic (their families) with a Mean value 74.40 ± 3.145 μg/dl. On the other hand, mean serum levels of ceruloplasmin in patients 9.20 ± 2.745 mg/dl compared with 73.60 ± 2.258 mg/dl in Asymptomatic (their families) significant difference (Table3).

Excess copper deposition occurs naturally in liver cells. However, free copper bypasses the storage capacity of the liver cells. These varying amounts of the metal and the extracellular matrix enter the bloodstream. Since the level of copper in the serum will be within normal limits, it is possible to understand that the disease is still in the primitive stages. The interpretation of the high amount of free copper through the fact that the increased concentration of copper inside the liver cells caused a decrease in a protein called inhibitory-associated X of apoptosis (XIAP). This leads to accelerated apoptosis in caspase 3 by accidental cell death18. Dead liver cells release all of its material, including accumulated copper, which was the cause of toxicity, which led to cell death. In patients with Wilson’s disease, Ceruloplasmin deficiency was evident19. To confirm this, the current study showed a reduction in Ceruloplasmin in WD patients where this mean protein was lower than in controls. In fact, ATP7B protein contains defects, we may find a decrease in Ceruloplasmin levels in serum (ATP7B), which makes it unable to complete the copper fusion with apoceruloplasmin and complete its secretion process, which will turn into an active and stable protein, ceruloplasmin, when the association with copper occurs, and finally, low levels of ceruloplasmin20.

Correlation among all biochemical tests: Routine biochemistry testing was recorded for all study patients. The serum AST to urine cu mg/24 hrs Positive correlation (the other variable has a tendency to also increase)(0.951**), total bilirubin Positive correlation(0.795*), S.CU mg/dl Positive correlation lower (0.691).

The AST enzyme is found in different tissues of the body such as the liver, brain, spine, pancreas, kidneys, lungs and skeletal muscles. Any abnormalities in these tissues will lead to the release of the enzyme into the bloodstream. Therefore, the high serum level is considered an indication of an injury that may not be specific to the liver itself, but if the disease in the liver progresses slowly, the damage in the liver will affect the rest of the other organs. However, damage to the liver as well as other organs will show elevated levels of AST enzyme if the base of the elevation is a defect in the liver, this increase may be considered an indicator of Wilson’s disease. One of the products of the normal course of hemoglobin breakdown and specifically hematopoietic organisms is bilirubin. Therefore, the high level of bilirubin may indicate some diseases such as Wilson disease because one of the disposal routes is located in the liver. If there is a defect in the pathway inside the liver cells, thus its main symptom is the yellow color of the skin (jaundice). Copper is a cofactor many of the enzymes in the cells of the body that control many important vital functions within these cells. The presence of copper-free is tested in three positions and is either in urine, blood, or liver. Therefore, the copper test is essential in the diagnosis of Wilson’s disease for two reasons. The first is that copper is important for many of the enzymes of the liver and the second is that the process of regulation is through a protein expressed mainly in the liver, so the damage of organized protein in liver cells causes the accumulation of copper unregulated and thus damaged Liver cells release copper into circulation. From this, we conclude that the presence of copper in the blood at a high level of evidence of liver failure and that the accumulation of copper in the liver cells prevented the entry of other quantities and therefore copper in the blood free. However, this test was not useful, but this test was suggested as a diagnostic indicator for Wilson’s disease. In addition, it was noted that copper is high in the treated and untreated people. To diagnose Wilson’s disease and to monitor appropriate treatment, measuring the percentage of copper in 24 hours/day is very useful. Polycarbonate copper is an extension of the copper in the circulatory system, or it reflects the amount of copper that is not arranged by ceruloplasmin or any other transporter in blood. However, measuring the amount of copper as a test for Wilson disease is very difficult, since there is an overlap of results such as this with the results of other tests of liver disease and it is derived from other disorders. If this measurement is considered a diagnostic test, where it was noted that the measurement of the amount of copper urinary linked with the rise in the level of the enzyme, the high level of bilirubin and the lower level of copper in the blood or treated from the treatment of D-penicilamin and this latter challenge is very important in diagnosing the disease. Then they are considered an important diagnostic factor.

Conclusion

The common part of Wilson disease patients had hepatic presentations. The majority part of Wilson disease patients of positive consanguineous parents. A significant association exists between the serum AST, bilirubin, 24 hr- urine copper. Serum copper and 24-hr urine copper levels were significantly lower.

Outcome of Low Birth Weight Infants in AL-Zahraa Teaching Hospital in Kut; Iraq (Comparison between 2003 and 2008)

Qasim Dawood Yasir Altameemi1, Mohannad Khadim Mohammed Ali2
1Consultant Pediatrician and Assist. Prof. of Pediatrics, 2Senior Pediatrician and Tutor, Wasit University–Faculty of Medicine, Iraq

ABSTRACT

In AL-Zahraa Teaching Hospital in Kut, Iraq; 152 infants with birth weight less than 2500 g admitted to NICU in 2003 compared with 147 infants admitted in 2008 with male to female ratio of 1.37 : 1 and 1.19 : 1 respectively. The outcome was compared by mortality rate according to birth weight into three categories: 500-999g, 1000-1499g and 1500-2499g. The mortality rate was calculated as the number of deaths while admitted to NICU divided by the number of live births.

The mortality of LBWI was 8% in 2003 and 23.86% in 2008 (p.< 0.05), mortality of VLBWI was 47.36% in 2003 and 80.48% in 2008 (p.< 0.05) and mortality of extremely LBWI was 78.57% in 2003 and 77.77% in 2008 (p.> 0.05). The total mortality of infants had been increased from 24.34% in 2003 to 46.26% in 2008 (p.< 0.05).

RDS (29.73% in 2003 vs. 26.47% in 2008), perinatal depression (27% in 2003 vs. 32.35% in 2008) and sepsis (29.72% in 2003 vs. 30.88% in 2008) proved to be the commonest etiologies of death.

Keywords: outcome, LBWI, Al-Zahraa hospital, Kut.

Introduction

It is known that about 130 million live birth deliveries occur yearly worldwide and more than 4 million of them die in the neonatal period.1 About 75% of deaths occur in the first week of life, and more than 25% occur in the first 24 hours.1,2 Death in neonates constitutes about 40% of total deaths below 5 years of age worldwide. Sepsis (36%), premature delivery (28%) and perinatal depression (23%) are the leading causes of death for 87% of neonates worldwide.3

Preterm babies delivered below 37 weeks gestational constitute about 8% of total births on average and those who born below 2,500 g body weight are categorized as low birth weight infants (LBWI) while those below 1,500 g as very low birth weight infants (VLBWI) and infants below 1,000 g as extremely low birth weight infants (ELBWI).4,5 Both LBW and preterm babies are considered high-risk group because the majority of them need special care and facilities due to higher rates of morbidity and mortality. Global Standardizations applied to classify the child’s life into timed-specific periods to determine the quality of interventions needed to raise the chances of survival among children, so that neonatal period is recognized as the period since birth to the end of 28 completed days of life and it is considered the most critical period in an infant’s life. Neonatal death “deaths among live births during the first 28 completed days of life” which includes early neonatal deaths (deaths from immediately after birth to end of 7th day of birth) and late neonatal deaths (deaths after 7th day to end of 28th day of birth).6,7 The conditions for preterm baby to survive is based on gestational age over 23-24 weeks and a birth weight of 500 grams or more.8

The outcome of babies admitted to the NICUs is not determined exclusively by birth weight and gestational age only, but it is also affected by other conditions including perinatal and physiological factors of the individual patient, especially severity and impact of their diseases.8,9

A reduction in infant mortality rate is considered as an indicator of socio-economic improvement and progression of health standards and facilities in a society10 and for this reason, the infant mortality rate had significantly drop down all over the world in the past decade.11
Aims of the Study

To measure mortality rates according to birth weight and to determine the common etiologies of death among LBWI and to identify interventions for reduction of mortality among LBWI.

Patients and Method

All infants with birth weight of 500 to 2499 g delivered in AL-Zahraa Teaching Hospital in Kut, Iraq were admitted to the Neonatal Intensive Care Unit (NICU) for the period between 1st of January to 31st of December 2003 and for the same period during 2008.

Newborns were distributed according to their gestational age (4 groups according to last menstrual period determined by mothers, fetal assessment by ultrasonography, and clinical examination for assessment of maturity : 24-28 weeks, 29-32 weeks, 33-36 weeks, and 37 completed weeks or more ), birth weight( three groups : 500 – 999 g, 1000 – 1499 g and 1500 – 2499 g ), sex (male or female ), mode of delivery ( smooth vaginal delivery or caesarean section), and the Apgar score at 1 and 5 minutes ( 3 categories : score7 or more, score 4 – 6, score 3 or less).

The outcome of 152 newborn babies born through 2003 compared with 147 newborn babies born through 2008 with male to female ratio of 1.37 : 1 and 1.19 : 1 respectively. One hundred-five infants (69.1) were delivered vaginally and 47 (30.9%) by caesarean section in 2003 while 96 (65.3%) infants were delivered vaginally and 51(34.7%) by caesarean section in 2008.

The LBWI mortality increased from 8/100 ( 8%) in 2003 to 21/88 (23.86%) in 2008. The total mortality of infants had been increased from 37/152 (24.34 %) in 2003 to 68/147 (46.26%) in 2008. VLBWI mortality increased from 18/38 (47.36%) in 2003 to 33/41 (80.48%) in 2008 and the mortality of extremely LBWI was 11/14 (78.57%) in 2003 and 14/18 (77.77 %) in 2008.

Twenty – eight infants (26.6%) died in 2003 were delivered vaginally while 56 infants(58.33%) died in 2008 were delivered by the same route, nine infants(19.14%) died in 2003 were delivered by caesarean section while 12 infants (23.52%) died in 2008 were delivered by the same route. Twenty – two (59.46 %) male infants died in 2003 compared to 15 (40.54%) female infants, while 39 (57.35%) male infants died in 2008 compared to 29 (42.65%) female infants.

Respiratory distress syndrome (29.73% in 2003 vs. 26.47% in 2008), perinatal depression (27% in 2003 vs. 32.35% in 2008) and sepsis (29.72% in 2003 vs. 30.88% in 2008) ascertained to be the commonest aetiologies of death for the three subgroups of the studied population during both periods of this study. Among the LBWI who died, 64.87% in 2003 and 66.18% in 2008 had Apgar score below 7 at 5 minutes respectively.

Discussion

The mortality rate in infants born with birth weight less than 2500 g in 2008 was high. The mortality rate in 2003 was 24.34% compared to 46.26% in 2008 while it was 19.4% in I.R. Iran. The mortality of ELBWIs was 78.57% in 2003 and 77.77% in 2008 and this is a very high rate compared to all published worldwide reports (In UAE, registered reports showed that the mortality was 14% in 2004 and 33% 2006). The VLBWI mortality increased from 47.36% in 2003 to 80.48% in 2008 and LBWI mortality increased from 8% in 2003 to 23.86% in 2008.

Among infants who died, 24/37 (64.87%) and 45/68 (66.18%) had Apgar score below 7 at 5 minutes in 2003 and 2008 respectively compared to 42.1% in Iran. The highest increase in mortality was among the products of normal vaginal delivery (26.6%) died in 2003 were delivered vaginally while (58.33%) died in 2008 were delivered by the same route compared to (19.14%) died in 2003 were delivered by caesarean section while (23.52%) died in 2008 were delivered by the same route. More male infants died and this is consistent with the general agreement that male sex per se is a risk factor for more severe disease in the newborn especially the preterm.

Mortality rate in preterm babies delivered before 30 weeks of gestation or with a birth weight below 1500 g was estimated with a wide range (11-60%) among NICUs which may be explained by variability in quality of staff and facilities.

The high mortality among LBWIs is mainly due to poor quality of medical supervision and facilities starting from bad antenatal care giving a high rate of preterm deliveries, bad management of labor by inefficient hospital nurses and midwives, inadequate number of highly qualified pediatricians and nurses who are specialized in neonatal intensive care so that critical newborn babies were attended by general physicians and inefficient nurses who lack the skills required to perform a good resuscitation for the distressed or severely asphyxiated newborn.

The three most common causes of potentially preventable deaths were RDS (29.73% in 2003 vs. 26.47% in 2008), perinatal depression (27% in 2003 vs. 32.35% in 2008) and sepsis (29.72% in 2003 vs. 30.88% in 2008) during both periods of this study. Important factors included unavailability of important therapeutics like surfactant, lack of advanced modes of assisted ventilation and the limitations of using corticosteroids antenatally.

The association of mortality rate to birth weight and Apgar scores had shown to be insufficiently precise in quality assessment of NIC settings and the quick progression and advances in neonatal care made the association between mortality rate and these determinants questionable. Many published studies revealed that weight at birth, age at admission, sex and period of hospitalization in the NICU had no considerable effect on mortality while the severity of illness of sick newborns compared to birth weight and gestational age is an important predictor of neonatal mortality rate.

Conclusions and Recommendations

- The mortality rate of LBWI is higher than expected and it increased markedly between 2003 and 2008. It was more in products of vaginal delivery than caesarean section, and more in male than female infants. RDS, perinatal depression and sepsis reported to be the commonest etiologies of death.
- Faculties of medicine are called to develop and create postgraduate specialties in neonatal intensive care in a manner to reach the quality standards and to cover the national requirements of Iraq.
- Centralization of care given to severely sick neonates and to women with high risk pregnancy in optimal conditions is most needed.
- A concomitant increase in neonatal intensive care resources through quality improvement projects including specialized training programmes for doctors and nursing staff, provision of new therapeutics and equipments, establishing a tight infection control policies, with organization of neonatal transport system.
- Health care authorities need to adapt a preventive strategy for reduction in the incidence of LBW and premature deliveries.

Ultrasoundographic Study to Evaluate the Healing of Achilles Tendon Defect in Rabbits

Saddam Khalid Humadi1, Ahmed Abdullah Sultan2, Hiba Abdulaziz Shekho1
1Department of Surgery, 2Department of Pathology, College of Veterinary Medicine, Tikrit University, Tikrit, Iraq

ABSTRACT
The current study conducted on twelve adult rabbits to evaluate the healing of Achilles tendon defect by using ultrasonography. Six animals exposed to traumatic injuries 5%. Our diagnostic study included: ultrasonic examination carried out by ultrasound apparatus employing 7.5 MHz frequency with linear probe. Ultrasound was successful in traumatic injury and partial rend of the tendon diagnosis and should be used as an excellent choice when the animal shows local clinical signs of tendon injury which represented swollen and pain. Radiography should be used when the bony insult is doubtful. A retard in identification and treatment of tendon injury has been shown to cause considerable impairment for that our study is offered elucidating the usefulness and readily of ultrasound to rapidly emphasize the diagnosis.

Keywords: Ultrasound, Diagnosis, Tendon injury.

Introduction
Tendon is rigorous band of fibrous connective tissue that connects muscle to bone and authorize transmission of forces created by muscles to bones, resulting in locomotion of joints [1]. Tendon is analogous to ligament, both are composed of collagen. Ligaments link one bone to another bone, “whilst tendon fastens muscles to bone [2]. The Achilles tendon is made of five tendons, four of these tendons attach to the heel or calcaneus bone and one gone over the back of the heel bone to the toes of the hind limb [3]. Histologically the tendon composed of dense regular connective tissue covered by dense irregular connective tissue sheaths ”. Normal sanitary tendons are consist of parallel arrangement of collagen fibers closely packed together, the dry mass of normal tendon which makes up about 30% of their overall mass. The tendon dry mass consists of around 86% collagen, 2% elastin, 1-5% proteoglycans and 0-2% in organic components such as calcium, manganese and copper [4]. The main function of the tendon is a mechanism that connects the muscles to the bones which act as forces transmission [5].

Tendon injuries can be two types occur most commonly traumatic and atraumatic [6].

Healing of the tendon occurs in three overlapping phase. Initially the inflammatory phase in which the inflammatory cells mostly neutrophils infiltrate to the injured site, a few days the proliferative phase begin to complete the repair process [3, 7]. Treatment of tendon injury treatment medically with external support and other choice is by reattaching the healthy ends of the injured tendons surgically by suturing, sometime may necessitate additional supporting device to maintain injured ends of the tendon apposite during healing period, such as natural or synthetic grafts. After tendon surgery must be prevent the tension on the treated tendon for 6-12 weeks [8].

Ultrasound diagnostic techniques are becoming more commonly because of its afford ability, rapidity and safety ultrasonic waves can be used for imaging tissues directly and can be also provide acquaintance concerning the mechanical state of the tendon [9]. The perfunctory location of the tendons in the body makes them especially appropriate to ultrasonographic estimation [10].

Materials and Method
Experimental Animals: Twelve Local bread male rabbits aged 9-12 months weighing 1.5-2 kg were used...
in current study. The animals were housed in standard room temperature (22 ± 3°C). During experimental time, rabbets were given same diet.

**Inducing Tendon Injury:** The posterior aspect of hind limb skin of the rabbits was prepared surgically. Animals were anesthetized with 35 mg/kg, of Ketamin and 5mg Xylazine\(^{[11]}\). A sharp skin incision made above the Achilles tendon for exposure the tendon and inducing trauma (figure1) as in studies by Chidambara et al., (2004), Pirbalouti et al., (2010) and Burgisser et al., (2016) \(^{[12, 13, 14]}\).

**Experimental Design:** Twelve adult male rabbits were divided randomly into two groups of sex animals each. Group I, represented control was prepared the site of operation surgically and casted with bandage and adhesive tape, and group II was exposed to transverse cutting of tendon and then sutured with four loop suture pattern using nylon suture size 3.0 (figure 2) and casting of affected limb, the animals gait was daily observed during the experiment. Each groups examined ultrasonography after 1 and 2 months to evaluate the healing of the tendon and comparing between the two groups carry out by ultrasound apparatus employing 7.5 MHz frequency with linear probe (figure3) as in studies by LaRocco et al., (2008) and Gurgenidze et al., (2009)\(^{[15, 16]}\).

![Fig. 1: The induced tendon injury](image1)

**Results and Discussion**

**Clinical Observations:** Initially the signs of local swelling, heat and pain were seen at the site of operation above the affected tendon; these inflammatory signs disappear gradually at (7-10 days) post induced injury but signs of lameness were persisted for 2- 3 weeks after surgery

**Ultrasonography Evaluation:** Information of Ultrasound mode-B images shows the clear difference between the two groups, regardless of the differences between the members of the second group ultrasonographically. The ultrasonography image of group I refer to the similarity among tendons of all animals which characterized by regular arrangement of tendon fibers and uniform in thickness and echogenicity in a longitudinal plane (fig.4), these findings are similar to the reports of Docking et al., 2015 \(^{[17]}\).

The collagen deposition still remained in irregular direction in second group and this give an indication of immature connective tissue formation (fig.6), this result was in accordance with \(^{[19]}\).

Some findings in the present study resembled partial tear which appear as a hypoechoic or anechoic cleft, indicates a partial tear (fig.7), that mentioned by several authors \(^{[20, 21, 22]}\).
Conclusions

The diagnosis of Tendon Injury by Ultrasound results has been shown to be effective for the different defects of tendon. Once the ultrasound examination has been mastered, the diagnosis of tendon injuries will be early enough to provide an opportunity for appropriate treatment.

Ethical Clearance: The ethical committee of the concerned institute approved the research protocol.

Assessment of Patients Fear from Cancer in Basra Oncology Center

Sajjad S. Issa1, Afkar F. Kareem2, Samira M. Ibrahim3
1Family Medicine, 2Psychiatric Nursing, 3Community Medicine, Department of Fundamental of Nursing, College of Nursing, University of Basrah, Basrah, Iraq

ABSTRACT

Cancer is a monstrous disease. The diagnosis of “cancer” evokes a shock reaction in the patient and his family. Perhaps the most universal emotional response to cancer is fear. The patient can express progressive fears: the fear of the unknown, a basic death anxiety; the fear of loneliness or separation, particularly from family and friends; fear of body image change such as mutilation; fear of loss control; fear of regression; and a fear of loss of identity. The mere diagnosis of cancer leads to fear, completely independent of the severity of the illness and any therapeutic interventions(5). Many patients suffer from fear and depression long...

Introduction

Cancer is a complex family of diseases characterized by cells that divide and grow without normal control(1). Cancer is a monstrous disease(2). The diagnosis of “cancer” evokes a shock reaction in the patient and his family(3). Perhaps the most universal emotional response to cancer is fear(4). The patient can express progressive fears: the fear of the unknown, a basic death anxiety; the fear of loneliness or separation, particularly from family and friends; fear of body image change such as mutilation; fear of loss control; fear of regression; and a fear of loss of identity. The mere diagnosis of cancer leads to fear, completely independent of the severity of the illness and any therapeutic interventions(5). Many patients suffer from fear and depression long...
after the conclusion of a successful primary therapy. (6) An adequate therapy of the fears and depression is a prerequisite for other rehabilitation measures (e.g., vocational). Medicinal support may be considered but it cannot replace cognitive therapy. (7).

Fear from Cancer: Cancer is often viewed as the “helpless disease”. Treatment is seen as something that is done to a patient and for a patient, with very little opportunity to actively assist the process. It is important for caregivers to recognize and appreciate the impact that the fear of cancer can have on a patient and his family. (8).

Fear of Hospitalization: The very act of being hospitalized is often a stressor which is overlooked by physicians, nurses, medical social workers, etc. Who are so acclimated to the hospital environment and its routine and rules that they fail to appreciate who difficult it is for many people to cope with and adjust to this world. (9).

Fear of Death: The word ‘cancer’ is enough to bring fear into people’s minds, sometimes overwhelming all else. For some, it is not fear of death but of dying, for which it is easier to offer some reassurance. (10).

Fear of Treatment: Even if the cancer patient is relatively well, treatment sometimes has drastic effects on their bodily appearance, ranging from the temporary hair loss caused by radiotherapy and chemotherapy to permanent change after surgical treatments. Hair loss is associated with depression, loss of confidence, and shame, and for some women with breast cancer it may be more distressing than the loss of a breast. (11).

Methodology

Design of the Study: A descriptive cross-sectional study was carried out in Basra oncology centers, started from December 1st 2016 up to 30 March 2017 in order to assess patient’s fear from cancer.

Setting of the Study: The present study carried out in Basra oncology centers in the following hospitals: 1- Al-Sadr teaching hospital 2- The General child hospital

The Sample of the Study: A probability (random) sample of (244) patients males and females in Al-Sadr teaching hospital were selected, and a non-probability (purposive) sample of (56) patients boys and girls in the general child hospital were selected. The patients in hospital were assigned for the study according to those whose ages are fifteen years old and older. 300 Patients were selected from Al-Sadr teaching hospital and from the general child hospital. These two groups of subject made up the total size of the sample.

Study’s Instrument: For the purpose of the study, the researcher constructed the study instrument because no existing tool was found to measure the desired information (Patient’s fear from cancer). The construction was based on the extensive review of relevant literature (12). Closed-end questions questionnaire was used for the purpose of data collection; the data collection was carried out from December 2016 to March 2017. The questionnaire contains two parts, the first part consists of 7 items related to Socio-demographic characteristics of the patients in Basra oncology centers and include: age, gender, type of treatment (chemotherapy, radiation, surgery), the diagnosis, number of chemotherapy’s doses, duration of diagnosis and number of tumors. The second part of the questionnaire consists of 16 questions that are concerned with patient’s fear from cancer. Standardized 3- point Likert scales ranging from never to very much (1 to 3 points) were used for all the 16 items. Fear was classified into two categories: feared and not feared \[ \frac{\text{total highest score - total lowest score}}{2} + \text{Total lowest score} \] The data was collected via face-to-face interviews. Each interview session took 10 to 15 minute. Before any attempt to collect data, approval to conduct the study was obtained from the heads of oncology’s centers and from the manager of the hospitals of both Al-Sadr teaching hospital and The General Child hospital. Also, each participant (patient) was informed about the aim of the study, they have the right to refuse to participate in the study, and confidently of the information gathered.

Statistical Analysis: Analysis was made by using SPSS (Statistical package for Social Sciences) version 16, data was expressed in (frequency and percentage). Bivariate correlations was used to examine the association between fear score and the demographic characteristics of the patients. T-test was also used to compare the arithmetic Means between males and females.
## Results and Discussion

</tr>
</tbody>
</table>

Table (7) showed that the difference between the mathematical means of the two groups (male & female) is significant, and that the fear of female was higher than the fear of male.

Conclusions

1. Most cancer’s patients had a high percentage of fear from cancer.

2. Leukemia was the most common cancer in Basra followed by breast cancer while rectum and spleen cancers were the least cancers.

3. There was no statistical significant association found between patients’ fear and their age neither with their number of tumors nor with their number of chemotherapy doses.

4. There was significant association between patients’ fear and their gender, diagnosis, duration of diagnosis and treatment.

5. The level of fear was highest among females than males.

Recommendations

1. Attitude therapy (includes techniques aimed at keeping problems such as pain at a distance).

2. Distraction (takes off worries or discomforts. Talking with friends or relatives, watching TV,
listening to the radio, reading going to the movies, doing needlework or puzzles, building models, or painting are all ways to distract. Music or creative art therapies, dance therapies can be very helpful).

3. Hypnotherapeutic procedures (modifies perception of pain so that the latter is no longer perceived as distressful; help to lower the pain threshold).

4. Imaginative procedures (takes away tension).

5. Message therapy (achieves muscular relaxation).

6. Meditation and prayer (is especially helpful when mind and body are stressed from cancer treatment).

**Ethical Clearance:** Approval to conduct the study was obtained from the heads of oncology’s centers and from the manager of the hospital.

**Source of Funding:** Self

**Conflict of Interest:** Nil

Dental Hygienist Awareness Level and Preference Image on Health and Non-Health College Students

Se-Yeon Kim¹, Jung-Eun Ha², Min-Ji Kim³

¹Department of Preventive and Community Dentistry, School of Dentistry, Pusan National University, Yansan 50612, Korea; ²Department Dental Hygiene, Baekseok University, Cheonan 31065, Korea; ³Department of Dental Hygiene, Dongseo University, Busan 47011, Korea

Abstract

The aim of this study was to investigate the perception level of dental hygienists by health (HRC) and non-health related college (NHRC) students. The data collection was conducted using the questionnaire tool in the web for HRC and NHRC students. The data were analyzed by frequency and x²-test using SPSS statistical program to verify the significance. There were 62.6% for NHRC students and 37.6% were HRC students. As a result of the perception of dental hygienists, 94% of HRC students knew dental hygienists and their main task is prevention of dental hygiene. However, 74.1% of NHRC students knew them and their main task is dental assistant work (p<0.05). The preferred external image of dental hygienist were responded as 50.7% for ‘neat image’ in HRC students, and 50.0% for ‘bright facial expression’ in NHRC students, but there was no statistically significant difference. In the important qualification that a dental hygienists should have internally was answered as ‘expertise’ by both HRC and NHRC students. Our findings suggest to provide efficient and better medical services for patients and to establish for recognizing dental hygienists properly, and the legal institutional arrangements, administrative support and diverse efforts are needed.

Keywords: perception level of dental hygienist, prevention of dental hygiene

Introduction

As the standard of living and consciousness of the people increases, the demand of customers for high quality medical care is getting higher and the demand for medical service is also strengthened as the expected level of medical service is increased accordingly(1). It is necessary to improve the quality of medical services in order to meet the demand for such services. It will be necessary to refine patients according to patient characteristics and to provide appropriate services to them in order to reconsider patient satisfaction through the quality of medical services and recommend the hospital to other patients(2). Therefore, in dental clinics and hospitals, various methods are being sought to increase the satisfaction of medical consumers. Among them, dental hygienist is one of the important factors that determine the quality of dental services(3).

The reason for this is that dentists can no provide dental health services that the public needs, and they also demand the role of professionals who combine expertise, technology, and service concepts(4). A desirable dental hygienist identity is to establish a dental hygienist is able to provide patients with dental treatment services based on their expertise, skills and experience in a positive manner so that the dental hygienist continues to grow and the patient develops a correct perception of the dental hygienist(5).

A professional image of a job is called 'professional image'. A desirable dental hygienist identity is to establish a dental hygienist is able to provide patients with dental treatment services based on their expertise, skills and experience in a positive manner so that the dental hygienist continues to grow and the patient develops a correct perception of the dental hygienist(5).

An image is generally a picture, reflection, a physical similarity, an expression or a symbol of a visible person-animal-object, or a concept that influences an individual’s attitude and behavior(6). In detail, the image suitable for the job is called 'professional image'. A professional image of a job is needed to give the core members, who interact in the course of an individual’s job role, a belief that he or she will outperform the average(7). Also, considering that the image of a profession generally has a significant influence on the
development of the professionalism, image research is inevitably required in the development of dental hygienist professions(8).

However, research on the image of dental hygienists is limited to the image of the uniform, and there is insufficient research on the preference of the specific image desired by the patient by analyzing the dental hygienist in detail. The purpose of this study is to investigate the preference of dental hygienists by health related (HRC) and non-health related college (NHRC) students, and to compare the image preference difference between students who have basic medical knowledge and students who do not by comparing images and services.

Material and Method

Subject and Period: The subjects of this study were college students from HRC and NHRC residing in Busan from April 14th to May 12th, 2018. The questionnaires were collected using the Naver Office form for mobile to HRC and NHRC students. A total of 207 subjects were surveyed by self-filling questionnaire and within the survey, 28 were excluded which was not respond in good faith and 179 were analyzed.

Research Method: The questionnaire used in the survey was based on the degree of recognition of the dental hygienist and the image survey(9) questionnaire. The questionnaire consisted of 30 questions, 15 items on gender, age, and sequence, and 15 questions on dental hygienist awareness and preference.

Statistical Analysis: The study data were analyzed using the SPSS 24.0 program. The general characteristics of the subjects were analyzed, and the general characteristics and dental hygienist preference survey items were cross-categorized and verified by chi-square.

Findings

General Characteristics of the Subjects: Table 1 shows the general characteristics of the subjects. As a result of gender, male and females were 42.5% and 57.5%, respectively. By age, 21.8% were under 20 years old, 64.8% were between 21-25 years old, 12.3% were between 26-30 years old, and 1.1% were over 31 years old.

37.4% of the students were in the HRC and 62.6% of the students were in the NHRC. Among them, 26.3% were freshman, 26.8% were sophomore, 13.4% were junior, and 33.5% were senior year of the college. The recent dental experience from these students were as follows: 38.5% have visited within 6 months, 21.8% have visited within 12 months, 7.3% have visited within 18 months, 10.1% have visited within 24 months, and 22.3% have not visited dental clinic.

Whether the external appearance of a dental hygienist affects confidence or stability: As shown in Table 5, 86.2% of HRC students and 78.6% of NHRC students were affected by whether the external appearance of the dental hygienist had an influence on the confidence or stability, and there was a slight difference of approximately 11.0% but there was no significant difference (P>0.05).

Important qualifications that a dental hygienist should have internally: The question about the important qualifications that a dental hygienist should have internally was answered as ‘Expertise’ by both HRC and NHRC students with 43.9% and 44.6% respectively, but there was no statistically significant difference (p>0.05). Overall, expertise was 44.4%, sincerity and responsibility was 28.1%, kindness was 15.2%, and personality and cultivation was 12.4%.

**Conclusion**

As the medical environment changes, demand for oral health increases and competition among hospitals is accelerating. As a result, dental hygienists are increasingly playing a role in providing dental hygienists with access to high-quality medical services which is becoming very important because doctors and dentists cannot provide all the oral services that customer wants. In order to fulfill this role, it is important to learn about the image of dental hygiene that customers want. Therefore, this study aims to provide better medical services by examining the perception level of dental hygienists and the preference of image dental hygienists by HRC and NHRC students as well as by constructing and comparing images and services corresponding to them to provide better medical services.

In the present study, 94.0% of the students in the HRC and 74.1% of the NHRC students were aware of the dental hygienist’s perception level. This is consistent with the findings of Kim et al.\(^{(10)}\) that 100.0% of the health department, 87.8% of the non-health department, 84.1% of civil society, and 80.0% of the natural engineering department. In addition, according to additional survey data, from 81.9% of the respondents answered ‘Yes’, only 39.9% are aware of the dental hygienist’s occupation exactly. About 40 percent of people know exactly what a dental hygienist is, and about 20 percent of people do not even know about it, so it is thought that active publicity and efforts are needed to inform dental hygienists.

In the main task recognition of dental hygienists, prevention work was the highest with 41.8% in the HRC, while the dental assistant work in the NHRC was the highest with 50.9%. Moreover, 38.5% of the respondents said that the duties of the dental assistant work were the main tasks, and the second was 25.1% of the preventive duties. In the study of Kim et al.\(^{(10)}\) in 2016, 43.6% were in the first place for the dental diagnosis assistant work, 30.1% were in the second place for the plaque removal, and 25% were in the third place for the dental consulting. In addition, in the study of Choi et al.\(^{(11)}\) and Yoo et al.\(^{(12)}\) in 2004 and in 2002, 53.3% and 71.8% responded the dental hygienist’s main task were dental assistant work respectively.

Although the percentage of dental hygienists’ perceptions of dental hygienists is decreasing as the years go by, the perception of dental assistant work is stronger than prevention, education and scaling work especially in NHRC students\(^{(13)}\). In order to improve this, it is necessary to take measures to publicize dental hygienists’ work to the general public.

In the preferred images of dental hygienists, 50.7% answered ‘neat image’ and 38.8% of ‘bright facial expressions’ in HRC students and 50.0% answered ‘bright facial expressions’ and 35.7% answered ‘neat image’ in NHRC students so that both groups preferred ‘neat image’ and ‘bright facial expressions’. In addition, 86.2% and 78.6% for both HRC and NHRC students responded the external image influences to the trust and stability of dental hygienists so that it is important to have good image and bright expression in order to give confidence and stability to the dental hygienist.

Dental hygienists’ internal qualities of qualification were responded as ‘expertise’ with 43.9% and 44.6% for both HRC and NHRC, respectively. This is because the expert knowledge is one of the most important factors in the modern service, and it is one of the qualities that should be equipped.

The purpose of this study is to analyze the perception level and preference image of dental hygienists and to provide opportunities for those working in dental related services to think about the qualities of qualifications which should be considered and prepared for the future and this study can be supportive material for them. Through these efforts, it is believed that the dental hygienist’s social status will be enhanced by providing more efficient medical services and increasing awareness and role of dental hygienists in the intensified medical competition.
This study is based on the research conducted on some part of HRC and NHRC students, so it may be insufficient to generalize it. Through this study, it is possible to contribute the basic data and to establish a role as a medical professional by arranging measures to inform the general public about the dental hygienists’ work in order to provide better service and improve the patient with proper recognition of dental hygienist and formation of desirable image. Therefore, it will be necessary to carry out concrete and systematic research with a wider age group through future research.

**ABSTRACT**

**Background:** Brain injury is one of the risk factors for stress ulcers. As many as 52% of brain injury patients use inappropriate prophylaxis, this can result in gastrointestinal bleeding and may lead to death. Until now the most widely used type of prophylaxis is the H2-Antagonist receptor, Proton Pump Inhibitor (PPI) and sucralfate.

**Objective:** This study aims to determine the use of stress ulcer prophylaxis in patients with brain injury.

**Method:** Retrospective study with 43 data of patients with brain injury. The data on stress ulcer prophylaxis during the patient’s hospitalization are collected.

**Results:** There are 3 types of prophylaxis used, namely H2-Antagonists, PPIs, and Sucralfates. The most widely used type is H2-Antagonist, which is 85.7%. The next drugs were PPI by 10.39% and sucralfate by 3.90%. The route of administration is mostly through oral administration of ranitidine as much as 93.5%. Therapy can be given in single drug or in a combination.

**Conclusion:** The type of drug used for stress ulcer prophylaxis in patients with brain injury is H2-Antagonists, PPIs and Sucralfate. Prophylactic therapy can be given in single drug or in combination. The administration of omeprazole affected the performance of phenytoin and diazepam.

**Keywords:** stress ulcer prophylaxis, brain injury, H2-Antagonist, PPI

**Introduction**

Brain injury is one factor in the occurrence of stress ulcers(1). This occurs due to microcirculation of the mucosal and bicarbonate gastroduodenal barrier so that it can trigger stress ulcers and the risk of gastrointestinal bleeding(2). However, the use of stress ulcer prophylaxis in patients with high risk is inappropriate. Inappropriate use of prophylaxis can lead to increased costs of health care, side effects and drug interactions(3).

There are several factors that can trigger Stress Related Mucosal Disease (SRMD), including excessive gastric acid secretion, gastric mucosal ischemia (so that it can cause splachnic hypoperfusion). Hypoperfusion can cause an imbalance between supply and oxygen requirements so that it can induce mucosal damage. Due to this imbalance, it triggers ischemic(2). It causes cell death and induces ulcers. In addition, there is a disruption of gastric mucosal homeostasis which causes prostaglandin production to decrease, resulting in a decrease in the ability of prostaglandins to protect the gastric mucosa from gastric acid.

Stress ulcer prevention is important to prevent the erosion of the submucosal tract, gastrointestinal perforation that may lead to death. Some effective drugs that can prevent stress ulcers are drugs that can reduce gastric secretion or can increase mucosal resistance to acids or pepsin. H2-Antagonists can block the release of stomach acid by blocking the effect of histamine on...
parietal cells so it will reduces the secretes of gastric acid. H2-Antagonist drug are i.e cimetidine, ranitidine, famotidine, nizatidine.

Proton Pump Inhibitor (PPI) is one of the drugs approved by the Food and Drug Administration for prevent bleeding so that it can also be used to prevent stress ulcers\(^2\). The most widely used type is oral omeprazole. However, although it was widely used there are no controlled trials that shows the benefit or optimal dose\(^2,5\). In addition, the use of sucralfate as a mucosal secretive agent is also common in prevention of stress ulcers. The mechanism of action of sucralfate is by minimizing wounds caused by gastric acid or by inhibiting the secretion of gastric acid. Sucralfate is available in tablets or liquid slurry at a dose of 1g orally or with a nasogastric tube every 4-6 hours.

Pharmacologically, combination and single therapy can be used to prevent stress ulcers. H2-Antagonists are most widely used for a single therapy, while for combination therapy can be used H2-Antagonists with sucralfate or the combination of PPI with sucralfate\(^6,8\).

In hospital services, 76% of patients receive stress ulcer prophylaxis even though there is no indication. The risk of the appearance of stress ulcers is related to the severity of brain injury, the amount of surgery and the length of surgery. The high clinical manifestations of stress ulcers in patients with brain injury and the many problems that arise related to the administration of stress ulcers need to be studied further regarding the administration of stress ulcer prophylaxis. Including the type, dose, route of administration and duration of administration of stress ulcer prophylaxis. This study aims to determine the use of stress ulcer prophylaxis in patients with brain injury.

**Method**

This study is a non-experimental study with a descriptive and retrospective design. Samples were taken using the time limited sampling method, that ranged from July to December 2015. The study was conducted by examining the medical record data of patients that had been in surgery and experiencing stress ulcer prophylaxis from July to December 2015 at Dr. Soetomo Hospital Surabaya. The study was conducted in March - July 2016 with the research criteria of patients being neurosurgical patients.

The study was conducted on patients with inclusion criteria receiving stress ulcer prophylaxis during hospitalization. Exclusion criteria: i) moderate or suspected suffering from gastrointestinal bleeding; ii) has a history of GERD, peptic ulcer, or erosive esophagitis.

Data that had been recorded includes: medical record number, patient identity, diagnosis, comorbidities, laboratory data, clinical data, treatment profile (type of therapy, administration dose, frequency of administration and duration of administration of the drug). The data obtained is then recapitulated and then analyzed descriptively in the form of narratives, tables or graphs which include patient demographics, drug usage patterns, and possible related drug problems that occur.

**Results**

After conducting a research related to patient demographic data and administration of stress ulcer prophylaxis, the following data that had been collected, as follow.

**General Data of Respondent:** 43 patients received stress ulcer prophylaxis. As in Table 1. From 43 respondents, the majority were male, as many as 32 people. Male in this case is higher because it is estimated that the types of activities carried out are heavier than women. The most common cause of injury is traffic accidents. A total of 27 respondents are diagnosed with mild brain injury.

Table 2: Duration of Therapy

The Use of Prophylaxis in Stress Ulcer: Therapy can be administered in the form of a single or combination therapy. The result showed that the dosage and route of the drug are in accordance with the guidelines.

The Types of Therapy: Based on Table 4. From 43 respondents, 85.7% of them were using H2-antagonist as treatment. Ranitidine is always given intravenously when patients are admitted to the hospital because generally the consciousness of neurosurgical patients with brain injury are decreasing. In combination therapy, mostly use ranitidine with omeprazole or added with sucralfate.

## Discussion

From the data that has been collected, it can be concluded that patients of all respondents used several classes of stress ulcer prophylaxis, including H2-Antagonists, PPIs and Sucralfate. Based on sample analysis, the most widely used type is H2-Antagonist group which is equal to 85.7% which is an anti-acid secretion. The next drug is PPI and Sucralfate, which are 10.39% and 3.90% respectively. In America, the use of H2-antagonists is recommended as the treatment of choice by the Food and Drug Administration (9). In patients who are at risk of bleeding because of stress ulcers, additional therapy is given such as antacids and sucralfate (10).

H2-Antagonists and PPIs have the same function, namely as antisecretory, where H2-Antagonists are able to inhibit acid secretion by 60-70% (5). Therefore, administration of H2-Antagonists alone is quite effective (11,12). Combination therapy is carried out if the patient have a high risk of suffer from stress ulcer.

H2-antagonist that been used is Ranitidine. Ranitidine is the most widely used because the incidence of side effects is lowest compared to other types in the same group. Ranitidine is used in the form of intravenous injection and orally. Oral Ranitidine is used for short-term therapy or for indications of active duodenal ulcers. While intravenous injection is used in patients who are hospitalized if oral administration is not possible. Intravenous injection is more effective because it has better bioavailability and faster onset to deal with stress ulcer symptoms.

The PPI group is also an antisecretory agent but has a greater potential (10). PPI can inhibit acid secretes by 90% because PPI inhibits H + K + ATPase. PPI drugs are activated products after being absorbed systemically (13). About 50% of drug absorption is influenced by the presence of food, so the drug must be taken without a meal or 1 hour before a meal. In fasting conditions, only 10% of PPIs actively secretes acid and are susceptible to inhibition, so that peak serum concentrations coincide with maximal secretion activity. The PPI has a short half-life of about 1.5 hours, but the acid inhibition stage lasts up to 24 hours due to irreversible inactivation of the proton pump. From this group, omeprazole is widely used intravenously. PPI-class drugs are not the right drug because the inhibition of acid secretes may lead to hypochloride which can cause nosocomial infections (13). The dose of omeprazole is 20-40 mg once a day. In this study, the dosage that used was appropriate.

Sucralfate group is used to protect the stomach and intestinal mucosa and form a mucous layer so that it will protect mucosa from aggressive factors, especially gastric acid (14,15). The dose of sucralfate is 1g orally 4 times a day or 2g orally 2 times a day, the maximum dosage that can be taken are 8g a day, 1 hour before meals or before sleep. Sucralfate must be taken before meal/without meal because sucralfate can form complexes with food proteins. In this study the frequency of therapy is 1 tablespoon of sucralfate 3 times a day with a dose of 500mg/5ml each. The dosage is appropriate, not exceeding the maximum dose.

Table 4 shows the interaction between several drugs. Three patients received omeprazole therapy which was administered together with phenytoin. Omeprazole enhances the effect of phenytoin both orally and intravenously. The increase in the half-life of phenytoin is 27%. Omeprazole doses that are equal to or greater than 40 mg inhibit phenytoin metabolism. Omeprazole inhibits the liver metabolism of phenytoin and cytochrome P-450, the relatively strong CYP2C19 sub-family (16,17). This can be overcome by reducing the dose of phenytoin and must monitor the patient’s condition by examining drugs concentration in the blood. In addition, one patient received omeprazole therapy which was administered together with diazepam, where administered at the same time, it can reduce the effect of diazepam. Omeprazole increases plasma concentration of diazepam, thereby increasing the half-life elimination of diazepam by as much as 130% and omeprazole inhibiting the liver metabolism of diazepam which undergoes metabolism by cytochrome P-450-mediated oxidation in the liver
So, omeprazole extends diazepam elimination. Diazepam has a narrow therapeutic index so this can be a problem, for that it is necessary to monitor diazepam levels if administered together with omeprazole.

The duration of drug administration must be considered. PPI-class drugs are recommended not to be used for more than 7 days because they can lead to hypochloridia in patients.

This study shows that stress ulcer prophylaxis can overcome the symptoms that occur in patients, such as dyspepsia, nausea, and vomiting, that resolved after several doses of prophylactic therapy. Therapy is still administered to the patients even though the symptoms already disappeared due to prevent an increase in gastric acid reflux and to prevent gastrointestinal injury.

**Conclusion**

The type of stress ulcer prophylaxis that used is H2-antagonist, PPI and sucralfate can be added if it requires combination therapy. H2-antagonist that widely used is Ranitidine in tablet preparations. Prophylactic therapy can be given in a single way or a combination of several prophylactic drugs. The dosage are already appropriate.

**Ethical Clearance:** The research process involves participants in the survey using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

**Conflict of Interest:** The author reports no conflict of interest of this work.

**Source of Funding:** This study is done with individual funding.

Modern Lifestyles and Overnutrition among Undergraduate Students in the Northeast of Thailand

Surasak Thiabrithi, Wongsa Laohasiriwong, Teerasak Phajan

1Doctor of Public Health Program Student, 2Faculty of Public Health, Khon Kaen University, Khon Kean, Thailand; 3Sirindhorn College of Public Health, Khon Kaen, Thailand

ABSTRACT

Overnutrition among adolescents is one of major global and Thailand public health problems. However, there are limited studies on how modern lifestyle might associate with overnutrition among undergraduate students in the Northeast (NE) of Thailand.

This study aims to determine the prevalence of overnutrition and influence of modern lifestyles on overnutrition among undergraduate students. A cross-sectional study was conducted among 1,184 undergraduate students who were selected by using multistage random sampling method from three universities in the NE. A self-administered structured questionnaire was used for data collecting. The generalized linear mixed model (GLMM) analysis was used to determine the association between modern lifestyles and overnutrition among students when control other covariates and clustering effects and presenting adjusted odds ratio (Adj. OR) with 95% confident interval (CI) were used to demonstrated to strength of association.

The results, most of students were female (70.10%) with the average age of 21.24 ± 1.19 years old. The prevalence of overnutrition was 24.24 % (95% CI: 21.87- 26.76). Multivariable analysis indicated that the modern lifestyles that associated with overnutrition were: had pizza for ≥ 3 days per week (Adj. OR=3.07, 95%CI:2.16-4.36; p-value <.001), had buffet for ≥ 3 days per week (Adj. OR=3.44, 95%CI:2.51-4.71; p-value <.001), consumed carbonate beverages for ≥ 3 days per week (Adj. OR= 2.37, 95% CI: 1.70-3.28; p-value <.001), and played games via internet ≥ 3 days per week (Adj. OR=2.31, 95%CI:1.53-3.48;p-value <0 .001). A significant covariate was alcohol for ≥ 3days per week (Adj.OR=3.12, 95%CI: 2.28-4.28; p-value<.001).

Keywords: Modern lifestyles, overnutrition, undergraduate students

Introduction

Overnutrition which includes overweight and obesity have been increasing dramatically worldwide as one major public health problem especially in childhood, adolescents and adults. In 2016, about 1.9 billion people aged 18 years or over (39%) were overweight and more than 600 million (13%) were obese. In Thailand, people aged 15-29 years or about 42.70 % (41.8 % of females and 32.9% of males) were obese. The Northeast (NE) region of Thailand, the prevalence of obesity was 35.20 %. It was noted that the prevalence of obesity was very high among female (41.80%) when compared to males (32.90%). One important related lifestyle factor is consumption of modern food such as fast food which can be defines as convenience food. Increasing of modern food consumption habits as well as poor diet were identified as the most important factors of obesity among young people and adults. In addition to fast food consumption, excessive consumption, lack of physical activity or exercise, insufficient sleep were related with overweight and obesity. This lifestyle is crucial risk factors of chronic illness such as cancer, type 2 diabetes and cardiovascular disease.

In Thailand undergraduate students are mostly aged 18 to 22 years old. It is a “crisis age” from their
body, socially changes, and most importantly an identity formation. Permanent personality, lifestyle usually begins in adolescence or early adolescents with the influence of social networking and parental independence attempted. Modern lifestyles of less physical activity such as using internet or watching TV, consuming fat, flour and sugar rich diet were common among them.

There were few studies that investigated the effects of modern lifestyle of undergraduates students on their over nutrition in Thailand of which to our knowledge, there was no data on modern lifestyle and over nutrition among adolescence. Therefore, we aimed to investigate the prevalence of over nutrition and the association between modern lifestyles and over nutrition among undergraduate students when controlling other covariates.

Material and Method

This cross-sectional study was conducted in the Northeast of Thailand. The population were undergraduate students of all universities in the Northeast. The sample size was estimated by using the sample size calculation formulae for a multiple logistic regressions analysis of Heish and et al. (1998). The estimated sample size was 391 and was further adjusted to control the model over-fitting, using the rho of 0.70 and variance inflation factors (VIF) equal to 3.33. Therefore, the total sample size was 1,184. The samples were recruited by using a multistage random sampling method. The first step was that 3 universities in the NE, Khon Kean, Mahasarakham and Ubon Ratchathani Universities were randomly selected. In each university, one faculty was randomly selected from each study field of Sciences and Technology, Health Sciences, and Humanity and Social Sciences. Therefore, the total of 9 faculties were included in this study. Then, simple random sampling was applied to select the students proportional to the size of undergraduate students of each faculty. The inclusions criteria were undergraduate students who have registered in academic year 2017, aged 20 years or older, able to verbally communicate with researchers, and agreed to participate in the study with written inform consent. The exclusion criteria were having critical illness.

The research tool was a structured questionnaire consisted of 5 parts: Demographic and socioeconomics characteristics; Modern lifestyle habits; Attitude towards modern lifestyle; Body figure perception; Body mass index (BMI): The BMI was calculated as weight in kilograms divided by the square of height in meters (kg/m²), and was used classified the nutritional status using the WHO criteria for Asian population as underweight = <18.22, normal =18.5-22.99, overweight = 23-24.99, obesity = ≥25.00. Overnutrition was BMI ≥ 23.00 kg/m². The questionnaire was validated by 5 experts. The Cronbach’s alpha coefficient of modern lifestyle, and attitude toward lifestyle were 0.76 and 0.78 respectively.

Participants received the study information and explanation. The written informed consent was signed before data collection. A self-administration questionnaire was conducted for data collection. If they had questions they could asked research assistant who were waiting outside the room. The research assistants were trained and standardization for data collection process.

Statistical Analysis

The characteristics of participants were described as frequency and percentage for categorical variables; mean and standard deviation or median for continuous variables. Simple logistic regressions were used to analyses the association between individual independent factors with over nutrition. The variables with p-value < 0.25 were proceeded to a multivariable analysis modeling using a generalized linear mixed model (GLMM) to determine the influence of modern lifestyle on overnutrition when control other covariates presenting adjusted odds ratio (Adj.OR), 95% confidence intervals (CI) and p-value, of which p-value < 0.05 was considered statistically significant.

Ethical consideration: This study was conducted according to the guidelines of the Declaration of Helsinki and all procedures involving human subjects were approved by the Khon Kaen University Ethical Review Broad Committee (approval number: HE 612120). A written informed consent was obtained from all subjects before data collection.

Findings

Sociodemographic characteristics, modern lifestyles, attitude on modern lifestyles and body figure perceptions: Among a total of 1,184 undergraduate students, 70.10% were female with the average age of 21.24 ± 1.19 years old [Table1], 54.44% had average
to high levels of modern lifestyle on eating habit, on internet use (74.41%). However, 85.80 % and 81.30% had low physical activity and recreation, 49.20% had average to good levels of attitude on modern eating habit, 72.10% had poor attitude on internet use, 61.90 % had average level of attitude on exercise and 57.80% perceived of being slim and thin (57.80%), 54.10% wanted to be slim and 33.20% wanted to join weight control program. [Table 2].

Nutrition Status: Among the undergraduate students in the NE, 14.40% were overweight (95%CI=12.56-16.57), and 9.80 % (95%CI: 8.22 = 11.62) were obese. Only 53.90% were normal weight (95%CI=51.03-56.71). [Table 3].
Factors influencing overnutrition: A bivariate analysis: The bivariate analysis indicated that some modern eating habits including consumed pizza, barbecue buffet, buffet, fried chicken, French fries, buffet, coffee, alcohol, carbonate beverages ≥3 days per week were significantly associated with overnutrition. Internet use especially for game and entertainment ≥3 days per week were significantly associated with over nutrition. [Table 4].

**Discussion**

The prevalence of overnutrition was 24.24% of which 10% were obesity. At the young age of 20 to 24 years old, it is challenges for actions to prevent them from developing chronic diseases such as diabetes and cardiovascular diseases. A study in Thailand among people aged 15-29 years old indicated the prevalence of over nutrition was 25.60%. A study reports a 22.00% prevalence of overnutrition among undergraduate university students in low, middle income countries. Our results indicated weekly consumption pizza ≥ 3-7 days increased the odds of over nutrition by 3.07 times. It was common that fast foods were poor in nutrients, low in fiber, but had high energy density, glycemic load and large portion size with sugar; therefore, food consumption is positively related to overweight and obesity due to their extremely high energy density. Moreover, some studies reported that food consumption such as fried chicken, pizza were associated with overweight and obesity. Consuming extremely high amounts of food was positively correlated with weight gain. The students who had buffet ≥ 3 days weekly had 3.44 times higher odds of over nutrition. Buffet is common in the Northeast with ‘all you can eat’ for a lump sum price of 5-8.5 $. Therefore, they would consume as much as they could and gained more calories. Consumed alcohol ≥ 3 days per week were 3.12 times higher risk of overnutrition. There was positive association between alcohol intake and body weight. Calories from alcoholic beverages were equal to big meals. Consumed carbonate beverages ≥ 3 days week were 2.36 times higher chances to be overnutrition. On average of 12-oz serving, is equivalent to 10 teaspoons of table sugar, a carbonate beverage could make 15 pounds or 6.75 kilograms weight gain in 1 year. Low physical inactivity, using internet for game > 1hour for ≥3 days per week had 2.31 odds of...
overnutrition. Physical inactivity had strong association with overweight and obesity. Adults who spent more times with internet were more likely to be overnutrition\textsuperscript{18}.

The strength of this study was the large sample size, sampling technique that the samples were representative of undergraduate students in the Northeast of Thailand. Therefore, the results could be generalized to the population.

**Conclusion**

Modern lifestyles were associated with over nutrition among university students in the NE. The results from current study could be an evidence for universities, local administrations and health sectors to develop policies to promote healthy lifestyles such as food consumptions, active live with exercises, reduced times with computer and internet. Healthy public policies are essential for them to be able to modify their behaviors with supportive environments.

Dietary Diversity and Nutritional Status of Female Residential Students in University of Dhaka, Bangladesh

Marjia Sultana¹, Towhid Hasan¹, Nazma Shaheen²

¹Lecturer, Department of Food Technology and Nutrition Science, Noakhali Science and Technology University, Noakhali-3814, Bangladesh; ²Professor, Institute of Nutrition and Food Science, University of Dhaka, Dhaka-1000, Bangladesh

ABSTRACT

Background: Globally, micronutrient malnutrition has become a public health concern affecting millions of lives. Hence, the present study was undertaken to assess the dietary diversity and nutritional status of female residential students of Dhaka University.

Method: This is a cross-sectional study conducted among 180 female residential students, between 18-26 years of age, of three female dormitories of Dhaka University.

Results: The median age and BMI of the respondents were 21 years and 20.31 kg/m², respectively. About 70% of the respondents exhibited normal nutritional status with 63% had adequate micronutrients in their diets having minimum dietary diversity for women (MDD-W) ≥ 5. Significant positive associations were observed between energy and all nutrients intake, and MDD-W scores while only energy and some nutrients intake showed a positive correlation with nutritional status of the respondents.

Conclusion: The findings of the study represent the importance of diversified foods, especially among residential students who stay away from the home. The present study also confirms that high dietary diversity enhance nutrients intake thus helps to improve the diet with micronutrients adequacy. Therefore, it is needed to educate the female residential students to improve their diet quality through diversification for better nutrition and health outcome.

Keywords: dietary diversity, nutritional status, minimum dietary diversity for women (MDD-W), residential students, Bangladesh.

Introduction

Micronutrient deficiency, particularly vitamin A, iron, iodine, and zinc deficiency is a global public health concern undermining the health and welfare of millions of people worldwide.¹ The cause of these deficiencies can be many, however, a major portion of the population results from nutritional inadequacies.² As nutrition is the cornerstone of health, for proper and healthy growth and development, a balanced diet including a variety of foods from different food groups is especially needed and recommended internationally by nutritionists.³,⁴

A transition from secondary education to undergraduate level reflects one of the women’s life stages that can reshape their social and environmental situation, and impact upon their capacity to embrace healthy behaviors. Studies have shown that a female student’s dietary pattern may change notably, especially when they start living in dormitories away from home. They become accustomed to the food menu of the hall cafeteria and in the dormitory, and start taking the similar quality and quantity of foods almost every day ultimately fail to have a nutritious and diversified diet.⁵ This type of poor dietary practices may have a negative influence on their nutritional status predisposing them to undernutrition resulting in poor reproductive health

outcomes which may lead to elevated preterm births, infant death and maternal mortality. Good nutrition, therefore, is desired for them due to their prominent reproductive and productive roles in the society especially to insure healthy birth outcome.6

Dietary diversity is a qualitative measure of consumption of a variety of foods and is also a proxy indicator for micronutrient adequacy.7 A number of studies have found that higher dietary diversity is associated with the nutritional status of adult women and the World Health Organization (WHO) suggests that one of the main strategies to improve nutrient content through increase dietary diversity.8 Information on diet quality and micronutrient status of the female residential students are less readily available and incomplete. However, few studies have been conducted to understand the poor dietary habits and health behaviors among university students. The present study, therefore, was undertaken to assess the dietary diversity and nutritional status of the female residential students.

Method

Study Design and Subjects: This cross-sectional study was conducted among the residential students of three female dormitories of the Dhaka University, Bangladesh during January to March 2016. A total of 180 female residential students, aged 18-26 years, were enrolled for the present study. The study was carried out with ethical approval from the Ethical Review Committee, Faculty of Biological Science, Dhaka University and a written consent was taken from each respondent before collecting information.

Dietary Assessment and Nutrient Intake: The food intake information was recorded using a Multiple-Pass 24-h food recall. The data were collected for three consecutive days (two weekdays and one weekend), to allow for better estimation of food intake. Foods consumed over this period were converted into weights in grams using standard reference tables.9 To compute usual intake of energy and other nutrients, the data of the mean 24-h dietary intake and “Food Composition Table for Bangladesh (FCTB)”9 was used. The recommended intake of energy and nutrients were estimated based on the age and sex-specific reference values.10-12

Anthropometric Measurements: WHO recommended standardized procedures were followed to collect the anthropometric information.13 Weight was measured to the nearest 100 g using Hanso HX6000 electronic scale, and height to the nearest 0.1 cm using locally made portable wooden stick equipped with height gauges (SECA 206 Bodymeter). The body mass index (BMI) was calculated as weight (kg)/Height² (m²) and respondents with a BMI less than 18.5 kg/m² were regarded as underweight, those between 18.5-24.9 kg/m² as normal, 25.0-29.9 kg/m² as overweight, while those with BMI ≥30.0 kg/m² were regarded as obese according to the WHO classification of BMI.14

Assessment of Dietary Diversity: Dietary diversity was assessed using a standardized Food and Nutrition Technical Assistance Project (FANTA) questionnaire based on a set of 10 food groups. The 10 food groups comprise: starchy staples group, pulses, nuts and seeds, dairy, animal foods, eggs, vitamin A rich dark green leafy vegetables, other vitamin A rich fruits and vegetables, other vegetables, and other fruits. The MDD-W score is ranged from 0 to 10. MDD-W ≥ 5 represents a greater likelihood of meeting micronutrient needs than MDD-W <5.15

Statistical Analysis: Statistical analysis was performed using Statistical Package for the Social Sciences (SPSS) for Windows version 25 (SPSS Inc., Chicago, IL, USA). Mean, median, standard deviation, interquartile range (IQR), percentage and frequency distribution of the data were estimated for the parameters where required. Differences among the categorical variables were determined by Mann-Whitney U test. The relationship between nutritional status and dietary diversity was assessed using the logistic model. Spearman’s rho correlation coefficient was used to explore associations between respondent’s dietary diversity, nutrient intake and nutritional status. P < 0.05 was accepted as statistically significant for all tests.

Results

Participant Characteristics: The median (IQR) age and duration of stay in the university residence of the participants were 21 (18-26) years and 24 (1-72) months, respectively. The respective median weight, height, and BMI of the respondents were found 50 kg (ranged 33-86 kg), 160 cm (ranged 141-174 cm), and 20.31 kg/m² (ranged 14.24-32.77 kg/m²). The median (IQR) MDD-W of the respondents was 5.0 (3.0-7.0). About 56% of the respondents prepared their food by themselves while other 44% get their food from both self-cooking and hall
The prevalence of underweight (BMI < 18.5 kg/m²), and overweight and obese (BMI ≥ 25.0 kg/m²) was 23.9% and 9.10%, respectively, while 70.0% exhibited normal nutritional status (BMI 18.5-24.9 kg/m²).

**Dietary Diversity:** About 63% of the respondents had micronutrient adequacy in their diets consuming ≥ 5 food groups in the previous 24-h while other 37% not fulfilling minimum dietary diversity (10% consuming three and 27% four food groups).

Along with the starchy staples group other groups that were consumed by 100% of the respondents were dark green leafy vegetables, other vitamin-rich fruits and vegetables, and other vegetables while other fruits group was not widely consumed by the respondents (only 30%). More than 90% of the respondents consumed pulses group but nuts and seeds group were consumed by none of the respondents in the reference period. In the animal-source foods group, meat, poultry, and fish were consumed by almost all students (98%) followed by eggs (96%) and dairy group (90%).

**Food Groups Intake:** The respondent’s intake of different food groups is shown in Table 1. The consumption of starchy staples was the highest among the food groups and varied significantly within the two groups of MDD-W (307.50 vs. 287.67 g; P<0.05). Dairy and other vegetables consumption also showed a significant difference between the MDD-W groups (6.0 vs. 12.0 g and 65.15 vs. 77.85 g; P<0.05, respectively). No significant differences were noted in other food groups intake within the two groups of MDD-W.

Association between MDD-W and nutritional status:
Between the two groups of MDD-W, median BMI was higher in individuals consuming more food groups (20.06 kg/m² in <5 food groups and 20.45 kg/m² in ≥5 food groups). There were also higher percentage of female students with normal nutritional status in the high category of MDD-W than in the lower category (48.9% vs. 27.2%). However, this difference between categories was not significant (Table 3).

Discussion

The present study included the female residential students of reproductive age group (18-26 years) from university dormitories, for assessing their dietary diversity and nutritional status as they are one of the most vulnerable age groups having micronutrient deficiency.

The prevalence of underweight among female residential students was 23.9%. This result corroborates to a nationwide survey conducted in Bangladesh[16] as well as studies in Bangladesh and other countries.[17-20] This high prevalence of malnutrition among female students might due to their energy consumption.

A significant difference was observed between the dietary diversity and nutrient intakes (except for energy, carbohydrate, niacin, and vitamin B₁₂) of the respondents. Students whose diets were highly diversified had a higher nutrients intake. The findings support other similar studies conducted in India, South Africa, and Tehran.[4, 6, 21]

Although BMI was higher in individuals consuming more food groups, no significant association was observed between dietary diversity and nutritional status of the respondents in the study. This is agreeable with some other study findings.7, 22

In the present study, a positive correlation was noted between dietary diversity and energy/nutrients intake. The findings are similar to other study findings.4, 21 This suggests that nutrient intake increases with the increment of dietary diversity.

Conclusion

To inhibit the intergenerational cycle of malnutrition, amelioration of the quality of diet is thought to be the best way. The findings of the study highlight the importance of diversified foods along with adequate consumption of every food groups, especially among the residential students, staying away from the home. Present study again confirmed that a high dietary diversity score improves the nutrients intake thus helps to enhance the diet with micronutrients adequacy. There is, therefore, the need to educate and motivate the female residential students to promote behavioral change for diversifying their diet for a good nutrition and health outcome.

Conflict of Interest: None to declare.

Effect of Sponge Cylinder Exercises on The Rubber of Working Muscles to Perform Human Wheel Skill in Technical Gymnastics

Wajdan Saeed1, Fatimah Abed-Maleh1, Hoda Shehab Jary1

1University of Baghdad, Faculty of Physical Education and Sports Sciences for Girls, Iraq

ABSTRACT

The objective of the research is to prepare exercises using sponges to increase the elasticity of the working muscles to perform the human wheel skill on the treadmill in the technical gymnasium. Use the experimental method with tight control and design of the two equal groups with pre-test and post-test. The sample of the study was the third stage students in the College of Physical Education and Sports Science for Girls - University of Baghdad and the number of (38) students. The sample was selected by random sampling. After homogeneity and equivalence, the pre working muscle rubber tests were performed by the Stretch Sensor. After applying the exercises and conducting the post-tests, the researchers concluded: The use of sponge cylinder as part of the warm-up and final part of the lecture process has effectively contributed to the increase of elastic muscles operating short period of time corresponds to the time of the semester. Sponge cylinder exercises have a positive effect in the development of the technical performance of the skill of the human wheel on the treadmill device due to the evolution of rubber working muscles. Therefore, the researchers recommend using spongy cylinder exercises in similar new research with other sports events and other age groups. And the use of sponge cylinders in sports training curricula.

Keywords: Spongy exercises, rubber muscle and human wheel skill.

Introduction

Gymnastics is one of the individual sports activities performed by the player individually and thus depends on his muscular abilities in performing the motor duty on the gymnastic machines. The muscle elasticity of the muscles is the strength of the muscles. If the more elastic the muscles produce more muscular strength, the elasticity of the working muscles increases and the elongation of muscles towards development. The main muscle groups and achieving the congruence with the kinetic shape of the basic skills of sports activities is positively reflected in larger muscular production, wider motor range and thus skilled performance.1

Therefore, the researchers sought to pay attention to the technical performance through interest in the exercises of the preparatory and final section to prepare the working muscles and joints for the basic work and thus reflected on the technical performance of the skill of the human wheel as one of the skills of the ground movements.2

It is necessary to search for modern methods that increase the strength and elasticity of the muscles working in the students and improve the performance of the skills of the gymnastics, where researchers found many methods that increase muscle elasticity in the students, including the sponge cylinder, which occurs a kind of massage of the muscles through the movements of the massage guidance, which leads to those exercises when skating muscles, through the use of sponge cylinder as part of warm-up exercises in the preparatory section and the part etc. Which reduces the chances of injury to the joints and soft tissues and the speed of healing of muscles with increased muscle strength of those working muscles.3

The importance of this research is to invest in the characteristics and characteristics of sponge cylinders in the formation of muscles and increase elasticity to carry out the exercise with the basic goals, as well as investment to reorganize and arrange the muscle fibers resulting from the performance of basic exercises, an attempt by researchers to demonstrate the usefulness of a training
tool cost-effective, dangerous and easy to use And the application in the development of muscle strength and thus the performance skill through the development of muscle rubber working on the main joints in the body through the use of exercises sponge cylinders in the practical lecture to study the gymnastics for students.4

Research Objectives:

1. To identify the degree of elastic muscles working to perform the skill of the human wheel on the ground movements in the gymnastic art.

2. Number of exercises using sponges to increase the elasticity of the muscles working to perform the skill of the human wheel on the ground movements in the technical gymnastics.

3. To identify the differences between the tests pre and post experimental and control samples in the rubber muscle working to perform the skill of the human wheel on the ground movement in the technical gymnastics.

4. To identify the differences between the tests of the dimension of the experimental and control experimental samples in the rubber muscles working to perform the skill of the human wheel on the ground movements in the gymnastic art.

Hypothesis:

1. There are differences between the tests of pre and post experimental and control samples in the rubber of the muscles working to perform the skill of the human wheel on the ground movements in the gymnastic art.

2. There are differences between the tests of dimension in the experimental and control experimental samples in the rubber muscles working to perform the skill of the human wheel on the ground movements in the gymnastic art.

Research Methodology

Use the experimental approach and design of the equivalent groups with pre and post testing to suit the nature of problem solving.

Community and Sample Search: The research community represents the third stage students in the College of Physical Education and Sports Science for Girls - University of Baghdad for the academic year 2017-2018, the number of (38) students in the Division (A) (22) students and (B) 16 students. The random sample was selected in the control and experimental group, with Division (A) selected as the control group and (B) to be the experimental group.

The homogeneity of the sample was verified through pretests of muscle sprain and human wheel skill based on the Levine test to demonstrate the homogeneity of the sample. The value of Levin showed a level greater than the 0.05 mean, which means homogeneity of the sample. The experimental and control groups were equally validated by means of independent sample tests. No significant differences were found indicating the equivalence of the two groups. As in table (1).

Means, tools and devices used in research:
- Arab and foreign sources and references.
- International Information Network (Internet).
- Feedback and experimentation.
- Personal interviews
- 20 cylinder sponges.
- Surface movements legal
- Simplest Gymnastic rise (1.20) m (2).
- Colored tape and sticker.
- String Sensor (Power Sensor)
- Personal mobile device (laptop type CASIO)) Japanese-made

Used tests:

**Muscle Rubber Measurement:** The muscle rubber is measured by the electronic Styr sensor by placing it on the muscle to be measured directly rubber, and the reading appears on the screen of the device to be recorded.

Evaluation of the performance of human wheel skill on the ground floor:
- The skillful performance of the human wheel skill in accordance with international law in the Gymnasium was assessed by (3) judges in the gymnasium after shooting the skill and presenting it to them and setting a score of 10.

**Pilot study:** The pilot study was conducted on 5 female students of the research sample at 10:00 am on Tuesday, 28-2-2017 at the Gymnastic Hall in the Faculty of Physical Education and Sports Science for Girls. The purpose of this experiment was to identify the difficulty of exercise for the sample and to replace some exercises that are difficult for the players to perform exercises to fit the level of the sample. As well as the obstacles and errors that may face the researchers during the tests to overcome, and know the time it takes to perform the exercise and testing.

**Procedures of the main experiment:**

**Pretests:** The pre tests were conducted on the members of the research sample on 15/3/2017 at 9:00 am and at the Gymnastic Technical Hall in the College of Physical Education and Sports Science for Girls University of Baghdad. Taking into account all temporal and spatial conditions for application in the post-test.

**Sponges Exercises:** The researchers prepared exercises with sponge cylinders and use them in the lectures of the technical gymnastic in warm up and the final section of the lesson. The curriculum included the use of exercises that contribute to the development of elastic muscles and increase the range of mobility of the special joints associated with the skills of the floor of the gymnastics movements of the third stage students. Physical properties possessed by students to achieve the required development.

The experimental group is given the exercise group according to the time allocated in the weekly lecture within the college curriculum. The control group used warm up without the spongy cylinder, while the experimental group takes (practicing with the sponge cylinder in the preparatory and closing section of the lecture). The exercise was conducted in (15) week by two lectures (2) weekly distributed on days (Sunday and Tuesday) that exercises used to target all muscles of the body.

Examples of exercises sponge cylinders

**Posttests:** The tests were carried out after taking into account that the same conditions of pretests and at 9 am and the gymnasium technical hall in the Faculty of Physical Education and Sports Science for Girls on Monday, 8/5/2017.
View, analyze and discuss results: Table (2) shows that there are significant differences between the values of the arithmetic mean and the standard deviation values of the pre and posttests in the experimental group in the rubber gauge of the muscles to perform the skill of the human wheel. The wrong level values for all the measurements reached values below 0.05. Experimental has evolved in the rubbery muscles and performance of human wheel skill as a result of the practice of sponge cylinders.

Table (4) shows significant differences between the experimental and control groups in the values of the computational medium and the values of the standard dimensional deviations in the elasticity of the muscles to perform human wheel skill. The wrong level values for all measurements reached values below 0.05. Has developed in the rubber of the muscles and performance of the human wheel skill as a result of the practice of sponge cylinders better than the control group.

The researchers attributed the moral difference to the use of various sponges exercises (30-60) seconds for each exercise, which led to the development of muscle harmony of the muscles surrounding the joints of the body and thus improve the range of motor joints.5

MacDonald said that the use of sponges in warm-up and soothing exercises have physiological effects in increasing the elasticity of the muscles and the kinetic range of the joints of the body where the weight of the body is used to roll on the cylinder.6

This means that there is an improvement resulting from the exercise of sponge cylinders, where these exercises to mobilize the required amount of muscle fibers in different areas of the body, which increases the strength of muscle, the range of movement of the joint, as exercises sponge cylinders massage of muscle tissue.

Spongy sponge massage is very important in reducing muscle stiffness and helping to increase the range of motion. It aims to reduce muscle stiffness as well as help to increase tissue elasticity.

“The lack of muscle elasticity of the individual affects the extent to which he is acquired and mastered the performance of the basic skill, and that increased muscle stiffness makes it difficult to develop other physical qualities.”7

“The presence of muscle elasticity in the student is a prerequisite for the art of performing skills and without the presence of rubber cannot be able to obtain a strong and rapid muscle contraction, as playing muscle rubber plays an important role in the art of performance in the gymnastics, so the student needs to rubber in many working muscles On the joints of the body, the element of rubber and strength in the gymnastic of the basic elements and the task as well as other elements such as flexibility and speed agility The experimental group that used exercises sponge cylinders have evolved in rubber muscle and dynamic range better than the control group that The practice of sponges is a modern technique in the development of muscle elasticity and flexibility of the joints and thus give a wide range of movement to perform any movement that requires it.8 Sponges are working to rearrange and regulate the muscle fibers after they have been scattered as a result of effort It also provides a massage mechanism and muscle fiber drip and reduces muscle stiffness. The higher the muscle fiber is characterized by high muscle strength, the more muscle strength tests are an important indicator of the extent of muscle elasticity and lack of hardness.9

Conclusions

1. The use of sponge cylinders as part of the warm-up and closing part of the lecture process has effectively contributed to the increase of rubber muscles working short time to match the time of the semester.

2. Sponge’s exercises have a positive effect on the development of the technical performance of the human wheel skill on the treadmill device due to the evolution of rubber working muscles.

Seroprevalence of CMV Infection in Multi-Transfused Adult Patients with Haematological Malignancies: Single Iraqi Hematology Center Experience

Zaman I.L Al-Kaabi
Dept. of Laboratory and Clinical Sciences, College of Pharmacy, University of Babylon, Hilla, Iraq

ABSTRACT
Transfusion-transmitted viral infections (hepatitis B (HBV), hepatitis C (HCV), human immunodeficiency virus (HIV) and cytomegalovirus (CMV) are the most common transfusion-transmitted infections. Screening for HBV, HCV, HIV are recommended by WHO to be screened for before transfusion. The aim of the study is to determine the seroprevalence of transfusion transmitted CMV infection in a subsets of hematological malignancy patients as compared to non-transfused healthy controls. A serology for the detection of CMV IgG and IgM antibodies was done for 48 multi-transfused patients with hematological malignancies and for 96 untransfused healthy controls to determine the seroprevalence of CMV in this study which showed positive CMV IgG in 84 control subjects (87.5%) and 45 patients (93.8%) with no statistically significant association in the seroprevalence of CMV IgG and history of transfusion (P value > 0.05) while positive CMV IgM was seen in 2 control subjects (2.1%) and 10 patients (20.8%) with a statistically significant association (P value < 0.05) between the seroprevalence of positive CMV IgM with exposure to the blood products. This high prevalence result of CMV infection also mandate appropriate actions include the using of leuco-depleted filters or CMV-negative blood.

Keywords: Seroprevalence, CMV Infection, Multi-Transfused Patients, Haematological Malignancy.

Introduction
Blood and blood product transfusion is an integral component of medical practice and is essential in many treatments including hospitalized surgical and medical patients [1]. It is vital for a variety of patients with chronic anemia such as haemoglobinopathies and for those with coagulopathies [2]. In addition, transfusion is critical for patients with hematological malignancies undergoing aggressive treatment regimens. Transfusion of any blood product involves the risk of an adverse reaction, including disease transmission [3]. While stringent measures are being taken to minimize the risk of transfusion-transmitted viral infection, it may never be possible to guarantee that donor blood is absolutely safe [2].

Human cytomegalovirus infections commonly are associated with the salivary glands. Human cytomegalovirus (CMV) is a wide-spread virus and its infection may be asymptomatic in healthy people, but they can be life-threatening in an immunocompromised patient [4-6]. Congenital cytomegalovirus infection can cause morbidity and even death. After infection, CMV often remains latent, but it can reactivate at any time. Eventually, it causes mucoepidermoid carcinoma, and it may be responsible for prostate cancer. CMV infects between 60% to 70% of adults in industrialized countries and close to 100% in emerging countries. Of all herpes viruses, CMV harbors the largest number of genes dedicated to evading innate and adaptive immunity in the host. CMV represents a lifelong burden of antigenic T-cell surveillance and immune dysfunction. Congenital CMV is a leading infectious cause of deafness, learning disabilities, and intellectual disability [7].
CMV is the most significant in blood transfusion, and was previously transmitted widely, with serious consequences for some patients [8]. Once CMV is transmitted, and the primary infection clears, the virus remains dormant in myeloid cells. Vital replication and reactivation are contained primarily by cytotoxic T-cell immunity. However, when reactivation occurs, virions are released into the bloodstream and other body fluids, leading to the presence of symptoms, predominantly in immunocompromised patients [7,9]. CMV can infect a wide range of cell types, including leukocytes of monocyte-macrophage lineage and their progenitors, of which the former represent the preeminent source of transfusion-transmitted infection. Consequently, cell-depleted blood components (plasma, cryoprecipitate) do not transmit CMV and infection has not been reported [10].

Primary CMV infection in immunocompetent individuals is usually community-acquired and often asymptomatic or associated with a mild, self-limited infectious mononucleosis syndrome. The incubation period generally lasts from 1 week to 1 month and antibodies appear following resolution of infection and the development of latent state of infection. However, in virtually all cases, latent virus persists permanently in cellular reservoirs, allowing lifelong reactivation infections, or in the setting of transfusion or transplantation, viral transmission via cellular blood products, or transplanted donor organs [10]. In immunosuppressed patients, CMV infection usually leads to gastroenteritis, hepatitis and pneumonitis and rarely retinitis, encephalitis and other inflammatory conditions often associated with considerable morbidity and mortality. The reported risk of (usually asymptomatic) CMV infection in seronegative immunocompetent patients who receive non-leukocyte-reduced cellular blood components unscreened for presence of CMV antibodies is approximately 1% [8]. In contrast, the historical risk of CMV infection in immunocompromised recipients receiving CMV unscreened, non-leukocyte-reduced blood components has been reported in various studies from 13.5% to 53.3% [10].

CMV seronegative tested blood is given to immunosuppressed patients who are susceptible to acquiring CMV. Selection of CMV seronegative or leukocyte-reduced blood components for susceptible patient groups have significantly reduced the risk of transfusion-transmitted CMV infection to 0-7% [16-19]. Screening for CMV is not generally applied to all donations because the percentage of patients requiring screened blood is relatively low [8].

The aim of this study was to in order to investigate the prevalence of CMV infection in immunocompromised patients by determining CMV IgG and IgM antibodies in multi-transfused adult hematological malignancies patients.

Materials and Method

A total of forty-eight patients with hematological malignancies were enrolled into this study for determination the sero-prevalence of transfusion-transmitted CMV infection by including patients in the post-transfusion period once and excluding new patients not receiving transfusion products. The baseline data requested were concentrated mainly on patient’s name, age, sex, marital status, residence, the diagnosis of hematological malignancies type, comorbidity, blood group and Rh, whether the patient donate blood before or not, the type of blood product the patient received (packed red cells, platelet transfusion, cryoprecipitate or fresh frozen plasma) and any previous CMV infection. All patients in this study were compared with a control group (96 healthy donors) obtained from our local blood bank who was not previously transfused.

Anti-CMV IgG and Anti-CMV IgM ELISA kits (Biocheck, Inc., USA) were used in this study for the quantitative determination of CMV IgG and IgM antibodies in human serum or plasma. Purified CMV antigen is coated on the surface of microwells. Diluted patient serum was added to the wells and the CMV IgG or IgM specific antibodies, if present, bind to the antigen. The intensity of the color generated (yellow) is proportional to the amount of CMV IgG or IgM specific antibody in the sample. A CMV IgG index of 1.0 or greater, IU value greater than 1.2 is seropositive, whereas, > 1.2 IU/ml indicate prior exposure to the CMV. A CMV IgM index of 1.0 or greater is positive for IgM antibody to CMV. The data were analyzed by the computer software program Statistical Package for Social Science (SPSS, version 18/IBM.US./2007).

Results

Forty-eight patients were included in this study: 22 males (mean age 37.3 ± 18.33, age range 16-69 years) and 26 females (mean age 37.7 ± 15.7, age range 15-75
years) with different hematological malignancies. From all patients, there were 19 patients with acute myeloid leukemia (AML), 11 patients with Non-Hodgkin’s lymphoma (NHL), 9 patients with acute lymphoblastic leukemia (ALL), 6 patients with chronic lymphocytic leukemia (CLL) and 3 patients with plasma cell myeloma, or called multiple myeloma (MM). Female to male ratio, number and percentage of patients under study with different hematological malignancies are shown in Table (1), and figure (1). The demographic and clinical characteristics of all patients are shown in Table (2).

The Seroprevalance of CMV infection in this case-control study which include 96 healthy untransfused donor population as control and 48 patients showed that positive CMV IgG was seen in 84 control subjects (87.5 %) and 45 patients (93.8%) under study. There was no statistically significant association in the seroprevalence of CMV IgG and history of transfusion (P value > 0.05). Positive CMV IgM was seen in 2 control subjects (2.1 %) and 10 patients (20.8 %) under study. There was statistically significant association (P value < 0.05) between the seroprevalence of positive CMV IgM with recent exposure to the blood products. The positive results for both CMV IgG and IgM antibodies which indicated by ELISA in all patients and control group are shown in Table (2), Figure (2).

Discussion

World Health Organization (WHO) recommended optimal blood donation screening for hepatitis (HBV and HCV), HIV and CMV. The first three viruses are recommended to be tested for before transfusion in both immunocompetent and immunocompromised patients while CMV is no usually tested but testing is recommended in the immunocompromised patients [20-22].

This study showed higher prevalence of anti-CMV IgG and IgM antibodies among patients, and these findings are comparable to that reported by Alizi [23], who found that 99.1% of the Iraqi immune-compromised patients were positive for anti-CMV IgG, and 8.4% for IgM and Omer et al [24] who found that 96% of the Iraqi immune-compromised patients with acute leukemia were positive for anti-CMV IgG, and 12% for IgM. In Egypt, Loutfy et al [25] also found a high seroprevalence of CMV antibodies in both leukemic children (100%) and their
controls (100%). The detection of a high prevalence of CMV antibodies among patients and apparently healthy Iraqi people indicates that CMV infection is endemic in our country. This supports the suggestion of CMV reactivation particularly among immunocompromised patients including leukemic patients. These results show that there are at least 3 factors that may play a role in active CMV infection among immunocompromised patients; first receiving large amount of blood ensuring transfer of viable cells latently infected with CMV. The second factor may be the course of immunosuppressive therapy in different doses depending on their disease. Lastly, this variation may be due to the pathogenesis of their diseases [26].

Prevention of CMV infection in Iraq needs the adoption of Iraqi blood banks which still not adopt CMV for screening for blood donors and to provide leukocyte-depleted filters to high risk patients (including pregnant, neonates and immunocompromised patients receiving chemotherapy) which will significantly reduce the risk of transfusion-transmitted CMV infection to 0-7% [12, 16-19].

What is the risk of CMV transmission to an already CMV seropositive individual? Contact with blood products containing CMV may cause reactivation of latent CMV virus in a state of immunosuppression. Another possibility is reinfection with a new strain of CMV, as demonstrated in patients with the human immunodeficiency virus (HIV) and organ transplant recipients [27,28].

A higher risk for a severe CMV infection has been suggested following infection with a second strain of CMV [27]. It is very difficult to assess with certainty the importance of CMV transmission by blood products into already CMV seropositive patients.

Whether CMV disease occurring in seropositive patients is more or less frequently caused by a reactivation of a previous strain or by re-infection of a new strain is unknown but is likely to be strongly influenced by the existing CMV immunity in the patient and the donor [29, 30].

For years only blood from CMV-negative donors was used to transfuse CMV-negative patients. This policy is effective in preventing CMV infection, but because 50% of the population is positive for CMV antibodies, it may potentially lead to shortages of products that could be transfused to the patient [31]. Currently, leuko-reduced blood products are used since leuko-filteration of the blood is just as effective as transfusion of CMV-negative blood in preventing infections and allows greater use of all blood products [32].

Pathogen inactivation is the newest approach for CMV inactivation making blood safer. Several technologies are already available or in development and their efficacy in inactivating CMV has led to discussions on omitting CMV testing in the future. The final choice of a technique will most likely depend on the risk for severe CMV disease in the patient population as well as the efficacy, safety and costs of the chosen techniques [12].

Conclusion

There was a high prevalence of cytomegalovirus infection in the multi-transfused patients relative to healthy untransfused patients. High prevalence of CMV infection which also mandate appropriate actions include: Use of leuko-depleted filters, use of CMV-negative blood and viral inactivation methods.

ABSTRACT

In 2020 patients of Diabetes Mellitus in Indonesia increase to 7 million people. Diabetes Mellitus is characterized by increased blood glucose chemical reaction with hemoglobin that is HbA1c. It need a patient compliance in the treatment of Diabetes Mellitus. Compliance can be achieved through counseling methods. This study aims to determine the effectiveness of counseling on the level of knowledge and compliance patients of Diabetes Mellitus is measured through HbA1C.

The study is a quasi experimental design using validated questionnaires with before and after one group design. Sampling was done by purposive sampling. The sample size used as many as 21 patients. The research variables measured were the level of compliance, knowledge and HbA1c. The data analysis was conducted on the Wilcoxon Signed-Rank test to analyze differences in knowledge between before and after counseling and Paired t-test to analyze differences in compliance and HbA1c (P <0.05).

The results were significantly different in increasing knowledge with p = 0.020 and a significant difference in improving HbA1c with p = 0.023. There were no significant differences in compliance with p = 0.153. Counseling improve the knowledge however does not improve compliance patient of Diabetes Mellitus measured by HbA1c values.

Introduction

According to a WHO report in 2003, the average patient compliance with chronic disease to long-term therapy in developed countries is only 50%, while in developing countries is even lower. Noncompliance become one of the biggest medical challenges faced by health professionals and is an obstacle to the achievement of treatment goals.¹²

Diabetes mellitus (DM) is a degenerative disease polypharmacy with a long duration of therapy and chronic asymptomatic condition.³⁴ In the treatment of DM requires knowledge and compliance. Through knowledge of illness, diabetic patients expected to avoid the complications of the disease and an increase in quality of life.⁵-six
