Counseling aimed at improving treatment outcomes by maximizing the use of right medications. One of the benefits from counseling is to improve patient compliance in medication use, so the number of mortality and morbidity (both costs and loss of productivity) can be pressed.⁴In addition, patients get information and knowledge about the illness.⁷-eight

Dinoyo and Kendalsari Health Center is located in the region of 6 (six) villages, Lowokwaru District, Malang, East Java, Indonesia. The number of patients with DM who came an average of 30 people each month, but the counseling to the patient is minimal because Pharmacists just 1 (one) person. It can lower the implementation of Pharmaceutical Care and the quality of life of patients, especially patients with DM.

Material and Method

This research was conducted at Dinoyo and Kendalsari Health Center in October 2015 to February
2016 with a quasi-experimental methods, using pre-experimental design. Mechanical pengambian sample is purposive sample. This study uses a pre-test before treatment and post-test after being treated, with a design that is used is the one group pretest-posttest design. Inclusion criteria for this study were patients with DM without complications anemia, thalassemia, hemoglobinopathies, hemolytic retikulosa and accept to participate in counseling by completing the informed consent. The research instruments include video, questionnaires, leaflets, collecting pieces of data (age, gender, education, the way of drug use) and patient protocol sheet.

Step study include:
1. Selection group of patients with inclusion criteria
2. Measurement HbA1C patients and give pre-test to determine the knowledge and compliance. Pre test using a questionnaire.
3. Hold a seminar on Diabetes Mellitus.
4. After the seminar, patients received post test for knowledge, while the post-test for compliance given 2-3 months later when a re-examination of HbA1c.
5. Monitoring of treatment and the patient’s condition is conducted every month by telephone.

The questionnaires about compliance that patients use “Morisky Medication Adherence Scale” while the questionnaires about knowledge that patients also must answer the question with cross-marking the available letters below:

1. How do blood sugar levels in diabetic patients?
   A. Blood sugar levels higher than normal
   B. Lower blood sugar levels than normal
   C. Blood sugar levels under normal circumstances
   D. Blood sugar levels can be high or low

2. The main causes of diabetes are:
   A. An increase in the amount of insulin hormone in the body
   B. Decreased amount of insulin hormone in the body
   C. insulin hormone is normal in the body
   D. The amount of insulin hormone in the body can increase or decrease

3. The characteristics of diabetes are:
   A. Frequent urination
   B. Often hungry
   C. Often thirsty
   D. All of the above

4. Lifestyle changes needed for diabetics are:
   A. weight loss
   B. quit smoking
   C. Stop consuming alcohol
   D. All of the above

5. Treatment of diabetes consists of:
   A. antibiotics
   B. blood transfusion
   C. insulin
   D. Captopril

6. Diabetes can not be treated with:
   A. insulin
   B. Glibenclamide
   C. Metformin
   D. mefenamic acid

7. Complications of diseases that can arise due to diabetes are:
   A. Uric acid
   B. High blood pressure
   C. Cholesterol
   D. Influenza

8. If blood sugar levels have been good, then the use of drugs:
   A. Can be stopped immediately
   B. Can be stopped after one month
   C. Should be continued for life
   D. Consultation doctor

9. If you feel healed, will you stop taking the medicine?
   A. Stop immediately
   B. Stop after 1 month
   C. Should be continued for life
   D. Consultation doctor.
10. Normal fasting blood glucose levels for both men and women are:
   A. 200 - 300 mg/dl
   B. 105 - 230 mg/dl
   C. 70 - 110 mg/dl
   D. ≥ 110 mg/dl

11. Significant laboratory data for examination of body blood sugar levels are:
   A. HbA1C
   B. Fasting blood sugar levels
   C. Blood sugar levels 2 hours after eating
   D. Blood sugar levels are random

Results

This research obtains 25 patients of DM with appropriate inclusion criteria. Based on the scores of pre and post test knowledge, there is a difference in diabetic patients. Pre tests done before counseling, from 9 questions given through a questionnaire to get a total score of 54 while the post-test score of 69. Values are given correct =1 and incorrect = 0. Statistical tests using Wilcoxon obtained t value -2.333 with a significance level of 0.020 (p <0.05).

Based on the scores of pre and post tests HbA1c significant differences in DM patients. The difference is an increasing value of HbA1c in before and after counseling. Statistical using paired t-test obtained t value -2.471 with a significance level of 0.023 (p <0.05).

The results of pre and post scores compliance give a results of statistical test use paired t-test was data value t = 1.486 and p = 0.153 (p > 0.05) and can be interpreted no significant difference of patient compliance.

Discussion

The number that female patients (52.38%) more than male patients (47.62%). This is because most of the factors can increase the risk of type 2 diabetes experienced by women, such as pregnancy history with the baby’s birth weight> 4 kg, history of diabetes during pregnancy (gestational diabetes), obesity, use of oral contraceptives, and stress levels are high enough. Patients with gestational diabetes have a 30-50% risk to develop into type 2 diabetes mellitus.³

Factors aged 45-55 years had the highest percentage (52.38%) in this study. Age 45 years and above have a higher risk of diabetes mellitus type 2. This is mainly in older, the function of pancreatic cells and insulin secretion will be reduced, and also associated with insulin resistance due to decreased muscle mass and vascular changes, reduced physical activity.³-⁴

When viewed from the education factor, the patients of DM with elementary school have a percentage (52.38%). Lack of education can cause a person reluctant to learn science, especially the science of disease. In addition, the lifestyle of the people with elementary school are not settled, especially in terms of exercise and diet. They control the consumption of carbohydrates, fats and proteins are very rare.

Consumption OAD (Oral Antidiabetic Drug) the largest is glibenclamide (66.67%). Glibenclamide is OAD class of sulfonylureas having a reaction mechanism increases the production of insulin by the pancreas.³ Glibenclamide is used for conditions of type 2 diabetes patients with normal weight. The use of these drugs also increase the effects of hypoglycemia, althught in this riset noone(based on questionnaires ). The use of insulin also made by 2 patients with type 2 diabetes mellitus in combination with glibenclamide. A total of 19 patients received treatment OAD singly or combination. But there are 2 patients who also receive therapy Na-Diclofenac and Antalgin.

a. Analysis pre and post difference scores for the knowledge test: Increased knowledge score occur after counseling. It showed that counseling goal is reached. In accordance with the educational theory that states of the counseling should aim to educate patients. Knowledge of the patient will increase and encourage a change in behavior will be correct.³ At the time of counseling, a lot of things asked by the patient. Most questions is drug side effects and complications. There are some patients who have experienced complications up to neuropathy in their hands. Neuropathy indicates poor blood perfusion and this is supported by blood pressure data (140/80 mmHg).

b. Analysis of pre and post difference scores for HbA1c: Data retrieval HbA1c Pre and Post is 3 months. HbA1c is a substance formed by the chemical reaction of blood glucose and hemoglobin. HbA1c is formed that circulates in
the blood, such as age erytrocit is 8-12 weeks. The HbA1c is made at 3 month. The normal value for HbA1c is $\leq 5.7\%$ while the value of 5.7 to 6.4% already entered a period of prediabetes.\textsuperscript{5-10} Many of diabetic patients have a value HbA1c $> 5.7\%$ but there is 3 people have value HbA1c $\leq 5.7\%$. They was known that have DM disease 3 months ago and immediately take medication diligently and control routine to the clinic. Once a month in the health center always take measurements of fasting blood glucose (FBG). Health center does not measure HbA1c on diabetic patients because of the high price of reagents. The value of HbA1c also $> 10\%$ in 4 people (data pre). One of the DM patients with HbA1c values $> 14\%$ said that less attention to the drug has been given doctor. Patients were more likely to boiling herbal therapies or powders for its DM disease. Patients did not indicate the presence of complications because it has never perform complete blood test. High HbA1c value describes the progression of the microvascular or macrovascular complications. Any increase in the value of HbA1c can be cause of 10% the mortality of heart disease, stroke and progressive increase in the cost of therapy. HbA1c $< 7\%$ can lower the risk of complications DM.

The total value of HbA1c pre and post counseling have increase. It indicated that diabetic patients were not adherent to treatment. Noncompliance can be due to many factors such as a perception and behavior of the patient (eg, a perception of the severity of the disease, a variable sociodemographic, beliefs, attitudes and expectations that influence patient motivation to start and maintain the drinking of drugs) the interaction between the patient and doctor, interprofessional service (eg skills in giving advice can improve compliance), the policy and practice of medicine in the public created by the authorities (eg tax systems recipes, deregulation recipes), a variety of interventions that compliance in taking medication (eg pharmacist visit to the ward and ask the patient to remember about the rules in taking medication).\textsuperscript{11-12}

c. Analysis of pre and post difference scores for compliance: The absence of these differences indicate that counseling through video, information and leaflets failed to increase patient compliance. It was measured through HbA1C.

The total value of HbA1c increase after the re-measurement of 3 months later. In fact, the team provides counseling regarding the dosage, how to take the medicine, time to take medication, lifestyle and the importance of control of every month in the health center rather directly meet with the patient (at month 0) and each month over the phone.

Compliance is a patient’s level of implementing and behavioral remedies suggested by the doctor, pharmacist or by another person. Patient compliance as the extent of the patient’s behavior in accordance with the provisions given by health professionals.\textsuperscript{3} Noncompliance can be seen taking medication related to dosage, how to take medication, and the period of time to take it is not within the rules. Type of non-compliance include deliberate and accidental. Deliberate non-compliance due to limited treatment costs and patient mistrust of the effectiveness of the drug. Unintentional non-adherence due to patients forget to take medication, not understand instructions for use, errors in reading etiquette.\textsuperscript{13-14}

Some studies show that for drug efficacy can improve cure rates of patients significantly, the level of compliance in taking medication by the patient must be at least 80%.\textsuperscript{15} As a behavioral aspects of patient compliance in taking the drug can be known from the method used to measure it. The method can be used to measure compliance in taking medication is a direct and indirect method. In this study the methods used to measure patient compliance is to use indirect methods that give the questionnaire. Advantages of direct methods by giving questionnaires to patients is simple, not expensive and most widely used in the clinical setting. The weakness is very likely an error occurred and the time between visits may occur distortion.\textsuperscript{16-17}

How to improve compliance inform the patient of the benefits and the importance to achieve treatment success, reminding patients to do everything that must be done for the success of treatment by telephone and other communication tools, demonstrate to patients the drug packaging or actual show their original packaging, giving confidence to patients for an effective drug in the treatment, providing information will
noncompliance and pharmaceutical services with direct observation, visited the home immediately and medical consultation, use of compliance tools and their support of the family and friends in order to comply taking medication.18

**Conclusion**

Counseling can improve the knowledge however does not improve patient compliance measured by HbA1c values.

Protein Kinases A (PknA), a Good Target for Vaccine Design against Tuberculosis

Asra’a Adnan Abdul-Jalil¹, Samer N. Khalaf²

¹University of Anbar, College of Pharmacy; ²University of Anbar, College of Science

ABSTRACT

The tuberculosis (TB) pandemic continues to rampage despite widespread use of the Bacillus Calmette–Guérin vaccine. Novel vaccination strategies are urgently needed to arrest global transmission and prevent the uncontrolled development of multidrug-resistant forms of Mycobacterium tuberculosis.

In this study, protein sequences of PknB were collected from GenBank database at NCBI, the immunogenic protein was chosen and its 3D structure retrieved from database to use in the steps of rational vaccine design, High antigenicity value showed in (YIAPEQALGHDASPASDV) and (EFSSDPE) epitopes.

Keywords: Tuberculosis, PknB, Epitopes

Introduction

Mycobacterium tuberculosis kills more people than any other single infectious causative; an estimated 1.674 million persons died of Tuberculosis in 2016 (1). It has the potential for hidden infection to become active and cause Tuberculosis disease. During initial infection and in reactivated disease, M. tuberculosis actively replicates in vivo. Hidden infection is thought to result from major shifts in gene expression and metabolism, allowing persistence with minimal replication (2)

Vaccination has been widely used and is the most cost-effective approach for disease prevention. BCG is a live attenuated vaccine, and the only vaccine used for TB prevention. It has made great contributions in the past, even though its efficacy is dubious. However, novel vaccines principal to BCG are urgently needed to cope with the contestation TB situation (1)

M. tuberculosis has a row of proteins to ensure its existence during the course of contagion (4). Protein kinase (PKnA) has a crucial role in cell shape and division (3), which is part of an operon encoding genes involved in cell shape control and cell wall synthesis. With continuous existence of muti drug resistance strains of M. tuberculosis, the need arose for designing a vaccine against the infections with tuberculosis. The structural analysis of PKnA protein gives it a good target for vaccine design.

Materials and Method

The following databases and softwares were used in this study:

- MEGA v.6 software: used for alignment and estimation of phylogeny (5). http://69.36.184.213/mega.php
Results and Discussion

Tuberculosis is a disease rich in contrasts. It was one of the first diseases for which the causative agent (M. tuberculosis) was identified, and one of the first for which a vaccine was evolved. The success of Mtb as a pathogen is in part because of the ways in which Mtb shirks and exploits different cell subsets, to insist and cause disease. Mtb produces several molecules to prevent its recognition and devastating by immune system cells. “Bacille Calmette-Guerin (BCG)” is the only vaccine used for about 100 years against Tb, but the reasons for protection variability in populations remain unclear (13), it is effectual at inhibiting propagated disease in infants but confers highly variable efficacy against pulmonary Tuberculosis in adults, especially in the developing countries.

The protein sequences were subjected to VaxiJen v2 (14,15) to predict the most immunogenic protein, using threshold 0.4 as shown above. The sequences were aligned using COBALT and their phylogeny was estimated using MEGA software (v7) as shown in Fig I.

![Fig. I: The Neighbor Joining phylogenetic tree](image-url)
value was so small (0.00050) and this mean the protein sequences of KnA gene for *Mycobacterium tuberculosis* are very similar except the protein sequences of Colombia, Kazakhstan, china. The alignment of the protein sequences in this study shows multiple conserved regions as shown in Fig. II.

![Fig. II: Multiple sequence Alignment results of protein sequences](image)

The protein with ID CLR89265 was chosen as it is the most antigenic protein (0.5565, Table I) for further analysis.

The characters of the selected protein were estimated using ExPASy ProtParam, shown in Table II.

</table>

The results reveal that the protein is slightly positive as the residues (Arg+Lys) are more than the negatively charged residues (Asp+Glu). The isoelectric point (PI) is 10.72 i.e., slightly basic, demonstrates that the protein is non-allergen \(^{(16)}\). The GRAVY hydrophobicity is negative value 0.268 indicates that the protein is hydrophilic, other characters such as aliphatic and instability index pointed that the protein is aliphatic and stable. The immunogenic protein was analyzed for secondary structure with SPIDER2 softwares, the sequence contain high percent of B-turn and Helices structures as appeared in Fig. III.

![Fig. III: Secondary structure of immunogenic selected protein](image)

The protein sequence modeled by using I-TASSER server \(^{(17)}\) (https://zhanglab.ccmb.med.umich.edu/I-TASSER/) and choose best models which represent the tertiary structure of pkA protein as shown in fig. IV.
Fig. IV: Tertiary structure of pkA protein

As shown in the Fig the protein rich in Beta-turn (coils connected to Beta sheets), many experimental studies found that the antigenic parts of the protein belong to B-turns regions \(^\text{(18)}\).

Antigenic protein pkA was subjected to estimate the B cell and T cell (Helper and Cytotoxic) epitopes which represented the molecular targets of adaptive immune responses \(^\text{(19)}\) using the facilities provided in IEDB 3.0

**B cell epitopes:** The binding sites of antibodies to antigens sites called antigenic determinant regions, which are also called “B-cell epitopes” since antibodies are produced by B-lymphocytes. Identification of B-cell epitopes is a fundamental step for development of epitope-based vaccines \(^\text{(20)}\) and essential in several biomedical applications such as “rational vaccine design”, disease prognosis and immune therapeutics \(^\text{(21)}\).

Four epitopes resulted from using BepiPred Linear Epitope Prediction with default threshold (0.35), shown in Table III, these epitopes modeled by using PEP-FOLD 3 depending on Java Script Protein Viewer.

**Table III: Designed B cell epitopes**

High antigenicity value showed in (YIAPEQALGHDA SPASD V) and (EFSSDPE). Their locations on protein sequence surfaces were displayed by using PyMOL software as showed in fig.V.
Linear epitopes are an extension of continuous amino acids are enough for binding and conformational epitopes where key amino acid residues are brought together by protein folding (22) which can easily be used to replace antigens for immunizations and antibody production (23).

Other characters for B-cell epitopes were checked by using the tools of IEDB database, “hydrophilic amino acids” are overrepresented in the middle of the antibody depth and under-represented further away and hydrophobic amino acid are over represented close to the antibody, and usually B-cell epitopes likely to be hydrophilic (24) as shown in fig.VI multi residue were found above the threshold value (3.0) for hydrophobicity and (1.05) for beta turn prediction.

The Role of Myocardial Performance Index in Assessment of Left Ventricular Function in Patients with Valvular Mitral Regurgitation

Sameerah Rashid Jabbar¹, Noori Odah Madhee¹, Muthanna H. Al-Quraishi¹, Hayder Adnan Fawzi²

¹Department of Cardiac Surgery, Ibn Al-Bitar Teaching Hospital, Baghdad, Iraq; ²Baghdad Medical City, Baghdad Teaching Hospital, Baghdad, Iraq

ABSTRACT

Objective: evaluate the role of myocardial performance index (Tei index) in assessing left ventricular function in patients with valvular mitral regurgitation (VMR).

Materials and Method: A case control study conducted at Iraqi center for heart disease, Ibn Al-Naffees and Ibn Al-Bitar hospitals for cardiac disease. The study included 50 patients with VMR and 50 subjects as control. All participants were subjected to full echocardiographic study (in left lateral decubitus position including left ventricular systolic and diastolic function), myocardial performance index (Tei index) calculated

Results: Left ventricular ejection fraction (LVEF) was normal to all patients with mild mitral regurgitation (MR), 87% of patients with moderate MR had normal LVEF, and 92.2% of patients with severe MR had normal LVEF. There was an increase in left ventricular end systolic dimension with increase in grading of MR. Tei index was increased with higher level of MR severity, and in affected before the decline in EF.

Conclusion: Myocardial performance index is good and easily determined index in the assessment of left ventricular function in patients with MR and myocardial performance index has the ability to detect LV dysfunction earlier than ejection fraction.

Keywords: Myocardial performance index, mitral regurgitation, valvular, ejection fraction, Left ventricular dysfunction

Introduction

Mitral regurgitation (MR) is a common valvular disorder that can arise from abnormalities of any part of the mitral valve apparatus. These include the valve leaflets, annulus, chordae tendineae, and papillary muscles. The widespread use of color flow Doppler echocardiography, a sensitive technique for detecting valvular regurgitation, has increased the recognition of this lesion, even in healthy subjects. In a review of 3486 subjects in the Strong Heart Study, transthoracic echocardiography found moderate or severe MR in 1.9 and 0.2 percent, respectively.

The diagnosis in patients with suspected MR is generally confirmed by transthoracic echocardiogram (TTE). TTE is recommended in patients with known or suspected MR to determine the severity, etiology, and hemodynamic consequences of MR. Left atrial size is usually increased. LV size and systolic function are normal early in the disease course, but progressive ventricular dilation and a decline in ejection fraction occur with chronic severe MR.

Tei et al. described an echocardiographic index ‘myocardial performance index’ as a reliable assessment of both systolic and diastolic function of the left ventricle. The myocardial performance index is the summation of the isovolumetric contraction and
relaxation times divided by the ejection time. It reflects systolic and diastolic function of the left ventricle and correlates well with both peak positive and negative dP/dt 4,5. It is independent of loading conditions of the left ventricle and heart rate. Its measurement is reliable with little inter-and intra-observer variability 4.

Myocardial performance index has a narrow range of values in subjects with normal left ventricle function (0.37 ± 0.05) 4. Ventricular dysfunction prolongs isovolumetric contraction, isovolumetric relaxation and shortens ejection times, resulting in an increase of the index compared with normal subjects 5. Patients with moderate left ventricular systolic dysfunction (mean left ventricle ejection fraction 36 ± 6%) had measured myocardial performance index ranging from 0.59 ± 0.01 6. Patients with severe left ventricular systolic dysfunction (mean left ventricle ejection fraction 17 ± 7%) had myocardial performance index of 1.06 ± 0.24 7. The current work aimed to evaluate the role of Tei index in assessing left ventricular function in patients with valvular mitral regurgitation (VMR).

Method

Study Design and Setting: A cross sectional study conducted at Iraqi center for heart disease, Ibn Al-Naffees and Ibn Al-Bitar hospitals for cardiac disease. The study included 50 patients with VMR and 50 subjects as control.

Data Collected: The age of participants range from 18 to 65 years, all the patients were in sinus rhythm. All participants were subjected to full echocardiographic study (in left lateral decubitus position including left ventricular systolic and diastolic function), myocardial performance index (Tei index) calculated using the following formula:

\[
\text{Tei index} = \frac{\text{IVRT} + \text{IVCT}}{\text{ET}}
\]

Two dimensional and Doppler echocardiographic studies were performed using Philips (Envisor C-13) instrument with a 3,5 MHz transducer, the following measurements were obtained:

1. Left ventricular end-diastolic diameter (LVEDD)
2. Left ventricular end-systolic diameter (LVESD)
3. LA diameter
4. Left ventricular ejection fraction, calculated using the following equation:

\[
\text{EF} \% = \frac{\text{EDV} - \text{ESV}}{\text{EDV}} \times 100
\]

5. Functional echo findings (including Tei index)
6. Isovolumetric relaxation time (IVRT), isovolumetric contraction time (IVCT) measured with pulse wave, sample volume placed between mitral inflow and the left ventricular outflow tract.

Exclusion Criteria: Patients with ischemic heart diseases, cardiomyopathies, and aortic valve disease

Assessment of MR severity: MR were classified into mild, moderate, and severe according to:

1. Color Jet Area: The MR jet area, LA area in left parasternal long axis, and apical four chambers views were measured
   - Mild MR jet cover less than 20% of total LA area
   - Moderate MR jet cover more than 20% and less than 40% of total LA area
   - Severe MR jet cover more than 40% of total LA area

2. Vena Contracta Width (cm): It is the narrow neck of the MR jet as it traverses the regurgitant orifice, which is measured from the left parasternal long axis view
   - In mild MR, vena contracta width less than 0.3 cm
   - In moderate MR, vena contracta width is 0.3 – 0.6 cm
   - In severe MR, vena contracta width more than 0.7 cm

Statistical Analysis: Anderson darling test was done to assess if continuous variables follow normal distribution, if follow normal distribution than mean and standard deviation, discrete variables presented using there number and percentage. One way ANOVA used to analyze the differences between more than two groups (if they follow normal distribution with no significant outlier) after that in the results is significant post Hoc Tukey test will be used to find which pair is significant. SPSS 22.0.0 (Chicago, IL) used to make the statistical analysis, p value considered when appropriate to be significant if less than 0.05.
Results

In the present study, Tei index was significantly higher in MR compared to control, in which severe MR was significantly higher than moderate and mild MR patients, while no difference between moderate and mild MR patients, the rest of echocardiographic parameters are illustrated in table 1.

Discussion

In the current study fifty patients with chronic MR was examined of them 3 (6%) patients had mild MR, 34 (68%) patients had moderate MR, and 13 (26%) had severe MR.

All patients with mild MR had normal EF, 87% of patients with moderate MR had normal EF, and 92.2% of patients with severe MR had normal EF, Nasr et al found that left ventricular EF was preserved in all patients with MR, additionally they found a correlation between increased severity of LV dysfunction with increased degree of severity of MR.

In the present study EF and Tei index was assessed to evaluate LV systolic function; in severe MR patients 10 (76.9%) patients had EF above 60% in the same time 9 (69.2%) patients, this indicate with increased severity of MR there is increased in MR value, and this change appear before the change in EF. Manovit et al studied 53 patients with various mitral valve diseases, they found there was no difference in Tei index between different grades of MR severity, this finding was in disagreement with the present study, this disagreement may be related small number of patients.

In the present study there was an increase in LVESD which is associated with increased MR severity, however there was no significant correlation between Tei index with MR severity. Bruch e al found that there was significant correlation between LVES volume with Tei index (r = 0.71, p-value = 0.01).

In the present study mean LVEDD was higher in severe MR patients, however there was no correlation with Tei index across the MR grades, Manovit et al found that patients with severe MR had significantly higher LVEDD and LA volume than those with mild and moderate MR.
Nasr et al reported that Tei index is a simple, non-invasive, easy to estimate and reproducible measure of LV function. They assumed that Tei index would be a useful tool in the assessment of systolic function in the presence of MR. They compared the ability of EF and Tei index to assess the systolic function in patients with MR, they concluded that EF underestimates the presence of left ventricular dysfunction in these patients, however this was unmasked by Tei index which could be an additive tool for detecting early left ventricular dysfunction 8.

Conclusion

Tei index is a good and rapidly determined index in assessing the severity of left ventricular function in patients with MR and the ability to detect LV dysfunction earlier than change in ejection fraction

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by Ibn Al-Naffees and Ibn Al-Bitar hospitals for cardiac disease.

Lived Experiences of Egyptian Women with Breast Cancer Receiving Chemotherapy

Sanaa Loutfy Abdel-Ghany1, Bassamat Omar Ahmed2, Safaa Mohammed Hassanein3, Abeer Saad Zaghloul Eswi4

1Assistant Lecturer, 2Prof., 3Assist. Prof. Medical Surgical Nursing, 4Prof. Maternal and Newborn Health Nursing, Faculty of Nursing, Cairo University

ABSTRACT

Breast cancer is the most common cancer among women worldwide. In Egypt it accounts for 34% of reported malignancies. The aim of current study was to explore the lived experiences of Egyptian women with breast cancer receiving chemotherapy. Qualitative research approach based on phenomenological perspective was utilized in this study. Purposive sample consisting of 12 participants were recruited. Three themes were emerged from the current study: unforeseen effects of chemotherapy, troubled femininity and disturbed role function. The findings revealed the resemblance between Egyptian women with breast cancer receiving chemotherapy and women from different cultures in similar situation emphasizing shared emotions and feelings between women with breast cancer in different countries.

Keywords: lived experiences, breast cancer, chemotherapy, phenomenological study.

Introduction

Breast cancer is the most common cancer in women worldwide, contributing to 25.4% of the total number of new diagnosed cases in 2018; moreover, it is the leading cause of cancer death in females as it accounts for 13.7% of their cancer related mortality1. Actually, it accounts for 34% of reported malignancies among Egyptian women with higher incidence among urban residents and those over 40 years2.

Several treatment modalities may be used for the treatment of breast cancer, depending on the individual women’s preferences and medical situation. According to American Cancer Society, surgery ranges from breast-conserving surgery to mastectomy is surgery in which the entire breast is removed, including all of the breast tissue and sometimes other nearby tissues1. Moreover, adjuvant therapy as radiation therapy, chemotherapy or hormone manipulation may be also prescribed. Often two or more modalities may be used in combination3.

Chemotherapy is one of the highly used treatment modality prescribed for women with breast cancer, nevertheless, the main distressing one for women with breast cancer. It is associated with tremendous side effects, it is considered disabling because of its negative impact on women’s physical condition, such as fatigue, changes in general appearance, loss of sense of self and potential for an early death4,5.

Generally, the side effects of chemotherapy are an individual experience, regarding both physical and emotional drawback6. It is well known that breast cancer diagnosis and treatment with chemotherapy represents crisis situation as it affects all aspects of women’s life during and after treatment. In two qualitative studies investigating side effects of chemotherapy on women with breast cancer, both cited upper extremity motion restriction, weight gain, pain and body image disturbances, in addition, impaired psychosocial wellbeing in form of anxiety, depression, cognitive dysfunction of attention, memory and psychomotor functions domains as having a profound impact on daily functioning and quality of life7,8.

Nurses are the key members of the multidisciplinary team who serve as liaisons between oncologists and patients. Oncology nurses play critical role not only in the delivery of care; but also in patient education about the importance of recognizing as well as managing potential side effects and complications of cancer treatment and by bringing patients concerns and priorities to the attention of oncologists. Reducing chemotherapy complication with supportive care measures definitely can have a positive effect on patients’ outcome and quality. Therefore the aim of this phenomenological study was to explore the lived experiences of Egyptian women with breast cancer receiving chemotherapy.

Method

Research Questions: What are the lived experiences of Egyptian women with breast cancer receiving chemotherapy? How do Egyptian women live with breast cancer and receiving chemotherapy incorporate diagnosis and management into their lives and their bodies?

Research Design: A qualitative research approach based on phenomenological perspective was utilized to explore the lived experiences of Egyptian women with breast cancer and receiving chemotherapy.

Participants: Purposive sample was utilized to explore the phenomenon under investigation, a total of twelve women that had a confirmed diagnosis of breast cancer and treating with chemotherapy constituted the study sample; sampling process was ended when the researchers got saturated with collected data.

Tools for Data Collection: Data was collected using the following three tools that were developed by the researchers.

1. Personal Background Information Form which includes data such as age, marital status.
2. Semi-structured, face to face, open ended guided interviews.
3. Researchers field notes.

Procedure: Upon obtaining official permission to proceed with the proposed study, the researchers initiated data collection. Potential participants who agreed to participate in the study and signed the consent form including the usage of voice recorder were approached individually. All participants were interviewed twice, with the exception of six where interviewed three times for more in depth. Total number of all interviews was thirties. All interviews were held in quite places where the participants reside to ensure participants’ privacy. Each interview ranged between 30 to 60 minutes, with average total hours 15 to 30 hours; each interview required between 8-10 to be manually transcribed.

The first interview started by introducing self, while explaining the purpose and the nature of the study to develop a trust relationship with the participant. Then participants were informed to ask questions for clarification or to request discontinuation when they feel emotionally laden. Within the scope of the study the researchers tried to tailor interview according to each participants’ status by asking the probing questions in different styles as well different order. The first interview was concluded when the participants became exhausted. While, the second interview started by some clarifying questions from the researchers’ side as well as checking several responses collected from the first interview. Otherwise, third interview was held for few participants as mentioned before for more crystallization of some data. During interview sessions the researchers attempted not to interrupt the participants’ thoughts, but simplifying questions, and giving enough time for the participants to express feelings. Interviews were concluded by expressing researchers’ gratitude to the participants and assuring them of the confidentiality of their responses. Further, field notes were used mainly for writing down all remarks that occurred during the interview sessions that deemed pertinent to the study such as participants crying; shouting….etc.

Trustworthiness of Data: Trustworthiness of the research established using the four criteria developed by Lincoln & Guba’s, whereas credibility was established by sharing questions about the research process with peers. Dependability was applied by reviewing the transcripts by the researcher several times. Transferability achieved through extensive description of the study sample while conformability was established by consistently reporting of the steps of the study.

Result

The current study identified three main themes covering up the lived experiences of Egyptian women with breast cancer treated with chemotherapy and each theme divided into subthemes
Unforeseen effects of chemotherapy was the first emerged theme in which all studied participants suffered from many undesirable side effects, which mostly are described by the participants as awful. This theme was dissected further into five subthemes as follows:

Seven participants expressed information deficits about chemotherapy side effects and it was eminent from their verbatim, “I had no idea about chemotherapy”; “I heard about it, but the experience was completely different”. Further ten participants had forced dietary changes which they attributed to nausea and vomiting, it was notable from their verbatim “Of course I was annoyed because the taste and odor of food were very distasteful”; “The most undesirable effect from chemotherapy was stomach ache and vomiting”; “After first session, I had continuous vomiting, I could not tolerate food odor”.

Moreover, eleven participants expressed having drained Energy, “I feel tired all the time”; “I could not do anything and I was very tired”. While nine participants declared variable body response as follows “After chemotherapy I had severe diarrhea and numbness above my eyebrows”; “I had pain and hotness all over my body”; “During treatment with chemotherapy I could not sleep at all”. Psychological troubles were the last subtheme that seven participants experienced during administration of chemotherapy, stating “My psychological status was very bad while I was receiving chemotherapy”; “I was going to the session with a bad mood”.

Troubled femininity came out to occupy the second theme; participants expressed the negative impact of breast cancer diagnosis and the associated treatment on femininity as a consequence of breast removal as well as the resulting chemo therapy. Ten participants reported that hair loss was the main cause of spoiling their appearance “I was very annoyed when my hair started to fall”; “I did not expect that my hair will completely fall from the first session”. Feeling incomplete was the second troubled subtheme for this theme, eight participants expressed the feeling of being imperfect woman, “Now I cannot wear my usual clothes at home, I feel that I missed an important thing”; “I searched for something that looks like my breast”.

Disturbed role functions is the third extracted theme expressed by almost all studied participants, this disturbances evidenced in their roles either at homes or at work. In relation to the family role, all participants reported that they had absolute disturbances in their roles either as a house wife or as a mother. “At the time of chemotherapy, I could not do anything in the house”; “I neglected my husband and my children school work”; “My daughter was being absent from her school to serve me”.

Seven participants had troubled social interaction with friends, family members and colleges at work, “I had a lot of sick leave during treatment period”; “I deprived myself from visiting my brothers when I was on chemotherapy”.

Discussion

Three main themes were emerged from the analysis of the current study findings which are: unforeseen effects of chemotherapy, troubled femininity and disturbed role function. These findings are congruent with Nizamli9, who reported four main themes which are psychological discomfort, physical problems, social dysfunction and failure in the family role. Also, matched with Beaver10 who told three themes related to information needs and decision making; needing support and empathy; and negative impact on family.

Regarding the first theme of unforeseen effects of chemotherapy, all participants in the current study denoted that they were overwhelmed with the undesirable side effects that happened right after receiving chemotherapy. Most of them were not informed about what to expect from chemotherapy session, so; these overwhelming feelings were translated into five subthemes.

First related subtheme represented that more than half of the studied participants expressed that they were startled by the side effects of chemotherapy, that they had not enough information about it. One possible explanation of this finding would be lack of communication and time spent between health care providers including nurses and women before the start of chemotherapy session. This finding is in harmony with Uysal11 who reported that participants’ experiences many symptoms in different ratio regarding side effects of chemotherapy. So, participants needed information about the effects of chemotherapy.

The second subtheme was forced dietary changes, this could be attributed to participants gastrointestinal upset in form of anorexia, nausea…etc. This finding
is symmetrical with Salihah\textsuperscript{12} who concluded that chemotherapy induced nausea and vomiting constituted a problem that adversely affects the daily lives of women with breast cancer.

Drained energy represented the third subtheme that was extracted from the studied participants; they reported being so exhausted, easily fatigue. This may be attributed to the former subtheme forced dietary changes which led to insufficient food intake. Another possible reason could be the fact that chemotherapy causes profound declining in blood components resulting in anemia which can be contributory factor to fatigue. This interpretation is in accordance with Peoples\textsuperscript{5} who demonstrated high prevalence of clinically relevant CRF in breast cancer patients following chemotherapy.

The fourth subtheme was variable body responses, in which all studied participants communicated different forms of chemotherapy side effects such as sever persistent diarrhea, inability to walk, fainting, sleeping all the time…etc, this could be attributed to various chemotherapy protocols used, health status of each participant and the nature of body response to the chemotherapy. This finding is supported by Lawrnce\textsuperscript{13} with the main emerged theme “experiences related to the body”, with subthemes dry and sensitive skin, changes in eating and bowel habits and fever.

Psychological troubles surfaced as the last subtheme of the first theme, these troubles took many different forms such as being anxious before the session and preferred to be left alone. This finding is coherent with Al-Azri\textsuperscript{14} who indicated that diagnosis of breast cancer and its treatment can be devastating and can trigger several adverse psychological reactions such as anxiety.

The second main theme in the current study was about troubled femininity. Participants uncovered the feeling of losing their identity as women, with disturbed body image, consequently, this theme has great contribution to the interpretation of previous subtheme of psychological troubles, nevertheless, two main subthemes were emerged as follows: hair loss and feeling incomplete.

Almost all participants suffered from hair loss as a result of chemotherapy treatment, they reported that this loss was the most devastating experience they ever encountered. The fact that hair loss is prominent and easy to be recognized by others and not being informed about this side effect, might partially account for this finding. It is aligned with Jayde\textsuperscript{4} who found that the women described alopecia as the most distressing corporeal symptom.

Feeling incomplete was the second feature of troubled femininity; that participants expressed the feeling of lost femininity after mastectomy. Participants used pessimistic statements about their look and negative body image. These feelings may be attributed to the fact that breast is being regarded as a sign of womanhood. This corresponded to Koçan\textsuperscript{15} who reported that most of the participants equated their breast with femininity, and beauty.

Disturbed role function was the third theme of current study; participants expressed disturbances in both family and social role functions. Two main subthemes were shown up, family role and social interaction.

The majority of studied participants experienced disturbances in family role, it could also be linked with the former subthemes as forced dietary changes and drained energy. This finding is in the same line with Mermer\textsuperscript{8} who founded that social perception and interpretations of chemotherapy by the women with breast cancer were related to the side effects of chemotherapy and the losses of physical control.

Impaired social interaction was the second subtheme of the third theme, this could be attributed to the disease process in general and chemotherapy in particular which could be explained in the light of the former subtheme drained energy as they could not interact with others. This finding matched with Günüşen\textsuperscript{16}, who reported that women with breast cancer suffered social strain and trouble in the family role.

**Conclusion and Implications**

The themes of current study implied the resemblance between Egyptian women with breast cancer receiving chemotherapy and women from different countries in similar situation emphasizing shared emotions and feelings between women with breast cancer. The main implication of this qualitative study lies in its detailed provision of evidence based information that describes the lived experiences of Egyptian women with breast cancer receiving chemotherapy. The current study is strongly recommended that mixed method design to be applied for further research.
Conflict of Interest: No conflict of interest among authors.

Source of Funding: It is a self-funding.

Ethical Clearance: A written approval was obtained from the Ethics and Research committees of the Faculty of Nursing, Cairo University. Potential participants were asked to sign on informed consent after explaining the nature and the purpose of the study. Voluntary participation and confidentiality were assured. Data as well as the recorded voice materials were kept in a safe, locked place accessible only by the researcher.

Influence of Swallowing Exercises, Thermal Tactile Stimulation and Neuromuscular Electrical Stimulation in Treatment of Patients with Dysphagia Caused by Stroke

Emmy Bucyana¹, R. Dhanalakshmi², Sankar Ganesh³
¹PG Student MPT Ortho, ²PG Student MPT Ortho, ³Assistant Professor, SRM College of Physiotherapy, SRM Institute of science and technology, Kattankulathur

ABSTRACT

Background: Inability to swallow also known as Dysphagia is a common condition in clinical settings, and is known to affect 45-65% of individuals sooner or later after stroke. It is believed to be the principle predisposing factor for the development of respiratory and pulmonary conditions counting pneumonia, and deteriorating the expected prognosis of the patient.

Objective: The main purpose of this study was to determine the efficacy of surface electrical stimulation on infra-hyoid muscles in comparison with the thermotactile stimulation both combined with swallowing exercises in stroke survivors with dysphagia.

Methodology: A systematic random sampling was utilized to group the subjects, a number of Ten (n=10) that was divided into two groups of 5 each, participated in the study where by the experimental group only infrahyoid muscles were stimulated. The study setting was SRM Hospital and different outside private clinics in a period of 2 months.

Results: Results of the current study shown a significant difference in group experimental group (Group A) which had a neuromuscular electrical stimulation on Infra-hyoid muscles and swallowing exercises than the control group that had only thermotactile stimulation and swallowing exercises.

Conclusion: This study concluded that Neuromuscular Electrical stimulation on infra-hyoid muscles combined with Swallowing exercises would be more effective treatment for patients who are having difficulties in swallowing especially after stroke while comparing it with other conventional treatments including thermotactile stimulation.

Keywords: Dysphagia, Neuromuscular Electrical Stimulation, Infrahyoid muscles

Introduction

Swallowing disorders have become common in the patients mostly those affected by stroke it was demonstrated that paramedical professionals like physiotherapy and speech and language therapists have introduced treatment methods and techniques that shown a good impact in the rehabilitation of Dysphagia by improving Nutritional status as well as limitation of dysphagia complications and side effects.[1]

It is still unclear presently about how and which technique, dosage, duration of treatments as well as the anatomical landmarks and hence the efficacy of the treatment as far as the patient response and prognosis is concerned.

Swallowing center lies in the higher centers of the brain including the Brain cortex and the brainstem. Not all the brain injuries affect swallowing, but stroke is considered as the most intrinsic cause of swallowing.
disorders leading to various respiratory and airway abnormalities by the disrupted swallowing physiology.\cite{2}

According to Kil-Byung Lim 2009, Dysphagia affects about 45-65% of post stroke patients or stroke victims which is considered as the noticeable cause of dysphagia leading to significant cause of respiratory infections like pneumonia and the latency of the patient’s prognosis and functional stability. \cite{3}

Prognosis of a dysphasic patient following stroke is not definite. It is with this regard that the researchers and medical professionals strived to develop more effective treatment techniques to efficiently help these patients, among which the commonly used is Thermotactile stimulation that involves the use of Ice and a probe to stroke the specific posterior buccal cavity and the soft palate all to achieve the swallowing independency to the patient.

According to the recent studies, Surface neuromuscular electrical stimulation was stated as the efficient treatment of pharyngeal and dysphagia abnormalities. This involves the use of surface electrodes which help in transmission of electrical stimulations to the muscles producing muscle excitability and contractions to the local points of stimulations. \cite{4}

As there are less evidence on effect of swallowing exercises combined with thermal tactile stimulation and neuromuscular electrical stimulation and it’s inclusion in physiotherapy protocol for post stroke patients, this study focused on their effectiveness.

**Methods and Procedures**

The aim of this study was to evaluate the efficacy of surface electrical stimulation, Thermotactile stimulation both in conjunction with swallowing exercises among patients with swallowing disorders or dysphagia following stroke. Ten (n10) patients of both gender with a medical diagnosis of dysphagia due to stroke and admitted in SRM Hospital and research center Kattankulathur; from September 2017 to February 2018 participated in this study, and proven to participate voluntarily by signing an informed consent.

Subjects with a proven diagnosis of dysphagia and stroke by either MRI or CT scan were included basing on their admission sequence with a systematic sampling method in a period of five moths. Treatment sessions were 1 hour/session/Day divided into two phases 5 to 6 days depending on the patient hospital stay and prognosis. Tube dependent or lower scores of Functional Oral intake scale (FOIS) were included and classified according to their enrolment.

The population was divided into two groups; Experimental (A) and Control group (B). The placebo control group patients were treated with Thermotactile stimulation and swallowing exercises. While the experimental group was given Electrical stimulation along with swallowing exercises.

**Neuromuscular Electrical Stimulation:** According to Recent studies, neuromuscular surface electric stimulation is known to be the I deal management of swallowing disorders caused by the pharyngeal muscles weakness and dysphagia.

This kind of stimulation (NMES) which involves the usage of surface electrical stimulation to transfer electrical stimulation (NMES) uses surface electrodes to distribute the electric stimulations to the specific posterior buccal cavity and the soft palate all to achieve the swallowing independency to the patient.

The overall advantage of electrical stimulation is to enhance the muscle contractility, strength as well as endurance to regain their potential functioning. Electrical stimulation was applied by the researcher, using galvanic current of a four channeled muscle stimulator.

**Infrahyoid Muscles:** Infrahyoid muscle are responsible for depressing the hyoid bone while swallowing; therefore stimulating them and instructing the patient to voluntarily swallow, it creates a resistance against the pull against the suprahyoid muscles that pull up the hyoid bone while swallowing.

With the use of pen electrodes and stimulating the infrahyoid muscles on their bilateral anatomical landmarks just one inch lateral to the thyroid cartilage.

Swallowing exercises used in this study were; Effortful/Hard that focus on the functions of the tongue to be able to mix food and clear the buccal cavity while eating and Super-Supraglottic that involves
Breath holding maneuvers and swallowing as well as Mendelsohn and Shaker’s swallowing exercises.

**Thermotactile Stimulation:** With use of a dental mirror, Participants in the control group were stimulated while using a dental mirror that was kept in ice then it was used to stroke around their soft palates along with swallowing exercises. A cold mirror of a standardized size was used to stimulate the oral cavity. The stroking was extended from as low, sides and up of the faucial pillar depending on the capacity of the patient to expose it. To some participants the nearby surface of the tongue was stimulated others could not with stand as it could cause a sense of vomiting. Participants prior the intervention instructions were given to them where the researchers asked them to report any discomfort immediately. The same as the Electrical stimulation, the treatment sessions were 5 to 6 per week depending on the participant hospital stay, but the mean of treatment days were ranging from 3 to 5 in general.[5]

**Statistical Analysis:** The 21.7 version of statistical package for social sciences for windows was used to analyse the data for this study, whereas independent t-test was another statistical tool used to differentiate by comparing the two groups of this study (A and B) which shown a reasonable change and a significance of (p<.001) in group A as demonstrated in Table 1.

Table 1 Shows Pre and post values of stimulation and swallowing exercises among the stroke patients in the experimental group. This table shows that there is a significant difference between pre and post among group A treated with neuro muscular electrical stimulation and swallowing exercises in consideration of FOIS (Functional Oral Intake scale).

**Discussion**

The main purpose of this current study was to evaluate the efficacy of pharyngeal muscular stimulation (infra hyoid muscles) along with swallowing exercises, while comparing it with Thermotactile stimulation with swallowing exercises a lone.

Various researchers have done more on post stroke swallowing disorders including dysphagia, but most of them were not experimental based and they did not specify the anatomic landmarks to be stimulated as well as the stimulation intensity and dosage which was elaborated in this current study.

The results of this study found that treatment with neuromuscular electrical stimulation combined with swallowing exercises (Group A) was more effective than (Group B) which was treated without neuromuscular electrical stimulation but Thermotactile stimulation and swallowing exercises only. This goes in line with the results from Freed et al 2001 which showed a considerable improvement with electrical stimulation but they did not mention specific points stimulated to improve swallowing.
Less sample size was a limitation for this study, it is therefore recommended to increase the sample size for more significant results. It is with this regard that the authors assumed the cause of the obtained discrepancy of the P-Values of the two groups (p<.001) and (p<.142) present.

**Conclusion**

The results of this study concluded that Neuro Muscular Electrical Stimulation on infra-hyoid muscles combined with Swallowing exercises is a better treatment for patients with swallowing disorders after stroke than conventional stimulations alone and Thermotactile stimulation alone.

**Conflict of Interest:** Authors of this study declare that there is no conflict of interest regarding the publication of this research paper. There was only self arrangements by the authors, without any external financial support.

Lived Experience as Perceived by Patients with Implanted Cardiac Devices: A Phenomenological Study

Shaimaa Ramadan Abdelwahab1, Warda Youssef Mohamed2, Hanaa Ali Elfeky3, Nefissa Mohamed Abdel Kader4, Khaled Mohamed Taema5

1Assistant Lecturer, 2Professor, 3Assistant Professor, Critical Care and Emergency Nursing, 4Professor, Psychiatric and Mental Health Nursing, Faculty of Nursing, 5Assistant Professor, Critical Care Medicine, Faculty of Medicine, Cairo University, Egypt

ABSTRACT

Objective: Cardiac implantable electrical devices are the most effective modality of treatment for different life-threatening dysrhythmias. However, living with these devices is associated with many multidimensional challenges.

Aim: The aim of this study was to explore the lived experience as perceived by patients with implanted cardiac devices at Cairo University hospitals.

Method: A descriptive phenomenological approach was utilized; 30 participants were interviewed; the interviews were audiotaped and transcribed verbatim, then analyzed using a phenomenological content analysis.

Results: Four main themes were emerged: feeling near to death; facing ongoing challenges; adopting coping behaviors; and Reaching adaptation.

Conclusion: Cardiac devices recipients are facing many biopsychosocial challenges that need to be addressed before and after device implantation. Therefore, provision of ongoing counseling and support are essential to help cardiac devices’ recipients achieve adaptation and continue their roles after device implantation.

Keywords: lived experience, cardiac implantable devices, challenges, adaptation, phenomenology.

Introduction

Cardiac dysrhythmias are a major type of cardiovascular diseases. They remain a source of morbidity and mortality in developing countries. Approximately 80% of deaths results from ventricular arrhythmias.1,2 Cardiac implantable electrical devices (CIEDs) such as permanent pacemakers (PM), implantable cardioverter defibrillators (ICDs) and cardiac resynchronization therapy (CRT) have become an integral part of modern cardiovascular medicine and one of the greatest important advances in treatment of cardiovascular patients suffering from acute cardiac problems.3

Problems associated CIED treatment are of particular importance to health professionals. Critical care nurses as members of the health care team must have the ability to assess and manage patients’ biophysical, emotional, and socio-cultural problems that may result from different treatment modalities. They can play a key role in improving and designing effective and comprehensive quality care that meet patients’ complex and varied needs.7 Therefore, the present qualitative study aims to explore the lived experience as perceived by patients with implanted cardiac devices at Cairo University Hospital.

Material and Method

Design, participants and setting: A qualitative phenomenological research design was utilized in the
current study. It is concerned with understanding the meanings and describing life experiences from the perspective of persons involved in specific phenomenon (8). A purposive sample consisting of 30 participants was involved according to these criteria; Adults (≥18), of both genders, and after at least three months since implantation. The current study was conducted at a follow up unit affiliated to critical care medicine department in Kasr Al Aini- Cairo University Hospitals, Egypt.

**Data Collection and Analysis:** Data collection was fulfilled over a period of eight months. Semi-structured face-to-face interviews were conducted using pre-prepared interview guide, which involved open-ended questions to help elicit and capture participants’ experiences, activities, and attitudes. Each interview lasted for 30–50 minutes. Data collection continued until data saturation was reached (the point where no new information emerged). All interviews were audio recorded and verbatim transcription was done by the researcher. A second interview via telephone were conducted after data analysis to make sure that the study findings reflects the participants’ own experiences. Data was analyzed following the guidelines for phenomenological analysis as proposed by Giorgi (2009).8

**Ethical Considerations:** Approvals were attained from the ethical committee at faculty of Nursing - Cairo university and the director of the selected critical care unit. Participation in the study was voluntarily and based on the participants’ agreement. Purpose and nature of the study were explained for all participants and informed consents were signed before recording the interviews.

**Findings**

The current study revealed that more than one half of involved participants were adults (in the age group between ≤ 40 -59 years with a mean of 51.77 ± SD 13.89), males, employees, had secondary school education, and came from urban areas in percentages of 53.3%, 60%, 50%, and 63% respectively. The great majority (83.3 %) of participants were married. As Regards medical data, the most common type of implanted cardiac devices was pacemaker. It was found among more than one half (56.6%) of participants, followed by the ICD among 20% of participants (Figure 1). More than half (56.6%) of the participants had undergone devices implantation once. The time since device implantation for nearly half of participants (48%) ranged from (one to five years) post implantation (Figure 2). Four main themes were identified through analysis and interpretation of obtained data: feeling near to death; facing ongoing challenges; adopting coping behaviors and reaching adaptation (Table 1).

![Figure 1: Percentage Distribution of the Participants As Regards Type of Implanted Cardiac Device (N = 30)](image1)

![Figure 2: Percentage Distribution of the Participants as Regards to Time Since Implantation (N = 30)](image2)

**Feeling Near to Death:** Feeling near to death is the first main theme emerged from data analysis. It describes the initial impact of diagnosis and pre-implantation time as reflected by many of participants who indicated that, the
deterioration in their heart function was considered as a near to death experience that in turn led to many life alterations and psychological disturbances. This theme covers two sub-themes: unpredicted life events; and cardiac device implantation as the only choice

Unpredicted Life Event: Involved participants reacted differently to their diagnosis and cardiac devices. Approximately, one quarter (26.6%) perceived their medical diagnosis as a serious and unpredicted event. They used different terms to describe their feelings when cardiac devices were suggested, such as getting shocked, being in crises, fear, panic and psychologically disturbed when cardiac devices were suggested. e.g. “When I knew that I need a device, I just collapsed... I didn’t expect that my condition requires a device...The doctor told me that I’ll live with device forever which made me shocked” (Participant: 17).

Cardiac Device Implantation as the Only Choice: Getting a cardiac device was not an easy choice for involved participants. More than one third (40%) indicated that, they were faced with decision making regarding getting cardiac devices or not. Participants believed that their doctors knew and selected the best for them, so they decided to accept doctors’ recommendations. One of participants reflected that: “I didn’t have another choice. ... He tells me (physician) either to die or to implant the device. What can I do? I had no choice rather than having it inserted” (Participant: 19).

Facing Ongoing Challenges: Despite providing significant benefits for many of participants, cardiac devices implantation created new challenges for different aspects of life:

Dependency on the Device: All Participants (100%) were aware that they became totally dependent on their devices forever. This caused feeling of vulnerability and uncertainty over their lives with greater emphasis on keeping and monitoring the device’s functioning for maintain surviving and facing death. For example: participants stated: ‘Sometimes my son sits next to me and asks: “Mum, won’t you remove the device and live like us?” I tell him that If I removed the device I would die” (she seemed sad) (Participant: 20).

Imposed Life Restrictions: Imposed life restrictions were emerged among approximately two thirds (60%) of participants who perceived that many routine activities of daily living, sports, and work as unsafe for their devices’ functioning. Therefore, they put limitations on activities, sleep and occupations. ‘After device implantation, I cannot carry heavy things or practice exercise. .. I like playing football, but now I cannot play even with my children... even sleeping, it (pacemaker) prevents me from sleeping on lateral side” (Participant: 16).

Experience with ICD Shock: In the current study, some of implantable cardioverter defibrillator recipients (30%) described the given electric shock as an event which is extremely painful, traumatic, anxiety-provoking and scary for both participants and who are witnesses at shock time. Participants used terms such as explosion or blow of bomb, feeling like a strong electric current, or seeing light flashes, to describe high intensity of pain associated with shocks. “I wish that shock not to be experienced by any one ... It looks like if you are holding high electricity ... anyone stands in front of me at the time of delivering shock must cry from the horror and pain that I feel” (Participant: 17); and “Shock is very strong and painful ... I felt pain like a gas tube explode in my chest” (Participant: 22).

Social Role Change: Many participants experienced significant changes in their social roles because of illness and having ICDs. Also, they felt incompetent in performing roles they had within their family or work due to imposed changes of the devices on employment or work, for example, some participants worked part-time in spite of full time, while others left their work and were concerned about finding more suitable jobs. “I stopped working because I am strictly forbidden from working as a driver... This was the decision of medical committee... and I have no other job other than driving which I had worked for 37 years” (Participant: 19).

Adopting Coping Behaviors: This third main theme implied problem-focused and emotional-focused coping strategies that were used to achieve adaptation and to tolerate the negative feelings associated with device related stressors.

Avoidance Behavior: This subtheme was indicated by 50% of participants who avoided certain behaviors as a main coping strategy for self and device protection. Therefore, they avoided engaging in certain activities that were considered risky. “I avoid things that affect the device ...I must avoid being near to towers of electricity and electronic corridors ... I always keep the mobile far from the pacemaker”. (Participant: 25)

Seeking Information/Counseling: Participants in the current study indicated their need for understanding, as well as seeking information and guidance regarding their devices’. In particular, ICD recipients indicated their
need to more detailed instructions regarding ICD shock. e.g. one participant reported that seeking information offered an opportunity to share and compare experience with others who have the same condition; “I wish I could sit with someone who has the device even if by chance to ask ‘what is happening to him/her’...when I want to know any information about pacemaker I access the internet and watch it” (Participant: 7).

**Having Social Support:** More than two thirds (63.3%) of the current study participants expressed their receiving adequate support. Family, friends, and health care professionals were the main sources of social support. e.g. “All people including my family and my colleagues or anyone who know that I have an implanted device offer me help, they always ask me not to carry or do anything”. (Participant: 7)

**Reaching Adaptation:** Approximately 70% of participants showed and clearly verbalized adaptations to life after their devices’ implantation. This appeared especially prominent after passing the first few years post implantation. Participants also expressed a sense of acceptance of their altered health status and device-imposed limitations.

**Feeling of Security:** This subtheme was frequently mentioned by many participants. They recognized the benefits of cardiac devices as “a mean of defence” and ‘source of security. This feeling seemed to be more obvious in participants who experienced loss of consciousness or previous cardiac arrest. Thus, they felt that their initial insecurity and near to death attacks changed to a feeling of security. “I was afraid to be alone at home because the doctor told me that it is possible to die at any moment to the extent that I thought to change my apartment and live next to a hospital ... But praise be to God who guided me to the device, thus it gives me reassurance ... The best thing it provided for me is a feeling of safety” (Participant: 12).

**The Feeling of Gratefulness Toward Device:** Several participants consistently showed positive emotional responses toward their devices and verbalized feeling of gratefulness to advanced technology. They described the device as a valuable life-saver which helped them for being alive. “This (pacemaker) is my breathing... one is considered as if he is living by artificial heart, this is what helps me to live Praise be to God for presence of the device” (Participant: 27)

**Discussion**

The current study showed that cardiac device implantation represented a stressful and unpredicted event. It also represented life crisis and caused a feeling of near to death among many participants. In this regards Paslar revealed that, having an ICD is considered a new situation that leads to ambiguity and surprise for patients. It results in an unknown feeling of uncertainty and leaving patients alone in permanent anxiety. ‘Cardiac illness “from the researchers’ point of view” is considered as a turning point in individual’s life, during which patients may face overwhelming feelings of fatigue, helplessness, or long-term changes in their abilities.

Facing challenges was the second main theme in participants’ experience of living with pacemakers and/or ICDs. These challenges were reported in form of different physical and psychosocial problems associated with devices. In this regards Ghojazadeh et al. reported that physical, financial and socialization problems, where participants intended to limit their physical activities to keep their devices’ functioning. In contrary, Conelius studied the experience in living with ICDs and indicated that participants described the process of device implantation as easy and nothing changed in their everyday lives. This contradiction “from the researchers’ point of view” could be related to the type of device, diagnosis, associated comorbidities, lifestyle and cultural background.

Participants reported multiple sources of anxiety and fear while living with pacemakers and/or ICDs, one of these sources was anxiety about device malfunction. Therefore, they were cautious when performing usual activities. Similarly, Abbassi et al. indicated that most participants were concerned about device’s malfunction and possible displacement of the leads. Excessive fear of device malfunction may be due to conflicting or unclear medical advice. Also, in some instances concept of having a foreign device inside of the body forever, might cause fear and insecurity feelings.

Social support was evident in every aspect of participants’ coping and contributed to better adaptation after device implantation. In this regards, previous studies have emphasized the importance of psychological support from family members, friends, peers, and health professionals. In addition, professional therapeutic relationship is beneficial for ICD recipients and found that non-constructive support is associated with increased post-traumatic stress disorder (PTSD) symptoms. However, other studies have showed contradicting
findings where they indicated that not everyone was comfortable to receive help as occasionally some participants reported their feeling of overprotection and imposed restrictions from family members, so by time they rejected family members’ overprotective behaviors and struggled for independence. Despite having contradicting findings, it is important to emphasize the role of social support resources in optimizing coping behavior and developing positive psychosocial adjustment in patients with chronic diseases.

Although Participants complained of life restrictions imposed by the device, many of them expressed positive emotional responses toward device and verbalized their appreciation to such advanced technology. Similarly, Starrenburg et al. found that participants appreciated the device for its lifesaving abilities and improvement of symptoms. Thus, when experiencing life threatening symptoms, these devices may be seen as gifts which give them a new chance for better quality of life. Hence, feeling gratefulness was prominent among many of the participants.

Conclusion

Findings of the current study have provided understanding for how patients with cardiac implantable electrical devices are affected physically, socially and psychologically after their devices’ implantation. Therefore, establishing planned discharge teaching and providing supportive care are important for this category of patients.

ABSTRACT
Diabetes Mellitus (DM) is a metabolic disorder characterized by increased glucose level in the blood, resulting from defect in the insulin secretion, insulin action, or both. In advanced stage of disease; peripheral circulation of lower extremities is impaired which increases the risk for developing peripheral arterial diseases (PAD). Buerger Exercises is a simple intervention for improving the peripheral circulation of patients with diabetes mellitus. The aim of the current study was to assess the effect of Buerger Exercises on improving the peripheral circulation among patients with type 2 DM as assessed by Ankle Brachial Index (ABI) scale. Quasi experimental design was used. A non-probability purposive sample consists of sixty male and female adult patients with type 2 DM were selected. The study findings revealed that the post intervention mean ABI scores of both legs (Rt leg =1.097, Lt leg =1.086) were significantly higher than pre-intervention scores (Rt leg =.885, Lt leg =.937) (p=0.001). The use of Buerger Exercises is effective in improving the perfusion of lower extremities. Therefore, it is recommended that Buerger Exercises can be used to improve the peripheral circulation of lower extremities among patients with type 2 diabetes mellitus.

Keywords: Peripheral circulation, Buerger exercises, type 2 Diabetes mellitus

Introduction
Diabetes Mellitus (DM) is becoming one of the increasing health problems’ concern worldwide. Half of patients with DM were undiagnosed and about 4 out of 5 patients live in low and middle income countries. According to the World Health Organization (WHO)1; Diabetes is a pandemic disease affecting more than 415 million adults worldwide. This number is expected to surge to 642 million by 2040, diabetes will become the seventh leading cause of death worldwide with diabetes deaths expected to rise by 50% during the next 10 years2.

According to the International Diabetes Federation (IDF), Egypt is one of the top 10 countries in the number of people with diabetes between 20 and 79 years of age, with 8.5 million of and around 4.5 million undiagnosed. Consequences of the compromised vascular system in DM are among the most devastating complications. Both macro and micro-vascular diseases are believed to contribute to the consequences of peripheral vascular disease(PVD) 3.

The risk of PVD is increased in patients with DM, it occurs earlier and is often more severe and diffuse, leading to ischemic ulcers, gangrene and possible amputation, it is also a marker for generalized atherosclerosis and impaired peripheral circulation of lower extremities4. The use of ankle-brachial index (ABI) provides a measure of blood flow to lower extremities. This could help in early detection, initiate early therapy and reduce the risk of limb ischemia and amputation. It is recommended that patients with DM should be screened annually for impaired peripheral circulation5.

There are many modalities to improve the lower extremities’ perfusion such, Buerger exercises which
considered one of the low cost and simple physical interventions to stimulate the development of collateral circulation in lower extremities. The exercises were proposed in 1924 by Leo Buerger and modified by Arthur Allen in 1931.

The mechanism of Buerger exercises depend on the use of gravitational changes in positions that are applied to the smooth musculature of vessels and to the vascular bed of lower extremities. Gravity helps alternately to empty and fill the blood vessels, which can eventually increase transportation of blood through it. Buerger exercises drained engorged vessels by using postural changes. However in spite of its simplicity, the application of these exercises to patients with diabetes is very rare, and the clinical significance of peripheral circulation improvement is still limited due to the lack of measuring tools.

Nurses should focus on the prevention of impaired peripheral circulation among patients with DM by early recognition and detection of those at risk. An awareness of diagnostic and treatment strategies will enable nurses to educate patients. This will help to improve both concordance with treatment and disease outcome. Therefore, the aim of the current study was to evaluate the effect of Buerger exercises on improving the peripheral circulation of the lower extremities among patients with type 2 DM.

Hypotheses:
H1: There is a statistical significant difference between the pre and post interventional mean scores of ankle brachial index (ABI) of the study participants after five days.

H2: There is a statistical significant difference between the pre and post interventional mean scores of ankle brachial index (ABI) of the study participants after fifteen days.

Method

Selection and Description of Participants: A non-probability purposive sample consists of sixty male and female adult patients who met the inclusion and exclusion criteria were selected for the study from the medical departments of a selected university hospital in Cairo, Egypt.

Inclusion and Exclusion Criteria: Patients diagnosed with type 2 DM according to WHO criteria, with regular treatment, had ABI score of 0.7 up to .99 were eligible to be included in the study. Patients who had: previous re-vascularization, hyperglycemia above 300 mg/dl, uncontrolled hypertension (BP≥160/100 mmHg, Extreme obesity (BMI ≥37.5 kg/m2, and sever edema according to level (sever edema (4): up to the groin) and severity (+4), active foot ulcer, gangrene and history of amputation, were excluded.

Data Collection Tools:

Peripheral Circulation Assessment Tool (PCAT): Tool was developed by the researcher guided by extensive literature review. It consists of three parts:

Part 1: Demographic Data: age, gender, education.

Part 2: Medical History and General Health Status: duration of diabetes, blood sugar, blood pressure, weight, height & body mass index (BMI).

Part 3: Assessment of ABI Value: The ankle-brachial index (ABI) is the ratio of the blood pressure at the ankle to the blood pressure in the upper arm (brachium).

\[
\text{Ankle Brachial Index} = \frac{\text{Highest ankle pressure}}{\text{Highest brachial arm pressure}}
\]

Interpretations of ABI:
- Normal ABI ranges from 1.0 — 1.4
- Values above 1.4 suggest a non-compressible calcified vessel.
- Value below 0.9 is considered diagnostic of peripheral arterial disease (PAD) and less than 0.5 suggests severe PAD, according to the American Heart Association (AHA) guidelines.

Tool Validity and Reliability: Tool validity was assured and was also tested for internal consistency by test-retest reliability. Cronbach’s alpha was 0.99.

Procedure: Patients who met the inclusion criteria for the study were approached by the researcher; individualized interview session was conducted to collect data related to the demographic and medical data. Ankle Brachial Index (ABI) of the lower extremities of the study participants were assessed and recorded. Buerger exercises as a study intervention (independent variable) was administered on the same day and continued 2-3
times for 15 days for each patient. Post assessment of ABI was done on the fifth and 15th day using the same scale. Buerger Exercises were performed and taught for each participant in the following position sequence:

- Elevation of lower extremities to a 45 to 90 degree and keep in position until the skin blanches (appears dead white);
- Put lower extremities below the level of the rest of the body until redness appear; Flexion, extension, and circumduction of the ankles are done during this phase of dependency.
- Finally, the lower extremities are placed flat on the bed (horizontal) for a few minutes.

The length of time for each position varies with the patient’s tolerance and the speed within which color change occurs. Usually the exercises were prescribed for about 12 -15 minutes. The final overall effect was determined by comparing ABI pre and post-test scores of the participants.

**Statistical Analysis:** Data were coded and analyzed using SPSS, version 20. Shapiro-wilk Normality test was done. Descriptive statistics including frequency distribution, mean, and standard deviations, as well as inferential statistics such as Wilcoxon test were used to examine the relationships between variables. A p-value less than 0.05 were considered statistically significant.

**Results**

Table (2) illustrates that about three quarters of participants had a systolic blood pressure ranged from 120 to 140 mmHg, while more than half had a diastolic blood pressure ranged from 60 to >75 mmHg. Participants’ random blood sugar ranged from 102 – 250 mg/dl. About one third of participants were diabetics since one to > five years, and one third were from five to > 10 years. More than half of participants were overweight.
Figure 1: Percentage distribution of ankle brachial index (ABI) scores of the Rt & Lt legs among participants in the pre intervention, 1st & 2nd post-intervention (n = 60)

The Figure depicts the changes which happened between the ABI categories for both Rt and Lt legs. Before intervention; more than half of the participants had mild ABI value in the Rt leg and borderline in Lt leg while the minority had normal ABI, whereas after performing Buerger exercises for five days (post 1): Percentage of mild category decreased while the borderline and normal ones increased. In 2nd post intervention after 15 days; the majority of participants moved to the normal category for both legs. The shift of the participants from each category to another revealed the improvement of the lower extremities’ peripheral circulation after performing Buerger exercises.

* significant > 0.05

There was a gradual increase of the ABI mean scores in terms of improvement of the peripheral circulation after exercises. There was no statistical difference found between the ABI mean scores of pre intervention and 1st post intervention. On the other hand, there was a high statistical difference found between the ABI mean scores of pre intervention and 2nd post intervention and also between 1st and 2nd post interventions.

Discussion

The present study results revealed that ABI mean scores before performing Buerger exercises in the right and left legs were .885 and .937 respectively, while the mean scores after were 1.097 and 1.086, in the right and left legs respectively.

According to WHO index for blood pressure; the study findings regarding blood pressure showed that participants were in the pre-hypertension category which means that they are at increased risk for developing hypertension and subsequently impaired peripheral circulation especially that they are diabetics. This is congruent with Makin10 and Priya11, who reported that the diabetic patients, with elevated blood pressure, long disease duration and obesity; are at a greater risk to develop impaired circulation of lower extremities.
Ankle brachial (ABI) mean scores after performing Buerger exercises for five days didn’t show any significant difference between pre intervention mean scores so the 1st hypothesis was not supported. It might be due to the short period to produce effect from performing the exercises. Also as any exercise program; increasing the duration and compliance might help in producing the desired results. The current study results were concurrent with some studies 12,13, While it weren’t matched with other studies 8,11 as there was a significant difference after five days.

Regarding the results related to the 2nd post intervention which was assessed after 15 days, a significant difference and acceptable level of improvement of ABI mean scores was presented as there was an observable shift from each category to another. In a simple way, the participants improved from mild-moderate ABI to borderline and from borderline to normal as shown in fig (1). This mean that performing Buerger exercises for 15 days is more effective in improving peripheral circulation. So the 2nd hypothesis was supported and verified. These results were supported and concurrent with Sathya, Vijayabarathi & Mehani12-14 who reported a significant difference after using exercises for 15 days as recommended.

The resulted change might be due to the sufficient period that help in establishing new collaterals of the lower extremities and improve the peripheral circulation, and perfusion, which was presented as acceptable ABI values. These findings were supported by the AHA9 and ADF3 guidelines which emphasized the importance of performing exercises regularly than other invasive procedures to maintain lower extremities’ perfusion.

**Conclusion and Implications**

The current study concluded that Buerger exercises are effective noninvasive intervention that helps in improving the peripheral circulation of lower extremities among patients with type 2 diabetes mellitus.

The study recommended the following:

- Replication of the study by using a large sample from different geographical areas, and different settings, and for long duration.
- A comparative study is recommended to evaluate the effectiveness of Buerger exercise with other non-pharmacological measures for improving the level of lower extremity perfusion.

- Evidence based nursing practice should be encouraged for applying Buerger exercises to prevent PAD among diabetic patients.
- There is a need for further investigation of standardized procedures of Buerger exercises.
- More studies are needed on the prevention of diabetic foot using Buerger exercises.

**Conflict of Interest:** No conflict of interest among authors.

**Source of Funding:** It is a self-funding.

**Ethical Consideration:** A written initial approval was obtained from the ethics and research committee of the Faculty of Nursing - Cairo University. Written informed consent was obtained from each patient after explaining the nature & purpose of the study. Patients were informed that participation in the study was entirely voluntary and anonymity and confidentiality of the data were assured.

ABSTRACT

Breastfeeding is an important issue for infant health, knowledge of new mothers has important role in their practice to breast fed their children. The objective of this study to assess the knowledge about breastfeeding issues among group of Iraqi female students in Wasit province. A total of 384 female students were enrolled in the study. Data collected using a pre-constructed data collection form (questionnaire) with 19 questions to assess the responses of students about the breast feeding issues. Total score then categorized to be adequate or inadequate. Data analysis and management were performed using statistical software and appropriate statistical tests applied accordingly. Findings revealed that 78.1% of the students had adequate knowledge. In conclusion the overall knowledge of the students about the breastfeeding issues was adequate and not affected by their age or educational level of their parents.

Keywords: Breastfeeding, Epidemiology, Knowledge

Introduction

Breastfeeding refers to the usual means for offering young infants nutrients that are essential to their healthy development and growth¹. Breastfeeding, alongside its numerous health roles to the children, mothers, and infants is the main approach to improving the general health of the community². Breastmilk creates a health, equal, and smart world. The universal breastfeeding can help to counter 823000 infant and 20000 maternal deaths that occur yearly, and assist to reduce medical costs by $300 billion. In relation to the economic and health, breastfeeding’s benefits include bolstering intelligence, reducing infection, and prevention of cancer in mothers as well as protection against diabetes and overweight¹. Breastfeeding is among the cost-effective-- and best – means of improving and saving infant lives all over the world, resulting in long-lasting health advantages to the mothers and infants. Breastfeeding does not only function as a cornerstone of an infant’s healthy growth, but also works as the basis for a nation’s growth. Therefore, embracing breastfeeding is among the best investments nations may pursue to ensure the wellbeing for people—and hence, their enduring ability ³,⁴. For instance Iraq’s nutrition information for children illustrated that timely breastfeeding, breastfeeding that is less than 6 months, breastfeeding while 2 years old, had the following proportions 19.6%, 22.7%, and 42.8% as per the period ranging from 2008 to 2012, however, these proportions are below the global and regional goals ⁵. Marriage factors such as husband’s age, age at first marriage, and consanguinity. The legally allowed age to get married in Iraq is 18 years and above, despite the fact that some people at age 12 to 14 may be already in marriage ⁶. The more educated a woman at adolescent stage is, the more probable she is to apply the best family planning approaches, delayed childbearing and marriage, be stable financially and have healthier and a few children. Registering and holding female learners in school is hence very significant when it comes to infant and maternal health, to add to all the other positive aspects of education⁷. Pre-motherhood period is a critical for health promotion and increase health awareness about maternal and child health (MCH) especially infant feeding. Several studies assessed knowledge of mothers regard breastfeeding issues in different settings but, in our province there is no one, therefore, this research aimed

at examining the knowledge issues of Iraqi girls aged 15-19 years old about breastfeeding in education settings in Wasit it province/2017 7,8. According to the Oxford dictionary, Knowledge refer to information, skills, and facts obtained through education and experience; the practical or theoretical knowledge regarding the topic, information regarding or understanding of the topic obtained through study or experience, either common to an individual or the general public9.

**Subjects and Method**

**Study Design and Sampling Technique:** A multi-stages cross-sectional study targeted female students in 12 secondary schools in Al-kut city the Centre of Wasit Province in 2017. Sample size was 384 students calculated according to standard equation for cross-sectional studies 10.

**Measurement and Data Collection:** Data collection of socio-demographic (age of students, parents educational level) and knowledge issues of breastfeeding profile carried out by an anonymous self-administered translated questionnaire11. Written and verbal consent obtained from General Directorate of Education, school managerial personnel and all students. All data collected during period 12/3/2017 to 12/4/2017. Timeframe is 2-3 days in a week, 1-2 hours in a day.

**Scoring:** The responses in regard to knowledge were computed and scored. In relation to the responses, answers were computed through application of the model key response sheet that was created by the investigator previously. The responses of the participant students scored (one) for the correct response and (zero) for incorrect response. For every knowledge area, the outcomes of the items were totaled and the summation divided by the number of items, assigning an average score to every area. The total knowledge items was 19 and they results in a total score of 19. The poorly rated knowledge obtained < 10 scores and this transformed into 50 percent or less; they assigned as inadequate knowledge. Those obtained a score ranging from 10 to 19 (> 50 percent) assigned as adequate knowledge.

The final knowledge outcome was assigned as inadequate or adequate knowledge and compared across the age of students and their parents level of knowledge

**Statistical Analysis:** Data entered and analyzed by using SPSS V 0.17. Descriptive statistics presented as frequency, percentage, mean and standard deviation. For analytical statistics, Chi-squared test used to assess the association between age of students and the level of knowledge. Bivariate correlation test (Spearman’s test) used to assess the correlation between the mean overall knowledge score across the parents’ level of education were used, correlation coefficient was calculated \( R \).

Value of \( R \) ranged between zero and One, the larger \( R \) value close to one indicated the stronger correlation and the \( R \) value below 0.4 indicated weak correlation. Level of significance of 0.05 or less considered as a cutoff point for significant correlation or difference.

**Findings**

A total of 384 female students in 12 secondary schools were participated in this study represented the studied group in 4 school classes 1st. to 4th class. The mean age of the studied group was 16.6 ± 4.2 years. Fathers of 25 (6.5%) students were illiterate or read and write, 138 (35.9%) had primary or secondary school level, 192 (50%) with institute or college level of education and 29 fathers (7.6%) had higher education graduation. The corresponding levels of education among mothers were 12.2%, 40.9%, 43.2% and 3.6%, respectively. Most of students coming from middle socio-demographic families, (Table 1).

### Discussion

Lack of information and inadequate knowledge about breastfeeding benefits lead to impairment in maternal and child health. Four out of five female students have adequate knowledge about breastmilk, even though, there were one fifth (21.9 %) have inadequate knowledge. In a study conducted by Hamade et al. from Syria in 2014, showed that students from both Syria and Lebanon had an average knowledge and almost 52% had knowledge score below the midpoint11. Other study from Pakistan was conducted by Anjum et al12 reported that the overall knowledge of medical students about breastfeeding was low furthermore, Yang et al.13 investigated the knowledge of health professional students about breastfeeding issues and found that they had limited knowledge in some setting. From other point of view, previous studies showed that among different socio-economic background, the most knowledgeable about breastfeeding were housewives and students have less knowledge12-14, so practicing and living among housewives mothers was important factor. It is essential to adopt breastfeeding enhancement approaches in female learners to motivate them to breastfeed in
future and support breastfeeding as an infant survival approach’. Breastfeeding is among the selective and significant health approaches that are very common in the developing nations and compared to the first-world countries; additionally, “less fortunate” mothers breastfeed over a lengthy period as compared to those who are rich in the developing countries15.

The teaching guide involved a training and materials that dealt with the gaps within the breastfeeding experience and sensitive parts discovered in the previous ECE providers’ survey. Information can be shared and awareness created regarding the significance of proper young child and infant feeding by other means, for instance, through incorporating school-going learners and employees in other areas15,16. The varied strategy to supporting and promoting young child and infant feeding is clearly illustrated as an effective approach in diverse backgrounds3. Physician medical education need to involve awareness regarding existing information, pass to others essential abilities, and offer know-how in the abilities needed attaining their obligations in protecting, supporting, and promoting breastfeeding 17-19

Conclusion

The overall knowledge of the female students about breastfeeding issues was adequate and not affected by their age or parents’ educational level. However, almost quarter of the students had inadequate knowledge and need further educational program to increase their knowledge.

Ethical Clearance: All ethical issues were approved by the local committee of the researches ethical fairs. Verbal informed consent obtained from each participant before they were recruited in the study in addition to signed informed consents were obtained from the parents of the students. Data were kept confidentially and were not disclosed to unauthorized personnel.

Conflict of Interest: None

Source of Funding: Self-funded

Association between Eating Habits and Body Mass Index in a Sample of Medical College Students in Wasit University

Taqi Mohammed Jwad Taher
MBChB, FABHS-CM, College of Medicine, Wasit University, Wasit-Iraq

ABSTRACT
The prevalence of overweigh and obesity is increasing worldwide, patterns and habit of eating in terms of frequency and timing of eating have been shown to be important factors affect the body mass index (BMI) of individuals. The objective of this study to assess the nutritional status of group of Iraqi medical college students in Wasit, and to assess their eating habits and behavior to find the association between their eating habits and BMI. Therefore, 320 students of both genders were recruited. Students with chronic diseases were excluded. Data collected using a structured self-administered questionnaire collecting the demographic and the eating habits data. Findings revealed that 60.3% of the students had normal BMI, 15% overweight and only 3.1% were obese. Eating snacks frequently, Red meat, Fried food, Processed food Sweets and consumption of beverages are associated with larger BMI of the students while eating with the family, taking the breakfast, and lower number of meals were significantly associated with lower BMI. In conclusion BMI of the medical college students in Wasit was affected by their eating habits.

Keywords: Eating habits, Obesity, Epidemiology, Risk factors,

Introduction
Previous studies and literatures suggested that the patterns and habit of eating in terms of frequency of eating, timing of eating across the day, skip the breakfast meal, and fast food eating times outside the home, all are possible risk factors of being overweight or obese. On the other hand, changing the eating habit, could contributed to increasing body weight in particular among the young subjects. The prevalence of overweigh and obesity is increasing worldwide, in 2016, 39 % of population at age 18 years and above has excess weight (BMI ≥ 25 kg/m2) and 13 % were obese. About 2 billion have excess weights all over the world and over 0.5 billion are obese. Occurrence of overweight and obesity is pretty rapid in the world’s population. Obesity and overweight result in negative metabolic impacts on cholesterol, blood pressure, insulin resistance, and triglycerides. Dangers of ischemic stroke, type 2 diabetes mellitus, and coronary heart illness increased with the rise in the BMI (body mass index). Increased BMI also raises the danger cancer and mortality. A number of researches have revealed that eating behaviors, eating rate, the time-based dispersal of eating actions throughout the day, frequency of eating, and breakfast skipping have a direct impact on obesity status of an individual.

Dr. Amett J classifies the ages of 18-25 as “emerging adulthood”. Despite it being viewed as a well-being and optimum health age, the change from teenage to adulthood is a vital period for disease prevention and health promotion. The nutritional behaviors of college students is influenced by many factors including stress exposure. Some previous studies showed that majority of the students who have healthy eating habits had normal body weight. The lately examined outcome from non-communicable diseases risk influences survey carried out in Iraq in the year 2006 revealed a high rate of more than 66%, of population at age 25-65 years are overweight or obese. The overweight and obesity are more prevalent in male than female. Information on dietary behaviors in Iraq is very limited, especially for university students. So the aim of this study is to assess the relationship between eating habits and body mass index of group of Iraqi university students.
Subject and Method

This was an analytical cross-sectional study conducted among group of medical students (aged 18 - 25 years) in Wasit University chosen by random sampling method at 2015 (April-May). Students with chronic diseases were excluded.

Sample Size: The sample size was calculated according to the standard equation for cross-sectional studies and the final sample size after adding 15% was 320 students and were enrolled.

Data Collection: A self-administered structured questionnaire on eating habits was adopted from previous published studies with some modifications. The questionnaire consisted of two sections assessing the demographic data and eating behavior and dietary habits.

Other data collected were weight and height and body mass index was calculated according to standard equation in kg/m² and categorized into four categories, underweight, normal, overweight and obesity, according to the WHO classification and cutoff points.

Statistical Analysis: Data were analyzed using statistical software (SPSS) version 20. Statistical procedures and tests applied accordingly. P < 0.05 was considered statistically significant.

Findings

A total of 320 medical students (141 male (44.1%) and 179 (55.9%) female) were included with mean age 20.2 ± 1.67. Of them 94(29.4%) were residential college while 70.6% were living with their parents. Body mass index (BMI) distribution revealed that 21.6% were underweight, 60.3% normal, 15% overweight and 3.1% obese, (Figure 1). Out of the total participants, 163(50.9%) took their meals regularly (Table 1). Overweight and obesity were significantly and inversely associated with frequency of eating with the family, frequency of taking breakfast, (P<0.05) while directly associated with taking snacks, (P<0.05), (Table 2)

A significant association was found between BMI and each of Fruit and vegetables, Red meat, fried food and sweets consumption (Table 3). A significant association was found between BMI and eating Processed food and beverages consumption where within those drinking fresh fruit juice more than half were within normal weight while none of those drinking milk were obese (Table 4).

In this study, more than half of participants had normal BMI and this agreed a previous Iraqi study in Babylon college students that found 65.9% were within normal BMI. Overweight and obesity percent in this study 15% and 3.1% respectively which is much more lower than the prevalence of overweight and obesity.
reported in a study conducted among the university students in Jordan 15, and among King Saud University students in Riyadh, Saudi Arabia which were 31%, and 23.3% respectively.

The low percent of overweight and obesity may be due to intellectual level of medical students selected in this study that made them more knowledgeable and oriented about the effect of healthy food and life style on body weight and the health in general. Female in general are more cautious about their weight status and body image than males and they are more desired to be slender as the society perception encourage and obligate them, and this is may be the cause behind the lower percent of obesity and overweight with significantly higher percent of normal and under weigh than male students.

Same finding was reported in an Iranian study where 9% of the participants had BMI above 25 and males were heavier than female students 9. The study found that around half of students were regularly taking meals and about 64% took three meals daily, the same as the finding of a study in Sudanese medical students 11, and in contrast to study conducted in Malaysian medical school 12. Half of students eating one meal per day were underweight, while the majority of those with three-four meals per day were within normal body mass index that gave the important of taking the three daily meals in their usual times. Nearly half of the students have a daily breakfast which is a little bit lower than Sudanese students 11 and higher to Malaysian 12 and Chinese medical students 17. In our study only 41% of the students consumed snacks daily, this finding was in accordance with Malaysian medical school and Sudanese students 11,12. The majority of the students (70%) in our study consumed vegetables at least three times per week, this finding was consistent to Sudanese study 11 but lower than Malaysian study (81.8%)12. We found that almost half of medical students consumed fried food daily, and near half consumed fried food at least three times per week, finding was lower than Malaysian study (73.5%) of the students consumed fried food at least twice per week12. Only one quarter of our students consumed soda or other sugared beverages, this finding was low when compared to other study that showed more than the half (57%) of the students consumed soft drinks at least three times per week13. Other dietary behavior of university students in Wasit shows that the majority of students regularly eat cereals daily, and almost 67% of students eat milk dairy more than three times per week. Significant association between body weight and consuming red meat, sweets, cereals, fried and proceed food as they approved to have their effect on the BMI.

**Conclusion**

Body mass index of students was significantly affected by their eating habits and behavior. Eating snacks frequently, Red meat, Fried food,, Processed food Sweets and consumption of beverages are adversely increase the BMI of the students while eating with the family, taking the breakfast, and lower number of meals were significant factors to maintain normal BMI.

Factors Related to Chronic Obstruction Pulmonary Disease in Indonesia: Analysis of Indonesian Family Life Survey-5 Data

Bima Uramanda¹, Nurhayati A. Prihartono²

¹Master of Epidemiology Student, ²Department of Epidemiology, Faculty of Public Health, University of Indonesia, Depok, West Java, Indonesia

ABSTRACT

Chronic obstructive pulmonary disease (COPD) is a major health problem and now ranks 5th in terms of the global burden of disease. Although COPD is a disease that is characterized by progressive respiratory symptoms and functional decline. This study aims to determine factors associated with COPD in Indonesia. A total of 10,360 subjects which fulfill the questionnaire. Data were collected by interview in community. COPD was defined when subject have COPD diagnose by doctor and other paramedic. The data were analyzed by logistic regression. Respondents who live in urban were have a risk 1.7 times less likely to experience COPD than respondents who live in village area (OR 0.59; 95% CI 0.44-0.78). In the TB history variable, respondents who had a history of TB were 3.6 times less likely to develop COPD than respondents who did not have a history of TB (OR 0.28; 95% CI 0.14-0.55). Asthma history tends to be 2.4 times less likely to develop COPD than respondents who have no history of asthma (OR 0.42; 95% CI 0.24-0.74). In the BMI variable, respondents who had a BMI ≤18.50 tends to be 2 times less likely to develop COPD (OR 0.49; 95% CI 0.36-0.69). In the smoking status variable, respondents who smoked 2.4 times the risk of having COPD compared to non-smoking respondents (OR 2.42; 95% CI 1.78-3.28). Body mass index, air pollution, history of TB, and history of asthma had a significantly increased risk of developing COPD in Indonesia.

Keywords: COPD, risk factors, Indonesia

Introduction

COPD is a major health problem in subjects over 40 years of age. COPD is a major cause of chronic morbidity and mortality throughout the world.¹ The Global Burden of Disease Study reported 251 million COPD cases globally in 2016. Globally, it is estimated that 3.17 million deaths were caused by COPD in 2015. More than 90% of COPD deaths occur in developing countries.² In Indonesia according to the 2013 Riskesdas data COPD has a prevalence of 3.7%.³ COPD is a chronic airway disease characterized by airflow resistance, especially expiratory air and is progressive due to exposure such as smoking, indoor and outdoor air pollution, bronchial hypereactivity, and history of lower respiratory tract infections.³,⁴

Many studies have been conducted to investigate risk factors for COPD. COPD risk factors include age, smoking, body mass index (BMI), physical activity, exposure to water pollutants, history of asthma and offspring. Study examining COPD determinants in young children shows similar risk factors (age, sex, BMI) in the general population.⁵,⁶ Furthermore, COPD studies among young people revealed a relationship between behavioral or lifestyle factors such as smoking, physical activity, BMI with COPD.⁷ But the results were still inconsistent for gender and BMI variables.⁵ The purpose of this study was to determine the factors associated with COPD in Indonesia.

Method

Study Design: This analytical observational study uses a cross-sectional design. Study data source from the
Indonesian Family Life Survey (IFLS)-5 in 2014. This survey collects information on the level of individuals, households and communities with a multistage stratified random sampling approach. The IFLS is a longitudinal households survey using questionnaires and anthropometric measurements collected under the supervision of the Rand Corporation and an ethical review was conducted by Gadjah Mada University.8

Population and Sample: The study population was the subjects of the IFLS-5 study conducted in 13 provinces in Indonesia from September 2014 to March 2015 in 16,204 households and 50,148 individuals. While the sample is respondents aged ≥15 years who were willing to take interviews and have questionnaire data about risk factors and complete COPD diagnosis on each variable studied, namely a total of 10,360 individuals.

Exposure and Outcome:

Outcomes in this study were COPD defined as chronic pulmonary disease characterized by airway obstruction in the airways which was progressively nonreversible or partial reversible.4 COPD status was assessed from the subject report, based on the diagnosis of health professionals. Exposure in this study were age, education level, gender, body mass index, physical activity, smoking behavior, place of residence, history of Tb and history of asthma. Risk factors assessed such as age characteristics were categorized to be <40 years and ≥40 years, namely the age at which pulmonary function began to decline according to the Global Initiative for Chronic Obstructive Lung Disease (GOLD)5, gender, smoking status, physical activity, residence, body mass index categorized <18.50 kg/m² and ≥18.50 kg/m²5,9, history of asthma10 and TB history.11 Smoking behavior was categorized as not smoking and smoking. Physical activity was assessed through questions on the type and timing of physical activity carried out in daily life and then categorized as adequate and less physical activity. The history of TB and asthma was assessed through questions diagnosed by doctors or paramedics.

Data Collection

Height was measured by the plastic board height Seca model 213 and weight was measured using the Camry scale model EB1003. In this study measurements of weight and height were carried out by interviewers who were competent in their fields and had received previous training.8

Data Analysis

Data were analyzed using logistic regression to calculate risk on all variables including age, gender, BMI, physical activity, smoking behavior, place of residence, history of TB and history of asthma by including these variables in multivariate analysis. In this study we used the steps of a logistic regression test to identify and determine the factors that significantly associated the incidence of COPD in Indonesia. All candidate variables with p-value <0.25 in bivariate analysis will be further analyzed to be included in multivariate analysis. Variables that have a significant relationship with COPD (p value <0.05). The strength of the association between predictor and COPD variables was measured using POR with 95% CI to predict factors associated with COPD in Indonesia.

Results

Of the 50,148 individuals in IFLS-5 can be processed 36,405 individuals. Of these there were subjects who did not answer questions, answered they did not know, missing data were 26,045 individuals. Then the subjects who answered all the questions completely, especially on the variables examined amounted to 10,360. Table 1. shows more COPD in women, young age, less physical activity, and has no history of TB and asthma and has active smoking status. Most respondents were women (60.2%), <40 years old (57.2%), have a BMI ≥18.50 kg/m² (85.6%), have a history of TB (1%), have a history of asthma (2.4%), living in the village (58.7%), smoking (84.3%).

The proportion of respondents who experienced COPD was more in women (61%) than men (39%), more at age <40 years (60%) compared to age ≥ 40 years. Although COPD was higher in women and the age category <40 years but the results of statistical tests showed no significant relationship (p 0.810) and (p 0.412) between sex and age with the incidence of COPD. The proportion who experienced COPD was greater in respondents who lived in the city (54.1%) than those who lived in the village (45.9%), the results of statistical tests showed that there was a significant relationship between smoking status and the incidence of COPD with a value (p 0.000). The proportion who experienced COPD was more at the basic education level (35.5%) than the higher education level (25.5%), more so for respondents whose BMI was ≥18.50 kg/m² (75.1%) than underweight (24.9%), less physical activity (76.6%). Statistically there was a significant relationship between BMI and the incidence of COPD (p 0.000). The proportion of respondents who experienced COPD was more in those who did not have a history of TB (94.6%) than those who had a history of TB (5.4%), more in those who did not have a history of asthma (92.7%) than those who had a history of asthma (2.7%). Statistically there was a relationship between history of TB and a history of asthma with COPD with a value (p
0,000) and (p 0,000), more smoking (96.4%) than not smoking (3.6%), statistical test results showed there is a significant relationship between smoking status and COPD with a value (p 0,000) (Table 1).

Note: -2 Likelihood = 85.162 > (p 11.7)

Based on the multivariate analysis above, it was seen that a significant predictor of COPD in Indonesia was place of residence, history of TB, history of asthma, BMI and smoking status. Respondents who live in cities have 1.7 times less risk of COPD than respondents who live in villages (POR 0.5; 95% CI 0.44-0.78). In the TB history variable, respondents who had a history of TB were 3.6 times less likely to experience COPD than respondents who did not have a history of TB (POR 0.28; 95% CI 0.14-0.55). In the history of asthma variables tended to be 2.4 times less risk for COPD than those who did not have a history of asthma (POR 0.42; 95% CI 0.24-0.74). In the BMI variable, respondents who had a BMI of ≥18.50 kg/m² tended to be 2 times less likely to experience COPD (OR 0.49; 95% CI 0.36-0.69). In the smoking status variable, respondents who smoke are 2.4 times more likely to experience COPD than non-smoking respondents (OR 2.42; 5% CI 1.78-3.28).

Discussion

In this study we found that the prevalence of COPD in Indonesia was 2.0%. We found the prevalence of COPD associated with women aged <40 years, primary and secondary education, living in a village, BMI ≥18.50 kg/m², having smoking habits, no history of asthma and TB. In the results of the research respondents who smoke were 2.4 times more at risk for COPD than respondents who do not smoke. This was because smokers experience inflammation in the respiratory tract and pulmonary parenchyma to cause irreversible airway obstruction. Previous studies also found that the number of smoked cigarettes was positively correlated with macrophages in bronchial biopsies which caused irreversible inflammation and airway obstruction.

Respondents who live in cities were 1.7 times less likely to experience COPD than respondents who live in villages. This is likely related to the prevalence of smokers in cities smaller than in villages based on 2013 Riskesdas data. In previous COPD studies in developing countries, Rwanda also found that COPD prevalence in cities was lower than in cities.

Respondents who have a history of TB with a risk of 4.5 are less likely to experience COPD. This can happen if respondents who have COPD with a previous history of TB are not smokers. In eligible populations taken from the IFLS 5 data, it was found that 84% of respondents were smokers so the historical association of TB with COPD was distorted by the presence of potential confounders, smoking, thus requiring further research on the historical association of COPD in smokers. Asthma was characterized by chronic airway inflammation with respiratory symptoms such as wheezing, shortness of breath, coughing and an expansion of expiratory air flow but can heal spontaneously or vice versa can also experience chronic airway obstruction.

The results of this study also found that asthma was 2.4 times less risky for COPD than respondents without a history of asthma. In this study the possibility that happened was that asthma experienced did not develop into COPD. This is also in accordance with previous studies with a cohort design in asthma populations in Sweden with conclusions of asthma experienced not developing into COPD (OR 0.97; CI 0.76-1.25).

In other variables respondents who have a BMI of ≤18.50 have a 2 times lower risk of experiencing COPD. The results of this study are different from previous studies which found that a low BMI increases the risk for COPD. This is probably caused by the majority of
respondents who experienced COPD mostly 75.1% BMI (≥18.50 kg/m²) with a mean (22 kg/m²) making the study sample not comparable. As found in previous studies there was no significant difference between the distribution of BMI and the incidence of COPD in populations with a high BMI. Several previous studies found that patients with emphysema tended to experience low BMI, and patients with chronic bronchitis were more likely to be obese. Thus, the temporal relationship between abnormal BMI and COPD onset is uncertain. There are several limitations in this study, namely outcome measures based on reports of respondents who have been diagnosed with COPD by doctors and/or paramedics. Accurate outcome measures for COPD are clinicians’ diagnoses or investigations such as spirometry. In addition, it uses a cross sectional design so that it is very difficult to determine the variables that are the cause and effect to fulfill the requirements of causality. However, this research has several strengths, including data obtained from IFLS 5 covering all regions of Indonesia.

Conclusion

The prevalence of COPD based on the IFLS survey is 2%. Predictors of COPD prevalence in Indonesia were residence, history of TB, history of asthma, BMI and smoking status. Respondents who smoke were 2.4 times more at risk for COPD than non-smoking respondents.

The Effectiveness of Environmental Health Behavior in the Community through Coastal Community Empowerment Program in Kendari City Southeast Sulawesi Province, Indonesia

La Dupai¹, Ruslan Majid¹, Syawal Kamaluddin¹, Rahman¹, Yusuf Sabilu¹, Junaid¹
¹Faculty of Public Health, University Halu Oleo, Green Campus Bumi Tridharma, Anduonohu, Kendari, Southeast Sulawesi, Indonesia

ABSTRACT

Generally, coastal area settlements are areas that have very complex health problems with very limited availability of basic health services and facilities. The limitations of health facilities and environmental health facilities have resulted in the low health status of coastal area. The aim of study was to determine the determinant model of behavior of coastal communities through the empowerment of coastal communities in Kendari City. The type of study was qualitative research. The results showed that the factors that led to the behavior of coastal communities towards environmental health besides being influenced by knowledge, attitudes and behavior, the determinants that shape clean and healthy living behavior were the availability of infrastructure, stakeholder intervention, routine monitoring by stakeholders, threats of health risks due to unhealthy behavior, and habits of coastal communities thus enhancing the environmental health behavior of coastal communities through the findings of these behavioral determinants, the form of empowerment of coastal communities includes the provision of housing assistance through proper housing program and meeting health standards, latrines, procurement of clean water; do routine controlling every day by stakeholders; reprimand sanctions raised by stakeholders for communities who behave unhealthy and health education by health workers to improve healthy behavior of the community. Conclusion: to change the healthy behavior of the community it will not be effective if it only changes knowledge, but it needs stakeholder commitment, cooperation between community leaders and health workers as well as policy support from the government in order to improve the environmental health of coastal communities. Suggestion: It is a need for socialization, education, and training for community based on community employment for health, advocacy and collaboration across sectors of government agencies in the preparation and improvement of policies through structuring the management of environmental resources and institutional health facilities

Keywords: Health environmental behavior; community empowerment; coastal area

Introduction

The degree of public health is closely related to people’s behavior in the management and use of environmental resources and health resources. Creation of a clean and healthy environment by human activities, thus enabling humans to avoid the occurrence of diseases both from non-living beings and living things. The role of human behavior is important to note in terms of clean and healthy behavior, especially in environmental management¹.

Generally environmental health facilities such as drinking water sanitation, family latrines, waste management, household waste management, and food beverage security, including personal hygiene are important factors in life, even becoming determinants.

of public health. The environmental conditions of sanitary housing are needed not only to improve public health status, but also can improve living comfort, work efficiency and work productivity.

Behavior is related to environmental health, that environmental behavior becomes a determinant of human health. These environmental health issues are specifically examined from the aspects of community knowledge, attitudes, and actions. Actions include the availability of healthy latrines, sewerage, waste management, clean water supply, healthy and clean living behavior, and healthy home arrangements.

Future health development programs require environmental engineering by focusing on integrated environmental management, emphasizing changes in community behavior through socialization, education, training guidance, provision of environmental health facilities, related sector involvement and policy improvement, need for continuous monitoring of the quality of community environmental health, easy, cheap, and objective, so that the results of the supervision can understand and find the problems and solutions in the future. Community empowerment is intended to facilitate and encourage the community to be able to position themselves professionally and become the main actors in utilizing their strategic environment to achieve sustainability in the long term. The purpose of this study was to create a model of environmental health behavior through the study of coastal community empowerment in Kendari City.

**Method**

This type of study was qualitative study. Qualitative study uses instruments in the form of interview guides that have been prepared in advance. In this case, to obtain supporting data, in-depth interviews and focus group discussions (FGD) were proposed. Qualitative research is intended to gain an understanding using a particular methodology principle that is able to explore social or human problems where environmental health problems actually have problems interacting with behavioral problems, socio-cultural, and environmental issues that are quite influential on environmental health (Creswell, 2009)². This study was conducted in 2017 in the Coastal Region of Kendari City, Southeast Sulawesi Province, Indonesia

**Results**

**Guarantee of Infra Structur Eavailability:** One of the obstacles in healthy behavior was that the facilities were not available. Basically, coastal communities realize that the presence of healthy latrines, sewerage, garbage, clean water, clean and healthy living behavior, and the arrangement of healthy houses are very important to be held by every household. This is indeed an obstacle for the community because there are still some people who do not have latrines because they prefer to dispose of their latrines in the sea, this community behavior is also like throwing out trash and sewerage. It is in a small part because they house is usually not habitable.

From the interview, it can be concluded that to ensure healthy behavior of the community environment, one of the social policies that needs to be executed is the provision of facilities through the mechanism of family latrines, sewerages, trash cans, proper housing repair program. People’s behavior also is very much determined by the availability of infrastructure that meets or does not meet health requirements.

**Routine Monitoring:** The results showed that one of the factors that drives healthy behavior society is the supervision carried out by stakeholders towards the community in controlling the cleanliness of the environment around the residents’ homes by asking them to clean the surrounding pages when they get rubbish scattered or give warning if they don’t follow directions. The form of social control is intended as an individual behavior of the community by creating a moral burden through directing the apparatus as part of the community through attitudes and behavior if a group of people do not behave well through environmental health efforts.

**Health Risk Threats:** The threat of health risk is based on fear of the risk resulting from deviant behavior which is a health condition that has the potential to threaten human life as an implication of deviant healthy behavior. All of these are deviant behaviors that can threaten health. The form of community empowerment to overcome deviant behaviors such as dispose of trash, dispose of feces, waste, and unhealthy environment, the efforts made by stakeholders are to involve the community in health education and outreach activities carried out by health workers or from the Environmental Agency Life.

**Ease of Sccessibility:** The results of this study indicate that the factors that encourage healthy behavior are
ownership and ease of access in their use. Ownership of family latrines will support the behavior of family members to dispose of feces in available latrines and not dispose of them in places that cause diseases such as diarrhea and cholera. The availability of garbage cans, the availability of clean water and other facilities that support healthy behavior can make it easier for people to behave in a healthy manner. Therefore, bringing access through the provision of facilities such as family latrines, garbage cans, the availability of clean water, sewerage and the availability of livable houses is the right strategy to improve healthy behavior for the whole community and provide awareness of the importance of having such facilities and improving the potential of the community to have it. Based on the interview above to overcome the problem of people’s ability to have decent houses and meet health standards, the form of community empowerment programs includes the provision of assistance in the form of materials for home repairing program.

**Habits of Coastal Communities:** Community habits are intended as a pattern of activities that carried out in a sustainable manner because it is supported by environmental conditions.

Based on the interview showed that the behavior of throwing garbage at any places, the ability to provide healthy latrines, sewerage is an implication of the usual patterns of community practice. It is conducted more easily. To prevent the bad habits that have an impact on the environmental health of coastal communities, efforts made include: an invitation to participate in community service activities through healthy Friday to familiarize the community; make a routine program to do a health education program by public health center officers, the involvement of public health students in providing education and practice of clean and healthy living behavior.

**Discussion**

**Guarantee of Infrastructure Availability:** The results of the study showed that one of the obstacles in healthy behavior was the facilities were not available. Basically, coastal communities realize that the presence of healthy latrines, sewerage, garbage, clean water, clean and healthy living behavior, and healthy home arrangements is very important for every household, because it will encourage healthy behavior such as blending feces in healthy latrines, removing trash in garbage bins, providing clean water, clean and healthy living behavior and structuring decent homes. According to Green (1980), there are three factors a person does in a clean and healthy lifestyle, namely: enabling factors that trigger behaviors that allow a motivation or action to take place. This factor includes the availability of infrastructure or health facilities for households such as the availability of healthy homes, clean water, landfills, healthy latrines and so on.

Saputro D., Peduk Rintayati and Siti Supeni (2016), stated the results of their research that there is a positive attitude and significant relationship between knowledge about the environment with an attitude of caring for the environment, socio-economic level with environmental awareness, level of education with environmental awareness, and environmental knowledge, level education, and socio-economic level together towards concern for the environment. Triyono (2014), in his study found that factors related to behavior including open defecation behavior were economic factors. Based on the results of the study, the emergence of public health problems is one of the triggers of financial factors by looking at the ability to have livable houses and facilities that support healthy behavior such as the availability of latrines, sewerage, garbage, clean water, clean and healthy living behavior, and habitable homes. This is because most people have a source of non-permanent income so that they have the limitation to own a house with all the ingredients that meet health requirements. Mardikanto (2012), the condition of various infrastructure facilities that need to be considered by each facilitator in his working area is the requirement for reliable quantity and quality as well as timely distribution.

**Stakeholder Modeling and Interventions:** Green (1980), Reinforcing factor is a factor that determines whether health actions get support or not. This factor is manifested in the form of attitudes and behavior of health officers and religious leaders or community leaders who are community role models as examples of health cadres providing health education or health information, support and direction of community leaders to maintain and preserve environmental hygiene.

Based on this research, it is seen that participatory cultural approaches built by stakeholders are more effective compared to violent approaches or forms of emphasis. Ife (2008), one way to encourage healthy
communities is to encourage broad participation in various social activities. Promoting building communication between the local government and the community with a family approach, providing exemplary, understanding and personal awareness. Mardikanto (2012)⁹, community empowerment activities will be more efficient if applied only to a few community members, especially those recognized by their environment as good “role models” and a communication approach is one method to communicate innovations in the community development process.

Ease of Accessibility: Based on the concepts and definitions of the Millennium Development Goals (MDGs) which in 2016 were continued by the Sustainable Development Goals (SDGs), households were said to have access to proper sanitation if sanitation facilities used met health requirements including a goose neck latrine, septic tank, sewerage, that is used alone or together. The percentage of households in Indonesia that have access to proper sanitation in 2013 is 60.05% and increased in 2014 to 61.08% and in 2015 it increased to 62.14% (Ministry of Health, 2015)¹⁰.

Routine Monitoring: The results of the study showed that the involvement of community leaders as people who are role models for community groups is able to mobilize all citizens, provide motivation, and desire to do something that is desired by these figures, namely implementing healthy behaviors to realize the vision and mission of a Healthy City. Exemplary and persuasion and control from the community encourage people to act. According to Tanto (2012)¹¹, community leaders are prominent and famous people in various fields of people’s lives. A person who is identified usually has an example. This means that it can be used as an example and imitated its good qualities, having charisma, following, being wise in making decisions that are always beneficial for all members of the community in their groups. Mardikanto & Soebiato (2012)¹² therefore the facilitator must be professional, in the sense of having certain good qualifications concerning personality, knowledge, attitudes and skills facilitating community empowerment.

Health Risk Threats: The results of the study showed that giving a description of unhealthy behavior that results in health hazards can increase concerns and efforts to improve healthy behavior. The Health Belief Model theory states that individuals will behave if they feel themselves vulnerable to a problem and consider a serious problem (Machfoedz, Suryani, 2006)¹³.

From this study it was found that the effectiveness of the dissemination of information and health counseling was emphasized more on the picture of the disease caused by unhealthy behavior of the community. With the approach taken to motivate and provide an overview of the experience of health hazards to deviant community behavior towards health. According to Widayati (2011)¹⁴, attitudes toward behavior are influenced by the belief that the behavior will result in desired or unwanted results. Beliefs about behavior that are normative or expected by others and motivations to act in accordance with normative expectations form subjective norms in individuals. Azwar (2005)¹⁵, states that attitudes obtained through experience, will cause a direct influence on the next behavior.

Green (1980)¹⁶ Facilitating factor (predisposing factor) which includes knowledge and attitudes of the family towards clean and healthy behavior. these factors become triggers or antecedents of behavior that forms the basis or motivation for actions due to tradition, habits, beliefs, education level and socio-economic level. Social factors as external factors influence behavior such as: social structure, social institutions, and other social problems. Cultural factors as external factors that influence a person’s behavior include: values, customs, beliefs, community habits, traditions, and so on. Internal factors that influence the formation of behavior such as: attention, motivation, perception, intelligence, fantasy and so on.

Conclusion

The effectiveness of changing healthy behavior of coastal communities is not only influenced by knowledge factors, but also supported by the availability of facilities that support healthy behavior; exemplary and encouraging stakeholders in the form of the ability to arouse enthusiasm in overcoming their own health problems; instilling awareness of the health consequences of unhealthy behavior; regular monitoring of community environmental hygiene carried out by stakeholders and health care conducted to prevent potential unhealthy behavior habits that endanger environmental health.
Suggestion

There is a need for socialization and counseling, education, training based on community employment for health, advocacy and collaboration across sectors of government agencies in the preparation and improvement of policies through structuring the management of environmental resources and institutional health facilities, as well as continuous supervision.

Factors Related to Good Glycemic Control among Type 2 Diabetic Patients at Jimma Medical Center and Shanan Gibe Hospital, Jimma, Ethiopia

Million Abera Berhie1, Abiru Neme Negewo1, Tabarak Malik2
1School of Nursing and Midwifery, Institute of Health, Jimma University, PO Box 378, Jimma, Ethiopia; 2Department of Biochemistry, School of Medicine, College of Medicine and Health Sciences, University of Gondar, Gondar, Ethiopia

ABSTRACT

Background: Ultimate outcome of diabetes management is to achieve controlled glycemic level and to prevent or delay complications related to diabetes. Understanding the factors associated with achieving good glycemic control for diabetic patients will help to improve the treatment and prevents complications of diabetes. Therefore, the aim of this study was to identify related factors of good glycemic control among adult diabetic patients in Jimma Medical Center and Shanan-Gibe Hospital, Jimma.

Method and Material: Institutional based cross-sectional study was employed and proportionate systematic sampling was followed to select 308 participants. Data were collected using semi-structured questionnaire and client chart review then descriptive and logistic regression analyses were conducted.

Results: One third (33.9%) of study participants had good glycemic control. Multiple logistic regression revealed that males (AOR=4.96, 95%CI (1.8,14.1)), having longer duration of diabetes (AOR=1.12, 95%CI (1.02,1.23)), being younger (AOR=0.07, 95%CI (0.02,0.22)), who tested their blood glucose at home (AOR=6.1, 95%CI (1.75,21.4)), and took a combinations of insulin and oral medication (AOR=7.3, 95%CI (3.1,17.5)) were key related factors of good glycemic control.

Conclusion: To attain target level of fasting blood glucose health information concerning components of diabetic care like self-monitoring of blood glucose and combination of drugs without changing the regimen should be provided by healthcare providers.

Keywords: Glycemic control, Type-2 diabetes, Jimma Medical Center, Shanan-Gibe Hospital

Introduction

Diabetes mellitus refers to a grouping of metabolic diseases characterized by prolonged excess BG level caused by the inadequate secretion of insulin, poor insulin action, or a combination of the two causes1. Diabetes is a globally chronic disease which affecting 366 million people, a number which has been estimate to rise to 552 million by 20302. Diabetes has been ravaging millions of people from all over the world3. More than 77% of morbidity4 and 88% of mortality because of DM occur in low and middle income countries5. Like the rest of the world, Sub-Saharan Africa is experiencing an increasing prevalence of diabetes beside to other non-communicable diseases where rapid socio-demographic, socio-cultural, and economic transitions are increasing risk and prevalence of diabetes6. Ethiopia, which is one of the developing nations, is at a risk of increased diabetes prevalence, and the number of people due to diabetes deaths reached over 21,000 in 2007. This estimate has increased to about 25,000 in 201 and T2D is the most common form of diabetes, accounting for >90% of cases of all diabetes7.
Diabetes management aims to delay the onset of diabetes complications, and to hinder its progression, mostly by improving glycemic control and controlling the risk of disease. It is known that achieving glycemic control for patients with diabetes prevents complications. Prior researches have reported many factors as contributing to poor control among patients, including their age, gender, level of education, family history, marital status, duration of diabetes, medications taken, and numerous other factors. However, it has been proved difficult to confirm which of these factors are most directly associated with poor glycemic control. This is because the prior findings indicated that glycemic control and the factors affecting it vary across the countries and between different ethnic groups and lifestyle variations. In addition, all previous studies in Jimma did not address factors contributing for achieving good glycemic control. Therefore the aim of this study was to identify related factors with good glycemic control among T2D patients in Jimma.

Method and Materials

Study Design, Setting, and Participants: An institution-based cross sectional study was employed from January 22-February 24, 2018 in two public hospitals located in Jimma zone: JMC and SGH which are located in Jimma town. All adult (>=18years) T2D patients, those who agreed to participate and give patient-signed informed consent, and those who attended regular follow up for at least 3 months were eligible. However, those who were critically ill and unable to participate in the interview were excluded. Ethical clearance was obtained from ethical review committee of JU, Institute of Health and this was communicated to hospitals to have their permission and undertake the study.

Sample Size and Sampling Procedure: Required sample size was determined using the single population proportion formula \(n = \left(\frac{Z_{a/2}}{d}\right)^2 \times p(1-p)\) with the following assumptions: since prevalence of poor glycemic control among adult T2 diabetic patients of Jimma University Teaching Hospital (JUTH) was 70.9%, which in turn gives proportion of good glycemic control of 29.1%, confidence level of 95%, and 5% degree of precision.

Calculated sample size was 280, with an additional 10% estimated non-response rate, giving a final sample size of 308 T2D patients. A proportionate systematic sampling was followed to select patients and \(k\)th interval was 5. Permission and verbal consent were obtained from each participant and confidentiality also assured before conducting data collection. All information that was obtained from the individual was not used to the determinant of the subject and their right was guaranteed to stop or refuse participation.

Variables and Measurements: After getting patient-signed informed consent from patients, data were collected by four nurses holding BSc. degree by interviewer-administered approach using pre tested questionnaire and reviewing client chart. Questionnaire composed of four parts: socio-demographic characteristics, clinical characteristics, behavioral factors, and self-management and drug utilization. Type of anti-diabetic medications used and last readings of fasting blood glucose (FBG) measurement taken on the day of visit and two last readings of FBG obtained from the patient records. Height and weight of patient measured on day of visit.

For the purpose of this study SMBG was defined if the patient performed it in 5 or more days in previous seven days. BMI was calculated as weight in Kg divided by height in meter squares and it categorized as normal (BMI<25kg/m²), overweight (BMI 25-29.99kg/m²), and obese (BMI≥30kg/m²). Patients FBG readings were computed by taking the mean value to classify the respondents as “good” and “poor”. Glycemic status was categorized as good glycemic control if FBG<130mg/dl and poor control if FBG ≥130mg/dl.

Questionnaire was prepared in English, translated into Afaan-Oromo, and back translated English to check consistency. Instrument was pre-tested on 5% of sample size (15) at Agaro Hospital. Any constraint was corrected promptly. Training was given to data collectors and supervisors for one day before the actual data collection period about data collection tool, how to collect data, and taking informed consent. Principal investigator was supervised the overall activity of data collection, checked used questionnaire at the end of each data collection day.

Data Analysis

Data were coded and entered to computer using Epi Data software version 3.1 and exported to SPSS version 20.0 for further analysis. Descriptive result presented using frequency and proportions for all variables and we
performed bivariate regression to determine association between factors of good glycemic control at 95%CI and p-value of <0.2. To identify the independent predictors of good glycemic control, we performed multivariate logistic regression and variables with p-value <0.05 were considered as statistically significant predictors of outcome variables.

Results

From a total of 314 T2D patients who were identified, 304 of patients were involved in study with a response rate of 96.8%.

Baseline Information of the Participants: More than half (52.6%) of participants were males. The mean age was 50.3 (± 10.1) years (range 28-80 years). Large numbers of patients were older age group (40-59 years) by account 201 (66.1%). Above two-thirds (74.4%) of participants were married, 168 (55.3%) were Christian, 88 (28.9%) were housewife, and 137 (45.1%) had completed primary education.

The mean BMI of participants was 23.1 (± 3.1) kg/m² (range 17.3-31.8 kg/m²) and 210 (69.1%) of patients had normal BMI. Mean disease duration was 2.9 ± 1.08 years (range 1-23 years) and 120 (39.5%) of patients had confirmed T2D for longer than 5 years. One hundred eighty-four (60.5%) of patients didn’t get support from their families and 189 (62.2%) had family history of diabetes. Ninety (29.6%) of patients had co-morbidity. Majority of participants, 296 (97.4%), 282 (92.8%) and 276 (90.8%) have never smoked cigarettes, drunk alcohol, and chewed chat respectively.

Two hundred fifty-seven (84.5%) patients weren’t tested their BG at home and 248 (81.6%) patients didn’t participate in regular physical activity for controlling diabetes. Concerning type of diabetic medications, 168 (55.3%), 112 (36.8%), and 24 (7.9%) of participants were taking oral medications, insulin, and combination of oral medication and insulin respectively. Of the patients on oral medication therapy, 136 (44.7%) were on monotherapy while 32 (10.5%) of patients were on combination therapy of oral medications. Two hundred sixty-four (86.8%) of patients were taking medications as prescribed.

Good Glycemic Control and Contributing Factors:

Overall, this study found that among those participants in JMC and SGH, 103 (33.9%) of diabetic patients did attain target level of FBG of <130 mg/dL. We performed logistic regression to identify the effect of factors on good glycemic control with 95%CI and P-value <0.05. The final model showed that gender, age, SMBG, duration of disease, and type of drug used were statistically associated with good glycemic control (Table 1).

Thus, the odds of good glycemic control were 4.96 times higher on male patients as compared to female patients [(AOR = 4.96, 95% CI (1.8, 14.1)]. Duration of diabetic disease was also related factor of good glycemic control and result showed that per a unit increase in total score of diabetic disease duration, the odds of good glycemic control is increased by 1.12 and the observed difference was statistically significant [(AOR = 1.12, 95% CI (1.02, 1.23))]

However, per a unit increase in total score of age of participants, the odds of good glycemic control is decreased by 2.5 and the observed difference was statistically significant [(AOR = 0.9, 95% CI (0.87, 0.96)]. Compared to participants who hadn’t tested their blood glucose at home or SMBG, participants who had tested their BG at home were six times [(AOR = 6.1, 95% CI (1.75, 21.4))] more likely to have good glycemic control. The odds of good glycemic control among patients who took insulin only and combinations of insulin and OHA were 7.3 [(AOR = 7.3, 95% CI (3.1, 17.5))] and 6.6times (AOR = 6.6, 95% CI (1.97, 22.23)) more than patients who took oral medication only respectively.

Discussion

Diabetes control comprises practices and comprehensive management approach therefore; understanding factors associated with achieving good glycemic control for patients with diabetes will help to improve treatment and prevents complications of diabetes. We assessed prevalence and related factors with achieving good glycemic control.

Generally, our study revealed that one third (34%) of participants did attain target level of FBG (<130mg/dL). Consistent with study done in Jimma (35%)15, while, this finding is higher compared to findings from Malaysia16 and Saudi-Arabia17 that showed the prevalence of good glycemic control were 24% and 27%, respectively; probably the variations in prevalence of glycemic control could be attributed to the presence or absence of practices that are necessary for management of diabetes. This might be because of chronic disease in Ethiopia increased from time to time, due to this patients’ awareness on controlling and management of chronic illness could increase, and difference in the study period and behavioral change of the current patients.

There is a clear visible effect of gender on level of glycemic control; male patients had good glycemic control compared to females. There is also a statistically significant association between gender and glycemic control. This goes in line with finding in Dares Salaam18. This might be due to high proportion of good glycemic control in male patients in this study area in addition females roles such as; married women at home such as motherhood and taking care of children may affect BG controlling.

When the age of participants increased, the odd of good glycemic control is decreased and the observed difference was statistically significant. This is coherent with study done by Lipska et al19 stated that, as the person get older mitochondria activity in muscles is diminished, also fat started to accumulate in muscles and liver tissues leading to a defect in insulin secretion and insulin resistant. This could be related to development effect.

In this study, good glycemic control was more likely among patients with longer duration of diabetes than short duration. Consistent with study done by Turner R, Holman R, and Cull C.20, possibly because of patients becomes more familiar with disease treatment and prevention by controlling glycemic level to optimum due to getting high understanding on the importance of glycemic control and self-management practices.

Good glycemic control appeared to be greater among patients who treated with insulin only or combination of insulin with OHA when compared with oral medication only, which agrees with findings of a study by Benoit, et al21. This might be because of high proportion of patients with good glycemic control was observed in group of patients using insulin and combination of OHA and insulin (69.9%). Good glycemic control appeared to be greater among participants who were tested their BG at home compared to who weren’t tested. This finding was supported by study in Pakistan22. This might be because of SMBG is essential component of self-management in achieving glycemic control.

This study was strengthened by the incredible response rate; therefore, generalization could possibly be applied to all diabetic patients. However, our study had few limitations, which relates to the use of self-reported questions on some related factors, could lead to social desirability biases. Again a cross-sectional nature of the study precluded determining causal relationship.

Conclusion

Significant segment of T2D patients did attain target level of FBG. The key and related factors to achieve controlled glycemic level among diabetic patients were male, younger, had shorter duration of diabetes, SMBG, and took combination of drugs. Patients that
had access to SMBG should be taught about importance of more intensive monitoring of BG. Patients that had a combination of drugs therapy should be encouraged to take their prescribed medication without changing the regimen, particularly in those patients who presented with shorter duration of disease and have poorly controlled glycemia.

Acknowledgement

We would like to acknowledge to all of study participants and officials working in JMC and SGH that really deserves acknowledgement for their cooperation.

Ethical Clearance: Institutional review board of JU, Institute of Health approved the study and a formal letter of support written to JMC and SGH administrator’s office, and the procedures were in compliance with Helsinki Declaration.

Conflict of Interest: None.

Pathological Fractures: Main Causes, Sites and Outcomes a Prospective Clinical Study in Najaf City

Wejdi A. Al–Fatlawy
M.B.Ch.B, M.R.C.S.Glasgow, MD, FICMS. Surgical department, Orthopedic Branch, Medical Collage, University of Kufa, Consultant Orthopedic Surgeon, Alsader Teaching Hospital, Najaf, Republic of Iraq

ABSTRACT

The rate of pathologic fractures is increasing due to increased longevity on the one hand and the development of diagnostic techniques on the other hand, which makes any fractures diagnosed and treated well. To assess the causes and clinical profile of pathological fractures in Najaf City. A prospective study conducted at two main hospitals in Najaf city, The study included 79 cases with pathological fractures who were admitted to Al-Sader Teaching medical city and Al-Hakeem general hospital during the period 2017 to 2018. Findings revealed that, out of 892 fracture cases, 79 had pathological fractures, giving a prevalence among all fractures of (8.95%), 11 cases were unfit for surgery and excluded. The 68 cases underwent operative treatment had a median age of 54 years (range 13-82), additionally, majority of the patients aged more than 30 years. Males were 32 (47.1%), females were 36 (52.9%). Femur was the more frequent site accounted for (52.9%) followed by humerus in (25%), while fibula was the least frequent site contributed only (1.5%). Osteoporosis was the more frequent cause, (38.2%), followed by primary bone malignancy (14.7%), metastatic carcinoma (13.2%), metabolic bone diseases (13.2%), while bone atrophy was the least frequent in only2 cases (2.9%). The overall complication rate was 10.3% and mortality rate was 2.9%. In conclusion, pathological fractures represented almost 9% of all fractures in Najaf city. Osteoporosis and malignancies were the more common causes. Complications and mortalities reported in our study were comparable to other studies concerned with this problem.

Keywords: Pathological Fracture, etiology, epidemiology, outcome.

Introduction

Fractures are one of the significant health problems that humankind has experienced. It has been more encountered in the present life due to industrialization. Societies and vehicle upgrades to the extent of fractures with impact has been added more than once. Along with the increase in the incidence of fractures worldwide, the prevalence of pathological type of fracture is also increased dramatically. The rate of pathologic fractures is increasing due to increased longevity on the one hand and the development of diagnostic techniques on the other hand, which makes this fractures more easily diagnosed and reported where it is easily been encountered1,2. Pathologic fracture is occur secondary to an underlying illness where the bones is weak and more liable to fractures even with simple trauma. These fractures might be localized or generalized due to different etiological factors; One of the most important are benign and malignant tumors 3. Additionally, many systemic, infectious and congenital causes could lead to pathological fractures4. In the past because of lack of appropriate treatment and because of not well understood etiology, these fractures represented a challenge to orthopedics5. However, with advancing diagnostic and treatment techniques, a great transformation was occur in the management of these fractures in addition to better outcome and prognosis6,7. However, proper management mainly based on the
underlying cause, age of patients, location of fracture, type of fracture (Openness or closure), the presence or absence of complications, and other clinical and technical factors. Osteoporosis where it contributes for 80 to 90 percent of this type of fracture. Metastatic cancers are also one of the causes of pathological fractures where bone is the third most common site of metastasis in cancer patients. Lung, thyroid, prostate, kidney and breast tumors are the most likely to be metastasized to the bones and almost fifty percent of patients died from cancer have bone metastasis. Other causes of pathological fractures include osteomyelitis, osteomalacia, Paget's disease and osteogenesis imperfecta. In children, the pathological fractures usually associated with benign bone tumors and congenital or genetic disorders, and caused by a spectrum of underlying conditions that differ from that in adults. The diagnosis of pathological fractures based on clinical history and examination in addition to other investigations such as X-ray, CT scanning, MRI, nuclear bone scans, laboratory testing often to estimate the calcium levels and blood counts and biopsy. The treatment choice in pathological fracture management depends on the involved bone and the patient's clinical status. However, indications for surgical procedures include a survival duration of more than 6 weeks (in metastatic cancers), the ability to perform internal fixation, and the absence of comorbidities and factors that preclude early mobilization. The main objective of this study is to investigate the prevalence of pathological fractures, main causes, sites, mode of treatment and outcome of cases with pathological fracture admitted to our hospitals.

**Patients and Method**

This was a prospective study conducted at two main hospitals in Najaf city, included 79 cases with pathological fractures out of 892 bone fractures cases who were admitted to Al-Sader Teaching medical city and Al-Hakeem general hospital during the period 2017 and 2018. Data were collected using a data collection sheet prepared for the purpose of this study to gather demographic and clinical data, additionally, operative, postoperative and follow up notes of the patients were reported. Out of the 79 cases with pathological fractures, 11 patients had multiple medical comorbidities and were unfit for surgery, they treated conservatively and excluded from the study. The remaining 68 patients were treated operatively. Pathological fracture was suspected and considered according to the history if the fracture occurred with minimal trauma or during normal activities, Also in cases with history of recurrent fractures, multiple fractures, known metabolic disorders, or carcinomas are more likely to have pathological fractures. Complete clinical examination was performed, checking for swollen lymph nodes near the site of fracture, evidence of signs of carcinoma, osteoporosis, metabolic disorders. Laboratory investigations and studies were done including complete blood count, ESR, chemistry studies, serum protein electrophoresis, tests for Paget’s disease, thyroid function, parathyroid hormones and other necessary investigations. All patients were evaluated pre-operatively with plain X-ray, and chest X-ray to check for evidence of metastatic cancers. In some cases, CT and MRI were performed to determine the optimal surgical intervention that will applied and to check the extent of tumor (in cases with malignancies) near the fracture site and the surrounded soft tissues. Patients were followed up for a period of 9 to 12 months. Operation and surgical procedure and the decision about them applied for each individual case accordingly; intramedullary nail, plate, prosthesis and Dynamic hip screw (DHS) were used to fix such fractures. During the follow up period, complication and the outcome were reported. All statistical procedures and analysis performed using the SPSS software version 25 and appropriate statistical tests applied accordingly using descriptive statistics and cross tabulation with a level of significance, P. value, of 0.05.

**Findings**

Out of 892 fracture cases, 79 had pathological fractures, giving a prevalence among all fractures of (8.95%), 11 cases were unfit for surgery and they were excluded. The 68 cases underwent operative treatment had a median age of 54 years (range 13-82), additionally, majority of the patients aged more than 30 years. Males were 32 (47.1%), females were 36 (52.9%). Patients of urban origin were 45 (66.2%), (Table 1). The anatomic sites of fractures are shown in (Table 2), where femur was the more frequent site accounted for (52.9%) followed by humerus in (25%), while fibula was the least frequent site contributed only (1.5%).

Osteoporosis was the more frequent cause, it was reported in 26 cases (38.2%), followed by Primary bone malignancy (14.7%), Metastatic carcinoma (13.2%), metabolic bone diseases (13.2%), other causes included Paget’s disease in 5 cases (7.4%), hematopoietic disorders in 3 cases (4.4%), benign tumor in 4 cases (5.9%), while bone atrophy was the least frequent in only2 cases (2.9%), (Table 3). Intramedullary nail fixation, plate fixation, prosthesis and DHS were used in 41, 19, 3 and 5 patients, respectively, (Table 4). Regarding the
complications, two patients had surgical site infection, 2 patients had recurrence after 6 months follow up, One patient with DHS was converted to total hip arthroplasty after DHS lag screw cut out of the femoral head. Nail Breakage in one patient and one patient end with amputation, however the overall complication rate was 10.3%. (Table 5). Unfortunately two patients died and the mortality rate was 2.9%, (Figure 1).

Figure 1: Mortality and survival of 68 cases with pathological fractures

Discussion

The prevalence of pathological fractures is increasing due to increased longevity of population and the development of diagnostic techniques. The present...
study assessed the prevalence, main causes, main sites, complications and outcome of 68 of Iraqi patients with pathological fractures treated in two main hospital in Najaf, Iraq. The total number of cases admitted for different fractures during the study period was 892 cases of them 79 had pathological fractures giving a prevalence of almost 9% of all fractures. The prevalence of pathological fractures reported in previous studies ranged 8-30% of patients with bone metastasis 19,20.

In the present study, those who were fit for operation and surgically treated were 68 cases and were operated on using different surgical procedures accordingly. Evaluation of the patients showed that majority of those 68 cases (94.1%) aged more than 30 years with a median of 54 years, proportion of males among the cases was not much different than females, (47.1%) vs. (52.9%), respectively. These findings consistent with the clinical and epidemiological picture of pathological fractures as that reported in previous studies and literatures 2,19,21,22.

The present study found that the main anatomic site affected was femur, (52.9%), followed by humerus in (25%), while fibula was the least frequent site contributed only (1.5%). Narazaki et al and other studies reported almost close findings 6,17,23.

In our study we found that osteoporosis was the more frequent cause, it was reported (38.2%), followed by primary bone malignancy (14.7%), metastatic carcinoma (13.2%), metabolic bone diseases (13.2%), other causes included Paget’s disease (7.4%), hematopoietic disorders (4.4%), benign tumor (5.9%), while bone atrophy was the least frequent (2.9%), these findings were not unexpected as these factors are mainly cause pathological fractures particularly in elderly. Nonetheless, a variation is found in the frequencies and proportions of these causes in different studies and population due to variation in the prevalence risk factors and disease in different countries 3,7,20,23,24.

Intramedullary nail fixation, plate fixation, prosthesis and DHS were used in our patients and each individual case evaluated and the decision made accordingly. Management options and operative procedures depend on many factors including patients related factors such as age, gender, medical history, underlying cause and risk factors, the presence of malignancy and the affected bone 3,8,15,16,18,22. Regarding the complications, we reported 7 complications among our cases with an overall complication rate of 10.3%. Complications varies in different studies because development of complications affected by many factors, however, previous studies reported an overall complication rates ranged from as low as 5% to 25% 16,26. Choy, et al reported an overall complication rate of 16% while Yan xiong et al reported 17% 17,23. The mortality rate was 2.9% and it was low compared to mortality rates reported in previous studies, however, both died cases were postoperatively and were not related to operative technique or treatment procedures but due to other factors such as advanced malignancy status, on the other hand, wide variation in mortality rates was found among different studies 27–31.

Conclusion

Pathological fractures represented almost 9% of all fractures in Najaf city. Osteoporosis and malignancies were the more common causes of pathological fractures. Complications and mortalities reported in our study were comparable to other studies concerned with this problem.

Effects of Biomass Fuel Smoke on Pulmonary Functions in Rural Women of Southwest Ethiopia

Samuel Tadesse Abebe¹, Tabarak Malik²

¹Assistant Professor, Medical Physiology, ²Assistant Professor, Medical Biochemistry, Biomedical Sciences Department, Faculty of Medical Sciences, Institute of Health, Jimma University Ethiopia

ABSTRACT

Introduction: Biomass fuel is used commonly for domestic cooking by most of the rural Ethiopian housewives, in an enclosed space with poor ventilation. Incomplete combustion of biomass produces harmful products which may exert various adverse effects on lung functions.

Aim: To assess the adverse effects, if any, on pulmonary functions and respiratory symptoms in rural women using biomass fuel for cooking and compared to housewives who were not exposed.

Materials and Method: A comparative cross-sectional study was conducted with a total of 132 study participants (66 women exposed to biomass fuel smoke and 66 controls), from September 5 to October 5, 2018. Anthropometric and spirometric measurements were carried out. SPSS version 20.0 was used for data analysis. Frequencies, means, percentage and chi-square were used for descriptive analysis. Independent sample t-test, bivariate and multivariate logistic regression was used to compare mean and relevant associations.

Results: The mean age of biomass fuel smoke exposed and non-exposed group were 29.12 ± 8.40 and 29.21 ± 6.51 respectively. The mean of BMI among exposed group was 22.90 ± 2.47 while 23.37 ± 2.55 was in non-exposed group. Among biomass fuel smoke exposed group mean of 3.56 ± 0.70 for FVC, 2.87 ± 0.77 for FEV1, 80.40 ± 11.36 for FEV1 %, 3.77 ± 1.09 for FEF25-75% and 6.60 ± 1.90 for PEFR was recorded while 3.95 ± 0.77 for FVC, 3.33 ± 0.68 for FEV1, 84.38 ± 9.19 for FEV1 %, 4.33 ± 1.15 for FEF25-75 % and 7.55 ± 2.31 for PEFR was recorded among controls. A significant reduction was found in pulmonary function parameters among biomass fuel smoke exposed group compared to non-exposed. The prevalence of abnormal lung function is 37.9% and 15.2% among exposed and controls respectively. Biomass fuel smoke exposed women for greater than 5 years were six times (AOR=6.321; 95%CI=2.100, 19.022; P=0.035) more likely to have pulmonary function impairment compared to those exposed for less than or equal to 5 years. The prevalence of cough, phlegm, wheeze, breathlessness and chest pain was 39.4%, 22.7%, 30.3%, 19.7% and 16.7% for exposed group respectively while 21.2%, 13.1%, 15.2%, 6.1% and 12.1% for non-exposed respectively.

Conclusion: This study concluded that biomass fuel smoke exposed women are at greater risk of pulmonary function impairment than non-exposed group. The prevalence of adverse respiratory symptoms was higher among biomass fuel smoke exposed compared to non-exposed.

Keywords: Pulmonary function test, Body mass index, Respiratory symptoms, Indoor biomass cooking.

Introduction

Biomass fuel is derived from plants or animals and humans from very beginning of civilization. Most common is wood, but the use of animal dung and crop residues is also used widely¹. Half of the domestic energy demand is fulfilled by biomass fuel in most developed countries and more than 90% in developing countries. Low combustion efficiency of biomass fuel...
leads to incomplete combustion and production of harmful substances which may induce various harmful effects on the lung function. In sub-Saharan Africa, where the majority of women rely on biomass fuel, burden of affiliated respiratory diseases has not been well documented. The studies conducted on the effects of indoor air pollution in African countries are very rare in available literature. Ethiopia, one of the country in East Africa having more than 100 million people, is one of the poorest country in the world. Majority of the population in Ethiopia lives in a rural environment.

The biomass fuel is widely used as a primary source of cooking fuel in every part of Ethiopia. Available literature reveals that 80% of housewives having indoors cooking environment and using biomass as fuel in rural northern Ethiopia moreover, are using inappropriate devices in pitiful ventilated kitchen resulting in high exposure to toxicants.

Indoor air pollution because of biomass fuels is ranked 10th amongst most preventable risk factors globally and among developing countries it ranked fourth. In communities with poor access to green fuels in rural setting of developing countries, burden of disease is high and it constitute a 2.7% of overall health risks.

Epidemiological studies have shown that pulmonary functions are decreased with long term/short term exposure to polluted air. Therefore, the current study was carried out to evaluate the effects of biomass fuel combustion on pulmonary function in the women of Alemyehu Mecha village and compared the pulmonary function between biomass fuel users and non-users i.e. those using clean fuels like liquefied petroleum gas or electricity for cooking.

**Materials and Method**

**Study Setting:** This study was conducted in Alemyehu Mecha kebele which is located 15 km to Jimma town, south west Ethiopia. Approximately 2500 people live in the Village.

**Study Design and Participants:** A comparative cross-sectional study was employed from September to October 2018. The sample size was calculated using the method of Dupont & Plummer, where the confidence interval was set as 95%. The study was conducted with 66 subjects in each group which was greater than computed sample size, subjects were randomly selected for the study using systematic sampling methods. Eligibility criteria for exposed group were being greater than 18 years old and responsible for household cooking. Convenient sampling technique was used to select control group. 66 women with same age, BMI, and educational status were selected from residents of Jimma University apartments who used electricity, LPG and had separate ventilated room for cooking. The purpose of the study was explained clearly in local language to all potential participants and informed consent was also obtained. Each subject filled up one questionnaire to record their personal demographic data, health status and consent to participate in the study.

The subject’s height measured in standing position without shoes in centimeters and weight measured in kg were taken as continuous variables.

Using the digital spirometer, Forced vital capacity (FVC), Forced Expiratory Volume in one second (FEV\textsubscript{1}), FEV\textsubscript{1}/FVC ratio, FEF\textsubscript{25-75} and Peak Expiratory Flow Rate (PEFR) were measured. All pulmonary function tests were carried out from 08:00-10:30 AM as per guidelines of American Thoracic Society.

**Data Analysis Procedures:** Data were analyzed using the SPSS Version 20. Descriptive statistics were used to summarize socio-demographic characteristics and anthropometric measurements of subjects. Chi-square test was used to compare the prevalence of respiratory symptoms among exposed and non-exposed group. Independent sample t-test was used to compare the mean respiratory scores of exposed and non-exposed groups. Logistic regression was used to evaluate relationship between respiratory function test and independent variables.

**Ethical Consideration:** This study was approved by Institute of Health Science Ethical Review committee of Jimma University vide Ref. No. IHRPGD/587/2018 dated 14/05/2018.

**Results**

A total of 132 (66 from each exposed and control group) study participants were involved in this study. Age of study participants ranged from 19 to 60 years with a mean age of 29.12 ± 8.40 for biomass fuel smoke exposed women and 29.21 ± 6.51 for controls. Regarding educational status, 47% and 53% of exposed; 42.4%
and 57.6% of controls educated to primary school level and high school and above respectively. Majority of the participants from both study groups were not married. Cooking experience among exposed participants ranged from 1 to 19 years. 62.1% of cases were having 1-5 years of exposure to biomass fuel smoke while the remaining 37.9 % were having greater than 5 years of exposure. Matched variables for age, BMI, and Educational Status showed that there was no significant difference among exposed and their matched controls [Table/Fig-1].

**Pulmonary Function Test:** An independent sample t-test was used to compare Spirometric measurement of pulmonary function (FVC, FEV1, FEV1%, FEF25-75% and PEFR) of exposed and non-exposed group. Accordingly, FVC, FEV1, FEV1%, PEFR and FEF25-75% were higher in control respondents than exposed respondents and the mean difference was found to be statistically significant (p<0.05) [Table/Fig-2].

</tbody>
</table>

SD: Standard Deviation, CI: Confidence Interval, * p value < 0.05, **p value < 0.001

**Respiratory Symptoms:** The self-reported prevalence of respiratory symptoms were analyzed among the study participants. Cough was the most prevalent respiratory symptom among biomass fuel smoke exposed (39.4%) participants. Prevalence of respiratory symptoms was compared using chi-square test between exposed and controlled. The result showed significant difference (p< 0.05) for cough, wheezing and breathlessness with p-value of 0.023, 0.038 and 0.019 respectively [Table/Fig-3].

![Table/Fig. 3: Respiratory symptoms among exposed and control group](image-url)
Pulmonary Impairments: The prevalence of abnormal lung function is 37.9% and 15.2% among biomass fuel smoke exposed women and controls respectively. The type of lung disorder mostly evident in biomass fuel smoke exposed women was restrictive. About 3(4.5%), 16(24.2%), 6(9.1%) and 4(6.1%), 4(6.1%), 2(3%) develop obstructive, restrictive and mixed type of lung disorder in exposed and controls respectively. FVC and FEV1 were affected in all three lung disorders but FVC and FEV1 were more affected in restrictive and obstructive impairment respectively [Table/Fig-4].

Table/Fig-4: Ventilatory impairment among exposed and non-exposed participants

Factors Associated with Pulmonary Function: The variables that showed statistically significant association (p<0.25) in the bivariate analysis were transferred and further analyzed in multivariable logistic regression to adjust for potential confounders and to identify factors associated with pulmonary function. In multivariable logistic regression, variables with p<0.05 were considered as factors for pulmonary function. The model was tested for multicollinearity (VIF=1.012-1.799 for exposed and VIF=1.083-2.036 for non-exposed) and goodness of fit was tested by Hosmer-Lemeshow test (p=0.678 for exposed and p=0.443 non-exposed). The model was fit and no multicollinearity existed.

The result of multivariable logistic regression indicated that cooking experience was the only variable independently associated with pulmonary function. Women who cooked with biomass fuel for greater than 5 years were six times (AOR=6.321; 95%CI=2.100, 19.022; P=0.035) more likely to have lung function impairment compared to those who worked for less than or equal to 5 years [Table/Fig-5].

Discussion

The effect of biomass fuel on pulmonary functions in current study showed that, FVC, FEV1, FEV1%, FEF25-75% and PEFR values in the exposed group were significantly decreased (p<0.05) when compared to that of control. This finding is in line with study conducted in Karnataka India and Cameroon. Authors observed that the pulmonary function parameters were significantly lesser in the study subjects as compared to group exposed to biomass fuel13. Recently another study on pulmonary function in rural women exposed to biomass fumes also conducted which reported that pulmonary function parameters \{FEV1 in liters (1.44 ± 0.36), FVC in litres (1.62 ± 0.38), PEFR in liters/second (3.11 ± 1.05), MVV in litres/minute (49.70 ± 14.11)\} were significantly reduced in biomass fuel subjects as compared to green fuel users. The mean exposure in hours was 3.5 hours/day with duration of exposure ranging from 8 to 30 years in the above-mentioned study14. Similarly, other studies show FEV1, FEV1/FVC%, FEF 25-75%, PEFR values were decreased statistically among the biomass affected subjects15. This attribute may be due to exposure of high concentration of pulmonary toxicants emitted during incomplete biomass fuel combustion and poorly ventilated environment. These alteration in pulmonary function parameters in biomass fuel exposed women may be avoided by improving adequate household ventilation, by improvement in stoves and change of the fuel type for cooking and heating.

The present study revealed the prevalence of respiratory symptoms of cough (39.4% vs. 21.1%), phlegm (22.7% vs. 13.1%), wheeze (30.3% vs. 15.2%), and breathlessness (19.7% vs. 6.1%) in biomass fuel affected group and controls, respectively. In this study, the higher prevalence of respiratory symptoms in biomass fuel exposed group may be due to unhygienic conditions, and poorly ventilated workplaces of the study areas as compared to the controls.

A study conducted in India reported cough as the common presenting symptom16, similar results was reported in Port Adelaide Australia17, where the presence of wood heaters at home was significantly associated with increased prevalence of respiratory symptoms in females.

Even if a study conducted in India shows obstructive pattern of pulmonary dysfunction in biomass fuel exposed females18, the present study indicates restrictive pulmonary dysfunction as the most evident lung disorder in biomass fuel smoke exposed women. The alteration in pulmonary function could be due to chronic inhalation of high concentration of respiratory toxicants present in biomass fumes. There are plenty of studies which reported ill effects of biomass fuel smoke on quality of life19.

Limitations of the Present Study: This was an interviewer administered cross sectional study which may be subjected to error in interpretation of terms by the interviewer and accurate recall by the participants. The study was unable to measure indoor emissions, indoor concentrations, outdoor concentration of air pollutants and amount of smoke exposure of the individual.

Conclusion

The findings of this study suggest the deteriorating effects of biomass fuels on the various pulmonary function parameters. High prevalence of abnormal lung function (37.9%) was indicated among biomass fuel smoke exposed women. Our study also indicates negative health consequences due to exposure from biomass smoke and other solid fuels in Ethiopia. These negative effects should not be ignored because such fuels will continue to be used by a large number of rural households in the predictable future in Ethiopia. Further research is recommended to investigate the biochemical and molecular mechanism if any, responsible for various pulmonary alterations due to biomass smoke.

Acknowledgments

We greatly extend our sincere thanks to local health authorities and the community female health extension workers of Alemayehu Mecha district who helped to collect data.

Conflict of Interest: The authors declare no conflict of interests.

ABSTRACT

Diabetes mellitus is one of the most frequently encountered medical disorders complicating pregnancy course. Some pregnant women are poorly control or unaware of having diabetes mellitus. We aimed to study clinical presentation and complications of different types of diabetes mellitus during pregnancy in women with variable glycemic control and awareness. Therefore, a randomized cross sectional study-research initiated in Baghdad, Elwiya-Teaching Hospital of Maternity, from the January, 1st. 2017, to Jan.1st 2018. Included 222 pregnant women with singleton pregnancies. Findings revealed that more frequent adverse maternal clinical presentations, maternal and neonatal complications and adverse outcome were associated with the poor glycemic control and unawareness about having diabetes mellitus. In conclusion, higher incidence of complications were seen in pregnant women who failed to reach an accepted glycemic control.

Keywords: Singleton pregnancy, diabetes mellitus, epidemiology, complications, Gestational diabetes, glycemic control

Introduction

The presence of Diabetes Mellitus (DM) is a significant and utmost frequently met health problem with its impact in term of complicating pregnancies. DM may be pre-gestational in onset, or gestational (GDM), which is diagnosed during pregnancy for the first time. Carbohydrate intolerance is a condition induced by the metabolic stress of pregnancy, resolves on its own after giving birth1,2. Diabetes mellitus represented a significant problem worldwide, particularly in developing countries due to the alteration in these countries towards industrialization with its effect on the life-styles diet-habits and higher prevalent obesity. The incidence of DM is increasing worldwide 3,4. Globally, 6 countries in the middle east among the top 10 countries in the world that have the higher prevalence rates of DM. A previous study in Iraq, reported high prevalence rates among Iraqi population in Basraah where almost 20% were affected, this higher prevalence had a significant burden on the health system, population life and economic resources of healthcare services 5. In Iraq, lack of education and sociocultural limitations represented the major hurdles, lead to inadequate ANC, failed risky pregnancies screening and failure of referral to appropriate healthcare services at right time6. In our country we have an increasing burden of facing a significant number of pregnant women with complications of undiagnosed diabetes 4, making our aim to raise the women awareness about these risks in order to decrease the adverse maternal, fetal and neonatal outcome. Therefore, in this study, we aimed to study clinical presentation and complications of different types of diabetes mellitus during pregnancy in women with variable glycemic control and awareness.

Patients and Method

The study was a random-cross-sectional design initiated in Baghdad, Elwiya-Teaching Hospital of Maternity, from the January, 1st. 2017, to Jan.1st 2018. Included 222 pregnant women with singleton pregnancies. All were either known cases of diabetes
during pregnancy or not aware of having impaired glucose tolerance at their first clinical presentation. All cases with other medical and obstetrical disorders were excluded. Detailed history and clinical examination findings were reported. Blood samples were sent for hemoglobin level, one hour postprandial blood sugar for those who were not known to be diabetic. Ultrasound was done to all women to ensure viability, gestational age, congenital anomalies, intrauterine growth restriction or death, accelerated fetal growth, and polyhydramnios. Doppler ultrasound performed at third trimester to exclude placental insufficiency. Participants were sub grouped according to their glycemic control to have good glycemic or poor control. Findings of clinical examination, ultrasonography and other variables were compared. Data analysis was performed using MINITAB soft. Appropriate statistical tests and procedures were applied accordingly with a level of significance of 0.05 (two tailed)

**Results**

Out of the 222 participants, 110 (49.5%) had good and 112 (50.5%) had poor glycemic control. One hundred fifteen ladies were unaware of having diabetes and 107 had different types of diabetes, with no significant difference in glycemic control between both sub groups. A significant association was found between good ANC and good glycemic control, (P<0.05). Poor glycemic control groups had more frequent history of macrosomia, (P<0.05). No significant differences were found regarding other variables(Table 1). Table 2 shows the clinical presentation according to glycemic control; women with poor glycemic control experienced more, fatigability and malaise, abdominal pain., premature contractions, preterm labor and Premature rupture of membranes, moniliasis, headache, decreased fetal movement, antepartum hemorrhage and hypertension, (P.value < 0.05). Table 3 shows the ultrasound findings in both groups; macrosomia and polyhydramnios and intrauterine growth restriction were significantly more frequent in poor glycemic control group. From other point of view, headache, preterm labor, urinary tract infection and decreased fetal movement were significantly more frequent among unaware sub group, (P<0.05), (Table 4). In (Table 5), on ultrasonography, unaware women had more frequent macrosomia and polyhydramnios compared to other subgroup, (P<0.05). Other findings were insignificantly different, (P>0.05). Finally, women who achieved higher levels of education were significantly more aware about their glycemic control, (P<0.05), (Table 6)

Discussion

In our study we confirmed that almost half of the studied group had poor glycemic control and they were unaware about their status. We confirmed that participants better glycemic control was more in women who were more attending the ANC units. Murphy et al, demonstrated also that preconception approaches improve preparation for pregnancy reduce the risks of adverse pregnancy outcomes. Early detection and prompt management of diabetes during pregnancy can decrease maternal and fetal adverse outcomes. Vaginal moniliasis may be higher in diabetic pregnant women compared to non-diabetics, due to the increased levels of glucose in DM and the suppression in the immune system during pregnancy. Jodhpur city, Rajasthan, India from November 2012 to July 2013 and 50 pregnant women included as a control group without diabetes. All specimen from three sites (Vaginal swab, Throat swab & Urine, we found, higher prevalence of vaginal candidiasis, among pregnant women with poor glycemic control and also found to be more frequent in those who
were unaware of their diabetes. Similar findings reported in previous studies where a significant association had been documented between DM and higher incidence of vaginal candidiasis.

However, Sopian et al. found no association between diabetes and vaginal yeast infection in pregnant women. Higher prevalence of UTI in women with uncontrolled DM compared to the controlled cases was found, however, the difference did not reach the statistical significance. In 2016 and 2017 two studies reported that, no significant differences in the incidence of UTI between diabetic pregnant women and non-diabetics. Regarding clinical presentations, majority of these presentations were more frequent in poorly controlled group.

Mimouni F, et al. found that diabetic women were more likely to give pre-term birth. However, the relationship between DM and pre-term labor, is still under debate by many investigators, endocrinologists and obstetricians. However, Biswas R, found that preterm labor and birth weight >3.5 kg were independently associated with diabetes.

We found that PET & hypertension is increased more in diabetic women with poor glycemic control.

Kari et al. reported in 2017 that the occurrence of DM may possibly increase the likelihood of incidence of premature rupture membrane, that may result in an intense rise in the proportion of pregnancies related complications, which in turn, could lead to a dramatic escalation in the rate of pregnancy-related complications. The available data, however, are not sufficient in this regard in the literature. This study aims to examine pregnancy outcome in pregnant women with simultaneous diabetes mellitus/gestational diabetes and PPROM.

Materials and Methods: A total of 134 pregnant women with gestational diabetes (n = 99). According to our results we found that polyhydramnios in (51.35%) women and macrosomia affected (73.84%) neonates, and were more in pregnant women with uncontrolled DM and more frequent in those who were unaware of having diabetes. Adam et al. found in 2015 that

Almost 12% of non-diabetic normal women and up to 45% of diabetic women may have newborns with Macrosomia and that polyhydramnios in 56% of cases, and the majority were diabetics.

The higher risk of Macrosomias among diabetic women, could be attributed to the increase insulin resistance. The increased risk of macrosomia in DM is mainly due to the increased insulin resistance among these women, which lead to passing of larger amount of glucose via placenta to the circulation of fetus that later stored as fat tissue and lead to macrosomias.

Intrauterine growth restriction (IUGR) is diagnosed in DM is usually caused by placental dysfunction related to vasculopathy. IUGR is a common cause of iatrogenic prematurity, IUD, and predispose the child to cardiovascular disease and type 2 DM in the future. In our study, IUGR & IUD were both found in the studied diabetic pregnant women especially women with uncontrolled DM. Although more cases of IUGR were collected from the studied pregnant patients with newly diagnosed DM but without statistically significance. Similar results found in previous study of Corocran et al. in 2015.

Fetal congenital anomalies were more frequent in poor control and unaware subgroups, but the difference was statistically insignificant, however, some investigators found that infants malformation were more frequent by almost 2-3-folds in women with IDDM however, this higher rates are not documented in women with GDM. There was no statistical differences regarding the results of Doppler U/S in our study. Other studies found that uterine and umbilical artery vascular impedance in pregnancies complicated by gestational DM is related to birth weight and placental weight, but not to maternal HbA1c levels.

We found that women who achieved higher levels of education were more aware about their glycemic control and clearly had less obstetrical complications as discussed above. Liu showed that health education has positive effects on pregnancy outcomes of patients with GDM.

Conclusion

Patient’s education and awareness about the symptoms of diabetes was associated with less maternal and fetal complications and higher incidence of these complications are still seen in pregnant women who failed to reach an accepted glycemic control.

Association between SES, Health behavior and Periodontal Disease

Eun-Sil Choi1, Young-Soo Lee2

1Research Scholar, Department of Public Health Sciences, Graduate School, Korea University, Seoul, Korea; 2Professor, Department of Dental Hygiene, College of Health Sciences, Sunmoon University, Asan, Korea

ABSTRACT

Objective: The study was to use data from the Korea National Health and Nutrition Examination Survey (KNHANES) to association between SES, health behavior and periodontal disease.

Method: The survey selected a total of 5,677 adults aged 19 years. Dependent variable of oral health was based on presence of periodontal disease. Independent variable was childhood, adulthood SES and heath behavior. Complex sample logistic regression analysis was performed on the effects of SES and health behavior on oral health.

Findings: All variables were adjusted and the factors that affect periodontal disease were identified as demographic factors (gender and age) and health behavior factors (floss, brush, mouth rinse, and smoking). using dental floss, as compared to not using dental floss (OR=1.63, 95% CI: 1.31-2.01); daily tooth brusing of ≥3 times, as compared to ≤1 time (OR=2.76, 95%CI: 2.33-3.28); using dental rinse, as compared to not using (OR=0.76, 95%CI: 0.61-0.94); and smoking, as compared to not smoking (OR=0.46, 95%CI: 0.36-0.59) were found to affect periodontal disease.

Improvements: Independent association between SES and periodontal disease was identified and the oral health behavior and smoking status were the factors with the most significant influence on periodontal diseases. Based on reports of SES-associated oral health inequalities, policy intervention by the government is needed to promote oral health through active oral health education programs.

Keyword: adulthood SES, childhood SES, health behavior, oral health behavior, periodontal disease

Introduction

Despite efforts to promote oral health in citizens of countries worldwide, oral diseases still remain a burdensome issue that affects the entire population, and especially, the vulnerable population.1 Various social, economic, and environmental factors are known to affect oral health.2 In particular, there is a growing interest in the significance of socioeconomic status (SES) in the etiology of diseases. Health-related behavior, health service utilization, degree of stress, and psychosocial resources have been suggested as the mediating mechanism for explaining the association between SES and health, while income and education levels have been reported as variables that can explain SES.3

SES refers to the total measure of economic ability and social status of an individual or a household based on income and education level.4 People with higher SES are known to be healthier than those with lower SES;5 6 and Petersen claimed that socioeconomic factors have a direct impact on oral health through their effects on dental care utilization and oral health behavior.7 Watt reported that among the significant influencing factors of oral health status of individuals or groups, SES was associated with poor oral health status of groups.8

Case et al. reported that the association between SES and oral health is present even during childhood and the association increases with aging.9 Generally, parents
play a major role since they are involved in health care of children in most cases. Oral health is a phenomenon that appears to result from cumulative effects over time, and previous studies have shown that inequalities in oral health were identified through the association of oral health and SES of the parents.\textsuperscript{10-13} Health behavior has a major impact on the health of an individual and plays a definitive role in the acceptance and maintenance of preventive health behavior.\textsuperscript{14} Among the indicators of personal health, oral health-related behavior plays an important role in prevention and onset of chronic diseases;\textsuperscript{15} to date, the association between oral health behavior and oral health has been reported to include variables such as tooth brushing, use of dental floss, dental care utilization, and smoking.\textsuperscript{16, 17}

Few studies have investigated SES, a major influencing factor of oral health, in childhood and adulthood, and studies that identified by effect size of health behavior on oral health are also rare. Therefore, it is necessary to investigate oral health according to social polarization, while also identifying the effect size of health behavior.

The present study aims to assess the association between SES, health behavior and periodontal disease.

**Materials and Method**

**Subjects and data collection:** The present study used data from Korea National Health and Nutrition Examination Survey (KNHANES) VI-2 (2014). This data was approved by the Institutional Review Board of Korea Centers for Disease Control and Prevention (2013-12EXP-03-5C). The target population in data included 9,701 people, of whom 7,550 people participated in the survey (participation rate, 77.8%). The survey selected a total of 5,677 adults aged 19 years and older who completed the health questionnaire and health examination.

**Study materials:** Childhood SES consisted of questions about the education level of the parents: paternal education level (<10 years or ≥10 years) and maternal education level (<10 years or ≥10 years). For adulthood SES, education level were binary variable (<10 years or ≥10 years). Personal income level were converted to low level(<50%) and high level(50-100%).

Demographic factors included gender and age (19 years or older).

Health behaviors included the following factors: frequency of tooth brushing, use of dental floss, use of interdental brush, use of mouth rinse, use of electric tooth brush, and drinking, and smoking. Frequency of tooth brushing was categorized as ≤1, 2, and ≥3 times/day. For the use of oral hygiene products (dental floss, interdental brush, mouth rinse, and electric tooth brush), response was given as either “Yes” or “No.” Drinking status was categorized as “Yes” for consumption of at least one serving of alcohol in the past one year and “No” for otherwise. Smoking status was categorized as “Yes” for current smokers and “No” for non-smokers.

Oral health was based on presence of periodontal disease. Based on the community periodontal index (CPI) measured by a dentist during an oral examination, CPI 3 and 4 were defined as periodontal disease; whereas, CPI 0, 1, and 2 were defined as non-periodontal disease.

**Methods of Analysis:** KNHANES used rolling survey sampling to ensure that the sampled data for each year were highly representative. For accurate data analysis, weighted value was applied to each individual using primary sampling unit (PSU) and K strata. Accordingly, the present study used complex sampling analysis. Complex sample chi-square test was performed on oral health according to SES and health behavior. Complex sample logistic regression analysis was performed on the effects of SES and health behavior on oral health. The effects of childhood and adulthood SES on periodontal disease were established as Models 1 and 2, respectively; the effects of demographic factor and health behavior on periodontal disease was established as Model 3; and the model with all factors adjusted was established as Model 4. Odds ratio (OR) and 95% confidence interval (CI) were derived. Statistical analysis on the collected data was performed using PASW Statistics 22.0 version (IBM Co., Armonk, NY, USA). Statistical significance level was set to 0.05.

**Results**

**Childhood SES, adulthood SES, and periodontal diseases:** In the association between periodontal diseases and demographic characteristics, males (35.7%) showed statistically significantly higher incidence of periodontal diseases than females (22.9%; p<0.001). With respect to periodontal diseases by age, the mean age of those with periodontal disease was 54.0 years, which was statistically significantly higher than 42.4 years for those without
periodontal disease (p<0.001). In the association between childhood SES and periodontal diseases, incidence of periodontal disease was 16.3% and 35.6% in those with paternal education level of ≥10 and <10 years, respectively. Lower paternal education level showed higher incidence of periodontal disease and the difference was statistically significant (p<0.001). Lower maternal education level also showed higher incidence of periodontal disease and the difference was statistically significant (p<0.001). In the association between adulthood SES and periodontal diseases, lower education level showed statistically significantly higher incidence (incidence rate, 45.8%) of periodontal disease(p<0.001). Likewise, lower income showed significantly higher incidence (incidence rate, 31.3%) of periodontal disease (p=0.01). In the association between health behavior and periodontal diseases, daily tooth brushing of ≤1 time showed the highest incidence of periodontal disease (incidence rate, 40.9%), while daily tooth brushing of ≥3 times showed an incidence of periodontal disease of 23.7%. Lower frequency of daily tooth brushing showed higher incidence of periodontal disease and the differences were statistically significant (p<0.001). Not using dental floss showed statistically significantly higher incidence of periodontal disease with 32.7% (p<0.001). Similarly, not using interdental tooth brush showed significantly higher incidence of periodontal disease with 30.1% (p=0.002). Smokers also showed statistically significantly higher incidence of periodontal disease with 40.8% (p<0.001) (Table 1).

**Effects of childhood SES, adulthood SES, and health behavior on periodontal diseases:** In Model 1, Paternal education and periodontal diseases were statistically significant. In Model 2, SES and periodontal diseases were statistically significant. In Model 3, Sex, age, brushing, floss, smoking and and periodontal diseases were statistically significant. In Model 4, all variables were adjusted and the factors that affect periodontal disease were identified as demographic factors (gender and age) and health behavior factors (floss, brush, mouth rinse, and smoking). Being a male, as compared to being a female (OR=1.63, 95% CI: 1.31-2.01); being of higher age, as compared to being of lower age (OR=2.76, 95%CI: 2.33-3.28); using dental floss, as compared to not using dental floss (OR=1.63, 95% CI: 1.31-2.01); daily tooth brushing of ≥3 times, as compared to ≤1 time (OR=2.76, 95%CI: 2.33-3.28); using dental rinse, as compared to not using (OR=0.76, 95%CI: 0.61-0.94); and smoking, as compared to not smoking (OR=0.46, 95%CI: 0.36-0.59) were found to affect periodontal disease (Table 2).

**Table 2:** Results of logistic regression analysis for association between periodontal disease and childhood SES, Adults SES, health behavior factor

Discussion

The present study investigated the effects of SES categorized into childhood and adulthood SES, and health behavior on oral health. With regard to oral health, investigation of incidence of periodontal diseases showed the following results. The prevalence of periodontal diseases among Korean adults aged 19 years or older was found to be approximately 29%. The reported prevalence of periodontal diseases varies according to different countries around the world, and various epidemiological associations have been reported to reduce the prevalence of periodontal diseases. This study results (Model 4), which included childhood SES, adulthood SES, and health behavior, SES and periodontal diseases did not show statistically significant association, while health behavior alone appeared to be associated with periodontal diseases. Other studies on SES and periodontal diseases have reported that the independent influence of SES on periodontal diseases was found to be sufficient, but when the behavior of smoking was introduced, smoking had a greater influence on periodontal disease than SES, which supported the findings of the present study. In a study by Marcheasan JT et al., use of dental floss was reported to improve oral health, which was consistent.
with the finding of the present study. Various studies have reported that use of oral hygiene products can help improve oral health, which supported the findings of the present study. The incidence of periodontal diseases increases with age, and as a result, social costs associated with periodontal diseases increase. Oral health programs at national or community level are required to reduce such social costs. Efforts should focus on the development and promotion of education programs on oral health behavior and prevention of smoking, which were found to have the most significant influence on periodontal diseases.

Our study had the following limitations. First, childhood SES was associated with the paternal and maternal education level, but association with economic income levels could not be identified. Second, the models were established with the risk factors of periodontal disease limited to SES and health behavior, hence, other risk factors could not be adjusted. However, despite such limitations, the present study showed that the association between SES and periodontal disease was independent, and oral health behavior and non-smoking were factors with the biggest influence on periodontal diseases.

**Conclusion**

In this study, we confirmed the positive relationship between SES and periodontal disease was identified with following details:

1. Independent association between SES and periodontal disease was identified.
2. Oral health behavior and smoking status were the factors with the most significant influence on periodontal diseases.

The Effects of Job Satisfaction on Organizational Commitment in Korea Dental Hygienist: Organizational Communication Mediation Model

Young-Soo Lee¹, Marcia Lorentzen², Eun-Sil Choi³

¹Professor, Department of Dental Hygiene, College of Health Sciences, Sunmoon University, Asan, Korea 31460; ²Professor, Fones School of Dental Hygiene, Bridgeport, University of Bridgeport, Connecticut, U.S.A. 06604; ³Research Scholar, Department of Public Health Sciences, Graduate School, Korea University, Seoul, Korea 02841

ABSTRACT

Objectives: This study aimed to assess the relationship between job satisfaction, organizational communication, and organizational commitment in dental hygienists, and understand the mediating effect of organizational communication.

Method: The study was conducted with dental hygienists from the Chungnam region, selected using non-random convenience sampling. Measures were 5 items of job satisfaction, 12 items of organizational communication, and 5 items of organizational commitment. The analysis was performed on the participants’ general characteristics, frequency of the study variables and correlation analysis. Researchers also analyzed the structural model combining CFA and Path analysis.

Findings: Job satisfaction affects organizational commitment (β=.292, p<.001), job satisfaction affects organizational communication satisfaction (β=.670, p<.001), and organizational communication satisfaction affects organizational commitment (β=.546, p<.001). The effect of job satisfaction on organizational commitment was statistically significant (Direct effect=.292, p<.001). For the effect of job satisfaction on organizational commitment, organizational communication was a partial mediating factor (indirect effect=.366, p<.001, total effect=.658, p<.001).

Conclusions: The fact that the indirect effect using organizational communication as a mediating factor was greater for the effect of job satisfaction on organizational commitment shows the importance of organizational communication in organizational commitment. To increase organizational commitment, active communication within an organization is necessary.

Keyword: Dental hygienist, Job satisfaction, Organizational commitment, Organizational communication

Introduction

Dental hygienists are professional workers that can facilitate the prevention of oral disease via clinical and educational interventions. They perform dental scaling and educate patients on oral health in dental clinics and have direct interactions with patients. ¹ Undoubtedly, dental hygienists are an important part of the dental clinic, performing various roles. ²³ However, organizational commitment of dental hygienists – who are professional workers as mentioned above – tends to be on the lower. In the Korean Healthcare Employee Satisfaction Survey 2016, turnover intention of dental hygienists was 61.8%, which consequently affected average length of service. ⁴ Dental hygienists’ job satisfaction and employment status are important research issues. ⁵⁶ It is important to note that this subject arouses interest is a must for the organizational commitment of dental hygienists.
Organizational commitment was defined as the individual’s psychological attachment to the organization. That’s shows the employee’s voluntary active attitude towards working, and not being limited to fulfilling what has been outlined by the organization. Increasing the organizational commitment level allows recruitment of talented individuals, which consequently brings the company ahead in corporate-level competition. The most important factor of organizational commitment is job satisfaction.

Job satisfaction indicates the level of satisfaction that individuals experience related to their work. Defined job satisfactions as people’s thoughts on their job that affect work performance, and as their emotional response to the outcomes of their work. There have been many studies on job satisfaction, also within healthcare-related jobs. There have been studies on job satisfaction of dental hygienists there was also a study on the relationship between job satisfaction and education level. However, only a few studies have assessed the relationship between job satisfaction and organizational commitment in dental hygienists.

Organizational communication is one of the key factors affecting organizational commitment. Organizational communication was associated with better organizational commitment. Many of the studies confirming the role of organizational communication on the relationship between job satisfaction and organizational communication were large-scale studies focusing on large organizations. Dental hygienists work at bigger, general hospitals as well, but many of them work in smaller-sized dental clinic settings. Therefore, the effect of organizational communication of dental hygienists on their organizational commitment needs to be validated.

In the healthcare field, the most active area of research was the relationship between job satisfaction and organizational communication, commitment, and turnover. Rarely any studies have focused on the organizational commitment of dental hygienists. It is necessary to confirm that it affects the enhancement of organizational commitment of dental hygienist. Therefore, this study aimed to assess the relationship between job satisfaction, organizational communication, and organizational commitment in dental hygienists, and understand the mediating effect of organizational communication.

Materials and Method

Study Design and Participants: The study was conducted with dental hygienists from the Chungnam region, selected using non-random convenience sampling, and who agreed to participate in the study after receiving an explanation on the purpose of the study. The participants completed self-administered surveys between May 20, 2013 – July 23, 2013. A total of 234 surveys were collected, and 217 surveys – after excluding 17 surveys that contained insufficient responses or information – were used for the final analyses. Our study was carried out in accordance with the ethical principles of the Helsinki Declaration.

Data Collection: The survey used in this study is a modified version of the survey used in studies by Mowday et al. to better reflect the purpose of this study. There were 5 questions related to job satisfaction. The responses – based on 7-point Likert scales – ranged from “Strongly disagree (1)” to “Strongly agree (7).” With Cronbach’s α=.883, higher scores indicated higher job satisfaction.

There were 12 questions related to satisfaction in organizational communication. Cronbach’s α=.930, higher scores indicated higher satisfaction in organizational communication.

Lastly, there were 5 questions related to organizational commitment. Cronbach’s α=.916, higher scores indicated higher organizational commitment.

Statistical Analysis: The analysis was performed on the participants’ general characteristics, frequency of the study variables, and descriptive statistics. Correlation analysis was performed among organizational communication, job satisfaction, and organizational commitment. To create a structural model, the correlations were assessed after setting satisfaction in organizational communication, job satisfaction, and organizational commitment as latent variables. In other words, a Structural Equation Model (SEM) – a model combining Confirmatory Factor Analysis (CFA) and Pathway Analysis – was created. Goodness of fit was assessed using the Tucker-Lewis index (TLI), comparative fit index (CFI), and root mean square error of approximation (RMSEA). Values of TLI>.9, CFI >.9, and RMSEA<.05 were indicative of good fit. All analyses were performed using SPSS version 22, and the structural equation model was analyzed using Mplus 7.0 software.
Results

Study Participants’ Characteristics: General characteristics of the study participants are outlined in Table 1. The range and average of the age of the participants were 21 – 42 years and 26.0 years respectively. The range and average of the work career of the participants were 1 – 17 years and 3.2 years respectively. It was found that 66.4% of the participants had ≤3 years of education level, and the remaining 33.6% had ≥4 years of education level. For the monthly income, 24.0% had ≤1,500,000 KRW, 34.1% had 1,510,000 – 2,000,000 KRW, and 25.8% had ≥2,010,000 KRW.

Correlations between key variables: The average scores for job satisfaction, organizational communication satisfaction, and organizational commitment were 23.33 ± 5.17, 50.65 ± 13.0, and 20.9 ± 7.57 respectively. Looking at the correlations or associations in Table 2, the following variables showed statistically significant relationships: Job satisfaction and Organizational communication satisfaction (r=.565, p<.001); Job satisfaction and Organizational commitment (r=.547, p<.001); and Organizational communication satisfaction and Organizational commitment (r=.634, p<.001). In other words, higher job satisfaction was associated with higher organizational communication satisfaction and organizational commitment, and higher organizational communication satisfaction was associated with higher organizational commitment. The correlations observed were positive.

Correlations in structural model: The CFA results showed moderate levels of factor loading (≥.5) (Table 3). Goodness of fit assessment for the Job satisfaction model showed values of CFI=1.000 TLI=1.000, RMSEA=.000, and SRMR=.001, indicating good model fit. Goodness of fit assessment for the organizational communication satisfaction model showed values of CFI=.968 TLI=.946 RMSEA=.0820, and SRMR=.037, also indicating good model fit. Lastly, goodness of fit assessment for the organizational commitment model showed values of CFI=1.000 TLI=1.000 RMSEA=.044, and SRMR=.001, again indicating good model fit. Table 4 shows the regression coefficients and statistical significance of the structural model. Job satisfaction affects organizational commitment (β=.292, p<.001), job satisfaction affects organizational communication satisfaction (β=.670, p<.001), and organizational communication satisfaction affects organizational commitment (β=.546, p<.001). Goodness of fit assessment for the structural model showed values of CFI=.942, TLI=.927, RMSEA=.073, and SRMR=.049, indicating good model fit. Table 5 shows direct and indirect effects of the structural model. The effect of job satisfaction on organizational commitment was statistically significant (Direct effect=.292, p<.001). For the effect of job satisfaction on organizational commitment, organizational communication was a partial mediating factor (indirect effect = .366, p<.001, total effect = .658, p<.001) (Fig. 1). Therefore, not only does job satisfaction have a direct effect on organizational commitment, it also has an indirect effect on organizational commitment using organizational communication satisfaction as a mediating factor.

Discussion

In this study, the effect of job satisfaction and organizational communication of dental hygienists on organizational commitment, as well as the mediating effect of organizational communication, were validated. The following discussion points can be made from the above results.

First, there were statistically significant correlations between job satisfaction, organizational communication satisfaction, and organizational commitment. Looking at the correlation between job satisfaction and organizational communication, the results from the study by Deriba BK et al. 12 which indicated a correlation between job satisfaction and organizational communication support our findings. In addition, high correlation between organizational communication and job satisfaction, again supporting our findings.13,14 Looking at the correlation between job satisfaction and organizational commitment, some studies confirmed the effect of job satisfaction on organizational commitment.27,28 Again supporting the results of our study. A correlation between organizational communication and organizational commitment was reported in our study. Also, according to our study, dental hygienists’ job satisfaction was high, similar to previous studies.6,16 Dental hygienists can be considered to value their careers.

Second, when job satisfaction had an effect on organizational commitment, there was a partial mediating effect coming from organizational communication. Looking at the correlation between organizational communication and organizational commitment, previous studies by Postmes et al.19 and Putti et al.20 showed that the effect of organizational communication on organizational commitment was greater for communication with management or the board of directions compared to co-workers, partially supporting the findings of this study. From this study, the indirect effect when organizational communication was mediating exhibited stronger effectiveness compared to the direct effect. job satisfaction on organizational communication, indicating that organizational communication plays an important role in organizational commitment. Therefore, to increase organizational communication, active communication within the organization is necessary. The communication ability of individual workers is crucial within their work environment. Communication ability of the dental hygienist likely contributes to organizational commitment. A comparably high turnover rate for dental hygienists is not only a problem of the individuals, but also a problem of a manpower shortage for opening clinics. It is important to enhance individuals’ communication ability so that active organizational communication and consequently increased organizational commitment can be achieved for dental hygienists.

This study was limited by its cross-sectional nature. Therefore, it would be difficult to describe the cause-and-effect relationship between job satisfaction and organizational commitment. Moreover, the study was completed on a cohort of dental hygienists, and generalization of the findings must be done with caution. However, the study was meaningful in that it provided significant outcomes confirming the mediating effect of organizational communication through the structural model of correlations among job satisfaction, organizational communication, and organizational commitment of the dental hygienist cohort.

Conclusion

The fact that the indirect effect – using organizational communication as a mediating factor – was greater for the effect of job satisfaction on organizational commitment shows the importance of organizational communication in organizational commitment. To increase organizational commitment, active communication within an organization is necessary.

Effectiveness of the Otaria’s Postpartum Gymnastic Model and Caregiver Assistance on Decreasing of Uterine Fundal Height in Postpartum Mothers

Emy Rianti¹, Elina¹, Mugiati², Yudhia Fratidhina³, Suparman⁴, Agus Triwinarto⁵
¹Department of Midwifery, Health Polytechnic of Jakarta I, Indonesia; ²Department of Midwifery, Health Polytechnic of Tanjung Karang, Indonesia; ³Department of Midwifery, Health Polytechnic of Jakarta III, Indonesia; ⁴Department of Nutrition, Health Polytechnic of Bandung, Indonesia; ⁵Center for Research and Development of Public Health Efforts, Indonesia

ABSTRACT

Postpartum gymnastic is one of the efforts to restore the postpartum mother’s womb, therefore the development of postpartum gymnastic to get an effective gymnastic model is still needed. The purpose of this study was to assess the effectiveness of the Otaria postpartum gymnastic model and caregiver assistance to reduce of postpartum maternal uterine fundal height, using matching pretest-posttest with control group, involved 160 postpartum maternal. The final results based on the General Linear Model-Repeated Measures (GLM-RM) for the difference (∆) between of uterine height in the intervention group and the control group showed that a very significant difference occurred on the 6th day to the 7th day postpartum with a difference of 1.65 cm (p<0.05). Conclusion, that by implementing Otaria’s postpartum gymnastic model and caregiver assistance, the uterine height will return to its normal form on the 7th day postpartum.

Keywords: Postpartum, Gymnastic, Caregiver, Uterine Fundal Height

Introduction

The maternal mortality rate has decreased since 2002 at 307 per 100,000 live births, and in 2008 it was 228 per 100,000 live births, but the MMR increased again in 2012 to 359 per 100,000 live births. Based on the evaluation of the Millennium Development Goals (MDGs) in 2015, cases of maternal deaths in Indonesia are still 305 per 100,000 live births, even though the target set by the United Nations is 102 per 100,000 live births, the program has not been implemented properly so that the program is currently being continued through Sustainable Developments Goals (SDGs) with the target is to reduce maternal mortality to below 70 per 100,000 live births by 2030.(1) The cause of maternal death in Indonesia is still dominated by bleeding, namely 32%, hypertension 25%, followed by 5% infection, 5% prolonged labor and 1% abortion. One of the causes of the bleeding is uterine atony.(2)

Uterine involution is the process of the uterus returning to the condition before pregnancy. Uterine involution in postpartum mothers must return well, so that there is no uterine sub involution or delayed uterine return to normal size which caused bleeding, and occurs diastasis recti abdominis or separation of the right and left side of the rectus abdominis.(3) To restore reproductive organs, postpartum mothers need effective postpartum care, including early mobilization and exercise. Contraction of the abdominal muscles will help the process of uterine involution, with ambulation as soon as possible and frequency is often very necessary in the process of uterine involution,(4) (there was relationship between early mobilization and involution). The results of similar the study in Lampung showed that the factors associated with a decreased in uterine fundal height in postpartum mothers were early mobilization.(5)
The cause of diastasis recti is the softening of the ligament due to hormones resulting in very rapid stretching of the abdominal wall due to uterine enlargement. The results of the study on the application of transversus abdominis muscle strengthening exercises in postpartum mothers have a significant relationship with a high decrease in uterine.

South Jakarta Health Center has the highest number in performing postpartum services by health workers, which is 35,588/year. South Jakarta is ranked the second highest in capital city of Jakarta, which is 38,832. Whereas in Lampung Province there are 115 Public Health Center units inpatient care and 85 units (73.9%) there are basic essential obstetric neonatal health service center.

The purpose of this study is assessing the effectiveness of the Otaria postpartum gymnastic model and caregiver assistance to decrease in the height of the uterine fundal in postpartum mothers.

**Method**

The study design was matching pretest-posttest with control group. The population was all postpartum mothers who gave birth in health centers of South Jakarta and Bandar Lampung. The intervention group were 80 postpartum mothers who gave birth at Pasar Minggu Health Center, South Jakarta and Kota Karang Health Center, Bandar Lampung. They were treated with the Otaria’s postpartum gymnastic model from 1st day to 10th day. The control group were 80 postpartum mothers who gave birth at Jagakarsa Health Center, South Jakarta and Kemiling Health Center, Bandar Lampung. They were treated with early mobilization. Sample restriction: the age of the mother during childbirth 20-35 years. Matching samples: multiparous mothers 2 and or 3, normal BMI values (18.5-22.9), normal Hb (11-12 gr/dL). Inclusion criteria: postpartum mothers who gave birth normally, did not experience labor complications, gestational age ≥ 37 weeks, were born alive, by informed consent. A sample size of 160 people, calculated using the sample size formula with 95% of CI, 80% of power, selected by accidental sampling. Data was collected in May to October 2018, then analyzed by GLM-RM.

**Results**

Table 1 shows that based on measurements in centimeters unit the average value of uterine fundal height in the intervention group was lower than the control group and it’s began to occur on day 3 to day 7 and it was not palpable on the 8th day. Whereas in the control group until the 10th day the average of uterine fundal height was still as high as 1.01 cm.

**Discussion**

Based on centimeter unit measurements, the average of fundal height reduction of intervention group is faster than control group. This is in line with the opinion of Kenneth, that the process of decreasing uterine fundal height was fast if on the 3rd day the uterine fundal height was >3 fingers below the center. On the third to fourth day uterine fundal height was 2 cm below umbilicus, on the fifth to the seventh day uterine fundal height was half the symphysis, and on the tenth day the uterine fundal height was not palpable. Immediately, after removal of the placenta the fundal drops 1-2 cm every 24 hours and after 6 days the fundal will be between the symphysis pubis and the umbilicus.\(^{(11)}\)

Based on measurements in the fingers unit it appears that the intervention fundal height was lower than the control group began to occur on the 5th, 6th, 7th, and on the 8th day all were not palpable. Whereas in the uterine fundal height control group on the 9th and 10th day some were still half finger high.

The results of research in Kupang, measurement of day 2 uterine height there were 38 respondents (86%) experienced a decrease of 3 fingers below the center in mothers with primiparous age <35 years, there was a relationship between mobilization early with a decreased in uterine height where mothers who did early mobilization did not experience sub involution or failure in uterine involution.\(^{(12)}\)

Based on delta analysis, the average decreased in uterine height based on centimeter showed that the average decreased in uterine height in the intervention group was greater than that of the control group, starting at the 3rd to 10th day. The biggest difference in the decrease in uterine height in the intervention group compared to the control group occurred at the time period of the 7th day postpartum with a difference of 4 cm.

After labor, the abdominal wall is loose because it is stretched for so long, but usually recovers within 6 weeks. Exercises carried out on certain muscles will give effect to increased muscle blood flow so that the transport of oxygen and other nutrients to the muscles also increases, this will give maximum strength to the muscles.\(^{(13)}\)

Otaria puerperal exercise carried out from the first 2 hours, 6 hours and 24 hours postpartum as initial mobilization and continued until 7 days postpartum. With early mobilization the mother will be more active in moving so that it will accelerate the process of involution of uterine devices, expedite the release of lockhea, and increase the smooth circulation of blood.\(^{(14)}\)

A study found that there was a difference in the decrease in uterine fundus height between groups who performed a combination of abdominal and pelvic muscle exercises with a group that only performed pelvic floor muscle exercises.\(^{(15)}\) A Quasi-Experimental revealed that there were significant differences between pre-intervention and post-interventional scores of uterine involution in the experimental group and controls among postnatal mothers with p-value<0.05.\(^{(16)}\) Strengthening the transversus abdominis muscle is an exercise by providing a stimulus to the part by contracting so that it can increase intra-abdominal pressure. The benefit of strengthening the transversus abdominis muscle is to tighten the uterine wall, accelerate uterine involution and facilitate the removal of lockhea.

**Conclusion**

The results of this study concluded that by implementing Otaria’s postpartum gymnastic model and caregiver assistance, the uterine involution process and/ or High Uterine returned to its original form as before pregnancy occurred on the seventh day postpartum.

ABSTRACT

The right to work and the right at work are part of the human rights. The fulfillment of these rights for the citizens who work gives an important sense to reach a good living standard. Health rights of Indonesian migrant workers are regulated in the Constitution No.18, 2017 on the Protection of Indonesian Migrant Workers. This legal protection for Indonesian migrant workers includes rather wide aspects, such as the protection of safety, health, the maintenance of work ethics, also rightful treatments according to the human dignity and the religious morals. Legal protection of health for the migrant workers are part of the efforts to maintain and to increase their physical and mental health, as well as letting them reach social welfare. The host country of the Indonesian migrant workers must give insurance of health rights. The five favorite destination countries of Indonesian migrant workers are Malaysia, Singapore, Taiwan, Hongkong, and Saudi Arabia. Those five countries have regulations in giving health rights insurances for Indonesian migrant workers.

Keywords: Legal protection, Health rights, Indonesian migrant workers.

Introduction

The 1945 Constitution states that every person has the right to work, to receive wages, and to obtain just treatments in work relations. This normative stipulation confirms the constitutional rights to work and the rights in work(1). The right to work and the right in work are part of the human rights. Legal protection and fulfillment for the citizens who work give an important sense to achieve a good standard of living, (2) the government has the obligation to realize the rights to work for the citizens.

Work is an application of the mandate of human existence. Work can be chosen freely, whether it is within the country or overseas. The country has the obligation to provide work for the citizens well and give positive influence for their survival without discrimination. (3) Indonesia is one of the largest senders of workers. Formerly, the term Indonesian migrant workers were called Indonesian work force (TKI). They are every Indonesian citizen who fulfill the requirement to work overseas in work relations for a certain period of time and they must also receive wages for their work⁴, both based on the request of the sending country or from the initiative of the destination country.⁵

Indonesia’s contribution in sending work forces overseas, in the social aspect and in the development aspect have some positive impacts. It aids the country’s foreign exchange, it opens up new work fields, it minimizes the pressure of problems, it lets citizens experience obtaining high wage, and it decreases the number of unemployment. If we see the meaning and the aim of sending Indonesian migrant workers overseas in the wider sense, it does not only solve the pressuring problem of the Indonesian work force, yet it is also a form of the migrant workers’ financial improvement. Working overseas is an effort to resolve the workforce’s problems in their country⁶.

The existence of Indonesian workers is one of the sectors which can drive the economy of Asian countries. The high number of workers overseas on one hand has some positive impacts (increasing the country’s foreign exchange and resolving unemployment), though
it also has some negative impacts (risk of inhumane treatment to the migrant workers) (7). A legal protection insurance for the migrant workers is very important. Parallel to the increasing interest of citizens to become migrant workers, the number of inhumane treatment to those migrant workers overseas have also increased (8). Cases which have to do with the migrant workers’ fate increasingly varies, and they have even developed towards a form of human trafficking which may be categorized as a violation of human rights.

The insurance for health rights (9) of Indonesian workers is regulated in the Constitution No.18, 2017 regarding the protection of Indonesian migrant workers. The legal protection for Indonesian workers include a wide array of aspects, such as the protection of safety, health, the maintenance of work morals, and also the treatment according to the human dignity and the religious morals. The protection for the workers’ health is an effort to maintain and to increase the degree of physical and mental health, as well as the social welfare of all workers as high as possible (10).

The effort for legal protection in the aspect of occupational health and safety, in the aspect of humanity, is based on the fact that taking care of health and safety is the basic right which must be obtained by workers. The principle of occupational health and safety is a principal factor which cannot be negotiated, as mentioned in one of the rules of fiqh, where all kinds of harm must be eliminated.

Method

This research used a doctrinal analysis. The first stage was undergoing legal inventory to find legal norms which regulate the health rights of migrant workers, in which the sources were the constitutional laws or policies, then continued with a normative analysis, to find the in-concerto law (which comes from an analysis of secondary data with the legal constitutions which apply) and the legal principles (which come from the analysis of secondary data with the islamic laws) which regulate the health rights of Indonesian migrant workers (11).

Findings and Discussion

The favorite destination of Indonesian migrant workers are Malaysia, Singapore, Taiwan, Hongkong, and Saudi Arabia. These are their policies to fulfill the health rights of the Indonesian migrant workers.

First is Malaysia. The protection of the health rights of Indonesian migrant workers are covered by the workmen's compensation act 1952 and insurance policies which will be paid by the employers. It will soon be abolished, and it will be substituted by the sosco regulation. This discourse is planned for the Indonesian migrant workers in the aspect of health insurance, by paying the amount of around rm14 to rm15 every month. The workers will receive plenty of benefits as they are protected by the insurance, and they will receive compensations for the rest of their lives. The payment to sosco for the migrant workers will be the burden of the employer. Socso owns one of the best hospitals in Southeast Asia in Melaka, and if there occurs an occupational accident, it is expected that the victim will receive full treatments until they recover their health. (12)

Second is Singapore. The Indonesian migrant workers, both in the domestic and in the non-domestic sector are obliged to obtain insurance from the employers. This insurance is an obligation of the employers, based on the governmental decree of Singapore. The right of health for Indonesian migrant workers are clearly stated in the employment act chapter 91 in part XI health, accomadation and medical care, therefore the health rights of the migrant workers are covered well. The health insurance and the accidental insurance are included as some of the requirements to employ the Indonesian migrant workers. The health insurance is used to give basic protection such as inpatient or surgery. Apart from that, it can be used for conditions which are perhaps unrelated to work. If the Indonesian migrant workers experience sickness while on holidays or on resting days, thus the employer must be responsible for the disease treatment payment. Compensation for occupational accident insurance must be paid to the indonesian migrant workers or their family. The occupational accident consists of death insurance, accidental insurance or permanent disability. These compensations can be given if the occupational accident happens while their stay in singapore. (13) The employers who do not give nor do not take burden of the occupational health and accident insurance for the indonesian migrant workers are regarded as having violated the rule. If proven guilty, the employer who did not pay for the insurance will receive a fine or they will be sent to prison.
Requirements of the employment contract which must be fulfilled by the employers include occupational accident insurance, making sure of the rights to undergo religious rituals, and not giving work tasks which endangers the safety of the workers. The abundant cases of where the health insurance of the Indonesian migrant workers are not covered triggers the application of these new policies. The main aim of these policies are to “give better protection for the Indonesian citizens”. These policies will not decrease the interest of recruiters in singapore to employ Indonesian migrant workers. The government of Singapore, through the ministry of labor, also implements a similar policy in which its target is to give protection to the migrant workers who work in the lion state, with the total insurance of 5,000 Singaporean dollars. The distributors of the migrant workers admit to feeling burdened with the scheme of this insurance policy, which are implemented by singapore as well as the origin country of the Indonesian migrant workers. (14)

Third is Taiwan: The Indonesian migrant workers receive health insurance in which its premiums are paid by the employers. The health is insured by the Taiwan government. The national health insurance (NHI) program is one of the benchmarks of the international health insurances, as it offers treatment with high media which is also cost effective, and which applies to every citizen.

The policy of the labor system obliges all employers to register their workers to the health insurance. Even though the insurances in taiwan are given by independent companies, all Indonesian migrant workers who are employed both legally and illegally are protected in the access of healthcare through insurance. (15) The requirements of the insurance: (a) the migrant workers experience accidents which stops them form working, so that they do not receive wages according to the employment contracts, so the migrant workers have the right to obtain treatment, starting from the fourth day of the healing process. (b) inpatient in hospitals which makes the migrant workers unable to obtain the righs of wages, thus they will receive accidental help, starting from the fourth day of the treatment. These requirements can be obtained by the migrant workers if proposed by the employer or by the agencies.

Fourth is Hongkong: This is one of the countries which have the best healthcare treatment(1). The healthcare services can be accessed with low budget. HHSAR allocates the budget of 7 million people 5.8 billion USD (830 USD per-capita), 250% higher per-capita than the healthcare budget allocated in the usa(17).

The system copies the healthcare services in England. Hongkong establishes healthcare services which are coordinated through the food and health beureau. This beureau establishes holistic health services which may be accessed by all parties in Hongkong. It insures that there will be no late treatments in medical emergencies. The migrant workers, in emergency cases which risk their survival, may access this service without discrimination. The services consist of comprehensive services which may be accessed through the CSSA scheme. It includes 90% of hospitals and 29% of non-hospital services. It provides cheap hospital services, which is only 13 USD/ day with a 95% subsidy from HKSR (with the subsidy, the estimated rate per day is only 1-2 USD).

This grand subsidy makes healthcare services in Hongkong easy to be accessed by migrant workers who need health services(18) apart from the subsidized services from the HKSR healthcare insurances, there are also private health services with premium payment. The migrant workers may choose the service which is most suitable, but only 11% of migrant worker patients choose to access the premium healthcare services without healthcare insurance, with the market price of around ten times more expensive compared to the subsidized services with the cssa scheme. This private service provides better access in terms of medical equipments(19).

There are two healthcare services in Hongkong which may be accessed by migrant workers. First is the subsidized public healthcare service with the social welfare scheme from CSSA, which may be accessed limitedly with the requirement of having lived in the country for a minimum of 1 year and the complete social welfare which may be accessed freely after having lived in the country for at least 7 years. The CSSA system may be accessed by migrant workers who own valid visas, and complete work permits. Complete social insurances can be accessed with HKSR PIC (permanent id card). Illegal workers, in emergency situations, also have the right to access healthcare services until they are saved. The healthcare institutions which treat the illegal migrant worker patients are obliged to report to the authorities so that a legal process may be done and to pay for the healthcare services. The police will inspect the illegal migrant workers after they are claimed healthy by the healthcare instances.

Fifth is Saudi Arabia: Kafeel have the responsibility for the fees of recruitment, thorough health checkups, and the ownership of Iqama (the Saudi Arabian identity card). The mentioned thorough health checkup includes checking for hiv/aids as well as giving meningitis immunizations, which are part of the requirements for migrant workers to enter saudi. Article 117 of the royal decree states that if the migrant workers are sick, they must still receive full payment for 1 month. The Indonesian migrant workers in Saudi Arabia who experience sickness for two months may be terminated from the contract, migrant workers for three months or 90 days.

The migrant workers may receive the sponsors’ permit to access healthcare services. This permit includes work permit documents in saudi arabia. This access regards the Kafeel’s access as the local citizen. The healthcare fee in saudi is usually very affordable, as the kingdom’s government provides a large amount of subsidy. The kafeel may easily abolish the visa permits of the migrant workers if there exists a problem, such as if the migrant workers run away from their work, even if their rights as migrant workers are not fulfilled, for example if they are not paid, or if they are not given healthcare insurances in which according to the regulation must be paid by the kafeel. The migrant workers may access healthcare services without discrimination and with the same fee as what must be paid by the saudi arabian citizens.

Conclusion

Legal protection for health rights of the indonesian migrant workers is a form of effort for legal protection in the aspect of occupational health and safety. It is based on the fact that the protection of health and safety are basic rights which must be obtained by the indonesian migrant workers. The principle of occupational health and safety is the main factor which is unegotiable, as it is a form of humanity, that all kinds of harmful actions must be eliminated. The fulfillment of health rights (20) is a requirement of employing indonesian migrant workers overseas, with the destination countries such as Malaysia, Singapore, Taiwan, Hongkong, and Saudi Arabia. So far, these countries have sufficiently taken care of the health rights as regulated in each of the country’s regulations. The deal in the fulfillment of health rights for Indonesian migrant workers in the destination country have been agreed upon together through the employment contracts between the employers and the Indonesian migrant workers.

ABSTRACT

The Policy for Community-based Forest Resources Management (PHBM) aims to realize the welfare of the community in forest areas by no longer placing forest area communities as legal objects, but as legal subjects in forest management in Indonesia, through strengthening and empowering Forest Village Community Institution (LMDH) as stated in the constitution of the Republic of Indonesia in 1945, Article 33, paragraph 3: “The earth, water and natural resources contained therein are controlled by the State and used for the greatest prosperity of the people.” Implementation of PHBM is carried out by optimizing the involvement of local community resources in around the forest by empowering forest village communities in a synergistic and participatory manner. One manifestation of the elaboration of strengthening local institutional forest village communities is through the management of the Forest Village Community Health Care Insurance (JPKMDH) in Ngawi District, East Java Province, Indonesia.

Keywords: Elaboration, Forest Village Community Institution, Forest Village Community Health Insurance

Introduction

Indonesian forestry area which has been widely known as part the world’s lungs, currently experience conditions such as deforestation and land degradation, which raises concerns both nationally and internationally. The context of forest resource management in Java is managed by Perum-Perhutani as stated in Government Regulations No.72, 2010 about Indonesian State-owned Enterprise on Forestry. Perhutani’s position represents the state in the context of property rights, which was stated as both policy maker and executor in managing the State’s forest for the State’s foreign exchange income and to gain optimal advantages for the company, communities and national economic development, also forest authorization ideology.

By today there are numerous problems regarding deforestation whose quantities are gradually growing higher. Historically, forest resources management in Java, since the colonization era until this modern day, has not yet been able to give expediency for citizen prosperity. The increasing amount of deforestation and damages caused by deforestation is not solely caused by wood thievery and destroying plants, but instead the main issue is that there has not been any agreements regarding the preservation of forest resources and forest village communities’ prosperity-who are by average still under the poverty line.

Community-based forest resource management model through the instrument of Perum-Perhutani Director Decree Number SK 136/Kpts/Dir/2001 concerning Joint Forest Management (PHBM) by making those who live in the forest area as legal subjects instead of legal objects in managing forest resources in Indonesia. Community-based forest resource management is based on following principles: (a) justice and democracy; (b) openness and togetherness; (c) mutual learning and understanding; (d) distinctness of rights and obligations; (e) populist economic empowerment; (f) institutional cooperation; (g) participative planning; (h) simple system and procedures; (i) the company as facilitator; (j) management compatibility with regional characters.

DOI Number: 10.5958/0976-5506.2019.01371.8
Providing active role within the villagers with all wisdom, yet making the forest as the main component of community development (ecosystem) which is able to provide prosperity for all Indonesian citizens (7).

PHBM was born from the transformation paradigm from Forest Timber Management to Forest Resource Management and State-Based Forest Management to Community-Based Forest Management. On 2017, the instruments of PHBM was updated and adjusted according to the demands of an increase in Human Development Index (IPM) which was legalized as a PHBM plus program through Perum Perhutani General Director Decree Number SK 268/Kpts/Dir/2007. The support for increasing IPM within PHBM plus is reviewed from three indicators which include purchasing power level, education level and health level.

The said program is expected to be able to fulfill the needs of the forest villagers. Unfortunately, the existing facts state otherwise, as it did not give any significant impact for them. This matter then brought forth the Forest Village Community Organization (LMDH) which was initiated by Perum-Perhutani and Ngawi Regency Governments on 2004. The initial aim of the LMDH was to assist PHBM in implementing their programs which include empowering local resources in forest areas and assisting the increase of the forest villagers’ prosperity. Various efforts were made for LMDH to become a well-organized and a stable institution to assist PHBM in implementing their programs. One of their forms of strategy for institutional strengthening through the health sector is the management of Forest Village Community Health Care Insurance Services (JPKM) which is also an embryo of Forest Village Community Institution (LMDH), whose aim is to both form and reanimate the forest resources management body in each village, including planning the agreements between forest villagers representatives and Perum Perhutani in forest resource management in the village, including planning the agreements between Perhutani officers to formulate Statutes and Bylaws of PHBM management plan in their

### Materials and Method

This study used the approach of socio-legal research of analysis. With this approach, the law was positioned as a social phenomenon. Law was seen from the outside perspective and associates with the reality of individual or community behavior in relation to the law. With this socio-legal approach, one phenomenon will not be resolved by merely giving information on the rule of law, but also integrating with approaches from the other perspectives (9). This was a qualitative research which analyzes data deeply and comprehensively (9).

### Findings and Discussion

Perum-Perhutani, as an Indonesian State-Owned Enterprise which is designated by the central government to manage forests in Java Island, reforms the previous forest management system by optimizing the involvement of the forest villagers. (10) Through the instrument of Perum-Perhutani Director Decree Number SK 136/Kpts/Dir/2001, Joint Forest Resources Management (PHBM) program was launched. PHBM is a forest resource management system by Perum-Perhutani alongside the forest villagers with the partnership and profit-sharing principles, which means managing the forest by taking into account the empowerment of forest villagers in a participatory manner (11).

PHBM was born from the transformation paradigm from State-Based Forest Management to Community-Based Forest Management. In Ngawi Regency, PHBM is executed in 59 forest villages in 16 sub-regencies. The implementation of PHBM was announced through several stages starting with the formation of the Forest Support Village (DPH) initiation. This activity focuses on the forest villagers institutional maturity process which is also an embryo of Forest Village Community Institution (LMDH), whose aim is to both form and reanimate the forest resources management body in each village, including planning the agreements between forest villagers representatives and Perum Perhutani in forest resource management, which involves planning, planting, maintaining, harvesting, protecting, profit sharing, to evaluation monitoring (12).

The first step of forming LMDH is to form an institutional management on an orchard scale which is the Forest Farmer Workgroup (KKP). The members of KKP are chosen from local residents because of their characters are believed to be of ace in the growth of their own orchards. This work group then joins in with the village governments (village head and its officials), Village Representative Body, respectable figures, accompanied by non-governmental organization and Perhutani officers to formulate Statutes and Bylaws of LMDH including agreements of width, location and map boundaries between Perhutani’s forest land gap which can be utilized to plant intercropping crops such as bulbs, vegetables, and other food crops.

The next step involves the local forest villagers independently set out PHBM management plan in their
own region. For the last part, after all preparations for the PHBM execution are ready, a Notarial Deed of LMDH would then be made alongside the cooperation agreement on PHBM implementation between the Perhutani party and the forest villagers who joined the LMDH\textsuperscript{(13)}.

To strengthen the Human Resources quality, through assistance from Non-Governmental Institution (LSM) and related agencies, LMDH members obtain training in productive economic businesses, post-harvest processing, organizational administration management as well as conflict management. Whereas in terms of developing productive economic businesses, LMDH seeks to optimize its potential as a leading productive economic business center which is tailored to the characteristics of the local areas.

The existence of LMDH has begun to be able to overcome local problems, including the forest villagers’ health care. On 2008, LMDH in the Ngawi Regency, specifically in Bringin sub-Regency, has been able to initiate the Forest Village Community Health Insurance Services (JPKMDH) program, which is the health care program for the forest villagers, whose financial support is in the form of claim. The background of this program is based on the inaccessibility of forest villagers by the Health Care for the Poor program and the National Health Insurance, and also the independence of the forest villagers in financing the health services needed, according to the principle of togetherness and guarantee of legal certainty.

There are several components within the JPKMDH, which includes the JPKMDH Implementing Agency, whose members consist of forest villagers in the LMDH meeting. After an agreement on the organizational structures for the Implementing Agency is made, the Health Office of Ngawi Regency facilitates the legalization in the form of cooperation with the Community Health Center. After being formed and legalized, next is running the membership and financial management functions, including accepting collective dues from its citizens in the amount of IDR 40.000 per head of family within the period stated in the mutually agreed contract.

Those who have paid the dues, namely the JPKMDH participants, will then be entitled to acquire services from Health Care Provider (PPK) who are none other than medical personnel in five Community Health Center in the Ngawi Regency, which includes Padas, Bringin, Karangjati, Kasreman, and Ngawi Purba Community Health Centers. JPKMDH participants who are in need of health services will have to report to the Implementing Agency and then propose for an examination claim to the local Puskesmas. The said examination claim includes the services which are verified by the JPKMDH Implementing Agency and Community Health Center, including outpatient services (dental and general examinations included), laboratorium, Emergency Room, and Maternal and Child Health. Until today, there are 1,217 JPKMDH participants in the Ngawi Regency from approximately 300 head of families\textsuperscript{(14)}.

For families with rather low financial condition and who feel burdened by the amount of the dues, the collective due system sought by JPKMDH Implementing Agency can be cross-subsidized and coordinate the dues in the social gathering arranged by Forest Village Women’s Association (KPDH). This gender-based association is one of the institutions which is also the substitution (part) of LMDH and the thought of institutionalizing forest villagers’ women because women, especially mothers, are considered to play an important role in intensively communicating with their family members (children).

The response of the Ngawi Regency Government on PHBM program, specifically in the strengthening of LMDH, is cooperative partnership, which means that the regency government takes the role of an equal partner of LMDH, which is realized through the involvement of an integrated work unit or agency\textsuperscript{(15)}. Planning, management, as well as solving problems which are executed independently through the LMDH forum, are then followed up by the regency government in the form of elaborating integrated and sustainable forestry development programs in each government work unit.

Specifically, for the JPKMDH program, the Health Office of Ngawi Regency acts as the Community Health Center services provider which is used as a reference by JPKMDH participants. The results of the agreement are then followed up by the Regency Government alongside the medical personnels and other supporting facilities in Puskesmas, as the closest health service available near the forest village community.

The amount of the dues and claim payment method which are also conducted independently is determined
through the mechanism of JPKMDH. The forest village communities are trying to gain funds for their health care services alongside with the cross-subsidy guarantee for the poor (16).

The Ngawi Regency Government has also changed the paradigm of utilizing forest products, which is not always approached with an orientation of increasing the regional income, but through strengthening institutional capacity of LMDH and empowering the local forest villagers by still providing assistance from the strength of civil society, by building synergies with the regency government to facilitate in strengthening local institutional forest village communities, including utilization of JPKMDH program (17).

Re-optimization of forest villager local institutions such as LMDH is one of the forms of social engineering which was initially a stimulus to change the paradigm of the communities and the State (read: Regency Government and Perum-Perhutani) by including a design which shows the multi-stakeholder involvement in the management of forest resources. The increase of forest village community institutional capacity is present to put LMDH as an independent institution which is partnered with external forces around it (18).

The forms of cooperation (elaboration) between various parties in strengthening the LMDH institutions that are based on trust have also utilized the potential of social capital. The provision of space by Perhutani for local residents to implement the use of inter-land as well as a system of profit sharing between them, is a resource of the mutual trust to emerge. It gives Perum Perhutani a sense of guarantee, when local forest villagers are entrusted with a management space for their prosperity, hence the conflict is reduced as minimum as possible (19).

JPKMDH was initiated after LMDH institutional empowerment topic was emerged which also directly strengthen social trust and social collaboration among local residents, as well as those without institutional power within. This strengthening of collaboration then shapes out patterns of interactive and intensive communication among the local forest villagers in determining the kind of health services needed for them; including the shape of participation in monitoring the practice of providing health service they receive.

Conclusion

The strengthening of forest village institutions through the LMDH forum in Ngawi Regency, is one of concrete examples where the Regency Government synergizes with Perum-Perhutani in designing a pattern of elaboration of forest resources management with the local residents, based on strengthening the forest villagers’ participation through the Forest Village Community Health Care Insurance Services (JPKMDH). The principles of partnership and togetherness which bring the local government and is citizens closer in various feedback processes lead to the presence of responsive public policies. In this condition, the participation of local insitutions to connect the interests of local governments with its citizens directly has also conceived a new spirit of trust which also opens up space for public access and control in the local field.

Clinicopathological and Immunohistochemical Study of Fascin-1 Expression as a Predictive Factor for Invasiveness in Transitional Cell Carcinoma of Urinary Bladder

Roaa Sadiq Obaid¹, Haider Abdul Ridha Alkafaji², Mohammad Ridha Jodi²

¹Al-Hilla General Teaching Hospital, ²College of Medicine, University of Babylon, Al-Hilla, Iraq

ABSTRACT

Background: Urothelial carcinoma of the urinary bladder represents 90% of all primary tumors of this structure. It is one of the most common ten malignancy in Iraq and worldwide. The depth of invasion, particularly for muscularis propria is the most important prognostic and therapeutic determinators. Fascin-1 is an actin bundling protein involved in cell migration and motility and up-regulated in transformed and aggressive epithelial carcinomas like urothelial carcinoma and overexpression is associated with advance stage. The aim of the present study is to evaluate the fascin -1 expression as a predictive marker for assessment of depth of invasion and as prognostic and therapeutic purposes. Methods: Fifty five patients were of age range from 16-95 years with mean age ± SD of 65.8 ± 13.7 years and with different grades and stages were taken from laboratory of histopathology of Al-Hilla Teaching Hospital. Histological sections of paraffin embedded tissue were be taken for H and E staining for assessing grades and stages according to WHO grading system and AJCC staging system, respectively. Immunohistochemical staining by using mouse monoclonal antibody for fascin-1, then correlation between clinicopathological parameters and marker expression were done. Results: The fascin-1 expression was found not related to age, gender, tumor grade and perineurial invasion (P>0.05). The intense expression was noted predominantly in the invasive component. Tumor size, lympho-vascular invasion and necrosis were noted to be associated with aggressive tumor with increased fascin expression (P<0.05), Conclusion: fascin-1 can be used as a predictive marker for recurrence and invasion and as a therapeutic target.

Keywords: Urothelial carcinoma, Fascin-1, Invasion, Tumor grade, Tumor necrosis.

Introduction

Urothelial carcinoma represents 90% of primary urinary bladder tumors. The age of incidence is usually more than 50 years with male to female ratio about 3:1 [1]. It is one of the ten most common cancers in Iraq and worldwide. In Iraq, it represents the fifth most common tumor; it is the second most common cancer in males and the tenth most common cancer in females[2]. Females have more aggressive tumor behavior than males [3]. It is two folds higher in white people than blacks [4]. Worldwide, bladder cancer represents the ninth most frequent cancer with the highest incidence in men from Southern and Western Europe as well as North America. Bladder cancer ranks 13th in terms of deaths ranks. Bladder cancer occurs predominantly in heavy smokers and occupational exposure to chemicals such as benzidine, beta-naphthylamine, painters and ingestion of analgesics, parasitic infections, bladder calculi, and chemotherapy [5]. Pathogenesis is complex and recent mRNA sequencing studies identified two molecular subtypes: luminal and basal bladder cancers[6]. It presents grossly either exophytic or endophytic growth [7]. According to WHO/ISUP (2016), urothelial carcinoma is divided microscopically into infiltrative and non invasive urothelial neoplasms [8]. The non-invasive papillary tumors graded into low grade and high grade papillary urothelial carcinomas. About 75%
are non invasive of low grade. The infiltrating urothelial tumors include tumors with divergent differentiation toward squamous, glandular, trophoblastic, nested, microcystic, micropapillary, lymphoepithelioma-like, sarcomatoid, plasmacytoid [9]. In this study, only the papillary urothelial tumors were included. The treatment depends on age, grade, stage and presence of dysplasia or carcinoma in situ [10]. Low grade and non muscle invasive treated by transurethral resection, while high grade and muscle invasive are treated by radical cystectomy with or without preoperative radiation therapy or chemotherapy [11]. The invasion of muscularis propria is either superficial invasion (submucosa and inner half of muscle) or deep (outer half of muscle and perivesical tissue and lymphatic) [12]. Fascin-1 (FSCN1) is a 55 KD monomeric actin filament bundling protein that plays a role in cell adhesion and motility. Three forms of fascin are found in vertebrates; Fascin-1 (most common) present in specialized cells with extensive surfaces or migratory potential such as neurons, glial cells, dendritic cells, macrophages, skeletal and smooth muscle cells and endothelial cells [13]. The level of fascin-1 is low or undetectable in normal epithelial cells; overexpression was seen in transformed epithelial cells and associated with high grade and aggressive tumors. Fascin binds beta-catenin and colocalizes with it at the leading edges and borders of epithelial and endothelial cells so it has a role in the maintenance of cell adhesion, coordinating motility and invasion [13]. Fascin-1 localizes to actin-rich protrusions at the cell surface called filopodia. A recent study showed that fascin also localizes to invadopodia, membrane protrusions formed at the adherent cell surface that facilitates extracellular matrix (ECM) invasion, this provide a mechanism for how fascin increases the invasiveness of cancer cells [15]. Studies have shown that fascin plays a major role in immune suppression. T regulatory cell adhesion to antigen presenting dendritic cells causes sequestration of Fascin-1, which is essential for immunological synapse formation, and skewes Fascin-1-dependent actin polarization in antigen presenting dendritic cells toward the T regulatory cell adhesion zone, this sequestration of cytoskeletal components causes a lethargic state of dendritic cells leading to reduced T cell priming [16, 17].

The aim of the present study is to evaluate the fascin-1 expression as a predictive marker for assessment of depth of invasion and as prognostic and therapeutic purposes.

**Materials and Method**

This study was carried out in the Department of Pathology and Forensic Medicine, Faculty of Medicine/Babylon University. The samples were taken from the laboratory of histopathology at Al-Hilla Teaching Hospital. Fifty-five paraffin embedded blocks were included. The clinical data were obtained from the reports at Al-Hilla Teaching Hospital, these included age, gender, tumor size, grade, stage, vascular invasion, perineurial invasion and tumor necrosis. The age of patients ranged from 16-95 years with mean age ± SD of 65.8 ± 13.7 years. Subjects were 46 males and 9 females, cases with tumor size <1cm were (40) and those >1cm were (15 ) cases; low grade tumor cases were (30) and high grade cases were (25). In addition, (35) cases were stage Ta, (8) cases stage T1, (8) cases were stage T2 and 1/8 case was with squamous differentiation and of high grade, (2) cases were stage T3, (2) cases were T4 and all cases from T2-T4 were high grade except one case. The cases without vascular invasion were (48) cases and those with vascular invasion were (7) cases. Also, (53) cases were without perineurial invasion and (2) cases with perineurial invasion, (49) cases were negative for tumor necrosis, while (6) cases were positive for tumor necrosis.

Fascin-1 is a monoclonal mouse anti-human fascin-1 protein of isotype IgG2a/k, Bio SB, Santa Felida, USA. The detection system was mouse/rabbit poly detector plus HRP/DAP kit. The positive immunoreaction is evaluated by the diffuse brownish staining of the cytoplasm and two parameters were evaluated semi-quantitatively according to [18] scoring system:

1. The extent of immunostaining according to the percentage of stained neoplastic cells.
2. The intensity of immunostaining according to the staining of endothelial cells as positive internal controls.

Then for each case, a combined immunoreactivity score was evaluated by multiplying the score for extent by the score for intensity so the combined immunoreactivity score (CIS) ranged from( 0-12) as the following:

Score 0: Absent (no staining).
Score 1: Mild staining 1-4 (≤25% of cells with Weak (less than that of endothelial cells)).
Score 2: Moderate staining 5-8 (25%-50% with moderate (equal to endothelial cells staining)).
Score 3: Intense staining 9-12 (50%–≥75% of cells with intense (more than of endothelial cells staining)).

The statistical analysis was done with SPSS software version 22. P-value less than 0.05 was considered statistically significant and less than 0.01 as highly significant.

**Results**

Fascin-1 overexpression was reported in 35(63.6%) of 55 cases while 20(36.3%) were negative. Also, 46(83.6%) of total cases were males with 28(60.9%) positive staining and 18(39.1%) cases were negative; females totally were 9(16.3%) with 7(77.8%) positive and 2(22.2%) negative and there was no relation between gender and fascin-1 expression (P= 0.3). According to age groups (Figure 1), there were only 2 cases (3.6%) of 16-35 years group and all were positive, 8(14.5%) of 36-55 years group and 4(50.0%) positive, 32(58.1%) of 56-75 years group with 22(68.8%) cases were positive, 13(23.6%) of 76-95 years group and 7(53.9%) cases were stained with fascin and there was no correlation found between expression and age groups (P= 0.4). Tumor size <1cm was 40(72.7%) and ≥1cm 15 (27.3%) of cases (Table 1) and a strong association between increased fascin expression and tumor size (P=0.007) (Table 2). Low grade were 30(54.5%) cases and high grade were 25(45.5%) cases (Table 1) and no correlation was found between expression score and grade (P=0.08) (Table 2). Cases of stage Ta were 35(63.6%),T1 were 8(14.5%), T2 were 8(14.5%) and one case of T2 with squamous differentiation, T3 were 2(3.6%), T4 were 2(3.6%) and all T2-T4 cases were stained and no negative cases (Table 1) and there was a strong relation between fascin expression score and stage of tumor (P= 0.001; Table 2). Vascular invasion was only present in 7(12.7%) cases and was absent in 48(87.2%) of cases (Table 1) and a relation was found between vascular invasion and score (P= 0.04). Moreover, all 7 cases stained moderately and intensely with no negative staining (Table 2). Perineurial invasion was reported in only 2(3.6%) of cases and was absent in 53(96.3%) of cases (Table 1), both 2 cases were score 3 and of high grade (stage pT2) and there was no correlation between expression and invasion (P=0.1; Table 2). Tumor necrosis was reported in 6 (10.9%) of cases (Table 1),1/6 of cases were score 2; whereas 5/6 of cases were score 3 without negative staining and there was a relation between score and necrosis (P= 0.01; Table 2).

**Discussion**

In the present study there was no detectable fascin immuno-reactivity in normal urothelium which was agreed with [18-20].

It was found that there was no correlation between age and gender with fascin expression (P>0.05). A similar correlation was observed by [21-23].

Tumor size was also evaluated and a strong expression of fascin-1 was found with large tumor size (P=0.007) which may be related to the aggressive behavior of the tumor, this also observed by [23, 3].

Tumor grade was found not related to fascin expression (P=0.08). In variance, the only study of [24] found positive correlation between fascin expression and histological grade (P=0.02).

Regarding the tumor stage, there was strong correlation between fascin expression intensity and tumor stage (P=0.001) with the depth of invasion and only 3/35 (8.6%) of non-invasive tumors (pTa) showed intense staining and 1/8(12.5%) of pT2 was urothelial with squamous differentiation (Table 2). There is no difference within the same stage between low and high grade tumors. This result was also reported by [19] who found that 42% of superficial papillary urothelial carcinomas (pTa) and 95% of invasive urothelial carcinomas (pT2 and higher) demonstrated strong staining for fascin-1. Also, they found the micro-invasive foci in the lamina propria were positive for fascin-1 but not strongly as the deeply invasive tumors. In agreement with findings is the study of [21] who found that the expression of fascin correlated with invasive carcinomas in low and high grade tumors, and staining was intense in the invading tumor cells lamina propria or the muscularis propria and absent or very low expression in tumors pTa stage.

However, in contrast to these findings are those reported by [18,25] who found that none of pTa tumors showed intense staining.
Vascular invasion was associated with fascin-1 overexpression which may be related to advanced tumors, this was similar to [23].

The perineurial invasion was evaluated and no association was found between fascin expression and perineurial invasion (P= 0.1) which may be due to very small sample size and no previous study to compare with it.

On the other hand, tumor necrosis shown a correlation with fascin expression although there was no similar study to compare with it.

**Conclusions**

The fascin-1 overexpression by tumor cells is associated with advanced stage and can be used as predictive marker for recurrence and invasion. Fascin level reduction can be used as therapeutic target in the future.

Effects of Infrared Radiation on *Escherichia coli* Isolated from Appendectomy

Ibrahim Mohammed Saeed Hussein¹, Sameerah Hasan Abdullah², Sameen Fadel Mohammed³

¹Microbiology, ²Medical Physics, ³Nuclear Physics, Northern Technical University, Iraq

ABSTRACT

**Background:** *Escherichia coli* belongs to the genus of Escherichia which can cause many diseases to humans including gastrointestinal diseases and appendicitis. The aims of study were to determine and evaluate the effects of infrared radiation on *E. coli* isolated from appendectomy.

**Method:** In this study, we had 10 tubes contained known numbers of bacterial colonies in Nutrient Broth. These tubes were irradiated by infrared from a source emits infrared at wave length 700-1200nm with 50watt ans at different exposure times, constant energy rate.

**Results:** The results showed that the number of *E. coli* bacterial colonies were significantly (P<0.01) decreased at each increasing in exposure time at constant energy rate. The number of *E. coli* bacterial colonies died in first tube after irradiation at 10min was 11 and in the seventh tube at 70min were 110. So, all bacterial colonies died at infrared radiation wave length 700-1200nm in 150watt within 70min. We concluded that the infrared radiation can kill *E. coli* bacteria by stimulating oxidation, breaking chemical bonds and producing free radicals.

**Keywords:** Infrared radiation, *E. coli*, free radicals, Bacterial colonies, Nutrient Broth.

**Introduction**

Infrared radiation (IR) is a type of electromagnetic radiation with wave length range between (750nm-1mm) and frequency range between 300GHz-400THz. Main bands of IR are: near IR (215THz-430THz) visible to human eye and Mid IR (100THz-215THz) and Far IR (300GHz-100THz), which are natural sources; whereas artificial source include luminous-non luminous [¹]. When infrared radiation strikes the skin, it will be scattered, refracted, reflected, absorbed or penetrate the tissues. The latter is regulated by many factors such as: 1- Frequency of radiation, 2- Tissue thermal conductivity, 3- Thickness of tissue, 4- Arndt-Schultz principle, 5- Grotthous Draper law, 6- cosine law, 7- Inverse square law, 8- Tissue vascularity and 9- Type of the skin [²-⁴].

Infrared radiation can improve healing of skin wounds, relieving pain, fatigue, stiffness and blood pressure regulation, treatment of skin tumors, vascular diseases and hemophilia [⁵].

**Biological effects of infrared:** These effects result from interaction between IR and biological structures in the cell (such as DNA, cell fluids–water, cell membranes and proteins) and all functioning living systems. The biophysical mechanisms of the interaction can be framed in terms of altered mitochondrial metabolism and altered cell membrane potentials [⁶].

*Escherichia coli:* These are one type of the bacteria that live normally in intestines and in the gut of some animals. They were discovered by German bacteriologist, Theodor Escherichia, in the human colon in 1885. There are about 700 serotypes of *E. coli* that have been specified [⁷].

*E. coli* is coli form bacterium of the genus Escherichia, Gram-negative, rod-shaped and anaerobic. Many types of *E. coli* are harmless and part of normal flora of gut. They benefit their hosts by producing vitaminK₂ and inhibiting colonization of intestine with pathogenic bacteria. However, some strains may cause diarrhea when drinking contaminated fouled water or eating contaminated food. Some types of *E. coli* produce toxin called Shiga which damages the lining of intestine [⁸]. In addition, these bacteria are one of the causes of urinary tract infection and appendicitis [⁹].

The early symptoms of *E. coli* infections appear within 1-10 days after the person had ingested the
bacteria. The symptoms include diarrhea, stomach cramps, fever (37.7°C–38.3°C), vomiting, mild dehydration and loss of appetite [10]. On the other hand, late symptoms include severe dehydration, pale skin, hemorrhagic diarrhea, reduced urine output, anemia, severe abdominal pains, shortness of breath, renal failure, jaundice, mental changes and death [11]. Perfect cooking and fluids pasteurization can prevent infection with *E. coli* [12].

**The Appendix:** It is a small tube-like structure attached to the large intestine. It has no known function and removing it does not have an effect on digestive function. It is located in the lower right part of the abdomen [13].

Appendicitis is one of the most common acute surgical emergencies of the appendix can burst and cause infection in the abdominal cavity then death. Appendicitis occurs in any age, but most often between ages of 11 and 31 years. When the inflammation starts, there is no any medical therapy can affect it, so appendicitis is a medical emergency case [14].

**Causes of Appendicitis**

*These include:* 1- Blockage inside the lumen of appendix. When the blockage occurs, the pressure increases due to blood flow impairment, inflammation, gangrene of the appendix can cause [15], 2- blockage of feces inside the appendix so that *E. coli* or viral infection can cause lymph nodes swelling which may squeeze the appendix and cause obstruction [16].

Aims of study were to determine and evaluate the effects of infrared radiation on *E. coli* isolated from appendicectomy.

**Material and Method**

In this study, samples were taken from patients underwent appendectomy. The samples isolated from appendix then cultivated in MacConkey agar medium and incubated for 24h at 37°C, the *E. coli* diagnosed by APi20 system Figure (1). We took loop from bacterial colonies added to tube contains 10ml of Nutrient Broth media, the tube had shaken to homogenize the cells then we added 10μl of media in each tube (ten tubes) contained 10ml of Nutrient Broth media. Before infrared irradiation, we cultivated 10μl of Nutrient Broth form one tube in Nutrient agar with pour plate method and incubated for 24h at 37°C. After this step, the number of bacterial colonies will be known by (colony counter instrument).

![Figure 1: Api 20 system for E. coli diagnostic](image)

**Samples Irradiation:** We had 10 tubes contained known numbers of bacterial colonies in Nutrient Broth. These tubes were irradiated by infrared from a source emits infrared at wave length700-1200nm with 150watt (the rabulb) design with different exposure time at constant energy rate. The distance between sample and infrared source was 20cm. After samples being irradiated, we took 10μl from each tube and cultivated in Nutrient agar. The numbers of bacterial colonies growing in media after 24h incubation will be counted.

**Result**

Our study was carried out on *Escherichia coli* bacteria isolated from appendectomy. We had ten tubes each tube contained *E. coli* colonies in Nutrient agar. Each tube contained 110 of *E. coli* bacterial colonies for each 10μl of Broth media, then irradiated by infrared radiation with different exposure times at constant energy rate. The results showed that the number of *E. coli* bacterial colonies were significantly (P<0.01) decreases at each increasing in exposure time at constant energy rate. The number of *E. coli* bacterial colonies died in first tube, after irradiation for 10min, was 11and in the seventh tube, for 70min, was 110. So, all bacterial colonies died at infrared radiation wave length 700-1200nm in 150watt within 70min (Table 1).

Discussion

This study was aimed to determine and evaluate the effects of infrared radiation on *E. coli* bacteria isolated from appendectomy. The results showed that the number of *E. coli* bacterial colonies significantly (P<0.01) decreased with increasing exposure time at constant energy rate (Table 1). The results were in agreement with many studies such as [17,18], *E. coli* bacterial cell has a single chromosome of 4,600kb [19]. The infrared radiation can cause physical and chemical changes lead to stimulate oxidation, IR effects on chemical bonds of biomolecules in the cell and lead to breakdown of strong bonds (O-H, N-H ) in proteins and DNA as well as (P-O) bonds in nucleic acids. When these bonds are broken, they cause damage in proteins and DNA and can produce free radicals that lead to killing of *E. coli* bacteria [20,21].

Conclusion

We concluded that infrared radiation can kill *E. coli* bacteria by stimulating oxidation, breaking chemical bonds and producing free radical.

Isolation and Identification of Some Bacterial Strains Isolated from Throat Infections in Hilla Province, Iraq

Ilham A. Bunyan¹, Safaa S. Najj², Haider H. Aljooda²

¹Dept. of Microbiology, ²Dept. of Surgery, ENT, College of Medicine, University of Babylon, Iraq

ABSTRACT

Background: Sore throat, also known as throat pain, is pain or irritation of the throat. It is usually caused by pharyngitis or tonsillitis. These infections are usually self-limiting with symptoms typically resolving within 1–2 weeks and complications are rare for the vast majority of throat infections. The present study was aimed to isolation of bacteria from throat infections, identification by routine bacteriological, biochemical tests, vitek, API20, and molecular detection of bacteria by using PCR technique with use of specific primers.

Method: The present study included, (204) samples which were collected from patients with throat infections, who were visiting AL-Hilla Teaching Hospital and private clinic of superadviser for the period from February to December (2017). Two swabs were collected one for culturing and the other for direct DNA extraction for swabs of Moraxiella catarrhils and Haemophilus influenza.

Results: Only 190(93.1%) were positive cultures; whereas 14(6.9%) samples showed no bacterial growth. Gram-positive bacteria constituted 116/190(61.1%) from the total isolates and Gram-negative bacteria constituted 74/190(38.9%). Streptococcus pyogenes was appeared with percentage 78(67.2%), and Staphylococcus aurous constituted 38(32.8%), and out of the 74(100%) the Moraxiella catarrhils was the most predominant as gram negative bacteria with percentage 44(60%), Klebsiella pneumonia was 12(16%), E. coli appeared with 10(13%) and Haemophilus influenzae had 8(11%) positive isolates.

Keywords: throat infections, DNA extraction, Epi20, E, Haemophilus influenza, PCR.

Introduction

Sore throat, also known as throat pain, is pain or irritation of the throat. It is usually caused by pharyngitis or tonsillitis. These infections are usually self-limiting with symptoms typically resolving within 1–2 weeks and complications are rare for the vast majority of throat infections. The most common cause (80%) is acute viral pharyngitis. Other causes include streptococcal pharyngitis, trauma, and tumors. Group A beta-haemolytic Streptococcus infections are the most common bacterial cause of sore throat. However, in clinical practice it is notoriously difficult to distinguish between URTIs of viral and bacterial origin. Factors associated with an increased risk include advanced age, respiratory or immuno-compromising and long duration of symptoms.

There are many other bacteria which play an important role in the infection of throat such as S. aurous which is responsible for about 38% of throat infection, Klebsiella, E. coli, Haemophilus and Moraxella which also causes URT infection. Pharyngitis is inflammation of the back of the throat, it typically results in a sore throat and fever. Most cases are caused by a viral infection streptococcal sore throat is the cause in about (25%) of children and 10% of adults. Tonsillitis refers to inflammation of the pharyngeal tonsils. Peritonsillar abscess is a collection of pus between the fibrous capsule of the tonsil. The present study was aimed to isolation of bacteria from throat infections, identification by routine bacteriological, biochemical tests, vitek, API20, and molecular detection of bacteria by using PCR technique with use of specific primers.
**Materials and Method**

Samples Collections[15]. A total of (204) swab samples were obtained from patients had throat infections diagnosed as throat infections who were visiting Al-Hillah Teaching Hospital were subjected for culturing on different types of culture media, Vitek$_2$ system to detect Gram positive bacteria, API$_{20}$E System: For Gram-negative bacteria and molecular detection during the period from February to December (2017).

Microscopic properties depend on [16]. Biochemical tests depend on [17], API$_{20}$E System: For Gram-negative bacteria

Identification bacterial isolates with Vitek$_2$ System

Molecular Identification (16S rRNA and P4) genes for identification of *Haemophilus Influenzae* and *Moraxella catarrhalis*:

**Results and Discussion**

**Isolation and Identification:** Out of the (204) clinical samples, only 190(93.1%) showed positive cultures; whereas 14(6.9%) samples showed no bacterial growth, which might have been treated with antibiotics or due the presence another types of causative agents. Gram-positive bacteria constituted 116/190(61.1%) from the total isolates and were considered the predominant etiological agents to Gram-negative bacteria which constituted 74/190(38.9%; Figure 1). Table (2) showed distribution of bacterial isolates from patients. *Strep. pyogenes* was the most common bacterial species isolated (41.1%). These results were in agreement with [18] who had emphasized group A *Streptococcus* (GAS) as the most common bacterial cause of pharyngitis that reach to (37%). Moreover, current data were in agreement with [19,20] who demonstrated that (30-40%) of throat infections were due to group A *Streptococcus*. These bacteria possess protein M which is a potent virulence factor that inhibits bacterial phagocytosis, hyaluronic acid and capsule that enhances its ability to invade tissues. Multiple exotoxins, hemolysins (Streptolysin S and Streptolysin O). on the other hand, [21] found that (2%) belong to *Strep. pyogenes*. *M. catarrhalis* was the second type of bacteria isolated from throat infections 44(23.2%). This result agreed with [22] who found that (32%) had *M. catarrhalis*, and with [21] who mentioned that the *Moraxella* was responsible for about (20% to 30%) of infections of upper respiratory tract.

DNA was extracted from all (204) specimens; conventional PCR was carried out using the amplification of specific 16S rRNA primer; according to the sequences and program listed in Table (1). Gel electrophoresis showed that, out of the (204) samples, only 44/150 (23.3%) produced the specific 600bp DNA fragment when compared with allelic ladder (Figure 2). Moreover, [24] found that *Moraxella* caused (63.1%) of upper respiratory tract infection. The recognition of *M. catarrhalis* as an important human respiratory tract pathogen. The isolation rate of *M. catarrhalis* from the respiratory tract in study published by [25] was (9.8%); whereas [26] showed that the isolation rate was about (3.6%). The rates of *M. catarrhalis* carriage in children and adults differed considerably, about two-thirds of children were colonized within the first year of life by these bacteria [27]; whereas it was estimated to be represented in about (10-15%) of adults [28] or may be more as in the case of [29] who reported that the prevalence of *M. catarrhalis* in respiratory tract of adults has been detected in (15-32%) of the samples. The carriage of this organism is probably due to bacterium antibiotics resistance properties and there is a correlation of *M. catarrhalis* carriage with seasonal fluctuations [25] although this organism was regarded as commensal for a long period in the mucosal surfaces of upper respiratory tract [30;31]. *S. aurous* was the third type of bacteria isolated from throat infection 38(20%), this frequency may be due to firstly; it may enter the throat from nasal canal as a normal flora and by reflux otitis media when the tympanic membrane was not intact. Also, it contains teichoic and lipoteichoic acids as well as capsular material which facilitates the adherence of these bacteria to epithelium. Furthermore, [32] showed that *S. aurous* was the most common bacteria isolated from tonsillitis (83%). In addition, [33,34] showed that (42.7%) of *S. aurous* from throat swabs in prison population. Also, [35] showed that *S. aurous* was isolated from throat swabs that were taken from patients (20.13%) and [36] reported that (16.83%) of isolates from pharyngitis and tonsillitis were *S. aurous*. In current study *H. influenzae* subjected to molecular detection method using conventional PCR. Gel electrophoresis showed that, out of the (204) samples, only 8/150 (4.2%) produced the specific (1500bp) and (1100bp) DNA fragments, respectively, when compared with allelic ladder (Figures 3 and 4). The increased isolation of *H. influenzae* (in APT only) and *M. catarrhalis* in association with GABHS may be due to a synergistic relationship between these organisms [37,38].
On the other hand it was reported that *H. influenza* was involved in various infections including otitis media [39], conjunctivitis and meningitis and also frequently isolated from patients with chronic infections of the upper and lower respiratory tracts. Moreover, [40] had evaluated different rates from different sites as they reported the percentage of isolation from CSF was (78%), while from nasal swabs, throat swabs and sputum to be (80%), (55%) and (53.3%), respectively. In contrast to the results of this study, [41] found that 80 isolates of *H. influenza* were based on their growth requirement and serotype distribution. The other gram-negative bacteria, *E. coli*, was isolated from throat infection represented 10(5.2%) [42]. In a previous study, [44] found that this microorganism represented (28%), while [42] mentioned that *E. coli* represented (12.5%) of throat infections. Our results, if compared with previous studies, was approximately similar to those carried by [43] who reported that the prevalence of *E. coli* was (3%) among throat infections. *Haemophilus Influenzae* was presented in (4.2%). These results indicated that isolation of these bacteria differs according to the site of isolation and method applied and this can be attributed to different virulence factors expressed by *H. influenzae* in different sites of human body as its natural host and can be correlated with the severity and invasiveness of the disease.

1Assistant Instructor, M.Sc. Maternal and Neonatal Health, 2Assistant Instructor, M.Sc. Nursing Administration, Nursing Department, 3Assistant Professor, College of Nursing, University of Al-Qadisiyah, Iraq

ABSTRACT

Background: Breast cancer is one of the important diseases that intimidate woman’s sexual life and her well-being. Early diagnosis and successful therapeutic intervention would prevent morbidity and death of such patients. The latter can be achieved through raising women’s awareness of risk factors, preventive measures and screening techniques, such as Breast Self-Examination, related to breast cancer. The aim of current study was to appraise knowledge and performance related to breast cancer among women in AL-Diwaniyah City, Iraq.

Method: Cross-sectional descriptive questionnaire-based study involved 50 women attending Breast Oncology Clinic at AL-Diwanyia Teaching Hospital between November 2016 and March 2017. Data were analysed using descriptive and inferential statistics and tested for significance at P≤ 0.05.

Results: Current study revealed that the 50 women participated were aged 20 to 60 years, (64%) of them were between 40 and 59 years. Also, 72% were married, 72% were highly educated and 96% were urban women. However, they had below average level of knowledge concerning breast cancer. Also, they had poor practice regarding breast self-examination.

Conclusion: The reported results in current study could be attributed to cultural issues, limited availability and/or access to information resources and screening techniques for this disease. A well-planned nationwide health-promoting programme is required to raise awareness of this disease. Also, research in this area of medicine needs to be highly encouraged.

Keywords: breast cancer, knowledge, practice, breast self-examination.

Introduction

Breast cancer (BCA) develops when malignant cells generate within breast tissue. It can affect males and females, yet it is much more common in females [1]. Also, it can be classified into sub-types that have distinctive genetic, histopathological and clinical characteristics.

BCA can intimidate woman’s sexual life and her well-being [1]. It is the most common cancer affecting women all over the world as it accounts for approximately 25% of all newly diagnosed cancer cases every year [3]. In Iraq, BCA represents approximately one third of malignant diseases affecting women [1].

Early diagnosis and successful treatment of BCA would prevent life-long morbidity and death of patients [4-5]. To achieve this objective, it is essential to raise awareness of women regarding risk factors, preventive measures and screening techniques of BCA [6-8] using mass media, healthcare workers and/or books.

Risk factors for BCA [1] include radiation, family history, advanced woman age, early menarche, use of hormonal contraceptives, obesity and late menopause. However, preventive measures of BCA include increasing

DOI Number: 10.5958/0976-5506.2019.01375.5
physical activity, changing life style, consumption of high-fiber diet and regular intake of phytonutrients and antioxidants [1].

The symptoms suggestive of BCA include presence of a palpable breast lump, unusual discharge from the nipple, tenderness and redness of the breast, breast skin appearance is similar to that of an orange with/without nipple retraction [1].

Moreover, screening techniques for BCA include mammography, physical examination conducted by specialist doctors and Breast Self-Examination (BSE) performed by the individual herself at home [6-8]. The first two techniques maybe unavailable, unaccessible and/or expensive. In contrast, BSE technique is cost- and time-effective, straightforward to perform, does not require hospital visit, reliable and can be performed on regular basis as it involves self palpation and inspection of both breasts and axillary regions at home [9,10].

Women’s knowledge regarding BCA and their practice of BSE were the focus of a number of local and international studies [5-7,11,12], however, there was no published study that had investigated these topics among women in AL-Diwanyia City.

Therefore, current study was designed to appraise background information about BCA and performance of BSE among women attending Breast Oncology Clinic at AL-Diwanyia Teaching Hospital in Iraq.

**Methodology**

Current study was descriptive cross-sectional questionnaire-based. It was conducted at AL-Diwanyia Teaching Hospital from 1\textsuperscript{st}, November 2016 to 17\textsuperscript{th}, March 2017. Ethical clearance was obtained from Research Ethics Committee in the hospital before contact with patients. The study targeted women attending Breast Oncology Clinic in the Hospital. Participants were informed that their participation is voluntary, anonymous and confidential and data will be only used for research purposes. Verbal consents were obtained before administration of questionnaires. Following evaluation of relevant literature and questionnaires employed in comparable studies [5-8,11,12], a questionnaire was developed and critically appraised by a panel of expertes. It was administered by face-to-face interview with participants. The questionnaire consisted of three sections that covered demographic data of subjects, their knowledge regarding breast cancer and their background and practice of breast self-examination.

Data were analysed using descriptive, inferential and chi-squared statistics and tested for significance at \( P \leq 0.05 \).

**Results**

Out of the 50 women participated in the study, 64% were 40-59 years old, 72% of them were from educated background, 72% were married, 60% were employed and 96% were living in urban areas (Table 1).

Data revealed that the majority of participants (84%) had poor knowledge about this life-threatening disease (Table 2). In addition, none of BCA symptoms included in the questionnaire could be recognised by ≥50% of participants (Table 2).

Moreover, only 28%, 44%, 22% and 20% of participants acknowledged that high fat diet, exposure to radiation, reduced physical activity and early menarche, respectively, may contribute to development of BCA (Table 2). Interestingly, 68% and 78% of participants, respectively, recognised that consumption of oral contraceptives and having breast biopsies could contribute to development of BCA (Table 2).

On the other hand, 58% of participants agreed that increased physical activity would prevent development of BCA. However, only 20% and 48% of participants, respectively, acknowledged the potential efficacy of high-fiber diet and regular breast self-examination in putting-off progression of this disease (Table 2).

Results of current study showed that 60% of participants had heard about BSE (Table 4), of whom 42% knew from mass media, 38% learnt from healthcare workers, 8% read about it in books, 2% heard from their friends and 10% had their knowledge from multiple sources (Figure 1). In addition, only 16% of participants performed BSE in a systematic manner. The others either did not know how to perform BSE (32%) or they (52%) carried out it however they want (Table 3). Also, results showed that 22% of participants had never performed BSE before, 36% practiced it irregularly, 8% on weekly basis and 34% on monthly basis (Table 3).

Discussion

Results of current study suggested that participants were representative of women at risk for BCA as 72% of our study sample were ≥ 40 years old and 96% were urban women (Table 1). The risk of BCA is growing up to the age of 50 years and rises as age increases and it is higher among urban women than countryside-resident women [6,13].

Moreover, only 60% of participants had information about BCA and BSE (Figure 1). This figure is similar to the 69.1% from Kirkuk City [12], but lower than the 91.5% from Baghdad [13]. These differences could be due to different living circumstances and diverse life styles of residents in these cities which greatly affect individuals’ thinking, experiences and priorities [18].
Furthermore, 42% of participants got their information from mass media (Figure 1). Similar data were reported by previous studies [6,13,15] indicating the importance of mass media in dissemination of knowledge, education and health promotion. However, unavailability of relevant books about BCA as potentially sensitive issue accounted for the findings that books and friends were poor sources of information about BCA in AL-Diwanyia City. Moreover, healthcare workers were in the second rank (38%) as a source of information about BCA and BSE (Figure 1). Similar findings were reported in India [6]. This finding indicated that healthcare personnel at AL-Diwanyia Teaching Hospital do not allot enough time for education of people at risk of this potentially fatal disease.

Reasons for the insufficient knowledge about BCA and BSE our participants have may include unemployment (40% of participants) and probably insufficient incomes for those who were employed (60%) as it has been concluded that individual’s education is greatly influenced by his/her income [16]. In addition, lack of ineffective local or nationwide [12] health promotion programmes concerning BCA and its screening techniques might have contributed to the reported level of knowledge. Also, participants viewed healthcare workers as being inexperienced and/or so busy to provide relevant information [17]. Moreover, breast disease is a culturally sensitive issue [12], therefore, presentation of relevant data via mass media and discussions with friends or within families are somewhat restricted.

The poor practice of BSE by our participants maybe because they prefer other screening techniques like mammography [19], they were unsure about their abilities to perform BSE and/or they were panic from discovering a lump in the breast [12]. Also, they might have not heard about BSE.

Data from current study revealed that the insufficient level of knowledge concerning BCA did not associate with any of the demographic variables of interest (Table 3). Nonetheless, an association between participants’ knowledge and their age, employment and family history has been documented in other studies [12,18].

Current study was conducted for the first time in AL-Diwanyia City. Also, most of participants were urban women and ≥ 40 years old. However, the nature of their jobs and the sufficiency of their earnings were not reported in this study. Also, it had better recruit more participants to ensure generalizability of results.

Research is needed to get an insight into the actual reasons that influence practice of BSE among women of different age groups and to suggest the optimal age-related screening method in Iraqi population.

### Conclusions

The reported low level of knowledge and limited practice concerning BCA and BSE among women at risk of this disease in the AL-Diwanyai City could be attributed to cultural issues and limited availability as well as accessibility to information resources and screening techniques for this disease. However, adoption of a national health-promoting programme, training of healthcare workers and encouraging scholarship in this field would make it possible win the battle against this potentially fatal disease.

Molecular Detection of RIF Resistance in Pulmonary and Extrapulmonary Specimens in Misan Province–South of Iraq

Zainab Mohammad Edi, Sanaa Basheer Kadhem, Mayssa Ghazi Jumaa

1Department of Microbiology, College of Medicine, University of Misan, Misan, Iraq

ABSTRACT

Background: Tuberculosis remains an important public health problem especially in the developing world. The tuberculosis burden is worsened by the emergence and spread of multi-drug resistant bacteria. The aim of current study was to evaluate detection of Mycobacterium tuberculosis in respiratory and non-respiratory specimens and mutations associated with rifampicin (RIF) resistance directly from specimens in less than 2 hours by using GeneXpert MTb/RIF.

Method: A total of 511 patients attended to the TB center in Misan/Iraq from January 2016 to February 2018. These patients were clinically diagnosed or suspected to have TB. The samples were examined by GeneXpert assay. For extra pulmonary fluid samples, the same test was done.

Results: Out of 511 cases, 90 (17.6%) were detected as having M. tuberculosis—86 (95.5%) were rifampicin sensitive and 4 (4.4%) were rifampicin resistant. Also, 79 (87.7) were pulmonary samples and the remaining 11 (12.2) cases were extrapulmonary specimens (lymph node aspirate, pleural fluid, saliva, abscess and bronchoalveolar lavage).

Conclusions: GeneXpert assay is a new rapid molecular test in the detection of Mycobacterium tuberculosis directed from pulmonary and extra pulmonary specimens and detection of resistance to antibiotics(Rifampicin).

Keywords: GeneXpert assay, MTB, Rifampicin, Drug resistant, Extra pulmonary.

Introduction

Tuberculosis (TB) is an infectious disease caused by the bacillus Mycobacterium tuberculosis (MTB). It spreads from person to person predominantly through an airborne route. It remains a major global health problem as it causes ill-health among millions of people. After the human immunodeficiency virus (HIV), TB ranks as the second leading cause of death from an infectious disease worldwide [1,2].

Worldwide, there are estimated 9 million new cases and 1.4 million deaths caused by Mycobacterium tuberculosis (MTB) infections [3]. These numbers are increasing due to the increasing emergence and spread of multi-drug resistant M. tuberculosis strains (MDR-TB). The latter are now a serious threat for public health control systems and do not have effective treatment regimens [4]. Rifampicin is a very important component of the current tuberculosis treatment regimen and has proved to be effective to both susceptible strains and strains resistant to streptomycin and isoniazid [5]. Drug resistance in MTB has been characterized by a number of mutations in genes that are involved in drug targets/metabolism. Mutations in rpo B and kat G genes of MTB have been shown to be responsible for resistance to rifampin (RIF) and isoniazid (INH), respectively [6]. Ninety-five percent of mutations for RIF resistance are located in 81-bp region of the rpoB gene that codes for the β subunit of RNA polymerase. Mutations in codon 315 of the katG [7].

Rapid detection of drug resistance is crucial in choosing the most effective treatment to avert morbidity and mortality of infected individuals and reduce...
the risk of MDR tuberculosis transmission. Xpert MTB/RIF assay is a new rapid molecular test that was asserted that it was able to overcome many of the current operational difficulties in TB diagnosis. WHO endorsed Xpert MTB/RIF assay in 2010 for use in TB prevalent resource limited countries as a first line diagnostic test for rapid diagnosis of TB in HIV infected patients or for management of MDR-TB suspect.

In this study, we aimed for detection of Mycobacterium tuberculosis in respiratory and non-respiratory specimens and mutations associated with rifampicin (RIF) resistance directly from specimens in less than 2 hours by using GeneXpert MTb/RIF (Cepheid GeneXpert® System, USA).

**Material and Method**

**Clinical samples:** In total, 511 specimens were included in the study. They originated from patients with suspected TB between January 2016 to February 2018 at TB center in Misan Governorate, Iraq. A total of 90 samples (79) respiratory and (11) non-respiratory specimens) that were determined as positive for *M. tuberculosis* complex by Xpert MTb/RIF (Cepheid GeneXpert® System, USA) were included in the study.

**Procedures for Xpert assay:** Xpert MTb/RIF testing was performed on samples according to the manufacturer’s recommendations. The Xpert assay sample reagent (containing NaOH and isopropanol) was added in a 1:3 ratio to the tubes to kill the mycobacteria and liquefy the sample. The mixture was vigorously shaken and allowed to sit for 15 min before being shaken again and allowed to sit for another 5 min. Finally, 2 mL were pipetted into the Xpert assay cartridge and inserted into the GeneXpert instrument for polymerase chain reaction (PCR) testing. The measurement and analysis were conducted automatically and reported by the GeneXpert Dx software.

Fluid samples from non-respiratory sites were centrifuged at 400xg for 15 minutes then the deposit was dealt with exactly like sputum samples. The tubes were incubated at room temperature for at least 15 minutes during that they were shaken manually twice then 2 mL of this suspension was aspirated using Pasteur pipette and loaded into the GeneXpert cartridge for PCR test.

**Results**

A total of 511 specimens were run in the Xpert MTb/RIF assay. MTb was detected by GeneXpert in 90 (17.6%) specimens, while MTb was not detected in 421 (82.38%) specimens (Table 1). Rifampicin resistance among MTb detected cases was observed by GeneXpert in 4 (4.4%) out of 90 MTb cases (Table 2). Among 90 (17.6) MTb detected cases 50 (55.6) were males and 40 (44.4) were females (Table 3).

The pulmonary specimens were detected in GeneXpert assay 75 (84.3), and extra-pulmonary specimens (plural fluid, lymph node aspirate, saliva, abscess, bronchoalveolar lavage) were detected in GeneXpert assay 11 (12.2) (3,1,1,2,4), respectively, (Table 4).

Discussion

This study demonstrated that the Xpert MTb/RIF assay system can rapidly detect the presence of *M. tuberculosis* and identify the mutations most frequently associated with rifampin resistance directly from sputum samples.

In this study, GeneXpert assay detected *M. tuberculosis* in 90 (17.6%) of cases. In another study, [10] detected *M. tuberculosis* in 283 (94.33%) of samples out of 300, which disagreed with the findings of this study. GeneXpert MTB/RIF assay detected 4 (4.5%) of MTB positive cases resistant to rifampicin therapy, which was very close (agreed) to what was found by [11], who reported a prevalence for Rifampicin resistance rate of 6.9%, and by [12] who reported 3.1% in Iran. However, [13] detected 20 (14.2%) rifampicin-resistant cases out of the total positive MTB cases which disagreed with the findings of our study. This discrepancy in results could be attributed mostly to existence of mixed bacterial strains in sputum sample particularly in retreated patients, or due to gene mutations in MTB especially rpo B gene [14].

In our study, among 90 clinically suspected pulmonary and extra pulmonary tuberculosis cases, 50 (55.6%) were males and 40 (44.4%) were females. Another study, [15] reported that out of 107 pulmonary tuberculosis patients, 64 (59.81%) were males and 43 (40.19%) were females, this was almost similar to our study. The reason of higher male tuberculosis cases than female cases might be explained by the fact that males are actively populated in the community and may come in contact with TB infected persons more frequently, and the associated habits of alcoholism and smoking among the males which may imply an increased susceptibility of males to respiratory illnesses. But female members still reside at home and, therefore, the chance of exposure is comparatively less. Thus, it is recommended to use the GeneXpert assay to prevent prevalence MDR-TB and provide sufficient quantity of GeneXpert kits to examine all the negative and positive samples that attended the tuberculosis centers.

Conclusion

The current study proved the high incidence and prevalence rates of TB in Misan province. The GeneXpert can be rapid and helpful assay for the diagnosis of rifampicin resistant TB that needs minimal technique and can be operated by non-specialist laboratory staff. Furthermore, GeneXpert can provide results in a short period of time, as it is not necessary to wait for smear results like in the traditional method. As a result, treatment can be started more quickly.

Acknowledgment

We would like to thank Prof. Majed Shyal Rahima (Microbiology, University of Misan, College of Medicine) for his valuable advices. Also, we would like to thank all members in TB center in Misan for assisting our in collecting the data as well as their kind technical support.

Ethical Clearance: The study was approved by the Research Ethics Committee at College of Medicine/University of Misan, Iraq.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Effect of Laser Diode 820Nm on the Levels of Lactate Dehydrogenase, Creatin Phosphokinase, and Lactic Acid in Muscles of Students

Mahdi Ali Sukkar Al-Farawn¹, Zahida Miran Hussein², Wafaa Sameer Abdullah²
¹Department of Conservative Dentistry, ²Department of Basic Sciences, College of Dentistry, University of AL-Qadisiyah, Diwaniyah City, Iraq

ABSTRACT

Background: Lactic acid is the end product of glycogenolysis. Glycogen is converted to pyruvic acid in the deficiency of oxygen. The creatin phosphokinase enzyme activity is important to change AMP to ATP in glycogenolysis. However, in the deficiency of CPK, the pyruvic acid is changed to lactic acid with the lactate dehydrogenase (LDH) enhancement. Low level laser treatment (LLLT) is one of the most important research aspects targeting the cellular level. The output laser should be low and do not make thermal changes inside tissues. The aim of this study was to see the effect of laser diode 820nm on the levels of lactic acid and body enzymes, lactate dehydrogenase (LDH) and creatin phosphokinase (CPK), in the after physical activity of facial muscles which are considered important for various activities. Methods: The sample was taken from the 1st-year dentistry students, College of Dentistry/Kufa University in 2014-2015 in collaboration with Al-Saddar Teaching Hospital, Kufa City, Iraq. This study was based on retrospective studies that are related to our research. The protocol of this research was based on clinical studies on three groups of students. Each group contained 30 patients. All the samples were based on same biological qualification of age, weight, and length. The first two groups were submitted into pre and post evaluation of the lactic acid, LDH, and CPK except the control group. From all the groups, each subject was asked to chew a gum of frankincense continuously for a half hour. The weight of the gum was 1.5gm. Results: The result of this study was positive toward the laser group. After mouth muscle activity, lactic acid and enzymes accumulated in the muscle cells. The laser effect reduces muscle fatigue and pain due to reorientation the chemical levels to normal values.

Keywords: Creatin phosphokinase, facial muscles, lactate dehydrogenase, laser diode 820nm, lactic acid.

Introduction

Lactic acid is the end product of glycogenolysis (GCS). Glycogen is converted to pyruvic acid in the deficiency of oxygen. The creatin phosphokinase (CPK) enzyme activity is important to change AMP to ATP in the GCS. However, in the deficiency of CPK, the pyruvic acid is changed to lactic acid with the lactate dehydrogenase (LDH) enhancement. The anaerobic GCS increases lactic acid, LDH, and CPK in the body especially in muscles affected by intense exercise.

CH₃–C–COOH* + NADH + H↔CH₃–C–COOH** + NAD
Without O2

*pyruvic acid
**Lactic acid

Equation Glycogenolysis without Oxygen.

The concentration of lactic acid in normal people at rest position equals 10mg/100ml of blood. The maximum concentration after intense exercise, within 1-3 minutes, in arterial blood stream for normal men and ladies is 10-15mg/100ml of blood. The normal persons can’t tolerate more than 112mg/100ml in blood while the concentration in rest position is 10-12 mg/100ml.

DOI Number: 10.5958/0976-5506.2019.01377.9
The CPK is considered as one of the transport enzymes. This enzyme is found in the skeletal muscles, smooth muscles, and cardiac muscles. This enzyme is found in blood stream when the body has an accident or muscle spasm\textsuperscript{[6,7]}.

The LDH is an enzyme that can stimulate the reverse reaction between lactic acid and pyruvic acid according to the equation shown below:

\[
\text{CH}_3\text{C-COOH} \quad \text{LDH} \quad \text{CH}_3\text{CH-COOH} \quad \text{OH}
\]

\[
\text{Pyruvate} \quad \text{Lactate}
\]

This enzyme is found in all body cells of liver, heart, skeletal muscles, kidneys, and red blood cells in high concentrations\textsuperscript{[8,10]}.

Low level laser treatment (LLLT) is one of the most important research aspects targeting the cellular level\textsuperscript{[11]}. The output laser should be low and do not make thermal changes inside tissues. For laser output to be as LLL, the output should be between 300-9000mj/cm². The laser–tissue interaction explains how the electromagnetic field can change electrolyte elements like sodium and potassium in and out of the cell\textsuperscript{[12]}. Rather than who activates Crip’s cycle to increase ATP production from ADP, the cytochrome alpha is the last chain in Crip’s cycle of the electron transport chain. Laser, especially in red and near infrared is absorbed by this cytochrome. This cytochrome lets the O\textsubscript{2} electrons to potentially be attracted to this magnetic component of the Crip’s chain\textsuperscript{[13]}. The end result is a lot of O\textsubscript{2} electrons with end result of much ATP\textsuperscript{[14,15]}. Finally, the cells will be enriched with energy that is necessary for their activities. Figure 1 summarizes the LLLT-tissue interaction\textsuperscript{[16]}.

The aim of this study was to see the effect of laser diode 820nm on the levels of lactic acid and body enzymes, lactate dehydrogenase (LDH) and creatin phosphokinase (CPK), after physical activity of facial muscles which are considered important for various activities.

![Figure 1: Flow chart of the LLLT-tissue interactions\textsuperscript{[16]}](image)

Materials and Method

Diode laser 820nm: It’s a semiconductor laser 820nm (OMEGA Co., UK). It consists of two parts; control part (time, frequency and output) and laser delivery part. These two parts are connected by cable to allow the operator reach different areas on the patient face.

The gum: For all students, the gum (frankincense) was chewed continuously for a half hour. The weight of the gum was 1.5gm.

Sampling: In the College of Dentistry, 1st-year dentistry students, 90 healthy students with an average age of 28 years old, were divided into three groups; laser treatment, no laser treatment and control groups.

Measurement of lactic acid: Blood samples, obtained via fingers, were taken from each student pre and post experiment to measure lactic acid concentration (Lactic acid measurement device, mmol/100ml, Figure 2), LDH and CPK enzymes [17].

Stimulation program by laser 820nm: The laser group was exposed to a laser session applied on the facial muscles bilaterally. The laser parameter was 100mJ output. The laser delivery system had 100 laser apertures. Each laser spot area was at 2.07mm². When it was divided to change it to cm² and multiply to sum all areas of laser apertures, it became the same area but in cm² to calculate the power density divided by the output over area, that was 500mJ/cm² irradiance. To reach the maximum therapeutic dose, the time was 2 minutes, the total session time. The final dose was between 9000-10000mJ flounce. After the laser session was done, blood samples from all groups were taken for laboratory tests.

Results and Discussion

According to the Tables 1 and 2, shown below, laser exposure showed significant differences between the control group and the laser-treated group. That can be explained due to the laser effect on biology of the cells. However, it restored back the normal activities of the cells getting rid of the fatigue and made much difference on the muscles. The laser was very effective in improving and changing the CPK levels by regeneration of ATPs. The ATPs normally produced by cells are few and can be consumed quickly. However, when the cells are affected by laser, they can produce more ATP energy in a period of two sessions per week according to the response of the cells. When a living being is exposed to a low power laser in organized sessions, the laser supports to rebounce the activities of the LDH, CPK, and lactic acid [18]. Moreover, the activity of muscles is subscribed with enzymes as co-enzymes, so it raises the activity of the coenzymes. The unexposed samples to laser showed no changes. Lactic acid is accumulated inside the cells. Normally, lactic acid already exists in muscles and elevates during muscle activity. Though, lactic acid is the final image of the anaerobic metabolism. In conclusion, the reaction of laser at low power with living tissue is very energetic and ends with clinical results such as healing of injuries, pain relief, biological stimulation, and many others. Laser light has special physical properties that do not exist in the ordinary light (mono chromatic, coherence, brightness and/or one direction).

Genotypic Study of Hepatitis Type B in Al-Diwaniya Province, Iraq

Wisam S. Abbood1, Hazim S. Atiyah Al-Mhanah1
1Department of Microbiology, Faculty of Medicine, University of Al-Qadisiyah, Iraq

ABSTRACT

Hepatitis B virus (HBV) with its possible serious sequels of liver cancer and cirrhosis is a well recognized worldwide health problem. These problems are particularly occurring as complications of the chronic form of the disease. Relying on the sequence homogeneity, there are ten HBV genotypes (A-J). The aim of current study was to establish the main genotypes of HBV in clinical cases from Al-Diwaniyah City/middle of Iraq.

Methods: A total of 80 blood samples were collected from patients clinically suspected to have HBV hepatitis and diagnosed basically as Hbs Ag positive. The study sample included 59 males and 21 females with age range of (12-75 years). Nested PCR assay was performed for HBV genotyping. Results: Recorded results for HBV DNA were as follows: 33(41.25%) samples were positive for HBV DNA while 47 (58.75%) samples were negative for HBV.

Nested PCR results done on the positive samples for HBV genotyping showed that genotype E was the only single genotype at a percentage of (3%), while most of the samples showed mixtures of more than one genotype as follows: A+E (3%), C+D+e (12.12%), B+C+D+E (15.15%), A+D (3%), A+B+C+D+E (18.18%), A+B+D+E (18.18), B+D+e (3%), A+C+D+E (3%), B+C+D (6%), A+B+D (3%), A+B+C+D (6%), D+E (6%). Genotype F was not found in any sample in this study. There was no significant difference in distribution of genotypes between males and females (P = 0.369).

Keywords: Hepatitis B Virus, nested PCR, genotyping, serology, prognosis.

Introduction

Variable Hepatitis B genotypes have different geographical distribution, different ways of disease progression and variable prognosis. These factors justify the importance of genotyping of the virus [1]. Several studies were conducted In Iraq that had studied Hepatitis B Virus (HBV) prevalence and genotyping. For example, in Wasit Governorate all the tested samples were of mixed genotypes and no single genotype was found [2]. The main mixture was “A +B+ C+ D+ E” in a percentage of (77.7%) and the other combinations were of less percentages; “A+ B+ D+ E”, “A+ B+ C”, “A+ B+ E” and “A+ D+ E” of 16.6%, 2.7%, 1.3% and 1.3%, respectively, [2]. In Duhok, North of Iraq, a study stated that genotype D is the main genotype and the second genotype was B. Also, high percentage of chronic hepatitis type B patients who exhibited genotype D, were HBe Ag positive [3]. A similar study was conducted in Basra/South of Iraq, found that the main single genotype was genotype D and the main mixture of genotypes was of D+E [4]. The aim of current study was to establish the main genotypes of HBV in clinical cases from Al-Diwaniyah City/middle of Iraq.

Materials and Method

The primer for detection of the virus and the primers used for genotyping were supplied by “Bioneer. Korea” with the design described by Naito [5] (Table 1).

A blood sample of 5ml of venous blood was collected from each of the 80 patients enrolled in current study. The serum was collected in Eppendorf tubes then stored at -20°C to be used for DNA extraction and nested PCR technique.

**Extraction of DNA:** Genomic viral DNA was extracted from utilizing “gSYAN Genomic DNA Mini Kit” (Geneaid, USA).

**Detection of HBV:** PCR master mix was prepared for direct detection of HBV by using (AccuPower® PCR PreMix Kit). The resultant mixture was 20µl which is constituted of P1 gene primer 1µl (10pmol), S1-2 gene primer 1µl (10pmol), PCR water 13µl and DNA template 5µl (DNA extraction).

After that, these PCR master mix components were placed in standard AccuPower PCR PreMix Kit that contained all other components needed for PCR reaction such as (Taq DNA polymerase, dNTPs, Tris-HCl pH: 9.0, KCl, MgCl₂, stabilizer and tracking dye). Then, all the PCR tubes transferred into Exispin vortex centrifuge at 3000rpm for 3 minutes. The Thermocycler program was as follows: Primary denaturation step by incubation at 94°C for 5 minutes, proceeded for 40 cycles. Each cycle included the following: 1- Denaturation at 94°C for 30 seconds, 2- Annealing at 55°C for 1 minute, 3- Elongation at 72°C for 1.5 minute and 4- Extension at 72°C for 5 minutes.

**Genotyping Method:** Direct detection of HBV genotypes was performed by means of two mix reactions: Mixed A reaction for the detection of the genotypes (A, B and C) and Mixed B reaction for genotypes (D, E and F). Each positive serum sample was subjected for both reactions A and B. The master mix constituents were supplied by “(AccuPower® PCR PreMix Kit)”. The nested PCR master mix was composed of B2, BA1R, BB1R, B2, BA1R, BB1R (5µl) or BD1, BE1, BF1 bb, B2R primers (10pmol), PCR water (15µl), DNA template with addition of 1µl aliquot DNA product of the primary PCR step from each positive sample.

The thermocycler conditions of nested PCR were programmed for 40 cycles; 20 cycles of 1- 94°C for 30 seconds, 2- 58°C for 30 seconds, 3- 72°C for 40 seconds and another 20 cycles of 1- 94°C for 20 seconds, 2- 60°C for 30 seconds, 3- 72°C for 40 seconds and with the final extension at 72°C for 5 minutes.

Electrophoresis of the products was performed using 1% agarose gel stained with ethidium bromide followed by visualization under UV transillumination. A ladder of 100bp DNA was used for the prediction of the PCR products size and consequently determining the genotypes for each sample.

**Results and Discussion**

**HBV DNA detection by PCR:** Out of the (80) serologically positive samples for HBV tested by PCR technique for HBV DNA, thirty three samples (41.25%) were found to be positive, while forty seven (58.75%) were found to be negative (Table 2 and Figure 1).

The discrepancy between the results of the screening ELISA test and PCR does not deny the occurrence of infection with HBV in these 47 patients. HBs Ag is still regarded the main HBV serological indicator in the confirmation of the occurrence of the HBV infection [6,7]. This may be explained by the presence what is termed “non-replicative phase” in the chronic HBV disease course since its natural course is known to pass through four phases that are HBs Ag positive, but some are “non-replicative” [8,9]. Furthermore, it is recognized that seroconversion of HBe Ag positive into HBe Ab positive is common in patients at the “non-replicative” phase. HBV DNA during this phase is merely undetectable in serum HBV DNA levels referring to an immunological response to the infection [9,10]. This conclusion was agreed by other studies in other areas in Iraq were similar results were obtained [2,12]. The present study established no significant difference between female and male patients.

**HBV Genotypes:** Although different genotypes were all presented in different mixed forms, there were different percentages for each genotype. According to this study, the different percentages of the different genotypes were as follows: genotype D in a percentage of (93.94%), followed by genotype E in a percentage of (81.82%). In addition, genotype B percentage was (69.70%) and C was (60.61%) while A percentage was (54.55%) as shown in Figure 2.
In this study, only genotype E (3%) was found as a single form among other genotypes which were all present in mixed forms (Figures 3, 4 and 5).

The distribution of different mixtures of the different HBV genotypes reported in this study were at the following percentages: A+E (3%), C+D+E (12.12%), B+C+D+E (15.15%), A+D (3%), A+B+C+D+E (18.18%), A+B+D+E (18.18%), B+D+E (3%), A+C+D+E (3%), B+C+D (6%), A+B+D (3%), A+B+C+D (6%) and D+E (6%). Genotype F was the only genotype not discovered in any of the patients’ samples studied in current study (Figure 3).

Figure 3: Distribution of the different mixtures of HBV genotypes reported in this study.

Figure 4: Agarose gel electrophoresis of PCR assay products for HBV genotypes A, B, and C from positive samples. M “Marker ladder at 1500-100bp”. Lanes 1 and 2 at 28bp (genotype B). Lanes 2, 4, 6, 7 and 8 at 122bp (genotype C). Lanes 1-4 and 6-8 at 86bp (genotype A).
HBV is known to be differentiated into 8 genotypes (A to H) [13]. These genotypes have some variation in pathogenesis, virulence, and other factors affecting the outcome of the disease and response of the immune system to the infection as well as treatment [1,5]. Genotypes (A, C and D) are the most common in Asia [14]. The 6 major genotypes (A-F) were chosen to search for in this study using nested PCR technique described by Naito [5]. This method is approved to be highly sensitive for recognition of HBV genotypes [15].

In current study, the majority of patients having HBV were confirmed to have a mixture of more than one genotype (96.97%), while it was found that only small proportion showed a single genotype infection (3.03%) which is E genotype. These results were consistent with the conclusion of a study in Sulaimania (North of Iraq) where same technique was technique. The latter study reported that all the examined samples were of mixed genotypic viruses [16]. In Wasit province, a similar study were conducted and reported that that 100% of the samples were of mixed genotypes. The combination of genotypes (A, B, C, D and E) was the major cause (77.7%); whereas the mixture (A, D and E) was found to be the least (1.3%). Furthermore, no single genotype was recognized and no sample was found to contain genotype F neither single nor mixed [2]. In Duhok (North of Iraq) a study reported that the predominant genotypes causing HB infection were genotype D and genotype B, respectively [3]. Another study in Baghdad stated similar results [17].

In Asia, the main well documented genotypes to be predominant are (A-G), mainly (A, C and D). (A, C, D and G) genotypes are the predominant genotypes in Europe. Mixed genotypes (A+C and C+D) are the main mixtures in Asia, while (C+D) are in Europe and (A+D) are recognized in Africa [14].

The opportunity of the occurrence of mixture of multiple genotypes may be explained by the assortment between multiple digenotypes [18]. In Wasit (Mid of Iraq), a researcher found a high incidence of mixed genotypic infections [2]. Patterns of genotypic mixtures were documented in Sulaimaniya (North of Iraq) where they attributed this high percentages to the emigration movements of refugees to Europe and longstanding periods in refugee camps at which many opportunities to get infection from other nationalities within same camps [16]. In addition, low hygienic levels may enhance disease transmission particularly in dental clinics, hairdressing and tattoo salons are other important risk factors to HBV transmission.

Immunological and Molecular Detection of Hepatitis E Virus in AL-Samawah City, Iraq

Mouna Akeel Hamed Al-Oebady

Department of Biology, College of Sciences, Al-Muthanna University, Iraq

ABSTRACT

Background: Hepatitis E virus is an emerging disease with a high incidence globally. Acute hepatitis is related to high mortality rates in pregnant women, particularly throughout the third trimester of pregnancy as a result of fulminant liver disease. The aim of this study was to identify the prevalence of anti-HEV within human population and its relationship with age and gender so as to support the implementation of future methods that can enhance national and international surveillance.

Method: The blood samples (63 samples; 32 females and 31 males) were obtained from blood donated by other people in AL-Samawah City, Iraq. The study was conducted during the period from January 2017 to January 2018. Serological tests for anti-HEV antibodies by ELISA, HEV-RNA detection by PCR and phylogenetic analysis were performed. Results: Data from current study showed that 26 samples were positive for anti-HEV antibodies and 37 samples were negative. In addition, the total prevalence of anti-HEV antibodies in humans was higher in female (57.6%) than in male (42.3%). On the other hand, the prevalence of HEV seemed higher in people aged ≥50 (34.6%) than within the age group 1-9 years (26.9%).

Keywords: HEV, antibodies, ELISA, PCR, blood donors, genotyping.

Introduction

Hepatitis E virus (HEV) may be a pathological state in many regions of the world and it seems to be the second most frequent reason for the enteric hepatitis after hepatitis A viral infection. Acute hepatitis is related to high mortality rates in pregnant women, particularly throughout the third trimester of pregnancy as a result of fulminant liver disease [1].

HEV has been represented for many populations with high levels especially in India [2]. Investigations showed that HEV may be a serious public health problem in the developing countries of Asia, Africa and Mexico [3]. HEV endemicity within the world is presently below investigation and an additional complete picture of the worldwide distribution and seroprevalence of HEV infections is emerging [4].

The aim of this study was to identify the prevalence of anti-HEV within human population and its relationship with age and gender so as to support the implementation of future methods that can enhance national and international surveillance.

Materials and Method

Laboratory Assay: Blood samples (63) were collected from blood donated by other people and stored in the blood bank of AL-Samawah City.

The sera were tested for anti-HEV IgG and anti-HEV IgM by Enzyme Linked Immuno-Sorbent Assay (ELISA) kit (Dia-pro from Milan, Italy) according to the manufacturer’s method.

RNA Extraction and Primer Designing: RNAs were extracted by using the QIAmp viral RNA Extraction Kit (QIAGEN, Switzerland).

There are two sets of primers i.e primer set for 1–9 is designed from ORF2 and is used to distinguish between the four genotypes of HEV (Table 1).
Table 1: HEV primer set for genotypes (1–9)

PCR amplification and genotyping of HEV: The extracted RNA was used to amplify HEV genome segment using specific primers as described above. The PCR amplification was performed according to the program described previously and its products of positive samples were run on 2% agarose gel prepared in 0.5× TBE buffer then it was purified by gel purification kit (Invitrogen, USA) according to manufacturers’ protocol (5).

Statistical Analysis: Chi–squared test was used for statistical analysis of data using a computer-based software (Statistical Package for Social Sciences; SPSS).

Results

A total of 63 human sera were collected from January 2017 to January 2018. Human sera were 26 positive and 37 negative for anti-HEV. The distribution of positive samples according to gender was 15(57.6%) and 11(42.3%) for females and males, respectively. Statistical analysis of these data showed non-significant differences (P>0.05; Table 2).

HEV increased with age from 34.6 %, in over 50 years old, to 26.9 % in children aged 1-9 years. Then percentages were (15.3%, 11.5%, 7.6% and 3.8%) for the age groups 30-39, 10-19, 20-29 and 40-49 year, respectively. The results of the statistical analysis showed non-significant differences (P>0.05; Table 3).

Genotyping of HEV: PCR primers were used specific for the molecular detection of HEV from the blood samples. Current study revealed that HEV genotype 1 was the most prevalent genotype in this study. Lanes 1 to 5 showed 375bp of HEV bands, lanes 6 and 7 showed negative control, lane 8 represented the HEV positive sample with 375bp amplification, Lane M showed the 100bp molecular marker (Figure 1).

![Figure 1: Amplification of HEV genome from a blood sample](image)

**Discussion**

The seroprevalence of HEV in patients of current study was 41.26% which was higher than the 13.1% reported [6]. In addition, HEV was detected in 13.5% of the samples analyzed in earlier of the randomly selected patient population in Ekiti State, Nigeria [7].

The rates of HEV infection documented in other studies were lower than that reported in current study. For example, in the general population in Pakistan it was 17.5%, in Iraqi-Kurdish refugees was 14.8% and in Ankara, Turkey was 3.8% [8-10]. Also, in Turkey, different results were reported in the several regions and the percentages ranged from (2.1%-12.8%) [11]. In other parts of the world, anti-HEV antibody had been reported at 3.4% in the preschool children of Taiwan, 10.5% in Mexicans aged 1 to 29 years, 11.9% within Korean population and 17.2% in a village (Nile Delta) in Egypt [12-13].

In developed countries, HEV is lower as in example, it had been reported at a rate of 2.6% in Italia, 2.8% in Israeli Jews and 1.8% in Israeli Arabs [14,15]. Alizadeh et al. [14] reported, in Nahavand-Iran, a 9.6% incidence of anti-HEV antibody and it was higher among females aged 30—50 years than in males within other age groups. In the other study [17], anti-HEV antibodies were detected in the blood donors in Tehran-Iran, where anti-HEV antibodies were detected in the blood of 7.8% of them.

The optimal concentration of the antigen and serum dilution was assessed for ELISA of the human serum. This study additionally demonstrated the potential risk of HEV transmission from the animal reservoir host to individuals who have regular contact with the secretions and excretions from these animals. The situation could also be worse by the poor sanitation and hygiene that should be considered to prevent zoonotic transmission of HEV at the human-animal interface. This was also the view of the World Health Organization during a report on the zoonotic transmission of HEV from the animals to human where exposure to infectious body fluids of infected animals was a major risk factor [18,19]. Globally, the highest percentages of HEV were discovered in the regions where low standards of sanitation increase the danger of transmission of the virus by the fecal-oral route [20].

PCR techniques are one of the most reliable and sensitive tools for the detection of HEV in blood samples [20-21]. HEV mostly affects adult population and all of the small epidemics were reported because of poor sanitary conditions [14].

Current study showed that out of 63 total samples, only 26 samples were found positive for HEV which belonged to genotype 1 as shown in Figure 1. Contaminated food and water supplies increase the possibilities of outbreaks within the heavily-populated low socioeconomic areas. For example, HEV in Pakistan had remained at a stable nonexpanding stage from (1970-2005) then followed by an explosive emergence of the recent HEV variants [21,22].

Comparison of High Molecular Weight Beta Trace Protein and Low Molecular Weight Beta Trace Protein for the Assessment of Kidney Function in Patients with Chronic Kidney Disease

Mudher Kidher Mohammed1, Amer Hamza2, Mufeed Jalil Ewadh3

1Ministry of Health, Babylon Health Directorate, Iraq; 2Klinkum St. George g GmbH, Leipzig, Germany; 3University of Babylon, College of Medicine, Hilla, Iraq

ABSTRACT

Background: Chronic kidney disease (CKD) can be defined as either decreased kidney function (GFR < 60ml/min/1.73m²) or persistent kidney damage (indicated by markers of kidney damage) for 3 or more months. BTP is a monomeric glycoprotein with 168 amino acids and a molecular mass variation. Low beta trace protein isoform (L-BTP), the smaller “brain” origin isoforms, predominate in the CSF; whereas, high beta trace protein isoform (H-BTP), the larger “plasma” type glycoforms, predominate in serum and urine. These multiple isoforms certainly have implications for BTP measurement.

Aim of Study: Current study was aimed to compare the clinical usefulness of serum levels of H-BTP isoform for the detection of renal dysfunction in patients with chronic kidney disease (CKD) and making a comparison with levels of L-BTP.

Method: The study included 150 patients divided into three groups with a wide range of renal dysfunction that encompassed CKD stages from (I-IV).

Results: The obtained data showed that H-BTP was highly correlated (Pearson test) with measured GFR (mGFR) (r= 0.86) in logarithmic linear model, and correlated with L-BTP (r= 0.209). The results of this study showed that H-BTP had a significant higher concentration and strongest correlation with mGFR in comparison with L-BTP isoform.

Conclusion: H-BTP (and not the L-BTP isoform of brain origin) may be a useful and reliable serum marker for identifying the magnitude of renal dysfunction in patients with CKD and may have its place besides serum cystatin C and creatinine as an alternative endogenous GFR marker.

Keywords: H-BTP, L-BTP, Chronic kidney disease, mGFR, Cystatin C.

Introduction

Chronic kidney disease (CKD) can be defined as either decreased kidney function (GFR <60ml/min/1.73 m²) or persistent kidney damage (indicating by markers of kidney damage) for 3 or more months [1]. A variety of congenital and acquired conditions that represent the underlying etiologies [2]. CKD is associated with high incidence of morbidity and mortality because of the poor outcomes. The major outcomes of CKD, whatever the cause, include progression to end stage renal disease (ESRD) and kidney failure, complications of decreased kidney function, and cardiovascular disease (CVD). Many efforts had been done for early detection of this condition to prevent or at least delay some of these adverse outcomes [3]. However, CKD is not easily diagnosed early or treated properly which may due to a lack of agreement on a definition and classification of stages in the progression of CKD [4]and a lack of uniform application of simple tests for detection and evaluation, and this can result in a lost opportunity for prevention[5-7].

Beta Trace Protein (BTP): BTP, or prostaglandin D₂ synthase (PGDS) is a low molecular weight

heterogeneous monomeric glycoprotein with 168 amino acids. Its micro heterogeneity is the consequence of post-translational N-glycosylation resulting in different glycoforms of varying molecular weights (23-29 kDa) \[8,9\], (18.5-29 kDa) \[10\]. BTP almost “completely” is excreted by kidneys \[9,11,12\]. BTP has a low molecular mass, constant production rate and constant stability. So, for all these reasons BTP has been proposed as a new endogenous marker of GFR \[13,14\], and, compared to the conventional methods, serum BTP has been shown to be more helpful for estimating GFR and measurement of serum BTP can be a reliable tool for assessment of kidney function in neonates \[15\].

The aim of current study was to compare the clinical usefulness of serum levels of H-bTP isoform for the detection of renal dysfunction in patients with chronic kidney disease (CKD) and making a comparison with levels of L-bTP.

**Materials and Method**

**Subjects Samples:** The study was performed in a population of 150 patients (43 females and 107 males) with chronic kidney disease. Serum samples were collected from each patient. Serum concentrations of creatinine and cystatin C were measured on the day of blood collection, and BTP was measured later in serum samples stored at (–80) °C. All study participants gave written informed consent.

**Method**

High molecular weight BTP (H-BTP) “24 kDa” was measured by enzyme linked immunosorbent assay (ELISA) Cat. No.: RD191113100R by BioVendor – laboratorní medicína a.s. Low molecular weight BTP brains origin (L-BTP) “18.5 kDa” was measured by enzyme linked immunosorbent assay (ELISA) Cat. No.: EH3560 by Wuhan Fine Biotech-China. H-BTP and L-BTP were also measured in the sera of 50 healthy volunteers (18 females and 32 males) with mean ± SD age of 29.76 ± 13.1 years and the mean concentrations (SD) were 0.460.07mg/L, 0.003 ± 0.0013, respectively.

Measured GFR (mGFR), by using \(^{99m}\text{Tc-DTPA}\) radio isotopic technique as a standard method.

**Statistical Analysis:** All statistical calculation were carried out by the aid of SPSS software (IBM Corp. Released 2012. IBM SPSS Statistics for Windows, Version 21.0. Armonk, NY: IBM Corp. USA) and Microsoft Excel (2010, Microsoft Corp. USA). Taking P<0.05 as a significant result. One way ANOVA was employed to evaluate the presence of significant difference of measured parameters among studied groups.

**Results**

General characteristics of study groups are summarized in Table 1.

**Table 1: Study groups characteristics**

Serum concentrations of H-BTP and L-BTP in control and renal disease groups were presented in Table 2. As shown in Table (2), the mean ± SD of H-BTP in control group was 0.46 ± 0.07mg/l, while it was 0.003 ± 0.0013 mg/l concerning L-BTP.
Pearson correlation shown that there was a significant negative correlation (P<0.05, $r = -0.799$) between serum concentrations of H-BTP and mGFR (using ${}^{99m}$Tc-DTPA as an exogenous standard marker). In addition, the analysis shown that, the logarithmic linear model of correlation represents the best prediction of mGFR ($r = 0.86$). At the same time, Table (3) illustrated that L-BTP provided only minimally diverging results ($r = 0.166$) comparing to the performance of H-BTP ($r = 0.799$). However, a significant negative correlation (P<0.05) between L-BTP and mGFR were presented in this study. As the mGFR decreased, the H-BTP had increased in serum of patients groups (Figure 2).
Figure 2: Mathematical linear model correlation between L-BTP (A), and H-BTP (B), with mGFR.
Discussion

Markedly increased serum levels of H-BTP had been shown in patients with various renal diseases. The mean ± SD of BTP serum concentration (mg/l) in RT was 1.36 ± 0.36, in CKD was 0.88 ± 0.26, and in DM was 0.69 ± 0.22. These data had been shown significant higher levels than their serum concentration in control group (0.46 ± 0.07). At the same time, H-BTP concentration was elevated in the serum of all renal disease groups in this study compared to control group and more than L-BTP. These data indicated that plasma BTP differs from brain origin BTP isoform (Figure 3).

H-BTP had a higher value of correlation with mGFR (r= 0.799) compared to L-BTP (r= 0.166). H-BTP is superior in performance to L-BTP in detecting mild reduction in GFR in children [16] (Table 4).

Figure 3: Fold increment of the two BTP isoforms in all renal disease groups compared to control group (mean ratio)

Patients were stratified into 5 groups according to the CKD stage. H-BTP was significantly increased from CKD stage I to stage IV (P<0.05); whereas it was non-significant for LBTP and overlap had occurred to its level among stages (Figure 4).

Figure 4: Serum level of H-BTP and L-BTP (mg/l) in groups of patients stratified according to CKD stage. Data are presented as box-plots.

In general, BTP is a low molecular weight protein (18.5-29 kDa) that is removed from plasma by the kidneys as main route of excretion by glomerular filtration and the renal handling can be finished by tubular reabsorption and catabolism inside tubular cells [10,17,18]. It is freely filtered through the glomerular basement membrane with minimal non-renal elimination. Hence, it has been proposed as a new endogenous marker of...
glomerular filtration rate (GFR). Studies have confirmed a good correlation between serum BTP levels and GFR measurement based on inulin clearance and nuclear medicine methods [19].

L-BTP, the smaller “brain” origin isoforms, predominates in the CSF and has truncated oligosaccharide side chains with absent sialylation; whereas H-BTP, the larger “plasma” type glycoforms, predominates in serum and urine and has more fully sialylated oligosaccharide chains [20]. These multiple isoforms certainly have implications for BTP measurement.

BTP is a monomeric glycoprotein with 168 amino acids and a molecular mass variation depends on whether it is N-glycosylated at three positions: Asn⁵¹, Asn⁵⁶ and Asn⁷⁸ [21]. The polypeptide amino acid sequence is unique at the amino-terminal of BTP which is APEAQVSVPNFQDKFLGRWFSA [9]. The N-glycosylation sites of the polypeptide have been occupied by carbohydrate. Carbohydrate compositional and methylation analysis indicated that Asn⁹ and Asn⁵⁶ exclusively bear complex-type oligosaccharide structures—(partially sialylated with alpha 2–3- and/or alpha 2–6-linked N-acetylneuraminic acid)―that are almost quantitatively alpha 1–6 fucosylated at the proximal N-acetylglucosamine; about 70% of these molecules contain a bisecting N-acetylglucosamine, but agalacto structures and those with a peripheral fucose are also present [9]. Although both brain (L-BTP) and serum (H-BTP) are composed of an identical amino acid sequence, variations in molecular size can be caused by differences in oligosaccharide structure and N-glycosylation. For example, serum and urine BTP (H-BTP) have longer sugar chains and higher sialylation than BTP in CSF (L-BTP) [20]. It is believed that the sialylated glycoforms have been derived from resorbed CSF fluid and cleared by kidneys, while there are no asialo-oligosaccharides in blood as a result of hepatic clearance (at least five carbohydrate-specific receptor systems have been found in the liver and recognize non-reducing monosaccharides. The asialo-oglycoprotein receptor of hepatocytes is specific for terminal galactose and N-acetylgalactosamine. Also, there are N-acetylgalactosamine- and mannose-receptors on Kupffer and endothelial liver cells. Only glycoproteins circulating in blood which do not bear such sugar residues can persist. Especially, glycoforms lacking N-acetylmuraminic acid residues are rapidly eliminated. Thus, glycoproteins in serum must be protected from degradation “masked” by such sugar molecules. Tissue-specific glycosylation may, on one side, have a special biological function, on the other side, it may also be used as a “marker” for elucidating the origin of a selected glycoprotein, for example, its site of biosynthesis or for following its way throughout the body. The human CSF-BTP has been cleared by hepatic glycoprotein receptors. However, those BTPs bearing “serum compatible,” i.e., fully sialylated oligosaccharide chains do persist and are probably eliminated from the circulation into the urine. In the case of functional disturbances of protein elimination in the kidney, they accumulate in the blood as demonstrated here by analysis of serum from patients with terminal renal failure [20]. The interest in studying BTP as a marker of kidney function was based on the finding that the physiological clearance of these sialylated glycoforms is “impaired” in CKD. BTP is slightly negatively charged [22] and its serum concentration in a healthy patient is about 40ng/mL (0.4mg/l) [20], Figure (5).

Figure 5: BTP of CNS origin theory. “brain” and “serum” isoforms are produced in the CNS and then traffic to the serum where the liver rapidly metabolizes the smaller, “brain type” isoforms, leaving the larger serum type intact. (A) Intact liver that leaves only serum isoforms; (B) Cirrhotic liver with accumulation of both isoforms, potentially leading to higher serum concentrations depending on which epitopes the assay antibodies recognize [8].

A Comparative Study of Serum Levels of the Anti-inflammatory Cytokines IL-35 in Allergic Asthma and H. pylori Infected Patients

1Department of Biology, College of Science, AL-Mustansiriya University, Iraq; 2Allergy Centre, Baghdad, Iraq

ABSTRACT

Background: IL-35 is an inhibitory cytokine, produced by Treg cells, smooth muscle cells, monocytes and vascular endothelial cells and has multiple functions to produce various phenotypic features. The aim of current study was to investigate the role of serum IL-35 concentration and other clinical parameters in allergic asthma patients and the role of treatment with corticosteroids on IL-35 concentration. Patients and methods: Clinical samples were obtained with informed consent from 54 allergic asthma patients (32 with treatment and 22 without treatment), 14 patients with Helicobacter pylori (H. pylori) infection and 22 healthy controls. The serum IL-35 has been detected according to the manufacturer’s instruction with commercial human IL-35 ELISA Kit (My biosource, USA). Results: The mean concentration of plasma IL-35 in allergic asthma patients with treatment, allergic asthma patients without treatment, healthy control, and H. pylori patients, were 35.34, 71.4, 94.5 and 68.1 pg/ml, respectively, and the highest concentrations were 104.62, 310.3, 241.3, and 229.1 pg/ml, the lowest concentrations were 9.10, 11.6, 29.1, and 19.3 pg/ml, respectively, and no significant correlations were found between IL-35 levels and total serum IgE levels, white blood cell count, and the percentage of eosinophils count in two groups of patients. Conclusion: This study supported previous studies in that serum IL-35 level is reduced in allergic asthma patients.

Keywords: H. pylori, allergic asthma, interleukin-35, eosinophils, correlation.

Introduction

Interleukin (IL)-35 is a member of interleukin 12 family (which consists of IL-12, IL-23, IL-27 and IL-35). They participate in receptor and ligand chains and functions that due to the expression of different cell types and different receptor chains [1]. IL-35 was known as a regulatory cytokine, anti-inflammatory and immuno-suppressive cytokine [2]. It has the ability to induce the response against inflammatory stimuli which leads to suppressing the inflammation and make balancing in the immune response [3]. The mechanisms of allergic asthma involve activation of innate immune system through Toll-like receptors and Th2 pathways and release of Th2 cytokines. Also, Th17 cells or macrophages produce IL-17 that promotes infiltration of neutrophils into the lung and contributes in the development of allergic asthma [4]. Moreover, it acts synergistically with Th2 cytokines to promote airways hyperresponsiveness, then Tregs secrete IL-35 which in turn suppresses Th1, Th2, and Th17 effector responses to control the inflammatory responses by reducing or suppressing airway hyperresponsiveness and inflammation. The immune response involves various mechanisms in H.pylori infection that includes both innate and adaptive immune responses and the latter includes humoral and cellular immune responses which lead to inflammatory as well as anti-inflammatory responses that permit for a continuation of many H. Pylori infections [5,6]. It plays a role in host immunity by activation of T- helper (Th) cell subsets (Th1, Th2, Th17, and T regulatory (Treg) cells). Th1 and Th17 are responsible for pathogenic and protective effects, while Th2 and Treg are responsible for anti-inflammatory effects [7]. Many studies indicated an association between H. pylori and asthma [8-10].

The aim of current study was to investigate the role of serum IL-35 concentration and other clinical
parameters in allergic asthma patients and the role of treatment with corticosteroids on IL-35 concentration.

Material and Method

All patients had been diagnosed by a physician, and clinical samples were obtained with informed consent from 54 AAPs, 32 of them on corticosteroids treatment (AAPsT) and 22 without corticosteroids treatment (AAPsOT). Also, the study involved 14 patients with *H. pylori* infection and 22 healthy controls (HC). After collection of blood samples, serum was separated by centrifugation and stored at −20°C in Eppendorf tubes till analysis was done. For each subject, pulmonary function test was measured by computerized Spirometry (SPIROLAB COLOUR SPIROMETER, Roma-Italy) according to American Thoracic Society. The serum IL35 has been detected according to the manufacturer’s instruction with commercial human IL-35 ELISA Kit, My Biosource, USA.

In addition, serum total IgE was detected by total IgE ELISA Kit, Euroimmun, Germany.

The prevalence of *H. pylori* was detected according to the *H. pylori* (IgA) ELISA Kit, Euroimmun, Germany.

Total and differential WBC counts were performed CELL-DYN Ruby Auto-analyzer.

The Body mass index was calculated for study subjects from their weights and heights; [weight/kg/(height/m)²].

Statistical Analysis: Parametric data were analysed using ANOVA test to find any differences between the groups and the correlation between study variables was explored using Pearson’s bivariate test (Minitab version 13).

Non-parametric data were expressed as percentages of the total and compared using chi-squared test.

For statistical significance, a P value <0.05 was considered statistically significant, while a P value <0.01 was considered highly significant.

Results

Table 1 displayed the general characteristics of the studied groups as mean ± SD values. Significant differences were found among the study groups for FEV1, FVC, FEV1/FVC, serum total IgE concentration, total count of WBCs and eosinophils percentage (Table1).

There was an inverse relation between *H. pylori* and asthma (Table 1) as there was reduced prevalence of *H. pylori* in tow asthma patient groups compared with controls.

Further statistical analysis was done to investigate the effect of H. pylori infection on the concentration of IL-35 (Table 3). There were significant differences between control group and each of the AAPsT and positive H. pylori groups, AAPsT and negative H. pylori patients, AAPsOT and negative H. pylori groups, AAPsT negative H. pylori groups, and AAPsOT and positive H. pylori groups.

**Discussion**

It has been shown that in patients with allergic asthma, serum levels of IL-35 were decreased compared with healthy controls, and no significant correlations were found between IL-35 levels and total serum IgE levels, white blood cell count, and the percentage of eosinophils count in two groups of patients.

Allergic asthma is an inflammation caused by the innate and adaptive responses and mediated by Dendritic cells and IgE antibodies, then dendritic cells which present antigens through MHC II to T- and B-lymphocytes [11-13], which lead to the release of mediators, including prostaglandins, histamine, cytokines, leukotrienes, and chemokines [13,14].

These mediators cause contraction of airway muscle cells which lead to attracting inflammatory cells like eosinophils, macrophages, neutrophils. Th2 induce IgE production by B cells due to cytokines secretion [13], and allergy includes the Treg and Th1 responses to suppress Th2 activity in atopy [15], and expansion of Th2 cells and Th17 cells which act synergistically with Th2 cytokines to promote airway hyperresponsiveness, then Tregs secrete IL-35 which in turn suppresses Th1, Th2 and Th17 effector responses to control the inflammatory responses by reducing or suppressing airway hyperresponsiveness and inflammation.

After the encounter of challenges such as infections from certain pathogens, the key role for restoring immune system homeostasis is regulatory T cells. IL-35 is the essential mediator of T cell function and [16] were the first to conclude that, in a mouse model, *H. pylori* infection is protective against allergic asthma. In addition, there are many studies demonstrated that *H. pylori* infection induces Treg, Th1 and Th17 responses in both humans and mouse models [17-19], while IL-35 increases the differentiation and proliferation of Treg cells and inhibits the differentiation of Th1 and Th17 cells [20].

Our result agreed with many studies that reported a decrease in serum concentrations of IL-35 in asthmatic patients in comparison with healthy controls [22-23] and the previous studies showed that they were inversely related to asthma.

However, [23] found that the concentration of IL-35 slightly decreased in allergic asthma patients in comparison with healthy controls [23], which indicated that IL-35 had markedly reduced the degree of airway hyperresponsiveness and inflammatory cells infiltration [24].

Although *H. pylori* inhabits the overlying mucus and gastric epithelial cell surfaces, little amount of *H. pylori* enters host immune cells and epithelial cells and it is considered an intracellular bacteria. In addition, due to the expression of virulence genes, such as vacA and cagA, antimicrobial therapy often fails to eradicate *H. pylori* infection, therefore, reinforces the importance of using antibiotics that achieve high intracellular concentrations [25].

In addition, by using transmission electron microscopy (TEM) and Time-lapsed scanning electron microscopy (SEM), it was possible to demonstrate that *H. pylori* survives within immunocytes and epithelial cells [26].

In *H. pylori* patients, the IL-35 levels were lower than healthy controls, but not statistically significant (P>0 .05) and this agreed with [27], but there were different studies which revealed that the concentration of IL-12 differs and depends on the component of two cytotoxins of *H. pylori* [28,29].

**Conclusion**

This study supported previous studies in that serum IL-35 level is reduced in allergic asthma patients.

**Ethical Clearance:** The study was approved by the Research Ethics Committee at College of science, Mustansiriyah University, Iraq.

Association of Arginase I Gene Polymorphism with the Risk of Atherosclerosis in a Sample of Iraqi Patients

Suhad A. Ibrahim¹, Hameed M. Jasim², Jwan A. Zainulabdeen¹
¹College of Sciences, University of Baghdad, Iraq; ²College of Biotechnology, Al-Nahrain University, Iraq

ABSTRACT

Background: Arginase is one of the enzymes that play an important role in atherosclerosis because of its complicated function in vascular cells. This study was aimed at determining the relationship between genetic polymorphism in three loci in arginase I gene and the incidence of atherosclerosis in a sample of Iraqi patients with an emphasis on the most common SNPs associated with atherosclerosis; rs 2781666, rs 2781668 and rs 60389358.

Method: Reliaprep™ Blood gDNA Miniprep System/Promega (USA) was used to extract total genomic DNA from blood samples. The amplification products for ARG I gene were sequenced and data were analyzed by the National Center for Biotechnology Information/single-nucleotide polymorphism (SNP; http://www.ncbi.nlm.nih.gov/SNP).

Results: Data showed that the genotype distribution of rs2781666 G>T was significant (P<0.01) in atherosclerosis patients who underwent percutaneous coronary intervention (PCI) compared to healthy controls as the occurrence of GT heterozygous in those patients was higher than in healthy controls. On the hand, these heterozygous alleles in patients who underwent diagnostic catheterization were not significantly different compared to healthy controls. Meanwhile, homozygous polymorphic alleles TT in PCI patients were significantly different (P<0.01) compared to healthy controls. Results also showed that rs 2781668 C>T SNP was not associated with the incidence of atherosclerosis in patients groups, PCI and DIG, compared to healthy controls. Also, heterozygous CT SNP for rs 60389358 in DIG patients was significantly different (P<0.01) compared to healthy controls.

Conclusion: Our finding suggested that genetic variations in ARG I may predispose subjects to T2DM, but not to atherosclerosis. This finding reinforces our interest in studies focusing on the role ARG I in different diseases.

Keywords: Atherosclerosis, arginase1 gene, SNP (rs2781666, rs2781668 and rs60389358), T2DM, alleles.

Introduction

Genetic factors are involved in the occurrence of atherosclerosis which is one of the most common health problems and causes mortality worldwide. Atherosclerosis occurrence increases with age in the vast majority of the population [1]. In the past, many risk factors have been identified, including hyperlipidemia, hypercholesterolemia, physical inactivity, smoking, hypertension and genetic pre-disposition [2]. Because of the functional contribution of genomics to research, it has been estimated that the incidence of coronary heart disease ranges from 20%-60% [3]. Considering the impact of atherosclerosis, it is fundamental to establish the genetic basis and to understand the pathophysiology of this disease. The available data support the role of arginase I (ARG I) located on 6q23 in the initiation, growth, and complications of coronary heart disease [4]. Notwithstanding hepatocytes, the gene encoding ARG I appeared to be expressed in different types of vascular cells, such as vascular smooth muscle cells, endothelial cells, and macrophages. It has been suggested that the overexpression of ARG I can be harmful through its contribution to the endothelial dysfunction observed in cases of vascular disorders including atherosclerosis [5].
This effect has been connected, to some degree, to the competition between endothelial nitric oxide synthase and \( \text{ARG I} \) for their shared substrate, L-arginine \(^6\). In many populations, the rare allele of the \( \text{ARG I} \), rs-2781666 G/T single nucleotide polymorphism located within the promoter of the gene, has been linked to an increased incidence of myocardial infarction (MI) \(^7\). In this study, we investigated the relationship between \( \text{ARG I} \), rs 2781666, rs 2781668 and rs 60389358 SNPs in Iraqi patients who had atherosclerosis and underwent diagnostic (DIG) and percutaneous coronary intervention (PCI) catheterization.

**Materials and Method**

**Blood Samples:** Blood samples were collected from atherosclerosis patients who visited the Department of Clinical Chemistry/Coronary Care and Catheterization Unit at Ibn Al-Nafees and AL- Sheikh Zayed Hospitals in Baghdad Governorate, Iraq. Patients were 64 men and 64 women who underwent percutaneous coronary intervention and diagnostic catheterization, as well as 64 healthy controls, during the period from June 2017 until January 2018. The study protocol was approved by the Research Ethics Committee at the College of Sciences/University of Baghdad.

**Genomic DNA Extraction:** Reliaprep™ Blood gDNA Miniprep System/Promega (USA) was used to extract total genomic DNA from blood samples.

**Amplification of \( \text{ARG I} \) gene:** A working solution of two primers indicated in Table (1) was prepared by mixing 90\(\mu\)l of deionized distilled water with 10\(\mu\)l of stock primers solution (100\(\mu\m)) in order to obtain a final concentration of 10pmol/\(\mu\)l. These primers SNPs supplied by Alpha DNA/Promega (USA) were selected for amplification rs 2781666 and 60389358 in 5′ promoter region and rs 2781668 in Intron I.

The amplification program was done by initial denaturation for one cycle at 94°C for 1min, denaturation and annealing for forty cycles at 94°C for 30sec., then extension for forty cycles for 1min at 72°C and a final extension for one cycle for 1min at 72°C.

**Single-nucleotide polymorphism selection and genotyping:** The amplification products for \( \text{ARG I} \) gene were sequenced and data were analyzed by the National Center for Biotechnology Information/single-nucleotide polymorphism (SNP; http://www.ncbi.nlm.nih.gov/SNP).

**Statistical Analysis:** Genotype and allele distributions were compared among the three groups using one-way analysis of variance (ANOVA) from SPSS version 23.0 (SPSS Inc. Chicago, IL, USA). The Hardy–Weinberg equilibrium (HWE) test was used to assess the consistency of genotypic distribution in controls. A two-tailed \( P < 0.05 \) was considered significant. This study used the Student \( t \)-test to determine significance when comparing between percentages through the SAS program (SAS, 2012).

**Results and Discussion**

Genomic DNA was first extracted from blood samples of subjects. The concentrations of DNA solutions ranged between 70-85ng/\(\mu\)l, while the purity ranged between 1.6-2.0ng/\(\mu\)l. The purity and concentrations of DNA solutions were appropriate and highly recommended for more genetic analysis using Polymerase chain reaction (PCR) \(^8\). PCR was used to amplify the promoter regions (rs 2781666) (rs 60389358) and Intron 1 (rs 2781668) of \( \text{ARGI} \) under optimum amplification conditions. Results were illustrated in Figure 1 which showed the amplified products with a molecular size of 331bp and 538bp for the promoter and Intron 1 regions in \( \text{ARG I} \), respectively, for healthy controls and atherosclerosis patients who underwent diagnostic catheterization (DIG) and percutaneous coronary intervention catheterization (PCI).
Nucleotide sequence alignment of two amplified regions in \emph{ARG I}: Arginase is known to contribute directly to atherosclerosis progression and to counteract the beneficial effects of nitric oxide. In the present study, single nucleotide polymorphisms in \emph{ARG I} were detected. The rs 2781666 G/T located within the promoter sequence of several ethnic populations has been reported to be associated with myocardial infarction (MI) which is caused by atherosclerosis \cite{10}. Ethnic background is known to influence polymorphism frequencies and their effects on the disease. This study’s results showed a significant and consistent association of \emph{ARG I} that was restricted to the rs 2781666 SNP in Iraqi patients (Table 2). The results indicated that this site of polymorphism was highly significant (P<0.001) in patients who underwent percutaneous coronary intervention catheterization (PCI) compared with healthy controls as the occurrence of GT heterozygous in those patients was higher than in healthy controls. However, heterozygous alleles in patients underwent diagnostic catheterization were not significantly different from healthy controls. On the other hand, homozygous polymorphic alleles TT in PCI patients, but not in DIG patients, were significantly different (P<0.01) compared to healthy controls. The nucleotide sequence of \emph{ARG I} illustrated in Figure (2) showed the complete nucleotide sequence of promoter region in PCI and DIG patients and the position of the expected rs2781666 SNP associated with the incidence of atherosclerosis. This sequence was identical to the reference sequence of \emph{ARG I} promoter region of the same gene recorded in NCBI, except for the position of polymorphism (G/T).

Meanwhile, the results of the nucleotide sequence for promoter sequence of \emph{ARG I} in Iraqi patients, as indicated in Table (2), showed that (29.03\%) of patients are genotyped as homozygous GG non-polymorphic in patients underwent PCI as compared to healthy controls (25.00\%). These results may be related to the deleterious effect of \emph{ARG I} overexpression, at least in endothelial cells, as the rs2781666 polymorphism is located in the promoter region of the gene and it might modify \emph{ARG I} expression\cite{11-12}.

### Table 2: Distribution of GG rs2781666 polymorphism and allele frequency for all patients and healthy controls

PCI: Percutaneous coronary intervention Catheterization. DIG: Diagnostic catheterization. *: P<0.05. **: P<0.01.

On the other hand, the results mentioned in Table 2 showed that (61.29\%) and (9.67\%) of Iraqi patients who underwent PCI catheterization were genotyped as polymorphic heterozygous (GT) and homozygous (TT), respectively, were positive for rs 2781666 SNP, as guanine nucleotide was substituted by thymine.
Figure 2: Nucleotide sequence for 5' promoter sequence of ARG I in healthy controls group. Red square indicates the position of expected SNP (rs2781666) in PCI and DIG patients. Query represents patients’ samples. Subject represents database of National Center for Biotechnology Information (NCBI).

Furthermore, the results (Table 2) showed that (38.46%) and (38.46%) of Iraqi patients who underwent DIG catheterization were genotyped as polymorphic heterozygous (GT) and homozygous (TT), respectively, and were positive for rs 2781666 SNP compared with healthy controls. The use of SNP-based disease-susceptibility tests tend to be clinically justified because the disease categories covered include more common disorders that represent greater socio-economic burdens to the health care system [13].

The relationship between the rs2781668 polymorphism in Intron I and atherosclerosis in Iraqi patients was also investigated. Results (Table 3) showed that the rs2781668 C/T polymorphism had decreased significantly in PCI patients and diagnostic (DIG) when compared with healthy controls.

On the other hand, results of polymorphism and allele frequency for rs 2781668 Intron 1 sequence of ARG I in Iraqi patients (Table 3) showed that (80.76%) of PCI patients were genotyped as homozygous (CC) compared with healthy controls, while (19.23%) of Iraqi patients underwent PCI catheterization were genotyped as polymorphic heterozygous (CT) and were positive for rs 2781668 SNP, as cytosine nucleotide was substituted by thymine. Results also showed that (72.72%) of DIG patients were genotyped as homozygous (CC) compared with healthy controls. In addition, (27.27%) of Iraqi patients underwent DIG catheterization were genotyped as polymorphic heterozygous (CT) and were positive for rs 2781668 SNP. These results were observed in other ethnic populations such as some French populations; whereas the genetic polymorphism rs2781668 in ARG I may be a predisposition for MI [14]. The genotype distributions in both patient groups, who underwent PCI and DIG catheterization as well as controls, were conducted in Hardy-Weinberg equilibrium for ARGI gene polymorphisms.

*: P<0.05. **: P<0.01. NS: Non-Significant.

During the present study, other SNPs were investigated in promoter region rs 60389358 with highly significant difference (P<0.001) in atherosclerosis patients who underwent PCI and patients underwent DIG catheterization,
when compared with healthy controls. The nucleotide sequence of \textit{ARG I} promoter region was determined for genotyping the genetic polymorphism in this region. Results illustrated in Figure (3) showed the nucleotide sequence alignment of this region in healthy controls and the position of the expected rs60389358 SNP which is considered to be associated with the incidence of type 2 diabetes mellitus (T2DM) in patients who underwent DIG catheterization, but this SNP is considered not to be associated and not related with incidence of atherosclerosis in T2DM patients who underwent PCI catheterization.

![Figure 4: Nucleotide sequence for 5’ promoter sequence of \textit{ARG I} in healthy controls group. Red square indicates the position of expected SNP (rs 60389358) in PCI and DIG patients. Query represents patients’ samples. Subject represents database of National Center for Biotechnology Information (NCBI).](image)

Results indicated in Table (4) showed that (74.19%) and (53.84%) of patients underwent PCI and DIG, respectively, were genotyped as homozygous (CC) polymorphic compared with healthy controls. Results indicated in Table (4) also showed that (25.80%) and (46.15%) of Iraqi patients who underwent PCI and DIG catheterization, respectively, were genotyped as polymorphic heterozygous (CT) and were positive for rs 60389358 SNP, as cytosine nucleotide was substituted by thymine with a highly significant difference (P<0.01) in comparison with healthy controls. These results may be related to the deleterious effect of \textit{ARG I} over expression as mentioned in other studies \cite{11, 12}. Because the disease categories covered include more common disorders which represent greater socio-economic burdens to the health care system, the use of SNP-based disease-susceptibility tests tend to be clinically justified \cite{13}.

**: P<0.01. NS: Non-Significant.

It is important to mention that this study was the first to investigate the role of rs 2781666 G/T, rs2781668 C/T and rs 60389358C/T polymorphism of ARG \textit{I} gene in susceptibility to atherosclerosis and T2DM in Iraqi patients underwent PCI and DIG catheterization. This study found an excess of GT genotype for rs 2781666 variant among PCI catheterization compared with control group, and an excess of TT genotype for those SNPs variant among DIG catheterization patients compared with control group. Multivariate analysis showed that this association was independent of other factors related to vascular disease risk. Some previous studies on other populations and/or sub-populations showed similar results to ours such as the study of \cite{14}, who suggested concordant results of significant association between variant genotype/allele at rs 2781666 and MI.
Conclusion

Our findings suggested that there is significant association between \textit{ARG I} rs2781666 (G/T) heterozygous SNP and atherosclerosis patients with T2DM, who underwent PCI catheterization. Also, there is significant association between (T/T) as well as rs 60389358 (C/T) and patients with T2DM who underwent DIG catheterization, yet they did not have atherosclerosis. Meanwhile, this study found that rs2781668 (C/T) SNP was a functional mutation, yet not associated with the disease of polymorphism and atherosclerosis in Iraqi population.

REFERENCE

Study of the Association between Prolidase Enzyme Kinetics and Severity of Asthma in Children

Seham A. Muhsen¹, Hassan H. AL-Saeed¹, Areej Abdul Abass ALOmrani²

¹Chemistry and Biochemistry Department, ²Department of Pediatrics, College of Medicine, Al- Nahrain University, Baghdda, Iraq

ABSTRACT

Background: Asthma is a perpetual provocative sickness comprising a mix of natural and hereditary factors. The catalyst prolidase assumes an imperative part in the breakdown of collagen, the breakdown of intracellular protein particularly in the last stage when peptides and dipeptides contain an abnormal state of proline. The aim of current study was to estimate prolidase enzyme levels in serum, plasma and hemolysate of asthmatic children and their healthy control.

Material and Method: A case–control study included two groups; the first group consisted of (80) asthmatic children aged 1-13 years. The second group contained 30 children as control. Enzyme activity was measured using spectrophotometry.

Result: The serum levels of prolidase enzyme showed significant decrease in asthmatic children group in comparison with control group (P<0.001). Also, serum levels of prolidase enzyme were significantly decreased with increasing severity of asthma in patients subgroups (P<0.001).

Conclusions: Spectrophotometer method is a simple and good method for determination of prolidase enzyme activity in patients with asthma.

Keywords: Prolidase, enzyme activity, spectrophotometry, asthmatic children, AUC, sensitivity, specificity.

Introduction

Asthma is a perpetual provocative sickness of the aviation routes [1]. It is a mix of natural and hereditary factors [2]. The catalyst prolidase assumes an imperative part in the breakdown of collagen [3]. Prolidase (EC3.4.13.9) is a cytosolic manganese-subordinate homodimeric iminodipeptidase [4]. Prolidase is the main human compound in charge of the absorption of iminodipeptides containing proline or hydroxyproline at their C-terminal end [5]. Prolidase deficiency (PD) is an uncommon hereditary issue [6]. Lack of prolidase prompts an uncommon [7]. The created three recombinant prolidase frames, hRecProl-231delY, hRecProl-E412K and hRecProl-G448R [8]. Anomalous prolidase action has been portrayed in numerous disarranges [9]. The indications are caused by the diminishment or loss of prolidase movement because of changes in the peptidase quality situated in chromosome 19q13.11 [10].

The aim of current study was to

Material and Method

A case–control study was executed during the term from March–July 2018. This study included two groups; the first group consisted of (80) asthmatic children aged 1-13 years, 41 of them aged 1-4 years and 39 aged 5-13 years. This group was divided according to severity of asthma into four subgroups. The second group contained 30 children as controls. The study was conducted at AL-Emamain AL-Kademain Teaching Medical City and AL-Kadhimiya Hospital for Children, Baghdad, Iraq.

Preparation of plasma and erythrocyte hemolysate:
Peripheral blood samples (3ml) from case and control
subjects were collected in heparinized tubes. The supernatant was collected which represents plasma and washed the precipitate twice with two volumes of PBS, hemolyzed with four volumes of ice-cold water and two cycles of freezing and thawing.

The amount of hemoglobin was determined by spectrophotometric measurement [11]. Samples were diluted 1:2 with 50mmol/l Tris–HCl; pH7.8. Plasma and erythrocyte hemolysate were stored at -20°C until used.

**Measurement of Prolidase:** Prolidase concentration was measured by (ELISA) in serum, plasma and erythrocyte hemolysate. Prolidase activity was determined optimizing and unifying all the various modifications by spectrophotometric measurements activity from blood [12]. Measurements were performed at 515nm. Kinetic analysis of prolidase was performed with different concentrations of the Gly-Pro substrate from 0 to 0.1mol/l (1×10^{-2}, 2 × 10^{-2}, 4 × 10^{-2}, 6 × 10^{-2}, 8 × 10^{-2}, 1×10^{-3}mol/l) [11].

Michaelis-Menten equation and Line weaver-Burke plot were used to obtain the Km. The kinetic parameters Vmax (μmol Pro min⁻¹ mg⁻¹), Km (mM) was determined with the Enzyme Kinetic.

**Result**

**Determination of the levels of serum prolidase in asthmatic children and controls and the levels of prolidase among the four subgroups:** The distribution of serum prolidase levels in asthmatic and control children was shown in Figures (3).

![Figure 3: Serum prolidase distribution in asthmatic and control children](image)

Serum levels of prolidase were significantly decreased with increasing severity of asthma in patients’ subgroups (P 0.001; Figure 4).

**Determination of serum levels of prolidase in asthmatic children aged <5 years and their healthy controls:** Serum levels of prolidase were measured for each child aged <5 years participated in this study and the results showed significant decrease of serum prolidase levels in asthmatic children group in comparison with control group (P<0.001; Table 1).
Moreover, serum levels of prolidase had significantly decreased with an increasing severity of asthma in children aged <5 years (P 0.001; Table 2).

Defining the normal ranges (cut-off values)

**Defining normal range (cutoff value) of prolidase in sera of children with asthma:** The (ROC) curve showed significant discriminating ability of decreased serum prolidase as shown in Figure (5).
Defining the normal range (cut-off value) of prolidase in erythrohemolysate of asthmatic children: The (ROC) curve showed significant discriminating ability of decreased prolidase in erythrohemolysate as shown in Figure (6).

Kinetic studies for determination of prolidase activity in plasma and erythrohemolysate of asthmatic children: Kinetic studies were used for determination of prolidase activity and to obtain the Michaelis constant ($k_m$) and maximum velocity ($V_{max}$) in plasma and erythrohemolysate of asthmatic children compared with their controls using spectrophotometric method.

The results showed a decrease in $k_m$ and $V_{max}$ values in asthmatic children compared with control in both plasma and erythrohemolysate as shown in table (6).

Discussion

More grounded genetic part [14], environmental and others might be all exposures [15,16]. To achieve a good control of asthma, we have to minimize symptoms burden and risk of exacerbations. Pharmacological treatment is based on a cycle of assessments [17].

There was significantly decreased serum prolidase levels in asthmatic children group in comparison with control group (P<0.001). Also, serum levels of prolidase were significantly decreased with the increasing severity of asthma (P<0.001). These results agreed with the study done by [18].

The levels of prolidase were studied according to age in asthmatics compared with controls and according to the four asthmatic children subgroups. The results of current study for the serum levels of prolidase were measured for each children aged <5 years participated in this study. Unpaired test showed significantly decreased serum prolidase levels of asthmatic children group in comparison with control group (P<0.001). These findings agreed with study done by [12]. These results indicated that serum prolidase levels were significantly decreased with increased severity in asthmatic children, and this agreed with the study done by [19].

Serum levels in this study had significantly decreased with an increasing severity of asthma at this age groups (P<0.001) using ANOVA test, these result indicated that serum prolidase was significantly decreased with increased severity in asthmatic children. This agreed with the study of [20].

Serum levels of prolidase showed no significant differences according to gender in control group, however, significantly higher levels in sera of boys than girls reported by [21]. Some studies showed that asthma is a chronic inflammatory airway disease that has a higher prevalence in boys than in girls before puberty and a higher prevalence in women than in men in adulthood [22].

The levels of prolidase in plasma and erythrocytes were measured for asthmatic patients and controls. Unpaired $t$-test showed a significantly decrease of plasma and erythrocytes prolidase levels of asthmatic children group in comparison with control group (P<0.001). These results agreed with studies done by [1,23].

Current study concluded that the cut-off value of serum prolidase in asthmatic children when the serum prolidase concentration of 1.18 was used as cut-off value for this marker in asthmatic patients, the sensitivity was 90.0% and specificity was 92.5%. The (ROC) curve showed a significant discriminating ability of decreased serum prolidase. The element we have measured and assessed was the area under the ROC curve (AUC) [27] as the result showed that it may be possible to consider the test of prolidase enzyme sensitivity and specificity as a good biomarker. These findings agreed with study done by [20]. When the serum prolidase concentration of 1.25 was used as cut-off value for this marker in asthmatic patients, the sensitivity was 90.0% and specificity was 90%. Increased prolidase activity was associated with severity of bronchial asthma [12]. Prolidase in humans is essential for maintenance, rebuilding and degradation of collagen-containing connective tissue [13].

Currently, there is no standard protocol to evaluate the human prolidase activity. Kinetic studies were used for determination of prolidase activity and to obtain the Michaelis constant ($K_m$) and maximum velocity ($V_{max}$) using spectrophotometric method [26].

Kinetic studies were applied to obtain, and to accurately determine, the maximum activity for the recombinant enzyme. Results revealed that $V_{max}$ in plasma (8.55x10$^2$, 5.53x10$^2$) μmol Pro min$^{-1}$ mg$^{-1}$ as control, test and $V_{max}$ in erythrohemolysate...
The present data showed that the maximum amount of substrate hydrolyzed was achieved by activating the enzyme with 1 mmol/l MnCl₂ and 0.75 mmol/l GSH at 50°C for 20 min before incubation with the substrate (Gly-Pro) that was also performed at 50°C for 20 min [12,28].

Conclusions

Spectrophotometer method is a simple and good method for determination of the activity of prolidase enzyme in patients with asthma.

ABSTRACT

This study was carried out on semen of adult twenty four (eight Awasi, eight karadi and eight Arabi) rams, semen was collected by means of artificial vagina. Once weekly for one year period, the study included season variations in semen quality. The volume, percentage of sperm motility, concentration rate, live percentage was high in Awasi in spring, and low abnormalities from Arabi and karadi breeds. The spring was the best season in high quality of semen in three breeds.

Testosterone was high in blood plasma of Awasi rams. Moreover, Awasi had the highest AST enzyme concentration (6.7 IU/L). From these results we show that semen characteristics was highest in Awasi in spring in different regions of Iraq (north, medium and south).

Keywords: Physiological of ram semen, Awassi, Seasons, Testosterone, Enzyme.

Introduction

Environmental factors affect living organisms, as plant, humans and animals also it has an effect on the physiological reproduction of animals. In our research we discussed effect of temperature on sheep breeds at four seasons1.

Animal resources is one of the main economic sources in Iraq for agricultural sector since it increases the national income and improve economic development and affect breed sheep and nutrition on the quality of ram semen2, also semen is affected by environmental factors as light in day which vary by season because pineal gland is affected with secretion of melatonin that affects hypothalamus to secret hormones that cause the pituitary gland to secret FSH & LH Hormones3.

Sheep are considered one of the most animals resistant to heat as they have the ability to lose heat by tolerance and radiation to get rid of excess body temperature but increase of temperature in summer that may reach (46-52°C) sheep can’t get rid of high temperature so increase heat tolerance and those all vital physiological activities are affected including reproduction4.

This study aims to know the effect of heat as an environmental factor on three breeds of Iraqi sheep in three different areas with different climate as Sulaymaniyah, Wasit and AlBasrah by analysis semen physical characteristics, testosterone and sperm plasma enzyme concentration.

Materials and Method

This study was performed in three Iraqi governments (AlBasra, Al-Kut and Al-Sulaymaniyah) from (1/9/2017 to 1/9/2018) including 24 adult rams divided into three groups (8 Awasi rams, 8 Arabi Rams and 8 Karadi Rams) their ages was between 2.6 - 3.6 years old and similar weight with no anomalies and no diseases.

The experiment was done to study effect of heat on semen physical characteristics Sheeps were trained one month ago by collection of semen by using artificial vagina of sheeps. During the experiment semen was
collected once weekly (4 times monthly), each time we evaluate the physical characteristics of semen of each Ram then semen of 8 Rams is mixed together then semen plasma is separated by centrifugation (3000 rpm/10min) to analyze enzyme.

Testosterone in blood serum and semen plasma enzyme (AST) monthly in each season and in three governments (AlBasra, Al-Kut and Al-Sulaymaniyah) each group (8 Rams) in barn after all examinations for checkup from diseases. Nutrition of sheeps depend on concentrated bullet with 17% protein concentration 1 kg/sheep with green leaves, hay and clean water. The first group was in Al Basrah (Arabi bread), second group in Wasit (Awasi bread) and third group in Sulaymania (Karadi group).

We evaluate semen directly after collection in tube to measure ejaculation volume then volume is recorded, then we calculate the mass motility by7 method by taking a drop of semen and it on a warm slide whose temperature is 37°C then examined by microscope magnification power x 100, while the concentration of sperms we used improved neubauer haemocyromerer chamber which was applied by7 equation to calculate concentration of sperms in cubic centimeter.

Number of sperms/cm² = (Number of sperms in 5squeres/80)x400x200x10x1000

We also calculated percentage of live and dead sperms, we used afresh drop of semen then put it on a clean warm slide whose temperature is 37°C after that we put 5% eisoin stain and 10% negrosin stain to be mixed with the drop of semen for 10 seconds then take a smear to put on another slide to be examined by microscope with magnification power x400 then calculate 100 sperms and calculate live and dead ones live sperm ratio = ( number of live sperms/100)x 100, while ratio of abnormal sperms was calculated, we put a drop of semen on a slide then we added 2 drops of methyl alcohol (97%) for 2 minutes to kill sperms, then we put it on slide by adding fast green stain to be mixed and leave it to dry also we add oil drop on the slide to be examined by microscope with oil focus6.

Percentage of abnormal sperms= (number of abnormal sperms/100) x 100.

To evaluate concentration of testosterone we took 5ml blood by puncture jugular vein twice each month (six in every season) from each sheep to be inserted in a test tube containing anticoagulant (EDTA) then we used centrifugation to separate plasma at speed rate 3500 rpm/min for 15 minutes then plasma was conserved in frozen at (-20°C) for hormonal analyses by ELFA (Enzyme Linked Flourescent Assay) by using kits manufactured by BioMerieux. In order to get seminal plasma we put mixed semen from sheeps in 5ml test tube afterwards we centrihge for 15 minutes at speed rate 3500 rpm/min. Then plasma was obtained by pipette to be frozen at (-20°C) to measure the enzymes by7,a to measure enzyme (AST)9. The statistical analysis system program was used to identify effect of difference factors in study parameters. The outcome quantitative variables were normally distributed, and conveniently described by mean SE and tested for statistical significance by ANOVA test with least significant difference (LSD). P value less than the 0.05 level of significance were considered statistically significant9.

Results and Discussion

Table(1) shows significant difference (P<0.05) in ejaculation volume between three breads and the overall mean was the highest among Awassi sheep (1.05 ± 0.11 ml) then karadi (0.90 ± 0.18 ml) then Arabi (0.74 ± 0.31 mL) from these results we conclude that Awassi sheep has the highest ejaculation volume.

Difference in ejaculation volume among these breads is due to different hereditary factors. This approves10 in his study on national Iraqi goat and crossbreed results agree with1 while 11 didn’t find significant difference between karadi and Arabi breeds.

Values bearing different superscript differ significantly (P<0.05)

A,B,C letters difference between seasons in significant (p<0.05).

a,b,c. letters difference between breeds in significant (p<0.05)
We found spring was the best season among seasons due to cool and warm weather then winter and autumn while in summer ejaculation volume was the least among breads, and the ejaculation volume in spring was (0.79, 1.02, 1.27 ml) for Awassi, karadi and Arabi respectively. The cause of difference in ejaculation volume is due to different temperature and humidity in these seasons which affects spermatogenesis and testis function as was concluded by\textsuperscript{12} that it increases during hot months compared to warm and cold month but our results were similar to results done by\textsuperscript{13} in his study on Finland sheeps but he noticed that spring was the best and autumn was the worst in ejaculation volume\textsuperscript{14,15} noticed that seasons has a significant difference in ejaculation volume among breeds in spring second the highest results for semen volume in autumn and winter, the least volume was in summer, because of the difference in the environmental factors\textsuperscript{14}.

Results showed significant increase in concentration of semen of Awassi sheep (P<0.05) compared to karadi and Arabi and overall mean of semen concentration of Awassi, Karadi and Arabi (2.78, 2.4m, and 2.27x10\textsuperscript{9} mL) respectively. The cause of difference is due to variety of hereditary factors of the breed this means Awassi is the best then karadi comes in the second place and finally comes the Arabi sheep according to concentration of sperms and this agree with\textsuperscript{16,17}.

Table (2) shows the percentage of sperm motility among Awassi is significantly the highest (P<0.05) then comes karadi and the last is Arabi (80.03, 74.35 and 69.75 %) respectively, the cause of variety is due to genetic factors of the breed which agree with\textsuperscript{20} also in the study\textsuperscript{21} showed that the percentage of sperm motility of Arabi sheep was the least compared to Negdi and cross breed sheeps in AlBasrah in months.

Values bearing different superscript differ significantly (p<0.05)

A,B,c. letters difference between seasons in significant (p<0.05).

a,b,c. letters difference between breeds in significant (p<0.05)

Sprin then winter, autumn and summer showed significant difference (P<0.05) characteristics by destroying sperm membrane so increase percentage of dead sperms as it affects sperm DNA\textsuperscript{22}.

Table (3) shows effect of breeds on live sperm percentage. The percentage of live sperms was (78.3%) among Awassi which was significantly higher than karadi (73.6%) than Arabi (70.35%) due to excellence genetic factors of Awassi sheep than Arabi and karadi.

</tbody>
</table>

A,B,C letters difference between seasons in significant (p<0.05).

a,b,c . letters difference between breeds in significant (p<0.05)

Also the difference in sperm motility is due to high testosterone level in seasons\textsuperscript{21} disagree with\textsuperscript{22} their results increase significantly in summer than other seasons due to different environmental temperature and humidity.

Table (4) shows significant increase of abnormal sperm percentage (P<0.05) among Arabi breed (22.38%) more than Awassi breed (17.53%) and karadi (20.18%) due to increase heat tolerance in different regions in Iraq as AlBasra where Arabi is dominant cold weather where karadi and cool weather as in Al-Kut the percentage is significantly less this means that the breed plays an
important role in percentage of abnormal sperms as shown in study\textsuperscript{23} as sperm membrane is destroyed so DNA is affected and percentage increases.

</tr>
</tbody>
</table>

A,B,C letters difference between seasons in significant (p<0.05).

Moreover spring is the best for least percentage of abnormal sperms among breeds then autumn comes in the second place then winter and summer.

The season has a significant effect (P<0.05) among breeds in concentration of testosterone, spring is the best season then comes autumn then winter and the worst concentration was recorded in summer due to the hot weather that affects the reproductive ability of the rams that depend on the activity of testes that secrete reproductive hormones\textsuperscript{25} our results agree with\textsuperscript{26} in their study about different breeds and differs with\textsuperscript{21} that found autumn and summer are better than spring and winter among Nagdi and cross breed sheep in Al Basra.

In Table (6) Alwassi Rams had the highest (AST) enzyme concentration was (6.7 IU/L) in plasma of semen of karadi sheep was (5.64 IU/L) and Arabi (4.98 IU/L) due to difference between breeds and their genetic properties of each breed [27\&28] in their study about sheep and male goats as spring was the best season.

Human Metapneumovirus in Patients with Respiratory Infection Negative for Influenza Virus (H1N1, H3N2, Influenza B)

Luma Ghaeb Al-Saadi1, Hadeel M Fayyadh2, Eman Natiq Naji3, Iman M Aufi4

1College of Science, Al-Mustansiriya University, 2College of Veterinary Medicine, University of Fallujah, 3College of Science, Al-Mustansiriya University, 4Central Public Health Laboratory, Ministry of Health, Baghdad, Iraq

ABSTRACT

Background: Human Metapneumovirus is a member of the family Pneumoviridae. It is the second most common cause, after human respiratory syncytial virus (RSV), for lower respiratory tract infection in young children. The aim of current study was to explore the infection rate of influenza viruses (H1N1, H3N2, influenza B) in patients with upper respiratory tract infection. Also, to investigate the percentage of HMPV in patients who were negative for (H1N1, H3N2, influenza B).

Patients and Method: This is a cross-sectional study conducted in Central Public Health Laboratory/Ministry of Health (MOH-CPHL), Baghdad, Iraq from May to December/2016 including 372 who had upper respiratory tract infection and they were diagnosed as having influenza viral infection (H1N1, H3N2, influenza B). One hundred patients of them, who were negative for influenza viruses, were randomly selected and tested for the presence of HMPV. Their age range was 1 month to 82 years. They were 163 (43.8%) males and 209 (56.1%) females. Molecular detection and determination of plasma viral DNA was achieved by Real Time quantitative PCR for all viruses. All data were statistically analyzed and P value <0.05 was considered significant.

Results: The results found that the highest rate of influenza viral infection was due to strain H1N1 (14.24%) followed by strain B (13.1%), while infection by strain H3N2 was the lowest rate (7.5%). HMPV was detected in 9.9% of patients who were negative for the influenza virus infection. HMPV infection was significantly higher among age group 1-11 months (P= 0.001). The male: female ratio was (1.8:1).

Conclusion: A part from influenza viral infection, infection by HMPV can occur separately and predominantly among male infants less than one year old.

Keywords: Human Metapneumovirus, Influenza virus, H1N1, H3N2, Influenza B, Respiratory infection.

Introduction

Human Metapneumovirus (HMPV) is a negative-sense single-stranded RNA virus of the family Pneumoviridae. It is closely related to the avian Metapneumovirus (AMPV) subgroup C [1]. It was isolated for the first time in 2001 in the Netherlands by using the PCR technique. It is the second most common cause, after human respiratory syncytial virus (RSV), of lower respiratory tract infection in young children [2]. HMPV isolates revealed morphological characteristics consistent with paramyxoviruses after being examined by electron microscope which revealed spherical enveloped particles with a mean diameter of 209nm [3].

HMPV is transmitted mainly through contact with infected respiratory secretions and it is associated with 6%-40% of respiratory tract infections in hospitalized and outpatient children. It is also documented as a significant cause of illness in transplant recipients and acute exacerbations of asthma in both children and adults. The peak age of hospitalization for infants with HMPV is between 6–12 months of age, slightly older than the peak of respiratory syncytial virus (RSV).
which is around 2–3 months \cite{4}. The clinical features and severity of HMPV are similar to those of RSV, including fever, cough, nasal congestion, rhinorrhea, dyspnea, hoarseness and wheezing. Besides, HMPV is an important cause of disease in older adults \cite{5}.

The HMPV epidemiology is distributed worldwide. In temperate regions, the seasonal distribution generally follows that of RSV and influenza virus during late winter and spring \cite{6}. In the northern hemisphere, the peak tends to be from January to March, while in the southern hemisphere, the peak is from June to July \cite{7,8}. The virus is difficult to be isolated on culture. Polymerase Chain Reaction (PCR) may be the preferred detection technique. So far, there is no vaccine for HMPV.

Patients and Method

This is a cross-sectional study conducted in Central Public Health Laboratory/Ministry of Health (MOH-CPHL) in Baghdad, Iraq from May to December/2016. Following the CDC influenza-like illness case definition (CDC, 2016), a total of 372 upper respiratory tract specimens were collected from hospitalized patients by local authorized and trained medical personal in twelve central Iraqi provinces. The age of participants ranged from 1 month to 82 years. They were 163 (43.8%) males and 209 (56.1%) females. Patients complained from some or all of the following symptoms; fever, chills, cough, sore throat, runny or stuffy nose, bronchial breathing, muscle or body aches, headache, wheeze, fatigue, sometimes associated with vomiting and diarrhea. Specimens were taken from the deep nostrils (nasal swab) and throat swab, then sent to the Central Public Health Laboratory (CPHL) in a cool sealed bag and were refrigerated at -70°C till use \cite{9}. All patients were diagnosed as having influenza viral infection (H1N1, H3N2 and Influenza B) by using Real time quantitative PCR.

One hundred patients of these, with negative results for influenza viral infection (H1N1, H3N2 and Influenza B), were randomly selected and tested for the presence of HMPV by Real time quantitative PCR.

RNA Extraction: Viral RNA was extracted from 140μl of original sample using QIA amp viral RNA mini-kit (QIAGEN®, Hilden, Germany) according to the manufactures instructions and then eluted using 60μl of elution buffer.

Real-time quantitative reverse transcription PCR (RT-qPCR): Real time quantitative PCR was performed using Ag Path-IDTM One Step RT-PCR Kit (Applied Biosystems) and according to the manufacturer’s instructions, with primers set and prob shown in Table (1) used for detection of HMPV. RT-qPCR was done using ABI Prism 7500 (Applied Biosystem). The reaction volume was 25μl. Thermocycler set up as follows:

- Reverse transcriptase at 45°C for 10min.
- Tag inhibitor activation at 95°C for 10min.
- PCR (denaturation at 95°C for 15 seconds, annealing and extension at 55°C for 1 minute) for 45 cycles.

We can see from Figure 1 that the distribution of HMPV infection among age groups in both genders was higher among infants aged less than 1 year.

Figure 2 revealed that the number of HMPV positive cases recorded in Baghdad was higher than in other cities.

Discussion

This study was designed for detection of HMPV in 100 patients with respiratory tract infection who were negative for influenza virus (H1N1, H3N2 and influenza B) to give new insights into circulating HMPV. Results in Table (2) revealed that the infection rate by influenza viruses; H1N1, H3N2 and Flu B were 14.2%, 7.5% and 13.1%, respectively. From those patients who were negative for these viruses submitted for another RT-PCR detection for the presence of HMPV and the results showed high percentage of infection (37%; Table 3).

A recent study conducted in Baghdad indicated that 29.74% of patients with influenza-like illness under 15 years were positive for HMPV [10]. Another study
conducted by [11] reported that 13% of children with lower respiratory tract infection were positive for HMPV.

The study of Manuel, 2009 documented that combined yearly infection rates varied from 5.9%, in healthy elderly population, to 13.1% in young population. The overall infection rate was 4% in patients with community-acquired lower respiratory infection in Upper Egypt [12].

Rate of HMPV infection varied not only between study groups, but also from year to year [13]. Geographical distribution, seasonal variation, age and type of sample and laboratory technique used, all may play a role in the variability of the infection rates.

The result of influenza virus infection also showed that the highest rate of viral infection was caused by H1N1 followed by flu B virus while H3N2 infection rate was the lowest. These results were comparable to those obtained by [14] in AL-Najaf Governorate, Iraq who found that infection rates by H1N1, H3N2 and flu B among healthy adults were 27.7%, 25.79% and 9.23%, respectively. Infection rate obtained in current study was closely similar to that of H3N2, but it is somewhat differ from that of H1N1. This variation may be due to social, health and age differences. Generally, current results are consistent with recent report published by WHO in February 2018 which revealed that there is increasing rate of infection by influenza A (H1N1) pdm09 and influenza B viruses in countries of Western Asia [15].

Results presented in Table (4) showed that the highest rate of respiratory tract infection was among age group 1-11 month with significant differences when compared to other age groups. These results were in agreement with a large cohort study conducted on 1203 hospitalized patients with influenza virus and reported that 76.2% of patients were children [16]. Furthermore, another study showed that there was a decrease in the rate of respiratory viral infections with increasing age and viral respiratory infections were more common among patients less than 14 years [17].

On the other hand, results presented in Table (5) indicated higher rate of HMPV infection in females than males with a ratio of 1.8:1. These results were concordant with those from another study which found that 53.2% of children infected with HMPV were females considering female gender as a predisposing factor for high mortality rates [18]. Conversely, current findings were inconsistent with studies reported no female predominance [19].

Figure (1) showed the distribution of HMPV infection among age groups in both genders and it was higher among infants less than 1 year. This finding was compatible with that reported by [20] and [21]. Another study in Iraq found that infection rate in infant less than 1 year was 28%; whereas it was higher, 57%, among children 4-7 years old [22]. However, in the latter study the virus existed in small sample size (only 7 patients) which may be responsible for the differences found when compared to our study.

It is obvious from Figure (2) that the number of HMPV positive cases recorded in Baghdad was higher than other cities. This is probably due to difficulties for delivering samples from other cities to the CPHL, or may be the genetic material was denatured during the transport process.

It can be concluded that HMPV and influenza viruses have an important role in viral respiratory infections and HMPV is more common in females and in children less than 1 year old.

Ethical Clearance: It was obtained from the Research Development Unit at Central Public Health Laboratory/Ministry of Health (MOH- CPHL), Baghdad, Iraq.

Do Dental Arches Lengths, Widths and Perimeters Affect Bolton’s Ratios?

Nadia Basim Al-Ansari¹, Suha Ali Abdul Ameer¹, Mohammed Nahidh²

¹Department of POP, Al-Rafidain University College, Baghdad, Iraq; ²Department of Orthodontics, College of Dentistry, University of Baghdad, Baghdad, Iraq

ABSTRACT

Background: The main objectives in treating any orthodontic case are establishing stable occlusion with normal overjet and overbite class I canines relationship and good teeth interdigitation with appropriate proportion of maxillary and mandibular teeth widths. Bolton in 1958 introduced his analysis depending on the study models of fifty five cases with excellent occlusion, of which 44 cases where treated orthodontically (non-extraction) and 11 cases were untreated. He developed two ratios one related the whole teeth anterior to the second molars and the other from canine to canine. The aim of this study was to test whether Bolton’s tooth size ratios were affected by the maxillary and mandibular dental arch widths, lengths and perimeter.

Materials and Method: This investigation was performed on a sample of dental casts belong to sixty Iraqi individuals. Anterior and overall tooth size ratios, dental arches widths, lengths and perimeters of maxillary and mandibular arches were measured using digital caliper. Pearson’s correlation coefficient test was used to test the relation between the anterior and overall Bolton’s ratios with the dental arches parameters.

Results: The mean values of anterior and overall Bolton’s ratios were near to that reported by original study of Bolton. Statistically, there was no relationship between dental arch parameters and Bolton’s ratios.

Conclusions: Dental arch widths, lengths, perimeter had no effect on Bolton’s ratios.

Keywords: Bolton’s ratio, arch widths, arch lengths, arch perimeters, tooth size.

Introduction

The main objectives in treating any orthodontic case are establishing stable occlusion with normal overjet and overbite class I canines relationship and good teeth interdigitation with appropriate proportion of maxillary and mandibular teeth widths (¹²).

Bolton (³) in 1958 introduced his analysis depending on the study models of fifty five cases with excellent occlusion, of which 44 cases where treated orthodontically (non-extraction) and 11 cases were untreated. He developed two ratios one related the whole teeth anterior to the second molars and the other from canine to canine. These ratios are universal and have consideration in developing treatment planning for any case, aiding in determining the extraction or inter-dental reduction in crowding cases or composite build-up in spacing cases.

The literature is rich in research and review articles regarding Bolton’s ratios. Many researches developed the normal values of these ratios in different racial groups (⁴⁻⁵), as the mesio-distal widths of the teeth varies in different ethnic groups, while others discussed the effects of various parameters on these ratios like the effect of gender (⁴⁻⁸), method of measuring (⁹⁻¹²), types of malocclusion (¹³⁻¹⁸), degree of overbite and overjet, labio-lingual thickness of upper incisors, mesio-distal tipping of upper incisors (¹⁹), dental arches dimensions and forms (²⁰) and finally the effect of dental extraction (²¹,²²).

The aim of this study was to find whether the dental arch width, length and perimeter have an effect on Bolton’s ratios.

Materials and Method

Samples: This study was conducted on sixty pairs of dental casts belonged to sixty Iraqi individuals selected randomly, according to specific inclusion criteria, from patients attending the Orthodontic Department at Al-Rafidain University College, Baghdad, Iraq.

Inclusion Criteria

- Subjects were of Iraqi Arab origin aged 15–28 years with full permanent dentition regardless of third molars.
- Normal occlusion with bilateral Class I molars and canines relationships.
- Maxillary and mandibular well-aligned arches with less than 3mm crowding or spacing.
- No history of trauma nor previous orthodontic, prosthodontic treatment, maxillofacial or plastic surgery.
- No craniofacial anomalies such as cleft lip, cleft palate or both.
- Absence of gingival or periodontal problems or therapy that would demoralize a healthy tissue to tooth relationship.
- Good quality stone casts with no substantiation of air bubbles.

Exclusion Criteria

- Subjects with severe crowding, excessive spacing, periodontal disease, retained deciduous teeth.
- Interproximal caries or restorations, or tooth wear that affected the tooth size measurements.
- Congenital missing or supernumerary teeth
- Abnormal teeth morphology.

Method

History and Clinical Examination: Consent form was signed by each subject to participate in this study then extra- and intra-oral examinations on the dental chair were done to check the participant’s fulfillment for the required sample selection criteria.

Dental Impressions and Casts Preparation: Dental impressions for the maxillary and mandibular arches were taken for each individual using Alginate hydrocolloid impression material (Tropicalgin, Chromatic alginate, Zhermack, Italy). The impressions were then inspected for any defect, disinfected with sodium hypochlorite (1:10) solution (23) then rinsed again and poured with dental stone (Elite Rock, Sandy brown, Zhermack, Italy). A base from plaster (Plaster of Paris, Al-Ahleea Co., Iraq) was prepared using plastic molds, then participant’s name was labeled on the base and finally the casts were ready for the measuring procedure.

Measurements

The teeth widths, dental arch lengths, widths and perimeters were measured for both arches using digital vernier (Mitutoyo, Japan) with 0.01mm accuracy.

Teeth Width Measurements: The greatest mesial-distal distance, measured from the buccal view, was obtained by measuring the distance from anatomical contact of one tooth to another on a line parallel to occlusal surfaces and perpendicular to the long axis of the teeth (24).

Teeth widths were utilized to calculate Bolton’s anterior ratio (BAR) and Bolton’s overall ratio (BOR) with the application of the subsequent equations (3)

\[
\text{BOR} = \frac{\text{Sum of the mandibular 6 to 6}}{\text{Sum of the maxillary 6 to 6}} \times 100
\]

\[
\text{BAR} = \frac{\text{Sum of the mandibular 3 to 3}}{\text{Sum of the maxillary 3 to 3}} \times 100
\]

Arch length (AL): Arch length was obtained using triangular shaped lines between the mesio-buccal cusp tips of first permanent molars and the central point between the incisors of each respective arch (25).

Arch width measurements (26,27): Maxillary and mandibular inter-canine widths (ICW) were obtained by measuring the linear distance between the right and left canines’ cusp tips.

- Maxillary and mandibular inter-premolar widths (IPW) were obtained by measuring the linear distance between the buccal cusp tips of the first premolars.
- Maxillary and mandibular inter-molar widths (IMW) were obtained by measuring the linear distance between the mesio-buccal cusp tips of the first molars.

Arch Perimeter (AP): Arch perimeter was measured as a segmental sum of five measurements, from the mesial of the right first molar to the distal of the right canine, from the distal of the right canine to the distal of the right central
incisor, from the distal of the right central incisor to the distal of left central incisor, from the distal of the left central incisor to the distal of the left canine, from the distal of the left canine to the mesial of the left first molar \(^{25}\).

**Statistical Analyses:** The data were analyzed using SPSS (Statistical Package of Social Science; version 24, IBM Co., New York, USA). The statistical analyses included:

1. **Descriptive statistics:** Means, standard deviations, minimum and maximum values.
2. **Inferential statistics:** Pearson’s correlation coefficient test to study the relation between the anterior and overall Bolton’s ratios and the dental arches widths, lengths and perimeters.

**Results**

Table (1) showed the descriptive statistics of the measured variables. Table (2) demonstrated the relation between the anterior and overall Bolton’s ratios with dental arches lengths, widths and perimeters. Generally, there were no significant relations between the measured variables except for a weak significant correlation between the inter-molar width and overall ratio in the maxillary arch, and between arch length and overall ratio in the lower arch.

**Discussion**

Andrews \(^{28}\) determined the famous six keys to normal occlusion, but to seat a good occlusion with proper inter-digitations in all planes of space, there must be a specific balance between the mesio-distal tooth size of the maxillary and mandibular arches \(^{29}\). However, \(^{30}\) concluded that this proper anterior and posterior fit could not be gained without the seventh key (Bolton’s tooth size ratio) is fulfilled.
Determination of teeth size ratio is an inter-maxillary analysis of enormous importance that needs to be routinely measured in the orthodontic practice prior to starting any orthodontic treatment in order to localize any difference in tooth size for anterior and overall discrepancy.

Since its publication in 1958, Bolton’s method of diagnosing tooth-size discrepancy has been commonly used in scientific researches and has become one of the key factors in orthodontic diagnosis and treatment planning.

Despite the availability of different types of measurement tools, in this study all the measurements were made directly on study cast with electronic calipers, as the conventional plaster study models are considered as a standard component of orthodontic records, and their analysis proved to be the most accurate, reliable and reproducible one (31-33). Moreover, (12) compared the measurements using digital calipers with OrthoCAD and found that digital calipers gave the most precise and reproducible measurements, hence electronic caliper was used in the present study. Also, (28) used CBCT in measuring dental arch and teeth dimensions. CBCT cannot be used routinely for each patient attending the orthodontic clinic unlike the study models.

The gender dimorphism in Bolton’s ratios was not considered in the present study as the findings of many previous studies proved statistically non-significant gender differences (8,13,15).

The researches depended on Bolton’s analysis for people of dissimilar races and from various countries could be very expedient for the determination of their own normative value. The Iraqi’s overall tooth size ratio was comparable to the original Bolton’s overall ratio and near to many previous Iraqi studies (34-39).

The current study investigated the effect of dental arches widths, lengths and perimeters on the Bolton’s ratios (both anterior and overall ratios) in Iraqi sample with Angle Class I normal occlusion. Generally, no significant relations were found (P≥0.05); this was in agreement with the findings of (28) regarding the arch width groups (inter-canine, inter-premolar, and inter-molar). However, (28) reported a statistically significant relation between arch length and arch perimeter with Bolton’s ratio and this could be explained by cultural and environmental differences in addition to the measuring methods differences.

Like any study, there are several inherent limitations that may exist. The sample included class I only, so class II and III with crowding and spacing of varying amount, cross bite or scissors bite, congenital missing or impacted teeth, cases indicated for orthognathic surgery should also be considered.

Conclusion

Dental arch widths, lengths and perimeters had no significant effect on Bolton’s ratios.

Ethical Clearance: The research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq.

Persistently Elevated Levels of Serum Autoimmune Inflammatory Markers after Total Thyroidectomy for Hashimoto’s Thyroiditis. An Indicator of Prevailing Autoimmunity

Adil Shaker Al-Tamimi¹, Israa A. Dheeb²

¹Department of Surgery, ²Department of Medical Microbiology, College of Medicine, University of Al-Qadisiyah, Diwaniyah, Iraq

ABSTRACT

Hashimoto’s thyroiditis characterized by glandular lymphocytic infiltration with progressive parenchyma destruction and fibrosis. The autoimmunity was suggested by the reduced immune tolerance and the production of antibodies. The description of Th17 subpopulation has undesirable role in the pathogenesis of Hashimoto’s disease. Among the cytokine secretion of Th17 is cell-type specific which carry its major effectors functions, IL17 and IL22 are the most important.

Fifty two drug native patients with Hashimoto’s thyroiditis were enrolled in the study. Preoperative, 6 weeks and 6 months postoperative serum assay of ATPO Ab, IL6, tumor necrosis factor TNF-α, IL17 A, IL22,IL23 was adopted. Surgery in form of total thyriodectomy was carried out for patients with suspicious nodule based on cytological examination or large symptomatic multinodular goiter.

The preoperative elevated Anti TPO Ab significantly higher levels than the 6 weeks and 6 months post operative measurement. Serum levels of IL 6 and TNF-α were significantly higher in the preoperative measurement than the 6 weeks post operative measurement, and higher than 6 months serum level for IL6 but not TNF –α. The IL 17A levels were significantly higher in the preoperative patients sera than the 6 wk post operative measurement, but not the 6 months measurement. No statistical difference was observed in the preoperative and post operative levels of IL 22. The preoperative serum Level of IL-23 was apparently high, and significantly different from 6 weeks and 6 months post operative measurement.

The measured selected immune parameters exhibit partial decrease in serum level which would not reach the normal circulatory levels 6 months after thyroidectomy.

Keywords: Autoimmunity, Thyroidectomy, Inflammatory Markers.

Introduction

Hashimoto’s thyroiditis (HT) is common autoimmune thyroid disorders with glandular lymphocytic infiltration with progressive parenchyma destruction and fibrosis¹. HT affects 3–4% HT of the general population². The disease is 10 times more frequent in females than males³. The exact etiology of the disease is still elusive however genetic and environmental factors influence the development of autoimmunity against thyroid tissue⁴. The autoimmunity was suggested by the reduced immune tolerance and the production of antibodies⁵,⁶. The majority of patients have raised anti-thyroid peroxidase (anti-TPO)⁷. As destruction of thyrocytes progress followed by loss of thyroid hormone synthesis and eventual hypothyroidism⁸. Cell mediated autoimmune response is the main although not the sole pathogenic finding in HT, this response arise from a disruption of self-tolerance to thyroid antigenic structure⁹,¹⁰. In HT Th1 (T helper) lymphocytes generate an intense
inflammatory infiltrate (predominantly lymphocytic) of thyroid gland, which initiate further thyroiditis and loss of thyrocytes. The activated cytotoxic lymphocytes and macrophages, directly attack and destroy the thyroid follicular cells. The suggested accelerated apoptosis seen in HT is thought to be induced, when thyrocytes express molecules involved in cell cycle and apoptosis (Fas receptor and also Fas ligand), a process mediated by cytokine released from Th1 and macrophage. Th2 also induce B lymphocytes and plasma cells to produce thyroid targeted antibodies. In fact, although the cell-driven destruction of thyrocytes is the main pathological finding, antibodies to TPO and Tg are also important components. Th1 cytokines stimulate the release of immunoglobulin (Ig) G1, whereas Th2 cytokines participate in production of IgG4. TPO and Tg auto antibodies are of both IgG4 and IgG1 subclasses, indicating participation of Th2 and Th1 cytokines, including IL6 and TNF alpha. The Th1 mediated disease is the most widely accepted, however the concept is further modulated by the description of Th17 subpopulation. The Th17 cells mediate both normal and pathological immune response by its major role in immune response to the confounding extracellular pathogens and the disadvantageous role in the pathogenesis of several autoimmune diseases. The cytokine secretion of Th17 is cell-type specific which carry its major effectors functions, among which IL17 and IL 22 are the most important. Moreover, the Th17 cell expansion and survival is mainly mediated by IL-23. The clinicopathological course of the disease is very variable ranging from subclinical state to overt thyroid failure. Clinically HT present early with transient subclinical or overt hyperthyroidism for a variable periods followed by a stationary phase of euthyroid state eventually culminating on hypothyroidism, all stages of the disease may or not associated with goiter.

Aim: To evaluate some immune parameters in the sera of selected patients with Hashimoto’s thyroiditis before and after total thyroidectomy.

Materials and Method

Fifty two patients with presumptive diagnosis of Hashimoto’s thyroiditis were included in the study. The preoperative diagnosis was based upon clinical features, raised serum thyroid peroxidase Ab, cytology, TSH, thyroid hormone estimation and thyroid ultrasound. All patients were drug native euthyroid or mildly hypothyroid. Blood samples were collected in three different occasions, preoperatively as part of the assessment, 6wk and 6 months post operatively as part of the follow up, serum obtained for assay of ATPO Ab, IL6, tumor necrosis factor TNF-α, IL17 A, IL22, IL23. The indications for surgery was Hashimoto’s thyroiditis with suspicious nodule based on cytological examination or large symptomatic multinodular goiter. Surgery in form of total thyroidectomy was successful in all patients and was followed by full Levo-thyroxin replacement. All resected specimens were subjected to histopathological examination which proved the diagnosis of Hashimoto’s disease.

Inclusion Criteria: Adults patients (18-60 years) with recent diagnosis of Hashimotos thyroiditis with euthyroid or subclinical hypothyroid state who were not subjected to any form of thyroid hormone replacement therapy.

Exclusion Criteria

1. Patients with malignant disease including patients in whom thyroid malignancy was discovered after thyroidectomy.
2. Patients on thyroxin replacement.
3. Patients with advanced hypothyroidism.
5. Patients with chronic or autoimmune disease other than HT.
6. Patients on chronic steroid or immunosupressive drugs.

All candidates informed about the details of the research including the hazards of surgery and the planned follow up, for which they signed a written consent. Levels of antithyroid peroxidase (anti-TPO) antibodies in the sera of all candidates was determined, using the diagnostic enzyme-linked immunosorbent assay (ELISA) kit (Monobind Inc., Lake Forest, USA). Values more than 40 IU/ml were considered positive.

IL-6, TNF-α, IL-17A, IL-22, and IL-23 serum measurements were detected using human ELISA kit in accordance to the manufacturer’s instructions (KOMABIOTECH- INC. Korea).

Statistical Analysis: t-test for Independent sample was used for comparing the means of the two groups.

The preoperative elevated Anti TPO Ab showed higher levels than the 6 weeks and 6 months post operative measurement p value 0.001 and 0.0001 respectively. The 6 weeks serum level of anti TPO Ab was significantly higher than the 6 months measurement p value 0.0001. Serum levels of IL 6 were significantly higher in the preoperative measurement than the 6 wk and 6 months post-operative measurement p value 0.01 and 0.003 respectively. Furthermore, no statistical difference was found between the 6 wks and the 6 months post operative measurement. The serum level of TNF-α in the preoperative measurement was significantly higher than the 6 wk post operative measurement p value 0.02 but no significant difference was found between the preoperative and 6 months measurement. The IL 17A levels were significantly higher in the preoperative patients sera than the 6 wk post operative measurement P value 0.04, but not the 6 months measurement. Furthermore no significant difference found between the 6 weeks and 6 months measurements. No statistical difference was observed in the preoperative and post operative levels of IL 22. The preoperative serum Level of IL-23 was apparently high, and significantly different from 6 weeks and 6 months post operative measurement p value =0.0001. No difference was found in serum level between the 6 weeks and 6 months measurements (Table 2).

Discussion

In 2003 the discovery of Th17 cells, a unique CD4+ T-cells sub population have been found to have both beneficial and harmful immunological function, especially as a result of extravagant Th1 responses22,23. These lymphocytes are the major source for production of cytokines from IL-17 family namely the IL17A and IL17 F, together with IL21 and IL22, which particularly accentuate the immune state by further release of other pro inflammatory cytokines like IL-Beta, TNF-α, and chemokines which are involved in cellular induced tissue damage24. The IL-17A is the well known form in this family and has established proinflammatory effect in HT25. Many cytokines have been suggested to have a potential role in the Th17 cells differentiation in humans among which the IL23, IL21, IL6 and TNF-α are the most important players26. It has been found that patients suffering from HT found to have abnormally raised levels of Th17 cells and Th-17- related pro inflammatory cytokines27. Our findings was supportive of the persistently high serum level of ATPO antibody following total surgical thyroid ablation.

The pro inflammatory IL6 and TNF alpha has been found to have crucial role in the pathogenesis of HT, most of the published data agreed with the finding of increases serum level in patients with HT irrespective to the clinical state28,29. To date no available data regarding the serum level of these proinflammatory cytokines in thyroidectomised patients with HT. Yet no available research has depict the changes in the IL17 serum level in patients with HT after thyroidectomy. IL22 has a potential role in autoimmune disorders including HT, through its ability to induce other pro inflammatory cytokines30. Our results are associated with only modest increased serum level of IL-22 in HT patients preoperatively, results which has been demonstrated by31. Moreover our
results declared no difference in serum level of IL-22 between pre and post operative measurement in our sample. IL-23 is known to have potent stimulatory effect on Th-1 to differentiate, producing the Th-17 subpopulation. Ruggeri et al has recorded a significant increase in serum level as compared with healthy control. While results displayed by Fatemeh et al declare a non significant difference in serum level of IL-23 between patients with HT and healthy control. Our data revealed an abnormally high serum levels of IL-23 in the pre operative measurement which was statistically different from the post operative one, in which the levels approximately halved and remained static in an abnormally higher level for the following 6 months period. These parameters are indicative that the immune process is still working in spite of removal of the thyroid gland. The mechanisms, by which the auto reactive T cells escape deletion earlier and subsequent anergy, and activated thereafter remain elusive. Furthermore it has been found that patients with HT have elevated levels of Th-17 and its associated pro inflammatory cytokines both in the thyroid and peripheral blood. The natural T regulatory cells regarded by many as the natural suppressor of T reactive cells and responsible for maintaining the peripheral tolerance, In HT they found to be dysfunctional and loss their immunosuppressive function and in the affected patients, and possibly converted to a pro inflammatory cells (Th-1 and Th-17). On the other hand the coexistence of HT and other autoimmune diseases like diabetes and Addison disease and the existence of autoimmune polyendocrine syndrome type II, supplement the involvement of generalized autoimmune process rather than isolated thyroid targeted autoimmunity. Moreover the development of Hashimotos related encephalopathy which has immunologically based pathogenesis, may uncover the prevailing autoimmunity.

**Conclusion**

The level of selected circulating immune parameters which was essentially elevated before thyroidectomy in patients with Hashimoto’s thyroiditis, exhibit only partial reduction after total surgical removal of the gland. Therefore, in autoimmune disease extirpation of the target organ will not ablate the autoimmunity in particular patient.

Assessment of Non-technical Skills Using High Fidelity Simulation among Emergency Medical Services (EMS) Students in Pune, India

Parag Rishipathak¹, Monesh Bhandari², Anand Hinduja³
¹Director, ²Medical Officer, Academics, ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

ABSTRACT

Introduction: In the curriculum for Emergency Medical Services (EMS), much emphasis is given on teaching technical skills and little focus on non-technical skills (NTS). The non-technical skills specifically applicable in emergency medical services are communicating, managing workload, anticipating, situation awareness, supervising, maintaining standards, using assertiveness and decision making which are broadly integrated into three key areas of Leadership, Teamwork and Task management. Simulated scenarios are an opportunity for presentation of similar crisis situations.

Objective: To assess non-technical skills using high fidelity simulation among Emergency Medical Services (EMS) students.

Methodology: Non-technical skills were assessed among 48 students using six clinical case scenarios on high fidelity simulation in a single day session. To assess the NTS, a standardized 11 item observational tool called Team Emergency Assessment Measure (TEAM) was used. The students were subjected to a simulation session followed by focused debriefing. The item on the TEAM tool was scored by two Simulation Educators to avoid rater bias.

Result and Discussion: Leadership and Task management were found to be relatively better compared to Teamwork across all groups. Overall team performance by all groups was found to be 5.38 out of 10. The participants scored well in parameters pertaining to leadership. The groups performed better in areas of effective communication, timely completion of tasks, acting with composure and control and maintaining a positive morale. High fidelity simulation offers an environment to hone both technical and non-technical skills.

Conclusion: This study underlines the significance of conducting more frequent non-technical skills training with adequate debriefing time dedicated to it.

Keywords: Leadership, Communication, Decision making, High fidelity simulation, Non-technical skills, Emergency medical services.

Introduction

Teaching technical skills and interventions using models and simulators specially intended for basic technical skills, prepare trainees for a positive and enriching educational experience in the technical or interventional platform¹. In the curriculum for Emergency Medical Services (EMS), emphasis is given on teaching technical skills and there is little focus on non-technical skills (NTS). Analysis of adverse events in the Emergency Department (ED) reveals that contributory factors commonly relate to non-technical skills such as decision-making. Crisis Resource Management (CRM) courses, designed to improve non-technical skills, invariably center on the critically ill patient. While resuscitation is undeniably important, little attention has been paid to the skills necessary for routine management of the ED and the vital leadership role². Traditionally, non – technical skills training is given to students through task trainers which are low fidelity in nature. Good non-technical skills are pivotal to delivering high quality care, particularly in acute situations. Five categories of non-technical skills have been identified -- situational awareness, teamwork,
leadership, task management and decision making. The non-technical skills specifically applicable in emergency medical services are communicating, managing workload, anticipating, situation awareness, supervising, maintaining standards, using assertiveness and decision making which are broadly integrated into three key areas of Leadership, Teamwork and Task management. High fidelity Simulation training helps improve non-technical skills along with the technical skills. The use of a Simulation based training program has the potential to amplify learning from real-life clinical scenarios. Medical teams depend on technical skills as well as non-technical skills for successful management of critical events. Simulated scenarios are an opportunity for recreation of similar crisis situations.

**Objective**

To assess non-technical skills using high fidelity simulation among Emergency Medical Services (EMS) students.

**Methodology**

Non-technical skills were assessed among 48 students using high fidelity simulation in a single day session. Six clinical case scenarios based on EMS curriculum were designed and tested before the session. The participants had experienced similar cases on low fidelity manikins along with the background theory of the cases. The session did not focus on technical skills of the participants. To assess the NTS, a standardized tool called Team Emergency Assessment Measure (TEAM) was used. The TEAM tool is an 11 item questionnaire with 5 point Likert scale having rating from 0 (lowest) to 5 (highest). The 12th item is the overall score for global rating of the team’s NTS performance on a scale of 1 (lowest) to 10 (highest). The 11 item observational TEAM tool is used to assess three key NTS including Leadership (2 items), Teamwork (7 items), and Task management (2 items).

On the day of the session, the participants were divided into eight groups of six students each. Each group was oriented to the manikin and prebriefed about the case history. This was followed by a simulation session lasting for about 10-12 minutes. The students underwent a focused debriefing session after the simulation. The entire event was video–recorded with prior consent of the students. The items on the TEAM tool were scored by two Simulation Educators to avoid rater bias. The data was collated and tabulated. The means and standard deviation of the scores was calculated.

**Result**

</tbody>
</table>
Table 1 shows the mean scores and standard deviation for each non-technical skill parameter.

**Fig. 1: Score of assessed non-technical skills (Out of 5)**

Leadership and Task management were found to be relatively better compared to Teamwork across all groups. Overall team performance by all groups was found to be 5.38 out of 10.

**Discussion**

The 3 key non-technical skills assessed in the study included Leadership, Teamwork and Task management. The participants scored well in parameters pertaining to leadership.

**Figure 2: Mean Score for Leadership-sub parameters**

The team leader across groups gave frequent directions to the team and maintained a global perspective during the case simulation. Leadership remains the cornerstone of successful team dynamics and also impacts patient outcomes.

**Figure 3: Mean Score of Task management - sub parameters**
The participants also scored fairly well in the parameters measuring task management. All groups diligently followed approved standards and guidelines. But there was wide variation in prioritization of tasks. Some groups could not correctly prioritize the management steps. Correct task prioritization requires extensive experience and hence exposure to more simulation sessions can lead to improvement in this trait.

Figure 4: Mean Score of Teamwork - sub parameters

Teamwork was judged in seven parameters. The groups performed better in areas of effective communication, timely completion of tasks, acting with composure and control and maintaining a positive morale. However, the participants scored poorly in complex parameters like adapting to changing situations, monitoring and reassessment of situations and anticipation of potential actions. These parameters require repetitive practice to improve the overall situational awareness among the participants.

The participants scored on average of 5.38 out of 10 on overall rating of team. This value indicates large room for improvement in non-technical skills and draws attention to the significance of teaching non-technical skills to students involved in patient care.

High fidelity simulation offers an environment to hone both technical and non-technical skills. Unfortunately the focus of most simulation based trainings currently is hinged on technical skills.

Conclusion

This study underlines the significance of conducting more frequent non-technical skills training with adequate debriefing time dedicated to it. NTS training has a potential to vastly improve co-ordination amongst professionals in different specialties including medicine and nursing.

Impact of First Exposure to High Fidelity Simulation on Self-Reported Psychological Stress Levels amongst EMS Students in Pune, India

Parag Rishipathak¹, Shrimathy Vijayraghavan², Anand Hinduja³

¹Director, ²Medical Officer, Academics, ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

ABSTRACT

Introduction: Stress is an emotion-related response that results from exposure to various emotionally charged clinical events. Anxiety generated by these stressful clinical experiences may inevitably affect learning. A certain level of anxiety shall improve decision-making and clinical performance. High fidelity simulation is an innovative and effective teaching strategy for medical students. Emergency Medical Services (EMS) students are at present exposed more to low fidelity simulation, which fails to replicate real clinical stress. The study aims to assess self-reported psychological stress levels in EMS students before and after exposure to high fidelity simulation.

Objective: To assess the self-reported psychological stress levels in EMS students on their first exposure to high fidelity simulation.

Methodology: A facilitator guided simulation session was conducted in order to study the impact of psychological stress on first exposure to simulation amongst 65 students of Post Graduate Diploma in Emergency Medical Services (PGDEMS). The standardized Stressor Appraisal Scale (SAS) questionnaire comprising of 10 items was administered to the students before and after the simulation session to document the baseline self-reported psychological stress level. The scores of the Post Simulation versus Pre Simulation were tabulated and compared using t test.

Discussion: On comparison of the scores of post simulation questionnaire versus pre simulation questionnaire, the parameters pertaining to demanding and stressful nature of task, level of exertion, degree of effort, seriousness and perception of performance in the task showed remarkable significance as opposed to perception of threat, ability to cope, level of uncertainty and confidence which was not significant.

Conclusion: The participants felt that the simulation session was more stressful than expected. However, this stress was positive in nature as the score obtained on the parameter of importance to do well significantly increased after the simulation session.

Regular exposure to high fidelity simulation may help in channelizing the psychological stress constructively thereby improving the participant performance.

Further elaborate studies are required on this subject.

Keywords: High fidelity simulation, Psychological stress, Emergency medical Services.

Introduction

Medical training is identified as ‘full of stress’ and it is observed that students undergo tremendous stress during various years of medical training¹. Stress is an emotion-related response that results from exposure to various emotionally charged clinical events². It has been noted that the anxiety generated by these stressful clinical experiences may inevitably affect learning and clinical performance³.

Simulation is used as a safe format for instruction of students and trainees in the field of medicine and high fidelity simulation is an innovative and effective
teaching strategy for medical students. However, it is observed in many studies that simulation session can cause a certain degree of stress and anxiety in the participants, which can thereby affect their performance both positively and negatively. High-fidelity simulation using physiological. Model-driven, life-sized manikins with measurable vital signs and other ‘real’ attributes can create ‘true to-life’ experiences for learners thereby creating an environment similar to real clinical setting.

Emergency Medical Services (EMS) students are at present exposed to low fidelity simulation. It is important to expose them to high fidelity simulation, and evaluate their self-reported psychological stress levels.

Emergency medicine providers are tasked with performing highly complex skills and assessments under dynamic conditions in which every second matters and the cost of failure is significant. Furthermore, researchers in the fields of peak human performance and neuroscience have observed strong correlations between one’s performance state and the likeliness of performing optimally under duress. Learning how to prepare and respond more effectively in advance of potentially stressful situations, and how to refocus one’s attention within those moments, would be of tremendous value.

A study performed by Geeraerts T et al. in 2017 states that even if simulation-induced stress, as measured by self-assessment and biological parameter, does not seem to impact performance negatively, it should be still taken into account. Beverley Nielsen et al. in their study conducted in 2013 on anxiety of nursing students claim that anxiety is evident during the simulation experience as students experience heightened anxiety when “onstage” in a scenario.

The study aims to assess the impact of first exposure to high fidelity simulation on the self-reported psychological stress amongst EMS students. This shall help arrive at conclusion regarding utility of high fidelity simulation in creating psychological stress thereby helping learners perform better in real clinical situations.

### Objective

To assess the self-reported psychological stress levels in EMS students on their first exposure to high fidelity simulation.

### Methodology

A facilitator guided simulation session was conducted in order to study the impact of psychological stress on first exposure to simulation was conducted amongst 65 students of Post Graduate Diploma in Emergency Medical Services (PGDEMS).

Stressor Appraisal Scale (SAS) a standardized questionnaire was administered to evaluate self reported psychological stress amongst students before and after the exposure to high fidelity simulation.

On the day of session, One-hour orientation was conducted on the subject of Simulation and high fidelity manikin prior to the simulation in order to orient them to simulated environment.

The standardized SAS questionnaire comprising of 10 items was administered to the students before the simulation session to document the baseline self-reported psychological stress level. The items were scored on a 7-point Likert scale with one depicting lowest and seven depicting highest score.

The students were divided into six groups of 10 each and a facilitator guided simulation scenario was conducted. The session lasted for 10 minutes followed by a focused debriefing session. The session was video recorded with the consent of the participants. The same facilitator debriefed all the groups to avoid bias.

The SAS questionnaire was administered again immediately after the simulation session to document the post session stress levels. The scores of the post simulation questionnaire versus pre simulation questionnaire were tabulated and compared using ‘t’ test for equality of means of independent samples.

The models used for analysis were present in the Statistical Package for Social Sciences (SPSS) v23.

### Results

<td>4.76</td>
<td>5.28</td>
<td>0.02*</td>
</tr>
</tbody>
</table>
Table No.1 depicts, T test results and the * marked show significant p values.

### Discussion

As seen in fig.1, the participants underestimated the demanding nature of simulation before the session. This is reflected by the sharp increase in the score obtained after the session.

![Demanding Nature of the Task](image)

**Figure 1**

![Stressful nature of task](image)

**Figure 2**
As shown in fig.2, the participants found the simulation task to be more stressful than their expectation. This could be attributed to the stress, caused due to a new experience, as this was their first exposure to simulation.

![Figure 3](image)

**Figure 3**

As shown in figure. 3, the participants realized that they need to exert a greater deal after the exposure to simulation.

![Figure 4](image)

**Figure 4**

Figure. 4, depicts that the participants opinion on the degree of effort required to be spent both at mental and physical level increased drastically after the session.

![Figure 5](image)

**Figure 5**
As shown in figure 5, the participants took the simulation exercise very seriously. This is reflected in the high scores obtained both before and after the simulation session. Simulation acted as a positive stressor as the score obtained on the importance to do well significantly increased after the simulation session.

**Figure 6**

Figure 6 shows that the participants found the simulation task to be difficult which is reflected in their self-appraisal on performance, which deteriorated post simulation session.

**Figure 7**

Figure 7. Highlights the following:

1. The threat perception increased after the simulation experience. Yet, the increase was not statistically significant.

2. The level of uncertainty regarding simulation increased marginally after the session.

3. The participants were confident that they would be able to manage the demands imposed on them by the task before the simulation session. This confidence wavered slightly after the task.

4. The participants' perception of the ability to cope with the task decreased marginally after the session.

**Conclusion**

The participants felt that the simulation session was more stressful than expected. However, this stress was positive in nature as the score obtained on the parameter of importance to do well significantly increased after the simulation session.
Regular exposure to high fidelity simulation may help in channelizing the psychological stress constructively thereby improving the participant performance.

Further elaborate studies are required on this subject.

The Impact of Teaching the Creative writing by FOCUS Strategy to Develop

Hawraa Hafudh Kareem¹, Sabeefa Hamza Dehham¹, Muhataram Abid Al-Wahid¹
¹University of Babylon–College of Basic Education, Department of Post-Graduate Studies, Iraq

ABSTRACT

This study aims to identify the effect of creative writing instruction on FOCUS strategy in developing the habits of the mind for the Fifth grade students. In order to achieve the goal, the researcher put the zero hypothesis, which states: There is no statistically significant difference at the level of significance (0.05) among the average of the students of the experimental group, the average score of the students of the control group who will study according to the usual method in the test habits of the mind, and to verify the application of her experience in the first half of the academic year (2018-2019). The sample consisted of (65) students of the Fifth grade in Al-A'MIL secondary school, they distributed randomly, (33) students in the experimental group and (32) students of the control group. The two groups were rewarded in the following variables: age, IQ, and linguistic ability test. The researcher prepared a measure of the habits of the mind based on Costa & Kellick, 2005, the researcher constructed the paragraphs of the habits of the mind in the form of positions and each position containing four alternatives to answer and the number of positions sixteen positions.

Keywords: FOCUS Strategy, fifth grade students, habits of mind, development.

Introduction

Innovation has become an important problem from the problems of scientific research in a large number of countries ¹. The growing interest in the subject of creativity and creative people is not confined to developed countries only, not to the community without the other, is a university education in Iraq and one of the communities the job that needs to be great interest, especially in the mental and creative, through the use of methods and programs of modern scientific in its development. So select the researcher in identifying the problem of her research on the effectiveness of an educational program in the development of creative writing using the habits of mind among the students of the um- al-kitab secondary at the Wasit city ². The researcher to conduct pre-testing of Creative writing Using a scale Torrance on members of the research sample’s (65) students from the fifth grade representing the research groups of the four, then the application strategy, which consists of five modules actual (usually mental), the duration of the module (60 minutes), given the educational unit and one each week and this took ³ the implementation of the strategy (10) weeks, after you complete the application tutorial on the two sets of research experimental groups female students, the researcher conducting the tests dimensionality of testing the Torrance Creative Thinking on the two groups mentioned in on Sunday (20/1/2019). The neglect of the use of mind habits causes many shortcomings in the results of the scientific process, habits are not the possession of information, but is to know how to work on it and use it, It is a pattern of intelligent thinking ⁵ behaviors that leads the learner to the product of knowledge as a result of responding to certain patterns of skills, values and attitudes, not just remembering them, that failure to take into account patterns of brain sovereignty in education is reflected negatively on students’ tendencies habits, attitudes, and attitudes. Most learners seem to recognize that most schools and universities do not take into account patterns of brain sovereignty⁵.
Methodology

It includes a presentation of the procedures that have been carried out to achieve the research objectives, starting with the research methodology and experimental design, defining the research community and its design, the equivalence of the research groups (experimental and control), preparation of the research requirements and tools, Experimental design of the research includes the independent variable (FOCUS strategy), the normal method, and the dependent variable (the development of the habits of the mind). Therefore, the researcher used experimental design with partial control of two equal groups, one experimental and the other controlling.

The study community and its model: The current study community represents fourth grade students, all of them in the governmental day-school preparatory school of the Directorate General of Education in Wasit Governorate for the academic year 2018-2019. In the same case, the researcher chose the middle school of swirah in the city of Wasit province in order to conduct this study. It was found that it includes two divisions for the fourth grade (A, B). The researcher chose (a) the random drawing method (the drawing method) to represent the experimental group and the number of its students 33) students who will study their students according to the (FOCUS strategy), the same way the researcher chose randomly Division (b) to represent the control group and the number of students (32 students), which will examine its students according to (the usual way). The researcher conducted a statistical equivalence between the experimental and control groups in some variables that affect the results of the experiment. Although the researcher chose the two groups in the random drawing method, although the students of the research sample from the social and economic center are very similar and study in one school, But he was keen to make the equivalence of the following variables: the age of time calculated months, the test of intelligence, the test of language ability), as the researcher parity between the two research groups in the variables mentioned above and showed the results according to the following table:

Adjusting Exotic Variables: Although the researcher verified the equivalence of the two sets of research in some variables that are believed to affect the course of the experiment, he tried to avoid the effect of some of the extraneous variables in the course of the experiment and some of these variables and how to control them: Accidents associated with the experiment: The sample was selected: The two sets of research were chosen in the logical way and the two groups were confirmed. The maturity factor: Since the duration of the experiment is uniform between the two research groups As well as the approximate age of students B in the two groups, so what happens growth will return to the members of the two groups at the same level, so it was not for this factor is the impact of the research, the impact of the experimental procedures: the work of the researcher to reduce the impact of the experimental procedures that could affect the dependent variable during the course of the experiment. Preparation of research requirements: The research requirements of the basic things on which the research is based on which the search procedures are implemented and these requirements are: Scientific material (content): The scientific material that the researcher has been taught. For the students of the two groups of research during the duration of the experiment (the second semester) of the academic year (2018 - 2019). The researcher prepared 7 plans for the experimental group, which is taught according to (FOCUS strategy) and the same to the control group, which is taught according to (the normal method). The tools and methods used to develop the habits of mind according to FOCUS strategy.
Research Tool: A measure was prepared to measure the habits of the mind: The researcher constructed the paragraphs of the habits of the mind in the form of positions and each position includes four alternatives to answer (A, B, C and D) and the number of positions sixteen position, as each position is usually a mentality.

A. The validity of the paragraphs of the habits of the mind (the analysis of the paragraph): The logical analysis is the general appearance of the scale as a means of mental measurement, since the presentation of the paragraphs of the scale to a group of arbitrators to judge their validity in measuring the property to be measured is a kind of honesty to which the apparent honesty applies. The researcher verifies the validity of the paragraphs by presenting the scale to a group of specialized arbitrators in educational and psychological sciences to benefit from their observations and opinions in the amendment and delete what they see as inappropriate, so I got the proportion of agreement (96%)

B. Reliability of the building: And this type of Reliability, which illustrates the relationship between the theoretical basis of the test and the paragraphs of the scale in its fields, has achieved this truth by applying it to (40) students of the fourth grade literary and the calculation of correlation coefficients between the degree of each position and the total score, (0.62_0.84), and the significance of correlation coefficients. The T value of the correlation coefficient of each item was computed and compared with the tabular T value of (2.021) at the significance level (0.05) and the degree of freedom (38).

Spatial Application of the Habits of Reason Scale: The researcher applied the scale to a sample of 30 students randomly selected from the wasit prep school for girls in order to know the clarity of the instructions of the 16 habits of the mind, as well as calculating the time taken to answer this scale. His answers were clear and the average time to answer all the paragraphs was (55) minutes.

Item Analysis (Statistical Analysis): The process of analyzing paragraphs is statistically defined as the study of evaluating their effectiveness through the students’ response to the scales. The aim of this procedure is to keep the good paragraphs in the scale.

Discriminatory power of item: The distinction of a paragraph is strongly meant to distinguish between higher-level, lower-level, or test-measured subjects whose usefulness is to clarify the differences between the most capable individuals and the weaker individuals,, after calculating the power of discrimination of each Item, using the equation of discrimination of paragraphs, the researcher found that the forces of discrimination were limited between (0.31 - 0.53), as Ebel believes that the paragraphs of the test is good if the strength of the distinction (0.30) and more, The test is all good, and acceptable.

Validity of the scale:

Test-Retest method: The persistence of the Vaccronbach method depends on the consistency in the stability of the results of the individuals for all the paragraphs of the scale. To calculate the stability of this method, 20 random forms were withdrawn from the analysis sample of the vertebrates and the Vecronbach equation was applied to the internal consistency.

The final view of the measure of the habits of the mind and how to correct it: The scale consists of sixteen cards each representing one area for each of the habit of the sixteenth mind. 16 The items of the scale were formulated in the form of positions, from each position, four alternatives (A, B, C and D) (4) degrees, (b) give (3) degrees, (c) give (2) degrees, while (d) the lowest degree of common sense and give it a score, Every habit of mind habits is individualized.

Application of the study instrument: The experimental and control groups were informed of the date of application of the habits of the mind standard a week before it was carried out. It was applied after the completion of teaching the specific material for the two research groups at one time.

Statistical methods: The researcher used the t - test equation for two independent samples to make the parity between the experimental and control groups, Pearson ‘s correlation equation, the alpha - cronbach equation, and the spss.
Results and Discussion

The results showed statistically significant differences between the experimental and control groups in the development of the habits of the mind and can be explained as follows: The educational strategy of the same effect in the development of creative thinking (originality, fluency, flexibility) using the habits of mind to students. The researcher recommended the need to adopt FOCUS strategy a method independent in the education and development of creative writing in school because of its great importance in the development of creative writing. The students of the experimental group that studied according to FOCUS strategy surpassed the students of the control group which were studied in the normal way in the development of the habits of the mind in the post-test. This shows that teaching according to FOCUS strategy had a positive effect on the development of the habits of the mind. In light of the researcher’s experience, the results obtained and the reasons for the research, the researcher reached the following conclusions: FOCUS strategy has a positive impact on the development of the habits of the mind to the fifth grade students and increase their ability to understand information, facts and knowledge and raise their academic level. The FOCUS strategy has a role in making students the focus of the educational process through their active participation in the educational situation, which will increase their self-confidence and encourage them to persevere to raise their level of science. In light of the results, the researcher recommends: The researcher recommends the need to adopt the FOCUS strategy in teaching creative writing material for the preparatory stage. Provide English language teachers with the procedural steps of the FOCUS strategy, in light of which the subjects are taught, as well as giving a graphic video of how to teach according to FOCUS strategy. The researcher provided the English language teacher at the UM-alkitab Preparatory School for the procedural steps through which she is taught.

Conclusion

The sample consisted of (65) students of the Fifth grade in Al-A’MIL secondary school, they distributed randomly, (33) students in the experimental group and (32) students of the control group. The two groups were rewarded in the following variables: age, IQ, and linguistic ability test. The researcher prepared a measure of the habits of the mind based on Costa & Kellick, 2005, the researcher constructed the paragraphs of the habits of the mind in the form of positions and each position containing four alternatives to answer and the number of positions sixteen positions.

Certain Hematological Denotations in Chronic Renal Failure Patients

Wasan Adual Wahab Alsiadi1, Majid M. Mahmood2, Abed Sultan Hassan3

1Department of Medical Lab Techniques, Bilad Al-Rafidain University College, Iraq, Baqoubah, Iraq; 2Department of Biology, College of Science, Mustansiriyah University, Iraq, Baghdad, Iraq; 3Department of Medical Lab Techniques, Bilad Al-Rafidain University College, Iraq, Baqoubah, Iraq

ABSTRACT

The study was concerned with investigating certain hematological indicators (including anemia parameters, hsCRP and WBCs) in chronic renal failure. Sixty patients among those who attended Baghdad teaching hospital during the period from 25 October-15 December 2018, in addition to 22 matched apparently healthy controls and whose ages are ranging from 32-56 years were investigated. Anemia parameters represented by Iron, unsaturated iron binding capacity and total iron binding capacity decreased in patients compared to healthy controls. High sensitive CRP increased significantly in patients compared to controls. White blood cells recorded gradual decrease depending on the disease progression. High iron requirements as a result of an enhanced erythropoiesis, an insufficient release of iron from the body iron stores insufficient iron absorption necessitate a compensatory measures.

Keywords: Patients, Hematological Denotations, Renal Failure

Introduction

Chronic renal failure (CRF) is a progressive and permanent kidney failure in which many numbers of nephrons are damaged, leading to impaired metabolic and electrolytic balance 1. Chronic kidney disease is defined as the existence of structural and functional signs of kidney damage for at least three months with or without glomerular filtration rate decline 2. Chronic kidney failure is associated with overt inflammatory events leading to progressive renal damaging, in addition to reduced renal function 3. Renal diseases are associated with a variety of inflammatory changes. Leukocyte disorders, as a result of uremic toxins, are commonly seen in CKF patients reflected by functional abnormalities 4.

Materials and Method

In the present study Sixty CRF patients in addition to 22 matched apparently healthy controls were investigated for their hematological and inflammatory parameters. They were selected among those who attended kidney unit in Baghdad teaching hospital, renal dialysis center, during the period extended from 25 October to 15 December 2018. Anemia parameters, namely iron, unsaturated iron binding capacity and total iron binding capacity were measured by using an automated hematology analyzer XT200 I (Sysmex, Japan). High sensitive CRP was measured turbidimetrically at 552nm 5. Differential white blood cells was performed for all participants in which normal ranges of hematological parameters were depended 6.

Results and Discussion

Results of anemia parameters indicated obvious changes in chronic renal failure patients compared to that in their matched control groups. Decreased iron level has been noticed, even though it is still within normal range, in patients group (15.9 ± 1.05µmol/L) compared to the normal values recorded in healthy group (21 ± 1.8µmol/L). In the same context TIBC and
UIbC recorded to be lower in the group of patients (47 ± 1.45µmol/L) (34 ± 1.02µmol/L) than that recorded in control group (58 ± 3.8 µmol/L)(40 ± 1.35 µmol/L) sequentially Table (1). The recorded levels indicated that CRF patients were iron deficient which can, in part, be attributed to malnutrition or a lack of proper nutrition. Such finding conflicts with the report of 7, who recorded that patients with end stage renal disease were not iron deficient, regardless of the type of dialysis 8. On the contrary, in an earlier study 9 found decreased iron levels in CRF patients. However, the presence of anemia, which may occur when iron stores are depleted as a result of loss or decreased intake, as a preservative measures, beside the occurrence of functional deficiency when there is a need for a greater amount of iron to support hemoglobin synthesis than can be released from iron stores 10. Poor iron utilization occurred in CRF patients due to the defective erythropoiesis was also reported by 11. The decreased UIbC in the group of patients indicates that UIbC may also be used as a marker for altered iron metabolism. UIbC represents the portion of iron binding sites on transferrin that are not occupied by iron therefore, a low UIbC indicates that transferrin is highly saturated with iron. These results are in consistence with other studies, which showed significant lowering of UIbC and TIBC in CRF patients before hemodialysis, and significant increase of the levels of these parameters after hemodialysis 12,13. High sensitive C reactive protein levels recorded to be higher than the upper limit of its normal value, and than that recorded in healthy group. The mean value of hsCRP in CRF patients was (13.29 ± 3.65mg/L) which differ significantly (p<0.05) than the mean value of healthy subjects (7mg/L) (table2). Such result may reflects what is going on of inflammatory events, related to tissue damage 14 or for vulnerability for infections, or even caused by dialysis itself 15.

White Blood Cells and Differential Count: Lymphocytes, monocytes, eosinophil and basophils decrease significantly (p<0.05) in CRF group when compared with control group. The results of total white blood cells count, Lymphocytes, monocytes, neutrophils, eosinophil and basophils were (5.20 ± 0.21, 1.50 ± 0.12, 0.4 ± 0.06, 0.42 ± 0.02, 0.15 ± 0.02, 0.03 ± 0.00) respectively in the group of CRF group in comparison to healthy subjects which were at follow (6.80 x10^9/L, 2x10^9/L, 0.7 x10^9/L, 4.5 x10^9/L, 0.03x10^9/L, 0.1x10^9/L). Table (3). Our study showed that white blood cells and differential count decreased significantly in CRF patients, but still they were within normal ranges. Most of the studies focus on the functional abnormalities of WBC. However, some immune system functional abnormalities are reported due to accumulation of uremic toxins. Minnaqanti and Cunha have declared that patients with kidney disorders may suffer impair host defenses 17. The precise mechanism by which chronic renal disease leads to a slight decrease in total leukocyte count is not fully understood. The postulated hypothesis is that in chronic renal failure patients, upon hemodialysis, exposed to artificial membranes which may result in complement activation8. Complement activation induces neutrophils aggregation and adherence to endothelial surface leading to fall in total leukocyte count 19. While Agarwal and Light had reported that Over time, granulocytes increased and lymphocytes decreased in those patients 20.

Effectiveness of the Problem Tree Strategy in the Development of Multiple Intelligences among Preparatory School Students

Laith Al-Janabi¹, Mohammed H.¹
¹College of Basic Education, University of Babylon, Iraq

ABSTRACT

The research aims to identify the effectiveness of the problem tree strategy in the development of multiple intelligences among preparatory school students. The sample consisted of two groups: one was the experimental group (30) students, the other was the control group (30) students, (Imam Ali Preparatory School) has been chosen from the research community represented by secondary and preparatory schools belonging to the Directorate of Education of Babil Governorate/the center. The empirical research method was adopted as a methodology for conducting the research which includes an independent variable (problem tree strategy) and one dependent variable (multiple intelligences). The partial experimental design was chosen to control the research variables. Before starting the experiment, the research groups were equalized for accurate results with the following variables: (time age calculated by months, the first semester grads of students, Raven’s test for intelligence). After the parity between the two sets of research, the application requirements of plans, objectives, and tests were prepared for the two research groups. The data results were statistically analyzed by t-test for two independent variables. The results showed that the experimental group was superior to the control group according to the problem tree strategy in multiple intelligences.

Keywords: Problem tree strategy, multiple intelligences, preparatory school students.

Introduction

The theory of multiple intelligences was not the product of its day, but rather the culmination of a heritage that extended from ancient historical times, the proofs and monuments are a clear evidence of the origins of multiple intelligences in primitive human, including written records dating back 3,000 years refers to linguistic intelligence, the existence of systems, tools and annual calendar refers to logical intelligence, cave drawings to spatial intelligence, early use of the machine refers to bodily intelligence, the existence of old musical instruments refers to musical intelligence, meditation and worship refers to intrapersonal intelligence. Specifically, in 1979, the Van Leer Foundation at Harvard University asked the American psychologist Howard Gardner and a group of specialists in the field of human and philosophical history, natural sciences and humanities to carry out a scientific research aimed at opening up the status of scientific knowledge interested in the mental potential of the human, the results of their research showed that man possesses multiple abilities of intelligence without limiting to a specific aspect. Gardner presented a new theory of intelligence through his observations of many individuals who have exceptional mental abilities in some aspects but do not get high marks in intelligence tests, it was also based on the idea that damage to some areas of the brain may affect a particular function without other functions. For example, Gardner observed that a child have an intelligent ratio, but he can mention the date from any day of weeks, he was able to play the piano and sing songs in a foreign language from just hearing it for the first time, and spelling any words told to him with normal or reverse spelling, as well as the ability to memorize long speeches. Many knew by their ability to perform the four mathematical calculations in orally long numbers so that they equal in accuracy and speed with calculator. The strategy of teaching directly and indirectly affect the increasing of multiple intelligences development or decreasing it so must be familiar with the strategies, methods of teaching, and modern methods through which to increase development of intelligence among students and one of these strategies is the problem tree strategy, which is based on enabling students analytical accuracy skills for one problem,
Methodology

The methodology and procedures of the research include the selection of the experimental design, the research community, and its population, as well as the parity procedures between the two groups of research (experimental and control), and the consideration and control of the external variables, also includes the preparation of research tools and requirements, application of the experiment, and identifying the needed statistical methods, as follows:

Experimental Design: It includes an independent variable (problems tree strategy), (normal method), and a dependent variable (multiple intelligences). Therefore, an experimental design was used with partial control of two equal groups, one experimental and the other control.

Research Community and Population: The current research community represents all high school students in the (secondary and preparatory) governmental day schools of the General Directorate of Education in Babil Governorate for the academic year (2018-2019), in which they have at least two classes (A, b). The researcher chose (A) class by the method of random selection to represent the experimental group with a number of students (30), who will study according to (Problems tree strategy), and in the same way the researcher randomly selected class (b) to represent the control group with a number of students (30), who will study according to (the normal method).

Equivalence of the two research groups: A statistical equivalence was conducted between the experimental and control groups in some variables that affect the results of the experiment. Although the two groups were chosen in the random selection method, and although the students of the research sample were from similar social and economic level and study in the same school, the equivalence of variables was performed and the following results Table (1).

</table>
Control of External Variables: Although the researcher verified the equivalence of the two sets of research groups in some variables that are believed to affect the progress of the experiment, he tried to avoid the effect of some external variables. Some of these variables and how to control them are as follows:

1. Accidents associated with the experiment: The experiment in the research did not experience any emergency or accident that hinders its progress.

2. Experimental Evanescence: There was no discontinuity or transfer of any student throughout the experiment.

3. Selection of the sample: The two research groups were chosen by the intentional method, and the equivalence between them was ascertained.

4. Maturity factor: Since the duration of the experiment is united between the two research groups as well as the age of the students in the two groups is approximate, so the growth will return to the members of the two groups at the same level, so this factor has not affected the research.

5. Effect of experimental procedures: The researcher worked to limit the effect of experimental procedures that may affect the dependent variable during the progress of the experiment.

Preparation of Research Requirements: The requirements of the research are some of the basic factors on which the research is based, where the search procedures are implemented. These requirements are:

1. The scientific material (content): The scientific material that the researcher is teaching has been determined for the students of the two research groups during the period of the experiment (the second semester) of the academic year (2018 - 2019). It included the last three chapters of the scientific material for the preparatory school stage.

2. Formulation of Behavioral Goals: The researcher formulated 95 behavioral goals based on general objectives and the content of the material covered by the experiment, according to the Bloom classification in the field of knowledge distributed among the six levels of Bloom’s classification (cognition, understanding, application, analysis, composition, evaluation).

3. Teaching plans: The researcher prepared a set of teaching plans for the experimental and control groups in light of the content of the three chapters (fifth, sixth, and seventh) of the scientific material to be taught for the academic year (2018 - 2019). The number of teaching plans was (16), which was taught according to the problem tree strategy and the same for the control group, which was taught according to the normal method.

Research Tool

Steps have been developed for the research tool (multiple intelligences) were as follows:

1. Determining the purpose of the test: The purpose of the test is to measure the multiple intelligences of the preparatory stage students (information, skills, and experiences) in the scientific material of the last four chapters of the book, according to the behavioral goals that were formulated from the scientific material.

2. Determine the objectives of the test: After determining the purpose of the multiple intelligences test, the objectives of the test are determined to find the extent of achievement, and a number of behavioral goals have been formulated.

3. Determination of the test paragraphs: The researcher determined the number of paragraphs that constitute the test to develop multiple intelligences, which were (40 paragraphs).

4. The output of test paragraphs: The multiple intelligences test paragraphs were formulated in its preliminary form. The researcher chose the type of the test (multiple choice) which is one of the best objective tests. The test consisted of (40) test paragraphs distributed on Bloom’s cognition levels (cognition, understanding, application, analysis, evaluation) and on the four subjects of the scientific material.

5. Test instructions: The instructions and guidance on how to answer questions were formulated as (choosing one correct alternative to the paragraph, answering all paragraphs, the time period for the answer, writing the triple name).

6. Test Answers Correcting: After the test paragraphs were drafted and the test type was
888

selected, a standard answers correction was established. As developed (one degree for each correct test paragraph) and (zero for the wrong answer, the abandoned paragraph which the student did not answer, and the paragraph to which he placed more than one choice). Thus, the maximum degree of the multiple intelligences test was (40°) and the minimum was (zero).

7. The validity of the test: The apparent validity of the test and the validity of the content was confirmed. The results showed that the apparent validity have obtained a percentage of agreement of which (80%) by the arbitrators and specialists. While the validity of the content, the results showed that all paragraphs of the multiple intelligence test are statistically significant, therefore; The test is valid in measuring the understanding and comprehension of preparatory school students.

The Survey application of the multiple intelligences test: It includes the following:

1. The first survey application: The multiple intelligence test was applied in its first survey phase to a group of students in the preparatory stage with a non-research sample, where the number of students was 30 students. The purpose of this test was to know the clarity of the test instructions and guidance, and the clarity of paragraphs for students understanding, and to calculate the time required for the test, the researcher recorded the exit time for each student.

2. The second survey application: The test was applied to a sample of (100) non-research sample. The purpose of the test is to analyze the test paragraphs statistically, namely paragraph difficulty, paragraph discrimination, the effectiveness of the wrong alternatives.

Statistical analysis of multiple intelligence test paragraphs: The multiple intelligence test paragraphs were analyzed as follows:

1. The difficulty of the paragraph: The statistical analysis of multiple intelligence test paragraphs found that the coefficient of the difficulty of paragraphs ranged from (0.43 - 0.70) and thus the paragraphs of the multiple intelligences test were all good and have appropriate difficulty.

2. Discrimination of the paragraph: One of the important characteristics that must be provided in the paragraphs of the test is the distinguishing feature which means the possibility of items or paragraphs to identify the individual differences of students, and the test items are valid when the coefficient of discrimination of items is (20.0) and above. The coefficient of discrimination of the multiple intelligences test paragraphs ranges from (0.33 - 0.63). Thus, the multiple intelligences test paragraphs were well-defined and appropriate.

3. The effectiveness of the wrong alternatives: The researcher conducted a statistical analysis (highest 27% and lowest 27%) to find the effectiveness of the wrong alternatives ranging from (-0.11 _ -0.33). As a result, the alternative of the multiple intelligences test paragraphs were all effective and therefore considered appropriate.

Reliability of the Test: Reliability is one of the indicators to verify the accuracy of the scale and the consistency of its paragraphs in measuring what should be measured and indicates its ability to produce the same results if it is applied to the same individuals in the same circumstances. The researcher investigated the reliability of the test by the method of Kuder-Richardson. This method is used in the case of calculating the reliability of a single application without the need for fragmentation. It is also used with two-answer (yes/no) (right/wrong) tests. This equation is designed to extract the internal consistency of tests, and by applying the equation, the reliability coefficient was (0.89) which is a good reliability coefficient.

Research Tool Application: The experimental and control groups were informed of the date of application of the multiple intelligences test a week before it was carried out. It was applied after the completion of teaching the specific material for the two research groups at one time. The researcher supervised the application of the test.

Statistical Methods: The researcher used the t - test equation for two independent samples to perform the parity between the experimental and control groups in the following variables: (age calculated by months, first semester student’s grades in the scientific material, IQ test (Raven).
Results and Discussion
The students of the experimental group who studied according to the problem tree strategy exceeded the students of the control group who studied according to the usual method in the multiple intelligences test. This is in line with the studies that confirmed the superiority of the experimental group that studied according to the problem tree strategy to the control group who studied according to the normal method, as shown in the following table 2.

Conclusion
The use of the problem tree strategy in the teaching of scientific material has contributed to raising the level of multiple intelligences of students and activate their memory in the retrieval of information and give the correct answer. The problem tree strategy has helped to increase the multiple intelligences of students because they are modern theories that give students the opportunity to learn correctly and participate positively during the lesson.

ABSTRACT

The purpose of this study was to evaluate the impact of maternal obesity on birth weight and determine which gender is affected more. The study included 100 consecutive healthy eligible pregnant women enrolled at Al-Eluia Teaching Hospital in Baghdad, Iraq between February and May 2017 for childbirth. Newborns were classified based on the definition of mothers’ BMI into three groups: 32 normal weight (18.5–24.9 kg/m²), 31 overweight (25–29.9 kg/m²), and 37 obese (>30 kg/m²). Detailed information on maternal age, gestational age, baby’s gender, birth weight, and birth order were obtained. No significant difference was observed regarding birth weight and gestational age among the studied groups. However, when we considered gender differences, we found that male newborns of obese mothers are significantly heavier than newborns of normal weight mothers. As for females, there were no statistically significant differences in birth weight between three groups. Nevertheless, males of obese mothers are significantly ($p <0.001$) heavier (3700.0 ± 416.95) than females (3173.91 ± 405.88) of obese mothers. Moreover, gestational age was positively associated with birth weight for both genders ($r=0.658$, $p:0.000$ for males; $r=0.680$, $p:0.000$ for females), whereas maternal BMI was significantly associated with birth weight for male gender only($r=0.334$, $P:0.029$).

Keywords: Body Mass Index, Gestational Age, Pregnancy, Maternal Obesity, Birth Weight

Materials and Method

The study included 100 consecutive healthy eligible pregnant women enrolled at Al-Eluia Teaching Hospital in Baghdad, Iraq between February and May 2017 to deliver...

a single, viable, non-anomalous baby which were classified
based on the definition of mothers’ BMI. Medical history
reviewed to determine eligibility pertaining to obstetric
complications during pregnancy. Women were excluded if
the pregnancy was complicated by medical conditions that
could affect fetal growth, such as hypertension, diabetes,
infection diseases, or smoking. Gestational age was
estimated based on ultrasound scans, expressed in weeks.
Data recorded just after birth included baby’s gender and
birth weight, which obtained using a digital scale. Each
mother was interviewed in a post-delivery ward to provide
detailed information on maternal age, birth order, which
was grouped into three categories: first, second, third or
more, if they were taking contraception. For maternal BMI
calculation, anthropometric measurements such as weight
and height were recorded after delivery. BMI defined as
weight in kilograms to square of height in meters and
categorized into three groups: 32 normal weight (18.5–
24.9 kg/m2), 31 overweight (25–29.9 kg/m2), and 37 obese
(>30 kg/m2)14.

Statistical Analysis
The quantitative variables were expressed as means
± standard deviation (SD), whereas qualitative variables
were expressed as absolute numbers and frequencies.
Maternal and newborn characteristics were compared,
according to maternal BMI, using analyses of variance
(ANOVA) followed by least significant difference-LSD
post hoc analysis for continuous data and chi-squares tests
for categorical data. The Pearson correlation coefficient
test was used to assess relationships of quantitative
variables. A p-value of <0.05 was considered significant.

Findings
The study group consisted of 100 mother-newborn
pairs which were classified based on the definition
of mothers’ BMI into three groups; controls of BMI
mean 23.33 ± 1.59 kg/m2, aged 24.53 ± 4.75 years and
overweight of BMI mean 27.98 ± 1.49 kg/m2, aged
26.87 ± 7.31 year and obese of BMI mean 33.81 ±
3.43 kg/m2 aged 29.05 ± 7.04 year. Characteristics of
Newborns among study groups are presented in Table 1.
No significant difference was observed regarding birth
weight and gestational age among the three groups. As
for birth order, we found a significant difference between
newborns of obese mothers compared with newborns
of normal weight mothers. However, when we take in

891

to account gender differences in mean of birth weight
and gestational age as shown in Table 2, we found that
male newborns of obese mothers (3700.0 ± 416.95)
have significantly higher birth weight than newborns of
normal weight mothers (3025.0 ± 738.17), while male
newborns of overweight mothers (2953.33 ± 748.44) did
not differ from control group. As for females, there were
no statistically significant differences for all variables
between three groups. Nevertheless, when we compared
birth weight between males and females, we observed
that only males of obese mothers are significantly (p
<0.001) heavier (3700.0 ± 416.95) than females (3173.91
± 405.88) of obese mothers. Correlation between birth
weight and maternal BMI, gestational age, maternal
age and birth order is presented in Table 3. Gestational
age was positively associated with birth weight for
both genders (r=0.658, p: 0.000 for males; r=0.680, p:
0.000 for females). Maternal BMI was significantly
associated with birth weight for male gender (r=0.334,
P=0.029) but no such association was seen for females.
Birth weight is an important determinant of infant’s
wellbeing15. Our results indicated that male newborns
of obese mothers are heavier than of normal weight
mothers. Fetal growth is a complex biologic process that
is regulated by both maternal and fetal factors including
genes and environment. The amount and quality of food
that the mother consumes during gestation influences
birth weight, and therefore susceptibility of progeny
to disease in later life16. Birth weight is influenced by
common biological determinants across cultures, and
is also influenced by social, ethnic, and environmental
factors. Sex and birth order, maternal age and education
and to a lesser extent region were determinants of birth
weight17. Our study found that birth weight was positively
associated with gestational age for both genders, whereas
maternal BMI was significantly associated with birth
weight for male gender only. Other study reported that
gestational age and parity were found to be the important
maternal parameters influencing the birth weight whereas
maternal age and anthropometry showed no significant
relationship with baby weight18. Voldner et al., found
that parity, maternal BMI, gestational age and maternal
birth weight were associated with birth weight for both
sexes12. Although, several studies have indicated that
maternal obesity is associated with high birth weight both
gender11-13, our findings is the first to indicate a specific
influence of maternal obesity on birth weight. Further
research is required to determine the causes behind these
differences. Furthermore, a systematic review and meta-


analysis confirmed that maternal obesity is associated with fetal overgrowth\textsuperscript{11}. Additionally, neonates of obese women have increased body fat at birth, which increases the risk of childhood obesity. Maternal obesity likely contributes increased birth weight via mechanisms including increased insulin resistance (even in women who do not have diabetes) resulting in higher fetal glucose and insulin levels\textsuperscript{19}. Placental lipases metabolize triglycerides in maternal blood, allowing free fatty acids to be transferred in excess to the growing fetus\textsuperscript{11}. We found that males of obese mothers are significantly heavier than females of obese mothers. These findings are in accordance with a previous study reported that birth weight has consistently been shown to be higher in boys than in girls due to androgen action\textsuperscript{20}. Birth weight is a good indicator of mothers’ and neonates’ nutritional status, and it contributes to the newborn survival, health, growth and development\textsuperscript{11}. A birth weight of >3000g was found in 60\% of males and 40\% of females in this study. According to Qiao et al., a positive association between birth weight and childhood obesity was found, indicating higher levels of birth weight, defined as birth weight >3000 g, were associated with an increased risk of childhood obesity\textsuperscript{22}.

**Conclusion**

There is a sex-specific impact of maternal obesity on birth weight. Furthermore, male newborns are more prone for childhood obesity than females. Birth weight of both genders is affected by gestational age, while only male gender is affected by maternal BMI. As far as we know, this is the first study to report gender difference regarding the effect of maternal obesity on birth weight.

ABSTRACT

Epstein Barr viruses are well known to induce tumorigenesis in proliferative epithelial tissues. Many studies have implicated EBV in the progression of benign and malignant head and neck tumors by affecting cell cycle proteins expression. This study designed to determine the rates of existential concomitance of EBV in relation to P27 gene expression in tissues from nasopharyngeal and sinonasal lesions. The study included a total number of (183) formalin fixed, paraffin-embedded tissue blocks including 35 inflammatory nasal polyps (INP), 35 sinonasal papillomas (SNP), 65 nasopharyngeal carcinomas (NPC), 18 sinonasal carcinomas (SNC) as well as 30 nasal healthy tissues as control group. After histopathological confirmatory re-examination, a Chromogenic In Situ Hybridization technique (CISH) for EbV-EbERs localization and immunohistochemistry technique (IHC) for p27 expression were performed. The positivity percentages of EBV-EbERs detection in NPC and SNC carcinoma tissues were (86.2% and 88.9%, respectively) while it was (57.1%) in SNP and INP. These results were with highly significant differences (P<0.01). The positively percentages of p27-IHC were (58.5% in NPC, 66.7% in SNC, 51.4% in SNP and 60% in INP) tissues in comparison to control healthy tissues in which only (3.3%) noticed as positive. The statistical analysis shows highly significant differences (P<0.01).

Keywords: NPC, SNC, EBV-EBERS, P27, CISH, IHC.

Introduction

SINonasal Carcinom (SNC) could arise from various tissues within the nasal cavity, including lymphoreticular, epithelial and nonepithelial tumors ¹. However, it is a rare tumor, representing about 1% of all human cancers and 3% of the head and neck cancers². Although certain environmental exposures, including high consumption of salt-preserved fish, tobacco smoking and lack of fresh fruit and vegetable intake, are risk factors of NPC, a lot of evidences were accumulated for the a probable causal role of EBV in the pathogenesis of the most common histological subtype of NPC, that is true undifferentiated NPC ²³. Epstein Barr virus (EBV) also has been shown to be associated to other human cancers, such as burkitt’s lymphoma and Non-Hodgkin lymphoma etc. ⁴⁵. The Epstein Barr virus Early Repeats (EBER1 and EBER2), have 167 and 172 nucleotides long in consequence with 54% sequence homology between them. EBERs were used for the recognition of EBV infected cells in tissues by CISH and are a reliable markers indicating the presence of EB, EBER-1 interacts with interferon-inducible protein kinase R (PKR), inhibiting its activation and protecting infected cells from IFN induced apoptosis and induce the expression of growth factors that promote cell survival ⁶⁷. The p27 is cyclin dependent kinase CDK-inhibitor belongs to the Cip/Kip proteins that are playing an important role funkung extracellular regulatory growth signals to progress or exit from cellular cycle ⁸. The P27 Kip is phosphorylated in S–phase by cyclin...
E-CDK2. Alteration of $P27^{kip1}$ protein expression was excessively associated with cell proliferation and have been linked to many types of human tumors, such as NPC, oral cavity squamous carcinoma (OSC), gastric cancer, and small cell lung cancer. Moreover, $p27$ dysregulation was found to play a role both in cell cycle dysregulation and chromosomal instability, leading then to higher-grade NPC malignancy and an increased cell proliferation in sinonasal tumors. The aim of this study is to analyze the rate of accompaniment of $P27$-gene translational expression and Epstein Barr Virus-Encoded Small Untranslated RNAs (EBERs) in nasopharyngeal and sinonasal malignant and benign tumors.

**Materials and Method**

A total of 183 formalin-fixed paraffin-embedded tissue samples (120 male, 63 female) with an age ranging from 15 to 82 years were collected from archives of histopathological laboratories of several hospitals in Baghdad. These collected samples are including 18 rare cancers, namely Sinonasal carcinomas group (SNC), 65 nasopharyngeal carcinomas (NPC), 35 sinonasal papillomas (SNP), 35 inflammatory nasal polyps (INP) and 30 normal apparently sinonasal tissues as healthy control. All clinical data were taken from the accompanied histopathological reports in hospitals. A confirmatory re-examination of each block was done by the consultant histopathologist. The practical work of this study was carried out in the Molecular Virology Research Laboratories at Communicable Diseases Research Unit/Baghdad Medical College/Baghdad University. The paraffin blocks are sectioned serially at 4 μm thickness and stuck on the specified charged slides. The CISH kits (ZytoVision/Germany) were used for detection EBERs in tissue sections and done according to the manufacturer company protocols (Cat. Numbers: T-1061-40) using digoxigenin-labeled long DNA probe for EBERS detection (Cat. Number: T-1114-400:0.4 ml) (Zyto Visions/Germany). Immunohistochemical (IHC) assays were used to evaluate $p27$ expression in sinonasal and nasopharyngeal lesions by using Monoclonal Rabbit Anti-$P27$ antibody (Cat. Number: ab32034) and rabbit specific (HRP/DAB detection IHC Kit, Abcam/England) which binds to nuclear targeted protein. Quantification of CISH and IHC signals were assessed under light microscopy at X1000 also, scoring and intensity of signals were done according to.

**Statistical Analysis:** In this study Chi-Square test ($\chi^2$), Odd ratio and Spearman’s rho were used to assess the significance between variables where the statistical analysis was done by SPSS program (version-21).

**Results and Discussion**

The results of EBERs-CISH among nasopharyngeal and sinonasal study groups: Table (1) shows the positive EBERs-CISH signal detection NPC and SNC cancers tissues as well as benign sinonasal tumors; the signals of EBERs/CISH reactions were recognized as blue discoloration that was detected by their specific probes and counter stained by nuclear red, CISH-positive reactions constituted 86.2% of total NPC tissues, 88.9% of total SNC tissues. On the other hand, in benign SNP and NP tumors each of them were 57.1% in comparison to control group in which (6.7%) total positive signals were detected. The results revealed that SNC and NPC have odds ratio value of 112 (11100) and 87.111(8611.1) whereas, SNP and INP each have odds ratio of 18.667(1766.7). Highly-significant differences recorded among the studied groups ($P<0.01$). Of the positive of NPC tissues the highest percentage (35.4%) was in score 1, while the highest percentage of SNC (66.7%) in score 3. On the other hand, the highest percentages of SNP (37.1%) was noticed in score 1,while (20%) of INP was recorded in score 2 and 3 for each. The signal intensities of EBERs-CISH detection were detailed in (Figure 1). In NPC tissues group the strong signal intensity was noticed in (58.5%); while (18.5%) and (9.2%) have moderate and weak intensity. In sinonasal carcinoma, (83.3%) have strong intensities; while (5.6%) and (zero%) have moderate and weak intensities. The results of $P27$-IHC among study groups: The signals of $p27$-IHC were detected as brown discoloration at the specific antigenic sites of these reactions. (Table 2) shows the positive results of $P27$-IHC detection, where 58.5% of NPC, 66.7% of SNC, 51.4% of SNP and 60% of INP tumor tissues were with total positive signals in comparison to control healthy group in which 3.3% only noticed as positive signals. Statistically, highly significant differences were noticed between studied groups ($P<0.01$). The highest percentage of NPC tissues positivity was (26.2%) was with score 3, on the other hand highest percentage of SNC (61.1%) was with score 3. In SNP, the highest percentage (25.7%) was in score...
results in relation to the examined histopathological grading of NPC and SNC. Regarding EBERS in SNC (81.2%) are mainly noticed to have moderate and poorly differentiation grades. While in NPC highest percentage (73.2%) was undifferentiated grade. On the other hand, p27 in SNC was (66.7%) are mainly noticed to have poorly and undifferentiation grades whereas in NPC highest percentage (76.3%) have undifferentiated grade.

Figure 1: Intensity of EBERs-CISH reactions
Correlation of EBER-CISH with p27 in Patients with Sinonasal and Nasopharyngeal Lesions:

There are weak negative relationships don’t reach a significant level (P > 0.05) between EBERs and p27 scores (r = -0.027, P = 0.830) in NPC group while this relationship was a non-significant weak positive (r = 0.329, p = 0.183) in SNC. In INP, there are also weak negative relationships which again did not reach a significant levels (r = -0.281, p = 0.102), on the other hand, the correlation between EBERs and p27 scoring was a non-significant weak positive in SNP (r = 0.03, p = 0.835) (Table 4). The EBV latent proteins expression
contribute to most, if not all, of the transforming and immortalizing properties of prototype DNA oncogenic viral agent. In addition to the EBERs, human cancer cells, that are latently infected with this virus express the most powerful oncogenic proteins, latent membrane protein LMP-1 and LMP-2 (13,14). Again it is possible that HPV exerts its oncogenic influences in concert with cofactors including a possible collaboration with EBV (15,16). The higher results of EBER in present study of tumor groups are supporting other studies which found the percent of EBER in NPC were (81%, 63%, 91%, 59% and 62.2%), respectively (17,18,19). Several studies have declared an association between EBV and undifferentiated SNC; Gallo et al., (1995) (20) found that 39% of SNC was positive for EBV beside Zahedi et al., (2017) who found 100% EBV-positive SNC by CISH (21). Regarding SNP study done by Costa et al., (2014) found that EBV positively detected in (65%) while in INP, higher EBV frequency in polyps (60%) compared with 10% in nasal healthy group were found (22).

**Conclusion**

The highly significant translational expression of p27 gene as well as the high percentage of EBV-associated SNC and NPC malignant and benign tumors in our results might indicate the oncogenic potential of such bilateral relation in these cases, as well as pointing for its crucial role in development, transformation and/or progression of a subset of SNC and NPC cancers and benign SNC and NPC hyperplasia.

Nosocomial Bacterial Strains Isolated from Patients Who Reside in Different Health Facilities in Duhok City with Their Antibiotics Resistance Patterns

Zahraa Kamaz¹, Alla’a Miyasar Ahmed², Haval Abdulkhalik Hamadamin³
¹Karbala University, Nursery College, Iraq, ²Hawler Medical University, College of Health Sciences, Iraq, ³Hawler Medical University, College of Health Sciences, Iraq

ABSTRACT

Nosocomial infections are health associated problem since the emergence of multidrug resistance bacteria, MDR bacteria have been linked with mortality and morbidity globally. Most frequent bacterial strains that have been recovered from Iraqi patients reside in hospital are identified, antibiotics patterns for all isolates have been included in this study. S. aureus and mannitol negative S.aureus have high frequency rate among recovered nosocomial bacteria with 25% and 29% consequently. 90% of all bacterial strains were multi-drug resistant bacteria, MDR incidence was higher in female in compare to male p<0.05. following international infection control guidelines and CDC recommendations are required to burden the spread of nosocomial infections and MDR bacteria among Iraqi patients.

Keywords: Nosocomial infections, Multi drug resistance bacteria, Antibiotic resistance.

Introduction

Nosocomial infections are bacterial infection that patients acquired over staying in hospital for at least 48-72 hrs¹. Most frequent nosocomial infections are urinary tract infections, respiratory tract infections, burn- wound infections and blood stream infections². About 7% to 10% of patients are at risk of acquiring infections over residing at a hospital³. Gram positive bacteria especially S. aureus is predominant bacteria in nosocomial infections⁴. People who accompanying patients in intensive care units are under high risk of getting disease by nosocomial bacteria. Bacteria are rapidly spread in hospital environment by different sources, transmission from patient to patient, through contaminated medical instruments or through health care providers⁵. Hospital acquired infections constitute a major health problem in developing countries due to increasing resistance of bacteria to wide range of antibiotics⁶,⁷. Bacteria can develop resistance through different mechanisms such as modifying enzymes, efflux pump, target mutations⁸, widespread of antibiotics misuse like interrupting treatment, overuse of antibiotics or use it incorrectly aid in bacteria gaining resistance against it⁹. Study showed that the percentage of multidrug resistant bacteria isolated from intensive care units in Uganda were 58% of E.coli, 33.3% of K.pneumonia and 9.1% of Acinetobacter spp¹⁰. Whereas in Iraq, nosocomial bacteria that have been isolated from burn patients exhibited multidrug resistance were 51%, most of bacterial isolates were S. aureus¹¹. Bacteria resistance profiles has been complicated since the emergence of multidrug resistance bacteria (MDR), these bacteria show resistance to one or more of mechanisms which antibiotics work on¹⁰. An example of MDR is methicillin resistance S. aureus that are resist to more than 5 antibiotics such as aminoglycosides, macrolides, tetracycline, chloramphenicol, and lincosamides, MRSA accounts for most hospitals infections and high mortality rate in developing countries¹¹,¹². Other recently emerged bacteria are multi drug resistance gram negative bacteria which consider other health threats¹³. Studying patterns of antibiotics resistance for isolated bacteria help in prescribing the right antibiotic to combat infection, also identifying similar antibiotic resistance patterns for two or more bacterial strains can be used to determine the

DOI Number: 10.5958/0976-5506.2019.01395.0
source of contamination. This study will display most frequent bacterial strains that have been isolated from patients residing in hospital for more than 48 hrs. & identifying antibiotics sensitivity profile for each strain.

Materials and Method

**Specimen Collection:** 109 patients were involved in this study, collected samples included urine, semen, swabs, sputum and blood. For blood collecting, area was swabbed with 70% of alcohol, 5-10 mmol of blood was collected in blood culturing bottles. Midstream urine was taken for diagnosis of UTI infections. Swabs were used to collect wounds, burns and vagina discharges. Each sample was collected in a suitable transfer media until the time of culturing. Culture media: blood, chocolate and MacConkey media were used as an enrichment and selective media for primary diagnosis of bacteria. All petri dishes were incubated aerobically and in the presence of 5% of CO2. Gram staining and different biochemical tests were applied for further identification of grown bacteria at genera and species levels.

**Antibiotic Sensitivity Test:** Antibiotic susceptibility testing was performed by Kirby-Bauer’s disk diffusion method on Muller-Hinton agar (Hi Media, Mumbai, India) in accordance with the standards of the Clinical Laboratory Standards Institute (CLSI, formerly National Committee for Clinical Laboratory Standards [NCCLS]) guidelines. Antibiotics that used are Amikacin (AK), Ampicillin (AM), Amoxicillin+ Clavulanic acid (AMC), Azithromycin (AZM), Chloramphenicol (C), Cefixime (CFM), Ciprofloxacin (CIP), Colistin (CL), Ceftriaxone (CRO), Cefotaxime (CTX), Doxycycline (DOX), Nitrofurantoin (F), Gemifloxacin (GEM), Gentamicin (GEN), Imipenem (IPE), Levofloxacin (LEV), Meropenem (MEM), Nalidixic acid (NA), Netilmicin (NET), Norfloxacin (NOR), Piperacillin (PI), Rifampin (RA), Tetracycline (TE), Ticarcillin (TI).

**Statistical Analysis:** Data were analyzed using excel program 2017, Comparisons between patients’ gender in the rate of occurrence of MDR nosocomial infections were made using fisher test, Probability <0.05 considered significant.

Results and Discussion

113 different bacterial strains have been isolated from different specimens, frequency of each isolated bacteria is illustrated in table 1. Nosocomial bacteria that have been isolated from female was 77% while in male was 19% with P<0.05.

Antibiotics sensitivity patterns for gram positive and gram negative bacteria are stated in table 2&3, MDR nosocomial bacteria percentage was 90%. The rate of MDR bacteria occurrence among male and female are explained in Figure 1. The problem of antibiotics resistant bacteria has been widely distributed in Iraq, the misuse of antibiotics by patients is the mainly cause of such problem. We conducted this study for the above reason, to determine the percentage of MDR bacteria and to recognize which antibiotics should be excluded from patients’ treatments. Emergence of MDR mannitol negative *S.aureus* have been reported, 33% of nosocomial bacterial isolates are Mannitol negative *S.aureus*. Molecular identification for this isolates are required for validation since STAPH API misidentified mannitol negative strains of *S.aureus* with *S. lundunensis* 17. *S. aureus* and *E.coli* were the most common nosocomial bacteria that have been isolated in the current study. Other studies have been recorded that *S.aureus* followed by *E.coli* and *Klebsiella* are the most common bacteria that have been isolated from different infections. 90% of our isolates were MDR bacteria, Most MDR *E.coli* strains have been isolated from female with UTI. *E.coli* UTI infections are common in female rather than male because of physiological reasons. Following infection control tips are required to burden the spread of nosocomial MDR infections such as hand washing with alcohol gels that are bactericidal, fungicidal and virucidal, wearing garments, gloves and a good quality air filters masks specifically for nurses and other health care providers are important to avoid infections through patients’ body fluids and droplets during coughing 21.

![Table 1: Nosocomial bacteria frequencies distributed by gender](image-url)
help in minimizing the risk of MDR infections, Local surveillance of MDR bacteria percentage and their pattern of resistance should be done annually in order to determine the right antibiotic and the accurate duration of treatment\(^2\). There are guidelines that are followed by US hospitals to minimize the spread of MDR nosocomial bacteria, these guidelines are 1- following SHEA guideline on control of MRSA and VRE\(^2\), 2- CDC recommendation to fight resistance by: Implement infection prevention and control practices. Improve antibiotic use. Implement data and tracking systems to track resistance, guide prevention strategies, and report results at the local and global level. Improve lab capacity to identify resistant bacteria\(^2\).

Prevalence and Risk Factors of Low Back Pain among Nurses in Kirkuk General Hospitals

Omed Hamarasheed Mehammed-Ameen¹, Nashwan Nadhim Hasenb², Suhailah Mohammed Ali³
¹Community Health Nursing, Iraq; ²Psychiatric Nursing, Iraq; ³Maternal and Child Health Nursing, Iraq

ABSTRACT

Work-related low back pain (LBP) is a significant problem among nurses. Great prevalence rates of LBP among nurses are recorded in many countries. Many factors affect back problem included individual and occupational factors. This study aimed to assess the prevalence and associated risk factors with low back pain (LBP) among nurses in general hospitals. A cross-sectional descriptive design study. Convenience sampling technique was used comprising 204 nurses who have fulfilled the inclusion criteria. Data were collected through a self-constructed questionnaire over a period of three weeks, and from two general hospitals (Azadi teaching hospital and Kirkuk general hospital) in Kirkuk city/Iraq. Most of the respondent nurses (52 %) were reported having LBP during the last 12-month of their life. Factors that significantly associated with LBP were personal factors included age, marital status, and weight level in addition to occupational factors such as hospital and the unit/department they work. The current study cautions of high LBP prevalence rates among nurses in Kirkuk city/Iraq. The LBP has a significant association with multiple factors such as; age, marital status, weight level, hospital and the unit or department they work in.

Keywords: Kirkuk, low back pain, nurses, prevalence

Introduction

Musculoskeletal disorders are one of the major troubles that occur in the discipline of health. It is viewed globally as the 2nd leading reason of physical disability ¹. Low back pain (LBP) as one of the most musculoskeletal disorders considered a predominant public health problem, reaching epidemic levels among general people, affecting economically active humans and considered the most critical reason for medical leave ². Previous studies indicated that more than 80% of the overall population will experience a back disorder at some period in their lives ³. The LBP can be defined as pain for at least one day that might radiate to one or both lower limbs in the area between the lower margins of the twelfth ribs to the lower gluteal folds, acute LBP also defined as any LBP that lasts for less than three months, and chronic LBP is defined as pain that lasts for three months or more ⁴. Back pain can be described as all disorders of pain; ache, stiffness or fatigue localized to the back, associated to nursing practice ⁵. Generally, it is the leading reason of disability, reduced bodily overall performance at work and absenteeism in the working people ⁶. The nurses who work for protection, increase and promotion of health in cases of health problems for individuals and families, devote more time with the patients when compared with other health specialists and deliver direct care for the patients ⁷. Therefore, Nurses are amongst the professionals with the most elevated occurrence rates of work-related LBP ⁸. For example, prevalence rate among Iranian nurses was 50%, and one-year prevalence among nurses in Qatar was 54.3 % ⁹,¹⁰. Previous studies discovered that there is different risk factors affecting the incidence and prevalence of low back pain among nurses. These risk factors are divided into: personal, occupational, and psychosocial risk factors. Personal risk factors includes; participants age, gender, marital status, educational level, body mass index, family history, smoking, alcohol usage and physical activity performance ¹¹,¹². Whereas, occupational risk factors that associated with LBP among nursing staff includes; prolong standing, frequent bending, lifting and moving patients or heavy objects, continued postures, awkward positions, job organization,
inadequate ergonomic structures, inappropriate work
design, low social support, poor job satisfaction, staff
deficiencies and unsuitable working condition\textsuperscript{13,14}.

Methodology

Design and Sampling: This study adopted a cross-
sectional descriptive design. Convenience sampling
technique was used to involve 204 nurses who fulfilled
the inclusion criteria. The participant nurses were from
different workplace (units/departments) and at different
work shifts. The researchers had excluded the nurses
with less than a year experience, pregnant nurses, and
nurses with a metastatic disease.

Data Collection Tool: A data collection sheet was
constructed after reviewing many relevant literatures. It
composed of 30 items comprising: personal characteristics
(age, gender, marital status, education level, weight,
height, smoking and exercise performance), work-related
characteristics (hospitals, units/departments, experience,
weekly working hours’ rate, working shifts, dual jobs,
work stress, frequent standing, sitting, walking, bending
or twisting, lifting heavy weight and participation in
training course regarding preventing LBP). The final
part of the tool concerned prevalence of LBP (last 12
month), pain description (pain acuity, duration, causes,
and professional consequences (absence from work, and
change of workplace). The English questionnaire was
translated to Arabic language.

Data Collection Procedure: The data were collected
over a period of three weeks from two general hospitals
(Azadi teaching hospital and Kirkuk general hospital)
in Kirkuk city/Iraq. The data were collected through
self-administrated questionnaire and filling out the
questionnaire took about 5-10 minutes. Ethical approval
was granted by the Directorate of Kirkuk health and the
hospitals. Informed consent was obtained from all the
participants before the data collection procedure. They
were informed that their participation was fully voluntary
and they had the right to withdraw or discontinue from
this study at any time without any hesitation or risk.

Data Analysis: All data were summarized and analyzed
by using Statistical Package for Social Sciences version
23. Descriptive statistics described the nurses’ personal
characteristics data, work-related characteristics data and
the prevalence of LBP. Group differences and association
were analyzed by the ($t$-test and Chi-square test and Fisher
test) with the level of significance determined at P- value
less than 0.05. Data were further analyzed using Binary
logistic regression techniques to discover for independent
predictors of point prevalence of LBP.

Result and Discussion

Sample Characteristics: Two hundred and eighteen
questionnaires were distributed and only 206 nurses
(response rate = 94.5\%) decided to participate and
completed the survey from the selected hospital.
Respondents were mostly young ($M = 28$, $SD = 7.86$) and
71.6\% were between the age 20-29 years, approximately
60\% of were female and 53.4\% were single. Most of the
nurses (84.6\%) had work experience ranged from 1 to 10
year. Other details are shown in Table 1.

Prevalence Rates: Figure 1 shows the last 12-month
prevalence of low back pain (LBP). Total 106 (52\%) of
the respondent reported having LBP and 98 (48\%) not
reported LBP during the last 12-month of their life.
Factors associated with LBP: Regarding the personal factors, the results revealed that age, marital status and weight level were personal factors significantly associated with LBP within the P-value less than 0.5. Also, the results of the t-test show that the prevalence of LBP was higher in older nurses ($M = 29.09$, $SD = 8.33$) than in younger nurses ($M = 26.97$, $SD = 7.1$) ($t$-test $= -1.953$, $P = 0.05$). Furthermore, the results of the Fisher test show that single nurses significantly reported higher prevalence of LBP (59.6 %) compared to the married nurses 43 % (Fisher = 5.777, $P= 0.03$). The prevalence of LBP was also higher in overweight nurses (63.6%) compared with underweight (25 %) and normal body weight nurses (44.9 %) (Fisher = 8.01, $P = 0.04$). Other personal factors, such as gender, educational level, smoking and regular exercise performance were not significantly associated with LBP within the P-value equal or less than 0.5 (Table 2). The hospital and the workplace (department/unit) were only the occupational factors significantly associated with LBP. The results of the Chi-square show that the prevalence of LBP was more common in nurses who working in Azadi teaching hospital (63.9 %) in compare with nurses who working in Kirkuk teaching hospital (38.5 %) ($X^2 = 9.505$, $P = 0.002$). Regarding the unit/department, the result of Chi-square reveals that the prevalence of LBP was higher in nurses who are working in Operations department (68.9 %), Pediatric departments (66.7 %) and Maternity departments (66.7) sequentially ($X^2= 23.219$, $P = 0.003$). Other occupational factors, such as experience, work stress, standing, sitting, walking, bending or twisting and lifting heavy weight were not significantly associated with LBP within the P-value less than 0.5 (Table 3). Binary logistic regression demonstrated the association between LBP and risk factors; such as age, gender, marital status, educational level, smoking, exercise, BMI, work experience, hospital, department/unit, work stress, prolong standing, prolong sitting, prolong walking, prolong bending and lifting heavy weight. Four of these risk factors, reached statistical significance ($P < 0.05$) including department or unit, hospital, age and marital status. Some departments or units show statistically significant association includes pediatrics, operation department, consultation and surgical departments, with working in pediatric departments ($P= 0.00$) and operation departments ($P= 0.006$) sequentially being the strongest risk factors with an odds ratio of 0.1 (range 0.031 to 0.318) and 0.162 (range 0.044 to 0.591). Hospital is also considering statistically significant factor with an odds ratio of 0.288 (range 0.135 to 0.612) and $P= 0.001$. Furthermore, age is statistically significant with an odds ratio of 1.05 (range 0.998 to 1.104) and $P= 0.041$, indicating that, for every additional year of age, nurses are 0.8 more likely to report LBP, controlling all other factors in the model. The last statistically significant factor is marital status, with an odds ratio of 0.555 (range 0.301 to 1.021) and $P= 0.045$. Other risk factors were not demonstrated significant association with LBP within the P-value less than 0.5 (Table 4). Current study results show that more than half of nurses (52 %) experienced LBP during the last 12-month period. This indicates that LBP is an existing and prevalent problem among the nurses. Comparing with the results from various studies using the same measure, the result is in line with a result of a study conducted among nurses in Fattouma Bourguiba teaching hospital in Tunis when last year prevalence rate was 50.1% 16. Higher records of LBP prevalence were observed in a study done among nurses working in intensive care units in China and they reported an annual prevalence of 87% 17, and among Jordan nurses with the one year prevalence of 78.9% 18. Lower records of LBP prevalence were also observed in studies conducted in England 45% 19, Italy 44% 20, and Hong Kong 41.6%.

Conclusion

The current study cautions of high LBP prevalence rates. Though, taking precautions for prevention of LBPs in nurses is necessary in order for nurses to exercising their fundamental right to work below healthful and safe conditions, to keep their professions and to grant better support for their patients. The LBP has associated with factors, such as age, marital status, weight level, and hospital and the unit or department they work in. We recommend conducting further studies with a larger sample of nursing staff in different cities and regions and include other types of risk factors such as psychosocial factors. In addition, there is need to conduct more studies to investigate the level of nurse’s cognitive knowledge for this problem, and its ergonomic solutions.

Quality of Life among Caregiver of Children with Thalassemia in Al-Najaf Governorate

Wameedh Hamid Shaker
University of Kufa, Faculty of Nursing, Iraq

ABSTRACT

Objective(s): To assess quality of life among child’s caregiver with thalassemia, and to find out relationship between socio-demographic data and caregiver of child with quality of life among caregiver. Descriptive study designed was carried out through the present study in order to achieve the early stated objectives for period from February 2017 to March 2017. The study is conducted at AL-Najaf health directorate Al Zahra’a teaching Hospital the governorate of Najaf. Simple purposeful sample of (80) children with thalassemia in the present study all from teaching Hospital. The main findings of the study indicated that through the course of data analysis more than one half of the study sample the most hospitals are distributed in the city center rather than in the city side or in rural areas, the males patients are more attend than the female patients, the study sample responses to overall evaluation for the majority of the family interaction items was unsatisfied, study subject’s responses to the correlation ship through all domain the family interaction was which reported a significant cases correlation ship at p-value 0.01 level correlation is significant also parenting and physical material well–being.

Keyword: Caregiver, Children, Quality of life, Thalassemia.

Introduction

Thalassemia at current is reflected as one of the most challenging hematological disorder with no permanent cure. It refers to a group of genetic disorders, characterized by insufficient making of hemoglobin\(^1\). The genetics of thalassemia are alike to those of sickle cell disease in that it is hereditary through an autosomal recessive process. It a genetic disorder that most often affects those of African descent, but it also affects individuals of Middle Eastern, Caribbean, Mediterranean descent and South Asian,\(^2\). There are two basic types of thalassemia, \(\alpha\) and \(\beta\). In \(\alpha\)-thalassemia, synthesis of the \(\alpha\) chain of the hemoglobin protein is affected. Complications with the \(\beta\) chain occur more often.\(^2\) Thalassemia affects patients’ health-related quality of life (HRQOL). Children with thalassemia major has to undergo blood transfusion at least once a month, depending on the severity of the disease. Iron chelation therapy such as desferrioxamine is required to remove excessive iron in the blood, which resulted from regular blood transfusion\(^3\). Although efforts to measure quality of life (QOL) of children are complex, more and more generic measures of disease-specific tools have been reported HRQOL of the physical, psychological and social domains of health are influenced by experiences, beliefs, expectations and perceptions\(^4\).

Methodology

A descriptive “Evolutional” design was carried out to determine the Quality of life among caregiver of children with thalassemia. Simple purposeful sample of (80) Quality of life among caregiver of children with thalassemia in al-najaf governmental.

Instruments: Through extensive review of relevant literature, a questionnaire was fashioned for the purpose of the study. It is composed of three major parts included personal information sheet. Demographical data, social-demographic data of child and family interaction.

Data Collection: The data collection process was initiated for the period of February 1th, 2017 through March 23th, 2017. Data were collected through the use of the constructed questionnaire.

Data Analysis: In order to determine whether the objectives of the study were met or not, two statistical approaches were used for analyzing the data of the study. Results were considered highly significant.

Results and Discussion

Table 1 shows that the different levels of Age Groups variable whatever a large frequency was reported at seven and above (55.0%). This table shows that the majority of the study subjects haven’t male (56.2%). This table show is father occupation was student 57.5%. This table also father that frequency is a highly significant mainly at the father alive 98.8% and mother alive 93.3%. (Institution and college graduate) for father education level (37.5%), whereas the mother education level was Secondary school graduate (17.5%). This table show is father occupation was Employment (51.2%). While mother occupation was House wife (61.3%). This table shows that majority have urban (52.5%). Whereas the family socio-economic status was (52.5%) barely sufficient. Table 2 showed the correlation ship through all domain the family interaction was which reported a significant cases correlation ship at 0.01 level correlation is significant also parenting and physical/material well-being

Throughout the course of the present study, the study results show of the sample age of the child that the percentage was for (7-11) average (50.%) this result agree with the Caregiver Burden and Social Support in Mothers with β-Thalassemia children concerning the gender, most of the study sample (56.2 %) this may be due to that the mean gender of the patients, this result is similar to results (51.8%) obtained from study Quality of life in children with β-thalassemia major at center for special diseases  the study results show of the sample child is student (75.5%) and father alive is (98.8%) and mother alive is (93.8%). This result similar to result (95.1%), caregiver age (26-40) year is (50%) the study found that high percentage of caregiver is mother (48.8%) and educational level for mother is primary school (31.2%) while education level for father is institution and college graduated (37.5%) this result agree with Quality of Life among thalassemia children, adolescent and their caregivers and study of occupation of mother is house wife (61.3%) and father occupation is employed (41.2%)  the study results show of the satisfied with hepatic iron stores and plasma ferritin concentration in patients with sickle cell anemia and thalassemia major satisfied for emotional well-being in the study  the study results show of satisfied with bone marrow transplantation for children with thalassemia major in the UK is the quality of life satisfied was reach agreement in study  This table show is explain the quality of life variables that include Caregiver, Educational level for father, Educational level for mother, Occupation for father, Occupation for mother, Residential area, and Family socio-economic status was disagree with for the Growth and puberty and its management in thalassemia

**. Correlation is significant at the 0.01 level (2-tailed).
Conclusion

The majority of the study subjects father occupation and mother occupation was majority. Most of the sample from above 7-11 years old. The educational level of majority of the sample is Secondary school graduate the majority of gender was of the sample male, overall disability assessment of the physical and emotional study subjects responded with overall disability. The quality of life was affected the most domain. The overall assessment of quality of life and demographic data significant.

The Impact of Teaching on the Skills of Visual Thinking and the Development of the Tendency of Pupils in the Fifth Grade Primary

Olfat Kazem Omran1, Mahdi Jader Habib1, Qais Hatem Hani1
1University of Babylon, College of Basic Education, Babylon, Iraq

ABSTRACT

The aim of the research was to identify the effect of teaching on the skills of visual thinking in the collection of social subjects and the development of the inclination of the students in the fifth grade. The researcher adopted the method of experimental research as a methodology for the research, which includes independent variable (visual thinking skills) and two variables (achievement and tendency development) A partial-experimental experiment to adjust search variables, Before applying the experiment, the researcher was rewarded between the two research groups for the purpose of obtaining accurate and objective results with the following variables (The chronological age is a month, Grades of social subjects in the half year, Educational achievement of parents, Raven test for intelligence, Tribal test for tilt scale) After the equivalence between the two groups of research, the researcher prepared the application requirements of plans, objectives and tests for the two research groups, after the completion of the application of the experiment. The researcher applied her research tools to the two research groups and after correcting the students’ answers, the researcher obtained data for the experimental group and control. The data were processed statistically by (spss) and (T-test) for both groups.

Keywords: education, Course of Study, Teacher, Modalities and skills, Social Studies, Visual thinking, Visual Thinking Skills, Collection, development of inclination.

Introduction

Since education is a planned and deliberate process, it aims at making desired positive changes (educational and social) in the student’s behavior, thinking and understanding. The main objective is to make the student a strong and influential figure in society and to establish relations with his peers. The first goal of education is to graduate men who are capable of producing new things, innovative men and explorers 1, Hence, education has become one of the most important means adopted by nations and peoples to raise their children in accordance with the social philosophy they are following. This is the most powerful way for nations to prepare their generations 2. The curriculum is a means of education that includes all the experiences that are given to the student from inside and outside the school. It also constitutes a basis in shaping the life of the individual and the society and preparing generations capable of keeping pace with the progress of civilization and keeping pace with the scientific development. The curriculum is important for giving the individual the ability to deal with others Ability to think properly, which includes analysis, criticism, reasoning and evaluation in the stages of the educational process, all of which passes through the student 3. The school can achieve its objectives represented by the objectives of education through various means, including the school curriculum, which means the range of experiences and the practical activities of the school for students with the purpose of contact and interaction with them and the results of this interaction to learn and modify their behavior and lead these experiences and those activities to achieve the ultimate goal of education 4. And that the school curriculum is closely related to the methods of teaching; because teaching methods are one of the important means in translating the curriculum to what the school aims to create habits, tendencies, trends and values when asked and the good way of teaching is not limited to providing methodological information.
only but helps to develop student tendencies and push them to Positive action and productive participation in education\(^5\). There is no better method of teaching, so the teacher must choose a method appropriate to the nature of the learner and the subject matter for each method of social and descriptive environment that achieves its objectives Titi, (2007). The social materials curriculum has a prominent place because of its importance and effective impact in the preparation of young people for their academic and professional future to make them useful and active members of society so that they can bear the consequences of life and their burdens, understand the problems surrounding them and their society and contribute to the development of successful solutions to them and have the will to change for what is best for them and their community. An important factor that leads to the success of the teacher in his work is his proficiency in teaching skills, because this leads to increasing the participation of students and attract their attention and raise their level of education. The successful teacher is the teacher who adapts the different methods and volunteering to suit the different grades that differ according to the students themselves\(^8\).

**Methodology**

**Experimental Design:** Research Methodology The researcher adopted the experimental approach to achieve the two research objectives and used the experimental design of the experimental groups and the partial control.

**Research Community:** The research community is one of the fifth grade primary school pupils in the primary day schools for girls in Babil governorate for the academic year 2017-2018. A sample of schools from the Directorate General of Babylon was randomly selected. Fifth Primary Of the 69 students distributed between the two divisions (A - B) In a random way was chosen Division (A) to represent the experimental group and Division (B) to represent the control group and after the exclusion of student deposits in the two divisions (A - B) The total number of 63 students in each The experimental and control groups.

**Equal Search Groups:** The two groups were investigated in the following variables (IQ test, the age of the students, the grades of the social subjects in the semesters exam, the parents’ educational achievement and the pre-test of the slope scale).

**IQ Test:** The researcher applied the Raven test for successive colored matrices on the students of the two research groups because of their suitability for the students of the research sample. After correcting the responses, the average score of the experimental group was (21.06), while the average score of the students in the control group was( 20.66), When the T-test was used for two independent samples, it was found that the difference was not statistically significant at (0.05).

The chronological age is computed per month: The mean age of the experimental group was 130.94 months. And the arithmetic average of the control group (129.78) months. The variance of the control group was (19,27) and the experimental group (29,70). When the t-test was used for two independent groups to determine the difference between the age of the students of the two groups of research, it was found that the difference was not statistically significant at (0.05) and the freedom degree (61). The calculated T value (0.928) Which is smaller than the scale value of (2,000) as in Table (2). The T tabular value is (2) at the degree of freedom (61) and the significance level (0.05), meaning that there are no statistically significant differences between the average age of months for the two research groups.

Grades of social subjects in the half year: The score of the students in the experimental group was (64.29) and the standard deviation was 14.7. The average score of the students in the control group was (63.88) and the standard deviation was (14.74). When the t-test was used for two independent samples to determine the significance of statistical differences, it was found that the difference was not statistically significant at (0.05). The calculated T value (0.112) was smaller than the scale (2,000) and the degree of freedom (61) However, the experimental and control groups are statistically equivalent in the grades of social subjects in the semester, and Table (3) shows this.

Parental Achievement:

A. Educational achievement of parents: The researcher conducted an equivalence between the two research groups in the educational achievement of the parents through an information form distributed to the students. After collecting the data on the parents’ achievement of the two groups, the achievement levels were (reading, writing, primary, intermediate, preparatory). Of these levels, In order to determine the parity of the students of the research groups (experimental and control) in the educational achievement of the parents, the researcher used the square equation of Ka (2) t was found that the difference was not statistically significant at the significance level (05, 0). The value of Ka (Ka2) calculated (1,032) was less than the value of Kai (Ka2) of the scale (7,815) and the degree of freedom (3) In parents’ academic achievement and Table (4)

Determination of scientific material: The scientific material included the second and third units of the social books to be taught for the fifth grade for the academic year (2017-2018) during the period of the experiment.

Teaching Plans: The researcher prepared for the two groups research the teaching plans based on the content and behavioral objectives of the scientific material has been prepared (20) study plan for each group and formulated (141) behavioral goals.

Test application for testing: The researcher applied the experimental test to a sample of 100 students from the fifth grade The response time for students was approximately (46) minutes.

Statistical analysis of test paragraphs: The researcher applied the test to a sample of 100 students with the characteristics of the research sample to extract the statistical analysis of the test paragraphs in the school of rejoicing The coefficient of difficulty of the paragraph calculated by the researcher where Oujda it ranges between (0.39-0.70) The difficulty coefficients were acceptable because the coefficient of difficulty of the paragraph was acceptable, ranging from (0.20 to 0.80). (Bloom, 1971: 40)

Parameter discrimination coefficient: The coefficient of discrimination of paragraphs ranged from (0.33, 0.56) It is preferable to have a coefficient of distinguishing paragraphs (0.30) (Eble, 1972: 40).

The effectiveness of wrong alternatives: The researcher used the equation of excellence with the wrong alternatives for each paragraph, which turned out to be attractive to the respondent of the low level, as he chose more than the high level.

Test stability: The test was verified In the equation of alpha chromosome Which is the usability that indicates the homogeneity of the interior which is closest to the concept of stability, but divided the test into parts with a number of paragraphs The
stability coefficient (0.88) It is a good stability factor because tests with a coefficient of stability of (0.60) and more, it is reliable.

The researcher used the statistical means T-test for two independent samples The coefficient of ease The difficulty And the effectiveness of wrong alternatives And the Kai box (Ca 2 - x2 - quire - his).

The results indicated that there was no statistically significant difference at the level of (0.05) between the experimental and the control groups between the average achievement scores and the experimental group that studied the social subjects through visual thinking skills and the average control group scores studied by the normal method The average score of the experimental group was (28.94) and the standard deviation was (5.9), while the average score of the control group was (24.19) and the standard deviation was (5.69).

Conclusion

The adoption of visual thinking skills in teaching activate knowledge and generate excitement and motivation and suspense for the lesson, which increases the educational achievement of students. The adoption of visual thinking skills in learning social subjects for the fifth grade has had a positive impact on the expansion of visual thinking of girls, And encourages learning based on the skills of visual thinking on freedom and express opinion and active participation in the lesson and this in turn increases self-confidence when expressing ideas and opinions without hesitation or fear. The teaching of social sciences according to the skills of visual thinking has had a positive impact on the level of students’ attitudes toward social subjects.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon, College of Basic Education, Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Uric Acid Correlates Negatively with Anti-Mullerian Hormone in Chronic Kidney Disease and/or Polycystic Ovary Syndrome Patients

Samal Hakeem Kareem AL-Jaff
Mustansiriyah University, College of Science, Biology Department, Baghdad, Iraq

ABSTRACT

Female reproductive is deteriorating during CKD by a disruption in (hypothalamic-pituitary-gonadal axis). Our interest was to study the Anti-Mullerian Hormone (AMH) in CKD patients, with the possibility that CKD (not kidney failure) may effect on women AMH levels in CKD and/or PCOS, and the affection possibility of PCOS on kidney function. Eighty female involvement in this research (26-40) years old divided in to: twenty female as a healthy control. Twenty female PCOS group. 3) Twenty CKD group. Twenty female patients suffering from both CKD and PCOS (CKD+PCOS). This study conducted between (April 2015 to August 2017), in Baghdad. AMH was sub normal in CKD patients with a significantly higher level of LH (P ≤ 0.01). Uric acid, urea, Creatinine, monocytes and AMH was elevated in PCOS patients, uric acid correlate positively with and monocytes and negatively with AMH, also uric acid, LH, AMH and monocytes were significantly high (P≤0.01) in CKD+PCOS group. Uric acid negatively affect AMH levels in women, AMH is not a good diagnostic indicator of PCOS status, if blood uric acid was high. PCOS may cause hyperuricemia leading to kidney failure. Kidney function showed be tested rottenly in any suspected case of PCOS.

Keywords: Anti-mullerian hormone; Luteinizing hormone; Polycystic Ovary Syndrome; Chronic Kidney Disease; uric acid; monocytes.

Introduction

Menstrual defects, premature menopause, and infertility are mutual incident among chronic kidney disease (CKD) in women 1. Their etiology is complex, such disorders may deteriorate fertility (secretion or metabolism) of several hormones 2,3. The kidney is a sex hormone key regulator in CKD patients 4, kidney disease onset results in the dysfunction of ovaries in women, predominantly though normal hypothalamus-pituitary-gonadal axis disruption 1. Fertility disturbance by uremia in women with CKD may cause ovaries damage 5. Luteinization of the follicles of the ovaries in patients with uremic CKD is very unusual leading to arrest of the ovary follicles 6, the un Luteinization of ovary follicles in CKD seems to be similar to the Poly Cystic Ovary Syndrome (PCOS) in women. In premenopausal women, PCOS is a very common endocrine disturbance, it’s distinguished by, oligo-anovulation leading to changing in the morphology of the ovaries 7,8. Anti_mullerian Hormone (AMH) a delicate indicator for the activity of the ovaries and for diagnosis of PCOS 9,10. AMH is a 140 kDa glycoprotein 11, granulosa cells of essential pre antral follicles and small antral follicles in the ovaries synthesized AMH until these follicles reach to a diameter of 6-8 mm 12. AMH function as folliculogenesis is to suppression the excessive of more primordial follicles recruitment and growth modification of the pre antral follicles and antral follicles by decreasing follicle sensitivity to Follicle Stimulation Hormone (FSH) 11,13. The number of follicles correlates positively with serum level of AMH, Therefore, it is related to the reduction of growing follicles quantity 14,15. Thus, the concentration of serum AMH reflects to follicles pool and it considers the best marker for ovarian reserve 14,16. Serum Creatinine derived

from the breakdown of Creatinine and phosphocreatine in muscle, it is filtered freely by glomerular. In Nerwan study, Creatinine and urea were significantly higher in CKD case, in addition, there is a growing proof that hyperuricemia (elevation in uric acid) is correlated with CKD development. There are limited literatures on the sexual problem of CKD in women. The aim of this study was to 1 comparing the level of AMH in PCOS patients and in CKD patients and in patients who have both diseases (PCOS and CKD). 2 Investigate the accuracy of using AMH for PCOS diagnosis when there is a kidney problem. 3 The causal relationship between PCOS leading to Kidney Disease. There are no other studies of this precise topic have been proceeding so far.

**Material and Method**

This study accepted by all parties with the ethical standards of the responsible committee of the medical college in Mustansiriyah University.

**Subjects:** The informed written agreement has been signed by the participant. Before any involvement in this study. Eighty female involved in this study their age ranged between (26 - 40) years old, divided in to; (1) twenty healthy fertile female as control, (2) twenty female as PCOS patients (PCOS group), (3) twenty female previously diagnosed chronic kidney disease patients (CKD group), not a stage of kidney failure that need hemodialysis, and (4) twenty female patients with both CKD+PCOS. Blood sample and testing were collected in (Baghdad Medical City) in Baghdad during the period from (February 2015 to June 2017). Poly cystic ovary syndrome has diagnosed according to Rotterdam 2003 criteria: After exemption of any other disorders, PCOS defined as the existence of two of three of the following signs. (a) Menstrual and/or ovulatory disorder, Oligo or anovulation {Oligo menorrhea, less than six menstrual periods in the prior year} or Amenorrhea {no menstrual bleeding over prior three months}. (b) Hirsutism (clinical evidence of Hyperandrogenism) and/or biochemical signs of androgen excess. (c) Polycystic ovaries. This study discarded by a (questionnaire way) any patients with obvious system diseases such as diabetes, genetical diseases, obesity (Body Mass Index (BMI) ≥ 25 kg/m2 was excluded), liver and thyroid diseases, and any endocrine disorder, also we excluded any patients on long-term treatment.

**Method:** Blood samples collected from the antecubital vein using a disposable syringe then centrifuged after that, serum was separated and kept in (-20 C) to be tested later by using.

- a. AFIAS- 6 {Automatic Florescence Immuno-Assay} were used to measure FSH, LH, by a Kite produced by (boditech)® from Boditech Med Inc. (KOREA).
- b. {ELIZA} for AMH using (BECKMAN COULTER) ® kite from Beckman Coulter, Inc. (U.S.A.).
- c. Serum urea, uric acid, and Creatinine are most widely accepted parameters to assess kidney function status as well as renal status blood urea, Creatinine, and uric acid tested by using (BioSystems) ® Kite, (Spain).

- Monocytes count was done with whole blood, using DxH 500®, a five-part differential hematology auto-analyzer, (BECKMAN COULTER) ®, (USA).

**Statistical Analysis:** The research data expressed as mean ± standard error (M ± SE). Considered data were analyzed by one-way analysis of variance (ANOVA) then followed by fisher’s test for multiple comparisons using (Stat View software version 5.0). The differences were considered significant only when P-value is ≤ 0.01. Analyses Regression were conducted through covariance analysis (ANCOVA) for correlation also carried out by using (Stat View software version 5.0).

**Results and Discussion**

Anti-mullerian hormone data differentiated significantly, in the table (1) AMH significantly differs (P ≤ 0.01) between all study groups and control group, it was higher (P ≤ 0.01) in PCOS group and lowest (P ≤ 0.01) in CKD group. In FSH, results showed significant differences (P ≤ 0.01) between all study groups and control group, the CKD group had the higher level (P ≤ 0.01) and the CKD+PCOS group showed the most lowest level (P ≤ 0.01), there were no differences (P ≤ 0.01) between CKD+PCOS group with PCOS group. This study showed a clear significant elevation (P ≤ 0.01) in LH concentration between all study groups compared with control group. It was very high (P ≤ 0.01) in the CKD+PCOS group and lowest (P ≤ 0.01) in the control group. Table (1) showed differences (P ≤ 0.01) in Creatinine. All groups under study showed a differences
(P≤ 0.01) compared with control group, Creatinine was higher (P≤ 0.01) in CKD group and lowest (P≤ 0.01) in the control group, urea concentration was significantly different (P≤ 0.01) between all study groups compared with control group. Urea was higher (P≤ 0.01) in CKD group and lower (P≤ 0.01) in the control group. There were no differences (P≥ 0.01) in Creatinine and urea levels between CKD+PCOS group and CKD group. Also in the table (1), a significant difference (P≤ 0.01) in uric acid between all groups of the study compare to control group, it was higher (P≤ 0.01) in the CKD+PCOS group and lowest (P≤ 0.01) in the control group. No significant difference (P≥ 0.01) was in uric acid between CKD group and PCOS group. Monocytes was increased significantly (P≤ 0.01) in all study groups comparing with control group, it was higher in CKD+PCOS group and lower in control group. This study showed a negative association between AMH and uric acid in all study groups (fig 1, B.C.D) except in healthy control group (fig 1, A). Also Uric acid correlate positively with monocytes in all study groups (fig 2, B.C.D) except in control group (fig 2 A).

In CKD group, AMH decreased under normal level; in women the onset of kidney disease results in dysfunction of the ovaries, largely by (hypothalamus-pituitary-gonadal axis) normal disarrangement, the degree of dysfunction seems to be linked directly to CKD, Thus, any disorder in menstrual cycle and in fertility become increasingly prevalent as CKD progressing in women (28). Logically impairment of ovulation in CKD may lead to increasing AMH, similar to PCOS cases (25), but our data showed decreases in AMH in CKD patients. We believe that this decrease due to the size of the follicles in the ovary, it might be bigger than (8mm) in CKD patient, normally AMH secretes from follicles less than (8mm) in size (27). More studies should be done to compare the size of ovarian follicles between PCOS and CKD.

Grabkaa (5) and Stoumpos (29) found that women with CKD, levels of AMH decreased but not in hemodialysis CKD patients, they found that with hemodialysis AMH increased, because AMH molecular weight of 140 kDa, and it cannot be cleared by dialysis (30). Uric acid in PCOS group was elevated, this result agreed by Gozukara (50) who also tested a high uric acid in PCOS patients, PCOS patients suffered from high C-Reactive Protein (CRP), and high CRP correlated positively with hyper filtration (49). This correlation is very important because increasing filtration is linked to renal function decline eventually (48). This declining in renal function leads to rising blood uric acid in PCOS patients.

Luteinizing hormone in CKD+PCOS group was very high, higher than all study groups, this might be due to a synergism between CKD and PCOS, with the fact that both diseases cause LH elevations, LH elevated in CKD (34-36) and LH elevated in PCOS (24,32,39). AMH in CKD+PCOS group was lower than PCOS group this due to kidney disease which affect negatively on the ovaries by disruption of (hypothalamus-pituitary-gonadal) axis (28), also AMH was higher in CKD+PCOS group than the CKD group; this is a confusing result, logically it should be non-significant. This elevation of AMH in CKD+PCOS group may be hypothetical because: There are some small ovary follicles less than (8 mm) which still secrete AMH even with the disruption of (normal hypothalamus-pituitary-gonadal axis), this appeared to be due to kidney dysfunction (28), also, this is why AMH in CKD+PCOS group was higher significantly than control group. We believe that with time AMH will decrease in CKD+PCOS group.

Table 1: Comparison of data between study groups
Figure 1: Show the correlation between AMH: Anti-mullerian hormone (ng/ml) and Uric acid(mg/dl).
A) Control group: no correlation (P-value =0.490) (R²-value =0.136). B) CKD+PCOS group: negative correlation (P-value = 0.001)(R²-value = - 0.663). C) CKD group: negative correlation (P-value = 0.001) (R²-value = - 0.775). D) PCOS group: negative correlation (P-value = 0.001)(R²-value = - 0.932)

Figure 2: Show the correlation between Monocytes (cell/mm³) and Uric acid (mg/dl). A) Control group: no correlation (P-value =0.476) (R²-value =0.430). B) CKD+PCOS group: positive correlation (P-value = 0.001) (R²-value = + 0.268). C) CKD group: positive correlation (P-value = 0.001)(R²-value = + 0.680). D) PCOS group: positive correlation (P-value = 0.001)(R²-value = + 0.678)

Conclusion

Blood uric acid negatively affect AMH levels in women, AMH is not a good diagnostic indicator of PCOS status, if blood uric acid was high. PCOS may cause hyperuricemia leading to kidney failure. Kidney function showed be tested rottenly in any suspected PCOS cases. Blood uric acid positively correlate with monocytes numbers.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Mustansiriyah University, College of Science, Biology Department, Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

The Cytotoxic Effects of Lipopolysaccharide Extracted from a Local Isolate of *Salmonella enteritidis* on Breast and Ovarian Cancer Cell Lines

Rihab Abbas Sabeeh¹, Ahmed Jasim Neamah², Alaa Abdelkadhim Jawad²

¹Maternity and Children Teaching Hospital, Ministry of Health, Al-Diwaniyah, Iraq; ²University of Al-Qadisiyah, College of Veterinary Medicine, Unit of Zoonotic Disease Research

**ABSTRACT**

The current *in vitro* study was performed to evaluate the anti-tumor cytotoxic effects of lipopolysaccharide (LPS) extracted from a local isolate of *Salmonella enteritidis* on breast and ovarian cancer cell lines, MCF-7, SKOV-3 respectively. Here, a local isolate of *S. Enteritidis* was obtained from Al-Diwaniyah Teaching Hospital, Al-Diwaniyah City, Iraq. The isolate was exposed to a series of morphological examinations and API 20E kit-based test to confirm the identity of the bacterium. Then, the bacterium was used in a polymerase chain reaction (PCR), and partial sequencing is targeting the RNA polymerase subunit beta (*rpoB*) gene at pieces of 1090bp and 897bp respectively to confirm the bacterium identity. After that, the bacterium LPS extracted to study its cytotoxic effects against MCF-7 and SKOV-3 cancer cell lines, in comparison with a commercial LPS using different concentrations (100µg/ml, 200µg/ml, 300µg/ml, 400µg/ml, and 500µg/ml). The results of the cytotoxicity effects showed that both LPSs had significant (*p*<0.05) cytotoxicity against both cell lines. This study reveals that LPS isolated from *Salmonella enteritidis* might provide a promising substance for controlling breast and ovarian cancers.

**Keywords:** Cancer, lipopolysaccharide, MCF-7, *Salmonella enteritidis*, SKOV-3.

**Introduction**

The Gram-negative bacterium of the *Enterobacteriaceae* family, *Salmonella enteritidis*, is a well-known facultative anaerobic bacterium with a motile-based characteristic. In mammals especially humans, the bacterium introduces a series of infections such as typhoid fever, gastroenteritis, bacteremia or septicemia, abscess, osteomyelitis; however, bloodstream dissemination of the microorganism may be initiated to all organs and tissue ¹. These systemic-based localized infections are predisposed by some health conditions such as diabetes, pneumonia or empyema with malignant tumors, sickle-cell disease infections with urolithiasis, immunosuppression-based osteomyelitis with sickle-cell disease, structural abnormalities, sickle thalassemia, and Sickle-C disease ²-⁸. These bacteria have lipopolysaccharide (LPS) in the outer core of their outer membrane which considered as a major constituent of these microorganisms. LPS is known as an essential material for bacterial adherence and invasion of epithelial-based cells ⁹. LPS is formed out of lipid A, oligosaccharide core, and most of the times O-antigen polysaccharide ¹⁰. This importance of LPS-mediated bacterial colonization was shown to be defected in a mouse-intestine model infected with an LPS-mutants of serovar *Typhimurium* ¹¹. Cancer is a global problem an especially in Iraq increased in recent years due to environmental pollution related to several years of conflicts in Iraq since 1980 until recently ¹². Cancer cell lines used as a successful in vitro models for drug development ¹³,¹⁴. At the Michigan Cancer Foundation of the year 1973, the MCF-7 cells were established by Dr. Soule and colleagues. From a 69-year-old pleural effusion woman with a metastatic condition, the MCF-7 cells were isolated ¹⁵. Since after that time, the MCF-7 cell line has been used as a well-proved suitable cancer-based cell line to study breast cancer-
related conditions. This cell line is an endoreticulum (ER)-positive and progesterone receptor (PR)-positive, and this cell line is considered as a low-metastatic luminal A-based molecular subtype of breast cancer cells. The SK-OV-3 cell line is an ovarian-based cancer cell line isolated from a 64-year-old Caucasian female ascites affected by cystadenocarcinoma. The SK-OV-3 cell line is positive for antigens such as high molecular weight cytokeratin, vimentin, low molecular weight cytokeratin, leucocyte common antigen, and epithelial membrane antigen. The current in vitro study was performed to evaluate the cytotoxic effects of lipopolysaccharide (LPS) extracted from a local isolate of Salmonella enteritidis on breast and ovarian cancer cell lines, MCF-7, SKOV-3 respectively.

Materials and Method

Cell Culture: The SKOV3 ovarian cancer and MCF7 breast cancer cell lines, were cultured in MEM medium with 10% fetal bovine serum (FBS), 100 units/mL penicillin, and 100 µg/mL streptomycin and then incubated at 37 °C.

Bacterial Isolate Identification: A local clinical isolate of S. Enteritidis was obtained from Al-Diwaniyah Teaching Hospital, Al-Diwaniyah City, Iraq, that was exposed to a series of morphological examinations on Salmonella-Shigella (SS) agar and XLD (Oxoid) and biochemical API 20E kit-based test (Biomerieux, France) to confirm the identity of the bacterium. The results were interpreted using Bergey’s Manual of Determinative Bacteriology (Bergey and Holt, 1994). Finally, the genomic DNA of the isolate was extracted using a genomic DNA isolation kit (Primer Design, UK, Co.) following the manufacturer’s instructions.

PCR- and Sequencing-based Identification: Then, the bacterium was used in a polymerase chain reaction (PCR) and partial sequencing targeting the rpoB gene to confirm the bacterium identity by running the extracted DNA on 1%-agarose-gel electrophoresis. The primer set was (F: 5-AAC CAG TTC CGC GTT GGC CTG G-3 and R: 5- CCT GAA CAA CAC GCT CGG A-3). The PCR reaction volume was 25µL including a DNA template at 30ng, both primers at 15 pmol/each forward and reverse primer, 2X of Master Mix at 12.5µL (Kappa Biosystem), and H₂O for molecular-biology use at 6.5µL. The thermocycler (Primus 25 pQLab) reaction conditions were initial denaturation for 5min at 94°C, 35 cycles of each of (denaturation for 2min at 94°C, annealing for 1min at 60°C, and extension for 1min at 72°C), and 10min for the final extension at 72°C. The bands of the PCR products were visualized under a UV-based imager.

The amplified piece of the rpoB gene was purified employing the PCR Clean UP-kit (Promega, Co.) following the manufacturer instructions. Then, sequencing was made (ABA applied Biosystem). BLASTN (Basic Local Alignment Search Tool, http://www.ncbi.nlm.nih.gov/BLAST/Blast.cgi) was used to analyze the sequencing data.

LPS-based lipopolysaccharide by phenol extraction: Here, the water bath at 70°C was used to prepare the bacterial suspension. Then, an equal amount of phenol solution at 90% was added and heated up at 70°C. After that, the mixture was placed on a magnetic-stirrer at 70°C for 15min. The mixture was then placed in an ice bath cooling it down to 20°C and then was centrifuged at 18000g and 3000rpm for 15min. Then, from top to bottom, phases observed were an aqueous phase, interphase, phenolic phase, and sediment. Using a Pasteur pipette, the aqueous and phenolic phases were separated (both on one side). Then, re-extraction of the remainders was done by adding three volumes of distilled water (DH2O) and placing the mixture on the magnetic stirrer for 5min. Then, centrifugation of the mixture was performed at 18000g and 3000rpm for 15min. After that, the floating liquid was separated and added to the aqueous phase. Finally, a dialyzing-based step was induced on the phases against DH₂O for several times/day/several days to remove phenol’s odor.

LPS-Cytotoxicity on the MCF-7 and the SKOV-3 cancer cell lines: MTT (3-(4,5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazoliumbromide) was used to study the cytotoxicity of the LPS on the MCF-7 and the SKOV-3 cancer cell lines. A 96-well plate was utilized to initiate the test by plating these cells in the wells at 37°C for 24hrs at 10000 cell/well of density. Then, different concentrations (100µg/ml, 200µg/ml, 300µg/ml, 400µg/ml, and 500µg/ml) of LPS for both phenolic and aqueous phases were added to the cells in the wells plus using a control LPS, commercial. After incubation for 72hrs at 37°C, the viability of the cells in these wells was determined. The addition of 28µg/ml of MTT was used to remove the medium, and incubation of the cells was performed for 1.5hr at 37°C. Then, removing of the
MTT solution was done. A dissolving-based step was performed to remove the remaining crystals in the wells by adding of Dimethyl Sulphoxide (DMSO) at 100mg/ml. Then, a shake-incubating step was performed for 15min at 37°C. Using ELISA, the absorption was detected at 492nm wavelength repeating this step three times for each concentration. The following equation was used to measure the inhibition rates of the LPSs.

\[ \text{Inhibition rate} = \frac{A - B}{A} \times 100 \]

Results and Discussion

Morphological and Biochemical Identification: For the SS agar colonies, their morphological features were pale-yellow or having no color, 1-3mm in diameter, and lactose fermentation negative. Moreover, the colonies were circular, gas-bubble producing, and H2S-based black spots. The XLD agar colonies were small, convex, smooth, circular, and red with as black center. These features confirmed the family identity. The results of the API 20 kit, numerical profile (6704752), showed the confirmation of Salmonella sp identity.

PCR Results: The results of the PCR showed the amplification of the 1090-bp piece of the rpoB gene as shown in figure 1.

LPS Cytotoxicity Results: The LPS cytotoxicity effects showed that both LPSs had significant (p<0.05) destructive activities to both cell lines, figure 2 and 3. The Gram-negative bacterium, Salmonella Enteritidis, is a well-known facultative and motile anaerobic LPS-containing microorganism that infects humans causing typhoid fever, gastroenteritis, bacteremia or septicemia, abscess, osteomyelitis; however, bloodstream dissemination of the microorganism may be initiated to all organs and tissues (1). The current in vitro study was performed to evaluate the cytotoxic effects of lipopolysaccharide (LPS) extracted from a local isolate of S. Enteritidis on breast and ovary cancer cell lines, MCF-7, SKOV-3 respectively. Using the phenotypic methods, the results in the identity detection of the microorganism revealed the accurate isolate that belongs to Salmonella sp; however, these methods have limitations of detection beyond the genus level. The current results agree with 30 who isolated and identified Salmonella from diarrheagenic infants using phenotypic methods such as urease broth, triple sugar iron, ortho-nitrophenyl galactosidase, indole, Voges-Proskauer, methyl red, and Citrate test. Moreover, 31 had been successful in characterizing isolates of Salmonella Typhimurium using phenotypic approaches such as SS and deoxycholate citrate agars plus antibiotic susceptibility tests. Although these tests were able to identifying Salmonella genus, they still have obstacles in going beyond the genus level. Molecular techniques provide tools to overcome some of these obstacles. After doing PCR and sequencing using the rpoB gene as a target, the results showed that the current study isolate was S. Enteritidis. PCR approaches, most of the times, are accurate in identifying species and beyond the species levels using suitable primers for a specific region of a target gene. The current study results regarding the PCR method agree with 32 who used a PCR approach in detecting Salmonella enterica Serovars from febrile patients, and their PCR was 100% sensitive and specific in identifying Salmonella Enteritidis, Salmonella Typhimurium, Salmonella Stanleyville, and Salmonella Dublin. The sequencing results showed the current...
study isolate identity that belongs to \textit{S. Enteritidis}, and these findings agree with \cite{33} who successfully genotyped \textit{Salmonella enterica} using \textit{ropB} gene partial sequencing. The current study also is focused on LPS-based cytotoxic effects on breast and ovarian cancer cell lines, MCF-7, SKOV-3. The LPS cytotoxicity effects showed that both LPSs had significant ($p<0.05$) cytotoxicity activities against both cell lines. The LPS was found to be effective in increasing apoptosis in breast cancer epithelial cells, and this activity was found to be in the presence of the Toll-like receptor 4 (TLR4) ligand LPS which increased apoptosis in cancer cells due to differential-based kinetics of the TLR4-related signal transductions \cite{34}.

**Conclusion**

The results of the cytotoxicity effects showed that both LPSs had significant ($p<0.05$) cytotoxicity against both cell lines. This study reveals that LPS isolated from \textit{Salmonella enteritidis} might provide a promising substance for controlling breast and ovarian cancers.

ABSTRACT

Objectives: This study aims to assess the knowledge for pregnant women toward risk of pregnancy and to identify the association between level of awareness and demographic data. Quantitative design (Descriptive study) was conducted during the period 15th November 2018 at 25th March 2019 in the city of Al-Amara at Southern of Iraq. A simple random sample is used by the researcher to select (4) primary health care centers. Purposive sample of (150) pregnant women visiting health centers were selected according to special criteria. The data was collected through interview method by using constructed instrument, which consisted of (2) parts. The first part for socio-demographic characteristics and second part to risk of pregnancy which contain: nutritional; exercise; smoking; caffeine; polycystic ovary syndrome; radiation; consanguineous marriages, and non-prescription drugs. The mean score and standard deviation for overall domains to risk of pregnancy were moderate level of knowledge were (1.93 ± 0.433) with the majority sample 63 (42%). Moreover, the findings of the study demonstrated that there was no significant between women’s age and knowledge at (P > 0.05), but there were high significant between level of education, occupation, monthly income and level of knowledge at (P < 0.01).

Keywords: Risks of Pregnancy, Knowledge, Pregnant Women.

Introduction

Pregnancy is usually a tranquil time of unequaled joy and expectation in the life of women’s. Particularly, all pregnant women need to health education during pregnancy period to promote healthy behaviors and prevented risk factors, which can be initiated from the woman herself, family support, community, or health care providers ¹. However, prenatal care is an effective care for health intervention to reduce risk of the pregnancy mortality and morbidity, especially in places where the general health status of women is poor. Most studies indicate that these risks are much higher among women who do not receive this care ². In general, the pregnant woman is at greater risk when exposed to the following conditions such as smoking, obesity, alcohol, poor exercise, polycystic ovary syndrome, exposure to radiation, non-prescription drugs and consanguineous marriage, or include the history of chronic diseases such as (diabetes mellitus, hypertension, and cardiovascular disorders). In addition, previous pregnancies, multiple pregnancy, reproductive aged women less than 18 or increase than 35 years, and intervals less than 3 years between pregnancies, and therefore mother, fetus or neonate is more susceptible to death, disability or disorders (³). The prevalence of high-risk pregnancies was reported up to 20% worldwide. Also, 50% of perinatal deaths are being observed during high-risk pregnancies. Prevalence of high-risk pregnancy varied in different countries, for example it is reported as of 31.4% in the north India, 59.3% in Tunisia, 40.1% in Nigeria, 39.8% in Iran, 53.2% in Iraq (³). In many developing countries, complications due to pregnancy and labor are main causes of maternal mortality. According to WHO reports
almost every day (800) women die due to preventable risk factors associated with pregnancy (99%) of these deaths occur in developing countries 4. Finally, improving women’s health and establishing good health behavior before or during pregnancy is especially important because nearly half of pregnancies (49%) may be unintended and associated with inadequate knowledge about the risk factors that place them at constant risk 5, 6.

Methodology

A descriptive study was done during the period 15th November 2018 at 25th March 2019. Simple random sample is used by the researcher to select (4) primary health care centers PHCs at Al-Amara city. Purposive sample (150) pregnant women visiting PHCs for therapeutic or preventive reasons, these women were collected from the four centers which include (37) women from Dijla Health Center Model, (38) women from AL-Askan, (37) pregnant women from Al-Quds, and (38) women from Shaheed Al-Watan PHCs. The selection of them were according to special criteria which include (1) Pregnant women. (2) Pregnant women have from (1 to more) gravida. While the excluded criteria which including (1) Female non pregnant. (2) Female non married. Data was collect through use of contracted questionnaires by the researchers for aims of this study, which contains two parts. First part comprised of (4) items in regarded to socio-demographic characteristics, and the second part to assess of knowledge for pregnant women toward risk of pregnancy it was consisted of (40) items. It comprises of (9) section which including (the nutritional status during pregnancy; exercise for women; risk of smoking; effect of caffeine on pregnant women; polycystic ovary syndrome effect on the pregnancy; radiation exposure during pregnancy; the sections seven it concerned with consanguineous marriages; also, awareness of pregnancy about intake of non prescription drugs. Finally, the section nine it concerned with other risks during pregnancy such as hypertension, diabetes mellitus and anemia. These items were rated according to the three likert scale: I know (3); uncertain (2) and I do not known scored as (1). The measurement was scored by using grand mean of score through intervals (1-1.67) low, (1.68-2.33) moderate, and (2.34-3) high, as well as (L), (M), and (H) respectively. The data collection process was conducted by interviews technique with each woman who visits the PHCs and by using Arabic version to assess of knowledge for pregnant women toward risk of pregnancy. The data of our study was analysis by used of Statistical Package of social sciences (SPSS) version 20, by application of two statistical approaches. (1) Descriptive approach that includes Percentage, Frequency, and Mean of Score. (2) Inferential statistic that include Chi-Square test. The results were affirmed as significant at $P \leq 0.05$ and not significant at $P < 0.05$.

Results and Discussion

The results of the data analysis were corresponding with the objectives of the study. Such a presentation was systematically organization to demonstrate the significant findings. Table 1 shows majority of sample were (16-20) years old (32.7 %), most of the sample within level of education of read and write and primary (20%), so the almost of participant is housewife (86.7%), and finally in regarding for monthly income is not enough within (38%). Table (2) demonstrates assessment of overall domains the pregnant women’s knowledge concerning risk of pregnancy are moderate level of knowledge with average of mean and standard deviation were (n=150; 1.93 ± 0.433). While, this table shows there were low level of knowledge in polycystic ovary syndrome with average mean and standard deviation was (1.54 ± 0.579), but demonstrated high level of knowledge in non prescription drugs with average mean and standard deviation was (2.80 ± 0.405). Table (3) Shows majority of participants in moderate knowledge toward risk of pregnancy (n=150 with 42. %).

Above table shows there are association between the knowledge for pregnant women toward risk of pregnancy and their demographic characteristics (level of educational; occupational status, and monthly income) at $P \leq 0.05$. While there were no association between the knowledge of pregnant women toward risk of pregnancy and their ages at $P > 0.05$. Considered our study is one of the few investigations intended to collect particular data regard knowledge of pregnant women toward a number of risk factors. In table (1): data showed in regarding for ages of sample was (32.7%) which means nearly quarter of the participants were married in young age, and therefore are more at risk than others as a result of inexperience that lead to low birth weight, prenatal or infant mortality, and maternal complications. This result was agree with study was conducted by Guimaraes, et al., (2013) 7 shows approximately (30%) of participants with aged 18 and 19 years. In relative to their educational status, most of the sample in our study was able to read and write or have a primary school (20 and 20%) respectively. This result was agree with 8 who found majority of pregnancy have read and write was (22.3%) or with primary school (22.5%). In regarding to occupational status the housewife accounted for almost (86.7 %), this result concur with Esposito, et al., (2015) 9 who found that more than half of the sample was unemployed/housewife (60.9%). In concerning to monthly income nearly quarter of participants in the study (38%) does not have enough financial support which is due to the poor economic situation in the country or the majority of women are housewives with a low level of education. In regarding to assess of knowledge for pregnancy concerning risk of pregnancy in all domains as in table (2) that is shows moderate level of knowledge in all domain with low awareness about polycystic ovary syndrome which considered more risked on life of mother and their baby. This result consistent with study done Kamalanathan et al., 2013 10 who mentioned that the polycystic ovary syndrome affects (6 to 15%) of reproductive age and associated with increased risk of hypertensive disorders, gestational diabetes mellitus, miscarriage, and preterm delivery for women globally. While domain of non prescription drugs were all pregnant women have adequate level of knowledge, this result supported by Okandceji-Barry, (2016) 11 who found the majority (80.6%) of the participants had good knowledge about non-prescription drugs and considered most harmful in the first trimester. Generally, according to the researchers’ perspective the result of (table 3) was moderate level of knowledge may have been due to a low level of education as the majority have primary schools or because of the lack of experience resulting from the fact that the majority of ages located between 16-20 years who have inadequate knowledge about risk factors during pregnancy. This result was agree with Esposito et, al., (2015) 91 who found that the pregnant women has moderate knowledge (42%) in regarding to maternal risk factors such as smoking, alcohol conception, and obesity. The results of our study in table (4) showed there were no significant association ($P< 0.05$) in the
variable under study of the age, this result may be related to the small sample size and majority of the sample was young women do not have experience during pregnancy. This result agrees with a study conducted by Jerdén, who found no significant between age and level of knowledge about risk of pregnancy (Jerdén, 2010) 12. While in regarding to level of education, the result showed there is a significant association between educational level and their knowledge, in our opinion the majority of pregnant women are read and write and they have good knowledge about risk factors through the recent development in technology, such as watching health programs through television, You Tube or Facebook. This result agrees with a study conducted in Ethiopia by Daba et, al., (2013) 13 who shows significant between educational level and level of knowledge. In concerning to occupation and level of knowledge, the result shows there were a significant association, these result may be related to the vast majority of pregnant women were housewives, and they have moderate knowledge about the risk factors caused by communicating with relatives or neighbors or reading health magazines. This result agrees with a study conducted by Zaki, and Albarraq (2013) 14 Finally, in concerning of monthly income in table (4) that show there are a significant association between monthly income and level of knowledge. In our point view as researchers this result may be due to from application the health visitor program in Al-Amara city that was plays an important role in education pregnant women, as well as proximity of PHCs from residential areas, which in turn offer free service with lower cost. This result supported by a study conducted by Daba et, al., (2013) 13 in Ethiopia to assess awareness for pregnancy concerning maternal nutrition and associated factors, who found that a significant association between monthly income and level of knowledge.

**Table 4: Association between Knowledge for Pregnant Women toward Risk of Pregnancy and their Demographic Characteristics**

**Conclusion**

The study show that quarter the sample have low knowledge, while less than half of the sample had a moderate knowledge about risks of pregnancy. In regarding to associations between level of knowledge and the socio-demographic characteristics the result shows there were no significant association between age and level of knowledge, but there were high significant between level of education, occupation, monthly income and level of knowledge toward risk of pregnancy.

ABSTRACT

Objectives: Osteoarthritis is a leading cause of disability. This study aimed to assess level of depression in patients with osteoarthritis. A descriptive study design was conducted at handicap center in Al-Nasiriyah city for period from 29th November 2016 to 1st March 2017. A purposive (non-probability) sample of 50 patients were included. Data were collected through the use of the constructed questionnaire and the process of the self-administrative report. The questionnaire consists of 2 parts: part 1 includes Patients socio demographic characteristics includes (age, gender, educational level, monthly income, and duration of diagnosis). Part 2: consist of: Beck Scale for depression. Content validity of the instrument was determined through the use of panel of experts and the internal consistency of the instrument was determined through the pilot study and the computation of Alpha Correlation Coefficient (r = 0.870). Data were analyzed through the application of descriptive and inferential statistical approaches by using Statistical Package for Social Science (IBM SPSS) version 20.0. The findings of the study revealed that most of study sample (46%) have sever and very severe depression. The assessment of level of depression among patients with osteoarthritis require more and more attention.

Keywords: Patient, Osteoarthritis, Depression Level, Beck Scale of Depression (BSD).

Introduction

Osteoarthritis (OA) is a degenerative and chronic disease of musculoskeletal system that have an international prevalence of 20% of females and 10% of males above 60 years of age 1. Despite increment in expectancy of life internationally 2,3, patients are as well struggling through additional years to live with disability caused by this musculoskeletal disease 4. Osteoarthritis usually apply an intense effect on a patient’s well-being and health due to it is association with progressive pain, impairment in function and disability elevation 5,6, and affiliated troubles experienced in preserving daily life activities 7 and resulting decrement in life quality [8]. So, it is expected that patients that have osteoarthritis have a higher possibility of developing disturbances in mental health 9-11. A considerable literature has proved that chronic pain, which is a regular symptom in osteoarthritis, is linked with depression and anxiety manifestations 10-11. Nowadays, the significance of major depression, depression manifestations and anxiety amongst patients with osteoarthritis has achieve growing recognition 7. Symptoms of depression were considered as a possible obstacle to physical activity in patients with osteoarthritis in a current systematic review 12. This is very significant regarding that physical activity has been established to decrease disability and pain in those population 13. A study of more than 2,000 individual with possible osteoarthritis 14 showed that 29% of individuals had depression probably and about half of them did not get any mental healthcare support. This is even though a recent proof showing that integrated depression management, cognitive behavioral therapy, and exercise, and can enhance results for people with osteoarthritis and co-morbid depression 15. A recent study proved that symptoms of depression were very common among

DOI Number: 10.5958/0976-5506.2019.01402.5
patients with rheumatoid arthritis and related to lower outcomes. The study aims to assess level of depression in patients with osteoarthritis.

**Material and Method**

Descriptive study design was conducted at Al-Nasiriyah Handicap Center in Al- Nasiriyah city during the period from 29th of November 2016 to 1st March 2017. A purposive (non-probability) sample of 50 patients were included which all have the following criteria:

1. Age from 20 years to 59 years old.
2. Patients accepted to cooperate in the study.
3. Male and female patients.
4. Patients diagnosed with osteoarthritis of any joint weather diagnosed through a combination of clinical signs and symptoms and/or radiological evidence of degenerative osteoarthritis changes in line with recognized international criteria (American College of Rheumatologists). Official permission was obtained from the administration of Thi-qar health office and from patient before their inclusion in the study. Nature and aim of the study was explained to each member of participants. In order to assess level of depression in patients with osteoarthritis, the researchers use questionnaire consists of 2 parts. Part 1 involves patients socio demographic characteristics includes (age, gender, marital status, monthly income, and duration of diagnosis). While Part 2 of the questionnaire includes. Beck Scale for depression (named after Bmchterah world specialist in known Byron Beck psychiatry). Dr. Abdul Sattar Ibrahim translated Beck psychotherapy for depression to the Arabic language. The scale consist of twenty-one question about known disease and depression symptoms, after choosing answers and calculate the obtained points, the examiner can know the degree and rate of depression suffered by the person. Phrases in testing Beck express the class, for example, it takes zero and one degree and no one counted one point and so on. The items was rated and scored according to the following designs gauge standards: 0-9 (does not have a depression); 10-15 (simple depression); 16-23 (average depression); 24-36 (severe depression). The content validity of questionnaire were determined by panel of (5) experts, whom review the instruments for content, clarity, relevancy, and competence. Reliability Coefficient for (Inter Examiners, Intra Examiners) revealed that 0.870 (52:400), 0.720 (3.567) respectively. Data was analyzed using IBM.SPSS (Statistical Package for Social Sciences) version to data was presented as number and percent data analyzed though an application of frequency and chi-square test to determine the association.

**Results and Discussion**

Table (1) indicated that (37.0 %) of the patients within age group of (49-58). Concerning to the gender, the greater number of study sample are male and account (78.4 %). Regarding to the level of education, the greater number of them do not read and write and they are accounted for (30.0%) of the sample. The majority of monthly income of the study sample individuals are barley insufficient and they are accounted (33.3 %). Table (2) indicated the majority of study sample duration of diagnosis are since one to five years with percent (33.3). Table (3) reveal non statistical significance between sociodemographic characteristics (age, gender, and educational level), while there is a (statistical significance) between level of depression and the duration of diagnosis. Table 4 show the highest percent of study sample have sever and very severe depression account for (46%). Result of the study indicated that 37.0 % of the patients within age group of (49-58). Greater number of study sample are male account for 78.4 %. Regarding to the level of education, the greater number of them do not read and write and they are accounted for (30.0%) of the sample. The majority of monthly income of the study sample individuals are barley insufficient and they are accounted (33.3 %) this results agree with study done by. Relative to the patients Distribution of the (50) Patients According to the duration of diagnosis this results agree with another studies. That reveal association between level of depression and duration of diagnosis.

Assessment of Quality of Life in Patients with Brain Tumor after Surgery

Shatha Saadi Mohammad¹, Raheem Malalla ABADI², Mohamed igrishi², R. N. Kadhim Hussein Jassim²
¹University of Babylon, College of Nursing, Iraq; ²Babylon Health Directorate, Iraq

ABSTRACT
A descriptive study which was utilized as an assessment approach, and was conducted from the 12 of September 2018 to 1St of November 2018 in order to assess the quality of life of the brain tumor patients. A purposive (non probability) sample of (82) brain tumor patients was selected from radiation and nuclear medicine hospital in Baghdad. The findings of the study proved that the demographic characteristics of the brain tumor patients, age, gender, level of education, marital status, type of work, had significant correlation with the quality of life of these patients. The socioeconomic characteristics of the brain tumor patients, income, and residency had no significant effect on the QOL of these patients. The findings also indicated that medical information for the brain tumor patients had a significant correlation with medical diagnosis and surgical treatment with their QOL. The findings also revealed that the assessment of brain tumor patients QOL had different significant effect through the relative sufficient from the social interaction domain (RS=85), level of independence (RS=82.5), psychological (RS=81.2), physical, (RS=67.2) and finally spiritual domains (RS=58.2). The sub domains of pain and discomfort, recreation & leisure had been highly affected by the brain tumors of these patients after surgery.

Keywords: assessment, quality of life, brain tumors, surgery.

Introduction
The brain controls our thoughts, intelligence, memory and emotions. Brain tumor is an abnormal growth of tissue in the brain; these tumors rarely spread (metastasisise) outside the brain. The tumor either originates in the brain itself, or come from another part of the body and travel to the brain (metastasize). It may be classified as either benign (non-cancerous) or malignant (cancerous) depending on their behavior. Cancer is still a major worldwide problem, it accounts for one-tenth of all deaths worldwide. Today more people are surviving cancer, especially brain cancer and even more have extended lives because of early diagnosis and improved treatment options. The increase intensity of brain tumor research, especially in the study of tumor genetics, invasion and impairment of normal functioning brain, as well as novel therapies that sometimes involve combining potent modalities have renewed interest in tumor and treatment effects on quality of life. Quality of life (QOL) assessment in neurosurgery is becoming more relevant with the proliferation of intensive research into brain tumors and their therapy therefore the authors examined several aspects and problems associated with the past, present and future application of quality of life assessment in neurosurgery. The phrase (quality of life) can mean different things at different periods during this century, it entered the vocabulary of the United States towards the end of World War II and implied the good life, or marital affluence evidence by possession of cars, houses and other consumer good. In addition to that, (QOL) assessment has become increasingly important in clinical research, especially for cancer such as brain cancer. As far as we are concerned, the QOL indicators in patient monitoring is important not only because it is a basic part of the concept of health but also the close relationship between QOL, morbidity and mortality. In USA more than 79,000 new cases of primary brain tumors are expected to be diagnosed this year (2017). Approximately one-third or 32% of brain and CNS tumors are malignant. It has recorded brain tumors incidence is about 2/100,000 of population per year as it’s registered
in cancer registry for the year 1994. From 1997 – 2001 Iraq Cancer Registries had recorded all primary brain & CNS tumors by histology in a different percentage. Aims of the Study: To describe the brain tumor patients socio-demographic characteristics and clinical characteristics. To assess the quality of life of brain tumor patients throughout its domains of physical, psychological, social, level of independence, and spirituality ones. To identify the relationship between the QOL domains for these patients and the sociodemographic characteristics (age, gender, occupation, level of education.).

**Materials and Discussion**

**Design of the Study:** A descriptive study used the assessment as an approach to assess the quality of life for brain tumor patients who have undergone craniotomy.

The study was carried out during the period of 12 Sep 2016 to 12 Nov 2016. The study was conducted in the out patients clinic of the Radiation and Nuclear Medicine Hospital in Baghdad. All its attended patients were cancer patients and brain tumor cancer was one of them.

Data collection: A purposive (non-probability) sample of (82) brain tumor patient who had craniotomy, was selected from the out patients clinic in this hospitals.

The criteria of the sample selection employed were:

Adult patients with brain tumor (malignant) (18 years and more) patients who had craniotomy and they were conscious.

**Tools:** A questionnaire was designed and constructed by the investigator to measure the variables underlying the present study. The questionnaire were determined through extensive literatures and studies review. It was adopted and developed from the (WHOQOL) scale by the researcher to measure these variables. The study instruments consist of total of (43) items which were distributed through 4 parts. The developed questionnaire consists of (4) parts: Demographic Data, Medical Information, Quality of life domains, Physical domain, Psychological domains, Level of independence domains, Social relationship domains, Spiritually, Religion, personal believes domains. A descriptive statistics used to characterize the sample with regard to socio-demographic characteristics, in addition to, three point type Likert scale was used to rating the items as always, sometimes, never, they scored as 3 for always, 2 for sometimes, 1 for never. The reliability was tested using Cronbach’s alpha reliability coefficient it was 0.85. P (0.05)

**Results and Discussion**

The finding of the study shows that the highest incidence of the sample (31.7%) was within the age group of (20-29) years. Our finding is consistent with international reports, that brain tumors occurs at any age, but the most common age in adults for primary brain tumors is between the ages (20-40) years. Regarding gender, the majority of the sample were males (74.4%). Our findings are in agreement with 10 who found that among 79 patients analyzed 54% were males and 46% were females in their study to predicate neurocognitive outcomes for these brain tumor patients. All incidence reports agree that brain tumors are more frequent in males than females 10. It is estimated that 16,050 adults (9,440 men and 6,610 women) will die from primary cancerous brain and CNS tumors this year. 5 Regarding educational status, the results revealed that the majority of the samples (25.6%) were secondary school graduates. Concerning occupational status after craniotomy, most of the female samples were housewives (22.0%). Furthermore (24.4%) of the sample were jobless or earner. Comparing unemployment brain tumor patients with employment (41.6%) one can suggest that in this study brain tumor patients have higher percentage of employment. However brain tumor patient’s job changed because of the disease and the prognosis of it, after surgery. A proximately (50%) of the sample had Medulloblastomas which is one of the brain tumors type, whereas (29.3%) of them had astrocytoma’s, and the lowest percent was (20.7%) it belongs to gliomas. Regarding headache before operation 78% of the sample had headache for variable periods. These were (32.9%), (23.2%), (22.0%) respectively regarding them. (22.0%) of the patients did not suffer from headache before surgery. This indicated that headache is one of the most important and most common symptoms in patients with brain tumors. These results inconsistent with the finding of 13. The data analysis indicated that the highest percentage of the sample who stay in hospital for two weeks were (35.4%) and those who stay for one month were (34.1%), finally (30.5%) of the patients, stay one week only in the hospital after operation. Our findings agree with 6 who stated that the median length of the hospital stay was one week. The follow-up for the patients after surgery are necessary to maintain healthy status
and to improve their QOL after that period. Regarding period after operation (51.2%) of the patients (which was the highest percent in the sample study) attended to hospital (3-4) months after operation, which is one of the aims of our study. Many studies evaluating the QOL of patients with primary brain tumors who have usually been based on small samples of patients suggest the goal of the physicians, nurses and staff at any institute is to provide the best possible QOL for all its patients. They also have a new clinical intervention study designed to help improve QOL by teaching patients skills for coping with the many changes that occur in their lives as a result of brain tumors 17. Analysis of such assessment shows that most of brain tumor patients experienced pain and discomfort (RS=91.36) they usually have headache and pain in lower extremities 16. reported that headache was more common at presentation in his group study which was enrolled in Brain Tumor Research Center, in University Of California.

**Conclusion**

Assessment of the brain tumor patient’s quality of life domains indicated that the QOL domains of those patients are affected by different weight, accordingly with social interaction, level of independence, psychological, physical and spiritual domain. Generally, the entire brain tumor patient’s quality of life is in low level of affect according to this study and it could be changed in the future. Finally all variables which are included in this study (age, gender, level of education, marital states, type of work, treatment cost) have high significant correlation with the QOL of brain tumor patients, whereas income and residency do not have effect. An education oriented program can be designed, constructed and administered to brain tumor patients and their family through which health and life related issues can be presented. Well-structured and highly-specialized brain tumor patients center can be established in every governorate in Iraq to provide brain tumor patient’s treatment and psychological and social counseling to all patients and their families with reasonable cost. As a nursing implication, the researcher had obtained many information from this study, the first priority of it was the assessment tool which was the most important step in nursing care to identify the patients problems
after suffering from any disease or tumors, this step helps the nurses to recognize area that need support, be strengthened or developed.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the University of Babylon/College of Nursing, Iraq and all experiments were carried out in accordance with approved guidelines.

¹MSc. Assistant Lecturer, Department of Adult Nursing, ²MSc. Assistant Lecturer, Department of Community Health Nursing, ³MSc. Lecturer, Head of Department of Adult Nursing, College of Nursing, University of Misan, Iraq

ABSTRACT

Objective: The aim of the study is to assess the senior students’ knowledge concerning nursing diagnosis at southern of Iraq nursing faculties, and to find out relationship between students’ knowledge with demographic characteristics (age, gender, acceptance certification in college; residency during study; monthly income and desire of admission to the faculty of nursing). A quasi experimental design was carried out at southern of Iraq nursing faculties (Misan; Thi-Qar and Basra) from 11th November, 2018 to 28th March, 2019. The instruments was constructed by the researcher for the purpose of the study. It was consisted of two parts: Part one demographic characteristics. Part two of the questionnaire was include knowledge level which include (25) question. A random sample comprised of (90) male and female students who were admission in college of nursing at fourth stage. The measurement of instrument used observes knowledge level as the following: Within low (0-0.33); moderate (0.34-0.67); and high (0.68-1.00). The study findings indicated that there were the majority of participants’ level in colleges of nursing (Basra, Misan, and Thi-Qar) have moderate level of knowledge; = (0.34- 0.67) for students were (66.7%), (40%), (69%) and (66.7%) respectively.

Keyword: assessment; senior students; knowledge; nursing diagnoses; nursing faculties

Introduction

Nursing process is a global concept, which forms the foundation and organizational framework that guides professional nursing practice. The process has defined as a systematic and dynamic way to deliver nursing care, operating through five interrelated steps: assessment, diagnosis, planning, implementation and evaluation. The introduction of nursing process as a systematic and scientific approach to patient’s care started in the early 60s in the developed countries, which be used in demonstrating nurses’ responsibility and responsibility while providing care to the patients. It is a widely accepted scientific method to guide procedures and quality nursing care. The term of nursing diagnosis was introduced in 1953 to describe a step necessary in developing a nursing care plan, after the next 20 years specifically 1973, the American Nurses Association published the standards of practice, and it was followed in 1980 with a statement of social policy, which defined nursing as “the diagnosis and treatment of human response to actual or potential health problems” (3). More than 40 years have passed, and the idea of “nursing diagnosis” has inspired and encouraged nurses around the world who seek independent practice based upon professional knowledge. Nursing diagnosis “provides the basis for selection of nursing interventions to achieve outcomes for which nursing has accountability” (NANDA-I 2013) (4). Nursing diagnosis is defined as “a clinical judgment about individual, family, or community experiences/ responses to actual or potential health problems/life processes. There are four types of nursing diagnoses: actual, risk, possible, wellness, and syndrome (5). The NANDA-I system of nursing diagnosis provides for four categories and each has 3 parts: diagnostic label or the problem, related factors or the cause of the problem, and defining characteristics found in the selected patient are
the symptoms present that are supporting the diagnosis. These categories include: Actual diagnosis; Risk diagnosis; Health promotion diagnosis, and Syndrome diagnosis. Importance of the Study: The important nursing diagnosis formula used to identify a complex problem involves investigating the problem etiology and describing signs and symptoms, it can provide the basis for the proper nursing intervention.

Methodology

Descriptive design is carried out in order to achieve the early stated aims of the study by using the assessment knowledge for fourth stage nursing colleges students concerning nursing diagnosis, the study was performed in southern of Iraq nursing faculties (University of Basra; University of Misan and University of Thi-Qar). The period of the study was from 11th November, 2018 to 28th March, 2019. The total population of the study was consist of (178) students who were study in colleges of nursing fourth stage. Random sample selected in the present study consisted of (90) students distributed equally (30) students in each college of nursing. The data collection process has been performed through the utilization of the developed questionnaire in Arabic version, Each test spends approximately (15-25) minutes to complete the interview. The study instrument was adopted and developed by the researcher to assess knowledge of the nursing students colleges. It was consisted of two parts: Self-administered questionnaire sheet related to demographic characteristics of the students consisted of (6) items, which included age, gender, acceptance certification in college; residency during study; monthly income and desire of admission to the faculty of nursing, and second part of questionnaire sheet is assessment students’ knowledge, it was composed of (25) questions, which use to assessment of students’ knowledge. Each question comprised of (4) alternatives for multiple choice. The questions were scored as correct (1) point and incorrect (0) point. The test covered relevant points from the major content area of the nursing diagnosis.

Results and Discussion

Analysis of nursing colleges students’ demographic characteristics in our study revealed that the most of age group to the study sample were within (21) years represented (44.4%), and the majority of participants in study sample were female (60%). In regarding to the subject acceptance certification in college, the results show that majority of them have secondary school graduate (78.9%). This study is supported by (Narmeen Badri., 2009) reported that evaluation the knowledge of the nursing students colleges related to nursing diagnosis, its revealed that the most ages of the sample was between (20-25) years and the most of them was male who are come from secondary school/scientific. Residency during study, majority of them live in internal department (56.7%). In addition the monthly income, the finding show that of them have some rather enough (44.4%). In the above table the results show that majority of desire of admission to the faculty of nursing were unconvinced of acceptance (40%) (table-1). This study agree with Demir, (2017) Nursing Diagnoses Determined by Second Year Students: Findings of study involve students mean age was 19.93 ± 1.18 and most of students were female (71.2%). The students were determined 13 out of the 15 nursing diagnoses. Conclusion: Students were successful in half identified the majority of nursing diagnoses. Assess what stage we are at identifying nursing diagnoses will contribute to the development of nursing education. The assessment of knowledge was developed purposely by the investigator for the students in colleges of nursing for the purpose of evaluating students’ knowledge. The knowledge score was divided into; low (0-0.33):1; moderate (0.34-0.67):2; high (0.68-1.00):3. The results of the study revealed that the analysis of the data (25 items) of the students’ knowledge concerning nursing diagnosis in the study sample had indicated that there table (2) demonstrates that overall assessment of the students’ knowledge concerning nursing diagnosis at southern of Iraq nursing faculties (university of Basra; university of Misan and university of Thi-Qar) are moderate level of knowledge, with average of mean and standard deviation were (n=90; (0.61 0.083). As well as table (3) reveals that the majority distribution of participants in all colleges of nursing (Basra, Misan, and Thi-Qar) have the moderate level of knowledge, with total percentage (n=90; (74.4% ) and each college represented (66.7%, 73.3%, 83.3% ) from participants in study sample respectively. The results agree with following study: Examination of nursing diagnoses used by nursing students and their opinions about nursing diagnoses. The findings of the students, 76.9% knew what nursing diagnosis was, but 31.5% had difficulty stating patient care needs as nursing diagnoses. Our study also shows that there are no significant differences in students’ knowledge among
nursing colleges (university of Basra; university of Misan and university of Thi-Qar) in overall items concerning nursing diagnosis, when analyzed by ANOVA (table-4). This study revealed that the colleges of nursing (university of Basra, university of Misan, and university of Thi-Qar) have similar participants’ level of knowledge, with average of mean and standard deviation were (n=30; (0.59 0.099), n=30;(0.63 );and n=30; (0.60 ), respectively. (table-3).

Conclusion

The majority of participants’ level in colleges of nursing (Basra, Misan, and Thi-Qar) have moderate level of knowledge. The results of study sample represented that the nursing students have deficit knowledge in nursing diagnosis. Analysis findings of the study show that there are no significant differences among nursing colleges in southern of Iraq (Basra; Misan and Thi-Qar) in all students’ knowledge items.

ABSTRACT

Objectives of the study were: assess the possessions of victimization on child life and correlate obesity and overweight with the bullying behaviors of others in the school. A correlation study was started from 31st of June 2017 to 10th December 2017 in Al Hilla city schools, a purposive sample of (100) students were selected randomly from (12) schools with Body Mass Index of more than normal. Most of the sample were females (78%), (42%) of the subjects are in (G5), (35%) were obese the highest percentage of them ordered the 1st child in the family. Majority of the mothers working that represents (75%), differences between the bullying behaviors, according to attacks of belongings and other avoidance behaviors reported the uppermost mean of scores, while the bullied behavior in general showed low mean. This study revealed that was a weak noteworthy correlation amongst the age, Sex, Body Mass Index and child order in the family with assessment of bullying behaviors they exposed to. This study showed that there was several victimization effects on students social, psychological health and even academic performance associated with the increased body weight as shown in a form of verbal, or even physical.

Keywords: Bullying, obesity, overweight, school age children

Introduction

Obesity and overweight during Childhood period are of the peak thoughtful public health challenges of the “21st century” increased worldwide, further in economically developed countries and less in rural populations. Worldwide, in 2016 the numeral of weighty children underneath the age of five is predictable to be above 41 million. Very nearly half of totally overweight children under 5 survived in Asia and one section lived in Africa. Overweight and obese children are likely to stopover obese into adulthood and more likely to develop non-communicable chronic diseases like diabetes and cardiovascular illnesses at a beginning age. Overweight and obesity, as well as their allied diseases, are essentially avoidable, as a result discouragement of childhood obesity needs high priority. Many children today are rising up in an obesogenic environment that inspires weight gain and obesity. Energy inequity has resulted from the variations in food type, availability, affordability and marketing, as well as deterioration in physical activity, with more time being spent on screen-based and deskbound leisure activities. Probable harm, emotional magnitude of childhood obesity together with being liked to a less significant extent by peers, being prohibited by peers, and actuality the victims of numerous structure of peer violence such as bullying have been well predictable. Different types of studies show a connection between being bullied and different health outcomes indicate that low self-esteem reduced life satisfaction. Bullying is defined as an intentional, recurrent hostility committed by a more influential person or group attacking a less dominant victim, it is an imperative issue in schools. Bullying is divided at least into five types verbal cruelty is the public type such as name calling or teasing. “Somatic bullying includes

Email: nuhad64@yahoo.com
forcefulness such as being hit or thrusted or locking someone in a room and is more common among boys, although bodily attacks on girls by girls are becoming more public, depression, emotional, developmental, besides behavioral (EDb) problems, and exposure to child abuse and domestic violence are associated with increased bullying”. 6 Body size and obesity in school age and adolescence have a high level of distress and strongly associated with school bullying which escalated to the peak incidents within school age as middle childhood. 7 Scholars elaborate in bullying are at a noteworthy threat of come into contact with a wide field of psychosomatic symptoms, running away from home, alcohol and drug misapplication, malingering and above all self-inflicted, accidental or executed injuries. 8 “In the UK (6,700 school-age children) “27 percent” conveyed that they had been intimidated ‘occasionally or often’ throughout that term and ten per cent described existence bullied at least once a week”. 9

Methodology

Design of the study: Correlation design conducted to study the association between the bulling children and malnutrition.

Sample of the study: probability (purposive sampling) was selected which consists of (100). School age students selected form multi sector schools in Babylon Governance by divided the schools as cluster sample to choose random sample from (12) schools

Setting of the study: primary schools and 1st grade form secondary schools, data collected from the period of 31th of June 2017 to 10th December 2017

Instruments: The questionnaire was assembled for the purpose of the study. The Instruments consisted three parts: data was gathered by interviewing child through a questionnaire was completed by the researchers. All the participants were informed about the objectives of the study and informed consent were taken from all of them. Ethical considerations were approved by the scientific committee in the college.

Part 1: Demographic Date Sheet: This part concerned with personal information include, the patient (Age, sex, address, grade Body Mass Index).

Part 2: items related to child family history (6) variables regarding bullied child (16) items. These items are rated according to three levels Likert scale three level Likert scale (Always, Sometimes, and Never)

Statistical Analysis: Data were analyzed using the Statistical Package for Social Sciences (SPSS) version 19. Through the application of descriptive statistical data analysis include (Frequencies and Percentages, and arithmetic mean with standard deviation, Mean of score (M.S.) with their Standard Deviation (SD), and inferential statistics, Pearson Correlation.

Results and Discussion

Table (1) Displayed the maximum percentage of the sample conveyed at age oscillated (10-11 years old) and they are accounted (%79). Greatest are females (78%), (52%) are rural residence in recent times. In regard to grade or class of students (42%) of the subjects are in (G5). The body Mass Index indicated that (35%) are obese. Table (2) represented the participants’ family history (46%) of them their order was the 1st child, while in regard to age of the mother (32%) of them aged 18-23. Whereas (33%) of them were primary school graduates and the majority of them working which represents (75%). According to number of children, table shows that (56%) of mothers have only (1) child, (45%) of the subjects was economically satisfied. Table (3) confirmed the Bullying behaviors were (11) of them showed significant assessment, scored more than (2) mean of score and they stating (others have taken my belongings, others do avoid sit by me or talk to me, others try to hurt me on the way to and from school, I miss school because felt unsafe, uncomfortable or nervous at school, or on way to or from school ….) Table (4) showed sample overall effect scores, a moderate level of effect assessment were found among the participants as represented as (58%), At the same time the high level was almost same which represented (35%). Table (5) illustrated the correlation between the sample scores and some of the sociodemographic data, it is indicated that there is no to weak significance regarding the Age, Sex, Body Mass Index and Child order in the family at p (< .05). The current study involved a group of school age children with different Socio – demographic characteristics and variables investigated against the bullying matters. It has been found that the age domain was the pre-adolescent period, most are females, lived in rural areas. In a large UK study of bullying, was found the suitability to administer a modified questionnaire for children from
eight years and older and summaries the nature and extent of victimization above the aforementioned duration. Moreover from a 37 schools through four federations in the USA a five-year randomized controlled trial of both primary and secondary, selected a 11-year-olds to identify whether primary or secondary prevention approaches are effective in evolving social, emotional and cognitive skills to handle struggle. Some others originate that no gender differences in the school which can be recognized aside from those between the boys and girls who are self-identified as such but grade level moderated in differences by gender for all types of aggression. The present study came in consistent with results predicted that sixth grade students would report higher levels of victimization than older students, the study emphases the main variables in regard to the type of bullying which have been scored differently that children were affected and bullied when others tackle their things, exposed to hurt on the way to and back to school as well as avoid the communication with them and this is came along with some results which found that being affected by these difficulties in school will impair the social relationships and lower educational achievements. A study mentioned that difficulties in children’s lives may be both a consequence of and partial explanation for bullying victimization. Interaction styles and psychosocial factors may interact to create a vicious cycle in which children place themselves at risk, which might explain the reduced well-being. Other results agree that bullying among children takes the form of voiced abuse, racist name calling, spreading rumors besides somatic intimidation. In this definition, negative actions include physical contact, words, making faces or dirty gestures, and intentional exclusion from a group. It was found also that boys were more likely to be exposed to physical aggression and girls were more likely experience social aggression, which in turn might be cultural influences on their personalities. Adults who care for these children must be focused to the likelihood that bullying distresses their lives and learn how to together be aware of bullying and victimization comportments and respond effectively. Though the present study did not account high bullying scores in regard to verbal abuse, a study found that bullying among the susceptible children profits the form of verbal abuse, racist name calling, spreading rumors and physical bullying. in his study a low to reasonable association of direct bullying such as hitting with common health problems in younger children aged six to nine years was demonstrated. It is merely recognized that experiencing bullying victimization might be ranged from mild to severe according to many factors, among them we may find the family support, the school approach toward children and even the health care providers’ consultation role. Results of this study did not indicate a correlation between the gender and the level of hurt the sample may exposed to so that male and female may have the same effects, some studies pass on that the gender differences in aggression roles are examined for verbal aggression, not reached the p > .05 standard for statistical significance. The body mass index is examined against the bullying victimization which indicated no correlation between them, means as long as the child looks with a problem of increases weight, there will be such a behavior from others.

**Conclusion**

Conclusion: this study showed that there was several victimization effects on students social, psychological health and even academic performance associated with the increased body weight as shown in a form of verbal, or even physical.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Effectiveness of an Instructional Program of Nurses Knowledge Concerning Management of Anaphylactic Shock at Emergency Units in Babylon Teaching Hospitals

Hussain Khalif Kitab AL-Sultiny1, Hussein Hadi Atiyah2

1Adults Nursing, Babylon Health Directorate, Iraq; 2PhD, Adults Nursing Department, College of Nursing, Bagdad University, Iraq

ABSTRACT

Anaphylactic shock is the hyper-response of the immune system following the allergic or allergic reaction, thus threatening the life of the person and is considered a serious problem that requires direct and rapid medical intervention. The study aims at: to assess nurses’ knowledge concerning management of anaphylactic shock. A quasi-experimental design with the application of a pre-test/post-test approach is conducted for the period of October 14th 2018 to June 1st 2019 on nurses working in emergency units. By non-probability sampling (purposive sample) are chosen, (30) nurses through the verbal consent has been taken and the answering of questions have been done by using the self-administrative method. The investigator informed the nurse about the study to insure their consent and discuss the plan of the program. The implementation of the program and conducted the post test. A descriptive statistical data analysis approach used to describe the study variables: Frequencies, Percentages, and standard deviation. The grand mean of all items shows that there is a low level of knowledge of the at pre test toward anaphylactic shock the mean was 1.26.

Keywords: Effectiveness, Knowledge, Anaphylactic Shock

Introduction

Anaphylactic shock is defined as a severe life-threatening generalized or systemic hypersensitivity reaction. All anaphylaxis guidelines, highlight the severity of the anaphylactic episode and the risk of death. Since anaphylaxis is characterized by rapidly developing life-threatening airway and/or circulation problems, it must be managed quickly. However, anaphylaxis is often difficult to recognize owing, in part, to the variability of diagnostic criteria, which in turn leads to a delay in administration of appropriate treatment, thus increasing the risk of death. In addition, it hampers reliable epidemiological data since medical records are the basis of national and international registries1, 2. Anaphylaxis develops rapidly, usually reaching peak severity within 5-30 min, and may, rarely, last for several days. All dental practitioners should be aware of the diagnosis and management of emergencies such as anaphylaxis that may arise from the use of local anesthetic agents in their clinical set up. Resuscitative drugs such as antihistamine, adrenaline and corticosteroids should be available at chair side for immediate use. All patients must be warned prior to local anesthetic administration of the possible danger that follows its use. They should be told to report back immediately to the clinic if a rash should develop3. Primary care physicians have a pivotal role in the prevention and treatment of anaphylaxis. However, few studies have covered the management of anaphylaxis in primary care. A systematic review on the management of anaphylaxis identified a number of gaps at this level, most notably a lack of knowledge regarding recognition of the reaction, treatment with epinephrine (adrenaline), and prescription of epinephrine auto-injectors (EAI)4. The most common approach to the evaluation of the management of anaphylaxis in primary care has been through questionnaires and case studies. The results of several recent surveys from different countries are based on data from general practitioners, paramedics, and, most frequently, pediatricians and do not differ much from one study to another. There is still much room for improvement with respect to
knowledge about epinephrine as the initial treatment of anaphylaxis, intramuscular administration, doses, and prescription of EAs. It is estimated that the world population has a lifetime prevalence of 1% to 3%, though the prevalence is increasing. While reactions can occur in any age group, they are most commonly noted in the younger population and developed countries. Unfortunately, anaphylaxis is often misdiagnosed or not diagnosed at all. The consequences of missed or delayed diagnosis result in increased morbidity and mortality. Anaphylaxis is an emergency condition that requires immediate, accurate diagnosis and appropriate management. However, little is known about the level of knowledge of doctors and nurses treating these patients in the emergency department. Adrenaline is the life-saving and first line of drug to be used for the treatment of anaphylaxis. Several studies conducted previously reveals that there is a lack of knowledge regarding dose and route of administration of adrenaline and confusion in selecting the first line drug for treating the emergency condition among health care professionals. Knowledge regarding the management of anaphylaxis was inadequate in almost all the health care providers among nurses. Improved education and training of health care providers are necessary for better management of anaphylaxis.

**Methodology**

**Study Design:** A quasi-experimental design with the application of a pre-test/post-test approach is conducted for the period of October 14th 2018 to June 1st 2019 on nurses working in emergency units.

**Study Sample:** Non-probability sampling (purposive sample) are chosen, (30) nurses is selected according to the criteria includes the nurses all educational levels working in emergency units, nurses have one year or more of experience in emergency units, and those who agreed to participate in the study.

**Study Instrument:** The study instrument was constructed depending on literature reviews and previous studies related to the anaphylactic shock. It is a questionnaire format for the research purpose and composed of two parts and these parts are:

**Part I:** Which composed of demographical characteristics.

**Part II:** This part is related to the evaluation of the knowledge of nurses for pre and post program.

**Data Collection the Methods:** A verbal consent has been taken and the answering of questions have been done by using the self-administrative method. The investigator informed the nurse about the study to insure their consent and discuss the plan of the program. The implementation of the program and conducted the post test.

**Statistical Analysis:** The statistical data analysis approach by using (SPSS-ver.20) is used in order to analyze and evaluate the data of the study. A descriptive statistical data analysis approach used to describe the study variables: Frequencies, Percentages, and standard deviation.

**Results and Discussion**

Table 1 indicate that male more than female study group 56.7%, the age is between (21-25) for most of the study sample 50%, most of the study sample are married 60%, the level of the education graduate diploma of nursing 40% and study group have from (1-5) years of service in nursing generally and 80% of the study group have from (1-5) years of service in emergency units in particular, 73.3% of the study sample have from (1-3) No. of specialized courses in emergency units and 100% of them the place of courses inside the country. Table 2 indicate that the study group at the pre test had a low level of knowledge by the mean for all items except the items (1, 2 and 7) had moderate level by the mean, the grand mean of all items shows that there is a low level of knowledge of the study group at pre test toward anaphylactic shock the mean was 1.26. Table 3 indicate that the study group at post test had a high level of knowledge by the mean for all items except the items (3, 6, 7, 9 and 15) had a moderate level, the grand mean of all items at post test shows that there is a high level of knowledge of the study group toward anaphylactic shock the mean was 1.73. The life-threatening allergic reaction can be dangerous. Shock or sudden drop in blood pressure and difficulty breathing. It can occur in people who already have allergies after minutes of exposure to an allergen. At times, there may be a delayed allergic reaction or delayed retinopathy without a clear emotional effect. It is occurs within seconds or minutes after exposure to certain foreign substances, such as medications (penicillin, iodinated contrast material), and other agents, such as latex, insect stings (bee, wasp, yellow jacket, hornet), or foods (eggs, peanuts). Repeated administration of parenteral or oral therapeutic agents (repeated exposures to penicillin) may also
precipitate an anaphylactic reaction when initially only a mild allergic response occurred. Results of the study indicate that male more than female study group 56.7%, the age is between (21-25) for most of the study sample 50%, most of the study sample are married 60%, the level of the education graduate diploma of nursing 40% and study group have from (1-5) years of service in nursing generally and 80% of the study group have from (1-5) years of service in emergency units in particular, 73.3% of the study sample have from (1-3) No. of specialized courses in emergency units and 100% of them the place of courses inside the country. The study in the same decade, has been assessed the knowledge of anaphylaxis among emergency department staff. These study results may come because that the equal sample size selected from study and control group is from the researcher opinion, while for the study sample age group, this result come because that the majority of the nurses they dealing directly with the patients are from those with this age group because the action with the patients require a high physical activity and the nurses who are advanced age fail to dealing with the patients. In addition, the participation in a training sessions outside of Iraq is diminished due to the political and economic limitation and this is controlled by the policy of the minister of health of Iraq. Findings depicts 76.9% of the nurses incorrectly diagnosed single organ involvement without hypotension as anaphylaxis. The knowledge of treatment of anaphylaxis among nurses was moderate and can be improved [19].

Conclusions

A designed program in the emergency department related to emergency services as anaphylaxis management, the program has been influential on nurses’ knowledge. Health directorate need to be engaging emergency nurses in special training with guide course for improve knowledge and practice concerning emergency situations.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Adults Nursing/Babylon Health Directorate- Iraq and all experiments were carried out in accordance with approved guidelines.

Environmental Impact Assessment of Medical Wastes Shredding Machine in Al-Hila Teaching Hospital-Babylon Province, IRAQ

Zeena H. Ali¹, Sedik A. K. Al-Hiyaly², Ghydae Y. Rashid³
¹Sanitary and Environmental Engineering, Department of Building and Construction Engineering, ²Environmental Research Center, University of Technology, Iraq

ABSTRACT

This study was carried out to assess the environmental impact of medical wastes shredding machine in Al-Hila Teaching Hospital- Babylon Province, IRAQ and samples of medical wastes received from various local health premises were identified and the percentage of each component in wet and dried forms were assessed. Several heavy metal ions were determined while air variables such as CO, NO₂ and SO₂ were measured in shredding machine location and surrounding environment. Regarding waste heavy metal content, current work has found that the highest mean concentration (1.473 ± 0.786 µg/kg) was recorded for cadmium ion which was within standard limit (1 – 3 µg/kg) while both copper and ferrous ions gave mean value of 0.0163 ± 0.005 µg/kg and 0.679 ± 0.431 µg/kg respectively. In case of air gases, it was found that there were no significant differences between all measured gases in all measured sites within shredding room and surrounding environment where NO₂ mean values were 0.0194 ± 0.006 ppm and 0.019 ± 0.002 ppm respectively while SO₂ gave mean values of 0.033 ± 0.002 ppm and 0.049 ± 0.003 ppm respectively and CO mean concentrations have been found to be 0.026 ± 0.023 ppm and 0.05 ± 0.007 ppm respectively.

Keywords: Medical wastes, Shredding machine, Surrounding environment, Air gases, Noise level

Introduction

It is very obvious that medical solid wastes generated by various health institutes represent environmental and health problems 1-3. In general, these medical solid wastes can be classified into two main categories such as general and hazardous wastes 4,5. General wastes consist of municipal and other un-harm wastes while hazardous wastes include biological, chemical and radioactive wastes 6. These medical wastes need to be soundly handled and controlled otherwise they would cause severe environmental and public health impacts. However, much attention has been focused on health care wastes worldwide 1,7,9 and various techniques have been invented to properly discharge these wastes such as land disposal 10, wet thermal treatment 11, chemical disinfection 12, waste autoclaving 13, microwave irradiation 14, encapsulation 15, incineration 9,16 and recently applied technique of shredding 17,18. Currently, the most common techniques used in various world countries are incineration and shredding of medical solid wastes. So, significant attention was focused upon health and environmental impacts imposed by incinerating such wastes due to various gasses and suspended particulate released from the burning process 1,2,9,11,16 and reported different health and environmental effects while shredding technique has received few attention 9,18,19 which is associated with less harm impacts on both public health and surrounding environment. The current study was designed to assess environmental and health impacts caused by medical solid wastes shredding in Al-Hilla teaching hospital in Babylon Province, IRAQ via calculating daily generated solid waste, examining most wastes components and assessing certain heavy metals content. Also, the work has recorded the concentration of several air gases and noise level in shredding machine site and surrounding environment.
Materials and Method

Al-Hilla teaching hospital is situated in Babylon province- Iraq and consists of 447 beds. Estimated medical solid wastes per bed was 0.44 kg/day (Hospital records). So, this study has calculated the expected daily total generated wastes using hospital records by the following equation:

\[
\text{Total daily generated medical solid wastes} = \text{Rate of patient waste per day} \times \text{Bed No.} \\
= 0.44 \text{ kg/day} \times 447 \text{ bed} = 196.68 \text{ kg/day}
\]

The annual grand wastes total = 71,984.88 kg.

Random sample of such waste with weight of 0.832 kg and free from municipal wastes was obtained from the hospital and isolated in different categories such as biological tissues, glass, metals, fabrics, plastics, and papers. Each waste component was weighted as fresh and dried and their percentages were recorded. Also, heavy metal contamination of medical solid wastes was determined for cadmium, copper and ferrous following the method of USEPA at four weeks and finally, air contamination by CO, NO2 and SO2 was recorded using portable multi-gas detector in shredding, sterilizing, controlling, worker rooms and surrounding environment while noise level was measured only in shredding apparatus site and outside using portable sound meter.

Results and Discussion

Wastes Classification: Table 1 shows the fresh and dry weight and percentage of each medical solid wastes component. Apparently, all waste components were varied significantly in both fresh and dry weight values and it seems clearly that biological and fabric wastes had higher fresh weights than those of other components (Fig 1). In case of fresh wastes, biological wastes had the highest (34.8%) percentage followed by fabric waste ((21.07%) while the lowest percentage (1.56%) was recorded for metal waste followed by that paper (4.46%) waste. But in terms of dry wastes, the highest percentage (41.56%) was recorded for glass waste followed by that of plastic (21.96%) while the lowest percentages were 2.55 % and 6.85 % for metal and paper wastes respectively (Fig 2). It was found that the average medical solid waste generated was 0.44 kg per bed per day. Similar mean medical waste was reported in Khartoum State Hospitals which was 0.38kg/bed/day and in Istanbul- Turkey was 0.63 kg/bed/day while a study has reported a mean of 0.758 Kg/Bed/Day in the Sirsa city- India but other study in kargil hospital- India has reported a mean of 2.0 kg/bed/day 24 found to range from 2,250 to 2,500 kg/bed/
Fig. 3: Cd, Cu and Fe concentrations in medical solid waste from Al-Hilla teaching hospital

Waste Heavy Metal Contamination: Table 2 contains concentrations value of Cd, Cu and Fe in medical solid wastes in a sample collected from Al-Hilla teaching hospital measured in four weeks. It has been found that medical solid wastes contained certain heavy metal ions such as Cd, Cu, and Fe. Cadmium ions content was varied from 1.14 to 2.1786 µg/kg and copper ion concentrations were found to range from 0.0089 to 0.0252 µg/kg while ferrous ions had varied from 0.271 to 0.9719 µg/kg. Apparently, quantity and quality of heavy metal ions contained in medical solid wastes are affected by medicine species and healthcare equipments used. However, a recent study 29 has examined heavy metals content in medical solid wastes after being incinerated and reported that the ash of such wastes had high Fe, Zn, Cd and Pb ions.

Air Contamination: Table 3 shows concentration of CO, NO2 and SO2 measured in shredding, sterilizing, controlling and worker rooms and surrounding environment. The highest CO concentration (0.4 ppm) was in sterilizing room while surrounding environment had the lowest (0.05 ppm) concentration and for NO2 concentrations, it was found that the highest (0.025 ppm) concentration was again recorded in sterilizing room but worker room had the lowest (0.014 ppm) concentration. In case of SO2, surrounding environment had the highest (0.06 ppm) concentration while the worker room contained the lowest (0.03 ppm) concentration (Fig. 4).

In general, all concentrations of these air gases were within standard limits. No data related to air pollutants in shredding medical solid wastes are available but many works have examined such air contaminants in case of incineration of such medical wastes 30. On the other hand, noise level was found in shredding room being higher than that recorded in surrounding environment (Fig 5) and such difference may be expected due to the sounds generated by shredding machine operation. The current work has concluded that shredding technique of medical solid wastes seems to be much better in terms of having almost insignificant impacts on both public health and surrounding environment and may present good opportunity to recycle certain solid wastes components such as plastic and metals but it needs controlling and treating biological pollutants in proper methods and to handle hazardous wastes scientifically and soundly.

Immunohistological Study of ER, PR, and Her2/neu Status in Breast Carcinoma

Ali Hassan AI-Timimi1, Ahmed Obaid Hossain1
1Department of Biotechnology, College of Biotechnology, Qasim Green University, Iraq

ABSTRACT

Immunohistological (IH) procedure was used to detect the expression of ER, PR and HER2/neu in postoperative paraffin blocks of breast tumors and statistically analyzed their correlations with clinicopathological characteristics. The mean age was 47.3 years (range 31-76 years). Most of the patients (66.0%) were ≤50 years at diagnosis. The left breast was more commonly involved (57%). Tumor size ranged from 0.5 - 13.0 cm. The staining of Her2/neu was mainly localized in the membrane, whereas ER, PR, were localized in the nucleus. ER positivity was observed in 70% grade I, 48.2% grade II and 3.5% grade III carcinomas (P<0.05). Similarly PR positivity was observed in 70% grade I, 36.14% grade II and 1.75% grade III carcinomas (P<0.05). HER2/neu was positive in 1 (10%) case of grade I carcinoma, 31 (37.35%) cases of the grade II carcinoma and 24 (42.11%) cases of grade III carcinoma. In the HER-2/neu positive tumors, ER and PR expression in high grade tumors was significantly decreased compared with intermediate grade tumors (ER 5.6% vs 10.5; PR 0% vs 5.3%). Among the ER, PR and HER2/neu statuses, a significant correlation was observed between ER expression and PR status (P<0.05).

Keywords: Breast carcinoma, Estrogen, Progesterone, Her-2/neu receptor, Immunohistology.

Introduction

Breast cancer is the most common cancer among women, accounting for one in four types of cancer diagnosed in women worldwide, and is the main cause of death in women 45 to 55 years of age. Over 1.1 million women are diagnosed with this disease each year and incidence rates are still on the increase in several countries. The ultimate outcome of breast cancer relies on its initial stage at diagnosis with the main prognostic factors associated with breast cancer being lymph node involvement, tumor size and histological grade. However, tumor at the same stage can behave in a different manner, and the prognosis can vary. Therefore, it is important to find biomarkers that will predict the likelihood of recurrence and identify those patients who might benefit from additional therapy. Hence, low-risk patients can be spared unnecessary and costly treatment. Moreover, high-risk patients could be rapidly identified and offered appropriately aggressive treatment. Estrogen and progesterone receptors (ER, PR) and more recently, HER-2/neu have with increasing importance influenced the management of the malignancy. Estrogens are potent mitogens that mediate its proliferative action through the induction of cyclin D1, the major regulator of entry into the G1 stage of the cell cycle, and promote the secretion of positive or negative paracrine growth signals by breast stroma cells, stimulating epithelial cells to proliferate. With an established positive correlation of ER and PR with the degree of tumor differentiation, determination of ER and PR status on biopsy specimens prior to therapeutic intervention is advocated as standard practice. HER-2/neu also known as C-erb B2 (HER-2), is a proto-oncogene located on chromosome 17(9, 10). It is amplified and the protein (HER-2) overexpressed in 15-25% of invasive breast carcinoma with associated poor prognosis. HER-2/neu encodes a transmembrane glycoprotein with tyrosine kinase activity known as p185 belonging to the family of epidermal growth factor.

DOI Number: 10.5958/0976-5506.2019.01408.6
receptors. Immunohistological (IH) detection has become essential to many malignancies and plays a key role in tumor diagnosis, treatment and prognostic assessment. In this study, we study 75 cases of invasive BC and 15 of benign proliferative diseases, to detect the expression of estrogen receptor (ER), progesterone receptor (PR), and human epidermal growth factor receptor-2 (HER2), by IH and analyzed the associations between these indicators and the clinico-pathological characteristics.

Materials and Method

Breast samples used in this study were obtained by total or partial mastectomy in Hilla Teaching Hospitals, Babel, IRAQ during a ten years period extending from 1st January 2005 to 1st December 2017. They included a total of 75 cases of infiltrative carcinoma and 15 of benign proliferative diseases including ductal and lobular hyperplasia, apocrine metaplasia, fibroadenoma, and fibrocystic changes. Four micrometer thick formalin fixed, paraffin embedded tumor sections were stained with Haematoxylin and Eosin. Histological grade was assessed according to Nottingham modification of the Bloom-Richardson system. The presence of invasive carcinoma was confirmed in all cases. The histologic type of each tumor was recorded. All infiltrative tumor samples were classified by the TNM system. Each specimen was processed for immunohistochemistry using formalin fixed and paraffin embedded tissues sections and the hormonal status of each lesion was evaluated. Representative sections with breast tissue tumor were processed for ER, PR and HER-2/neu Immunohistological staining. Sections 4 μm thick were processed by using the avidin–biotin–peroxidase complex method (Figure 1). After the removal of paraffin, sections were hydrated and incubated for 30 min in 0.3% H₂O₂ to inhibit endogenous peroxidase activity; to retrieve the antigen the sections were incubated with retrieval solution (DakoCytomation, Carpinteria) and heat at 90°C in a vegetable steamer for 10 minutes. After being rinsed in Tris-buffered saline (TBS), the slides were incubated with 3% normal rabbit serum (NRS) in TBS for 30 min to prevent non-specific binding of the first antibody. The sections were then incubated with primary mouse monoclonal antibodies, ER (dilution 1:25) (DakoCytomation) and PR (DakoCytomation) (dilution 1:100), for 30 minutes at room temperature. For HER-2/neu staining, after antigen retrieval, slides were stained with a polyclonal antibody against HER-2/neu (DAKO) oncoprotein by envision system. HER2 score of 3+ was taken as positive. A score 3+ may be taken as “positive” as over 90% of these show gene amplification

Figure 1: Immunohistological (IH) procedure - Avidin-Biotin Complex (ABC) Method

Statistical Analysis: The results of principal components analysis were confirmed by determination of the correlation of ER, PR and HER-2/neu receptors expression status and several clinicopathological factors, by using Chi-square tests (χ² test two-tailed). Fisher’s exact test were also performed to examine whether or not the studied variables differed. A p value of <0.05 was taken as significant.

Results and Discussion

A total of 75 breast cancer cases were included in the study. The mean age was 47.3 years (range 31-76 years; median age 44.5 years). Most of the patients (66.0%) were ≤50 years at diagnosis. The left breast was more commonly involved (57%). Tumor size ranged from 0.5 - 13.0 cm. Immunohistological stained slides were evaluated for the presence of positive reaction, cellular localization (nuclear or cytoplasmic), pattern of staining (focal or diffuse), and intensity of reaction in individual tumor cells (strong or weak). The intensity of positive nuclear reactions was evaluated against the reaction in respective control samples. The staining of HER2 was mainly localized in the membrane (Fig. 2), whereas ER, PR, were localized in the nucleus (Fig. 3, respectively). Cells were classified according to the positive rate and colour intensity as follows: negative (-), weak positive (+), moderate positive (+++) and strong positive (++++). The morphological categories were infiltrating ductal carcinoma (IDC) 64 (85.3%) cases, metaplastic carcinoma 3 (4.0%) cases, IDC with mucinous differentiation 2 (2.7%) cases, infiltrating...
lobular carcinoma 1 (2.0%) case; mixed (ductal and lobular) carcinomas, IDC micropapillary and medullary carcinoma 1 (1.3%) cases each. Other types were apocrine, papillary and pleomorphic lobular carcinoma accounting for a single case each. Tables 2 and 3 give the ER, PR and HER-2/neu status by tumor grade, size and lymph node involvement. Seven (9.3%) cases were grade I, 40 (53.3%) were grade II and 28 (37.3%) were grade III. ER and PR were positive in 49 (32.7%) and 38 (25.3%) cases respectively. HER-2/neu was positive (3+) in 37 (24.7%), 2+ in 19 (12.7%) and negative (0 and 1) in 94 (62.7%) cases. Simultaneous ER and HER-2/neu positivity was observed in 6 (4%) cases. Special subtype of carcinomas like metaplastic carcinoma showed no HER-2 positivity, except for a case of grade II IDC with mucinous differentiation. ER and PR expression correlated inversely with HER-2 over-expression. ER and PR expression were decreased significantly in HER-2/neu positive compared with HER-2/neu negative tumors (Table1, 2). ER positivity was observed in 71.4% grade I, 50% grade II and 3.5% grade III carcinomas (p value <0.005). Similarly PR positivity was observed in 70% grade I, 36.14% grade II and 1.75% grade III carcinomas (p value<0.001). HER-2 was negative in all cases of grade I carcinoma, 9 (22.5) cases of the grade II carcinoma and 10 (35.7) cases of grade III carcinoma. In the HER-2/neu positive tumors, ER and PR expression was significantly decreased (Table1).

ER positivity was observed in 71.4% grade I, 50% grade II and 3.5% grade III carcinomas (p value <0.001). Similarly PR positivity was observed in 71.4 grade I, 37.5% grade II and 3.5% grade III carcinomas (p value<0.001). HER-2 was positive in None case of grade I carcinoma, 31 (22.5%) cases of the grade II carcinoma and 35.7% cases of grade III carcinoma. In the HER-2/neu positive tumors, ER and PR expression in high grade tumors was significantly decreased compared with intermediate grade tumors. With regard to tumor size, three groups was performed, group 1 (tumor size < 2 cm), group 2 (2–5 cm) and group 3 > 5 cm in diameter. The total number of group 1 tumors was 9 [5 (55.5%) ER positive; 4 (44.4%) PR and 2(22.2%) HER-2 positive]. Of the group 2 tumors 14 (35%) were ER positive, 12 (30%) were PR positive and 9 (22.5%) were HER-2 positive. Of the group 3 tumors 7 (20%) were ER positive, 5 (14.2%) were PR positive and 8 (23%) were HER-2 positive. ER expression in the HER-2/neu positive, large sized tumors was significantly decreased compared with smaller tumors (ER 20% vs 55.5). Breast cancer survival is linked to early detection, timely appropriate treatment and genetic predisposition. Prognosis is related to a variety of clinical, pathologic and molecular features which include classical prognostic factors viz. histologic type, grade, tumor size and lymph node metastases [14-19]. In the present study data regarding tumor size, type, histological grade, lymph node status and hormone receptor status as well as HER2 marker status for breast carcinomas were analyzed. These demographic findings
complement other studies which have stressed on the younger age of breast cancer cases at presentation and the higher stage and tumor grade\textsuperscript{14-19}. With regard to hormone receptors, ER were positive in 71\% for grade 1 and 50\% for grade 2 breast cancer cases respectively and PR were positive in in 71\% for grade 1 and 37.5\% for grade 2 cases respectively. Regarding HER2 expression, HER-2/neu was nil in grade 1, positive in 22.5\% for grade 2 and positive in 35.7\% for grade 3 breast cancer cases respectively. The ER, PR expression in breast cancer, in the current study is comparable to published international studies, but the frequency of HER-2/neu expression is higher in the current study. This may reflect the younger age at diagnosis. Larger studies are required to study the biological behavior of breast cancer in this high risk population. The clinical importance of these prognostic markers in the management of breast cancer patients is strongly advocated in our population to improve the dismal prognosis and to provide better therapeutic options\textsuperscript{28}.

\textbf{Conclusion}

There is a definite correlation between IH indices and clinicopathological characteristics in breast carcinomas. Combined detection of these indices may be significant in the evaluation of biological behavior and prognosis of breast carcinomas and thus in the diagnosis and comprehensive treatment of this disease.

ABSTRACT

This study aims to (1) Assess the level of nurses’ burnout in oncology wards. (2) Identify the relationship between nurses’ age, years of experience in nursing, years of experience in the oncology ward, the nurse’s burnout and quality of oncology nursing care. (3) Find out the differences in nurses’ exposure to burnout and quality of oncology care between the groups of age, gender, and educational qualification. For the assessment of Burnout Syndrome and quality of oncology nursing care we used the questionnaire: (1) Maslach Burnout Inventory (MBI) and (2) quality of oncology nursing care scale (QONCS). Respondents consisted of Nurses n=46, who working in oncology ward in pediatric teaching hospital in Baghdad City. In our study, out of n=46 Nurses working at the wards of Oncology, most of study participants experience high level of emotional exhaustion (n = 32; 71.1%), Most of study participants experience low level of depersonalization (n = 29; 64.4%) and more than a half of study participants experience low level of personal accomplishment (n = 23; 51.1%). There are statistically significant associations between nurses’ age, nurse-to-bed ratio, socioeconomic status and the quality of oncology care.

Keywords: burnout, oncology, nursing care.

Introduction

Burnout occur when a person experiences chronic emotional and interpersonal stress for a prolonged time\(^1\). Burnout is determined by the dimensions’ exhaustion, cynicism, and decreased professional efficacy. As a predetermined job-related stress syndrome, the individual stress experience accompanied to burnout syndrome are laid within the organizational context of individual’s relation to their job. Burnout negatively affects individuals’ personal and social functioning. Burnout can result in a compromised quality of work and an increased cost both for the individual and his/her their significant others. This cost is owing to both physical and psychological health. The interventions that aim to minimize the severity of burnout and to better its adverse effects can involve workers’ engagement with their work at the individual and organizational levels\(^2\).

According to Maslach, burnout is a final reaction that manifests as a result of chronic stressors from the job characterized by three dimensions which are cynicism, inefficacy, and exhaustion\(^3\). This implies that burnout is characterized by a number of factors not just one single symptom therefore a rough day at work or a bad day does not imply that the individual is suffering from burnout. Burnout will be inevitable when discrepancy occurs between the type of job performed and the type of person performing the job. The widening gap between the individual and demands from the job becomes too great eventually leading to burnout\(^4\). The issue of burnout and stress among nurses is familiar, nursing is inevitably a stressful profession\(^5\). The prevalence of burnout in nursing is a real issue and a real threat to the health care system. Several studies around the world in different continents have been carried out showing the high rates of burnout among nurses, more especially staff nurses working in hospitals. High levels of burnout among nurses are reported in Europe, Asia and North America\(^6\). Burnout reduces productivity and saps your energy, leaving you feeling increasingly helpless, hopeless, cynical, and resentful. Eventually, you may feel like...
you have nothing more to give. The negative effects of burnout spill over into every area of life including your home, work, and social life. Burnout can also cause long-term changes to your body that make you vulnerable to illnesses like colds and flu. It has been reported that there are approximately 14 million new cancer cases every year in the world, and this number is expected to reach 22.2 million by 2030. Of these annual cases, 175,000 are children under 15 years of age. WHO has projected that new cancer cases in Southeast Asia will rise from 1.3 million to 2.1 million between 2002 and 2020 - a dramatic 60 percent jump (WHO, 2005). Standards of practice and competencies for oncology nurses appear to be similar across continents. Many childhood cancers are now curable. In recent years, understanding the importance of early diagnosis, new diagnostic methods, new chemotherapy regimens, and especial improvements in bone marrow transplantation have affected survival rates. Oncology nursing society approximately 48 percent of nurses in the U.S. hold a bachelor’s degree. In this context, the pediatric oncology nurse must go beyond the application of technical and scientific knowledge, offering the child and his family a humanized care. aiming at the promotion of health, quality of life, comfort and well-being of them. It is necessary that all those involved in care are more sensitive and responsible, open to forming partnerships with families and mobilizing possible social support networks, in order to create links. Among the professionals who deal with the oncological child, the Nurses stand out, once they assume a position of support, dealing daily and directly with the child. It has an important role in guiding the patient and his family in the experience of the disease process, treatment and rehabilitation, definitively affecting future quality of life. It acts to alleviate the suffering caused by hospitalization, through the humanization of the care and development of the ludic. The nurse has an indispensable role in the care of the oncological child, and must act consciously, reflexively and critically in the care of the child and the family that is under his care. carefully considering the particularities and singularities of each. They are sensitized by the whole situation that cancer imposes. It is necessary that the nurse professional understands the pain of the other, in order to relieve it, seeking recovery and a good standard of quality of life of the pediatric patient.

Methodology

Study Design: A descriptive design research is used to discover relationships among variables and to allow the prediction of future events from present knowledge. In the present study, several variables were examined to determine each subjects’ likelihood to experience burnout including age, gender and educational qualification. The period of the study started from October 15th, 2018 to April 30th, 2019.

Study Sample: The study applied the convenience sampling method. This type of sampling is inexpensive and feasible, and usually requires less time in comparison with other types of samples. Convenience sampling facilitates conducting studies on topics that could not be investigated via the application of probability sampling. Furthermore, it allows researchers to obtain information in unexplored fields. In the convenience sampling approach, participants were included in the study since they happened to be in the right place at the right time. Therefore, it is also convenient to the researcher for data collection purposes. Based on predictors (age, gender, marital status, educational qualification, income, number of working hours). The total number of nurses who work in pediatric oncology unit is 56 nurses. The researcher distributed (50) copies of the study instrument to those nurses. The returned questionnaires were 46; 4 of them were incomplete. So, they were excluded from the data analyses. The final sample size was 46. Thus, the response rate was 92%.

Study Instrument: In addition to collecting demographic data, the researcher used the Maslach’s Burnout Inventory (MBI) and quality of oncology nursing care scale (QONCS). The latter measures the burnout level in oncology nurse’s.

Part 1: The Maslach’s Burnout Inventory

Part 2: The quality of oncology nursing care scale

Data Collection the Methods: The researcher collected data throughout different times of the day in morning and night shift. The researcher used the same form of the study questionnaire to collect data for all hospitals. Using simply language clearly because different of nurses educational levels. The estimated time range for each participant to complete the study questionnaire ranged between 15-20 minutes, to be
The data were collected from the period from December 20\textsuperscript{th} 2018 to January 30\textsuperscript{th}, 2019.

**Statistical Analysis:** Data were analyzed using the Statistical Package for Social Science (SPSS), version 24 for Windows©. Descriptive statistical measures of frequency, percentage, mean, and standard deviation were used to demonstrate the participants’ sociodemographic characteristics. Inferential statistical measure of bivariate Pearson correlation was used to measure variables that can predict participants’ likelihood to experience burnout.

## Results and Discussion

The mean age for nurses is 32.53 ± 7.93; more than a half age 21-31-years (n = 25; 55.6%), followed by those who age 32-42-years (n = 13; 33.3%), and those who age 43-55-years (n = 5; 11.1%). Concerning gender, most are females (n = 28; 62.2%) compared to males (n = 17; 37.8%). Regarding marital status, most are married (n = 31; 68.9%), followed by those who are not married (n = 13; 28.9%), and one who is widowed (n = 1; 2.2%). With respect to educational qualification, less than a half hold an associate degree (n = 22; 48.9%), followed by those who are nursing high school graduate (n = 17; 37.7%), and those who hold each of a bachelor’s degree and a graduate degree (n = 3; 6.7%). Concerning socioeconomic status, most are of lower-middle class (n = 33; 73.4%), followed by those who are of upper lower class (n = 6; 13.3%), those who are of upper-middle class (n = 5; 11.1%), and one who is of upper class (n = 1; 2.2%). There are statistically significant associations between nurses’ age, nurse-to-bed ratio, socioeconomic status and the quality of oncology care (p-value = .034, .003, .030) respectively. There are statistically significant associations between years of experience in the current unit, socioeconomic status and the level of emotional exhaustion (p-value = .011, .034) respectively. There are statistically significant associations between years of experience in the current unit, number of shift hours and the level of depersonalization (p-value = .033, .026) respectively. There is a statistically significant association between nurse-to-bed ratio and the level of personal accomplishment (p-value = .006). Most of study participants experience high level of emotional exhaustion, followed by those who experience an average level of EE, and those who experience a low level of EE. According to the Multidimensional Theory of Burnout, BO is a person stress knowledge embedded in a context of complex social association, and it includes the individual’s perception of both self as well as other people (Maslach, 1998). In this sense, the stressors that the nurse feels more in the workplace that trigger emotional exhaustion include job dissatisfaction owning to societal negative view of nursing as a profession. Other stressors related to person’s perception of self—include workload and conflict at work. Maslach (1998) stated that workload happens when job demands exceed human limits. People have to do too much in too slight time with too insufficient resources. When overwork is a chronic work condition, not an occasional emergency, there is slight chance to rest, recover, and reinstate equilibrium. This fits with the findings of the current study which demonstrated that about a quarter of participants work for 18-hours per shift which could result in such a high level of emotional exhaustion. Maslach (1998) stated that workload can make employees feel exhausted and used up without any source of renewal and they deficiency enough energy to face another day or another person in need.

On the other hand, the person’s perception of others may be contextualized within the nature of the patients admitted to the oncology wards who experience compromised psychological status. The complex health status of those patients require greater physical efforts and more vigilance. Maslach (1998) stated the centrality of relations at work—whether it be associations with patients, colleagues or managers—has always been at the heart of descriptions of burnout.

Concerning DP, the finding of the current study displayed that most of study participants experience low level of depersonalization (n = 29; 64.4%), followed by those who experience high level of DP (n = 15; 33.3%). Maslach (1998) stated that workload Depersonalization improves in response to the excess of emotional exhaustion. The relationships are the basis of both emotional strains and rewards, they can be a source for coping with work stress, and they often tolerate the burnout of the negative effects of burnout. The finding of the current study displayed that most study subjects experience high level of emotional exhaustion which could result in Depersonalization. Regarding personal accomplishment, more than a half of study participants experience low level of PA (n = 23; 51.1%), followed by those who experience an average and high levels of PA.
(n = 11; 24.4%) for each of them. Maslach (1998) stated that reduced personal accomplishment this lowered fell of self-efficacy has been connected to depression and an incapability to cope with demands of the work and it can be worsened by a deficiency of social support and chances to develop professionally. The reality of health agencies in Iraq lacks to any social support system. Insufficient reward includes a deficiency of suitable rewards for the work people do. This deficiency of recognition devalues both the job and the workers. Prominent amongst these rewards are outside ones such as salary and benefits, but the loss of internal rewards (such as pride in doing something of importance and doing it well) can also be a critical part of the mismatch between the person and the work.

Conclusion

Most of nurse’s experience high levels of EE, DP, and low level of PA, Female nurses have better quality of pediatric oncology care than male nurses, the better the nurses’ SES, the better quality of pediatric oncology care and nurses who hold a graduate degree have better quality of pediatric oncology care.

Physiological Aspects of Osmolality and Cations of Young University Adults Suffer from Blood Glucose, Blood Pressure and Smokers

Nada Saad Naji Al-Taee
Department of Environmental Pollution, Faculty of Environmental Sciences, AL-Qasim green University, Iraq

ABSTRACT
The study deals with the physiological measurements of cations and osmolality for fasting blood glucose (FBG), clinic blood pressure (CBP) and smokers among university students. A total of 254 students (77 females and 177 males) were registered. Including 41 healthy and 42 students who were FBG; 31 were healthy and 68 were suffering from CBP; 39 nonsmokers and 33 students who were smokers; aged 19-26 years. A significant increase was observed in the concentrations of trace elements (Cd²⁺, Pb²⁺, and Cu²⁺ excluding the smokers group), electrolytes (Na⁺) and osmolality, as well as significantly reduced serum Zn²⁺, Fe²⁺ and K⁺ for the three cases at (p<0.05) in comparison with healthy students. The lack of Zn²⁺ and Fe²⁺ and the rise exposure to toxic elements from the three cases may be synergistic with the hazard factors linked with many diseases.

Keywords: blood glucose, blood pressure, smoking, cations, osmolality.

Introduction
Trace minerals are dietary minerals that are needed in very small quantities for the growth, development, and physiology functions appropriate to the body¹. Although the trace elements are essential components for biological activities, the immoderate levels of them can be toxic for body health. The imbalances in the optimum levels of trace minerals may have a negative impact on biological processes because of the tendency of the components to collect and accumulate organisms within and are associated with many fatal diseases². The proposed mechanism for trace minerals that promote insulin function include activation sites of insulin receptor, according to³, they act as co-factors or component of enzyme systems involving glucose metabolism. Cigarette smoking may be an important source of absorption of these dangerous minerals not only for smokers, but also through smoking passively⁴.

The human body contains water about 60% of body mass and a small proportion of solutes. In the path of development, knotted arrangement mechanisms developed to osmolarity keeping the (≈280 mosm/L) and thus water amount at needed level. Thus it came the function of major solutes and their mechanisms of regulatory in blood pressure regulation⁵. Therefore, serum osmolality is an essential laboratory parameter to understand several clinical disorders such as electrolyte disturbances exogenous intoxication and hydration status⁶. Literature survey showed that no sufficient work has been done to study the effect of the three cases on serum cations alterations and osmolality, so the current work was carried out to determine the influence of the cases on serum minerals and osmolality to decrease exposure for toxic minerals in the student’s college in order to reduce the hazard of adverse health influences.

Materials And Method
Criteria of Participants: A sample of 254 students aged between 19 and 26 years was selected randomly among students. About 83 of FBG were divided to: health (<100 mg/100cm³), pre-diabetes (100-125 mg/100cm³), diabetes (≥126 mg/100cm³), and hypoglycemia (≤70 mg/100cm³). In addition, 99 of a CBP level were divided as:
Results and Discussion

There is growing guide that the metabolism of many trace minerals changes in diabetes, and these micro-nutrients may have particular roles in causing disease and its development. The level of Pb2+, Cd2+, and Cu2+ was found to be significantly elevator in diabetic of students, while the concentration of Zn2+ and Fe2+ was found to be significantly lower than healthy (Table 1). This result agrees with7, who showed a significantly higher level in Cd2+ level of experimental rats when compared to control. Other toxic minerals, including Pb2+, have been reported in higher concentration in biological samples of diabetics when compare to non-ones8. The results of9, the level of copper in control cohort was 933.43 (mg/L) and 950.30 (mg/L) of type 2 diabetes cohort in Chinese adults. The low plasma level of Zn2+ negatively impacts the capability of islet cells to produce and secrete insulin10. While11 found that iron (Fe2+) serum level there were low in diabetic patients. The data obtained in study appeared significant increase of Cd2+, Pb2+, and Cu2+ concentration in FBG. And data gained in12, suggested that an high cadmium (Cd2+) concentration lead to high blood pressure(HBP)/ischemic heart illness or it is the result of outset of disease that is resulted in the rising of Cd2+. While the potential health effects of Pb2+ accumulation are HBP and peripheral arterial disease13.

In subgroups of coronary artery disease (CAD) patients according to hypertension (HT) and diabetic (DM) they had a lower level of Zn2+ and a high level of Cu2+ in HT and DM than normotensive and non-diabetic, respectively14. The concentrations of Zn2+ in15 study on blood samples low-HT male patients. And16 showed that there was a low serum Fe2+ level in HT patients. A high levels of toxic minerals (Pb2+ and Cd2+) and a low levels of Cu2+, Zn2+ and Fe2+ were associated with raise in a number of cigarettes (Table 3). In Iraq, according to17, the concentration levels of Cd2+ was 0.023 μg/dl in infertility men smokers higher than in fertility men non-smokers (0.006 μg/dl). A positive linked was found between Pb2+ serum and the duration of smoking and number of cigarettes smoked per day18. The results appeared that serum Cu2+ was significantly decrease in number of cigrattes compared with nonsmokers ones, which came in line with19. The study20 found that serum Zn2+ was lower in cigarette smokers. Zn2+ was detected in cigarette smokers in Sudan, and low concentrations of Fe2+ plasma in infants’ exposure to tobacco smoke21. The results illustrated a significance increased and decreased

Collection of Data and Measurement: The data were collected using a self-administered questionnaire and it is built on several axes: age, smoking case, the number of cigarettes smoked per day and the duration of smoking, the family history of diabetes and physical activities. Women smokers were not comprised because of the tradition of Iraq society, in which restricts the arrival of researchers to females at the time of study, and prevents their smoking. The criteria for selecting students were that no one should suffer any medical complication such as heart disease, stroke or any other disorder. A total of five ml of the venous blood sample was gathered from the healthy student and FBG in the morning after the fasting period for at least 8-10 hours. The serum was separated using a centrifuge device for 3000/10 rpm and stored at (-20°C) until analysis. BG were measured using the active glucose meter Accu-chek. BP was measured by the electronic pressure device, by taking the pressure rate while students were at rest for at least 10-15 min.

Methods of Measuring Minerals: Serum microminerals (mg/L) were determined from all samples. Ten ml of HNO3 was added to one ml of serum, heated under boiling for 3 hours on a hot plate device. Then 5 ml of 30% H2O2 was added to low amounts of samples, and also heated at the same temperature to dry. The remain was dissolved at 50 ml of 1% HNO3, after it was filtered by the whatman filter. The element was then analyzed using atomic absorption spectrophotometer. Depending on a flame photometer device, to assessment Ca2+, Na+ and K+ (mg/L), after serum dilution with a certain percentage of water free of ions. Osmolality (mosm/Kg) was determined for cases by using standardized procedures of single-sample Micro-Osmometer device.

Statistical Analysis: Data of study were analyzed using ANOVA, differences of the entire study students for osmolality and cations were statistically assessed using F-test. Least significant difference, LSD was applied to compare the results, descriptive analysis was also used to show the mean and standard deviation (SD) of the results. The various letters indicated significance in p<0.05.
in level of sodium and potassium in FBG, respectively (Table 4) and came in line with. In appeared that the average value of K+ was significantly decreased, while the Na+ blood level was higher in samples of non-HT diabetic subjects as compared to healthy of both sexes. Na+, the major extracellular cations, has long been seen a vital environmental factor in disruption. by contrast, K+, the essential intracellular cat-ion, has commonly been viewed as a secondary factor in the pathogenesis of HBP. K+ supplementation can lower the need for anti-hypertensive medication. The kidneys account for 90% or more of K+ loss, with the remnant exiting via the fecal way. This technique, is inadequate for the Na+-rich and K+-poor modern diet. The end outcome of the failure of the kidneys to acclimate to this diet is an excess of Na+ and a deficit of K+ in the patients of hypertensive. This end outcome came in line with my results (Table 5). Hypotension is associated with a reduction in Na+ food intake with a sensitivity of Na+.

### Conclusion

A significant increase of toxic minerals (Cd²⁺, Pb²⁺, Cu²⁺), electrolyte Na⁺, osmolality and reduce serum Zn²⁺, Fe²⁺ and K⁺ of the cases and cigarette smokers in young university was observed, whereas the level of toxic minerals was affected by number of cigarettes. Alteration in the level of one metal as a result of the three states listed in the search may influence normal levels of other metals. Which in turn may serve as a simple plate of vital indicators for the risk of many diseases.

ABSTRACT

Is an acute infection of the protecting membranes that cover the spinal cord and brain, known as meninges. Meningitis may be dangerous because of its proximity to the spinal cord and brain; hence, meningitis is categorized as an emergency health condition. The study aims at assessment the prevalence of meningitis in children less than 10 years for the Last 5 year. A descriptive (retrospective) study used assessment approach was carried to explore prevalence of meningitis for the period of September 1st 2018 to January 1st 2019. It conducted at Statistics Unit in Babylon Teaching Hospital for Maternity and Pediatric. The sample collection was five years from 2014 to 2018 and was for all months of the year for children with meningitis. descriptive statistical approach that includes of frequencies, percentages data were analyzed. May month were recorded the highest percent (12%) as a more frequent of infection. As well as the 2017 were recorded highest percent among 5 years. A fifty seven percent of male gender as a majority of 5 years exposed to the infection than the female in under one years of their age.

Keywords: Prevalence, Meningitis, Under Fifteen Years

Introduction

The existence of microorganisms in normally sterile body fluid samples may be representative of dangerous infections ¹. Bacterial meningitis is a universal public health concern, with various accountable etiologic agents that vary by age group and geographical region. Bacterial meningitis, an infection of the membranes (meninges) and cerebrospinal fluid (CSF) surrounding the spinal cord and brain, is the main reason of decease and disability worldwide ². Bacterial meningitis can be deadly in fifty percent of cases if untreated. Even when diagnosed early and treated adequately eight–fifteen percent of the patients die, typically within twenty-four and forty-eight hours of symptom onset ³. Furthermore, ten–twenty percent of the survivors are prone to permanent sequelae involving brain harm, hearing lack, and learning disabilities ⁴. In the united states, bacterial meningitis was responsible for an estimated 4100 cases and 500 decease yearly between 2003 and 2007 ⁵. In developing, nations face the highest burden of illness ³. In African Meningitis Belt, comprising 26 nations in the sub-Saharan area has the highest meningitis illness rate; in 2009, an estimated 80000 suspected cases of meningitis, resulting in more than 4000 decease, were reported WHO, (2017). The etiologic agents responsible for bacterial meningitis vary by age group. between newborns ⁵. Most cases of bacterial meningitis are due to, Escherichia coli, group B Streptococcus agalactiae, and Listeria monocytogenes, while most cases in babies and adults are caused by Streptococcus pneumonia and Neisseria meningitis ⁶. Although Haemophilus influenza is implicated in bacterial meningitis in all age groups, it is preponderant in babies under five years of age ⁷,⁸. Given the variability in causative agents across regions and bacterial meningitis incidence clear differentiation

between them is essential to treat cases of bacterial meningitis. Bacterial meningitis can be decreased by the use of prevention strategies against these etiological agents, like a vaccination against H. influenzae type B (Hib), S. pneumoniae and N. meningitidis. Pneumococcal conjugate vaccines and Hib were introduced in the 1990s and 2000s, and the implementation of additional prevention programs utilizing these vaccines has decreased the occurrence of bacterial meningitis. Presently, there are no vaccines available against E. coli, group B S. agalactiae or L. monocytogenes. Another prevention strategy involves using chemoprophylaxis to prevent secondary illness in high-risk persons.

**Study Aim:** To assess the prevalence of meningitis in children less than 10 years for the last 5 years.

**Methodology**

**Study Design:** A descriptive (retrospective) study used assessment approach was carried to explore prevalence of meningitis for the period of September 1st 2018 to January 1st 2019.

**Study Sitting:** Conducted at Statistics Unit in Babylon Teaching Hospital for Maternity and Pediatric.

**Sample of Study:** A sample convenience sample of (N=884) was collected five years from (2014, 2015, 2016, 2017, and 2018) and was for all months of the years for children with meningitis. As a medical records of statistic considered a study tools.

**Statistical Data Analysis:** A descriptive statistical (SPSS) version XX analysis approach that includes, frequencies, percentages, and graphical presentation of Chart.

**Results and Discussion**

Results depicts that the May is the most frequent month of meningitis in the last five years. Findings reveals that 2017 recorded the highest percentage in the prevalence of meningitis, while the year 2018 recorded the lowest percentage. Findings presence that the male patients have been the most exposed to meningitis infections in compared to female in the last four years. This results come as being may be that more births are of the male gender. These results come in the same line with a cross sectional study was conducted in three hospitals of Gaza strip -Palestine during the period 2009. Their results indicated that the male gender were a most common exposed to amenities than the female, it constituted (62%) out total number of the study sample. Findings indicate that the age groups of under one years were most exposed to meningitis infections in compared to female in the last four years. This results come because this age group of children is more prone to infection than others as an immature immune system. Results consistent with study has been investigated Bacterial Meningitis in Malawian. Their findings depicts that more infection was in the age group of 1-month-two years with frequency (44%). These age groups for the children have considered as development age and they are more susceptible to infection than elder one.

Conclusions

During hot weather, meningitis increases, and frequent among male who under one years. Health institutions (hospitals) need to be consider that the climate play an important role in frequent of meningitis especially those who are under the age of one year to take the necessary measures against infection and dealing with the infected people.

Prognostic Importance of Some Hormones in Menopausal Women in Babylon City-Iraq

Reem Abdul Raheem Mirdan Alsaad
Department of Anatomy and Histology, College of Medicine, University of Babylon, Iraq

ABSTRACT

Estimation of hormone concentrations TSH, T3, T4, and testosterone in menopausal women in Babylon CITY were carried out in this study. There was no significant difference in body mass index (BMI) and age group distribution between cases and controls. P>0.05, while there was a statistical differences in fertility status between two studied groups. P<0.05. According to statistical analysis could been concluded that the level of T3, T4, TSH and testosterone were decreased in menopausal women in comparison with healthy control group and there are differences between patient and control group. P<0.05. While in the study of levels of TSH it has been found that there are no significant differences between various period times. P>0.05.

Keywords: TSH, T3, T4 and Testosterone, menopausal women

Introduction

Menopause usually occurs between ages 48 and 52. The onset of hot flashes, extreme mood swings, insomnia, hair loss, uncontrollable weight gain, skin changes, vaginal dryness, decreased sex drive, the fear of osteoporosis, breast cancer and heart disease all are a part of American women’s experience.1 Menopausal symptoms are more common in women in industrialized nations or with specific diets and lifestyles. Women in the United States and Europe complain more of menopausal symptoms than Asian women or women from less industrialized nations. Women in Asia have no word in their language for hot flash because they are non-existent in their culture. However, if an Asian woman moves to America or Europe and adapts the diet and lifestyle the likelihood of menopausal symptoms is equal to an American woman.2 This phenomenon tells us that menopausal symptoms are not genetic and unavoidable. Diet, lifestyle and the environment play a role in the difficulties experienced during menopause.3 Menopause occurs when a woman permanently stops ovulating or producing an egg that can be fertilized and used for reproduction. Menopause is diagnosed when a woman no longer has a monthly cycle for a year and has an elevated blood level of FSH (follicular stimulating hormone). FSH is elevated when a woman stops ovulating or producing an egg. FSH is not an indicator of estrogen deficiency. Unfortunately, FSH levels are what most doctors use to diagnose menopause. Estrogen is made from a variety of sources.2,4 The ovary is only one of many sources. Estrogen is available because hormones that are made by the adrenal gland can be converted into estrogen in fat, muscle and skin cells. Estrogen is also available through food sources such as soy, and flax seed. We are exposed to many chemical substances in the environment that behave like powerful estrogens. With the abundance of sources of estrogen available in the environment and the other sources available in the body, it seems unlikely that estrogen deficiency is the problem. When estrogen levels are obtained from saliva testing, most menopausal women have normal or elevated levels of estrogen.5,6 Menopause cannot be simply explained by lack of estrogen. While estrogen deficiency may play a role in some women’s experience in most cases it does not. Most women in America are over their ideal body weight.7 It is well documented that overweight women produce too much estrogen. Estrone, an estrogen, is made in fat cells. It is a relatively strong estrogen when compared to estrogens made by the body. Women who are overweight are at an increased...
risk of diseases that are known to be caused by elevated estrone levels. Uterine cancer and breast cancer are more common in women who are overweight.⁸Women that are overweight are more likely to be diabetic. Women who are diabetic are more sensitive to estrogen than women who are not diabetic. Estrogen also increases weight gain and makes it more difficult to lose weight. Women who are overweight should not take standard synthetic estrogen replacement. Women who are not at high risk for osteoporosis should avoid estrogen replacement. Estrogen has two FDA approved indications. One is the relief of hot flashes the other is the prevention of osteoporosis in high risk women.¹⁰Women that have a thin frame, and of North European decent with extremely fair skin, sedentary lifestyle, history of smoking and prolonged steroid use are at risk for osteoporosis.¹¹Women that are not in a high risk group do not need estrogen to maintain normal bone health. African-American women and other people of color are at very low risk for osteoporosis and should not take estrogen for osteoporosis prevention. Although very thin fair skinned African American women may be at risk. ¹²Overweight women do not have to worry about osteoporosis. Osteoporosis is very uncommon in women over their ideal body weight especially if they have no other risk factors. Symptoms of Menopause Totally, women face 34 different symptoms of menopause. They are classified as physiological and psychological in nature. All are frustrating and debilitating. To better understand how these symptoms affect women, here is a categorical breakdown:¹²,¹³,¹⁴

1. **Vascular Instability:** Most of the women suffer a lot based on this kind of symptom because the hormonal imbalances caused by menopause create vascular instability, which means your body struggles to regulate its own internal temperature. The most common symptoms associated with vascular instability are hot flashes and night sweats.

2. **Urogenital Atrophy:** These symptoms are most commonly associated with dryness in private parts, it can lead to bleeding, itchiness and incontinence.

3. **Skeletal Pain:** Normally women suffering from menopause claim to have back or joint problems, and it’s widely recognized that menopause can lead to osteoporosis.

4. **Psychological Damage:** Arguably the worst side effect of menopause is the depression, mental fatigue, memory loss, insomnia, etc. that can debilitating one’s personal and professional life.

5. **Sexual Stagnation:** In addition to dryness in private parts, menopause has been known to cause loss of libido. It’s worth reiterating that while there are 34 recognized symptoms of menopause, not every woman reacts to aging the same way. Some may experience more symptoms than others and some more severely than others. It usually comes down to your personal habits and heritage. The Aims of the study are to Study the concentrated levels of some hormones in such as TSH, T3 T4, and testosterone in menopausal women in Babylon city

### Materials and Method

**Patients Groups:** A total of 50 menopausal women who were admitted to the various hospital in Babylon city were investigated biochemically from March 2018 to December 2018. And women age over than 50 years.

**Control Groups:** The control groups included 50 healthy women with no signs of menopausal status or other diseases, and the ages below than 40 years.

**Collection of Blood Samples:** For each patient (patient groups and control groups) 2-3 ml of blood were aspiration by syringe 5ml, serum was separated by centrifugation at 3000rpm/10 minutes, and kept in 10°C until used and thawing of each frozen sample

**Hormone Kits:** The kits used in this study for estimation of TSH, T3, T4 and Testosterone concentrations were supplied by Spectrum co., Netherlands, and the determination of hormone concentrations would done according to supplied company

**Body mass index (BMI)** was calculated as follows: weight (kilograms)/height² (meters).

**Statistical Analysis:** Results were analyzed using the test T test use of less significant difference (least significant differences) (LSD) at the level of significance (P≤0.05, P≤0.01 and P≤0.001) to show statistically differences.
Results and Discussion

Basic Subject Characteristics: This is a case control study involved 50 menopausal women. These were compared with age matched 50 apparently healthy controls. The basic characteristics of menopausal women and control groups are shown in Table (1). There was no significant difference in BMI and age group distribution between cases and controls. Tables 2-5 and fig 1 illustrate the levels of various hormones in menopausal women According to statistical analysis could been concluded that the level of T3, T4 and testosterone were decreased in comparison with healthy control group and there are a differences between patient and control group. P<0.05. Menopause is the irreversible end of the reproductive stage in a woman’s life. This usually occurs around the age of 50 with menstrual cycles becoming less frequent. Menopause is caused primarily by ovarian failure when the ovaries fail to respond to the gonadotropins (sex hormones) mainly because the follicles and eggs have disappeared through atresia. Although small amounts of estrogen are still secreted into the plasma, largely from the alteration of adrenal androgens to estrogen, menopause is associated with a precipitous fall in plasma estrogen levels. Menopause is associated with osteoporosis (decrease in bone mass and strength), hot flashes, night sweats, vaginal dryness, and increase in cardiovascular disease. Menopause cannot be simply explained by lack of estrogen. While estrogen deficiency may play a role in some women’s experience in most cases it does not. Most women in America are over their ideal body weight. It is well documented that overweight women produce too much estrogen. Estrone, an estrogen, is made in fat cells. It is a relatively strong estrogen when compared to estrogens made by the body. Women who are overweight are at an increased risk of diseases that are known to be caused by elevated estrone levels. Uterine cancer and breast cancer are more common in women who are overweight. Women that are overweight are more likely to be diabetic. Women who are diabetic are more sensitive to estrogen than women who are not diabetic. Estrogen also increases weight gain and makes it more difficult to lose weight. Women who are overweight should not take standard synthetic estrogen replacement. Women who are not at high risk for osteoporosis should avoid estrogen replacement. Estrogen has two FDA approved indications. One is the relief of hot flashes the other is the prevention of osteoporosis in high risk women. Women that have a thin frame, and of North European decent with extremely fair skin, sedentary lifestyle, history of smoking and prolonged steroid use are at risk for osteoporosis. Women that are not in a high risk group do not need estrogen to maintain normal bone health. African-American women and other people of color are at very low risk for osteoporosis and should not take estrogen for osteoporosis prevention. Although very thin fair skinned African American women may be at risk. Overweight women do not have to worry about osteoporosis. Osteoporosis is very uncommon in women over their ideal body weight especially if they have no other risk factors. It is well renowned that menopausal symptoms experienced by women affect their quality of life. Studies show that when compared with peri and post-menopausal, premenopausal women have less menopausal complaints. They were seems to complain significantly more of severe physiological, somatic and psychological symptoms like bladder infections, urinary infections etc. when compared to premenopausal women. During menopause, women often experience some symptoms which may affect their daily activities. In recent years, studies have shown that menopausal symptoms may affect healthrelated quality of life.

Role of Nurse in Reducing Stress among Female Patients Performing Magnetic Resonance Imaging

Younus Khudhur Baeez1, Abid Salih Kumait AL-Jumaily1, Nazar Ahmed Mahmood2, Qasim Hussein Mohammed1

1Department of Adult Nursing, 2Department of Community Health Nursing, College of Nursing, University of Kirkuk, Iraq

ABSTRACT

Stress is common during Magnetic resonance imaging. Usually, stress more reported in female patients. The study aims to assess patient knowledge regarding magnetic resonance imaging procedure, and evaluate the effectiveness of nursing instruction program on reducing patients stress level during performing Magnetic resonance imaging. The study design is quasi-experimental. The samples were allocated into either the study (experimental) group (taking the program, n = 30) or the control group (not taking the program, n= 30). The extent of samples anxiety during MRI for both study and control group were measured before applying the education program was measured. Post-test assessment performed for both the study and control group after applying for an education program. The results of the study were elicited based on two statistical approaches, first, descriptive statistics and the second is an inferential statistical analysis. The study findings revealed that the majority of the sample were having unsatisfied knowledge regarding MRI procedure before applying for the education program, there was a higher score of anxiety in female patients in control group more than female patients in the study group as a result of receiving the designed instructions before MRI procedure.

Keywords: Stress, Anxiety, claustrophobia, education program, MRI

Introduction

Magnetic resonance Imaging (MRI) has been defined as the most essential medical modernization in the last 25 years. There has been a vast increase in the use of MRI in the clinical setting. More than 80 million MRI procedures are achieved each year in the world. MRI is a noninvasive imaging technique procedure that adopts magnetic range, waves, and computers to manifest deformity. MRI is the best procedure for recognizing a large number of possible problems or abnormal situation in many varies parts of the body. Generally, MRI builds an image that can display variation between normal and abnormal tissues. MRI uses an electromagnet so that patients with any metal tools or pacemakers are not preferred to doing MRI. To reinforce the visualization of internal structures, contrast media can be inserted through intravenous. During the MRI procedure, the patient obligates to lie still for 1 to 2 hours and will listen a rhythmic knocking sound. Patients who suffering claustrophobia can be not able to tolerate the confinement of locked MRI tools without given him sedation. Anxiety is defined as a situation of emotional distress, which can be demonstrated by nervous behaviour and discomfort, muscular tension as well as some other somatic complaints. Anxiety-associated to claustrophobic reactions and some anxiety reduction protocols have been evaluated mainly for MRI tests. MRI is familiar as a physiologically non-invasive procedure. Patients being examined, however, occasionally suffering from anxiety as a result of the procedures or settings. Meanwhile, the procedures, 25–37% of patients may happen anxiety to them, and the causes of anxiety are due to the enclosed nature of the scanner leading to claustrophobic feedback. Most of the patients visiting imaging departments will have a good experience. However, some patients can suffer a wide range of emotions disclose to their scan procedure, including anxiety, fear, and claustrophobia. The methods that the patients experience health care widely depends on the actions of the nurse professionals. Actions such
as giving information, adapt audiovisual systems, health care team training, and anxiety reduces protocols have all been shown to be useful in reducing anxiety, fear, claustrophobia, and the demand for sedation for patients undergoing imaging. Many research examining a different type of interventions to decrease the level of anxiety to minimum level, and to promote patient experience. Moreover, most previous interventions are time-consuming, and difficult to apply into practice, or may cost too much. Patients experience with the new technology of MRI has demonstrated that the test may induce anxiety in some of the patients. Some female patients who are undergoing magnetic resonance imaging examination cannot complete the test because of anxiety and claustrophobia, so nursing instructions for those are very important, which has an impact on reducing anxiety and claustrophobia associated to MRI examination. Magnetic resonance imaging (MRI) has become a common form of examination for patients. Despite, it is non-invasive and has no pain, patients experience anxiety during the procedures. Female patients undergoing MRI test can suffer from anxiety, claustrophobia and fear along the examination and, for some patients, it needs to use medication to sedate the patients. For these reasons, this research is conducted to evaluate the role of the nurse in reducing stress among female patients performing MRI.

Methodology

Design and Sample: A quasi-experimental design was applied to achieve the goal of the study. Non-probability, purposive sample, with the use of pre-post test approach for both study and control group. A sample of (60) patient chosen among patients who attended to the MRI unit at Azadi Teaching Hospital in Kirkuk city. The samples were divided into two groups; (30) patient as a study group was exposed to the education program and the other (30) patients are not exposed to the education program, considered as the control group with the same demographic characteristic for both groups.

The Educational Program: A structured teaching program for imparting knowledge related to stress associated with doing MRI and method of who to getting rid of anxiety was developed by the authors. The content of the educational program was designed based on an extensive review of the literature and expert opinion. The program composed of two modules related to stress. Models content was created and edited by the researchers; the first module included nursing instruction about MRI procedures, while the second model is about methods to cope with anxiety. Before the program is finalized, it has been presented to a group of experts. Those experts were asked to review the education program as well as the instrument for their content, clarity, and adequacy. After the review, some items were excluded and some others are added after face to face discussion with experts and the instrument considered valid after taking all the comments and recommendations in considerations.

Procedure: After ensuring informed consent from the patients, they were given the pre-test questionnaire before the administration of the educational program. Each patient was given a serial number to be followed in the second assessment (post-test). After administration of the pre-test questionnaire, the patients were imparted with an education program by face-to-face interview with the primary author. The face-to-face interview lasted ‘30-35 minute-sessions’ by using booklets and short videotapes. As a reminder, each patient was provided with a copy of the education booklet prepared and designed by the primary author and reviewed by other authors. The content of the booklet was similar to that of the educational program and it summarized the most important points in the program. After undergoing the MRI, THE patients were assessed again for the second time (post-test).

Data Analysis: The data were analyzed by applying SPSS, version 22, with using frequency, percentage, distribution, mean, range and standard deviation. The level of statistically significant was considered at p<0.05. T test was used to determine the differences between study and control group.

Results and Discussion

The finding of the study showed that most of the study and control group were between the ages of 20 - 40 years. As for the level of education, the study reveals that the highest percentage of the study and control group were illiterate. The study findings revealed that the majority of the sample were having unsatisfied knowledge regarding MRI procedure, and this can be attributed to that most of the study sample were illiterate. The results in table two showed that both study group and control group were unsatisfied regarding the knowledge related to
MRI procedures The study supported by Selim, (2001)\(^{14}\) who declared in his study “Effect of Pre-Instruction on Anxiety Levels of Patients Undergoing Magnetic Resonance Imaging examination,” patients who received the designed instructions significantly lower levels of anxiety than the controls group. Revealed a highly significant difference was found between the two groups (study and control groups) in the study group decrease in the level of anxiety than in the control group. The study findings in table number three showed that there was a higher score of anxiety in female patients in control group more than female patients in the study group as a result of receiving the designed instructions before MRI procedure. There was a statistically significant difference between pre and post-test for the study group. The study supported by Mohammed et al., (2013)\(^{15}\) who concluded that there were highly statistically significant difference among levels of anxiety from pretest and post-test. In the same line (Tischler et al., 2011)\(^{16}\) revealed that A highly significant difference was found between the two groups when the total anxiety scores were compared after the procedure of MRI examination and after the designed instructions were given. The findings in table number four showed that the study group reveals high score in term of using different methods to cope with anxiety more than the control group who reveals fewer scores. This also can be attributed to the effectiveness of the education program. Tischler et al., (2008)\(^{17}\) reported that there was a statistically significant difference between anxiety for patients who received information and who did not. Before a scan, many patients feel a need for information. The patients who received information mainly found it useful or very useful. Medeiros et al., (2012)(18) mentioned that according to the values of anxiety obtained by both groups in this study, the experimental group showed lower levels of anxiety. providing information prior to the MRI scan has positive effects, which decreases the state of anxiety of the patients.

Conclusions

Female patients Knowledge regarding MRI procedure in those patients who take the instructions and guideline from the education program is higher than those who didn’t take the education program. Anxiety level was lower in female patients who take instructions and guideline from the education program about MRI procedure. So that the effect of the nursing role is very important in reducing stress among female patients was performing MRI examination.

Role of Toll Like Receptor-9 Gene Polymorphism among Patients with Exacerbation Chronic Obstructive Pulmonary Disease in Holy Karbala, Iraq

Zainab Abed Alftah Alhabeeb¹, Abeer Thaher Naji AL-Hasnawi², Huda Hadi Al-Hasnawy³

¹MSc Student, University of Karbala, College of Medicine, Department of Medical Microbiology & Immunology, Karbala, Iraq; ²Assist Professor, Karbala University, Medicine College, Microbiology Department, Iraq; ³Assist Professor, Babylon University, Medicine College, Microbiology Department, Iraq

ABSTRACT
There are few studies investigate the effect of TLR-9 (T1237C) gene polymorphism in the development of Exacerbation Chronic Obstructive Pulmonary Disease (ECOPD), therefore, this study mainly aims to estimate whether (T1237C) polymorphism in TLR-9 gene is associated with ECOPD in Iraqi patients. Case-Control Study was done on patients were diagnosed clinically and confirmed with spirometer test. Attended AL- Hindia hospital and Imam AL-Hussein medical city hospital in Karbala/Iraq. The sampling collection period extended from October 2017 to April 2018, the study included 40 patients with ECOPD and 40 as a healthy control. The permission had been taken from all subjects, venous blood sample with EDTA tube collected, PCR performed for TLR-9 gene detection followed with RFLP technique for revelation of SNP (rs5743836)(T1237), the distribution of genotypes and allele frequency was tested for differences between controls and ECOPD patients. We observed in present study, there were three genotypes for this SNP among ECOPD patients; CC, TC and TT with frequency of 5 (12.5%), 27 (67.5%) and 8 (20%) respectively, whereas, there were only two genotypes among control group; TC and TT with frequency of 17 (42.5%) and 23 (57.5%) respectively.

Keyword: TLR-9 (T1237C), single nucleotide polymorphism, Exacerbation Chronic Obstructive Pulmonary Disease.

Introduction

TLRs are expressed in innate immune cells for example dendritic cells (DCs) and macrophages, just as, non-immune cells like fibroblast cells and epithelial cells.⁰Although TLRs respond to a different Pathogen-Associated Molecular Patterns (PAMPs) such as lipopolysaccharides set on the cell wall of whole Gram-negative bacterial species. it is additionally identify molecules that released with stressed or damaged host cells, known as damage associated molecular patterns (DAMPs) such as heat-shock proteins, hyaluronans and fibronectins. ² TLR9 senses unmethylated CpG motifs which found in microbial DNA.³ It is intracellular communicated in vesicles (e.g endosomes, lysosomes, and the endoplasmic reticulum). ⁴ With pneumococci, the TLR9 appears to contribute to the stimulation of the innate immune response. Activation of eosinophil lead to expressed of TLR9 in the various levels, including delayed survival, enhanced migration and induction of CXCL8 release.⁵ The expression of TLR9 regulated smoke-mediated immune cell induction to the lung that clarify with apoptosis, the expression of granulocyte-colony stimulating factor (G-CSF), matrix metalloproteinase-2 (MMP-2), the CXCL5 protein and protein tyrosine phosphatase 1B (PTP1B) action in the lung.⁶ TLRs performed an important role in defense and it can thus be hypothesized that poor TLR function share extremely to pulmonary disease exacerbation. Reduced TLR function could cause disease worsening because of encompass sensing of viral or bacterial components.⁷ As well as, a reduced ability to bacteria phagocytosis

DOI Number: 10.5958/0976-5506.2019.01414.1
and apoptotic cells. Some TLRs including TLR2, TLR4 and TLR9 are a key mechanism for innate immune recognize and are significant for the host’s response to Strep. pneumoniae. Genetic disorder of TLR which lead for signaling pathway proteins basically, excess the danger of invasive Strep. Pneumoniae infections. Single nucleotide polymorphisms in TLR-9 are able to alter the course of COPD or raise the susceptibility for developing one of the disorders. As well as, TLR-9 up-regulation of cytokines, chemokines and signaling molecules in the lung. Finally, specific study presented by Berenson et al., (2015) corroboration the role of TLR-9 gene polymorphism (T1237C) as one component underlying dysfunctional innate immune responses of alveolar macrophages and progression of COPD. Polymorphism (T1237C) as one component underlying dysfunctional innate immune responses of alveolar macrophages and progression of COPD.

**Materials and Method**

**Sample Collection:** This population Case-Control Study included 80 subjects 40 patients which clinically and with spirometer test confirmed ECOPD also 40 matching healthy smoking control with no history of ECOPD and confirmed with spirometer test. Patients with no exacerbation COPD excluded from this study. After diagnosis, 3ml of peripheral blood was collected with EDTA tube from each patient and healthy control.

**DNA Extraction:** The DNA was extracted by using Genomic DNA Mini Kit(Cat. N. GB100) from Geneaid (USA) as per the manufactures instructions. The extracted DNA was dissolved in nuclease-water and stored at 4°C until use. Quality and integrity of DNA were checked by NanoDrop™ (Thermo Scientific, USA).

**Genotyping for TLR9 Gene:** The TLR9 gene was detected by using Polymerase chain reaction Conventional PCR system Thermal cycler (Cleaver Scientific UK), primer selected as a table (1). PCR was carried out in 25μl reaction mixture containing 1.5μl of genomic DNA, 1 μl of each 10 pmol/μl primer forward and revers primers, ddH2O (Dionized distilled water) 16.5μl with 5 μl master mix (Bioneer/Korea).

**Thermocycling Conditions:** The amplification condition for SNPs consisted of an initial cycle 95°C for 5 min in a thermocycler followed by 50 cycles, denaturation with 95°C for 45 Second, annealing with 58°C for 45 Second, extension with 72°C for 45 Second and a final synthesis step with 72°C for 7 minute. PCR product, the band (135bp) was visualized by electrophoresis on (3.5%) agarose at 5 volt/cm². 1x TBE buffer for 1:30 hours, compared with DNA ladder (100bp), which was used for TLR9 gene detection (135bp) (Figure-1). Also, SNP genotyping was performed by digestion with the restriction endonucleases BstNI. Moreover, after PCR amplification product was digested and the reaction was conducted in 10μl final volume; at 60°C for 60 minute, for genotyping of studied samples, the digested fragments were electrophoresis on 2.5% agarose gel mixed with Ethidium bromide stain in 0.5x TBE (rs5743836, New England Biolabs) figure(2).

**Figure 1:** Gel electrophoresis for TLR-9 gene PCR products visualized under U. V light after staining with ethidium bromide. M: 100 bp marker; lane:(1to 11) PCR product with positive result. Lane (12) negative results. The size of product is (135)bp The product was electrophoresis on 3.5% agarose at 5 volt/cm². 1x TBE buffer for 1:30 hours. N: DNA ladder (100)
Figure 2: Electrophoresis pattern of PCR product digested with *Bst*NI restriction enzyme (2.5% a garose gel). Lane’s 1, 2, 3, 4, homozygous: TT genotype; Lane’s 5, 6 homozygous: CC genotype; Lane’s 7, 8, 9, 10 heterozygous: TC genotype; Lane11, negative results. M: DNA molecular marker 50bp size by Ethidium bromide stained bands in the gel.

Statistical Analysis: Fisher’s exact correlations and Chi-square were undertaken to determine the relationship between distributed group of demographic data related to exacerbation COPD patients (Age, Gender, Smoking, Type of bacteria, Gold Classification and Genotype). Allel frequency was determined using Hardy Weinberg Equation Statistical significance was defined as *when p ≤ 0.05 and **when p ≤ 0.01 and statistical significances were carried out using Graphpad Prism version 6 (GraphPad Software Inc., La Jolla,CA).

Results and Discussion

Study Population: Population-based Case-Control Study included 140 subjects, presented AL- Hindia hospital and Imam AL-Hussein medical city hospital from respiratory unit care Department at a period from December-2017 to April-2018. The patients were 70(33male and 37female) diagnosed with ECOPD, although the matching control included 70 healthy smoking people (33male, 37female), only 40 of each group inclusive in the study. All of them afford for clinical examination and spirometer to exclude ECOPD disorder. Severe cardiovascular comorbidities, Asthma or A topy, Autoimmune diseases, Cancer, renal and liver complications had been excluded. The high percentage 24 (34%) of ECOPD was found at aged group (61-70) years old, while the lower percentage 2(3%) was found in aged group ≥ 81 years old. It was observed that the number of patients with ECOPD was higher in sever obstructive stage 26 (37%) when compared to other stages. Also, there was no significant difference between females 37 (53%) and males 33 (47%) among ECOPD patients (Figure-3). In present study, the highest incidence of ECOPD was found in smoking patients (68%) compared to non-smoking (9%) and ex smoking (23%) (Figure-4), there was a significant statistical relationship (p ≤ 0.01) between smoking and development of disease. The result of TLR-9 gene was present in (135bp) fragment of Gel electrophoresis of PCR product, as shown in (figure-1). A conventional PCR was used to analyze the presence of TLR-9 gene. PCR product of homozygous wild genotype (TT) include two bands (108 and 27 bp), while heterozygous genotype (CT) is cut into four bands (108, 60, 48 and 27bp). The homozygous mutant genotype (CC) is cut into three bands (60, 48 and 27bp), as shown in (figure-2)table-2). The study results have shown that the single nucleotide polymorphism mutation (T1237C) of TLR-9 genotypes (TC,CC) and allele C frequency have a significant association as a risk factor for ECOPD. The large occurrence of ECOPD patients were at aged group (61-70) years, while the lower occurrence of ECOPD patients at age group (≥80) years, these results agreed with result of the study by Akhila *et al.*, (2017) who demonstrated that the larger occurrence of ECOPD (38%) was at age group (61-70) years and lower occurrence (4%) at age group (≥81)13. Furthermore, the results of present study were differed from a study carried out by Kohansal *et al.*, (2009) and Agustí and Celli, (2017), whose founded that some smokers suffering from decline of lung function value at the age of (25 ) years old that eventually lead to COPD. The differences of these results may be due to different environmental condition and size number.14

Table 2: Genotypes and allele frequency distribution of TLR-9 gene polymorphism in patients and control
The present study reveals a high significant distribution of ECOPD patients in severe obstructive stage which 26 (37%), while low incidence of ECOPD in Mild obstructive stage that 6(9%) and these results agreed with a study in Italy by Tantucci and Modina, (2012), whose founded a high occurrence of ECOPD patients in severe obstructive stage which (38%), while low occurrence of ECOPD in Mild stage (18%).

However, the results of current study were differed from the results of Hurst et al., (2010) who reported that the highest prevalence of ECOPD was observed in very sever stage (47%) of disease. The differences in rate of decline in FEV1 was affected by smoking status, with a decline more among current smokers than among ex-smokers. FEV1 at baseline was lower in patients who reported more exacerbations. Also, effect estimates were adjusted for age, sex, height, and weight at study entry, thus the changes in FEV1 is over time in COPD (Vestbo et al., 2011). In the present study, there was no significant difference between females and males, these results were in agreement with the results of Michael et al., (2013), who reported that the current smokers of male and female had similar relative risks in COPD, (26.61%) for men and (22.35%) for women that almost equal. In addition, the results of current study were differed from the study conducted in Saudi Arabia by Al Ghobain et al., (2015) who found that males were (54%), while females were (46%). The variation of these results may be due to the changing pattern of tobacco smoking. Indeed, some studies reported that women are more susceptible to the effects of tobacco smoke than men (Hagen et al., 2016). In addition smoking COPD is a heterogeneous disease and the prevalence of COPD differed according to the geographic location. Smoking is a major cause of chronic obstructive pulmonary disease (COPD), although individuals show differing susceptibility to smoking-related airflow limitation, because of interacting environmental and host factors. Smoking accelerates decline in forced expiratory volume in first second (FEV1) in susceptible subjects (Berenson et al., 2015).

Conclusion

Our findings indicate that TC and CC genotype and allele C of TLR-9 (T1237C) gene polymorphism are associated with an increased susceptibility to ECOPD in Iraqi population. Further studies with larger sample sizes are necessary to confirm our findings.

The Effect of Hidden Arrangement in Creative Thinking

Hussein Rajeh Nemma Makhif¹, Bassim Abd Al-Khaliq Abaas², Thaar Sameer Hassan³
¹College of Basic Education, ²College of Education for Human Sciences, ³College of Basic Education,
University of Babylon, Iraq

ABSTRACT

This research aims at recognize the hidden arrangement strategy in expressive performance and creative thinking in the fifth grade, the researcher made a test to measure the performance of the expression and Torrance test to measure the ability of creative thinking, the study has applied in Iraq for the academic year 2018/2019, that consists of (68) pupils in Babylon city, the sample of the research was chosen according to the intentional method. They were randomly divided into two groups, the first one is experimental group which consists of (35) pupils in section (B), have studied according to the hidden arrangement strategy, while the second one was control group that consists of (33) pupils in section (D), who have studied according to the traditional method, after exclusion of students who failed, the final number of the sample became (27) pupils in section (B), and (29) pupils in section (D), in the result the total number became (56) pupils). The study has required the availability of two tools: the construction of a test of expressive performance and the adoption of the Torrance test for creative thinking, after the statistical data collected and analyzed by using the t-test of two independent samples

Keywords: The Hidden Arrangement, Creative thinking, Expression

Introduction

The human mind is a complex system that create in order to processing information through put the sensory stimuli, that transform physical stimuli such as touch, heat, sound waves or light photons into electrochemical signals. ¹ The human mind deals with language that is a sound system that is spoken and heard by the people and the community to understand and express their needs and desires. The importance of the research is highlighted by the importance of the subject and its development in improving the language skills. Language is a sound system that is modest to a group of people or society for understanding each others and the expression of needs and desires and meanings ². The importance of language in relation to thought and thinking is highlighted as there is a close and direct relationship between language and thought. It is clear to us that when we connect the abstraction of thought, the language is a system that works at the level of concepts and abstractions of the arguments and relations and attributes ³. Al-Zwaini pointed out that modern education seeks to develop the learner’s thinking skills. The first of these skills is the development of the higher mental processes of the learners in general. It requires that the mind be mentally active in the case of continuous vitality, so as not to rely on minimal issues such as Conservation and absorption ⁴. It is no longer enough to provide pupils with information and knowledge. Pupils cannot learn all the information in a particular science or subject because of the lack of time within the school to achieve their goals. On the other hand, the scientific and technological progress makes the school look after its pupils the basis of the success of the learner today is not to memorize and absorb the subjects but to learn the correct ways of thinking make him think of any problem of scientific and objective thinking and adds new solutions to those problems ⁵ and that flexibility in thinking is the opposite of mental inertia in problem solving and development, pupils see things more clearly and develop a broader and look more creative in solving problems in order to think about positive thinking, a thinking that leads to a new ideas ⁶ creative thinking is defined as “a deliberate mentality directed towards finding solutions and reaching unfamiliar results and

Corresponding Author:
Hussein Rajeh Nemma Makhif
College of Basic Education,
University of Babylon, Iraq
Email: huseinn112233@gmail.com
characterized by inclusiveness and complexity.” As a guest of language is based on understanding and thinking, it is necessary to master the skills that are capable of good comprehension and understanding. The correct thinking means that mastering the language does not come to anyone but to master their four skills (reading, writing, speaking and listening) and teaching them coherently so that each one of them accompanies each other and is composed in a coherent way to achieve the goal of human learning and learning the language, from Pupils at all grades are clearly weak in expression and show signs of fatigue over their language, the teaching of thinking requires the use of modern teaching methods in the teaching of expression, and access to the largest number of methods successful in the educational process of others, whether orally or in writing, which chose a strategy of cooperative learning strategies that make the student active The strategy of the hidden arrangement is in response to what is called for recent trends on making the learner the focus of the educational process, and this strategy is one of the modern strategies adopted by the educational movement after the validation of its impact and effectiveness, studies have shown that the failure of individuals to perform their tasks is due to the lack of social cooperative skills they enjoy, not to lack of mental abilities. It is a strategy that focuses on cooperative activity and positive learners in educational situations. The basis of the lesson is a learning environment with a cooperative social environment in which students cooperate with some of them in order to collect knowledge. On this basis, the strategy of hidden arrangement is considered as part of the cooperative learning strategy because the learner is active and stressed by the cognitive theories, especially the constructivism. The theoretical basis on which cooperative learning is based is a combination of social learning theories that emphasizes interaction with others and interaction with them in the learning process and behavioral learning theories that focus the learner must be active and theories of cognitive learning that focus on the role of the learner in building knowledge and revitalization and discovery and re-discovery of knowledge, which is based on the face of structural theory, which sees the learner positively active social participant takes with his/her peers and gives with others.

Methodology

Experimental Design: The pilot design is a blueprint or a work program for how to implement the experiment.

The community and sample of the research:

A. The research community: The current research community includes primary schools in the center of Babylon province for the academic year 2018-2019, so the researcher visited the General Directorate for the education of Babylon to find out the schools affiliated with it. Which was (21) schools.

B. The sample of the research: The researcher chose AL- Zahawi primary school because it is close to his work, and the fact that it consists of four sections for the fifth grade, namely (A - B - C - D), and then he chose the B - D randomly to be the two groups of research, (B), the experimental group, and (D) the control group. The total number of pupils in the two groups is (68), (35) pupils in section B and (33) pupils in section D, after exclusion of failure pupils, the final number of the sample was 27 pupils in section B and 29 in section D and the total number of the sample was 56 pupils. The equivalence of the two sets of research, the researcher conducted a statistical equivalence between the two research groups in the following variables: (age with months, the academic achievement of the father, the academic achievement of the mother, the grades of the Arabic language in the final exam for the academic year 2017/2018). Preparation of the teaching plans: The researcher prepared the appropriate teaching plans for the subjects of the experiment to be taught in the light of the independent variable and the content of the Arabic reading book, adopting the hidden arrangement strategy in teaching this subject to the pupils of the experimental group and using the traditional method of teaching the pupils of the control group. The method of conducting the experiment after completion of the requirements of the experiment started by the researcher applied on 5/11/2018, which was devoted to introduce the pupils of the experimental group to the experimental procedures, by telling them that the Arabic reading will be taught by using the hidden arrangement strategy and the role of the researcher is to guide pupils, and supervise their works, while the control group has been studied in a traditional method, the experiment finished on 9/1/2019.
The Two Research Tools: Post-Expression Testing: From the current research requirements, the applying of a test in the expression to measure the performance of pupils of both groups during the duration of the experiment in the subjects that will study the Arabic reading book to be taught for the fifth grade for the academic year 2018 - 2019, and to recognize the differences in the average Performance between the two groups, and finding statistical significance. The researcher did not have a ready-to-use test covering the subjects to be taught. The researcher prepared a test of expression to measure the performance of pupils in the two groups. Validation of the tool: the test is valid when it is able to measure what was put for it. For the purpose of verifying the validity of the test, the researcher presented the subject of the expression to be adopted to measure the performance of the pupils on a group of experts and specialists in Arabic language, teaching methods, measurement and evaluation. For this purpose, after reviewing the opinions of the experts, the necessary modifications were made to the test. Stability of the test: the test is constant when it is able to achieve the same results if applied twice to the same group. To ensure the stability of the test, the researcher followed the method of re-correction over time to measure stability, applied to a sample of 30 pupils of the same school, Followed by stability using the Pearson correlation coefficient between the two degrees. The stability coefficient was (0.84) which was appropriate in the non-standardized. Test of creative thinking: The researcher adopted the Torrance test to measure the ability of creative thinking expressed by Sayyid Khair Allah in 1974, which is the appropriate test for the present study. This test has been prepared in the Arab environment and has been used in many Arab studies. Begin with the fourth grade to the university level.

Attitudes: It requires the examinee to find out how to behave in some situations and the test consists of two attitudes: If you be responsible of charge for cash at the club and a member of the club tries to enter into the thinking of others that you are not honest. What do you do? The researcher changed this attitude to: If you be a responsible of your colleagues for collecting donations in the classroom to do something and one of them tries to enter into the thinking of others that you are not honest, what are you doing? If all schools were not at all (or canceled), what would you do to become educated? (The time of each attitude is 5 minutes).

Development and improvement: in which the researcher is asked to propose several methods to become some things familiar to him/her such as the bicycle and pen (each one 5 minutes). Each of these five tests measures the three components of creative thinking, intellectual fluency, automatic flexibility, and the ability to understand the meaning of the word “Authenticity. The total score of the three components of creative thinking represents the overall degree of creative thinking. (Khair Allah, 1981: 10-12) This test is valid and characterized by stability for the great use in studies and research in the field of teaching methods.

Statistical Method: Pearson correlation coefficient to determine the correlation coefficient to calculate stability. Test test (TTest) for two independent samples, used to perform the parity process, and to calculate the difference between the two groups in the post-achievement test. Kai square (Ka 2) in the equivalence of the two groups of research in the level of parental

Results and Discussion

The results of the first objective were identified: The effect of the strategy of the covert arrangement on the expression performance of the students in the first five grade according to the researcher of the average scores of the students in the experimental and control groups in the expression performance test. The test was then used for two independent samples to test the difference between the averages As in table (1) Table (1) shows that the average score of the experimental group (37.6), the difference (96.04), the mean of the control group (28.9), the degree of variance (86.49), and the calculated T value (3.8) (0.000) at the level of significance (0.05) and the degree of freedom (65). This indicates that the students of the experimental group who studied using the hidden order strategy exceeded the students of the control group who studied the traditional method of expressive performance Interpretation of the results related to the first objective. In the light of the results presented, the researcher believes that the reason for the superiority of the experimental group on the control group is due to:

A. The strategy of the hidden arrangement made students develop the process of self-regulation before and during the reading, and after that, which led to a greater understanding of what they
read texts, because the inclusion of the strategy of hidden arrangement in the content of the study leads to a significant change in self-organization of students.

B. The use of the strategy of hidden arrangement in teaching increased the motivation of students to read, and thus increase their understanding of what they read.

Table 1: The test was then used for two independent samples to test the difference between the averages

Conclusion

Through the findings of the researcher can be concluded as follows: The strategy of the hidden arrangement has an impact on the formation of the students’ new cognitive structures. The strategy of hidden arrangement has contributed to the reorganization of experiences and information obtained by students.

Financial Disclosure: There is no financial disclosure.

Conflicts of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Basic Education/University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

The Efficacy of 6 Weeks Course of 0.05 % Topical retin-A in the Treatment Molluscum Contagiosum: A Cohort Study

Suhad Jassim Abdlkadhim1, Akeel Hamed Jabur1, Farah Saleh Abdul-reda1

1Dermatology Specialist, Department of Medicine, College of Medicine, University of AL-Qadisiyah, Iraq

ABSTRACT

Aim of the study: to evaluate the role of 0.05 % topical retin-A in the treatment of molluscum contagiosum. The present cohort study included 23 patients with molluscum contagiosum. The study was has been carried out at dermatology unit at Al-Diwaniyah teaching hospital, Al-Diwaniyah Province, Iraq during the period from June 2018 through January 2019. Age, gender and number of lesions were the main variables included in the study. All patients were given a topical retin-A cream, 0.05% concentration in a dose of one bed time application per day. There was highly significant reduction in mean number of lesions from 8.65 ± 3.20 to 0.87 ± 1.46 (P < 0.001) and the cure rate was 65.2 %. The current study included 23 patients with molluscum contagiosum with a mean age of 13.26 ± 8.60 years and an age range of 3 to 23 years; 16 (69.6 %) children and 7 (30.4 %) adults. The study included 13 (56.5 %) and 10 (43.5 %), male and female patients respectively. The use of topical 0.05% rein-A can be justified in patients with molluscum contagiosum because of high rate of cure and negligible side effects.

Keywords: topical retin-A, molluscum contagiosum

Introduction

The well-known molluscum contagiosum is a dermatological disease that is caused by a double-stranded DNA poxvirus 1. There are four subtypes of this virus, MCV-1, MCV-2, MCV-3 and MCV-4. MCV-1 is mainly seen in children; whereas, MCP-2 is seen in patients with HIV. MCV-3 and MCV-4 are frequently seen in Australia and Asian countries 2. The virus is transmitted most commonly by direct and indirect contact; other ways of transmission include autoinoculation, sexual transmission and vertical transmission 3. The typical presentation of this superficial skin disease, also known as water wart, is in the form of dome shaped popular lesion that is purple pinkish, sometimes white in color, 2 to 5 mm in diameter. The number of these lesions is often in the range of 1 to 20; however, a number such as 100 has been reported 3.5. Very large lesions (more than 1.5 cm), secondary bacterial infection and multiple lesions are often seen in immune compromised patients 6. Abdomen, inner thighs and genitalia are the usual sites of involvement in adults whereas in children lesions are mainly seen in areas such as face, trunk and limbs 7,8. The disease is a common clinical problem all over the world particularly in warm humid areas. It has been estimated that about 122 million subjects were suffering the disease in 2010. The principal age groups affected by the disease include children between 2 and 5 years of age and adults who are sexually active. The prevalence rate is even higher in immune compromised patients, particularly HIV patients in whom it may reach up to 18 %. There disease is equally common in males and females 9. The virus typically infects keratinocytes and the lesion is limited to epidermis. The virus has the ability to interfere with host innate immunity through production of specific viral proteins 10. Typical histopathological features of skin biopsy include the cup shaped epidermal indentation and Henderson-Paterson bodies 11. The disease is self limiting; however, infected individuals or their parents seek medical advice for cosmetic reasons, to void transmission of the disease to other members in the family, or because the disease may lasts unusually for long periods 12-14. Treatment approaches may be in the form of physical

University of AL-Qadisiyah, Iraq
removal of the lesion, topical application of certain medical preparation and sometimes systemic approach; however, there is no clear consensus about an effective mode of therapy. Physical removal may be done by cryotherapy or curettage and topical medications include benzoyl peroxide, salicylic acid, potassium hydroxide and podophyllotoxin. Topical retin-A cream has been described by a number of recent literatures; nonetheless, the results were controversial. In view of the available data about the lack of effective mode of treatment of molluscum contagiosum and because of sufficient controversy about the use of retin-A topical preparation, the planning and conductance of the current study were justified.

Methodology

The present cohort study included 23 patients with molluscum contagiosum. Those patients were selected from the pool of patients visiting the dermatology consultation unit at Al-Diwaniyah teaching hospital, Al-Diwaniyah Province, Iraq during the period from June 2018 through January 2019. The first patients was selected randomly out of 13 patients seen during the first week of study according to a random number generated by random function of a calculator; the rest of patients were selected as one of every other three. Age, gender and number of lesions were the main variables included in the study. All patients were given a topical retin-A cream, 0.05% concentration in a dose of one bedtime application per day. The patients were followed up 6 weeks later with two main outcomes being looked for: the number of lesions and possible side effects. The study was approved by the institutional ethical approval committee and a verbal consent was obtained from each participant or his parents, in case of children, after full illustration of the purpose and the procedure of the current study. Obtained data were then transferred into an SPSS (version 23) spread sheet. Numeric data were expressed as mean, range and standard deviation, whereas, categorical data were expressed as number and percentage. Willcoxon test was used to compare the mean number of lesions before and after treatment. The level of significance was set at $P \leq 0.05$.

Results and Discussion

The current study included 23 patients with molluscum contagiosum with a mean age of $13.26 \pm 8.60$ years and an age range of 3 to 23 years; 16 (69.6 %) children and 7 (30.4 %) adults, as shown in table 1. The study included 13 (56.5 %) and 10 (43.5 %), male and female patients respectively, table 1. Statistical indexes and number of lesions before and after topical retin-A treatment are shown in table 2. There was highly significant reduction in mean number of lesions from $8.65 \pm 3.20$ to $0.87 \pm 1.46$ ($P < 0.001$) and the cure rate was 65.2 %, as shown in table 2. Current study showed that the use of topical 0.05% retin-A for the treatment of skin lesions caused by molluscum contagiosum was effective and resulted in cure of approximately 65 % of patients and reduced the lesions in the rest of patients significantly. On the other hand, daily bed night administration of topical 0.05% retin-A was free of side effects in all patients. In another Iraqi study, the cure rate was 65% after the same period of treatment (6 weeks); thus our findings agree with the finding of this study. In addition, the previous Iraqi study has reported no significant side effect with the exception of some mild irritation which needed no discontinuation of the treatment. This finding also solidifies our finding that the use of retin-A in treatment of molluscum contagiosum for six weeks is associated with minimal if any side effects. In another comparative study, carried out by Rajouria et al, the use of retin-A topically was able to reduce mean number of lesions from $8.35 \pm 2.82$ to $2.00 \pm 1.00$ (19); whereas our study showed a reduction in the mean number of lesions from $8.65 \pm 3.20$ to $0.87 \pm 1.46$. Indeed, the concentration and the application way used by Rajouria et al was the same as that used by the present study; however, the duration treatment in the current study was longer than that of Rajouria et al’s study, 6 weeks versus 4 weeks. In view of the present data obtained from the current study and some previous studies, the use of topical 0.05% retin-A can be justified in patients with molluscum contagiosum because of high rate of cure and negligible side effects. However, to validate the results of the present study a larger sample multi-centre randomized controlled clinical trial is needed.

A Study of Risk Factors and Associated Symptoms among Patients with Bronchial Asthma Attending Al-Hillah Teaching Hospital

Fakhria Jaber Mubabes1, Salma Kadum Jehad2, Hussien Jassim Mohammed2, Dia S Abdul-Hadi3
1Adult Nursing, 2Community Health Nursing, College of Nursing, University of Babylon, Iraq; 3University of Tartu

ABSTRACT
Bronchial asthma is a chronic disorder of respiratory system. It is considered as an important worldwide public health problem. Objectives of the study are to: Identify the risk factors and symptoms which are associated in patient with bronchial asthma and find out the relationship between the risk factors of asthma and symptoms with some demographic variables. Methodology: A descriptive study was started from 25/5/2016 to 7/2/2017 in Al-Hilla teaching hospital. a purposive sample of (100) patients with bronchial asthma admitted to Al-Hilla teaching hospital were selected. Results: Most of the patient were male (55%), the highest percentage of their age group were more than (58) years old. This study showed the differences between the risk factors, according to time of attack,” evening” reported the highest mean of occurrence (2.20), while the seasonal factors showed that high mean in “spring” accounted (2.62). However, this study revealed that there is a significant association between the gender, marital state, academic level and the clinical manifestations. Conclusion: this study showed that there were several factors associated with development of bronchial asthma such as age, economic status stress, smoking, and environmental factors.

Keywords: risk factors, symptoms, patients, bronchial asthma

Introduction
Bronchial asthma is a chronic disorder of respiratory system. It is considered an important public health problem, the incidence of this disease gradually increasing in various countries affecting more than 300 million individuals worldwide. It may occur in children and adults and in various age groups. High prevalence of this disease cause a considerable burden on health care resources, while effective management reducing the morbidity and increasing the utilization of health care facilities 1. Asthma can be considered as a disease that changes a person’s physical functioning, decrease physical exercise endurance, felt unhappy in his live and may further affect an individual psychologically and socially, in addition patients complained from the need to be admitted to hospital, missing their work, job or school. There is an inadequate data about asthma risk factors and prevalence in Iraq and Middle East countries, Nevertheless a study carried out by (Abuekteish, et al.1996) showed that the prevalence of asthma and wheezing among school children aged 6–12 years in the northern part of Jordan was (4.1%) and (8.3) respectively. While other study conducted by (Muhabes & Alyeassery 2014), they concluded that Asthma had impact on patients physical status, as well as causing psychological and social disruptions; the majority of the sample patients in their study were facing various stressors which had impacts on their lives. Despite the availability of effective medications and treatment strategies, many patients continue to report hospitalizations, missed school or work days, and suboptimal pharmacotherapy, one reason for this may be fluctuations in patients, asthma symptoms3. Patient with asthma may experiences various symptoms, they are different in severity and frequency in adults or in children and may be changed periodically. These changes in asthma symptoms may be various and they may be
aggravated after the exposure to different factors which may effect on the severity and increase the sequences of attack. currently experiencing worsening of upper respiratory track symptoms such as coughing, sputum production or shortness of breath, and chest tightness need for higher doses of medication, Moreover, Poorer asthma control and symptoms attack may impair an individual’s normal function and lifestyle. Various factors can lead to an increase (or decrease) in symptoms of this disease at the severity and intensity level of these symptoms may be a response to the individuals environment (e.g. seasonal variation, cigarette smoke, and air pollutants) or personal. Yawn (2008). In addition to day-to-day and day-to-night changes in asthma symptoms, various factors are known to aggravate the disease exposure to these intrinsic and extrinsic factors makes it appear as though patients are shifting from one level of severity classification to another over time (e.g. mild persistent to moderate persistent), and this can trigger periodic exacerbations or “attack”. Patient’s must be aware about the symptoms and the risk factors, therefore, it is very important to study those factors and symptoms which may affect asthma prognosis to help in controlling them and providing them the necessary treatment.

**Methodology**

**Design of the study:** A descriptive analytical study design

**Sample of the study:** probability (purposive sampling) was selected by randomized system which consists of (100) patients with bronchial asthma from Al-Hilla teaching hospitals.

**Setting of the study:** Al-Hilla teaching hospitals data collected from the period of 31st of June 2016 to 10th February 2017.

**Instruments:** The questionnaire was constructed for the purpose of the study. They were consisted of three parts: data was gathered by interviewing patients and the questionnaire was completed by the researchers. All the participants were informed about the objectives of the study and informed consent were taken from all of them. Ethical considerations were approved by the college and the particular hospital.

**Part 1: Demographic Data Sheet:** This part concerned with personal information include, the patient (Age, Gender, Marital status, Academic level, Job, Residency, economic status).

**Part 2:** items related to patient risk factors (8) items related to information of disease (3) items related to symptoms of different systems (12) items

These items were rated according to two level Likert scale (Yes, No) and scored (1, 2), and three level Likert scale (Never, Sometimes, Always),

**Statistical Analysis:** Data were analyzed using the Statistical Package for Social Sciences (SPSS) version 19. Through the application of descriptive statistical data analysis include (Frequencies and Percentages) and arithmetic mean with standard deviation, Mean of score (M.S.) with their Standard Deviation (SD), and inferential statistics $\chi^2$-test and Pearson Correlation.

**Results and Discussion**

Table (1) showed the highest percentage of the sample reported at age ranged (58 years old and more) and they are accounted (32%). Most of them were males (55%).The greater number of them were married accounted (68%). (43%) of patients were primary school graduates, regarding the sample job results demonstrated that (32%) were employed. The highest percentage of the sample (place of residence recently) were at rural setting and they were accounted (56%), in addition sample represents (54%) economically satisfied to some extent. Finally the majority of the participants were smokers they constitutes (56%). Table (2) declared that the highest percentage represents (56%) of study samples answer (yes) for having family history of disease occurrence. (52%) their family were smokers, (53%) of the sample were suffering from disease for 5-8 years, higher percentage reported (65%) with (No) chronic diseases, while (58%) of them were not obese. The majority had (No) allergy from foods, Such as Banana (88%). Moreover (86%) of the present sample had (No) allergy from drugs, Such as Penicillin. Regarding the environmental factors results indicated that the majority of the sample were not exposed to dust constitutes (55%) and smoke (62%). However, allergy from Plants results showed that (57%) of the study population with (No) history of being affected, While (53%) of them say (yes) for perfumes. At the same time the sample showed negative exposure to pets. Finally most of study sample did not live near factories which were constituted (75%). Table (3) presented the specific risk factors of the disease, it showed the differences between such variables, according to time of attack, “evening” reported the highest mean of occurrence (2.20), while...
the seasonal factors showed that high mean in “spring” accounted (2.62). The last factors which was the stress events had a high mean in regard to the “economic stressors” (2.44). Table (4) illustrated the sample according to symptoms related to disease. Regarding the respiratory disorders, sample mean reported highly affected by “wheezing” (2.71), while C.N.S disorders indicated “sleeping disturbance” had a high mean (2.20). Table (5) showed the relation between age and symptoms of the disease, it is illustrated that there was a significant relationship between the participants age and all the symptoms, Nausea and vomiting, Wheezing, Sleep disturbance, and Urticaria, (124.934, 72.314, 127.633, and 124.934) respectively at P<value (0.001).

Table (6) revealed the association between demographic data, signs and symptoms of the sample, it showed that there was a significant association between the gender, marital state, and academic level and the clinical manifestations at P<value (0.001). The current study reported that the sample mean of age was (59.0), (range 18–72 years), most of the subjects were male (55%), in addition this study found the educational level of the sample in the present study was at low level. Regarding to exposure to pet the results indicated that the sample of this study were non-exposed this is supported by who reported that pets allowed in bedroom, saw cockroach inside home in past 30 days, or saw or smelled mold in past 30 days) were no longer significant.

Conclusion

Based on the findings of this study, it can be concluded that the overall sample characteristics were old, males, married, educated up to primary school and most of them were smokers, the participants reported family history of disease occurrence, duration of disease for 5-8 years, fortunately subjects did not have history of food allergy or drugs. Moreover the results showed a high mean of time occurrence at evening and at spring season. Mostly participants reported respiratory disorders, there was a relationship between age, gender, marital state, academic level and the symptoms of the disease.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Adult Nursing College of Nursing, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Assessment of Nurses’ Knowledge Concerning Management of Fractures in Orthopedic Wards

Bashar R. Mohammed Ali
Department of Adult Nursing, University of Kufa, Faculty of Nursing, Iraq

ABSTRACT
The main purposes of fractures care are to support injured joints and prevent joint injury, correct and support weak or deformed extremities, prevent worsening of abnormal curves in the spine and support in a specific positions in healing. Objectives of the study to order to assess nurses’ knowledge concerning management of fractures and to Find out the relationship between nurses’ knowledge and their demographic characteristics of age, gender, level of education, type of ward, training session, duration of session and years of experience in orthopedic wards. Descriptive Cross-Sectional Design carried out in Al-Sadder Medical City and adopted in the current study to achieve the early stated objectives. The study started from October 1st, 2016 until April, 20th, 2017. A Non-Probability (Convenience Sample) of (40) nurses were including in the present study. Sample collect from orthopedic wards. Data collected through using of a well-designed questionnaire consist of two parts: part I consists of (7) items, which included age, gender, level of education, type of ward, training session, duration of session and years of experience in orthopedic wards, and part II consists of (36) items, which included questions about anatomy, definition, types, treatment and general information about the fractures.

Keywords: Assessment, Nurses, Management, Knowledge, Fractures

Introduction
A fracture is a complete or incomplete disruption in the of bone structure and is defined according to its type and extent. Fractures occur when the bone is subjected to stress greater than it can absorb. Fractures may be caused by direct blows, crushing forces, sudden twisting motions, and extreme muscle contractions. When the bone is broken, adjacent structures are also affected, resulting in soft tissue edema, hemorrhage into the muscles and joints, joint dislocations, ruptured tendons, severed nerves, and damaged blood vessels. Body organs may be injured by the force that caused the fracture or by fracture fragments 1. Nursing staff that interfaces between physicians and patients plays a key role in health’s promotion as an important determinant of health and welfare of the patient-citizen 2. Fracture incidence is multifactorial and often complicated by such factors as the patient’s age, sex, co-morbidities, lifestyle, physiological status, and occupation. In the United States, 5.6 million fractures occur each year, corresponding to a 2% incidence. Almost 6000 fractures were treated in an orthopedic trauma unit in Edinburgh, Scotland, in one year. The overall fracture incidence in the Scottish case series was 1.13% in men and 1.16% in women. Interestingly, there was a bimodal distribution of fractures in males, with a high incidence in young men and a second rise in men starting at the age of 60 years. In women, there was a unimodal distribution of fractures, with a rise around the time of menopause 3. Nursing management is a service based on scientific knowledge and skill, as well as trust, that the nurse will do what is right, what is needed and what will benefit the patient and their well-being 5. All type of fractures are associated with a significant morbidity, but the hip and spine fractures are also associated with an increased mortality, with an incidence of around 24% in the first year after a hip fracture. In addition, these fractures cause significant problems in terms of economic resources. In
most European Countries, the annual costs associated with hospitalization for fractures (in terms of length of the hospitalization) were higher than those due to other chronic illnesses such as chronic obstructive bronchial pulmonary disease, stroke, myocardial infarct. Due to a better understanding of the causes, an easy access to diagnosis and therapeutically options, before fractures occur, is now possible providing a real prevention to OP and its related complications. The risk factors for fractures-extremes of age, altered mental status, multi-trauma and distracting injuries, developmental delay, altered sensation (nerve blocks, neuropathies),diabetes, immune compromise and cerebral palsy/spasticity. X-ray examination is designed to give information additional to that obtained by clinical judgment (X-rays) in at least two planes, usually at right angles, are essential. A injury may be missed if only one film is taken. Some injury may elude both clinical and radiological diagnosis. The main purposes of fractures care are to support injured joints and prevent joint injury, correct and support weak or deformed extremities, prevent worsening of abnormal curves in the spine and support in a specific positions in healing. The potential complications of cast application are; compartment syndrome, cast syndrome and pressure ulcers. Orthopedic care is a specialty that required staff to have the knowledge, skills and attitudes that will enable them to competently meet the needs of patients required and wearing musculoskeletal complications. The treatment of orthopedic conditions must account for a variety of factors that includes; casts, and supports, braces medications, surgery, and rehabilitation therapy. Orthopedic medical devices have been extremely successful in restoring mobility, reducing pain, and improving the quality of life for millions of individuals. Fracture management modalities include a wide variety of devices including wires, pins, screws, plates, spinal fixation devices and artificial ligaments. Physicians often make decisions about the use of casts and splints in the management of musculoskeletal disorders. Because of this, they need to be familiar with indications for application, proper technique, and the potential pitfalls of casting and splinting to optimize Patient care when treating common orthopedic injuries. Nurses should always observe for sign and symptoms of circulation, pain, swelling, tingling, numbness, diminished, absence pulse, paralysis, cool to touch. The pillow are needed to achieve high elevation of the leg, after improving of circulation and swelling controlled the evaluation can be gradually reduced.

Materials and Method

Design of the Study: Descriptive Cross-Sectional Design is adopted in the current study to achieve the early stated objectives. The study started from October 1st, 2016 until April, 20th, 2017.

Setting of the Study: The study is conducted in Al-Najaf City/Al-Najaf Al-Ashraf Health Directorate/Al-Sadder Medical City.

Sample of the Study: A Non-Probability (Convenience Sample) of (40) nurses were including in the present study. Sample collect from orthopedic wards.

Study Instrument: An assessment tool is adopted and developed by the researcher to assess nurses’ knowledge concerning management of fractures. The complete instrument of the study consists of (2) parts:

Part I: Demographic Data: This part consists of (7) items, which included age, gender, level of education, type of ward, training session, duration of session and years of experience in orthopedic wards.

Part II: Nurses’ Knowledge Concerning Management of Fractures: This part of the questionnaire comprised of (36) items, which included questions about anatomy, definition, types, treatment and general information about the fractures.

Data Collection: The data collection is done by utilization of the semi-structured questionnaire and by means of self – reported technique with the object and the researcher use Arabic version of the questionnaire. The data collection process started from February, 15th, 2017 to February, 28th, 2017.

Validity of the Instrument: A content validity of the study instrument conducted through a group of experts who have more than 10 years of experience in nursing field.

Statistical Analysis: The data were analyze through application of the descriptive and inferential data analysis methods, included:

- Frequency, percentage, and Statistical mean and standard deviation.
- Measures of central tendency: Mean, Mean of scores (MS) And the two points likert scales with two levels of assessment, poor (mean of score less than 1.5), good ( mean of score more than 1.5) for Nurse’s knowledge about management of fracture.
• Chi-square : to test independency distribution of observed frequencies, and for measuring the association between the studies variables according to its type.

Results and Discussion

Table (1) shows that the majority of the study sample (75%) are within (19-27) years old. Regarding gender, the study results revealed that the majority (65%) are female and remaining are male. In addition, the study results present that (55%) of the sample are technical institute, while (32.5%) are Secondary nursing school. Additionally, the study results revealed that (65%) of the sample are public ward. Also (62.5%) are haven’t training sessions in orthopedic wards. In regards to number of training sessions, (25%) of the study sample have one training sessions in orthopedic wards. While concerning duration of training sessions (22.5%) is between (1-3) day. Additional to highest percentage (80.0%) at Years of experience (<=1) years and lowest percentage (2.5%) more than (7) years. Table (2) shows that the overall assessment for nurses knowledge are poor. Table (3) shows that there is a non- significant relationship between the nurses’ knowledge and their demographic data except with their duration of training sessions at p-value 0.009. (Tables 1) Show that there are (75%) among nurses of sample study is within (19 – 27 years). This outcome is reinforced by a study done by Sathiya, et al., (2015) and El Enein, et al., (2012) they concluded in their results that the dominant age of the study sample are 21-30 years old 13,14. Regarding gender, the results reveal, that the majority are (65%) of subjects are females. Both studies Al-Barwari, et al., (2006) and Cohen, and Stellenberg (2012) mentioned that females are the dominant gender for nurses 15,16. Concerning educational levels, the higher percentage (55%) are technical institute. This result is in agreement with other studies Abd and Georgies, (2005) and (Radhi, and Tawfiq 2015) in their studies found that the majority of the study subjects are technical institute 17,18. Concerning type of ward, the highest percentage of participant (65%) from public ward. This come is consistent with another study of (Radhi, and Tawfiq 2015) reveals in their studies that most of the study sample from public wards 18. The present study shows that (62.5%) of nurses were not participating in the training sessions concerning management of fractures. In other study Al-Barwari shows that (95%) of nurses were not participating in the training sessions related to care of fractures 15. Also in El Enein study results 97.5% had no training sessions towards fracture care 14. Concerning duration of training session, approximately (22.5%) from those who share in training has period (1-3) days, this result agree with Kadhim, (2013) who demonstrate that the (80%) of studied sample had training session period less than (3) days. The study sample indicated that (80%) from nurses have (<= 1) years of experience in the orthopedic wards. Al-Barwari study results indicated that (65%) from nurses have 1-5 years of experience in the orthopedic in Duhok and (55%) in Arbil 15. While in Bader Study results indicates that (53.8 %) of the study sample having 1-5 years of experience in orthopedic wards. Finally Mohamed study results views that The (75%) of participants were experience within 1-5 years in the orthopedic wards. The results of previous mentioned studies are in agreement with the present study finding regarding years of experience in orthopedic wards. (Tables 2) The study results indicate that the most of the nurses’ knowledge for management of fractures is poor at general mean of score. (1.45). These results agreed with Sathiya et al., (2015) and Al-Barwari, et al., (2006) reveals in their studies that most of the nurses’ knowledge for management of fractures is poor 13,15. (Tables 3) The study results indicate that there is a non- significant relationship between the nurses’ knowledge and their demographic data except with their duration of training sessions at p-value 0.009. these results come because the issue of management of patients with fracture is missed in the secondary nursing schools curriculums, so the levels of education and other demographic data are not affects the nurses knowledge, and the practice area is the source of knowledge for nurses.

Conclusion

Based on the study results the study concluded the following: It is found that the most of nurses are middle age group within (19-27) years old, most of the nurses were female. It is concludes that the most of nurses are secondary nurses graduated, due to a much presence of junior nursing which mostly of the graduates are female nurses, most of the nurses years’ experience in orthopedic wards(<= 1.0) years. Most of the sample have no participating in the sessions training in orthopedic wards. The orthopedic nurses have inadequate knowledge in some aspects for management of fractures.

Assessment of the Midwives, Knowledge toward Management and Prevention of Postpartum Hemorrhage at Delivery Rooms in Holly Karbala and Hilla City Hospitals

Manar M Hameed1, Salma K Jihad1
1Comunity Health Nursing Department, College Nursing, University of Babylon, Iraq

ABSTRACT

Globally, there is an estimated of (287,000) maternal deaths. This means, every day, about 830 women decease from preventable causes linked to pregnancy and childbirth. One woman dies every two minutes. About 99% of maternal deaths happen in developing countries, while above half of these deaths were preventable. Postpartum hemorrhage (PPH) is a major cause of maternal mortality and morbidity, especially in developing countries, where most pregnancy-related deaths are connected with hemorrhage. It aimed to assess midwives knowledge regarding management and prevention of PPH. A descriptive study was found to be effective for the present study. In this study the target population was consisted of all midwives working in delivery room in hospital of a Holy Karbala and Hilla city. The sampling technique use in this study was (nonprobability) purposive method of sampling; sample were consist of 60 midwives working in delivery room in Karbala and Hilla hospitals. There were 30 items regarding knowledge of management and prevention of PPH. The data analyzed through the use of the descriptive and inferential statistical analysis procedures. Our study reveal that (50%) of midwives had adequate knowledge, (45%) had a moderate knowledge and only 3(5%) midwives had inadequate knowledge.

Keywords: postpartum hemorrhage, Midwives, knowledge toward management prevention of PPH.

Introduction

More than half million women around the World die as a result of complications during pregnancy and childbirth. Common of these deaths occur within few hours of delivery and in most cases are due to (PPH). Approximately 24% of maternal death occur through pregnancy, 16% in the period of labor and births and 61% occur during the postpartum period. 45% of death occur within the earliest 24 hours of birth mostly as a cause of PPH. Postpartum hemorrhage is the major cause of maternal morbidity and mortality worldwide with the main incidence in developing countries. According to (WHO, 2005) obstetric hemorrhage causes 127,000 deaths worldwide and is the leading cause of maternal mortality. Universally, obstetric hemorrhage remains the most significant cause of maternal mortality. It is expected that PPH is the most common cause of maternal deaths across the world, responsible for more than 25% of deaths annually and is a major cause of several maternal morbidity. PPH is one of the obstetric emergencies that can be prevented if the correct skills are employed yet it remains the leading cause of maternal mortality globally. In 2010 nearly 14 million women suffered from PPH worldwide resulting into 287,000 women dying while pregnant or giving birth. 99% of global maternal deaths occur in developing countries, with the maternal mortality ratio (MMR) of 239 per 100,000 live births, 14 times higher compared to the developed regions (17 maternal deaths per 100,000 live births). PPH is accounts for approximately one-quarter of all maternal pregnancy-related deaths. Many studies have recommended that several deaths associated with PPH could be prevented with prompt recognition and more timely and forceful treatment. Morbidity from PPH can be severe, with sequelae including organ failure, shock, edema, compartment syndrome, transfusion complications, thrombosis, acute respiratory
distress syndrome, sepsis, anemia, intensive care, and prolonged hospitalization. The most common etiology of PPH is uterine atony (impaired uterine contraction after birth), which occurs in about 80 percent of cases. Atony may be related to over distention of the uterus, infection, placental abnormalities, or bladder distention. Although the majority of women who develop PPH have no identifiable risk factors, clinical factors associated with uterine atony, such as multiple gestation, polyhydramnios, high parity, and prolonged labor, may lead to a higher index of suspicion. Other causes of PPH include retained placenta or clots, lacerations, uterine rupture or inversion, and inherited or acquired coagulation abnormalities.

Materials and Method

Study Design: A descriptive design study was found to be effective for the present study.

Sample: Sample were consist of 60 midwives working in delivery room in Karbala and Hilla hospitals. The sampling technique use in this study was non probability purposive method of sampling.

Setting: In this study the target population was consisted of all midwives working in delivery room in Maternity Teaching Hospital of a Holy Karbala and Hilla city. This Study is carried out in Holy karbala and Hilla city from December, 3th, 2017 to July, 26th, 2018.

Instrument: The questionnaire was consisted of (30) items of multiple choice questions under 6 categories such as meaning and definition, causes of postpartum hemorrhage, uterotonic drug use in management of postpartum hemorrhage, risk factor that can increase incidence of PPH, signs and symptom of PPH and items related management prevention of PPH. Each question has 4 answer (1 correct answer and 3 false answer), the score “1” was given for correct answer while the score “0” was given for wrong. The result of scores were ranked as follows:

- Maximum midwife’s score gained =22
- Minimum midwife’s score gained = 6
- The range was 22-6=16
- Interval= rang/No of class=16/3=5.3~ 5
  1. In adequate knowledge 6-10.
  3. Adequate knowledge 16-22.

Validity: The content validity of the tool was established in consultation with guide of experts from the field of obstetrics and gynecology department of nursing & medicine and other field specialties. Suggestion of the experts were considered for modification and changes which were made accordingly.

Data Collection: The data collection was carried out during the period from February 4th to May 28th, 2018.

Data Analysis: The collected data was analysis by using descriptive statistics (mean, mean percentage, standard deviation) and T-test to find out the association between the demographic variables and the scores of knowledge.

Results and Discussion

Table (1) demonstrates the frequency and percentage analysis of demographic variables of the study sample and shows that the highest percentage (40%) of study sample were at age group 21-29 years. The preponderance (65%) of them were graduated from secondary school of midwifery. The higher percentage (61.7%) of study sample have (1-5) years of total years of experiences in the delivery rooms. While (35%) of study sample have (6-10) years of service employment. Table (2) demonstrates the frequency and percentage of the subject correct answers regarding management and prevention of postpartum hemorrhage in present study. The total correct answer of knowledge question was (51.8%). The highest was recorded to item 3 (Meaning of primary postpartum hemorrhage) (f=58, 96.7%) and the lowest was found in item 24 (Increase hydration in cases of temperature is 38.8 c and more to a mother delivered 4 hours ago.) (f= 3, 5.0%). Table (3) revealed that 30(50%) of midwives had adequate knowledge, 27(45%) had a moderate knowledge and only 3(5%) midwives had inadequate knowledge. It is observed that the mean ± SD during the present study is found to be 15.60 ± 3.35. The calculated ‘F’ value was 66.98 which was significant at the level of p<0.001. Analysis of the midwives demographic characteristics in the present study, verified that higher percentage constituted less than half of midwives, while the lowest their age (21-29) years old percentage (13.3%) in the age group ≥48 years. This finding agreed with the study done in Nigeria by Onasoga, et al., 2012 who found that the higher percentage represented (40%) of the study sample between (22-30) years old, while the lowest percentage was (6.25%) in the age group between (49-57) years. The most of these midwives (65%) were graduated.
from secondary school of midwifery. While (11.7%) were graduated from secondary school of nursing and the (16.7%) graduated from institute of nursing. This finding supported by an Iraq study conducted by Ghailan, 2005 and showed that the higher percentage represented (33.3) midwives graduated from secondary midwifery school and the lowest percentage (16.0) graduated from technical medical institute\(^8\). The Iraqi ministry of health employed midwives from different programs (from school of midwifery to the institutes) and even nurse who were finished nursing programs. Same table illustrated that less than half of participant have total years of employment between (6-10) years. While the lowest (11-15) years, this finding disagree with a study done in Nigeria by Chigozie A, 2017 who mentioned that the higher percentage (55%) of midwives their total years of employment from (8-14) years and the lowest percentage (4.5%) (29-35) years\(^9\). The highest percentage of midwives were having experience in delivery room (1-5) years and only (13.3%) ≥ 11 years. This finding is supported by Opiah et al., 2013 who conducted a study in Nigeria and found that 59% of midwives have 1-5 years of experiences in delivery room \(^10\). Table (2) demonstrated the knowledge level of midwives toward the management and prevention of postpartum hemorrhage, result shows that majority of the respondents (73.3%) were incorrectly answer the questions regarding definition and classifications of PPH. This result agree with the study done in Al – Ribat by Balla, 2015 which showed that the participant had poor knowledge toward definition of PPH, but they had good knowledge about classification \(^11\). The same table showed that (75%) of participants had agree that uterine atony is the most causes of PPH. This result was incompatible with the study done by Balla, 2015 which showed that (98.7%) of study sample was answered the returned tissue is the most causes of PPH \(^11\). Same table revealed that most of the participant use oxytocine as auterotonic drug to management PPH cases. This result agree with the study done in Nigeria by Onasoga, et al., 2012 they found that use of uterotonics with oxytocin being the most commonly used \(^7\). The current study was showed that more than half of midwives had poor knowledge regarding risk factors that upturn the occurrence of postpartum hemorrhage. Midwives require a deep understanding of all intrapartum risk factors regarding PPH and constantly need to reassess the woman throughout labor including; prolong labor, prolong third stage, retained placenta, febrile illness, instrumental delivery and cesarean section. According to Jhpiego (2001), it is difficult to predict who will have PPH based on risk factors because two-thirds of women who have PPH have no previous risk factors. Therefore, all women are considered at risk of hemorrhage \(^7\). The finding of present study revealed that more than half of study sample (71.7%) was answered correctly that the boggy uterus is the signs of uterine atony and half of midwives answered that the rapid pulse is the sign of shock. When excessive bleeding is suspected and the fundus is boggy midwife should do uterine massage, check the bladder to ensure its emptiness, catheterizing the women if required, weigh blood soaked pads to fix the amount of blood lost. If massage is not effective physician should be notify. The general evaluation of participants knowledge in the current study presented the total percentage and it was found fair in general (51.8%). A comparable findings were reported in Nigeria in 2012 by Onasoga, et al., 2012 showing that majority of the study population had high level knowledge of strategies used in prevention and control of PPH \(^7\). Table (3) revealed that fifty percentage of subjects had adequate knowledge, and only few of them had inadequate. It is observed that the mean ± SD during the present study is found to be 15.60 ± 3.35. The calculated ‘F’ value indicated that there was a significant association at the level of p<0.001. This finding agrees with a study conducted in Nigeria by Chigozie A, 2017on a sample of 60 observed midwives working in PHCs, his study mentioned that participants had possessed high to moderate level of knowledge regarding life skill savings (52.54%) (37.29%) respectively\(^9\).

ABSTRACT

Objectives:

To develop Women’s information toward their hemophilic children. Discover the Association that affecting Women’s information and Demographic data. Quasi study was conduct on a sample consisting of (75) from 110 woman is having hemophilic children who were select randomly from Hereditary Bleeding Disease Center in Nasiriya city. women’s their Children who have hemophilia, carried out in Nasiriya city/Hereditary Blood Disease Center starting from first to 20 Feb. to 14 June 2018. Regard the demographic characteristics data of the hemophilic children in the study and control groups, the results that indicate that the high percentage of children are (6 - 10) years of age, and most of children irregularly attend to school (48.0 %, 63.64 %) respectively or do not attend school (32.0%, 31.83%) respectively in study and control groups. Family history of the disease in the present study found to be (48.5%) in families have one child affected and (25.6%) of families have more than one child affected, in the study group. While the family history in the control group was (60.0%) of families have 1 child affected and (22.8 %) of families have more than 1 child affected.

Keywords: Hemophilia, Women, Children, information.

Introduction

Hemophilia as a rule happens in guys (with uncommon special cases) and around 1 out of 5,500 guys are conceived with hemophilia every year (Bolton and Pasi.2013). Hemophilia B, otherwise called factor IX insufficiency or Christmas sickness, is a X-connected draining issue caused by surrenders in the vitamin K subordinate chemical factor IX of the thickening course 1. Factor IX is otherwise called the Christmas factor, consequently the relationship of hemophilia B with the term Christmas women 2. Enacted Factor IX (factor IX) is the protein in charge of the initiation of consider X to X a response alluded to as the tenase” complex. A cofactor in this response is factor VIII, insufficiencies in which result in hemophilia A 3. Numerous transformations have been distinguish prompting hemophilia (B). A total aggregation of the considerable number of transformations can be established at the hemophilia B database. Hemophilia B brings about a draining issue that is clinically vague from the more typical hemophilia A 4. Hemophilia B happens in around 1 of every 31,000 male births. The other sort of hemophilia will be Hemophilia C, which is a gentle type of hemophilia influencing both genders. In any case, it overwhelmingly happens in Jews. It is the fourth most normal coagulation issue after von Will brand’s infection and hemophilia. In the USA, it is thought to influence 1 out of 100,000 of the grown-up populace, making it 10% as regular as hemophilia. Individual with Hemophilia C has low levels of or is missing totally factor 11 (additionally called FXI or factor XI insufficiency) Hemophilia C is 10 times more uncommon than type An or B. Calculate XI insufficiency Hemophilia C is not the same as alternate
kinds of Hemophilia, since it can appear in the two guys and females. In hemophilia while all intense draining scenes are viewed as genuine and rising, five noteworthy locales of genuine seeping in hemophilia undermine life, appendage, or capacity. They are intracranial or spinal line drains, throat drains, intra-stomach drains, appendage compartment disorders (e.g. calf, thigh, upper arm lower arm,) and visual drains. These territories are portray by seeping into and an encased space, pressure of fundamental tissue, and potential death toll, appendage, or capacity. Since draining scenes likewise cause uneasiness and dread in patients and families, the nursing overseeing and mediations of correspondence, consolation, training, and support will help them through these emergencies.

Methodology

Non–probability (purposive) application was conducted on a sample consisting of (75) women having hemophilic children who were selected randomly from Hereditary Blood Disease Center in Nasiriya city. Five from this study excluded to pilot study. This study was starting from first Feb to 14 June – 2018.

Results and Discussion

Table (1) demonstrate that the study group the highest percentage women age range from (35-40) years old which present (28.50%) while the control group range from (25-30) years old which presents (28.50%). With regard to the level of education of women, the highest percentage of the study and control groups, are primary school graduate which represents (28.60%, 35.20%) respectively. About women occupation, the majority in the control and study groups were unemployed (65.70%, 71.60%) respectively. In respect to the residential areas the majority of women in the control and study groups come from rural areas (51.40%, 62.60%) respectively. Table (2) indicate there is no significant association between women information and their age at the pretest and posttest occasion in the control group. Table (3) shows that there is no significant association between women information and their educational level at the pretest and posttest occasions in the control group. However, no significant association between women information and their educational level at the pretest occasion, but there is high significant statistical association between women educational level and their information at the posttest occasions in the study group. Table (4) indicate that there is no significant association between women information and their occupation at the pre-test occasion, but there is high significant statistical association between women occupation and their information at the post-test occasions in the study group. While, there is no significant association between women information and their residential area at the pretest and posttest occasions in the control group. While, there is no significant association between women information and their residential area at the pre-test occasion, but there is high significant statistical association between residential area and their information at the posttest occasions in the study group. Table (5) indicate there is no significant association between women information and their residential area at the pretest and posttest occasions in the control group. While, there is no significant association between women information and their residential area at the pre-test occasion, but there is high significant statistical association between residential area and their information at the posttest occasions in the study group. Table (6) indicate there is no significant difference between the pretest and posttest and follow up 1 and 2 within the group as well as relative to women information in the control group. While, that there is high significant difference between the pretest and posttest and follow up one and two within the group as well as relative to women information in the study group. The results also were in agreement with that of HFA., Throughout the implementation of the education program, it has been shown that there were no significant changes experienced by the control group between the pretest and the posttest at P < 0.05 (Table 2) This means that care giver and women did not have enough information about management for their hemophilia children during this period. The present result are in agreement with that of Srivastava (2015), who indicated that most women of the world especially in-developed countries need more information and practices about how to manage their hemophilic children and how to prevent complications of hemophilia. It had been found in all age significant differences between women’ information at pretest and posttest and their age in the study group, while in the control group there was no differences between women information at pre and post-test occasions and their age (Table 2). Significant difference was notice between women’s information and pretest and posttest occasions in all educational levels in the study group, (Table 3), while in the control group there was no significant difference between women’s information and pre-and post-test occasions in all educational levels (Table 3). Significant difference was indicate concerning information in the study group at pre and post-test occasions for employed and unemployed women (Table 4). That means both employed and
unemployed women experienced significant increase in their information after the implementation of the educational program. While in the control group there was no significant difference relative to the women information at pre and post-test occasions in respect to women occupation (Table 4). The result of Boyed and others (2014) indicated that occupational status has a significant effect on women’s hemophilia type A information and their children condition this finding is in consistent with to the present study. Significant difference was noticed concerning information at pre and post-test occasions in the study group in respect to residential area, (Table 5), that means both rural and urban women in the study group improved their information after the implementation of the educational program. At the present study, it found that significant difference between women practices at pre and post-test occasions in the study group and their ages. (Table 6). That means the level of women practices were improved after implementation of the educational program in the study group while in the control group there was no significant difference between women practices at pre and posttest occasions and their ages (Table 6). This indicated that the women in the control group did not experience of any changes in their practices when they were exposed to the pre and posttest.

**Conclusion**

Information of women’s in posttest high significant difference between information at (P < 0.05) after application the education programs in posttest conducts with relative comparison to the pretest occasion in the study group, has been found in all age significant differences between women information at pretest and posttest occasions and their age in study group, while in the control group there was no differences between women information at pretest and posttest occasions and their age, high significant effect on women information toward hemophilia and their children condition (hemophilia) this finding is in consistent with to the present study.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Pediatrics Nursing, Instructor, Pediatrics Nursing Department, College of Nursing, Al-Muthanna University, Iraq and all experiments were carried out in accordance with approved guidelines.

Evaluation of Pruritus Self-Management among Hemodialysis Patients in Baghdad Teaching Hospitals

Widad K. Mohammod

Assist. Professor, Adults Health Department, College of Nursing, Baghdad University, Iraq

ABSTRACT

Objective(s): To evaluate self-management concerning pruritus among hemodialysis patients and to find-out the association between self-management, sociodemographic characteristic of age, gender, and education qualification. A descriptive design, using the evaluation approach, is carried out in Baghdad teaching hospitals in order to evaluate pruritus self-management from November 16th 2016 to the end of May 17th 2017. Purposive (non-probability) sample, which is consisted of 62 hemodialysis patients. A questionnaire is designed and constructed for the purpose of the study. The questionnaire is comprised of three parts: part 1: Participants’ sociodemographic characteristics composed of (5 items), part 11: participants’ clinical characteristics composed of (3 items) and part 111: description of participants’ self-management composed of (13 items). Reliability and validity of the questionnaire is determined through pilot study. Data are collected through the use of the questionnaire and the structured interview as means of data collection. The results show that the level of pruritus self-management among hemodialysis patients more than a half is fair (n = 32; 51.6%), followed by a poor self-management for more than a third of them (n = 22; 35.5%), and a good self-management for a small proportion (n 8; 12.9%).

Keywords: Evaluation, Hemodialysis patients, Self-management, pruritus

Introduction

Pruritus is an unpleasant feeling of discomfort in the skin affecting many hemodialysis (HD) patients and it is a common problem with multifactorial etiology seen in hemodialysis patients 1, 2. The intensity of uremic pruritus ranges from sporadic discomfort to complete restlessness during day and night time. Pruritus is an intrusive and distressing symptom occurs more frequently at night that leads to sleep disorders, anxiety, depression, and social dysfunction, that affecting the quality of life of patients, worsening prognoses, and increasing the cost of health care 3, 4, 5, 6. Approximately 50–90% of hemodialysis patients complain from pruritus 7. The interventions and self-management to improve uremic pruritus included using Baby oil contains liquid paraffin with high moisturizing properties accordingly, it can relieve or even treat this condition properly, moisturizer the skin at least twice a day by using effective moisturizers include Vaseline skin care products, starch, fragrance-free sensitive skin bar soap (i.e. Dove sensitive skin), avoid excessive bathing or bathing with hot water, protect the skin from the sun – apply sunscreen, avoid wearing rough clothing, such as wool, over itchy areas, use mild detergent for clothes/sheets and rinse well, keep fingernails short and clean, try not to rub or scratch the itchy areas, finally keep the house cool and humid, especially in the winter 8, 9.

Materials and Method

A descriptive design, using the evaluation approach, is carried out in Baghdad teaching hospitals in order to evaluate pruritus self-management from November 16th 2016 to the end of May 17th 2017. Agreement is obtained from each hemodialysis patient for being participant in the present study. The study is conducted in hemodialysis centers at Baghdad Teaching Hospital and Al Yarmouk Teaching Hospital, Al-Emamen Al-Khatemeian, and Al- Karama Teaching hospital in Baghdad City.
Part I: Sociodemographic information sheet

It is consisted of (5) items that include, age, gender, educational qualification, monthly income, marital status.

Part II: Clinical characteristics sheet it is consisted of 3 items

A pilot study is carried out for the determination of the study instrument’s validity and reliability:

1. Validity of the instrument: The content validity of the constructed questionnaire is determined through the use of panel of (10) experts. They are provided with copies of the questionnaire and they are asked to review it for the determination of its clarity and content adequacy. Their responses have indicated that the questionnaire is clear and adequate.

2. Reliability of the instrument: Reliability of the questionnaire is determined through the use of (test-retest) which has been (0.87) for (10) hemodialysis patients.

Data are collected through the use of the questionnaire and the structured interview as means of data collection.

A statistical analysis was performed by using SPSS package (version 19)

Results and Discussion

Participants’ age mean is 42.6 ± 12.73; more than a quarter are within the each of the age groups of (30-39) and (50-59) years-old (n = 16; 25.8%). Most are males (n = 37; 59.7%), and two-fifths are females (n = 25; 40.3%). Concerning marital status, most are married (n = 45; 72.6%), followed by those who are not married (n = 11; 17.7%), and those who are divorced/widow(ed) (n = 6; 9.7%). Regarding educational qualification, more than a quarter are Middle school graduates (n = 16; 25.8%), followed by those who are elementary school graduates (n = 15, 24.2%), those who are High school graduates (n = 13; 21.0%), those who don’t read and write (n = 8; 12.9%), those who hold Bachelor’s degree (n = 6; 9.7%), and those who hold associate degree (n = 4; 6.5%). Ultimately, more than two-fifths described their monthly income as an insufficient (n = 27; 43.5%), followed by those who described it as somewhat sufficient (n = 21; 33.9%), and those who described it as sufficient (n = 14; 22.6%). More than a half reported that the duration of initiating hemodialysis is (1-5) years (n = 51.6%), followed by those who reported that such a duration is less than a year (n = 15; 24.2%), those who reported that such a duration is (6-10) years (n = 11; 17.7%), and those who reported that it is 16 years or longer (n = 4; 6.5%). Concerning the frequency of weekly hemodialysis, the majority of them reported that they have been receiving hemodialysis twice a week (n = 47; 75.8%) followed by those who reported that have been receiving hemodialysis thrice a week (n = 9; 14.5%), and those who reported that they have been receiving hemodialysis once a week (n = 6; 9.7%). Lastly, all participants reported that they experience itching (n = 62; 100.0%). The self-management of more than a half is fair (n = 32; 51.6%), followed by a poor practice for more than a third of them (n = 22; 35.5%), and a good self-management for a small proportion (n = 8; 12.9%). Participants of the age group of (40-49) years-old have a better practice in managing itching related to hemodialysis than those who are in the age group of (30-39) years-old, those who are in the age group of (20-29) years-old, those who are in the age group of (50-59) years-old, and those who are in the age group of (60-69) years-old respectively. However, there is a statistically significant difference in self-management level among age groups (Chi-square = 1.197, DF = 4, p-value = .879). Males have better practice in self-managing itching related to hemodialysis. However, there is a statistically significant difference in practice level among age groups (Mann-Whitney U = 440.000, p-value = .754). Participants who are High school graduates have a better practice in managing itching related to hemodialysis than those who hold an associate degree and do not read and write, those who hold a Bachelor’s degree, and those who are Elementary school graduates respectively. However, there is a statistically significant difference in practice level among educational qualification groups (Chi-square = .473, df = 5, p-value = .993).

Conclusion

The study concluded that a good self-management for a small proportion of participants and the findings from these studies have association between participants’ gender, age, and educational qualification, and their practice concerning managing itching related to hemodialysis.

Screening of Obesity, Blood Pressure and Blood Glucose among Female Students Athletes at the College of Physical Education and Sport Sciences in the University of Baghdad

Suhad Q. Saeed¹, Mohammed F. Khalifa², Mawahb H. Noaman³
¹College of Physical Education and Sport Sciences, ²College of Nursing, ³College of Physical Education and Sport Sciences, University of Baghdad, Iraq

ABSTRACT

Objective(s): To initiate screening measurements of body mass index, blood pressure and blood glucose among female students at the College of Physical Education and Sport Sciences in the University of Baghdad. A descriptive design, using the screening technique, is carried throughout the present study for the period of December 13th 2018 through December 27th 2018. A convenient sample of (162) female student are recruited for the study. A screening tool is constructed for the purpose of the study. Validity and reliability of the study instrument is obtained through pilot study in which content validity and internal consistency reliability are determined. Data are collected through the use of the study instrument and the measurement of blood glucose, blood pressure and body mass index. Data are analyzed through the application of descriptive statistical data analysis approach of frequency and percentage. The study depicts that almost one third of the subjects has developed pre obesity (32.09%) and (6.78%) of them has obesity class I and (1.23%) has obesity class II. While (3.7%) has underweight. (20.1%) of subjects has developed elevated blood pressure, (5.55%) has developed high blood pressure stage I, and (1.85%) has experienced high blood pressure stage II.

Keywords: Screening, Body Mass Index, Blood Pressure, Blood Glucose.

Introduction

A cross-sectional study, of (7705) student athletes, confirms the progressive nature of the obesity epidemic and identifies the contribution of obesity to the worsening cardio-metabolic profiles in student athletes. The study also identifies that participation in multiple sports and running sports decreases the individual’s risk for obesity and hypertension. The study emphasizes the importance of screening for obesity and elevated blood pressure during the athlete’s pre-participation in physical examination ¹. Another study, of (2700) middle school and high school student athletes, aims at assessing the prevalence of obesity and hypertension-level blood pressures in an urban, athletic adolescent population using pre-participation physical evaluation (PPE) data. The PPE includes biometric information, a history, and a physical examination. Medical volunteers measured blood pressures using a manual blood pressure cuff with an aneroid manometer. The data from each PPE were collected and analyzed for prevalence of obesity ², overweight and hypertension-level blood pressure readings. The study indicates that a large percentage of student-athletes were found to be overweight (20%) or obese (24.0%). Many of these athletes also had stage 1 or 2 level blood pressure readings (14.8%), a finding which strongly correlated with elevated body mass index (P<.00001). The study concludes that the cardiovascular health of this urban adolescent athletic population is a major concern because their rates of obesity and elevated blood pressure place them at increased risk of cardiovascular complications later in life despite their participation in school athletics ². Diabetes is not necessarily as debilitating to a sportsperson’s career as...
some people might think. With proper management, any sport is possible. For longer-distance events, blood glucose levels usually decrease because the intensity is lower than it is for sprint-type activities or high-intensity intervals. Many people with type 1 diabetes train for and compete successfully in endurance events”. For those involved in pursuits, which mandate brief and explosive bursts of energy, the issues are different. “Their intensity causes a large release of glucose-raising hormones that can cause blood glucose levels to rise from the activity 7. More now cases of Type 1 diabetes are diagnosed each year in people age 20 and younger. It is no secret that exercise and physical activity are important for all kids, especially for youth with diabetes 4. Not only do exercise and physical activity improve blood glucose control in kids with Type 1 compared to being sedentary (engaging in fewer than 30 minutes a day of activity), but they also improve blood cholesterol and blood pressure, lower body fat content, increase bone and muscle fitness, and improve well-being 5. When youth with Type 1 diabetes are athletic, it is key that parents help their children learn to plan ahead to assure they have the opportunity to be their best athletic selves. The type of athletic activity can affect blood glucose response, as can the time and duration of exercise and the order of activities. Activities that involve aerobic, sprint, or resistance training can result in widely varying blood glucose responses. Many times, your child’s insulin doses and food intake will need to be adjusted to prevent hypoglycemia or hyperglycemia (high blood glucose) before, during and/or after activity 7. Based on the early stated evidence, the study ought to detect obesity, hypertension and diabetes among female students’ athletes at the College of Physical Training and Sports Sciences in the University of Baghdad.

Materials and Method

A descriptive study using mass screening as an approach to detect obesity, hypertension and diabetes among female students’ athletes at the College of Physical Training and Sports Sciences in the University of Baghdad for the period of December 13th 2018 through January 24th 2019. Convenient sample of (162) female students athletes is collected for the purpose of the present study. Ethical consideration is performed when personal agreement is obtained from each participant in the study to guarantee confidentiality and privacy for them. Screening tool is constructed for collecting data for the study. Content validity is determined for the tool through the utilization of panel of (10) experts. Internal consistency reliability is applied for the tool through employment of split-half technique and the computation of Cronbach alpha correlation coefficient (r=0.86). Data are collected through the application of the screening tool and initiation of structured interview with each participant. Data are analyzed through the application of the descriptive statistical data analysis approach of frequency, percentage and range.

Results and Discussion

The results out of table 1 depict that almost one third of the subjects has developed pre obesity (32.09%) and (6.78%) of them has obesity class I and (1.23%) has obesity class II. While (3.7%) has underweight. Table 2 presents that (20.1%) of subjects has developed elevated blood pressure, (5.55%) has developed high blood pressure stage I, and (1.85%) has experienced high blood pressure stage II. While (72.2%) of them has normal blood pressure. Table 3 indicates that more than half of the subjects has normal blood glucose level (59.25%), (38.27%) of them has pre diabetic, and (2.46%) are diabetic. Throughout the course of data analysis, the study depicts that third of the subjects has advanced pre obesity (32.09%) and (6.78%) of them has obesity class I (Table 1). Such findings can be interpreted in a way that these female students are being at risk of weight gain. So, they should be regularly monitored for the purpose of protecting them from such risk. Those who are at normal weight should be aware of the benefit of maintaining health weight status as far as they are performing their role as athletes. With respect to their blood pressure level, the findings indicate that (20.1%) of subjects has settled elevated blood pressure, (5.55%) has established high blood pressure stage I, and (1.85%) has experienced high blood pressure stage II (Table 2). Female students, who have problems with blood pressure as being candidates for hypertension in the future, have to monitor their blood pressure and follow up healthy eating habits and modifying their lifestyle to fit with their career as athletes. A cross-sectional study, of (7705) student athletes, approves the progressive nature of the obesity epidemic and identifies the contribution of obesity to the deteriorating cardio-metabolic profiles in student athletes. The study also recognizes that participation in multiple sports and running sports declines the individual’s risk for obesity and hypertension 1. Feenie (2018) has found high rates of obesity and high blood pressure in the student athlete population. 20% of
participants were overweight, 24% were obese and 14.8% had high blood pressure readings. Georgeson and others (2017) find that the prevalence of obesity is (11%), and (19%) of participants were overweight. Many of the athletes have an elevated blood pressure (15%). There is a significant association (P<0.001) between weight and elevated blood pressure. Among athletes with elevated blood pressure, (50%) are either obese or overweight. Ramsey and colleagues (2016) recommend that athletes, during their careers, should seek nutritional counseling by which they guarantee that most of their weight gain is muscle not fat. Counseling also should be provided to athletes at the end of their competitive careers to help them effectively change their eating habits and maintain a reasonable exercise program to transition into a healthy weight for life. With regard to their glucose level, the study reveals that (38.27%) of the female students has pre diabetics, and (2.46%) are diabetic (Table 3). Such findings suggest that female students who are diabetic and those who are at the risk of developing diabetes have visit physicians on a regular base to have control on their glucose level and track medical instructions to avoid any possible consequences or complications that may result due to diabetes.

### Conclusion

According to the discussion and interpretation of the study findings, the study concludes that: Significant proportion of female students may progress the risks of obesity (weight gain), hypertension and diabetes. The study emphasizes the importance of screening for obesity, elevated blood pressure and blood glucose level during the athlete’s pre-participation in physical examination.

Study to Diagnose the *Entamoeba histolytica* Parasite from Patients with Diarrhea Attended to General Education Hospital in Al-Qadisiyah Province Use PCR Conventional for Detecting

Saafa Ressan Abdullah Al-Kaeebi  
*College of Nursing, Al-Qadisiyah University, Iraq*

**ABSTRACT**

The present study designed to diagnose the *Entamoeba histolytica* parasite from patients with diarrhea attended to General Education Hospital in Al-Qadisiyah province, Aged between 18 to 40 years at the period from the beginning of March to the end of December 2017. The number of samples that have been collected (210) stool samples, and the number of samples infected is (72) sample ; After samples were examined in direct wet smear method using normal saline, include the study to investigate and to emphasize the presence of virulence factors amoebapore in parasite using Conventional PCR Technique. The result showed that the infection rate was 34.28%. The age group of 24-29 years showed the highest rate of infection (33.33 %), while patients aged 35-40 years showed the lowest rate of infection (18.05 %). The infection rate in male was higher (58.3 %) than in female (41.6%). It was found that the majority of cases (63.88 %) were from Urban areas. After amplified using special designed for primers *E. histolytica* virulence factor genes that was called amoebapore for DNA. The results showed that the mentioned factors is present in all positive samples of *E. histolytica*.

**Keywords:** *Entamoeba histolytica*, diarrhea, age group, virulence factors genes, gender, and Conventional PCR Technique.

**Introduction**

Amebiasis is caused by *Entamoeba histolytica*, a protozoan that is found worldwide. The highest prevalence of amebiasis is in developing countries where barriers between human feces and food and water supplies are inadequate. There are several factors that help spread and increase the incidence of amoeba, especially in the tropics and sub-tropical areas because of the health conditions. That are usually suitable for survival of the cyste longer and thus provide a greater chance of infection, and these factors. Infection of children under the age of five is usually less than that of older children and adults. The incidence is high in crowded areas such as shelters, prisons, and hospitals. The social situation plays an important role, and the rate of infection is high among members of poor communities. The transmission of amoeba dysentery can occur through food or drink contaminated with mature cystes and is the most common and arises from the carriers of the disease. Carriers, who cast the infection stages in the faeces. Food or drink contamination can be due to the use of a contaminated water source or lack of hygienic conditions, especially restaurant workers or the use of faeces as fertilizer for vegetables. The mechanical carrier (flies and cockroaches) plays an important role in food and drink contamination. Direct contact in crowded places such as shelters, and prisons stored hosts such as monkeys, rodents, dogs and pigs play an important role in the spread of infection. The diagnosis was made through a clinical diagnosis based on the symptoms of the disease. This diagnosis is not useful because of the involvement of symptoms with other diseases, but it is useful in the infected areas or through laboratory diagnosis, which proves the presence of parasite in the faeces or in body fluid or tissue obtained from an infected member. Or culture of substances containing amypia in the middle of the plant or the use of serological or immunological methods such as ELISA.
or Use PCR Conventional for detecting. Virulence is a complex phenomenon that depends on two general properties; the invasiveness, or ability of microorganism to multiply and to cause localized tissue destruction, and toxigenicity, or the ability to produce and secrete substances that can cause distant lesions. However, the virulence of *E. histolytica* related strains likely depends mainly on the tissue-damaging potential of individual trophozoites and the number of invasive amoebae in the infected host. The major pathogenic function and the most prominent property of *Entamoeba histolytica* is its remarkable cytolytic capacity. A number of *E. histolytica* molecular components have been thoroughly established as contributors to its pathogenesis. During initial intestinal colonization, a protein Twenty years ago termed amoebapore(AP) which is capable of forming ion channels, or pores in lipid membranes, and depolarizing target cells, was discovered in *E. histolytica*. Trophozoites of *E. histolytica* secrete pore-forming peptides known as ‘amebapores’ that assemble within host cell membranes to trigger cell death. Amoebapores insert into the membranes of bacteria or eukaryotic cells and form pores that result in lysis of the target cells. The addition of purified Amoebapores to eukaryotic cells results in cell necrosis and possibly apoptosis.

### Materials and Method

**Samples Collections:** 210 Fecal samples were collected for patients with diarrhea from Microbiology laboratory of General Education in Al-Qadisiyah Hospital for six months and were collected in plastic containers with information on the patient’s sex, age and living area. then transported to laboratory and stored in freeze.

**Microscopic Examination:** Using microscopic examination (direct method, Wet mount,) were tested at the laboratories. and examine under the microscope on the two powers 25X,40X.

Positive Samples were quickly frozen for DNA detection by Real time PCR.

**Genomic DNA Extraction:** Genomic DNA was extracted from stool samples by using “Stool DNA grabbing Kit, Bioneer. Korea”, The grabbing was done according to company instructions by using stool lysis method with Proteinase K. After that, the Grabber gDNA was checked by Nanodrop spectrophotometer, and then stored at -20C at freeze until used in PCR amplification.

**Polymerase Chain Reaction (PCR):** PCR was performed for detection virulence factors genes in *Entamoeba histolytica* using specific primer which was designed in this study for amoebapore C by using Genbank NCBI database and primer3plus. These were provided by (Bioneer company, Korea), as the:

**Primer Sequence amplicon Genbank**

F TCCAGTTCTTTGTCTGGTTTG
amoebapore C 229bp AY956434.2
R ACATGCATGAATCAACCA

After that, PCR master mix was prepared by using, (AccuPower® PCR PreMix kit, Bioneer. Korea). The PCR premix tube contains freeze-dried pellet of (Taq DNA polymerase 1U, dNTPs 250µM, Tris-HCl (pH 9.0) 10mM, KCl 30mM, MgCl2 1.5mM, stabilizer, and tracking dye) and the PCR reaction prepared according to kit instructions in 20ul total volume by added 5uL of purified genomic DNA and 1.5ul of 10pmole of forward primer and 1.5ul of 10pmole of reverse primer, then complete the PCR premix tube by deionizer PCR water into 20ul and briefly mixed by Exispin vortex centrifuge (Bioneer. Korea). The reaction was performed in a thermocycler (Mygene Bioneer. Korea) by set up the following thermocycler conditions; initial denaturation temperature of 95 °C for 5 min; followed by 30 cycles at denaturation 95 °C for 30 s, annealing 60 °C for 30sec, and extension 72 °C for 1 min and then final extension at 72 °C for 5 min. PCR products( 420bp) were examined by electrophoresis in a 1% agarose gel, stained with ethidium bromide, and visualized under U.V transilluminator.

### Results and Discussion

**Prevalence of *E. Histolytica* According to Microscopical Examination:** A total of 210 samples were collected and examined during the period mentioned above by persons of different age groups (4 age groups). Prevalence of *E. Histolytica* in Human according to direct wet smear, 72 out of 210 stool samples were positive distributed, over the study is shown in the figure (1).
Prevalence of *E. Histolytica* According to the age groups: The results of the present study showed the high percentage (33.33%), which was recorded in age group (18-23 years), while the lowest percentage infect (18.05%) in the age group (35-40 years) with significant difference at p<0.05. Table (1)

Molecular Study: Results of positive samples *E. histolytica* by PCR showed that all these samples 100% contain pathogenic virulence factor under study which are, amoebapore as the picture show 2 the molecular weight factor of the AP factor, at PCR product size is 229 bp. and it was examined by electrophoresis in a 1.5% agarose gel. stained with ethidium bromide, and examined under UV transilluminator. *Entamoeba histolytica* is the third leading cause of death due to parasites, after malaria and schistosomiasis. Amoebiasis presents a high index of morbidity and mortality, mainly in developing countries. According to the World Health Organization (WHO), 500 million people are infected with amoebae; 10% of infected individuals have virulent *E. histolytica*, resulting in 40,000–100,000 deaths annually (9). The result showed that the infection rate was 34.28% proved the high infection, use PCR conventional in detection AP factor. The results founded the prevalence of cases in the age groups between (18-40 years) the number of infection ownership amounted to 72 of (210) cases of infection were highest (24-29 years), reaching (33.33%), which was recorded in age group (18-23 years), while the lowest percentage infect (18.05%) in the age group (35-40 years) 41%. this agreed with the study in Thi-Qar Governorate (17) The study recorded the prevalence of infection stood at 42%. The study recorded the number of infection in male of 42 infection and the prevalence is 58.3 % and females number of 30 cases and the percentage of 41.6 %. Our study agreement with the results of (18) infection rate. Males were 54.6%, while females were 45.4%. and (19) respectively. Diwaniyah governorate, where the percentage of males was 64.2%. The females were 5.99%. while 20 In Erbil where. The percentage of males was 27.35%, which is lower than the percentage of females. Which amounted to 33.37%. The study showed prevalence in rural areas is (38.8%). and in Urban area is (61%). Our results also agreed with 20 records recorded in Erbil. The rate of infection to the population of the city amounted to 34.69%, which is higher than of the population of rural areas, which accounted for
25.49%. However, the results of the current study were not consistent in study 21 in Tikrit. The city’s infection record was 7.26%, which is less than the rate of injury to the rural population, which amounted to 9.77%. Results proved the existence of the factor of 100% of samples positive for infection 22. Use PCR technique to identify the spread of E. histolytica parasites and 23 the same technical to differentiate between these two types of amoeba (E. histolytica and E. dispar) in Mexico to identify the genetic patterns of pathogenic parasites. By highly sensitive molecular methods is of great importance in preventing unnecessary drug treatment and providing us with information on the epidemiology and spread of the parasite 24.

Conclusion

After amplified using special designed for primers E. histolytica virulence factor genes that was called amoebapore for DNA. The results showed that the mentioned factors is present in all positive samples of E. histolytica.

The Histological Study of Proventriculus Stomach in Iraqi Black Francolin (Francolinus francolinus) and Common Teel (Anas Crecca)

Alaa Najee Salih¹, Osamah Nassir Wali², Ali Fayadh Bargooth³
¹Collage of Education for Pure Scienceces, Wasit University, Iraq; ²Department of Adult Nursing, Collage of Nursing, Misan University, Iraq

ABSTRACT

Six adult of Black Francolin and six of adult of common Teel were prepared for the histological study of true stomach. The samples from proventriculus of two birds which stained with routine staining by hematoxylin and eosin. The wall of proventriculus in two types of birds consists of four layers or tunics: the first was tunica mucosa had longitudinal folds and lined by simple columnar epithelium. The lamina propria contained simple tubular gland, the super facial gland in Common Teel was longer than in the black Francolin. The tunica sub mucosa contained compound tubular gland, the tunica muscularis in the in both species was consist of two type of smooth muscles inner, circular and outer longitudinal the tunica musculris in Black Francolin were thicker than in the Common Teel the tunica serosa in the both species about loss connective tissue contained blood and lymph vessels.

Keywords: Stomach, Histology, Common Teel, Black Francolin

Introduction

The digestive system and stomach morphology show considerable variation among animals based on phylogenetic food type the size of the animal and variation environmental pressures. The bird’s digestive system has a larger number of organs, which have greater, inter organ cooperation, than do mammals ¹. The fowl stomach is formed of two parts: gastric (Proventriculus or true stomach which lay posterior to the esophagus and the ventricular or gizzard which is located posterior to the glandular part ². The proventriculus and gizzard constitute the first important site of enzyme activity. The main function of true stomach is production of gastric juice and propulsion of juice and food in to the gizzard which is the main site of gastric proteolysis ³. The true stomach is lined with glandular mucous tunic which secreted gastric juice like pepsin and HCL by this mechanism, the ingested food with its juices passes quickly to the gizzard in which the food particles are reduced to fine particles took by the intestine for more digestion and absorption ⁴. The purpose of this study was to study the histological features of glandular stomach of Common Teel and Black Francolin.

Materials and Method

Six adult of both sex from male and female each species Black Francolin and Common Teel during the period between the winter and spring from the 2017 year used in this study. The birds in which good health and stayed in cage for three days and feed with grain, insect and fish then humanely killed by used ethyl ether then dissected the birds for intake specimens for the histological preparation and then histological sections stained routinely with hematoxylin _eosin stain. The sections were documented by light microscope, with a common digital camera 18.0 mega pixel.

Results and Discussion

The results sections show the wall of the glandular part of stomach in two type of bird consist of four tunics;
tunica mucosa, tunica sub mucosa, tunica muscularis and tunica serosa (fig1a,1b). The tunica mucosa of proventriculus of Black Francolin and Common Teel were longitudinal folds as finger like structure. These branched were lined by simple columnar epithelium, the epithelial of mucosa were rested on lamina propria which contain simple tubular gland (fig2A,B). These glands opened in the cavity of proventriculus through ducts. The superficial gastric gland of Black Francolin has (420µm) was longer than the superficial gastric gland in the stomach Common Teel the mean which has length was (310 µm) as appeared of histological section (fig3B, fig3A). Lamina propria separated from under lining tunica by the muscularis mucosa which is smooth muscle fibers (fig2A,2B). in both species, the tunica sub mucosa appears consist of loose connective tissue containing proventriculus glands which simple tubular glands (fig3A,3B). The tunica muscularis in two bird consist of two layer inner circular and outer longitudinal (fig4A,4B). The mean thickness of tunica muscularis in Black Francolin was (195.12µm) while in the Common Teel was (130.14µm), there were no differences in both species of tunica serosa which appeared contained loose connective tissue, blood vessels and nerve plexus(fig4A,4B). The results of this study show the wall of proventriculus (true stomach) of Black Francolin and Common Teel consist of four tunics the first tunic is tunica mucosa, tunica sub mucosa, tunica muscularis and tunica serosa this result resemble with 5-7 who were recorded in fowl, with 3 who recorded in guinea fowl, pigeon, and conformable with(9) who recorded in Anas platyrhynchos. In both species the tunica mucosa of proventriculus of Black Francolin and Common Teel was folded and lined by simple columnar epithelial. The type gland in mucosa simple tubular gland located in the lamina propria this glands open in collecting duct this result parallel with 10,11 who recorded in avian, jungle fowl, and pigeon while disagreement with 12 were recorded the epithelial layer simple cuboidal epithelial in the partridge and disagreement with 13 when referred to the gland in croot bird was branched tubular gland. the muscularis mucosa consist of two type of muscle inner circular and outer longitudinal, this result agreement with 13 who appeared same result recorded in Coot bird he tunica sub mucosa was connective tissue occupied by some of sub mucosal glands which are compound ramified or tubular, these result agree with 14 in partridge. The tunica muscularis consist of inner layer circular and outer longitudinal these finding agree with 15 who observed in proventriculus of fulica armillata. The outer layer was serosa which was consist of loose connective tissue contain blood and lymph vessels these result agreed with 16,17 were recorded in chicken and partridge. we suggest that the increasing in the thickness in the tunica muscularis of the proventriculus for Black Francolin compare with Common Teel, because the differences of the food for these bird, therefor the Black Francolin need more muscle for processes of digestion as the remain of 18 who mention that the food of Francolinus is ground grain in the terrestrial environment, while 19 mention the nutrition of Common Teel are the wet seed, insect larva and fish. It is clear from the above that the food of Black Francolin needs increasing of grinding and pushing for transmission which requires thickness of tunica muscularis in the proventriculum.

Fig. 1A, 1B: Show the tunics of proventriculus in Francolinus Francolinus and Anas Crecca. Tm:tunica mucosa, Tsm :tunica submucosa, TM:tunica muscularis, Ts:tunica serosa. H&E 10X
Fig. 2A, 1B: Black arrow show the fold in tunica mucosa of proventriculus in *Francolinus Francolinus* and *Anas Crecca*. H&E 40X

Fig. (3A): Cross section in the proventriculi in *Anas Crecca* shows: 1 - superficial gland 2 - deep facial gland 3 - serosa. H&E 10X

Fig. 3B: Cross section in the proventriculi in *Francolinus Francolinus* shows: 1 - superficial gland 2 - deep facial gland 3 - serosa. H&E 10X
Fig. 4A, 4B: Show the tunica muscalris(Tm) and tunica serosa(Ts) of proventriculus in Francolinus Francolinus and Anas Crecca.HaE 10X

Conclusion

The tunica sub mucosa contained compound tubular gland, the tunica muscularis in the in both species was consist of two type of smooth muscle; inner, circular and outer longitudinal the tunica muscularis in Black Francolin were thicker than in the Common Teel the tunica serosa in the both species about loss connective tissue contained blood and lymph vessels.

The Significance of p53, Bcl-2, and HER-2/neu Protein Expression in Iraqi Females Breast Cancer Cell Line (AMJ13)

Doha F. Alawsi¹, Ahmed Majeed Alshammari¹, Maha F. Majeed²

¹Baghdad University, College of Science, Department of Biotechnology, Iraq; ²Mustansiriy University, Iraqi Center for Cancer Medical Genetic Research, Iraq

ABSTRACT

Breast cancer is a significant cause of death affecting females globally. It is the first cause of death from cancer in females in Iraq. AMJ13 Cell line derived from Iraqi female patient was established and used for drug development as in vitro model in cancer research. There are two apoptotic pathways—the extrinsic pathway (activated by ligand engagement of cell surface death receptors) and the intrinsic (mitochondrial) pathway: The biochemical assay for the Her2neu, P53, and Bcl-2 receptors have shown the clinical value of knowing the concentration of the receptor within the tissue. The immunocytochemical assay is rapidly taking over from the biochemical assay. This approach should apply to many more biomarkers detected by immunohistochemistry.

Keywords: hormone receptor negative, quantitative image analysis, immunocytochemistry

Introduction

Breast cancer is a diverse disease with varying biological and clinical characteristics. Breast cancer has emerged as a grave danger in the last 50 years. It is a common cancer-related deaths among women in Iraq according to the latest Iraqi Cancer Registry. Cancer incidence increased in Iraq linked to environmental pollution related to conflicts. AMJ13 breast cancer cell line was established from the primary tumor of Iraqi female that suffer from infiltrating ductal carcinoma and found to be useful as in vitro cancer model. Changes or loss in cell factors could have a significant impact on tumor growth or regression. Alterations in different genes are involved in the development of this tumor and alterations in essential pathways related to proliferation and apoptosis have been used as targets for treatment. A large percentage of cell loss in tumors was due to apoptosis. Apoptosis is a well-regulated process responsible for the removal of damaged and unnecessary cells that regulated by several factors. Tumor suppressor genes such as P53 plays a critical role in preventing human cancer formation. In response to different stress signals, p53 becomes activated and induces cell cycle arrest and apoptosis. It is a sequence-specific DNA binding protein that regulates transcription. P53 functioning in response to DNA damage and various cellular stresses induced by deregulated oncogenes. There are extrinsic and intrinsic apoptotic pathways, intrinsic is characterized by mitochondrial outer membrane permeabilization (MOMP), resulting in the release of cytochrome-c into the cytoplasm. This apoptotic pathway is governed by interactions between pro-apoptotic and anti-apoptotic Bcl-2 proteins (B-cell lymphoma 2). Bcl-2 is a protein that supports cell survival through antiapoptotic activity. In breast cancer, bcl-2 expression also correlates with ER positivity. Its shown that women with bcl-2-positive tumors have better overall survival compared with those with bcl-2-negative tumors. The human epidermal growth factor receptor-2 gene (Her-2/neu) is a member of HER family and encodes a receptor. The key function of HER2 is to enhancing cell survival by suppressing apoptosis to induce uncontrolled tumor growth. These receptors are single transmembrane
proteins consisting of an intracellular tyrosine binding domain with various tyrosine phosphorylation sites and an extracellular domain for ligand binding and a cytoplasmic tail. After dimerization, Her-2 promote numerous cellular functions such as cell differentiation, survival, and growth by a different cascade. HER-2 is the most frequent amplified oncogene in breast cancer. Gene amplification and protein overexpression of the HER-2 has been reported to be linked to the sensitivity to Herceptin and anthracycline-based therapy as well as the prognosis for breast cancer. This study aimed to estimate the expression of the oncoproteins HER2/neu, BCL2 and tumor suppressor protein p53 in AMJ13 Iraqi breast cancer cell line. The expression status is important to understand this cell line as model for use in drug development and cancer research.

Materials and Method

Cell Maintenance: The AMJ13 breast cancer cell line was cultured in a RPMI-1640 medium (USBiological, USA), and supplied with 10% fetal bovine serum (FBS) (Capricorn-Scientific, Germany), 100 units/mL penicillin, and 100 μg/mL streptomycin and incubated at 37 °C. The cell line was supplied by the Cell Bank Unit, Experimental Therapy Department, Iraqi Center for Cancer and Medical Genetic Research, Mustansiriyah University.

Immunocytochemistry: P53, HER2/neu, and Bcl-2 proteins were detected in Iraqi breast cancer cell line (AMJ13) using immunocytochemistry assay. Cells were cultured in RPMI-1640 supplemented 10% fetal calf serum (Thermo Scientific, Waltham, MA, USA). The cells were cultured in mini tissue culture plastic Petri dishes and maintained at 37°C in a humidified incubator with 5% CO₂ to allow the cells for developing a monolayer of adherent cells within one day. Before fixation, PBS was used to wash the monolayer cells twice. Cells were fixed for 5 min in cold acetone. Endogenous peroxidase activity was neutralized by incubation for 10 min in a solution consisting of 3% H2O2. The cells were washed with PBS, blocked for 1 h at room temperature in PBS containing 1% fetal bovine albumin, and reacted with selected primary antibodies, mouse anti-human-BRCP and mouse anti-human-MDRP1 (Santa Cruz Biotechnology, USA). The antibodies were diluted (1:50–100) according to the manufacturer’s recommendations. Color development was performed with the chromogen diaminobenzidine (0.6 mg/ml) in a solution containing 0.02% H2O2 at pH 7.6. After counterstaining of nuclei with hematoxylin, cells were examined with a leica light microscope.

Quantitative Image Analysis: The digital images of immunocytochemistry were used for quantitative analysis protocol for the hematoxylin – DAB staining slides were taken by leica inverted microscope and camera (Leica microsystems, Germany), three different staining zones of ICC images of each slide were analysed in this study. firstly, color de-convolution technique was used to un-mix the DAB, hematoxylin stained areas leaving a complimentary image. As we got three new images. First image is the hematoxylin stain, the second one is the DAB image, and we quantify the DAB image. the number of pixels of a specific intensity value vs. their respective intensity was raised using “Fiji” version of ImageJ from http://fiji.sc. We converted the intensity numbers in the results window to Optical Density (OD) numbers with the following formula: OD = log (max intensity/ Mean intensity), where max intensity = 255 for 8-bit images.

Statistical Analysis: All data were shown as mean ± standard deviation. For ICC experiment, n = 3 images were used. One-way analysis of variance (ANOVA) multiple comparision was done to show variations among groups. The statistical analyses were performed using (GraphPad Prism version 6.07 for Windows, GraphPad Software, San Diego, CA, USA). and p < 0.05 was considered to be statistically significant.

Results and Discussion

Immunocytochemistry of Cultured Breast cancer cell: The expression proteins P53, Bcl-2 and human epidermal growth factor receptor (HER2/neu) in breast cancer cells was tested by immunocytochemistry assay. Under the light microscope, the results of immunocytochemistry showed no brown staining in control cells that was not exposed to primary antibody, it was exposed to the secondary antibody only (Figure-1a). The results showed positivity to P53, weakly positivity to Bcl-2 and Her2neu proteins, (Figures-1b, c and d).
Figure 1: The result of immunocytochemistry by used primary antibodies marker (Her-neu2, P53 and Bel-2) marker with immunocytochemistry staining kit, A: Negative Control (200x), B: Positive P53 receptor (20X), C: weakly positive of Bcl-2 receptor (20X), and D: weakly positive of Her-neu2 receptor (20x). E: Digital Image Scoring showing significant proteins expression when stained with relative mAbs against the markers that analyzed using ImageJ program.

Digital Image Scoring: Images of ICC stained AMJ13 breast cancer cells were further analyzed by using ImageJ program. Figure-1e shows demonstrative zones and pixel intensity analysis of ICC images. The analysis showed that the three proteins were significantly expressed when compared to control not stained cells using ANOVA one-way multiple comparison test. The results reported the P53 protein is weakly expressed by AMJ13 cell line, yet it is significant when compare to control unstained AMJ13 cells using quantitative image analysis method. P53 is a tumour suppressor protein that acts as a major defense against cancer but has been found to be mutated in 50% of all human cancers. All grade I invasive breast carcinoma (IBC) were negative for p53, 50% of grade II and 91% of grade III IBC were positive for p53. P53 expression increased significantly with increased tumor grade of IBC. Many therapeutic agents act by damaging DNA, which may in certain contexts function as a signal to trigger apoptosis. P53 is a nuclear phosphoprotein capable of binding to specific DNA sequences and activating specific target genes. Normal p53 exerts its antiproliferative action by inducing reversible or irreversible cell cycle arrest, or apoptosis. Cells with non-functional or mutated p53 no longer have the G1 checkpoint and accumulate in the G2/M phase, a target of mitotic arrest by the taxanes. The current investigation confirmed that Her-2/neu protein is expressed to certain level and these results in agreement with the establishment report that showed this protein as low expressed. Her-2/neu (also known as ErbB2/c-erbB2/HER-2) proto-oncogene is the most frequently amplified oncogene in breast cancer. ERBB tyrosine receptor kinases activate several pathways, including PI3K-AKT and RAS-MAPK pathways, which regulate many cell functions including proliferation, migration, survival, and cell growth among others. Hyperactivation or overexpression of these receptors can lead to uncontrolled cell growth and proliferation leading to cancer development. Amplification/overexpression of HER-2 is observed in 25–30% of human BCs, and has been associated with poor outcome, in both node-negative and node-positive early BC. HER-2/neu overexpression predicts altered chemosensitivity to different forms of cytotoxic drugs. The cytological immunostaining for BCL-2 was insignificantly a lower expression that P53 expression. BCL-2 has an important role in inhibiting apoptosis thus it is expected that there is a close relationship between the over expression of BCL-2 and tumorgenesis of different tissues. Tumor resistance to apoptosis is frequently acquired through deregulated expression of BCL-2 family members or mutations in the p53 tumor suppressor pathway that ablate the ability of this transcription factor to induce BH3-only proteins (such as PUMA and NOXA), which are critical for the initiation of apoptosis. Taxanes have been reported to induce post-translational serine phosphorylation of the Bcl-2 protein. The Bcl-2 and P53 proteins expression has been found to have correlation with each other and the proliferation activity in invasive ductal carcinoma of the breast. The ICC images were analyzed to further confirm the accuracy, precision, and reproducibility of the results for breast cancer cells. Quantitative image analysis provided valued evidence to create a approach to investigate HER2 in ICC for breast cancer as described by college of American pathologists.
In conclusion, we shown that P53, BCL2 and HER2 proteins expresses significantly in AMJ13 breast cancer cell line. The expression insignificantly differs among the tested proteins of AMJ13 breast cancer cells. Further sequencing study is required to confirm the functionality of P53 gene in this cell line.

**Conclusion**

There are two apoptotic pathways—the extrinsic pathway (activated by ligand engagement of cell surface death receptors) and the intrinsic (mitochondrial) pathway: The biochemical assay for the Her2neu, P53, and Bcl-2 receptors have shown the clinical value of knowing the concentration of the receptor within the tissue. The immunocytochemical assay is rapidly taking over from the biochemical assay. This approach should apply to many more biomarkers detected by immunohistochemistry.

Use *Siphoviridae* Bacteriophage as a Treatment for Mice Infected with MDR *Pseudomonas aeruginosa* and Histopathology Study

Mays B. Jalil¹, Maha Khalil², Zainab R. Abdul-Hussien², Hayder A. Al.Hmudi²

¹Department of Pathological Analyzes Techniques, Al-Kunooze University College, Iraq; ²Department of Biology, College of Science, University of Basra, Iraq

ABSTRACT

The study was carried out to isolate, purify and quantification of bacteriophages against Multiple Drugs Resistance (MDR) *P. aeruginosa*, and using a bacteriophage as a treatment for mice experimentally. Four groups (Intraperitoneal injection group, local swab group, Positive group, and Negative group) of animals were tested for purpose of using lytic phages of *Siphoviridae* family as a treatment for MDRs *P. aeruginosa* isolated from patients suffering from moderate to severe burns wound infection. The current study presents evidence in murine models that animals can be successfully treated with specific bacteriophages that target these MDRs microbes.

*Keywords:* *Siphoviridae*, *Pseudomonas aeruginosa*, bacteriophages, Histopathology study

Introduction

Burn wound infection is an extensive health problem in many countries of the world. *P. aeruginosa* is an opportunistic pathogen that can cause serious diseases in patients. Its strains can cause nosocomial infections such as pneumonia, bacteremia, urinary tract infection, as well as skin infections. In addition, they are involved in chronic and acute infections, especially in immunocompromised patients. It is found as a dominant colonizer of the burns wound.

Materials and Method

Determination of Bacterial Density and Colony Forming Units: MDR *P. aeruginosa* was grown in BHI broth and incubated at 37°C for 24 h. Serial dilution and The colony forming unit (CFU) was performed and the cell density was determined at OD600 has corresponded to approximately $3 \times 10^4$ and $3 \times 10^8$ cells/ml, then the visible colonies were counted and the CFU/ml was calculated. The dilutions were spun down at 8000 rpm for 10 min, 4°C. The pellet was washed and suspended in 10 ml normal saline (pH 7.4).

Mouse Model and Animal Experiment: The animal experiment was performed according to with some modification. The lytic phage of *Siphoviridae* family was used in the current experiment. A 7 week’s old BALB/c male mice (n=21, in four groups) with weighing 20 to 25 gm and placed in the cages (30×25×20 cm) and left for 48 h. to adapt at controlled room temperature, distributed in cages where each group consisting of three animals. After 24 h., the animals were anesthetized with chloroform and burned using a spatula about 90°C by placing it on the skin for 10 sec. to make superficial burns with stage II wound. In acute infections, the first group of animals is an intraperitoneal (I.P) injection group, and the second group is local swab group which consist of two subgroups, one of which was challenged by local infection of MDR *P. aeruginosa* with ($\sim 3 \times 10^4$ CFU/ml) while the other was challenged with ($\sim 3 \times 10^8$ CFU/ml). Following the bacterial challenge, each animal in subgroups was treated with injections, about 1 mL of phage ($26 \times 10^5$PFU/ml), administered for intraperitoneal (in an (i.p) injection group) and local swap (in local swap group) at 30 min and 24h. Then given a daily oral...
dose of phage. The third group was kept as a positive control without phage therapy, but infected with MDR *P. aeruginosa*. The fourth group served as the negative control, which only administered intraperitoneal of phage without bacterial infection. Infected mice and controls were observed under the sterile condition for one week, also the wounds were follow up and recorded by photography. The number of deaths was counted every 24h. In chronic infections, one week after infections with the bacteria, the chronically infected mice (positive control group) was treated with two doses of phage administered (i.p) injection. The second dose was administered 24 hours after the first infection and then given daily oral doses of phage.

**Histopathological Study:** The tissues were prepared depending on the method of Luna (1968)\(^1\).

### Results and Discussion

#### The Therapeutic Effectiveness of **Siphoviridae** Phage:

In acute infections, the results were very encouraging as it was found in response to treatment in the intraperitoneal (I.P) injection group in different doses than the treatment with local swap group in which one animal died (in the dose \( \sim 3 \times 10^4 \) CFU/ml) on the first day after the injection and was also suffering from sleep and red eyes in each animal in subgroups. Furthermore, in the positive group, there was death one animal after the first day of challenge with bacteria and the death of the rest on the fifth day. Also, all animals in the negative group were intact and active. In chronic infections, the animals were challenged by local infection of MDR *P. aeruginosa*, and before the death of these animals, they treated with doses of lytic phage via I.P injection and daily oral dose after three days after the injection. The results showed that all animals were cured after a week of treatment with no side effects were recorded. The culture of animal blood showed no bacterial growth, while it showed successful infection with *P. aeruginosa* in positive groups.

#### Histological changes

**A. Acute infection**

**1. Negative Group**

**Liver Sections:** The results revealed to histological changes with liver sections from the negative group, normal hepatocytes polygonal shape, arranged as hepatic plates around the central vein, most hepatocytes with two nuclei, kupffer cells showed within the sinusoids (Figure, 1).

![Figure 1: Section in mice liver from the Negative Group, Showed normal polygonal hepatocytes ( ), kupffer cells showed within the sinusoids ( ), hepatocytes with two nuclei ( ), part from portal duct visible ( ) (H&E stain 40X)](image)

**2. Positive group**

**Liver Sections:** Histological examination on liver sections of mice infected with bacterial dose of \( \sim 3 \times 10^4 \) CFU/ml and untreated with phage showed vacuolated hepatocytes, congested portal duct, and appearance of rod-like bacteria (Figure 2).

![Figure 2: Liver section of mice infected with bacterial dose of \( \sim 3 \times 10^4 \) CFU/ml, Showed vacuolated hepatocytes ( ), Congested Portal vein ( ), and Rod Bacteria ( ) (Gram stain 40 X)](image)

**Lung sections:** Lung sections from mice infected with bacterial dose of \( \sim 3 \times 10^4 \) CFU/ml and untreated with phage showed severe changes included heavy infiltration of inflammatory cells, mostly neutrophils and macrophages, thick alveolar septa with the collection of red blood cells, bronchus epithelium hyperplasia and degeneration of lining epithelial layer and collapse of most alveolar sacs, there was hyperplasia of bronchioles walls and thickening alveolar sacs wall, deposition of collagenous
fibers and increased with pneumocytes (type II) was observed (Figure, 3).

Figure 3: Cross Sections in mice lung infected with bacterial dose of ~3×10^4 CFU/ml, showed thickening of alveolar septa ( ), degeneration of lining epithelial layer ( ), collapsed alveoli and diffuse cellular infiltration ( ) (H&E stain 10X)

3. Intraperitoneally injection group

Liver sections: The results of microscopic examination of liver sections from mice infected with bacterial dose of ~3 × 10^4 CFU/ml and treated intraperitoneally with 1 mL of *Siphoviridae* phage, was observed hepatocytes more regular arranged around the central vein, normal sinusoids, normal polygonal hepatocytes, some with two nuclei, arranged hepatic plates with normal kupffer cells (Figure, 4).

Figure 4: Liver section of mice infected with bacterial dose ~3×10^4 CFU/ml, Showed Normal Hepatocytes ( ), Some with two nuclei ( ), Clear Sinusoids ( ), and normal Kupffer Cells ( ) (H&E stain 40X)

4. Locally group

Liver Sections: The results of liver section from mice infected with bacterial dose of ~3×10^4 CFU/ml and treated locally with 1 mL of *Siphoviridae* phage showed hepatocytes with oval, vesicular nuclei, the hepatic plates separated by sinusoids, some kupffer cells, hypertrophied and other crescent shapes. Also, inflammatory cells around the central vein, some hepatocytes appeared hypertrophy with large oval nuclei. normal hepatocytes, some inflammatory cells, kupffer cells aggregated to form granuloma (Figure, 5).

Figure 5: Liver section of mice infected with bacterial dose ~3×10^4 CFU/ml, showed normal hepatocytes ( ), kupffer cells aggregated to form granuloma ( ), and focal degeneration ( ) (H&E stain 40X)

B. Chronic infection

Liver Sections: The observations on liver sections of chronic group that infected with a dose of ~3×10^8 CFU/ml and treated intraperitoneally with 1 mL of *Siphoviridae* phage after fifth day of infection showed the hepatocytes arranged regularly around the central vein and regular hepatic plates, the hepatocytes with normal nuclei and some of the mitotic figures appeared in this section, although mild region with hemorrhage and aggregation of inflammatory cells (Figure 6).

Figure 6: Liver section of mice infected with bacterial dose ~3×10^8 CFU/ml, showed degenerated hepatocytes ( ), others hypertrophy ( ), vacuolated and accumulation of kuffer cells ( ) (H&E stain 40X)
Discussion

The therapeutic effectiveness of Siphoviridae phage: *P. aeruginosa* can enter the bloodstream, sepsis and bacteremia could be occurred leading to increasing death rates among burn patients. Despite the significant development of antibiotics against microbial infection, the existence of therapeutic alternatives remains a major challenge for many countries. Many experiments have been conducted on humans and animals to assess the efficiency and effectiveness of the phage, especially against *P. aeruginosa* where recorded that the survival rate of mice infected with bacteria alive after giving the phage ranged from 80-100% 7. The current study presents evidence can be successfully treated with specific bacteriophages that target these MDRs microbe and the culture of animal blood proved that there were no bacteria in it, while blood culture of the positive groups showed that it is infected with bacteremia. Also, the present results showed that giving the dose phage via I.P injection and orally were more effective than the local dose after the bacterial challenge. The intraperitoneal injection and oral administration of phage is the best method to understand the effects of phage in vivo. This method makes murine safe from bacteria and death and few numbers of *P. aeruginosa* in their blood, liver, and spleen after blood culture. Another study shows the phage in the bloodstream in the first hour and even after 3-4 h. after the injection, but the number of phages was low at 24 h. and completely absents within 36 h. in the body of mice 8. Likewise, the effectiveness of phage in chronic infection appeared in 6 days 9.

Histopathological Study: The histopathology study supported the animal experiment which showed that the mice treated with bacteriophage. The percentage of large tissue collapse after infected with a bacterial infection is mainly due to the contribution of virulence factors. Some of the studies have indicated that the exoenzyme S produced by MDR *P. aeruginosa* plays a clear role in pulmonary infection. Tillotson and Lerner (1968) observed when they studied histopathological changes of ten cases of *P. aeruginosa* pneumonia where spread abscesses and alveolar cell-wall necrosis but not seen arterial wall necrosis, perivascular infiltration, and thrombosis. In a study conducted by Forristal *et al.*(1991) using a burned mouse model, proved that the Exotoxin A-Binding Protein(PE) produced by *P. aeruginosa* plays important role in in inhibition of protein synthesis, hepatotoxicity and depletes elongation factor2 in mouse. Because the liver is a prominent target of toxins in animals, Snell *et al.*(1978) 16 noted the production of toxin in the burning mice and infected with bacteria are lead to rapid depletion of liver elongation factor 2 in the liver and other tissues.

Conclusion

The results showed that all animals were cured after a week of treatment with no side effects were recorded, indicating the safety of phage as a treatment, indicates its ability to kill the bacteria directly.

Vitamin D Insufficiency is a Risk Factor for Infertility: Case Control Study

Lina Muhsen Atyia
Gynecology Specialist, Al-Diwaniyah Child and Maternity Hospital, Department of Obstetrics and Gynecology, Al-Diwania, Iraq

ABSTRACT

Aim of the study: To study the prevalence of vitamin D insufficiency in infertile women and see its impact as a risk factor through a case control study. This case control study was conducted at Al-Diwaniyah maternity and child teaching hospital in Al-Diwaniyah province, Mid-Euphrates region of Iraq. The study started on February 2018 and extended through February 2019. The study included 52 apparently healthy and fertile women serving as control group and 35 infertile women serving as study group. The age ranges of control and study groups were 21 – 39 and 20 -40 years, respectively. Venous sample was obtained from each woman and sent to the central laboratory of Al-Dewaniyah maternity and child teaching hospital to measure serum vitamin D level. Mean serum vitamin D of infertile women was lower than that of fertile women, 20.57 ± 8.69 ng/ml versus 24.85 ± 5.85 ng/ml, respectively and the difference was highly significant (P = 0.007). Moreover, the prevalence rate of vitamin D insufficiency (< 20 ng/ml) was significantly higher among infertile women in comparison with fertile women, 40 % versus 19.2 %, respectively (P = 0.035). Vitamin D appears as a risk factor for women infertility.

Keywords: vitamin D insufficiency; fertility.

Introduction

The problem of vitamin D deficiency is relatively common and universal as it happens in almost all geographic regions around the globe 1. This wide spread of such health problem is attributed mainly to inadequate nutritional supply 2-6. Vitamin D is widely known for its contribution to the health and wellbeing of musculoskeletal system 7,10; however, its role in extraskeletal abnormalities has been highlighted by a number of observational studies such as the link among vitamin D deficiency and neoplastic disorders, neurologic abnormalities, immune disorders and cardiac problems 9,11. Despite that, the outcome of randomized clinical control trials failed in the majority of reports to support the validity of replacing vitamin D in correction of such extraskeletal abnormalities 12,14 leading to the belief that vitamin D deficiency by itself is not able to cause such extraskeletal manifestation rather being a risk factor among multiple other factors working together to produce specific extraskeletal manifestations 15. The link between vitamin D and female fertility has been the aim of several recent published articles 16-20. In western countries, one of the interesting findings is that the highest pregnancy rate coincides with the seasons of highest serum vitamin D levels namely autumn and summer 16. Studying the outcome of assisted reproductive techniques revealed that women with adequate vitamin D level had better outcome in terms of biochemical pregnancy, clinical pregnancy and live birth rates 19,21. Early spontaneous pregnancy loss has been linked to undernormal serum vitamin D concentration 23,24. Polycystic ovary syndrome and endometriosis, conditions that are associated with reduced fertility rates, have been shown in some studies to be associated with vitamin D deficiency 16,18. Receptors for both vitamin D and 1-α-hydroxylase have been found in a number of tissues involved in female reproductive health such as endometrium, placenta, ovaries and pituitary gland in...
addition to the finding in experimental studies of vitamin D metabolites in the above mentioned tissues making an insight on the possible role of vitamin D in women fertility 26,27. On the contrary, some authors deny the existence of a significant association between fertility rate and outcome of assisted reproductive techniques and women vitamin D status (28-30). Vitamin D is included among the umbrella of fat-soluble vitamins and has a role in the intestinal absorption of calcium, zinc, magnesium, iron and phosphate. The principal molecular forms of this vitamin are cholecalciferol and ergocalciferol 31. According to some authors levels of vitamin D in the serum that define a deficiency state is below 20 ng/ml 32. In our country and in regions that from the intimate borders of our country in the Middle East, vitamin D deficiency is claimed to happen because of inadequate exposure to sun light attributed to women dressing habits in these nations 31. For that reason we planned and conducted the present case control study in order to estimate serum vitamin D concentration in infertile women and comparing the results with that of fertile women of comparable age.

Subjects and Method

This case control study was conducted at Al-Diwaniyah maternity and child teaching hospital in Al-Diwaniyah province, Mid-Euphrates region of Iraq. The study started on February 2018 and extended through February 2019. The study included 52 apparently healthy and fertile women serving as control group and 35 infertile women serving as study group. The age ranges of control and study groups were 21 – 39 and 20 -40 years, respectively. Venous sample was obtained from each woman and sent to the central laboratory of Al-Dewaniyah maternity and child teaching hospital to measure serum vitamin D level. The study was approved by the Ethical Approval Committee of the College Of Medicine/University of A-Qadisiyah. Verbal consent was obtained from each women following comprehensive explanation of the study aim and procedure. Data presentation and analysis was accomplished using statistical package for social sciences (SPSS version 23). Numeric data were expressed as mean, range and standard deviation whereas nominal data were expressed as number and percentages. Chi-square was used to study association between categorical variables while independent samples t-test was used to compare mean vitamin D levels between control and study groups. The level of significance was considered at P ≤ 0.05.

Results and Discussion

The present study included 35 infertile women with an age range of 20 – 40 years and a mean age of 27.34 ± 4.52 years and 52 fertile women with an age range of 21 – 39 years and a mean age of 27.34 ± 4.52 years. There was no significant difference in mean age between control and study groups (P = 0.249), ensuring statistical matching between the two enrolled groups, table 1. There was also insignificant difference in mean body mass index (BMI) between the two groups, 27.71 ± 3.35 kg/m² and 27.69 ± 2.91 kg/m² (P = 0.947), table 1. Distribution of women according to occupation discloses no significant difference, employment versus housewife (P = 0.757) in addition to lack of significant difference in their distribution according to residency, urban versus rural (P = 0.554), table 1. Mean serum vitamin D of infertile women was lower than that of fertile women, 20.57 ± 8.69 ng/ml versus 24.85 ± 5.85 ng/ml, respectively and the difference was highly significant (P = 0.007), as shown in figure 1. Moreover, the prevalence rate of vitamin D insufficiency (< 20 ng/ml) was significantly higher among infertile women in comparison with fertile women, 40 % versus 19.2 %, respectively (P = 0.035), table 2. Estimation of odds ratio showed that vitamin D insufficiency is associated with 2.8 fold rise in the risk of infertility in comparison to women with adequate vitamin D (95 % confidence interval of 1.07 - 7.36) and the etiologic fraction of vitamin D insufficiency in association with infertility was 0.38, as shown in table 2. Regarding infertile group, serum vitamin D showed insignificant correlation to age of women, BMI, occupation or residency, table 4. The present study showed that vitamin D deficiency is significantly associated with infertility in such a way that women with vitamin D level lower than 20 ng/ml are approximately 3 times more liable to be infertile than women with serum vitamin D of 20 or more ng/ml. Pagliardini et al. (2015) reported in a cross sectional study that about 40.1 % of included infertile women had vitamin D < 20 ng/ml and this observation is similar to our finding that 40 % of infertile women had vitamin D insufficiency. Indeed vitamin D insufficiency (< 20 ng/ml) is a frequent observation in women seeking fertility centers 34. Several other studies estimated the prevalence rate of vitamin deficiency in infertile women to be ranged from 21 up 99 % (35-39). During the last decades a number of studies supposed that vitamin D has a role in the modulation of the reproductive events in female because of the expression of vitamin D receptor and 1α-hydroxylase in reproductive organs such as placenta, uterus and ovary as well as the hypothalamus and the pituitary gland. In addition, vitamin D plays a role in
the control of sex hormone biosynthesis. Emerging data suggests that vitamin D could have a role in “polycystic ovary syndrome (PCOS)-associated manifestations”, such as insulin resistance, ovulatory dysfunction and hyperandrogenism. Vitamin D insufficiency has also been observed to take part in the pathogenesis of endometriosis because of its anti-inflammatory and immunomodulatory characteristics. Observation from assisted reproductive techniques reported that fertility parameters such as fertilization, clinical pregnancy and implantation rates are significantly higher in women with adequate vitamin D (> 20 ng/ml) in comparison with women with vitamin D insufficiency (< 20 ng/ml). However, other authors deny any role for vitamin D in women fertility. In view of the available findings and previous reports we suggest using vitamin D supplementation for infertile women to increase the chance of pregnancy in addition to other assisted reproductive measures.

Congenital Heart Diseases in Consanguineous Marriages in Tikrit-Iraq

Mejbil Ahmed Abd¹, Rikan sulaiman², Ashoor R Sarhat³
¹Salahdeen Health Directorate, Iraq; ²Tikrit Medical College, Iraq; ³Tikrit Nursing College, Iraq

ABSTRACT

Consanguineous marriage means a union occur between related individuals as second cousins or closer. Iraq as part Middle Eastern States show a high rate of consanguineous marriage due to tribal society. In Iraq, consanguineous marriage is a socially supported custom. To study the association of consanguinity as a risk factor for congenital heart diseases (CHDs). Patients with suggestive signs of CHD admitted Tikrit teaching hospital were subject to diagnostic investigations. Case data includes: name, age, gender, and cause of admission. Parents data includes: age, residence, degree of consanguinity, and history of family recurrent CHDs. Congenital heart diseases was slightly higher in females than males, and there is 40% of studied cases were from positive consanguinity families. This study shows that the least congenital heart disease age reported was neonatal period, and the highest in ages between 1-5 years. Consanguinity in CHD was present in 81 cases (40%) and absent in 123 cases (60%). Family history in CHD was positive in (38%). most common congenital abnormality associated with CHD was Down’s syndrome.

Keywords: Congenital Heart Diseases in Consanguineous Marriages-Iraq, CHD and Consanguineous Marriages.

Introduction

CHD is one of the leading causes of mortality during the first year of life ¹, and represent the major human birth defect globally ², it is prevalence 1% of live births ². From linguistic point of view, consanguinity comes from Latin word, “con” which mean common and “sanguineus” which mean blood, so it is known as a relationship occur between two persons sharing a common ancestor. ³ According to clinical genetics, a consanguineous marriage defined as the one with union between two persons related as second cousins or closer. ⁴ The functional or structural abnormalities present at time of birth defined as birth defects or congenital malformations, which result in devastating illness and usually associated with long term sequela which may cause increased morbidity and mortality. Around 270,000 neonates die during the first neonatal period yearly because of congenital defects ⁵. The etiology of most CHD are unknown. Multifactorial origin of CHD form the main explanation for CHD which revealed interaction of genetic and environmental factors. Chromosomal abnormalities were form a small percentage of CHD specially, Down 21, 13, 18 and Turner syndrome. Heart disease is found in more than 90% of patients with trisomy 18, 50% of patients with Down syndrome, and 40% of those with Turner syndrome, and about 2% are attributed to known environmental factors. CHD has an increased risk of recurrence of CHD if a first-degree relative (parent or sibling) is affected ⁶,⁷. Variety of researches, all around the world have shown the elevated risk of congenital abnormalities associated with inbreeding. Iranian study revealed 43.6% consanguinity in parents of affected children mostly having congenital diseases like psychomotor and mental retardation ⁸. An Indian research revealed that the percentage of CHD to be 3.37% which rose to 4.41% in first cousins when children born to consanguineous marriages were compared to those born to a non-consanguineous marriage, which was found to be 1.22% ⁹. An Iranian study showed that with consanguinity positive in 59.7% of cases and 31.5% in controls, odds of congenital malformation were 3.22 times more in

DOI Number: 10.5958/0976-5506.2019.01428.1
consanguineous group. Because of Due to the crippling sequelae of birth defects and the powerful relation with consanguineous marriages, this research aimed to describe the association between the two so that the ways to lower the disease’s possible burden may be tried. Patient and methods: written ethical approval & study execution permission were gained from Tikrit College of Medicine. Parental consent was taken. This is an observational cross-sectional study which was conducted during the period extending for 6 months and conducted in Tikrit Teaching Hospital. The sample of (204) cases. Were selected by convenient sampling technique from those patients with CHD attending pediatrics clinic. A special questionnaire used to get information about sex, age, address, family history, consanguinity, sign & symptom of CHD, growth & developmental parameters, socioeconomic status. All cases of CHD which were diagnosed by echocardiography. Exploratory data analysis was performed using descriptive measures. Data put in tables and figures, statistical analyses was done by Chi- square using p-value. P-value less than 0.05 considered significant.

### Results and Discussion

The types and distribution of CHD were as follows; VSD 72 (35.2%), TOF 29 (14.2%), ASD 28 (13.7%), PDA 15 (7.35%), PS 11 (5.4%), TGA 10 (4.9%), COA 7 (3.4%), AVSD 6 (2.95%), and miscellaneous 26 (12.7%). The frequency of 26 miscellaneous types of CHD in 204 Iraqi children were as follows: Aortic stenosis 4 (1.96%), ASD+PS 3 (1.47%), VSD+PS 3 (1.47%), DORV3 (1.47%), Dilated CMP3 (1.47%), Pulmonary atresia 2 (0.98%), Truncus arteriosus 2 (0.98%), Single ventricle 2 (0.98%), VSD+PDA 1 (0.49%), TAPVR1(0.49%), Hypertrophic CMP1(0.49%), Aortopulmonary window 1(0.49%). The least CHD age reported was in neonatal period (11%), and the highest in ages between 1-60 months (44%) (Table 1). Consanguinity in CHD was present in 81 cases (40%) and absent in 123 cases (60%). Family history in CHD was positive in (38%). most common congenital abnormality associated with CHD was Down’s syndrome 60% of cases, and Edward 20% of cases. It is different from another study in the same center in 2017 which found that Down syndrome (70%), and (10%) of them had Edward syndrome.

Decrease the Severity of Spasticity Symptom for Patients with Multiple Sclerosis after Performance of Structured Self-Management Training Program (Theoretical Framework)

Sahar Adham Ali¹, Hassan Alwan Baiee², Hayder Ibrahim Ali³

¹Ph.D, Adult Nursing, Faculty of Nursing, University of Babylon, Iraq; ²Ph.D, Faculty of Nursing, University of Babylon, Iraq; ³MSc, Adult Nursing, Higher Health Institute AL-Najaf health director, Iraq

ABSTRACT

Multiple sclerosis is a chronic neurological autoimmune diseases which affect adults female more than male at productive age and distributed among more than 2 million peoples around the world, occupy the second neurological reason for disability and interact with the quality of life. Objectives: To evaluate the effectiveness of structured training program to decrease spasticity symptom severity for patients with multiple sclerosis. Middle Euphrates Neuroscience Center in AL-Najaf City choice as a proper setting to carry out this study, a purposive sample of (61) patients diagnosed with MS are divided to (31) experimental group and (30) control group, structured self-management training program prepared to decrease the spasticity level, special form prepared to evaluate the level of spasticity contain of Modified Ashworth Scale, data were collected by interview and of reliability was calculated as (0.78). the results show that the highest percentage of participant were female (59%), between age group the (31-40) years, with primary school (37.7%), (80.3%) were married, overall assessment for (61) MS patients related to spasticity shows severe spasticity symptom in pre-test. while in posttest shows improvement of spasticity symptom associated with performance of structured training program among experimental group members.

Introduction

Multiple sclerosis (MS) is one of the known chronic neurological autoimmune diseases drive by pathological inflammatory demyelination of central nervous system distribute among more than 2 million peoples around the world, and it considered one of the main cause of disability in young adult how are affected by this disease.¹ The disease can affect any part of the brain or spinal cord that’s why it may present with motor symptoms, sensory symptoms, visual disturbance, cerebellar symptoms, sphincters dysfunction, psychological or cognitive dysfunction. The diagnosis of MS is based on the clinical findings and supporting evidence from ancillary tests, such as magnetic resonance imaging (MRI) of the brain and/or spinal cord and/or cerebrospinal fluid examination.² Multiple sclerosis typically diagnosing at early stages of life commonly between 20-50 years of life, the females are commonly affected by this disease in two to three times more than males. Limitation in mobility may appear as a clear symptom, disability, fatigue, spasticity, weakness, and imbalance, are most significant symptoms which may be seen in MS patients, the self-management is the effective way to decrease the intensity of these problems.³ Epidemiological studies show that the female/male ratio ranged from 0.8 in Oman to 4.3 in Saudi Arabia. MS prevalence ranged from 14.77/100,000 population in Kuwait to 101.4/100,000 in Turkey. The overall MS prevalence in the region was 51.52/100,000. The mean age at disease onset ranged from 25.2 years in Kuwait to 32.5 years in Northeastern Iran, with an overall estimate of 28.54 years.⁴ Orem’s self-care theory consider as one of the important nursing theories deal with the care used as framework to transfer the patients from dependent role to independent in providing of self-care to him/herself by considering that all human being have a potential to develop intellectual...
and practical skills when the essential motivation in self-care used as a base. Nurses play important role in improving health of MS patients by interaction with patients and their families to provide knowledge and practices that MS patient’s needs.

**Methodology**

Middle Euphrates Neuroscience Center in AL-Najaf City used to carry out this study, in order to obtain the study objectives the quasi-experimental design used as a proper design, a purposive sampling method used to select the sample of (61) patients who previously diagnosed with MS, this sample was divided in to (31) patients act as experimental group and the others (30) patients were assigned as a control group who frequently visit the center for treatment and consultation, a Modified Ashworth Scale (MAS) a spasticity scale used to assess the level of spasticity. Self-management training program prepared and special form constructed to assess the severity of spasticity, the form content two parts the first part content demographical characteristics from the study sample, while the second part include Modified Ashworth Scale (MAS) to assess the severity of spasticity. The content and clearance of the program and the form were obtained by (10) expert panel, while the reliability of the form were statistically calculated after a pilot study which recorded as (0.78); agreement of participants were obtained by assigning special consent form which content the objectives and brief of the study. Data in pretest were collected form the study sample (experimental and study groups) as a base data to assess the change in severity of the spasticity, after that the experimental group members involved in training sessions which content theoretical presentation and practical administration of self-management training program to reduce the severity of spasticity. Two posttest performed to evaluate the effectiveness of the training program, the first posttest data were collected after four weeks, while the second posttest data were collected after two months later.

**Results and Discussion**

Table (1) present the distribution of demographical data for (61) patient with multiple sclerosis those agree to participate in the study, divided in to two groups (31) patients as experimental group and (30) patients as control group related to age the table shows that the higher percentage 14 (45.2), 12 (40%) of the experimental and control group were between (31-40) years age group. In relation to gender the high percentage 16 (51.6%), 20 (66.7%) of both groups were female. Both group recorded high percentage 22 (71%), 27 (90%) were married, related to educational level the results shows that the high percentage of the experimental group 10 (32.3%) were secondary school and college level, while the high percentage 14(46.7%) among the control group were with primary school level. 20 (64.3%) of the experimental group were urban area residency, while the control group show equal distribution 15 (50%) between urban and rural as residency area. The patients with MS who participate in the experimental group recorded high percentage 13 (41.6%) were officeholder, while the result of the control group patients show that 7 (23.3%) were house wife. Table (2) depict the results of response of control and experimental groups related to spasticity symptom, and these results shows a significant differences in result between control and experimental group, The control group shows no significant changes during follow up period presented upon their general mean for their pre-test and First Post-test which is achieved after four weeks (5.16 ± 2.29), (5.16 ± 3.49), and the second Post-test after eight weeks (5.14 ± 4.57), while the experimental group members presented changes which were clearly recorded among their general mean between pre-test (5.13 ± 0.03) and first Post-test (5.10 ± 0.02), the second Post-test (5.04 ± 0.02).That indicated the effectivenss of educational program toward decreasing the spasticity symptom for patients who attend to sessions. Spasticity is considered as the common and traditional symptom for many neurological defects and diseases such as MS, stroke, and spinal cord trauma and injuries, many epidemiological studies reported that highest prevalence of spasticity distributed among patients with MS than those with stroke and patients with traumatic brain injury. Spasticity level in current study decrease after applying the educational symptoms management program regularly by experimental group, while those not attending to sessions and not applying the program were not achieve the improvement that lead to fact that the applying of program content related to good prognosis of spasticity, these result in compatibility with the Adar S., et. al. at 2017 finding of exercises ability in improvement of spasticity management and motor function.

ABSTRACT

Objective: The study aim to Assess Daily Living Activities Domains. And find out the relationships between daily living activities domains and their demographic characteristics (age, gender, parent’s level of education, parent’s occupation and economic status) of School Age Children with sickle Cell Anemia in Al Nasiriya Centre for Hereditary blood Diseases Quantitative design (a descriptive study) of one hundred children was selected. All the patients for both sexes diagnosed as having sickle cell anemia, for the period from 11th November 2018 through to 12th February 2019. The collection of data is performed out of the utilization of developed questionnaire and by means of structured interview technique with the subjects who were individually interviewed by the using of Arabic version of the questionnaire in Al Nasiriya Centre for Hereditary Blood Diseases. The results of the study indicate more than third 31% of age is 6-7 years, more than half 51% in 1-2 days is male, there is 18% child isn’t in school, child in first class is 24.4%, absence number from school is 40% and most of them have a moderate level activities of daily living 65.0%.

Keywords: Daily living activity; Sickle cell anemia; School age children

Introduction

The World Health Organization has classified sickle cell disease as a major public health priority, given the severe impact of the disease on patients, their families, and the community. Therefore, In 2006, the World Health Organization (WHO) recognized sickle cell disease as a global public health problem 1. Sickle cell is a life-threatening blood disorder that is characterized by red blood cells that assume an abnormal, rigid sickle shape. Sickled cells can stop or slow blood flow to parts of the body, causing less oxygen to reach different areas, resulting in a pain crisis and other complications 2. In the United States, over 80,000 people have sickle cell anemia. Each year about 1,000 babies are born in America with sickle cell disease. It is estimated that 3.5 million Americans carry sickle cell trait 3. Sickle cell anemia as hereditary diseases effect on any organ or system of the human body. Lifelong problem, in sickle cell anemia the red blood become (sickle like shapes). The sickle-shaped cells become clogged in small blood vessels, causing obstruction of the microcirculation, which in turn results in damage to and destruction of various tissues 4. Prevalence of Sickle Cell Anemia (SCA) is a common hematologic problem in Basrah in Southern Iraq around 6.48% of population are carriers for the sickle cell gene 5. Most affected births occur in Asia, Africa, Mediterranean, Caribbean, Arabian, and Indian 6. The disease comes to Iraq due to migration or as a result of population movement it spread to different areas of the world. SCA is inherited disorder that means the children who get abnormal hemoglobin genes from parents, in the Basrah governorate because of its high carrier rate due to the frequency of consanguineous marriages high rate is 56.4%. Therefore, the SCA appear 7. In children, especially the school age group, normally very active with sickle cell anemia (SCA) is more limited general health and physical functioning, more limitations in their academic functioning and social activities attributed to their physical health, and more behavior and emotional problems8. Daily living activities that important part of an individual’s quality of life, that means things normally do on a daily basis, including any daily activity perform

for self-care. These are activities that are absolutely necessary for someone to live independently such as of daily living activities, personal hygiene, school activities dressing, eating, sleeping, transferring, social activities and play. When body does not have an adequate number of red blood cells present due to damage, destruction red blood cells (RBCs), anemia occurs, fatigue that causes low activities, because insufficient oxygen levels will sap energy.

Methodology

Quantitative design (a descriptive study) of one hundred children was selected. All the patients for both sexes diagnosed as having sickle cell anemia, for the period from 11th November 2018 through to 12th February 2019. The collection of data is performed out of the utilization of developed questionnaire and by means of structured interview technique with the subjects who were individually interviewed by the using of Arabic version of the questionnaire in Al Nasiriya Centre for Hereditary Blood Diseases.

An assessment tool was adopted and developed by the investigator design for the purpose of the study. Questionnaire format that used of one hundred child was designed and constructed by the researcher depending on

1. Translates the scales (Katz ADL, Lawton ADL and Bristol ADL) from English to Arabic and select appropriate to measure the variables underlying the present study.
2. Extensive review of available literature and studies related to the concept of daily living activities and sickle cell anemia.
3. Meeting with parent and children having sickle cell anemia were carried out and opened questions used related to their disease and how it effects on their daily living activities.

Data was collected through using a questionnaire modeled and made up of three parts, the first part included children’s demographic data and parent’s demographic data with socio-economic status of children’s family, the second part included clinical data and clinical manifestations of children and three part daily living activities of school age children with sickle cell anemia domains.

Results and Discussion

Table 1 shows (51%) of the children are males, their age is 6-7 years old (31%) and the mean and standard division of age is 8.90 (2.067), children in school are (82%), in first class (24.4%) while third class is (23.1%), mean and standard division of absence number from school is 2.73 (3.149) of high percent 40 of 1-2 days, and the socioeconomic status of children’s family is (71%) middle. Table 2 shows the mean age of onset is 2.92 ± 2.058, the age onset for most of children is 1-2 years (n=57; 57.0%), the mean of ill brothers is 0.93 ± 0.832, less than half of families have one ill child (n=45; 45.0%), the mean of blood transfusion is 0.6 ± 0.72, most of children have no blood transfusion (n=52; 52.0%), two third of them have one blood transfusion (n=40; 40.0%), the mean of hospital admission is 0.99 ± 0.75, most of children have hospitalized once (n=58; 58.0%), the mostly reported clinical manifestations are pallor (n=82; 82.0%), fatigue (n=78; 78.0%), loss of appetite (n=77; 77.0%), joint pain (n=73; 73.0%), more than two fifth of families visit health clinic, and visit hospitals when clinical manifestation appear on child (n=41; 41.0%) for each of them. Table 3 shows that more than half of participants have a moderate level activities and motors (transferring) (n=55; 55.0%), two fifth of them have a moderate level school activities (n=40; 40.0%), more than half of them have a moderate level play activities (n=53; 53.0%), the majority of them have a poor personal hygiene (n=72; 72.0%), more than half of them have a moderate level dressing activities (n=51; 51.0%), the vast majority of them have a poor level eating and drinking activities (n=95; 95.0%), more than half of them have a moderate level sleep (n=53; 53.0%), more than half of them have a moderate level social activities (n=56; 56.0%), and most of them have a moderate level activities of daily living (n=65; 65.0%). Table 4 shows age of onset negatively correlates with child’s activities of daily living (r=-0.206; P<0.05), while child’s absence number, number of blood transfusion and hospital admission positively correlate with child’s activities of daily living( r= 0.574; P<0.05),( r= 0.361; P<0.05), (r= 0.257; P<0.05) respectively.

The children with days of school absence with sickle cell anemia. This study finding the mean 2.73(3.149) with high frequency of school days absences were (1-2) days. These findings agree and supported with results obtained from study done by Day and Chismark(11). They
reported children who have a school absence have a high incidence of (1-2) days, which indicates to sickle cell anemia table (1). Table (2) also shows significant relationship between age onset( diagnosis ) and daily living activities ($r=-0.206; P < 0.05$) this finding agree with results obtain from study done by Animasahun et al (12) children with sickle cell anemia (70%) were first diagnosed above one year of age at the onset of children’s illness. The researcher thinks that there is association between age diagnosis and daily living activities. Diagnosis is often made when child show up with clinical manifestations through visit health clinic or hospital. The relationship between number of blood transfusions and daily living activities with sickle cell anemia, table (4) shown ($r=0.361; P<0.05$) of children, the finding shows that mean 0.6(0.72) and the majority of non-blood transfusion was 52%, these findings agreed and supported with results obtained from study done by Arceci(13). Who reported of blood transfusion of sickle cell anemia can occur in more than 30% of patients usually administered every 3–4 weeks. Also shown there is significant relationship between number of hospital admission in children and daily living activities ($r=0.257; P<0.05$), the study indicates to more than half of sample 58(58%) were have once of hospital admissions, this finding agree with results obtain from study done by Ezenwosu et al (14), the study result indicate that the most of the hospital admission were 55 (61.1%) of 90 children with sickle cell anemia in age school. This finding disagree with results obtain from study done by Ali et al (15) they reported with children were less than 12 years with sickle cell anemia, that result mentioned to 43(16%) of children have once of hospital admissions. Also shown there is more than fourth five of sample 82% is pallor, this result less than the report indicate to 51.8% of patients complained of pallor in children with sickle cell anemia in Nigeria with results obtain from study done by Juwah et al (16). Also more than third quarter of sample 78%, 77% are fatigue and loss of appetite, fatigue is consider a key symptom of anemia this report agree and supported by the results obtained from study done by Ameringer and Smith(17). Also the study shows 73% of joint pain children with sickle cell anemia (SCA), this result similar report and supported with study done by Yusuf et al(18) who reported indicate to the most common reason for the hospital or specially center visits is joint pain symptom (67%) from patient with sickle cell anemia. Throughout the course of the present study table( 3 ), the study results showed the effected of the daily living activities by 8 indictors under three levels scales of good, moderate and poor. The transferring activities, school activities, play activities, dressing activities, sleeping activities and social activities all those domains the sickle cell anemia(SCA) effect on it moderate effect, but the effect sickle cell anemia(SCA) on personal hygiene.

**Conclusion**

The study shows significant relationship between ages of onset negatively correlates with child’s activities of daily living. While child’s class, child’s absence number and number of blood transfusion positively correlate with child’s activities of daily living.

ABSTRACT

Objectives: To determine the knowledge among osteoporosis for female students and identify the association between overall assessment knowledge osteoporosis with demographic characteristics among female students. The study design a quantitative research by a descriptive study, the sampling it is non-Probability “purposive” sample was conducted on 200 Female Students among Osteoporosis Knowledge at Institutes in Al-Furat of Middle for the period from February 7, 2018 to March 16, 2018. A questionnaire it has used as a tool of data collection to fulfill the study, which consist of three parts, include demographic characteristics, medical history, and the health Protective behaviors. A content validity, which is carried out through 13 panel of experts. A panel of experts determines validity, while reliability use split half. A descriptive and inferential statistics are used to analyze the data. Results: Findings stated that the higher percentage were (68%) at age group (18-20) years, (91.5%) from urban areas, (74.5%) singles, and relative to source of information (48.5%) had more than source, followed by (23.5%) internet and social networking web. Also majority of those students (54%) were in fair level knowledge about osteoporosis disease, followed by (46%) had a good level of knowledge.

Keyword: osteoporosis, risk factors of osteoporosis, complication of osteoporosis.

Introduction

Osteoporosis defined as a reduction in bone mass per unit volume such that fractures may occur with minimal trauma. It is the most common metabolic bone disease in the Western world. There are many causes, but by far the most common and most important is postmenopausal osteoporosis, which affects most women by the end of their lives ¹. Osteoporosis is the most common silent disease in the world, where it is estimated that a woman of every (3) women, and a man of every (5) men will suffer from fractures resulting from the disease after the age of fifty years ². Osteoporosis is a disease that causes the bones to become fragile and weak, leading to increased risk of fractures in the bones. Osteoporosis patients may be fractured due to a minor collision or falling from a rise during daily activities ³. Osteoporosis refers to it’s often affects the elderly. Bone loss with aging process is a global phenomenon, but it becomes a disease when bones become more vulnerable to breakage ⁴. Despite an increasing awareness of the importance of osteoporosis in some sections of the population, many women are still not sufficiently aware of the condition, do not appreciate the way in which it may affect their lives and, most importantly, do not understand that it is preventable. It is the duty of healthcare professionals to provide women with an impartial account of the current knowledge regarding osteoporosis ¹. Osteoporosis can be defined as low bone mass leading to structural fragility; it is difficult to determine the extent of the condition described in these qualitative terms. Using the World Health Organization’s quantitative definition based on bone density measurement, there are roughly 10 million Americans over age 50 with osteoporosis.

and an additional 34 million with low bone mass or “osteopenia” of the hip, which puts them at risk for osteoporosis, fractures, and their potential complications later in life. Osteoporosis was defined previously by a consensus panel as a “disease characterized by low bone mass and micro architectural deterioration of bone tissue leading to enhanced bone fragility and a consequent increase in fracture incidence.” According to this definition, the diagnosis of osteoporosis requires the presence of a fracture. Osteoporosis develops in older adults when the normal processes of bone formation and resorption become uncoupled or unbalanced, resulting in bone loss. Fractures are the result of decreased bone mass and strength, and, in the case of wrist and hip fractures, they usually involve a fall. Osteoporosis prevention and treatment programs should therefore focus on strategies that minimize bone resorption and maximize bone formation, as well as on strategies that reduce falls. Optimal treatment and prevention of osteoporosis require modification of risk factors, particularly smoking, physical activity, and diet, in addition to pharmacologic intervention. Osteomalacia, a less common disorder, occurs when bone is inadequately mineralized; the result is a syndrome of bone loss accompanied by bone pain, myopathy, fatigue, and fractures. Osteoporosis unless the patient has a fracture, so it is disease is often called silent disease. The fracture due to osteoporosis often occurs in several areas such as the wrist, upper arm, pelvis, thigh, spine, and can cause severe pain and inability to move significantly and may cause death. Aims of the study: To assessment the knowledge regarding osteoporosis of a selected sample of female students. To find out the relationship between knowledge osteoporosis with demographic characteristics of female students.

Methodology

A descriptive quantitative study was carried out in order to achieve the stated objective. The study was begun from February 7, 2018 to March 16, 2018, Study Sample. A non-probability Purposive sample of 200 female students of institute in Al-Furat of middle. Several statements of this questionnaire were modified and developed to increase the validity of this instrument and to be more appropriate for achieving the aims of the present study. The study instrument consisted of (4) parts as the following: Demographic data, risk factors, etiology of osteoporosis, treatment of osteoporosis and complication of osteoporosis, Each item answered by one of these (Always, Sometime, Never). The collected data were statistically analyzed by two methods:

1. A descriptive statistical method (frequencies and percentages).
2. Inferential statistical method (Correlation Coefficient and P. Value).

Results and Discussion

The observed frequencies and percentages of the studied demographic characteristics variables which are distributed according to the study sample. Findings stated that the higher percentage were (68%) at age group (18-20) years, (91.5%) from urban areas, (74.5%) singles, and relative to source of information (48.5%) had more than source, followed by (23.5%) internet and social networking web. Table 1 shows that the majority of risk factors for study subject responded for women are more exposed than men, over-drinking coffee and tea, family history of disease, lack of exercise, lack of calcium and vitamin d, increased salt intake, lack of exposure to sunlight, increased intake of dietary fiber, non-pregnancy, refrain from breastfeeding, extreme thinness respectively. Table (1) indicated that most of the study sample had responded as (Don’t know) (46%, 39.5%, 45.5%, 46%) for kidney disease, thyroid diseases, psychological diseases, surgical removal of ovaries respectively. the highest percentage (64.5%), (66%), (56.5%) majority of these students had responded as (Yes) to backache and arching, decrease in length, exposed body bones to fracture respectively. the vast majority of the study sample had responded as (Yes) (63%, 70.5%, 68%, 72%, 69.5%, 72.5%, 61.5%, 53%) for regular exercise, refrain from smoking and alcohol, drink milk and eat its products, adequate exposure to sunlight, hormonal therapy, follow the doctor, encourage breastfeeding, surgical treatment respectively. Table (3) shows that majority of those students (54%) were in fair level knowledge about osteoporosis disease, followed by (46%) had a good level of knowledge. The study finding observed frequencies and percentages of the studied demographic characteristics variables, which are distributes according to the study sample. The Findings of the study indicate that the higher percentage age group (18-20) years within age groups. Concerned with residence of the study sample are urban areas which inconsistency with Awan and others (2016) in their study.
they mentions the majority of study sample from the rural settings of our study which has early sleeping habits and less room for electronic media entertainment. This result consistent with Kamran, and others (2016), who studies knowledge and behavior regarding osteoporosis in women. Also regarding the marital status are singles this results are disagree with of studied that indicate the women related marital that about three quarters (75.9%, n =404) of them were married, 16.5%, n = 87 were widows, 5.3%, n =28 were single and 21% divorces by El-Tawab and others (2016). Relative to source of information had more than source, followed by internet and social networking web. Many studies is consistent with such as Jalili and others (2007) that findings high percentage for sources information from internet and media. The study finding concerned with overall assessment knowledge about osteoporosis indicate that the majority of the study sample responses are fair of knowledge. This finding of the study are come with study that indicate Knowledge, attitudes and activity regarding osteoporosis among Iranian women (n=729) Knowledge score (total) mean and standard division (44.3) (21.5) by Askari1 and others (2016). Also another studies such Green and others (2005) who there is not enough knowledge about risk factors, one does not consider them as serious threats and so does not look for prevention and treatment. Hossien and others (2014), who founding through study osteoporosis knowledge among female adolescents in Egypt, that indicate knowledge of about osteoporosis, it was found that 38.4% of the studied sample didn’t know the meaning of osteoporosis, more over 75.9% of them didn’t know what to do in the case of osteoporosis this results is agree with finding of the study. Concerned with correlation between knowledge among osteoporosis and their demographic characteristics for study sample the finding of the study that the indicate there is no significant between demographic characteristics variables (residence, source of information, age) which disagree with Riaz and others (2008), in their study found the association between the knowledge score for osteoporosis and women’s age its non-significant (P =0.075). Also others study are agree with study finding such El-Tawab and others (2016) in their study they mention no correlation between age groups and sources information with knowledge for osteoporosis disease.

DNA Genetic Recombination based Image Encryption using Chaotic Maps

Dina Riadh Alshibani, Narjis Mezaal Shati, Nada Thanoon Ahmed

1Department of Computer Science, College of Science, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

In this paper, a new encryption algorithm is proposed for grey scale image. The proposed algorithm consists of two main stages: the DNA stage and the chaotic map stage. In the DNA stage, each pixel in plain image can be represented by four nucleotide bases by carrying out DNA coding and decoding to produce the plain image in DNA strands form. While chaotic stage exploits the Lozi Map, Logistic Map and Clifford system in keys generation to be used in the substitution, genetic recombination and permutation processes respectively. Accepted key space and sensitive key are gained by the proposed method, and the evaluation of the algorithm illustrates it has high effectiveness to resist exhaustive statistical attack.

Keywords: Chaotic maps, DNA encoding, Genetic Recombination.

Introduction

The protection of data such as image, text, and videos from disclosure and altering its content is an urgent issue due to the insecure communication channels through the internet. Various approaches of encryption have been suggested to protect the images, some of these approaches can be simply attacked such as substitution, transposition, and other approaches is very complex such as public key encryption. Recently, the chaotic maps concept has been proposed to enhance the security and quality of image cryptosystems. This approach can be characterized by: firstly, the ergodicity property of chaotic signals resembles the confusion property in cryptography. Secondly, High sensitivity of chaotic signals to their initial conditions / system-parameters resembles the diffusion property of cryptography and noise-like behavior of chaotic sequences resembles the key sequences used in cryptography. Finally, the highly sensitive response of chaotic systems to initial conditions makes their trajectory unpredictable and highly random. However, the direct overlaying of a chaotic sequence and the pixel grey value of the image to achieved encryption have made the existing algorithms to be attacked easily by the statistical analysis or differential attack. In the other hand, image encryption based on DNA approach have recently emerged. This approach characterized by its massive parallelism, bulk storage, and ultralow power consumption. The DNA approach generally consists of three stages: DNA encoding, DNA operations, and DNA decoding. In the DNA encoding, an encoding rules are used to encrypt the stream of bit in image as DNA sequences. In the DNA operation, a various kind of operations such as logical addition, subtraction, and exclusive XOR are used to perform on DNA. The kinds of encoding and operations are usually controlled by chaotic sequences. The results of DNA operations are decoded to bits with the counterpart of corresponding encoding rules. In this article, proposed method for Image Encryption based on “DNA” approach and the “Chaotic map” is proposed (IE-DC). The DNA encryption is added in order to overcome the limitations of the chaotic map. The algorithm has exploited a combination on one, two, and three dimension of chaotic system depended on the DNA encoding and decoding and genetic recombination. The evaluation of the proposed algorithm has been illustrated a promising results in the image encryption.

The remainder of the article is organized as follows: Section 2 illustrates the chaotic Lozi map, Logistic map,
Clifford system, DNA encoding, decoding and genetic recombination principle. Section 3 and 4 explain the main steps of the IE-DC algorithm. The evaluation of the IE-DC algorithm is presented in Section 5. Finally, section 6 Conclude the article.

**Methodology**

The main aim of this study is to develop a method based on DNA and chaos map. To get hold of this aim a methodology of three steps are done as follows:

**Chaotic Maps:** In mathematics, a chaotic map is a map that shows some kind of chaotic behavior. There are various kind of chaotic map such as Lozi map, Logistic map, and Clifford system.

**i. Lozi Map:** Lozi is a 2-D discrete-time dynamical system as defined in Equation (1) and Equation (2):

\[ x_{zn+1} = 1 - \alpha \cdot \text{abs}(x_{zn}) + y_{zn} \quad \ldots(1) \]
\[ y_{zn+1} = \beta \cdot x_{zn} \quad \ldots(2) \]

Where \((x_{zn}, y_{zn})\) and \((x_{zn+1}, y_{zn+1})\) are the present and the next chaotic values respectively. Note that, the chaotic values are controlled by two factors \(\alpha\), \(\beta\). Facts of Lozi map can be found in [5]. Frequently, the initial values of controlled vector set to factors \(\alpha = 1.4\) and \(\beta = 0.3\).

**ii. Logistic Map:** Logistic map is a good example of 1D chaotic map, as describe in Equation (3):

\[ x_{ln+1} = \mu x_{ln} (1 - x_{ln}) \quad \ldots(3) \]

Where \((x_{ln})\) and \((x_{ln+1})\) are the present and the next chaotic values respectively. \(\mu \in [0, 4]\), \(x_{ln} \in (0, 1)\) and \(n = 0, 1, 2, \ldots\) The examination outcome displays that the system is in chaotic state under the condition that \(3.56994 < \mu \leq 4\[6]\).

**iii. Clifford system (attractor):** Clifford system is described as follows:

\[ x_{cn+1} = \sin(a) \quad \ldots(4) \]
\[ y_{cn+1} = \sin(b \cdot x_{cn}) + d \cdot \cos(b \cdot y_{cn}) \quad \ldots(5) \]
\[ z_{cn+1} = \sin(e \cdot y_{cn}) + f \cdot \cos(e \cdot z_{cn}) \quad \ldots(6) \]

Where \(x_{cn}, y_{cn}\) and \(z_{cn}\) are the present chaotic values, \(x_{cn+1}, y_{cn+1}\) and \(z_{cn+1}\) are the next chaotic values. The chaotic values are controlled by six factors “a, b, c, d, e, f”. Facts of Clifford system can be found in [8].

**DNA Encoding and Decoding:** A sequence of DNA composed of 4 nucleic acid bases “Adenine (A), Cytosine (C), Guanine (G) and Thymine (T)” Where (A, T), (C, G) are integral pairs. Therefore, 8 types of encoding groups can be used due to the integral link between DNA 4 nucleic acid passes only. Relationships of DNA acids (Eight kinds) \{AGCT, AGCT, CATG, CTAG, GATC, GTAC, TGCA, TGCA\} as Each pixel in For 8 bit/pixel grayscale image can be encoded into a nucleotide string of 4 bits length. For example, if the gray value of pixel \(I(r, c)\) is 39, then the binary representation of pixel \(I\) is \([00100111]\), the corresponding DNA sequence is \[AGCT\] using the 1st DNA encoding rule. \[AGCT\] using the 2nd DNA encoding rule, \[CTAG\] using the 3rd DNA encoding rule, and so on. [9, 10]. Exclusive-OR operations for DNA sequences are performed according to traditional Exclusive-OR in the traditional binary systems.

**Genetic Recombination:** Genetic recombination can be defined from the biological perspective as the construction of offspring with mixtures of traits that vary from those originate in either parent. DNA strand is split, combined to another slice of a different DNA molecule, and then a new DNA molecule appears. In this article exchange recombination or crossover is adapted. Exchange recombination referring to exchange particular genes of any broken DNA strand with the corresponding part of another DNA strand [11].

**Benefit of recombination**
- Greater variety in offspring.
- Negative selection can remove.

Eventually, the Exchange recombination or crossover with one point cross over and two point are supported as described in Fig. 1.

**Figure 1: Exchange recombination or crossover**
The IE-DE Algorithm: The IE-DE algorithm consists of two stages: the DNA stage and chaotic map stage. The main steps of the IE-DE algorithm is illustrated in algorithm 1 and Fig. 2.

Algorithm 1

Input: Plain image (L×L), DNA mask key, column and row scrambling keys

Output: Encrypted image

Step 1: Read Image: Load the plain image into an array \( \text{img}(L \times L) \)

Step 2: DNA Encoding: convert the \( \text{img}(L \times L) \) to its equivalent binary representation array \( \text{img}_{\text{bin}}(L \times L \times 8) \). Subsequently carry out DNA encoding to \( \text{img}_{\text{bin}} \) according to section 2.2, thus an encoded array \( \text{img}_{\text{DNA}}(L \times L \times 4) \) is gained.

Step 4: Masking Operation: \( \text{img}^{'}_{\text{DNA}} \) is obtained by constructing of mask key \( \text{MK}_{\text{DNA}} \) (as explained in algorithm 2) with the same size of matrix \( \text{img}_{\text{DNA}} \). The Exclusive-OR operation between mask key \( \text{MK}_{\text{DNA}} \) and matrix elements \( \text{img}_{\text{DNA}} \) resulted from (step 3). Masking operation is performed by following formula:

\[
\text{img}^{'}_{\text{DNA}}(i, j) = \text{img}_{\text{DNA}}^{'}(i - 1, j) + \text{img}_{\text{DNA}}(i, j) \oplus \text{MK}_{\text{DNA}}^{'}(k, j) \quad \cdots (7)
\]

Step 5: Genetic Recombination: \( \text{img}_{\text{DNA}}^{''} \) is gained by implementing genetic recombination on \( \text{img}^{'}_{\text{DNA}} \) as explained in algorithm 3.

Step 6: Scrambling Operation: Gain \( \text{img}_{\text{DNA}}^{'''} \) by generation of scrambling key 1 and 2 (SK_{1r}, SK_{2c}) as explained in algorithm 4 in order to accomplish row and Column scrambling to \( \text{img}_{\text{DNA}}^{''} \) resulted from step 4.

Step 7. DNA Decoding: Gain encrypted image \( \text{Enc}_{\text{img}} \) by convert \( \text{img}_{\text{DNA}}^{'''} \) the transformed matrix resulted from (step 6) into binary matrix whose size is \( (L \times L \times 8) \) then transform the binary matrix to decimal matrix to obtain the encrypted image.

Note that \( \oplus \) in step 3 denoted the Exclusive-OR operation, \( i = 1, 2, \ldots, N, j, = 1, 2, \ldots, N \times 4, k = N, N - 1, \ldots, 1 \).

Key Generation Process: In this section, the masking key, genetic recombination process, and scrambling keys will be will be generate according to algorithms 2,3 and 4.

Masking Key Generation: The replacement procedure is controlled by the mask key, in which the pixel's values are transformed to other values with no altering their positions in the input image. The main steps of the mask key generation algorithm is illustrated in algorithm 2 Fig. 3A

Algorithm 2

Input: initial condition \((xz, yz)\), facts \((\sigma, \beta)\) in the acceptable intervals.

Output: mask key (MK_{\text{DNA}})

Step 1: Generate initial sequences \( \{x_{z_1}, \ldots, x_{z_L}\} \), \( \{y_{z_1}, \ldots, y_{z_L}\} \) by iterating Lozi map Equations (1,2) for \( L \times L \times 2 \) times with its facts and initial values \( x_{z_0} \) and \( y_{z_0} \). Where \( L \) is the row and column numbers of the DNA encoded image \( \text{img}_{\text{DNA}} \).
Step 2: Construct matrix \( x_{sc} \) of size \( L \times L \times 4 \) by cross couples of \( x_i \) and \( y_i \), outcomes from step 1.

Step 3: Transform real values of \( x_{sc} \) into integer form by using the following formula:

\[
I_i = \text{mod}(\text{Abs}(\text{floor})(\text{matrix } x_{sc}) \times 10^{44}), 8) \quad \ldots(8)
\]

Note that \( i = 1, 2, \ldots, L \times L \times 4 \). According to \( I_i \) the mask key elements is determined.

Genetic Recombination Process: Algorithm 3 illustrated the base steps of the genetic recombination.

Algorithm 3:

Input: \( \text{img}_{DNA}^{'}, \) initial condition (\( x_i \)), facts (\( \mu \)) in the acceptable intervals.

Output: \( \text{img}_{DNA}'' \)

Step 1: Generate initial sequence \( x_l = \{x_l^1, x_l^2, \ldots, x_{L+L\times4}^4\} \) by iterating Logistic map equations (3) for \( L/2 \) times with its facts and initial values \( x_{li0} \). Where \( L \) is the row and column numbers of the DNA encoded image \( \text{img}_{DNA}^{'} \).

Step 2: Perform genetic recombination according to section 2.3 on each two rows depending on \( x_{li} = \{x_l^1, x_l^2, \ldots, x_{L+L\times4}^4\} \) items.

\[
\text{img}''_{DNA} = \begin{cases} 
\text{perform one point cross over depending on row number if } x_l^i \geq 0.5 \\
\text{perform two point cross over depending on row number if } x_l^i < 0.5 
\end{cases}
\]

Where \( i = 1, 2, 3, \ldots, L/2 \). Note that row number will determine the size of the fix point of the parent DNA strands for example row 1 and 2 will have one fix point, while row 3 and 4 will have two fix point and so on.

Permutation Key Generation: Two keys will be constructed the first key is used for row scrambling while the second key is used for column scrambling. Algorithm 4 and fig. 3B illustrated the base steps of the scrambling keys generation.

Algorithm 4:

Input: \( \text{img}_{DNA}'' \), initial condition \( \{x_c, y_c, z_c\} \), facts \( \{a,b,c,d,e,f\} \).

Output: \( \text{img}_{DNA}''' \)

Step 1: Three initial sequences \( x_c = \{x_c^1, x_c^2, \ldots, x_{L+L+L\times4}^4\}, y_c = \{y_c^1, y_c^2, \ldots, y_{L+L\times4}^4\} \) and \( z_c = \{z_c^1, z_c^2, \ldots, z_{L\times4}^4\} \) are generated by iterating Clifford System Equations (4,5,6) for \( L + L \times 4 \) times with its control parameters and initial values \( x_c^0, y_c^0 \) and \( z_c^0 \).

Step 2: Divide the position sequences \( x_c, y_c \) and \( z_c \) into groups \( G_l = \{1, 2, 3, \ldots, 6\} \) and they can be denoted as:

\[
G_1 = \{x_c, y_c, z_c\}, G_2 = \{x_c, x_c, y_c\}, G_3 = \{x_c, x_c, z_c\}, G_4 = \{y_c, z_c, x_c\}, G_5 = \{z_c, x_c, y_c\}, G_6 = \{z_c, y_c, x_c\}
\]

Step 3: Convert the \( L + L \times 4/3 \) items of \( x_c^i \) to integer values by the following equation:

\[
M_i = \text{mod}((\lfloor x_c^i \rfloor - \lfloor \text{floor}(x_c^i) \rfloor) \	imes 10^{14}, 6) \quad \ldots(10)
\]

Where \( i = 1, 2, \ldots, L\times L\times4/3 \), \( M_i \) belongs to \( [1,6] \).

Select the group \( G_i \) according to \( M_i \) value. According to \( M_i \), a temporary matrix \( \text{Temp}_j \) \( (j=1,2,3,4,5,6) \) is determined. For example, \( M_1 \) corresponds to \( G_1 \) in step 2, and \( M_2 \) corresponds to \( G_2 \), and so on.

Step 4: Copy first \( L \) items of \( \text{Temp}_i \) into \( R \) which is used to form key row permutation \( \text{SK}_1 \). and the second \( L \times 4 \) items into \( C \) which is used to form column permutation of \( \text{img}_{DNA}'' \). fig. 3 C shows the permutation process.

Simulation Result: In the next sections, the evaluation of the IE-DC algorithm is conducted in terms of numerical attack, differential examination, key space, and sensitivity. Numerical attack covers: histogram, correlation, and entropy. Differential examination covers: NPCR and UACI [12,13,14,15].

The IE-DC algorithm has been established using C#, and the tests have been conducted under the environment of Windows-10 operating system, laptop computer processor: Intel Pentium Dual CPU T230, 1.60 GHz, and (8 GB) RAM. Four images of size 256 x 256 with gray-scale were used. Fig.4 (A,B) showed the outcomes of the IE_DC algorithm which are explaining system performance.

Suggest Algorithm Analysis: The performance of the IE_DC algorithm is tested in term of three metrics: histogram peaks, correlation coefficient, and the entropy
score. Firstly, the results show that the histogram of the encrypted image is more flat and contains less peaks compared with the plain image histogram. Note that, the flat histogram will make the analysis of ciphered image more complex. Secondly, the correlation coefficient of the pixels pair is calculated and the result shows that there is no relationship between neighboring pixels in the encrypted image as illustrated table (1) and Fig. (4 E,F). Finally, it is clear that the entropy scores for the encrypted image are close to the ideal value 8 which means that there are no duplicate patterns in the encrypted image also the IE_DC algorithm is highly sensitive to a small change in the secret key as shown in table 1.

### Table 1: The Adjacent Pixels Correlation, Entropy, NPCR and UACI values

### Key Space Analysis: Key space size which represents the total number of different keys that can be used in the encryption. For a $10^{-14}$ floating point precision, all keys parameters (3) introductory status, (3) facts to mask key and (3) introductory status, (6) control parameters to transformation key can take $10^{14}$ possible values. Therefore, the key space comes out as $(10^{-14})^{15}$, which is big as much as necessary to defend against the brute force-attack.

### Key Sensitivity Test: The key sensitivity of the IE_DC algorithm is tested based on two experiments:

1. Experiment one uses the same secret key.
2. Experiment two uses a different secret key. The recovered image is meaningless as illustrated in Fig. (5B).

Therefore, it can be concluded that the IE_DC algorithm is sensitive to the initial key, any change of the key will recover a completely different decryption result and cannot recover the plain-image.

### Conclusion

In this paper, a new encryption algorithm is proposed for gray scale image. The IE_DC algorithm consists of two stages: the DNA encoding stage, chaotic stage. The DNA coding stages is used to overcome the limitations of the chaotic map. The Experimental outcome illustrated that in the encrypted image there are very low bordering pixel connection, roughly homogeneous histogram distribution, and can be considered as an approximately random image. In the security analyses, the scheme is responsive to the encryption key, and has enough large key space. Thus, the encryption schema is of high security and can defy against “common attacks”.

Effectiveness of Structured Educational Symptoms Management Program upon Muscle Strength for Patients with Multiple Sclerosis

Hayder Ibrahim Ali¹, Sahar Adham Ali², Hassan Alwan Baiee³

¹MSc, Adult Nursing, Higher Health Institute AL-Najaf Health Director, Iraq; ²Ph.D, Adult Nursing, ³Ph.D, Faculty of Nursing, University of Babylon, Iraq

ABSTRACT

Objectives: To identify the effectiveness of structured educational symptoms management program on the muscle strength for patients with multiple sclerosis. Quantitative quasi-experimental designed was selected to obtain the objective of the current study, the out patients consultation clinic for multiple sclerosis (MS) in the Middle Euphrates Neuroscience Center at AL-Najaf City chose functionally as a proper area to carry out this study, special form prepared to collect the data which contains two parts (demographical characteristics and Muscle Strength Grading Scale (Oxford Scale)) was used to determine the level of muscle strength. Purposive sample from (61) patients with MS were distinguished to participate in the study, they divided to two groups (30) patients as control group and (31) patients assigned as experimental group. The results shows that the highest percentage of participate were female (59%), between age group the (31-40) years, were with primary school (37.7%), (80.3%) were married. The first assessment (pretest) of patients shows deterioration in muscle strength for both experimental and control group, while posttest and second posttest shows an improvements in muscle strength for experimental group after applying of structured symptoms management educational program.

Keywords: Multiple Sclerosis, Educational Symptoms Management Program, Muscle Strength

Introduction

Multiple sclerosis disease most commonly occupy the second neurological reason for disability to adults at productive age, this non cure disease will alter the quality of life for MS patients especially when the symptoms related to this disease interfere with their daily functions and activities progressively then impairing their tasks and jobs.¹ Multiple sclerosis typically diagnosing at early stages of life commonly between 20-50 years of life, the females are commonly affected by this disease in two to three times more than males. The limitation in mobility may appear as a clear symptom in addition to disability, fatigue, spasticity, weakness, and imbalance, with bowel and bladder dysfunction are significant symptoms may be seen in MS patients. Self-management is the effective way to decrease the intensity of these problems.² Studies on life expectancy for MS patients shows increased mortality rates caused by serious injuries after falls. Cardiovascular diseases, infections, and injuries which cause falls.³ The symptoms of MS, such as weakness, sensory loss, and ataxia, which are directly related to demyelination and axonal loss, along with other symptoms such as reactive depression or social isolation, can result in functional limitations, disability and reduced quality of life (QOL).⁴ Patient with MS disease refer to rehabilitation when there is a gradual worsening, impairing or limitation in functioning that interacting with dependency, mobility or/and QOLs of patients, at this point time it is important to discuss the complications with the patients and prepare plans to avoid the progression in potential and actual problems in order

DOI Number: 10.5958/0976-5506.2019.01433.5
to reduce or prevent these problems that will improve QOLs for MS disease and decrease dependency.5

Methodology

Quasi-experimental design was carried out at Middle Euphrates Neuroscience Center in AL-Najaf City to achieve the study objectives, a purposive sample of (61) patients previously diagnosed with MS were selected, divided as (31) patients assigned in the experimental group and (30) patients act as control group, all participant have frequent visit to the center for treatment and consultation, a proper form which consist of two parts, the first part contain demographical data and the second part depend on the Oxford Muscle Strength Grading Scale. The validity was obtained by experts panel and the reliability was determined statistically (0.78) after the pilot study which performed upon (10) MS patients.

A special consent form used to obtain the participant agreement as one of the patients right protections. The data were collected by interview to full the first part and physical examination to determine the level of muscle strength, pretest performed as a baseline data for all participants, then the experimental group members attend the educational program sessions after four weeks posttest were performed, then follow up posttest were performed after eight weeks. The researcher need (20 to 30) minutes to complete the full of the form for each patients.

Results and Discussion

The higher percentage 14 (45.2), 12 (40%) of the experimental and control group were between (31-40) years age group. In relation to gender the high percentage 16 (51.6%), 20 (66.7%) of both groups were female. Both group recorded high percentage 22 (71%), 27 (90%) were married, related to educational level the results shows that the high percentage of the experimental group 10 (32.3%) were secondary school and college level, while the high percentage 14(46.7%) among the control group were with primary school level. 20 (64.3%) of the experimental group were urban area residency, while the control group show equal distribution 15 (50%) between urban and rural as residency area. The patients with MS who participate in the experimental group recorded high percentage 13 (41.6%) were officeholder, while the result of the control group patients show that 7 (23.3%) were house wife. Table (1) shows a significant differences in the results between control and experimental group, the general mean (2.98 ± 0.79) of the control group recorded no significant changes extended to their pretest and the first posttest (3.03 ± 0.77) and even the second posttest (2.92 ± 0.87), while the result of patients in the experimental group recorded general mean and SD (3.09 ± 0.65) in pretest significant changes presents in the level of the muscle strength symptoms after four weeks first Posttest (4.04 ± 0.54), then they shows more improvement in muscle strength symptom level during the second posttest (4.02 ± 0.61) after two months this result shows the effectiveness of educational program. The main objectives of this study is to evaluate the effectiveness of symptoms management educational program to decrease the severity of the spasticity symptom for patients with MS. The finding of current study shows that the highest percentage (59%) of the study sample were female, this finding supported by a study published in (2018) the finding revealed that female are commonly effected with MS than male.6 More than (81%) of cases were female, while less than (19%) were male according to Marck et al, 2016.7 Muscles strength defects are focused in current study because it one of the major symptoms that the patients with MS are complain during disease course, the finding in table (2) presented effectiveness of structured educational symptoms management program in improvement muscles strength level for MS patients who attend the educational program (experimental group), this result in compatibility with Moradi M et al. (2015) who investigate the effect of training program on men with MS involve the regular resistance exercise for 8 weeks, they find the resistance training is effective to improving muscle strength, functional ability.8 Nazari M. et. al. (2016) catch the same result of the study focused on muscle strength which performance on young active girls shows positive effect of resistance training exercise on muscles strength.9

Epidemiology of Congenital Heart Diseases in Tikrit Teaching Hospital

Ashoor R Sarhat¹, Rikan sulaiman², Mejbil Ahmed Abd³
¹Tikrit Nursing College, Iraq; ²Tikrit Medical College, Iraq; ³Salahdeen Health Directorate, Iraq

ABSTRACT

Congenital heart disease is a very significant health problem and the leading cause of death in children with congenital malformations. The aims of this observational cross sectional study is to decrease morbidity and mortality among patients with CHD by early detection of cardiac lesion using clinical evaluation, radiological, ECG, Echo finding. This study involved (204) patients attended to pediatrics cardiac clinic in Tikrit Teaching Hospital (106 females and 98 males). Between 204 cases of CHD studied, ventricular septal defect present in 32% of cases. CHD was higher in females than males, and the most affected age group was 1-5 years. The most common symptom was of congestive heart failure and recurrent chest infection and most common sign was heart murmur. It is concluded that early detection of neonatal CHD remains challenging because clinical findings may be subtle or absent immediately after birth, and prenatal screening does not reliably detect all cases of CHD.

Keywords: Congenital Heart Diseases, Epidemiology, Tikrit Teaching Hospital

Introduction

CHD is one of the major causes behind mortality during infancy ¹, and represent the major human birth defect globally ², it is prevalence 1% of live births ². The etiology of most CHD are unknown. Multifactorial origin of CHD form the main explanation for CHD which build upon interaction of genetic and environmental factors. Chromosomal abnormalities were form a small percentage of CHD, heart disease, for example is found in more than 90% of patients with around 2% are due to known environmental factors. CHD has an increased risk of recurrence of CHD if a first-degree relative affected ³,4. Gender differences seen in certain CHD ³. The group of acyanotic CHD can be divided on the base of the predominant physiologic load that place on the heart. The most frequent CHD are those that cause a volume over load, and the more common of these are left-to-right shunt lesions such as VSD, ASD ⁴. The group of cyanotic CHD divided depending on the pathophysiology: if pulmonary blood flow is lowered (TOF, pulmonary atresia with an intact septum, tricuspid atresia, total anomalous pulmonary venous return with obstruction) or elevated (TGA), single ventricle, truncus arteriosus, total anomalous pulmonary venous return without obstruction)⁵.

Methodology

Patient and Method: written ethical approval, & study execution permission were gained from Committee of Iraqi Board for medical specializations. Parental consent before data collection and assessment of baby was taken. The study has been conducted in Tikrit Teaching Hospital in which all cases with CHD were included during the study period. This is an observational cross-sectional study which was conducted during the period extending for 6 months. A Convenient sampling technique which has been used to collect samples from those patients with CHD attending pediatrics clinic with regular working hours within 2 days per week. During the study period the total (204) cases. The questionnaire was developed to collect all data relevant to the objectives of study. The questionnaire include information about sex, age, address, sign & symptom of CHD, growth & developmental parameters, and socioeconomic status. The study includes interviewer administration of questionnaire, anthropometric measurements. All cases of CHD were
diagnosed by echocardiography. The following age groups were considered: newborns, infant, preschool children, schoolchildren. The following conditions were excluded: cardiac arrhythmias, PDA in premature newborns and newborns, bicuspid aortic valve, MVP, mirror-image dextrocardia, patent foramen ovale and right sided aortic arch. Examination: each child was assessed for: general and specific cardiac examination. Any child showing an abnormal heart condition was checked by electrocardiogram, and chest X-ray, and complete echocardiography examinations. Echocardiography examination was conducted Exploratory data analysis was performed using descriptive measures. Data put in tables and figures, statistical analyses was done by Chi-square using p-value. P-value less than 0.05 considered significant.

**Results and Discussion**

The total No. of cases were 204 case, female was 106 case, male 98 cases, most common defect was VSD, male: female ratio 1:1.08. Most of cases were VSD 72 case (35.2%) and most common was large VSD, followed by TOF, 29 case (14.2%), least CHD, TAPVR and AP window as in table (1,2). Total cases of VSD was (72). The frequency of types of VSD were as follows; small VSD (24 cases), moderate VSD (22 cases), and large VSD (29% cases). The age distribution of CHD was as follows; neonate (11%), infants (18), (1-5 years) (44%), and children > 5 years (27%). The sex distribution of CHD was as follows; CHD in female was (106 case), in males (98 case), with male to female ratio =1:1.08 (table 3) Family history in CHD female was (106 case), in males (98 case), with male to female ratio =1.08 (table 3) Family history in CHD was seen in TOF. This is consistent with that reported in Jordan (15). In this study most cases were underweight, like other studies done by Krieger I, Forchielli ML, and Pittman JG, which also demonstrate same results 19-21. The cause of growth retardation in CHD is multifactorial 15,19. Inadequate caloric intake, malabsorption, and increased energy requirements caused by increased metabolism may all contribute. However, inadequate caloric intake appears to be the most important cause of growth failure in CHD 15. When heart failure is mild the infant commonly overfeeds, and fluid and sodium overload disturb cardiac haemodynamics, leading to decompensation of heart failure and decreased intake. As a result, the individual’s overall nutrient intake is inadequate. 22 In this research family history was present in 38% similar to that reported in Saudi Arabia (14), but not consistent with that reported in Iceland the high ratio in this study may due to cultural habits of relative marriage 18. Developmental mile stone was normal in
This is consistent with that reported in Jordan, but it is higher than found in the USA. This variation in the result may be related to high level of medical care in the developed country. A USA study showed that there was an increase in incidence of CHD in low economic status population may be related to high level of medical care and high incidence of infectious diseases among this social class. This study revealed Tikrit city have more cases of CHD (19.6%) and the least cases were from Al-dijieal. The probable reason of this difference is that in our study most of the children were referrals cases. In this study most common symptom was of heart failure and recurrent chest infection and most common sign was heart murmur, other studies in Tikrit-Iraq, USA and India obtained the same results. However, in general signs and symptoms of patient presenting with CHD in children are tachypnoea, tachycardia, edema, wheeze, growth failure, pallor, feeding difficulty, sweating, irritability pulmonary crackles, hepatomegally, repeated chest infections and failure to thrive.

Evaluation of Nurse Role in Management of Patients with Heart Attack

Younus Khudhur Baeez¹, Qasim Hussein Mohammed¹, Abid Salih Kumait¹, Yousif Mohammed Younis², Dara Abdulla Qadir²

¹Department of Adult Nursing, College of Nursing, Kirkuk University, Kirkuk, Iraq; ²Department of Adult Nursing, College of Nursing, Hawler Medical University, Erbil, Iraq

ABSTRACT

The study aims to evaluate the effectiveness of a nursing education program on the nurses practice toward cardiac rehabilitation in patients with heart attack. A quasi-study design study was carried out at Azidi Teaching Hospital. A total of (50) samples were allocated into either the study (experimental) group (taking the program, n = 25) or the control group (not taking the program, n= 25). The extent of samples knowledge about the assessment of the heart, assessment chest pain, evaluated Cardiogenic shock, evaluated activity daily living and health education for both study and control group were measured before applying the education program was measured. The structured teaching program for imparting knowledge about cardiac rehabilitation after diagnosis of the disease was developed based on a literature review and expert opinion. Post-test assessment performed for both the study and control group after applying for an education program. The data were analysed through the application of descriptive and inferential statistical analysis. The results of the study were elicited based on two statistical approaches, first, descriptive statistics and the second is an inferential statistical analysis.

Keyword: Heart attack; nursing; education program; cardiac rehabilitation.

Introduction

Heart attack also is known as myocardial infarction (MI), happens at the blood flow reduce or stops to heart muscle which leads to permanent damage to these muscles.¹ The most familiar manifestation is chest pain which may move to the shoulder, left arm, back, neck, or jaw, the pain may be felt like heartburn.² Further manifestation often includes shortness of breath, nausea, feeling faint, fatigue, and sweating.³ Chest pain often not present in female patients, but instead of it there may have neck pain, arm pain, or feel tired. Among those over 75 years old, about 5% have had a heart attack with a light or no manifestation.⁴ A heart attack may cause heart failure, an irregular heartbeat, cardiogenic shock, or cardiac arrest. Most heart attack cases occur due to coronary heart disease. Most risk factors of the disease include increased blood pressure, smoking cigarette, diabetic history, shortage of exercise, increase weight, increase cholesterol, and excessive alcohol intake.⁵ A number of tests are useful to help with diagnosis, including ECG, blood tests, and coronary angiography. An ECG, which is a recording of the heart’s electrical activity, may confirm an ST elevation MI (STEMI) if ST elevation is present. Commonly used blood tests include troponin.⁶ Cardiac rehab is a medically supervised program designed to improve cardiovascular health. If you have experienced a heart attack, heart failure, angioplasty or heart surgery. The role of cardiac rehabilitation has been the spotlight of attention by the massive literature. Effective rehabilitation is multifactorial management requiring including nurse with health professionals.⁷ The chief goal of cardiac management is to prompt patients to participate in their therapeutic treatment regimen to such an extent that they can achieve living almost a normal life. Cardiac management programs comprising prescriptive exercise, health education, and counselling, yield compelling improvements in cardiac morbidity and mortality of

Corresponding Author:

College of Nursing, University of Kirkuk, Iraq
participants. Furthermore, detection, diagnosis and monitoring of psychological distress should be part of cardiac management since after admission patients frequently experience clinically significant levels of anxiety or depression that may persist for long thus affecting the outcome of the cardiac disease. Usually, health professionals fail to recognize psychological distress in patients with coronary artery disease because they perceive it as a normal reaction to the stressful event of acute myocardial infarction. As a result, symptoms are misdiagnosed as physical problems while the underlying cause remains. Education is the process of acquiring knowledge and skills that can lead to changes in human behaviour, necessary for the maintenance or improvement of health. More in detail, to achieve optimal benefit for patients, education should involve definition of goals, assessment of patients’ needs, modification of patient’s behavior towards more self-control, active participation in decision making, development of self-care to handle the disease and possible complications, assessment of personal risk factors, implementation of realistic goals, support to adopt a positive attitude towards the disease and alleviate psychological distress. The learning process (ways of learning, duration of sessions) differs among individuals and depends mainly on the apprehension of participants and their personal goals. Cardiac rehabilitation programs are intended to enhance the effect of acute treatment actions and to prevent risk factors, thus leading to an improvement in the patient’s well being and recovery. Accordingly, all cardiac rehabilitation activities do not take place at the same time, which is the reason why the nurse’s role changes in character over time.

### Methodology

A quasi-experimental design was applied to achieve the goal of the study. Non-probability, purposive sample, with the use of pre-post test approach for both study and control group. A sample of (50) patient chosen among patients who attended to the Azadi Teaching Hospital in Kirkuk city. The samples were divided into two groups; (25) patient as a study group was exposed to the education program and the other (25) patients are not exposed to the education program, considered as the control group with the same demographic characteristic for both groups. An educational program designed for imparting knowledge to the nurses related to health assessment of the heart; assessment of chest pain; evaluating cardiogenic shock; evaluating daily activity living of the patient. Observation checklist was used as the study instrument for nurses’ practice and was developed by the researchers for the purposive of the study, the instrument content two parts: self-administration sheet related to demographic nurses and observation checklist for nurses practice regarding cardiac rehabilitation program phase one. The observation checklist consists of (50) item divided in to five parts: part one deals the health assessment of the heart, composed of (10) items, part two deals the assessment chest, compromised of (14) items, part three is about evaluation of cardiogenic shock, content (10) items. The last part is about daily activity evaluation which consists of (16) items. After ensuring informed consent from the patients, they were given the pre-test questionnaire before the administration of the educational program. Each sample was given a serial number to be followed in the second assessment (post-test). These items were rated according to the Liker scale always (3), sometimes (2), never (1). The levels of scale which were scored as a total of three episodes of events were observed for each respondent; practices as the mean of data collection (3) or (2) correct practices out of three episodes were rated as always. (1) Correct practices out of (3) episodes were rated as sometimes and uncorrected practices were rated as never. The result of the present study was analysis through application of statistical approaches. The descriptive statistical approach that includes (Frequencies, Percent, Standard Deviation) and inferential statistical approach (t-test).

### Results and Discussion

Analysis of nurse’s demographic characteristics ensures equivalence in both groups and there are no significant differences between study and control group. The study revealed that the majority of the study sample with age ranged from 20-59 years with the mean age of the nurses was (28.65 ± 5.70) years for the study group and (31.42 ± 7.23) years for the control group. Relative to their level of educational, most of the samples in the study group (56%) were graduated from nursing college, and also in the control group (60%) were graduated from nursing college. Joanne and Timothy, (2013) reported that majority of the study sample (66.7%) of the nurses had a Bachelor of Science in Nursing degree and (33.3%) had an Associate of Science or Associate of Arts Degree in Nursing. (88.9%) of the nurses claimed that they had experience teaching cardiac patients. The researcher confirmed that the majority of the nurses in CCU who graduate from
university and institute showed poor theoretical knowledge and demonstrated willingness and motivation for courses in basic life. (14) This study showed that there are highly significant differences between pre - post-tests of the study group in (table 2). The researcher confirms that to increase the understanding, competence and confidence of nurses by developing their skills in a way that will enable them to engage effectively with patients in responding to their needs. (15) Catherine G, et al., (2017) mentioned that patient education program for cardiac patients is an essential part of the quality of nursing staff working in cardiac unit only if the nurses acquire practice regarding cardiac rehabilitation they can improve the practice of patient with heart attack. (16) reported that effective patient education will be provided when nurses have enhanced their patient teaching skills a lack of teaching skills and a lack of utilizing teaching skills will impact on nurses abilities to provide effective patient education. The researcher confirms that the negative correlation between nurses‘ practice in pre and post-test in relation to their educational level.(17)

### Conclusions

The study concluded that there is an increase in nurse knowledge and also increase in nurse practice for that nurse who takes the educational program about the role of the nurse in the management of heart attack.

ABSTRACT

Objectives: To estimate the prevalence of hypertension and myocardial infarction among patient attending Open Cardiac Center at Al - Najaf city and investigated them in relation with blood groups. A study was conducted on 100 patients (55 males and 45 females) from which (9 male and 18 female) with hypertension and (25 male and 12 female) with MI who were admitted to Al- Sadar Hospital to perform surgical operations in the period from March 2018 to December 2019, and a total of 19 healthy persons were considered as a control group. Their ages ranged from (18–70) old years. The results show the male patients (55) %, significantly increase (p≤0.05) as compared with the females (45) %, and are observed in younger ages (18-40) old year the females (22) % were recorded significantly elevate (p≤0.05) in comparison with the male (14) % at the same ages. The results demonstrate that there was no significant different among all blood groups, but, the blood group O+ of control sample (healthy persons) is recorded high rate ((51.2) % as compared with other blood groups of control samples and with patients of (hypertension and myocardial) groups.

Keywords: Hypertension, myocardial infarction, Blood Groups.

Introduction

High blood pressure (Hypertension) is the main health problem, that is because it does not cause symptoms. In addition, several people have hypertension without knowing it. Evidence has proven that modifiable factors like overweight, obesity, that is measured by body mass index, visceral adiposity measured by waist circumference, as well as increasing age, are related to the high incidence of hypertension ¹². Previous studies have been found there are a relationship between the ABO blood group and certain health problems. However, a few of these studies have been done to find out the association of hypertension with individual’s blood groups ³. Cardiovascular diseases (CVDs) have been found to be the main cause of premature mortality and long term disability, globally ⁴. In addition, acute myocardial infarction (AMI), as a subtype of CAD, is considered the most common cause of death. Myocardial infarction (MI) is the irreversible death (necrosis) of the heart muscle, which is a result of prolonged ischemia or knows as lack of oxygen supply. frequently when the coronary arteries, which supply blood to the heart become totally obstructed. This obstruction is usually caused by the build-up of plaque in the artery walls or a thrombus in the coronary artery which is developing over the years ⁵. In the United States, around, 1–1.5 million people have found suffer from MI of which about 33% die of the disease yearly ⁶. In 2015, it was estimated that approximately 7.92 million cases of AMI have recorded, according to a review study in 2016, Iran. in-hospital case fatality rate of MI was 12.1% that ST-segment elevation myocardial infarction and age over 84 years were such contributing factors ⁷. According to above the prevalence of AMI in Iran is high and has increased in recent years ⁸. The ABO blood group that is one of the best known genetic traits because of its importance in transfusion medicine, it was discovered by Karl Landsteiner in 1900 ⁹. In addition, there is a lot of evidence supporting the notion that ABO antigens are involved in the pathogenesis of various systemic
multifactorial traits, including infectious, neurological, cardiovascular disorders as well as cancers. The aim of this study estimate of prevalence of hypertension and myocardial infarction among patient attending Open Cardiac Center, Al - Najaf city and investigated them in relation with blood groups.

**Subjects and Method**

This study conducts on 100 patients (55 males and 45 females) from which (9 males and 18 female) with hypertension and (25 males and 12 female) with MI who were admitted to Al- Sadar Hospital/Cardiac center/Najaf/Iraq to perform surgical operation in the period from March 2018 to December 2019, and a total of 50 healthy persons were considered as control group with no history of heart disease or diabetes mellitus. Their ages ranged from (18–70) years, others data were collected include the important symptom which they suffer from it and the type of operation. The diagnosis was made by the consultant medical staff at the hospital. It was based on a clinical examination and other confirmatory investigations. Regarding the hypertensive group, a subject whose blood pressure was more than 140/90 mm Hg were included in the study group. Blood pressure measurements were done by physicians with all patients and the determination of ABO using anti-sera.

**Statistical Analysis:** Social Package for Statistical Analysis (SPSS) version 19 was used, the chi-square test was performed to test the significant difference between all findings in this study. The probability (P) equals or less than 0.05 was considered significant.

**Results and Discussion**

A total of (100) patients in this study who prepare to perform one form of these operations are illustrated in (figure 1). The male patients (55) %, significantly increase (p≤0.05) as compared with the females (45) %, but, in younger ages (18-40) old year the females (22) % were recorded significantly elevate (p≤0.05) in comparison with the male (14) % at the same ages as shown in (table 1). In an investigated the hypertension and myocardial among patients, the results show there was a significant decrease (p≤0.05) of these parameters (27) % of hypertension and (37) % of myocardial as compared with non hypertension and myocardial of both male and female patients, table (2). The results show the non hypertension patients significantly increase (p≤0.05) as compared with hypertension patients in all age groups, on the other hand, the results observe the hypertension patients significantly higher (p≤0.05) in younger ages (18-40) old year than elderly ages (41-70) are observed in figure (2). In contrast, the result demonstrates there was a significant increase (p≤0.05) of non myocardial patients in comparison with myocardial patients, also the patients with myocardial have significantly higher in elderly ages (41-70) old year than younger ages (18-40) old year as shown in (figure 3). The results observe that the infection with heart disease greater among Rh+ than Rh-, also, Rh+ groups are predominate in healthy persons. So, there was no significant different between patients and healthy control, (table 3). The statistical analyses in present finding reveal that the heart disease, no association with blood groups, no significant different between patients with (hypertension, non hypertension, myocardial and non myocardial) and blood groups as shown in table (4) and (5). In addition, this result observe the blood group A+ and O+ are a predominant groups comparing with other blood groups of heart patients. The results in table (6) demonstrate that there was no significant different among all blood groups, but, the blood group O+ of control sample (healthy persons) is recorded high rate ((51.2) % as compared with other blood groups of control samples and with patients of (hypertension and myocardial) groups, otherwise, present study, observe that the blood group A+ was recorded higher rate in patients were (38.4) % and (44.1) % of (hypertension and myocardial) respectively followed by group O+, B+ and AB+ and the blood group A+ was equal to blood group O+ in patient with hypertension. In the current study the most common symptom in patient with heart diseases was chest pain, fatigue ability and fitting attach. The rate of a woman patient in younger age (22) % higher than the rate of men (14) %, this disagreement with Gupta and Gupta (2017) who revealed that in males coronary artery disease (CAD) develops around ten years before a woman. The results in the present study, observe the hypertension factor significantly elevation in ages (18-40) old year patients in comparison with elderly patients (41-70) old years, but, in comparison with non hypertension patients the present results show that the hypertension significantly decline, So, there may be other factors that have led to increased heart disease except hypertension and have not been reported in the current study. Aggarwal, et al (2014), concludes that in
young with smoking (age ≤ 45 years), the existence of high blood pressure (hypertension), overweight, diabetes and metabolic syndrome can determine as a subset at increased risk for future (ACAD) acute Coronary artery disease. Other investigations were revealed risk factor of ischemic heart disease are distributed in the old person age (male and female), stress of mind (male and female), diabetes mellitus, high blood pressure, Smoking, and absence of regular exercise.8,11 The current finding shows the myocardial infarction significantly increased in patients at ages (41-70) old year as compared with age (18-40), while, there was significantly elevated at age (18-40) old year in non myocardial patients compared with elderly patients (41-70), in agreement with Gupta and Gupta (2017), who has mentioned that the extreme number of patients located in the late forties. Furthermore, this study observes the men are recorded rate of infection (25%) with myocardial more than a women (12%) %. This agreement with Mohseni et al. (2017) who show the prevalence of AMI is higher in men. Hormones in females play significant role in the delay of (IHD) ischemic heart disease. Current investigation demonstrates there was no significant difference of blood groups in hypertension and myocardial patients in comparison with non hypertension and non myocardial patients, and there was no significant difference among blood groups in hypertension and myocardial patients, so no correlation among patients and blood groups.

Generals the heart diseases were recorded regardless the sex or age or blood groups. Smoking, body mass index (overweight), physical stillness and custom of junk food can lead to earlier of coronary artery diseases and myocardial infarction (MI). Otherwise, in this study, the dominant blood group was A+ and O+ among the patients followed by the blood group B+ and AB+, this finding is in accordance with Chowdhary et al. (2016) who reported that ischemic heart patient highest with blood group A+, but did not agree with Chowdhary et al. (2016), when found a significant difference between blood groups and ischemic patients, in addition, they were found the blood group O+ was the low rate among patients. Present study found the blood group O+ was the highest among controls, in accordance with Al-Katib et al (2015) who observe that blood group O predominates in controls in study conducted in Al - Najaf city, but this study disagreement with Al-Katib et al (2015) who reveal that blood group O predominates in patients with coronary artery disease followed by A, B, and AB, also disagree with Jassim (2012) and Dibby (2015), who show that blood group O is more predominant among high blood pressure patients and Chandra and Gupta (2012) and Sadiq (2017), who conclude the B blood group was more susceptible to high blood pressure and overweight (obesity). Distributions of blood groups have some variations whilst occur in one small country in various areas.

Conclusion

The present finding reveals that the heart disease, no association with blood groups, no significant different between patients with (hypertension, non hypertension, myocardial and non myocardial) and blood groups. In addition, this results observes the blood group A+ and O+ are a predominant groups comparing with other blood groups of heart patients. Otherwise, the blood group O+ is predominant in control sample (healthy persons).

Prevalence of Serratia Species Isolated from Children with Diarrhea and Studying their Virulence Factors

Gulbahar F. Karim
College of Nursing, Basic Science Dept. University of Kirkuk, Iraq

ABSTRACT
The aim of the current study is to find out the prevalence of Serratia species in stool samples of diarrheal cases in children less than five years old in Kirkuk City. In addition to study the virulence factors produced by the isolates under investigation. Patients and methods: Four hundred and seventy six stool samples were collected from children under five years with diarrhea during 1st of June 2016 to end of August 2018. The collected samples were cultured directly on different types of media for primary isolation of the Enterobacteriaceae then the suspicious colonies were selected for definitive microscopic examination, culture characteristics, biochemical testing and API 20E System for identifying Serratia species. Later the virulence factors for Serratia isolates were investigated. The results showed 10 (2.1%) isolates of Serratia species were recovered, which were distributed as follow; 4 (0.8%) belonged to S. marcescens, in which only 1(0.2%) isolate was pigmented S. marcescens, 4 (0.8%) were S. liquifaciens and 2 (0.4%) belonged to S. rubidea. The results showed that the distribution of the virulence factors were differ among the tested isolates. All the ten isolates (100%) were siderophores producers. Moreover, all S. marcescens isolates were able to produce, gelatinase, DNase, licithinase.

Keywords: Serratia species, S. marcescens, virulence factors, diarrhea, prevalence

Introduction
Numerous pathogens can cause diarrhea, but the causative agents of many cases are unknown. Therefore, identification of pathogenic species within intestinal microbes is important. The genus Serratia is a member of the Family Enterobacteriaceae that is consists of 14 species and two recognized subspecies. It is a gram-negative bacterium that cause disease in a wide range of hosts including plants, insects, and vertebrates. Serratia marcescens is the most frequently isolated Serratia species from human infections. It was considered previously to be non pathogenic, but it know becoming an important cause of hospital acquired infections that can be life threading. Furthermore, the non pigmented strains are clinically more prevalent. It has been improved to be associated with urinary tract infection, blood infection, surgical wounds, cerebrospinal fluid infection, respiratory tract infections. Fecal specimen of patients with diarrhea. However, they are more frequently cause outbreaks in neonates intensive care units, as well as it affects weak and immunocompromised patients. The infection has been acquired via ingestion of contaminated foods, and contaminated hospital environments. The pathogenicity of this species attributed to intrinsic resistance that considered virulence factors which including hemolysin, various enzymes as urease enzyme, siderophore and extracellular protease like gelatinase, lipopolysaccharide, chitinase, lipase, DNase, chloroperoxidase. In addition to its ability to acquire resistant to multiple antibiotic agents. Moreover, the cytotoxicity of clinical strains in vitro were investigated by other investigators, who suggested that S. marcescens induces changes in the intestinal epithelial cells in culture as inflammation, cytotoxicity, adherence, and invasion. Whereas, Carbonell, et al. improved the cytotoxic activity of most their pigmented isolates of S. marcescens on various tissue culture, and virulent for mice with LD50 = 10^7 bacteria ml^-1. Accordingly, the aims of the current study were to find out the prevalence
of Serratia species in stool samples of diarrheal cases in children less than five years in Kirkuk City. In addition to study some of the virulence factors produced by the isolates in order to better understanding the characteristics of Serratia species that aid in preventing its dissemination in the hospital environments.

Methodology

Sample Collection: The study was carried out on out and inpatients (children less than five years) suffering from diarrhea attending Pediatric hospital in Kirkuk City, from 1st of June 2016 to the end of August 2018. There were 476 stool samples collected in disposable, clean screw-capped containers. The samples were processed immediately. The Carry Blair transport media used if samples delayed for 1-2 hours after their collection then immediately. The Carry Blair transport media used if samples delayed for 1-2 hours after their collection then cultured. All samples were cultured directly on MacConkey agar, nutrient agar and blood agar to detect beta hemolytic isolate (6). All isolates incubated aerobically at 35 °C for 24 hours, and suspicious colonies were selected for microscopic examination, culture characteristics, biochemical testing, and API 20E System (BioMérieux/ France) for identifying Serratia species.

Bacterial Isolation and Identification: Collected samples were cultured directly on MacConkey agar, nutrient agar and blood agar to detect beta hemolytic isolate (6). All isolates incubated aerobically at 35 °C for 24 hours, and suspicious colonies were selected for microscopic examination, culture characteristics, biochemical testing, and API 20E System (BioMérieux/ France) for identifying Serratia species.

Detection of Some Virulence Factors: The Hemolysin production, Gelatin liquefaction, Extracellular protease, DNase production, Lecithinase production, Urease activity, Binding to Congo red by the tested isolates determined according to 18. The method of Sambrook was adopted for production of Siderophores, and Lipase test according to Branson. All S. marcescens were submitted to pigment production test as described in 16.

Results and Discussion

Isolation and Identification: The results of identification showed that out of 476 stool samples from children with diarrhea, 10 (2.1%) isolates belong to the genus Serratia were recovered during two years. Table (1); demonstrates the distribution of species into 4 (0.8%) S. marcescens, from which 1(0.2%) was pigmented S. marcescens (Figure-1), while the other 3(0.6%) isolates were non pigmented S. marcescens, 4 (0.8%) S. Liquifacience, and 2 (0.4%) belonged to S. rubidea. However one isolate of S. rubidea found to be in association with K. oxytoca and three isolates of S. Liquifacience were isolated with E. coli and Proteus mirabilis. The identification and characterization of the isolated Serratia species were based on morphological, cultural characteristics, and biochemical tests as well as the results of API 20E System. The finding of current study demonstrate the low distribution of Serratia species including S. marcescens in stool samples of children with diarrhea, This result was found to be lower than that reported by 21, who isolated (2.26%) of S. marcescens out of 398 hospital environmental samples in Baghdad. It had been found that these bacteria may be detected more frequently in the stool of patients with diarrhea than in asymptomatic control children 16. Other researchers found that only (3.4%) of 938 clinical isolates of S. marcescens were pigmented, which improved the higher frequency of non pigmented strains among clinical isolates of S. marcescens. 6. These finding were matched with the results of current study. Table 2 illustrates the frequency of Serratia infections among males were higher than that of females, the ratio of male/female is 1.5:1, as well as the infection is more frequent among age group (2-12) months rather than other age groups. Adamson, et.al. 10 reported prolonged outbreak of S. marcescens in a neonatal intensive care unit, including cases of necrotizing enterocolitis in children 22. S. marcescens can cause rapid spreading outbreaks of severe and fatal infections in neonatal units 23. The increased incidence in this age is most likely the result of greater exposure to enteropathogenic bacteria as well as the presence of susceptible host 24, and the immaturity of the immune system of the infant 25. The results also showed that Serratia infections were more frequent among inpatients 8(1.68%) rather than outpatients. Infection of Serratia acquired through contaminated hospitals’ equipments, the hands of medical staff, as well as contaminated food 12. Other investigators reported that S. marcescens is an opportunistic human pathogen and is responsible for increasing nosocomial infections in hospitalized patients which can be life threatening 26. It survive in hospital environment 22, and resistant to most antibiotics, in addition to producing potent virulence factors 27.

Virulence Factors of Serratia Species: The identification and characterization of bacterial virulence factors is important for effective treatment of bacterial infections, and prevent their dissemination. Hens, some of virulence factors of selected isolates were characterized as shown in (Table.3) and (Figur.1).

Figure 1: A-pigmented and non-pigmented Serratia spp. on nutrient agar media.

B- pigmented Serratia marcescens on Mac Conkey agar media.

C-The opacity around the streaking culture represent lecithinase producer Serratia marcescens on Egg Yolk agar media.

D-The opacity around the streaking culture represent protease producer Serratia marcescens on Skim milk agar media.

E-Clear zone on DNA agar with methyl green around the colony represent DNase producer Serratia marcescens on DNase agar media.

F-The opacity around the streaking culture represent lipase producer Serratia marcescens on Sierra media.

G- pigmented Serratia marcescens on nutrient agar.

H-The clear zone around the colony represent beta-hemolysis on blood agar.

Siderophore and Hemolysin: The results revealed that all 10 (100%) of the isolates were able to produce siderophore (in presence of dipyridil). While only three isolates of Serratia species were able to produce hemolysin on blood agar, including three isolates of S. marcescens. However other investigators in Baghdad reported that all nine isolates of S. marcescens from
different clinical sources were hemolytic\textsuperscript{7}. Hemolysin production is associated with necrotoxicity and cytotoxicity of cell and can destroy the erythrocyte to extract iron from them\textsuperscript{28}. The supply of free iron in the host milieu may be extremely low; many bacteria attempt to secure their supply of iron in the host by secreting high-affinity iron chelators called siderophores\textsuperscript{29}.

**Lecithinase Production:** The results in Table.3 also showed that all 4 \textit{S. marcescens} isolates were lecithinase producers, while other two species were negative for this enzyme. Lecithinase destroys red blood cells and other tissue cells. It is active in phosphatidylserine PS and phosphatidylcholine PC degradation. It hydrolyzes lecithin which is a lipid component of eukaryotic membrane thereby this enzyme destroys the integrity of the cytoplasmic membranes of many cells. The two enzymes (lecithinase and Hemolysin) have a synergistic effect on the ability of the organism to invade host tissues\textsuperscript{30}.

**Extracellular protease, lipase, DNase production, and urease:** Table.3 demonstrates that all the tested isolates of \textit{S. marcescens} were able to produce extracellular protease. This finding is higher than other researchers\textsuperscript{8} who observed that 4.4\% out of 45 bacterial isolates from diarrheal cases of children under 5 years were \textit{S. marcescens} which were protease producers. It considers one of the factors that enhance inflammatory intestinal disease. More than half or two third of the isolates showed ability to produce gelatinase, lipase and DNase including all \textit{S. marcescens}. However only on isolates of \textit{S. marcescens} was produce urease. These finding relatively in agreement with\textsuperscript{21} who reported that all the nine isolates of \textit{S. marcescens} that isolated from Baghdad hospital environment were produce DNase, Protease, Esterase, and Lipase, as well as most of them were able to produce \textbeta- lactamase and adhere to epithelial cells.

**Invasiveness (binding to Congo red):** Regarding invasiveness, the results in Table.3 illustrates that from 10 Serratia species two of \textit{S. marcescens} and \textit{S. liquifaciens} gave positive red colony. This finding is lower than that reported by El-Baghdady, \textit{et. al}.\textsuperscript{31} who reported that all Serratia spp isolated from different clinical samples exhibited both high invasion capability and epithelial cell cytotoxicity. Also Jacobsen \textit{et. al}.\textsuperscript{32} reported invasion, cytotoxicity and biofilm formation of \textit{Serratia} spp. And \textit{Escherichia coli}. Congo red dye agar test was used by researchers as phenotypic marker to differentiated invasive and non- invasive \textit{E. coli} and Shigella species\textsuperscript{21}. It have been observed from above results that the four isolates of \textit{S. marcescens} were posses most of the virulence factors under investigation. This might be attributed to its pathogenicity and potency for causing various nosocomial infections. This finding was in agreement with other investigators who were improved that \textit{S. marcescens} is a potential enteric pathogen, and suggested that this organism interact with intestinal epithelial cells in culture and induces dramatic changes similar to those produced by well known enteric pathogens\textsuperscript{30}.

**Conclusion**

It have been concluded that the \textit{S. marcescens} isolates were the most virulent species in the genus Serratia and causing nosocomial infections, affecting immunocompromised patients especially in children under five years. The identification and characterization of the virulence factors produced by Serratia species especially \textit{S. marcescens} is crucial for effective treatment of infected patients. In addition to develop more effective novel antibiotics, It is recommended to prevent the spread of this organism into the hospital environment and all necessary precautions must be taken, as well as rapid and proper treatment of infected patients.

Some Functions of the Lungs and Emotional Arousal and their Relationship to Achieve the Effectiveness of Running 1500 m for Young Players

Ali Bukheet Hassan¹, Mahmoud Nasser Radi¹

¹Physical Education and Sports Sciences, University of Kufa, Iraq

ABSTRACT

This study dealt with several topics including the introduction of the research and the importance which lies in the knowledge of the relationship between some functions of the lungs and emotional excitement and the completion of 1500 m for young players, and through the experience of researchers and follow-up to most local tournaments noted that the functional competence of the lungs have a large role and very important in achieving the high achievement of the race (1500 m). In addition to the fact that emotional arousal aims to enhance the confidence of the player himself and increase the sense of security and psychological stability, especially before the competition and therefore the researchers sought to enter into this experiment by studying the relationship between some functions of the lungs excitement and its relationship to achievement 1500 m for young players. Researchers used the descriptive approach to solving the problem of research. The results of the statistical analysis of the data and their discussion revealed that there is a significant negative correlation between the achievement in the 1500 m race and the function variables of the lungs, vital capacity VC, forced exhalation of the first second (FEV1), peak exhalation force.

Keywords: Effectiveness, Lungs, Emotional arousal

Introduction

Taking the flag progress from year to year and this progress was clear and continuous in most areas of life and reflected positively on the most important manifestations, and here we find that developed countries spare no effort to scientific research in order to get everything that is new so they took rapid progress in the most important aspect of these aspects is the sports aspect, which is considered a fundamental pillar and an important aspect of these countries ¹, which led to the monitoring of large amounts of training and numbers of athletes who are in return for large financial returns to their clubs and their countries. This led to the use of various science and training programs, Data or modern equipment, which led to the high level of various games, whether individual or collective, Athletics is an activity that is influenced by all the elements of fitness and the development of functional devices. Athletics is one of the most popular events. Among these games, the 1500m is one of the most exciting events for athletes. Olympia and the world and a special character with the speed of the runner and run long distances ², and since the competition ran 1500 is a combination of aerobic and anaerobic capacity, the views of many experts in training in determining the rate of development of this event. The process of specialization in athletics activities is to improve the physiological aspects through the development of the work of the circulatory and respiratory systems. The respiratory system is one of the most important functional devices that helps athletes to cope with the high efficiency through the functional efficiency of this device which is responsible for saturation The body cells in sufficient quantities of oxygen inhaled and then supplied ³ to the muscles working after oxidation and disposal of carbon dioxide and therefore the process of breathing and the use of oxygen is of the utmost importance and a significant and clear in the employment efficiency of other functional devices, which Leading to adaptation and economy in

the process of energy discharge during performance. That the exercise of the effectiveness of 1500 m, whether in training or competition, the player to many of these circumstances and situations and psychological situations are different and often accompanied by excitement and excitement, especially during the competition so the preparation and psychological preparation has become a necessary and urgent for the player so as to be able to control his emotions and control his actions, which helps to increase and improve the efficiency of performance. Hence the importance of research in identifying the relationship between responses to functional and emotional variables and the achievement of the effectiveness of 1500 m for young players.

### Methodology

The curriculum is one of the important factors followed by the researcher to solve the problem and is tested according to the nature of the problem to be studied since the nature of the problem requires researchers to use the approach to describe the method of relationship relations “to see the correlation of two or more variables.

### Community and Research Sample:

The research community was determined by the players of the 1500 m youth of the Middle Euphrates clubs (Al-Khornaq, Midwest, Al-Buzar, Babel, Qassim, Rafidain and Shamiya). (16) runner, and then the sample was selected by the amount of (10) runners to experience the simple random way (lot), and Table (1) shows that.

### Tools and Equipment used in Research:

- Spirometer for measuring (vital capacity and exhalation of the first second and the inspiration reserve).
- Knapsacks.
- Gymnasium.
- Measuring tape (40 meters).
- Sport stopwatch number (2).
- Whistle number (2).
- Office tools (papers and pens).
- Camera type (Canon) number (1).
- Laptop type calculator (Lenovo) number (1).

### Determination of measurements of lung variables:

#### Measurement of Vital Capacity:

The measurement is carried out by the Spirometer device. The laboratory holds the tube connected to the device from the stand position and then takes the maximum possible inhalation and maximal exhalation in the tube. The measurement is done according to the aforementioned device by drawing the graph on the sheet, The end of the device indicator from the curve diagram is the top of the dynamic volume taking into account the position of the payment on the nose.

#### Measurement of exhalation for the first second:

The measurement is carried out by the spirometer. The laboratory takes the maximum possible inhalation and then quickly generates the inside of the tube and is measured by the same sheet of paper that is used to measure the biological capacity.

#### The peak of the rush of the exhalation:

The measurement is performed by the Spirometer device through the same chart that prepares us to plan the breathing process after the referee has taken the maximum possible inspiration.

#### The measure of emotional arousal:

In order to reach the goals that were developed, the researcher adopted the emotional arousal scale prepared by Essam Mohammed Abd al-Rida al-Nahi (1) after making some modifications in the wording of the paragraphs so that the scale becomes more suitable for the sample of the research. The scale may be (31) paragraph, Paragraph

### Test ran 1500 m:

#### Objective:

Measurement of the achievement level of running 1500 m.

#### Tools:

Timing clocks number (3), whistle.

#### Description of the performance:

Start of the situation of the bird where each member of the sample search run 1500 m according to legal rules.
Registration: The assistant team records the time spent for this distance and the nearest part of a second to the mean hour.

Exploration Experiment: The researchers conducted an exploratory experiment to test 1500 m on a sample of the original research community and from the same sample of the study and a number of (4) players on Sunday, 3/2/2019 where the exploratory experiment aims to:

Verify the validity of the devices and tools used in the research.

Identify the time required to perform tests.

Know the obstacles that may arise and avoid mistakes and interference in work.

Main Experience: After the completion of the exploratory experiment and ensure that the researchers applied the main experiment through the application of tests and measurements on the research community and the tests were conducted on Sunday 10/2/2019, as the tests were in the following sequence:

Tests of functional variables of the lungs.

Emotional arousal scale

The test ran 1500 m.

Statistical means used: The researchers used statistical pouch (spss) in analyzing the search results, including:

- Arithmetic mean.
- Standard deviation.
- Mediator.
- Pearson correlation coefficient.

Presentation, analysis and discussion of the results: Presentation of the results of the relationship between some functions of the lungs and completion of 1500 m.

Results and Discussion

The results showed that there is a significant negative correlation between the achievement in the 1500 m race and the function variables of the lungs, vital capacity VC, forced exhalation of the first second (FEV1), peak exhalation force (PEF). It is negative links in the sense that the increase in the size of lung function variables that showed a significant correlation offset by a decrease in the performance time of the contestants and this is due to the specificity of effectiveness. In the view of the researchers that the correlation between the vital capacity and the achievement of (1500 m) output of the ability of the lungs to absorb the largest amount of air at the inhalation as well as the result of increased amount of air paid at the expense of the amount of air remaining in the lungs. To increase the elasticity of the pectoral muscles in the expansion and increase in size of the racers increases the viability of the thorax, which indicates an increase in the volume of oxygen entering the lungs. Qassim Hassan Hussein pointed out that practicing sports training on a regular basis leads to positive functional changes in the respiratory system. These changes achieve additional flexibility in the muscles of the rib cage, which increases their ability to expand and widen, which increases the volume of inhaled air and thus helps to increase the amount of oxygen in the exchange of gases between the blood and the alveoli and the economic breathing movements due to increased bio-capacity. West also noted that sports training leads to increased bio-capacity due to increased chest muscles’ ability to stretch. In the view of the researchers that the moral correlation between the forced exhalation of the first second and the peak of the eruption and the achievement of (1500 m) is the result of the efficiency of breathing muscles, the nature of the breathing method of the process of inhalation and exhale during swimming requires a high effort of breathing muscles to overcome the water resistance that limits the expansion of the rib cage During inhalation and water resistance to exhaled air which leads to increased efficiency of respiratory muscles. As Mohamed Hassan Allawi pointed out, “the volume of forced exhalation is strongly related to the exhalation muscles and the degree of air resistance in the airways” (1). “The physical fitness of athletes may be high or low depending on sports training, they increase with regular training and decrease in case of interruption,” said Abu El-Ella Ahmed Abdel-Fattah. Through these functions of the lungs it became clear to us that the player who has good variables, the results of his achievement is good through the moral links with the completion of (1500 m), which demonstrates the good preparation contestants. This view is in line with what Marwan Abdel Meguid said, “The best measure to measure the efficiency of the respiratory and circulatory systems is the maximum percentage of oxygen used during physical work, ie, the amount of oxygen used per kilogram of body weight per minute.” (3). In the third
The objective is to identify the level of emotional arousal where the total score was calculated for each player if the score increased to (62) degree that the player has a high level of emotional arousal either if the total score is less than (62) or equal to That the player varies to the level of emotional arousal and this so-called theoretical average and to estimate whether the differences are apparent. Table (2) shows that the value of sig is less than the level of significance (0.05) in freedom degree (15) which indicates that athletics and especially the effectiveness of 1500 have a high level of emotional arousal and this gives an impression on the relationship between search variables (Allawi, 1998) Emotional arousal is a subjective state of consciousness in the organism accompanied by internal physiological changes and external expressive manifestations that may often express the type of emotion.

Table 2: Shows the results of the computational environment, standard deviations, simple correlation coefficient (Pearson) and the value of test indication (sig) for some functions of the lungs and emotional arousal and completion of 1500 m

**Conclusion**

Based on the research results reached within the research community, the following conclusions were reached: There is a significant correlation between the vital capacity (VC) and the achievement of 1500 m. There was a significant correlation between the forced exhalation volume of the first second (FEV1) and the achievement of 1500 m. There was a significant correlation between peak exhalation force (PEF) and achievement 1500 m. 1500m players have a high level of emotional arousal.

Synthesis and Characterization of New Heterocyclic (Triazoline) Anticancer Compounds

Hayfaa A. Mubarak¹, Kadhum Jwad Al-Hamdani²
¹Faculty of Science, ²College of Medicine, University of Babylon, Iraq

ABSTRACT

Synthesis of triazoline compounds using 1,2,3 propane triol as beginning material. Step syntheses of these triazoline derivatives is the Cu(I)-catalyze azide-alkyne, also known as click reaction, react 4-(azidomethyl)-2,2-dimethyl-1,3-dioxolane(2) with compounds(alkene, anhydride derivatives). The three product compounds were purified and characterized by FTIR, CHN. and 1H NMR, 13C NMR.

Keywords: 2- butanone, acrylamide, maleic anhydride.

Introduction

1,2,3-Triazoles defined as aromatic heterocyclic molecules which have five-membered of exclusively nitrogenated synthetic source, it is usually stable and inert hydrolysis, reduction and oxidation ¹. A result for its high effectiveness the researchers interested in this group of compounds besides major range of biological activities include anti-bacterial², anti-tumor ³ Cytotoxicity ⁴ adding another point the pharmaceutical applications and it’s important for biological activity ⁵,⁶ Triazoles importance privileged medicinal scaffolds as arsul for their important biological activities including anti-allergic anti-HIV ⁷,⁸ anti-microbial ⁹,¹¹, anti-tubercular agent,¹²,¹³ selective adrenergic receptor agonist receptor ¹⁴ antagonists.¹⁵ Huisgen was the first to study the synthesis of triazoles giving rise to the1,3-dipolar cyclo-addition ¹⁶ which involves the reaction of an alkyné and an azide to give and subrogate triazole regioisomer. methodologies were developed involving transition metals the Cu catalyzed alkyné azide cyclo. reaction. Sharpless ¹⁷ and Meldal ¹⁸ product copper catalyzed azide alkyné cyclo-addition reaction, which allowed the region-selective gave the 1,4-regioisomer. Ru catalyzed cyclo-addition gave away the 1,5-regioisomer, different method logie were investigated to rule the regi-oselectivity besides control improve the reaction conditions for the formation of 1,2,3-triazoles ¹⁹.

Methodology

1,2,3 propane triol, 2-butanone, Zncl₂, NaN₃, acrylamide, maleic anhydride, Na₂SO₄, NaAsc, CH₂Cl₂, DMF, H₂SO₄, General chemicals were purchased from Merck or Aldrich, All solvents (Merck).

Instrumentation: FTIR spectra obtained using Shimadzu university of Babylon scan of 4000 to 400 cm⁻¹, were spectra ¹H, ¹³C-NMR recorded on (Iran- Beheshti university) at 300 MHz, using DSMO and TMS as internal standards. Melting points were determined, CHN were determined in Bagdad university.
Procedure

Preparation compound \{(2-Ethyl-2-methyl-1,3-dioxolan-4-yl)methanol\} 1): This Compound were synthesized from propane triol as shown in (Scheme 1). Compound 1 was obtained by the reaction of 2-butanol, 1,2,3 propane triol catalyzed by ZnCl₂, yellow color liquid, yield: 83%

\[ \text{FTIR (cm}^{-1}\text{): } 3444 (\text{NH}), 2980 (\text{CH}_3), 2883.6 (\text{CH}_2), 1377 (\text{CH}), 1103 (\text{C-O}). \]

Results and Discussion

A series of compound was prepared from the reaction glycerol with 2-butanon utilize ZnCl₂, H₂SO₄ (Strong acid to draw water from the reaction and to make the reaction forward) give high product Acetal (83%) (Table 1) According to the principles of green chemistry and easy method.

The FTIR (cm⁻¹) show the following: 2935 (CH₃), 2129 (NN), 1327 (C-O). The ¹H-NMR (DMSO) show the following: 1.16-1.21 (m, 4H, CH₃), 1.97 (d, 5H, CH), 7.1-7.2 (d, 5H, CH), 7.3-7.4 (d, 3H, CH₂), 7.6 (d, 3H, CH₃). The ¹³C-NMR (DMSO) show the following: 21.2 (CH₃), 28.6 (CH₃), 39.6 (CH), 40.7 (C-N), 83.5 (CO), 125.5 (O-C-O). Elemental analysis: calc. for C₇H₁₃N₃O₂ (MW =171): 49.11% C, 7.65% H, 24.54% N; found: 48.91% C, 7.27% H, 24.77% N.

Cycloaddition Reactions for Preparation of 1,2,3Triazolines (3,4): The azide (2) (1 g, 7 mmol), different compound (9 mmol), t-butyl alcohol (30 mL of D.W/30 mL of t-butyl alcohol), Sodascorbate (0.004 g, 0.2 mmol) CuSO₄·5H₂O aqueous solution (0.0024 g), were added in a round. The mixture was stirred for 8 h at 50°C. After the end of the reaction D.W (10 mL), CH₂Cl₂ (3*20 mL) was added. The organic phase separated, extracts and dried over Na₂SO₄ (Scheme 2)

Synthesis of 1-{(2-ethyl-2-methyl-1,3-dioxolan-4-yl)methyl}-4,5-dihydro-1H-1,2,3-triazole-4-carboxamide (3): The reaction of acrylamide gave 55.8% yield powder as a pink color.

The FTIR (cm⁻¹) show the following: 3358, 3182 (NH₂), 2883 (CH₃), 2802 (CH₂), 1676 (C=O), 1433 (CO). The ¹H-NMR (DMSO) show the following: 1.2 (m, 4H, CH₃), 1.71 (brs, 3H, CH₃), 2.5 (q, 4H, CH₂), 3.4 (d, 3H, CH₂), 4.5 (m, 3H, CH₂), 5.5-5.6 (d, 3H, CH₂), 6.05-6.2 (OCH), 7.1 (m, 2H, NH₂).

The ¹³C-NMR (DMSO) show the following: 10.2 (CH₃), 21.24 (CH₃), 26.261 (CH₂), 55.9 (CH₂), 68.6 (C-N), 79.2 (C-N), 88.66 (C-O), 119.2 (C=O), 176.6 (C=O). Elemental analysis: calc. for C₁₆H₁₈N₄O₇ (MW=242) 49.57% C, 7.49% H, 23.13% N; found 49.03% C, 7.94% H, 22.78% N.
Synthesis of 1-{(2-ethyl-2-methyl-1,3-dioxolan-4-yl) methyl}-1H-furo[3,4-d] [1,2,3] triazole-4,6(3aH,6aH)-dione (4): The reaction of maleic anhydride gave 61.33% yield amorphous as a brown color

The FTIR (cm⁻¹) show the following: 3425.69 (NH), 2953.1 (CH₃), 1649.1 (C=C), g1228 (CO).

The ¹H-NMR (DMSO) show the following: 1.4 (t, 4H, CH₃), 1.9 (m, 2H, CH₂), 2.45 (q, 4H, CH₂), 3.3 (m, 3H, N-CH₃), 3.7 (brs, 3H, N-CH₃), 3.8-4.5 (m, 3H, CH₂), 4.47 (d, 3H, CH₃-N), 5.2 (m, 1H, CHN), 6.8 (m, 5H, CHO).

Elemental analysis: calc. for C₁₁H₁₅N₃O₅ (MW=269): 49.07% C, 5.62% H, 15.61% N; found 48.12% C, 5.09% H, 14.99% N. Another green aspect of CuAAC reaction is the application of alcohol as solvent in the preparation of 1,2,3-triazole use a components reaction of alcohol and NaN₃. Triol is highly hydrophilic, naturally available, inexpensive and environmentally friendly. Triazolene were produce in good to excellent with this green solvent. The published procedure involves the use of azide and different compound, which are easily available reagents as the catalytic system at room temp. This low-cost, simple protocol exhibits wide substrate scope and ambient reaction condition and can be ease utilized for high syntheses. “click” Cu-catalyzed azide-alkyne cycloaddition reactions (CuAAC) have become the focus of many chemists and were found wide application in drug synthesis, chemical biology, anti-cancer among others. Some synthetic aspects of this reaction should be taken into consideration before the preparation of desired 1,2,3-triazole derivative 3, 4:

a. The standard protocol, which consists in using the cost-efficient salt CuSO₄.5H₂O and NaAsc, is usually realized in a mixture of NaN₃, DMF, could all be employed as co-solvents for this cycloaddition reaction, enabling a wide range of substrates to be adapted.

b. Triazol driydivtive (3), common key intermediates in this transformation, are not available and must be prepared from azide and acrylamide.

c. To improve the utility and manipulability of this process for generation of desired products 4, azide component reaction of maleic anhydride, sodium ascorbate.

Conclusion

Synthesis of triazoline compounds using 1,2,3 propane triol as beginning material. Step syntheses of these triazoline derivatives is the Cu(I)-catalyze azide-alkyne, also known as click reaction, react 4-(azidomethyl) -2,2-dimethyl-1,3-dioxolane(2) with compounds (alkene, anhydride derivatives). The three product compounds were purified and characterized by FTIR, CHN, and 1H NMR, 13C NMR.

The Effect of Teaching on the Skills of Logical Thinking in the Achievement of Student’s Achievement in Biology

Hawraa Qusay Jawad¹, Moshrak Majwall¹, Abass Hussien¹
¹University of Babylon, College of Basic Education, Babylon, Iraq

ABSTRACT

The aim of the research was to identify the effect of logical thinking skills on the achievement of the fifth grade biology students. To achieve the goal, the researchers put the zero hypothesis which states: There is no statistically significant difference at the level of (0.05) between the averages scores of the female students of the experimental group will be guided by the logical thinking skills. The average number of female students of the control group will study according to the usual method in the biology test. In order for the researchers to apply, the experiment was applied in the second half of the academic year (2018-2019). If the sample consisted of (82) fifth grade female students of Al-Baqir High School for Girls. And random image were divided into two groups of 36 students per group. The two groups were equivalent in the following variables: age, decision scale, testing the previous information of the new material, and in light of the behavioral objectives and the relative importance of the content, (40) paragraph of multiple choice, and the researcher has achieved the specifications of the cycmometric test, the experiment continued to apply for (8) weeks.

Keywords: Logical thinking skills, fifth grade students, biology, achievement

Introduction

Biology aims to help humans to understand the nature that surrounds them, by increasing their ability to test them, and then benefit from them. Biology is part of our general culture and will continue to develop and promote modern science. ¹ noted that with the scientific development in biology that emerged at the turn of the twentieth century, those interested in living had to pause to consider teaching this science at different levels of study and to give students the opportunity to assimilate the concepts of biology. Biology has evolved from being just a branch of natural sciences to the basis and origin of other sciences. It has become necessary for students to understand other basic sciences ². They must absorb many biological concepts that play a fundamental role in the formation of the rest of science, linking the daily life of female students and increasing their biological culture, and clarifying the role of biology in the development of medicine and its applications in society ³. Most of the specialists agree that biology is one of the pillars of natural science and its basis, which is concerned with analyzing the study and investment of natural phenomena, and the revival of the great impact in scientific development, because the biology includes life concepts and medical relationships and questions of conclusion; this is why students have difficulties in understanding and learning this subject which reflected negatively on their motivation and achievement when they learn ³-⁵. This has been demonstrated by previous studies ⁴⁶. This has made teachers look for the best strategies and methods that are more effective in teaching science in general and biology in particular ⁷. It has been found that one of the ways that contribute to the broader understanding of biology and achieve its objectives in the secondary stages, is the use of logical thinking skills because it is a modern methods that help to eliminate the problems that hinder students’ understanding of biology and raise their levels of achievement, and that these skills did not. This study was conducted in order to determine the extent to which there is a difference between the students of the experimental group who study according to logical thinking skills and the students of the control group who study according to the usual method.

DOI Number: 10.5958/0976-5506.2019.01440.2
The logical thinking skills used in the current research are:

1. **Information organizing skills:** the order of information for the use of effectively and include three sub-skills is the skill of comparison, and the skill of classification, and the skill of ranking, as follows:

   A. **The skill of comparison:** Through which the student can identify and the existence of the phenomenon and its various elements by finding points of similarity and differences and examine the relations between them.

   B. **Classification skill:** The basis of building the knowledge of the student, and the task of progress and scientific development, but is one of the most important skills of thinking and used to separate and sort things according to their characteristics, functions and characteristics

   C. **The skill of arrangement:** means the development of things, concepts or events that are interrelated in one way or another in a sequential context according to a certain criterion.

2. **Skills of generating information:** It is a basic skill through which students can predict and formulate hypotheses, and include the following:

   A. **Research skill:** The student seeks information to answer the question posed, with the organization and arrangement of information

   B. **The skill of experimentation:** the ability of the student to subjugate the former probabilities and opportunities in practical procedures.

   C. **Composition skills:** The ability to assemble elements and ideas and produce new buildings, plans and ideas.

   D. **The skill of the conclusion:** is the ability of the student and enable them to get to the conclusion and the reasons or result.

   E. **Predictability:** reliance on prior information in order to predict an event or phenomenon in the future.

   (E). **The skill of representation:** the presentation of concepts or information and their output in tables or graphs or conceptual maps.

**Methodology**

It includes a presentation of the procedures prepared for the achievement of the research objectives, starting with research methodology, experimental design, community identification, research sample, preparation of research tools and requirements, equivalence of research groups (experimental and control), presentation of statistical means and implementation procedures.

**Experimental Design of the Research:** It includes the independent variable (logical thinking skills) and (the usual method), the variable dependent (achievement) and (decision-making), so the researchers used the experimental design and the equivalence of the two sets of research one experimental and the other control.

**Equivalence of the Two Research Groups:** The researchers conducted a statistical equivalence between the students of the experimental and control groups in some variables that affect the results of the experiment, for the difference of the study society between the control and experimental groups, The researchers sought to achieve equivalence with the following variables (age calculated by months, testing the previous information with the new material, decision scale). The researchers performed the equivalence in the variables mentioned for the two research groups.

The results were as follow:

<table>
<thead>

</table>
**Control of Exotic Variables:** Although the researchers verified the equivalence of the two sets of research to some variables that they think affect the course of the experiment, but they tried to avoid the impact of some variables that affect the process of the experiment and of these variables and how to control it:

**Accidents Accompanying the Experience:** The research experience has not been subjected to any accident or emergency condition that hinders its progress.

**Experimental Absence:** did not get a case of transfer or interruption of any student length of the experiment.

**Sample Selection:** The sample members were chosen intentionally and the equivalence of the two research groups was ascertained.

**Factor of Maturity:** Due to the duration of the experiment in being uniform among the members of the group as well as their age, Therefore, the growth of individuals will return to the same level as the two groups of research, so this factor has no effect in the experiment.

**Effect of Experimental Procedures:** The researcher worked to limit the impact of those procedures that affect the dependent variable during the course of the experiment.

**Methods and tools used to study blood according to logical thinking skills**

**Search tool:** Steps for the search tool (the achievement test) are:

**Determination of the purpose of the achievement test:**
The purpose of the test is to measure the achievement of the fifth grade biology (information, experience and skills) in biology in the study of blood.

**Determination of the objectives of the test:** After determining the primary purpose of the test, the objective of the test is determined to determine the extent to which these objectives are achieved. The researcher formulated a number of behavioral goals

**Test instructions:** The instructions and instructions for how to answer (answer all paragraphs, choose one correct alternative to the paragraph, write the triple name, the row and the division in the specific place, the duration of the answer.

**The test answers correction:** After the test paragraphs were drafted and the choice of the test type was selected, a standard was established to correct the answers. One (one score for the correct test paragraph) and zero for the wrong answer were placed, And the abandoned paragraph that the student did not answer), the upper final score of the test is 40 and the minimum test score is zero.

**Test authentication:** the truthfulness of the test were confirmed The results showed that 80% of the agreement was achieved by the arbitrators and the specialists for the validity of the content. The results showed that all the items in the test are statistically significant, so the test is true. In measuring the comprehension and understanding of fifth graders in biology.

**The second exploratory application:** The test was applied to a sample consisting of (100) female students in the fifth grade of biology, other than the research sample. The purpose of the test is to analyze the paragraphs for the statistical achievement test, which is to distinguish the paragraph, the difficulty of the paragraph, the effectiveness of the wrong alternatives.

**Analysis of the scores of the achievement test statistically:** The sections of the achievement test are analyzed as follows:

**Stability of the test:** The stability coefficient of the test depends on the relationship between all test paragraphs or between each paragraph, and this is evidenced by the consistency of its paragraphs and the stability of its grades. The stability coefficient of the test can be calculated by using the legal relationship between the test units. A good test is to be honest and consistent. Meaningful test must be consistent and true at the same time. Stability indicates a match between test scores when returned at the other time, indicating the stability and balance of the students’ grades in the test.

**Methods of finding the stability of the test:**

**Partition to half method:** This method is one of the most used methods, because it avoids the other defects of some methods and in order to obtain two images of the test researchers have divided the paragraphs of the test To individual and single paragraphs and to the choice of students of the survey sample of (100) answer. And by extracting Pearson correlation coefficient between the single and individual scores, the stability factor was obtained (0.87). Since the half-stability coefficient of
the index does not measure the total homogeneity of the test (because it is only half constant), So the corrective measures were carried out using the Spearman Brown coefficient, which reached (0.93) from the point of view of the specialists is a good stability coefficient.

Koder-Richardson Method 20: The Koder-Richardson equation was applied on the basis of the students’ scores. The researcher found that the stability value of the test is 0.83 and thus is a suitable and good value so the test is stable.

Application of the research tool: The control and experimental research groups were informed a week before the date of the assessment test and was applied after completing the teaching of the material identified for the two research groups at the same time, and supervised the researchers to apply the test.

Statistical Methods: The researchers used the T-test equation for two independent samples for the equivalence between the control and experimental groups, And Pearson’s correlation equation, where they used the equivalent researchers to correct the correlation coefficient between the test parts (single and double paragraph) after being extracted by the spss and the Pearson correlation coefficient.

Results and Discussion

It was found to the students of the experimental group through the use of the microscope that:

<table>
<thead>
<tr>
<th>Character</th>
<th>Red blood cells</th>
<th>White blood cells</th>
</tr>
</thead>
<tbody>
<tr>
<td>Morphology</td>
<td>Small, both sides concave cells</td>
<td>Small cells differ from red blood cells as larger ones</td>
</tr>
<tr>
<td>Nucleus</td>
<td>No nucleus</td>
<td>Nucleus</td>
</tr>
<tr>
<td>Type</td>
<td>One type</td>
<td>Two types: granulate and a granulate</td>
</tr>
<tr>
<td>color</td>
<td>containing hemoglobin</td>
<td>Do not contain hemoglobin and be transparent (colorless)</td>
</tr>
<tr>
<td>Number</td>
<td>(6) million in the micrometer</td>
<td>Their number ranges from (5000-11000) per cubic Mel</td>
</tr>
</tbody>
</table>

The above table shows the difference between red blood cells and white blood cells in some of the basic characteristics that distinguish between them. The white blood cells are based on two basic types: granular and a granular white cells in human blood. Blood has a special process called coagulation, which can be explained by the following diagram: Then the researcher prepared a test after the completion of the educational material for both groups that the researcher taught them as the results showed that the experimental group exceeds the control group according to the following table:

<table>
<thead>
<tr>
<th>Statistic group</th>
<th>Number</th>
<th>Average</th>
<th>standard deviation</th>
<th>Variance</th>
<th>Freedom degree</th>
<th>Fixed values</th>
<th>Significance level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Experimental</td>
<td>36</td>
<td>26.03</td>
<td>6.30</td>
<td>39.57</td>
<td>69</td>
<td>21.158</td>
<td>Statistically significant</td>
</tr>
<tr>
<td>Control</td>
<td>36</td>
<td>22.64</td>
<td>6.78</td>
<td>45.84</td>
<td></td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

Note from the previous table that the experimental group exceeds the control group in the achievement test. Therefore, there is a statistically significant difference in the level of significance between the average score of the students of the experimental group who studied the biology according to logical thinking skills and the average score of the students of the control group who studied the same subject in the usual way of collection in favor of the experimental group.

This is consistent with the previous studies which confirmed the superiority of the students of the experimental group, which studied according to logical thinking skills on the control group, which studied according to the usual method. In addition, the researcher used the test of Kilmajrov Smirnov, which is a non-parametric test of natural distribution, we can judge by the value of probability p if the value of p is greater than the level of the approved indication, this indicates that there is no difference between the distribution function and the theoretical distribution function of the distribution of the average, i.e. the acceptance of the null hypothesis, that is, the distribution is moderate, p probability values are greater than the level. The significance relied on by the researcher is (0.05) for the experimental and control group in the study achievement variable, the members of the two groups in all search variables follow the normal distribution.
The T-test is used to analyze the variance. This is illustrated by the following table:

<table>
<thead>
<tr>
<th>Group</th>
<th>Test variable</th>
<th>Kolmogorov-Smirnov test</th>
<th>Shapiro-Wilk test</th>
</tr>
</thead>
<tbody>
<tr>

**Conclusion**

The use of logical thinking skills has a positive impact on increasing the achievement of the fifth grade biology students in biology and increasing their ability to understand information and knowledge and facts and raise their academic level. The use of logical thinking skills to play a role in making students the center of the process of communication through their active participation in educational situations, which increase their self-confidence and encourage them to persevere to raise their scientific level.

ABSTRACT

The study aimed to measure Effectiveness of the specimen collection Edilson in the fifth grade students in the bio - biology material, and to achieve the goal of the researcher developed a null hypothesis, which states: there is no difference is statistically significant at the significance level (0.05) between the mean scores of the experimental group students who Sidersn according to the specimen Edilson And the average score of students of the control group who will be taught according to the usual method in the test of the collection and reflection of the biology, and to verify the researcher applied its experience in the second half of the academic year (2018 - 2019), where the sample of the study of (60) The two groups were rewarded with the following variables: age, intelligence test scores, half-year grades of biology, and the relative importance of content and purposes. Behavioral, collection test was built Consisting of 40 items of multiple choice test to think Contemplative consisting of (paragraph 30). The researcher from Alsekoumtrah to test yen test properties have been achieved,

Keywords: Edilson specimen, collection, neighborhoods, students fifth grade bio, thinking Contemplative.

Introduction

Modern education is not merely a process of providing the learner with a fixed and limited amount of information, but also enabling him to learn for himself and develop his ability to employ knowledge in his life. It is essential that the learner’s education is comprehensive and integrated in all aspects. And includes the life of the learner in its entirety from cradle to grave and the involvement of several institutions in education, including school, family and society in that and no nation seeks to occupy a prestigious position among the nations and gave the educational process of great interest to be able to build a generation conscious and seeks to grow in his culture and able to To adapt to new developments in order to Enmaa advanced civilization with a society. The education and learning of the Third Millennium Science has come to face a range of challenges and variables, requiring science education and learning professionals to deal with these challenges in an unconventional way. Education is the only way to meet the challenges of the 21st century Salman, 2018 : 9Salman, 2018), And through scientific and scientific education curricula aimed at supply Learner Group From Of experience Scientific studies )) Knowledge, skills Scientific, trends Scientific value (Necessary to be Able On Keeping pace with the age requires attention to understanding the nature of science, applying scientific knowledge related to daily life situations. Science is one of the most important subjects in any education system at the global level. The importance of science and its contribution to the progress and development of nations is significant. The developed countries sought to improve the curricula of science and develop them, and stressed the adoption of methods and methods of modern teaching as it makes the learner the focus of the educational process and try to stimulate the thinking of both the teacher and the learner in the course of the implementation of the lesson. The teaching methods of science, such as biology, emphasize that teaching should be carried out through the practice of the activities carried out by the learner under the direction of the teacher, whether in the classroom or laboratory, as well as the adoption of modern teaching models.

There are three steps to implement the ADSLON model for use: Motivation or motivation: In this model, “knowing the need and desire for new knowledge” means the motivation to acquire knowledge, and occurs when the learner is confronted with a problem, constraint, gap, activity or event that shows his past knowledge deficits and his need to learn to solve the new problem in knowledge, this two effects occur in the learner: the creation of desire and motivation to acquire new knowledge, and create a context any boot for the introduction of new knowledge into memory and integrated with prior knowledge, and the presence of motivation here achieves the existence of a goal oriented and understanding conscious of the nature of learning. Knowledge building: It means “developing new knowledge” as a result of experiences that enable the learner to add new concepts, to fragment existing concepts or to create new relationships between concepts, bearing in mind that the learner can build new knowledge as a result of the self-experience that allows him to integrate, the learner is active and has the opportunity to observe and integrate into activities or through communication with others or both. Knowledge revision and refinement: It means “organizing and linking knowledge structures” to organize, purify, refine and link knowledge structures, Knowledge and application in learning for use. This step focuses on the organization of knowledge and linking it to other knowledge and promoting it so that it can be retrieved, used and applied in the future. This is achieved through two processes: application and reflection. In this step the third and fourth principles of the model are achieved. The following table shows the procedural steps of Edelson Learning and processes involved in each step and the strategies and activities proposed to implement each process.

**Methodology**

It includes a description of the procedures that have been carried out to achieve the research objectives, starting with the research methodology, experimental design, defining the research community and its design, the equivalence of the research groups (experimental and control), preparation of the research materials and tools, will be displayed as follows:

**Experimental Design Research:** includes the independent variable (specimen Edilson) and (the usual way), and the dependent variable (collection), so the researcher used t of experimental design The partial adjustment of the two experimental and unequal; one other officer.

**The research community and its model:** The current research community represents all fifth grade students in the secondary and preparatory schools of the General Directorate of Education in the province of Baghdad (first Karkh) for the academic year (2018 - 2019), in which the population of the fifth grade is not less than bifurcated, and the sample chose T. researcher of (secondary Sayyyab for girls) in the first province of Baghdad/Karkh center are intentional to conduct his research a found Tha it includes two divisions (a, b), Akhtar T. researcher of the Division (a) way random clouds to represent the experimental group and a number of her students (39 students), which will study according to N. (Model Edilson), the same way the researcher chose T. Division of random (b) to represent the control group and the number of her students (38 students), which will study n according to (the usual way).

**Equality of the two sets of research:** production rate researcher of equal statistically between the experimental and control groups in some of the variables that affect the results of the experiment, although the selection of the researcher of the two groups in a manner of random draw, and although the research sample students from the center of social and economic is similar to a large extent and studying in one school, but it is a keen t on the equivalence of the following procedure variables: chronological age measured in months, first semester grades, IQ test, as the T researcher of parity between the two groups to conduct research in the variables mentioned above showed the results according to the table 1.

Table 1: The equivalence of the two groups in some variables
Preparation of research requirements: The requirements search of basic things underlying the research and that the accordingly be implemented research procedures. These are requirements for: scientific material (content) have been identified scientific article that T. folk researcher of taught for students of the two sets of research during the duration of the experiment (second semester) of the academic year (2018 - 2019) m, and scientific material included a study (the last three chapters of the book biology fifth grade bio), as a researcher of 16 prepared a plan for the experimental group that studied according to (specimen Edilson) and the same for a group The control is taught according to the method Normal).

Search Tool: Steps are set for the tool: The research (the achievement test) is as follows:

**Determination of the purpose of the achievement test:** The goal of the achievement test is to measure the achievement of the fifth grade biology students in the study (last three seasons).

**Define test objectives:** Having been identified the purpose of the achievement test is to determine the objectives of the test to determine the extent achieved and the T researcher formulated a number of behavioral goals.

**Identify paragraphs test:** The T researcher identified a number of paragraphs that achievement test consists of which it reached the number of paragraphs of the test (paragraph 40).

**Directed paragraphs of the test:** was drafted paragraphs of test grades as preliminary in the light of the contents of the map of experiential, chose T. researcher of the type of test (multiple choice) which is one of the best objective tests, consisted test of 40 test paragraph, distributed to the levels of cognitive Bloom (Knowledge, understanding, application, analysis, composition, calendar), and the last three topics of biology book for the fifth grade.

**Test Instructions:** Formulate instructions and special instructions on how to answer (Choosing one correct alternative to the paragraph, answering all paragraphs, the time period for answering, writing the triple name, the row and the division in the assigned space).

**Correcting the test answers:** After the test paragraphs were formulated and the type of test was formulated, a response was developed to determine the correct answers. It was put (one score for each correct test paragraph) and zero for the wrong answer and the left paragraph that the student did not have, It has more than one choice) and therefore the highest final score. For the achievement test is (40 degrees) and the minimum score (zero).

**Believe the test:** it was confirmed virtual honesty to test the sincerity of the content, as the results showed that the apparent honesty obtained a ratio of agreement (80%) by the arbiters and specialists, either content sincerity results have appeared that all the paragraphs of the achievement test is statistically significant, so it is a test summative honest

Methods of finding the stability of the test:

**Retail half-way:** This method is one of the most methods widely used, due to a Nha avoid defects some ways the other and in order to obtain two equal test the T researcher of dividing the paragraphs of the test to the individual and even-numbered paragraphs and choose answers students exploratory sample the (100) Reply, and Extracted Pearson correlation coefficient between the scores of odd and even paragraphs were obtained on the consistency factor of (0.8 8 ) As the retail stability of the mid-term test coefficient does not measure the overall homogeneity of the test (because the stability of only half of it), so the patch using the coefficient of procedure Spearman Brown As it amounted to (0.9 2 ) It is a good stability from the point of view coefficient specialists.

**Application search tool:** the media and the two sets of experimental research officer of the date of the achievement test application a week before the vote was applied after the completion of the teaching material specific to the two sets of research at one time, and supervised T. researcher of the testing process application.

**Statistical methods:** Use T. researcher of the test equation Altaia (t-Test) For two independent samples to conduct parity between the experimental and control groups, and Pearson correlation equation used as T. researcher of the equation to correct the correlation coefficient between the partial test (grades odd and even paragraphs) after the Pearson correlation coefficient extracted.

Results and Discussion

For the purpose of verifying the null hypothesis, which states (There is no statistically significant difference at the level of significance (0.05) between the average
scores students in the experimental group who studied according to the specimen Edilson and the average score of the control group who studied on the way according to normal in the Open Waseel material biology).

It was the arithmetic average calculation deviation standard scores both sets of research in test grades were calculating the value of T for two independent samples as in the table (2)

<table>

It is clear from Table (2) that the value of T calculated to test grades (4.031) greater than the value of T Tabulated (2,000) at the degree of freedom (75) and the level of significance (0.05) and that the value of T calculated to test the reflective thinking (3.016) greater than the value T Tabulated (2,000) at the degree of freedom (75) and the level of significance (0.05) therefore rejects the null hypothesis, and thus the students group pilot who was their teaching on according to a specimen Edilson has excelled on the students of the control group who were taught n According to the usual method used in the teaching of biology in the test of achievement and contemplative thinking. -The teaching according to the specimen Edilson has contributed to raising the academic achievement of the students in the fifth grade bio - material biology better than the usual method of teaching, increasing academic attainment. The teaching according to the specimen Edilson has contributed to the lifting of reflective thinking for students in the fifth grade bio - material biology better than the usual way in Altd Rees, increasing of thinking Contemplative.

**Conclusion**

If the specimen Edilson effectiveness of the great increase in the collection of students grade the fifth bio in biology material and increase their ability to understand Almaloma T, facts and knowledge and raise their level of school. That the specimen Edilson role in making the students at the center of the educational process through their participation effective in the educational situation, which would increase their confidence and encourage them to persevere to raise their level of scientific. That the specimen Edilson a significant role in increasing reflective thinking among students in the experimental group through the steps of the specimen (motivation and refinement of knowledge building) and the opposite of the usual way.

The Impact of Challenge Strategy on Student Achievement of fourth-grade Students in Biology

Hassanein Fawzi Latif, Arif Hatem J., Amna Kazem

University of Babylon, College of Basic Education, Babylon, Iraq

ABSTRACT

The aim of the research is to identify the impact of the challenge strategy in the achievement of the fourth grade students of biology. To achieve the goal, the researcher put the zero hypothesis which states: There is no significant difference at the level of significance (0.05) between the average score of students of the experimental group who will study according to the challenge strategy and average The grades of the students of the control group who will study according to the normal method of testing the collection of biology. The study sample consisted of (70) students of the fourth grade in the university’s junior high school. They were randomized to two groups of 35 students in each group. The two groups were rewarded with the following variables: age, IQ test, half-year biology. In the light of the relative importance of content and behavioral purposes, an achievement test consisting of (40) multiple choice types was constructed. The researcher investigated the characteristics of the cytometric test for testing. The experiment lasted 8 weeks. At the end of the experiment, The results were then analyzed and showed that the students of the experimental group who studied according to the challenge strategy.

Keywords: achievement, Biology, Fourth grade students, Strategy Challenge.

Introduction

Biology is a natural science that includes facts, theories, inventions and discoveries that occur around the universe and its components. It also includes various mechanisms of thinking, analysis, experiments, evidence and evidence, as well as being responsible for the interpretation of most phenomena in nature. And the material of biology, and what happens in the universe, and close to them to explain things and how to live organisms. In spite of the importance of the subject of biology, we find that the actual reality of teaching is still characterized by stagnation and boredom because of the use of most teachers the usual methods in the teaching of biology and neglect of the use of Modern and effective teaching strategies, which led to low level of student achievement in biology. Therefore, the biology teachers should search for the best methods and modern strategies that will be more useful in teaching biology. It has been found that strategies that may contribute to a broader understanding of biology and achieve many of the objectives of teaching in the secondary stage, Is the use of strategies of serious innovation, including (challenge strategy) because it is a modern strategies that may help in overcoming the problems that hinder the students' understanding of biology and raise the level of achievement, as well as that this strategy was not placed in the experiment in teaching biology. Therefore, this study was conducted to determine whether there was a difference between the students of the experimental group who were taught according to the challenge strategy and the students of the control group who study according to the usual method. In his development of this type of creativity, De Bono has relied on an understanding of the mechanism in which the brain operates based on what has been achieved in neuroscience. The brain organizes the information it receives through the senses in an organized way. And search for them later, The pattern is the organized configuration of the neurons that make up the brain or the organization of information on the surface of memory. The pattern is a repetitive neuronal sequence. It is a concept, an idea or a picture.
The pattern can indicate a chronological sequence of such ideas or concepts. And it is more like the water that falls from the sky on a soft ground that takes the paths available to it, or forms its own paths in which it takes place. The shape of these courses depends on the nature of the information received and the way which were received. The ability of the brain to shape, recognize, and manipulate patterns makes it effective in dealing with what surrounds it. This gives it the ability to quickly recognize things, and the speed of interaction with them, allowing them to explore their surroundings very effectively. In spite of the effectiveness of the brain, however, in the formation of patterns and dealing with them acquire specific defects affect the performance, and make them captive these patterns, which limits the ability of creativity and launch, and these defects are that the patterns tend to be established and stability over time, and difficult to change and out of the circle. And they are based on a particular pattern and become these patterns belong to him, and consists of a kind of polarization, and these patterns become rigid molds. In order to overcome these shortcomings, DeBono has created a set of strategies. Perhaps the most prominent of these is the strategy of challenge, which is due to the theory of serious creativity or so-called lateral thinking.

Methodology

It includes a presentation of the procedures that have been carried out to achieve the research objectives, starting with the research methodology and experimental design, defining the research community and its design, the equivalence of the research groups (experimental and control), preparation of the research requirements and tools.

Experimental design of the research: includes the independent variable (challenge strategy) and (normal method) and the dependent variable (collection), so the researcher used experimental design with partial control of two equal groups, one experimental and the other control.

The research community and its model: The current research community represents the fourth grade students all in the secondary and preparatory schools of the General Directorate of Education in the province of Babil for the academic year (2018 - 2019), where the people of the fourth grade are not less than two divisions (A, B, C, D), the researcher chose (a) the method of random drawing (the drawing method). To represent the experimental group and the number of students (35) students who will study their students according to (Ast Atejah challenge), the same way the researcher chose randomly Division (c) to represent the control group and the number of students (35 students), which will examine its students according to (the usual way).

Equality of two search groups: made a researcher equal statistically between the two groups experimental and controlled in some variables that affect the results of the experiment, despite the selection researcher the two groups manner drag-random, in spite of the students sample from the Center of social and economic similar to a large extent and they learn in one school, he was keen on an equivalence variables the following: The chronological age is calculated by months degrees of separation first, intelligence test, as the researcher an equivalence between the two sets of research in the variables above showed the results according to the table 1.

Preparation of supplies search: The requirements of the search of the things basic underlying find that According to which the research procedures are carried out and this supplies in: material science (content): were selected art. Scientific by the researcher teach the students my search within an experiment (second semester) of the academic year (2018 - 2019), M., included article scientific study (fish · pigeon pickles, and-papyrus, reptiles and birds and livestock and algae, fungi and, relationships between organisms, environmental pollution), as prepared a researcher 16 plan for the group’s experimental taught to according to (a strategy challenge) ideals the group’s control taught to according to (the way the normal).

Search tool: The steps of the search tool (the collection test) are as follows:

Determine the purpose of the test: The purpose of the test is to measure the achievement of students in the fourth grade scientific (information, skills and experiences) in the biology study (fish and pigeon, Bacillus and papyrus, reptiles, birds and animals, algae and fungi, relations between organisms, environmental pollution).

Determination of the objectives of the test: After the purpose of the test was determined the objectives of the test to determine the extent of achievement and the researcher formulated a number of behavioral goals.

Determination of the test paragraphs: The researcher determined the number of paragraphs that constitute the test achievement as the number of paragraphs of the test (40 paragraphs).
Extracting the test vertebrae: The terms of the test were formulated as preliminary in the light of the test map. The researcher chose the type of test (multiple choice) which is one of the best objective tests, The test consisted of (40) experimental paragraphs, which were distributed at the levels of cognitive knowledge (understanding, understanding, application, analysis, composition, and calendar); and the five topics of the book of biology (fish, dove, Environmental pollution).

Test instructions: Specific instructions and instructions are written on how to answer (choosing one correct alternative to the paragraph, answering all paragraphs, answer time, typing the triple name, row and division in the assigned space).

Correcting the test answers: After the test paragraphs were formulated and the type of test was formulated, a standard was established to correct the answers. It was put (one score for each correct test paragraph) and zero for the wrong answer and the left paragraph that the student did not answer. Selection) and therefore the final score for the achievement test is (40 degrees) and the minimum grade (zero).

The validity of the test was confirmed by the veracity of the test and the validity of the content. The results showed that the apparent honesty obtained 80% of the agreement by the arbitrators and the specialists. As for the validity of the content, the results showed that all the clauses of the test are statistically significant. In measuring the understanding and understanding of students in the fourth grade in biology.

The pilot application for the test of achievement: including the following:

The first survey application: In the first phase of the survey, the achievement test was applied to a group of fourth grade non-research students. The number of students was 40. The purpose of this test was to know the clarity of the instructions and the test instructions, For the test, the researcher recorded the exit time for each student. In calculating the arithmetic mean of time, it was found that the time required to answer all the test paragraphs was (43) minutes.

The second survey application: The test was applied to a sample of (100) students in the fourth grade of scientific research. The purpose of the test is to analyze the statistical achievement test paragraphs, namely paragraph difficulty, paragraph discrimination, effectiveness of the wrong alternatives.

Statistical analysis of the test scores: The test scores were analyzed as follows:

Difficulty of paragraph: The statistical analysis of the terms of the test of achievement found that the coefficient of the difficulty of paragraphs ranging from (0.30 - 0.67) and thus the paragraphs of the test collection are all good and difficult to appropriate.

The distinction of the paragraph: the important characteristics and must be provided in the paragraphs of the test is the characteristic of discrimination and means the possibility of items or paragraphs to identify individual differences of students and the test items are valid as the coefficient of discrimination of items is (20,0) and above, (0.33-0.69), thus the subjects of the achievement test are characterized by a good and appropriate discrimination coefficient.

Effectiveness of the wrong alternatives: The researcher conducted a statistical analysis (highest 27% and lowest 27%) to find the effectiveness of the wrong alternatives ranging from (-0.11 - 0.41) and it turned out that the alternatives of the test paragraphs are all effective and thus the collection of all appropriate.

The stability of the test: The coefficient of the stability of the test depends on the relationship between each paragraph or between the paragraphs of the test all, and this is evidenced by the stability of degrees and consistency of paragraphs, and can calculate the stability of the test using the legal relationship between the units of the test, and the characteristics of the good test to be stable and true and even be The terms of the test have a clear meaning that must be both true and consistent. Stability indicates that the test scores match once again, ie, it indicates the balance and stability of the students' grades in the test.

Methods of finding the stability of the test:

Midterm fragmentation method: This method is one of the most widely used methods, because it avoids the disadvantages of some other methods. In order to obtain two equal images of the test, the researcher divided the test paragraphs into individual and marital paragraphs. Pearson correlation coefficient between the individual and marital scores was obtained by the coefficient of stability (0.87). Since the half-stability coefficient of the test does not measure the total homogeneity of the test (because it is only half stability) Lg (0.91) is a good stability coefficient from the point of view of specialists.
**Koder-Richardson Method 20:** The Koder-Richardson equation is applied according to student scores. The researcher found that the stability value of the test is (0.86) and thus the value is good and suitable so the test is constant.

**Application of the research tool:** The experimental and control groups were informed of the date of application of the test, one week before it was carried out, and it was applied after the completion of teaching the specific material for the two research groups at one time. The researcher supervised the application of the test.

**Statistical Methods:** The researcher used the t-test equation for two independent samples to make the parity between the experimental and control groups and the Pearson correlation equation. The researcher used the equation to correct the correlation coefficient between the test segments (individual and marital scores) after the Pearson correlation coefficient Statistical spss, excel program (Excel)

**Results and Discussion**

For the purpose of verifying the null hypothesis, which states (There is no statistically significant difference at the level of significance (0.05) between the average scores of the experimental group who studied the challenge and the mean scores of the control group who studied according to the usual method of collecting biology. The mean and standard deviation of the scores of the two groups were calculated in the test. The T value of two independent samples was calculated as in Table (1) Table (1) shows that the calculated T value (3.015) is greater than the numerical value T (2000) at the degree of freedom (66) and the significance level (0.05). Therefore, the null hypothesis is rejected. Thus, the students of the experimental group, The challenge strategy has surpassed the students of the control group who were taught according to the usual method of teaching biology in the achievement test. Teaching according to the challenge strategy has contributed to raising the academic achievement of the fourth grade students in biology better than the usual method of teaching.

**Conclusion**

The challenge strategy has a positive impact on increasing the achievement of students in the fourth grade in biology and increasing their ability to understand information, facts and knowledge and raise their academic level. The challenge strategy has a role in making students the focus of the educational process through their active participation in the educational situation, which will increase their self-confidence and encourage them to persevere to raise their scientific level.

The Impact of Nedham’s Structural Model in the Reflective Thinking to Develop the Habits of Mind for Students

Yasser Salman Hamza¹, Mohamed Hadi Shnein¹, Abtisam Jafar Jawad¹
¹University of Babylon, College of Basic Education, Iraq

ABSTRACT

The objective of this research was to identify the effectiveness of the teaching of the Nidham structural model in the reflective thinking of the applied fifth grade students. The experimental design of the two groups (experimental group and control group) with the post-test was adopted according to this design, it has been selected the research’s sample (Al-Jamaa secondary school) intentionally whereas the sample composed of (64) students distributed on two sections the experiment sample (A) which composed of (32) students and the control group (B), consisting of (32) students and excluded (4) students statistically because they are failed in their classes which has effect on the experiment and its results and then made a set of equivalences between the two search’s groups and several variables including (age in months, IQ test, the parents educational level). After the end of the experiment, it has been applied a test of the contemplative thinking on the two research’s groups, The data were collected and processed statistically using the SPSS, EXEL, The results showed that there was a statistically significant difference between the experimental group and the control group in the reflection test and for benefit of the experimental group.

Keywords: Neidham constructivist model, reflective thinking, the applied fifth grade students, physics.

Introduction

The science of physics is one of the oldest natural sciences. It was known 3,000 years before BC. The civilizations of the Sumerians and the ancient Egyptians used this science to know the predictions of the movements of the sun, the moon and the stars. The stars represented a s gods for them to worship. Although, this science was ancient and unscientific and lacked much evidence to prove their theories, and the origins of Western astronomy ¹, which is currently used to know the constellations and the movement of celestial bodies in Greece, were present in Mesopotamia, and are still used so far. In the study of physics, we are in dire need of inventing modern strategies, methods and ways to learn scientific concepts. The teacher must extend his hand from behind the walls of modernity to capture a fertile imagination in which he invites these concepts to his scientific table to achieve endless dialogues with video and segments and images to come in line with the spirit of the age away from the usual methods of learning monotonous ², which stands in the way of the learner’s understanding of the learner, depending on the narration of information and fill it in the mind of the learner without organization or arrangement, creative ideas must make the love of material increases in the student. To accommodate concepts in new ways. The criterion of success in this article is the preservation of the material and the student’s ability to solve the physical problems and neglect educational activities that develop multiple thinking patterns and multiple skills, which causes the negative understanding of the material and does not achieve the actual objectives of teaching ². One of the modern methods of teaching that develop student thinking and facilitate the understanding of the process of education is the structural model Nidham. This model was proposed by researcher Richard Nedham in the United Kingdom. The program was designed to enhance the ability of learners to understand the scientific concept and motivate them to participate themselves, actively and effectively within the classroom. Nedham proposed this model, which was based on the foundations of

DOI Number: 10.5958/0976-5506.2019.01443.8
Orientation or Attention: It draws the attention of learners and raised their abilities towards the subject of the lesson by the teacher, as follows: Presenting the subject in the form of pictures or in the form of stereotypes or video clips. Allowing learners to think about those topics, and then find solutions to those topics or scientific phenomena studied.

3 - the ability to predict the causes of the phenomenon, and what the consequences of it, and the mechanism to develop possible solutions. To develop appropriate justification for such predictions before commencing the implementation of such scientific and practical activities. Receive views and ideas on topics of learners in individual form. The production of ideas Generation of Idea: At this stage the teacher determines the amount of previous ideas owned by the learner and through: Receiving and recording learners’ predictions about the problem or phenomenon presented to it. put a set of questions that raise learners to think about the problem, then recording answers. The work of binaries Restructuring of Idea: Here begins the role of the teacher in rebuilding the previous ideas, which are originally false ideas for learners: The learners are divided into two groups, each of which contains (5-6) learners. Urge learners to cooperate through conducting scientific activities and the use of surveys and problem solving during the activities. Recording all observations, interpretations and conclusions. Conducting an open dialogue among the members of the same group in order to identify the contradictions that resulted from the predictions in the guidance stage. Each group presents the scientific expertise they have obtained on the rest of the groups within the class. Open dialogue between the groups on the scientific expertise they reached.

**Methodology**

It includes a presentation of the procedures that have been carried out to achieve the research objectives, starting with the research methodology and experimental design, identifying the research community and its design, the equivalence of the research groups (experimental and control), preparation of the research requirements and tools, The empirical design of the research includes the independent variable (the Nedham model), the normal method, and the dependent variable. The researcher used the partial experimental design of two equal groups, one experimental and the other control.

The research community and its sample: The current research community represents the fifth grade students in all the secondary and preparatory schools in the governorate of Babil for the academic year (2018-2019), which has at least two divisions. The researcher chose (a), (b) the random sampling method (the drawing method) to represent the experimental group and the number of its students (30) students who will study their students according to (Anmoz Nedham), the same way the researcher chose randomly Division (b) to represent the control group and the number of students (30 students), which will examine its students according to (the usual way).

The equivalence of the two search groups:

The researcher conducted a statistical equivalence between the experimental and control groups in some variables that affect the results of the experiment. Although the researcher chose the two groups in the random drawing method, although the students of the research sample from the social and economic center are very similar and study in one school, The equivalence of the following variables: the age of time calculated in months, the first semester, the IQ test. The researcher conducted the equivalence between the two research groups in the variables mentioned above and the results were shown in the table 1. Control of Exotic Variables: The researcher tried to avoid the effect of some of the extraneous variables in the course of the experiment. Some of these variables and how to control them are as follows: Accidents Accompanying the Experiment: Experiment in the research has not been subjected to any emergency or accident that hinders its progress. For each student throughout the experiment, the sample was selected: The two groups were randomized and the two groups were confirmed. The maturity factor: Since the duration of the experiment is uniform between the two research groups as well as the age of the students in the two groups, the growth will return to both groups at the same level., So for This factor has no effect on research, the effect of experimental procedures: the researcher’s work to limit the effect of experimental procedures that may affect the dependent variable during the course of the experiment.
Preparation of Search Tools:

Scientific Material (Content): The scientific material that the researcher is teaching was selected for the students of the two research groups during the period of the experiment (the second semester) of the academic year (2018 - 2019). The researcher prepared 16 a plan for the experimental group, The structural model of Nedham) and the same for the control group, which is taught according to the “normal method”.

Research Tool: The “Collective Test” has been prepared according to the following steps:

Determination of the purpose of the test Reflective thinking: The goal of contemplative thinking is to measure the achievement of students in the fifth grade applied (information, skills and experiences) in physics in the study of (circular and rotational movement, vibration movement, wave, sound, electric current).

Determination of Behavioral Goals: After the purpose of the test was determined the contemplative thinking behavioral goals are determined to determine the extent of achievement and the researcher formulated a number of behavioral goals.

Determining the Test Paragraphs: The researcher prepared a specification table and a test map. In light of this, 30 test cases were identified.

The test subjects were designed as a preliminary test in the light of the experimental map. The researcher chose the type of test (multiple choice) which is one of the best objective tests. The test consisted of (30), Understanding, application, analysis).

Test Instructions: Specific instructions and instructions are written on how to answer (selecting one correct alternative to the paragraph, answering all paragraphs, answer time, writing the triple name, row and division in the assigned space).

Correcting the Test Answers: A standard was set for correcting the answers by placing one score for each correct test paragraph, zero for the wrong answer, the left paragraph that the student did not answer, and the paragraph for which he placed more than one choice. Thus, (30 degrees) and the minimum score (zero).

The validity of the test: The veracity of the test was verified and the validity of the content was confirmed. The results showed that the apparent honesty obtained the percentage of agreement (85%) by the arbitrators and specialists. As for the validity of the content, the results showed that all the paragraphs of the test reflective thinking is statistically significant. Reflective in measuring the comprehension and comprehension of students in the fifth grade applied in physics.

The Exploration Application for the Achievement Test: which included the following The first survey application: The test was applied in the first phase of the study. The students were 30 students. The purpose of the test was to

know the clarity of the instructions and instructions of the
test and the understanding and clarity of the paragraphs
of the news to the students and the calculation of the
time period. The researcher calculated the exit time for
each student. In calculating the arithmetic mean of time,
it was found that the time needed to answer all the test
paragraphs was (44) minutes.

**The second test application:** The test was applied to
a sample of (100) students in the fifth grade applied
without the research sample. The purpose of the test is to
analyze the test paragraphs. The theoretical thinking is
the difficulty of the paragraph.

Statistical analysis of the test paragraphs Reflective
thinking: The test paragraphs were analyzed as follows:
The difficulty of the paragraph: The statistical analysis
of the test paragraphs Theoretical thinking found that the
coefficient of difficulty of paragraphs ranged from (0.39 -
0.72) and thus the test paragraphs are all reflective thinking
acceptable and difficult appropriate. The distinction
of the paragraph: the important qualities and must be
provided in the paragraphs of the test is a distinguishing
feature and means the possibility of items or paragraphs
to identify the individual differences of students and the
test items are valid as the coefficient of discrimination
of items is (0.2) and above, the value of the coefficient
discrimination test paragraphs reflective thinking
(0.32 - 0.68). Thus, the test paragraphs are considered
to have a good and appropriate discriminating factor.

Effectiveness of the wrong alternatives: The researcher
conducted a statistical analysis (highest 54% and lowest
54%) to find the effectiveness of the wrong alternatives
ranging from (0.05 - 0.41 -) and it turned out that the
alternatives of the test paragraphs reflective thinking are
all effective and thus the collection of all appropriate.

**Methods of finding the stability of the test:** The midterm
split method: The researcher divided the test paragraphs
into individual paragraphs and double paragraphs and
chose the answers of the sample of the survey sample
(100). In the Pearson correlation coefficient between the
individual and marital scores, the stability coefficient
was obtained (0.78) The midpoint of the test does not
measure the overall homogeneity of the test (because
it is stable for only half). Therefore, the correction was
done using the Sperman Prowan coefficient, which
reached (0.88) a good stability coefficient from the point
of view of the specialists.

**Koder-Richardson Method:** The Koder-Richardson
equation is applied according to student scores. The stability
coefficient was calculated by equation (0.79) as the test is
good if the coefficient of stability (0.70) and more

**Application of the research tool:** The experimental and
control groups were informed about the date of application
of the test. The study was conducted one week before the
completion of the teaching of the specific material for
the two research groups at the same time. The researcher
supervised the application of the test.

**Statistical Methods:** The researcher used the t-test
equation for two independent samples to make the parity
between the experimental and control groups and the
Pearson correlation equation. The researcher used the
equation to correct the correlation coefficient between
the test segments (individual and marital scores) after
the Pearson correlation coefficient. The spss program,
the Microsoft Excel 2007 program (Excel). Results
showed that the experimental group was superior to the
control group and the following table shows the results
of t-test of two independent samples of the experimental
and control groups in the test of the Reflective thinking.

**Conclusion**

The students in the experimental group showed a
significant difference in the level of significance (0.05)
between the average score of the experimental students
who study the science according to the Nidham model
and the average score of the students of the control group
who studied The same material in the usual way in the
test of contemplative thinking and for the benefit of the
experimental group.

Analysis and Measurement the Standards and its Impact the Reflective Thinking to Develop the Habits of Mind for Students

Riyadh Kahdum Azouz¹, A. Saad Abdul Razzaq Al-Khorsan², Salah Mahdi Saleh²

¹Assist. Prof., ²Faculty of Basic Education, Babylon University, Department of Graduate Studies, Methods of Teaching Social Sciences, Iraq

ABSTRACT

This research aims at identifying the availability of USC standards In the content of a book founded the geography and techniques for the fourth grade literary, and included (NCSS) for social studies Society of Search Book Content The Foundations of Geography and its Techniques for the Fourth Literary Class in Iraq 10th Edition (2018) for the academic year (2019-2020) and the number (143), has been excluded from the book (Introduction, The index, questions, and images) and thus the number of pages of the book analyzed (107) pages. Issued by the National Council for Social Studies, which concerns (NCSS) the researcher adopted standards Article geography is taught for the fourth grade literary, after the translation into Arabic, and to verify its sincerity in First and then its relevance to the Iraqi environment, and was finalized in ten areas of sixty-nine A standard, obtained stability through persistence over time, and stability with analysts have been good proportions, and have been Use the idea as a unit for analysis and replication as a unit of census and the analysis on the basis of fixed steps.

Keywords: Techniques, NCSS, Fourth Grade

Introduction

Analysis and measurement, the geo-curricular approach has seen recent leaps as well as content. Scientific, where specialists in the field of geography to deal with topics that did not exist and are known. Previously, for example, global warming, environmental pollution, and the spread of dangerous and common diseases. Drugs, climate change resulting from human activities and geographic information systems ¹. Hence, the contemporary interpretation of geography as well as the description of the land is a study of what exists On the surface of the study of scientific and accurate and real, and know all what affects their manifestations, and what is affected by, and statement Laws that define geographical relations as natural, human and economic². In order to achieve these objectives, an analysis of the approach to vulnerability should be undertaken Diagnose negatives and develop appropriate solutions, by using specific and appropriate criteria During the process of analysis, it is necessary to know what has achieved this content, and in order to be in line The curriculum with the rapid changes taking place in the world must be analyzed ³. In light of the above, we find an urgent need to know the extent to which the content is adopted by the standards and objectives through which it is developed. The content must be analyzed and described quantitatively and quantitatively, so analysis can not be abandoned by experts, experts, researchers and developers of the curriculum. That through the process of analysis we identify the content of the educational curriculum that we want to present and teach to our students and the contents of the concepts, facts, subjects and skills because it is a tool of the curriculum that reflects the content and as a result led to the urgent need to know the concept of content analysis as well as the characteristics and uses related to it ⁴. On this basis, content analysis is a common common value among all research and studies that follow the same method. The accurate and reliable objective observations measure the frequency of certain

Methods of Teaching Social Sciences, Iraq
Email: salah.althabhawe@gmail.com
characteristics of the content. The alternative to self-impressions and accurate calculations of the frequency of phenomena in aspects of scientific research and studies is found. The curriculum can issue a judgment on the availability of standards in the curriculum, the strengths and weaknesses of the textbook currently being studied, and the development of rules and principles for review and development when necessary. Based on the great importance of educational curricula, it is necessary to conduct the analysis process to see the extent of its suitability and pace of scientific development in order to achieve a high degree of admissibility in the mastery of work, and the high level of performance to the maximum that can be aspired to the goal that everyone seeks to achieve and hope that aspire To achieve it and the desired end. Based on the above, this research was conducted to analyze the content of the book based on the geography and techniques of the fourth grade literary according to the standards of the National Council for Social Studies (NCSS), to see the extent to which these standards are comprehensive and keep pace with the scientific and technological developments in the contemporary world in quantity and quality.

**Methodology**

This chapter includes a description of the research methodology and procedures followed by the researcher in order to achieve the goal of the research, which is the analysis of the content of the book bases the geography and techniques of the fourth grade literary according to the standards of the National Council for Social Studies (NCSS), and description of the research community and eye and how to rely on the search tool and its relevance to honesty and stability And the application of the tool and the statistical means I use to analyze and process data. The most appropriate approach to the nature of the research is descriptive because it is appropriate to the requirements of its research, which is based on monitoring and accurate follow-up of a particular event or event in quantitative or qualitative manner in a period of time or for many periods in order to identify the phenomenon or event in terms of content and content to reach the results and generalizations help to understand, and that “content analysis” is one of its methods and prepares a structured and accurate description of the content of texts written or audible by determining the subject of the study and its purpose and the definition of the study community to be chosen

**Research Community and its Eye:** It is difficult to obtain a representative sample unless the original community and its description are accurately described, because each community has its own characteristics. The research community, the book of the foundations of geography and its techniques for the fourth grade in Iraq, the tenth edition (2018 - the Committee of the Ministry of Education) to be taught in the academic year (2019-2020 m) the researcher adopted the entire research community as a sample for his research, the book consists of (142), The researcher excluded the pages that contain (the introduction, the index, the illustrations and the questions that appear at the end of the chapters of the book). The pages under analysis have become (107) pages.

**Search Tool:** The form designed by the researcher to collect the data and monitor the frequency of the phenomena digitally in the materials analyzed content is called (analysis tool) (absolute and alive, 149: 2013). That the number of the tool many benefits may be the most important:

1. Monitoring the frequency of phenomena digitally, and thus can be used data in more than one way to achieve more than one goal.
2. shortening the time and effort.
3. followers of one system in data analysis.
4. Complete the elements of analysis.

Therefore, the researcher worked on the preparation of a tool in the light of which analysis of the content of the book bases the geography and its techniques

For the fourth grade literary in Iraq to be taught in the academic year (2019-2020 m), and followed The following steps:

A. access to literature and previous studies

**B.** Obtaining the standards of the National Council for Social Studies (NCSS)

The Department of Education in the United States of America has developed the curriculum and used these criteria in the field of geography, which includes areas (culture, time, continuity and change, people, places and environments, identity and individual development, individuals, groups and institutions, power and government, production, distribution and consumption, science and technology). Society, global associations, ideals and civil practices). These areas consist of (69) criteria.
To use and guide the opinions of experts and specialists in the field of educational and psychological sciences and to obtain a tool to achieve the goal of research translated the list of standards of the National Council for Social Studies (NCSS) from English to Arabic, the list included ten areas comprising 69 sub-criteria.

Tool Validation: One of the conditions that must be met in the research tool is honesty and is honest if it measures what is already measured. The research tool must belong to the subject to be examined. There are several ways to achieve honesty. The apparent honesty of the search tool is presented by a group of experts and research specialists to judge the validity of the paragraphs and the items contained in the tool to measure what they have set for it.

In order for the researcher to verify the validity of the research tool, follow the following procedures:

1. Verifying the veracity of the translation by presenting the standards translated into Arabic with English standards on a group of specialists in English, in order to demonstrate the accuracy and clarity of the translation.

2. Calculation of the proportion of their agreement on the paragraphs using the square of Kai, and found that the paragraphs have the truth of translation, exceeded the criterion of 80%, and to verify the validity of the tool in terms of appropriate standards of the Iraqi environment, the researcher follow the following procedures:

   A. Presentation of the standards translated into Arabic on a group of arbitrators and specialists in educational sciences, psychological and geographical in order to demonstrate the adequacy of standards for the Iraqi environment, as well as verification of the credibility of the tool, the experts agreed And specialists on the appropriate standards for the Iraqi environment and therefore the tool is able to measure what has been prepared to measure already.

   B. The proportion of their agreement on the paragraphs was calculated using the square of Kai, and found it to be verifiable paragraphs.

Analysis

The analysis is carried out in order to uncover and explore knowledge as well as to examine it thoroughly and critically and then to present it in full to add to the knowledge that has been reached because it is a method that helps solve certain problems. This proves that there is a close correlation between the content analysis and the research problem.

The result can be followed by this method or method of research in reaching the answer to a problem question

Research (to what extent the NCSS standards are available in the content of the book The Foundations of Geography and Techniques for the Fourth Grade).

Rules and Analysis of Analysis: The research has several rules and bases followed by the researcher:

1. When there are two ideas in one sentence or more, one was cause and the other result or “one means And the other is an end, both are treated as one idea.

2. When there are two ideas in the same phrase, and can not be fragmented then the researcher resort to the strongest idea

3. If an idea does not show a certain significance because it is linked to the idea before or after, then the researcher returns to the previous or subsequent idea of diagnosing the current idea he

Wishes to Analyze: Steps of analysis

1. working on obtaining a list of standards, which are the standards of the National Council for Social Studies (NCSS) and translated into Arabic.

2. reading each of the topics of the book founded the geography and techniques of the fourth grade literary to identify Ideas in general.

3. a second reading of each line in the same subject for the purpose of reaching the extraction of phrases that include an idea.

4. Determine the terms to which each idea refers to and then classification, application of the registration unit.

5. To discharge the results of the analysis in the form of analysis and give a repeat for each area and the standard number Which refers to the resulting idea of analysis.
6. Calculate the frequency of availability of standards for each field in the book content of the foundations of geo and its techniques.

**Statistical and Arithmetic Methods**

1. Pearson correlation coefficient
2. square as any
3. percent

**Results and Discussion**

Your search yielded the following results: focus on some areas and calibration, such as the area of people, places and environments, if it got high values. And few in other areas such as the sphere of influence, power and government, and the researcher discussed these results. Some criteria, such as the criterion of different maps of the globe, are high, compared with some criteria that were not included in the book as the criterion of privatization in commercial companies. The researcher believes that the results of the research are due to the authors’ emphasis on highlighting the relationship between geography and the history that emerged. In the field of time and continuity and change as they are branches of social materials, and although it is a positive factor because history is the basis of the understanding of geography, but it was a degree carried with weakness in the other areas of geography included in the standards (NCSS).

**Conclusion**

The researcher used the square of Kai to obtain honesty and Holistic equation to obtain coefficient of stability and proportion As a computational method for calculating the frequencies. The results of the research showed a focus on some areas and their criteria, such as time, continuity and change. He obtained high values and said in other fields, such as the sphere of influence, power and government. The researcher discussed these results.

Assessment of Secondary School Female Students’ Knowledge about Reproductive Health in Basra City

Aliaa H. Ali¹, Ezedeen F. Bahaaldeen²

¹MSc Student, College of Nursing, University of Basra, Iraq; ²Professor, College of Nursing, University of Baghdad, Iraq

ABSTRACT

The study started from November 2018 to April 2019. Validity of the questionnaire is determined through a panel of (12) experts and the reliability through the pilot study. Descriptive and inferential statistical analysis were employed for data analysis. The results show that the highest percentage of girls (82.5%) was in age (14-18) year’s age, (60.2%) from student have between 1-4 brothers, (92%) of students was lives in urban area, (93.0%) of them was lives with their parents, (34.8%) of the student fathers was government employing, and (54.4%) of the student mothers have income, the majority of students’ family have low income (34.9%), (34.9%) of student at good level of attainment, external books were the first source of information (62.5%) of respondents. This study shows that student knowledge toward all domain of reproductive health were moderate level which as the total means (0.81), while student’s knowledge about Sexually transmitted diseases was low level of knowledge which of the total means was (0.68). This study present that there were significant association between the student knowledge and their frequency among brother, and external reading from internet, and there were no significant between the student knowledge and their age, and living of student at P≤0.05 level.

Keywords: Assessment, Knowledge, Reproductive Health.

Introduction

Adolescence is the period of human growth and development that occurs after childhood and before adulthood, from 10 to 19 years of age. Adolescence is a period of potent developmental and emotional interval. Most of adolescents yet neither have approach to information and education on sexuality, reproduction, contraception and sexual and reproductive health and rights, nor do they have access to preventive and curative service. Teenage pregnancies look as high-risk pregnancies result in unsafe abortions, low birth weight, and high maternal morbidity and mortality. Almost 40% human immunodeficiency (HIV) virus infection is found within teenagers. Study was performing with objective to study the knowledge and attitude regarding menstruation, contraception and sexually transmitted diseases among secondary and higher secondary school girls. Adolescents need to know how to keep themselves from Human immunodeficiency virus (HIV), sexual transmitted diseases (STDs) and early pregnancies, for this sex education is the best way, it should be a lifelong learning process based on the knowledge and skills and positive attitude, it helps the young people to enjoy sex and relationships that are based on qualities such as positive knowledge, cross respect, confidence, conversation and enjoyment. Focusing on adolescent reproductive health is both a challenge and an occasion for health care providers. While adolescence generally is a healthy period of life, many adolescents are less informed, less experienced, and less comfortable accessing health services for reproductive health than adults. Adolescents often loss basic reproductive health information’s, knowledge, and access to affordable confidential health services for reproductive health. Many do not sense comfortable in exploring reproductive health parents. Parents, health care workers, and educators frequently are unable to provide entire, accurate, and age-appropriate
reproductive health information to young people. This is often due to their own discomfort about the topic or the false belief that providing the information will encourage sexual activity. Adolescents may also experience resistance or even hostility and bad attitudes from adults when young people effort to gain the reproductive health information and services they need. They therefore may be at an increased risk of sexually transmitted infections (STIs), unintended pregnancy, HIV, and other health consequences. For women aged 15 to 19, complications of pregnancy, childbirth, and serious abortion are the major causes of death.

Methodology

A descriptive analytic study was conducted to assess the level of knowledge about reproductive health among 287 school females students in the age (14-23) years from six secondary schools in Al-Zubair district in Basra city, the data was collected by direct interview using constructed questionnaire to obtain socio-demographic characteristics and level of knowledge related to reproductive health. The study started from November 2018 to April 2019. Validity of the questionnaire is determined through a panel of (12) experts and the reliability through the pilot study. The data was collected through students self-filling technique by using questionnaire which designed for the purpose of the study, which consist of two main parts (Socio-demographic characteristics, and knowledge of students about reproductive health). Descriptive and inferential statistical analysis were employed for data analysis.

Results and Discussion

The present study showed that the majority of the respondents 237 (82.5%) are at age group (14-18years), and (92%) of them live in urban area. The majority of participants (62.5%) reported that the major source of information from browsing internet, these results was in disagreement with the results of a study done by Mattebo, Elfstrand, Karlsson, and Erlandsson, (2015) who stated that 78% of participants were receive information from their friends. The findings of this study showed that the participants have moderate knowledge about menstruation (menstruation means, normal cycle length, causes of menstruation, and source of menstrual bleeding). This result is inconsistent with Fehintola et al.,(2017) who stated that more than half of participants have good knowledge about menstruation.

The study findings revealed that the students have moderate knowledge about infertility (Alcohol can predispose to infertility, it is easy for a woman to conceive after 40years, Smoking can predispose to infertility, etc), consistent with Adesiyun et al., (2014) who stated that the knowledge of participants regarding infertility were moderate. The possible explanation for these could be that students need more assistance in this subject. Regarding sexually transmitted diseases, the participants have poor information regarding STDS (Sexually transmitted diseases can be transmitted by Exposure to cough and sneeze from infected persons, Transfusion of blood from one person to another, Unprotected sexual intercourse, etc). This result is consistent with Ali, (2013) who stated that more than a half of adolescent girls had poor awareness regarding (AIDS). The participants reported that they have moderate knowledge about prevention methods (Use of condom during sexual intercourse protect against sexual transmitted diseases, Don’t share with others sharp or engraving tools, Having a single faithful partner). This is inconsistent with Nwatu, Young, Adikaibe, Okafor, and Onwuekwe, (2017) who stated that knowledge of appropriate preventive measures and practices for STIs and HIV, more than a quarter of the students were not aware that having a single faithful partner was an effective method of prevention while only three quarters of have good knowledge of all preventive measures assessed. This results show that the participants have moderate knowledge about signs of maturity (Hair growth, Breasts enlarge in puberty, Hips enlargement in puberty, etc). This findings consistent with petter, (2013) who stated that Female students were more likely to have moderate knowledge regarding the physical changes of girls. This proves that the girls have aware about physical changes during puberty. The study revealed that the girls have moderate knowledge about premarital counselling (Thalassemia test, Screening for Hepatitis type B, Detection for hypertension, etc). This result inconsistent with kmail, (2011) who stated that the participants have good knowledge about premarital screening. This because to educational lessons that studied for adolescent in their schools. The study conducted moderate knowledge about preconception counselling of the participants (avoiding tobacco and other drugs, seeking further information about pregnancy and care of the children, Life styles change (healthy weight), etc). This is inconsistent with Nascimento, Borges, Fujimori et al.,(2015) who stated that there
was a small proportion of adolescents who have some preconception information. The researcher proves that the study done of unmarried adolescent, on another hand may didn’t hear about this items, so they haven’t enough of information about this mater.

Regarding the conditions of pregnancy the participants reported moderate knowledge about this topic (Hormone necessary for the occurrence and continuation of pregnancy is testosterone, The pregnancy with age more than 35 years occur without complication, There are no health contraindications for anemic woman to become pregnant,,etc). This result is inconsistent with that Basyouni, and Aly, (2015) who showed that the participants have little knowledge about this subject. The researcher believes that health education topics didn’t included within the curriculum of adolescent students. The study showed that the participants reported moderate knowledge regarding this item, this finding is inconsistent with Basyouni, and Aly, (2015) who stated that the participants have inadequate knowledge about this item. This proves that the adolescent didn’t visit the antenatal care because they are unmarred and ignore their family the necessity of the antenatal care. Concerning the tetanus vaccine the students showed that they have moderate knowledge about this vaccine (People who are not completely immunized and have wounds should receive a tetanus immunization,,etc). This result of the study disagreement with Orimadegun, et al., (2014) who showed that Almost two- thirds (64.7%) of the respondents had poor knowledge about tetanus vaccine.

The Impact of the Pairs Check Strategy on Achieving Fourth Grade Students to Develop the Habits of Mind for Students

Khamael Mohammed Merzah¹, Ibtisam Jaafar Jawad alKhafji², Sana Salim Najm³

¹Master of Science Teaching Methods of General Science, Physics Department, ²Doctor of Philosophy in Education Teaching Methods of Science, Department of Teaching Methods of Science, ³Master of General Physics, Faculty of Basic Education, Babylon University, Hilla, Iraq

ABSTRACT

The purpose of the research is to identify the impact of the Pairs Check strategy in the achievement of students in the fourth grade in physics. The researcher adopted the empirical research method as a methodology for conducting the current research. It includes an independent variable (Pairs Check) and the usual method (and a dependent variable) The results of the study were calculated according to the Pairs Check strategy and the average scores of the students of the control group who study according to the usual method in the test. In addition, the researcher prepared an achievement test consisting of (50) paragraphs according to the behavioral objectives set according to the relative importance of the content. The researcher investigated the psychometric characteristics of the test after conducting the experiment on the research sample in the academic year (2018-2019), which lasted for 8 weeks. Finally, the experimental test was applied to the two groups. Which is examined according to the peer examination strategy (Pairs Check) on the control group that was studied in the normal way of the academic achievement variable.

Keywords: Pairs Checking Strategy, Achievement, fourth grade students, physics, electromagnetic waves, brain.

Introduction

According to the philosophy of education in society, the world has turned to modern education by providing a modern environment to build and shape the personality of the individual in the society and make their development integrated and balanced physically, psychologically and mentally through the acquisition of good social qualities and it is through the school which is the tool of education to achieve its desired goals. The specialists in scientific education emphasize that teaching in general and teaching physics in particular not only convey information to the learner, it is a process that helps the learner build their knowledge and increase their understanding of the world around them and help their growth (physical, mental and skilled) to integrate their personalities in various aspects. Abees, (2018) says that scientific education emphasizes the creation of a conscious individual capable of coping with cognitive and technological development and coping with life and its future, economic and social challenges. Scientific education is an ongoing process. The basic task is from the perspective of experts and specialists in scientific education, They think in a critical scientific way, especially in physics. Physics is the branch of knowledge that gives organized answers to all the questions that are in our minds about nature. These answers depend on the scientific method based on experimentation and logic that explain the phenomena according to the scientific theories that have proven to be applied in the field. Some of them are based on mathematical interpretation through laws and relationships. Concerns about the phenomena of cosmic and material that most of the issues depend on the conclusions as in the physical experiments of this is a physics quantitative science describes all the phenomena in terms of a few relationships and be measurable, and characterized by a high degree of general and derived from a large number of For phenomena called laws of
According to Abd Omran, (2018) The scientific breakthrough in physics began at the dawn of the twentieth century. It was necessary to pause to consider how to teach this science at different levels of study and to allow the learner to understand and understand physical concepts. Physics is not just a branch of science. Natural, but the origin of other sciences, it became clear to the learner that if he wanted to understand the other basic sciences, it is necessary to absorb more of the concepts of physics that involve the composition of the rest of science and linking physics to daily life and increase the physical culture of the learner. Badawi (2010) says that structural theory is one of the most active theories that support active learning because it depends on the activity of the learner and revolves around it. The learner learns the importance of thinking and allocates sufficient time to it, and linking new ideas with his daily life and also related to previous topics, and also linking ideas in the article with ideas of other materials. The application of this method requires that students be trained in the practice and modeling provided by the teacher in front of students and requires the identification of problems or issues that are intended to train students to solve them from the teacher and write them in working papers distributed among couples and each student to prepare paper and pencil to write the solution or training and recording notes. And train students to give feedback and give praise to the difference between giving an answer to the question and to train others to solve and teach them how to give others time to think about the solution or answer.

**Methodology**

The researcher adopted the experimental approach as a methodology for carrying out this research, which includes an independent variable (Pairs Check, and the usual method). The researcher used experimental design with partial control of the experimental and control groups after the equivalence between them. This method is best suited to achieve the research objectives.

**Search Community and Design:** The current research community included students of the fourth grade in the government day schools of the Directorate General for the Education of Rusafa II in Baghdad - a center for the academic year (2018-2019), which has a population of not less than two divisions. The sample of the research chose the researcher (Nazareth Preparatory for Girls) (B), the researcher chose the (B) method of random drawing (the drawing method) to represent the experimental group and the number of female students (35) students who will study according to (Pairs Checking Strategy) and in the same way chosen to represent the control group and the number of female students (35) students who will study according to (the normal method).

**My Search Group Parity:** In order for the results to be more accurate, the difference between the experimental and control groups should be equal to the independent variable. The researcher must achieve the equivalence between them to exclude all the variables that affect the results of the experiment. The variables are (age calculated by months, first grade, IQ test). The equivalence between the two research groups in the variables above. The results showed in Table (1).

</tbody>
</table>

**Search Tools:** The research material is one of the most important things that the researcher does for the purpose of conducting the research. These requirements are as follows: (The scientific material (content)): The scientific material that the researcher has been teaching was determined for the students of the experimental and control groups during the period of the experiment (second semester) (2018-2019). The scientific article included the last five chapters of the book of physics for the fourth grade scientific, the formulation of behavioral goals: The researcher adopted the classification of (Bloom) of the field of knowledge, which includes six main levels (recall, understanding, application, analysis, synthesis, evaluation) Behavioral objectives.
based on the general objectives, the scientific subject (content) covered by the experiment, the teaching plans: The researcher prepared a set of teaching plans for the experimental and control groups in light of the educational content of the five chapters (fifth, sixth, seventh, eighth and ninth) of the physics book to be taught to fourth graders (2018-2019), and the number of (16) teaching plan for the experimental group, which is taught according to the strategy of peer examination (Pairs Check) and similar to the control group, which is taught according to the normal method.

Search Tool: The steps of the research tool (the collection test) are:

Determining the purpose of the achievement test: The purpose of the preparation of the achievement test to measure the achievement of students in the fourth grade in physics for the second semester in the academic year (2018-2019). Therefore, the researcher prepared an achievement test for the subject according to the behavioral objectives and appropriate level. The research sample

Determining the purpose of the test: The purpose of preparing the test is to measure the achievement of students in the fourth grade scientific (research sample) in the last five chapters (fifth, sixth, seventh, eighth, ninth) of the book physics after teaching them.

Determination of the test paragraphs: The researcher prepared a specification table according to the basic steps, and determined the relative importance of the five chapters (light V, VI (reflection and refraction of light), VII (mirrors), VIII (thin lenses) The researcher determined the relative weights of each level of the cognitive field in the light of the number of pages of the chapters of the book. After defining the test paragraphs with (50) paragraphs, the number of questions per cell was determined in the specification table.

Preparation of the test paragraphs: In the light of the specification table, the researcher prepared (50) objective test paragraphs of multiple choice type with four alternatives to measure the level of knowledge, understanding, application, analysis, Reflection and refraction of light, mirrors, precision lenses, static electricity).

Formulation of the test instructions: The researcher prepared the instructions and instructions for the collection test, including how to answer (selecting one correct alternative to the paragraph, answering all paragraphs, the time to answer, writing the triple name and the row and the division in the field assigned to it).

Correcting the test answers: After determining the type of test and formulating its paragraphs, the researcher determined a standard for correcting the answers. The researcher put one score for each correct test paragraph and 0 for the wrong answer and the left paragraph that the students did not answer. Is (50) degrees and the minimum grade (zero).

The validity of the test: The researcher confirmed the truthfulness of the test and the validity of the content. The results showed that the apparent honesty was agreed upon by (80%) by the specialists and arbitrators. As for the validity of the content, the results showed that all the clauses of the achievement test are statistically significant. Honestly in measuring the comprehension and comprehension of fourth graders in physics.

The pilot application of the assessment test

The first test application: The achievement test: To verify the clarity of the test subjects, instructions and answers and to determine the time required for the test, the test was carried out on a sample of 50 female students from the fourth grade without a research sample to determine the time taken to answer. (50) minutes by recording the exit time for each student, and by calculating the mean of the time needed to answer all the test paragraphs.

The second survey application of the test of achievement: The test was applied to a sample of (100) students in the fourth grade of scientific non-research sample, the purpose of which is to analyze the items of the statistical achievement test, namely the difficulty of paragraph, discrimination of the paragraph and the effectiveness of the wrong alternatives.

Statistical analysis of the test scores: The achievement test was analyzed as follows:

Coefficient of difficulty of paragraph: The performance test was found to have a difficulty coefficient of (0.31-0.74). Therefore, all the test scores are good and difficult.

Parameter discrimination coefficient: The distinguishing features of the items are: (0.30-0.70) and above, and the difference between the test scores of the test scores (0.20 - 0.80). Thus, the test scores are considered to have a good and appropriate discrimination coefficient.
The effectiveness of the wrong alternatives: The researcher conducted a statistical analysis (highest 27% and lowest 27%) to find the effectiveness of the wrong alternatives ranging from (-0.11) - (-0.33). This indicates that the alternatives of the test scores are all effective, occasion.

Results and Discussion

The students of the experimental group who studied according to the Pairs Check strategy exceeded the students of the control group who studied according to the usual method in the achievement test. This study was unique in this study as the first study on the strategy of peer examination in the achievement of fourth grade students in Physics, as in Table (2). There is a statistically significant difference at the level of significance (0.5) between the average score of the students of the experimental group who study according to the Pairs Check strategy and the average score of the control group students who study according to the usual method in the physics collection test. The researcher found that the level of students in the fourth grade of science is low in physics and touched this decline through the degrees of previous years in physics so the researcher was surprised to experiment with a new strategy of active learning strategies, namely the strategy of peer examination (Pairs Check), the researcher noted that the average grades of female students The experimental group is 36.51 and the difference is 33.52. The average score of the students in the control group is 28.97 and the difference is 53.00. The calculated value of T (4.796) is greater than the numerical value of (2.000), And therefore the difference between the two groups is statistically significant at the level of (0.05) and the degree of freedom (68), and Ali E, the students of the experimental group may outperform the students of the control group in the collection variable.

Conclusion

Teaching fourth grade students according to the Pairs Check strategy has had a positive effect on raising their academic achievement in physics and increasing their understanding of information, facts and knowledge. Teaching according to the Pairs Check strategy has greatly helped raise students’ ability to organize information and relationships that can be used to solve the daily problems they face. Teaching according to the peer examination strategy (Pairs Check) has made the student the focus of the educational process, by activating its role in the classroom participation in the educational situation and this in turn increases their self-confidence and encourage them to persevere to raise their level of science.

Effectiveness of Training Program of School-Age Students about First Aid by Videos Techniques on their Safety Practices in Al- Ashar District Schools at Basra City

Nuha Saeed khadhim Al-Mansuri1, Iqbal Ghanim Ali Ma’ala2
1Teaching Assistant, Pediatric Nursing Department, College of Nursing, Basra University, Iraq; 2PhD, Pediatric Nursing Department, College of Nursing, Ba’daad University, Iraq

ABSTRACT

This quasi-experimental study aims to identify the students’ knowledge about first-aid (Epistaxis, Epilepsy, Fracture, and Wounds), Evaluates the effectiveness of training program of school age students about first aid by videos on the study group, and Find out the relationships between the effectiveness of the training program of school age students about first aid and their socio- demographic characteristics (age, gender, parents’ education, parents’ occupation, and family’ socioeconomic status). The study was conducted at primary schools in Al-Ashar District at Basra City for the period from October 7th, 2018 to April 16th, 2019. The study included a probability (simple random) sample of 160 students who were randomly select into study and control groups; 80 students for each group. The results of the study displayed that there were statistically significant differences in students’ practices related to first-aid (Epistaxis, Epilepsy, Fracture, and wounds) after the administration of the video-assisted training program. The study concluded that the video-assisted training program positively affected students’ practices related to first-aid of epistaxis, epilepsy, fractures, and wounds. Furthermore, parents’ level of education has an effect in determining students’ overall practices related to first-aid.

Keywords: Effectiveness, Training Program, First Aid, Videos Techniques, Safety Practices.

Introduction

First aid is applied to injure or patients in any health-threatening environment to save life, prevent deterioration of the condition or contribute the treatment process prior to the availability of specialized medical care. First aid may refers to evaluation and attacks that may be carried out by a bystander (or victims) or without them 1,2. Thus, early treatment for such emergencies reduces morbidity and mortality among school-age children 3-5. A school is where children spend most of their time, learning new things and promoting themselves. Apart from their studies, they participated in many extracurricular activities which aimed at their physical and mental development in a healthy manner. Most common activities involving children are cycling, swimming and playing. However, during these activities children are more likely to be physically injured 6,7. From an active perspective, schools have individuals and facilities for first aid education facilities and because they have the largest number of students, there are places where the impact of first aid education can be maximized. Thus, first aid education is a measure to enhance understanding, abilities, knowledge about jobs, and attitudes about safety that can occur in the daily life of both individuals and groups. Thus, teaching first aid is used as the most effective way to maintain health and life. It is compulsory for anyone to learn first aid as preventive measure 8. However, to provide first aid correctly, the service provider should have some basic knowledge and experience to reduce the damage and save life. Therefore it is important that everyone has some basic knowledge about first aid to save the injured person until medical advice is provided 9. First aider is defined as someone who has been trained in first aid. He is the first person to provide care as a caregiver to provide first aid measures.
He must practice the perception of what to do and what not to do. He should realize that his knowledge and skills in first aid can reduce future injury and disability. The importance of first aid training in the early stages of their careers is now being implemented throughout the world. As persons have the ability to change the community’s health scenario if they are properly prepared and educated for a healthy living. WHO estimates, nearly 9,50,000 children die in the world due to an injury each year. However a recent national review on burden of injuries in India revealed that, nearly 8.2% of death and 20-25% of hospitalization occur among children based on few hospitals and population based studies. In the same year there were deaths among 1,133 children in Karnataka. A one year data from Bengaluru on the injury surveillance programme showed that 5,505 children brought to hospitals with an injury and 209 children below the age of 18 years died due to an injury.

Methodology

Study Design: A quasi-experimental design was used to guide this study. The study was conducted at primary schools in Al-Ashar District at Basra City, for the period from October 7th, 2018 to April 16th, 2019.

Study Instrument: To evaluate the effectiveness of the training program on students’ knowledge about first-aid at primary schools in Al-Ashar District at Basra City, the researcher constructed a questionnaire format in order to achieve the aims of the study after demonstration of the videos film about steps of first-aid.

Part I: This part content socio-demographic and personal characteristics items which include (age, gender, grade, parents’ education, residency, and students’ receiving of any first-aid training).

Part II: This part contains students’ practices questions related to first-aid which includes four sections (Epistaxis, Epilepsy, Fracture, Wounds).

Data Collection the Method: The study sample was randomly and equally selected from each (fifth and sixth grades) primary school students. The simple random sample method was used to recruit study subjects. The names of all students were written in identical pieces of paper. These pieces were stirred well and let one of the students drawn one piece. A probability simple random sampling method was used for selecting the study sample. The participants were randomly assigned to either the control group or the study group. Distributing questionnaires in person allow the researcher to explain the instructions before the participants start answering the question. The pre - test was given to participants for complete study questionnaire (self-administration), to assess their knowledge toward first aid.

Statistical Analysis: Data were analyzed by using the statistical package for social science (SPSS) version 24, for windows (Chicago, IL).

Results and Discussion

The age mean for students in the study group is 11.38 ± .86; more than two-fifth age 12-years-old (41.25%), followed by those who age 11-years-old (36.25%). For the control group, the age mean is 11.56 ± .79; less than a half age 12-years-old (45.0%), followed by those who age 11-years-old (38.75%). Concerning students’ gender and grade, students are equally distributed (50.0%) for each group. Regarding father’s level of education, more than a third of students’ fathers in the study group hold a bachelor’s degree (35.0%), followed by those who hold a diploma (22.5%). For the control group, more than a quarter reported that they hold a bachelor’s degree (27.5%), followed by those who hold a diploma degree (26.25%). With respect to mother’s level of education, more than a third of students’ mothers in the study group hold a bachelor’s degree (35.0%), followed by those who hold a diploma (21.25%). For the control group, less than a third hold a bachelor’s degree (32.5%), followed by those who hold a diploma degree (23.75%). Concerning the residency, all students in both groups reported that they live in urban areas (100.0%) for each group. Lastly, all students in both groups reported that they never received any training about first-aid (100.0%) for each group. There is a statistically significant differences in students’ practices related to the first-aid of epistaxis for the study group (p-value = .000). For the control group, there is no statistically significant difference in students’ practices related to the first-aid of epistaxis. There is a statistically significant differences in students’ practices related to the first-aid of epilepsy for the study group (p-value = .000). For the control group, there is no statistically significant difference in students’ practices related to first-aid of epilepsy. There is a statistically significant differences in students’ practices related to the first-aid of fractures for the study group (p-value = .000).
For the control group, there is no statistically significant difference in students’ practices related to the first-aid of fractures. There is a statistically significant difference in students’ practices related to the first-aid of wounds for the study group (p-value = .000). For the control group, there is a statistically significant difference in students’ practices related to first-aid of wounds (p-value = .000). Health education programs can be implemented in schools to prevent health-related problems consequently contributing to youngsters’ and community’s wellness Alexandropoulou in (2013). There was a noticeable improvement in level and first aid management skills of primary school students who received video-assisted teaching method concerning practices related to first aid of epistaxis with a statistically significant difference. This finding indicates the positive influence of the video-assisted teaching method in improving students’ practices related to first-aid of epistaxis. Also this finding is supported by Bandyopadhyay and others (2017) who reported that there was statistically significant increase in students’ knowledge on the first-aid management of epistaxis between pre-and-post-intervention. There was a noticeable improvement in students’ practices related to first aid epilepsy. This finding indicates the positive influence of the video-assisted teaching method in improving students’ practices related to the first-aid of epilepsy with a statistically significant difference. This finding is consistent with that obtained by Elewa and Saad (2018) who concluded that students’ knowledge and practices related to the first aid of epilepsy has improved after the administration of child-to-child health approach. There was a noticeable improvement in students’ practices related to the first aid of fractures. This finding indicates the positive influence of the video-assisted teaching method in improving students’ practices related to the first-aid of fracture with statistically significant difference. Consistently, this present study is supported by Bandyopadhyay and others (2017) who reported that there was statistically significant increase in students’ knowledge in the first-aid management of fractures between pre-and-post-intervention. There was a remarkable improvement in students’ practices concerning first aid of wounds. This finding indicates the positive influence of the video-assisted teaching method in improving students’ practices related to first-aid of wounds with a statistically significant difference. This finding of present study are consistent with that of Mohan and Chandrakala (2017) who reported that there was a statistically significant increase in students’ knowledge about the first-aid management of wounds.

Conclusions

The video-assisted teaching method has a positive effect in improving students’ practices related to first-aid of epistaxis, epilepsy, fractures, and wounds. Parents’ level of education has an effect in determining students’ overall practices related to first-aid and students’ age, gender, grade, and residency have no influence on students’ overall practices related to first-aid.

ABSTRACT

The present study aimed to measure the correlation between healthy nutrition and mental skills among primary school students in science. The sample consisted of (60) primary school girls in two schools and was chosen in a deliberate way to achieve the study objectives. The researcher prepared a questionnaire for health nutrition (44), and a test of the basic mental skills that fit the mental development of this stage, which consisted of (8) mental skills, where the number of three paragraphs about each skill and after ascertaining the indications of honesty and consistency, The analysis of the correlation coefficients revealed that there is a strong positive relationship between the healthy food that the student is taking and the raising of her mental skills. In light of the researcher’s findings, she recommends more studies on healthy food and its relation to other variables such as concentration, intelligence and academic achievement. And their mental abilities.

Keywords: Health Nutrition, Mental Skills, Elementary School Pupils

Introduction

The current research aims to improve the nutritional status of girls by providing food that can avoid the shortage of food provided to children in their homes and increase their intellectual activity as children who receive good nutrition are able to perform better than students who do not get nutrition and therefore are vulnerable to diseases. As the school cannot satisfy the needs of food in the home environment according to changing lifestyle and to instill proper eating habits and to familiarize them with the diversification of food and accept all varieties of food and develop a spirit of cooperation and collective participation, including through inspiration in the provision of food and create the table and create a diet pattern is true and good and prevent leakage in schools. And encourage parents to send their sons and the success of compulsory education, as well as the transfer of the right habits to the family atmosphere which the child will learn in school and thus Effect in society in general. The primary school age is a time of concern not only in terms of pedagogy and culture, but also nutritionally and its impact on the pupil’s body to grow healthy. If we prepare the right food for our students and our students, we will see the benefits of this in the future through a strong generation Of students with healthy and healthy bodies for the other stages of study in addition to organizing the life of the student in the primary scientific, educational, intellectual, social and health and facilitate the growth of healthy development. It is therefore necessary to provide a meal for primary school pupils which must contain important elements for the child and to help raise his or her nutritional level. Food, whether liquid or solid, the body after absorption from the intestine can be used in the generation of thermal energy and the growth or construction of tissues of the body and compensate for the loss of it and the preservation of the body and prevention of diseases. There are also dietary habits followed in the choice of food and related to the ways of preparation, cooking, presentation, eating and keeping all these habits in general formed from the age of the student, the family is the first source and responsible for raising the child and the definition of habits and practices of food and thus shaping the child’s social trends associated with food to agree then with Food and social literature prevailing in the community or food exchange

and promote and develop these food habits Photos of other social activities available in the environment such as school and public holidays and religious events and other social events Rodeo 4. In many countries, the school has become the primary institution responsible for preparing children to live in good health. The relationship between child health and education is close and reciprocal to teach children the right skills and behavior and to become useful factors for promoting community health. The employment of science processes in the science lesson transforms it from mere boring to creative intellectual processes that helps the learner to observe and think about their answers to the various questions and propose a design for experiments and the ability to interpret, infer and generalize. The earliest attempts to define the concept of science operations began relatively recently in the writings of Dersel in 1949. These writings included what is called scientific thinking as an important component of the objectives measured by a comprehensive examination in biological sciences. The ability of the learner to be: The Biological Science Project (1960) defined the processes of science (mental skills) as “the mental processes on which a person relies on organizing observations, collecting data and building relationships, and seeks to interpret or explain a mental event. This mental event represents the” problem “In science because scientific problems are sensed by man and determined by the work of his senses and thought, and there is no independent of him in nature. Scientific studies have shown the importance of breakfast for students. It comes after a period of sleep of up to eight hours, during which time it is not possible to eat any type of food. Therefore, the importance of breakfast in the work of the child’s devices has been shown to be effective. Necessary. Glucose, for example, is the main fuel for brain cell energy, and brain work is affected by the concentration of sugar glucose in blood and this is affected by the concentration of sugar glucose blood, which means low concentration of blood leads to fatigue and fatigue, so maintain a good breakfast meal and balanced nutrients at the beginning of the day To fill the brain’s need for glucose to perform the brain the best performance it needs a continuous supply of glucose because the brain cannot store glucose Unlike the muscle that can store energy in the form of Claykogen, after (9 hours) of non-eating student is considered to be fasting at The glucose is at its lowest level and the need to increase its concentration in the blood. Since the brain is in continuous working state, the brain is in a continuous state of glucose. If the amount of glucose is insufficient in the blood, the brain cannot perform what is asked to the fullest, And here comes the importance of breakfast and its role in the renewal of the level of blood glucose after the fasting period associated with sleep breakfast improves the mental and physical performance of the student as well as reduce the tensions and anxiety and improve the turnout of the child to the school and is the beginning of the right start for a busy day of work and work, Those who eat a good breakfast with a high nutritional value are more active at work and study. Those who accept breakfast with appetites who have a sound sleep and enough hours to be promoted early so that they have time to eat a meal Some of the students exercise a certain diet. They do not eat breakfast in order to lose weight. When food is needed, they try to eat some sweets and chocolate. As a result, they eat more energy than they do. The food is useful, the breakfast is different, so it is light and heavy. But if it is heavy, it gives a feeling of laziness and inactivity because the body in this case takes longer to digest food. Through a number of studies conducted at various age stages to demonstrate the mental capacity of children before and after school age, one of the teachers at King Saud University found that pre-school children were smarter than their American counterparts based on the exact criteria they were in. That their mental abilities decreased and recorded a significant difference from their American peers and one of the most important reasons is the health and nutritional status of these children (and that malnutrition is basically a bad food and not only about inadequate food, but also when food is surplus, On the other hand, the response of the body to a wide range of diseases may be infectious, which leads to poor absorption of nutrients or inability to use these nutrients properly to maintain health. Excessive intake of nutrients, energy and nutrients with essential vitamins and minerals. Another concept of malnutrition is that food may be adequate enough to meet energy needs, but at the same time be weak in providing protein, vitamins and minerals in quantities that provide natural health, growth and vitality. The lack of nutrition is an expression used to describe the continued inability to obtain enough food to meet the needs of the body of energy. The health of the crown on the heads of healthy people, but patients and the Prophet Muhammad (PBUH), recommended us to take care and care for health, and urged us to take advantage of the days when
the human is recovering He said (r) recommend us to take care and care for health, and urged us to take care to take advantage of the days when a person is well, he said (r) take five, five were said, including your health before your illness. Children suffering from developmental delays due to malnutrition and infectious diseases are very vulnerable to the decline of their cognitive abilities at a time when malnutrition has a negative impact on the performance of primary school pupils. The number of students enrolled in the first stage of the study, the number of students who are absent from school, Early study and poor performance in the classroom and thus shows the role of nutrition in the health of the individual is a key factor in school entry and continued participation and attendance. And that the symptoms of malnutrition is pale color with the emergence of abnormal growth in the joints of the hands and legs and in some cases twisted by vitamin D deficiency, which leads to rickets, while vitamin A deficiency leads to impaired vision (1). Iron deficiency leads to anemia,

Food Anemia: A condition that is caused by the lack of hemochlorobinemia, which leads to a decrease in the amount of oxygen, which is the important component and helper of the cells to carry out operations, that food anemia is caused by iron deficiency usually leads to the production of small red blood cells and lack of hemoglobin and the proportion of hemoglobin Less than 11 g/dl for children under 5 years of age. The human body contains about 3.8 grams of iron and 2.3 grams of females. The most iron-absorbing areas in the human body are the last part of the decimal female and the beginning of the small intestine. Anemia is common among primary school children due to unbalanced eating and low iron content. For many reasons, iron deficiency foods are poor due to poverty and ignorance, such as eating habits, digestive diseases, etc., and the increased need for one or more nutrients Hematopoietic iron, protein, folic acid, vitamin B12. In addition to increased amounts of iron because of rapid growth processes as occurs in children and teenage girls

Food anemia may affect the child’s lack of ability to learn, the ability to attain education and stuttering scholastic performance, and directly affect physical growth. This is why nutritionists recommend teaching primary school children healthy eating habits and behaviors such as washing hands and eating foods with high nutritional value, and reduce the consumption of gypsum, chocolate and soft drinks after or before meals.

Methodology

Research Methodology: The researcher adopted descriptive research methodology for its suitability with the current research objective and problem, where he mentioned (Obaidat et al., 1996) that the descriptive approach depends on the study of reality and the phenomenon as it exists in reality and is concerned as a precise description and expresses it quantitatively or qualitatively. Dawood and Anwar (1990) add that the descriptive approach does not depend on the limits of the phenomenon that is the subject of the study, but rather on analysis, interpretation, comparison and evaluation to reach meaningful generalizations that increase information about the phenomenon.

Research Community: The research community included primary school pupils (fifth primary) for two schools of the day schools of the Directorate General of Education in Babil Governorate - Center for the academic year 2018 - 2019 The sample of the researcher chose the female sex division of the fifth stage of primary

Search Tools:

Firstly:

A. Health nutrition questionnaire for girls: The researcher prepared a questionnaire on healthy nutrition after reviewing the literature related to health nutrition in order to obtain data on evaluating the health nutrition of the sample. The questionnaire included data on healthy nutrition. The questionnaire consisted of 44 words. The questionnaire was presented to a group of experts And most of them doctors nutritionists, to express their views in terms of clarity and lack of suitability to the nature and sample of the study and after obtaining the views of the arbitrators, the researcher reviewed the questionnaire and make a number of amendments and additions that they proposed.

B. The validity of the health nutrition questionnaire: The researcher chose the sincerity of the arbitrators to ascertain the veracity of the scale, as they numbered ten (10) arbitrators, all doctors with experience and specialization. The arbitrators referred to the amendment of some paragraphs, and the final form of the questionnaire has become (44) paragraphs.
Second:

The test of mental skills: After reviewing the literature related to mental skills, the researcher designed this tool, drawing on some of the previous studies, the researcher presented a group of mental skills to a group of experienced and specialized arbitrators to express their views in determining the mental skills that fit the stage and mental development of students in the fifth grade primary. According to the opinion of the arbitrators has been identified eight mental skills and the test of (25) paragraph of the type of pans, each skill three paragraphs.

Results and Discussion

The results indicated that there was an inverse correlation between the nutritional imbalance of the students and the level of their mental skills. The value of R = -0.65 was statistically significant, i.e., the higher the malnutrition, the lower the mental skills. The malnourished student is the student who does not receive On the balanced food between the food components necessary for the safety of growth and physical and mental health, regardless of the economic level of the family, the researcher noted through the field study that there are families financially comfortable but do not provide their children with the necessary nutrients for their age, And poor nutrition education. This is confirmed by the predicted proportions, so that the malnourished students do not have a low or very low cognitive achievement at a rate of 68.46% while those who receive a balanced diet with excellent mental abilities are estimated at 74.71 These results indicate the extent to which malnutrition is related to mental skills because malnutrition affects children's intelligence and mental abilities. This is confirmed by the study by Sarah Al-Sibai and Sana Abdel-Aziz. If the student obtains an integrated diet of both quality and quantity, Knowledge, science and good education.

Conclusion

Lack of schools to health schools because there is no cooperation between health authorities and schools. There are many studies and medical research that indicate the danger of fast food as well as the maintenance of balanced nutrition and diverse. Students have bad habits, including not eating breakfast and eating too much junk food. Most of the sample is completely agree that the lack of love of the school and the delay of the school sense or realistic is due to the health and nutrition status, which push the student to focus and thinking because of eating nutritious diets are not useful.

ABSTRACT

Organotin complexes are known for their outstanding structural diversity and applications. Organotin carboxylates form an important class of organotin compounds. The structural diversity of these compounds emanates from several features including flexibility in coordination geometries, coordination numbers, and versatility of the ligands to engage in different modes of chelation from monodentate to bidentate. Triorganotin(IV) complexes with various ligands mostly demonstrate tetrahedral or trigonal bipyramidal symmetry with some distortions, while diorganotin(IV) complexes have variation of geometries and coordination numbers.

Keywords: Organotin(IV), Carboxylates, Coordinate, Ligands, Triorganotin(IV), diorganotin(IV).

Introduction

Organotin compounds (OTs) are defined as those that contain at least one carbon-tin covalent bond, the carbon atom being part of an organic group. The compounds contain tetravalent tin centers and are classified as mono-, di-, tri- and tetra-organotin (IV) s, depending on the number of alkyl (R) or aryl (Ar) moieties. The anion is usually a chloride, fluoride, oxide, hydroxide, a carboxylate or thiolate ¹. Tin has 5s²; 5p² electronic configuration in its valence shell and therefore, two oxidation states i.e., +2 and +4 (due to ‘inert s-pair effect’) are possible. The ground state for tin is a 3P state, derived from s²p² configuration. In this state, there are only two unpaired electrons and a covalence of two would be expected. But the tetra-covalent state occurs much more frequently than the divalent state. The four-covalent state is derived from the sp³, 5S state of the tin, which is not the ground state but the first excited state ². The electronegativity of tin change with its oxidation number. Tin(II) compounds are generally more ionic than tin(IV) compounds ³. The structural chemistry of tin(IV) compounds reflects the relative simplicity of the electronic configuration in this oxidation state and is dominated by regular bond arrangements: tetrahedral, trigonal bipyramidal and octahedral depending on the coordination number⁴. Tin(IV) is remarkable in its capacity to expand its coordination number from four (which is found in most simple organotin compounds like the simple tetra alkyls and tetra aryls) to five, six or seven. In organotin derivatives of the type RnSnX₄-n (n = 1 to 3), where X is an electronegative group (e.g. halide or carboxylate etc.), the compounds R₃SnX usually yield five-coordinate complexes R₃SnXL which are approximately trigonal bipyramidal, and the compounds R₂SnX₂ and RSnX₃ usually form six-coordinate complexes R₂SnX₂L₂ and RSnX₃L₂ which are approximately octahedral ⁵. The chemistry of organotin has a long history that started since 1849, when Frankland isolated a specimen of diethyltin diiodide ⁶. In 1852, Lowich reported on the reaction of alkyl halides with a tin-sodium alloy giving alkyltin compounds ⁷. The basic studies in the field of organotin compounds have been developed due to the success of a large number of modern techniques applied to the organotin compounds. Investigations can be performed by the general techniques such as UV ⁸, IR ⁹ ¹H-NMR ¹⁰, ¹³C-NMR ¹¹, Mass Spectroscopy ¹² and also by the specialized techniques of ¹¹⁹Sn Mossbauer

DOI Number: 10.5958/0976-5506.2019.01449.9
spectroscopy 13 and 119Sn NMR spectrometry 14. Because of diverse applications in industry and in basic research, the chemistry of organotin compounds has gained considerable importance 15.

**Organotin(IV) Carboxylates:** This class of compounds comprises organotins containing (Sn–O) bonds formed through COO group. The compounds containing (OCOR) groups bonded to tin are defined as organotin esters which may be either monomeric or polymeric and of three general types, viz. $R_3SnOCOR^*$, $R_2Sn(OCOR^*)_2$ and $RSn(OCOR^*)$, where $R$ and $R^*$ may be same or different groups. Organotin(IV) carboxylates are widely studied organotin compounds due to their structural diversity and pharmaceutical applications, especially with reference to their antitumour activity 16. These compounds also exhibit a number of interesting structural features because of the tendency of the anionic group to coordinate inter or intra-molecularly 17. Therefore, organotin carboxylates have been studied extensively. Based on the available crystal structures, organotin(IV) carboxylates can generally be categorized into the following four classes:

1. Triorganotin(IV) carboxylates
2. Diorganotin(IV) dicarboxylates
3. Monoorganotin tricarboxylates
4. Chlorodiorganotin(IV) carboxylates

Carboxylates in the solid state show four types of structures. The structure of $R_3SnOCOR$ depends upon the size of R attached to tin, tetrahedral geometry this structure has a four-coordinate distorted tetrahedral tin as in figure 1 type (1) Trigonal bipyramidal geometry, type (2) contains a five coordinate tin with a bidentate carboxylate 18,19. Linear polymeric geometry type (3) compounds exhibit polymeric trans-$R_2SnO_2$ structural motif, in which adjacent SnR₃ moieties are bridged by a single bidentate carboxylate. Polymeric triorganotin(IV) carboxylates, type (4) has a macrocyclic tetramer, which contains four units of five-coordinate tin with bidentate carboxylate moieties. Diorganotin dicarboxylates adopt a variety of structural modes (figure 2) depending on the nature of organic substituents at the tin and/or carboxylate octahedral geometry and monomeric structure. Two longer and two shorter tin-oxygen bonds form the tetrahedron figure 2 type (1) 20-24. Trigonal bipyramidal geometry has distorted trigonal bipyramidal geometry. This is due to extensive crowding by the bulky anthracene groups, preventing the carboxylates to make a coordinate bond intra- or inter-molecularly with tin. Many organotin(IV) carboxylate complexes have been synthesized and studied with different applications. Spectroscopic studies showed that the coordination took place via oxygen atoms from the carboxylate anions and tin atom of di (or, and) tri organotin compounds. The difference of these complexes was in the ligands 25-28.

![Figure 1: Four structural classes for compounds of the type $R_3SnOCOR$](image)
Figure 2: Two major structure classes of diorganotin(IV) compounds

Scheme 1: Fragmentation pattern of triorganotin(IV) carboxylates

Scheme 2: Fragmentation pattern of diorganotin(IV) carboxylates
Physicochemical Properties of Organotin Carboxylates: Many of the carboxylates have low melting points which indicate that these are covalent compounds. The carboxylates with small organic groups are more soluble in alcohol, ether etc. than in water because the Sn-O bond is essentially covalent. The solubility of triorganotin carboxylates is low in common organic solvents because of their polymeric associated structure. The Sn-C bond is covalent in nature due to small electronegativity difference between Sn and C. However, Sn-C bond can readily participate in ionic reactions through polarization, where the carbon atom acts as a nucleophile and the tin atom as an electrophilic center. On the other hand, the bonds between tin and heteroatoms (Sn-x, where x = O, N, halogen, etc.) are thermodynamically stable but are chemically highly labile and readily participate in substitution reactions. The large size of the tin atom (covalent radius 1.4 Å), the greater polarisability of the Sn-X bond relative to that of C-X bond and the possible participation of the tin 3d orbitals are more important for determining their structures in the solid state than at carbon.

Spectroscopic Studies of Organotin Carboxylates: Structural aspects of organotin(IV) carboxylates have received a lot of attention. For determination of structural features of organotin carboxylates in solutions their 1H, 13C, and 119Sn NMR have been performed in appropriate solvents. On the other hand, structures in the solid state are usually predicted using infrared data.

1. Infrared Spectra: Solid-state FT-IR spectra were recorded in the spectral range of 4000-400 cm⁻¹ and important ν_{asym}(COO), ν_{sym}(COO), ν_{asym}(Sn-C), ν_{sym}(Sn-C), μ(Sn-O) vibrational frequencies were observed in this region. The IR stretching frequency of carboxylate groups are very important for determining their structures viz., when there are interactions between the carbonyl oxygen atoms of the carboxylate groups and the tin atom. The carboxylates generally have two strongly coupled C=O bonds with band strengths intermediate between C=O and C-O. These give a strong asymmetric stretching band near 1545-1598 cm⁻¹ and a weaker symmetrical stretching band near 1400 cm⁻¹. The Δυ values [Δυ = ν_{asym}(COO)-ν_{sym}(COO)] were used to predict the mode of tin carboxylate interaction. The differences [Δυ] between ν_{asym}(COO) and ν_{sym}(COO) are more than 200 cm⁻¹, indicating the covalent nature of the metal- oxygen bond and unidentate coordination of the carboxylic groups bonding to the metal must therefore be assumed. The bridging carboxylate of organotin compound is observed when the difference [Δυ] is less than 200 cm⁻¹. The presence of ν(Sn–O) in the range of 520-400 cm⁻¹ indicates deprotonation of the carboxylic acid group and consequent coordination of the carboxylate group with tin metal. The IR spectra of triorganotin (IV) compounds, Ph₃MeSnL, Me₂SnL, Ph₂EtSnL and PhMe₂SnL (L=AC) have been studied by Amini et al. The ν_{asym}(COO) and ν_{sym}(COO) modes of these complexes appear at 1579, 1385; 1549, 1392; 1568, 1378; 1546, 1389 cm⁻¹ respectively. On the other hand, in the IR spectra of triorganotin (IV) complex of general formula Ph₃SnL (L= AC, TPMG and MIG) the ν_{asym} mode was observed at 1620-1600 cm⁻¹ and the value of Δυ exceeds 230 cm⁻¹; this clearly show that these complexes adopt the monodentate carboxylate structure, but for other complexes of Ph₃SnL (L= α-ph-MDC, DMAN [38], DEPAB, the carboxylate groups are bidentate, (υ_{asym}(COO) = 1610-1580 cm⁻¹; Δυ < 200 cm⁻¹). In the triorganotin carboxylates, R₂SnL (R= Me, n-Bu, Ph, L= BM), the ν_{asym}(COO) stretching has been assigned in the range between 1625-1590 cm⁻¹ and the magnitude of ν_{asym}(COO)- ν_{sym}(COO) (Δυ) separation is 200 cm⁻¹, indicating monodentate carboxylate group. While for Bz₂SnL Δυ is 195 cm⁻¹, is on the broader line of monodentate and bidentate carboxylates; therefore, one can conclude a four- or six-coordinated tin for this complex but a four coordinated tin is observed due to the presence of bulky benzyl group. Carboxylate groups in the diorganotin (IV) derivatives adopt a bridged structure in the solid state unless the organic substituents in tin are bulky or unless the carboxylate group is branched at the α-carbon. The IR spectra of diorganotin (IV) complexes of general formula R₂SnL₂ (R= Me, Et, Pr, n-Bu, Ph, Bz, L= MIB) have been studied by Khan et al. 31.

2. Nuclear (1H, 13C and 119Sn) Magnetic Resonance Spectral Studies: The value of 70-71 Hz measured in DMSO-d₆ solutions is in the range for five coordinate compounds, due to adduct formation with the donor solvent. In 1H NMR spectra of organotin(IV) carboxylates,
a signal between 10.00-13.00 ppm due to the CO(OH) resonance of the ligand is absent, which suggests the replacement of the carboxylic proton by the organotin(IV) moiety. The protons of n-butyltin(IV) and triphenyltin(IV) complexes mostly show a complex pattern in the region of 1.30-1.66 ppm and 7.25-7.71 ppm. Although the complex motif of ¹H-NMR spectra of di- and tri-n-butyltin(IV) derivatives, a clear triplet due to terminal methyl group appears in the range of 0.84-0.95 ppm. The values of the coupling constant ³J[¹H-¹H] of 8.83-9.15 Hz for -CH=CH-protons in the dibenzyl and trimethyltin (IV) derivative of 4-bromomaleamic acid, indicate the cis-configuration.

Mass Spectral Studies: The major fragmentation in the organotin(IV) derivatives is observed due to the loss of the ligand moiety from the tin derivatives. Successive fragmentation is observed by the loss of R groups (Me, Ph, Bu, Bz) until the Sn⁺ ion is obtained. In an alternative route, R groups are eliminated first and in the next step one molecule of CO₂ is evolved from the ligand moiety attached to the tin atom. In the successive steps the remaining substituents are evolved from the tin atom (Schemes 1 and 2).

Conclusion

Three main factors have been found to play an important role in determining the relationship between structure and activity for organotin(IV) derivatives (L)₉₂SnX₄₋ are: the nature of the organic group R; the nature of halide or pseudohalide X; the nature of donor ligand. The spectral data suggest that the ligand acts in a bidentate manner, coordinating through the oxygen atoms. These spectroscopic techniques exposed a distorted tetrahedral geometry in the solution state for the triorganotins, while a mean coordination number between five to six for the di-organotin(IV) dicarboxylates. In the solid phase, the tri-organotins were essentially trigonal bipyramidal polymeric while the di-organotins were octahedral. Investigations on organotin(IV) complexes have received considerable attention due to their non-biological and biological applications. Organotins are also finding important place as effective antitumor agents.

The Impact of Daniel Model on the Fifth Grade Students for Development the Skills of Students’ Science

Saif Hamed Sarhan Al-Sayegh1, Mohammed Hamid Mahdi Al-Masoudi1, Mohammed Rasan Daman1

1Babylon University College of Basic Education, Iraq

ABSTRACT

This study was conducted in Iraq Babylon province/University of Babylon/Faculty of Basic Education, the purpose of the study is known as “the impact of the model Daniel Neil in the collection of history in the fifth grade literary students.” The current study community was the preparatory school for boys in the center of Babylon governorate. The sample was the Thawra high school for boys. The fifth grade was chosen by two groups (A and B), one was experimental and the other was an officer with 54 students. The researcher has equaled the previous collection variables, the parents’ achievement and the age of the time calculated in months. The researcher applied the research experience in the first semester of the academic year 2018-2019. The results showed that the experimental group exceeded the control group. The researcher came out with a set of conclusions, recommendations, and proposals.

Keywords: Daniel Neil Model, Collection, History, Fifth Literature, Methods of Teaching History

Introduction

The subject of history as a subject has faced a number of problems that contributed to its nature and its applications in highlighting it, including that it is wide, and its many branches and subjects. Therefore, the teachers use this article to memorize the students about the facts and historical information; and not to take care of whether the student realized what was presented in the article 1. Social materials are about a year old, and history in particular faces multidimensional problems that have emerged in a rapidly changing world, requiring teachers to abandon their traditional roles to new roles 2. The problem lies in the reality that embodies an unpleasant picture showing the low student achievement in that article 3. Social problems in general means talking about the weakness of achievement in the subject of history in particular. Students do not accept that article because they consider it useless, so weakness is inevitable 4. The reality of teaching history depends on filling the students’ minds with information without understanding and understanding. Moreover, the teaching is based on teaching the teacher a set of facts, events, and dates in the textbooks, and teaching and memorizing them from the students while calling for contemporary educational trends to use the teaching methods Actors 5. It is no longer acceptable to stick to traditional methods because they are no longer sufficient to meet the requirements of the educational and educational process. It is important to be familiar with all that is new in teaching, especially in light of the fact that the world today is witnessing qualitative and quantitative leaps in all areas of life, and that maintaining traditional methods of teaching will inevitably increase the gap between us and the countries of the developed world. Hence the current search problem with the question: Does the teaching of the Daniel model have an effect on the achievement of fifth graders in history? Perhaps this model contributes to addressing or minimizing some aspects of the problem?

In view of the above, the importance of the current study is reflected in:

1. The use of the Daniel model may contribute to raising students’ achievement in history, and to achieving a positive learner in the educational process by actively participating in them and increasing their motivation towards learning.

2. The importance of introducing a number of contemporary models active in the stage because
the students reached an age whose mental abilities and motivation are more mature and renewed.

3. The researcher hopes that the relevant parties will benefit from the educational process from the results of this research in the methods of teaching social sciences in general and history in particular.

**The Daniel Model:** This model was invented by Daniel in 1987, and it has been used in the crystallization of this model of ideas in the learning cycle and concept maps, where direct education focuses on the teacher’s interest. On the outcomes of learning to his students and the teacher to talk about the subject of the lesson, such as basic information to benefit students and cannot reach it in another way and raise the interest of students and their motivation to learn and master the facts and rules and procedures necessary for subsequent learning and the prelude to the activity is taught indirectly, Scientific, and explain to them how to do the required work and how to operate and install the devices and draw conclusions and scientific experiences and activities in the manner of other teaching methods. Based on some constructional ideas derived from the learning cycle, Daniel and his colleagues designed this model, one of which is to discover the concept, in which the teacher gives the students appropriate materials, questions or images and instructions to collect data by means of direct sensory experiences related to the concept. At this stage, the teacher encourages his students to interact in a cooperative way to formulate interpretations and give predictions, and this phase corresponds to representation in the formation of knowledge at Piaget. The model designer has benefited from the practical development of Ozbel’s theory of meaningful learning, which is called the advanced organizations, which are excellent in their voice. They are preliminary introductions at the level of generality, abstraction, and comprehensiveness of the educational material, provided with the beginning of the new learning to provide the intellectual foundations through which the new material relates to previous experiences.

**The Characteristics of the Daniel cognitive Education Model:**

Daniel’s model achieves many goals, including:

1. It helps to develop the skills of students’ science processes such as observation, interpretation, prediction and control of variables. This is because the model is based on the survey.

2. Give students the opportunity to participate in scientific activities in the exploration phase.

3. Students develop logical-mathematical intelligence through the use of science processes such as classification and linguistic intelligence ethnically, reading and writing activities and talk about results and intelligence, social through the interaction of students with each other.

4. The model is a thrill, attracting attention and inspiring students to learn.

5. The model is to purchase, interpret and discuss through groups with each other, between them and the teacher.

6. The model provides students with various means of assessment.

7. The model allows the use of many activities, methods and experiments that help students learn.

**The levels of Daniel’s Model:**

Daniel El cognitive model includes the following levels:

1. **Direct education:** At this level, the teacher begins by giving a general overview of the lesson’s objectives and activities and providing simple subheadings about the content of the new lesson. The purpose of this lesson is to focus students’ attention.

2. **Review:** At this level discuss the previous lessons associated with the new lesson in order to prepare the minds of students to accommodate the Updates in the current lesson.

3. **Review:** At this level, a general and preliminary review of the new information or problem to be studied, and stimulate students’ ideas through the work of cognitive schemes existing learner related to understanding the phenomenon, and you mentally re-form these plans to modify or use new schemes.

4. The student can conduct the experiment in a practical and practical manner by raising questions, giving hints and helping to help students reach the desired goal and implement it in practice to preserve the safety of the students.

5. **Expression and Expression:** Students at this level deal with the materials, equipment and
equipment necessary to convey the results of their activities in tables, drawings and paintings. The purpose of this is to familiarize them with the results they have achieved.

Methodology

The researcher has used the experimental method in this study, and experimental design has chosen a partial tuning of the two groups equaled (experimental and control) to measure achievement.

Study Sample and Population: The current study community is determined by the fifth grade students in secondary and middle schools (morning study) in the center of Babylon province in the district of the center for the academic year (2018-2019). The researcher randomly selected (by lot) the junior high school among the schools, (B) as a pilot group and a (a) as a control group. After excluding students who failed the previous year, the number of students in the two groups was (54) students (26) students for the experimental group and 28 students for the control group. (Age, intelligence, achievement) For the former, the academic achievement of the parents) and there were no differences between the two groups in these variables.

Procedures: In the first four chapters of the book, the scientific material had identified in the modern and contemporary history of Europe for the fifth grade. 116 behavioral goals were formulated according to the six levels of Bloom’s cognitive classification. The researcher prepared 20 study plans for both groups, and a model of behavioral plans and objectives was presented to a group of arbitrators in education and the methods of teaching history to determine their suitability for the purpose for which they were set up and to view of what the arbitrators showed, some modifications were made.

Instrument: The researcher prepared a tool to measure the achievement of the independent variable (Daniel model) in this variable. Here is an explanation of the procedures used in building the tool:

First: making achievement test: The researcher determined the aim of the test to measure the achievement of the students of the study groups in the history of modern and contemporary Europe for the first four chapters. They also prepared the test map and the six levels of Bloom’s cognitive classification. Therefore, the study identified (50) the results of the test were reviewed by the arbitrators in order to express their opinion on the validity of the test paragraphs. Some of them were amended in light of their opinions. The paragraphs that obtained the percentage of agreement (80%) were retained. And more, as has been verified honesty construction specifications table numbers. The pilot test was conducted on a sample of (36 students) of the fifth grade students in (preparatory Jihad for boys) on 10/12/2018. It was found that the test instructions and paragraphs were mostly clear and understood by all students The survey was conducted on a random sample of (115 students) randomly selected from fifth grade students in Al Fayhaha Preparatory School for Boys and Imam Ali Secondary School for Boys on Monday, (17/12/2018) and supervised the researcher himself to the application, after the calculation of the time taken to complete the answer was (41) minutes, and after correcting the answers, the grades were ranked in descending order and 27% of the answers and (27%) of the answers were obtained. As follows:

A. Difficulty coefficient of the paragraphs: When calculating the difficulty factor for each of the test paragraphs, it was found to range from 0.28 to 0.71. All the test subjects were moderately difficult and thus all were acceptable. Bloom believes that the test is good and valid for application If the coefficient of difficulty of its paragraphs between (0.20 - 0.80).

B. Coefficient of discrimination of paragraphs: When calculating the coefficient of discrimination for each of the paragraphs of the test found between (0.33 - 0.67), where Ebel that the paragraphs of the test is good if the strength of discrimination (30, 0) All test paragraphs are good.

C. The effectiveness of the wrong alternatives: The alternative is more effective the greater the value in the negative and after the researcher conducted the statistical operations necessary to know the effectiveness of the wrong alternatives for the paragraphs of the test collection found good alternatives.

Stability of the test: In order to verify the stability of the test, the researcher used the method (Cronbach’s Alpha) reached (0.85) and is a very good stability index.

The collection test is ready to be applied to the research sample, consisting of (50) objective test paragraphs with four correct alternatives, and the highest score for the test (50) and the lowest score is (zero).
Application of the Experiment: The researcher began applying the experiment from the beginning of the academic year (2018-2019) to the members of the research groups in the teaching of three classes per week according to the plans prepared for each group, as the teaching continued until Thursday, 27/12/2018.

Statistical Methods: The researcher used the statistical record for social sciences (24-Spss) and Microsoft Excel in arithmetic: standard mean, standard deviation, t-test, square, and coefficient of difficulty for test paragraphs, coefficient of discrimination.

Results and Discussion

Results for the first zero hypothesis states that (There was no statistically significant difference (0.05) between the average achievement of the experimental group studying the date material using the Daniel model and the average achievement of the control group students who study the same material in the normal way, To verify the validity of this hypothesis, the mean, standard deviation and T value of the scores of the two groups were calculated in the collection test, as shown in the table 2. As shown in the above table, the mean for the experimental group is 42.2. The mean of the students in the control group is 33.8. The calculated T value is 8.214, which is greater than the numerical value of (2.02) (0, 05). This means that there are statistically significant differences in favor of the experimental group in the achievement test, thus rejecting the null hypothesis, and accepting the alternative that confirms a statistically significant difference at the level of (0.05) They study the Daniel model and the average scores of the control group students who are They studied the usual way of collecting.

Conclusion

Through the present study results, the researcher concludes the following: Daniel’s model has a positive impact on student achievement through interaction between students and teachers. The Daniel model helped to preserve the subject of the fifth grade students in the history material through the grades obtained by the students. The Daniel model has an impact on the thinking of the fifth graders in history.

The Impact of the Content of the Science for the First Stage for Development of the Curriculum and its Effects on the Mental and Emotional Aspects of the Students

Widian Jawad Kadhim1, Ghadah Shareef Al-Sheikh1, Mohammed Hadi Shinen1

1Department of Higher Education, College of Basic Education, University of Babylon, Babylon, Iraq

ABSTRACT

The paper aimed to analyze the content of the science book for the first stage of middle school based on standards of (STEAM). In order to achieve this objective, The researcher reviewed the studies that dealt with STEAM standards and prepared a list of STEAM standards, consisting of (5) fields and (50) standards, and presented them to a group of experts and specialists in teaching science and quality of education to express their opinions and observations. Consequently, the elements on the STEAM Standards List have been modified slightly. The analytical descriptive approach was used as a tool to analyze the content of the science book in light of STEAM standards. The study achieved the achievement of the STEAM standards in the content of the science book for the first middle in a very low percentage which was almost negligible. Results indicate that the STEAM standards should be included in the content of the first-middle science book for its integration of science, design, innovation, ability to work, and the generation of a generation capable of choosing the job that suits it in the future. STEAM provides meaningful learning experiences by linking education With daily life and the development of skills Meh labor market, such as the skill of problem-solving and critical thinking.

Keywords: Content Analysis- Science Book- STEAM standards- first stage of middle school.

Introduction

The problem of research can be shaped by the following question: What is the availability of STEAM standards in the science book for the first middle of middle school? Currently, human communities are in the orbit of change and development that is required by the most needs and information in this century of technology 1. information technology itself is not a goal at all, rather it is a means to deliver knowledge and to achieve the aims expected from education2. One of the main desired goals of education is to provide learners with a set of required scientific experiences in order for them to keep pace with modern knowledge and technologies. Among important goals of teaching science classes are to develop the capacity of learners to face problems and create creative attitudes to encourage their curiosities; increase learners’ ability to process and interpret information; improve their ability to review and evaluate different possible solutions; and apply scientific methods related to real life situations3. Education is one of those aspects and it plays a major role in societies and nations. It is the foundation of its development, its main viability, continuity and the wave of environmental challenges4. Scientific education emphasizes creating a conscious person who has the ability to face this knowledge and technological development, the future challenges, economic, social, scientific culture and able to keep up the modern life5. The textbook is one of the main elements of the educational system. And an important means to achieve its objectives, including the provision of scientific material and various educational experiences depend on the teacher and the learner within and outside the classroom and reflects the vision of the national educational curricula and educational
The book of science is an important part of the curriculum, used by the teacher and can not imagine any school without it, where the book of science the attention of those involved in the educational process, and is an analysis and evaluation. The book of science is important when applying the curriculum. The book is considered the essence of the educational process that facilitates the teacher and student the process of education and learning is an educational tool rich in information and facts, concepts and principles that help the success of education and learning in different stages of study. So educational studies have shown the need to reconsider the development of the curriculum and its effects on the mental and emotional aspects of the students, which requires re-formed or modified and balanced curricula and systems have proven their progress and success.

The definition of content analysis is one of the scientific research tools, one of the descriptive research curricula, that aims at knowing the communication characteristic or school books. It also describes these characteristics using quantitative symbols plus using any data obtained from different tools to fulfill the requested development. Analyzing the content of the textbook is one of the most important branches of analytical research to determine the relevance of the content of the book to the curriculum document and to explore the strengths and weaknesses of the textbooks for the purpose of improving them.

Learners today are driven and dictated by technology in their daily lives so firmly gripping the same old traditional teaching is not enough anymore, for we need to integrate technology and innovation into our teaching. Content analysis is a set of procedures and techniques designed to interpret and classify a textbook, including text, graphics, images and ideas contained in a book or curriculum. The integration of Science, Technology, Engineering, Arts and Mathematics (STEAM) and the linking of science to life is essential for the development of 21st century skills, so it is necessary to analyze the content of the science book for the first middle school and indicate the extent to which these standards need to add STEAM to the content of the books because it stimulates learning by making it more exciting; develop creative thinking and problem-solving skills; and makes the student the focus of the learning process and responsible for learning. A contextual approach in which themes are coordinated in support of each other in the context of which they are Science, technology, engineering, mathematics, and a wide range of arts. In fact, science and technology are understood as the basis for what the world must go through, analyzed and developed through engineering and the arts. Everything is based on the elements of mathematics, innovative art and design practices that play a key role in improving teaching, learning and research in science, technology, engineering and mathematics, and was also known as "integrating art and artistic design with science and technology and India Mathematics and mathematics through the educational ladder (kindergartens - the third secondary). The integration of the arts helps students to promote literary and aesthetic development as well as improving and understanding the competencies of mathematics and hopes for the concepts and facts of science and the renewal of the skills of the logic of monetary response. In a paper written by STEAM, Georgette Yekman describes science and technology as being interpreted through engineering and the arts, all based on mathematics. There are previous studies with the same research variable (STEAM Standards): the study of Choi (2015) A Case Study of the Application of Science Teachers in the Secondary Stage of the Integrative Approach (STEAM) in their Teaching. Topsakal (2017) Knowledge of students’ views on STEAM activities.

Methodology

The researcher used the descriptive approach (the method of content analysis) as the appropriate method for the purpose of research aimed at analyzing the content of the analysis of the content of the book of science for the first stage of middle school based on STEAM standards, the basic research sample subjects science book in the first grade intermediate taught in the year (2018 − 2019), and for the purpose of achieving the goal of the research used the researcher method of analysis of content, and requires the conduct of this research prepare a tool against which the analysis of the content of science books in the first row the average and must include the tool criteria for the basis of analysis. The researcher steps next to build this tool To turn standards (STEAM) and the use of the opinions of experts and specialists in the field of psychology and teaching methods. In light of this, the researcher has formulated a set of criteria in the initial formulation numbered (50) standard within (5) areas. The rules and foundations adopted by the researcher in the analysis are to read each subject of the science book for the first grade intermediate in order to control the analysis. The subject, which contains many
conclusions or many of the objectives of the researcher each one of the ideas within the main subject and gives it a repeat if the idea expresses standard. Balancing each subject to the criteria adopted by the researcher in the search tool. The results of the analysis were analyzed in the analysis table by giving the (x) sign for each subject within the classification in the analysis table, ie, the availability of the standards in the subject and giving the sign (-) Indicate that there is no standard in the subject. Transform qualitative responses into a quantitative image to facilitate statistical processing (such as calculation of frequency and percentage repetition). The statistical methods used in the research are the Cooper equation to calculate the proportions of the female analysis and find ratios in the research sample through the calculation of frequencies and the percentage of each standard.

Results and Discussion

The results showed that the field of science obtained (25) repetitions and (29.76%) percentage recurrence, while the field of technology obtained (1) recurrence and (1.19%) percentage recurrence, (19%) and (22.61%). The field of mathematics received (12) repetitions and (14.28%).

Conclusion

The first field (science) and the third field (engineering) were included in the science book for the first-grade intermediate received the highest percentage. STEAM scores were low in the science book for the first grade due to the lack of interest of the authors to include them.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Graduate Studies Methods of Teaching General Sciences, Faculty of Basic Education, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

The Impact of Using Chunking Technique on Developing Reading Skill and Perception of Intermediate School Students

Zahra’a Mohammed Hussein1, Sabeeha Hamza Dehham1, Abd Ali Nayif Hasan1

1University of Babylon, College of Basic Education, Iraq

ABSTRACT

Teaching reading skill to the students is very difficult thing. The difficulties might come from the teachers who are not creative to simulate in teaching reading, lack of using affective strategies to attract students’ attention to the lesson and keep using traditional ways of teaching. Other difficulties came up from the students who did not interest to read a long passage, lack of vocabulary, and understanding the meaning of what they have read. Students who learn English as foreign language face difficulties in reading long stories, texts and paragraphs. The presented study aims at investigating effects of using chunking technique on developing English language reading skill of Iraqi EFL students. The study uses quantitative research method. The samples of the study were randomly selected from the second intermediate school students. The study adopted a pretest treatment- post-test design. Through the results of the study, the first hypothesis was accepted and was concluded that chunking technique was better than the recommended teaching in both the overall achievement and reading comprehension items.

Keywords: Chunking, Technique, Reading Skill, Perception

Introduction

In education, Reading is considered to be a mental process and cognitive ability which a person is able to use when interacting with the written text. Many scholars and scientists of language have confirmed the important of reading like Davies (1968) who states that reading skills involve: identifying word meaning, drawing inferences, identifying writer’s technique, recognizing mood of passage, finding answers to questions. Further more, reading skill should not be separated from other skills. This means that everything that people talk or write is all about things that they have read. Reading relates to reading comprehension. Students when they are reading, they think by comprehending all the words, phrases, sentences, and paragraphs in order to get the meaning of the texts as a whole 1. To make teaching language more effective, the researcher uses certain strategy which is called Chunking strategy, it means : the gathering of words in a sentence into short important expressions (for the most part three to five words). This procedure contemplates word-by-word perusing, which can cause necessity of perception, since understudies omit the sentence introduction before they get to the end (Casteel, 1988). Chunking strategy is a chunking is a process by which individual pieces of an information set are broken down and then grouped together. A chunk is a collection of basic familiar units that have been grouped together and stored in a person’s memory. These chunks are able to be retrieved more easily due to their coherent familiarity3. The present study aims at :Investigating the effect of chunking strategy of Iraqi EFL Intermediate Students’ reading skill. That there is no statistically significant differences between the mean scores of the experimental group which is taught by using chunking strategy and the control group which is taught according to the conventional way. Reading is also defined by Rumptz (2003) who says “Reading is a complex process. It involves visual action in analyzing printed letters, and then identifying these letters as the components of words, until reaching the interpretation of the meaning of these words”. Bernhard et al. (2000:6), has stated that reading is about understanding written text. It is a complex activity in which it involves both perception and thought. Moore, et al. (1980: 8 ) also state...
that: “Reading is an active process, not a passive process. It involves interpreting passages, not just receiving a message. A reader interprets a passage by: understanding a writer’s implications, making inferences, realizing not only what information is given but also what information is not given, evaluating the passage”. While, Goodmann (1988) defined Reading as the operation which demands readers to explain the graphic signs, to delineate reading in a variety of ways, i.e. matching sounds to letters. In this sense, reading is as a cognitive process which could make readers provoke meaning from text. From all these definitions above, it is found that reading is an active process to get meaning of current information by connecting readers’ background knowledge to the information that is found in the written text. Reading skill is a cognitive ability when a person has the ability to interact with the written text. According to Davies (1968) reading skills involve: drawing inferences, identifying writer’s technique, identifying word meaning, recognizing mood of passage, finding answers to questions. It also include: recognizing the script of language; communicative value of sentences, deducing the meaning, use of unfamiliar lexical items; recognizing explicitly and non-explicitly stated information, conceptual meaning, relations within the sentences and between parts of text through lexical cohesion devices; perceiving indicators and main point of information in discourse; identifying main idea from supporting detail; selective summary of relevant points from the text. Munby (1978), Lanzer, Waite and Dolan (1979) classify reading skills as: word meaning in context, literal comprehension, drawing inferences, interpretation of metaphor, finding main ideas, forming judgments. chunking is a term in which it refers to the process of taking private section of information (chunks) and gathering them into larger units. By doing this, a reader can promote the quantities of information he can remember.

According to Casteel (1988) chunking is the gathering of words in a sentence in a certain text to put it into short meaningful phrases (usually three to five words). This process helps in preventing word-by-word reading, which can bring about lack of comprehension, since students overlook the beginning of a paragraph before they gain the end. Smith (1982) asserted that chunking refers to the largest meaningful sets of units in which it can be stored in short-term memory. Many studies point out that the presentation of “chunked” material can be separated into meaningful related sets of words which promotes the comprehension of some readers, who can be classified as poor or low-ability readers (Casteel, 1989), the term “chunking” as a fundamental learning strategy is used to portray a wide diversity of learning techniques that cover the organization of study time as well as a diversity of memory tools.

**Procedures and Methodology:** The following statistical procedures which followed by the researcher in order to reach the aim of the study and prove its hypothesis. The following procedures are:

1. Selecting the experimental design.
2. Selecting the population and sample and Equalizing the sample.
3. Controlling extraneous factors.
4. Applying the experiment.
5. Designing and administering tests.
6. Analyzing the data statistically.

**Experimental Design:** The experimental design includes one independent variable (chunking technique) and a dependent variable (the test scores), thus the experimental design was adopted on two equivalent groups one experimental and the other is controlled.

**Population:** The population of the presented study is represented by the second-grade intermediate school students in the province of Wasit for the educational year (2018-2019). Al Huda intermediate school lies at the heart of the province was chosen to represent both samples the control and the experimental group which we randomly selected class (A, 37 students) to represent the experimental set that received chunking technique based instruction and class (B, 39 students) to represent the control group which taught by recommended teaching.
Samples Equivalence: The researcher conducted a statistical equivalence between the experimental and control sets in some variables that could affect the results of the experiment. The researcher has chosen the two groups randomly, the students of the research sample from similar social and economic status and study in one school. These variables are: the age measured by months, first course scores, and parents academic achievement (Hammad et al., 2019). The statistical results demonstrated that the two sets were equivalent in all the aforementioned variables.

Extraneous Variables: Despite the fact that the researcher verified the equivalence of the two sets of research in some variables that are believed to affect the course of the experiment, she also tried to avoid the effect of some extraneous variables in the course of the experiment. Some of these variables and how to control them are as follows: Accidents associated with the experiment. There were no accidents during the execution of the experiment. No students left the school or got transported to another one. The sample was chosen intentionally and the two sets were equalized accordingly. The maturity factor: Since the duration of the experiment was unified between the two research groups as well as the age for students in the two groups so all the growth that occurred will be unified between all the students because they are on the same level, so this factor did not have an impact on the research, the impact of experimental procedures: the researcher worked to reduce the impact of experimental procedures that can affect the dependent variable during the course of the experiment (Dehham, 2019).

Preparing the Material: The teaching materials that were used in conducting the experiment were represented by the English for Iraq syllabus and the content that was taught during the second course of the educational year (2018-2019) was set to be from (Unit 6- Unit9). In which the researcher set a number of behavioral objectives to be expected from the test sample, as for the lesson plans the researcher prepared a total of (30) lesson plan for each sample set based on the second intermediate grade book (English for Iraq).

Research Instrument

The Performance Test: It is defined as the assessment of the knowledge of an individual in a particular area content area, skill or accomplishment in a particular curriculum, time frame, and material. They can also help in diagnosing the level of students and what they need to develop and work on (Brown, 2003, Ali et al. 2019).

The performance test was constructed by following these steps:

- The purpose of the test: the desire of constructing the test was to measure students’ reading skill aptitude in the English language by depending on the behavioral objectives specified by the teachers’ guide.
- Determining test items: the test items were determined by the researcher to be 25 test items and prepared a scoring scheme for the test.
- The test was designed by depending on the revised Bloom’s Taxonomy of educational objectives.

Pilot Test: The researcher chose the students of two schools that are located near the main school on which the experiment was conducted. The two schools were Wait Intermediate school and Al-Huda and on (50) student from each school. The test items were statistically analyzed and found that the item difficulty ranged from (0.76- 0.31) by which the test items are considered valid in difficulty. The item discrimination ranged from (0.82-0.33) which is accepted also.

Conducting the Test

The Pre-test Final Administration: Both students of the experimental and control groups were pre-tested on the 20th of February 2019. This pre-test aims at comparing the scores of the students’ achievement in the pre-test with those in the post-test. As a result, the researcher tested and scored the sample of the study.

The Post-test: Students of both groups (the experimental and control ones) were post-tested on the 20th of April 2019. The same pre-test procedures were followed in conducting the post-test, namely scoring scheme, validity, pilot study, item difficulty, item discrimination, and reliability. It is worth mentioning that the post-test also was seen by a jury of fifteen specialists in linguistics and TEFL methodology.

Results and Discussion

The students of the experimental group who studied according to the chunking technique were superior to the students of the control group, who studied according to
the guided method in the performance test, thus rejecting the first null hypothesis and accepting the alternative null hypothesis: (There is a statistically significant difference at the level of (0.7) and the average score of students in the control group who study according to the guided method in the English test). This is consistent with the studies that confirmed the superiority of the experimental group studied according to chunking technique to those of the control group.

Comprehensive Learning Strategies for the Development of Mind Theory for Deaf Children and Hearing Impaired

Baraa zuheir abd alkreem1, Abdul Salam Jawdat1, Nahida Abdel Zaid Al Dulaimi1
1University of Babylon, College of Basic Education-Department of Special Education, Babylon, Iraq

ABSTRACT

Modern studies aim to push children with hearing impairment to integrate into social life and communicate with others. On the other hand, to develop the theory of mind by integrating them with educational systems that ensure their optimal development in order to raise the level of their cognitive intelligence and academic achievement. This study will review the literature of modern strategies for the integration of Hearing impaired and deaf children in the educational process and determine the negative and positive actions of each strategy through a theoretical comparison of the results of each strategy and then propose a set of recommendations to reach a comprehensive strategy focused on the positive points and are trying to eliminate the negative effects of previous strategies in order to make the integration of students with hearing impairment or deaf in the process of comprehensive education to ensure that the development of the theory of mind to them as normal as possible compared to their peers and on the other hand ensure the psychological structure Sound and scientific achievement that qualifies them to integrate into practical life.

Keywords: Theory of Mind, ToM, Hearing impairment, deaf, Comprehensive education, language.

Introduction

There is a consensus in recent studies that exceptional children are part of society and can be integrated into society to be active and interactive actors through the application of appropriate education strategies for each category of children with disabilities. The concept of special education has been found to explain this process and develop it. The condition of hearing impairment or what is commonly called deafness is a condition that indicates the inability to hear normally, which affects the negative impact on the process of pronunciation and learning of language because of the correlation of the development of speech reception and processing information, which led to their inclusion in the curricula of special education. The peculiarity of this category is that they have a good chance of developing their mind theory at a normal rate compared to their normal peers but also have a chance of having a higher rate of evolution than their peers if appropriate strategies are used for their condition. The creation of appropriate learning strategies for this category of children has become the concern of most researchers in this field. During the literary reading of previous scientific research in this area, it was found that there are many strategies proposed for the development of the theory of mind in children with hearing impaired or deaf, but it was noted that these strategies did not produce positive results enough; these strategies have suffered some negative points that may causing the success of the strategy to be reduced. On the other hand, some research compared the development of the theory of mind in children with hearing impaired or deaf with their natural peers without proposing a mechanism to increase the rate of development of the theory of mind in these children. The best definition of mind theory is provided by Peterson & Siegal in 2000, where this concept refers to the ability to attribute mental and mental states such as beliefs, intentions, memories, desires to self and others. In other words. Where the theory of reason is an expression refers to the individual’s ability to visualize and display and determine the causes of mental states. In the full maturity stage of theory of mind, it becomes refer to a special conceptual framework to deal with

Email: brzu8520@gmail.com
sensory and physical factors such as sensory perception, intentional acts and faith. This framework can be activated very easily. In other words, it can be said that the theory of reason is the reason for conscious and unconscious awareness of human behavior. It represents the set of concepts that people understand the social reality surrounding not only dependence on stimuli but also on reasoning, prediction and explanation. 6

Based on this definition, Sylvia Glenn presented a research study comparing the development of the theory of mind among deaf adolescents with their natural peers. The study confirmed that the deaf community has a less developed theory of mind in the fields of reading and reasoning. The study explained this phenomenon by methodological, linguistic and social factors. Specifically for use with the Deaf group rather than relying on interpreted measures. The study attributed the delay in the development of the mind theory of the deaf to systematic, educational and social factors. In this context, Bertram F. Malle conducted a study on the relationship between language and the development of the mind theory of the deaf. Since the close relationship between language and the theory of mind in the field of development and social behavior in addition to being linked physiologically and ideologically and applied are facts can not be denied but the mechanism of influence on each other is a complex process so the researcher tried to find all possible relationships between them and made a conceptual arguments and an experiment of the mechanism of mutual influence between the development of the theory of mind and language and has concluded to practical procedures for the development of language and the theory of mind for the hearing impaired alike. On the other hand, Gudyanga and his colleagues stressed the danger of excluding deaf students from education and continuous learning and taking measures to ensure that they are fully included in the process of education and training. Where the researchers discussed the problems associated with the inclusion of students with hearing impairment in secondary schools, where the study proved that communication problems are not the only problem suffered by students, but also suffered from students feelings of anger and frustration isolation based on the dictates of the environment, and proved that there is a chance for teachers and Other stakeholders to reflect on school and classroom practices with students with hearing disabilities and adopt effective strategies for their management in comprehensive secondary schools.

The study recommended the following

- Students with hearing impairment served through inclusion with clinical remediation need to take the full curriculum in ordinary classrooms and receive clinical remedial instruction as needed.
- Policies that would guide the inclusion of learners with hearing impairment in secondary schools need to be put in place.
- Further research on the inclusion of students with hearing impairment in secondary schools at a wider scale is recommended.

While Emil Holmer, Mikael Heimann and Mary Rudner presented a research survey of the relationship between the development of the theory of mind and reading in Sweden. The study was conducted according to three tests: the choice of reading and understanding, the Swedish sign language test and the working memory test. The relation between the theory of mind on the one hand and reading and working memory on the other, but there is no connection between the theory of reason and sign language. 8 In a related context, Hülya Çizmeci, Ayça Çiprut, conducted a statistical research study aimed at evaluating the reading and writing of students with hearing impairment and cochlear implantation and comparing these results with their natural counterparts according to the age of cochlear implantation and the duration of this technique In the development of reading and writing skills, where the researcher chose 20 students who implant the cochlea and 20 others have a natural hearing within the ages of 12 to 14 years of statistical specific to conduct the study also relied on the tool to evaluate the written expression and reading inventory to assess the skills of students according to These two factors are The study concluded the importance of early cochlear implantation to the development of reading and writing skills and thus the development of the theory of mind in the upper grades. 9 Depending on the fact that deaf adolescents have similar kinetic skills to their peers except balance. The study by Tan SY Jernice and Karen Nonis compared the total and precise motor skills of 24 adolescents (7 normal and 17 deaf) in a public school and found no significant difference in overall motor skills While deaf group recorded a weakness in sensory integration compared with the hearing group. The study concluded that organized individual sports activities focused on balance development in addition to the usual PE lessons should be organized to improve balance efficiency in order to improve inclusiveness.
Methodology

The practical work of this study begins with an academic study covering all aspects of each of the previous strategies, identifying their basic tools and then determining their strengths and weaknesses to reach the research objectives described above. Strategies studied in the development of the theory of mind and the integration of Hearing impaired and deaf children in the process of education:

**Strategy Achieving Developmental Synchrony in Young Children With Hearing Loss:** Nancy K. Mellon and her colleagues proposed a model of intervention that combines best practices from a range of different disciplines that affect young development outcomes with deafness, as well as specific strategies and methods that help promote the optimal development of these children. The proposed model was based on a shared teaching model between healthy and deaf students, in addition to the social constructivist perspective of education and learning. This strategy is based on a set of core points that must be met: consistent access to a classroom majority of typically developing peers. Small class size and acoustical modifications. Well-trained motivated educators who hold high expectations for students. A co-teaching model that includes a full-time speech language pathologist (SLP) in the classroom. Transdisciplinary support teams, including occupational therapists, psychologists, and an audiologist, who can support teachers and children. A play-based, developmentally appropriate approach in the classroom. The use of thematic curriculum to promote vocabulary and language development. A focus on social emotional learning. Support for sensory–motor development. Language and literacy programs beginning at 18 months. The study concluded that this method is suitable for some children only, as children with hearing impairment who are amplified correctly and can reach all sounds of speech have given positive results, while this strategy has shown negative results on the psychological and cognitive level. For the rest of the children. On the other hand this strategy may cause psychological damage on children with hearing impairment or deaf, because of the lack of observance of psychological supervision during the application of the algorithm.

**Teacher-based strategy:** This strategy is based on the preparation of comprehensive classroom teachers capable of dealing with hearing impaired children. In this context, Santhi S Prakash also presented a study aimed at including students with disabilities in the classroom. This concept has both positive and cognitive advantages, as it provides a real opportunity for social interaction and interaction.

Which is based on three domains:

1. **First Domain:** Effective strategies to meet the needs of all students
   - Remedial classes are needed in regular schools for children with disability.
   - Maximum class size should be lowered when including students with disabilities.

2. **Second Domain:** Support educational change in the region
   - Achieve cooperation and planning between staff and teachers to develop teaching methods
   - Provide input to the program for students with disabilities who have been placed in the classroom

3. **Third Domain:** Inclusive education
   - Placement of a student with a disability in a regular classroom is not disruptive to students without disability.
   - Students should be served in regular classes regardless of disability.

This strategy was tested by a study conducted by a researcher in Andhra Pradesh, India to measure and compare the position of teachers of inclusion of children with hearing impairment in children in the classroom. For this reason, the researcher adopted the 1995 Giles and Tanner questionnaire. This questionnaire was applied to 100 teachers from various government and non-governmental schools in two districts of Andhra Pradesh, taking into account cultural and geographical differences. The study concluded that intervention was
needed to promote positive attitudes among teachers to implement universal education. On the other hand, this experiment had negative effects on the formulation of consensus and policies for children with hearing impairment.

**Strategy to depend on the integration of modern technology the process of education:** In this area the ICT become part of the education of what its importance in the field of promoting participate in educational activities for students with special needs Consequently feet helene lidström and helena hemmingsson study aims to explore the elements of information technology and communication and how to use this technology by children with disabilities physically add to determine the benefits of the use of information technology and communication in school activities terms of use researchers way to find the systematic within a period of 2000 2012 and heuristics to get to the objectives of the search. Where concluded that this technology was useful in the development of writing and dictation add to communicate and on the other hand, the dogs benefit from this technology, regardless of type. As a result of this study, we present a set of recommendations that should be considered and expected to yield effective results in this area: Children with hearing loss are identified and referred for assessment as early as possible to enable the best possible language, communication, and achievement outcomes. Children with hearing loss should be categorized according to the degree of deafness and the theory of reason Combining each class into the classroom based on the previous classification and not age Design approaches educational suitable for each category includes the mass suitable for ensuring education suitable for both children and healthy and with the vulnerability of hearing. Training cadre teaching able to handle cases located within the class. Use of information technology and communication through classes to explain the lessons. Ensure a social environment and psychological sound for students in the classroom. Emphasis on the principle of cooperation between teaching staff and parents

**Conclusion**

The scientific development and the knowledge explosion that the world is witnessing every year has become the hallmark of this era in various fields, especially in the field of strategies and methods of teaching for people with special needs, in order to improve and develop the process of learning, education and education is an effective means to achieve the strategic goals of the society for all its categories due to its importance in adaptation And interaction with the local environment, and this will create the appropriate conditions for the formation of citizens and prepare them capable of strengthening the community and adapting them to changes in the environment and society. Early intervention in hearing loss cases yields significant gains in speech, language, and literacy skills. In many cases, however, children continue to exhibit cognitive, behavioral and motor cognitive disorders. As a result, an appropriate educational and pedagogical environment is needed to foster skills growth across multiple dimensions. During these papers, a series of strategies for the development of the theory of mind in children with hearing impairment or deafness were reviewed through the comprehensive classes.

ABSTRACT

The current study was conducted for the period from 1/10/2018 to 1/3/2019 in the Department of Biology - Faculty of Education for Girls - University of Kufa, which aims to study the effectiveness of the ethanol extract of *Cydonia oblonga* seeds in the viability of the protoscolices of the *Echinococcus granulosus* *In vitro*. The results showed that the ethanolic extract of the *C. oblonga* seeds had a significant effect on the destruction of the protoscolices. The mortality rate was 42.4% and 68.4% after 30 and 120 minutes respectively when exposed to 4 mg/ml, while the mortality rate was 68.9% and 98.1% after 30 and 120 minutes respectively at 16 mg/ml. Statistical analysis showed significant differences between the treatments at the probability level of 0.05. In the calculation of the concentration necessary for the destruction of 50% (LC50) of the protoscolices, it was 6.5 and 3.9 mg/ml after 30 and 120 minutes of the exposure to the extract respectively and when calculating the time required to destroy 50% (LT50) of the protoscolices, it was 39 and 27.40 minutes at the exposure to concentrations 4 and 16 mg/ml of the extract, respectively.

Introduction

Hydatid disease is a common disease worldwide, a common disease of humans and animals (Cyclo-Zoonotic disease)¹. The genus *Echinococcus* has two types, the most important of which are the most important medical and the most common are *E. granulosus*. Its larval development is called the unilocular hydatid cyst and the *E.multilocularis*, the cause of alveolar echinococcosis ²⁻⁴. The parasites belonging to the genus of *Echinococcus* require two hosts to complete their life cycle. The first host includes carnivorous animals and represents the definitive host. The second host is Herbivorous and represents the intermediate host. The human is an accidental host or aberrant, and does not contribute to the perpetuation of the life cycle ⁵. The disease develops in most parts of the body ⁶. The parasite is able to reach any organ in the human body when the eggs are accidentally ingested and developed into hydatid cysts, mainly the liver and lungs ⁷ this is called primary hydatid disease. A rupture of the cyst or drainage of hydatid fluid during surgery or bruising can lead to the spread of Protoscolices and thus lead to the formation of secondary hydatid cysts in other parts of the body ⁸⁻⁹. Surgery is the best option for treating human hydatidosis. Surgical operations may be accompanied by a secondary infection that results from the spills of protoscolices into the peritoneal cavity. Many chemical agents have been used as anti-protoscolices to discourage cyst contents, but most are associated with adverse side effects. Some studies have suggested that traditional plants had an effective effect in the prevention of post-surgical secondary infection ¹⁰. *Cydonia oblonga* is a member of the Rosaceae family, traditionally, *C. oblonga* is used as an anti-diarrheal agent, tonic for the stomach, healing of ulcer, anti-inflammatory, anti-emetic and astringent and the fruit is suitable for uterine bleeding and hemorrhoids ¹¹. The results of the chemical analysis showed that the alcoholic extract of *C. oblonga* seeds contain tannins, glycosides and Phenolic compounds and the seed extract are effective against *Staphylococcus aureus* ¹². Since there

DOI Number: 10.5958/0976-5506.2019.01454.2
are no studies on the effects of *C. oblonga* seeds on the viability of the *E. granulosus* protoscolices, therefore, this study was proposed to evaluate the effectiveness of ethanolic extract of *C. oblonga* seeds in the viability of the protoscolices of the *E. granulosus In vitro.*

**Materials and Method**

The current study was conducted for the period from 1/10/2018 to 1/3/2019 in the Department of Biology - Faculty of Education for Girls - University of Kufa, where the seeds of *C. oblonga* were obtained from the local markets of Najaf province, and was crushed by the electric grinder for the purpose of obtaining powder, (50) gm powder were mixed with 200 ml of 96% ethyl alcohol (volume/volume) in a glass flask with capacity of (400) ml then covered and left the flask at lab temperature in a dark place for 72 hours with stirring using Shaker to ensure that the substance is exposed to alcohol. The samples were filtered by filtration papers and the extract was then dried by the rotary evaporator at a temperature of 40 ° C. The dry extract was then stored in a sterile container at a temperature of 4 ° C until use 14. Samples of infected sheep liver, (Image 1) were collected from the Najaf province massacre and placed in clean containers and transferred to the laboratory in the Department of Biology - College of Education for Girls - University of Kufa, and the processing of the preparation and counting in a period not exceeding two hours, where sterilized the outer surface of the cysts by 70% ethyl alcohol, pulling about 75% of the hydatid fluid and placed in a sterile glass container. Then remove the germinal layer. (Picture 2) is placed in a sterile glass dish and washed with sterile saline solution 0.9% for three times. Use the centrifuge at 3000 rpm for 3 minutes to precipitate the protoscolices in the hydatid fluid and the solution of the wash of the germinated layer, where the leachate was neglected and the precipitation containing the protoscolices was suspended by 0.9% saline solution. The protoscolices were calculated using the fixed size transfer method by micro pipette, where the total number of protoscolices in the volume of (10) μl of the suspension was calculated using the compound microscope under (20x). The average number of three replicates was calculated by calculating the total number of protoscolices. The viability of the protoscolices was examined using 0.01% eosin stain, where equal amounts of protoscolices suspension were mixed with the eosin stain, and examined under the microscope (20x) and a manual counter was used., 200 protoscolices were counted as living and dead, where the living protoscolices appear in a greenish color, while the dead protoscolices appear red. Prepare a stock solution for the extract by dissolving 2 g of dry extract in 100 ml of the 0.9% physiological solution. Then prepare the concentrations 4, 8 and 16 mg/ml for the extract and store at a temperature of 4 ° C until use in vitro tests. The suspension were well shaken for regular distribution of protoscolices in the suspension The total number of protoscolices was calculated in 1 milliliter of suspension using the fixed-size transfer method, 12 test tube with tight lid, three tubes for each concentration and control, and then transferred 1 ml of the protoscolices suspension containing approximately 2000 ± 20, and the tubes containing the protoscolices were treated with concentrations of 4, 8 and 16 mg/ml for the extract. The control tubes were treated with 0.9% saline solution. The viability of the protoscolices was examined using 0.01% eosin stain at intervals of 120,60,30 minutes after treatment. 200 living and dead protoscolices were counted, where the living protoscolices appear in the greenish color, while the dead protoscolices appear red.

**Statistical Analysis:** The results were statistically analyzed using the ANOVA table and the least significant difference (L.S.D.) was used to diagnose statistical differences between treatments (Daniel, 1988). The method of the lower squares of the deviation of values was applied to calculate the concentration and time required to destroy 50% of the protoscolices of which a correlation coefficient was calculated Finney, (1977).

**Results and Discussion**

The results of the current study showed that the ethanolic extract of the *C. oblonga* seeds had a significant effect on the destruction of the protoscolices. The percentage of mortality increased with the increased the concentration and exposure time to extract. The mortality rate was 42.4% and 68.4% after 30 and 120 minutes respectively when exposed to 4 mg/ml, while the mortality rate was 68.9% and 98.1% after 30 and 120 minutes respectively at 16 mg/ml. Statistical analysis showed significant differences between the treatments at the probability level of 0.05 as in table (1). In the calculation of the concentration necessary for the destruction of 50% (LC50) of the protoscolices, as in table (2), it was 6.5 and 3.9 mg/ml after 30 and 120 minutes of the exposure to the extract respectively and when calculating the time required to destroy 50% (LT50) of the protoscolices, as in table (3), it was 39 and 27.40 minutes at the exposure to concentrations 4 and 16 mg/ml of the extract, respectively, and statistical analysis showed the existence of a positive correlation
between the concentration and the time and the percentage of mortality of the protoscolices at the level of probability 0.05. Most studies have focused on the efficacy of *C. oblonga* seeds extracts against bacterial microorganisms. Alizadeh *et al.* (2013) studied the effect of ethanolic, acetonic and aqueous extracts of *C. oblonga* seeds in some intestinal bacterial isolates in vitro and in vivo. Ethanol extract was found to be the most effective in inhibiting the growth of *Escherichia coli*, while the aqueous extract was effective in inhibiting the growth of *E. aerogenes* bacteria, and concluded that the extract of the *C. oblonga* very effective in controlling intestinal bacterial infections. Kadhum *et al.* (2017) tested the effect of the aqueous extract of the *C. oblonga* seeds in some positive and gram negative bacterial isolates. The most sensitive bacterial isolates were *Staphylococcus saprophyticus*, while the lowest sensitive bacterial isolates were *Pseudomonas aeroginosa* and *Pseudomonas fluroscences*.

Conclusion

The conclusion from the present study that the seeds of the *C. oblonga* as natural substances are effective in the destruction of the protoscolices of the *E. granulosus* and can be used as scolicidal agent before surgical operations to remove the hydatid cysts.

The Association between Abnormal Body Mass Index and First Trimester Spontaneous Abortion in Iraqi Women: Case Control Study

Suad Abdulzahra Mutar Al-Gassar¹, Nibras Naser Hasan¹, Lina Muhsen Atiya¹
¹Gynecology Specialist, Al-Diwaniyah Child and Maternity Hospital, Department of Obstetrics and Gynecology, Al-Diwania, Iraq

ABSTRACT

The lack of consensus regarding the effect of pre-pregnancy BMI on pregnancy outcome and in particular on the risk of early miscarriage, and the rarity of Iraqi literatures dealing with this subject, justified the planning and the conduction of this study on a sample of Iraqi pregnancy ladies that unfortunately developed spontaneous abortion in the Mid-Euphrates region of Iraq. Aim of the study: To evaluate the correlation between pre-pregnancy BMI and risk of spontaneous abortion. The study was conducted at the Department of Obstetrics and Gynecology in Al-Diwaniyah maternity and Child Hospital in AL-Diwaniyah Province, Mid-Euphrates region of Iraq. The study was started at January 2018 and ended at March 2019. BMI measurements of two groups of women, the first group included women with early spontaneous abortion and the second group included women with uneventful term or near term pregnancy, were obtained and contrasted. There was no significant difference in mean BMI between study and control groups, 24.60 ± 4.57 kg/m² versus 23.55 ± 3.50 kg/m², respectively (P = 0.195). However, the incidence rates of underweight and overweight were significantly higher in study than in control groups, 10% versus 1.7% and 40% versus 23.3%, respectively (P <0.05).

Keywords: abnormal body mass index, first trimester spontaneous abortion

Introduction

The common goal for every couple when get married is to have a baby; however, a significant proportion of couples in our community and worldwide will either fail to have pregnancy “the problem of infertility” or will lose their baby unexpectedly early during pregnancy “the problem of miscarriage”¹-³. The debate about the exact nomenclature that should be applied to the loss of pregnancy product is well recognized issue in obstetric literatures⁴. However, there is some common consensus about considering miscarriage event that occurs within 20 weeks gestation as spontaneous abortion provided that pregnancy loss has occurred accidentally without medical or non medical intervention⁵,⁶. Early pregnancy spontaneous abortion is seen in up to 15% of clinically documented pregnancies⁵,⁶. This relatively high incidence rate justifies the huge amount of literatures dealing with identification of risk factors associating spontaneous abortion and searching for ways to avoid this catastrophic pregnancy event⁷-¹¹. The list of factors that have been recognized to accompany spontaneous abortion is long; nevertheless, embryonic chromosomal abnormalities and hormonal factors are the principal blamed factors; even though, a number of environmental factors and demographic characteristics have been linked to spontaneous abortion⁷-¹¹. Abnormalities related to mother weight in the form of overweight or underweight have been blamed as risk factors for spontaneous abortion. Overweight weight and obesity, based on pre-pregnancy body mass index (BMI) records have been shown to increase the risk of spontaneous abortion in a number of case control studies¹²,¹³. However, there are some studies that have denied such an association¹⁴,¹⁵. On the other hand, underweight has been shown to increase
the susceptibility of pregnant ladies to lose their babies early in pregnancy. Again, there are reports that rejected the association between women underweight and risk of spontaneous abortion. The lack of consensus regarding the effect of pre-pregnancy BMI on pregnancy outcome and in particular on the risk of early miscarriage, and the rarity of Iraqi literatures dealing with this subject, justified the planning and the conduction of this study on a sample of Iraqi pregnancy ladies that unfortunately developed spontaneous abortion in the Mid-Euphrates region of Iraq.

Methodology

The current study has been designed to be a cross sectional one including 40 women who have experienced spontaneous miscarriage during the first trimester, that is during the first 13 weeks of gestation. This group included 30 women. The second group included 60 pregnant ladies with uneventful pregnancy that is at or near full term. The latter group served as control group. Information regarding age, parity, previous abortion, occupation and residency has been obtained from all participants. In addition, height and pre-pregnancy weight of each women was obtained in order to calculated pre-pregnancy body mass index (BMI) according to the formula: BMI = weight (kg)/(height in meters)$^2$. Women were later classified into three groups: those with BMI $<$ 18.5 kg/m$^2$ were considered underweight, women with BMI between 18.5 and 24.9 kg/m$^2$ were considered of normal weight and women with BMI $>$ 24.9 kg/m$^2$ were considered overweight.

The study was conducted at the Department of Obstetrics and Gynecology in Al-Diwaniyah maternity and Child Hospital in AL-Diwaniyah Province, Mid-Euphrates region of Iraq. The study was started at January 2018 and ended at March 2019. The study was approved by the institutional ethical approval committee and verbal consent was obtained from all women subjected to the current study following full illustration of the purpose and methodology of the current study. Data were then transferred into an SPSS (version 23) spread sheet for statistical analysis. Microsoft Office Excel 2010 was also used for this purpose. Numeric variables were expressed as mean, standard deviation and range, whereas, categorical variables were expressed as number and percentage. Association between categorical variables was evaluated using Chi-square test or Fischer exact test. Difference in mean between two groups was evaluated using independent samples t-test.

Results and Discussion

Demographic characteristics of the study group (women with spontaneous first trimester abortion) and control group (women with term and near term uneventful pregnancy) are shown in table 1. There was no significant difference in mean age between study and control groups ($P = 0.512$). Distribution of women according to parity, as nulliparous, low multaparous and grand multaparous, exhibited insignificant difference ($P = 0.100$). In addition, the distribution of women according to residency and occupation showed insignificant difference between both groups ($P > 0.05$). The association between body mass index (BMI) and spontaneous abortion was demonstrated in table 2. Indeed, there was no significant difference in mean BMI between study and control groups, $24.60 \pm 4.57$ kg/m$^2$ versus $23.55 \pm 3.50$ kg/m$^2$, respectively ($P = 0.195$). However, the incidence rates of underweight and overweight were significantly higher in study than in control groups, 10% versus 1.7% and 40% versus 23.3%, respectively ($P < 0.05$). On the other hand, presence of previous abortion was significantly higher in study group when compared to control groups, 90% versus 36.7% ($P < 0.001$). Moreover, recurrent abortion ($\geq 3$ previous abortions) was significantly more frequent in study than in control group. In addition, there was no significant correlation between number of previous abortions and recent pre-pregnancy BMI ($P > 0.05$), figure 1. The problem of recurrent miscarriage is common in our community and identification of risk factors associating this problem may help limiting its frequency in the population. The current study has shown two important risk factors associating early spontaneous abortion and these were abnormal BMI, whether low or high and previous history of abortions and in particular recurrent abortion. One may argue that one of the risk factors, BMI or previous recurrent abortions, is a confounder so that the same patient with abnormal recent BMI is liable for having previous recurrent abortions; however, we were able to prove the lack of statistical correlation between those two factors. Therefore, the most likely explanation for higher rate of recent abortion in patients with history of recurrent abortion is embryonic chromosomal abnormalities; however, this explanation, in our opinion, is sufficient to be applied partially and that abnormal BMI index is an independent risk factor for spontaneous early abortion in the current study at least in a significant proportion cases. A number of studies have investigated the correlation between abnormal body mass index and the risk of spontaneous abortion. In a large cohort
Chinese study that included 536,098 pregnant ladies, it was found that both obesity and underweight were significantly associated with spontaneous abortion. These findings support the findings of the current study. In another cohort study, carried out in Denmark and included 23,821, underweight was shown to be a significant risk factor for spontaneous abortion. We agree with the later Danish study that underweight is a risk factor for spontaneous miscarriage. It was also shown, by previous studies, that obesity is an independent risk factor for spontaneous abortion, in accordance with the findings of the current study. However, some authors have denied the existence of significant impact of maternal BMI on the incidence rate of spontaneous abortions. The epidemiologic observation that obesity increases the risk of spontaneous abortion, as demonstrated by the current and some previous studies, may be explained by low level of estradiol in obese women or by low concentration of sex hormone binding globulin. Another suggested mechanism that increases the rate of spontaneous abortion in obese women is the higher level of circulating pro-inflammatory cytokines. Underweight women are more prone to nutritional deficiencies that may adversely affect fetal growth and development and may increases maternal susceptibility to infection because of less optimum immune responses. On the other hand, underdeveloped placenta with small volume and surface area in underweight women may lead to placental insufficiency. Indeed, we believe that more research work, both clinical and experimental, is needed to prove these suggestions; but for the time being, it is essential to inform women to have optimum pre-pregnancy BMI before planning to get pregnant because of the significant risk of having spontaneous abortion in women with both lower and higher than normal BMI.

The Effect of the Strategy (Mental and Informational) on the Ability of Pupils in the Fifth Grade in Primary School in Reading Material

Ameerah Ghanim Akkar Al-Delfi, Aref Hatem Hadi al-Jubouri, Saad Hassan Alawi

1University of Babylon, College of Basic Education, Iraq

ABSTRACT

The research aims at identifying the effect of strategy (mental and informational) in the language ability of pupils in the fifth grade primary school in reading material, the researcher adopted the method of experimental research as a methodology for conducting research which includes an independent variable (mental and informational strategy, the usual method) and a dependent variable (linguistic ability), where the researcher adopted experimental design with partial settings to adjust the search variables, and before applying the experiment the researcher conducted equivalence between the two research groups for the purpose of obtaining accurate results and objective in the following variables (half-year grades, the chronological age is calculated in months, parents’ achievement), the completion of the application of the experiment, the researcher applied its research tool to the two groups of research, after correcting the answers of the students, the researcher obtained data for the two research groups, the data were statistically treated by t-test of two independent samples, the results showed the superiority of the experimental group, which was studied according to a mental and informational strategy for the control group, which was studied in the usual way in the linguistic ability variable.

Keywords: Strategy, Mental, Pupils, fifth grade, Strategy (mental and informational), language ability, elementary schoolgirls, reading

Introduction

The present era has witnessed a great development in all aspects of life and this development has been reflected in the field of education and teaching methods and reflected in the light of the need to train the teacher to acquire modern teaching skills may facilitate the process of learning and education, supporting its job: as guide and facilitator, inspired by modern methods unconventional; this type of program requires distinct planning according to modern strategies which proved to be effective in the learning environment. In recent years, there have been several educational theories based on a number of methods strategies used in teaching, these constructivism theories call for the learner to build his own knowledge through his direct interaction with educational attitudes and with new knowledge, and links them with previous knowledge in the light of the guidance of the teacher, structural theory is a contemporary educational trend that has been widely sought and an increasing interest in contemporary educational and teaching thought, because of its great impact on the same learner, structuralism has shifted attention from external factors to internal factors, i.e., what is going on inside the learner’s mind like: His previous information, his motivation, and his patterns of thinking and all that makes learning based on a deep understanding of meaning. Education seeks to build the learner to know him through a cooperative society, and thus benefit the learner from his peers during work and signals and assistance provided by the teacher. This is also consistent with Scaffolding’s goal of learning to connect to a possible or adjacent growth zone, which Vygotsky defines as the distance between the possible level to solve problems when assistance or support is available through cooperation between students themselves. The traditional education was seen as a learner as an empty vessel and

Corresponding Author:
Ameerah Ghanim Akkar Al-Delfi
University of Babylon, College of Basic Education, Iraq
learner and it is a negative future of knowledge dictated by the then changed education and became a learner with positive images. The modern education concerned the learner, making it its material, and its role was not limited to the transfer of knowledge, but rather aimed at teaching individuals how to think and how to learn. Education is one of those aspects and has a great role in societies and nations. It is the foundation of its development, its well-being and its main drivers of survival and sustainability. In the wave of environmental challenges, it plays a large role in the lives of both developed and developing peoples. Some teachers may neglect reading and consider it as time to rest of the trouble of the rest lessons whereas he orders his students to take out the book and read the subject boring sequence read until the lesson ends, the meanings of some of the words may not be mentioned, and the speed of reading whether time constraints or other, the main cause of the error, and the header does not benefit anything because he cannot follow up with the reader and does not come to him understanding what he hears, the length of the sentence affects the understanding, because the long sentence is more difficult than the short sentence, as well as the difficulty of vocabulary. Or uncommon is more difficult than a sentence that does not contain such vocabulary. Therefore, the researchers have been interested in the development of implementation strategies followed by the teacher in the classroom going according to the theories (constructivist knowledge) which emphasizes on making the student the axis of the learning process without ignoring the role of the teacher, as a key to the success of the educational process, therefore, the educational system becomes more positive when it focuses on a range of modern strategies such as self-learning strategy and problem-solving strategy, and mental maps, selective learning, exploratory learning, cooperative learning strategies, the cluster strategy is one of cooperative learning strategies, it emphasizes a special structure designed to influence student interaction and aims to improve the mastery of educational outcomes through student traps in reviewing the material covered for the lesson and understanding the content of the lesson, it is a sophisticated structure that students have to help each other in small blocs, students seek to achieve a meaningful outcome for themselves and for all members of the community, students feel that each of them has a certain responsibility each of them has a specific role to play in order to integrate the work of the whole group, so they are responsible for teaching each other as an alternative to traditional structures such as lifting hands and then assigning a teacher to answer the questions raised. This strategy is easy to apply as it relates to the student’s self-potential and development, and is based on evaluating the findings of the clusters of responses.

Methodology

It includes a description of the procedures that were carried out to achieve the research objectives, starting with research methodology and experimental design, defining the research community and its design, the equivalence of the research groups (control and experimentation), preparation of the research requirements and tools, experimental design: It includes one independent variable (mental and informational strategy) and a dependent variable (linguistic ability).

The research community and its model: The current research community consists of the fifth primary school of female pupils in elementary schools affiliated to Babylon Directorate of Education in the academic year (2019-2018) which falls within the Musayyib District, after the researcher identified the school in which it is applied, school (Hittin) visited by the researcher carried official letter of Babylon Directorate of Education, I found it included two divisions, and in a random drag mode she chose Division (B ), to represent the experimental group, and Division (A) to represent the control group, The number of students in the two research groups was (66), and after the exclusion of the failed (5) students from the two groups, whereas reached (34) in the experimental group and (32) in the control group.

Equivalence of research groups: The researcher conducted a statistical equivalence between the experimental groups and control in some variables that affect the results of the experiment, although the researcher chose the two groups in random drawing mode, although the students of the research sample are from a social center economically very similar and studying in one school, and of the same sex, but it was keen to make equivalence of the following variables (The chronological age calculated in months, the educational attainment of parents, classes in the first semester in the Arabic language for the academic year (2010-2019 ), the results of the parity of the two groups of research, that the two research groups are equivalent to the variables mentioned above. Table 1.

**Adjust Variables:** Although the researcher verifies the equivalence of the two research groups in some variables that you think affect the course of the experiment, However, it tried to avoid the effect of some extraneous variables in the course of the experiment, here are some of these variables and how to adjust them: (Accidents associated with the experience: The experience in the search has not been subjected to any emergency or accident that hinders its progress, experimental extermination: There was no interruption or transfer of any pupil or pupil during the experiment, Sample Selection: The two groups were randomly selected The equivalence of the two groups, maturity factor:

The effect of the experimental procedures is as follows: The researcher’s work was to limit the effect of experimental measures that could be applied to the experimental procedures. Affect the dependent variable during the course of the experiment).

**Preparation of the research requirements:** The research requirements are the basic elements on which the research is carried out, according to which the research procedures are carried out. These requirements are as follows: (The scientific material is the scientific material that the researcher is teaching to the students of the two research groups during the period of the experiment of the academic year (2019-2018) included the topics of the second chapter of the book of Arabic reading, formulation of behavioral goals: The researcher formulated (80) behavioral goals based on the general goals and the content of the material covered by the experiment, according to Bloom’s classification the field of knowledge is distributed between the number of plans (16) plans and presented the researcher a sample of them to a group of experts in the methods of teaching Arabic language to express their views on the integrity of its formulation after taking their observations, it became its final image and its application.

**Search Tool**

**Language ability test:** The test is a structured procedure to measure the changes that occurred in the students after passing through specific learning experiences (Katami, and others, 2003: 271).

**The purpose of the test determine:** The purpose of the test is to measure the understanding of primary school students in the reading, in accordance with the behavioral goals that were formulated from the scientific material. determination of the objectives of the test: After the purpose of the test was determined for the language ability, the objectives of the test are determined to determine the extent of their achievement and the researcher formulated a number of behavioral goals.

**Determination of the test paragraphs:** The researcher determined the number of paragraphs consisting of the linguistic ability test, the number of paragraphs of the test (24) paragraph.

**The test instructions:** Specific instructions and instructions are written on how to answer (selecting one correct alternative to the paragraph, answering all paragraphs, answer time, typing the triple name, row and division in the assigned space).

**Correcting the test answers:** After the test paragraphs were drafted and the test type was selected, a standard was developed to correct the answers. One score for each correct test paragraph for questions first, second, third, eight for the fourth question and zero for the wrong answer and the left-item that the student didn’t answered, the paragraph to which more than one choice was made. Thus, the final upper level of the reading comprehension test is (30) degrees and the minimum grade (zero).

**The validity of the test:** The authenticity of the test was verified and the validity of the content was confirmed. The results showed that the virtual honesty obtained 80% by the referees and specialists. As for the validity of the content, the results showed that all paragraphs of the reading comprehension test were statistically significant.

- Understand and absorb students.

The test was carried out in the first phase of the survey on a group of students from the non-research sample. The number of students was 30 students. The purpose of the test was to know the clarity of the instructions and the test instructions, the comprehension...
and clarity of the test paragraphs for the students and the calculation of the time period of the test. The time of departure for each student and the calculation of the arithmetic mean of time showed that the time needed to answer all the test paragraphs was (40) minutes.

The Statistical application: The test was applied to a sample of (100) students from a non-research sample. The purpose of the test is to analyze the test paragraphs statistically, the difficulty of the paragraph, distinguishing the paragraph, the effectiveness of the incorrect alternatives.

The statistical analysis of the test paragraphs: The test paragraphs were analyzed as follows:

The level of difficulty of paragraph: By conducting the statistical analysis of the test paragraphs, the researcher found that the coefficient of difficulty of paragraphs is limited to (0.32-0.62) and thus the test paragraphs are all good and their difficulty is appropriate.

Level of distinguish Paragraph: It was found that the test paragraphs ranged from (0.37 to 0.77).

The effectiveness of the right alternatives: After calculating the effectiveness of each wrong alternative and each experimental paragraph of the test paragraphs using the equation of effectiveness of the alternatives, it was found that he brought the largest number of students in the lower group compared to the students of the upper group. The values of the wrong alternatives ranged from (0, -37, -11, 0), and accordingly the researcher kept the alternatives unchanged.

The test Stability: The test is the one that gives results if applied more than once in similar circumstances, to calculate the stability of the test, the researcher used the half-Test, It is not characterized by its economy in the time required to apply the test, It is applied in one go, avoiding the experience of students as in the method of retesting, and the researcher adopted the scores of the members of the statistical analysis sample, the test sections were divided into two halves, the first half included individual scores, the second half is the degree of conjugal vertebrae and the Pearson correlation coefficient being the most common and commonly used correlation coefficient in this field.

The research tool implementation: Experimental research groups reported and the officer to the date of application of the language ability test a week before it was carried out and applied after completing the teaching of the specific material for the two sets of simultaneous research, the researcher supervised the application of the test.

The statistical Methods: The researcher used the T-test equation for two independent samples to make the equivalence between the experimental and control groups in the following variables (the age of time calculated in months, the educational achievement of the parents, the first grade of the students).

The results: The students of the experimental group who studied according to a mental and information strategy were superior to the students of the control group who studied according to the usual method of testing the language ability.

Conclusion

Based on the research findings, the researcher reached the following conclusions: Employing a mental and informational strategy in primary education stimulates the learner’s desire and motivates them to learn, and increases the integration of learners in learning without asking questions and recording them, listening to good and exchanging roles, adding to the learning fun and joy, and has an active role in creating an active teaching environment through participations educated and encouraged them to work themselves.

An Evidence for Ability of Malassezia Species to Experimentally Induce Pityriasis Versicolor in Various Skin Layers by Using Periodic Schiff Stain (PAS)

Farqad M. Al-Hamdani¹, Maha K. I. Almallak², Ihsan E. AlSaimary¹, Khalil I. Al Hamdi³, Muslim A. Muhammad²

¹Department of Microbiology, Collage of Medicine, ²Department of Biology, College of Science, ³Department of Medicine, College of Medicine, University of Basrah, Basrah, Iraq

ABSTRACT

The fungal agents were visualized in skin sections stained with Periodic Schiff Stain (PAS), fungal spores and hyphae were attached and colonized in the stratum corneum of most of skin sections from infected rat skin with Malassezia species spores isolated from patients, spores well organized, morphologically identified and this method very suitable for diagnosis of Malassezia species from other pathogenic yeasts, the present results showed Malassezia species yeasts that penetrated the corneum layer formed sometimes sheet or aggregation on epidermis surface with cellular debris. Moreover the spores budding noticed, the hyphae showed filamentous with pink color.

Keywords: Malassezia, pityriasis versicolor, Periodic Schiff Stain (PAS)

Introduction

Malassezia are part of the microbiota (microorganisms found on normal skin), that are colonizing the human skin as normal flora which can affect and change their saprophytic state, enabling them to invade and penetrate the stratum corneum layer of the skin and behave as pathogens under certain condition, e.g. a hot climate, perspiration a lot, and a weakened immune system ¹. Now a days, it is very well documented that the colonization of skin by Malassezia spp. can cause various type of skin diseases, e.g. pityriasis versicolor, Malassezia (Pityrosporum) folliculitis, seborrheic dermatitis, dandruff, steroid acne, atopic dermatitis and psoriasis ²,³. The appearance of round to ovoid yeast cells with characteristic short filaments in scales was considered in past to be one of the most diagnostic findings in direct microscopy, in addition to that a slight inflammatory changes in cornified layer of affected area of the skin with no or very weak cellular and humoral immune responses had been demonstrated ⁴. Pityriasis versicolor is a superficial chronically recurring fungal infection of the stratum corneum layer of human skin, characterized by scaly, dyspigmented irregular macules most often occurring on the trunk and extremities. Malassezia yeasts reside mainly in the stratum corneum, though some authors suspect their presence in the hair follicles which could act as a reservoir and thus accounts for the recurrence of PV after treatment ⁵. Microscopy of the PV scales adds a distinguishing feature to its diagnosis and helps differentiate it from the various skin disorders that may have similar clinical features to PV. The study was aimed to evaluate the pathogenicity and histopathological changes of laboratory animal (rat) as experimental model infected with Malassezia species used Periodic Schiff Stain (PAS) as specific stain for yeasts spores and hyphae diagnosis.

Materials and Method

Sample Collections: Ninety five samples were collected from patients with pityriasis versicolor in the form of skin scrapings took by sterile surgical blade, then transported in sterile containers and processed at the
Mycology section of the Department of Microbiology. Direct and indirect methods were applied for diagnosis.

**In Vivo study:** The in vivo study was found necessary and useful to prove the germ theory and to document any suggestions that interest in relation between pityriasis versicolor and their possible yeast causative agents. We proposed these investigation to get these proven, as well as to identify the possibility of experimentally induce of pityriasis versicolor (human being origin) in animal model, and to determine the similarity between human PV and rat PV.

The laboratory animals was the white rat (*Rattus norvegicus*), (20) rats aged between one to two months, weighted 150-200 gm grew under standard conditions were used.

All rats were divided into groups (6 rats for each group except 2 rats for control) as the follow:

1. Infected by Intradermal injection.
2. Infected by Spot technique (kept infectious agents on externally determinant area).
3. Infected by Prick technique (scratching) (streaking the epidermal layers).
4. Control group without any infections, injected by normal saline (0.85% NaCl).

All above mentioned groups infected with 1ml of *Malassezia furfur* suspension (10^8 - 10^9 cells) of overnight culture.

The pathogenicity and clinical complications of the rat skin were observed after two weeks.

**Histopathological Study:** An experimental rat and control were examined histopathologically by taken an oval shaped, 10mm diameter of the skin. Fixed in 10% formalin, 6mm sections stained by PAS (periodic acid Schiff’s) stain to reveal the histopathological changes.

**Results and Discussion**

In some skin sections, the yeast spores that appeared at the surface layer of epidermis have rounded or oval shape, pink color, budding sprouting up from one side of the original through a collarette (Fig 1,2). Sections stained with PAS related to rats skin infected intradermally with *Malassezia* species showed heavy deposition of yeast spores appeared globose to elliptical in shape, budding gave rise to a large collarette from which younger buds emerge, the yeast and hyphal elements can be observed, inflammation signs accompanied with large number of inflammatory cells (Pic3). The histological examination of skin biopsy from infected rats with *Malassezia* species showed moderate to large numbers of yeast in the corneum layer with epidermal hyperplasia, keratosis and dermatitis, the inflammation associated with number of inflammatory cells infiltration and obvious around the hair follicles (Fig 4,5). The present result was confirmed by microscopic examination the variability in keratin deposition pattern and highly keratinocytes proliferation, this may regarded to the adherence of fungus spores with these cells directly and the finding agreed with studies revealed to the alteration of the keratin deposition and to a grave changes of their cornified envelope. The scratching and maceration incision in the rat skin was suitable to establish the infection, this may be due to wide regions which offer more appropriate area for fungus to entry and growth that appeared more suitable than the spot skin, this result is agreed with Kaya, *et al.*, (2009) who found that the maceration and scratching methods offered more entry points that originating from the infundibulum follicular epithelium, various patterns of hair involvement can develop depending on the fungus species. Pictures showed aggregation of large number of *Malassezia furfur* spores within the stratum corneum, around hair root and dermis layer, due to the suitable environment (body temperature that is suitable for *M.furfur* spores and hyphae which can be grown in 37°C, matrix of the connective tissue which prevent growth and diffusion of these fungi, these findings also reported that the matrix of connective tissue play an important role in pathogenesis, by protecting the yeast spores from destruction, through preventing their spread or inactivation by direct binding, low PH and high concentration of metallic ions (Harada, *et al.*, 2015). Findings reported inflammatory cells infiltration in the most sections stained with (PAS) stain, this suggested that *M.furfur* excited immunological effect and play an important role in the pathogenesis, this findings were agreed with other studies proved the same results.  

Our results showed that the infection extend to the hair follicles and adjacent sebaceous glands, this may be considered that *M.furfur* was lipophilic yeast and implicated in the pathogenesis of seborrhiec dermatitis and *Malassezia* folliculitis. Histology of skin biopsy from PV patients can be accessed via the Hematoxylineosin stain or the PAS stain.
Figure 1: Infected rat skin with *Malassezia* furfur showed large number of spores( ) some that attached on surface corneum, others reached to the dermis and hyphae formed. PAS (10X)

Figure 2: Infected rat skin with *Malassezia* furfur showed aggregation of spores on the surface layer of the epidermis, hyperkeratosis, vacuolated keratinocytes. PAS (10X)

Figure 3: Infected rat skin with *Malassezia* furfur showed large number of hyphae as segmented filaments, stained pink, embedded within amorphous substance. PAS (40X)

Figure 4: Infected rat skin with *Malassezia* furfur showed number of yeast spores stained pink, near the hair follicle within flamed dermatitis. PAS (40X)

Figure 5: Infected rat skin with *Malassezia* furfur showed number of yeast spores embedded within the keratin, hyperkeratosis, epidermis hyperplasia and dermatitis. PAS(10x)

**Conclusion**

The present results showed *Malassezia* species yeasts that penetrated the corneum layer formed sometimes sheet or aggregation on epidermis surface with cellular debris. Moreover the spores budding noticed, the hyphae showed filamentous with pink color.

Citric Acid Production Using Wheat Bran by *Aspergillus niger*

Aiden M. Hussain  
*Department of Biology, College of Education for Pure Science Ibn-Al Haitham, University of Baghdad, Iraq*

**ABSTRACT**

This study aimed to obtain a local isolation of *Aspergillus niger* and then studied its ability to produce citric acid from raw materials available locally using solid state fermentation. Six local isolates were collected from different sources including some samples of the damaged fruits such as grapefruit, oranges and sindi. Wheat bran was used as a raw material or as culture medium for the production of citric acid from the collected isolates. The conditions for citric acid production were determined by humidity percentage of 1:1 (water: culture medium), temperature of 28 °C, pH 4 and inoculum dose with $5 \times 10^6$ spore/ml and for 3 days of incubation. The orange was the best model for citric acid production with a concentration of 12.8 mg/ml. In this study the citric acid was diagnosed by using High Performance Liquid Chromatography (HPLC) technique, and it was found that the concentration of citric acid after three days of incubation was 3.662 mg/ml

**Keywords:** citric acid, *Aspergillus niger*

---

**Introduction**

Citric acid is one of the most common acids in the nature. It is found mainly in the group of citrus fruits such as orange, lemon, grapefruit, mandarin, etc., as well as in other fruits but with various quantities. The production of citric acid theory using fermentation method in microorganisms belongs to German botanist Wehmer in 1893, when it was discovered that certain types of fungi including *Penicillium* had the ability to biosynthesis of citric acid as a metabolic product after growth of microorganism on sugars-rich solutions. The establishment of the first commercially factory to produce citric acid was designed by Currie and Thom in 1923 using superficial fermentation. Citric acid is consumed in the production of food in large quantities about 70% of its total production. FAO/WHO Expert Committee on Food Additives is classified citric acid generally as a safe recognized substance followed by the pharmaceutical industry, which consumes approximately 12% of citric acid, and the rest of it is found in other applications or industries such as the manufacture of plastics and animal feed. Citric acid has several and different uses especially in 65% - 70% of the food industries. Production of citric acid was carried out by several physical and chemical methods. However, such conventional methods are found to be an expensive, complex and not eco-friendly. The variation of citric acid uses is due to several properties including good taste, high solubility in water, regulation of pH, and its ability to connect the metals with claw property. Citric acid used as antioxidant and as food preservative as well as used in the pharmaceutical and cosmetic industries. Many residues are used to produce citric acid, such as corn cob banana peel, Apple Pomace and Corn Steep Liquor cotton wastes, kiwi pulp, date pulp, apples and solid wastes, orang pulp residues, Pineapple residues, wheat bran and soybeans, fresh kumara (*Ipomoea batatas*), potato (*Solanum tuberosum*) and taro (*Colacasia esculenta*). Citric acid occupies a key position in the global market due to their heavy usage in many industries.

**Materials and Method**

**Isolation sources:** A group of damaged fruits such as orange, grapefruit and sindi.
Culture media and stains: Potato Dextrose Agar (PDA) was prepared according to manufacture instructions (OXOID Company) by dissolving 39 g of the medium in the distilled water. The medium sterilized for 15 minutes and pressure 121 pound/inch\(^2\). The culture medium also was used in the purification of isolates and in the study of the fungi characteristics and the nature of their growth. All fungal isolates are then preserved on PDA slants under refrigeration (4˚C). The isolates may also be stored in glycerol solution (30% V/V) at -76˚C.

The screening medium: The screening medium was placed on Czapek-Dox Agar by dissolving the components listed below in one liter of the distilled water with sucrose with 30 g/L of distilled water. The components are: KCl 0.5 g, K\(_2\)HPO\(_4\) 1.0 g, MgSO\(_4\) 0.5 g, NaNO\(_3\) 3 g, Fe\(_2\) (SO\(_4\))\(_3\) 0.01 g, Agar 13 g. pH of the medium was adjusted to 6.

Methyl Red reagent: This reagent was prepared by dissolving 0.1 of methyl red powder in 300 mil of ethanol (95%) and distilled water was added up to final volume 500 ml Mohammed,(2015) and pH adjusted to 6 using HCl solution (0.1 M).

Isolation and screening: This study used a number of local isolates that their characteristics in the culture media are similar to fungus of *Aspergillus*; all isolated were collected from damaged fruits. The screening process included the sterilization of sieving medium and then methyl red was added with (1-4) drops for each 10 ml of the medium. The medium was inoculated with active isolates of fungi and incubate at 28 °C for six days, and the diameter of growth zone (cm) of citric acid was recorded after 3, 4, 5 and 6 days of incubation. The diameters of growth zone were as initial indication of the ability of the isolates in the production of citric acid.

Diagnosis the efficient isolate at the level of genus and species: The classification keys were depending on to diagnose the efficient isolate in the production of citric acid which is called N1. code N1. The diagnostic tests included morphological characteristics of the isolate that cultures on Czapek Yeast Extract Agar (CYA) medium at 28° C for 6 days; after that the growth and separation of isolate on culture media was evaluated. Then, some samples were tested under microscope using lactophenol blue solution to detect the conidial heads, mycelium, Conidia and Vesicle, and compare all the information them with the available taxonomic information in a number of scientific references and with the assistance of specialized researchers.

The production of citric acid: The solid state fermentation method was used; this method included moisten 10 g of raw material, which is wheat bran, with ratio of 1: 1 (water: medium of production) and pH=4, then all the suspension sterilized and inoculated with 1 ml of 5 \(\times\) 10\(^6\) spore in a 250 ml conical flask. All the flasks were incubated at 28° C for 3 days. Citric acid extracted from the fermentation medium with 50 ml of distilled water, and filtered using Whatman No.1 filter paper, and then filtered solution was centrifuged at 7000 rpm for 15 minutes and then pH and volume using the methods listed below.

Determination Methods:

**pH Estimation:** pH-meter was used after adjusting the device using two types buffer, one with pH=4 and the other with pH=7.

**Determination of total acidity:** The total acidity was estimated according to Pearson, (1973) method; total acidity was estimated by adding 10 ml with sodium hydroxide (NaOH 0.1 M) using phenolphthalein reagent. The concentration of acidity was calculated according to the following equation:

\[
\text{The percentage of citric acid (\%)} = \left[\frac{\text{volume of alkaloid consumed} \times \text{normality of alkaloid} \times \text{equivalent weight of citric acid}}{\text{volume of acid} \times 1000}\right] \times 100
\]

**Determination of citric acid using HPLC technique:** The produced citric acid from *Aspergillus niger* N1 was estimated in the sample using High Performance Liquid Chromatography (HPLC) technique, and according to the conditions of using the device of the laboratories of the Ministry of Science and Technology using a standard sample. A 20μl was injected into the device to identify the citric acid during the time of detention. The quantity of produced acid in the sample was calculated using the following equation:

\[
\text{Concentration of the sample} = \left(\frac{\text{sample area}}{\text{standard sample area}}\right) \times \text{concentration of standard sample} \times \text{dilution factor}
\]

Results and Discussion

In this study, six isolates were selected from samples of fungi that isolated from damaged fruits on PDA
medium. Isolates were purified from the PDA medium and the screened to detect their ability to produce citric acid, by culturing it on Czapek-Dox Agar culture media that containing sucrose, a source of carbon, and methylene red reagent; all isolates were incubated at 28°C for 6 days. The changing of culture medium color from yellow to red ad indicator to production of citric acid due changing of pH. The efficiency of isolates in citric acid production was compared by calculating the ratio between the diameter of the colored zone to the diameter of the growth zone during 3, 4 and 6 days of culturing (Table 1). Three isolates out of 6 were characterized by a high production rate, so that screening was repeated. The most efficient isolate was selected after testing in the first and second stages of screening. This isolated called N1 (Table 2), this isolate characterized with high efficiency to produce the citric acid that detected from the ratio of diameter of produced acid to the diameter of growth zone after 1, 3 and 5 days. Thus, citric acid concentration was estimated according to the total acidity method, and the concentration was 12.8 mg/ml; the citric acid also measured using pH meter and was 2.9, and thus isolate obtained from the damaged orange was found to have a higher efficiency in citric acid production than that isolated from sindi and grapefruit samples. This difference is due the variation in the isolates efficiency to metabolite the carbon source or sugar in the culture medium which in turn leads to produce different concentration of citric acid.

Diagnosis genus and species of N1 isolate: This study determined the morphological characteristics of the efficient isolate in citric acid production to detect genus and species of this isolate according to the taxonomic keys of 24 in addition to the help of specialized researchers. It is observed that isolate formed black colonies filled with conidial heads and grows rapidly on Czapek Yeast Extract Agar. The growth intensity was exceeded on the culture media margin after 6 days of incubation at 28°C its spores are characterized with dark black color. The isolate was examined under the light microscope using lactophenol blue; it was found that the conidial stalks were non-branched or divided (Fig. 1).
Determination of citric acid using HPLC technique:
Citric acid was determined in the sample using standard solutions in HPLC device, and the conditions of the device were described in Table (3). As shown in Figure (2), the peak of the standard citric acid solution appears in the detention time of 2.963 minute and the area was 54.7468% of the total area of the various peaks of standard solution that injected 20 μl of it into the device. While the detention time of the produced citric acid sample was identical to that time of standard citric acid, the detention time was 2.978 min (Figure 3) and the area was 20.0537% of the total area, and the concentration of citric acid was 3.662 mg/ml. This value is lower than those estimated in titration method, and this is due the presence of other compounds were associated with the production of citric acid with a quantity is equivalent to the concentration of citric acid and did not recognized. These compounds may be the organic acids of grape cycle, which may interact with citric acid during determination. Thus, based on the results of citric acid estimation using HPLC technique, it many concluded that the actual production of citric acid from the studied isolate was 3.662 mg/ml but not those calculated on the basis of the titration method which the concentration was 12.8 mg/ml.

Figure 2: curve of standard citric acid by HPLC

Figure 3: curve of citric acid in a sample after 3 days by HPLC

Conclusion

This study confirmed that isolate N1 isolate, which isolated from various sources, was with high susceptibility to produce citric acid. Isolate N1 was detected according to the morphological characteristics on the culture medium, and it was proved is belong to Aspergillus niger. Additionally, the titration method for estimating the produced citric acid did not consistent with HPLC technique, while the latest give an indication of productivity of acid at a lower value than the first method.

Effect of *Olea europea* L Extraction and TiO$_2$ Nanoparticles against *Pseudomonas aeruginosa*

Hiba Qasim Hameed¹, Anaam Abdulqader Hasan¹, Rana Mujahid Abdullah¹

¹Department of Biology, College of Education for Pure Science Ibn-Al Haitham, University of Baghdad, Iraq

**ABSTRACT**

The effect of TiO$_2$ nanoparticles on *Pseudomonas aeruginosa* was determined and the results observed that this compound had inhibitory effect on the isolate (1) of bacteria but not with isolates (2,3). Moreover the effect of *Olea europea* leaves extract on *Pseudomonas aeruginosa* was studied, the results of this study showed that there was inhibitory effect of olive leaves extract against the three isolates of the studies bacteria (1,2 and 3) with different rates of inhibitory zone. When TiO$_2$ nanoparticles mixed with olive leaves extract the results were higher in effect and the mixture showed a synergistic action against the three isolates of *Pseudomonas aeruginosa*. The detection results of the active compounds revealed that the hot crude alcoholic extract of olive leaves contained flavones, tannins, alkaloids, phenols, glycosides, fatty acids, steroids and terpins. The X-Ray Diffraction Analysis (XRD) of TiO$_2$ was performed also for TiO$_2$ solution, and the results showed that the average size of each molecule of TiO$_2$ nanoparticles was (15.96nm).

**Keywords:** *Olea europea, TiO$_2$ nanoparticles, Pseudomonas aeruginosa.*

**Introduction**

In the recent days the herbal and medicinal plants have been assumed greater important due to the considerable role that they propose in formulating new antibiotics ¹, so the ever increasing resistant of pathogens towards antibiotics has caused serious health problems ² that caused increasing interest in antimicrobial effects of plants extracts ³. Olive tree is one of the medicinal plants that it uses in alternative medicine for thousands of years, Olive plant belongs to *Olea europeae* L. is typical Mediterranean species where more than 95% of the world total production is localized ⁵. And it has been an important source of medicine and nutrition ⁵. The leaves of olive plant contain some active compounds include saponine, steroid, and flavonoids to express the desired properties ⁶. So Olive plant may have antibacterial activities because it contains many potential bioactive substances ⁷. In addition there is more interest in nanomaterials according to the ability of antimicrobial effects ⁹. So in the recent years the nanoparticles become attractive as anew antibiotic against infectious diseases, depending on their interesting features which makes them worthwhile in pharmaceutical and biological applications ¹⁰-¹². That means nanoparticles have unique physical and chemical properties, TiO$_2$ one of this materials that used in last decades because it is cheap, non-toxic and easy in production ¹³. As well as the possibility of NPs permeation inside the bacteria cell membrane due to their potential toxicity mechanism such as endocytosis, diffusion and channel implication so NPs have been used to be an antibacterial agent against microorganisms such as bacteria ¹⁴,¹⁵. The activity of TiO$_2$ nanoparticles (1-100) nm diameter have become interesting to investigators because of special features as shape, structure and size of TiO$_2$ nanoparticles, surface stability, the transferences between different phases of TiO$_2$ NPS under stress and heat. Nanoparticles of TiO$_2$ known as glamour of the recent medicine due to its antimicrobial effects to different diseases - causing organisms ¹⁶. The photo catalytic agent TiO$_2$ has been used widely for inhibit various groups of microorganisms such as fungus, viruses and bacteria because it has broad antibacterial activity, high photo reactivity, optical competency and chemical stability ¹⁷,¹⁸ and that results...
to apply this materials in purifying air and water from bacteria and another harmful organic materials also in cleaning and sterilization for places such as clinical centers\textsuperscript{19,20}. So the purpose of this research is to estimate the antibacterial activity of some substances like medicinal plants and nanoparticles of metal oxide which have a good activity against infectious and pathogenic bacteria without side effects.

Materials and Method

Microorganism: \textit{Pseudomonas aeruginosa} isolate was obtained from the laboratory of molecular microbiology at college of education for pure science Ibn-Al haitham for microbiology and molecular laboratory for high Graduate Studies.

Sample Collection: Olive leaves were collected from olive trees in Baghdad. The leaves were washed under sterile distilled water (SDW) to remove impurities such as dust. Blotted with paper towels then dried in open air. Once completely dried there were ground to powder.

Preparation of olive leaves extract: The dried leaves were ground in blender to form powder. Thereafter (20) gm. of the powder were dissolved in (150) ml absolute ethanol and allowed to extract in (soxhlet apparatus) for three hours then the extract was dried at (50-60)° C. The dried extract was collected in sterile tubes until use.\textsuperscript{21}

Analysis of active compounds: The methods that were employed to analysis the active compounds in olive leaves extract: alkaloids with\textsuperscript{22}, flavonoids with\textsuperscript{23}, tannins with\textsuperscript{24}, glycosides and polyphenols with\textsuperscript{23}, fatty acids with\textsuperscript{25}, Terpenes and steroids with\textsuperscript{26}.

Preparation of olive leaves extract concentrations: Stock solution was prepared from the ethanolic extract of olive leaves by transfer (1) gm. of dried extract into volumetric flask (100) ml, the volume was completed with sterile distilled water then it was filtered with Millipore filter (0.22) \mu g\textsuperscript{27}.

Preparation of nanoparticle solution: Nanoparticles was suspended in distilled water by using ultrasound for (15) minutes, the concentration that prepared was (1) gm./100ml.\textsuperscript{28}

Preparation of nanoparticles solution combined with olive leaves extract:

(1) ml of nanoparticles was suspended with the hot ethanolic extract of olive leaves (1)ml at concentration 1gm/100ml by ultrasound for 15 minutes.\textsuperscript{29}

Antibacterial activity: Well diffusion method was employed to determine the antimicrobial activity of TiO\textsubscript{2} nanoparticles and the ethanolic extract of olive leaves each one itself and when they were combined together.\textsuperscript{30}

X-Ray Diffraction (XRD) Analysis: Titanium dioxide powder was used to determine (X-ray diffraction) Shimadzu XRD-6000), the analysis was done in the service The Central Laboratory of college of Education for Pure Science (Ibn Al-Haitham)/University of Baghdad.

Results and Discussion

Titanium oxide TiO\textsubscript{2} nanoparticles were tested for their antibacterial efficacy against three isolates of \textit{Pseudomonas aeruginosa}, Titanium dioxide nanoparticles (1- 100) nm in diameter have become a quintessential materials due to their optical competency, dielectrical, photo-catalytic characteristics from size quantization.\textsuperscript{28} The results showed that TiO\textsubscript{2} nanoparticles had a relatively low inhibitory effect against \textit{Pseudomonas aeruginosa} for isolates (1,2,3) (Table 1), where isolate (1) was affected by these nanoparticles with high efficiency while isolates (2,3) did not actually inhibited in the presence of TiO\textsubscript{2} many recent and previous research have been indicated the ability of nanoparticles of TiO\textsubscript{2} to inhibit certain species of bacteria. Current results of antibacterial effect of titanium oxide nanoparticles were compatible with previous studies reporting that NPs possessed good antibacterial activity against pathogenic bacteria such as \textit{Klebsiella aerogenes} and \textit{staphylococcus aureus} \textsuperscript{31}, another study mentioned that concentration 100\mu/ml of nanoparticles suspension had inhibition effect against \textit{Bacillus subtilis}, \textit{Pseudomonas aeruginosa}, and \textit{Escherichia coli} \textsuperscript{32}. It is recorded that nanoparticles of Titanim dioxide are effective bactericidal agent against both strains of bacteria but the activity against gram negative bacteria was more than in the gram positive bacteria.\textsuperscript{33} Many studies refer to that the bacterial cell carries negative charges where the metal oxide carry the positive charge so there is an attractive between the metal oxide and the bacterial cell and these leads to oxidation so the bacterial cell will die finally.\textsuperscript{34} and we can say that nanoparticles can deactivate DNA and the enzymes of bacterial cell by coordination to electron-donating groups like Thiols, Amides, Carbohydrates, Indoles, Hydroxyls and etc. So that leads to make pits in the cell wall of bacteria and causes to increased permeability and cell death, surface modification intrinsic properties, composition, and the cell surface characteristics of microorganisms could be another reason.\textsuperscript{35} Interestingly, the results showed the antibacterial activity of hot alcoholic leaves extract
of *Olea europea* and indicated that olive leaf extract presented abroad – spectrum antibacterial activity against the three isolates of *Pseudomonas aeruginosa* (Table 1), many researches emphases the great role of olive leaves as a medical plant against the pathogenic bacteria. 36 studied the effect of aqueous extract of olive leaves with concentration of 0.6 % (w/v) and he found that the extract killed *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus* and *klebsiella pneumonia* in three exposure 37 found that methanol extracts of arugula seeds and olive leaves gave posetive antibacterial effect with average inhibition zone between 3-8 mm. Olive leaves (*olea europea*) have been used for pharmaceutical purposes since ancient times and the studies have proposed that olive leaves extracts have antimicrobial activities 38, so olive plant may be useful as an antibiotic against the opportunistic infectious diseases 39, especially against *Pseudomonas* and *Klebsiella*, so both of bacteria pose a high resistance problem 40. The results also showed a synergistic activity of olive leaf extract and TiO2 mixture against the studied bacteria and for three isolates. Many studies pointed the high inhibitory activity of nanoparticles and plant extracts in the case of mixing them together in comparison to their effectiveness if they were used alone, this in agreement with results of 41 that find increase in the size of inhibition zones, they reach to (19-21)mm in case of use ELE-Ag nanoparticles combination as compared to (8-10) mm with extract alone. as well as there is a significant inhibition effect of biofilm formed by *Pseudomonas aeruginosa* and *Staphylococcus cereus* with mix of Eucalyptus extract and nanoparticles of silver, while there is no with Eucalyptus extract alone. The detection results of the active compounds revealed that the hot crude alcoholic extract of olive leaves contained flavones, tannins, alkaloids, phenols, glycosides, fatty acids, steroids and terpins (Table 2) the reports describing antimicrobial features of phenolic compounds in olive products refer to compounds obtained from olive plant particularly hydroxyrosol and oleuropin. phytochemical screening of many extracts of (*olea europea*)leaves showed the presence of steroids, saponins, flavonoids, terpins and sterols, and these compounds were many previously studies reported to exist in olive leaves, these compounds are responsible for antimicrobial properties. X-Ray Diffraction analysis was performed for TiO2 (Fig 2) and the diffraction peaks were indicated to the small size of the crystals. Scherrer equation was used to calculate the average size of the nanoparticles for TiO2 as well as the capacity of nanoparticles

\[ D = \frac{K\lambda}{\beta\cos\theta} \]

- **D** = size of particles
- **K** = Scherer constant (1-0.9)
- **\( \lambda \)** = the wave length of x-ray (A1.5418)
- **\( \cos \theta \)** = Bragg angle

Based on the above equation, the results found that the average size of nanoparticles of TiO2 was (15.96) nanometer. Observation where found that the size of TiO2 nanoparticles was (22) nanometer according to Scherer equation.

Evaluation of the Midwives, Practices toward Management and Prevention of Postpartum Hemorrhage at Delivery Rooms in Holly Karbala and Hilla City Hospitals

Manar M Hameed¹, Salma K Jihad²

¹Maternal and Neonatal Health Nursing, ²Community Health Nursing Department, College of Nursing, University of Babylon, Hilla City, Iraq

ABSTRACT

Globally, there is an estimated of (287,000) maternal deaths. This means, every day, about 830 women deece from preventable causes linked to pregnancy and childbirth. One woman dies every two minutes. About 99% of maternal deaths happen in developing countries, while above half of these deaths were preventable. Postpartum hemorrhage (PPH) is a major cause of maternal mortality and morbidity, especially in developing countries, where most pregnancy-related deaths are connected with hemorrhage. It aimed to assess midwives knowledge regarding management and prevention of PPH. A descriptive study was found to be effective for the present study. In this study the target population was consisted of all midwives working in delivery room in hospital of a Holy Karbala and Hilla city. The sampling technique use in this study was (nonprobability) purposive method of sampling ; sample were consist of 60 midwives working in delivery room in Karbala and Hilla hospitals. The main results of the study reveal that majority of the midwives had fair evaluation according to the mean of scores in most of the items regarding participants’ practices toward management and prevention of postpartum hemorrhage.

Keywords: postpartum hemorrhage, Midwives, practices toward management prevention of PPH.

Introduction

More than half million women around the World die as a result of complications during pregnancy and childbirth. Common of these deaths occur within few hours of delivery and in most cases are due to (PPH). Approximately 24% of maternal death occur through pregnancy, 16% in the period of labor and births and 61% occur during the postpartum period. 45% of death occur within the earliest 24 hours of birth mostly as a cause of PPH. Postpartum hemorrhage is the major cause of maternal morbidity and mortality worldwide with the main incidence in developing countries.¹ According to WHO, (2005) obstetric hemorrhage causes 127,000 deaths worldwide and is the leading cause of maternal mortality. Universally, obstetric hemorrhage remains the most significant cause of maternal mortality. It is expected that PPH is the most common cause of maternal deaths across the world, responsible for more than 25% of deaths annually and is a major cause of several maternal morbidity.² PPH is one of the obstetric emergencies that can be prevented if the correct skills are employed yet it remains the leading cause of maternal mortality globally.³ In 2010 nearly 14 million women suffered from PPH worldwide resulting into 287,000 women dying while pregnant or giving birth. 99% of global maternal deaths occur in developing countries, with the maternal mortality ratio (MMR) of 239 per 100,000 live births, 14 times higher compared to the developed regions (17 maternal deaths per 100,000 live births).⁴ PPH is accounts for approximately one-quarter of all maternal pregnancy-related deaths. Many studies have recommended that several deaths associated with PPH could be prevented with prompt recognition and more timely and forceful treatment. Morbidity from PPH can be severe, with sequelae including organ failure,
shock, edema, compartment syndrome, transfusion complications, thrombosis, acute respiratory distress syndrome, sepsis, anemia, intensive care, and prolonged hospitalization.

Materials and Method

Study Design: A descriptive design study was found to be effective for the present study.

Sample: Sample were consist of 60 midwives working in delivery room in Karbala and Hilla hospitals. The sampling technique use in this study was non probability purposive method of sampling.

Setting: In this study the target population was consisted of all midwives working in delivery room in Maternity Teaching Hospital of a Holy Karbala and Hilla city. This Study is carried out in Holy karbala and Hilla city from December, 5th, 2017 to January, 3rd, 2019.

Instrument: Checklist used by the researcher for three observations for each study sample (midwives). An instrument was constructed through the use of three level type of Likert scale to evaluate the midwives practices toward management and prevention of PPH in delivery room. Each midwife was observed 3 time, (3) times considered as always, (2-1) times considered as sometime, and (zero) as never. The rating score of the observational checklist was (3) for always, (2) for sometime, and (1) for never. Depended on Likert scale, scoring of practice was done as:

- Poor practice (mean of score= 1-1.66).
- Fair practice (mean of score= 1.67-2.33).
- Good practice (mean of score= > 2.33).

The instrument was comprised of (4) categories, each of them included several items.

1. Administration of a uterotonic drug which contain (6) items.
2. Controlled cord traction which contain (12) items.
3. Uterine massage which contain (5) items.
4. Immediate postpartum care which contain (8) items.

Validity: The content validity of the tool was established in consultation with guide of experts from the field of obstetrics and gynecology department of nursing & medicine and other field specialties. Suggestion of the experts were considered for modification and changes which were made accordingly.

Data Collection: The data collection was carried out during the period from March 28th to July 1st, 2018.

Data Analysis: The collected data was analysis by using descriptive statistics (mean, mean percentage, standard deviation) and T-test to find out the association between the demographic variables and the scores of knowledge.

Results and Discussion

Since 2007, the world health organization recommendations need maintained active management of the third stages of labor (AMTSL) as acritical intervention for postpartum hemorrhage prevention. AMTSL has become a central factor of the PPH reduction plans of government around the world. Table 1 of this study demonstrated that more than half of midwives had some times checked and palpated the uterus to ensure no other baby is present. This result disagree with the study done in south of Ethiopia by Zelalem T, et al., 2017 who showed that all of obstetric care provider had given uterotonic drug intramuscularly and only (1.7%) had given intravenously and agree with the study done in Addis Ababa by Andualem & Rahel, 2015, the aimed of their study was to assess factors associated with knowledge, attitude and practice of midwives on active management of third stage of labor and they reported that about (89%) of midwives had awareness on oxytocin intramuscular injection as a first line drug for the management of postpartum hemorrhage.

Table (2) explained how midwives deal with the cord traction, the results showed that there are more than one procedure can be performed. In this instant, high percentage of them never change gloves when cutting the cord, followed by the action of clamping the cord close to the perineum and hold the cord in one hand which they always did that, (58.3%) of the participants always place the palm of the hand on the lower abdominal, just above the pubic bone and finally it was observed that subjects did not put the baby before cord clumping on the mother abdomen. The woman’s life sometimes rely on one moment to be saved with very simple intervention. A study was conducted by Rahel Y, et al., 2014 they
aimed to assess the knowledge, attitude and practice of midwives on active management of third stage of labor. The current study indicated that (61.7%) of midwives always done immediately cord clamping (less than 60 sec) and (51.7%) study participants encourages the mother to push while gently pulling downward on the cord to deliver the placenta, with the strong uterine contraction. Table 3 Majority of the participants in this study prefer to immediately massages the fundus of the uterus until it contracted while high percentage of them never palpate for a contracted uterus every 15 minutes and repeats uterine massage as needed during the first 2 hours. This result agree with the study done in Ethiopia by Rahel Y, et al., 2014 shows that (86%) of the sample immediately massages the uterine fundus and (60.3%) palpates the uterus every 15 minutes. Massaging the uterus should be done only when uterus is not firm, otherwise muscle fatigue and uterine relaxation may occur. Aggressive massage may lead to partial or complete uterine prolapse. Table 3 revealed that more than half of study sample ensure that the uterus does not become relaxed (soft) after stopping uterine massage while (55%) of midwives never instruct the woman on how to massage her uterus. Table 4 the result of the current study shows that all midwives inspect and repairs lacerations or tears and majority of the midwives (78.3%) always repair the episiotomy if one was performed. In a study conducted by Balla B, 2015 in Al-Ribat which aimed to assess the knowledge of midwives toward postpartum hemorrhage the researcher found that almost all the sample (94.8%) inspected the perineum after delivery and repairs laceration or tears. Moreover more than half of midwives never estimate blood loss. The current study results is supported by Faiza A, 2014 who had done a study and reported that (61.7%) of midwives had assessed of blood loss and lochia. Most of the midwives the in present study remove soiled bedding and makes the woman comfortable, explain the procedures and actions to the woman and her family and Continue to provide support and reassurance throughout while, (61.7%) of them never put the baby to the mother’s breast. One of the most important action that the nursing process emphasized is to teach and discuss any procedure will be implemented on the patient. As well as making the mother comfortable. Another issue in the assessment of the hemorrhage when care provider position the baby to the breast of the mother which make

Evaluation the Effect of Gentamicin on Fertility of Male Rats & Probable Protective Role of Lipoic Acid

Kawther Yahya¹, Ayyed Hameed Hassan¹, Haydar Nadhem¹
¹Department of Physiology, Biochemistry & Pharmacology, College of Veterinary Medicine, University of Kerbala, Iraq

ABSTRACT

The aim of our research was to investigate the probable preventive effect of lipoic acid in fertility of rats against gentamicin toxicity. Twenty four male rat divided into four groups each group have 6 animals were treated as follows: untreated control animals (group1), treated with lipoic acid 600 mg/kg orally (group 2), treated with gentamicin 80 mg/kg intraperitonialy (group 3) & treated with lipoic acid combination with gentamicin (group 4) all these groups treated for four weeks. The result revealed physiological & histopathological changes in animals treated with gentamicin, there are significant decrease in testosterone & LH levels, also there are significant decrease in sperm count, viability, motility & significant increase in sperm abnormality. On the other hand, lipoic acid when given with gentamicin lead to return all these alteration near closely to the normal states. In conclusion, lipoic acid causes enhancement the alteration induced by gentamicin in male reproductive system of rat.

Keyword: fertility, lipoic acid, gentamicin, testosterone

Introduction

Infertility is an inability to become pregnant after an unprotected year of intercourse ¹. Infertility is experienced by 15 percent of couples. In general, there are anatomical factors for male infertility (e.g. varicoceles, ductal obstructions or ejaculatory disorders) as reported by ²,³. There are few investigations managing the impacts of gentamicin on the regenerative arrangement of guys. It has been accounted for that gentamicin does not aggregate in the testicles because of poor transport over the blood testicles hindrance ⁴, despite the fact that a later report detailed a restraint of the cell division of germ cells & the union of proteins in the testis & the acceptance of cell passing in the testis. Numerous examinations have as of late demonstrated that gentamicin causes oxidative worry in the testis by expanding free extreme arrangement & lipid peroxidation ⁵. Alpha lipoic corrosive (ALA) is a characteristic substance combined by octanoic corrosive & cysteine, which are immediate antecedents of lipoic corrosive, in human & creature bodies in mitochondria. In numerous investigations, ALA has been appeared to battle oxidative worry by free radicals ⁶. ALA has likewise been recognized as a member in the development of other cell cancer prevention agents, for example, nutrient C, nutrient E, & the decrease of glutathione (GSH) in a reusable structure by recovering them ⁶, notwithstanding its job in the searching & end of the extreme impacts of ROS. This experiement has been designed to know the protective effect of lipoic acid against the negative effect of gentamicin on the male rat system.

Materials and Method

Male rats (Rattus Norvegicus) obtained from Faculty of science, University of Kufa were used in the present study. The animals housed in animal’s house in College of Veterinary Medicine/University of Karbala in plastic cages under suitable environment conditions at temperature 23 ± 2 °C from 14/12/2017 to 6/2/2018, food & water were offered daily, they kept for two weeks before experimental beginning for acclimation.
Experimental Design: Twenty-four male rats weighing 200–220 g were used in the present study under suitable environmental conditions at temperature 23 ± 2 °C. Food & water were offered daily, they kept for two weeks before experimental beginning for acclimation then randomly divided into four groups comprising six animals for each group as the following:

Group 1: Rats were given normal saline orally & served as control (C).

Group 2: Animals of this group were given gentamicin (G) intraperitonially at a dose of 80 mg/kg, for four weeks according to 7.

Group 3: Rats were given lipoic acid (LA) orally at a dose of 600 mg/kg BW according to 8 for four weeks.

Group 4: The animals were orally given lipoic acid after administration of gentamicin (A/G) at a dose of 80 mg/kg, for four weeks.

At the end of the experiment, animals were anesthetized by chloroform followed by blood collection to perform hormonal & biochemical assays, then after animals sacrificed, caudal epididymis was isolated for epididymal spermatozoal examination.

Parameters of the Study: In this examination sperm motility, tally, & feasibility were assessed by utilizing customary techniques 9-11. Amount of the motile spermatozoa were determined per the unit of territory & communicated as rate sperm motility. Sperm checks were finished utilizing haemocytometer & outcome were communicated as Mil./ml of suspension. Hormonal test: Estimation of serum testosterone, luteinizing hormone (LH) & Follicle-animating hormone (FSH) levels by adhere to produce directions of pack. All packs utilized for hormone test were (Monobind Inc. lake woodland CA 92630, USA) according to 12. The outcomes were spoken to as mean ± standard blunder. The information were investigated by t test & a likelihood (p≤0.05) was acknowledged as huge (SPSS, 2014)

Results and Discussion

Effect of gentamicin & lipoic acid on some hormone levels:

Effect of gentamicin & lipoic acid on some hormone levels in male rat: The statistical analysis revealed presence significant decrease (p ≤ 0.05) in testosterone level in animal that treated by the gentamicin only & there is no significant change in animals treated with gentamicin & lipoic acid in compare with animals treated with lipoic acid only as well as control. In addition level of LH hormone revealed significant decrease (p ≤ 0.05) in rats which treated with gentamicin only when compare with rats treated with gentamicin & lipoic acid & that treated with lipoic acid only as well as control group. Last column observe no significant change in FSH hormone level between groups, table (1).

Epididymal Sperm Analysis: Table (3) represent values of sperm analysis; first column shows presence significant decrease (p≤ 0.05) in the epididymal sperm count in rats administrated gentamicin in compare to other groups. There was significant decrease (p ≤ 0.05) in the sperm viability in animals giving gentamicin in compare with animals in control, treated with lipoic acid & treated with both lipoic acid & gentamicin respectively. Sperm motility in column three showed presence significant decrease (p ≤ 0.05) at the rats administrated with gentamicin when compare with rats in the other groups. Finally there were significant increase (p ≤0.05) to sperm abnormality in the animals injected intraperitonially with gentamicin in compare to animals in control, giving lipoic acid orally in addition to animals treated with gentamicin & lipoic acid in combination.
In the present examination gentamicin have no noteworthy impact on FSH levels this finding is coordinate with that revealed by 14. What’s more, testosterone, is a hormone delivered by Leydig (interstitial) cells in the testicles manages development & support of optional sex organs 17. The pituitary gonadotropin luteinizing hormone (L H) is the critical trigger of testicular steroid genesis, specifically of testosterone (T) generation, in the Leydig cells present in testicular interstitial tissue. LH & T structure the practical spine of the hypothalamic – pituitary – testicular (HPT) pivot, an administrative circuit where LH invigorates T creation, which equally manages LH discharge by negative input activity 18. In guys, LH invigorates androgen generation by interstitial Leydig cells, despite the fact that FSH targets Sertoli cells in the testicles to control spermatogenesis 19. In worry to testosterone our outcome indicates critical lessening in testosterone levels when administrated gentamicin this finding concur with 20 who detailed that diminished testosterone levels were seen on account of gentamicin organization (20– 24th day) in solid rodents. The diminished serum testosterone in the gentamicin treated rodents might be expected to Leydig cell debilitation brought about by ROS age 21,22. Then again on the grounds that the gentamicin have negative impact on the nerve center pituitary-gonads pivot this lead to diminish the dimension of the testosterone just as luteinizing hormone by decline the GnRH–LH motioning in the testis; which have invigorate the arrangement & emission of testosterone hormone 23,24. In other component demonstrates the job of gentamicin as a cationic component appears to collaborate with the Ca++ authoritative to lipid mono-layers & to bio-membranes 25. Various examinations demonstrate the limit of gentamicin & different aminoglycosides to square different calcium channels 26-28. Calcium assumes a noteworthy job in the excitation-discharge pairing of synapses & hormones 29. It is conceivable that gentamicin squares testosterone blend either meddling with the movement of the relative steroidogenic compounds 30, or restraining testosterone discharge in the blood as it occurs with the acetylcholine discharge, by means of calcium enmity in the aminoglycosides actuated neuromuscular blochade 31-33. The impregnation of gentamicin in testosterone pellet inserts, in people, in spite of the fact that not critical brought about 20% decrease of the testosterone expulsion rate 34. In our investigation we demonstrate that the lipoic corrosive have defensive impact to improve & amiolerate the negative impact of gentamicin on the regenerative tract of male rodent. Concerning male proliferation, a noteworthy number of restorative investigations proposed that LA ensures the testis & its capacities against an expansive range of lethal abuse where oxidative pressure is a piece of the fundamental etiology 35-37. It is trusted that the lipoic corrosive by means of its cell reinforcement property can search a few receptive oxygen animal categories & furthermore restrains the age of hydroxy radicals that assault sulfur-containing cancer prevention agents 6. In addition, lipoic corrosive has capacity to support the dimensions of protein thiols & regulate tissue endogenous cancer prevention agents 6. In view of these phenomenal properties, lipoic corrosive has been appeared to be of enthusiasm as a helpful instrument to secure the male regenerative wellbeing against a scope of testicular toxicants in test creatures, where oxidative pressure is the piece of fundamental etiology 37.

**Conclusion**

Lipoic acid when given with gentamicin lead to return all these alteration near closely to the normal states. In conclusion, lipoic acid causes enhancement the alteration induced by gentamicin in male reproductive system of rat.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

Introducing 5P’s Methodology as Healthcare Marketing Plan: Using 5P’s Healthcare Marketing Plan in Diabetic Foot Care Management

Salama Jabbar Raji
Quality Management, Abu Dhabi, United Arab Emirates

ABSTRACT

This study will focus on introducing 5P’s (Product, Place, Process, Price, and Promotion) methodology as health care marketing study through implementing the lean process in diabetic foot management in outpatient services in a five hundred and fifty six bed, tertiary hospital in the UAE. The Quality specialist applied lean methodology to eliminate unnecessary staff and patient movement. Focussing on analysing delays, defects, and variations in diabetic foot care management and streamlining the patient pathway to improve quality and safety, reduce costs, and increase profit margins. Lean methodology can be used to eliminate wasteful practices and reduce variation in clinical services. Innovation in healthcare processes uses lean methodology to focus on value stream mapping of a process. This in turn leads to superior utilization of hospital resources.

Keywords: Healthcare, Diabetic Foot, Care Management

Introduction

Abu Dhabi is experiencing rapid economic growth and fast becoming an attractive base for healthcare investment 1. The healthcare system attracts a large number of nationals and none national workers. This leads to continuously changing demographics and cultural social structure. The prosperity Gross Domestic Product (GDP) and life style of the population results (The Canback Global Income Distribution Database, 2015) in an increased rate of high risk diseases such as diabetes placing the existing health care infrastructure under pressure 2. Ogrin et al. (2013) 3 suggest that a well-coordinated multidisciplinary team is the most effective way to provide diabetic foot management and reduce the overall burden of disability on society. A robust support system that can sustain the diabetic population increases healthcare service demands but improves cost efficiency and activities of daily living 4. The recent establishment of “Daman” as the national health-insurance carrier places my tertiary hospital in a prime position to become a major regional diabetes provider. Developing a diabetic foot centre of excellence would enable sustainment for an increased demand being placed on the current diabetic foot care services.

Methodology

Using lean methodology redesigns the flow of patients, materials, information and or clinicians. This then streamlines processes and systems to improve patient outcomes. Lean innovative solutions continuously improve processes as the industry evolves. The methodology employs a systematic approach utilizing several tools to achieve intended outcome. A SWOT assessment (Appendix 1) was used to analyse the Strength and Weaknesses (SW) of the Diabetic Foot care clinic services in relation to: 1. Stakeholders, 2. Financials, 3. Customers and Community Stakeholders, 4. Service Quality & Operational Efficiency, 5. Learning Growth & Infrastructure. A search was performed using the following databases: CINAHL, PUBMED. Search was performed using the following key words: lean methodology, lean thinking, diabetic foot care, cost effective, multidisciplinary team, waste reduction, value added mapping, and industrial quality management, 60 second diabetic foot assessment with appropriate
problems and being at risk of diabetes will be identified. Index (ABI) and toe pressure so as the severity of foot nurses may access vascular status with an ankle brachial screening for high risk and report. In diabetic foot clinic the multidisciplinary diabetic foot team after foot foot team members. Nurses should communicate with seconds assessment and collaborate with other diabetic foot examination using monofilament within a 60 seconds assessment and collaborate with other diabetic foot team members. Nurses should communicate with the multidisciplinary diabetic foot team after foot screening for high risk and report. In diabetic foot clinic nurses may access vascular status with an ankle brachial index (ABI) and toe pressure so as the severity of foot problems and being at risk of diabetes will be identified.

Another element of diabetic foot care excellence provided by nursing is the accurate selection of appropriate dressing according to wound/ulcers type, e.g., wet or dry. Dressing choice is extremely important as it is designed to keep the wound clean, maintain wound moisture levels, and support debridement and reduction of bacteria. Accordingly, all diabetics should be referred to the diabetic clinic in order to be evaluated, screened, diagnosed and avail comprehensive foot care annually. Diabetic foot nurses examining patient’s feet in clinic(s) should complete the initial patient evaluation screening list and examine the level of limb health via movement, moisture, color, temperature, edema, pain and sensation.

Place: According to the organization’s internal data analysis, there were 29,484 diabetic outpatient visits, out of which, 57 visits with wound complication during the studied period. For the same period of time, 17,704 patients were admitted with diabetes mellitus (Internal patients’ data analysis). Patients may show up in late stages of their disease to the hospital. This variable means they may end up anywhere in the hospital rather than going through the designed care pathway.

In the studied period, the hospital admitted 244 diabetic inpatients. Twenty-three of those ended up with amputation, seven patients lower limb amputations, (3 legs and 4 toe/toes amputation). Diabetic patients develop serious life threatening complications. The average length of stay for diabetic amputee patients was 34.7 inpatient days (Data extracted based on principal diagnosis code, from local internal electronic system).

Multidisciplinary teamwork is a driving force behind the success of a diabetic foot clinic, in fact most patient pathways today (Samuel, 2014). Due mainly to an increased aging population with comorbidities, sound teamwork has become necessary for successful patient outcomes.

Process: The innovative new process will focus on improving compliance through standard patient care screening and assessment aiding early identification of high-risk patients. This process improvement not only ensures early intervention and reduction of hospital admissions but also reduces costs and increases patients’ satisfaction. The lean process begins by helping focus on early assessment and identification of high-risk of diabetic foot patients every visit. The existing process of diabetic foot patients’ care happens in five different clinics based on the type of visit (Appendix 2). This process starts with registration, waiting for nurse assessment and examination (foot care/general assessment), referral to diabetic foot clinic, possible procedure and education. Patient then re-booked for another appointment. In case the patient needs another clinical service (i.e. vascular consult), patient has to be re-registered again in the system. Existing policies and procedures do not allow nurses to refer patients to different specialities; neither can nurses register patients under their own services (e.g. wound care clinic), patients must be registered under a physician name as per insurance requirements. Diabetic foot clinic is not accessible in booking lists via registration but only through direct appointment; requiring a special referral to be seen. These referrals are done manually as no automated system exists. Appendix 2 shows a process map of existing journey flow for diabetic foot patients. The proposed new process dealt with non-value added steps in seeing diabetic foot
patients. A multi-disciplinary team was formed to study the existing process and improve it. The team consisted of a physician, vascular surgeon, wound care nurse, quality assurance, and patient access, marketing and finance representatives. The existing process was carefully mapped detailing all steps. Geographical layout of five clinics was drawn and the patient journey traced. Consensus reached by all team members including timings of each step. Follow up discussions proposed non-value added process steps be eliminated.

Non-value added steps:

1. Duplication of patient examination
2. Duplication of registration
3. Patients’ referrals to other specialties during the visit
4. Diabetic foot re-assessment in the diabetic clinic

Appendix 3 shows new process steps and layout reflecting a leaner, efficient approach to patient care providing effective and timely services.

Measuring outcomes of clinicians and patient adaptation to new process will be via data extraction from electronic medical record. Extracting data from the medical record system retrospectively includes timings of patient’s registration-assessment, examination, education/procedure completion, and patients’ check out. This approach will be used also to standardize treatment methods, and decrease the probability of patient complaints and incidences from delay to treat. Nurses can also prioritize the patient’s urgency for treatment using the new process flow. The multidisciplinary team will then triage the level of urgency by following clinical protocols or guideline (60 seconds diabetic foot tool). The Diabetic Foot Clinic will provide optimum healing for people with diabetic foot disease and a holistic, coordinated wound care regime for all patients in the system.

All UAE national patients are covered by medical insurance and are given free treatment. Expatriates’ insurance is covered either by insurance agencies or by company sponsorship. A small minority may be classified as self-pay. Healthcare clinicians are obliged to follow the legal regulations in terms of providing health services. An analysis of DFU patient’s needs from the last three years outpatients’ clinical visits has made it possible to justify the establishment of the MDT consisting: Two Internists, Wound Care Nurses, Orthopedic surgeon, Vascular surgeon, General surgeon, Radiologist and interventional radiologist, Microbiologist, Podiatrist and Clerk and educator. The diabetic foot clinic will help the organization by increasing registered patient visits through leaning the existing process. This in turn increases organization revenue. Decrease of waiting time also leads to more efficient resource utilization and organizational savings. The medical need and expenditure for diabetic foot care have increased markedly over the past decade. The diabetic foot centers viability is dependent on revenue, and its clinical effectiveness is based on generated revenue and the multidisciplinary approach to diabetic foot care. Diabetic foot is the most common cause of hospitalization and health system concerns in diabetic patients. Specialized diabetic healthcare providers are assigned to the prevention and diagnosis of diabetic foot complications. Nurses as members of the diabetes care team not only need to play the role in clinical health care, but public education, health system management, patient case management and monitoring the activities of daily living. The goals of health promotion are to achieve disease prevention, effective patient care and ensure patients’ treatment compliance. To achieve these goals, healthcare professionals play different roles: providing clinical care, care connectors, educators, consultants, leaders, researchers and patient advocates. They combine science and art to provide health services, seeking to balance physical, emotional, mental, social and cultural norms with spiritual needs. Compliance to standard procedures, policies, guidelines through evidence-based practice, will increase the knowledge in management of care of diabetes and diabetic foot wounds. All educational information, trainings, conferences were offered to all staff but still there is no standard of care being done to patients with diabetic foot wound. Having a new process or framework requires promotion and marketing. The diabetic foot clinic is promoted through two directions, the first by healthcare providers. This approach will be through meetings, flyers, and circulars. All-important information will be specified in the flyer. Educational sessions will be conducted to all involved healthcare providers on the new process and layout. Most importantly, senior leadership engagement and support will be evidenced and regular communication to all staff. Marketing department will be involved in the process of promoting the creation of the new clinic. Other healthcare organizations will be notified and the new process and referral guidelines explained. The other
direction will be focused on patients and community. Special patients’ education program will be held in the clinics. This program will involve all staff involved in the patients’ journey. It will include physicians, nurses, dieticians; wound care nurses and other professionals. Healthcare diabetic foot care education printed materials will be developed to comply with patients and family’s needs. Marketing department will contact local media for publicizing the new process and to educate the community about it. The community education will focus on encouraging patients to take a direct appointment with the diabetic foot clinic made available in the new system.

**Results and Discussion**

Our vision is to have a lean diabetic foot care management process in the hospital by end of 2018 that is properly equipped with all resources. The clinical information outlined in our internal statistical reports (2012, 2013 and 2014) clearly shows the need and benefits for implementation of a DFU lean pathway but strategies to overcome current barriers preventing the hospital from forging ahead must be sought. Our goal is to set up a multi-disciplinary team to implement the lean diabetic foot care process for all patients at risk of diabetic foot ulcers with the aim to empower patients to participate in their management. Strategies consist of a comparison of the current management of patients with diabetic foot ulcers at the hospital to future management of these patients defined by the new lean process. Support and approval from the senior management team is the key successful factor to implement the lean process and resolve several barriers currently contributing to delays in implementation. Establishing evidence of the successful implementation of the lean process starting with launching patient surveys and observations of clinical practice to compare treatment before and after the establishment of a lean DFU pathway (NICE, 2011). We plan to document the level of care and ask the patient about quality of life criteria and monitor implementation of on-going treatment plans. The new process results are shown below in appendix 3. Most important of these results is the new layout having a decrease 68% in total process time and allowing for 18 additional patients per week to register. The results of the new layout implementation were:

- Using diabetic foot care assessment as a key process.
- Having an own minor OP’s nurse.
- Educate patients to be aware of side effects and to call immediately when they have something
- Discussion with all staff to have a standard process

Also the results out of the process changes were:

- A total time reduction of 83% or 144 min (Appendix 4)
- A total waiting time reduction of 93% or 105 min (Appendix 4)
- A total process time reduction of 68% or 47 min (Appendix 4)
- Involvement of DF team
- Much reduced patient ways

**Conclusion**

The 5P’s (Product, Place, Process, Price, and Promotion) strategies are introduced to improve healthcare services. The above healthcare marketing study recommend to add the 5th P (Process) as core of healthcare marketing plan approach to improve or establish any healthcare services. A healthcare marketing plan should be purposefully and consistently developed to be part of routine and integrated to achieve the organization mission. These strategies (5P’s) are necessary to develop and execute the healthcare services and growth of the profession that customers as well as the healthcare community which can embrace these services. Considering that the support of top management is a necessity for a transition to a market and make sure of marketing represents a “central success factor”. The 5P’s can guide the healthcare marketing and ensure effectively reaching the market requirements toward providing the needed services. The right 5P’s marketing plan implementation gets into a pro-active mode and will be part of the culture.

New Ruthenium Metal Complexes for their Activity with DNA and Cells of Cancer/DFT-B3LYP Calculations

Asmah Asaad Muhmood¹, Faeq A. Al-Temimei¹

¹Department of Physics, College of Sciences, University of Kufa, Iraq

ABSTRACT

In the current study a ruthenium (II) metal complex \([\text{Ru(bpy)}_2(\text{H}_2\text{saltsc})]^+\) (bpy = 2,2'-bipyridine) (2saltsc = salicylaldehyde thiosemicarbazone) was investigated using DFT/B3LYP with different basis sets. The results showed that the geometric properties agree with experimental data. Three metal complexes were designed and suggested as new isotopes of the ruthenium metal complex. The energy gap of the new ruthenium metal complexes were in the range 0.7034 to 0.7644 eV, this value makes the ruthenium metal complexes have applications lie in the semiconductor region. The calculations obtained that the compound A4 has a smaller energy gap and high molecular polarizability, also more active to interact with other molecules or species than the compounds A1, A2 and A3 according to the quantum chemical parameters. In addition, the highest fraction of electrons transferred is connected with the best inhibitor, while the least fraction is related to the inhibitor that has the least inhibition efficiency. In general, the results showed that the ruthenium metal complexes have high ability to interact with other species or molecules such as DNA and cells of cancer.

Keywords: Ruthenium metal complex, DFT, Basis sets, HOMO, LUMO.

Introduction

For many years ruthenium and its compounds are represented important role in organometallic chemistry. Ruthenium metal is definitely a metal star in the current search for a treatment agent in various medical uses. The ruthenium metal compounds are well famous for their high application as drug applicants, where the ruthenium metal complexes are very important as anti-cancer, anti-bacterial and anti-parasitic drugs. The past of ruthenium complexes equally cis-platin competitors initiated in 1980, after chloro-ammine-Ru (III) analog complexes were create as an anti-cancer activity. The activity against metastatic cancers is a common feature of other ruthenium complexes, some of ruthenium complexes newly arrived medicinal trials as an anti-cancer, anti-metastatic and efficient drug. In current years, many research groups have investigated the structure, properties and spectroscopic of ruthenium compounds by using chemical quantum mechanics with density functional theory. The quantum mechanical calculation can give information and data on the electronic structures and many properties of compounds, and additionally it analyzes important details about the electronic structure to be studied and analyzed. Current work represents a theoretical study by employing the DFT/B3LYP with different basis sets such as LANL2DZ, LANL2MB and SDD for investigating the ruthenium metal complexes and design new metal complexes for ruthenium metal after the choice of stable and the most accurate of basis sets then report the computational results.

Computational Details

The DFT method used for molecular calculations in the gas phase by using the Gaussian09 package program, as well as Gauss View 5.0.8, which was used to prepare...
the input files to Gaussian09 and draw the initial structure of the ruthenium metal complexes\textsuperscript{13,14}. The full geometry optimization calculations have been performed for the ruthenium metal complexes with the B3LYP functional “Becke’s three parameter hybrid functional with the LYP correlation functional” done with ECPs “the relativistic Effective-Core Potential” such as LANL2DZ “effective core Los Alamos National Laboratory 2-Double-Z”, LANL2MB “Los Alamos ECP plus MBS” and SDD “Stuttgart Dresden triple zeta ECPs” basis sets\textsuperscript{15-17}. The use of these basis sets is recommended because it gives sufficient precision to the system of heavy metal complexes\textsuperscript{16,17}, so they have been used and compared for the purpose of selecting the best and most accurate in the current study.

Results and Discussion

The relaxed structure of ruthenium (II) metal complex (A1)\textsuperscript{18} was optimized at three levels using DFT with B3LYP/LANL2DZ, B3LYP/LANL2MB and B3LYP/SDD for comparison. The basis sets “SDD, LANL2DZ, and LANL2MB” are used effective core potentials to decrease the calculation cost\textsuperscript{15,17}. The use those basis sets with ECP on ruthenium metal replaces the inner core electrons\textsuperscript{17,19}. The results obtained by the DFT method showed the effective theory in determining the geometrical optimization of molecular structure in which the relax of the structure was complete without any imaginary frequency and the total energies are minimize at virial ratio “\textit{V/T}” were (2.00507, 2.00345 and 2.00624) using the LANL2DZ, LANL2MB and SDD basis sets respectively. These results were obtained because the DFT method is taken into account for all corrections due to the interaction that occurs between the electrons in the molecular structure. Fig. 1. denoted optimized geometry of the ruthenium metal complex(A1) by using DFT with B3LYP/LANL2DZ level in ground state. Table 1. refers the geometric structures (bands and angles) of the ruthenium metal complex (A1) theoretically by DFT method and B3LYP with deferent basis sets LANL2DZ, LANL2MB and SDD and have been found a good agreement comparison with the experimental values\textsuperscript{18} but the LANL2DZ was more accurate. The calculation results showed that the LANL2DZ basis set was more perfect for ruthenium metal complexes. The choice of stable basis sets is very significant for the most accurate calculation of the characteristics of metal compounds. In the current study selected the LANL2DZ basis set appropriate to optimized molecular structures. After confirming the method and its accuracy and selecting the bases set (LANL2DZ), suggested three metal complexes were designed as new isotopes of ruthenium metal complex active sites to interact with DNA and cells of cancer. Fig. 2. indicates the relax structure of the three structures molecules under study labeled A1, A2, A3 and A4 by using DFT/B3LYP/LANL2DZ. Table 2. indicates the electronic properties (E\textsubscript{HOMO}, E\textsubscript{LUMO} and E\textsubscript{gap}) for the studied molecules (A1, A2, A3 and A4) consequently, higher values of E\textsubscript{HOMO} indicate a better tendency towards the donation of electrons, increasing the adsorption of the inhibitor for mild steel and therefore better inhibition efficiency. E\textsubscript{LUMO} refers the ability of the molecule to accept electrons. The value of energy gap is a significant properties as a function of reactivity of the inhibitor molecule towards the adsorption on the metallic surface. It is important that the values of E\textsubscript{HOMO}, E\textsubscript{LUMO} and the gap between HOMO and LUMO properties the molecular chemical stability. Egap determining stability of the compound, chemical reactivity, optical and electrical properties. In addition, the smaller Egap is a sign of the biological reactivity of the complex. All the ruthenium metal compound under studied has applications within the range of the semiconductor area. The values of the HOMO and LUMO energies as well as the energy gap of the ruthenium complexes are important to obtain information on the electronic absorption to know the energy of electron transmitted from HOMO to LUMO. This means that it must be associated with the less optical transmission of energy in the electronic spectrum. The smallest value of Egap means the more reactivity. According to the Egap values in the ranking of the complexes should be: A4˃A2˃A1˃A3.. denotes the distribution of the HOMOs and LUMOs (in 3-D) due to the LCAOs-MOs according to the coordination of ruthenium metal complexes by employing the LANL2DZ/B3LYP-DFT. Table 3 displays the molecular polarizability values of the ruthenium molecules includes the molecular dipole moment “D. M.” in Debye and molecular polarizability in a. u. From results in Table 2 we can observe two notes; first the compound A4 has the heist D. M (13.2305 Debye) and that molecular A3 has the lowest D. M in which more symmetric structure compared to others. The second note that the molecular polarizability of all structures are in order of (\(\alpha_z > \alpha_y > \alpha_x\)), and all the suggested ruthenium molecules have different average polarizability “\(\alpha_{\text{avg}}\)” in which this mentions to constructing new structures have new electronic properties and therefore, have high ability
to interact with other species or molecules. In general, the results showed that the new ruthenium metal complex structures have high ability to interact with other species or molecules such as DNA in particular compound A4. It illustrates the MEP surfaces “molecular electrostatic potential surfaces” of the complexes (A1-A4). The diverse values of MEP at the surfaces are symbolized by diverse colors. The negative regions the MEP surfaces are connected to electrophilic and the positive regions related to nucleophilic reactivity \(^9\). Where the negative area of MEP is determined for compounds mainly depending on sulfur, nitrogen and chlorine atoms, demonstrating that they are the most appropriate and important locations for electrophilic dose. As for the maximum positive region is located on the 2H atoms of the O-H and C-H, displaying that they are probable locates for attack by nucleophiles. The ESP surfaces of complexes displayed the potentials were dragged toward the region of highly electronegativity, and consequently, give one to understand to determining the effective ends positions of compound to connection with the surrounding species or molecules to construct new metal complexes. The produced maps of ESP are results from the strength of attraction or repulsion for the area surrounding the molecule. Generally, the ESP surface is dragged toward the negative charge (chlorine and oxygen atoms of high electronegativity). Significant quantum chemical properties such as ionization potential \(I_e\) (eV), electron affinity \(E_a\) (eV), electronegativity \(E_N\) (eV), chemical potential \(\mu\) (eV), electrophilicity (eV) and back donation \(\Delta E\) (eV), these parameters are measured and describe the activity of the compounds. The calculations of properties are carried out by the Koopmans theorem (KT) \(^{11,12}\). The ionization energy ranking of mentioned complexes are: A3>A4 >A2>A1. We can note that the compound A3 has a larger value of \(E_a\) and \(E_N\) comparison with other complexes, this means, that the A3 has high ability to acceptance electrons and small excitation energies may need to an electron transfer. From Table 4 shows the order of \(E_N\) were A3 >A4 >A2>A1. The complexes A4 and A3 have large value of. This means, that compounds A4 and A3 have a high ability to interacts with other species. The \(\Delta E\) in Table 3. Thus, the highest fraction of electrons transferred is linked with the best inhibitor (compound A4), while the least fraction is associated with the inhibitor that has the least inhibition efficiency (A3).

Figure 1: The band and angle of the ruthenium metal complex (A1) using B3LYP/LANL2DZ, B3LYP/LANL2MB and B3LYP/SDD

Figure 2: Optimized structures of ruthenium metal complexes A2, A3 and A4

Conclusion

The electronic structure was optimized by using a DFT/B3LYP with DFT/B3LYP method with different basis sets (LANL2DZ, LANL2MB and SDD). The geometric results were showing that the structural properties are in a well compatible with experimental results. The choice of base sets is very significant for calculating characteristics of the properties of a metal complex, so we choose the LANL2DZ basis set because it was more accurate for ruthenium atom. We showed the new suggested complexes have energy gap applications lie in the semiconductor region. The complex A4 is more active than A1, A2 and A3 due to their highly molecular polarizability and small energy gap. The parameters $I_k$ (eV), $E_{\Lambda}$ (eV), $E_{\eta}$ (eV), $\mu$ (eV), ($eV$) and $\Delta E$ (eV) approve the inhibition efficiency in the order of A4>A3>A2>A1. The new ruthenium complexes have active sites interact with DNA and cells of cancer. The highest fraction of electrons transferred is connected with the best inhibitor, while the least fraction is related with the inhibitor that has the least inhibition efficiency. In general, all the ruthenium metal complexes have high ability to interact with other species or molecules such as DNA, but the complexes A4 and A3 are more active than the A1 and A2.

Pioneer Data for Initiating Prostate Cancer National Screening Program in Baghdad

Bashar Mohammed Hobi¹, Alaa Al-Deen Al-Dabbagh²
¹Family Medicine Specialist, Baghdad Al Karkh Health Directorate, Iraq; ²Assistant Professor, Al-Mustansiriyah University, College of Medicine, Department of Surgery, Baghdad, Iraq

ABSTRACT

Prostate cancer is one of the commonest men cancers in the world, about 1600000 newly diagnosed cases yearly worldwide and 366000 men died every year around the world because of this disease. Seventy seven histopathologically diagnosed prostate cancer patients were interviewed in the urology department of Alyarmook Teaching Hospital in Baghdad/Iraq during 6 months period (from 1st June 2018 to1st December 2018) and direct questions were asked about age, symptoms at time of presentation and family history for each patient. A total of 77 patients with prostate cancer were included in this study, their ages ranged from 51 -90 years with a mean age of (70.6 years ± 7.3 SD.). The biggest age group 39 patients (50.6%) were extending in the age from 71-80 years. Positive family history of prostate cancer in first degree relatives was noted in 10 patients (12.9%) of the cases Most patients with positive family history had their fathers affected 7 patients (70%) while 3 patients (30%) had their brothers affected. The most common presenting clinical symptom in our patients was dysurea in 41(53.2%) patients followed by urine retention in 36 (46.8%) patients.

Keywords: Prostate cancer, age, family history, symptoms, screening.

Introduction

Prostate cancer is one of the commonest men cancers in the world, about 1600000 newly diagnosed cases yearly worldwide and 366000 men died every year around the world because of this disease.¹ As stated by the last WHO statistics reported in 2017, 432 men died in Iraq because of prostate cancer which represent 0.25% of all deaths, age adjusted dying estimate was 7.02 per 100000 persons which grades Iraq 152 internationally.² Public screening means applying suitable screening test for certain disease to a target group of people defined by certain criteria such as age in well organized system.³ Prostate cancer usually affects elderly men and rarely found in patients less than 55 years old.⁴ Probability for man with first degree relative having prostate cancer is about 2 to 2.5 times to develop prostate cancer than man with negative family history for the disease.⁵ It is exceedingly acceptable that prostate cancer includes offensive and inactive kinds, inactive prostate cancer may stay asymptomatic for long time without causing mortality, while the offensive kind will cause symptoms and lead to death.⁶ Usually prostate cancer is asymptomatic during early disease stages but with disease progression, lower urinary tract symptoms may start to appear such as dysurea, nacturia, poor stream, urine retention and burning micturation, as the disease becomes more advanced other symptoms like hematuria, hematospermia and erectile dysfunction may develop, bone pain with generalized weakness and weight loss, urinary or fecal incontinence may indicate distant metastasis with compression on other organs such as the spinal cord.⁷ Aim of the study: the aim of this study was to describe recent prostate cancer age specific, clinical and family history informations in Baghdad which help in developing national screening program for this disease.

Methodology

Seventy seven histopathologically diagnosed prostate cancer patients were interviewed in the urology department of Alyarmook Teaching Hospital...
in Baghdad/Iraq during 6 months period (from 1st June 2018 to 1st December 2018) and direct questions were asked about age, symptoms at time of presentation and family history for each patient, all cases of prostate cancer were included with no exclusion

Results and Discussion

Between 1st June 2018 and 1st December 2018 a total of 77 patients with prostate cancer were included in this study, their ages ranged from 51 -90 years with a mean age of (70.6 years ± 7.3 SD.) The biggest age group 39 patients (50.6%) were extending in the age from 71-80 years, table 1 showed the age distribution of the studied sample. Positive family history of prostate cancer in first degree relatives was noted in 10 patients (12.9%) of the cases (Fig.1). Most patients with positive family history had their fathers affected 7 patients (70%) while 3 patients (30%) had their brothers affected (table 2). The most common presenting clinical symptom in our patients was dysurea in 41(53.2%) patients followed by urine retention in 36 (46.8%) patients (Table 3).

Prostate cancer incidence is strongly related to age with the highest incidence rates being in older men. In this study the age range was 51-90 years with a mean age of 70.6 years. This was in accordance with the mean age (70 years) of ustoo organization [8] and the cancer society of Finland [9] However it differed from a study reported by Oluwole op. [10] which recorded a mean age of 64.5 years and other comparable African series; Mandong [11], Akang [12], Echimane [13], Angwafo [14] and Eke [15], this is because black men are usually affected at an earlier ages than white men [16] The peak age frequency in our study lied in the ages between 71-80 years (50.6%).this result agreed with that of cancer researches in uk (2013-2015) [17-20] which stated that their age specific incidence rates peak in the 75-79 age group, also it agreed with European and American studies where their prostate cancer patients mainly present in the 8th decade [21]. However in our patients prostate cancer occurred a decade earlier as compared to their counterparts in studies made by Oluwole [22], Ugare [23] and Mohammed [24] which found the peak age at diagnosis was in the 7th decade. This may be due to the concept that colored men are at greater risk to have prostate cancer even at earlier ages than white men with more malignant course of the disease, the exact reasons for these differences are not known although a lot of theories tried to explain that it might be due to inherited genes, environmental, social or economic causes [16]. In the current study positive family history of prostate cancer in the first degree relatives was noted in 10(12.9%) patients, this developed because of multifactorial effect of inherited genes, similar environment and daily life behaviors, our finding was consistent with the results of Steinberg [25] (15% positive family history), however it was lower than other studies published by Samuel [26] and by Chen [27] which showed positive family history in 17% and 20% of the cases respectively. In our study 70% fathers and 30% brothers were affected by the disease a result which agreed with previous studies, Steinberg [25] and Chen [27] but it disagreed with that of Samuel [26] which showed nearly equal percent of affected fathers and brothers. The most common presenting clinical symptom in our patients was dysurea in 41(53.2%) patients followed by urine retention in 36 (46.8%) patients and this was in consistence with other references like studies of Bollinger[28] and Thomas[29] which stated that lower urinary tract symptoms with heamaturia are the commonest early symptoms of prostate cancer.

**Figure 1**: Percent of positive and negative family history in patients with prostate cancer

**Conclusion**

Most of the patients with prostate cancer in our study presented late with a peak age of diagnosis was the 7th decade. Men with positive family for prostate cancer are more vulnerable to have the disease especially with affected fathers or brothers. Most of the cases of prostate cancer presented with lower urinary tract symptoms mainly dysurea with or without hematuria.

Psychological Study of Ethics, Values and Functionality for understanding Attitudes, Habits, Beliefs, Functional Skills in a Staff of University of Babylon

Moheh Arak Uleywi, Mohamed Shaker Hamza
1Faculty of Arts, University of Babylon, Iraq

ABSTRACT

Social values play a significant role in shaping positive social behavior and often alienating society from all that is affecting their needs, then the conviction that they have generated makes them proud and perhaps sanctified it, which makes it need long periods to change it as a form not as a content form, therefore, social values in the form of social behavior seeks to impose social reality within formal and informal social institutions, eventually, the individual transmits his ideas to the official social institutions. This makes the formal and informal interaction a complex process and intertwined in the context of official control. Thus, this process will undoubtedly be reflected in the employee’s performance inside the official institution negatively and positively. Social values have a great importance in the behavior of individuals in educational institutions, as they were depended on changing behavior patterns in different work environments to control the behavior of individuals in society, as well as how do they affect their performance inside the educational institution, therefore, values are as a key element in understanding attitudes, habits, beliefs, managerial and functional skills that reflect the individual and collective behaviors of the individual inside the formal social institution.

Keywords: Values, social values, functioning, employee, university

Introduction

The saturation of individuals in society value system makes them an integral part of society and this is what distinguishes their behavior and attitudes towards the others, every action produced by the individual is in itself carrying the meanings of the value that agreed by the society to deal with them, also has become determined as a social paths and ideas towards the things or persons who deal with them, since the educational institution has completely different nature of the social reality that the individual lives and be based on informal social relations 1, It is obliged to drift according to the mechanisms that used in the dealings and determine the light of the relationships of its members, assessing their performance according to the benefits of conventional and this complicates the subject of the debate between official and non-official, thus it affects the performance of the employee to his work because of the interrelationship with Social obligations and functional obligations. Here, the functional behaviors appear in some cases but with social cover. The stability of the individual inside the society is directly linked to the stability of social values and the way they deal with them. Social values are the real link of the individual with the society in general 2, thus it affects all his actions, emotions and behaviors with the others, therefore, the process of dealing with social values needs to analyze and interpret the behaviors that the individual adopts in his life especially inside the official social institutions that adopt a complex system of controls and instructions that define and restrict the individual within its framework and this makes the performance depends heavily on the balance between formal and informal. On this basis we can say that social 3 values directly affect the human personality in the framework of social interactions within the institutions, which is reflected mainly in the evaluation of its performance. The aim of the research is to know the importance of social values and their relation to the performance of the employee. Identify the most important ways to improve the performance of the

Corresponding Author:

Faculty of Arts, University of Babylon, Iraq
employment. Identification of the most important social values affecting the performance of the job. Performance is a behavior in which the individual contributes to the expression of his contributions to the achievement of the objectives of the institution to support this behavior by the institution to ensure quality and quantity. Miller & Bromiley defined performance as “the employee’s ability and experience in how to use the available material and human resources in front of him and which he used them in such a way as to be able to achieve goals that set for him and to the institution. Functionality defined as: It is the activity done by the employees through their performance, duties, responsibilities, tasks and each according to their job position so that the optimal performance of the employees is by carrying out the responsibilities, tasks and duties to the fullest extent. David defined it as: a set of activities and practices carried out by employees of the organization in a purposeful and efficient manner that could be consistent with the objectives and plans issued by senior management decisions. Functional performance can be defined as: a set of activities and tasks that are practiced by the university employee in the educational institution for the purpose of achieving the goals efficiently and effectively according to the administrative resources and regulations, the administrative and technical procedures and the specific methods of career and administrative work. An employee is defined as a person entrusted with the performance of work in the service of a public facility administered by the State or a person of public law. The employee is also defined as: any person who works in the State or public sector permanently and the rights, duties and obligations imposed by the public interest. A job is defined as a specific job or civil office that requires its occupant to perform certain duties or responsibilities whether full-time or not.

The University: The university is known as an educational institution specialized in preparing human resources for the society as an important human resource or an institution composed of professors and students. It is a place of comprehensive knowledge.

The importance of social values of employees and ways to improve their performance: The subject of values is one of the most controversial topics that scholars and thinkers are interested in. They are still interested in them, so the social values shared by a group of individuals that affect the fields of work are: “Religious, economic, humanitarian, financial, political, organizational, disciplinary, leisure, participatory and other values” have a strong influence on the performance and behavior of individuals in the institution, the social values have great importance in the lives of individuals and society, because they affect human relations in all of their forms, therefore, they are important social necessities in the lives of individuals and groups, because they are in the form of cultural and social trends motivations, values may appear new in human behavior, which some can see as a characteristic of human behavior. The importance of social values for individuals lies in the fact that they help to build the life of the individual, also to form a personality, to define his goals and objectives, and the means of achieving these goals and objectives. It also represents a frame of reference that governs the actions of individuals in their private and public life. They work to control their behavior and direction, for example, the Secretariat is valuable if adopted by the individual directed by the deviation. The religious and social values adopted by the individual are protected from error. They act as a protective factor and In addition, it acts as a personal development agent. It highlights the importance of social values to society by helping them to connect cultural parts with each other and to link multiple elements and systems so that they appear consistent and provide the basis for those systems to settle in the minds of community members who belong to that culture. Values serve to provide members of society with a life of prosperity, stability and balance. In the sense that they collect members of society to survive through the format of the values of the individual thinking of his work as an attempt to reach the goals and ends in itself rather than looking at the work as an attempt to satisfy the motives and desires, so the highest values in any group is the goal that seeks To all members to reach something an important justification for existence. While some social and economic researchers believe that values play a prominent role in shaping and embodying the culture of the institution and have an impact on the performance of individuals, especially those values that relate to the scientific format if it can be used as a tool to solve problems, where managers and employees can focus on differences and similarities in their values and enables the manager to change his management style in line with the values of employees, in order to improve their performance, so that the employee who behaves at a performance level is somewhat different based on the values it holds, it will end the conflict with
other employees on the one hand and his administration on the other and thereby lead to a low level of his job performance. The importance of integrity in institutions through the dissemination of culture, Fair institution is adopting an administrative, educational and scientific approach to improve the members of the phenomenon of corruption and commitment to integrity in the work of all kinds and forms, but stems from the principle of responsibility in creating and forming a civil servant is able to cope with the abnormal conditions that have passed by society.

1. The value of sincerity in work and not to drop out: The sincerity to work of social and functional values must prevail in the employees of any profession for the purpose of increasing production and accessing to the results of it, because each profession in society values, ethics committed to, affect the individual and acquire these values through home or school, literary teachings and other sources of social values, the values of sincerity in work also play a great role in guiding the human and preparing his energies and behaviors in all aspects of life with the texts of the performance of the institution, this individual performance is reflected in turn on the performance of the institution as a whole and achieve the goals that seek to reach it.

2. The value of respect for time: Estimating and respecting the value of time is a cultural feature of developed societies, because it makes it a framework through which all elements of development, programs and goals are achieved. It is time that reveals skill and precision when the subject becomes an idea, a motive and a work. Here, institutions that seek development and progress must recognize the value of time and move away from random planning, implementation and follow-up. It is not enough to have material resources, wealth or money, but must use and realize the value system that sets the real development by exploiting those resources, the most important is to appreciate and respect the value of time. Therefore, the employees’ sense of the value of time within the institution and its investment in the performance of the tasks and tasks assigned to them must follow the culture that brings them all this leads to its effective role in the performance of the job within the institution.

3. The value of loyalty and functional affiliation: The concept of loyalty and belonging of modern social and administrative concepts, has been highly respected by researchers and scholars, given the impact on the behavior and attitudes of individuals, its impact on the institution in which they work. Therefore, loyalty is composed of pride in belonging and a sense of integration with the institution, its distinguished paths and to participate in achieving this, the sense of personal friendship of the members of the institution is supposed to be this value of the first natural behaviors and important, which must be characterized by human behavior in the institution. that this value is very important in the life of institutions and has a clear impact on the work process and the level of performance of employees in the institution and the achievement of its objectives effectively and distinctly, the sense of belonging and loyalty to the institution leads the individual to reduce his negative behavior such as leaving work or absence or frustration

4. Value of Tolerance: This value is an important social value indicating that it does not give tolerance to the application of regulations, regulations and instructions or non-compliance with the regulations governing the activities of the institution. Tolerance means flexibility in dealing with and not taking serious approval towards employees in the institution. Hence the employee should be characterized as welcomed sense, passionate, has the ability to persevere and does not acquire towards his colleagues and his superiors, waiting for the opportunity to get them.

5. Value of cooperation: Cooperation refers to a social process which is the main form of social relations and interaction within groups. People cannot come together without cooperation or without working together for common interests. Cooperation works to strengthen morale, generate enthusiasm and connect among the members of the group in close association and cooperation is great importance in the energy levels of the individual, group, state or institutions and other lifestyles.

6. The Value of Incentives: Management, sociology and psychology stressed the value of incentives
and their effective impact on the performance of institutional workers. It is one of the means to encourage individuals to work effectively and efficiently, whether those incentives are physical or moral. Therefore, it has a great impact in encouraging employees to develop and improve their performance and to do more in the achievement and development of performance and increase productivity and intellectual energy as the absence of incentives and rewards are the obstacles that reduce the determination of individuals in the institution and affect the level of performance and productivity.

7. The value of specialization and the division of labor: The principle of specialization and division of labor is one of the general and distinctive features of the success of institutions in its work, since there are a group of individuals in the workplace, it is useless only through division of labor and the individual is responsible for certain actions with some The appropriate powers to do what is entrusted to him, this helps to master the work and to provide him with the skills and experience in performance which will lead to high efficiency and performance of individuals, that specialization helps to raise the administrative efficiency.

Conclusion

Social values have a great importance in the behavior of individuals in educational institutions, as they were depended on changing behavior patterns in different work environments to control the behavior of individuals in society, as well as how do they affect their performance inside the educational institution, therefore, values are as a key element in understanding attitudes, habits, beliefs, managerial and functional skills that reflect the individual and collective behaviors of the individual inside the formal social institution.

Role of Toll-Like Receptor Gene Polymorphisms in Patients with Type 2 Diabetes and Diabetic Foot Ulcer

Furqan Naeem Al-karawi, Abeer Thaher Naji Al-Hasnawi, Thekra Abd Jebur Al-Kashwan

1College of Medicine, University of Karbala, Karbala, Iraq; 2College of Medicine, University of Kufa, Najaf, Iraq

ABSTRACT

This study mainly aims to evaluate whether Thr399Ile polymorphism in TLR-4 genes is related to DFU in a sample of Iraqi patients with type 2 diabetes mellitus (T2DM). The case-control study included 120 patients with the type 2 diabetes, 60 participants with the type 2 diabetes and foot ulcer group I, 60 participants with the type 2 diabetes group II and 60 controls group III. TLR-4(Thr399Ile) genotyping was done by Polymerase chain reaction (PCR) followed by restriction analysis. There was no statistical difference in the distribution of TLR-4 (Thr399Ile) genotypes between the 3 study groups, the genotypes in group I included CT 6 (10.0%) and TT 0 (0%) was compared with wild type CC 54 (90.0%) while CT 10 (16.7%) and TT 0 (0%) was compared with CC 50 (83.3%) in group II and in group III CT 7 (11.7%) and TT 0 (0%) was compared with CC 53 (88.3%). The distribution of genotypes between group I and group III was (OR= 1.2, 95% CI: 0.4-3.8, p = 0.8) while when comparing group I and group II (OR=1.8, CI=0.6-5.3, p=0.3). On the other hands, the comparison between group II and group III was (OR= 0.7, 95% CI: 0.2-1.9, p = 0.4).

Keywords: diabetic foot, gene polymorphism, toll-like receptors, type 2 diabetes mellitus.

Introduction

Type-2 diabetes refers to a progressive long-term metabolic aberration, characterized by hyperglycemia and relative insulin deficiency. It is much more prevalent than type-1 diabetes, accounting for (90-95%) of the diabetic population. It is commonly associated with a number of complications as diabetic retinopathy, nephropathy, cardiovascular disease (CVD) and neuropathy. Diabetes mellitus is one of the most common metabolic aberrations that interfere with wound healing. It has been reported that diabetic subjects show prolonged inflammatory and proliferative phases of wound healing. In addition, diabetic foot ulcer (DFU) occurs in 15% of the diabetic population, and responsible for 85% of the associated lower extremity amputations. DFUs and the subsequent amputations significantly reduce the survival rates. It is estimated that 50% of diabetic patients exposed to amputations have a 2-year survival rate, whilst the survival is 5 years for diabetic patients having DFUs without amputations. The uncontrolled hyperglycemia impedes the normal defense mechanisms. It has been reported that leukocytes dysfunction is positively correlated with poor glycemic control. Supportingly, the metabolic aberrations of diabetes induces the production of proinflammatory cytokines and increases the activity of matrix metalloproteinases, which in turn prolong inflammation and impede wound healing. Toll-like receptors (TLR) are a wide group of evolutionarily transmembrane pattern recognition receptors (PRRs). They are expressed on sentinel cells such as macrophage and dendritic cells, which in turn recognize the invading pathogen conserved molecules or endogenous damage signals and induce the innate immune response. TLRs play a pivotal role in development of the innate immune response. TLR4 is strongly involved in the pathogenic process of type-2 diabetes, through induction of a chronic sub-clinical inflammatory process, which further causes dysfunction of the pancreatic B cells. The resulting uncontrolled hyperglycemia is positively correlated with poor healing process. In human diabetic wounds, differential expression of TLR4 leads to impairment of the wound healing cascade.
and finally to chronic non-healing ulcers. Due to the single nucleotide polymorphisms (SNPs) in the extracellular domain of TLR4, the deregulation of the TLR4 signaling may alter the ligand binding capacity and disturbs the pro- and anti-inflammatory cytokines, hence modulating the risk of chronic inflammation, thereby delaying wound healing. The cosegregating SNP which result in the change of amino acids in the extracellular domain of TLR4 have been identified. This SNP, namely Thr399Ile (rs4986791), affect the TLR4 mediated effector functions in a variety of ways. These polymorphisms reduce the binding efficiency of TLR4 with its endogenous and exogenous ligands, and other reported that these polymorphisms reduce the extracellular accumulation of functional TLR4 thereby resulting in inadequate TLR4 signaling in response to microbial infection.

Materials and Method

The study involved 180 Iraqi subjects. Group 1 including 60 patients with T2DM and DF. Their mean (standard deviation [± SD]) age, diabetes mellitus (DM) duration, and body mass index (BMI) were 56.9 ± 9.2 years, 10.7 ± 4.8 years, and 27.1 ± 3.8 kg/m², respectively. Group 2 including 60 patients with T2DM and without DF. Their mean (± SD) age, DM duration, and BMI were 47.9 ± 8.6 years, 2.9 ± 1.3 years, and 30.1 ± 4.1 kg/m², respectively. Group 3 including 60 the healthy control group, their mean (± SD) age and BMI were 45.0 ± 8.9 years and 30.1 ± 4.1 kg/m² respectively. The patients were recruited, from those who attended the Center of Diabetes and Endocrinology in Al-Sader hospital in Najaf city During the period from September 2017 to February 2018. The study protocol was approved by Kufa University ethical committee. All participants underwent a complete screening panel, including medical history, clinical examination, and assessment of BMI. Biochemical profile included fasting and, glycated hemoglobin, Urea and creatinine, total cholesterol, and triglycerides (data available at Table 1) TLR4(Thr399Ile) genotyping were performed by Polymerase Chain Reaction-Restriction Fragment Length Polymorphism (PCR–based RFLP) analysis.

Genotyping of TLR4(Thr399Ile, rs4986791): Genomic DNA extracted from peripheral blood leucocytes was performed using Flexi Gene DNA kit, TLR4(Thr399Ile) genotyping was performed by PCR–restriction fragment length polymorphism technique. The PCR reactions were performed in a total volume of 25mL containing 2μl genomic DNA, 12.5X PCR Master Mix, 0.6μl of each forward and reverse primers For TLR4(Thr399Ile) genotyping, the primer set used was forward: 50 GGTTGCTGTCTCAAAGTGATTTTGGAGAA -30 and reverse: 50 ACCTGAAGACTGGAGGTGATTTAATGCT -30. The PCR products were visualized by 3% agarose gel electrophoresis under UV light.

The cycling conditions: The thermocycler program conducted initial denaturation at 95°C for 5 minutes followed by 35 cycles of denaturation at 95°C for 30 mnts, annealing at 62°C for 30 mnts, extension at 72°C for 30 mnts, and a final extension step at 72°C 10 minutes. Final hold 10°C for 10 minutes. The generated amplicon is a 407bp fragments. The wild type allele (C allele) produced a single band of 407bp, while the polymorphic allele (T allele) produced 2 bands of 378 and 29bp.

Statistical Analysis: All statistical analyses were performed by using Statistical Package of Social Science software (SPSS) computer program (Version 22, SPSS Inc., Chicago, IL, USA).

Results and Discussion

The mean-fasting blood glucose, glycated hemoglobin, urea and creatinine were highly significant in group I in comparison to groups II and III (P<.001). (Data are summarized in Table 1). Regarding TLR there was no statistically significant difference noticed in the distribution of the wild type or the polymorphic TLR4(Thr399Ile) genotypes between the different study groups. (Data are summarized in Table 2). TLRs play a vital role in mammalian innate immunity as the pattern-recognition receptors. They are activating by pathogen-associated molecular patterns and endogenous molecules, triggering the activated of signal transduction pathways, that stimulate dendritic cell maturation and the production of cytokine. These receptors play an important role in activating innate immunity. TLR4 polymorphism has been suggested to be associate with atherosclerosis and chronic inflammatory disease in Caucasians. Furthermore, a study conducted by 16 who reported that the TLR4 (Thr399Ile) gene polymorphism have strong association between prevalence of diabetic neuropathy in T2DM. To the best of our knowledge there is no study has been proved the association of TLR4 (Thr399Ile) gene polymorphism with development of DFU and T2DM in Iraq.
In present study there was no significant association in the distribution of TLR4-Thr399Ile gene polymorphism between the three groups and these results were in agreement with 17 who showed a non significant association of Thr399Ile polymorphism in T2DM patients. This may be explained by the fact that the T2DM The patient is generally unable to provide a sufficient inflammatory response due to the compromised ability to fight infection. On the other hand, the result of present study was disagreement with 11 who reported a significant association between TLR4-Thr399Ile gene polymorphism and development of DFU in T2DM might be associated with impaired expression and action of TLR4 in T2DM patient resulting in impairment the healing of wound and developing of DFU in patient with T2DM. Another study conducted by 18 have clearly shown that any deregulation in the TLR4 mediated downstream signaling may lead to chronic non healing ulcers in humans. The differences of these results may be due to the ethnicity in different populations and may be due to the small volume of samples in this study.

Safety Measurement among Pregnant Women with Anemia at Babylon Teaching Hospital

Wafaa Ahmed Ameen
Maternal and Neonatal Health Nursing, College of Nursing, University of Babylon, Iraq

ABSTRACT

Objectives: To assess socio demographic characteristics, reproductive characteristics of pregnant women. To find out the relationship between the socio demographic, reproductive characteristics and safety measurement. A descriptive analytic design was conducted on (purposive sample) of (90) pregnant women with anemia at Babylon teaching hospital for maternal and children in Al- Hilla city. The tool used for data collection is an instrument for the period from 20th February to 30th July 2018, consists of four-section; involving socio demographic, reproductive characteristics, dietary and healthy measurement. Descriptive and inferential statistics are used to analyze the data. The finding of the study depict that (28.9%) of women aged (17-22) years, (45.6%) were Primary educational level ; (60.0%) were (2-4)family numbers, most of them were house wives; (57.0%) were enough economic status; (62.0%)were resident in urban areas; (51.0%)were overweight (25 – 29.9) kg/m^2; according to reproductive characteristics ; (59.0%)were have gravidity(3-4); (60.0%)were not have antepartum hemorrhage; (42.2%) were period between conception and other(1 year); (43.3%)were Parity (1-2); (53.3%)were 2nd trimester of gestational age; (47.7%)were use contraceptive;(60.0%)were having abortion; according safety measurement most variables were fail assessment. There is association with all items at P≤ 0.01.

Keywords: Safety Measurement, Pregnant Women, Anemia.

Introduction

According to the World Health Organization, Anemia through conception, it influences four of every ten conception women and is the underlying reason of approximately 115,000 maternal decease annually in poor nations a previous study showed that over sixty percent of women experience anemia through pregnancy. It is related to increased rates of maternal and perinatal decease, premature delivery, low birth weight and other adverse outcomes. The World Health Organization estimates that two billion people over thirty percent of the world’s populations are anemic, although prevalence rates are variable due to differences in food habits, socioeconomic conditions lifestyles, and rates of communicable and non-communicable diseases. A study was done in Erbil city. Among conception women in the third trimester; the hemoglobin level of <11 gm/ dl. The overall prevalence of anemia was fifty- five. Five percent, with the highest rate among the age group of < twenty years and ≥ forty years. Low consumption of iron-folate supplements, overcrowding index, poor dietary habit, multiparty, the presence of a specialist doctor and monthly screening for anemia were significantly related to the prevalence of anemia. The authors concluded that high in the prevalence of anemia among conception women in Erbil city, all the cases are of mild and moderate severity which is related to many factors such as overcrowding, poor dietary habit, gravidity, shortage of iron-folate supplements, lack of qualified staff, and poor counseling. Anemia is generally preventable and easily treatable if detected in time. Effective management of anemia involves treatment of the underlying reasons, restoration of the hemoglobin concentration to normal levels, and treatment and prevention of complications. Despite this fact, anemia is a common cause of morbidity and death during conception.
Methodology

A descriptive analytic study. Non-probability (purposive sampling). which consists of (90) conception women with anemia at Babylon teaching hospital for maternity and children in Al- Hilla city, data collected from the period of 20th February to 30th July 2018. The instrument was constructed for the purpose of the study. The Instruments consisted of four section:

Demographic Date Sheet: This part include, (age, educational level, family numbers, economic status, resident, BMI).

Reproductive Variables include, (gravidity, suffered antepartum hemorrhage, duration between conception and other, parity, gestational age, use of contraceptive, No. of abortion. gestational age was determined on source information on menstrual history and early ultrasound examination

Safety measurements: include (9)items. These items are rated according to three level Likert scale (never, sometimes, always) and scored ( 1,2,3 ). Data were analyzed using the Statistical Package for Social Sciences ( SPSS ) version 19. Through the application of descriptive statistical data analysis include ( Frequencies, Percentages, and Cum. Percent ) and arithmetic mean with standard deviation, Mean of score (M.S.) with their Standard Deviation (SD), Cutoff point = 3+(2+1)/3=2 and inferential statistics Summary Statistics tables including: Mean of score (M.S.) with their Standard Deviation (SD), Relative Sufficiency (R.S. %), and their assessment by cutoff point ( 66.67% ) due to scores ( 1, 2, 3 ) which are reported Pass and Failure ( Under/Upper ), as well as reassessment scoring by ( Bad, Moderate, and Good ) through the intervals ( 33.33 - 55.54 , 55.55 - 77.76 , and 77.77 – 100 ) respectively. Where Relative Sufficiency ( R.S. % ) is calculated by: R.S % = Mean of Score / No. of Scoring Scales

* 100%, Contingency Coefficients for the association tables& Chi-Square test

Results and Discussion

The present study identified the safety measurement among pregnant women. The result revealed that age ranged (17-22) years. This result is advocated with. (5) a study in Iraq, which revealed the most common type of anemia in conception women, the minimum age was 17 years and maximum of 42 years, less than half of them were primary educational level. This finding agrees with (6)in Uganda which stated that the Primary level of conception women was a danger factor for developing anemia. the highest percentage of participants were having (2-4) family numbers. this finding disagrees with (7)in Ethiopia who reported that conception women with family 4 and above were more likely to be anemic as compared with those with 2 and less..(sixty -two.0%) of conception women live in urban. These findings have similarity with (6), a study in Uganda found anemic conception women were lived in Urban, (55.6%)of participants were not enough economic status. This similarity with (8) study in Nigeria that found women with low socio-economic class had a fourfold risk for anemia compared to those from high social class. Regarding Reproductive variables, results of present study shows that the majority of the study sample (59.0%)were gravidity numbers (3-4). The findings (7) revealed that number of pregnancies(gravidity) was associated with anemia. The odds of developing anemia were higher among women with 5 and above pregnancies as compared with those who had 3 pregnancies , (60.0%) of the study sample, were not having antepartum hemorrhage. This result is In same line with(9) that found (95.92%) of pregnant women with anemia not having antepartum hemorrhage. (43.3%) of the study sample were parity (1-2). This results is disagree with (7) study revealed that as parity increased the chance of developing anemia among the respondents increased. For instance, pregnant women with parity 5 and above were highly to be anemic. Also is advocated with (6) that found anemia among multipara pregnant women more than nullipara. (42.2%), of the study sample were (1year) between conception and other. is disagree with finding (9) in Nigeria found Interval between pregnancies 2 to <4 years among anemic pregnant women. Regarding gestational age (trimester) The results of present study shows that the majority of the study sample were second trimester, they are accounted(53.3%),The finding of (10)were revealed that age at current pregnancy (trimester) were found to be important variables. As trimester increased the chance for developing anemia was also increased. This result was supported by a study conducted in Saudi Arabia by (10)and India by (11) which both showed that a high prevalence in the second and third trimester. This may be gestational age increases pregnant women shared their resource with fetus which may expose to decreasing iron . (47.7%) of present study were used hormonal injection of contraceptive,
finding is agree with study in Ethiopia found most of anemic pregnant women have history of contraceptive usage, (60.0%) of the study sample were having abortion. This result is agree with that found (58.8%) of them experienced abortion 1 to 3 times. This result found significant association between demographical data and anemia. This result is in disagreement with that found there is no relation ship with age(p value 0.874), also family size and anemia revealed a positive relation.,for instance, pregnant women with family 4 and above were more likely to be anemic as compared with those with 2 and less. The results of present study shows that (66.7%) of the study sample were sometimes eating meat. that found eating red meat regularly may help increase the amount of iron acquired from the diet. Also that found body absorbs iron from meat better than any other food sources. This result may be the economic stats. (56.7%) of the study sample were always eating green vegetable. shows pregnant women must eat foods rich in iron such as green leafy vegetables and cook their food in iron utensils and cooking very long be avoided. We must encouraged those to eat green leafy vegetables because very cheap and available in all season and rich in substance need to body. shows Legumes food include, are excellent plant sources of fiber, protein, iron, folic acid (B9) the body needs more of during pregnancy. Eating Dry fruits, (60.0%) of the study sample were never eating dry fruits. stated that one portion of dried fruit can provide of many vitamins and minerals, including folic acid, iron and potassium. They are natural laxatives. Dates are rich in fiber, potassium, iron, consumption regulary in the third trimester may help facilitate cervical dilation and reduce the need to induce labor. Regarding to milk drinking shows that (60.0%) sometimes don’t Drink milk or yogurt derivatives (cheeses and other) During meals, Related to tea result found (42.2%) Sometimes Don’t Drink tea or coffee during meals and (49.9%). Drinking tea or coffee after one hour of eating food, this fail assessment of pregnant women. result that found (98.8%) drink tea and (52.9%) drink tea before meal shows some foods, like milk, coffee or tea, can actually block your body from absorbing iron. While you don’t have to stop eating them completely, you should avoid consuming them with your iron-rich meals. Adding a glass of orange juice with your breakfast can easily double the amount of iron your body absorbs. Consider adding other foods high in vitamin C, like chili and bell peppers, to your daily meals to increase your iron intake. As opposed to refined grains, whole grains are packed with fiber, vitamins and plant compounds. Oats and quinoa also contain a fair amount of protein, which is important during pregnancy. Additionally, whole grains are generally rich in B-vitamins, fiber and magnesium. All of these are frequently lacking in the diets of pregnant women. prevents treatment with iron supplements has always been given in combination with folic acid and this has been included as part of routine antenatal care provided to pregnant women at every visit in developing countries.

The Effect of Maternal Level of Mother Education on the Prevalence of Dental Caries in School Aged Children

Wissam Hamid Al-Janabi¹, Hassan Faleeh Farhan AL-Sultani¹
¹P.O.P. Department, College of Dentistry, University of Babylon, Iraq

ABSTRACT

The objective of the present study was to conduct a cross-sectional study on a sample of Iraqi children to assess the correlation between mother’s level of education and dental caries. This cross-sectional study was carried out on children aged 6 to 10 years at pediatric dental clinic in College of Dentistry, University of Babylon, Babylon Province, Hillah city, Iraq between November 2017 and August 2018. Clinical assessment of dental caries was done according to the WHO oral health surveys-basic methods in 2013. Mother’s level of education was determined through completion of a questionnaire, which included information about the child’s age, gender, and mother’s level of education. The level of mother education was classified into illiterate, literate (read and write), primary school, secondary school and higher school education. These were scored as 0, 1, 2, 3 and 4, respectively. The achieved sample size was 60 children (mean age= 7.90 ± 1.36 years, 51.7 % boys and 48.3 % girls. dmfs scores were negatively correlated with age of children in which dmfs scores decrease with age. No significant difference (P.>0.05) was found between dmfs scores of boys and girls. The majority (50%) of children were from parents of middle level educational background.

Keywords: level of education, school age children, oral health

Introduction

The level of education in our community is reflected by the proportion of people who are literate as well as the proportion of literate individuals, who have achieved higher levels of education. Indeed, the body of data supporting the direct relationship between health care and wellbeing and the level of education is so big 1-7. Mother who is literate can achieve her goals and develop her knowledge in a way that can be mirrored on the health of her children 1. This is attributed to the fact that the decision concerning child health, including dental care is the responsibility of parents and in our communities of the mother during most of children life 8. A review and meta-analysis study has shown that mothers’ education is one of the significant predictors of the level of dental caries in children 9. Child oral health has been proved to exhibit strong association with mothers’ level of education in a study included children aged between 9 to 12 years 10. Among socioeconomic determinants, mother education has been proved to be linked to the state of oral health in children; however, the exact way of interaction between mothers’ level of education and child oral health is not clearly understood 11. In medical practice it has been found that, among sociodemographic characteristics such as economic level, employment and education, the level of education is number one factor that affects adult health and wellbeing 12. The dental caries is the result of a demineralization focus in tooth surfaces triggered by metabolic acts that happen in the tooth plaque situated in the area being affected 13. Caries during early childhood usually affects number of teeth, by happening in regions regarded of low risk and by demonstrating fast progression 14. It has been hypothesized that family environments or social factors related to mother influence bacterial acquisition 15; therefore, the behaviors related to oral health, visiting dental care, inadequate oral hygiene, and frequent intake of sugar containing feeding have been considered as predisposing factors for caries during early childhood 16. Indeed, the pathophysiology of dental caries involves interaction among biological factors such as saliva, diet and biofilm 17, as well as sociodemographic factors which
can modulate the outcome of biological factors and on the top of the list of sociodemographic factors is the level of education 18,19. Among socioeconomic determinants, mother’s level of education has been proved to be linked to the prevalence of dental caries in children; however, the exact way of interaction between mother’s level of education and dental caries is not clearly understood. Therefore, the objective of the present study was to conduct a cross-sectional study on a sample of Iraqi children to assess the correlation between mother’s level of education and dental caries.

**Methodology**

This study was approved by the ethical approval committee at the College of Dentistry, University of Babylon. Following that, verbal and written consents were obtained by parents and or persons, who take care of children, who participated in the present study. The study was carried out on children aged 6 to 10 years at pediatric dental clinic in College of Dentistry, University of Babylon, Babylon Province, Hillah city, Iraq between November 2017 and August 2018. Clinical assessment of dental caries was done according to the WHO oral health surveys-basic methods in 2013 20. Mother’s level of education was determined through completion of a questionnaire, which included information about the child’s age, gender, and mother’s level of education. The level of mother education was classified into illiterate, literate (read and write), primary school, secondary school and higher school education. These were scored as 0, 1, 2, 3 and 4, respectively. A sample of children was selected randomly. In other words, the first child was chosen according to a random number out of 25 (the usual daily rate of children seen) and then every 10 children, a child is selected. Data was analyzed using SPSS version 23. Quantitative variables were expressed as mean, range, median and inter-quartile range, whereas, categorical variables were expressed as number and percentage. Mann Whitney U test was used to study difference in mean between two groups in case of non-normally distributed numeric variables. Spearman Correlation Coefficient was used to assess correlation between age and dmfs score. The level of significance was set at $P \leq 0.05$.

**Results and Discussion**

Table 1 shows general characteristics of the studied group according to the age and gender. The achieved sample size of this study was 60 children (mean age= 7.90 ± 1.36 years). The highest percentage (25.0 %) of children, who participated in the study was among 7 years old group, while the lowest percentage (16.7 %) was among 10 years old group. The sample included 31 boys (51.7 %) and 29 girls (48.3 %) with male to female ratio was (1.07:1). Table 2 illustrates the distribution of children according to their mothers’ level of education. The majority (50%) of children were from parents of middle level educational background, followed by those from parents of low educational level (40%). The percentage of children from parents of high level of education was the lowest (10%). The distribution of children according to dmfs score is shown in table 3. The dmfs score ranged from 1 to 12 and the mean was 6.28 (± 2.50) with a median and inter-quartile range of 6.00 (4.00). There was significant negative correlation between age of child and dmfs score ($r = -0.259$, $P = 0.025$); however, the line of correlation was ill-fitting so that the $R^2$ value was very small (0.081) which indicates that the line can explain only 8.1 % of correlation among children enrolled in the current study. Figure 2 displays boxplots of dmfs scores by gender. There was no significant difference ($p> 0.05$) in dmfs score level between boys and girls in which the means were 6 (± 3) versus 6 (± 4.5) respectively. Figure 3 shows the median and inter-quartile range of dmfs score of children according to their mothers’ level of education. Values of median and inter-quartile range were 7 (3.5), 7 (4), 6.5 (2.25), 4 (2.4) and 4 (2.4) in illiterate, literate, primary school, secondary school and higher education respectively. There were significant differences ($P <0.05$) in the dmfs scores between children of mothers with higher education and those with secondary education from that of the children of rest of women. However, no significant difference was obtained when higher education was compared against secondary education ($P > 0.05$). To our knowledge, it is from the many studies conducted in Iraq to evaluate the relationship between mothers’ level of education and dental caries among school age children. Literature reports that tooth decay is a disease that is multifactorial. It happens due to the interaction of some blamed reasons, whether biological or social. The interaction of cariogenic bacterial agents with the required substrate, in a susceptible child, during a certain time, facilitated by a long list of economic, social, and cultural events, affect the evolution and development dental caries 31. One of the most important factors is the mother level of education. The present study showed that the dmfs scores were high among children from parents of low and middle level.
educational backgrounds, and how among children from parents of high level of education. In other words, dental caries and the state of oral health in children is affected by mothers’ level of education in such a way mothers, who are more educated have children with better dental health than that of mothers, who are less educated. Till now there is no clear consensus in the available published articles regarding the value of mother’s level of education on the acquisition and development of children dental caries. Several authors suppose that there is no significant correlation between these two conditions. The results described in our article are in line with results that suggest that the higher the level of education of mothers, the lower the incidence of dental caries in their children. The inadequacy of guidance related the baby’s oral hygiene was proved to be a predominant player in relation to outcome of dental health, as most mothers have little or essentially no information about dental care and when to start the baby’s oral hygiene or when to visit the dentist for the first time. Several authors proved the efficacy of women knowledge in the fight against dental caries in children, since mother knowledge about dental decay may protect against early tooth decay in children.

Figure 2: dmfs score according to the gender of children
Figure 3: Median dmfs score according to mothers’ level of education

Conclusion

The association between mothers’ levels of education and their children dental care and oral health is significant and this implies that education programs should be encouraged to increase awareness of women about early dental caries in children.

The Impact of Scamper’s Strategy in Developing Creative Thinking and Achievement for Fifth Graders in the Field of Eloquence and Application

Ibtisam Sahib Mussa AL-Zuwainy
College of Basic Education, University of Babylon, Iraq

ABSTRACT
The study was conducted at Babylon University, College of Basic Education, and aims to identify the effect of the SCAMPER strategy in developing creative thinking and achievement of fifth grade students in the field of rhetoric and application. The researcher adopted the experimental method and randomly selected the sample, reaching (56) (29) students for the experimental group studied according to the SCAMPER strategy and (29) students for the control group, which is taught according to the usual method, the researcher prepared the first two tests to identify the previous experience of the students and the second test is the final test of the researcher also adopted the test of the ability of creative thinking prepared by Sayyid Muhammad Khair Allah. After exhausting the validity and consistency of the achievement test applied by the researcher to the experimental and control groups, the results showed that the experimental group studied according to the SCAMPER strategy on the control group The researcher recommended the need to use Scamper’s strategy in teaching rhetoric and application, because of the impact on the development of creative thinking among students.

Keywords: scamper strategy, creative thinking, achievement, rhetoric and application

Introduction
The researcher believes that the success of the educational process depends on the success of the teaching method adopted by the teacher in the delivery of learning material to him and bring them to mind, and must follow the new strategies in education, and keep pace with developments in the age in which to live away from the usual methods that lead to stagnation and boredom. The teaching strategy is of great importance in education, which has led to the emergence of many modern strategies such as Bob Eberle 1994 (SCAMPER), which is aimed at developing creativity. It aims to generate and generate new ideas and flexibility in creativity and diversification of these ideas, Steps to generate the new idea, and each letter of the name of the strategy indicates the stage or step of its steps. The use of the SCAMPER strategy in teaching leads to the creation of the teacher and increases his ability to reflect on new ideas and apply them in practice in the field of specialization and the ability to innovate in the presentation of lessons and implementation and evaluation, and the design of innovative educational tools and the beginning to find solutions and proposals for issues or problems that The role of the teacher is therefore controlled, disciplined, facilitative and facilitative, inspecting the work of groups to ensure that each member participates in discussion and dialogue, and maintains classroom discipline. Thinking plays a vital role in the student’s success and progress within and outside the educational institution because their performance in the educational and testing tasks, and the life situations during the study, and after their completion (such as relationships with others and the requirements of the work) are the result of their thinking and the extent of their success or failure. Success decreases if teachers do not provide appropriate learning and training skills to carry out the thinking processes and skills required for...
The current research problem is summarized by answering the following question: What is the impact of the SCAMPER strategy on achievement and the development of creative thinking for fifth graders in the field of rhetoric and application. Scamper’s strategy of modern brainstorming is creative, which is integrated into brainstorming circles. The brainstormer, to create a new set of stimuli and generate more ideas, and to avoid the brainstorming and the inability to reach the stage of crisis and drought in generating new ideas.

Methodology

Experimental Design: The choice of experimental design is one of the important steps that the researcher has to undertake when conducting a scientific experiment. The advantage of empirical design is that it alleviates the difficulties faced by the researcher when conducting the statistical analysis obtained after conducting his experiment. Van Dalin (1985) Determining the type of experimental design depends on the nature of the problem and the conditions of the research sample. Therefore, the researcher adopted experimental design with a partial adjustment appropriate to the current research conditions.

The research community and its design: The identification of the research community is one of the important methodological steps in educational research, as the research procedures and the efficiency of its results depend on it. The sample is part of the society being chosen according to scientific rules and foundations to properly represent society. The researcher chose a representative sample of the community. The researcher visited the General Directorate for the Education of Babel to find the names of the preparatory and secondary schools in the center of Babil province. After identifying the names of the schools, the researcher visited the schools to find out the number of people in each school. Al-Hawra Preparatory School for Girls and Al-Tahrir Girls’ Secondary School. In the random drawing method, Al-Hawra Preparatory School for Girls was selected as the first experimental group to be exposed to the first independent variable (Scamper model), and the secondary school of girls for the control group that will study their students (the normal method). The number of female students in the sample was 56 students, 27 in the experimental group and 29 in the control group.

Students in the experimental group and one student from the control group, to the researcher’s belief that they have previous experience on the subjects to be studied in the experiment, which may affect the accuracy of the search results or the internal safety of the experiment. It is clear from Table (4) that there is no statistically significant difference at (0.05) in the academic achievement of the parents of the two groups because the calculated value of Ka2 was (0.779), which is less than the tabular value of (7.82), which indicates that the two groups are equal in this variable.

1. The educational achievement of mothers: It is clear from Table (5) that there is no statistically significant difference at (0.05) in the educational achievement between the mothers of the students of the two groups because the calculated value of (Ka2) was (0.619), less than the value of (k2), which indicates that the two groups are equal in this variable.

1. Test the previous information: The researcher tested the previous information consists of (20) test paragraph consists of two questions of the first type of test complement and the second type of test interview (pair) for the purpose of equivalence in this variable, and the response to the paragraphs of the test through a form distributed to students, By giving one degree for the correct answer, zero for the wrong or abandoned answer, to be the total score of the test (20)

Table (3) shows the arithmetic mean, variance and standard deviation of the two groups. In order to determine the difference in the test scores of the tribal creative thinking using the T-test, it was found that the difference is not statistically significant at (0.05), because the calculated T value was (0.876) Of the table T value of (2.05) at (54), which shows the equivalence of the two groups of research, table (1).

1. Adjust the non-experimental variables: The researcher tried to avoid the effect of some extraneous variables in the course of the experiment and then in its results. The following are some of these variables and how to control them:

1. Experimental Extermination: This is the effect of leaving a number of female students subject to experimentation, or their discontinuity from work, resulting in this effect in the results and did
not experience the entire duration of the process to leave or break out of school. Except for the individual absences that the research groups were exposed to in small, almost equal proportions.

2. Experimental and Accident Accident Conditions: Experiment in the current research has not been subjected to any emergency or incident that hinders its functioning and affects the dependent variable next to the independent variable.

3. Differences in sample selection: The researcher tried to avoid the effect of this variable in the results of the research by random sampling of the sample, and the parity between the two research groups, as well as the homogeneity of the students of social and cultural research groups to a large extent to their belonging to a single social environment. It is true that the test measures the object for which it was prepared and that the quality of the test is good if it is true, and the honest test is actually measuring the ability, character, or direction that the test is designed to measure. (80%) of the specialists were mainly to accept the test paragraphs after verifying the clarity and difficulty of the paragraphs and the strength of discrimination and stability, so got (30) paragraphs of the test on They agreed and deleted (6) paragraphs and modified some paragraphs that were valid after they were modified.

4 The pilot application of the test:

Analysis of test paragraphs: The analysis of the test paragraphs is to improve their quality and to detect their difficulty or difficulty, in order to exclude or redraft the invalid paragraphs and to preserve what was valid. This is done through individual responses to each of the test paragraphs.

Sincerity Test: The researcher used the same sample used to calculate the stability of the test by extracting the correlation matrix between the five test tests which are: Uses tests, dependencies, attitudes, and improvements., And fragmentation as in Table (2). In order to obtain the degree of saturation of these tests with the ability to think creatively, the sum of each test is divided by the square root of the total sum, and Table (3) shows that. Table 3 shows that the degree of saturation of battery tests with the ability to think creatively high, it is limited between (0.64 - 0.73), which indicates the authenticity of this battery internationally.

1. Test application for testing: The researcher applied the test of the ability of creative thinking and the achievement test on a sample of 38 female students in the fifth grade in Al-Talayyah Preparatory School for Girls after confirming the completion of the subjects. The researcher aimed at the following:

A. Ensure the clarity of the test paragraphs:
After the test was distributed to the students of the survey sample, they were asked to give their observations about any paragraph of the test, and to inquire about any word or phrase they find vague or unclear, it turns out that the test instructions and paragraphs were mostly clear and understood by all students.

B. Determination of test time:
Procedures for applying the experiment. Using the T-test for two independent samples to determine the significance of the differences between these two averages, there were statistically significant differences between the two groups. Table (5) shows that: The results showed that the students of the experimental group were superior to the students of the control group in the creative thinking test. The reason can be attributed to:

1. Scamper’s strategy helped students understand, understand, absorb and preserve information.

2. The Scamper strategy helps the school to be the role of mentor and supervisor instead of the role of telegram, resulting in the emergence of positive impact in the collection of students.

3. Scamper’s strategy is to organize students’ thinking by making them walk in specific logical steps to achieve their goals accurately.

4. Effectiveness of Scamper’s strategy in motivating students to think and creativity.

5. Scamper’s strategy has been instrumental in developing students’ abilities and strengthening their thinking skills.

6. Scamper’s strategy reinforces previous knowledge as a basis for new learning and curiosity to think through the lesson, by asking questions and thinking deeply to answer them.

Conclusion

In the light of the research results, the researcher can conclude the following: Scamper’s strategy to help students generate a large number of information by providing them with the opportunity to train their minds to engage in an exchange of views in a friendly atmosphere and challenge ideas with justification while retaining respect. The presentation of the lesson according to the steps of the strategy Sempr helped to the occurrence of conflicts of knowledge among students, which urged the use of previous ideas and rebuild in the brain, to rebalance. Effectiveness of Scamper’s strategy in teaching rhetoric and application, which reflected positively on the achievement of students of the fifth grade literary. Teaching using the Scamper strategy led to the development of thinking processes among students of the fifth grade literary. The use of the Scamper strategy is in line with the emphasis on the positive role of the learner because it is the main axis in the educational process called for by modern education.

The Impact of Teaching Critical Thinking Skills in Achieving Fourth Grade Students

Ahmed Samer¹, Mohamed Kazem Mintoub¹, Mohammed Rassin Al-Sultani¹
¹College of Basic Education, University of Babylon, Babylon, Iraq

ABSTRACT

The aim of the research is to identify the effect of teaching on the main thinking skills in the achievement of the fourth grade students in the history subject. In order to verify the objective, the researcher put the zero hypothesis which states: There is no statistically significant difference at the level of significance (0.05) The basic thinking skills and average grades of the students of the control group who will study according to the usual method in the test of collecting the history material, and to achieve it according to the experience of the second half of the academic year (2018-2019), The study sample consisted of (60) students of the fourth grade students in the preparatory school of the revolution, and were randomized to two groups (30) students in each group. The groups were rewarded in the following variables: age, IQ test scores, For the subject of history, and in light of the relative importance of the content and behavioral purposes, an achievement test was constructed consisting of (40) multiple choice types.

Keywords: Critical Thinking Skills, Fourth Grade Students, Achievement, History

Introduction

History is one of the oldest branches of social materials and a fundamental pillar in it, because it is a chronological record of all the nation’s sciences, arts and literature, which is the basis of the present and the basis of the future, and represents the nation’s character that distinguishes it from other nations ¹. Since history can be used in all spheres of life, the study of the past can not be separated from the present man and what is required is useful in the solution and management of the present and predict the future, and may not rely on the prevailing ideal (history repeats itself), to say, not to benefit from history it really does not repeat the exact same Pveselath, but this does not negate the existence of conditions to the future history of this concept the student can provide the opportunity to take advantage of missteps and blunders of others, because it is broader and more different than any personal experience universal experience, and here The comprehensive scientific study

Rees our history is very important, because it enables us to see our past and ponder seriously because he was a beacon guiding generations present in the re - past exploration process, and re - evaluation in turns with him this past general and heritage to the creative force in our present, because the present is inseparable from the past, and that past It is inseparable from the future.

Stages of pivotal thinking: First: Focus skill: A cognitive skill that requires specific mental actions and contributes to building students’ perceptions when they face the problem of failure to achieve goals ². This skill helps students to collect phenomena, to operate the appropriate information required by the processes of mental knowledge, and to make it possible to store, classify and collect. This information is usually retrieved and retrieved using the senses. Third: Skills of remembering: The lowest levels of thinking include remembering facts, terminology, events and characteristics. Fourth: The skill of organization: is the process in which the classes of things or phenomena in a particular system are arranged, or arranged according to these categories of mutual relations. Fifth: The skill of analysis: It is the mental process by which the phenomenon of a composite faculty is disassembled from its constituent components to its partial components. If we want to understand the nature of any work done by the student,
we must analyze this work in its different parts. Sixth: The skill of generation: This skill includes the processes of organizing and analyzing how to connect parts of each other, and note in these skills that new information and experiences come completely and collectively and constitute a new intellectual and cognitive construction and the function of the teacher to generate ideas in the minds of students.3

Methodology

It includes an overview of the procedures that were carried out to achieve the research objectives, starting with the research methodology and experimental design, defining the research community and its sample, the equivalence of the research groups (experimental and control), preparation of the research requirements and tools, Will be displayed as follows:

The experimental design of the research includes the independent variable (axial thinking skills), the usual method, and the dependent variable. Therefore, the researcher used experimental design that is partially controlled by two equal groups, one experimental and the other controlling.

The research community and appointed: Represents the research community the current fourth grade literary students all in schools (secondary and junior high) day government of the General Directorate of Education in Babil province (center) for the academic year (2018-2019 m), not less than the number of fourth grade people. The researcher chose the (preparatory of the revolution) in the center of the province of Babylon in a deliberate way to conduct his research, it was found that it includes two divisions of the fourth grade literary (a, b), the researcher chose Division (a) method of random drawing (drawing method) to represent The experimental group and the number of students (30) students who will study their students according to (skills of Axial thinking), the same way the researcher chose randomly Division (b) to represent the control group and the number of students (30 students), which will examine its students according to (the usual way).

Preparation of research requirements: The research requirements are fundamental to the research, according to which the research procedures are carried out. These requirements are as follows: Scientific Article (Content): The scientific material that the researcher is teaching has been determined for the students of the two research groups during the period of the experiment Aldra C - II) of the academic year (2018-2019 m), and the scientific material included the last three chapters of the history textbook for fourth grade literary.

Search tool: The steps of the search tool (the collection test) are:

Determine the purpose of the achievement test: The purpose of the envisaged achievement test is to measure the collection of literary fourth grade students In the history.

Determination of the objectives of the test: After the purpose of the test was determined the objectives of the test to determine the extent of achievement and the researcher formulated a number of behavioral goals.

Determination of the test paragraphs: The researcher determined the number of paragraphs that constitute the test achievement as the number of paragraphs of the test (40 paragraphs).

Directed paragraphs of the test: was drafted paragraphs of test grades as preliminary in the light of the contents of the map of experiential, and chose the researcher type test (multiple choice) which is one of the best objective tests, consisted test of 40 test paragraph, distributed to the levels of Bloom ‘s cognitive (knowledge, Comprehension, Application, Analysis, Composition, Calendar), and the last three topics of the history book for the fourth grade literary year (2018 - 2019).

Test instructions: Instructions and special instructions are formulated on how to answer. (Choosing one correct alternative to the paragraph, answering all paragraphs, the time period for answering, writing the triple name, the row and the division in the assigned space).

Answers the test correction: After that was drafted paragraphs of the test and choose the type of test, the standard for correct answers mode, as developed (one degree of each paragraph test correct) and (zero to answer the wrong, and the paragraph left, who did not need the student, paragraph, which put her more than Selection) and therefore the highest final score for the achievement test is (40 degrees) and the minimum grade (zero).

Believe the test: It was confirmed virtual honesty to test the sincerity of the content, as the results showed that the apparent honesty obtained a ratio of agreement
The application in the phase of the first reconnaissance on a group of fourth-grade students, so it is a test summative honest in measuring the comprehension and comprehension of students in the fourth grade in the subject of history.

The pilot application for the test of achievement: including the following

Application exploratory first: The achievement test applied in the phase of the first reconnaissance on a group of fourth-grade literary students from non-research sample, and the number of students (65 students), the purpose of knowledge and clarity of instructions and guidelines for testing and the extent of understanding and clarity of the paragraphs of the test for students and calculate the necessary test time duration. The researcher recorded the exit time for each student. In calculating the arithmetic mean of time, it was found that the time required to answer all the test paragraphs was (38) minutes.

The second application exploratory: The test was applied to a sample of 150 students in the fourth grade of non-literary research sample, and the purpose of the analysis of the paragraphs of the achievement test statistically paragraph of the difficulty, discrimination paragraph, the effectiveness of the wrong alternatives.

Statistical analysis of the test scores: The test scores were analyzed as follows:

The difficulty of paragraph: To conduct statistical analysis of the paragraphs of the test grades found that the difficulty of its paragraphs coefficient ranges from (0.33 - 0.6) and thus longer paragraphs achievement test are all good and difficult occasion.

Discrimination of the paragraph: An important feature that must be provided in the test paragraphs is the distinguishing feature. It means that the items or paragraphs can detect the individual differences of the students. The test items are valid. The coefficient of distinguishing the items is (20) and above, and the value of the coefficient of distinction between the test scores is between (0.43 - 0.69). 43-0.69) Thus, the subjects of the achievement test are characterized by good and appropriate discrimination.

Effectiveness of wrong alternatives: The researcher conducted a statistical analysis (highest 27% and lowest 27%) degree to find the effectiveness of the wrong alternatives ranging from (-0.15-0.44-) (-0.1 5 - 0.4 4 -) and it became clear that the paragraphs of the achievement test alternatives are all effective and thus are suitable for all counting.

Stability of the test: The stability coefficient of the test depends on the relationship between each paragraph or between the paragraphs of the test all, and this is evidenced by the stability of degrees and consistency of paragraphs, and can calculate the stability of the test. Using the legal relationship between the test units, and the characteristics of the good test to be consistent and true and so that the test paragraphs have a clear meaning must be true and consistent at the same time, the stability indicates that the test scores when you return it again, that is to indicate the balance and stability degrees Students in the test.

Methods of finding the stability of the test:

Retail mid-term method: This method is one of the most widely used methods, because they avoid other disadvantages and some of the ways to get two equal test, the researcher divided the test into individual paragraphs and even-numbered paragraphs. By choosing answers to the scoping sample students and the (150) answer, Extracted Pearson correlation coefficient between the scores of odd and even paragraphs were obtained on the consistency factor of (.91), As the retail stability of the mid-term test coefficient does not measure the overall homogeneity of the test (because the stability of only half). Therefore, the correction was done using the Spearman Brown coefficient (0.95) which is a good stability coefficient from the point of view of the specialists.

Way Cooder-Richardson 20: The application of the equation Cooder - Richaderson according to the students' grades. The researcher found that the test stability value is (0.89) and thus is a good value and suitable so the test is constant.

Application of the research tool: The experimental and control groups were informed of the date of application of the test, one week prior to its completion, and was applied after the completion of teaching the specific material for the two research groups at one time. The researcher supervised the application of the test.

Statistical Methods: The researcher used the T-test equation (t – Testt - Test) For two independent samples to make the parity between the experimental and control groups, and the Pearson correlation equation. The researcher used the equation to correct the correlation
coefficient between the test segments (individual and marital scores) after the Pearson correlation coefficient, spss, The Excel program (Excel))

**Results and Discussion**

For the purpose of verifying the null hypothesis, which states: (There is no statistically significant difference at the level of significance (0.05) between the average grades of the experimental group students who studied using the central thinking skills and the average score of the control group who studied according to the usual method of collecting history). It was the arithmetic average calculation deviation standard scores both sets of research in the test of the achievement was the value account T for two independent samples as in the table (2).

**Conclusion**

The pivotal thinking skills of the positive impact of the great increase in the collection of the fourth grade students of literature in material history and increase their ability to understand information and facts, knowledge and raise their school. Centralized thinking skills play a role in making students the focus of the learning process through their active participation in the educational situation that will encourage them to persevere to raise their level of science.

Influence of Occupational Safety and Health Training toward Staff Practices at Fast Food Restaurant in Malaysia

Sarimah Ismail¹, Siti Zuhaili Samsudin¹, Arif Kamisan Pusiran²

¹Senior Lecturer, School of Education, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, Johor Bahru, 81310 Skudai, Malaysia, ²Senior Lecturer, Faculty of Business, Economics and Accountancy, Universiti Malaysia Sabah Kota Kinabalu, Sabah, Malaysia

Abstract

Among food service establishments in Malaysia, fast food restaurant (FFR) was found having zero rate of accident that causes permanent disability and death at workplace. Result of preliminary study of this study showed occupational safety and health training gave high influence to safety and health practices among staff of the FFR. A quantitative research was conducted to identify level of influence of four major areas of the occupational safety and health training (workplace hazards and emergency procedure, personal hygiene and the use of personal protection equipment (PPE), food safety, and cleaning procedure) toward the practices of 225 FRR staff. The staff were selected randomly from various FFRs in Malaysia. Results of the preliminary study indicated overall mean level of influence of those four research variables toward staff practices at workplace was high with mean value=4.35 and standard deviation=0.37. The study suggests for the FFR management to provide future training with holistic content. This study also suggests to Malaysia Ministry of Health to establish guidelines for compulsory on-site similar occupational safety and health training to food handlers in all food service establishments for effective food safety practices as well as for the benefit of public health.

Keywords: Occupational safety and health, training, fast food restaurant, staff practices, Malaysia

Introduction

Eating out is a part of life style among Malaysian due to various reasons. Restaurant was found as the most popular destination for eating out ¹. Malaysia has various types of restaurant. Besides ethnic family restaurant, the second most popular food outlet is fast food restaurant (FFR). Result of a survey study conducted in 2018 by Cint on the most visited fast food restaurant among multiple races of Malaysian showed KFC (82.1%), McDonald’s (81.34%), Pizza Hutt (57.18%), Domino’s (46.38%), Subway (45.23%), Secret Recipe (42.09%), The Chicken Rice Chop (29.79%), Kenny Rogers Roasters (29.38%), A&W Restaurants (28.96%), Marry brown (27.71%) and Nando’s (27.6%). Value sales of almost all of the FFRs at constant in the year of 2017 prices are expected to show positive growth for value sales in year of 2022 ².

The Malaysia Services Producer Price Index (SPPI) of second quarter of 2018 showed the expenditure of Malaysian for Restaurant and Mobile Food Service Activities and Beverage Serving Activities have contributed 0.5 per cent respectively to the rose to 0.5 per cent for Accommodation & Food and Beverage as compared to the previous quarter. The increase of 2.9 per cent was driven by Restaurant and Mobile Food Service Activities (+3.4%), Beverage Serving Activities (+2.9%) and Event Catering and other Food Service Activities (+0.6%) ³. The statistics indicates Malaysian has high buying power that led them to eat out, the FFR service having high demand and it is important for the contribution to Malaysia gross domestic profit.

Email: p-sarima@utm.my
High demand in FFR services signs busy activities in the FRR kitchen as well as high frequent of the restaurant staff expose to hazards. There are 10 occupational sectors in Malaysia that reported involve in accident at workplace. However, accident rate that cause permanent disability and death in the hotel and restaurant service sector was found the lowest if compare to other nine occupational sectors. Within the hotel and restaurant service sector, FFR chain contributed to zero per cent of accident rate that cause permanent disability and death.

A preliminary study was conducted to identify what are factors that influenced the FFRs practice until achieve zero per cent of accident rate that cause permanent disability and death. Finding of the study found occupational safety and health training was a major influence to staff practices working in the FFRs. Therefore this quantitative study was conducted to identify areas of the training that contributed to the positive achievement on occupational safety and health of the FFR.

**Methodology**

This study employed sequential exploratory of mixed method research design. The study was started with qualitative research method by interviewing FFR staff to identify in depth the influence factors toward the achievement of zero per cent of accident that cause permanent disability and death in FFR service. According to 1, interview data collecting technique provides rich data if compare to data collecting using survey method. Saturation of data indicated 10 of the FFR staff were interviewed. They were selected applying convenience sampling technique from various FFRs in Wilayah Persekutuan of Malaysia that reported having the lowest accident rate compare to the same brand of FFR outlets in other 12 states of Malaysia. Finding of the qualitative study showed that four major areas in the occupational and safety and health training have influenced the FFR staff practices working in the FFR. They were workplace hazards and emergency procedure, personal hygiene and the use personal protection equipment (PPE), food safety, and cleaning procedure.

These four areas later on have been used as research variables for quantitative research method and items development for research instrument of questionnaire. Data were collected from 225 out of 544 FFR staff in Wilayah Persekutuan. The 225 sample size of the study that selected randomly was determined by the following equation:

\[
S = \frac{X^2 NP (1-P)}{d^2 (N - 1) + X^2P (1 - P)}
\]

where \(S\) = sample size; \(X^2\) = confident level (at 3.841); \(N\) = population size, \(P\) = ratio of population at 0.5, \(d\) = degree of accuracy at 0.5

The questionnaire had been verified by two experts in the field of Food Service Management and Occupational Health and Safety. A pilot study was conducted at one FFR in Johor State and involved 23 restaurant staff. Result of the pilot study found overall validity value of the instrument was high with \(\alpha\) value = 0.90 while validity value according to research variables of workplace hazards and emergency procedure, personal hygiene and personal protection equipment (PPE), food safety, and cleaning procedure were 0.76, 0.82, 0.76 and 0.87 accordingly.

Those values showed that items of the research instrument are acceptable and the research instrument can be used for actual data collecting. According to 5, validity value of survey research instrument that close to 1.0 indicates the research instrument has high value of validity, consider very good and ready to be used for data collecting. Data of this study were analysed using descriptive statistical of frequency, mean and standard deviation, which assisted by Statistical Packages for Social Science (SPSS) version 22.0 computer software.

**Result and Discussion**

40 items were prepared to measure four variables of the study. Those items were related to types of workplace hazard, emergency procedure, personal hygiene of staff, the use of PPE, food safety, food handling, safe cooking oil handling, safe oil trap cleaning procedure, hand wash, safe dish washing procedure, proper steps of waste disposal, hardware safety precautions, safe raw food material handling, food storage, right method serving food, safe drainage system operation and chemical handling.
Results of this study indicated overall influence mean level of research variables toward staff practices at workplace was high with mean value=4.35 and standard deviation=0.37. Mean value of each research variable for workplace hazards and emergency procedure: mean=4.29 and standard deviation=0.40; personnel hygiene and the use of PPE: mean=4.40 and standard deviation=0.35; food safety: mean=4.28 and standard deviation=0.39; and cleaning procedure: mean=4.43 and standard deviation=0.32 (refer to Table 1).

Researcher studied on safety training in 108 FFR at Porto Alegre observed only 21.7% of the FFR staff attended the training. The study suggested for the management of the FFR to make the safety training compulsory to all of their staff so that adequate food safety conditions can be offered for the consumers.

A case study on fast-food employee’s experience at three different FFRs conducted by suggested that employees’ training and supervision require more attention to safety procedures. Greater manager accountability for employee noncompliance emphasis on employee education could help FFRs minimize threats to public health and strengthen the fast-food industry.

A study revealed that those who exposed to food safety training demonstrated better practices in handling raw food and cooking equipment. Similar findings were observed in their study on the effect of an intervention targeting perceived barriers (TPB) to improve the handling of food-contact surfaces amongst food handlers. That study found that those given TPB-based intervention (targeting barriers) performed better than the control group.

A study to assess knowledge and practice of food hygiene and safety among food handlers in FFRs in Benin City, Edo State by indicated knowledge was significantly influenced by previous training in food hygiene and safety (p = 0.002). Food handlers who had worked for longer years in the FFRs had better practice of food hygiene and safety (p = 0.036). The level of education of respondents did not significantly influence their practice of food hygiene and safety (p = 0.084). Although, 299 (85.4%) food handlers were generally clean, skin lesions was seen in 4 (7.3%) of them.

Researcher measured food safety knowledge of 297 out of 1084 food handlers at FFRs in Jordan. Result of their study showed the overall knowledge of food handlers on food safety concepts is moderate. They had poor knowledge regarding foodborne pathogens and safe storage, thawing, cooking and reheating of the foods but had good knowledge on personal hygiene and symptoms of foodborne illnesses. Food handlers who enrolled in food safety training had significantly (P < 0.05) higher total food safety knowledge score compared to the score of those who did not enrol the training. The study suggested adopting proper food safety education training to food handlers, periodic evaluation of food handlers’ knowledge and food safety training materials would improve the food safety status in foodservice institutions.

Research finding showed food safety training that targeted the attitudes, normative beliefs and perceived behaviours of school canteen food handlers resulted in suggestion for improvement in food safety knowledge, practices and sanitary conditions of the food handlers to offer potential to reduce the incidence of foodborne diseases amongst primary-school children. Suggestion for further improvement was addressed to content of the safety training in relation to high-risk food, cross contamination, food poisoning and temperature control.
The latest, 12 reported a cross-sectional study to assess safe food handling practices, food safety knowledge, and adherence for the implementation of Hazard Analysis and Critical Control Point (HACCP) among 53 food safety managers working in randomly selected food service establishments in Qatar. About 66% and 68% of managers had college degree and were trained on HACCP respectively. Results of the study also showed that casual sit-in and fine dine-in restaurants were the only food service establishments that consistently kept records on safe food handling practices (100%), followed by fast-food food service establishments (36%). Managers’ training and education level were highly correlated with the probability of their employees receiving food safety training. The study demonstrated that training and education are important factors that directly give impact to food safety working culture in food service establishments.

Finding of this study shows occupational safety and health training provided by FFR has highly influenced the safe and health FRR staff practices at workplace. This finding is consistent with previous studies by 7, 8, 9, 10, 11 and 12. However, the complexity of the training depends on the size, complexity of the workplace, nature of hazards and potential hazards exist at the FFR.

Kitchen is a place where almost all food is stored, prepared and cooked. Although working in the FFR industry is generally safe, however, the FRR staff are often exposed to hazards. For instance, unhygienic kitchen will have high potential to food contamination and high risk of hazard, injuries (slips, falls, burns, cuts) and illness (due to working too quickly and standing in a long hour), which, threatening safety and health of kitchen staff and will give impact to their lives, income, family members and financial challenges. Having knowledge and skills to identify both visible and less visible hazards at workplace, plan effective solution to prevent injuries and illness will assist the FRR staff practicing safety and health while working.

Internal health and safety working policies of FFR to carry out at workplace is important. However, the one who are responsible to sustain the safe working atmosphere is the restaurant staff. Therefore, occupational safety and health training program was perceived the best strategy to expose the staff with safety and health policies, guidelines and issues. The training should be compulsory to all FFR staff that usually dominated by teenager that usually having low academic background, insufficient working experience and immature.

The Occupational Safety and Health Act (OSHA) of 1970 regulate employee safety to mitigate incidences of death or workplace injuries. The Act sets out the rights of employees to have safe working environments, to be trained about the functioning of equipment, to be provided with safety gear, to get information about hazards in the workplace, to ask Occupational Safety and Health Administration to inspect the conditions of the workplace without retaliation from their employer and to be informed of hazards that are pertinent to the job such as handling of chemicals like soaps, detergents and disinfectants used in cleaning (to secure their health and safety, the staff must have access to material safety data sheets that provide information on the chemical content of substances used in the workplace) 13.

According to United State of America Food and Drug Administration (FDA), food service workers are required to maintain high levels of personal hygiene to protect them from illness and prevent food contamination. Therefore they should be trained on hand-washing after and before handling food and kitchen equipment 11 as well as after using toilet, the use of food tong and or gloves for food handling, ensure taking extra effort to keep hands clean and as germ-free as possible all the time to avoid cross contamination that lead to foodborne diseases and food poisoning (although in many restaurants these days, chefs do not wear glove), wearing PPE, keep health and personal hygiene, understand food-borne illnesses, how to diagnose symptoms and procedures for reporting illnesses in time to avoid contagion and contamination.

**Conclusion**

Finding indicates occupational safety and health training provided by FFR highly influenced staff practices at workplace. The training was compulsory to all new staff (given during orientation week) and also for senior staff (conducted as in-house trainings for staff development program). Through the training, the staff were exposed to important issues related to FFR occupational safety and health requirements like working standard operating procedure (SOP), the importance of wearing PPE, food safety, safe food handling, safe food storage, waste disposal, working with correct ergonomic and the function of FFR safety facility at the premise. The safety and health practices
of the staff were contributed to the achievement of zero rate of permanent disability accident and death and low rate of workplace accident. Current study also suggests to Malaysia Ministry of Health to establish guidelines for compulsory on-site similar occupational safety and health training as FRRs do to food handlers in all food service establishments to improve the existing Food Handling Training for effective practices on food safety and restaurant cleanliness as well as for the benefit of public health.

Abstract

This study aimed to investigate the impact of stress on psychological wellbeing among the students from various faculties in Universiti Teknologi Malaysia. The questionnaire was administrated and was distributed to a sample of 368 students in the selected university. The findings illustrated that anxiety showed non-significant impact on psychological wellbeing. Depression and stress were instead found to have significant impact on the psychological wellbeing. In order to improve this phenomenon, it is highly recommended that university should take necessary proactive actions in helping students manage their mental health needs. Access to interventions and prevention programmes needs to be strengthened within the university settings.

Keywords: Stress, Psychological wellbeing, Case Study

Introduction

Being a university student is a stressful phase for an individual. They are required to juggle different roles in being a student as well as continuously developing as a person while undergoing role transition from adolescent to adulthood. Examinations, group projects and activities as well as relationship issues are among stress-inducing events faced by university students. As a consequence, they are directly and indirectly exposed to different kinds of mental health issues that may interfere with their daily functioning. The failure to cope with these multiple roles may lead to the feelings of hopelessness, exhaustion, impaired functioning, rumination, lack of sleep, and poor sleep quality¹.

Among different mental health problems, stress, anxiety and depression have been identified as the most common amongst university students². It was previously highlighted that the prevalence of depression and anxiety was 15.6% among undergraduates and 13% among graduate students³. In recent years, there has been a shift of focus on research from disorder and dysfunction oriented to well-being and positive mental health⁴. It was also highlighted the increasing evidence that support promoting well-being rather than just treating illness⁵. While these views apply to the general population, emerging studies of psychological well-being among university students has been conducted and showed various results⁶, ⁷, ⁸, ⁹, ¹⁰, ¹¹, ¹². Despite this, very few studies examined psychological well-being, particularly among Malaysian university students.

One recent study was conducted in a public university in Malaysia which reported the age group of 41 years and above possessed the highest level of psychological well-being¹³. It was also studied public university students and reported that there is a significant relationship between age and the level the psychological well-being of the students, suggesting that the well-being of the students increases with age¹⁴. However, these two studies only focused on postgraduate students, and investigated the level of psychological well-being for different age groups.

DOI Number: 10.5958/0976-5506.2019.01473.6
Another study conducted by Md Nordin & Abu Talib\(^1\) has found that 503 Malaysian university students (34%) showed symptoms of poor psychological well-being. One of the factors that could affect students’ psychological well-being is stress. There are various factors that can lead to stress among students, for instance financial difficulties\(^16, 17\), academic pressure\(^18, 19, 20, 21\), unconducive study environment\(^20, 22\), lack of career preparation\(^20\), negative perception towards personal appearance\(^18, 21\), and poor relationship with peers\(^18, 21\).

Poor management of these stressors could eventually affect students’ psychological well-being, such as anxiety and depression\(^23\). This finding is further supported by Andrews & Wilding\(^16\) who concluded that stress not only may affect students’ mental health but also their academic performance. Conversely, students who were not satisfied with their academic performance may experience a higher stress level than other students\(^24\). Apart from poor academic performance, students are also feeling stressed out due to too many assignments at one time\(^20\), lack of revision time, difficulty in understanding the lessons, unable to answer lecturers’ questions, the anticipation in waiting for examination result\(^19\), and extra co-curricular activities\(^18\). Moreover, a significant correlation between workload and academic stress was found among students\(^19\). In other words, higher workload leads to higher stress among university students, and consequently affecting students’ psychological well-being.

These academic stressors may be due to unconducive study environment which includes uncomfortable place of study, noisy lectures, and small lecture room\(^20\). The researchers also revealed another factor that can cause stress among students. University students were concerned about their career prospects (80%)\(^20\). In specific, they lacked of the knowledge and skills in resume writing (87%), have poor English language proficiency (80%), and feeling unprepared for their future career (93%).

Another contributor for stress among university students is their concern towards personal appearances. A significant relationship was found between physical development and stress, which includes feeling ugly, overweight and acne problem\(^21\). Poor relationship with peers can also lead to stress, thereafter affecting students’ psychological well-being. The researchers have also found a significant correlation between peer factors and stress, such as not having friends, unlike by friends, unhelpful friends, and friends who like to critique. This finding is also supported by Ooi\(^22\). In conclusion, there are various factors that can cause stress among university students. As shown by past studies, it is the ability of the students to cope with these stressors that would determine their state of psychological well-being.

This study is conducted mainly to investigate the impact of stress, depression, and anxiety in psychological well-being among university students.

### Material and Method

This study adopts a quantitative approach, using questionnaire as the main instrument for data collection. A total of 375 surveys were distributed to undergraduate students from various faculties in Universiti Teknologi Malaysia using convenience sampling method. Out of 375 responses, only 368 were valid and analysed.

Apart from collecting data on respondents’ background information, this study has adopted 21 items from Lovibond and Lovibond\(^23\) Depression, Anxiety, and Stress Scale (DASS) and 12 items from Goldberg\(^26\) General Health Questionnaire (GHQ) to measure the students’ stress and psychological health respectively. Data collected was then analysed using descriptive statistics i.e. frequency and percentage, as well as inferential statistics i.e. PLS-SEM. SEM is one of the methods that analyses multivariate data which involves multiple variables in one study. It allows the researcher to study the relationship between different variables in one proposed framework.

### Results

The following part displays the demographic details such as gender, age, race, marital status, educational level, and their name of courses in the university. Table 1 shows the distribution of respondents by their gender, age, races, faculties, courses, etc. Overall, majority of the participants were female (73%), aged between 19-24 years old (96%), from the Malay ethnicity (83%), and holds other types of academic qualification such as the university foundation course (49%), There is a balanced between the number of respondents from the engineering and the social sciences course, 50.3% and 49.7% respectively, whereby the highest number of respondents were from the Faculty of Management (40%), followed by the Faculty of Electrical Engineering (19%). Most of them were in Year 2 (54%) and Year 3
and 99% of them were unmarried.

The following Table 2 shows the results of the inferential statistical analysis. In summary, the result revealed that depression has a significant ($t>1.96$) impact on psychological wellbeing, hence supporting Hypothesis 1. Hypothesis 3 was also supported whereby this study has found a significant impact of stress on students’ psychological wellbeing. However, it was found that anxiety has non-significant impact on psychological wellbeing due to their $t$ values are less than 1.96, where $\beta = -0.069$. Hence, Hypothesis 2 is not supported in this study. This study also found that between stress, depression, and anxiety, the students’ psychological wellbeing were mostly affected by depression, followed by stress and anxiety.

Conclusion

Inevitably, university students will consistently face different challenges that may affect their state of mental health. As this study has shown, stress and depression have an impact of the students’ psychological wellbeing. It is imperative for university to take necessary proactive actions in helping students manage their mental health needs. Access to interventions and prevention programmes needs to be strengthened within the university settings. Furthermore, the university should take necessary actions to encourage students to improve help-seeking especially to those experiencing high levels of stress, anxiety and depression symptoms. Consequently, it is hoped that the risks of more negative implications such as diagnosable psychological disorders can be reduced. This study highlighted the significant role of mental health aspects particularly stress, anxiety and depression in influencing the psychological wellbeing among university student.

Role of Emotional Intelligence and Mental Health in Improving Performance

Jen Ling Gan¹, Halimah Mohd Yusof ²

¹PhD Scholar, Azman Hashim International Business School, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia, ²Senior Lecturer, School of Human Resource Development and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

Emotional intelligence has been concerned due to its contribution in enhancing occupational mental health at workplace. Many studies had been conducted to examine its role in improving the overall performance of organizations. Till the recent years, new insight has been brought up in examining the effect of emotional intelligence on organizational justice. However, there is insufficient empirical evidence in proving the significant impact of emotional intelligence on organizational justice, especially in Asia context, particularly Malaysian manufacturing sector. Malaysia is known as collectivism country, where the matter of fairness is highly concerned. Hence, it is important to investigate how emotional intelligence improve the perception of fairness among the employees in Malaysia context. Therefore, this conceptual paper proposed to examine the impact of each emotional intelligence’s dimensions on the organizational justice, which might contribute to the existing literature of the effect of emotional intelligence towards organizational justice in Malaysia.

Keywords: Emotional Intelligence, mental health, Malaysia

Introduction

Emotional intelligence (EI) has been receiving attention from the scholars in the field of occupational psychology due to its contributions in occupational mental health¹ ². Many researchers had studied the contributions of EI to several work-related outcomes, such as job performance³, perceptions of stress⁴, as well as organizational commitment⁵ among their respondents. The role of EI has been discussed actively by the scholars because it is believed that the ability of EI could assist the employees in maintaining healthy working environment by being tolerance and patience⁶.

There are few EI models developed by the past scholars. Among those developed EI models, it was argued that Mayer and Salovey⁷ Ability-based EI Model is the most recognized EI theory which viewed EI as mental ability⁸. Ability-based EI Model consists of four branches, where it is believed that the four branches of EI could provide a clear and logical comprehension in understanding the concept of EI⁹. In this conceptual paper, the four dimensions of EI are proposed in examining their impacts on organizational justice (OJ). The first dimension is Regulation of Emotion (ROE). A person with the ability of ROE is prone to have the ability to overcome emotional disturbance when he regulates his emotions effectively⁷. The second dimension is Self-Emotion Appraisal (SEA), where an individual tends to have the ability to appraise, alter, and observe their own emotions or moods when incidents happened at their workplace⁷. The third dimension is Others’ Emotion Appraisal (OEA), where the individual is more likely to have the ability to understand and to assess others’ emotion⁷. The fourth dimension is Use of Emotion (UOE). An individual with UOE ability tends to have the ability in creating emotions that can improve their cognitive functions, such as decision making and problem solving⁷.

In recent years, the contributions of EI in enhancing employees’ performance at workplace has attracted the attention of the scholars of human resource development\textsuperscript{10}. Among the work-related variables, organizational justice (OJ) has recently arisen as one of the crucial components that could enhance overall performance of organizations\textsuperscript{11}. OJ is defined as the extent to which the employee perceived fairness in job related matters at their workplace\textsuperscript{12}. OJ can be divided into four dimensions, namely distributive, procedural, informational, and interpersonal justice\textsuperscript{13}. It was argued that OJ plays a significant role in affecting the behaviour as well as the attitude of employees in organizations\textsuperscript{14}. Due to the importance of OJ, the antecedent that could affect the perception of OJ among the employees should be examined thoroughly in order to improve the level of OJ. According to Fairness Theory, it is believed that employees’ fairness judgement could be formed through the process of emotional or cognitive function\textsuperscript{15}. Hence, this study attempts to propose the investigation of the impacts of EI’s dimensions on OJ. This idea is further supported by another scholar that, an emotional intelligent worker is less likely to perceive OJ negatively\textsuperscript{16}. This is because employees with higher EI tend to use their emotions effectively in motivating themselves to overcome with unfairness\textsuperscript{16}.

**Problem Statement**

The role of EI has been proved in affecting peoples’ perceptions\textsuperscript{17}. Similarly, in the context of organizations, it is believed that EI is a potential antecedent that could affect the perception of employees in the aspect of OJ. However, it was claimed that, there is a lacking of discussion on EI’ roles towards employees’ attitude and behaviour at workplace, especially organizational justice\textsuperscript{16}. This is further supported by another scholar, where it was mentioned that, EI was just newly introduced as the factor that could affect perceived OJ in the recent literature of workplace justice\textsuperscript{18}. In other words, the knowledge of the relationship between EI and OJ is still lacking in the body of literature.

Although there are few studies that have examined the impact of EI on OJ, those studies are mainly conducted in the Western context\textsuperscript{16, 18}. It should be cautioned that Western countries have different culture or practices as compared to Malaysia context, hence generalization is very limited. For example, Malaysia is a collectivist country, while Western countries practice individualism\textsuperscript{19}. It is important to gain insight on the antecedents that could affect OJ among Malaysian because collectivists tend to highly concern the level of fairness at their workplace\textsuperscript{20}. As far as we know, there is no previous study conducted in Malaysian context to examine the impact of EI on OJ, specifically in manufacturing sector. In addition to that, although previous studies have examined the impact of EI on OJ, there is a lacking of empirical evidences that used Mayer and Salovey’s Ability-based EI Model to measure the impact of EI to OJ\textsuperscript{16}. Hence, there is a calling for further empirical study that examine the impact of EI’s dimensions to OJ, using ability-based EI model in Malaysian manufacturing context.

A direct relationship between EI and OJ was found in few previous studies. It was claimed that EI has significant influence in affecting employees’ perception on OJ through the personality of employees\textsuperscript{18}. Besides, it was also revealed that EI is able to significantly influence employees’ interpretation on organizations’ fairness matters, then affecting their perception of OJ\textsuperscript{16}. It is believed that employees with higher EI tend to perceive positive OJ due to their abilities in managing and regulating their emotions when they faced injustice at workplace\textsuperscript{21}. The proposed conceptual framework is developed for this conceptual paper based on the findings in previous empirical studies, as shown in Figure 1. Based on the findings above, five hypothesis are stipulated as below.

**Hypothesis 1:** There is a significant impact of EI on OJ.

**Hypothesis 2:** There is a significant impact of Regulation of Emotion on OJ.

**Hypothesis 3:** There is a significant impact of Self-Emotion Appraisal on OJ.

**Hypothesis 4:** There is a significant impact of Others’ Emotion Appraisal on OJ.

**Hypothesis 5:** There is a significant impact of Use of Emotion on OJ.
Methodology

Research Design and Samples

In order to test all the proposed hypotheses, the authors intended to adopt quantitative approach. When researcher plans to test objective theory via examining the impacts among variables, he should use quantitative research method\textsuperscript{22}. Besides, it is claimed that, quantitative research is well-known to be used to examine the impacts between variables\textsuperscript{23}. Hence, in order to examine the impacts between the dimensions of EI and OJ, the authors employed quantitative approach. This will be a cross-sectional study, where the authors will collect the data at one time only. The authors will employ survey method, where questionnaire will be distributed to collect the response of selected respondents. The respondents of present study will be the employees from Malaysian manufacturing companies. Multi-stage sampling method will be adopted in the stages of choosing samples.

Measures

Emotional Intelligence. This study adopted Wong and Law\textsuperscript{24} Emotional Intelligence Scale (WLEIS), where the concept of WLEIS is similar with the concept of Mayer and Salovey EI Ability Model. The instrument consists of 16 items that measure each dimension of EI, namely Regulation of Emotion (ROE), Self-Emotion Appraisal (SEA), Others’ Emotion Appraisal (OEA), and Use of Emotion (UOE). The sample of the items is, “I am able to control my temper so that I can handle difficulties rationally”. Each item is given five Likert scales, from 1=strongly disagree to 5=strongly agree. The construct of EI was tested with reliability, and it scored 0.89, indicating a high reliability value.

Organizational Justice. This study adopted Colquitt\textsuperscript{13} Organizational Justice Scale, where it consists of four dimensions, namely distributive, procedural, informational, and interpersonal justice. The instrument consists of 20 items that measure each dimension of OJ. The sample of the item is, “My outcome is justified, given my performance”. Similarly, each item is given five Likert scales, from 1=strongly disagree to 5=strongly agree. The construct of OJ was tested with reliability, where it scored 0.86, indicating a high reliability value.

Data Analysis

Structural model will be used to analyse the data. This is because majority of the researchers agreed that structural model is suitable to be employed when the researchers need to explain the impacts of variables by using path diagrams\textsuperscript{25}. The structural model’s validity is assessed through multicollinearity, coefficient of determination ($R^2$), effect size and path coefficients. In order to test the hypotheses, the author will make a decision on the acceptance or rejection of hypotheses, depending on the result of path coefficients, $t$-values, as well as $p$-values with a significance level of 0.05.

Conclusion

To summarize, the impact of EI on OJ has been less explored by the past studies. Hence, this conceptual paper proposed a framework to illustrate the influence of the dimensions of EI towards OJ. The authors attempts to discover the significance of EI dimensions’ impact on the perceptions of OJ among the employees in Malaysian manufacturing companies. It is believed that interesting insight could be provided since there is a lacking of study that examined the impact of EI’s dimensions on OJ, especially among the respondents in the context of
Malaysian manufacturing sector.

The Psychological Distress among Youths in Nigeria

Darma Kabiru Rabiu¹, Zainudin Abu Bakar²

¹PhD Student, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia,
²Associate Professor, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia

Abstract

Studying at school under specific distress condition such as war requires resilience and persistence among students to survive. This paper is written with the intention to highlight war experiences among Nigerian youth at school under the pressure of war condition. Studies have shown that they struggle in their learning at school. The tension between educational requirement and the safety of life become common dilemma that most of Nigerian students were facing in their everyday schooling life. The difficulties have been found by many studies to affect not just to their schooling life but their personal development. They are to develop emotional and psychological problems that affect their personality development which manifest the symptoms of psychological distress such as irritability, insomnia, sleeping disorders, fear, aggression, confusion and an inability to concentrate. These developments facilitated the emergence of behavioural problems that lead to the prevalence of negative attitude towards schooling among secondary school students in Nigeria. As a result it affect the amount of motivation to display by youths in order to achieve success in school activities and all other extra-curricular activities that aims at development of social interaction among youth irrespective of their socio-economic, tribal or religious inclination. The discourse is intended to highlight what need to be done in order to assist how the youth can survive in their educational life at school under the hard condition like war experiences.

Keywords: youth, psychological distress, psychological trauma, posttraumatic stress disorder, trauma, Nigeria.

Introduction

Nigeria as a nation witnessed various ethno religious and political instabilities since from the return of democratic government in 1999. The emergence of the country as a poverty-stricken nation as a result of poor leadership facilitated the emergence of various extremist groups seeking to establish an independent and sovereign state out of Nigeria. The nation has been considered as one of the countries in Africa that is currently facing security challenges in form of kidnapping, arm bandits and also the fast-growing nation in term of militant activities¹.

The Niger Delta region serve as main source of Nigeria national income and the hub of oil and gas production in Nigeria that accounts for 95 percent of foreign exchange earnings, 95 percent of national budget, 80 percent of government revenue and over 80 percent of national wealth². But yet, the region remains neglected without infrastructural facilities and effective health care delivery system. Given this, the people of the region believe that they are carrying the burden of developing other regions of the country whilst their region is neglected and considered backwardness in term of human and material resources in the country. This development promotes the emergence of terrorist groups carrying out various attacks in order to set themselves free against economic marginalization of their region.

The emergence of the region as a pillar supporting the economy of the country and at the same time the most neglected areas in term of infrastructural development. This greatly opened the way for the emergence of various militant groups such as Niger Delta Volunteer

The Northern region characterize with a unique form of violent that created an indelible impact on the entire educational system of many students in the region. The conflict in this zone is known as Boko Haram crisis that is purely meant to put a stop or stumbling block against Western education system and Western Euro-American Christian ideology. The words Boko Haram are Hausa terms which mean western education is forbidden. The sect emphasized more on the child to be educated in Islamiyya schools across the northern region. The kind of education to be imparted must be in line with the teaching of Islam. The core education system that involve mixing boys and girls in one class or school must be stopped; wearing of shirt and short skirt by girls that appear half naked must be abolished. The sect emphasize greatly on the complete adherence and tolerance of Islamic law in the search of Islamic knowledge. The knowledge acquired must be employed in the service of Islam and for the wellbeing of entire humanity.

The sect like the other militants groups draws its members mainly from disaffected youth, unemployed high school and university graduates, and destitute children. The activities of the group became even more dangerous and threat to security challenges in 2004 when students, especially in tertiary institutions in Borno and Yobe states, withdrew from school, tore up their certificates, and joined the group. The activities of the sect affected greatly the emotional and psychological well-being of many students in Nigeria. The exposure of children to various forms of war atrocities such as the loss of loved ones, displacement, hunger and famine, and the fear of school attack that may likely to occur at any time of the day during the school hours has negative impact for student’s mental health and psychological well-being. Children are affected by Psychological problems such as irritability, insomnia, sleeping disorders, fear, aggression, confusion and an inability to concentrate, which greatly affects their ability to have a loving relationship with their family, friends and to perform well in school.

Source of Psychological Distress Among Youth in Nigeria

The Boko Haram insurgency is one of the obnoxious events in the history of Nigeria. The insurgency characterized with various forms of atrocities melted on innocent youth irrespective of genders, religious or tribal inclination in Nigeria. As a result of this development an increasing number of children from schools and outside schools especially the “Al majirai” street boys or abandon children have also been forcefully recruited by rebel group mostly in conflicted affected areas. These children carry out diverse multiples roles, including fighting, and sometime they are as used as human shield against their leaders who were assign in fore front during the course of fighting with the government forces. More so, female child soldiers were used for sexual slavery rendering various sexual services to the militant and sometime they save as the wives of the commanders or reward to those who fight bravery and cause serious ailment to the enemy or rival.

It is important to note that the highest numbers of girls abducted by the Boko Haram in one single attack of Government Secondary School Chibok in Borno state was 276 girls mostly ranging between the ages of 17 and 23. The incident became one of the most remarkable events in the history of the world in which over 200 girls were abducted in one single attack. There was record of frequent cases of sexual abuse and harassment in the concentration camp of Boko Haram. The abducted girls were turn in to sex machine, the prevalence of unwanted pregnancy and sexually transmitted diseases.
like chlamydia, genital herpes, gonorrhea, HIV/AIDS, syphilis and trichonomiasis were common among the abducted girls. Studies conducted to explore the health consequences of the youth that were subjected to sexual abuse and harassment found that the victims of sexual harassment develop some symptoms of psychological distress such as unhealthy behaviours may occur indirectly as a result of the violence, common among these include increased reports of fear, anxiety, insomnia, headaches, aggression, anger, hostility, poor self-esteem, and suicide attempts. These facilitated seriously in the emergence of psychological trauma, and post-traumatic stress disorder among the war victims subjected to various kinds of atrocities. As reported by one of the victims of sexual harassment regarding the group that:

“(they) went from house to house. When they arrived at our house, they wanted to marry me, and I refused. I told them I wouldn’t marry anyone without my father’s consent. They came back again at night and kidnapped me.” Aisha (17) was forced to “marry” a fighter, and she became pregnant. “I hated the baby,” she said, but a woman she didn’t know showed her kindness and taught her to love her son. “She preached to me about his innocence.” —Reported by Larisa Epatko, PBS News hour, October 19, 2016.

It is common for victim of unwanted pregnancy by force is more predictive of a mother at-risk for the prevalence of mental health and behavioural problems than other types, because she will uncared without proper needed for the wellbeing of both the mother and infant, but little research has examined the question of “severity” of unwantedness empirically. Identifying a pregnancy as unwanted was associated with the highest rates of maternal depressive symptoms, perceived stress, and negative paternal and social support.

There are a number of possible consequences that are likely to suffer by women and their children of unwanted pregnancies within their community over a longer period of time. Psychologically, women that become the victim of unwanted pregnancies might be at-risk for poor psychological well-being during and after the perinatal time. The prevalence of psychological disorders, such as perinatal depression, can over a period of time negatively affect parenting and relationship domains. In addition, unintended pregnancies are associated with prenatal and perinatal risks for the infant’s health and developmental wellbeing, such as prematurity, low birth weight, and lower likelihood of being breastfed.

Years of war in Nigeria especially during the peak of Boko Haram insurgency weakened the entire health systems in Borno state and contributed significantly to a long-term deterioration in infection control practices. The failures for effective and efficient management of health sector in the state tend to have direct health consequence that cause drastic increase in infant and maternal mortality cases. Likewise, there also a range of other socio-economic consequences that will affect people’s health.

The disruption in agricultural activities due to the frequent attacks carried by the Boko Haram insurgents on villagers that depend on agriculture at subsistence level means that food insecurity has deteriorated which directly has negative consequences on peoples’ health and emotional wellbeing. Studies show that food insufficiency is associated with higher prevalence of poor health conditions, including stomachaches, headaches, and cold; and that severe hunger can predict chronic illness among both preschool and school-age children. It also contribute to toxic stress – the strong, unrelieved activation of the body’s stress management system.

**Conclusion**

During the period of war or insurgency many youth in Nigeria particularly in Borno state lived in unhealthy and dangerous situation. The problems posed by the war affect every aspect of human life. There were constant lacks of electricity, deterioration of health sector, lack of safe drinking water and frequent kidnapping and abducting of secondary school students either in the school or their way. The attacks carried out on schools by the insurgents using explosive weapons or through employing young girls in order to carry out suicide bombing serve as the distressing condition that negatively affect the emotional and psychological wellbeing of most secondary school students in Borno, state Nigeria. These development results in the emergence of ill health situation characterize with frequent headaches, stomachache, frequent high fever among youth mostly living in the volatile areas and concentration camps.

It is recommended that in order to assist youth who experiencing such distress like war in their educational life we should consider a proper care and concern, considerate and responsible teachers, parents and other
members of the society that willing to be with them along the way. Several suggestions as follow are worth to be considered:

There is the need to establish functional guidance and counselling centre in schools to address some of the psychosocial problems. This will help to instil confidence among the victim that will help them to develop positive attitude.

Government should encourage various programme using mass media aim at enlighten the people the roles to play in solving out some of the psychosocial problems associated with war in Nigeria.

There is the need for taking proper care for those who suffer from life threatening illness that result from school attacks and if possible they should be given free medical treatment until they regain to their normal condition.

Special classes or schools should be established for those with severe psychosocial problems that cannot commensurate with normal schooling.

Physical Activity Among Malaysian University Students: The Motives

Zainudin Abu Bakar¹, Halijah Ibrahim², Zakiah Mohd Ashaari²
¹Associate Professor, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia, ²Senior Lecturer, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia

Abstract

Regular activities among students are always required. Studies have shown that regular activities among students are related to the fitness, focus and attention in the learning activities, student performance and attitudes. The main issue to this is that how far and how much the students willing to spend their time to engage in the physical activities on a regular basis. This study highlights the nature of students' physical activities around the campus, especially during their free time, such as weekends. The sample of the study was students in one research universities in southern part of Peninsular of Malaysia. 628 students male and female were involved in the study including various department and programme of studies. It was found that most of the participants were casual types of exerciser. Male is found to be more frequent to do physical exercise as compared to his female counter part. The motives of the activity were mostly on friends. Hence, it functions as an accelerator of the physical activities among students. It is suggested that in order to increase the possibility of the students to engage in such activities are to utilise the friends factor. The findings support the previous findings that regular physical activities accelerate the potential of healthy life among students.

Keywords: Physical activities, motives, student, student performance, friends

Introduction

It is suggested that the regular exercise will increased potentially the personal health, including reducing the risk of chronic diseases such as hyper tension, diabetics, cholesterol and alike. Consistent practices of regular exercise are proven to improve the personal mental health, social interaction and emotionally stable. It is speculated that inactivity promote obesity, heart disease and other chronic conditions. Similarly, it also reported where physical activities if done correctly and regularly will affect the personal psychological and social health which in turn improving the wellbeing and reducing stress and distress. In earlier study suggested that the physical inactivity accelerate the potential of suffering chronic diseases, whereas the active life is predicted to prevent or delay for chronic diseases. Research who was studying the older people concluded that those who engaged in intermediate and high physical activity significantly lowered the utilisation of health care and expenditure as well as lowering the prevalence of chronic diseases.

Context of Study

Regardless of the age and situation it is argued that the physical activity have the potential to increase if not to improve the personal health. With consistent and regular physical activities the individual have the opportunity to explore not just his physical benefits but also social, mental and psychological benefits.

In regards to student context, the similar perspective can also be derived. As students they are required to focus to their learning activities so that they can graduates without any problem. Physical fitness, mental strength, a stable psychological and socially adaptable to name a few is the basic requirement for active students. By having such competencies and capabilities they are expected to engage actively in their daily teaching and
learning activities. It is indicated that in order to have such energy to devote the focus to their very demanding learning activities, the students require maintaining their physical, mental and psychological in check. One of the activities is regular physical exercise.

Studies have shown that students who practiced regular physical activities have the potential to perform and engage actively in their learning. Researcher 5 defined that the physical activity is related to the motives and by understanding the motives it will increase the potential of higher level of involvement. In addressing the effect of physical activity among students, 6 suggested that the physical activity had a positive effect on improving task and reducing off-task classroom behaviour. In other word they concluded that the classroom-based physical activity have positive impacts on academic-related outcomes. Researcher 7 also found that the physical activity is significantly correlated to the school achievement.

Method

This study is conducted to explore the motives of engaging in the regular activities among students in one Research University in Malaysia and to measure how it affect to their learning performance. A structured cluster random sampling was executed to select the participant for the study. A total of 628 participants across the universities participate in the study. Descriptive analysis was conducted to identify the motives for engaging in regular physical activities around the campus.

Results

The category of the physical activity among participants were categorised into four that are ‘very active’, ‘active’, ‘casual’ and ‘leisure’. The data showed that the physical activities among students are categorised as casual activity which contributed 41.5% (261 participants) which is almost halve of the total participants. They spent times on physical between 1 – 2 times per week. The second group was the active group which contributed 29% (182 participants). Surprisingly the very active group of participants contributed quiet a big portion of percentages at 16% (100 participants). Unfortunately there are also a big number who just engaged in the physical activities mostly between 1 – 3 times per week. However the significant number of participants who engaged in what is consider as almost regular at 69 (11.0 %) participants is also recorded. Table 1 below showed the distribution of the physical activities among students.

<table>

If we look further by comparison between gender, the tendency to engaged to the physical activities are moving into an opposite direction between male and female. The distribution of the percentages among male shows that the regularities are increased in the frequency of the activities from less to more frequent. Whereas among female the number is decreased from more frequent to less frequent. However the bigger portion for both still the casual category. Table 2 below explain the distribution of physical activities between male and female in comparison.

Discussion

It shows from the result that the physical activities among student in one research university in Malaysia are varies. Although there are some who engaged in the physical activities very actively, but most of them are more to active to casual type of physical exerciser. In regards to gender, the tendency to do physical activities were moving to opposite continuu between male and female. The motives of the activity also associated to the social factor which is to get along with friend in which they can feel happy.

The findings suggest similar notion as previous studies that the element of friends play an important role in encouraging students to do physical activities at their given free time (see 5, 6. It is suggested that in order to encourage student more frequent to engaged in physical activities at a regular basis, the element of motives (in this context of study is friends) should be considered. This aligned to what being proposed by 5 that the motives of the activity plays important role for the students to engaged on regular basis.

Being with friends will also make life more interesting. As students they sometimes requires break from their very demanding activities in the classroom. As suggested by 6, the physical activity had a positive effect on improving task and reducing off-task classroom behaviour. Whether that be direct or indirect the impact of the activities on the academic-related outcomes is potentially higher. Researcher 7 also found that the physical activity is significantly correlated to the school achievement. Having active and interesting break from the study will charge their energy to do more in the learning.

Big Five Personality and Eating Disorder Symptoms among Students in a Malaysian Public University: A Cross-Sectional Study

Lim Xing Yan¹, Wan Mohd Azam Wan Mohd Yunus², Norashikin Mahmud²

¹Undergraduate Researcher; ²Senior Lecturer, Department of Psychology, School of Human Resource Development and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

Eating disorders are arising in Malaysia at alarming rate, yet studies examining eating behaviour such as eating disorder symptoms in Malaysia is still at infancy stage. Since personality traits can affect an individual’s health-related behaviour, it is crucial to explore its association with eating disorder symptoms. This study explores the link between the Big Five Personality and eating disorder symptoms among university students at a Malaysian public university. A total of 139 respondents participated in this cross-sectional study. Big Five Inventory (BFI) was employed to measure personality traits, while an abbreviated 26-item version of Eating Attitude Test (EAT-26) was used to examine eating disorder symptoms. Data was analysed using Statistical Package for Social Science version 22.0. The findings revealed that there is a weak positive association between neuroticism and eating disorder symptoms (r=0.266, p<0.01). a weak negative association was recorded for agreeableness and eating disorder symptoms (r= -0.228, p<0.01) and between conscientiousness and eating disorder symptoms (r= -0.18, p<0.05). No significant association was recorded for extraversion (r= -0.008, p=0.926) and openness to experience (r= -0.008, p=0.890) with eating disorder symptoms among the university students. This research concludes that several but not all components of the Big five personality are associated with eating disorders symptoms among university students.

Keywords: Big Five Personality; Eating Disorders Symptoms; University students; Cross-sectional

Introduction

Many researchers have supported that personality was an important factor that affects eating disorder symptoms of students [1-8]. Individual personality traits and eating styles has impact on the extent to which individuals adhere to dietary guidelines and choose recommended rather than not recommended food on a regular or daily basis [3]. It has been reported that there’s a probable link between personality and eating behaviour over a period and suggested that personality traits has impact on consuming healthy diet as well as maintaining a healthy weight [9].

Of this, university students are potentially important targets in the effort of promoting healthy lifestyles in order to reduce the risks of lifestyle-related disorders later in life [10]. This is because individuals who undergoes the transition period from adolescence to young adulthood are facing pressures from many dimensions, such as coping with their studies and handling personal, social or family relationship. Some studies reported that university students experienced high level of eating disorder symptoms [10-13], have inadequate nutrient intake [10] and have low physical activity [12], especially when they are bothered with psychosocial problems.

In addition, studies examining eating behaviour such as disordered eating in Malaysia is still at infancy stage
A cross-sectional study conducted in Klang Valley, Malaysia found that the prevalence of underweight among university students was quite high (14.3% males and 22.4% females). The study also found that 14.0% of males and 12.3% of females are categorized as overweight or obese. Another study conducted in Universiti Sains Malaysia also reported that 27.4% of the students were underweight, 9.6% of them were overweight and 1.8% were obese. Therefore, eating problems are arising in Malaysia at alarming rate, particularly among university students.

A number of research supported that personality was an important factor that affects eating disorder symptoms of students. Notably, the World Health Organization claimed that a person’s personality may be a risk factor for an unbalanced diet, and this may result in the increased likelihood of developing chronic diseases such as cardiovascular diseases, cancer or diabetes. Personality traits was also reported to have a strong relation towards some eating disorder symptoms, such as emotional and external eating as well as restrained eating and obesity. Therefore, investigating the link between personality and eating disorders symptoms is imperative.

Although research on the association between personality and eating disorder symptoms conducted overseas are not uncommon, research conducted among Malaysian students is scarce. Even though there are few research carried out in other university, there is no similar research has been conducted among the university in the southern region of Malaysia. Given the importance of the association between traits of openness to experience, conscientiousness, extraversion, agreeableness and neuroticism with eating disorder symptoms, this study was aims to investigate the association between personality and eating disorder symptoms among university students, this study aims to investigate the link between Big Five personality and eating disorder symptoms among university students in a Malaysian public university.

Material and Method

A total of 148 university students from a Malaysian public university provided informed consent and was recruited for this cross-sectional study. Big five personality was measured using the Big Five Inventory which contained of 44 items. This questionnaire was used to measure the five components of Big Five Personality; Extraversion, Agreeableness, Conscientiousness, Neuroticism, and Openness to Experience. The eating disorders symptoms was measured using an abbreviated 26-item instrument of The Eating Attitude Test (EAT-26). However, the result of the instrument does not provide a diagnosis, it only reflects on the presences of symptoms that are consistent with a possible eating disorder. Statistical Package for Social Sciences (SPSS) version 22.00 was used to analyse the results. Descriptive analysis was used to identify the demographics information while Pearson Correlation was used to investigate the association between Big Five personality and eating disorder symptoms.

Table 1 below demonstrated the findings from data collection for the demographics section.

Discussion

The current research postulates that there is a weak positive association between Neuroticism and eating disorder symptoms among university students, which is in line with a number previous research 1, 7, 25-28. Neuroticism are found to be the principal contributor of eating disorder symptoms 29, and have a significant positive correlation with eating disorder symptoms 3. One of the study suggested that high scorer of Neuroticism has higher risk in developing disordered eating behaviours, and the impulsiveness facets of Neuroticism are found to be the predictor of eating disorder subtypes35. For instance, dieting and bulimia subscales of Eating Attitude model 30 are significantly correlated with Neuroticism. A study among 323 psychology students from a Canadian university found that higher level of neuroticism lead to higher body dissatisfactions, thus, resulting in the engagement of disordered eating behaviours28. It was argued that people who are more vulnerable to stressful or emotional situations have higher tendency to eat more food to feel secure or comfortable31. In such, Multidimensional Model 32 has further explain the association of Neuroticism that contribute to development of eating disorder symptoms through negative affect under personal factors.

Next, the findings revealed that there is a weak negative association between Agreeableness and eating disorder symptoms, in line with several previous research 7, 21, 28, 31. It was reported that agreeableness were negatively related to unhealthy eating behaviour such as uncontrolled eating 21, and emotional eating 31. It was argued that the regulation of healthy eating attitude were directly and positively associated with Agreeableness33. Agreeableness is also negatively associated with BMI, whereby obese individual who are more likely to displayed disordered eating has lower agreeableness score21. Another research also suggested that obese women that engaged in dieting possess higher level of agreeableness than those who are not dieting 4. One of the fundamental causal factor of eating disorder symptoms, body dissatisfaction were found to be negatively related to agreeableness 28.

Likewise, a weak negative association was also found between Conscientiousness and eating disorder symptoms in the current study. The findings are similar to several previous studies 7, 21, 25, 28. It was claimed that higher level of eating disorder symptoms are associated with low level of conscientiousness 7, 28, and it is negatively related to unhealthy eating behaviour 21. Moreover, another study has proposed that the dimension of oral control has no significant correlation with overall Conscientiousness score, while the dieting subscale are correlated significantly with self-discipline facets of Conscientiousness 25. The correlation are further explained by the findings that people with high level of conscientiousness are more likely to adopt regulatory retrained eating, less likely to practice external eating and emotional eating, and tend to practice healthier diet such as high consumption of fruits and vegetables 3.

No significant association was recorded for Extraversion and eating disorder symptoms. Contradictorily, previous research has proven that Extraversion was positively and significantly associated with eating disorder symptoms because of more embedded in social nets28, thus exposed more to tasty foods with great smell that lead to external eating 3. Extraversion lead to endorsement of the importance of thin body from their active engagement in social network 29, which has been highlighted as a causal factor in both developmental model of eating disorder symptomatology 32, 34. On the other hand, some researchers proposed that there was a significant negative correlation between extraversion and eating disorder symptoms 23, whereby lower scores on the extraversion facets of assertiveness and positive emotions contributes significantly to higher level of eating disorder symptoms. One study among 196 undergraduates students reported that the respondents
with greater risk of eating disorder symptoms are those who scored high in neuroticism and low in extraversion. Interestingly, the research found that Extraversion are found to be unrelated to eating disorder symptoms among those with low level of neuroticism\textsuperscript{37}. Therefore, in line with that research it can be concluded that Extraversion and eating disorder symptoms has no association in the current study because the students are reported to have the lowest scores in Neuroticism.

Moreover, the current study also recorded no significant association between Openness to Experience and eating disorder symptoms. This is consistent with several past studies \textsuperscript{3, 21, 28, 33}. Meanwhile, this findings is contradicted with one study conducted among 289 psychology students that reported that openness to experience are weakly and negatively correlated to cued eating \textsuperscript{7}. However, although openness to experience do not related to eating style and eating disorder symptoms, it is proven that openness to experience plays an important role in individuals' adherence to a healthy and balanced diet \textsuperscript{1}.

**Conclusion**

The aim of the study is to investigate the association between personality and eating disorder symptoms among university students. A weak positive association was found between neuroticism and eating disorder symptoms. Agreeableness and conscientiousness, the association were weak negatively related to eating disorder symptoms. No association was recorded between extraversion and openness to experience with eating disorders symptoms. Therefore it can be concluded that several but not all Big five personality domain is associated with the eating disorder symptoms of an individual, particularly university students.

The Association between Emotional Intelligence and Depressive Symptoms Among Nurses in a Malaysian Private Hospital

Chan Mun Mun¹, Wan Mohd Azam Wan Mohd Yunus², Norashikin Mahmud²
¹Undergraduate Researcher; ²Senior Lecturer, Department of Psychology, School of Human Resource Development and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

Nurses are predisposed to depression due to the nature of their work, where it is emotional demanding. Since depression is a type of mood disorder, emotional intelligence is believed to act as a protective factor against depression among emotional labours. The purpose of this study is to investigate the association between emotional intelligence and depressive symptoms among nurses in a private hospital in Malaysia. A total number of 125 respondents participated in this cross-sectional study. Wong and Law Emotional Intelligence Scale was used to measure emotional intelligence among respondents whereas Center for Epidemiologic Studies Depression Scale-Revised (CESD-R) was used to measure depressive symptoms among respondents. The collected data was analysed by utilizing Statistical Package for Social Science (SPSS) version 22.0. This study had found a weak negative association between emotional intelligence and depressive symptoms ($r=-0.217$, $p=0.015$). Specifically, self-emotion appraisal ($r=-0.237$, $p=0.008$), use of emotion ($r=-0.209$, $p=0.019$) and regulation of emotion ($r=-0.242$, $p=0.006$) were found to have a negative association with depressive symptoms. On the other hand, others’ emotion appraisal was the only dimension which showed that it does not have significant association with depressive symptoms ($r=0.013$, $p=0.882$). It can be concluded that nurses who possesses higher level of emotional intelligence tend to experience lower level of depressive symptoms. Hence, any effort of increasing the level of emotional intelligence among nurses should be done in order to lower the risk of depression.

Keywords: Emotional Intelligence; Depressive Symptoms; Nurses; Cross-sectional

Introduction

Over the past several years, emotional intelligence (EI) had received much attention as a factor that was useful in understanding and predicting individual’s performance at workplaces, home and even at schools. It was argued that individuals who possess the ability to maintain emotional balance using emotional skills are better adjusted to their social circle, enjoy better quality of life and are physically and psychologically healthy. Mayer and Salovey defined EI as the ability to monitor one’s own and others’ feelings and emotions, to discriminate among them, and to use this information to guide one’s thinking and actions. Therefore, EI is like an umbrella that captures a broad collection of interpersonal and intrapersonal skills. EI plays a very important role in determining one’s life success.

Unsurprisingly, recent studies had shown that EI is highly correlated with psychological health and wellbeing. People with various symptoms of depression generally reported lower emotional intelligence scores. Depression is a common illness worldwide, with...
more than 300 million people affected. Depression is a serious mental health illness to the extent where it can cause the affected person to suffer greatly and function poorly at work, at school and in the family. At its worst, depression can lead to suicide.

Undeniably, some jobs are more depression-prone than other occupations due to stress, unpredictable or long working hours and complexity of job nature. Healthcare workers, typically nurses were more prone to depression, with the risk twice more than the general public. Nurses can have irregular and long working hours with little sleep as well as much less personal time. Like other personal care professions, nurses may feel fulfilled in helping other people but having to face sickness and death every single day for a prolonged period of time. Among health workers, nurses were more likely to be reported depressed, since they had to deal with human suffering, pain, joy, sadness and they need to offer help to those who need their care.

It was claimed that emotional and physical exhaustion, workplace stress, together with feeling a lack of control had been shown to contribute to depression and nurses were reported to suffer depression at twice the rate of the national population. Moreover, other researchers proposed that the prevalence of depressive symptoms among health care professionals were high, which typically influenced by environmental stress as well as work process. Slowness in activities, disinterest, reduced energy, apathy, difficulty concentrating, recurrent negative thoughts, loss of capacity in planning and altering the perception of truth were evidence that signal depression among nurses.

Nursing personnel are regarded as a professional team with increased stress, anxiety and depression due to their work routine, where they were forced to cope with pain, sadness and death. Fatigue from an increased workload and inability of nurses to cope with emotional needs of patients or their families may increase their level of stress. EI is a key skill for nurses in patient care, and this skill may contribute to patient’s therapeutic relationship as well as the nurses themselves, in terms of their mental health.

Apart from that, several studies had investigated the association between EI and depression among nurses. For example, several researchers reported a negative linear correlation between EI and three examined emotional state (depression, stress and anxiety) among nurses. Existing findings had shown that EI played an important role in a profession that not only required technical expertise, yet mainly relied on the physical and psychological care of human beings. However, the role of EI in the development of the nursing profession have not yet been adequately studied, especially in Malaysia context. Only a few local studies in Malaysia explored the association between EI and depression, by having nurses as main population such as the study by Bakri and Ali. With the aim of filling this gap, the present study examines whether EI (self-emotion appraisal, others’ emotion appraisal, use of emotion and regulation of emotion) is associated to depressed mood in nurses in a Malaysian private hospital.

**Material and Method**

A total of 125 nurses from a Malaysian private hospital provided informed consent and was recruited for this cross-sectional study. Emotional intelligence was measured using the Wong and Law Emotional Intelligence Scale dimensions which consists of 16 items and four dimensions, known as self-emotion appraisal, others’ emotion appraisal, use of emotion and regulation of emotion. The depressive symptoms was measured using the 20-items Center for Epidemiologic Studies Depression Scale and had been revised to adapt the symptoms of major depression as according to Diagnostic and Statistics Manual of Mental Disorders Fifth Edition (DSM-5). Statistical Package for Social Sciences (SPSS) version 22.00 was used to analyse the results. Descriptive analysis was used to identify the demographics information while Spearman correlation was used to investigate the association between emotional intelligence and depressive symptoms.
Table 1 below demonstrated the findings from data collection for the demographics section.

The association between emotional intelligence and depressive symptoms are shown in Table 2. Primarily, there is a significant and negative association between emotional intelligence and depressive symptoms among nurses, yet it is weak (r=-0.217, p=0.015). In other words, when nurses are having higher level of emotional intelligence, they tend to report lower level of depressive symptoms. Looking particularly into each EI dimensions, there is no significant association between others’ emotion appraisal and depressive symptoms (r=0.013, p=0.882). In contrast, remaining EI dimensions have demonstrated a significant and negative association with depressive symptoms, whereby self-emotion appraisal (r=-0.237, p=0.008), use of emotion(r=-0.209, p=0.019) and regulation of emotion (r=-0.242, p=0.006). In a nutshell, the result of correlation analysis indicates that there is a significant and negative association between emotional intelligence and depressive symptoms among nurses. Among all the EI dimensions, others’ emotion appraisal is the only variable that does not show correlation with depressive symptoms.

Discussion

Based on the research findings, there is generally a significant negative association found between emotional intelligence and depressive symptoms among the nurses. Similarly, previous literatures reviewed by researcher had broadly demonstrated a significant association between emotional intelligence and depressive symptoms. For instances, there was a negative linear correlation among the three examined emotional state categories (depression, stress and anxiety) and all of the relative EI categories (recognition and expression of emotions, use of emotion to facilitate thoughts as well as emotional control) among nursing personnel. Additionally, a study conducted to examine how emotional intelligence impacts on depression among professional caregivers showed that the higher the participant’s EI scores were, the lower they scored on the depression scale.

More particularly, the significant negative association between EI dimensions (self-emotion appraisal, use of emotion and regulation of emotion) with depressive symptoms of current study is congruent with the findings of several previous researches. Based on the summary of past studies, it can clearly be seen that emotion regulation, use of emotion as well as emotion clarity (can be referred as self-emotion appraisal) are the most crucial EI dimensions in determining level of depression. Regulation of emotion is negatively correlated with depression because individuals who possesses high ability to regulate own emotion can accurately perceive and appraise their emotional states, know how or when to express their feelings and can effectively control their mood states.

On the other hand, some researchers argued that higher ability of self-emotion appraisal and use of emotion are always associated with lower depressive symptoms whereby individuals reported greater ability to discriminate clearly among feelings. In this context, individuals’ capability of attending to own feelings can successfully allow them to facilitate their thought and making decision out of it.

Nevertheless, high level of self-emotion appraisal may often have a positive relation with depression, typically in the cases where individuals are overly paying attention on their negative emotions, also known as pathological attention. As a result, bias toward negative emotions can be considered as a trait marker of depressive symptoms. In other words, emotional perception without proper emotional regulation has rather negative consequences and may subsequently contribute to depression.

On the contrary, it was stated that clinically depressed patients tend to score low in understanding others’ emotions and this statement is supported by another research where significant negative correlation was found between late life depression and ability to accurately identify emotion in others. However, current research revealed that others’ emotion appraisal shows no significant association with depressive symptoms among nurses in Hospital X.

All in all, Wong and Law claimed that the EI dimensions self-emotion appraisal (SEA), use of emotion (UOE) and regulation of emotion (ROE) assess intrapersonal aspects of oneself whereas others’ emotion appraisal (OEA) evaluates interpersonal aspects. Interpersonal abilities are believed to be related to better personal or social relationship, while intrapersonal skills are expected to have relationship with subjective well-being, where high level of all these EI dimensions can generally lower the rate of depressive symptoms.

Conclusion

The aim of the study is to investigate the association between emotional intelligence and depressive symptoms among nurses in a Malaysian private hospital. In short, results of current findings had discovered that emotional intelligence is negatively correlated with depressive symptoms. Specifically, a very weak negative association are indicated between EI dimensions and depressive symptoms as according to the research’s findings (self-emotion appraisal, others’ emotion appraisal, use of emotion and regulation of emotion).

Teacher Well-being and Mental Health at Schools

Zainudin Abu Bakar¹, Syed Nazmul Amin²
¹Associate Professor, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia, ²PhD Student, School of Education, Universiti Teknologi Malaysia, Johor, Malaysia

Abstract

Teaching is often characterised as a stressful profession and schools in general have paucity of desirability as a workplace. Teacher wellbeing and mental health has been the focus of numerous studies highlighting multitude of factors. The factors both positive and negative have a complex interplay, some residing within the control of teachers while some beyond. The article aims to highlight the most important factors affecting well-being and mental health of teachers in schools. It appears that both factors internally as well as externally affects the teacher well-being in their career life as a teacher at school.

Keywords: teaching profession, teacher well-being, mental health

Introduction

It is widely accepted that teachers are the most essential factor in school that contributes to student achievement, fulfilment and accomplishment. Likewise it is also recognised that teacher well-being is firmly connected to the quality of their work ¹³. Research has identified various reasons for poor retention of school teachers having connection with teacher well-being. Dated work from as far back as 2005⁴ reveals that if teachers have no sense of well-being at work- can experience a feeling that that they lack skills, which can lead to high levels of attrition and extreme stress. Over the last half a century, teaching has been perceived as being in the league of generally considered high-stress professions⁵. Unbearable workload, uncalled student behaviour, low pay, lack of career growth, unsatisfactory workplace environment, lack of understanding relationships with colleagues, pupils and administrators and a multitude of other problems plague education systems in major parts of the world⁶.

On the contrary, there is a real substantive link between employee well-being and its impact in the workplace. Employers now acknowledge that actively promoting well-being amongst the employees could reinforce positive results, the likes of increased productivity and quality⁷. Briner and Dewberry⁸ argue that improving school performance may also have a positive effect on the well-being of teachers and vice versa. Teacher well-being is specified to have an impact on student achievement or on school performance at the broader scale. Making a case for this, Briner and Dewberry⁸ found that teacher well-being accounted for 8 percent of the deviation of SAT (Standard Assessment Test) scores in the UK.

Teacher Well-Being

A number of studies have found teacher wellbeing to be significantly lower than other professional occupations such as health, social work, finance and human resources. While many scholars believe that individuals have responsibility for their own wellbeing, a numerous other factors over varying time periods can have a damaging impact on one’s wellbeing. Some of these factors are within one’s control while some are not⁹,¹⁰.

The rapidly changing interplay between teachers and their environment is shaped by perceptions of the teachers their aptitudes and the way they handle the environment¹¹. Even though the school environment is fundamental to the well-being of teachers, family contexts, colleagues and broader organizational, social,
environmental and cultural contexts interact with the prior to varying degrees. Increasingly, system and societal views, beliefs and administrative influences impact the well-being of educators. Lastly, the time of occurrence of events, choices and actions can play a key role in affecting the well-being of teachers. The following discussion is a glimpse into the most common individual and relational factors that affect the mental health of teachers in schools.

According to Grenville-Cleave and Boniwell\(^{12}\) a number of studies have stated well-being and control perceived by teachers to be substantially lower than that of non-teachers. Four themes central to control can be identified in literature- autonomy, authenticity, connection to others, and resilience. According to the authors at least some of the basic psychological needs of teachers remains unfulfilled, specially their need for autonomy, connectivity and competence. This has a negative impact on teacher self-efficacy\(^{12}\).

In a similar note, Fetherston and Lummis\(^{13}\) by analyzing qualitative data gathered from interviews of 11 secondary teachers and three senior level administrators in Western Australia came to conclusion that teachers follow a path to resignation that is very close to student attrition from school. The process involves being watched (surveillance), becoming labelled as abnormal, being subject to discipline, and eventually resigning. Likewise, Johnson and Birkeland\(^{14}\) from analysis of their longitudinal collected data in the United States confounded that teachers who left the profession within the first three years saw their careers as short-term occupations or had experienced frustration or a sense of failure. Studies from Europe, Australia and the USA suggest that teachers have become dissatisfied with burdensome administrative tasks and expectations for curriculum change, while at the same time have a sense of increased levels of accountability, surveillance and role conflict and the problems are most prominent amongst young and beginning teachers\(^{15-17}\).

With the decrease of self-efficacy, teachers sometimes lack resources to deal with negative emotions. A legion of published studies have recognized teaching as one of the most stressful occupations\(^{18-21}\). According to Curry and O’Brien’s\(^{22}\), teachers face both work and institutional stress on a daily basis. Their study sums up the most common educational stressors:

- Overly bureaucratic schools and education systems;
- Greater demand in service with little regards to limited school resources;
- Unrealistic expectations on teachers to handle difficult pupil behavior which includes misdemeanors, aggression, and lack of motivation in students;
- Dearth of time for planning;
- Overemphasis on accountability procedures to amplify efficiency;
- Marginalization of teachers from playing any role in policy-making;
- Teachers and school systems have also been affected by global stressors. Teaching is affected by the likes of terrorism, natural catastrophes, growing inequality in socio-economic conditions and shifting population demographics. To add to this, legal or federal policy regulations also contribute to increased levels of stress experienced by teachers in and out of work\(^{22}\).

Curry and O’Brien\(^{22}\) assert that if not addressed and resolved, the stress experienced by teachers may lead to a possible burnout. Burnout “is characterized by emotional fatigue, disengagement, irritability, and apathy resulting from the work environment”\(^{23}\). In addition, according to Maslach and Leiter\(^{24}\), burnout is the dislocation index between what individuals are and what they have to do. It results in depletion in principles, dignity, resolve and determination.

According to Jennings and Greenberg\(^{25}\) lack of supportive teacher-student relationships, effective classroom management, and successful social and emotional learning program implementation contribute to classroom climate that is not favourable to learning\(^{32,33}\). The deficit in teacher social-emotional competence and wellbeing may provoke a “burnout cascade” that may have devastating effects on classroom relationships, management, and climate. In a similar vein, Palomera et al.\(^{26}\) seek to demonstrate the need for developing emotional competencies in teaching in order to enhance wellbeing.

Hartney’s\(^{27}\) work focused on how to enhance teaching quality and effectiveness by providing teachers with professional learning in stress management, specific to the stressors of teaching. She found existing
research that clearly identified key stressors for teachers, and evidence-based stress management approaches that have been shown to be effective in mitigating teacher stress and improving teaching quality. Newly appointed teachers to rural areas where large proportions of Indigenous students attend experience heightened levels of stress and burnout. Likewise, Sharplin et al.\textsuperscript{28} studied 29 teachers in remote Western Australia and reported that all participants articulated experiences of stress but had developed coping strategies, namely, those of a direct-action nature; of a palliative kind; or ones where avoidance was used. Thereby mental and health and well-being is significantly affected by the ability of individual teachers to cope with stress.

Relational factors identified in the literature as inhibiting the well-being of teachers include student misconduct, parental issues, management and leadership support or lack of support, and strenuous situations that arise with peers. Ross et al.\textsuperscript{29} report that teachers have to absorb high levels of accountability inside schools and all these stressors ranging from student discipline issues, to poor working conditions and lack of emotional support are linked to burnout and eventually leaving the profession. The emotional nature of the teaching profession is also often overlooked. Teachers can have repeated experiences of unpleasant emotions owing to the relational factors leading to burnout\textsuperscript{30}.

On the contrary, positive relationships with students, parents, peers and management can have a positive influence on teachers’ sense of wellbeing and mental health. This is an area that warrants further research. According to Spilt et al.\textsuperscript{31} the interpersonal relationships between students and teachers have not often been studied as a contributing factor to teacher well-being. A positive sense of wellbeing does indeed contribute to work satisfaction and productivity, and most importantly, teachers’ positive influence on their student’s wellbeing and academic achievement.

**Final Thoughts**

The study of teacher wellbeing is vital because it not only adds to the understanding of careers in teaching but also helps to develop a conducive school environment which will enhance commitment and reduce attrition. Many studies have attempted to find the factors that affect the mental health of teachers but one must understand that it is a complex phenomenon which has to be comprehended as a whole.

Work Safely at Workplace: Does Work Experience Influence Workers Safety Behaviour?

Nor Hidayah Abd Radzaz¹, Siti Aisyah Panatik², Nor Akmar Nordin³
¹PhD Scholar; ²Senior Lecturer; ³Lecturer, School of Human Resource and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

Most of the issues related to safety practices in organization are always being related to the interaction between managerial aspect and workers behaviour on safety. However, previous study showed that demographic factors reported to be significant as there was an argument about how working tenure affects safety compliance differs between experienced and inexperienced workers. Thus, this study aim is to investigate the different between workers’ experience and inexperience on workers safety compliance. Using quantitative research design, data were collected through self-report questionnaires. This study used AMOS version 22 and SPSS version 22 to test confirmatory factor analysis (CFA) and analysis of the descriptive data. T-test analysis has been performed to test the differences between experience and inexperience on workers safety compliance. The respondents for this study were 239 production workers in two Automotive Manufacturing and Assembly plants in Selangor, Malaysia. Results revealed that there were insignificant differences between inexperienced and experienced workers on the safety compliance. In conclusion, this research highlighted that there is no differences of safety compliance based on the working tenure. As contribution, this study provides information in promoting safety practices. Organization should focus on safety implementation for all workers despite their differences of work tenures because every worker are exposed to risk and require safety support from organizations. The research findings can be used by automotive manufacturing as a guideline for workers’ safety compliance enhancement.

Keywords: Safety Behaviour, Safety Compliance, Working Tenure, Automotive Industry

Introduction

Manufacturing industries had lead the numbers of reported occupational accident with more than 50 percent from the overall report from 2011 until August 2018¹. Thus, the workers safety on one of the largest industry in manufacturing which is automotive industry cannot be ignored. In Malaysia, the automotive industry classified as heavy industry and regarded as largest auto markets in the ASEAN region². According to the National Automotive Policy (NAP), automotive industry forecast to contribute 10 percent on the Malaysia’s GDP on 2020 where the production expected to increase to 1.35 million units. As for manpower, additional of 150,000 workers were expected towards 2020³. Automotive industry also contributes to Malaysia economic growth with investment of RM2.7 billion in 2017. Hence, this industry should be keep competitive and safe.

However, in contrast to the contribution from automotive industry in the manufacturing sector, it shows that occupational accident were highly reported in manufacturing sector which included automotive sector. Until October 2018, manufacturing industry has lead the numbers of reported occupational accident with total of 1303 cases (1188 non permanent disability, 90 permanent disability and 25 fatality)¹ (Refer Figure 1). This unsafe situation could threatening the industry growth and workers performance where⁴ previous research highlights that safety practices had increase the performance and perceived as good investment.

Figure 1: Occupational Accidents Statistics by Sector until October 2018
(Source: DOSHM, 2019)

Nonetheless, safety standard seldom emphasized the ‘human element’ when developing and implementing essential safety process and procedure. This situation is contrary to the behaviour-based system as a critical methodology to observe workers’ behaviour and provide feedback, especially on safety climate and safety behaviour. It had been reported that workers’ reaction to safety was vary according to the workers’ circumstances; working on shift or a normal working hour or being inexperienced or experienced based on their working tenure. The inconsistency result in previous studies that observing workers safety perception regarding the differences of their work experience and working tenure leaved researcher with question mark on how the actual pattern happen in Malaysia automotive manufacturing and assembly plants and it related to safety behaviour among the production workers in the plants.

As conclusion, integrating workers’ demographic factors of working tenure in predicting safety behaviour are important as these factors will lead to different responses from workers. The study is conducted in Malaysia’s automotive manufacturing and assembly plants with the production workers as the research sample. Automotive manufacturing and assembly plants were chosen because of its important role in contributing to Malaysia economic growth; yet, the safety issues seem to be in a dire situation as supervisors are reported to neglect safety practices. Moreover, the occupational accident in manufacturing sector ranking the highest until October 2018. The persistency of this situation is alarming as neglecting safety could lead to a domino effect on workers safety behaviour.

Work tenure and safety compliance

In organisational safety practices, safety compliance had been of the focus. As the rising of reported occupational accidents, one of the factors to this was related to workers’ low responsibility on safety behaviour. The issues might arouse as safety knowledge was unable to being translated into actual behaviour and practical application. The example for this problematic situation is the workplace might be provide with safety banners and signage, but the actual workplace hazards was not addressed and control which lead to unsafe behaviour practices by workers. The issues of safety compliance can be viewed from demographic factors. The findings can assist the organisation in developing strategies for organisational safety practices and management. Inexperienced and experienced workers (working tenure) expose to variance situation. Thus, this demographic factors could assist in designing more effective and flexible safety strategies suite with workers background. Based on the above discussion, the significant of present study had been highlighted. Present research intent to contribute to safety literature by investigated current pattern of working tenure (experienced and inexperienced) correlation to workers safety compliance.

The studies that linked working tenure and safety behaviour is rather inadequate and conflicting. Research among nurses reported that novice nurses with short tenure are associated with medication error. In the medical field, safety is a top priority of which this research can conclude that a short tenure workers might failed to follow the safety procedure. Similar findings is presented by Gyekye and Salminen in their study among industrial workers in Ghana. Their study reveals that experienced workers have the best perception on safety, which found to be more compliant with the safety procedure and recorded low accident concurrently. On the other hand, the inexperience workers are found to be the least compliance with safety policies and have low safety perception. The experience and inexperience workers different responses to safety were explained by the concept of familiarity and perception on hazard. The longer exposure to the organisational environment allow experienced workers to acquire obligatory knowledge and awareness of the safety procedure and process in the organisation. Inexperience workers response on safety might be low due to the lack of sense of belonging and low sense of responsibility as they are yet to receive ample safety knowledge.

However, a study by Zeitlin on four groups of chain saw users found contradictory findings; inexperience workers showed a higher safety compliance. The findings indicate that inexperience workers performed a higher safety compliance while operating the chain saw compared to experience workers. Interestingly, the members in group made an assessment on risk using their individual experience and safety orientation and acted accordingly. A further investigation is required to determine if individuals’ perception can influence
group perception. Gyekye and Salminen\(^6\) suggested that analysing the differences of working experience could be used to assess organisation strategy to develop safety programme for particular groups. Most of previous studies supported the notion that experienced workers with ample safety knowledge tend to comply with the safety procedures, thus less accident reported. Despite the mixed conclusion, numerous research supported the argument that experienced worker impact positively on safety behaviour. Thus, the present research investigating the effect of workers tenure between inexperienced and experienced on group safety climate, safety behaviour and task performance can be a novel contribution as organisation will be to see the latest trend of this topic.

**Hypothesis:** There is a significant difference in workers safety compliance between inexperience and experience workers.

**Method**

**Data collection**

This study was conducted among production workers of automotive manufacturing and assembly plants in Malaysia. The respondent for this study were 239 production workers from plant A and plant B. The researcher used SPSS version 22 to perform independent T-test to identify the differences between inexperienced and experienced worker correlation with their safety compliance.

**Respondent background**

In this research the majority of the respondent is male workers (97.1%) as compared to only seven female respondents (2.9%) with a total of 239 respondents of production workers from the automotive manufacturing plants. The respondents who participated in this study were mostly 30 to 49 years old (166 respondents) and in general, the respondents have more than 10 years working experience (72%).

**Working Tenure**

Working tenure refers to as working experience\(^6\) or job-relevant knowledge gained over time\(^20\). Others studies refer to working tenure as the numbers of time the workers performed for a given task \(^21\). In this research, working tenure is define as working experience observed from two constructs, namely inexperienced (working less than 6 years) and experienced (working less than 6 years) workers\(^6\).

**Safety compliance**

Safety compliance had been evaluated by safety behaviour scale by DeArmond and colleagues\(^22\). The scale comprises what is lacking in the other scale, in regards to examine the workers voice in safety issues. For instance, safety behaviour scale by DeArmond et al.\(^22\) used an item “I appropriately report injuries, accidents, or illnesses”. Moreover, in this safety behaviour instrument, the items purposely evaluated the behaviour of safety practices among workers. The instrument contains 4 items assessing safety compliance. All items rate ranges from 1 (never) to 6 (always). Even the items is only 4 items, the instrument show high reliability (r=.70)\(^22\).

**Findings and discussion**

Confirmatory Factor Analysis for Safety Compliance

The results of this research were obtained from 239 production workers from the automotive manufacturing plants in Malaysia. The CFA 1-factor safety compliance reported to be fit as the RMSEA was < 0.08 (0.07), CFI (0.97) and GFI (0.95) reported to be > 0.90. The results of CFA of 1-factor safety compliance are presented in Table 1.

The Differences of Safety Compliance between Inexperience and Experience Workers

An independent *t*-test was conducted to compare the differences of workers safety compliance between inexperienced and experienced workers. The findings of the analyses presented in Table 3. The findings reported that no significant differences between inexperienced and experienced workers in predicting safety compliance (*t*=1.22, *p*=n/s). The result revealed that workers’ differences on work experience were not related to their response to comply with the safety.

Discussion and Conclusion

In every manufacturing and assembly plants, it was a requirement for them to establish safety department that ensures the safety practices in the organization. The safety department functions are to make sure the safety policies able to be outline and practise in the manufacturing and assembly plants. Regarding the safety policies, workers had been guided with safety regulation and procedure in completing their work task. With the execution of safety policies, it becomes mandatory for workers to comply with the safety regulation and procedure that lead to workers enhancement of safety compliance. It is because if workers failed to follow the safety regulation and procedure, they have to face punishment or disciplinary action. Hence, the implementation of this enforcement encourages workers to comply with the safety rules and regulation despite their differences in experience.

For production workers, when they have been given the necessary resource to comply with their task for instance safety equipment, skill, knowledge and support, they able to behave accordingly for performance increment. Above discussion had shown on how the enacted safety policies as a set of obligation and the failure for them to obey it leads to punishment or demerit. To avoid punishment or being demerit the production workers despite years of work experience they have tended to behave safety accordance with the safety regulations and procedures. In other words, regardless of their working experiences, workers required to effectively complete their task according safety policies. Hence, it explained why there are no differences between experienced and inexperienced workers in predicting workers safety compliance.

As conclusion, the result provides current trend that working experience of workers is not significant to influence safety compliance. From a practical perspective, the findings from this study was beneficial for an organization when developing and implementing safety program by focusing to all workers regardless of their working experience and accumulated knowledge on safety issues. Indeed, all workers need to be provided with safety encouragement and information. Meanwhile, the safety policies, procedure and practices need to be implemented thorough with any violation suggested for disciplinary act.

Abstract

The major purpose of the study was conducted to find out relationship among self-concept, vocational preference and educational needs of married women in women centre for continuing education Sokoto on senior secondary school married students. The study used a descriptive research of the correlational type design, with a population of 270 senior secondary school married students, the whole population was used as sample and purposive sampling was employed as sampling technique. The instruments used in this study were: Adopted (A) Akinboye’s Adolescent Personal Data Inventory Subscale-A (APDI) for measuring self-concept and (B) researcher designed questionnaire named Questionnaire for Vocational preference and educational needs (QVPEN) which was used in measuring vocational preference and Educational needs respectively. Four hypotheses were formulated, hypotheses 1-3 was analysed using Pearson product moment correlation coefficient, while hypothesis 4 was analysed using multiple regression. The major findings of this study are: there is significant relationship between self-concept and vocational preference, there is significant relationship between self-concept and educational needs, there is also significant relationship between vocational preference and educational needs and self-concept is more related to educational needs than vocational preference of married women in women centre for continuing Education. Recommendation were made as efforts to enhanced married women vocational preference through workshops their educational needs can be improved by provision of adequate qualified Teachers, enhancement of their self -concept through teacher’s efforts and school counsellors.

Keywords: Self-concept, Vocational Preference, Educational Needs, Married Women, Centre for Continuing Education

Introduction

Societies are integrally linked; the relations, roles, attitudes and practices are clearly differentiated in terms of societal values. Education is a key factor in overcoming the difficulties that women face and a basic tool for empowering and bring them into the mainstream. Nigeria society for development education does not only provides knowledge and skills to improve health and livelihood. Education gives women status, virtue and confidence in decision making. And reduce poverty. The need for women education is emphasized all over the world this fact is presented by1,2.

One of our greatest needs is to spread education among our women as a matter of fact there is room for the extension of education even among men. The condition of such that any attempt its spread deserves help and encourage from all quarters.
Marriage as a social institution serves a number of social functions. First it serves as a basis for family formation, which in itself serves as a basic for human procreation and child socialization. A married woman working to undergo a course of study may often have to combine these marital obligations specified for her with her study and this may have some serious devastating effect on her study. Women are faced with challenges of education despite the fact that they have many other roles to play in the home as mothers and wives.

Everyone has an image or concept of himself as a Unique person or self, different from every other self. Regard self-concept as a multi-dimensional hierarchical construct that constitutes a person’s perception of his total self (such as physical self, mental and cognitive self, social, moral and psychological self). According to self-concept is important because it shows emphasis on possibilities and excellence, therefore an individual (student) can always put his education to his use for the betterment of the society. It is all these components of self that merge together to form an individual’s global self-concept which is widely viewed as determinants of human behaviour. Some scholars consider self-concept as a mediating variable that hinders or facilitates attainment of other desirable outcomes such as academic achievement, career interest, vocational preference, vocational choice.

Person’s work is probably the most dominant single influence in the course of his life. It affects his family structure, his social and intellectual activities, economic status, personality and happiness. Therefore, person has to be well informed and guided in vocational preference. Blamed the society because it places demands and responsibilities on individuals and also expects students to choose vocation that will yield great financial gain to the students rather than security and satisfaction. This is the reason why students are carried away by fantasy or illusion or the prestige that is attached to jobs such as medicine, accountancy and engineering, which make them to choose careers that does not relate to their personal construct training or that outstrip the available opportunities, thus causing a lot of problems. Vocation is finding a suitable job or occupation for one’s self. It is among the functioned goals of Nigeria educational system. Researcher explain to provide not only man – power but people who could mount the various available jobs.

It is with regards to the dissatisfaction with the level of development of women education in the state that the government has made education free for female. It became clear that illiterate women in the focus communities (Hausa and Fulani) were very keen to become literate and numerate, thus adult literacy was included in the free Girl Education Program (GEP) project design. This is with the view of easing remarks financial problem. This does not seem to be achieving the goal aimed at especially at the secondary and tertiary levels. As a result of this the number of graduate female students in Sokoto State is so low such that, few females in comparison to their male counterpart in the state are found in public or private employment. This serious and unfortunate situation has been attributed to some factors such as culture, misconception of religion, academic background, status of women and parental attitude towards women education. The findings of the research will help women to choose a better career according to the learning facilities available in their schools. It is also hoped to help women to have better self-concept of themselves in their academic life and also marital life.

**Problem Statement**

Academic performance is a reflective outcome of effective learning. This provides information about the academic worth of the learner. This is to say that for women to be able to carry out their social responsibilities they have to be well educated, but unfortunately women in Nigeria and in Sokoto state in particular are surrounded by a number of social problems. are researchers that identified vocational preference not relevant to one’s self-concept could lead to dissatisfaction, unproductivity or even dismissal from job. General life satisfaction depends heavenly upon the ability of a person to get a job that is congenial to his self-concept. This show the compatibility between self-concept and vocational preference. One of the problems of this study is to identify if women relates their self-concept with their vocational preference. The research investigated the relationship between self-concept and educational needs and relationship among educational needs and vocational preference of married women in Sokoto centre for continuing education.

The study focused on the educational needs of married women in Sokoto state. With regards to the issue of environment, women access to education.
and schooling and attitudes of husbands, parents and community was investigated. Federal Government of Nigeria has made efforts to establish education centres for continuing Education for Adults in which women centre for continuing education, Sokoto was inclusive and this was to fill the gap between the literates and illiterates and to make people gain economic empowerment and to create rooms for higher education. Like acquisition of SSCE result enrolment into Polytechnics, Colleges of Education Universities as the case may be.  

Hypotheses  

Methodology  

The Research design of the study was descriptive research of the correlational type. Descriptive research according to involves collection of data through development of questionnaires or another instrument like interviews. The population of the study was 270 senior secondary school, (SSS I, II and III) married students, in which purposive sampling was employed where all the population was used as sample SS1 (85), SSII (70) and SSIII (115).  

Instrumentation  

Adopted Adolescent, Personal Data Inventory Subscale A (APDI). This was adopted and was used to measuring self-concept. The APDI consists of 30 items that basically examine the various ways the child perceives himself. Rating of respondents was done using 2-points Likert scale. The rating ranges from least like me to most like me (from 1 to 5). 4 was taken against any item as most like me and 2 against any item as least like me. The co-efficient alpha was equal to 0.75, and Cronbach’s alpha as .874. The highest score for each respondent is 150 and the least 30. So the scores obtained by a student in this instrument represent the level of his/her Self-concept.  

Researcher design Questionnaire for Vocational Preference and Educational Needs. (QVPEN). It contained forty items, based on 4-likert scale ranging from Strongly Agree (4)- Strongly Disagree (1). Cronbach’s alpha of .76 was reported. The highest score for any respondent in the instrument is 160 (4×40) and the lowest in 40 (1×40). Before completing the scale the respondents responded to demographic questions based on age and class.  

Results and Discussions  

Data collected were analyzed using the Pearson Product-Moment Correlation Coefficient to test hypotheses 1, 2, and 3, while Multiple Regression Analysis was used to test hypothesis 4. To retain or reject hypotheses, an alpha level of, 0.05 was set.  

H01 There is no significant relationship between Vocational Preference and Self Concept of Married Women in Women Centre for Continuing Education.  

Table 1: Relationship between Vocational Preference and Self Concept of Married Women, in Women Centre for Continuing Education.

</tr>
</tbody>
</table>

Table 1 gives the vocational preference (VP) and self-concept (SC) along with their corresponding number of observations P = 0.05 , since P<0.05,(0.001), it is concluded that there is significant relationship between vocational preference and self-concept, hence the hypothesis is rejected).This finding is in accordance with13,14. But this findings contradicts. The extent of the relationship is 47.2%. But there was a statistically significant difference in mean score for self-concept (M=11.93, SD=5.424) and vocational preference (M=9.93, SD=2.911) .  

Ho2: There is no significant relationship between vocational preference and educational needs of married women, in women centre for continuing education Sokoto.
Table 2: Relationship between Vocational Preference and Educational needs of Married Women in Women Centre for Continuing Education

</tr>
</tbody>
</table>

Vocational preference (VP) and educational needs (EN), $P = .05$ level of significance, since $P=.001$ less than 0.05, it is concluded that there is significant relationship between VP and EN, hence Ho2 is rejected. The extent of the relationship is 36.9%. This finding corresponds with 14,23,24. However, there was a statistically significant difference of mean score between VP ($M=9.93, SD=2.911$) and EN ($M=11.0, SD=4.230$).

**Ho3:** There is no significant relationship between self-concept and educational needs of married women, in women centre for continuing education.

Table 3: Relationship between self-concept and educational needs of married women, in women centre for continuing education.

<table>
<thead>
<tr>
<th>Variables</th>
<th>N</th>

<tr>
<td>EN</td>
<td>270</td>
<td>11.05</td>
<td>4.230</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Married women’s self-concept and educational needs are significantly related, $P=0.001$. This indicates that there is significant relationship between SC and EN, hence Ho3 is rejected because P-value is less than 0.05. The degree of relationship is 73.69%. This goes with the findings of 3,23,24, but contradicts 8, which he found out low and negative relationship. Although there was difference in mean score between SC ($M=11.93, SD=2.424$) and EN ($M=11.05, SD=4.230$).

**Ho4** Vocational preference and self-concept are not related to Educational needs.

Table 4: Self-concept, Vocational preference relation to educational needs.

<td>0.878</td>
<td>0.787</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>EN</td>
<td>270</td>
<td>11.05</td>
<td>4.230</td>
<td>0.568</td>
<td>0.183</td>
<td>1.335</td>
<td>0.183</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A constant of linear relationship: $EN = 0.183\ VP + 0.502$ SC
From the table above the squared part correlations shows that vocational preference has 4.5% self-concept accounted for 5.0% and educational needs accounted for 1.8%. Although vocational preference was an explanatory variable of educational needs, analysis of regression coefficients indicated that self-concept, B = .502, t = 16.53, P <0.05 is the significant predictor when they were in the model. Thus, self-concept is more related to educational needs than vocational preference. But both vocational preference and self-concept are significant related to educational needs it corresponded with 14. The extent of the relationship is 78.7%.

Conclusion

The result of this study revealed that there is significant relationship between vocational preference and self-concept. Thus, married women that have higher perception of who they are tend to have better vocational preference that suits their self-concept or personality. Self-concept is related to educational needs meaning that higher perception of self-concept tends to have significant perception of their educational needs. Significant relationship between vocational preference and educational needs existed. Married women mostly use the available knowledge, occupational information and skills for their vocational preference. The finding of also revealed that self-concept is more related to educational needs than vocational preference.

Based on this findings of this recommendations were made as efforts should be made to enhance the vocational preference of married women through workshops, dissemination of occupational information by school counsellor. Married women educational needs can be improved by provision of adequate and qualified teachers, conducive learning environment, adequate teaching and learning materials, acquisition of skills, reduction of domestic chores and positive attitude of parents and husbands towards women education. Self-concept of married women can also be enhanced through teacher’s efforts and school counsellors by explaining that higher and positive perception of, it makes them to be congruent and be motivated towards effective learning and choice of vocation.

Exploring the Middle Phase Principals’ Leadership Journey: Evidence from Malaysian Primary Principals

Lokman Mohd Tahir¹, Mohd Fadzli Ali², Juhazren Junaidi², Narina A.Samah¹

¹Associate Professor, ²Lecturer, School of Education, Universiti Teknologi Malaysia, 81310, Skudai

Abstract

Academics in principalship studies had explored the principals’ pathways into experiences and challenges faced within their authorised appointment at schools. Thus, the purpose of this study was to explore middle phase Malaysian primary principals’ leadership journeys through series of interviews with five primary principals who were purposely selected. Findings revealed that middle phase Malaysian primary principals have encountered several challenges; motivating teachers, solving school’s financial issues and improving their school’s academic performance. They also initiated some efforts such as creating the school’s succession planning and built a good relationship with teachers. In addition, within this middle phase, they also revealed that they have higher level of confidence in leading their schools towards excellence.

Key words: Public schools, middle phase leadership journey, primary principals.

Introduction

Empirically, the school principal is the most indispensable individual who governs the school and achieves school excellence through their leadership qualities [1, 2]. In Malaysia, with the implementation of the new National Educational Blueprint 2013-2025, it will prepare prospective principals for encountering complex and challenging school issues [3]. Thus, training and preparations of principals are emphasised in producing quality leadership [4]. Through continual training, principals are equipped with knowledge and with suitable leadership competencies; indeed, the National Principalship Qualification for Educational Leaders (NPQEL) certification is required for the appointment as a school principal. Through these two major strategies, it is believed that principals’ leadership qualities will be much improved since it is proven that preparatory programs and their experiences have significant factor towards their leadership excellence [5].

In relation, principalship trajectories are defined as the principals’ professional journey through their length of time at different stages starting from preparatory stage until retirement phase [6, 7]. Initially, Earley and Weindling (2004) [8, 21, 22] posit that study of theory of principalship stages has positive implication which can be employed to improve principals’ knowledge, support and preparation for effective principalship [9, 6]. Even though the study of principalships’ career pathways is quite intriguing, there is still much to be explored due to limited relevant literatures and insufficient attention that has been paid to research into principals’ career stages in school leadership [10, 11] especially within the Malaysian principalship context. In this sense, Steyn (2013) [2] emphasised that only recently, more studies started to focus on leadership journeys after realising the importance of trajectories as a mechanism in enhancing the professional training and socialization processes.

Middle phase leadership journeys literature

Since the late 1980s, there have been many studies, conducted predominantly within English schools, which have qualitatively examined the pathways to principalship. Recent studies by Ingate in 2006 [12] discovered that principals who in the middle phase leadership were felt more comfortable in creating a good teamwork with their own teachers and focuses on school improvement and establishing standards to improve the school’s operational system. In Greece, Theodosiou
(2015) [7] found that Cypriot principals tried to establish the reciprocal relationships, collaboration, and personal communication with staff and parents. In addition, they also talked about the school’s vision and the changes affecting teachers’ professional development and parental support, and upgrading the school’s infrastructure and resources. At this middle phase, principals focused on the school’s instructional practices resulting in a higher level of trust, bonding, and reciprocal relationships between teachers and principals as means for school improvement. Lastly, in Malaysia, Wai-Bing and Omar (2014) [13] found that in the middle phase leadership, known as the identity formations stage, the principals tried to establish their identity through establishing interpersonal skills and relationships with their teachers and staff. Thus, principals acted like a motivator and coach in building teachers’ motivations and commitments, and concurrently, building a good relationship with teachers. They also enhanced the instructional leadership practices when they emphasised the importance of teaching and learning as an indicator for school growth and development.

The aim of the study

Despite numerous studies investigating principalship pathways, there is little evidence reported on the investigation of Malaysian primary middle leadership phase. Therefore, the main aim of this study is to explore Malaysian primary principals’ career stages which specifically focus on their middle phase leadership journey. It is hoped through this study, it provides a closer look at the primary principals’ middle phase leadership with related to their preparation programs.

Methodology

Sample and interviewing

In this study, five middle primary principals were chosen through purposive sampling strategy. Data was obtained from their experiences, viewpoints and perceptions on their middle leadership phase. As for data collection purpose, interview was selected as the major approach to obtain data from primary principals who related to their life experiences of principals and through interviews, it also permitted principals to discuss and reveal their own standpoints and experiences. In collecting the data, the ethical considerations were also adhered; the primary principals’ consent and the confidentiality of the interview data [14, 15]. Firstly, the subjects gave their approval by filling in the consent form provided by the researcher before the actual data collection commenced. Secondly, it was the duty of the researcher to protect the real identity of the subjects due to issues that may involve individuals within the administration and implementation of the policy [16].

Since there was lack of clarifications on determining the principalship stages, the interview’s protocol items constructed were based on previous literature on principalship stages. During interview, primary principals were asked on pertinent questions which related to their career stages experiences such as;

Based on your leadership journeys as middle phase principals, could you explain your experience and journey as middle stage primary principals?

Do you feel confident in leading your school within the middle leadership phase?

Data analysis

After the actual data were collected from five primary principals regarding their middle phase leadership, the interview data were analysed structurally accorded to the procedures of thematic analysis. In the first stage, all interview data were transcribed. Next, data were re-read at least twice to comprehend the principals’ feedbacks and comments. Next, the transcribed data were compared with the actual recording data to ensure the accuracy of the data which later lead to data familiarisation phase and the emergence of data coding [17; 18]. Thirdly, each transcription was reviewed and the relevant sentences highlighted to assist in assigning the codes as part of the process called ‘generating initial codes’. The codes that were employed were in the form of a word or short phrase [19; 20]. Further, codes were categorised into small units according to their similarities and differences. Later, data were synthesised into patterns and similarities categorisation.

Findings

Higher level of confidence

In this phase, principals revealed that they were motivated and confidence to lead their schools. Thus, they felt happy in fulfilling the routine tasks of leadership.

After a few years, I have experienced many elements in school management, which has implications [for my]
level of self-confidence in leading my school.

Improving schools’ performance

In describing primary principals’ experiences in the middle stage, Principal R admitted that she had to struggle with the efforts to improve her school’s financial issues, which were in a poor situation when she arrived. Hence, she had to devote most of her time to ‘correct’ her school’s financial procedures.

When I arrived, I [had] to settle the financial issue, which was the initial task to be fulfilled. Even though I considered that as [an] initial challenge, I [had] to ‘study’ the grassroots of the financial issue and most of my time was devoted [to] settling it.

Sustaining the previous principals’ systems and procedures

Even though a majority of principals commented on the improvement process, principals also talked about maintaining the positive achievements and changes made by previous principals. Some principals believed that some significant improvements should be maintained to avoid teachers becoming confused since they were accustomed to the school’s operational system.

There are elements which should be sustained, as introduced by [the] former principal. Any improvement shouldn’t be drastically implemented to [prevent] teachers’ confusion. I also believe that any improvement should also align with the school culture.

Building relationships with teachers

At this stage, most principals also tried to build a good relationship with the teachers to increase their commitment. In the process of ‘winning’ teachers’ commitment’ and encouraging positive relationships, the principals employed a range of strategies, such as having meals with teachers, holding frequent discussions with teachers, and lastly, providing some advice. In this sense, Principal C explained about her continuous advice to instil in teachers professional values:

I continuously advise my teachers on the usage of the official leave which [is] meant only for emergencies cases. I also talked on reasons why they should be at school which [are] related [to] students’ teaching and learning processes which was neglected once they were on leave.

Similarly, Principal E highlighted her approaches to provide significant encouragement for teachers’ motivation with the purpose to change teachers’ negative attitudes to become instead more positive about fulfilling their obligations.

I think it is my duty to change teachers’ attitudes to [become] positive. One approach that I frequently employed was the admiring approach when they produced [good quality] work. It is part of developing their motivation for much [better quality] work in the future. At the same time, I also gain their trust and friendship.

Motivating teachers

From the interviews, two primary principals revealed that they were quite privileged when they encountered lesser challenges as a result of the strict character of the former principal. As a result, they did not experience many problems with teacher discipline, but they had to provide motivation in gaining the teachers’ confidence.

I was fortunate because the previous principal was a very strict person when I entered the school; I faced [a] lack of issues in terms of teachers’ discipline. However, I had to build teachers’ level of confidence and motivations.

Succession planning through talent management

In this stage, principals manage the leadership succession planning, which involved immersing talented teachers through a developmental process, such as teacher leadership and distributed leadership approaches. Through these approaches, senior teachers are trained and supported through empowerment and delegation and are allowed to make decisions within the scope of their responsibilities. Principal C, for instance, described the process of succession planning:

I also emphasised the concept of succession planning to my deputys and senior teachers especially when out of the office. Through this approach, it provides exposure and training to my senior teachers to make decisions. Thus, through empowerment and delegation, I provided them with chances to decide what is best for our school.

Overcoming the school’s problem through networking
In the middle phase, primary principals continued to improve the school’s performance with the support of the local communities through the effective networking approaches in resolving issues with the school’s finances and resources. Similarly, Principal D highlighted her school’s financial issues and problems with the maintenance of facilities which required financial resources and support from the local community, the parent-teachers association (PTA), and non-governmental organisations.

In order to enhance the school’s capacity, we had to find some resources from the local communities. In fact, their management is helping with our students’ programs. Additionally, our PTA also provided their best in ensuring the successful completion of our academic programs. For instance, we just received some allocations for ICT facilities.

**Discussion**

In general, it is concluded that Malaysian primary principals underwent the middle phase leadership journey in which they have to implement some improvement towards school’s academic performance and financial situation. In the middle phase, the recurrent activities among the primary principals were on change management and focusing on the processes of improving the school administration’s operational procedure. Therefore, the improvement phase started with principals’ initiatives to correct all previous weaknesses and mistakes with some changes. Simultaneously, primary principals also tried to solve all the school’s problems.

In the middle stage, they obtained a level of confidence in improving their school’s performance. Besides improving the schools’ management system, primary principals tried to establish positive relationships in the process of adapting themselves to teachers and staff. Further, they also started to introduce some changes within the school context and developed the school’s succession planning as a platform such as teacher leadership and distributed leadership programs for preparing senior teachers and the middle-layer leaders for their future role as school leaders. In addition, they also share their leadership and decision-making responsibilities with senior teachers. Next, primary principals were later preceded with macro-level changes through a series of collaborations with local communities in improving the school’s overall accomplishment, such as networking with the local community, the PTA, and non-governmental organisations. Through positive networking with the local communities, principals attained support for the school’s growth, dealing with school management issues and attaining the allocation funds and resources (Refer Figure 1 below).

![Diagram of the Middle Phase of Primary Principalship](image-url)
Limitations

In this study, the limitations of the research are also acknowledged. Firstly, the exploration typically used semi-structured interviews with five primary principals which are challenging to be generalised. The perceptions and feedbacks reported were typically based on the five primary principals’ views. Therefore, it was hard to generalise the middle leadership journey of the primary principals through only one type of data collection, namely, interviews. In terms of sampling, this study interviewed five primary principals to explore qualitatively the leadership journeys or principals’ middle leadership journeys which strongly limited to their perceptions, experience and standpoints. Secondly, this study was conducted in public primary schools which reflected on the national medium primary schools. To list the patterns and journeys, principals from preschool education centres, private-funded schools whether primary or secondary, and religious-based schools can be studied to identify differentiations in schools’ organisational culture and values and can be compared and tested.

Conclusion

In general, this study has provided an insight into the career progression of Malaysian primary principals, a field which has been little explored by local researchers. Through the findings of the study, the Malaysian educational authorities will be able to record and outline the principals’ professional and leadership journeys in order to provide support in terms of programs and courses to prepare prospective principals with the knowledge, skills and disposition needed to face complex and challenging school issues.

Abstract

This paper provides a content analysis of studies focusing on depression and the perceived social support that have been published in online journals from Science Direct database. A total of 328 articles on depression and the perceived social support were selected from 2014 to 2018. Then, 10 articles were selected and analysed based on the scope and the highlighted category. The main focus is to conduct content analysis based on (i) the people who give and receive social support, (ii) ways of giving social support, (iii) the main finding of the articles. The result shows social support from parents is vital to prevent and treat depression. Parents are expected to increase parenting skill and knowledge in developing children positive self-image and empathy towards others. This helps their children to handle stressful life better and serve social support for those in need. The study also found limited discussion on spiritual support in dealing with stress and depression.

Keywords: depression, social support, content analysis

Introduction

Depression is amongst the menacing psychological problem infecting people globally. There are more than 300 million people suffered from mental health problems including depression with a significant upward trend from 2005 to 2015 which makes it the fourth serious medical illness in the community. Depression symptom can vary from mild to severe depending on individuals. Generally, depression will slowly fade in few days, however some have to live with depressive disorder for weeks, months and years.

Today’s modernization challenges people’s physical and intellectual. Urban development contributes to the increasing rate of social problems, culture, economic issues and psychological syndromes such as illegal substances, mental and marriage problem. These conditions lead to mental stress and depression among community.

Social support is important during major life transitions and stressful situations. There are several types of social support namely perceived, functional and enacted social support. Perceived is the process of interaction in relationships which improves coping, esteem, belonging and competence through actual or perceived exchanges of physical or psychological resources. Functional encompasses emotional, instrumental, and informational support. Enacted refers to the specific supportive behaviours to individuals by their social networks.

Problem Statement

This global issue has put depression as the second leading cause of death between 15 to 29 years-old.
According to the World Health Organization (WHO),
close to 800,000 people die due to suicide every year. In Malaysia, local experts believed more than 2,500 suicidal cases happened every year caused by financial problem, poverty, relationship issues, drug abuse and critical physical illness.

In Malaysia, suicidal attempts and completed cases are rampant regardless races and religions. Many shut themselves off from the world due to stress and depression. According to the national edict, suicide is a serious crime as for Muslim, there is a special verse in Quran states the prohibition of suicide; “And do not kill yourselves [or one another]. Indeed, Allah is to you ever Merciful.” (Surah An-Nisa:29)

Postpartum period depression is another significant public health concern, affecting women, infants and families. Thoughts of suicide and infanticide are symptoms of severe postpartum depression. Moreover, this type of depression has major effects on child development. These infants and children would have sleep problems, temperamental difficulties, aggressive and hyperactive, low self-esteem, anxiety, passive and too dependable which make them vulnerable to depression.

Depression is a serious psychological disease and complex interaction of physiochemical and physical factors that enables changes in individual’s lifestyle. People suffer from depression feel disappointment, sad and lose hope to live and feel happy. However, there are effective treatments available to curb this disease.

Therefore, it is important to care about social support in depression because stress is buffered by social support. The stress-buffering model suggests that social support can be intervene by providing necessary social resources. Social network members play the roles as sources of information regarding appropriate health behaviour, contribute to positive mental health and reduce PTSD among communities affected by violence.

Objectives

This study analyses content of articles on depression and the perceived social support in ScienceDirect database based on following aspects:

- the people who give and receive social support
- ways of giving social support
- the main finding of the articles

Methodology

This research method focuses on content analysis which studies and interprets chapters in books, transcript, interview, discussion, historical document, speech, commercial dialogue, theatre script or any other platforms of communication. In content analysis, significant theme or scope of study will be determined by analysing and reporting the data.

This study cross-examines 328 articles published in ScienceDirect database. The key words used were “social support” and “mental health” from 2014 - 2018. A total 113 articles were selected from this filtered process. Another limitation was made to articles with more than 50 times of key word occurrence. This step is important to ensure only related and relevant articles for comprehensive review. Finally, 10 articles were identified and examined based on 4 elements identified for this research.

Results and Discussion

The content analysis focuses on these 4 aspects which are (i) group of people who give and receive social support, (ii) ways to give social support or types of social support, (iii) issues or area of concern and (vi) the result of the study. The findings show numbers of literature on the correlation between social support and depression. Despite of the advancement of technology such as online social network and working abroad, many are struggling to get through stressful life events.

Most articles focused on women and adolescents. These two groups are more likely to develop depressive symptoms such as getting pregnant and giving birth, having child with special need or disability, being old and vulnerable. They are the central in the household, especially in making decision regarding health, diet and child rearing. Pregnancy, giving birth and rearing children pressure women mentally and emotionally if none social support existed.

Most studies revealed families’ support especially parents is more capable to deal with depression factors. This study signals parents’ responsibility to develop their children social and communication skill. Positive family communication has greater potential to equip their children in making friends and prevent them...
from being lonely that leads to depression. Parents need to enhance good parenting skills to develop empathy and willingness to support each of their children\textsuperscript{15}. Empathy promotes a comfortable environment; emotional comfort and reassurance in the family and society\textsuperscript{12,25}.

This study documents a wide range of social support such as listener, showing care and understanding, spending time together and giving good and comforting advice. These simple habits need to be encouraged since the early ages of life\textsuperscript{1}. Strengthening good self-ethics is the precaution against depression. Individuals with a purpose of life are prone to handle depression well\textsuperscript{9}.

From the analysis, social support on spiritual support is limitedly discussed. Having strong faith in Allah is the main factor for someone to remain positive. Spiritual social support is trained by reminding and reconnecting the individuals with Allah. Prayers and zikr are additional acts to support individuals with depression and other mental illness\textsuperscript{1,18}.

**Conclusion**

This content analysis shows that social support benefits in preventing and curbing depression. Strong family ties are needed cope with stressful life events, especially on adolescents and women. It is suggested that parents play greater roles in developing children positive self-image, empathy, social and communication skills. However, this content analysis discloses inadequate literature of social support in spiritual relationship with God in coping with depression.

Coping Strategies and Challenges among Visual Impaired Students

Rozita Jayus¹, Aqeel Khan²

¹Lecturer, School of Social & Economic Development, University Malaysia Terengganu, 21030 Kuala Terengganu, Terengganu, ²Senior Lecturer, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

The present study explored the coping strategies and challenges among student with visual impairment. In Malaysia, visually impaired people category approximately 8.9% including student at the university level. Government of Malaysia has recognize lifelong learning on this category of disability as one of the focus to be approaches and strategies to fulfill their education needs. Furthermore, student with visual impairment also need to be proactive to set up their coping strategies based on the challenge they faced. Coping strategies elaborated based on The Goodness of Fit Model. Effective coping strategies focused on three aspect of student needs in the university students living with visual impairments in adaptive behaviour on campus, mobility on campus, and reading materials and resources. Moreover, the discussion drive the student to be more excellent in their new coping strategies in the university surrounding.

Keywords: Coping, Visual Impair students.

Introduction

The World Health Organization¹ defined the concepts of impairments, disabilities, and handicaps are interrelated. Impairments are abnormalities in the system or organ functioning, body structure and/or appearance (any loss or abnormality of psychological, physiological or anatomical structure or function). Impairments represent disturbances at the organ level. The functional consequences of impairments are disabilities (any restriction or lack of ability to perform an activity in the manner, or within the range, considered to be normal for a human being).

Malaysia consists of two geographically distinct areas, West Malaysia (Peninsular Malaysia), and East Malaysia (located on the island of Borneo), with a total of 14 states. It is a country with multiple ethnicities comprising Malays (58%), Chinese (24%), Indians (8%), and other indigenous groups (10%). The estimated population of Malaysia in 2018 is 32.4 million as compared to 32.0 million in 2017 with an annual population growth rate of 1.1 per cent. The registered Person with Disabilities (PWD) at the Department of Social Welfare, Malaysia in 2017 were 453,258 persons. PWD in physical category recorded the highest number which was 35.2 per cent, followed by Learning disability category (34.8%) and Visually impaired category (8.9%). Speech category recorded the lowest registration of 0.5 per cent².

Government of Malaysia has recognized the lifelong learning and provision of learning opportunities for people with disabilities. To justify the government’s seriousness, The commitment has been a responsibility of the Ministry of Women, Family and Community Development (MWFC) and they review various approaches and strategies to fulfill the intention of Malaysian Plan of Action for People with Disabilities 2016-2022 that is in line with Government Persons with Disability (PWD) Policy and the 11th Malaysian Plan (RMK11). The Government continued to provide care and support for the disabled people through various
programs such as campaigns from the voluntary organization, offering postgraduate programs in the universities and providing financial support that related with Core Strategic 3 (Goal 5 Incheon Strategy) – Increase PWD Access for Education; Strategy: Increase PWD access to a quality and inclusive education at all stages including lifelong learning towards talented and potential development of human resources.

Ministry of Women, Family and Community Development has stipulated specific categories of vision disabilities and meanings. Blind in both eyes or blind in one eye or limited vision in both eyes or any other permanent visual impairment. Visual disabilities can be divided into:- Low vision means vision that is worse than 6/18 but equal to or better than 3/60 even with the use of visual aids or a visual field that is less than 20 degrees from fixation. Blindness means vision of less than 3/60 or a visual field of less than 10 degrees from fixation. Less than 3/60 means counting Fingers (CF), Hand Movement (HM), Perception of Light (PL) and No-Light Perception (NPL). Other permanent visual disturbances (must be confirmed by an Ophthalmologist)4. Severe visual impairment and blindness, though less common, still impact a significant portion of youth, with approximately 25 per 1,000 youth under 18 years of age being blind or visually impaired5.

According to Convention on the Rights of Persons with Disabilities6 stated that persons with disabilities (including visual impairment) should be guaranteed the right to inclusive education at all levels, regardless of age, without discrimination and on the basis of equal opportunity. In addition, the convention stated that state parties should ensure that adults with disabilities have access to general tertiary education, vocational training, adult education and lifelong learning and persons with disabilities receive the necessary support, within the general education system, to facilitate their effective education.

In the recent global political and economic development as well as in the highly intense competition, education has become one of the effective tools to enhance the capability of human capital to remain sustainable. Vital perspective of human being about the opportunities in higher education, it plays a huge role in individual development and nation building. Today, education is important in developing one’s intellectual and personal quality. This scenario also applies to PWD in Malaysia therefore, as a consequence; they need more education opportunities to upgrade themselves. For persons with disabilities, education is a vital part of their lives and enabled them to read and write, to speak in English language, to find a job and involved in making decisions along with their family members7. In addition, education is important as it able to give one’s a better life, respect from others, realize one’s rights and gain interpersonal skills7. Ministry of Education do provides special education programs at primary and secondary school level for three types of disabilities, namely, hearing, visual and learning disabilities8.

Past research about PWD in Malaysia include prevalence of blindness and low vision9 accessibility of visually impaired passengers10, adult learning for PWD11, the evolution of special education12, special education for children with disabilities13, the right of people with disabilities and social exclusion14, scenario on access and facilities for PWD15, provisions of disabled facilities at public transport stations16. According to previous research17 12 challenges faced by students with visual impairment in the higher education in Malaysia, 1- socializing on campus, 2- mobility on campus, 3- reading materials and resources, 4- acceptance among lecturers and staff at the university, 5- personal difficulties, 6- ICT facilities on campus, 7- computer facilities, 8- financial difficulties, 9- education opportunities for the visually impaired, 10- role of societies or non-governmental organizations, 11- choice of programs available at the university, and 12- daily facilities. Youth with visual impairments experience significant academic and social-emotional concerns. With regard to educational outcomes, untreated visual impairments can lead to lower academic achievement18.

Coping is defined as an individual’s cognitive and behavioural efforts to manage stress. The term coping process refers to what the individual actually thinks and does in a specific encounter and the way in which these efforts change over the course of the stressful encounter19. A review of the literature suggests that the positive coping strategies of proactive coping, hope, and humour share a cognitive-emotional process and result in better adjustment among individuals with disabilities20, 33.

**Theory**

The focus of this review is based on The Goodness
of Fit Model, an alternative approach for evaluating coping emphasizes the process rather than the outcome. The central idea of this approach is goodness of fit, the appropriateness of the coping strategy given the demands and constraints of the situation. Effective coping depends on two fits: the fit between reality and appraisal and the fit between appraisal and coping21. The fit between reality and appraisal refers to the match between what is actually going on in the person-environment transaction and the person’s appraisal of the personal significance of that transaction and his or her options for coping.

**Adaptive behaviour on campus**

Adaptive behaviour is diverse by definition, as it mirrors a person’s efforts to adjust to the various environmental demands he/she is faced with22. Previous study defined that adaptive behaviour is include communication, daily living skills and socialization23. Adaptive behaviour is potentially amenable to behavioural interventions or adjustments in the environment, which could have a positive impact on a person with visual impairment’s life 24.

According to Papadopoulos et al.23 lifetime learning refers to the provision of learning opportunities in the educational institution, each individual can gain appropriate and meaningful personal, social, academic and vocational skills in order to correspond to the demands of the society. Moreover, the instruction of these skills can increase personal effectiveness and independence, self-direction, vocational awareness and self-advocacy. Several studies have shown that key to successful transitions for students with disabilities are a range of key skills, including self-determination, self-advocacy, problem-solving, self-management, use of assistive technology, resilience, understanding of strengths and weaknesses and study skills25.

Socialization in campus might be different from previous secondary education experience. Student with visual impairment need to adjust with their new campus life and peers perceptions26. Based on Brown et al.26, their research finding provides evidence for the need to support interactions between normal student and student with disabilities that encourage each to play a valuable role. Instead, future efforts should focus on increasing the level of mutuality between students when interacting on class tasks and should improve opportunities for meaningful social interactions as well. High self-esteem in individuals with visual impairments is positively linked to the social support27.

**Mobility on Campus**

A challenge for students with visual impairment can be getting independently. An obvious individual adjustment is the provision of mobility support to enable the student to learn necessary routes around the institution. General practice includes restricting the amount of movement that students need to make between lectures (e.g. not scheduling consecutive lectures on opposite sides of the campus). The receipt of mobility support relies on the student engaging with this support, and for them to have existing mobility skills to draw upon. Most of the students needed close support from an adult or peers, and some of them clearly learned best when working alone with the teacher, free from other distractions. However, the teachers all had the ambition that the students should also be engaged in activities together with peers28.

Instead of being able to go between lectures independently, student will reliant upon a sighted guide. Sighted assistance are needed at first, as they learned to navigate their new environment, but over time they were able to learn the necessary routes, illustrating how the amount of support that a visual impairment student will require is progressive17.

In Malaysia, Kadir and Jamaludin29 discover that the visual impaired emphasize on the design of guiding blocks, tactile direction or warning indication to facilities in the building, and signage of the building. According to their findings, notice that policies have been given extra attention to guidelines or design for the wheelchair bound user, while other PWDs like the hearing impaired were neglected.

**Reading Materials and Resources**

Central to the concept of higher education is the aspiration for the student to become an independent learner, facilitated through independent study. For students with visually impaired, this is often problematic due to barriers in obtaining accessible copies of text, beyond the immediate control of the institution. University can promote inclusive practice by providing copies of reading lists in sufficient time for alternative formats to be obtained and subscribing to accessible online journals/e-books. This can advantage all students
as they have more time to access reading material to conduct preparatory reading and have more options for accessing texts.

The use of social media is an everyday occurrence for blind and partially sighted people. It is a very important tool for this user group to help them with tasks such as information seeking and social interaction for leisure and work purposes and to feel connected with society. However, barriers to full accessibility to online content can also result in negative feelings for visually impaired users, such as frustration, time wasting and uncertainty over content which may have been missed.

The previous study, the data highlighted that blind and visually impaired students suffer from information overload more than their peers and this must be borne in mind when designing assessment tasks and delivering them. Students with vision impairments are using digital tools innovatively and creatively to cope with the challenges of their transition experience. Transition 2.0 represents a significant shift from the way transition to university has conventionally been seen by scholars and it refers to a generation of young students with vision impairments which has grown up using digital technologies as part of their daily lives.

**Conclusion**

To conclude, by exploring on coping strategies by the university student with visual impairment based on The Goodness of Fit Model, and focused in adaptive behaviour on campus, mobility on campus, and reading materials and resources, the institutional level and the higher education system can support the basic needs of this minority student in the university community.

Obesity and Prolactin in Various Populations

Jaiprakash M1,2, Urban J.A. D’Souza2, Heethal J3, Alison Fong Siat2
1Faculty of Medicine, MAHSA, Selangor, Malaysia, 2Faculty of Medicine & Health Sciences, Universiti Malaysia Sabah, Sabah, Malaysia, 3School of Medicine, IMU, Kuala Lumpur, Malaysia

Abstract

Association of Obesity with altered levels of serum prolactin (PRL), a marker of stress is well documented. The objective of this systematic review and meta-analysis was to estimate the association between obesity and PRL according to sex, ethnicity and age. PubMed, Web of Science (WoS) & EBSCO database were searched from the 5th to 20th of October 2018. Two reviewers independently extracted data from 12 cross-sectional studies that used body mass index (BMI), waist circumference (WC) or waist-to-hip ratio (WHR) as measures of obesity and aggregated using the random-effect model. The correlation (r) for BMI and PRL was -0.231; 95% confidence interval (CI) = -0.392 to -0.055) in adults and (r = -0.500; 95% CI = -0.622 to -0.354) in children. In adults, r for BMI and PRL was greater in women than men by -0.127 (95% CI = -0.178 to -0.05) and greater in European populations r=0.156 (95% CI = -0132 to -0.079) than Middle Eastern populations r = -0.655(95% CI = -0.880 to 0.191). Obesity is associated with decreased levels of PRL, and the association is greater among women and Europeans. The emergence of difference between different genders was observed only in adulthood.

Keywords: Prolactin, meta-analysis, obesity, sex differences, systematic review.

Introduction

Adipose tissue dysfunction is a hallmark of obesity-induced metabolic disorders. It is a feature of type 2 diabetes and accelerated cardiovascular disease1, which is a leading cause of mortality and morbidity in developed and developing countries. A 2004 population-based cross-sectional study conducted in all Malaysian states found an overall prevalence of obesity of 12.3%, which was 280% higher than that in 1996.4 Many well-accepted theories associate the pathophysiological mechanisms observed in obesity predisposing to cardiovascular accidents.5 These metabolic syndromes are associated with reduced levels of serum prolactin (PRL) in humans and rodents, raising the question of whether low PRL levels contribute to metabolic dysfunction.1

In many species, prolactin is of biological importance and plays a major role in determining the deposition and mobilisation of fat. In human physiology, except for pregnancy, prolactin secretion is altered by increasing body weight in both children and adults. Prolactin appears to be a marker of hypothalamic-pituitary function; the prolactin response to insulin-hypoglycemia, thyrotropin-releasing hormone stimulation and other stimulatory factors may be diminished. Further, obesity alters the 24 h spontaneous release of prolactin. The association of obesity with prolactin is primarily due to the broad distribution of prolactin receptors correlating to its concurrent functions. Due to its presence on adipocytes, the prolactin receptor (PRLR) is an important effector modulating adipocyte fate and differentiation with impact on energy homeostasis, and adaptive thermogenesis.6 Studies show the association between adiposity and sex hormone also showing synergy between obesity in their association with various hormone levels such as estrone, estradiol and prolactin.7

Several cross-sectional studies narrative reviews have linked prolactin with obesity.8 Studies were done in populations of different sex, ethnicity and age have reported varying degrees of association between obesity and prolactin. To date no systematic review or meta-
analysis has been done, gathering the evidence to assess such associations according to population characteristics. In this systematic review and meta-analysis, the study aims to investigate the associations between obesity and prolactin in general adult and child populations as well as sub-populations of males, females, and Asians.

Method

Data sources and searches

The data source search was conducted between 5th to 20th October 2018. Standard search engines and websites such as PubMed, WoS & EBSCO for cross-sectional studies of obesity and prolactin were used. The text words and MeSH terms ‘Prolactin’, ‘body mass index’, ‘BMI’, ‘waist circumference’, ‘WC’, ‘waist-hip ratio’, ‘WHR’, ‘overweight’ and ‘obesity’ were used. We also conducted searches on ProQuest and Google Scholar to retrieve grey literature. Only studies written in English published between the year 1966 to 2018 were included in this review.

Data extraction and quality assessment

The extracted data set was subjected to assessment by two independent assessors. Articles that were not agreeable by both the reviewers was resolved by consensus by the third reviewer. Reviewers extracted information on author names, year of publication, study design, study setting, as well as in male and female participants. The characteristics of the participants from the extracted studies included sex, age, ethnicity, mean BMI, WC, WHR, prolactin, obesity prevalence and prevalence of altered prolactin. Spearman or Pearson correlation coefficients were also extracted as the outcome data. Sex-specific data were collected wherever available. Strengthening the Reporting of Observational Studies in Epidemiology (STROBE), a checklist for cross-sectional studies was used to reduce the risk of bias of individual studies. Studies that failed to meet any of the checklist items were excluded from analysis, as shown in the flow chart.

Data synthesis and analysis

Eligible studies were grouped based on their effect measures that included, age group (children or adults), sex (male or female), ethnicity (European, Middle Eastern, African & North American) and a measure of obesity (BMI, WC or WHR). Separate reviews were conducted for these selected studies.

The results synthesised included studies using random-effects meta-analyses, and we have reported the results in the form of correlation coefficients with corresponding 95% confidence intervals (CIs). Meta-regression models of correlation coefficients evaluated the association between each of the criterions accounted for BMI, WC and WHR with PRL by including sex (male or female) and ethnicity (European, Middle Eastern, African & North American) of study subjects as categorical moderators.

The effect measures are reported here as part of our systematic review. All statistical analyses were conducted using Comprehensive Meta-Analysis Version 3.
Results

Search results and study inclusion

In our preliminary literature search a total of 1,962 potentially relevant abstracts and full texts were identified. From the extracted articles, we used the inclusion and exclusion criteria to identify and extract 53 full-length papers that the reviewer found to be most relevant. These 53 articles were then assessed for eligibility. Out of the 53 studies, using the STROBE index, we included a total of 12 studies in our review. The 44 studies excluded were rejected for reasons mentioned in the flow chart. Search using Google Scholar and ProQuest for any grey literature showed no article that relevant or eligible to our study.

We gathered studies from 1981, and these studies had sample sizes ranging from 11 to 1121. Among these studies, 9 studies provided an effect measure that was sex-specific which included 1087 males and 1780 females, 7 studies covered around 25774 North American/Europeans (German, American, Italian, Australian, Polish and Swiss), 3 studies observed 193 African & Middle Eastern people (Egyptian, Nigerian & Turkish) and one study focused on 122 children.

Immunoassay test was commonly used in all the studies to estimate serum prolactin. One study used immune-fluorometry, two used immune-radiometry, one used enzyme-linked immunosorbent assay; two used chemiluminescence immunoassay and 4 used immune-assay.

Obesity and Prolactin

Irrespective of age, ethnicity or gender of the participant the studies used in this review showed the measure of obesity to be associated with PRL. The overall random-effects summary correlation between

Flow chart showing protocol for study selection including justification for exclusion. Body-mass index (BMI); Prolactin (PRL); waist circumference (WC); waist-hip ratio (WHR). Low quality studies defined as failing to meet the following STROBE criteria; data source/measurements (n=1) objectives (n=0) statistical methods (n=0), participants (n=0), main results (n=0), limitations (n=0)
obesity and PRL was strong \( r = -0.231; 95\% \text{ CI} = -0.393 \) to \(-0.055\). In adults, the random-effects summary correlation coefficient between BMI and PRL was strong \( [r] = -0.177; 95\% \text{ CI} = -0.265 \) to \(-0.086\). The random-effects summary correlations between PRL with WC \( (r = 0.40; 95\% \text{ CI} = 0.31 \) to \(0.48\) and WHR \( (r = -0.499; 95\% \text{ CI} = -0.728 \) to \(-0.169\) in adults were strong. Studies in children also showed strong associations between both BMI with PRL reported in a study in Italian children\(^9\). The random-effects summary correlation between BMI and PRL in children was strong \( (r = -0.500; 95\% \text{ CI} = -0.622 \) to \(-0.354\).

**Gender**

We assessed the potential impact of sex in the association between obesity and PRL in adults using meta-regression, subgroup analysis and qualitative review of data. Using sex moderators, the results from meta-regression models showed that the correlation was stronger in women than men. The average difference in the correlation coefficients between BMI & PRL in men and women were \(-0.127\) \(95\% \text{ CI} = -0.178 \) to \(-0.079\). This was found to be significantly higher in women than men as shown in many of the studies.\(^10\)

**Ethnicity**

Studying the association between obesity and PRL using meta-regression and qualitative review of data showed a difference between various ethnic populations that included European, Middle Eastern, African & North American populations regardless of sex. In meta-regression models that include sex and ethnicity moderators, the correlations between BMI, WC and WHR with ln (PRL) were significantly greater in European and Middle Eastern population by \(-0.121\) \((-0.170 \) to \(-0.071\) \) & \(-0.655\) \((-0.880 \) to \(-0.191\) \) when compared to the other ethnic groups. Due to the insufficient number of studies in African & American groups, it was not possible to compare the ethnic differences through subgroup analyses.

**Discussion**

Our study shows an inverse association of obesity with PRL level in most of the observed population. Meta-regression, subgroup analyses and a qualitative review of data revealed stronger associations between obesity and PRL in women when compared with men, especially within the European population. The conduct of subgroup analysis indicates a correlation between PRL and BMI in children of both the genders, especially in Italy. Substantial studies have established the pathobiology linking obesity to PRL.\(^6\) It is well established that a variety of hormones and cytokines are released from adipose tissue contributing to the secretion of PRL.\(^1\)

The main factor contributing to excessive weight gain in children is the impaired balance between energy intake and expenditure.\(^11\) PRL is produced by the pituitary gland and by other tissues including adipose tissue where it acts as a cytokine.\(^12\) Peripherally, it is regulated by insulin and is affected by obesity in a depot-specific manner.\(^13\) PRL was shown to influence two of the most important adipokines - adiponectin and leptin. PRL was described to inhibit adiponectin serum concentration in both humans and mice.\(^14\) This effect match those described on lipogenesis because adiponectin can activate AMP kinase which in turn inhibits acetyl CoA carboxylase (ACC) and thus inhibits lipogenesis.

In our study, a greater scale of association between obesity and PRL in women compared with men has been observed. However, the pathophysiological mechanisms behind the sex difference, within the context of obesity, remain unclear. One of the probable reasons could be because of the effect of circulating oestrogens.\(^8\) The evidence suggests that the hypothalamic alteration, which may occur in those with a propensity for obesity, not only involves the control of pituitary but also affects the control of the sympathetic nervous system through prolactin.\(^15\)

**Ethnicity**

Our literature search yielded studies investigating the relationship between prolactin and obesity mainly in the European population. There were few studies from the Middle-eastern population and even fewer from the North American & African population and none reported among the Asian population. Most of the studies conducted were among the European population that evaluated the association between BMI and PRL, and further suggest a stronger correlation in women when compared to men. On the contrary, most of the studies investigating the Middle-eastern population used either WHR or WC and PRL. The important role of lifestyle in modifying the association with obesity has been well chronicled in many studies. PRL levels have been
associated with diets high in glycemic loads. There is already evidence that the European diet plays a major role in the development of atherosclerosis.

**Age**

The main factor contributing to excessive weight gain in children is the impaired balance between energy intake and expenditure. Our results from the meta-analysis conducted show that in obese adolescents and children, just as in the obese adults, there is a hypothalamopituitary disorder which affects prolactin release. Both in normal and obese children, it was found that there are no differences between males and females of the same age and the same pubertal stage that existed. A larger study population is recommended to reduce this bias further and make the results more reliable.

**Limitations**

Firstly, we were not able to draw casual inference on the association between obesity and PRL as the studies included a cross-sectional design that limits this effort. There is a lack of prospective studies estimating the link between weight gains longitudinally and PRL. Secondly, due to the limitation in the evidence of literature accounting for the differences in BMI, WC and WHR between European and Middle-Eastern, African & North American populations there might be a bias observed in our comparisons made based on ethnicity. Thirdly, anthropometric measures of obesity have a limited diagnostic capacity for body fatness in both adults and children and may result in the misclassification of patients with altered PRL levels. Finally, measures of publication bias could not be reasonably estimated due to the limited amount of studies in each subgroup analyses. Publication bias is an inherent limitation to virtually all meta-analyses.

**Conclusion**

Obesity is inversely associated with the levels of PRL. This association is stronger in women than in men especially in the European population when compared with the Middle-Easterners. The implementation of sex-specific PRL cut-offs might be considered for improving cardiovascular disease (CVD) risk assessment conducted in European populations. It is further recommended for the current CVD risk prediction models considering the incorporation of PRL to provide risk assessment methods that account for the sex-specific associations between measures of obesity and PRL. Also, the association between obesity and PRL was not found to be different between male and female children. Currently, the pathophysiology leading to sex and ethnicity differences in the association between obesity and PRL in adults are not well understood. The absence of such sex differences in childhood and its emergence in adulthood could indicate a role associated with the hypothalamopituitary axis.

Abstract

Children who have a good level of emotional intelligence will be able to manage their lives in a more orderly and harmonious. Good emotional control is a very important aspect in the well-being of individuals. This study aims to identify the reliability of emotional intelligence module (EQ) in building positive emotion in preschool children. The samples involved a total of 100 preschool children aged four to six years in Terengganu, Malaysia. The analysis used was Rasch Model analysis to see the reliability level of Emotional Intelligence Module (KE) in building positive emotions of children. The findings show that the module is used to record a good level of reliability which is the reliability of the (person) is 0.74 and reliability of the item is 0.89. This shows the selection of the sample is appropriate and in keeping with the characteristics of the research objectives. While the items that have been built are valid and appropriate to the level of ability and understanding of the study sample.

Keywords: Module Emotional Intelligent for Children, Malaysian children, rasch model.

Introduction

Socioemotional support at preschool plays an important role in building emotional intelligence among children to achieve excellent achievement at this time and in the future⁵. Referring to a study conducted ⁶ showed that individuals who are successful in life whether in daily life or even career only use 20 percent of the intelligence intellect than 80 percent of emotional intelligence.

A failure in academics and behavior which is incompatible with the norms of society is caused by a deficiency of one field of interpersonal intelligence⁹,¹⁷. Researcher¹⁸ says that one of the key skills that must be learned by a child during its development is to establish effective communication skills with others. Elements of interpersonal and communication skills are some of the sub-elements contained in the constructs of EQ¹⁰,¹³.

Recognizing the importance of emotional intelligence since early childhood, the researchers decided to test the extent of the reliability level of emotional intelligence module (EQ) existing in building positive emotion in preschool children. This module can also be used as a reference to facilitate the smooth process of teaching and learning in the classroom.

Problem Statement

This study touches on issues arising out of the implementation of teaching and learning at the core socioemotional preschool children in Malaysia. Some issues have been identified that lead teaching and learning process rooted socioemotional difficult to run. Based on studies conducted¹¹ showed that the preschoolers were found to be weak in the one of the elements in socioemotional sphere which is the element of achieving emotional intelligence.
In addition, the results of interviews conducted with the teachers in preschool shows that emotional intelligence elements and other elements in the cord socioemotional only made the subject side only. The lack of teaching aids and teaching and learning modules which specializes in spinal socioemotional also cause difficulties for teachers to implement teaching and learning. Difficulty teachers to carry out teaching and learning, this is because there are no guidelines that provide disclosures in a planned and systematic way that is based on the syllabus.

Recognizing this problem, the researchers decided to use emotional intelligence module (EQ) which was ready for use in research on preschool children aged four to six years in Terengganu, Malaysia. Researchers use this module to examine to what extent the reliability level of emotional intelligence module (EQ) in building positive emotion in preschool children in Terengganu.

**Method**

This study is done to look the reliability emotional intelligence module (EQ) in building positive emotion in preschool children. The emotional intelligence module (EQ) in building positive emotions of these children will be given to two preschool teachers in two different preschools for them to use the whole activity available in the module with the researchers monitored. Implementation or use of the module in a preschool run for two months. After the expiration of the implementation of the module, the researchers will get the children EQ data using Sullivan Emotional Intelligence Scale for Children that have been adapted to suit the scope of Malaysian children. After that, the results that were obtained are analyzed using the Rasch model to see the reliability and usability of emotional intelligence module (EQ) in building positive emotions of children in Terengganu.

**MODULE EMOTIONAL INTELLIGENCE FOR CHILDREN: BUILDING POSITIVE EMOTIONS OF MALAYSIAN CHILDREN**

Through this module, children will be applied to the four elements of emotional intelligence to be mastered by them to achieve positive emotions. Four of these elements is to build self-concept, build momentum and a positive attitude, build confidence to communicate and build self-control abilities.

Children who are able to build self-concept can be positive about the strengths and weaknesses of self. They can express ways to overcome their own weaknesses with teacher guidance. In addition, children who are working to build momentum and a positive attitude will have a good degree of patience, self-reliant, confidence to do something, can foster an attitude of love and mutual help. Next, the children were able to build the confidence to communicate can speak and ask with confidence. They can also interact with confidence, telling stories and giving opinions. Children who are able to develop the ability to control themselves will know how to control his emotions in an unpleasant situation.

Accordingly, the modules that cover all of these elements will be used by researchers to serve as a mechanism to help raise another child’s emotional intelligence. Children need the help of adults or their friends who are more capable to guide and express things learned easily. This method is based on the theory of the Zone of Proximal Development (ZPD) to support it. According to researcher, children who have learning difficulties can be resolved when getting help from an adult or collaboration with his friend.

Thus, the role of adults is essential to help children express what they learn. With the aid of teaching and learning modules that build emotional intelligence available, expected a bit much to help teachers carry out their task of teaching emotional element at the preschool children. The implementation of this module is carried out in stages. The module has ten events that represent sub-elements build emotional intelligence. Table 1
shows the theme, sub-elements and related activities carried out.

Reliability of Module Emotional Intelligence for Children: Building Positive Emotions of Malaysian Children

The reliability of the module has been tested using the Rasch model analysis that aims to see whether the module is built it has enough capacity to help build preschool children emotional intelligence. Rasch analysis results show the characteristics of a good reliability of 7.73 logit of a range of items and also for the range of 10:49 logit. It shows the measuring stick is long and impressive, namely by 3.19 logit. Hint PCA which is 56.2 percent above the 40 percent minimum extent necessary in Rasch analysis. This proves that built module capable of become a mechanism to assist the development of emotional intelligence of preschool children.

Measuring Instruments

The instrument used in this research using emotional intelligence module (EQ) in building positive emotions of preschool children. To identify the level of preschool children emotional intelligence, researchers will use the Sullivan Emotional Intelligence Scale for Children (EISC), which has been adapted in the context of preschool children in Malaysia. The EISC Measurement include the ability to identify emotions (identifying emotion), the ability to understand emotions (emotion understanding), the ability to control emotions (controlling emotion) and the ability to use emotions (using emotion)

EISC provides a subset of test measurements through facial expression, storytelling, understand and regulate emotions. There is a 20-item test to identify the level of emotions through facial expressions (face expressions) and eight items tested through narrative (storytelling). Both subset of the domain is under examination to know identify emotions. Domain for know to understand the emotion had 12 and next nine item contained in the domain know emotions. There is another section under emotion had 12 and next nine item contained in the domain know emotions. There is a 20-item test to identify the level of emotional intelligence. The last section is empathy domain know emotions. There is another section under emotion had 12 and next nine item contained in the domain know emotions.

Researchers have changed some of the items that are appropriate to the tendency of concentration of children in Malaysia. In addition, every facial expression under the domain identify emotions also changed out and replaced with facial expressions that resemble those

Social Support as Mediating Effect of Psychological Well-Being amongst Emerging Adolescents

Koh Yuan Hao¹, Aqeel Khan², Tan Joo Siang²
¹Master Student, ²Senior Lecturer, School of Education, Universiti Teknologi Malaysia, Malaysia

Abstract

Current study investigates mediation model design through a quantitative survey. Paper-pencil questionnaires were administered to 100 emerging adolescents who were purposely selected, aged around 12 to 14 years old from Johor, Malaysia. Findings indicated that parental involvement, psychological well-being and social support have significant positive correlations. Mediation model analysis based on SPSS Macro Process by Hayes was executed for examining whether social support had any significant mediating effect on parental involvement and psychological well-being. The outcome of the analysis showed that social support was a significant mediator between parental involvement and psychological well-being. Parents involvement for emerging adolescents was also shown to be important for the psychological well-being among emerging adolescents.

Keywords: Social Support, Psychological Well-Being, Emerging Adolescents Development

Introduction

Bronfenbrenner’s ecological theory of development stressed the importance of parental and community involvement, and the social environment in promoting adolescents’ behavioural and psychological growth¹. Since the living context of emerging adolescents is claimed to have a proximal effect on their overall development, the perception of the environment as a supportive resource will have an effect on their psychological well-being.

Parental involvement in adolescence was found to have an impact on emerging adolescents, especially those facing hormonal changes and difficulty in social adjustment. Therefore, parental guidance, support, and companionship is significantly important at this stage to fulfil their need for love and sense of belonging as stressed by Maslow’s ᵃ²Hierarchy of Needs Theory.

Researchers have suggested that there is a direct linear relationship between secure parental attachment and their psychological well-being³–⁸. However, the research was based on the respondents’ subjective experiences within a specific cultural context, and do not sufficiently measure actual parental involvement and its association with the individual’s psychological well-being. Thus, our research sets out to examine the direct relationship between perceived parental involvement and the psychological well-being of emerging adolescents, as well as how social support mediates between the two.

In a longitudinal study by Ramamurthy⁸, adolescents aged between 12 to 18 who enjoyed positive moments with their parents were found to feel more contented and supported when facing psychological distress. They also reported experiencing a healthier adulthood²³. Thus, current research examined the level of social support, parental involvement, and psychological well-being among emerging adolescents and the relationships between these variables.

Method

The targeted population in this study are emerging adolescents aged 12 to 14 years’ old who live with grandparents or parents, in the Pontian district of Malaysia. Parents of these emerging adolescents often arranged a lot of tuition classes for their children to ensure that they would not be left out in the new learning
environment. These emerging adolescents spend most of their time at tuition centres or the school, and were not able to enjoy quality bonding sessions with their parents. A total of 100 respondents from three tuition centres in Pontian were recruited for this study.

A revised perceived parental involvement instrument established by with high internal consistency (Cronbach alpha .76 to .83) and a test retest reliability (ranged between .87 and .68.) was used in this study. The social provisions scale developed by in 1987 to examine the degree of respondents’ social relationship in their life was adopted in the current research for assessing PSS (Cutrona & Russell, 1987). This scale consists of 6 social support dimensions (Attachment, Social Integration, Reassurance of Worth, Reliable Alliance, Guidance and Opportunity for Nurturance) with a total of 24 items. Internal consistency of the scale reported with Cronbach’s alpha ranged from .60 to .70. The Cronbach’s alpha from the sample of the current study was .84. Ryff’s Psychological Well-being Scale was adopted in this research, which was developed by Carol Ryff in 1989 based on the six factors model of psychological well-being theory for assessing the positive functioning among . This PWB scale had been continuously revised into various versions which are available in 84, 54, 42 and 18-item format since 1996 and had been published in more than 500 . Researcher had adopted the 42-item PWB which consists of 6 psychological well-being dimensions namely autonomy, environmental mastery, personal growth, positive relation, purpose in life, and self-acceptance to identify the well-being of emerging adolescents. Internal consistency of the scale reported with alpha ranged from .60 to .70. The PWB was rated on a 6-point Likert-type interval scale ranging from 1 (strongly disagree) to 6 (strongly agree). The Cronbach’s alpha from the sample of current study was .91.

Data were analysed by mean, pearson’s correlation and a mediation analysis model by using SPSS MACRO PROCESS v 3.3 by Andrew F. Hayes. The analysis was used to investigate the significance of perceived social support as a mediator between perceived parental involvement and the psychological well-being of emerging adolescents.

*p < .05, **p < .01

There was a significant positive relationship between perceived parental involvement and psychological well-being. A higher level of perceived parental involvement translates into greater psychological well-being of emerging adolescents. However, the effect of perceived parental involvement was not as significant to the psychological well-being of the respondents, when there is presence of perceived social support. This shows that social support has a mediating effect between the two.
Moradabbasi mentioned that there might not be a direct relationship between parental attachment and the psychological well-being of emerging adolescents, as self-esteem and internal security serves as protective factors. Other than parental attachment, the development of an individual’s self-esteem and internal sense of security can be attributed to other factors, such as the perceived level of social support an individual receives. Therefore, researchers hypothesized that there is a significant mediating effect of perceived social support \((M)\) on the relationship between perceived parental involvement \((X)\) and psychological well-being \((Y)\) of emerging adolescents. Based on the output of SPSS MACRO PROCESS version 3.3. statistical analysis for mediation model, the lower level Confidence intervals (LLCI) and upper level Confidence intervals (ULCI) is more than zero. This further establishes the hypothesis that the effect of perceived parental involvement on the psychological well-being of the respondents were mitigated with the presence of perceived social support as mediator.

The mediating effect of perceived social support \((M)\) on the relationship between perceived parental involvement \((X)\) and psychological well-being \((Y)\) was supported by Roth, Suldo and Ferron. They suggested that parental involvement was important in developing strength of character at the age of identity formation as well as boosting the adolescents’ self-esteem. Whether emerging adolescents can develop a healthy social network and hence experience greater psychological well-being in their lives are often determined by being aware of their strengths and having a sense of purpose in life.

Furthermore, Tomyn added that as long as youths have good parental or social support, they can maintain optimal psychological well-being compared to those who shared the same negative experiences without the warmth and support of parental involvement in their life. Findings found that disabled youths tend to enjoy their learning and rehabilitation process when they were accompanied by their parents compared to those without their parents’ presence.

However, Toikko and Rantanen alerted that studies of psychological well-being among emerging adolescents in relation to perceived parental involvement and perceived social support has to be examined against other socio-environmental factors and cultural values. These values include level of independence and the ability to strive for happiness, which are not determined by the level of parental involvement and social supports. Emerging adolescents who live in a community with low public welfare and safety would have lower psychological well-being. For example, those living in countries strife in war might often experience starvation, anxiety and panic.

Parents who are actively involved in their children’s life and have a good relationship with their children can help them to deal with the psychological distress in their transit into adolescence. Overcoming these psychological distress will help them develop their resilience towards greater challenges they might face in future.

**Conclusion**

Living in a competitive and stressful era with the advancement of technology can be stressful. Hence, psychological well-being of vulnerable groups including emerging adolescents are at risk given that they are in an ambivalent stage in searching for their identity. In order to encourage healthy psychological and socioemotional development in emerging adolescents, parents’ involvement and adequate social support are necessary.

Investigating Value Co-creation Behaviour among International Postgraduate Students in Malaysia’s HEI’s

Shamima Raihan Manzoor¹, Chinnasamy Malarvizhi², Junainah Binti Mohd Mahdee³
¹PhD Student, ²Senior Lecturer, ³Lecturer, Faculty of Management, Multimedia University Malaysia

Abstract

This study investigates the impact of gender, scholarship status, marital status and country of origin among the various factors of value co-creation behaviour – namely, participation behavior and citizenship behavior of the international postgraduate students towards Higher Education Institutions (HEI’s) in Malaysia. Drawing upon a sample of 110 international postgraduate students, the independent sample t-test results suggest that there are differences in case of information seeking and responsible behavior between the international postgraduate male and female students towards their respective universities. However, the outcomes show no differences in value co-creation factors in the case of scholarship status and marital status among these students studying in Malaysia’s HEI’s. The one way ANOVA result reveals an interesting insight that the extent of showing tolerance varies among the students from various countries towards their respective universities. The findings have implications for universities seeking to compete in a complex market-driven higher education setting.

Keywords: Value co-creation behavior; International postgraduate students; Higher education marketing

Introduction

Education is a service industry which presents a particular set of challenges for practitioners¹, and in the service industry, the main focus is on the students-cum-customers. Therefore, several service-providing companies/institutions show the relevance of active participation of their customers for the development of resonating value propositions supporting competitive advantages in the market. Central to such customer participation are co-creation behaviours that facilitate beneficial relationships among market actors.

The growth of higher education in Malaysia can be seen in several areas: increase in students’ enrolment, increase in the number of higher education institution (HEIs), increase in government spending, additional government policies in promoting education and the country’s continuous need for human resources².

Internationalisation of higher education in Malaysia is a rising phenomenon of the recent decades. It is recorded that 18,242 international students studied in Malaysia in 2001⁴ and in 10 years, it grew to 86,919, which was equivalent to a 16% growth per annum. The country has articulated goals of becoming “the world’s sixth-biggest education-exporting country by 2020 with a target of 2,00,000 international students studying in Malaysia’s HEIs”³,⁵. As of 2014, this goal is deviating from the target⁶ primarily due to declines in the three largest current sources of international students (Nigeria, Yemen and Iran) which provide “nearly half the foreign students in Malaysia”⁷.

Both public and private HEIs in Malaysia have to take more responsibilities for the overall products and services offered to customers. Therefore, HEIs in Malaysia are required to adopt relationship marketing aspects such as value co-creation behaviour as a form of business strategies for strategic activities in their operations and thus to create competitive advantage. The increased interest of the company/institution managements to encourage customer co-creation behaviours has attracted scholarly attention and resulted in preliminary research. Recently, Yi and Gong⁷ established the
significance of “value creation behaviour” (VCB) – a multi-dimensional construct manifesting various value co-creation activities. Value co-creation is “a relatively abstract concept in line with service-dominant logic’s (SDL) zooming out perspective”.

This study intends to investigate how the international postgraduate students vary in terms of gender, scholarship status, marital status and the country of origin towards the various dimensions of value co-creation behavior. To complement the objective, the research question is framed as whether (or not) there are any differences in terms of gender, scholarship status, marital status and country of origin towards value co-creation behaviour dimensions towards the international postgraduate students in Malaysia.

**Literature Review**

Service-dominant (S-D) logic is a school of thought that views all businesses as service providers who exchange service for service as the fundamental basis of exchange. With the evolution towards a dominant logic of marketing in which customers (students) are not merely responders but rather active value co-creators, researchers have begun to focus on customer (such as students) behavior in this regard, extending previous customer behavior literature that focuses on the customers’ decision-making process at the time of purchase (such as student enrolment) in the higher education institutions. To explain the nature of customer value co-creation behavior, some studies use a multidimensional approach and identify distinctive components, whereas other studies follow a unidimensional approach.

Value co-creation behaviour is conceptualized as “customer participation behaviour” (CPB) and “customer citizenship behaviour” (CCB). CPB refers to the involvement of customers (such as students) in “producing and delivering service” in higher education institutions. For instance, if customers (i.e. students) interact with the service provider (i.e. HEIs) during the service provision process to seek and share information, it is customers’ in-role behaviour which is essential for value co-creation to occur. It is operationalized as “information seeking, information sharing, responsible behaviour, and personal interaction”. During information seeking, customers engage in information exchange to clarify service (e.g. university service) status or parameters and satisfy other cognitive needs. Customers (i.e. students) share information to ensure that the service offered by employees (e.g. university staff) is appropriate with individual needs. Customers must demonstrate responsible behavior to support a successful value co-creation process as partial employees of the firm.

CCB, such as “suggesting additional service improvements, helping other customers, and spreading positive word-of-mouth, is an extra-role behaviour which gives additional advantage to firms or higher education institutions in this case. CCB in the form of feedback, advocacy, helping, and tolerance is considered a value-added service to the firm and is not the primary responsibility of the customers such as students. The first dimension of CCB in the current study, i.e. providing feedback, refers to providing or suggesting information to the service provider (i.e. HEIs). In the current study, helping refers to students assisting other fellow students regarding the problems arising during service delivery in any sort of educational or campus activities. Students’ tolerance refers to being patient in case of any discrepancies of the desired university services. Students’ tolerance will plausibly help the HEIs in the aggregate overall. The last dimension is called advocacy/recommendations, which refers to customers (i.e. students) recommending the service provider (i.e. HEIs) to other students, relatives, friends and so on.

**Methodology**

Malaysia’s expectation was to attract international students by 2015, focusing on postgraduate and sponsored international students in particular. The main target countries for international student recruitment are from Asia, the Middle East and Africa. China, India and Indonesia are particularly targeted among Asian countries because they are the largest student markets in the region and because they share language and cultural similarities with Malaysia’s Chinese, Indian and Malay communities, respectively. The international postgraduate students of two leading universities in Malaysia, one public and one private, have participated in the survey of this study. They were students of Masters, PhD, and Postgraduate Diplomas from various departments. Purposive sampling was used to select the respondents. A total of 200 questionnaires were distributed and 110 of them were usable and complete that is used for analysis. The response rate
was 55%. The CVCCB (customers’ value co-creation behaviour) scale was adapted from Yi and Gong. The original scale contains two dimensions, namely, CPB and CCB as measured by 29 items. The items were measured using seven-point Likert scales (1 – strongly disagree and 7 – strongly agree). Data were analysed using SPSS 22.

**Discussion and Findings**

Based on the 110 respondents in this study, 52.7% are male and 47.3% female international postgraduate students. 38.2% of them are studying under scholarship and 61.8% mentioned that they do not have any scholarship. Out of 110 international postgraduate students participated in this study, 58.2% are “single” and the remaining 41.8% are “married”. Based on the nationalities of the participating international postgraduate students in this study, 24.5% are from Bangladesh; 11.8% from Indonesia; 16.4% from Yemen; 14.5% from Nigeria; 12.7% from Pakistan; 10% from India, and 10% from countries other than these.

The independent Samples t-Test was performed to see the differences among the male and female international postgraduate students towards participation behaviour dimensions (i.e. information seeking, information sharing, responsible behaviour and personal interaction) and citizenship behaviour dimensions (i.e. feedback, advocacy, helping behaviour and tolerance). Levene’s test for equality of variances shows that male and female international postgraduate students differ in case of information seeking (P-value 0.37<0.05 at 5% significant level) and responsible behaviour (P value .04<0.05 at 5% significant level). In case of marital status and scholarship status, Levene’s test for equality of variances shows no differences among the international postgraduate students as the P value is >0.05 at 5% significant level towards the dimensions of participation and citizenship behaviour.

Based on One Way ANOVA test of Homogeneity of Variances results, it is evident that the international postgraduate students from different countries are homogenous (with a P value >0.05; at 5% significant level) towards the various dimensions of participation and citizenship behaviour except helping behaviour dimension (P-value .042<0.05; at 5% significance level).

From the ANOVA table, the results clarify that the international postgraduate students from various countries demonstrate similar pattern towards all the dimensions of the value co-creation behaviour except one dimension from citizenship behaviour that is tolerance (P-value .036<0.05; at 5% significance level). Hence, at least one of the nationalities (i.e. Pakistan) of postgraduate students differs significantly in terms of showing tolerance towards their respective university services. Since the equality of variance can be assumed, Duncan’s post hoc test is used to compare the tolerance behaviour among the various nationalities of international postgraduate students studying in Malaysia.

</tbody>
</table>

Means for groups in homogeneous subsets are displayed.
b. The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

Based on this procedure, the mean of the tolerance behaviour for the international postgraduate students from Pakistan is significantly lower compared to the rest of the nationalities. The international postgraduate students from Bangladesh, Yemen, Nigeria, India, Indonesia and other nationalities’ mean of the tolerance behaviour do not differ significantly.

**Conclusion**

To achieve the country’s goal to become the regional education hub, higher education institutions in Malaysia need to bring in several changes to maintain their service excellence in the global educational platforms. These institutions need to shift from a unidirectional perspective of viewing students as largely passive receivers of value to the ones who can more actively engage in mutual value co-creation.  

Firstly, this study analyses the value co-creation behaviour dimensions namely, participation behaviour (i.e. information seeking, information sharing, responsible behaviour and personal interaction) and citizenship behaviour (i.e. feedback, helping, advocacy and tolerance) in case of several demographic aspects such as gender, marital status, scholarship status and

Cont... Table I: ANOVA test results
country of origin among the international postgraduate students in Malaysia’s HEIs. The findings of this study showed that male and female international postgraduate students differ in the case of information seeking and responsible behaviour. The international postgraduate students, irrespective of their marital status or whether they are studying under scholarship or not, show no differences towards value co-creation behaviour.

Lastly, the outcome of one way ANOVA shows that international postgraduate students do not differ in all the dimensions of the value co-creation behaviour except one from citizenship behaviour that is tolerance. The result further reveals that Pakistani students are less tolerant compared to the rest of the nationalities of international postgraduate students in Malaysia. The implication of this research is that universities might consider designing their communication strategies in such a way that can facilitate the co-creation behavior of international postgraduate students. According to Joseph and Joseph, “the items selected by the international students should be a concern by the HEIs to market positioning strategy and to strengthen their offerings in these areas”. Besides, HEIs which pay more attention to their service qualities are more likely to enrich the international students’ experience and influence students’ evaluations. True that the samples were reasonably diverse in terms of students’ gender, nationality, country of origin etc., but their size was small and they were drawn from a single country Malaysia. Future research could aim to replicate the findings with a larger sample size among other student populations (such as undergraduate students) from other emerging hub countries.

Building Employees’ Mental Health: The Correlation between Transactional Leadership and Training Program with Employees’ Work Motivation at XWJ Factory

Bernadetha Nadeak¹, Sasmoko², Uli Erni Iriani³, Lamhot Naibaho⁴, Elferida Sormin⁵, Citra Puspa Juwita⁶

¹Lecturer, Educational Administration Department, Faculty of Post Graduate Universitas Kristen Indonesia, Jakarta, Indonesia, ²Professor, Primary Teacher Education Department, Faculty of Humanities, Bina Nusantara University, Jakarta, Indonesia, ³Lecturer, Research Interest Group in Educational Technology, Bina Nusantara University, Jakarta, Indonesia, ⁴Lecturer, Abira Learning Center, ⁵Lecturer, Educational Management Department, Faculty of Teacher Training and Education, ⁶Lecturer, Chemistry Education Department, Faculty of Teacher Training and Education, ¹Lecturer, Physical Therapy Department, Faculty of Vocational, Universitas Kristen Indonesia, Jakarta, Indonesia

Abstract

This study is aimed to find out how to building employees’ mental health with the correlation between the transactional leadership and training program both partially and jointly on employees’ work motivation of XWJ Factory and it was done at XWJ Factory. The method of the study used was the quantitative method with a descriptive approach. The data collection technique was done by giving questionnaires to 80 respondents who were sampled from populations of 100 employees, and the analysis technique used was multiple linear regression analysis which is aimed to calculate the magnitude of the regression coefficient to show the correlation between the transactional leadership and training program variables on employees’ work motivation. This study has some results, such as a) transactional leadership has a significant correlation with employees’ work motivation, b) training program has a significant correlation with employees work motivation, c) transactional leadership and training program have a significant correlation with employees’ work motivation at XWJ Factory.

Keywords: transactional leadership, training program, work motivation

Introduction

Transactional leadership towards human resources has an important role in every company activity, namely in managing, regulating, managing and using all available resources productively and effectively to achieve the good condition of the employees. To improve employee performance, it is necessary to improve the quality of employees through employee training functions. Employee training is one means to create quality human resources in achieving the company’s goals and objectives.¹ The training aims to improve employee performance in achieving the work results set. Performance improvements can be done by improving employee knowledge, skills, and attitudes of employees themselves on their duties.²,³ In general, training refers to the efforts planned by a company to facilitate the learning of employees about work-related competencies.

The XWJ company established in 1967 is one of the companies engaged in dairy manufacture.

The problems in this study are: a) is there any significant correlation between transactional leadership with the employees’ work motivation of the XWJ Company?; b) is there any significant correlation
between training with the XWJ Company employees’ work motivation?; and c) is there any significant correlation between transactional leadership and training with the employees’ work motivation of the XWJ Company? With the purposes to find out: a) whether there is a significant correlation between transactional leadership with the employees’ work motivation of the XWJ Company; b) whether there is a significant correlation between training with the XWJ Company employees’ work motivation; and c) whether there is a significant correlation between transactional leadership and training with the employees’ work motivation of the XWJ Company.

**Literature Review**

Motivation is a process which is started with physiological or psychological deficiencies that drive behaviour or impulse aimed at goals or incentives. In the context of the system, motivation includes three elements that interact and are interdependent, namely: needs, incentives, incentives. Motivation is the desire to do something and determine the ability to act to satisfy individual needs. Motivation is the provision of the driving force that creates the enthusiasm of one’s work, in order to cooperate, work effectively and be integrated with all its efforts to achieve satisfaction.

In this case there are several opinions regarding leaders and transactional leadership, including a) Leader is a person who applies principles and techniques that can ensure motivation, discipline and productivity when working with other people, tasks and situations to achieve company goals; b) The leader is a person who has special skills with or without official appointments which can affect the group he leads to do business leading to achieving certain goals; c) Transactional leadership is defined as a person’s ability to affect the behaviour of others to think and behave in the framework of formulating and achieving organizational goals in certain situations; d) transactional leadership is interpreted as the ability and skill of someone who occupies the position of head of a work unit to affect the behaviour of others, especially his subordinates to think and make a real contribution in achieving organizational goals; e) Transactional leadership is defined as a set of processes that are primarily aimed at creating organizations or adjusting to conditions that change considerably.

Training is activities designed to provide learners with the knowledge and skills needed for their current job. Training includes activities that function to improve a person’s performance in the work that is being undertaken or related to this job. Training is a planned organizational effort to help employees learn the knowledge, skills, and abilities associated with a job so that they can improve work performance.

Training and development is an important organizational investment in human resources. Specifically, the training is an effort carried out in a continuous, gradual and integrated manner. This is reinforced by Rivai that training is the process of systematically changing employee behaviour to achieve organizational goals. Training is a learning process that involves the process of expertise, concepts, rules or attitudes to improve employee performance. Most training for job knowledge and skills is completed in just a matter of days. There are 2 main categories of training and development methods, namely practical methods (on the job training) and simulation methods (off the job training).

**Research Method**

The research was carried out in the XWJ Company. The research method used is quantitative research, the design of research was a survey. The variables in this study are independent variables (X1 and X2) and non-independent variables (Y). The population of this study is 100 employees at the XWJ Corporate Headquarters. The sample of this study were 80 employees. The instrument used in this study was a questionnaire using a Likert scale. The data were analyzed through the validity test then continued by the calculation of correlation.

**Research Results and Discussion**

To produce an unbiased decision in the linear regression equation or “BLUE” (Best Linear Unbiased Estimator), the symptoms of aberration are tested using the classical linear model framework. They are the linearity test, normality test, multicollinearity test, heteroscedasticity test and autocorrelation test. The results of each test were described as follows:
Normality Test: the result of the normality test shows that the independent variables and multiple linear regression are normally distributed (figure 2).

Table 1. Multicollinearity Test “Coefficients”

<table>
<thead>
<tr>

<th>Durbin-Watson</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>.815*</td>
<td>.665</td>
<td>.656</td>
<td>4.14172</td>
<td>1.909</td>
</tr>
</tbody>
</table>

a. Predictors: (Constant), transactional leadership, training.

b. Dependent Variable: work motivation

Multiple Linear Regression Analysis: By looking at the table of calculation results on table 3, it can be
produced multiple linear regression equations, as follows:

\[ Y = 6.124 + 0.559 \times X_1 + 0.284 \times X_2 \]

From the regression equation, it can be seen that the regression coefficients of the two independent variables, namely \( b_1 \) and \( b_2 \) are positive. This means that if each independent variable (\( X_1 \) and \( X_2 \)) is increased it will have an impact on the increase in variable \( Y \) at a significant level of 5%.

**Table 3. Regression Coefficient “Coefficients”**

<table>
<thead>
<tr>
<th>Model</th>
<th>Unstandardized Coefficients</th>
<th>Standardized Coefficients</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Std. Error</td>

<tr>
<td></td>
<td>Transactional leadership</td>
<td>.559</td>
</tr>
<tr>
<td></td>
<td>Training</td>
<td>.284</td>
</tr>
</tbody>
</table>

a. Dependent Variable: work motivation

**The Correlation Coefficient (R):** From the data in the table above, the value of the correlation coefficient \((R)\) is 0.815. This means that there is a strong and positive relationship between independent variables \( X_1 \) and \( X_2 \) (transactional leadership and training) on the dependent variable \( Y \) (work motivation).

**Table 4. Correlation Coefficients “Model Summary”**

<table>
<thead>
<tr>
<th>Model</th>
<th>R</th>
<th>R Square</th>
<th>Adjusted R Square</th>
<th>Std. Error of the Estimate</th>
<th>Durbin-Watson</th>
</tr>
</thead>
<tbody>
<tr>

<td>.815(^a)</td>
<td>.665</td>
<td>.656</td>
<td>4.14172</td>
<td>1.909</td>
</tr>
</tbody>
</table>

\(^a\) Predictors: (Constant), transactional leadership, training

b. Dependent Variable: work motivation

**The Determination Coefficient Analysis:** From table 4 above, it is known that the value of the coefficient of determination (R Square) is 0.665 or 66.5%. This shows that the contribution or direct correlation between variables \( X_1 \) and \( X_2 \) (transactional leadership and training) with the \( Y \) variable (work motivation) is 66.5%, and the remaining 33.5% is affected by other factors which were not observed in this study. The adjusted determination coefficient was 0.656 or 65.6%. This means that the direct correlation is adjusted to 65.6% and the remaining 34.4% is an indirectly adjusted correlation.

**The t-test** is done by comparing the value of sig. \( t_{\text{count}} \) of each independent variable using a significance level of 5%. The criteria used are as follows: 1) If the value is sig. <5%, then \( H_0 \) is rejected and \( H_a \) is accepted: 2) If the value is sig. > 5%, then \( H_0 \) is accepted and \( H_a \) is rejected.

Based on the research results listed in table 6 above, the result is that the value of sig. transactional leadership variables of 0,000 and sig values. training variable is 0.020. This means the sig value of the two independent variables is <5%. Thus \( H_0 \) is rejected and \( H_a \) is accepted. So that it can be concluded that partially transactional leadership and training have a significant correlation on
the work motivation of employees of the XWJ Company.

The F test is done by comparing the value of sig. F<sub>count</sub> using a significance level of 5%. The decision-making criteria used are as follows: 1) If the value is sig. <5%, then Ho is rejected and Ha is accepted; 2) If the value is sig. > 5%, then Ho is accepted and Ha is rejected.

Based on the results of data processing obtained results as listed in the following table:

Table 5. Value F Calculate “ANOVA”

<table>
<thead>
<tr>
<th>Model</th>
<th>Sum of Squares</th>
<th>Df</th>
<th>Mean Square</th>
<th>F</th>
<th>Sig.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Regression</td>
<td>2</td>
<td>1311.177</td>
<td>76.436</td>
<td>.000&lt;sup&gt;a&lt;/sup&gt;</td>
</tr>
<tr>
<td></td>
<td>Residual</td>
<td>77</td>
<td>17.154</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Total</td>
<td>79</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. Predictors: (Constant), Transactional leadership, training

b. Dependent Variable: work motivation

From the data listed in Table 7. It is known that F<sub>count</sub> is 76,436 with degrees of freedom are 2 and 77. The value of F<sub>table</sub> with degrees of freedom 2 and 77 is 3.12. This means that F<sub>count</sub> is greater than F<sub>table</sub> and sig F value is 0.000. This significance value means less than 0.05 (5%). So the regression equation is significant. So that it can be concluded that simultaneously, transactional leadership and training have a correlation with the employees’ work motivation of the XWJ Company.

The hypothesis that it is assumed that there is a significant correlation between transactional leadership with employees’ work motivation of the XWJ Company is accepted. Regression coefficient value of the transactional leadership variable (X1) of 0.559 explains that 55.9% effective transactional leadership will be able to increase employee’s motivation.

The Correlation between Leadership with Work Motivation: The hypothesis states that it is assumed that there is a correlation between training on employees motivation at XWJ Company is accepted. The training variable (X2) regression coefficient value of 0.284 explains that 28.4% related to training have correlation on employee work motivation. This shows that providing training for employees to be able to improve their abilities and competencies will be able to provide better work motivation.

The Correlation between Transactional Leadership and Training with Work Motivation: The hypothesis that it is assumed that there is a correlation between transactional leadership and training on employee motivation at XWJ Company is accepted. The coefficient of determination of 0.665 explains that transactional leadership and training simultaneously have correlation on the work motivation of the XWJ Company. This shows that the two independent variables examined in this study contributed 66.5% to employee motivation.

Conclusions

Based on the analysis and processing of the data described above, the results of processing data about the correlation between transactional leadership and training on the work motivation of employees of the XWJ Company, which refers to concepts and theories relevant to this study and supported by statistical methods using multiple regression models, can be concluded as follows:

a) There is a significant correlation between transactional leadership (55.9%) on employee work motivation at the
XWJ Company. This is indicated by the responses of respondents who mostly agree that leaders have carried out transactional leadership variables in accordance with what was stated in the questionnaire carried out. However, there are also variables that some respondents give low scores. Namely, according to the leaders in their transactional leadership still often use their power to employees and leaders also do not implement a system of giving punishments and rewards for employee performance consistently; b) There is a significant correlation between training (28.4%) with employees’ work motivation of the XWJ Company. This is indicated by the responses of respondents who mostly agree that the training variable is in accordance with what is stated in the questionnaire carried out. However, there are also variables that some respondents give low scores. That is, according to them the existence of training has not determined the existing mutation and promotion programs regularly and the opportunity to develop themselves which can encourage them to work more actively; c) Simultaneously, transactional leadership and training variables correlation between employees’ work motivation (66.5%).

Analysis of Nursing Quality Services

Bernadetha Nadeak¹, Sasmoko², Desy Ria Simanjuntak³, Lamhot Naibaho⁴, 
Elferida Sormin⁵, Citra Puspa Juwita⁶, Sudung O. Pardede⁷

¹Lecturer, Educational Administration Department, Faculty of Post Graduate Universitas Kristen Indonesia, Jakarta, Indonesia, ²Professor, Primary Teacher Education Department, Faculty of Humanities, Bina Nusantara University, Jakarta, Indonesia, ³Lecturer, Research Interest Group in Educational Technology, Bina Nusantara University, Jakarta, Indonesia, ⁴Lecturer, Public Health, Faculty of Medical, Universitas Kristen Indonesia, Jakarta, Indonesia, ⁵Lecturer, Educational Management Department, Faculty of Teacher Training and Education, Universitas Kristen Indonesia, Jakarta, Indonesia, ⁶Lecturer, Cemistry Education Department, Faculty of Teacher Training and Education, Universitas Kristen Indonesia, Jakarta, Indonesia, ⁷Lecturer, Physiotherapy Department, Faculty of Vocational, Universitas Kristen Indonesia, Jakarta, Indonesia

Abstract

This study is focused on the analysis of nursing quality services, and it was done to know how the quality services of the nurses. The population of this study were the nurses and the patients at private hospitals in Jakarta, and the sampling technique used was cluster random sampling. The sample were the nurses and patients who were hospitalized at East Jakarta. The method of the study used was explanatory using a survey method with a cross-sectional approach, where the instruments of the study were a set of questionnaire with likert-scale 1-5. The results of the study show (α<0.05) show that: a) there is a significant effect of commitment of the nurses to the quality services improvement having by the nurses; b) there is a significant effect of the leadership to the quality services improvement having by the nurses; c) there is a significant effect of the ethics of the hospital to the quality services improvement having by the nurses; d) there is a significant effect of the nurses' performance to the quality services improvement having by the nurses; and e) there is a direct significant effect of the ability of the nurses, the ethics of the hospital, and leadership behaviour on the commitment of the nurse.

Keywords: nursing, service, quality

Introduction

Hospital is one form of service industry, where the existence and absence of a hospital depends on the level of public trust in using the services of the hospital. The quality services of nurse is usually associated with healing processes, reduced pain, speed in service, hospitality, and cheap service rates.¹

Service quality is a picture of the total nature of a product or service related to its ability to meet satisfaction.² Experts in nursing and health have always tried to improve self-quality, profession, and nursing equipment, as well as managerial ability of nursing, especially management of the quality services of nurse is also improved.³ There are still obstacles faced by nursing in Indonesia, including the limited human resources in nursing and the availability of integrated information technology.⁴

The cause of the declining trend in hospital hospitalization is suspected because of the human element (nurses), namely the quality services of nurse that have not been maximal in providing nursing services. Nursing is one of the professions in a hospital that plays an important role in carrying out its work, a nurse uses a standard of nursing practice.⁵

Corresponding author:
Sasmoko,
Professor, Primary Teacher Education Department, Faculty of Humanities, Bina Nusantara University, Jakarta, Indonesia
Literature Review

There are some definitions of nursing quality services, such as: 1) a process of activities carried out by the nursing profession in fulfilling the needs of patients in maintaining the biological, psychological, social, and spiritual conditions of patients; 2) professional nursing care which refers to the 5 dimensions of service quality, namely (reliability, tangibles, assurance, responsiveness, and empathy); 3) a service that describes the product of the nursing service itself which includes biologically, psychologically, socially, and spiritually in sick and healthy individuals and is carried out according to nursing standards.

Leadership in nursing services must have the ability and skills in nursing and can influence other nurses under their supervision to carry out their duties and responsibilities in providing care and nursing care so that the goals of nursing are achieved. Leadership arises as a synergistic result of various skills ranging from administrative (planning, organizing, controlling, supervision), technical skills (management, marketing and procedural technical), and interpersonal skills. Ethics is the application of good behavior from individuals to the environment in the form of good social relations by exercising rights and obligations in accordance with the norms, rules and culture that apply to the community environment. Ethics is the intention whether the act is permissible or not in accordance with the consideration of good or bad intentions as a result.

Organizational commitment is the desire of organizational members to maintain their membership in the organization and are willing to strive for the achievement of organizational goals. In other words, that this attitude reflects employee loyalty to the organization and the ongoing process of organizational members expressing their concern for the organization and its continued success and progress.

Performance is a business carried out from work that can be achieved by a person or group of people in an organization in accordance with the authority and responsibility of each in order to achieve the objectives of the organization legally, not violating the law and in accordance with morals and ethics. The success of health services depends on the participation of nurses in providing quality nursing care for patients. Nurse performance is the activity of nurses in implementing as well as possible an authority, duty and responsibility in order to achieve the objectives of the profession’s main tasks and the realization of the goals and objectives of the organizational unit.

Research Method

This study carried out in private hospitals in Jakarta. The population of this study is: 1) patients or families over the age of 17; and 2) able to answer the questions given. The total number of the sample are 600 persons, consisted of 300 patients and 300 nurses of the hospital. The sampling technique used was cluster random sampling. The method of the study used was explanatory using a survey method with a cross-sectional approach. To get the data of this study, two sets of instruments were used: 1) a set of questionnaire filled up by the patients consisted of 24 statements; and 2) a set of questionnaire filled up by the nurse consisted of 24 statements. Both questionnaire used likert-scale 1-5.

Results and Discussion

The data of this research which were taken through questionnaires (filled up by the patients and the nurse) were analyzed as follows:

<table>

<td>268</td>
<td>22,3%</td>
</tr>
</tbody>
</table>

From the table above, it can be concluded, 76.1% of patients admitted to East Jakarta private hospitals said they agreed and 22.3% said they strongly agreed that: 1) the nurse tried to calm anxiety about the illness being suffered by the patient; 2) nurses always give special time to communicate with patients; 3) nurses do not forget to remind the safety of valuables of patients and families of patients; 4) nurses always entertain and encourage patients.
The performance of nurses at private hospital in East Jakarta have a significant effect on nurses’ quality service. The results of the test stated that the performance of nurses at private hospital in East Jakarta had a significant effect on nurses’ quality service, with a path coefficient of 10.7. This result is reinforced by the acquisition of \( p = 0.000 \) (<0.05) which indicates a significant effect. Then it can be generalized that the higher the performance of nurses private hospital in East Jakarta, the better is the quality service of the nurse.

The results of this study are consistent with Gronroos’ interactive marketing theory, which emphasizes the importance of the service delivery process to customers. Estimation of the significant relationship between hospital ethics in private hospitals in East Jakarta with the quality services of nurse have been proven through testing hypotheses. The results obtained from testing of this hypothesis are that hospital ethics has significant effect on nursing service quality, with a path coefficient of 9.3. While the significance of this result is proven by the acquisition of CR > 2 (t test), with \( p <0.05 \). These findings indicate that the better implementation of hospital ethics in the private hospital in East Jakarta, and the better nurses quality setvices.

These empirical findings are in line with Zhang and friends, where in the code of ethics of large companies in the world, one of them is to be kind to your customers.

Among the three predicted variables as builders of nursing service quality, the ethics variable of this hospital has the greatest effect, which is equal to 0.94. In addition to the founding of a significan effect of hospital ethics on the quality services of nurse, it also found a significan effect of hospital ethics on the quality services of nurse.

The test results on this study found that the leadership behavior of private hospital in East Jakarta had a significant effect on the quality services with a path coefficient of 6.3. Meanwhile, the significance of this result is proven by the acquisition of CR > 2 (t test), with \( p <0.05 \). The results of this study indicate that if subordinates assess good leadership behavior, then the level of quality services of nurses will be better as well.

Basically this study is consistent with the findings of previous experts who stated that there is a relationship between leadership and motivation and performance of subordinates. Sfantou, et al., states that leadership behavior greatly affects the success of an organization.

In addition to the significan effect of leadership on the quality services of nurse, which has been empirically proven. There is also an indirect effect of leadership on the quality services of nurse. It seems that the findings or results of the analysis of the relationship between employee commitment and the quality of this service support the findings of Alsharari and fiends.

Conclusions

Hospital management is expected to reorganize the job specifications of nurses in hospitals to eliminate the impression that nurses tend to do any work. In addition, to prevent the feeling of being burdened by daily work routines, hospital management should launch a capacity building program, based on open space courses on a regular basis (i.e. a training program held in the open), which is intended to upgrade capabilities as well as indirectly relaxation from the routine and burden of daily work.

Hospital management is also expected to provide extra attention to hospital employees (without exception), with regard to the achievements achieved by them through evaluating the nurse performance per quarter.

Hospital management can also implement Good Hospital Governance, namely management of the quality of good nursing services. This concept focuses on the principles of accountability, professionalism and transparency. The hospital’s board of directors is expected to behave as a risk challenger, to promote the hospital’s mission among hospital nurses, to act as a motivator, guide, and support for hospital nurses. Thus the leader will be a figure for the subordinates, so it does not cause misperception and will lead to confidence in the management leadership of the hospital.

Abstract

The quality of higher education is largely determined by the quality of lecturers, one of which is determined by their performances. This research is aimed to find out the prior description of the lecturers’ performance of Indonesia private higher education. The method of the study used was descriptive qualitative. The entire population of the study were the lecturers in Indonesia. The sampling technique was cluster random sampling, and the research sample were the lecturers at private higher education in East Jakarta, as many as 400 lecturers. The results of the research were: (1) 85% of the lecturer stated themselves have effective and efficient performances; (2) 89% of the lecturers stated themselves have high responsibility, (3) 85% of the lecturers stated themselves having high discipline, and (4) 85% of the lectures stated themselves having a very good initiative. The implication of this study is the importance of institutional higher education regulation that meets the by maximising the lecturers’ empowerment model is the key to the realization of better education quality and create healthy work culture.

Keywords: lecturers, performance, private higher education

Introduction

In order to achieve the objectives of Indonesia’s national education, one of which is to educate the life of the nation, the quality of the Indonesian nation must be continuously improved so that it is able to compete with developed countries. Higher education is the highest level of education which has a very important role in achieving educational goals. Some important components or elements in higher education include lecturers. There are four competencies that must be possessed by lecturers based on Law No. 14 of 2005 in relation to the development of the Tri Dharma College’s duties, namely pedagogic, professional, personal and social competencies. The four competencies are very important in achieving national education goals which are manifested through the performance of the lecturer 1.

Lecturer performance is the outcome of the process carried out by the lecturer through work presentations, work implementation, work achievement, work results and performance2. Lecturer performance is one of the determinants of the success of the teaching and learning process in higher education.3

Some advanced universities have carried out a routinely and systematically performance appraisal. External and internal pressure forces the university to improve its governance system, organizational structure, and management style. Evidence can be seen through the adaptation of management tools and practices by profit entities, especially the performance measurement system into university management activities. For example, the University of Siena, Italy has actively used a dynamic performance measurement system when conducting teaching, research activities and management 4. However, there are still many universities that still have not implemented the performance appraisal to the lecturers. As the opinion of Zangouieezhadand Moshabakisay that although research in terms of resource

DOI Number: 10.5958/0976-5506.2019.01491.8
allocation and accounting systems at the university level is growing, studies on performance and management at the department and staff level at universities are still lacking. The Indonesian government through the Ministry of Research, Technology and Higher Education has actually conducted a systematic assessment of lecturer performance through the provision of lecturer certification incentives, where each lecturer who passes administratively is required to report the performance of each lecturer (tri dharma tertiary) every semester through the lecturer workload report. Some studies have found that competence has an influence on individual performance, including in educational settings. The above descriptions further strengthen the basis of how important it is to measure lecturer performance. If several researchers previously analyzed the performance of lecturers in the field of tri dharma, this study examines and then describes the performance of lecturers based on other performance indicators, namely (1) effectiveness and efficiency, (2) authority and responsibility, (3) discipline, and (4) initiative. This research is also devoted to the assessment of the performance of lecturers in private universities in East Jakarta.

**Literature Review**

Performance is to measure or monitor and report how either someone or something that is being done that applies to people, activities and organizations. While management performance is a process that helps organizations to formulate, implement and change strategies that can be used according to the needs of shareholders. Performance appraisal is one of the real manifestations of the attention of superiors to their subordinates, which ultimately encourages subordinates to work, provided the assessment process is honest and objective and there is a follow-up. Follow-up of performance appraisal is possible for employees to be promoted, developed and or rewarded to be raised. This also applies to educators in higher education. The demands of this policy lead not only to changes in the scope of the company but, the nature and intensity of academic work as performance management and quality assessment is also needed. This statement is in line with Parsons and Slabbert that says performance appraisal is a social demand for higher education, therefore it is inevitable that performance appraisal is something that is mandatory for academics to be continuously appraised under supervision, thus challenging institutional managers to manage staff performance to be more effective on achieving a higher level of productivity, achieving an increasing social demands, the number and range of institutional goals and objectives.

Effectiveness and Efficiency: The effectiveness of an organization if the goals of an organization can be achieved in accordance with planned needs, efficiency is related to the number of sacrifices incurred in achieving the goals. Getting the profession right and efficiently is important in the process of achieving goals.

Authority and Responsibility: In this case, the authority is the authority a person has to govern another person (subordinate) to carry out the tasks assigned to each subordinate in an organization. Whereas responsibility is an inseparable part or as a result of ownership of that authority. If there is an authority, it means that responsibility naturally arises.

Discipline: when obeying applicable laws and regulations. Employee discipline as the obedience of the employee concerned in respecting work agreements where employees work. Work discipline is needed to produce a good performance, with discipline employees will try to do the work as much as possible and the resulting performance will be better.

Initiatives: relating to thinking power, creativity in the form of ideas for something related to organizational goals. Every initiative instead gets attention or positive responses from superiors.

**Research Method**

This research was conducted in the area of higher education service institutions in region III. It was chosen because higher education service institutions region III has more higher educations to be served compared to other higher education service institutions in other region and the higher education service institutions region III is located in the capital city so that various characteristics of the lecturers are expected to represent all the lecturers in Indonesia. The population is all private university lecturers. The number of lecturers in the higher education service institutions region III in the 2018/2019 academic year was 21,423. The research sample used the Slovin formula with a significance
level of α 5% and the sampling technique using cluster random sampling. Was 393 respondents so rounded up to 400 respondents.

The technique of data collection is done by distributing the questionnaires via e-questionnaire and e-mail using Google Form. The analytical method used is descriptive quantitative. Questionnaire use a weighted Likert scale as follows: Answers strongly agree to be given a score of 5, agree to be given a score of 4, less agree to be given a score of 3, not agree to be given a score of 2, and strongly disagree given a score divided into four non-test question categories in the form of questionnaires based on four performance indicators. Analysis techniques with descriptive statistics that provide an overview of the weight gain of the item questions, the interval value obtained by the average number of respondents’ answers to the question items based on the weight.

The final results obtained in the form of a percentage that will be interpreted according to the reference with 5 assessment criteria, Interpretation Criteria measurement as determining the level of satisfaction of lecturers, educational staff administration and supporting staff on human resource management are: 0% -20% (very bad), 21% -40% (not good), 41% -60% (good enough), 61% -80% (good), and 81% -100% (very good).

Result and Discussion

Recapitulation of Respondents’ Responses regarding question items:

Description of Effectiveness & Efficiency

<table>
<thead>
<tr>
<th>Total Item</th>
<th>Scale and Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>5</td>
</tr>
<tr>
<td></td>
<td>Num</td>
</tr>
<tr>
<td>11</td>
<td>1471</td>
</tr>
</tbody>
</table>

From table 1, the percentage of performance appraisal from indicators of effectiveness & efficiency of lecturers by comparing the total score (18,735) and the maximum score (22,000) is 85%, so it can be stated that the performance of lecturers in terms of indicators of effectiveness and efficiency is excellent. Effectiveness emphasizes the results achieved, while efficiency is more on how to achieve these goals by comparing the input used with the output produced. with high effectiveness and efficiency, it is expected that organizational goals can be achieved. This is in line with Andini, Arwiyah, Pangarso that of the six-factor variables that enter into component factors show a strong correlation with the component factor or the first factor has the largest% of variance which is 34.837% so that this factor is the most dominant factor which encourages performance in terms of ability, attitude, motivation, expertise, discipline, effectiveness and efficiency.

Description of Authority and Responsibility

Table 2. Recapitulation of the number and score of answers for indicators of authority & responsibility

<table>
<thead>
<tr>
<th>Total Item</th>
<th>Scale and Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>5</td>
</tr>
<tr>
<td></td>
<td>Num</td>
</tr>
<tr>
<td>9</td>
<td>1657</td>
</tr>
</tbody>
</table>
The data in table 2 gives the results of the percentage of performance appraisal for lecturer responsibility indicators by comparing the total score (15,934) and the maximum score (18,000) is 89%. Thus it can be stated that the performance of the lecturer in terms of the Responsibility indicator is in the interpretation of excellent performance. Very good responsibility contributes to the acquisition of good results, as the results of the research on the analysis of 36 case studies in the Netherlands which are known to have implemented team-based work. Case studies were executed in 1997 by face-to-face interviews with HRM staff and line management.

This concludes from the analysis that the two types of responsibilities are the winning team. In a “hierarchical team” team leaders take responsibility for decisions regarding work preparation, support and control, while in “Shared-team responsibility” decisions are made by team members themselves. Regression method providing evidence empirically which revealed that autonomy, responsibility, information, and creativity each had a positive and significant impact on team performance\(^1\).  

**Table 3. Recapitulation of the number and score of answers for Discipline indicators**

<table>
<thead>
<tr>
<th>Total Item</th>
<th>Scale and Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>5</td>
</tr>
<tr>
<td></td>
<td>Num</td>
</tr>
<tr>
<td>7</td>
<td>1027</td>
</tr>
</tbody>
</table>

The results of the analysis of the data in table 3 show that the percentage of lecturer performance assessment for indicators of lecturer discipline by comparing the total score (11,965) and the maximum score (14,000) is 85%. Thus it can be stated that the performance of the lecturer in terms of the Discipline indicators is in a very good interpretation.

**Table 4. Recapitulation of the number and score of answers for Initiative indicators**

<table>
<thead>
<tr>
<th>No</th>
<th>Total Item</th>
<th>Scale and Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Num</td>
</tr>
<tr>
<td>13</td>
<td>1770</td>
<td>8850</td>
</tr>
</tbody>
</table>

From the results of the analysis of the data in table 4, the percentage of lecturer performance appraisal for lecturer Initiative indicators by comparing the total score (22,237) and the maximum score (26,000) is 85%, which means that the lecturer performance in terms of Initiative indicators is very good.

**Conclusion**

In accordance with the results and discussion, it can be concluded that the effectiveness and efficiency, responsibility, discipline and initiative of lecturers are very high so that it is expected that with the performance of lecturers the higher education regulations can maximize the lecturer empowerment model in order to realize better quality of education and healthy work culture. The analysis shows that “Shared-team responsibility” is considered to contribute more substantially to the team’s performance results from “hierarchical teams”. This analysis helps to gain a better understanding of the relationship between HRM and organizational performance, as seen in “a human resource-based view\(^1\).
Initiatives as actions taken on their own accord from a lecturer are indeed very necessary. Finding that the participatory development process increases employee attitudes, perceived social pressure and perceived ability to take the Initiative. 16.

Work discipline has a positive and significant impact on teacher performance, Islamic leadership has an insignificant influence on teacher performance through work discipline, competence has a non-significant impact on teacher performance through disciplinary work and compensation has a non-significant impact on teacher performance through work discipline. 17. In addition, department performance improves when developed. Thus the opinion of Frese and Fay said that the personal high level can change the work situation of employees and relate to success as an entrepreneur. 18.

Are Depressive Symptoms Linked to Self-esteem? A Study on University Students

Nabila Mohd Nazari¹, Wan Mohd Azam Wan Mohd Yunus², Umar Haiyat Abdul Kohar³, Siti Khadijah Zainal Badri⁴, Nor A’tikah binti Mat Ali⁵

¹Undergraduate Researcher, ²Senior Lecturer, Department of Psychology, School of Human Resource Development and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia, ³Senior Lecturer, Department of Business Administration, Azman Hashim International Business School, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia, ⁴Assistant Professor, Division of Organisational and Applied Psychology, Faculty of Arts and Social Sciences, University of Nottingham Malaysia Campus, 43500 Semenyih, Selangor, Malaysia, ⁵Senior Lecturer, Department of Applied Psychology, College of Arts and Science, Universiti Utara Malaysia, Sintok, Kedah, Malaysia

Abstract

Everyday experiences suggest that individual who often feel dejected from daily life and often feel sad and lonely tend to have low self-esteem. The purpose of this study is to investigate the link between depressive symptoms and self-esteem among university students. A total number of 120 respondents participated in this cross-sectional study. The Beck’s Depression Inventory (BDI-II) was used to measure the level of depressive symptoms and the Rosenberg Self-Esteem Scale (RSES) was used to measure the respondents’ self-esteem. Data collected was analysed by utilizing Statistical Package for Social Science (SPSS) version 22.0. Students were reported to experience mild level of depression (Overall BDI-II mean=15.75) and possesses moderate level of self-esteem (Overall RSES mean=16.8). Notably, this study had found a weak negative relationship between depressive symptoms and self-esteem ($r=-0.222$, $p=0.015$). It can be concluded that the higher level of depressive symptoms is linked to lower level of self-esteem among university students. Hence, appropriate prevention strategies are crucial for both; university students who possess low self-esteem as well as those who experience high level of depression symptoms.

Keywords: Depressive Symptoms; Self-esteem; University students; Cross-sectional

Introduction

In Malaysia, the National Health Morbidity Survey 2015 statistics showed that 29.2 percent, or 4.2 million, citizens above the age of 16 years suffer from mental health issues. It was reported the percentage had doubled compared to 2006 which was 11.2 % and 1996 which was 10.6% ¹. People with high self-esteem are knowingly to be happier than other people. They also tend to be less depressed, either in general or specially in outcome of stressful, traumatic events. A number of studies have confirmed this link ²,³.

Researchers have argued that people with low self-esteem has higher risk to develop clinical and mild form of depression consequently making them to feel inferior, worthless and incompetent ⁴,⁵. However, there is inconsistency in the findings of previous research despite most of psychologist agree that mental health does associated with individuals’ self-esteem. Zeigler-Hill ⁵ stated that the precise nature of the relation between mental health and self-esteem is still debatable but it is well documented that depression and low self-esteem are related. However, the direction of its relationship is a question of debate among scholars despite emerging
studies suggesting that low self-esteem contributes to the development of depression.

Nowadays, there are a lot of university students with low self-esteem and low level of mental health such as depression as they often lack self-security and self-confidence. According to Carpenito-Moyet, self-esteem derives from own perceptions, or self-evaluation, about self-competence and efficacy. However, in Malaysia, studies focusing on this topic is scarce, particularly those targeting university students. Given that depressive symptoms and self-esteem can contribute to a students’ overall level of daily functioning, this study aims to 1) identify the level of depressive symptoms among university students; 2) identify the level of self-esteem among university students; and 3) investigate the relationship between depressive symptoms and self-esteem among university students.

Material and Method

A total of 120 undergraduate students from a Malaysian public university provided informed consent and was recruited for this cross-sectional study. Self-esteem was measured using the 10-items Rosenberg Self-Esteem Scale and categorized into three levels; low M=0-10, moderate M=11-20, and high M=21-30. The depressive symptoms were measured and scored using the 21-items Beck’s Depression Inventory II (BDI-II) (total raw scores); minimal depression=0-13, mild depression=14-19, moderate depression=20-28 and severe depression=29-63. Statistical Package for Social Sciences (SPSS) version 22.00 was used to analyse the results. Descriptive analysis was used to identify the demographics information, level of depressive symptoms and level of self-esteem. Moreover, Pearson correlation was used to investigate the relationship between depressive symptoms and self-esteem.

Results

The level of depressive symptoms, self-esteem and the relationship between depressive symptoms and self-esteem are shown in Table 2 (means and standard deviations by item). Overall, the respondents were reported to experience mild level of depression (Overall BDI-II mean=15.75) and possesses moderate level of self-esteem (Overall RSES mean=16.8). In terms of the link between depressive symptoms and self-esteem, a significant and weak negative relationship was recorded (r=-0.222, p=0.015). In other words, students who experience mild level of depressive symptoms are linked with moderate level of self-esteem.

Discussion

1) University Students’ Depressive Symptoms Level

The finding has suggested that level of depressive symptoms among university students is at mild level, contradicted to the prior studies. Depressive symptoms among university students could be caused by several reasons with most commonly reported are financial difficulty or issue such as low self-esteem. Whilst, some study emphasised on the significant role of first year in college as a challenging transitional period that contributed to further development of depressive symptoms among students in the university setting. Adjustment issue among university student is often linked to psychological conflicts related to study, value determination and interpersonal relationship crisis. Okrawaji et al for instance, found adjustment issue with student inability to form attachment with their new surroundings. Inability to make a new friend and engage in a new relationship restricts their interest towards other which may then affect their self-esteem.

As majority of university students are in their late adolescent or early adult period, experiencing these events are commonly stressful for them. Although the above is mentioned, this study reveals only a mild occurrence of depression symptoms among the respondents. This is a good sign which indicates that student might have equipped themselves with a proper coping strategy to combat stresses. Whereby, this study found an evidence that students are practicing good viewpoint whilst engaging in social relationship with mean value score is found at highest for this item (i.e. “I am less interested in other people than I used to be”). Controlled social time is a good approach to reduce depressive symptoms, since study has been suggesting that those who frequently exposed to social media or engage in unconstructive relationship are prone to poses higher depression levels. Lack of constructive interaction reduces one sense of belongingness, henceforth increases depressive symptoms (14). Consequently, adolescents who faced challenges might aggravated with insufficient social support received from their surrounding.

2) University Students’ Self-esteem Level

Self-esteem otherwise has been found in a moderate level. Finding of this study has suggested that item in particular “I take a positive attitude towards myself” is recorded as the highest compared to other items. Similarly, this study ascertained a positive state of the respondents’ self-esteem. This indicates that students in this study have a good ability to reflect themselves in a positive manner despite failure or challenges. Positive attitude in facing their failure, is an indicator that students are applying optimistic ways of thinking. Individual with a high level of self-esteem able to facilitate more adaptive behaviour in facing failure. Wherein, failure or challenges are perceived as an opportunity for them to learn and develop their capability. In lined with Erkut, a state of high self-esteem is described by the occurrence of constructive self-evaluation and clear perception on competencies development. Hence, a moderate level of self-esteem displayed in this study is a good sign that student has a decent ability to adapt and deal with unfavourable incidents occurred in their surroundings.

In contrast, those with low self-esteem might respond critically when there is a discrepancy between the desired with what they have been receiving. This is especially crucial for those who in their first-year in college, who may experience the challenges of academic pressure and navigating social adjustment for the first time. In fact, self-esteem could also be influenced by people and surroundings. This has been emphasised in prior study which found those with more support displayed a higher level of self-esteem. Berns stated that self-esteem reflects oneself worth, in which receiving constructive or functional interaction from peers and parents are
beneficial to increase self-esteem. Therefore, moderate level of self-esteem among respondents in this study is assuring, whereby, this state should be maintained or improve for more positive outlook in the future.

3) Depressive Symptoms and Students’ Self-esteem

This study has established an evidence in demonstrated the relationship between depressive symptoms and student’s self-esteem. Even though result has suggested the relationship between these two are weak in magnitude, however, paying attention to this connection for future prevention is deemed necessary. Consistent with the previous studies, higher depressive symptoms level is linked to lower level of self-esteem \(^{10, 12, 23}\). Notably, these findings supported the notion that depression is associated with low self-esteem albeit in one of the models as postulated by Orth and Robins \(^{25}\); the vulnerability and its revised models; mediated and moderated vulnerability models, the scar model, the reciprocal relation model, the precursor model and the diathesis-stress model. However, further studies are required to disentangle the actual direction of the relationship between depression and self-esteem.

This result additionally leads to the argument that self-esteem may decrease negative mental conditions and prevents depression occurrence \(^{24}\). However, little is known if based on this study, henceforth a more robust analysis and comprehensive study is needed to explore the possible relationship. In fact, established weak relationship between self-esteem and depressive symptoms among the respondents pointed out possibility for other variable to be explored in deriving a more conclusive finding.

**Conclusion**

In conclusion, this study has revealed the negative relationship between depressive symptoms and self-esteem in the samples of university students. Student depressive symptoms level is recorded at mild level. While, self-esteem has been recorded at moderate level. As mental health is an ongoing crisis in the higher institution setting, therefore more practical approach should be implemented in responding to this situation in the future.

The Value Relevance of Environmental Responsibility Performance

Juniarti¹, Imelda Margalo², Stephanie Moudy Santosο², Yolanda Florenzcia²
¹Associate Professor, ²Student, Accounting Study Program, Faculty of Economics, Petra Christian University, Jl. Siwalankerto 121-131, Surabaya 60236, Indonesia

Abstract

In Indonesia, research on the value relevance of non-financial information is still very rare, while several studies outside Indonesia also show mixed results. This leaves a challenge to test the value relevance of environmental performance information. This research was conducted in the period of 2010 to 2017, with companies that consistently became PROPER participants for 8 consecutive periods as its research subjects. The result shows that environmental performance information provides additional value relevance, which is indicated by an increase in R squared after entering environmental performance variables.

Keyword : Value Relevance, Environmental Performance, Share Price, PROPER

Introduction

Previous research on the value relevance of environmental performance shows varying results. Some research shows that environmental performance have relevant value but has negative effect on financial performance. Disclosed information on environmental performance has a negative effect on future financial performance. This is in accordance with cost-concerned school approach, which declared that investment on environmental performance could cause cost increase, which in turn lowered companies' income and market value. Investors also do not necessarily assess a company based on their environmental performance rating. According to additional cost for companies to fulfill their environmental performance will affect companies' profitability.

Other research proved that environmental performance only has value relevance on companies with a good rating, which shows that market values environmental performance differently. The increase of environmental awareness and higher indirect costs cause future environmental performance information’s value relevance to affect an increase in the financial market. This is in accordance with the value creation school approach, which stated that the effort to increase environmental performance is one of the options to increase competitive advantage and investor’s returns.

In Indonesia, research on the value relevance of non-financial information is still rare, On the other hand, companies need to know whether their published environmental performance information has value relevance or not. The investment done by the company to achieve good environmental performance needs to be evaluated, whether these investments give value or only increasing the expenses. This research uses modified the Ohlson Model by adding Environmental Performance Ratings (PROPER) to test the value relevance. This research contributes by adding evidence on whether environmental performance has value relevance. Moreover, this research is done in the latest research period, from 2010 to 2017, which is research with the latest data. This research started in 2010 because there are a concept and method renewal on PROPER in that year. The companies used as the research subject are those who have consistently become PROPER’s participant for 8 consecutive periods.
The next parts of this research are as follow: Chapter 2 consists of literary review and hypothesis development; Chapter 3 gives the research method; Chapter 4 explains the analysis and discussions, including empirical findings. Research’s conclusion and limitation are in the last part of this research.

Theoretical Framework and Hypothesis Development

Climate change and globalization make the company and society to be more aware of the importance of corporate social and environmental responsibility. Because of that, the government had made the Law that mandates the company to practice environmental responsibility in order to reduce the impact on the environment. Environmental responsibility will help the companies in using their resource efficiently. Every company has to ensure that its environmental responsibility leads to the improvement of corporate performance. If a company does not do its environmental responsibility right, it may also affect the corporate reputation and image.

Nowadays, a company’s performance is not only measured financially but also from non-financial factors such as environmental performance. Non-accounting performance measures make it possible for the company to do continuous improvement so that the company could create value. Environmental performance is a result of corporate strategic activities, where the company tried to manage their impact on the environment. Aside from that, environmental performance is a nonfinancial result that emerges from the company’s internal process, which can be a company’s competitive advantages. The social pressure is expected to motivate the companies to be responsible for environmental performance so that the resulted information can give the signal to the stakeholders that the companies have a proactive environmental strategy.

In Indonesia, environmental performance is measured with PROPER ratings. PROPER is environmental performance ratings that are used to evaluate and give ratings to participated companies with five color codes, from the worst to the best: black, red, blue, green, and gold, which was given by Indonesia’s Ministry of the Environment annually. These ratings are given to companies whose operational facilities have significant impacts on the environments.

In the previous research, value relevance is measured with Ohlson Model as the research basis. The Ohlson Model basically connects stock price with earnings per share (EPS) and book value per share (BVPS) that can be used to influence value relevance. This model is needed to know the connection between stock price change influenced by book value and earnings. Thus, the Ohlson Model can be concluded as such:

$$R_{t+1} = \alpha_0 + \alpha_1 \text{BVPS}_{it} + \alpha_2 \text{EPS}_{it} + \varepsilon_{it}$$

Where:

- $R_{t+1}$: the stock price of $i$ company on year $t+1$
- $\text{BVPS}_{it}$: book value per share of $i$ company on year $t$
- $\text{EPS}_{it}$: earning per share of $i$ company on year $t$

Non-accounting information of environmental performance becomes one of the companies’ primary needs because of it relates with the decision making and sustainability of a company. Because of that, it is important to know the impact of value relevance from environmental performance information. Thus, this research modified the Ohlson Model by adding Environmental Performance Ratings (EPR) as a non-accounting information variable, Cash Flow Operating (CFO), and control variables from value relevance (firm size and leverage).

$$SP_{it} = \alpha_0 + \alpha_1 \text{EPS}_{it-1} + \alpha_2 \text{BVPS}_{it-1} + \alpha_3 \text{CFOS}_{it-1} + \alpha_4 \text{PROP}_{it-1} + \varepsilon_{it-1}$$

Hypothesis Development

Environmental performance information is one of the stakeholders’ demands. This is triggered by globalization and various environmental problems that happened, especially in Indonesia. Indonesia is the biggest country in South East Asia and has a complex geographical environment. According to there is a serious deforestation case in 2013. This shows that it is important to discuss environmental problems in Indonesia. The increase of awareness on the importance of environmental problems in making economic and ethical investors’ decisions causes the demand for environmental performance environment to be higher.

Previous studies found that environmental performance does not have value relevance. The companies that received high valuation in environmental performance are not necessarily being valued by investors. The investors think that the improvement of environmental performance needs a lot of expenses and will have negative impacts on future earnings. The
Improvement in environmental performance is one of the managers’ effort in using corporate resources for their own interest, and will affect shareholders return.

The additional cost to fulfill environmental performance will affect companies’ profitability. The revealed environmental performance information has negative effects on future financial performance. That research result is in accordance with cost-concerned school approach that stated that investment in environmental performance could cause increased cost that will result in the loss of income and market value.

On the other hand, there is the value creation school, where the effort to improve environmental performance is a way to improve competitive advantage and increase investor return. A green company is being more appreciated in the capital market, product, or services. Producers that shows their effort in minimizing the negative impact to the environment from their product and process, can easily spread their market or even replace their competitors who failed to promote a strong environmental performance.

Value creation school is supported by the research of that also found that environmental performance has value relevance. Environmental performance’s information is said to have value relevance if it can help the investor in making an investment decision. Based on value creation school, this research assumed that:

\[ S_{Pt} = \alpha_0 + \alpha_1 EPS_{it-1} + \alpha_2 BVPS_{it-1} + \alpha_3 CFOS_{it-1} + \alpha_4 PROP_{it-1} + \alpha_5 VC_{it-1} + \epsilon_{it-1} \]

Where:
- \( S_{Pt} \) = Stock price of company i on year t
- \( EPS_{it-1} \) = Company’s earning per share i on year t-1
- \( BVPS_{it-1} \) = Company book value per share i on year t-1
- \( CFOS_{it-1} \) = Company’s operating cash flow per share i on year t-1
- \( PROP_{it-1} \) = Company’s PROPER result i on year t-1
- \( VC_{it-1} \) = Control variable which consists firm size and company leverage i on year t-1

Research Method

To verify this research, Ohlson’s Model is used, which is modified with environmental performance ratings (PROPER) and added with independent variables such as cash from operating (CFO), and control variables. Environmental performance Rating can be considered as an additional information for accounting. The model which can be formulated in this research is as follows:

Sample

To produce accurate findings, this research applies some criteria of sample selection. First, companies which are listed in the Indonesia Stock Exchange before 2010 and remain as public companies until 2018; second, the companies have at least participated in PROPER and consistently participated in PROPER program for eight consecutive years. There are 208 firm-year that include as the final sample for the period of 2010 – 2017.

Data Analysis Techniques

Obtained data are processed by using the help of GRET’L software. To conduct hypothesis test data analysis technique, it is necessary to conduct a statistical test which is used to test the hypothesis. The hypothesis is accepted if: 1) Regression coefficient shows the relationship according to the hypothesis; 2) significant t-value <0.05. Best model selection is applied to determine whether research panel data fit with the Ordinary Least Square (OLS), Fixed Effect (FE) or Random Effect (RE). Best model selection requires a Chow test and a Hausman test.

Result and Discussion

Sample Profile

Samples which met the criteria from 2010 to 2017 were 208 observations. The selected samples represent 4 sectors on the IDX, namely manufacturing, mining,
energy and oil & gas, agro-industry and regional and service sectors

The number of companies selected as samples represents 5.87% of companies that participated in PROPER. The biggest composition is in the manufacturing sector, which is 61.54%. All selected companies are companies which are companies with high profile, which are companies that have large and widespread impacts on the environment so that the company’s activities will get the attention from the community.

**Descriptive Statistic**

The complete profile of the variables used in this research is presented in Table 1 below:

**Table 1. Variable Measurement According to PROPER Rating**

<table>
<thead>
<tr>
<th>Variable (Mean)</th>
<th>PROPER Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Observation</td>

<td>180,22</td>
</tr>
<tr>
<td>FS</td>
<td>29,81</td>
</tr>
<tr>
<td>LEV</td>
<td>30,46</td>
</tr>
</tbody>
</table>

Table 1 also shows that companies with high PROPER rankings have better financial performance such as EPS and CFOS than companies with lower PROPER rank. Companies which receive PROPER ratings 4 and 5 have a higher mean SP, EPS and CFOS than rank 2 and 3. Companies with high PROPER ratings will receive market appreciation, which can be seen from the average share price of companies in the PROPER group 4 and 5, which are far higher than the average price of the company’s shares at a lower PROPER rating. The risk of companies with a higher PROPER rating are lower which can be seen from the LEV value, companies with a red PROPER rating have the highest LEV mean.

The results of the best model selection concluded that the fixed effect is the model that best fits the research data.

The results show an increase after adding PROPER in the Ohlson model, R-squared increase to 0.17 from 0.08. This means that environmental performance information has additional relevance value, however; the information is responded negatively by investors. Investors still consider that environmental performance is not an investment incurred by the company for purposes that do not produce results.

This research adds new evidence that in Indonesia, as a developing country, environmental performance information provides added value relevance. The results of the research support the cost-concern school and are consistent with some of the results of previous studies conducted in developed countries 1,2,4. 4 argue that if the environmental performance of the company is getting better, the company will increase costs, reduce profits and market value. According to 22, the efforts of managers in environmental or social problems by using company resources can be interpreted by investors as managers’ personal interests to build managers’ personal image. This is feared to reduce shareholder value.

The pros and cons regarding the benefits of environmental performance information in Indonesia in particular, are intense debates, and the results of this study support the opinion of the majority of investors in Indonesia, who find that social responsibility performance is a cost which will potentially reduce shareholder value. However, the results of the study are different from what has been done by 5, who found that the market respects the environmental performance of companies which get high or low ratings differently.

**Conclusion, Implication and Limitation**

This research has a goal to prove whether environmental performance information can provide additional relevant values. The results show that environmental performance information provides additional relevant values as hypothesized and as evidenced by an increase in after adding PROPER in the Ohlson model. Even though it has additional relevant values, the environmental performance information is responded negatively by investors. The environmental performance investment conducted by companies is considered a cost by investors and does not provide benefits, which is in line with the cost concern school.

However, this study does not include all the companies participating in PROPER, due to data availability. Besides that, not many companies consistently involve in PROPER program for the 8 consecutive periods. Future research can address this issue by combining the method of data collection to reach the generalizability of results.

Emotional Intelligence in Relation to Ethical Values of Malaysian University Students

Shahira Nordin¹, Mohd Rustam Mohd Rameli², Tan Joo Siang¹, and Najua Syuhada Ahmad Alhassora²

¹Master Student, ²Senior Lecturer, School of Education, Universiti Teknologi Malaysia, Malaysia

Abstract

University students who are commonly regarded as generation Y (Gen-Y) is exposed to a lot of emotional challenges and there has been evidence of decline in moral standards among Malaysian university students. Consequently, the ethical issues among young generation might jeopardize the national aspirations to develop future intellectual generations who are capable to manage their emotions as well as to resolve ethical dilemmas. There is a lack of research investigating the emotional intelligence mechanisms in relation to university students’ ethical values. Therefore, as to cultivate the holistic well-being of a nation with good moral values among future leaders, the purpose of this study is to determine the relationship between emotional intelligence and ethical values. This study also investigate whether there are differences of emotional intelligence level and ethical values level between first year and final year students. A quantitative research design was utilized and the respondents comprised of 217 undergraduate students in School of Education, Universiti Teknologi Malaysia. USM Emotional Quotient (USMEQ-i) Questionnaire and Ethical Values Questionnaire were used as the instruments in this study. The analysis of the results were in the form of inferential statistics. Results revealed that there was a significant relationship (p < 0.05) between emotional intelligence and ethical values. The independent t-test result was clearly depicted that there was no significant difference (p > 0.05) in the scores for emotional intelligence level for first year and final year students meanwhile there was a significant difference (p < 0.05) in the scores for ethical values level for first year and final year students. The present study contributes to an understanding of the relationship and impact of emotional intelligence on ethical values. This study has highlighted that individuals with high level of emotional intelligence is perceived to be more ethical.

Keywords: Emotional Intelligence, Ethical Values, University Students

Background of Study

The aim of universities is much broader than just granting students with degrees or providing general education. Higher institutions equipped students with appropriate learning abilities and life skills that can be applied in the future. The National Philosophy of Education (NPE) calls for developing harmonious individuals who are intellectually, spiritually, emotionally and physically balanced. Thus, continuous effort in integrating emotional intelligence education and ethical values should be an ongoing focus of higher institutions for the betterment of future generations.

Several research examined university students’ level of emotional intelligence (EI) across all years of study. Ghanimat et al.,¹ highlighted that no significant relationship between the age and total EI score of female students at Islamic Azad University of Tabriz. Whereas, studies conducted by Snowden et al.,¹⁸ Ungur and Karagozoglu discovered that students’ age has a significant relation with their total EI scores.

Prior research on ethical values across all university students’ by Sanders and Hoffman found that graduate students in their final term exhibited less ethical sensitivity than their first-year peers. In contrast, Yuen in his research concluded that the higher the year of
study among accounting students the likelihood for them to be more ethical is greater.

Aside from that, former studies analyzing the relationship of EI and ethical values stressed that EI was significantly correlated with individual ethics, perceptions of other’s ethics and ethical judgment\textsuperscript{2,4}. In addition, a study by Agarwal and Chaudhary\textsuperscript{1} stated that EI enhanced our personality and moral reasoning.

Further research to examine the relation between EI and ethical values of university students would give a significant contribution towards the field of research as EI has been recognized as one of the most successful factors in the workplace\textsuperscript{14}. Holian\textsuperscript{9} suggested that future study should investigate whether skills associated with EI has an impact on ethical decisions.

Therefore, this present study examines the relationship between EI and ethical values of undergraduate students. This study also seeks to investigate if differences exist in the level of emotional intelligence and ethical values between first year and final year students when students in different years of study might experience different transitional challenges in academic and social life adjustment.

**Objectives**

The main objective of this research is to investigate the difference of emotional intelligence and ethical values level between first year and final year students. This research also analyzed the relationship between EI and ethical values of the undergraduate students.

**Methodology**

A quantitative research design was utilized in this study and the respondents comprised of 217 undergraduate students in School of Education, Universiti Teknologi Malaysia. USM Emotional Quotient (USMEQ-i) Questionnaire and Ethical Values Questionnaire were used. Independent-samples t-test was conducted to study the level of emotional intelligence and ethical values across the students’ year of study. Plus, Pearson Correlation analysis was conducted to investigate the relationship between emotional intelligence and ethical values of undergraduate students. The analysis of the results was run using SPSS version 24 and the results were in the form of inferential statistics.

**Findings**

Table 1 illustrates the group statistics on emotional intelligence of undergraduate students for first and final year students. The first year students had a slightly higher mean value (Mean = 4.21, SD = 0.41) of emotional intelligence level as compared to final year students (Mean = 4.16, SD = 0.42).

<table>

Table 5 shows the correlations result of emotional intelligence and ethical values. The correlation coefficient of the two variables in this study had an absolute value of 1 that indicates a perfect linear relationship. There was a strong, positive correlation between emotional intelligence and ethical values of undergraduate students in the School of Education, UTM which was statistically significant (r = 0.665, n = 217, p< 0.05, two-tailed). Therefore, the null hypothesis for this research is rejected which shows no significant relationship between emotional intelligence and ethical values of undergraduate students’.

**Discussion**

The independent t-test result in Table 2 has clearly depicted that there was no significant difference in the scores for emotional intelligence level for first year and final year students. Generally, most of the first year students are between 19 to 21 years old whereas final year students commonly are between 23 to 25 years old. The result of present study is consistent with the studies conducted by Ghanimat et al., that found no significant relationship between the age of the studied subjects and their total EI score. Previous studies consistently indicate that EI is a mental ability to implicate and apply emotional information which is partly intrinsic and partly acquired through life experiences. Thus, it can be assumed that the first year students can control and regulate their emotion better when the academic challenges experienced by them are not as difficult as compared to the final year students as they have just entered the university.

Previous studies emphasized that age is significantly related to students’ total EI scores. On the contrary, this research indicates different results. The difference between both findings might be related to the difference in age gap. Respondents in the present study are all undergraduate students where they mostly fall under the same age group. Therefore, not much difference in age variation that can clarify the significant difference of emotional intelligence levels among the students.

Independent t-test result in Table 4 illustrates that there was a significant difference in the scores for ethical values level for first year and final year students. Referring to the descriptive analysis result, first year students in the School of Education, UTM were perceived to be more ethical as compared to the final year students. The findings of the present study is in line with prior studies where they found that graduate students in their final term exhibited less ethical sensitivity than their first-year peers. The previous researchers concluded that as the age of the respondent increases, their ethical sensitivity becomes lesser. On the other hand, this finding contradicted with a study previously conducted by Yuen found that the higher level of students had the greater tendency of having strong intention to achieve their ambitions and hence are more ethical.

Final year students who had spent longer time in the university might have encounter varieties of external influences which seems to be more on the negative side than on the positive. The negative influences might deteriorate the awareness of practicing ethical values among graduating class students. Consequently, the students have the possibility to commit wrongdoing throughout their academic years. The deterioration in ethical behavior among students suggest that ethics education is not adequately stressed or properly taught in the academic curriculum of the learning institutions.

Based on Pearson Correlation analysis, there was a strong, positive correlation between emotional intelligence and ethical values of undergraduate students in the School of Education, UTM. Specifically, this study shows that emotional intelligence has the greatest impact on the overall ethical values scores. Students who have the ability to regulate emotions also have the capability of to think rationally and practice the ethical values. This findings is in line with prior studies where all concluded that EI was significantly correlated with individual ethics, perceptions of other’s ethics and ethical judgment. In addition, the result of the present study agrees with Agarwal and Chaudhary that EI enhances character building and guide one’s ethical conducts.

In brief, the results suggest that individuals who better evaluate their emotions tend to be more ethical. As opined by Goleman et. al, emotional intelligence is able to assist individuals’ self-awareness to appropriately respond to life challenges and maintains the relationship with others ethically. Thus, EI undoubtedly can assists in personality maturation and directs the person to take moral decisions and act professionally regardless of his own interests. Thus, students who can evaluate and regulate emotions well would also have the capability to think more rationally and ethically in decision making.

**Conclusion**

This study has investigated the relationship between emotional intelligence and students’ ethical values. The findings of this study suggest that there is a positive relationship between emotional intelligence and ethical values of undergraduate students in the School of Education, UTM. Based on the results, it is imperative for the university students to learn and be concerned
about the importance of emotional intelligence and the application of ethical values conduct. Higher institutions’ administrators and academicians are recommended to consider integrating emotional intelligence with ethical values into the curricula of higher education.

The Impact of Prevalence of Substance Abuse among Secondary School Students in Borno State, Nigeria

Mohammed Kaka Gana¹, Ibrahim Abubakar Njodi¹
¹Lecturer, Faculty of Education, Department of Physical and Health Education, University of Maiduguri, Borno State, Nigeria

Abstract

The objective of this study is to determine the prevalence of substance abuse among senior secondary school students in Borno State. A total of 3,298 students participated in the survey. A self-developed questionnaire with 42 items measured information on prevalence, of substance abuse, on a 5-point Likert scale. The items were first content validated by experts and pilot tested before being administered to the respondents. The data were analyzed quantitatively using descriptive statistics and a factorial ANOVA of multivariate statistical analysis. The results of the study indicated that there is high prevalence in the consumption of substances like panadol, kolanut, paracetamol and septrin among senior secondary school students in Borno State. Significance: The finding has important implication on how secondary school students could effectively prevent the prevalence consumption of dangerous substances that alter their health. Beside that the findings will help promote campaign against the use of illicit drugs among the members of the public.

Keywords: Substance Abuse, Prevalence, Consumption of Dangerous Substances, illicit Drugs

Introduction

Substance is a drug that is considered harmful and whose use is controlled by law or made illegal⁷. Substance abuse is a pattern of harmful use of any substance for mood-altering purposes. It is an excessive use of drugs (such as stimulant, depressant, psychedelics and alcohol) without medical justification¹⁴. Substance abuse is characterized by a pattern of substance use that causes grade impairment. Examples of commonly abused substances are tobacco, alcohol, cocaine, valium and heroin. Despite worldwide concern and education about substances, many youths have limited awareness of their adverse consequences. Prevalence of substance abuse vary from one country to the other. For instance, in the United State of America, 52 percent of the eighth graders and 80 percent of the high school senior have abused substance (National Youth Violence Prevention, 2000¹). World Drug

In Nigeria, many adolescents engage in various risky behaviors such as smoking, alcohol drinking and other substance abuse. Situation shows that, there is high prevalence of substance abuse among adolescents and there is high probability that, the frequency of substance abuse will continue to increase¹. Prevalence is always contrasted with incidence. prevalent used to refer to that which is widely accepted and practiced by a large number of people⁷. The prevalence of substance abuse and its effects is on the increase worldwide among youth thus, assuming a dangerous dimension while its consequences have reached a global concern. A study by⁸ revealed that, prevalence of substance abuse is the frequency of substance abuse which predisposes individuals to various risk and consequences currently demanding much attention in the contemporary society.

A study in Nigeria, by national drug law enforcement agency¹⁵, revealed that, there is a widespread of substance abuse which include consumption of cannabis, psychotropic substance, heroin, cocaine, and...
volatile organic solvent. A study by\(^3\), revealed that, the commonest substances abused by subjects were mostly caffeine, mild analgesics, and psycho stimulants. \(^2\)reported that, hypnotedatives, tobacco and psycho stimulants were the commonly abused substances with varying prevalence, in Ilorin, a city in Nigeria. However, prolonged abuse of these substances has negative consequences on health, social and psychological wellbeing of youths as well as students’ performance in schools. Prevalence of substance abuse among students seems to have rich an alarming proportion and has been identified as one of the pandemic health problems in Nigeria which demand urgent attention. Youth are predisposed to substance abuse by various risks, which result to different consequences in the society. This study seeks to determine the prevalence of substance abuse among senior secondary school students in Borno State.

**Method**

Descriptive statistics of percentage and frequency count were used for demographic information and to answer research questions while Factorial ANOVA of multivariate statistical analysis was used to test all the hypotheses and pair wise comparison test was used to consider the effect of interaction between school location and gender.

**Participants**

The population of this study involved all the senior secondary school students in Borno State. There are seventy-three senior secondary schools with sixty five thousand nine hundred and sixty senior secondary school students (65,960)\(^16\). Out of this number thirty-eight thousand nine hundred and thirty seven students (38,937) were males, while twenty seven thousand and twenty three (27,023) were female students. Stratified random sampling technique was used to select the required sample size in each stratum. A stratified random sampling technique was used because both gender and school locations were compared according to their strata. According to\(^8\) (1998) if the population is few, a sample of 40 percent should be selected to give equal representation to all. Therefore, a sample of twenty nine (29) schools comprising of 19 in urban and 10 in rural areas were sampled from the total of 73 senior secondary schools in Borno State.

**Research instrument**

A self-developed questionnaire called prevalence, risk factors and consequences of substance abuse questionnaire (PRFCSAQ) was used to collect data. The instrument was structured on 5-point Likert-type response scale and has 42 items to solicit information on prevalence, risk factors and consequences of substance abuse. Five (5) point Likert-type response modes was used on section (B) on prevalence of substance abuse which has never (1 point), Rarely (2 points), sometimes (3 points) often (4 points) and always (5 points). The reliability result on prevalence of substance abuse revealed a reliability coefficient of 0.71 for Cronbach.

**Results**

What is the prevalence of substance abuse among senior secondary school students in Borno State?

</table>
Results showed responses of respondents on prevalence of substance abuse among senior secondary school students in Borno State. The result showed on item four (4) that 579 (23%) have never abuse anadol, 490 (19%) of the respondents have rarely abuse panadol, 801, (32%) of the respondents abuse panadol sometimes, 411(16%) of the respondents said they often abuse panadol while 261 (10%) of the respondents said that they always abuse panadol. Item five (5) of the same table showed that, 955 (38%) of the respondents never abuse kola nut, 351 (14%) abuse kola nut on rare occasion, 552 (22%) of the respondents abuse kola nut sometimes, 366 (14%) said they often abuse kola nut while 348 (14%) of the respondents said they always abuse kola nut. On the same table item six (6) showed that, 2146 (84%) of the respondents said they never abuse petrol, 102 (4%) said they rarely abuse petrol, 250 (10%) of the respondents sometimes abuse petrol, only 26 (1%) said they often abuse petrol, while 18 (1%) agreed that they always abuse petrol. Item seven (7) showed that 1554 (61.1%) of the respondents never use Alabukun, 632 (24.9%) abuse alabukun on rare occasion, 263 (10.3%) sometimes use alabukun, 46 (1.8%) said they often abuse alabukun while 47 (9%) said they abuse alabukun always. Results on item eight (8) showed that, 2124 (84%) of the respondents never abuse cocaine, 236 (9%) abuse cocaine rarely, 125 (5%) said they sometimes abuse cocaine, 37 (2%) of the respondents said they often abuse cocaine while only 20 (1%) of the respondents said they always abuse cocaine. Item nine (9) of the same table showed that 2007 (80%) of the respondents never abuse valium, 333 (13%) rarely abuse valium, 117 (4%) of the respondents sometimes abuse valium, 71 (3%) of the respondents often abuse valium. Result on item ten (10) showed that, 1782 (70%) of the respondents never abuse marijuana, 479 (19%) abuse marijuana rarely, 183 (7%) sometimes abuse marijuana, 75 (3%) often abuse marijuana while only 23 (1%) said they always abuse marijuana.

The result further showed on item eleven (11) that, 274 (17%) of the respondents never abuse paracetamol, 456 (18%) said they rarely abuse paracetamol, 1373 (54%) said they sometime abuse paracetamol, 225 (8%) often take paracetamol, while 215 (9%) said they always take paracetamol. Item twelve (12) on the same table showed that, 298 (12%) of the respondents never abuse aspirin, 736 (29%) said they rarely abuse aspirin, 1215 (48%) sometime abuse aspirin, 208 (8%) often abuse aspirin while 85 (3%) said they always abuse aspirin. Item thirteen (13) of the same table 4.2 showed that 181 (7%) of the respondents never abuse chloroquine, 1051 (41%) said they rarely abuse chloroquine, 1028 (40%) said they sometimes abuse chloroquine, 239 (9%) often abuse chloroquine while 43 (2%) said they always abuse chloroquine. Item fourteen (14) on the same table showed that 2044 (80%) of the respondents never abuse heroin, 160 (6%) rarely abuse heroin, 144 (6%) sometimes abuse heroin, 142 (6%) often abuse heroin while only 52 (2%) abuse heroin always. Item fifteen (15) on the same table showed that, 167 (7%) of the respondents never abuse septrin, 668 (26%) of the respondents rarely abuse septrin, 1235 (49%) of the respondents sometimes abuse septrin, 311 (12%) often abuse septrin, while only 161 (6%) of the respondents abuse septrin always. Finally result on the table showed that, kolanut, panadol and paracetamol are the substances abuse with high prevalence by the students.

Table 2 showed the result of factorial ANOVA determining prevalence of substance abuse between school location (urban/rural) and gender (male/female) students. The result showed that there is significant difference on prevalence of substance abuse between school location (urban/rural) schools, and significant difference also existed between gender (male/female) students on prevalence of substance abuse.

As regard to interaction effect between school location (urban/rural) schools and gender (male/female) students, the result showed that regardless of gender (male/female) students and school location (urban/rural) prevalence of substance abuse among students was found to be insignificant. Therefore, the null hypothesis is retained and there is no need of post-hock pair wise comparison of honestly significant differences on prevalence of substance abuse between school location and gender.

**Discussion**

This study examines the prevalence of substance abuse among urban/rural senior secondary school students in Borno State, Nigeria. Social cognitive theory by $^{11}$ and psychological theory on behavioral influence by $^{13}$ were adopted to guide the study.

**Prevalence Substance Abuse**

Finding of this study showed that, there is high prevalence in the consumption of substances like panadol, kolanut, paracetamol and septrin among senior secondary school students in Borno State. This finding confirmed with WHO (2008) which stated that in Nigeria almost all human societies engage in the practice of abusing drugs either for psychiatric, religion or social reasons. The$^{14}$ stated that, in Nigeria, self-medication and treatment of illness is common and is still accepted in our contemporary society as advanced by the organ of the legislature against self-medication. This finding is also in line with$^{10}$ who stated that, multiple drug abuse is greater in the urban settlement than rural areas, the author further stated that, abuse of various substances has been reported among students, youth and unemployed.

Finding of this study revealed that, individuals were influenced by the attitude of parents, teachers and peer groups to adopt certain acts and behaviors that could predispose them to substance abuse. This statement agreed with$^{15}$ who stated that, no individual under the influence of substance can and will abide by rule and regulation in any given environment, because substance abuse alter very high percentage of behavior in an individual thereby it redirects the individual behavioral pattern.$^{6}$ concluded that, abuse of substances leads to form attitude toward drugs, low religiosity, educational and psychological disturbance. $^{7}$ opine that, individual’s risk factor such as personality trait and attitude have higher impact of substance use during adolescent. While$^{7}$ also noted that, personality traits such as hostility and low self-esteem are suggested to be positively associated with substance use. It is also established that, behavioral trait of impulsivity is an essential risk factor for the development of substance use problem and dependence among adolescents.

**Conclusion**

In this study the researchers compared the prevalence of substance abuse among senior secondary school students in Borno State, Nigeria. We found out that there is high prevalence in the consumption of substances like panadol, kolanut, paracetamol and septrin among senior secondary school students in Borno State.

Psychological Factors for Organizational Health

Javeria Baig, Ng Kim Soon, Naima Andleeb

Technology Management PhD Program, Professor, Technology Management PhD Program, Faculty of Technology Management and Business, University Tun Onn Hussein Malaysia, Parit Raja, Johor, Malaysia

Abstract

Psychological contract violation has been considered a phenomenon which incorporates a wide range of behavioral responses. This study examined psychological contract violation and organizational cynicism relationship that takes a systematic view in which organisational cynicism considered as negative attitude directed, particularly towards the educational sector. Using a sample of secondary public-school teachers in Malaysia. Results found that psychological contract violation positively significant with cynicism which has negative consequences on employee behavior. Furthermore, the results of the SEM procedure significantly supported the hypothesis.

Keywords: Organizational Cynicism, Psychological Contract Violation, Teachers’ Behavior.

Introduction

Unvoiced emotional issues due to interdependent culture, people feel hesitate to communicate their work-related problems directly. That produce a gap of communication between employer and employee. When a contract is violated, mistrust arises and intense emotional and attitudinal responses get evolve. The violation experiences are believed to engender feelings of unfairness and unmet expectations that damage the sense of reciprocal obligation between employer and employee. Anger, outrage, and resentment have been identified as some of the negative effects associated with psychological contract violations. The violation has also been associated with behavioural outcomes after that employee intention toward their organization will start changing. If employees don’t intend to leave their jobs, then it would be bad news for the organization because either their work-performance would be low or they start having intense relationship with their colleagues. There are some kind of psychological agreement between employers and employee, most of the time such contracts are not fulfilled; when such agreement breached, it increases the emotional intensity which referred to as a contract violation then this psychological contract violation as a negative aspect start positively associating with the organizational cynicism. In this study, we examined the relationship of perceived psychological contract violation (PPCV) and organizational cynicism (OCY) among public school teachers in Johor Bahru, Malaysia.

Literature

Psychological contract violation has been defined as a failure of the organization to fulfill one or more obligations of an individual’s psychological contract. Psychological contracts represent the belief in an obligation of reciprocity between an employee and an organization. It has been further argued that this definition focuses on the rational, mental calculation of what individuals have or have not received and downplays the emotional aspect of the violation. There is a distinction between ‘breach of contract’ and ‘contract violation’. Contracts are highly subjective assumptions of good faith and trust concerning the employee-organizational exchanges existing in the minds of the employees. When individuals feel that the organization has failed to uphold its obligations, the perceived breach occurs. Breach is essentially the identification of perceived unmet obligations; consequently, it may be a relatively short-term phenomenon and may result
in individuals returning to their relatively “steady” psychological contract state, or alternatively, it may develop into full violation. Violation, however, is an “emotional and affective state that may follow from the belief that one’s organization has failed to adequately maintain the psychological contract”\(^6\) (p.230). Contract violation is more than the failure of the organization to meet expectations; responses are more intense because the respect and codes of conduct have called into question because essentially a “promise” has been broken and it is more personalized\(^2\).

Psychological contract violation has been described as multi-faceted\(^6\) because it incorporates a wide range of responses. When a contract is violated, mistrust arises and intense emotional and attitudinal responses evolve \(^2\). Violation experiences are believed to engender feelings of unfairness and unmet expectations that damage the sense of reciprocal obligation between employer and employee. Anger, outrage, and resentment have been identified as some of the negative effects associated with psychological contract violations\(^1,2\). The violation has also been associated with behavioural outcomes such as lower organisational citizenship, reduced commitment, satisfaction, and trust while cynicism increases\(^3-9\).

The cynicism literature has identified the experience of unmet expectations and the feelings of disappointment that go along with it, as one of the primary determinants in the development of cynicism. In fact, unmet expectations have been labeled as a direct antecedent of cynicism in organizations \(^10\). The definitions and elements of both cynicism and psychological contract violations suggest that an employee-related social exchange is inherent in both constructs\(^11\). Not surprisingly, it also has been argued that these two forms of unmet expectations are linked\(^1,13\), suggesting that psychological contract violation is a fundamental determinant of employee cynicism.

The employees expect their organization to fulfill certain obligations in return for their allegiance and hard work. When the organization does not meet its expectations, negative attitudes and behavior are bound to result\(^14\). The majority of this literature provides evidence of changes to the employee and employer relationship at the attitudinal level, but there is little evidence of behavioural outcomes\(^9\). The current research intended to extend literature in behavioural context. Critical commentaries ask to what extent psychological contract violation lead to tangible changes in employee attitude and behaviour, and ultimately organizational performance.

**Relationship of PPCV and OCY**

The violation has also been associated with behavioural outcomes such as lower organizational citizenship, reduced commitment, satisfaction, and trust while cynicism increases \(^3-4\). Psychosocial interpretation of stress and burnout among teachers\(^10\), view that understanding the social context is at the heart of understanding and ameliorating teacher burnout. Psychological contract violation with several works out comes. Their research suggested that intent to quit was positively related with the psychological contract violations, but has negative results with in-role job performance out comes. Moreover, study explained that employee only seek new job when psychological contract violations leads to the feelings of anger and anxiety. Furthermore, if employee doesn’t intent to leave job, it would be bad news for the organization because employee performance will be low and relationship with colleagues will be affected as well. Many researcher also examines the effects of psychological contract violation on an individual employee in an organization and stated that it strongly influences on employees’ behavioral attitude and well-being. He emphasis to extend the research, designing broader studies which examine the interplay among psychological contract breach, so that it can be improved understanding how it influences organizational effectiveness in managing the employment relationship. Psychological contract violation as a negative aspect of the work environment\(^11\). Although cynicism has a number of negative factors which reduced the employee performance and organizational commitment. The study proved that there is some kind of psychological agreement between employers and employee, most of the time such contracts are not fulfilled; when such agreement breached, it increases the emotional intensity which referred to as a contract violation. The finding of the study indicated PCV as a negative aspect positively associated with the organizational cynicism. The magnitude of the effect was found to be strongly related. The effect of breach of psychological contract violation on employee attitude and behaviour. The study was conducted on Albanian banking sector. The unmet expectation of employees influenced the behaviour of them at workplace. The finding of the study highlighted that although the psychological contract has violated but
the intention to leave job does not grow. This case has been explained by the researcher that those employees pays their more intention towards the monitory side and try to establish a more close relation with the employer due to the economic crisis in business and economy. Therefore, it has been assumed that it would be hard to find new jobs in such circumstances. This study reveals the suggestion that proper care should be undertaken during training programs because training itself sometimes raises expectation of promotion in employees’ mind. Research indicated that lack of managerial interaction with subordinates, lack of open dialogues or face to face visibility; ignited bitterness, cynicism, anger or isolation from community activities. The study suggested defusing the possibility of psychological contract violation and future conflicts; managers or policymakers should involve employees’ voice in important decision making. Peng conducted their study on primary and secondary school teachers in China. The findings of the results were found quite different than the previous studies in the American context. The study clarified that people in China hesitate to communicate their problems in direct manners. Therefore, the researcher found unvoiced emotional issues due to interdependent culture. At such time of situation, employees keep their emotions, expectation, and suggestion inside their heart and start assuming that employer is breaching their contract which they assumed psychologically. Paillé envisioned after research that if managers provide such strategic environment for employees which has motivational training programs which also boost the level of communication between employer and employee, reported less psychological contract breach. The finding of the study also indicated that such working environment less trigger negative psychological behaviors.

Hypothesis: There is a relationship between perceived psychological contract violations and organizational cynicism.

Methodology

Three hundred and forty-one secondary public school teachers in Malaysia’s second largest state, Johor participated in this research. Targeted city in that state is Johor Bahru for data collection. Principles of respective schools received questionnaire from researcher and distributed to the teachers and 224 valid questionnaires were returned to test the hypothesis. The response rate was 80%.

Measures

PPCV

Adapted measures by Robinson and Morrison’s, 5-items instruments with the 5-point Likert scales presented by (1) Strongly Disagree and (5) Strongly Agree. Only some words of items have been changed to make it useable for the educational sector. The composite reliability (CR) of PPCV questionnaire was 0.90 with an average variance extracted (AVE) 0.66.

OCY

Organizational cynicism was measured with 7-time scale. Measurement scale presented from (1) Strongly Disagree to (5) Strongly Agree. Only some words of items have been changed to make it useable for the educational sector. The questionnaire yielding a CR 0.86 of organizational cynicism with an AVE .57.

Results

Complete list of the reflective measurement items of this study has been listed in Appendix with the assessment of their psychometric properties. All items Standardized factor loading were significantly relevant to the latent variables (as shown in Appendix) while convergent validity of the instrument has been assessed by the factor loading, Cronbach’s Alpha, composite reliability and AVE. The value of CR for both constructs were greater than 0.50 and the value of AVE were greater than 0.70. Moreover, path analysis of hypothesis found positively significant between PPCV and OCY (β= 0.187, p < 0.001).

Discussions

The findings of the current study suggested that the top management of the schools should be concerned about the deviant reactions of the teachers. The training which provided to the teachers should not increase the expectation of promotion or reward, if there are no such incentives ought to be provide after training. Moreover, teachers should provide enough space to express workplace emotions and voice-out their questions and concerns about themselves or work. The study also found the hesitation of communication in direct manner, quite common in Malaysia, which causes multiple stressors among teachers.

Oral Communication Barriers Facing Arab Medical Students

Mohammad Sohrab Khan¹, Abdur Rahim Salam²

¹PhD Scholar, ²Assoc. Prof Dr, Language Academy, Universiti Teknologi Malaysia, Skudai, Johor, Malaysia

Abstract

Effective oral communication skills are critical to progress and success in academic and health care environments. As it happens, medical students at the College of Health Sciences in Umm Al Qura University in Saudi Arabia are required to perform various academic oral literacy tasks as preliminary requirement of medical curricula. These tasks include task-based learning/problem-based learning (TBL/PBL) sessions, classroom interaction, group/team work, delivering poster presentations and oral presentations. In order to navigate through these tasks successfully, they heavily depend on their ability to communicate their intended meaning—an opportunity for them to exhibit their proficiency at such tasks. Unfortunately, as these students engage in oral interactions their communication ability and progress in getting through such tasks are hindered by various barriers. This study takes a holistic view of understanding the oral communication barriers facing Arab medical students during their performance in the oral literacy tasks. Four colleges from the College of Health Sciences were chosen as targets for this study. The study adopted a qualitative research design where interviews were used as a major tool to collect data from eight current medical students and eight content area professors. Findings reveal that medical students are required to spend significant amounts of time interacting orally with each other as well as with the content area professors during these tasks. It might be argued that success or failure in such tasks depends on the tacit assumption of having good oral communication skills and communicative competence. The students were found to be facing different types of barriers; both Internal and External. The majority of the students were found to have positive attitudes towards the status, prestige and instrumental significance of oral communication skills. However, around one fourth of the students were found to think of English as an alien language and disregarded its instrumental significance.

Keywords: Oral communication, barriers, communicative competence, medical students

Introduction

Learning English as a second language (ESL) has always presented to learners as non-native speakers with unique challenges, ranging from socio-cultural to academic to psychological. Perhaps the most crucial among these challenges are the oral communication barriers that students face in performing various academic literacy tasks in different academic settings. Academic oral literacy tasks in the context of this study refer to interaction-based tasks.

For success in both academic studies and professional world, oral communication skills are clearly a critical need ¹. Hence, before students step into the professional world, their oral communication needs must be taken into consideration at tertiary level. In a study by Hinchliffe and Jolly ², effective communication was ranked fifth out of 47 statements by employers. Keeping in view the substantial contribution the oral skills make towards high individual success in academic life and at work, it is necessary to unravel the complex process of interpersonal communication skills in the first place, point out possible problems the medical students face, and explore ways to enhance oral communication skills to avoid possible breakdowns.

Literature Review

Worldwide, faculty members feel that English
language learners need to enhance their oral communication skills in class discussions and presentations. Speaking of the workplace success, effective communication remains a salient feature. Pedagogically speaking, the ability to engage in discussions and group work is very important for international students. Oral communication skills of Saudi EFL learners happen to be very poor, mainly because they hardly use English as a mode of communication.

According to Clampitt, humans construct meanings in a way that includes the spoken words, the context of the conversation, and the people participating therein. Oral communication in English among non-native speakers is more prone to breakdowns because English language can be a troublemaker in communication due to low English language proficiency where students can face problems related to oral communication skills. Such problems are often the result of not having learnt the pragmalinguistic resources such as vocabulary, grammar and a repertoire of phrases and their appropriate use in the professional context. Therefore, teaching and assessment of communication skills have become mandatory in medical education as it guarantees learning effective communication skills in medical schools which is considered one of the most important skills of a physician.

Previous studies have only looked at the existence of language learning problems in the context of English for General Purposes on exploratory level. According to Basturkmen, specific groups of language learners should be taught the language and communication skills they need or will need to function effectively in their disciplines of study, professions or workplaces. This research goes further by investigating oral communication barriers in specific tasks.

Lack of proficiency in all aspects of English language usage is one of the main difficulties faced by Arab students at tertiary level which acts as affective filters, preventing language learning. Likewise, medical terminology namely sub-technical language can cause communication breakdown among non-native speakers of English. Saudi learners do not possess the required proficiency in oral skills when they join universities. Similarly, Al-Asmari, Al-Ma’shy and Fallaj identified lack of attention, time allocation, negative attitude, fear of making mistakes etc. as barriers to learning English. Negative attitudes can result in students’ poor academic performance and can cause anxiety towards oral communication skills learning. It is in this context that this study aims to explore communication barriers through the following research question.

What barriers negatively affect oral communication skills development of medical students in oral literacy tasks at UQU, Saudi Arabia?

Materials and Method

We conducted interviews with eight current medical students and eight content area professors in order to gain complete understanding of what actually act as affective barriers from the point of view of the subjects. The interviewees were chosen by using purposive sampling method for ‘information-rich’ subjects, based on who would be a source of rich data and information about the topic under study.

Results and Discussion

Oral Communication Barriers and Academic Oral Literacy Tasks:

In response to the interview questions, both students and content area professors revealed some of the most common interaction-based literacy tasks such as TBL/PBL sessions, presentations and weekly learning projects, the skill of presenting being the most difficult for students. This necessitates developing effective communication at academic level as an essential part of the training for all the healthcare students.

Barriers to communication:

Oral communication barriers in the context of this study are classified into two main types: 1) Internal Barriers (IB) and External Barriers (EB). Next, the subtypes of these categories are elaborated in detail.

Internal barriers:

In the light of the data collected from interviews, internal barriers are split into sub-categories: i) Language-Based Barriers (LBB); and ii) Personality-Based Barriers (PBB).

The all the professors responded by pinpointing several areas of weakness the medical students suffer from. “The fragmentary language the students use during
the interactive sessions is indicative of the fact that they lack the necessary language skills.’ (content professor 1 and 7) Moreover, content professor 5 said, ‘Their limited English language ability is always a barrier.’ Content area professor 3 further elucidated that due to grammatical and pronunciation errors students avoid mostly speaking English, especially when the task is graded. Similar views were expressed by interviewee 6 who said, ‘as part of their culture, students happen to be not very expressive which hampers their communication ability and they hardly get the chance to develop their skills.’ Another reason given by content professors 2 and 4 also authenticates the same proposition. ‘Some students feel handicapped as their English is not strong enough.’ (content professor 4) Similarly, content professor 2 said, ‘Poor grasp of English language results in ineffective use of medical terminology. They lack vocabulary and therefore cannot express themselves.’ This finding is also confirmed by Abdulmohsen Al Hassan 30 who found the same results.

Next, findings from the study indicated the most common personality-based barriers such as communication apprehension (CA), stage fear, low level of self efficacy, shyness or lack of confidence, lack of expressiveness and performance anxiety. ‘Various communication problems are seen among students such as lack of confidence, stage fear, and fear of audience. They find it hard to keep their mind clear in time of pressure.’ (content area professor 1) Referring to the low level of self efficacy, content professor 5 explained, ‘they feel that English is a difficult and that they can never learn it.’ Five out of eight students revealed that students make faces and make fun of those who commit mistakes while speaking. This finding confirms the findings by Alamara, Rahim, & Abdullah, Alshahrani and Alandal, Al-ma’shy and Doerr 31, 32, 22, 33. Moreover, the majority of the students feel apprehensive when they have to speak English. They get frightened as all eyes are looking at them. Speaking at the rostrum is very difficult for some of them. (All interviewees) This finding is in line with the studies conducted by McCroskey and Asif 34, 35.

Findings revealed that one-fourth of the students hold negative attitudes towards oral communication. According to content professor 4 and 7, ‘Saudi students’ attitude towards English is positive especially the ones whose parents are educated, but there are some who think of it as a barrier.’ Content professor 3 expounded on the causes of having negative attitude: ‘For some it is a waste of time as they believe they won’t require English when they enter the workplace.’ This finding concurs with the findings by Al-bizrah et al., Guraya et al. and Zainol Abidin et al. 24, 26, 36.

External Barriers:

Owing to the potential damage caused by external barriers, the overview of the interview data deals with inclusively here. All the subjects showed their dissatisfaction with the learning environment at both school and tertiary levels. ‘We don’t have enough time to prepare for presentations as most of our time is consumed by the content subjects.’ (current student 2) The majority of the content professors admitted that medical students especially in their 2nd year are not used to presentations and they find them really hard as they mostly depend on the slides rather than doing them independently. Similarly, the pressure of the performance is so much that they seem lost. ‘Some of the students fail to answer the sequential questions at the end.’ (Content professor 1) Moreover, about the use of Arabic language both inside and outside the classroom, all the interviewees pinpointed that the freedom to use Arabic during lectures damages the students’ English language communicative competence. This finding is supported by a study conducted by Al-Ma’shy, Al Asmari and Abdulmohsen Al Hassan 22, 17, 30.

Educational background, curriculum-related issues, and past negative experiences were seen as major barriers. Current student interviewee 5 informed us about the pathetic situation in schools in Saudi Arabia: ‘We hardly get the chance to speak inside the classroom due to short time, and lecturing style where students just sit and listen to the teachers.’ This finding is supported by a study conducted by Al Maneoai 37 who asserted that the causes of students’ weak command on oral language were due to the insufficient contact hours. According to content professor 5 and 6, ‘MCQs types of exams don’t require them to rely on oral communication skills.’ They also pointed out the lack of training and preparation as potential barriers.

Conclusion

This is a qualitative investigation of the oral communication barriers facing Arab medical students of 2nd and 3rd year enrolled at the College of Health Sciences during interaction-based literacy tasks. The results of the study reveal that Saudi medical students face two
major oral communication barriers: internal and external barriers. The findings of the present study reveal that both internal and external barriers contribute to students’ poor performance and deficient communicative competence. From the analysis of the data it is obvious that as part of medical curriculum, success or failure of students during such tasks can be attributed to possessing or lacking efficient communication skills. In response to the research questions, the current students and content area professors revealed that most of the students find presenting as the most difficult task and students face formidable language-based and personality-based barriers during the oral tasks. The results of the study also indicate that developing communicative competence of students at tertiary level not only benefit them in academic education but sound oral competency can pay off students in their desired workplace. The findings of this study confirm that it should not be taken for granted that communication skills learning can occur on its own. This study has pedagogical implications for structuring curricular reforms by replicating the oral literacy tasks inside the classroom.

Abstract

Technological advances in the present era are very important to all aspects of life in society. One of the current phenomena is the use of media to early childhood. The current problem is that many of the early age children are using unsupervised media from both parents. They are pay less attention to the use of media for children and let them without supervision from others, especially parents. Whereas, in the media there are various contents that are sometimes not suitable for children’s consumption at an early age. Not a few parents who do not know or are not aware of the threat. So that there needs to be an intervention design that aims to increase parental awareness about the importance of knowledge about media literacy in children. The purpose of this paper is to make psycho-education about media literacy to support those who have a children in Early Childhood. This paper uses the literature review method that discusses the problem of media for early childhood and the role of parents in early childhood problems both through journals, books, news and videos, and equipped with interview methods. The findings of this paper are to make health promotion media for parents who have early childhood.

Keywords: Literacy, Media Literacy, Parents, Children, Early Childhood

Introduction

Technological advances in the present era are very influential on human life. Alia & Irwansyah suggest that technological advances have influenced many people’s views on things in everyday life, including the view of being a parent. In the past, parents still allowed their children to play outdoors with traditional games with other children. However, the current phenomenon of parents relies more on digital technology as a media game for children. Many parents who then compete to give access to digital technology to their children and provide digital technology directly in the hands of children 1.

Technology is now the most important aspect of child development. Rowan argues that technology makes children’s lives faster and more efficient. These technologies, namely television, internet, video games, mobile phones, iPods, iPads, and others have developed so rapidly that it makes a family almost unaware of the significant impact and lifestyle changes in their families. In this case parents must fortify children in accessing the media 2.

The American Academic of Pediatrics conducted a study of media use in children. The results of his research show that school-age children are more likely to be negatively affected than the positive impact of watching television. The results also showed that 90% of parents reported that their children who sat in elementary school like watching television, especially soap operas, 43% of all children under the age of 12 watch soap operas every day and 26% of children have TV in the bedroom. In Indonesia, there are also many school-age children who like to watch films, especially drama soap operas 3.
Children now spend more time with the media. Hendriyani, et al. suggested that children access to watching television on average 3 hours in school days and 7 hours on holidays, when playing electronic games about 4 hours and playing the internet about 2 hours without restrictions from both parents. According to data from the Indonesian Internet Service Providers Association in 2016 revealed that data on internet users at the age of children ranged from 768 thousand and on average accessed videos from Youtube⁴.

Current conditions can be found in various regions in Indonesia, when new media has reached children, both those in big cities and those far away in the countryside. Efendi, Astuti, & Rahayu conducted observations in three elementary schools in Bendosari Subdistrict, Sukoharjo Regency. Observations show that more than 70% of children aged 6–12 years have known, owned and were able to operate at least 2 new types of media ⁵.

An example of a technology use is a seven-year-old boy who was burned to death by imitating a scene on television in India. A seven-year-old girl named Prarthana died tragically because of imitating a scene on an Nandini TV series. In an episode, the main character is seen dancing in a circle of fire. Prarthana was reportedly imitating the scene ⁶. The case of a child who was killed was beaten by his friends as a result of watching the television series “Seven Human Tigers”. Has, a grade 1 elementary school student at the Islamic Foundation Zaidar Yahya, the victim of beatings by five of his friends at school, finally breathed his last breath, Tuesday (4/28/2015) night at around 22.00 WIB. Has then played with his friends. In the game, there were friends who hit brooms, hit and kicked, like action soap operas ⁷.

There are many kinds of impacts from this media. Faizal, et al., argues that the positive impact of the media is that it can shape children’s ways of speaking and behavior, formulate self-image and determine expectations ⁸. The negative impact of the media is the potential to pervert the norm and influence value degradation. Not a few sites that expose content with elements of pornography, commercial value, and violence, both tangible content of the site itself and in the form of advertising. This can have an impact on the behavior of children who will tend to emulate it, both in the form of solving problems with acts of violence, carrying out pornographic acts, and so on. Faizal, et al., stated that according to data from the Children’s Media Development Foundation (YPMA), the impact of the media is increasingly prevalent in violence, sexual aggression, physical and mental health, and the formation of instant lifestyles in children ⁹. The fact is that most children behave negatively because they mimic impressions in print and electronic media. This shows how powerful the influence of the media is on the development of the nation’s generation. The purpose of this study is the purpose of this paper is to make a psychoeducation design on media literacy for parents who have early childhood.

**Literature Review**

**Early Childhood**

Papalia and Feldman suggest that early childhood aged 2-6 years are children who are still in the preoperational stage. Preoperational stages are cognitive stages which are characterized by massive expansion in using symbolic thinking, or showing ability, when first appearing in the sensory motoric stages ⁸.

Hartati suggests the characteristics of early childhood are, children are egocentric, children have a great curiosity, children are social creatures, children are unique, children are generally rich in fantasy, children have a short concentration, and child is a potential learning period ⁹.

Suryana presents aspects of early childhood development, namely:

1. Aspects of physiological development
2. Cognitive Development Aspects
3. Development of Social Emotions ¹⁰

**Parenting**

Hurlock suggests that parenting is a way of parents in educating children, namely parents’ efforts manifested in the form of structuring the physical environment, children’s social environment, children’s education, dialogue with children, control of children’s behavior, determining moral values for children ¹¹.

Bibi, et al., stated that there are four types of parenting parents, namely:

Democratic parenting is a pattern of care that prioritizes children but parents do not hesitate in
controlling children. Parents in this parenting style are rational, always underlying their actions on their thinking.

Authoritarian parenting patterns that tend to set standards that must absolutely be obeyed, usually accompanied by threats. This form of parenting emphasizes parental supervision or control that is shown to the child to get obedience and obedience.

Permissive parenting is parenting where parents give as much freedom as possible to children to regulate themselves, children are not required to be responsible and not much control by parents.

Parenting neglect namely parenting parents of this type generally gives very little time and money to their children. When they are widely used for their personal needs, such as work, and also sometimes costs are saved for their children.

Media Literacy

The National Leadership Conference on Media Literacy (Baran, 2009) states that media literacy is the ability to access, analyze, evaluate, and communicate messages. While Rubin (in Baran, 2009) states that media literacy is an understanding of the sources and technologies of communication, the codes used, the messages produced, and the selection, interpretation, and consequences of these messages. Celot & Tornero suggest media literacy skills are individual capacities related to training certain skills (access, analysis, communication).

Baran identified four basic elements of media literacy. The elements of media literacy are:

An awareness of the consequences of the media. Writing and printing have helped change the world and the people in it. The mass media also do the same thing. If individuals reject the consequences of the media in their lives, avoiding the risks that will be obtained and carried during the change will be better than allowing the consequences to run rampant.

An understanding of the process of mass communication. If each individual knows the components of the mass communication process and how these components relate to each other, then that individual can form expectations about how these components can serve them.

Strategies for analyzing and discussing media messages. To consume media messages well, each individual needs a foundation as a basis for thinking and reflection. If an individual makes an understanding, then it must have a tool that can do it (for example, understanding the intentions and consequences of movies and videos such as camera angles and lighting, or strategies behind placing photos on a newspaper page).

An understanding of the contents of the media as a text that gives ideas into the culture and life of each individual.

Method

In its implementation there are several methods applied, namely:

1. Promotion of media literacy to parents.

2. Case studies in the Focussed Group Discussion are given in the hope that parents have initial experience in applying the knowledge gained during the seminar, in addition, by getting to know each other in the FGD forum it is hoped that parents in the future can share their thoughts and help each other in solving media literacy problems in their daily lives.

Psychoeducation Design

Dissemination of the implementation of media literacy workshops conducted in the form of distributing brochures and invitations to parents and communities of parents who have children at the age stage of early childhood development.

Implementation of media literacy workshops. This activity discusses the development of children related to media literacy, children’s mental health, and the importance of selective attitudes in determining content in the use of various media, both social media and mass media (television, newspapers, magazines, etc.). This promotion is provided with the aim that parents can screen appropriate content to consume according to their age, especially for their children. So that they are prepared to face the curiosity of the great child correctly.

Implementation of case studies in FGDs between parents. With the opening of a discussion forum and case studies in a group of parents, it is expected that they will be able to share their thoughts and help each other in solving media literacy problems in their daily lives.
Presentation of FGD results and case studies. The presentation of the results of the discussion and case study aims to share knowledge and the results of discussions between groups. In this presentation, there will also be many issues that occur in the world of media literacy, especially for children.

Evaluation of activities contains a reflection of all activities that have been carried out.

**Conclusion**

The conclusion of this study is that technology users have now touched children from an early age. There are various effects of the use of technology for early childhood. Of course as a parent must control the use of technology in children. Parents must get debriefing related to media literacy. The advice of this study is to implement the design of media literacy promotion for parents who have early childhood.

Evaluation of the School Administrative Stressors’ Psychometrics Properties among Malaysian School Administrators

Lokman Mohd Tahir¹, Mohd Fadzli Ali ², Juhazren Junaidi², Narina A. Samah¹, M. Al-Muzammil Yassin¹

¹Associate Professor, ²Lecturer, School of Education, Universiti Teknologi Malaysia, 81310, Scudai

Abstract

As school leaders, school administrators experience stress while leading their schools. At present, there are only two instruments developed that examine the school administrators’ stress while little attention is given to Malaysian’s schooling context. Thus, this study was conducted to examine the reliability and validity of the stressors that caused stress to the school administrators in Malaysian schools. Items were inspected on its’ reliability, validity and homogeneity. Through the conducted analyses, findings indicate that the items had a good consistency and reliability in measuring the school’s administrator’s stressor within Malaysian context of schooling.

Key words: school administrators, stressors, psychometric properties, Malaysia.

Introduction

Empirically, school administrators experienced stress which can be described as occupational stress in determining the smooth operation of their schools¹. In understanding the stress factors among the schools’ administrators, previous studies revealed several causes: high demands from stakeholders ², lack of power in decision making and the existence of organisational politics ³, isolation ⁴, escalating demands and workloads ⁵, and even equivocal understanding towards changes within the educational legislation and policy⁶. In studying the experience of stress within school administration profession, researchers ⁷; ⁸ believed that the experience of stress is an extremely serious issue which is capable of affecting school administrators’ health, well-being and even their performance which leads to weakness in their decision making capabilities⁹. According to Nhundu (1999)¹⁰ the occupational stress experienced by school administrators have affected their behaviours such as anxiety, angriness, fatigue even absentee from work, annoyance, or uneasiness ¹ and burnout ¹¹.

In measuring the school administrators’ experience of stress, Gmelch and Swent (1982)¹² have introduced the standard instrumentation or index called the Administrative Stress Index Questionnaire (ASIQ). The 30 items questionnaire was employed within various educational administration settings such as Australian schools ⁸ and Canadian schools ⁶. Within the 30 items, four factors of stress were identified: role-based stress (administrators’ perceptions and belief about their tasks), task-based stress (routine activities such as meetings, preparing reports), boundary spanning stress (negotiations and gaining public support) and lastly conflict mediating stress (resolving differences and conflicts, handling issues and problems). In addition, the ASIQ instrument was also tested within different administrative professions such as the higher education deans ¹³ and the administrators of the nursing faculty ¹⁴. Later, in 2007, Philips, Sen and McNamee (2007)¹⁵ developed an instrument with 14 items while studying the prevalence and causes of stress among United Kingdom’s head teachers.

Even though both instruments are relevant instrumentation in measuring school administrators from various educational system, there are several constraints in terms of the methodology within Malaysian school administrators’ context such as language barriers, educational structure and context and finally the element
of culture which are typically different from the US and UK schools. Admittedly, there is currently lack of published literature regarding the psychometrics that measure the occupational stress experienced by school administrators in Malaysian schools regardless whether it is from the primary or secondary settings.

Research aims

This study is purposely conducted to examine the reliability and validity of the school administrators' occupational stress in Malaysian schools. Specifically, we examined the internal consistency, validity and homogeneity of Malaysian school administrators' occupational stress.

Method

Participants

Respondents for this study were 195 school administrators from 45 schools who provided their feedbacks on their stressors. In terms of the school administrators’ genders, 105 (48.6 %) were males and 90 (41.7 %) were females school administrators. During the surveys’ distribution, 125 school administrators have the experience as school administrators between 1 to 5 years (57.9 %), 40 administrators between 6 to 10 years (18.5 %) and 30 school administrators have experienced more than 11 years (13.9 %). In this study, the school administrators were operationalised as school’s senior assistants and principals.

Instrumentation

For the quantitative data collection, a survey instrument that comprised of two main sections was used in this study. In section A, school administrators were asked to provide their reflections on the demographics factors such as their gender and years of experiences as school leaders. In section B, school administrators were asked to select the lists of managerial and leadership aspects that might be the source of their stress. Twelve translated items in section B, which were adopted from Phillips, Sen and McNamee (2007) [15] who studied the prevalence and causes of stress among head teachers throughout the United Kingdom’s schools. The section also requested the school administrators to select and indicate their stressors on a five-point Likert scale, anchored as highly stress = 4, moderately stress= 3, slight stress = 2, and no stress = 1. All items were shown and presented in a positive response and presented in the questionnaire using the Malay language which the school administrators considered as familiar.

Procedure and data analysis

Prior to data collection, permission in distributing the questionnaires was obtained from the State Department of Education. All fulltime school administrators were provided with the questionnaires. At the time of distribution, all school administrators were informed on the purpose of the study and their anonymity was guaranteed.

After all data were obtained, the reliability and their homogeneity were later analysed. In determining the reliability, the Cronbach’s Alpha coefficients values were used with suggested values of more than 0.70 was decided as an accepted value. As for determining the homogeneity of the items, the correlational matrix was employed and inter-items correlation values that ranged 0.20 to 0.70 were deemed good reliability [16,17].

The next phase was the factor analyses which comprised of the Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA). As for the EFA analysis, the items’ factor loadings, the extraction method, the number of factors to be extracted, and percent of variance will be inspected to ensure the underlying structure of the questionnaire. Items which have factor loading values below than 0.30 will be discarded as suggested by Hair et al (2012) [18]. Specifically, the Principal Component Analysis (PCA) procedure was selected as the extraction method. Factor solution was rotated using the Varimax rotation procedure. As continuation, the confirmatory factor analysis was performed using the AMOS software and maximum-likelihood estimation procedures, and considering the covariance matric as the input of the analysis. In determining the good evaluation on the measurement model, the fit statistics were also calculated. In this case, the Comparative Fit Index (CFI), the roots mean square error of approximation (RMSEA) which recommended by Hu and Bentler (1999) [19]. At the same time, the Chi-squared statistic to the degrees of freedom (χ²/df) was also calculated to ensure the acceptable fit for the measurement model.

Results

Reliability analysis

First, the Cronbach’s alphas values for the all 12 items were analysed and inspected based on respond
provided by Malaysian school administrators. Based on the descriptive analysis, the Cronbach’s alphas values were detected more than 0.70 values. The overall Cronbach’s alpha for 12 items measured at 0.843 and all 12 items have the Cronbach’s alphas values ranging 0.81 to 0.86. Specifically, the reliability analysis were based on reported 12 items: managing changes in schools (α = 86), inspectorate visit to school (α = 83), understanding curriculum changes (α = 82), improving teachers’ competencies (α = 82), ensuring students’ academic achievements (α = 81), solving teachers’ issues and conflicts (α = 82), solving students’ disciplinary issues (α = 82), lack of parental supports (α = 84), managing financial in schools (α = 83), leading instructional practices (α = 83), SDE/DOE visit to school (α = 83), and finally completing SDE/DOE tasks (α = 82).

Secondly, the inter-correlational matrix showed the homogeneity of the items which most correlational values were ranged between 0.20 to 0.60 values. The overall Cronbach’s alpha for 12 items measured at 0.843 and all 12 items have the Cronbach’s alphas values ranging 0.81 to 0.86. Specifically, the reliability analysis were based on reported 12 items: managing changes in schools (α = 86), inspectorate visit to school (α = 83), understanding curriculum changes (α = 82), improving teachers’ competencies (α = 82), ensuring students’ academic achievements (α = 81), solving teachers’ issues and conflicts (α = 82), solving students’ disciplinary issues (α = 82), lack of parental supports (α = 84), managing financial in schools (α = 83), leading instructional practices (α = 83), SDE/DOE visit to school (α = 83), and finally completing SDE/DOE tasks (α = 82).

Exploratory Factor Analysis (EFA)

In determining the factor structure of the administrator stressor items, the EFA analysis was executed. Before commencing with the EFA analysis, the Kaiser-Meyer-Olkin’s and Bartlett’s values were inspected to determine the reliable adequacy of the size of the sample. Based on the EFA analysis, the KMO values for sampling adequacy were measured at 0.864. The Bartlett’s test indicated significant values ($\text{Approx } \chi^2 = 897.165; df = 66; p < .0000$).

Note: Factor loadings that shown are more than 0.5.

Through the Principal Component Analysis (PCA) using the Varimax rotation, two factors were identified. The first factor comprised of six items (item12, item11, item10, item8, item7, and item9) which can be classified as school administrators’ stressors to solve problems (SSSP) which being their stressors. The second group of items which also contained six items (item4, item5, item6, item1, item2 and item3) basically represented the school administrators’ stressors to improve the school performance (SSSP). Based on the percentage of variance, all 12 items contributed to 55.508 per cent of variance which considered as accepted values with factor 1 contributed 39.256 % and factor 2 contributed 16.252 percent.
**Confirmatory Factor Analysis (CFA)**

In this study, the CFA models were evaluated through the fit statistics on fitting the data. To compare, three models were evaluated through three phases of modification indices procedure in obtaining the suitable model that fit the data.

Based on Table 2, the first model (Model 1) that was evaluated and the model did not provide an acceptable fit to the data ($\chi^2$ (195) = 137.865; CFI = .895; RMSEA = .091) due to the RMSEA value which is higher than 0.050. Through the modification indices procedure, Model 2 and 3 was created. In model 2 and 3, even though the fit statistics able to provide an acceptable values which can fit to the data ($\chi^2$ (195) = 88.642; CFI = .954; RMSEA = .065), it did not provide an acceptable fit to the data ($\chi^2$ (195) = 74.945; CFI = .940; RMSEA = .055) based on the RMSEA value which is also higher than 0.50. Finally, the fourth model (Model IV) able to provide an acceptable and satisfactory fit to the data ($\chi^2$ (195) = 58.794 CFI = .984; RMSEA = .040) based on the RMSEA value which much lower than 0.50. The relationship between SSSP and SISP was $r = 0.56$ and all factor loadings exceeded the values 0.40 which shown in Figure 1 below the measurement model of school administrators’ stressors.

---

**Fig. 1. The CFA model (SSSP: Stress Solving School Problems; SISP: Stress in School Performance)**
**Discussion and Conclusion**

This study was an attempt to measure the psychometrics properties of school administrators’ stressors items which was adopted from Philips, Sen and McNamee (2007)’s [15] items and later improved for Malaysian school administrators’ stressors study. In obtaining the psychometrics properties on the stressors, the items were distributed to 195 school administrators in obtaining their self-perceptions and feedbacks on the stressors or causes of stress while leading their schools.

Statistically, all 12 items were evaluated through three rigorous tools in determining its’ reliability and validity through the Cronbach’s alpha values, the Exploratory Factor Analysis (EFA) and the Confirmatory Factor Analysis (CFA) in evaluating the internal consistencies of the items within the questionnaire. Through the Cronbach’s alphas analysis, data indicated on high reliability on the items studied which was more than 0.70. Further, items were analysed through the EFA analysis which two remaining purpose: clustering the items, extracted factors and percentage of variance that contributed to the items’ constructs. From the analysis, two factors were extracted which represented the clustering of stressors among the school administrators in Malaysian schooling context. The final phase of the analysis involved the development of the measurement model through the CFA analysis. Based on the CFA model, revised model IV that went through a few processes on model modifications have been chosen as the suitable revised model that represented the school administrators’ stressors with high and satisfactory values on fit statistics.

Admittedly, this study also has its’ limitation. Firstly, this study relatively used small sample size of 195 school administrators from Malaysian schools which can be replicate with much bigger sample size. Secondly, it is appropriate to use only one sample category in assessing this item due to the different preferences of stressors that contributed to their stress level. For instance, a study should only use all principals from primary or secondary schools. To consider, items on the school administrators’ stressors could be adopted and useful in examining the reliability and construct validity from other administrative positions such as the university and college’s dean, the head of departments and other relevance posts. As for future consideration, administrator’s gender and educational background should be considered in examining the stressors while leading or administrating their schools. In addition, future qualitative research through interviews with all school administrators could be used as sources for triangulation purpose.

Abstract

Iskandar Malaysia Ecolife Challenge (IMELC) started in 2013 among Year 6 students (12 years old) to foster low carbon awareness and practice. In order to trace the sustainability of the low carbon awareness and practice, a survey was carried out in 2016 to determine if the students maintain the awareness and practice. A number of 4,439 secondary students from Form 1 until Form 4 participated in the survey. The questionnaire constructed has an acceptable level of reliability of 0.686 using Cronbach’s alpha analysis. Descriptive and inferential statistics were used to determine the differences between IMELC and NO IMELC group. The analysis shows that students who have undergone IMELC obtained higher mean scores in terms of the awareness and practice but lower in knowledge. Further analysis using t-test shows that the differences are significant. The discussion suggested that, the strength of IMELC is in changing the behavioral characteristic and have not yet capable for behavioral change.

Keywords: Environmental education, low carbon society, informal learning

Introduction

Environment sustainability is an ongoing effort to ensure that every human has the skills and attitudes about their action and the natural world. In Malaysia, EE is brought into the education in 1991¹ as a component across the curriculum. The interdisciplinary elements seen in EE however have its potential to be underrepresented as sustainable goal due to teachers’ lack of awareness regarding environmental issues². Thus, this explained why green movement can only be seen in non-formal education setting like co-curriculum activities or school clubs³. In this paper, it focuses on non-formal environmental education program known as IMELC and examine on how it become an empowerment to learning about environmental issues.

Literature Review

Low Carbon Society (LCS) is an initiative among many countries to reduce GHG emission without compromising economic and social development⁴. Most countries like Australia⁵, China⁶, Japan⁷, United Kingdom⁸ and Belgium⁹ initiated their study by focusing on changing the behavior of community practices and building the low carbon society. The initiative was driven with an intention to achieve low carbon society⁷, limit the rise of temperature⁹, sustainable urbanization⁶ and sustainable development⁸ through behavior and environmental understanding. Therefore the trends in EE are known for their mutual themes which are aimed to change individual understanding and behavior¹⁰.

The Iskandar Eco-Life Challenge Project (IMELC) is designed to allow students to participate with eco-
household accounting\textsuperscript{11}. The targeted audience, students of 6th grade are exposed with the idea of energy saving, the practices of energy saving and what is mean by energy saving. IMELC is listed as one of the significant educational program in Low Carbon Society Blueprint for Iskandar Malaysia 2025 under Action 6, Measure 6.1\textsuperscript{12}. The execution of IMELC in primary school is done through non-formal education setting where the activities are conducted as part of co-curriculum activities. The IMELC program is targeting energy consumption within home and students are given the chances to adopt the basic auditing. Following these activities, the level of awareness is expected to increase and eventually lead to behavioral change.

**Data Collection Method**

This study employed an explanatory research design by using a survey as a research method. The survey was intended to trace the sustainability of the low carbon awareness and practice. A number of 4,439 secondary students from Form 1 until Form 4 at secondary school in Johor participated in the survey. These students are identified as IMELC while for the rest of the students they are being analysed as NO IMELC. The participants had previously engaged with IMELC since 2013 when they were in primary school Year 6. Table 1 below provide an overview about students’ demography.

*Cases might not total up as there are missing persons*

From the analysis, the first two constructs were measured using a 3-point scale (1 - not agree, 2 - neutral, 3 - agree) while the knowledge construct used objective questions with multiple choice answers (refer Table 2).

The survey was developed to measure three constructs which are awareness, practices and knowledge of low carbon. The instrument was constructed with 64 items and tested for its reliability using Cronbach’s alpha analysis, which is 0.686. The reliability indicates that the instrument is good enough to measure the constructs because the value exceeds 0.6\textsuperscript{13}. There are 23 items used to measure awareness, 23 items for practices and 18 items that represent knowledge constructs. The scale construction is done using Rasch analysis during pilot study.

**Data Analysis**

The following data was analysed using SPSS 14.0. The comparison between these groups was made with an intention to understand the impact of IMELC on the students as social agency after they reached secondary school. How well these students are able to function as social agent after they had participated in IMELC program and how they might differ if compared to the NO IMELC group. Table 3 provides an illustration about the mean analysis for each construct for the two groups. The analysis showed that, generally students who participated in IMELC achieved higher means for awareness (2.0770) and practice (2.2329). Oppositely, for knowledge construct, the NO IMELC group showed slightly higher mean which is 0.2954 compared to IMELC group that obtain 0.2914. Although the differences of means between the groups are relatively small, yet the differences of means are worth to be further investigated using inferential statistic.

</tbody>
</table>

An independent sampled t-test was conducted and showed significant differences for both groups. From Table 4, the analysis indicates that the differences are significant with the p value .000 (p < 0.05). This measure also confirmed that for the knowledge construct, IMELC program does not provide many differences between the groups. This is explained by the higher mean obtained by the NO IMELC group in comparison to the IMELC group. Clearly IMELC has successfully sustained the change to cultivate awareness and practice among the participants. While these might represent the significance of IMELC, the knowledge construct however is identified as the barrier to this claim because the NO IMELC group has a higher mean value.

**significant at p < 0.05

As seen, both IMELC and NO IMELC groups showed a significant relationship between the constructs. For this
measure, this study found that the value of relationship is weak because it falls within the range of 0.20 until 0.39 and below. Referring back to this study argument to explain the extent of IMELC impact to change students’ habitual practice, it showed a significant improvement according to different mean scores. However, the correlation between awareness and practice is higher compared to their relationships with knowledge. This shows that awareness and practice of low carbon may have very little link with knowledge. In other words, knowledge may not be the indicator of good practice and awareness on low carbon. Social transformation as aimed by IMELC is able to change students’ habitual practice.

**Discussion**

This paper is based on the analysis of means, t-test and correlation to determine the impact of IMELC program towards low carbon awareness, practice and knowledge among the participants. Activities in IMELC includes completing a workbook, carry out recycling, electricity and water saving projects at school and at home. IMELC provides an opportunity for the students to explore, discuss, and reflect their own practices and values toward the environment with a community wide focus. One of the particular concern about IMELC as EE program is to examine the extent to which this program can be claimed as instrumental for the behavioral change. This is following Tidbal and Krasny position that EE program which does not has focus on behavioral changes will eventually achieved only behavioral responses from the participant. However, this analysis was done without analysing the contribution made by the formal education which students received in school to differentiate between IMELC and NO IMELC groups. This is why the discussion is focused more weather the IMELC is instrumental for behavioral changes for students’ habitual practice as they entered secondary school.

In this study, the practice and awareness are identified as the variables that are potential to promote behavioral change among the participants through IMELC program due to slightly higher mean score. But, the analysis implies that both groups have significant mean differences. The findings suggest that it is difficult to claim that IMELC program is able to promote behavioral change as the NO IMELC group has significant result as well. But, what can be concluded is the IMELC program through the environmental activities is capable to affect behavioral responses. Following DiClemente and Prochaska, it can be said that IMELC only achieve either contemplation or preparation stage for behavioral change. This study however unable to claim toward what extent IMELC might cause behavioral changes. At contemplation stage, the students are aware of the problem and probably taking into consideration for an action. While at preparation stage, students are assumed to have an intention for behavioral change. Which this might explains on why there is only small mean difference between both groups. The IMELC is targeting at helping the students to become rationally competence to change their negative behavior when they are presented with the facts using the workbook. Students’ responses about their practice are directed to accepted norm practice known as habit at home rather than behavioral choice. This suggests that, by treating students as reacting to the environment, IMELC program is only beneficial to change the behavior with a routine character and the changes is only reach towards either contemplation or preparation stages. This showed that IMELC is gravitating with the outcome from theoretical framework of Moloney et al as it only capable with changing the social character.

This claim has also considered on why knowledge constructs has the highest mean yet showed a very weak correlation with the practice and awareness. The knowledge construct has the weakest relationship between the variable. The similar trend between the groups suggests a probability that the student’ awareness and practice are not driven by their knowledge about the environment. The implication from the analysis claimed that even with the right information that students acquire from IMELC, this however only lead to responsible behavior and not towards the behavioral changes. Thus the rational choice that students made are influenced by their awareness and practices gained from formal or non-formal EE. This is supported by the correlation analysis that showed a very weak correlation between knowledge and other constructs.

The implication of this finding suggests that the practice and awareness are achieved through moral persuasion and unlikely from their knowledge about environment. This is similar to the study of Wong and Phang where the level of knowledge among the primary students is relatively low compared to attitude and practice. With this limitation with the outcome
from IMELC, knowledge construct is essential to be comprehensively integrated to the development of strategies of IMELC. The knowledge can be regard as the gap which hindering the behavioral changes as intended by IMELC. More work is needed to study the causal relationship and impact of IMELC towards the students as they progress to secondary schools especially qualitative research to explore how the students gain awareness and practice of low carbon through IMELC.

**Conclusion**

Treating an EE program not as a cultural tool has constrained IMELC from becoming the tool that can guarantee behavioral changes in learning through discourse consciousness. The acknowledgement of the relevance to change the practical consciousness is a step forward that IMELC has greatly offered in their educational practice. IMELC is capable to seek for change in students’ practical consciousness like habit formation and routine through their awareness. This study concludes that a non-formal setting adopted through IMELC clearly is helpful to increase students’ awareness and practice in low carbon. When considered collectively about the theoretical perspective underline IMELC, the structure of IMELC require an improvement that can lead to the behavioral changes.

Development and Validation of Behavioural and Health Sciences Research Instrument

Ado Abdu Bichi¹, Rohaya Talib², Rahimah Embong³, Hawa Syamsina Md Supie⁴, Nor’Aida Khairuddin¹, Muhammad, ‘Afifi Mohd Diah¹

¹Graduate Scholar; ²Senior Lecturer, School of Education, Universiti Teknologi, Malaysia, Johor Bahru, Malaysia; ³Associate Professor; Department of Education, Dakwah & Islamic Civilization, FKI, Universiti Sultan Zainal Abidin, Malaysia; ⁴Lecturer, Academy of Language Studies, UiTM, Shah Alam, Selangor, Malaysia

Abstract

Instruments development and validation are critical to research endeavour in social, behavioural and health sciences. This study provides a systematic review of published researches on instrument development, evaluate the current practice and limitations in the process. To achieve this objective published research works were search and selected in February, 2019 from four academic databases: PsycINFO, Scopus, Web of Science and Google scholar, with the search terms as ‘instrument development and validation’, ‘item development’ and ‘construction of questionnaire’ there was no restrictions at initial stage. At the end of the selection process, 25 published works between 2010 to 2019 were evaluated. The analysis of the reviewed studies was done based on the stated objective current practice and identified limitations. The results showed that, the item generation, theoretical analysis or item review and psychometric analysis were the common basic steps adopted by scholars when developing research instrument. With regards to the limitations in the process, the study identified three main limitations; sample characteristic related limitation, Methodological and psychometric limitations. In view of these findings, as significant number of the reviewed studies were reported to have methodological and sample related weaknesses. Thus, this systematic review can serve as an important reference point for scholars to ensure adequate attention are paid to the methodological elements when developing and validating research instruments adequate for making valid inferences to inform policy making and implementations.

Keywords: Instruments development, validation, psychometric analysis

Introduction

Instruments are an indication of latent construct; they assess attitudes, behaviours and theoretical circumstances we hope to exist because of our theoretical conception of the world, however can’t appraise directly¹. Instruments are ordinarily used to capture a feeling, behaviour, or an act that cannot be caught in a self-contained variable or item. The utilization of different items to gauge a fundamental latent variable can furthermore represent, and confine, item explicit estimation error, which prompts progressively precise study outcomes. A number of instruments or scales have been constructed that can assess a range of social, psychological and behavioural practice.

Instrument development is not, in any case, a conspicuous or a straight forward. There are numerous means to instrument development, there is vast terminology within these methods, the work can be costly and tedious, and statistical analysis frequently needed is sometimes complex. Further, numerous behaviour science degrees do ignore preparing students on scale development. In spite of the accessibility of a lot of specified literature on the instrument development, there are various fragmented instrument used to assess physical, mental and behavioural attitudes that are central research²,³.

Measurement scales comprises of collections of item uncovering dimensions of hypothetical factors that cannot be directly observed. Several researchers have confirmed that, instrument development includes complex as well as systematic procedures that need hypothetical, operational and methodological rigor.

**Objective of the Study**

The objectives of this review are to review the: (i) current practices of the instrument development and (ii) main limitations in the instrument development.

**Instrument Development**

Instrument or scale development consists of different process usually complex because of the procedures and interrelationships between various latent constructs. The complex steps have been summarised into three main stages; Item generation, theoretical analysis and Psychometric analysis.

**Item Generation:** in this stage, the scholars give hypothetical support to the preliminary item pool. Strategies for the initial item generation can be considered as inductive, deductive or a mixture of the two. Deductive strategies include item generation base on a broad literature survey and previous scales. Then again, inductive strategies base item development on subjective information in regards to a construct acquired from opinions gathered from the target audience or population e.g., centre interviews, focus group discussions, exploratory research methods.

**Theoretical Analysis:** here, the investigator examines the content related validity of the new instrument, to make sure that the underlying item fool reflect an ideal intended construct to be measured. The content related validity assessment is required, since interpretations made depended on the items in the instrument. To guarantee the content validity, the researcher can employ experts or judges or target population to ensure that, the theory expounded in the investigation appropriately represent the construct under consideration.

**Psychometric Analysis:** in this stage, the instrument developer ought to appraise if the new instrument is reliable and have construct related validity. The construct validity is directly associated with the behaviour an instrument is actually measuring. This denotes to the extent to which decision can be justifiably made from the observed scores to the hypothetical constructs about which these observations are expected to contain data. The construct related validity can be measure using confirmatory factor analysis (CFA) Exploratory factor analysis (EFA) or with discriminant, criterion and convergent validity. Thusly, the score consistency is measure using reliability which is normally estimated by using any of the test-retest internal consistency, item-total correlation and split-half methods.

**Methodology**

To achieve the objective of this systematic review, the researchers search, identified and selected research-based article on instrument development from four popular databases i.e PsycINFO, Web of Science, Scopus and Google Scholar. During the search no restrictions were placed in the search of the published articles, the search was done in February 22, 2019 using search terms as “Instrument development”, Instrument Validation”, “Scale Development” and Developing Questionnaire”. During the initial stage, there were no limitations on searching relevant studies, all research papers, concept papers, conference and other technical or government reports. Hence, the search found a total of 577 papers which stated about instrument development. In the second phase the numbers of articles were reduced to 104 articles that were empirical studies on instrument development and validation, lastly 25 articles that satisfied the inclusion criteria of articles developing newly instruments excluding those for achievement test were included in the study. The selected articles were limited to those published from 2010 to 2019. The analysis was done in line with the objective of this review. The summary of selection steps is presented on a methodological flowchart represented in figure 1.
Results and Discussions

This study reviewed 25 articles selected after rigorous selection process, all the articles 100% were evaluated. The authors reviewed the selected articles in line with the study’s objectives.

Objective 1: Current practices of the instrument development

In addressing this objective, the findings were considered on the three main stages identified in the literature on instrument development in the preceding section. The results of the analysis as presented in Table 1, showed that;

In line with item generation, 50% (n = 8) of the studies revealed that, deductive technique exclusively in item generation, 13% (n = 2) revealed that, inductive technique was applied in item generation. However, 38% (n = 6) use a combination of inductive and deductive strategies in item writing. This finding means that, although a number of studies applied deductive methods exclusively, the majority such as used a combination of the inductive and deductive strategies. This mixture is in line with the recommended methods for developing new measuring instrument (1), the results obtained here disagree with the findings of similar systematic reviews that, many studies reported used deductive technique exclusively in the development and validation of instruments (17).

In line with theoretical analysis, majority of the studies 12(75%) used experts’ opinions in modifying their developed items. However, the rest of the 4(25%) resorted to using the target population to refine their items. This finding revealed that, panel of experts or judges are the most widely used in analysing the content validity of the instrument i.e (18)(16)(19)(20). Previous studies revealed that, experts’ opinion were the most prevailing qualitative techniques for reviewing the poor item in the instruments (17)(9). A survey of literature carried out stressed the significance of the judges or experts in the content validation of the initial items in the newly developed instrument (21).

In line with psychometric analysis, the results indicated that, only 1 (6%) of the studies used each of EFA, CFA and DV in assessing their construct validity. Two (12%) of the studies are reported to have used convergent validity. Most studies opted to combine EFA and CFA (30%, n = 3). Similarly, 6 (38%) of the studies...
reported shows that, they used both CFA and EFA in validating the constructs of their research. The review also led to the discovery among the studies that, 5 (31%) did not used any of the factor analysis or any statistical techniques to validate their studies. The studies reported internal consistency reliability with the test-retest as the second most employed technique in establishing instrument reliability. The results indicated that, 70% of the articles used one kind of factor analysis or the other, some of the studies that, used factor analyses such as CFA and EFA includes(12)(20).

**Objective 2: Main limitations in the instrument development**

The findings in this review led to identification of several shortcomings which can be classified into three main categories mostly associated with instrument development. The limitations are (a) Sample Characteristics noticed in about 75% of the articles; (b) Methodology related limitations, 60% and (iii) psychometric limitations, 45% (see Table 2).

</table>

The sample characteristics limitations were recorded in two main ways or directions. First, is the issue related to the type of sample used in developing the instrument, the sample used in many studies is homogeneous in nature(22)(7)(23)(24)(19). Others used convenient sampling(25)(26). (18) maintained that, “the participants for all stages of the study were US consumers; therefore, this study cannot be generalized to other cultural contexts.” Or certainly, “convenience samples are weaknesses of this study, as they pose generalizability questions,” as stressed by(27).

Cross-sectional survey methods were the main methodological limitation as reported in most of the studies(19)(18)(7). Data gathered using cross-sectional design carries distinctive limitation attached to this type of research approach, which is failure to identify the determine the underlying correlation. Researchers such as(16)(18) acknowledged that, utilizing a research instrument at some point in time hinders the ability to evaluate the underlying relationship. Another methodological problem reported in some studies is the use of web-based surveys(28).

The major psychometric limitation was lack of rigorous demonstration of the construct validity and the reliability in most of the studies(22)(12) termed the lack of evident temporal stability such as test-retest reliability. Inaccurate psychometric techniques that most of the studies used during instrument development were likely to affect the results or outcome.
Conclusion and Recommendations

This study examined different studies that proposed instrument development processes and practice, identified and reported its main shortcoming. There are two principle limitations of this study. first relates to the limited number of studies used. It may be of interest to know that, review many articles may bring about different and much more improved findings. Secondly, the researchers reviewed higher quality articles and we consider that, had the less quality articles were reviewed several shortcomings may have been revealed. Furthermore, the facts might confirm that researchers attained all stages of instrument development but there was incomplete report by the researcher. The researchers are however, not in the position to control these limitations. Similar studies should also be conducted with a relatively large number of articles to reveal a number of issues that affect the validity of research instruments.

Abstract

This paper investigates the state estimation of a stochastic model for the spread of HIV in mobile heterosexual population. The transmission of HIV model with the force of infection in the multiple patches is investigated for the varying population. In this paper, we introduce a novel concept of the observer model like a transmission of HIV model to estimate the spread of HIV in mobile heterosexual population. The boundedness and the equilibrium points have been found for the error state of observer model and original model. The global stability properties are analyzed by the concept of Lyapunav function. The stochastic model is introduced for the examination of the stochastic stability of the positive equilibrium. The stochastic and deterministic models of the system are compared and analyzed. Finally numerical examples and corresponding diagrams are presented to support the results.

Keywords: HIV/AIDS, Mobility, Multiple patches, Synchronization, Epidemiology, Equilibrium points, Stochastic Stability, Lyapunov function.

Introduction

AIDS (Acquired Immune Deficiency Syndrome) is one of the diseases caused by Human Immuno Deficiency Virus transmitted through heterosexual and homosexual population. The first cases of AIDS were reported in 1981, and two years later the HIV was identified as the virus that causes AIDS¹. Nowadays all over the world, the number of HIV infected people and the AIDS death rate has been raised rapidly and the ratio of infected population level shows is found high between all developing countries². Mathematical models can help to predict the effectiveness of control measures on the spread of HIV and other sexually transmitted diseases³–⁵. The dynamics of transmission of HIV is quite complex and there is no other human infection which has the same epidemiological characteristics with a similar mode of transmission. The growth of migration among populations further increases the contact between individuals in different patches and consequently it might trigger more epidemics⁶–¹⁰. Heterosexual contact is the major mode of transmission of HIV between susceptible(males and females) and infected (males and females).

If the nonlinearity of the system is known, linear active control techniques can be easily designed according to the given conditions of the biological system to achieve control and synchronization globally. There are no derivatives in the controller or the Lyapunov exponents are not required for their execution and these characteristics gives an edge to the control techniques on other conventional control approaches. Various forms of HIV/AIDS have attracted the attention of mathematicians for the last two decades. It is now significant to synchronize the HIV/AIDS chaotic system for further research purposes in order to reduce the causes of mortality due to HIV in the future²¹.

Motivated by the above, the main goal of this paper is to employee the stabilization of HIV models and extend the work in randomness, boundedness and find the equilibrium points of the error state of dynamics in transmission of HIV/AIDS related epidemics on
theoretical ground. Based on the Lyapunov stability theory, the local and global stability properties of error state of the dynamical system of HIV transmission are analyzed and discussed. We consider the problem of the robustness of the model with respect to white noise stochastic perturbation around its positive endemic equilibrium. Numerical simulations and graphs will be furnished to show the efficiency and the performance of the proposed approach.

This paper is organized as follows. In section 2, the system description are discussed. In section 3, we discuss about the boundedness of solution and dynamical behaviour of boundary as well as interior equilibrium points of the deterministic model. In section 4, we introduce the stochastic model. In section 5, we analyze about its stability properties by means of Lyapunov function. In section 6, Numerical simulation and discussion. Finally in section 7, conclusion are discussed and results presented.

System Description

Let $x_1^{(r)}, x_2^{(r)}, y_1^{(r)}$ and $y_2^{(r)}$ denotes the number of the susceptible females, infected females, susceptible males and infected males in patch ‘r’ at time ‘t’ respectively, relative to a scaling parameter $V = \frac{2B}{\mu}$ for the varying population. The evolution of susceptible (Males and Females) and infective(Males and Females) among ‘r’ and ‘j’ patches for the varying population which is different population sizes among the patches. The dynamics of the spread of HIV in a mobile heterosexual population is

$$
\begin{align*}
\frac{dx_1^{(r)}}{dt} &= \frac{\mu}{2} - \sum_{j=1}^{r} \beta_{rj} \frac{y_2^{(j)}}{n_M} x_1^{(r)} - \mu x_1^{(r)} \\
\frac{dx_2^{(r)}}{dt} &= \sum_{j=1}^{r} \beta_{rj} \frac{y_2^{(j)}}{n_M} x_1^{(r)} - (\mu + \gamma) x_2^{(r)} \\
\frac{dy_1^{(r)}}{dt} &= \frac{\mu}{2} - \sum_{j=1}^{r} \beta_{rj} \frac{x_2^{(j)}}{n_F} y_1^{(r)} - \mu y_1^{(r)} \\
\frac{dy_2^{(r)}}{dt} &= \sum_{j=1}^{r} \beta_{rj} \frac{x_2^{(j)}}{n_F} y_1^{(r)} - (\mu + \gamma) y_2^{(r)}
\end{align*}
$$

where $n_F^{(r)} = x_1^{(r)} + x_2^{(r)}$, $n_M^{(r)} = y_1^{(r)} + y_2^{(r)}$ and $\beta_{rj}$ denotes the infection rate of susceptible(males and females) in patch ‘r’ by infected individuals from patch ‘j’. The force of infection in each patch ‘r’ is described by the term $\sum_{j=1}^{k} \beta_{rj} \frac{y_2^{(j)}}{n_M}$ for susceptible females and $\sum_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_F}$ for susceptible males. The natural death and death due to AIDS diseases are at the rate of $\mu$ and $\delta$ and the infected individuals develop AIDS at the rate of $\gamma$.

Figure 1: Flow Diagram for the spread of HIV in a mobile heterosexual population
Figure 1 depicts the flow diagram for the spread of HIV in a mobile heterosexual population.

The observer for the dynamics of spread of HIV in a mobile heterosexual population is

\[ \frac{dx_1(r)}{dt} = \frac{\mu}{2} - \sum_{j=1}^{r} \beta r_j \frac{y_2(j)}{n_M} x_1(r) - \mu x_1(r) \]

\[ \frac{dx_2(r)}{dt} = \sum_{j=1}^{r} \beta r_j \frac{y_2(j)}{n_M} x_1(r) - (\mu + \gamma) x_2(r) \]

\[ \frac{dy_1(r)}{dt} = \frac{\mu}{2} - \sum_{j=1}^{r} \beta r_j \frac{y_2(j)}{n_M} y_1(r) - \mu y_1(r) \]

\[ \frac{dy_2(r)}{dt} = \sum_{j=1}^{r} \beta r_j \frac{y_2(j)}{n_F} y_1(r) - (\mu + \gamma) y_2(r) \]

\[ (2) \]

The Estimation of state error dynamics can be obtained by

\[ e(t) = \hat{x}(t) - x(t); e_1 = \hat{x}_1(r) - x_1(r); e_2 = \hat{x}_2(r) - x_2(r) \]

\[ e_3 = \hat{y}_1(r) - y_1(r); e_4 = \hat{y}_2(r) - y_2(r); e_4^{(j)} = \hat{y}_2^{(j)} - y_2^{(j)} \]

\[ e_5^{(j)} = \hat{x}_2^{(j)} - x_2^{(j)}; e(t) = \hat{x}(t) - x(t); \hat{e}_1 = \hat{x}_1(r) - \hat{x}(r) \]

\[ \hat{e}_2 = \hat{x}_2(r) - \hat{x}_2(r); \hat{e}_3 = \hat{y}_1^{(r)} - y_1^{(r)}; \hat{e}_4 = \hat{y}_2^{(r)} - \hat{y}_2^{(r)} \]

which gives,

\[ \begin{align*}
\dot{e}_1 &= -\sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_M} [y_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}] - \mu e_1 \\
\dot{e}_2 &= \sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_M} [y_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}] - (\mu + \gamma) e_2 \\
\dot{e}_3 &= -\sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_M} [y_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}] - \mu e_3 \\
\dot{e}_4 &= \sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_F} [x_2^{(j)} e_3 + y_1^{(r)} e_5^{(j)}] - (\mu + \gamma) e_4 \\
\end{align*} \]

\[ (3) \]

**Boundedness, boundary equilibria and stability**

**Equilibrium Points:-**

The Error state model equation (3) has the following non-negative equilibria namely

\[ E_1 = (0,0,0,0); E_2 = (0, \sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_M} e_1^{(j)}, 0,0); E_3 = (0,0,0, \sum_{j=1}^{k} \beta r_j \frac{y_2(j)}{n_F} e_3^{(j)} + y_1^{(r)} e_5^{(j)}) \]

The \( E_1 \) is free equilibrium point. In \( E_2 \), except infected female remaining states are free equilibrium state, it is called infected female equilibrium point. In \( E_3 \), except infected male remaining states are free equilibrium state, it is called infected male equilibrium point. The in-host state equilibrium points are
Global Stability Analysis

Theorem

If

\[ (e_1 - e_1^*) = \sum_{j=1}^{k} \frac{\beta_{rj}}{n_M^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}}{e_1} \right) + \mu; (e_2 - e_2^*) \]

\[ = (\mu + \gamma) - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_M^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}}{e_2} \right) \]

\[ (e_3 - e_3^*) = \sum_{j=1}^{k} \frac{\beta_{rj}}{n_F^{(j)}} \left( \frac{\tilde{y}_1^{(r)} e_3 + x_2^{(j)} e_3^{(j)}}{e_3} \right) + \mu; (e_4 - e_4^*) \]

\[ = (\mu + \gamma) - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_F^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_3 + e_5^{(j)} y_1^{(r)}}{e_4} \right) \]

then the in-host equilibrium point \( E^* \) is globally asymptotically stable.

Proof:

Consider the Lyapunov function

\[ V = \sum_{i=1}^{4} \delta_i (e_i - e_i^*)^2 \log \left( \frac{e_i^*}{e_i} \right) \]

\[ \dot{V} = \delta_1 (e_1 - e_1^*) \left[ - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_M^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}}{e_1} \right) \right] - \mu \]

\[ + \delta_2 (e_2 - e_2^*) \left[ \sum_{j=1}^{k} \frac{\beta_{rj}}{n_M^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_1 + x_1^{(r)} e_4^{(j)}}{e_2} \right) \right] - (\mu + \gamma) \]

\[ + \delta_3 (e_3 - e_3^*) \left[ - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_F^{(j)}} \left( \frac{\tilde{y}_1^{(r)} e_3 + x_2^{(j)} e_3^{(j)}}{e_3} \right) \right] - \mu \]

\[ + \delta_4 (e_4 - e_4^*) \left[ \sum_{j=1}^{k} \frac{\beta_{rj}}{n_F^{(j)}} \left( \frac{\tilde{y}_2^{(j)} e_3 + e_5^{(j)} y_1^{(r)}}{e_4} \right) \right] - (\mu + \gamma) \]

\[ \dot{V} = - \delta_1 (e_1 - e_1^*)^2 - \delta_2 (e_2 - e_2^*)^2 - \delta_3 (e_3 - e_3^*)^2 - \delta_4 (e_4 - e_4^*)^2 \]

which is negative definite function. Hence \( E^* \) is globally asymptotically stable by Lasalle’s invariance principle.

Stochastic Differential Equations

In this section, we allow stochastic perturbations of the variables \( e_1, e_2, e_3, e_4 \) around their values at the positive equilibriums \( E^* \) in the case when it is locally asymptotically stable. We consider the white noise stochastic perturbations which are proportional to the distance of \( e_1, e_2, e_3, e_4 \) from \( e_1^*, e_2^*, e_3^*, e_4^* \). So the stochastically perturbed system is given by
\[ \begin{align*}
de_1 &= -\left[ \sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} \phi_{ij}^{(j)} e_1 + x_1^{(r)} e_4^{(j)} \right] dt + \sigma_1 (e_1 - e_1^*) d\omega_t^1 \\
de_2 &= \left[ \sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} \phi_{ij}^{(j)} e_1 + x_1^{(r)} e_4^{(j)} \right] dt + \sigma_2 (e_2 - e_2^*) d\omega_t^2 \\
de_3 &= -\left[ \sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} \phi_{ij}^{(j)} e_3 + x_2^{(r)} e_3^{(j)} \right] dt + \sigma_3 (e_3 - e_3^*) d\omega_t^3 \\
de_4 &= \left[ \sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} (\hat{x}_2^{(j)} e_3 + y_1^{(r)} e_5^{(j)}) \right] dt + \sigma_4 (e_4 - e_4^*) d\omega_t^4 \\
\end{align*} \]

where \( \sigma_i, i = 1, 2, 3, 4 \) are real constants, \( \omega_i = \omega_i(t), i = 1, 2, 3, 4 \) are independent standard Wiener processes.

The stochastic differential equation (4) can be centered at its positive equilibrium \( E^* \) by change the variables,
\[ u_1 = e_1 - e_1^*; u_2 = e_2 - e_2^*; u_3 = e_3 - e_3^*; u_4 = e_4 - e_4^* \]

To analyze the stochastic stability of \( E^* \), we consider the linear system (5) of around \( E^* \) as follows:
\[ du(t) = f(u(t))dt + g(u(t))d\omega_t \]

where,

\[ u(t) = [u_1(t) \quad u_2(t) \quad u_3(t) \quad u_4(t)]^T \]

\[ f(u(t)) = \begin{bmatrix}
-\sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} \phi_{ij}^{(j)} + \mu & 0 & 0 & 0 \\
0 & -(\mu + \gamma) & 0 & 0 \\
0 & 0 & -\sum_{j=1}^{k} \frac{\beta_{ij}}{n_{ij}^m} \phi_{ij}^{(j)} + \mu & 0 \\
0 & 0 & 0 & -(\mu + \gamma)
\end{bmatrix} \]

\[ g(u(t)) = \begin{bmatrix}
\sigma_1 u_1 & 0 & 0 & 0 \\
0 & \sigma_2 u_2 & 0 & 0 \\
0 & 0 & \sigma_3 u_3 & 0 \\
0 & 0 & 0 & \sigma_4 u_4
\end{bmatrix} \]

In (5) the positive interior equilibrium \( E^* \) corresponds to the trival solution \( u(t) = 0 \).

Let \( U \) be the set \( U = (t \geq t_0) \times \mathbb{R}^n, t_0 \in \mathbb{R}^+ \). Hence \( V \in C^2_0(U) \) is a twice continuously differentiable function with respect to \( u \) and a continuous functions with respect to \( t \). With reference to [20], we have

\[ LV(t,u) = \frac{\partial V(t,u)}{\partial t} + f^T(u) \frac{\partial V(t,u)}{\partial u} \frac{1}{2} Trace[g^T(u) \frac{\partial^2 V(t,u)}{\partial u^2} g(u)] \]

where
\[ LV(t, u) = \frac{\partial V(t, u)}{\partial t} + f^T(u) \frac{\partial V(t, u)}{\partial u} \frac{1}{2} \text{Trace}[g^T(u) \frac{\partial^2 V(t, u)}{\partial u^2} g(u)] \] (6)

where

\[ \frac{\partial V}{\partial u} = \text{Col}\left( \frac{\partial V}{\partial u_1}, \frac{\partial V}{\partial u_2}, \frac{\partial V}{\partial u_3} \right); \]

\[ \frac{\partial^2 V(t, u)}{\partial u_2} = \left( \frac{\partial^2 V}{\partial u_j \partial u_i} \right), i, j = 1, 2, 3, 4 \]

**Theorem:** If there exists a function \( V(u, t) \in C^2(U) \) then it satisfying the following inequalities,

\[ K_1 |u|^p \leq V(t, u) \leq K_2 |u|^p, LV(t, u) \leq -K_3 |u|^p, K_1 > 0, p > 0. \] (7)

then the trival solution of (5) is exponentially p-stable for \( t \geq 0 \) and the trival solution of (5) is globally asymptotically stable when \( p = 2 \).

**Theorem:** Suppose that \( \sigma_i^2 < 2(\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{\sigma_i^2}) \), \( \sigma_2^2 < 2(\mu + \gamma) \), \( \sigma_3^2 < 2(\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{\sigma_i^2}) \) and \( \sigma_4^2 < 2(\mu + \gamma) \) then the free state solution of (5) is asymptotically mean square stable.

**Proof:**

Let us consider the Lyapunov function,

\[ V(u) = \frac{1}{2} \left[ w_1 u_1^2 + w_2 u_2^2 + w_3 u_3^2 + w_4 u_4^2 \right] \]

where \( w_i, i = 1, 2, 3, 4 \) are real positive constants to be chosen in the following. It is easy to check that inequalities (7) hold true with \( p = 2 \)

Now the Itô Process becomes,

\[ V(u) = w_1 \left[ -\left( \sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} y_2^{(j)} + \mu \right) u_1 \right] + w_2 \left[ -\left( \sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} x_2^{(j)} + \mu \right) u_2 \right] + \frac{1}{2} \text{Trace}[g^T(u) \frac{\partial^2 V(t, u)}{\partial u^2} g(u)] \]

\[ V(u) = -w_1 \left[ (\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} y_2^{(j)} + \mu) u_1 \right] - w_2 \left[ (\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} x_2^{(j)} + \mu) u_2 \right] + \frac{1}{2} w_1 \sigma_1^2 u_1^2 + \frac{1}{2} w_2 \sigma_2^2 u_2^2 + \frac{1}{2} w_3 \sigma_3^2 u_3^2 + \frac{1}{2} w_4 \sigma_4^2 u_4^2 \]

\[ V(u) = -w_1 \left[ (\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} y_2^{(j)} - \frac{1}{2} \sigma_1^2) u_1^2 \right] - w_2 \left[ (\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} x_2^{(j)} - \frac{1}{2} \sigma_2^2) u_2^2 \right] + \frac{1}{2} \text{Trace}[g^T(u) \frac{\partial^2 V(t, u)}{\partial u^2} g(u)] \]

which is asymptotically mean square stable.

**Numerical Simulation and Discussion**

In this paper “State estimation of a stochastic model for the spread of HIV in a mobile heterosexual population” is analyzed, where the total population is divided in to two groups, susceptible and infected. It is observed that the boundary equilibrium point E* is feasible. If the decreasing rate of susceptible females, males and infected females, males population remains a certain threshold value then the positive equilibrium is feasible. Moreover all the solutions are converges to the equilibrium point. It is observed that, if \( \sigma_1^2 < 2(\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} y_2^{(j)}) \), \( \sigma_2^2 < 2(\mu + \gamma) \), \( \sigma_3^2 < 2(\sum_{j=1}^{k} \frac{\beta_{rj}(j)}{n_p} x_2^{(j)}) \), \( \sigma_4^2 < 2(\mu + \gamma) \) then the positive equilibrium is feasible.
\( \sigma_3^2 < 2(\sum_{j=1}^k \beta r_{ij} x_2^{(j)}) \) and \( \sigma_2^2 < 2(\mu + \gamma) \) then the stochastic perturbation model is asymptotically mean square stable. It is observed that the deterministic model is robust with respect to stochastic perturbation.

For the numerical simulation, the fourth order Runge kutta method is used to solve the system of transmission of HIV in a mobile heterosexual population differential equation. The parameter values are taken as \( \mu = 0.1 \), \( \gamma = 0.12 \) and \( r = 10 \) patches. The population in varying population and the initial densities are taken as susceptible females is 5877, infected females is 4515, susceptible males is 6357 and infected males is 2306. From this analysis, it is observed that for varying total population the “State estimation of a stochastic model for the spread of HIV in a mobile heterosexual population” is stabilized.

Figure (2)–(4) depict the estimation of susceptible females in spread of HIV mobile heterosexual population. When time span increasing, the observer \( \hat{x}_2 \) estimate the state \( (x_2) \) with different initial populations. Its means, the estimation error becomes zero. With the selection of random numbers, the number of observers and susceptible females were taken as 1624 and 9844, respectively.

Figure (5) and (6) depict the estimation of infected females in spread of HIV mobile heterosexual population. When time span increasing, the observer \( \hat{y}_2 \) estimate the state \( (y_2) \) with different initial population. With the selection of random numbers, the number of observers and infected females were taken as 6482 and 4515, respectively.

Figure (7) and (8) depict the estimation of susceptible males in spread of HIV mobile heterosexual population. When time span increasing, the observer \( \hat{x}_1 \) estimate the state \( (x_1) \) with different initial populations. With the selection of random numbers, the number of observers and susceptible males were taken as 3487 and 7665, respectively.

Figure (9) and (10) depict the estimation of infected males in spread of HIV mobile heterosexual population. When time span increasing, the observer \( \hat{y}_1 \) estimate the state \( (y_1) \) with different initial populations. With the selection of random numbers, the number of observers and infected males were taken as 8267 and 2306, respectively.

Table 1: Absolute values of the Error System

| t  | 5, 10, 15, 20 | 14 | 6 | 21 | 16 | 12 | 11 | 28 | 15 | 13 | 9 | 18 | 22 | 12 | 8 | 24 | 22 | 5 | 9 | 19 | 12 |
Numerical simulation has been carried out with observer values more than the corresponding initial values for the original system. Thus the following observer values have been taken: susceptible females-7896, infected females-6752, susceptible males-8765 and infected males-5623. The corresponding absolute values of the error system provided by equation (3) have been calculated with a multiplication factor of 1000 for the disturbance to the system = 0.1, 0.2, 0.3, 0.4 and 0.5 for \( t = 5, 10, 15 \) and 20, as presented in Table (1). Considering the sum of squares of errors for a given \( \theta \) and different values of \( t \), it is observed that the error is the least for \( \theta = 0.5 \). Maintaining the same initial values of the original system and slightly increasing each one of the observer values, the error is found to be the least for \( \theta = 0.4 \). From this result, it follows that the error system attains convergence for some value of \( \theta \in [0.4, 0.5] \). Thus our analysis provides a method of simulation to examine convergence of the error system.

Figure 2: Estimation of susceptible females in spread of HIV mobile heterosexual population

Figure 3: Observation for susceptible females in spread of HIV mobile heterosexual population
Figure 4: Estimation of susceptible females in spread of HIV mobile heterosexual population

Figure 5: Observation for infected females in spread of HIV mobile heterosexual population
Figure 6: Estimation infected females in spread of HIV mobile heterosexual population

Conclusion

In this Paper “State estimation of a stochastic model for the spread of HIV in a mobile heterosexual population” model is investigated. The boundedness and the equilibrium of the state estimation model has been found and identified. The in-host state equilibrium point of the state estimation model is global asymptotically stable by the constructing suitable Lyapunov function. The stochastic perturbations is also introduced to the system by using stochastic differential equations and It process. It is shown that the zero solution of this stochastic system is asymptotically mean square stable through the construction of the Lyapunov function. Finally, Numerical examples are analyzed and diagrams are presented which supports the results.

Effect of Electronic Cigarette Usage on Oral Health: 
A 6-Month Prospective Study

Ahmad Faisal Ismail¹, Aini Fatimah Ghazali², Azlina Daud³

¹Department of Pediatric Dentistry & Dental Public Health, Kulliyyah of Dentistry, ²Kulliyyah of Nursing, International Islamic University Malaysia, ³International Islamic University Malaysia

Abstract

A growing trend towards a new type of alternative device where cigarette smokers use electronic cigarette (e-cigarette) to receive nicotine is a concern to global health. Questions have been raised about the safety of the prolonged used of e-cigarette as it claims as the system to substitute nicotine from tobacco. However, to date there has been little documented evidence regarding the oral health effects of e-cigarette users. The objective of this study was to evaluate the oral health status of e-cigarette users based on time effect. This observational, cohort study conducted at Kulliyyah of Dentistry, International Islamic University Malaysia, involved 45 participants. Oral health examination was conducted by a single trained examiner at baseline and 6-month according to the World Health Organization (WHO) criteria. Dental caries was evaluated using the DMFT index, while the periodontal parameters that were assessed used plaque, gingivitis, gingival bleeding, and calculus indices. The results were compared using Paired t-test, the outcomes of which were significant for Gingival Index (p=0.048), Calculus Index (p=0.034), and DMFT Index (p=0.002). In conclusion, e-cigarette posed a detrimental effect on oral health status with increased caries prevalence and poorer gingival health.

Keywords: Oral Health, E-cigarette, Caries, Periodontal Health

Introduction

Oral health is a part of healthy living as oral health is more essential than we recognize. Oral health is like a gate to our health status as it provides clues as to one’s overall health. Correspondingly, around the globe, smoking has been distinguished as a significant hazard factor for lung tumour, heart illnesses, fringle vascular sicknesses and respiratory ailments¹. Furthermore, smoking has various all encompassing consequences related to oral depression, for example, periodontal diseases, impaired wound healing, dental caries, precancerous lesion and is linked to oral carcinoma². In 2015 there are approximately 22.8%(4,991,458) smokers in the Malaysian population, age 15 and above³. Along with this growth of cigarette smokers that pertain to global health, there is an increasing concern about the impact of e-cigarette trends on society. Recently, there has been a growing trend that is a new type of alternative device where cigarette smokers use electronic cigarette (e-cigarette) to receive nicotine⁴. This has gained in popularity when it was introduced in the market⁵. The current, prevalent e-cigarette users among Malaysian adults are aged 18 and above, which is an estimated number of 602,122 users - 3.2% of the population⁶. Questions have been raised about the safety on the prolonged used of e-cigarette as there are no product standards that control the levels of dosage, contaminants, toxins or carcinogens in the liquid used in e-cigarette or the aerosols they produced⁷. E-cigarette are claims as the system to substitute nicotine from tobacco⁸. To date there has been little documented evidence regarding the oral health effects on e-cigarette used. A short observational study that has been conducted in 2011 has reported repercussions such as mouth irritation, sore throat, dry mouth, and mouth ulcers after 4 weeks of usage. The high levels of nicotine dosages suggest that these products may increase the risk of experiencing periodontal damage⁹. A cross-sectional, comparative study with non-smokers group conducted in 2017 reported that e-cigarette users...
exhibited poorer periodontal markers. However since oral disease is dynamic, the study lacks of explanation on the effect of e-cigarette usage over time. Although extensive research has been carried out on the effects of cigarette smoking on oral health, the study of e-cigarette on oral health are unclear and scattered. Hence, this study aimed to investigate the detrimental effects of cigarette usage on oral health in 6-month period.

Materials and Method

Sample size

This study was approved by IIUM Research Ethical Committee (IREC 556) and was conducted in accordance with Declaration of Helsinki 1964 and its later amendments. With reference, the sample size calculation was done using the OpenEpi software (version 3.01). Data from previous studies indicated that the occurrence of the outcome was 31% among the exposed groups. Based on this assumption, along with a Type 1 error of 95% and type 2 error of 80%, a sample size of 34 was required. However, after allocating for a 10% dropout rate, 38 participants were needed.

The dental examination was conducted at the Kulliyyah of Dentistry Specialist Clinic. During the visit, each participant was given a participant information sheet. Participation in this study were voluntarily and they can quit the study at any point of time. After being informed about the aims and nature of the study, participants will sign a consent form prior to starting the clinical dental examination.

Dental Examination

Dental examination was performed by a single, trained examiner using dental mirrors, dental explorers, periodontal probes, and light from the dental chair. All data were recorded in clinical forms. For intra examiner reliability, reliability was conducted prior to starting the research project. A coherence Kappa value of at least 0.6 indicated good reliability. The result was shown Cohen Kappa value of 0.86.

Dental Caries

The caries experience of the participants were assessed using the DMFT Index. The diagnosis of caries was made by visual and clinical examination with no radiographic assistance.

Periodontal Parameters

The periodontal health of the participants was measured using the Plaque Index, Gingival Index, Gingival Bleeding Index, and Calculus Index according to protocol by Loe.

Statistical Analysis

All data was analyzed using the Statistical Package for Social Sciences (SPSS) software (version 23.0) (SPSS Inc, Chicago, Ill., USA). The differences in the caries statuses and periodontal health between the e-cigarette users were compared using Paired Sample T-Test according to a normal data distribution. The level of statistical significance was set at 0.05.

Results

A total of 45 participants were included. The mean age for the e-cigarette users was 22.92 years. At 95.6% males were the predominant gender in the use of e-cigarettes. Besides this all the participants were Malays (100%); no other race was recruited into the study. As for the level of education, the majority of participants had secondary education (60.0%). Pertaining to monthly income, 80% of the e-cigarette users earned less than RM4999. Moreover, a majority of the participants were single (82.8%), employed (64.4%) and had been vaping for 1-5 years (100%). The summary of the demographic data is presented in Table 1.

A paired t-test was conducted to evaluate the oral health status of e-cigarette users at baseline and a 6-month follow-up as presented in Table 2. There was a statistically significant difference in Gingival Index ($p=0.048$), Calculus Index ($p=0.034$) and DMFT Index ($p=0.002$). The mean of Plaque Index is lower at baseline ($M=23.20$, $SD=20.71$) compared to the 6-month follow up ($M=23.82$, $SD=19.46$). Meanwhile, for Bleeding Index, the mean is higher in baseline ($M=25.35$, $SD=18.05$) compared to the 6-month follow up ($M=22.79$, $SD=16.78$) respectively. There were no significant differences in the other periodontal health parameters, as the $p$ values of the Plaque Index and Bleeding Index were 0.855 and 0.355 respectively.

</table>
The present study evaluated and compared the oral health of the e-cigarette users. The ages of our participants were mostly young adults from age 20 to 29 years old, where the means was 22.92 years. These findings further supported the idea that the most e-cigarette users among those in age of 18 to 24 years

In this study, periodic follow-up was done on baseline and six-month follow-up to see the detrimental effect of e-cigarette use towards oral health. It was advisable to have a dental check-up at least once a year. Another key point on the frequency of dental check-up, study shows two dental cleanings a year gave huge advantages to individuals with at least one of the three hazard factors, while individuals with a few of the hazard components may require more than two cleanings per year. Since the effects of e-cigarette use on oral health are unknown, 6-month intervals of follow-ups can provide information on oral health status.

The connection amongst smoking and periodontal attachment loss has often been reported in epidemiological studies but not for e-cigarette usage. In cigarette, the gingival appearance in chronic smokers is known to be disease-masking as the gingiva bleeds less and appears hardened as compared to that of non-smokers. The vasoconstrictive properties of cigarette smoke reduce gingival inflammation. These findings further imply that those who use tobacco are at an increased risk of periodontitis, regardless of the type of tobacco. Furthermore, there is clear evidence by Adamopoulos, Van De Borne, & Argacha that vasoconstriction, which is promoted by nicotine, can cause peripheral vasoconstriction which lead to reduced blood supply. In this study, the significant findings in Gingival Index imply that while the e-cigarette does not contain tobacco, it does contain nicotine.

The Bleeding Index was not significant for e-cigarette users. It was reported that the usage of e-cigarettes that contain nicotine increased capillary perfusion to the buccal mucosa. In addition, previous animal studies have demonstrated enhancements in the muscular and intestinal blood flow, but reductions in the peripheral perfusion. However, in our study, it can be inferred that the oral mucosa blood flow in our participants was not affected by e-cigarettes usage.

Smoking has been linked with the increased incidences of dental caries. It has also been suggested that the increase in the development of caries is independently related to the level of tobacco consumption. Since, e-cigarette does not contain tobacco, the link between dental caries and e-cigarette usage is still ambiguous.

**Conclusion**

Very few studies have been conducted to assess the oral health status of e-cigarette users in the global and local context. This study is the first cohort that investigated the effect of e-cigarette usage on oral health. The results of our study can be a reference for the detrimental effects of e-cigarette towards oral health. Moreover, it has also explained the harmful effects of nicotine consumption on periodontal health.

Monitoring of Smart Systems Using Internet of Things in Healthcare

Suvarna Pawar¹, H.R. Deshmukh²

¹Research Scholar, ²Head (Comp & IT), Dr. Gode College of Engineering, Amaravati

Abstract

In healthcare domain significant advancements are taking place day by day. Exploration of technology overrules all traditional approaches used by the medical practitioners. Under healthcare, there is always a chance for uncertainty and imprecision under various aspects of medical diagnosis process. The recent survey shows tremendous rise in people who are at the diseased conditions irrespective of age factor. In such situations on the contrary doctors also need assistance for fast tracking ongoing number of patients. But at some point due to lack of medical facilities in emergency situations, there is always a need of smart devices and smart technology to assist doctors and even to the patients for better management of any kind of disease. It does strengthening of existing healthcare services. This paper surveys different existing approaches and procedures utilized for early analysis of heart disease which works like hazard alerts to spare human life.

Keywords: healthcare, Internet of things, monitoring devices, sensor network, smart devices

Introduction

The Internet of Things (IOT) is a major technological revolution in computing and transmission media. Whereas IOT is majorly a network associated with multiple objects which communicate with each other with unique ID using different technologies like RFID, NFC, Bluetooth etc. which follows standard communication protocols. Now-a-days researchers have been working hard on IOT to know different perspective of it.

According to IOT is a sophisticated network of things that is uniquely identified and where each of these objects connected to the server which provides necessary assistance. According to this, it is clear that every object has its own characteristics and which prominently play its important role namely in different situation.

This seduction draws our attention on IOT and all above; IOT is the most happening solution for healthcare industry. As in this approach, patients has integrity to work on his symptoms and able to manage himself in any of emergency situation. Even it is always possible to stay tune through mobile to the medical practitioners and to his family member because of unique ID. Some of the unending diseases like diabetes, heart disease, hypertension or any other severe diseases which required long lasting medical attention and hence healthcare domain is most important essential need of human life.
plays very critical role with the help of information technology and internet technology. The elements are interdependent on each other. All of them are acting as greatest support to each other. Following figure shows necessary components of IOT on e-Healthcare domain.

![Fig.2 Shows Components of IOT e-Healthcare](image)

This paper is structured as written in section II we will review research done in healthcare domain using internet of things. Section III focuses on results obtained through existing technologies and section IV addresses on conclusion and future scope.

**Literature Survey**

The bird eye view on healthcare domain shows that internet of things is worldwide technology used to give better opportunities and service to the disease survivors as there is rise in chronic illness. IOT technology right away provides superior and effective solution to remotely monitor the patients using sensor network which not only accumulates the data on cloud but also preprocess it using machine learning approach and finally demonstrates desirable outcome using smart devices.

Stephanie Baker et al.\(^5\) also expresses on healthcare as technologies, challenges and its opportunities. They proposed a standard model for healthcare systems. In this article they presented the state-of-art research relating to each of the model. It calculates their strengths, weaknesses and actual applicability for wearable IOT healthcare systems. Among different challenges of IOT, author also focused on security, privacy, wearability, less-power consumption is attempted. Here they placed focus on sensors for monitoring various health parameters, short and long range communications standards and cloud technology.

Siddesh Sonawdekar et al.\(^6\) proposes Smart hospital title using IOT. As the patient in intensive care unit needs continuous attention towards the critical situation. Problem may occur if in urgency patient doesn’t get proper care. Even if the real time parameters are not up to date, then also problem persists. So author implemented a solution which accumulates different information about through sensors network and then transfer this sensed data to internet server so that caretaker can continuously monitor patients’ health from remote location. In turn hospitals or any organization can able to save electricity component. This is happening due to global warming or due to burning of different fossil fuels. These fuels play important role in electricity generation. Author claimed that these IOT techniques gives much better platform for smart IOT hospital systems.

Bernald Vrijens et al.\(^7\) along with Vodafone presented adherence in healthcare by connecting the dots theory. He also addresses about why the patients are not seriously following up the treatment as it is the major important part of their life. Even what is the adherence factor which matters a lot. Every medical practitioner is looking for something new and better treatments for acute conditions for the patients. But if adherence has not been improved then it could harm in a massive portion to the patient and it even leads to developing a new medication at no cost. In this case, many smart appliances are there in the market which can sustain the patient to get out of it. But for this patient must adhere themselves at certain level to use smart packaging, smart pills, smart delivery or smart diaries also.

Higinio Mora et al.\(^8\) emphasis on remote healthcare monitoring of the patients in mobile environment using IOT framework. In this paper, a distributed framework is proposed based on IOT technology which continuously records human biomedical parameters involving physical activities. Major advantage is providing flexibility in computing the health application by using resources from available devices inside the body area network. This model is also proposed for the environment where intensive data collection and high data processing is required. It can able to predict the sudden death but also possible injuries if any. This solution has been monitoring especially data acquisition from athletes which could overflow the computing capabilities of the wearables and mobile devices. Here centralized system is proposed to do deeper analysis and takes advantage of big data technology on historical aggregated data. In this article main aim of the proposal is to optimize the use of biomedical sensors and computing resources for being able to provide advanced mobile applications.
to the user. Ms. Priti Satpute et al.10 also projected the health parameters measurement using microcontroller ATMEGA 328P programming which converts data and send it to LCD and other component. Later on this data is getting converted into digital form. Use of emergency switch is also provided in case of non-working condition of the system.

Amir Rehmani et al.9 explored e-health gateways using IOT under healthcare. They used fog computing approach. They emphasis on bridging point i.e. gateway is needed between sensor infrastructure network and the internet. This gateway is used to perform basic tasks such as translating between the protocols used in the web and sensor network. In this paper, author exploit the strategic positions of such gateways at the corner of the network to explore more services like data processing, local storage, embedded data mining etc. Hence it is called as smart e-gateways. Fog is acting between sensors and network. It not only reduces the burden of the sensor network but also resolves issues in the network. It enables massive implementation of ubiquitous health monitoring system in clinical environment. This system proved the enhancement in overall intelligence, energy efficiency, mobility, performance, interoperability, security and reliability.

Mostafa Haghi et al.11 proposed an research on wearable device under the domain internet of things. Wearable devices are heart of the bigger part of the exchanges held in IOT innovation. As there is dramatic increase in the number of elderly people who seeks attention in healthcare. In current years there is more improvement in the semiconductor technology, so sensors are cumulatively does its investigation to its full range of parameters closer to its realization. In today’s world time is precious; people who are working outside spend their most of time in doing various tasks which in turn ignore their health and fitness. Goal of the research paper is to audit the wearable human services gadgets both in scientific papers and commercial efforts.

**Analysis for existing healthcare systems**

After studying some of the existing healthcare systems which is used for continuous attention seekers to provide them better opportunity to self-manage their diseased attire and tackle with acute conditions. Under analysis of existing systems, following graphical presentation shows the exponential growth in use of IOT technology.

![Fig.3 Shows drastic increase in IOT technology](image)

**Conclusion**

Extensive literature of healthcare era is a major challenge. To fulfill the challenge up to some extent is possible due to innovation in internet of things. Here survey emphasis on different techniques which have been implemented like Zigbee, GSM technology or any microcontroller technology to acquire data, preprocess it and get the desired outcome for needy one. Wearable devices along with sensor network is used which gives more accurate results. Consolidating keen wearable sensors into routine care of patients is the major key point of this paper to follow the better care to the general human beings who are really in need of that.

Brain Tumor Levels Detection in Three Dimensional MRI using Machine Learning and MapReduce

Jyoti S.Patil¹, G.Pradeepini²

¹Research Scholar: Department of CSE, Koneru Lakshmaiah Education Foundation (KLEF), Guntur, A.P., India, ²Professor: Department of CSE, Koneru Lakshmaiah Education Foundation (KLEF), Guntur, A.P., India

Abstract

The latest technological developments in medicinal data need accurate diagnosis which may demand corrective prediction using advanced machine learning algorithms. Brain tumor analysis is an emerging field in healthcare domain as lots of death occurs due to inaccurate and late detection of this disease. This paper focuses on real time detection of tumor levels in three dimensional MRI images. 3D MRI image in DICOM format is converted into JPEG format then denoising, grey scale and blurring techniques were applied on it to remove noise. Feature extraction algorithms were applied on each layer of 3D image to generate feature vectors and save these images on HDFS. Clustering techniques is used to identify region of interest in each and every layer of 3D image. Then classification algorithm is used on learning trained datasets to predict accurate level of brain tumor. To speed up diagnosis time and improve efficiency through parallel processing Hadoop’s MapReduce framework is used.

Keywords- Medical image processing; MRI images; feature extraction; clustering, Kmeans, classification, Map Reduce, HDFS.

Introduction

Nowadays, medical analysis shows that brain tumor is one of the major causes of death amongst adults and youngsters. It’s been observed that the majority of the western world that number of people who are suffering and dying from brain tumors continues to be exaggerated to three hundred a year throughout past few decades. As this variety is exaggerated, we’d like additional tools and ways to sight, extract the tumors and additionally to investigate their behavior. We should think about the category of tumor, the type of images to be used and relying there from the many approaches to use or develop efficient technique which can facilitate doctors to simply diagnost tumor levels. Brain tumor could be uncontrolled rapid growth of massive tissues within the brain¹. A tumor occurrence depends on a various causes like size, type, location, tumor level, and its affected area. Glioma¹ is primary level of brain tumor detected in adults. They rise from interstitial tissue cells and finally classified into four stages; stage three or four is that the top-grade Glioma. Stages one and two of may be used as inferior Gliomatums. Magnetic Resonance Imaging² is an imaging technique utilized by practitioners and radiologists to review the structure of the body. As tomography will represent a great deal of data regarding the soft tissue in the human body. These images help in the identification of the tumor. These tomography images are also accustomed to analyze and study the behavior of the brain. Concerning the nature and appearance of the brain tumors, only MRI technique is not sufficient for tumor segmentation including overall space. Following sections elaborates various methods to detect brain tumor levels and its accurate prediction.

Methods Used

Image Preprocessing

Preprocessing is a process of converting query image into a form which is best suitable for the system. MRI Images are available in custom file format known as DICOM (Digital Imaging and Communication in Medicine)³ which is not directly readable. These images are first convert to acceptable JPEG format. MRI images usually include additional tissues, lower brightness which reduces accuracy of diagnosis. Figure 1 (a) elaborates Image de-noising, blurring techniques which are applied on it to get smoothening of each layer of 3D⁴.
Feature Extraction

The feature extraction is responsible for extracting visual features from query images. This system extracts two types of features i.e. Color and Edges. Gray scale color extraction extracts gray scale color value for each pixel of the query image, and edge detection is used to detect major boundaries. Figure 1(b) depicts edge detection. Then generation of the feature vector for each layer is calculated. It combines two features i.e. color and edges then it generates the final feature vector for the inputted image. Generated result of feature vector is similar to the feature vectors stored in feature library. Figure 1(c) describes vector generation in Hadoop. Each image is stored on HDFS along with its feature vector.

Hadoop Distributed File System (HDFS)

It is a Hadoop Distributed File System that executes on top of the default file system available in operating system on every machine included in the cluster. HDFS makes it extremely portable. It provides built-in support for huge data files and fault tolerance. The HDFS is actually a distributed architecture where the NameNode is acting as master and the DataNode is working as slave. NameNode holds the metadata concerning the files stored in DataNodes. Images can be converted to bytes and store on HDFS.

MapReduce

MapReduce is a component of Hadoop framework which used for parallel processing of big datasets using a huge number of commodity hardware (nodes). A single Hadoop cluster comprises one master node, a secondary node (in case of master node failure) and many slave nodes which are acting as workers. JobTracker, NameNode, TaskTracker and DataNode are resides in master node. Slave node comprises of its own DataNode and TaskTracker, it may be possible to slave node to act as data-only slave nodes or compute-only slave nodes. MapReduce is responsible for work distribution for each and every node which is submitted by a client. It creates small parallelized map and reduce jobs which leads to faster execution.

i. Map: The master node takes job inputted by client, divides it into smaller subtasks, and each task is allocated to slave nodes. A slave node may further divide it again, in turn, leading to a multi-level tree hierarchy. The slave node processes the distributed chunk of tasks and passes the results back to its master node.

ii. Reduce: The master node then accumulates the results to all the subtasks and combines them in such a way that it frames output as the answer to the problem which was originally given to solve.
In our research MapReduce compares feature vector of inputted MRI image of patient with feature vectors of stored MRI images in a library. The result of the comparison is the difference of Euclidian distance between images.

**Clustering**

Clustering algorithm provides balanced data which is observed in all time under training phase. To predict levels of tumor accurately extraction of region of interest is needed. Segmentation is commonly thought of to be the primary step in image analysis that splits an image into significant layered regions, which might be useful in additional analysis. These small sections obtained related to the physical components or objects present in (3-D) scene described by the image (2-D).

Thresholding is employed to fetch interested object from its background by its intensity assignment value named as T (threshold) for every pixel in such a way that it is either an object point or a background point. Optimum thresholding chooses threshold value to minimize the variance obtained between classes of the thresholded black and white pixels.

Use of K-means algorithm in the threshold selection method is given as follows:

1. Initialize center of the clusters.
   \[ \mu_i = \text{position value, } i = 1 \ldots k \text{ i.e no of clusters} \]

2. Allocate the nearest cluster to each data point.
   \[ C_i = \{j: d(x_j, u_i) \leq d(x_j, u_l), l \neq i, j = 1, \ldots n\} \] (1)

3. Set the position of every cluster to the mean of all data points belongs to it.
   \[ u_i = \frac{1}{|C_i|} \sum_{j \in C_i} x_j \forall i \] (2)

4. Go to step 2 and 3 until the centroid positions remains unchanged.

5. Compute thresholds value which belongs to final partition.

Bi-level thresholding method depicts k=2, which is the tiniest and biggest grey levels within the image which are designated as the initial centroids. These threshold value T may be obtained by computing the average of the final obtained centroids.

**Classification**

This is Naïve Bayesian classifier algorithm is used for classification that worked on training image datasets of MRI. Stages of tumor are classified according to their percentage of tumor occupancy in clusters named as Stage4, Stage3, Stage2 and Stage1 respectively. Attributes consider for predictions are if percentage of occupancy is high then stage 4 type of tumor. Given image is matched with images stored on HDFS. Percentage of matching is considered. Accordingly prediction is done.

<table>
<thead>
<tr>
<th>Percentage</th>
<th>Type</th>
<th>Suggested Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>80% and above</td>
<td>Stage 4</td>
<td>Surgery</td>
</tr>
<tr>
<td>50% to 80%</td>
<td>Stage 3</td>
<td>Radiations</td>
</tr>
<tr>
<td>20% to 50%</td>
<td>Stage 2</td>
<td>Medications</td>
</tr>
<tr>
<td>Below 20%</td>
<td>Stage 1</td>
<td>Self-Care</td>
</tr>
</tbody>
</table>
As per Bayes theorem, \( P(X|y) \) defines the probability of “Occurrence of tumor” with the given conditions are “tumor is of stage 4”, percentage is “80% above” and suggested treatment is “self-care”. Where \( X = \) (stage 4, percentage 80% above,Self-care) and \( y = \) Yes (occurrence of tumor)

If two events \( X \) and \( Y \) are autonomous then
\[
P(X, Y) = P(X).P(Y)
\]

Here we reached to result:
\[
P((y|x_1, \ldots , x_n) = \frac{P(X_1|y)P(X_2|y)\ldots P(X_n|y)P(y)}{P(x_1)P(x_2)\ldots P(x_n)}
\]

After creating classifier model we get the probability of all possible values of the class variable \( y \) inputted and elite the output through extreme probability. It can be mathematically expressed as:
\[
y^* = \text{argmax}_y P(y) \prod_{i=1}^{n} P(x_i|y)
\]

Task of scheming \( P(y) \) and \( P(x_i|y) \) is leftover.\( P(y) \) is defined as class probability while \( P(x_i|y) \) is defined as conditional probability. We should try this by applying the above formula automatically on tumor datasets. Figure 2 depicts results gained after applying classification.

![Figure 2: Resultant Page after classification.](image_url)

**Algorithm**

Step 1. Take a 3D MRI Query image as input from client. Convert it in JPEG format. Consider \( n \) is total number of layers available in image.

For (\( i=0 \) to \( i=n-1 \))

Convert DICOM[i] image to JPEG[i]

Step 2. Apply Image Blurring techniques on every layer of inputted query image.

i. move through complete input image array.

ii. Scan individual pixel with color value (24-bit).
iii. Divide the color value into individual R, G and B 8-bit values.

iv. Calculate the average of RGB of neighboring pixels and allocate obtained average value to it.

v. go to step i to iv until each and every pixel is scanned.

vi. Save the newly obtained value at the same location in the output image.

Step 3. Apply edge detection algorithm to extract features from each layer of inputted query Image

Following are the steps to convert input image into gray scaled image.

i. move through complete image pixel by pixel.

ii. Identify each and every pixel and its neighboring pixels in the image, consider a window of 3x3 pixels and multiply it with the given template in the matrix. We have two template matrices.

For X axis

\[
G_X = \begin{bmatrix}
-1 & 0 & +1 \\
-2 & 0 & +2 \\
-1 & 0 & +1
\end{bmatrix}
\]

For Y axis

\[
G_Y = \begin{bmatrix}
+1 & +2 & +1 \\
0 & 0 & 0 \\
-1 & -2 & -1
\end{bmatrix}
\]

iii. Then we will calculate the G which is gradient of an image i.e. directional derivative estimate vector which is defined as density difference / distance to neighbor.

\[
|G| = \sqrt{G_X^2 + G_Y^2}
\]  

(6)

iv. Apply the templates on grey levels of each pixel to a 3x3 filter window. All values are grey levels from a1 to a9 for each pixel in filter window.

\[
\begin{array}{ccc}
a_1 & a_2 & a_3 \\
a_4 & a_5 & a_6 \\
a_7 & a_8 & a_9
\end{array}
\]

Value of X and Y are obtained after multiplication.

\[
Value \ of \ X = -1 \times a_1 + 1 \times a_3 - 2 \times a_4 + 2 \times a_6 - 1 \times a_7 + 1 \times a_9
\]  

(7)

\[
Value \ of \ Y = 1 \times a_1 + 2 \times a_2 + 1 \times a_3 - 1 \times a_7 - 2 \times a_8 - 1 \times a_9
\]  

(8)

\[
Sobel \ Gradient = \sqrt{(X \times X + Y \times Y)}
\]  

(9)

Step 4. Build Feature Vector of each image in layer upto n. We consider 8 bin buckets modulo operation is performed on color code value by 8 and we allocate value to bucket which is having value equal to reminder value obtained after applying the modulo operation.
Consider example for colorcode value given of specific pixel is 225. Perform modulo operation on it.

E.g. 225 % 8 = 1  hence we assign 225 value to bucket no.1

Sample feature vector generated = [654, 54, 354, 354, 87,735,354,325]

Store this feature vector on HDFS (with path of original image and its diagnosis) in order to generate feature library.

Step 5. Match this feature vector with feature library using MapReduce also calculates Euclidean distance between them.

Step 6. Apply k-means to find region of interest to detect tumor size in specific area.

Step 7. Arrange images in ascending orders depending upon thresholds and Euclidean distance. Maximum to minimum. Accordingly store different levels of tumor.

Step 8. Apply classification on set of images, if maximum stored images is representing brain tumor of Stage 4 and treatment as surgery then display diagnosis as

1. Stage 4: Brain tumor 80% above
2. Treatment: Surgery

Step 9. Apply classification algorithm on trained datasets to check accuracy of prediction of tumor levels.

Results and Analysis

Trained datasets of MRI images are evaluated as per defined parameters using MapReduce framework on Hadoop platform. Images are divided into 3 classes of datasets each contain 20 image set, 60 image set and 100 image set respectively. As shown in Figure 3, the graphs show precision and recall values obtained from retrieved images. Within the dataset of each 3D image consist of 22 layers which are compared with each layer of 3D image stored in HDFS.

Precision defined as ability of the system to extract only relevant images whereas Recall defined as ability to extract all relevant images. The Precision and The Recall can be computed using following:

\[
\text{Precision} = \frac{\text{number of relevant images retrieved}}{\text{total number of images retrieved}}
\]
\[
\text{Recall} = \frac{\text{number of relevant images retrieved}}{\text{total number of relevant images}}
\]

Figure 3. Graph for Precision and Recall
Conclusion

In this way a framework for implementation of brain tumor diagnosis in 3D MRI image data sets using the MapReduce is described here. Every patient MRI image is analyzed by greyscaling, edge detection and feature extraction to identify key points at variant scales. While Hadoop’s MapReduce is employed to compare extracted feature vector of each inputted image and HDFS supports storage of existing medical images within developed system. Clustering algorithm is useful for applying on each and every slice of 3D image while classification algorithm enhances accuracy in prediction of tumor levels. Given research work will certainly improve decision making time and assist doctors for accurate diagnosis.

Unsought Product Buying: Empirical Study on Determinants of Health Insurance Plan Buying

Chand Prakash Saini1, Sunil Kumar2, Amit Dangi1, K. Tara Shankar3

1Assistant Professor, Faculty of Commerce and Management, SGT University, Gurugram, 2Assistant Professor, School of Banking, Financial Services and Insurance, Symbiosis University of Applied Sciences, Indore, 3Professor & Dean, Faculty of Commerce and Management, SGT University, Gurugram

Abstract

Purpose – The purpose of this paper is to identify and study various determinants that customers take into consideration for buying health insurance plans.

Design/methodology/approach – A total of 250 existing health insurance users were personally surveyed with a structured questionnaire. These respondents were from Gurugram city. Exploratory factor analysis and one sample t-test were used to assess the determinants of health insurance plan buying.

Findings – It was found that health insured considered Personal, Marketing, Product, Social and Security factors to be important while opting for health insurance plans. Among all these factors social factor was found on the customers’ mind followed by security, product, personal and marketing factor while buying health insurance plans.

Research limitations – This paper analyses the buying behavior of the existing insured with respect to health insurance plans and can be different from those of potential insured, who have not taken any health insurance plan till now. Also, study was conducted on limited geographical area of Gurugram city only and hence results cannot be generalized.

Practical implications – The results may help the health insurance providing companies to understand a diversified set of mind of the insured, so that they can come up with the strategies that are aligned with the customers’ expectations.

Keywords: Health insurance, Personal factors, Marketing factors, Product factors, Social factors and Security factors.

Introduction

Uncertainty is the only definition of life. This is what is the model of life insurance companies which cover individuals from these uncertainties and helps in planning the future. The pool fund being collected as premium form insured is the fund being utilized by the insurance companies. It we study various countries around the world we will find different policies prevailing for life insurance business. Talking about India general insurance is something which is mandatory while, health and life insurance are discretionary. Considering the above policy in India, various factors are being taken into account by customers while the planning to get the health/life insurance plans. It is important to mention here that there is quite a large percentage of Indians who do not have any health or life insurance plan till date and hence this sector has a lot of potential of growth. The Indian insurance sector which earlier was dominated by LIC only, now facing a tough competition from private players.

The present study is an attempt to find the major factors that influence the decision of buying health insurance plan, it is expected that the study will be helpful for life insurance companies to frame marketing strategies to attract the potential and present the customers.
Review of Literature

Studied various factors affecting the decisions to buy health insurance. The study found that the major reason of buying health insurance policy was to protect them against the loss of money they have to incur for healthcare. Also, insured who generally buy health insurance plan annually (i.e. to be renewed every year) and renewal depends on the deliverance of health insurance provider.

5 compared various med claim, ESIS and SEWA health insurance policies and found that customers usually decide their health insurance plan only after the comparison of the plan with the competitors. 6 in her study found that the major component of poor reach of health insurance plan among Indians was because of the problem of not making health insurance compulsory in India. The study advocated that government should put this on priority and measures should be taken to improve the level of awareness for the benefits of the health insurance plans. A comparative study of four different CBHIS in Gujarat was attempted by and and found similarity and differences among them.

2,3 studied various factors that affect the decision of buying health insurance plans with an household survey in Anand district of Gujrat and concluded that decision is being taken into two phases by the customers. First phases covers decision of buying health insurance plan in yes or no and if the decision is positive there were various factor like income , health expenditure of the family, perception of coverage of illness and health expenditure, knowledge about health plan affects the buying decision.

found that renewal of health insurance plan is directly proportional to the past experience of the customers. It the insurance provider has fulfilled all this promises, there are all great chances that the customers will buy or renew the same plan.

7 studied the impact of social or economic factors on purchase decisions of life insurance policy and reported income level , occupation and family size significant on the buying of various policies.

4 studied the reasons behind the preferences for a particular company for health and life insurance plans and found that more return, less premium level of awareness about the company, variety of plan, advertisement and ease of access were all the major reasons.

9 studied the awareness level and reasons for buying life insurance policies and found that there is a strong need of awareness among the respondent and life insurance is being taken as an investment channel, tool for tax saving and in very less cases meeting post retirement needs.

6 attempted to identify the preferences regarding insurance plan and purpose of buying and found that protection was the main purpose of buying an insurance policy and gathering the information about the company along with the policies of claim settlement was found the main factors while deciding for health plan.

After the review of literature, present study focuses on finding the answers of following research questions of identifying the determinants contributing to the buying of health insurance plans and to study the impact of identified factors on the buying of health insurance plans.

Research Methodology

This study is based on exploratory cum descriptive research design. Exploratory research design has been used to identify the factors that health insured relate to buying health insurance plans and descriptive design has been used to make the concept clearer. Because of limitation of time and financial resources, it was not possible to study the census. Therefore, a sample of 300 respondents has been taken form Gurgaon city. Out of 300 distributed questionnaires 270 responses were collected and 250 responses were found correct for further research. Correct data response rate was 92%. For the study, Purposive sample design has been used. Purposive sample design justified on the ground that only those respondents were taken who already have health insurance plans. Both primary and secondary data has been taken for the study. Primary data has been collected through questionnaire technique. Questionnaire framed under this study was divided into two parts. Part A covers the demographic information and Part B covers the 20 statements related to the health insurance plan buying based on a five-point Likert scale with scale anchors from “1” – strongly disagree to “5” – strongly agree. Secondary data has been collected through books, journals, articles, newspapers and web sites. Collected questionnaires were coded and entered in SPSS spreadsheet for analyzing the data. After entering the data exploratory factor analysis, one
sample t-test and mean were used for analyzing the data. Exploratory Factor analysis technique has been used for identifying the factor contributing to the buying of health insurance plans. Factor analysis is techniques through which variables that are correlated with one other but independent of other variables are combined into factors (Malhotra and Dash, 2016).

**Data Analysis**

Before applying factor analysis, appropriateness of factor analysis has been checked. For this purpose Kaiser- Meyer-Olkin measure of sample adequacy and Bartlett’s test of sphericity has been performed.

<table>
<thead>
<tr>
<th>Table 1: KMO and Bartlett’s Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kaiser-Meyer-Olkin Measure of Sampling Adequacy.</td>
</tr>
<tr>
<td>Bartlett’s Test of Sphericity</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Higher the value of KMO and Bartlett greater will be the reliability of factor analysis. The value of KMO should be greater than 0.5 for applying factor analysis. In this study value of KMO comes 0.812, considered as excellent. It means our sample size was adequate and factor analysis can be used for reducing data.

Above table 4 shows the results of one sample t-test. Observed t statistic for each factor is represented by “t” column in table. “df” column represents the degree of freedom. On the basis of one sample t test, it was found that all the factors Personal, Marketing, Product, Social and Security factor significantly influences the customers of health insurance plans.

Table 5 represents the values of mean and standard deviation of various factors of health insurance plans that existing customers found significant. Mean value depicts the level of significance and standard deviation represents the variations of responses. Social factor was found most contributing factor that influences the buying decision of existing health insurance users with mean value(\(\bar{x}\)) 3.8016 followed by Security factor(\(\bar{x}=3.3733\)), product factor (\(\bar{x}=3.2013\)) and personal factor (\(\bar{x}=3.1688\)). Marketing factor was least significant factor with mean value (\(\bar{x}\)) 3.1650.

Source: Primary data

Table 5 also shows that marketing factor has highest variations in the responses shown by the highest value of standard deviation i.e. 0.86893 followed by security factor (0.84190), product factor (0.83428) and social factor (.77470). Personal factor shows highest consistency in the responses with lowest standard deviation value 0.75207.

Conclusion

This study identified the factors that significantly
influence the health insurance plan buyers. It was found that customers considered Personal, Marketing, Product, Security, Social factors to be important while thinking of getting any health insurance plan. Among all these factors social factor was found on the customers’ mind followed by security, product, personal and marketing factor while buying health insurance plans. This study is not free from limitations. As this study was conducted on a limited geographical area of Gurgaon city only, so, it is difficult to generalize the result. Limited time and financial resources acted as a limitation for the study.

**Future Scope for the Study**

For further research, a comparative analysis of factors of potential and existing health insured customers can be performed. A comparison on the basis of demographics can also be done for future research. Further research can be conducted by considering other geographical area.

Attitude of Undergraduate Students towards Use of Social Networking Sites in Relation to Emotional Maturity

Kundan Singh¹, Pankaj Kalyan²
¹Assistant Professor; ²M. Ed. Student, School of Education, Lovely Professional University, Phagwara (Punjab)

Abstract

Aim of this study was to find the attitude of undergraduate students towards use of social networking sites in relation to emotional maturity. Descriptive method of research was used. Stratified random sampling was used to select 300 undergraduate students from Kapurthala district of Punjab. Data was collected using Scale on Attitude towards Use of Social Networking Sites (2015) and Emotional Maturity Scale (2006). Data was analyzed using t-test and coefficient of correlation. It was found that female undergraduate students exhibit more favourable attitude towards using the social networking sites than male undergraduate students; Urban undergraduate students exhibit more favourable attitude towards using the social networking sites than rural undergraduate students; Male undergraduate students were more emotionally mature than female undergraduate students; Urban undergraduate students are more emotionally mature than rural undergraduate students; There is no relation between attitude towards using the social networking sites and emotional maturity of undergraduate students.

Keywords: Attitude, Social Networking Sites(SNSs), Emotional Maturity, Undergraduate Students.

Introduction

We are living in the 21st century, which is called as the digital age. Advancements in technology have made our life easy and comfortable. Information and communication technology (ICT) contributed a lot in this direction. Social networking sites are the means of ICT. Such sites are part and parcel of our day-to-day life. A layman uses these sites in order to establish and strengthen social relations. Social networking sites have their own importance in the field of teaching and learning. Teachers can use these sites to collaborate with other teachers and students for learning. Students utilize the sites to make their learning easy and convenient. Attitude of the students towards using these sites can play a vital role in their learning.

Emotions are the expression of our feelings. Are we able to control our emotions? Can we pay due regards to the emotions of others? The answer to these questions can be given by assessing the emotional maturity among students. Emotions are caught rather than taught. Thus, it is responsibility of the parents and teachers that they themselves should be well trained in controlling their emotions in adverse situations. Whatever we demonstrate in front of our wards or students, similar kind of reactions can be observed in their behaviour. Consequently, behaviour of students is being influenced by their parents, peers, teachers and the sites they use to interact with each other.

Social Networking Sites

A thing, place, person, or incident is being either favoured or disfavoured by an individual. This expression of favour or disfavour is termed as an attitude. Social networking websites are online sites through which users connect with other users. A social networking site is also called as a social website. Examples are: facebook, Whatsapp, Twitter, My space, Orkut, Google+ etc. Now a days these sites have become useful for study purpose because many school or undergraduate students use these networking sites for their study.
found that internet makes college students more creative and literate.\textsuperscript{1} suggested that self-personality and belongingness essentially anticipated addictive inclinations toward social networking websites (SNWS).\textsuperscript{2} concluded that social media is being used by females for relational purposes and females are more connected to their friends as compared to males.\textsuperscript{3} examined the popularity of social networking sites (SNSs) among youths. Results indicated that successive engagement in social networking sites is developing as an essential apparatus for youthful socialization.\textsuperscript{4} asserted that social networking sites are considered to assume an essential part in the strategies included in prosecuting common and criminal cases.\textsuperscript{5} concluded that students routinely post content using social networking sites.\textsuperscript{6} analysed that towards the use of Facebook, students have developed positive attitude. In a language classroom, Facebook can be used as a supplement. It was also found that learning language in a traditional classroom has not lost its importance. It acts as a backbone for providing language education.\textsuperscript{7} asserted “using of the social networking sites impacted the academic performance positively among Malaysia university students”.\textsuperscript{8} analyzed that regarding their schoolwork students were less comfortable to utilizing SNS than other online specialized instruments, and females felt more uncomfortable than guys utilizing such sites.\textsuperscript{9} found that a great number of students are addicted to social media. He suggested to use social media for educational purposes, SNSs should be expanded, used to enhance academic activities among students.\textsuperscript{10} conducted a study on the title “The Effect of Blended Learning and Social Media-Supported Learning on the Students’ Attitude and Self-Directed Learning Skills in Science Education”.\textsuperscript{11} A positive impact of social media was found on self-directed learning skills and attitude of the students. found that academic success and motivation is increased in a meaningful way by using blended learning than face-to-face learning; a positive impact of social media supported learning was found on motivation and academic success among students, academic success and motivation among students do not differ whether they learn with support of social media or through face-to-face learning.\textsuperscript{12} found that for English learning and for organizing online educational discussions, Facebook is an effective online platform. Facebook can be used as a meaningful and promising teaching tool by English language instructors and other educators. It will foster quality in providing online education.\textsuperscript{13}

### Emotional Maturity

Emotions are natural response of human being like when we feel sad, fearful or angry and joyful. All people different from each other in how to express their emotions and how much aware they are to their feelings. “Emotions are affective experience that one undergoes during an instinctive excitement” (McDougall).

The word ‘mature’ means ‘ripe’ or full development. Emotional maturity involves emotional control that emotionally matured person has on his feelings. A person who knows how to express his emotions according to situation in proper quality is called as emotionally matured person. Emotional maturity is a set of ability or capacity that people use to interact and communicate with others.

revealed negative correlation between emotional maturity and self-concept.\textsuperscript{14} suggested that in case of emotional stability, male students excel female students.\textsuperscript{15} confirmed that family type and age had an impact on emotional maturity of an individual.\textsuperscript{16} revealed that students attending the school are more emotionally mature than the kids engaged in child labour.\textsuperscript{17} explored “the final year undergraduate students were more emotionally mature as compared to first year students. Further, first year undergraduate students faced difficulty in adjusting both emotionally and socially. They also faced more academic difficulty as compared to final year students”.\textsuperscript{18} asserted “emotional maturity was very intimately related to the health, adjustment and behaviour of the individual. Thus, a student should have healthy emotional development”.\textsuperscript{19} found that day scholars and hosteller women students differ in decision making styles and emotional maturity.\textsuperscript{20} found that emotional maturity is not influenced by gender.\textsuperscript{21} found no relation between coping styles and emotional maturity among teacher trainees. Teacher trainees do not differ in coping styles and emotional maturity on the basis of gender.\textsuperscript{22} revealed that there exist gender related differences among adolescents in their level of emotional maturity and self-confidence.\textsuperscript{23} found that there is huge connection between emotional maturity and family relationship.\textsuperscript{24} revealed that adjustment and emotional maturity do not differ on basis of gender. Also, adjustment and emotional maturity are not related to each other.\textsuperscript{25} suggested that females are more emotionally mature than their counterparts males. Working and non-working adults do not differ in their social competence
level. Adults do not differ in their social competence level on the basis of gender.\textsuperscript{26} found that a large number of undergraduate students belong to normal range in emotional intelligence; these students were found to be extremely unstable in emotional maturity scale; there is a positive correlation between emotional maturity and emotional intelligence of undergraduate students.\textsuperscript{27} conducted a study to reveal that majority of students are users of online social networks and it has great influence on their emotional maturity. The students having high social network usage have less emotional maturity.\textsuperscript{28}

### Significance of the Study

An analysis of reviews reveals that social networking sites have greatly influenced the life of undergraduate students. Now a days student have more opportunities of using social networking sites because of new technologies. They are utilizing more resources as compared to past. SNSs have positive impact on the undergraduate students but we cannot deny the negative impacts also.

Social networking sites have brought a revolution in distance education and regular education or linking with the people. Students use these sites for facilitating their learning. This study focused on attitude of undergraduate students towards use of social networking sites in relation to their emotional maturity.

### Objectives

1. To find gender and locality related differences among undergraduate students in their attitude towards the use of social networking sites.

2. To analyze gender and locality related differences among undergraduate students in their emotional maturity.

3. To find relationship between attitude towards use of social networking sites and emotional maturity of undergraduate students.

### Hypotheses

Undergraduate students differ significantly in their attitude towards the use of social networking sites on the basis of gender.

Undergraduate students differ significantly in their attitude towards the use of social networking sites on the basis of locality.

Undergraduate students differ significantly in emotional maturity on the basis of gender.

Undergraduate students differ significantly in emotional maturity on the basis of locality.

There exists significant relationship between attitude towards use of social networking sites and emotional maturity of undergraduate students.

### Research Methodology

Descriptive survey method was used. A sample of 300 undergraduate students was drawn from Kapurthala district of Punjab. In order to draw a sample of 300 undergraduate students, stratified random sampling technique was used. Sample comprised of 150 male and 150 female undergraduate students, which in turn were divided into rural and urban undergraduate students.

### Tools Used

- Scale on Attitude Towards Use of Social Networking Sites (2014), developed by the investigator.
- Emotional Maturity Scale (2006) by Singh and Bhargava

### Statistical Techniques

- t-test
- coefficient of correlation.

### Results and Discussion

**Table 1: Results of t-ratio between Male and Female**

<table>
<thead>
<tr>
<th>Gender</th>
<th>N</th>
<th>M</th>
<th>SD</th>
<th>df</th>
<th>t-value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attitude Towards Use of Social Networking Sites</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Male</td>
<td>150</td>
<td>80.68</td>
<td>6.88</td>
<td>298</td>
<td>2.01</td>
</tr>
<tr>
<td>Female</td>
<td>150</td>
<td>82.32</td>
<td>7.21</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Significant at .05 level
t-value (2.01) in table 1 is significant at 0.05 level. Mean score of female undergraduate students (82.32) is greater than mean score of male (80.68) students. Thus, it may be interpreted that female undergraduate students exhibit more favourable attitude towards use of social networking sites than their counterparts male undergraduate students. Therefore, hypothesis 1 was accepted. Similar results are found by Barker (2009).

**Table 2: Results of t-ratio between Rural and Urban Undergraduate Students in their Attitude Towards Using of the Social Networking Sites**

<table>
<thead>
<tr>
<th>Attitude Towards Use of Social Networking Sites</th>
<th>Locality</th>
<th>N</th>
<th>M</th>
<th>SD</th>
<th>df</th>
<th>t-value</th>
<th>Significant at .01 level</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Rural</td>
<td>150</td>
<td>80.16</td>
<td>7.69</td>
<td>298</td>
<td>3.24</td>
<td>Significant at .01 level</td>
</tr>
<tr>
<td></td>
<td>Urban</td>
<td>150</td>
<td>82.76</td>
<td>6.11</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

t-value in table 2 is 3.24. It is significant at 0.01 level. Further, mean score of urban undergraduate students (82.76) is greater than mean score of rural (80.16) students. Thus, it may be interpreted that urban undergraduate students exhibit more favourable attitude towards using of the social networking sites than rural undergraduate students. Hypothesis 2 was accepted. No study was found to support this result.

**Table 3: Results of t-ratio between Male and Female Undergraduate Students in Emotional Maturity**

<table>
<thead>
<tr>
<th>Emotional Maturity</th>
<th>Gender</th>
<th>N</th>
<th>M</th>
<th>SD</th>
<th>df</th>
<th>t-value</th>
<th>Significant at .05 level</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Male</td>
<td>150</td>
<td>120.24</td>
<td>18.86</td>
<td>298</td>
<td>2.01</td>
<td>Significant at .05 level</td>
</tr>
<tr>
<td></td>
<td>Female</td>
<td>150</td>
<td>115.38</td>
<td>22.65</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It may be analyzed from Table 3 that t-value is 2.01, which is significant at .05 level of significance. Mean score of male undergraduate students (120.24) is greater than mean score of female undergraduate students (115.38). Thus, male undergraduate students excel female students in emotional maturity. Hypothesis 3 was accepted. The result is opposite to the findings of Kaur (2013) and Nehra (2014), who found that emotional maturity do not differ on basis of gender. But this result is supported by Lal (2014), who found that there exist gender related differences among adolescents in their level of emotional maturity. Results of Aleem and Sheema (2005) are similar, in case of emotional stability, male students excel female students.

**Table 4: Results of t-ratio between Rural and Urban Undergraduate Students in Emotional Maturity**

<table>
<thead>
<tr>
<th>Emotional Maturity</th>
<th>Gender</th>
<th>N</th>
<th>M</th>
<th>SD</th>
<th>df</th>
<th>t-value</th>
<th>Significant at .01 level</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Rural</td>
<td>150</td>
<td>114.66</td>
<td>22.64</td>
<td>298</td>
<td>2.62</td>
<td>Significant at .01 level</td>
</tr>
<tr>
<td></td>
<td>Urban</td>
<td>150</td>
<td>120.96</td>
<td>18.66</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 4 indicates that t-value between rural and urban students is 2.62. It is significant at 0.01 level. Mean score of urban undergraduate students (120.96) is greater than mean score of rural undergraduate students (114.66). Thus, it may be interpreted that urban undergraduate students are more emotionally mature than their counterparts rural undergraduate students. Hypothesis 4 was accepted. No study was found to support this result.

Table 5: Co-efficient of Correlation between Attitude towards Use of the Social Networking Sites and Emotional Maturity of Undergraduate Students

<table>
<thead>
<tr>
<th>Variables</th>
<th>N</th>
<th>df</th>
<th>Co-efficient of Correlation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attitude of Students towards Use of the Social Networking Sites</td>
<td>300</td>
<td>298</td>
<td>-0.10 Not Significant</td>
</tr>
<tr>
<td>Emotional Maturity</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Co-efficient of correlation between attitude towards using of the social networking sites and emotional maturity of the undergraduate students is -0.10. It is not significant at .05 level. Thus, it may be interpreted that emotional maturity and attitude towards use of social networking sites of undergraduate students, is not related. Hypothesis 5 was rejected. No study was found to support this result.

Conclusions

Female undergraduate students exhibit more favourable attitude towards using of the social networking sites than male undergraduate students. Urban undergraduate students exhibit more favourable attitude towards using of the social networking sites than rural undergraduate students. Male undergraduate students are more emotionally mature than female undergraduate students. Urban undergraduate students are more emotionally mature than rural undergraduate students. Emotional maturity and attitude towards using of the social networking sites among undergraduate students are not related.

Business Strategy and Performance of Traditional and Complementary Medicine (T&CM) Industry in Malaysia

Saari Ahmad¹, Shahibudin Ishak¹, Noraini bt Othman¹
¹School of Business Management University Utara Malaysia

Abstract

The review of small business literature conclude the lack of study on the Traditional and Complementary Medicine (T&CM) in Malaysia. This article addressed the issue by examining the type of business strategy adopted by the industry and the performance of the T&CM entrepreneurs in Malaysia. Adopting the stratified sampling method the data was collected from 150 respondents. The findings clearly indicate that the business strategy adopted by the Traditional and complementary medicine (T&CM) entrepreneurs are specializing in product type strategy, specializing in customer type strategy, growth strategy, differentiation strategy, low-cost strategy, hold and maintain strategy. The performance of the industry improved annually, reflected by the increased in the volume of sale and the number of employees.

Keywords: Business strategy and Performance of T&CM

Introduction

The traditional medicine market is classified into two type of market dominance. Firstly the corporate players and secondly by small and medium sized entrepreneurs. Besides that the world market for herbal medicine appears to be highly competitive and also fragmented. The big players are expanding their market share in developing countries to benefit from cheaper raw material cost and cheaper direct labor compared to develop countries. These pioneer corporate players also market leaders in medicine, are putting more effort to switch from conventional medicine to medicinal herbs as their new profit opportunities. They also multiplying their research and development effort for new product and services development. With their innovative and technological know how they manage to improve the product quality which will push their market share and their market to continuously. Thus, the objectives of this study are examine the type of business strategy adopted by the T&CM entrepreneurs and to investigate the performance of the T&CM industry.

Literature Review

Malaysia natural tropical rain forest is a superior asset to the Nation. Besides as water catchment area the asset is also rich in natural and traditional resources of medicine. The Malaysia forest provides opportunities for traditional medical practitioners to fulfill their economic obligation as one of their income sources. Herbal medicine or “phytomedicine” is a medicinal system using a plant or animal materials such as seeds, roots, leaves, bark, flowers, oils and others for medicinal purposes. The market drivers for the global herbal medicine are expanding progressively. The current increase in population and also with the increase in aging population have created new market in herbal medicine and alternative medicine. Besides that most of the consumers are highly educated and with the assistance of internet they are very cautious in choosing the medicine available in the market. The competitive landscape for medication has changed tremendously. The increase in the number of non-government organizations have arouse the increase in consumer awareness for safe product to be consume with least or no side effect. Technological advancement and also the side effect of most conventional medicine have become the catalyst and motivators for new innovative product and services to be offered to the world market. The enforcement of legislative authority by the local authorities on current

Figure 2 illustrate the current and forecasted global stevia Market. The growth for stevia market is also incremental and sustainable. Stevia is highly demanded by diabetic patient. Besides maintaining blood sugar level stevia also assist to reduce dependency on conventional glucose by diabetic patient.

Figure 2 Global Stevia Market 2014-2020Source: FMI Analysis 2015

Food from herbs is expected to reach US$ 111 billion by the end of 2023. This market is projected to grow at Compound Annual Growth Rate (CAGR) 7.2 % from 2017-2023.Figure 3 illustrates some of the sources and process of herbal medicine.
T&CM industry in Malaysia

Malaysian current herbal business performance

The Malaysian government emphasized several core strategies for the country’s economic growth to achieve the benchmark of a developed nation by 2020. The introduction of the twelve National Key Economic Area (NKEA), which include the potential of herbs to propel the business sustainability of the nation’s Bio-economy sector. Besides that, herbs industry was chosen as the firstEntryPoint Project (EPP1) for the nation’s Agriculture NKEA. At the earlier stage of the EPPI herbal industry was selected for the commercialization of five types of herbs with the aim of producing high-value products amounting RM2.2 billion of the Gross National Income (GNI). Previously five herbs identified are Tongkat Ali, Kacip Fatimah, Misai Kucing, Hempedu Bumi and Dukung Anak. At present, six more herb species have been added to the project: Mengkudu, Roselle, Ginger, Mas Cotek, Belalai Gajah and Pegaga. The government of Malaysia has forecasted that the herbs industry will grow over RM two Trillion (RM 2 Trillion) by the year 2020.

Malaysia Herb’s Classification by Product Groups

**Flavors & Fragrance**

a. Cosmetics
b. Perfumes
c. Oil for aroma
d. Essential oil
e. Beverages

**Pharmaceuticals/Herbal**

a. Remedies/Drugs
b. Vitamins/supplements

**Health/Functional Food**

a. Health food
b. Herbal teas
c. Herbal supplement

**Bio-pesticides**

a. Insect repellent
b. Crop pesticide
c. Household pesticide

Malaysia T&CM has three unique features.

i) Malaysia T&CM is highly diversified in terms of heritage, history, language, philosophy, ethnic origin,
ii) T&CM is associated to the culture and heritage of various ethnic group in Malaysia.

iii) The dominance of T&CM product and services in Malaysia is by private sector.

Malaysia has legalized the T&CM by introducing the T&CM Act 2016 which is known as Act 775. There are four main focus of T&CM development in the National Policy as listed below:-

i. Practices of T&CM

ii. Education and training

iii. Raw material and products

iv. Research

The T&CM industry in Malaysia appears to have grown steadily and continuously over recent years. Whilst there are limited data to define the size of the T&CM industry. However, there is clear evidence that size of the market is growing and its usage is being widespread. Its breadth and potential are reflected by the increased demand of its product and services. Based on the Ministry of Health (MOH) database, there are 16,050 T&CM registered members in Malaysia (MOH). However, it is believed that many more are unregistered practitioners available in the market. It is believed that there are 13,000 premises offering T&CM services in Malaysia. (Ministry of Health). Tradeliberations have given opportunities to players in the herbal industry to penetrate into new market opportunities available abroad. The consumers have many options and alternative to choose hence getting value for their money with high degree of efficiency to fulfill their needs and wants. In this industry monitoring fair network access by all suppliers is essential to allow the consumer to choose the supplier that offers the best price, quality and effect.

In Malaysia T&CM industry would have better opportunities to compete with other nations in term of manufacturing cost and production efficiency. Malaysia is in the middle of the India and China trade route. Consequently, it assists Malaysia to be more competitive in the T&CM world market.

**Issues and Challenges in practicing Traditional Medicines**

i. Difficulty to enforce Act 775 because of its complexity and diversity of T&CM industry includes lack of trained personnel and facilities and suitable mechanism to register T&CM industry without formal training programs.

ii. T&CM are not adequately regulated because of the current Act 775 does not regulate T&CM premises adequately.

iii. Lack of information to facilitate the formulation of policies.

iv. Lack of participation of T&CM in tertiary and health care

v. There is no action plan to integrate T&CM in the national health care system.

**Business strategies in Malaysian SMES**

Porter’s model of generic strategies has been found to be particularly useful to the Malaysian SMES. Malaysian SMES use Porter’s generic strategies because of the explicitness with which it captures the essence of the strategy formulation process. The changes of the political, economic and legal environment lately, forced the entrepreneurs to look for immediate solutions to remain in the competitive market.

Entrepreneurs must focus on their costing and pricing to enable them to remain competitive in the market. Some of the cost control measures that could be used by the entrepreneurs are reducing their waste, increase the efficiency of the machineries, multi-skilling workforce, and optimum amount of stock to be kept in the warehouse. Besides that, they can also generate more revenue by renting unutilized premise and also closing down the uneconomic production activities which are not competitive in the market. From the review of literature, the author found that entrepreneurs adapt and adopt six business strategies. For business and consumer market the strategies are harvest, build, cash out, niche, climber and continuity. There are four in industrial market such as low commitment, growth, maintenance and niche. Entrepreneurs should choose the right strategy that fit to their company. In addition, specializing customer type strategy emphasized on specializing in serving customers who are less price sensitive. Previous study have proven that most of
The entrepreneurs adapt and adopt business strategy in their decision making. Most of the empirical studies were conducted upon large firms previous research done by Hashim et al. and Ahmad, S; found that business strategy also influence the firm performance of small firms. The authors emphasized that in deciding which strategy to adopt or adapt, entrepreneurs must consider their competitive environment before choosing which strategy to be adapted or adopted.

Organizational Performance

Performance of an organization is the result of the competitive advantage achieved by converting a source advantage resulting from superior skills and resources into revenue. Ahmad, S et al; (2017) Ahmad, S, et al; 2016, and Ahmad, S at. al; (2017), pointed out that profitability is the most common measure of performance in Malaysian companies. Profit margin, return on assets, return on equity, return on sales are considered to be the common measures of financial profitability.

Definition of T&CM industry;

T&CM industry is being defined as “form of health-related practiced designed to prevent, treat, or manage ailment or illness, or preserve the mental and physical well-being of an individual and includes such practices as traditional Malay medicine(TMM), traditional Chinese medicine(TCM), traditional Indian medicine(TIM), Islamic medical practice, homeopathy, and complementary therapies but exclude medical and dental practices used by medical and dental practitioners respectively. (Act 775)

Research Methodology

Sampling

This study is confined to T&CM companies registered with Company Commission of Malaysia. The data was collected by mail survey from the top management of the 2000 participating firm. The outcome of returned questionnaires is 200. Only 150 were reusable and analyzed.

Questionnaires

The self-administered questionnaire was used to gather the data from the respondent. The questionnaires were mail to the respondents together with the self-addressed envelope and stem. The first section focused on the general characteristics of the T&CM entrepreneurs in Malaysia. These characteristics include information on the owners/managers, percentage of ownership, industry experience, size of capital, age, organization structure, employees. Following this, the second section of the questionnaire aimed to capture information on the types of business strategy adopted by the T&CM industry. This includes low-cost strategy, differentiation strategy, hold and maintain strategy, bare bone strategy, by product type strategy, and by customer-type strategy.

The final section of the questionnaire seeks information on the performance of T&CM industry in Malaysia. In this study performance was measured by number of employees at business startup, number of employees at the financial year, and also volume of business at start-up and the volume of business at financial year ends.

Results and Findings

Table 1 illustrates the respondent Ethnicity. Majority of the respondents that is 76% are Chinese, 20% are Malays and 4% are Indian. The respondent’s status of ownership. It clearly indicates that 28% of the respondents are founder to the business, 12% are cofounder, 4% inherit from their family while 56% others. The number of business owned. It clearly shows that majority of the respondents that is 46% did not owned any business, 44% own at least one business. While 10% owned more than 3 business. The respondent position in the company. It clearly shows that majority of the respondents that is 54% are Manager and 46% are CEO/MD of the company. Table 5 illustrates the business Strategy applied by herbs entrepreneurs. It shows that 30% of the respondents adopt Specializing by product type strategy, 20% of the respondents adopt specializing by customer type strategy, 14% Growth strategy, 10% Differentiation strategy, 12% Low cost strategy, 8% hold and maintain strategy. The respondent’s number of employees at business start-up. It shows that 28% of the respondent’s number of employees at business start-up is more than 100 employees. While 72% of the respondent’s number of employees at business start-up is 100 or less.

</tbody>
</table>

Table 3 illustrates the respondent volume of business in the last fiscal year in Ringgit Malaysia (RM). It clearly shows that 60% of the respondents volume of business in last fiscal year is above 10,000,000, 30%, 5,000,001-10,000,000 while 10% are <RM 5,000,000.

**Conclusion**

The findings clearly indicates, the business strategy adopted by the T&CM industry are specializing by product type strategy, specializing by customer type strategy, growth strategy, differentiation strategy, low cost strategy, hold and maintain strategy. The performance of these T&CM industry was indicated by the number of employees and the volume of business which are increasing annually. Their performance are mainly depending on the nation’s economic growth and the regional economy as well as the world economic situation.

Robotic Surgery: A Technovative Approach to Medical Surgeries

Hariharan Ravi ¹, Vedapradha. R², Rajani H. Pillai³

¹Assistant Professor, Department of Commerce and Management, St. Joseph’s College of Commerce, Bangalore, ²Assistant Professor, Department of Commerce and Management, St. Joseph’s College of Commerce (Autonomous), Bangalore- 25. Karnataka. India. ³Assistant Professor, Department of Commerce, Mount Carmel College (Autonomous), Bangalore

Abstract

Purpose: Robotic surgery is a prominent technology that holds a significant contribution towards the perception of medical science in performing surgeries, often interpreted as the new revolution. The objective of the study is to evaluate the challenges encountered by surgeons to perform robotic surgeries among different patients.

Design/Methodology/Approach: Convenience sampling method was adopted to conduct the study with a sample size of 60 respondents, surgeons of various private hospitals based on the primary data collected from the respondents. ANOVA, Chi-square statistical tests were performed using Statistical Package for Social Science (SPSS). Age, Gender, Specialization area, Cost, Treatment, Perception, Comfort level, Experience, and Surgery were the variables considered.

Findings: Surgeons are more comfortable in treating different types of diseases implementing robotic surgery across the different patients irrespective of surgeon’s gender being significant at 0.05 per cent level at p (0.049), age group of surgeons at p (0.036). They can perform the surgery easily based on their expertise area while treating all types of diseases with a greater level of comfort which is significant at 0.01 per cent level.

Originality/Value: Robotic surgery has an exceptional significance in transforming the world of surgery with benefits like smaller incisions, better visualization, fewer scars, less pain, shorter hospital stay, fewer side effects, and faster recovery time. It also promotes the application of innovative technology in treating the most complicated diseases with ease.

Keywords: Robotically-Assisted-Surgery (RAS), Surgeon, and Arthrobot.

Introduction

Surgery is a medical process especially using operative manual and instrumental techniques on a patient to treat a pathological condition. This traditional process has challenges in terms of human error, timely diagnosis, not adapting innovative technology resulting in either death of patients or unsuccessful surgery. Robotic surgery has an exceptional significance in transforming the world of surgery with benefits like smaller incisions, better visualization, fewer scars, less pain, shorter hospital stays, fewer side effects, faster recovery time. It is based on the “minimally invasive” approach where miniature surgical instruments are inserted into the body of patients by the surgeons roughly of a quarter inch size through a large incision. Robotically –Assisted-Surgery (RAS) was developed to
enhance the capabilities of performing open surgeries based on two important methods:

**Direct telemanipulator:** A tele manipulator is a remote manipulator that allows the surgeons to perform the normal movements linked with the surgery while the robotic arms carry out those movements using end-effectors and manipulators to perform actual surgery on the patients.

**Computer Control:** In computer-controlled systems, the surgeons use a computer to control the robotic arms and its end-effectors, though these systems can also still use telemanipulator for their input. One of the advantages of using this computerized method is that the surgeon does not have to be present, but can be anywhere in the world, leading to the possibility for remote surgery.

**Conceptual Framework**

The first robot that came into the state of reality to assist surgery was ‘ARTHROBOT’ which was developed and used for the first time in Vancouver in 1983. Biomedical engineer Dr. James McEwen, Geof Auchinleck, a UBC engineering physics graduate, and Dr. Brian Day as well as the team of engineering students were closely associated with the development of ‘ARTHROBOT’. The robot was used in an orthopedic surgical procedure in 1984 at the UBC Hospital in Vancouver and over 60 plus arthroscopic surgical procedures were performed in the first 12 months. A surgical robot ‘SCRUB NURSE’ was developed and was able to handle operative instruments on voice command. SRI International and Intuitive Surgical an American corporation that develops manufactures and markets robotic products carried out the development of robotic systems by introducing Da Vinci Surgical System and computer motion with Automated Endoscopic System For Optimal Positioning (AESOP) and the Zeus Robotic Surgical System (ZRSS) robotic surgical system. The first robotic surgery took place under the direction of Robert E. Michler at Ohio State University Medical Center in Columbus. In 1998 ZEUS Robotic surgical system underwent various surgeries which include fallopian tube reconnection, a beating heart coronary artery bypass graft in 1999, and cholecystectomy performed remotely in 2001. The importance of this surgery is gaining popularity with marginal errors during the process.

**Literature Review**

Robotic-assisted surgery is equipped with a 3-dimensional camera which makes surgeons easy to operate and also there is a separate room where surgeons can operate without any help from another surgeon. The studies also show how robotic surgery will be overtaken by laparoscopic surgery. The surgeons are also worried about the cost associated with robotic surgery and longer functioning time. Computer-assisted surgical systems should be used by surgeons who have undergone through official training, not the surgeons who operate traditional surgery. In robotic-assisted surgery, traditional surgeons with lack of training have resulted in negative outcomes so a surgeon must undergo formal official training to eradicate such outcomes. This surgery is still in growing stage or can be also said to be in the initial stage and its niche has not yet well defined. Robotic surgery is a stirring visible technology which is taken by the surgical profession by more gale. The author examines that robotic devices seem to have more of a marketing role than a practical role. The authors also questions that the manufacturers of robots do not disclose the cons associated with it. The authors identified major findings that India is readily accepting this robotic surgical innovation, the use of which is on continuous rise and will cover entire market if cost factor is considered as it is second largest populated country in the world proving to be a huge market for inducing robotic surgery systems and demand from the patient’s side should not be overlooked. Occurrence but not important it wouldn’t be fair to say the image of recent past, is finally seen into the reality of today and of unmatched surgical a merit for tomorrow. Technological innovation must be tested and coined with affordability, accessibility, availability, appropriate and acceptable. As far as robotic surgery is concerned the above five things must be considered. The paper also examined the typical Indian mind set which takes a long time to accept new technologies and adopt it compared to western countries. The paper also states why robotic technology is not widely accepted in India and the reason behind it is a huge cost, the time required for setup, applicability in all the cases and the learning curve. There are other reasons as surgeons are untrained, unskilled to operate the robotic system.

**Statement of the Problem**

Robotic surgery is one of the most significant advances in recent years. It has scope in various areas
of surgeries like Urological Surgery, Gynecological Surgery, Cardio Thoracic Surgery, General Surgery and other surgeries safer with far superior results as compared to laparoscopic or open surgery. Hence the researcher has attempted to analyze the practical concerns encountered by patients and surgeons with special reference to robotic surgery being performed in hospitals.

**Objectives**

Evaluate the challenges faced by the patients and surgeons towards robotic surgery.

**Hypothesis**

Ho: There is no significant variance between the gender, an age of the surgeon, area of specialization, years of experience and the problems faced by the surgeon.

**Sampling**

Convenience sampling method has been adapted to survey 60 respondents which were collected from Hospitals in Bangalore city.

**Data Collection & Source**

Primary data forms the base for the study through a structured questionnaire duly filled by the surgeons belonging to different age groups and specialized areas.

**Variables & Statistical Tools Used**

Age, Gender, Specialization area, Cost, Treatment, Perception, Comfort level, Experience, and Surgery

**Limitations**

The study was confined only to the Hospitals in Bangalore city, sample size collected from urban Bangalore and also the time constraint.

**Results**

Source: Computed from primary data

A one-way ANOVA was conducted to compare the effect of gender among the surgeons in performing the robotic surgery by the surgeons under challenges encountered with treatment type, level of comfort, perception conditions. There is no significant effect of gender on challenges encountered by surgeons under the condition of treating all the diseases appropriately at the p >0.05 level with 0.581 and perception of the using the robots in surgery at p > 0.05 (0.116). However, there is a significant effect on the level of comfort in the application of technology in operations by the surgeons as the p < 0.05 with 0.049.
A one-way ANOVA was conducted to compare the effect of different age group in performing robotic surgery by the surgeons based on the treatment type, level of comfort, perception conditions. There is no significant effect of different age groups on challenges encountered by surgeons under the condition of treating all the diseases appropriately at the $p > 0.05$ level with 0.426 and perception of the using the robots in surgery at $p > 0.05$ (0.792) but there is a significant effect on the level of comfort in the application of technology in operations with respect to the age group of the surgeons as the $p < 0.05$ with 0.036.

<td>15</td>
</tr>
</tbody>
</table>

Pearson Chi-square Value: 2.252

Sig.: 0.689

Source: Computed from Primary Data

There is a negative relationship between age of the surgeon and time period for recovery of a patient opting robotic surgery as the probability value is 0.689 for the surgeons experienced in robotic systems. Hence, the relationship is not statistically significant.

### Findings & Discussions

There is significant variance between the genders of surgeons in treating the different diseases based on their comfort level by the surgeons while performing the surgery through the robotic system but has no variance.
between the gender and the different diseases treated the perception of the surgeons towards the robotic surgeries. Surgeons are more comfortable in treating different types of diseases implementing robotic surgery across the different patients. There is no effect of an experienced surgeon who has been applying the robotic system in their surgeries among the patients on the challenges encountered by them. There exists a negative relationship between age of surgeon and overall cost for a patient opting for robotic surgery.

**Conclusion**

The integration of Artificial Intelligence and Augmented Reality has shown rapid improvement in healthcare. Robotic surgery is one example of such technology that may reduce hospital stay, operative morbidity and recovery period. Still the level of awareness among patients is comparatively low and also costs associated with robotic surgery is higher and as a result, certain category of people are covered under this type of surgeries. Also, hospitals should be made accountable if malfunctioning happens while operating robotic surgery.

A Study on Impact of Nutrition Labeling on Buying Behavior

A. S. Nagalatha¹, G.Chandhana Deepa¹

¹Asst. Professor, Department of Commerce, Sri Kanyaka Parameswari Arts and Science College for Women, Chennai, Tamil Nadu, India

Abstract

Health is a major source of living. Fast and irregular food habits and unhealthy practices of individuals, in modern days tax more on health. “You cannot buy your health; you through health living.”- Rightly said by Joel Fuhrman. The study investigates the impact of nutrition labeling on buying behavior. Structured questionnaire was employed and circulated to departmental shoppers in Chennai. Regression is employed to identified impact of the predominate factors of nutritional labeling which influencing the buying behavior of consumers. Result highlighted that trust on nutritional labeling; education level and nature of food habit of consumer impact the factors influencing the nutritional labeling. Buying behavior is impacted by mindful buyer and ignorant buyer positively and negatively.

The study concludes that nutritional labeling is attracted by the few buyers like healthy diet seekers, people in cure of unhealthy food practices and old age people.

Key words: Nutritional labeling, healthy food practices, healthy diet.

Introduction

India is a country for multi-dimension attributes especially in culture and food. The traditional methods of food habit and belief in health conscious make people unique and strong¹. The present food habit and quality less tasty food impulse the youth to scrawny and unhealthy. The changes in the environment and work nature make the people to skip the routine and traditional nourish habit. The health issues on diet have been increased intensely high in the last decades. Lot of health hazards and mortality rate reflects in the impact of wrong food habits which paw the way for risks like blood pressure, cardio disease and high body mass index. The malnutrition is becoming serious note to the growing nations. The need of the hour to trust the food packet to know the nutritional scale’s level. The promises of product make people to feel better and believe the corporate food product. Consequently, nutritional labeling has emerged as an important aspect of consumers’ food purchase decisions.

The nutritional content in food product is considered to be a credence attribute. However, if trustworthy nutritional labels are available, it could function as a search characteristic. Many developed countries has long recognized the potential of standardized on back nutrition information and has mandated the presence of nutritional labels on all processed food products. Growing literacy and technology paved a way to know the best of healthy foods and their sources. This made the corporate to more focus on the content and elements of food on food and other mandatory products. The study would like to identify one of the diverged metropolitan city Chennai residence preferences in nutritional labeling.

The study investigates the intension of the consumers buying behavior by considering the nutritional labeling. The consumer forum and brand power codes stimulate the buyer to more conscious in making choice of the product. The changing trend to become Ayurvedic and organic food consumption kindle to focus on the nutritional labeling. The study was under take with following questions: RQ1. Which resource gives them more awareness about nutritional labeling?, RQ2. Does the labeling significantly influence the buying behavior of the consumers? and RQ3. Does the demographic variable impact their buying behavior?
Review of Literature

The food labeling can impress the consumer or its target user that it is the product of his choice, which suits him / her according to needs. Thereby, the correct and required labeling undoubtedly promotes the sale of the product and attracts the customers. Food labeling serves as a primary link of communication between the manufactures of packer of the food and user or consumer on the other hand. every packets food articles for the domestic use has to be labeled in accordance to the related Indian Food law i.e. Food safety and standards (packaging and labeling) regulation, 2011 notified by Food safety and standards Authority of India (FSSAI) Food safety helpline.com (2013).

According to the FDA (1998) a label should clearly and minimally state the name of the product, the net weight, the nutrition facts, the name and address of the manufacturer and the brand name. These food labels have become increasingly complex, particularly as products move from the status of basic commodities to highly processed, value – added products (APO, 2002). The Indian consumers have been responding to changes in quality of food intake and are becoming more conscious about nutritional diet, health, and food safety issue4. According to Norhidayah Azman, Siti Zeleha Sahak (2014)7 study defining the use of nutritional label has a multi dimensional issue.

Now a day, customer is concerned not only on the appearance of the products but also on the nutritional information in the packaged food sold at retail outlets. By providing a nutritional label, it will assist customer in making healthier choice5. Consumers consulted labels mostly as assistance in purchase decisions for examples comparing price, expiry dates etc. but very few read information regarding certification mark from quality agencies like FPO, Agmark etc5. In recent days consumers are becoming more clear and aware and showing greater concern about what they eat. The recent controversy in Maggi, Coke, Pepsi and korkuray in India, which lead to aversion among the consumer still the ignorance and attractive advertisements make them to depend on the product. The main indention of the consumer is to transfer information from the produces to the consumers.

Objectives of the Study

To study the buying behavior on nutritional labeled products.

To study the awareness of the consumers regarding nutritional information on selected product

Identify the factors influence to buy the nutritional labeled product.

Research Methodology

The present study is analytical in nature and has adopted survey method for its findings. This study is based mainly on the primary data collected from the respondents residing in Chennai. The through a well-designed and well-structured questionnaire. However, efforts were also taken to collect information from all available published data, especially from websites, newspapers, magazines and journals.

Sampling Size and Design: Non-random convenient sampling method was adopted for collecting primary data. A total of 165 questionnaires were issued and the respondents were given sufficient time for filling the questionnaire. 165 of the issued questionnaire were received back from the respondents. On scrutiny of these 60 of them were found to be incomplete. So, they were rejected and the remaining 105 samples were taken for the study.

Questionnaire Design and Scaling Pattern: A questionnaire with three sections was finalized to collect information from the respondents. Section one deals with the various demographic profiles of the respondents. Section two contains with the consumer perception towards nutrition labeling and followed by rest of the section consist the consumer attitude towards nutrition labeling and it is measured through appropriate 5 point Likert scale. The test the reliability and consistency of the instrument the Cronbach’s Alpha reliability co-efficient were conducted and the value being 0.88 indicates that, the scale is more consistent and highly reliable in nature.

Statistical Software and Tools Selection: The data collected were subjected to analysis using PSPP Version 1.0.1 which is free alternative software for IBM SPSS Statistics. The statistical tools such as, percentage analysis, factor analysis and multiple regression analysis were used to draw meaningful answers to research objectives.
Results and Discussion

Demographic Profiles of the Respondents:
Percentage analysis has been applied to understand the demographic profiles of the respondents such as gender, age, educational qualification, occupational status, annual income, area of living, religion, nature of food habit and followed by consumer perception towards nutrition labeling such as, reading labeling information before purchase food product, source of information getting nutrition labeling and high price and the results are shown in table 1.

</table>

The study figure-outs that male and female were more or less equal in this sampling and their opinion is similar on nutritional labeled product. Major respondents fall under the category of 20-30 years of age group. Major respondents are non-vegetarian, sub urban and Hindu religious. The study highlights that irrespective of the respondent’s nature of occupation, living place, religion, nature of food habit and annual income are differing but their opinion on the nutritional labeling are comparable. This says that the respondents were look in to the nutritional labeling and reading the content all the time before they buy from the departmental stores. The major informers of awareness of nutritional labeling of products are television and followed by health professionals. The respondents agreed that that they are not ready to pay high price for the nutritional labeling. They believe it is part of their responsibility which packing and marketing the product. Most of the consumers reported that they read food labels, and check safety, and genuineness and quality the food labeling before buying pre-packaged food Sudershan R Vemula., et al (2013)^9.

Exploratory Factor Analysis: The factor analysis was applied for data reduction process and to identify predominant factors which influence the buying behavior of the customer on nutritional labeled products. Kaiser –Meyer – Olkin Measure of sampling Adequacy test reveled 84.8% of adequacy of data and initial Eigen values extraction on loading factors is 69% of the total variance. The factor analysis identified four factors that
influence the nutritional labeling on buying behavior. The factors were Mindful buyer, ignorant buyer, learners and unconcern buyers. The Cronbach’s reliability test also has been applied to identify the reliability of the data. The test acknowledged 88% of reliability of the data.

**Multiple Linear Regression:** Linear regression was employed to examine the relationship between the demographic variables with factors motivating the respondent on look in to nutritional labeling. The factors motivating the respondent on look in to nutritional labeling serve as predictors and the explain the variance in independent variable such as age, gender, region, monthly income, educational qualification, annual income, trust on Nutritional labeling, nature of food habit. Factors motivating NL variable influence only three on out of all independent variable. They are trust on NL, nature of food habit and education of the respondents. The test proves the correlation R=0.592, F and P value (F value = 15.056, P value =.000) shows at 5% level of significance there is strong relationship between factors motivating NL with trust on NL, nature of food habit and education of the respondents. The model is frames as Y= 42.05 – 5.06 X1 – 3.488 X2 + 1.213 X3

The linear regression was applied to examine the relationship and influence between of factors on buying behavior with buying behavior of respondent. Buying behavior play as predictor has dependent variable were has factors are independent variables. The below tables -2 shows the model summary and co efficient of regression by taking buying behavior of the respondent as a predictor variable to explain the relationship towards the independent variables of factors influence the nutritional labeling. Buying behavior of the respondent variable only influences the two factors namely, mindful buyer and ignorant buyer. The test proves the correlation R=0.744, F and P value (F value = 63.388, P value =.000) shows at 5% level of significance there is strong relationship between buying behavior of the respondent with factors influencing the nutrition labeling. The model is frames as Y = 17.670 +1.435 X1 -0.359 X2

Consumers demand for detailed information regarding content and nutrition of packaged food products is amplifying in recent days. Regression test of table -1 highlights that encouraging factors of preferring nutritional labeling are influenced by trust on nutritional labeling. Shoppers of the departmental stores are almost learned and educated respondents. They really look into the details of the product on the packets such as ingredients, date of manufacture, price and type of nature like vegetarian or non-vegetarian. Most of the consumer seek canned food and they look more on ingredients, health claim, nutritional information, producers, country of origin, and net weight on the package. India is a country where the customs are very rigid and non-violatable. Many of the respondents are very particular about the contents of the food item like vegetarian or non-vegetarian based ingredients. Most of the vegetarians keen about the content of the food where as non-vegetarian or less in nature. Education level also play major role in the impact of buying motive of nutritional labeling because the more shoppers are business and employee based respondents are found more in departmental stores. The Indian consumers have been responding to change of intake and becoming more conscious about nutritional diet, health, and food safety issues. The buying behavior influenced by the major two factors such as mindful buyer and ignorant buyers. Both responders are extreme in their nature. Mindful buyer they are very conscious on their choice but ignorant are least bother about the nutritional labeling. They buy the product when it is discounted, may be language is unknown, very little print on pack and they are hurry to buy. Ignorant buyers they rarely look in to the labeling because of the language they may not follow, content letter may be little to read and understand, they buy product routine, and when it is in offer. The regression is negatively impact on the buying behavior of the respondent this is because only fast shoppers and offer sale buyer are not focus on the nutritional labeling. Though the respondents are well educated they may not look in to the details of the nutritional labeling when they purchase very faster. Sushil kumar and jabir Ali (2011) conclude that most of the lifestyle products such as breakfast cereals, readymade food etc. that would be used by people who have higher level of income and education would pay more attention to various kinds of labeling information.

Growing online sale influencing the behavior of the people to spotlight in all aspects. Especially big basket, Grofers, Amazon pantry, Bazaar car, etc. pulling the customer towards their commercial offers. May these sellers can focus on the high lighting the nutritional benefits through the labeling may attract many buyers. Health conscious of the people attract the new product with natures ingredience and benefits. Murali and Basisya (2007) triggered out that Indians check nutritional labels when purchasing a product for the first time, though consumer were concerned with nutritional information on food labels. Most of the Indian manufacture must give attention to nutritional labeling with proper standard to catch the attention of health conscious buyers. The study highlights that non-vegetarians are more conscious on nutritional labeling than vegetarians and majority of the respondent are reading the nutritional labeling before they buy. The changing habit of consuming good food will create good health and good thought.

Patient Satisfaction of BPJS Kesehatan Service after Three Years of Program Implementation

Diena Dwidienawati, Mts Arief, Sri Bramantoro Abdinagoro

1Doctor of Research Program, Bina Nusantara University (BINUS)

Abstract

BPJS Kesehatan has had a large coverage in short period of time. The rapid expansion of health insurance coverage has created demand which cannot be met by current healthcare system and will disrupt the delivery service (Bredenkamp et al., 2015). The disruption of service, as a consequence, will influence the satisfaction. Patient satisfaction evaluation is important because it is not only as an important indicator to evaluate the achievement of the program but also it is important to improve treatment outcome. At present there is limited report on patients’ satisfaction to BPJS Kesehatan provider. This study is aiming to find out the satisfaction level of BPJS Kesehatan in Indonesia after 3 years of program implementation.

This study using questionnaires as survey instruments. Aiming to BPJS Kesehatan midair that pays monthly payment insurance in six hospitals in five big cities in Indonesia. Three hundred and twenty-eight questionnaires are eligible to be analyzed. Descriptive analyzed is done to evaluate the satisfaction rate. The result of the study shows that patients are satisfy with the interaction, support and services provided by BPJS Kesehatan patients, which is ninety-four per cent satisfaction. This study result is different with the pervious study which shows lower satisfaction rate. The explanation is that in this study majority of respondents come from private hospitals which known to have better service compares to public hospitals. To confirm the result of the study, further study which involved more balance public and private hospitals and big cities and small cities should be done to compare the satisfaction rate from each type of hospitals and cities. Further study to identify which variable of satisfactions are more influencing is also needed to identify are of improvement of BPJS Kesehatan services.

Keywords: BPJS Kesehatan, Satisfaction, Patient

Introduction

Everyone, regardless gender, ethnic and citizenship has the right to health. United Nations (UN) in its Universal Declaration of Human Right has stated in 1948, that “everyone has the right to a standard of living adequate for health and well-being of oneself and one’s family, including food, clothing, housing and medical care”. WHO (1978) declared that Health care is a fundamental right. Health is considered as one important factor which might affect the continuity of human well-being. Without health, people might jeopardize their productivity, loss their employment or lost their independency due to disability. Furthermore, healthcare expenditure can cause financial catastrophe. The healthcare expenditure has been known to increase the impoverishment in China (Liu et. al., 2003), Vietnam (Wagstaff & Doorslaer, 2001) and Kenya (Kimani et.al., 2016).

Indonesia is one of low and middle-income countries aiming to improve their health financing system and to implement universal health coverage (UHC). Starting just in January 2014, within less than 3 years, BPJS Kesehatan has successfully had a large coverage. In January 2017, BPJS Kesehatan has enrolled 172.97 million members according to BPJS official website. It is considered as the biggest single payer institution of Universal Health Coverage program in the world (Teh,
The rapid expansion of insurance coverage has created demand which cannot be met by current healthcare system (Bredenkamp et al., 2015). Furthermore, Bredempkamp et al., state that the sudden increase of demand will disrupt the delivery of service, especially in the public hospitals. As a consequence of disruption of service, the satisfaction level will be influenced. Currently, there is limited report on patients’ satisfaction to the service of BPJS Kesehatan. One study from Center for Health Economic and Policies Study from University of Indonesia shows that the satisfaction level to hospital service is 54% and the satisfaction level to doctor service is 44% (Thabrany, 2016). Dwidienawati & Abdinagoro (2017) in their small study also report similar result that the satisfaction rate is still below expectation. Only sixty per cent of respondent state that they are satisfy with BPJS Kesehatan service.

This study is aiming to find out the satisfaction level of BPJS Kesehatan in Indonesia after 3 years of program implementation.

**Literature Review**

Consumer satisfaction is seen by marketing literature originally as being an outcome resulting from the consumption experience. At present, the most dominant of the conceptual models of consumer satisfaction is disconfirmation. Satisfaction is defined as “the consumer’s fulfillment response”, a post-consumption judgment by the consumer that a service provides a pleasing level of consumption-related fulfillment, including under- or over-fulfillment (Oliver, 2015). Kashyap & Sivadas (2012) define satisfaction as consumer positive affective response to relationship exchange.

Newsome & Wright (1999) state that consumer satisfaction is at the very core of marketing theory and practice. Ramsaran-Fowdar (2008) further argue that retaining customers may be more profitable than attracting new ones, dissatisfied customers may lead to unfavorable behavior intentions such as negative word of mouth, doing less business or switching to alternative service provider.

In healthcare, Roberts & Reich (2002) argue that patients’ satisfaction is an important indicator to evaluate the achievement of public service system (Roberts & Reich, 2002). Investigating public satisfaction is the most common way to confirm public opinion and needs for policy innovation. However, it is demonstrated that there is link exist between satisfaction and patient compliance in areas such as appointment keeping, intentions to comply with recommended treatment and medication use. The high quality clinical outcome depends on compliance, which indirectly we can say it depends on patients satisfaction (Newsome & Wright, 1999). Therefore, patients’ satisfaction is also important to improve treatment outcome (Gill & White, 2013).

Patients’ satisfaction affects healthcare providers financially through referral and reimbursement. Patients’ satisfaction has also been linked to unsolicited complaints and medical malpractice lawsuits (Stelfox, Gandhi, Orav, & Gustafson, 2005).

**Method**

The population of this study is all BPJS Kesehatan Mandiri members, which total approximately 61 million. Data for statistical analysis were gathered through field survey to in April-July 2018. This survey was using questionnaire as instrument.

The survey was administered in five big cities on Java Island, Indonesia. The survey was designed to elicit the post-consumption judgement of BPJS Kesehatan providers (medical professionals and hospital staff). They were asked to self-rate the customer satisfaction from BPJS Provider services. Six hospitals in five big cities in Java Island were targeted. Six hundred and thirty-five questionnaires were distributed. Sample collection used the convenience sample collection method, due to time and resource limitations.

**Measures**

The survey explored respondents’ judgments of customer satisfaction. In the survey, respondents were asked to rate their level of agreement with particular items using a 6-point Likert scale anchored with strongly disagree and strongly agree. Mid-point is omitted to avoid social desirability bias.

Customer satisfaction was measured using three indicators modified from Carr (2007) and Kasyap & Sivadas (2012). The questionnaire was taping the respondent evaluation on satisfaction of interaction, support, and service.
Measurement model

Data from returned questionnaire was compiled and then analyse to find out the descriptive analysis of customer satisfaction. The measurement for latent variable customer satisfaction was analysed with LISREL.

Result

From six hundred and thirty-five questionnaires distributed, 100% questionnaires were returned. Since

Almost all respondents agreed that they were satisfy with interaction (94%) with healthcare providers. Ninety-five per cent of respondents agreed that they were satisfy with the support given by the staff of healthcare providers. Regarding the service ninety-four per cent agreed that they were satisfy.

Discussion

Patients’ satisfaction is an important indicator to evaluate the achievement of public service system (Roberts & Reich, 2002). Investigating public satisfaction is the most common way to confirm public opinion and needs for policy innovation. However, patient satisfaction has another important role rather than just indicator of program achievement. Newsome & Wright (1999) stated that patient satisfaction will influence the compliance and participation to treatment. Therefore, patients’ satisfaction is also important to improve treatment outcome (Gill & White, 2013).

BPJS Kesehatan is a very important healthcare program for Indonesian. It give patients access to treatment without jeopardize their financial status. However, due to the rapid expansion, the service quality might not be able to catch up with the increasing number of patients. That will lead to lack of customer satisfaction.
The result of this study showed however, that the satisfaction level of BPJS service is quite good. More than ninety per cent respondents agreed that they are satisfied with interaction, support and service of healthcare provider. This result is different with showed by Thabrany (2016) and Dwidienawati & Abdinagoro (2017) that BPJS Kesehatan service is still not satisfying.

The reason behind the high rate of satisfaction is the profile of the hospitals. Table 1 showed that in this study only fifteen-point five percent respondents were from public hospitals, the rest were from private hospitals. When analyzed separately, it was shown that the satisfaction rate in the public hospitals was not as high as in the private hospitals. The satisfaction for interaction was only ninety per cent. As for satisfaction for support and service was only eighty-eight per cent.

Healthcare industry is a heavy regulated industry with so many procedures to follow. Especially in private hospitals which are very competitive. They have to set a good standard not only how to ensure the outcome of treatment but also how they treat their patients. The staff of the private hospitals have to act and communicate to patients in certain way. Healthcare staffs are well trained. How patients rate them is important. Some hospitals even implement the customer survey and use the rating result as part of performance appraisal. Therefore, the way they treat and communicate with patients can be expected as polite and respectful. The follow up interview conducted to BPJS patients confirmed that the reasons patients choose to go to private hospitals for BPJS service because the healthcare professional who treat them were polite and friendly.

**Conclusion**

This paper sought to explore the satisfaction rate of patients to BPJS Kesehatan service provider. Patient satisfaction evaluation is important because it is not only as an important indicator to evaluate the achievement of the program but also it is important to improve treatment outcome.

The result of the study showed that patients are satisfy with the interaction, support and services provided by BPJS Kesehatan pasien. This study result is different with the pervious study by Thabrany (2016) and Dwidienawati & Bramantoro (2018) which showed lower satisfaction rate. In this study satisfaction rate was ninety-four per cent. The explanation because of the different of hospitals profile. In this study eighty-five per cent of respondents are from private hospitals. Yet, due to competitive nature, private hospitals are known to have better standard compared to public hospitals.

To confirm the result of the study, further study which involved more balance public and private hospitals and big cities and small cities should be done to compare the satisfaction rate from each type of hospitals and cities. Further study to identify which variable of satisfactions are more influencing is also needed to identify are of improvement of BPJS Kesehatan services.

The managerial contribution will be giving the insight to BPJS Kesehatan that the current health care provider service especially from private hospitals is satisfying. With that insight, BPJS Kesehatan needs to put some effort to involve more private hospitals in giving services to BPJS Kesehatan patients. It will help increasing the access to treatment and helping government spends less build new public hospitals.

Heat Transfer Model for Firefighter’s Burn Injury

Zaina Norhallis Zainol¹, Masine Md Tap¹, Haslinda Mohamed Kamar¹, Nazri Kamsah¹
¹School of Mechanical Engineering, Skudai, Universiti Teknologi Malaysia, Johor Bahru, Malaysia

Abstract

Burn injury is a common injury that can occur in firefighting. Personal protective clothing is used for protection against fire hazards and burn injuries. The purpose of this study is to assess the effectiveness of firefighter’s personal protective clothing by utilizing heat transfer model in finite element analysis. The model used a 2 dimensional quarter circle geometry representing the human limb as it is the most common area for burn injury. The result shows skin temperature increases significantly with the heat flux intensity. Findings shows that the heat flux of 1200W/m² causes skin temperature to be at 38.3°C. The initial skin temperature will gradually rise at t = 0 second and approaches it’s steady at t = 198 seconds. The increment in air gap thickness reduces the heat stress effect. The reduction of 1 mm air gap thickness contributes to an increment of 0.2°C of the skin temperature.

Keywords: Firefighter; burn injury; heat transfer

Introduction

Thermal protective clothing is primarily designed to provide protection from thermal hazards which include exposure to high temperature radiant sources, flame impingement, hot liquids and gasses. Heat flux transmitted by thermal hazards ranges from 20 – 160 kW/m² and encountered during large fires and explosions¹. Existing protective clothing is capable of providing protection against thermal hazards and can sustain the heat flux intensities in the range of 5 to 20 seconds². Exposure to low-level radiation heat flux ranging from 5 kW/m² to 20 kW/m² has been found to be the most common thermal hazards that could cause skin burn injuries³.

There are many factors that influence burn injuries, such as heat flux, protective clothing material properties and the air gap thickness. Previous researchers utilized bench scale test¹¹ thermal manikin³ in order to exert flash fire to study the effect of skin temperature. The human limb is the most common part of the human body where injury occur among fire fighters⁵. To achieve a more accurate result, studies and experimentations need to be conducted on two dimensional quarter circle geometry that represent the human limb.

Air gap thickness has significant influence to skin burn¹⁰, ¹¹. The air gaps located between the human skin and the inner surface of the personal protective clothing formed a buffer region restricting heat transfer from the heat exposure to the human skin. When exposed to heat, the air gap acts as an insulator protecting from burn injuries. Psikuta et al. (2012) and Li et al. (2013) studied the effect of air gap thickness using body scanner on thermal manikin.

In this study, a new and practical approach is developed to assess the effects of heat flux intensity and air gap thickness on the human skin temperature in quarter circle geometry using finite element analysis.

Literature Review

Burn injury is a common injury that occur during fire fighting. The statistics show that more than 75,000 burn injuries and fatalities occurred annually in USA⁹, ¹². Considering that in the total amount of time spent for fire suppression, approximately 5-10% of this time involves exposure to extreme heat and flame, there is considerable risk of such injuries occurring ¹³. The material’s protective performance is most important in ensuring life saving capability and this depends on the fire and, type and characteristic of the personal protective
clothing. The evaluation on the potential protective characteristics of protective clothing material can be done through experimental study and mathematical model. The experimental study can be conducted using three methods. These methods are known as bench scale test, thermal manikin test and test method for wet sample. However, experimental methods are very exhaustive and time consuming. Currently there are numerous studies that have been carried out regarding mathematical model developed to evaluate the performance of personal protective clothing. There are two types of mathematical models that have been developed. The first type are those that consider heat transfer only. The second type are those that consider heat and moisture transfer.

Methodology/ Materials

The model is developed using finite element then validated using data and findings other researchers. A simplified two-dimensional model of multi-layer clothing materials is developed using ANSYS transient thermal finite element software as shown in Figure 1. The model also includes a human skin and air gap layers. The effects of the air gap thickness on the skin temperature, Table 1 shows the thickness of each layer.

Table 1. The model dimension

<table>
<thead>
<tr>
<th>Layers</th>
<th>Thickness (mm)</th>
</tr>

</tr>
<tr>
<td>Thermal barrier</td>
<td>1.46</td>
</tr>
<tr>
<td>Outer Shell</td>
<td>0.50</td>
</tr>
</tbody>
</table>

Figure 2 shows the boundary condition prescribed on the model. The skin temperature 37°C is at the E-layer. Heat flux is placed at the outermost layer specifically at the layer D. The effects of heat flux on the skin temperature are evaluated based on five different intensities, they were 1200 W/m², 1000 W/m², 800 W/m², 600 W/m² and 400 W/m². The analysis considered the effect of radiation heat transfer by specifying emissivity values on each Layer A, B and C respectively as shown in Figure 2.

The development of the finite element model is in transient condition which is depending with time. The heat flux located at the outside of the fabric at D layer represents the real fire exposure during fire suppression. According to Onofrei et al. (2015) the textile structure for aramid fabrics hold amount of water regain in fiber is small approximately around 3-4% therefore the heat evaporation can be neglected. The type of material was prescribed as aramid since it has a high insulator thermal
protective performance fabric commonly used during fire suppression. The outer shell is made of polyurethane coated with 100% aramid, while the thermal barrier and moisture barrier are made of 100% aramid. The material properties for the protective clothing were given in Table 2.

The simulation is performed under transient condition for a duration of 1000 seconds. The initial ambient temperature is specified at 22°C as prescribed by the International Organization for Standardization.

### Results and Findings

Validation is done by comparing the simulated results of the model with the model developed by Onofrei et al. (2015). The model developed by Onofrei et al. (2015) was based on multiple layer model that solved heat transfer problem using numerical method. The aim of the study was to evaluate the effectiveness of the personal protective clothing material. The model used was a two dimensional plane geometry. This study explores the quarter circle geometry representing the human arm. Table 3 shows the result of skin temperature with variation heat flux obtained from this study and Onofrei et al. (2015) study. Table 4 shows that the percentage error increases when the heat flux continue to rise. The previous model reached second degree burn when the heat flux was at 1000W/m² and 1200W/m². The current study found that second degree burn did not occur as the skin temperature did not achieved 44°C.

Table 4 is the results of skin temperature with various air gap thickness and at constant heat flux of 1200 W/m². The percentage error increase when the air gap thickness increases. The results from Onofrei et al. (2015)²⁸ shows that the skin temperature reaches second degree burn at air gap of 3mm thickness which is at 44°C. However the current study found that it with the quarter circle geometry second skin burn did not occur at 3mm thickness air gap. The percentage error is less than 20%, according to American Society of Heating, Refrigerating and Air-Conditioning Engineers³³ it is acceptable and reliable for further analysis.

**Result and Discussion**

Figure 3 shows the plot of the skin temperature against time for various heat flux intensities. The skin temperature increases as the heat flux increases. The skin temperature rises gradually when the material of the personal protective clothing is exposed uniformly to the heat flux and it reaches stable condition at 198 seconds. The skin temperature remain constant and unchanged until the simulation ended at 1000 seconds. Weaver and Stoll (1967)³⁰ stated second degree burn is achieved when the skin temperature reaches 44°C. According to this results burn injury do not occur yet as the highest skin temperature recoded is 38.3°C. Therefore, skin burn injury may occur at heat flux higher than 1200W/m² exerted at the outer layer of the personal protective clothing.

Figure 4 shows the plot of skin temperature against time with the variation of air gap thickness. The heat flux exerted at the outer layer of the personal protective clothing is with the heat intensity 1200W/m². From Figure 6, it is observed that increase in air gap causes skin temperature to decrease. The air gaps affect the skin temperature distribution as well as the heat flux that comes from the heat source at the outer surface of the protective clothing. It indicates that the air gaps thickness can reduce skin temperature effectively. The thickness of the air gap between the garment and the body depends on its particular location on the human body. According to Song (2003)²³ and Song et al. (2004)³¹ the maximum air gaps occur at the leg, approximately around 15 to 22mm and the minimum air gap is at the shoulder at 1.6mm. However for this study air gap thickness is varied between 1mm to 6mm, consistent with the previous studies²⁷,²⁸,³².

Air gap has low thermal conductivity and specific heat, it acts as thermal resistance. It reduces the amount of heat transmitted from the heat source and becomes buffer that restricts heat transfer from the external heat. The air gaps become good insulator protecting human from skin burn injury. The factors influencing the air gap thickness are drapability, rigidity and weight of the protective clothing material¹⁰. Good draping material and less rigid garment have less air gap thickness, and most likely will contribute to skin burn injury as compared to more rigid material. Rigid material causes the fabric to be closer to the skin, thus air gap thickness is less and enhance heat to penetrate through the multiple layers of clothing material.
This model developed in this study could be used as an evaluation tool for assessing potential design of material for firefighter's personal protective clothing. The evaluation can be done at various thermal environments. The model is able to evaluate the thermal performance of the protective clothing under these relevant factors. Furthermore, this model can be employed to predict when the burn injury will occur under these relevant factors. Thus, minimum exposure time required to cause second degree can be predicted.

**Conclusion**

From this study it found that the heat flux intensity significantly increases the skin temperature. The heat flux of 1200W/m² causes the skin temperature to reach up to 38.3°C. The air gap thickness significantly reduces the skin temperature as 1mm reduction thickness leading to increment of 0.2°C of skin temperature. The air gap is found to be a good insulator for minimizing skin burn injury. It shows that the three layered material used for the personal protective clothing provides protection against heat as there is no skin burn occurring even when the heat flux is significantly high.

Novel Design the: - Real-time Assistance of Smart Stick for the Blind

Abdullah J. H. Al Gizil, Yearb M.M1, Azli Yahya2, Ali Idham Abdullah2, Hayder husam2
1Thi-Qar Technical Collage, Southern Technical University, Iraq, 2Faculty of Electrical Engineering, UniversitiTeknologi Malaysia, 81310 UTM Skudai, Johor, Malaysia

Abstract

Individuals who suffer from loss or running out of vision cannot be active without relying on others and in order to make them independent and rely on themselves in the movement and to move freely be through a smart assistant. Smart Assistant is a Muscovite stick that can be used by the blind to avoid obstacles such as barriers, drilling, locating the blind and the parking brake. This proposed new design for the blind sticks is characterized by the use of the detector distance of ultrasonic tones and places are different in severity whenever the defect or limits the user whether the barrier or barrier as easily as can detect obstacles, potholes can determine the location of the user by sending a message to specify its location in an emergency. Such animals are called Electronic Travel Aids (ETA). The new design consists of an ultrasonic sensor, Arduino, a GSM chip, a vibrator, buzzer and a chargeable battery and headphone. The aim of this project is to build a sightless man stick that can detect obstacles, potholes and thus facilitate the blind person travel independently. The intellect of the general system is to provide a depressed price and well-organized navigation aid for blind, which conveys a sense of artificial vision by providing information about the environmental situation of static and dynamic objects around them.

Keyword:- Electronic Travel Aid (ETA); Obstacle Detection; Arduino; ultrasonic sensor, GSM, Smart.

Introduction

The objective of this project is to help the blind people to depend on themselves and travel independently by the help of modern technology such smart stick. That provide more safety to the blind this smart cane detect the obstacles in the path this system using ultrasound sensor, programmable interrupt controller (PIC) contain an analog digital converter, buzzer, vibrator and power supply In addition hardware. In this paper, an overview of the Internet of Things for people with disabilities is provided. On October 6, 1964, a joint resolution of the Congress, HR 753, was signed into law authorizing the President of the United States of America to announce October 15th of each year as “White Cane Safety Day.” The resolution read, “Resolved by the Senate and House of Representatives that the President is hereby authorized to issue annually a declaration designating October 15th as White Cane Safety Day and calling upon the people of the United States of America to observe such a day with appropriate ceremonies and activities.” Within hours of passage of the congressional resolution, President Lyndon B. On October 15, 2000, President Bill Clinton again reminded us of the history of the white cane as a tool, and its purpose as a symbol of blindness: “With proper training, people using the white cane can enjoy greater mobility and safety by determining the location of curbs, steps, uneven pavement, and other physical obstacles in their path.

The proposed system provides the following features, Cheap mobility stick with total cost not exceeding $120, Light weight components integrated to the stick which makes it user friendly, Fast response of obstacles, Avoidance confusion by playing comprehensible speech message through an earphone, Detection of stairs and its direction (upward and downward) stairs, Low power consumption and battery life up to 14 hours before recharge. During the early 1960’s, several state systems and rehabilitation agencies serving the blind and visually impaired citizens of the United States urged Congress to proclaim October 15th of each year to be White Cane Safety Day in all fifty states. Its use has promoted courtesy and the opportunity for mobility of
the blind on our streets and highways.” During most years since 1964, the President has proclaimed October 15th as White Cane Safety Day. This paper reports the results of three experiments on tactile perception, spatial representation, and tactile display design for assistive mobility devices for blind, partially sighted, and deaf blind people. Today the Internet of Things (IoT) is the emerging technology that can provide people with special needs the support to achieve a better quality of life. In the first White Cane Proclamation, President Johnson commended blind people for the growing spirit of independence and the increased determination to be self-reliant and dignified.

**Materials and Method**

**System Design**

The implementation of the proposed design of the stick requires following hardware components: Ultrasonic sensors, Electrical sensor, Water sensor, GPS module, GSM module, Infrared sensor, Arduino UNO Microcontroller Board[3]. One ultrasonic sensor is stuck to the front of the joint to detect obstructions in front of the person, and the other two sensors are placed on either side of the joint to detect obstacles on the left and right of the person holding the stick. If the distance is below the given threshold the microcontroller will send a signal to the vibrator and buzzer which will warn the blind person that he/she is also close to an obstacle and need to alter the way of their course. The fig 1 block diagram of our proposed system show clearly the hardware parts required for our system and the way connect each other.

![Fig.1. Block diagram of the proposed system](image)

**Ultrasonic Sensor**

The length of the obstacle can be measured every bit,

\[
\text{Distance} = \frac{(\text{time} \times \text{speed of sound in air})}{2}
\]

**Pothole Sensor**

The maintenance cost of an Accelerometer Sensor is low Thus it would be ideal for pothole detection.

**C-WaterSensor**

At the time of the stick be in water the short circuit will be connected and the microcontroller will be on then the beep sound is produced to warn the person who held it.

**GSM module**

Blind person for any emergency will use the gsm by switching the system stick on which allow to other person to find him or help him for any emergency situation.

**Arduino**

One of the flexible Microcontroller which is used in different application because it has everything need to support the microcontroller with 14 digital input and output.

**Pulse Width Modulation**

Permits input Arduino and yield read information input sticks and have the capacity to take consistent estimations of the gathering (for example, data got from the sensor) Then again, beat width adjustment (abbreviated as PWM) has permit by Arduino for (and has extraordinary yield pins committed to). The voltage quickly changes from 0V to 5V relies upon the furious
Results and Discussion

The Smart Cane that have been compound with technology to better the living quality of the blind and visually impaired. This sample highpoint the resemblances and changes between the Smart Cane and other progressive canes on the market. In the Fig 4 the Ultra Cane, a cane industrialized and created by Sound Foresight Technology Ltd., is a technically improved white cane that uses ultrasonic waves to sense latent obstacles in the user’s path. Smart Cane in the handle, has two vibrating motors.

The vibrating motors deliver a haptic form of feedback, warning the user of the obstacle’s place and space from the user. Two ultrasonic sensors, together located on the handle, produce waves in three different methods: in forward-facing of the user crossways a long range space of 4 meters, in obverse of the user crossways a short range space of 2 meters, and absorbed at rising angle that can sense crossways 1.6 meters. Fig.5 shown the distance response difference between the pothole sensor and distance sensor.

The achievement of the Smart Cane project, numerous tests were directed to see how the cane would sense objects. In actual, these tests checker the discovery competences of the ultrasound specified the design and location of the cane. These tests are essential because they can deliver an sign of the circumstances in which the Smart Cane would do incompetently. As seen in fig 6 the first test examined how well the cane sensed stationary objects at variable distances as shown in fig 6. The cane was located in the similar way it would be if a visually reduced person were holding it. A direct evaluation was made by insertion objects at dissimilar distances from the cane and likening the experiential distances with the sensor distance readings outputted. The sensor was verified at distances reaching from 30 to 200 centimeters, with a regular percent error of 0.20% and a all-out error of 1 centimeter.
over the pothole for it to detect the pothole, this working can controlled by switch hand used ,whereas the normal used one sensor only this new technique can by this option. The second experiment investigated how well the stationary cane observed a moving object as shown in Fig.7. In the experiment, set at various distances away from the ultrasonic sensor in increments of 25 centimeters, so that recorded the response for each 25cm starting with 25cm from the object to 200cm .On the other hand the experiment for move object test done by, a small robotic car moved past the ultrasound sensor at 0.8 meters per second.

Fig.7 Stationary cane observed a moving object

The ultrasound would once in a while get certain articles and send PWM signs to the engine, causing arbitrary vibrations that would fill no need to the user—the client needs predictable vibration to respond to an adjacent object.4.3 Issues with Motors When programming the Arduino, it was hard to roll out the vibration force improvement such that the client would see a critical abatement (or increment) in separate. Finally, PWM itself was to a great degree hard to accomplish this issue overcome by Arduino Uno board, while in spite of a precise setup including a resistor, diode, transistor, and different pins from the Arduino, it was difficult to accomplish the essential PWM. This is unfortunate on the grounds that the clamor is diverting and it can befuddle the user—as expressed before, the rate of discrete vibrations means that vicinity to the identified protest, and impact may degrade the client’s capacity to comprehend the vibrations. Although there are some minor disparities when the stick is in movement, the discrete mapping of vibration forces unto separate esteems implies this blunder will have practically no impact on the vibration felt by the client so we enhance that by utilized two ultrasonic sensors yield into engine vibrator.

Conclusion

Utilizing the ultrasonic sensor for separation and pothole sensor, Arduino board, GSM, water sensor, an electrical sensor and vibration engine, the Smart Cane enormously expanded the question identification scope of the white stick, along these lines enhancing the lives of the visually impaired and outwardly disabled clients. The keen stick likewise encourages the visually impaired individual to make calls now and again of crisis. The water sensor, electrical sensor is utilized to keep the client from going the through the water waterway and electrical stunning. Finally, the Smart Stick’s utilization of novel strategy and ergonomic outline has essentially upgraded upon the savvy stick and has involved an awesome jump towards enhancing the lives of the outwardly debilitated.

Family Caregivers for Cancer Patients

Nurin Hazirah Othman¹, Zuria Mahmud¹, Dharatun Nissa Fuad Mohd Karim¹
¹Universiti Kebangsaan Malaysia (UKM), Faculty of Education, Bangi, Malaysia

Abstract

Non formal, especially family caregivers are the most vital support for cancer patients in their healing process. However, caregivers are the least known, informed, and researched of all groups of people surrounding cancer patients. Ten family members are individually interviewed on their phenomenal experience in caring for cancer patients. Common themes that emerged from the interviews include financial, social, emotions, and physical challenges. Financial problems rooted from unemployment as caregivers have to spend time looking after their sick family members. Social emotional problems included perception from society on their unemployment and family relationship issues. Caregivers also experienced physical strains as they put aside their well being in caring for others. However, caregivers have their own coping skills which included positive outlook and family support. Understanding of caregivers experiences is important for mental health professionals, medical team attending to the patients, and the public at large. Results of this study suggests further assistance and guidance for caregivers in carrying their responsibilities.

Keywords: Family, Caregivers, Cancer Patients, Counselors.

Introduction

Cancer becomes a universally dreaded disease because it is considered chronic and it may change the life quality of patients². The Malaysian National Cancer Registry Report recorded a total number of 103,507 new cancer cases were diagnosed in Malaysia during the period of 2007 to 2011. In Malaysia, the number of chronic patients receiving informal treatment at home is high³. The inability of the patients and their need for proper and persistent care causes high dependence on the family¹. This reliance led the family to indirectly engage in the role of a caregiver. In meeting the needs of patients, family caregivers are oftentimes plagued with problems such as financial, physical, personnel, psychological and social⁴. As cancer requires extended time to heal, the life functionality of caregivers are also affected.

This study was conducted to draw attention to caregivers of cancer patients. To date, there has been a dearth of study on this population in Malaysia. The problems faced by the caregivers of family members with chronic illness has not been discussed thoroughly⁵. In other places, mental health effect studies of caregiving have shown higher levels of depression and physical health problems in caregivers when compared with noncaregivers⁶,⁷. In addition, cancer-related studies are more widely done in medical and nursing, but is still under-developed in psychological and social work areas where studies of life quality is needed. Therefore, this study aims to explore and understand the experiences of informal caregivers and to find basis of extending support for caregivers.

Literature Review

The diagnosis of cancer and its treatment has a major impact on both patients and their family caregivers⁸. In recent years, the caregiving of family members have slightly increased⁹,¹⁰. Caregivers are taking a huge responsibility for the care of the patients in ordinary living, hence, the number of caregivers is rising all over the world¹¹-¹³. Caregiving will become important in the future when the number of those who need this care increases, while government provided and private centers are no longer able to cope with the number of patients¹⁴.

Corresponding author:
Nurin Hazirah Othman
E-mail: nurinhazirah61@yahoo.com
Caregivers duties include not only helping the patient with personal and instrumental daily living activities but it is far more complexed. Caregivers are also responsible in providing emotional support and overall supervision of the patients. Family caregivers such as spouse, children, or close friends of the patients are the backbone of services provided to surviving patients. Infact, caring for sick family members has always been seen as a family responsibility. Appraisal and measurement of burden experienced by caregivers can show positive, negative or neutral impact as caregivers estimate the amount of significance of caregiving by taking into consideration of the personal stress and the resources to cope with it.

Being too focused on caring for cancer patients causes caregivers often forget to think about their needs and emotions. A review by stated, factors that contribute to caregivers’ depression include burden of care, the caregiver’s medical illness, ethnicity of the caregiver and the caregiver’s level of mastery in providing care for the patient. These findings have been reaffirmed in a study whereby caregivers experienced additional stress as they have other responsibilities to attend such as managing their own household and maintaining their social life as usual. So that, all these will land the caregivers in a conflict and stress. Most caregivers also have their own regular work and this causes them to feel guilty because they feel like ignoring their role in the family. After their studies on caregivers of breast cancer, suggest in order to help caregivers maintain their well being, there should be a move towards providing easy access to mental health services, setting up respite care facilities to relieve caregivers from caregiving burden and having support groups for caregivers.

Methodology/ Materials

A semi structured interview protocol was prepared consisting of questions regarding background information, caregiving experiences and coping strategies. According to the use of partial structured interviews is more flexible and this allows the participants to describe their thoughts and feelings to researchers. During the interview, the researcher used probing methods to explore in-depth each individual participant phenomenal experiences.

Permission to conduct this study was obtained from the Medical Research & Ethics Committee, Ministry of Health, Malaysia. Researchers were given permission to meet with cancer patients and their families at the clinics and daycare wards (as part of a bigger research project) during patients hospital visits. Individual interviews with 7 participants was held at the National Cancer Institute, Kuala Lumpur Hospital and Pulau Pinang Hospital while the other 3 conducted at their offices and homes. All the interviews were audio recorded. Each interview session lasted between 1 to 1 and a half hours.

Gibbs, 2007 suggested various techniques to ensure researchers to obtain rich data. Observation technique is a research method used to examine the behavior of the participants. In this study, the researchers observed the participants’ behaviors and interactions with their sick family members. These observations allow the researcher to check the congruence of participants information and their nonverbal behaviors.

The data collected was transcribed and shown to the participants for confirmability called member checking. The researcher were able to meet the respondents again for member checking (process to validate the transcripts). The transcriptions were then analyzed and coded using Atlas.ti.8 to find the themes. As a result of this encoding, two major themes and five sub themes have emerged.

Results and Findings

Demographic data of respondents.

Table 1 tabulated the participant biographical data. Participants for this study consisted of 10 caregivers (8 females and 2 males) who were family members of the patients. The ages of the caregivers ranged from 20 to 51 years old. Researchers have agreed that cancers are causing economic burden, as observed in the case of colorectal cancer which is likely to increase over time in Malaysia.

As a result of these studies, two major themes have been emerged; namely challenges and coping skills.

**Challenges**

Study from reported challenges that faced by the caregivers are physical disabilities and emotional issues. This study also found physical and social emotional issue but with an addition of financial challenges.

(i) **Social Emotional Issue**

Social emotional challenges come from various sources. These include disturbing perceptions from society. Disturbing perceptions from society concerning the patients conditions makes the participants feeling down and stress.

“Other people doesn’t know anything about our situation, but they simply talk bad about us to other people. This just make me feel so sad”

(PK6/55)

“Sometimes people that visit my father said that I can’t taking care my father properly. Its so unfair for me and I feel really stress”

(PK8/67)

(ii) **Physical Challenges.**

Caregiving can cause physical strain as fatigue, sleep disturbances and impaired cognitive function than noncaregivers. In this study, PK3 and PK10 shared that they felt bodily pains as they had to lift patients.

“My body feel so pain because I have to pick him up to the toilet everyday. Plus, I also sleep in a chair every night and this just make my back in a pain”

(PK10/77)

(iii) **Financial Issue**

Two caregivers became unemployed as they have to give full attention to their sick family members.

“I work in a boutique. But I stopped last year to take care of my mom.”

(PK3/71)

Some caregivers feel unsupported by family members.

“Siblings just come to show face. And my father never care if I have money or not”

(PK3/75)

“Auntie feel very sad. I have two sons and they have married but they doesn’t ask anything about auntie or uncle whether we have money or not? Are we comfortable or not? Are we okay or not? Because of that I feel very sad.”

(PK5/45)

PK4 argued that other grandchildren do not care much about their sick grandmother and that makes him feel irritated (PK4/38).

(PK4/38)
"I stopped working because I want to take care of her”  

(PK1/45)

For poor families, cancer has taken a toll on their financial stability. For PK10 who lived far away from the hospital, money is scarce for transport and hospital (PK10/46).

This issue were also faced other participants where money or financial issue is a major challenges for them in survived as a caregivers.

"It takes a lot of money when I have to taking care for my sister in the hospital.”  

(PK7/34)

“Eventhough I’m working, but I still have a financial issue when I have to care fo him.”  

(PK9/40)

Coping Skills

Despite many challenges faced by the caregivers, coping skills involves acceptance and social support help the caregivers to adapt the crisis.

i. Acceptance

In the context of this study, acceptance define when the participants apply religious teachings to accept their situations.

"I accept what He give to me. I know this is the best from Him and He knows that I can handle it with responsible”

(PK2/74)

PK7 took on the task of taking care of her sick youngersister because of his responsibilities as elder sister and the value of love for hersister.

"As an elder sister in family, I think this is one of my part or responsibilities to taking care of her”

(PK7/61)

They was always positive because they believed that cancer could be healed and therefore they looked after their sick family members lovingly in the hope that the patients would recover soon (PK8/138) (PK9/97).

Meanwhile, for PK5, his love as a wife is expressed by caring for the husband and making her husband a priority (PK5/49). PK5 also become more patience after caring for her sick husband (PK5/53).

ii. Social Support

Apart from the good personal quality that makes respondents capable of surviving the caregiver role, social support also plays a very important role. Having support groups for caregivers, 33 stated that social support that are needed by the caregivers are emotional and financial support either from their families, friends or their neighbors.

“I’m okay and happy because I know my family are there for me and my Mom.”

(PK1/85)

“With the support from other siblings, support from my husband, I can take all the stress and burden in a positive way.”

(PK6/93)

“I think my family support is the best cure for me and my dad.”

(PK8/81)

Conclusion

Findings showed that caregivers of cancer patients faced social emotional, physical and financial challenges as a result of doing their family responsibility. Findings also revealed that among coping strategies of caregivers are positively accepting their fate and appreciating social support. This information is important for medical staff as it would be beneficial for them to include family caregivers in the patients treatment plan. Educating family members of their role in caregiving of cancer patients may contribute to patients’ motivations towards wellness. This study showed that among Malaysians caregivers family support is of utmost importance. Knowing the needs of caregivers and building supportive relationship among family members could contribute towards meaningful journey for the cancer patients. To connect medical issue and community role there is a very important role played by mental health professional. Thus, there is a need for the mental health profession to prepare in the area of caregiving knowledge and skills in our effort to provide...
help for our community.

The Modelling of DNA Splicing Systems with Two Non-Palindromic Restriction Enzymes

Wan Heng Fong1, Nurul Izzaty Ismail1, Nor Haniza Sarmin1

1Department of Mathematical Sciences, Faculty of Science, UniversitiTeknologi Malaysia

Abstract

DNA splicing system is mathematically modelled by the process of recombinant DNA which focuses on the possible reaction of sets of restriction enzymes and a ligase. The restriction enzymes are known as endodeoxyribonucleases that allow DNA molecules to be cut and reass ociated. The cutting point of a restriction enzyme is determined by its cleavage pattern in the formation of a triple: left context, crossing and right context. The molecules resulting from DNA splicing systems are depicted as splicing languages. A palindrome is a sequence of strings that reads the same forward and backward. Researches on splicing languages in DNA splicing system involving palindromic sequences of restriction enzymes have been done previously. In this research, the splicing languages generated from DNA splicing systems with two non-palindromic restriction enzymes are generalised using Head’s splicing model. The generalisations of splicing languages for DNA splicing systems involving two non-palindromic restriction enzymes with same and different crossings are given as theorems, which are proved by induction and direct methods respectively. By using these theorems, the splicing languages from the DNA splicing systems are determined and demonstrated through some examples.

Keywords: DNA; splicing system; splicing language; non-palindromic; restriction enzyme

Introduction

Deoxyribonucleic acid (DNA) is the molecule that plays the important role in DNA computation. In 1959, the idea of DNA computation is started by Feynman involving the field of computer science, biology and mathematics. Much interest has been performed by DNA computing as it involves computation in molecular biology instead of the typical binary system in computer science. The contribution of Adleman’s experiment gives highest impact in the implementation of DNA computations by using two features, namely massive parallelism of DNA strands and Watson-Crick complementarity. In massive parallelism, computation on DNA is derivedas DNA-based mechanism for solving intractable problems where the DNA strand is a chain composed of nucleotides. The nucleotides may differ only in their bases: adenine (A), guanine (G), cytosine (C) and thymine (T). Watson-Crick complementarity is presented in the formation of double stranded DNA (dsDNA) which is generated from nitrogenous base pairings: adenine pairs with thymine, while cytosine pairs with guanine.

Throughout the years, several models of DNA computation have been developed including DNA splicing systems. The DNA splicing system is mathematically modelled and simulated by the process of recombinant DNA which focuses on the potential effect of sets of restriction enzymes and a ligase.

Literature Review

DNA splicing system was introduced by Head in 1987 as a study relating between formal language theory and informational macromolecules, where DNA molecules are cleaved and recombined with the presence of a ligase and restriction enzymes. The molecules resulting from DNA splicing systems are depicted as a splicing language using formal language theory. The formal language consists of a set of strings of symbols derived from an alphabet. In this research, the splicing

languages are analysed using some notations in formal languages. For instance, $\lambda$, $+$, $*$ and $\{\}$ or () denote the empty string, union, star-closure and parentheses respectively.

Several years, Head's splicing model had been extended and followed by Paun's, Goode-Pixton's, and Yusof-Goode's splicing systems. The comparison between notations in Head's and these three splicing models were shown in. Moreover, Laun also developed a new splicing model known as a simple splicing system. In this research, Head's splicing model is used for modelling DNA splicing system with specific sequence of restriction enzymes.

Next, restriction enzymes are biologically known as endodeoxyribonucleases that act as catalyst for accelerating chemical reactions. Restriction enzymes cut the molecules based on the cleavage patterns in term of three parts: left context, crossing and right context. In fact, DNA molecule can read in two ways: forward and backward. Palindrome is a sequence that reads the same forward and backward. A palindromic string is a sequence of DNA molecule which is exactly the same in both directions. Head mentioned the concept of palindromic string in DNA splicing systems in his first paper on the splicing system. Yusof also proposed the definition of a palindromic string. Besides, palindromic and non-palindromic sequences can also be determined in the recognition sites of restriction enzymes. Research on the generalisations of splicing languages resulting from DNA splicing systems involving palindromic restriction enzymes has been done previously.

In this paper, the splicing languages from DNA splicing systems involving two non-palindromic restriction enzymes for same and different crossings are generalised and presented as theorems.

**Methodology**

In this research, the modelling of DNA splicing systems with two non-palindromic restriction enzymes is done using Head's splicing model. The definitions of Head's splicing system and splicing language are stated in the following.

**Definition 1 [5] Splicing System and Splicing Language**

A splicing system $S = (A, I, B, C)$ consists of a finite alphabet $A$, a finite set $I$ of initial strings in $A^*$, and finite sets $B$ and $C$ of triples $(c, x, d)$ with $c$, $x$ and $d$ in $A^*$. Each such triple in $B$ or $C$ is called a pattern. For each such triple the string $cx$ is called a site and the string $x$ is called a crossing. Patterns in $B$ are called left patterns and patterns in $C$ are called right patterns. The language $L = L(S)$ generated by $S$ consists of the strings in $I$ and all strings that can be obtained by adjoining ucxfq and pexdv whenever ucxdv and pexfq are in $L$ and $(c, x, d)$ and $(e, x, f)$ are patterns of the same hand. A language, $L$ is a splicing language if there exists a splicing system $S$ for which $L = L(S)$.

Next, the definition of a palindromic string is stated.

**Definition 2**

A string $I$ of a dsDNA is said to be palindromic if the sequence from the left to the right side of the upper single strand is equal to the sequence from the right to the left side of the lower single strand.

In this paper, generalisations of splicing languages in DNA splicing system are done involving non-palindromic sequence for restriction enzymes. For example, the enzyme AciI is a non-palindromic restriction enzyme because the upper single strand of enzyme AciI does not match with the lower single strand when read from backward, that is . The name and sequence for all restriction enzymes used in this research are taken from.

**Results and Findings**

In this research, the generalisations of splicing languages from DNA splicing systems with two non-palindromic restriction enzymes are determined and given as theorems, which are mathematically proved. Some examples of DNA splicing systems with two non-palindromic restriction enzymes are provided to determine the respective splicing languages using these theorems. The symbols ↓ and ↑ indicate the cutting sites of the restriction enzymes.

The splicing language generated from a DNA splicing system with two non-palindromic restriction enzymes for same crossing is generalised and presented as Theorem 1.
In this paper, generalisations of splicing languages in DNA splicing system are done involving non-palindromic sequence for restriction enzymes. For example, the enzyme AcI (5' - CCGC - 3') is a non-palindromic restriction enzyme because the upper single strand of enzyme AcI (5' - CCGC - 3'), does not match with the lower single strand when read from backward, that is 5' - GCGG - 3'. The name and sequence for all restriction enzymes used in this research are taken from the Indian Journal of Public Health Research & Development, June 2019, Vol. 10, No. 6.

Results and Findings
In this research, the generalisations of splicing languages from DNA splicing systems with two non-palindromic restriction enzymes are determined and given as theorems, which are mathematically proved. Some examples of DNA splicing systems with two non-palindromic restriction enzymes are provided to determine the respective splicing languages using these theorems. The symbols ↓ and ↑ indicate the cutting sites of the restriction enzymes.

The splicing language generated from a DNA splicing system with two non-palindromic restriction enzymes for same crossing is generalised and presented as Theorem 1.

Theorem 1
Given \( S = (A, I, B, C) \) is a DNA splicing system in which \( A = \{ A, C, G, T \} \) is the set of dsDNA symbols, \( I = \{ N_1 N_1 \ldots N_1 X_1 \ldots Y X_2 M \ldots M W_1 Z W_2 N_2 \ldots N_2 \} \) is the set consisting of an initial string with non-overlapping cutting sites of two non-palindromic restriction enzymes \( X_1 Y X_2 \) and \( W_1 Z W_2 \), set \( B = \{ (X_1 Y X_2), (W_1 Z W_2) \} \) is the set of cleavage pattern for restriction enzymes and set \( C \) is the empty set, the resulting splicing language consists of strings of the form

\[
N_1 N_1 \ldots N_1 X_1 \ldots Y X_2 M \ldots M W_1 Z W_2 N_2 \ldots N_2 \]

where \( n \in \mathbb{Z}^+ \), \( N_1, X_1, Y, X_2, M, W_1, Z, W_2, N_2 \) are complementaries for \( N_1, X_1, Y, X_2, M, W_1, Z, W_2, N_2 \) respectively, \( Y \) and \( Z \) are the crossing, and \( \{X_1 Y X_2, X_2 Y X_1, W_1 Z W_2, W_2 Z W_1\} \notin \{N_1 N_1 \ldots N_1 M M \ldots M N_2 N_2 \ldots N_2\} \)

\( \{N_1 N_1' \ldots N_1' M M' \ldots M' N_2 N_2 \ldots N_2\} \).

Proof.
Suppose the restriction enzyme is not palindromic, so the base sequences of enzymes are not the same backward and forward:

\[
X_1 Y X_2 \not= X_2 Y X_1
\]

and

\[
W_1 Z W_2 \not= W_2 Z W_1
\]

Then

\[
X_1 \not= X_2, Y \not= Y', X_2 \not= X_1' \quad \text{and} \quad W_2 \not= W_2', Z \not= Z', \quad \text{and} \quad W_1 \not= W_1'.
\]

Since the crossings are the same, \( Y = Y' \). Then, the initial string,

\[
N_1 N_1 \ldots N_1 X_1 Y X_2 M \ldots M W_1 Y W_2 N_2 \ldots N_2
\]

with the cutting site of the enzymes \( X_1 Y X_2 \) and \( W_1 Y W_2 \) is shown respectively in the following:
for the first cutting site and
\[ N_1 N_1 \ldots N_1 X_1 Y \quad X_2 \ M \ M \ldots M W_1 Y W_2 N_2 N_2 \ldots N_2 \] (2)
for the second cutting site.

The initial string can be written 180 degree wise as
\[ N_2 N_2 \ldots N_2 W_2 Z W_1 M \ M \ldots M X_1 Y X_1 N_1 N_1 \ldots N_1 \] (4)

Since \( X_1 \neq X_2 ', Y \neq Y ', X_1' \neq Z \) and \( W_2 \neq W_1 \), then there is no cutting site in (4).

When the enzymes \( X_1 Y X_2 \) and \( W_1 Y W_2 \) are added to the initial string, (2) combines
with (3) which gives
\[ N_1 N_1 \ldots N_1 X_1 Y W_2 N_2 N_2 \ldots N_2 \] (5)
and
\[ N_1 N_1 \ldots N_1 X_1 Y X_2 M \ M \ldots M W_1 Y X_2 M \ M \ldots M W_2 Y W_2 N_2 N_2 \ldots N_2 \]

By using induction, this theorem can be proved. For \( n = 1 \), string(1) is true since its stated as
string (5). Next, let \( n = k \in \mathbb{Z}^+ \), string (1) becomes
\[ N_1 N_1 \ldots N_1 X_1 (Y X_2 M M \ldots M W_1)^{k-1} Y W_2 N_2 N_2 \ldots N_2 \] (6)

By expanding string (6), the string can be written as
\[ N_1 N_1 \ldots N_1 X_1 (Y X_2 M M \ldots M W_1) (Y W_2 N_2 N_2 \ldots N_2) \] (7)

Then, the string (3) combines with (7) which produces new string
\[ N_1 N_1 \ldots N_1 X_1 Y X_2 M M \ldots M W_1 (Y X_2 M M \ldots M W_1)^{k-2} Y W_2 N_2 N_2 \ldots N_2 \] (8)

By simplifying string (8), the resulting strings are:
\[ N_1 N_1 \ldots N_1 X_1 (Y X_2 M M \ldots M W_1)^{(k+1)-1} Y W_2 N_2 N_2 \ldots N_2 \] (9)
\[ N_1 N_1 \ldots N_1 X_1 (Y X_2 M M \ldots M W_1)' Y W_2 N_2 N_2 \ldots N_2 \]

So, string (9) is true since it depicts string (1) when \( n = k + 1 \). Hence, Theorem 1 is proved.

Example 1

Given a DNA splicing system \( S = (A, I, B, C) \) where \( I = \{TTCAACACCGCG\} \) is the set of
initial string, set \( B = \{\begin{pmatrix} T & CG & A \\ A & GC & T \end{pmatrix}, \begin{pmatrix} C & CG & C \\ C & GC & G \end{pmatrix}\} \) is the set of cleavage pattern for the enzymes TaqI and AciI and set C is the empty set.

Solution

The enzymes TaqI, \( 5' - TCGA - 3' \) and AciI, \( 5' - CGCG - 3' \) are not palindromic
since the base sequence of enzymes TaqI and AciI do not read the same forward and backward.

The enzymes TaqI and AciI also have the same crossing, \( 5' - GC - 3' \)
The initial string $\overline{5'} - TT \downarrow CG$ AACAC $\downarrow CG$ GC GC $\overline{3'}$ has one cutting site each of the enzymes Taqland Acil. Thus, by using Theorem 1, the splicing language is

$$\overline{5'} - TT \ (CGAACAC)^{n-1} TGGCGC - 3'$$

$$3' - AA \ (GCTTTGCG) \ GCGGC - 5'$$

where $n \in \mathbb{Z}^+$. 

Next, Theorem 2 presents the generalisation of splicing language from a DNA splicing system with two non-palindromic restriction enzymes for different crossings.

**Theorem 2**

Given $S = (A, I, B, C)$ is a DNA splicing system in which $A = \{A, C, G, T\}$ is the set of dsDNA symbols, $I = \{N_1N_1 \ldots N_1X_1YX_2M' \ldots M'W_1'ZW_2'N_2'N_2 \ldots N_2\}$ is the set consisting of an initial string with non-overlapping cutting sites of two non-palindromic restriction enzymes $X_1YX_2$ and $W_1ZW_2$, and set $B = \{(X_1, Y, X_2), (W_1, Y, W_2)\}$ is the set of cleavage pattern for restriction enzymes and set $C$ is the empty set, the resulting splicing language consists of strings of the form

$$\begin{align*}
N_1N_1 \ldots N_1X_1YX_2M' \ldots M'W_1'ZW_2'N_2'N_2 \ldots N_2 \\
N_1'N_1' \ldots N_1'X_1'Y'X_2'M' \ldots M'W_1'Z'W_2'N_2'N_2 \ldots N_2
\end{align*}$$

where $N_1$, $X_1$, $Y$, $X_2$, $M'$, $W_1'$, $Z'$, $W_2'$ and $N_2'$ are complements for $N_1$, $X_1$, $Y$, $X_2$, $M$, $W_1$, $Z$, $W_2$, and $N_2$ respectively, $Y'$ and $Z'$ are the crossing, and

$$\begin{align*}
\{X_1YX_2 \ldots X_1Y'X_2' \ldots X_1YX_2, Y'X_2' \ldots Y'X_2, W_1 \ldots W_1'Z'W_2' \ldots W_2, W_1 \ldots W_1'Z'W_2' \ldots W_2, Z' \}
\end{align*}$$

is the set of cleavage pattern for restriction enzymes.

**Proof.**

Suppose the restriction enzyme is not palindromic, so the base sequences of enzymes are not the same backward and forward:

$$\begin{align*}
X_1YX_2 & \neq X_1'Y'X_1' \\
X_1'Y'X_1' & \neq X_2'Y'X_2'
\end{align*}$$

and

$$\begin{align*}
W_1 \ldots W_1'Z'W_2' & \neq W_1' \ldots W_1'Z'W_2' \\
W_1' \ldots W_1'Z'W_2' & \neq W_1' \ldots W_1'Z'W_2'.
\end{align*}$$

Then

$$\begin{align*}
X_1' \neq X_2', \quad Y \neq Y', \quad X_2' \neq X_1', \quad W_1' \neq W_1', \quad Z' \neq Z' \quad \text{and} \quad W_2 \neq W_2'.
\end{align*}$$

The initial string $\overline{N_1N_1 \ldots N_1X_1YX_2M' \ldots M'W_1'ZW_2'N_2'N_2 \ldots N_2}$ with the cutting site of the enzymes $X_1YX_2$ and $W_1ZW_2$ is shown respectively in the following:

$$\begin{align*}
N_1N_1 \ldots N_1X_1YX_2M' \ldots M'W_1'ZW_2'N_2'N_2 \ldots N_2 \\
N_1'N_1' \ldots N_1'X_1'Y'X_2'M' \ldots M'W_1'Z'W_2'N_2'N_2 \ldots N_2
\end{align*}$$

(10)

for the first cutting site and

$$\begin{align*}
N_1N_1 \ldots N_1X_1YX_2M' \ldots M'W_1 \downarrow Z \quad W_2N_2N_2 \ldots N_2 \\
N_1'N_1' \ldots N_1'X_1'Y'X_2'M' \ldots M'W_1' \downarrow Z' \quad W_2'N_2'N_2 \ldots N_2
\end{align*}$$

for the second cutting site.

The initial string can be written 180 degree wise as

$$\begin{align*}
N_2N_2' \ldots N_2'W_2'Z'W_2'M' \ldots M'X_1'Y'X_1'N_1'N_1' \ldots N_1' \\
N_2N_2 \ldots N_2W_2ZW_2M \ldots MX_2YX_1N_1N_1 \ldots N_1
\end{align*}$$

(11)

for the first cutting site and

$$\begin{align*}
N_2N_2' \ldots N_2'W_2'Z'W_2'M' \ldots M'X_1'Y'X_1'N_1'N_1' \ldots N_1' \\
N_2N_2 \ldots N_2W_2ZW_2M \ldots MX_2YX_1N_1N_1 \ldots N_1
\end{align*}$$

(11)

for the second cutting site.

Since $X_1' \neq X_2', Y' \neq Y', X_2' \neq X_1', W_1' \neq W_2', Z' \neq Z$ and $W_2' \neq W_1'$, then there is no cutting site in (11) and no new resulting molecule.
From (10) and (11), the resulting splicing language is the initial string:

\[ N_1N_1 \ldots N_1X_1 Y X_2 M M \ldots MW_1 ZW_2N_2 \ldots N_2 \]

\[ N_1'N_1' \ldots N_1'X_1' Y'X_2' M'M' \ldots M'W_1'Z'W_2'N_2' \ldots N_2'. \]

Hence, Theorem 2 is proved. □

Example 2 shows the splicing language from a DNA splicing system with two non-palindromic restriction enzymes for different crossings.

Example 2

Given a DNA splicing system \( S = (A, I, B, C) \) where \( I = \{\text{ATTAGCCAAGGCACGAGTTC}\} \) is the set of initial string, set \( B = \{(G, CCA, A, C, AGA, G, CGGTT, GCACGAGTTC}\} \) is the set of cleavage pattern for the enzymes HbaI and BssSI respectively and set \( C \) is the empty set.

Solution

The enzymes HbaI, \( 5' - GCCCAA - 3' \) and BssSI, \( 5' - CACGAG - 3' \) are not palindromic since the base sequence of enzymes HbaIand BssSI do not read the same forward and backward. The enzymes HbaI and BssSI have different crossing where crossing sites HbaI and BssSI are \( 5' - CCCA - 3' \) and \( 5' - TGCTC - 3' \) respectively.

The initial string \( 5' - ATTAGCCCAAGGCACGAGTTC - 3' \) has one cutting site each of the enzymes TaqI and AciI. Thus, by using Theorem 2, the splicing language is \( 5' - ATTAGCCAAGGCACGAGTTC - 3' \).

Conclusion

In this research, the generalisations of splicing languages in DNA splicing systems involving two non-palindromic restriction enzymes for the same and different crossings are presented as Theorem 1 and Theorem 2 respectively, which are mathematically proved using the induction and direct methods. The results from this research depict the language that consists of a set of double stranded DNA strings resulting from the corresponding DNA splicing systems. From the theorems, the resulting molecules from DNA splicing systems are determined without actual lab experiments. The contributions from the results of this research lead to the development of ideas in different splicing systems as well as for the revolution of recombinant DNA technologies.

A Novel Mathematical Technique for Stability Analysis of Plasmodium Life Cycle in Hepatocyte

Nagadevi Bala Nagaram1, Suresh Rasapan2
1Assistant Professor, 2Associate Professor, Department of Mathematics, Vel Tech Rangarajan Dr. Sagunthala R & D Institute of Science and Technology, Avadi, Chennai, Tamilnadu, India

Abstract

Present paper investigates the complexity and stability analysis of plasmodium life cycle model. The system of plasmodium life cycle in random noise has not been investigated so far. The present paper is a handout in this range over area. The existence of equilibrium point of the system are presented. Global stability properties of the model are investigated by constructing Lyapunov function. Also we introduce the stochastic perturbation and suggest the deterministic model is robust with respect to stochastic perturbation. The analysis leads to the equilibrium of the stochastic perturbation wherein the total number of plasmodium parasites remain stationary. Theoretical results are numerically supported and the diagrams are presented.

Keywords: Randomness, Lyapunov function, Stochastic perturbation, Inhost equilibrium point, Plasmodium.

Introduction

An mosquito borne disease is malaria which is transmitted by anopheles mosquito. Around the world, 2500 species of mosquitoes are there. Among that 300 species well known disease carriers. One of the most serious infectious diseases in tropical countries is malaria, which comes due to plasmodium parasite1, 2. This disease is spread by female Anopheles mosquito. About a half of the world is a ected by plasmodium parasite. Five plasmodium species infect human: Plasmodium falciparam, Plasmodium vivax, Plasmodium ovale, Plasmodium malariae, Plasmodium knowlesi3. The sporozoite travels from the Anopheles mosquito salivary gland to the human host while taking blood meal from the human host. The life cycle of malaria causing parasite circulates between human and mosquito host 4, 5, 6. In this paper, we describe how plasmodium goes through the different stages of its life cycle. There are several features of plasmodium life cycle which makes it complicated for diagnosis. Plasmodium can become invisible and undetectable in the hepatocyte, to avoid host defenses7. It mostly is in the hibernate stage and it will wait for a comfortable stage for infecting blood. The life cycle of plasmodium have several different stages between insect and vertebrate hosts8. The infected mosquitoes have sporozoite in their salivary gland. The sporozoite are injected through saliva while taking blood meal from vertebrate host. The sporozoite are mixed with blood streams and are traveled to the hepatocyte. In this stage, some species of plasmodium can form a hypnozoite which is a long-lived dormant stage9, 10. It can remain in the hepatocyte for many years. The parasites that become visible from infected hepatocyte stage are called merozoites11. Now it started to infect the red blood cells. Within the red blood cells, the merozoite rst developed to a ring-shaped form and then it becomes larger, at this stage the merozoite are called as trophozoite: The matured trophozoite formed at this stage are named as schizont. In this level, schizont reproduce to form new merozoite. The infected red blood cell bursts and the new merozoite enter into the blood stream to infect new red blood cells12. Most merozoite continue this replicative cycle however some merozoite, after infecting red blood cells differentiate into male or female sexual forms called gametocytes13. These gametocytes are taken up by the mosquito while taking blood meal from infected vertebrate host. The gametocytes travel along with the blood meal to the mosquitoes midgut. Here the gametocytes develop as a zygote, that is, where male and female gametes which
fertilize each other forming a zygote. The developed zygotes called as ookinetes, penetrates the wall of the midgut. Upon traversing the midgut wall, the ookinete embeds into the exterior membrane of gut and develops into an oocyst. In this stage, oocyst produce large numbers of small elongated sporozoite. These sporozoite migrate to the salivary glands of the mosquito. From here they are injected into the blood of the next host the mosquito bites, repeating the entire life cycle. The analysis of anopheles mosquito life cycle which was studied. Analyzed the stochastic perturbation for plasmodium life cycle. In the authors knowledge, no one has investigated the system of plasmodium with random noise which we have discussed in this work. A lot of work has been done to describe about the plasmodium life cycle, but the stochastic perturbation has not been investigated so far. This work is a novel contribution in this area. This paper is organized as follows, in section2, the mathematical model of plasmodium life cycle has been described with the assumption. In section 3, the analysis of global stability around the equilibrium point is discussed in detail. In section 4, the stochastic nature is analyzed. The diagrams which support theoretical part is presented in section 5 and the conclusion is given in section 6.

The Mathematical Model

The assumptions in mathematical model of plasmodium life cycle are given below:

- In human hepatocyte, the total population of plasmodium life cycle consists of ten states, such as Anopheles mosquito (x1), Sporozoite (x2), Hypnozoite(x3), Infected hepatocyte(x4), Hepatic schizont(x5), Ruptured schizont(x6), Merozoite(x7), Early trophozoite(x8), Late trophozoite(x9) and Gametocyte(x10) which are taken as a parameter in the described model.
- The natural death rate µ is considered to be uniform in each state.
- Let ‘b’ be considered as natural birth rate at adult mosquito stage the existing population is bN.

![Figure 1: Flow diagram of plasmodium life cycle](image-url)
The Mathematical model of plasmodium life cycle is given below:

\[
\begin{align*}
\frac{dx_1}{dt} &= bN + \alpha_1 x_1 x_10 - (\mu + \alpha_1) x_1 \\
\frac{dx_2}{dt} &= \alpha_2 x_1 - (\alpha_2 + \alpha_3 + \mu) x_2 \\
\frac{dx_3}{dt} &= \alpha_4 x_2 - (\alpha_4 + \mu) x_3 \\
\frac{dx_4}{dt} &= \alpha_5 x_3 + \alpha_5 x_4 - (\alpha_6 + \mu) x_5 \\
\frac{dx_5}{dt} &= \alpha_6 x_5 + \alpha_10 x_9 - (\alpha_7 + \alpha_11 + \mu) x_6 \\
\frac{dx_6}{dt} &= \alpha_7 x_6 - (\alpha_8 + \mu) x_7 \\
\frac{dx_7}{dt} &= \alpha_8 x_7 - (\alpha_9 + \mu) x_8 \\
\frac{dx_8}{dt} &= \alpha_9 x_8 - (\alpha_10 + \mu) x_9 \\
\frac{dx_9}{dt} &= \alpha_11 x_6 - (\alpha_12 + \mu) x_{10}
\end{align*}
\]  

where \( x_1 \) is the number of adult mosquitoes, \( x_2 \) is the number of sporozoites, \( x_3 \) is the number of hypnozoite , \( x_4 \) is the number of infected hepatocyte, \( x_5 \) is the number of hepatic schizont, \( x_6 \) is the number of ruptured schizont, \( x_7 \) is the number of merozoites, \( x_8 \) is the number of early trophozoite(Ring form), \( x_9 \) is the number of late trophozoite, \( x_{10} \) is the number of gametocyte, with respect to time. ‘b’ is the natural birth rate at initial stage, \( \alpha_1 \) is the rate of sporozoite from adult mosquito, \( \alpha_2 \) is the rate of sporozoite splited and one amount of them push to hypnozoite, \( \alpha_3 \) is the rate of remaining sporozoite push to infected hepatocyte, \( \alpha_4 \) is the rate of hypnozoite push to hepatic schizont, \( \alpha_5 \) is the rate of infected hepatocyte push to hepatic schizont, \( \alpha_6 \) is the rate of hepatic schizont push to ruptured schizont, \( \alpha_7 \) is the rate of ruptured schizont push to merozoite, \( \alpha_8 \) is the rate of merozoite to early trophozoite(Ring form), \( \alpha_9 \) is the rate of early trophozoite push to late trophozoite, \( \alpha_{10} \) is the rate of late trophozoite to ruptured schizont, \( \alpha_{11} \) is the rate of ruptured schizont to gametocyte, \( \alpha_{12} \) is the rate of gametocyte push to anopheles mosquito, is the normal death at all stages and \( N \) is the total population.

**Simplified Form of Plasmodium Life Cycle**

The simplified form of plasmodium life cycle is obtained by replacing the value

\[
A = \mu + \alpha_1, n = \alpha_2 + \alpha_3 + \mu, a = \alpha_4 + \mu, P = \alpha_5 + \mu, H = \alpha_6 + \mu, E = \alpha_7 + \alpha_{11} + \mu,
\]

\[
L = \alpha_8 + \mu, e = \alpha_9 + \mu, S = \alpha_{10} + \mu, M = \alpha_{12} + \mu \text{ in eqn.(1) , we get,}
\]

\[
\frac{dx_1}{dt} = bN + \alpha_{12} x_{10} - Ax_1
\]
\[ \frac{dx_2}{dt} = \alpha_1 x_1 - nx_2 \\
\frac{dx_3}{dt} = \alpha_2 x_2 - ax_3 \\
\frac{dx_4}{dt} = \alpha_3 x_2 - px_4 \\
\frac{dx_5}{dt} = \alpha_4 x_3 + \alpha_5 x_4 - Hx_5 \\
\frac{dx_6}{dt} = \alpha_6 x_5 + \alpha_{10} x_9 - Ex_6 \\
\frac{dx_7}{dt} = \alpha_7 x_5 - Lx_7 \\
\frac{dx_8}{dt} = \alpha_8 x_7 - ex_8 \\
\frac{dx_9}{dt} = \alpha_9 x_8 - sx_9 \\
\frac{dx_{10}}{dt} = \alpha_{11} x_6 - Mx_{10} \]  

(2)

### 3.1 Equilibrium and Interior equilibrium point

Let us discuss the equilibrium point and interior equilibrium point. The following equilibrium point and interior equilibrium point are obtained by equating the right hand side of the system (2) to zero, respectively. Then the equilibrium point is

\[ E = (x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10}) \]

where,

\[ X_1 = \frac{bn + a_12x_{10}}{a}, \quad X_2 = \frac{a_1(bn + a_12x_{10})}{an}, \quad X_3 = \frac{a_201(bn + a_12x_{10})}{ana}, \quad X_4 = \frac{a_301(bn + a_12x_{10})}{anp} \]

\[ X_5 = \frac{a_1(bn + a_12x_{10})}{anH} \frac{a_42a_2}{a} + \frac{a_52a_3}{a}, \quad X_6 = \frac{a_1(bn + a_12x_{10})}{anHE} \frac{a_42a_2}{a} + \frac{a_52a_3}{a} + \frac{a_{10}a_9a_12Mx_{10}}{eS_{11}E} \]

\[ X_7 = \frac{a_7Mx_{10}}{a_{11}L}, \quad X_8 = \frac{a_8a_7Mx_{10}}{a_{11}e}, \quad X_9 = \frac{a_0a_7a_12Mx_{10}}{a_{11}e} \]

\[ X_{10} = \frac{a_1bn}{a_{12}} \]

and the interior equilibrium point is

\[ E^* = (x_1^*, x_2^*, x_3^*, x_4^*, x_5^*, x_6^*, x_7^*, x_8^*, x_9^*, x_{10}^*) \]

where,

\[ X_1^* = \frac{bn + a_12x_{10}^*}{a}, \quad X_2^* = \frac{a_1x_{10}^*}{n}, \quad X_3^* = \frac{a_2x_{10}^*}{a}, \quad X_4^* = \frac{a_3x_{10}^*}{p}, \quad X_5^* = \frac{a_4x_{10}^* + a_5x_{10}^*}{H}, \]

\[ X_6^* = \frac{a_6x_{10}^* + a_{10}x_{9}^*}{E}, \quad X_7^* = \frac{a_7x_{10}^*}{L}, \quad X_8^* = \frac{a_8x_{10}^*}{e}, \quad X_9^* = \frac{a_9x_{10}^*}{s}, \quad X_{10}^* = \frac{a_{11}x_{10}^*}{M} \]
Global Stability Analysis

**Theorem 1**: The interior equilibrium point \( E^* \) is globally stable

\[
\alpha_1 = \frac{-x_2 (x_2 - x_2^*) + nx_2}{x_1}, \quad \alpha_2 = \frac{-x_3 (x_3 - x_3^*) + ax_3}{x_2},
\]
\[
\alpha_3 = \frac{-x_4 (x_4 - x_4^*) + px_4}{x_2}, \quad \alpha_4 = \frac{-x_5 (x_5 - x_5^*) - ax_4 + Hx_5}{x_3},
\]
\[
\alpha_6 = \frac{-x_6 (x_6 - x_6^*) - a_{10}x_9 + Ex_6}{x_5}, \quad \alpha_7 = \frac{-x_7 (x_7 - x_7^*) + Lx_7}{x_6},
\]
\[
\alpha_8 = \frac{-x_8 (x_8 - x_8^*) + ex_8}{x_7}, \quad \alpha_9 = \frac{-x_9 (x_9 - x_9^*) + Sx_9}{x_8},
\]
\[
\alpha_{12} = \frac{-x_{10} (x_{10} - x_{10}^*) - bN + Ax_1}{x_{10}},
\]

if the above conditions holds.

**Proof**: By defining the Lyapunov function

\[
V(x_i) = \sum_{i=1}^{10} \beta_i \left[ (x_i - x_i^*) - x_i^* \ln \left( \frac{x_i}{x_i^*} \right) \right]
\]

where \( i = 1, 2, 3, \ldots, 10 \) are chosen as a positive constants. It is observed that \( V \) is a positive definite function in the region except at \( E^* \) where it is zero. Solving the rate of change of \( V \) along the solutions of the system (3), we get,

\[
\dot{V} = \sum_{i=1}^{10} \beta_i \left( \frac{x_i - x_i^*}{x_i} \right)
\]

\[
\dot{V} = \beta_1 (x_1 - x_1^*) \frac{bN + a_{12}x_{10} - Ax_1}{x_1} + \beta_2 (x_2 - x_2^*) \frac{a_{11}x_1 - nx_2 + ax_3}{x_2} + \beta_3 (x_3 - x_3^*) \frac{a_2x_2 - ax_3}{x_3} +
\]
\[
\beta_4 (x_4 - x_4^*) \frac{a_3x_2 - px_4}{x_4} + \beta_5 (x_5 - x_5^*) \frac{a_4x_3 + ax_4 - Hx_5}{x_5} + \beta_6 (x_6 - x_6^*) \frac{a_6x_5 + a_{10}x_9 - Ex_6}{x_6} +
\]
\[
\beta_7 (x_7 - x_7^*) \frac{a_7x_6 - Lx_7}{x_7} + \beta_8 (x_8 - x_8^*) \frac{a_8x_7 - ax_8}{x_8} + \beta_9 (x_9 - x_9^*) \frac{a_9x_8 - Sx_9}{x_9} +
\]
\[
\beta_{10} (x_{10} - x_{10}^*) \frac{a_{11}x_6 - Mx_{10}}{x_{10}}
\]

By applying the condition (3) in (6) will get the result as given below:

\[
\frac{dv}{dt} = -\beta_1 (x_1 - x_1^*)^2 - \beta_2 (x_2 - x_2^*)^2 - \beta_3 (x_3 - x_3^*)^2 - \beta_4 (x_4 - x_4^*)^2 - \beta_5 (x_5 - x_5^*)^2
\]
\[
- \beta_6 (x_6 - x_6^*)^2 - \beta_7 (x_7 - x_7^*)^2 - \beta_8 (x_8 - x_8^*)^2 - \beta_9 (x_9 - x_9^*)^2 - \beta_{10} (x_{10} - x_{10}^*)^2
\]
In this paper, the stochastic perturbations of the variables which are proportional to the distances of allowed and analyzed their values around the positive equilibrium point.

Stochastic Analysis of the Positive Equilibrium point for stability

Stochastic perturbations were introduced in the main parameters involved in the model. In this paper, the stochastic perturbations of the variables \( x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10} \) are allowed and analyzed their values around the positive equilibrium \( E^* \) are also allowed.

Local stability of \( E^* \) is implied by the existence condition of \( E^* \). In eqn.(1), the Stochastic perturbations of the variables around their value at \( E^* \) are of white noise type, which are proportional to the distances of \( x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10} \) from values \( x_1^*, x_2^*, x_3^*, x_4^*, x_5^*, x_6^*, x_7^*, x_8^*, x_9^*, x_{10}^* \).

\[
\begin{align*}
\dot{x}_1 &= [bN+\alpha_1 x_{10} - Ax_1]dt + \sigma_1[x_1-x_1^*]d\omega_t \\
\dot{x}_2 &= [\alpha_1 x_1 - \alpha x_2]dt + \sigma_2[x_2-x_2^*]d\omega_t \\
\dot{x}_3 &= [\alpha_2 x_2 - \alpha_3]dt + \sigma_3[x_3-x_3^*]d\omega_t \\
\dot{x}_4 &= [\alpha_3 x_2 - Px_4]dt + \sigma_4[x_4-x_4^*]d\omega_t \\
\dot{x}_5 &= [\alpha_4 x_3 + \alpha_5 x_4 - Hx_5]dt + \sigma_5[x_5-x_5^*]d\omega_t \\
\dot{x}_6 &= [\alpha_6 x_5 + \alpha_7 x_6 - Ex_6]dt + \sigma_6[x_6-x_6^*]d\omega_t \\
\dot{x}_7 &= [\alpha_7 x_6 - Lx_7]dt + \sigma_7[x_7-x_7^*]d\omega_t \\
\dot{x}_8 &= [\alpha_8 x_7 - Ex_8]dt + \sigma_8[x_8-x_8^*]d\omega_t \\
\dot{x}_9 &= [\alpha_9 x_8 - Sx_9]dt + \sigma_9[x_9-x_9^*]d\omega_t \\
\dot{x}_{10} &= [\alpha_{10} x_{10} - Mx_{10}]dt + \sigma_{10}[x_{10}-x_{10}^*]d\omega_t
\end{align*}
\]  
\tag{8}

where \( \sigma_i \)'s are real constants and \( \omega_t = \omega(t), i = 1,2,3,...,10 \) are independent from each other.

The dynamical behavior of equation (1) of the described model is robust with respect to such a kind of stochasticity by investigating the asymptotic stability behavior around the equilibrium point \( E^* \). This analysis is mainly to represent the dynamics of the system around the interior equilibrium point \( E^* \). For this purpose, the model is linearized by using the following perturbation method. That is, the stochastic differential equation of (8) can be centered at its positive equilibrium \( E^* \) by the change of variables

\[
u_i = x_i - x_i^*
\]  
\tag{9}

where \( i=1,2,3,...,10 \) are positive constants. The linearized SDE's around \( E^* \) take the form

\[
\dot{u}(t) = f(u(t))dt + g(u(t))dw(t)
\]  
\tag{10}

where
where
\[ u(t) = [u_1(t) \ u_2(t) \ u_3(t) \ u_4(t) \ u_5(t) \ u_6(t) \ u_7(t) \ u_8(t) \ u_9(t) \ u_{10}(t)]^T \]  \hfill (11)

and
\[
\mathbf{f}(\mathbf{u}(t)) = \begin{pmatrix} -A & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \alpha_1 \alpha_{12} \\ \alpha_1 & -n & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \alpha_2 & -a & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \alpha_3 & -p & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \alpha_4 & -H & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \alpha_5 & -E & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \alpha_6 & -L & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \alpha_7 & -S & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & -M \end{pmatrix} \hfill (12)
\]

\[
\mathbf{g}(\mathbf{u}(t)) = \begin{pmatrix} \sigma_1 u_1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \sigma_2 u_2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \sigma_3 u_3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \sigma_4 u_4 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \sigma_5 u_5 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \sigma_6 u_6 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \sigma_7 u_7 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_8 u_8 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_9 u_9 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{10} u_{10} \end{pmatrix} \hfill (13)
\]

In equation (10), the positive equilibrium \( E^* \) corresponds to the trivial solution \( u(t) = 0 \). Let \( U \) be the set
\[ U = \{ t \geq t_0 \} \times R^+ \]

Hence \( V \in C_b^2(U) \) is twice continuously differentiable function with respect to \( u \) and a continuous functions with respect to \( t \). Now the \( \text{Ito} \) stochastic differential equation is defined as
\[
\dot{V}(t) = \frac{\partial V(t, u)}{\partial t} + f^T(u(t)) \frac{\partial V(t, u)}{\partial t} + \frac{1}{2} \text{trace}[g^T(u(t)) \frac{\partial^2 V(t, u)}{\partial u^2} g(u(t))] \hfill (14)
\]

where
\[
\frac{\partial V(t, u)}{\partial u} = \begin{pmatrix} \frac{\partial \psi_{1}}{\partial u_1} & \frac{\partial \psi_{2}}{\partial u_1} & \frac{\partial \psi_{3}}{\partial u_1} & \frac{\partial \psi_{4}}{\partial u_1} & \frac{\partial \psi_{5}}{\partial u_1} & \frac{\partial \psi_{6}}{\partial u_1} \end{pmatrix}^T,
\]
\[
\frac{\partial^2 V(t, u)}{\partial u^2} = \text{col} \left( \frac{\partial^2 \psi_{i,j}}{\partial u_i \partial u_j} \right), \quad i, j = 1, 2, 3, \ldots, 10.
\]
Remark: Suppose there exists a function $V \in C^2_0(U)$ satisfying the inequalities

$$V(t, u) \leq K_2 |u|^p,$$

$$LV(t, u) \leq K_3 |u|^p, \quad K_i > 0, \rho > 0$$

Then the trivial solution of (10) is globally asymptotically mean square stable.

**Theorem 2:** The solution (14) is asymptotically mean square stable if the following condition holds,

$$\alpha_1 2u_1 u_1 + \alpha_1 2u_1 w_2 u_2 + \alpha_2 u_2 w_3 u_3 + \alpha_3 u_3 w_4 u_4 + w_5 (\alpha_4 u_4 u_4 + \alpha_4 u_4 u_4)$$

$$+ w_6 (\alpha_5 u_5 + \alpha_5 u_5 + \alpha_5 u_5) + \alpha_7 w_7 u_7 + \alpha_8 w_8 u_8 + \alpha_9 w_9 u_9 + \alpha_{11} w_{10} u_{10} = 0$$

(17)

**Proof:** Now consider the Ito process where $w_i$ are real positive constants to be chosen in the following. The inequalities (16) hold with $\rho = 2$.

Now the Ito process (14) becomes

$$\frac{1}{2} \text{trace}[g^T(u(t)) \frac{\partial^2 V(u(t))}{\partial u^2} g(u(t))]$$

(18)

Here

$$\frac{\partial^2 V}{\partial u^2} = 
\begin{pmatrix}
  w_1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & w_2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & w_3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & w_4 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & w_5 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & w_6 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & w_7 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & w_8 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_9 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_{10}
\end{pmatrix}$$

(19)

and

$$g^T(u(t)) \frac{\partial^2 V}{\partial u^2} g(u(t))$$

$$= 
\begin{pmatrix}
  w_1 \sigma^2_{u_1} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & w_2 \sigma^2_{u_2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & w_3 \sigma^2_{u_3} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & w_4 \sigma^2_{u_4} & 0 & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & w_5 \sigma^2_{u_5} & 0 & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & w_6 \sigma^2_{u_6} & 0 & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & w_7 \sigma^2_{u_7} & 0 & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & w_8 \sigma^2_{u_8} & 0 & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_9 \sigma^2_{u_9} & 0 \\
  0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_{10} \sigma^2_{u_{10}}
\end{pmatrix}$$

(20)
with

\[
\frac{1}{2} \text{trace} \left[ g^T(u(t)) \frac{\partial^2 V(t,u)}{\partial u^2} g(u(t)) \right] = \frac{1}{2} \left[ w_1 \sigma_1^2 u_1^2 + w_2 \sigma_2^2 u_2^2 + w_3 \sigma_3^2 u_3^2 + w_4 \sigma_4^2 u_4^2 + w_5 \sigma_5^2 u_5^2 \\
+ w_6 \sigma_6^2 u_6^2 + w_7 \sigma_7^2 u_7^2 + w_8 \sigma_8^2 u_8^2 + w_9 \sigma_9^2 u_9^2 + w_{10} \sigma_{10}^2 u_{10}^2 \right]
\]

(21)

Use (17) and (21) along (18) we get

\[
LV(t,u) = -w_1 [A - \frac{1}{2} \sigma_1^2] u_1^2 - w_2 [n - \frac{1}{2} \sigma_2^2] u_2^2 - w_3 [a - \frac{1}{2} \sigma_3^2] u_3^2 - w_4 [P - \frac{1}{2} \sigma_4^2] u_4^2
\]

\[
- w_5 \left[ H - \frac{1}{2} \sigma_5^2 \right] u_5^2 - w_6 [E - \frac{1}{2} \sigma_6^2] u_6^2 - w_7 \left[ L - \frac{1}{2} \sigma_7^2 \right] u_7^2 - w_8 [e - \frac{1}{2} \sigma_8^2] u_8^2
\]

\[
- w_9 [S - \frac{1}{2} \sigma_9^2] u_9^2 - w_{10} [M - \frac{1}{2} \sigma_{10}^2] u_{10}^2
\]

which is negative definite and asymptotically mean square stable by Laselle’s principle.
In this paper, the complexity of plasmodium life cycle model is investigated. The boundedness and equilibrium points of the system have been found. By using Lyapunov function, global stability properties of the plasmodium life cycle model are investigated. The stochastic perturbation is introduced and suggested the plasmodium life cycle model is robust with respect to stochastic perturbation. By constructing suitable Lyapunov function, it showed that the interior equilibrium point of the plasmodium life cycle model is global asymptotically stable. Moreover all the solutions converge to the positive equilibrium. The stochastic perturbation is also introduced to the system by stochastic differential equations and Ito’ process. Through the construction of the Lyapunov function, it is showed that the zero solution of this stochastic system is asymptotically mean square stable. Finally numerical examples are given and respected diagrams are presented which support the result.

Abstract

This paper investigates the randomness of plasmodium life cycle model when initial population are introduced at each stage. The system of plasmodium life cycle in random noise has not been investigated so far. This paper is a contribution in this range over area. The existence of interior equilibrium points of the system are presented. Global stability properties of the model are analyzed by using Lyapunov function. Also we introduce the stochastic perturbations and suggest the deterministic model is robust with respect to stochastic perturbations. The analysis leads to the interior equilibrium of the stochastic perturbation wherein the total number of plasmodium parasites remain stable. Theoretical results are numerically supported and respected diagrams are presented.

Keywords and Phrases: Randomness, Lyapunov function, Stochastic perturbation, Equilibrium point, Plasmodium.

Introduction

In the world, humans are suffered a lot by biting of mosquitoes. On which perhaps 300 species are well known disease carriers¹. One of the most infectious disease carriers. One of the most infectious disease carrier is anopheles mosquitoes²,³. Moreover, malaria that affects other animals cannot be transferred to people. Only human malaria can affects human by some specific species which is known as anopheles mosquito that are capable of transmitting malaria⁴,⁵. This disease is caused by a protozoan of the plasmodium parasite. Plasmodium is more complex than many other parasites⁶,⁷. In plasmodium genus, only five of them which cause human malaria: Plasmodium falciparum, Plasmodium vivax, Plasmodium ovale, Plasmodium malariae, Plasmodium knowlesi⁸,⁹. While the biting of infected mosquito in human, the plasmodium parasites enter into the human blood and travel to the hepatocyte¹⁰. Within an hour, all the parasites have penetrated the hepatocyte, none remain in the circulating blood. After entered the protozoan multiply asexually that is, each protozoan divides into two identical copies of itself. They continue this reproduction for few weeks, after they invade red blood cells from the hepatocyte. By taking energy from human hemoglobin the parasites are grown well in the red blood cells and continue to reproduce asexually¹¹. Eventually they burst out of the red blood cells, rupturing them in the process. The matured parasites are released when the blood cells burst¹². The newly liberated parasites quickly infected new cells. This event repeats several times. At this time, the asexual stage of the malaria cycle comes to an end. Most of them reinvade the hepatocyte, where they may remain for a long time. Some of these newly emerged parasites, become sexually reproducing cells, called as gametocyte¹³. If an anopheles mosquito bites a person when these gametocytes are present in the human blood and picks up any of them the malarial life cycle continues into its sexually reproducing generation. When an anopheles mosquito swallows the gametocyte that it has obtained from an infected human blood each of the cells fuses with another in the mosquitoes midgut. These new cells penetrate the wall of the
mosquitoes intestine, called as ookinete. Upon traversing the midgut wall the ookinete embeds into the exterior membrane of gut and develops into an oocyst. In this stage, sporozoites are produced by oocyst. The sporozoites migrate to the mosquitoes salivary gland. When the mosquito bites a subsequent human, it injects the parasites into the human blood, repeating the entire life cycle\textsuperscript{14}.

By analysing the dynamics of anopheles mosquito life cycle which was referred\textsuperscript{15,16,17,18,19} and at each stage if varying population are presented then the analysis of stability is described. In the authors knowledge, no one has investigated the system of plasmodium life cycle with initial population are introduced at each stage with random noise which we have discussed in this present paper. Most of work has been done to describe about the plasmodium life cycle, but the stochastic perturbation has not been investigated so far. This work is a contribution in the above specified area.

This paper is organized as follows, In section 2, the mathematical model of plasmodium life cycle with initial population introduced at each stage has been presented. In section 3, the analysis of local and global stability around the equilibrium point are discussed in detail. In section 4, projects about the stochastic nature on this model. In section 5, the diagrams are presented and the conclusion is given in section 6.

The Mathematical model

The following are assumptions for modeling the Plasmodium life cycle by introducing varying population at each stage:

- In malaria infected human hepatocyte, the total population of plasmodium life cycle parasite consists of ten forms, such as Anopheles mosquito, Sporozoite, Hyphozoite, Infected hepatocyte, Hepatic schizont, Ruptured schizont, Merozoite, Early trophozoite, Late trophozoite and Gametocyte, which are taken as a parameter
- The initial population are taken at each stage in the described system.

\centering
\includegraphics[width=\textwidth]{plasmodium_diagram.png}
\caption{Flow diagram of plasmodium life cycle with varying population}
\end{figure}

Fig. 1 depicts the flow diagram of plasmodium life cycle.

The Mathematical model of varying population of plasmodium life cycle is given below:
\[
\frac{dx_1}{dt} = \lambda_1 x_1 + \alpha_{12} x_{10} - \alpha_1 x_1
\]
\[
\frac{dx_2}{dt} = \lambda_2 x_2 + \alpha_1 x_1 - (\alpha_2 + \alpha_3) x_2
\]
\[
\frac{dx_3}{dt} = \lambda_3 x_3 + \alpha_2 x_2 - \alpha_4 x_3
\]
\[
\frac{dx_4}{dt} = \lambda_4 x_4 + \alpha_3 x_2 - \alpha_5 x_4
\]
\[
\frac{dx_5}{dt} = \lambda_5 x_5 + \alpha_4 x_3 + \alpha_5 x_4 - \alpha_6 x_5
\]
\[
\frac{dx_6}{dt} = \lambda_6 x_6 + \alpha_6 x_5 + \alpha_{10} x_9 - (\alpha_7 + \alpha_{11}) x_6
\]
\[
\frac{dx_7}{dt} = \lambda_7 x_7 + \alpha_7 x_6 - \alpha_8 x_7
\]
\[
\frac{dx_8}{dt} = \lambda_8 x_8 + \alpha_8 x_7 - \alpha_9 x_8
\]
\[
\frac{dx_9}{dt} = \lambda_9 x_9 + \alpha_9 x_8 - \alpha_{10} x_9
\]
\[
\frac{dx_{10}}{dt} = \lambda_{10} x_{10} + \alpha_{11} x_6 - \alpha_{12} x_{10}
\]

where \( x_1 \) is the number of adult mosquitoes, \( x_2 \) is the number of sporozoite, \( x_3 \) is the number of Hypnozite, \( x_4 \) is the number of Infected hepatocyte, \( x_5 \) is the number of Hepatic schizont, \( x_6 \) is the number of Ruptured schizont, \( x_7 \) is the number of Merozoites, \( x_8 \) is the number of Early trophozoite (ring form), \( x_9 \) is the number of late trophozoite, \( x_{10} \) is the number of gametocyte. \( b \) is the natural birth rate at initial stage, \( \alpha_1 \) is the rate of sporozoite from adult mosquito, \( \alpha_2 \) is the rate of sporozoite spilted and one amount of them push to hypnozoite, \( \alpha_3 \) is the rate of remaining sporozoite turn to infected hepatocyte, \( \alpha_4 \) is the rate of hypnozoite push to hepatic schizont, \( \alpha_5 \) is the rate of infected hepatocyte push to hepatic schizont, \( \alpha_6 \) is the rate of hepatic schizont turn to ruptured schizont, \( \alpha_7 \) is the rate of ruptured schizont turn to merozoite, \( \alpha_8 \) is the rate of merozoite to early trophozoite (ring form), \( \alpha_9 \) is the rate of early trophozoite turn to late trophozoite, \( \alpha_{10} \) is the rate of late trophozoite to ruptured schizont, \( \alpha_{11} \) is the rate of ruptured schizont to gametocyte, \( \alpha_{12} \) is the rate of gametocyte push to anopheles mosquito and \( \lambda_i x_i \) is the initial population at all stages in the described system, where \( i = 1, 2, 3, ..., 10 \).

**The simplified form of the mathematical model of plasmodium life cycle with varying population**

By replacing the values of \( V = \alpha_1 - \lambda_1, A = \alpha_2 + \alpha_3 - \lambda_2, R = \alpha_4 - \lambda_3, Y = \)
\[ a_5 - \lambda_4, \]

\[ I = a_6 - \lambda_5, \quad N = a_7 + a_{11} - \lambda_6, \quad G = a_8 - \lambda_7, \quad C = a_9 - \lambda_8, \quad T = a_{10} - \lambda_9, \quad L = a_{12} - \lambda_{10} \]

in eqn.(1) we obtained the modified system of plasmodium life cycle with varying population are given below:

\[
\begin{align*}
\frac{dx_1}{dt} &= a_{12}x_10 - Vx_1 \\
\frac{dx_2}{dt} &= a_1x_1 - Ax_2 \\
\frac{dx_3}{dt} &= a_2x_2 - Rx_3 \\
\frac{dx_4}{dt} &= a_3x_2 - Yx_4 \\
\frac{dx_5}{dt} &= a_4x_3 + a_5x_4 - Ix_5 \\
\frac{dx_6}{dt} &= a_6x_5 + a_{10}x_9 - Nx_6 \\
\frac{dx_7}{dt} &= a_7x_6 - Gx_7 \\
\frac{dx_8}{dt} &= a_8x_7 - Cx_8 \\
\frac{dx_9}{dt} &= a_9x_8 - Tx_9 \\
\frac{dx_{10}}{dt} &= a_{11}x_6 - Lx_{10}
\end{align*}
\]
Analysis of Equilibrium point

This section is analyzed the equilibrium point and interior equilibrium point. The following equilibrium point and interior equilibrium point are obtained by equating the right hand side of the system (2) to zero respectively.

That is,

\[ E = (x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10}) \]

where,

\[ x_1 = \alpha_1 x_1^* \]
\[ x_2 = \alpha_2 x_2^* / A \]
\[ x_3 = \alpha_3 x_3^* / R \]
\[ x_4 = \alpha_4 x_4^* / Y \]
\[ x_5 = \alpha_5 x_5^* + \alpha_6 x_6^* / I \]
\[ x_6 = \alpha_7 x_6^* + \alpha_8 x_7^* / N \]
\[ x_7 = \alpha_9 x_7^* / G \]
\[ x_8 = \alpha_9 x_8^* / C \]
\[ x_9 = \alpha_9 x_9^* / T \]
\[ x_{10} = \alpha_{10} x_{10}^* / L \]

and the interior equilibrium point is

\[ E^* = (x_1^*, x_2^*, x_3^*, x_4^*, x_5^*, x_6^*, x_7^*, x_8^*, x_9^*, x_{10}^*) \]

where,

\[ x_1^* = \frac{\alpha_2 x_2^*}{A} \]
\[ x_2^* = \frac{\alpha_3 x_3^*}{R} \]
\[ x_3^* = \frac{\alpha_4 x_4^*}{Y} \]
\[ x_4^* = \frac{\alpha_5 x_5^*}{I} \]
\[ x_5^* = \frac{\alpha_6 x_6^*}{N} \]
\[ x_6^* = \frac{\alpha_7 x_7^*}{G} \]
\[ x_7^* = \frac{\alpha_8 x_8^*}{C} \]
\[ x_8^* = \frac{\alpha_9 x_9^*}{T} \]
\[ x_{10}^* = \frac{\alpha_{11} x_{10}^*}{L} \]

Global Stability Analysis

**Theorem 1:** The interior equilibrium point \( E^* \) is globally asymptotically stable

\[ \alpha_1 = \frac{-x_2 (x_2 - x_2^* + Ax_2)}{x_1} \]
\[ \alpha_2 = \frac{-x_3 (x_3 - x_3^* + Rx_3)}{x_2} \]
\[ \alpha_3 = \frac{-x_4 (x_4 - x_4^* + Yx_4)}{x_2} \]
\[ \alpha_4 = \frac{-x_5 (x_5 - x_5^*) - \alpha_5 x_4 + Ix_5}{x_5} \]
\[ \alpha_5 = \frac{-x_6 (x_6 - x_6^*) - \alpha_6 x_9 + Nx_6}{x_5} \]
\[ \alpha_6 = \frac{-x_7 (x_7 - x_7^*) + Gx_7}{x_6} \]
\[ \alpha_7 = \frac{-x_8 (x_8 - x_8^*) + Cx_8}{x_7} \]
\[ \alpha_8 = \frac{-x_9 (x_9 - x_9^*) + Tx_9}{x_8} \]
\[ \alpha_9 = \frac{-x_{10} (x_{10} - x_{10}^*) + Lx_{10}}{x_8} \]
\[ \alpha_{10} = \frac{-x_{11} (x_{11} - x_{11}^*) + Vx_{11}}{x_{10}} \]

If the above condition holds good.

**Proof:** Define the Lyapunov function

\[ V(x_i) = \sum_{i=1}^{10} \beta_i \left[ (x_i - x_i^*) - x_i^* \ln \left( \frac{x_i}{x_i^*} \right) \right] \]
where \( i = 1, 2, 3, \ldots, 10 \) are chosen as positive constants. It is observed \( V \) is a positive definite function in the region except at \( E^* \) where it is zero. Solving the rate of change of \( V \) along the solutions of the system (3), we get,

\[
\dot{V} = \sum_{i=1}^{10} \beta_i \frac{x_i}{x_i^*} (x_i - x_i^*) \tag{5}
\]

\[
\dot{V} = \beta_1 (x_1 - x_1^*) \frac{a_{12} x_{10} - V x_1}{x_1} + \beta_2 (x_2 - x_2^*) \frac{a_{1} x_1 - A x_2}{x_2} + \]
\[
\beta_3 (x_3 - 3) \frac{a_{2} x_2 - R x_3}{x_3} + \]
\[
\beta_4 (x_4 - x_4^*) \frac{a_{3} x_2 - Y x_4}{x_4} + \beta_5 (x_5 - x_5^*) \frac{a_4 x_3 + a_5 x_4 - l x_5}{x_5} + \]
\[
\beta_6 (x_6 - x_6^*) \frac{a_6 x_5 + a_{10} x_9 - N x_6}{x_6} + \beta_7 (x_7 - x_7^*) \frac{a_7 x_6 - G x_7}{x_7} + \beta_8 (x_8 - x_8^*) \frac{a_8 x_7 - C x_8}{x_8} + \beta_9 (x_9 - x_9^*) \frac{a_9 x_8 - T x_9}{x_9} + \beta_{10} (x_{10} - x_{10}^*) \frac{a_{11} x_6 + L x_{10}}{x_{10}} \tag{6}
\]

\[
\dot{V} = \beta_1 (x_1 - x_1) (\frac{a_{12} x_{10} - V x_1}{x_1}) + \beta_2 (x_2 - x_2^*) (\frac{a_1 x_1 - A x_2}{x_2}) + \]
\[
\beta_3 (x_3 - 3) (\frac{a_2 x_2 - R x_3}{x_3}) + \]
\[
\beta_4 (x_4 - x_4^*) (\frac{a_3 x_2 - Y x_4}{x_4}) + \beta_5 (x_5 - x_5^*) (\frac{a_4 x_3 + a_5 x_4 - l x_5}{x_5}) + \]
\[
\beta_6 (x_6 - x_6^*) (\frac{a_6 x_5 + a_{10} x_9 - N x_6}{x_6}) + \beta_7 (x_7 - x_7^*) (\frac{a_7 x_6 - G x_7}{x_7}) + \]
\[
\beta_8 (x_8 - x_8^*) (\frac{a_8 x_7 - C x_8}{x_8}) + \beta_9 (x_9 - x_9^*) (\frac{a_9 x_8 - T x_9}{x_9}) + \beta_{10} (x_{10} - x_{10}^*) (\frac{a_{11} x_6 + L x_{10}}{x_{10}}) \tag{7}
\]

Now choosing (3) to (7), we get
\[
\frac{dV}{dt} = -\beta_1 (x_1 - x_1)^2 - \beta_2 (x_2 - x_2)^2 - \beta_3 (x_3 - x_3)^2 - \beta_4 (x_4 - x_4)^2 \\
- \beta_5 (x_5 - x_5)^2 - \beta_6 (x_6 - x_6)^2 - \beta_7 (x_7 - x_7)^2 - \beta_8 (x_8 - x_8)^2 \\
- \beta_9 (x_9 - x_9)^2 - \beta_{10} (x_{10} - x_{10})^2
\] (8)

and hence \( \dot{V} \) is negative definite.

Therefore, \( E^* \) is globally asymptotically mean square stable, by Laselle’s invariance principle.

**Stochastic Analysis of the Positive Equilibrium Point for Stability**

Stochastic perturbations were introduced in some of the main parameters involved in the model. In this paper, the stochastic perturbations of the variables \( x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10} \) are allowed and their values are allowed around the positive equilibrium \( E^* \). In this case when it is feasible and locally asymptotically stable. Local stability of \( E^* \) is implied by the existence condition of \( E^* \). In Model(1), the Stochastic perturbations of the variables around their value at \( E^* \) are of white noise type, which are proportional to the distances of \( x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10} \) from values \( x_1^*, x_2^*, x_3^*, x_4^*, x_5^*, x_6^*, x_7^*, x_8^*, x_9^*, x_{10}^* \).

\[
\begin{align*}
\frac{dx_1}{dt} &= [\alpha_{12}x_{10} - Vx_1]dt + \sigma_1[x_1 - x_1^*]d\omega_1 \\
\frac{dx_2}{dt} &= [\alpha_1x_1 - Ax_2]dt + \sigma_2[x_2 - x_2^*]d\omega_2 \\
\frac{dx_3}{dt} &= [\alpha_2x_2 - Rx_3]dt + \sigma_3[x_3 - x_3^*]d\omega_3 \\
\frac{dx_4}{dt} &= [\alpha_3x_2 - Yx_4]dt + \sigma_4[x_4 - x_4^*]d\omega_4 \\
\frac{dx_5}{dt} &= [\alpha_4x_3 + \alpha_5x_4 - lx_5]dt + \sigma_5[x_5 - x_5^*]d\omega_5 \\
\frac{dx_6}{dt} &= [\alpha_6x_5 + \alpha_{10}x_9 - Nx_6]dt + \sigma_6[x_6 - x_6^*]d\omega_6 \\
\frac{dx_7}{dt} &= [\alpha_7x_6 - Gx_7]dt + \sigma_7[x_7 - x_7^*]d\omega_7 \\
\frac{dx_8}{dt} &= [\alpha_8x_7 - Cx_8]dt + \sigma_8[x_8 - x_8^*]d\omega_8 \\
\frac{dx_9}{dt} &= [\alpha_9x_8 - Tx_9]dt + \sigma_9[x_9 - x_9^*]d\omega_9 \\
\frac{dx_{10}}{dt} &= [\alpha_{11}x_6 - Lx_{10}]dt + \sigma_{10}[x_{10} - x_{10}^*]d\omega_{10}
\end{align*}
\] (9)

Where \( \sigma_i, i = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 \) are real constants, \( \omega t_i = \omega_i(t), i = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 \) are independent from each other standard Wiener process. The dynamical behavior of model(1) is robust with respect to such a kind of stochasticity by investigating the asymptotic stability behavior of the equilibrium \( E^* \). This analysis is mainly to represent the dynamics of the system around the interior equilibrium point \( E^* \). For this purpose, we linearize the model using the following perturbation method, that is the stochastic differential
system of (9) can be centred at its positive equilibrium $E^*$ by the change
of variables

$$u_i = x_i - x_i^*$$

(10)

where $i=1,2,3,...,10$ are positive constants. The linearized SDEs around $E^*$ take the form

$$du(t) = f(u(t))dt + g(u(t))dw(t)$$

(11)

where

$$u(t) = [u_1(t) u_2(t) u_3(t) u_4(t) u_5(t) u_6(t) u_7(t) u_8(t) u_9(t) u_{10}(t)]^T$$

(12)

and

$$f(u(t)) = \begin{pmatrix}
-V & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \alpha_{12} \\
\alpha_1 & -A & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \alpha_2 & -R & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \alpha_3 & 0 & -Y & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \alpha_4 & \alpha_5 & -I & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & \alpha_6 & -N & 0 & 0 & \alpha_{10} \\
0 & 0 & 0 & 0 & 0 & \alpha_7 & -G & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & \alpha_8 & -C & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & \alpha_9 & -T \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -L
\end{pmatrix}$$

(13)

$$g(u(t)) = \begin{pmatrix}
\sigma_1 u_1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & \sigma_2 u_2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \sigma_3 u_3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & \sigma_4 u_4 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & \sigma_5 u_5 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & \sigma_6 u_6 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & \sigma_7 u_7 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_8 u_8 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_9 u_9 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sigma_{10} u_{10}
\end{pmatrix}$$

(14)
In (11) the positive equilibrium $E^*$ corresponds to the trivial solution $u(t) = 0$. Let $U$ be the set

$$U = (t \geq t_0) \times R^+.$$ 

Hence $V \in C^0_2(U)$ is twice continuously differentiable function with respect to $u$ and a continuous functions with respect to $t$. Now the Itô stochastic differential is defined as

$$dV(t) = \frac{\partial V(t,u)}{\partial t} + f^T u(t) \frac{\partial V(t,u)}{\partial t} + \frac{1}{2} \text{trace}[g^T(u(t)) \frac{\partial^2 V(t,u)}{\partial u^2} g(u(t))]$$

(14)

where $\frac{\partial V}{\partial u} = \left[ \frac{\partial V}{\partial u_1}, \frac{\partial V}{\partial u_2}, \frac{\partial V}{\partial u_3}, \frac{\partial V}{\partial u_4}, \frac{\partial V}{\partial u_5}, \frac{\partial V}{\partial u_6}, \frac{\partial V}{\partial u_7}, \frac{\partial V}{\partial u_8}, \frac{\partial V}{\partial u_9}, \frac{\partial V}{\partial u_{10}} \right]^T$,

$$\frac{\partial^2 V(t,u)}{\partial u^2} = \text{col} \left( \frac{\partial^2 V}{\partial w_i \partial u_j} \right), \text{ i, } j = 1, 2, 3, ..., 10.$$

**Remark:** Suppose there exists a function $V \in C^0_2(U)$ satisfying the inequalities

$$V(t,u) \leq K_2 \vert u \vert^\rho,$$

(15)

$$LV(t,u) \leq K_3 \vert u \vert^\rho, K_i > 0, \rho > 0$$

(16)

Then the trivial solution of (9) is globally asymptotically mean square stable in probability.

**Theorem 2:** The population free solution (14) is asymptotically mean square stable when

$$\alpha_{12} u_{10} u_1 + \alpha_{11} u_1 w_1 + \alpha_{22} w_5 u_5 + \alpha_{21} w_4 u_4 + \alpha_{32} w_5 u_6 + \alpha_{31} w_4 u_6 + \alpha_{42} w_5 u_8 + \alpha_{41} w_4 u_8 + \alpha_{52} w_5 u_{10} + \alpha_{51} w_4 u_{10} = 0$$

(17)
**Proof:** Now consider the Ito process where $w_i$ are real positive constants to be chosen in the following. The inequalities (16) hold with $\rho = 2$.

Now the Ito process (14) becomes

$$
\frac{1}{2} \text{trace} [g^T(u(t)) \frac{\partial^2 V(t,u)}{\partial u^2} g(u(t))] 
$$

Here

$$
\frac{\partial^2 V}{\partial u^2} = \begin{pmatrix}
    w_1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & w_2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & w_3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & w_4 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & w_5 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & w_6 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & w_7 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & w_8 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_9 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_{10}
\end{pmatrix}
$$

(19)

and

$$
g^T(u(t)) \frac{\partial^2 V}{\partial u^2} g(u(t)) = \begin{pmatrix}
    w_1 \sigma_1 u_1^2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & w_2 \sigma_2 u_2^2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & w_3 \sigma_3 u_3^2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & w_4 \sigma_4 u_4^2 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & w_5 \sigma_5 u_5^2 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & w_6 \sigma_6 u_6^2 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & w_7 \sigma_7 u_7^2 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & w_8 \sigma_8 u_8^2 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_9 \sigma_9 u_9^2 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & w_{10} \sigma_{10} u_{10}^2
\end{pmatrix}
$$

(20)

With
\[
\frac{1}{2} \text{trace} \left[ g^T(u(t)) \frac{\partial^2 V(t, u)}{\partial u^2} g(u(t)) \right] = \frac{1}{2} \left[ w_1 \sigma_1^2 u_1^2 + w_2 \sigma_2^2 u_2^2 + w_3 \sigma_3^2 u_3^2 + w_4 \sigma_4^2 u_4^2 + w_5 [\sigma_5^2] u_5^2 + w_6 \sigma_6^2 u_6^2 + w_7 [\sigma_7^2] u_7^2 + w_8 \sigma_8^2 u_8^2 + w_9 \sigma_9^2 u_9^2 + w_{10} \sigma_{10}^2 u_{10}^2 \right]
\]

(21)

Use (21) along (18) we get

\[
L V(t, u) = -w_1 \left[ V - \frac{1}{2} \sigma_1^2 \right] u_1^2 - w_2 \left[ A - \frac{1}{2} \sigma_2^2 \right] u_2^2
\]

\[
- w_3 \left[ R - \frac{1}{2} \sigma_3^2 \right] u_3^2 - w_4 \left[ Y - \frac{1}{2} \sigma_4^2 \right] u_4^2
\]

\[
- w_5 \left[ I - \frac{1}{2} \sigma_5^2 \right] u_5^2 - w_6 \left[ N - \frac{1}{2} \sigma_6^2 \right] u_6^2
\]

\[
- w_7 \left[ G - \frac{1}{2} \sigma_7^2 \right] u_7^2 - w_8 \left[ C - \frac{1}{2} \sigma_8^2 \right] u_8^2
\]

\[
- w_9 \left[ T - \frac{1}{2} \sigma_9^2 \right] u_9^2 - w_{10} \left[ L - \frac{1}{2} \sigma_{10}^2 \right] u_{10}^2
\]

Which is negative definite and asymptotically mean square stable.

**Numerical Simulation and Discussion**

In this paper, the complexity of plasmodium life cycle model with varying population are introduced at all stage is investigated and it is observed that the equilibrium point E* of the plasmodium life cycle with varying population model is feasible. Moreover all the solution converges to the positive equilibrium. It is observed that the stochastic perturbation of the deterministic model is robust. It is observed from this analysis that for varying population, the complexity of varying population introduced in plasmodium life cycle model is stabilized. It is to be noted that when \( x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8, x_9, x_{10} \) increases, the asymptotic mean square stability property is achieved.

For the numerical simulations, the fourth order Runge-kutta method is used to solve the system of varying population introduced in plasmodium life cycle differential equation. The parameter values are taken as \( a=0.341, b=0.567, \)
c=0.197, d=0.741, e=0.904, f=0.432, g=0.169, h=0.228, i=0.753, j=0.896, k=0.732, l=0.907, \sigma=10 and the initial densities are taken as \(x_1=0.124, x_2=0.324, x_3=0.654, x_4=0.342, x_5=-0.0553, x_6=-0.019398, x_7=0.281, x_8=0.555, x_9=0.444, x_{10}=0.333\). While the increasing of time span all the stages are stable for all values of initial population.

Figure 2 depicts the stability of deterministic of plasmodium life cycle model. When some random noise occur at all stages around interior equilibrium point then it stabilized at equilibrium point. Figure 3 depicts the equilibrium point of stochastic of plasmodium model.

![Figure 2: Stability of deterministic plasmodium life cycle model](image1)

![Figure 3: Equilibrium point of stochastic of plasmodium life cycle model](image2)
Conclusion

In this paper, the complexity of plasmodium life cycle model with initial population are introduced at all stage is investigated. The boundedness and equilibrium points of the system have been found. By using Lyapunov function, global stability properties of the plasmodium life cycle model are investigated. The stochastic perturbation is introduced and suggested the plasmodium life cycle model is robust with respect to stochastic perturbation. By constructing suitable Lyapunov function, it showed that the interior equilibrium point of the plasmodium life cycle model is global asymptotically stable. Moreover all the solutions converge to the positive equilibrium. The stochastic perturbation is also introduced to the system by stochastic differential equations and Itô process. Through the construction of the Lyapunov function, it is showed that the zero solution of this stochastic system is asymptotically mean square stable. Finally numerical examples are given and respected diagrams are presented which support the result.

Genotypes of *Orientia Tsutsugamushi* from Patients with Scrub Typhus in Kolar, Karnataka

Gangannagari Vijay Kumar¹, Parvangada Madappa Beena²

¹PhD Scholar; ²Professor and Head, Department of Microbiology, Sri Devaraj Urs Medical College, Kolar, Karnataka, India

Abstract

O. tsutsugamushi is a causative agent of scrub typhus that is widespread in Asia-Pacific region and it shows a high degree of antigenic variation. This study was done to find the circulating genotypes of circulating genotypes of O. tsutsugamushi from patients with scrub typhus in Kolar district. A total of 197 patients with symptoms were included in the study and Scrub typhus in patients was confirmed by performing Scrub typhus IgM ELISA and Weil-Felix test. All sero-positive samples were subjected to standard PCR and DNA sequencing performed for PCR positive samples. Out of 67 seropositive samples, 22 samples were positive for OT 56kDa type specific antigen gene. Of these 22 amplified samples, 17 DNA sequences yielded good results. Phylogenetic analysis of 17 sequences showed 10 (58.8%) clustered with Karp-like strain, 6 (35.2%) with Boryang-like and one with Orientia chuto Dubai strain. This study shows there is a great genetic diversity among the O. tsutsugamushi. These circulating genotypes would be helpful in the development of vaccines and rapid diagnostic tests.

Key Words: O. tsutsugamushi, Scrub typhus, 56 kDa Type specific antigen, PCR, DNA sequencing.

Introduction

Scrub typhus is a zoonotic disease caused by obligate intracellular bacteria *Orientia tsutsugamushi* and transmitted by trombiculid (chigger mites)¹. This disease is of public health concern to the population over the geographical area covering from northern Japan in the east to Pakistan and Afghanistan in the west and northern Australia in the south with an estimation of one million cases per year²,³. Scrub typhus has been reported from the state of Karnataka and neighbouring states, as well as from the sub-Himalayan states ⁴,⁵,⁶,⁷,⁸. Common clinical manifestations of infected patients are fever, headache, lymphadenopathy, hepatosplenomegaly, rash and an eschar. The severity of the infection ranges from a mild, self-limiting disease to fatal illness in untreated cases. Antigenic diversity among the strains of *O.tsutsugamushi* have been reported and also interstrain variability has been connected with virulence of the disease resulting in mild disease or fatal disease among humans as well as in rodents⁹. 56 kDa type specific antigen is a unique transmembrane protein in *O.tsutsugamushi*, probably involved in the adherence and to invade the target cells. It is highly variable as well as highly antigenic. By performing genetic sequence analysis, the strain differentiation within the genus can be detected.¹⁰,¹¹. Till date more than 20 antigenic variants of *O.tsutsugamushi* such as Japanese Gilliam, Japanese Karp, Kawasaki, Kuroki, and Shimokoshi, included previously identified prototype strains Karp, Gilliam and Kato¹²,¹³,¹⁴. Even though reemergence of Scrub typhus has been reported, the circulating strains and their origin have not been documented. This study was conducted to identify the circulating 56 kDa antigen genotypes in patients from scrub typhus suspected in the Kolar region.

Materials and Method

This study was conducted in the Department of Microbiology, Sri Devaraj Urs Medical College from December 2014 to January 2016. The blood samples were collected from RL Jalappa hospital, Kolar and SNR District Hospital. A total of 197 patients with symptoms fever of one week duration with or without eschar or rash was included in the study. Patients diagnosed with dengue, malaria, typhoid and other febrile illness were excluded. Written informed consent was obtained
from the patient before collecting blood samples. Scrub typhus in patients was confirmed by performing Scrub typhus IgM ELISA (In Bios International) and Weil-Felix test (Plasmatec)\textsuperscript{15,16}. All sero-positive samples were subjected to standard PCR and DNA sequencing performed for PCR positive samples. This study was approved by the Institutional Ethical Committee.

**DNA Extraction and Amplification**

The DNA was extracted from the Blood samples using the QIAamp Blood DNA Mini Kit (QIAGEN GmbH, Hilden, Germany) according to the manufacturer’s instructions. Conventional PCR, targeting the 56 kDa type specific genes were performed according to our previous study\textsuperscript{25}.

**Purification of amplified products and Sequence Analysis:**

PCR amplified products were purified by using the Gene JET Gel Extraction Kit (Thermo Fisher Scientific) according to the manufacturer’s instructions and were subjected to a sequencing reaction using the BigDye Terminator Mix (Applied Biosystems, Foster City, CA) and sequencing reactions subjected to automatic sequencer using the ABI 3500 Genetic Analyzer (Applied Biosystems). The sequences obtained were compared with sequences available in GenBank by using BLAST (http://blast.ncbi.nlm.nih.gov). The sequences obtained were submitted to GenBank (Accession nos. KY497018, KY497020, KY305482, MG930463-70, MH260083-85). Phylogenetic analysis of sequences was performed using Mega 7 software.\textsuperscript{18}

**Results**

Among 197 samples tested, 48.11% (81) were from male patients and 58.88% (116) were from female patients. The average mean age was 31.13. Among 197 samples tested for scrub typhus, 6.09% (67) were positive by both Weil-Felix test and IgM ELISA. Out of 67 seropositive samples, 22 samples were positive for OT 56kDa TSA gene by conventional PCR (fig:1). Of the 22 amplified samples, 17 DNA sequences yielded good results.

**NCBI blast analysis**

BLAST analysis of the 17 sequenced data revealed, 35.2% (6) of the DNA sequences had closest homology to strains reported from India, 29.4% (5) were originating from Taiwan followed by 17.6.4 % (3) strains in Cambodia, 11.7% (2) strain from Vietnam and a single sequence to Thailand (5.88%). The nucleotide similarity ranged from 73-100%. The number of sequences having homology to other strains of other endemic regions has been described in the fig:1

**Phylogenetic analysis**

To understand evolutionary trends, phylogenetic analysis was performed with 17 good sequences in this study with reference strains taken from NCBI database. The strains obtained from this study were grouped into three clusters, namely; Karp, Boryang and Orientia chuto-like Ten (58.8%) strains clustered under Karp strain. Six (35.2%) strains clustered under Boryang strain followed by 1 (5.8%) strain clustered under Orientia chuto Dubai strain.

**Discussion**

Scrub typhus is an acute febrile-illness caused by *O. tsutsugamushi* and cause mortality as high as in 30-50% in untreated cases\textsuperscript{3}. Prevalence of scrub typhus has been reported from all over the India. Genotyping of *O. tsutsugamushi* strains would be useful in development of rapid diagnostic tests and vaccines. In spite of knowing the genotypes in endemic regions in India, there is a paucity of information on genotypes prevalent from Karnataka. We targeted 56kDa type specific antigen protein gene for genotyping, as it is the most abundant transmembrane protein in *O. tsutsugamushi* and it contains both group specific and type specific antigenic sites\textsuperscript{10}.

In this study, there was a high percentage of the Karp-like strains a (58.8%), followed by Boryang-like (35.2%) and Orientia Chuto-like (5.8%). Karp-like strains were similar to strains reported from India,
Taiwan, Cambodia and Thailand. Boryang-like strains seen in our study were similar to the strains previously found in humans and chigger mites from Taiwan, Vietnam and Cambodia. A recent study by Kelly et al., reported that strains phylogenetically similar to Karp-like constituted almost 40% of all genotypes followed by JG-like genotypes. In the recent past, studies from southeast Asian countries reported an increase in prevalence of Karp-like strains. Varghese et al., from Vellore, South India reported the occurrence of two prototypes Kato and Karp. A study conducted by the same team analysed samples from scrub typhus endemic regions of South, North and North East India and they reported Kato-like, Karp-like, Gilliam-like, Ikeda and Neimeng-65 strains. A study from the state of Andhra Pradesh, reported their strains were similar to Gilliam type. A recent case study from Manipal, Karnataka, reported a strain similar to Ikeda. Mahajan et al., reported the occurrence of two new genotypes, IHS1 and IHS2 from the state of Himachal Pradesh. Out of 17 sequences performed, only one sequence was under the Orientia Chuto Dubai cluster, which is a novel species isolated from patient in Dubai. Interestingly, that sequence was from a patient who hailed from the area where the same strain was isolated from domestic rodent as reported in our previous study.

Conclusion

Molecular characterization of O.tsutsugamushi showed great antigenic diversities among the O. tsutsugamushi strains isolated in south India. Thirty five percent of the DNA sequences of O. tsutsugamushi in our study had highest homology to the strains from India followed by Taiwan (29.4%), Cambodia (17.6%) and Vietnam (11.7%). A similar observation was made by Varghese et al. from the Tamilnadu indicating there may be similar circulating genotypes in both the southern states.

Karp-like circulating strains of O.tsutsugamushi in the Kolar region, Karnataka is found to be predominant, followed by Boryang-like and one strain is similar to the O. Chuto Dubai strain which is a novel Orientia species. This study reveals there is an extent genetic diversity among the O. tsutsugamushi within the Karnataka. The presence of genetic variability of O.tsutsugamushi will influence the use of diagnostic methods and vaccine development.

Randomness, Boundedness and Stability Analysis of HIV Spread in a Mobile Heterosexual Population

Suresh Rasappan¹, Regan Murugesan¹

¹Department of Mathematics, Vel Tech University, 400 feet outer Ring Road, Avadi, Chennai

Abstract

The model of HIV in a mobile heterosexual population with random noise has not been investigated so far. The purpose of this paper is to present the randomness, boundedness and the stability analysis for the spread of HIV in a mobile heterosexual population. The boundedness and equilibrium points of the model have been determined. By the construction of a Lyapunov function, the global stability properties are analyzed. By comparison to stochastic perturbation, the deterministic model is found to be robust. The analysis leads to the equilibrium of the stochastic perturbation wherein the total number of population is varying. Finally, numerical examples are furnished and diagrams are presented which support the findings.

Keywords: HIV/AIDS, Mobility, Multiple patches, Epidemiology, Equilibrium points, Stochastic Stability, Lyapunov function.

2000 Mathematics Subject Classification: 34D23, 34D20, 37C75, 26A18.

Introduction

A major epidemic disease of serious concern in recent times has been AIDS (Acquired Immune Deficiency Syndrome) caused by the Human Immuno Deficiency Virus which is transmitted through mobile heterosexual population. The mobility of the population infected by HIV is a crucial aspect leading to the dynamic transmission of the disease. Nowadays, HIV affected population has been registering rapid growth in all the developing nations. If statistics in India are considered, wide variation in the ratio of infected population level is observed between states, districts and even between urban and rural areas. The policy makers in India are worried with the occurrence of a series of epidemic diseases with their own attributes and dynamics. It is often seen that the dynamic transmission of HIV is quite complex to be investigated. Health personnel find that the period of incubation after infection with HIV is extremely long and has to be measured in years. During this period, the individuals affected by HIV are unknowingly transmitting their HIV to others through several means such as sexual transmission, sharing infected syringes with others, pregnant women affecting the babies etc. The movement among populations has been a crucial factor which augments the contact between individuals in different patches, thereby leading to more epidemics. Consequently the migration of people among different subgroups has many worrisome impacts for the outcome of the epidemic spread.

It is of paramount importance to understand how the disease spreads among people. Towards this objective, mathematical models based on the transmission mechanism of HIV will be handy to the medical and social community. With the development of a mathematical model, it is feasible to a certain extent to understand how the infection spreads in different populations which would facilitate the evaluation of the effectiveness of various approaches for placing the epidemic under control. In this process, the rapid scale of the spread of HIV can be minimized. Ever since the recognition of the first few cases of HIV/AIDS epidemic, extensive studies have been undertaken by various researchers by constructing mathematical models for the spread of this disease 4-7, 9, 16. In a majority of such works, the attention has been paid only on a single population of constant size. Some researches have pointed out that studies of the epidemic dynamics on population with variable size would be necessary for better understanding of the disease 11, 14, 15, 21. The models dealt with by many previous authors have focused only on a single homosexual
The model for the spread of infection is concerned with the patches grouped as susceptible males (resp. females) and infected females (resp. males) with constant and varying population. In this model, the author has considered the transmission of HIV between the susceptible male/ female and the infected male/ female within a varying population. In another work, the authors have investigated and discussed the stability properties, equilibrium points and stochastic stability properties of the force of the infection. They have considered the problem of the robustness of the model in the matter of white noise stochastic perturbation in the neighbourhood of its positive endemic equilibrium.

The following is the outline of the presentation of the contents of this paper. In section 2, a detailed description of the system is provided. In section 3, the boundedness of the solution and the dynamical behaviour of the boundary together with the interior equilibrium points of the deterministic model are dealt with. In section 4, the stochastic model is introduced. In section 5, the stability properties are analyzed by means of a Lyapunov function. In section 6, results arising out of numerical simulation are discussed. In section 7, the findings and conclusion are presented.

The flow diagram for HIV spread in a mobile heterosexual population is provided in Figure 1.

![Flow Diagram for HIV spread in a mobile heterosexual population](image)

**Boundedness, boundary equilibria and stability**

### Equilibrium Points:

\[
\begin{align*}
\frac{dx_1^{(r)}}{dt} & = \frac{\mu}{2} - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_m} y_2^{(j)} - \mu x_1^{(r)} \\
\frac{dx_2^{(r)}}{dt} & = \sum_{j=1}^{k} \frac{\beta_{rj}}{n_m} n_M^{(j)} - (\mu + \gamma) x_2^{(r)} \\
\frac{dy_1^{(r)}}{dt} & = \frac{\mu}{2} - \sum_{j=1}^{k} \frac{\beta_{rj}}{n_f} y_1^{(j)} - \mu y_1^{(r)} \\
\frac{dy_2^{(r)}}{dt} & = \sum_{j=1}^{k} \frac{\beta_{rj}}{n_f} n_F^{(j)} - (\mu + \gamma) y_2^{(r)}
\end{align*}
\]

where \( n_M^{(r)} = x_1^{(r)} + x_2^{(r)} \), \( n_F^{(r)} = y_1^{(r)} + y_2^{(r)} \) and \( \beta_{rj} \) denotes the infection rate of susceptible (males and females) in patch 'r' by infected individuals from patch 'j'. The force of infection in each patch 'r' is contributed by the term \( \sum_{j=1}^{k} \frac{\beta_{rj}}{n_m} y_2^{(j)} \) for the susceptible females and \( \sum_{j=1}^{k} \frac{\beta_{rj}}{n_f} n_F^{(j)} \) for the susceptible males. The natural death and death due to AIDS disease are assumed to be at the rate of \( \mu \) and \( \delta \) and the infected individuals develop AIDS at the rate of \( \gamma \).

The flow diagram for HIV spread in a mobile heterosexual population is provided in Figure 1.
It is seen that the model equation ((1)) has the following non-negative equilibria:

\[ E_1 = \left( \frac{1}{2}, 0, 0, 0 \right), E_2 = (0, 0, 0, 0) \]

\[ E_3 = (0, 0, \frac{1}{2}, 0) \]

**Interior Equilibrium Points:**

The interior equilibrium point is \( E^*(x_1^{(r)}(r)^*, x_2^{(r)}(r)^*, y_1^{(r)}(r)^*, y_2^{(r)}(r)^*) \) with

\[
\begin{align*}
    y_2^{(r)^*} &= \sum_{j=1}^{k} \frac{\beta_{rj} x_2^{(j)}(r)^*}{n_F^{(j)}} = \frac{\mu}{2 \sum_{j=1}^{k} \beta_{rj} n_F^{(j)}} - \mu \\
    x_2^{(r)^*} &= \sum_{j=1}^{k} \frac{\beta_{rj} y_2^{(j)}(r)^*}{n_M^{(j)}} = \frac{\mu}{2 \sum_{j=1}^{k} \beta_{rj} n_M^{(j)}} - \mu 
\end{align*}
\]

Concerning the stability of the interior equilibrium point of (2.1), we have the following

**Theorem**

The interior equilibrium point \( E^* \) is globally asymptotically stable, if

\[
\begin{align*}
    (x_1^{(r)} - x_1^{*(r)}) &= \sum_{j=1}^{k} \beta_{rj} y_2^{(j)} x_2^{(j)} - \mu(1 - 2x_1^{(r)}) (y_1^{(r)} - y_1^{*(r)}) = \sum_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)} (r)}{n_F^{(j)}} - \mu(1 - 2y_1^{(r)}) \\
    (x_2^{(r)} - x_2^{*(r)}) &= \sum_{j=1}^{k} \beta_{rj} y_2^{(j)} x_2^{(j)} - (\mu + \gamma) (y_2^{(r)} - y_2^{*(r)}) = \sum_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)} (r)}{n_F^{(j)}} - (\mu + \gamma)
\end{align*}
\]

Proof:

Let us employ the Lyapunav function

\[
\begin{align*}
    V &= \beta_1 (x_1^{(r)} - x_1^{*(r)}) - x_1^{*(r)} \ln \frac{x_1^{(r)}}{x_1^{*(r)}} + \beta_2 (x_2^{(r)} - x_2^{*(r)} - x_2^{*(r)} \ln \frac{x_2^{(r)}}{x_2^{*(r)}}) + \beta_3 (y_1^{(r)} - y_1^{*(r)}) - y_1^{*(r)} \ln \frac{y_1^{(r)}}{y_1^{*(r)}} + \beta_4 (y_2^{(r)} - y_2^{*(r)} - y_2^{*(r)} \ln \frac{y_2^{(r)}}{y_2^{*(r)}}).
\end{align*}
\]

From this we obtain

\[
\begin{align*}
    \dot{V} &= \beta_1 (x_1^{(r)} - x_1^{*(r)}) \frac{x_1^{(r)}}{x_1^{*(r)}} + \beta_2 (x_2^{(r)} - x_2^{*(r)} - x_2^{*(r)} \ln \frac{x_2^{(r)}}{x_2^{*(r)}}) + \beta_3 (y_1^{(r)} - y_1^{*(r)}) \frac{y_1^{(r)}}{y_1^{*(r)}} + \beta_4 (y_2^{(r)} - y_2^{*(r)} - y_2^{*(r)} \ln \frac{y_2^{(r)}}{y_2^{*(r)}}) \\
    &+ s \beta_4 (y_2^{(r)} - y_2^{*(r)} - y_2^{*(r)} \ln \frac{y_2^{(r)}}{y_2^{*(r)}})
\end{align*}
\]

A few steps of simplification lead to
\[ \dot{V} = \beta_1(x_1^{(r)} - x_1^{(r)*})^2 + \beta_2(x_2^{(r)} - x_2^{(r)*})^2 + \beta_3(y_1^{(r)} - y_1^{(r)*})^2 + \beta_4(y_2^{(r)} - y_2^{(r)*})^2 \]

As a result, we get
\[ \dot{V} = -\beta_1(x_1^{(r)} - x_1^{(r)*})^2 - \beta_2(x_2^{(r)} - x_2^{(r)*})^2 - \beta_3(y_1^{(r)} - y_1^{(r)*})^2 - \beta_4(y_2^{(r)} - y_2^{(r)*})^2 \]

Consequently, it turns out that \( \dot{V} \) is negative. Considering this result in the background of the invariance principle of LaSalle, it follows that \( E^* \) is globally asymptotically stable.

**Stochastic Model**

In the present work, stochastic perturbations are introduced in some of the main parameters involved in the model equations. We allow stochastic perturbations of the variables \( x_1^{(r)}, x_2^{(r)}, y_1^{(r)}, y_2^{(r)} \) around their values at the positive equilibrium \( E^* \) in the case when it is feasible and locally asymptotically stable. Local stability of \( E^* \) is implied by the existence conditions of \( E^* \). So in the model (1) we assume that stochastic perturbations of the variables around their values at \( E^* \) are of white noise type, which are proportional to the distances of \( x_1^{(r)}, x_2^{(r)}, y_1^{(r)}, y_2^{(r)} \) from the values \( x_1^{(r)*}, x_2^{(r)*}, y_1^{(r)*}, y_2^{(r)*} \).

The stochastic differential equation of the HIV is
\[ \begin{align*}
\dot{x}_1^{(r)} &= \left[ \mu - \sum_{j=1}^{k} \beta_{jr} \frac{y_2^{(j)}}{n_F} x_1^{(r)} - \mu x_1^{(r)} \right] dt + \sigma_1 [x_1^{(r)} - x_1^{(r)*}] dw_1(t) \\
\dot{x}_2^{(r)} &= \left[ \sum_{j=1}^{k} \beta_{jr} \frac{y_2^{(j)}}{n_F} x_1^{(r)} - (\mu + \gamma) x_2^{(r)} \right] dt + \sigma_2 [x_2^{(r)} - x_2^{(r)*}] dw_2(t) \\
\dot{y}_1^{(r)} &= \left[ \mu - \sum_{j=1}^{k} \beta_{jr} \frac{y_2^{(j)}}{n_M} y_1^{(r)} - \mu y_1^{(r)} \right] dt + \sigma_3 [y_1^{(r)} - y_1^{(r)*}] dw_3(t) \\
\dot{y}_2^{(r)} &= \left[ \sum_{j=1}^{k} \beta_{jr} \frac{y_2^{(j)}}{n_F} y_1^{(r)} - (\mu + \gamma) y_2^{(r)} \right] dt + \sigma_4 [y_2^{(r)} - y_2^{(r)*}] dw_4(t)
\end{align*} \]

where \( \sigma_i, i = 1, 2, 3, 4 \) are real constants and \( w_i(t), i = 1, 2, 3, 4 \) are independent from each other standard Wiener processes. A question that arises naturally is whether the dynamical behaviour of the model (1) is robust with respect to such a kind of stochasticity. This makes it necessary to
investigate the asymptotic stability behaviour of the equilibrium $E^*$ for (2) and compare the results with those obtained for (1).

**Stochastic stability of the positive equilibrium**

The stochastic differential system (2) can be centered at its positive equilibrium $E^*$ by the change of variables

$$
\begin{align*}
    u_1 &= x_1^{(r)} - x_1^{*\,(r)} , \\
    u_2 &= x_2^{(r)} - x_2^{*\,(r)} , \\
    u_3 &= y_1^{(r)} - y_1^{*\,(r)} , \\
    u_4 &= y_2^{(r)} - y_2^{*\,(r)}
\end{align*}
$$

(3)

On the basis of the method described in ?, it is seen that the linearized stochastic differential equations around $E^*$ take the form

$$
\frac{du(t)}{dt} = f(u(t)) \ dt + g(u(t)) \ dw(t)
$$

(4)

where

$$
u(t) = [u_1(t) \quad u_2(t) \quad u_3(t) \quad u_4(t)]^T
$$

From equation (2), we obtain the matrix equations

$$
f(u(t)) =
\begin{bmatrix}
- \sum_{j=1}^{k} \beta r_j \frac{x_2^{(j)}}{n_M} - \mu & 0 & 0 & 0 \\
\sum_{j=1}^{k} \beta r_j \frac{y_2^{(j)}}{n_M} & -(\mu + \gamma) & 0 & 0 \\
0 & 0 & - \sum_{j=1}^{k} \beta r_j \frac{x_2^{(j)}}{n_F} - \mu & 0 \\
0 & 0 & \sum_{j=1}^{k} \beta r_j \frac{y_2^{(j)}}{n_F} & -(\mu + \gamma)
\end{bmatrix} u(t)
$$

(5)

and

$$
g(u(t)) =
\begin{bmatrix}
\sigma_1 u_1 & 0 & 0 & 0 \\
0 & \sigma_2 u_2 & 0 & 0 \\
0 & 0 & \sigma_3 u_3 & 0 \\
0 & 0 & 0 & \sigma_4 u_4
\end{bmatrix}
$$

(6)

The positive interior equilibrium $E^*$ in (4) corresponds to the trivial solution $u(t) = 0$.

Let us consider the set $U = (t \geq t_0) \times \mathbb{R}^n, t_0 \in \mathbb{R}^+$. Then $V \in C_0^2(U)$ is a twice continuously differentiable function with respect to $u$ and a continuous function with respect to $t$.

From $V$, the Itō Stochastic differential is obtained as
\[ LV(t, u) = \frac{\partial V(t, u)}{\partial t} + f^T(u) \frac{\partial V(t, u)}{\partial u} + \frac{1}{2} Tr[g^T(u) \frac{\partial^2 V(t, u)}{\partial u^2} g(u)] \] (7)

where

\[ \frac{\partial V}{\partial u} = \left( \frac{\partial V}{\partial u_1}, \frac{\partial V}{\partial u_2}, \frac{\partial V}{\partial u_3} \right)^T \]

\[ \frac{\partial^2 V(t, u)}{\partial u_2} = \left( \frac{\partial^2 V}{\partial u_j \partial u_i} \right), i, j = 1, 2, 3, 4 \]

**Remarks**

Suppose there exist a function \( V \in C_0^2(U) \) with the following properties are satisfied:

\[ K_1 |u|^p \leq LV(t, u) \leq K_2 |u|^p, \quad (8) \]

\[ LV(t, u) \leq -K_3 |u|^p, \quad K_1 > 0, \ p > 0. \quad (9) \]

Considering these inequalities from the perspective of stability in (5), it is seen that the trival solution of (4) is exponentially p-stable for \( t \geq 0 \); When \( p = 2 \), the trival solution of (4) is found to be globally asymptotically stable in probability.

Now we examine the asymptotically mean square stability of the stochastic system. In this aspect, we have the following

**Theorem**

Provided the condition

\[ (x_1^{(r)} - x_1^{* (r)})(x_2^{(r)} - x_2^{* (r)}) = \frac{w_1}{w_2} y_1^{(r)} y_2^{(r)} (y_1^{* (r)} - y_1^{* (r)})(y_2^{* (r)} - y_2^{* (r)}) \] is satisfied, then the zero solution of (4) is asymptotically mean square stable.

**Proof:**

Let us consider the Lyapunov function,

\[ V(u) = \frac{1}{2} \left[ w_1 u_1^2 + w_2 u_2^2 + w_3 u_3^2 + w_4 u_4^2 \right] \]

where \( w_i, \ i = 1, 2, 3, 4 \) are real positive constants to be selected. One can check that the inequalities (8) hold when \( p = 2 \). Now the Itô process leads to

\[ V(u) = w_1 \left[ ( - \sum_{j=1}^k \beta_{rj} \frac{y_{(j)}^{(j)}}{n_M} - \mu) u_1 \right] + w_2 \left[ \sum_{j=1}^k \beta_{rj} \frac{y_{(j)}^{(j)}}{n_M} u_1 - (\mu + \gamma) u_2 \right] + w_3 \left[ ( - \sum_{j=1}^k \beta_{rj} \frac{x_{(j)}^{(j)}}{n_P} - \mu) u_3 \right] + w_4 \left[ \sum_{j=1}^k \beta_{rj} \frac{x_{(j)}^{(j)}}{n_P} u_3 - (\mu + \gamma) u_4 \right] + \frac{1}{2} Tr[g^T(u) \frac{\partial^2 V(t, u)}{\partial u^2} g(u)] \]

A reference to (5.5) implies that
\[ V(u) = w_1\left( -\sum_{j=1}^{k} \beta_{rj} \frac{y_2^{(j)}}{n_M} + \mu \right) u_2^2 - w_2(\mu + \gamma) u_2^2 - w_3(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_M} u_1 u_2) + w_4(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_F} u_3 u_4) + \frac{1}{2} w_1 \sigma_1^2 u_1^2 + \frac{1}{2} w_2 \sigma_2^2 u_2^2 + \frac{1}{2} w_3 \sigma_3^2 u_3^2 + \frac{1}{2} w_4 \sigma_4^2 u_4^2 \]

\[ = -w_1(\Sigma_{j=1}^{k} \beta_{rj} \frac{y_2^{(j)}}{n_M} + \mu - \frac{1}{2} \sigma_1^2) u_1^2 - w_2(\mu + \gamma - \frac{1}{2} \sigma_2^2) u_2^2 + w_3(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_M} u_1 u_2) + w_4(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_F} u_3 u_4) \]

\[ = -w_1(\Sigma_{j=1}^{k} \beta_{rj} \frac{y_2^{(j)}}{n_M} + \mu - \frac{1}{2} \sigma_1^2) u_1^2 - w_2(\mu + \gamma - \frac{1}{2} \sigma_2^2) u_2^2 - w_3(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_M} u_1 u_2) - w_4(\mu + \gamma - \frac{1}{2} \sigma_4^2) u_4^2 + \sum_{j=1}^{k} \beta_{rj}[w_2\frac{x_2^{(j)}}{n_M}(x_1^{(r)} - x_1^{*(r)})(x_2^{(r)} - x_2^{*(r)})]
\]

Thus we obtain

\[ V(u) = -w_1(\Sigma_{j=1}^{k} \beta_{rj} \frac{y_2^{(j)}}{n_M} + \mu - \frac{1}{2} \sigma_1^2) u_1^2 - w_2(\mu + \gamma - \frac{1}{2} \sigma_2^2) u_2^2 - w_3(\Sigma_{j=1}^{k} \beta_{rj} \frac{x_2^{(j)}}{n_M} u_1 u_2) - w_4(\mu + \gamma - \frac{1}{2} \sigma_4^2) u_4^2 \]

**Numerical Simulation and Discussion**

The objective of this paper is to analyze the randomness, boundedness and stability of the spread of HIV in a mobile heterosexual population. For this purpose, the total population is divided into two groups namely, susceptible and infected. It is observed that the boundary equilibrium point \( E^* \) is feasible. If the decreasing rate of susceptible females, males and infected females, males population remains at a certain threshold value, then the positive equilibrium is feasible. Moreover all the solutions are converge at the equilibrium point.

It is observed that, if \( \frac{w_2 y_2^{(j)} n_F}{w_4 x_2^{(j)} n_M} = \frac{(y_1^{(r)} - y_1^{*(r)})(y_2^{(r)} - y_2^{*(r)})}{(x_1^{(r)} - x_1^{*(r)})(x_2^{(r)} - x_2^{*(r)})} \) then the stochastic perturbation model is asymptotically mean square stable. It is seen that the deterministic model is robust with respect to stochastic perturbation.

In order to carry out the numerical simulation for the transmission of HIV in a mobile
heterosexual population, the fourth order Runge Kutta method is used to solve the system of differential equations. The parameter values are taken as $\mu = 0.1$, $\gamma = 0.12$ and $r = 10$ patches. The subjects in varying population and the initial densities are taken randomly as susceptible females 2389, infected females 2499, susceptible males 6357 and infected males 3432.

As a result of this simulation process for varying total population, it is observed that the spread of HIV in a mobile heterosexual population in different cases is stabilized as follows.

![Figure 2: Deterministic model for the spread of HIV in a mobile heterosexual population](image)
Figure 3: Equilibrium points for the spread of HIV in a mobile heterosexual population

Figure 4: Stochastic model for the spread of HIV in a mobile heterosexual population
Figure 2 depicts the deterministic model for the spread of HIV in a mobile heterosexual population.
Figure 3 depicts the equilibrium points for the spread of HIV in a mobile heterosexual population.
Figure 4 depicts the stochastic perturbation for the spread of HIV in a mobile heterosexual population.

When the time span is increasing, the susceptible females \((x_1)\) and susceptible males \((y_1)\) in the deterministic model are stabilized at the equilibrium points \(E_1(\frac{1}{2}, 0, 0,0)\) and \(E_2(0, 0, \frac{1}{2}, 0)\).

The equilibrium points at which the system is stabilized are \(E_1(\frac{1}{2}, 0, 0,0)\), \(E_2(0, 0, \frac{1}{2}, 0)\) and \(E_3(0, 0, 0,0)\).

When the randomness occurs in all the stages (susceptible male \((y_1)\), female \((x_1)\) and infected female \((x_2)\) and male \((y_2)\)), the susceptible males and females are stabilized at the equilibrium points \(E_3(\frac{1}{2}, 0, 0,0)\) and \(E_4(0, 0, \frac{1}{2}, 0)\).

### Conclusion

In this paper, Randomness, boundedness and stability analysis for the spread of HIV in a mobile heterosexual population model has been investigated. The boundedness of the model has been determined and the equilibrium points of the system have been identified. Global stability properties of the model have been investigated by employing Lyapunov function. The stochastic perturbation has been introduced and the deterministic model is found to be robust with respect to stochastic perturbation. With the construction of a suitable Lyapunov function, it emerges that the interior equilibrium point of the spread of HIV between susceptible females (resp. males) and infected males (resp. females) model is global asymptotically stable. Moreover all the solutions converge to the positive equilibrium. Furthermore, the stochastic perturbation has been introduced to the system by using stochastic differential equations and Itô Process. Through the construction of the Lyapunov function, it is shown that the zero solution of this stochastic system is asymptotically mean square stable. Finally, numerical examples are provided and diagrams are presented which support the findings.

Patient Satisfaction of BPJS Kesehatan Service after Three Years of Program Implementation

Diena Dwidienawati¹, Mts Arief¹, Sri Bramantoro Abdinagoro¹

¹Doctor of Research Program, Bina Nusantara University (BINUS)

Abstract

BPJS Kesehatan has had a large coverage in short period of time. The rapid expansion of health insurance coverage has created demand which cannot be met by current healthcare system and will disrupt the delivery service¹. The disruption of service, as a consequence, will influence the satisfaction. Patient satisfaction evaluation is important because it is not only as an important indicator to evaluate the achievement of the program but also it is important to improve treatment outcome. At present there is limited report on patients’ satisfaction to BPJS Kesehatan provider. This study is aiming to find out the satisfaction level of BPJS Kesehatan in Indonesia after 3 years of program implementation.

This study using questionnaires as survey instruments. Aiming to BPJS Kesehatan midair that pays monthly payment insurance in six hospitals in five big cities in Indonesia. Three hundred and twenty-eight questionnaires are eligible to be analyzed. Descriptive analyzed is done to evaluate the satisfaction rate. The result of the study shows that patients are satisfy with the interaction, support and services provided by BPJS Kesehatan patients, which is ninety-four per cent satisfaction. This study result is different with the pervious study which shows lower satisfaction rate. The explanation is that in this study majority of respondents come from private hospitals which known to have better service compares to public hospitals. To confirm the result of the study, further study which involved more balance public and private hospitals and big cities and small cities should be done to compare the satisfaction rate from each type of hospitals and cities. Further study to identify which variable of satisfactions are more influencing is also needed to identify are of improvement of BPJS Kesehatan services.

Keywords: BPJS Kesehatan, Satisfaction, Patient

Introduction

Everyone, regardless gender, ethnic and citizenship has the right to health. United Nations (UN) in its Universal Declaration of Human Right has stated in 1948, that “everyone has the right to a standard of living adequate for health and well-being of oneself and one’s family, including food, clothing, housing and medical care”. WHO (1978) declared that Heath care is a fundamental right. Health is considered as one important factor which might affect the continuity of human well-being. Without health, people might jeopardize their productivity, loss their employment or lost their independency due to disability. Furthermore, healthcare expenditure can cause financial catastrophe. The healthcare expenditure has been known to increase the impoverishment in China⁵, Vietnam¹⁵ and Kenya⁵.

Indonesia is one of low and middle-income countries aiming to improve their health financing system and to implement universal health coverage (UHC). Starting just in January 2014, within less than 3 years, BPJS Kesehatan has successfully had a large coverage. In January 2017, BPJS Kesehatan has enrolled 172.97 million members according to BPJS official website. It is considered as the biggest single payer institution of Universal Health Coverage program in the world¹². The target is to reach 100% coverage in 2019⁸.

The rapid expansion of insurance coverage has created demand which cannot be met by current
healthcare system. Furthermore, Bredempkamp et al., state that the sudden increase of demand will disrupt the delivery of service, especially in the public hospitals. As consequence of disruption of service, the satisfaction level will be influenced. Currently, there is limited report on patients’ satisfaction to the service of BPJS Kesehatan. One study from Center for Health Economic and Policies Study from University of Indonesia shows that the satisfaction level to hospital service is 54% and the satisfaction level to doctor service is 44%. Dwidienawati & Abdinagoro (2017) in their small study also report similar result that the satisfaction rate is still below expectation. Only sixty per cent of respondent state that they are satisfy with BPJS Kesehatan service.

This study is aiming to find out the satisfaction level of BPJS Kesehatan in Indonesia after 3 years of program implementation.

**Literature Review**

Consumer satisfaction is seen by marketing literature originally as being an outcome resulting from the consumption experience. At present, the most dominant of the conceptual models of consumer satisfaction is disconfirmation. Satisfaction is defined as “the consumer’s fulfilment response”, a post consumption judgment by the consumer that a service provides a pleasing level of consumption-related fulfilment, including under- or over-fulfilment (Oliver, 2015). Kashyap & Sivadas (2012) define satisfaction as consumer positive affective response to relationship exchange.

Newsome & Wright (1999) state that consumer satisfaction is at the very core of marketing theory and practice. Ramsaran-Fowdar (2008) further argue that retaining customers may be more profitable than attracting new ones, dissatisfied customers may lead to unfavorable behavior intentions such as negative word of mouth, doing less business or switching to alternative service provider

In healthcare, Roberts & Reich (2002) argue that patients’ satisfaction is an important indicator to evaluate the achievement of public service system. Investigating public satisfaction is the most common way to confirm public opinion and needs for policy innovation. However, it is demonstrated that there is link exist between satisfaction and patient compliance in areas such as appointment keeping, intentions to comply with recommended treatment and medication use. The high quality clinical outcome depends on compliance, which indirectly we can say it depends on patients satisfaction. Therefore, patients’ satisfaction is also important to improve treatment outcome.

Patients’ satisfaction affects healthcare providers financially through referral and reimbursement. Patients’ satisfaction has also been linked to unsolicited complaints and medical malpractice lawsuits.

**Method**

The population of this study is all BPJS Kesehatan Mandiri members, which total approximately 61 million. Data for statistical analysis were gathered through field survey to in April-July 2018. This survey was using questionnaire as instrument.

The survey was administered in five big cities on Java Island, Indonesia. The survey was designed to elicit the post-consumption judgement of BPJS Kesehatan providers (medical professionals and hospital staff). They were asked to self-rate the customer satisfaction from BPJS Provider services. Six hospitals in five big cities in Java Island were targeted. Six hundred and thirty-five questionnaires were distributed. Sample collection used the convenience sample collection method, due to time and resource limitations.

**Measures**

The survey explored respondents’ judgments of customer satisfaction. In the survey, respondents were asked to rate their level of agreement with particular items using a 6-point Likert scale anchored with strongly disagree and strongly agree. Mid-point is omitted to avoid social desirability bias.

Customer satisfaction was measured using three indicators modified from Carr (2007) and Kasyap & Sivadas (2012). The questionnaire was taping the respondent evaluation on satisfaction of interaction, support, and service.

**Measurement model**

Data from returned questionnaire was compiled and then analyse to find out the descriptive analysis of customer satisfaction. The measurement for latent variable customer satisfaction was analysed with LISREL.
Result

From six hundred and thirty-five questionnaires distributed, 100% questionnaires were returned. Since the evaluation is about post-consumption judgment of satisfaction, therefore all questionnaires returned underwent first screen which is that they confirm that they have min 3 interactions with BPJS Kesahatan provider and second screening is about missing data. From screening result there were three hundred twenty-eight questionnaires were included into the analysis. In other words, we can say that the sample size is three hundred twenty-eight.

Table 2 showed that 3 indicators used in this study to measure customer satisfaction were valid (SFL >0.5 and t-value >1.96), reliable (CR>0.7 and VE>0.5) and the model was in good fit (all GOFI criteria were met).

Table 3. Satisfaction Rate of each Indicator and Overall Satisfaction

Almost all respondents agreed that they were satisfy with interaction (94%) with healthcare providers. Ninety-five per cent of respondents agreed that they were satisfy with the support given by the staff of healthcare providers. Regarding the service ninety-four per cent agreed that they were satisfy.

**Discussion**

Patients’ satisfaction is an important indicator to evaluate the achievement of public service system\(^9\). Investigating public satisfaction is the most common way to confirm public opinion and needs for policy innovation. However, patient satisfaction has another important role rather than just indicator of program achievement. Newsome & Wright (1999)\(^7\) stated that patient satisfaction will influence the compliance and participation to treatment. Therefore, patients’ satisfaction is also important to improve treatment outcome\(^3\).

BPJS Kesehatan is a very important healthcare program for Indonesian. It give patients access to treatment without jeopardize their financial status. However, due to the rapid expansion, the service quality might not be able to catch up with the increasing number of patients. That will lead to lack of customer satisfaction.

The result of this study showed however, that the satisfaction level of BPJS service is quite good. More than ninety per cent respondents agreed that they are satisfy with interaction, support and service of healthcare provider. This result is different with showed by Thabrany (2016)\(^13\) and Dwidienawati & Abdinagoro (2017)\(^2\) that BPJS Kesehatan service is still not satisfying.

The reason behind the high rate of satisfaction is the profile of the hospitals. Table 1 showed that in this study only fifteen-point five percent respondents were from public hospitals, the rest were from private hospitals. When analyzed separately, it was shown that the satisfaction rate in the public hospitals was not as high as in the private hospitals. The satisfaction for interaction was only ninety per cent. As for satisfaction for support and service was only eighty-eight per cent.

Healthcare industry is a heavy regulated industry with so many procedures to follow. Especially in private hospitals which are very competitive. They have to set a good standard not only how to ensure the outcome of treatment but also how they treat their patients. The staff of the private hospitals have to act and communicate to patients in certain way. Healthcare staffs are well trained. How patients rate them is important. Some hospitals even implement the customer survey and use the rating result as part of performance appraisal. Therefore, the way they treat and communicate with patients can be expected as polite and respectful. The follow up interview conducted to BPJS patients confirmed that the reasons patients choose to go to private hospitals for BPJS service because the healthcare professional who treat them were polite and friendly.

**Conclusion**

This paper sought to explore the satisfaction rate of patients to BPJS Kesehatan service provider. Patient satisfaction evaluation is important because it is not only
as an important indicator to evaluate the achievement of the program but also it is important to improve treatment outcome.

The result of the study showed that patients are satisfy with the interaction, support and services provided by BPJS Kesehatan pasien. This study result is different with the pervious study by Thabrany (2016) and Dwidienawati & Bramantoro (2018) which showed lower satisfaction rate. In this study satisfaction rate was ninety-four per cent. The explanation because of the different of hospitals profile. In this study eighty-five per cent of respondents are from private hospitals. Yet, due to competitive nature, private hospitals are known to have better standard compared to public hospitals.

To confirm the result of the study, further study which involved more balance public and private hospitals and big cities and small cities should be done to compare the satisfaction rate from each type of hospitals and cities. Further study to identify which variable of satisfactions are more influencing is also needed to identify are of improvement of BPJS Kesehatan services.

The managerial contribution will be giving the insight to BPJS Kesehatan that the current health care provider service especially from private hospitals is satisfying. With that insight, BPJS Kesehatan needs to put some effort to involve more private hospitals in giving services to BPJS Kesehatan patients. It will help increasing the access to treatment and helping government spends less build new public hospitals.

Abstract

“Social competence refers to the abilities to understand others’ perception, emotions, feelings and attain social cues, understand other people goals and motivation and complex situation and resolve the social conflicts” (Osman, 2001). “Parenting refers to “the perceptions of the individual (perceived parenting) on one’s own feeling as to how one is brought up by one’s parents. It refers to the role of mothering, fathering and parenting as a whole” (Bhardwaj, 1998). The present study was undertaken to find out social competence of secondary school students and to analyze its relationship with their parenting. The study included 200 secondary school students (100 students from each type of school i.e. Government and Private schools, out of 100 students (50 male students and 50 female students). The study revealed that male and female students possessed similar social competence and had similar parenting. Significant positive relationship was found between social competence of secondary school students with parenting.

Keywords: social competence, parenting, secondary school students

Introduction

Social development has been acknowledged as a crucial factor for the holistic development of an individual. The first social experiences are lived and gained by the child in the family. From the interaction within the family, child learns how to behave with people around, how to cope with the varied situations and problems that are likely to come across. The significance of social interactions in human development has been acknowledged by various developmental theories since early twentieth century with the dawn of formal study of social competence. Several researches reported that social competence was associated with children’s mental health and adjustment in future, while social incompetence in childhood was associated to maladaptive outcomes in adulthood. In fact the kind of experiences gained in the childhood period unfolds itself during the later stages of development. A socially competent person proves a valuable asset not only to himself/herself but also to the society. Social competence can be protective against abnormal behaviours, depression and behavioural disorders among adolescents. Social competence is critical for success in life as it enables an individual to know about ‘what’ and ‘how’ of varied situations and thereby enables him/her to make right choices.

Social Competence

Social Competence, though an elusive concept, in simple words, means to be able to get along with other people i.e. one’s ability to establish, sustain and develop constructive social relationships with other people. Indeed, “how well an individual interacts with others can be looked at in terms of his or her social competence”. Bandura pinpointed that “individuals can choose to apply a variety of problem solving skills and strategies in problematic social situations”. He stated “social competence as the effectiveness or adequacy with which an individual is capable of responding to various problematic situations which confront him”. In 1977, according to Bandura, “social competence is the ability to emit both positively reinforcing behaviour towards others and to avoid emitting behaviour that involves punishment.” In the words of social competence is an “effective response
of the individual to specific life situations.” Gresham in 1981 acknowledged “adaptive behaviour”, “social skills” and “peer acceptance” as sub-domains of social competence. According to “social competence includes both verbal and nonverbal behaviour that are socially valued, so social competence includes children’s social skills, self-confidence, social awareness and it also refers to the abilities to understand others perception, emotions, feelings and attain the social cues, understand other people goals and motivation and complex situation and resolve the social conflicts”.

Social competence is an assemblage of knowledge, understanding, skills and emotional responses present within the individual in diverging degrees and that interact differently as per the demand of the situation. “Social competence, comprises of six categories of behaviour, viz. social values, self-identity, interpersonal skills, self-regulation, and planning, organizing and decision-making and cultural competence”. According to “social competence can be seen as protective factor against loneliness in children”. found that affectionate, respectful home environment as vital for inter communication skills and social competence developmentin gifted students. found higher social competence among adolescent girls whose mothers possessed authoritative and permissive parenting style, while supportive role of mothers was found more effective for social competence performance. Furthermore, various researches suggested that social incompetence in children in certain areas of social knowledge and skills can be improved through coaching or training.

Parenting

Family is a fundamental psychosocial environment, where through interaction with parents, family members, caregivers that an individual gradually acquires social skills. In the words of “family is the first social environment and one of the main social institutions that affects development of self-esteem and internal control in an individual”. found that adolescent’s social competence is derived from their experience of close relationships within their family. According to Chan (n.d.), “parenting is not only limited to the concerned couple but all the family members since the birth of a child affects the whole family” further Chan also pinpointed that “parenting has become a choice in life due to the advancement in medical knowledge and technology; it is a life-long commitment and involves responsibility of providing good care to children”. Parents play a significant role in assisting youngsters identify and cultivate satisfying relationships and live a well-adjusted life in society. defined “parenting as the process or the state of being a parent”. defined “parenting as the process of developing and utilising the knowledge and skills appropriate to planning for, creating, giving birth to, rearing and/or providing care for offspring.” “Parenting is the style of child upbringing, refers to a privilege of responsibility of mother and father, together or independently to prepare the child for society and culture, which provides ample opportunity to a child to find roots, continuity and a sense of belonging and also serves as an effective agent of socialization”. Parenting refers to “the perceptions of the individual (perceived parenting) on one’s own feeling as to how one is brought up by one’s parents. It refers to the role of mothering, fathering and parenting as a whole. The two distinctive roles of parents include both mothering and fathering. A child bestows on both mother and father together independently, the responsibility of upbringing him/her. reported maternal parenting as predictor of child’s emotional adjustment, and parental parenting as predictor of child’s academic achievement. While Forehand and suggested that since fathers are less available and less involved as compared to mothers, so fathers parenting is more importance to children. found that perceived paternal parenting had significant impact on social competence of children. Baumrind, in series of studies in (1967, 1971, 1978, 1989, 1991), identified “three approaches to parenting, viz. Authoritative, Authoritarian and Permissive”. Further these approaches consisted of varied combinations of responsiveness, demanding-ness and autonomy granting, and were useful in understanding the behaviours of caregivers and how it related to children’s outcomes. Later, the initial description of parenting styles by that is “authoritative”, “authoritarian” and “permissive” was reconceptualised and a fourth parenting style, ‘rejecting-neglecting’ was added, introduced two key elements of parenting, “parental responsiveness” and “parental demandingness”. reported a model of parent–child socialization and focused on three roles taken on by parents, viz. “child’s interactive partner”, “a direct instructor”, and “a provider of opportunities for the child”. Through these varied roles the parents assist the child to begin and sustain social relationships; educate and guide the child with respect to social, cultural and moral norms and dealing varied social situations; and
deal and regulate the child’s social experiences beyond the family also.

Despite much debate and discussion regarding the conceptualization of parenting, now in the light of various researches, it has been emphasised whether these parenting styles in actuality capture the contextual and group variations, and these concerns has led to the creation of “domain specific models”, more flexible and situation specific. Several researchers have reported that supportive parental interactions and practices develop social skills, like emotion recognition, self-regulation, more self-esteem and social behaviours in adolescents that contribute in social competence. Research outcomes show that parenting style play a vital role in developing social competence in children associated higher parental monitoring and parent–child closeness and caring with being more socially competent. Several researches have reported that supportive parental interactions and practices develop social skills, like emotion recognition, self-regulation, more self-esteem and social behaviours in adolescents that contribute in social competence. Several researchers have reported that supportive parental interactions and practices develop social skills, like emotion recognition, self-regulation, more self-esteem and social behaviours in adolescents that contribute in social competence. Research outcomes show that parenting style play a vital role in developing social competence in children associated higher parental monitoring and parent–child closeness and caring with being more socially competent. Reported that children exhibited more prosocial behaviour, whose mothers showed authoritative parenting as compared to those whose mothers showed permissive parenting. found that involvement of parents plays an important role in student’s academic and social success. Several researchers have reported that effectiveness of parenting varies with culture and society. claimed authoritative parenting to be most favourable for both children as well as adolescents across cultures and contexts. In European American context, authoritative parenting aids teenagers to develop greater social competence. On the contrary, found permissive parenting to be associated with greater social competence. However, few research studies by pinpointed mixed findings, where both authoritative and authoritarian parenting in Asian American context were found to be related to lesser depressive signs and behaviour problems. Similarly, a few researches in the Asian context linked authoritative parenting with better development of social competence. So in order to substantiate the research findings, it is imperative to discern how parenting can influence social competence. Thus, present study was undertaken to fulfill the below given objectives.

**Objectives**

1. To explore the social competence and parenting of secondary school students.

2. To compare of male and female secondary school students with respect to social competence and parenting.

3. To find out the relationship between social competence of secondary students and their parenting.

**Hypotheses**

1. There exists no significant difference in social competence of male and female secondary school students.

2. There exists no significant difference in parenting of male and female secondary school students.

3. There exists no relationship of social competence of secondary school students with their parenting.

**Method and Procedure**

The present study employed descriptive survey method. The collection of data was done from male and female students studying in four schools (two Government and two Private) of Jalandhar district of Punjab, by using the technique of simple random sampling. A sample of 200 secondary school students (100 students from each type of school, i.e. Government and Private, out of 100 students, 50 male students and 50 female students) were selected randomly. For the collection of data, two psychological tests were used, one was “social competence scale” and the second tool, “parenting scale” by R.L. Bhardwaj. In order to find out the current status in terms of social competence and parenting of school students, Mean and standard deviation were calculated, while for testing significance of difference between means of social competence and parenting, t-test was applied. Further to analyse relationship between social competence of school students with parenting, correlation was calculated.

**Results and Discussion**

Results relating difference between mean scores of male students and female students in social competence

...
TABLE1: MEAN SCORES OF SOCIAL COMPETENCE OF MALE AND FEMALE STUDENTS

<table>
<thead>
<tr>
<th>Variable</th>
<th>Gender</th>
<th>N</th>
<th>Mean</th>
<th>SD</th>
<th>t-value</th>
<th>Level of Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Social competence</td>
<td>Male</td>
<td>100</td>
<td>176.8</td>
<td>27.12</td>
<td>0.261</td>
<td>Insignificant</td>
</tr>
<tr>
<td></td>
<td>Female</td>
<td>100</td>
<td>177.7</td>
<td>21.25</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A look at the above Table 1 reflects mean scores and standard deviation of social competence of male students and female students. Further, t-value calculated with regard to social competence of male and female students was found to be insignificant. It can further be explained that male and female students possessed similar social competence. Keeping in view above findings, hypothesis no.1 i.e. “there exists no significant difference in social competence of male and female secondary school students” is thus accepted.

Results relating difference between mean scores of male students and female students in parenting

TABLE2: MEAN SCORES OF PARENTING OF MALE AND FEMALE STUDENTS

<table>

<td>732.0</td>
<td>74.29</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A look at the above Table 2 reflects mean scores and standard deviation of parenting of male and female secondary school students. Further, the t-value calculated with regard to parenting of male and female students was found to be insignificant. It can further be explained that male and female students had similar parenting. Keeping in view above findings, hypothesis no.2 i.e. “there exists no significant difference in parenting of male and female secondary school students.” is thus accepted.

Results pertaining to relationship of social competence of secondary school students with their parenting

TABLE3: SOCIAL COMPETENCE OF SECONDARY SCHOOL STUDENTS WITH THEIR PARENTING

<table>
<thead>
<tr>
<th>Variables</th>
<th>Social Competence (N=200)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parenting</td>
<td>0.716</td>
</tr>
</tbody>
</table>

The above Table 3 exhibits the relationship of social competence of secondary school students with their parenting. The result showed that the calculated value of correlation of social competence of students with parenting is positive. This indicates that if secondary school students have better parenting as whole, then students are likely to show better social competence. Thus, there exists a positive relationship of social competence with parenting. Keeping in view the above findings, hypothesis 3, namely, “there exists no relationship of social competence of secondary school students with their parenting pattern.” is thus rejected.

Conflict of Interest: Nil

Source of Funding: Self

Ethical Clearance: IJRISE Journal Reviewer Committee

Conclusions

Male and female secondary school students did not differ significantly with respect to social competence. Male and female secondary students possessed similar social competence.

Male and female secondary school students did not differ significantly with respect to parenting. Male and female secondary students had similar parenting.

Significant positive relationship was found between social competence of secondary school students with
If secondary school students have better parenting as whole, then students are likely to show better social competence.

Approach to Design Cardiac, Blood Pressure Body Temperature Monitoring Analyzer

Jayant Y. Hande¹, Suhas Kakde¹, Jayant Dorve¹

¹Assistant Professor, ETC Dept., P.J.L.C.E Nagpur (MS), India

Abstract

This paper describes the development of a system capable of biometric recognition health monitoring was design and implementation. The body Temperature, Pressure and Heart Beat was prepared as an information resource for person. A basic understanding of the thermal sciences is necessary for the Heat Transfer, Pressure and Humidity. The paper consists of sensors which measures heartbeat and body temperature of a patient which is controlled by the microcontroller. The information provide a foundation for applying engineering concepts. This knowledge will help personnel more fully understand the impact that their actions may have on the safe and reliable operation of facility components and systems.

Keywords: Body temperature, Biometric, Cardiac, Humidity

Introduction

Since the dawning of the age of electronics, countless attempts have been made to convince the medical profession of the advantage of amplifying hearts sounds with the idea that if the sound level could be increased a greater diagnostic capability might be achieved. The heart sound heard by the physician through his conventional stethoscope occurs at the time of closure of major valves in the heart. In an abnormal heart additional hearts sounds. Murmurs are heard between the normal sounds. Murmurs are generally caused either by improper opening of the vales or by opening in the septum, which separates the left and the right side of the heart. Different physicians may hear the same sound but interpret them differently. This could lead to faulty diagnosis¹.

In addition high fidelity equipment would be able to reproduce the entire fidelity equipment would be able to reproduce the entire frequency range much of which is missed by the ordinary stethoscope. The instrument that has been developed in order to utilize the entire sound spectrum with high fidelity is the digital stethoscope from heart by means of suitable hardware. The extracted signal is feed to computer to detect for abnormalities of the heart if any².

Physical Characteristic of heart sounds and murmurs:-

A normal hearts produces four separate heart sounds that occur during the sequence of one complete cardiac cycle called, second, third and fourth sound. Practically all hearts sounds and murmurs are made up of frequency between 10 and 1000 Hz.

Normal hearts sounds are quite short in duration, approximately one tenth of second for each while murmurs usually extend between the normal sounds. Murmurs are distinguished from the normal sound as they have high frequency component up to 1000Hz³.

Early detection of heart disease is very important area of research and several diagnostic methods have developed. In this article, low cost diagnostic tools which analyses the digitized sound of the heart beat is presented this could be used to detect abnormalities such as aortic and mitral stenosis and aortic regulation and rheumatic Valvular lesions. The instrument displays the heart sound and also maintains long term records of a patient for future use⁴.

Temperature:- Temperature is a measure of the molecular activity of a substance. The greater the movement of molecules, the higher the temperature. It is a relative measure of how “hot” or “cold” a substance is and can be used to predict the direction of heat transfer.
For an overview and comparison of these sensors, “Temperature-Sensing Technologies”, of these technologies, the platinum RTD temperature sensing element is the most accurate and stable over time and temperature. RTD element technologies are constantly improving, further enhancing the quality of the temperature measurement (see Figure 1). Typically, a data acquisition system conditions the analog signal from the RTD sensor, making the analog translation of the temperature usable in the digital domain.

This application note focuses on circuit solutions that use platinum RTDs in their design. Initially, the RTD temperature-sensing element will be compared to the negative temperature coefficient (NTC) thermistor, which is also a resistive temperature-sensing element. In this forum, the linearity of the RTD will be presented along with calibration formulas that can be used to improve the off-the-shelf linearity of the element. For additional information concerning the thermistor temperature sensor, refer to Microchip’s AN685, “Thermistors” in Single Supply Temperature Sensing Circuits. Finally, the signal conditioning path for the RTD system will be covered with application circuits from sensor to microcontroller.

Pressure:- Pressure is a measure of the force exerted per unit area on the boundaries of a substance (or system). It is caused by the collisions of the molecules of the substance with the boundaries of the system. As molecules hit the walls, they exert forces that try to push the walls outward. The forces resulting from all of these collisions cause the pressure exerted by a system on its surroundings. Pressure is frequently measured in units of lbf/in² (psi). A major application of operational amplifiers (op amps) is converting and conditioning signals from transducers into signals that other devices such as analog-to-digital converters (ADCs) can use. Conversion and conditioning are usually necessary because the transducer and ADC ranges and offsets are rarely the same. Op amp circuits are also useful in signal filtering for compatibility with ADC circuits. This article shows how to use a bridge-type transducer for measuring gas or liquid pressure, and for measuring strain in mechanical elements. A basic understanding of active and passive analog devices and their use is helpful to use this article to complete a design.

**TEMPERATURE SENSOR CIRCUIT**

**Working**

**TEMPERATURE SENSOR CIRCUIT**

**FIGURE 1:-Temperature sensing circuit**

**Temptrature Working**

The key component is the Dallas Semiconductor’s DS1621 temperature sensor. This tiny 8 pin IC needs only +5 volts to measure the temperature and to send it out via its IIC bus output. Since many IIC bus devices can be connected in parallel, three address inputs (A0, A1, A2) are provided to select one out 8 addresses the device will respond on. This way, up to 8 sensors can be connected in parallel. I have set the internal temperature sensor to address 0 and the external one to address 1. If you plan to use only one sensor connect it as address 0. Interfacing the IIC bus to the RS232 com port is a matter of adapting levels. IIC works on 0.5V signals, RS232 uses -12V .. +12V. The trick here is that, although specified for -12V .. +12V, almost all PC com port I know work equally well with 0..5V signals. This eliminates the need to raise the IIC output to RS232 levels, and the SDA data line connects directly to the PC CTS line. On the opposite way, the RS232 signals can damage the IIC inputs, so I placed voltage limiters (R1, DZ2, R2, DZ1) on the SCL clock input and SDA data input. (note that SDA is bidirectional: receives from the DTR line and transmits to the CTS line).

Since the circuit draws very little current, there is no need to add an external power supply. The +12V from the RS232 lines are conveyed to the regulator by diodes D1, D2, filtered by C1 and regulated to +5V by the LM2936-Z5. Don’t replace it with an ordinary 78L05 regulator unless you want to add an external 9V battery: the LM2936 is capable to regulate even with input voltages near to 6V, as is the case of many serial ports.
WORKING BLOOD PRESSURE

1) Transducer:
   The sound signals from the heart are converted to analog electrical signals using a condenser microphone fastened to conventional physician’s stethoscope. This is directly coupled to the chest wall of the person whose heart sound is to be recorded. The microphone presents a higher impedance, high sensitivity, low noise, weight and operates with a battery.

2) Pre-Amplifier:
   The ac voltage output of the microphone is only of the order of few mill volts and is not sufficient amplitude for signal analysis. Hence a pre-amplifier shown in the Fig-2 acts as the next stage. An amplification of about 1000 is provided in two stages. The first stage has an amplification of about 20 while the second stage has an amplification of about 50. Continuous variation the gain can be achieved through a 22 Kilo ohm potentiometer.

3) Low pass Filter:
   A second order Butterworth low pass, filter with a cut of frequency of 2 kHz is used since the frequencies interest (both abnormal and normal) file within 2 kHz. The circuit indicates the filter that has been used. The cut of frequency of the filter is given by \( f = \frac{1}{2 \times 3.14 \times R \times C} \).

Medical Applications Of Digital Stethoscope

Digital stethoscope can be used in the diagnosis of many coronary artery diseases like

Rheumatic Valvular Lesions :

Rheumatic fever is an autoimmune disease in which the heart valves are likely to be damaged or destroyed. This can be detected.

Murmur of Aortic Stenosis :

In aortic stenosis, the blood is ejected from the left ventricle through a small opening which increases the pressure to 350 mm of Hg. This causes turbulent flow which can be detected by the instrument.

Murmur of Aortic Regurgitation :

This is caused due to the damage of the valves. The sound causes a blowing murmur, which is not as high as that of aortic stenosis.

Murmur of Mitral Regurgitation :

In this case the blood flows backwards through the mitral valve during systole which produces unnecessary sounds.

Murmur of Mitral Stenosis :

The blood passes with difficulty from the left atrium into the left ventricle due to pressure difference. It produces murmur which is very weak.
Software has also been developed along with this instrument. The software can be broadly classified into three segments.

1. Acquisition routine
2. Line display.
3. Materializing user friendly interfaces.

The first major segment is the acquisition routine which digitizes and converts analog heart sounds to digital values. The algorithm involved in the data acquisition is indicated.
The second is the display segment, which does the on-line display of the heart sound. The processor displays the on-line recording as well as signals recorded earlier. In case of retrieval of recorded signal, system displays the name, age and other information of the patient stored by the user at the time of recording. In case of live signals, the system displays the name and age and information prompts the user to enter any other information to be stored along with the signal data. The third segment makes the instrument very user friendly. The interface enables three methods of configuring a signal. In the default Configuration, it enables the user to record the signal on-line and store it in a database and also retrieval of the recorded signal. In the second, standard configuration, expansion in the ratio of 1:2 and 1:4 is possible and a compression of 2:1 and 4:1 is possible. In the third, non-standard configuration, the user is free to choose the ratio to any desired value. There is no limit for compression or expansion and hence a ratio like 1:10 may produce best results particularly for analysis of abnormal signals. The heart sound of normal and abnormal subjects record using the designed digital stethoscope. Capturing Printer for Windows provides several ways to read and write to parallel ports. The most direct way is reading and writing to the port registers. Most programming languages included this ability, or at least allow you to add it. Windows also has API calls for accessing LPT ports, and 16-bit programs can use BIOS software interrupts for LPT access. In C, you can access a parallel port with the in and out functions.

This writes AAh to a Data port at 378h:

```c
unsigned Data Address=0x378;
    into Data Port;
DataPort=outp(DataAddress,0xAA);
return 0;
```

This display the value of a Status port at 378h:

```c
unsignedStatusAddress=0x379;
    intStatusPort;
StatusPort=inp(StatusAddress);
    printf("Status port = %Xh\n",StatusPort);
return 0;
```

**Applications**

1. **Multiplexing the ECG**:

   The instrument can be extended by placing the electrodes on the limbs so that ECG can also be simultaneously displayed as well as analyzed. In this method the result would be more accurate, reliable and efficient.

2. **Telephone cardiograph**:

   The most recent advancement of biomedicine, namely telemedicine, in which the digitized heart sound can be transmitted from a remote to a central hospital for consultation.

3. **Hearing the heart beat at remote place**:

   A built in speaker may be conveniently provided with the instrument, which when placed near the mouth piece of the telephone may be heard at the other end by the doctor from which he may analyses the exact condition of the heart.

**Advantages**

1. Long term recorded of the state of the heart can be maintained as a database.

2. Cost is very low

3. Easy to handle
4. Portable
5. Correct reading
6. Easy to me measurement the parameter

Academic Resilience in Relation to Educational Aspirations among International Students

Preeti Bala1, Renu Verma2

1Assistant Professor, School of Education, Lovely Professional University, Phagwara, 2Associate Professor cum Dean, Govt College of Education, Sector: 20 Chd

Abstract

The present study aimed to explore the relationship of Academic Resilience of International students with their Educational Aspirations. The study was conducted on the sample of 500 International students studying in Universities of Punjab and Chandigarh mainly. Students of five different countries namely Nigeria, Bhutan, Afghanistan, Nepal and Tanzania were taken into consideration. The results of the study highlighted significant relationship (strong positive correlation) between Academic Resilience and Educational Aspirations among International students. In terms of students belonging to different countries as well, a strong positive correlation was found between Academic Resilience and Educational Aspirations.

Keywords: Academic Resilience, Educational Aspirations

Introduction

In the past few years India has witnessed developments in many areas like industry, politics, Information technology, media and education. Although as a result of these changes every area has undergone through the process of transformation. One of the areas where this enormous change is evident is none other than Education sector. From pre-independence era to till date education sector in India has evolved to a great extent. This development in Indian education sector is evident from the fact that earlier as per the trend only Indian students used to visit foreign lands to pursue further studies, although even today this practice is in continuation but time has transformed and nowadays there are thousands of International students who visit India with a dream to pursue their education.

Academic Resilience:

Resilience in academic context is identified as student’s capability to successfully tackle with impediments, pressure and challenges in the school settings. Student face multiple problems at academic as well as social front. Those challenges and pressure may weaken their achievement and lead to dropout development in education but despite obstacles and difficult circumstance, there are student who are able to adjust with difficulties and attain high level of academic achievement and success, because they believe that successful learning is the outcome of undying efforts and positive thinking. Such type of students are termed as academically resilient students. Hence, academic resilience denotes towards the capacity to handle academic challenges, problems or failures at school and pressure out of excessive work load.

Resilient students do come across negative circumstances but they are able to overcome their opposing influence. Although this is an inbuilt strength, it can be greatly enhanced by social supports, especially the one which is provided by the teacher who while narrating any story promotes the development of coping mechanisms. These social supports help the students in their adjustment.

Educational Aspirations:

Considering the prevailing conditions in the contemporary world, education has turned into a necessity nowadays. Resultantly, gradually it has acquired an imperative place in the lives of people especially future generation. In the journey of education, people acquire essential skills and proficiencies in order to become capable of performing in a better manner in different tasks especially in the field of competition. As being highly educated, open avenues for lucrative job, provides a more respectful career, leads towards less
probability of unemployment which ultimately results into better well-being.

For the promotion as well as sustainability of economic growth and technological development, education is considered as a key element. The good remuneration and the better career are the significant economic motivation behind education. This scenario is prevalent in every culture and society therefore, the educational aspirations are integral part of every society. On the contrary, in societies with low socio-economic background, people do not support education that much. Because of increased awareness among masses, nowadays people aspire to get higher education. It is believed that student’s educational and career aspirations are the most relevant factors which determine their educational attainment in future.  

Objectives

1. To study the relationship of Academic Resilience with Educational Aspirations of International students.

   (a) To study the relationship of Academic Resilience with Educational Aspirations of International students from Nigeria.

   (b) To study the relationship of Academic Resilience with Educational Aspirations of International students from Bhutan.

   (c) To study the relationship of Academic Resilience with Educational Aspirations of International students from Afghanistan.

   (d) To study the relationship of Academic Resilience with Educational Aspirations of International students from Nepal.

   (e) To study the relationship of Academic Resilience with Educational Aspirations of International students from Tanzania.

Operational Definitions of the Terms Used:

Academic Resilience

Academic resilience is the capacity on the part of students to deal with adversities which are termed as major challenges in educational processes.

Educational Aspirations

Educational aspirations refer to condition which motivates an individual to make efforts to excel in educational field. In other words, it is a strong desire to achieve something at academic front.

Sample:

In the present study, data was collected from 500 International students from Nigeria, Bhutan, Afghanistan, Nepal and Tanzania. From each country sample of 100 students was taken.

Research Method:

As per the nature of the study, descriptive survey method was applied in the present study. In the present study null hypotheses were framed and results were verified as well as interpreted in the light of that only.

Tools:

1. Academic Resilience Scale constructed and standardized by supervisor and investigator (2017)

2. Educational Aspirations Scale (Form V) by Sharma and Gupta (1987) revalidated by investigator in 2017

Results

The variable of academic resilience consists of five dimensions namely confidence, coordination, control, composure and commitment. The analysis of correlation of academic resilience (in total as well as dimension wise) with educational aspirations for total sample has been given in the undermentioned table 1.1.
Hypothesis 1: There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students

From table 1.1, it is clearly evident that the correlation value of academic resilience and educational aspirations of International students came out as .675 which shows strong positive correlation between concerned variables. The p-value .000 is found significant at 0.01 level. In addition to this, the table value for the same was found out to be 0.088 and 0.115 at 0.05 and 0.01 level of significance, hence the hypothesis i.e. there exists no significant relationship between academic resilience and educational aspirations of International students is not retained. Hence it can be concluded that there exists a significant relationship between academic resilience and educational aspirations among International students. Positive correlation between the both variables reveal that those students who have high academic resilience have higher educational aspirations as well and vice versa. It can be inferred that generally those students who have high educational aspirations, somehow manage to face academic adversity also. High educational aspirations do not let students deviate from their educational targets even in case of academic adversities. Their high aspirations instill in them a capacity to overcome or avoid any academic setback.
Somewhat similar association has been explored in a study conducted by Chinwe (2008) in which it was highlighted that educational aspirations is significant, positive predictors of academic self-efficacy among African American male High School students.

Hypothesis 1 (a): There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students from Nigeria

Table 1.1 indicates that the correlation value regarding relationship between academic resilience and educational aspirations among International students from Nigeria came out to be .632 indicating a very strong positive correlation between variables. The p-value came out as .000 which stands significant at .01 level, whereas the table value for the same was found out to be 0.195 and 0.254 at 0.05 and 0.01 level of significance. Hence the hypothesis that there exists no significant correlation between academic resilience and educational aspirations of International students from Nigeria is not retained. It therefore, becomes appropriate to mention that there is a significant relationship between academic resilience as well as educational aspirations among International students from Nigeria. It discloses that International students from Nigeria possesses high academic resilience and educational aspirations as well.

Table 1.1 further reveals that the correlation of academic resilience with educational aspirations among International students from Nigeria came out as \( r = 0.289, p = 0.004 \) \( r = 0.411, p = 0.000 \), \( r = 0.438, p = 0.000 \), \( r = 0.401, p = 0.000 \) and \( r = 0.524, p = 0.000 \) respectively for confidence, coordination, control, composure and commitment dimension of academic resilience. All these values are significant at .01 level of significance. Further all these ‘r’ values are greater than table values, which are found as .195 and .254 at 0.05 and 0.01 level of significance. It is evident from correlation values that there exists a positive correlation between dimensions of academic resilience and educational aspirations among International students from Nigeria. The correlation between confidence and educational aspirations is weak positive correlation. It can be said that such weak positive relation may be because of the reason that at times there are certain students who because of their over confidence turn less careful towards educational plans in near future, whereas coordination, control and composure share a moderate positive correlation with educational aspirations among International students from Nigeria. Only commitment dimension of academic resilience has strong positive correlation with educational aspirations. The anticipated reason behind such result may be that Nigerian student’s diligent efforts in educational field save them from getting derailed from their academic path.

Hypothesis 1 (b): There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students from Bhutan

Table 1.1 points out towards the value of correlation between academic resilience and educational aspirations among International students from Bhutan. The ‘r’ value came out to be .777 (strong positive correlation). The p-value is .000 which stands significant at .01 level. On the other hand, the table values for the same found out to be 0.195 and 0.254 at 0.05 and 0.01 level of significance. Hence the hypothesis that there exists no significant correlation between academic resilience and educational aspirations of International students from Bhutan is not retained. Therefore, it indicates towards a significant relationship between academic resilience and educational aspirations among International students from Bhutan. The probable reason behind such results may be that in case of Bhutanese International students, their high educational vision in life, enables them to confront any academic challenge. Table 5.8 further supports that the correlation of academic resilience with educational aspirations among International students from Bhutan which came out as \( r = 0.569, p = 0.000 \), \( r = 0.526, p = 0.000 \), \( r = 0.625, p = 0.000 \), \( r = 0.599, p = 0.000 \) and \( r = 0.560, p = 0.000 \) respectively for confidence, coordination, control, composure and commitment dimension of academic resilience. All these values stand significant at .01 level. Further all these ‘r’ values are greater than table values, which are found as .195 and .254 at 0.05 and 0.01 level of significance. Correlation values indicates towards a strong positive correlation between various dimensions of academic resilience and educational aspirations among International students from Bhutan.

Hypothesis 1 (c): There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students from Afghanistan
Table 1.1 depicts the correlation value of academic resilience and educational aspirations among International students from Afghanistan which comes out to be .559. This ‘r’ value exhibits a very strong positive correlation between the mentioned variables. The p-value for the same came out as .000 which stands significant at .01 level, whereas, the table values for the same is 0.195 and 0.254 at 0.05 and 0.01 level of significance. Therefore, the hypothesis that there exists no significant correlation between academic resilience and educational aspirations of International students from Afghanistan is not retained which indicate towards a significant relationship between academic resilience and educational aspirations among International students from Afghanistan. It is anticipated that such result may be because of the reason that high educational aspirations do not let students give up their efforts even during academically challenging situations as well. A close look at table 5.8 further indicates that the correlation of academic resilience with educational aspirations among International students from Afghanistan came out as (.217, p=.000), (r=.360, p=.000), (r=.564, p=.000), (r=.367, p=.000) and (r=.386, p=.000) respectively for confidence, coordination, control, composure and commitment dimension of academic resilience. All these values stand significant at .01 level. All these ‘r’ values are greater than table values, which came out to be .195 and .254 at 0.05 and 0.01 level of significance. Therefore, correlation values indicate towards a positive correlation between dimensions of academic resilience and educational aspirations among International students from Afghanistan.

The correlation between confidence and educational aspirations is weak positive correlation. This indicates that although most of the time confidence leads to developing high aspirations in students but being a psychological construct, it may fluctuate over a period of time corresponding to changing circumstances which ultimately affects competence in educational field, whereas control dimension of academic resilience has strong positive correlation with educational aspirations which shows that resilient students remain focused in their academics. Coordination, composure and commitment share a moderate positive correlation with educational aspirations among International students. Therefore, it can be inferred that planning and continuous efforts remain vital ingredients for achieving high academic resilience.11

Hypothesis 1 (d): There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students from Nepal.

Table 1.1 points out that the value regarding correlation between academic resilience and educational aspirations among International students from Nepal came out to be .747 (strong positive correlation). The corresponding p-value came out as .000 which stands significant at .01 level. In addition to this, this ‘r’ value (.747) is greater than the table values which came out to be 0.195 and 0.254 at 0.05 and 0.01 level of significance. Hence, the hypothesis that there exists no significant correlation between academic resilience and educational aspirations of International students from Nepal is not retained indicating towards a significant relationship between academic resilience and educational aspirations among International students from Nepal. It can be inferred that high educational aspirations make International students from Nepal, academically resilient as well. Table 5.8 further supports that the correlation of academic resilience with educational aspirations among International students from Nepal which was found out to be (.625, p=.000), (r=.461, p=.000), (r=.518, p=.000), (r=.652, p=.000) and (r=.591, p=.000) respectively for confidence, coordination, control, composure and commitment dimension of academic resilience. All these values fall significant at .01 level. All these ‘r’ values are greater than table values, which came out to be .195 and .254 at 0.05 and 0.01 level of significance.

Correlation values predicts a strong positive correlation between dimensions of academic resilience and educational aspirations among International students from Nepal. It makes it comprehensible that believing in one capability, getting less effected by anxiety, remaining focussed and diligent efforts are major components for making someone academically resilient. Only coordination dimension of academic resilience has moderate positive correlation with educational aspirations. It indicates that at times International students from Nepal, may not be that efficient in educational planning which ultimately affects their academic resilience and vice versa.

Hypothesis 1 (e): There exists no significant relationship between Academic Resilience and Educational Aspirations of International Students from Tanzania.
Table 1.1 indicates that the value of correlation between academic resilience and educational aspirations among International students from Tanzania which came out to be .679 (strong positive correlation), whereas the p-value for the same, came out as .000 and found significant at .01 level of significance. In addition to this, this ‘r’ value (.679) is greater than the table values which came out to be 0.195 and 0.254 at 0.05 and 0.01 level of significance. Hence the hypothesis that there exists no significant correlation between academic resilience and educational aspirations of International students from Tanzania is not retained, indicating towards a significant relationship between academic resilience and educational aspirations among International students from Tanzania. It shows that academically resilient students have high level of aspirations in education as well. Table 5.8 further supports that the correlation values of various dimensions of academic resilience with educational aspirations among International students from Tanzania, which came out to be (r=.574, p=.000),(r=.482, p=.000) (r=.579, p=.000),(r=.516,p=.000) and (r=.481, p=.000) respectively for confidence, coordination, control, composure and commitment dimension of academic resilience. All these values are significant at .01 level. Here it is also worth mentioning that all these ‘r’ values are found to be greater than table values, which is .195 and .254 at 0.05 and 0.01 level of significance.

Conclusions

Findings of the study in hand helps to conclude that those students who have high educational aspirations, somehow manage to face academic adversity also. High educational aspirations do not let students deviate from their educational targets even in case of academic adversities. Their high aspirations instill in them a capacity to overcome or avoid any academic setback. It is assumed from results of the study that having confidence in one’s abilities, being strategy oriented and remaining academically committed helps in making students, academically resilient. In case of sample of Nigerian students, weak positive relationship was found between confidence dimension and educational aspirations. It can be said that at times there are certain students who because of their over confidence turn less careful towards educational plans in near future. In case of International students of Bhutan, high positive relationship was found between academic resilience and educational aspirations. The probable reason behind such results may be that in case of Bhutanese International students, their high educational vision in life, enables them to confront any academic challenge. Similarly, as per the results of International students from Afghanistan it was found that planning and continuous efforts are vital ingredients for achieving high academic resilience.

The Impact of Emotional Intelligence Competencies on Self-Esteem among Public Servants

Siti Sarawati Johar
Centre for General Studies and Cocurricular, University Tun Hussein Onn Malaysia, Johor, Malaysia

Abstract

Emotional intelligence is now increasingly concentrated and a place in psychology studies. Emotional intelligence is also detected can affect the self-esteem of employees in an organization. In this study, workplace issues refer to emotional intelligence and self-esteem of employees. The specific purpose of this study is to examine the impact of emotional intelligence competencies on self-esteem among employees. A total of 196 civil servants in local authorities (PBTs) was selected as the respondents. Measuring tools used in the data collection are Emotional Intelligence Self-Description Inventory (EISDI), and Rosenberg Self-Esteem Scale (RSES). The data were analysed using regression analysis. The findings show that emotional intelligence competencies have an impact on the self-esteem of employees. The most important findings are that emotional intelligence among the employees is more relevant to the more positive of self-esteem increased.

Keywords: Impact; Emotional Intelligence; Self-Esteem; Public Servant;

Introduction

Employee as a human resource is a valuable asset to every organization. The longer the service of an employee in an organization, the greater the value of the employee’s experience and expertise to the organization. The entity contributes greatly to the impactiveness of an organization as it seeks to achieve its objectives, vision and mission with excellence. Excellent organization requires excellent employees and is able to put organizations at a more flexible level of transformation. Excellent employees are high-quality and committed workers. Employees are not only expected to carry out their duties with full commitment, but also have pure values and positive behaviours and are willing to sacrifice for the organization.

Quite clearly to achieve greater glory in the public sector, it is of course the organization has a transformation for every implementation. The effort is towards a renewal application based on prioritization as a more strategic goal. Civil servants including those in PBT who are among the frontline of human resource management are required to stay close to the community and conduct more efficiently in their duties, as they become the symbol of the quality of government services. Emphasis should be placed on aspects of behavior, emotion and commitment within organizations that respond to the environment as it becomes a must in any organization. The use of human resources efficiently and impactively can increase organizational productivity and vice versa.

Ashkanasy et al., (2002) then compared the negative emotional impression to the negative, and they pay attention to positive aspects of mood closely related to the high commitment in work and for better performance. Emotion is also a factor in organizational success in the process of an employee in decision-making, transparent and open communication, ensuring customer loyalty, and teamwork. Afzaal and Taha (2012) highlighted the importance of finding new channels in implementing human resource management policies more impactively and requiring close association with the new dimensions.
Problem Statement

This study focuses on civil servants as workers in Malaysian PBT. They are also the human capital of the organization, especially because the frequency they interact with the community and the services rendered are directly and indirectly. Although various policies, systems and transformative are introduced and implemented in achieving quality of work, but there is still a gap which affects the image of the public sector.

The public sector is often faced with pressure from the community to work more proactively in improving performance and service delivery systems, including the role of the local authorities i.e. PBT. The increase made the public wonder how far civil servants can change the flaw and transformed them with the strengths that could raise the image of the organization. Previous studies also explore the impacts of emotional intelligence on self-esteem as tested in that dimensions of emotional intelligence such as dimension of Perception and Appraisal of Emotion, dimension Facilitating Thinking with Emotion dimension of understanding emotion, and dimension of Regulation and Management of Emotion able to give impact to the self-esteem of employees. This problem statement also addresses the question of the need for emotional intelligence affecting self-esteem.

This study employs the theory of Emotional Intelligence Mayer and Salovey (1990) through the Model Four Branch Emotional Intelligence Mayer and Salovey (1997); and Rosenberg’s Self-Esteem theory (1965); as the basis of the overall study. This study does not cover other emotional intelligence competencies, other self-esteem and other variables that are beyond the theory and model.

In summary, the researcher focus on this study is to examine the impact of emotional intelligence through these four competencies on the self-esteem of the PBT employees, based on the scenario and the context of the public sector in Malaysia. Therefore, based on several established theories, this study is conducted to look at the phenomena of the public sector in this country that is relevant to the current local situation.

Research Hypothesis

3.1 There is a significant impact of emotional intelligence (Perception and Appraisal of Emotion) on self-esteem.

3.2 There is a significant impact of emotional intelligence (Facilitating Thinking with Emotion) on self-esteem.

3.3 There is a significant impact of emotional intelligence (Understanding Emotion) on self-esteem.

3.4 There is a significant impact of emotional intelligence (Regulation and Management of Emotion) on self-esteem.

Hifsa (2013) in his study also found that there was a significant relationship and impact of emotional management competence on the self-esteem of respondents in Pakistan. Past studies have shown that there are significant relationships and impacts of some emotional intelligence competencies over the self-esteem of respondents. Neerpal and Renu (2009) studies found significant positive relationship between emotional intelligence and self-esteem. With the examples of the findings above, the researcher builds a hypothesis to test how far the competence of emotional intelligence can affect the self-esteem of employees.

Methodology

Research Design

This study is a type of non-experimental study and it is a field-based and descriptive study with the use of regression statistics. Field research is somewhat relevant to be used in this study because of its reliability, while the cost of consumption is relatively low. The needs of this study are for the descriptive and hypothesis testing.
Research Location and Subject

The limitation of the respondents' survey was focused on the category of grade 22 workers up to grade 44 who were civil servants at the Local Authorities, namely the City Council covering the southern zones of Peninsular Malaysia namely in Johor Bahru and Melaka. Researcher only selected two city councils from 12 city councils in Malaysia. Since this study requires a variety of costs, the cost of the present day is high, so researcher only selects the study location in the southern zone of Peninsular Malaysia. Logistics factors can be more cost-impactive, time and energy. The focus of the study is on the state city council. The city hall, the local municipal council and the local district council are excluded as a PBT sample in this study.

Research Instrument

The Emotional Intelligence Self-Description Inventory was used to measure employee emotional intelligence at work in this study. The reliability of this instrument is .915. While the Rosenberg Self-Esteem Scale Survey is to measure the self-esteem of employees and the reliability of the instrument for this study is .794. The reliability of these two surveys has a relatively high reliability value and can be believed to be used to obtain quality research results.

This study was conducted using a questionnaire to obtain the information needed by the researcher. Thus, researcher can measure the emotional intelligence and the self-esteem among respondents. The accuracy and reliability of this study are dependent on the accuracy and reliability of the instruments used, noting all the instruments used by the researcher in this study are instruments that are already well-established and used by other researcher as well as their earlier construction are from theoretical experts.12,13

Research Result

Table 1 shows the results of the study on the impact of Perception and Appraisal of Emotion on self-esteem. The findings from the linear regression analysis show that Perception and Appraisal of Emotion statistically significant give a significant impact \[F (1, 160) = 30.413, p<.005\] to self-esteem. Perception and Appraisal of Emotion contributed 16.0% variance in self-esteem with \(R^2 = .160\). This means that Perception and Appraisal of Emotion can be regarded as a significant predictor of self-esteem and acceptance of the hypothesis of this study. It also explains that Perception and Appraisal of Emotion are significant in helping to improve and improve the self-esteem level of employees in the workplace.

Table 1: The Impact of Perception and Appraisal of Emotion on Self-Esteem

<table>
<thead>
<tr>
<th>Variable</th>
<th>Self-Esteem</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perception and Appraisal of Emotion</td>
<td>(R^2)</td>
</tr>
<tr>
<td></td>
<td>.160</td>
</tr>
</tbody>
</table>

\(p = \text{significant at the level } < 0.005\)

Table 2 shows the results of the study on the impact of Facilitating Thinking with Emotion to self-esteem. The findings from linear regression analysis have found that Facilitating Thinking with Emotion statistically significant impacts \[F (1, 160) = 26.850, p<.005\] to self-esteem. Facilitating Thinking with Emotion contributing 14.4% variance in self-esteem with \(R^2 = .144\). This means that Facilitating Thinking with Emotion can be considered as a significant predictor of self-esteem, thus making the results of this analysis accept the hypothesis of this study. It also explains that emotional intelligence competencies which is Facilitating Thinking with Emotion are significant in helping to increase positively self-esteem of employees at the workplace.

Table 2: The Impact of Facilitating Thinking with Emotion on Self-Esteem

<table>
<thead>
<tr>
<th>Variable</th>
<th>Self-Esteem</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facilitating Thinking with Emotion</td>
<td>(R^2)</td>
</tr>
<tr>
<td></td>
<td>.144</td>
</tr>
</tbody>
</table>

\(p = \text{significant at the level } < 0.005\)

The results of the study on the impact of Understanding Emotion on self-esteem are shown in table 3. Linear regression analysis shows that the competence dimensions of Understanding Emotion statistically give a significant impact \[F (1, 160) = 27.525, p < .005\] to self-esteem. Emotional understanding contributes as much as 14.7% of variance in self-esteem with \(R^2 = \)
Therefore, Understanding Emotion can be regarded as a significant predictor of self-esteem, as well as the result of this analysis can accept the hypothesis of the study because Understanding Emotion is an important and significant in helping to increase self-esteem of employees at the workplace.

Table 3: The Impact of Understanding Emotion on Self-Esteem

<table>
<thead>
<tr>
<th>Variable</th>
<th>Self-Esteem</th>
</tr>
</thead>
<tbody>
<tr>
<td>Understanding Emotion</td>
<td>R^2  F Value</td>
</tr>
<tr>
<td></td>
<td>.147</td>
</tr>
</tbody>
</table>

p = significant at the level < 0.005

The results of linear regression analysis (table 4) found that statistically significant Regulation and Management of Emotion had significant impact [F (1, 160) = 47.124, p < .005] to self-esteem. Regulation and Management of Emotion contributed 22.8% of variance in self-esteem with R^2 = .228. This means that Regulation and Management of Emotion can be regarded as a significant predictor of self-esteem as well as accepting the hypothesis of this study. It can also be explained that employee Regulation and Management of Emotion is significant in helping to increase self-esteem of employees at the workplace.

Table 4: The Impact of Regulation and Management of Emotion on Self-Esteem

</thead>
<tbody>
<tr>
<td>Regulation and Management of Emotion</td>
<td>R^2  F Value</td>
</tr>
<tr>
<td></td>
<td>.228</td>
</tr>
</tbody>
</table>

p = significant at the level < 0.005

**Discussions**

Several past studies agree that emotional intelligence has significant positive relationships and impacts on self-esteem among workers\(^1\,^2\,^8\,^15\). While some previous studies have also focused on certain emotional intelligence competencies in evaluating their impact on self-esteem of employees toward the organization\(^9\,^20\). The results show that the ability to control and manage their own emotions and others also enables employees to be more positive in viewing and accepting their own deficiencies and advantages as well as others. Even workers are aware of uncontrolled emotional impacts that may cause their self-esteem to be negative. The ability of employees to regulate and manage their emotions can also help strengthen their estimates when employees can reduce their negative emotions and improve their positive emotions\(^3\).

When viewed from the impact of the influence of emotional intelligence through these four competencies on the self-esteem of the workers, it appears that these four competencies also show a significant impact on self-esteem at the workplace. The four competencies were Perception and Appraisal of Emotion (R^2 = .160, p < .005) with the contribution of variance in the self-esteem of employees by 16%. Facilitating Thinking with Emotion (R^2 = .144, p < .005) with the contribution of variance in self-esteem of employees is 14.4%. The amount of this variance also illustrates this contribution also plays an important role in influencing self-esteem of employees. Third competence is an Understanding Emotion (R^2 = .147, p < .005), with the contribution of variance in self-esteem of employees by 14.7%. While the last competence was Regulation and Management of Emotion (R^2 = .288, p < .005) with the contribution of variance in self-esteem of employees by 22.8%. For this fourth competency decision it was found that it was in line with the findings of Shohreh’s (2012) study, when his study also found a significant impact of the dimensions of social skills comprising emotion control and management, to the self-esteem of employees at the workplace\(^20\).

Positive emotions are closely related to self-esteem as it involves the way employees see and evaluate themselves based on other people’s judgments and past experiences. The benefits are not only focused on individual workers, but also provide positive waves for organizations where positive employees can provide motivation and inspiration to their friends and are able to handle conflicts in the organization. A combination of positive emotional intelligence and self-esteem leads to dynamic work behaviours in the workplace. This is in line as well with what James (1994) said that humans should always be interested in helping themselves and the people around to share their own high estimate when respecting fellow human beings created a more
Conclusion

It can be concluded that employees with high emotional intelligence are capable of consistently in a positive mood and achieve a high self-esteem as they can understand and control emotional influences rather than negative situations\textsuperscript{12,13}. It needs to be helped with the strength in emotional intelligence competencies involves the high self-esteem. Emotional intelligence should also be tailored to the needs of the function as an employee in order to make the employees more emotionally stable and positive, thus making the work better in quality. Plus, there is a significant self-esteem function in the organization. In summary, emotional intelligence is found to be able to influence the level of self-esteem among employees.

Definitions of Disruptive Behaviour by Secondary School Teachers of Brunei Darussalam

Fathimath Muna
Universiti Brunei Darussalam

Abstract

This paper reports on an investigation into teachers’ definitions of disruptive behaviour among young adolescents in Brunei Darussalam. A qualitative approach was applied in this study. By utilizing purposeful sampling method, a total of six teachers teaching Year 8 and Year 9 of three different public secondary schools were selected. A semi-structured interview guide was conducted for individual teachers to elicit information on the definitions of this phenomenon. The findings revealed that this particular group of teachers (in these three different schools) defined disruptive behaviour as shouting, drumming, singing, sleeping, not doing the work, inattentiveness, not following rules, disturbing other students and being aggressive. The implications of the findings of this study for teachers, researchers and further research are discussed.

Keywords: Disruptive Behaviour; Teachers’ Definition; Secondary School; Young Adolescents; Qualitative Study.

Introduction

Teachers daily face challenges in managing the young adolescents’ behaviour that exist in contemporary classrooms despite the efforts to create a conducive learning environment for all. Disruptive behaviour among young adolescents in secondary schools is a major issue across the globe and occurs at all levels of schooling. In most countries the concern of disruptive behaviour and research focus is mainly on secondary schools as none other than this level of schooling has experienced more and major rise in disruptive behaviour. Although this phenomenon is experienced by nations, the types of behaviour and the prevalence of it vary as each nation differs in terms of their social and cultural environment.

Most existing research on teachers’ perceptions on disruptive behaviour in secondary schools are from Western and European societies, such as Scotland, United Kingdom, Spain, Greece, Australia, New Zealand and the United States of America. The extent and nature of student disruptive behaviour may be different in these countries compared to Brunei Darussalam, an Islamic nation with a small population. The aim of this paper is to explore the definitions of disruptive behaviour among young adolescents as perceived by secondary school teachers in Brunei Darussalam.

The term “disruptive behaviour” was used in this study as any behaviour that is sufficiently off-task in the classroom, as to distract the teacher and / or class peers from on-task objectives.

Literature Review

There is an array of literature on disruptive behaviour among students in secondary schools. In the literature, different terminologies have been used to refer to disruptive behaviour of students. For example, misbehaviour, challenging behaviour, inappropriate behaviour, aggressive behaviour and so on. Nevertheless, all these terms encompass students’ unacceptable behaviours that distract the teaching and learning process.

In the study of disruptive behaviour by Lawrence, Steed, and Young (1984), it was found that for one respondent the disruptive child was simply “the one who does not follow the rules of the school and its order… it (disruptive behaviour) includes pupils who lack
understanding or acceptance of the norms of behaviour towards teachers or other pupils, who disregard printed and unprinted rules”. Another respondent identified three victims: the disrupter himself, the teacher and other pupils. The study revealed that there was good agreement on the definition of disruptive behaviour - it depends on perception; it departs from the norm and it has bad consequences.

Merrett and Wheldall (1984) defined disruptive classroom behaviour as an activity that interferes significantly with a student’s own learning, interferes with another student’s learning or responses, interferes with the teacher’s ability to operate effectively, or any combination of these. It is interesting to note that these three have been identified as the victims of disruptive behaviour in Lawrence et al., (1984) study. In a study conducted by Grieve, (2009) showed that there were discrepancies between what teachers in the various schools considered to be inappropriate behavioural issues. Behaviours described included violence and lower level of disruptive behaviour that occurs on a day-to-day basis, such as talking out of turn, lack of attending to tasks, or failing to follow instructions.

It is clearly known from the literature review that teachers commonly report talking out of turn, as the most problematic and most frequent disruptive behaviours. It seems that research focused on student behaviour problems has consistently found that, generally most of the behaviours that teachers find difficult are relatively minor, but high in frequency which makes classrooms disruptive. Teachers frequently report high levels of concern for student behaviour, although there is often high variability between research findings. Arbuckle and little, (2004) study showed that teachers’ main concerns were related to distractibility, student on-task behaviour, and adherence to classroom rules. Another study conducted in Hong Kong by Sun & Shek (2012b) on Chinese schools’ teachers’ defined “problem behaviours” as doing something in private, talking out of turn, verbal aggression, disrespecting teachers, nonattentiveness / daydreaming / idleness, sleeping, habitual failure in submitting assignments, and out of seat.

The behavioural problems may lead to aggression and students may become hostile to teachers or their peers. In Shireen and Malik (2015) study, it was found that students taunt, argue and pass rude comments to teachers. Boys use abusive and foul language, make groups or “Gangs” and there are clashes between these groups of students. Similarly, Verbal aggression (including attacking classmates, quarrelling with classmates, speaking foul language, teasing classmates, and gossiping) and physical aggression (including striking, attacking and pushing classmates, and destroying things) were also reported in Sun & Shek (2012a, 2012b) studies as problem behaviours.

**Methodology / Materials**

A qualitative approach was adopted for this study to find answers for the research questions because qualitative methodology is a means for exploring and understanding the meaning individuals or groups ascribe to a social or human problem (Creswell, 2014).

**Participants**

Purposeful sampling method was utilized for both selecting schools and teachers. Three public secondary schools were selected based on the prevalence of disruptive behaviour issues in these schools. In each school, two teachers (local Bruneians) who had experiences of teaching and presently teaching to Year 8 and Year 9 were selected as participants. In total, six teachers (two males and four females) participated in this study. All the teachers were coded T1-T6, respectively.

**Instruments**

A semi-structured interview guide (self-constructed) was used for each participant. In the interview guide as well as during the interview, further questions, prompts and probes were done to explore the participants definitions. The participants were asked to define “disruptive behaviour” based on their understanding and perception of these behaviours. The question was:

1. Based on your understanding and experiences, can you please define “disruptive behaviour”?

**Data Analysis**

Data was analysed using qualitative analysis techniques as a step by step process. The interview transcripts were read many times to get the whole idea of what it conveys. After reading, the six transcripts were compared to identify the similar words and phrases that formed meaningful text segments. These segments were assigned with many codes, these codes were reduced
by grouping the similar ones. The similar codes were aggregated together to form four major themes. The four major themes derived from the data are presented in the following section.

**Results and Findings**

The four themes that emerged were; (1) Preventing other students from learning (2) Behaviours that disrupt the class (3) Not following rules and (4) Verbal & physical aggression towards teachers, students and school property.

*Prevent Other Students from Learning*

Most of the teachers defined disruptive behaviour as when a student does a behaviour to deviate the rest of the students in carrying out their assigned tasks. As T1 illustrated:

“…when we are doing group and everything then one student…steer away…friends from the discussion and then talk about something else” (T1).

She further explained by giving an example:

“…I had one student…while writing...we were doing work then she started shouting and singing…disturbing their friends…every time” (T1).

Another two teachers remarked:

“being winding, move around, disturbing others, speaking up loud…” (T2).

“… the student will continuously do the same behaviour every day and disturbing their friends…” (T3).

*Behaviours that Disrupt Class*

One teacher stated a list of varied behaviours in the following narrative:

“…they are disrupting to class, they make noise, they walk around the class while we are teaching…they are shouting, they are drumming, they are singing…what else? they are screaming, they stand on the bench and jump to another bench” (T4).

Another teacher described the phenomenon as “inattentive ones”.

“…the inattentive ones, example for the one that are sleeping in class…that gives no attention in class. I mean they play around and then talking around”, (T5).

Another teacher talked about a lot of noises made by students.

“… they make a lot of noises in the class; they don’t want to learn…” (T3).

*Not Following Rules*

Teachers described that not following the teachers rule or the instructions define disruptive behaviour in a simpler way.

“In general, for me, is someone who cannot follow my rule not according to what I want. It could be kind of student that does not listen to what I want or listen to what I instruct them to do. That’s it”.

Similarly, another two teachers mentioned that:

“when the teacher warns them…scolds them…give them advice, the student will not listen to the teacher” (T3).

“…students not doing their work…given the time…” (T2).

*Verbal and Physical Aggression Towards Teachers, Students and School Property*

Teachers reported students exhibiting verbal and physical aggression and damaging school property as disruptive behaviours.

T3 described that:

“from my understanding it’s aggressive, the students are aggressive…they will damage the tables, the school properties and their friend’s belongings…then fighting of course, they have a gang, they have a group and then when they are having a fight over a small misunderstanding, they will bring all their group, their gang then together they have a fight”.

Another teacher commented that:

“saying vulgar, using vulgar language and they certainly would just be aggressive way aggressive towards other students even to myself,” (T2).

**Discussion**

This study aimed to find out the definitions of disruptive behaviour among young adolescents in Brunei
Darussalam from a group of secondary school teachers. As an act of behaviour which prevented others from learning included distracting others from their work by singing, shouting, talking about something else (not related to the discussion) and disturbing other students. Similar findings were revealed in Wheldall et al., (1988) study where disturbing or hindering other students were identified as one of the most troublesome behaviour problems. Furthermore, these behaviours demonstrated that not only the student who exhibit these behaviours are affected but other students are also involved directly or indirectly in these disruptive situations and impact not only the students but the teachers as well (Gasa, 2012; Lawrence et al., 1984). Different types of classroom behaviours were mentioned by the teachers as behaviours that disrupt the class including making a lot of noises, walking / playing around the class, drumming, screaming, stand on the bench and jump to another bench, sleeping, speaking up loud and inattentiveness. Most of these disruptive behaviours identified are similar to those reported in previous studies. Such as inattentiveness and sleeping in study 34.

Students not following the rules, be it classroom or school rules were a concern of teachers and identified as a disruptive behaviour. Teachers described students not listening to what the teacher instruct them to do, not doing their work and not listening to the teacher as not abiding by the classroom rules3,15. This showed that teachers would like to be in control of the classroom and to have order and discipline to create a good climate within the classroom by managing the students to pave way for effective learning to take place.

This study showed that verbal & physical aggression is disruptive in classrooms as well as within the school premises as a whole. These two types of aggressions exhibited by students have been found in other similar studies conducted in Western as well as in Asian contexts. Teachers reported students using vulgar or foul language towards teachers and other students as verbal aggressions. It was found that students showed physical aggression towards teachers. It was also found that damaging students belongings, the tables and school properties and incidence of gang fights occur in school premises. These disruptive behaviours identified in the definitions indicate that teachers have expressed what they have observed and experienced this phenomenon individually and differently in their teaching career that hinders the teaching and learning process.

**Conclusion**

This study investigated six secondary school teachers’ definitions of disruptive behaviour among young adolescents in three public secondary schools of Brunei Darussalam. The findings revealed how this particular group of secondary school teachers defined disruptive behaviour. The results of this study are similar to the existing studies on disruptive behaviour. The findings have implications for teachers, both in-service and pre-service teachers in understanding the existence of this phenomenon in the secondary schools so that they may be well prepared with effective strategies to deal with such behaviours. For researchers, it is important to look into disruptive behaviour in secondary schools from different perspectives as social reality is fluid in nature. Therefore, it is vital for future research to further explore students’ perceptions of disruptive behaviour in schools of Brunei Darussalam so that it would help to provide a more complete picture of disruptive behaviour that may reveal the student-teacher relationship which is a crucial component in creating a conducive learning environment for both teacher and students. It is important to understand the nature of these behaviours and the impact on the teaching and learning process in the classroom. It is vital for those who are keen and concerned with disruptive behaviour to discover one another’s explanations to benefit from shared knowledge so that the practices in the schools could be improved.

Obesity and Its Effect in the Mode of Delivery

Ban Amer Mousa¹, Ban Kadhim Abdul-Raheem², Asmaa Taha Abd Al Wahab³

¹Department of Gynecology and Obstetrics, Babylon College of Medicine, University of Babylon, Hilla Republic of Iraq; ²Department of Gynecology and Obstetrics, Al-Karama General Hospital; ³Department of Gynecology and Obstetrics/Abuagraib General Hospital

ABSTRACT

Introduction: Obesity is the most common health problem in reproductive age women. The obesity is a heterogeneous illness in which multiple factors interact to produce a state of positive energy balance, which leads to the increase in body weight.

Objective: To assess the effect of obesity on the mode of delivery and infant birth weight

Material and Method: A cross sectional study was conducted in the Department of OBG, Babylon Teaching hospital for Maternity and child complex from the 1st of Jun 2017 to the end of May 2018.

Results: mean age of the respondents was (27.2 ± 9.1) years. (40.4%) of the women were primigravida and (59.6%) were multigravida. (46.5%) were with NVD and (53.5%) delivered by cesarean section. 1108 of the infant were delivered with birth weight ≥4 kg and those who mother with morbidly obese were the main group (29.9%). The caesarean section is increased as the BMI was increased (18.6% for normal to 44.7 for morbidly obese). Birth weight ≥4 kg was increased as the BMI was increased.

Conclusion: Caesarean section and infant birth weight ≥4 kg were increased as the BMI of the women were increased.

Keywords: Obesity, NVD, BMI, primigravida, multigravida

Introduction

In the developed world they noticed that Obesity is hurriedly becoming one of the main health problems. Issued evaluations of obesity among women is vary from the age between 18 to 25 %.(1) World Health Organization defines obesity, in women not pregnant, depending on the index of body mass. This index is calculated from size and weight (Kg/m2) and is considered a value normal between 18.5 and 24.9. The overweight is defined as a BMI between 25 and 29.9, is considered obesity moderate (class I) between 30 and 34.9, severe (class II) between 35 and 39.9 and morbid (class III) greater than or equal to 40. Obesity can reduce the life expectancy of a person up to 10 years. (2)

It is also known that is associated with certain pathologies such as hypertension, heart disease, diabetes mellitus type 2, thromboembolisms, osteoarthritis, respiratory problems, dyslipidemia, psychosocial problems and certain cancers in addition to having a negative impact on reproductive health and during the gestational period of the woman. (3) The etiopathogenesis of obesity is complex and intervene by many factors that justify it. The progressive acquisition of Western lifestyles favors on the one hand, sedentary lifestyle; and the absence of interest in participating in some type of physical activity and the high number of hours spent sitting at work they are significant factors of obesity. For another side, both the intake and the composition of the diet play a important role in the pathogenesis of said disease. A high diet in fat, the frequent consumption of fast food and a decrease in the frequency between meals can be associated with an increase of weight. So, these bad dietary habits together with sedentary lifestyle are two of the main responsible increase in obesity in the past 20-30 years. (3)

Pregnancy is one of the periods of greater nutritional vulnerability, estimating an incidence of obesity from 6 to 28% in this era. Faced with a health problem in the pregnancy as emergent as this one, the objective set for this review is to determine in what way affects maternal obesity the course of delivery. Obesity is
associated with a series of complications in childbirth, such as pre-eclampsia (4,5) or caesarean section (5,6). As well as thrombo-embolism, congenital malformations, fetal macrosomia, maternal, fetal and neonatal death. Also premature births, hemorrhages and problems of postpartum infection are some of the many dangers that a pregnant woman with obesity runs. An excessive weight gain in the pregnant woman can lead to a delivery with complications, so the limits of this increase must be established according to the BMI before pregnancy. (7)

The different studies have described that the perception of motherhood and the birth of a child will be very different according to the course of pregnancy, the type of delivery and prenatal care and education. (8) When labor is long or becomes instrumental, the experience of women can be comparable to the recovery of a disease and can lead to difficulties in their ability to be emotionally linked to the child. (9)

Weight During Pregnancy: Pregnancy is a state of modifications Physiological causes of pregnancy and lactation and the intense growth and development of the fetus. Weight gain total currently recommended during pregnancy and according to the BMI before of pregnancy, it is suggested that it be 11 to 19 kg in twin pregnancy. Pregnant women usually win~ 1 to 2 kg in the first trimester. According the new recommended values, the normal weight women should increase ~ 0.4 kg per week in the second and third trimesters of pregnancy. Women with low weight should earn a little more (~ 0.5 kg per week) and overweight women a little less (~ 0.3 kg per week). Obese women should earn ~ 0.2 kg per week.

Prevention: It is recognized that prevention of Obesity in women of reproductive age is very important for mother health and the health of her offspring. The interventions of weight control, including pharmacological treatment in pregnant women who are obese or overweight have not had enough impact on pregnancy outcomes and childbirth, suggesting that the focus of intervention must be in the periods preconception or postpartum. (10)

Aim of the study: To assess the effect of obesity on the mode of delivery and infant birth weight.

Material and Method

A cross sectional study was conducted in the Department of OBG, Babylon Teaching hospital for Maternity and child complex for 2 years duration from the 1st of Jan 2015 to the end of Dec 2017. All pregnant women on deliveries who agreed to participate were included and BMI of them were measured.

Results

13245 deliveries were included in the current study, with mean age of (27.2 ± 9.1) years. 5357 (40.4%) of the women were primigravida and 7888(59.6%) were multigravida. The main group was in overweight in both primigravida and multigravida (table 1).

Table 2 shows that 5357 of the women were primigravida, 2488(46.5%) were with NVD and 2869(53.5%) delivered by cesarean section. 1108 of the infant were delivered with birth weight ≥4 kg and those who mother with morbidly obese were the main group (29.9%).
For those with multigravida it has been found that normal vaginal delivery were decreased as the BMI of the women was increased (81.4% of those with normal BMI with normal vaginal delivery and this decrease to 55.3% for those with morbidly obese). And the caesarean section is increased as the BMI was increased (18.6% for normal to 44.7 for morbidly obese). Birth weight ≥4 kg was increased as the BMI was increased (Table 3).

Discussion

Many previous studies have noted higher rates of labor induction and induction failure in obese women, and therefore, extremely high rates of cesarean delivery. The results of present study support these previous findings. In fact, the rate of cesarean delivery in our study for women undergoing labor induction was (39.4%), which is in agreement to that found in Subramaniam A et al, (18) (2014).

The current study revealed that as the BMI were increases from normal weight, so the increase in the possibility of a caesarian section for both primigravid and multigravid women were reported. This is same that found by Lynch C et al, (1) (2008). The primi women with morbidly obesity, we noticed that rate was 65.0% for the Cs delivery compared with 51.1% for those of normal weight prim gravid women. The equivalent figures for multigravid women were 44.7% for those who were morbidly obese and 18.6% for those of normal weight.

To our knowledge, this is the first study to have outlined the prevalence of obesity and its effect on the mode of delivery in Iraqi obstetric population. In this study, 51.4% of women were overweight, 33.4% were obese, and 11.3% morbidly obese, resulting in a figure of 84.8% of women being overweight or obese. These figures are actually more than that published rates by McCarthy S et al, study (2002) on obesity within the general Irish population. This prevalence of obesity is higher than that reported internationally.

Conclusion

Caesarean section and infant birth weight ≥4 kg were increased as the BMI of the women were increased.

Call for Papers/Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialties. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper; A general invitation is extended to authors to submit papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article an attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your affiliation (designations with college address)
- Abstract
- Keywords
- Introduction or background
- Material and Method
- Findings
- Discussion
- Conclusion
- Interest of conflict
- Source of Funding
- Ethical Clearance
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file.

All articles should be sent to: editor.ijphrd@gmail.com

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245  Electronic-ISSN: 0976-5506, Frequency: Monthly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal. The frequency is Monthly. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialties concerned with research and development for the masses. The Journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.
