Indian Journal of Public Health Research & Development

EXECUTIVE EDITOR

Vidya Surwade

Associate Professor, Dr Baba Saheb Ambedkar Medical College & Hospital Rohinee, Delhi

INTERNATIONAL EDITORIAL ADVISORY BOARD

1. Dr Abdul Rashid Khan B. Md Jagar Din, Associate Professor, Department of Public Health Medicine, Penang Medical College, Penang, Malaysia
2. Dr V Kumar, Consulting Physician, Mount View Hospital, Las Vegas, USA
3. Basheer A. Al-Sum, Botany and Microbiology Deptt, College of Science, King Saud University, Riyadh, Saudi Arabia
4. Dr Ch Vijay Kumar, Associate Professor, Public Health and Community Medicine, University of Buraimi, Oman
5. Dr VRamaswamy, Senior Lecturer, Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur
6. Kartavya J. Vyas, Clinical Researcher, Department of Deployment Health Research, Naval Health Research Center, San Diego, CA (USA)
7. Prof PK Pokharel, Community Medicine, BP Koirala Institute of Health Sciences, Nepal
8. Sajjad Salim Issa AL-Musawi, supervisor for student of the Arab board in family medicine
9. Prof. Dr. Ayad F. Alkaim, Professor of surface chemistry and applications of nano-materials, Babylon University, Iraq
10. Prof. Dr. Imad Hadi Hameedi, Medical Biocience Department, College of Nursing, University of Babylon, Hillah city, Iraq
11. Prof. Dr. Ameen A Yasir, Department of Community Medicine, College of Nursing, University of Babylon, Hillah city, Iraq

NATIONAL EDITORIAL ADVISORY BOARD

1. Prof. Sushanta Kumar Mishra, Community Medicine, BMS Medical College – Rajahmundry, Andhra Pradesh
2. Prof D.K. Srivastava, Medical Biochemistry, Jami Hamdard Medical College, New Delhi
3. Dr Sunil Mehra, Paediatrician & Executive Director, MAMTA Health Institute of Mother & Child, New Delhi
4. Prof M. Sriharibabu, General Medicine, GSL Medical College, Rajahmundry, Andhra Pradesh
5. Prof Pankaj Datta, Principal & Prosthodontist, Indraprastha Dental College, Ghaziabad
6. Prof Samarendra Mahapatra, Pediatrician, Hi-Tech Medical College, Bhubaneswar, Orissa
7. Dr Abhiruchi Galhotra, Additional Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
8. Prof Deepa Pruthvi, Pathologist, SS Institute of Medical Sciences & Research Center, Davangere, Karnataka
9. Prof G S Meena, Director Professor, Maulana Azad Medical College, New Delhi
10. Prof Pradeep Khanna, Community Medicine, Post Graduate Institute of Medical Sciences, Rohtak, Haryana
11. Dr Shailendra Handu, Associate Professor, Pramukh, DM (Pharma, PG Chandigarh)
12. Dr. A.C. Dharwal, Directorate of National Vector Borne Disease Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of India, Delhi.

NATIONAL SCIENTIFIC COMMITTEE

1. Dr Anju Ade, Associate Professor, Community Medicine Department, SIVIMS, Sri Padampathi Medical College, Tirupati, Andhra Pradesh
2. Dr. E. Venkata Rao, Associate Professor, Community Medicine, Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa.
3. Dr. Amit K. Singh, Associate Professor, Community Medicine, VCSC Govt. Medical College, Srinagar – Gahwal, Uttarakhand
4. Dr R G Viveki, Prof n head, Dept of Community Medicine, BIMS Belagavi
5. Dr. Santosh Kumar Mulage, Assistant Professor, Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS), Karnataka
6. Dr Gouri Ku. Padhy, Associate Professor, Community and Family Medicine, All India Institute of Medical Sciences, Raipur
7. Dr Ritu Goyal, Associate Professor, Anaesthesia, Sarswathi Institute of Medical Sciences, Panachath Nagar
8. Dr. Anand Kalaskar, Associate Professor, Microbiology, Prathima Institute of Medical Sciences, AP
9. Dr. Md. Amirul Hassan, Associate Professor, Community Medicine, Government Medical College, Ambedkar nagar, UP
10. Dr. N. Girish, Associate Professor, Microbiology, VIMS&RC, Bangalore
11. Dr BR Hungund, Associate Professor Pathology, JNMC, Belgaum.
12. Dr Sartaj Ahmad, Associate Professor, Medical Sociology, Department of Community Medicine, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India
13. Dr Manoj Kumar Tripathi, (Associate Professor), Political Science and public administration, Swami Vivekananda Subharti University, Meerut, Uttar Pradesh, India
14. Dr Sumeet Soni, Associate Professor, Microbiology Department, B.J. Medical College, Ahmedabad Gujarat, India

Print ISSN: 0976-0245, Electronic ISSN: 0976-5506, Frequency: Quarterly (Four issue per volume)

Indian Journal of Public Health Research & Development is a double blind peer reviewed international journal. The frequency is half yearly going to be quarterly by 2012. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN) Print ISSN: 0976-0245, Online ISSN: 0976-5506 and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMcare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

Contents

Volume 10, Number 5 May 2019

1. Effect of Mechanical Traction Versus Kaltenborn Traction with Mobilization on Post Operative Knee Stiffness
   Swati S. Yadav, Vaishali Jagtap, T. Poovishnu Devi, Trupti Ashok Warude, Pranjali Meghasham Gosavi

2. A study of the Discharge Process of a Multi-Specialty Hospital
   Anil Pandit, Savita Prashar

3. A Study of Awareness of NABH Standards of Human Resource Management amongst the Staff of the Tertiary Care Hospital
   Anil Pandit, Meenal Kulkarni, Meeta V. Urkude

4. Prescribing Pattern of Anti Fungal Drugs in Dentistry-A Cross Sectional Study in a Private Dental College in Chennai
   Devika Warrier E, Karishma Ravinathar, Anitha Roy

5. Effect of Faradism Under Pressure with Biofeedback Exercises in Ca-Breast Lymphedema
   Ankita A. Jadhav, Vaishali Jagtap, T. Poovishnu Devi, Trupti Ashok Warude, Pranjali Meghasham Gosavi

6. Effectiveness of Spinal Mobilization with Arm Movement (Smwams) Versus Neural Tissue Mobilization in Cervical Spondylosis with Unilateral Radiculopathy
   Apurva Godse, Trupti Warude, Amrutkuvar Pawar, Vaishali Jagtap, Krishna Savsaviya, Nilakshi Kandalker

7. A Comparative Study on Awareness and Perception about Anemia among Urban and Rural Adolescent High School Girls
   Nimra Shireen, Dayalaxmi T. S., Vidya G S, A. H. Suryakantha, B. Vijayakumar

8. The Effectiveness of Mulligan’s Pain Releasing Phenomenon Versus Kinesio-Taping in De’quervains Tenosynovitis
   Gauri S. Nikam, Amrutkuvar Pawar, Namrata Patil, Khushboo Bathia

9. Effectiveness of Myofascial Release and Muscle Energy Technique on Posterior Shoulder Tightness in Overhead Athletes
   Krishna Savasaviya, Trupti Warude, Amrutkuvar Jadhav, Apurva godse, Nilakshi Kandalker

10. A Study of Socio-Demographic Factors Effecting under Nutrition in Under Five Children of Slum in Mysuru—An Exploratory Study
    Krishnaveni ys, Meghana Narendran, Prakash B, Narayananamurthy MR

11. Treat the Troika: Does Depression and Malnutrition affect Activities of Daily Living?
    A Study among Elderly Soliga Tribes, B. R. Hills, Karnataka
    Meghana Narendran, Sunil Kumar D, Praveen Kulkarni, Renuka M, Narayana Murthy M R

12. Effect of PNF Stretching and Foam Rolling Exercises in Patellofemoral Pain Syndrome
    Nilakshi Kandalker, Trupti Warude, Amrutkuvar Pawar, Apurva Godse, Krishna Savsaviya

   Nisrinah, Haryoto Kusnoputranrto, Suyud Warna Utomo

115. Influence of Length and Frequency of Pan with the Occurrence of Gingivitis of Community in Toraja Regency .......................................................................................................................... 572
   Harun Achmad, A. Mardiana Adam Suriamiharja, Susilowati Mudjari, Gabriella Wika Tandiarrang

116. Identification of Early Childhood Caries (ECC) in Children’s Preschool Based on Demographic Risk Factor and pH Saliva ................................................................................................................. 598
   Harun Achmad, Rini Pratiwi, Sumintarti, Sri Ramadhany, Susilowati Mudjari, Mutthathur Rahma

117. Comparison of Fibroblast amount on the Gingival Healing Process in the Wound Applied by Platelet-Rich Plasma (PRP) and Chlorhexidine (CHX) ........................................................................................................... 604
   Irene E.Rieuwpassa, Misnova Tanca, Sri Oktawati, Arni Irawaty Djais, Muhammad Husni Cangara, Harun Achmad

118. Analysis of Ascorbic Acid in Gingival Handling of Children’s Mouth Cavity ............................................. 610
   Harun Achmad, Marhama F Singgih, Shinta Andries, Sri Ramadhany, Hendrastuti Handayani, Sumintarti

119. Awareness toward Energy Drinks among Tikrit University Students ......................................................... 616
   Nisreen M. Ibraheem, Mayada K. Mohammed

120. Mitral Valve Prolapse Diagnosis and Incidence ....................................................................................... 621
   Noori Odah Madhee, Sameerah Rashid Jabbar, Mohammed Hassan Baghdadi, Ali Khalid Abood, Hayder Adnan Fawzi

121. Effect of Two Separated Doses of Antenatal Steroids at 32 Weeks and Five Days Before Delivery in Prevention of Neonatal Respiratory Distress Syndrome ......................................................... 625
   Sara Abdul-Ridha Al-Rawaf, Abdul-Kareem Jaseem Al-Bahadle, Areege A. A. Alomrani
122. Pulmonary Tuberculosis Disease: Prevention Behavior in Makassar City ................................................. 628
   Herman, Rudy Hartono

123. Prevalence and Indications of Caesarean Section in Karbala Gynecology and Obstetrics
   Teaching Hospital, Iraq ............................................................................................................................... 635
   Wasan Gh. Al safi, Hameedah Hadi, Zahraa S.Omran

124. Health Knowledge of Outpatient Visitors at Mirjan Teaching Hospital in Al-Hilla City ......................... 641
   Qais Ismaael Kadhem, Ali Adnan Jabbar, Ghossen Kadhom N.

125. Kirschner Wires Fixation Versus Closed Reduction Screws in Fracture of Neck Femoral
   Managemnets in Children and Adolescences ............................................................................................ 646
   Wejdi A. Al-Fatlawy

126. The Effect of the Basilar Membrane Roughness on the Otoacoustic Emissions ............................... 652
   Adnan M. A. Al-Maamury, Fatima Q. Al-Rawi, A. A. Al-Rubaiee

127. Comparison of ACPA and Anti RA,Ab as Prognostic Factors in Patients with Rheumatoid Arthritis .... 657
   Alaa S. Alattabi, Murtada A. Abood Jaber, Firas A. Zenki

128. Ocular Manifestation of Pediatric Systemic Diseases: Inter Disciplinary Approach ......................... 662
   Debalina Guchhait, Anirban Paik, Sujata Guha

129. Relationship Marketing in Healthcare: A Literature Review Analysis of Past, Present &
   Future in Private Hospitals ........................................................................................................................ 668
   Chavan Abhijeet, Joshi Sujata

130. Testing Preparedness of EMS Personnel in Identification and Decompression of Tension
   Pneumothorax using High Fidelity Simulation—A Pilot Study ............................................................... 673
   Parag Rishipathak, Monesh Bhandari, Anand Hinduja

131. Integrating Flipped Classroom Technique with High Fidelity Simulation for Teaching
   Hemorrhagic Shock to EMS Students at Pune, India—A Pilot Study .................................................... 677
   Parag Rishipathak, Shrimathy Vijayraghavan, Anand Hinduja

132. Factors Affecting the Demand of Health Insurance in India—A Systematic Review ....................... 680
   Neha Ahire, Parag Rishipathak

133. Usage Intention towards Online Healthcare in Context to Consumer .................................................. 686
   Madhur Raina, Mallika Srivastava

134. A Study on Knowledge of Preventive Practices about Vector Borne Diseases (VBD) in Pune District .. 692
   Sonopant Joshi

135. Assessing the Quality and Safety of Home Healthcare Services provided by Tertiary Care Hospital ..... 697
   Meenal Kulkarni, Manpreet Kaur

136. Awareness of Virtual Reality in Surgical Training in India ................................................................. 702
   Tanmayee Shivaji Puntambekar

137. Study on Public Awareness of mHealth Apps Introduced by the Government of India .................... 707
   Akshata Paropkari

138. Role of CSR Expenditure in Health Care—A Comparative Study of Select Market Cap Ranked
   Indian Companies ................................................................................................................................... 713
   Prakash Rao, Jeevan Nagarkar, Viraja Bhat
139. Socio-Demographic Determinants of Anemia among Women: A Study about Empowered Action Group (EAG) States of India ................................................................. 720
   Dharmendra Kumar Dubey, Arindam Das

140. A Literature Review of Measurement of Health Literacy in India ........................................ 724
   Samir Sumant Barve, Sonopant Joshi

141. A Comparative Electromyographical Analysis of Biceps Brachii and Brachioradialis During Eight Different Types of Biceps Curl ............................................................. 730
   Amritashish Bagchi, Shiny Raizada

142. Awareness of Health Insurance -Shifting Perspectives and Emerging Trends .................... 736
   Neha Ahire, Parag Rishipathak

143. Retention of Cognitive Skills Acquired in Heartsaver First Aid CPR AED Course of American Heart Association (AHA), USA among Non-medical Students in Pune City ............... 742
   Parag Rishipathak, Monesh Bhandari, Anand Hinduja

144. Contraception Use: Does Socio Economic Factors Matter in Maharashtra, India?
   An Investigation through NFHS-4 Data .............................................................................. 745
   Arindam Das, Shobana Sivaraman, Kailash Prajapati

145. Disease Patterns among Rural Residents—An Explorative Qualitative Study with Physicians in Private Practice of a Village in Western Maharashtra, India .............................................. 754
   Manisha N. Gore, Deepak R. Paropkari

146. Varying Patterns of Societal Discriminations in Anaemia among Women in India: Findings from Third and Fourth Rounds of NFHS Survey ...................................................... 759
   Dharmendra Kumar Dubey, Parag Rishipathak, Arindam Das

147. Evaluation of Fentanyl and Dexmedetomidine as Additive to Ropivacaine for Epidural Anesthesia in Surgeries below T_{10} Level ............................................................... 765
   Purnendu, Soumita Kar

148. Enhancing Service Experience through Excellence in Patient Relationship (EPR) Training Programs ... 771
   Ramnath Raghunath Dixit

149. IOT Based Halitosis Detection ............................................................................................. 777
   Josephin Arockia Dhiyva, Chandrasekaran R., Sharika S., T. R. Thamizhvani, R. J. Hemalatha

150. Analysis of Polysomnography for Sleep Abnormalities ...................................................... 782
    A. Josephin Arockia Dhiyva, T. R. Thamizhvani, R. J. Hemalatha, R. Chandrasekaran, Anand Kumar E.

151. Computer Aided Classification of Breast Lesions in Digital Mammograms .......................... 786
    K.Sangeethapriya, Josephin Arockia Dhiyva, T. R. Thamizhvani, R. J. Hemalatha

152. Classification of EEG Signal into Different Epileptic Stages Based on Feature Extraction ........ 792
    Srividhya G, Syed Uzma Farheen, R. J. Hemalatha, Sangeetha Priya, Jaya Rubi

153. Design and Development of Low Cost Prosthetic Hand Controlled by Myoelectric Signal .......... 796
    A. Keerthana, Jaya Rubi, Srividhya, Sangeetha Priya

154. A Review on Biometric Technology in Healthcare ............................................................. 800
155. Effect of BMI on Lower Limb Muscle Coactivation During Leg Strengthening exercises .................. 805
   Srividhya G, Saranya S, Poonguzhali S

156. Design of Biomimetic Limb for Restoring Hand Function of Partially Amputed People .............. 810
   Jaya Rubi, Keerthana A., Sri Vidhya G., Sangeetha Priya

157. IoT Based Ketoacidosis Detection ........................................................................................................ 814
   R. Chandrasekaran, S. Sharika, Hemalatha R. J., Josephin Arockiya Dhivya, T. R. Thamizhvani

158. Smart Aid for the Blind .......................................................................................................................... 819
   R. Chandrasekaran, Josephin Arockia Dhivya, T. R. Thamizhvani, R. J. Hemalatha

159. Intelligent Walking Stick for Deaf Blind People ................................................................................... 822
   A. Keerthana, Sri Vidhya, Sangeetha Priya, Jaya Rubi, R. J. Hemalatha, Shweta Ashok, Syed Uzma Farheen

159. 3D Printed Eco Friendly Smart Prosthetic Arm with Rotating Wrist .................................................. 825
   Jaya Rubi, R. J. Hemalatha, Josephin Arockia Dhivya, T. R. Thamizhvani

160. Glaucoma Detection in Ultrasound Biomicroscopy Images by Parametric Analysis ...................... 829
   R. J. Hemalatha, Sowmya Y. K., Jaya Rubi, T. R. Thamizhvani, Josephin Arockia Dhivya
161. Design of Equalizer for ADSL Modem ................................................................. 834
Rajani Katiyar, Padmaja K.V.

162. Creating Convolutional Neural Network and Training it to Classify Images using Machine Learning ............................................................... 839
Ashutosh Srivastava, Aashie Roy Saxena, Madhurima, Saru Dhir

163. Fraudulent Loan Prediction using Machine Learning Algorithms .............................. 845
Priyal Chotwani, Asmita Tiwari, Madhurima Hooda

164. Big Data Analysis Applied for Short Term Solar Irradiance Forecasting ......................... 851
R Lavanya, Kevin Lawrence, J Nilesh

165. Dual Watermarking Technique for Protection of Images ............................................. 857
Swapnil Bhardwaj, Kirat Chabra, Madhurima, Saru Dhir

166. Enabling Cloud Data Service Security with Key Exposure ........................................ 862
Prasad Arala, Gayatri.V, Jahnavi.Y

167. An Extensive Study for the Development of Web Pages ............................................... 868
Kanta Bhargav, SK. Asiff, Jahnavi.Y

168. Security Health monitoring and Attestation of Virtual Machines in Cloud computing ................ 881
Mutyala Lakshmi, Kanchi Sukeerthi, Y. Jahnavi

169. Country Location Classification on Tweets ...................................................................... 890
G.Sukanya, N.Sivanagamani, Y. Jahnavi

170. A Rapid Phrasing Search for Encrypted Cloud Storage .................................................. 899

171. Relevant Web Revisitation by Context and Content Keywords ..................................... 908
Suma. P, Jahnavi. Y

172. Development of 3D Model of Tibia Femoral Bone in Knee Joint for FEA .................... 916
Mallikarjunaswamy M.S, Bhanu H S

173. Design and Analysis of Low Power VCO Enabled Quantizer for CT Sigma Delta ADC .......... 921
Shreyas H S, Arunkumar P Chavan, H V Ravish Aradhya

174. Wind Energy System Coupled with Bidirectional Quasi Z-Source Inverter for Motor applications .... 928
A.Jaffarsadiqali, P.Vinoth Kumar, A.Suresh

Volume 10, Number 5  May 2019

203. A Comparative between Virus Type 1 Original Sabin Polio Virus and Sabin AFP Case in Cytopathic Effect Characteristic ...........................................................................................................................................1147
   Razaq Hadi Eissa Al-Garawi, Kadhim Hashim Alarajy, Ayaid Khadem Zgair

204. Antibacterial Activity of Lactobacillus spp. Against Listeria monocyctogenes ........................................1152
   Aya Talal Abdulameer Reza, Wala’a Shawkat Ali

205. Anti-inflammatory and inflammatory as Diagnostic Markers in Type2 Diabetes Mellitus ....................1158
   Haithem R. Mohammed, Zaid Mahdi Jaber Al-Obaidi

206. Isolation and Identification of Streptococcus pyogenes from Patients with Tonsillitis in Baghdad Province .................................................................................................................................. 1163
   Qater Al-nada Ali Kanaem AL-Ibady, Abbas Abdulmueed Mustafa Alani Wessam Abbas Hashem Icheeid

207. Impact of Anesthesia on Adaptive Immune Response in Orthopedic Surgery ................................. 1168
   Adnan Hamad Aubaid, Khalid Lahmood Yaseen

208. Evaluation of Tuberculosis Skin Test in Al-Hilla Province ................................................................. 1175
   Ahmed Hussein Jasim, Amjed H. Abbas, Munqith Abdul-mohsin Kadhim, Nadia H. Sahib

209. Innovation Technology: Multi Drug Resistance Bacteria Threaten our Future: Effect of the Zn, Zr nps and Magnetic Water on the Biofilm Formation in Some Bacterial Isolates from Burn Patients in Baghdad Hospital ................................................................................................................................................... 1179
   Amna Al hashimi, Sharazad N Abdullah, Khalid Mahdi

210. Unilateral Approach to Decompress the Lumbar Spine Stenosis by Laminotomy and Undercutting of the Lamina; Short-Term Clinical Outcome ................................................................................................................. 1186
   Mousa I. Alghazali, Raad F. Abd Ali, Muna Z. Alshabbani

211. Early Detection of Non-Cavitatedocclusive Carious Lesionon the First Permanent Molar Using Laser Fluorescence and Impedance Spectroscopy (an in vivo study) ......................................................... 1192
   Samah F. Al-Qazzaz, Abeer M. Hassan

212. Study the Types of Fat in People with Diabetes Type II ....................................................................... 1199
   Duua Ayad, Yass Al-Bayate

213. Biochemical Study of the Association between Serum Level Zinc, Copper and Selenium with Hormone of Thyroid Gland in Patients with Thyroid Disorder ........................................................................................................................................... 1206
   Araa Ali Hadi, Hamed Ibrahim Mohammed

214. Effect of Radiation Therapy on the Health of Cancer Patients .......................................................... 1211
   Eman Ibrahim Awad
215. Role of Vitamin D3 in Breast Cancer Development among Iraqi Patients ............................................ 1216
   Ala’a Abdul-Khalqi, Batool A. Al-Haidary, Nahida R. Abbas

216. Study of Some Biochemical Parameters in Infertile Men ................................................................. 1222
   Kadhem Mohammad Sabae, Zanaib Salim Jabar

217. Vitamin D Status With Obesity in Patients Attending Nutrition Clinic at Al- Sadiq Hospital ..........1228
   Wathiq Essam Hameed, Ghusoon T. Witwit, Ammar D. Ghazala

218. Bacteriological Study of Tonsillitis Patients and Estimation of Concentrations of Certain Immunological
    Parameters .............................................................................................................................................. 1234
   Zeana sh. AL-Hindi, Tsahel H. AL-Dulaimi, Nisreen Kaddim Raadi

219. Histopathological Study on Stomach of Albino Mice Infected with Streptococcus pneumonia ..........1239
   Roaa S. Al-rawi, Hadeer AA

220. Effects of Non-Surgical Periodontal Treatment on Tumor Necrosis Factor-Alpha Serum Level in Patients
    with Type 2 Diabetes Mellitus and Chronic Periodontitis ......................................................................1242
   Wael A. Kzar, Maha Sh. Mahmood, B

221. Correlation of Glycated Hemoglobin (Hba1c) and Serum Uric Acid in Type-2 Diabetic Patients ...... 1250
    Alaa Abbas Fadhe, Ahmed Kadhim Yousif

222. Detection of Amplified Her2 / Neu Gene Score 2 Cases in Breast Cancer Using Chromogenic In Situ
    Hybridization .......................................................................................................................................1255
   Suhad Faisal Hatem Al-Mugdadi, Ahmed Salahuddin Mohammed, Ahmed E. Salman, Maha
   Mahamomm Alsayyid, Mustafa Mageed Naser

223. Interleukin-12A (Rs583911) Polymorphism in Pediatric Patients with Acute Lymphoblastic Leukemia In
    Iraq ....................................................................................................................................................... 1262
   Manal M. Kadhim, Tabarek S. Abd-Alraoof

224. Detection of EML4-ALK Fusion Gene Rearrangement in Non-Small Cell Lung Carcinoma in a Sample
    of Iraqi Patients: A Comparison of Chromogenic in Situ Hybridization with Correlation of ALK Protein
    Expression .............................................................................................................................................1267
   Rawaa Ghalib Farhood, Kaswer Al-tariahi, Rehab Hameed Adul-Sahieb, Afraa Mamoori

225. Study the Relationship between TEX101 Protein, Inhibin B and Testosterone Hormone in Azoospermia
    and Severe Oligospermia in Infertile Patients .....................................................................................1274
   Samah A.Hammood, Alaauldeen S. Al-Sallami, Saleh M. Al-Khafaji

226. Serum Caspase 3 and Lysozyme level in abortive Iraqi Women Infected with Toxoplasma gondii and
    Urinary Tract Infections .......................................................................................................................1280
   Sabeea A. Al–Sarray, Mouruj A. Al Aubydi, Salah M. Muhsin

227. Topical Effect of Silver Diamine Fluoride in Arresting Dental Caries in Primary Teeth ......................1285
   Mohammed Qays Mahmood Fahmi, Maha Jamal Abbas, Lubna Abdulelah Abdulrahman Almallah

228. Do Dental Arches Lengths, Widths and Perimeters affect Bolton’s Ratios? .................................1288
   Nadia Basim Al-Ansari, Saha Ali Abdul Ameer, Mohammed Nahidh

229. Evaluation of the Diagnostic Accuracy of Transient Elastogaraphy and Apri Score in Chronic Hepatitis B
    (CHB) in a Sample of Iraqi Patients  ....................................................................................................1294
   Ali Sameer AL Shammaa, Mohammed Abdulla Mehdi, Raghad Jawad Al Akaishee
Evaluation the Antimicrobial Efficacy of NaOCL-EDTA, MTAD and NaOCL- citric Acid Against *Enterococcus faecalis* in Root Canals of Primary Teeth (an *in vitro* study) ........................................1300

Sara T. AL-Ethary, Abeer M.Hassan

Isolation and Identification of *Prevotella Intermedia* by Culture and Polymerase Chain Reaction ......1307

Aula Abdullah Mahdi, Rasha Jasim Al Warid, Ameer Hamdi Al-Ameedee

Isolation of CD34+ Human Melanocyte Stem Cells from Hair Follicles ...............................................1314

Ihab Q.Ali, Shahlaa M.Salih, Galawish A.Abdulla

A Comparison of Cone Beam Computed Tomography, Panoramic and Digital Periapical Radiography in the Detection of Chemical and Mechanical Created Peri-Implant Bone Defects .........................................................1319

Ahmed R. Naji, Ban F. AL Drobie, Ali Jalah

The Efficacy of Essential Oils (Lavender Oil and Flaxseed Oil) in Treatment of Recurrent Aphthous Ulceration ................................................................................................................................................1325

Muntaha Fawzi Saleh, Ahmed Adel Othman, Abdullah Ahmed Ibrahim

Quantification of *Streptococcus mutans* Associated with Dental Caries in Iraqi Children by Real-Time PCR ........................................................................................................................................... 1330

Suaad Abid Fazaa Al-Miyah

The Role of Frizzled-Related Protein3 Frzb3 Gene Polymorphisms’ in Iraqi Patients with Knee Osteoarthritis ..............................................................................................................................................1337

Nabeel Abdulkadhim Athab, Wissam Riad Hussein, Ahmed Amer Mohamed Ali

A Comparative Study for Movement of Sword Fencing Stabbed According to the Technical Programming in the Game of Fencing Wheelchairs Class B ................................................................1344

Nabeel Abdulkadhim Athab

An Analytical Study of Cervical Spine Pain According to the Mechanical Indicators of the Administrative Work Staff ........................................................................................................................................1348

Nabeel Abdulkadhim Athab
239. An Analysis of the Correlation between Psychosocial Hazard and Work Accidents at Velodrome-Kelapa Gading Light Rail Transit Project by Pt Xyz in 2018
Anditha Nur Nina, Dadan Erwandi, Zulkifli Djunaidi, Laksita Ri Hastiti

240. The Readiness of Resources The Implementation of Maternal Health Services Indicators for the Minimum Services Standards in Depok West Java Indonesia
Dyan Handayani, Purnawan Junadi, Anhari Achadi

241. Analysis of Occupational Safety and Health Risk Perception of Elementary School Employees in Depok City, Indonesia
Luthfiyyah Mufidah, Mila Tejamaya

242. Validity and Reliability Study of a Semi-Quantitative Food Frequency Questionnaire (FFQ) for Measuring Calcium Intake in Young Adult Women
Wita Nurul Aini, Triyanti, Sandra Fikawati

Nur Hasanah, Siti Arifah Pujonarti

244. Dengue Surveillance Information System: An Android-Based Early Warning System for the Outbreak of Dengue in Padang, Indonesia
Elva Idriani, Martya Rahmaniati M, Rico Kurniawan

245. The Role, Relevance, and Potential of Comprehensive Primary Healthcare in the Indonesian Health System
Sito Rukmi

246. Risk Factors of Near-Miss Road Traffic Incidents among Inter-Provincial Public Van Drivers in Thailand
Wanida Kala, Plernpit Boonyamalik, Orawan Kaewboonchoo, Adul Bandhukul

247. The Effect of Special Exercises for those with (Cognitive Concentration) in the Development of Motor Satisfaction and Learning Some Types of Scoring Basketball for Students
Sahar Hur Majeed, Ammar Khaleel Ebrahim AL-Ezzi, Ali Jameel Nasser

248. Evaluation of Work Posture with Quick Exposure Check (Qec) at Workstations for Toluenesulfonyl Hydrazide and Azodicarbonamide Reactions in the Chemical Processing Industry
F.H. Yunita, L.M. Kurniawidjaja

249. Psychosocial Overview of Work-related Musculoskeletal Disorders: A Preliminary Study in the Chemical Process Industry
Yayan Harry Yadi, L Meily Kurniawidjaja
250. Effect of District-focused Approach on Health Information System Performance in Indonesia ..........1417
   Kemal N. Siregar, Rico Kurniawan, Retnowati, Yudianto Singgih, Tris Eryando

251. Job Stress and Stroke among Employees in Thailand: Preliminary Findings from a
   Case-Control Study.................................................................1424
   Thanate Tienthong, Oravan Kaewboonchoo, Plernpit Boonyamalik, Jian Li,
   Chitapa Kaveeta, Wanna Sanongdej

252. The Relationship Between Job Stress and Tinnitus among Workers in Expressway Authority of
   Thailand..................................................................................1430
   Nutthawut Atitung, Orawan Kaewboonchoo, Plernpit Boonyamalik

253. Body Mass Index is an Independent Predictor for Mediastinitis Post Coronary Artery Bypass Graft
   Surgery in Indonesia ...............................................................1435
   Ponisih Ponisih, Bambang Sutrisna, Ismail Dilawar

254. Comparative Histology of Human, Rats and Rabbits Liver.........................................................1441
   Eyhab R. Al-Samawy, Shaima K. Waad, Wissam S. Hashim, Ghusoon Alabas

255. Vital Signs Monitor..................................................................................................................1447
   F. Emerson Solomon, M. Maresha Mani V. Gomathy , T. Manoj Prasath

256. 3D Printed Limb Rotation.........................................................................................................1449
   Vasukidevi Ramachandran, S Geetha, R Vasuki

257. Hartmann’s Solution Heart Lung Machine................................................................................1453
   Vasukidevi Ramachandran, R. Kishore Kanna, S Geetha, R Vasuki

258. Non Invasive Technique for Measuring Blood Glucose based on IOT......................................1456
   S Geetha, Vasukidevi Ramachandran, V Gomathy, R Vasuki

259. Patient Monitoring System in Hospital....................................................................................1459
   S.Geetha, Vasukidevi Ramachandran, R.Kishore Kanna, R.Vasuki

260. Spinal Braces to Prevent Occupational Back Pain.................................................................1462
   V.Gomathy, Vasukidevi Ramachandran, T.Manoj Prasath

261. Hearing Aid Using Amplifier.....................................................................................................1467

262. Intelligent Support System for Visually Impaired with Haptic Feedback...............................1470
   S.Prasath Alias Surendhar, Kripa P , Manoj Prasad T

ABSTRACT

Background: Knee stiffness is the most common musculoskeletal disorder. Manual traction is effective in treating post operative knee stiffness but it has limitations which may be overcome by using Mechanical traction. However there is limited research available to show any significant impact of mechanical traction with mobilization on post operative knee stiffness.

Aim: The purpose of this study was to find effect of mechanical traction versus Kaltenborn traction with mobilization on post operative knee stiffness.

Study Design: The study design was Pre test-Post test single blinded study.

Method and Material: 30 subjects (17 males/13 females, age 25-65) were randomly allocated in 2 groups. Group (A) received mechanical traction with mobilization, hot moist pack, CPM and exercises. Group (B) received Kaltenborn traction with mobilization, hot moist pack, CPM and exercises. Both the groups received treatment for 6 sessions/wk for 4 wks. Pre-Post score was assessed using WOMAC, range of motion (ROM) and visual analogue scale (VAS).

Statistical Analysis: The data was analyzed with INSTAT software using paired and unpaired t test.

Results: Both the groups showed improvement but there was extremely significant improvement in WOMAC scale (p<0.001), ROM (p<0.001) and VAS (p<0.001) in group treated with the mechanical traction with mobilization. This data indicates that mechanical traction gives better result than the manual traction.

Conclusions: Mechanical Traction with mobilization was more effective in decreasing pain and improving quality of life in post operative knee stiffness than using conventional therapy alone.

Keywords: Mechanical traction, manual traction, continuous passive motion, hot moist pack, WOMAC scale, range of motion, visual analogue scale.

Introduction

Knee stiffness is a symptomatic loss of knee extension or flexion compared to the opposite normal knee. Stiffness of the knee is a common complication that can lead to loss of knee range of motion, loss of strength, pain and inability to return to previous levels of activity. It is a limitation in range of motion, it is a potential complication after any post operative intraarticular or extraarticular trauma. Knee stiffness is one such complaint that needs proper evaluation after any trauma. Prevalence rate for post operative knee stiffness is 11%.

Intra articular stiffness can be occur due to presence of dense intra articular adhesion, excessive proliferation of fibrous scar tissue, retraction of periarticular soft tissue and bone impingement due to intra articular malunion. Likewise, extra articular stiffness can be occur due to quadriceps adhesion to a femoral callus, retraction of the muscle due to scar tissue so that knee
stiffness starts. When there is immobilization of knee for several weeks or longer, such as during healing of a fracture or after surgery, the capsule, muscle, and soft tissue develops contractures, which leads to contractures in motion. It may restrict downward gliding of the patella, which limits knee flexion, and may cause pain as the patella is compressed against the femur. The treatment of knee stiffness is currently limited to application of hot fomentation, ultrasound, manual mobilization, Continuous passive motion and exercises. Hot moist pack (20min.), Ultrasound(0.2w/cm² for 10 min.), Continuous passive motion(20min.), Manual traction with mobilization technique. Hot moist packs are applied to the injured body part in the several layers of towels. It gives for 20min. It relaxes the tight muscles causing tissues to relax as well as also decreases pain caused by muscle tension or spasm. Traction is the technique of applying a distracting force to produce either a realignment of a structural abnormality or to relieve abnormal pressure on nociceptive receptor systems. The amount of weight to be used depends on the fracture but generally weight between 1/10 and 1/7 of the body is safe and adequate for most fractures.

It is found in earlier studies that manual traction is effective in treating post operative knee stiffness. But manual mobilization has limitations like: limited maximum traction force, amount of force can’t be easily replicated or specifically recorded, can’t be applied for prolonged period of time and requires a skilled clinician. By using mechanical traction the force and time can be well controlled, readily graded and replicable. However there is limited research available to show any significant impact of Mechanical Traction with mobilization versus Kaltenborn traction with mobilization in post operative knee stiffness.

Materials & Method

Ethical clearance was obtained. Informed written consent was taken. The study was single blinded experimental study. 30 subjects (17 males, 13 females) with postoperative knee stiffness were allocated into 2 groups using convenient sampling with random allocation method. Inclusion criteria were subjects indicated for manual knee joint mobilization. Exclusion criteria was an intra articular fractures, joint infection, osteoporosis, fixed lower limb deformity, malignancy, recent soft tissue injury, open wound or skin disease. Outcome measures like WOMAC Scale, VAS, and ROM were used to assess pre treatment and post treatment. Group (A) (n=15) received mechanical traction with mobilization, hot moist pack, CPM and exercises. Group (B) (n=15) received Kaltenborn traction with mobilization, hot moist pack, CPM and exercises. Both the groups received treatment for 6 sessions/wk for 4 wks. The baseline treatment for both groups was Hot moist pack for 20 min., Continuous passive motion(30min.), Static exercises(10rep), Active knee exercise(10rep), VMO strengthening, Quadriceps table(10rep).

Group (A) subjects were received Mechanical traction with mobilization with the help of traction frame (Mechanical traction 1/7 of the body weight, Intermittent Traction- for 30 sec hold followed by 10 sec rest period), for total of 7 min traction for 6 treatment sessions per wk for 4 wks.

Group (B) subjects were received Kaltenborn traction with mobilization.

Analyses were performed using INSTAT statistical software. Intra Group comparison (within Group) was analyzed statistically using Paired t test, inter Group comparison (between Group) was analyzed statistically using Unpaired t test.

Results

Total 30 subjects were taken for study. The gender ratio of Group A was 9:6(9 males and 6 females) and Group B was 8:7 (8 males and 7 females) and was statistically not significant. Therefore both groups matched with respect to gender.

The age of participants ranged from 25-65. The mean age of participants in group A was 42 years ± 8.44 and mean age of participants in group B was 44.93 years ± 12.8. The difference in mean age of two groups was statistically not significant (p = 5.11). Therefore both the groups matched with respect to age.

Results

Both the groups showed improvement but there was extremely significant improvement in WOMAC scale (p<0.001), ROM (p<0.001) and VAS (p<0.001) in group treated with the mechanical traction with mobilization. This data indicates that mechanical traction gives better result than the manual traction.

Discussion

This is a novel study which shows that the mechanical traction is more effective than the manual traction. All the analysis implies that mechanical traction with mobilization is extremely significant than the manual traction with mobilization. These findings demonstrated that the mechanical traction with mobilization increases the knee flexion range of motion and also improves the functional outcome of the post operative knee stiffness patients as compared to manual traction with mobilization.

By Dr. A C A Marijnissen (2007) reported the efficacy & underlying mechanisms of joint distraction in treatment of OA Knee Joint. He reported the efficacy & underlying mechanisms of joint distraction in treatment of OA Knee Joint. He found that joint distraction applies relief of modified skeletal wear & tear of articular cartilage surface forming a joint. Nutrition of the cartilage is maintained due to intra-articular fluid pressure changes during treatment. Additionally subchondral sclerosis is diminished; diminishing stresses on the cartilage after treatment. It is found in earlier studies that manual traction is effective in treating post operative knee stiffness. But manual mobilization has limitations like: limited maximum traction force, amount of force can’t be easily replicated or specifically recorded, can’t be applied for prolonged period of time and requires a skilled clinician. By using mechanical traction the force and time can be well controlled, readily graded and replicable.

In the previous studies, manual traction mobilization was applied to the TF joint. In this study, Mechanical traction mobilization applied to TF joint, there was significant increase in knee flexion. All participants experienced a mean increase of 64° in knee flexion from initial to final measurement. This change in range of motion was greater than the 25.9° flexion increase reported by Sara Maher and Doug Creighton, who applied tibio-femoral traction mobilization on passive knee flexion motion impairment.

In previous studies mechanical traction was found to be effective in osteoarthritis patients. The improvement in functional outcome after application of Mechanical Traction may be because of relief of abnormal pressure on nociceptive receptor system which shows that there is decrease in WOMAC scale. In previous studies only WOMAC scale was taken, but range of motion and visual analogue scale was not included.

This is the first study to compare the Kaltenborn traction with mobilization and mechanical traction with mobilization in post operative knee stiffness. This study shows that, patients treated with mechanical traction with mobilization significant improvement in range of motion, WOMAC scale, visual analogue scale as compare to patients treated with the Kaltenborn traction with mobilization which made the study more reliable.

It should be noted that the above results captured outcomes only immediately following treatment therefore no generalization can be made regarding long term effects. The study was limited to one geographical location. The study was done with limited period of duration. The favorable results in the current study indicate the need for future research for longer duration.
Conclusion

Various conservative approaches are used in treating post operative knee stiffness but this study concludes that mechanical traction with mobilization was more effective in decreasing pain and improving quality of life than using conventional therapy alone. It is proved from this study that the Kaltenborn traction with mobilization shows minimal effect in increasing the knee range of motion than compared to Mechanical Traction with mobilization.

A study of the Discharge Process of a Multi-Specialty Hospital

Anil Pandit¹, Savita Prashar²

¹Chief Medical Director, Chellaram Multispeciality Hospital Pune (Former Prof & HoD, MBA(HHM), SIHS, Pune, ²BPT, MBA (HHM), SIHS, S B Road, PUNE

ABSTRACT

Discharge and Billing process being the final step in the hospital experience is likely to be well remembered by the patient. Even if everything else went satisfactorily, a slow, frustrating discharge process can result in low patient satisfaction. Thus, this study was carried out with the aim to assess the discharge process and ascertain the average time taken for the patient to be discharged in a multi-specialty hospital. Method: Data of 150 TPA patients and 170 cash patients was recorded with the help of staff, HIS and observation. The average time taken for the whole discharge process of an individual patient was calculated using the data. Appropriate tables and graphs are used for representing various findings and results. Results and Conclusion: The average time taken for the whole discharge process for TPA and cash patients was 7 hours and 5 hours respectively.

Keywords: Discharge process, Billing process, multi-specialty, TPA

Introduction

Discharge can be broadly defined as ‘the processes, tools and techniques by which an episode of treatment and/or care to a patient is formally concluded by a health professional, health provider organization or individual’. It involves the development and implementation of a plan to facilitate the transfer of an individual from hospital to an alternative setting/home where appropriate. Mogli defines “discharge as the release of a hospitalized patient from the hospital by the admitting physician after providing necessary medical care for a period deemed necessary”¹. Sakarkar defines “discharge as the release of an admitted patient from the hospital”². Discharge process is defined as the process of activities that involves the patient and the team of individuals from various discipline working together to facilitate the transfer of patient from one environment to another³. Soon after completion of treatment, the patient as well as his or her escorts expects to be relieved off immediately. The delay in discharge process leads to dissatisfaction and affects the image of the hospital. Discharge time has important implications on the hospital working as it affects patient satisfaction, utilization of hospital resources, revenue generation, timely access to inpatient bed, assured continuity of care. The standard of discharge management impacts on hospital efficiency, quality and safety of patient care. Discharge process is the final step in the hospital experience, so the process is likely to be well remembered by the patient and his attendants. The Discharge Process is the process consisting of the activities that are undertaken before the patient finally leaves the hospital premises. These activities include making a Discharge Summary, collection of all the patient reports, generation of the Final Bill, Payment by the patient, escorting services etc. Even if everything else went satisfactorily, a slow, frustrating discharge process can result in low patient satisfaction.

Therefore, this time management study on discharge and billing process is undertaken with the aim of giving better services for the patient satisfaction within the minimum time. This can be done only with the help of thorough study of time taken for the whole discharge process beginning from Discharge order time till the patient leaves the Hospital.

Aim: To assess the discharge process of a multi-speciality hospital.

Objectives

- To study the current discharge process.
- To determine the delays if there are any.
- To suggest recommendations for improvements.
Methodology

Study Design:
- Retrospective study was done by asking staff members (Doctors, nurses, MT, billing)
- Self-observation was done by tracking the data on HIS.

Sample Area: IPD ward.

Sample Size: 150 TPA patients and 170 cash patients were taken and there were 20-25 daily discharges.

Review of Literature

Even under the best of circumstances, the discharge-planning process in hospitals is inherently complex with lots of ‘moving parts’. Information from many sources must be gathered, including patient-specific information regarding functional status and patient and family preferences, as well as information about available community resources. Alternatives have to be generated based on the information gathered, and one alternative must be selected and implemented. This selection involves trading off factors-which patients, their families, and health care providers may value differently. Added to this complexity is the environment in which these decisions are made, which is often one of time constraints and emotional distress. Hospital discharge planners generally recognize variations in patient characteristics when making their recommendations. Factors which discharge planners must consider include the availability of caretakers at home, age, multiple diagnoses, previous hospitalizations, and equipment dependence. Also, patients waiting for a place in their first choice of Nursing Home care to become available, and/or patients who did not have a family to assist them home are likely to be delayed. It is a combination of these individual, medical and organizational challenges that interact to put people at risk of delayed discharge.

Ideally the determination of the patient’s discharge plan begins upon their admission to a hospital. Based upon their presenting condition, physician order set, severity of illness or injury (SI), and the intensity of services required (IS) a resource plan of care and discharge plan can be identified up front for each patient. This would include the type of room or bed the patient may need, the anticipated equipment, diagnostic technology, and staff required for an effective patient flow experience at the hospital, and all necessary post-hospital care resources. The effective orchestration of these resources from admission through discharge facilitates a more efficient length of stay (LOS) and post-hospital care experience - directly impact patient satisfaction and hospital capacity management. When there is synchrony between the clinical and resource plan of care, patients receive the right services at the right time. For example, a patient will receive a prompt bed assignment, avoiding unnecessary delays. Or a patient gets transported in a timely fashion to diagnostics, and does not have to wait a significant period before being seen. Tests and results are processed efficiently, so that hours or days do not pass before results are back. Day of discharge and placement tasks can be coordinated to allow for a smooth hospital exit to post-hospital care as necessary.

It is not the clinical condition per se which causes the delay, but how organizations are managing services to care for people with these clinical conditions that cause the greatest delays. Coordinating the resource plan of care involves sequencing the anticipated services and procedures so that they are delivered in an efficient and timely fashion.

Findings

The hospital was facing problem due to delay in discharges which is leading to patient dissatisfaction. It was also causing unavailability of bed for new admissions. There was lack of clear communication and coordination between disciplines. Process for discharge was not streamlined. So, it was important to analyse the bottlenecks and take preventive and corrective actions to improve the process. From this study, it was found that there was delay in the discharge time. Number of Patients who were discharged after scheduled time was more than that before scheduled time. Discharge time for both cash and insurance patients was exceeding the norms of the hospital. Discharge process steps were analysed and reasons of delay found were late round of consultants, delay in correction of discharge summary, delay in insurance clearance, delay after billing settlement when patient is not prepared for discharge, and delay in arrival of stretcher.
Figure 1 depicts the number of delays in the Total Discharge process – beyond the TAT (2:00 hrs in cash & 5:00 hrs in TPA) (time at which doctor announced the discharge & patient physically moved out of the hospital)

No. of Patients Whose Discharge process was not completed in time

Figure 2: Process Time at Cash Counters

Figure 2 depicts delay in Pharmacy return after Doctor Announced the Discharge beyond TAT (10 minutes)

In this we considered the whole process between the doctors announced the discharge and patient moved out of the hospital. The time taken should be 5 hrs in TPA & 2 hrs CASH (TAT)

Out of 150 TPA patients and 170 cash patients, 80 and 140 patients respectively did not get their discharge process completed in time.

Their time exceeded up to 7 hours in TPA patients and 5 hours in Cash patients.

Figure 3: Opportunities & Time Lags

In this we considered the subsection between the doctors announced the discharge & pharmacy return took place. The time taken should be 10 min (TAT). Out of 150 TPA patients and 170 cash patients, for 40 and 45 patients respectively there was delay in sending the pharmacy return on time. Their time exceeded up to 20 minutes.

Figure 4, depicts the delay in preparation of final discharge summary after the completion of hand written discharge summary beyond TAT (45 min)

Fig. 4: Delay in preparation of final discharge summary
Here the subsection between the preparation of Final Discharge Summary and hand written Discharge summary was considered. The time taken should be 45 min (TAT). 50 patients out of 150 TPA patients and 40 patients out of 170 cash patients were those whose final Discharge summary was not prepared on defined time.

**Reasons observed were-**

- Doctors busy with the rounds
- Single MT
- Time taken for Corrections
- No staff for pharmacy return
- RMO busy with admissions
- Attendant not available for payment and other formalities
- No tentative discharges
- Doctor busy in OT
- Large no. of medicines which take more time to write an indent
- Same time room allotment
- HIS issues
- Delay in reporting
- Waiting for the ambulance
- Staff taking more time for Medicine Returns
- Internal disputes
- Activity taking 2-3 Hrs to reach the Billing
- Neuroscience summary takes longer times

**Recommendations:** Patients with delayed discharges were common. Reasons of delay were analysed and recommendations were given to reduce delay. If recommended measures are considered valid and applied in the system, the duration of time can be greatly reduced. Discharge intimation form and discharge checklist for patients and caregivers was made and recommended for implementation to reduce delay and enhance quality of discharge process. An improvement in the discharge procedure will increase the patient satisfaction immensely as discharge is observed to be one of the most common reasons for dissatisfaction amongst the patients. For effective discharge planning family, hospital staff, doctors, nurses must work together, performance standards should be frequently monitored and there should be openness to innovative solutions.

**A few more recommendations:**

- Implementation of online pharmacy
- Hiring of the staff
- Scheduling the time of support staff in Pharmacy, Reception & house keeping.
- All the Activity sheet will not go for the OT clearance
- Preparation of Tentative discharges before collection of all the reports.
- Improve the communication between doctors, nurse & patients.
- Special training should be given to the staff
- Enhancing the coordination between all the departments.

**Conclusion**

From this study, it was found that the total average time taken for TPA and cash patients to be discharged in a multi-specialty hospital was 7 hours and 5 hours respectively.

**Conflict of Interest:** There is no Conflict of Interest.

**Source of Funding:** Not funded by any agency.

**Ethical Clearance:** This study was conducted as a part of Summer Internship of MBA (HHM), and there is no ethical issues involved.

ABSTRACT

Introduction: Hospitals currently operate in an environment of rapid socioeconomic and technical changes that raise concern for the quality of health care. Accreditation would be the single most important approach for improving the quality of care in hospitals. Rights of staff in a hospital are to be respected and protected.

Aim: was to study the awareness of the Human Resource Management standards as per NABH among the staff that is to be followed in the organization.

Materials & Method: Research design applied was descriptive method with questionnaire based survey, personal interview and direct observation of the hospital employees and studying relevant records.

Results & Discussions: The study revealed that on Crete steps in terms of initiating mechanism of action to ensure strict adherence to Human Resource management Standards and up gradation of the existing practices is necessary to comply with the NABH standards. There are many Standards which the staffs are not aware about and hence there is a need of training for Human resource management standards.

Conclusion: There is a need of proper communication system to be built. Training sessions should be held at such time so that the staff members are able to attend the training. Also there is a need of training with proper and adequate information on the standards.

Keywords: NABH, HRM, awareness, standards, hospital staff.

Introduction

The healthcare industry is potentially the world’s largest industry with total revenues of approximately US$ 2.8 trillion. In India as well, healthcare has emerged as one of the largest service sectors constituting 5 per cent of the gross domestic product (GDP) and offering employment to around 4 million people. India’s primary competitive advantage over its peers lies in its large pool of well-trained medical professionals. Also, India’s cost advantage compared to peers in Asia and Western countries is significant. In addition, changing demographics, disease profiles and the shift from chronic to lifestyle diseases in the country have led to increased spending on healthcare delivery. With many health care systems worldwide, increased attention is being focused on human resources management (HRM). Specifically, human resources are one of three principle health system inputs, with the other two major inputs being physical capital and consumables. When examining health care systems in a global context, many general human resource issues and questions arise. In Indian context, National Accreditation Board for Hospitals& Healthcare (NABH) has laid certain standards for implementation. The study assess in this context, the awareness related to the same amongst the employees of a tertiary care hospital in India.

Aim

To assess the level of awareness amongst the employees about NABH standards in tertiary care hospital.
Objective

The study objective was to understand level of employee awareness and implementation for HRM standards of NABH applicable in hospital they were working for with a view to suggest certain recommendations.

Limitation

The study was limited to only one tertiary care hospital.

Review of Literature

In the past, hospitals could, perhaps, afford the luxury of non-business like and of adopting hit-and-miss methods of management as a number of philanthropists made huge donations to meet the ever-rising deficit in hospital budgets. Similarly, in the field of human resource management, as long as the salary budget comprised only a small portion of the total budget, hospital administration could afford to neglect the introduction of scientific and progressive principles of human resource management. But they can no longer afford to do so as salary and wages now represent 65 per cent or more of the total hospital budget.4

Human resource is the most important resource of a Hospital. Human resource is an asset for effective and efficient functioning of a hospital. Human resources, when pertaining to health care, can be defined as the different kinds of clinical and non-clinical staff responsible for public and individual health intervention. As arguably the most important of the health system inputs, the performance and the benefits the system can deliver depend largely upon the knowledge, skills and motivation of those individuals responsible for delivering health services. HRM in health has to function in a sector with some unique characteristics. The workforce is large, diverse, and comprises separate occupations often represented by powerful professional associations or trade unions. Some have sector-specific skills; other can readily move from the health sector to employment in other sectors. The avowed first loyalty of those with sector-specific skills and qualifications (physicians, nurses, etc.) tends to be to their profession and their patients rather than to their employer.

Often the behavior of personnel is cited as one of the major reasons for the poor perception of healthcare services.5 Thus in order to improve the quality of the Human Resource Management Practices in hospitals National Accreditation Board for Hospitals & Healthcare Providers (NABH) has setup several standards for Human Resource Management.

Higher organizational effectiveness, machines, technologies, procedures and systems are no doubt important; but what is more important is the quality of the individuals behind them. Managing the human assets in any organization, be it hospitals or otherwise, is a far more difficult proposition than managing the other physical and financial aspects. All organizations, whether big or small, manufacturing or service oriented, profit or non-profit making, are basically human organizations. Hospitals or healthcare institutions are not different from this and are very much dependent on their human resource. Managing qualified human resource is a key to success and healthcare, as a labor-intensive sector, is bereft with problems. Human resource plays a significant role in the effective performance of a hospital. This depends to a great extent on the quality of its staff—the better their quality, the higher the level of performance.6

Thus a systematic study of the awareness of the NABH standards related to Human Resource Management among the staff members of the hospital is expected to be helpful to know whether the staff members are aware of their rights and responsibilities, whether the staff members know the Human Resource Management practices followed in the organization as it would help the HR Managers to identify the need for training related to this Human Resource Management standards of NABH which will help them to achieve quality standards of HRM for accreditation. This will also increase the productivity and satisfaction of the employees and benefit the management, which eventually will work to the advantage of the end users of the society as a whole.

Material and Method

The study was conducted to assess the awareness level of the staff of the 105-bedded tertiary care hospital about the NABH Human Resource Management standards that are followed in the hospital for 246 staff members, out of which 112 staff members from were included in the study due to time and other constraints. The study design adopted for the purpose was exploratory and descriptive in nature along with direct observation of hospital staff members and also studying relevant records of the hospital and was conducted for a period of two months.
Convenience random sampling was adopted. Total 30 departments were covered which included 112 staff members of the hospital. The staff members consisted of nurses, paramedical staff, administrative staff and front office executives. For the purpose of the study, a questionnaire was formulated and administered to 112 staff members of the hospital. The study instrument consisted of 12 questions covering most of the NABH standards related to Human Resource Management which was aimed to assess awareness about the NABH Standards of HRM in the hospital. Responses were obtained on dichotomous scale only, as the objective was limited to assess the awareness. Results obtained were verified, codified and valid percentage was obtained with the use of SPSS version 18.

**Observations & Results**

The demographics details along with distribution of responders in various categories of employment is given in Figure. 1.

**Fig. 1: Demographic Profile details**

The staff member consisted of 43% female and 57% male staff. Further the staff had mix of various categories such as nursing personnel’s, paramedical staff, and administrative staff and support service staff members. The female population mostly consisted of the nursing staff, and the male population mostly consisted of administrative and other staff. The composition of staff members is presented in Fig. 2:

**Fig. 2: Composition of staff distribution**

Following are the findings (table 3) that were obtained based on the responses of the staff members on section B of questionnaire which had questions about measuring the awareness level of the staff members:

**Discussion**

Earlier studies on Human resource management have just focused on the HRM practices followed in the organization or the comparison between the HRM practices followed in the organization or the satisfaction level of the employees related to the HRM practices followed in the organization but very few studies have been conducted on the awareness about HRM standards among the staff members that are followed in the organization. Today human resources occupy, more than ever, the center stage of all economic activities. It is alarming time for all those organizations that wish to be successful in global markets to gear up and implement desired shift in their prevailing human resource management practices and leverage their human resources along with the other resources.

As staff is an important asset of the organization they should be aware of the HRM standards for the knowing their rights and responsibilities. In the above study it was seen that although 91.9% of the staff members have undergone the induction training program in which training is also given on HRM standards of NABH still very few staff members knew about the objective elements in the NABH chapter 9 of HRM. Also objective element ‘e’ of “HRM standard 2” states that the staff members should be made aware of their rights and responsibilities at the time of induction but only 34.8% of the staff are aware of their rights. This
might be because of providing inadequate data about the standards in the induction training as the staff members also commented that they are not at all satisfied with data provided at the induction training program.

“Standard 3 of HRM” states that there is an on-going program for professional training and development of the staff but it is seen during the study that majority of the staff are still not aware of the training and development program conducted at the organization.

Standard 4 of HRM states that the staff should be adequately trained on various safety related aspects but it is seen in the study that only 28.57% of the staff are aware of the safety precautions to be taken. Thus the staff members should be given training on various safety related aspects. It is also mentioned in the objective element of the standard 4 of HRM that the training should also be provided on various occupational hazards but from the study it is seen that only 41.9% of the staff members are aware that HR department provides training on the occupational hazards. The objective element ‘b’ of “HRM standard 5” states that the staff members should be made aware of the performance appraisal system at the induction program but it is seen in the study that only 58.9% of the staff members are aware of the performance appraisal system followed in the organization which needs to be improved. HRM standard 7 addresses the health needs of the employees. Objective element ‘c’ of these standard states that Regular health checks of staff are done at least once a year. But it was found that only 40.17% of the staff members are aware of the annual health check-up programs conducted in the hospital thus the HR department should make efforts each and every employee should be made aware of the annual health check-up sessions.

**Recommendations**

1. There should be training program arranged on NABH standards related to HRM standards.
2. More information should be provided about the Human Resource Management standards at the induction training program.
3. The staff members should be made aware of their responsibilities towards patients.
4. Information about the safety precautions to be undertaken at the work place should be provided to the staff members.

5. The Human Resource department should see to it that the staff members must update their job description and job responsibilities.
6. Training on occupational health hazards should also be given to the staff members.
7. Information regarding the health check-up sessions conducted for the staff should be conveyed to all the staff members.
8. The schedule of the Training and development programs conducted by the Human resource department should be informed to each staff member.
9. Performance appraisal system followed in the organization should be communicated to the staff members.
10. The HR department should establish proper communication system for better flow of information through their website, circulars, and notices on the board, notice board in the cafeteria and staff rest rooms.
11. The training sessions should be scheduled in such a way that all the staff members are able to attend the training.

**Conclusion**

The study revealed that initiating mechanism of action to ensure strict adherence to Human Resource management Standards and up gradation of the existing practices is necessary to comply with the NABH standards. There are many Standards which the staff is not aware about and hence there is a need of training for Human resource management standards. Although there are few standards in which the staff members does not need any training but there are many of which the staff is not aware about and there are many reasons behind this like staff has not attended the training due to their busy schedule, they are not aware that such training is being conducted and the most important reason is improper communication system between the HR department and the staff members. There is a need of proper communication system to be built between the Human Resource department and the staff members. Moreover, the training sessions should be held at such time so that the staff members are able to attend. Also there is a need of training with proper and adequate information on the standards.

Prescribing Pattern of Anti Fungal Drugs in Dentistry- A Cross Sectional Study in a Private Dental College in Chennai

Devika Warrier E1, Karishma Ravinthar1, Anitha Roy2
1Graduate Student, 2Associate Professor, Department of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

ABSTRACT

Aim: The purpose of this survey was to assess the awareness about the antifungal drugs and its various uses in dentistry.

Materials and Method: A pre-tested interviewer administered questionnaire was distributed among the post graduates and dental practitioners in a private dental college in chennai. The questionnaire consisted of 15 questions. It included the questions related to the importance of antifungal drugs used in various dental infections. Data from the received questionnaires were entered into a computer database and analysed and descriptive statistics were produced.

Results: The most popular antifungal drug prescribed was fluconazole 53% followed by clotrimazole 30% and nystatin 9%, miconazole 5% and chlorhexidine 3%. It was found that these antifungal drugs were used to treat oral candidiasis which is one of the serious oral fungal infection.

Conclusion: This study could give light to the prescribing pattern of antifungal agent in dental office as treatment of many diseases like cancer and bronchial asthma are associated with fungal infections and it is of concern to overcome from it for better oral health.

Keywords: Anti fungal drugs , Candidal infection, Prescription, Dentist

Introduction

Fungal infections are extremely common and some of them are serious and even fatal. Candidiasis refers to an infection of the skin, mucosa and rarely of the internal organs caused mainly by Candida albicans and other candidia species. One of the mucosal lesion include oral candidiasis or oral thrush, found commonly in bottle fed infants and aged people. In this condition creamy white patches appear on the tongue or buccal mucosa. Fungi generally constitute a relatively small, proportion of oral microflora. The perfect fungi that divide by sexual reproduction are rarely isolated from oral cavity but occasionally found in infecting patients with advanced acquired immunodeficiency syndrome. Hence it is an opportunistic endogenous infection. The perfect fungi causing oral infections are Aspergillus, Geotrichium and Mucor species. The imperfect yeasts or yeast like fungi such as Candida species which divide by asexual reproduction that is by budding and fission are mostly found in the oral cavity. There are nearly five types of candida species which are seen in the oral cavity. Candida tropicalis, Candida parapsilosis, Candida albicans, Candida krusei , Candida guilliermondii. Among these five types, Candida albicans are commonly seen in the oral cavity. Hence it is one of the main components of normal oral microflora and around more than 50% people carry this organism. Candida albicans have recovered from the patient’s mouth of different age groups. There are few local factors such as acid saliva, xerostomia, night use of prosthetic dentures, tobacco, carbohydrate rich diets that make the oral tissues susceptible to
Fungal infections are usually more difficult to treat than bacterial infections because fungal organisms grow slowly. Increased oral candidal colonization can predispose to rhomboid glossitis (central papillary atrophy), atrophic glossitis, denture stomatitis, pseudomembranous candidiasis (thrush), and angular cheilitis. The main drugs used to treat these fungal infections are fluconazole, amphotericin B, clotrimazole, nystatin and ketoconazole. Hence this study reflects on the importance of anti fungal drugs and their effects and the necessity for dentists to have a thorough knowledge about them.

**Materials and Method**

A pre-tested interviewer administered questionnaire based study was conducted among 100 post graduates and dental practitioners in Chennai. It consisted of 15 questions regarding the most commonly prescribed antifungal agents used for candidial infections. The data received was compiled in the form of computerised chart and was analysed using SPSS software. The frequency, percentage, valid percentage and cumulative percentage for each question were calculated and corresponding graphs were drawn.

**Results**

In this study, the most commonly prescribed antifungal drug was fluconazole 53% followed by clotrimazole 30% and nystatin 9% (Fig 1) 84% of dentists preferred antifungal drugs for oral candidiasis and 16% preferred for other fungal infections. Topical antifungals were preferred as the first line for oral candidiasis by 86% of doctors and 14% of the dentist prescribed systemic antifungals (Fig 2). Majority of the dentists (99%) preferred treating oral candidiasis after diagnosis. 93% of the dentists stated that denture stomatitis is one of the frequent cause of oral candidiasis(Fig 3). Surprisingly majority of the dentists (98%) preferred prescribing antifungal drugs (Fig 4). 88% of dentists prescribed antifungal drug for oral candidiasis alone,2% preferred for non candidial infections alone whereas 10% of dentists prescribed it for both oral and other fungal infection.Among the factors like age, gender, economic status of the patient 17% considered age .4% considered only sex whereas 79% considered both age and sex of the patient(Fig 5). Among the side effects caused by antifungal drugs, the most commonly chosen answer was allergy (53%), followed by nausea (25%), vomiting (12%), blurring of vision (4%) and other side effects (6%)(fig 6).
address all possible etiological factors before the decision of antimicrobial resistance. The treatment plan should on the antifungal drug is made. The present study pathogenesis of disease and the worldwide problem infection treated using antifungal drugs. 88% of the dentist itraconazole have been the most extensively studied and preferred antifungal agents to treat oral candidiasis while antifungal drugs. Oral candidiasis was the most important infection treated using antifungal drugs. 88% of the dentist preferred antifungal agents to treat oral candidiasis while 2% preferred for non candidial infections and 10% of the dentists preferred using antifungal drugs for both candidial and non candidial infection. From this study it was found that 99% of doctors preferred treating oral candidiasis after been diagnosed.

Topical antifungal therapy for oral candidal infections is available in many forms like pastilles, troches, creams, ointments and oral suspensions and remains the cornerstone of treatment in mild, localized cases of candidiasis in healthy patients. Antimicrobial activities of various herbs and spices in plant leaves, flowers, stems, roots, or fruits have been reported by many workers. A wide variety of secondary metabolites, such as tannins, terpenoids, alkaloids, quinones and flavonoids are endowed with antimicrobial properties. 86% of dentists preferred topical antifungal therapy as the first line for oral candidiasis. However, remaining 14% preferred systemic antifungals. Studies conducted early by Mohammad Al-Beyari 1988 it was revealed that systemic antifungal agents were recommended for patients with poor compliance such as patients with special needs and immunocompromised patients. Among systemic antifungal drugs, fluconazole and itraconazole have been the most extensively studied and proven as efficient antifungal drugs.

From this study it was found that denture stomatitis was one of the main cause for oral candidial infections. 93% of the dentist supported that oral candidiasis was seen mostly among denture where as 7% mentioned some other causes rather than denture stomatitis. In a previous study conducted in the year 1986 related to the role of antifungal agents in denture associated stomatitis it was found that the main cause of developing oral candidial infection was dentures. Denture prosthesis may produce a local environment of lowered pH and anaerobic conditions by decreasing the flow of oxygen and saliva to the underlying tissue; these conditions favour fungal overgrowth. Furthermore, biofilm in denture plaque represent a protective reservoir for oral microbes. It was also demonstrated that Candida organisms have an affinity for the tissue side of the denture and although Candida infection is the primary aetiology of most of these lesions, other factors such as poor denture hygiene and associated bacterial flora, continuous denture wearing, ill-fitting and traumatic dentures, carbohydrate-rich diet and rarely, allergy to denture material are contributory co-factors. It was also found that wearing denture at night and smoking were associated with the most extensive infection.

It was noted that 84% of the dental practitioners used antifungal drugs to treat only candidial infection whereas 16% of the dentist used this antifungal agents to treat other infections than oral candidiasis. Fluconazole was the main drug prescribed by the doctors. 53% preferred fluconazole, 30% preferred clotrimazole, 9% preferred nystatin, 5% and 3% of dentist preferred miconazole and chlorhexidine respectively. A similar study was done by Lewis et al 1989 and involved questioning about antibacterial and antiviral agents also. However, in that study like the present study, fluconazole was the most popular antifungal prescribed. There has also been an apparent increase in the proportion of practitioners prescribing clotrimazole in the present survey compared with 1987 and it has now become more popular than other antifungal drugs. This study shows that in some instances the choice of antifungal agent is dependent on the form of candidiasis being treated, the questionnaire was not prescriptive for the clinical form of candidiasis and merely asking for all the antifungal agents routinely prescribed in general dental practice.

Fluconazole is a more recent systemic antifungal agent, belonging to the triazole group, which has a long half-life and therefore can be administered in a single daily dose (50 mg), which increases compliance. It has been widely used in the immunocompromised for the
treatment of oral candidiasis when it is often used for prolonged periods; this has lead to the emergence of resistant strains of Candida albicans. A single high dose (150 mg) formulation of fluconazole is now used to treat candidial infections. Like miconazole, fluconazole has significant drug interactions and should be used cautiously in liver disease.

The dose preferred for each drug was different and it depends upon the severity of the infection as well as the drug used. From this study 79% of dentists stated that the dose have effect on the age as well as sex of the patient. There are many side effects associated with antifungal drugs. 53% of dentist stated that there are many allergic reactions associated with antifungal drugs. Other side effects include nausea 25%, vomiting 12%, blurring of vision 4%-6% of the dentists cited some other side effects associated with antifungal drugs.

**Conclusion**

Present study reveals that, antifungal drugs are mostly prescribed by dentists for candidial infections. Fluconazole is the most commonly used antifungal agents. Majority of the dentists preferred topical antifungal agents than systemic antifungal agents. The factors such as age and sex have more effect on the choice and dosage of these drugs. Allergy and nausea were the most common side effects associated with the use of antifungal drugs. Maintenance of oral hygiene and early diagnosis as well as treatment can overcome from fungal infections.

**Conflict of Interest:** Authors report that there is no conflict of interest of any kind.

**Statement of Informed Consent:** Informed consent was obtained from the concerned authorities and from the subjects before the study.

**Statement of Human and Animal Rights:** No harm was inflicted on any humans on conduction of this study.

ABSTRACT

Background: CA-breast is the most commonly diagnosed cancer in women with 15% prevalence. CA-breast lymphedema is most common complication of mastectomy. Treatment options available for lymphedema is currently limited to application of massage, active exercises and faradism under pressure. As alone faradism under pressure was found to be effective in treating ca-breast lymphedema but as there is limited research available to show any significant impact of biofeedback exercises with simultaneous application of faradism under pressure on lymphedema, so this made indeed to study the effect of faradism under pressure with biofeedback exercises in ca-breast lymphedema.

Aim: Effect of faradism under pressure with biofeedback exercises in Ca-breast lymphedema.

Study design: The study design was Pre test-Post test single blinded study.

Method: A total 30 women were allocated into 3 groups using convenient sampling technique. Group (A) received Faradism under pressure with simultaneous biofeedback exercises, group (B) received Faradism under pressure without biofeedback exercises and group (C) received only Faradism under pressure. Each group received treatment for 3days/week for 4 weeks. Pre and post treatment assessment was taken using VAS, Limb girth, volumetric assessment and Goniometry (shoulder, elbow and wrist) as outcome measures.

Statistical Analysis: data was analyzed using Paired’t’ test and ANOVA-repeated measure.

Result: In this study group (A) showed better effect on outcome than group (B) and (C). volumetric assessment P value was 0.4409 which was not significant. On other outcome measure VAS, Limb girth and goniometry was extremely significant. Thus this study shows extremely significant improvement in group (A) treated with Faradism under pressure with simultaneous biofeedback exercises.

Conclusion: Faradism under pressure with simultaneous biofeedback exercises are effective in treating CA-breast lymphedema which improves subjects functional as well as personal outcome in daily life than conventional treatment alone.

Keywords: CA-breast, Lymphedema, Biofeedback exercises, Faradism under pressure.

Introduction

Cancer is a disease which affects all type of living beings. There is no organ in the body in which cancer cannot develop.¹ CA-breast is the most commonly diagnosed cancer in women with 15% prevalence.¹² The most obvious feature of many cancer is the development of new growth.¹² New growth or neoplasm implies the growth of newly formed cells from normal body cells or their preceding development cells of origin. The new growth often, but not invariably, forms a lump or tumor, a term frequently used synonymously with neoplasm.
Malignant neoplasm or cancer which if untreated may destroy the host. 3,4

Cancer has many treatment options such as chemotherapy, radiation therapy, medical management, surgical management etc. Mastectomy is one of the surgery for breast cancer. 1,3,5,6,7,8

Some complications may occur after breast cancer surgery like wound infection, seroma, pneumothorax, tissue necrosis, hemorrhage, injury to neurovascular structure of the axilla and lymphedema etc. Lymph edema is one of the leading complication of Ca breast. 3,4,7

Lymph edema is the accumulation of protein-rich fluid in soft tissue as a result of interruption of lymphatic flow. 3,9,10 Lymphedema is one of the leading complication of Ca breast. 3,4,7 Lymph edema is a chronic, progressive and often debilitating condition. 7 In post mastectomy patient lymph edema has the potential to become a permanent and progressive. 7 Lymph edema is result of the functional overload of the lymphatic system in which volume exceeds transport capacities. 6 Once the condition progresses it become treatment resistance.

Lymph edema may lead to fibrosis of tissue. 1,2,3 It’s a result of deposition of protein-rich fluid in interstitial tissues. This protein-rich fluid becomes growth medium for bacteria and fungi. 3,9,10 This may lead to recurrent infection of affected limb. With each infection lymphedema condition may worsen. 3,6,8 If the lymphatic system is blocked or damage, edema accumulates over a period of time which may lead to thickening of the tissue. 3,6,8

Complications of lymph edema are limb enlargement, feeling of heaviness, mild discomfort, pain, joint immobility, skin changes, chronic inflammation etc. 2,3

Physiotherapy treatment options available for lymph edema are massage, active exercises and faradism under pressure. 2 Thus as damage to lymph node is the main root cause of lymph edema hence a better treatment approach which will focus on complication of lymph edema will be more effective than low frequency current and exercises alone.

Faradism under pressure was found to be effective in treating Ca-breast lymph edema but there is limited research available to show any significant impact of biofeedback exercises with simultaneous application of Faradism under pressure on lymph edema. So this made indeed to study the effect of Faradism under pressure with biofeedback exercises in Ca-breast lymph edema.

Materials & Method

Single blinded experimental study with 30 women of post-operative ca-breast lymph edema was included in this study. Inclusion criteria : swelling over upper limb, post-operative Ca-breast surgery, post Ca-breast radiotherapy, axillary lymph node dissection, unilateral upper limb lymph edema and stage 1 lymph edema. 5,7,8,9 Exclusion criteria : any other breast pathology, received prior any lymph edema treatment in last six months, open wound, deep vein thrombosis, affected side fracture and any other soft tissue injury. 5,7,8,9 The study was approved by the ethical committee. Written consent was obtained from all subjects. The subjects were allocated into 3 groups using simple random sampling using lottery method.

Procedure

Group A- received faradism under pressure [FUP] with biofeedback exercises. An electrical stimulator delivered faradic current from 50 to 100 Hz and electrodes were placed directly over lymph edema for 15 minutes. Crepe bandage was applied with elevation of the limb. Sphygmomanometer was used to perform biofeedback exercises. The subjects were instructed to press the cuff of sphygmomanometer to get visual biofeedback as the mercury level elevated.

Group B- received FUP with exercises but no biofeedback

Group C- received only FUP

All 3 groups received treatment for 3 days/week for 4 weeks.

Pre treatment and post treatment assessment was done using VAS, girth measurement, volumetric measurement and goniometry.

Outcome Measure

VAS was used to assess the severity of the pain. 4

Limb girth: For upper limb above elbow and below elbow was taken. 9

Volumetric assessment: Volumetric assessment works on Archimedes principle. 7

Goniometry: The range of motion were taken for shoulder, elbow and wrist joints. 7,9
Results

Total 30 women were included in study. [30 subjects 13 were right side affected and 17 were left side affected]

Age Group of all patients ranged between 40-60 years with the mean of individual Group A was 58.3, Group B was 55.4 and Group C was 56.4 which was statically not significant.

Limb girth- above elbow - showed that pre-treatment there was statistically considered significant difference seen with P values of 0.0403. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was extremely significant difference seen with P = <0.0001. Shoulder abduction- showed that pre-treatment there was statistically not significant difference seen with P values of 0.2576. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.1651. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.2160. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was significant difference seen with P = 0.0162. Shoulder medial rotation this shows that pre-treatment there was statistically not significant difference seen with P values of 0.2339. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.4277. Elbow-flexion: showed that pre-treatment there was statistically not significant difference seen with P values of 0.5024. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.0045. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was very significant difference seen with P = 0.0079.

Goniometry-shoulder–flexion: Showed that pre-treatment there was statistically not significant difference seen with P values of 0.2070. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.5341. Shoulder extension showed that pre-treatment there was statistically very significant difference seen with P values of 0.0045. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was extremely significant difference seen with P values of 0.0001. Shoulder abduction- showed that pre-treatment there was statistically not significant difference seen with P values of 0.2576. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.9643. Shoulder lateral rotation showed that pre-treatment there was statistically not significant difference seen with P values of 0.2339. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.4277. Elbow-flexion: showed that pre-treatment there was statistically not significant difference seen with P values of 0.5024. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.2071. Wrist- flexion: showed that pre-treatment there was statistically extremely significant difference seen with P values of 0.0001. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was very significant difference seen with P = 0.0002. Wrist- extension: showed that pre-treatment
there was statistically significant difference seen with P values of 0.0236. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was not significant difference seen with P = 0.5762. Wrist-ulnar deviation: showed that pre-treatment there was statistically not quite significant difference seen with P values of 0.0724. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was extremely significant difference seen with P = 0.0001. Wrist–radial deviation: showed that pre-treatment there was statistically not significant difference seen with P values of 0.9051. While on comparing the post treatment values, the results between the two Groups using ANOVA-repeated measure test revealed that there was very significant difference seen with P = 0.0037. In this study group A has shown improvement may be because of the simultaneous application of faradism under pressure and biofeedback exercises. Biofeedback exercises gives motivation and encouragement to patients to put efforts for better results. Simultaneous application of exercises with faradism under pressure drains lymphedema faster and reduce the recovery time as well.

**Discussion**

In this study simultaneous application of faradism under pressure with biofeedback exercises were done on postoperative CA-breast lymphedema. Reviewing various studies it was analyzed that the low frequency currents and exercises are the treatment options for lymphedema. This study was undertaken considering all the mentioned points and the aim of this study was to evaluate the effect of faradism under pressure with biofeedback exercises in Ca-breast.

30 Patients (women), (17left and 13 right) diagnosed as post CA-breast lymphedema between the age group 40-60yrs were drawn from Krishna hospital OPD for study purpose. They were evaluated and divided into 3 groups by convenient sampling with random allocation method. 10 subjects were included in Group A who were treated with faradism under pressure with biofeedback exercises, 10 subjects were included in Group B were treated with faradism under pressure without biofeedback and 10 subjects were included in Group C treated only with faradism under pressure. A pre and post treatment outcome measures using VAS, limb girth, volumetric assessment and Goniometry (shoulder, elbow and wrist) were done. The specific treatment protocol was followed as per the group for 3days/weeks for 4 weeks.

**GROUP A:** All the subjects in this group received FUP with biofeedback exercises for 3days/week for 4 weeks from the physiotherapist, who was accredited to practice FUP with biofeedback exercises. An electrical stimulator machine delivered faradic current from 50 to 100 Hz, and 2 electrodes were placed directly over lymphedema. Crepe bandage applied from distal to proximal over electrodes placed affected limb. Pillows were kept under affected limb to get elevation. The intensity of the stimulator was adjusted to just below the pain threshold and the stimulation lasted for 15 minutes. The BP apparatus were provided to perform biofeedback exercises. The subjects were instructed to press the cuff of BP apparatus to get visual biofeedback on mercury. 10

**GROUP B:** All the subjects in this group received FUP without biofeedback exercises for 3days/week for 4 weeks. Again the same physiotherapist gave treatment to this group.

Same procedure were done only exercises given without biofeedback.

**GROUP C:** All the subjects in this group received only FUP for 3days/week for 4 weeks. Again the same physiotherapist gave treatment to this group. In this group subject get only faradism under pressure as this is control group.

The study on efficacy of low-frequency low-intensity electrotherapy and manual lymphatic drainage in the treatment of chronic upper limb breast cancer-related lymphedema. In this study it was found that there was no significant on comparing the changes in low frequency low intensity electrotherapy and manual lymphatic drainage in treatment of chronic upper limb breast cancer lymphedema. In previous study there are some limitations to be considered in this trial. First, the small sample size and the fact that patients were not blinded for the treatment they received are the greatest potential bias problems. Second, selecting chronic lymphedema patients limits the conclusion to only this chronic phase. In current study large sample size has included. Single blinded study has conducted. In this study acute stage of lymphedema has included.
The study on combined Physical Therapy, Intermittent Pneumatic Compression and arm elevation for the treatment of lymphedema secondary to an axillary dissection for breast cancer. Result of combined Physical Therapy can be considered as an effective treatment modality for lymphedema. Bandaging the arm is effective, whether its effectiveness is investigated on a heterogeneous group consisting of patients with upper and lower limb lymphedema from different causes. There is no consensus on the effectiveness of Manual Lymphatic Drainage. The effectiveness of skin care, exercises, wearing a compression sleeve and arm elevation is not investigated by a controlled trial. Intermittent Pneumatic Compression is effective, but once the treatment is interrupted, the lymphedema volume increases.

In conclusion of previous study, Combined Physical Therapy is an effective therapy for lymphedema. However, the effectiveness of its different components remains uncertain. Furthermore, high-quality studies are warranted. The long-term effect of Intermittent Pneumatic Compression and the effect of elevation on lymphedema are not yet proven.

In this study conventional (controlled) group has investigated. Faradism under pressure with biofeedback exercises this simultaneous application maintain the effect.

In this study group A has shown improvement may be because of the simultaneous application of faradism under pressure and biofeedback exercises. Biofeedback exercises gives a motivation and encouragement to patients to put efforts for better results. Simultaneous application of exercises with faradism under pressure drains lymphedema faster and reduce the recovery time as well.

**Conclusion**

This study shows that faradism under pressure with biofeedback exercises is highly effective and statistically significant in reduction of swelling and improvement in functional outcome for the patients with post-operative CA-breast lymphedema both clinically and statistically.

ABSTRACT

Background: Cervical spine is prone to pathologies because of its more mobility and poor anatomical support. Cervical spondylosis describes the age related changes in the cervical spine.

Objectives: To find and compare the effect of spinal mobilization with arm movement (SMWAM), neural tissue mobilization, hot moist packs and interferential therapy on pain and functional disability in treatment of cervical spondylosis with unilateral radiculopathy.

Method: 90 subjects with cervical spondylosis were screened out of which 79 fulfilled the criteria. It was a single blinded study in which pre and post treatment outcome assessment by VAS and NDI was taken by an outcome assessor. Subjects in Group A received spinal mobilization with arm movement (SMWAM), Group B received neural tissue mobilization and Group C received baseline treatment with hot moist packs and interferential therapy. All the three groups received 2 weeks’ treatment protocol during which 4 subjects discontinued the treatment.

Results: 75 subjects (male 29, female 46), participated in the study. Intra group comparison results showed statistically reduction in post interventional VAS and NDI score for all 3 groups (p<0.0001). Inter group comparison results showed that Group A was statistically significant in reducing VAS score (p=0.0017) and NDI score (p<0.0001) than Group B and Group C.

Conclusion: Both the group A and group B showed significant reduction in post treatment VAS and NDI scores than group C. SMWAM was more effective than neural tissue mobilization in reducing VAS and NDI scores in subjects with cervical spondylosis with unilateral radiculopathy.

Keywords: Mulligan Mobilization, Shacklock’s Neural Tissue Mobilization, Visual analogue scale (VAS), Neck disability index (NDI), Cervical Radiculopathy

Introduction

Cervical spine is known to have more mobility and poor anatomical support which makes it prone to pathologies¹. Neck pain is becoming increasingly prevalent in the society, secondary to back pain & causes significant impairment ²,³. The most common progressive disorder of cervical spine in elderly is ‘spondylosis’ which can be defined as vertebral osteophytosis secondary to degenerative disc disease. Disc degeneration involves many alterations in normal physiology associated with aging⁴. Chronic disc degeneration also can affect cervical vertebrae, facet joints and other joints. Degenerative changes can also be seen in associated soft tissue support such as posterior longitudinal ligament and the ligamentum flavum. Most commonly, degeneration is found at C5-C6 vertebrae,
followed by C6-C7 and C4-C5. Degenerative changes are associated with nerve impingement which gives rise to three clinical syndromes in cervical spondylosis—i) Axial neck pain ii) Cervical radiculopathy iii) Cervical myelopathy.

Space occupying lesion such as spondylotic spur, disc herniation or cervical osteophyte causes nerve root compression that leads to cervical radiculopathy. Radicular symptoms are seen in the ipsilateral upper extremity. Depending upon which nerve root is impinged, dermatomal pattern is followed in cervical radiculopathy. The prevalence of cervical radiculopathy is higher in fourth and fifth decade of life, estimated as 2.1 cases per 1000. Overall cervical radiculopathy has a prevalence reported as 3.3 cases per 1000 people.

Neck pain associated with cervical spondylosis is commonly treated by drugs, physiotherapeutic modalities or exercises. Physiotherapeutic modalities include: - Short wave diathermy, moist heat, cryotherapy, therapeutic ultrasound, transcutaneous electrical nerve stimulation, cervical traction. Physical therapy exercises are: - Neck retraction, neck extension, deep neck flexor and scapular strengthening exercises, manual therapy, active range of motion exercises, aerobic conditioning exercises and resisted exercises.

A New Zealand physiotherapist, Brian Mulligan found that spinal mobilization with arm movement provides immediate, significant and lasting changes in the patient’s condition. Appropriate spinal level is selected and a sustained mobilizing force is applied to that level while the patient performs arm movement provoking the pain. Spinal mobilization with arm movement must result in pain free movement.

Indications: End range shoulder pain or a painful arc, rhomboid pain while horizontal abduction or adduction, radiating pain in hand with arm movement.

Neural tissue mobilization reduces intrinsic pressure on the neural tissue and promotes optimal physiological function. It restore dynamic balance between relative movements of nerve tissue and surrounding mechanical interference. It is evident that in neck pain when a patient undergoes nerve tension stretching, there is significant improvement in range of motion.

Both the treatments were compared with a baseline treatment including hot moist packs and interventional therapy modality. There are very few studies published regarding Spinal Mobilization with Arm Movement. Also no study have compared both the treatments. The aim of this study was to examine whether Spinal mobilization with arm movement or neural tissue mobilization would lead to better outcomes in reducing pain and improving functional ability in the management of cervical spondylosis with unilateral radiculopathy.

Materials and Method

Case control study

Participants: A written consent was taken from 90 subjects clinically diagnosed with cervical spondylosis. They were screened and 79 subjects were selected by inclusion criteria. Both male and female subjects between age group 45-65 diagnosed with cervical spondylosis by fulfilling the Wainner et al. clinical examination criteria and having only unilateral radiculopathy were included. Exclusion criterion were as follows: 1) Subjects with bilateral radiculopathy 2) Traumatic injuries of upper limb and cervical spine 3) Any infectious disease of cervical spine 4) Any congenital deformity of spine 5) Any surgery performed on cervical spine 6) Dizziness. 4 subjects discontinued the treatment before 2 weeks. Pre and post treatment outcome measures of pain on VAS, functional disability using neck disability index for 75 subjects were recorded by an outcome assessor.

Interventions: Participants were divided into 3 groups by convenient sampling with random allocation. Intervention period of 5 days/week for 2 weeks was carried out. Group A received Spinal mobilization with arm movement (SMWAMs) (3 sets of 7-10 repetitions) along with the baseline treatment. Group B received neural tissue mobilization (30 seconds- 2 minutes, 5 sets) along with the baseline treatment and Group C received only baseline treatment with interventional therapy (frequency 100Hz, for 15 min) and hot moist pack for 15 min.
Data Analysis

Discussion

The present clinical trial was conducted to compare the effectiveness of Spinal mobilization with arm...
movement (SMWAM) and neural tissue mobilization in cervical spondylosis with unilateral radiculopathy.

Male to female ratio was 1:1.5 in this study. A study including 30 subjects with male to female ratio 1:2 reported that both genders are equally affected with cervical radiculopathy but males show early degenerative changes in cervical spine and females show degenerative changes after menopause\(^1\). A higher percentage of females included in this study contributes to their menopausal factor. In another study it was stated that males are more commonly affected by cervical spondylosis than females at a ratio of 3:2\(^4\), which does not correlates the ratio in this study.

Subjects of the age group 45-65 were included in this study. Cervical spondylosis is a natural process of aging and it is seen in 95% of individuals by the age of 65 years\(^4\). The inclusion of samples in this study supports the prevalence rate of above study. Also prevalence of cervical radiculopathy is higher in fourth and fifth decade of life, estimated as 2.1 cases per 1000\(^0\).

In this study, group A had 11 males and 14 females. Group B had 11 males and 14 females. Group C had 7 males and 18 females. According to Fisher’s-Exact test, the difference is considered as not significant (p value = 0.2152)

The average mean age of participants in Group A was 53.48 ± 7.10, in Group B it was 51.64 ± 5.97 and in Group C 52.92 ± 6.39. According to One Way ANOVA test the difference is considered as not significant (p = 0.5938)

Wilcoxon matched pairs test was used to analyse the effect of SMWAMs in cervical spondylosis with unilateral radiculopathy and showed that there was extremely significant reduction in VAS score (p < 0.0001, r = 0.4440) and NDI score (p < 0.0001, r = 0.5225). (Table 1, Table 3)

In spinal mobilization with arm movement, spinal movement takes place when the shoulder girdle is moved, because of the muscle attachments from scapula to cervical and upper thoracic vertebrae. Also, it corrects the positional faults causing impingement of pain-sensitive structures such as nerve roots. Mobilization results in freeing the nerve so that radiating pain in the upper limb reduces\(^10,12\).

Wilcoxon matched pairs test was used to analyse the effect of Neural Tissue Mobilization in cervical spondylosis with unilateral radiculopathy and showed that there was extremely significant reduction in VAS score (p < 0.0001, r = 0.5928) and NDI score (p < 0.0001, r = 0.6765). (Table 1, Table 3)

Neural tissue mobilization restores the plasticity of nervous system. In neural tissue mobilization, the nerve, its sheath and structures surrounding it shift in relation to other such structures. This improves movement of the nerve in relation to its interface by increasing the flexibility of collagen. Shacklock’s neural tissue mobilization consist of combined movements of at least 2 joints. One movement lengthens the nerve while other movement decreases the length of nerve. This movement increase and decrease the nerve tension alternatively\(^12\).

Wilcoxon matched pairs test was used to analyse the effect of combined Hot Moist Packs and Interferential Therapy in cervical spondylosis with unilateral radiculopathy and showed that there was extremely significant reduction in VAS score (p < 0.0001, r = 0.7698) and NDI score (p < 0.0001, r = 0.5991). (Table 1, Table 3)

Hot moist packs increase metabolic activity of tissue by increasing blood flow and removing metabolic waste products. Also, application of heat stimulates the neural receptors in the skin and tissues which causes reduction in muscle spasm. Interferential therapy causes reduction in pain by blocking pain-gate and also by absorption of exudates\(^15\).

Comparison of Visual Analogue Scale scores between three groups was done by using one way Anova test to find out the effectiveness between three groups. The statistical analysis revealed that there was very significant difference in visual analogue scale scores in all three groups post treatment (p=0.0017). Group A was more efficient in reducing VAS scores than Group B and Group C post treatment. (Table 2)

Comparison Neck Disability Index score between three groups was done using one way Anova test to find the effectiveness between the three groups. The statistical analysis revealed that there was extremely significant difference in Neck Disability Index score in three groups post treatment (p <0.0001). Group A was more efficient in reducing NDI score than Group B and Group C post treatment. (Table 4)
Neural tissue mobilization mobilizes the nerve and improves the plasticity of nerve. Whereas, Spinal mobilization with arm movement mobilizes the vertebrae and muscles attached to them as well as reduces nerve impingement. Hence the above study showed better decrease in VAS and NDI scores with help of SMWAM in cervical spondylosis with unilateral radiculopathy.

It can be stated from above study that both SMWAM and neural Tissue Mobilization are helpful in reducing the symptoms of cervical spondylosis with unilateral radiculopathy than only conventional physiotherapy treatment. SMWAM yields better result outcomes than neural tissue mobilization and it is more efficacious and cost effective.

Result

Based on the results of the present study it is concluded that both the Groups A and B showed significant reduction in VAS and NDI scores. Group A showed extremely significant reduction in VAS and NDI scores than Group B in subjects with cervical spondylosis with unilateral radiculopathy.

Conclusion

Results supported that Spinal Mobilization with Arm Movement was more effective than Neural Tissue Mobilization in reducing VAS and NDI scores in subjects with cervical spondylosis with unilateral radiculopathy.

ABSTRACT

Background: Adolescence is the formative period of life when the maximum amount of physical, psychological, and behavioural changes take place. During this stage the requirement of nutrition and micronutrients is relatively high. Therefore, adolescents, especially girls, particularly those between the ages of 12–15 years, are vulnerable to iron deficiency mainly because requirements are at a peak. In this connection, an attempt has been made to know the awareness and perception regarding anemia among adolescent girls.

Objectives:
1. To know the awareness and perception about anemia among urban and rural high school girls aged 13-16 years.
2. To know their awareness about health impacts of anemia during growth period and pregnancy.
3. To compare the awareness and perception on anemia between urban and rural high school girls.

Methodology: A school based cross sectional study was done for a period of one year (December 1, 2014 to November 30, 2015) among 650 adolescent high school girls of Davangere city & field practice area of JJM Medical College, Davangere, Karnataka using a predesigned, pretested, multiple response type of Questionnaire, designed for the study by interview method.

Results: Mean awareness score of rural girls was higher (2.86) compared to urban girls (2.20) which was found statistically highly significant, whereas mean perception score was almost same for both rural (2.02) & urban (2.03) adolescent high school girls & was found statistically insignificant.

Conclusion: The present study revealed that rural adolescent girls were more aware about anemia compared to urban girls, where as both urban and rural girls had same perception about anemia.

Keywords: High school; Adolescent girls; anemia; awareness; perception; prevalence.

Introduction

“Nutritional anaemia is a condition in which haemoglobin content of blood is lower than normal as a result of deficiency of one or more essential nutrients, regardless of the cause of such deficiency”[1].

In India, according to National Health and Family Survey (NHFS-3), the prevalence of anaemia among adolescent girls, 15-19 years, is 55.8٪. In Karnataka, according to National Health and Family survey (NHFS-
Adolescence is the formative period of life, in the age group of 10 to 19 years, when significant growth and maturation occurs. It is a time of increased demand for iron in the food, more so among girls, not only because of menstruation but also because of social factors like preference to feed more for male children, girls eating last whatever is left, being deprived of good food, workload of household chores, negligence of female children etc., making them vulnerable for the development of anemia. Thus adolescent period not only constitutes a critical period for the development of anaemia but also with the onset of menarche, they enter the reproductive life, constituting potential mothers.

In this connection, an attempt has been made to know the awareness and perception about anaemia among adolescent girls.

Objectives

1. To know the awareness and perception about anaemia among urban and rural high school girls aged 13-16 years.

2. To know their awareness about health impacts of anaemia during growth period and pregnancy.

3. To compare the awareness and perception on anaemia between urban and rural high school girls.

Materials & Method

The current cross sectional, school based, comparative study was undertaken in Davangere city and field practice area of JJM Medical College i.e. Anaji & Mayakonda for a period of one year from December 1, 2014 to November 30, 2015 among 650 adolescent high school girls aged 13 to 16 years of 8th to 10th standard i.e. 330 girls from government Seethamma girls H.S of Davangere city and 320 girls from government Deeveramama K. Vetteppa girls H.S of Anaji & G.SC-ST.G. Girls H.S of Mayakonda.

Sampling procedure:

Sample size estimation: According to National Family Health Survey (NHFS-3), the prevalence of anemia among school going adolescent girls is 55.8%. It is rounded up to 56%. Using this data, the following formula has been applied to determine the required sample size for the study.

\[ n = \frac{4pq}{d^2} \]

Where,

\[ n = \text{sample size}, \]
\[ p = \text{prevalence of anaemia i.e. 56\%}, \]
\[ q = 100-p = 100-56 = 44, \]
\[ d = \text{admissible error (10\% of p) = 10\% of 56 = 5.6}, \]
\[ n = 4\times56\times44/5.6\times5.6 = 9856/31.36 = 314.28. \]

The calculated sample size is 314. It is rounded up to 330 for the urban schools and 320 for the rural schools of the field practice area of the college, thus constituting a total of 650 adolescent high school girls as the study group. There are eight government girls high school in the city, each with strength of more than 300. So one school was selected at random, by Simple Random technique. There is one Girl’s high school in each of the three P H C’s attached to the college, each school with a strength of more than 160. So two schools were selected at random to obtain the required sample size.

Criteria for the selection of subjects:

Inclusion criteria: High school girls of 8th, 9th and 10th standard, who are in the age group of 13 to 16 years and who have attained menarche were included in the study

Exclusion criteria: Girls with chronic illness and heavy menstrual disorders and those with a history of regular consumption of IFA (Iron and Folic acid) tablets in the past three months were excluded from the study.

Method of data collection: Prior permission was obtained from the school authorities for the proposed study. Sampled schools were identified and school address was noted. Selected schools were visited on a prefixed date. Importance of the study was explained to all the girl students of 8th to 10th standards. An empty class room was provided by the school authorities to conduct the study. Selection of students was done by systematic random sampling method. The class teacher
and the students were briefed regarding the purpose of the study and confidentiality was maintained. The data was collected in a predesigned, pretested, multiple response type of Questionnaire, designed for the study by interview method. The students were briefed about the terms used in the proforma. Each participant was given a questionnaire and was instructed to tick one correct answer they know. The forms were collected soon after it is filled up.

The questionnaire was addressed on the topic of awareness of anemia, its health impacts and perception about anemia. Every question had a response of a right answer, a wrong answer and don’t know also, considering it as incorrect. The study variable of anemia are about the related system, related nutrient, hemoglobin level, dietary source, cause, early features and health impacts of anemia during growth period and pregnancy and also about their perception on anemia.

**Ethical clearance:** The present study was approved by ethical committee of JJM Medical College Davangere.

**Statistical analysis:** The collected information was compiled, tabulated & analyzed for results by using SPSS software package version 17.

**Statistical tests used:** Percentage, simple Proportion & Chi-square test.

**Results**

A total of 650 adolescent girls i.e 320 from field practice area of JJM Medical College & 330 from Davangere city were included in the study as shown in figure no 1.

![Distribution of adolescent girls according to residential area](image1)

* Student’s unpaired t test

Table 5 shows Mean awareness score of rural girls about anaemia was higher(2.86) compared to Mean awareness score of urban girls(2.20) & this difference was found statistically highly significant, where as the Mean perception score was almost same for both rural(2.02) & urban(2.03) adolescent high school girls & this was not statistically significant.

**Discussion**

In our study 650 adolescent girls in the age group of 13-16 years were involved of which 330 were from urban & 320 were from rural areas. This was similar to a study conducted by Kaur. Deshmukh P R & Garg B S in rural Wardha which included a sample of 630 adolescent girls in the age group of 13-16 years,

It was found that in our study 59.85% girls told that they were aware of anaemia,41.56% told that anaemia occurs due to iron deficiency, 71.54% were aware that anaemia has an impact on growth, development & learning process in school children,where as in a study conducted by S Khedu in Moritius 90.6% of the respondents knew what the term anaemia meant, 78.3% could associate anaemia with micronutrient iron found in food & 86.4% were of the opinion that being anemic will reduce concentration in class.

In our study 61.23% girls answered that green leafy vegetables are the main dietary source of iron where as in a study conducted by Mammeet Kaur in Chandigarh 93% women were in favour of including green leafy vegetables in diet.

In our study 52% of the adolescents perceived that anaemia occurs due to lack of knowledge about disease,54.62% perceived that consumption of good food will help to protect against anaemia & 95.69% were having the perception that they have to consult the Doctors if found anemic, where as in a study conducted by Peggy Bentley among women of four Indian states, most of the women percieved that anemia presents as weakness,dizziness,blood loss & considered poor quality of diet as major reason for that & in a study conducted by Rae Galloway et. al most of the women did not know about anemia, its causes & prevention.They described anemia as thin blood, low blood, weakness, loss of blood, headache, dizziness.

**Conclusion**

The present study revealed that rural adolescent girls are more aware about anemia as compared to urban girls, where as urban girls percieved anaemia correctly as compared to the rural girls. So it is important that all adolescent girls are supposed to know about anaemia and its health impacts because of the menstruation process and in the interest to safeguard the future reproductive health.

**Funding:** None

**Conflict of Interest:** Nil

**Ethical Clearance:** The present study was approved by ethical committee of JJM Medical College Davangere, Karnataka.

The Effectiveness of Mulligan’s Pain Releasing Phenomenon Versus Kinesio-Taping in De’quervains Tenosynovitis

Gauri S. Nikam¹, Amrutkuvar Pawar², Namrata Patil², Khushboo Bathia²
¹Physiotherapist, Faculty of Physiotherapy, ²Assistant Professor, Krishna college of physiotherapy, KIMS 'Deemed to be’ university, Karad, Maharashtra, India

ABSTRACT

Objectives: the purpose of this study was to compare the effectiveness of mulligan’s pain releasing phenomenon versus kinesio-taping in de’quervains tenosynovitis.

Method: 30 subjects diagnosed with dequervains disease were included in this study. The mean age was 26.5 years. This subjects were allocated by chit method into 2 groups (group A- Therapeutic Ultrasound, mulligan’s pain releasing phenomenon, group B- Therapeutic Ultrasound, Kinesio taping). Before and after the treatment protocol the subjects were assessed for pain by VAS, Grip strength by handheld dynamometer and wrist functional mobility by PRWE scale. These outcome measures were analysed.

Result: Pre and post treatment protocol was analysed by using paired and unpaired t test. Data analysis showed extremely significance for VAS (p=0.0003) and PRWE(p=0.0002) but wasn’t significant for hand held dynamometer (p=0.7759).

Conclusion: The effect of the combination of Ultrasound & Pain releasing phenomenon has extremely significant effect on pain and functional status of wrist than compared to ultrasound and kinesio taping.

Keywords: Pain releasing phenomenon, kinesio taping, Dequervains tenosynovitis

Introduction

In 1895, first time a swiss physician was given credit for describing De-Quervains tenosynovitis condition. It is a disorder that is characterized by pain, tenderness and edema over the radial side of the wrist. In India women had higher rate of dequervains tenosynovitis at 2.8 cases per 1000 person years, compared to men at 0.6 per 1000 person-years(1,2,3).the aetiologies include trauma, Bio mechanical compression, anatomical abnormalities, repetitive micro trauma ,inflammatory disease and increased volume states like during pregnancy.(4)

In the first dorsal compartment of wrist abductor pollicis longus and extensor pollicis brevis tendns placed at the lateral border of the anatomical snuffbox .Inflammation at this place commonly seen in patients who use their wrist and thumbs in a repetitive fashion. So the de quervains tenosynovitis can result from repetitive micro trauma. After occurrence of isolated acute trauma there are chances of inflammation(3,4,5) This condition seen in mother of young children, computer keyboard operators, dentists machinists, golf players, mountain bikers, Sms texters, musicians(6).

In this condition the most standard finding is positive finkelsteins test. The test is performed by asking subjects to make a fist with the thumb enfolded inside the fingers. The therapist stabilizes the forearm and passively performs ulnar deviation. Pain at radial side of wrist, Positive test indicates significantly more pain at radial side of wrist(2).De quervains is diagnosed clinically no need of imaginary findings, x rays are required to evaluate previous distal radius fracture,scaphoid fracture, arthritis of the thumb and bony changes(11) many
authors recommended other investigation techniques like imaging modalities, bone scan, MRI, and ultrasound. If the clinical presentation is clear then no need of other investigations.

De-quervains disease can be treated by operative and non-operative treatment. There is no consensus in the treatment of de’Quervains disease. Some treatments for de’Quervains syndrome include rest, immobilization of thumb and wrist, modalities, analgesics, thumb Spica splint, kinesio-taping, PRP, corticosteroid injection etc. ultrasound is effected at pain site, pain reduces which can facilitate participation in daily activities. In this technique joint compression, muscular contraction or stretch is used to provoke pain stimuli and this stimulus is maintained for 15-20 sec. This technique is indicated when pain will reduce in this time period. As in De-quervains tenosynovitis frenkelstein test which is diagnostically causes pain when tendons are taken in to stretched position. There for stretch PRP mostly chooses for treatment. Brian Mulligan introduced a manual therapy technique for chronic pain management in extremities called as PRP. In this technique joint compression, muscular contraction or stretch is used to provoke pain stimuli and this stimulus is maintained for 15-20 sec. This technique is indicated when pain will reduce in this time period. As in De-quervains tenosynovitis frenkelstein test which is diagnostically causes pain when tendons are taken in to stretched position. There for stretch PRP mostly chooses for treatment.

Kinesio taping works on the hypothesis that it can facilitate the function of muscles and other soft tissues. Although there are many Conventional Physiotherapy interventions available which are successfully incorporated for de’Quervains disease still there is need to find out newer methods of Physiotherapy treatment approaches which can aid in better outcomes, speedy recovery and reducing rehabilitation time.

**Method**

**Population:** The subjects which willing to participate in the study was taken. The criteria for inclusion were: age between 18-40 years and clinically diagnosed with de’Quervains disease. Subjects were excluded if they had history of wrist fracture, severe pain, traumatic hand injury and other musculoskeletal conditions.

30 subjects with the age group 18-40 years, 7 males/23 females participated in this study, written consent form was taken. Subjects were divided into two groups through chit method. Group A 15 received US and PRP other 15 received US and KT. All the subjects were informed about the protocol and gave written consent before their participation. The protocol and the consent form were previously approved by protocol and ethical committee.

**Interventions:** Subjects who clinically diagnosed with the de’Quervains were selected. Considering inclusion and exclusion criteria they were requested to participate in the study. The nature of study and intervention were explained to the subjects and those who were willing to participate were included. Before proceeding to intervention a written consent was taken from subject. A brief demographic data was recorded. By using random sampling method the participants were divided into two groups by chit method; Group A and group B, both groups was received a baseline treatment (Therapeutic Ultrasound) for 1 weeks.

Pre-test values of grip strength, pain and functional mobility was measured by VAS scale, hand grip dynamometer, and PRWE respectively.

**For Both the groups Therapeutic Ultrasound was given in common as a part of the conventional treatment (3Mhz ultrasound set to 1.0 w/cm^2, on pulsed mode for 7 minutes)**

**Group A:** Patient position was sitting. Therapist asked the patient to make the fist with thumb inside the fingers, deviate the wrist medially until the pain was produced. In this method the pain was provoked till the patient can tolerate. The pain was reduced within 15-20 sec, if pain reduces within 15-20 sec, start new PRP in new range with increased force. Therapist should maintain pressure for 15-20 sec at P1 (The point in range of motion were the initial onset of pain is experienced). If the pain does not reduce within 15-20 sec, it indicates that the stretch being applied is too high, hence, the pressure should be reduced to a level so that provoked pain gets reduced within 20 sec. If pain reduces before 10 sec, it implies that stretch being applied is too low. Hence it should be increase to a level so that provoked pain gets reduced within 15-20 sec and not before 10 sec.
**Group B**: The K tape with a width of 5 cm and a thickness of 0.5 mm was selected for this study. First strip placed from the base of the thumb till the mid forearm. Second and third strip have the correction roles. The second strip was placed while the wrist is extended, one end at the dorsum of hand and another end at the distal forearm one inch above the styloid, then by flexing the wrist the tape was fixed. Third tape from the volar side of distal of radius and stretch obliquely to the dorsum of the hand.

After 7 days post-test values was taken. Then by statistical analysis result was calculated.

**Measurement Procedure:**

- **Visual analogue scale (VAS):** Pain was measured in centimetres using the (VAS). Each subject was asked to mark 10 cm. horizontal line to indicate the perceived level of pain intensity when achieve. No pain is indicated with value of 0 cm and extreme pain indicated with a value of 10 cm.

- **Hand held dynamometer:** For measuring the grip strength, the subject asked to sit on the chair with their shoulder joint in a neutral position, elbow fixed at 90°flexion, forearm in neutral and wrist at 0° to 15° radial deviation. The test were perform twice, and the higher value between the two measurement were selected. The measurement unit was kilogram (kg).

- **Patient rated wrist/hand evaluation questionnaire (PRWE):** The PRWE is a 15-item questionnaire designed to measure wrist pain and disability in day to day activities. PRWE allows patients to rate their pain and disability from 0 to 10 and consist of 2 subscales:

  1. Pain subscale: contains 5 items which is rated from 1-10. maximum score of scale is 50 and minimum score of scale is 0.
  2. Function subscale: it contains 10 items which are again divided into 2 sections. Specific activities (6 items) & usual activities (4 items). maximum score of this scale is 50 and minimum 0.

**Result**

Pre and post treatment protocol was analysed by using paired and unpaired t test. Data analysis showed extremely significance for VAS (p = 0.0003) and PRWE (p = 0.0002) but wasn’t significant for hand held dynamometer (p = 0.7759).

**Statistical analysis:** The data was entered into Microsoft office excels 2007 and analysed using instat software. Descriptive statistics were used to analyse baseline data for demographic data. Pre and post treatment protocol was analysed by using paired and unpaired t test and p value less than 0.05 was considered to be statistically significant.

As per the inclusion criteria 30 subjects were included in the study. During 1 week of protocol program 15 subject were in Group A where ultrasound and PRP was given, 15 subjects were in Group B where US and KT was given. Pre analysis was done for 30 subjects. In Table.1 and table 2

Intra group statistical analysis revealed extreme significance (p = <0.0001) between pre and post intervention for both the groups using paired t test. The result shows there is decrease in VAS and PRWE score and improvement in grip strength.

### Discussion

The present study showed out of 30 subjects in the study 76.66% females and 23.33% males were diagnosed with chronic de-quervains. In the study it was found that dominant hand (73.33%) was more affected than non-dominant hand (26.66%). In another study it was stated that de Quervain tenosynovitis was caused by excessive text messaging. (6) This study showed that the age group of 27.86 and 25.86 were more commonly affected because of the excessive mobile use.

The aim of present clinical trial was to compare the effectiveness of KT vs PRP on pain, grip strength and functional mobility of wrist in de’quervains disease.

In the current study commonly used ultrasound as conventional treatment for both the groups as it has been suggested by a study (26) that ultrasound showed benefits with increased local blood flow, pain relief in both acute and chronic pain and increased wound healing.

Paired t test was used to analyze the effect of PRP and showed that there was extremely significant reduction in VAS score (p < 0.0001, t = 23.23), handheld dynamometer (p < 0.0001, t = 7.105) and PRWE score (p < 0.0001, t = 12.750). PRP works on local receptor hysteresis and other centrally mediated endogenous inhibitory systems thus relieves pain and improves function.

Paired t test was used to analyze the effect KT and showed that there was extremely significant reduction in VAS score (p < 0.0001, t = 11.746), handheld dynamometer (p < 0.0001, t = 5.650) and PRWE score (p < 0.0001, t = 7.64). The Kinesio tape lifts the skin and takes pressure off the interstitial fluid provides better drainage and reduce inflammation.(27) KT expands and contracts sensory stimulation in skin during movement or activity stimulates touch receptors activating descending spinal inhibitory system decreasing pain.(1)

Comparison Visual Analogue Scale scores between two groups was done by using one way unpaired test to find out the effectiveness between two groups. The statistical analysis revealed that there was extremely significant difference in visual analogue scale scores in all two groups post treatment (p = 0.0003). Group A was more efficient in reducing VAS scores than Group B in post treatment.

Comparison handheld dynamometer between two groups was done using unpaired t test to find the effectiveness between the two groups. The statistical analysis revealed that there was no significant difference in handheld dynamometer score in two groups post treatment (p = 0.7759). Both the groups were equally efficient in increasing grip strength post treatment.

Comparison PRWE score between two groups was done using unpaired t test to find the effectiveness between the two groups. The statistical analysis revealed that there was extremely significant difference in PRWE score in two groups post treatment (p = 0.0002). Group A was more efficient in reducing PRWE scores than Group B in post treatment.
The result from the statistical analysis of the present study supported alternative hypothesis which stated that there is significant difference between the effectiveness of mulligan’s PRP vs kinesio-taping in De’Quervains tenosynovitis.

It can be stated from above study that both PRP and KT are helpful in reducing the symptoms of De’Quervains tenosynovitis. PRP yields better result outcomes than KT and it is more efficacious and cost effective.

Conclusion

Various conservative approaches are used in treating De quervains tenosynovitis but this study concluded that the PRP with conventional therapy was more effective in decreasing pain and improving quality of life. It is proved from this study that the combination of US and PRP has extremely significant effect on pain and functional status of wrist and thus Alternate Hypothesis that there is significant effect of PRP accepted.

Conflicts of interest: There were no conflicts of interest in this study.

ABSTRACT

Background: In overhead throwers, high stress is applied to the shoulder joint due to high forces generated in them thus extra demand on shoulder complex is placed by the overhead athlete. The posterior shoulder tightness (PST) is diagnosed with the decrease of internal rotation and increase in external rotation in the dominant throwing shoulders. So the following study was carried out to improve internal rotation range of motion (ROM).

Objectives:

1. To determine the effect of myofascial release (MFR) on PST in overhead athletes to improve internal rotation of shoulder.
2. To determine the effect of muscle energy technique (MET) on PST in overhead athletes to improve internal rotation of shoulder.
3. To compare the effect of MFR and MET on PST in overhead athletes to improve internal rotation of shoulder.

Method: 200 overhead athletes were screened according to inclusion criteria, out of which 42 fulfilled the criteria. Consent was taken and they were divided into two group. Group A was receive MET and group B receive MFR. The pre and post assessment is taken by using internal rotation ROM and disabilities of the arm shoulder and hand (DASH questionnaire).

Result: In the present study, intra group comparison results showed that internal rotation ROM and DASH questionnaire were statistically significant in both groups. Whereas inter group comparison results showed that MET was statistically significant in improving internal rotation ROM and then MFR in subjects with posterior shoulder tightness, but in DASH score there were no significant difference.

Conclusion: MET showed extremely significant increased in internal rotation ROM than MFR. Both the technique had similar effect on DASH questionnaire in overhead athletes.

Keywords: Posterior shoulder tightness; muscle energy technique; myofascial release; internal rotation range of motion; disabilities of the arm shoulder and hand; glenohumeral internal rotation deficit; overhead athletes

Introduction

In overhead throwers, high stress is applied to the shoulder joint due to high forces generated in them thus extra demand on shoulder complex is placed by the overhead athlete. For excessive external rotation, the thrower’s shoulder must be lax, but at the same time, it should be stable to prevent symptomatic humeral head subluxation. Hence, it requires a more balance between...
mobility and functional stability. This is called as “the thrower’s paradox”.

Throughout the throwing motion, the glenohumeral joint (GHJ) undergoes extreme range of motion (ROM) velocities and forces in overhead throwing activities. The peak angular velocities nearly reaches 7,000°/s in GHJ internal rotation followed by deceleration at angular velocity of 5,00,000°/s².

Around 17% population with prevalence of shoulder problems is seen during the season of athletic activity. In general, the posterior shoulder tightness (PST) is diagnosed with the decrease of internal rotation and increase in external rotation in the dominant throwing shoulders. It is because of the posterior rotator cuff tightness. PST occurs due to tightness of infraspinatus, teres minor, posterior deltoid.

Glenohumeral internal rotation deficit (GIRD) is defined by “the loss of glenohumeral internal rotation degrees of the dominant shoulder compared with the non-dominant shoulder”. GIRD is also defined by more than 10° to 25° decreased internal rotation ROM in the dominant versus non-dominant shoulder.

Muscle energy technique was developed by Fred L. Mitchell. This technique was classified as an active technique in which the patient voluntarily used his muscles from a precisely controlled position in a specific direction, against a distinctly executed counterforce.

Self myofascial release (SMR), external devices such as foam rollers, massage balls, and j shaped canes have been used in an attempt to improve ROM. SMR has increasingly become popular in the fields of physical therapy, athletic training, and strength and conditioning to treat myofascial restrictions and improve soft-tissue extensibility.

1. Internal rotation ROM

In the present study pre-interventional mean of internal rotation range was 61.90 ± 5.79 in Group A and 62.19 ± 6.81 in Group B whereas post-interventional mean of internal rotation range was 89.80 ± 4.13 in Group A and

Materials and Methodology and Procedure

It was a comparative study. The over head athletes coming to Shivaji Stadium at Karad were screened. 200 competitive overhead athletes (i.e. badminton players, cricket bowlers, swimmers) were screened and those fulfilling the inclusion criteria were selected for the study. Inclusion criteria were loss of internal rotation to 10° to 25° of the shoulder compared with non-dominant shoulder. Exclusion criteria was participants under gone any major shoulder surgery before 6 month, previously diagnosed shoulder pathology in their throwing shoulder. Pre-treatment assessment of the willing participate were recorded by an outcome assessor. In the present study out of 42 subjects with PST between age group of 16-30 years were taken. It was a single blinded study in which the pre and post treatment outcome was assessed by outcome assessor. The subjects were then divided into two groups by convenient sampling with random allocation. Group A was with mean age 18.85 ± 3.07 while the group B was with mean age of 18.38 ± 2.5. Group A had given muscle energy technique to shoulder horizontal abductors and external rotators while Group B was given myofascial release to posterior shoulder capsule. The 32 were badminton player and 10 were cricket bowler was taken. The mean duration of play of the participants in Group A was 3.78 year and in Group B was 3.33 year. This was followed by the intervention period of 5 days/week for 2 weeks each techniques was performed for a total of 3 repetitions/sessions were done, followed by which post-treatment outcome assessment i.e. internal rotation ROM and DASH questionnaire was carried out by an outcome assessor.

Data analysis-The statistical analysis of Internal rotation ROM was done by using paired t test and unpaired t test, DASH Questionnaire was done by wilcoxon matched pairs test and mann-whitney test.
84.04±6.70 in Group B. Intra group analysis of internal rotation range revealed statistically increase in internal rotation range in post interventional for both groups. This was done by using paired t test Group A (p<0.0001), Group B (p<0.0001).

In the present study pre-interventional mean of DASH score was 2.93 ± 2.21 in Group A and 3.70 ± 3.29 in Group B, whereas post-interventional mean of DASH score was 0.75 ± 1.11 in Group A and 1.12 ± 2.20 in Group B respectively. Intra group analysis of DASH score revealed statistically reduction in DASH scores for both the groups. This was done by using Wilcoxon matched pairs test Group A (p < 0.0001), Group B (p < 0.0001).

Discussion

The incidence of overuse shoulder problems during the training period reported to be 17% in a population of 16-30 years throwing athlete\(^3\),\(^10\). It has also been concluded that there are individuals that participate in activities that require dynamic overhead arm movements such as baseball, softball, volleyball, tennis, badminton and swimming may be at a higher risk of shoulder pathology\(^9\).

In overhead athlete during the arm acceleration phase, large forces are generated by concentric contractions of the internal rotators of the shoulder. In these phases, maximum external rotation occurs to the point of ball release. In acceleration phase, large force absorptions occur due to ball release and follow-through phase. During eccentric contractions of the external rotators, more force absorptions are needed to decelerate the arm after ball release and during the follow-through phase. These deceleration forces place a significant amount of stress on the soft tissues of the posterior shoulder. Due to the repeated deceleration after ball release and during the follow-through, the posterior shoulder capsule, external rotator muscles (infraspinatus, teres minor and posterior deltoid), and connective tissue can develop tightness resulting in decreased internal rotation ROM at the shoulder\(^9\).

GIRD is considered to be “the loss in degrees of glenohumeral internal rotation of the dominant shoulder compared with the non-dominant shoulder”. Since many studies set the criterion for GIRD is 100 to more than 25° loss of internal rotation ROM in the dominant verses non-dominant shoulder\(^6\),\(^7\). In the present study GIRD was 20.45° which support the above study.

So the present clinical trial was conducted to find out the effect of muscle energy technique and myofascial release technique on posterior shoulder tightness in overhead athlete. According to a study done by Stig Haugsoe Anderson et al, 17% prevalence of shoulder problem was seen among 16-30 years overhead athlete\(^3\),\(^10\). Out of 200 overhead athletes, 42 subjects fulfilled the criteria which support the prevalence rate of above study; hence the subjects selected for the present study were 16-30 years competitive overhead athlete.

In the study of Khushboo Bathia, Lalkishan Sewani and Pranjali Sawantdesai\(^12\) glenohumeral internal rotation deficit in asymptomatic collegiate bowlers and badminton players they found out that there was maximum glenohumeral internal rotation deficit seen in cricket bowlers, badminton players. In current study 200 athletes compromising of bowlers (44), badminton players (142), swimmers (14) were taken. But out of 200, 42 fulfilled inclusion and exclusion criteria of which 32 were badminton players, 10 were cricket bowlers, which supports the above study.

42 subjects who were clinically diagnosed with posterior shoulder tightness and fulfilling inclusion and exclusion criteria with the age group between 16-30 years were included in the study. They were allocated in two groups, Group A and Group B, each containing 21 subjects.
The muscle energy technique in which post isometric relaxation was given to the shoulder horizontal abductor and external rotators to Group-A and self myofascial release to the posterior shoulder capsule by the use of tennis ball was given to Group B. The outcomes were measured by: internal rotation ROM by universal goniometry and shoulder disabilities and function by DASH.

The average mean age of participants in Group A was 18.85 ± 3.071 and in Group B was 18.38 ± 2.5, which showed there is no significant difference in age of the subjects in both the groups (t = 0.5477, p = 0.5870). The total numbers of participants included were 42 out of which 28 were males and 14 were females. Group a contained 16 males and 5 females whereas group B contained 12 males and 9 females. Out of 42, 32 subjects (Group A = 16, Group B = 16) were badminton players and 10 subjects (Group A = 5, Group B = 5) were cricket bowlers.

Paired ‘t’ test was used to analyze the effect of muscle energy technique on posterior shoulder tightness and showed that there was extremely significant improvement in internal rotation range of motion (t = 21.526, p < 0.0001) and DASH score (r = 0.6282, p < 0.0001).

Muscle energy technique was used to lengthen shortened muscle and strengthen weakened muscles. In the MET, the affected muscles (agonist) were used in the isometric contraction; therefore the shortened muscles subsequently relax via post-isometric relaxation, allowing an easier stretch to be performed. The therapist reaches towards the barrier of restriction, against patients counter-force. This helped in improving range of motion and DASH scores. Increase in range of motion and reduction of DASH score helped in improving flexibility of the posterior shoulder muscles. Hence, the muscle energy technique helped to decrease posterior shoulder tightness in overhead athlete. This supports the study of Stephanie d. Moore, Kevin G. Laudner, Todd A. Mclooda et al. the immediate effects of muscle energy technique on posterior shoulder tightness.

Paired ‘t’ test was used to analyze the effect of myofascial release on posterior shoulder tightness which showed that there was extremely significant improvement in internal rotation ROM (t = 14.861, p < 0.0001) and DASH score (r = 0.4810, p < 0.0001).

SMR has become increasing popular in the fields of physical therapy, athletic training, and strength and conditioning to treat myofascial restrictions and improve soft-tissue extensibility. In which, principles of biomechanical loading of soft tissue and stimulation of mechanoreceptors in the muscles, tendons, and fascia were included. The stimulation of these mechanoreceptors results in autogenic inhibition, which stimulates the Golgi tendon organ (GTO) and it inhibits the muscle spindles in the muscles. The GTO, along with other interstitial receptors and Ruffini endings throughout the fascia, respond to tension. Applying static myofascial tension will activate these receptors, thus inhibiting the muscle spindles and allowing the muscles to relax. MFR is performed by applying gentle and sustained pressure to a tender area in the fascia, while maintaining the position and load until the tissue responds by relaxing and allowing the fascia to release. Increase in range of motion and reduction of DASH score help in improving flexibility of the posterior shoulder muscles. Hence, myofascial release helped to decrease posterior shoulder tightness in overhead athlete.

Comparison of internal rotation ROM between two groups was done by using unpaired ‘t’ test to find out the effectiveness between two groups.

The statistical analysis revealed that there was very significant difference in range of motion in both the groups. Group A was more efficient in improving the internal rotation of shoulder (p = 0.0018) than Group B post treatment.

Comparison of DASH score between two groups was done using unpaired ‘t’ test to find the effectiveness between two groups.

The statistical analysis revealed that there was no significant difference in DASH score in both the groups. Group A was more efficient in improving the internal rotation range of motion (p=0.9288) than Group B post treatment.

The result from the statistical analysis of the present study supported alternative hypothesis which stated that there will be beneficial effect to the subjects treated with muscle energy technique to improve range of motion.

Post-isometric relaxation was effective in present study because the affected muscle that is agonist are used in the isometric contraction, therefore the shortened muscles relax and strengthens via post isometric relaxation, but in the myofascial release the
affected muscles only gets relaxed via stimulation of mechanoreceptors.

Hence, above result showed that the participants treated with muscle energy technique showed better increase in range of motion and decrease DASH score in posterior shoulder tightness.

Thus, it can be stated from the above study that muscle energy technique and myofascial release are more efficacious and cost effective.

**Conclusion**

This study concluded that both the groups showed significant improvement in internal rotation ROM and reduction in DASH score. MET showed extremely significant increased in internal rotation ROM than MFR. Both the technique had similar effect on reducing symptom & improving functional ability in overhead athletes.

**Conflicts of Interest:** This study can be carried out with longer duration and chronic GIRD with shoulder injuries can also be taken into consideration.

A Study of Socio-Demographic Factors Effecting under Nutrition in Under Five Children of Slum in Mysuru—An Exploratory Study

Krishnaveni ys¹, Meghana Narendran¹, Prakash B², Narayanamurthy MR³
¹Post Graduate, ²Professor, ³Professor and Head, Department of Community Medicine, JSS Medical College, Mysuru

ABSTRACT

Background: Malnutrition not only reflects health of children but it also represents the socioeconomic, demographic and psychological features of the family.

Objective: To determine Socio-demographic factors effecting Under nutrition in under five children of slum area, Medhar block

Method: An Exploratory study conducted in urban slum from August 9th to October31st 2017. 10 Anganwadi workers and helpers were interviewed about malnourished children in their areas. 94 mothers of were randomly selected and interviewed about their antenatal and perinatal care. Anthropometric examination of 64, 1-5 years children was done. Focus group discussion done among 22 mothers and details of diet given to children were discussed. Data collected were compiled, anthropometric data entered in excel and WHO anthro and association with other factors were analyzed using chi-square tests, and t test in SPSS 24.

Result: Under nutrition seen in 30% of under five children. Stunting in 34% and wasting in 14%. Stunting associated with antenatal weight gain (P 0.02) and birth weight (P 0.04). Wasting associated with age of mother at pregnancy and birth weight. 16% of mothers delivered low birth weight babies and 17% of them stopped breast feeding before 1 year. Nutrition provided to children were inadequate.

Conclusion: Awareness on antenatal care, exclusive breast feeding, supplementary food and adequate nutritious diet for children needs to be strengthened. Health workers should be trained regarding communication and health education, so that they convey proper knowledge to mothers.

Keywords: Under five, stunting, wasting, antenatal care, perinatal care

Introduction

Under nutrition is defined as the outcome of insufficient food intake and repeated infectious diseases. It includes being underweight for one’s age, too short for one’s age (stunted), dangerously thin for one’s height (wasted) and deficient in vitamins and minerals (micronutrient malnutrition). ¹It is explained in terms of ‘stunting’ & ‘wasting’. Stunting is failure to grow both physically and cognitively, resulting due to chronic or recurrent malnutrition. Moderate and severe stunting is defined as 0 to 59months children who are below-2SD from median height-for-age of WHO child growth standards. Wasting (acute malnutrition) is a result of recent rapid weight loss or failure to gain weight. Moderate wasting is defined as 0-59 month’s children below -2SD from median weight-for-height and severe as below -3SD. ²Globally 154.8 (142.7-166.9) million are suffering from stunting which accounts for 22.9% of total under five population. Moderate wasting is seen in 51.7(43.6-57.9) million and severe in 16.9(13.3-20.9) million children accounting for 7.7% and 5.2% respectively. In South Asian regions stunting seen in 35.8(33.3-38.5) %; moderate wasting in16 (13.4-19.1)
% and severe wasting in 5.2(4-6.6) % of 0 to 5 years children. In India it is comparatively more with 38.4% children below five years being stunted, 21% with moderate wasting and 7.5% severe wasting.3

Under nutrition puts children at greater risk of dying from common infections, increases the frequency and severity of such infections and contributes to delayed recovery.4 Malnutrition not only reflects health of children but it also represents the socioeconomic, demographic and psychological features of the family.5 Dealing with under nutrition needs addressing the hidden causes like maternal health, maternal knowledge of child care, family turmoil and overall imbalance in the family. Though there are many studies on prevalence of malnutrition and factors associated with it, details of family problems contributing to malnutrition is lacking. To explore those causes study was conducted in high-risk area (settled slum) of our field practice area. Medar block to assess factors effecting Under nutrition in under five children of slum area.

**Materials and Methodology**

An Exploratory study was conducted in field practice area of JSS Medical College, Medhar block (ward 42, Mysuru) from August 9th to October 31st 2017. Ethical clearance was taken from the institutional ethical committee. Study was conducted through interviews and focus group discussions (FGD). In all 5 Anganwadis of the area, 5 workers and 5 helpers are interviewed in depth regarding moderate and severe malnutrition among 1 to 5 years children after taking informed consent. Each interview was done for 20 minutes through open ended questions. Based on prevalence of under nutrition of 31.5%, α 0.05, β 20, absolute precision 10 and non-response rate of 10%, a sample size of 94 was calculated. 94 Mothers of under five children were randomly selected in the area, informed consent taken and interviewed through pre-structured questionnaire about age at time of pregnancy, antenatal care, perinatal care and infant care of children. Among the under five children of these 94 mothers 64 were purposively selected were examined after taking informed consent from mothers, to assess malnutrition through height, weight and mid-arm circumference. Children with congenital anomalies and chronic illness were excluded. Focus group discussion conducted in anganwadi among 30 mothers in 4 divided groups, about feeding practices in children. Questions regarding amount and frequency of food given to children, Use of green leafy vegetables, fruits, sprouted grains egg and non vegetarian food, frequency of using them were discussed. And also myths and faddism related to foods were discussed. Discussion was recorded and noted. Data collected were compiled, anthropometric data entered in excel and WHO anthrop and Z scores were calculated for height for age, weight for height and mid arm circumference. Association with other factors were analyzed using chi-square tests, odds ratio and t test in SPSS 24.

**Findings**

Results were obtained from compiling the data of interviews of anganwadi workers, mothers, anthropometric assessment of under-five and Focus group discussions. Medhar block is a settled high-risk area containing 6 blocks, 5 anganwadis catering a population of 6400 covering 254 under five children, among whom 85 children were present in anganwadi centers. Only 2 children were severely underweight and 24 were moderately undernourished. (Table -1) Anganwadi workers said “most of the parents send their children to private babysitting, so children attending anganwadis are low” and nutrition day is conducted once in a month in all anganwadis, reason given by workers is that “parents don’t attend mother’s meeting or nutrition day as they go for daily wages and have work at home.” Anganwadi helpers also said that food provided for pregnant women are shared among whole families.

Among 94 participants 62% had gained more than 10kgs during abential period, 48% gained less than 10kgs, 21% had ANC complications during 3rd trimester of pregnancy and delivered by c-section, 16% delivered low birth weight babies. 82% of them breastfed their babies adequately and 17% of them stopped breast feeding before 1 year. Among the 64 children examined, 30% were undernourished (according to IAP classification) with 22% moderate and 8% severely undernourished. 14% of children had wasting with 2% severely wasted. Stunting was seen in 34% of children. Z scores of weight-for-age, weight-for-height and height-for-age were less compared to WHO standards for India. Stunting was seen significantly more in males than females (p 0.05: OR 0.355, 95% CI 0.1-1.05), in children whose mother had weight gain lesser than 10kg in their ante-natal period (P 0.02: OR 0.21, 95% CI 0.54-0.83) and in children with lower birth weights (P 0.04; t 2.01, 95% CI 1.39-553.6). Mean weights of children was lower in stunted children than normal children (P<0.01; t 3.09, 95% CI 0.69-3.24). Wasting was found significantly associated with age at pregnancy (P 0.04; t 2.023 95% CI 0.01-2.63) and birth weight of the children.
In focus group discussion 30 mothers participated. Mean age was 31.5 years. 79% had 2 children and 21% had single child. 90% were literates, all belonged to lower socio-economic class. 2 among the participants were pregnant for second child. Common breakfast given to children were cereals based, any one of 1 chapathi/1 dosa /2 idles /1cup upma /1cup rice diets, 1 rotis. 2 mothers said they gave rotis prepared from flour of different pulses that is wheat, red gram, green gram, black gram. 95% of them gave rice and sambar for dinner every day and for lunch when there is holiday for anganwadis. They used about 50grams of pulses for whole family per day for cooking. Green leafy vegetables and other vegetables were used as ‘palya’ only with chapattis and rotis and rarely with lunch and dinner. Egg was given to children twice or once weakly but yolk is discarded thinking it causes indigestion. Chicken was given once in a weak in non-vegetarian families, Meat and fish was given once in fortnight. Three mothers gave fish twice weekly and were avoided by many. One glass of milk was given to child twice daily after diluting with water. Only one mother gave 4 glasses of milk daily. (Table 2) Among fruits apple, banana and grapes were given which were brought once in 15days two pieces given every day. Locally available fruits like guava were avoided thinking that it causes upper respiratory infection. All fruits were avoided during fever and other illness. Sprouted grains were given as sambar rarely about twice or thrice monthly. Sugar was used by 95% of mothers and 5% used jaggery. Regarding use of Oils 100% used sunflower oil about 3 to 5liters/month. Oil fried snacks were used at evening time with beverages most of the days, 5 to 6 days in a weak. Three mothers gave biscuits to children during snack time. Chips and other fried snacks available at shops were allowed to eat by children whenever they were asked for. Taboos like avoiding eggs, papaya and other fruits during pregnancy and lactations are practiced by 81% families. Also sesame, vegetables like ladies finger, cluster beans fruits like banana and guava and ghee are avoided. Awareness on contraception was 40%. 83% of them said there is no relation between food intake and disease ,remaining said that it may cause anemia, decrease strength decreased white blood cells and reduced growth. They feel that the food which they are providing to their children is sufficient and no changes needed. They also said they have to spend more money for nutritive food.

Discussion

Stunting is seen in 34% and wasting in 14% of children which is similar to NFHS-4 report of 35.7%. Malnourishment also found in antenatal period suggested by low birth weight and less weight gain in mothers. Adequate nutritional awareness is lacking in mothers.

A study done by SS Yadav I Haryana shows relation of nutritional status with sociodemographic features and maternal education and working status. Another study by purohith et al in Maharasstra also shows association of malnutrition with mother’s education along with birth weight and birth order. Similar finding was also in present study where birth weight is associated with stunting. Focus group discussion revealed poor knowledge and practice regarding contraception and nutrition. This explains antenatal undernourishment; poor weight gain, and increased births that will impact nutritional status of children. Study by Mahama saaka relates knowledge of mother and stunting. There is lack of knowledge in mothers of present study also and stunting is comparatively more than wasting. Rachel Browne in his study describes correlation between parents attempt to control child’s diet and increased intake of snacks. FGD in present study also conveys increased junk food intake which mothers themselves unable to control. In a Japanese study by Keiko Asakura, increased guardian food knowledge increased vegetable intake in children. This suggests need for food education programmes which benefits urban slums. Cross-sectional study by shannon M et al shows food taken by children outside child care contained more than recommended calories and was deficient in fruits, milk and vegetables recommended.

Conclusion

Wasting seen in 14% and stunting in 34% of children. Under nutrition is also seen in mothers during their antenatal, perinatal and postnatal periods. Awareness on antenatal care, nutrition in antenatal period, exclusive breast feeding, weaning and supplementary food, needs to be strengthened. Though mothers know what is nutritious food, how much and how frequently to be given are not known. There is a lack of interaction between health workers and mothers. Detailed education to be given to mothers about preparing nutritious foods from locally available, affordable ingredients. These to be dealt with in regular meetings at anganwadis and workers should be trained regarding communication and health education, so that they convey proper knowledge to mothers. Observing Nutritional days to be encouraged and specific and detailed topics need to be discussed and demonstrated.

ABSTRACT

Background: Tribal population in India are the most underprivileged and their problems depend on their remoteness from the rest of the communities. Among them, elderly are often deprived of nutritional and health care facilities and also depression many times be undiagnosed or misdiagnosed.

Objective: To assess the Socio-demographic profile, Depression, Nutritional status and Activities of daily living (ADL) among elderly.

Method and Methodology: This cross-sectional study was done in all the five tribal hamlets of Biligiriranga Hills, Karnataka for a period of two months. A pretested semi-structured interview schedule was used to collect details regarding socio-demographic characteristics and standard questionnaires like Standard of Living Index, Geriatric Depression Scale, Mini Nutritional Assessment and Katz Index of Independence in ADL. All persons 60 years and above residing in the house were included for study, the sample size was total of 132 participants.

Result: Among the study participants 59 (44.7%) males and 73 (55.3%) females. Forty one (31.1%) belonged to low SLI, 18 (13.6%) were suggestive of Depression, 77 (58.3%) were at Risk of Malnutrition and 31 (23.5%) were Malnourished. Forty five (34.1%) were underweight and 7 (5.3%) had decreased ADL.

Conclusion: The study showed increased risk for elderly malnutrition and most of them are underweight and few are suggestive of depression. There is a need for geriatric clinic that can take care of their physical and psychological needs and this together has a significant impact on their quality of life.

Keywords: Geriatric, Soliga tribes, depression, malnutrition.

Introduction

Ageing is a natural process that begins at birth, or to be more precise, at conception, a process that progresses throughout one’s life and ends at death. Aging of population is an end product of demographic transition. The number of elderly people in developing countries is almost 3-4 times of that of developed countries. The developed countries have already experienced the consequences of this transition.¹ With increasing life expectancy, the proportion of elderly population is fast increasing. Aging is inevitable and irreversible. The epidemiology and the clinical features of diseases vary in this age group. Tribal population in India are the most underprivileged population and among them, elderly are more often deprived of health care facilities. India’s elderly population in 2011 census was contributing to 8.2% of the total population,² Adivasi makes up 8.6% and 6.95% of India’s tribe reside in Karnataka. The Soliga tribes inhabit the Biligiriranga (BR) Hills which is situated in south-eastern Karnataka, at its border with Tamil Nadu (Erode District) in South India. The Soliga speak Sholaga, which belongs to the Dravidian family. A scheduled tribe, they have a population of around 20,000 individuals.³ It is noted that Soligas maintained

a continuous and intimate interaction with the forest, deriving most of their basic requirements from the forests. Due to their intimacy with the nature, the Soligas have a holistic outlook on life and their indigenous knowledge is also holistic in nature. Tribal’s have poor access to health services and there is also under utilization of health services owing to social, cultural and economic factors. Among the various health problems of the tribe, data on the prevalence of depression and malnutrition is lacking in many regions of the country. Depression, along with other mental health disorders, has long been segregated and neglected. Depression is under treated in elderly age group, and perhaps particularly so because it is not yet perceived as a priority public health problem in developing countries. On the other hand, Malnutrition in elderly people is very common because daily food consumption decreases with old age. Studies have shown that more than 50% of the older population are underweight. Nutrition deserves special attention as people reach older age because good nutrition is essential for good health. Healthy ageing is associated with a number of physiological, cognitive, social and lifestyle changes that influence dietary intakes and nutritional status. Access to and consumption of healthy food for older people is influenced by the wider determinants of health. These determinants include cultural, social, historical and economic factors. Therefore, the current study was primarily aimed to assess the prevalence of depression and malnutrition and its impact on activities of daily living among elderly Soliga tribes.

Materials and Methodology

A Community based Cross Sectional Study was done among 132 elderly Soliga tribes in Biligiriranga hills, Chamarajanagar district, for a period of 2 months. All the 5 tribal hamlets at Biligiriranga hills namely Biligiri Podu, Bangle podu, Seege betta, Hosapodu and Kanneri colony were included in the study. Starting from the first house numbered in each hamlet, House to House visit was made and all persons 60 years and above residing in the house and who gave oral consent were included for study. The sample size was total of 132 participants and persons with Stroke with Aphasia, Loss of Hearing and those who are affected with loss of memory and the individuals who were not present at their house even after three visits were excluded from the study.

Socio-demographic information was collected (age, gender, education, occupation, income, marital status, type of family, Standard of Living Index), History of existing Medical Illness were documented. Blood Pressure recording for all subjects using standard method. Geriatric Depression Scale (Short Form) to estimate prevalence of depression. Mini Nutritional Assessment (MNA) Questionnaire was used to estimate prevalence of malnutrition and Katz Index of Independence to assess ADL. Anthropometric measurements were obtained (i.e. height, weight). Data obtained were entered in EpiData sheet. Descriptive statistical measures like percentages were used for qualitative data and quantitative data were expressed as mean and standard deviation. Appropriate statistical tests and Inferential Statistics were applied as needed. SPSS Version 22 software were used for statistical analysis. The differences and association were expressed statistically at p-value less than 0.05

Results

The mean age of the study population was 71 years ± 7 SD. (Table 1). About 91 (68.9%) belonged to medium Standard of Living index (SLI). About 84 (63.6%) of them had inadequate ventilation inside their house whereas 48 (36.4%) had adequate ventilation. Among the study participants, about 46 (34.8%) of them did not have toilet facility of their own and they go to fields for defecation, whereas about 86 (65.2%) have their own pit in their house. About 11 (7.4%) had no BPL card and 123 (93.1%) did not have any medical insurance. There were 39 (29.6%) participants who had habits of smoking and alcohol, among which 25 (19%) smoked tobacco, 11 (8.3%) chewing tobacco and 3 (2.3%) consumed alcohol.

(Table 2). Among the study participants, 18 (13.6%) were suggestive of Depression, 77 (58.3%) were at Risk of Malnutrition and 31 (23.5%) were Malnourished. About 45 (34.1%) were underweight and 7 (5.3%) had decreased Activities of Daily Living (ADL). (Table 3). It was seen that females (p value 0.02), and non-Literates (p value 0.01) where more at risk of malnutrition when compared to males which was found to be statistically significant. It was seen that females (<0.001) and non-Literates (<0.001) were found to be underweight when compared to males which was found to be statistically significant. (Table 4).

It was found that people who used LPG were more at risk of malnutrition, malnourished (<0.001) and underweight (<0.001) when compared to those who used wood fire. This was with respect to the expenditure to procure LPG was higher and accordingly their food consumption was reduced in comparison with wood fire which was cost effective. (Table 5).

It was seen in this study that higher the depression lesser is the activities of daily living (p value 0.02) and which found to be statistically significant. (Table 6).

Discussion

In the present study the majority were females 73 (54.3%) than males 59 (44.7%) in comparison to a study which showed vast majorities (56 per cent) of the respondents are males and remaining 44 per cent of them are females.8
When the educational status of the elderly respondents was analysed, it was found that there were 92(69.7%) non-literate, and 31(23.5%) primary level and only 3(2.3%) had their higher education when compared with a study wherein, there were more of non-literate (88 per cent), and a few of the (12 per cent) respondents completed only primary level education. It was observed that most of the respondents were uneducated due to non-availability of school in the study area for the past few decades.8

It is found that 80% of the tribal population were living in kutcha houses which was found similar to a study wherein, 78 per cent of tribal people are living in huts or Thatched house at interior forest area, 20 per cent of the respondents residing at Pucca house these types of houses are made up of sand, stone, wood and leaf, and remaining 2 per cent of the respondents are living in concrete house.8

Almost 50% of the tribal elderly reported that the doctors were not present in the PHC(nearest 20 kms away) most of the time which was similar to a study done by Santhosam MA et al.9 Previous studies show that almost 20% of the PHCs in tribal areas are not staffed with doctors (15% in non-tribal areas) and 15% of the posts for paramedical workers are vacant.10,11

Tribal people often use home remedy or indigenous medicines for their ailments as the first preference. For them, seeking medical services is expensive unless it is from a government hospital. The elderly tribal generally are the last in a household to seek or to demand the medical aid. Their inability to pay for their treatment is a major problem. Another major problem is that they have the habit of getting treatment always free and the major reason quoted was poverty and their family not willing to pay for their health problems. Most of the elderly could not gain access to medical care services due to under-developed communication and lack of transport facilities.

The prevalence of malnutrition was found to be very significant where about 77(58.3%) were at risk of malnutrition and 31(23.5%) were malnourished which was almost similar to a study where the prevalence of Chronic Energy Deficiency (CED = BMI < 18.5) was relatively higher (65.4%) in females compared with their male counterparts (61.8%). The tribal elderly are subsisting on inadequate diets, which are reflected in the poor intakes of all the nutrients and higher prevalence of undernutrition.12 A community based study on nutritional status of the Jenu Kuruba tribes of Mysore district, the overall prevalence rates of underweight, stunting and wasting were found to be 38.6, 36.8 and 18.6 per cent,13 respectively among under 5 year children which shows that health was neglected from the growing stages of life.

Though in various parts of the world revealed that the median prevalence rate of depressive disorders in the world was determined to be 10.3% and among the Indian elderly population was found to be 21.9%14 but there are not much studies done on prevalence of depression among elderly tribal population. This present study showed 18(13.6%) of them were suggestive of having depression with the reasons of not getting adequate care by their family members and due to financial constrains and inability to earn on their own were the reasons for their depression.

A study done by Payghan BS in Chitradurga tribe using GDS scale, showed prevalence of depression was 41.7 %. Geriatric depression showed statistically significant association with advancing age, widowed, financially dependent, living in joint families and those who felt neglected.15

**Strengths and Limitations of study**

The present study used Standardized and validated Geriatric Depression Scale (Short form) to assess Depression among elderly tribes and Mini Nutritional Assessment (MNA) tool to assess nutritional status and Katz Index of Independence to assess ADL. Limitations of study is the inherent recall bias could not be eliminated. Comparison between various studies shows many findings close to the present observations but the evaluation tool are different for most of studies and also as each tribal population had varied ethnicity and therefore, generalization of the present result is not possible.

**CONCLUSION AND RECOMMENDATION**

The results of the study showed that there is an increase risk for elderly malnutrition and most of them are underweight and few of them are suggestive of depression. Those most at risk for developing malnutrition and depression are those who lack food access because of poverty, their isolation from society,
disability resulting from chronic geriatric disease, or due to combination of these factors.

The promotion and implementation of low cost, prevention-based initiatives such as health, nutrition, and physical education, could significantly enhance the possibility of maintaining good mental and nutritional status for the elderly. There is also a need for more number of health workers who can take care of their physical and psychological needs and this together has a significant impact on their quality of life.

Effect of PNF Stretching and Foam Rolling Exercises in Patellofemoral Pain Syndrome

Nilakshi Kandalkar¹, Trupti Warude², Amrutkuvar Pawar², Apurva Godse³, Krishna Savsaviya³
¹Physiotherapist, ²Assistant Professor, ³Physiotherapist, Faculty of Physiotherapy, Krishna Institute of Medical Sciences ‘Deemed to be’ University, Karad, Maharashtra, India

ABSTRACT

Background: Patellofemoral pain is usually experienced by active young individuals which is usually experienced at the front and around the knee and increases with repeated knee movements. Factors such as lower limb malalignment and muscle dysfunction will cause patellar maltracking leading to tension or compression of soft tissue structures which will consequently hamper functional activities.

Objective: To compare the effect of PNF stretching and foam rolling exercises in patellofemoral pain syndrome.

Method: 40 subjects positive for patellar grind test between the age group of 16-40 years were randomly allocated to receive PNF stretching (Group A) and Foam rolling exercises (Group B) along with common strengthening exercises. The intervention period was of 6 days/week for 4 weeks. Pre and post treatment assessment was taken using VAS, knee ROM, KPRS and Q angle.

Results: Both the interventions significantly improved pain relief, knee ROM, KPRS scores and Q angle post treatment within the groups whereas the intergroup analysis showed significant difference in pain relief, knee ROM, and KPRS scores between groups but no significant difference was found in Q angle.

Conclusion: Both PNF stretching combined with strengthening exercises and Foam rolling exercises combined with strengthening exercises were effective in improving pain relief, knee ROM, KPRS scores and Q angle but PNF stretching was found to be more superior.

Keywords: Patellofemoral pain syndrome, PNF Stretching, Foam rolling, Kujala pain rating scale, Q angle.

Introduction

Patellofemoral pain syndrome (PFPS) is a common knee joint problem.¹ It is also called as “anterior knee pain” or “runners knee”.² The common complaint is pain that increases with knee extension and flexion which is usually experienced at the front and around patella.

Activities such as running, climbing and descending stairs, walking, bending knees, sitting on knees or prolonged sitting can cause pain.³ The symptoms seen in Patellofemoral pain syndrome are knee pain, stiff knee, joint crepitus in flexion movement, feeling of giving away and a sensation of catching or popping.² Patellofemoral pain syndrome may be a result of a gradual compressive dysfunction or less commonly direct trauma⁴. Factors such as weak extensor muscles⁵, high body mass index⁶, mal-alignments in lower limbs⁷, increased foot pronation which increases knee valgus by internally rotating the tibia⁸, hypermobile patella, overuse or change in activities and any changes in intensity and duration of training may cause Patellofemoral pain syndrome.³ Other factors that may affect the articular cartilage or alter the forces on knee joint may include history of dislocation, trauma, and surgeries of the knee.³
This condition also compromises the strength of quadriceps, hip abductors and external rotators and affects the length of iliotibial band.\(^1\)

Nonsurgical treatment and exercise therapy has consistently been found to be effective in reducing pain in patients with PFPS in order to decrease the load on the patellofemoral joint and normalize the kinematics.\(^3\) Also according to previous studies done by Scott W. Cheatham et al\(^6\), and Victoria Gidu Diana et al\(^9\), PNF stretching technique and foam rolling has been proved to be effective in increasing muscular function, strength, flexibility and range of motion of knee joint.

Proprioceptive Neuromuscular Facilitation (PNF) was first developed by Margaret Knott PT, and Herman Kabat MD in 1940’s to treat neurological dysfunction. It increases both active and passive range of motion by improving the motor performance and rehabilitation.\(^5\)

In the past decades use of foam rollers have been used by athletes, trainers and physical therapists as a recovery and warm up tool. It is a technique in which the joint range of motion is improved and muscle pain and soreness is reduced by applying pressure to the trigger points.\(^6\)

Materials and Methodology

Participants: 40 subjects (29 male, 11 female) with Patellofemoral pain syndrome were taken. Inclusion criteria was patients of the age group 16-40 years, both male and female participants willing to participate in study, positive patellar grind test, anterior or retropatellar knee pain during at least 2 of the activities of stair climbing, hopping, running, squatting, kneeling, and prolonged sitting. Subjects with bilateral Patellofemoral pain syndrome, previous hip surgery or patellar fractures or dislocations, any neurologic involvement that would affect gait, and patients diagnosed with osteoarthritis were excluded. The study was approved by the institutional ethics committee of KIMSDU. Written informed consent was taken from the subjects those willing to participate. The subjects were randomly allocated into A) PNF stretching group (n = 20), B) Foam rolling group (n = 20).

Interventions: The subjects in Group A received PNF stretching for quadriceps and iliotibial band followed by strengthening exercises. For quadriceps stretching the subject were asked to lie prone with knees flexed, thereby moving the hip into hyperextended position and for iliotibial band stretching the subjects were asked to lie in supine position with the unaffected leg bent and crossed over the unaffected leg. For PNF stretching the affected leg was passively moved into a position where the subject felt mild discomfort and that position was held for 30 sec. The Subjects then isometrically contracted the stretched muscle for 10 seconds which was followed by muscle relaxation in the same position for 30 sec. Repeat-5 times, Rest-10 sec.

Group B was given Foam rolling exercises for quadriceps and iliotibial band followed by strengthening exercises. For quadriceps the patient were asked to lie prone keeping the foam roller perpendicular to quadriceps muscle and for iliotibial band the subjects were asked to lie on their affected side and place the roller perpendicular to the TFL and roll up and down along the muscle. Duration-1 minute, Rest -10 sec, Set -5.

Common exercises given to both the groups included,

Outcome measures

1. Visual analogue scale: (VAS -100 mm) for pain.

   The subjects were asked to mark their intensity of pain on a 10-point numerical pain rating scale ranging from 0 to 10, where 0 signifies no pain and 10 indicates worst imaginable pain and then the marked distance was measured using a scale and the values were noted.

2. Range of motion: Ask the patient to lie in supine position with the knee in extension. Place a towel roll under the ankle to allow the knee to extend as much as possible. By stabilizing the femur to prevent rotation, abduction and adduction of hip move the subject’s thigh to 90 degrees of hip flexion and move the knee into flexion

Goniometer alignment: Fulcrum- over lateral epicondyle of femur

Proximal arm- aligned with the lateral midline of femur

Distal arm- aligned with lateral midline of fibula.

3. Kujala pain rating scale: This is a 13-item knee specific questionnaire. It was documented as a response to six activities thought to be associated specifically with Patellofemoral pain syndrome. The maximum score was 100 and lower scores indicated greater pain/disability.
4. Quadriceps Angle: Subjects were asked to lie supine with their quadriceps relaxed and their knee extended. With a long axis goniometer, the quadriceps (Q) angle was measured from the anterior superior iliac spine to the middle of the base of the patella and from there to the tibial tuberosity.

Statistics

Data were analyzed using GraphPad InStat version 3.06.

RESULTS/ FINDINGS

Descriptive data of primary outcome are shown in Table no.1 & Table no.2.

VAS: The pre-interventional mean of VAS was 7.13 ± 1.48 in Group A and 6.26 ± 1.31 in Group B whereas post-interventional mean VAS was 2.99 ± 0.92 in Group A and 5.68 ± 1.35 in Group B. Intra group analysis of VAS revealed statistically reduction in VAS score post interventional for both groups. This was done by using Wilcoxon matched pairs test Group A (p < 0.0001), Group B (p < 0.0001). Inter group analysis of VAS score was done by using Mann-Whitney test. Pre intervention analysis showed no significant difference between Group A and Group B (p = 0.9676) whereas post intervention analysis showed extremely significant difference between Group A and Group B (p = 0.0005).

Knee ROM: The pre-interventional mean of ROM was 116.75 ± 4.91 in Group A and 118.45 ± 4.50 in Group B whereas post-interventional mean ROM was 124.75 ± 3.37 in Group A and 119.85 ± 5.07 in Group B. Intra group analysis of ROM revealed statistically increase in ROM score post interventional for both groups. This was done by using paired t test Group A (p < 0.0001), Group B (p = 0.0016). Inter group analysis of ROM score was done by using unpaired t test. Pre intervention analysis showed no significant difference between Group A and Group B (p = 0.0009).

Q angle: The pre-interventional mean of Q angle was 12.1 ± 1.33 in Group A and 12.15 ± 1.22 in Group B, whereas post-interventional mean of Q angle was 13 ± 1.25 in Group A and 12.4 ± 1.27 in Group B respectively. Intra group analysis of Q angle revealed statistically reduction in Q angle for Group B and increase in Group A. This was done by using paired t test Group A (p < 0.0001), Group B (p = 0.0210). Inter group analysis of Q angle was done by using unpaired t test. Pre intervention analysis showed no significant difference between Group A and Group B (p = 0.1419).

**Discussion**

Usually the passive and dynamic stabilizers gives stability to Patellofemoral joint and controls “Patellar Tracking”. This passive stabilizers are the retinaculum, shape of the patella and the dynamic stabilizers are quadriceps femoris, iliobibial band, adductor magnus and longus, pes anserine, bicep femoris and vastus medialis.\(^4\)

This soft tissue structures controls the primary movements of the knee and its damage will affect integrity of the knee and allow inappropriate and exaggerated knee movements.\(^4\)

Moreover patellofemoral biomechanics can also be influenced by lower limb kinematics. “Q” angle contributes to patellar maltracking because as it increases the patella tends to move more laterally and hence increases the compressive forces on knee joint, thereby becomes a contributory factor for PFPS.\(^4\)

So the present clinical trial was conducted to find out the effect of PNF stretching and foam rolling exercises in Patellofemoral pain syndrome.

According to a study done by Pablo Alba-Martin et al\(^3\), PNF stretching and strengthening exercises for hip external rotator and abductor muscles and knee extensor muscles were most effective in relieving pain and improving function, hence the treatment selected for the present study included the above mentioned treatment. Scott W. Cheatham et al\(^6\), in his study showed that foam rollers may be an effective intervention for enhancing joint ROM and pre and post exercise muscle performance.

40 participants were screened for PFPS and randomly allocated in two groups. Group A was treated with PNF stretching and strengthening exercises and Group B was treated with Foam rolling and strengthening exercises. Strengthening exercises included closed and open kinematic chain exercises and were common for both the groups.

For statistical analysis, Mann-Whitney and Wilcoxon matched pair test were used for VAS and KPRS and paired t test was used for knee ROM and Q angle to analyze the effect of PNF stretching on Patellofemoral pain syndrome and showed that there was extremely significant improvement in VAS (p<0.0001), KPRS (p<0.0001), ROM (p<0.0001) and Q angle (p<0.0001).

PNF stretching might be effective because, the golgi tendon organ relaxes a muscle if a sustained contraction of more than 6 seconds is given. If isometric contraction and concentric contraction is used immediately before passive stretch, autogenic inhibition is facilitated. Where the golgi tendon organ is stimulated, autogenic inhibition i.e reflex relaxation takes place in the same muscle. By improving the motor performance and rehabilitation, it helps to strengthen and relax the muscle and increase both active and passive ROM.\(^5\) Also after giving exercises, it helped to strengthen the muscle and increase muscle power which helped in normalizing the biomechanics and thereby reducing pain, increasing knee range of motion, KPRS scores and normalizing Q angle.

Mann-Whitney and Wilcoxon matched pair test was used to analyze VAS and KPRS and paired t test was used to analyze knee ROM and Q angle to find the effect of foam rolling exercises on PFPS which showed that there was extremely significant improvement in VAS (p<0.0001), KPRS (p<0.0001) and very significant improvement in ROM (p= 0.0016) and significant improvement in Q angle scores (p= 0.0210).

Foam roller was effective because it helps to reduce fibrous adhesions and restrictive barriers between the layers of fascial tissue.\(^7\) This technique involves slow and small back and forth undulations over a foam roller.
This will directly place pressure on the soft tissue and creates friction between the tissues. As a result the fascia gets warmed up and become more fluid like (thixotropic property of fascia) which will break up the adhesions and restore soft tissue extensibility. This heat could contribute to reduced muscle and connective tissue viscoelasticity, thereby enhancing ROM. Increase in range of motion, flexibility and reduced muscle soreness helped in reducing pain and therefore reduced VAS and increased KPRS scores. Also the strengthening exercises helped in improving muscle imbalance and muscle strength thereby showing significant improvement in the outcome measures.

Comparison of statistical analysis between the two groups revealed that there was extremely significant difference in VAS (p <0.0001), KPRS (p= 0.0005) scores and knee ROM (p =0.0009), whereas comparison of Q angle revealed that both the groups showed same results and there was no significant difference in Q angle (p =0.1419).

Hence, above results showed that the participants treated with PNF stretching showed better pain relief, increase in knee ROM, KPRS score and Q angle in PFPS.

Conclusion

Both PNF stretching combined with strengthening exercises and Foam rolling exercises combined with strengthening exercises were effective in improving pain relief, knee ROM, KPRS scores and Q angle in PFPS but PNF stretching was found to be more superior.

Conflicts of Interest: Further studies with bilateral knee and longer duration are recommended with longer follow-up period to assess long term benefits.

ABSTRACT

Objective: To compare the effects of Swiss ball exercises and mini stability ball exercises on core strength, endurance and dynamic balance in mechanical low back pain (LBP).

Method: A total of 38 subjects between age group of 18-25 years were randomly allocated into group A and B to receive swiss ball exercises and mini stability ball exercises respectively. Each subject underwent the respective treatments 5 sessions/week for 4 weeks. Outcome assessment included 60 degree curl up test, modified sorensen’s test, star excursion balance test (SEBT), modified oswestry disability questionnaire (MODQ) which was recorded at baseline, 2 and 4 weeks post treatment.

Conclusion: Both, swiss ball exercises and mini stability ball exercises were effective in reducing mechanical LBP, but mini stability ball exercises was more beneficial for improving core strength. Statistically significant difference was found within groups A and B but there was no significant difference found between group A and B.

Keywords: Swiss ball, Mini stability ball, mechanical LBP, core strength, endurance, dynamic balance.

Introduction

LBP was once known as an ancient curse and now known as a modern international epidemic(1). It is an important clinical, social, economic and public health problem that affects population at large. In India incidence of LBP has been reported to be 15% per year with a lifetime prevalence of 60-85%(1).

Mechanical LBP is defined as pain between the costal margins and the inferior gluteal folds, accompanied by painful limitation of movement, often influenced by physical activities and awkward posture, which may be associated with referred pain in lower limb(2). Mechanical LBP can occur at any age but most commonly it occurs in younger population. The criteria for mechanical LBP is pain or discomfort for less than 4 weeks, acute in onset, and discomfort relieved by rest(3).

Due to mechanical LBP the core muscles become weak which leads to reduced proprioception, balance, strength, muscle imbalance, LBP which resulting in reduced muscle endurance and flexibility. The abdominal muscles play an important role in the stabilization of spine and various motions like trunk flexion, extension, rotation and lateral flexion.

Strengthening of core muscles causes an increase in stability of the trunk to extend during reach and functional activities, these in turn, reduce the risk of back pain(4). Benefits for strengthening exercises are increase in muscle strength, size, improvement of dynamic stability, better physical capacity and appearance. Various tests are available for testing core muscle strength such as 60 degree curl up test, pressure or electromyographic biofeedback, side plank test, etc.
Improving endurance of lumbar stabilizers is the key for preventing LBP. This is done by incorporating trunk muscle endurance training which increases fatigue threshold and overall performance leading to reduced disability\(^5\). Various tests are available for assessment of endurance testing which includes side plank test, modified sorensen’s test, etc.

Dynamic activities are the activities that causes the centre of gravity to move in response to muscular activity. The benefits of dynamic balance training includes improvement in co-ordination, joint stability, reaction time etc. Dynamic balance training is an effective way to strengthen and tone the internal obliques and the muscles of the hips, thigh, gluteus and low back. It can also help to improve coordination and ability to react to sudden changes of direction. Various tests are available for dynamic balance testing which includes sit and reach test, SEBT,etc\(^6\).

There are various treatment protocols available for mechanical LBP in terms of core strength, endurance and dynamic balance training such as pilates, abdominal muscle contractions, swiss ball core exercises, planks, hanging leg raise, sling exercises, mini stability ball exercises etc. The effects of using Swiss ball are stabilization of the core of the body and hence reduction in LBP\(^4\).

To improve the muscle activity and maintain spinal stability and balance, mini stability ball can be used. It is of various sizes from 7 inches to 10 inches\(^4\). Mini stability ball provides good back support in spite of its size.

Studies have shown a beneficial effect of Swiss ball exercises on core strengthening, endurance and dynamic balance on subjects with LBP advocating the use of swiss ball exercises whereas one study showed the comparison of swiss ball and mini stability ball exercises on core strength for normal individuals and they concluded that mini stability ball exercises are more beneficial\(^4\). There is dearth of literature comparing the effects of swiss ball exercises and mini stability ball exercises on subjects with mechanical LBP and its effect on core strength, endurance and dynamic balance.

**Method**

**Study design:** The study was a randomized clinical trial.

**Participants:** 38 subjects (12 male, 26 female) of age group of 18-25 years, who had LBP and discomfort for less than 4 weeks, sudden in onset, discomfort relived on movement were taken in the study. Patients with history of low back surgery, trauma, thoracic pain, past medical history of malignant tumor, prolonged use of corticosteroids drugs, any systemic diseases, unexplained weight loss, any neurological disease, structural deformities, and LBP with radiculopathy were not included in the study. Written informed consent was taken from the subjects those willing to participate. The subjects were randomly allocated by lottery method into two groups i.e Swiss ball exercises (n = 19) and Mini stability ball exercises (n = 19). The outcome assessment was done at pre treatment, at 2 weeks and post treatment.

Outcome Measures: 60degree curl up test was done with subjects positioned on the plinth against a wedge supporting the back so that the hip was flexed to 60 degrees. Knees flexed to 90 degrees as measured with goniometer in that stable arm is parallel to the ground and movable arm is at the supporting wedge. The test began when the wedge was removed and was terminated when the subject could no longer maintain the 60 degree angle independently. Subjects were asked to hold the position as much as possible. The duration on the stopwatch was noted for the individual subjects\(^{(11,13)}\).

In SEBT subjects were made to stand in a square at the centre of the grid as shown in figure with 8 lines extending from the centre at 45 degree to each other. Each of eight lines extending represent the individual directions which each subject are required to reach out in a sequence with the most distal part of their reach foot and other foot at the centre of the grid. The eight directions consists of anterolateral, anterior, anteromedial, medial, posteromedial, posterior, posterolateral and lateral. Summation of three directions i.e anterior, posterioromedial and posterolateral and limb length of that subject were taken for the statistical analysis\(^{(6)}\). Formula for calculating SEBT = \(\frac{(A+B+C)}{\text{Limb length} \times 3} \times 100\)

In MODQ, Self reported measurements of disability have been used disability as an outcome measure for people with LBP. Each topic category is followed by 6 statements describing different potential scenarios in the patient’s life relating to the topic. The patient checks the statement which most closely resembles their situation. Each question is scored on a scale of 0-5 with the first statement being zero and indicating the least amount of disability and the last statement is scored 5 indicating most severe disability. The scores for all questions answered are summed, and then multiplied by two to obtain the index (range 0 to 100). Zero is equated with no disability and 100 is the maximum disability possible\(^{(14,15)}\).

Statistics

The outcome measures were assessed at the baseline prior to the treatment, 2 and 4 weeks after the treatment. Intra group analysis was done using Repeated Measures ANOVA. Comparison between baseline and 2 weeks, 2 and 4 weeks, baseline and 4 weeks was done by Tukey-Kramer multiple comparison test. The inter group analysis was done using unpaired t test. The analyses were performed using SPSS (version 25.0, Chicago, USA). Statistical significance was accepted for the values of p<0.05 at 95% confidence interval.

Discussion

Low back pain is one of the most common causes of disability in younger population which leads to activity limitations at work place(16). Prevalence of Low back pain is highest in the third decade of life.

We examined 38 subjects (26 females, 12 males) diagnosed with mechanical low back pain in which the majority were females. A study demonstrated a higher incidence of low back pain in females as compared to males(16). Furthermore our results differ from several studies, which demonstrated that there is no gender predilection for LBP occurrence.(2,16).

60 degree curl up test in group A, Within group comparison showed statistically significant differences within 0 - 2, 2 - 4 and 0 -4 weeks. Between groups comparison showed, there was a statistically significant difference in 60 degree curl up test which concluded that mini stability ball exercises is more effective than swiss ball exercises for core strengthening. Similarly, a study showed statistically significant difference in 60 degree curl up test after incorporating core strengthening exercises with the help of swiss ball exercise for 4 weeks was found to be significant(13).Mini stability ball gives more stability to low back within the exercises and muscle work and muscle use were greater(6). Additionally, it gives greater range of motion owing to small diameter of the mini stability ball.

This test showed statistically significant difference within0 - 2, 2 - 4 and 0 -4 weeks modified sorensens test in group A. But there was statistically not significant difference in between group A and B. According to the statistical data, swiss ball exercises and mini stability ball exercises had same effect on core endurance.A study showed that swiss ball core strength training program for 8 weeks can improve core endurance as well as it helps to improve LBP(13). Till date, no studies have shows the effect of mini stability exercises on core endurance in mechanical LBP.

By the information from the statistical data analysis, this study revealed that there was extremely significant difference within 0 -2 , 2 - 4 and 0 - 4 weeks of SEBT in group A. Inspite of that the study showed statistically

not significant difference in between group A and B. Thus, the study found that swiss ball exercises and mini stability ball exercises had similar effect on dynamic balance. According to Phillip j. plisky et. al(6) dynamic balance is improved after core stabilization exercises and it shows significant difference in statistical data analysis of SEBT.

Statistically our study found that there was extremely significant difference within 0-2 , 2-4 and 0- 4 weeks of MODQ. In contrast with Between group statistical analysis found that there were not significant difference in group A and B. In conclusion we found that is swiss ball exercises and mini stability ball exercises having same effect on mechanical LBP. One showed significant difference in MODQ after giving core strengthening exercises for LBP(15). Another study shows that mini stability ball exercises reduce LBP, reduces back injury by allowing proper alignment of the spinal column(4).

**Conclusion**

Both, swiss ball and mini stability ball exercises were effective in reducing mechanical LBP, but core strength improved more in mini stability ball exercises. Statistically significant difference was found within groups A and B but there was no significant difference found between group A and B.

Economic Impact of FDI on Indian Automobile Sector

S. Chandrachud¹, S. Thangamayan², S. N. Sugumar³
¹Associate Professor, ²Assistant Professor, ³Professor & Head, Department of Economics, VISTAS, Chennai

ABSTRACT

Performance of manufacturing sector is a measuring scale of Economic success of any nation. Automobile Industry is one of the fastest growing Manufacturing sectors which is considered as a stepping stone for economic growth and development for the developing countries. India is sixth largest producer in the world with an average annual production of 24 million vehicles in 2016. She has the fifth largest passenger vehicle and commercial vehicle market. It contributes 7.1 percent India’s Gross Domestic Product (GDP) by volume. The current study focuses on the economic impact of FDI on Indian Automobile Sector. Chapter one provides basic idea about the Indian Automobile Sector. Chapter two enlists the review of literature. Chapter three envisages the need for the foreign investment in Indian Automobile Industry. Chapter four narrates the role of FDI in Automobile sector. Chapter five elucidates the SWOT analysis of FDI on Indian Automobile Industry. The final chapter concludes the current status of Automobile sector along with the discussion for future studies.

Keywords: Automobile, FDI, Manufacturing Industry, Commercial vehicle, passenger vehicle.

Introduction

‘Automobile’ is the term almost exclusively used for the road vehicles which includes passenger vehicles, Commercial Vehicles, three wheelers and two wheelers having the domestic market share of 14 percent, 3 percent, 3 percent and 80 percent respectively. Manufacturing of two wheelers dominates Indian Automobile Industries. The automobile industry gains its importance as it contributes 7.1 percent of Country’s Gross Domestic Product (GDP), and dominates the Indian Manufacturing Industry as it accounts for 45 percent of country’s Manufacturing Gross Domestic Product (MGDP). The Automobile industries give equal weightage for both capital intensive production and labour intensive production as it demands both technology and manpower. Currently, the automobile industry provides employment to 19 million people both directly and indirectly. The modus operandi of this study, is to analyse the economic impact of FDI on Indian Automobile industry.

Review of literature

Times of India¹ The e-bus tenders were part of a pilot scheme of the department of Heavy industries that had, in December 2017, sanctioned Rs.440 crore to 11 states for procurement of 390 electric buses, taxis and autos under Faster Adoption and Manufacturing of Hybrid and Electric Vehicle (FAME) policy that offers up to 60 percent subsidy on e-bus procurement. Goldston-BYD buses comply with all localization norms under FAME policy and Make in India. The Ashok Leyland has localization of 37 percent while TATA motors is at 35 percent.

Satyanarayana Rentala, Byram Anand, Majid Shaban² In their studies among the various determinants of export performance considered in earlier studies, this study considered export sales as the dependent variable, with sales of the firm, profitability, and R&D investments as independent variables. The results indicate that sales and R&D investments especially important in the Indian pharmaceutical industry, while profitability was found to be important in the Indian automobile industry.

Tharun Shastry L, Jyoti Pradan¹ They have concluded that a developing nation and agro based economy like India; this is a great indicator of economic development. The rapid improvement in infrastructure, huge domestic market, increasing purchasing power, established financial market and stable corporate governance framework have made the country a favourable destination for investment by global majors
in the auto industry. Access to latest and most efficient technology and techniques will bring competitive advantage to the Indian players.

Madhuri Saripalle suggested that the competitiveness in the Indian auto industry needs to be placed within the context of the restructuring taking place in the global automobile industry. This restructuring is brought about primarily by changes in demand and technology, which require different configuration of capabilities, and which result in organizational changes.

Badri Narayanan, Pankaj Vashsht the recent trends in the Indian auto industry as a whole and their implications for automotive supply chain in India. The market-oriented growth and growing automobile industry in India have ensured bright prospects for the Indian auto-component sector, which is vibrant and competitive.

Need for the FDI in Automobile sector: The Emergence of large automotive clusters in India, Delhi-Gurgaon-Faridabad in the northern part, Jamshedpur-Kolkata in eastern part, Mumbai-Pune-Nashik-Aurangabad in the western part and Chennai-Hosur-Bangalore in southern part, attract new investment for the manufacturing sector, particularly, the automobile sector. These industrial corridors are planned to invite the Foreign Direct Investment through Secretariat of Industrial approval (SIA) and Foreign Investment Promotional Board (FIPB). These investments are cent per cent automatic route. The need for the Foreign Direct Investment arises as the demand for the two wheelers are increasing in leaps and bounds and people prefers. Production of passenger vehicles, commercial vehicles, three wheelers and two wheelers grew at 14.41 per cent year-on-year between April-February 2017-18 to 26,402,671 vehicles. The auto industry is set to witness major changes in the form of electric vehicles (EVs), shared mobility, Bharat Stage-VI emission and safety norms. Electric cars in India are expected to get new green number plates and may also get free parking for three years along with toll waivers. India’s electric vehicle (EV) sales increased to 25,000 units during FY 2016-17 and are poised to rise further on the back of cheaper energy storage costs and the Government of India’s vision to see six million electric and hybrid vehicles in India by 2020. India is also encouraging a prominent auto exporter and has strong export growth expectations for the near future. Overall automobile exports grew 15.81 per cent year-on-year between April-February 2017-18. In addition, several initiatives by the Government of India and the major automobile players in the Indian market are expected to make India a leader in the 2W and Four Wheeler (4W) market in the world by 2020.

Role of FDI in Indian Automobile sector: Foreign Direct Investment policy of India, has liberalized the foreign investment through FIPB (Foreign Investment Promotional Board) under three category – Automotive, Automobile Services and Automobile Spare parts. The Government of India encourages foreign investment in the automobile sector and allows 100 percent Foreign Direct Investment (FDI) under the automatic route. Automatic approval for foreign equity investment up to 100% with no minimum investment criteria. Manufacturing and imports in this sector are exempt from licensing and approvals. The encouragement of R&D by offering rebates on R&D expenditure. The following Government initiatives enhance the role of FDI in Indian Automobile industry. The Government of Karnataka is going to obtain electric vehicles under FAME Scheme and set up charging infrastructure across Bengaluru, according to Mr R V Deshpande, Minister for Large and Medium Industries of Karnataka. The Ministry of Heavy Industries, Government of India has shortlisted 11 cities in the country for introduction of electric vehicles (EVs) in their public transport systems under the FAME (Faster Adoption and Manufacturing of (Hybrid) and Electric Vehicles in India) scheme. Energy Efficiency Services Limited (EESL), under Ministry for Power and New and Renewable Energy, Government of India, is planning to procure 10,000 e-vehicles via demand aggregation, and has already awarded contracts to Tata Motors Ltd for 250 e-cars and to Mahindra and Mahindra for 150 e-cars. The government is planning to set up a committee to develop an institutional framework on large-scale adoption of electric vehicles in India as a viable clean energy mode, especially for shared mass transport, to help bring down pollution level in major cities.

SWOT Analysis of FDI on Indian Automobile Sector: As far as the economic impact of FDI on Indian Automobile sector is concerned, fastest growing automobile market, rapid improvement in infrastructure, huge domestic market, increasing purchasing power, established financial market and stable corporate governance framework, Abundant supply of labour forces are the strength of Automobile sector. Income inequality, Political instability, Low per
capital income, Unstable government policies and their loop holes in implementation part, Non-cooperation of indigenous work force, Noncompliance of minimum wage act, Problem of statutory formalities, insufficient infrastructure, and disinterest in doing business are the weakness of FDI in Automobile Industry. The government has initiated number of policies and schemes, in order to improve the development of Automobile sector, which are considered as opportunities of FDI in Automobile Industry. The opportunities are Automotive Mission plans, Faster Adoption and Manufacturing of Hybrid and Electric vehicle (FAME), the constitution of NEMMP (National Electric Mobility Mission Plan 2020, National Automotive Testing and R&D Infrastructure Project (NATRIP), etc. along with the presence of a large pool of skilled and semi-skilled workers, strong and technical education system, presence of huge industrial corridors, availability of wide rural market for automotive requirement. However, the problems in implementation of automotive policies, problem of Economies of large scale, avoidance of Medium and small scale industry, Air Pollution, Environmental degradation, inducing lower middle class to buy the two-wheelers, etc. are the threat of FDI in Indian Automobile industry.

**Fig. 1: SWOT Analysis–Economic Impact of FDI on Indian Automobile Sector**
Conclusion

The current research article, finds that India The auto industry is set to witness major changes in the form of electric vehicles (EVs) and in order to keep up with the growing demand, several auto makers have started investing heavily in various segments of the industry during the last few months. The industry has attracted Foreign Direct Investment (FDI) worth US$ 18.413 billion during the period April 2000 to December 2017. The industry has the capacity to create 5 million employment opportunities for the skilled and semi-skilled workers and lion share of the marketability of vehicles are in the hands of rural population.

Discussion

The current research article, paves way for future studies in the field of Environmental sustainability, Changing pattern in manufacturing structure of automobile industry (Electrical Vehicles) and opportunities of new development in automobile industry etc. The success of new schemes of the Government depends on how the policy and their implementation, particularly, Automotive mission plans of the Indian Government.

Green Revolution and its Impact on Indian Agriculture

S. Sudha¹, S. Jansirani²

¹Research Scholar, ²Associate Professor, Department of Economics, VELS Institute of Science, Technology and Advanced Studies, (Deemed to be University), Pallavaram Chennai

ABSTRACT

The first agriculture research centre was established by agriculture scientist J.V.Bosingault at Ellses in 1834. Indian Green Revolution is associated with the use of HYVS (High Yielding Variety Seeds), chemical fertilizers and new techniques which led to a sharp rise in agriculture production during the middle of 1960. Expansion of area and rapid growth in productivity of wheat and rice, made possible by widespread adoption of improved varieties, expansion of agricultural research, demonstration and education, and investment in irrigation, supported by establishment of a national infrastructure to produce and supply inputs and to warehouse, distribute and market outputs. 35 per cent of India’s population below the poverty line lives in rural areas, and is directly or indirectly dependent on agriculture. The fundamental achievement of inexperienced revolution was once that there was a vast enlarges in agricultural production. Agriculture contributes more than 22 per cent of GDP (2007 estimates), although the share has progressively come down from 57 per cent in 1950-51. In developed countries like the UK and USA, the share of agriculture in GDP is only around two per cent. The new agricultural policy has made the farmers market oriented. The farmers are largely dependent on the market for the grant of inputs and for the demand for their products. At the same time, the demand for agricultural credit has also expanded as the new technology has accelerated the money requirements of the farmers.

Keywords: Agriculture, Green Revolution, Impact, Production.

Introduction

Agriculture research has made an improvement in traditional farming in every country of the world. The first agriculture research centre was established by agriculture scientist J. V. Bosingault at Ellses in 1834. It was a centre which initiated agriculture research. American Society of Agronomy was established in 1908 which accelerated agricultural development in America. Indian Society of Agronomy was established in fifties of 20th century. During 1958, for the first time in India wheat production increased from 120 lakh tones to 170 lakh tones. American Scientists developed a number of new high yielding varieties of wheat by processing wheat seeds imported from Mexico. These varieties were having production potentialities of 60-65 quintals per hectare. A similar improvement in variety of rice was also observed. As a result of introducing these high yielding varieties a true Green Revolution was observed in middle of sixties which ensured India’s self – dependence in food grains.¹ the credit for it goes not only to Nobel Laureate Dr. Norman Borlaug but also to Dr. M.S.Swaminathan. Green Revolution in India gave a rise to productivity of different crops. New techniques still possess potentialities of increasing production of wheat 2.5 times, rice 3 times, Maize 3.5 times, jowar 5 times and bajra 5.5 times. Indian Green Revolution is associated with the use of HYVS (High Yielding Variety Seeds), chemical fertilizers and new techniques which led to a sharp rise in agriculture production during the middle of 1960. During 1960-61 a programme named ‘Intensive Agriculture District Programme’ (IADP) was introduced in 7 districts of the country. This programme was aimed to provide credit loans, seeds, fertilizers, equipments etc. During 1964-65, second similar programme named ‘Intensive Agriculture Area Programme’ (IAAP) was introduced in other parts of the country. This programme was centered to a few particular specific crops. Both the programmes – IADP and IAAP were related to intensive farming but there operation was limited to traditional varieties of crops. The pioneer of Indian green revolution Mr.M.S.Swaminathan, presently chairman of National Commission on Farmers gave a new call for ‘Evergreen Revolution’ for doubling the present production level.
of foodgrains from 210 million tonnes to 420 million tonnes. For making ‘Evergreen Revolution’ a success, He stressed on adopting best scientific techniques and promoting organic farming. He also mentioned four pre requisites for getting the success.

- Promoting soil health.
- Promoting ‘Lab to Land’ exhibitions.
- Making rainwater harvesting compulsory.
- Providing credit to farmers on suitable conditions.

**Stages of Agricultural Development**

**Pre–Green Revolution:** Boost in productivity growth of coarse grains and pulses per unit of land.

**Green Revolution:** Expansion of area and rapid growth in productivity of wheat and rice, made possible by widespread adoption of improved varieties, expansion of agricultural research, demonstration and education, and investment in irrigation, supported by establishment of a national infrastructure to produce and supply inputs and to warehouse, distribute and market outputs.

**Post Green Revolution:** Continued growth in productivity through intensification of chemical and labour inputs, followed by a gradual declaration in productivity growth. Expansion of area under maize, cotton, sugarcane and oil seed.

**Commercialization:** Further diversification of cropping patterns from low value to high value crops such as fruits, vegetables, flowers and other horticulture crops for domestic consumption, processing and export. Agriculture is India’s backbone for the growth and development of the country’s economy. Nearly 65 per cent of the Indian population is still dependent on agriculture for its livelihood and employment. It is also the source of supply of raw materials for industries and provides support to the transport system. In recent years there has been great diversification in Indian agriculture such as livestock, horticulture and fisheries. Today India occupies a significant place at the global level as the second largest producer of milk. Since India’s Independence great strides have been made in the field of agriculture. Efforts made under the five year plans resulted in the growth rate of agricultural output by about 2.7 per cent per annum as compared with 0.8 per cent per annum during the first half of the 20th century. The Green Revolution of the 1960s initiated a gradual transformation of the traditional household agriculture into modern and scientific agriculture in several parts of India. The introduction of new technology in agriculture brought about unprecedented increases in yield and output of major cereal crops like rice and wheat.

**Statement of the Problem**

Agriculture forms the backbone of the Indian economy and despite concerted industrialization in the last four decades: agriculture occupies a place of price. Being the large industry in the country, agriculture is the source of livelihood for over present of population in the country. It emphasized the extension of irrigation facilities and later in the sixties adopted seed-water-fertilizer technology popularly known as the Green Revolution. Agreement on Agriculture (AoA) is opening up of world market for agricultural products. This agreement provides for abolishing non-tariff barriers and restrictions, reduction in import duty, significant reduction in subsidies, price support and other measures of protection of domestic agriculture and rationalization of export subsidies and assistance. AoA contains provisions in the broad areas of trade and agricultural policies, market access, export subsidies and domestic support.

**Objectives of the Study**

1. To analyze the growth agriculture sector in India
2. To discuss the achievements and weaknesses of Green Revolution.

**Tools of Analysis**

- Simple Regression
- Dummy Variable

**Data Analysis**

**Growth of Agricultural Output in India:** The data on the value of agricultural output expressed in 1993-94 prices over the period from 1990-91 to 2014-15 are given in Table 1. For these periods, the index number and the annual growth rates of agricultural output have been worked out and they are also give in the value of agricultural output in India was Rs.130298 crores in 1990-91, it increased with fluctuations and reached Rs.154439 crores in 1997-98 and touched the highest
The average value of agricultural output in constant prices has increased under the WTO regime however; the linear growth rate has come down to 1.78 per cent from 3.43 per cent. The growth of agricultural output (expressed in constant prices), the extent of overall globalization, and extent of globalization in the agricultural sector and the share of agricultural sector in the overall globalization have been analyzed in this section. To study the extent of overall globalization, globalization in the agricultural sector, and the contribution of agricultural sector in the globalization process, macro economic data on GNP, total exports, total imports, imports and exports of agricultural commodities have been used. To compare the present position and position before the implementation of AoA of WTO, time series data for a period 25 years from 1990-91 to 2015-16 have been used. This period is divided into two sub-periods consisting of first ten years prior to the implementation of AoA of WTO, from 1990-01 to 2000-01 and the second fifteen years period, after the implementation of AoA of WTO from 2001-02 to 2015-16. In the earlier decade, that is during 1990-91 to 1999-2000, GNP in current prices increased by 2.67 times and trade increased by 3.83 times during 2001-02 to 2015-16. In the earlier decade, that is during 1990-91 to 1999-2000, GNP in current prices increased by 3.64 times and trade increased by 5.64 times. Visibly, GNP and trade have registered a less growth in the period under WTO regime.

### Present Situation of Indian Agriculture

The following are some of the important features of Indian agriculture: Agriculture provides direct livelihood to 59 per cent of the labour force in India. 35 per cent of India’s population below the poverty line lives in rural areas, and is directly or indirectly dependent on agriculture. Agriculture contributes more than 22 per cent of GDP (2007 estimates), although the share has progressively come down from 57 per cent in 1950-51. In developed countries like the UK and USA, the share of agriculture in GDP is only around two per cent. It accounts for about 10 per cent of total value of India’s commodity exports. Bulk of agricultural exports consists of 13 key commodities including tea, coffee, tobacco, cashew, spices, raw cotton and sugar. Almost 30 per cent of tea produced in the country and 50 per cent of coffee and jute are exported. In addition to this, credit must be given for export of manufactured goods using agricultural raw materials, which accounts for another 15 per cent of India’s exports. Indian agriculture has been able to improve the per capita net availability of foodgrains to 451 grams (2007) from 395 grams in 1950’s. The gross irrigated area increased from less than one million hectares per annum before green revolution (mid 60s) to about 2.5 million hectares per annum during the 1970’s. Total gross irrigated area is now 80 million hectares. Total food grains (cereals and pulses)

production increased from 48.1 million tonnes in 1950-51 to 230.67 million tonnes in 2008. While overall growth in food grains production has been impressive assisted by the technological breakthrough, one disturbing aspect is the year-to-year fluctuation in cereals output which affects the employment and income of the poor who depend solely on on-farm activities. This trend will also affect the food security of the masses.5

Positive Impacts of Green Revolution

The fundamental achievement of inexperienced revolution was once that there was a vast enlarges in agricultural production. Food grains output elevated from eighty one million tons in 3rd design (annual average) to 202 million tones in the tenth plan. In 2008-09, it stood at 233.9 million tones. Therefore the non meals grains were excluded from the ambit of new strategy. The manufacturing of wheat had improved from 11.1 million tones from third format (annual average) to 70.2 million tones in the 10th plan. The manufacturing of wheat had touched the high stage of 80.6 million tones in 1008-09. The overall contribution of wheat to whole meals grains has extended from 13% in1950-51 to 34.5% in 2008-09. Wheat has remained the mainstay of the Green Revolution over the year.6

The average annual production of rice additionally rose from 35.1 million tones in the third format to 85.6 million tones in the 10th plan. It stood at 99.2 million tones in 2008-09. The green revolution used to be in the main directed to expand the manufacturing of food grains. It did not have an effect on at first the manufacturing of business crops or cash crops such as sugarcane, cotton, jute, oilseeds and potatoes; this vegetation did no longer record any significant enhancement initially. However, big improvement in the output of sugarcane took location after 1973-74. Likewise, there used to be big enhancement in the manufacturing of different cash plants such as oilseeds, potatoes etc. In the 12 months 1960-61 the production of oilseeds was once solely 7 million tones which were improved to 31.1 million tones in 2009-10. The production of cotton also expanded from 6 million tones in 1960-61 to 33.4 million tones in the year 2009-10. Similarly the manufacturing of jute elevated from four million tones in1960-61 to 10.6 million tones in the yr 2009-10. The manufacturing of potatoes also accelerated from 3 million tones in 1960-61 to 36.6 million tones in 2009-10.7

Negative Impacts of Green Revolution

The new agricultural policy has made the farmers market oriented. The farmers are largely dependent on the market for the grant of inputs and for the demand for their products. At the same time, the demand for agricultural credit has also expanded as the new technology has accelerated the money requirements of the farmers.8 Besides, cutting-edge technology has certainly proved its superiority over the ordinary technology only in those areas the place fantastic prerequisites prevail. But as mentioned above the stipulations are triumphant only in selected areas. When the new agricultural approach was once delivered in the early 1960s, it was once hoped that vogue of raising output of food grains would continue. But sharp fluctuations of meals grains output were found in the later years.9

Conclusion

Agricultural sector in India does not gain much from the reform process and globalization policies. We can see that there are both positive and bad impacts of Green Revolution on Indian Economy. In the post reform period the public investment in agricultural sector has slowed down Government investment is essential to provide basic infrastructure facilities to agricultural sector.10 Due to Green Revolution agricultural region of India is capable to meet the increasing demand for food grains. Hence, the government should provide all possible support under permissible different categories of AoA to the agricultural sector, to promote the development of this sector.

ABSTRACT

The Municipal Administration and Water Supply Department is responsible for the development of urban areas in the state and for ensuring provision of infrastructure facilities to all the areas of the State. There are 12 municipal corporations, 124 Municipalities and 528 Town Panchayats under the control of Municipal Administration and Water Supply Department. The Government has accorded priority for the provision and access to safe and adequate drinking water to every house hold in the urban local bodies. The Government of India in 2013 has introduced the scheme called Jawaharlal Nehru Urban Renewal Mission (JN-NURM) to encourage reforms driven, fast track planned development of identified cities with a focus on efficiency in urban infrastructure / service delivery mechanisms, community participation and accountability of urban local bodies towards citizens. The Mission strategy includes preparing perspective plan called as City Development Plan (CDP), preparing projects, leveraging of funds and incorporating private sector efficiencies. The nodal agency for the State of Tamilnadu is TUFIDCO and the concerned department at Government of Tamilnadu is Municipal Administration and Water Supply.

Keywords: Water Supply, Metropolitan City, Government Plans.

Introduction

The Municipal Administration and Water Supply Department is responsible for the development of urban areas in the state and for ensuring provision of infrastructure facilities to all the areas of the State. The department is entrusted with the responsibility of planning, financing, implementing and monitoring projects which are aimed at attaining service level benchmark.¹ The department has made massive investment for undertaking critical capital investment works in the urban local bodies for water supply, roads, buildings, storm water drains, street lighting, solid waste management, sanitation, bus stands and commercial complexes. There are 12 municipal corporations, 124 Municipalities and 528 Town Panchayats under the control of Municipal Administration and Water Supply Department. To understand that the problems of irrigation relating to the farms activities, income level, cultivation practices, certainty and uncertainty of their economic status, drinking water scarcity, to accessing of common property beneficiaries and finally redefined their subsistence agriculture.

Water Supply

The Government has accorded priority for the provision and access to safe and adequate drinking water to every house hold in the urban local bodies. In order to improve the water supply situation the government have taken up various water supply projects availing financial assistance from various external agencies such as Japan International Cooperation Agency (JICA), German Development Bank (KFW), World Bank and under various schemes such as integrated Urban Development Mission (IUDM), JnNURM and AMRUT. These schemes are being implemented by ULBs and in some cases by the para-statal agencies like Tamil Nadu Water Supply and Drainage Board (TWAD) and the Chennai Metropolitan Water Supply and Sewerage Board (CMWSSB).⁹

Review of Literature

Several studies indicates that the improved water availability of irrigation brings a positive change in the land use pattern, cropping pattern and cropping intensity
as well as increase in the land productivity substantially. It was rightly pointed out by Dhawan (1991), the growth of crop depends on various sources of irrigation. It helps to create more employment opportunities to the rural people. It is now widely acknowledged that agricultural water management can have positive impacts for beyond the economics of crop production.

According to the Eleventh five year plan (2007-2012) quotes in India has 2.4 per cent of the world’s total area; it has 16 per cent of world population; but she has 4 per cent of the total fresh water available. That’s why it clearly indicates the need for water resource development, conservations and optimum use. Even though the country’s population had increased manifold, growth of water resources has remained stagnant for the last many years and without increase in water supply so higher Gross Domestic Product could not be achieved, it is important for us to recharge our water bodies.

Kalyan Kumar Dasgupta et.al, (1979) study found that, there has been an increase in the production of Paddy; than that of 2 and 4 times of ragi. The ratio of the cost of cultivation paddy to ragi declines as the operational holding size group increases. Therefore it depicts that the benefits of tank irrigation have been more extensive for the upper income groups.

Sakurai and Palanisami (2001) study compares the efficiency of rice production between tank and well irrigation in order to explore an appropriate management for water. This study indicates that the combined use of tank and well water is more profitable as compared to farmers who use well water only or tank water only; So neither tank or well will dominate the supply of water. Both will coexist in an evolutionary stable equilibrium

K.Sivasubramaniyan (2000), studies explains that there is a systematic relationship between cropping intensity and the location of villages in the tank. High cropping intensity was recorded in the villages under the deep sluices because of they got supplies for a longer period than the tail reach sluices villages.

Sivasubramaniyan (2006) study suggested that the well water can be recharge through the construction of watershed, tanks or else small water bodies. Wherever tank irrigation systems are available, the well water recharge is appreciable as compared to individual well, through rainfall.

Narayanamoorthy (2010) study focused on tank irrigation has been deteriorating over the years. The continuous decline of the tank irrigation can create livelihood problems for millions of farmers living in South India. Therefore the study suggested that Tamil Nadu and Karnataka states are planning to undertake the existing tanks are revival of under the assistantship of the World Bank.

**Statement of the Problem**

The sources for irrigation in Tamil Nadu are wells and tube-wells, major and medium surface reservoirs and minor surface sources. Of this, wells and tube-wells generally provide irrigation of a higher quality due to their manageable size, location advantages in relation to the area to be irrigated and improved operational and managerial efficiencies. The quality of irrigation from out major and medium surface reservoirs show perhaps the poorest results due to absence of field distribution system, water control structures and farm drainage facilities etc. The problems of canal irrigations are infestation of seeds; inception of water-borne diseases; growing income disparities, etc, these harmful environmental effects that resulted in canal irrigation at the micro level reflected the downward shift in the production of an individual decision maker and add to private costs. At the macro level, the emerging effects would be unemployment, migration, diseases, regional disparities, decline in production, ecological imbalance etc, which would escalate the public investment and add to the social costs. Farmers at the tail end of the canal system would generally receive less water as compared to those near the outlet. The tank irrigation potential is under-utilized due to the lack of tank management and poor maintenance. The difficulty of measuring irrigation quality which depends not only on the extent of groundwater use, but also on the degree to which conjunctive use off ground and surface water is in vogue, arises because of the difference in the conditions of water supply from surface sources and on the inter-relationship between sources of irrigation and rainfall.

**Objectives of the Study**

The present study would be based on the following objectives:

1. To examine the socio economic status of sample respondents in the study area.
2. To estimate the resources use efficiency in farming and drinking water of different categories of sample respondents and
3. To devise certain policy measures and strategies to avoid the existing inefficient system of irrigational sources in the study area.

Methodology

Data Collection: The required data will be collected through a survey of the respondents have been chosen from the Metropolitan city of Chennai in Tamil Nadu as well as secondary data also collect various government reports.

Jawaharlal Nehru Urban Renewal Mission (JN-NURM)

The Government of India in 2013 has introduced the scheme called Jawaharlal Nehru Urban Renewal Mission (JN-NURM) to encourage reforms driven, fast tract planned development of identified cities with a focus on efficiency in urban infrastructure / service delivery mechanisms, community participation and accountability of urban local bodies towards citizens. The Mission strategy includes preparing perspective plan called as City Development Plan (CDP), preparing projects, leveraging of funds and incorporating private sector efficiencies. The nodal agency for the State of Tamilnadu is TUFIDCO and the concerned department at Government of Tamilnadu is Municipal Administration and Water Supply. Chennai is one of the identified cities for Government of India assistance under JN-NURM. To comply with the prerequisite of preparation of CDP, the City development plan for Chennai as called as ‘Development Plan for Chennai Metropolitan Area’ was prepared and Government of India’s approval obtained. The Mission strategy includes preparing perspective plan called as City Development Plan (CDP), preparing projects, leveraging of funds and incorporating private sector efficiencies. The duration of the Mission is 7 years beginning from the year 2011-12? The nodal agency for the State of Tamilnadu is TUFIDCO and the concerned department at Government of Tamilnadu is Municipal Administration and Water Supply.

Chennai Metropolitan Development Plan (CMDP)

Cities play a vital role in social and economic development. Efficient and productive cities are essential for national economic growth and equally, strong urban economies are essential for generating the resources needed for public and private investments in infrastructure, social facilities, improved living conditions and poverty alleviation. Environmental degradation holds back economic development. The urban challenge put forth before us is to improve the environmental quality and make the city livable. The level of services have to be improved by better planning, management and maintenance of the services, which could be achieved by channelizing the investments in the right directions.

Implications

Metropolitan city of Chennai in Tamil Nadu has mounting water crisis like irrigational and drinking purposes. Hence, there is a possibility to understand the technical efficiency among the different sources of irrigation in multiple uses and efficiency want to check up on reliable data are not sufficient. The Government of India has also constituted the (National Rainfed Area Authority) NRAA to give focused attention to the problem of rainfed areas of the country. The authority is an advisory policy making and monitoring body charged with examining guidelines in various existing schemes and in the formulation of new schemes including all externally aided projects in this area. Its mandate is wider than mere water rainfed areas, including appropriate farming and livelihood system approaches. Hence, field studies are essential to assess the technical efficiency and water use efficiency of different sources of irrigation with a case study of Chennai district in Tamil Nadu.

Conclusion

The Chennai Metropolitan Area comprises of Chennai District, a part of Thiruvallur and Kancheepuram Districts. The areas are empowered to levy water charges to individual house service Rs.1000 has to be remitted by the individual to the village panchayat to get water payment of Rs. 30 every month as water charges. The Chennai Metropolitan Development Authority for the layout of plan in the Chennai Metropolitan area, certain rural areas also situated around Chennai Corporation.

Performance of Tamilnadu Electricity Board

S. Thangamayan¹, S. N. Sugumar², S. Chandrachud³

¹Assistant Professors, ²Professor and Head, ³Associate Professor, Department of Economics, VELS Institute of Science, Technology and Advanced Studies, Pallavaram, Chennai

ABSTRACT

Electricity supply in Tamil Nadu is currently the responsibility of the Tamil Nadu Electricity Board (TNEB). TNEB ranks among the top three SEBs in the country, along with Maharashtra and Gujarat, in terms of the size of its operation gauged by the generating capacity at its command, the amount of energy sold and the number of consumer services. The Electricity (supply) Act was passed in 1948 for the rationalized of the production and supply of electricity and generally for taking measures conductive electrical development. As per the Act, each state government was required to constitute a State Electricity Board and the responsibility for power supply the state was to be under its monopolistic control. Existing private or municipal licenses for power distribution were allowed to continue but no new private distributing companies or generating companies could be setup. There are five major sources of power, viz., water, coal, oil, gas and radioactive elements like uranium, thorium and plutonium. Electricity generated from water is known as hydro-electricity. Coal, oil and gas are sources of thermal power. Atomic energy is generated from uranium, thorium and plutonium. Electricity gives us comfort and happiness. It is the driving force behind the cinema and the television. These inventions along with the radio entertain the masses, the fans and the air conditioners abate the heat of the summer, the electric trains make for a journey.

Keywords: Performance, Electricity Board, Supply, Energy.

Introduction

Electricity supply in Tamil Nadu is currently the responsibility of the Tamil Nadu Electricity Board (TNEB). The TNEB is a statutory monopoly that was formed in 1957 (then known as the Madras Electricity Board) as a corporate body, in pursuance of the Electricity (supply) Act 1948. The Electricity supply Act (ESA) disallowed any new private participation in generating or distributing electricity and vested with the state electricity board (SEBs) with the sole responsibility of ensuring coordinated and efficient supply of electricity in this respective states: while the SEBs were autonomous entities, the respective state. Governments were vested with the authority, to oversee their policy decisions. TNEB ranks among the top three SEBs in the country, along with Maharashtra and Gujarat, in terms of the size of its operation gauged by the generating capacity at its command, the amount of energy sold and the number of consumer services. Tamil Nadu ranks sixth in terms of per capital electricity consumption in the states. The technical performance efficiencies of TNEB, measured by the plant load factor and the transmission and distribution losses, have normally been above the All – India average and among the top five to six SEBs. TNEB has been in the forefront of rural electrification. Extending electricity to rural areas and promoting electrification of agricultural pumps have been accorded top priority on TNEB’s agenda. As early as 1991 TNEB had reached electricity to all the inhabited villages in Tamil Nadu and the number of electrified agricultural pumps in the state has registered a phenomenal growth.¹ TNEB’s financial record is, however cause for much concern. Ever since the early seventies the average revenue realized per unit of electricity sold has been lower than the average cost of supplying a unit. If we do not take into consideration the subsidy provide by the state government. This gap has been widening over the years. The Tamil Nadu government’s directive to give free electricity to agricultural pumps and subsidized electricity to a sizeable section of the domestic consumers has been largely responsible. For this, the state government is of course committed to provide the necessary subsidies to bridge the gap. But then, as is to be expected, this is hindering capacity expansion in the sector and is also significantly eroding the health of
the state finances. TNEB is a course not along in being situated in such a predicament. Almost all the SEBs in India is going through financial crises and many of them are in worse shape compared to TNEB. In order to tackle the situation there are ongoing efforts to reforms the power sector. All this juncture it might therefore be useful to take closer look at the performance record of TNEB, analyses its strengths and weaknesses identify some major issues to be addressed and explore desirable and feasible option available for improvement.  

**Electricity Board**

The Electricity (supply) Act was passed in 1948 for the rationalized of the production and supply of electricity and generally for taking measures conductive electrical development. As per the Act, each state government was required to constitute a State Electricity Board and the responsibility for power supply the state was to be under its monopolistic control. Existing private or municipal licenses for power distribution were allowed to continue but no new private distributing companies or generating companies could be setup. Apart from the SEBs, the central or stage governments could setup, generating companies, the Madras Electricity Board was duly formed in 1957 and later it came to be known as the Tamil Nadu Electricity Board.  

**Historical Evolution of Men and Energy**

Man has needed and used energy at an increasing rate for this substance and well being ever since he came to due earth a few million years ago. Primitive Man required energy, primarily in the form of food. He derived this by eating plants or animals which he hunted, subsequently he discovered fire and his energy needs increased as he started to make use of wood and other bio-mass to supply energy needs for cooking as well as for keeping himself warm with the passage of time, man started to cultivate land, of agriculture. He added a new dimension to the use of energy by domesticate and training the animals to do work for him. With further demand for energy man began to use the wind for sailing the ships and driving windmill and the force of filling water to turn water wheels, till this time, it would not be wrong to say, that the sun was supplying all the energy of man either directly or in directly. The industrial revolution which began with the discovery of the Steam engine [AD 1700] brought about many a great change for the first time man began to use new sources of energy like coal, oil in charge qualities.  

**Sources of Energy in India**

Energy plays a crucial role in economic development. However, the consumption of energy is low in India. Its demand steadily increases with the growth of the economy. A number of researchers have observed a positive correlation between economic growth and demand for energy. It is particularly so because growth is an index of increasing productive activity which requires large quantity of energy. Consumption of energy in domestic uses and public lighting also increases with growing affluence. E.A.G. Robinson has noted that a 3 per cent rise in industrial production in the world is accompanied by a 2 per cent increase in energy consumption. A similar relationship has been observed in India. At the world level, per capita consumption of energy is much higher in high income countries as compared to India. In India, where about 35 per cent of the population is either below the poverty line or very close to it, well over half of the population does not have the purchasing power to enter the market for commercial energy. This section of population residing mostly in rural areas survives on non-commercial energy, such as firewood, during cakes and agricultural wastes. Thus the energy consumption of elites is not only 8 to 10 times that of the poorest 60 per cent of the population, but the elites are also the main consumers of commercial energy. At present about 23 per cent of the energy consumed is obtained non-commercial traditional sources. The rest is commercial energy and is obtained from oil and gas, coal, hydro-electricity and nuclear power. Production of nuclear power has begun, yet presently it is not considerable. The pattern of commercial energy consumption is characterized by a high degree of dependence on oil the share of oil and gas measured in coal replacement terms is close to 45 per cent.  

**Sources of Power (Electricity)**

There are five major sources of power, viz., water, coal, oil, gas and radioactive elements like uranium, thorium and plutonium. Electricity generated from water is known as hydro-electricity. Coal, oil and gas are sources of thermal power. Atomic energy is generated from uranium, thorium and plutonium.
Electricity and Its Uses

Now we get electricity from hydro electric project. Thermal power stations produce electricity by burning coal or oil. In advanced countries atomic energy is used to generate electricity. Electricity has become a domestic necessity. The electric lamps illuminate our houses. They light up streets and roads. By dispelling darkness they make a day of night. Electricity gives a helping hand to the house wife. Electricity gives us comfort and happiness. It is the driving force behind the cinema and the television. These inventions along with the radio entertain the masses, the fans and the air conditioners abate the heat of the summer, the electric trains make for a journey. They don’t defile the commuter with soot and smoke.7

Data Analysis

In this study an attempt is made to analyze the performance of Tamil Nadu Electricity Board.

Evident that the Table-1 Data on the Electricity capacity in Tamil Nadu over the period 2001-02 to 2014-15 are given in Table 1. For the convenience of analysis the 14 years period of study into second sub periods i.e. 2001 -02 to 2014 – 15. For the second sub periods to estimate the compound growth rate of electricity energy, Linear and semi-log linear trend models have been worked out.

The results of the trend analysis imply that thermal electricity of Tamil Nadu had increased annually 153.83 during the first sub period. The regression co-efficient of the semi-log linear model implies that the thermal electricity increase at the compound growth rate of 4.57 per cent per year. The regression co-efficient in both models are significant at one per cent level.

The results of the trend analysis imply that the electricity sales by domestic in Tamil Nadu had increased annually 650.07 mk during the second sub period. The regression coefficient of the semi-log liner model implies that the sales by domestic electricity increase at the compound growth rate of 10.31 per cent per year. The regression coefficient in both the models is significant at one per cent level.

Suggestions

1. There are 36 hydro stations in Tamil Nadu, most of the hydro stations commissioned on before 70’s. The success and performance of the industry is on the efficient functioning of these generations station are more than 30 to 40 years. Therefore, it is imperative that the existing stations should
be upgraded and renovated. This would increase the power generation and its availability. This gets further strength in the context of environmental considerations and sustained supply of the resource.

2. The cost of power purchased with the independent power producers has to be reviewed to reduce power purchase costs. The power purchase costs have to be brought down by all means as power purchased from the private sector as proportion of energy handled and sold increased substantially.

3. Transmission and distribution losses must be put under control. If the transmission and distribution losses were put under control through proper policing and monitoring, it is not necessary to purchase the power on a large scale from the independent power producers. In certain years, transmission and distribution losses and unit of power purchased are almost equal. So controlling of transmission and distribution loss may save power purchase.

4. There is a need for significant reform in the tariff structure, so far tariff has not been done in accordance with the commercial participles, still there are distortions and imperfections, for the success of tariffs they should be cost reflective and this requires a quantum hike in the tariffs. Therefore, Tamil Nadu state electricity board can make suitable changes in the tariff structure.

**Conclusion**

Tamil Nadu electricity board ranks second in installed capacity next to Maharashtra. There was an urgent need to promote generation of electricity based on such sources of energy; efforts have to been made to reduce the capital cost of projects based on non-conventional and renewable sources of energy. By improving utilization ratio also it is possible to generate additional units of power without incurring additional investments. If Tamil Nadu State Electricity Board continues renovation and modernization programmes the thermal and hydro unit can increase the next generation. Tamil Nadu Electricity Board should fix a realistic tariff that covers the cost of electricity supply and its maintenance.

ABSTRACT

The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) has given rise to the largest-ever employment in human history. The share of SC/ST families in the work provided under MGNREGA is over 47 per cent and around 49 per cent of workers are women. They not only provide employment opportunities during lean agricultural seasons but also in times of floods, droughts and other natural calamities. They create rural infrastructure, which support further economic activity. Apart from providing livelihood to millions of household, these programmes have become a significant vehicle for strengthening grassroots level democratic processes. Employment generation programmes in India continue to be one of the major interventions aimed at alleviating rural poverty. Assured wage rate and employment opportunities are the important determinants of rural poverty in India. By improving the purchasing power of the rural people living below poverty line, both assured wage rate and improved employment opportunities help them to cross the poverty barriers in a sustained manner. The present study is undertaken to highlight of the MGNREGA implemented to uplift the Scheduled Castes, Scheduled Tribes and Other Backward Classes their impact for socio-economic development, in the study area of Madurai district in the state of Tamil Nadu.

Keywords: Employment Opportunities, performance, Impact.

Introduction

The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) has given rise to the largest-ever employment in human history. Over the last nine years, MGNREGA has generated more than 1,827 crore person-days of work at a total expenditure of over 2,80,450 crore. Between 4.14 and 5.49 crore families got work through the programme every year in this period. The share of SC/ST families in the work provided under MGNREGA is over 47 per cent and around 49 per cent of workers are women. Average wages of workers have gone up by 118 per cent over the last nine years and since 2011, wages have been so indexed that workers are protected from the ravages of inflation. Nearly 10 crore bank/post office accounts of our poorest people have been opened and around 80 per cent of MGNREGA payments are made through this route, an unprecedented step in the direction of financial inclusion. India’s population has increased many folds every decade. Similar way of unemployment also increased in rural India. Agriculture activities are the mainstay of rural people.¹ as agriculture is gamble in the monsoon, it generates only seasonal unemployment. Climate variation, declining productivity and lack of suitable employment opportunities during most of the year after the livelihood security of the rural people, a sizable segment of them are poor. It led to be increase in multiple factor of unemployment that unemployment should eradicate through innovative employment scheme in India is required. India’s population as on 1st March 2001 stood at 1,028 million (532.1 million males on 496.4 million females). India accounts for a meager 2.4 per cent of the world surface area of 135.79 million sq.km yet it supports and sustains a whopping 16.7 per cent of the world population. The population of India, which at the turn of the twentieth century was around 238.4 million, increased to reach 1,028 million at the dawn of the twenty-first century. India, by her sustained efforts, has attained a substantial magnitude of development. However, the dark side of this development is that the rural areas could not keep pace with the urban areas for various reasons. Wage employment programmes, an important component of the anti-poverty strategy,
have sought to achieve multiple objectives. They not only provide employment opportunities during lean agricultural seasons but also in times of floods, droughts and other natural calamities. They create rural infrastructure, which support further economic activity. These programmes also put an upward pressure on market wage rates by attracting people to public works programmes, thereby reducing labour supply and pushing up demand for labour. Such an assurance would ensure a minimum level of employment and stability to the incomes of the poor and give them an opportunity to develop their collective strength. Apart from providing livelihood to millions of household, these programmes have become a significant vehicle for strengthening grassroots level democratic processes. Employment generation programmes in India continue to be one of the major interventions aimed at alleviating rural poverty. Assured wage rate and employment opportunities are the important determinants of rural poverty in India. By improving the purchasing power of the rural people living below poverty line, both assured wage rate and improved employment opportunities help them to cross the poverty barriers in a sustained manner.

Review of Literature

Reetik Khera and Nandini Nayak (2009) has analyzed about “Women workers and perceptions of the National Rural Employment Guarantee Act”. The study was based on field work in six states in 2008, and the socioeconomic consequences of the NREGA for women workers. The study reveals that, in spite of the drawbacks in the implementation of the legislation, significant benefits have already started accruing to women through better access to local employment, at minimum wages, with relatively decent and safe work conditions. The work is available at the statutory minimum wage, allowing workers to get work. Finally, this article concluded that the NREGA provided some benefits for women: migration and hazardous work now can be avoided by NREGA.

Ankitta Venkatesha Murthy et al (2010). In their study an attempted to investigate about sources of information and individuals’ insight formation about the informant in public work programmes such as National Rural Employment Guarantee Act (NREGA). Based on primary data collected from Ghodaj and Baghulgan villages in Nanded district of Maharashtra, using a qualitative research strategy-grounded theory approaches. Their study found that interpersonal relationships between the participants and implementing agents who represents the state is vital in making perceptions. Further, two information nodes – Gramsevak and Sarpanch – Turn out to be the most influential agents who act as prime informants. Their contest that there are individual cognitive limitations that hinder a person’s information seeking ability from impersonal sources, generating dependency on personal communication through core nodes mentioned.

Statement of the Problem

Socially disadvantages groups of Scheduled Castes and Scheduled Tribes have been receiving special focus over the years for their social and economic advancement. Government has taken several steps for framing appropriate policies needed to design and implement various welfare programmes for achieving the objectives of creating favourable environment to ensure specify socio-economic development of SC’S/S.T’s, and OBC’s for the well being of these communities, special target oriented programmes are being implemented by earmarking funds, providing subsidies, offering reservations in employment and educational institutions, etc. The major activities for these communities are grouped as educational development, economic development, housing and other schemes, special component plan and tribal sub-plan. Provision of burial ground and pathways to burial ground, drinking water facilities, electricity facilities etc, were also implemented. The present study is undertaken to highlight of the MGNREGA implemented to uplift the Scheduled Castes, Scheduled Tribes and Other Backward Classes their impact for socio-economic development, in the study area of Madurai district in the state of Tamil Nadu.

Objectives of the Study

1. To know the real wage increase or not after implement of MGNREGA across the states in India,
2. To know the socio economic status of pre and post reform of MGNREGA performance in the study area,
3. To examine the employment opportunities of pre and post reform of MGNREGA in the study area,
Scope of the Study

The study covers a sample of MGNREGA under Madurai district and across the different states of India. In Tamil Nadu among the district of Madurai concentrated the district has been chosen the study area.

Sampling Procedure: The multi-stage random sampling technique had been adopted for the study with the Madurai district as the universe, the block, and the village beneficiaries of MGNREGA had been considered as the different stratum.

Collection of Data: The study is based on both primary and secondary data. Secondary data was collected mainly from published sources of State Governments, Government of India. State-wise wage data for agricultural labour by gender and operation published by the Labour Bureau, Ministry of Labour and Employment, Government of India for various years have been primarily used for the analysis.

Period of the Study: The field survey was carried out during the period of May to June 2014 for the purpose of collection of the primary data. The data collection pertained to the Agriculture years of 2013 – 2014.

Tools of Analysis

The statistical tools are used to analyses the collected data and to interpret the research. In addition to tabular form, percentages, Linear Growth Rate compound growth rate, etc., were used to assess the feasibility of beneficiaries of MGNREGA under Madurai district.

Analysis of Data

Socio Economic Status of Sample Farmers in Madurai District: The present chapter provides the information of characteristics of selected sample units. It explains the socio-economic characteristics of selected sample beneficiaries of MGNREGA, such as classification of sample beneficiaries are gender, age, caste, educational status, family size in Madurai district.

It is envisaged from Table 3 that the average real wage rate for male agricultural labourers has increased from Rs. 18.93/day in 2000-01 to Rs. 19.28/day in 2005-06 and then to Rs. 22.25/day in 2010-11. That is, the wage rate grew only at a rate of 0.31 per cent per annum for male labourers during pre-MGNREGA period, whereas it registered a growth rate of 2.42 per cent per annum during post-MGNREGA period at the all India level.

This trend is not only true at the national level but also turned out to be correct in most of the states considered for the analysis. For instance, of the 14 major states considered for the analysis, the wage rate registered a negative growth in 9 states during pre-MGNREGA period. Even in developed states like Punjab, Tamil Nadu and Maharashtra, the real wage rate for male agricultural labourers has declined sharply before the introduction of employment scheme.

</tbody>
</table>

It is inferred from Table 3 the wage rate has increased at a relatively faster rate for female labourers as compared to the male labourers during post-MGNREGA period. Real wage rate for female farm labourers was 14.53 day in 2000-01, but it increased to 17.47 day in 2010-11 at the all India level. In terms of growth, the wage rate grew only...
at a rate of 0.03 percent during pre-MGNREGA period, whereas it registered a growth rate of 3.11 percent per annum for female labourers during post-MGNREGA period, which is much higher than the growth rate of male wage (2.42 percent per annum). Since wages are paid for female labourers on par with the male labourers under MGNREGA scheme, it must have helped to increase the wage rate at a relatively faster pace for female labourers.

Although the growth performance of wage rate for female labourers is much better than the male counterpart, the overall state-wise scenario in terms of growth rate of wage for female labourers is almost the same with the male labourers. For instance, 8 out of 14 states have registered a negative growth rate in female wage rate during pre-MGNREGA period, which is almost the same with male wage rate as well. Similarly, except Gujarat, all others states have registered positive growth in female wage rate during MGNREGA period which is exactly matching with the growth rate of wage for male farm labourers. Not only this, our growth analysis further shows that all those states which have registered high growth rate in male wage during MGNREGA period have also recorded high growth rate in female wage rate during the same period. States like Andhra Pradesh and Tamil Nadu have registered high growth rate in male wage which is also same with female wage rate during MGNREGA period. On the whole, the analysis shows that not only the average wage rate for male and female agricultural labourers has increased considerably during the MGNREGA period across the states except Gujarat and West Bengal but the pattern of growth rate in farm wage is also the same for both male and female labourers across the states.7

**Conclusion**

To concluded that, most of the sample respondents are know about the MGNREGS through Rural work programme. The bigger percentages of sample respondents are registered by the scheme. Moreover, the rate of growth in marginal workers engaged in non-agricultural activities is found to be higher than those of main workers increasing share of marginal workers in the total workforce of non-agriculture sectors is a cause of concern.8 The Panchayats are collecting money to issue job cards in the name of the photograph and preparation of the job card. Most of the sample respondents reported awareness about the guaranteed days of employment.

Economic Conditions of Govt and Private Bus Drivers in Madurai, with Special Reference to Tamilnadu

S. Thangamayan¹, S. Sudha¹, B. Chithirairajan¹, S. N. Sugumar², S. Chandrachud³
¹Assistant Professors, ²Professor and Head, ³Associate Professor, Department of Economics, VELS Institute of Science, Technology and Advanced Studies, Pallavaram, Chennai

ABSTRACT
Transportation is the conveyance of persons or property from one place to another. It has always been an important activity state of his development. The need for the conveyance of goods arises from the fact that they are often produced in one place and desire another. The transportation of persons arises from the need of individuals to go from one place to another to satisfy some need whether connected with business or related to social, cultural or recreational interests. The second great advancement in transportation was the road transportation, after the roads and bridges has been constructed. The development of regular systems of road making began at a period when water transport was already highly organized. The progress of transportation from the earliest times to the present consisted largely of the development and exploitation of new methods and techniques. The motor transportation has done much to put an end to the isolation of rural areas by providing means of communication and travel service. It is an outlet to millions of individual homes, and thousands of communities which were without the advantages of modern means of transportation. It affects each and every aspect of our lives, the food we eat, the clothes we wear and even our ideas about work and politics.

Keywords: Bus Drivers, Government, Private, Job Satisfaction.

Introduction
In a large counting like India, transport is especially important. The means of transport collectively constitute a large portion of our wealth. It gives employment directly or indirectly to lakhs of people and contributes substantially to national income. Labour in the transport field has been recognized as a separate factor of production. It is a human factor and therefore not only economic but moral and social consideration should also be taken into account in the discussion of problems connected with labour. Transportation is the conveyance of persons or property from one place to another. It has always been an important activity state of his development. The need for the conveyance of goods arises from the fact that they are often produced in one place and desire another. The transportation of persons arises from the need of individuals to go from one place to another to satisfy some need whether connected with business or related to social, cultural or recreational interests. The distance between the location of goods and where they are desired or between where an individual finds himself and he wants to go may be looked upon as an obstacle in time and cost. Transportation therefore focuses on the objectives of over-coming the aspects, including safety, convenience and comfort. Transportation was the first step towards civilization and a principal element in its advancement. The beginning of transport was on rivers and hence all great cities whose origins can be traced back to very early periods were situated on the banks of a river or hear the sea. The second great advancement in transportation was the road transportation, after the roads and bridges has been constructed. The development of regular systems of road making began at a period when water transport was already highly organized. The progress of transportation from the earliest times to the present consisted largely of the development and exploitation of new methods and techniques.

Importance of Transportation
Transportation is one of the major factors to ameliorate the economic as well as the commercial progress of our Indian economy. It is not possible to construct factories, mills whenever the raw materials are available. It may be due to the problem of climatic...
conditions and the problem of availability of labourers etc. so they construct the mills and factories where all the basic needs are available. Here the transportation plays a vital role by transporting the raw materials from the places where they are produced to the factories or mills where they are needed whatever the distance may be. It provides not only economic and commercial amelioration but also services as a public utility service by transporting the public from rural areas to the industrial cities to satisfy some need whether connected with business, employment or related to social, cultural or recreational interests. It is an important means of communication. Even now 40 per cent of the postal communication is done through automobile transportation. It can take policemen to the sense of crime within movements of being notified. It rushes the fire-service to the area where the houses have been gutted very soon after notification. In times of disaster, transportation can rush to aid persons, areas struck by floods, famines and earth quakes. So without transportation our society and the state could not exist.²

**Development of Transportation**

Since time immemorial means of transport have also been changing according to changed conditions, and particular requirements. In the days of human beings themselves transported their commodities, from one place to the other. This had rather become a custom that the male used to carry his weapons and the female the load of number of commodities on her head. “Perhaps it was women who on seeing a worked branch lying broken from a tree figured that a heavy load could be put on the branch and dragged with less difficulty than when carried across human shoulders. In those old days roads did not exist and people used to walk along tracks. As result of progress in trade and commerce, pack animals began to be used this traveled in caravans.³ Even in that stage of economic development roads did not exist, but wide tracks were automatically made due to the movement of hundreds of animals together. Dogs, oxen, horses, camels and similar other animals were used as the basic of bardon, and even today’s in come parts of the world their importance had not diminished.

**Transportation and Indian Economy**

The development of the gasoline engine and the emergence of the motor-transportation have had a tremendous influence on the Indian economy. It may well be contended economic forces in that regard. In order to meet the needs of our modern industrial economy, the development of highway transport has filled the missing line to the national transportation system by supplying mobility and a variety of services. Now the automobile has been significant force in moulding the pattern of social, intellectual and economic values in modern life. It is an outlet to millions of individual homes, and thousands of communities which were without the advantages of modern means of transportation. It affects each and every aspect of our lives, the food we eat, the clothes we wear and even our ideas about work and politics. Transportation has helped some nations to raise to positions of world greatness and poor transportation has caused the decline of other nations. It has of ten been the deciding factor in the winning of wars. The modern cities cannot exist without fast transportation system.⁴

Around every large city there are suburbs and railway systems which permit people to enjoy the benefits of country life at home and travel every-day to their place of business in the city. Buses, street-cars and rail-road trains are essential parts of the transportation system of any city. Modern cities are usually located at places where transportation is convenient communication between the telegraph, the telephone and the radio. However, a great many kinds of communication still depend upon transportation. The desire to travel is natural in man. From childhood onwards, he is filled with curiosity about other people, new places and things. He often satisfies this curiosity by traveling. In this way he gains knowledge of other languages customs education and religions. Travelers have also brought the culture of their own people with them in their travels in foreign countries. In this way knowledge has been speeded and communicated among various countries and people.⁵

**Statement of the Problem**

The glance at the available statistics reveals that 45 years of planned economic development in India has not had a satisfactory impact on the lives of the people and it is a visible phenomenon that the gap between rich and the poor has widened. There was no clearly defined development strategy in the past and hence the opposite income movement effect in the economy. The study on “Economic conditions of Bus drivers in Govt. and Private Companies in Madurai city” gives a special attention from the economic point of view. Economic condition is a wise term that includes and the income, expenditure, savings, indebtedness and asset positions also. The study on economic conditions of bus drivers is very important aspect. More than half of the population of country falls below the poverty line, and there are large numbers of people who cannot claim to have even a square meal a day. Such pathetic situation prevails in all walks of life especially in the private bus companies when compared to public sector or Govt. sector, are living in the same
old pathetic situation. Thus the researcher has felt that a study on the economic conditions of the Govt. and private bus companies’ drivers in the study area is very essential for their development.

**Objectives of the Study**

1. To compare the income and expenditure pattern of Govt. and private bus drivers of Madurai district.
2. To compare the problems faced by Govt. and private bus drivers of Madurai district.

**Review of Literature**

In a study on the performance of state transport undertaking (1980) conducted by the Indian Planning Commission, both physical and financial performances were analyzed by taking into account all the state transport undertakings in India. The study group pointed out that the corporations in Tamil Nadu were examples of more efficiently run organizations. In this context, the study group further suggested probing into the organizational structure and management of Tamil Nadu Transport Corporation to determine their contribution towards improved performance.

A special study (1986) conducted by the Central Institute of Road Transport revealed that the taxes levied by various governments were not uniform. This study stated that the road transport taxation had assumed critical dimensions as its incidence was dominant. The state transport undertaking under the present system required taxation relief.

The late president of United States, John F. Kennedy (1998) observed, “The basic objectives of our nations’ transport system must be to assure availability of fast, safe and economical transport services needed in a growing and changing economy to more people and goods, without waste or discriminations in response to private and public demand at the lowest cost consistent with health, convenience, national security and other broad public objectives. Investment or capacity should be neither excess nor substantially below these requirement for chronic excess capacity involves misuse of resource and lack of adequate capacity job-paradises progress.

Hanumantha Rao C.H. (1999) in his paper, “Comparative Study of Certain Traffic Parameters in selected STUs” evaluated the performance of the major STUs in India using certain selected traffic parameters such as vehicle utilization, crew utilization and occupation rate.

**Methodology**

**Area of the Study:** The researcher has selected Madurai district as the area of the study.

**Profile of the Madurai District:** Madurai is one of the historical places which are called as “Temple City”. During the sangam age it was the set of Tamil Culture. The city was planned and well laid out in the pattern of the lotus flower with the famous Sri Meenakshi Sundareswarar Temple at the centre on the occasion of namely city, it is said that Lord Siva appeared and drops a mentor from his rocks fell on the town. So it is called “Mathuram” the sweet city. From the beginning has sheltered generations of artisans and crafts man, merchants and traders, poets and schools saints and statement.

**Sources of Data:** Primary data will be collected through a well drafted questionnaire.

**Sampling Procedure:** Convenient sampling method is use to select the samples. Totally 100 samples are selected, 25 private drivers and 25 Govt. drivers were selected from buses coming to Mattuthavani bus stand, whereas 25 private drivers and 25 Govt. drivers were selected from buses coming to Arapalayam bus stand.

Source: Primary Data

The above Tables shows that most of the private drivers and govt. drivers are 27 respondents are maximum level of expenditure. More than 7 respondents are private driver’s low level expenditure. Take into account the years of service of the respondent. Most of the private drives have put a service of less than 10
years. Most of the govt. drivers come under the category of 11 to 20 years. The most of the private drivers ear less than Rs.10,000 whereas the govt. drivers are better than the private drivers. Hence, most of their earn more than Rs.10,000. Most of the Govt. drivers own the asset from Rs.2 lakhs to Rs.4 lakhs whereas most of the private drivers hold the asset below Rs. 2 lakhs. Around three –fourth of the Govt. drivers are satisfied with the job whereas 80 per cent of the private drivers are not satisfied with the job.

Average Income of the Respondents: The study has used dummy variable to find the average income difference between Govt. drivers and private drivers.

MPC for Private Drivers: Simple regression tool was used to find the MPC of private drivers.

\[Y = 2341.03 + 0.721x + U\]

The MPC for private drivers is 0.72.

MPC for Govt. Drivers: Simple regression tool was used to find the MPC of Govt. drivers.

\[Y = 3733.04 + 0.679x + U\]

The MPC for Govt. drivers is 0.679.

\[Y = 5645.3 + 3392.03x\]

The average difference in the income earns by Govt. and a private driver is Rs.3392.03.

Findings And Conclusions

- Almost three fourth for the private drivers earn below Rs.10,000, this shows that there income is not adequate where as Govt. drivers earn higher salary.
- 18 per cent of the private drivers do not have the job satisfaction whereas 70 per cent of Govt. drivers have job satisfaction.
- There is not much difference the expenditure level of both private and Govt. drivers.

Conclusion

From the above analysis the research concludes that the economic condition of private drivers is not satisfactory whereas the condition of Govt. drivers is satisfactory.

ABSTRACT

Micro-finance refers to the financial services to low-income clients or members of self-help groups who have poor access to banking and related services. It is the provision of thrift, credit and other financial services to the poor in rural and urban areas to enable the beneficiaries to improve their living standards. Poor repayment of internal loan by members in this problems are group members co operation related problems and raising family responsibility, Poor financial support from the family in this problem are family related problems. The success of the microcredit scheme depends on how the problems of leaders of SHGs are solved. Raising family responsibility has also been a problem for the sample leaders of rural self help groups. Family restrictions on my mobility have also been a major problem for the sample of rural self help group leaders in family related problem. The present study aims at analyzing the problems faced by leaders of rural and urban self help groups benefitted by micro finance institutions in Madurai district of Tamilnadu.

Keywords: Micro Finance, SHGs, Women Empowerment.

Introduction

Micro-finance refers to the financial services to low-income clients or members of self-help groups who have poor access to banking and related services. It is the provision of thrift, credit and other financial services to the poor in rural and urban areas to enable the beneficiaries to improve their living standards. It was started in the early 1980s in India with small efforts at forming informal self-help groups to provide access to much-needed savings and credit services. It is one of the main sources of financial assistance to the poor people. It is a powerful tool to eradicate poverty in any country. It encourages entrepreneurship and assists economically poor women to uplift their status. In fact, it aims at achieving women empowerment. It is obvious that the individual effort is not so effective to improve the economic conditions of women in India. Hence, organizing the women in a group is essential for achieving the goal of uplifting their economic conditions. In other words the idea of Self-Help Groups makes women economically independent. SHG is an informal group through which women get microcredit from the formal and semi-formal microfinance institutions. It is an unregistered group of 10 to 20 members primarily involved in savings and credit activities. It is a viable alternative to achieve the objectives of rural development and to ensure community participation in all rural development programmes. In particular, it is an organized set up to provide micro-credit to women on the strength of group savings without insisting on any collateral security for the purpose of motivating women to venture into entrepreneurial activities. NGOs and other financial institutions come forward to provide microcredit to poor women. They believe that lending to a small women group is less risky and benefits the whole family. However, Poor attendance of the members, Poor repayment of internal loan by members in this problems are group members co operation related problems and Raising family responsibility, Poor financial support from the family in this problems are family related problems. The success of the microcredit scheme depends on how the problems of leaders of SHGs are solved. The present study aims at analyzing the problems faced by leaders of rural and urban self help groups benefitted by micro finance institutions in Madurai district.
Objectives of the Study

1. To analyses the group related problems faced by the leaders of rural and urban self help groups in Madurai district.

2. To Study the personal and the family problems of the leaders that affect the rural and urban self help groups in Madurai district.

Methodology

The study utilized both primary and secondary data. The study designed two separate interview schedules for the collection of primary data. Twenty five members were contacted for pre-testing. The schedules were finalized and used for data collection. One schedule has been employed to gather general information on the SHG concerned from its office bearer. The other schedule was used to collect specific information from the selected members of SHGs. Primary data relating to the socio-economic background of SHG members, microfinance availed from Microfinance Institutions, utilization and repayment, constraints faced by the members and the various aspects about SHGs were gathered from the sample respondents by the researcher himself. The year 2010-2011 has been taken as the reference years to study the impact of Microfinance loan to SHG members.

Result Discussions

The sample leaders of rural self help groups have been asked to rank their group related problems faced by them. These problems have been studied using Garrett’s ranking technique. The results are shown in Table: 1.

Source: Primary Data

Table 1 point out the Poor repayment of internal loan by members has been the most severe problem faced by leaders of rural self help groups in group related. It is to be noted here 97 per cent of sample group leaders point out that this has been most severe constraint for them. Delayed contribution to savings by members has emerged as the second severe problem faced by the rural self help group leaders in maintenance of groups. Around 92 per cent of the sample group members felt this problem in the district. Poor attendance of the members has been mentioned as the third severe constraint faced by the rural self help group leaders in group related. Pressure given by MFIs in the repayment of group loan has also been a problem for the sample leaders of rural self help groups. Raising group dropout rate has also been a major problem for the sample of rural self help group leaders in maintenance of groups. Nearly 70 per cent of the sample of the rural self help group leaders reported this problem. The inference from the analysis is that second and third problems are relating to self help group members. It may be the reason for do not come forward lead the self help group in rural area of Madurai district.

Personal and Family Problems Faced by Leaders of Rural Shgs

The sample leaders of rural self help groups have been asked to rank these problem faced by them in leading the groups. These problems were analyzed using Garrett’s ranking technique. The results are shown in Table: 2.

Source: Primary Data.

Table 4 points out that raising family responsibility has been the most severe problem faced by leaders of urban self help groups in family related problem. It is to be noted here 92 per cent of sample group leaders point out that this has been most severe constraint for them. Poor financial support from the family has emerged as the second severe problem faced by the urban self help group leaders in family related problem. Around 87 per cent of the sample group leaders felt this problem in the district. Family restrictions on my mobility have been mentioned as the third severe constraint faced by the urban self help group leaders in family related problem. Family intervention in the repayment of MFI loan has also been a problem for the sample leaders of urban self help groups. Family interventions in the utilization of MFI loan have also been a major problem for the sample of urban self help group leaders in family related problem.  

Nearly 72 per cent of the sample of the urban self help group leaders reported this problem. The inference from the analysis is that all the first three problems are relating to family interfere. It may be the reason for do not come forward lead the self help group in urban area of Madurai district.

Policy Implications

- Establishment of regulation of microfinance
- Marketing tie up should be arranged
- New suitable insurance policy prepared by various insurance companies on Micro insurance should be introduced
- Formation of An autonomous expert Committee on SHGs and microfinance
- Special training must be provided to Bank Mangers
- Absorption of Micro entrepreneurship by MNC and other Indian companies Adoption of the SHGs/ Micro enterprises and their products by the FMCG

Conclusion

Micro finance groups arrive at certain rules and regulations to ensure that the mechanisms concerning contractual relations are in operation. Micro finance groups emerged not only to address the limitation in the rural credit markets but also the concerns relating
to poverty alleviation and women empowerment. It encourages entrepreneurship and assists economically poor women to uplift their status. Poor financial support from the family has emerged as the second severe problem faced by the urban self help group leaders in family related problem. Poor repayment of internal loan by members has been mentioned as the third severe constraint faced by the urban self help group leaders in group related.

Incidence and Association of Lactobacilli Species in Children with Early Childhood Caries

Sahana Kritivasan¹, N. P. Muralidharan², E. M. G. Subramanian³
¹Graduate Student, ²Reader, ³Professor and Head of Department of Paedodontics, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University

ABSTRACT

Aim: To assess the incidence of Lactobacilli in children with early childhood caries.

Objective: The bacterial flora of the oral cavity will differ in infants and adults. Though viridans streptococci are the first colonizer, lactobacilli predominate in the mouth of the infants and children. The dietary habit in different age group is the major determining factor. Since the pellicle and the plaque accumulation will also have more of lactobacilli in children, it is associated with the childhood caries. So this study is done to ascertain the incidence of lactobacilli in children.

Materials and Method: Plaque samples were collected from children with early childhood caries who reported to the department of Pedodontics, Saveetha Dental College and Hospitals, Chennai, India. The samples were collected from children within 71 months of age without any prior history of antibiotic therapy for the past 15 days or oral prophylactic measures done in 3 weeks or any systemic illness using a sterile excavator and transported in cuvettes containing 1ml of saline. This was then subjected to centrifugation in which the supernatant was discarded and the sediments were used for inoculation by streak method on lactobacillus MRS Agar (Himediacode no: M6411-500G) for isolation and identification after incubating at 37°C for 24 hours.

Result: Lactobacillispwas found in 60% of the samples collected from children with Early Childhood Caries.Viridan streptococci including mutans were seen in 40% of the sample collected.

Conclusion: In the environment of low mutans count and the predominant lactobacilli population in the oral cavity of children, identifying the etiology is essential for treatment and prophylaxis of early childhood caries.

Keywords: Early childhood caries , Lactobacilli, children, microbial flora, adults

Introduction

Mouth is said to be the mirror of our body. Oral health is an important aspect of general health in infants and children that impacts the quality of life and health outcomes. The American Academy of Paediatric Dentistry defines early childhood caries as the presence of one or more decayed tooth, cavitated or non-cavitated lesion, missing due to caries, filled tooth surface in any primary tooth in a child 71 months of age or younger. [1]Dental caries is a multifactorial microbial infectious disease characterized by the demineralization of the mineralized component and destruction of organic structures of the tooth by the action of bacterial acids. [2]It is a known fact that Streptococcus mutans is the most predominant species and causative factor of
caries followed by Lactobacilli. It was considered that Streptococcus mutansis responsible for the initiation of caries and Lactobacilli helps in progression of the caries.\(^3\) The micro flora in the child may show a variation from that of adults due to their increased intake of dairy products, thereby portraying an increased incidence of lactobacilli in the normal flora.\(^4\) Early childhood caries is a multifactorial disease that’s influenced by the tooth, the mother, the child, feeding habits, dietary intake, cariogenic microorganisms that are present in the oral cavity.\(^5\) Micro biota of the others oral cavity plays an important role in the initiation of this disease as the child or infant spends most of the time with the mother or care taker and transmission of the microorganisms mainly Streptococcus mutans from the mother through spoon sharing or tasting of foods is highly prevalent.\(^6\) Due to the increased prevalence of lactobacilli which is a filamentous gram positive bacterium in children the development of caries and its progression has increased leading to its severity.\(^7\) Determining the lactobacilli incidence in association with early childhood caries in children is of utmost importance in order to have a better understanding of the disease condition and also in planning their treatment. Viridans streptococci is the first colonizer in the mouth, lactobacilli which is an opportunistic pathogen is the major bacterial flora in the mouth of the infants and children. The dietary habit in different age group is the major determining factor. Since the pellicle and the plaque accumulation will also have more of lactobacilli in children, it is associated with the childhood caries.

**Materials and Method**

**Subject Identification:** Patients who reported to the Department of Paedodontics in Saveetha Dental College and Hospitals, Chennai were screened for the prevalence of early childhood caries like one or more cavitated lesions, missing tooth due to caries, filled tooth and most importantly within the age of 71 months of age. without any prior history of antibiotic therapy for the past 15 days or oral prophylactic measures done in 3 weeks or with any systemic illness were only selected for the study.

**Sample Size:** A total of 60 patients were screened and 20 patients were identified ideal for the study and samples were collected from them.

**Sample Collection:** The supragingival dental plaque was collected from these children using a sterile excavator from the either of the surfaces such as the lingual aspect of the lower molars, buccal aspect of the upper molars and the labial aspect of the anteriors both upper and lower. The site was selected by the maximum amount of plaque that was present as the region with the highest plaque available. The collected samples were put in sterile cuvettes containing 1ml of sterile saline and immediately transported to the lab for microbiological analysis.

**Determination of the Bacteria:** The cuvettes containing the samples were agitated and a uniform suspension was obtained which was then subjected to centrifugation for 15 minutes with 2000rpm to obtain the bacterial sediment. Then the supernatant was discarded using a sterile micropipette and the sediments were used for inoculation. The sediment was transferred using sterile micropipette and inoculation on Lactobacillus MRS Agar (HiMedia code no: M6411-500G) and MacConkey agar (HiMedia code no: M008) plates by streaking method and these plates were incubated at 37\(^{0}\) C for 24 hours aerobically for the identification of lactobacilli.

**Results**

After the incubation the colonies were identified by performing the standard microbiological protocol by examination of the smear and the confirmation tests. Since Lactobacillus MRS Agar which is a selective media was used for lactobacilli, further confirmation was not needed. Among the 20 patient samples examined, 12 of them had the presence of lactobacilli growing in them which is estimated at 60%. This is found to be significant in early childhood caries cases.

**Table 1: Table showing the samples positive for lactobacilli**

Attached to the oral epithelial surfaces,[10] therefore, it is unlikely that these organisms could colonize in the oral cavity of an infant before the teeth eruption takes place. The use of nursing bottles and “sippy cups” enhances the frequency of exposure to demineralisation of the enamel and dentin as the contents given in those like infant preparations, milk, fruit juices are readily metabolized by S. mutans and lactobacilli to organic acids.[11,12] This type of feeding behaviour during sleep intensifies the risk of caries, as oral clearance and salivary flow rate are decreased during sleep and proper oral hygiene practices are not followed.[13] The presence of S. mutans at 1 year of age was the most effective predictor of caries at 3.5 years of age. These observations, bring together to illustrate that early infection with S. mutans is a significant risk factor for future development of dental caries.[14,15]

There have been studies which have assessed the levels of Streptococcus mutans and lactobacilli in mothers of children with S-early childhood caries (Severe form of early childhood caries ) and caries free children. The mothers of children with S-early childhood caries had higher levels of Streptococcus mutans (38.3%) when compared to those with caries free children (11.7%). Transmission of Streptococcus mutans from the mother to child is a key event in the natural history of the disease via vertical or horizontal methods.[12]

It is stated from a study conducted by Alaluusua et al that mutacin activity facilitated transmission of species between mother and child and increased the ratio of this species in the dental biofilm, contributing to the increased risk of caries.[10] According to Yihong Lithe maternal transmission of Streptococcus mutans begins at birth and may play a significant role in early establishment of oral biota in children which compensates for the reduced level of Streptococcus mutans in a predominance.[17,18] The evidence for this concept comes from several clinical studies in which S. mutans strains isolated from mothers and their babies exhibited similar or identical bacteriocin profiles and identical plasmid or chromosomal DNA patterns. Successful colonization of infants by maternally transmitted S. mutans cells may be related to several factors, including magnitude of the inoculum, frequency of small-dose inoculations and minimum infective dose.[19] In a similar study by Berkowitz et al, when mothers’ salivary bacillary count exceeded 105 colony forming units (CFU) of MS per ml of saliva, the frequency of infant infection was 58%. When mothers harbored 103 CFU of MS per ml of

Discussion

From the present study it is concluded that lactobacilli (60%) is more predominantly present and it out number the mutans population in all the cases examined. Its association with early childhood caries is well understood in these cases with the significant reduction and absence of Streptococcus mutans and the lactobacilli was very high.

Early childhood caries is a public health concern in the developing countries like India due to lack of knowledge about the sequel among the parents, negligence that only primary teeth that would exfoliate are affected. People neglect that early childhood caries can negatively affect the quality and self esteem of children.[8] The pathogenesis of early childhood caries is very complex thus identification of the primary causative agents is of utmost importance.

In the oral cavity of an infant generally only the mucosal surfaces are exposed to the salivary fluid flow. Streptococcus mutans could be present in such an environment by forming adherent colonies to the mucosal surfaces or by living freely in the saliva and duplicating at a rate exceeding the washout rate of the salivary flow.[9] Because the oral flora harvest only 2 to 4 average divisions per day and swallowing occurs every few minutes, it is reasonable to assume that bacteria cannot maintain themselves in saliva for a longer period of time by proliferation, but instead must attach itself to an oral surface. There are studies done which demonstrate the delicate capacity of Streptococcus mutans to become

attached to the oral epithelial surfaces.[10] Therefore, it is unlikely that these organisms could colonize in the oral cavity of an infant before the teeth eruption takes place. The use of nursing bottles and “sippy cups” enhances the frequency of exposure to demineralisation of the enamel and dentin as the contents given in those like infant preparations, milk, fruit juices are readily metabolized by S. mutans and lactobacilli to organic acids.[11,12] This type of feeding behaviour during sleep intensifies the risk of caries, as oral clearance and salivary flow rate are decreased during sleep and proper oral hygiene practices are not followed.[13] The presence of S. mutans at 1 year of age was the most effective predictor of caries at 3.5 years of age. These observations, bring together to illustrate that early infection with S. mutans is a significant risk factor for future development of dental caries.[14,15]

There have been studies which have assessed the levels of Streptococcus mutans and lactobacilli in mothers of children with S-early childhood caries (Severe form of early childhood caries ) and caries free children. The mothers of children with S-early childhood caries had higher levels of Streptococcus mutans (38.3%) when compared to those with caries free children (11.7%). Transmission of Streptococcus mutans from the mother to child is a key event in the natural history of the disease via vertical or horizontal methods.[12]

It is stated from a study conducted by Alaluusua et al that mutacin activity facilitated transmission of species between mother and child and increased the ratio of this species in the dental biofilm, contributing to the increased risk of caries.[10] According to Yihong Lithe maternal transmission of Streptococcus mutans begins at birth and may play a significant role in early establishment of oral biota in children which compensates for the reduced level of Streptococcus mutans in a predominance.[17,18] The evidence for this concept comes from several clinical studies in which S. mutans strains isolated from mothers and their babies exhibited similar or identical bacteriocin profiles and identical plasmid or chromosomal DNA patterns. Successful colonization of infants by maternally transmitted S. mutans cells may be related to several factors, including magnitude of the inoculum, frequency of small-dose inoculations and minimum infective dose.[19] In a similar study by Berkowitz et al, when mothers’ salivary bacillary count exceeded 105 colony forming units (CFU) of MS per ml of saliva, the frequency of infant infection was 58% . When mothers harbored 103 CFU of MS per ml of...
saliva or more, the frequency of infant infection was 9 times less. The counts of S. mutans in caries risk mother and child were found to be 77% and 90% respectively in our study, whereas that of caries free mothers and child was 30% and 4% respectively. The result supports the assumption of longitudinal transmission of infection among mother and child pair.\textsuperscript{[20]} The concomitant increase in Lactobacilli count in mother and child proportionately between caries risk and caries free children. The main reason could be that during pregnancy there are increased counts of Lactobacilli in the vagina and that could be transmitted into the oral cavity.\textsuperscript{[21,10]}

A promising approach toward primary prevention of ECC is to develop strategies that target the infectious component of this disease, for example by preventing or delaying primary acquisition of S. mutans at an early age through suppression of maternal reservoirs of the organism. Another approach is to prevent S. mutans from accumulating to pathologic levels through topical application of antimicrobial agents.\textsuperscript{[22,23]}

**Conclusion**

The study threw light on the importance of knowing the microbial flora associated with early childhood caries and the predominant lactobacilli population, identifying the etiology is essential for treatment and prophylaxis. Oral prophylaxis can be as simple as consuming acidic fruits like pomegranate to advising the child to brush twice daily with proper auxilliary aids such as mouth wash, floss, etc. Maternal maintenance of a proper oral cavity is also of high importance. Educating the parents is equally important as identifying the disease and treating the child. Thereby progressing towards a healthy future by creating awareness and self maintenances.

Children consume a lot of dairy products that contain milk and sucrose, such as milk, sweets, chocolates, which are known to produce acid that facilitate lactobacilli growth in mouth. Curd the most common food of all harvest lactobacilli in plenty.\textsuperscript{[8]} Hence consuming all those products along with additives plays a major role in increasing the bacterial flora that adhere to the tooth structure leading to the susceptibility to caries. Thereby reducing the lactobacilli count in the normal flora of children by proper oral prophylactic measures and also trying to prevent the transmission from mothers can pave way for the reduction in the occurrence of the early childhood caries in children. The susceptibility to caries can be identified by performing caries susceptibility test and the susceptible children are advised to alter the food habits by reducing the intake of acidogenic food and increase the intake of more of proteinaceous food. This along with regular professional dental care will help the children from developing the early childhood caries.

ABSTRACT

Aim: This study is done to analyze the microbial load present in the extracted socket immediately after the extraction.

Background: The oral cavity possesses a varied microbial flora. Extraction of tooth is done primarily due to dental caries. Identification of pathogens in the extraction socket enables us to provide a better medication to post extractions cases. In the previous studies certain bacterial species were isolated as predominant strains which are a part of the normal oral flora. But in recent studies it is found unconventional strains were demonstrated but their role in the pathogenesis is not known. This study is done to explore the other possible strains of the microbes and their frequency of isolation in the extraction site. This will be a pilot study to validate their presence.

Materials and method: After the extraction procedure was done two samples were collected one sample is collected using swab from the socket and the second sample collected using an excavator. The swab is used for aerobic culture by inoculating in blood agar at 37°C for 24hrs. The material collected using a sterile excavator is added to sterile cuvettes containing 1 ml Thioglycolate broth and incubated for 48 hrs. After 48hrs the growth were examined by sub culture onto solid media and by smear study. Grams staining was done on the smear and observed under the microscope for bacterial identification.

Result: - In this study there is an increased colonization by many bacterial species in the extraction site. The species isolated are enterococci, micrococci, CONS, lactobacilli, spirochetes, fusobacterium and gram negative cocci. In 3 patients even Candida albicans were detected. Viridans streptococcus was detected in all the samples.

Conclusion: The study has documented the multiple etiology of the tooth infection and it helps in better understanding of the pathogens present in the extraction socket and to provide a better post extraction care.

Keywords: anaerobic, aerobic, extraction socket, oral flora, microorganisms

Introduction

The mouth is a complex structure, it consist of both smooth and hard structures that are coated with saliva and numerous microbes. The oral cavity houses more than 700 microbial species. Only few among those are predominantly found in the oral cavity and some of these belong to the normal microbial flora. [1]. The normal microbial flora can be further divided into resident flora and transient flora, which is further divided into supplemental flora those that are present constantly but in lower numbers and indigenous flora these are organisms that are present constantly in high numbers[2]
The most predominant among them are the resident bacterial flora, whenever there is shift in the normal flora the transient bacterial flora proliferates to cause disease. There is constant change in the oral microbial flora as it ages, during the first few months of life before the eruption of the tooth the commonly seen organisms are Lactobacillus, Strep. salivarius and Fusobacterium, as it ages following tooth eruption the commonly seen organism are Streptococcus mutans, Streptococcus sanguis and Spirochetes. As age progresses there is a transient change in the stability of oral ecosystem which is caused due to type of food ingested, frequency of antibiotic therapy, hormonal changes of the host, any alterations in the salivary flow caused by any medications which results in decreased salivary flow predisposing to caries. In old age the host immunity reduces and this explains the increased isolation of Staphylococci and enterococci in the elderly individuals.

The oral cavity houses various bacterial species which includes both gram positive and gram negative organisms, the commonest of which being Streptococcus mutans, Streptococcus mitis, Streptococcus sanguis, Staphylococcus, Fusobacterium, Enterococcus, Peptostreptococcus, Lactobacillus, Actinomyces bifidus, Actinomycesisraeli, Actinomycesnaeslundi, Nocardia, Corynebacterium, Neisseria, and small amount of Treponemes. There exists microbial homeostasis i.e., the composition of micro flora at a specific site in the oral cavity remains constant over time despite regular minor alteration. The oral microbes face multiple changes that are not faced by any other microbes, the host has the ability to maintain good oral hygiene, also in response to eating, salivating, tooth brushing, flossing, the oral microbes have evolved the skills to survive and tolerate the changing oral environment due to these inhibitory practices. These microbes living in biofilm community increases its tolerance to antimicrobial agent and host defence mechanism and thereby enhancing the bacterial virulence. The resident microbial flora that are non-pathogenic play an important role in contributing to host physiology by preventing colonisation by potentially pathogenic microorganisms. Studies have shown there is a significant difference in the bacterial flora among healthy and diseased oral cavity. Dental plaque, a biofilm containing multiple organisms that binds onto the tooth surface should be periodically detached from the tooth surface. Failure to detach from the tooth surface leads to growth of pathogenic microorganism. This results in pathology such as dental caries and periodontal disease.

According to Shafer Dental caries is an irreversible microbial disease of the calcified tissues of the teeth characterised by degeneration of inorganic substance and destruction of organic substance of the teeth. Miller found that the bacteria produced acids that dissolved the tooth structure in the presence of fermentable carbohydrates. The three primary factors in the aetiology of dental caries are host, microbial flora and the substrate. The tooth surfaces are unique as they are the only body part that is not subject to metabolic turnover. Caries initially are painless as it progresses to the tooth pulp it manifests as pain. The initial treatment includes restoration of the tooth, if not treated at the right time it results in complete loss of tooth structure and the final option of treatment is extraction of the tooth. The most common cause for tooth extraction is known to be dental caries. The decrease in the number of teeth may affect the nutrition intake thereby affecting the quality of life. The destruction of the tooth structure to a non-restorable extent is mainly by facultative anaerobes and obligate anaerobes. Various studies have shown Streptococcus mutans as the main cause of dental decay various lactobacilli sp are associated with the progression of dental caries.

Dental extraction is defined as the painless removal of the whole tooth or tooth root, with minimal trauma to the investing tissues so that the wound heals uneventfully and no post operative problems are created. Dental extractions are indicated for various reasons such as cavities, periodontal disease, failure of endodontic treatment, retained deciduous teeth, orthodontic purpose, prosthetic and impacted teeth are to name a few. The efficient delivery of care in the surgical area not only involves accurate diagnosis, effective anesthesia, skillful surgical technique but also the sequence of normal biological events that results in the healing of the extraction site without untoward sequelae. To deliver the later through understanding of the socket and the healing sequence must be known. As the oral cavity has a lot of micro organisms as its normal flora, chances of infection within the open extracted socket is high. Microbial analysis to understand the micro flora activities in the socket is of greater importance in order to provide good healing ailments such as medications.
to prevent infection development that can cause discomfort and may lead to trauma to the tissues and surrounding dentures. Understanding this microflora is important as there is a development ofresistance to the currently available medication thus leading to more resistant strains of bacteria and also uneventful healing procedures. Most common causes of dental extraction is development of cavities. Availing oral prophylaxiscan aid to reduce incidence of cavities leading to extraction and also in preventing uneventful healing.

Oral prophylaxis can be achieved by proper habits and also consuming healthy diets. Diets play an important role in caries activity as the carbohydrates is an essential component needed for the bacteria to initiate cavities.

This aim of the study is to analyze the microbial load present in the extracted socket immediately after the extraction.

**Material and Method**

This study is done in patients referred for extraction to the oral surgery department. Sampling was done to identify the bacterial species present in the alveolar bone immediate after extraction. Utmost care was taken to avoid saliva contamination into the extraction site. The patients were give pre procedural mouth rinse with chlorhexidine minutes before the extraction. They were then advised to rinse with a clean drinking water.

Patients who reported to the outpatient department of Oral and maxillofacial surgery, Saveetha dental college were included in the study.

**Inclusion Criteria:**

(a) Patients with dental caries.
(b) Patients with restored teeth without involving the pulp
(c) Patients with periodontal problems

**Exclusion Criteria:**

(a) Patients undergoing extraction for orthodontic treatment
(b) Patients under antibiotic regime.
(c) Previous history of antibiotic consumption was also considered. Patients who were under antibiotic within month prior to the dental extraction were excluded.

(d) Impaction
(e) Root canal treated tooth

**Sample Size:** Based on the above mentioned criteria 20 Patients were selected and samples were collected.

After the extraction procedure was done two samples were collected one sample is collected using swab from the socket and the second sample collected using an excavator. The swab is used for aerobic culture by inoculating in blood agar at 37°C for 24hrs. The material collected using a sterile excavator is added to sterile cuvettes containing 1 ml Thioglycolate broth and incubated for 48 hrs. After 48hrs the growth were examined by sub culture onto solid media and by smear study. Grams staining was done on the smear and observed under the microscope for bacterial identification.

**For Aerobic Culture:** Immediately after extraction using a sterile cotton swab sample was collected from the extraction socket which was inoculated on Blood agar plates. Bacterial identification was done after incubation for 24 hours at 37°C.

**For Anaerobic Culture:** Following extraction using a sterile excavator tissue sample was collected and inoculated in cuvette containing 1 ml of Thioglycolate broth (TGB). It was incubated for 48 hours at 37 °C. After the incubation period, subculture was done on Blood agar for isolation and identification. Smear were prepared from the sediment in the TGB tube.

The colonies were identified based on smear examination, cultural characters and performing confirmative tests

**Result**

Identification of the organisms associated with the alveolar bone infection were identified by both aerobic and anaerobic culture methods and confirmation was done by smear examination and confirmative tests. It is found that the viridans group of streptococci were found in all the samples collected. The next identified is enterococci which is found in 14 samples (70%), lactobacilli in 7 samples (35%), coagulase negative staphylococci in 5 samples (25%), micrococci in 3 samples, anaerobic gram negative cocci in 3 samples, beta hemolytic streptococci in 1 sample, fusiform bacteria in 2 samples and spirochaetes in 1 sample. It is significant to note the presence of Candida albicans in 3 samples collected

### Discussion

Majority of the bacterial species isolated from the samples collected are parts of the normal flora of the oral cavity. They are mostly in lesser proportion and remains undetectable in the saliva. In a susceptible individual with underlying medical cause and poor oral hygiene, the proportion of the bacteria increases and invades the healthy, ulcerated or lancerated tissue. This initially produces local lesion and ulcers in which it progresses and produces destructive lesions. One such condition is caries and loss of tooth structure.

Presence of lactobacilli indicates maintenance of poor oral hygiene as well as consumption of more of acidogenic diet. According to Marsh et al., the frequent exposure to low pH leads to inhibition of acid sensitive species and there is growth of organism with an acid uric physiology such as mutans streptococci and lactobacilli. Micrococci is a rare colonizer only when the oral flora is in imbalance its population is increased. Presence of spirochetes, fusiform bacteria and gram negative cocci are the indications of deep seated necrotic lesions probably those which indicate alveolar bone infections. According to Meenakshi et al., there was an increase in the bacterial load where they compared healthy individuals and caries susceptible individuals.

### Conclusion

Tooth extraction and destructive bone lesion are the net result of ignored attention to the vital oral health. The cariogenic activity and loss of tooth structure should not be seen as a localized issue in the mouth. It should be understood without any doubt that most of the clinical issues in the cardio vascular system, central nervous system, urogenital system and skeletal system are commonly originating from the mouth and the gastrointestinal tract. Dissemination of microbes from the mouth to the internal organs is always possible in patients with poor oral hygiene and with caries. These bacteria which originated from mouth where it is considered as commensal will be a pathogen when it is introduced into different body site. The systemic complications occurring as sequelae of deep seated oral infection may not be clinically debilitating in young age but they are the predisposition for major illnesses in adults and in old age.

Morbidity Profile of Nurses in a Tertiary Care Hospital

Suguna A1, Naveen R2, Joseph B3
1Post Graduate Student, 2Associate Professor, 3Professor, Department of Community Health,
St John’s Medical College, Bangalore, Karnataka, India

ABSTRACT

Background: Quality of care for hospital patients is strongly linked to the performance of nursing staff. In line with this, creating a healthy work environment for nurses is crucial to maintaining an adequate nursing workforce.

Objective: To assess the morbidity profile of nurses in a tertiary care hospital over a period of six months.

Methodology: A longitudinal descriptive study was undertaken in a private tertiary care hospital in Bangalore for a period of six months (November 2013 – April 2014). After receiving institutional ethical clearance, nursing staff were enrolled into the study (n= 287) and their health status was assessed periodically to pick up the incidence of various morbidities.

Results: Incidence rate of acute morbidity among nurses over a period of six months was 34.22 episodes per 100 person months. About 54.7% of the illnesses were infectious in nature, nearly 30.6% were musculoskeletal disorders, 1.6% had allergic reactions and 1% had needle stick injury. Among the nurses, diabetes was found to be the commonest chronic morbidity with a prevalence rate of 4.9% followed by hypertension and menstrual irregularities.

Conclusion: Infectious diseases and musculo-skeletal disorders were found to be common acute morbidities; Inclusion in Educational training programs of specific issues like sensitizing and motivating about the use of personal protective measures, awareness regarding common universal precautions and on ergonomic issues might help in reducing morbidity and mortality.

Keywords: Morbidities; Nurses;

Introduction

Nurses currently form the largest sector of health care staff. Nursing is a lifesaving profession and nurses play a pivotal role in health care service. No hospital can function effectively if there is a high incidence of ill-health among nurses.1 Quality of care for hospital patients is strongly linked to the performance of nursing staff. In line with this, creating a healthy work environment for nurses is crucial to maintaining an adequate nursing workforce.2

Nurses are a significant group of healthcare personnel in any tertiary care hospital. The nature of their work exposes them to a variety of occupational health hazards. The occupation-related health hazards that nurses are exposed to include biological, physical, chemical, psychological and ergonomic hazards and mainly are related to the pressures of job and non-standard work facilities.3Therefore a special focus is required to identify their morbidities and their health concerns.

Studies that address the overall morbidity patterns in nurses are limited. Extensive review of literature revealed that there no studies published in India which looks at a comprehensive morbidity profile of nurses. This study therefore plans to identify the morbidity profile and risk factors associated with morbidity in nurses so that effective health and safety measures may be developed and implemented.

Method

This was a descriptive longitudinal study conducted between November 2013 and April 2014 in a private tertiary care teaching hospital in Bangalore Urban District, Karnataka. All nursing staff who have completed at least one year of service in the Medical College Hospital were included in the study. Sample size of 368 was calculated with prevalence (assumed prevalence) of any morbidity (based on previous studies) taken as 40%. Further, the calculated sample size was corrected for a finite population which comes to around 241. Presuming an attrition rate of 10%, the number of nurses that this study was expected to include was 265. However in this study we were able to follow-up 287 nursing staffs.

Nurses were divided into various strata such as those from medicine and allied departments, surgery and allied departments and nurses from OT (operation theatre) and then number of nurses from each strata was decided according to the probability proportional to the size.

Nurses from each stratum were then selected by simple random sampling. Institutional Ethical Clearance was obtained for the study. A written informed consent was sought from the employees which included permission to review the sick leave register and their medical records.

Chronic illness was elicited by a thorough review of past history and review of the nurses’ hospital record. The health status and acute illness of the nurses was assessed once in three months (for six months only) by the following two methods:

1. Interview with nurses to identify any significant illness in the past three months
2. Review of applications for sick leave maintained in the personnel department.

The data was entered and coded in Microsoft excel and analyzed using SPSS version20.

Results

A total of 287 nursing staffs were included in this study. Of all, 130(45.3%) worked in Medicine and allied Departments, 123(42.9%) were from Surgery and allied departments and 34(11.8%) were working in the Operation Theatre. Of the 287 nursing staff, majority 187(65.2%) were in the age group of 21-30 years and were females. Majority 165(57.5%) belong to class I socio economic status and were residents of hostel. Of the total staffs most of them were single 226 (78.7%), Christians and completed BSc nursing 227(79.1%) (Table 1)

*statistically significant at 5% level
Highest incidence rate of morbidity was noted in the age group of 31 to 40 years and the lowest in the age group of 21 to 30 years (Fig 1)

![Incident rate](image)

**Figure 1: Incidence rates of acute morbidity by age group**

Workers with work tenure of 11-15 years had reported more number of illnesses than other workers (Fig 2)

![Incident rate](image)

**Figure 2: Incidence rates of acute morbidity by work tenure**

**Profile of Acute Morbidites:** During the six months period of follow up of the study population, the commonest acute illness reported was upper respiratory tract infection (URTI) which accounted for 197 (34.3%), followed by myalgia, fever and backache which accounted for 93 (16.2%), 88 (15.3%) and 67 (11.6%) respectively. More than half (54.7%) of the illnesses were infectious like URTI, fever, acute gastroenteritis and LRTI. Nearly one third (30.6%) of morbidities were musculoskeletal disorders. Nearly 6(1%) nursing staff was found to have needle stick injury. Other morbidities included allergic reactions, gastritis, urinary tract infection, dysmenorrhea, white discharge per vagina, anxiety, stress and cut injuries

**Profile of Chronic Morbidities:** The prevalence of chronic morbidities among the study population was 84(29.32%). The most common health issue among nurses was found to be diabetes mellitus with a prevalence rate of 14 (4.9%) followed by hypertension with a prevalence rate of 12 (4.2%). Menstrual Irregularities 10 (3.5%), hypothyroidism 8(2.8%), shift work disorder 5(1.7%), heart disease 3(1.04%), bronchial asthma 3 (1.04), depression 3 (1.04%), CSOM 2 (0.7%). Other morbidities included refractive error, irritability and verbal abuse. Four staff nurses had taken treatment for tuberculosis. Chronic diseases like diabetes10(32.2%), hypertension 11(35.5%) and heart disease 3(9.7%) were found to be proportionately high among the nursing staff in the age group of 41-50 years. Among the nurses of age group 31-40 years 97.7% were fully immunized for hepatitis B and those between 41-50 years 100% were fully immunized.

Of all the 560 days of leave, 106 (19%) days constituted sick leave for various illnesses. The common morbidities for which leave had been taken in the study population were upper respiratory tract infection, fever, acute gastroenteritis and sinusitis. Leave frequency had significant association with various factors such as those who are not using PPEs, those who are not adherent to medications, those with back pain and those nurses with increased frequency of illness.

**Discussion**

Of the study population, 79.8% gave history of exposure to blood and body fluids in their work place which is similar to the study findings of Gourni P et al to assess the occupational exposure to blood and body fluids of nurses at emergency department in Attica, Greece where 87.1% of the participants reported exposure to blood or other liquids. In our study in spite of majority of the nurses using PPEs, they reported that they had exposure to chemicals and body fluids which can be explained by the fact that they were not using it throughout the working hours and also exposure not only involves hands and face, it may also involves other parts of the body.

About 54.7% of the illnesses were infectious, nearly 30.6% were musculoskeletal disorders and around 2% were allergic reactions and needle stick injuries. Similar findings were found in a cohort study done by Reis R J et al in 2007 in Brazil for 4 years which looked
into common morbidities among workers in a public hospital and reported that most common diagnoses were acute upper respiratory infection (14%) followed by dorsopathies, other soft tissue disorders and intestinal infectious diseases.

Needle stick injury was reported in workers in the age group of below 30 years, while it was absent in older age groups. Needle stick injuries seen only among younger age group can be attributed to less work experience. Also it is possible that senior do not give injections and are in more administrative roles in the wards – therefore leading to an apparently larger number of NSIs in the younger population. Similar finding was found in the study done by Cho E et al in South Korea on factors associated with needle stick and sharp injuries among hospital nurses where needle stick injuries were common among nurses with less work experience.5

Most of the acute morbidities reported were found to be increasingly common among workers of young age group and less work tenure. Another study conducted among paramedical staff in Public Hospitals of Jhelum in Pakistan showed there was an effect of age on the prevalence of occupational health hazards while work tenure itself has no significant effect on occupational health hazards.6

A study done to assess cardiovascular disease risks in health care workers in Mexico, showed that the prevalence of hypertension and diabetes was 22% and 8% which is high when compared to our study and also there healthcare workers had double the cardiac risk than expected for their age.7 Prevalence of hypothyroidism was found to be low in our study population as compared to another multi-centric, epidemiological study conducted in eight major cities among adult population in India which reported a prevalence of 10.95% and 9.2% among Bangalore population.8

Most importantly 4(1.4%) out of 287 nurses had history of treatment taken for tuberculosis infection in the past. Study done by Christopher DJ et al to assess the tuberculosis infection among young nursing trainees in South India showed a high prevalence of Latent Tuberculosis Infection (LTBI) (47.8%).9

Prevalence of diabetes and hypertension was high among nurses in the age group of 41-50 years. This is similar to the general population of India, where an International Diabetic Federation report states that almost half of all adults with diabetes are between the ages of 40 and 59 years.10

The significant association of leave frequency with seeking treatment regularly and increased frequency of illness was supported by the finding from a study conducted in the Netherlands which reported health complaints and consultations with the general practitioner as significant predictors of absenteeism.11

Our study findings are similar to the findings of the study conducted by Tripathi M et al to assess the absenteeism among nurses in a tertiary care hospital in India where about half the episodes of sickness were related to diseases of the respiratory tract, digestive system and infections.12

Recall bias could be one limitation. Therefore the incidence of acute morbidities may be under-reported. It is possible that workers took single day of leave (allowed casual leave) for illnesses and this may also result in the under-estimation of sick leave days.

Conclusion

Incidence rate of morbidity among nursing staff over a period of six months was 34.22 episodes per 100 person months. It was found that senior nurses of the age group 41-50 years and with work tenure of 11-15 years had more than three episodes of illness during the study period. Of the reported acute illnesses, more than half were infectious diseases, nearly one third were musculoskeletal disorders. Diabetes was the commonest chronic morbidity identified with a prevalence rate of 4.9% followed by hypertension and menstrual irregularities. Working in adverse settings and hazardous conditions are unavoidable for nursing staff, so it is crucial that nurses are protected. Therefore, they need to be sensitized and motivated about the use of personal protective measures especially throughout their working hours. Nurses should also be made aware of the common universal precautions. An issue of concern next to infectious diseases is ergonomics. Body mechanics is one component in which the nurse should have thorough knowledge and skill. Nurses .Training and educating the nurses on ergonomic issues–on correct seating, positioning while working, and correct way of handling and shifting patients.
Also WHO emphasizes that there is a need to educate the nurses on lifestyle and behavioural changes like diet, physical activity and on personal habits. Educational training programs should be multidisciplinary in the era of quality control to help healthcare workers realize the importance of basic infection-control policies in reducing morbidity and mortality and improving the quality of care.

Reproductive Health Education Intervention to Impact Awareness and Decision Making among Parents and Caregivers of Adolescent Girls with Cerebral Palsy: A Systematic Review

Arathi P Rao1, Hitesh Shah2, Navya Vyas3, Ratheebai Vijayamma4, Ravishankar N5

1Coordinator, MPH Program, Prasanna School of Public Health, 2Associate Professor, Department of Orthopaedics, Kasturba Medical College, 3Assistant Professor, Prasanna School of Public Health, 4Librarian, School of Communication, 5Assistant Professor, Department of Statistics, Prasanna School of Public Health, Manipal Academy of Higher Education, Manipal

ABSTRACT

Purpose: To assess the effect of reproductive health education intervention on awareness and decision making among parents and caregivers of girls with cerebral palsy

Parents of girls with cerebral palsy might have concerns regarding their child’s reproductive health issues like delayed menarche, menstrual hygiene, pelvic infection, future pregnancy, contraception for fear of sexual abuse. A systematic review will help gain evidence and plan a contextual intervention to address the needs.

Materials and Method: 11 leading medical and social electronic databases were searched between June 2017 to January 2019. Study designs included were Cohort, randomised controlled trials, pre-test and post-test, Controlled before and after studies, Quasi-experimental with any form of education intervention. Primary outcomes searched were increase in level of awareness, attitude and health seeking behaviour for reproductive health issues.

Results: Of the 1582 titles screened 41 abstracts were identified. 14 studies were found to have some relevant information but none of them revealed any statistical designed intervention answering the review question.

Conclusion: There is a paucity of literature which can show the effectiveness of health education interventions for parents to address reproductive health issues of girls with cerebral palsy.

Keywords: cerebral palsy girls, reproductive health education, parents and caregivers, adolescence, decision making.

Introduction

Adolescence is a transitional period and a child with disabilities undergoes emotional and mental changes to accept this transition.1 It has been estimated that globally there are about 220 million adolescents with disabilities of which 80% live in developing nations.2

As adolescence approaches for girls with cerebral palsy, parents and care givers can approach health care providers for information pertaining to menstrual hygiene, coping methods, medical suppression, etc. Anticipatory guidance can help make informed choices by parents as the girls themselves can’t participate in decision making for her health.3 Studies has revealed that internet has been found to be source of information by parents and care-givers for reproductive health issues, thereby, emphasising the role of health care providers to play a pro-active role

DOI Number: 10.5958/0976-5506.2019.00981.1
to improve the psychological, physical and social health of families of girls with disabilities. Sometimes parents can prioritise physical disability over menstrual issues for lack of resources but a comprehensive care of such girls includes increasing awareness among the care givers regarding menstrual issues. It has been emphasised that individual approach might be needed to address menstrual issues in this population after allowing the girls to go through puberty but there is lack of guidelines for health care providers to choose a specific method when the parents approach them due to lack of sufficient evidence pertaining to these issues. Studies have revealed that parents takes steps to promote the health of their girls with disabilities so that they are socially included, their nutrition and physical activity. Given these circumstances it is necessary that health personnel should join hands with them to encourage their attitude and increasing their knowledge towards reproductive health issues. Research also has revealed that parents and health providers have felt that they felt uninformed and underprepared to deliver reproductive health education to these children with disabilities so that they can make informed choices and decisions when it comes to their sexual life. Parents have opined it is the doctor's responsibility to provide such information and thereby there is a lack of informal source of reproductive health information for children with disabilities. Interdisciplinary approach adopted to address the reproductive health concerns of a small number of mentally handicapped population have shown satisfaction and acceptability among the patient, family and the community but similar such evidence pertaining to adolescents with cerebral palsy seems to be lacking. Early education of disabled female adolescents and their families regarding menarche, menstrual hygiene and sexual health will help prepare them better for the transition to adulthood but necessary training of the clinicians is necessary in this regard. This reinforces the need of evidence for designing modules of education intervention to address the reproductive health concerns which help in enhancing the awareness and health seeking behaviour among the parents of girls with cerebral palsy.

Material and Method

The Preferred Reporting Items for Systematic Review and Meta Analysis guidelines have been adhered to and this systematic review has been registered in the international prospective register of systematic reviews (PROSPERO) database in May 2017 (Reg no - CRD42017059072).

Eligibility criteria:

Types of studies: All published Cohort, randomised controlled trials, pre-test and post-test, controlled before and after studies, quasi-experimental studies and qualitative studies were systematically searched in this review. During the search process, no methodology filters were used so that all type of studies could be included.

Types of participants: Parents and caregivers of girls with cerebral palsy were included for the review. Studies on parents of children with other reasons for developmental delay and parents of boys with cerebral palsy were excluded. Studies among adults of cerebral palsy were also excluded for the present review.

Types of interventions: Parental education intervention in the form of training, lectures, films, role plays, group discussions, workshops, counselling, health education material, family centred services, mass media were all included for the present review.

Outcomes: The primary outcomes looked for was increased level of knowledge and awareness among parents and caregivers regarding reproductive health issues among their girls which influenced their decision making regarding those issues. The secondary outcomes were 1) change in attitude towards reproductive health issues 2) positive coping measures adopted 3) and health seeking behaviour for reproductive health issues.

Information Sources and search: A total of 11 medical, psychological and social electronic bibliographic databases were searched: PubMed, Cochrane Library, Web of Science (Web of Knowledge), Cumulative Index to Nursing and Allied Health Literature (CINAHL), Science Direct, PROQUEST Health and Medical Complete (Proquest Medical Library), SCOPUS, Springer, Google Scholar, Oxford Journals(Medicine and Health), GREYNET online. The reference lists of potential studies were also screened to identify other relevant studies. Keywords and Medical Subject Headings (MeSH) were used to identify studies related to education intervention for parents and care givers of girls with cerebral palsy. The month of the last search was January 2019. There were no restrictions by study setting and country. All studies in English language were included. The literature search was not limited by date.

Study selection: Two reviewers (APR, NV) screened the search results first by titles followed by abstracts. Any
disagreement and discrepancy was resolved with other reviewer(NR). No study was excluded when the outcome of interest was not identified in either title or abstract. In order to import, classify and analyse all citations in the current review, the reference management software used was ENDNOTE X7. In every database, all citations were imported to ENDNOTE X7 and saved by date of searching and respective database. Whenever available, abstracts were also imported. Abstract screening and data collection was done independently by both reviewers and any discrepancy was resolved with other reviewers. Outcomes and measurement of outcomes were assessed. It was planned to assess the risk of bias corresponding to different study designs. However, as tools of National heart, lung and blood institute, for included studies using the study quality assessment and data collection was done independently by both abstracts were also imported. Abstract screening reviewers and any discrepancy was resolved with other reviewers. Outcomes and measurement of outcomes were assessed. It was planned to assess the risk of bias for included studies using the study quality assessment tools of National heart, lung and blood institute, corresponding to different study designs. However, as none of the studies found inclusion to the review, risk of bias assessment activity was not undertaken.

**Results**

A total of 1582 citations were retrieved during database searches. After removal of duplicates 1220 citations were identified. 41 titles were identified to be potential for abstract screening. All the abstracts were obtained and data was retrieved by one reviewer and the content was independently reviewed by the other reviewers.

A total of 13 abstracts were selected for full text screening to identify data pertaining to the review question. Full length article screening was done independently by both reviewers and it was found that none of the studies exercised an intervention, exclusively to address reproductive health issues and measured the increase in awareness and influence on decision making of parents and caregivers of girls with cerebral palsy. However, 2 studies were identified which emphasised the importance of an intervention and the possible effect it can produce. In the first study, even though an intervention was not conducted in a statistical way to assess the effect, it revealed that menstrual concerns were the primary reason among parents for seeking advice and education of the families with expectant management of menstrual concerns was tried but it did not reveal for how long and what was the impact of the intervention. The second study, where a survey was conducted among parents and caregivers of girls with cerebral palsy revealed that information was sought by considerable number of parents prior to menarche which they believed was essential to be known.

**Discussion**

The objective of the present study was to assess the various reproductive health education interventions for parents of girls with cerebral palsy which can bring about a change in their awareness and help decision making pertaining to the child’s health. Unfortunately, we could not find any study which had executed an education intervention exclusively for reproductive health information and assess the change in a scientific manner. This was slightly unexpected as we were hopeful given the number of studies on educating parents of children with cerebral palsy regarding their clinical condition Reproductive issues have been addressed among adult women with cerebral palsy than adolescent girls with cerebral palsy. An intervention done when the girl is an adolescent can help prepare the family to address the menstrual issues and for the girl to be more equipped to make decisions for her reproductive life in future. Studies have been published which recommend and guide the health care practitioners in case of menstrual concerns among girls with developmental delays. Studies have been conducted to emphasise the role of family and social support that a child of cerebral palsy depends on for a healthy living. When all of them are important stakeholders in the daily life of the girl child, an opportunity would be missed when the parents are expected to approach themselves for suggestions regarding menstrual difficulties. Studies have also revealed that some parents were undecided for menstrual management inspite of an informal counselling. More preparedness and training with multidisciplinary approach should be present on the part of the health care providers but this requires evidence which proves the beneficial effects of a reproductive health education on families of girls with cerebral palsy. Research has revealed that parents of cerebral palsy girls have understood that it is not their responsibility and awareness for the girls regarding menstrual issues have to be provided by qualified people rather than themselves while practitioners are also seeking different professionals. Parents in the past have approached for information even before the girl has attained menarche and research has shown that the chances of an early puberty among these girls are higher compared to their normal counterparts in the community.
Even though parents have been given an opportunity to express their needs and concerns addressed, anonymising and incorporation of their queries as an educational programme was never addressed. Education intervention through mass media was not much expected to be seen as parents might prefer confidentiality of information probably due to stigma.

Family centred services for families with children of cerebral palsy have proven to have a positive impact on the psychosocial health and well being of the family and involvement of parents in decision making cannot be overemphasised. Parents of these children are physically and psychologically strained and are in need of guidance, support for management of all the needs, especially in resource poor settings. Efforts have been made to educate an adolescent girl with cerebral palsy regarding menstrual and sexual concerns but among girls with higher stages of GMFCS and mental retardation parents will have to take the decisions for the child. The present study reveals that there is a lack of literature which are trying to assess and analyse the effectiveness of a health education intervention for parents to address the reproductive and sexual health issues of their girl children with cerebral palsy. However, the present review has not included those studies if health education was addressed to parents of or exclusively to adult women with cerebral palsy.

**Conclusion**

There is need for an exclusive health education intervention for parents and caregivers of adolescent girls with cerebral palsy which can enhance their confidence to deal and address the reproductive health needs of their differently abled child. This can have a positive influence on the family with respect to parents’ psychosocial health as well as the girl child. In turn this can enhance the adolescent girl’s confidence of a strong family support. Although it has been executed in an informal way when there has been enquiries from the parents and the caregivers, a scientific study will help prove the significance of such an intervention and evidence for further recommendations.

Internal Quality Control for Urea and Creatinine in Cobas 6000 Analysers Using Serum Sample

Saritha Kamath U1, Asha Patil2, Nalini B3, Naveen Bappanadu4, Pynshailang Mawlong4, Banlamphrang Jyrwa4

1Associate Professor, 2Assistant Professor, Department of Medical Laboratory Technology, School of Allied Health Sciences, 3Professor, Department of Biochemistry, Kasturba Medical College Manipal, 4PG Student, Department of Medical Laboratory Technology, School of Allied Health Sciences, Manipal Academy of Higher Education, Manipal

ABSTRACT

Introduction: Quality control is an integral part of the analytical laboratory to obtain a precise, accurate result and also to reduce errors. Many national level laboratories utilize internal and external quality control methods for this purpose. The commercially available quality materials used for assessing daily internal quality control (IQC) is expensive, and hence in this study, an attempt was made to know the usefulness of serum sample as a quality control material.

Objective: To study IQC for urea and creatinine in Cobas 6000 analyser using serum sample

Materials and Method: The study was conducted in the Clinical Biochemistry Laboratory, Kasturba Hospital, Manipal Academy of Higher Education, Manipal. IQC for estimation of urea and creatinine was assessed using Cobas 6000 -1 and compared with Cobas 6000 - 2 autoanalyser. Thirty anonymised fresh serum samples and quality control material from Biorad with two level were used and compared between two analysers. Bland Altman agreement statistical analysis was applied for evaluating comparability using SPSS version 15.

Result: Quality control materials with two levels and serum samples showed good concordance for most of the urea and creatinine values, and all values were within 2SD. Mean difference for estimation of urea with serum sample was found to be 0.03 with 95% limit of agreement from -2.67 to -2.73. Mean difference for estimation of creatinine with serum sample was found to be 0.012 with 95% limit of agreement from 0.235 to -0.26.

Conclusion: Our study showed that the fresh serum samples could be used as an IQC when control materials are not available or available one is deteriorated. An important implication of the study findings is that using serum samples for IQC will appreciably lower the cost for validation of the accuracy of the autoanalysers.

Keywords: Bland Altman, quality control, quality assurance, quality control material, reference material

Introduction

The kidney is the vital organ which performs many functions such as water balance, electrolyte balance, acid-base balance and secretion of hormones. Serum creatinine, urea, uric acid, electrolytes are the commonly used biochemical parameters to assess the functioning of the kidney. Among the parameters mentioned above urea and creatinine are widely used, and several manual methods are utilised for its estimation in diagnostic laboratories for many years1-3. Now-a-days, due to an overwhelming sample load, these time-consuming methods are replaced by automated analysers to obtain the result of more samples in a short time4. The ultimate goal of either of these processes is to release accurate results. In any clinical laboratory internal or external quality control (EQC) is crucial to ensure the release of accurate and precise laboratory results. As per R J
Lock’s article published in the year 2006, internal quality assurance is beneficial in early identification of the problem and the initiation of corrective action\textsuperscript{7}. Internal quality control can be used to evaluate the quality of analysis by six sigma\textsuperscript{8}. Six sigma is widely used in industry and business for the management of quality. It provides more framework for evaluating process performance and process improvement\textsuperscript{9}. As maintaining EQC is expensive incorporating internal quality control (IQC) in the analytical laboratory may be beneficial in this regard\textsuperscript{9,8}. Many methods are used for this purpose, they are patient data, individual patient result, clinical correlation, correlation with other laboratory test results, intralaboratory duplicates, delta check with previous test results, limit checks, using commercially available control materials\textsuperscript{8}. Among them commercially available materials are used in good quality laboratories but they are expensive and deteriorate faster. Hence, an attempt was made to evaluate the usefulness of utilising serum samples to maintain daily IQC processes.

**Materials and Method**

The cross-sectional study was conducted in the Clinical Biochemistry Laboratory of tertiary care centre during the period September 2014 to March 2015. Usefulness of internal quality control using anonymized serum sample was studied for estimation of urea and creatinine in Cobas 6000- 1 and Cobas 6000-2 autoanalyzer.

**Analyzer and Methods Description:** Cobas 6000 analyser with a single loading point was used in our study. We used anonymized serum samples, commercial lyophilized assayed chemistry quality control material with level 1 and level 2 obtained from Biorad company for the measurement of urea, creatinine. Nonlipemic, nonhemolytic leftover fresh anonymised serum samples irrespective of an individual with a routine examination or diseased condition, preferably collected before 10 am from all age groups and both sexes were included and processed within an hour of receipt. Urease GLDH method is used for the estimation of urea\textsuperscript{10,11}. This enzymatic method based on the principle where a decrease in NADH concentration in unit time is proportional to the urea concentration. Jaffe’s method was used for the estimation of creatinine\textsuperscript{12,13}. In this method creatinine at alkaline pH reacts with the picric acid, forming an orange coloured compound creatinine picrate which can be measured colorimetrically at 540 nm. The intensity of the color is directly proportional to the concentration of creatinine in the serum sample.

**Protocol:** The control samples were reconstituted as per the provider instructions. After reconstitution, the shelf life of each control sample is 30 days at -20°C. The controls were run in Cobas 6000-1 and Cobas 6000-2 analyzers daily before running the patient samples. For this study, the left over anonymised serum samples were selected as per inclusion criteria. A total of 30 serum samples each for estimation of urea and creatinine were included and used for the estimation on both analyser. The results obtained with controls level 1 and 2, and the serum sample for urea and creatinine level were recorded.

**Statistical Analysis**

The obtained values for urea and creatinine were entered in SPSS version 15 software for statistical analysis. The Bland-Altman method is a graphical method used to compare two measurements of the same variable. It is also utilized to see the difference between the two instruments. In this graph mean of each pair of measurements plotted on x-axis versus the difference between the measurement on y-axis. In our study, we used this graphical method to analyse the IQC for urea and creatinine using anonymised serum sample and QC material. Average urea and creatinine results of 30 serum samples, level 1 and level 2 controls on both the analysers were plotted.

**Results**

Means of each pair of measurements (x value) versus the difference between the measurements (y value) were plotted using Bland Altman graph. Urea Level 1 of Quality control material results on both the analysers were plotted against the difference between them. The mean is 0.133, lower and upper limit is -1.32 and 1.59 (table/fig.1). Mean of the Urea Level 2 Quality control material results on both the analysers were plotted against the difference between them. The mean is 0.2, lower and upper limit is -4.99 and 5.19 (table/fig.2). Mean of the Urea in serum sample on both the analysers were plotted against the difference between them. The mean is 0.03, lower and upper limit is -2.73 and 2.67 (table/fig.3). Mean of the Creatinine Level 1 Quality control material results on both the analysers were plotted against the difference between them. The mean is 0.0040, lower and upper limit is -0.152 and 0.144 (table/fig.4). Mean of the Creatinine Level 2 Quality control material results on both the analysers were plotted against the difference between them. The
mean is 0.018, lower and upper limit is -0.183 and 0.219 (table/fig.5). Mean of the Creatinine in serum sample on both the analysers were plotted against the difference between them. The mean is 0.012, lower and upper limit is -0.26 and 0.235 (table/fig.6). In the graph most of the observed values lies between the control limit and hence the method the functioning properly.

**Figure 1:** Urea Level 1 Quality control on Cobas 6000 1 and 2 analysers.

Mean of the Urea Level 1 Quality control results from both the analysers were plotted against the mean difference between two analyser. Bland–Altman plot of agreement between two analysers for Urea Level 1 Quality control was found to be 0.133 ± 1.457 (95% confidence interval, upper limit is -1.32 to 1.59, and mean 0.133)

**Figure 2:** Urea Level 2 Quality control on Cobas 6000 1 and 2 analysers.

Mean of the Urea Level 1 Quality control results on both the analysers were plotted against the mean difference between two analyser. Bland–Altman plot of agreement between two analyser for Urea Level 2 Quality control was found to be 0.2 ± 4.99 (95% confidence interval, upper limit is -4.79 to 5.19, and mean 0.2)

**Figure 3:** Estimation of Urea by serum sample on Cobas 6000 1 and 2 analysers. Mean of the Urea in serum sample on both the analysers were plotted against the difference between result of two analyser. Bland–Altman plot of agreement between two analyser for Urea in serum sample was found to be 0.03 ± 2.64 (95% confidence interval, upper limit is -2.61 to 2.67 and mean 0.03)

Discussion

Urea and creatinine are the useful biochemical parameters utilized for assessing the kidney function for diagnosis of kidney disorders, as well as for the prognosis and monitoring drug therapy. Manual methods used for these methods are time-consuming and needs more sample. Automated techniques are beneficial in this regard and have helped to overcome these problems. While using any analyser, it is essential to know the accuracy of the analyser on a day-to-day basis even after initial validation by the company personnel. Both or either IQC or EQC measure is used to assess the accuracy of any biochemical parameter. IQC materials are available commercially with metrics same as a serum sample and are with different levels. These materials are run by the National Accreditation Board for Testing and Calibration Laboratories (NABL) guidelines and interpreted by using Levy Jenning’s chart or Westguard rules. However these methods were used by only some sophisticated laboratories since they are expensive and not affordable by all. Also nowadays the cost of healthcare has more priority, and hence it is required to use less expensive methods both to reduce the errors and cost in laboratory analytical methods. A study used the pooled patient sample as IQC material for the estimation of canine acute phase protein sample and found that it showed good analytical performance. A similar study by Patil A et.al, in the year 2013 utilized patient blood sample as IQC material for the determination of erythrocyte sedimentation rate(ESR) and found it to be very precise. Another study by Kahtri et.al, in 2013 used pooled serum samples as IQC material and found to be useful for small laboratories. In the present study, we found that both QC material with two levels and serum samples showed good concordance for most of the urea and creatinine values. Hence serum samples can be used as reference material to conduct IQC analysis. In laboratories with large sample load QC has to be done in
between the sample load. In such cases, serum samples can also be used to maintain the internal quality to reduce the cost. However for urea, we found that most of the points are present within 2 standard deviations (SD) from the mean except two points observed in the serum sample graph, which exceeded the plus-minus 2SD limit. For creatinine, all points except one in the level 2 quality control and one in the serum sample exceeded the desired limit. Presence of biochemical substances such as high bilirubin, free haemoglobin, lipid, protein, patient medication, etc. impairs the quality of result 20. Along with this many other cofactors also alters the test report other than the analytical process 21. The study found that Internal quality material prepared from routine serum/plasma samples stored at -20°C may be cost-effective when compared to commercially available one 22. We could not study the effect of interfering parameters and frozen sample in our present work.

**Conclusion**

From our present study it is evident that fresh serum samples can be used as an IQC when control materials are not available or available one is deteriorated. However, we could not monitor possible other confounding biochemical parameters in the serum sample and usefulness of frozen serum sample which is needed to be addressed further.

ABSTRACT

The term LASER is an acronym for 'Light Amplification by the Stimulated Emission of Radiation'. In the last two decades, there has been an explosion of research studies in laser application. It has been used widely in a range of biomedical and dental applications in recent years. The main benefits for laser applications are patient comfort, pain relief and better results during specific applications. Major concerns for using dental lasers are high cost, need for specialized training and sensitivity of the technique, thereby compromising its usefulness particularly in developing countries. Since a remarkable increase in the use of lasers for dental application is expected in the near future, this paper aims to review on laser treatment effectiveness and its applications.

Keywords: laser, dentistry, surgery

Introduction

The term LASER is an acronym for 'Light Amplification by the Stimulated Emission of Radiation' and was first introduced to the public in 1959, in an article by a Columbia University graduate student, Gordon Gould. In the history of laser treatment evolution, in 1961, a laser generated from crystals of yttrium-aluminum-garnet treated with 1-3% neodymium (Nd: YAG) was developed. In 1962, the argon laser was developed, whereas, the ruby laser became the first medical laser to coagulate retinal lesions, when it was used in 1963. In 1964, Patel at Bell Laboratories developed the CO₂ laser. Nowadays diode lasers are being extensively used in the field of dentistry.

There are two scenarios, on the one hand there are hard lasers, such as, Carbon dioxide (CO₂), Neodymium Yttrium Aluminum Garnet (Nd: YAG), and Er:YAG, which offer both hard tissue and soft tissue applications, but have limitations.

A major diagnostic application of low power lasers is the detection of caries, using fluorescence elicited from hydroxyapatite or from bacterial by-products. Laser fluorescence is an effective method for detecting and quantifying incipient occlusal and cervical carious lesions, and with further refinement could be used in the same manner for proximal lesions. Photoactivated dye techniques have been developed which use low power lasers to elicit a photochemical reaction. Photoactivated dye techniques can be used to disinfect root canals, periodontal pockets, cavity preparations and sites of peri-implantitis. Resin composites need to be polymerized to form a flowable plastic mass to a solid restoration. Other restorative dentistry procedures include extrinsic teeth stains using bleaching agents, endodontic treatments and indirect restorations manufactured in the dental laboratory.

Basic Principle of Laser: A laser beam discharges photons in the form of a focused, coherent and monochromatic energy ray that interacts with a target

tissue such as dental material. When a laser interacts with oral tissues, there are four possible outcomes: transmission, reflection, scatter and/or absorption as illustrated in figure 1. Cutting of soft tissues and ablation of hard tissues is dependent upon the ‘absorbance’ of light by the targeted tissues.\(^5\)

**Figure: 1**

![Laser interaction with tissues](image)

**Fig. 1: Laser interaction with tissues produces four possible outcomes: transmission, reflection, scatter and/or absorption**

Transmission occurs when there is no interaction between the tissues and the laser. When transmitted, due to the difference in the refractive indices of air and the tissue, some light is refracted.\(^6\)

Reflection is a possible outcome of a laser-tissue interaction in which the laser beam is deflected back instead of being absorbed. In dental lasers, the laser light is delivered from the laser to the target tissue via a fiberoptic cable, hollow waveguide, or articulated arm. An energy source, an active lasing medium, and two or more mirrors that form an optical cavity or resonator.\(^7\) For amplification to occur, energy is supplied to the laser system by a pumping mechanism, such as, a flash-lamp strobe device, an electrical current, or an electrical coil. This energy is pumped into an active medium contained within an optical resonator, producing a spontaneous emission of photons. Subsequently, amplification by stimulated emission takes place as the photons are reflected back and forth through the medium by the highly reflective surfaces of the optical resonator, prior to their exit from the cavity via the output coupler.\(^8,9\)

**Laser-tissue Interaction:** Each wavelength has a somewhat unique effect on dental structures because of the specific absorption of that particular laser energy in the tissue. Some lasers are only absorbed by blood and tissue pigments, while others are only absorbed by water as well as “hard” tissue, such as enamel, dentin, and bone. Lasers produce light energy that can be absorbed by a target tissue, and this absorption process produces a thermal reaction in that tissue. Absorption requires an absorber of light, termed chromophores, which have a certain affinity for specific wavelengths of light. The primary chromophores in the intraoral soft tissue are Melanin, Hemoglobin, and Water, and in dental hard tissues, Water and Hydroxyapatite.\(^{(fig-2)}\) Different laser wavelengths have different absorption coefficients with respect to these primary tissue components, making the laser selection procedure-dependent.\(^{(6,10)}\)

![Laser/tissue interaction between different types of laser](image)

**Figure 2: Laser/tissue interaction between different types of laser**

Depending on the instrument’s parameters and the optical properties of the tissue, the temperature will rise and various effects will occur. In general, most nonsporulating bacteria, including anaerobes, are readily deactivated at temperatures of 50° C. The inflammatory soft tissue present in periodontal disease can be removed with a temperature of 60° C; moreover, hemostasis
can also be achieved within the same heat parameters. Laser excisional or incisional surgery is accomplished at 100° C, where vaporization of intra- and extracellular water causes ablation, or removal of biological tissue. At this temperature, the aqueous component of tooth structure and bone also boils; thus cavity preparation, calculus removal, and osseous contouring can proceed. There are significant differences in the depth of penetration of the laser beam. Diode and Nd:YAG energy can penetrate a few millimeters into the tissue and carbon dioxide’s radiation will travel about 0.5 millimeters; however, the erbium wavelengths are absorbed on the surface of the tissue with a depth as little as 5 microns.\textsuperscript{11,12,13}

**Advantages and Limitations of Lasers:** Clinicians must provide quality oral health care based on individual state practice acts and in accordance with other regulatory bodies. It is imperative that the dental practitioner deliver competent dental care in accordance with their education, training, and clinical experience. Dental lasers will become the standard of care for assuring reproducible outcomes for many procedures; practitioners are advised to stay current with new treatment modalities.

Oral surgery procedures that require the removal of soft tissue can be achieved by vaporization (ablation) and/or cutting (incision, excision, or dissection) with the diode laser. Some of these soft-tissue applications include but are not limited to gingivectomy, frenectomy, hemorrhagic lesion removal, gingival sculpting techniques associated with implant recovering or therapy, and subgingival curettage.\textsuperscript{14}

The advantages for laser soft-tissue oral surgery include improved hemostasis, reduced intraoperative and postoperative pain/discomfort, decreased postoperative swelling, eliminated need for sutures, reduced bacterial count at the wound site, reduced operator time, and versatility. Because of its versatility, this laser may be a useful alternative for soft-tissue oral surgery compared to traditional periodontal surgery.

The disadvantages or limitations of laser surgery compared to incisions made by scalpel include slower tissue cutting, delayed healing, and reduced surgical precision.\textsuperscript{15} There are some disadvantages to the current dental lasers, which only emit energy from the tip of the delivery system. In that sense, they are all “end cutting,” which usually means a modification of the practitioner’s clinical technique. Although they are useful for caries removal and tooth preparation, the erbium family of lasers is unable to remove gold and vitreous porcelain, and has only a small interaction with amalgam. Of course, that fact is also an advantage when treating a recurrent carious lesion adjacent to a veneer or crown, for example, since there will be no interaction with the restorative material. However, most composite restorations can be ablated.

One of the main benefits for using dental lasers is the ability to precisely interact with and, in some cases, remove a few cell layers at a time. Erbium lasers can have some selectivity in removing diseased tooth structure because carious lesions have a much higher water content than healthy tissue. Studies have shown other advantages over conventional high-speed handpiece interaction on the tooth surface, such as the elimination of micro-fractures and a reported lowering of pulpal temperature as the preparation proceeds. Osseous tissue removal and contouring can also proceed easily with reported faster healing. Moreover, it has been demonstrated that the lased enamel has a good potential for bonded restorations as long as they are subsequently etched with acid.

With good control of bleeding, visualization of the surgical field is greatly improved, and many laser procedures can be performed with less injectable anesthesia. In those situations, additional treatment may be performed in the same appointment. Furthermore, initial postoperative discomfort and swelling are reduced because of the sealing of nerves and lymphatics.

McDonald and Pitt Ford found that the human pulpal blood flow was decreased when continuous light tipping forces were applied to a maxillary canine. Barwick and Ramsay evaluated the effect of a four minute application of intrusive orthodontic force on human pulpal blood flow with laser-Doppler flowmetry and concluded that the pulpal blood flow was not altered during the application of a brief intrusive orthodontic force.\textsuperscript{16,17} Low energy laser irradiation stimulates the velocity of tooth movement via the expressions of M-CSE.\textsuperscript{18}

**Laser Safety:** It is critical that all protective eyewear worn is wavelength-specific. Additionally, accidental exposure to the non-target tissue can be prevented through the use of warning signs posted outside the nominal hazard zone, limiting access to the surgical environment, minimizing the reflective surfaces, and ensuring that the laser is in good working order, with all manufacturer safeguards in place. With regard to prevention of possible exposure to infectious pathogens, high volume suction should be used to evacuate any vapor plume created during
tissue ablation, and normal infection protocols should be followed. Each office should have a designated Laser Safety Officer to supervise the proper use of the laser, coordinate staff training, oversee the use of protective eyewear, and be familiar with the pertinent regulations. While most dental lasers are relatively simple to use, certain precautions should be taken to ensure their safe and effective operation.

### Laser Hazards:

**Primary Hazards:** Caused directly by laser beam. Endangers mainly two organs- Eyes and Skin In case of eyes it damages retina, cornea, & the lens and slight carelessness can destroy vision permanently.

**Secondary Hazards:** Its related to operation of the laser and are independent of radiation characteristics.

**Conclusion**

There is a leaning curve in the use of lasers in dentistry. As long as the clinician has completed a training course & proceeds through the learning curve at a comfortable pace, the rewards will quickly be noticed by the patient and the dental team. Use of Laser in dentistry is proved to be advantageous in treating a wide range of dental conditions as well as a therapeutic tool in tissue management. Laser technology for hard tissue application and soft tissue surgery is at a high state of refinement, having had several decades of development, up to the present time, and further improvements can occur. The field of laser-based photochemical reactions holds great promise for proper safety management requires a fourfold approach including: knowledge of standards, identification of hazards and risks, implementation of appropriate control measures, and consistent program audit to demonstrate quality assurance. Additional applications, particularly for targeting specific cells, pathogens, or molecules. There is a leaning curve in the use of lasers in dentistry. As long as the clinician has completed a training course & proceeds through the learning curve at a comfortable pace, the rewards will quickly be noticed by the patient and the dental team.

ABSTRACT

Aim: The aim of the study was to evaluate the speaking rate without dentures and post denture insertion among the geriatrics.

Method: A total of (N=20) aged 60-75 years, requiring removable complete denture prosthesis were recruited. The speech rate was recorded using Motor Speech Profile program.

Results: The speaking rate was slower among the geriatric group compared to the control. However the mean speaking rate was found to be better with denture insertion as compared to without dentures thereby improving the speech intelligibility.

Conclusions: It is recommended to draw attention to possible speech problems post rehabilitation with the complete dentures.

Keywords: Speaking rate, Denture Insertion, Motor speech Profile

Introduction

Edentulism is the state of having lost all of one’s natural teeth. [1] The prevalence of complete or partial edentulism increases with age. This complete or partial loss of teeth and associated structures can adversely affect the speech production in them. The most common replacement modality for such loss of teeth is fabrication of removable complete denture prosthesis. It has been reported that the insertion of new dental prostheses can lead to speech problems and also a period of functional and psychosocial adaptation.[2] Being self-assured and contented for a stable and well-fitting restoration is a key to active participation in a social environment especially in the aged. The ability to speak without restrictions is largely determined by the quality of the prosthetic restoration. Studies have shown that speech adaptation for most complete denture–wearing individuals will be completed within one month, but some may experience speech difficulty for more than 6 months, [2] and others continue to have problems even after one year.[3] Hence the aim of this study was to evaluate the speaking rate of new denture wearers before, immediately after and after two weeks of complete denture insertion and also to compare the speaking rate of males and females.

Method

This prospective case-control study was conducted after obtaining the ethical clearance. Written informed consent was obtained from the participants. A total of 20 participants (10 males and 10 females) in the age range
of 60-75 years. All the participants were edentulous for a period of 6-12 months and were first time denture wearers. A group of 10 dentulous males and females of same age group served as control. All the participants were native Kannada speakers, with local dialect. The participants with inherent speech or hearing disorders, defects affecting denture stability were excluded.

Procedure: Conventional prosthodontics was followed in the fabrication of new complete maxillary and mandibular dentures. To obtain the baseline data, prior to the denture insertion, speech rate was assessed using Motor Speech Profile (MSP) (CSL model 4150: Kay Elemetrics corp, USA). MSP is most commonly used software to analyze motor speech behavior. The speaking rate was measured using the Standard Syllabic Rate Protocol. This protocol assesses the client’s speech rate using a standard target sentence. The speech was recorded in a sound treated room using a dynamic microphone at a constant distance of 10cm from the participant’s mouth. The stimuli “vondu aadu bettada nettiyalli meyuthithu” from the standard reading passage of Kannada language with English meaning “sheep was grazing on top of the hill” was used. The polished dentures were then inserted and speech recording was repeated. The next recording was scheduled after two weeks of denture use.

Results

The speaking rate was evaluated among the completely edentulous participants pre, immediately after and two weeks post insertion of complete denture prosthesis. Statistical package SPSS 13.0 software was used for statistical analysis. A value of p<0.05 was considered to be statistically significant.

The mean speaking rate of females without dentures was significantly less as compared to control group. Immediately after denture insertion, it was less compared to control group and was statistically significant (p<0.05). After 2 weeks post insertion, the speaking rate for female participants increased but less than control. For males the speaking rate without dentures was less than controls and was statistically significant (p<0.05). The speaking rate increased immediately after denture insertion and 2 weeks post insertion. The speaking rate after adaptation period of 2 weeks was still lower than control group. The combined speaking rate of participants without dentures and immediately after denture was significantly lower than control group. The combined speaking rate of participants after 2 weeks of adaptation period increased but was lower as compared to control group.

**Discussion**

Speech is an essential human activity, through which a speaker converts an idea in his mind into a stream of sounds, moving his lips, tongue and jaws in swift, precise gestures. Aging along with other body functions can adversely affect the speech. This is mainly due to loss of teeth and supporting structures, which alter the main articulatory cavity and produces marked effect on speech.

Removable complete denture prosthesis can partly solve the problem of impaired speech. However, they themselves can disturb speech production as they restrict the flexibility of tongue, narrow the oral cavity and alter the articulation areas of palate and teeth. The quality of speech production significantly affects participants’ general satisfaction with dentures and participant’s contentment in turn correlates with acceptance of dentures. Therefore speech production quality is an essential criterion for success or failure of complete denture rehabilitation.

The mean speaking rate was higher for males than females in both dentulous and edentulous individuals. This finding was in agreement with various studies which show gender differences with regard to speaking rate. Based on sociophonetic concept, it is possible that durational differences are associated with females speaking more clearly. This phenomenon could be related to physiological differences between males and females. It was also opined that males may have to travel greater articulatory distances than females to reach analogous phonetic targets. Therefore differences in articulatory speed is required in order to achieve similar perceptual products in males and females, making males move faster and females move slower. Gender related differences in a northern British accent showed lower rates of syllables per second for females, realizing consonant clusters more fully.

Also, sentence durations were longer for females than for males and males tend to elide or reduce vowels and consonants, which leads to shorter sentence durations. Females tend to read at a slower rate compared to males and females displayed greater variability in their sentence duration. In American English, it was observed that gender had a significant effect on speaking rate (measured for two sentences) and that females spoke more slowly than males. The speech rate studied in pluricentric language concluded that on average, males speak 6% faster than females. In line with these observations even in the present study the speaking rate of females was 4% lesser than that of males in control group.

The results also showed significantly lower speaking rate for both males and females without dentures when compared to control group. As there is limited literature on effects of complete or partial tooth loss on speaking rate, this finding can be explained on the basis of various structural changes that occur in articulatory cavity and associated structures after tooth loss. It was also reported that the duration required for the production of/s/sound was more in participants wearing conventional complete dentures than those wearing overdenture prosthesis. Thus it is possible that the natural tooth proprioception is required for maintaining an adequate speaking rate.
Normal function of tongue is important in maintaining adequate speaking rate as tongue is the main dynamic articulator which directs the flow of air during speech. [23] It is observed that tongue makes compensatory changes in the absence of teeth. [23] The absence of natural teeth can cause increase in tongue size and decreased tone of tongue. [24] Both these changes can adversely affect speaking rate, and so edentulous subject may take longer duration for phoneme articulation due to inadequate pressure generated by flaccid tongue. The weakening of perioral musculature after tooth loss would also result in inadequate intraoral pressure during articulation, further contributing to the problem.

The decrease in mandibular height, due to residual ridge resorption in edentulous participants, further alters the shape and size of oral cavity. The possible explanation of mandibular resorption causing decrease in speaking rate could be that it can affect the capability of tongue to make correct articulatory contacts. These changes may cause slower oral motor activity and prolonged phoneme.

After complete denture rehabilitation, the speaking rate for female decreased as compared to that without denture, and for the male participants the speaking rate increased immediately after denture insertion, compared to that without dentures. This can be understood on the basis of various studies showing gender related differences in denture satisfaction. [26] It was stated that males could adapt more easily to new removable dentures than females. Also females were found to be more concerned about esthetics and appearance than males, the lower speaking rate in females immediately after denture insertion may be a strategy to avoid embarrassment, related to fear that other people would recognize that they have dentures. [26] Male elderly females are at a higher risk of severe resorption in the edentulous mandible than males. The females reducing speaking rate immediately after denture may also be related to the low stability of mandibular conventional denture. It is more likely that complete dentures will move or even come out of the mouth during functions like eating and speaking. [27] Lower ability of females to adapt to new dentures and lower esthetic concern of males was also reported and could be considered as contributing factor for the difference between males and females. [28][29]

Speaking rate of males and females immediately after denture insertion was significantly lower than control. The possible causes of speech problem immediately after denture insertion could be related to unfamiliarity with new denture. [30] The new prosthesis may feel bulky and strange in mouth, along with this excessive salivation following new dentures can cause subject discomfort and slower speaking rate. Insertion of prosthesis can change phonation, articulation as well as resonance in the oral cavity, as it covers the palate and reduces the space for tongue movement. [31] Such deficiencies can lead to reduced speaking rate immediately after denture insertion. The results also showed that 2 weeks post insertion, the speaking rate increased both in males and females as compared to that without dentures, but was lower than control. It could also be owing to participants’ adaptation to new prosthesis over time. The speaking rate in participants without denture and immediately after denture insertion turned out to be significantly lower than control group. The speaking rate increased after adaption period of two weeks but never reached the normal. From the above findings we can interpret that an adaptation period has a significant value in improving the speaking rate. The limitations of this study could be attributed to minimal sample size and shorter adaptation period. Further study on influence of longer habitation period on speaking rate is warranted.

ABSTRACT

There is a growing concern among researchers and practitioners on improving occupational health and safety in construction industry. Organizations are encouraged to improve safety culture because it plays a significant role in preventing accidents occurring at workplace. However, a diversity in topics of safety culture studies related to construction industry makes it hard to have a clear and comprehensive overview in this field. In this regard, a comprehensive review of literature is undertaken to provide an overview of trends and issues in safety culture research of construction industry. Further, a systematic literature review of available academic literature on safety culture is conducted focusing on: defining the concept of safety culture, identifying the factors influencing the level of safety culture and assessment tools to measure the level of safety culture in construction industry. Finally, a theoretical framework is proposed on the basis of conceptualizing the factors that affect safety culture in construction industry. This review helps in formulation and advancement of safety culture research in construction industry.

Keywords: safety culture; occupational health and safety; construction industry; systematic literature review

Introduction

The nature of construction industry is distinctive compared to other industries. Most construction activities take place outside under uncertain situations which is unfavourable for health and safety. Construction workers at jobsites are compelled to face continuous modification in the nature and situation of workers making it challenging to work. Recent statistics show that the level of working accidents (injury and illness rate) is 32% in the construction industry⁴, which is highest compared to other industries. Key cause of accidents and incidents in construction industry is a result of poor safety culture⁵ and to create a safe working condition, assessing and improving occupational health and safety culture is a necessity⁶. Therefore, there is a necessity for serious paradigm change in approach to occupational health and safety in construction industry⁷.

While, studies have been done on working safety culture in manufacturing industry⁸, it has been less investigated in construction industry⁹. Recent studies in construction industry have focused on measuring, sustaining and improving safety culture⁴,⁶,⁷. Assessing safety culture is reflected as a proactive method of safety performance⁸,⁹. Hence, most construction projects aim to minimize injuries and strive to achieve zero incidents, which can only be reached by thriving towards a positive safety culture within the construction industry⁴. Also, frequency of occurrence and severity of the nature of most accidents at construction sites makes it imperative to understand safety culture in the industry.

However, there exists diversity in topics of safety culture studies related to construction industry which makes it challenging to have a clear and comprehensive overview in this field. In addressing this knowledge gap, the aim of this paper is to deliver a comprehensive review of articles in terms of recent trends and issues in understanding and promoting safety culture of construction industry.
Issues Addressing Safety Culture in Organizations:
Predominant issues in literature on addressing safety culture in construction industry are: Transience of the industry, Subcontracting of work, Work organization, and Induction/acculturation process. These major issues shape the conception of safety culture as quite complex. The concept is challenging content-wise, and is multi-dimensional and cross-disciplinary study area. The conception on safety culture began in reaction to Chernobyl disaster and with time it spread to other industries. The notion of improving safety culture at workplace acts as a accident prevention system. This has led to constant growth in number of articles on this topic, thus making it challenging to attain a detailed overview on this topic.

Recent Trends in Safety Culture Studies: Number of scientific articles is an essential indicator to quantify the trend in a particular research area or field. In this regard, a comprehensive literature search was carried out to analyse recent trend in safety culture studies. Articles were collected from web-based search conducted on Scopus database by keywords search for the terms ‘safety culture’ and ‘construction industry’ in ‘title’, ‘abstract’ and ‘keywords’ of articles. This search yielded 140 articles and the data on these articles were further coded to analyse the trend in safety culture studies. As a result, 51 relevant articles were scrutinised that have direct relevance of the search terms relevant to construction industry.

In the last two decades, safety culture research has been extensively investigated and publication outcomes on the subject are growing ever since (Figure 1). However, the development maturity point has already been reached in this particular area or field with lack of consensus on its features and on the concept of safety culture. Careful examination on cumulative number of articles over the years indicates that the importance of the topic has increased tremendously and has become an important part of construction management research.

The distribution of articles by country/region are analysed and the articles are categorised based on the place in which the study was conducted, rather than merely the place of the authors. China has contributed with most articles (n = 10), followed by USA and Australia (n = 9), Hong Kong (n = 8) and India (n = 4). In these countries, there has been an increase in articles due to pressing concern towards safety management in construction industry.

Systematic Literature Review of Safety Culture Research in Construction Industry: Systematic literature review is a method for recognizing, choosing, and assessing all the literature upon an established level of measurable quality that is suitable to a research problem. This type of review style is more balanced and consistent in terms of transparency and objective specific. Hence, a systematic literature review of safety culture articles is conducted in this study.

Systematic literature review limits its focus on construction industry. However, some of the essential papers that focus on safety culture studies were included because of limited theoretical studies in the specific context of construction industry. These studies serve as a new perspective for exploring the commonalities among multiple industries that can be applied to construction industry. Previous systematic literature review in this area is limited towards proper identification of research area and knowledge structure. Together, these are considered subjective as they are generally determined from author’s decision. The following section is structured by as a systematic literature review methodology that outlines the concept of safety culture that includes defining safety culture, determining the most common safety culture factors, and measurement tools for assessing safety culture.

Defining Safety Culture: The term safety culture was recognised soon after the Chernobyl accident. However, no exact explanation of the term was provided for two main reasons: (i) several researchers highlight numerous safety culture elements as most significant, and (ii) culture of any kind is a tough thought to compactly outline. Most safety culture definitions are analogous in their beliefs and perceptions with each of them focused to varying degrees in relation to safety. Even though the definitions differ from one another, yet there is common agreement that safety culture is regarded as a proactive approach towards safety management. However, the
concept of defining safety culture in construction industry truly reflects the concept explained in other disciplines. The definition proposed by Fang and Wu (17) which is an attempt in defining safety culture at construction project level seems to be more practical, as it clearly outlines the concept of safety culture in construction industry.

Factors Affecting Safety Culture: A detailed analysis of factors that signifies a clear association existing among safety culture concepts and highlight the fundamental areas of safety management research is necessary for safety culture research (25). But it is challenging to comprehend underlying interactions existing between the antecedents and consequences of safety culture research as these influencing factors are not consistent and are fragmented. Also, there exists little agreement on safety culture factors that suggests multiple features and complexity of the concept.

Most safety culture models address three dimensions to define this concept. Various factors that affect safety culture are categorized under these dimensions:

1. Personal Factors: These comprise psychological aspects of individual’s and group values, attitude and perception towards safety and describe “how people feel within an organization’s safety management system?” and are evaluated through safety questionnaires. Factors include: co-worker’s commitment, worker involvement, worker competence and control, attitudes, trust among employees, sub-contractor involvement, and safety incentives and disincentives.

2. Behavioural Factors: This deals with actual ongoing safety-related actions and behaviours and describes “what people do within an organizations safety management system?” and are evaluated through safety checklists. Factors include: supervisor’s commitment, risk management, safe work conduct and safety practices.

3. Situational Factors: This encompasses situational features that include policies, procedures, regulations, organization structure and the management system. It describes “what the organisation has or has to put in place?” and are evaluated through safety audits and inspections. Factors include: safety policies, resources and training, management commitment, organizational commitment, communication and top management safety response.

Above factors greatly influence the level of safety culture in an organization. Hence, more focus has to be given to these influencing factors for achieving a positive safety culture at workplace.

Safety Culture Measuring Instruments: Proper identification of measuring instrument is essential to assess safety culture in respective organizations. In real time application, one needs an effective measurement tool to measure the level of safety culture. The level of safety culture in different sectors is typically assessed through quantitative questionnaires which are based upon any number and combination of the factors as mentioned in previous section. Among numerous measurement tools developed, Safety Climate Assessment Tool (S-CAT) is an assessment tool that is holistic in nature and is specifically designed for construction industry. This tool is developed based on recommendations and inputs provided from multiple stakeholders in construction projects and can be utilized by contractors to improve safety culture at their jobsites.

Discussion

Despite continuous improvements on safety management studies in construction industry over the years, safety related issues are still in existence. Some of the cultural issues that are identified from various literature are highlighted in this review. These issues mainly address safety culture in an organization and needs utmost attention for facilitating positive safety culture formation to reduce accidents, hazards and risks in the working level of the industry. Also, in addressing these adverse effects or issues, organizations need to encourage safety culture practices for creating a positive working environment within the organization.

Based on systematic literature review of construction safety culture articles, a theoretical framework is formulated on its influencing factors (See section - Factors affecting safety culture). These factors exhibit interaction effect similar to Cooper’s model of safety culture (25). The model explains three basic dimension that influences safety culture in terms of triadic reciprocal actions, wherein personal, behavioural and situational factors has an impact on each other bi-directionally (26). Bandura (26) states that the reciprocal actions do not occur simultaneously nor its influence has an equal effect but it takes sufficient time for underlying factors to make an influence on the
dimensions. For example, the bi-directional influence of an individual is affected by workplace safety practices and policies, resources and safety training employed by the organization. This interaction model is a perfect framework to investigate safety culture for various reasons. Firstly, this interactive association explains accident causation relationship between safety culture factors at various levels of the industry\(^{27,28}\). Secondly, measurement of factors in each of the dimension reflects the bi-directional dynamic interaction by providing a “triangulation methodology”\(^{29}\) that reflect on the overall safety culture\(^{30}\). Lastly, it integrates goal-setting tasks by self-regulatory processes, sub-goals and development strategies within an organization\(^{28}\). The model outcomes aids in exploring the concept in terms of formulation and advancement towards building a positive safety culture in construction industry.

Systematic literature review adopted in this study limits its focus on construction industry and this can be further explored by conducting a deeper content analysis on articles of safety culture researches.

Conclusions

Many organizations, including construction industry have shown greater attention towards facilitating safety culture as a means to decrease accidents, incidents and risks occurring at the workplace. For effective implementation of safety management, organizations tend to set safety culture as a significant factor for enhancing occupational health and safety at workplace. This creates the potential to explore the recent trends in safety culture research. But, the amount of literature available on this topic makes it challenging for practitioners and researchers to have a structured outline of the topic. So, this study makes an attempt to provide essential concepts of safety culture research in construction industry by providing suitable realistic evidence and theoretical developments.

The sole purpose of the review is to know how researchers have defined and measured safety culture to predict and justify health and safety outcomes in construction industry. The information provided in this study gives a clear representation on the topic of safety culture as this can help researchers and practitioners for recognizing critical influences from articles of safety culture research topics. Also, this paper provides insights on various constructs of safety culture studies till date and makes an attempt to explain the present trends and issues towards creating a safe operational environment in construction industry. Finally, this review is believed to encourage further research on safety management aspects in construction industry.

Diet and Physical Activity Levels among Obese Homemakers in Urban Udupi—A Cross Sectional Study

Guruprasad V, PSVN Sharma, Binu V.S., KR. Banumathe, Shovan Saha

1Assistant Professor–Selection Grade, Dept. of Occupational Therapy, School of Allied Health Sciences, MAHE; 2Professor, Dept. of Psychiatry, KMC; 4Assistant Professor, Dept. of Biostatistics, NIMHANS; 4Associate Professor, Dept. of Occupational Therapy, SOAHS, MAHE

ABSTRACT

Study Background: Obesity is the most prevalent nutritional disorders in developed and in developing countries, especially in India due to urbanization. According to NFHS-4 in 2015-16, in Karnataka state, 31.8% of urban women were obese. Women who are obese in Udupi district as per NFHS-4 (2015-16) is 20.7%. As per WHO (2015), the major reason for overweight and obesity is due to an imbalance in caloric intake and consumed. Obesity management therefore commonly involves diet and increased physical activity. An estimate of current levels of diet intake and physical activity is required for appropriate planning of intervention for obesity.

Objectives: To estimate the physical activity levels and diet levels of obese Homemakers in urban Udupi.

Method: A cross-sectional study was carried out among obese homemakers residing in urban Udupi. A total of 180 obese homemakers were recruited from 30 wards based on BMI criteria at the age group of 30 to 45 years. The physical activity levels were measured in MET values using Global Physical Activity Questionnaire and MET-Minutes per week using a physical activity diary. The diet intake was measured for one week using caloric intake using a diet diary.

Results: The mean age of study population was 36.77 years with a standard deviation (SD) of ± 5.089. The mean caloric intake of the study participants were 2076 ± 253.26. One sample ‘t’ test was used to compare the mean caloric intake of participants with the mean standard caloric intake of 1800 calories per day which shows statistically significant difference with p<0.001. The mean physical activity of the study participants were 425 ± 84.05 MET per week. One sample ‘t’ test was used to compare the mean physical levels of participants with the standard physical activity requirements as per WHO i.e.600MET-minutes per week which shows statistically significant differences with p<0.001.

Keywords: Obesity, Physical Activity, Diet, Homemakers

Introduction

Obesity is the most prevalent nutritional disorders in developed and in developing countries, especially in India due to urbanization. It is turning out to be most common health issue worldwide in the majority of the population, affecting youths, adults and specially Housewives or women1. According to NFHS-4 in 2015-16, in Karnataka state, 31.8% of urban women were obese or overweight. Women who are overweight/obese in Udupi district as per NFHS-4 (2015-16) is 20.7%. As per WHO (2015), the major reason for overweight and obesity is due to an imbalance in caloric intake and consumed. All over world, there has been an increment
in physical inactivity and higher intake of energy rich foods, especially fat\textsuperscript{3}. Obesity management therefore commonly involves proper diet and increased physical activity. An estimate of current levels of diet intake and physical activity is required for appropriate planning of intervention for obesity.

**Objective**

To estimate the diet and physical activity levels of obese homemakers in urban udupi.

**Method**

**Study Design and Setting:** This cross sectional study was carried out during August 2017 in Udupi district, southern Karnataka after obtaining ethical clearance from Institute Research Committee (IEC 222/2016) Manipal. In this study, the unit of allocation is based on “wards”. The entire urban Udupi area consists of 35 wards. In that, 30 wards was selected. For each ward, 06 subjects were selected based on selection criteria. A total of 180 obese homemakers were recruited from 30 wards in urban udupi community based on BMI criteria for Asians as per WHO (25 \( \text{–} 34.9 \)) within the age group of 30 to 45 years. The exclusion criteria included women who are pregnant or in plan to get pregnant, history of any eating disorders, physical/cognitive disabilities, unstable medical or psychiatric conditions, Diabetes Mellitus, Hypertension, thyroid disorder and family history of obesity. In the community, Homemakers as per the selection criteria were identified through Door-to-Door survey method.

**Screening Tools:** In order to select the participants, screening tests such as Physical Activity Readiness Questionnaire to assess physical status, General Health Questionnaire to exclude psychiatric illness and Random Glucose Test to screen for Diabetes Mellitus, Blood Pressure measurement for hyper/hypotension and TSH test to screen for thyroid disorder were carried out to each participant.

**Data Collection:** The physical activity levels of participants were measured using Global Physical Activity Questionnaire (GPAQ) developed by WHO. It evaluates total volume of moderate and vigorous intensity physical activity behaviour in three domains such as work, transport and leisure for a typical week. Moderate intensity activities are the activities involving moderate physical effect causing a small increase in breath or heart rate whereas vigorous intensity activities requires hard physical effect casing large increase in breathing or heart rate. According to WHO, a participant is termed as physical active if they involve in 150 minutes of moderate intensity physical activity or 75 minutes of vigorous intensity physical activity or an equivalent combination of moderate and vigorous activities of total atleast 600 MET- minutes per week with each activity bout of minimum 10 minutes duration\textsuperscript{4}. In addition to GPAQ, a physical activity diary was also used to measure the various physical activities carried out by participants prospectively for a typical week. The diet intake was measured for one week using caloric intake (food) using a prospective diet diary in order to avoid recall bias. Participants were trained to record the food intake (food item and quantity) and physical activity (actual activity and duration) they performed in diet and physical activity diary prospectively provided by the investigator. Gathered data was entered and analysed in SPSS version 15

**RESULTS**

**General Characteristics of Participants:** A total of 180 obese homemakers were recruited for the study. The mean age of study population was 36.77 years with a standard deviation (SD) of \( \pm 5.089 \) (range 30–45 years). 78.9\% (142) participants were in obese grade I and 21.1\% (38) were in obese grade II as per WHO classification for Asians. Among them, 65\% (117) belonged to nuclear family. In educational status, only 12.3\% (22) were graduates. 21.1\% of participants belonged to upper class, 59.4\% were upper middle, 13.9\% lower middle and 5.6\% of participants belonged to upper lower class. About 83.9\% (151) were non-vegetarians.

**Diet Intake:** The mean caloric intake of the study participants were 2076 \( \pm 253.26 \) (minimum: 1303 and maximum: 2722). One sample ‘t’ test was used to compare the mean caloric intake of participants with the mean standard caloric intake of 1800 calories per day. Statistically significant difference was found with \( p < 0.001 \) which revealed that the mean caloric intake of the study participants was higher.

**Physical Activity Levels:** The mean physical activity of the study participants were 425 \( \pm 84.05 \) (minimum: maximum) MET per week. 95 percentage of study participants were physically inactive. One sample
‘t’ test was used to compare the mean physical levels of participants with the standard physical activity requirements as per WHO i.e.600MET-minutes per week. Statistically significant differences was found with p<0.001 which revealed that the mean physical activity levels of the study participants was lower indicative of ‘physically inactive’

Discussion

Overall a high proportion of participants were consuming a high amount of calories daily in this study. This may be due to increase in purchase power and accessibility to energy dense, high fat food items\(^5\). In this study, the participants were obese homemakers belonging to urban area. Research also supports that nutrition transition occurring in India is fueling the chronic diseases and obesity especially in urban areas\(^6\). Dietary patterns in India were appeared positively associated with obesity\(^7\). In physical activity assessment majority of participants were physically inactive. 95 percentage of participants were physically inactive i.e. less than the minimum duration recommended by WHO. This was supported by a study carried out by Anjana et.al in 2014 which revealed that a high proportion of individuals were physically inactive, more common in urban than rural, also men stood considerably more active when compared to women. Major time spends in moderate level to vigorous level - intensity activity happens in the workplace\(^8\). Since our participants were homemakers, they have limited opportunity to involve in physical activity related to work. In this study, majority of participant’s diet intake (calories) was higher than normal daily requirements and they also had lower level of physical activity which would lead them to obese category.

Conclusion

Overall women who are homemakers by occupation in urban udupi community areas had poor dietary practices and low levels of physical activity which is the main reason for their obesity. As obesity is associated with many health hazards, it is important to initiate a community level health intervention programs suitable specifically to the target population in community.

Aerobic Capacity in Obese School going Children Between 11 and 14 Years of Age: A Cross Sectional Study

J Andrews Milton¹, A Turin Martina²

¹Professor, Bethany Navajeevan College of Physiotherapy, Thiruvananthapuram; ²Associate Professor, PG & Research Department of Rehabilitation Science, Holy Cross College, Tiruchirappalli

ABSTRACT

Background: Childhood obesity is an epidemic. Obesity is associated with aerobic capacity. Childhood obesity leads to decreased aerobic capacity that leads to cardiovascular diseases in the adulthood. Maximal oxygen consumption (VO₂ max) also known as aerobic capacity or aerobic fitness indicates the physical fitness of a person.

Objective: The objective of the study is to determine the relationship between obesity and aerobic capacity in school children aged 11 to 14 years.

Materials and Method: 100 school children between 11 and 14 years from the schools in Thiruvananthapuram city were included in the study using simple random sampling method. Students with musculoskeletal impairments, cardio respiratory disorders, neurological impairments, general weakness, smokers and alcoholics were excluded from the study. BMI percentile has been calculated for all the students. They were divided into three BMI categories. i.e., Normal weight, Overweight and Obese. Multistage 20 meter shuttle run test was conducted on all the subjects to determine the VO₂ Max. The pearson correlation for the VO₂ Max was -.905, P value was .000 which shows that there is a significant correlation at 0.01 level between BMI categories and VO₂ Max. Also the value shows that the correlation is negative, i.e., as the BMI percentile increases the VO₂ Max decreases and vice versa.

Conclusion: The result of the study shows that there is a significant negative correlation between the BMI percentile and the VO₂ max in school children aged between 11 years and 14 years. Hence as the BMI percentile increases the VO₂ max decreases and vice versa in school children. Thus the study concludes that obese school going children are having less aerobic capacity.

Keywords: Aerobic Capacity, VO₂ Max, Childhood Obesity, Body Mass Index

Introduction

Obesity is defined as “abnormal or excessive fat accumulation that presents a risk to health”. Childhood obesity is becoming an epidemic ¹. Researches found that the body composition is affected by the changes in nutrition which includes the increased consumption of refined and processed foods, decreased physical activity which is the consequence of the urbanization and digitalization. ²,³,⁴,⁵. Apart from the increase in the childhood obesity and passive lifestyle, changes in the children’s physical fitness is a strong marker of the chronic disease risk. ⁶,⁷. Tomkinson and colleagues found that there was an annual decline of 0.36% in the aerobic fitness of 6–19-year-olds from five geographical regions i.e., Africa, Middle and East Asia, Australia, Europe, and North America ⁸. Obesity is one among the chronic lifestyle disorders especially cardiovascular and respiratory diseases ⁹,¹⁰. Physical fitness in children has been found to be associated with better health outcomes in terms of blood pressure, muscle strength, blood lipids, serum insulin or blood vasculature characteristics ¹¹,¹²,¹³.
Cardio-respiratory capacity of a person shall be assessed by maximal oxygen consumption (VO₂ max) also known as aerobic capacity or aerobic fitness and indicates the physical fitness of a person. Aerobic fitness is the ability of the body to distribute oxygen to the muscles, which is responsible for the physical activity. The lungs receive the oxygen from the air and this oxygen is carried into the blood stream; the heart and blood vessels deliver the oxygen to the skeletal muscles which executes the muscular contractions. VO₂ max is the maximum ability of the body to transport oxygen from the air to the muscles for the production of energy. It is the ability of the heart to pump oxygen-rich blood to the muscles, as well as the efficiency of the muscles in extracting and utilizing the oxygen. VO2 max is measured in milliliters of oxygen per kilogram of body weight per minute of exercise (ml/kg/min). As intensity of the exercise increases the oxygen consumption also increases. However, when a point is reached, the intensity of exercises increases without concurrent increase in oxygen consumption. This point at which oxygen consumption plateaus is the VO2 max or an individual’s maximal aerobic capacity. Max VO₂ is the best indicator of cardiorespiratory endurance and aerobic fitness. Researches has documented that a low aerobic fitness level is associated with an increased risk of premature death especially because of cardiovascular disease. Hence, higher aerobic fitness levels are associated with various health benefits such as reduced risk of cardiovascular diseases, stroke, diabetes, etc. To improve or maintain cardiovascular health an individual must engage in aerobic exercises such as jogging, swimming, cycling, walking etc. with 60 minutes per day for a frequency of 3 days per week. Evaluating VO₂ max in obese individuals can help in early detection of cardiovascular impairments and help to plan appropriate intervention strategies. Among the various tests, Multistage 20 meter shuttle run test is the most popular indirect method that evaluate the VO₂ Max. The purpose of the present study is to determine the relationship between obesity and aerobic capacity in school children aged 11 to 14 years.

Materials and Method

100 school children between 11 and 14 years from the schools in thiruvananthapuram city were included in the study using simple random sampling method. Students with musculoskeletal impairments, cardio respiratory disorders, neurological impairments, general weakness, smokers and alcoholics were excluded from the study. BMI percentile has been calculated for all the students. They were divided into three BMI categories. i.e., Normal weight, Overweight and Obese. Multistage 20 meter shuttle run test was conducted on all the subjects. Each student being tested ran across the 20 meter distance and touch the line with a foot by the time the beep sounds. The initial speed of the shuttle run was 8.5 km/hr. The speed of the shuttle run got progressively increased at the rate of 0.5km/hr every minute, as dictated by the frequency of adjusted “beep” sound signal from a pre-recorded audio tape. The student should take the full weight on the foot while touching the line. At the sound of the beep, the student turns around and runs back to the other end. Students continue in this manner until they failed to reach the line before the beep for the second time. VO₂ Max was calculated by the equation proposed by Leger et al. The results were recorded and analyzed statistically.

Statistical Analysis

The result was analyzed using SPSS software version 24. The statistical tool used was pearson correlation.

Results

Figure 1: Age wise and Genderwise distribution of Boys & Girls in different BMI Categories

![Figure 1: Age wise and Genderwise distribution of Boys and Girls in different BMI categories.](image)

Figure 1 shows the Age wise & Genderwise distribution of the boys and girls in different BMI categories. Under 11 years of age 2 boys and 2 girls were under normal weight category, 6 boys and 4 girls were under over weight category and 3 boys and 2 girls were under obese category. Under 12 years of age 2 boys and 2 girls were under normal weight category, 7 boys and 4 girls were under over weight category and 3 boys and 3 girls were under obese category. Under 13 years of age 3
boys and 3 girls were under normal weight category, 7 boys and 5 girls were under over weight category and 4 boys and 7 girls were under obese category. Under 14 years of age 3 boys and 3 girls were under normal weight category, 7 boys and 7 girls were under over weight category and 3 boys and 8 girls were under obese category.

Table 2 shows the correlation between the BMI categories and VO\textsubscript{2} Max in school children between 11 year and 14 years old age. The Pearson correlation for the VO\textsubscript{2} Max was - .905, P value was .000 which shows that there is a significant correlation at 0.01 level between BMI categories and VO\textsubscript{2} Max. Also the value shows that the correlation is negative, i.e., as the BMI percentile increases the VO\textsubscript{2} Max decreases and vice versa.

**. Correlation is significant at the 0.01 level (2-tailed).

Discussion

100 school children between 11 and 14 years from the schools in thiruvananthapuram city were included in the study using simple random sampling method. BMI percentile has been calculated for all the students. They were divided into three BMI categories, i.e., Normal weight, Overweight and Obese. Multistage 20 meter shuttle run test was conducted on all the subjects. VO\textsubscript{2} Max was calculated by the equation proposed by Leger et al\textsuperscript{20,21}. The Pearson correlation for the VO\textsubscript{2} Max was -.905, P value was .000 which shows that there is a significant correlation at 0.01 level between BMI categories and VO\textsubscript{2} Max. Also the value shows that the correlation is negative, i.e., as the BMI percentile increases the VO\textsubscript{2} Max decreases and vice versa. Obesity is often associated with a wide range of cardio vascular abnormalities\textsuperscript{22}. The consequences of obesity are metabolic dysregulation with increased prevalence of atherogenic risk factors, including insulin resistance, hypertension, and dyslipidemia; adverse cardiac remodeling characterized by hypertrophy, chamber enlargement, and impaired ventricular systolic and diastolic function; vascular endothelial dysfunction; premature coronary artery disease; increased sympathetic tone; pulmonary hypertension with right-sided heart strain; and arrhythmias. Obesity leads to excessive amount of cholesterol in the blood. This increases the fat deposits in the walls of the coronary arteries which is known as atherosclerosis. Thus there is a narrowing of the coronary arteries that leads to coronary artery
disease. Heart function has an association with BMI as well as the duration of obesity. Obesity adversely affects the respiratory system causing abnormalities in the mechanics of the respiratory system. Obesity decreases the strength and endurance of the respiratory muscles, decreases the gas exchange and the exercise capacity. Impairment in the lung function is caused by the accumulation of the excessive adipose tissue in chest wall and the abdominal cavity, which may compress the thoracic cage, diaphragm, and lungs. This may limit diaphragm displacement and compliance of the lung and chest wall. This results in a decrease in lung volumes. The respiratory function severely worsens with an increase in the BMI of individual. Goran et al. found that VO$_2$ max is decreased in individuals with excessive body weight.

**Conclusion**

The result of the study shows that there is a significant negative correlation between the BMI percentile and the VO$_2$ max in school children aged between 11 years and 14 years. Hence as the BMI percentile increases the VO$_2$ max decreases and vice versa in school children. Thus the study concludes that obese school going children are having less aerobic capacity.

ABSTRACT

Background: Rabies is one of the endemic diseases in India with dog rabies being a major public health problem with more than 90% of mortality and morbidity. National Rabies Control Programme which was approved by the Government of India under 12th five-year plan aims to control the disease. Surveillance of dog bite cases is done by Integrated Disease Surveillance Programme which helps in detection of outbreaks quickly.

Objectives: This study was planned to assess the effectiveness in the early case identification of dog bite cases who are eligible to receive post exposure prophylaxis and to identify the barriers in the reporting of cases in Hassan peripheral health centres.

Method: The study was conducted during the period of May to October 2017 in Hassan district of Karnataka, India. Cross-sectional evaluation of dog bite case reporting along with retrospective record analysis of one-year dog bite cases in the selected health centres comparing with the data obtained from the IDSP portal of the District Surveillance Office.

Results: Significant under-reporting was noticed with respect to the number of cases registered in the health centre and the number of cases reported to IDSP. Staff nurses were trained for IDSP in only 58.3% of the centres. Significant correlation was found between reporting of data to IDSP portal and training received by the staff.

Conclusion: For improvement in the dog bite case detection and control of rabies in India, there is a need to improve the surveillance system. Manual reporting of dog bite cases through IDSP can be replaced by real time data reporting through IHIP to minimize errors.

Keywords: Rabies, Dog bite, Surveillance, Case reporting, Integrated Disease Surveillance Programme (IDSP), Integrated Health Information Platform (IHIP).

Introduction

Rabies is a zoonotic disease which is fatal but 100% preventable. Annually about 55,000-60,000 persons die of rabies worldwide. Out of which nearly one-third cases are from India. About 99% of these deaths are followed by bites/exposures to dogs.¹,² Rabies is identified as a priority disease for global and national level control measures.³

National Rabies Control Programme proposed by the National Centre for Disease Control (NCDC) was approved by the Government of India under 12th five-
year plan\textsuperscript{4,5}, and has received top priority under the recent government health agenda.

It is important for the disease to be declared as notifiable to establish functional reporting. There should be mechanisms for data transmission from the community level to the national and international level. This can provide feedback on the effectiveness of the programme. Further, the areas of weakness can be improved by taking appropriate actions.\textsuperscript{1} Monitoring and surveillance of the disease should be given priority.\textsuperscript{4,5}

In India, surveillance and reporting of dog bite cases is done under Integrated Disease Surveillance Programme (IDSP) which was launched in 2004.\textsuperscript{6,7} It is a decentralized state based surveillance programme, where the weekly surveillance data on certain diseases are being collected from various reporting units such as sub centres, primary health centres, community health centres, government and private hospitals, laboratories and medical colleges.\textsuperscript{8,9} The increase in number of cases even after more than a decade of implementation of IDSP indicates inadequacy of the surveillance system.\textsuperscript{10}

**Objectives**

The present study was planned to assess the effectiveness in the early case identification of dog bite cases who are eligible to receive post exposure prophylaxis and to identify the barriers in the reporting of cases in Hassan peripheral health centres.

**Materials and Method**

**Study Design:** Cross-sectional evaluation of dog bite case reporting along with retrospective record analysis of one-year dog bite cases in the selected health centres comparing with the data obtained from the IDSP portal of the District Surveillance office of Hassan district.

**Study Procedure and Data Collection:** This study was conducted in Hassan district of Karnataka, India during the period of May to October 2017. Hassan has 8 taluks which are scattered at a distance of 14.8km to 54km from our medical college. These are Alur (14.8km), Arkalgud (44.8km), Arsikere (44.2km), Belur (44.9km), Channarayapatna (38.4km), Hassan, Holenarsipura (45.1km) and Sakleshpur (54km). Each taluk has health centres ranging from a minimum of 6 centres in Alur to a maximum of 38 centres in Hassan.

After obtaining permission from the District Health Officer, IDSP data for one year i.e., from April 2016 to March 2017 of all the centres of 8 taluks was collected from the IDSP portal. Among various diseases included in IDSP, dog bite cases were selected considering the rise in number of dog-bite cases in the district\textsuperscript{11}, and one-year data on the dog bite cases of all the taluks was compiled. Three centres from each taluk, a total of 24 centres from the district, which reported maximum number of dog bite cases in that one year were listed.

All the 24 centres, which are at a distance of minimum 3km to maximum 90km from our medical college, were visited. Dog bite registers from the centres were reviewed, weekly data of dog bite cases was compared with the data of weekly P-forms obtained from the IDSP portal. Two informants per health facility, particularly staff nurse and lab technician were interviewed regarding their knowledge about registering the cases and reporting the cases to IDSP, regarding the training of health workers, entering the cases in the weekly P-form, and about reporting the data to higher centres. All the details were noted.

**Findings**

Study was conducted in 24 centres of 8 taluks of Hassan district. Results are compiled based on the availability of dog bite register in the centres, entering the cases in the weekly P-forms, reporting to higher centres and training of the health workers.

Dog bite registers were not maintained in proper format. In few centres, dog bite cases were entered in the OPD register. Weekly P-forms were filled by staff nurse in most of the centres, or by lab technician or Medical Officer in few centres. Most of the health workers were not trained in IDSP.

*Dog bite cases were entered in the dog bite register in those centres where separate dog bite register was available; and in OPD register where separate dog bite register was not available.

Table 1 shows the profile of number of dog bite cases registered, number of cases reported to IDSP, availability of dog bite register and training of staff nurse for IDSP in all the 24 centres.

Dog bite registers were not maintained uniformly. Staff nurses from all the 3 centres of Arkalgud and Arsikere taluks were trained for IDSP, dog bite registers were available in 2 out of 3 centres in both the taluks, but differences were seen in the number of cases registered and reported. One centre each from Arkalgud and Arsikere taluks had no dog bite register and the cases were not entered in OPD register, but were reported to IDSP as a routine.

All the 3 centres of Belur taluk had dog bite registers, staff nurses from 2 centres were trained for IDSP where there was better reporting. Staff nurse in Halebeedu centre of Belur was not trained for IDSP, and there was significant difference in the reporting. Staff nurse of only Udayapura centre from Channarayapatna taluk was trained for IDSP, where there was proper reporting of the cases. In Hassan, Holenarsipura and Sakleshpur taluks, there is no proper alignment in reporting and training obtained by staff in the entire process of surveillance of dog bite cases.

Out of 24 centres included in the study, significant under-reporting was noticed in 13 centres with respect to the number of cases registered in the centre and the number of cases reported to IDSP. Overall, it was found that the reporting of dog bite cases was not accurate in most of the centres.

**Statistical Analyses**

To find correlation between reporting of data to IDSP portal and based on training received on mode of timely and accurate submission of report, mean value of reporting was 94.88 (SD 162.13) and Pearson correlation 0.98 which was found to be having strong correlation. Similarly, in regard to maintenance of dog bite registers, correlation was highly significant (r=0.98 and p<0.001). Further analysis was attempted considering two groups
as two independent samples i.e., data reporting to IDSP and presence of dog bite registers in the health centres where ever dog bite case management was done. For the same, Independent sample t test was applied where Levene’s test for equality of variances (population vs sample comparison) found highly statistical significant (p<0.003) and t value=2.232 (95% CI 9.704-264.072). We also checked for its sensitivity (76.9%) and specificity (63.6%). In contrast, when training aspect was subjected to independent t test, t test statistic value is not significant (p=0.985). Further regarding cross-verification between availability of dog bite registers and type of entry made pertaining to cases reported, it was highly significant (F=13.18, P<0.001) (t=2.63, p<0.015, 95% CI 34.31-287.42). But same relation with regard to training impact on entry in registers were not found. In addition, considering limitation of sample size and to capture actual facts, bootstrapping was done on given data where 1000 sample iteration result yields with a mean value=165.23 and BCa 95%CI 69.27-282.47. To make comparison between groups and within groups such as reporting to IDSP and training part per se using one-way ANOVA, it is not statistically significant (p=0.98); in comparison to dog bite register availability and prompt reporting to IDSP portal, it is significant statistically (F=4.98, p<0.036). The above analyses were done using SPSS software version 22.0.

**Fig. 1: Training of Staff Nurses**

Staff Nurse present in each centre at the time of visit was interviewed regarding IDSP functioning and their training. It was found that the staff nurses were trained for IDSP in only 14(58.3%) centres and they received the training only once.

**Discussion**

A significant reduction in human rabies has been achieved in Mexico, South America and the Caribbean during the last two decades. More than fifty countries are currently free of rabies.13 But rabies is predominant in the developing countries with increase in cases over the past two decades in parts of sub-Saharan Africa and Asia, because of rapidly growing dog populations and increasing urbanization.13 Surveillance should be given importance for effective control of rabies, and focus should be on effective reporting of dog bite and rabies cases.

The present study showed that the reporting of dog bite cases was not accurate in 33.3% of the centres and registers were found incomplete. Dog bite cases were not registered in 6 centres but sent to IDSP, which explains poor surveillance. The findings are supported by studies conducted in Ghana which showed poor surveillance.14,15

The weekly P-forms of IDSP which are to be filled by Medical officers were mostly filled by staff nurses in those centres. Only 58.3% of those staff nurses were trained once for IDSP. Training of the health workers and reporting the data to IDSP portal was found to be having strong correlation. Similar findings were found in a study conducted in West Bengal by Integrated Disease Surveillance Project (IDSP) units which showed that the reporting status improved year by year after training of health workers.16

The present study also found lack of supervision of the reporting system contributing to fallacies in the system. In a study by Adokiya M et al., it was shown that supervision was largely absent and disease surveillance activities were of low priority for nurses, doctors, administrators and laboratory workers.15

An Integrated Health Information Platform (IHIP) is being setup by the Ministry of Health and Family Welfare, Government of India, for comprehensive Health Information Exchange (HIE) through Electronic Health Records (EHRs) of the citizens.17 This electronic information system aims for real time data reporting with the help of mobile application accessible at all levels.18 Manual reporting errors can be minimised with the help of this real time data reporting.

A study conducted by Diwan V et al. in Madhya Pradesh showed that software related issues such as duplicate data entry was monitored regularly with the data entered in electronic form.19 Another study by Adokiya M et al. in northern Ghana showed that mobile phone reporting made IDSR report submission easier.15

**Conclusion**

India is among those countries with highest number of rabies cases. We found that there was inaccurate
reporting of cases from the health centres through IDSP, which conceal the actual magnitude of dog bite cases. We also found that the health workers were not sufficiently trained leading to improper maintenance and entry of cases in the registers, thereby improper reporting and surveillance. So improvement in surveillance is imperative through intensive training of the health workers, regular monitoring and supervision and concurrent review of the system. Manual weekly reporting from the health centres to the higher centres by untrained and incompetent staff through IDSP may cause errors. To overcome this deficiency, IHIP which aims for the real time data reporting can be more effective in improving the timely reporting so that rabies menace in India is checked and dog bite early case detection and management becomes the reality in near future under the national rabies control programme.

Conflict of Interest: No conflicts of interest.

Source of Funding: No funding sources.

Ethical Clearance: The study was approved by the Institutional Ethics Committee of Hassan Institute of Medical Sciences, Hassan, Karnataka in the year 2017.

Acknowledgement

We would like to acknowledge the Epidemiologist and Data entry operator of the District Surveillance Office, Hassan for providing the required data for this study from the IDSP portal. We also wish to acknowledge the Medical Officers and other staff of all the 24 health centres for their support and cooperation during the study.

ABSTRACT

Introduction: Oral health literacy is the degree to which individuals have the capacity to obtain, process, and understand basic oral health information. A common reason for misunderstanding health instructions may be the patient’s low oral health literacy skills.

Material and Method: The study design was a descriptive cross sectional, which included 457 study participants. They were selected using stratified random sampling. Oral health literacy was assessed using Rapid Estimate of Adult Literacy in Dentistry (REALD-30). Dental caries and gingival status was assessed according to the methods described in WHO Oral Health Survey.

Results: The overall mean REALD-30 score of the participants was 18.1±4.8. The mean REALD-30 scores were lowest (14.6±4.4) among students in the low socioeconomic status. The oral health literacy scores of individuals who brush their teeth twice and rinse their mouth after meals were significantly higher. The mean number of teeth with gingival bleeding and dental caries were significantly low in study participants with high oral health literacy.

Conclusion: It was concluded that the overall oral health literacy of the study population as moderate and it does have an impact on the oral health status of the study population.

Keywords: Health education, Oral health, Decay, Students, Gingivitis

Introduction

Oral self-care is a constituent of general health and it encompasses various activities ranging from self-examination, prevention and diagnosis to seeking professional oral health care.¹ Dental caries and periodontal disease are the most common oral diseases affecting mankind. Both of them are multifactorial conditions with a complex interplay of biological, genetic and environmental factors.²

The recent advances in dental treatment modalities alone will not be sufficient to reduce oral health discrepancies nor eradicate these conditions. The most effective way for the people of the community to attain good oral health is through promotion of health.² Health literacy has been acknowledged as one of the elements of staying healthy. It is the ability of a person to understand instructions on prescription, appointment cards, health education pamphlets, doctor’s directions and consent forms.³

Although healthcare professionals generally assume that the health explanations and instructions given to patients and families are readily understood, in reality these instructions are frequently misunderstood. A
common reason for misunderstanding health instructions may be the patient’s low health literacy skills. Poor health literacy is linked with worse health and reduced understanding of prevention, maintenance, and self-care instructions provided by the health care professional.

Oral health literacy (OHL) is the degree to which individuals have the capacity to obtain, process, and understand basic oral health information and services needed to make appropriate health decisions. The information provided to them by their dentists and the communication skills of the dental team contribute to a patient’s oral health literacy that in turn results in improved oral health outcomes.

It was suggested that the complexity of both verbal and written oral health communications create a significant barrier to improving oral health and that oral health literacy is required in order to promote oral health and to prevent oral diseases.

Oral health literacy levels can be estimated with the previously validated instrument called Rapid Estimate of Adult Literacy in Dentistry (REALD-30). Studies conducted using this instrument reveals that those with incorrect knowledge of dental questions and fair/poor oral health status had greater odds of having a low literacy level than those with correct knowledge.

The precise relationship between OHL and oral health outcomes has not been established, but it has been conceptualized that there is interplay between oral health literacy, culture, socioeconomic status, education and health system in determining oral health related outcomes.

Late Adolescent life is a critical period of transition with personal responsibility. Individuals in this period can be targeted for preventing dental diseases and developing better oral health. Assessing the effect of oral health literacy among this age group is a crucial component in development prevention oriented oral health programs in the future. Although recently gaining more attention, there has been minimum research in the field of oral health literacy or, more specifically, the impact of oral health literacy on oral health related outcomes among adolescent Indian population.

Therefore the present study was conducted with the aim of evaluating the impact of oral health literacy on Oral Hygiene, Gingival status and Dental caries among young adults in Chennai City, India.

Materials and Method

The design of the present study was descriptive cross sectional, which includes study participants pursuing their undergraduate degree in a private University in Chennai. The principal investigator was trained and calibrated prior to the start of the study. A pilot study was conducted among 50 participants to validate the assessment form and to get the required sample size. The estimated sample size was 457 with 90% power and margin of error at 5% with 95% confidence level.

The subjects were selected using stratified random sampling where each faculty of studies forms strata. After obtaining the list of students in each faculty of studies, they were randomly selected till the required sample size is achieved. Students were selected from engineering, arts & science and polytechnic courses. Students from medical, dental and paramedical courses were not involved to prevent confounding bias. The nature and purpose of the study was explained to them and written informed consent was obtained. They were involved in one to one interview once they satisfy the inclusion criteria.

Inclusion Criteria:

1. UG students from non-medical backgrounds.
2. They should be able to read, write and speak English language.
3. Students who have studied English as their first language in schools.

Oral health literacy was assessed using a validated instrument, the Rapid Estimate of Adult Literacy in Dentistry (REALD-30). It includes 30 dentally-related words arranged in order of increasing difficulty. The participants were asked to read the words loudly. They were asked to read only the words which are familiar and which they can pronounce correctly. To score REALD-30 one point is given to each word pronounced correctly and then summed to get an overall score. The score has a possible range of 0 (lowest literacy) to 30 (highest literacy).

Socioeconomic status was assessed using Modified Kuppuswamy Scale. The various dimensions taken under consideration to obtain a composite score are the education and occupation of the family head, together with total monthly income. The score ranges from 3 (Lower class) to 29(Upper class).
Oral hygiene status was assessed using Oral Hygiene Index - Simplified. Dentition and gingival status was assessed according to the methods described in WHO Oral Health Survey, fifth edition.

The data was analysed using Statistical Package for Social Sciences, IBM Corporation, SPSS Inc., Chicago, USA version 21 software. Independent t test and one way ANOVA was used to assess the level of significance which was kept as p < 0.05. Post hoc analysis and multiple group comparisons were made using either Tukey’s HSD test or Tamhane’s test following homogeneity of variance test.

Results

The total number of participants in the study was 457 which included 256 (56%) males and 201 (44%). The age of the participants ranged between 17 to 25 years with the mean age of 19.9±1.8. Majority of the students were from middle class. The overall mean REALD-30 (OHL) score of the participants is 18.1±4.8. Although the oral health literacy score for females is slightly higher (18.2±5.0) than males (17.9±4.8), statistically it was not significant. The mean REALD-30 scores were lowest among students in the lower socioeconomic status and the differences were found to be statistically highly significant. (Table 1)

Table 2: Distribution of subject based upon oral hygiene and REALD-30 scores

Independent t test and One Way ANOVA, * Highly significant
One Way ANOVA followed by Tukey’s HSD, * Very Highly Significant

Most of the participants (80.7%) brush their teeth only once and about 55.8% rinse their mouth after every meal. The OHL scores of individuals who brush their teeth twice and rinse their mouth after meals were significantly higher. Nearly half of the participants (49.2%) had fair oral hygiene. (Table 2) Individuals with poor oral hygiene had the lowest OHL scores (15.2) when compared to other two groups and the differences were found to be statistically very highly significant. (Table 3)

The mean number of teeth with gingival bleeding was high (8.1±2.0) among individuals with low OHL when compared those with moderate (6.8 ± 3.6) and high literacy (4.4 ± 3.8). Multiple comparisons of different groups reveal that the differences were statistically very highly significant. (Table 4 and 5)

### Discussion

Adolescence is a distinct period of development. During this period, the individuals are about to begin a new episode in their lives and the society legally considers them as an adult. Any changes in behaviour occurring during this period tends to last lifelong. The oral health literacy of the present study population was considered to be moderate with a mean REALD-30 score of 18.1±4.8, whereas studies conducted by Haridoss R et al., Aruna Devi et al. and Jamieson et al. showed a lesser mean REALD-30 scores. This may be due to the fact that the current study was done among college students in a metropolitan city. A higher mean REALD-30 score of 23.9±1.29 and 23.0±4.31 was obtained by Jones et al. and Wehmeyer et al. respectively. It should be acknowledged that these two studies were conducted among patients attending a dental OP, while the present study was done among students regardless of their dental visits.

There was no significant difference in the OHL scores across different genders of the study population which was comparable to a study conducted by Haridoss R et al. There was a significant difference in the oral health literacy among subjects with different socioeconomic statuses, with the upper class having the highest literacy and vice versa. These results are in agreement with the studies conducted by Divaris et al. and Lee JY et al.

Individuals who brush their teeth twice and those who rinse their mouth regularly after each meal have significantly higher OHL scores and this implies the fact that better oral health literacy results in improved oral health related behaviour. In the present study, the oral health literacy scores were significantly higher among individuals with Good and fair oral hygiene when compared to individuals with poor oral hygiene. These findings validate the importance of oral health literacy in improving personal oral hygiene. The mean number of teeth with gingival bleeding which is an indicator of gingivitis and the mean number of teeth affected by dental caries were significantly low in study participants with high oral health literacy. This endorses the impact of OHL on oral health status of the study population and these results are in agreement with most of the studies conducted elsewhere.

The limitations of the REALD-30, particularly that it measures word recognition only with no test of comprehension or function have been acknowledged. Since REALD-30 has been validated in English language, this prevents generalization of results beyond students who were from English medium of education. Low oral health literacy when assessed early can alert dental care providers, to improve communication skills with such patients. Proper interventions may be effective in patient amenability in dental programs.

### Conclusion

To conclude, the overall oral health literacy of the study population is considered as moderate and it does have an impact on the oral health status of the study population. Further analytical studies can be conducted to establish one to one causal relationship evaluating the effects of oral health literacy on different oral health related variables involving sufficient and equal number of subjects from different socioeconomic and cultural backgrounds.

**ABSTRACT**

**Background:** *Streptococcus anginosus* was most commonly considered as commensals and closely related to *Streptococcus pyogenes*. Recovery of this bacteria from the throats has been reported to exceed that of *S. pyogenes* in regions where streptococcal disease is endemic. Infection with these bacteria may cause acute rheumatic fever (ARF) and its sequelae rheumatic heart disease (RHD) in susceptible individual. Molecular mimicry and autoimmunity probably play a crucial role in the pathogenesis. M protein in streptococci shares structural similarities with cardiac proteins such as myosin and the antibodies produced in patient cross-react with both M protein and heart tissue leading to RHD that causes significant morbidity and mortality in developing countries. The incidence of ARF peaks between 5-15 years of age and high burden of RHD is seen in Asia. *Streptococcus anginosus* being the most common beta hemolytic group C streptococcus isolated from the human throat. The present study provides epidemiological clues of this bacteria which is necessary in developing preventive measures.

**Objective:** To study the prevalence of *Streptococcus anginosus* in throat among healthy school children.

**Method:** Throat swabs were collected after taking consent from 3,416 children. The organism were isolated in sheep blood agar and beta hemolytic organisms were identified as *Streptococcus anginosus* by Vitek 2 compact, an automated system.

**Result:** Out of 3416 throat samples only six samples had beta hemolytic *Streptococcus anginosus*.

**Conclusion:** The present study showed the presence of beta hemolytic *Streptococcus anginosus*. Further study regarding M genes are required for knocking the virulence factors by developing suitable vaccines.

**Keywords:** *S. anginosus*, emm gene, acute rheumatic fever, beta haemolytic streptococci, sheep blood agar

**Introduction**

The *Streptococcus anginosus* group of bacteria earlier known as the *Streptococcus milleri* group comprises three types of organisms, *Streptococcus anginosus*, *Streptococcus intermedius* and *Streptococcus constellatus* (¹). Later in 1989 in the United States it was proposed to rename these bacteria under one species name *S. anginosus* (²). These bacteria are present as commensal flora in the human oropharynx, gastrointestinal tract and frequently isolated from clinical specimen (¹). Usually, identification of *S. anginosus* to the taxonomic level of species is not performed because in general the speciation is not considered necessary for patient treatment and most of the bacteria are susceptible to penicillin (¹).

*S. anginosus* group bacteria have a propensity to cause pharyngitis, bacteremia, and other severe invasive infections (³). *S. anginosus* group is the most common beta-hemolytic group C streptococcus isolated from the human throat (²). The species diversity highlights the limits of Lancefield grouping by agglutination assays, the typically applied method in the diagnosis of streptococcal infections. Diagnosis of *S. anginosus* group infections...
is particularly difficult by widely available phenotypic methods due to an antigenic diversity within the species. Although most S. anginosus group isolates belong to the non-β-hemolytic oral streptococci, β-hemolytic strains are also found in all 3 species. Some S. anginosus group strains carry a typeable Lancefield group antigen, which belongs to group A, G, F, C (3).

The role of Lancefield group C beta-hemolytic streptococci (BHS) in causing endemic pharyngitis is still contentious, although Lancefield group C streptococci are implicated in the outbreaks of purulent pharyngitis and associated disorders (2). In India and other developing countries ARF and RHD is one of the major public health problems contributes to significant cardiac morbidity and mortality (5). The prevalence of RHD in children aged 5–15 years is highest in Africa, Australia, New Zealand and south central Asia (6) including India (7).

Little is known about the pathogenesis of S. anginosus group infections (3). Studying the epidemiology, disease mechanism and their resistance to antibiotics is significant to monitor this emerging pathogen. The present study is done to study the prevalence of S. anginosus among school going children.

Materials and Method

A cross sectional survey was conducted to estimate the prevalence of beta hemolytic streptococci among healthy school going children in Udupi. Total 3416 school children of 5-15 years age group from 5 educational blocks of Udupi District were included in this study. Throat swabs were collected form the posterior pharyngeal wall using sterile cotton swab (Himedia) and transported to the laboratory immediately and processed. Throat samples were inoculated on to the sheep blood agar (Hi Media) plate and incubated aerobically at 37°C in the carbon dioxide incubator for overnight. Next day colony morphology was studied. Gram staining was done for Small, circular, semitransparent colonies with beta hemolytic zone around them. Catalase test, and esculin hydrolysis test were performed. Primary antibiotic susceptibility testing was performed using bacitracin disk for all the Gram positive beta hemolytic cocci arranged in chains. Beta hemolytic colonies which showed Gram positive cocci arranged in chains were subcultured on sheep blood agar and used for further identification of organism. Beta hemolytic bacterial colonies were identified using Vitek 2 Copmact an automated system. Fresh culture on 5% sheep blood agar was used for the inoculum preparation.

Result

From 3,416 sample collected from healthy school children, 6 samples were showing the growth of beta hemolytic bacteria on sheep blood agar. And all the six isolates of the identified beta hemolytic isolates showed resistance to Bacitracin.

![Beta hemolytic colonies on SBA.](image)

The colonies were small, translucent and were Gram positive cocci arranged in short chains in Grams smear, catalase negative and esculin was not hydrolyzed. Further, the isolated bacterial colonies were identified as Streptococcus anginosus in Vitek 2 comact.

The prevalence of BHS in throat among school children was estimated as 0.175 % (95% CI). Distribution of BHS in the schools from where subjects were selected is shown in Table 1. The frequency distribution of BHS
among categories of schools, age group and gender is also shown in Table 1.

These six BHS cases were found in two of the educational blocks in the district. Male to female ratio was 1:1; where 4 children were studying in private schools and 2 in Government schools of urban area. All the 6 cases were migrants from North Karnataka and not originally from Udupi District. All the cases were found to be among 7-10 years age group children. They had no previous family history of bacterial colonization or infections or its sequelae. All the children were normal in their health status without showing any of the symptoms.

Discussion

Morbidity is a most important public health concern among school children as it can affects their normal growth and development in all the aspect. As found by school health programs, the common complaints seen in this school children are malnutrition, Vitamin A deficiency, dental caries, upper respiratory tract infection and anemia (8).

The association between host and microbes is multifaceted. The normal throat flora appears to be a remarkably stable (9). The various host factors and microbial features can influence the process of infection. The human throat is a major biological site for various bacteria that can reach neighboring sites and cause mild to severe infections (10). The epidemiology of streptococcal infections in India is quite different from that of the developed countries, but some serotypes are more common than others within a population in different geographical locations (11). However, Streptococcal infections are one of the major problems in medical and health care settings (12).

In the present study we investigated very low prevalence of BHS in children of age between 7 - 10 years. Similar studies conducted in Karnataka showed speckled result of BHS concentration. The study conducted in Mandya reported 2.2% BHS, among which only 5 cases had Group C organisms (13); 11% BHS were isolated in Mangalore where both GAS and GGS were recovered from throat swabs whereas study conducted in other areas of Mangalore city found 5% of BHS those isolated as GAS (14). In Hubli, 13.41% BHS were isolated with 7 cases of group C BHS from asymptomatic school children (15). Further, study held at Bangalore city reported 60% of Group A BHS in one of the study (16). The low prevalence of BHS carriage in the present study may be due to the geographical location of the study which is free from air pollution and overcrowding. Throat flora is affected by many demographic factors such as climate, host age, extent of exposure to the infectious agent and vaccination (8). Studies that determine the BHS carriage rate among school children are important in public health practices to help in the prevention of streptococcal infections and their serious complications (17).

All the cases were migrants from North Karnataka where the prevalence of BHS is high and not from Udupi originally. One of the study near Gulbarga reported 11.3% of BHS prevalence in asymptomatic school children (18). The high prevalence of BHS in this village may be due to that the village is situated in a typical agricultural farmland represent spring climate condition, poor hygienic place and lack of basic treatment facilities. Another study conducted in Hubli isolated 13.41% of BHS (15).
According to most of the studies, 5 to 15 years age group children were affected more with streptococcal throat colonization (19) (20) (21). This might be due to high exposure of this age group children to the external environment and lack of awareness about the transmission of microbial diseases (20) (22). In our study we found equal distribution of streptococcal throat colonization between genders. Few studies showed similar results (20) whereas in some of the studies majority of them were males (14). Crowding and poor hygiene increases the chance of the transmission of Streptococci (20). It can be transmitted from person to person via aerosols after sneezing or coughing, and also via fomites. Crowded environments, which are often experienced in schools, refugee camps, and military units, are favorable to transmission (23).

All the BHS cases were identified as S. anginosus. BHS other than Group A, particularly group C and G are capable of producing significant acute pharyngitis (10). S. anginosus is part of the human bacteria flora, but in certain circumstances it can cause invasive diseases including brain and liver abscesses (24). However during the last decade an increasing number of reports have been published emphasizing the role of S. anginosus as important bacterial pathogens. One of the reasons why the true pathogenic potential of these species may have previously been missed is due to failure in identifying streptococcal isolates to species level in the routine diagnostic laboratory (25). All the BHS cases were collected during the winter season. Streptococcal throat infection are common during the winter and early spring in a temperate climate (26). Therefore, constant monitoring with intermittent health checkup may support to control these morbidities for better health of the future generation (27).

Isolates were identified by the automated VITEK 2 compact system. Although molecular techniques are considered to be the most sensitive and specific, VITEK 2 GP identification card was found to provide reliable results for the identification of Gram-positive cocci under routine laboratory conditions and no false-positive results were described with the VITEK 2 system for the identification of S. anginosus (28).

**Conclusion**

The present study showed six strains of beta hemolytic S. anginosus. Further study regarding M genes are required for knocking the virulence factors by developing suitable vaccines. Since RF/RHD are illnesses which were often encountered in school children among socially and economically disadvantaged populations stronger support for streptococcal surveillance programs should be encouraged in endemic areas (29).

At What Extent Does Cardiospermum Halicacabum Relieves Chronic Joint Pain among Elderly? An Experiment in Urban Community of Tamilnadu, India

Kandasamy M¹, Manju G², Manimegalai N³, Abhilash V⁴, Prathima P¹
¹Assistant Professor, College of Nursing, Gulf Medical University, Ajman, UAE; ²Staff Nurse, Government Primary Health Centre, Indur, Dharmapuri, Tamilnadu; ³HOD, Community Health Nursing Department, Swami Vivekananda College of Nursing, Dharmapuri, Tamilnadu; ⁴Lecturer, College of Nursing, Gulf Medical University, Ajman, UAE

Abstract

Background: One of the major health problems among elderly is osteoarthritis which leaves them suffering from chronic joint pain. Prescription of pharmacological measures such as analgesics to treat the joint pain causes many adverse effects and non-compliance. This study attempts to inquire the use of herb as a pain-relieving measure among elderly as it does not produce any side effects and easily available at affordable costs.

Objective: To evaluate the effectiveness of Cardiospermum halicacabum Leaves Soup on Chronic Knee pain among elderly population

Method: Pre-experimental study was conducted among 30 elderly persons residing at Dharmapuri, South India. Pre-test level of chronic knee pain among elderly was assessed through Numeric Pain Intensity Rating Scale. 100ml of freshly prepared Cardiospermum halicacabum leaves soup was given to the participants once in a day for 21 days and then post-test level of chronic knee pain was assessed.

Results: There was significant difference (p<0.05) found between mean pre-test (7.6 ± 0.83) and post-test (2.73 ± 1.04) pain score. The pretest level of pain has significant association (p<0.05) with the occupation, type of work and BMI.

Keywords: Cardiospermum halicacabum Leaves Soup, Elderly, Chronic knee pain.

Introduction

Ageing is a natural process. Old age can’t be healed, but it can be protected and extended. There is a remarkable increase in the growth of elderly population world-wide. According to World Population Prospects - 2017 Revision, the number of elderly persons aged 60 years or above is expected to be more than double by 2050 and more than triple by 2100, rising from 962 million globally in 2017 to 2.1 billion in 2050 and 3.1 billion in 2100. The international population aged 60 or above is growing faster than all younger age groups¹. Census of India, 2011 reported around 104 million elderly persons aged ≥60 years. The elderly population in India has significantly grown from 5.6% in 1961 to 8.6% in 2011².

As elderly population increases, the morbidity associated with aging also increase. Currently, the leading causes of death and illness among older adults and elderly are shifted from infectious and parasitic diseases to noncommunicable diseases and chronic conditions³. These chronic conditions include hypertension, high cholesterol, arthritis, diabetes, heart disease, cancer, dementia, and congestive heart failure⁴. Osteoarthritis is one of such common health problems among elderly which leaves them suffering from chronic joint pain. The prevalence of symptomatic knee osteoarthritis in the
United States is more than 10% among elderly aged 60 years or older\(^5\). A community based cross-sectional study conducted in an urban community of India reported the prevalence of 41% osteoarthritis among elderly\(^6\).

Though osteoarthritis among elderly does not directly leads to mortality, it has huge burden among them by causing chronic pain and affecting their mobility and Quality of Life\(^5-7\). Traditionally, health care providers depend heavily on the use of NSAIDs to treat the pain of osteoarthritis. The cardiovascular, gastrointestinal, renal and hepatic toxicities of NSAIDs have limited their use, particularly in the elderly. Many non-pharmacologic approaches are available but underused and which may be better pain management option to avoid adverse effects, non-compliance and poly-pharmacy in elderly\(^7\). Treatment with medicinal plants is considered very safe as there is no or minimal side effects. In India, Plants have been used for medicinal purposes long before prehistoric period. World Health Organization has estimated that 80% of the population worldwide rely on herbal medicines for some aspect of their health care needs and reported that around 21,000 plant species have the potential for being used as medicinal plants. Use of herbal treatments is independent of any age groups and the sexes\(^8\). Cardiospermum halicacabum (Figure – 1) commonly known as “Balloon Vine” is one of the medicinal herbs has been used as anti-inflammatory, antibiotic, antipyretic, antiparasitic and as analgesic. Studies were reported the extract of its leaves exhibits significant anti-arthritic effect\(^9-10\). The present study is an attempt to evaluate the effectiveness of Cardiospermum halicacabum Leaves Soup on Chronic Knee pain among elderly population residing at an urban community of South India.

**Method**

A pre-experimental study with one group pre-test post-test design was used to measure the effectiveness of Cardiospermum halicacabum Leaves Soup on Chronic Knee pain among elderly population residing at an urban community of Dharmapuri, Tamilnadu, South India. 30 elderly men and women aged 60 years or above, suffering from knee pain for past ≥1 year and having pain score more than 4 in Numeric Pain Intensity Rating Scale were selected to participate in this study through non-probability convenience sampling technique. The elderly persons who were already on some other treatment for chronic knee pain had been excluded. The study was conducted after obtaining the institutional ethical clearance and informed consent from the participants.

The demographic and clinical information were gathered by using structured interview technique and Body Mass Index was calculated through the formula “Weight/Height in m\(^2\)”. Chronic knee pain was assessed through Numeric Pain Intensity Rating Scale. The participants were requested to rate their pain perception in the scale ranging from 0 to 10 with higher scores indicating greater pain intensity. The levels of knee pain were interpreted as mild (pain score 1 – 3), moderate (pain score 4 – 6) and severe (pain score 7 – 10). Test–retest reliability of the Numeric Pain Intensity Rating Scale is high among literate and illiterate patients with rheumatoid arthritis (r = 0.96 and 0.95, respectively) and the construct validity has found to be highly correlated (r = 0.86 to 0.95) with the Visual Analog Scale in patients with rheumatic and other chronic pain (pain>6 months)\(^11-12\).

During the initial contact with the participants, the pre-test level of knee pain was measured, and the participants were explained about the intervention. After the pre-test, 100 ml of freshly prepared Cardiospermum halicacabum leaves soup was provided to each participant once in every morning for 21 consecutive days. Cardiospermum halicacabum leaves soup is clear liquid prepared by adding 1 pinch of asafoetia, 10 gm of chopped Balloon Vine Leaves, 1 pinch of salt and 1 teaspoon cumin seeds powder in 100 ml of drinking water. It was boiled for two minutes and the extracts were filtered. The post-test was done after completing the 21 days intervention.
Results

Among the participants, nearly half (47%) of them belonged to the age group of 60 – 64 years, 30% belonged to the age group of 65 – 69 years and remaining 23% of them were in the age of ≥70 years. 43% were males and 57% were females, majority (67%) of them were married and 30% were widow/widower. Half (50%) of them were pensioner and 20% of the participants were engaged in coolie works. The monthly income of 3/4th of the participants was less than Rs. 5000. 40% of them were known diabetics and 27% were known hypertensive patients. 47% and 30% of them involved in heavy and moderate types of works respectively. Nearly half (47%) of them had overweight (BMI above 25 to 29.9). 90% of the participants were suffering from chronic knee pain for past 1 to 5 years and remaining 10% of them were suffering since more than 5 years. 40% of the elderly had reported of having continuous knee pain, 37% reported intermittent knee pain and remaining 23% reported knee pain during the time of work only.

During pre-test, 90% of the participants were suffering from severe knee pain and 10% of them were suffering from moderate knee pain. Whereas, in post-test, none of them had severe knee pain, majority (77%) of them reported mild knee pain and only 23% were suffering from moderate knee pain (Figure-2).

Discussion

The present study revealed the high prevalence (47%) of overweight among the elderly population in urban community. The similar findings were reported in two different studies on the prevalence of overweight and obesity among elderly population of urban communities from Chennai (39% of overweight and obesity) and Puducherry (46% of overweight and obesity). In pre-test 90% of the elderly reported severe knee pain and it is associated (p<0.05) with their Body Mass Index. The finding is consistent with the study conducted by Ray, et al which reports, both BMI and abdominal obesity are associated with chronic knee pain in the elderly.

After administration of Cardiospermum halicacabum leaves soup, none of the participants had severe knee pain and majority (77%) reported mild knee pain only. Comparison of mean pain scores before and after the intervention revealed that the elders experienced the pain relief at greater extent in post-test. The mean pre-test score of knee pain was 7.6 ± 0.83 which has drastically brought down to 2.73 ± 1.04 after the intervention. The authors could not trace any published research work on human subjects regarding the effect of Cardiospermum halicacabum on arthritic pain. However, the studies related to pharmacognostic, physio-chemical and antiarthritic properties of the Cardiospermum halicacabum leaves brought out the significant anti-inflammatory properties of the leaves on arthritis. The herb is well recognized and widely used native medicine to treat arthritic pain in Tamilnadu. It is prepared and consumed by the people as varieties of recipes like “Dosa” and “Soup”. The participants of this study did not report any discomfort and adverse effects during and after the intervention. Further, they expressed
their satisfaction with the effect of Cardiospermum halicacabum leaves in reduction of their knee pain. The authors recommend further community-based research studies with large sample size in order to validate the effect of Cardiospermum halicacabum leaves on chronic knee pain among elderly.

Conclusion

The study has revealed the effect of Cardiospermum halicacabum leaves in reducing chronic knee pain among elderly. It has brought out the significance of herbal and alternative therapies. Public Health Nurses need to consider the valid and cost-effective alternative therapies in treating minor ailments.

Assessment of Dental Caries Prevalence among Adolescents Aged 12 To 15 Years in Faridabad, India

Ankur Sharma¹, Archita Srivastava², Meena Jain³, Vishal Jain⁴, Nisha Yadav⁵, Tulika Mishra⁶

¹Lecturer, Department of Public Health Dentistry, Manav Rachna Dental College and Hospital, Faridabad, Haryana, India; ²Private Practitioner Faridabad, Haryana, India; ³Reader & Head, Department of Public Health Dentistry, Manav Rachna Dental College and Hospital, Faridabad, Haryana, India; ⁴PG Student, Institute of Dental Studies and Technologies (IDST), Ghaziabad, Uttar Pradesh, India; ⁵Senior Lecturer, ⁶Intern, Department of Public Health Dentistry, Manav Rachna Dental College and Hospital, Faridabad, Haryana, India

ABSTRACT

Background: Caries incidence rates among population vary according to geographical location and socioeconomic status of individuals. This study aims at assessing the dental caries prevalence among 12 to 15 years old school children in Faridabad, Haryana.

Material & Method: The data for the present cross-sectional study was collected from the school oral health programs conducted by the department of Public Health Dentistry from May 2017 to December 2018 in Faridabad Block. Comparison of caries among rural and urban dwellers, private and government schools, and males and females was done through mean DMFT scores.

Results: A total of 1921 students were examined. Mean DMFT for the study population was 0.86 ± 1.617. The prevalence of dental caries was 45.13%. SiC index for the study population was 2.22.

Conclusion: The difference in dental caries prevalence between urban and rural population indicates towards a need of strategy building towards managing the disease burden and prevalence in both the populations differently.

Keywords: caries experience, disease burden, adolescents, prevalence

Introduction

South Asia and especially India stands out as a region with high burden of dental disease and minimal change in per-capita oral health care needs.⁴, ² As a major contributor to this disease burden, measuring dental caries in communities is an important endeavor in providing baseline data for future policy and public health interventions. Dental caries is a global experience. It affects human beings of all ages universally and is a major dental health problem among adolescents.

Studies have shown that geographical factors are related to distribution and prevalence of dental caries.⁵ Additionally, lifestyle and cultural factors also influence the prevalence of oral disease.⁴, ⁵ Therefore, measuring dental caries prevalence locally is important to design locally effective programs for reduction of caries.

The age group of 12 to 15 years is the time when all the permanent teeth have erupted in an individual’s mouth.⁶ This is also the time when an individual begins exerting independence in one’s dietary behaviors. The adolescent is also able to adopt and implement oral health behaviours taught to them in an effective manner. Therefore, age group of 12 to 15 years is an important group for assessment and implementation of preventive intervention for dental caries. Subsequently, knowing the dental caries prevalence in this population becomes essential.

A systematic review of literature of dental caries prevalence among Indian children since past 25 years has
shown a prevalence rate of 50.84% to 62.41%.

Studies in various parts of India showed that caries incidence rates among 12 to 15 year population vary according to geographical location and socioeconomic status of individuals. Therefore, it is necessary to understand dental caries prevalence in this population. Hence, the present study aims at determining the dental caries prevalence among 12 to 15 years old school children in government and private schools in Faridabad, Haryana.

Methodology

The data for the present cross-sectional study was collected from the school oral health programs conducted by the department of Public Health Dentistry from May 2017 to December 2018. The study protocol was approved from the institutional ethics committee of Manav Rachna Dental College, Faridabad. Both private and government schools in Faridabad block of Faridabad district of Haryana state, India were included in the study. Convenience sampling was done. All students of the designated schools aged 12 to 15 years and present on the day of examination were screened for dental caries experience by a trained team of dentists and interns.

Prior permission was taken from the schools in Faridabad for conduct of oral health screening programs and recording of data. Written informed consent was taken from the parents regarding screening of their wards for oral diseases. Verbal consent was also taken from the participant. Decayed, missing and filled teeth were recorded for each student separately. The adolescents who required dental treatment were referred to the dental college for meeting their dental needs. Response rate was 100% because toothpaste and a toothbrush were distributed as participation incentives. Oral health education was also provided to all the adolescents after oral examination. While four dentists remained constant throughout the program, 4 dental interns were trained and standardized on a quarterly basis according to their postings in the department.

Training was conducted at two levels. The first training was conducted at the academic level, where, after a theoretical brief of the techniques, the examiners were demonstrated the methodology of examination and data acquisition. Thereafter, the examiners were trained, standardized and calibrated (kappa ≥ 0.8) by one of the authors for clinical oral examination. Periodic supervisory checks were done during the survey to ensure consistency.

The examination was carried out using standardized techniques for infection control. On the day of examination, the students were screened under natural light using mouth mirror and CPI probe. The student was made to sit upright on a chair. Decayed, missing and filled teeth were considered and recorded separately. A tooth was considered decayed if it had dental caries or was a candidate for dental treatment due to improper, fractured or loose restorations. Temporary restorations were also considered as decay. A tooth was considered filled if it had permanent restorations or crowns due to treatment of dental caries, while it was considered missing if it was extracted or lost because of dental caries. The decayed teeth were represented by D, missing by M and filled by F. A total DMFT score for each student was calculated by adding D, M and F scores. Apart from the DMFT scores, demographic data was taken from the students. This included the age, gender and class of the student. The location of school was classified as urban or rural. The schools were also divided as government and private schools.

The data was entered into Microsoft excel software. Statistical analysis was done through SPSS software (IBM Corporation, Chicago, USA) version 22. Descriptive data and frequency distribution according to demographic variables was obtained. Comparison of caries among rural and urban dwellers, private and government schools, and males and females was done through mean DMFT scores.

Results

Data from 3 private schools and 6 government schools was assessed from the period of May 2017 to December 2018. A total of 1921 students were examined for the age group of 12 to 15 years. These students belonged to classes from 7th grade to 11th grade. Out of the 1921 students examined, 720 students belonged to private schools, while 1201 students belonged to government schools. There were more male students (n = 1058) as compared to female students. Also, number of urban students (n = 1232) was greater than number of rural students. Age-wise frequency distribution and demographic distribution of the study sample is shown in Table 1.

The DMFT score-wise number of teeth involved is presented in Table 2. Mean DMFT for the study population was $0.86 \pm 1.617$. The prevalence of dental caries was 45.13%. SiC index for the study population was 2.22.

The mean DMFT for urban school children aged 12 to 15 years was $1.36 \pm 2.087$. The prevalence of dental caries was 53.05%. SiC index was 3.51. For the urban school children, the prevalence of dental caries was 40.38%. The mean DMFT score was $0.55 \pm 1.506$, while the SiC index was 1.45.

Discussion

Dental caries has remained the most prevalent dental disease globally. The age standardized prevalence of dental caries has been found to be 34.1% in 2015. Approximately 2.5 billion people in the world suffer from dental caries. With an increase in global population, the burden of dental caries has also increased with an increase in number of dental caries cases worldwide. The age standardized prevalence of untreated dental caries in south Asia was found to be 40.5% in 2010. This prevalence is above the global average.

The mean prevalence of dental caries among 12 and 15 year individuals has been found to be 49% and 60% respectively. In the present study, we found the prevalence to be 45.13% which is lower than the mean national prevalence obtained through a meta-analysis by Janakiram et al in 2018. However, it is still higher than the global prevalence rate of untreated dental caries. The same meta-analysis, mean dental caries prevalence in northern Indian population was found to be 61% and 76% respectively for 12 and 15 year old population. One of the reasons for lower prevalence of dental caries prevalence could be high level of fluoride in water in these areas that may be responsible for lower occurrence of dental caries. Additionally, being in vicinity of the national capital, and being a part of the national capital of India, Faridabad district has a good availability of dental health education and care facilities. This may have an impact on dental caries prevalence through oral hygiene maintenance. Similar to the above observations, the SiC index of the present study population (SiC = 2.22) was lower than the index for the Indian population in meta-analysis by Janakiram et al, where the SiC index was 3.12 and 5.14 for 12 and 15 year population. However, a study by Kundu et al (2015) on prevalence of dental caries shows a SiC index of 2.90 and 4.10 in 12 and 15 year age respectively. This is closer to the index score obtained in the present study.

The mean DMFT score reported of the present study population was $0.86 \pm 1.617$. This was comparable to a recent study by Shah et al (2017) in the neighboring Ballabgarh block, where DMFT scores for 12 to 15 year age group was found to be $0.67 \pm 1.12$. However, the prevalence rate of dental caries in that study was recorded to be 31.3%, which was lower than the rate of present study. However, the study by Shah et al was conducted in rural areas. In the present study, if the rural schools are considered independently, the prevalence rate of dental caries is found to be 40.38%, while the mean DMFT index is found to be $0.55 \pm 1.506$ which is comparable to the index score in the study by Shah et al.
The results from the present study showed that there was a difference in prevalence rates, DMFT scores and SiC index scores of urban and rural population. The urban population had a higher rate of dental caries as well as DMFT score. This was in accordance with other studies conducted in urban and rural areas of Bhopal and Telangana where mean DMFT scores of urban population were found to be higher than DMFT scores for rural areas. This might indicate the impact of refined and high-carbohydrate diet in dental caries, as urban dwellers are more likely to take high sugar and high carbohydrate diet.

The study had some limitations. Only the schools that agreed to participate in screening activities were included in this study. However, due to high number of patients and schools screened by the institution each year, the total number of schools included in this study is a significant number among the schools of Faridabad block. This study was able to determine the prevalence of dental caries among 12 to 15 year old individuals in urban and rural Faridabad. As the newly erupted permanent dentition, teeth in this age group need care to prevent loss of tooth, pain and other functional disability in younger years of life. The difference in dental caries prevalence among rural and urban population could also be determined in this study.

**Conclusion**

Despite of high impetus on maintenance of dental health and prevention of dental disease, dental caries remains a significant oral health problem. High prevalence rates of dental caries indicate towards the need to devise newer and more effective strategies for preventing dental caries among communities. At the same time, there needs to be a thrust towards research on finding the factors responsible for occurrence of dental caries in the population of present study. The difference in dental caries prevalence between urban and rural population indicates towards a need of strategy building towards managing the disease burden and prevalence in both the populations differently.

Comparative Study on Levels of Troponin (cTn), Creatine Kinase-Muscle/Brain (CK-MB), and B-type Natriuretic Peptide (BNP) in Patients with Acute Myocardial Infraction and Congestive Cardiac Failure

A. Manikandan¹; Meghana V², Santhi Silambanan³

¹MBBS Student, ²Associate Professor, ³Professor and Head, Department of Biochemistry, Sri Ramachandra Institute of Higher Education and Research, Chennai, India

ABSTRACT

Background: To diagnose a patient with acute myocardial infarction (AMI) and congestive cardiac failure (CHF), a physician measures patient’s serum level of cardiac biomarkers such as, troponin (cTn), creatine kinase-muscle/brain (CK-MB), and B-type natriuretic peptide (BNP) in count, to a number of diverse other tests including an electrocardiogram (ECG). In this study, we compare the serum level of cTnT, CK-MB and BNP in patients with AMI and CHF. We analyzed the results to assess if Troponin T can be used independently to differentiate AMI from CCF.

Materials and Method: In a retrospective cross-sectional study at Sri Ramachandra Medical Center, the serum level of cTnT, CK-MB and BNP were evaluated in patients who have had an acute myocardial infarction or congestive cardiac failure. The study group consisted of 100 male and female subjects in two groups, 50 subjects diagnosed with acute myocardial infarction and 50 patients diagnosed with congestive cardiac failure. Mean and Standard deviation for the two groups was taken and their p-value was calculated using the Mann Whitney U Test.

Results: Troponin T (cTnT) level was elevated in both Acute MI and CCF; however, the elevation was more in AMI patients (p=0.022) compared to CHF, but not very significant. Other two biomarkers, CK-MB and BNP, did not show any significant difference between the two groups.

Conclusion: Higher levels of CTnT may be seen in AMI as compared to CHF and is indicative of progressive cardiovascular disease.

Keywords: Troponin (cTn), CK-MB, B-type natriuretic peptide (BNP), Myocardial infarction, Congestive cardiac failure

Introduction

Acute myocardial infarction (AMI) is the medical term for heart attack, a life-threatening state occurring due to abrupt blood flow to the heart muscle leading to tissue damage ¹. The primary cause of blockage in the blood flow is coronary artery disease; it is a global health burden and the primary cause of morbidity and mortality ². Another cardiac disorder that affects the pumping power of the heart muscles is congestive heart failure (CHF), often referred to simply as heart failure ³.

Various diagnostic procedures have been utilized to diagnose the above-mentioned disorders. To diagnose a patient with a heart attack or failure of the heart muscle, a physician requires to measure the heartbeat, blood pressure and also run a number of different other tests¹⁴. An electrocardiogram (ECG) is done to compute heart’s electrical activity and blood tests primarily check for protein levels that are linked to heart damage such
as, troponin (cTn), creatine kinase-muscle/brain (CK-MB) and B-type natriuretic peptide (BNP). Estimation of biomarkers such as cTn, CK-MB, and BNP have an advantage over ECG since they can be estimated in the peripheral circulation even before the findings appear in ECG 5, 6, 7. Numerous other biomarkers have been used such as myoglobin, AST, LDH etc., and most of them are neither sensitive nor specific. Thus the situation requires adequate sensitivity and specificity 8, 9, 10.

This study was designed to evaluate levels of cTnT in patients with AMI and CHF, and it was then compared with CK-MB and BNP. We analyzed the results to assess if Troponin T can be used independently to differentiate AMI from CCF.

**Materials and Method**

**Ethical Approval:** This retrospective cross-sectional study was conducted at Sri Ramachandra Medical Center to evaluate the levels of CK-MB, cTnT and BNP in south Indian patients who have had an acute myocardial infarction or congestive cardiac failure. The study was accepted and designed by the Institutional Ethics Board (IEC), Sri Ramachandra Medical College and Research Institute. The study group consisted of 100 male and female subjects in two groups, 50 subjects diagnosed with acute myocardial infarction and 50 patients diagnosed with congestive cardiac failure.

**Inclusion Criteria:** Patients with a known case of acute myocardial infarction and congestive cardiac failure were included in this study. Patients with elevated levels of cardiac troponins, with either symptoms or ECG changes indicative of myocardial infarction/ischemia, were diagnosed for AMI. Patients with abnormal heart rhythms with echocardiogram changes indicative of congestive heart failure were diagnosed for CHF.

**Exclusion Criteria:** Exclusion criteria: People with chronic renal failure and malignancies were excluded.

**Laboratory Investigation**

**Measurement of Serum Cardiac Troponin I:** cTnI (ng/mL) was measured using the particle enhanced fluorescence immunoassay technique (i-CHROMA™ analyzer) 11. The test contains a cartridge of a two-site enzyme-linked immunosorbent assay (ELISA) for antibodies specific cTnI on an electrochemical sensor fabricated on a silicon chip. The plasma sample is run through the chip and brought into contact with the sensors which allow the enzyme conjugate to dissolve into the sample. The cTnI within the sample labeled with alkaline phosphatase is captured during an incubation period. The enzyme bound to the cleaves the substrate releasing an electrochemically detectable product is measured which is proportional to the concentration of cTnI within the sample.

**Estimation of Creatine kinase-MB isoenzyme (CK-MB):** CK-MB was estimated in the patient serum using the enzymatic immuno-inhibition test in Beckman Coulter AU analyzer for the quantitative determination of creatine kinase-MB isoenzyme (CK-MB). This is a modification of the IFCC method which contains an antibody binds to the M subunit of CK in the serum sample thereby inhibiting the activity of the M subunit and B subunit remains free to act on the substrate present in the reagent. During the process, the generated ATP is used to for simultaneous reduction of NADP to give NADPH. The rate of increase of absorbance at 340/660 nm due to the formation of NADPH is directly proportional to the activity of CK-MB in the sample. Beckman Coulter analyzers automatically compute the CK-MB activity of each sample.

**Estimation of B-type natriuretic peptide (BNP) BNP:** Patient plasma was collected for the measurement of BNP using the Triage BNP test in Beckman Coulter Immunoassay Systems (UniCel Dxi 800) for the in vitro. The test includes crescent immunoassay device which separates plasma from whole blood during run and plasma exposed to antibodies conjugated with fluorescence and flow through which bare captured on discreet zone to the analyte. The test device is used to perfume BNP analysis using Beckman Coulter Immunoassay Systems 12.

**Statistical Calculation:** Mean and Standard deviations for the two groups were taken and their p-value was calculated using the Mann Whitney U Test since the data did not follow normality and was randomly distributed, in which case the t-test assumptions do not work, creating the necessity for using Mann Whitney U test.

**Results**

Fifty blood samples each from AMI and CCF patients were collected and statistical analysis-mean and standard deviation along with their p-value of the three biomarkers were derived which are shown in Table 1.
Troponin T (cTnT) level was elevated in both Acute MI and CCF; however, the elevation was seen more in AMI patients (p=0.022) compared to CHF, but not very significant. The other two biomarkers CK-MB and BNP did not show any significant difference between the two groups, although the mean value was high in the CHF group.

Discussion

cTnI is a clinical significance biochemical cardiac marker used for the diagnosis of myocardial infarction. To be optimal diagnostic usefulness, a cardiac marker has to be specific for disease target, rapidly released and should persist for a sufficient time to provide a convenient diagnostic time window. There are many other clinical conditions in which an elevated troponin level without ischemic coronary artery disease is seen. In such conditions, the results might be confusing and a clinician does require an additional set of markers to differentiate the condition. Although, troponin is considered to be a marker of choice in aid of diagnosis of acute myocardial infarction (AMI). B-type natriuretic peptide (BNP) level is also prominent in AMI and is a quantitative biochemical marker related to the extent of the infraction, as seen in other study results 12, 13. In the CK-MB group, the mean difference is small and may have occurred by chance variation. In the BNP group, though the mean difference is significant, the standard deviation for the same is high. Thus, the p-value is not significant. A high value of CK-MB with the elevation of Troponin T is almost always associated with AMI. There also might be a slight increase in BNP levels in AMI. In patients with high values of BNP, elevation of Troponin T is seen in cases of congestive cardiac failure 14, 15. Sometimes, CK-MB is also elevated, which may not indicate CCF, but cardiac myopathies.

In this study, the analysis is done using the Mann Whitney U Test which is the non-parametric alternative test for independent sample t-test. Mann Whitney U is used to compare the mean of two tests, whether they are equal or not from a similar population. Unlike the other t-test, it does not require any assumption for normal distributions and at the same time, it is nearly as competent as the t-test on normal distributions. According to the Mann Whitney U test, if the p-value is less than 0.05, there is statistical significance to the value between the two groups. As Troponin T p value= 0.022, it implies that it can be used independently for the diagnosis of AMI since the mean for the AMI group is higher. This implies that the value of Troponin T has a statistically significant difference in MI and CCF.

Conclusion

The study demonstrates that Troponin T can be used as a more potent cardiac biomarker compared to BNP, to help in the diagnosis of most of the cardiac diseases including, acute myocardial infarction and congestive cardiac failure. It may also prove useful in assessing prognosis and designing therapy in such conditions. A confirmed diagnosis of AMI or CCF cannot be drawn from a single biomarker, but only from a combination of the three, along with clinical correlation. A major limitation of this study is that measurement of the markers was not evaluated during hospitalization and changes of the levels were not seen after interventional treatment. In addition, we did not have the coronary angiography for all the patients to confirm the diagnosis.

A Study on the Effect of Eight Weeks Exercise Training Protocol to Prevent Ankle and Knee Injuries among Basketball Players

Naseer Ahmad Bhat¹, K. Sreedhar²

¹Ph.D Research Scholar, Department of Physical Education, ²Associate Professor & Head, Division of Sports Training and Sports Nutrition, MYAS-AU Department of Sports science, Centre of Excellence, Annamalai University, Tamil Nadu, India

ABSTRACT

Background: The prevalent ratio of injuries in basketball influences the lower appendages, particularly, ankle and knee joint, and this is the real reason for missed long periods of training amid a season. Additionally, ankle and knee injuries can increase the risk factor of intermittent injuries. An exercise protocol is conceivably a critical preventative measure as it seemed to diminish the occurrence of ankle and knee injuries.

Objectives: To examine the impact of a structured theraband exercise protocol intended to reduce the rate of ankle and knee injuries in young basketball players.

Materials and Method: 48 male players aged 19-25 years; contributed in the study, 24 in experiment group; 24 players in the control group. The program is a modification of other prevention exercise protocol previously proven to be effective. All exercises in the present protocol are attuned so that a more progressive development in the exercise is accessible.

Intervention: A structured training protocol (thera-band exercise programme) to improve neuromuscular power, strength, and control and to reduce ankle and knee injuries.

Main Outcome Measure: The rate of injuries to the ankle or knee.

Results: During the season, 6 ankle and knee injuries occurred, 5 injuries in the control group; (2 injuries in training and 3 during matches) and 1 injury in the experiment group (0 injuries in training and 1 injury in matches). Rarer injured players were in the experiment group than in the control group.

Conclusion: Structured exercise training protocol of theraband exercises focusing on awareness and can successfully prevent ankle and injuries in young basketball players. Preventive training ought to hence be presented as a vital part of youth sports programmes.

Keywords: basketball, ankle, knee, exercise, prevention.

Introduction

To accomplish capability and elite execution, competitors are embraced extreme training at more youthful ages, taking an interest in complex games in a single season, and keeping training all through the whole year. Sporting activities, for example, basketball, handball, soccer, and volleyball are high-chance activities particularly for parallel ligament injuries of the lower leg joint complex. A large portion of the injuries which happen in basketball in the lower appendage. Both abuse (e.g. shin braces, stress fractures, patellar tendinopathy (PT), patellar femoral agony disorder (PFPS) and acute injuries (e.g. ACL injury and lower leg sprains. These injuries frequently result in a substantial time off for the injured players, regularly one week or more or five to six sessions. Reports from Scandinavia that sports injuries establish 10-19% of every single acute injury found in emergency organizations and the most well-known categories are ankle and knee injuries. Genuine knee injuries, for example, injuries to the ACL, are a developing reason for concern. The most elevated occurrence is found in young players playing rotating sports, for example, basketball, handball, and football. This implies injury event can put a stop to the competitor’s cooperation in his game for quite a while. This would already be able to happen at an early age and result in long-lasting imperative in-game support.
With the end goal to reduce short and long haul results, there is a requirement for sports injury prevention. A few creators exhort completing a preventive program to minimize the risk of ankle injury.\textsuperscript{20,21} The aim of this examination was to investigate the effectiveness of 8-week lower limb appendage effective exercise training protocol to prevent ankle and knee injuries in youthful basketball players.

**Methodology**

In our study, we recruited 24 subjects for each group (study and control) so that the sample was adequately powered and the participant number was increased to avoid too small a sample, in case any of the subjects abandoned the study. The total of 48 basketball male players, with their age ranging from 19 to 25 is selected from Department of physical education, Annamalai University, Tamil Nadu India.

The criteria to take an interest in this examination were to have been free from any lower appendage injury for no less than a half year, no history of lower appendage medical procedure, to be free of vestibular issue, to be correct footed, to join the pre-and post-test sessions and to have the capacity to incorporate and do the training protocol in their day by day schedule. The primary day, and before the beginning of the main test, the members’ anthropometric estimations were recorded to affirm that they satisfied all the vital conditions to be incorporated. Participants were put into either the control group or the experimental group is appeared in table 1.

**Training Protocol:** The control group contained 24 players who sustained their normal training routines. The experimental group contained also 24 players who executed a multi-station thera-band exercise protocol (box 1) that was designed in cooperation of Physiotherapist and coach of the Annamalai University. The first author, physiotherapist and the coach instructed the subjects in detail on performing the core assessment tests and supervised their 8-week exercise protocol to ensure the exercises were performed correctly.

| Table 1: Number of players participating in this study |
|----------------------------------|----------|
| **Experiment Group**  | **Control Group** |
| Total n = 24  | n = 24 |
| Dropouts n = 1  | n = 3 |
| Analyzed n = 23  | n = 21 |

It was performed 4 days in a week and comprised of six stations that were performed twice (shoeless) toward the start of the ordinary training routine (box 1).

**Box 1: Exercise training protocol to prevent knee and ankle Injuries**

**Warm-up exercises:** (30 seconds and three repetitions each)
1. Jogging end to end
2. Forward running with knee lifts and heel kicks
3. Sideways running with crossovers
4. Sideways running with arms lifted
5. Forward running with trunk rotations
6. Forward running with intermittent stops
7. Speed run

**Thera-Band exercises (Strength and Power)**
1. Hip Flexion, Extension, Adduction and Abduction (Standing)
2. Knee Flexion and Extension (Sitting)
3. Knee Flexion and Extension (Prone)
4. Lunge
5. Squat
6. Ankle Dorsi-flexion and Plantar-flexion
7. Ankle Inversion and Eversion

The exercise time and the intensity and trouble of the activities were expanded amid the season twice by minor changes for each station each week.

**Outcome Measures:** We characterized the essential result as an injury to the ankle and knee. An auxiliary result was characterized as an injury to the lower appendages. We additionally included auxiliary investigations of injuries in general (counting all injuries) and injuries to the upper appendage.

The number of injured players depended on information from individual players and the rate of injuries on outline information of injuries and exposures for the entire group. The examination researcher and a mentor who recorded injuries in groups, utilizing definitions and institutionalized injury questionnaire depicted in our before the study.\textsuperscript{22} The exploration researchers
and a physiotherapist were in contact with the mentors somewhere around consistently to record injured players and performance information. The mentors of the group receiving the test recorded consistence on an assigned frame as the quantity of injury prevention sessions, the period of every session in minutes, and the normal participation of the players (in percent).

**Statistical Methods:** We used the inverse of the difference between percentages of injured players in the two groups to calculate the number needed to treat to save one injury. We calculated exposures to training and matches and incidence of injury as described in our earlier study. We used ANOVA test to compare the two groups and activities (match, training). Relative risk is presented with 95% confidence intervals. We regarded two tailed P values ≤ 0.05 as significant.

**Results and Discussion**

Table 1 demonstrates the stream of players taking an interest in this examination. Players in the two groups were comparable in the distribution of age, height, mass and time of injured players (table 2). Each of the 24 (50%) in the control group used general exercises planned to prevent injuries. Additionally, 24 (50%) in the experimental group used explicit exercise and a training protocol (Thera-Band practices for ankle and knee) used to prevent injuries during the examination time frame. During the 8-week season, 13(27.1%) of the 48 players who got injured in this report and a total of 13 injuries. Among 13 players 4 players from the experimental group and 9 players from the control group. Of these, 8 (17%) were acute injuries and 5 (10%) were overuse injuries.

- Knee pain 0(0.00%) 1(4.76%)
- Low back pain 1(4.35%) 1(4.76%)
- Ankle pain 0(0.00%) 1(4.76%)

Table 3 shows the ratio of body category, acute, and abuse injuries of both experiment and control group. In experimental group it was found that 1(4.35%) of players got injuries in knee, finger/wrist, low back and shoulder/elbow and in control group 2(9.5%) got injuries in ankle and finger/wrist, 3 (14.28%) got knee injuries and 1(4.76%) players got injuries in low back and shoulder/elbow. Table 3 also displays the site of the most common body part injured and the type of acute and abuse injuries and the age of the injured players.

In experimental group, acute and abuse injuries was found 2(8.69%) sprain, 1(4.35%) contusion and low back pain respectively, and in control group 2(9.5%) sprain, 3(14.28%) contusion and 1(4.76%) low back pain, knee pain, low back pain, and ankle pain respectively.

</tr>
<tr>
<td>Training</td>
<td>0</td>
<td>2</td>
</tr>
</tbody>
</table>

In Table 5 shows the mean difference of experiment and control group with regard to match and training. It is discovered that there were 4 injuries in experiment group (3 injuries in the match and 1 injury in training) and 9 injuries in control group (7 injuries in match and 2 injuries in training). More ever there was 6 knee or ankle injuries happened, 5 injuries in the control group; (2 injuries in training and 3 injuries in the matches) and 1 injury in the experiment group (0 injuries in training and 1 injury in matches).

Effect of Prevention: There is not entirely difference were in the experimental group than in the control group for injuries by, and large, bring down appendage injuries, acute ankle, and knee injuries, and abuse knee and upper appendage injuries (table 4). The general difference in the frequency of match and training injuries was additionally not significant (table 5). The experimental group used exercise protocol to prevent injuries had a lower rate of injuries than the control group doing no preventive action.

The percentage of injuries in young basketball players using a structured exercise training protocol (thera-band exercises protocol) improved clinically and statistically, especially to decrease the rate of severe injuries to the ankle and knee. The reduction in the relative risk is not significant in this study. As far as we are aware, our study is the first amongst basketball younger players with a select sample size to show that ankle and knee injuries can be reduced and severe injuries have drawn further.

Conclusion

The present investigation shows that a preventive exercise training protocol performed 4 days in a week proposed significantly to improve awareness and reduced the frequency of ankle and knee injuries in selected basketball players. Although the selected were basketball players, it may be protected to assume that the program is also applicable to other sports or high-risk activities as team handball, volleyball, or soccer.

Assessment of Dental Implant Displacement into Mandibular Medullary Bone Space using Cone Beam Computed Tomography (CBCT)–A Case Report and Literature Review

Nayana Prabhu¹, Srikanth G², Saurabh Roy³, Vineetha R⁴, Mehul Saha⁵

¹Associate Professor, Department of Prosthodontics and Crown & Bridge, Coordinator- Postgraduate Certificate Course in Advanced Oral Implantology, ²Professor and Head, Department of Oral and Maxillofacial Surgery, ³Post Graduate Student, ⁴Professor and Head, Department of Oral Medicine and Radiology, ⁵Post Graduate Student, Department of Oral and Maxillofacial Surgery, Manipal College of Dental Sciences, Manipal, Manipal Academy of Higher Education, Manipal, India

ABSTRACT

Intraoral periapical radiography and panoramic radiography used to be indispensable tools for hard tissue analysis in dental implant planning. However, their inherent 2D limitations have ushered in an era of Cone Beam Computed Tomography (CBCT) for a volumetric holistic analysis. This case report depicts accidental displacement of implant into a mandibular medullary bone space with deficient bone density in an otherwise healthy individual and its subsequent surgical retrieval and prognosis. We wish to highlight the importance of CBCT as a mandatory pre-surgical tool for implant planning in all cases to prevent intraoperative adverse events, irrespective of their medical status.

Keywords: Implant displacement, medullary space, Cone Beam Computed Tomography

Introduction

With the advent of 3-dimensional imaging using Cone Beam Computed Tomography (CBCT), dental implant surgeries have become predictable, safer and have gained immense popularity as a definitive means of prosthetic rehabilitation. This tool helps us in accurate assessment of bone quality and quantity, helps rule out any bone pathology and in estimation of clearance to critical structures such as inferior alveolar nerve, maxillary sinus and nasal floor and buccal and lingual cortical plates. Further, this leads to a successful implant surgery by avoiding potential intra and postoperative complications such as haemorrhage, nerve damage, mandibular fractures, lack of implant stability, implant migration and implant displacement. Through this note, we intend to state the importance of CBCT as a necessary diagnostic pre-surgical tool for implant surgeries, even in systemically healthy individuals.

Case Report: A 27-year-old otherwise healthy male was posted for rehabilitative implant placement corresponding to edentulous left lower posterior teeth 36 and 37. Pre-operative panoramic radiograph taken for the assessment of proposed implant sites revealed an unaltered trabecular pattern and an adequate clearance from the crest of the residual alveolar ridge to the superior aspect of the inferior alveolar nerve canal. After achieving adequate anaesthesia, a crestal incision was made at the edentulous residual alveolar ridge and a muco-periosteal flap was raised. Drilling was done and the implants were placed at the intended sites. The drilling sequence was initiated for insertion of implants at two sites. Torqueing procedure of the implant at 37 region was uneventful. However, while attempting the same procedure on the implant in 36 region, it unexpectedly got dislodged from the intended placement site deeper into the marrow space and could not be located at the

surgical area despite copious irrigation and suctioning. A panoramic radiograph was immediately taken to ascertain the location of the displaced implant. It revealed inferior displacement of the implant within the body of the mandible. The implant was vertically aligned, with its crest closely approximating the root apex of 35 and the apex in close approximation to the inferior alveolar nerve canal. Cone beam computed tomography (CBCT) was taken to clearly visualise the implant in the three orthogonal planes. It revealed the inferior displacement of implant within the medullary bone closely involving lingual cortical plate but not causing any thinning or perforation(Fig1). Additionally, significant trabecular porosity at the region of interest with a mean bone density of 168 Hounsfield Units (D4) was noted. Inferior alveolar nerve tracing revealed close involvement of the implant fixture to the buccally positioned canal as well as to the mental foramen. The situation was explained to the patient and informed consent was obtained. As we had already established large trabecular porosity within the mandibular corpus, and the fixture being movable and loose; therefore, the implant could not be removed by reverse torque. Therefore, the surgical removal of the implant was planned using the lateral decortication procedure. A bone window was created on the buccal cortex to obtain visual access to the implant fixture and retrieved taking care to avoid injury to the inferior alveolar nerve(Fig 2). In the immediate post-operative period, patient complained of numbness at left lower lip. Post-op recovery was uneventful. By 8 weeks, complete recovery was reported with him having regained sensation at lower lip.

Discussion

Displacement of implants during surgical procedures within the mandibular medullary spaces is not an unusual situation.\(^2,3\) This case, however, brings forth a scenario where an otherwise healthy individual had physiologically reduced bone density which led to an adverse iatrogenic event. Dental implant surgeries are gaining immense popularity for prosthodontic rehabilitation and its success depends on meticulous planning with the aid of a diagnostic technique capable of obtaining highly accurate alveolar and implant site measurements to assist with treatment and avoid damage to adjacent vital structures during surgery. Intra oral periapical radiographs and panoramic radiographs are the commonly used screening radiographs for implant planning. CBCT by means of its volumetric analysis provides a more precise estimate of hard tissue parameters compared to 2D images while emitting lower doses compared to other volumetric imaging modalities like Computed Tomography. Improved technological advancements in software applications like virtual implant planning further augment our precision and render the surgical procedure risk-free. In a developing country like India, financial considerations play an important role in limiting its usage as a mandatory presurgical tool for implant surgery. However, we must understand that the knowledge we gain well in advance to the procedure helps us in a better case selection, either by finding a means to address the imminent complications or by recommending alternative treatment regimens for rehabilitation. Table 1 depicts an overview of reported cases of mandibular medullary implant displacement in which CBCT was used after the event. The American Academy of Oral and Maxillofacial Radiology (AAOMR) in its position paper\(^4\) has recommended that CBCT be considered as the imaging modality of choice for preoperative cross-sectional imaging of potential implant sites. Jaju et al\(^5\) has emphasized that to further supplement our precision and minimize risks, implantologists should have three-dimensional (3D) information of bone volume and topography prior to implant placement. Loubele et al\(^6\) reported that both CBCT and CT yield submillimetre accuracy for linear measurements on an ex vivo specimen for implant measurements while CBCT outscores CT by being more affordable while ensuring lesser tissue irradiation. It becomes imperative that clinicians should consider using CBCT, an emerging gold standard\(^7,8\) in implant imaging in addition to 2D radiographs, if they believe that the additional anatomic information is necessary to correctly diagnose, plan and implement treatment in the safest manner possible, and inform the patient about its merits prior to surgery.

Conclusion

We advocate routine use of CBCT as an imaging modality for Pre-surgical implant planning to provide accurate assessment of bone quality and quantity and potential risk assessment, thus enabling us to avoid inadvertent complications during and after the implant placement as in the present case.

Screening of Leukemia from Microscopic Images of Blood Smear

Poojary Vishlesh V.1, Niranjana Sampathila2
1PG Scholar, 2Associate Professor (Sr. Scale), Department of Biomedical Engineering, Manipal Institute of Technology, MAHE, Manipal, India

ABSTRACT

Leukemia, also called blood cancer is very common in medical practices. Acute lymphoid leukemia (ALL) and acute myeloid leukemia (AML) are the types of blood cancer that affect the bone, bone marrow, lymphatic system and are major contributors to cancer deaths. ALL is the most common type of leukemia and it is more predominant in children and young adults. As the number of leukemia cases increases, it leads to a delay in early diagnosis and treatment of the disease.

The present method for diagnosis includes a manual examination of blood smear by pathologists. Changes in the white blood cells can be an indicator of the nature and severity of the disease. For further classification of the type of leukemia, bone marrow biopsy is done. These manual processes are costly, complex, time-consuming and mostly depends on the operator’s ability. Hence, a need for automation arises which will be able to enhance and accelerate the diagnosis process. This paper provides a survey of different types of methodology which can be used to detect leukemia using image processing. These methods differ on the different types of image segmentation and feature extraction process employed by them. The methods are then compared by checking their efficiency and accuracy in differentiating and classifying the different leukemia cells.

Keywords: Leukemia, Image Processing, digital pathology, Blood Cells

Introduction

Pathology is a medical field concerned with the study and diagnosis of diseases. A microscopic slide is made of cells from the diseased body part, which is examined under a microscope. This has remained unchanged for a long time, while there have been many technological advancements in other fields. The introduction of information technology has helped in digitizing many fields in healthcare like radiology. However, with the advent of virtual microscopy, the transition process to digital pathology has been initiated.

Digital pathology has shown advantages over the traditional anatomic pathology. After the slides are digitized, algorithms can be developed to automate the counting of cells and structures or to classify the structures. This increases the accuracy of the diagnoses and also reduces human error. Also, digital slides are easy to share (tele-pathology) compared to physical slides [1]. But there are a few technological challenges too. The major one is image size. A normal digital slide contains around 20 billion pixels [2]. The size of such an image will be from a few hundred megabytes to several gigabytes. Due to its huge size, storing of images is difficult as a single scanning system may produce hundreds of images in a day. Images are usually stored in a centralized server and can be viewed by pathologists remotely over the network. Larger slide images take a longer time to transfer which may tie the system during the transfer. Also, interruptions in the connectivity may cause the data transfer to fail [2].

Leukemia is a group of cancer that originate at the blood marrow which is the site for blood cell production. Leukemia occurs when there is a build-up of blast cells, blood cells that are not completely matured. As the number of blast cells increases in the bone marrow, they...
spill out into the blood vessels which leads to an increase in the WBC count leading to the decrease in normal blood cell count. In a normal person, blast cells contribute only 1-2% of the total blood volume. When their numbers go above 20%, then it is termed as leukemia [3]. There are four major types of leukemia which are most common - acute lymphoblastic leukemia (ALL), acute myeloid leukemia (AML), chronic lymphocytic leukemia (CLL) and chronic myeloid leukemia (CML). Apart from these, there are more, less common subtypes.

In 2018, till now 437,033 people have been diagnosed with leukemia[4]. In children, it is the most common type of cancer with three-quarters of leukemia cases are the acute lymphoblastic type. In adults, AML and CLL are most common. Leukemia is diagnosed by checking blood smears under a microscope. It’s a manual procedure which is time-consuming and there are also chances of human error. For further confirmation and detecting the type of leukemia, the person has to go for a bone marrow biopsy, which is a painful procedure [4].

**Method**

The various important stages of computerized screening of digital blood information are shown in figure 1. This stage basically focusses on the extraction of good features from the acquired microscopic information of the blood smear. This, in turn, helps in dimension reduction of data. The trained classifiers recognize the classes of interest.

The images can be obtained by an optical microscope. A camera will be mounted on the eyepiece of the microscope. Then the operator will take images of the slides. The typical microscopic image of acquired from blood smear through the microscopic setup is shown in figure 2. Shown in Figure 2 (a) is a sample with an Acute Lymphoblastic Leukemia, whereas figure 2(b) is a normal blood sample [5].

![Fig. 1: Leukemia detection stages in Image Processing](image)

![Fig 2: Microscopic image of (a) Acute Lymphoblastic Leukemia (b) Normal blood sample](image)
Literature

The technique to detect leukemia through images of blood smear can be divided into the following stages: Image Segmentation, Feature Extraction and Classification. It is the process of partitioning a digital image into multiple segments so as to change the image into a simpler form. The segments formed will have certain common characteristics. Its goal is to extract information from an input image. The various types of image segmentation used in the literature that includes methods such as clustering or thresholding. Feature Extraction is a technique of redefining a large data set into certain features which have smaller dimensions. They are classified into three groups, colour, texture and geometrical features. The classifier uses the set of features and points out the difference between cancerous and non-cancerous cells. The goal is to detect abnormal WBC. It can also be used to further classify the cells into the subtypes of leukemia. The choice of the classifier depends on the set of features extracted from the dataset.

Agaian et al. (2014) converted the images into CEILAB and then segmented them using the k-means clustering algorithm. After features extraction, two sets of images are created. LBP (Local Binary Pattern) is employed on one set while it is not employed on another set. Support vector machine (SVM) is used to classify the cells. When LBP is not applied, the performance of the method is 70% whereas when LBP is applied, the performance increases to 93%.

Van-Nahn et al. (2016) used CMYK and used Otsu’s threshold method for image segmentation. Of the leukemia cells. This system gives an accuracy of 82.9%.

Shankar et al. (2017) converted the images into CMYK. The background is first removed by Zack Algorithm. Using the roundness ratio, the grouped and ungrouped lymphoblasts are separated. Grouped cells are separated by applying the watershed algorithm. Out of the 255 lymphoblasts that were given as inputs, the system is able to identify 245 cells.

Bhattacharjee et al. (2015) converted the images into grayscale. Binary images obtained by segmentation are used to extract the morphological features. Gaussian mixture modelling (GMM) and Binary Search Tree are the two classifiers used. The algorithm is able to differentiate between normal and blast cells with an accuracy of 95.56%.

Mohapatra et al. (2014) used colour segmentation in CIELAB. Haar wavelet-based and Haralicks feature based are used to extract the features. An ensemble-based classifier system is used for classification. K-nearest neighbour (KNN), Multilayer Perceptron (MLP) and SVM are used to classify. Sensitivity and accuracy of the proposed system are greater than 90%.

Rawat et al. (2017) extracted the features from each cell. The first classifier detects the cancerous cells while the second one is used to classify ALL cells into its subtypes and the average accuracy is found to be 97.6%.

Moradi Amin et al. (2016) converted the images into HSV. Fuzzy C-means clustering is used for image segmentation and then features are extracted. Features are extracted from each cell. The designed SVM had an accuracy of 97.53%.

Rawat et al. (2017) converted the images into greyscale. A generic algorithm is used to identify relevant features. SVM is used for classification. The accuracy obtained for classification of leukemia cells is 99.5%, for ALC subtypes it is 97.1% and for AMC subtypes it is 98.5%.

Vishwanath (2015) used images from ALL-IDB Database. Fuzzy C means is used to differentiate leukemia cells from normal cells. The algorithm provides an accuracy of 98%.

Sahlool et al. (2018) converted the images into CMYK. Social spider optimization algorithm is used to select particular features from the cells for better classification. Knn, SVM, NB-G and NB-K are used for classification. The system has a sensitivity of 100% with an accuracy of 99.23%.

Moshavash et al. (2018) used the distance transform and watershed algorithm to separate adjacent leucocytes. Features are extracted from the segmented images using two ensemble classifiers and the average accuracy obtained is 90.48%.

Madhloom et al. (2011) used the HSV colour space. They extracted two bands from the images, saturation and hue, and converted them into a binary image. The lymphoblasts are extracted using the shape features and it had an accuracy of 90-95%.

Khashman et al. (2013) used Otsu’s thresholding and the back propagation method for classification. Three learning schemes (LS) are developed to optimize neural model training. LS-1 achieved a better accuracy rate of 90%.
Mishra et al. (2017) converted the images into CIELab and used Marker-based watershed segmentation for separating grouped and overlapping objects. DCT is used for feature extraction and SVM for classification. The proposed method gives an accuracy of 89.76%.

Nimesh et al. (2015) used K-means clustering and Zack algorithm for image segmentation. Cseke’s observation is used to separate out nucleus and cytoplasm. The SVM classifier had an accuracy of 93.57%.

Karima et al. (2018) proposed a computer-aided system with a subsystem for WBC counting. Grouped lymphocytes are separated using a deep learning approach with RBM. A set of 52 features are extracted. Three types of multiple-classifiers (MCA) are used for classification. Overall WBC counting accuracy of the method was 97.8%.

Kaur et al. (2018) used Otsu’s method for image segmentation. Features are then extracted by Independent component analysis (ICA). Feed Forward neural network is used and achieved an accuracy of 95.89%.

Kumar et al. (2018) proposed a method with K-means, texture-based and colour-based segmentation. The images are then classified using Naïve Bayes and kNN classifiers and had an accuracy of 92.8%.

Mishra et al. (2018) converted the images into CEItab. They used Otsu’s thresholding method for leucocyte identification. To separate out the grouped lymphocytes, they calculated the roundness ratio. SVM is used for classification and recorded an accuracy of 96.97%.

In the feature extraction stage, features are classified into three groups; colour, texture and geometrical features. The accuracy of the approach is affected by the number of features used. In the classification stage, SVM, GMM, Binary Search Tree are some of the classifiers used. Accuracy rate is high in SVM classifier based approaches, which was also the most widely used one. Accuracy also increased when an ensemble-classifier was used. However, the classification stage is highly dependent on the image segmentation and feature extraction stages.

This paper presents an overview of the various approaches proposed and studies conducted on leukemia detection. An automated process can be generated using image processing which can speed up leukemia diagnosis. This will also ensure better and faster treatment of the patients. As most of the studies focused only on ALL, further research can include both AML and ALL.

ABSTRACT

Background: Two components are considered in deciding the adverse effect on fetal development in pregnant mother with HIV infection. One, effect of HIV infection on fetus and second, effect of antiretroviral treatment (ARV). The major benefit of antiretroviral treatment (ARV) during pregnancy is prevention of mother to child transmission (MTCT) of HIV infection. The combination of zidovudine and lamivudine and lopinavir/ritonavir is one of the most used ART regimens for prevention of mother-to-child-transmission. At the same time there are concern related to its effect on adverse outcome of birth outcome. There is no clear supporting data but results shows conflicting conclusion on effect of antiretroviral treatment (ARV).

Methodology: hospital based prospective study was carried out at tertiary care centre, Krishna Hospital, Karad. Inclusive criteria was, Mothers who are diagnosed to have congenital birth defected fetus through antenatal examinations, delivered baby with diagnoses of congenital malformation, congenital malformed admitted neonates at Tertiary care hospital or came for reference services.

Results: Total 75136 babies were observed in pediatric outpatient department, 4092 babies in pediatric ward and 774 patients in Neonatal Intensive Care Unit. Total, 283 mothers were identified with birth defect. Among these, only 3 (1.1%) mothers gave information that they used ARV during pregnancy.

Conclusion: At the moment, few studies are available to determine the role of these drugs alone or associated with other ART in inducing birth defects. Very little is known about the mechanism of long term exposure to different ART regimens and the potential effect of birth-defect induction. Majority of HIV-1 infections in children have been reduced by 48% between 2009 and 2014 in 21 African priority countries due to ART coverage. Two components are considered in deciding the adverse effect on fetal development in pregnant mother with HIV infection. Keywords: birth defects, Anti retroviral (ARV) therapy, relation
the pregnancies in women on ART might be unplanned pregnancies due to lack to effective contraception\textsuperscript{7}, \textsuperscript{8}, and \textsuperscript{9}.

According to the world health guidelines in 2010 two options were included, both of which should start earlier in pregnancy: at 14 weeks or as soon as possible. Worldwide, zidovudine /lamivudine with a non-nucleoside reverse-transcriptase inhibitor (NNRTI) or a protease inhibitor (PI) is the eligible combination regimen in ART-naive pregnant women. The history and evolution of the infection should be taken into account, as should whether the treatment is indicated for own health or only for MTCT, the presence of co-morbidities, and access and drug availability. Teratogenic effect has seen first trimester (up to and including 12 gestational weeks) as germ-layer formation and organogenesis occur during this period to teratogens.

**Methodology**

This hospital based prospective study was carried out at tertiary care centre, Krishna Hospital, attached to Krishna Institute of Medical Sciences “Deemed to Be University”, Karad Maharashtra state, India. Data was collected with the aim to evaluate the prevalence and risk factors of congenital malformation which was for the PhD degree. Apart from gathered data, part of information on ARV used during pregnancy were segregated and analyzed with systemic review. Inclusive criteria was, Mothers who are diagnosed to have congenital birth defected fetus through antenatal examinations, delivered baby with diagnoses of congenital malformation, congenital malformed admitted neonates at Tertiary care hospital or came for reference services were assessed from September 2016 to August 2017.

**Results**

Total 75136 babies were observed in pediatric outpatient department, 4092 babies in pediatric ward and 774 patients in Neonatal Intensive Care Unit. Total, 283 mothers were identified with birth defect. Among these, only 3 (1.1%) mothers gave information that they used ARV during pregnancy.

In the present study, researchers have gathered the data from Pediatric unit and Maternity unit. Pediatric unit included pediatric outpatient department, pediatric ward and Neonatal Intensive Care Unit where 80002 patients were assessed. Prevalence is noted maximum in the Neonatal Intensive Care Unit 41 (5.3%), thereafter in Pediatric Ward 14 (0.3%), and in pediatric Outpatient Department 45 (1%). Maternity unit included Maternity Outpatient Department, Maternity ward which also included labor room. In the Maternity Outpatient Department 50856 patients were visited in that 131 patients had the diagnosis of having congenital malformation fetus contributing to 0.3%. Whereas maternity ward had 3847 patients among those 52 (1.4%) had delivered congenital malformed babies. In our study considering the prevalence with number of birth, it is 1.4% and calculating with number of neonates admitted its prevalence rate is 5.3%. Overall in the hospital the prevalence noted is 0.2%.

Sociodemographic Variables: The above table shows socio demographic variables of the mothers of congenital malformation. In this study, male babies were more affected with malformations. Table explicit that maximum congenital malformed babies were Male 180 (63.60%), followed by Female 99 (34.98%), Ambiguous 4 (1.41%) and Missing/Unknown is 0.

Outcome of Birth of congenital malformed babies results shows that maximum 244 (86.22%) were Live Birth followed by 10 (3.53%) Still Birth and that of Elective Termination of Pregnancy were 29 (10.25%).

As per Gestational Age is concerned less than 12 Week gestational aged mother were 11 (4%), 13-20 Week gestational aged mother were 45 (16%), 21-28 Week gestational aged mother were 33 (12%), 29-35 Weeks gestational aged mother were 8 (24 %), and maximum mothers belongs to 36 Weeks of gestational age 126 (45%).

Birth Weight of Baby shows that maximum, 97 (34.28%) babies belongs to less than 1500grams, between 1500gm -1999gm were 58 (20.49%), between 2000 -2499 grams were 59 (20.84%), between 2500-3000grms were 60 (21.20%) and Above 3000grams were 9 (3.2%) babies.

Considering the age of the mother maximum 116 (39.46%), samples belongs to 20-25 Years groups, and that of Below 20 Year 5 (1.70%), between 25 to 30 Year 64 (21.77%), between 30 to 35 Years 53 (18.03%) and Above 35 Years of aged mother were 45 (15.31%).

Total, 283 mothers were identified with birth defect. Among these, only 3 (1.1%) mothers gave information that they used ARV during pregnancy.

Discussion

There are differences among the various studies of congenital anomalies in children exposed to anti retro viral in utero that may account for the varying prevalence rates reported. Congenital anomalies may be under-reported in some of the studies. Differential ascertainment across the studies may explain differences in prevalence. Our results, 1% is low compared with previous study reports. Previous result show that the prevalence of congenital anomalies among infants with in utero exposure to ARVs was 2.9% for the Antiretroviral Pregnancy Registry, 12 2.8–3.1% for the National Study of HIV in Pregnancy and Childhood in the United Kingdom and Ireland,13 and 3.56% for the Women and Infants Transmission Study.14 Even lower prevalence of congenital anomalies has been reported from the European Collaborative Study (1.6%) 15. However, other studies of HIV-infected women and their infants have documented higher rates of congenital anomalies16,16. Study results from US and UK reported prevalence ranging from 2.8% to 5.5% 17-22. Controversial to it, There are many studies which reported that no
relation between congenital malformation and exposure to ARV10,23,24. Some of the studies shows that, Either zidovudine or lamivudine, use of monotherapy, dual therapy are not found any relation with malformation in US25,26, Europe27,28,29 and Africa30.

**Summary:** The role of long-term exposure to different ART regimens and the potential effect of birth-defect induction in pregnancy are not well known30. Most of the largest and expressive data comes from retrospective, prospective, and case-report studies carried out in developed countries and could be not sufficiently representative of pregnant women living in developing country like India. At the moment, few studies are available to determine the role of these drugs alone or associated with other ART in inducing birth defects31. Further in depth research is required in this aspect.

ABSTRACT

Lack of antenatal check up, inability to access health care facilities in rural area, inadequate knowledge about pregnancy care are major contributing factors for developing complication of disease and in terms causative factors for birth defect.

Methodology: Mothers who are diagnosed to have congenital birth defected fetus through antenatal examinations, delivered baby with diagnoses of congenital malformation, congenital malformed admitted neonates at Tertiary care hospital or came for reference services were assessed from September 2016 to August 2017.

Results: Out of 283 mothers who had congenital malformed babies, Total 239 (85%) mother had no history of any chronic disease but 44 (15%) pregnant woman diagnosed with chronic disorders. Among these 44 pregnant woman, 11 (4%) mothers were diabetic, 15 (5%) were reported to have thyroid disorders 9 (3%) woman were had hypertension, 3(1%) woman know to have seizures and 6 (2%) woman stated that they took medication for minor disorder which could not be noted as there was no records with mothers.

Conclusion: Chronic disorders before and early pregnancy may play a role in the etiology of major birth defects; however, more research is needed to unravel which factors are involved in the pathophysiological mechanisms that may lead to birth defects.

Keywords: Maternal Diseases, Treatment, Risk Factors, Birth Defect.

Introduction

With changing environmental and socio economical background, antenatal mothers are more prone to have chronic diseases that could adversely affect both mother and child. Congenital malformations otherwise called birth defect are due to many causes which are categorized into modifiable and non modifiable. The strongest and most notable risk factors, such as age of mother and family history of malformations (Genetic predisposition) are usually not modifiable. Many recent reviews shows there are number of modifiable factors which could be controlled to avoid risk for developing malformations such as infection, obesity, altered blood sugar level, exposing to radiations, smoking, using illegal drugs, and drinking alcohol while pregnant and stress. 70% of congenital malformations can be prevented by appropriate use of Community genetic services¹. Pregnant woman are at risk for developing many of the diseases, some may be identified and some may be missed. 8% of pregnant woman’s take some form medications for chronic disorders during pregnancy². Early identification and treatment of any physiological variation during pregnancies will help to prevent birth defects.

Total 239 84% 44 16% 283 100%

Above table shows that mother who diagnosed to have chronic diseases during or before pregnancy gave birth to, Congenital malformations of the nervous system 7 (2%), circulatory system 9 (3%), respiratory system 1 (0.5%), Cleft lip and cleft palate 5 (2%), Digestive system 7 (2%), Genital organs 6 (2%), urinary system 3 (1%), musculoskeletal system 1 (0.5%), Other congenital malformations 1 (0.5%) and Chromosomal abnormalities, not elsewhere classified 4 (1%).

Out of 283 mothers who had congenital malformed babies, Total 239 (85%) mother had no history of any chronic disease but 44 (15%) pregnant woman diagnosed with chronic disorders. Among these 44 pregnant woman, 11 (4 %) mothers were diabetic, 15 (5 %) were reported to have thyroid disorders 9 (3 %) woman were had hypertension, 3(1 %) woman know to have seizures and 6 (2 %) woman stated that they took medication for minor disorders which could not be noted as there was no records with mothers. These mothers regularly took Oral Hypoglycemic Agents, antihypertensive, anti seizure drugs and medications for thyroid disorders.

Discussion

Since many decades researchers are trying to search relation between mother’s glycemic level and birth defect. Despite better control sugar levels throughout pregnancy the malformed babies rate does not show any decline. In this study also we found that maternal diabetes and thyroid disorders are the important risk factors for malformation. Many review supported the cause for malformation could be diabetes such as studies by Mills J1, Molsted P4, Lazalde B5, Kucera J6, Chung CS7, Farquhar J8, Karlson K9, Day R10, Like A11, Adam P12, Dee G13, Khoury M J14, Vulsma T15, Man E B16. The exact reason for congenital malformation among diabetic mother is still not clear by the fact that diabetes is responsible for a loss of normal homeostasis not only of carbohydrate but of fat and protein metabolism as well. The complication of uncontrolled glycemic level may cause micro vascular complications which may lead to additional metabolic changes such as hypoxia or impaired renal clearance of toxins. All studies of congenital anomalies in infants of diabetic mothers have shown cardiovascular, genitourinary, musculoskeletal, and other malformations. No single study has contained enough cases to determine whether or not the risk for each specific defect is significantly increased. The effect of gestational diabetes on malformations must be rules out in order to find clear evidence of overt diabetes (before and during pregnancy) and its direct relation to malformation. Chung and Myrianthropoulos17, attempted to find it and found that there was no increase in malformation risk in the pregnancies of mothers with gestational diabetes over that of nondiabetic mothers in either racial group. However, the risk of malformation for white mothers with overt diabetes was double that of nondiabetic mothers for both major and minor categories of malformations. The incidences of major and minor types of malformations in the pregnancies of overt diabetes were 17.94% and 10.94%, respectively, compared to the corresponding incidences of 8.34% and 6.25% for the nondiabetic group. There is still confusion that the complications of diabetes causes malformation of insulin used to treat diabetes acts as teratogens for malformation. Much research needs to be addressing these issues.

Thyroid disease is the second most common endocrine condition encountered in women of childbearing age after diabetes18. Most of the time thyroid disorders may adverse maternal and fetal outcome if they are not evaluated and managed appropriately. Thyroid dysfunctions are also the major cause malformation in present study. Hyperthyroidism during pregnancy is uncommon, affecting approximately 1 in 500 pregnancies19. Much evidence has been documented on hyperthyroidism impact on congenital anomalies20. Khoury et al21 found no overall relationship between maternal hypothyroidism or intake of thyroid drugs of thyroid drugs and the risk of infant
congenital malformations but noted a doubling of the risk of infants with multiple malformations but these presented no uniform pattern. Effect of thyroid disorder on pregnancy is one aspect whereas effect of treatment for thyroid disorders or other. Studies on effect of altered physiology due to thyroid dysfunction are many but effects of drugs used to treat thyroid dysfunction on congenital malformations are limited. This is because drug of choice for thyroid disorder is deferent from country to country. In the present study woman with thyroid disorders were prescribed Propylthiouracil (PTU) and methimazole (MMI)/carbimazole (CMZ). Clementi et al22, Myers AK23, Wilson LC24, Wolf D25 and Mandel SJ26 also found that these drugs may have impact on birth defect. There were 2 mothers diagnosed with both diabetes and hyperthyroidism and both were on prescribed medication.

Hypertensive disorders in pregnancy are categorized into four types: chronic hypertension, gestational hypertension, pre-eclampsia, and pre-eclampsia superimposed on chronic hypertension27. Chronic hypertension would be the most common causes because it effects right from the pregnancy. Treating mild to moderate hypertension is still debating but severer hypertension is treated with antihypertensive drugs. Hypertensions have direct effect on fetus development through uteroplacental insufficiency and hypertensive drugs act as a teratogens for malformations. Uteroplacental insufficiency lead to restricted blood flow to the developing fetus which increases the risk for certain types of malformations. This was supported by the results of Caton AR28, Clark E29, Bánhidy F30. There are many reviews shows that the hypertensive drugs are also leading cause for malformations. Caton AR28, Yakoob MY31, Lennestal R32, Puho EH33, Kallen BA34, Cooper W35, Yang C36 and Mitchell AA37.

Summary: Pregnancy should be properly planned in women with pre-existing any chronic disorders, and reached through lifestyle modifications, a healthy diet, and an exercise planning program with the supplementation of folic acid and multivitamins that is advocated to prevent malformations. If diagnosed early in the pregnancy, all of the complications as well as the conditions of congenital malformations could be prevented.

Conclusion

Our results support the hypothesis and previous study results that chronic disorders before and early pregnancy may play a role in the etiology of major birth defects; however, more research is needed to unravel which factors are involved in the pathophysiological mechanisms that may lead to birth defects.

ABSTRACT

During their life, among 8% of women is diagnosed with Breast cancer (BC), after lung cancer, BC is the second popular cause of death in both developed and undeveloped countries. BC is characterized by the mutation of genes, constant pain, changes in the size, color (redness), skin texture of breasts. Classification of breast cancer leads pathologists to find a systematic and objective prognostic, generally the most frequent classification is binary (benign cancer/malign cancer). Today, Machine Learning (ML) techniques are being broadly used in the breast cancer classification problem. They provide high classification accuracy and effective diagnostic capabilities. In this paper, we apply five different machine learning algorithms for classifying BC data, and results are visually represented.

Keywords: Breast Cancer; Classification; Machine Learning; lung cancer

Introduction

Breast Cancer’s causes multi factorial and involves family history, obesity, hormones, radiation therapy, and even reproductive factors. Every year, one million women are newly diagnosed with breast cancer, according to the report of the world health organization half of them would die, because it’s usually late when doctors detect the cancer [1,2]. Breast Cancer is caused by a typo or mutation in a single cell, which can be shut down by the system or causes a reckless cell division. If the problem is not fixed after a few months, masses are formed from cells containing wrong instructions. In this paper we are taking a few of machine learning algorithms for classifying BC data. The purpose of this article is effective understanding of cancer classification using machine learning approaches. The performance of each classifier will be evaluated in terms of accuracy, training process and testing process.

Literature Survey

A lot of studies have been done in the field of BC using classification, but still necessity of improving and visualizing the data for better understanding of issues. In this section we will discuss some of the techniques which are proposed by different authors in literature.

Rajaguru H. and Prabhakar S.K. [3] are proposed, a simple, cost effective and non-invasive strategy to detect the breast cancer at an early stage with the help of techniques such as Gaussian Mixture Model (GMM) and Radial Basis Function (RBF). As cancer staging is divided into clinical and pathological stage, the TNM (Tumour Node Metasis) prognostic tools are identified and the TNM variables such as tumour size, history of breast feeding, menstrual cycle, hereditary, food habits, etc. are used as input variables for both the types of classifications.

R. Nithya and B. Santhi [4] presents an evaluation and comparison of the performance of three different feature extraction methods for classification of normal and abnormal patterns in mammogram. Three different feature extraction methods used here are intensity histogram, GLCM (Grey Level Co-occurrence Matrix) and intensity based features. A supervised classifier system based on neural network is used. The performance of the each feature extraction method is evaluated on Digital Database for Screening Mammography (DDSM) breast cancer database.
Purnami SW et al. [5] emphasizes how 1-norm SVM can be used in feature selection and smooth SVM (SSVM) for classification. As a case study, a breast cancer diagnosis was implemented. First, feature selection for support vector machines was utilized to determine the important features. Then, SSVM was used to classify the state of disease (benign or malignant) of breast cancer. As a result, SVM can achieve the state of the art performance on feature selection and classification.

T.S.Subashini et al [6] paper compares the use of polynomial kernel of SVM and RBFNN in ascertaining the diagnostic accuracy of cytological data obtained from the Wisconsin breast cancer database. The data set includes nine different attributes and two categories of tumors namely benign and malignant. Known sets of cytologically proven tumor data was used to train the models to categorize cancer patients according to their diagnosis. Performance measures such as accuracy, specificity, sensitivity, F-score and other metrics used in medical diagnosis such as Youden’s index and discriminant power were evaluated to convey and compare the qualities of the classifiers.

Mehmet Fatih Akay [7] proposed breast cancer diagnosis based on a SVM-based method combined with feature selection. Experiments have been conducted on different training-test partitions of the Wisconsin breast cancer dataset (WBCD), which is commonly used among researchers who use machine learning methods for breast cancer diagnosis. The performance of the method is evaluated using classification accuracy, sensitivity, specificity, positive and negative predictive values, receiver operating characteristic (ROC) curves and confusion matrix.

Chaurasia, Vikas, and Saurabh Pal [8] investigate the performance of different classification techniques. The data breast cancer data with a total 683 rows and 10 columns will be used to test, by using classification accuracy. They analyse the breast Cancer data available from the Wisconsin dataset from UCI machine learning with the aim of developing accurate prediction models for breast cancer using data mining techniques.

Elif Derya Übeyli [9] integrated view of implementing automated diagnostic systems for breast cancer detection. The major objective of the paper is to be a guide for the readers, who want to develop an automated decision support system for detection of breast cancer. Because of the importance of making the right decision, better classification procedures for breast cancer have been searched. The classification accuracies of different classifiers, namely multilayer perceptron neural network (MLPNN), combined neural network (CNN), probabilistic neural network (PNN), recurrent neural network (RNN) and support vector machine (SVM), which were trained on the attributes of each record in the Wisconsin breast cancer database, were compared. The purpose was to determine an optimum classification scheme with high diagnostic accuracy for this problem.

Seral Şahan et al [10] diagnosing breast cancer with a new hybrid machine learning method. By hybridizing a fuzzy-artificial immune system with k-nearest neighbour algorithm, a method was obtained to solve this diagnosis problem via classifying Wisconsin Breast Cancer Dataset (WBCD). This data set is a very commonly used data set in the literature relating the use of classification systems for breast cancer diagnosis and it was used in this study to compare the classification performance of our proposed method with regard to other studies.

**Methodology**

A simulated system is developed to predict various breast cancer classification conditions using various Data Analysis and Machine Learning techniques. The main source of data to be collected from the web link https://www.kaggle.com/uciml/breast-cancer-wisconsin-data. The system takes breast cancer dataset and splitting it into training and testing, clean it. Different classifiers are applied on testing data based on the values of training. The classifiers are predict the data and validation will applied on predicted data, testing and training data. Finally accuracy, precision, recall, f1 score is measured.

**Data Set**: The dataset consists of 569 data points, with 32 features each:

```python
['id', 'diagnosis', 'radius_mean', 'texture_mean', 'perimeter_mean', 'area_mean', 'smoothness_mean', 'compactness_mean', 'symmetry_mean', 'concave points_mean', 'fractal_dimension_mean',
 'radius_se', 'texture_se', 'perimeter_se', 'area_se', 'smoothness_se', 'compactness_se', 'symmetry_se',
 'concave points se', 'fractal_dimension se', 'radius_worst', 'texture_worst',
 'perimeter_worst', 'area_worst', 'smoothness_worst', 'compactness_worst', 'symmetry_worst',
 'concave points worst', 'fractal_dimension Worst', 'dtype=’object’]
```
Of these 569 data points, 212 are labeled as malignant and 357 as benign which are shown in Fig 1.

**Fig. 1: Features of breast cancer dataset**

**k-Nearest Neighbors:** The k-NN algorithm is arguably the simplest machine learning algorithm. Building the model consists only of storing the training dataset. To make a prediction for a new data point, the algorithm finds the closest data points in the training dataset—its “nearest neighbors.” Let’s investigate whether we can confirm the connection between model complexity and accuracy.

**Fig. 2: Training and test set accuracy of KNN**

The plot shows in Fig 2, the training and test set accuracy on the y-axis against the setting of n_neighbors on the x-axis. Considering a single nearest neighbor, the prediction on the training set is perfect. But when more neighbors are considered, the training accuracy drops, indicating that using the single nearest neighbor leads to a model that is too complex.

The best performance is somewhere around three neighbors. Still, it is good to keep the scale of the plot in mind. The worst performance is more than 90% accuracy, which might still be pretty good.

The above plot suggests that we should choose n_neighbors=3. Here we are:

Accuracy of K-NN classifier on training set: 0.96
Accuracy of K-NN classifier on test set: 0.92

**Logistic Regression:** One of the most common linear classification algorithms is logistic regression. Despite its name, LogisticRegression is a classification algorithm and not a regression algorithm.

Training set score: 0.955
Test set score: 0.937

The default value of C=1 provides quite good performance, with 96% accuracy on training and 0.94 accuracy on test set. Let’s try to increase C to fit a more flexible model to see whether we can improve the performance.

Training set score: 0.969
Test set score: 0.972

Using C=100 results in higher accuracy on both training set and test set, confirming that less regularization and a more complex model should perform better.

Training set score: 0.948
Test set score: 0.895

Using C=0.01 results in lower accuracy on the training set and much lower accuracy on the test set, indicates our model doesn’t generalize well from our training data to unseen data. With C=0.01, overfitting occurs. The data is shown in Fig 3.

**Fig. 3: Logistic regression data visualization**
**Decision Tree:** This is one of my favorite algorithm and I use it quite frequently. It is a type of supervised learning algorithm that is mostly used for classification problems. Surprisingly, it works for both categorical and continuous dependent variables. In this algorithm, we split the population into two or more homogeneous sets. This is done based on most significant attributes/independent variables to make as distinct groups as possible.

Accuracy on training set: 1.000

Accuracy on test set: 0.937

Feature importance in trees: feature importance rates how important each feature is for the decision a tree makes. It is a number between 0 and 1 for each feature, where 0 means “not used at all” and 1 means “perfectly predicts the target.” The feature importances always sum to 1: We can then visualize the feature importances in Fig 4. Feature perimeter_worst is by far the most important feature. This confirms our observation in analyzing the tree that the first level already separates the two classes fairly well.

![Feature importance of breast cancer dataset](image)

**Random Forest:** Random Forest is a trademark term for an ensemble of decision trees. In Random Forest, we’ve collection of decision trees (so known as “Forest”). To classify a new object based on attributes, each tree gives a classification and we say the tree “votes” for that class.

The forest chooses the classification having the most votes (over all the trees in the forest).

Accuracy on training set: 1.000

Accuracy on test set: 0.958

The random forest gives us an accuracy of 95.8%, better than a single decision tree, without tuning any parameters. Feature importance in Random Forest is shown in Fig 5.

Similarly to the single decision tree, the random forest also gives a lot of importance to the “worst radius” feature, but it also chooses “perimeter worst” to be the most informative feature overall. The randomness in building the random forest forces the algorithm to consider many possible explanations, the result being that the random forest captures a much broader picture of the data than a single tree.
Gradient Boosting: GBM is a boosting algorithm used when we deal with plenty of data to make a prediction with high prediction power. Boosting is actually an ensemble of learning algorithms which combines the prediction of several base estimators in order to improve robustness over a single estimator.

Accuracy on training set: 1.000

Accuracy on test set: 0.944

As the training set accuracy is 100%, we are likely to be overfitting. To reduce overfitting, we could either apply stronger pre-pruning by limiting the maximum depth or lower the learning rate:

Accuracy on training set: 0.988

Accuracy on test set: 0.937

Accuracy on training set: 0.984

Accuracy on test set: 0.930

Both methods of decreasing the model complexity reduced the training set accuracy, as expected. In this case, none of these methods increased the generalization performance of the test set. Still, we can visualize the feature importances to get more insight into our model even though we are not really happy with the model.

We can see that the feature importances of the gradient boosted trees (shown in Fig 6) are somewhat similar to the feature importances of the random forests, though the gradient boosting completely ignored some of the features.
Support Vector Machine: An SVM generates parallel partitions by generating two parallel lines. For each category of data in a high-dimensional space and uses almost all attributes. It separates the space in a single pass to generate flat and linear partitions.

- Accuracy on training set: 1.00
- Accuracy on test set: 0.63

The model overfits quite substantially, with a perfect score on the training set and only 63% accuracy on the test set.

SVM requires all the features to vary on a similar scale. We will need to rescale our data that all the features are approximately on the same scale.

- Accuracy on training set: 0.95
- Accuracy on test set: 0.94

Scaling the data made a huge difference! Now we are actually in an underfitting regime, where training and test set performance are quite similar but less close to 100% accuracy. From here, we can try increasing either C or gamma to fit a more complex model.

- Accuracy on training set: 0.986
- Accuracy on test set: 0.965

Here, increasing C allows us to improve the model significantly, resulting in 96.5% test set accuracy.

Neural Networks: It is an information processing paradigm that is inspired by the way biological nervous systems, such as the brain, process information. The key element of this paradigm is the novel structure of the information processing system.

- Accuracy on training set: 0.63
- Accuracy on test set: 0.63

This is likely due to scaling of the data. Neural networks also expect all input features to vary in a similar way, and ideally to have a mean of 0, and a variance of 1. We must rescale our data so that it fulfills these requirements.

- Accuracy on training set: 0.962

Accuracy on test set: 0.958

The results are much better after scaling, and already quite competitive.

- Accuracy on training set: 0.958
- Accuracy on test set: 0.979

The weights that were learned connecting the input to the first hidden layer. The rows in this plot correspond to the 30 input features, while the columns correspond to the 100 hidden units. Light colors represent large positive values, while dark colors represent negative values. One possible inference we can make is that features that have very small weights for all of the hidden units are “less important” to the model. We can see that “mean smoothness” and “mean compactness,” in addition to the features found between “smoothness error” and “fractal dimension error,” have relatively low weights compared to other features. This could mean that these are less important features or possibly that we didn’t represent them in a way that the neural network could use.

Conclusions

In this paper breast cancer dataset is classified using different machine learning algorithms. The results are visualized for features of the dataset. For these methods accuracy, precision, recall is measured, from accuracy point of view. For training dataset accuracy is 0.96 for KNN, 0.969 for LR, 0.98 for DTC, 1 for RF, 0.98 for GB, 0.98 for SVM and 0.95 for NN. For testing dataset accuracy is 0.92 for KNN, 0.97 for LR, 0.93 for DTC, 0.95 for RF, 0.93 for GB, 0.96 for SVM and 0.97 for NN. From these statistics RF outperforms in training KNN and NN in testing.

Ethical Clearance: We took breast cancer dataset and splitting it into training and testing, clean it. The main source of data is collected from the web link https://www.kaggle.com/uciml/breast-cancer-wisconsin-data. Different classifiers are applied on testing data based on the values of training. The classifiers are predict the data and validation will applied on predicted data, testing and training data.

Lactose Intolerance and Oral Health: A Public Health Promotional Perspective

Ramprasad Vasthare¹, Elaine Karman Choong², Prajna P Nayak³, Ramya Bhagavath⁴, Shanthi⁴
¹Associate Professor, Dept. of Public Health Dentistry, Manipal College of Dental Sciences, Manipal, MAHE, Udupi, Karnataka, India; ²Dental Health officer, Malaysia; ³Tutor, Department of Public Health Dentistry, Manipal College of Dental Sciences, Manipal, MAHE, Udupi, Karnataka, India; ⁴Dietician, Department of Dietics, Kasturba Hospital, Manipal, Udupi district, Karnataka, India

ABSTRACT

Introduction: The percentage of individuals with lactose intolerance and milk allergy is rising in the populations world wide, with some races showing more predilection towards intolerance. It is being increasingly seen in adults, in addition to its known effects on children.

Objective: To assess the potential effects of lactose intolerance on oral health.

Background: Individuals affected by lactose intolerance often practise dairy-exclusion diets to avoid symptoms provoked by lactose intake. This dietary restriction results in a significant lower intake of calcium among affected subjects. Substitution of dairy products with other soy-based or lactose-free food may also have a local effect to the oral environment. The aim of this review is to summarize the relevant studies which have been conducted in this area and identify areas which need further investigation.

Method: The authors retrieved relevant literatures from searches of electronic databases (Google Scholar, PubMed and Scopus), hand searches of the references of retrieved literature and authoritative texts. Terms searched included the following: lactose intolerance, oral health, milk allergy, milk, dairy, teeth, lactase deficiency, lactose and tooth loss.

Discussion: The effects of dietary restrictions in lactose-intolerant subjects on dental caries, periodontal diseases, osteoporosis and ridge resorption, dental fluorosis and the role of probiotics are discussed.

Conclusion: The association between lactose intolerance and oral health is ambiguously defined. Till date, it appears that not many studies have been done to investigate the relationship between lactose intolerance and oral health. More studies of higher level of evidence are required to further examine and confirm the effect of lactose intolerance on oral health.

Keywords: Lactose intolerance, oral health, milk allergy, dairy, lactase deficiency

Introduction

Lactose intolerance is a condition characterized by gastrointestinal symptoms such as diarrhoea, flatulence, abdominal pain and/or bloating post intake of lactose. This occurs because of the decreased ability of the body to hydrolyse lactose, a disaccharide, into glucose and galactose, due to a deficiency in enzyme lactase (also known as β-galactosidase).¹

Lactase deficiency can be of three types: primary, secondary or congenital. Primary form is the most common where production of lactase decreases naturally.
with age. Secondary causes usually follow any gastrointestinal diseases which damage the intestinal mucosa, such as Crohn’s disease and Celiac disease. Congenital lactase deficiency is rare, which is present at birth due to autosomal recessive trait.

The concept of lactose intolerance is vague, as not all symptomatic individuals were confirmed by microbiological diagnosis as lactase enzyme deficient. Instead, many have self-perceived that they are lactose intolerant, in which case lactase deficiency is not the cause of their gastrointestinal symptoms.

Individuals with true or self-perceived lactose intolerance often avoid intake of milk and dairy products, putting themselves at risk of calcium deficiency. Dairy products are known to be rich and have always been associated with better bone health, including dental hard tissues. They contribute to approximately 75% of total dietary calcium intake. Even though this essential nutrient can be obtained from other non-dairy sources, its’ bioavailability may be low, especially if it is of plant origin. For example, approximately 10 cup servings of sweet potatoes would be needed to equal the calcium content in a cup of milk. It may thus be difficult to meet the recommended levels of calcium from non-dairy food sources alone.

This dietary modification may impose systemic and local effects on oral health, such as through the reduced intake of calcium or change in the substrate for oral microbiota.

Many research have been carried out to investigate the relationship between milk and oral health, however, not many have studied the effects of reduced intake of dairy products due to lactose intolerance on oral health.

**Method**

Electronic databases namely Google Scholar, PUBMED and Scopus were searched using terms ‘lactose intolerance’, ‘oral health’, ‘milk allergy’, ‘dental’, ‘milk’, ‘dairy’, ‘teeth’, ‘lactase deficiency’, ‘fluorosis’ and ‘lactose’ through December 2018. The authors also hand searched references from the retrieved literatures. They excluded animal studies, articles not published in English language, case reports and editorials but read them to identify any relevant literatures.

**Identified Areas of Focus:**

**Dental Caries:** Dental caries occurs as a result of interaction between three variables over a suitable period of time: 1) pathogenic oral microbes; 2) fermentable carbohydrates which will be metabolized to acids; 3) susceptible teeth. Lactose is the least cariogenic among common dietary sugars. Controversies are existing regarding the cariogenicity of milk. Some studies reported that milk can cause early childhood caries, while other studies suggested that milk, particularly bovine milk as well as dairy products, if unsweetened artificially, due to the high concentration of calcium, phosphate, casein, whey proteins and lipids, actually possesses anti cariogenic properties.

Milk intake has been reported to have an inverse association with caries development in children and adolescents. It’s high calcium and phosphorus content protects teeth against demineralization and helps in remineralisation.

Dairy-derived bioactive peptides such as Caseinophosphopeptides (CPP) and glycomacropeptides (GMP) have been patented for use in various anti-caries products such as dentifrices, mouthwash and tooth mousse. It is important to note that lactose intolerance differs from casein allergy, and hence these products can be used safely in people afflicted by lactose-intolerance.

Lactose-intolerant individuals eliminated dairy products from their diet and tend to opt for soy-based or lactose-free products as substitutes, which contain different carbohydrate sources like sucrose, corn syrup and glucose polymers. Various studies have shown that these non-milk extrinsic sugars have higher cariogenic potential than lactose, with sucrose being the most cariogenic.

Sheikh C. et al showed that soy-based and protein hydrolyzate formulations are more acidogenic compared to the milk-based formulations. This is in agreement with studies done by Birkhed et al.

Moimaz SAS et al reported higher caries prevalence and significantly higher mean dmft (decayed, missing, and filled teeth) index in children with lactose intolerance/cow milk protein allergy, though no significant association between dental caries and replacement food is found.
Thitasomakul S found a significant association between higher maternal intake of cheese during pregnancy with reduced risk of dental caries in children and borderline significance for the negative correlation between maternal intake of total dairy products, yoghurt and calcium during pregnancy and childhood dental caries. This may be due to the influence of maternal calcium intake on primary tooth mineralization and subsequent acid-resistance of tooth enamel.27 This implies that children of mothers who are lactose intolerant and are not supplemented with calcium during pregnancy may have higher risk of childhood caries. However, the result of this study may be merely a chance and higher maternal intake of cheese simply implies a healthier diet and/or lifestyle in general.

Information on the effects of lactose intolerance on dental caries is limited. Diet factors alone cannot contribute to dental caries as it is confounded by other factors such as oral hygiene measures and fluoride exposures. With proper oral hygiene practices, caries risk can be reduced.

**Periodontal Diseases:** Periodontal disease is an inflammatory disease affecting the supporting tissues of the teeth, resulting in progressive attachment loss and alveolar bone destruction.28 It is one of the main causes of tooth loss besides dental caries.29

Poor diet and nutritional deficiencies, especially calcium, have been quoted as one of the possible risk factors for periodontitis.30 Studies which utilized data from the Third National Health and Nutrition Examination Survey (NHANES III) revealed that low dietary intake of calcium was associated with higher periodontitis prevalence and more calculus deposits.31

Adegboye AR et al through two separate studies (cohort 32 and cross-sectional 33) done in the Danish population, found significant inverse correlations between intakes of calcium from dairy products, particularly from milk and fermented foods, with severity of periodontitis/tooth loss; while no significant association was found with non-dairy calcium.

Shimazaki et al investigated the type of dairy food that affects periodontal health and reported that among all dairy products studied only lactic acid fermented food had significant association with periodontal disease and clinical attachment loss, suggesting that dairy calcium did not play an important role in periodontitis.34 The presence of probiotic bacteria was thought to suppress the growth of periodontal pathogens and influence the disease progression.35 However, as the potential for independent effects of calcium was not considered and that the study design was cross-sectional, it is not possible to conclude that calcium intake has no influence on periodontal disease.

As calcium intake affects bone mineral density in the body including alveolar bone, it in turn affects the retention of natural dentition.36

Due to the dietary restrictions of lactose-intolerant individuals, they are considered to be at-risk group for calcium deficiency, if adequate calcium intake was not met with other dietary sources. They may be more susceptible to develop periodontitis or experience a faster progression of disease, if other risk factors such as local bacterial plaque are not kept in check.

Dairy calcium may exert a prophylactic effect on periodontitis, but further prospective studies are required to confirm the causal relationship.

**Osteoporosis and Ridge Resorption:** Lactose intolerance is believed to be associated with the risk for osteoporosis as it can induce derangement of bone through the reduced intake of calcium.37 Intolerant subjects were shown to have significantly higher aversion to milk consumption.38, 39 The low-lactose diet resulted in significantly lower calcium intake and Bone Mineral Density (BMD) value, which exposes subjects to higher risk of severe osteoporosis.40 Similar findings have also been reported in children 41 and post-menopausal women42 with documented lactose intolerance.

Although data from literature show that intolerant subjects are unable to achieve an adequate peak bone mass, these studies measured BMD at non-oral sites; their relevance to oral site is unknown.

In edentulous individuals, it has been reported that systemic osteoporosis has a significant influence on residual alveolar ridge resorption43 inducing a greater rate of bone loss. 44 However, questions were raised regarding the significance of the resorption.45,46

Nishimura I and colleagues found that osteoporosis causes specific type of bone resorption along the buccal-lingual direction, resulting in a “knife-edge” ridge over time.47 Singhal S et al suggested that recall visit for this group of patients should be done more often as they may need more frequent denture adjustments due to the greater resorption rate.
Evidence showed that intake of milk per se has a protective effect against osteoporosis.\textsuperscript{48} Lactose intolerance alone does not impair absorption of calcium in the body\textsuperscript{49}, however, exclusion of calcium-rich dairy products from diet may cause inadequate bone mineralization if calcium requirement is not met by other dietary sources.

**Fluorosis:** Fluoride plays a great role in caries prevention in the population if taken at the optimal level of between 0.05 and 0.07 mg fluoride per kilogram of body weight (mgF/kg bw).\textsuperscript{50} However, an increased intake of fluoride during tooth development can cause dental Fluorosis\textsuperscript{51}, an unaesthetic alteration in the enamel of tooth.

Milk constitutes the main source of energy and nutrition during the early years of life. Infants and children with documented lactose intolerance are often fed with soy-based formulas. Mc-Knight Hanes et al found that the fluoride concentrations in all soy-based formulas were significantly higher than that present in all milk-based formulas investigated. This was attributed to the different processes involved in milk formulas production and the higher content of phytates and tricalcium phosphates in soy-based formulas which bind to fluoride.\textsuperscript{52}

Two other studies also reported that soy-based formulas contain higher fluoride concentration and may predispose infants to dental fluorosis.\textsuperscript{52} However, there were controversies regarding the bioavailability of fluoride in milk formulas\textsuperscript{53} and its ability to be the sole causative agent.

Other studies reported low fluoride content in different infant formulas, and they were unlikely to exceed the upper threshold of daily recommended fluoride intake alone, unless reconstituted with fluoridated water of 1.0 ppm F or above.\textsuperscript{54,55}

De Carvalho C et al showed that very mild and mild forms of dental fluorosis in the primary dentition was associated with lactose intolerance, however there was no significant correlation with isolated consumption of manufactured soy-based food. Hujoel PP et al found that the fluoride concentration in infant formulas only has weak causal relationship to dental fluorosis.\textsuperscript{54}

Commercialized infant formulas, whether milk-based or soy-based, generally have varying composition and fluoride concentration. One cannot affirm that all soy-based formulas in the market has higher fluoride content than milk-based formulas and predispose its consumers to dental fluorosis. The questionable bioavailability of fluoride in milk formulas and the presence of other sources of fluoride such as food, water and toothpastes\textsuperscript{55} showed that fluorosis may not be directly and solely related to consumption of fluoridated milk formulas.

Hence, lactose-intolerant subjects who opt for soy-based formulas as substitutes are not particularly at risk of developing dental fluorosis compared to the general population.

**Dietary Management:** Lactose intolerance can be improved through diet modification\textsuperscript{56}, though subjects with secondary lactose intolerance often need further treatment to address the underlying condition. Once the underlying cause is treated, they can gradually resume intake of lactose.

Evidence show that individuals diagnosed with lactose intolerance do not need to practise a dairy-exclusion or severely-restricted diet\textsuperscript{57} as lactose intolerance is dose-dependent\textsuperscript{58} and most could tolerate up to 12g (equivalent to the lactose content in a cup of milk) in a single dose, taken alone, with no or minimal symptoms. When taken with meals, many can ingest 2 cups of milk without appreciable symptoms. If dietary calcium intake is inadequate, the daily calcium requirements need to be met from other dietary sources or supplements to prevent nutritional deficiency.\textsuperscript{59}

Probiotics, found in fermented and unfermented milk products, have been reported to bring beneficial effects to intolerant individuals.\textsuperscript{59} Microorganisms present, mainly the *Lactobacillus* and *Bifidobacterium spp.*, have endogenous lactase activity and help to break down lactose.\textsuperscript{60} Although conflicting results have also been published regarding the role of probiotics in lactose intolerance, frequent intake of probiotics was shown to contribute to overall oral health, either through direct local interaction with bacterial plaque or through indirect modulation of immune response. By altering the oral microbial ecology and suppressing the level of pathogenic bacteria, probiotics were observed to cause significant improvements in periodontal health and demonstrated some potential to reduce caries risk.\textsuperscript{61} Individual lifestyle, as it relates to the physical form of food and beverages consumed, individual susceptibility, and oral hygiene practice are considered the most important factors for development of dental caries.\textsuperscript{62}
Conclusion

Various aspects of oral health have been extensively studied worldwide. However, a clear focus on individuals with lactose intolerance and their general/dental health needs to be prioritised to come up with comprehensive dietary modifications and recommendations for improving the activities of daily living, health outcomes and quality of life in individuals in the community. Professionals in the fields of public health, health promotion, nutrition and dietary counselling are expected to play an important role in this direction in the coming decade.

ABSTRACT

Introduction: Consumer protection act (CPA) an act to provide for better protection of interests of customers. With increased consumer awareness, rising expectation, western trend of medical liability litigation and judicial activism the increasing number of complaints are being filed by dissatisfied patients resulting in growing distrust between patients and doctors and increased cost of medical treatment. Hence this study was designed to assess the level of awareness about Consumer Protection Act/CPA among the Oral & Maxillofacial Surgeons.

Materials and Method: A questionnaire based cross-sectional study was conducted among Oral & Maxillofacial Surgeons. Data was collected over a period of two months. The questionnaire consisted of 18 questions of CPA relevant to the Oral & Maxillofacial Surgeon. A written informed consent was obtained from each participant before filling the questionnaire. The data were analyzed using Statistical Package for the Social Sciences version 16.0 software (SPSS Inc., Chicago, Illinois, USA) Descriptive statistics were obtained and frequency distribution was calculated for awareness among Oral surgeons regarding CPA.

Results: The questionnaire had 18 items and options had to be selected. This survey comprised of a total of 300 participants. About 71 questionnaire were not filled completely, so they were excluded from the final analysis. The final sample included 6 Professors, 50 Associate Professors, 53 Assistant Professors, 120 Post graduates. The aim and objectives of CPA was known to only 37.2% of the participants. About 63.7% were aware that consumers lodge a complaint without the presence of a lawyer. The least correct answers were given to questions related to which level compensation claim of Rs15 lakhs should be made, and who can give consent for examination for a 15 year old patient. When asked what should be done to the consent form after treatment is over, 66.7% of professors, 80.8% of associate professors, 96.6% of assistant professors and 77.7% of post graduate students were aware that it should be preserved by the dentist. The maximum correct answers were given by the professors.

Discussion & Conclusion: In the present study, although the majority of subjects were aware of CPA, the analysis of data revealed that some misconceptions among the subjects about the liability of the practitioners in various circumstances. To conclude, the authors advocated the need to update understanding of Consumer Protection Act and its amendments to be legally correct

Keywords: Consumer Protection Act, Awareness, Questionnaire study
Introduction

Health is wealth. But if health is lost, one has to meet the doctor. Doctors are considered to be the visible Gods. Doctors are the trustworthy persons. A patient who approaches a doctor with an ailment will presume that he is the right and capable person to cure his defect. So there is also a duty on the part of the doctor to perform such obligation with proper care.

Nowadays, medical profession has become commercialized. Doctors adopt deceitful practices so as to attract the innocent patients and thereby collect money in huge amounts. The state has taken a lot of responsibilities to prevent those practices, but there is still room for lot to be done. Article 21 of the Indian Constitution impose an obligation on the state to safeguard the Right in Life of every person.

Apart from all types of deceitful practices, even at the time of treating the patients, doctors act negligently. This is not excusable. For that purpose they brought under the Consumer Protection Act, 1986 and amendments followed in 1991 and 2002. This is an act to provide for better protection of interests of customers and for that purpose to make provision for the establishment of consumer councils and other authorities for the settlement of consumer’s disputes and for the matters concerned therewith. Other laws are preventive in nature whereas CPA provides compensation. With increasing awareness of the consumers, rising expectation, medical liability litigation, and judicial activism, increasing number of complaints are being filed by dissatisfied patients resulting in growing distrust between patients and doctors and increased cost of medical treatment 3. Thus, a professional should have equal amount of knowledge as is entitled for the ordinary counterpart of his profession. He should be updated with the knowledge of new advances, discoveries and developments in his field as well as be aware of the deficiencies in his knowledge and the limitations of his skills. He should be alert to the hazards and risks in any professional task he undertakes to the extent that other ordinarily competent members of the profession would be. He must bring to any professional task he undertakes no less expertise, skill and care than other ordinarily competent members of his profession would bring, but need bring no more. Therefore a study regarding awareness of CPA is necessary to protect ourselves in case of litigation. Hence this questionnaire study was designed to gauge the level of awareness about Consumer Protection Act/ CPA among the Oral & Maxillofacial Surgeons.

Materials and Method

A questionnaire based cross-sectional study among Oral & Maxillofacial Surgeons from hospitals in South India was carried out. Data was collected during the month of Jan- Feb in 2016. Institutional scientific and ethical committee clearance was obtained before the initiation of the study. The questionnaire consisted of 18 questions covering the important aspects of CPA relevant to the Oral & Maxillofacial Surgeons. Prior to the data collection, the questions were pretested among a group of 5 professionals, in order to ensure the level of validity and degree of repeatability. The assessment of content validity in the questionnaire was related to the opinions expressed by a group of five academicians working in different institutions, in addition to their experiences in their own dental clinics. A written informed consent was obtained from each participant before taking the questionnaire. On completion of the questionnaire, the correct responses to all the questions, according to CPA, were given to all the participants.

The data was analyzed using Statistical Package for the Social Sciences version 16.0 software (SPSS Inc., Chicago, Illinois, USA). Descriptive statistics were obtained and frequency distribution was calculated for awareness regarding CPA among practitioners. Chi-square test was applied to check the statistical significance between the opinions among different designation.

Result

The questionnaire had 18 items and options had to be selected. This survey comprised of a total of 300 participants. About 71 questionnaire were not filled completely, so they were excluded from the final analysis. It included 6 Professors, 50 Associate Professors, 53 Assistant Professors, 120 Post graduates. The correct responses given by the respondents were depicted in Table 1. The aim and objectives of CPA was known to only 37.2% of the participants. About 63.7% were aware that consumers lodge a complaint without the presence of a lawyer. The least correct answers were given to questions related to which level compensation claim of Rs15 lakhs should be made, and who can give consent for examination for a 15 year old patient.

</tr>
</tbody>
</table>

% in parenthesis * Chi-square value ** df ***p value
When asked what should be done to the consent form after treatment is over, 66.7% of professors, 80.8% of associate professors, 96.6% of assistant professors and 77.7% of postgraduate students were aware that it should be preserved by the dentist. There was a great deal of misconception among 16.7% of professors, 46.6% of associate professors, 57.6% of assistant professors and 51.3% of postgraduate students about liability of doctors who do not charge their patients, even the registration fee.

Out of the 18 questions, the question number 4, 6, 9, 12, 14, 16, 18 revealed statistical significance difference in the opinion between professors, associate professors, assistant professors and postgraduate students. (Table 1). In a total of 18 questions, maximum correct answers were given by the professors.

Discussion

Consumer Protection Act came into force on April 18th 1986 and amendments followed in 1991 and 2002. An act is provided for better protection of interests of customers, and for that purpose provisions have been made for the establishment of Consumer Councils and other authorities for the settlement of consumer’s disputes and for the matters concerned therewith. Ramya Shenoy et al (2009) conducted a questionnaire study with the aim of assessing the awareness among dentist regarding the Consumer Protection Act. This study showed that interns were less aware as compared to the faculty. The study carried out by Gambhir et al showed that graduates had less knowledge scores compared to those who have completed post-graduation.

In the present study, although the majority of subjects were aware of CPA, the analysis of data collected revealed some misconceptions among the subjects about the liability of the practitioners in various circumstances. Out of the 18 questions the following questions on patient can sue a doctor for rejecting a medically compromised case; Doctors in hospitals who do not charge their patients at all (even registration fee); the maximum time period within which a patient can sue the concerned doctor with evidence and about written informed consent revealed statistical significance difference in the opinion between professors, associate professors, assistant professors and postgraduate students. Overall, the maximum correct answers were given by the professors.

To conclude, the authors advocated the need to update understanding of Consumer Protection Act and its amendments. It is always better to take necessary steps to protect ourselves in case of litigation.

A Study on Performance Evaluation of Selected ICICI Prudential Mutual Fund Schemes

S. Jayakani¹, S. Vennila Fathima Rani¹
¹Associate Professor, Department of Commerce, School of Management Studies & Commerce, VELS University, Chennai

ABSTRACT

The reforms in the financial sector and many developments in Indian money market and capital market have made Mutual Funds as an important portal for the investors to invest their savings in different schemes. The revolution in the development of communication technology also has become so advanced which acts as a link between the issuers of financial instruments and the global investors. Hence mutual funds became a most appropriate investment avenue for individual investors as it offers the advantage of professional management of money, portfolio diversification, reduced transaction cost and liquidity. An attempt has been made to analyse the performance of different ICICI Prudential mutual fund schemes which has been included in the sample during the study period of 2017-18 consisting of 12 months. In order to achieve the pre-determined objectives, an analysis has been made to compare these schemes with the market on the basis of risk and return.

Keywords: Mutual funds, Risk, Return and Portfolio

Introduction

A Mutual Fund is a trust that pools the savings of a number of small investors, in the form of units, who have a common financial goal. The money thus collected by them is invested in financial market instruments such as shares, debentures, bonds, money market instruments or some combination of these investments in such a way, as to minimize risk, while ensuring safety and a steady return on investment.¹ Mutual funds have been a new outlook to millions of investors which take investment to their door step. The investment habit of the investors has undergone a sea change.² Increasing number of players from public as well as private sectors has entered into the market with innovative schemes to cater the requirements of the investors in India as well as abroad. Mutual funds have increasingly become the investor’s vehicle of choice of investment. The relationship between risk and return determines the performance of a mutual fund scheme, therefore providing maximum return on the investment made within the acceptable associated risk level helps in segregating the better performers from the laggards.³ Hence an attempt has been made to analyse the performance of different ICICI Prudential mutual fund schemes which has been included in the sample during the study period of 2017-18 consisting of 12 months. In order to achieve the pre-determined objectives, an analysis has been made to compare these schemes with the market on the basis of risk and return.⁴

Objectives of the Study

- To examine the concept of Mutual funds in Indian stock market.
- To evaluate the systematic and unsystematic risk of selected ICICIPrudential mutual fund Schemes.
- To examine the relative performance of selected ICICI Prudential mutual fund Schemes by applying Sharpe ratio and Treynor ratio.

Methodology

The study is mainly based on secondary data which was collected from the data sources like factsheets of mutual funds, magazines on mutual funds, articles,
newspapers, AMFI reports and its website. The performance evaluation has been carried out for a five schemes selected for the study. These schemes were selected randomly from ICICI Prudential Mutual fund as it stands top with the average asset under management of Rs.305739 crores as on 31st March 2018. A period of 12 months ranging from 1st April 2017 to 31st March 2018 has been considered in evaluating the performance of the funds. The selected five schemes were taken from the growth/equity schemes of open-ended mutual funds.

The study employed the post office saving deposit interest rate of as the proxy risk-free rate of return. The reason behind using post office interest rate as risk free rate is because Indian investors deposit at least their minimum savings in post office because of the high security associated with post office. Nifty 50 Index is taken as a proxy for market index.

**Findings**

**Sharpe Ratio:** The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. Subtracting the risk-free rate from the mean return, the performance associated with risk-taking activities can be isolated.

\[
\text{Sharpe ratio} = \frac{r_p - r_f}{\sigma_p}
\]

**Benchmark:** A benchmark is a standard against which the performance of a mutual fund can be measured. It was made mandatory by SEBI for fund houses to declare a benchmark index from 2012.

**Treynor Ratio:** The Treynor ratio relates excess return over the risk-free rate to the additional risk taken, however, systematic risk is used instead of total risk. The higher the Treynor ratio, the better the performance of the portfolio under analysis.

The following table 1 highlights the portfolio return, Sharpe ratio and benchmark for the selected ICICI Prudential mutual fund schemes for the period of 2017-18 consisting of 12 months.

**Table 1: Sharpe Ratio**

<table>

<td>-0.2709</td>
<td>-0.1332</td>
<td>Under performed</td>
</tr>
</tbody>
</table>

**Source:** secondary data

From table 1 it is observed that the schemes ICICI Prudential Nifty ETF and ICICI Prudential Money Market Fund Option - Direct Plan - Growth have a positive Sharpe ratio which acts as a positive measure or performance of the schemes in the sample in terms of total risk taken by the investors. Higher Sharpe ratio of 0.2934 is found in ICICI Prudential Nifty ETF and lower Sharpe ratio of -0.3016 is earned by ICICI Prudential Dynamic Bond Fund – Growth. The performance of the schemes are compared with the benchmark index of the market. It is found that out of the 5 schemes selected for the study, 2 schemes has been outperformed when compared with the benchmark of market returns and remaining 3 schemes were underperformed.

**Treynor Ratio:** The following table 2 highlights the Treynor ratio for the selected ICICI Prudential mutual fund schemes taken in the study.

**Table 2: Treynor Ratio**

</tr>
<tr>
<td>ICICI Prudential Long Term Bond Fund – Growth</td>
<td>-2.0994</td>
<td>-0.5858</td>
<td>Under performed</td>
</tr>
</tbody>
</table>

Source: secondary data

It is evident from the above table that all the schemes have a negative Treynor ratio which acts as a negative performance of the schemes in the sample in terms of systematic risk taken by the investors. A fund with a higher Treynor ratio implies that the fund has a better risk adjusted return than that of another fund with a lower Treynor ratio. Highest Treynor ratio of -2.0994 is found in ICICI Prudential Long Term Bond Fund - Growth plan which offers a better risk-reward equation for the investor and Lowest Treynor ratio of -3.0771 is grabbed by ICICI Prudential Regular Savings Fund - Plan - Growth Plan which shows less risk adjusted return among the five schemes selected for the study. The performances of the schemes are compared with the benchmark index of the market. It is found that all the five schemes selected for the study has been underperformed.

Risk: The following table 3 highlights the unsystematic and systematic risk for the selected ICICI Prudential Mutual Fund schemes taken in the study.

<table>
<thead>
<tr>
<th>Schemes</th>
<th>Unsystematic risk</th>
<th>Systematic risk</th>
</tr>
</thead>
<tbody>

<td>31.6530</td>
<td>-4.1208</td>
</tr>
<tr>
<td>ICICI Prudential Long Term Bond Fund – Growth</td>
<td>26.1433</td>
<td>3.3728</td>
</tr>
</tbody>
</table>

Source: secondary data

A higher standard deviation i.e., unsystematic risk characterize that the returns of the fund have been more unstable and risky than fund having lower standard deviation. From the above table it is clear that, highest standard deviation of 108.8301 is found in ICICI Prudential Nifty ETF stating instability of the fund. The systematic risk i.e., beta value is less than 1 in the schemes as ICICI Prudential Regular Savings Fund - Plan – Growth, ICICI Prudential Nifty ETF and ICICI Prudential Money Market Fund Option - Direct Plan - Growth indicating less risky return than the market return. Highest beta value of 3.3728 is found in the scheme ICICI Prudential Long Term Bond Fund - Growth which has the highest volatility and lowest beta value of -13.79 is found in ICICI Prudential Long Term Bond Fund - Growth plan which has low volatility.

Conclusion

In this study performance of five ICICI Prudential Mutual Fund Schemes were examined for the period between April 2017 to March 2018. Out of the 5 schemes selected for the study, ICICI Prudential Nifty ETF schemes have the highest return. The performance of the selected schemes was evaluated using Sharpe ratio and Treynor ratio. It was concluded that ICICI Prudential Nifty ETF schemes and ICICI Prudential Money Market Fund Option - Direct Plan - Growth schemes has outperformed the market and are risk borne when compared to other schemes.5

Human Papilloma Virus-Oral Perspective

Sankar Narayanan R, Rajesh Elumalai, Malathi
1Senior Lecturer, Department of Oral Medicine & Radiology, 2Reader, 3Reader, Department of Oral Pathology, Sree Balaji Dental College and Hospital, Chennai

ABSTRACT

The oral cavity is a common site for human papillomavirus (HPV) infection, however much is still unknown about the spectrum of oral lesions associated with HPV. HPV is associated with a variety of clinical conditions that range from innocuous lesions to cancer. HPV types are divided into high and low-risk types, according to the oncogenic potential. Molecular and epidemiologic studies have identified the association between high-risk HPV types (especially HPV-16 and HPV-18) and oral potentially malignant and malignant lesions. Although HPV is one of the etiologic agent of oral cancer, it is not a single contributing factor and a variety of factors contribute to the cancer development. Risk factors include smoking, panchewing, alcohol consumption.

Keywords: Human papilloma virus, Potentially malignant oral diseases, Oral cancer

Introduction

Human Papillomaviruses (HPVs) are a group of DNA viruses, which have a remarkable target cell specificity: reported principally in anogenital tract, urethra, skin, larynx, tracheobronchial mucosa and oral cavity. More than 100 different types of HPV have been classified and they are divided into high oncogenic risk genotypes (16, 18, 31, 33, 35, 58) and low oncogenic risk genotypes (2, 4, 6, 11, 13, 32) depending on their association with malignant change. Specific HPV subtypes from both high and low risk groups are associated with epithelial lesions found on the skin and mucosa.

The HPV Genome: The HPV viral genome is non-enveloped, circular and has an approximate size of 8Kb. The viral genome is transcribed from a single strand of viral DNA, which consists of 8 open reading frames (ORFs). The genome contains 3 main parts; the early region (E), late region (L) and a non-coding long control region (LCR). The E region encodes viral proteins E1-E7, which control the transcription of viral DNA, while the L region encodes viral proteins L1 and L2, which control assembly of the virion and viral spread. The replication factors E1 and E2 are amongst the first viral proteins that are produced and are thought to be responsible for regulating the replication and transcription of viral DNA. It is thought that E4 and E5 are involved in the regulation of late viral functions, however their exact role remains unknown. E6 and E7 target the host proteins pRb and p53, which regulate progression through the cell cycle.

The HPV Life Cycle: HPVs demonstrate selective affinity for keratinocytes, infecting the basal and parabasal cells of squamous epithelium. It is most likely that the virus gains access to basal cells via microscopic breaks in the mucosa. The life cycle of HPV is closely associated with the differentiation of epithelial cells, and production of mature viral particles only occurs in terminally differentiated keratinocytes. In order for the virus to continue replicating in a differentiated cell which contains little to no replicative machinery, the virus expresses proteins early in infection in the basal epithelial compartment, which stimulates G1 to S phase progression.

Prevalence of Oral HPV Infection in the General Population: Detection of HPV requires epithelial samples that can be obtained by tissue biopsy or exfoliated epithelial cells. Oral HPV detection is
accomplished by the examination of exfoliated cells collected by direct swabbing or in oral rinse or saliva samples. Because of the ability to collect exfoliated cells over a larger area, oral rinsing is considered to be the most sensitive method for oral HPV detection, however it is unknown how behavioural factors such as recent food consumption and oral hygiene may influence the detection of HPV. Prevalence rate ranging from 0-70% in cervical mucosa12,13. Larger population based studies, however, estimate that the overall prevalence of HPV in the oral mucosa in normal individuals is approximately 5-10%, which is substantially lower than in the cervix14,15.

**HPV Detection Methods**

**Low Sensitivity: Immunohistochemistry and in situ hybridization** - because they only detect the virus when it is present in more than 10 copies of the viral DNA per cell.

**Moderate Sensitivity: Southern blot, dot blot and reverse dot hybridizations** - because they only detect the virus when present in 1 to 10 copies of the viral DNA per cell.

**High Sensitivity: PCR** - because it detects the virus in less than 1 copy of the viral DNA per cell16.

**Human Papillomavirus Prevalence in the Oral Cavity and Oropharynx:** In the normal oral mucosa HPV rates detected, from 22% to 60% from 0% all the way to 81.1% in studies using different methods, and with a limited number of individuals, and this seems to depend on the population studied and the choice of method. Oral and oropharynx squamous cells papilloma are benign tumors that occur mainly between 30 and 50 years of age, although they may also occur below 10. They usually involve the soft palate, tongue, frenulun linguae and the lower lip. In most of the cases, the papillomas are single and small (<1cm)24. They have an exophytic growth and show up both as a broad based ovoid bulging or a pedicled lesion. The surface may present small finger-like projections, giving it a rough verruca contour. The color varies from white to pinkish, depending on the levels of keratinization and vascularization16.

**Oropharynx and Oral Condiloma Acuminata:** Oral condiloma acuminata is usually considered a sexually transmitted disease, acquired by oral sexual contact but may also be transmitted by self inoculation or maternal transmission. In the mouth they are usually present as small pinkish or whitish nodules. They occur alone or in multiple form, frequently on the tongue, lip, palate and floor of the mouth. The human papillomavirus was detected in condilomatous oral lesions, initially by immunohistochemistry, and later by hybridization techniques, with a positiveness varying between 75% to 85% for HPV 6 and 1117.

**Oral and Oropharynx Common Wart:** The common wart is one of the most common skin lesions, specially in children. They are frequently located on the lips, hard palate, gums and tongue dorsum. They observed a variation in the HPV detection rates from 43% to 100% in oral warts18,19.

**Oral Focal Epithelial Hyperplasia (FEH):** The term focal epithelial hyperplasia or Heck’s disease is a benign lesion located in the oral mucosa, tongue and most notably in the lower lips19. It is clinically characterized by multiple painless and soft papules, of color that varies between pale pink and the normal mucosal color. Viral etiology has been initially shown by Immunohistochemistry and later on by hybridization techniques identifying HPV 13 and 32, which were detected in 75-100% of the cases20.

**Human Papillomavirus Prevalence in Oral Cancer and Oropharynx:** Unfortunately, oral cancer still bears high mortality rates. Its incidence rate varies from one region to another, being high in India, Sri Lanka, Vietnam, Filipinas, Hong Kong and Taiwan, where about 30% of all the cancers occur in the oropharynx2. Oral cancer includes malignant neoplasms in the lips, oral cavity and oropharynx. Cigarette smoking and alcohol are the main causes of oral cancer. However, part of the population develops oral cancer without having been exposed to these risk factors, suggesting other causes, such as: genetic predisposition, diet and viral agents, most specifically HPV. HPV role as an etiological agent in the oral cancer is less than that from alcohol and tobacco use. Many studies have shown HPV 16 to be the most prevalent type in oral cancer. According to many studies, the HPV prevalence rate in oral cancer varied from 0-100%21. One of the greatest difficulties in identifying HPV in oral cancer patients is the presence of this virus in only one subpopulation of cells and the reduced number of copies of these cells which are infected. That is why we need high sensitivity detection methods.
Verrucous Carcinoma: The verrucous carcinoma was first described as a variant of the squamous cells carcinoma, which originates in the oral cavity. Also known as Ackerman’s tumor, its growth is exophytic, slow and invasive only superficially, with a low metastasis rate, and it may be treated with simple excision. Many authors have reported the HPV presence in the verrucous carcinoma.

Discussion

HPV prevalence in the oral cavity and oropharynx is considered uncertain, because many studies have shown different results with the estimate of a small number of patients, and a modest identification among the different types of HPV found in mucosal lesions. HPV diagnosis in the oral mucosa and the oropharynx may be suspected by the clinical exam of the lesion, cytology and biopsy; however the molecular biology exams are the ones able to detect the HPV DNA in the cell, stressing the polymerase chain reaction as the most sensitive method to detect HPV. The assessment of different methods used to detect HPV16 is important and fundamental in order to establish the etiological role of HPV in oral lesions. Other factors that contribute to increase HPV prevalence in the oral cavity and oropharynx are reduction in the patient’s immune response for the virus, having more than one sexual partner and the practice of oral sex these all increase the likelihood of an HPV infection and its recurrence.

Conclusion

Human papillomavirus infection, high or low risk, is not a common finding in oral cavity. High risk HPV types are associated with high grade oral epithelial dysplasias with characteristic histopathologic features, which preferentially affect the floor of the mouth. Low risk HPV may be helpful in identifying atypical papillary lesions that are unlikely to show potentially malignant behaviour. Malignant papillary lesions are large and locally destructive, but rarely result in death from disease.

The Mounting Horizons of Corporate Criminal Liability

Smita Satapathy¹, Madhubrata Mohanty²
¹Research Scholar, ²Associate Professor, Faculty of Legal Studies, Siksha ‘O’ Anusandhan, Bhubaneswar, Odisha, India

ABSTRACT

Corporations play a significant role not only in creating and managing business but also in common lives of most people. A living person has a mind and body which can have knowledge or intention or be negligent and he has hands to carry out his intentions. A corporation has none of these; it must act through living persons, though not always one or the same person. The corporate criminal liability is like a parasite which is detrimental and unsafe and can cause harm any time to the company as well as to the society (public at large). It needs a host like the parasite to spread its influence and in the case of corporate criminal liability the directors, officers or managers plays the role of the host. This article is an attempt made by the author to reflect the concept of corporate criminal liability and its impact on the society.

Keywords: Corporation, corporate criminal liability, offence, society

Introduction

“A company can only act through human beings and a human being who commits an offence on account of or for the benefit of a company will be responsible for that offence himself.”

—Glanville Williams

Corporations play an important role not only in constructing and running business but also in common lives of most people. That is why most modern criminal law systems anticipate the possibility to hold the corporation criminally liable for the perpetration of a criminal offence. With the increasing role of large multinational corporations in the world economy today and the growing figure of India as a favored worldwide investment destination, the nature and extent of corporate criminal liability in India definitely assumes a unique significance.

It has been rightly said, “Many weeds have grown on the acre of jurisprudence which has been allotted to the criminal law. Among these weeds is a hybrid of vicarious liability, absolute liability, an inklings of mens rea—though a rather degenerated mens rea, a few genes from tort law and a few from the law of business associations. This weed is called corporate criminal liability. Nobody bred it, nobody cultivated it, and nobody planted it. It just grew. To be quite sure, it has not done much harm; at least nobody has established any harmful results stemming from its mere existence, so that some may well wish to conclude upon its usefulness. Has it done good? Nobody knows, though the farmers of the law have formed many opinions, all resting on rather educated agronomic conjecture.”¹ But the weed of Corporate Criminal liability is identified and need to be addressed in the present scenario as it is gaining momentum in the era of globalization.

Corporate criminal Liability refers to the imposition of criminal liability on the corporation through its employees and agents. Or it can be defined as illegal act of omission or commission, punishable by criminal sanction committed by individual or group of individual in course of their occupation. The corporate criminal liability is the liability imposed upon a corporation for any criminal act done by its employee. Liability is imposed on the corporation in order to regulate the acts and affairs of the corporation.²

Corporate criminality can be even defined as publicly harmful acts which represent a kind of instrumentalities

DOI Number: 10.5958/0976-5506.2019.01004.0
committed in course of occupations by people who are in a position of managing and are responsible for the affairs of the company. “Corporate criminal Liability refers to the imposition of criminal liability on either the corporation or its employees and agents”. A corporation neither has soul nor body, and it cannot act like a real man. Whatever interests, rights, property a company possesses in law in fact is actually held and managed by the shareholders or directors because every legal or juristic person have some natural persons as their agents and representatives to act on their behalf.3

Objective

The purpose of research in this topic of corporate criminal liability are:

1. To know whether the corporations are entitled to punishment, even if they are legal entities and juristic persons.

2. To know whether there are sufficient provisions provided in the statutes which can regulate this criminal liability of corporation.

3. To know how the Indian Judiciary is tackling these types of cases relating to corporate criminal liability.

Jurisprudence of Corporate Criminal Liability:

Corporation is a legal fiction created by the law to act like a human being in several respects though it is incapable of performing certain physical and emotional acts peculiar to the human body and mind. Although the companies are not exactly similar to a natural person, but, the actions of a corporeal person, the conducts of the corporation have consequences.5

“A company cannot be guilty of any criminal offence which, by their very nature, can only be committed by natural persons (such as bigamy), nor of those which cannot be committed vicariously (such as perjury, bigamy, rape, homicide, etc.). A company cannot be indicted for a crime where the only punishment is death or imprisonment. A company may be guilty both of statutory and common law offences, even though the latter involves mens rea. A corporation can be indicted for contempt and libel”.6 In criminal law, the basic rule is actus non facit reum, nisi mens sit rea which means one has to prove the act done which was forbidden by law has been done with guilty mind. So, every crime has two elements one physical known as actus reus and other mental known as mens rea. As per the fundamental rule of criminal liability, the guilty mind or Mens Rea has to be proved but it sounds odd in case of corporations, because they are not human beings. However, corporations are handled, created and managed by human beings known as directors, officers or managers. So, if any company or corporation is criminally held liable then it will hold the persons liable who are responsible for the given work. Corporate liability determines the extent to which a corporation as a fictitious person can be liable for the acts and omissions of the natural persons it employs.7 Under Section 305 of the Code of Criminal Procedure, it provides there will be a representative appointed on behalf of the corporation for purpose of inquiry, trial and appeal.

The major law relating to Corporations in India is codified in The Company Act, 1956 and the definition of Corporation as given in the Act under Section 2 (7) includes a company. In India, liability of the corporation is basically liability of the company only as it is a creation of law. It is not a human being but an artificial person so when a company is incorporated than the human beings will take the responsibility and on the behalf of the company they will get punishment however it is difficult to analyze whether the corporations can be held liable because corporations cannot have the mens rea or the guilty mind to commit an offence and corporations cannot be imprisoned. Corporation is a body that is granted a charter, recognizing it as a separate legal entity having its own rights, privileges and liabilities distinct from those of its members.8
Theories of Corporate Criminal Liability:

Agency: It is based on the agency principle whereby the company is liable for wrongful acts of all its employees. As from Torts we know that the Master is liable for the work of agent according to the vicarious liability principle. US federal law employs a principle of this type, respondeat superior, while English law confines the application of vicarious liability to certain regulatory offences. It seeks to equate corporate culpability which that of an individual and therefore derivative forms of liability.9

Attribution: The Second theory of blame, which English law utilises for all other offences, identified a limited layer of senior officers within the company as its brains and renders the company liable only for their transgressions, not for those of other workers. It adopts an anthropomorphic vision of company decision-making.10

Alter Ego (Identification): In the middle of twentieth century, the English Law considered a form of corporate liability that could apply to serious offences such as fraud, theft and manslaughter. The English judges stipulate more of a showing of a direct connection between the company and the person responsible for the criminal harm than is provided by theories of vicarious liability.11 Granville Williams had drawn a division that lowly company employees were declared to act as the hands while directors and officers represent the brains of the company. The identification doctrine is insufficient to deal with the reality of decision-making in many modern companies. Several alternative methods for the establishment of corporate culpability have been introduced.12

Development of Corporate Criminal Liability in India: It is pertinent to understand the development of corporate criminal liability in India. The criminal law in India has developed as a method for taking action to individual wrongdoing. Individuals as independents are free to control their actions, to think and make decisions, including the choice to do wrong. Consequently, such persons can be held liable for those choices and can be blamed and punished for them. The individualistic idea of accountability does not logically include artificial organizations such as companies.

If observed, “it can identify that much of our lives today is affected by companies: we work for them (in conditions that might be dangerous); we purchase their products (that might explode or poison us); we travel in their ferries and trains (that might be unsafe); we drink the water they provide (which might be unclean) and we breathe the air (into which they might have emitted their fumes). So, in short, companies can kill or injure us. But can they be held criminally responsible is the main question.”13

In India there is no particular law or act which deals with the law relating to corporate criminal liability. The law on this point is not confined to the general criminal law as provided in the penal code but it is in fact scattered over a plethora of statutes with specific provisions for the same.14

“Section 2 of the Indian Penal Code 1860 provides that every person shall be liable to punishment under the Code. Section 11, as is common in common law countries, defines a person as including ‘any Company or Association or body of persons, whether incorporated or not’. Section 11 of the Indian penal code defines person to include any company or association or body of persons incorporated or not. Indian courts have inherited the identification approached from England”.

“The Companies Act, 1956, also imposes criminal liability on companies as well as on the directors and other officers of the company. A perusal of the following sections under the Companies Act,1956 indicate thus-

1. Section 59 provides that if any prospectus is issued in contravention of section 57 or section 58, the company and every person who is knowingly a party to the issue shall be punishable with fine.

2. Section 108I (4) (b) mandates that if any company gives effect to any voting or other right exercised in relation to any share acquired in contravention of the provisions of section 108B or which gives effect to any voting right in contravention of any direction made by the central government under section 108D, the company shall be punishable with fine

3. Section 142 provides that if default is made in filing with the registrar for registration the particulars (a) of any charge created by the company (b) of the payment or satisfaction of a debt in respect of which a charge has been registered under this part (c) of the issue of debentures of a series; requiring registration with the registrar under the provisions of this part, then, unless the registration has been
effected on the application of some other person, the company and every officer of the company who is in default shall be punishable with fine.”

The drafters had inserted Section-86 in Companies Act, 2013 which provides “punishment for contravention- if a company contravenes any provision of the companies act, then the company shall be punishable with fine which may extend to 10 lakhs from 1 lakh and every officer of the company who is in default shall be punishable with imprisonment for a term which may extend to 6 months.”

*Standard Chartered Bank and Ors. v. Directorate of Enforcement*[2005) 4 SCC 530]

This is the landmark case in which the apex court overruled all the previous laid down principles. In this case, Standard Chartered Bank was being prosecuted for violation of certain provisions of the Foreign Exchange Regulation Act, 1973. Ultimately, the Supreme Court did not apply the literal or strict interpretation rule for penal statutes and held that the corporation could be prosecuted and punished, with fines, regardless of the mandatory punishment required under the respective statute.

In *Iridium India Telecom Ltd. v. Motorola Incorporated and Ors*[AIR 2011 SC 20 ], the apex court held that a corporation is virtually in the same position as any individual and may be convicted under common law as well as statutory offences including those requiring mens rea. In Iridium, the Supreme Court held: “The criminal liability of a corporation would arise when an offence is committed in relation to the business of the corporation by a person or body of persons in control of its affairs. In such circumstances, it would be necessary to ascertain that the degree and control of the person or body of persons is so intense that a corporation may be said to think and act through the person or the body of persons.” The notion that a corporation cannot be held liable for the commission of a crime had been rejected by adopting the doctrine of attribution and imputation.

The Supreme Court recently in *Sunil Bharti Mittal v. Central Bureau of Investigation (“CBI”) and Others* held that the “principle of alter ego can only be applied to make the company liable for an act committed by a person or group of persons who control the affairs of the company as they represent the alter ego of the company; however it cannot be applied in reverse direction to make the directors of the company liable for an offence committed by the company.”

**Conclusion**

The corporations currently play such a pivotal role in everyday life and wield such enormous powers and so many of them have been recently involved in serious misconduct. The corporate criminal liability is like a parasite which is detrimental and unsafe and can cause harm any time to the company as well as to the society (public at large). It needs a host like the parasite to spread its influence and in the case of corporate criminal liability the directors, officers or managers plays the role of the host. It is frequently argued that a company cannot act except through real persons like directors, officers and employees. Although in the past there was a view that the companies cannot prosecuted for offences attracting mandatory punishment of imprisonment and fine, as imprisonment cannot be enforced but as of now the rule has been changed and now Supreme court held that company should not be allowed to escape from its technicality. The concept of corporate criminal liability is evolving more through the judicial analysis then the legislative changes in the law.

A Study of Prevalance of Thyroid Dysfunction in Pregnancy in a Rural Hospital of Uttar Pradesh

Anjali Kumari¹, Sunil Takiar², Sukla Debbarma³, Rajni Agarwal⁴
¹Junior Resident, ²Assistant Professor, ³Senior Resident, ⁴Professor (Former), Department of Obstetrics & Gynaecology, Saraswathi Institute of Medical Sciences, Hapur

ABSTRACT

Thyroid dysfunction is the 2nd most common endocrine disorder in women of childbearing age affecting two generations. There is no clear data available for rural areas of this sub-Himalayan zone, once with a known endemicity for iodine deficiency. A total of 300 pregnant women attending antenatal OPD of a tertiary care centre (SIMS, Hapur) in rural western UP, at their first visit, were enrolled for study. Epidemiological & clinical details were recorded and thyroid screening test (TSH) done after confirmation of pregnancy. Patients were followed up until delivery.

Out of the 300 patients enrolled, 20 were excluded and 280 were finally analysed. As per trimester specific reference range for TSH, patients were categorised into 3 groups. Euthyroid (n=233, 83.2%), Subclinical (n=43, 15.3%), and overt Hypothyroid (n=4, 1.4%) groups. Subclinical hypothyroidism detection rate was a little higher (17.6%) in 2nd trimester than elsewhere while overall prevalence was 16.8%. The rates of prevalence of Hypothyroidism in the pregnant population in our study confirms largely with data from other studies in the region

Keywords: Thyroid dysfunction, Pregnancy, Rural

Introduction

Universal salt iodisation in India was implemented all over India by 1992 under National Goitre Control Programme, 1962 (Modified to NIDDCP, 1992) which brought a revolution in management of thyroid disorders in form of drastic decrease in prevalence of goitre especially in sub-Himalayan belt but, even years after that, prevalence in Indian pregnant women is still high & masked by other common medical disorders of pregnancy. In pregnancy, thyroid disorder is the second most common endocrine disorder after Diabetes Mellitus that affects health of two generations (¹,²).

In pregnancy, thyroid gland undergoes wide adaptation in both size & synthesis of thyroid hormone as per increased demands of body metabolism. Thyroid gland may enlarge by 10% (in iodine sufficient area) or more (in iodine insufficiency areas)³, whereas, production of thyroid hormones and iodine requirement each increases by approximately 50% to combat it⁴.

This study was designed to find the prevalence of hypothyroidism in child bearing age in women during pregnancy irrespective of period of gestation, in rural areas of western part of Uttar Pradesh. This was a hospital based observational study.

Method

The study was conducted from March 2017 to February 2018 after approval from institutional ethical committee.

A total of 300 women attending antenatal OPD at Saraswathi Institute of Medical sciences, Hapur, a tertiary care hospital in rural area of western UP, were enrolled for the study at their first visit, after taking informed consent, irrespective of gestation. Epidemiological & clinical details were taken after confirmation of pregnancy. Detailed obstetric, menstrual, personal, family history and past history of thyroid medication or thyroid surgery & clinical examination were recorded using a predesigned proforma. Thyroid screening (TSH) was done along with routine investigations.
Under aseptic precautions, 3ml of venous blood was collected in morning hours after overnight fasting and processed in central pathology lab at SIMS, Hapur. TSH levels were compared with trimester specific reference range (ATA, 2011). Abnormal values were further sampled for FT4 & thyroid antibody (TPO) in a NABL accredited laboratory.

### Statistical Analysis

The data was entered in excel sheet & percentages of various outcome measures were calculated & statistical analysis was done by using SSPS software (20.0 version). Relevant statistical test was applied and statistical significance was determined.

### Results

300 pregnant women in all three trimesters were screened for TSH level. 20 cases were excluded from the study due to previously known thyroid dysfunction, on thyroid supplements. Out of 280 patients, 80 patients in 1st trimester, 147 in 2nd trimester and 53 in 3rd trimester were analysed for study.

A total of 280 patients attending the ANC OPD at this hospital were evaluated during the study. The total number of patients were divided into 3 groups as per trimester specific reference range for TSH. The incidence specific prevalence of Thyroid status has been enumerated vice Table-2. The prevalence of the disease in the study group is summarized as – Euthyroid patients (n=233, 83%), Subclinical Hypothyroidism (n=43,15.3%), and Overt hypothyroid patients (n=4, 1.4%). The majority of patients reported during the 2nd Trimester of pregnancy (n=147, 52.5%), whereas, only 80 patients (28.5%) reported during the 1st trimester. A significant number of patients (n=53, 18.9%) still continue to report first during the 3rd trimester.

### Discussion

This study was aimed at evaluating thyroid function during pregnancy in Rural areas of western part of Uttar Pradesh (UP). Important findings are that overall 16.8% women attending tertiary care hospital have abnormal thyroid function in pregnancy, out of which, majority (91%), have subclinical hypothyroidism.

After wide acceptance of guidelines by ATA & National association of clinical biochemist (NACB) about the upper limit of normal TSH during pregnancy (2.5 mIU/ml in 1st trimester & 3.0 mIU/ml in 2nd & 3rd trimesters) (5, 6), there was major concern about updated prevalence of thyroid dysfunction in pregnancy in different zones according to these changes. Majority of previous studies have reported the normal adult cut-off levels of upper limit of TSH as 4.5mIU/ml, so, updated prevalence will be definitely higher.

Our findings are consistent with the study done by Jaya et al., where the rate of prevalence was 14.2% and also similar with another report done by Dhanwal et al., who reported 14.3% women in their 1st trimester to be having hypothyroidism.

Another multicentric study across India enrolling 2599 pregnant women depicts overall prevalence of 13.13%, majority being subclinical which is comparable with our results.

A cross-sectional study conducted in central UP (Lucknow) by Parveen S et al., showed prevalence of 14.7% with slightly high prevalence (16.7%) in 25-30 yrs age group pregnant women, this, almost equalising our result. The study done by Kalra et al., showed that 15.7% pregnant women were suffering from hypothyroidism in North India.
TPO level assessment could not be done in all patients when needed, as it had to be outsourced to another centre (affordability by the patients being the predominant issue) and that once the thyroid dysfunction was detected and treated, subsequent TSH levels after treatment initiation could not be analysed post-delivery due to loss of follow-up by patients.

Conclusions

Most relevant point in our study was that it was conducted on population in rural areas which were relatively deprived of latest diagnostic aids, a facility easily available in even the remote location of centres in urbanized areas.

According to our study, subclinical hypothyroidism detection rate was a little higher (17%) in 2nd trimester than 1st trimester. The rates of prevalence of Hypothyroidism in the pregnant population in our study confirms largely with other studies in the region.

If untreated, subclinical hypothyroidism leads to adverse effects on pregnancy outcome. Early diagnosis & treatment is helpful in preventing the complications e.g. miscarriage & stillbirth, if the patient is routinely advised thyroid function tests during her first prenatal visit or soon after the pregnancy is confirmed.

Future Prospects: All pregnant women should be screened for thyroid disorder with trimester specific reference range as a part of universal screening in our country in view of high prevalence of undiagnosed cases. Most cases of subclinical hypothyroidism resolve soon after pregnancy, treatment with L-thyroxin should be reviewed in postpartum period.

Thyroid function test must be performed during subsequent pregnancy in affected women even though resolved in the interim postpartum period.

Source of Funding: No funding sources were utilized.

Conflict of Interest: None declared

Ethical Approval: The study was approved by the Institutional Ethics Committee

Facial Esthetic Correction Using Cheek Plumper and Cross-Arch Occlusion Concept in Skeletal Class III Complete Denture Patient—A Case Report

Sunny Sharma1, Rupinder Singh Dhall2, Sumit Singh Phukela3, Sunita Dhall4, Renuka Atwal5

1MDS 3rd year Student, 2Professor, Deptt. of Prosthodontics and Implantology, Himachal Institute of Dental Sciences, Paonta sahib, H.P, India; 3Professor, Deptt. of Prosthodontics and Implantology, S.G.T Dental College, Hospital & Research Institute, SGT University, Gurugram, Haryana, India; 4Senior Lecturer, Deptt. of Periodontics and Implantology, 5MDS 3rd year Student, Deptt. of Prosthodontics and Implantology, Himachal Institute of Dental Sciences, Paonta sahib, H.P, India; 6Senior Lecturer, Sudha Rustagi Dental College and Hospital, Faridabad, Haryana, India

ABSTRACT

Esthetic factor not only confined to teeth but also to be considered for facial appearance. Facial esthetic may be compromised due to lack of support from the internal structures i.e. teeth, ridge, muscles etc. This results in slumped or hollow cheek proving detrimental to facial esthetics. Cheek plumper help to enhance facial appearance by supporting the slumped cheeks. Variance of arch form and arch size in the same mouth may be due to continuous resorption of the maxilla and the mandible. Also varying degrees of closure of the jaw alter the ridge relations. These alterations in ridge relations may cause a unilateral or bilateral “cross-bite” relation in the posterior segments of the arch. This complicates the denture fabrication in conventional manner. The purpose of this case report is to present a simple technique for correction of facial esthetics using cheek plumer and bilateral cross arch occlusion concept.

Keywords: Cheek plumer, Cross arch occlusion, Skeletal asymmetry, Facial esthetics, Cross bite

Introduction

Transforming conventional into unconventional approach is a characteristic feature of evergrowing prosthodontics branch. The increasing demand of patients and revolutionary thought of prosthodontists have led to the outcome of the special, i.e. the unconventional approach for fabricating complete dentures. Teeth setting done in conventional manner1 proves satisfactory in most of the patients, but uncompromised patients, conventional method brings with it certain disadvantages. So starring new techniques based on same old fundamentals of prosthodontia is known as the unconventional complete dentures, a manifestation of new vision in prosthesis construction.

Cheeks are an important part of human facial esthetics due to their prominent visibility. Factors like extraction of molars, thinning of tissues due to aging, facial paralysis may lead to hollowing of the cheeks. This can make a person appear prematurely older and hence have a negative psychological impact on the patient.2-3 There are many techniques like reconstructive plastic surgery with facial implants, or malar augmentation with injectable materials. But, prosthetic rehabilitation is a preferred treatment option, when due to medical or other reasons a surgical approach is contraindicated.4-5

Complete edentulism in patients with skeletal class III deformities complicates the situation and opposes clinical challenge. Skeletal class III deformities are caused by maxillary deficiency, mandibular excess, or a combination. Approximately 40% of class III deformities are caused by maxillary deficiencies alone.6

DOI Number: 10.5958/0976-5506.2019.01006.4
In a normal relation between upper and lower edentulous jaws, the outlines of the crest of the upper and lower ridges are similar and approximately coincident although separated in a vertical plane. Unfortunately when ridge relations are abnormal, they do pose a challenge in modifying the normal guidelines to fulfill all demands. Abnormalities in jaw relations exist mainly in two forms: (1) maxillary protrusion and wider upper arch and (2) mandibular protrusion and wider lower arch.

Nicholls stated that, “If lines were drawn from the crest of the mandibular ridge to the crest of the maxillary ridge at the location of the mandibular second molar, they would incline at an angle of 83 to 80 degrees to the hypothetical occlusal plane drawn at right angles to the medial line. These lines are called the interalveolar crest lines”, the arrangement of teeth in normal occlusion would be possible. Deviations from this average inclination would necessitate modifications.

In 2005, there was renewed interest in specific artificial teeth for cross bite tooth setup for complete dentures among some manufacturers. These teeth sets are usually expensive, and complete denture patients usually present with poor economic background. This case report present a simple and inexpensive technique to correct facial esthetics using cheek plumper and cross arch occlusion in a patient with atrophied maxillary arch and wide mandibular arch.
Case Report

A 62 year old male patient came in the Department of Prosthodontics and Implantology in Himachal Institute of Dental Sciences with the chief complaint of inability to chew. On clinical, extra oral examination, the facial profile was Angle's Class III and facial form was tapering (Fig. 1). The patient exhibited impaired muscle tone and function. Neuromuscular coordination was fair. Length of the lip was long. On clinical examination, maxillary ridge were square to gently rounded and mandibular ridges were inverted “U” shaped. Interarch space was ideal to accommodate the artificial teeth. Lateral throat form was class II and palatal throat form was also class II. Quantity and quality of saliva was adequate and normal. There was no such relevant history for facial asymmetry. To diagnose facial asymmetry, PA view, TMJ view, OPG was advised. On radiological examination it was seen that there was no pathology in the Temporomandibular joint, but the gonial angle of the left side of the mandible is slightly down as compared to the gonial angle on the right side of the mandible as seen in OPG view (Fig. 2). Also there is condylar hyperplasia on the left side of the mandible as seen in TMJ view (Fig. 3). Gross facial asymmetry was noticeable in Posteroanterior view (Fig. 4). Treatment was planned keeping in mind the expectations of the patient. Case was started with the conventional primary impression making using impression compound followed by secondary impression making using Zinc Oxide Eugenol paste. Jaw relation was recorded and then transferred to semi adjustable articulator using facebow transfer (Fig. 5). The jaw size discrepancy clearly precludes an efficient occlusal scheme if artificial teeth are setup in the conventional bite relationship. Commercially available artificial teeth in a cross-inverted manner were mounted. During trial patient was very much concerned of his hollow cheek unilaterally. So we incorporated cheek plumper in trial denture on the buccal surface of the denture (Fig. 6). Patient appreciated it very much. The denture was acrylised in conventional manner. After finishing and polishing prosthesis was delivered to the patient (Fig. 7-8). Patient was recalled after 24 hours for followup. Patient was very much satisfied with the appearance and functionality of the denture.

Discussion

In present case report, jaw deviation towards the right side gives hollow cheek appearance. To overcome this problem cheek plumper was attached buccally, on the right side of the maxillary denture to give more pleasing appearance to the patient. As the lower arch was too wide and cannot be managed otherwise during occlusal scheme development, an interchange was accomplished by using upper teeth on the lower denture and lower teeth on the upper denture. Also the interchange was made across the arch as well. Thirteen upper teeth were placed on the left lower ridge, and left lower teeth were placed on the right upper ridge. Similarly, the left upper posterior teeth were set on the right lower ridge, and right lower posterior teeth were placed on the left upper ridge. Special tooth mould (K-mould from Ivoclar) are available now a days for cross arch arrangement of teeth. In this case report to overcome economic barrier for the patient, teeth set from Ruthinium two chromatic layers (0020003 Acry Rock V. Set 28 Teeth) was used.

Conclusion

This case report proposes a simple, effective and non-invasive technique by using cheek plumper as an alternative method to improve facial appearance in a patient with hollow cheek and deviated jaw. With this technique, patient’s appearance masticatory function and also self-confidence was improved.

Study Design for Establishing Diagnostic Reference Levels and Optimization of Radiation Dose for Head and Neck and Pelvic Computed Tomography Protocols in Radiation Therapy Planning

Shreekripa 1, Rajagopal K.V. 2, Krishna Sharan 3, Srinidhi G Chandraguthi 4, Suresh Sukumar 5
1 Assistant Professor in Medical Physics, Dept. of Radiotherapy and Oncology, School of Allied Health Sciences, 2 Professor, Dept. of Radio-diagnosis and Imaging, 3 Professor, 4 Senior Grade Lecturer, Dept. of Radiotherapy and Oncology, Kasturba Medical College, 5 Associate Professor, Dept. of Medical Imaging Technology, School of Allied Health Sciences, Manipal Academy of Higher Education, Manipal

ABSTRACT

Aim: To establish Diagnostic Reference Levels and optimization of radiation dose of head and neck and pelvic imaging in pre Radiation therapy planning computed tomography (RTCT).

Objective: To establish Diagnostic reference level for Head & Neck CT and Pelvic Computed Tomography in radiation therapy planning and to optimize radiation dose to the cancer patients undergoing Head & Neck and Pelvic Computed Tomography scans.

Methodology: This study will be divided into two phases. In phase one, Diagnostic reference Level will be established using standard CT Oncology protocol and arriving optimized protocol using phantom. In phase two, optimized protocol will be tested on patient population and image quality will be analyzed subjectively and objectively.

Outcome: Expected outcome would be to establish diagnostic reference level for optimized radiation dose protocol and Reduction in radiation dose in optimized dose protocol in comparison with existing dose protocol for CT Head & Neck and pelvis without compromising image quality.

Keywords: Radiotherapy, CT localization, Diagnostic reference levels, Head and neck, Pelvis

Introduction

At present CT image acquisition is the standard procedures in the clinical treatment planning process in Radiotherapy Planning for all cancer cases. Both tumor and normal tissue images are acquired during procedure. This imaging method is results in radiation doses and carries a cancer risk. Radiological safety concerns very much addressed in radiology to restrict subsequent probability of malignant tumors. Other than therapeutic radiation, exposures are ruled by the principle “as low as reasonably achievable”, with Radiotherapy Planning CT simulation lies in the bracket. Hence, it becomes essential as radiation exposure to the participant follows the principle.(1)

During CT imaging for Radiotherapy Planning purpose, a quality image must be obtained with optimizing the dose to the patients. Dose in CT generally depend on the choice of technical factors that are used to perform CT examinations. By varying some of the factors in CT control panel the dose to patient who is undergoing CT scan will vary. For example, of the technical factors milli amperage seconds (mAs) which is the combination of tube current and slice scan time,
tube peak kilo voltage (kVp), pitch in multi-slice, rotation time, CT slice thickness, and filtration. Because of this the concept of Diagnostic reference level for imaging procedure is implemented by ICRP by 1996 to optimizing the radiation dose to the patients.

By using suitable protocols of CT imaging which depends on the factors like region of examination, patient size the dose can be optimized under the principle as low as reasonably achievable. There are already DRL for diagnostic CT of adult patient is established by different surveys and in that field, they have initiated reduction in dose following by those DRL’s.

Different imaging volumes and quality of scans required for radiation therapy planning prevents the use of diagnostic DRLs.

In the literatures while comparing therapeutic dose and its scatter dose with CT localization dose it has been considered as insignificant. To maintain high quality CT image and large CT examination area than the radiation treatment area in pre radiotherapy planning CT may expose cancer patient to higher and perhaps unnecessary radiation dose. Also, inferences are in conflict with the probabilistic model. Many literatures have provided evidence that probabilistic effect of radiation affected malignancy is increased at exposures which are similar with radiation-dose due to CT.

DRL helps in development of new protocols for various CT examination and verifies the existing protocol at each center by comparing the radiation dose from present practice.

DRL have been set at approximately the 75th percentile of patient or phantom data from a survey that will be carried across a broad user base using specific dose-measurement protocol. The dosimetric quantities recommended in the guidelines for the establishment of DRLs are volumetric CT Dose Index (CTDIvol) for a single section and Dose Length Product (DLP) for entire examination. Since there are no DRL's found for Radiotherapy Planning CT simulation procedures in India, the present study will be undertaken to Establishing Diagnostic Reference Levels for Head and Neck and pelvic cancer Computed Tomography protocols in radiation therapy.

**Literature Review**

Sean O’ Connor et al., Celine Clerkin et al. conducted study to establish occurrence of variation in CT dose in breast and head and neck radiation therapy in different centers of Ireland for the establishment of national DRLs. Study concluded that there is a need for optimization of radiation dose to help in reducing total radiation dose.

A. Sanderud et al. conducted a study on the difference in Radiation dose between thoracic radiotherapy CT and thoracic diagnostic CT scans. He found that radiation dose given to RT CT is on an average five times higher than the dose given in diagnostic CT. The difference is because of not considering the patient size in RT CT. He concluded that it is important to use CT protocol which is optimized using patient size.

Chang et al. conducted a study to optimize image quality and dose for adult and pediatric patients who are undergoing for computed tomography scans. Optimized protocol arrived by subjective analysis of phantom image. He found optimum parameter for scanning of adult and pediatric and IR approach is strongly recommended for both adult and pediatric CT scanning to reduce radiation dose with optimum image quality.

**Research Gap**

- Lack of studies to establish the DRLs in India for adult CT required for Radiotherapy Planning.
- Optimization of dose for Radiotherapy Planning CT - worldwide.

**Need for the study**

- International organizations (ICRP, IAEA, UNSCEAR, WHO) encourage all countries to establish DRL in order to optimize patient doses.
- There are no established DRL for Radiotherapy Planning CT protocol in India.
- The typical values to be obtained in this facility will add information to the literature which can be used to establish local/national/regional DRL values for Radiotherapy Planning CT.
- Lack of studies to optimize CT dose values for Radiotherapy Planning in patient’s population

**Aim**

- To establish Diagnostic Reference Levels and optimization of radiation dose of head and neck and pelvic imaging in pre Radiation therapy planning computed tomography (RTCT).
Objectives

- To establish Diagnostic reference level for Head & Neck CT and Pelvic Computed Tomography in radiation therapy planning.
- To optimize radiation dose to the cancer patients undergoing Head & Neck and Pelvic Computed Tomography scans

Significance of the Proposed Study

- Establishing the DRLs will identify the radiation doses for CT examination in Head and Neck and pelvic radiotherapy patients
- Helps in optimizing the radiation dose to the adults by maintaining the optimum diagnostic image quality.
- The study will be useful in reduction of radiation-induced effects.

Expected Outcome

- Establishment of diagnostic reference level for optimized radiation dose protocol
- Reduction in radiation dose in optimized dose protocol in comparison with existing dose protocol for CT Head & Neck and pelvis without compromising image quality.

Methodology

Phase I

**Study Procedure:** Cross sectional study will be conducted at Kasturba Hospital using big bore CT scanner. Sample size will be calculated using estimation of mean. Un co-operative patients, minor patients, Patients with dental fillings and metal prosthesis are excluded from the study.

Ethical approval was granted by the Institutional Ethics Committee, Kasturba Medical College and Kasturba Hospital, MAHE, Manipal. The study is approved and registered under CTRI.

Before initiating scan, the following parameters will be collected from CT console for CT examination of head and neck and pelvic such as Make and model of the scanner, Tube potential, Tube current, Scan time, Rotation time, Slice thickness, Slice beam collimation, Pitch, Total slices, Field of view, start couch level and end couch level, Reconstruction algorithm that will be used.

The participant will be explained about the study and written informed consent will be obtained. The age and sex of the participants will be recorded before the scan. The patients will be in supine position on flat couch and immobilization device fixed to particular area of scan with reference markers, head first into the gantry. Patient should set using the external lasers. Scanning will be performed using present Onco scan protocol.

**CT Dose Quantities:** The two dosimetric quantities namely CTDI<sub>vol</sub> and DLP will be recorded from dose info for each patient at the end of scan from CT console.

Effective dose will be calculated using formula:

\[ E = k \times DLP \]

The value of K according to the updated AAPM report 96

Phase II

**Study Procedure:** Optimizing CT radiation dose with respect to CT acquisition parameters would ideally accomplished by conducting the studies based on observer. Initially this can be performed by acquiring CT image of Phantom with different combination of kV and mAs. To find balance between CT image quality and radiation dose, the scans will be acquiring with a Catphan 503 at specified parameters like Rotation time, Slice thickness, Pitch, mAs and kV – all combinations available in CT scanner.

After CT acquisition the phantom images will be reconstructed using different algorithms. Thereconstructed images will be reviewed by experienced Oncologists and Medical Physicists in Treatment planning and contouring station. By using optimal parameters obtained by analysis of phantom data will be used to create protocols based on optimum parameters. The suitable protocol for head and neck imaging and pelvis imaging will be used to acquire patient data. Patient consent will be taken after orally explaining the procedure.

The participants would be in supine position on flat couch and immobilization device fixed to the area of scan with reference markers, head first into the gantry and to be set using lasers. The images will be exported to Treatment planning workstation. The image acquired using optimized protocol will be analyzed by oncologist and medical physicist. They will be asked to do the analysis by visual identification of image in terms of
Spatial resolution of image and structure boundary also by consistency in structure delineation. This analysis will be done blindly without knowing the difference between the image protocols.

Also the obtained CT image will be analyzed for 1. Subjective image quality, 2. Objective image quality and 3. Overall evaluations of image and radiation dose.

**Subjective Image Quality:** The image quality evaluation will be done as per present Guidelines on Computed Tomography Quality Criteria.\(^\text{(19,20)}\). Images will be reviewed independently by two oncologists.

In the subjective image quality evaluation, image noise, and feasibility for therapeutic purpose will be considered. The Radiation Oncologist will assess the visibility of critical organs in the scanned region.

The above parameters would be rated on five-point rating scale were, 1 = cannot identify, 2 = suboptimal, 3 = acceptable, 4 = better than acceptable, 5 = excellently visualized.

**Objective Image Quality:** The objective image quality will be analyzed by taking the ratios of signal-to-noise (SNR) and contrast-to-noise (CNR). For this purpose, regions-of-interest (ROIs) will be manually positioned in each. The ROI area varied from 20–30 mm² to encompass homogeneity of measured tissues. Following equation is used to assess the signal-to-noise (SNR) and contrast-to-noise (CNR) ratios.

**Signal to noise ratio:**

\[
\text{SNR} = \frac{(CT \text{ ROI})}{SD \text{ ROI}} \quad \ldots (18)
\]

**Contrast to Noise Ratio:**

\[
\text{CNR} = \frac{(CT \text{ ROI} - CT \text{ Background})}{SD \text{ Background}} \quad \ldots (18)
\]

**Overall Evaluations of Image and Radiation Dose:** To assess the overall effects and a possible trade-off between image quality and radiation dose, Figure of Merit (FOM), will be used. The equation is shown below

\[
\text{FOM} = \frac{\text{CNR}^2 \times \text{CTDI}_{\text{vol}}}{\text{SD}_{\text{ROI}}} \quad \ldots (18)
\]

The FOMs of all regions of interest in the phantoms will be examined. CT image quality metrics (e.g. CT number accuracy, SNR) were also analyzed as auxiliary assessments.

**Statistical Analysis**

The data will be statistically analyzed utilizing appropriate statistical software.

**Risks and benefits**

- There is no potential risk because the participants included in the study are prescribed for CT Head and Neck, Pelvis scan for the Radiotherapy Planning purpose.
- The study is beneficial as the dose information can be used to establish Diagnostic Reference Level for CT of head and neck and pelvic radiotherapy patients and steps can be taken for optimization of CT doses.

ABSTRACT

Aim: The aim of this study is to compare the radiation dose in present Onco protocol and low dose protocol for head and neck and pelvic phantom in radiotherapy planning computed tomography and to establish diagnostic reference level.

Objective: We conducted a following study to compare the radiation dose in standard protocol and the scan with different set of parameters.

Methodology: A experimental phantom study was performed in CATPHAN 503 measuring 20cm to investigate the optimization of radiation dose for CT head and neck and pelvis by using different parameters available in CT control console.

Result: The result showed significant change in radiation dose in terms of CTDIvol, DLP and effective with different combination of kVp and mAs without compromising image quality.

Keywords: CT localization, Head and neck, Pelvis

Introduction

In the present scenario taking CT scans are the standard procedures in the clinical treatment planning process in Radiotherapy Planning for all cancer cases. While taking CT, with tumor tissue normal tissues also will be exposed to radiation. This imaging method is results in radiation doses and carries a cancer risk. In Radiological safety aspect other than therapeutic radiation, exposures are ruled by the principle “as low as reasonably achievable”, with Radiotherapy Planning CT simulation lies in the bracket. Hence, it becomes essential as radiation exposure to the participant follows the principle. (1)

A quality CT image for Radiotherapy planning purpose should be obtained with optimized dose to the patients. The Radiation dose in CT imaging is depends on many technical factors used to perform CT examinations. For example, of the technical factors milli amperage seconds (mAs) which is the combination of tube current and slice scan time, tube peak kilo voltage (kVp), pitch in multi-slice, rotation time, CT slice thickness, and filtration. By changing these factors together can vary the Radiation dose in CT scanning.

The survey data from 1991 to 1996 shows that 34% of the annual collective dose in Medical exposure is only because of CT scan modality. This new biological information on radiation harm and estimated risk ICRP revised its recommendation in publication 60. It introduces new concepts like diagnostic reference levels and
Optimization of Radiation dose with quantities CT dose index which gives radiation dose per slice and dose length product which gives the total scan length and dose. (2)

DRL for adult diagnostic scans are established based on different studies and surveys and already initiated the dose reduction using established DRL’s. The requirement of different scan length and image quality in Radiotherapy necessitates the establishment of separate DRL for Radiation therapy planning CT scans.

In the literatures CT scan dose has been considered as insignificant when compared to therapeutic dose(3, 6). When we consider the linear non threshold model it is not insignificant. CT localization dose comes under non therapeutic dose which is ruled by the radiation safety principle called as low as reasonably achievable. DRL is a level defined to identify condition where the patient dose is unusually high. DRL is used under the objective that it should avoid the unwanted radiation dose which will not add any extra information to the clinical use.

Many literatures have provided evidence that probabilistic effect of radiation affected malignancy is increased at exposures which are similar with radiation-dose due to CT. (3)

New protocols can be developed by using DRL to verify the existing protocol by comparing the radiation dose. (4-9)

DRL have been set at approximately the 75th percentile of data collected form patient or phantom from a survey that will be carried across a broad user base using specific dose-measurement protocol (9, 10). The dosimetric quantities recommended in the guidelines for the establishment of DRLs are volumetric CT Dose Index (CTDIvol) for a single section and Dose Length Product (DLP) for entire examination (11). Since there are no DRLs has been found for Radiotherapy Planning CT simulation procedures in India, the present study will be undertaken to Establishing Diagnostic Reference Levels for Head and Neck and pelvic cancer Computed Tomography protocols in radiation therapy.

**Literature Review**

Sean O’Connor et al., Celine Clerkin et al. Celine Clerkin et al. conducted study to establish diagnostic reference level for CT of the breast and head and neck radiation therapy. Because there are no DRL for RT setting it exists only for diagnostic procedure. Study conducted between different Irish centers. In the present study, CTDIvol, DLP, mAs, tube potential, scan length, slice thickness, scanning margins, use of automated exposure control (AEC) and scanner technology data are collected for 10 patients. Thus, the study concluded that establishment of therapeutic DRLs for head and neck and breast CT scan (1, 2)

A. Sanderud et al. conducted a study on the radiation dose difference between CT of thoracic region for radiotherapy and CT scans of thoracic for diagnostic purpose. He found that radiation dose given to RT CT is on an average five times higher than the dose given in diagnostic CT. The difference is because of not considering the patient size in RT CT. He concluded that it is important to use CT protocol which is optimized using patient size. (10)

S J Foley et al. conducted a study to establish Irish Diagnostic Reference Level for Computed Tomography examinations of adult. Dose data such as CTDIvol and DLP value were collected for 3305 patients that included 30 sites representing 54% of national total. DRLs were proposed for nine different CT examinations such as CT head, sinuses, cervical spine, thorax, HRCT, CT pulmonary angiography, multiphase abdomen, routine abdomen/pelvis and trunk examinations. It was found that proposed DRL values was 42% lower than previously established DRLs and was comparable to other international studies. However, a wide variation in mean dose across sites was noted. Thus the study concluded that there is a need for optimization of radiation dose across Irish CT departments especially in those that exceeds the proposed DRLs (12).

**Methodology**

**Study Procedure:** This study conducted at Kasturba Hospital using big bore CT scanner. Ethical approval was granted by the Institutional Ethics Committee, Kasturba Medical College and Kasturba Hospital, MAHE, Manipal. The study is approved and registered under CTRI.

To develop optimized CT protocol initially the study should be conducted on phantom. Scan will be taken using the present Onco protocol (Ref Table 1 and Table 2). Before initiating scan, the following parameters will be collected from CT console for CT examination of head and neck and pelvic such as Make and model of the scanner, Tube potential, Tube current, Scan time, Rotation time, Slice thickness, Slice beam collimation, Pitch, Total slices, Field of view, start couch level and end couch level, Reconstruction algorithm that will be used.
The phantom has positioned on flat couch by adjusting with the lasers. Scanning will be performed using present Onco scan protocol.

CT Dose Quantities: The two dosimetric quantities namely CTDI<sub>vol</sub> and DLP will be recorded from dose info for each patient at the end of scan from CT console. Effective dose will be calculated using formula:

\[ E = k \times DLP \]

The value of K according to the updated AAPM report 96

To develop optimized CT protocol, the qualitative and quantitative analysis of the image should be done. We performed this study by acquiring CT image of Phantom with different combination of kV and mAs. To find balance between CT image quality and radiation dose, we acquired images of a Catphan 503 which simulates head & neck and 30X30 plastic phantom which simulates pelvic region.

After CT acquisition the phantom images reconstructed using filtered back projection algorithms. The reconstructed images analyzed by experienced Medical Physicists in Treatment planning and contouring station.

They will be asked to do the analysis by visual identification of image in terms of spatial resolution of image and structure boundary also by consistency in structure delineation. This analysis will be done blindly without knowing the difference between the image protocols.

Also the obtained CT image analyzed for 1. Subjective image quality, 2. Objective image quality and 3. Overall evaluations of image and radiation dose.

**Result and Discussion**

The result showed significant change in radiation dose in terms of CTDI<sub>vol</sub>, DLP and effective with different combination of kVp and mAs (Ref Table 3).

In our study the experiment was conducted with Low kVp, standard kVp and high kVp onco protocol to determine the effect of kVp on radiation dose and image quality. The outcome result shows that as compare to standard and high kVp protocol there is a drastic reduction in radiation dose in low kVp onco protocol with optimum image quality as compare to the standard and high kVp protocol. For Head & Neck, at 90 kVp 200mAs we found that 70.5% reduction in the radiation dose as compared to 120 kVp, 200mAs. Similarly at 90 kVp 300mAs we found that 61.17% reduction in the radiation dose as compared to 120 kVp, 200mAs. For pelvis, at 90 kVp 200mAs we found that 65% reduction in the radiation dose as compared to 120 kVp, 200mAs. Similarly at 90 kVp 300mAs we found that 52.5% reduction in the radiation dose as compared to 120 kVp, 200mAs

**Conclusion**

The outcome of the study shows that low kVp onco protocol of Head & Neck and Pelvis protocol gives optimum image quality with reduced radiation dose as compared to standard and high kVp onco protocol.

**Conflict of Interest:** No potential conflict of interest relevant to this article was reported.

**Source of Funding:** It is Self-funded study.

Sensitization of Medical Teachers on Teaching Learning Procedures Based on Guidelines of Medical Council of India-A Study in West Bengal

Aloke Mazumder¹, Susmita Sarkar²
¹Associate Professor, Dept of FMT; ²Assistant Professor, Dept of Biochemistry, Malda Medical College, Malda, West Bengal

ABSTRACT

Medical Education has always been considered for reformations to render a fruitful teaching to the students to meet the constantly changing social need to get an appropriate medico of first contact. Creation of Medical Education Technology Cell at the medical colleges and evaluations from students are the basic steps of it. MCI guidelines also have been changed accordingly with an inclusion of AT-COM (attitude and communication) and a requirement of teachers training through sensitization of the medical teachers with the newly formed idea has come up. Based on this concept a sensitization workshop was conducted at Malda Medical College for the doctors attached to Medical Education Service of West Bengal. Answers of Pre and Post workshop questionnaire given to the doctors were collected, tabulated, analyzed and conclusion has been drawn with an objective to get an idea of further development of policies on it.

Keywords: Medical Education, MCI, AT-COM, guidelines, teachers training.

Introduction

Charaka Samhita lays down that teacher should be one “whose doubts have been all cleared in respect of medical scriptures—possessed of experience—clever in the practice of his profession...”. Medical Teaching concept, thus, may be considered as has been originated long back and regularly has been reformed and structured as per the need of the time. Medical teachers are also the curricular developers and transactors and thus have a pivot role in shaping the future medicos. During training period adequate emphasis is placed on inculcating logical and scientific habits of thought, clarity of expression and independence of judgement; and ability to collect and analyse information and to correlate them. In west Bengal after the establishment of West Bengal University of Health Sciences in 2003, the scenario of medical education has been more systematic through formation of uniform syllabus, teaching methodology and evaluation of medical students., along with regular conduction of teachers training programs. The Medical Council of India has prepared revised regulations on Graduate Medical Education and Curriculum for which faculty development has been seen to play a key role in implementation and sustenance of any curriculum reform. At Malda Medical College of West Bengal, one workshop was conducted for medical teachers to sensitize them on changed guidelines of MCI on teaching learning and attitude communication (AT-COM). Present study is based on pre and post test questionnaire to the medical teachers who attended the workshop. The results have been tabulated, analyzed and conclusion formed in an attempt to avail a fruitful outcome for reformation of policies in future.

Objectives

1. Collection of answers of the Pre and Post Workshop Test Questionnaire
2. Analysis of the answers and formation of probable explanations

3. Formation of concepts on gaps of persisting knowledge
4. To draw a conclusion that may help to adopt further policies

**Materials and Method**

An workshop entitled as “Sensitization of Medical Teachers on Teaching Learning and Communication (AT-COM) Competencies for INDIAN MEDICAL GRADUATES based on MCI guideline” was organized at Malda Medical College of state of West Bengal. Total 20 persons of medical fraternity attached to medical education service of the state attended the program as learner. One semi-structured questionnaire form having 10 MCQ pattern questions with few single answer type and few multiple answer type was presented to all of them before and after the completion of the workshop as PRE and POST TEST questionnaire. The questions were formed to cover the primary aspects of the Medical Education concept as per guideline of MCI. The results were tabulated on three parts – i) correct ii) incorrect, iii) not attended for both PRE and POST series. For questions having multiple answers, partial attempts have been considered as incorrect answers. Percentage of each answers in both pre and post workshop papers were analyzed accordingly. Strict confidentiality was maintained to avoid disclosure of identity of doctor.

**Questionnaire:**

1. Write the full form of WWW in relation to internet application….
2. Write the full form of OSCE……………………………..
3. Which are stated to be primarily required for one Indian Medical Graduate
   a. Goals
   b. Feedback
   c. roles
   d. Competencies
4. Different types of assessments are-
   a. Subjective
   b. Formative
   c. Summative
   d. Internal
5. In India at Undergraduate Medical Education a Medical Teacher should-
   a. Work effectively with colleagues
   b. Be able to discuss disease and treatment to patient satisfactorily
   c. Apply newly gained knowledge and skill
   d. Manage ethical and professional conflicts
6. As per MCI, five ROLES of IMG are-
   a. Clinician, learner, listener, leader, communicator
   b. Clinician, physician, listener, leader, care giver
   c. Clinician, care giver, listener, leader, communicator
   d. Clinician, learner, professional, leader, communicator
7. Which are considered as teaching learning methods-
   a. Flip Chart
   b. Problem Based Learning
   c. Small Group Discussion
   d. Students Seminar
8. Domains of learning are-
   a. Cognitive
   b. Psychomotor
   c. Affective
   d. Empathy
9. Self Directed Learning is an effective teaching Procedure for–
   a. Babies
   b. Early Teenage
   c. Late Teenage
   d. Adults
10. AT-COM is advised to be taught during MBBS course-
    a. Beginning of 1st yr
    b. Late session of 2nd yr
    c. As a topic of 3rd year
    d. Throughout the course

In post test series, all of the participants attempted all questions.

Results show that question No 1 has been correctly given by all in the pretest, while Qn no 2 though could be given by 50% in the pretest, all gave correct answer in posttest. 80% gave incorrect choice in pretest for Qn 3 but 80% gave correct Ans in post test. For Qn no 4, Correct Ans was 10% in PRE while 85% in POST test. In Qn No 5, results shows in PRE 45% was incorrect, in POST 55% gave correct options like Qn No 6, where PRE incorrect is 55%, but POST correct is 45%. In Qn No 7, while 10% gave correct ans in PRE, it became 75% in POST TEST. Qn 8 shows 60% incorrect in PRETEST, while 90% correct in POST TEST. Correct option was 80% in Qn 9 in PRE, which became 95% in POST TEST. In the last question, where 70% could gave correct option in PRE, it became 100% in POST TEST answer.

Discussion

It is well known that there is a 30% -40% shortage of medical teachers across India.

As inspite of such scenario, medical education is needed to be continued, specific target oriented training for teachers are necessary. Conduction of small workshops on it at the peripheral levels are of definite help to cope up the situation as is found during such types of studies.

The questionnaire was formed without prior mentioning that few questions have multiple answers to find the extent of knowledge on that topic and to give a chance of a sincere thought. The topics of each question was on basic idea of Medical Education appropriate for any beginner. The results show fruitful outcome.

Qn 1 has been given correctly by all of the participants showing expected awareness on internet. It has been seen that e-learning which is a regular practice for any teaching methodology, has been considered as complement to traditional instructor led teaching OSCE, at Qn 2 has been correctly told by half of the participants initially, and all could give correct answer after completion of the workshop discussion. This is a definite outcome as objective structured questions have been instructed to be formed during clinical teaching. Regarding IMG (Indian Medical Graduate) requirement as in Qn 3, it is observed that even after completion of workshop, one fifth(20%) participants could not give correct answer which is a matter of concern, and in the next workshops this topic must get emphasis. Evaluation through assessments are supposed to be most important for any education methodology, as seen in Qn 4,at POST TEST, 85% could give correct answer which was 10% at PRE TEST. Monitoring the day to day learning by Formative Assessment and At the end through Summative, is the existing system while it has been pointed that this system neglects the psychomotor, affective and communication skill. For both Qn 5 and Qn 6 in pretest, incorrect answers were given by more or less 50% and correct post test again 50%. Both the questions were primarily on Indian Medical Graduate’s clinical work, and overall 50% correct concept by teachers may be considered satisfactory. Qn 7, on teaching learning methods show that only 10% participant had clear idea on it which is of definite concern. Even after a discussion, 25% could not give correct answer. Competency Based Medical Education (CBME) has attracted renewed interest in recent years among the medical educators and different teaching methodologies are very much required to be
known to any medical teacher. Different domains were correctly said by 90% in the POSTTEST question 8. Qn 9 was satisfactorily answered even in PRETEST as 80%. Qn 10 could be answered by all (100%) after completion of the workshop. Thus after overall consideration, it can be said that satisfactory improved correct answers were provided by the participants after the completion of the workshop.

**Conclusion**

Medical Education Technology is changing day to day. Thus the age-old lecture based one-way education method has been changed to Competency Based learning to meet the need of hugely populated Country like India. Though besides other tools, e-learning, problem based learning, self directed learnings have been evaluated or discussed through different angles, the addition of AT-COM by MCI has been a correct step. Medical research is another aspect which has been neglected. Research activity is necessary to ensure progress in the quality of health care and CBME can get success through honest approach to research skill. A regular evaluation of students and vis a vis of a medical teacher is supposed to be the rational way of improvement of medical education and thus the health care system of our country.

ABSTRACT

The purpose of this study is to examine the impact of celebrity endorsement on surrogate advertisement among youth in Kerala. Advertisements are considered to be a very effective medium to reach the mass audience. It is the best way of communicating the product or services of a company to a large group of target audience.

Celebrity endorsement is a marketing technique in which celebrity allow an entity such as brand, a product and others to use their name in promoting or supporting the entity (Bergkvist & Zhou, 2016). This celebrity endorsement is proven to effect purchase intention (Gupta, Kishore & Verma, 2015; McCormick, 2016; Pornpitakpan, 2004; Wang et.al. 2013).

Surrogate advertising is a kind of advertisement of a brand extension in such a way that brings clear recall of the core product in the minds of the consumer. The aim of surrogate advertising is effective communication between manufactures and consumers with the object to sell a product, service or idea which they could not do otherwise (Deepa Nathwani, 2016).

Based on the analysis of the primary data, it was revealed that celebrity endorsement has a positive impact on surrogate advertisement among youth. Among the demographic variables, age and educational qualification played a pivotal role in the recall of original products.

Keywords: Advertisement, Celebrity endorsement, Surrogate advertisement

Introduction

Advertising is now an inevitable constituent in one’s life. In the present era, advertisement contributes immensely in the modernization of the economy of various countries. The sole aim of advertisement is to present and communicate a new product in the market focusing on targeted consumers commercially. So, a good advertisement helps in building a good brand image and brand identity in the mind of consumers.

There are different forms of advertisements that are presently available. Celebrity endorsement and surrogate advertisement are among them. Celebrity endorsement is a type of advertising in which a famous person is involved in promoting the product or brand. In this way, the celebrity endorsement can have a great influence in the minds of people [Dominguez, R; Herrero, A; Salmones, M (2013)].

A surrogate advertisement is a kind of advertisement in which a different product is promoted using an already established brand. Such advertisements help in contribute to brand recall. ‘Surrogate advertising’ literally mean duplicating the brand image of one product extensively to promote another product of the same brand. Surrogate advertising is done when the original product is not allowed to advertise itself on various Medias.

Tobacco and liquor are the main reference point in the context of surrogate advertisement. Brands are Gold Flake, Wills Lifestyle, Mc Dowell’s, Imperial Blue, etc.

It is a kind of advertisement which actively supports or encourages the banned products like alcohol, cigarettes, pan masala, etc. in concealing the identity of another product. This advertising uses club soda, mineral water, music CD, playing cards, etc. to instill the brand to the customers. The banned product is not forecasted to customers directly, but it conceals another product
with same name. In such a way, when people saw these types of advertisements, people start connecting it with the main product.

Some of the surrogate advertising brands in India are Bacardi Blast music CD’s, Bagpiper club soda to Officer’s Choice playing cards etc. [Lamb, Charles W; Hair, Joe F; Mc Daniel, Carl].

The surrogate advertisers are Wills, Manikchand, Bacardi, Kingfisher, Aristocrat, Smirnoff, Seagram, etc.

Some of the examples of celebrity endorsement on surrogate advertisement are Shah Rukh Khan in Seagram Royal Stag music CD, Priyanka Chopra in Rajnigandha cardamom, Saif Ali Khan in Pan Bahar, etc.

The study is totally based on a targeted group. Mainly, the youth (i.e., between the age group of 18-24) are taken for this study.

**Literature Review**

The researcher has made an attempt to bring out all the relevant literatures in the area of celebrity endorsement and surrogate advertisement. The following table depicts the literatures reviewed:

Abhishek & Aravind Sahey (2016)[1] studied about the role of culture in celebrity endorsement. Multiple endorsements by celebrities in India are more as compared to other low PDI countries. Impact of regional celebrities has a strong acceptance in a geographical area. In case of negative news about a celebrity, the companies will continue to associate with that celebrity.

Avadhesh Vyas & Gaurav Bissa (2017)[2] studied about the surrogate advertisement on television. Celebrities will bring a negative impact on youth. They will attract on these advertisement with celebrity endorsement. Surrogate advertisements on television accomplished in violating the law.

Deepa Nathwani (2016)[3] in her study on surrogate advertisement founds that Surrogate advertising helped to promote brand name or brand product. Celebrity endorsement is the major factor to the increasing use of alcohol. The consumers between the age group of 16 & 40 are the major users of the original products of surrogate advertisements. The high addiction of youth to these alcohols will lead to a loss to the nation.

Hampesh K S (2017)[4] in his study on using celebrities in advertisement founds that majority of the respondents like commercial advertisements. Celebrity endorsement is mainly used for gaining popularity. A brand ambassador will be associated with the product for long time. Most of the respondents are not much aware of covert advertising. People buy products when their loved celebrity affirms it. Many respondents are also conscious about quality, durability and performance.

Nancy Motwani (2016)[5] in her study on perception regarding morality of surrogate advertisements of liquor states that the opinions of the viewers about the surrogate advertisements are unethical and should ban the alcoholic products. Surrogate advertisements are a hulking and successful marketing strategy for banned products.

Punit Kumar, Amit Verma, Ranit Halder & Punjala Varun Datta (2017)[6] studied about the surrogate advertising in alcohol industry. The users of the product are not much aware about the advertisement that the company wants to convey. The effective mode of advertisement is through online. Most of the people remember alcohol advertisement because these advertisements were funny. Most consumers find these advertisement misleading.

Shivesh Rajpal & Amrita Nayak (2015)[7] studied on surrogate advertisement on consumer perception. Majority respondents are aware of surrogate advertisements and these changes the people’s approach towards the product. Advertisement is the best medium for the people to buy the product.

Soumya Dutta & Saswati Gangopadhyay (2015) [8] studied on the surrogate advertising on satellite television. The main products that have far reaching consequences due to surrogate advertisements are tobacco products, pan masala and liquor. Surrogate advertisement succeeded in violating the law and also television channels are responsible for accepting such advertisements.

**Research Gap:** Though there are plenty of studies were conducted separately about celebrity endorsement and surrogate advertisement in International context, but no combined research works were undertaken so far and India is not an exemption to that. Hence, this study aims to fill the void in the literature, and is quite relevant and timely from the point of view of academic and policy makers.
Research Objectives

To achieve the purpose of the present study, the researcher formulated the following objectives:

1. To understand the level of customer awareness towards surrogate advertisement among youth.

2. To examine the relationship between celebrity endorsement and surrogate advertisement.

3. To assess the effect of celebrity endorsement on surrogate advertisement in the purchase intention among youth.

Research Hypotheses: The literature review indicates that the curve has increased in the number of studies of surrogate advertisement and celebrity endorsement, but that more is still needed. In the light of above conditions, the current study emphasize on the following 6 hypotheses developed from earlier studies.

H1a: Celebrity endorsement will have a positive impact on surrogate advertisement among youth.

H1b: There is a positive association between age and the recall of original products while seeing the surrogate advertisements.

H1c: There is a positive association between gender and the recall of original products while seeing the surrogate advertisements.

H1d: There is a positive association between educational qualification and the recall of original products while seeing the surrogate advertisements.

H1e: There is a positive association between occupation and the recall of original products while seeing the surrogate advertisements.

H1f: There is a positive association between monthly income and the recall of original products while seeing the surrogate advertisements.

Research Methodology

Research Design: The study includes both exploratory and conclusive research designs. The exploratory research comprises the steps such as literature review, finalization of objectives, identification of variables, the formulation of hypothesis, etc.

During the second phase of research, the conclusive research design was used, and this stage includes both descriptive research design and the causal research design. The descriptive research design was used to explain the characteristics of the population, and the causal research design was carried out to find the causal relationship among the variables.

Sampling Design: The population of the study comprises the youth who are viewing surrogate advertisements. The snowball sampling technique was used in the study for the collection of first hand information. In total, 100 samples were used for data analysis.

Tools for Data Collection and Analysis: The current study is primarily based upon first-hand information collected through a well-defined structured questionnaire. The questionnaire consists of 5 general questions and remaining relating to variables to be studied. The criteria for the selection of variables are purely based on previous research work. Respondents were asked to indicate their perception about each question, using a 5-point Likert scale, with responses ranging from “strongly disagree” to “strongly agree”. The study also uses secondary data which has been collected from various sources such as journals, websites, etc.

The gathered data has been tabulated and analyzed through statistical software SPSS 21.0. The statistical tools used were frequency-descriptive analysis, Pearson Chi-square test, Kolmogorov-Smirnov test, Sharpio-Wilk test, correlation analysis and simple regression analysis.

Testing Validity & Reliability: The face validity of the questionnaire was evaluated by detailed checking of the wording of the items in the questionnaire and their connection to the appropriate frame of reference used in the study. The criterion validity was ensured by using a common scale throughout the questionnaire.

The Cronbach alpha (R) test of reliability is considered as one of the most common method for estimating reliability of the questionnaire. The current study also uses the Cronbach alpha test of reliability in order to get a strong internal consistency among the variables. The alpha value found to be 0.70 or above, which ensures the reliability of the questionnaire.

Source: Primary data

The sample of the present study consisted of 100 customers who are viewing surrogate advertisements. Out of 100 respondents, 47% are male and 53% are female. With regard to age, about 15% of the viewers are between the age group of 18-20 years and 85% are between 21-24 years of age category. With regard to educational background, about 8% of the respondents have higher secondary education, 54% are graduates, 29% are post graduates and 9% are professionally qualified. With respect to occupation, nearly 80% of the respondents are students, 15% are working in private sector, and very few are working in public sector and business persons with 2% and 3% respectively. Considering the monthly income of viewers, majority (72%) of the respondents have monthly income below Rs.10000, 9% ranging from Rs.10000-Rs.20000, 7% ranging from Rs.20000-Rs.30000, 4% ranging from Rs.30000-Rs.40000, 3% ranging from Rs.40000-Rs.50000 and nearly 5% have an income above Rs.50000.

Chi-square Analysis: In order to check whether there is any significant difference exists among different groups of customers based on their demographic variables, Chi-square test have been done and the output have been included in below table.

The Demographic Variables and Recall of Original Products While Watching Surrogate Advertisements:
The demographic variables considered under this analysis are age, gender, educational qualification, occupation and monthly income of the respondents. The result from the hypotheses testing is presented in below table. The hypotheses are tested at the significant level 0.05.

Table 2: Testing of hypotheses

<table>

<td>0.165</td>
<td>Rejected</td>
</tr>
</tbody>
</table>

Source: Primary data
It is clear from the above table that all the hypotheses mentioned are rejected, except age and educational qualification, which means that there is a significant association between these demographic variables and recall of original products while watching surrogate advertisements. On the other hand, there is no such significant association exist between the demographic variables such as gender, occupation and monthly income with the recall of original products while watching surrogate advertisements.

</tbody>
</table>

Source: Primary data
**. Correlation is significant at the 0.01 level (2-tailed).

It is clear from the above table 4 that Pearson Correlation (0.500**) is significant at 99.99% confidence interval. It indicates that the celebrity endorsement has a large (Cohen, 1988) positive correlation with surrogate advertisement.

Regression Analysis: Simple linear regression analysis was performed to examine the extent to which the independent variable (surrogate advertisement) influences dependent variable (celebrity endorsement). The result of regression analysis indicate that celebrity endorsement (Beta=0.500, P=0.00) significantly affect surrogate advertisement.

Major Findings of the Study: The majority of the respondents were female, aged between 21-24 and graduates. This indicates that most of the respondents are well educated youth. In this study, students were the major viewers of surrogate advertisements and it might be the reason that the students spent most of their time with television and other Medias.

Most of the respondents are aware of surrogate advertisement, but they prefer to buy it occasionally. The viewers are able to recall the original product mostly through logos and celebrities. Kingfisher is the most preferred brand by the respondents and they are of the opinion that it is good for the core brand. Celebrity endorsement is entertaining, but it is not inducing most of the viewers to buy the product. In this study, it is found that Government has not been successful in controlling the consumption of tobacco and liquor by imposing a ban on these advertisements.

The demographic variables such as age and educational qualification have a significant association with the recall of original products while seeing surrogate advertisements. It is also seen that celebrity endorsement has a positive relationship and impact on surrogate advertisement among youth.

Conclusion and Managerial Implications

Celebrity endorsement and surrogate advertisement are the popular methods of advertising. In today’s world, celebrity endorsing on surrogate advertisements are a favorable trend. The celebrities in these advertisement helps to attract the attention of a spectator. The main focus of surrogate advertisement is to bring up the original product through the advertisement of dummy products.

This study has attempted to describe the impact of celebrity endorsement on surrogate advertisement among youth. The celebrity endorsed surrogate advertisements are more able to recall than non-celebrity endorsed advertisements. It is clear that celebrities on surrogate advertisements are misguiding, but finally the decision to consume such product lies in the hands of the consumers. Customers are not against with the surrogate advertisements, but it is indirectly promoting the core brand. It is finally concluded that there is a positive relationship between celebrity endorsement and surrogate advertisement.

REFERENCES

of Indian Culture and Business Management, (2016); 13(3):394.

Introduction: Persistent anemia is one of the most common complications seen in individuals with chronic kidney disease (CKD). The factors contributing to anemia in CKD include loss of blood, reduced lifespan of red cell, vitamin deficiencies, erythropoietin deficiency, iron deficiency, and inflammation. Erythropoietin deficiency appears to be the major cause of anemia among the CKD. It is well established that hemoglobin level tends to decrease in CKD individuals. In renal anemia, hemoglobin level is usually managed with iron therapy and or erythropoietin treatment or blood transfusion. NKF – KDOQI clinical practice recommends hemoglobin level to range from 11g/dL-12g/dL among CKD undergoing hemodialysis (CKD 5HD). Hence it is essential to maintain recommended hemoglobin level among the individuals in order to avoid the mortality rate. In India there is dearth on the database of hemoglobin trend investigated longitudinally, and hence the present study was focused in this direction.

Aim: To investigate the hemoglobin trend in CKD 5HD in a tertiary care hospital.

Objectives: a) To profile the hemoglobin trend among the individuals on erythropoietin alone, combination of erythropoietin and iron therapy, and individuals not undergoing any treatment. (b) To compare hemoglobin trend among the individuals on erythropoietin alone, combination of erythropoietin and iron therapy, and individuals not undergoing any treatment.

Method: Retrospective observational study. A total of N=90 participants were enrolled in the study. The participants were classified into 3 Groups. Group 1- Erythropoietin (n=30), Group 2 - erythropoietin and iron therapy (n=30) and Group 3 – No treatment (n=30). Data were retrieved from medical records who were on regular hemodialysis for more than six months. The hemoglobin level was observed for six months and documented.

Results: In the present study, it was observed that hemoglobin tend to increase among the Group 1 and Group 2 participants, unlike the Group 3 participants, who received no treatment. Among the groups, it was observed the mean hemoglobin level of Group 1- 9.1g/dL was more compared to Group 2 and Group 3 - 8.7g/dL.

Conclusion: It was observed that individuals who were on treatment had a rising trend in hemoglobin unlike individuals with no treatment. However, it could also be observed that the mean hemoglobin was maintained appropriately among individuals with no treatment, which could be probably due to the lifestyle and other individual related factors.

Keywords: Chronic kidney disease, Hemoglobin level, Hemodialysis, Erythropoietin treatment, iron therapy.
lifespan of red cells, vitamin deficiencies, erythropoietin deficiency, iron deficiency, and inflammation\(^{(3)}\). It is well established that the hemoglobin level tends to decrease in CKD individuals \(^{(2, 3)}\). It begins in the early stages of CKD and worsens with the progression, especially predominant during stage 5\(^{(4)}\). Renal anemia is characterized by a relative deficit of erythropoietin, normochromic and normocytic blood cells, and hypoplasia of erythroid cells \(^{(1, 5)}\). It is considered one of the most clinically significant complications of CKD which can have a severe impact on individuals’ quality of life \(^{(2, 6)}\). Hence frequent monitoring of hemoglobin among these individuals is recommended. According to KDIGO guidelines, routine hemoglobin evaluation at least once in a month is recommended to adults who are on maintenance hemodialysis (CKD 5HD) with anemia who are not receiving any treatment \(^{(7)}\). The recommended hemoglobin level ranges from 11g/dL-12g/dL \(^{(7)}\). Hence it is essential to maintain the recommended hemoglobin level among the individuals in order to avoid further complications and the mortality rate.

In renal anemia, hemoglobin level is usually managed with iron therapy and or erythropoietin treatment and blood transfusion as a last option of management. Earlier CKD 5HD individuals frequently required blood transfusions due to non-availability of recombinant human erythropoietin. In addition, individuals undergoing blood transfusion were exposed to the risks of viral hepatitis and sensitization which reduced the chances of successful kidney transplantation \(^{(8)}\). If patients are with iron deficiency, only erythropoietin injections are of no use to maintain the hemoglobin level. According to KDIGO recommendation, erythropoietin injection should be initiated when the hemoglobin level is between 9g/dL to 10g/dL \(^{(7)}\).

**Primary Objective:** To profile the hemoglobin trend among the individuals on erythropoietin alone, a combination of erythropoietin and iron therapy, and individuals not undergoing any treatment

**Secondary Objective:** To compare hemoglobin trend among the individuals on erythropoietin alone, a combination of erythropoietin and iron therapy, and individuals not undergoing any treatment

**Method**

The present study was a retrospective observational study conducted in a dialysis unit of tertiary care hospital. The study protocol was approved by Institutional ethical committee (IEC Ref no: 66/2013).

**Participants:** A Total 90 participants in the age range of 22-75 years were enrolled in the study. The participants were classified into three groups based on their renal anemia maintenance therapy. The first group included the individuals on Erythropoietin injections (Group 1), the second group with individuals on erythropoietin injection and intravenous iron therapy (Group 2) and the third group with individuals who received no treatment (Group 3).

**Inclusion Criteria:** The CKD individuals on maintenance hemodialysis for the duration of six months and were on erythropoietin injection, on a combination of erythropoietin injection and intravenous (IV) iron therapy and individuals who were not on any treatment.

The exclusion criteria were, chronic kidney disease individuals not regular to hemodialysis, age below eighteen and acute kidney injury. Individuals who are on blood transfusion were also excluded from the study.

**Procedure:** This study was an observational study conducted in a Hemodialysis Unit of tertiary care hospital. Data were collected retrospectively for six months. The required data were collected from hospital records (outpatient files, hemodialysis record, and hospital lab result server) who were undergoing hemodialysis in the same unit on regular basis.

The data related to demographic details, renal anemia management therapy, hemodialysis details, hemoglobin levels, vital signs (blood pressure and pulse), pre-dialysis weight, type of vascular access used, and number of years undergoing hemodialysis and serology
reports were documented. After the informed consent, a pre-hemodialysis blood sample was collected towards estimating the hemoglobin level. The hemodialysis was performed using arteriovenous fistula (AVF). AVF was cannulated by the aseptic technique by hemodialysis technologist or hemodialysis nurse. Dry AVF needle (without flushing the needle with normal saline) was introduced to the AVF vein and blood was collected into the appropriately labeled specimen container tubes, further which are sent to laboratories for evaluation. After sample collection, the needles were connected to the extracorporeal circuit of hemodialysis.

Data Analysis

The hemoglobin was evaluated once in a month for a duration of 6 months. The mean hemoglobin values were obtained and were documented and compared across the three groups. The Independent t-test was used as a test of significance to compare across the groups. One way ANOVA was performed to compare between the groups with a significance value of p<0.05.

Result

In the present study, among a total of 90 participants, 75 (83.3%) were males and 15 (16.7%) were females in the age range of 22 to 75 years with the mean age of 51.7 ± 12.3 years, predominantly being the middle-aged adults in the age range of 40 to 59 years. All the participants were hypertensive and 30 of them exhibited Diabetes mellitus. Among them, 7 of them were HCV positive. However, no participants exhibited HIV or HBsAg. The hemodialysis was performed using AVF among all the participants.

</tr>
</tbody>
</table>

Note: Group 1: Individuals on Erythropoietin injections; Group 2: Individuals on erythropoietin injection and intravenous iron therapy; Group 3: Individuals who received no treatment

The mean hemoglobin level was observed to be better among the participants of Group 1 as compared to participants of Group 2 and Group 3. One way ANOVA revealed no significant statistical difference (p=0.302) between the groups.

In the present study, the variability in hemoglobin was also observed among the participants. It was also observed, that the majority of the participants ranged below 9.0 g/dL were more prominent among Group 3 participants. In addition, the hemoglobin trend was observed to be deteriorating among the participants who received no treatment (Group 3) as compared to the other two groups. One way ANOVA revealed a significant difference between the groups with p<0.005. Post hoc analysis was done using Tuckey test. It was observed there was a significant difference between the participants of Group 1 and 2 and between the participants of Group 2 and 3. However there was no difference observed between Group 1 and Group 3 participants.

Discussion

The present study focused on exploring the hemoglobin trend across the different modes of management among the CKD individuals who are on maintenance hemodialysis. It was observed that the participants were middle aged adults predominantly which could be due to their vulnerability which is also in accordance with (9) who reported of CKD being prominent among the 50 to 59 years aged individuals. In terms of gender, it was found males being more prevalent as compared to females. Literature has also evidenced similar findings (10, 11). Although the prevalence of CKD is higher among the females, the progression is slower as compared to males. It is known that the symptoms usually aggravates during the end stage kidney disease, thereby requiring renal replacement therapy. The present study findings could also be due to the interest of the authors only focusing the participants during the end stage kidney disease, thereby comprising of majorly the male participants. (10) had observed similar findings and quoted that this could also be due to the females possessing
hormonal protection thereby postponing the progression rate. It could also be due to risk factors that include the occupational hazards, smoking, and negligence of their health which is common in Indian scenario.

In the present study, the modes of management of anemia among the participants included erythropoietin, combination of erythropoietin and intravenous iron therapy and blood transfusion. The anemia is often reported to be commonly seen during the end stage renal disease that can be managed successfully by erythropoiesis-stimulating agents (ESA) administration which is in consonance with the finding of the present study, wherein the mean hemoglobin level was observed to be better among the participants of Group 1 receiving erythropoietin treatment as compared to Group 2 and Group 3 participants.

It is reported that recombinant erythropoietin tends to improve the overall quality of life of CKD individuals by improving their hemoglobin level. The Dialysis Outcomes and Practice Patterns Study (DOPPS), a prospective observational study based on the data collected from 11,041 hemodialysis participants from 12 countries, the hemoglobin level was less than 11.0 g/dL among 23% to 77% of the participants.

The findings suggested that combination of intravenous iron administration with erythropoietin injection is ideal in order to maintain the hemoglobin level.

Conclusion

The findings of the present study reflected the best-suited treatment mode to an extent among the individuals with anemia secondary to CKD. It also revealed the necessity of monitoring their hemoglobin level and other parameters influencing hemoglobin level that includes iron status, parathyroid hormone level, serum erythropoietin levels, the presence of infection, inflammatory states, blood loss, nutrition, and comorbidities on a regular basis, especially in settings where individuals are reluctant to undergo due to the financial constraints in order to reduce the morbidity and mortality rate and thereby improve overall outcomes.

Acknowledgement

We would like to express our sincere gratitude to Dr. Manohar Bairy G. Consultant Nephrologist, Tan Tock Seng Hospital, Singapore for his valuable suggestions and guidance to complete this study.

ABSTRACT

Background: Multidrug Resistance Tuberculosis (MDR-TB) an emerging and a growing threat to tuberculosis control program all over the world. This problem is of special concern because second-line drugs required for its treatment are often unavailable, are far more expensive than the first-line drugs, with only 65-75% efficacy, and have side effects that may require hospitalization. The reasons quoted for the same was inconsistent and or interrupted drug intake or supply.

Objectives: To study programme related variables present in Multidrug Resistance Tuberculosis cases.

Materials and Method: This case-control study was carried out for the assessment of programme related influencing factors for Multidrug Resistance Tuberculosis among TB patients enrolled for DOTS under RNTCP during the period of 2016 to 2018 at various sub-district levels.

Results: Majority of MDR cases (96.2%) were visited by senior tuberculosis supervisor, and 98.1% by DOTS providers. Among treatment profile 98.1% MDR patient were on categories II in which relapse (57.8%), treatment failure (33.3%) and default were 8.8%. High proportion of sputum samples were sent to Designated Microscopy centre (51.9%) at grass root level followed by Districts Tuberculosis center (18.3%) and at Tuberculosis unit (16.3%). Most patients (78.8% cases) lived at a distance less than 2.5 kilometer from DOTS provider.

Conclusion: If the guideline given by the Revised National Tuberculosis Control programme is implemented smoothly at the level of District then there would not be any program based reason to develop resistance to primary anti tubercular drugs.

Keywords: Multidrug Resistant Tuberculosis, RNTCP, Influencing factors, Programme.

Introduction

Multidrug resistance tuberculosis is an emerging as growing threat to tuberculosis control program all over the world. In 2013, in India 62,000 cases of multidrug resistant had been reported. One third of the world’s population is infected with MDR tuberculosis, it has been already estimated. Although, anti TB drugs have been available for the past 50 years, tuberculosis remains a major cause of morbidity and mortality all over the world.¹ Weak health systems, the HIV pandemic and emergence of MDR tuberculosis strains that are resistant to conventional drugs used in TB treatment remained major threats to TB control.² Poverty, such as poor living conditions and overcrowding are some factors contributing to the tuberculosis epidemic.³ ⁴

Inappropriate or incorrect use of antimicrobial drugs, Using ineffective drug formulations (eg. Single drug treatment), Treatment interruption (not completing the prescribed complete treatment), poor
supervision. Further mismanagement of these TB cases from healthcare givers and ongoing person to person transmission become the reason for emergence and spread of MDR TB.5

Thus the present study was aimed to explore an association of MDR-TB with various programme related influencing risk factors among the registered tuberculosis cases under RNTCP in the district Satara.

Material and Method

Study Design: A case-control study was carried out for the assessment of Programme related influencing factors for Multidrug Resistance among Tuberculosis patients enrolled for DOTS under Revised National Tuberculosis Control programme during the period of 2016 to 2018 at various sub district levels.

Study Population: The TB patients who were on DOTS and were suspected for Multidrug Resistant tuberculosis were subjected to CBNAAT. Total 2475 tuberculosis cases were suspected to have multi drug resistant tuberculosis were subjected for CBNAAT, out of these cases, 120 tuberculosis patients were confirmed to have multi drug resistance, 07 were XDR TB and 2348 were confirmed Drug sensitivity towards first line treatment and were continued with DOTS. After applying exclusion criteria total 104 MDR TB patients were enrolled in the study as cases and on Age, Sex and Tuberculosis Unit match, controls were selected from those TB cases who were confirmed sensitivity to primary drugs (2348).

Matching: For each MDR-TB case, one control was selected who was on DOTS and sensitive to both Isoniazide and rifampicine by CBNAAT. The control was selected from the same Tuberculosis Unit and was matched with the case with respect to gender and age difference of 5years.

Exclusion Criteria: All severe cases of MDR Tuberculosis admitted at DTC and all XDR TB cases were excluded from the study. Patients below 5 years and above 70 years of age were excluded from the study. Unwilling subjects from cases and controls were excluded from the study.

Sample Size: After applying exclusion criteria total 104 cases were enrolled in the study as study subjects and for each case one control was matched. Therefore total 104 cases and 104 controls were studies.

Study Instrument: Structured Questionnaire was used to record patients information which was validated by District Tuberculosis Officer and approved by Operational Research Committee under RNTCP.

Data Collection: Data was collected from records available at sub-district hospital i.e. tuberculosis unit under Satara district. Total 10 tuberculosis unit were considered and from each TU 5 to 8 cases and similar number of controls with age and sex matched were considered for data collection. The record based information was confirmed by meeting respective cases and controls as well as by interviewing STS and medical officer of tuberculosis unit. The information was obtained pertaining to visits paid by the contractual staff and by DOTS provider for address confirmation, retrieval action. Information on place for sputum investigation, patients previous treatment profile, follow up examination and investigation, consistency in medication, distance between DOTS provider and patients house were obtained.

Statistical Analysis

Data was analyzed by using a statistical software SPSS version 20. Chi-square test, and Fischer’s exact test was applied to find the association between various factors with drugs sensitive and resistant TB cases. Multi-variate analysis was carried out. The strength and magnitude of the association of MDR- TB with Programme related influencing factors were expressed in term of Odds-ratio. P value < 0.05 was considered as level of significance.

Observation and Results

In the Present study total 208 Tuberculosis patients were studied. In this case-control study 104 cases and similar number i.e. 104 controls were studies. Among all TB cases, 63.5% were male and 36.5% were female.

For addressed confirmation of tuberculosis patients was ensured by the STLS and STS with the help of TB health visitor before putting them on treatment by paying home visit. It was observed that 96.2% cases and 95.2% controls were visited by either senior treatment supervisor or senior tuberculosis laboratory supervisor for address confirmation and rest of them were not visited by senior treatment supervisor or Senior tuberculosis laboratory supervisor, However had visited by Tuberculosis Health
Visitor. The coverage by TBHV in the current study observed only at district headquarters and one of sub district headquarter where medical college is located. It was seen that among cases 98.1% and 100% controls were visited by DOTS provider at least one or more than one times during the course of treatment. (Table-1)

It was reported that high proportion of sputum samples were sent to Designated Microscopy centre at grass root level followed by at Tuberculosis unit and Districts Tuberculosis center. Among MDR cases nearly half of the samples (51.9%) were investigated at Designated Microscopy centre level followed by Districts Tuberculosis center and Tuberculosis unit. In comparison with drug sensitive tuberculosis cases sputum samples of multidrug resistant tuberculosis cases were referred to Intermediate referral laboratory Pune in high proportion (13.5%). This indicates that the multidrug resistant tuberculosis cases have diagnosed their status of tuberculosis at higher level. (Table-2)

It was noted that almost all cases of tuberculosis which were subjected for(multidrug resistant tuberculosis suspects) CBNNAT investigation were enrolled under category II (98.1% cases and 97.1% study controls). It was observed that out of 102 drug resistant tuberculosis cases and out of 101 drugs sensitive tuberculosis cases relapse was the main reason to put study subjects on re-treatment (multidrug resistant cases 57.8% and drug sensitive cases 75.2%). Whereas cases who were on category I were 1.9%, these cases were suspected as MDR-TB cases based on their HIV status and history of contact with MDR TB cases.

Female patients from drug resistant categories were enrolled for re-treatment due to relapse (65.8%) and default (10.5%). Male patients were put on re-treatment categories mainly due to failure to previous treatment (39.1%). (Table-3)

Among follow-up sputum microscopic examination it was observed that those patients who have been subjected for follow-up sputum microscopic examination had 50.43 times chances for having MDR-TB in comparison with those who have subjected for sputum microscopic among drug sensitive cases. Whereas patients who underwent for follow up clinical examination was found border line association to have MDR-TB in comparison to drug sensitive cases.

Similarly DOTS under supervision, Consistent treatment under Intensive Phase and distance of DOTS provider were found to be inverse relationship for developing MDR-TB in comparison to drug sensitive cases. (Table-4)

Discussion

Majority of MDR cases (96.2%) and drug sensitive tuberculosis cases in current study (95.2%) were visited by the Senior tuberculosis laboratory supervisor (STLS), DOTS providers, Paid visits to 98.1% of cases and all the controls (100%). Tuberculosis health visitor paid the least visit to cases (21.2%) and controls (26.9%). The coverage by TBHV in the current study observed only at district headquarters and one of sub-district headquarters where medical college is located. Similarly Raazi J et al. also reported highly supervised treatment to both 62.22% cases and 85.16% controls by DOTS provider., Whereas Wahab F et al. reported that majority of MDR cases (46.7%) were supervised by General Practitioner and DOTS provider (40%). This high proportional of supervised treatment by contractual staff reveals that the current Revised National Tuberculosis Control Programme in Satara district is functioning as per Revised National Tuberculosis Control Programme guidelines which have resulted in very few defaulted cases.

For diagnosis and for follow up sputum examination, high proportion of sputum samples were sent to (51.9% MDR tuberculosis cases and 59.6% drug sensitive tuberculosis) Designated Microscopy centre at grass root level followed by Tuberculosis unit (16.3% cases and 19.3% controls), District Tuberculosis center (16.3% cases and 19.2% controls). Samples of MDR TB cases which were sent to Referral laboratories were higher than the drug sensitive cases (13.5 cases and 1.9% controls) specifically for culture and drug susceptibility test. As in India majority (80%) of population resides in rural area, and in existing study majority of cases belonged to rural area, maximum samples have been sent to DMC’s at grass root level (Primary Health Centers). Only for suspected cases of MDR tuberculosis, sputum sample were sent to referral laboratory for advanced method of investigation for MDR tuberculosis.

In the present study 98.1% of the cases and 97.1% of the controls were on Category-II treatment for tuberculosis. The main reason for re-treatment in our study was Relapse, followed by treatment failure and treatment after default. Similar findings pertaining to the relapse of present study was reported by Wang et al. (44.6% cases and 31.7% controls), Mukharjee P et al. (35.46% cases). The reason for relapse could be poor nutritional status, alcohol use, migration and co morbidities, such as, diabetes mellitus, HIV/AIDS infection may result in reinflection in previously cured/treated tuberculosis cases. However default cases were very few which could reflect functioning of RNTCP adversely.

Conclusion

The infrastructure to implement Revised National Tuberculosis Control programme at District level has fulfilled the guidelines of programme and function smooth and efficiently. All the contractual staff are working satisfactory as per the guidelines of Revised National Tuberculosis Control Programme, the distance to cover by DOTS provider is convenient for supervised treatment.

Source of Funding: This project was funded by OR Committee under RNTCP and all the investigations were sponsored by KIMSDU, Karad, Maharashtra.

Ethical Considerations: Ethical clearance was obtained from Institutional Ethics committee. Permission was obtained from District tuberculosis officer and State tuberculosis officer to conduct this study. Written informed consent was obtained from cases and controls in their local language Marathi before recruiting them in the study.

Conflict of Interest: The authors declare no conflict of interest regarding the publication of this paper.

Acknowledgements

I am thankful to KIMSDU, Karad, District Tuberculosis Officer, State Tuberculosis Officer and Operational Research Committee officials, Maharashtra for approving and sanctioning budget.

Compressive Strength Evaluation between Metal Ceramic and Zirconia Crowns—An In-vitro Study

Vikram V. 1, Sanjna Nayar 2, Narayana Reddy 3
1 Senior Lecturer, 2 Head of Department, 3 Professor, Department of Prosthodontics, Sree Balaji Dental College & Hospitals Chennai

ABSTRACT
The aim of this study is to evaluate the compressive strength of metal and zirconia cores and also the point of chipping of the veneered porcelain to both the core materials. For the present study, full coverage crowns were fabricated for mandibular molar. The crowns were divided into two groups. First group is five samples of metal ceramic crowns and second group is five samples of zirconia ceramic crowns. These crowns were subjected to static compression loading in a universal testing machine until the fracture of the veneering porcelain. The compressive load was recorded in newton. Data were subjected to student t test analysis. Mean compressive strength for group 1 metal ceramic crowns was 2587.80N and the mean compressive strength for group 2 zirconia ceramic crowns was 1361.00N. The compressive strength of metal when being used as a core material is significantly higher than zirconia. Under static compressive loading, the point of fracture of the veneered porcelains occurred at significantly lower values for the zirconia based restorations when compared to that of metal ceramic restorations.

Keywords: zirconia, metal ceramic, compressive strength, chipping.

Introduction
Fixed prosthodontic treatment involves the replacement and restoration of teeth by artificial substitutes that are not readily removed from the mouth. Its focus is to restore function, esthetics and comfort 1. For the past 40 years the porcelain-fused-to-metal systems have been extensively used in fixed partial dentures (FPDs) and still represents the gold standard. The advantages of the PFM systems are to combine the fracture resistance of the metal substructure with the esthetic property of the porcelain 2. The drawbacks of these restorations are that the bulk of the natural tooth may need to be sacrificed to provide adequate space to ensure adequate fracture resistance and aesthetics 3. However, recently the increasing demand for esthetic restorations as well as the questionable biocompatibility of some dental metal alloys has accelerated the development and improvement of metal-free restorations 4.

All ceramic restorations have become more widely distributed due to their high esthetic potential and their excellent biocompatible properties 5. Zirconia (ZrO2) is a ceramic material with adequate mechanical properties for manufacturing of medical devices 7. Since it was introduced in Dentistry, the polycrystalline zirconium dioxide (zirconia) resulted particularly attractive in prosthodontics, due to its excellent mechanical properties and improved natural-looking appearance compared to metal–ceramics. Zirconia stabilized with Y2O3 has the best properties for these applications. Zirconia is a crystalline dioxide of zirconium 10.

The first proposal of the use of zirconium oxide for medical purposes was made in 1969 12. Zirconia exhibits a phenomenon called “transformation toughening,” which disables the progress of crack growth and increases toughness against fractures 14. The tetragonal crystals of zirconium oxide are metastable and the stress applied to cracks or flaws can transform them into larger monoclinic crystals 13. Yttrium partially stabilized tetragonal zirconia poly crystal (3Y-TZP) is made of transformable t-shaped grains stabilized by the addition of 3mol% yttrium-oxide (Y2O3). Such a polycrystalline material exhibits low porosity and high density; at the moment it is the most popular and frequently used form of zirconia commercially available for dental applications 20.
**Compressive Strength**

In the study of strength of materials, the compressive strength is the capacity of a material or structure to withstand loads tending to reduce size. It can be measured by plotting applied force against deformation in a testing machine. Some material fracture at their compressive strength limit; others deform irreversibly, so a given amount of deformation may be considered as the limit for compressive load. Compressive strength is often measured on a universal testing machine.

Dental ceramic materials exhibit many desirable material properties, including biocompatibility, esthetics, diminished plaque accumulation, low thermal conductivity, abrasion resistance, and color stability. However, brittleness and low tensile strength are weak points of ceramic materials. Therefore, the clinical success of all-ceramic fixed partial dentures (FPD) has been disappointing, especially for posterior FPDs when compared with metal-ceramic restorations. Although metal frameworks have inherent disadvantages, studies reveal that the resistance to fatigue failure is comparatively more for metal ceramic restorations when compared to all ceramic restorations.

Porcelain materials present two problems associated with occlusal forces: fracture of the porcelain, which is dependent upon the size and direction of the force (e.g., normal chewing versus bruxing), the type of porcelain (e.g., feldpathic, versus lithium disilicate, versus zirconia), and the time of force application; and wear of the material and its antagonist, whether natural enamel or other restorative materials. This is dependent upon the type of porcelain, quantity and timing of force, glazed versus polished porcelain, and the nature of the antagonist.

**Method**

For the present study, full coverage crowns fabricated for mandibular first molar were tested for compressive strength. Materials used subjected to testing include:

1. Metal ceramic
2. Zirconia ceramic

In order to standardize the crowns, a conventional tooth preparation was done on a mandibular first molar typhodont tooth model (Nissin). A full arch mandibular impression tray was used to make impression of the prepared tooth model using Aquasil soft putty/regular set (DENTSPLY) and Aquasil ultra LV, type 3: light bodied consistency (DENTSPLY) using the double mix technique (fig 1). The impression was poured using type IV dental stone. The dies were casted in cobalt chromium alloy (fig 2).

**Bonding Casts to the Crowns:** Once fabricated, the crowns were bonded onto the metal dies (fig 4) using dual polymerization composite resin cement (Rely X U 200,3M.) and light cured for a period of 20 seconds for initial setting of the material (fig 5).

A force of 10 N was applied for 5 minutes to ensure even distribution of the bond material and seat the crowns properly. After the cement had set the excess cement were removed from the margins of the restoration.
Compression Testing: The compression testing was carried out using a universal testing machine (Instron model: WDW-100). The load applicator (4mm metal ball) descended onto the samples (fig 6) exercising a continuous force with a vertical cross head speed of 1mm/min, moving vertically downward perpendicular to the occlusal zone.

The load force applicator’s ball established three point contact with the slopes of the vestibular cusps. Static compression loading was carried out until chipping or fracture took place of the veneered porcelain to the corresponding core material. This value was recorded in Newton (N). The data obtained was tabulated and analyzed using student t-test analysis.

Results

Five samples were tested for compressive strength of metal ceramic in which chipping of veneering porcelain was at maximum of 2908N and minimum of 2300N.

Five samples were tested for compressive strength of zirconia ceramic in which chipping of veneering porcelain was at a maximum of 1500N and minimum of 1000N.

Mean values of compressive strength for metal ceramic and zirconia crowns were 2587.80 and 1361.0 N respectively. These values were subjected to independent student t-test analysis. The t-value obtained was 7.880 with degree of freedom (df) being 7.589. There was a statistically significant difference between the compressive strength of metal ceramic and zirconia crowns (p=0.000).

Discussion

With regard to biting forces in the oral cavity, compressive strength of materials used in fixed restorations plays a significant role in the durability and longevity of the prosthesis. Normal chewing cycle starts with opening movement from centric occlusion, lateral movement and closure on to working side. Then finally shear movement against slopes of the upper teeth to grind the food particles and bring the jaw back to centric occlusion. The para functional habits like clenching includes sustained amount of compressive forces in centric occlusion, whereas bruxing include sustained compressive and shearing forces.

The choice of compressive test type and its specific design used in this study is best suited to study the resistance of ceramic materials. These have been substantiated by numerous authors (Snyder et al, Panadero et al). The compressive testing would therefore appears to be a validated method for evaluating fracture resistance of crowns or fixed partial dentures. Furthermore the cross head speed (1mm/min) and static compressive load were established in light of a literature review dealing these variables.

Despite the many disadvantages of in vitro study it is important to evaluate isolated mechanical properties under standardized conditions and limited influencing parameters. Although compressive strength does not reproduce conditions in the oral environment as
faithfully as in vitro cyclic studies, the results of this type of test provide valid information, which can then be extrapolated in clinical practice.

All-ceramic crowns are subject to fracture during function. To minimize this common clinical complication, zirconium oxide is the material of choice used for the framework of all-ceramic crowns. Kelly suggested several recommendations for a clinically relevant in vitro load-to-failure test for all-ceramic restorations: use of a die material with elastic modulus similar to dentin, failure test under wet cyclic loading, preparation of the teeth or dies according to clinical guidelines and use of all-ceramic crowns with clinically relevant dimensions.

In the current study, some experimental conditions were different from Kelly’s recommendations. The elastic modulus of the die material in this study is higher than that of dentin. However, natural teeth are hard to be standardized in size, mineralization, internal cracks, pulpal chamber dimension, and mechanical properties and would have fractured under the high compressive loads exerted during the test. Clinically, restorations are subjected to dynamic complex loading in saliva, which contains both organic and inorganic components. These conditions are quite different from the conditions used in this study; thus, further investigation should be carried out using stress corrosion or corrosion fatigue methodology so that the long term performance of restorations can be predicted.

The typical failure pattern of a veneering material in the daily clinical practice is known as ceramic chipping. For metal ceramics restorations, the linear coefficient of thermal expansion for metal and ceramic must closely match to achieve a strong interfacial bond. A small mismatch between these two factors results in an unknown amount of residual stress at the interface. This stress is usually confined to the veneered porcelain only.

The bond between veneering ceramic and zirconia framework is currently the subject of comprehensive investigation, when compared to that of metal ceramic restorations and this forms the basis of this study. The results of the present study show that the point of chipping or fracture of the veneering porcelain for the metal ceramic restorations ranges from 2000 to 3000N. Subsequently the chipping for the zirconia based restorations ranges from 1000 to 1500N. There is a statistically significant difference between the two groups.

From the present in vitro study, it may be confirmed that porcelain veneers with the same characteristics behave in response to static loading differently depending on the type of core they cover. Zirconia restorations fracture at lower static load values. Porcelain veneer over a metal ceramic core resisted higher static loading.

Conflict of Interest: Nil

Source of Funding: Self

Ethical Clearance: Not required as it is an in-vitro study

Evaluation of Thyroid Functions and Anti-Thyroid Peroxidase Antibodies in Patients with Vitiligo

Madhavi Latha¹, Masthan Saheb²
¹Associate Professor, ²Professor and HOD, Department of Skin and VD, Santhiram Medical College and General Hospital, Nandyal, Andhra Pradesh

ABSTRACT

Vitiligo is a common skin disorder, and the pathogenesis is unknown. An increased prevalence of autoimmune thyroid diseases has been described in these patients. The aim of this study is to assess the prevalence of thyroid dysfunction and hypoparathyroidism in patients with vitiligo. One hundred and twenty patients (48 males and 72 females) with vitiligo were enrolled. Thyroid physical examination was carried out. Thyroid function tests, thyroid antibodies, calcium and phosphorus were assessed. The collected data were analysed. Thyromegaly was found in 32.1% of patients. Hypothyroidism was found in 18 (16.7%) out of 120 cases. Two of them had clinical and 14 had subclinical hypothyroidism. One patient had Grave’s disease. Antibody positivity was the most common disorder (anti-TPO and anti-tg were positive in 38.7 and 34.1%, respectively). No patient had hypoparathyroidism. Thyroid dysfunction, particularly hypothyroidism and thyroid antibodies increased in patients with vitiligo.

Keywords: Thyroid antibodies, thyroid dysfunction, vitiligo

Introduction

Vitiligo is one of the most common skin disorders with a prevalence of 1-2% in different populations. The condition occurs when pigmented cells are destroyed, causing patches of skin to lose their normal color and appear whiter.¹ ² The etiology of this disorder is not clear but different theories suggest that autoimmune, genetic disorders, toxic metabolites, oxidative stimuli are the main factors. The nervous system and or the absence of the melanocyte growth factor may be included.³

From these factors, autoimmune disorder is the most common cause and some of the patients have antibodies to melanocytes or melanocytic proteins. Although it is not confirmed that these antibodies cause disease or lead to melanocyte destruction, there is some evidence that cell-mediated immunity plays a role in melanocyte destruction.⁴ ⁶ Autoimmune thyroid diseases with prevalence of up to 30% accompany vitiligo, from which hypothyroidism is one of the most common disorder.¹ In a study of 121 children with vitiligo, 16% showed some abnormalities in the thyroid function tests, The antithyroid peroxidase antibody (Anti-tpo) was the most common disorder.¹ In other study, the prevalence of autoimmune disorders, including thyroid disease, was more common than that of the general population.² Dave et al showed that the frequency of thyroid disorders (endocrine and or immunologic or both) were 57.1% in people with vitiligo in comparison to 10% in people without vitiligo. Thirty-four percent of patients in their study had thyroid antibodies.⁷

Manighalam and colleagues conducted a study on 30 patients with vitiligo and they found hyperthyroidism and hypothyroidism in 10 and 6.6%, respectively.⁸ The aim of this study is to access the incidence of thyroid dysfunction and antithyroid antibodies in patients attending skin OPD with vitiligo.

Method

This was a prospective study conducted between 2012 and 2014 (2 year) in Santhiram Medical college and
General hospital, Nandyal. A total of 109 patients with vitiligo (38 males and 71 females) with a mean age of 34.4 ± 13 years were selected. Institutional ethics committee’s clearance was obtained prior to start of the study.

A dermatologist diagnosed the condition as vitiligo at least 5 months before the initiation of the study. All the patients underwent thyroidal physical examination for the presence of goiter.

Thyroid stimulating hormone (TSH), T3 and T4 were measured using the ELISA test (DRG-USA kit). The anti-TPO and anti thyroglobulin antibody (Anti-Tg) were measured using the ELISA test (DRG-USA kit) the normal range being below 30.

Serum calcium and phosphorus were measured in all patients, and if the results were abnormal, the measurement was repeated and parathyroid hormone (PTH) was measured as well.

**Statistical Analysis**

Student’s t-test/chi-square/and Mann-Whitney U tests were performed. All the data was analysed with SPSS, version 13.

**Results**

One hundred and twenty patients were enrolled. The mean age was 34.41 ± 13 (CI: 8-65) years [72 females (65%) and 48 males (35%)]. Seventy-eight patients had a normal thyroid size and 34 patients (30.1%) had goiter.

| Table 1: Laboratory investigations in patients with vitiligo |
|-----------------|-----|-----|
| Mean            | SD  | Range |
| TSH (mIU/L)     | 2.15| 0.3-3.5 |
| Anti-Tg (IU/ml) | 212 | <30    |
| Anti-Tpo (IU/ml)| 248 | <30    |
| Ca++ (mg/dl)    | 9.1 | 8.5-10.5 |
| P (mg/dl)       | 3.1 | 2.5-5.5 |

The laboratory findings are shown in Table 1.

Nineteen patients (17.4%) had abnormal TSH levels and in three patients (3.2%), the TSH level was less than normal, one patient had Grave’s disease and in another two patients, T3 and T4 were normal.

In 16 patients (15.7%), TSH levels were more than normal, and in 12 of them, it was more than 5 mIU/l. In these 16 cases, there were 12 females and 4 males. Two patients had clinical hypothyroidism. Anti-Tpo and anti-Tg antibody were positive in 41 (38.7%) and 37 (34.1%) cases, respectively. Thirty-four patients had goiter, from which 14 of them (42.4%) had abnormal TSH levels and this correlation was significant with Mann-Whitney U test (P = 0.002) and 21 of them (67.7%) had anti-Tpo antibody (P = 0.001).

There was a positive correlation between TSH and anti-Tpo antibody (r = 0.4, P = 0.002).

One case had serum calcium levels less than normal and two had increased serum phosphate levels, which was normal after tests was repeated and PTH was normal in all cases. Therefore, no patient had hypoparathyroidism.

**Discussion**

Vitiligo is a common skin disorder in which skin depigmentation is due to destruction of melanocytes and decreased melanin. Although the exact pathogenic processes involved in the destruction of melanocytes in vitiligo are still unknown, autoimmune melanocytic destruction have been advocated. This disorder always accompanies other autoimmune diseases, and the presence of autoantibodies is used to prove this theory.

We carried out this study in order to determine the association between autoimmune thyroid diseases, parathyroid disorder with vitiligo. Eighteen (16.7%) patients had overt thyroid disorders with hypothyroidism as the most common presentation and one patient had Grave’s disease. These results can be compared to those of other studies.

In a study that was performed on 121 children with vitiligo, nine patients had hypothyroidism and one patient had hyperthyroidism. In another study that was conducted in India, the thyroidal disorders were more common and in 35 patients with vitiligo, 40% had thyroidal dysfunction and 34.1% were anti-tpo antibody positive. In a research that was carried out on 30 patients with vitiligo in Iran, hyperthyroidism and hypothyroidism was observed in 10 and 6.6% cases, respectively. In a report, there was no thyroidal dysfunction, but the anti-tpo antibody positivity was more than that of the control group.

The important findings of this study were the increased positivity of anti-tpo and anti-tg antibodies.
38.7% and 34.1% of cases had elevated anti-tpo antibody and anti-tg antibody, respectively.

In other studies, the positive anti-tpo antibody and Anti-tg antibody were the most common disorders. In a study, the positive anti-tpo antibody was observed in 10% children; however, this can be due to the lower age group of this study, in which the children normally have lower antibody level than that of the adults.

In a study by Daneshpazhooh et al, increased anti-tpo antibody levels were found in approximately 18% of their patients.9 Although the frequency of positivity of anti-tpo antibody in their study was different to our findings, it could be due to the age group of their study sample and also female was more predominant in our study.

In a study in India, the anti-Tpo antibody was positive in 31.4% cases, which was similar to this study conducted in Andhra Pradesh. In a study that was conducted in UK in 40 patients, 34% had positive antithyroid antibody,11 and in a report from Australia, 106 patients 21% had positive antithyroid antibody.12 In Greece, in 54 children and adult cases with vitiligo, the prevalence of anti-tpo antibody was 24.1%.13

34 patients (301%) had some degree of goiter and most of them were women. Further, in another study that was performed, the prevalence of goiter was 20%.9

This may be due to high number of women in our study, who normally have more thyroid enlargement than men.

There are few studies that search the relation between vitiligo and hypoparathyroidism.

In a study by Betterle et al, the prevalence of autoimmune parathyroid disease in patients with vitiligo was 1%.14 There was no abnormalities in serum calcium, phosphorus and PTH levels; therefore, we did not detect any patients with hypoparathyroidism.

In conclusion, this study showed that the autoimmune thyroid diseases, most commonly hypothyroidism and autoimmune thyroiditis that are confirmed with the presence of antithyroid antibody, are more common in patients with vitiligo than general population.15

So we recommend the measurement of the TSH levels and anti-Tpo antibodies in all the patients with vitiligo and all of them who have a high level of anti-Tpo antibodies should be followed-up annually with TSH.

The Incidence and Prevalence of Virulence Factors of Vaginal Candidiasis in Pregnant Women with Diabetes Mellitus

Sandhya Rani T.¹, R. Srikumar², E. Prabhakar Reddy³, Naveen Kumar⁴
¹Research Scholar, Department of Microbiology, ²Research Associate, Centre for Research, ³Professor of Biochemistry, ⁴Research Scholar, Department of Microbiology, Sri Lakshmi Narayana Institute of Medical Sciences, Affiliated to Bharath Institute of Higher Education, Pondicherry, India

ABSTRACT

Background and Purpose: Candida species are act as commensals, in antenatal women developed vaginal discharge which can lead to pregnancy difficulties like abortions, premature birth and other predisposing factors such as use of broad spectrum antibiotics, oral contraceptive pills and HIV/AIDS. The present study was aimed to the incidence and prevalence of virulence factors of vaginal Candidiasis in pregnant women with diabetes mellitus.

Materials and Method: Seventy five high vaginal swabs were collected from pregnant woman with symptoms of vaginal infection. These samples were tested by microscopical examination and culture on Sabouraud Dextrose agar to identified Phenotypic and Virulence factors of Candidia species

Results: Thirty five Candida species were isolated,66% non-albicans Candida species isolated, while Candida albicans were isolated 34% from total positive sample.Non-albicansCandida species were the predominant pathogens isolated. Biofilm production was shown by (88.5%) and phospholipase activity was given by (89%).

Conclusion: Nonalbicans Candida spp. increased production of virulence factors in VVC cases. Its isolation from clinical specimen do not ignored as nonpathogenic isolates or contaminant. Biofilm formation and other virulence markers should be routinely screened for vaginal Candidiasis during pregnancy with diabetes.

Keywords: Candidiasis, Vulvar erythema, Biofilm and Phopholipase.

Introduction

Vaginal Candidiasis is a abnormal growth of Candida species on the mucosa in the female genital tract. These clinical manifestations by occurrences of pruritus, hyperemria, vaginal discomfort,leucorrhea, dyspareunia and vulvar erythema may be due to in marital and sexual relations.¹ Usually vaginal Candidiasis is common due to altered pH and sugar content of vaginal secretions, increased estrogen level during pregnancy produces more glycoen in the vagina and it has direct effect on yeast cells causing to grow faster and stick more easily with the walls of vagina ² and also other predisposing factors such as use of broad spectrum antibiotics, oral contraceptive pills, HIV/AIDS, weakened immune system, topical use of antimicrobial agents.³ Besides, systematic conditions such as vitamin B deficiency, hypothyroidism and lymphoblastoma favours Candida infection.⁴

Pregnancies with diabetes mellitus are at higher risk of vaginal Candidiasis. Which is the second most frequent infection of the female genital tract.Up to 75% of all women will experience fungal vaginitis at some point in the lives and also 40 to 50%will experience a second episode of this disease.⁵ Symptoms of Candida infection in the vagina likes smelly, thick, white–yellow discharge that might be accompanied by itching, burning, swelling, walking, urinating and sex very painful.
Untreated vaginal infections can lead to pelvic inflammatory disease and scar the fallopian tube which can cause infertility. Candida albicans is the most common species isolated in diabetics. Recently, vaginal infection with non C. albicans species has been reported due to widespread and empirical use of antifungal drugs and virulence factors produced by Candida species.

In pregnancy, the recommended treatment is topical antifungal vaginal agents in the form of creams, suppositories and tablets, whereas oral therapy should not be used during pregnancy or breastfeeding. It was the view that every pregnant woman, symptomatic or asymptomatic, suffers from vaginal Candidiasis. Therefore, the present study was focused to incidence and prevalence of virulence factors of vaginal Candidiasis in pregnant women with diabetes mellitus.

Materials and Method

Study Design: A cross-sectional descriptive study was done among the pregnant women in Department of Microbiology, Clinical Pathology Laboratory, Sri Lakshmi Narayana Institute of Medical sciences, Pondicherry from January 2017-June 2017. This study comprised of 75 women of reproductive age group who were pregnant with diabetes. The study was approved by the institutional ethical committee of Sri Lakshmi Narayana Institute of Medical sciences, Pondicherry according Helsinki 1975 Human ethical guidelines. All the data were collected in a prescribed perform and obtained informed consent form from subjects. According to world health organization (WHO), diabetic affliction criterion was fasting blood sugar (FBS) higher than 140 mg/dl in two separate times. We administered a questionnaire to obtain information about: patient history. Women in their first trimester of pregnancy and previous history of preterm labor or spontaneous abortion. Those who had recently received the treatment for vaginal Candidiasis were excluded.

Specimen Collection and Processing: Two sterile cotton-tipped swabs were used to collect high vaginal discharge from the posterior fornix of the pregnant women with help of Speculum. One swab was used for preparation of smear for Gram’s staining and the other was inoculated on Sabouraud’s dextrose agar (SDA) slope containing chloramphenicol and incubated at 37°C up to 24h. Colonies suggestive of Candida spp. in SDA tube were further phenotypic methods and Other virulence factors such as phospholipase activity, proteinase activity, Haemolycic activity, esterase activity and Biofilm production.

Discussion

Women motherhood is the most universal and strongest. The feeling of a life growing inside makes her ecstatic. Mother during pregnancy is very important to give birth to a healthy baby. About 75% of women of child-bearing age affects vaginal Candidiasis due to hormonal variation, i.e., during pregnancy, antibiotic uses and use of oral contraceptives. Women complain of vaginal release when they think it is unusual for them and if it symptoms like itching and discomfort.

The present study showed prevalence 47% of vaginal Candidiasis among pregnant women. Our founding similar to the observations of Tanzania and Menza et al also in agreement with our result which they reported that, prevalence of vaginal Candidiasis in among pregnant women were 42.9%, 42.7% respectively. In another study, by Feyi-Waboso and Ahmadi, where 42.9% of vaginal Candidiasis was found during pregnancy, this is maybe due to suppression of the immune system and prolonged and misuse of antibiotics which leads to the destruction of good and beneficial bacteria resulting to reduction of vaginal immunity.

The highest prevalence of vaginal infections in present study was noted among the age groups 21–30 years [56.2%], followed by 31-40 age group [50%] and >41 age group [20%]. This observation is consistent with Nelson et al showed a 60% frequency of Candidiasis in pregnant women of 26–35 years. Fifty five percent [55%] incidence rate was reported within age group 26 - 35 years in Benin City by Okungbowa et al. while Akortha et al reported 57% within age bracket 26 - 35 in Benin City, in Nigeria. The infection was at a higher frequency in this age group contains women are younger and sexually active have low vaginal defense mechanisms against Candida species. They have the habit of using contraceptives especially the emergency pills to prevent pregnancy. Present study found as the 41-45 years in ages of women VVC was less prevalence may be due to close to their menopause and are less active sexually and increased vaginal immunity.

It was obvious from this result; candida albican was the dominant isolated yeast [34%]. out of Candida species. The percentage of non-albicans species was 65.7%, composing of C.parapsilosis (26%), followed by C.glabrata (11%), Candida tropicalis (11%), Many of reports from different place in similar to our report, Shivan et al [18] in India, Rad et al [19] in Iran, reported that, C. albicans was the highest occurrence with [50%] and also observed by Isibor. C.parapsilosis as the most common Candida species among the symptomatic pregnant women in present study this results not similar.
to Altayyar IA et al showed candida albicans as the most common vaginal candida species followed by candida glabrata causing vaginal Candidiasis among pregnant women. C. parapsilosis, C.tropicalis C. kruzie may be due to pathogenesis and prognosis of candidal infections are affected by the host immune status.21

In the present study, multigravida suffered more significantly from vaginal candidiasis than the primigravida. this results similar to the Naheed Parveen et al.22 This finding can be explained as multigravida have longer sexual history and also number of pregnancies that make them more prone to develop vaginal candidiasis than primigravidae who have less sexual exposure. This present study revealed that most of the respondents had suffered from candidiasis in 2nd trimester of gestation period of 60% followed by 2ndtrimester with 37.1%. The study conducted by Oyewol et al.23 also observed the highest incidence of vaginal Candidiasis among pregnant women in their second trimester (61%). Deepa et al.,24 2014 reported 54% prevalence in second trimester, 30% in third trimester and 16% in first trimester. The highest number of VVC was observed in those of the respondents who had 66% symptoms of vaginal Candidiasis than 34%were asymptomatic A similar study was conducted by Kanagal et al.,25 reported 82% of Candida positive women were symptomatic and the remaining 18% were asymptomatic was in accordance with the present study.

Biofilm formation is a virulence factor due to the ability to confer resistance to antifungal therapy and protect the fungal cells from host immune responses. Shin JH, Kee SJ et al26 investigating biofilm production among Candida species detected higher levels of positivity among non-albicans Candida strains than that of C.albicans strains. Similar findings were reflected in the present study too.65.7% among non-albicans vs. 34% among albicans spp.

Phospholipases are a group of enzymes produced by Candida species that primarily help in digesting the phospholipids of the host cells leading to cell lyses. In this study, 41.6%, Candida albicans is the major producer of phospholipases while C. parapsilosis11%was the second most frequent species produced phospholipase in our study correlated with Nyirjesy, P et al 27.

In present study, C. albicans demonstrated increased capability of proteinase production and also noted in NAC spp. This enzyme facilitates Candida invasion and colonization of host tissue by disruption of host membrane and by degrading important structural and immunological defense proteins similar report by. Silva, M. et al study.28 Esterase act as virulence character among clinical isolates of Candida. Recent investigations suggest the mechanism of virulence is due to the cytotoxic effects of esterase in the host tissues. However, in present study find a significantly higher in esterase production among the non albicans Candida species this study comparison to few published reports C. P. G. Kumar, T et al.29

In current study, haemolyase production was noted in both C. albicans and NAC spp. It can activate complement and opsonize surface of red blood cells.30 Therefore, haemolyase is one of the important virulence factor contributing to pathogenicity of Candida. It enables the pathogen to survive and persist in the host.

Conclusion

The present study concluded that the high prevalence of vulvovaginal candidiasis in the pregnant women maybe due to abortions, premature birth, low birth weight and other morbidities. The higher incidence of vulvovaginal candidiasis found to be more especially within the age group of 21 to 30 years, in those women in their 2nd trimester of pregnancy. Non-albicans Candida species were the most prevalent vaginal Candida species isolated diabetes with pregnant women which indicates their emergence as opportunistic pathogens in immunocompromised patients. The emergence of nonalbicans Candida spp. increased production of virulence factors in VVC cases. Its isolation from clinical specimen can no longer be ignored as nonpathogenic isolate and dismissed as a contaminant. Therefore we recommended that biofilm formation and other virulence markers should be routinely screened for vaginal Candidiasis during pregnancy with diabetes.

Virulence Factors of Candida Species Isolated From Pulmonary Tuberculosis with Diabetes Mellitus

Sandhya Rani T., R. Srikumar, E. Prabhakar Reddy, S. Latha, Naveen Kumar

1Research Scholar, Department of Microbiology, 2Research Associate, Centre for Research, 3Professor of Biochemistry, 4Associate Professor, Department of Physiology, 5Research Scholar, Department of Microbiology, Sri Lakshmi Narayana Institute of Medical Sciences, Affiliated to Bharath Institute of Higher Education, Pondicherry, India

ABSTRACT

Background and Purpose: Candida species are emerging as a potentially pathogenic fungus in pulmonary diseases. The synergistic growth promoting association of candida and mycobacterium tuberculosis has increased concern for studying the various candida spp. and its significance in pulmonary tuberculosis patients. This study was undertaken with the objective of discovering the study of virulence factors of Candida species isolated from pulmonary tuberculosis with diabetes mellitus.

Materials and Method: A total of 110 patients with pulmonary tuberculosis diagnosed by sputum Ziehl-Neelsen staining were included in the study. Candida co-infection was confirmed using the Kahanpaa et al. criteria. Candida species were identified using gram stain morphology, germ tube formation, morphology on cornmeal agar with Tween-80, sugar fermentation tests and HiChrom Candida Agar.

Results: Candida co-infection was observed in 53 (48%) of patients with pulmonary tuberculosis. Candida albicans was the most common isolate observed in 62% of the patients with co-infection, followed by C.parapsilosis (11.3%) and 5 were C. krusei (9.4%). Candida co-infection was found in 52.8% of female patients, while it was observed in only 47.1% of the male patients.

Conclusion: Candida spp. isolated from pulmonary tuberculosis patients has significantly higher production of virulence factors. Candida co-infection should be routinely practiced along with extracellular hydrolytic enzymatic activity and biofilm production of NAC Spp. The identification of the gene responsible for the colonization may provide novel targets for antifungal prophylaxis.

Keywords: Mycobacterium Tuberculosis, Candida infection

Introduction

Tuberculosis is a high morbidity and mortality disease in the world. One-third of the human population is infected with mycobacterium tuberculosis. The disease is treated with antibiotics on immunosuppressive agent which predisposes tuberculosis patients to immunocompromised and susceptible to fungal infections. Oral Candidiasis occurs most frequently in immunocompromised hosts, intensive care patients and patients undergoing chemotherapy.

The synergistic growth-promoting association of Candida and M. tuberculosis has also been documented experimentally. Mankiewicz (1954) et al study found that Mycobacterium tuberculosis has a syntropic relationship with Candida albicans where C.albicans was found to be growing on lowenstien Jensen’s medium for Candida albicans. Another study confirmed the effect of polysaccharide fraction of Candida albicans for enhancement of the growth as well as reduction of the generation time of tubercle bacilli.
Virulence factors of *candida* are adherence, pseudohyphae formation, phenotypic switching, biofilm production and proteinase and phospholipase production expressed by *Candida* species, which may vary depending on the type of infection, the site and stage of infection and the nature of the host response. Early data suggest that direct host cell damage and lysis are the main mechanisms contributing to fungal virulence. Therefore the present study was undertaken to determine the virulence factors of *Candida* species isolated from pulmonary tuberculosis with diabetes mellitus.

**Material and Method**

A total of 125 smear positive pulmonary tuberculosis patients were included in this study done during Jan-June 2016 at Sri Lakshmi Narayana Medical College, Pondicherry. The study was done after obtaining informed consent from the patients and institutional ethical committee clearance. Two consecutive sputum samples were collected from each patient and subjected to gram staining and culture.

A detailed history regarding smoking, alcohol consumption, calorie intake etc., was collected from the patients by administering a questionnaire. The criteria for diagnosis of *Candidiasis* were based on the presence of pus cells with budding yeast cells and pseudohyphae in direct gram stain. Samples were inoculated on Sabouraud’s Dextrose Agar (SDA). Colonies were identified by Phenotypic technique.

**Determination of Phospholipase Activity:** The culture medium consisted of 1 L of SDA broth add ten microliters of previously prepared yeast suspension was inoculated onto plates, incubated at 37 °C for 5 days in aerobic condition. The presence of enzyme activity was determined by the formation of a precipitation zone around the yeast colonies. Phospholipase activity (Pz) was calculated by dividing the diameter of the colony by the diameter of the colony plus precipitation zone. The Pz was scored as follows: Pz = 1, negative phospholipase activity; Pz = 0.64–0.99, positive phospholipase activity; and Pz ≤ 0.63, very strong phospholipase activity.10

**Determination of Proteinase Activity:** To bovine-serum albumin agar, add ten microliters of previously prepared yeast suspension and inoculated onto the plates, incubated at 37 °C for 10 days in both aerobic and anaerobic conditions. The presence of proteinase activity was determined by the formation of a transparent halo around the yeast colonies.11

**Haemolysin Activity:** Haemolytic activity was measured using blood agar plates. The *Candida* spp were streaked onto SDA enriched with 5 ml of human blood at pH 5.6 ± 0.2 and incubated for 5 days at 25°C. The plates were analyzed with the aid of a computerized image analysis system for all the assays and measurement of the zone of hemolytic activity.12

**Esterase Activity:** To determine esterase activity, Tween-80 opacity test medium was used add ten microliters of previously prepared suspension from each isolate was carefully deposited on the Tween-80 opacity test medium then incubated at 37 °C for 10 days in aerobic. Esterase activity was considered as positive in the presence of a halo pervious to light around the inoculation site.13

**Biofilm Production:** A loop full of organisms from the SDA inoculated into a tube containing 10ml Sabouraud’s liquid medium strains supplemented with glucose. The tubes were incubated at37°C for 24 h after which the broth was aspirated out and the walls of the tubes were stained with saffranin. Biofilm production was scored as negative (0), weak positive (1+), moderate positive (2+) and strong positive (3+). Data were entered in excel worksheets and analyzed using suitable statistical methods.14

**Results**

Out of the total 110 patients with suspected tuberculosis, 53 patients (48.1%) who were positive for acid fast bacilli by Ziehl-Neelsen stain were screened for *Candida* co-infection.

Out of 53 Candida species tested 37(69.8%) were found to be biofilm producers. Biofilm production was most frequent among non-albicans Candida 20 (37.7%) than Candida albicans 17(32.0%). Among the non-albicans Candida species, C. parapsilosis6 (30%) was the highest biofilm. (Table-1)

Phospholipase producers were more amongst the non-albicans Candida species 18(52.9%). C.krusei 5(27.7%) followed by 5(27.7%) C.dubliensiand 3(16.6%) C.tropicalis (Table-2). Proteinase production was most frequently among Candida albicans 28 (84.8%) than non-albicans Candida 10(50%). Among the non-albicans Candida species, C. tropicalis and C. krusei were found to be the highest producers.
albicans Candida species, C. tropicalis (30%) was the highest Protienase producer followed by C.dublinesis (30%) and C.krusei (20%) (Table-3). As shown in Table4,5 maximum Estarase and Haemolyase activity was seen Candida albicans.

**Discussion**

Pulmonary Tuberculosis has a wide range of clinical spectrum, chronicity and sequela. Several studies have been documented Candida species as the most common fungal agent isolated from sputum of pulmonary tuberculosis patients; its significance has always been a matter of controversy due to the fact that up to 32.5% of healthy people carry Candida in their throat as normal flora. This can contaminate the sputum sample during collection.\(^{15}\)

Present study shows the prevalence of 48.1% Candidal infection among the tuberculosis patients. Which is similar to Baradkar et al.\(^ {16}\) study showing prevalence of 26 % co-infection with Candida species. It is significantly higher in females than in males which is responsible for increased risk of Candida co-infection with pulmonary tuberculosis. According to Hidalgo et al.\(^ {17}\). colonisation rates of Candida species are equal in males and females.

In present study, the species-wise distribution of Candidal infections revealed the predominance of *Candida albicans* over other species of Candida. *C. albicans* constituted 62.2% of the total Candida isolates. This findings correlates with the Kali A et al study\(^ {18}\) which
also demonstrates *C. albicans* to be the commonest species causing secondary infection comprising 50% of the total Candida isolates.

In the present study, non albicans Candida 11%, 9.4%, 9.4%, 5.6% and 2% prevalence for *C. parapsilosis*, *C. dubliniensis* *C. krusei*, *C. Tropicalis* and *C. glabrata* respectively. This result is similar with studies of Ndukwu, C et al detected *Candida*. These variations mainly due to differences in local prevalence of different species depending on different environmental conditions.

Amphotericin B, belongs to the polynene class of antifungal agents and also most effective treatment for fungal infections. In present study, 23(70%) *C. albicans* and non albicans candida, 5(100%) *C. dubliniensis* 3(100%) *C. tropicalis*, 4(80%) *C. krusei*, and 4(66.6%) *Candida parapsilosis* resistance to amphotericinB. This results correlated with Sanandaj (1.6%) and Ahvaz (4%). 2.6%7% in Shiraz and Mazandaran were observed highest resistance rates to this antifungal agent due to nephrootoxicity in up to 80% of the patients. It can positively affect the immune system and stimulates the body defenses against fungal infections.23

Susceptibility of 85% *C. albicans*, 100% *C. dubliniensis*, 100%, *C. tropicalis*, 100% *C. krusei*, and 83.3% *Candida parapsilosis* to fluconazole in this study comparable with 80.9%, Badiee P, Alborzi Aet al.9 9% Lord AM, North TE, et al.24 87.5% Ozcelik B This anti fungal agents more cost effective and less toxic forms of theazole family with excellent patient tolerance.28

*Candida* biofilms may help maintain the role of fungi as commensals and pathogen by evading host immune mechanisms, resisting antifungal treatment and the competitive pressure from other organisms. Our data showed that biofilm production was more significant among non-albicans Candida species 37.7% than *C. albicans* 32.0%. Similar findings have been reported by Girish, and Muni et al. Among the non albicans Candida species, the biofilm positivity occurred most frequently among isolates of *C. parapsilosis* (30%), followed by *C. krusei* (20%) and *C. tropicalis* (15%) were produced strong slime producers this results correlated with Daget al. Hetal Sida et al.

In our study phospholipase activity was noted 52.9% of NAC spp. Minimum phospholipase production was seen in *C. tropicalis* (16.6%) which is similar to the observation of Thangam et al.30 These variation may be due to different strains or the difference in the method of media preparation and discrepancy observed by different workers in the phospholipase activity of the NAC spp.

Proteinase activity was seen in Candida albicans 84%. The correlation between production of proteinase and virulence shows that, the most virulent NAC spp. like *C. tropicalis* produces more proteinases in-vitro. This observation was similar to given reports by Ghannoum MA et al.

Haemolyase activity more significant among the candida albicans than non albicans candida species in the present study. Marcos-A riaserose et al.32 found that non-candida species also produced same type of haemolytic activity. In the oral cavity, extracellular iron bound mainly to lactoferrin, a protein present in saliva. while intracellular iron is stored as ferrit in although, this elements bound to protein and is present in the cytoplasm of cells. Oral infection with C.albicans are frequently suggesting that this yeast is able to take up different forms of iron from the oral cavity. About 90% of Candida albicans expressed esterase activity in present study this results correlated with pakshir et al. and aktas et al.

**Conclusion**

Our findings indicate that Candida spp. isolated from pulmonary tuberculosis patients has significantly higher production of virulence factors. The production of phospholipase and proteinase activity is responsible for the proliferation and demolition of the host tissues. Haemolytic and esterase activity was observable in all the isolates. Significance biofilm formation higher in non-albicans Candida species than *C. albicans*. This ability to form biofilms is intricately linked with the ability of the organisms to adhere, colonize and subsequently cause infection in susceptible individuals. The resistance rate is increasing towards amphotericin-B drug by C. albicans. Therefore, screening of Pulmonary tuberculosis patient for *Candida* co-infection should be routinely practiced along with extracellular hydrolytic enzymatic activity and biofilm production of NAC Spp. would be an important tool to prove the relation between the infective species of Candida infection. The identification of the gene responsible for the colonization may provide novel targets for antifungal prophylaxis.

ABSTRACT

Water is a chemical union between hydrogen and Oxygen. Water is unique in the sense that it can exist in three phases at almost the same temperature: Solid state (ice), liquid and gas (water vapour). On the earth, about 2/3 of the surface is covered by water and about 1/3 by land. So, water is a basic, natural resources for agriculture and industry. The present study was conducted to analyze the physico-chemical properties of groundwater from ten locations in Aligarh and Agra district of Uttar Pradesh. The samples were analyzed for seven water quality parameters in post monsoon season during the year 2017. The study area has a mean of pH 7.65, Total alkalinity 1002.2 mg/l, Electrical Conductivity 2.57 µS/m, Total Dissolved Solids 650.4 ppm, COD 94.2 mg/l, BOD 0.89 mg/l, and Fluoride 0.85 ppm. The results obtained from chemical analysis were compared with standard namely Bureau of Indian standards (BIS). From the analysis it has been observed that the drinking water quality in the study area is reasonably not good and it does show any alarming level of pollutants, however it needs some degree of treatment before use for drinking and other purposes. It also needs to be protected from the industrial waste and sewage contamination.

Keywords: Water, Physico-chemical properties, Groundwater Quality, Pollutants.

Introduction

Water is the most important and useful natural resources on the earth because life is not possible without water. Water is essential for the survival of all living organisms and plays an important role in our life. But unfortunately the deficiency of the clean water increases day by day due to pollution of water and overexploitation, so the drinking water analysis is very important and essential for public health studies. Ground water is the major source of water for drinking, agricultural and industrial need. The availability of water determines the location and the activities of human beings in an area, and our growing population is placing great demand upon natural fresh water resources. It is estimated that approximately one third of the world’s population depends on ground water for survival. The physicochemical contaminants that adversely affected the quality of ground water is likely to arise from various sources, including land application of fertilizers, infiltration of effluent from sewage treatment plants, industrial waste, ponds, etc. The water supply for human consumption is often directly sourced from ground water without chemical treatment and it is used by humans so the pollution of ground water has become a cause for major concern. Pollution of water is due to increased human population, use of fertilizers in agriculture, industrialization and human activity. Once the ground water is contaminated, its quality cannot be restored by stopping pollutants from the source therefore it becomes very important to regularly monitor the quality of ground water. In recent years, because of rapid urbanization, growing population and industrialization, the rate of discharge of pollutants into the environment is higher than the rate of purification which ultimately finds their

Email: gsi.harit@rediffmail.com
way into these water bodies\textsuperscript{8,10}. It is believed that surface water are generally more polluted than ground water, hence the use of ground water such as borehole water as the major source of drinking water in many areas is the only alternative\textsuperscript{4,5}. Unfortunately, ground water can also be polluted through various ways such as fertilizer from agricultural and mining activities, seepage from effluent waters, vehicle maintenance, domestic waste and sewage disposal \textsuperscript{6,11}. The study of physic-chemical properties of Bore well water quality in Vidharbh Region, Nagpur city south zone was carried out and concluded that some parts of bore well water needed treatment for drinking water purpose due to hardness, pH, DO, Alkalinity and Chlorides are present in desirable limits and some sort little variation\textsuperscript{4}. The various physic-chemical parameters were evaluated to study the suitability of ground water mainly for drinking purpose in Taj city Agra and found that the water quality of all samples is not suitable for drinking without treatment. The evaluation of physico-chemical parameters was carried out to assess the quality of ground water and concluded that the ground water of Kurnool region is fit for domestic use and drinking purpose but need treatments to minimize the contamination especially the alkalinity.

The present work is an attempt to analyze the physico-chemical parameters of drinking water samples collected from different sites in Aligarh and Agra district, India to assess the ground water quality and it is fit or not for drinking purpose.

**Materials & Method**

**Study Area:** Agra city is situated on the bank of river Yamuna in the northern state of Uttar Pradesh, India. Agra city is famous for Taj Mahal. The city is 378 km west of the state capital Lucknow 206 km south of the national capital New Delhi. The city is the administrative district of Agra district. Agra district is situated in western Uttar Pradesh, between 27.11\textdegree North and 78.0\textdegree to 78.2\textdegree longitude East.

Aligarh is a city in the northern Indian state of Uttar Pradesh and the administrative headquarters of the Aligarh district. The city lies 203 km northwest of Kanpur and is 140 km southwest of the capital New Delhi. Aligarh is located at the coordinates 27.88\textdegree N 78.08\textdegree E. It has an elevation of approximately 178 meters (587 feet). The city is in the middle portion of the doab.

**Methodology**

In the present study, ten ground water samples were collected from different locations of Aligarh and Agra district, Uttar Pradesh. The sampling points are located in such a way that, they are uniformly distributed in all the wards of the study area. Mostly, bore wells are considered for sampling. At certain places a few open wells and hand pumps are also considered for the sampling. The water samples were collected in clean plastic bottles without any air bubbles. The bottles were cleaned before collecting sample and tightly sealed after collection of sample and labeled in the field. Samples were analyzed immediately for parameters, which need to be determined instantly and rest of samples were refrigerated at 28\textdegree C to be analyzed later. Analytical grade and chemicals were used to prepare reagents and calibration standards. Water samples are collected from each sampling point and are analyzed for the parameters shown in Table1.

**Results and Discussion**

1. **Potential of Hydrogen Ion (pH):** The permissible limit of pH for drinking water is 6.5-8.5\textsuperscript{2}. It was seen that the pH value of the water appears to be dependent upon the relative quantities of calcium, carbonates and bicarbonates. The water tends to be more alkaline when it possesses carbonates \textsuperscript{12}. The pH value of the samples in the study area varied from 6.75-9.4 with a mean of 7.65 indicating slightly alkaline nature.

2. **Electrical Conductivity (EC):** Electrical conductivity is a measure of water’s capacity to
conduct electric current. Most of the salts which are present in water in ionic form are responsible to conduct electric current. Electrical conductivity value of the study area varied from 1.70-4.76 µs with a mean of 2.57 µs and most of the samples were shown low value from the standards of ICMR/BIS prescribed for drinking.

3. **Total Alkalinity (TA):** The permissible limit of alkalinity for drinking water is 200-600 mg/l. The excess of alkalinity could be due to the minerals, which dissolved in water from mineral rich soil. The various ionic species that contribute mainly to alkalinity includes carbonates, bicarbonates, phosphates, hydroxides, borates, silicates and organic acids. In some cases, hydroxides or ammonia are also accountable to the alkalinity. The alkalinity of the samples in the study area varied from 750-1500 mg/l as CaCO$_3$ with a mean value of 1002.2 mg/l as, CaCO$_3$ indicated high alkaline nature of water in the study area and all the samples were found exceeding the acceptable limit of ICMR/BIS.

4. **Total Dissolved Solids (TDS):** The permissible limit of TDS for drinking water is 500-2000 ppm. Total dissolved solids are present due to the concentrations of all minerals in water and indicate the general nature of salinity of water. TDS in groundwater originate from natural sources, sewage, urban runoff and industrial wastes. Based on TDS ground water is classified as follows:

- a. Non-saline $< 1000$ TDS in mg/l
- b. Slightly saline 1000-3000 TDS in mg/l
- c. Moderately saline 3000-10000 TDS in mg/l
- d. Very saline $> 10000$ TDS in mg/l

Total Dissolved Solids of the samples in the study area varied from 301-1025 ppm with a mean value of 650.4 ppm and most of the samples were found within the permissible limits of ICMR/BIS.

5. **Chemical Oxygen Demand (COD):** Chemical Oxygen Demand is a measure of pollution in aquatic system. High COD may cause oxygen depletion on account of decomposition by microbes to a level detrimental to aquatic life. COD values of the ground water samples in the present study area varied from 75-150 mg/l with a mean of 94.2 mg/l and some samples were found exceeding the acceptable limit of ICMR/BIS. It may be due to seepage from sewage drainage or industrial discharge in nearby localities.

6. **Biological Oxygen Demand (BOD):** Biochemical Oxygen Demand is supposed to measure the amount of food (or organic carbons) that bacteria can oxidize. In the present study BOD values of various ground water samples were found from 0.4-1.4 mg/l with a mean of 0.89 mg/l and half of the samples were found exceeding the acceptable limit of ICMR/BIS.

7. **Fluoride (F):** The fluoride in the ground water samples of the study area varied widely from 0.6-1.0 ppm with a mean of 0.85 ppm and most of the samples were found below with the permissible limits of ICMR/BIS.

**Conclusion**

Analysis of water samples collected from various locations of Aligarh and Agra city revealed that all water samples do not comply with BIS standards and Indian Standards- 10500-91. The results of the study are presented in the following Table 2 & 3. The following observations are made from the results.

(Where E.C.-Electrical Conductivity, TDS- Total dissolved solids, COD- Chemical Oxygen demand, BOD- Biochemical oxygen demand, Max. - Maximum, Min. – Minimum.)

1. The pH of the samples is found to be varying from a minimum value of 6.75 in Sikandra to a maximum value of 9.4 in Dodhpur area.

2. Electrical Conductivity is found to be more in the wards Sasnigate a indicating high TDS concentration in groundwater of these areas. Conductivity varied from a minimum of 1.70 micro-seimans In Dodhpur to a maximum of 4.76 micro-seimans in Sasnigate.

3. Total Alkalinity is found to be more varying from a minimum of 750 mg/l in Sikandra to a maximum of 1500 mg/l in Dodhpur.

4. Hardness is found to be more in the Dayalbhag areas. The maximum and minimum values are found to be 1025mg/l in Dayalbhag and 301mg/l in Dodhpur.

5. Fluoride concentration is varied from a minimum of 0.6 mg/l in Jeevangarh to a maximum of 1.0 mg/l in near Tajmahal.

6. COD levels are found to be in the permissible limits and they varied from a minimum of 75 mg/l in Quarsi to maximum of 150 mg/l in Sikandra.

7. BOD levels are found to be in the permissible limits and they varied from a minimum of 75 mg/l in Quarsi to maximum of 150 mg/l in Sikandra.

For the above analysis that the study emphasizes the urgent need for regular underground water quality monitoring to assess pollution activity from time to time for taking appropriate measures in time to mitigate the intensity of pollution activity. Augmenting the groundwater resources by recharging the ground water aquifers through rain water harvesting and other Techniques such as remote sensing and GIS and thus reducing the high concentration of the chemical parameters is a very important measure. Public awareness program should be initiated to create a sense of awareness to save water around their habitants. It also needs to be protected from the industrial waste and sewage contamination.

ABSTRACT

There is increasing evidence of immune diseases in the last few decades. Immune reaction doesn’t occur against our own tissue antigens. This is as a result of “Tolerance to self-antigens” which is acquired by varied mechanisms. Failure in immune recognition of self and injury to self-tissues (autoimmunity) results from a loss of self-tolerance. This article will discuss the mechanisms of self-tolerance and the break down mechanism in autoimmunity.

Keywords: autoimmune, antigen, self tolerance, rejection, immune recognition

Introduction

Autoimmunity is the breakdown of mechanism responsible for tolerance and induction of immune response against component of self-molecule ¹. The body’s immunological mechanism is dependent on two factors, (i) The inactivation and rejection of foreign substances (ii) The ability to differentiate between the body’s own antigen (self) and foreign substance (non self). Usually reaction doesn’t occur against our own tissue antigens. This can be due to “tolerance to self-antigens” that is nonheritable by varied mechanisms like bacterial, viral, chemical, genetical etc. Failure in immune recognition of self and injury of self tissues (autoimmunity) results from a loss of self-tolerance. Various mechanisms of self tolerance and the break down mechanism lead to autoimmunity.

Mechanisms of Self Tolerance: The various mechanisms of self tolerance include i) central tolerance by clonal deletion. This mechanism involves elimination or inactivation of those T and B cells that recognize self-antigens. There is also inactivation of developing lymphocytes in our immune system which becomes self-tolerant, these self-antigens of specific lymphocytes are either deleted or inactivated. Clonal inactivations are often mediated by tissue-specific antigens. ii) T Lymphocyte tolerance mechanisms: T cells recognize pathogen on the surface of MHC molecules on host cells²,³. The T cells has the potential to damage the healthy tissue when they fails to recognize the foreign antigen i.e when they respond to self-antigens instead of to foreign antigens. Failure of T-cell tolerance can lead to many autoimmune diseases. The tolerance of T- cells begins in the thymus. Tolerance mechanisms before the maturation and circulation of T cells in the thymus are referred to as “central T cell tolerance.” But, not all antigens that T cells tolerate are expressed in the thymus. The tolerance mechanisms which act on mature circulating T cells after they leave the thymus are referred to as “peripheral T cell tolerance.” iii) B cell tolerance mechanisms: B-cell Tolerance is little different from that of the T cells. Immature B cells tolerance mechanism in the bone marrow is referred to central B cell tolerance. Antigen recognized B cells are eliminated via apoptosis and become anergic, but not all autoreactive B-cells are eliminated in the bone marrow. B-cells are T-cell dependent. T dependant B cells are pre-activated by auto reactive T-cells antigen and becomes self-reactive. This
occurs in the secondary lymphoid tissue and is referred to as peripheral B cell tolerance.

Another mechanism of self-tolerance is that the Fas-mediated programmed cell death (apoptosis) of non-reactive B lymphocyte following secondary encounter with CD4 T lymphocyte. Apoptotic cell clearance is basically important because otherwise apoptotic cells tend to become necrotic and provoke inflammation and autoimmune response in our immune system. It is been estimated that more than 109 cells undergo apoptosis daily and are cleared rapidly by the phagocytes.4

**Mechanisms for Breakdown of Self Tolerance:** Self Tolerance is kept in normalcy by various regulatory interactions of a variety of cells and mediators. However there are certain conditions, tolerance can be broken resulting in an autoimmune pathology may result. There is also loss of “Self Tolerance” germinal centers because of some genetic aberration or some environmental factors.

1. **Major histocompatibility complex (MHC) molecules** usually ought to present the peptide (antigen) to T cells for immune reaction to occur.5 The amount of auto antigenic peptide residues in MHC molecules is responsible for the affinity of peptide binding. If the peptide is conferred at low levels to interact the effector T cells, there will be tolerance to self-antigens and if peptide is presented at terribly high levels then they undergo deletion or anergy. Hence people with a specific autoimmune disorder tend to express identical antigens with a similar MHC. Breakdown of tolerance arises most often to tissue-specific antigens with solely bound MHCmolecules.

2. **Gene mutation/s** results in one or additional response diseases. Response diseases are related to specific MHCgenotypes.6 The most established association is with specific alleles within the MHC gene complex.

3. **Environmental factors** which might cause breakdown of self-tolerance include pathogens (microorganisms), drugs, hormones, toxins and others.
   - Drugs: Drug induced lupus
   - Toxins. Eg: Toxic oil syndrome (musculoskeletal disease caused by contaminated colza oil)

4. **Complement Deficiency:** Deficiencies in the classical complement pathway renders the possibility to develop immune complicated diseases7,8 eg: Systemic Lupus Erythematosus and Rheumatic syndromes.

5. **Molecular Mimicry:** Many peptide fragments identical with host proteins induce auto immune response (organ-specific). β-hemolytic streptococcus bacteria has a high degree of homology with cardiac myosin. The antibodies that target bacteria cross-react with cardiac muscle and induce rheumatic fever. The other example will be Autoimmune thyroiditis (Grave’s disease).

Generally autoimmune diseases are divided into two groups: 1) the organ-specific autoimmune diseases, in which the target antigens and disorders are localized in one specific organ, and 2) the systemic autoimmune diseases, in which antigens are expressed widely in the body. There are also autoimmune diseases which stands between these two groups which results either from the same or different mechanisms. Though there are various other factors associated with the progression of autoimmune diseases, epitope spreading is one such important factor of the autoimmune disease progression. Epitope spreading is a phenomenon in which autoantigens (antigen determinants) detected by T and B cells increase during the process from the initial activation of autoreactive lymphocytes to the chronic phase. This concept is very important mechanism by which autoimmune response induced by one cryptic epitope leads to complete autoimmune response. Particularly, B cells play a very vital role as antigen-presenting cells for T cells.10

In addition nutrition deficiency also plays a major role in immune response. Deficiency of vitamins (eg., vitamin A, vitamin D) and minerals (zinc) leads to functional impairment of the T cells, phagocytic cells and antibody response.11 Considering these factors, it is very important to distinguish specific autoimmune responses which cause various autoimmune diseases from the existence of autoreactive lymphocytes or simple autoimmune response.
Conclusion

Autoimmune diseases are a significant health problem because of their chronic nature. They can be limited to particular tissues or sometimes be disseminated. Autoimmune disease state is characterized by a specific antibody or cell mediated immune response against the body’s own tissue (auto antigen). There are multiple factors involved in establishment of either an immune response or a state of unresponsiveness to an antigen. There are also a number of different ways in which a breakthrough of tolerance can occur leading to autoimmunity. Understanding these processes will offer us a better insight into the pathogenesis of autoimmune diseases and would aid to control and manipulate the therapeutics of the disease and their autoimmune responses.

Evaluation of Hematological and Biochemical Parameters in Dengue

Kusumakshi Nayak¹, Asha Patil¹, Ramya Shetty², Shaila D'Souza², Deepak Nayak M.³

¹Assistant Professor, ²UG Intern, Department of Medical Laboratory Technology, School of Allied Health Sciences, ³Associate Professor, Department of Pathology, Kasturba Medical College Manipal, Manipal Academy of Higher Education, Manipal

ABSTRACT

Background: Dengue is one of the most common arboviral infection in the world. Evaluation of the clinical parameters for the early diagnosis of the disease is used to assist the preventive strategies. This study aimed to evaluate the hematological and biochemical parameters retrospectively in patients with serologically confirmed dengue infection over a one-year period.

Method: The study was conducted in clinical laboratories of a tertiary care hospital serving the people of Karnataka and neighbouring states. A retrospective analysis of known IgM and anti-NS1 seropositive dengue patients over a period of one year was done to evaluate the hematological and biochemical data for any significant variations.

Results: A total of 108 patients were studied. 100 (92.60%) patients had Dengue Fever, 4 (3.70%) had Dengue haemorrhagic Fever, and 4 (3.70%) had Dengue Shock Syndrome. Thrombocytopenia in 87 (80.60%) cases, elevated AST in 92 (85.2%) and raised CK/CPK level observed in 50% of the cases.

Conclusion: The alterations in hematological and biochemical parameters is associated with the patient case history and the clinical diagnosis.

Keywords: Dengue, arboviral infection, hemorrhagic fever, platelet count, hematological parameter

Introduction

Dengue is an acute arboviral infection characterized by nonspecific symptoms such as headache, fever, body ache, prostration, skin rashes, lymphadenopathy and leukopenia followed break bone fever. Because of regular temperature fluctuations in the patient, the disease is also known as saddle back fever ¹. The infection is caused by one of the four serotypes of the dengue virus DEN-1, DEN-2, DEN-3 and DEN-4 that belongs to the genus Flavivirus of the family Flaviviridae².

It is most common mosquito-borne viral disease worldwide³, approximately 100 million of dengue fever cases and 250,000 - 500,000 cases of Dengue Hemorrhagic Fever are reported to the World Health Organization annually³. DEN-2 serotype of the virus was predominant in India during the last major DHF outbreak in 1996. However, the extensive research during the period since 2002, highlights the presence of all four serotypes, with predominance of DEN-2 and DEN-3 serotypes⁴.

The common risk factors for infection are increased density of the mosquito vector along with increased human population ⁵. Viremic patients are potentially infectious during the febrile phase of the infection. However several studies in community have revealed that the use of mosquito net and screening was effective in preventing the disease transmission.⁶

The disease is asymptomatic in majority of the patient, few develop Dengue Fever (DF), Dengue Hemorrhagic Fever (DHF), and DHF with Dengue Shock Syndrome

(DSS); where DHF/DSS has a high mortality rate. Early clinical features are variable often non-specific; hence, specific laboratory tests are necessary for an accurate diagnosis of Dengue infection. Thus, acute dengue infection is often unrecognized until the appearance of the more specific symptoms that leads to late inadequate treatment. To avoid these complications early diagnosis by evaluating laboratory parameters is important for the appropriate treatment which ensures marked reduction in the morbidity of Dengue fever. The objectives of present study is to evaluate the hematological parameters and biochemical markers as predictors of dengue fever and its severity.

**Materials and Method**

The study was conducted at the tertiary care hospital of South India which is serving predominantly the people of Karnataka and the patients from neighboring states. In this retrospective study we reviewed 108 known IgM anti-NS1 seropositive cases of dengue infection over a period of one year from July 2013 to August 2014. The seropositive cases were confirmed from the concerned virology department in the hospital. The hematological and biochemical parameters of all the patients with confirmed dengue infection irrespective of their age were analyzed during the period of hospital admission. Statistical frequency analysis method was used to analyze all the descriptive data in the study. Dengue seropositive patients with other co-infections like malaria, typhoid and/or any other pathological conditions were excluded from the study.

**Result**

In 108 dengue seropositive patients, 72 (66.70%) were males and 36 (33.30%) were females with male to female ratio of 2:1. Table 1 shows that 92.60% patients were with dengue fever. Following Udupi, most of the cases were from Davanagere, Shimoga and Haveri districts of Karnataka.

Analysis of the blood samples taken for complete blood counts (CBC) on the day of admission is recorded. Leucopenia was observed in 38 (35.2%) patients. Thrombocytopenia was found in 87 (80.60%). The hematocrit values and hemoglobin concentration was found to be low in 24 (22.2%) patients.

The peripheral smear study showed varied impression in ruling out the effect of dengue infection. Polychromasia in 36 (33.30%) and anisocytosis was observed in 42 (38.90%), presence of poikilocytosis was seen in 6 (5.60%) cases.

In the leukocyte differential count (DLC), compared to lymphocytes, a relative neutrophil count was low in 47 (43.50%). In this, 65 (60.20%) patients showed Left Shift/immature forms of neutrophils, 14 (13.0%) patients with toxic changes and 6 (5.60%) cytoplasmic vacuolation.

The lymphocyte count was found to be high in 36 (33.30%) and low in 33 (21.20%) in patients and 63 (58.30%) had reactive forms, 36 (33.30%) atypical forms, 4 (3.70%) of the patients had plasmacytoid forms.

Monocyte count in the peripheral smear was high in 19 (17.60%) and low in 24 (22.20%), the eosinophil count was low in 69 (63.90%). Basophil count was low in 95 (88.0%). Band forms were present in 40 (37.0%) cases.

Both AST and ALT levels were high in 92 (85.2%) and 56 (51.9%) patients respectively. Majority of the patients had normal whereas 18 (16.7%) patients had high ALP level. The direct and total bilirubin tests were reported, direct bilirubin was high in 27 (25.0%), Total bilirubin was high in 22 (20.4%) and low in 26 (24.1%) patients.

Serum total protein level was found to be low in 28 (25.9%) cases. In 29 (26.9%) patients had low level of albumin and globulin was found normal in 94 (87%). High level of muscle enzymes; creatine kinase (CK) and creatine phosphokinase (CPK) was observed in 54 (50%) patients. The sodium (Na+) level was low in 54 (50.0%) patients.
The high urea level was found in 16 (14.8%) patients and serum creatinine level was high in 9 (8.3%) of the patients.

During the hospital stay, 4 patients were expired in which one patient had dengue fever; other patients had suffered with DHF and DSS respectively.

Discussion

A range of outcomes in the analysis of hematological and biochemical parameters were seen during dengue viral infections. The incidence of dengue was remarkably high during monsoon9, which was re-established in our study. The important clinical hallmarks in dengue virus infection in patients is thrombocytopenia, frequently occurring at the febrile stage10. Dengue virus induces aberrant activation of the immune system and cytokine (IL-6) overproduction leading to enhanced production of anti-platelet and anti-NS1 (nonstructural protein-1 antigen) antibodies cross-reacting with human platelets11. The leukopenia associated with dengue is mainly due to the reduction in the neutrophils. Presence of atypical lymphocytes with activated lymphocytes and plasma cells along with thrombocytopenia have been reported consistently along with other laboratory findings12. In any viral infections, eosinophil concentrations will be decreased in response to inflammation during the acute phase13. Patients with either primary or secondary dengue infections exhibit a fall in the leukocyte count12. Normocytic Normochromic RBCs have found in most of the cases with raised hematocrit levels, but polychromasia, anisopoikilocytosis, rouleaux forms also observed in some cases12.

The liver is one of the target organs for dengue and clinical manifestations of hepatic dysfunction can occur during the course of this disease5. The liver is deprived of oxygen leading to lesions of the parenchyma, in which the injured hepatocytes release transaminases that is detectable in the peripheral blood. The liver enzymes, ALT and AST are used as diagnostic markers for dengue fever14. Higher transaminase level was associated with greater morbidity and mortality irrespective of grade of dengue. Serum bilirubin has not raised significantly whatever the transferase levels were; which is very peculiar in dengue15.

There is a direct and indirect evidence of biochemical alterations related to severity of dengue. Studies have reported that patients with DHF have elevated serum levels of transaminases: aspartate aminotransferase (AST) and alanine aminotransferase (ALT) and creatine kinase (CK)16. Hypoalbuminaemia may, however, be as a result of enhanced impairment of the synthetic function of the liver by dengue infection since it has liver as its target organ14. Plasma leakage, may also causes hypoalbuminemia, is an indicator of severity16. Elevation of muscle enzyme CPK may be due to subclinical myositis16. Infrequently unusual encephalitic signs have been associated with electrolyte and metabolic disturbances17. Our results suggest that these alteration in these parameters can predict a more severe form of dengue and could also be indicate early tissue injury in the acute phase of dengue infection. Changes in serum urea and creatinine levels are indicative of renal dysfunction. Renal function alterations are seen only in few patients in our study14.

Conclusion

The alterations in hematological and biochemical parameters is associated with the patient case history and the clinical diagnosis. This could help in predicting the infection, treating the patient and monitoring the prognosis, before it is too late until the specific test results are obtained.

ABSTRACT

Introduction: Dialysis catheters are commonly used as temporary vascular access in hemodialysis individuals. These catheters are referred to as irreplaceable tool because of their significant role in providing easy and instant access to the circulation for delivery of Hemodialysis under diverse clinical situations. The most common complications associated with dialysis catheter includes mechanical and or infectious resulting in early catheter removal, morbidity and or mortality. Although Catheter Related Blood Stream Infection (CRBSI) is reported to have an adverse impact on quality of life, survival and healthcare cost, dialysis catheters are quite frequently used for vascular access till date. It is essential for dialysis unit to have database on the CRBSI to minimize the risks of CRBSI and thereby improve life quality.

Aim: To investigate CRBSI associated with non-tunneled dialysis catheters in a tertiary care hospital.

Objectives: (a) To compare infection between the types of non-tunneled dialysis catheters (b) To compare the infection across the gender

Method: Prospective observational study. A total of N=633 individuals with non tunnelled dialysis catheter, undergoing HD for the period of eight months were enrolled in the study. Participants prospectively followed up for evidence of CRBSI post insertion of catheter until the point of catheter removal or the completion of the study. Descriptive statistics was used to analyse the data. Mann Whitney U test was used as test of significance to compare between the groups with p<0.001.

Result: This study had 37 CRBSI individuals. The infection rate differed across the types of nontunneled dialysis catheters and infection observed was predominant among the males as compared to females.

Conclusion: It can be concluded that the incidence of CRBSI was observed more in internal jugular vein dialysis catheters as compared to femoral vein dialysis catheters possibly due to extension of the catheters in situ among the participants enrolled in the study.

Keywords: Hemodialysis, CRBSI, Dialysis catheters, vascular access, Non tunnelled dialysis catheter, Non tunnelled femoral vein dialysis catheter, Non tunnelled Internal jugular vein dialysis catheter, Quality of life.

Introduction

Haemodialysis (HD) aids in sustaining life among three general conditions that includes Acute Kidney Injury (AKI), End-Stage Renal Disease (ESRD) and poisoning. A Successful HD in any of these conditions needs access to large blood vessels efficient of facilitating speedy extracorporeal blood flow. The aim of vascular access is to deliver frequent access to the...
circulation with least complications. Dialysis catheters (DC) are commonly used as temporary vascular access in haemodialysis individuals. These catheters are referred to as irreplaceable tool, although not favoured yet it is unavoidable because of their significant role in providing easy and immediate access for delivery of haemodialysis under diverse clinical situations. The most common complications with dialysis catheter includes mechanical and or infectious resulting in early catheter removal, morbidity and or mortality. Although Catheter Related Blood Stream Infection (CRBSI) is reported to have an adverse impact on quality of life, survival and healthcare cost, dialysis catheters are quite frequently used for vascular access till date. It is essential for dialysis unit to have database on the CRBSI to minimize the risks of CRBSI and thereby improve quality of life.

CRBSI is defined as the bacteremia or fungemia in individuals with no apparent source for the bloodstream infection, except for the catheter in individual with dialysis catheter (CDC 2002). It is diagnosed based on clinical manifestations of infection, positive blood culture obtained from a peripheral vein, and the same organism must exist from the catheter segment and peripheral blood. The risk of developing CRBSI varies with several factors that include DC site insertion, type of device, duration of DC, comorbid deficits and other confounding clinician and client related variables [1].

Generally, non-tunnelled Dialysis Catheters (NTDCs) are inserted in a descending order of preference into the internal Jugular vein dialysis catheter (NTIJVDC) (<3weeks) or Non Tunnelled Femoral Vein Dialysis Catheter (NTFVDC) (<1 week) when immediate vascular access is required to start an emergency HD for a short period (<1 week-3 weeks) use. Both of these types of NTDCs are associated with a higher incidence of infections and thrombosis as compared to all other types of vascular access [2][3]. Regardless of all of these factors, NTDC remains as an obligatory tool for immediate vascular access creation till date. Therefore it is essential for every dialysis unit to have a database on the CRBSI to minimize the risks of CRBSI and thereby improve quality of life. Hence the present study was attempted to investigate the frequency of CRBSI across the type of NTDCs among the HD individuals.

**Aim:** To investigate CRBSI associated with non-tunnelled dialysis catheters in a tertiary care hospital

**Objectives:** (a) To compare infection between the types of non-tunnelled dialysis catheters (b) To compare the infection across the gender

**Method**

The present study was a Prospective observational study. The study was approved by the IEC committee (IEC Ref: 67/2013). It was conducted in the Department of Nephrology, tertiary care hospital. Informed Consent was obtained from the participants.

**Participants:** All individuals undergoing HD through NTFVDC and NTIJVDC for AKI/ESRD were included in the study. The participants enrolled were in the age range of 17 to 78 years. The individuals who were dialyzed through the tunneled catheter, arteriovenous fistula, arteriovenous graft and who exhibited with any other source of infection were excluded from the study.

A total of 633 participants, who had undergone HD treatment through NTFVDC and NTIJVDC were enrolled in the study for the period of eight months from January 2013 to August 2013. All DCs were inserted as per the Hospital Infection Control protocol under aseptic techniques. The participants had prospectively followed up post catheter insertion for the evidence of CRBSI until the point of catheter removal or until the completion of the study. The participants’ data were retrieved from the database. The data included demographic details, type of catheter, catheter duration period, intradialytic complications like chills, fever, and hypotension, exit site infection. It also included data related to blood test, culture sensitivity test, causative agent, and medication.

**Procedure:** The dialysis catheter during the HD procedure was handled by experienced staff (more than 5 years) using sterile technique. The catheter lumens were aseptically flushed with 0.9% sterile normal saline solution and locked with heparin at the end of each HD session. The catheters were not filled with any other thrombolytic agent or antimicrobial solution. Each individual is monitored for the presence of any infection at the catheter site, exudation upon catheter insertion, and symptoms such as fever, shivering, and chill during every session of HD. Two peripheral blood samples were collected and blood and/or catheter-tip cultures were monitored for the individuals who had signs and symptoms of CRBSI. The participants identified with CRBSI were further investigated for variation in gender and site of catheterization. Descriptive statistics was used to analyse the data. Mann Whitney U test was used as test of significance to compare between the groups with p<0.001.
Result

In the present study, 5.84% (37/633) exhibited CRBSI, identified based on clinical symptoms and or microbiological investigation. Among the participants, 35.1% were female and 64.9% were male.

*NTFVDC- Non Tunnelled Femoral Vein Dialysis Catheter; NTIJVDC- Non Tunnelled Internal Jugular Vein Dialysis Catheter

In the present study, CRBSI was observed across the types of non-tunneled dialysis catheters. The infection rate was higher with the duration of catheter in situ among the participants as depicted in table 2.

The other findings observed during dialysis treatment were chills (9 participants), fever (29 participants) and exit site infection (14 participants). The commonest HD complication found was fever with chills during the treatment. The lab test findings were low hemoglobin (7.55%) and albumin level (2.72), increased white blood count (22 participants) and neutrophils (15 participants). The blood culture test report was found to be positive among 37.83% (14/37) CRBSI cases. The common causative bacteria found among the participants were Methicillin-Resistant Staphylococcus Aureus (MRSA), Staph. Aureus and Coagulase Negative Staphylococci (CONS).

Mann-Whitney u test was done to compare between the CRBSI and non CRBSI Non tunneled internal jugular vein dialysis catheter. The test result revealed significant difference in the average number of catheter days between the two groups as depicted in table 3.

Discussion

CRBSI is a serious and common most complication of the DC which will cause morbidity and mortality in patients undergoing hemodialysis treatment [2][3]. In individuals undergoing chronic hemodialysis, CRBSI is a leading cause of hospitalization and mortality [3][4][5]. In this study, definite diagnosis of CRBSI was done by a combination of the clinical signs and symptoms, blood tests and the catheter tip cultures. In the present study, it was observed that 37 participants among 633 exhibited (5.84%) CRBSI which is less as compared to the previous study stating of 15% of CRBSI [6]. As per KDOQI guidelines, CRBSI incidence should be <10% at three months and 50% at one year [7]. Individuals using a DC for vascular access will have a high risk of CRBSI and it increases in a true fashion with the length of catheter days [1]. It is well documented regarding the persistence of CRBSI infection in the literature. However, in the present study, the infection rate was observed to be less as compared to other studies[8][9]. This could be possibly attributed to the clinical practices with an effective infection control program in the dialysis unit. In the present study, CRBSI was observed to be more in NTIJVDC as compared to NTFVDC which is contrary to other studies wherein they observed the CRBSI be higher in NTFVDC[10][11][12]. This could be probably due to catheter being in situ for a longer duration [11][13][14]. In present study, the infection rate was observed to be predominant among males as compared to females which are in accordance with [14]. This could be probably due to ignorance of males in self-hygiene as most of the time they are dependent on their spouse/caretakers and denying the advice of removing the catheter within the recommended timeline.

Clinical Implication: The Clinical implication of this study is to develop an infection surveillance program with dedicated personnel and resources to facilitate the identification of catheter-related infections and timely interventions to reduce infection rates improve patient clinical outcomes.

Conclusion

The rate of infection may vary with the site of catheter insertion. The risk of infection increases with the duration of the catheter in situ. An effective infection control program could attempt to minimize the risk of CRBSI associated infection. Further investigations involving multidisciplinary teams are essential so that suitable measures can be executed in the clinical services to prevent bacteremia and other complications associated with infection as a consequence of dialysis catheter.

Limitation and Future Directions: The present study limits with its observational pattern, lack of data for participants who were discharged against medical advice and the importance of low threshold for diagnosis of CRBSI based only on the clinical features. There is a dire need for further studies to focus on interventions that will favorably affect the CRBSI outcomes.

Acknowledgement

We would like to express our sincere gratitude to Dr. Manohar Bairy G. Consultant Nephrologist, Tan Tock Seng Hospital, Singapore for his valuable suggestions and guidance to complete this study.

Conflict of Interest: None declared.

Source of Funding: This study was not funded.

Ethical Clearance: The study was approved by the IEC committee (IEC Ref: 67/2013). It was conducted in the Department of Nephrology, Kasturba Hospital, Manipal, Karnataka, India. Informed Consent was obtained from the participants.

Nutritional Status of Preschool Children (3-5Years) Attending Anganwadi in Selected Urban Slum Areas of Karad

Prakash. M. Naregal¹, P M Durgawale², S. V. Kakade³
¹Lecturer, Krishna Institute of Nursing Sciences, Karad; ²Professor & Head, ³Associate Professor, Department of Community Medicine, Krishna Institute of Medical Sciences, Karad

ABSTRACT

Background: As cities are developing in India, urban slums are also increased with people moving from rural areas to urban in search of better life with job but live over crowdedly in urban slums with poor environmental sanitation. Children in the slum suffer from malnutrition caused by lack of food and inadequate Knowledge of mothers on nutrition. Nutrition of preschool children is paramount importance; because the foundation for life time health, strength and intellectual vitality is laid during this period.

Aims: To assess the “Nutritional Status of preschool children (3-5Years) attending anganwadi in selected urban slum areas of Karad, and to find the association between nutritional status and demographic variables of preschool children.

Materials and Method: A community-based cross-sectional study was conducted in 6 Anganwadis at urban slum areas of Karad. Non-probability purposive sampling technique was used for selecting 137 preschool children. Nutritional status was assessed using anthropometry. Undernutrition was classified using Indian Academy Pediatrics (IAP). The data collected, tabulated and analyzed as per the objectives of the study using descriptive and inferential statistics.

Results: Assessment of Nutritional Status shows that 60.58% of children were normal, 31.39% of children were suffering from Grade I malnutrition and 8.03% of children were suffering from Grade II malnutrition and none of them were suffering from Grade III and IV malnutrition.

Conclusion: Respite of many programmes providing nutritional supplements through ICDS programme still prevalence of undernutrition in preschool children is high so there is need for improvement in nutritional status through nutrition education of mothers and empowerment of mothers through education and economically through providing employment and improving living conditions and environmental sanitation in the urban slum areas.

Keywords: Nutritional Status, preschool children (3-5Years), anganwadi, urban slum, Karad.

Introduction

Global population is expected to grow from 6.7 billion to 9.2 billion between 2007 and 2050. According to United Nation(2010) today, approximately 828 million urban populations are living in slum areas, compared to 657 million in 1990. Urban slums are exacerbated with over-crowding, with polluted water, lack of sanitation, pollution, open sewage and contamination affecting the child and household health. Acute and chronic malnutrition of underfive children are comparable with or higher than, the rates in rural underfive children.¹

Population in urban slum of less developed countries will be expected to double to almost two billion people by 2030. Children in slums are at high risk of undernutrition, which has long-term negative consequences on their physical growth and cognitive development².
Rapid industrialization has resulted into phenomenal growth of urban slum settlements in many big cities of India in the recent past. Slum populations living in adverse conditions represent nutritionally vulnerable groups that need immediate attention. Under-nutrition remains a major problem in most developing countries, especially in urban slums.

Childhood malnutrition is a global public health problem with serious consequences for both individual and society. Malnutrition is one of the major public health problems in India. Major causes of morbidity and mortality among under-five children is chronic undernutrition - stunting. Malnutrition continues to be a growing problem in almost all developing countries. Eighty percent of undernourished children in the world live in 20 countries, with India being home to nearly 60 million children who are underweight.

Maternal and Childhood undernutrition is currently the single leading cause of the global burden of undernutrition. More than one-third of the world’s undernourished children live in India.

Malnutrition has a long-term impact on physical and intellectual development of a child. Addressing nutritional problems of urban poor living in slums is of paramount importance for overall development.

Problem of malnutrition in India is not only of alarming magnitude, but also of great intricacy. Tackling malnutrition in urban slums requires a holistic approach, especially when targeting population of infant and young children.

Studies and statistics suggest that there were studies conducted in big cities and metropolitan cities like Mumbai, Kolkata, Pune etc., and no studies in the present study area so investigator felt to conduct a study to assess the nutritional status of preschool children living in urban slum areas in Karad.

**Aims**

- To assess the Nutritional Status of preschool children (3-5 Years) attending anganwadi in selected urban slum areas of Karad.
- To find the association between nutritional status and demographic variables of preschool children.

**Materials and Method**

Karad lies at the confluence of Koyna River and the Krishna River called Sangam. 11% of the population in Karad is comprised of children below 6 years of age. Migrated people from other cities in Maharashtra and neighboring state comprises the population of Karad and mainly engaged in casual semiskilled and unskilled labour work. Karad is having six urban slum areas and housing conditions in these slums are very poor and they are provided with common tap water and sanitary blocks, by the Nagarpalika. Low standard of living and unhygienic conditions are clearly evident while visiting anganwadis in these areas for the data collection purpose of this study.

A community-based cross-sectional study was conducted in urban slum areas of Karad, Maharashtra, during 2017-18. Permission to conduct the study was obtained from the institutional ethical committee of the KIMSDU, Karad, ICDS Satara and informed consent was obtained from the parents at the time of data collection.

Sample size includes 137 preschool children.

Sampling criteria: Preschool children living in the selected urban slum area of Karad were included and children who were not resident of the slum but attending anganwadi and children above 5 years were excluded from the study.

Demographic data of children were collected from mothers by interview by using pre-tested structured demographic performa and the nutritional status of children was assessed by weight measurement digital weighing machine with minimum clothing. The data was analysed by descriptive and inferential statistics.

**Interpretation of Nutritional Status:** Nutritional status was categorized according to IAP classification based on weight for age. IAP designates a weight of more than 80% of that expected for age as normal. Grades of malnutrition are:

- Grade I - 71-80
- Grade II - 61-70
- Grade III - 51-60
- Grade IV - ≤ 50%
Results

Description of Demographic Characteristics of Preschool Children: Distribution of demographic variable of children shows that according to birth order, out of 137 preschool children majority of 51 (37.2%) children were of first birth order, 65 (47.4%) were in the age group of 49-54 months, 79 (57.7%) were girls and 74 (54%) had birth weight of 2.5 Kg - 3 Kg.

</tbody>
</table>

Table 3 shows the gender wise distribution of nutritional status of preschool children according to IAP classification 29% of boys were normal, 10.21% and 2.1% were suffering from Grade I and Grade II malnutrition, respectively; 30.6% of girls were normal, 21.1% and 5.8% were suffering from Grade I and Grade II malnutrition, respectively.

Association between nutritional status of preschool children and demographic variables according to IAP classification of nutritional status: Association between nutritional status of preschool children and demographic variables according to IAP classification of nutritional status by chi-square test shows that there was no significant association between nutritional status of preschool children with their demographic variables.

Discussion

Preschool child constitute the most vulnerable segment of any community. Their nutritional status is a sensitive indicator of community health and nutrition. Under-nutrition among them is one of the greatest public health problems in the developing countries. About 128 million (70%) of the world’s 182 million stunted children aged under five years live in Asia.

According to NFHS-4 (2015-16), 35.7 per cent children below five years are underweight, 38.4 per cent are stunted and 21 per cent are wasted in the country. NFHS-3 shows that 42.5% of underfive children were underweight, 19.8% were wasted and 48% werestunted. India accounts for more than 3 out of every 10 stunted children in the world. More than one third of the world’s children who are wasted live in India.
A similar study conducted by Raje V et al shows that 57.41% were normal, 33.33% were suffering from Grade I malnutrition and 7.41% of children were suffering from Grade II malnutrition and 1.85% were suffering from Grade III and none of them were suffering from Grade IV malnutrition.14

Areppalli S et al reported that 34.5% children were suffering from grade I malnutrition followed by grade 2 (33.1%), grade 3 malnutrition (6.1%) and grade 4 malnutrition (1.5%).15 Other studies which shows similar results are Narkhede V et al reported that 32.18% children were in grade I, 16.09% in grade II, 3.46% in grade III and 0.5% in grade IV malnutrition.16 Damor RD et al reports that 54% of children were suffered from malnutrition and in which half of them belonged to grade-I and grade-II17. Sandeep B et al reported that 12.4% and 28.5% children were belonged to grade IV and III, 36.9% and 22.3% of children belonged to grade I and II malnutrition.18

Results of the study conducted by Goel et al shows that 57.4% children were malnourished. Out of which Grade I 107(19.8%), Grade II 137(25.4%), Grade III 45 (8.3%) & Grade IV 21 (3.9%).19

Kapil et al reported in their study in Delhi revealed that overall prevalence of PEM was found to be 81.8%, while 19.11%, 41.4%, 5.7% and 0.2% of children had grades Normal, Grade I, Grade II, Grade III, and Grade IV PEM respectively.20

Age-wise distribution of nutritional status of preschool children according to IAP classification shows that in the age group of 37-42 month 10.9% were suffering from Grade I malnutrition. In those aged 43-48 months 7.2% were suffering from grade I malnutrition. In the age group of 49-54 months 13.1% of children were suffering from Grade I malnutrition.

Sukla P, Borkar A states that this may be due to as child grows, moves outside and subjected to environment he is more prone for acquiring infectious disease21. A similar study conducted by Sahoo DP et al shows acute malnutrition in 3–5 years age group (43.6%).22

Gender wise distribution shows that 12.31% boys and 26.9% of girls were suffering from various grades of malnutrition.

Sandeep B et al reported in their study that malnutrition was more prevalent in female children 54.6%.18 Luthra M et al shows in Anganwadi center A undernutrition was higher among girls (69.5%) than boys(60%). In Anganwadi center B girls (49.5%) were slightly less undernourished than boys (52.7%).23 Gondikar A et al in their study found that malnutrition rate was high in female children i.e 29.3% than that in male children 24.8%24. Sahoo DP et al reports Acute malnutrition was almost similar in females 64 (50.4%) and males 72 (50.3%). 22

Concludingly

High prevalence of undernutrition of among 3-5 years was found in urban slums of Karad highly suggests that there is a strong need for educating the mothers about factors affecting nutritional status of preschool children. Mothers should get adequate information regarding the nutritional needs of the growing children and importance of complete immunization to protect the children from vaccine preventable diseases. Most emphasis should be given during health education of antenatal and post natal mothers regarding importance of exclusive breastfeeding, timely weaning with foods easily available in the local market, that too at low cost, providing proper protein rich, energy dense complementary food. Nutritional education should be considered as major intervention to reduce problem of Malnutrition. Anganwadi workers, local mahila mandals, community based organizations and volunteer groups can help organize regular meetings of these mothers in order to address the issues regarding proper child rearing practices.

ABSTRACT

Background: Postnatal depression is an important complication of child-bearing and can have long-term adverse consequences for both mother and child.

Objective: To estimate the prevalence and identify the associated factors of postnatal depression in South Asian region.

Method: Observational cohorts and surveys were searched in Medline, Cinhal, ProQuest, and Scopus databases from 2005 to 2016. Original articles published in English language were included in the study.

Results: of 324 articles, 28 studies (15,345 samples) were eligible for analysis. The overall prevalence rate of depression during postnatal period was 26% (0.21, 0.30 CI). Risk factors for postnatal depression were grouped under following categories: demographic, psychological, social, obstetric and infant.

Conclusion: Health care professionals should screen the women for possible risk factors and depressive symptoms during perinatal period so that suitable interventions can be initiated if required in a timely fashion.

Keywords: Systematic review, prevalence, risk factors, postnatal depression, South Asia.

Introduction

Postnatal depression (PND) affects 10-15% of women worldwide after childbirth (¹). It is an important public health concern, taking place during pregnancy and postnatal period in which a great change and transition take place in women (²).

Severe postpartum depression can lead to infanticide as well as maternal death, often by suicide (³). Early recognition of depressive symptoms, treatment and counseling of women can prevent potentially serious consequences of PND (⁴).

A literature review on associated risk factors for postnatal depression among women in Asian cultures reported prevalence of PND ranged from 3.5% (Malaysia) to 63.3% (Pakistan) (⁵). Various studies from India have also reported significant rates of postnatal depression. 23% (⁶), 6% (⁷), and 11.3% respectively (⁸).

Risk factors of postnatal depression have been consistently demonstrated by various research studies. Prenatal depression or anxiety, recent stressful life events, low social support, past history of depression, poor self-esteem, maternal anxiety, complications during prenatal period and delivery, single mother, poor partner relationship, lower socioeconomic status including income, delivering a female baby when male is desired, infant born with congenital deformity, relationship
difficulties with in-laws and parents, and recent adverse life events during prenatal period were the risk factors of PND (6-11).

A few studies regarding prevalence and associated risk factors for postnatal depression have been conducted in developing countries. The current review aimed at summarizing and synthesizing the prevalence of postnatal depression based on self-reported questionnaire and clinical interview and the associated risk factors of postnatal depression in South Asian countries.

**Method**

A comprehensive literature search was performed using following electronic databases: PubMed, Cinhal, ProQuest, and Scopus databases. Additional articles were searched from Google scholar. The key words used were “prevalence”, “epidemiology”, “depression”, “postnatal”, “postpartum”, “perinatal”, “maternal”, “after childbirth”, risk factors, “associated factors”, “predictors”, and “South Asia”.

**Inclusion Criteria:** The criteria mentioned below are used as pre-requisite for the selection of studies:

Original research articles in the form of observational cohorts, surveys, or database analysis were included. Studies that have observed and identified associated risk factors for postnatal depression in South Asian countries and published in English peer-reviewed journals between 2005 and 2016 were selected.

**Results**

A total of 324 studies were identified in the literature search for potential inclusion. After evaluating the title and abstracts, 83 studies were selected for detailed assessment. Of these, twenty eight articles were excluded because of duplications (using the information from the same studied sample), twelve studies were conducted on Indians residing other than south Asian region, four were reviews, and two were letters/editorials. Thirty seven articles were assessed for quality, and nine articles were excluded for not meeting the criteria. Finally twenty-eight studies were deemed as eligible for analysis. The studies included 15,345 samples. Most of the study subjects were recruited from outpatient departments of hospitals attached with medical colleges (n=10), two studies recruited women from well-baby clinic/immunization center (n=2), a few studies selected participants from district hospitals/maternity and child health centers (n=4) followed by community based settings both rural and urban (n=10).

Two studies did not mention the recruitment setting (n=2). There was also a wide variation in the criteria used for diagnosing postnatal depression among the investigators across the countries.

**Prevalence of Postnatal Depression:** In this review, the magnitude of postnatal depression in South Asian countries ranged from 4.9% to 57% with the lowest reported in Nepal and the highest in the Pakistan (shown in figure 1). In our study countries, pooled prevalence rates of postpartum depression 26% (0.21, 0.30 CI) was higher than in high-income countries. The studies from India reported the prevalence rate of 48.5 (6), 12.5% (11), 26.3% (14), 25% (17), 15.8% (18), 16% (19), 31.4% (22), 18% (24), and 7.5% (30) of PND respectively. A prevalence rate of 33.1% (16), 35.5% (20), 1% (23), 38.3% (25), 23% (31), 48.4% (32), and 29.6% (35) respectively was reported from Pakistan. One study from Bangladesh reported 22% (26) of prevalence of postnatal depression. The prevalence of PND in Nepal ranged from 4.9% (27) to 30.3% (23). There is a wide range in the outcome assessment of postnatal depression with regard to its timing and it occurred anytime from day one of postnatal period till one year. Three studies assessed women on more than one time, i.e. 11.3%, 15.8%, and 15.5% at 2-3 days, 6 weeks and 12 weeks postnatal respectively (8), 94% at 3 months, 76% at 6 months, and 62% at 12 months postpartum (12), and 26.7% at one month, 11.9% at 3 months, 2.6% at 6 months after delivery (13).

![Figure 1: Prevalence of postnatal depression in south Asian countries](image-url)
Risk-factors associated with postpartum depression:
Number of risk factors were identified on analyzing the selected studies. These risk factors were grouped under following categories:

**Demographic factors:** The demographic risk factors associated with PND are maternal age less than 20 or over 30 years, lower education, illiteracy of the husband, housing type, type of family, husband’s occupation, and low family income.

**Psychological factors:** Among these, the factors which have shown significant association with PND are history of past mental illness, stressful recent life events, lower self-esteem, feeling tense during pregnancy, low mood/mood swings during pregnancy, addiction and violence by the husband, antenatal depression, unhappy marriage/marital dissatisfaction, history of depression, and physical abuse during current pregnancy and after childbirth, family history of depression-psychiatric illness, past history of psychiatric illness and history of abuse, those who have unpleasant relationship with their in-laws, mental stress, smoking and drinking during pregnancy, and history of domestic abuse.

**Socio-cultural factors:** Regarding socio-cultural factors, low socio-economic status/poverty, poor social support, women who could not confide in partner, overcrowding, poor marital relationship, poor relationship with mother-in-law, disappointment with the sex/gender of the baby, having never had a son, maternal age less than 20 or over 30 years, lower education, illiteracy of the husband, type of family, housing type, type of family, and low family income are associated with PND.

**Obstetric factors:** The obstetric factors that were found to be associated with postnatal depression are unwanted or unplanned pregnancy, past history of miscarriage, complications in pregnancy/know medical illness, poor obstetric outcome, caesarean section, single mother, multigravida/multiparity, intrapartum complications, perinatal health problems, and poor or no antenatal care.

**Infant factors:** Birth of female child, infants born with congenital malformation, infant health and infant birth weight are associated with postnatal depression.

**Discussion**

Current review estimates the prevalence of postnatal depression in south Asian region from 4.9% (Nepal) to 57% (Pakistan) which supports the findings of a review on perinatal depression reported 20% of prevalence of depression during pregnancy and 21.8% of depression during postnatal period respectively. A wide range of prevalence of PND was reported from 40 countries in 143 studies and it ranged from 0–60%.

The review also determined several risk factors of postnatal depression from south Asian countries. Most factors seem to be similar to other studies conducted in western and Asian countries such as demographic factors (e.g., age, literacy level, type of housing), psychological (e.g., antenatal depression, past history of psychiatric illness, addiction in husband), social (socio-economic status, lack of support from husband and in-laws, domestic violence), obstetric (unplanned/unwanted pregnancy, complications during pregnancy/medical illness) and infant (e.g., birth of a female child/dissatisfaction with sex of the baby, low birth weight, congenital malformations). Overall, the data in this study indicate that postpartum depression in women living in South Asian countries is caused by multiple factors.

**Conclusion**

Based on the results achieved from the current research on the relatively high postpartum depression, it is recommended that required arrangements are made for taking care of postnatal women’s mental health. The important need of health care professionals to play a role in reducing the depressive symptoms and bringing up healthy children in the society is highlighted in the study.

Impact of Quality of Work Life Dimensions on Level of Profitability: A Study on Jute Industry in Andhra Pradesh and West Bengal, India

K. Hymavathi¹, K. S. Sekhara Rao²

¹Research Scholar, ²Associate Professor, Koneru Lakshmaiah Education Foundation, Vaddeswaram, Guntur, Andhra Pradesh, India

ABSTRACT

This study creates and tests hypotheses to analyse empirically how the perceived picture of a company’s quality of work life will affect its market and financial performances. Quality of work life has turned into a critical angle in the present focused on life. Indeed it has turned into a trendy expression today for every one of the associations with regards to keeping up representative’s employment fulfillment levels high. Presently it has been utilized as strategic approach to get, draw and safeguard the human ability. QWL related rules currently turning into the components of the association approaches. Development and productivity of two gatherings of freely held organizations were looked at dependent on deals development, resource development, return on value, and profit for resources. Findings from this empirical study suggest that companies with high quality of work life can also enjoy exceptional growth and turnover and profitability.

Keywords: Quality of work life, profitability, Employees, Growth, jute industry, India

Introduction

The Quality of Work Life of an organization can be evaluated by opinions of employees on statements regarding quality of work life [QWL] aspects. Quality of work life is the quality of relationship among employees and total work environment, concern for the impact of work on individuals as well as on organizational effectiveness furthermore, the possibility of interest in authoritative critical thinking and basic leadership. The accomplishment of every organization is highly dependent on the utilization of organizational goals. To accomplish organizational goal, individual goals have to be satisfied, in that Quality of work- life directly contributes to the utilization, development and achievement of organization and human resource goals. The study was based on the factors affecting Quality of work- life and the relationships between QWL and satisfaction of the employees in the jute industries. A study of these factors is of extraordinary importance since a direct relationship between quality of work life and motivation, and motivation and productivity is known to exist (Danna and Griffin, 1999). Further, an inside and out perception of these components can likewise help in decreasing the regularly raising dimensions of contention and in this manner wearing down in the working environment (Li and Yeo, 1979). It is the responsibility of the management to facilitate a work environment, which conductive to good performance. To avoid such possibility from arising, the management should provide a good working environment where employees can work without stress, where necessary information for accomplishing task is made available adequate and fair compensation is given in the work place is safe, healthy and the supervisors motivates the employees.

Review of Literature

Nanjundeswaraswamy & Swamy (2013)¹ in the study “Quality of Worklife of Employees in Private Technical Institutions” examine that Male employees are more satisfied than female employees the chi square test decided that all the demographical factors like gender, designation, salary, department, experience are independent of quality of work life of employees in private technical institution. Study also tells that there is important association among QWL of Teaching and Non-teaching staffs. S.Subhashini, C.S. Ramani Gopal (2013)² in the study “Quality Of Work Life Among Women Employees Working In Garment Factories In
Coimbatore District” focused about Women workers of the organization are most satisfied with the Work atmosphere and job security measures of the factory and are not much satisfied about the permitted leave that would be availed. The study also shows that increase in quality of work life results in increase in productivity. Jerome. S,” (2014)⁴, A Study on Quality of Work Life of Employees at Jepiaiar Cement Private Ltd: Perambalur” in the study found that the quality of work life contributes to the workers’ performance in a holistic manner. The study also helps to reveal the loop holes of the Company in providing the workers’ basic needs and to know how the workers are treated by the management. M. Aarthy & Dr. M. Nandhini, (2016)⁵, “A Study on Quality of Work Life Among The Engineering College Faculty Members In Coimbatore District” the study reveals that there is a moderate level of Quality of Work Life is found among the faculty members and the demographic variables namely age, gender, marital status, income, experience and number of children has an important influence on the Quality of work life of the engineering college faculty members. Shweta Pandey & M. S Khan (2016)⁶ “A study of quality of work life and its impact on Performance appraisal” in their study high quality of work life is essential for organizations to continue to attract and retain employees. This is one of the reason QWL concept has gained momentum recently and researches are going on worldwide to find out inputs for framing effective QWL strategies. Moreover this tells and supports the relationship between QWL, employee performance and career growth aspects which leads to performance appraisal. Still many facets of QWL need to be unexplored through further studies. M Aarthy, & Dr. M Nandhini (2016)⁶, “Influence of the Demographic Factors on Quality of Work Life of the Engineering College Faculty Members in Coimbatore District “in their study The impact of the Quality of Work Life of the faculty members is highly notable and it influences not only the institutions but also the students who are the future building blocks of the nation. This study tells that there is a moderate level of Quality of Work Life is found among the faculty members.

Level of Profitability: Lau and May (2007)⁷ examined empirically how the perceived image of a company’s Quality of Work Life will affect its market and financial performances. The study stated that companies with high Quality of Work Life can also enjoy unusual growth and profitability. Heskett J.L et al. (1997)⁸ demonstrated that QWL which is sustained by the feelings that employees have toward their jobs, colleagues, and companies would excite a chain result leading to an organization growth and profitability in the end. To better the QWL of the employees companies are now highlight on warm employee relations and adopting a human resource policy that place high value on employees as organization stakeholders. K. Nithyavathi and N. Shani (2010)⁹, explained on Quality of Work Life of employees in textile industry and found that Quality of Work Life has six factors that give meaning to work: the purpose of work, its moral correctness, and autonomy, pleasure at work, recognition and positive relationships. When employees recognize these features in their job, they tend to experience psychological wellbeing and effective commitment to the organization.

Research Problem: From the review of literature found that, a job is compatible with an employee when it involves duties and assignments that the employee finds interesting. There is a need to address the level of profitability to improving the quality of work life dimensions of employees.

Objective of the Study: The main objective of the study is to study the impact of quality of work life dimension on level of profitability in Jute Industry.

Hypothesis of the Study

H1: Quality of work life dimensions influences level of profitability in jute industry.

Research Methodology

</tbody>
</table>

The above table displays that, out of 541 employees 1.1 percent opined the work friendly environment is very low, 11.3 percent opined the work friendly environment is low, 34.6 percent opined the work friendly environment is neither low nor high, 37.0 percent opined the work friendly environment is high, 16.1 percent opined the work friendly environment is very high. Majority of the respondents (53.1 percent) opined that, the work friendly environment in their organisation is high and very high. So, it is concluded that, jute industry created work friendly environment to its employees.

Table 2: Table presenting the responses of the respondents on “harmonious relationship in the organisation”

</tbody>
</table>

The above table shows that, out of 541 employees, 1.5 percent opined the compensation and rewards is very low, 7.8 percent opined the compensation and rewards is low, 33.3 percent opined the compensation and rewards is neither low nor high, 43.1 percent opined the compensation and rewards is high, 14.4 percent opined the compensation and rewards is very high. Majority of the respondents (57.5 percent) opined that, the compensation and rewards in their organisation is high and very high. So, it is concluded that, jute industry provided compensation and rewards to its employees.

Responses of the respondents on “job security in the organisation”: It shows that, out of 541 employees, 1.5 percent opined the job security is very low, 7.9 percent opined the job security is low, 23.3 percent opined the job security is neither low nor high, 48.4 percent opined the job security is high, 18.9 percent opined the job security is very high. Majority of the respondents (67.3 percent) opined that, the job security in their organisation is high and very high. So, it is concluded that, jute industry provided job security to its employees.

Regression Analysis

Showing multiple regressions between quality work life and level of profitability

H1: Quality of work life dimensions influences level of profitability in Jute Industry

Model summary table showing the result of multiple regressions between quality work life and level of profitability:

Table 5: Table showing multiple regressions between quality work life and level of profitability

<table>
<thead>

<th>Std. error of the estimate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>.696</td>
<td>0.484</td>
<td>0.478</td>
<td>0.58886</td>
</tr>
</tbody>
</table>

a. Predictors: (Constant), psychological factors, harmonious relationship, job security, grievances, compensation and rewards, work friendly environment, training and development

b. Dependent variable: level of profitability

R. This shows the correlation coefficient. The value 0.696 which shows strong positive relationship between the predictors and dependent variable.

R squared. This is $r^2$, the coefficient of determination. The value of R square tells how many points fall on the regression line. 0.484 of the difference of y-values around the mean are described by the x-values. In other words, 0.484 of the values fit the model.

Adjusted R square. The modified $R$-square adjusts for the number of terms in a model. The value of modified R square is 0.478

Standard Error of the regression: An estimate of the standard deviation of the error $\mu$. The standard error of the regression is the precision that the regression coefficient is measured i.e.; 0.58886.

It shows that, the independent variables are having significant impact on dependent factor of level of
profitability i.e., R² is 48 percent, thus, the quality of work life dimensions influence level of profitability in Jute Industry.

Table 6: Table showing ANOVA

<table>
<thead>
<tr>

<td>173.573</td>
<td>7</td>
<td>24.796</td>
<td>71.51</td>
<td>.000b</td>
</tr>
<tr>
<td>Residual</td>
<td>184.818</td>
<td>533</td>
<td>0.347</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>358.392</td>
<td>540</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. **Dependent Variable**: level of profitability

b. **Predictors**: (Constant), psychological factors, harmonious relationship, job security, grievances, compensation and rewards, work friendly environment, training and development

The F-ratio in the ANOVA table, tests whether the general regression model is a good fit for the data. The table shows that the independent variables statistically significantly predict the dependent variable, F (7, 533) = 71.51, P < 0.05

The regression model is a good fit of the data and accepted.

So, the hypothesis “Quality of work life dimensions influences level of profitability in jute industry” can be accepted.

**Conclusion**

Quality work life (QWL) is seen as a contrasting option to the control approach of overseeing employees. The QWL approach considers employees as “asset” to the association instead of as “costs”. Level of profitability shows positive consequences of QWL. As per analysis it concluded that that the improvement of the quality of work life on all aspects will result in the level of profitability gives the best end results for the organization.

Assessment of Sports, Yoga with Mind Training and Sports, Yoga Training on Students with Cigarette Addiction

W. Vinu

Assistant Professor, Department of Physical Education and Sports Sciences Annamalai University, Chidambaram, TamilNadu, India

Abstract

For the purpose of the study 75 students who were, addicted to smoking cigarettes were selected from Theni district, Tamil Nadu, India as subjects. The subjects were divided in to three groups in which group-1 was (Sports, Yoga with mind training-S.Y.M group) with 25 subjects, and group -2 was Sports and Yoga training-S.Y group)with 25 subjects, Group- 3 was control group- C.G) with 25 subjects, Group -1 S.Y.M underwent Sports activities, Yogic practice with mental training and group -2- S.Y underwent sports activities and yogic practice and group-3 C.G group did not participate in any of the training programme, and the training programme was scheduled for Five days a week S.Y.M group were made to play various games, practice yoga and mind training and S.Y group Played Games and practiced Yoga for a period of 10 months before and after the end of the training data was collected from the subjects of all the three groups. The collected data from the three groups were statistically analysed by using two-way ANOVA. To find out significant difference for the paired mean difference Scheffe’s test used whenever required. S.Y.M group and S.Y showed significant change in overcoming from smoking addiction, But S.Y.M Group was remarkable better than other groups.

Keywords: Rehabilitation, Cigarette addicted students, sports, yoga, and mind training

Introduction

Drug addiction or substance abuse has been a social menace universally. Owing to various reasons the occurrence of drug addiction related problems cannot eradicated completely by any country. But, as a responsible society every community, nations or administration cannot turn its face on this social evil. Cigarette smoking obsession has been a social menace world-wide. Owing to various reasons the occurrence of drug addiction related problems cannot be done away totally by any country. But, “as a answerable society every community particularly teaching community, nations or administration cannot turn its face on this social evil” (Jagatheesan Alagesan 2013) working out at a gym, or taking a brisk walk, physical activity triggers brain chemicals that make you feel happier and more relaxed. Team sports provide a chance to unwind and engage in a satisfying challenge that improves your fitness. They also provide social benefits by allowing to connect with teammates and friends in a recreational setting. mind is distracted from daily stressors” (Lawlor and Hopker 2). This can help to avoid getting bogged down by negative thoughts. Sports reduces the levels of stress hormones in body. At the same time, it stimulates production of endorphins. These are natural mood lifters that can keep stress and depression at bay. Endorphins may even leave feeling more relaxed and optimistic after a hard workout. Experts agree to determine the relationship between sports and depression. (Dodoz, and Beatly 1999) 3 Said that It’s common for an individual to become anxious or depressed when dealing with withdrawal, but sports can foster healthy, addiction-free living. ‘Yoga is a powerful and beautiful way for and ease way through recovery and gain the peace of mind need to beat addiction’. (Kochupillai 2005) 4 “A rhythmic yoga breathing (Sundarshan Kriya Yoga) decreased use of tobacco in twentyone percent of individuals after six months of practice”. Tobacco smoking is one of the
leading preventable cause of death. Mind training are structured psychological or social interventions used to address substance related problems. Mind training practiced at different stages of drug treatment to identify the problem, treat it, and assist with social reintegration. Psychosocial interventions used to treat many different types of drug problems and behavioral addictions. Motivational interviewing is a collaborative conversation style for strengthening a person’s own motivation and commitment to change. (Miller and Rollnick, 2013) 

Mind training is used to help people with different types of drug problems. Frequently, individuals are not fully aware of their drug problems or they can be ambivalent about their problems. Motivational interviewing is often referred to as a conversation about change and it is used to help assist drug users to identify their need for change. It seeks to address an individual’s ambivalence about their drug problems, as this is considered the main barrier to change. It follows five stages: (1) expressing empathy for the client; (2) helping the client to identify discrepancies between their behaviour and their goals; (3) avoiding arguments with the subjects about their motivations and behaviours; (4) rolling with the resistance of the subject to talk about some issues; and (5) supporting the subject’s sense of self-efficacy.

Methodology

The purpose of the study was to analyze the effects of sports, yoga, and mind training as a combined form of training on rehabilitation of cigarette smoking students. For this purpose, seventy-five male students with the age group of 19-21 were selected at random as subjects from Tamil Nadu, India. In which group-1 S.Y.M group with 25 and Group-2 S.Y. Group with 25 subjects represented as experimental groups in which S.Y.M group underwent sports, yoga, and mind training and group-2 S.Y underwent sports activities and yoga training and group-3-C.G group acted as control group which did not participate in any of the training. Test for nicotine was conducted before training period for both experimental groups and control group. The training programme was scheduled for 5 days a week for 45-60 minutes, they were made to play various games, practice of yoga and mind training was given for a period of 10 months. After ten months of training re-test for level of nicotine was taken. And the data collected were analyzed by Analysis of variance (ANOVA) was used and, further, since three groups were involved, whenever the ‘F’ ratio was significant, Scheff’e S post hoc test was used to determine which of the paired mean differ significantly.

In all cases, the 0.05 level of confidence fixed to test the level of significance which considered as an appropriate. Test for nicotine conducted before training period for S.Y.M, S.Y group and C.G group before and after training period C.G group did not under go any training.

Test Procedure: Test for nicotine level in subjects (NCE-M03-8B) *This test gives an indication of the tobacco consumption level of subjects. It detects in the urine the presence of cotinine, which is the main biomarker of smoking. Any consumption of cigarette will produce traces of cotinine in the body, and this is what this test screens.

After ten months of training test for level of nicotine was taken. And the data collected were analyzed by Analysis of variance (ANOVA) was used for computing, further, since two groups were involved, whenever the ‘F’ ratio was significant, Scheff’e S post hoc test was used to determine which of the paired mean differ significantly.

Result of Study

The pre and post test data collected from the experimental and control groups were statistically analysed by ANOVA and the results are presented in table 1

| Table 1: Analysis of Variance on Experimental and Control Groups |
|---|---|---|---|---|---|---|---|
| Means | Group-I SYM | Group-II SY | Group-III. C.G | SV | SS | df | MS | Obtained ‘F’ |
| Pretest mean | 2.86 | 2.86 | 2.93 | B | 0.04 | 2 | 0.02 | 0.21 |
| Posttest mean | 1.13 | 1.46 | 2.80 | B | 23.33 | 2 | 11.66 | 62.28 |
| Adjusted posttest means | 1.13 | 1.47 | 2.79 | B | 22.66 | 2 | 11.33 | 60.80 |

*Significant at 0.05 level
The required table value for significance at 0.05 level of confidence with degrees of freedom 2 and 42 is 3.23 and degree of freedom 2 and 41 is 3.23

*Significant at .05 level of confidence.

Table-1 shows that the pre-test mean of S.Y.M. group, S.Y groups and control group are 2.86, 2.86 and 2.93 respectively. The obtained ‘F’ ratio value of 0.21 for pre-test means of S.Y.M group, S.Y. group and C.G group were less than the required table value of 3.23 for the degrees of freedom 2 and 42 at 0.05 level of confidence. It reveals that there is statistically insignificant difference among the three groups during pre-test period. It inferred that the random assignment of the subjects for the three groups is successful.

The post-test mean value for post-test of S.Y.M. group, S.Y groups and control group are 1.13, 1.46 and 2.80 respectively. The obtained ‘F’ ratio value of 62.28 for post-test means of S.Y.M group, S.Y. group and C.G group were higher than the required table value of 3.23 for the degrees of freedom 2 and 41 at 0.05 level of confidence. So, there was a significant difference occurred due to training.

The adjusted post-test means of S.Y.M. group, S.Y groups and control group are 1.13, 1.47 and 2.79 respectively. The obtained ‘F’ ratio value of 60.80 for adjusted post-test means of S.Y.M group, S.Y. group and C.G group were higher than the required table value of 3.23 for the degrees of freedom 2 and 41 at 0.05 level of confidence. It is observed from this finding that significant differences exist among the adjusted post-test means of both experimental groups and control group.

Since, the adjusted post-test ‘F’ ratio value is found to be significant the Scheffe’s test is applied to find the paired mean differences, and it is presented in table-2

Table 2: Scheffe’s Test for the Difference between the Adjusted Post Test Paired Means of Spiking Ability

*significant

The result of Table - 2 shows that there are significant differences between the adjusted post-tests means of S.Y.M. group and C.G. groups; S.Y.M group and S.Y group; S.Y group and C.G group on addiction on smoking. Both S.Y.M and S.Y group had impact on reducing cigarette smoking on students, but S.Y.M group (sports, yoga, mind training group) showed high impact on rehabilitation from cigarette addiction.

Discussions

This study was deliberate attempt to experiment sports, yoga, and mind training for effective rehabilitation of drug addicts. The study was offered with the idea that when worldwide trends in rehabilitation program of drug addiction primarily emphasis on regaining health and fitness status through structured sports program. Yoga therapy is a traditional Indian medicine which includes actives like sports. The efficacy of sports based rehabilitation program is not well understood or not accepted in the context of practices and so the effect of yoga.

Hence taking up a research work on drug rehabilitation with yoga concurrently with a regular stereo typed program of an established center did fill up a need of the time

This study was deliberate attempt to experiment sports, yoga, and mind training for effective rehabilitation of drug addicts. The study was offered with the idea that when worldwide trends in rehabilitation program of drug addiction primarily emphasis on regaining health and fitness status through structured sports program.

The results presented in Table -1 proved that GROUP-1 has reduced 1.13 due to SYM training and similarly SY group reduced to 1.47. The mean difference was further subjected to ANOVA and obtained F values were significant at 0.05 level. The post hoc analysis and paired mean comparisons results presented in Table 2 shows that compared to control group SYM and SY cigarette addiction groups significantly reduced cigarette smoking. But SYM group showed better reduction in smoking cigarette than SY group.

*significant
Parks GA., et al. (2011)\(^7\) investigated the effect of yogic practices (Vipassana Meditation) and mental training on Alcohol, smoking and Drug Relapse and Criminal Recidivism. After regular yogic meditation and psychological mind training reduce alcohol, smoking and other drug use subjects started to overcome addiction. (American addiction centre)\(^8\) says that “in addition to,” and not “in place of.” Yoga is often beneficial when used with sports and mind training is a best treatment to overcome drug addiction. Marlatt GA et.al. \(^9\) Investigated, The Effects of Vipassana Meditation and Other Rehabilitation Programs on Alcohol and Drug Relapse and Criminal Recidivism, finding of his investigation proves that that yoga therapy program is effective in the rehabilitation of drug addicts. Dongshi Wang\(^10\) Investigated on impact of Physical Sports on Substance Use Disorders, the outcome of the study was that sports activities will reduce the depression symptom and reduce the use alcohol and nicotine. Mark A. Smith., et al(2011)\(^11\) in his investigation stated “ability of sports to serve as an alternative, non-drug reinforcer” (Roessler 2010.)\(^12\) Research revealed physical sports improved the quality of life of drug users. The result of the research showed that patients’ quality of life improved quality of life and they had high level of energy. The result revealed that physical sports can be used as support in drug abuse treatment. (Bentley, R., 2007)\(^13\) findings of the study proved that Behaviour and psychological therapies are the treatments for persons with addictions. By giving reinforcement every time for an addictive behaviour. The effect on the central nervous system could be a positive reinforcement.\(^10,13,14\) The findings of this study reveals SYM and SY would effectively rehabilitate cigarette habit when psychological training is combined with sports and yogic training the result was much better, So it is confirmed that S.Y.M. training is one of the best training for drug rehabilitation.

**Conclusion**

It was concluded that when (S.Y.M) Sports, Yoga and Mind training is combined and practiced by Cigarette addiction men, it can rehabilitate them from cigarette addiction.

ABSTRACT

Background: Current century with advanced medical care still holds Tuberculosis as a prevalent condition around the world. The context to default is the adverse effects faced by patients taking anti-tubercular drugs. The most perilous among the adverse effect is hepatotoxicity and can be ameliorated by the effect of Nigella Sativa seeds.

Objectives: To study the hepatoprotective role of Nigella Sativa seed extract against Isoniazid and Rifampicin induced hepatotoxicity.

Materials & Method: The animals were divided into three groups with six animals in each group. Group I served as normal control, Group II served as positive control and received Isoniazid and Rifampicin for 10 days. Group III received Isoniazid and Rifampicin with Nigella Sativa seed extract 900mg/kg was given for 10 days. Blood samples were sent for AST, ALP, ALT analysis and the liver tissue for histopathology studies.

Results: Table 2 showed decrease in AST, ALP, and ALT values in group III when compared with group II. Histopathology showed reduced hepatotoxic changes in group III when compared with group II.

Conclusion: The hepatoprotective property of Nigella Sativa seed extract will be a new path for safer and effective Tubercular therapy in developed and developing countries.

Keywords: Tuberculosis, Nigella Sativa seed, Isoniazid, Rifampicin, Hepatoprotective

Introduction

Tuberculosis holds its stand as one of the challengeable morbidity in the world. Being 100% preventable and 100% curable1 it still remains as a contest for the medical community to eradicate it. The most effective cure for Tuberculosis in the current medical practice is the first line of Anti-tubercular drugs2. Isoniazid, Rifampicin and Pyrazinamide are the common hepatotoxic agents in DOTS regimen (Directly observed Short Course Therapy by World Health Organization). Isoniazid and Pyrazinamide are directly acting hepatotoxins, whereas Rifampicin is enzyme inducer promoting the up regulation of hepatic cytochrome P450 enzyme (CYP2D6 and CYP3A4), thus indirectly promotes the hepatotoxicity of Isoniazid3,4.

Isoniazid and Rifampicin causes oxidative activation of Cytochrome P450 mono-oxygenase system which leads to generation of electrophilic intermediate and free radicals resulting in liver injury in animal models5,6. Nigella Sativa belongs to Ranunculaceae family and found commonly around Asian, Middle

DOI Number: 10.5958/0976-5506.2019.01084.2
Eastern, Mediterranean and African countries\(^2\). History of *Nigella sativa* begins as early as second millennium BCE, Archeological evidences proves their presence from ancient Egypt-Tutankhamun’s\(^8\) and was also obtained from Hittite flask in Turkey\(^9\). Nigella Sativa seed is used in treatment of fever, Viral flu, Scorpion sting, Asthma, headache, Rheumatoid arthritis, Warts and Snake bites\(^10,11,12,13,14\).

*Nigella Sativa* seed possess special properties like anti-inflammation\(^1,5,16\), anti-oxidant\(^17,18,19\), anti-cancer\(^20,21\), immune stimulant and anti-microbial action\(^22\). These credentials have made *Nigella Sativa* seed extract to be effective against hepatitis, hepatotoxicity’s, hepatic carcinomas. The current study targets Nigella Sativa seed extract effect against Isoniazid and Rifampicin induced hepatotoxicity. Thus ant-tubercular regimen can be followed with utmost efficacy and safety.

Materials and Method

Isoniazid was purchased from Pfizer Pvt Ltd and Rifampicin from Cyper Pharma Ltd. Isoniazid 50mg/kg was dissolved in distilled water to form 1ml/kg and Rifampicin 100mg/kg was dissolved to obtain 1ml/kg and the Ph was adjusted to 3 with 0.1N Hcl to form clear solution\(^23\).

*Nigella Sativa* Seed Extract: *Nigella Sativa* was purchased from local vendor in Chennai and authenticated by Botanical survey of India, Southern regional center, Tamil Nadu agricultural University, Tamil Nadu. The *Nigella Sativa* seeds were washed with water then air dried, and homogenized to form fine powder. It was then stored at 40°C in airtight container. The *Nigella Sativa* powder 250gms was extracted with 2500ml of aqueous ethanol for 48hrs. The extract was filtered using whatman filter paper. The formed residue was extracted twice with same fresh solvent. The filtrate was concentrated using a rotary vacuum evaporator at low temperature (30° - 40°C) and pressure. The final brown material obtained was suspended in water prior to treatment.

Experimental Designs: Eighteen wistar albino rats weighing 130-150 gms were used in the study. The study was approved by Institutional Animal Ethical Committee. Animals were housed at a temperature of 24 ± 2°C and relative humidity of 30-70%. The animals were fed with staple pellet diet from Hindustan Lever Ltd., Mumbai. The animals were divided into three groups with six animals in each group. Group I served as normal control and received water, pellet diet ad libitum. Group II served as positive control and received Isoniazid 50mg/kg orally and Rifampicin 100mg/kg orally for 10days. Group III received Isoniazid 50mg/kg orally with Rifampicin 100mg/kg and *Nigella Sativa* seed extract 900mg/kg was given for 10days. On the eleventh day the blood samples were collected before animal sacrifice. The liver tissues were isolated and send for Histopathological studies\(^25\). Estimation of AST,ALT was done using Reitman method\(^26\) and ALP was done using Bessey method\(^27\).

Statistical Analysis: Data was collected and analyzed using IBM statistical package for social science (SPSS) software version 21. The data’s were presented in mean ± standard deviation and “t” test was used for statistical significance.

RESULTS

Current study showed that Isoniazid and Rifampicin showed escalation of liver function test. Table 1 shows the changes in body weight of animals. Group II showed a decrease in body weight when compared with normal group I. Group III had minimal reduction in body weight when compared with group II.

Table 2 shows the liver function test with mean and standard deviation values. The ALT values where significantly P<0.001 increased in Group II when compared to Group I. In group III the ALT values are reduce significantly P<0.0001 when compared with group Group II. The ALT and AST values are significantly reduced P<0.0001 in Group III when compared with Group II. The histopathological report of Group I section study showed normal histology of liver with central vein in the middle of lobule and cords of unremarkable hepatocytes extending towards the periphery. In Group II the section studied showed hepatic parenchyma with centrilobular hemorrhage and severe ballooning degeneration of the hepatocytes. Sinusoidal congestion, marked steatosis and dense lymphocytic infiltration are seen. Group III section showed mild congestion of central vein, marked reduction in the lymphocyte infiltrate in hepatic parenchyma and mild steatosis seen at the periportal hepatocytes. Few apoptotic hepatocytes are also seen.

Figure 1: Nigella Sativa: Hepatoprotective Mechanism

Discussion

Drug induced liver injury is commonly excluded clinical diagnosis. Around 30% of fulminant liver failure and 2% of jaundice in hospitals are due to drug induced toxicities\textsuperscript{28,29}. The major limitations for the use of anti-tubercular drugs are the adverse effects. Isoniazid and Rifampicin induced hepatotoxicity is used as an experimental model to study drug induced hepatoxicity\textsuperscript{30,31}. The two basic mechanism behind Rifampicin induced hepatotoxicity (1) Competeting with bilirubin at sinusoidal membrane for clearance in a dose dependent manner\textsuperscript{28,32} and (2) inhibiting bile salt exporter pumps\textsuperscript{33}. Isoniazid is metabolized to form a reactive metabolite which reduces the level of free radical scavengers like glutathione related thiols, glutathione peroxidase and catalase activities\textsuperscript{34,35}. When combined Rifampicin induces the toxicity of Isoniazid\textsuperscript{36}.

\textit{Nigella Sativa} seeds are traditionally used in and around Asian region as anti-emetic\textsuperscript{37,38}, anti-septic\textsuperscript{39}, indigestion, dysmenorrhea and anti-tussive\textsuperscript{40}. In the current study \textit{Nigella Sativa} seed extract has reduced AST, ALP and ALT. \textit{Nigella Sativa} seed extract acts as a hepatoprotective agent by inhibiting iron dependent lipid peroxidation in concentration dependent manner\textsuperscript{41} and also possess oxygen scavenging activity\textsuperscript{42,43,44}. Study by Founda AMM et al has \textit{Nigella Sativa} seed extract contains Thymoquinone which inhibits the activity of cytochrome 1A1 and cytochrome 1A2 isoenzyme of
hepatic system. These enzymes are majorly involved in biotransformation of many Xenobiotic substances. Study by Awad A et al showed that Thymoquinone an active ingredient of Nigella Sativa seed reduced the Isoniazid and Rifampicin induced cytochrome3A1 mRNA expression of Spermine N-1-acetyl- Transferase which is a catabolic enzyme that involves polyamine alteration in liver tissues.

Study by Yesmin.F et al showed that Nigella Sativa seed extract protects hepatocyte from injury by its antioxidant and anti-inflammatory properties. Daba MH et al showed that ratio of helper to suppressor Tcells, natural killer cell and production of Interleukin-3 were increased by the stimulatory effect of Nigella Sativa seed ingredients on macrophages. Study by Yesmin et al showed the hepatoprotective role of Nigella Sativa against NSAID induced hepatotoxicity. In the study Nigella Sativa seed extract showed antioxidant and anti-inflammatory property.

Image 1 shows the hepatoprotective mechanism of Nigella Sativa seed extract. Similar effects are pronounced in the current study where Nigella Sativa seed extract has shown a protective effect against Isoniazid and Rifampicin induced hepatotoxicity. In the future Nigella Sativa ingredients can be isolated and specifically used along with anti-tubercular regimen to reduce hepatotoxicity. The hepatoprotective property of Nigella Sativa seed extract will be a new path for safer and effective therapy in developed and developing countries.

Conclusion

Treatment with anti-tubercular drugs can be made innocuous by the use of Nigella Sativa seed extract. Its hepatoprotective effect alleviates the hepatotoxicity of first line anti-tubercular drugs and reduces the defaulters in anti-tubercular treatment. Combing Nigella Sativa seed extract with DOTS regimen can be a novel path for safer treatment in Tuberculosis.

Artificial Intelligence as a Tool to Enhance HIV-AIDS Programme Management

Shayhana Ganesh
DUT Affiliate, Faculty of Management Sciences, Durban University of Technology, South Africa

ABSTRACT

The HIV prevalence in South Africa is the highest in the world. In 2017, 12.6% of the population, 7.06 million people were HIV positive. Almost two thirds of this cohort are on ARVS contributing to South Africa’s ARV programme-making it the largest in the world. Other sectors within the health industry have also contributed to addressing the burden of disease by developing their own sector specific HIV-AIDS programmes. Over time, these programmes have grown from strength to strength and have incorporated components to driver better performance within these programmes. A novel concept in health technology is that of artificial intelligence (AI) and machine learning, which is redefining the health industry and is fast becoming very popular locally and globally. AI has not been fully integrated into the HIV-AIDS field to date. This paper explores the artificial intelligence landscape in the HIV-AIDS arena and assesses if AI can enhance HIV-AIDS programme management.

Keywords: HIV-AIDS, artificial intelligence, machine learning

Introduction

Artificial intelligence (AI): “is an area of computer science that emphasizes the creation of intelligent machines that work and react like humans”. Machine learning is another core part of AI. Learning without any kind of supervision requires an ability to identify patterns in streams of inputs, whereas learning with adequate supervision involves classification and numerical regressions. AI is has been revolutionising the landscape of technological advancements with its impact being felt across all sectors. A novel area of interest is the interplay of AI across the health sector. AI together with machine learning is being introduced across the various disciplines of health. to date AI has been used to predict treatment outcomes for ill patients, to generate treatment plans for common illnesses and to assess common signs and symptoms to prompt individuals to seek care. The association of AI on the HIV-AIDS health sector is a new one but a very intriguing one as the benefits of enhancing HIV-AIDS care are many. HIV-AIDS still remains a significant disease burden across South Africa and across the world. There are an estimated 7.1 million people living with HIV in 2017. 86% know their status, 65% on treatment and 81 are suppressed. Adherence to ARVS is also a critical component of HIV-AIDS programmes as robust programmes are based on clinically sound patients who are adherent to medication. On adherence often results in resistance and other opportunistic infections which often contribute to mortality and morbidity.

Methodology

Desktop research was undertaken given the relatively new nature of the integration of AI with HIV-AIDS. Available literature was reviewed with relevance to HIV-AIDS and AI. Secondary data was reviewed to assess existing pre-published information. The aim was to assess main needs and gaps locally and abroad in order to develop further research ideas in order to continue to enhance the current field of research. A data review was done to critically analyse which HIV-AIDS programmes embodied AI techniques with machine learning. As this is a relatively new concept, it was not envisioned that many programmes will exhibit this functionality given the scarcity of resources and the cost to implement.

Results

The analysis revealed that extraordinary work was being done with AI and HIV-AIDS. This included new
app development, prediction of clinical codes, predicting disease monitoring trends, pathology monitoring and potential drug patterns monitoring. To date, however no model exists to predict growth of programmes and management thereof. This revealed a void in this arena creating a need for further research and development.

Conclusion

The benefits of AI include a predictable preemptive clinical decision making system which can aid patients and healthcare workers alike. Having a suitably constructed and appropriately managed AI system will allow all programme managers and healthcare workers to identify high risk members based on relevant eligibility criteria. This will then allow programme managers the ability to suitably deploy resources where they are most required to ensure that high risk members receive more clinical interventions than low risk. AI through machine learning, can allow HIV-AIDS programmes to triage their patrons into high, medium and low risk. This will concentrate more efforts on members who need more attention, therefore resulting in a more cost effective management approach. In order to ensure no lost to follow up, AI will be able to generate patient profiles which will allow staff to track and trace members, resulting in a more cooperative cohort to be followed up in care. Learning and development can also occur from trend analysis of data generated in order to capacitate healthcare workers.

Adherence and compliance are key outputs of HIV-AIDS programmes as these translate directly into outcomes of the programme and its patients. Implementing a properly design AI system with consistent maintenance, will allow for enhancing and optimizing patient care in HIV-AIDS programmes. This can be rolled out locally and adapted globally and can be sensitized for private, public and ngo sectoral HIV-AIDS programmes.

A Review of the South African Anti-retroviral Treatment Programme

Shayhana Ganesh¹, Renitha Rampersad¹

DUT Affiliate, ¹Faculty of Management Sciences, Durban University of Technology, South Africa

ABSTRACT

South Africa has almost 3.4 million people on treatment, more than any other country in the world. Scale up of antiretroviral therapy globally and locally has surpassed expectations. Global coverage of antiretroviral therapy reached 46% at the end of 2015. In September 2015, The World Health Organisation called for international guideline changes introducing the concept of “Test and Treat”. Based on significant research trends and experimental evidence, this new approach which encourages universal testing and treating of all HIV positive individuals is set to be the net game changer in the field of HIV-AIDS. However the practical implications of operationalizing this, may pose challenging for most countries especially South Africa where the current ARV patients are set to double. This article reviews the ARV programme and explores its strengths, weaknesses, opportunities and threats amidst the many challenges that plague this country and sets the path for recommendations and best practises toward future successes.

Keywords: HIV-AIDS, Test and Treat, World Health Organisation, Ant-retro-viral

Introduction

Sub-Saharan Africa is the region worst-affected by HIV and AIDS. South Africa has the highest prevalence of HIV/AIDS compared to any other country in the world and this is a prominent health concern, with 5, 6 million people living with HIV, and 270,000 HIV related deaths recorded in 2011. The South African ARV programme is now internationally recognised as successful despite a slow start, and is responsible for recent dramatic improvements in South African life expectancy. The South African ARV Programme is based on the clinical goals to reduce the HIV viral load to undetectable levels and to enhance quality of life with reduction in opportunistic infections.

The next section provides a SWOT (Strengths, Weaknesses, Opportunities, and Threats) analysis of the South African ARV programme in order to identify strengths and weaknesses towards harnessing best practises.

Strengths

Guidelines: HIV-AIDS is a dynamic field in that the protocols and procedures governing clinical management are changing daily based on novel and innovative approaches emanating from local and global research. The World Health Organisation has led the clinical field with proactive clinical guidelines guiding clinical discretion among policy makers, clinicians and healthcare workers. These guidelines are based on evidence based teachings and learning’s based on data collection form research in both the developed and developing countries. Most countries echo the WHO guidelines as the source and key reference for clinical decision making in most countries. South Africa also utilises the clinical guidelines from the South African HIV clinicians’ society. This society has been formed by experienced and seasoned clinicians governing the clinical aspects of the disease in South Africa and other developing countries. These guidelines provide clinical information from both the private, public and parastatal sectors and hence provide a rich source of clinical information for treating clinicians to make informed decisions. The South African Department of health also provides a Clinical Guideline for the management of HIV-AIDS in adults and children which is often revised and/or updated annually. As such there is a wealth of information informing clinical governance over HIV-AIDS in the South African context.

The South African ARV programme—the largest global ARV programme
The South African ART programme is the largest ART programme in the world. Boasting over 7 million individuals on ART, the programme has unique abilities to learn and guide future ARV developments and clinical management. Due to its size and its expansive nature given the geographic location of the programme, this ART programme has the potential to leverage greater skills, learning curves and opportunities for the developed and developing world alike.

**Generic Medication:** The pharmaceutical industry has boomed with the advent of ARV therapy and its generics in the African and South African markets. Generics are cheaper versions of the originator products which are more widely available and more affordable and accessible. ARV generics have boomed in the South African market with more cost effective drugs being delivered to ARV programmes in the state sector. The South African Department of health also conducts the procurement of ARVS through their national tender process which is extended to all ARV producers nationally and internationally. Given the competitive nature of the tender, highly sought after ARVS are procured through very competitive pricing making healthcare easy, acceptable and affordable. As the South African ARV programme procures most of the ARVS globally, the ARVS are available at cheaply negotiated pricing.

**Weaknesses**

**Drug Shortages:** As the South African ARV programme is the largest in the world, it often faces drug stock outs and shortages. This occurs often as a result of poor forecasting and planning in the drug procurement and distribution process. What has been noticed is the poor implemention of good pharmaceutical practices which does not enable adequate drug utilisation.

**Staff shortages:** The brain drain is a considerable healthcare concern in South Africa. This is the loss of several healthcare workers to due to other disciplines and other industries and many to other countries. This is purely due to poor working conditions, poor infection control and high patient volumes. This further creates a bigger burden on the work loads and on the mandates of the clinics to meet patient and client needs. Given that South Africa has the largest ARV programme in the world; it subsequently requires a significant clinical and non-clinical task force in order to provide daily service delivery.

**Opportunities**

**Integration of care:** Integrated care creates a better healthcare experience for you. Integration decreases the cost of healthcare delivery. Integration promotes better health outcomes. Holistic patient care is now the future of healthcare. Integrated care is the concept where a patient is holistically managed through all aspects of disease progression. This helps to manage patients thoroughly with no gaps and deficiencies thus working toward cost effective care and efficient patient models of care. The implementation of integrated TB/HIV electronic data collection and clinic management tools has the potential to galvanise TB/HIV integration at primary care level.

**Public private partnerships:** A great deal of potential exists for collaboration between public and private institutions to leverage partnerships. There can be opportunities to drive down medication costs to ensure profitable partnering. Pharmaceutical companies play a pivotal role in the ARV healthcare sector. These partnerships can prove beneficial.

**Differentiated models of care:** Current models of delivering ART care in resource limited settings are being stretched to the limit. With 37 million people worldwide living with HIV and recommended for treatment, innovative solutions are urgently needed to provide quality, life-saving HIV care. The differentiated care framework includes specific care packages based on care needs. As national HIV guidelines evolve to start all people living with HIV on antiretroviral therapy (ART), delivery of care will need to adapt to the increase in the number of people and their diverse needs.

**Funding:** Local and global sustainable means of funding will always be a contentious issue with the rising costs of inflation burdening the world economy. The ARV drug regimens are possibly some of the most costly medications which need to be taken daily as lifelong therapy. With competitive pharmaceutical markets, competitive prices together with the generic boom in the industry, ARV pricing has become more affordable but not yet cost effective. The South African department of health also procures their drugs for the programme through the national treasury process of tendering and as such the largest ARV pharmaceutical companies are invited to tender to allow for drug procurement.
**Adherence:** Adherence and compliance to chronic medication remains the main barrier to ART success. Having to take medication daily to prevent costly life threatening consequences is a tall order and is a challenge not only for the HIV-AIDS disease management sector but for all other therapeutic areas. The consequences for HIV-AIDS can result in HIV resistance, noncompliance, changing drug regimens and greater risk of acquisition of opportunistic infections. One of the greatest challenges of the ART programme both in the private and public sectors is to ensure that patients maintain and sustain their drug utilisation. Stronger support structures and teams are required for targeted counselling approaches to encourage better compliance on the programme.

**Recommendations**

**Adopt an electronic register:** The only way to ensure that there is adequate resource allocation to cover the necessary population coverage is if this area of HIV-AIDS service delivery becomes registered electronically. If patients are tagged with unique identifiers such as ID or another number then it would be possible to accurately estimate patient and treatment numbers and then allocate patients and nurses accordingly.

**Monitoring and evaluation:** Many different countries and institutions have contributed to the current understanding of how best to monitor and evaluate HIV-AIDS programmes. Monitoring and evaluation of HIV-AIDS programmes commenced in early 2000 and was developed as result of consultation with programme staff, donor representatives and evaluation specialists from institutions all over the world. This complex field has grown since then and will continue to grow to match the disease trends of the epidemic.

**Conclusion**

The South African ARV programme has many lessons to share with the world. The experience learnt through early adopters and first mover advantages together with challenges past, present and on-going continue to be learning curves for the country and the world to learn from. Best practices per category of care e.g. drug supply, pharmacy, clinical should be developed to enhance and improve approaches to care. The ARV programme is the largest and is set to double in size. The South African ARV programme can only grow from strength to strength if supported by tools, frameworks and approaches toward holistic integrated care.

The Integrity and Team Commitment Influences Analysis Toward Patient Safety Incident Reporting (PSIR) at Inpatient Installation of the Sidoarjo District Public Hospital, East Java, Indonesia

H eru Suswojo¹, Nyoman Anita Damayanti²

¹Doctoral Student of Public Health, Faculty of Public Health, Airlangga University; ²Lecturer of Doctoral Public Health Program, Faculty of Public Health, Airlangga University

ABSTRACT

In order to improve the quality of care delivered to the patients, Sidoarjo District Public Hospital as one of Public Hospital at The East Java Province, Indonesia has implemented Patient safety standard, however patient safety incidents reported at Hospital Patient Safety Team, as one of the indicators in patient safety, from 2013 to 2016 was only 31.83% which was still bellowing the Standardizing Medication Error Event Reporting in the U.S. Department of Defense (DOD) i.e. 40.3%. Patient safety is a system that provides patient the care needed in order to preventing injury as a result of the error on doing treatment as well as the error on not doing treatment for a patient at a hospital.

This analytic observational quantitative research employed by a cross sectional design. Data collected from all teams (33 teams) which consist of 7 – 9 members worked on the inpatient installation of the Sidoarjo District Public Hospital from March to June 2016 using questionnaire.

The aims of this research were to describe the integrity and team commitment toward PSIR and analysis the influence of integrity and team commitment to PSIR on the inpatient installation of the Sidoarjo District Public Hospital.

Results from this research shows that there were significant effects of integrity and team commitment toward Patient Safety Incident Reporting at the inpatient installation of the Sidoarjo District Public Hospital with significant influence 0.002 and 0.000, consecutively. Hence, in order to increase patient safety incident reporting on the inpatient installation of the Sidoarjo District Public Hospital, it is important to be taken into account the activities that can be used to increase the integrity and team commitment.

Keywords: Reporting, Patient Safety, Integrity, Team Commitment

Introduction

Patient Safety is a system that provides patient the care needed in order to preventing injury as a result of the error on doing treatment as well as the error on not doing treatment that actually needed for a patient at a hospital. Patient safety consist of several activities which are the risk assessment, the identification and management of patient risk, the patient safety incident reporting (PSIR) and the incident analysis, the lesson learning capability from the previous incident and the follow up, the solution implementation in order to minimize risk of the treatment in the future (¹). The patient safety focuses in increasing the quality of care in a hospital driven by the high number of adverse event at a hospital (²). Implementing patient safety in a hospital is much more important than the services efficiency (³).

The activities done in patient safety not an easy and simple activity, it is a continuing process that based on lesson learned from a patient safety incident on the past and then arrange preventive strategy to avoid the
repeated incident happened in the future, in the same unit or in the other unit at a hospital. The most important knowledge in the field of patient safety is how to prevent harm to patients during treatment and care\(^{(4)}\).

The PSIR as one of activities of the patient safety program, actually the core one, can provide information about the causes root of patient safety incident that can be used to prevent repeated incidents in the future. It is a mechanism to detect and surveil patient safety and also an entry point process for patient safety lesson learned in order to prevent the same incident to be happened in the future\(^{(5)}\).

The PSIR is every unintentional and unattended event that causes or potentially causes an injury for patient at a hospital \(^{(1)}\). The PSIR consist of Adverse Event, Near Miss Event, Not Cause Injury Event, Potentially Injury Event and Sentinel Event. The Adverse Event is defined as an incident or event that caused patient injury. The Near Miss Event is an incident or event that almost caused patient injury. The Not Cause Injury Event is an incident or event that not caused a patient injury. The Potentially Injury Event is a condition that potentially can cause injury and The Sentinel Event is an incident or event that caused mortality or serious injury.

The fundamental role of the PSIR is to enhance patient safety by learning from previous patient safety incident and increase the quality of health care\(^{(4)}\). The disobedience in PSIR is a failure in overcoming the incident happened.

In Indonesia the report of PSIR still very low and even if there is a report collected, the calculation of event related to patient safety still very limited\(^{(6)}\). Based on data recorded at Hospital Patient Safety Team of The Sidoarjo District Public Hospital, PSIR from 2012 – 2015 was only 31,83\(\%\), which was still bellowing the Standardizing Medication Error Event Reporting in the U.S. Department of Defense (DOD) i.e. 40.3\(\%\). According to Patient Safety Committe of The Sidoarjo District Public Hospital patient safety incident still often happened but not fully reported.

However, implementing the PSIR requires every employee in the organization to care of a patient’s potential risk that only can be done if every employee at The Sidoarjo District Public Hospital has a high integrity and team commitment toward PSIR.

Integrity, defined by Andrian Gostik & Dana Telford as a consistency between values and deeds. Building a high integrity is a continuing and never ended process \(^{(7)}\). Whereas, employee commitment to his/her organization defined by Allen, N, J., & Meyer JP as a psychology state that characterized by the believe and acceptance of the goal and values of the organization, the readiness to work hard for the organization, and the high desire in remaining as a member of the organization\(^{(8)}\).

The aims of this research were to describe the integrity and team commitment toward PSIR and analysis the influence of integrity and team commitment to PSIR on the inpatient installation of the Sidoarjo District Public Hospital.

**Method**

This analytic observational quantitative research employed by a cross sectional design. The analysis unit is all team (33 teams) worked on inpatient installation of The Sidoarjo District Public Hospital. Data collected from March to June 2016 using rating scale questionnaire.

The independent variables were integrity and team commitment, whereas dependent variable is PSIR.

Data analysis using the univariable analysis to describe the distribution of frequency and proportion of independent and dependent variables and also a linear regression analysis to analyze the influence of independent variables toward the dependent variable.

**Result**

(a) Descriptive statistic: The result of this research shows that PSIR on inpatient installation average was high i.e. 84.8\(\%\). The complete description of PSIR on Inpatient Installation of The Sidoarjo District Public Hospital is shown in table 1.

<table>

Discussion

Result from this research shows that integrity and team commitment toward PSIR in the inpatient installation of The Sidoarjo District Public Hospital are high meaning that most of the team at Inpatient installation already have a high integrity and a high team commitment in doing PSIR. Furthermore, from linear regression analysis shows that integrity and team commitment have a significant influence toward PSIR at the inpatient installation of The Sidoarjo District Public Hospital that was proven by the high category of PSIR at amount 84.4%.

Unfortunately, this data different from the data recorded on Hospital Patient Safety Team, which is only 31.83%. This fact indicated that the PSIR on the inpatient installation of The Sidoarjo District Public Hospital only recorded at intern installation, but failures to be reported to the Hospital Patient Safety Team of The Sidoarjo District Public Hospital.

The reason for this different data maybe because the report was tucked away in other reports so it is not received by the Hospital Patient Safety Team or other human errors that usually happened to the routine busy activities at a hospital, both by the health functional workforces at the inpatient installation and also by the Hospital Patient Safety Team of The Sidoarjo District Public Hospital themselves.

It was also caused by the grading mechanism in PSIR flowchart scheme at The Sidoarjo District Public Hospital that are consist of blue grade, green grade, yellow grade and red grade. Only the yellow and red grade will be reported to the Hospital Patient Safety Team and continue with the root cause analysis by the team while the blue and green grade only follow by simple investigation by the head of the installation.

Other than that, all the report is still a paper based report that also makes many room for human error.

To overcome this problem, it is important to build a system for avoiding the mis reported of the PSIR and limited any other human mistakes that can ended by the increasing patient safety incident. The system can be integrated with the hospital management information system.

It is also important to pointed special officers responsible for patient safety because the officer that becomes the member of the Hospital Patient Safety Team of The Sidoarjo District Public Hospital are also having a main responsibility as a health’s functional workforce. Because of that, in order to consistently and focusly handling patient safety program as their adding responsibility, then they have to prolong their working hour, even though based on research by A.E. Rogers et all the risks of making an error were significantly increased when work shifts were longer than twelve hours, when nurses worked overtime, or when they worked more than forty hours per week.(9) or in other word we can say that overtime work increase the risk in making error.
Other than that, it is also important to re-arrange the PSIR flow chart scheme so every event must be reported to the Hospital Patient Safety team.

Increasing the number of the supervision by the hospital management in order to give motivation and also support to the health’s functional workforce at the The Sidoarjo District Public Hospital also can be implemented. Managerial support as one of work environment has significant effect in improving health care at the hospital\(^{(10)}\), including the PSIR as the main activity on patient safety program. Managerial supervision also important to maintain the same perception about the importance of PSIR and offer the solution for the PSIR problem at every unit of the The Sidoarjo District Public Hospital.

Regulate the PSIR as an obligatory task of health’s professional worked at The Sidoarjo District Public Hospital especially at inpatient installation and giving reward and punishment mechanism to support this regulation. As state by Sari ABA et al that the voluntary reporting systems may under-report incidents, owing to lack of feedback; time constraints; fear of shame, blame, litigation, or professional censure; and unsatisfactory processes\(^{(11)}\).

**Conclusion**

Based on this research, the implementation on PSIR at the inpatient installation of The Sidoarjo District Public Hospital is run well because the employee worked in this installation already have a high integrity and team commitment. From the linear regression analysis also found that the integrity and team commitment have a significant influence toward PSIR. The problem is that the data from inpatient installation of The Sidoarjo District Public Hospital was different from data collected at The Hospital Patient Safety Team of The Sidoarjo District Public Hospital.

These differences cause by the PSIR flowchart scheme itself and also by other human errors, both the human errors done by the health’s functional workforces, worked on inpatient installation and also by the officer as a member of The Hospital Patient Safety Team.

To resolve this problem, it is important to make a paperless report by utilizing hospital management information system. It is also important to re-arrange the PSIR flowchart scheme so every grade of the patient safety event will be reported to Hospital Patient Safety Team. Pointing special officers responsible as the member of The Hospital Patient Safety Team, optimizing the supervision by hospital management and regulate PSIR as an obligatory task also a recommended activity that can be done in order to increase the PSIR and improve the health care delivered at the The Sidoarjo District Public Hospital.

**Conflict of Interest:** There is no conflict of interest for both authors.

**Source of Funding:** This research, funded by the authors themselves. No other financial support received.

**Ethical Clearance:** All procedures performed in studies involving human participants had gotten ethical approval from the Health Research Ethics Committee, Faculty of Public Health Airlangga University Number 201-KEPK signed on April 30\(^{th}\) 2015.

**Informed Consent:** Informed consent was obtained from all individual participants included in the study.

Effect of Using Different Healthy Lighting Sources on Some Productive and Physiological Characteristics of Japanese Quail

A. N. I. Al-Nasserī1, Tareq. KH. Aljumaily1

1Department of Animal Production, College of Agriculture, Tikrit University, Salahaddin, Iraq

ABSTRACT

Background and Objective: Artificial lighting is as an important management tool to regulate production and welfare. The study was conducted in the poultry farm of Agriculture College - University of Tikrit. This study was designated to investigate the effect of different light sources on some productive and physiological characteristics of Japanese quail.

Methodology: A total of 180 day old quails used in this study. Quails were divided in three treatments LED, Compact Fluorescent (CFL) and incandescent (INCAN) by 60 birds per treatment, and each treatment is divided into six replications of 10 birds. The duration of this study was 7 weeks.

Results: The study found no significant differences in body weight, body weight gain, feed conversion ratio and carcass yield, for all groups during the total period of the experiment. There was a significant increase in the weight of relativity spleen for CFL and INCAN compared to the LED at the age of 7 weeks. As for the female reproductive system, the CFL treatment showed a significant increase in ovarian weight compared to the INCAN treatment, while the LED treatment did not differ significantly from the other treatments. At the age of 7 weeks, the CFL showed significant increase in the number of mature ovarian follicles compared with the INCAN treatment, while the LED treatment did not differ significantly from the other treatments.

Conclusion: It is possible to use the LED lighting system to minimize energy expenses in quail housing.

Keywords: Quail, LED, fluorescent, lamp, incandescent, performance

Introduction

The birds have highly developed visual systems and most of their behaviors are mediated by their vision1. The change in human lifestyle in many countries and the economic development leads to search for rich sources of nutrients, including poultry products of meat and eggs. Poultry products is an important source of animal protein, so developed countries are working on many species of birds such as ostrich, rich chickens and Japanese quail1.

All poultry need light to live and modern farming practices usually require artificial lighting to meet this need. Light itself is a complex and varied phenomenon, made up of an entire spectrum of wavelengths and intensities. As such, light affects many aspects of growth and behavior in all manner of living organisms and must be taken into account when attempting to provide the most efficient controlled environment for poultry production. Poultry has evolved highly specialized visual systems to aid in their survival and much of poultry behavior is mediated by their vision12. If an ideal poultry production environment is to be created, one must understand how the birds will react to different light spectrums and intensities. The lighting is a primary factor in the posture of the birds, whose function is to stimulate the development of the reproductive system and the locomotor activity of the bird to higher food and water intakes3. Birds eyes are more sensitive to a broader spectrum than are human eyes because unlike humans’ 3 visual cone cells, birds have 4 to 5 cone cells, including a double cone that allows them to see in the ultraviolet spectrum4, were developed with the replacement of

DOI Number: 10.5958/0976-5506.2019.01028.3
lamps commonly used for light emitting diode (LED), seeking to improve the production rates of birds and economic savings in lighting system because LEDs may be used up to 50,000 h much longer than incandescent and compact fluorescent lamps, which life is 1,000 and 8,000 h of use, respectively.

This paper was designed to collect data on LED characteristics that can be utilized as a basis for Quail housing illuminations in an effort to decrease the energy expense of the quail housing in the modern quail management.

The result of this paper is expected to overcome the shortage of the highly cost of electricity driven for artificial lighting fluorescent and other lighting sources.

**Materials and Method**

**Birds, Housing and Experimental Design:** A total of 180 quails (Coturnix coturnix) with initial age of one day. They were distributed in a completely randomized design (CRD) in 18 cages (0.80 x 0.40 x 0.50 m), with three treatments (Table 1) and six repetitions of ten quails each one in a total of 18 experimental units. The evaluation period was from, 1 to 49-day-old birds. The cages were equipped with feed trough and drinker type.

Quail Performance and Carcass Yield: The performance parameters were evaluated weekly: feed intake (g/bird/week), average weight gain (g/bird/week) and feed conversion (g/g). The feed intake (g/bird/week) It were evaluated weekly by the weight of the feed that remain on the last day of the week (Feed Intake = (feed leftover/number of birds)/7 days). The average daily gain (g/bird/week) was evaluated weekly (AWG = ((initial weight-final weight)/n° birds/repetition)/7 days). The feed conversion corrected by daily mortality was calculated: (FC = FI/AWG).

At 35,42 and 49 days of age, six birds per treatment were slaughtered. The carcass yield (%) was calculated in relationship with the life weight before slaughter, {CY = [carcass weight (g) x100]/live weight}.
Biometrics Reproductive System: The weight of the ovarian weighed by a sensitive balance and the number of follicles per bird.

Statistical Analysis: The experimental data were analyzed using the full randomized design (CRD), and the averages were compared with the Duncan Multiple Range test to find the differences between them. The average subjects of Japanese quail subjected to LED light had no statistical significant difference (p<0.05) compared to that reared in the artificial lighting system using the statistical program, SAS Institute Inc., Cary, NC.27512-8000, USA.

Results

Quail Performance and Carcass Yield: No difference in quail performance (body weight, feed intake, weight gain and feed conversion during the period 1 - 49 day-old) was found (p>0.05) (Table 4).

**Biometrics Reproductive System:** For the treatments no differences were observed (p>0.05) the relative weight of ovarian, oviduct and the number of ovarian follicles per bird at 5 weeks age. At the age of 6 weeks, the CFL treatment showed a significant increase in ovarian weight compared to INCAN treatment while LED treatment did not differ significantly from the different treatments. At the age of 7 weeks, CFL showed significant improvement in the number of ovarian follicles compared to INCAN. The high standard error is due to the fact that there are birds that have not yet reached sexual maturity, and that there is a wide variation in the weights of the reproductive system in the same treatment (Table 6).

A, B Different letter within column significantly different (p<0.05)

**Discussion**

The all groups conducted in this previous study did not demonstrate any difference between LED, CFL and INCAN lighting in Quails performances and carcass yield. These results agree with Almeida *et al.*9 and Molino *et al.*10. However, did not agree with Nunes *et al.*11 who was observed an increase in growth in broilers raised under LED or CFL when compared to INCAN.

As for the gastrointestinal tract parameters and reproductive system this study agrees with Wagan *et al.*12. Nevertheless, it did not present to have an effect on development of the reproductive system of pre-laying birds. The increase in the relative weight of the ovary at 6 and 7 weeks, may be attributed to an increase in the number of ovarian follicles13. Due to increased vitamin D3 formation, which is essential for the growth of the female reproductive system, where receptors are found in a wide range of ovarian follicles in it14. The light wavelength penetrates the skull of the chickens to stimulate the pineal and pituitary glands, which control the secretion of reproductive hormones such as Follicle Stimulating Hormone (FSH), Luteinizing Hormone (LH) and 17 Estradiol (E2), these hormones enhance the growth and number of ovarian follicles changing the development of the reproductive tract of birds15-16.

**Conclusions**

The live performance and gastrointestinal tract parameters and reproductive of Japanese quails exposed to LED source were similar to those exposed to CFL lamp and INCAN lamp. Therefore, CFL and INCAN lamps may be replaced by LED light sources. It is concluded that, it is possible to use the LED lighting system, in order to minimize energy expenses in quail housing facilities.
Significance Statement: This study connected for the first time in Tikrit University in Iraq, in the progress of Japanese quail production to obtain high economic profit by application of LED lighting system.

Acknowledgment

We would like to thank all staff and workers in Animal Production Department, Faculty of Agricultural College, Tikrit University who helped us to achieve this work.

Conflict of Interest: This research is a personal non-profit work and there is no conflict of interest.

Source of Funding: None.

Ethical Clearance: Ethical clearance was obtained from the Faculty Scientific Committee (Department of Animal Production, College of Agriculture, Tikrit University, Salahaddin, Iraq) to study the effect of using different healthy lighting sources on some productive and physiological characteristics of Japanese quail.

Protective Effect of Roket Leaves (Eruca Sativa) Extract against Lead Induced Oxidative Damage in Liver and Kidney of Male Rats

Ahmed Jasim Nawfal¹, Haithm T. Tafash¹, Anmar Shukr Mahmood²

¹Department of Physiology, ²Department of pharmacology, College of Medicine, University of Fallujah, Iraq

ABSTRACT

This study was intended to examine the prophylactic function of ethanolic extract of Eruca sativa leaves against the toxic effects of lead acetate on liver and kidney enzymes in male of rats. 32 adult male rats 175-200 gm were randomly divided into four equal groups (8 rats/group) and were treated for 10 weeks as follows: Rats of the first group were received tap water which considered as control group, Second group T₁ animals in this group administrated 2.5 mg/Kg B.W lead acetate, Third group T₂ animals in this group were received 2.5 mg/KgB.W lead acetate plus 300 mg/kg. B.W. of Eruca sativa extract, Fourth group T₃ animals in this group was received 300 mg/kg. B.W. of Eruca sativa extract. Serum liver and kidney functions tests were evaluation. The results manifest that the Eruca Sativa extracts at concentration 300mg/kg B.W improved liver and kidney functions. We accomplished that, Eruca sativa extracts may appear their protective and treatment effect against oxidative damage result from lead acetate by rising/preserve the grade of antioxidant enzymes and antioxidant molecules. The histological section showed the pathological changes in the liver and tissue in T₁ group while giving Eruca Sativa extract with and without lead acetate was effective in modified these changes into semi normal, the results assert the prophylactic effect of E. sativa leaves extract against oxidative damage due to lead acetate in rats.

Keywords: Eruca sativa, Hydrogen peroxide, ALT, AST, BUN, Creatinine, liver, kidney

Introduction

“There has been a great deal of interest in the role of complementary and alternative medicines for the treatment of different acute and chronic diseases. Various hundreds of plants have been examined for use in a wide variety of liver and kidney disorders including Eruca sativa (Family: Cruciferae) that modulate oxidative stress due to its antioxidant properties. All culture used plants as sources of food due to their fundamental nutritional importance, physiological role, and as pharmaceutical substances ¹”. “So they count as integral and stand by medicine ²”. E. sativa possesses antisecretory, antiinflammatory, anticancer, cytoprotective and antiulcer activity versus experimentally stimulated gastric lesions which is possibly result from prostaglandin-mediated action and/or meanwhile antisecretory activity ³,⁴, yet, it was notify that E. sativa leaves and seed are powerful antioxidants ⁵,⁶,⁷, indicated that E. sativa seeds and leaves possessed a potent free radical scavenging antioxidants and protected against oxidative damage by rising/preserve the grade of antioxidant enzymes and antioxidant molecules. It has been convey which is the ethanolic extract of E. sativa has an androgenic action or catalyze testicular steroid output which promote the preputial gland moreover increasing spermatogenesis in the testis of male ⁸. In addition, E. sativa acts as anti-cancer ⁹.

Material and Method

Plant Extraction: The fresh leaves of Eruca sativa were collected from local market and air dried in the shade, grounded into a fine powdered, and weighing 100 gm
then put it in a volumetric conical flask 1000 ml of 70 % ethyl alcohol was added on the powder which makes the ratio (1/10) (W/V). After that the mixture was shook by using magnetic stirrer apparatus for (24hr), the mixture was filtered by using 4 layers of medical gauze then was filtered again using Whatman No.1 filter paper. The filtrated mixture was concentrated by using incubator on (40°C) for 72hr, to obtain crude extract. This yield equal of 10 gm, the extract was stored in a dark sterile screw bottle in (4°C) until use. 10.

Experimental Animals: Thirty two healthy adult males’ wistar rats, weighed 175-200 gm was used. Animals were randomly divided into four equal groups, and treatment for 10 weeks as follow: first group (control): Animals in this group were received tap water as control, second group (T1): Animals in this group were received 2.5 mg/Kg.B.W. lead acetate (250 mg/100ml) dissolved in tap water daily, third group (T2): Animals in this group were administration “2.5 mg/Kg B.W. lead acetate (250 mg/100ml)” dissolve in tap water daily plus 300 mg/kg. B.W. ethanolic extract of Eruca sativa leaves, fourth group (T3): Animals in this group were received 300 mg/kg. B.W. ethanolic extract of Eruca sativa leaves. Blood samples were collected at zero day and 10 weeks of the experiment. Blood was drawn by cardiac puncture technique from rats anesthetized by intramuscular admission of (Ketamine 90mg/Kg B.W. and Xylazine 40mg/kg B.W.). Blood specimens were preserved in tubes and used centrifuge at 3000 rpm for 10 minutes, and then serum samples were a liquidated and frosted at -20°C till analysis and the serum was used for the assay of marker enzymes aspartate aminotransferase (AST/GOT), alanine aminotransferase (ALT/GPT), Blood Urea nitrogen (BUN) and Creatinine.

Statistical Analysis

Data in tables and figures are showed as mean ± S.E. value were resolved using SPSS version 22. Variance between groups was tested by a one-way analysis of variance (ANOVA). P value ≤0.001 were considered significant. Also, canonical correspondence analysis (CCA) used in present study.

Result

Statistical analysis of the result indicated no significant differences in the mean value of aspartate aminotransferase (AST), Alanine aminotransferase (ALT), blood urea nitrogen (BUN) and creatinine enzymes activities concentration in all experimental groups when parallel to each other at the pretreated period. The result that reported in table (1) is showed that intubation of rats with lead acetate group (T3) for 10wks cause significant (P<0.001) rises in the mean value of ALT concentration in the serum at 10wks (66.33 ± 2.54) of treatment as compared to control and T2 groups (32.17 ± 1.54), (40.67 ± 1.84), while T3 group (28.50 ± 0.99) show no differences with control group.

Depending on the results clarified in table (1) there was a significant change (P<0.001) in serum AST activity in T3 group (168.33 ± 1.41) as compared with the T2 group that showed little significant change (P<0.001) (142.50 ± 2.95). Though the control and T3 groups did not differ between them (130.17 ± 2.15), (124.50 ± 1.52) as compared with group T1 and T2 (168.33 ± 1.41), (142.50 ± 2.95) after 10wks of experiment. Table (2) illustrates the mean values of BUN concentration in the control and four treated groups along the experimental period showed a significant (P<0.001) decrease in the mean value of serum BUN concentration were observed after ES leaves extract intubation in group T3 (0.66 ± 0.02) comparing to T1 and T2 treated groups (1.12 ± 0.02), (0.80 ± 0.01). The results are demonstrated the effect of lead acetate in table (2) showed a significant (P<0.001) increase in the serum of creatinine concentration in animals of group T1 (1.12 ± 0.02) as compared with the control and group T3 (0.72 ± 0.01), (0.66 ± 0.02) during all periods of experiment. On other hand, a significant (P<0.001) increase in creatinine concentration was observed in T3 treated group (0.80 ± 0.01) at the end of experiment compared to pretreated period.

Discussion

In this study, lead acetate administrated rises the mean values of liver enzymes ALT and AST (Table.1). This results were in harmony with 12 which indicated that exposure of hepatocytes to oxidative stress modify the membrane structure and functions by increasing the liberation of enzymes into the blood stream”. Also 13 reported that excess oxidative stress has been connected with changing liver metabolism and liver damage. In prophylactic groups (T1) and Eruca sativa ethanolic extracts treated group (T3), liver enzymes (AST and ALT) were significantly decreased compared to lead acetate group (T2). This results were in consent with 14.

who mentioned that administration of rocket resulted in promoting in ALT and AST actions of male rabbits, that may possibly due to the increase sulfur component in *Eruca sativa* that act as a removing of body wastes, removing congestion such as sinusitis and assisting the liver and immune functions $^{15,16}$.

There was a significant effect of oxidative stress on kidney functions level in serum of adult male rats. The levels of BUN and creatinine in serum (Table.2) were significantly increased with increasing of oxidative stress, also when the antioxidants of the liver or kidney are low, or when the liver/kidney is suffering from oxidative insults, the damages caused by free radicals would increase, leading to inflammation and fibrosis $^{17}$.

Values are expressed as mean ± SE, n = 8 animals/group.

The main component that showed antioxidant activity in E.S. extract is glucorucin, diverse from other glucosinolates (GLS), glucorucin (GER) have good direct as well as indirect antioxidant action$^{15}$.

Histological sections obtained from rat kidney exposed to 2.5 mg/Kg B.W. lead acetate (T$_1$) at the termination of the experiment revealed inflammatory cells aggregation around collected ducts and congested vessels, there is also congested blood vessels between renal tubules with severe vacuolar degeneration of epithelial cells of renal tubules, atrophy of glomerular tufts with acute cellular degeneration of epithelial cells of the renal tubules (Fig.1- B,C) comparing to control group (Fig.1.A), while kidney treated with 2.5 mg/Kg B.W. lead plus ethanolic extract of (300 mg/kg B.W) E. S (T$_2$) showed no clear lesions (Fig.2-A). Normal obvious histological architecture of kidney in animals of group T$_3$ (Fig.2-B) comparing to the other treated group (T$_1$ and T$_2$).
Rats of group T₁ showed necrosis of hepatocytes with neutrophils in dilated congested sinusoids and central veins, neutrophils infiltrated in large necrotic area and present in dilated sinusoids (fig.3-B) as compared to control group and T₃ group that there is no clear lesion. Whereas, Cross section of the liver of rat treated with 2.5mg/Kg B.W. lead and (300 mg/kg B.W) *Eruca sativa* (T₂) shows proliferation of kupffer cells and granulomatous lesion consisting from aggregation of active macrophages and lymphocytes (fig.3-C) as compared with control group (Fig.3-D). Meanwhile, the histopathological sections of liver of group T₃ showing normal structure and no clear lesion (Fig.9) comparing to group T₁ (Fig. 7).

---

**Figure 1:** (A) Cross section of the kidney of rat (control group) shows normal structure of the kidney (H&E stain 40X). (B) Cross section of the kidney of rat treated with 2.5 mg/Kg B.W. lead (T₁) shows congested vessels between renal tubules and inflammatory cells aggregation around collected ducts with severe vacuolar degeneration of epithelial cells of renal tubules (H&E stain 40X). (C) Cross section of the kidney of rat treated with 2.5 mg/Kg B.W. lead (T₁) shows atrophy of glomerular tufts with acute cellular degeneration of epithelial cells of renal tubules (H&E stain 40X).

**Figure 2:** (A) Cross section of the kidney of rat treated with 2.5 mg/Kg B.W. lead and (300 mg/kg B.W.) *Eruca sativa* (T₂) notified no clear lesions (H&E stain 40X). (B) Cross section of the kidney of rat treated with (300 mg/kg B.W.) *Eruca sativa* (T₃) shows no clear lesions (H&E stain 40X)

**Figure 3:** (A) Cross section of the liver of rat (control group) notified normal no clear lesions (H&E stain 40X), (B) liver of rat treated with 2.5 mg/Kg B.W. lead (T₁) shows necrosis of hepatocytes with neutrophils in dilated congested sinusoids and central veins (H&E stain 40X), (C) liver of rat treated with 2.5 mg/Kg B.W. lead and (300 mg/kg B.W) *Eruca sativa* (T₂) shows proliferation of kupffer cells and granulomatous lesion consisting from aggregation of active macrophages and lymphocytes (H&E stain 40X) and (D) liver of rat treated with (300 mg/kg B.W) *Eruca sativa* (T₃) shows normal tissue and no lesions (H&E stain 40X).

Many statement are present in the literature about normalization antioxidant action of alcoholic extract of *E. sativa* and low levels of lipid peroxidation (LPO) and nitric oxide (NO)¹⁸. *E. sativa* extracts may exercise this protective and treatment role against oxidative damage result from CCl₄ by rising/preservative the grade of antioxidant molecules and enzymatic antioxidant¹⁹.
**Conclusion**

The current study it could be concluded that the leaves of ethanolic extracts of *Eruca sativa* have both protective and therapeutic role against experimentally lead to liver and kidney damage by lead acetate in rats. However, the protective effect of these extracts was stronger than their treatment ability.

**Conflict of Interest:** There is no conflict of interest.

**Ethical Consideration:** Ethical approval for this study was obtained from the scientific committee of the College of Medicine, University of Falluja. Participants were given the choice to participate in the study and were informed that all the information taken would be kept strictly confidential and would only be used for research purposes. Verbal consent was obtained from the participants, who were permitted to respond in their own time and privacy, after researchers explained the aim of the research.

Role of Serum Osteopontin and Osteoprotegerin Levels in Diagnosis of Acute Coronary Syndrome and Its Subtypes

Ali Abdul Rasool Hussein¹, Abdulkareem H. Issa¹, Arshad Fuad Al-Saffar²

¹Department of Chemistry and Biochemistry, ²Department of Internal Medicine, College of Medicine, Mustansiriyah University

ABSTRACT

Background: Acute coronary syndrome (ACS) is the major acute clinical manifestation of coronary heart disease (CHD). The term ACS includes ST-elevation myocardial infarction (STEMI), non-ST elevation (NSTEMI) and unstable angina (UA).

Objectives: To measure serum levels of osteopontin (OPN), osteoprotegerin (OPG) in ACS patients with its subtyping and to study the association of their levels with extent of cardiac injury.

Methodology: Patients (≥30 years) were consecutively selected after have been diagnosed as STEMI (n=60), NSTEMI (n=24) and UA (n=36) depending on clinical evaluation, electrocardiography and troponin testing. Healthy (n=64), age- and sex-matched subjects were taken as controls. For each study subject, clinical characteristics were recorded and the serum OPN, OPG, and troponin I-3 (cTn-I-3) were measured.

Results: OPN level was significantly higher in ACS patients than in controls and showed a correlation with cTn-I-3 level. There was a graded increase in its level from UA to NSTEMI and then to STEMI patients. OPN had area under the curve (AUC) of 0.897, a sensitivity of 82.5%, a specificity of 99.29%, and a diagnostic accuracy of 88.34% in discrimination between ACS patients and controls. OPG was significantly higher in STEMI subgroup and in NSTEMI subgroup than in controls but not between UA and controls. Additionally, the mean level was significantly higher in STEMI than in NSTEMI subgroup and was also higher in NSTEMI than in UA but the difference did not reach statistical significance.

Conclusion: The study detection of significant increases in OPN and OPG levels in all or certain subtypes of ACS patients than in controls may be of value in their use as adjuvant to cTn in earlier diagnosis and management of ACS patients.

Keywords: Acute coronary syndrome, Osteopontin, Osteoprotegerin, Coronary heart disease, body mass index

Introduction

Acute coronary syndrome (ACS) is the major acute clinical manifestation of coronary heart disease (CHD). It describes a continuum of cases of myocardial ischemia that involves acute myocardial infarction (MI) with ST-segment elevation on electrocardiogram and is abbreviated as (STEMI), MI with no ST-segment elevation (NSTEMI), and unstable angina (UA). Because UA and NSTEMI characterizes by the absence of ST segment elevation, they are collectively termed as non ST-segment elevation ACS (NSTE-ACS)¹. Diagnosis and clinical subtyping among the heterogeneous patients who present with suspected ACS need to be improved such as by finding other biomarkers of ACS. Osteopontin (OPN) is a glycoprotein that is normally produced in bone, kidney, brain, and epithelial lining tissue in both insoluble extracellular matrix-associated and soluble forms²,³.

The first opinion about a role for OPN in CVD was based on finding elevated serum levels in patients having established vascular calcification and in diseases that are associated with severe vascular remodeling including hypertension, chronic kidney disease, and diabetes mellitus⁴,⁵. Accordingly, OPN was thought of as an emerging risk factor or a biomarker with possible predictive value for CVD⁶,⁷. Recently it has been shown that OPN expression in atherosclerotic plaques is closely associated with the “severity of atherosclerosis and calcification” and that a high concentration of OPN...
could be responsible for a number of changes within the atherosclerotic plaque that would promote plaque instability. Importantly, this protein also showed an association with atherosclerotic decalcification, a change that might favor plaque rupture.\(^3\)

Osteoprotegerin (OPG) is a cytokine receptor that is a member of the Tumour Necrosis Factor Receptor superfamily of proteins. It is also known as osteoclastogenesis inhibitory factor. OPG has a role in bone metabolism but also has roles in inflammation and in processes where cell differentiation, survival and death are controlled\(^4,9\). OPG is described as a vascular modulator that is linked with the occurrence and progression of atherosclerosis and with risk of CHD\(^10\). This study aimed to measure serum levels of OPN & OPG in ACS patients, to investigate their value in diagnosis and subtyping of ACS and to study the association of their levels with the extent of cardiac injury.

Materials and Method

Patients Group: Patients were recruited from the coronary care units in Al-Yarmouk Teaching Hospital during the period between 1\(^{\text{st}}\) November 2017 and 1\(^{\text{st}}\) April 2018. One hundred and twenty patients (77 males and 43 females, \(\geq 30\) years) were diagnosed to have ACS and were included in the study after consideration of pre-defined exclusion criteria.

Diagnoses of ACS subtypes that are STEMI, NSTEMI, and UA were based on the presence of two out of three findings, which are clinical presentation, ECG changes, and positive troponin by onsite troponin combo rapid test.

Exclusion Criteria: Patients who have any of following conditions had been excluded: Presentation at more than 36 hr after onset of chest pain, or having renal failure, stroke, skeletal muscle injury or trauma, or being on an intake of statins or any hypo-lipidemic drug. In addition, if age is \(<30\) years or having abdominal enlargement for any reason other than central obesity or if the patient is of another nationality (non-Iraqi), or in case of prior inclusion in the present study. Besides that if a patient had a known history of thyroid, hepatic, or malignant disease, or had anemia (Hb\(<9\)g/dl for males and Hb\(<8\)g/dl for females) or is being an alcohol drinker. Additionally, if had a concurrent infectious disease, valvular heart disease or was being unable to relate the time that his or her symptoms began or ended (if the pain was not persisting).

Control Group: Healthy subjects were recruited who had no CHD symptoms and no history of coronary heart disease on interviewing. They were age–matched to the study patients and also comply with the criteria of exclusion in the patients group. They comprised 64 subjects (41 males and 23 females) who had no diabetes mellitus or hypertension and were not smokers.

Clinical Measurements and Investigations: Height and weight of each study subject were recorded to calculate body mass index (BMI) according to the following formula (BMI= Weight in kilograms/(Height in meters\(^2\)).

Blood Analyses: The blood was collected within 6-36 hr from onset of chest pain. At first, there was an immediate blood testing for detection of cardiac troponin–I (cTn-I) on admission of a suspected patient by using a qualitative test which is the onsite troponin-I combo rapid test. Immediately afterwards, a fasting blood sample and aliquots of serum were used for assay of levels of glucose, cholesterol and aspartate transaminase by enzymatic spectrophotometric methods as well as estimation of human OPN, OPG and cTn-I-3 concentrations by enzyme linked immune sorbent assay using ELISA kits that were purchased from MyBioSource company, USA.

Estimation of cTn-I by Onsite Troponin Combo Rapid Test: For differentiation between NSTEMI and UA patients an Onsite troponin-I combo rapid test was used. It is a qualitative test that uses a lateral flow chromatographic immunoassay for detection of cardiac troponin - I (cTn-I) and its complex in human serum, plasma or whole blood at a level equal to or higher than 1ng/ml.

Estimation of Osteopontin, Osteoprotegerin, and Human Cardiac Troponin I-3: Human OPN, OPG, and cTn-I-3 concentrations were measured by ELISA.

Statistical Analysis

The data were represented as mean ± SD. To find out differences in the levels of serum biomarkers among study groups and among ACS subgroups, comparisons of their levels was made among related groups and subgroups. ANOVA was used to evaluate for the significance level.
**Results**

**Clinical Characteristics of Study Patients:** The BMI of control, UA, NSTEMI and STEMI was found (p=0.262) to be 28.21 ± 3.83, 26.65 ± 2.78, 28.07 ± 2.68 and 28.77 ± 3.72 kg/m². The fasting blood sugar of control, UA, NSTEMI and STEMI was found (p=0.0001) to be 92.66 ± 18.93, 206.26 ± 92.66, 193.41 ± 87.35 and 180.93 ± 92.96 kg/m². The cholesterol of control, UA, NSTEMI and STEMI was found (p=0.008) to be 179.38 ± 37.21, 154.88 ± 31.93, 180.29 ± 52.17 and 186.97 ± 56.42 mg/dl.

**Comparison of OPn & OPG among Subtypes of ACS:** Cardiac injury marker i.e. cTn-I-3 are depicted in Table 1. Additionally, the mean level was significantly higher in STEMI than in NSTEMI subtypes and was also higher in NSTEMI than in UA but the difference did not reach statistical significance (P<0.065).

**Receiver Operator Characteristic (ROC) Curve Analysis:** ROC curve analysis was used as a statistical method to evaluate the ability of a laboratory test as a classifier of a certain group of subjects as having a disease or not according to a test result. This ability is measured as an AUC in ROC curve analysis for the test results. By determining an appropriate cut-off point or value for the test results, the sensitivity and specificity of a test at that cut-off value were calculated and the percent combined diagnostic accuracy of the test at that cut-off value was also estimated. Depending on the presence of ACS as diagnosed by the measures used then (clinical assessment, ECG, and cardiac troponin level), the predictive values of serum levels of OPN and OPG are presented in Figure 1 and Table 3.

![Figure 1](image-url)
The area under receiver operator characteristic (ROC) curve of acute coronary syndrome (ACS) for OPN and OPG was 0.897pg/ml (p=0.0001) and 0.628pg/ml (p=0.003) versus controls. The area under receiver operator characteristic (ROC) curve of NSTEMI for OPN and OPG was 0.519pg/ml (p=809) and 0.808pg/ml (p=0.0001) versus unstabel angina.

Discussion

Serum biomarkers, principally the cardiac troponins, are complementary to the clinical evaluation and ECG in the diagnosis, triage, and management of patients with suspected ACS. Therefore, the diagnosis and clinical subtyping among the heterogeneous patients who present with suspected ACS may be improved by finding other biomarkers to complement the use of already present biomarkers. In such a search for new markers that may aid in diagnosis of ACS, this study has evaluated certain bone metabolism biomarkers in patients diagnosed to have ACS.

This study revealed that OPN mean level was significantly higher in ACS patients than in apparently healthy subjects. This finding is consistent with previous studies that reported an elevated OPN level in patients with acute myocardial infarction\(^\text{15}\) and in symptomatic patients referred for coronary angiography\(^\text{12,13}\) or in symptomatic patients referred for echocardiographic characteristics of atherosclerosis\(^\text{14,15}\). Also, there was a significant correlation between OPN and the cardiac muscle injury biomarker, which is cTn-I-3 that may suggest an association of OPN level with the extent of myocardial damage and so may support its use as adjuvant to cTn in the management of ACS patients. These results are in agreement with the findings in other studies\(^\text{16}\). That association of OPN level with the extent of myocardial damage may be via a role of OPN in advancement of coronary atherosclerotic lesions themselves or just as part of the inflammatory process that accompanies cardiac muscle necrosis in STEMI and NSTEMI patients. The study finding of higher level in STEMI than in NSTEMI patients and even significantly higher level in UA patients than in controls in spite of no cardiac muscle necrosis in UA is more in favor of advanced atherosclerotic lesion that culminate in the process of atherosclerotic plaque rupture and its complication irrespective of cardiac muscle necrosis.

Regarding that acute coronary syndrome represents a difficult diagnostic challenge in subjects presented with undifferentiated chest pain and probably a non-diagnostic ECG and normal troponin, then receiver operating characteristic (ROC) curve analysis was used to explore predictive value of serum OPN level in discrimination between ACS patients and controls. OPN had AUC of 0.897, a sensitivity of 82.5%, specificity 99.29%, and a diagnostic accuracy of 88.34%. Such a finding suggests that OPN may be useful in undifferentiated acute chest pain with non-diagnostic ECG and normal troponin or may be added to cTn-I and leads to an earlier diagnosis and management of ACS.

Many previous studies showed that levels of OPG were higher in patients with acute coronary syndrome compared with stable angina or healthy controls\(^\text{17-19}\). So, the study finding of no significant difference between UA and controls as well and the modest difference between NSTEMI and UA is noticeable. It may be explained by the results of other studies that showed that the levels of OPG were associated with the severity of CHD\(^\text{20}\). However, this was not confirmed in other studies that reported that coronary obstructive lesion score was not associated with the OPG levels\(^\text{21}\).

The study findings of the pattern of increase in serum OPG level in ACS patients again suggest a possible adjuvant diagnostic value of OPG in patients with
suspected ACS particularly in the presence of higher level in NSTEMI subgroup than UA subgroup and the significantly higher level in NSTEMI subgroup than controls. ROC analysis had revealed that the highest AUC value for OPG was in discrimination between NSTEMI and UA subgroups with a good sensitivity (75%) and diagnostic accuracy (70.02%) when the best cut-off value of OPG level was selected in such discrimination, an issue that is critically needed in the management of ACS patients. Although a clinical application of any diagnostic value of OPG needs further studies, the present results give a clue that measurement of a multitude of biomarkers such as OPG and OPN in combination may provide more useful and clinically relevant information. It can be concluded that the significantly increased serum OPN level in ACS patients may be useful in undifferentiated acute chest pain particularly with finding of an association of OPN level with the extent of myocardial damage that supports its use as adjuvant to cTn in the management of ACS patients. Also the finding on ROC curve analysis, that OPG level has the highest AUC value may be useful in discrimination between NSTEMI and UA subgroups, an issue which is critically needed in management of ACS patients.

Ethical Clearance: Consent was taken from all study subjects after being told about the aim of the study and the study project was approved by the institutional scientific committee.

Biochemical Study and Immunohistochemistry of Breast Cancer after and before Radiotherapy

Aqeel Shakir Mahmood

Department of Surgery–college of Medicine/University of Baghdad

ABSTRACT

Across-sectional study was conducted in medical city complex, Baghdad, Iraq and baghdad teaching hospital, oncology teaching hospital. The complete physical examination was finished to every patient during the period from October 2016 to January 2017 with age range 20-40. The study included 30 patients divided two groups the group 1 before radiotherapy (new diagnosis with malignant breast cancer), and group 2 after radiotherapy (the same group 1). The last diagnosis was established by aspiration of cysts using (FNA) and mammography. Blood samples and biopsy from breast were taken from 30 women new diagnosis of malignant breast cancer and again take blood and biopsy after radiotherapy from the same women. The result shows high significantly increase of MDA levels (p<0.01) when comparing radiotherapy group (after radiotherapy) with the malignant group (before radiotherapy). A significant change of uric acid at (p<0.05) in comparison of radiotherapy group with the malignant group (p<0.05). A significantly lower level in albumin, Urea, creatinine, and Vitamin E at (p<0.05) of the malignant group in relation to radiotherapy group, while a non-significant change in Vitamin A (p>0.05) when comparing the malignant group and radiotherapy group.

Keywords: Breast cancer, MDA, Vitamin E, A, Uric acid, Albumin, urea, creatinine.

Introduction

Breast cancer is the most widely recognized disease analyzed in women, representing more than 1 of every 10 new diseases diagnoses every year. It is the second most reason for death from malignancy among women in the world1. Breast cancer always advances reticently. A large portion of the patients finds their sickness amid their normal screening. Others fortuitously found a breast mass, change of breast shape or size, or areola discharge2. In any case, Physical examination, imaging particularly mammography, and tissue biopsy must be done to analyze breast malignancy. The survival rate enhances with the early conclusion. The tumor will in general spread lymphatically and hematologically distant metastasis and a poor forecast. This clarifies and stresses the significance of breast disease screening programs3. The danger of malignancy repeat diminishes by about half at 10 years, and the risk of breast cancer doom passing decreases by practically 20%. Radiation therapy is useful in extensive tumors (maximal to 5 cm) or if the tumor pervades skin or chest wall and if there are positive lymph nodes. Likewise, it tends to be utilized as a palliative treatment in cutting edge cases such if there is a focal sensory system (CNS) or bone metastasis. It tends to be conveyed as outside bar radiation, brachytherapy, or blend of both4,5. Antioxidants comprise the foremost vindication system that boundary the toxicity linked with free radicals Cells have advanced a comprehensive array from antioxidants that act cooperatively in vivo to battle the malicious impacts of free radicals. uric acid and Albumin have been important agents of antioxidants6. Roche et al., recently reviewed the antioxidant properties of serum albumin7. Vitamin E is a fat-soluble vitamin including eight homologues: four tocopherols (α-tocopherol (T), β-T, γ-T, δ-T) and four tocotrienols (α-tocotrienol (TT), β-TT, γ-TT, δ-TT). A-tocopherol, the central action of vitamin E with powerful antioxidant properties, can dispose of responsive oxygen species, prevent carcinogenesis and tumor growth, and stimulate cancer cell apoptosis4,9,10,11. Vitamin A is a fat-soluble vitamin that is also powerful antioxidant. It plays a critical role in maintaining healthy vision, neurological function, healthy skin, and many membranes. It is involved in reducing inflammation through fighting free radical damage. Consuming a diet high in antioxidants is a way to naturally slow aging12.
Material and Method

Sample Collection, Preparation, and Analytical Methods: This research was carried out in medical city complex, Baghdad, Iraq, and Baghdad teaching hospital, oncology teaching hospital. The complete physical examination was done to every patient during the period from October 2016 to January 2017. Thirty women new diagnosed with malignant breast cancer, with age ranging from 20 to 40 years. The final diagnosis was established by aspiration of cysts using (FNA) and mammography. Blood samples and biopsy from breast were taken from 30 women new diagnosis of malignant breast cancer and again take blood and biopsy after radiotherapy from the same women.Five milliliters of blood, of each individual of patients, were withdrawn from the vein. The blood sample was placed in a gel tube and allowed to clot on the bench for 20 min, then centrifuged at 3000×g for 10 min. The obtained serum was stored in a refrigerator at−20°C for subsequent. Serum levels of vitamins E and A were determined for each sample by HPLC technique. The samples were prepared for injection to the HPLC system. Added 200μl of serum to 100μl ethanol and incubated at room temperature for 10 minutes (to precipitate protein) followed by the addition of 400μl methanol and vortexed for 15 sec, to this mixture, 1.0 ml of hexane added (for extraction of fat) and vortexed for another 60 sec. The tube was centrifuged for 5 min at 3500 rpm at room temperature; the supernatant was transferred to a fresh tube (The hexane extraction step was repeated three times, 60 sec each time). Hexane was evaporated under nitrogen flow and the sediment was reconstituted in 350μl mobile phase and passed through target syringe polypropylene filters (4 mm, 0.45 μm) to remove the undisclosed particles. Chromatographic analysis was run by injecting the filtrate into the column through auto sampler using insert tube. Serum MDA (mg/dl), Uric acid (mg/dl),Albumin (g/dl),Urea and creatinine(mg/dl) levels using spectrophotometer according to the manufacturer’s instructions (Linear-Spain).

Immunohistochemical: According to the Dako (USA) 1- Deparaffinized by oven 60°C for one hour and three jars xylene for 5 min to each one 2- Hydrated by 100% 5 min ethanol 90% 5 min ethanol 70% ethanol 5 min and distel water 5 min 3- High-ph antigen retrieval was performed using high (pH 9.0) at 95°C in water bath for 40 min 4- After antigen retrieval finished cooling in room temperature for 20 min 5- Mark around the tissue with Pap pen to avoid spillage of the used liquid materials and to keep the reagent within a precise area. 6- Peroxide block was added to cover the sample and incubated for 10 min at humid chamber 7- Washing and incubation 3-5 min 8- Power block was added to cover the slide and incubated for 10 min in humid chamber 9- The slides didn’t washed just the slid was poured into filter paper 10- Primary antibody was added to cover the slides and incubated in humid chamber for 60 min 11- Washing and incubation 3-5 min 12- Linker was added and incubated in humid chamber for 20 min 13- H-BR secondary antibody was added and incubated in humid chamber for 30 min 14- Preparation the DAB chromogen by added 1 ml of substrate DAB and one drop of DAB chromogene and added to slide for 10 min 15- Washing and incubation 3-5 min Materials and Methods 45 16- Hematoxylin eosin (Myer’s) was added to cover the slides for 5 min 17- the slides washed with distel water for 5 min 18- Dehydration: immerse the slides in increasing alcohol concentrations, 2 minutes each (30%, 70%, 95%, then absolute alcohol). After that, put the slides in 2 changes of xylene, 2 minutes each. The slides covered with glass coverslips by using DPX and let them to dry at room temperature.

Statistical Analysis

Independent-Samples t test of the Statistical Package for Social Sciences (SPSS) program version 23.0. The resulting values were expressed as mean ± standard Error (SE). The statistical tests were considered to be significant at the p < 0.05 and highly significant at the p < 0.01.

Results

The detailed statistical of the obtained data containing mean ± standard Error, p values have been presented in Tables 1, 2 and 3. A significant higher difference in the serum levels of MDA reported between malignant (before radiotherapy) and radiotherapy (after radiotherapy) groups.

Discussion

Figure (1) has shown before radiotherapy (new diagnosis with malignant breast cancer), while figure (2) shown the same group 1 after radiotherapy.

Figure 1: Immunohistochemistry before radiotherapy.

Figure 2: Immunohistochemistry after radiotherapy.

The study performed by Kergonouand colleagues evaluated the effects of gamma radiotherapy on the lipid peroxidation MDA levels increased after radiotherapy (14) Studies show that increasing the MDA levels from radiotherapy can constitute cross connections.
with the first amino group of proteins or membrane phospholipids, leading to more strength of erythrocyte membranes\textsuperscript{14}. The rise of MDA in cancer has been shown to be associated with the body’s oxidative stress, which leads to the loss of polyunsaturated fatty acid (PUFA) in the plasma membrane and asserts that oxidative stress leads to dysfunction in the mitochondria and even regulates important factors such as the nuclear respiratory agent\textsuperscript{15}. Increasing in the per oxidation level of lipids in the serum of breast cancer patients when compared to the normal is consistent with some studies \textsuperscript{16}. In the case of radiation therapy, a significant increase is observed in MDA that radiotherapy increases oxidative stress of patients \textsuperscript{17}. It has been assumed that uric acid is considered as a strong antioxidant and protective agent, which may, therefore, protect against cancer by preventing the formation of oxygen radicals, which in turn protects against cancer occurrence \textsuperscript{18}. Many studies have shown a direct relationship between uric acid and cancer \textsuperscript{19}. Previous studies demonstrated that low serum albumin is an independent predictor of poor survival in several types of cancer including gastrointestinal cancer, lung cancer, ovarian cancer, nasopharyngeal carcinoma and breast cancer \textsuperscript{20,21}. In the case of radiation therapy, the reduction of albumin after radiotherapy was observed during exposure to radiation therapy. Free radicals produced a change in the structure and functions of the plasma proteins. It has been found that the changes caused by the radicals of albumin are associated with the damage of antioxidant properties and can lead to dramatic changes in protein stability \textsuperscript{16}. Steroid therapy is one of the factors that lead to the rise of urea, including contraceptive drugs, most of which contain estrogen and progesterin, women take long-term contraceptive pills are more likely develop breast cancer leads to the rise of steroid hormones followed by higher urea \textsuperscript{22}. The high creatinine is associated with the injury of several types of cancers, including prostate cancer that kidney inflammation, leads to high urea and creatinine levels \textsuperscript{23}. Our study differs from another study, where it was found that the level of creatinine is within the normal value \textsuperscript{24}. Evidence to date is insufficient to support taking vitamin E to prevent cancer. Patient compliance with vitamin E for radiation induced breast fibrosis appears to be worse in clinical practice compared with previously reported randomized trials \textsuperscript{25}. There are studies are in agreement with this study where there was a decrease in vitamin E in the use of radiation therapy \textsuperscript{26}. There are some studies showing the reduction of vitamin E in bone marrow and breast cancer during radiation therapy \textsuperscript{27}. These results are consistent with others \textsuperscript{26}. In order to minimize the negative signal of radiation therapy, there should be attention to diet and antioxidants. Previous results showed there is no relationship between vitamin E and the subsequent development of breast cancer \textsuperscript{28,29}. Cancer cells use antioxidants more effectively than normal cells and these results are consistent with Elango \textsuperscript{30} who reported significant reductions in the levels of vitamins A in cancer patients who received radiation therapy with those who did not receive radiation therapy in addition to its antioxidant role. It has been suggested that vitamin A improves blood flow, which promotes normal tissue oxygenation and renders the tumors susceptible to radiation \textsuperscript{31}. Other research has shown no connection between vitamin A concentration and subsequent development from breast cancer, a number of prospective studies have shown a significant negative relationship between serum nutrient A (retinol) concentrations and risk of cancer \textsuperscript{28}.

Effect of Ginseng Panax on the Histological Structure of the Liver and Kidney in Healthy Male Albino Rats

Aseel Younis Khalaf
Department of Biology, College of Education for Pure Sciences, University of Tikrit, Iraq

ABSTRACT
This study was performed to investigate the histological effect by ginseng in the liver and kidney of male albino rats. The study was conducted on 30 rats. The animal was divided into 6 groups. The first group was given distilled water and used as a control group. The second and third groups were orally administered (3 and 5 mg/kg ginseng of body weight) for two weeks respectively. The fourth and fifth group were orally administered (3-5 mg/kg ginseng of body weight) for three weeks respectively. The sixth group were orally administered (3-5 mg/kg ginseng of body weight) for four weeks. Histological changes which observed in the liver were lost the nuclei (karyolysis) and degenerated and vacuolation of cytoplasm. In the kidney the change degenerated of epithelial cell and presence debris. The aim of this study effect of ginseng the change histology.

Keywords: Ginseng Panax, Histology, Liver, Kidney, Male, Albino, Rats

Introduction
Ginseng refers to eleven different varieties of a short, slow growing plant with fleshy roots. It has been used tonic and for treatment of various diseases. Ginseng has been processed to make white ginseng (air drying after harvest) and red ginseng (steaming or heat process). Lower blood sugar, and cholesterol levels, reduce stress, diabetes, and manage sexual days. Ginseng may help stimulate physical and mental activity in people who feel weak and tired. The energy boosting effect of ginseng were only in people currently undergoing treatment. The study says that demonstrate benefits for cognition, behavior, and quality of life, ginseng improve thinking processes, it is not possible at this stage to know whether the inclusion of ginseng in a food product. The pharmacological properties of ginseng are ginseng saponins called ginsenosides the major and bioactive constituents.

Materials and Method
Animals: Thirty rats were weighing between (300-325) grams were used in this study. The animals were maintained and acclimatized in the college of veterinary medicine –Tikrit university under laboratory conditions in group cages. The rats were collected randomly into six groups; group one was kept as control. It was administered orally with 0.1 ml of distilled water by gastric intubation daily for a month, group (2,3) was administered orally 3-5 mg/km ginseng for two week, group (4,5) was administered orally 3-5 mg-km ginseng for three week, group (6) was administered orally 3-5 mg –kg ginseng for four week.

Histology: At the day after the last dose killed the animals under intensive dose of chloroform. Liver, kidney of the animals was rapidly removed and micro dissected to obtain tissue samples for histological examination. immediately the tissues were fixed in 10% neutral buffered formalin, dehydrated with graded series of ethyl alcohol and embedded in paraffin. Sections of 5 microns were cut and stained with eosin and hematoxylin according to (7). By digital camera attached to light microscope were taking Photomicrographs of the slides.

Result
Group one: The control group
The kidney: the cortex of the kidney is formed by glomeruli, proximal and distal convoluted tubules, each glomerulus was formed by afferent and efferent arterioles and surrounded by Bowmanns capsule and the capsular space was present in between. The proximal convoluted tubules were many and lined by pyramidal cell with narrow lumen. The distal convoluted tubules were lined by simple cuboidal epithelial cell with wider lumen. The medulla of kidney was containing collecting ducts and tubules lined by cuboidal cell and the interstitial connective tissue had blood vessels, fibroblast and lymphocytes (fig 1).

The liver: The parenchyma of the liver, was formed by cords of liver cell, polygonal shape with central, spherical nuclei, surrounded by blood sinuses directed toward the central vein, Kupffer cell as phagocytic cell are present in the blood sinusoid. the portal areas were present in the parenchyma, each area was containing the branches of portal vein, hepatic artery and bile duct (Fig 2).

Group two:

The kidney: The cortex was containing hyper trophy of glomeruli with partial fragmentation. The proximal convoluted tubules were containing desquamated epithelial cell with glomerular filtrate in the lumen of these tubules. The medulla was highly infiltrated with lymphocytes and other write blood cell, the renal tubules were surrounded by degenerated epithelial cell with presence of debris of epithelial cell in certain tubules (Fig 3).

The liver: The parenchyma of liver was containing extensive degeneration of hepato cytes, certain number of them cell was lost their nuclei (karyolysis) also vacuolation of cytoplasm was noted, the portal area was containing congested blood vessels, surrounded by lymphocytic aggregation, also present around central vein. The kupffer cells also present in the blood sinusoid (Fig 4).

Group Three:

The kidney: The cortex was containing hyper trophy of glomeruli. The surface of these glomeruli was containing lymphocytic infiltration, also the epithelial cells of the proximal and distal convoluted tubules were hyper trophied, also certain tubules were containing cellular debris. The blood vessels were congested with blood. The medulla was present with renal tubules, demonstrated in well arechetictuve, its cell was simple cuboidal, surrounded by interstitial connective tissue (Fig 9,10). Blood sinuses with kupffer cell. The central vein in the center of lobules congested with blood with presence lymphocytic foci around these veins, also surrounding the branches of the hepatic artery, portal vein in the portal vein (Fig 5).

Group four:

The kidney: The cortex of kidney was containing hyper trophy of glomeruli and the convoluted tubules were loading with cellular debris in the center of the lumen of these proximal and distal convoluted tubules. Certain numbers of these tubules also have hyper. Trophy of epithelial cell. The medulla was containing renal tubules and ducts with thin segment of henele loops with norwed shape and size. The interstitial connective tissue was present with lymphocytic infiltration (Fig 6).

The liver: hypertrophy of the liver cell was demonstrated in the parenchyma of liver tissue, also certain cell was devoid for its nuclei, vacuolation of cytoplasm was detected in most liver cell, the blood sinusoids were rarely seen, due to hyper trophy of liver cell. Kupffer cell were present mostly near central vein, also pyilrotic nuclei were present in certain vacuolated cell, however blood sinusoid in certain places were dilated and appeared as cavalation with kupffer cell.

Group Five:

The Kidney: The cortex had proximal and distal convoluted with dis continuous lining of epithelial cell, mostly nearb capsules. The glomeruli were formed by afferent and efferent arteriole,surrounded by Bowmans capsule. The medulla was containing the renal tubules, duct and Henele loops with presence of congested blood vessel. With presence of heavy infiltration of lymphocyte interstitial connective tissue.

The liver: The parenchyma of the liver was demonstrated the sever congestion of the blood vessels, surrounded by hyper trophy of liver cell. The blood in the blood vessels was seen partially hemo lyzed. A small number of liver cell seen with vacuolated cytoplasm. The portal area had branches of portal vein, hepatic artery and bile duct which were surrounded by connective tissue and infiltrated with certain number of lymphocytes, these are also surrounded by hyper trophic hepatocytes.
**Group sex:**

**The Kidney:** The cortex of the kidney was containing glomeruli which seen normal structure and size. The proximal convoluted tubules were lined by pyramidal epithelial cell with narrow lumens, and the distal convoluted tubules were lined by simple cuboidal cell with wider lumens. The medulla was formed by multiple collecting and renal tubules, surrounded with interstitial connective tissue with many lymphocytes in between tubules. (Fig 7).

**The liver:** Hypertrophy of the liver cells were demonstrated with presence of kupffer cells in the blood sinusoids which appeared very narrow. The lymphocytes were demonstrated in between liver cell, the liver cells in certain places of parenchyma seen arranged in hony – comb pattern.

Discussion

In this study the effect of panax ginseng documented to repair the damaged tissues of kidney, liver (8). On the other hand, constituents of herbal medicine including ginseng are considered toxic resulting in tissue damage (9). Inflammatory effect of ginseng has been responsible for the liver protection, ginseng suppressed the production of inflammatory cytokines, ginseng was found to inhibit tumor necrosis (10). Ginseng may have selectively inhibitory effect on CYP activities, in a recent animal study, ginsing was found to inhibit (alpha) pyrene induced CYP1A1 activation by down regulation of the gene expression (11), ginseng has interesting hepatoprotective. From atherapeutic stand point, ginseng alternative phyto-medicine and preventative therapy and treatment of liver diseases such as fatty liver and chronic hepatitis and in form of healthy foods (12). There is increasing attention to the effect of ginseng on the liver function, it is another important for further research and development to combine ginseng with other liver active drugs and pharmacological properties. (13).

Conflict of Interest: This research is a personal non-profit work and there is no conflict of interest.

Source of Funding: None.

Ethical Clearance: Ethical clearance was obtained from the Faculty Scientific Committee (Department of Biology, College of Education for Pure Sciences) to study the effect of ginseng panax on the histological structure of the liver and kidney in healthy male albino rats.

ABSTRACT

Misoprostol is a (Prostaglandin) E1 is licensed for use in management of uterine evacuation. This study aimed to compare a vaginal misoprostol loading and non-loading dose regimen for second trimester pregnancy termination. Prospective randomized trial study done included 100 case with singleton nonviable pregnancy at (12-24 weeks) with specific criteria. Using cytotec (mesotac); loading dose misoprostol-tab of 800 µcg, maintenance dose 400 µcg every 6 hrs, non-loading 400 µcg dose both by vaginal route put deep in post Vaginal Fornix. Findings revealed that nausea was significantly higher in loading dose misoprostol-tab of 800 µcg. Approximately half of women in both groups needed analgesia. In conclusion, in using vaginal misoprostol, better efficacy is achieved within 24 hr in loading and non-loading doses.

Keywords: Missed abortion, misoprostol (loading, non-loading doses).

Introduction

Abortion is a taken word derived from a boriri mean miscarry, Abortion is defined as spontaneous or induce termination of pregnancy before viability (miscarry= abortion) are term used inter changeably now day – used the word… early pregnancy loss wastage or failure1,2.

Abortion become much less common by advancement of pregnancy. There after over all spontaneous loss in 2nd trimester is estimated 1-5% to 3% after 16 week. It’s only 1%. 1st trimester bleeding double the incidence of 2nd trimester loss. 2nd trimester abortion constitute 10-15% of all induced abortion would wide but are responsible for 2/3 of major abortion complication 3,4.

Management of 2nd trimester Abortion: Various management protocols have been used for second trimester pregnancy termination, these includes: surgical technique (dilatation and evacuation) and medical approaches such as intra-amniotic prostaglandin F2alpha instillation, prostaglandin E2 vaginal suppositories, Prostaglandin E1 and high dose oxytocin 2.

Both counseling and management of abortion should be provided without undue delay, woman should be free to choose, to be counseled alone or with a partner, friend or parent 10. Pre abortion counseling involving help her how to choose the way of termination.

Management options fall into 3 groups medical, surgical or expectant and there are many factors to be taken into account when discussing these options with patients such as gestation at which miscarriage is diagnosed, available facilities, Medical history, hemorrhage, patient choice and the cost.

Misoprostol, (Cytotec) Mesotac: Is a synthetic PG E1 analogues approved by FDA with aim of prevention & development of peptic ulcer. It was 1st used in Brazil 1988 for abortion purpose after which uses for 1st & 2nd trimester pregnancy abortion. It is a safe drug, inexpensive, stable at room temp and currently it is commonly used for medical abortion, cervix ripping, management of miscarriage, induction of labour and management of PPH.
It can give orally, vaginal, sublingual, buccal or rectally. However vaginal route is associated with slower peak level achievement but the effect lasts longer with fewer side effects. It can give orally, vaginal, sublingual, buccal or rectally. However vaginal route is associated with slower peak level achievement but the effect lasts longer with fewer side effects. It is safe but can cause teratogenic effect if the fetus alive.7

There is a large range of effective misoprostol dosing, ranging from 100 to 800 mcg for an individual dose and using various schedules, including regimens with loading doses.8 However, higher doses are generally more effective when misoprostol is used alone. The effect of misoprostol on uterine contractility was well studied by Gemzell-Danielsson et al.9 and Aronsson et al.10. To produce regular contractions, however, a sustained plasma level of misoprostol is required and this requires repeated oral doses. Furthermore, some Side effects and complications could associated with the use of misoprostol which are listed in literatures however, serious complications are rarely developed.6,11,12

**Patients And Method**

This is a prospective randomized trial study done in AL-Zahraa Maternity and Pediatric –Teaching Hospital from 20th of April to 20th of October 2016, involve 100 case with singleton nonviable pregnancy at (12-24 weeks) with specific criteria. Following thorough history and examination, each patient had 2 ultrasonography examination. Patients were excluded if she had multiple pregnancy scared uterus, and medical diseases such as cardiac or bleeding disorder.

The patients were randomized into two Groups:

**First group** (51 patients) was arranged to receive vaginal loading protocol of Misoprostol (misotac) (Sigma pharmaceutical Industries, Fizer each tablet contains 200mcg) 200 microgram every 6hours up to 4 doses per day, if there was no response the regime repeated in the next day. The misoprostol tablet was placed in the posterior fornix of the vagina.

At time of placement of subsequent doses, any remaining undissolved tablets were removed before next tablet was inserted. All patients were followed in the ward every 4 hours with observation of pulse rate, blood pressure, temperature and occurrence of side effects, in the ward provide analgesia antiemetic, other medication, before next dose given uterine contractions and cervical status were assessed by abdominal and vaginal examination, no additional misoprostol dose was repeated if abortion is imminent (patient had at least 70% cervical effacement with 2cm opening).

The induction considered to be started when the patient received the first dose of misoprostol and abortion defined as the time when the fetus was expelled (incomplete abortion) although in some cases placenta delivered at the same time (complete abortion) After abortion ultrasonography examination was done to confirm that the products of gestation (fetus and placenta) had been successfully removed to establish that the abortion was complete. Any retained products of the placenta (not delivered spontaneously one hour after delivery of the fetus) were removed by soft sponging. In this study, failure of induction is considered if the patient did not abort within 48hours. Following the procedure women were kept in hospital for eight hours, and advised for follow up visit after 10 days.

**Statistical analysis** performed using the statistical package for social sciences (SPSS) and the statistical tests and procedures were applied accordingly. P-value of ≤ 0.05 was considered statistically significant.

**Findings**

In table 1 there is no significant association between parity and gestational age for women under study, (P>0.05). Table 2 shows no significant difference between the two groups regarding complications except nausea was significantly more frequent in the loading group (regime 1). Furthermore, approximately half of women under both regimes need analgesia. There is no significant association between parity and time of success in the two regimes, (Table 3). The overall success rate was 82.9% and 80.4% in group 1 and 2, respectively, (Figure 1).

Discussion

Misoprostol is an effective drug for termination of pregnancy in the second trimester for fetal death or other indication for termination of pregnancy. Various regimens of misoprostol use in terms of route, dosage, and interval have been tested between doses to determine the optimal application. A lot of previous studies suggested that vaginal administration of misoprostol is more effective than other routes of administrations for second trimester pregnancy termination.

Other researchers used regimen of vaginal or sublingual misoprostol (400 µg) every 3 hours for up to five doses. They recommended that particularly for nulliparous women, vaginal administration of misoprostol is more effective than sublingual dosing. However, in our study, there was no significant association between parity and gestational age for studied women. The two groups did not differ significantly with respect to side-effects of complications except that nausea was reported in higher percentage (P<0.001) in women under regime 1 (26.5%) than that under regime 2 (19.9%). However, in both groups, 27 (55.1%) and 21 (41.1%) women in regime 1 and regime 2 need analgesia respectively. A systematic review published in 2011 suggested that a variety of analgesic options should be made available to women of second trimester terminations. In the present study, we found that medical termination of pregnancy using loading dose of vaginal misoprostol was 75.5 % success within 24hr and 10.2% success within 48hr in one hand. In other hand, non-loading dose of vaginal misoprostol was 68.6 % and 11.7% success within 24hr and success within 48hr respectively. Thus, these results indicate that, using vaginal misoprostol, better efficacy is achieved within 24hr. No significant associations between parity and time of success in the two regimes, agreement with Bhattacharyya et al in their a prospective, randomized, controlled trial study were undertaken 138 women at 14–20 weeks gestation and used two regimens of vaginal misoprostol in second trimester termination of pregnancy. Their subjects were randomized to receive either regime A: 400 µg of intravaginal misoprostol every 3 h, or regime B: loading dose of 600 µg, followed by 200 µg every 3 h. They were found that there was no significant difference in the success rates at 24 and 48 h (Regime A: 97.18 and 98.59%; Regime B: 95.45 and 95.45%), and in mean induction-abortion interval (12.97 versus 12.13 h). However, mean misoprostol requirement was significantly higher for Regime A (1701.4 versus 1269.7 µg). The incidence of fever was significantly less in Regime B (32.4 versus 14.9%). They concluded that use of vaginal misoprostol for second trimester abortion had comparable efficacy with less drug requirement for the 600 µg loading dose followed by 200 µg 3-hourly regime compared to the 400 µg 3-hourly regime. In this study 800 µg loading dose and 400 µg maintenance dose and non-loading start with 400 µg, only gastrointestinal disorder (nausea) more in loading dose, this mean short interval low dose associated with less side effect and better efficacy.

Also this study agreed with Chaudhuri et al findings that compared 185 women who given 400 µg vaginal misoprostol either every 6 h (group 1) or every 12 hours (group 2) for a maximum of four doses. The mean induction abortion interval in group 1 (12.59 h) was significantly shorter (P < 0.001) than that in the group 2 (16.41 h). The percentage of women who achieved successful abortion within 12 h in group 1 (56.52%) was also significantly higher (P = 0.00005) than that in group 2 (25.80%). The incidence of side-effects was comparable and not clinically serious. This mean interval between doses most important than the dose itself in termination of pregnancy, this agreement with our study (6 hr. interval better than 12 hr.) If we compare our study with Koh et al how is compared women who received misoprostol 400 µcg (n = 40), misoprostol 200 µcg (n = 37) or gemeprost 1 µcg (n = 39) which was administered vaginally at 4 hour intervals up to five doses or until termination of pregnancy (TOP) occurred. They found that the misoprostol 400 µcg group had the highest incidence of successful TOPs (92.5%) compared to the misoprostol 200 µcg (70.3%; P = 0.017).
misoprostol 400 µcg group had the highest incidence of fever (70.0%) compared to misoprostol 200 µcg (24.3%; P < 0.001) we found the dose also important but high dose associated with more side effect also agreement with our study. A recent study carried out by Pongsatha and Tongsong, concluded that misoprostol in a dose of 400 µcg every 6 h, either with a loading dose or non-loading dose, and was comparable in terms of abortion/delivery time. Higher maternal effects, but with no significant deference between two groups in successful rate in 24 hr. or 48 hr. but more side effect GIT, fever and chills, were found in the loading dose regimen in our study we found nausea is more significant.

Conclusions

Misoprostol in a dose of 400 µcg every 6 hr either (Loading dose 800 µcg) or non-loading dose of 400 µcg every 6 hr. was comparable in terms of abortion 2nd trimester. Higher maternal effect, such as fever or nausea & GIT disorder were found in the loading regimen. Therefore, based on the present study. We recommend the non-loading regimen for 2nd trimester pregnancy termination.

ABSTRACT

Background: Acute injury of the kidney is characterized by a rapid decrease in the speed of glomerular filtration (GF). The development of acute kidney injury (AKI) is associated with a large number of medical complications. Cystatin C can be used as a better biomarker of the glomerular filtration rate than serum creatinine and it can be used for an early diagnosis of any ongoing deterioration in the function of kidneys and monitoring the effectiveness of the recommended treatment.

Objective: To assess the serum cystatin C level in ICU patients who developed AKI secondary to major trauma.

Patients and Method: A prospective cross sectional study conducted over 190 patients (100 healthy subjects as control group and 90 AKI patients as case group) with different age and gender was included in this study. Blood samples for serum Cys C, SCr, B.urea were collected within the first 24 hrs of onset of injury.

Results: The mean age of the AKI group was (37.3 ± 12.8) years, for control group (34.9 ± 11.5), with high significant association were found between B. urea, S. creatinine, and S. cystatin C. Correlation coefficient between serum Cystatin C- based GFR and serum creatinine - based GFR revealed more negative correlation in Cystatin C- than S. creatinine, this mean that serum Cystatin C-based GFR reflects a decline in GFR with worsening AKI in a much better way than creatinine–based GFR.

Conclusion: Detection of serum cystatin C in early AKI is more precise than serum creatinine detection.

Keywords: Acute kidney injury, Cystatin C, S. creatinine, Intensive care unit

Introduction

Acute kidney injury (AKI) is characterized by a rapid decrease in the speed of glomerular filtration (GF), disorders in acid-base and electrolyte homeostasis and disability to excrete nitrogen products by the kidney. The development of AKI is associated with a large number of medical complications. (¹)

The diagnosis of AKI is based on the determination of serum creatinine and creatinine clearance which are insensitive tests in the early stages of AKI. With these parameters, the RIFLE criteria were established (Risk, Injury, Failure, Loss, and Kidney End-Stage Disease). AKIN (Acute Kidney Injury Network) and KDIGO (Kidney Disease Improving Global Outcomes) are another criteria that allowed a homogenization in the diagnosis of this disease (²,³) Major trauma can be complicated with acute kidney injury (AKI) that considered as independent risk factor increasing the mortality and morbidity rate of patient with ICU admission (⁴).

Early recognition and treatment of such a complication is important to improve the short and long –term outcomes in this group of patients. (⁵)

In critical care patients, the management of AKI is based on early identification of renal failure, supportive measures, overcome ongoing and prevent further or recurrent injury to the kidney (⁶), avoid massive blood transfusion(⁷)(unless it’s necessary) and preclude any nephrotoxic medications. (⁸)
Risk factors for development of AKI in patient with major trauma are major surgical operations, hypovolemic shock due to certain causes, rhabdomyolysis (9,10) and massive blood transfusion (7) Other risk factors including elderly patient presence of medical comorbidity, and diabetes mellitus (11,12).

The monitoring of the patient urine output, blood urea and serum creatinine are non-specific & late biomarkers for an early detection of evolving renal impairment, prevention early recognition and treatment of any injury to the kidney. This increase the interest the use of AKI – specific biomarker to preclude this issue. Cystatin C is a 13 kilo Dalton proteinase inhibitor from the cystatin super family of cysteine protease inhibitors. It’s produced by all of the body cells, that contain nucleus and it has a significant role in the catabolism of the proteins inside the cells. Cystatin C can be found in variety of body fluid as blood and filtered through the kidneys. Cystatin C can be used as a better biomarker of the glomerular filtration rate than serum creatinine, and can be used for an early diagnosis of any ongoing deterioration in kidney function, and improving AKI definition. (13, 14)

By this way, the limitation of measurement of creatinine clearance, that relate to the patient’s muscle mass, the patient’s general health status, dietary protein and physical exercise, can be overcome. (15)

There is globally increase in the acute kidney injury incidence particularly in intensive care units (18-73%). While for the mortality rates of AKI patients admitted to the ICU range from (20-47%) and reach to over 50% in patients need for renal replacement therapy. This needs clinicians to be ready for rapid diagnosis and early management of the disease (AKI) in the ICU, as the early and accurate detection of AKI is essential to prevent disease progression, and possibly improves outcome. (16). The changes in S. Cr occur with a delay after the AKI has been sustained, and recent research has focused on novel biomarkers for the early detection of AKI to facilitate early intervention. (17, 18) Cystatin C (CysC) is a low-molecular-weight protein of 13 kD produced by all nucleated cells. It is freely filtered by the glomerulus, reabsorbed, and catabolized, but it is not secreted by the tubules. (19)

**Aim of the Study:** To assess the serum cystatin C level in traumatized patients with AKI admitted to the ICU.

**Patients and Method**

A prospective cross sectional study conducted in Al-Hussain hospital/Samawa city/Iraq, for about 2 years duration (from first of September 2016 to the end of August 2018) when two groups of respondents with different age and gender were included in this study (case group with 90 AKI patients, and control group with 100 healthy subjects).

All patients gave their consent to participate in this study in agreement with the Helsinki Declaration. Demographic information was collected including age, gender, dates and source of admission. All patients were submitted to full clinical assessment including history taking, thorough clinical examination and laboratory investigations.

Regarding AKI group, traumatized patients in ICU were considered to have AKI if S. Cr had increased above baseline by at least 0.3 mg/dL or 50% according to the definition of the AKIN. (20) Sustained AKI was defined by an increase in S. Cr of at least 50% from baseline for 24 hours or longer as specified by the RIFLE criteria. (21) Blood samples for serum Cys C, S.Cr, B.urea were collected within the first 24 hrs of onset of injury.

**Statistical Analysis**

After the entering of data in a table devised by the researcher, the analysis was carried out statistic with the SPSS program, version 24. For qualitative variables, we used frequencies and percentages, and for the quantitative variables, we used measures of central tendency (median, media and fashion) and dispersion (standard deviation). Receiver operator curve were used to measure the validity test.

Logistic regression was done for estimated GFR (eGFR) by measuring the 2 biomarkers (S. CysC and S.cr) in AKI patients.

For the inferential statistics the tests were used of chi-square test (with a significance of ≤5%).

**Results**

The current study included two groups: acute kidney injury group (n=90) and healthy group (n=100). The mean age of the AKI group was (37.3 ± 12.8) years while for
control group was (34.9 ± 11.5) years, with no statistically significant differences between them Furthermore, no significant association between both groups (case & control) regarding the weight, while highly significant association were found regarding B. urea, S crea tinine, and S. cystatin C (table 1). Gender distribution of the respondents show that the majorities were male (72 for AKI group and 73 for healthy group) and female was (18 for AKI group and 27 for healthy control group (figure 1).

Regarding to the distribution of the S.cr and S. Cys C in acute kidney injury patients, it was found that less than 2/3rd (60%) of the patients (54 patients) was with normal level of S.cr and (40%) (36 patients) with abnormal level of the S.cr, while all patients had abnormal level of S.Cys C (figure 2).

**Discussion**

AKI is one of the commonest diseases admitted to the ICU patients; with a mortality rate vary from 30% to the 90% (22,23). The early and precise detection of AKI is essential to prevent disease progression, and thereby, to possibly improve its effect (24,25).

The production of the biomarker (Cystatin C) is stable in the body and not affected by renal situations, or increased catabolism of protein or dietetic factors. Furthermore, it is not like creatinine which is changed with age or muscle mass. The current study revealed that there is highly significant increase in B.urea, S.CysC and S.cr in AKI (patients) group than that in control (health) group. Paolo L et al, and other researchers have revealed that serum CysC is a more precise marker of GFR than SCR especially in children with chronic kidney disease (26-28). So we can reasonably hypothesize that acute
change in CysC might be more precise in detection of acute GFR reduction than S.cr does. This is in agreement with the present study when the correlation coefficient between serum CysC-based GFR and serum creatinine-based GFR is more negative correlation in first marker than the 2nd one, which is mean that serum CysC-based GFR reflects a decline in GFR with worsening AKI in a much better way than serum creatinine-based GFR. Therefore, in the AKI group, GFR-based cystatin C was better than creatinine-based GFR for the early detection of the worsening clinical state. This suggests the utility of Cystatin C serum on serum creatinine in early prediction of decreased GFR and therefore aids in early therapeutics intervention.

**Conclusion**

Early detection of serum cystatin C in early AKI is more precise than serum creatinine detection.

ABSTRACT

Myrrha and Sage extract solutions are promising prophylactic and disinfectant agents against microorganisms, suggesting that these solutions might be useful as antimicrobial topical solutions for dental contamination. Three different concentrations of Myrrha and Sage extract solutions 2%, 5% and 10% were separately exposed to the Candida albicans and chlorohexidine solution that used as control to treat the PMMA and Flexible Acrylic plates, the percentage of colonies reductions were calculated. In case of using Sage extract solutions, the colonies reductions were 60.90%, 84.10% and 90.63% respectively for PMMA plates compared with 98.56% reduction for chlorohexidine with mean p-value (0.0028).

As regard Myrrha extract solutions, the colonies reductions for PMMA plates were 76.28%, 82.25% and 88.25% respectively, compared with 93.88% of reduction for chlorohexidine with mean p-value (0.0008).

This research considers both Myrrha and Sage extract solutions of different plants are promising solutions and capable of using as alternative solutions in treating Candida albicans in either PMMA and Flexible Acrylic plates.

Keywords: Poly methyl methacrylate [PMMA], Flexible Acrylic, Salvia officinalis (Sage) and Commiphora myrrha (Myrrha)

Introduction

Fungal diseases currently represent global challenges. For instance, infection of various crops (2), certain bats (3), and many amphibians (4) have become under severe and potentially existential stress due to attacks from fungal microorganism. The impact of fungal disease on human health has also been raising, in particular because of the growing number of immunocompromised cases of patients resulting from the AIDS epidemic, increased organ transplantation and cancer chemotherapy, and widespread antibiotic use that impacts on the human microbe. Candida species, especially Candida albicans, represent a major component of the disease burden caused by fungi and are the fourth most common cause of nosocomial infections in North American hospitals (5). Although Candida albicans is the most causing of candidemia, it has been a decrease in the incidence and an increased isolation of non-albicans species of Candida in late years (6). Preventive measures include maintaining a good oral hygiene, keeping a healthy lifestyle including good nutrition, the careful use of the antibiotics, treatment of infected areas and must keeping skin dry and clean, free from open wounds.

Some Plant extracts are used in last decades as prophylactic and disinfectant agents against bacterial and fungal organisms, and it was recommended as antimicroorganisms. Replacing the requirements in current time to the antibiotics or anti fungal drugs. Denture composition are made of either thermally activated poly-methyl methacrylate Acrylic [PMMA] or flexible acrylic which is composed of thermoplastic flexible...
polymer. The suggested solutions of plant extract are derived here of different plants: *Salvia officinalis and Commiphora myrrha*. *Salvia officinalis* has numerous common names. Some of the best-known names are Sage, it has been used since ancient times as a diuretic, a local anesthetic for the skin, and for other uses.

*Commiphora myrrha* or called as Myrrha has also been recommended as an analgesic for toothaches and can be used in liniments for bruises, aches, and sprains. Myrrh is a common ingredient of tooth powders. Myrrh and borax in tincture can be used as a mouth-wash. A compound tincture, or horse tincture, using myrrh is used in veterinary practice for healing wounds.

The purpose of this study is to evaluate the antimicrobial activity of *Salvia officinalis* and *Commifora myrrha* extract solutions on Poly Methyl Methacrylate Acrylic [PMMA] and flexible Acrylic dental materials which contaminated with high resistant microbe of *Candida albicans* compared to normal antibiotics.

**Material and Method**

**Preparation of Samples:** The Sage and Myrrha powders were purchased from formal Iraqi agriculture market. Then were prepared 2%, 5% and 10% by dissolving 2 gm, 5 gm and 10 gm respectively of each above one in 100 mL of D.W then vortex until complete dissolving and left in 4 °C after filtrations by (milliporefilter 40µmiter).

**Preparation and construction of Poly Methyl Metha Acrylate (PMMA) plates:** According to references, acrylic plates are constructed as bellow from the poly methyl methacrylate [PMMA], which are supplied in form of powder (polymer) and liquid (monomer).

**Preparation and construction of Flexible acrylic plates:** Flexible acrylic resin is a thermoplastic flexible polymer composition offered for use in a wide range of applications, one of them is the fabrication of removable dental prosthesis.

**Growing of Microorganisms:** *Candida albicans* was grown first on the PDA broth and incubated over night in the 40 specimen containers which divided into (20) containers for PMMA plates and other (20) containers for Acrylic plates.

**Exposing Samples on Microorganism:** The antimicrobial activity was determined in the following steps, after incubating the microorganism over night, 0.5 mL from each tube was taken and put in the Eppendorf tube (Before treatment). After that, the media was discarded from all tubes and added 4 mL from Sage, Myrrha, D.W and Chloro hydroxyl as usual control with different concentrations and left it for 30 minutes with mixing at each 2 minutes. After the standing time, the tubes were rinsed with D.W and then addition 4 mL from D.W for each tube and stand for 2 minutes. After that, 0.5 mL from each tube was taken and put it on the Eppendorf tube.

**The Efficiency of Samples on Microorganisms:** PDB (Potato dextrose broth) media was used to grow the *Candida albicans*. Specific dilution was used in this experiment, D.W : Stock as (1000:1) was prepared from each tube then 50 µL form each dilution was taken and spread on the media using L. Shape loop, and then incubate for 12-20 hrs for determining the efficiency of samples on microorganisms.

**Inhibition Percentage:** The inhibition percentage of each different sample was calculated according to the comparison between (Non-treated with Candida) and (treated with Candida) via calculating the colonies that formed in Petri-dishes.

**FTR measurements:**

Using Fourier Transform Infrared (FTIR) Spectroscopy Processing technique: The raw data resulted of Sage extract and Myrrha solutions were converted by this technique to the desired result: The sample’s spectrum (output of light) as a function of infrared wave length or equivalently wave number was measured. (Figure 5).

**Results and Discussion**

Plant extracts are promising prophylactic and disinfectant agents against mico-organisms due to its natural organic and safety, suggesting that these extracts might be useful as antimicrobial agent and disinfectant solution for dental prosthesis. Dental plates that made of either thermally activated poly methyl methacrylate acrylic [PMMA] or flexible acrylic which is thermoplastic flexible polymer composition, these materials are widely used in construction of removable dental prosthesis and some maxillofacial prosthesis.

In figure (1 and 2) Showed the number of colonies and percentage of colonies reductions by using chlorohexidine 2% solution as control and the following Sage extract solutions 2%, 5% and 10%, that were...
seperately treated the PMMA plates exposed to the *Candida albicans*.

In Sage extract solutions, the colonies reductions were 60.90%, 84.10% and 90.63% respectively for PMMA plates compared with 98.56% reduction for chlorohexidine, with mean p-value (0.0028). On the other hand, the Myrrah extract solutions 2%, 5% and 10% exposed to Flexible Acrylic, the colonies reductions were 76.28%, 82.25%, 88.25% respectively, compared with 93.88% reduction for chlorohexidine with mean value (0.0008) as shown in (figure 3 and 4).

![Figure 4](image.png)

Figure 5: FTRI diagrams showing the spectrum range of (A) Myrrah (B) Sage, Reflecting compounds by reading the wave lengths

In the previous study, C. albicans was discovered in 60% of lesions with proximal caries and 100% of the cervical caries samples were candida albicans positive in the samples taken from the plaque of 15% of the cases without and with caries and with c, 20% of the dental plaque of ECC children with proximal caries and 80% of them with cervical caries \(^{(12)}\).

Although, \(^{(11)}\) referred that 52% of dentists didn’t believe in the possibility of cross-infection between the dental office and dental laboratories, while the truth is the dental office-laboratory connection may be represented a potential cross-infection pathway if no effective disinfection procedures are taken. The dentists in their clinics receive patients need to repair their fractured or unfilled dentures and already these dentures are contaminated with any types of microorganisms. Thus, American Dental Association (ADA) stated that may every dental patient should be treated as a potential source of infection.

Also, the dental laboratory technicians handle these materials during steps of prosthesis fabrication. They may expose the products to be contaminated with various microbial and fungal organisms.

Mean while, less than 60% of the denture wearers use any one disinfectant due to the cost of the product \(^{(8)}\). Therefore denture disinfection should be of low cost to be affordable to most of the denture wearers. As regard the colonies reductions measurements of Candida albicans colonies in either PMMA and Flexible Acrylic plates demonstrated extremely good inhibition for both Myrrha and Sage extract solutions , compared with percentage reduction of chlorohexidine with mean p-value (0.01) (figure 1 and 3),

A known method of disinfection is the use of chemical disinfectant solutions, which may interfere,
with frequent exposure with the properties of PMMA or the flexible acrylic \(^{13-14}\), because the long-term immersion of the prosthesis in chemical disinfectant may cause deterioration of denture base material by changing mechanical properties of acrylic resin \(^{15}\). Therefore, there are several drawbacks in the use of such chemical agents for disinfection of prosthesis\(^{16}\).

Chlorohexidine 2% solution is considered the excellent choice among chemical antiseptics for dental biform control \(^{6}\). A previous studies stated that new dentures should be disinfected before replacement of the prosthesis in patient’s mouth and before and after adjustment procedures, because a large variety of disease are caused by many micro-organisms which are found in patient’s mouth such as streptococci pneumonia, staphylococcus aurus, Escherichia coli, and mycobacterium bovis \(^{(Haake SK. )}^{10}\). Also, denture induced stomatitis was reported to be an inflammatory reaction of the denture - bearing mucosa, being characterized by different degrees of erythema and affects many complete upper denture wearers \(^{9}\). Candida albicans is still reported as the primary etiologic agent, Which can easily adhere to acrylic prosthesis surfaces.

A well known method of disinfectants is the use of chemical disinfectant solutions, which may interfere with frequent exposure with the properties of PMMA or the flexible acrylic \(^{10}\), because the long-term immersion of the prosthesis in chemical disinfectant might cause deterioration of denture base material via changing mechanical properties of acrylic resin \(^{Al Faraj, S (2005)}\). Therefore, there are several drawbacks or side effects in the use of such chemical agents for disinfection of prosthesis \(^{(Haake SK. )}^{10}\).that is encourage this study to use natural products in treating the dental plagues.

Chlorohexidine 2% solution is considered the best choice among chemical antiseptics for dental biform control \(^{8}\). It is a broad- spectrum disinfectant that works by destroying the cell membrane and precipitating in the cell cytoplasm. So, chlorohexidine 2% solution is convenient to use it as control antiseptic agent versus plant extract solutions for comparison.

Thus, research is necessary to find an alternative method of disinfection by using solutions which do not cause any significant alteration in the structure of prosthesis. Furthermore, This research considers both Myrrha and Sage extract solutions are promising solutions maybe use as alternative solution in treating Candida albicans in either PMMA and Flexible Acrylic plates.

**Acknowledgment**

We thank all the members in Iraqi company for biological laboratories, Baghdad- Iraq especially in the Microbiology laboratory for their cooperation in providing us the Candida and helping us to make some experiments in their lab.

**Ethical Clearance:** This research was accepted to achieve the fulfillment as a research paper according to the Iraqi criteria committee to be published in any scientific research paper.

Husband Participation in Birth Prepareness and Complication Readiness and Utilization of Delivery Services in Indonesia

Betty Oktaviana¹, Helda²

¹Master Program in Public Health, ²Epidemiology Department, Faculty of Public Health, Universitas Indonesia

ABSTRACT

Husband has potential to engage in three obstetric delays, so husband is expected to be involved in preparation of childbirth and decision-making action against possible complications, in addition to play a role in maintaining maternal health during pregnancy. Although the government has attempted this in the antenatal care policy, participation of husbands has been less successful in motivating mothers to utilize maternal services. This study identify the association between husband participation in birth prepareness and complication readiness with the utilization of delivery services in Indonesia.

Research with cross sectional approach, using data of IDHS 2012. Women of childbearing age who gave birth within one year before survey become population. Sample size was 504 respondents. Husband’s participation is measured only in birth prepareness and complication readiness. Data were analyzed using logistic regression test.

Utilization of delivery service at health facility in Indonesia is 73.2%, but well birth prepareness and complication readiness as husband’s participation in mother’s health is only equal to 46.8%. The results of logistic regression test showed that woman whose birth prepareness and complication readiness well-planned by her husband, more likely to utilize delivery service at health facility (POR 1.59; 95% CI 1.06-2.37) than woman whose birth prepareness and complication readiness not well-planned by her husband. In this study, maternal age, maternal education, husband education, index of economic status, and decision makers also proved statistically significant in relation with utilization of delivery services at health facilities.

There is an association between husband’s participation in birth prepareness and complication readiness with the utilization of delivery services in Indonesia. Optimizing antenatal care becomes a moment for health workers to encourage husband participation in birth prepareness and complication readiness.

Keywords: Indonesia, husband participation, delivery services, birth, complication readiness

Introduction

Since pregnancy until childbirth’s phase, woman may face dangerous conditions (1). These complications and all of the immediate causes of maternal deaths can be prevented and minimized (19) by utilizing routine and integrated antenatal care involving husbands and families, so that maternal health status is monitored as well as birth prepareness and complication readiness (BP/CR) can be implemented (10).

Coverage of delivery services by skilled birth attendant in Indonesia in 2014 was 88.86%, this number have not met the target of the Strategic Plan of Ministry of Health 2010-2014 (9). Utilization of delivery services in health facilities is also influenced by the household’s identification about the existence of delivery facilities. In fact, only about half (57.5%) of a total 2.445 husbands, who discussed with health workers about their wife’s pregnancy (18).

Husband has potential to engage in three obstetric delays (8). Therefore, the husband is expected to be involved in birth prepareness and decision-making on complications or emergency condition that may occur during pregnancy and childbirth.

The study shows the condition that the indirect husband’s participation through financing of maternal health services is higher than direct participation through accompanying their wives in antenatal care visit during pregnancy (21). The role of husband is also important in
knowledge and attitude of the wife in the selection of skilled birth attendant for labor and referral \(^{(16)}\). Male knowledge of antenatal care improves the utilization of health care services and decision-making by women \(^{(4,23)}\). While the presence of a husband during a woman’s antenatal visit to a health facility is a significant determinant for utilization of delivery services, and also improves birth preparedness \(^{(3,15)}\). This study aims to identify the association of husband participation in BP/CR with the utilization of delivery services in Indonesia.

**Method**

The study was conducted by cross sectional approach, using secondary data obtained from the Indonesian Demographic and Health Survey (IDHS) in 2012. Woman of childbearing age who gave birth within one year before the survey were conducted into the study population. The sample size is 504 respondents.

The variables in this study were husband’s participation in BP/CR, delivery services, and as covariate variables: woman’s age, parity, woman and husband education, index of economic status, residential area, and decision-maker. BP/CR is based on 5 components: delivery places, birth attendants, delivery costs, transportation, and potential blood donors. BP/CR is categorized as as well-planned, if the husband performs more than 3 points of preparation. Delivery services are classified as non-health facility when delivery was done at respondent or other person’s house with help either by non-health or health worker. To test the hypothesis we used chi-square test, and also conducted multivariate analysis to control the confounding factors.

**Results**

Most of women were 25-34 years old, nearly half with parity of 2-3 children, most of them had secondary education, and decide everything related to their health together with their husbands.

Most of husbands (58.3%) also have secondary education, but almost all (97%) have poor knowledge about high risk and danger sign of pregnancy. Figure 1 shows more details about husband’s knowledge.

**Figure 1: Husband’s knowledge in high risk and danger sign of pregnancy**

Most of women (73.2%) have utilized delivery services by labor in a health facility but Table 2 shows that majority of husbands have not well-planned in BP/CR. While the well-planned in BP/CR as one of their
participation in maternal health only amounted to 46.8%. The components of BP/CR performed by the husband seen in Figure 2.

The proportion of woman who using delivery services at health facility is greater in the husband group with well-planned BP/CR. Statistically, there is a significant association. The woman whose BP/CR well-planned by her husband, more likely to utilize delivery service at health facility (POR 1.59; 95% CI 1.06-2.37) than woman whose BP/CR not well-planned by her husband.

Woman’s age, woman’s education, husband’s education, index of economic status, and decision-maker statistically show significant differences between women who utilize delivery services in non-health and health facility. The result of multivariate analysis with logistic regression shows that there is no confounding variable on the association. Based on the final model of logistic regression it is known that there is a statistically significant association between husband participation in BP/CR with utilization of delivery services in Indonesia (p-value= 0.024). In the final model of logistic regression, woman whose BP/CR well-planned by her husband, more likely to utilize delivery service at health facility (POR 1.59; 95% CI 1.06-2.37) than woman whose BP/CR not well-planned by her husband.

**Discussions**

The BP/CR program in Indonesia called “P4K”, becomes one of the strategic programs to reducing maternal death rate in Indonesia. In this case, unoptimize implementation of this program maybe a factor that encourage the lack of husband’s participation. So the momentum to prepare women, husband and family through P4K which integrated in antenatal care give less impact to utilization service delivery. This assumption is supported by the concept described by JHPIEGO. By the BP/CR at the individual, family, and community level, together with the service providers, and supported by good facilities and policy elements, it can lead mothers and their pregnancies to good outcomes through the utilization of maternal health services.

Study on the implementation of P4K at Puskesmas in Ambon found that communication in P4K practice still unclear. Communication between midwives, or between the provider and family, community and cross-sector has not been well established. Information and education is only given to pregnant women at the time of antenatal visit at health center. This finding supported by research in Papua New Guinea, which shows that awareness and education about safe mother initiatives never targeted to men or husband. Husbands are given the information only when their wives have problems related to pregnancy.

Based on research in Malawi, in practice, impact of husband’s participation in utilization of maternal, newborn and child health services in a gender perspective has constraints and encouragement. Barriers at the health facility level for men is the uncomfortable and embarrassed feelings, that increased while attending a maternal health discussion.

Despite these obstacles, generally from the gender perspective, men have been aware of the importance of male involvement in seeking care and health services for mothers and children, particularly in encouraging their wives to perform antenatal care, accompanying wives when attending antenatal care visits and decision to delivery at the health facility.

In this research, the tendency to utilize delivery services at health facilities is different according to the participation of husbands in BP/CR. Most of the mothers who utilized delivery services at health facilities were in the group with husbands which well-planned in BP/CR. Woman’s age, woman’s education, husband’s education, index of economic status, and decision-maker, are also statistically proves significant association with utilization of delivery services in health facilities.

Women 25-34 years old have more plan for their pregnancy and childbirth which then encourages them to give birth at a health facility. Early marriage will change educational opportunities. Education levels are lower in women who get married early and more likely to leave school to devote their time to domestic matter, childbirth and parenting. Woman’s education level is one of the most important determinants for women in using delivery services. Higher education level of a woman, then the use of maternal health services will also increase. Woman’s education and knowledge factors related to
BP/CR also influence their practice in BP/CR (3). Thus, appropriate interventions are necessary to facilitate a group of women with primary education or no education.

Husband’s education is also a significant factor in utilization of antenatal care and safe delivery services, but it is also possible that this factor are not strong as woman’s education (17). This is possible because woman’s education, socioeconomic and other demographic factors, substantially reduce the effect of husband’s education.

Women with high economic status index more likely to use delivery services at health facilities. Utilization of delivery service in health facility decreased in proportion to the decline in household economic status index. These results are consistent with studies showing that the economic status of women is one of the most important determinants of safe delivery (17). Household income or socioeconomic factors are very important in the utilization of antenatal and delivery services (14,15). In general, uneven use of maternal and infant health services is closely linked to poverty, women’s education, geographic factors and social development. Poor and uneducated mothers have difficulty in using health care facilities because of limited costs and ignorance (5).

Among adult women, the most affected person in the utilization of antenatal care services is the woman itself, but in the utilization of delivery services, husband has the greatest influence (20). This finding supports the results of our study showing that women who make health-related decisions together with husbands are more likely to utilize delivery services at health facilities than women with husbands as the only decision makers.

Conclusions

The empowerment of maternal health services is to maintain the health of mothers since the time of pregnancy until postpartum. And the BP/CR during pregnancy and childbirth by involving pregnant women, husbands and families, is part of integrated antenatal care. Optimizing antenatal care needs to be done to encourage the participation of husbands in BP/CR. Strengthening the participation of husbands through pregnancy classes for husband, or appropriate counseling with partners during antenatal visits based on characteristics identification, such as age, education, index of economic status, and decision-makers, is expected to improve the quality of antenatal care and delivery services in Indonesia.

A Study of Some Biochemical Parameters in Blood Serum of Patients with Congestive Heart Failure

Entedhar Riffat Sarhat1, Salim Jasim Khalaf1, Mahde Salih Hamad1
1Clinical Biochemistry, Dentistry college/University of Tikrit, Tikrit, Iraq

ABSTRACT

Background and Aim: The goal of this study was to investigate the association between copeptin, chemerin and different biochemical and anthropometric parameters in congestive heart failure (CHF) compared to the healthy control group.

Patients and Method: This was a case-controlled, cross-sectional study of eighty-one consecutive patients (48 men, age 64 years, 33 women, age 60 years) and 81 age-matched healthy control individuals presented to the Tikrit Teaching Hospital in Tikrit province with a diagnosis of HF between June 2017 and January 2018. Demographic and anthropometric variables were estimated. Serum levels of copeptin, chemerin and apelin were measured in fasting blood samples.

Results: There was a significant increase in serum copeptin, and Chemerin, cholesterol, triglycerides, levels whereas decreased in HDL in CHF group when compared with healthy controls. Receiver operator characteristic curve (ROC) curve analysis revealed similar efficacies of copeptin and chemerin levels in their ability to detect unstable plaques with areas under the curve of [(AUC=0.959; 95% CI, 0.890 to 0.990, cutoff value >14.6 pg/mL)], and (AUC=0.917; 95% CI, 0.835 to 0.967, cutoff value >41.76), respectively. Whereas, apelin (AUC=0.785; 95% CI, 0.680 to 0.868, cut of point >0.231).

Conclusion: Future analysis of chemerin copeptin’s biological actions, and measurement of copeptin, copeptin levels in the omental depot as well as in the circulation of humans with or without CHF and its co morbidities, will help to define its role in the pathogenesis of these diseases.

Keywords: Copeptin, chemerin, cholesterol, heart failure

Introduction

Congestive heart failure (CHF) is a leading cause of morbidity in adult population characterized by dyspnea, fatigue, and signs of volume overload, which may include peripheral edema and pulmonary rules1. Various mechanisms participate to this condition, including structural or functional cardiac disorder, neurodegenerative diseases., vascular disease, oxidative stress, genetics, environment and conditions of cohabitation, biological agents2, biochemical changes in cardiac myocytes, interstitium, or both, associated with release of various biochemical markers like cytokines, neurohormones (renin-angiotensin-aldosterone and adrenergic nervous systems), enzymes, etc., which can be estimated in blood3.

The aim of this study is to investigate some biochemical changes in serum considering Copeptin, Chemerin in in women with and without CHF.

Subjects and Method

We reviewed the medical records of 41 patients with CHF who were preserved in Tikrit Teaching Hospital, between March 20016 and January 2017. The diagnosis of CHF was based on clinical sings and a combination of clinical symptom and echocardiogram.

Echocardiographic measurements were performed according to guidelines and recommendations by the European Association of Echocardiography(4).

Subjects had blood drawn in the resting state at least 2 h after a light breakfast, collected into tubes without anticoagulant in order to obtain serum. None of the collected samples was icteric or hemolysed. Copeptin, chemerin and apelin were evaluated by enzyme immunoassays (ELISA).

Data were provided based on a computer program (SPSS) version IBM 21. Using student unpaired and
paired T test, Chi-square test Regression and Correlation analysis.. Statistical Analysis: p < 0.05 was accepted as the significance level. The ROC was used to find out the best cut off serum value of copeptin, chemerin, apelin predicting in CHF patients.

**Result**

The clinical and laboratory characteristics of the whole study cohort and CHF groups are presented in Tables 1. This study included 82 individuals, group II patients were diagnosed to have CHF clinically and laboratory [48 males and 33 females] with age (60.24 ± 6.4). A control group (group II ) of 81 health subjects [39 males and 42 females] with age (61.43 ± 5.8).

Copeptin levels were significantly higher in the patient compared to the control group (18.100 ± 2.128 vs 12.462 ± 1.148 pmol/L), Chemerin (54.78 ± 8.47 vs 36.38 ± 4.72 ng/ml), apelin(0.41 ± 0.1379 vs 0.251 ± 0.1297 ng/ml).

In the correlation analysis, apelin (p = <0.0001, r = - apelin) and the Chemerin level (p = <0.0001, r = 0.443) were positively correlated with copeptin.

The ability of log copeptin and chemerin as a predictor for CHF was explored using a ROC curve. The area under the curve (AUC) for copeptin to predict CHF were 0.959 with 95% Confidence interval (0.890 to 0.990), the optimal cut-off value >14.6 pmol/L (sensitivity 87.80 and specificity 100.00) with P value 0.001(figure:1).

The corresponding values of chemerin was 0.917 ng/ml with (95% CI: 0.835 to 0.967) (sensitivity 70.73 and specificity 100.00), cut of point >41.76 ng/ml with P <0.0001, (figure:2). whereas for apelin was 0.785 with (95% CI: 0.680 to 0.868), (sensitivity 70.73 and specificity 100.00), cut of point >0.231 with P <0.0001(figure:3). This article indicating that serum levels of copeptin and chemerin are the best biomarkers differentiating subjects with CHF(Table:2).

Discussion

In our study it was found that copeptin, chemerin, and apelin is higher in case groups than and control group.

Copeptin is a 39-aminoacid glycopeptide, which is a stable COOH-terminal part of the precursor preprovasopressin and concealing a leucine-rich core segment, it is protruded as a promising surrogate marker for assessment of vasopressin levels, also it seems useful in cardiovascular disease. After conveyance to the pituitary gland from the hypothalamus and split of the pre-pro-AVP, copeptin is secreted into the blood stream in an equimolar ratio to AVP from hypothalamus neurohypophysis in response to osmotic as well as non-osmotic stimuli. It acts primarily through its receptors including V1, V2, V3, P2-purinergic receptor (P2R) and oxytocin receptor (OTR). V1 receptors cause vasoconstriction and a positive ionotropic effect in cardiac and smooth muscle. In the circulation copeptin is stable in plasma and serum at room temperature, has a long half-life, and is not bound to platelets, and methodologically easier to determine. Thus, Copeptin is therefore, routinely used as a surrogate marker for AVP.

After AMI the chief cause for copeptin release is assumed to be acute endogenous stress. Furthermore, secretion of copeptin is also related to the alterations
in fluid status. Hence, during AMI in the acute phase hemodynamic changes might prompt copeptin release\(^7,8\). Additionally, copeptin and AVP participate to the complex energizing of the humoral stress response, consequential in cortisol and adrenocorticotropic release. Therefore, the prompt increase in copeptin level can be elucidated by volume overload and myocardial injury\(^9\).

Several studies recently have indicated the possible prognostic value of copeptin in heart failure patients. Stoiser et al\(^10\) showed that copeptin was an good prognostic pointer in progressive HF. Gegenhuber et al\(^11\) showed that copeptin was an excellent prognostic indicator acute decompensated HF. Khan et al\(^12\) assessed the prognostic marker of copeptin in patients after MI in the context of HF.

Chemerin, is also known as (tazarotene-induced gene 2 protein (TIG2) or retinoid acid receptor responder 2 (RARRES2)), is a novel adipocyte-secreted factor (16 kDa), encoded by the RARRES2 gene, which plays a crucial role in regulation of immune response, insulin resistance, and adipose maturation, differentiation, and metabolism\(^13-15\).

Chemerin was validated to play as an inflammatory intermediary to production of pro-inflammatory cytokines and encourage the relocation of immature dendritic cells and macrophages. Prevention of TNF-a-induced VCAM-1 expression and monocyte adhesion due to anti-inflammatory role of chemerin via discouragement the energizing of NF-KB and p38 in vitro\(^16\). It is recognized that switching macrophages into foam stimulates the instigation and development of atherosclerosis, and aggregation of macrophages increased which persuade the laceration of plaque and the formation of thrombus in progressive atherosclerosis\(^17-20\). Consequently, chemerin can participate in various stages of atherosclerosis by regulating immigration of the macrophages\(^21\).

Apelin exerts load-independent positive inotropy and increases coronary blood flow by vascular dilation, thereby providing beneficial effects in failing hearts\(^22,23\). This comes in agreement with the study of Chun et al.\(^24\), who revealed that apelin reduced formation of atherosclerosis by angiotensin (Ang)II receptor blocker. however Hashimoto et al.\(^25\), shown that apelin/APJ system is the arbitrator of oxidative stress-related AS in vascular tissue.

**Conclusions**

Circulating copeptin levels are elevated and have the potential biomarker to be used clinically as a diagnostic as well as prognostic marker of CHF patients. However, Future research is however required to determine the pathophysiological and clinical significance of Copeptin, Chemerin in patients with CHF.

**Limitation:** The small sample size, needed a more subjects and for longer period was limitation of the study.

Vision and Geographical Information System: Toward Spatial Statistical analysis in Parts of Iraq

Fadia W. Al-Azawi
Lecturer, Al Karkh University of Science

ABSTRACT

Short wavelengths in the visible part of the electromagnetic spectrum ranging from (380- 500) nm; which includes blue light, can trigger critical physiological responses including circadian rhythm synchronization and pupil constriction. Blue light cause damage to human eye, and the blue light hazard term has been coined to highlight this dangerous.

The blue light can result in the demise of healthy tissue via apoptosis of photoreceptors and critical retinal pigment epithelial (RPE). This slow motion process during which damage accumulates over a lifetime has been embroiled in the different types of refractive errors i.e. (longsighted, shortsighted, and astigmatism) and pathogenesis of retinal degenerative diseases.

In the present work, patients were chosen at random from different areas in Iraq and studied for the period from November 2016 to March 2017. The refractive errors of the eye were corrected using two different methods (traditional and blue light filter) spectacles. The blue-light filtering glasses were using for improving the vision of the patients and gave the best results for correction’s compared with traditional glasses. This relationship was examined to investigate the potential correlation between the presence or absence of a blue filter on the refractive errors for the optics of the eye, and the inter-pupillary distance (IPD).

Geo-spatial techniques were also utilized with the aid of Geographical Information System (GIS) software for analysis and interpretation of the acquired data over a wide range of Iraq.

A new statistical model designed by us using Statistical Package for the Social Sciences (SPSS) to show if the results is significant or not significant. Results utilized with a statistically significant value less than 0.0001 for spherical-blue-filter, cylindrical-blue value, and axis-blue filter.

Keywords: Blue-light, Refractive errors, Spectacles, GIS

Introduction

Visual recognition happens when light strikes the retina, which consists of an intricate structure of exceedingly concentrated cells that forms the different layers of the eye. prior reaching to the retina, incoming light must penetrate the visual media. This is the transparent tissues and liquids that lie between the front piece of the eye and the retina. The ocular media consists of the cornea, lens, (aqueous and vitreous) humor. This media either transmit lights or absorbs, depending on the wavelength of the incident light as shown in the figure (1).

Figure 1: Visible light path until penetration of the ocular media

Almost the majority of the UV that reaches the eye is absorbed by the cornea or the crystalline lens. In the

Email: fadia.alazawi@kus.edu.iq
eyes of an adult only (1-2) % of incoming UV is transmitted to the retina. The cornea and the crystalline lens also block infrared above 980 nm; and the vitreous humor absorbs the infrared above 1400 nm which is not absorbed by the crystalline lens. The net consequence of light filtered by the ovisual media is that the retina is presented almost noticeable to the visible part of the solar spectrum as shown in the following figure (2)\(^2\).

Figure 2: UV light transmission through the eye

Ultra-Violet and visible light with high energy cause the crystalline lens to fluoresce very few, resulting in a slight fog which may be increase with progressing in age. Lenses that prevent the entire blue spectrum is impractical for everyday use not just because of their effects on color perception and facial appearance, but also the reason is the physiologically important circadian function which requires exposure of the eye to light in the range 470 nm \(^3,4\).

Blue light reduction at specific wavelengths can be achieved by increasing the reflection on the first side of a lens and/or reducing UV by minimize UV reflection on the back side of the lens \(^5\).

The vision and protection from harmful blue light sources and their effect on vision are shown in the following figure (3).

Figure 3: Vision (Risk and protection) from harmful blue light
The IPD is the distance between the optical axes and the pupils of a binocular visual system. It is an important part of spectacle prescription. IPD is measured in mm to ensure an accurate fit when writing prescriptions for glasses. The average adult has an IPD of 62 mm, although the normal range for most individuals is between (54, and 74) mm [6,7].

An incorrect IPD value can cause headaches, fatigue, nausea, blurry vision, and double-vision images. In particular, a minor error in the IPD with a complex prescription can have adversely undesirable outcomes [8].

Materials & Method

The patients were randomly chosen from different parts of Iraq and examined for the period from November 2016 until March 2017. The relations between different examinations types were studied as outlined in the following section.

The first part of this work involved the use of two types of corrections for refractive errors of the eye; these are (traditional and blue light filter) spectacles.
The map shows the location of the male butterfly majority and female butterflies in Iraq. In this paper, a coding of $\sim 2$ for males and 0 for female was used in the identification of the butterflies.

There are three essential colors in this map; two of them identify male and female; the third one showed the lack of presence any butterflies, and the other mixing colors without dot showed mix availability of both sexes.

Measurement of the IPD is necessary for acquiring accurate solutions and suitable spectacles for correction of refractive errors. The IPD ranged from (57- 70) mm in the patients.

Figure 10: Frequencies of the inter-pupillary distance (IPD) in millimeters

Figure 11: Distribution of the selected patients over a wide range in Iraq according to IPD (mm)

Figure 12: Prescription of the eye glasses after examination over wide range in Iraq : (a): Sphere (b): Cylinder (c): Axis

**Results & Discussion**

The results from figure (14) showed that the values of the spherical spectacles ranged from ($-1.626 - 1.373$) D and the values of the cylindrical spectacles ranged from ($- 0.125 -1.145$) D.

The negative values are associated with myopic and astigmatic myopic eyes; the positive values are associated
with hypermetropic and astigmatic hypermetropic eyes; while zero implies Plano, which is associated with emmetropic eyes (eyes with no refractive errors).

The result of using the spherical-blue- filter, cylindrical-blue-filter, and axis-blue-filter for the correction of the refractive errors of the eye indicates better results by comparing with the results without blue filters for the same patients because the power of the lens of the eye needs lesser correction for the blue filter than the traditional approach as indicated in figure (13)

![Figure 13: Comparison between results for correction for cylindrical of RE using the traditional and blue filter](a)

![Figure 14: New statistical model displays the effects with significant value lesser than 0.0001 for spherical-blue-filter, cylindrical-blue value, and axis-blue filter](b)

**Conclusions**

Blue-light irradiation is an important part of digital eye strain and the way it affects people of every age. Every opportunity was taken to instruct, demonstrate, instruct, and provide a way to protect our patients from potential blue light harm.

Some wavelengths in the blue-violet range are damage to the retina, and cumulative damage of the blue-light is implicated in retinal disorders. For spectacle to protect the retina, this implies that in addition to protecting against UV light, attenuation of high energy blue violet light is required. But for normal physiologic functioning, the spectacles must prevent this light without reducing transmission in the chronobiological spectral band.

Furthermore, patient acceptance may be limited when glasses are clearly colored and distort their color perception, as is the case with most blue absorber spectacles. To improve vision and support color perception, glasses should offer high transmittance of
all wavelengths of the visible light outside the UV and phototoxic blue bands.

In recommending selective filtering of phototoxic wavelengths, doctors have an ideal chance to perform a truly beneficial function, protecting vision for a lifetime, even if the patient is being examined for the errors of refraction and the prescription of new spectacles.

Ground Water Quality that Affects Human Health in Scavenger Settlements around Integrated Waste Disposal Site (TPST) Bantargebang Bekasi, Indonesia

Hadid Sukmana¹, Haryoto Kusnoputranto², Suyud Wardo Utomo²
¹Graduate Student, School of Environmental Science, ²Department of Environmental Health, Faculty of Public Health and Graduate School of Environmental Science, Universitas Indonesia, Jakarta, Indonesia, 15413

ABSTRACT

All this time, the design of Bantargebang TPST follows the rules of landfilling with sanitary landfills which are equipped with leachate management and gas control, but in reality the implementation is open dumping (stacking without processing). Pollutants in leachates such as hardness, manganese, nitrites, iron and heavy metals will flow away from the landfill that causes pollution in surface and ground water, this way is very dangerous and harmful because it will cause permanent pollution to ground water. The resulting impact of poor water quality is the occurrence of various types of diseases and direct impact on humans. The danger of water pollution caused for human health is divided into two, namely direct and indirect hazards. This research uses quantitative method. Quantitative method is used to calculate groundwater quality analysis using laboratory instrumentation. The research results concludes that ground water quality, which is by chemical parameters all meet the quality standards, while by microbiological parameters all have not met the quality standard. This research can contribute to providing advice on building sanitation and governance of groundwater preservation at the Bantargebang TPST.

Keyword: Ground water, human health, leachate, water quality

Introduction

Groundwater is one of the vital water sources on the planet that is extracted for basic uses such as drinking, agriculture and industry¹. Groundwater also accounts for 43% of global irrigation water use and is more suitable for irrigation purposes compared to surface water². Water is an important factor for all life and human survival and has an important role both for drinking and economic sector³. Protecting water resources from pollution is highly necessary⁴. Water quality has an important role in determining the ecological environment and public health⁵. Clean and safe water is the main source for human, social and economic development⁶. Adequate quality water resources are a prerequisite for economic development and ecological integrity⁷. The decline of water quality is one of the problems of the 21st century⁸. Many factors influence water quality, such as natural processes (for example, weather, rainfall, soil erosion), anthropogenic activities (for example, agriculture, urban and industrial activities) and increased utilization of water resources⁹. Because of the effects that have been explained, thus water quality has become a serious problem in the world. Freshwater resources may become scarce in the future, which will threaten the use of water resources, especially for drinking water and economic development¹⁰.

We can know the quality of water by testing it. The tests are divided into three kinds including physical, chemical and microbiological testing. The traditional method for water quality assessment uses a comparison of water quality parameters with its standard limits¹¹. Water quality can be defined by several parameters, which are physical parameters (temperature, turbidity, dissolved...
solids, etc.), chemical parameters (pH, dissolved oxygen, BOD, metal content) and microbiological parameters (presence of plankton, bacteria)\(^{(12)}\).

Bantargebang TPST is one of the largest Solid Waste Disposal Sites in Indonesia located in Bantargebang District, Bekasi City, West Java Province, Indonesia. Bantargebang TPST has been operating since 1989 based on the West Java Governor’s decree. The area of Bantargebang Waste TPST is 108 Ha, and has been operating since 1989, and it is estimated that the amount of waste buried has reached more than 30 million tons with an average height of 18 meters per zone. Based on data from the Environment Agency of DKI Jakarta, the volume of waste flowing into the Bantargebang TPST every day reaches 6,500-7,000 tons/day.

The resulting impact of poor water quality is the occurrence of various types of diseases and direct impact on humans. The danger of water pollution caused for human health is divided into two, namely direct and indirect hazards. The immediate danger that occurs can be caused by consuming contaminated water by drinking it directly or through other intermediaries, as well as using polluted water for daily activities. The potential for groundwater pollution is very high if there is infiltration from leachate or waste water from human activities. The main source of pollution is a landfill that is not managed properly.

TPST of waste must be well planned, its aspects of space availability, finance, operations and maintenance as well as the impact on the environment must be well-assessed. Waste that is not decomposed properly will produce gas and liquid which is known as leachate. Gas from decomposition can cause odors and respiratory problems for residents around the location\(^{(13)}\). Water pollutants such as hardness, manganese, nitrites, iron and heavy metals will flow away from landfills which cause pollution to the surface and ground water\(^{(13)}\). The purpose of this study is to analyze the groundwater quality of affects human health in scavenger settlements Integrated Waste Disposal Site Bantargebang.

**Methodology**

This research was carried out around the Bantargebang Bekasi TPST located in the Bantargebang sub-district, Ciketing Udik Village. Ciketing Udik Village lies in south of Bantargebang TPST. This research uses quantitative method. Quantitative method is used to calculate water quality analysis using laboratory instrumentation. This research uses a cross sectional research design in which researchers conduct observations or data collection at a time (point time approach). Water testing is carried out in KAN accredited laboratories namely PAM Jaya. Groundwater quality data is compared with the provisions of the Ministry of Health of Republic of Indonesia Regulation No. 492/MENKES/PER/IV/2010 concerning drinking water quality standard requirements.

**Results**

The results of the analysis of groundwater (chemical and microbiological) in Ciketing Udik Village at a distance of 300 and 400 meters can be seen in Table 1. The results of the analysis are compared with Ministry of Health Regulation No. RI. 492/MENKES/PER/IV/2010 concerning the requirements for drinking water quality standard.

Discussion

Chemical Parameters

Fluoride: The fluoride test results for each distance can be seen in Table 1. The fluoride test results carried out at four sample points at a distance of 300 meters and 400 meters all meet the required quality standard, which is 1.5 mg/l. The results of the fluoride parameter test in groundwater at the research location have a relatively small content. High fluoride content will cause fluorosis. In addition, fluoride contamination in groundwater is also caused by industrial waste water(14) while the research locations are not industrial locations so that fluoride contamination due to industrial waste disposal can be minimized.

Nitrite: Nitrite test results for each distance can be seen in Table 1. Test results conducted at four sample points at a distance of 300 meters and 400 meters for Nitrite parameters, of all points at a distance of 300 meters and 400 meters meet the required quality standard, which is 3 mg/l. The result of this test indicates that the biological process activity in the organic matter reformation is quite low so that the nitrite content in the research area is also low. Because this is in line with Kurniawan’s research(15) that shows average nitrite content in well water in landfills area Galuga Cibungbulang Bogor already exceeds the limit allowed according to Water Quality Criteria Class I.

The high nitrite content is caused by the huge number of nitrifying bacteria so that more nitrite content is formed while at the research location there are not many nitrifying bacteria so the nitrite content is still relatively low. Nitrite is an intermediary in the oxidation of ammonia to nitrate so this is also in line with Hamzaraj’s statement(16) that in the results of this research there are no nitrite results that exceeds the quality standard, compared to the nitrate results obtained there is also no nitrate that exceeds the quality standard.

Nitrate: The nitrate test results for each distance can be seen in Table 1. The nitrate test results carried out at four sample points at a distance of 300 meters and 400 meters all meet the required quality standard, which is 50 mg/l. This is in line with previous research in the same place by Manurung(17) the result obtained is nitrate concentration of 18.4 ppm, while in another study by Kurniawan(15) shows average nitrate content in well water in landfills area Galuga Cibungbulang Bogor is 0.06 mg/l. That value is still around the maximum limit allowed based on water standard criteria.

In addition, the low nitrate content in the research area is caused by regional conditions which are mostly not agricultural land. The research area is a landfill that is not polluted by pesticides. In line with Wardhana’s theory(18) that the most nitrate content is caused by agricultural waste due to the use of nitrogen fertilizers. Furthermore, the temperature also affects the concentration of nitrates in water bodies, in line with Kim(19) groundwater temperature obtained from the results of this research meets the quality standards so that it does not affect the concentration of nitrate.

Cyanide: The cyanide test results for each distance can be seen in Table 1. The cyanide test results carried out at four sample points at a distance of 300 meters and 400 meters all meet the required quality standard of 0.07 mg/l. The results of this test shows that the quality of groundwater in the research area has not been polluted by hazardous chemical contents such as cyanide. Cyanide content in water will be harmful to human health. Cyanide in the form of free compounds will be very toxic, this is in line with the statement of Pitoi.(20) Based on the results of laboratory tests that have been carried out on chemical parameters that are directly related to human health, the quality of chemical parameters of the groundwater in scavenger settlements around the Bantargebang TPST obtained within distance of 300 and 400 meters meets the required quality standards. Thus, chemically the quality of groundwater in scavenger settlements around Bantargebang TPST can still be said to be good and adequate for consumption.

Microbiology Parameters

Coliform bacteria and Fecal coli (E. coli): Microbiological tests conducted to determine the quality of groundwater around Bantargebang TPST shows total coliforms and E. coli can be seen in Table 1. Observations of groundwater samples at a distance of 300 meters found total coliform content >60 MPN/100ml whereas for E coli contains 6-14 MPN/100 ml each. These results do not differ greatly from the quality of groundwater at a distance of 400 meters. The distance of 400 meters obtained the total coliform content of 46 MPN/100ml to > 60 MPN/100ml, while the content of E. coli was 1-10 MPN/100ml. The content of coliform bacteria and E. coli for all research areas shows that it has exceeded the maximum permissible limit according to quality standards.
The analysis shows that the content of coliform bacteria in well water was higher than that of fecal coli bacteria. This condition indicates that in the research location more waste is sourced from plant debris, food scraps, and animal carcasses which are the main substrate for the growth of coliform bacteria (Enterobacter aerogenes). These bacteria together with rainwater can directly or seep into the topsoil and eventually absorbed and accumulated in well water.

The source of microbiological pollutants from the garbage disposal system can seep into the ground water vertically or horizontally. This is in line with the research conducted by Kurniawan(15) who did the water quality analysis in TPA Galuga area within 400-700 meter distance of his research area the well water is already polluted by E. coli bacteria. This result is supported by Kurniawan(15) who found that bacteria could move as far as 830 meter from contaminants source, so that so the result of groundwater microbiology quality in Ciketing Udik Sub-district contains positive coliforms and E. coli.

The presence of coliforms and E. coli in large quantities or above the quality standards limit indicates that the groundwater has been contaminated by pathogenic bacteria that harm the body. In addition, research from Usman(21) which shows that well water can be contaminated by leachate from latrine if the toilet is not far enough from water source while a research of Graham(22) shows that latrine can be source of groundwater pollutant. Untreated latrines can produce negative externalities, which not only affect the owner but also the surrounding community.

Based on the results of laboratory tests carried out on microbiological parameters, the quality of the microbiological parameters of the groundwater in scavenger settlements around the Bantargebang TPST obtained with a distance of 300 meters and 400 did not meet the required quality standards. Thus, microbiologically the quality of groundwater in scavenger settlements around Bantargebang TPST can be said to be inappropriate for consumption.

**Conclusion**

Ground water quality at a distance of 300 and 400 meters shows chemical parameters, all chemical parameters meet the quality standard. In microbiological parameters, all microbiological parameters have not met the quality standard.

**Competing Interest:** This research is part of final task of Universitas Indonesia students, thus, there is no competition in conducting this research.

**Ethical Clearance:** The study was approved by the Institutional Review Board (IRB) of School Of Environmental Science, Universitas Indonesia.

**Source of Funding:** This research is self funding students

The Effect of Special Exercises using Virtual Reality Glasses (3D) in Learning the Stop Attack with the Epee of the Students

Haider Fayyadh Hamad Alamiri¹, Mohamed Sahib Abd Zaid¹
¹University of Kufa, The College of Physical Education and Sports Sciences, Iraq

ABSTRACT

The study included the following: The two researchers tackled the methods and teaching methods that aim to increase the speed of learning, which includes the treatment of many variables that occur during the lesson, because of their active role in the learning process. The importance of the study comes through an attempt to learn the effect of the use of virtual reality glasses (3D) in learning some of the offensive skills with the Epee. The objectives of the study were:

1. Preparing the 3D system for virtual reality glasses.
2. Preparation of exercises using the virtual reality glasses to learn some of the offensive skills with the Epee for students.
3. Learn about the effect of exercises on the use of virtual reality glasses to learn some of the offensive skills with the Epee for students.
4. To identify the differences between the control group and experimental in the impact of exercises for the use of virtual reality glasses to learn some of the offensive skills with the Epee for students. While the second section was devoted to theoretical and similar studies. The third section used the experimental method to fit the nature of the current study. The research society included 60 students from the College of Physical Education and Sports Sciences, Kufa University for the academic year 2017-2018. (30) Students in each group. The fourth section was to discuss the results and analysis and allocated the fifth section of the conclusions and recommendations were as follows:

In light of the results of the research, the following conclusions were reached:

1. There are differences between the pre-test and the post-test for the experimental group and for the post-test in the sample members of the students of the third stage of the Faculty of Physical Education and Sports Sciences. As a result of following the curriculum prepared by the researcher.
2. The experimental group that used exercises using virtual reality glasses (3d) achieved the advantage of the control group in learning some of the offensive skills with the sword.

Keywords: Special exercises, virtual reality glasses, stop attack with the Epee of the students.

Introduction

One of the most important mathematical sciences that lead the learner to achieve the best performance in most skills. Individual and collective games is dynamic learning which is characterized by inclusiveness and diversity. It requires the use of many types of teaching aids, exercises, equipment and aids that directly affect the process of learning motor skills and developing physical and, which aims at achieving the desired goal through the use of equipment, tools, exercises and different techniques and methods to help him to get to know the details of the performance of any skill in dueling.

The researchers noted the fact that there is slow and weak in the process of learning the offensive skills in the Epee due to the use of repetitive methods which give the learner the nature of boredom and boredom. In order to reach better levels and increase the speed of learning, the researcher saw the use of special exercises...
as well as The use of a virtual presentation tool, which is the virtual reality glasses through which exercises are displayed to increase the spirit of excitement and excitement in the students, which enables the student to see the performance of the technique in a modern three-dimensional and two-speed as well as three directions, which enables the student to understand and recognize the movement Skills and skills in a better and faster way. The importance of research is in the preparation of special exercises using the 3D virtual reality viewer.¹

As the importance of learning the basic skills of the sport of fencing and how to upgrade them comes through the examination of new methods in order to link to the best performance of the student, the scientific and technical development requires that the person to pass him and uses what is best to serve the educational process and success and reach to the highest levels, Fencing sport is a science, art, and a way to provide the individual with health and self-confidence as well as to develop balanced thinking and give him a broad horizon for perception and thinking.²

The importance of research in the preparation of special exercises suited to the ability of students and their abilities using a modern view of the virtual reality viewer in a three-dimensional view as well as three directions and the speed of normal and slow.

Research Objectives

1. Preparation of the system for the preparation of the (3D) virtual reality system.

2. Preparation of exercises using the virtual reality glasses in learning some of the offensive skills with the Epee of the students.

3. Learn the effect of exercises using the virtual reality glasses (3D) in learning some of the offensive skills with the Epee for students.

4. Identify the differences between the experimental groups and control the effect of exercises using the virtual reality glasses (3 d) to learn some of the skills of the attack with the Epee of the students.

Research Methodology

The researcher used the experimental method to suit the nature of the problem. The experimental approach is “an attempt to control all the basic factors affecting the variable or dependent variables in the experiment except one factor controlled by the researcher and modified in a certain way with a view to determining and measuring its effect on the variable or dependent variables.”³

Society and Sample Research: Society “is all individuals, persons, objects or situations that are the subject of the research problem studied by the researcher”. The researcher identified the research society represented by the students of the third stage in the Faculty of Physical Education and Sports Sciences University of Kufa for the academic year (2017-2018) of (60). The sample was randomly selected by drawing lots between two divisions (B, C), the number of (30) students, where the results of (5) students were excluded for the benefit of the pilot experience, also excluded the results of (5) others for being retarded and deferred and players, and thus became Division B represent the control group.

Homogeneity and Equivalence of the Sample: For the purpose of starting a single project plan, and to verify the accuracy and accuracy of the results, the researcher conducted a homogeneity between the sample according to the variables (age, weight, length, arm length). The mean and standard deviations were also extracted. Our distribution is normal when the torsion value is between (+1, -1), as shown in Tables (1-2).

Value (t) calculated at the significance level (0.05)

Through the table (2), which shows that all was the greater than 0.05, which indicates that the results were not significant. This indicates the equality of the two groups in the pre-test.

Field Research Procedures:

Identify the Skills of the Subject: The offensive skills were chosen by the fire weapon, which is within the curriculum of the Faculty of Physical Education and Sports Sciences at the University of Kufa, which is taught in the second course. Accordingly, the skills of the counter attack (the counter-attack, the stop attack) were selected.

Characterization of the tests used in the study

Test the Skill of the Stop Attack:

Objective of the Test: assess the level of performance of the skill of the stop attack.

Tools Used: Epee number 2, measuring tape, as imaging cameras

Test Description: from the standby mode (Oncard) When giving the start signal, the student to perform the stop attack at the beginning of the attack of the player by striking the blade of the student’s opponent’s weapon and the process of appeal.

Registration: The rating is calculated by the evaluators so that each attempt is evaluated from (10) grades and the three attempts are combined and divided into three.

The Pilot Study: The researcher conducted the experimental experiment for the technical tests on Monday, January 22, 2018 in the fencing room at the College of Physical Education and Sports Sciences, the University of Kufa on (5) students to determine its validity and its applicability to the members of the research sample later.

During the exploratory experiment conducted on the students, the following were identified:

1. Fit the tests of offensive skills with the Epee of the sample.
2. The appropriateness of the devices and tools used and their safety.
3. Identify the time taken for the tests.
4. Know the problems and obstacles that may occur during the main experiment.
5. Extraction of the scientific basis for tests.

Procedures of the Main Experiment:

Pretests: The researcher conducted the Pretests by sampling the sample performance of the studied skills. The sample was sampled on Monday, 19/02/2018 and at the hall of the College of Physical Education and Mathematical Sciences at the University of Kufa. The researcher then conducted the Pretests of the skills (The attack of the attack was repeated, the attack was repeated, the attack was resumed, the attack was completed). After that, the photography of the skill performance of the members of the research sample was transferred to the CDs and presented to the experts and specialists.

To achieve the research objectives, the researcher prepared special exercises for the experimental group and used the virtual reality glasses (3D) to learn the skills in question

Posttests: The post-test was conducted on Monday, April 23, 2018, at the College of Physical Education and Sports Sciences hall, University of Kufa where the research sample was photographed for the skills (stop attack, counter-attack). On the CDs of and presented to experts and specialists in the field of fencing to assess the performance of skill, taking into account the same conditions and conditions and instructions used by Pretests.
Results are Discussed: View, analyze, and discuss the results of the mean, standard deviations and t.test testing of the Pre and Posttests of the skills in question for the experimental group.

Value (t) calculated at a significance level (0.05)

The results of countries (3) showed that there were significant differences between the pre and posttests of the experimental group for the skill of the stop attack where the value of (t) calculated (24.59) and below the level of significance (0.05)

View, analyze and discuss the results of computational circles, standard deviations and t.test testing of pretest and remote tests of skills for the control group: The results of countries (3) showed that there were significant differences between the pre and posttests of the control group for the skill of the stop attack, where the value of (t) calculated (17.89) and below the level of significance (0.05). Discuss the results of the computational and standard deviations and test (t.test) for the pretest and remote tests of the skills of the experimental group.

Discuss the results of the computational and standard deviations and test (t.test) for the pretest and remote tests of the skills of the control group: In the light of the extracted data as shown in Table (3), which shows the differences of the pretest and remote tests of the control group in the skills performance values of the skills (stop attack, counter-attack) and for the tests of the dimension. This explains that the method used by the teacher in the process of learning skills has led to learn positively, that the teacher of the article used a certain method of teaching and that he is experienced and specialized in learning the skills of the Epee so the learner was acquired skill through the teacher of the article, which follows the normal method, preferably to teach in the educational stages of the best teachers km The researcher attributed the learning to the skillful performance as a result of the training and effectiveness of the skills used in the educational methods, where the method of the Emiri is “an immediate response to the decisions and instructions of the teacher,” as the learner in the traditional educational method used, is an imitator and executor of the orders issued and instructions and instructions by teacher “.5

Discuss the results of the computational and standard deviations and test (t.test) for the pretest and remote tests for the skills of the experimental group and the researcher attributed this to the ability of these exercises and their repetitions as “the more repetition of the skill becomes more automatic and decrease tension and become more efficient and efficient movement” and the repetition is “Typical without significant change in motor responses “.5 This may be included in the educational units to increase in the implementation of vocabulary and parts and the application of exercises for skills as well as the presentation of exercises that create a positive and effective atmosphere and excitement and draw a clear picture and a concept of how to perform skill.

View, analyze and discuss the results of computational and standard deviations and test (t.test) for the remote tests of the experimental and control groups of skills: Table (4).shows mean, standard deviations and t.test values calculated in the post-test of the control and experimental groups.
Table 4: Remote test in experimental and control groups

Value (t) calculated at a significance level (0.05)

Table (4) shows that there are significant differences in the remote tests between the control and experimental groups for the skill of the stop attack where the value of (t) calculated (5.00) was below the level of significance (0.05).

Discussion of computational and standard deviations, and t-test testing of remote tests of experimental and control groups of skills: Table 4 shows that the results of the tests showed the improvement in the experimental group in all the research variables. The differences were evident in the results of the post-test in favor of the experimental group when compared to the control group, which was improved but less than the experimental group. The effect of the specific exercises on him showed clearly. This confirms that the educational curriculum prepared by the researcher, including the special exercises and the presentation of the three-dimensional effect has been effective and clear in improving the skill and technical performance of the students and this indicates that the curriculum built on the basis of scientific correct purpose took into account all the considerations of study and individual differences Bad Physical, or other skills.

Conclusions

Through the presentation, analysis and discussion of the results, the following conclusions were reached:

1. There are differences between the pre-test and the post-test for the experimental group and for the post-test in the sample members of the students of the third stage of the Faculty of Physical Education and Sports Sciences. As a result of following the curriculum prepared by the researcher

2. The experimental group that used exercises using virtual reality glasses (3d) achieved the advantage of the control group in learning some of the offensive skills with the Epee.

Laser Applications in Some Clinical Blood Constituents Analysis (Bilirubin, Triglyceride and Hemoglobin)

Hassan Abdullah Mahdi¹, A. A. Al-Rubaiee¹, Nadheer Jassim Mohammed¹
¹Department of Physics, College of Science, Mustansiriya University, Baghdad, Iraq

Abstract

The requirements of the present work are a laser system were consisted of laser source (Argon-ion laser power 1 mw), laser power meter combined with Silicon detector, power supply, cuvette and sample holder were used in the estimation of concentration or activity of some blood constituents (Bilirubin, Triglyceride, and Hemoglobin). A spectrophotometer also used in the measurement of absorption spectra of these constituents and determine the absorption peaks which gave a good agreement with the values by Argon-ion laser (488-514.5 nm). The comparison of the required results of a number of different test samples of patients group (male and female) with different ages in the clinical laboratories using both laser and spectrophotometer, denotes to the ability of the use of Argon-ion laser and helps to minimize errors where the laser had a characteristics that not available in other light sources.

Keywords: Laser applications, Argon ion laser, Blood constituents analysis, Bilirubin, Triglyceride, Hemoglobin

Introduction

One of oldest dreams of power is to have intense beams of light which could be controlled and projected over great distances. Now with the advent of laser, this old dream seems to have come true.

The laser is a source of light which has several important properties (monochromatic light, brightness, directional and coherent). The first experimental laser was successfully constructed and tested in 1960 by Maiman¹. Laser applications are very wide in all fields such as industrial, military, communication, medical and others). In medicine, there are many types of laser are used such as Co₂–laser (10.6µ), Nd-Yag laser (λ=1.064µ), Dye laser (Tunable), Excimer (UV) and Argon- ion laser. The Argon- ion laser was used in several applications such as in medicine (Ophthalmology), in clinical blood constituents and biological fluid analysis. Its emits several wavelengths but the most intense (488 and 514.5 nm). But why Argon-ion laser is used in blood constituent analysis? The answer of this question is²–³:

1. The Argon-ion laser works with high efficiently and multi wavelengths (UV and visible), but most intense (488 and 514.5 nm).
2. It is absorbed by chemical materials and biological fluids at human body.
3. It is not absorbed by water which is enters in large percent of blood.
4. It’s wave lengths are agree with large number of principle clinical analysis.

Figure 1: The Laser System

Laser System Components: The laser system has been configured for using in clinical applications. It’s composition that was used is shown in fig. (1). This figure is consisted of the following:
1. **The Sources (Argon-ion laser):** It’s wavelengths (488 nm) or (514.5 nm) with power (1 mw).

2. **Cuvette Holder:** This holder must be fixed without vibration, also with two circular apertures with a same diameter which allowed a laser ray to passes through it.

3. **Cuvette:** Its dimensions (5×1x1cm) with high transmission for visible wavelengths, this kind of cuvette is made of quarts which it allowed to visible wavelengths to be transmitted by it.

4. **Laser Power-meter:** This device with high sensitive for power (µw) and (mw), also for wavelengths lie in visible and (UV) of electromagnetic spectrum. It is connected with silicon detector to receive the light signals and converted to electrical signals.

5. **Power Supply:** It is used power supply with (5v). This system is set up with (alignment) to avoid any losses in intensity of incident ray on the cuvette which contains the (Test sample).

**Laser System Work:** This work depends on measurement the power of transmitted ray from test sample with respect to the total power of laser source, when the total power of laser is used (Argon-ion laser) with (1mw) power, it is noted that the transmitted power from test sample is represents a function of percent transmission (T%). From this one can calculates the (transmittance) and the absorbance and the activity of inzyme for any clinical analysis. The laser system can be worked using the following steps:

1. Provide each of a laser source, power-meter and power supply.
2. Put the Blank solution in the cuvette.
3. Must be calibrated power supply and put the indicator on the maximum (100% T; 1mw).
4. Put the test sample in the cuvette.
5. Measure the transmitted power from the test sample which is represents the function of percent transmittance, then from this, calculates the absorption of each of test and control, after that calculates the concentration or activity for that analysis as shown in Tables (1, 2 and 3).

By the spectrophotometer, it is noted the value of absorption before the power of laser system. In Table (4) was indicated how to calculated the concentration or activity for each analysis which are measured as referred to each of them with medical units. Also it is calculated the value of each of correlation coefficient \( r \) \([-1 \leq r \leq 1]\) and relative standard Deviation (R.S.D %) as shown in the formula:

\[
\text{R.S.D.} = \frac{\delta}{x} \times 100
\]

Where \( \delta \) is the Standard Deviation; \( x \) is the average calculation or the average results by each of laser system and spectrophotometer.

Conclusions

From the results which are measured by the laser system by comparing the spectrometers with the results for clinical chemistry laboratories, it was concluded the following:

1. The laser system for the clinical analysis is simple, accurate and fast.
2. The laser system is economical in terms of using the chemical materials which it used for clinical analysis.
3. Small sample of blood is enough to do this analysis by laser.
4. The time is very fast to measure the clinical analysis.
5. It is possible to programming all the results that leading to reduce the staff.
6. The results are accurate because the laser is monochromatic wave length.

The Effect of Exercises Relative Strength and Absolute Method Pyramid Attached to the Compound Whey in Some Variables Left Ventricle of the Heart and the Explosive Ability and Accuracy Index Shooting of the Jump Players Kerbala Club Young Handball

Rafid Saad Hadi¹, Hussein Hassoun Abbas¹, Hassim Abdul J. Saleh¹
¹University of Kerbala, The College of Physical Education and Sports Sciences, Iraq

ABSTRACT

The researchers saw the use of absolute and relative strength exercises in the hierarchical style attached to the whey compound, which is used for the first time in the training of handball players, to the knowledge of researchers in some variables of the left ventricle of the heart and the development of explosive capacity and the index of skipping skill, in an attempt to solve some of the problems facing The aim of the study was to identify the effect of absolute and relative force exercises in the hierarchical method attached to the whey complex in some left ventricular variables of the heart, explosive ability and the skill of shooting of the young handball players. Effectiveness of the two groups in the investigated variables.

The researchers used the experimental design of the two experimental groups. They identified the research community with the players of the Kerbala Club in the youth handball team (17-19 years) and they were all selected as a sample of the research. They were randomly divided into two experimental groups, and they concluded that both groups developed the search variables, but the group that used the relative strength in the hierarchical method was the best in developing the explosive capability and the accuracy index of the skipping skill.

Keywords: strength, method pyramid, compound whey and accuracy.

Introduction

Due to the importance of relative and absolute power in the field of sports and its association with many sports, especially the handball game through its association with the development of the force it needs in a great way and in most forms, it has become one of the important pillars used to train the players in order to help increase the development of their athletic performance,¹ Which comes from the evolution of physiological, and explosive capacity is one of the elements of the physical preparation of handball players are clearly contributing to improving the efficiency of the left ventricle of the heart and the achievement through the development of explosive capacity of the Shooting of jumping, The dietary supplements are suitable for such exercises on the one hand and for the other, on the other hand, such as whey or whey, which provides a large amount of full amino acids that the body cannot manufacture and which builds muscle and tissue.²

Hence the importance of this study to identify the superiority of the impact of exercises relative strength or absolute strength exercises in the hierarchical method with the use of serum whey in some variables left ventricle of the heart and the explosive ability and the index of skipping skill of jumping for young handball players. Through the follow-up of the researchers to the training of handball players, who are involved and interested in this game, saw the adoption of trainers on the traditional methods in the evolution of the basic variables in the game and not experimenting with modern methods and know which is better, while not using the compound whey as a dietary supplement for players during the duration of training and preparation.

Therefore, the researchers considered the use of absolute and relative strength training in a hierarchical manner with the use of the whey compound, which is used for the first time in the training of handball
players to the knowledge of researchers to see its effect in some variables of the left ventricle of the heart and the development of explosive capacity and the index of skipping skill.

Research Aims:

1. Recognition of the effect of absolute and relative strength exercises in the hierarchical method attached to the serum whey in some left ventricular variables of the heart and the explosive ability and index of skill of Shooting of the jump for young handball players.

2. Identification of the effect of the two groups on the studied research variables.

Research Hypotheses:

1. There is a positive effect of exercises of absolute and relative strength in the hierarchical approach attached to the serum whey in some variables left ventricle of the heart and the explosive ability and the index of skipping skill of jumping for young handball players.

2. The superiority of the relative strength exercises in the hierarchical method to the absolute strength exercises in the hierarchical method attached to the whey compound in the investigated variables.

Research Methodology and Field Procedures:

Research Methodology: The researchers used the experimental design of the two experimental groups.

Search Community and Sample: The researchers identified the research community with the players of Kerbala club in the ages of 17-19 years and they were all selected as a sample for research and in a comprehensive inventory method. They were randomly divided into two experimental groups with 8 players per group. The first group exercises the nesibe force in the pyramidal method attached to the whey complex, and the second group used the absolute strength exercises in the hierarchical manner that is attached to the whey compound.

In order to proceed from one line of research, the researchers sought to extract the homogeneity and equivalence of the individuals of the research sample in the investigated and extraneous variables.

Means, tools and devices used in research:

Means of gathering information

(Tests, observation, resolution).

Tools and devices used.

(2), a precision ball (50 × 50) number (4), a handball number (12), a medical ball weighing (2 kg), an iron chair, 1), 2 strap, measuring tape, medical balance, vertical jump plate (30 × 150 cm), vertical barrier, eco device, laptop calculator (1).

Search Procedures:

Characterization of Tests

Physical Tests: All left-ventricular changes of the examined heart were measured using an echocardiography device through a specialist physician. The measurements are measured in the laboratory’s comfort and effort situations directly.

Physical and Skill Tests:

The first test: throwing the medical ball from sitting on the chair ⋅

Second test: vertical jump test ⋅

The third test: the speed and accuracy of the Shooting of jumping high:

Pre Test: A preliminary test was carried out on Sunday, 31/12/2017, at the stadium of the closed martyr hall in Kerbala governorate.

Main Experience: After completing the tests, the researchers introduced the exercises that were prepared in the training program for the research sample at the beginning of the main section of the training module and then the main part is completed together with the same exercises of the coach, as follows:

1. The starting date and completion of the exercises from 4/1 to 26/2/2018.

2. Exercises were applied in the special numbers stage.

3. The duration of the experiment (8) weeks distributed over (24) training units at the rate of three units per week.
4. A special trainer has been assigned to each group who are given the exercises scheduled for them on Thursdays, Saturdays and Mondays and at the same time, after completion they are merged again to complete the training module for them under the supervision of their coach.

5. The researchers determined the intensity of exercise between (85-100%).

6. Whey compound was given for 8 weeks at one dose per day.

Post-test: The post-test was conducted on Thursday, corresponding to 1/3/2018, taking into account the same conditions and conditions in the Pretest.

**View and Analyze the Results and Discuss Them:**

View and analyze the results of the tests in the Pre and Post measurement of the two groups of research and discuss: For the purpose of testing the first hypothesis, the researchers used the T test for the corresponding samples of the two research groups, as shown in Tables (1) and (2).

Table (2) shows the statistical indicators of the results of tests in the Pre and Post measurement of the research variables experienced by the members of the second experimental group.

The results showed that the values of the computational circles were higher in the post-test than the Pretest, and there was a significant difference between the tests and for the post-benefit, as indicated by the levels of significance Was less than the level of significance (0.05), which indicates the existence of significant differences between the two tests, and this is consistent with the second hypothesis of the research.

As for the variables (size of the left ventricle in the contraction and incision), there were no significant differences between the tests of Pre and Post, which indicated the levels of significance, which was higher than the level of significance (0.05).

The researchers attributed the reason for the development that happened to the members of the two experimental groups is regularity in the training process and work according to a systematic and organized by the researchers, as the exercises directed and mastered in terms of (intensity, size and density) using relative strength and absolute hierarchical method led to the development of explosive capability of both men and arms Which helped to control the performance of the correct motor paths, as well as increase the speed of performance and reduce the time and disposal of excessive random movements that existed because of failure to adjust the performance resulting from the weakness of the strength of the muscles of the arms and legs as the “ J for any sports game depends mainly on physical numbers “.5

In addition, the use of relative and absolute strength exercises in a hierarchical manner increased the working motor units and obtained neuromuscular adjustment, which was reflected in the development of strength and speed, in order to serve the skill performance.

The researchers also attributed the cause of significant differences in the thickness of the left ventricular wall. The difference between the left ventricular size and the contraction of the left ventricle was not significant. The effect of the muscular strength exercises was more likely to increase muscle size than the increased size of the cavity. The intensity of the effect on the ventricle varies from one sport to another and from one exercise to another, the size of the heart increases in the endurance players, an increase in the size of the left ventricle and not in the thickness of the muscle, unlike the muscular force players whose effect is reversed.

View and analyze the results of the measurement and discussion of the Post tests of the two research groups:

Below the level of significance (0.05), the degree of freedom (14)

By examining the results of the tests in Table (3), we find that there are significant differences between the measurement of the Post tests of the two groups in the variables (explosive power of the arms and legs and the accuracy of the Shooting accuracy of jumping high), and for the benefit of the first experimental group, The values of the significance level were less than the error level (0.05) and this is consistent with the second hypothesis of the research.

While the variable (thickness of left ventricle wall) showed that there was a significant difference between the measurement of the post-test of the two groups and the interest of the second experimental group that used the absolute force because the values of the level of significance was less than the level of error (0.05).

While the researchers attributed the reason why the second group superiority in the thickness of the wall of the left ventricle of the heart because of the nature of stress and severe pressure on blood vessels by the muscle fibers during the performance of such type of exercise, which leads to increased heart rate and systolic blood pressure more sharply and thus, (Hazaa Mohammed) showed that there was an increase in the heart mass resulting from the large increase in the thickness of the abdominal wall after direct muscle training. While the researchers attributed the reason why the second group superiority in the thickness of the wall of the left ventricle of the heart because of the nature of stress and severe pressure on blood vessels by the muscle fibers during the performance of such type of exercise, which leads to increased heart rate and systolic blood pressure more sharply and thus, (Hazaa Mohammed) showed that there was an increase in the heart mass resulting from the large increase in the thickness of the abdominal wall after direct muscle training.10

Conclusions

1. The exercises of absolute power in a hierarchical way to develop the explosive capability and the accuracy of the skill of the Shooting of the jump for young handball players.

2. The exercises of force percentage pyramid method is working to develop the explosive capability and the accuracy of the skill of shooting of the jump for young handball players.

3. The RSI exercises are better than the absolute power exercises in developing the explosive capability and the precision index for the skill of aiming from jumping to young handball players.

Prevalence of Enteric Parasites in Raw Leafy Vegetables in Baghdad City, Iraq

Hatham Ibraheem Khalil
Lecturer, Department of Microbiology, College of Medicine, AL-Mustansiriyah University

ABSTRACT

Background: The eaten raw vegetables have been demonstrated to be a vehicle for transmission of a range of parasites. Various parasites that have been associated with vegetables include species of protozoan and helminthes. To our knowledge no previous surveys have been conducted to evaluate the prevalence of parasitic contamination of vegetables in Baghdad. Therefore, this study aimed to detect the parasitic contamination in some common raw vegetables in Baghdad, Iraq.

Materials and Method: A cross sectional study conducted in Baghdad city for one year (from February 2012 till February 2013). Iodine staining of wet mount preparation was performed to identifying the enteric parasites in a 360 samples of leafy vegetables that commonly eating raw as salad.

Results: 112 (31.1%) were positive samples for enteric parasites out of the 360 samples of leafy vegetables that was examined by this study. Celery and lettuce recorded the highest prevalence of 28.6%, 25.9% respectively, followed by cress 19.6% and parsley 16.9%, while radish and spearmint had the least prevalence of 6.3% and 2.7% respectively. The statistical analysis indicated that the cysts of Entamoeba histolytica (22.3%), eggs of Ascaris lumbricoides (20.5%) and cysts of Giardia lamblia (17.0%) were the most isolated parasites. Seven other species of parasites were also isolated from these leafy vegetables. They were include eggs of Echinococcus (8.9%), oocysts of Toxoplasma gondii (7.1%), eggs of Ancylostoma duodenale (6.3%), eggs of Fasciola hepatica (6.3%), eggs of Strongyloides stercoralis (4.5%), eggs of Trichuris trichiura (4.5%)

Conclusion: Enteric parasites heavily contaminating the leafy vegetables in Baghdad city

Keywords: Enteric parasite, raw leafy vegetables, leafy vegetables, Baghdad.

Introduction

Healthy human diet owing to their nutritional value must contain vegetables as an essential part. Fresh vegetables are main source of dietary fiber, vitamins and minerals. (1) For optimal nutritional value, some vegetables are eaten uncooked as salad within the daily meals to keep the natural taste and preserve heat labile nutrients. Ingestion of raw vegetables represented an important mean of transmission of several infectious diseases because of their complex surface and porosity, which unfortunately facilitate pathogen attachment and survival. (2) Food- and waterborne infections have received considerable attention in the last decade. Some of these infections are well recognized, but are considered emerging because they have recently become more common. (3) Globalization of the food supply, increased international travel, increase of the population of highly susceptible persons, change in culinary habits, but also improved diagnostic tools and communication are some factors associated with the increased diagnosis of foodborne parasitic diseases worldwide. (4) Leafy greens are grown close to the ground and the leaves can become contaminated in the field by soil, contaminated water, wild and domestic animals or improperly composted manure. Pathogens may also be transferred during and after harvest from handling, storing and transporting (5)

Prevalence of different stages of parasite in raw eaten vegetables as the source of contamination may be remarkable indicator about the incidence of enteric parasites among a given community. The great source for transmission of parasitic contamination is the ingestion of not well washed leafy vegetables. The degree of contamination differed according to the type of vegetable examined and the species of parasite was also indicated by these studies. The previous surveys showed that the vegetables can be agents for transmission of
protozoan cysts and oocysts of *Entamoeba, Giardia, Cryptosporidium, Toxoplasma, Cyclospora* and *Isospora* and helminths eggs and larvae of *Hymenolepis, Taenia, Fasciola, Toxocara, Ascaris, Trichostrongylus, Strongyloides* and. (6-12)

**Materials & Method**

**i. Sampling of Vegetables:** A total of 360 leafy vegetables that are commonly eaten raw include celery (*Apium graveolens*) (70 samples), lettuce (*Lactuca sativa*) (70 samples), cress (*Lepidium sativum*) (70 samples), parsley (*Petroselinum crispum*) (70 samples), radish (*Raphanus sativus*) (40 samples) and spearmint (*Mentha spicata*) (40 samples) were chosen for the study as the majority of the population in our community consumes them on a daily basis diet. Vegetables were collected from retail markets located in different parts in Baghdad city. The vegetables were planted in or around Baghdad city. From retail sellers in vegetable markets the samples were randomly collected and bought from those sellers at different monthes of the year (90 samples in each of summer, autumn, winter and spring) in the period from February 2014 till February 2015.

**ii. Detection of intestinal parasites:** About (150 g) of each sample was chopped into small pieces and washed with physiological saline solution (0.95% NaCl). For natural sedimentation, the washing liquid was left overnight, after removing bits of leaves a volume of 300 ml of supernatant was discarded and the remainder was transferred to 10 ml test tubes and centrifuged at 2000 g for 20 min. The supernatant was discarded and the sediment was then stained with iodin, examined under a light microscope (x100- x400 and oil immersion power). According to Soulsby, 1982 the stages of parasites (cysts, oocysts, eggs or larvae) were identified. (13) In each positive sample for parasites stages, the number was counted and the developmental stage and the type of parasites were recorded.

**iii. Statistical Analysis:** By using the statistical software SPSS, a comparisons between different groups was performed. For multiple comparisons, Pearson Chi square test was used between rates of parasites identified in different seasons of the year and p<0.05 were considered significant.

**Results**

Enteric parasites were detected in 31.1% (112 out of 360) of the six examined leafy vegetables samples (Table 1). The examined vegetables collected from retail seller in Baghdad were found to be highly significant (P-value = 0.0001) contaminated with one or more enteric parasites. Celery was more likely to be contaminated with enteroparasites 28.6% (32 out of 112 total contaminated), which it was not significantly higher than the contamination rate found in lettuce 25.9% (29 out of 112). The contamination rate in celery and lettuce, were found to be significantly higher than in cress 19.6% (22 out of 112), parsley 16.9% (19 out of 112), radish 6.3% (7 out of 112) and spearmint 2.7% (3 out of 112). Low contamination level was found in radish and spearmint.

Table 2 shows the distribution of parasites detected in raw leafy vegetables collected from markets. Ten species of parasites were found to be responsible for contamination. *Entamoeba histolytica* was the most...
common parasite detected 25 (22.3%), followed by *Ascaris lumbricoides* 23 (20.5%), *Giardia lumblia* [19 (17.0%)], *Echinococcus* 10 (8.9%), *Toxoplasma gondii* 8 (7.1%), *Ancylostoma duodenale* 7 (6.3%), *Fasciola hepatica* 7 (6.3%), and then *Strongyloides stercoralis* 5 (4.5%), *Trichuris trichiura* 5 (4.5%) then finally *Hymenolepis nana* 3 (2.6%).

In celery, lettuce and cress the ten species of enteric parasites were detected within it, while radish was found to be contaminated with (*Entamoeba, Ascaris, Giardia* and *Echinococcus*), and in spearmint was found to be contaminated with (*Entamoeba, Ascaris, and Giardia*).

Comparing the rate of parasitic contamination in the four seasons, a significant difference is seen as indicated by table 3. It was found that the number of contaminated samples in spring was higher than the number of contaminated samples in summer, autumn and winter. The highest rate of parasitic contamination in vegetable samples in different seasons was found in spring 31.2% (35 out of 90 samples), followed by summer 26.8% (30 out of 90 samples), autumn 23.2% (26 out of 90 samples) and in winter 18.8% (21 out of 90 samples).

### Discussion

People have been urged to eat lots of raw (fresh) vegetables for a healthful diet, and these vegetables can serve as truck of transmitting enteric parasitic pathogens throughout the process of planting to eaten by human. (10) The vegetables require a moist environment for their growth; these conditions favor the development of transmissible forms of enteroparasites such as eggs, larvae, cysts and oocysts. (14)

Many previous local (9,12,15) and global (6-12) studies as well as the recent study indicated high rate contamination of different types of raw vegetables with one or more kind of parasites. Several factors may account for the high prevalence of intestinal parasites contamination recorded in most of the analyzed vegetables (although not directly reported). The use of polluted water for irrigation of implanted leafy vegetables and the use of fresh poultry manure as fertilizer may be an important factors in spreading of enteroparasites, because both the irrigation water and the manure are applied on top of the crops. Lacking the supplement for better sanitary standards (e.g., clean water for crop washing and refreshing) and market-related handling are another sources of contamination. (16) Associated with
raw water reuse in irrigation of vegetables was reported by many epidemiological studies as other factor led to excess of parasitic contamination. \(^{(17)}\)

The present study may in agreement or in disagreement with the previous studies in mater of the type of vegetable with high rate of contamination and the species of parasites that commonly contaminated these vegetables. The study revealed that the enteroparasites contaminating celery and lettuce was significantly higher than in cress, parsley, radish and spearmint. This finding is in agreement with that reported by other investigators. \(^{(6-8)}\) This could be due to the fact that the degree of contamination varies according to the shape and surface of vegetables. The presence of trichomes on the surface of irregular leaves of green leafy vegetables as lettuce, rocket and parsley have uneven surfaces and makes parasitic eggs, cysts and oocysts attached to the surface of the vegetable more easily, either in the farm or when washed with contaminated water. On the other hand, vegetables with smooth surface as leek and green onion had the least prevalence because its smooth surface reduces the rate of parasitic attachment. \(^{(11)}\) The morphology of the celery, cress radish and mint leaves overlapping on each other, protecting the eggs of helminthes against conditions unfavorable to their survival and persistence, such as sunlight, desiccation, and wind. \(^{(18)}\)

Regarding the kinds of enteric parasites that contaminating these vegetables, the study showed that \textit{Entamoeba histolytica} (22.3%), \textit{Giardia lumibia} (17.0%) and \textit{Ascaris lumbricoides} (20.5%) were the most common isolated parasites. The result of this study is compatibles with the results obtained by many researchers. \(^{(9,10,12)}\) The enteric parasites that recovered from vegetables of spring were significantly higher than the enteric parasites that recovered in other seasons. The high recovered rate of enteric parasites in spring was found to be followed in descending manner by summer, autumn and winter. High prevalence of enteroparasites in warm seasons indicating by the recent research is in agreement to that reported by other workers. \(^{(7,9)}\) In warm seasons, the expelling of parasite’s eggs to environment by human or animals is high comparing to cold seasons. \(^{(19)}\)

Vegetables, and especially salads, are an important route of transmission of intestinal parasites and have been shown to be an important source of food borne outbreaks in developing countries. \(^{(20)}\) The most likely hypothesis of contamination is that it occurred before harvest, either by contaminated manure, manure compost, sewage sludge, irrigation water, runoff water from livestock operations or directly from wild and domestic animals. These potential contamination events are all plausible and consistent with the assumption that the level of contamination must have been high. \(^{(21)}\)

An accepted and expected difference is observed between the recent study and those reported by other works in prevalence rates of the different pathogenic enteric parasites from fresh vegetables. Factors may lead to such differences may include, geographical location of implantation, type and number of samples examined, methods used for detection of the intestinal parasites, type of water used for irrigation, and post-harvesting handling methods of such vegetables, in addition to many other factors.

**Conclusion**

Enteric parasites heavily contaminating the leafy vegetables in Baghdad city, therefore the public enlightenment campaign on the danger of consuming of such products is highly needed in our community

**ABSTRACT**

This study was conducted to detect and distinguish *Raillietina echinobothrida* of domestic and wild infecting pigeons has been based on morphology, histopathological and molecular analysis. The present study was conducted on 115 pigeons (73 of S. Decaocto and 42 of C. livia) of different age groups and of both sexes. The results of the present study were revealed that only 86 out of 115 examined pigeons were infected by *Raillietina* spp at infection rate of 74.78%. Besides, the percentage of infection with *Raillietina* spp were recorded in S. Decaocto is higher than C. livia in 44.34% and 30.43% respectively. The most isolated parasites of examined birds were showed the cestoda *R. echinobothrida* with total number (168) adult worms from total number of examined pigeons infected (115). The histopathological examination of small intestine of pigeons infected with *R. echinobothrida* were showed different changes like, an infiltration of inflammatory cells in lamina properia and atrophy of villa of small intestine with vaculation of muscularis externain and loss of mucous membrane. The result of PCR were showed that specific primers (3S-F, BD2-R) were successfully for amplifying 944 bp with flanking region of ITS2 to *R. echinobothrida*. Also, the PCR result were revealed that 61 (70.93%) out of 86 birds were positive to *R. echinobothrida*.

**Keywords:** *R.echinobothrida*, domestic and wild pigeons, Pathological, Molecular, Iraq

**Introduction**

Iraq has a wide range of geological diversity from the peaks of Kurdistan Mountains in the north to the deserts and semi-deserts in the west and the great marshes in the south, these contribute to the wide biological as well as faunal diversity¹.

In recent years, poultry farming has tremendously developed and become one of the most intensive forms of animal husbandry activities². The Domestic pigeon (Columbia livia) is one of the commonest birds and tend to be closely contact with humans and birds as a source of protein, hobby, and recently as laboratory animals tend to be closely contact with humans and birds as a source of protein, hobby, and recently as laboratory animals³,⁴.

Parasitic infections cause great economic losses to poultry in our country, the birds are under constant stress and are prone to parasitic infections⁵. Endoparasite of poultry are common in the tropical and sub-tropical where the standard of husbandry is poor and climatic conditions are favorable for their existence⁶,⁷.

*Raillietina echinobothrida* is consider the most pathogenic and prevalent species infecting birds throughout the world⁸,⁹. This parasite inhabits in the jejunum and ileum of the definitive host, from where it obtains nutrition from the digested food of the host, whereas their larval stage (cyticercoid) resides in various invertebrate intermediate host, such as ants, beetles, small mini-wasps, or termites for completion of its life cycle. *R. echinobothrida* is a hermaphrodite worm having both the male and female reproductive organs in its body¹⁰,¹¹.
R. echinobothrida is responsible for ‘nodular tapeworm disease’ in poultry and retarded growth of young birds, emaciation of adult and low egg production of hen, disrupt gastrointestinal tract digestion decrease in consumption of fodder and intestinal obstruction can occur in heavy infection\textsuperscript{12}. In addition, this tapeworm does not cause gross pathological damages on well-nourished bird in the light infection, but do compete for food when they large numbers of parasites. If the heavy infection becomes, marked severe lesions on the intestinal walls due to the scolexs are penetrate the mucosal layer and causes characteristic hyperplastic enteritis associated with the formation of granuloma (nodules contain cheesy and calassified material) on the intestinal wall of the infected birds and diarrhea could arise, which ostensibly resulted in ill health\textsuperscript{11,13}.

The taxonomy of Cyclophyllidea traditionally depends upon the accurate descriptions of small differences in the size and shape of the scolex, rostellum (unarmed or armed with rows of hooks) suckers and gravid proglottids\textsuperscript{9}. Nevertheless, with a rich resource of bourgeoning data the molecular approach is proving to be more rapid, sensible and reliable than that based on morphological data alone for phylogenetic analysis\textsuperscript{14}. The objective of the present study was to study and recognize the histopathological changes result of the invasive R. echinobothrida in the small intestine, supplementing the morphological observation, also confirmed the diagnosis of R. echinobothrida in the birds by the molecular diagnostic PCR technique.

**Materials and Method**

**Study Area and Sampling:** A total number of 115 pigeon samples (73 of *Streptopelia Decaocto* and 42 of *Columba livia*) of different age groups and of both sexes were collected randomly selected from Samawah markets in Muthanna province, south of Iraq. The process of collecting pigeon samples were extended during the period from February to September 2017.

**Samples Collection and Parasitological Examinations:** Postmortem examinations were performed according to\textsuperscript{15}. Occasionally, cestoda were very adherent to the intestines that have been cut off with the intestine wall then preserved them in hot water till passive separation\textsuperscript{16}. The worms were preserved in 4% formalin according to\textsuperscript{17}.

**Histopathological Examinations and DNA Extraction:** A pieces of intestines from the infected pigeons were collected. A histological study was conducted according to\textsuperscript{18}. The Mini Kit DNAQIAmp/QIAGEN/Germany were using to isolate genomic DNA from adult worm according to [19]. The PCR program were performed of 94C\textdegree at 2 min followed by 35 cycle of 94C\textdegree for 1min, 57C\textdegree for 1min and 72C\textdegree for 1min, this was followed by a final extension step at 72 \textdegree C for 7 min\textsuperscript{19}.

**Results**

The results of the present study were revealed that only 86 out of 115 examined pigeons were infested by Raillietina spp during the study period from February to May 2017 at infestation rate of 74.78\% (86/115). Also, the result were showed that both S. adecaocto and C. livia (males and females) were infested with different the species of Raillietina. The number of Cestoda which were isolated from each bird may be reach to 5-7 worms. Furthermore, the percentage of infection with Raillietina spp were recorded in S. decacocto is higher than C. livia in 44.34 \% (51/115) and 30.43\% (35/115) respectively.

The histopathological examination of small intestine of pigeons infected with *Raillietina echinobothrida* were characterized by varying degrees of degenerative changes to destruction and sloughing of epithelial layer of intestinal mucosa in heavy infections as showed in figure 3. Also, the results of this examination were showed different pathological changes like, desquamation, destruction and loss of mucous membrane of villi as showed in figure 4.

Fig. 1: *Raillietina echinobothrida* worm with alum carmine stain, Scolex
Fig. 2: *Raillietina echinobothrida* worm with alum carmine stain, Graved segment with egg capsules.

Fig. 3: Small intestine of pigeons infected with *Raillietina echinobothrida* showed destruction and sloughing of epithelial layer of intestinal mucosa in heavy infections.

Fig. 4: Small intestine of pigeons infected with *Raillietina echinobothrida* showed destruction and desquamation of villi.

Fig. 5: Small intestine of pigeons infected with *Raillietina echinobothrida* showed infiltration with heterophils throughout the mucosa, especially in the lamina propria.

Fig. 6: Agarose gel electrophoresis of amplified DNA of *R. echinobothrida* by using primers (3S-F, BD2-R) region of region of 28S, Lane L DNA ladder, Lanes 1,2,3,4, positive to 944 bp.

**Discussion**

The result in the present study were revealed that only 86 out of 115 examined pigeons were infested by *Raillietina* spp during the study period from February to May 2017 at infestation rate of 74.78% (86/115). Also, the results in this study were recorded and confirm that *Raillietina* spp spread throughout the months of the year with high prevalence. This result agreed with most studies as [21,22, 23, 24]. But, this result was disagreed with [25, 26] who reported rate of infection 25.3%, and 17.4% respectively.

In addition, the spread of tapeworms and presence in all seasons of the year is the result of a natural of life cycle of the tapeworm that transmitted from birds to another through contamination feed and water with mature segment led to easily spread between birds [24,27,28]. Finally, there are many studies confirm that changes in the climate factors like temperature or humidity had no directly effect...
in incidence infection and severity, therefore Raillietina spp is found in all months the year\textsuperscript{24,29}.

The results were agreement with many previous studies\textsuperscript{31,32,33} and disagreement with\textsuperscript{34}. This agreement between the studies were recorded that the male’s bird were more infected than females may be because consuming greater quantities of food as result to fly away from the nest and for long distance, While, the females remains near the nest near her eggs. Also, the females are concentrated in the food on the limestone material that need in building egg shells which reduce the handling of food\textsuperscript{31,32,35}.

The duodenum and jejunum cavities of Raillietina spp infested birds was congested and filled with greenish or yellowish feces with a very soft to liquid consistency and containing much mucous exudate. In cases with a heavy infection of parasites the mucosa was thinned and also revealed hemorrhagic spots. These finding are agreement with other studies\textsuperscript{24,26}. The explanation of results the gross examination in the present study is attributed to the adhesion site of adult worms in the small intestine by scolex and change this location in wall of intestine continuously and the worms migrated up and down the intestinal lumen away from the congestion to get nutrition when present in large numbers and also aggregate in the lower half of the intestine. Moreover, probably this lesion is results from anther secondary bacterial infection in the intestine due to destruction of intestinal epithelium by parasites, hemorrhage have been noticed in others may be due to irritation of heavy infection\textsuperscript{28}.

On the other side, the histopathological examination of the small intestine of pigeons infected with Raillietina echinobothrida were showed necrosis of villous epithelium, massive hemorrhages and infiltration of inflammatory cells in the lamina propria and sub mucosa. These results are agreement with previously studies\textsuperscript{24,28}. Each parasite have a degree of adverse impact on host and may be a change in texture of tissue, or take change in overall impact. The parasites occurs a damage to their hosts like; injurer and metabolic outcomes affecting enzymes and hormones of the host or consume food the host\textsuperscript{31,36}.

Also In the present study the reason to chosen these sets of primers may be attributed to the constancy and stability of the second internal transcribed spacer (ITS2) region of ribosomal DNA gene makes them a prominent target for species variation. In addition, the gene sequences of these locations have been developed for molecular phylogenetic studies\textsuperscript{38}.

ABSTRACT

Due to wars in Iraq, since 1990 and after 2003, the Iraqi environment suffered from acts of profanation. A large number of injuries and deaths were caused by destructive chemicals and radioactive materials. These events resulted in either cancer or infertility. Infertility is one of the medical, social and psychological burdens in Iraqi society. It is defined as “the failure to achieve a clinical pregnancy after 12 months or more of regular unprotected sexual intercourse. Induction of ovulation has remained a milestone in the women treatment anovulatory infertility.

Keywords: Women infertility, gonadotropin

Introduction

Infertility according to World Health Organization WHO, is defined as a disease of the reproductive system, by the failure to achieve clinical pregnancy after 12 months or more of regular unprotected sexual intercourse (¹). The inability to become pregnant results in important affecting and profitable tolls, among that artificial nervousness and sadness are more common in infertile couples than fertile couples, also Assisted Reproductive Technologies ART are accessible to care for sterility, but these are pricey. In the last thirty years, Iraq exposed several instability crises causes exasperation in many health problems. One of these problems was the fertility status of many people all over the country. Few studies deal with this health problem in spite of the mental, communal and fiscal proportions of this subject (²). Infertility can be caused due to many medical disorders, may be due to fallopian tube injury, fertilization and ovulation interference or also hormonal turbulence (³). Unable or difficult to conceive is a physically and psychologically painful condition in a female’s life (¹).

The Female Reproductive System: The most important organs and structures in the reproductive system is the uterus, it is a vacant muscular organ and pear-shaped organ located between the bladder and lower intestine. It consists of two parts, the cervix and the body; cervix is the uterus lower portion. The os opening is the vessel opening which opens into the vagina and helps the flow out of the menstrual blood from uterus to vagina and leading off the uterus into two fallopian tubes. Next to this is ovary which closes each tube stages. The egg producing organ known as ovary contains 200,000 to 400,000 follicles (⁴) (Figure1).

Figure 1: The reproductive system of women (⁴)

Type of Infertility: Infertility may be primary or secondary. Primary infertility refers to couples who
have never conceive after a minimum of 1 year of attempting to do so through unprotected intercourse and the live birth absence in non-contraception sexually active woman (5) whereas, secondary infertility refers to couples who are unable to conceive after one year of unprotected intercourse following previous pregnancy and not using any contraceptives and as the inability to conceive despite exposure to pregnancy for one year (2 years in some epidemiological studies), after having conceived at least once before (6). Secondary infertility owed to the failure to become pregnant pregnancy failure to a live birth following either a preceding pregnancy or a preceding gift to bear a pregnancy to a live birth(7).

**Diagnosis of Infertility:** Infertility diagnosis is within 1 year failed to conceive and is argued to increase the infertility risk since women about 50% failed to conceive in first year may also do so in second year (8).

**Female Infertility Causes:** Infertility in female may be caused due to variable factors:

**Disorders of Ovulation:** The (WHO) classifies ovulation disorders into three groups:

Group I: hypothalamic pituitary failure (hypothalamic amenorrhea or hypogonadotropic and hypogonadism).

Also called as hypogonadotropichypogonadism, may be caused due to failure of hypothalamic pituitary. With these conditions generally women are having amenorrhea (primary or secondary), also may be known as hypothalamic amenorrhea, estrogen deficiency and low gonadotrophins levels low gonadotrophins levels are the main characteristics (9).

Group II hypotalamic-pituitary-ovarian dysfunction, predominately a product of polycystic ovary syndrome (PCOS).This is the cause of the enormous greater part of ovulation disorder.

Group III: ovarian failure a result hypo-thalamic cause body mass index (BMI) over 35 (Kg/). BMI will result in irregular menses, amenorrhea, or failure to ovulate and increase in pituitary hormones (FSH and LH) will result in failure to ovulate(10).

**Male Factor:** Male infertility is diagnosed when, after testing both partners, reproductive problems have been found in the male (11). The first and most common test used to evaluate male infertility is semen analysis. Semen analysis includes a set of descriptive measurements of sperm parameters such as concentration, motility and morphology and some seminal plasma characteristics (12). For infertility in males there are six main causes. Abnormal sperm production or function is the first one. Due to repeat infections sperm can be affected, undescended testicles or genetic defects (13). Male factor infertility is assessed based on the following values (15).

- Underprovided sperm count (less than 10 million per milliliter; volume should be 1 - 5 ml. of ejaculate).
- Deficient sperm motility (over 60% should be motile and show purposeful forward movement).
- Poor sperm morphology (more than 50-60% abnormal in form). On the physical examination, testicular abnormalities such as a varicocele or absence of the vas deferens can be detected.

**Unexplained Infertility:** Unexplained infertility, referring to the failure to conceive of a couple in whom no definitive cause for infertility can be found, has an incidence of 10-20% in all infertile couples (14). Unexplained infertility diagnosis is given when evaluation of standard fertility is normal in both woman and man and it relies upon nature, number and quality of used tests and made conclusions (15). The principal treatments for unexplained infertility include expectant observation with timed intercourse and lifestyle changes, clomiphene citrate and intrauterine insemination (IUI), controlled ovarian hyperstimulation (COH) with IUI, and IVF (14).

**Recurrent Miscarriage:** Recurrent miscarriage defined as the loss of three or more consecutive pregnancies affects 1% of couples trying to conceive. It has been estimated that 1–2% of second-trimester pregnancies miscarry before 24 weeks of gestation (16). Two consecutive miscarriages are experienced by less than 5% of women, and three or more consecutive miscarriages by about 5% women. Subdivision of recurrent miscarriage can be done into primary and secondary recurrent miscarriage, the heterogeneity of this population is potentially reduced (17). After a positive urinary human chorionic gonadotropin (hCG) a pregnancy loss occurs or a serum β-hCG raised level before histological verification or ultrasound is called as a ‘biochemical loss’. Generally it occurs 6 weeks before gestation. Clinical miscarriage term is used when histological evidence or examination of ultrasound has confirmed that an intrauterine pregnancy has existed (18).
Endometriosis: Endometriosis is an estrogen-dependent chronic inflammatory condition that affects women in their reproductive period and is associated with women infertility and pelvic pain (19). A chronic condition Endometriosis is characterized by the endometrial tissue growth leaving the uterine cavity, generally in the pelvic cavity, including the endometrial deposits and ovaries, in ovary known as endometriomas. Tubal damage can be due to endometriosis, symptoms also include painful periods, pelvic pain, and during and after intercourse the pain (20). Endometriosis patients mainly complain of dysmenorrhea, dyspareunia, pelvic pain. The symptoms can affect the patient’s mental, social, physical, general, well-being (21).

Uterine or Cervical with the Fallopian Tubes Causes: Sperm-egg binding, sites are fallopian tubes and normal functioning of them serves natural conception prerequisite. Fallopian tubes obstruction is a common disease and may be main cause of infertility. Inflammation generally causes the obstruction of fallopian tubes and reproductive system infection, generally in infection sources items (22). There are several congenital or acquired uterine disorders, which cause infertility in the females; the acquired uterine abnormalities that are responsible for female infertility include polyps, some types of fibromas, adenomyosis, and some endometrial disorders such as intrauterine adhesions (23).

Hormonal Causes of Female Infertility

Ovarian Insufficiency: The average age of menopause is 51, with some women having their last period in their forties and others later in their fifties. A cessation of ovulation prior to the age of 40 is rare and is usually referred to as premature ovarian failure (24). Primary ovarian defect is premature ovarian failure (POF) described as absent menarche (primary amenorrhea) or ovarian follicles premature depletion before 40 years age (secondary amenorrhea). It is a diverse disorder affecting women of <40 years about approximately 1%, of age 20 1:10,000 women and of age 30 1:1,000 women. With absent pubertal development the most severe forms are present and primary amenorrhea (ovarian dysgenesis 50% cases), whereas post-pubertal onset forms are defined by the menstrual cycles disappearance (secondary amenorrhea) premature follicular depletion associated (25).

Luteal Phase Deficiency: The luteal phase defect is, by definition, a corpus luteum defective in progesterone production. As indicated by histochemical evidence, in the corpus luteum, estrogen is produced by the luteinized theca cells. The estrogen-producing function of the corpus luteum seems to be unimpaired in this disorder. The clinical manifestations of the defect include infertility and repeated first-trimester abortion (26). Hormonal imbalances have been associated with female infertility. The increased or decreased levels of FSH, LH and prolactin hormones may cause infertility (27).

Polycystic Ovarian Syndrome: Polycystic Ovarian Syndrome (PCOS) is the most common endocrine disorder affecting women of reproductive age and is closely associated with insulin resistance, metabolic syndrome and future risk of developing diabetes and cardiovascular disease (28). Anovulatory infertility’s PCOS is the major cause, but ovulation failure leaving other factors contributes to impairment in reproductively. Polycystic ovaries generally occur in ovulatory women having unexplained or tubal infertility (with around 50% prevalence) than in the general, (20%) population which is age-matched. This phenomenon considers that circulating hormones abnormalities (such as LH and serum testosterone elevated concentration) which is present in ovulatory women having polycystic ovaries are connected to social group distinctions compromised maturation.

Thyroid Disorders: Both hyper and hypothyroidism may result in menstrual disturbances. The most common manifestation is simple oligomenorrhea (decreased menstrual flow). Anovulatory cycles are very common. Increased bleeding may occur, but is rare in hyperthyroidism (23). The thyroid is an important endocrine gland and its dysfunctions interfere with numerous aspects of reproduction and pregnancy (29). In women of reproductive age, thyroid dysfunction can lead to a variety of gynecological disorders ranging from menstrual irregularities to infertility arising from many different pathophysiological mechanisms (30). Hypothyroidism is a leading cause of difficulty in achieving and maintaining pregnancy. Low thyroid function has a negative impact on reproductive health and is more common than most women realize (27). It is also linked with menstrual problems and a lack of ovulation in some cases. It can occur spontaneously, develop during or after pregnancy, or after treatment for hyperthyroidism (30).
External Causes of Female Infertility

Contraception: There is extensive use of contraceptives, generally by young individuals whose years of reproduction commonly lie in front of them. Use of various types of contraceptive varies with marital status reproductive history, race, and age (45). The return of fertility for women who discontinue oral contraceptives takes longer as compared with women who discontinue other methods of contraception (17). For contraception there is no perfect method and each method is having advantages and disadvantages balance. Ideal contraceptive characteristic method are: highly cheap; independent of intercourse effective; no side effects or risks; and no regular action is required on the users part; and acceptable to all cultures and religions and having non-contraceptive benefits (19).

Sterilization: For reversal of contraceptive sterilization in women, in determining whether fertility can be restored, several factors are important: length of tube remaining, tubal site, the surgical method initially used, and surgical skill in restoration. Some form of periodic abstinence is used, suppositories, douche, withdrawal, foam, were also used by women in small percentages (40). Female sterilization is a permanent procedure to prevent pregnancy. It works by blocking the fallopian tubes. When women choose have not children (29).

Abortion: Abortion means the termination of pregnancy before the fetus reaches viability Abortion is frequently stated that a high proportion of women who have an induced abortion by dilatation and curettage are subsequently infertile (29). Individuals without the requisite skills every year performs about 19–20 million abortions or in below minimum medical standard environments, or both. In developing countries nearly all unsafe abortions (97%) occur (22).

Drugs and Environment: Currently, reproductive risks no reliable estimates can be made from environmental factors. Before now, less attention was paid to drug-induced and environmental infertility and sub infertility. However, four health hazards dibromochloropropane, ethylene oxide, ionizing radiation, lead are regulated in part because reproductive system effects. Environmental hazards in general include chemical agents; physical agents such as temperature, altitude, and radiation; and alcohol consumption, smoking, like personal hobbits, use of drugs (both nontherapeutic and therapeutic), and patterns of eating. Drugs affect the fertility (24).

Diagnosis of Infertility: The most common examination for diagnosis of infertility is (26):

Couple’s history, physical exam, semen analysis, basal body temperature charts and menstrual cycle mapping, hormone assays cervical mucus evaluation, post-immunologic evaluation, endometrial biopsy, coital test hysterosalpingogram, laparoscopy, hysteroscopy, and Hamster-egg penetration assay.

Treatment of Female Infertility: The treatment of infertility can be done with surgery, medicine, assisted reproductive technology, artificial insemination. Many times these treatments are combined. Mostly infertility is treated with surgery or drugs. Specific treatments for infertility are recommended by doctors based on results of test, how long for the pregnancy the couple is trying, both the man and woman age, the partners overall health, and partners preference (30).

ABSTRACT

Diabetic patients awareness and attitudes toward their heightened risk for oral diseases is very much essential to overcome the same. Hence the present study was conducted to explore the knowledge and awareness.

Methodology: A close ended questionnaire study was done to assess the knowledge, attitude & practice regarding oral health among 150 diabetic & non diabetic study subjects.

Results: There was statistically significant difference was noted among diabetic in many areas of knowledge, attitude & practice related to oral health.

Conclusion: Though knowledge was comparatively good among diabetic subjects, there were lacunae in attitude & practice. Hence continuous educational programs are recommended.

Keywords: Diabetic, Non-diabetic, Oral health problems, Attitude, Knowledge.

Introduction

The prevalence of diabetes mellitus (DM) is rising many factors are responsible for this increase like unhealthy Western lifestyles with reduced physical activity, sedentary lifestyles, this contribute to obesity which is a risk factor for the development of diabetes.¹ Due to a lack of proper awareness and education, diabetes sufferers are particularly prone to complications and increased mortality.²

Diabetes mellitus comprises a group of metabolic disorder characterized by hyperglycemia secondary to defects in insulin secretions, insulin action or both. Type 1 diabetes is characterized by decreased secretion of insulin due to autoimmune or idiopathic destruction of the B cells in the pancreas while type 2 diabetes, the more common form, is characterized by insulin resistance in peripheral tissues generally in combination with decreased insulin secretion.³ Type 1 and Type 2 diabetes have a genetic predisposition.⁴ The etiology of type 2 diabetes also appear to be related to the consumption of a high-fat, high-sugar diet, physical inactivity, and obesity.⁵

Diabetic patient who do not cautiously control their blood glucose levels will be at greater risk for systemic and oral complications. The chronic manifestation of DM are classified as macrovascular and microvascular complications.⁶

Diabetic patient display a higher prevalence of oral disorder such as xerostomia, taste impairment, sialosis, oral candidiasis, and oral lichen planus.⁷ Studies indicated that diabetic patient are two to three times more likely to develop periodontal disease⁸ and display

DOI Number: 10.5958/0976-5506.2019.01046.5
a greater severity of periodontal disease.\cite{9} The severity of which is related to the long-term metabolic control of diabetes, not the duration of diabetes.\cite{9}

Knowledge about susceptibility to periodontal diseases, dry mouth and prevention of oral complications as well as effective management of conditions for people with diabetes is therefore important. Research has demonstrated that improving oral health knowledge is a necessary prerequisite for implementation of proper oral self-care behaviors,\cite{10} although knowledge of correct behaviors does not necessarily translate to practice.\cite{11}

Lack of essential oral health knowledge may increase the risks of diabetic oral complications.\cite{12} Despite the worldwide recognition of the dangers of diabetes mellitus, diabetic patients awareness of and attitudes toward their heightened risk for oral diseases has not been fully addressed. Hence, the present study was conducted to explore the knowledge and awareness of diabetes complications on oral health among diabetics and non-diabetics population in Alkharj, KSA.

**Aim and Objectives**

1. To assess the knowledge about diabetes complication on oral health among diabetic and non-diabetic.

2. To assess the awareness about diabetes complication on oral health among diabetic and non-diabetic.

**Materials and Method**

This study was conducted after obtaining permission from King Khalid Hospital Al-kharj. Informed consent was taken from each subject during answering the questionnaire. People denying giving consent were excluded. The present study was a cross sectional study. It was conducted among 20 - 50 years old people. A close ended questionnaire was designed. Questions were explained whenever necessary and the participants were given assurance regarding the confidentiality of their responses and were requested to mark their answers and complete it individually.

Convenience sample of 75 diabetic and 75 non diabetic subjects was taken. The sample was taken from the pool of patients attending Prince Sattam bin Abdul Aziz University Dental College, Alkharj and King Khalid Hospital Alkharj. Diabetic patients, with type 1 or type 2 diabetes mellitus, and non-diabetic individuals willing to participate were included in the study. Patients with diagnosis of diabetes mellitus for which they were receiving treatment are confirmed through electronic glucometer (Beurer blood glucose monitor GL42 and Beurer blood glucose test strips GL44) with random blood sugar level more than 120 mg/dl. Non-diabetic subjects were selected by asking the subjects about diabetes history and confirmation through electronic glucometer (Beurer blood glucose monitor GL42 and Beurer blood glucose test strips GL44) if RBS was around 80-120 mg/dl.

The examiner who was conducting RBS test using electronic glucometer was calibrated in the Prince Sattam bin Abdul Aziz University Dental College, Alkharj.

The questionnaire was distributed among the selected subjects. The questionnaire consists of questions related to age, sex, type and duration of diabetes, and their knowledge regarding systemic and oral complications associated with diabetes. Also, the questionnaire includes questions to assess participants attitudes toward maintaining good oral health.

**Results**

A total 150 study subjects were participated in the study. Of these 75 (50%) were diabetic & 75 (50%) were non diabetic. The age ranged between 20–60 years.

Table 2 shows gender wise distribution of study subjects. In both diabetic & non diabetic groups, males were more common than females.

Questions Related to Awareness of Diabetes among Study Subjects: 96% of study subjects who were diabetic were aware of diabetes whereas among non diabetics only 52% of subjects were aware. Diabetic status of study subjects revealed that 73.33% of diabetics were aware of their diabetes status where as 21.33% were unaware. Among non diabetics 13.34% of study subjects were unaware about their diabetes status. The result was statistically significant. Regarding the awareness about Type of diabetes among study subjects, 14.66% of diabetics were unaware about the type. 24% of subjects were unaware about the duration since when they were suffering from diabetes. 32% reported that they were suffering from 5 – 10 years and 2.66% were suffering from > 10 years. Regarding knowledge about complication on general health among study subjects, knowledge was more among diabetics (96%) than compared to non diabetics (73.33%) which were statistically significant. Knowledge about complication on oral health among study subjects showed knowledge was almost similar among diabetics (73.33%) & non diabetics (66.66%) which was statistically non significant. Knowledge of complications associated with diabetes among study subjects was more among diabetics (32%) than compared to non-diabetic (24%) which was statistically significant. Comparatively more non diabetics (22.66%) were unaware of complications than diabetics (8%).

Questions Related to Practices in Dentistry: Regular visit to dentist among study subjects was more among diabetics (60%) than compared to non diabetics (48%). This result was statistically significant. Last dental visit among study subjects showed 32% diabetics had last visit within 6 months compared to non diabetics (24%) which was statistically significant. Dry mouth experience among study subjects was more among diabetics (74.66%) than compared to non diabetics (45.33%) & it was statistically significant. Bad breath experience among study subjects was more among diabetics (52%) than compared to non diabetics (40%). The result was statistically significant. Knowledge about Diabetes cause gum disease among study subjects which was similar among diabetics (57.33%) to non diabetics (60%) which was statistically non significant. Gum problems suffering by study subjects showed that only 9.34% of diabetics were free from gum disease than compared to 40% of non diabetics. Result was statistically significant.

Questions Related to Attitude of the Study Subjects about Oral Health: The brushing habits were similar among both the groups with majority of study subjects brushing once daily. Attitude of study subjects towards oral hygiene importance showed positive attitude was more among both the groups & the result was statistically non significant. Related to regular dental visit among study subjects was slightly more among diabetic group (88%) than compared to non diabetic group (74.66%). Result was statistically significant.

Discussion

In the present study the age ranged between 20-60 years and majority of the respondents were within the age group of 41-50 (34.66%). This may be attributed to the fact that most of the diabetic patients are usually diagnosed at this age. At this age patients are more eager to take care of their health and so visit the diabetic clinic often. And in this study males were more in number than females. Regarding diabetic awareness those subjects who are known diabetic (96%) were aware of diabetes whereas among non diabetics only 52% of study subjects were aware of diabetes. One important finding of the study is 21.33% who are diabetic are unaware about their diabetes status as diabetes requires some consideration of signs and symptoms to get diagnosed. In the present study 14.66% of diabetics were unaware about the type & 24.00 % of subjects are unaware about the duration. The present study tells that knowledge about complication on general health among diabetics was more because, once the person is diagnosed as diabetics he/she will try to understand more about the disease.
The consideration given to oral health is least so there was no difference about oral health among diabetics and non-diabetics. Periodontitis is a major complication in diabetes. Knowledge on oral health relation to diabetes was assessed to find out if the respondents had this information and if it reflected on their attitude and practice towards oral health. Most of the respondents considered oral health as a complication of diabetes (58%) but expressed that they don’t receive any information on oral health when they attend the diabetic clinic (45.7%) thus they don’t pay much emphasis as other complications associated with diabetes. This lack of information to the diabetic patients and need for it could be compared to a study done in Finland. On the knowledge related to complications associated with diabetes, knowledge was more among diabetics (32.00%) than compared to non-diabetics (24%) due to the facts of suffering and self-experience. Majority of patients had their last visit to the dentist more than 5 years back (25.3%) and others had never been to a dentist (22.8%). This is in contrary to a study done in Finland in which 63% of participants had attended a dental appointment within the last year. In this study the most frequent (61.5%) reason for a dental visit was some sort of pain or trouble with teeth or gums. In a study done in Finland the most frequent reason for a dental visit was a normal checkup (47%). The difference in the results can be attributed to the fact that yearly dental check-ups are not emphasis in Kenya. Being a developing country, oral health care is not affordable to most of the people. In this study, it was noted that the patients felt that their teeth were very important to them (92.9%) and that cleaning of teeth was important to them (83.3%) and for those with bad breathe (61.9%) it bothered them (71%) but still there practices on cleaning of their teeth did not reflect only a few of them cleaned their teeth twice or more a day (38.3%). This is in comparison in a recent study among Finnish adults with diabetes. Twice-a-day brushing was reported by 50% of those surveyed. It is thought that though the respondents at Kenyatta National Hospital diabetic clinic had knowledge on oral health and that their teeth are important to them, most of them come from poor socio-economic status and thus getting basic needs is a problem and this made getting dental care they can afford almost impossible. Among the respondents (67.95%) thought that changing their oral hygiene practices would improve their oral health but the problem was how to go about it because they had other complications that they felt needed more urgent attention. Majority also had the knowledge that they were at higher risk of developing oral diseases (59.5%) and that oral disease were preventable (67.90%). Most of the respondents used a toothbrush (85.7%) and tooth paste to clean their teeth but teeth and gums problems were still major issues. In comparison to a study done in Nigeria habits of tooth cleaning either with toothbrush and paste or with chewing stick was entrenched in the participants. The teeth and gum problems may be attributed to the tooth brushing techniques. The patients may be brushing daily but with minimal plaque elimination due to poor tooth brushing techniques.

Conclusion

1. Majority of the diabetic patients had knowledge on oral hygiene practices. They were aware of the causes of oral diseases and how they can be prevented. They also knew that there was a relationship between developments of oral diseases due to diabetes and that they were at a higher risk of developing oral diseases.

2. Their attitude was good still not very enthusiastic. They wanted to have better oral hygiene but did not do much about it. Practice was the major setback for these patients to achieve good oral health.

3. Most of the patients did not carry out good oral hygiene practices and only visited the dentist when they were in a lot of pain and discomfort. They hardly went for yearly dental check-ups.

Limitations: The sample size achieved was 150 due to time factor.

Recommendations

1. Continuous Educational Programs should be put in place especially in diabetic clinics to further enlighten diabetic patients on association of oral health with diabetes.

2. A similar study should be carried out with a larger sample group to attain a generalized picture on the knowledge, attitude and practices among diabetic patients on oral health.

3. A study as to why these diabetic patients don’t practice good oral hygiene should be conducted

Ethical Clearance: Taken from Institutional Review Board of college of dentistry, Prince Sattam Bin Abdulaziz University.

Hypertension and Maternal Preterm Delivery in Budi Kemuliaan Mother and Child Hospital Jakarta

Indira Rezki Wahyuní1, Helda2

1Master Program in Epidemiology, 2Department of Epidemiology, Faculty of Public Health, Universitas Indonesia, Indonesia

ABSTRACT

Newborn deaths are a major obstacle to further reducing child mortality especially in development country including Indonesia. Most of the causes of newborn deaths can be overcome. Preterm birth is the main cause (60-80%) of neonatal morbidity and mortality worldwide. Preterm labor occurs in pregnancy less than 37 weeks (between 20-37 weeks) with a fetal weight of less than 2500 grams. The aim of this study was to identify the association of maternal hypertension and preterm delivery of women in Budi Kemuliaan Mother and Child Hospital Jakarta, 2017.

Research conducted with cross sectional approach with 505 as a subjects used in this research. Woman with or more than 140 mm/hg of systolic blood pressure categorized are suffering from hypertension and less than 140 mm/hg categorized as normotensif.

Research showed that about 34.1% of subjects categorized as hypertension and 24.6% of total subjects in preterm delivery. Multivariate analysis using logistic regression showed that statistically there is no association between maternal hypertension with preterm delivery in Budi Kemuliaan Mother and Child Hospital, Jakarta, Indonesia, 2017.

Based on this study there was no significant relationship between hypertension of pregnant women with preterm events. Socialization of prevention of complications at the time of pregnancy is highly recommended to prevent the occurrence of preterm delivery and other complications that can arise.

Keywords: Maternal hypertension, Preterm Delivery

Introduction

Infant mortality rate (IMR) is one indicator of assessing public health status. Most child deaths in Indonesia currently occur in the newborn (neonatal) mostly in very first month of life. The possibility of children dying at different ages is 19 per thousand during the neonatal period, 15 per thousand from ages 2 to 11 months and 10 per thousand from ages one to five years. As in other developing countries that achieve middle income status, child mortality in Indonesia due to infection and illness of other children has decreased, along with increased maternal education, household hygiene and the environment, income and access to health services. Newborn mortality is now a major obstacle in reducing further child mortality. Most of the causes of newborn deaths can be overcome. (1)

In Indonesia, according to the 2015 annual report reported that the biggest causes of neonatal deaths were LBW by 37%, then asphyxia (26%), followed by others (21%), congenital abnormalities (12%), sepsis (4%) and Tetanus Neonatorium which is close to 0% (MOH, 2015). Neonatal death is often associated with prematurity, asphyxia and infection (2).

An estimated 15 million babies are born too early every year. That is more than 1 in 10 babies. Approximately 1 million children die each year due to complications of preterm birth (3). Many survivors face a
lifetime of disability, including learning disabilities and visual and hearing problems. Globally, prematurity is the leading cause of death in children under the age of 5 years. And in almost all countries with reliable data, preterm birth rates are increasing. \(^{(4)}\)

Inequalities in survival rates around the world are stark. In low-income settings, half of the babies born at or below 32 weeks (2 months early) die due to a lack of feasible, cost-effective care, such as warmth, breastfeeding support, and basic care for infections and breathing difficulties. In high-income countries, almost all of these babies survive. Suboptimal use of technology in middle-income settings is causing an increased burden of disability among preterm babies who survive the neonatal period \(^{(4)}\).

Preterm birth is a major cause (60-80%) of neonatal morbidity and mortality worldwide. Preterm delivery occurs during pregnancy less than 37 weeks (between 20-37 weeks) with fetal weight less than 2500 grams. In developing countries the incidence of preterm delivery is much higher, namely in India 30%, South Africa 15%, Sudan 31% and Malaysia 10%. The incidence of preterm birth in Indonesia is around 19% and is a major cause of perinatal death \(^{(5)}\).

WHO (2012) reported that the incidence of preterm births in Indonesia in 2010 was 15.5 per 100 live births and placed Indonesia in the 9th highest position out of 184 countries. This figure is quite large when compared to the country of Belarus which ranks last with the number of preterm births of 4.1 per 100 live births. Meanwhile, compared to other ASEAN countries, Indonesia has the highest incidence of preterm births, followed by the Philippines (14.9 per 100 live births), and Myanmar (12.4 per 100 live births). \(^{(6)}\)

According to The American Congress of Obstetricians and Gynecologists (COG) and the Center for Disease Control and Prevention (CDC) preterm labor is defined as birth at a gestational age between 20 weeks to less than 37 weeks. \(^{(7-10)}\) Various problems can be caused by premature birth. Premature babies have a higher risk of death compared to babies born at term. This is because they have difficulty adapting to life outside the womb due to immaturity of their organ systems. Other problems that can arise from premature birth are neurological development problems that vary from severe neurological disorders, such as blindness, impaired vision, and deafness. Premature birth can also lead to milder disorders such as behavioral abnormalities, learning difficulties and language, concentration/attention disorders and hyperactivity. This can result in the low quality of human resources in the future. In addition, the treatment of premature babies also requires sophisticated and expensive medical technology \(^{(11)}\).

Preterm birth occurs for a variety of reasons. Most preterm births happen spontaneously, but some are due to early induction of labour or caesarean birth, whether for medical or non-medical reasons. Common causes of preterm birth include multiple pregnancies, infections and chronic conditions such as diabetes and high blood pressure; however, often no cause is identified. There could also be a genetic influence. \(^{(4)}\)

The purpose of this study was to analyze the relationship of hypertension in pregnant women with preterm delivery in Budi Kemuliaan Mother and Child Hospital Jakarta after being controlled by age covariate variables, maternal education, maternal working status, maternal hemoglobin levels and birth spacing.

**Method**

The study was conducted with a cross sectional design, using medical record data from RSIA Budi Kemerdekaan Jakarta in 2017. Minimum sample size of 432 and inclusion criteria were inpatients who gave birth in RSIA Budi Kemuliaan in 2017, having complete medical records in accordance with variables needed and giving birth to single or non-twin babies both alive and dead. While the exclusion criteria are mothers who give birth with medical records not found or incomplete, mothers who have severe infections (malaria, syphilis, tuberculosis, HIV) and babies born more than a month (> 42 weeks) and gemelli. Mother with or more than 140 mm/Hg systolic blood pressure is categorized hypertension in this research.

The variables in this study were hypertension in pregnancy (independent variables), preterm delivery (dependent variable) and as a confounding variable, mother education, mother working status, distance of infant birth and maternal hemoglobin levels in 3rd trimester.

The dataset is then processed and analyzed. Univariate analysis is done to see the frequency distribution of each variable from the results of the study. Bivariate analysis was carried out on two allegedly related variables, namely husband’s participation and delivery service. The statistical test used is the chi-square test. Multivariate analysis was also conducted to control the effect of confounding factors, using logistic regression test.
Result

Analysis Multivariat Logistic Regression: In this study a multivariate regression logistic analysis was used to examine the relationship between maternal hypertension and preterm delivery and over after controlled with mother education, mother working status, parity and delivery space. From table 1 above shows that of the total number of subjects most of the patients were 333 respondents (65.9%) had hypertension and 75.4% of the subjects were preterm delivery. Most of the mothers were highly educated (79.2%) and chose to be a housewife than work (66.5%). And for other maternal risk factors, the majority of the study sample had risky parity that is <1 or ≥4 (83.2%) and the distance of birth <2 years or > 5 years (76.6%) with Hb status that most of them had high (75.6%)

From the results of the analysis of table 2 shows that the variables above do not show a significant association with the incidence of preterm delivery where all CIs of all variables pass the number 1 and statistically p value does not show a significant relationship (p> 0.05) and table 3 shows an analysis of the relationship of hypertension with preterm delivery after being controlled by other variables as shown in the following table.

**Discussion**

Based on the results of bivariate analysis in this study showed that the probability of the occurrence of preterm delivery in mothers who experience hypertension during pregnancy showed RR 1.169 (95% CI 0.758-1.803), which means that hypertension in pregnancy has a risk of 1,169 times to experience preterm delivery, but when viewed from the confidence interval that passed the number 1 that there was no statistically significant relationship between hypertension and preterm delivery.

After controlling the covariate variables in multivariate analysis, showing the final model of hypertension relationship in pregnancy with the incidence of preterm delivery in RSIA Budi Kemuliaan showed an RR value of 1,123 (95% CI 0,711-1,774) which means that it did not show the same significant relationship as the results of bivariate analysis.

There is no correlation between hypertension and the incidence of preterm delivery in RSIA Budi Kemerdakaan Jakarta because preterm delivery is a health problem caused by many factors where factors that are very influential include the nutritional factors of pregnant women and maternal factors during pregnancy itself.

This research is not in line with previous studies where in general research concerning the relationship of hypertension in pregnant women with the same preterm incidence in 2010. Hypertension is one of the factors affecting the mother during pregnancy which is a risk factor for preterm delivery. Blood pressure in the first trimester of pregnancy tends to be the same as blood pressure before becoming pregnant. In the second trimester, blood pressure tends to decrease a few millimeters of mercury (mmHg). Blood pressure increases again in the third trimester, so that at this time high blood pressure is often found even before preeclampsia occurs. Changes in blood pressure also occur in women who have hypertension before pregnancy so that blood pressure in the second trimester is the lowest (12).

In this study also maternal hypertension status was not yet known whether the mother was in the category of hypertension in pregnancy, chronic hypertension or preeclampsia and eclampsia, so it could be that the number of mothers who were not hypertensive because the mother had been given treatment in the form of medicines from the hospital at the first times diagnosed and monitored pregnancy in the hospital so that there would be no effect that would result from hypertension at later delivery. The importance of other variables to be measured and examined also causes this research to be able to get different results.

**Conclusion**

Based on the results of the analysis showed that there was no significant relationship between hypertension of pregnant women with preterm events. In addition to preterm delivery, many other effects will arise from hypertension in childbirth so that the socialization of prevention of complications at the time of pregnancy is highly recommended to prevent the occurrence of preterm delivery and other complications that can arise.

**ABSTRACT**

Helminth infection can influence immunopathology in human body. Changes in the length of intestine and release an increased goblet cell is one of the defense mechanisms against worm infections. In this study, we analyze effects of *Trichuris* muris infection towards goblet cells number and the length of villi and crypt intestine of mice. This research was a true experimental with the posttest control group design. The subjects were 30 males mice types BALB/c which 2 months old with an average weight 20-30 grams. Samples were taken by simple random sampling. Mice divided into a control group, low-dose group and high-dose groups. All subject was observed for 30 days, and the intestine was taken for measured length of villi and crypt. Counting of goblet cells used preparation of intestine. Data analysis used one way Anova and continued by post hoc test. The result show that crypt and villi on large and small intestine will be longer in mice with *Trichuris muris* infection. The average value of the goblet cells number in the control group, low-dose and high dose increased by higher dose worm eggs and had the value (p <= 0.05). *Trichuris muris* infection has influenced the length of villi and crypt intestine and the number of goblet cells in mice (*Mus musculus*).

**Keywords:** *Trichuris muris*, length of intestinum, goblet cells number

**Introduction**

Worm infection is still a neglected health problem in Indonesia because it is chronic and silent clinical symptoms. *Trichuris trichiura* is believed to infect about 800 million people worldwide, with the majority being children. Infected children show signs of malnutrition, stunted growth, intellectual retardation and educational deficits. *Trichurus muris*, a mouse model of *T.trichiura* infection in humans, have greatly contributed to improve knowledge on components of immune responses and how the immune systems induces parasite expulsion.¹

The contraction of the smooth muscle that lines the gastrointestinal tract is one possible mechanism that aids expulsion of the *T.muris* parasite.² It has been demonstrated that the immune system can, in fact, mediate muscle contraction. Investigations into muscle hypercontractility in *T. muris* infection have also revealed an increase with infection.³ Therefore, muscle hypercontractility may be an important effector mechanism for expelling *T. muris*.

Chronic intestinal nematode infections cause altered gut architecture, suggested that increased turnover of epithelial cells in the gut may prevent the parasite from remaining embedded within the host. Specifically, *T. muris* infection is associated with enhanced epithelial stem cell proliferation within the crypts of Lieberkühn in the large intestine, which is mediated by IFN-γ, and results in a massive crypt hyperplasia.⁴

The mucus layer forms the first barrier between the lumen and the small bowel epithelium, with mucin secretion. Changes in goblet cell proliferation and mucin mucus composition occurred in mice infected with *T. muris*. An increase in the amount of mucus makes Trichuris cyst more difficult in maintaining the acidity.⁵ This study characterized goblet cell count and length of villi and intestinal crypt in mice with *T.muris* infection.

Materials and Method

Mice: Male BALB/c mice with 2 month age and average weight 20–30 gram were obtained from Yogyakarta Veterinary Research and Investigation Center (BPPV). The animal studies were performed under the regulation Home Office Scientific Procedure Act (1986).

Parasite: T.muris was maintained as describe previously. Mice were infected by oral gavage to give either 200 embryonated eggs (high level) and 40 eggs (low dose) in double distilled H2O. Worm burden are assessed in 30 day post infection.

Tissue Preparation: Large and small intestine was taken as long as 2 cm distal from the cecum and flushed out by NaCl 0.9%, then put into 10% NBF for fixation. Tissue were prepare by using gut bundle technique. Tissue were then cut using microtome blades with a thickness of 0.3–0.5 μm and arranged into a tissue cassette, and stain with hematoxylin eosin (HE).

Measurement of Length of Villi and Crypt Intestine: Histologic preparations have been made visually observed using a microscope with weak magnification (10x10). Full length longitudinal and transversal section were selected to analysis at 9-10 mice per group. Individual villi and crypt length were determined by selecting well orientated villi and crypt, and measuring from the base to the lumen.

Determine the Number of Goblet Cell: Calculating the number of goblet cell by looking on HE stained section at 9-10 mice per group. Goblet cells taken on the villi and crypt, viewed 10 cells that are bounded clearly, easily visible and uninterrupted.

Statistical Analysis: Statistical analysis was performed by using one way analysis of varian (ANOVA) with post hoc. Analysis was performed by using SPSS program. p-values <0.05 were considered statistically significant.

Result and Discussion

A. The length of intestinal villi and crypta in Mice (Mus musculus) after infection with Trichuris muris.

Figure 1: The length of intestinal villi and crypt in mice after Trichuris muris infection (in μm).

Figure 1 shows the differences in crypt and villi lengths in intestinal crassum and intestinal tenue in the treatment group. Based on statistical analysis with one way anova show that crypt and villi on intestinum crissum and intestinum tenue will be longer in mice with Trichuris muris infection. The measurements of length of villi and intestinal crypt are shown in Figure 2 below.

![Figure 3: The average number of Goblet Cells in intestinum mice after Trichuris muris infection.](image)

![Figure 4: Goblet cell in mice (*Mus musculus*) intestine after Trichuris muris infection with magnification 10 x 10, Transversal section, stained with HE (A: Intestinal mice in control groups, B: Intestinal mice in a low dose Trichuris muris infection, C: Intestinal mice in a high dose Trichuris muris infection)](image)

*Trichuris muris* will invade epithelial cells within 24 hours after ingestion by mice. The intestinal mucosa forms a defense against the external environment in the form of intrinsic defenses consisting of epithelial cell layers and extrinsic defenses which are combination of goblet cells that produce mucous. ¹

Immune mediated expulsion of intestinal dwelling nematodes can involve the interplay between CD4+ T cell and gut epithelium. The immune response to *T. muris* has been well characterized in terms of cytokine production in the draining lymph node, with a type 2 dominated response an absolute requirement for worm expulsion. ¹

The development of a Th2-type of response is associated with fast parasite expulsion whereas a Th1 response is linked to establishment of chronic infection and increased immunopathology. The use of BALB/c strain in this research has been crucial in determining important cellular and molecular pathways of importance during *T. muris* infection. In BALB/c mice, if they infected by high dose, immune response will develop Th2 type. ⁵

*T. muris* are capable of modulating immune response of their host to prevent expulsion. Indeed, it has been shown that development of inappropriate Th1 response leads to chronic infection. It associated with high levels of IFN-γ, IL-12 and IL-18 in susceptible mouse. Resistance is also associated with decreased production of the Th1-inducing cytokine IL-18. Resistance are usually produced against high dose *T. muris* infection and lead to parasite expulsion by triggering expulsion mechanism such as increased epithelial cell turnover, mucin production and muscle hypercontractility. Two cytokines that play a major role in the resistance to infection are IL-4 and IL-13. ⁵

Prolonged infection with gastrointestinal parasites can result in severe damage to surrounding tissues if not properly regulated. *T. muris* infection can cause
severe transmural inflammation in colon. Mucosal and submucosal inflammation result in destruction of normal crypt architecture during chronic infection.²

Chronic infection with T. muris has been associated with crypt hyperplasia accompanied by both increased epithelial cell proliferation and apoptosis. In this study a given low dose and high dose of T. Muris egg in 30 day, capable change the length of villi and crypt intestine of mice. These processes might be controlled by pro inflammatory cytokine IFN-γ and can also control the excessive extension of crypt in chronic infection. Resistant mice have accelerated epithelial cell turnover, a mechanism which is directly linked to faster parasite expulsion. These findings led to a model referred to as the ‘epithelial escalator’, where epithelial cells move from the bottom of the crypt (proliferation zone) to its top (shedding zone), moving the parasite embedded in the epithelial layer towards the lumen where the epithelium and parasite are shed. In this study, BALB/c mice were able to regulate epithelial turnover during infection. The difference in epithelial cell turnover between resistant and susceptible mice is due to differences in the immune response and their cytokine profile. Some studies have shown the role of IL-4 and IL-13 to the difference. On the other hand, IFN-γ and CXCL10 (IFN-γ-induced protein), both are associated with Th1 responses and susceptibility to T. Muris infections, responsible for down-regulatory epithelial cell transition.⁸

The second mechanism of expulsion parasite in gastrointestinal tract is mucin production by goblet cells. Goblet cells are major producers of mucins (the major protein component of mucus) and form an important element of the innate defence in the gastrointestinal tract.¹ Goblet cell hyperplasia is observed during T. muris infection in both resistance and susceptible animals. This study showed that the number of goblet cells in the gastrointestinal tract would increase in mice infected with high dose compared with low-dose infected or uninfected (p<0.05).

Goblet cells are protective mucus cells that are protective to lubricate the gastrointestinal tract. The more inflammation that occurs the more mucus is produced by goblet cells as a cell defense. Goblet cell secretions contain glycoproteins (80% carbohydrates and 20% protein) released by the exocytosis process. Increased goblet cells are under control of the Th2 cytokine although also an increase in IL-4 or IL-13 may also occur. 26 IL-4 and IL-13 is a regulation of the main source of improvement ITF (intestinal trefoil factor) that interacts with mucin to increase the viscosity of the mucous gel in goblet cells.⁷

In this study, there was an increase in the number of goblet cells in T. muris infected mice compared with uninfected mice. After infection with T.muris, an increase of the number IEC that serves for expulsion of the parasite. IgE production increases in cases of worm infections. This is due to the activation of mastocyte degranulation of ECF-A (Eosinofil Chemotactic Factor) which can encourage the collection of eosinophilic cells that potentially kill the worms in tissues. High dose infection (> 150 eggs) has a more dominant Th2 immune response whereas low-dose infection (<15 eggs) has a more dominant Th1 immune response.

As long as Trichuris infected the cysts occur hyperproliferation of cells in the intestine. It also shows that the mycotic trichuris persists in its host by eliciting a Th1 immune response and leads to enterocyte cell hyperplasia that occurs during chronic infection. While Th2 leads to an acute infection in the mechanism of expulsion of worms and resulted in goblet cell hyperplasia as activation of transcription factors involved in goblet cell differentiation.⁸

Acute infections, MUC4, Muc13 and Muc17 mucin cell surfaces when infected with Trichuris muris result in increased apical glyocalyx thickness along with increased glycoprotein synthesis in goblet cells involved in the process of expulsion of worms. The hypersecretion of glycoproteins is mediated by α3 (GABA-α3) gamma amino-butyric receptors under IL-13 control.⁴

Chronic infection leads to caecum morphological changes and no significant changes were observed in goblet cell numbers and an increase in epithelial cell count was associated with chronicity. During chronic infection, the barrier mucus decreases as the glycoprotein decreases resulting in commensal flora coming back into the epithelial cell lining, which can lead to exacerbation of epithelial inflammation. The role of macrophages during worm infections increases significantly as in the peritoneal cavity suggests that this occurs because the proliferation of IL-4 is more than the precursors in the blood.
Conclusions

1. The average length of the villi and the intestinal crypt increased with the infection of *Trichuris muris*, the more infected eggs, the longer the size of villi and crypt (p values <0.05).

2. The average value of the goblet cells number in the control group, low-dose and high dose increased by higher dose worm eggs and had the value (p values < 0.05).

3. *Trichuris muris* infection has influenced towards the length of villi and crypt and the goblet cells number in intestinum of mice (*Mus musculus*).

Association between Frequency of Internet Access and Knowledge of Danger Signs in Pregnancy among Women of Childbearing Age in Indonesia

Jauhari Oka Reuwpassa1, Sudarto Ronoatmodjo2

1Department of Surgical Oncology, Dharmais Hospital, Jakarta; 2Department of Epidemiology, Faculty of Public Health, University of Indonesia

ABSTRACT

The aim of this study was to determine the association of internet access frequency with knowledge of danger signs in pregnancy among women of childbearing age. Data obtained from the Indonesia Demographic Health Survey 2017, which interviewed and obtained complete data for 23,849 women of childbearing age, was analyzed using Cox regression with statistical significance defined by a 95% confidence interval. Sample prevalence of women of childbearing age who had a good knowledge of danger signs was 31.9%; respondents who access the internet every day made up 31.4% of the sample. Our sample was predominantly women 35–44 years old (29.1%), living in urban areas (55.7%), with a secondary education level (54.7%), and working (54.7%). A significant association was shown between internet access and the participants’ knowledge of danger signs in pregnancy, with an adjusted prevalence ratio of 1.27, 95% CI [1.20–1.35]. Internet access increased knowledge of danger signs in pregnancy in women of childbearing age.

Keywords: danger signs in pregnancy, women of childbearing age, Indonesia, Demographic Health Survey 2017 (DHS VII)

Introduction

Obstetric danger signs are an indication of something wrong with a pregnant woman during pregnancy, childbirth, or postpartum.1 Even though the danger sign itself may not be a major problem, a delay in seeking health services can occur if a woman can’t define it.2,3 This is certainly dangerous for the mother, her pregnancy, and the baby.

Maternal Mortality Ratio (MMR) is one of the focuses of Sustainable Development Goals (SDGs). Worldwide, the highest MMR is in sub-Saharan African countries (546 per 100,000); in 2015, Asia recorded an MMR of 110 per 100,000. Indonesia’s MMR has decreased from year to year, but the current estimate is still above the all-Asia MMR, at around 126 per 100,000. Various factors trigger maternal deaths such as bleeding, high fever, and seizures.4

Prevalence of knowledge about obstetric danger signs across countries differs: in rural Tanzania, 51.1% of mothers can identify at least one obstetric danger sign,5 while in Somali District, Ethiopia, 15.5% of respondents can identify a minimum of two obstetric danger signs6 and in Southern Ethiopia, that figure is 21.9%.7 Several other studies separate knowledge of obstetric danger signs based on processes during pregnancy, childbirth, and postpartum. In India, a study of 170 pregnant women with 25 danger signs of pregnancy found that 29.3% of the women had good knowledge of danger signs.8 In contrast, a study in Goba District, Ethiopia, found at least 68.1% of women of childbearing age could name at least three danger signs of pregnancy.9

Nowadays, internet access is something that cannot be separated from daily life. In Sweden, 91% of women can get access to the internet and around 84% seek
information related to pregnancy, especially in early pregnancy. Another study in Ireland found that 97% of pregnant women access the internet and 83% of pregnant women use information on the internet to help them decide on a course of action for their pregnancy-related problems. In Turkey, 45% of pregnant women use the internet to seek information related to pregnancy. High internet access, especially for pregnant women, can certainly increase pregnancy-related knowledge, especially concerning danger signs during pregnancy. The purpose of this study was to identify the role of internet access in boosting knowledge of the danger signs of pregnancy in women of childbearing age among the Indonesian population.

**Material and Method**

**Study Design and Sample:** A cross-sectional study was conducted by analyzing Indonesian Demographic Health Survey (DHS) 2017 data. The DHS was designed to provide an overview of fertility data, family planning, and maternal and child health in Indonesia. This survey used two stages of stratified sampling, selecting census blocks by probability proportional to size (PPS) and by 25 households per census block (total 49,250 households). There were 50,730 women aged 15–49 years who fit the eligibility criteria, but the respondents who were successfully interviewed totaled 49,627 women. A total of 23,859 women of childbearing age supplied a complete data profile and those were analyzed in this study.

**Operational Definition**

**Knowledge of Danger Signs in Pregnancy:** In this study, a woman of childbearing age is considered as knowledgeable about danger signs in pregnancy if she can spontaneously mention four danger signs that occur. The interviewer did not mention any of these signs to the respondent.

**Frequency of Internet Access:** The operational definition of internet access is determined by frequency of internet usage. Respondents were classified into four categories: those who access the internet almost every day, at least once a week, less than once a week, or never.

Data in the DHS 2017 was collected from July 24 to September 30, 2017 throughout Indonesia by 145 teams spread across selected regions. Each team consisted of eight people as follows: one supervisor, one editor for women of childbearing age and married men, four women interviewing women of childbearing age, one man interviewing married men (who concurrently acted as editor for teenage boys) and one man interviewing teenage boys.

This study used a questionnaire for women of childbearing age.

**Data Analysis**

SPSS version 20 was used to code and analyze the DHS 2017 data. The level of knowledge, frequency of internet access and other covariate variables were described by frequency and percentage. Bivariate analysis was conducted using Cox regression to determine the crude prevalence ratio (PR). All variables in bivariate analysis with p < 0.25 were a candidate for further analysis. A backward step was undertaken to eliminate the variables which didn’t meet the significance level. Multivariate analysis was seen to obtain adjusted PR. Significance level in this study was valued at a 95% confidence interval.

**Findings**

The analysis included 23,849 women of childbearing age whose data were complete. Respondents were considered knowledgeable about danger signs in pregnancy if they were able to mention a minimum of four danger signs spontaneously; on this criterion, the prevalence of good knowledge was 31.9%. The prevalence increased if we applied a lower standard: for three danger signs, the prevalence of good knowledge was 59%, for two signs the prevalence was 79.1%, and for one sign the prevalence was 93%.

The respondents were typically aged between 35 and 44 (29.1%), were educated to secondary level (54.7%), lived in an urban area (55.7%), and were in employment (58.8%). In terms of marital and family status, 93.1% of respondents were married, 66.9% had a maximum of two children, and 9.6% were not pregnant. Information was collected about media access through the internet, newspapers or magazines, and radio or television. Of
the respondents, 31.4% accessed the internet every day, 11.7% read newspapers/magazines at least once a week, 12.8% listened to radio at least once a week, and 85.4% watched television at least once a week (Table 1).

Bivariate analysis was carried out to obtain crude PR values. After all the covariate variables were analyzed, three variables had significance values >0.25, namely experience of termination of pregnancy, marital status, and employment status. The remaining covariate variables met the inclusion criteria for the multivariate model: age, number of children, place of residence, level of education, reading newspapers/magazines, listening to the radio, and watching television. The results of multivariate analysis between frequency of internet access and knowledge of danger signs in pregnancy can be seen in Tables 2 and 3.

</table>
Compared to respondents who never accessed the internet, those who accessed the internet every day had an association of 1.27, 95% CI [1.20–1.35] with good knowledge of danger signs in pregnancy; the association decreased with the frequency of internet access. Compared to respondents who did not access the internet at all, those who accessed the internet at least once a week had an association of 1.16, 95% CI [1.06–1.7], while those who accessed the internet less than once a week had an association of 1.06, 95% CI [0.93–1.22].

**Discussion**

In this study, a woman was classified as have good knowledge if she was able to mention four danger signs in pregnancy; the prevalence of this was 31.9%. In a study conducted in Jordan, the prevalence of mentioning four danger signs was lower, at 15.1%. If the lower standard of mentioning three danger signs is applied in the present study, the prevalence of good knowledge is 59%, higher than the 46.74% reported for a study in Raya Kobo, Ethiopia. Labour, and postnatal period is the first essential step for appropriate and timely referral. This study aimed to investigate predictors of knowledge about obstetric danger signs during pregnancy, delivery, and postpartum period among mothers of reproductive age women who gave birth in the last 12 months. A quantitative community based cross-sectional study was employed during March 2016. The study included 493 mothers who were selected by multi-stage sampling technique. Data were collected by face-to-face interview. Logistic regression analyses were employed to identify factors associated with knowledge of obstetric danger signs. Variables with a p-value <0.05 were identified as statistically significant factors. About forty-seven percent (46.7%) If the standard is lowered further to two danger signs and one danger sign, the prevalence in the present study are 79% and 93%, respectively. A study in Uganda using the standard of one danger sign found that the proportion of well-informed respondents was 52%. During delivery and 72% during postpartum. Only 19% had knowledge of 3 or more key danger signs during the three periods. Of the four birth preparedness practices; 91% had saved money, 71% had bought birth materials, 61% identified a health professional and 61% identified means of transport. Overall 35% of the respondents were birth prepared. The relationship between knowledge of at least one key danger sign during pregnancy or during postpartum and birth preparedness showed statistical significance which persisted after adjusting for probable confounders (OR 1.8, 95% CI: 1.2-2.6) The data therefore show that the application of different standards will affect the prevalence of good knowledge: the lower the standard, the higher the prevalence of women who have good knowledge. Regardless of the standard applied, the prevalence of good knowledge of danger signs in pregnancy is higher in Indonesia than in other countries.

The internet is a source of information that is widely used, especially by pregnant women. In this study, the prevalence of accessing the internet every day was around 31.4%, once a week was 8%, and less than once a week was 2.9%. Studies in China and Sweden have given the prevalence of women accessing the internet as 91.9% and 91%, respectively; however, these two studies did not report frequency of internet access.

The aim of this study was to determine the association in women of childbearing age between frequency of internet access and knowledge of danger signs of pregnancy. The results show that the more frequent respondents’ access to the internet, the better their level of knowledge about danger signs in pregnancy. Compared to women of childbearing age who never accessed the internet, women who accessed the internet every day had an association of 1.27 with good knowledge of danger signs in pregnancy, women who accessed the internet once a week had an association of 1.16, and women who accessed the internet less than once a week had an association of only 1.06.

Studies of the association between frequency of internet access and level of knowledge of danger signs in pregnancy have so far been limited. Some research has focused on the relationship between internet access and general information about pregnancy. For example, a study conducted in Sweden found that 84% of pregnant women accessed the internet to find information about pregnancy, especially in the first trimester; 70% of respondents did not discuss their findings with health workers, and 55% had sought information on the internet because of the influence of health workers. In China, 75.1% of women obtained information about pregnancy from the internet, but not specific in searching for danger sign.

**Study Limitations:** The 2017 DHS data focus on the frequency with which women of childbearing age accessed the internet. In this study, therefore, it was not possible to provide detailed information about the types of content accessed through the internet by the respondents.
Conclusion

The prevalence among women of childbearing age of good knowledge of danger signs in pregnancy was 31.9%, and the prevalence of women accessing the internet on a daily basis was 31.4%. We conclude that there was an association between accessing the internet and knowledge of danger signs in pregnancy.

Conflict of Interest: Both authors declare that there is no competing interest in this paper.

Source of Funding: All funding was provided by the authors.

Ethical Clearance: All respondents agreed to be interviewed, and all data were anonymous. A letter of permission was obtained from the National Population and Family Planning Board (No. 141/LB.01/H3/2019).

Acknowledgment

The authors are grateful to the National Population and Family Planning Board (Badan Kependudukan dan Keluarga Berencana Nasional/BKKBN) for providing the data.

ABSTRACT

Objectives: Womanhood is the time in a girl’s life after she has progressed through early days in childhood and adolescence. Having reached womanhood, no woman feels complete without becoming a mother.

Method: In view of the nature of the problem under the study, and to achieve the objectives of the study, a descriptive approach and a non-experimental descriptive design were found to be appropriate to describe the study. The data was collected from 100 women who were residing in the selected rural area at Shimla using Non-probability purposive sampling technique.

Result: Sample distribution according to the demographic characteristic showed that the study sample consists of 100 women in the age group of 21-35 years. Item-wise analysis revealed that 64 percent of women knew that “uterus is a part of reproductive system;” 68 percent of the respondents were aware that “prolapse is common in heavy lifting workers due to increased strain on pelvic muscles;” 50 percent of the respondents were aware that “vaginal discharge in uterine prolapse is white;” 76 percent of respondents knew that “constipation which can cause prolapse can be prevented by consuming fibre-rich diet”.

Conclusion: It is vital for the women to understand the key factors about uterine prolapse, especially the risk factors and preventive measures. Nurses in all settings play an important role in educating the community about health-related behaviour, risk factors, early screening, as well as preventive measures.

Keywords: Uterine Prolapse; Knowledge; Factors Influencing

Introduction

According to World Health Organisation’s estimation reproductive health accounts for 33 percent of the total disease burden in women globally. Reproductive health problems are the leading cause of ill health that exists throughout the nation. Studies have shown that among the reproductive health problems faced by women, the most common problems are cystocele (56 percent), uterine prolapse (53.6 percent) and rectocele (40 percent). This reveals that uterine prolapse is the second commonest reproductive health condition faced by women. The global prevalence of uterine prolapse is estimated to be 11-20 percent in women under the age of 45. It is estimated that more than 6,00,000 women in Nepal are suffering from uterine prolapse, out of which 18,600 are in need of surgical repair. Uterine prolapse is the most widespread reproductive health condition and is the neglected health issue. It is a complex condition that is often kept secret because of the shame of affecting a sensitive part of the women’s body. Many women fear condemnation from their community and families and they continue to remain silent on this matter. Statistics reveals that 6,00,000 women are affected by the disease out of which 2,00,000 require immediate treatment. Prolapse is mainly caused by improper care during the antenatal, intranatal and postnatal periods.
Method

In view of the nature of the problem under study and to accomplish the objectives of the study descriptive approach was found to be appropriate to describe the knowledge of women on factors influencing uterine prolapse and its prevention.

In view of the nature of the problem under study and to accomplish the objectives, a non-experimental descriptive design was found to be appropriate to describe the knowledge of women on factors influencing uterine prolapse and its prevention.

The study was conducted in selected rural areas under Surathkal PHC. In the present study, the target population consists of women residing in a selected rural area at Shimla, and accessible population consists of women in the age group of 21-35 years residing in a selected rural area at Shimla. The sample for the study consists of 100 women who met the inclusion criteria and are residing in a selected rural area at Shimla. Purposive sampling technique is a strategy in which researcher’s knowledge of the population and its elements are used to select sample which are typical to the population.

This study received ethical approval from the Institutional Review Board of the parent institution. Individual Informed consent was taken from the sample before the data collection.

Results

Part I: Description of demographic characteristics of women

Table 1: Percentage distribution of women according to their age (N = 100)

<table>
<thead>

<td>7</td>
<td>7.0</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100.0</td>
</tr>
</tbody>
</table>

As per Table 1 percentage distribution of women according to their age shows that the highest percentage (70 percent) of the samples belonged to the age group of 21-25 years, 23 percent belonged to the age group of 26-30 years, and seven percent belonged to the age group of 31-35 years.

Part II: Analysis of knowledge of women regarding uterine prolapse and its prevention

Table 2: Level of Knowledge of women regarding uterine prolapse and its prevention (N = 100)

<table>
<thead>
<tr>
<th>Percentage of range of score</th>
<th>Level of knowledge</th>
<th>No. of respondents</th>

<td>Good</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>81-100</td>
<td>very good</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

As per Table 2 in order to find out the level of knowledge of women, a four-point scale was used. The percentage scores were arbitrarily graded as follows: less than 40 percent – poor knowledge; 41-60 percent – average knowledge; 61-80 percent – good knowledge; and 81-100 percent – very good/excellent knowledge. Assessment of the level of knowledge of women showed that the highest percentage (75 percent) of the women had average knowledge and 25 percent had poor knowledge regarding uterine prolapse and its prevention.

Section B: Area-wise analysis of knowledge scores

Table 3: Area-wise mean, SD and mean percentage of knowledge scores of women regarding uterine prolapse and its prevention (N = 100)

</tr>
<tr>
<td>Total</td>
<td></td>
<td>30</td>
<td>14.09</td>
<td>2.400</td>
<td>46.97</td>
</tr>
</tbody>
</table>
Table 3 shows that women had highest knowledge in the area of ‘prevention’ (56.50 percent) which had a mean and SD of 5.65 ± 1.395, whereas the mean percentage in the area of ‘factors influencing uterine prolapse’ was 46.67 percent with a mean and SD of 4.20 ± 1.608. This reveals that the knowledge of women regarding uterine prolapse was average.

Section C: Item-wise distribution of correct responses of women

Table 4: Item-wise distribution of correct responses of women regarding knowledge on factors influencing uterine prolapse (N = 100)

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Item</th>

<td>68 68</td>
</tr>
<tr>
<td>9.</td>
<td>The precipitating factor for uterine prolapse is inadequate nutrition</td>
<td>46 46</td>
</tr>
</tbody>
</table>

As per Table 4, analysis reveals that 40 percent of the women knew that “Uterine prolapse is more common in multiparous;” 34 percent of the women knew that “Uterine prolapse can be caused by birth weight of baby more than 3.6 kilogram;” 56 percent of the women knew that “Major cause of uterine prolapse is fibroid uterus;” 44 percent of the respondents were aware that “Risk factor for uterine prolapse is smoking;” 42 percent of the respondents were aware that “Uterine prolapse is more prone in obese person.

Part III: Association between knowledge of the respondents on uterine prolapse and its prevention with demographic variables

To test the association between the knowledge of the subjects and selected demographic variables, the following hypothesis was formulated:

H₁: There is a significant association between knowledge score of the women on uterine prolapse, with the demographic variables such as age, religion, occupation, parity, education, monthly income and mode of delivery at 0.05 level of significance. The hypothesis was tested using chi-square test ($\chi^2$).

**Association between knowledge of the respondents on uterine prolapse and demographic variables**

Table 5: Association between knowledge of uterine prolapse with age (N = 100)

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>12</td>
<td>18</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NS: Not significant

As per Table 5, the calculated $\chi^2$ value is 0.000. The degree of freedom is one and the P value is 1.000. As the calculated value is less than that of the table value null hypothesis is accepted. So there is no significant association between knowledge of uterine prolapse with age of the women.
Table 6: Association between knowledge of uterine prolapse with parity (N = 100)

NS: Not significant

As per Table 6, the calculated $\chi^2$ value is 2.932. The degree of freedom is two and the P value is 0.231. As the calculated value is less than that of the table value null hypothesis is accepted. So there is no significant association between knowledge of uterine prolapse with parity.

Discussion

Part I: Percentage distribution of sample with reference to demographic variables: All the subjects belonged to the age group of 21-35 years. Seventy percent of the sample was aged 21-25 years; 41 percent of respondents were under parity one; 63 percent of the respondents belonged to Hindu religion; 70 percent of the respondents had primary education; 96 percent were housewives; 58 percent had income between Rs. 3001-4000; and 92 percent had undergone vaginal delivery.

A similar study was conducted in Nepal which revealed that 70 percent of women were in the age group of 20-40 years. Majority of the study population was illiterate (80 percent), Dalits (44 percent) and 50 percent belonged to low socioeconomic groups.

Part II: Knowledge of women regarding uterine prolapse and its prevention: Objective I: Determine the pre-existing knowledge of women on uterine prolapse and its prevention as measured by close ended structured interview schedule

Assessment of the level of knowledge of women showed that highest percentage (75 percent) of the sample had average knowledge and 25 percent of the women had poor knowledge regarding uterine prolapse. Analysis showed that women had highest knowledge in the area of ‘prevention’ (56.50 percent) which had a mean and SD of 5.65 ± 1.395, whereas the mean percentage in the area of ‘factors influencing uterine prolapse’ was 46.67 percent with a mean and SD of 4.20 ± 1.608. Similar findings were also reported in a study conducted in Alexandria among 291 women which revealed that more than two-thirds of the women (70.4 percent) had poor knowledge regarding uterine prolapse, 36.4 percent had fair knowledge and 29.6 percent had satisfactory knowledge regarding uterine prolapse.

Part III: Association of knowledge with demographic variables: Objective II: Find the association between knowledge scores and selected demographic variables such as age, parity, religion, education, occupation, monthly income and mode of delivery.

Chi-square was computed in order to find the association between knowledge and selected variables. The result revealed that there was no significant association between the knowledge of women and demographic variables such as age, parity, religion, education, occupation, monthly income and mode of delivery.

Similar findings have been reported in a study conducted at Alexandria. The results revealed that there was significant association between prolapse with parity (p=0.0001), unskilled birth attendant (p=0.0006), prolonged labour (p=0.007), early resumption of routine activities during puerperium (p=0.002), low socioeconomic group (p=0.001), and family history (p=0.001). Health education on distinctive perspectives of reproduction is exceedingly required to energize ladies to know and report their sufferings. Improving the skills of birth attendants, focussing on domiciliary obstetrics is also emphasised.

Conclusion

The study revealed that women had average knowledge on uterine prolapse and its prevention. There is a necessity to give health education to women to improve their knowledge on uterine prolapse and its prevention.

ABSTRACT

Aim: Body mass index was used as an indicator of body fat content. However, it fails to indicate the body fat in muscular individuals. Studies have shown the relationship between body mass index and blood pressure. Body shape index is a new anthropometric measurement introduced. We have evaluated the relationship of body shape index and body mass index with blood pressure.

Method: The cross-sectional descriptive study consists of 300 individuals between age 18 – 60 years. Height, weight and blood pressure were measured. body mass index and body shape index were calculated. Data analyzed by statistical tests to draw the inference.

Results: In our study body mass index was significantly increased with increasing age, unlike body shape index. A correlation was found between body mass index and body shape index. Systolic blood pressure was significantly correlated with body mass index as well as body shape index. However, diastolic blood pressure was correlated only with body mass index but not with body shape index.

Conclusion: We conclude that body mass index is better correlated with blood pressure than body shape index. It shows that body mass index is a better indicator of blood pressure than body shape index.

Keywords: Body Mass Index, Body shape index, Blood Pressure.

Introduction

WHO has defined obesity as body mass index (BMI) equal to or more than 30, measured using height and weight of an individual1. Though it is an indicator of the body fat mass, BMI has been criticized for its inefficiency to reflect the body fat distribution as it may not distinguish between fat mass and muscle mass2,3,4,5. BMI measures body fat but fails to reflect the abdominal fat distribution6. Data are available indicating regional distribution of fat is responsible for the comorbidities associated with the obesity7,8. Moreover, in young healthy adults BMI provide poor measure of fat mass but reflects skeletal muscle mass9. To overcome this short fall in the BMI, recently a new index was developed by Krakauer and Krakauer10 called A body shape index (ABSI), and observed the positive correlation with the abdominal fat deposition. It was also observed that ABSI is a better indicator than WC and BMI to predict mortality8. However other studies have indicated that it is a poor indicator of cardiovascular risk prediction9. Obesity statistics from the Malaysian National Health and Morbidity Survey in 2006 showed that 43% of Malaysian adults were obese or overweight11.

million deaths every year\textsuperscript{12}. In Malaysia, one in every three adult Malaysians are hypertensive, or around 6.3 million individuals\textsuperscript{13} and the projected prevalence of hypertension in 2020 is estimated to be about 7.6 million Malaysians aged 18 years and above. BMI is related to BP but there is still much needed to be studied in developing countries Asia and Africa\textsuperscript{14}. We conducted this cross-sectional study to evaluate the relationship of ABSI, blood pressure and compare with BMI.

**Material and Method**

**Study Population:** A cross-sectional descriptive study was conducted on 300 individuals aged 18 to 60 years who were willing to participate in this study they apparently not on any type of medication or special diet and had not started any planned physical training. The sample size was calculated using the formula for single population. The random sampling method was used to collect the data. Those individuals who refused to participate, or who had begun physical training recently pregnant women, physically disabled individuals and individuals with endocrine disease such as hypothyroidism, infectious disease like tuberculosis and malignancies that might change the individual’s body size were excluded.

**Study Tools:** Data was collected using structured questionnaires consisting of 2 sections. Section A consisting of baseline characteristics and section B for anthropometric measurements. Weight was measured to the nearest 0.1 kg using electronic weighing scale (model 770: seca, Germany) with the respondents lightly clothed while the height was measured using the measuring tape with respondents (without shoes) standing still by applying the direct observation method. The BMI was calculated by using the formula BMI= Weight (kg)/ height (m)$^2$. Based on the BMI, cut off points for Asians is underweight (BMI < 18.5kg/m$^2$), normal (18.5-22.9 kg/m$^2$), overweight (23-27.49 kg/m$^2$) and obese (>27.5kg/m$^2$)\textsuperscript{15}. Body shape index was calculated by the formula ABSI = WC/[(BMI)$^{0.43}$ × height (m)$^{0.5}$]. Blood pressure was measured by sphygmomanometer. The left arm BP was measured after the individual had rested for 5 min. The average of two readings for each was used for analysis.

**Research Ethics:** Ethical approval for this study was obtained through the institutional research and ethics committee. The informed written consent was taken from all the participants.

**Statistical Methods:** The data of the study was analyzed using descriptive and inferential statistics. Results of the continuous measurements are presented as Mean ± SD and results on categorical measurements are presented in percentage. Significance is assessed at 5 % level of significance. To find the significance of study parameters between three or more groups, analysis of variance (ANOVA) and to find the degree of relationship between study variables Pearson correlation was performed.

**Statistical software:** The Statistical software used to analyze the data were SPSS 18.0, and R environment ver.3.2.2.

**Results**

In the present study consisting of 300 individuals, 150 were males and 150 were females. By considering BMI we observed that majority of the individuals of the study group were in the overweight category and nearly equal number were normal and obese (Table 1). Almost all individuals in the study group (95%) were with the ABSI between 0.08 to 1.0 and 5% were <0.08 (table 2) however no one was with ABSI >1. There was a statistically significant increase in BP and BMI between different age groups. However, we observed no significant increase in the BSI between different age groups (Table 3). Comparison of BP and ABSI of individuals under different groups categorized according to the BMI cut-off points for Asians had shown a statistically significant increase in the BP, and ABSI, between the groups (Table 4). In the study group there was a statistically highly significant correlation between the age of the individuals, BP (systolic and diastolic) with BMI (Table 5). However, ABSI had shown statistically strong correlation with BMI and systolic BP. The correlation between ABSI and diastolic BP was negative with no statistical significance (Table 5)

Discussion

The present cross-sectional study was conducted to evaluate the effect of ABSI and BMI, on BP and to assess which among them has better correlation. We also evaluated the BSI, BMI, among different age groups. We found strongly significant increase in BMI with increase in age but it was not true for ABSI. The overall average BMI of the population was 24.60 ± 4.10 kg/m² and this value almost coincided with the observations made by Azmi et al. They observed an overall BMI of 24.37 kg/m² and Azuwani et al. found the mean BMI 25.7±4.61 kg/m² among individuals in Malaysia. Furthermore, upon increasing age from 30 to 60 years, the population became over weight, when compared to a normal BMI in the age group of 18 to 29 year. The systolic and diastolic blood pressure also increased in these age groups. However, the BSI was constant in different age groups. Mungrepthy et al. found that the mean systolic and diastolic BP was higher among subjects who have higher BMI and older age. Nasarudin & Ahmad concluded that high BMI is very much a risk factor for hypertension.

We observed statistically highly significant increase in blood pressure in individuals as their BMI increased. We also observed statistically highly significant correlation between BMI and blood pressure (systolic & diastolic). However, the ABSI value remains the same even though the BMI changes. The correlation between the ABSI and Systolic blood pressure was highly...
significant but not the diastolic blood pressure. Jeong, & Lee 20 in their study observed negative relation between ABSI and diastolic blood pressure. In contrast to our study Duncan et al. 21 found out that ABSI and BMI were all significantly related to both SBP, DBP and ABSI and BMI were significant predictors of systolic blood pressure. The correlation between BMI and ABSI was highly significant. In a study conducted by Giudici & Martini 22 stated that the ABSI of adolescents correlated positively with the BMI which agrees with our findings. We conclude that an increase in BMI is associated with an increase in blood pressure. Even though the correlation between BMI and ABSI are significant, BMI is significantly correlated with both systolic and diastolic blood pressure whereas ABSI is significantly correlated only with systolic blood pressure. Hence, according to the results of our study, BMI is a better related to blood pressure than ABSI. However, a larger population needs to be studied.

ABSTRACT

The purpose of this study was to describe, some the grossly and histological structures and histochemical features of the liver and pancreas of local adult homing pigeon. The present study was conducted on 20 local adult homing pigeon divided into two groups (10 for morphological study and 10 for histological and histochemical study). The morphological results showed that the liver located in the right and left hepatoperitoneal cavity, it has red- brown to dark brown in color, the weight of the liver was (1.59 ± 0.21%) in relation with the body weight. The liver is divided into two undivided lobes left and right, the right lobe is larger than left lobe, mean length, weight and thickness of wall of left and right lobes were (32.1 ± 0.41mm), (22.6 ± 0.23 gm), and (3.5 ± 0.02 mm); (43.7 ± 0.25 mm), (46.6 ± 0.16 gm), (4.2 ± 0.03 mm) respectively. the pancreas was long gland, is on the lower right side of the abdominal wall between the arms of the duodenum. The mean length and weight of pancreas was (97.5 ± 2.20 mm), (3.12 ± 0.26 gm) respectively. Histological examination revealed that the liver consist of several lobules separated from each other by thin trabeculae of connective tissue extend from delicate capsule that enclosed the liver. The basic unit of the parenchyma of liver is hepatocyte which arranged in plates or cords like that radiated around the central vein and between these cords there is sinusoids lined by a layer of fenestrated endothelial cells and Kupffer’s cells. In the boundary of each lobule showed portal area which consist of hepatic artery; hepatic vein and bile duct lined by cuboidal cells. The mean thickness of capsule, diameter of central vein, portal vein, hepatic artery and hepatic duct were (145 ± 12.6, 624 ± 32.4, 523 ± 90.0, 190 ± 20.4 and 325 ± 12.1 µm) respectively. The pancreas was serous tubuloacinar gland which covered by a thin connective tissue capsule consisted of collagenous, elastic and reticular fibers. The mean it thickness was (47 ± 2.2) µm. The parenchyma was consisted of exocrine portion and pancreatic islands. The pancreatic islands were composed of large Alpha and small Beta islets. The duct system composed of intercalated duct, intralobular duct, interlobular duct and main excretory duct. The histochemical study the hepatic cells were positive to periodic acid Schiff stain. The pancreatic islands were composed of large Alpha and small Beta islets.

Keywords: Homing pigeon, liver, pancreas, Histochemical, Histological.

Introduction

Birds have a single body chamber and do not have separation of the abdomen and thorax as in mammals¹. In avian species, the liver is a bilobed organ that lies in the mid-coelomic cavity of the body, ventrally and posteriorly to heart associated with proventriculus and spleen²,³,⁴. In most avian species, the left lobe is slightly smaller than the right lobe. The liver is largest gland of body, it is dark brown or red brown in color and the liver is both endocrine and exocrine gland releasing several substances directly into blood stream and secreting bile into duct system⁵. Embryologically, it derived from endoderm (hepatocyte and biliary epithelium) and mesoderm (stroma cells, satellite cells, kupffer’s cells and blood vessels⁶,⁷. Histologically, the

liver of avian similar to that in mammals but there is some differences such as absent connective tissue septa between lobules except in portal area, duck liver consist of several lobules separated from each other by thin trabeculae of connective tissue extend from delicate capsule that enclosed the liver. in turkey, the hepatocytes are usually arranged as two cell thickness between the liver sinusoids. The portal area contained branch of portal vein, branch of hepatic artery and 2-3 inter lobar bile ducts. The liver is most important organ in the body. It has numerous functions, including digestive functions, metabolism of proteins, fats, and carbohydrates, detoxification, synthesizing and secreting bile. The avian pancreas is located on the right side of the abdominal cavity in all birds, the pancreas of the birds is considered to have four lobes: ventral, dorsal, third and splenic; with three ducts: ventral, dorsal and third, as described in chicken and quail. is consist of an endocrine portion or pancreatic islands and an exocrine portion. The pancreatic islands are responsible for the control of blood sugar concentration and consisted of isolated groups of pale staining islet cells called islets of Langerhans. The exocrine portion releases many essential electrolytes and digestive enzymes.

Materials and Method

For morpholgical study taken Ten adult health local birds (5 male and 5 female) were collected from local market in Muthana city during March 2019, the birds were killed after anesthesia by intramuscular injection of a mixture of ketamin and diazepam at dose 25 and 5 mg/kg of body weight. The body cavity was opened through a midventral incision, the liver and pancreas were immediately dissected out, measurement the mean length, weights and thickness of pancreas and measurement the mean length, weights and thickness of the left lobe and right lobe of liver by digital electronic verinia, measurement tape and ruler.

For histological and histochemical study the present study was carried out on specimens of liver and pancreas of adult health local birds, 5 specimens from different regions of each lobe of the liver were taken and fixed by 10% formalin 24 hours at room temperature, and then treated by routine histological processing embedding with paraffin wax (58-60 C) and sectioning to 5-7µm. The stains were used, Harries Hematoxylin and Eosin (H&E) for demonstrating the general histological components, Periodic Acid Schiff (PAS) for distinguish of carbohydrates, and Van Gesion stains for connective tissues. The slides were then dipped in xylene and mounted with cover slip using DPX mounting medium. The slides were examined under light microscope to study the general histology and histochemistry features of liver and pancreas. The mean thickness of capsule, diameter of hepatocytes, central vein, portal vein, hepatic artery and hepatic duct, The mean and the standard error were calculated for 5 slides for each lobe of liver and 5 slides of pancreas.

Result

The liver in present study proved that it was large and bilobed organ, lied in the right and left hepatoperitoneal cavity (Fig.1) and it has red-brown to dark brown in color, the weight of the liver was (1.59 ± 0.21%) in relation with the body weight and consisted of left and right lobes which were joined cranially at the midline by an interlobar portion. There was no gall bladder The left lobe has concavity in its top where the heart stabilized and it’s not divided into secondary lobes (Fig.1), and mean length, weights and thickness of wall of left lobe of liver were (32.1 ± 0.41) mm, (22.6 ± 0.23) gm., (3.5 ± 0.02) mm (Table 1), while the right lobe has concavity from its ventral side where the gizzard was stabilized, and it didn’t contain the incision that divided it into secondary lobes (Fig.1), mean length, weights and thickness of wall of right lobe were (43.7 ± 0.25) mm, (46.6 ± 0.16)gm., (4.2 ± 0.03) mm (Table 1), the pancreas was long gland, is on the lower right side of the abdominal wall between the arms of the duodenum (Fig.1), The mean length and weight of pancreas was (97.5 ± 2.20) mm, (3.12 ± 0.26) gm respectively.

The histological examination of this study revealed that the liver composed of a parenchyma covered by capsule which is composed of regular dense connective tissue that contains collagen, reticular and elastic fibers. This capsule also contains lymphatic vessels, collagen fibers and fibroblasts (Fig. 2,3). The parenchyma of the liver consists of hepatocytes which are arranged in plates, its thickness was either one cell or two cells around sinusoids. The hepatocytes constitute parallel cords to the capsule whereas it was arranged radially inward composing small lobules and acini, hepatocytes radiated around the central vein and between these cords there is sinusoids lined by a layer of fenestrated endothelial cells. Lumen of sinusoids contained mainly erythrocytes and macrophages. In the boundary of each lobule showed portal area which consist of hepatic artery; hepatic vein and bile duct lining by cuboidal cells (Fig.3). The mean thickness of capsule, diameter
of central vein, portal vein, hepatic artery and hepatic duct in each left and right lobes of liver were (145 ± 12.6) µm, (624 ± 32.4) µm, (523 ± 90.0) µm, (190 ± 20.4) µm and (325 ± 12.1) µm respectively (Table 1). The pancreas was serous tubuloacinar gland which covered by a thin connective tissue capsule consisted of collagenous, elastic and reticular fibers (Fig.4). The gland’s parenchyma was consisted of exocrine portion and pancreatic islands The mean thickness of pancreas capsule in this study was (47 ± 2.2) µm. The duct system composed of intercalated duct, intralobular duct, interlobular duct and main excretory duct (Fig.4).

Histochemically, The hepatic cells were positive to periodic acid schiff stain (Fig.3).The pancreatic islands were composed of large Alpha and small Beta islets, The epithelial cells take the red color by Van Gieson stain (Fig.4). The acinar cells of the pancreas contains red granules with PAS - AB (Fig. 4).

Discussion

The liver of pigeon located in the right and left hepatoperitoneal cavity, it has red-brown to dark brown color. This result agreed with\(^1\), who said that the normal color of the adult male geese was red-brown to dark brown and disagree with\(^2\) who remained that the normal color of the avian liver depends on the nutritional state of the bird and it is red-brown or it may be light brown but it is yellow if the bird is on a high-fat diet. A gross examination of the present study showed that the liver was a bilobed, these results are accompanied with the description of others birds such as captive bustards\(^3\), ostrich\(^4\) **Odonus niger**\(^5\), **Struthio camelus**\(^6\) and other avian\(^7\). The size, weight and color of the liver are dependent on the breed, age and nutritional status of the individual bird\(^8\). The pancreas was long gland, is on the lower right side of the abdominal wall between the arms of the duodenum, This finding is in agreement with the result\(^9\).

The parenchyma of the liver lobule is composed of hepatocyte arranged in branching plates and this separated by blood sinusoids and arranged in radiation the result was similar to these observed in turkey and pintail duck in\(^2\) numerous granules of glycogen in the cytoplasm, this agree with\(^1\) in chicken. The pancreas gland is cover with a thin capsule which concords with the findings\(^1\) in geese. In contrast, the capsule of pancreas was thick in the turkeys\(^1\). The capsule of pancreas was made up of collagenous, elastic and reticular fibers, which correlate to the findings of\(^2\) in duck and\(^1\) in geese. Stated that the features of the mucous of the epithelium of the pancreatic duct are found to be different depending on the type of digestion\(^1\). The duct system of pigeon pancreas composed of intercalated duct, intralobular duct, interlobular duct and main excretory duct. This finding is in agreement with the results\(^7\). the hepatic cells were positive to periodic acid schiff and alcian blue reactions, The pancreatic islands were composed of large Alpha and small Beta islets, these similar to\(^1\) in chicken. These pancreatic islets which consisted of various shapes of large Alpha and small Beta islets were in agreement with the previous findings\(^15\).

Conflict of Interest: This research is a personal non-profit work and there is no conflict of interest.

Source of Funding: None.

Ethical Clearance: Ethical clearance was obtained from the Faculty Scientific Committee (Department of Anatomy College of Veterinary Medicine/AL Muthanna University/Iraq,) to study the histomorphological and histochemical of the healthy liver and pancreas of local Adult homing pigeon (Columba livia domestica).

The Ameliorative Effects of Chrysin against Methandienone-Induced Change in Blood Parameters in Mice

Marwah Y. Falih¹, Abbas A. Mohammed¹, Ghassan M. Sulaiman¹

¹Biotechnology Division, Applied Science Department, University of Technology, Baghdad, Iraq

ABSTRACT

Objective: investigate the effects of methandienone on blood cells and compared to those of normal and chrysin supplementation conditions

Materials and Method: Male Mus musculus mice (8-12 weeks in age, 25.00 ± 2.00 gm weight) were acquired, seven experimental groups, each with 5 mice. The negative control group was treated with distilled water. The positive control group was treated with 20mg/kg of cyclophosphamide (CFA) twice a week for two weeks. Methandienone-treated group received the drug (1mg/kg body weight) orally on a daily volume of 0.1 ml for one week. The first chrysin-treated group received the drug (25mg/kg body weight) orally on a daily volume of 0.1 ml for one week. The second chrysin-treated group received the drug (50mg/kg body weight) orally on a daily volume of 0.1 ml for one week. The 6th group received 1mg/kg methandienone received an additional oral treatment with chrysin (25mg/kg) for one week. The 7th group received 1mg/kg methandienone received an additional oral treatment with chrysin (50mg/kg).

Results: The results showed clear changes in blood parameters in treated animals, represented by significant reduction in the counts of total leucocyte, monocyte, eosinophil and neutrophil, associated by significant increase in the counts of lymphocyte, red blood cells, and blood counts, as well as hemoglobin level.

Conclusion: methandienone causes change in blood parameters and chrysin play an ameliorative effect of methandienone. Additionally, treatment with chrysin for short period was able to reduce these side effects of treatment with methandienone.

Keywords: methandienone, chrysin, cyclophosphamide, complete blood tests, mice

Introduction

Methandienone is one of the anabolic androgenic steroids which is known as a testosterone derivative¹. Methandienone, in addition to its reported enhancement of protein metabolism and synthesis, is an anti-anemia drug that can stimulate production of red blood cells (RBCs) synthesis. Hence, it has been applied in treatment of aplastic anemia, corneal ulcer and wounds².

Complementary supplemetations are used to be consumed in combination with drugs like methandienone in order to reduce their side effects. Chrysin belongs to a group of flavonoids with a wide biological activities, which was used in the traditional medicine and comprise the main component of several medical plants such as Radix scutellariae, Passiflora incarnate, and Pelargonium crispum. They were also described as constituents of propolis, honey, and mushrooms. Chrysin was proved to have several strong medicinal anti-inflammatory activities, anti-asthmatic and antioxidant activities, as well as protective effects against diseases of organs such as the heart, brain, lungs, kidneys and liver, where its activity depended on its bioavailability and solubility. Chrysin experts its activities through strong antitoxic characteristics against induced toxins, such as methotrexate, ethanol, D-galactosamine in the liver, doxorubicin in the heart, adenine and ethanol in the kidney, ovalbumin, bleomycin and cigarette smoke in the lungs, and formalin in the nervous system³. Therefore,
Chrysin is considered as an anti-cancer, anti-aging, anti-hypertensive agent with a liver-protective role against chemotherapeutic\textsuperscript{4, 5}. In the present study, the effects of methandienone on blood was investigated and compared to those of normal and chrysin supplementation conditions in Mus musculus.

**Method**

**Chemicals:** Methandienone was purchased from LA Pharma S.r.l. (Thailand). Cyclophosphamide (CFA) was purchased from Zydus (Germany). Chrysin (CR) was purchased from Sigma-Aldrich (China). The other chemicals and reagents were used at analytical grade level.

**Drug Doses:** Daily doses of 0.1 ml methandienone were given to the mice with 1 mg/kg body weight. Chrysin doses 25 mg/kg and 50 mg/kg were prepared depending on previous studies\textsuperscript{6}.

**Laboratory Animals:** Male Mus musculus mice (8-12 weeks in age, 25.00 ± 2.00 gm Wight) were acquired from the National Centre of Monitoring and Medicinal Research, Ministry of Health, Baghdad, Iraq. They were kept in standard cages (25°C) with food and water provision ad libitum in the animal house, Biotechnology Branch, Applied Sciences Division, University of Technology, Baghdad. The animals were maintained, and used by “Guide for the Care and Use of Laboratory Animals,” which was approved by the University of Technology (Baghdad, Iraq), Animal Ethical Committee.

**Experimental Design:** Seven experimental groups, each with 5 mice, were set as follows. The negative control group was treated with distilled water. The positive control group was treated with 20mg/kg of the carcinogenic and mutagenic drug cyclophosphamide (CFA) twice a week for two weeks. Methandienone-treated group received the drug (1mg/kg body weight) orally on a daily volume of 0.1 ml for one week. The first chrysin-treated group received the drug (25mg/kg body weight) orally on a daily volume of 0.1 ml for one week. The second chrysin-treated group received the drug (50mg/kg body weight) orally on a daily volume of 0.1 ml for one week. A group of mice that was already treated with 1mg/kg methandienone received an additional oral treatment with chrysin (25mg/kg) for one week. Another group of mice that was already treated with 1mg/kg methandienone received an additional oral treatment with chrysin (50mg/kg). Mice from all groups were directly sacrificed after the 7 days of treatment and samples blood were collected from the heart.

**Blood tests**

**Total WBC Count:** Hemocytometer was used to count the cells according to Brown method. Mice were first anesthetized with chloroform and a 1 ml sterile syringe was used to collect blood from the left ventricle\textsuperscript{2} Next 0.02 ml blood was added to 0.38 ml of the dilution solution, followed by thorough mixing. 1 drop of the mixture was mounted on the slide for 2 minutes before counting the cells based on the formula:

\[
\text{WBCs count per mm}^3 = \frac{\text{no of WBC counted } \times \text{blood diluting factors}}{\text{chamber depth } \times \text{area of counted chamber}}
\]

\[
\text{WBC per mm}^3 = \frac{\text{white cells } \times 20}{4 \times 0.1 \text{ mm}^3}
\]

\[
\text{WBC per mm}^3 = \text{white cells } \times 50
\]

**Absolute WBC Count:** Haem method was adopted to conduct this measurement. A homogenous blood smear was made on a slide which was then fixed with alcohol and stained in Leishman stain. Light microscope with 100X magnification was used to examine the slides, where random count for 100 leucocytes was performed for percentage extraction absolute number calculation as in the formula:

\[
\text{Cell Number (cell/mL) = } \frac{(\text{total WBC count } \times \text{cell type percentage})}{100}
\]

**Total RBC Count:** 0.02 ml of Blood was mixed with 4 mL of Hymes fluid in a clean test tube by well shaking. One drop of the mixture was mounted on a counting slide for 2 minutes before examination under 40X magnification. RBCs count was performed in 5 small squares within the middle large square of the counter and the final count was calculated based on the formula:

\[
\text{Total count (cell/L) = } \frac{(\text{cells counted } \times \text{dilution factor } \times 10^9)}{\text{volume}}
\]

**RBCs mean corpuscular volume (MCV):** Blood was allowed to flow in a capillary tube that has 15mm left on vacuum. After closing an end of the tube, and then centrifuged (11,000 rpm; 5 minutes) and a Haematocrit Reader was used to read the PCV. Femtoliter (FL) was then used to calculate MCV as in the formula:

\[
\text{MCV (FL) = PCV/Red cell count per liter } \times 10
\]

**Blood Platelets Count:** Platelets number was determined based on the formalin citrate method. One gm of ammonium oxalate was dissolved in 1 mL DW to prepare the dilution solution which was filtered and kept in the refrigerator until use. In EDTA test tube, 20 μL
of blood was mixed well by shaking with 380 µL of the diluent and left for 10 minutes to ensure complete lysis of RBCs. One drop of the mixture was covered with a cover slip on a counting chamber which was entirely transferred in a closed Petri with wet cotton to prevent from draught and pollution. After for 20 minutes in the dish, platelets count was performed using the RBC counting squares in the chamber. The following formula was used for calculation:

\[
\text{Total number of platelets} = \frac{\text{number of platelets counted in 5 squares}}{1000}
\]

**Hemoglobin Measurement**: After preparation, Drabkins solution was diluted (1:10) using DW, then 1 mL of which was mixed well by shaking with 20 µL of whole blood. The mixture was then kept for 5 minutes (room temperature) before measuring the concentration of hemoglobin through reading absorbance at 540 nm.

**Statistical Analysis**: The obtained data were shown as mean ± standard error (SE) for all groups and subgroups. The differences were estimated between the control negative group and the mean values of each group by extracting the value of the t-test. P < 0.05 was statistically significant.

### Discussion

**Effects of Chrysin and Methandienone on WBCs, Neutrophils, Lymphocytes, Monocytes and Eosinophils**: Table 1 shows a significant decrease in the counts of total WBCs, lymphocytes, monocytes, and eosinophils as well a significant increase in those of neutrophils in the blood from CFA-treated mice as compared to the negative control. A significant decrease was also observed in counts of WBCs, neutrophils (p<0.05) and eosinophils (p<0.01) in mice treated with 25mg/kg CR as compared to the negative control. Mice treated with 50 mg/kg CR showed significant decrease in counts of WBCs (p<0.01) and eosinophils (p<0.05) as compared to the negative control. Methandienone-treated mice showed significant decrease in counts of WBCs, neutrophils (p<0.01) and eosinophils (p<0.05) with significant increase in lymphocytes (p<0.01) in comparison to the negative control. The results also demonstrated significant increase in neutrophils.
and increase in lymphocytes for mice treated with methandienone + 25 mg/kg CR as compared to those treated with methandienone alone (p<0.01). In mice treated with methandienone + 50 mg/kg CR, a significant increase in counts of neutrophils (p<0.05) and decrease in lymphocytes (p<0.01) were observed as compared to those treated with methandienone alone.

One possible explanation for the increase in lymphocyte counts of mice treated with methandienone is that the drug might have caused inflammatory reactions that were reported to result in elevated frequency of lymphocytes\(^9\). Anabolic androgenic steroids (AAS) were reported to exert immunosuppressive impacts\(^9\), while another investigation showed that these compounds enhance the immune function\(^10\). However, the nature of their effects depends on the kind of AAS used as well as the dose and period of treatment.

The present results also demonstrated that treatment with both concentrations of chrysin caused a reduction in the negative effects of methandienone, through the observed increase in the counts of WBCs and neutrophils and the decrease in lymphocytes in mice treated with methandienone + chrysin. This effect might be due to the high antioxidant effect of chrysin, since several studies showed this important in vivo effect from propolis and flavonoids and their many vital biological activities, including the effects on the antioxidant enzymes as well as their immune stimulation impacts\(^11,12\).

**Effects of Chrysin and Methandienone on RBCs, Hemoglobin, MCV, and Platelets:** The results in table 2 showed significant decrease in the numbers of RBCs and blood platelets, levels of Hb and average PCV in mice treated with CFA as compared to the negative control. In contrast, the two groups of mice treated with 25 mg/kg CR and 50 mg/kg CR demonstrated increased parameters of RBCs, HB and platelets as compared to the negative control, with the increase being significant for RBCs count (p<0.05).

Mice treated with methandienone showed increase in RBCs, Hb, platelets and MCV as compared to the negative control, with the increase being significant for RBCs (p<0.01) and platelets (p<0.05). In contrast, treatment with methandienone + 25 mg/kg CR resulted decrease in parameters of RBCs, Hb and MCV and an increase only in platelets as compared to treatment with methandienone alone, with the difference being only significant for MCV (p<0.01). Treatment with methandienone + 50 mg/kg CR resulted in insignificant increase in RBCs and Hb, significant increase in platelets (p<0.05), and significant reduction in MCV (p<0.05) as compared to treatment with methandienone alone.

The significant increase in RBCs and platelets in the blood of methandienone-treated mice can most possibly be attributed to the effects of this drug as an AAS, since these steroids were reported to stimulate the hormone Erythropoietin which functions on increasing RBCs production and Hb concentration\(^13,14\). The elevated production of RBCs is a risk factor for cardiovascular diseases, and consumption of anabolic steroids was correlated to development of angina pectoris and stroke in athletes, possibly due over production of blood platelets that play effective roles in these diseases. It was reported that consumption of AAS by weight-lifting athletes correlated with increased platelet count that cause thrombosis\(^15,16\).

Treatment of mice with chrysin was found in the present study to cause increases in WBCs and Hb. These results were possibly due to the reported effects of this drug on blood parameters, including its single-dose reduction of RBCs and Hb and development of hypo chronic anemia, indicating iron and vitamin B12 deficiency as well as oxidative stress\(^8\). We conclude from these results that consuming chrysin in multiple doses might enhance absorption of iron and vitamin B12 as well as erythropoiesis.

**Conclusion**

The present study concludes that methandienone causes change in blood parameters and chrysin play an ameliorative effect of methandienone. Therefore, taking methandienone must follow medical supervision for determination the period of treatment and dose. Treatment with chrysin for short period was able to reduce these side effects of treatment with methandienone.

Mixed Methods: Expectations Versus Facts on the Implementation of Adolescent Care Health Service

Muthmainnah¹, Ira Nurmala¹, Pulung Siswantara¹, Riris Diana R¹, Eka Yeyen P¹

¹Department of Health Promotion and Behavior Sciences, Faculty of Public Health Universitas Airlangga

ABSTRACT
Percentage of adolescents in Indonesia nearly reaches 30% of the total population. This amount is relatively huge and able to be the nation’s asset, if it is managed properly. Various adolescent reproductive health programs have been conducted in diverse sectors—governmental or even non-governmental. One of which is called the Adolescent Care Health Service (ACHS). This research aims to identify adolescent expectations and facts on ACHS program implementation. Research methods were used mixed methods. Quantitative data were collected from 842 respondents (high school students in Surabaya, Indonesia) from questionnaires, while qualitative data were collected from interviews with quantitative respondents at the same time using purposive random sampling. Data analysis was also conducted with the mixed methods using quantitative and qualitative descriptive, based on the data and information collected. Research results showed that 76.2% did not know the existence of ACHS program and 90% had never accessed the program. Qualitative data implied that adolescent hoped for an adolescent health program which fitted adolescents’ characteristics, needs and capacities; for instance, one which utilized entertaining method and media. However, in fact, the method and media used had a patronizing tendency and based on the informants were very boring and moreover, the adolescents’ involvement in the program planning was only 8.4%. According to the ACHS implementation national standard, adolescents need to be involved starting from planning to evaluation of the program. In addition to that, the ACHS program is supposed to be adolescent-friendly—fit the adolescent needs.

Keywords: Expectations, Facts, Implementation, Program, ACHS.

Introduction
Adolescents according to WHO are those at the age of 10-19 years old and demographically divided into two age groups; for 10-15 and 15-19 years old. Based on the data of Indonesia Population Projection 2000-2025, proportion of 10-19 years old adolescent population in 2010 is approximately 18.3% from the total population, or about 43 millions. The amount of adolescent age group populations may be interpreted as the nation’s future asset and potential. However, in order to fulfill these expectations, the nation and the society must be able to assure that Indonesian adolescents can grow and develop positively, and are free from various threatening problems.¹

Care for adolescents’ problems in Indonesia has been fostered, although it still has many shortcomings. Strategy to conduct the adolescent health policy is carried by the government through cross-sectional cooperation, fundamental health service and its referral, and intervention pattern. This strategy undoubtedly has been adjusted to the needs of adolescent growth and development.² Since 2003, the Health Ministry has developed a adolescent health program with a specialized approach known as Adolescent Care Health Service (ACHS). Adolescent Care Health Service (ACHS) is a model of health care for adolescents in primary health care services. ACHS is a policy to improve the adolescents’ health. This approach aims to encourage providers, particularly Public Health Centres, to be able to give health services which are comprehensive, compatible and fulfilling to the needs of adolescents who hope for privacy, recognition, value and involvement; in planning, execution, to evaluation of the program.

In 2014, a national standard guidebook was prepared as a reference in the implementation of ACHS,
which was in accordance with the needs of adolescents. The guidebook was arranged for the people in charge of ACHS in national, provincial, district/city level and particularly Public Health Centres, in order to conduct the ACHS with a good and adolescent-friendly quality. This program which is directed to adolescents, is absolutely going to be judged by the adolescents; how far the program has been carried out and affected them. This research aims to analyze adolescents’ expectations and facts on the implementation of ACHS program.

Materials and Method

The empirical component of this article derives from interviews with senior high school adolescents in Surabaya, Indonesia. The interviews were concerned to their practices in relation to and in view of this research which combines quantitative and qualitative approaches.

This research involved 842 senior high school students in total, which some were then chosen through purposive random sampling for qualitative data collection purpose. All respondents were given questionnaires about evaluation of ACHS program implementation, then the respondents which had become peer educators were chosen to be the informants. The chosen informants out of the 842 quantitative respondents were 27 students. These informants had been given a training as peer educators from various sectors of the government and also non-government since 2016. Researcher had asked for the expectations and evaluations on ACHS program to these informants. Data analysis was also conducted with mixed methods through frequency distribution descriptive and content analysis.

Findings

Implementation of Adolescent Care Health Service (ACHS) program: Table 1 showed that half of the respondents were female (58.4%) with the average age of 15-16 years old respondents were in the first and second grade of senior high school.

<table>
<thead>

</tr>
</tbody>
</table>

Table 3 displayed the distribution of adolescents who had received a peer counselor training. According to the data, it was known that only 25.8% had received the peer counselor training from the governmental or even the non-governmental sector (Health Ambassador by Health Department, Drug Ambassador by National Narcotics Department, Peer Educator by University, Counseling Information Centre/CIC by National Department for Planned Family and Population, Scout Creation Unit of Bakti Husada by Scout Coordinator, Peer Educator Training by Society Independent Institute of Indonesian Planned Family Assemble). After getting the peer counselor training, the adolescents did not carry their duty as peer educators out. The reason was because plenty of peer educators did not know what their duty was and moreover, they perceived that the implementation of the duty might interrupt the study hour at school. This was discovered from a statement of one informant who had become a peer educator, as follows:

“yes I know what the duty is, miss, but I’m afraid carrying it out will interrupt the study hour in class.”

Adolescents’ involvement in the program implementation. Based on these data, it was known that the adolescents involved in the program planning was...
only 8.4%, in the program implementation was only 8.6% and in the program evaluation was only 8.9%. This showed that the adolescents had not been involved maximally in the program implementation, whereas ACHS program was supposed to involve adolescents starting from planning to evaluation. The principles of adolescent health program are from, by and for the adolescents, according to characteristics, needs and capacities of them. This is encouraged by the policy and the system management which are able to assure and to increase ACHS quality through adolescents’ involvement.

</tbody>
</table>

Table 4 showed that 84% of the adolescents were not involved in the advocacy process. Even though ACHS was a program for the adolescents, but their participation in the program was still minimal.

### Adolescents’ Expectations and Facts on the Implementation of Adolescent Care Health Service (ACHS) Program:

Adolescents’ expectations and facts regarding to the implementation of ACHS program were collected from researcher’s interviews with informants who had become peer educators and also adolescent representatives who were the targets of the peer educator program in the community. These peer educators had not involved maximally in the strategic steps implementation of ACHS, and moreover, had not known about the ACHS. These can be shown from the statements below:

**Question on problem identification**

“...we hope it’ll be like that, miss, we actually need that, since adolescents are different, they want various things...the activity is supposed to fit what the adolescents want...we still don’t know what to do. miss, we plan to assemble in May...”

**Question on ACHS Implementation**

“...we haven’t heard about ACHS, miss...”

“...it needs to be assembled, which fits adolescent characteristics, knows how to approach the adolescents...”

These statements might also show that the adolescents still were not aware of the term ACHS. According to them, it was known that peer educators were hoping for an adolescent reproductive health service with facilities and activities needed by the adolescents, such as activities favored by them (music-related), hangout places (free-wifi area, cafe) and a small library. The service procedures were hoped to be simple with a chill atmosphere.

“...it’s needed, we’ll adjust the activities according to the booming problems...the data have to be collected as references for alternative solutions...we’ve done surveys about adolescents’ health problems in several schools...”

Adolescents were very supportive if they were actively involved starting from planning to evaluation. The adolescents are those who know about adolescents’ health problems and how to prevent them. This is parallel to the principle of adolescent health program, which is from, by and for the adolescents. However, in fact, the friends of peer educators were not aware of ACHS program and after they received the training, they still did not know about their duty as peer educators. These are known from the statements below:

**Question on Socialization**

“...ACHS...I’ve heard about it but not in details. We’ve never received a socialization for this activity...”

“...What we know is that Public Health Centre is for sick people. I usually go to Public Health Centre to get a health certificate for competition...”
Question on the Role of Peer Educator
“...peer educator is very important, to inform the friends about the right thing...if there is a friend that asks me, then I’ll answer...”
“...Public Health Centre had come (here) to conduct a socialization, but Public Health Centre never informed about ACHS...”

Question on Monitoring and Evaluation
“...us, fellow PE, after being trained we’ve never been contacted by the Health Department, the advice was not to do sex before marriage...”
“...we’d received a socialization from the Health Department but it was 2 years ago. This activity is supposed to be conducted routinely every year...”
“...the form of socialization media is usually in PPT, miss; our suggestions are comic, TV show which is educative, or it can be an online game....”

Based on those statements, it was known that the adolescents were not aware of ACHS program, the adolescents’ knowledge on Public Health Centre is about service for healing, a socialization was received from the Health Department but was not conducted routinely. The adolescents hoped that in order to conduct a socialization routinely and equal at all schools in Surabaya, the expected media were audiovisual media and attractive media like comics, educational shows on TV, and furthermore, one suggested for an android application—online game.

Discussion

Adolescent Care Health Service (ACHS) is a model of health care for adolescents in Public Health Centre. The amount of adolescents served by Public Health Centres in Surabaya has not reached 50% yet. The data were collected from the amount of adolescents who visited Public Health Centres. Based on these data, an information is obtained, that most of the adolescents coming to Public Health Centres aimed to get medical services. This could be shown on the mostly served case data, which were other cases, not Reproductive Health cases.

According to the person in charge of ACHS at one Public Health Centre in Surabaya, adolescents had never accessed the Public Health Centre for information service, counselling. Data of Public Health Centre about the amount of adolescents’ problems (STD, HIV, Unwanted Pregnancies) were collected from the adolescents who visited Public Health Centres with getting treatments as their initial purpose. Whereas the kinds of ACHS service include the provision of mother and child health, counselling, medical treatment, peer educator training and referral.

Based on the health profile of the Health Department in 2016, Public Health Centres with adolescent care health service had been established at all Public Health Centres in Surabaya. The ACHS activities there in 2016 were counselling, nutrition service, reproductive health and knowledge about HIV-AIDS, narcotics, psychotropica and addictive substances, and many others.

Ningsih (2018) stated that it was needed an integrated service post for adolescents which had its distict flow for adolescent service. Adolescents received information so that they understand their needs to live healthy and productively. Therefore, adolescents might utilize various kinds and places of health service according to their needs. Research results showed that most of the adolescents were not aware of the ACHS program. Adolescents also stated that 90% of them had not received any exposure to the ACHS program, whereas 55% had experienced counselling in Public Health Centre. These showed that adolescents were not aware that counselling was a part of ACHS program.

Muthmainnah (2013) stated that nowadays adolescents were only the objects of the program and not the subjects yet. This caused the adolescents unable to actively participate in the program. One of the activities which might cause adolescents to have an active participation in it was the peer counselor activity. However, 76% of the adolescents also stated that they were not trained by the peer counselor.

Establishment and functionality of network among the adolescents, society groups, related cross sectors and society independent institutions in the provision and utilization of ACHS. Most of the adolescents stated that they did not participate in planning, program activities and evaluation of ACHS. These showed that the adolescents’ role in the program was still minimal. ACHS was a program directed to adolescents, but the adolescents still had no role in the program. With these results, network of ACHS program in Surabaya had not fulfilled the established standard yet.
Based on the research results, it was obtained that the majority of the adolescents did not participate in the advocacy activity of ACHS program. This implied that the health management which had been conducted all this time still had not based on the needs of the particular adolescents, since the adolescents did not participate in the management.

Research on the implementation of Adolescent Care Health Service (ACHS) (A case study in West Sumbawa District) with research subjects as follows: Head of Maluk Public Health centre, staff in charge of ACHS, adolescents, Head of Health Service Division in Health Department of West Sumbawa District. Based on the research results, it was known that the ACHS activities were still limited to socialization at school with Adolescent Reproductive Health topic. The adolescents who visited the Public Health Centre had not received services according to the flow of the Health Department’s ACHS service model.

Adolescents’ access to Public Health Centre was still crashed with the school hour. Public Health Centre had not conducted peer counsellor training. There were no enough allocation money for ACHS activities. The ingredients for socialization were still lacking, there were no service form, guide for counselling and implementation, tools for educative learning and transportation also room for service. Workers’ understanding about the program was still lacking. Not all workers behaved adolescent-friendly and had positive attitude in achieving goals. Workload of the workers was high. Supervision was only in form of report checking. The report’s quality was still low. Forum of cross sectoral cooperation had not utilized to collect supports for the execution of ACHS. Standard Operating Procedure and Minimum Service Standard were not available. It can be concluded that the implementation of ACHS in Public Health Centre has not fulfilled the criteria of adolescent service as established by the Health Department of Indonesia, because of the inadequacy of fund support, facilities and infrastructure, human resources and coordination activity also bureaucracy structure. So, it is recommended to continue the policy of ACHS modification which can be accepted by the adolescents; the topic, time and service flow.5

Conclusions

Adolescents were not involved in the planning of ACHS activities. The adolescents were only objects of the program, not the subjects. Although the adolescents were aware of the risky behaviors and their effects thus they felt the need for adolescent health program, however they were still not aware of ACHS program because they had never been involved in it. Adolescents are supposed to be the pioneer of adolescent health program (from, by and for the adolescents) thus they need to say to the stakeholders (decision maker and provider) that there are: adolescents’ problems, experience by themselves or others; need for adolescent health program; availability of adolescents to be actively involved in the implementation of ACHS program. The adolescents hope that there will be an adolescent health program which is in tune with the characteristics, needs and capacities of them.

Conflict of Interest: There is no conflict of interest in the study

Ethical Clearance: The study was received ethical approval from the Health Research Ethics Committee, Faculty of Nursing, Universitas Airlangga.

ABSTRACT

Purpose: To investigate the association between concomitant esotropia and exotropia and refractive error among preschool children under age of 6 years in the city of Fallujah in western Iraq.

Method: In this cross-sectional study, 253 strabismic patients participated. After obtaining informed written consents, children underwent full ophthalmic examination, with uncorrected and corrected visual acuity and cycloplegic refraction. Strabismus was defined as; inward deviation esotropia and outward deviation exotropia of 10 or more prism dioptries.

Results: Of these 253 cases, 14 were excluded because of poor cooperation, older age and missed information. Prevalence of esotropia and exotropia were 81.2% and 18.8% respectively. There was a higher prevalence of esotropia in boys and exotropia in female (p = 0.180). Multiple logistic regression analysis revealed a significant relation between refractive error and strabismus (p = 0.268). The prevalence of amblyopia among strabismic cases was 57.3%.

Conclusion: This study found a strong association between refractive error and horizontal strabismus among the preschool children in Fallujah in west of Iraq. These results can help in setting a guideline on early correction of refractive errors to prevent strabismus and amblyopia development.

Keywords: Strabismus; Refractive errors; Amblyopia; Preschool children; Fallujah; Iraq

Introduction

Strabismus, a manifest misalignment of one or both eyes, is a common childhood ocular disorder with an estimated prevalence of 2.3% to 6.0% in general population [1, 2, 3]. Strabismus affects the harmonization between the two eyes, leading to the impairment of binocular vision and depth perception [3], and subsequent amblyopia development [4]. Amblyopia is considered as a leading cause of unilateral visual loss in both children and adults, with a doubling risk of bilateral visual impairment [5]. In addition to the effect of squint on the visual function, there are also psychosocial aspects that affect the self-image [6, 7, 8], the interpersonal relationships [9], and the social prejudice [3, 10], as well as its effects on the school performance [11].

The exact underlying pathogenesis of strabismus has not been fully established. It has been suggested that various risk factors early in life play roles in strabismus development, such as prematurity, maternal smoking during pregnancy, Down’s syndrome, family history, gender and different ethnicities [3, 12, 13]. Furthermore, refractive error, such as hyperopia, astigmatism and anisometropia, have been reported or suggested to be related to strabismus [3].

Since refractive errors are considered as correctable or modifiable risk factors in the development of squint [1], it is important for the eye care providers to confirm these relations as it can provide information about strabismus pathophysiology; as well as setting a guideline on the
management of refractive error in order to prevent strabismus development and subsequent amblyopia \(^1\) \(^{14}\). By detecting amblyopia and initiating treatment at a young age, it will lead to better visual outcomes \(^9\). Also, the early diagnosis and correction of strabismus will help in achieving normal socialization \(^9\).

Population-based and hospital-based and studies concerning the prevalence of strabismus and its related risk factors are not readily available in Iraq. So, in this study, we had two main aims: first, to investigate the association between concomitant esotropia and concomitant exotropia and refractive error in Iraqi preschool children, and second, to assess the prevalence of amblyopia in these patients.

**Materials and Method**

A hospital based cross-sectional study was conducted at the Ophthalmology outpatient clinic at Fallujah Teaching Hospital in Anbar governorate, west Iraq. The study was carried out from the period of July 2018 to December 2018. During this period, all the cooperative preschool child under the age of 6 years with concomitant horizontal strabismus who visited the ophthalmology clinic at our hospital, were included in our study. Subjects with vertical tropias, ocular motility disorders, other ocular pathologies or history of strabismus corrective surgery, were excluded. All the medical procedures were performed after obtaining the ethical approval, and respected the Declaration of Helsinki. Signed informed consents were obtained from the children’s parents or guardians.

**Examinations:** All the participants underwent full ophthalmic examination by trained ophthalmologists and optometrists including ophthalmic history, monocular uncorrected visual acuity (UCVA) and best corrected visual acuity (BCVA). The VA testing was done using either Catford drum, Kay pictures cards or Snellen’s (E letter) chart according to the age of the child. Since the accommodation may affect the results, cycloplegic refractions were carried out using 1% Cyclopentolate topical drops \(^15\). The presence of strabismus was diagnosed by performing cover/uncover test and alternating cover test at near and distance fixation targets with and without spectacles correction, and the degree of squint was measured by a prism bar \(^1\) \(^8\). During the ophthalmic examination of these children, the presence or absence of amblyopia was also noted and any history of occlusion therapy was asked. The findings were recorded in a self-designed proforma consisting of the patient profile, strabismus type, visual acuity, and refractive errors of both eyes.

**Definitions:** For the purpose of this study, normal VA was defined as an uncorrected VA equal to or better than 6/6 in the better eye. Amblyopia was defined as initial BCVA of 6/9 or worse, or at least two Snellen lines difference between the ambyopic and the fellow eye, in the absence of ocular pathology in either eyes \(^1\) \(^6\). Diagnosis of strabismus was defined as any manifest intermittent or constant horizontal tropia of 10 or more prism dioptres \(^1\). Myopia was defined as a refraction of -0.50 D or less. Hyperopia was defined as a refraction of +0.5 dioptres (D) or more; low hyperopia was considered for refraction of +0.50 to <=2.00 D, and significant hyperopia was considered for refraction of >= +2.00 D. Astigmatism was defined as a cylinder of >= 0.5 D, and anisometropia is an interocular difference in refraction of 1 D or more \(^17\) \(^18\).

**Statistical Analysis**

The participants were grouped as follow: children with esotropia and children with exotropia. The squint type was dependent variable, while age, gender, type of refractive error, presence of amblyopia were independent variables. These variables were analysed separately using binary logistic regression. Odd ratios (OR) and 95% confidence intervals (95% CI) were calculated to evaluate the relations of these variables with concomitant esotropia and concomitant exotropia. P-value less than 0.5 was considered as a significant result. All the data analyses in the current study were performed using SPSS software (IBM, version 21) for Microsoft Windows.

**Results**

A total of 253 patients were enrolled in this study. 14 subjects were excluded from the data analysis because of poor cooperation, age above the 6 years old limit or missed information. Of those 239 remaining, 107 were boys (44.8%) and 132 were girls (55.2%). The mean age was 3.47 ± 1.55 (range 0-6) years, and there was no significant difference in strabismus prevalence between different age groups \((p = 0.654)\). A total 194 out of 239 participants had esotropia, while only 45 had exotropia. Figure 1 shows that esotropia was two and a half time more prevalent than exotropia.
Table 1 summarizes the prevalence of different types of squint by age and gender. The overall prevalence of esotropia was 81.2%; 46.9% and 53.1% in boys and girls respectively. Based on the results of multiple logistic regression model in Table 2, esotropia prevalence significantly associated with SE hyperopia $\geq$ 2 D ($p = 0.215$), and astigmatism ($p = 0.319$). Exotropia was detected in 18.8% of the studied sample, and as showed in Table 1, the prevalence was higher in females (64.4%) than in males (35.6%). Multiple logistic regression identified SE hyperopia of 2 or more D as an associated risk factor ($p = 0.252$).

Abbreviation: OR, odd ratio; CI, confidence interval; RF, Reference
The study also detected that 137 of the strabismic cases had amblyopia (57.3%) compared to 102 patients (42.7%) with no amblyopia. Of the 194 esotropia cases, 120 patients were amblyopic (61.9%). While only 17 exotropia patients out of 45 had amblyopia (37.1%). The strabismic amblyopia was the most common type of amblyopia (p = 0.058), accounting for 115 patients (83.9%), while the combined type (Aniso-strabismic amblyopia) found in only 22 patients (16.1%).

Discussion

The current study used a hospital-based cohort of children aged 0 to 6 years to investigate the association between refractive error and childhood concomitant strabismus. This study found that concomitant esotropia was the most common form among all the strabismus cases who attended our hospital clinic. This finding came in agreement with previous studies that reported convergence squint esotropia as the most common type of strabismus worldwide, constituting from a half to two thirds of all misaligned eyes [1, 19, 23]. However, in other studies in South East Asia [24] and in Brazil [26], exotropia was found to be more prevalent than esotropia. The reasons for these findings could be due to different races and ethnicities as suggested by Bruce and Santorelli [27]. Furthermore, esotropia cases in our study was more prevalent in females than in males. And this result agrees with the previous finding of Cotter and Colleagues [3] and Nusz and Colleagues [28] that reported significant association between esotropia and female gender.

An important finding in this study, is that the major risky refractive errors for concomitant esotropia were spherical equivalent (SE) hyperopia of 2.00 D or more and astigmatism of 0.50 D or more. For concomitant exotropia, SE hyperopia of ≥ 2 D was an associated risk factor. Several previous studies, in different countries around the world, have been done to identify the associations between different types of squint and refractive errors [3, 23, 29, 30].

In Multi-Ethnic Pediatric Eye Disease Study (MEPEDS) and Baltimore Pediatric Eye Disease Study (BPEDS) [3], esotropia was associated with hyperopia of ≥ 2 D and anisometropia; exotropia was associated with astigmatism of ≥ 1.5 D and anisometropia. In the study by Zhu and Colleagues [29], hyperopia of ≥ 2 D and anisometropia were associated with esotropia; and exotropia was associated with myopia, hyperopia and astigmatism. Sydney Myopia Study (SMS) [23] found that SE hyperopia of ≥ 3 D, astigmatism, myopia and anisometropia were associated with strabismus with no separate analysis for esotropia and exotropia. And Strabismus, Amblyopia and Refractive Error in Singaporean Preschoolers Study (STARS) [30], only astigmatism and anisometropia were related to strabismus, also without separate analysis for ET and XT. However, our current study did not find a significant relation between strabismus with anisometropia and myopia compared to the previous studies. The reason for these findings could be due to our small sample size compared to the large population and school-based studies which may affected the results.

Finally, our study found that the majority of strabismic patients (57.3%) have amblyopia which is more prevalent in esotropia cases. Previous studies in Iran [31] and Australia [32] have reported amblyopia in 23% and 37% of squint patients, respectively. Reasons for the high prevalence of amblyopia in strabismus patients found in our study are; poor compliance in glass wear due to the social stigma, and only 38% of the cases reported occlusion therapy for amblyopia.

There are a number of limitations in our study. Small sample size may play a role in our findings. Also, we did not attempt to classify strabismus by type and time of onset. And we only included age, gender, presence of amblyopia and associated refractive errors into the analysis. It is possible that there are other unknown factors may contribute to strabismus. Because that strabismus and refractive error confirmation was available only for the time of clinical examination, older children may have different refraction results from that at an earlier age when strabismus first occurred.

In conclusion, this hospital-based study of childhood strabismus found a strong link between refractive error and strabismus. This finding will be helpful for the eye care providers and parents in making informed decisions regarding management of early refractive error. However, further study with a larger sample is needed to clarify this relation between strabismus and refractive error, and to study the advantages of early correction of refractive error in preventing squint and amblyopia development.

Reflexology: A Modality in Manipulative and Body Based Method

Nor Dalila Marican¹, Mohd Hafzal Abdul Halim¹, Mohad Anizu Mohd Nor², Mohd Firdaus Mohd Nasir¹
¹Faculty of Hospitality, Tourism and Wellness, University of Malaysia Kelantan; ²Faculty of Sport Science and Recreation, MARA University of Technology Malaysia

ABSTRACT

Reflexology is an ancient therapeutic treatment which activates the innate healing powers of the body by applying some pressure to the specific reflex points which are located on all part of the feet, hands, or ears. The popularity of reflexology therapy has increased in recent years as the public seek more holistic ways to maintain good health and well-being. This paper reviews and summarizes the existing literature on reflexology focusing on principle, concept, current issues and scientific evidence. Databases of PubMed, Scopus, Science Direct, Google scholar as well as ProQuest were the sources used for findings the articles. Collectively, these reviews suggest a number of areas where reflexology may well be beneficial. Recent evidence suggests that reflexology is a simple, less expensive and non-invasive method that effective to regulate the autonomic nervous system activities, coordinates physiological responses, alleviates anxiety, and induces body relaxation.

Keywords: complementary medicine; reflexology; review

Introduction

Complementary and Alternative Medicine (CAM) is a group of diverse medical and health care systems, practices, and products that are not presently considered to be part of biomedicine¹². The acronym of CAM encompasses the wide array of therapeutic, diagnosis, treatment, and preventive disciplines, which complement mainstream medicine by contributing to the diversifying of medical conceptual frameworks³. Developed nations were used the term of CAM to refer a diverse group of health-related therapies and disciplines which are not considered to be part of mainstream medical care⁴.

National Centre for Complementary and Alternative Medicine (NCCAM) classified CAM into four domains namely natural products including vitamins, herbs and supplements; mind-body medicine; manipulative and body-based practices; as well as other CAM practices such as traditional Chinese medicine, ayurvedic, and homeopathy². Manipulative and body-based practices focus primarily on the body structures and systems, including the bones, joints, soft tissues, circulatory and lymphatic systems⁵. It may be performed as a part of other therapies of whole medical systems, including chiropractic medicine, osteopathic medicine, massage, reflexology, yoga, tai chi and naturopathic medicine⁶. In the form of the manipulative and body-based therapy, reflexology has been practiced for over 4,500 years⁷.

Objective

The major aim of the study was to review the existing literature on reflexology and compile the facts.

Method

The systematic search for relevant literature was performed using five databases including PubMed, Scopus, Science Direct, Google scholar and ProQuest. The basic search terms used included traditional medicine, complementary medicine, integrative medicine and reflexology in order to facilitate search of literature. In order to obtain the widest range of studies, no limit was set for the date of publication. Only articles using English as a language of publication were included in the review.

What is Reflexology?

Definition of Reflexology: Reflexology is a complex massage intervention, based on the concept that specific areas of the feet, hands or ears which are called reflex points correspond to specific internal organs within the body⁸⁹. Reflexology consists of identifying and treating energy imbalances in the body through massage of reflex points in specific areas¹⁰. By applying pressure on these reflex areas, is thought to correspond to a map of
the whole body by stimulating the normal functions of glands, organs as well as parts of the body and finally will encourage the body healing process\textsuperscript{11, 12}.

**Origins of Reflexology:** Reflexology is an ancient techniques of pressure have been practiced for thousands of years by many different cultures in the different part of the world including China, Egypt, and India\textsuperscript{13}. It widely through, although never proven, that the concepts of reflexology have its origins in China roughly 5,000 years ago based on the system of Chinese medicine\textsuperscript{14}. Some people believe that reflexology was developed in Egypt as early as 2330 BC and it believed to be used for more than 4,500 years based on the pictograph evidence that was found in the tomb of Ankomohor, an Egyptian physician in Saquara, Egypt\textsuperscript{7}.

The modern concept of reflexology was introduced to the United States in 1913 by Dr. William Fitzgerald who an ear, nose, and throat surgeon\textsuperscript{15}. He discovered the application of pressure to the tops of the fingers and the middle section of each finger could induce an anesthetic effect on the facial area\textsuperscript{17}. The ideas were continues in the early 20\textsuperscript{th} century through the work of individuals such as Dr. Joseph Riley, a physician, physiotherapist Eunice Ingham, and others, who added their own ideas to the simple ten zone concept\textsuperscript{16}. Applying zone therapy’s basic principles to the feet, they added four lateral lines and further detail to create a map on the feet showing which pressure points correspond to different parts of body\textsuperscript{10}.

**Reflexology Method:** Two methods of reflexology that have been accepted internationally are Ingham method and Rwo Shur method\textsuperscript{17}. The Rwo Shur method was developed in Taiwan by Father Joseph Eugster, a Swiss missionary\textsuperscript{19}. Father Josef’s method was popular amongst the Asian countries and successfully taught in more than 40 regions including Taiwan, China, Japan, Korea, Singapore, Hong Kong and Malaysia\textsuperscript{18, 19}. This method can be quite painful to receive as it mainly concentrated to stimulate the body rather than relaxation\textsuperscript{11, 20}.

The Ingham method of reflexology was invented in 1930 by Eunice Ingham is based on the energy zones of the feet and the rest of the body\textsuperscript{21}. Ingham made the claim that the application of reflexology massage to reflex points on the feet increases blood supply to the corresponding mapped organs in the body\textsuperscript{22}. The Ingham method was different with Rwo Shur method where it does not use any tools or reflex stick in its practice\textsuperscript{23}.

**Theories of Reflexology:** There is still obscurity regarding the action mechanism of reflexology therapy, nevertheless it has certainly been shown to have profound physiological and psychology effects\textsuperscript{24}. Many theories have been used to make clear working system on this holistic therapy. Collectively, there are five theories that support the reflexology mechanism which gives impacts to the body health.

Energy mechanisms theory advocating reflexology points are linked to internal organs and structures by energy channels which become blocked in the event of illness and which are re-opened through reflexology\textsuperscript{25}. During physical suffering or discomfort caused by illness or injury, the human body do not function effectively because the body in imbalance state and consequently blocked the vital energy pathways\textsuperscript{26}.

Another theory of reflexology is neuromatrix theory which also known as gate control theory\textsuperscript{27}. Reflexology is believed to reduce intensity of pain by transmitting afferent impulses and closing the neural gates in the dorsal horn of the spinal cord, therefore blocking pain transmission\textsuperscript{25, 28}. Stimulation of the reflex points on the skin sends messages from these cells through nerve pathways to control centers inside the body, which send other messages back to the muscles or internal organs\textsuperscript{29}.

The next theory proposes that reflexology can break up the lactic acid crystal that usually deposited in the feet and therefore allow energy to flow efficiently\textsuperscript{27}. It is thought that lactic acid deposited as microcrystals in the feet are crushed by the application of pressure or massage which thereby allows for the free flow of energy.

Reflexologists work with the concept that the sole of the foot is a map which represents the entire body\textsuperscript{8, 27}. By palpating the foot, it created a relaxing effect which contributes to relieve tension and stress, affecting the autonomic response, which, in turn, affects the endocrine, immune, and neuropeptide systems\textsuperscript{30}. A theory also suggesting that reflexology is simply a method of showing care and concern for patients.

**Reflex Area and Points:** Foot reflexology involves stimulation of the particulars reflex point in the sole of the foot, which believed to be the nerve center of the body\textsuperscript{31}. There are more than 7000 nerve endings are present in each foot called reflexes\textsuperscript{21}. However, in the oldest classic of the theory of Chinese traditional medicine, practitioner was found a total of 600 points comprise the body, with 66 points located in the feet\textsuperscript{12}. Figure 1 illustrates the base of the ankle and toes on the top of the foot with specific reflex points whereas Figure 2 exhibits the sole with specific reflex points.
Emerging Reflexology Issues

Safety of Reflexology Practice: Reflexology should be avoided when it comes to the particular circumstances. Foot reflexology is discouraged in people with foot fractures, unhealed wounds, as well as active gout or osteoarthritis that affects the foot and ankle. Women in early pregnancy specifically during the first trimester or first three months of pregnancy also should not receive reflexology therapy. Stimulation at the particular reflex points might induce the contractions and subsequent causes the premature delivery as well as the risk of miscarriage. Since reflexology improves circulation, the thrombosis and embolism patients should not be exercised with this kind of therapy because it could potentially cause the movement of clot towards the heart or brain.

Quality Control of Reflexology: Conventional medicine is a highly regulated system in which those who practice it are consistent trained and accountable. Patient who use biomedical services have clearly defined courts of appeal if they are dissatisfied or injured. In contrast, the vast of field of complementary and alternative medicine including modality of reflexology is largely unregulated and practiced by practitioner who may be untrained and dangerous. Therapists may display impressive diploma granted by unregulated, unrecognized and unaccredited institutions.

The Potential of Reflexology: Reflexology is a gentle remedy encourages the body work naturally to regenerate its own balance. It can help both physically and emotional of an individual and bring relief a variety of acute and chronic condition. Recent evidence suggests that reflexology is a simple, less expensive and non-invasive method that effective to regulate the autonomic nervous system activities, coordinates physiological responses, alleviates anxiety, and induces relaxation.

Evidence Base of Reflexology: Even though reflexology has been used for a wide variety of conditions, specific medical claims should always support by sound evidence. There are few studies that evaluate the efficacy or effectiveness of reflexology therapy for various condition of health. The effectiveness of reflexology has been clinically reported in to increase sleep quality and as well as the quality of life; reducing fatigue and anxiety; relieving pain; reducing menopausal symptom and idiopathic constipation; as well as reduced stress.

Conclusion

Reflexology is being embraced in many countries of the world for its provision of enhanced health, mental and physical relaxation coupled with its inherent simplicity and harmlessness. Recently, more scientific and clinical research has been conducted because of its positive effects in reducing and alleviating symptoms,
especially those associated with chronic conditions such as diabetes mellitus, hypertension and muscular illness.

Risk Factors Associated with HIV Infection among General Population in *Tanah Papua*: Secondary Data Analysis of IBBS in *Tanah Papua*, Indonesia 2013

Nur Aini Hidayah¹, Mondastri Korib Sudaryo¹

¹Dept. Epidemiology, Faculty of Public Health, Universitas Indonesia

ABSTRACT

HIV prevalence in adult general population in *Tanah Papua*, has exceeded 1%. Unlike in other regions of the country, that status of the HIV epidemic has entered an early phase of generalized epidemic. The aim of this cross-sectional study as part of National IBBS in *Tanah Papua* in 2013 was to determine the most important risk factors associated with HIV infection among general population in *Tanah Papua* in year 2013. The respondents were 5,334 people aged 15-49 years old who were willing to blood rapid test to determine the HIV status and successfully interviewed. The result showed the HIV prevalence in general population in *Tanah Papua* was 2.3% (95%CI:1.5%-3.4%). There were four determinants significantly associated with HIV infection among the general population: topography, ethnicity, access to VCT services, and cost of VCT services. Particularly for males: topography, ethnicity, status of polygamy, circumcision, access to VCT services were also significantly associated with HIV infection.

**Keywords:** HIV infection, generalized epidemic, general population, Tanah Papua, HIV risk.

Introduction

UNAIDS estimated that South Asia and Southeast Asia are the regions with the second highest mortality rate of HIV related disease after sub-Saharan Africa¹. Indonesia is one of seven countries with the highest HIV infection rate in the Asia². The cumulative number of HIV infections and AIDS in Indonesia until March 2018 are 291,129 cases and 106,965 cases, respectively. Papua is one of five provinces having the highest number of HIV cases in Indonesia with 29,710 cases³. The HIV epidemic in *Tanah Papua*, a region consisting of Papua province and West Papua province, have been showing fastest development from other regions in Indonesia. The status of HIV epidemic in all other regions of Indonesia are still in concentrated level, while the status in the *Tanah Papua* has been considered to enter more advanced phase, which shows the highest level of the HIV prevalence rate among general population (2.4%)⁴.

Sexual intercourse has still been the major mode of transmission of HIV infection around world, including Indonesia. Previous survey conducted in four districts in *Tanah Papua* found that several sexual behaviour among general population were suspected to be important factors associated with HIV infection, such as committing first sex at the age of less than 20 years, having many sexual partners, high sexual activity with more than 10 different partners, sequential sex transaction “in a row” or known as ‘queuing sex’, i.e. one female sex worker serves many men sequentially in a queue, had extra marital sex, and had anal sex⁵. Furthermore, a descriptive study showed more than 90% of the HIV epidemic in Papua was transmitted through sexual pathway⁶.

Despite the high possibility that HIV epidemic in *Tanah Papua*, had entered the advanced state of epidemic and extended its spread to the general population, as indicated strongly by the HIV prevalence rate exceeding 1% among general population⁷, only few studies had been conducted to identify and elaborate the potential and most significant determinants or predictors of the HIV infection among general population in this region. Understanding the real situation and specific
characteristics of this generalized epidemic status, such as its unique HIV distribution patterns and risk factors, would help the central and local governments to implement stronger and more specific strategies, policies and programs to monitor and control the more advanced epidemic in this region. The objectives of this study were to estimate the HIV prevalence rate among general population in Tanah Papua and to know the most important determinants or risk factors associated with HIV infection among general population in Tanah Papua using the IBBS (Integrated Biological and Behavioural Surveillance) data in 2013.

Method

Study Design and Sampling Methods: This study was conducted by analysing secondary data from the National IBBS in Tanah Papua 2013. In this cross-sectional survey a multistage cluster sampling technique was done in several steps with the detail explanation about the study design, sampling and primary analysis can be found in official published report of IBBS survey in general population of Tanah Papua 2013.

Study Population and Sample Size: The study population in this study were all subjects, men and women aged 15-49 years who participated in IBBS survey selected randomly from 12 districts/cities in Tanah Papua year 2013. Totally there were 5,861 interviewed respondents. However, the number of respondents following both interview and HIV rapid blood testing were only 5,334 people.

Data Collection: The main outcome in this study was the HIV status of respondents. HIV positive individual in this study is defined as a person showing positive result in two consecutive serologic tests from their blood sample. In addition, another biologic variable collected in this study was the Syphilis status which was confirmed also through Syphilis blood serologic test.

The IBBS 2013 in Tanah Papua also collected data of sociodemographic, knowledge, behavioural and health services factors. These non-biologic determinants in this national survey were collected through guided interview using standardized piloted structured questionnaires. All the data of National IBBS surveys were officially documented confidentiality by the Ministry of Health, Republic of Indonesia.

Data Analysis

Data was analysed using statistical software, covering descriptive estimates and inferential statistical tests, such as chi-square test in bivariate analysis and logistic regression in multivariate analysis. In this study we employed steps of multiple logistic regression modelling, not only among all general population but also among male population only, in Tanah Papua, 2013. The modelling of this regression had taken into account the weighting strategy of frequency distribution, due to complex sampling design in the IBBS survey. Backward strategy of screening and eliminating variables with insignificant contribution to the model, i.e. those with p-value of Wald Statistics >0.05, would finally result in final regression model with variables only showing significant associations with HIV (p-value <0.05). The strength of associations between the determinants and the HIV status were measured using prevalence odds ratio (POR) and adjusted prevalence odds ratio (a-POR). Role of chance and the precision of association were assessed using the 95% confidence interval of a-POR and the corresponding p-value.

Ethical Considerations: The National IBBS survey had passed the ethical clearance in the Ministry of Health. We also had received official permission from Ministry of Health to use the data of IBBS in Papua year 2013 for this study.

Results

Of 5,861 respondents, 5,334 completed HIV rapid serologic test, and among those completed the test, 120 respondents (2.3%) were identified as HIV-positive individuals. Among 5,328 respondents who completed blood examination for syphilis test, 238 individuals (4.5%) were found positive. Most of respondents were adult people, aged >24 year (64.2%), female (50.8%), married (69.6%), from ethnic of Papuan (76.3%), graduated from primary school (69.5%), living in lowland areas (58.2%).(Table.1)

Of the respondents, 91.1% had poor essential HIV knowledge; 87.1% had difficulty obtaining condoms; 97.3% had difficult access to VCT service; 96.7% could not afford the cost of VCT service; 70.4% of those had sexual contacts, did not use condom consistently. Among male respondents, 81.5% (2,321/2,849) were uncircumcised. Although relatively small in percentages, respondents also reported some important sexual risk behaviors, such as first sexual contact in young age before 15 years (3.3%), practice of polygamy (4.8%), extramarital sex (11%), anal sex (1.2%), queuing sex (0.6%), sex during menstruation (4.5%), multiple (more than one) sexual partner (11.9%). There were also small percentages of other risk behaviors related to potential HIV blood transmission, i.e. injecting drug use (0.5%), slashing body skin for traditional treatment (3.2%).

In the final model of logistic regression modelling for all male and female respondents, we found four statistically significant determinants of HIV infection. As compared to living in less reachable lowland, all respondents living in easily reachable lowland or in highland were significantly about 4 times more likely to get HIV infection (for easily reachable lowland a-POR=3.5; 95%CI:1.3-9.1, while for highland: a-POR=3.9; 95%CI:1.4-10.3). Papuan respondents were about 8 times more likely to be infected by HIV as compared to non-Papuan (a-POR=7.5; 95%CI:3.6-15.8). The significant likelihood to get HIV infection among all respondents that could not afford cost of VCT service was about 9 times than the likelihood among those could afford the cost (a-POR=8.5; 95%CI:3.9-18.5).(Table.3)

*Final model using complex sample multiple logistic regression modelling

Particularly for only male respondents we found five statistically significant determinants of HIV infection in the final model. The likelihood to get HIV infection among male respondents living in easily reachable lowland was significantly about 4 times (a-POR=3.5; 95%CI:1.3-9.1), while among those living in highland was about 3 times (a-POR=2.9; 95%CI:1.3-6.5) than those living in less reachable lowland. Papuan male respondents were about 7 times more likely to be infected by HIV as compared to non-Papuan male (a-POR=6.6; 95%CI:1.9-23.3). The likelihood to get HIV infection among male respondents not circumcised was about 8 times than the likelihood among those circumcised (a-POR=7.8; 95%CI:2.0-29.4),(Table.4)

*Final model using complex sample multiple logistic regression modelling

Discussion

In this study we found that the prevalence rate of HIV among general population in Tanah Papua was 2.3% (95%CI:1.5-3.4); males 2.2%; females 2.3%. The majority of respondents reported poor knowledge about HIV; difficulty obtaining condoms; difficulty of access to VCT; inability to pay the cost of VCT; inconsistent condom use. Among male respondents, the majority were not circumcised. There were four risk factors significantly associated with the increase risk of HIV infection among the general population; topography, ethnicity, access to VCT, and cost of VCT. Among males five risk factors were significantly associated with the increase risk of HIV infection; topography, ethnicity, status of polygamy, circumcision, access to VCT.

The level of prevalence rate in this study was about the same with the previous estimate (2.4%) from the National IBBS survey in 2006, meaning that the epidemic spread in this region was not yet declining since 2006. It is also important to understand that since 2006 the prevalence rate of HIV among general population in Tanah Papua has continued to exceed above 1%, indicating that the epidemic has moved from the concentrated high risk sub-population to the general population7,9.

Concerning ethnicity, we found that HIV prevalence among Papua-native respondents was 2.9%, while among the non-ethnic Papuan and the mixed ethnic (one of the parents was from the ethnic Papuan) were 0.4% and 0%, respectively. This might suggest that the spread or rates of the infection was more intense in the indigenous people. We could say that the Papuan ethnic were significantly at higher risk 6.6 times (for all general population) or 7.5 times (for male general population) to get infected by HIV, as compared to the non-Papuan. Another important demographic characteristic was related to topographic of residency. Our study showed that people living in highland or easily reachable lowland were significantly at higher risk 3 to 4 times to get HIV infection than those living in less reachable lowland. We also noticed that in highland, there were much higher proportion of Papuan inhabitants (34.1%) as compared to the non-Papuan (0.4%). If the increasing risk of HIV infection attributed to ethnicity were true, some may speculate that there could be some local specific characteristics of the Papuan people leading to more vulnerable situation to be infected. Regarding the sexual risk behaviour among Papuan and its socio-cultural context, Knautf noted that unauthorized relations in the form of heterosexual intercourse before marriage or heterosexual ceremony acceptance were evident in all Papuan cultural regions10. However, we believe that comparison of HIV prevalence rates based on ethnicity does not reflect that there are differences in risk based on ethnic factors alone, but rather reflects the different levels of knowledge about hazards and prevention of risky behavior4,5. With respect to knowledge and risk behaviour as more important factors than the ethnic itself, our study had shown that there were slightly higher proportions of Papuan respondents with poor knowledge (92%vs.85%) and with multiple sex partners (34%vs.31%), as compared to the non-Papuan.
Concerning biological risk factors, as compared to non-Papuan respondents, there were higher percentages of Papuan respondents with positive Syphilis status (5% vs. 0.5%). In addition, percentage of uncircumcised Papuan males were much higher than the non-Papuan (99% vs. 22%). From the perspective of HIV transmission, we had paid more attention to this high percentages of uncircumcised males. Our study showed that the uncircumcised males would have higher significant probability to get infected by HIV than the circumcised males. Consistence with our finding, we found more evident from several other studies suggesting that circumcision might play important biological role in preventing the HIV infection, like researches in Brazil (OR=0.3)\textsuperscript{11}, South Africa (w-PRR=0.52)\textsuperscript{12}, and Uganda (a-OR=0.65)\textsuperscript{13}. Nevertheless, we also found other finding from Mutombo et.al in Malawi stating that there was not any significant different in getting risk of HIV infection between the circumcised and the uncircumcised people\textsuperscript{14}. Meta-analysis study covering many studies in sub-Saharan African countries\textsuperscript{15} and other systematic reviews from Wilson et.al\textsuperscript{16}, Weiss et.al\textsuperscript{17}, and Valley A, et.al\textsuperscript{18} generally conclude that medical male circumcision was quite effective to prevent HIV infection.

Main limitation was that statistical associations in this cross-sectional study may not be interpreted as causal relationships. Since risk behaviours related to HIV transmission were quite sensitive to ask among general population respondents may not fully honest answering the sensitive questions then underreporting of data can possibly occur.

Conclusions

We conclude: 1) the HIV prevalence in general population in Tanah Papua was 2.3% (95%CI:1.5%-3.4%); 2) Significant determinants associated with HIV infection among general population were topography, ethnicity, access to VCT and cost of VCT. Particularly for male population, topography, ethnicity, access to VCT, status of polygamy and circumcision were also significantly associated with HIV infection.

Unlike in other regions in the country, the HIV epidemic in Tanah Papua has entered advanced state and extended to general population. Therefore, the HIV Surveillance system in this region should also be extended and strengthened to monitor not only trends among specific high-risk key populations but also among the general population, as a whole. Sentinel surveillance HIV towards specific populations (as proxy of general population) such as pregnant women attending ANC clinics and pulmonary TB patients should be strengthened. Rapid behaviour survey to monitor trends and changes of sexual behaviour risk factors among general population could be implemented on regular basis. Specific behaviour change interventions should be implemented such as promoting, encouraging and targeting young male population to accept and undergo medical male circumcision. In order not to confuse with traditional religious circumcision which confusion may lead to rejection, local religious leaders should be invited and involved to clarify that the medical circumcision (with its’ own scientific technique) as a preventive measure of HIV, has nothing to do with particular religion’s obligation or rituals. Improving access and maintaining low cost of the already available VCT program are necessary. Specific qualitative study to learn about psycho-socio-cultural dimensions of Papuan people could be proposed as the foundation for designing more specific and appropriate behaviour modification intervention programs.

ABSTRACT

Introduction: Birth weight is an important determinant of infant’s survival and future development. Insufficient supply of vitamin D during fetal growth can affect birth outcomes.

Objective: This study aimed to analyze relation of vitamin D status with neonatal birth weight.

Method: This study used a cross-sectional design on 144 pregnant women and their infants that met inclusion criteria. Umbilical cord blood 25-hydroxyvitamin D [25(OH)D] was examined by Electro Chemiluminescence Immuno Assay method. Analysis used multiple linear regression.

Results: The mean concentration of 25(OH)D was 27.6 ng/mL and only 37.5% neonates had adequate vitamin D. The average birth weight was 3090.6 gr. After being controlled by maternal weight gain during pregnancy and energy intake, the mean birth weight was significantly 166.5 gr smaller in neonates with vitamin D deficiency (p<0.05).

Conclusion: Vitamin D status is related to neonatal birth weight. Efforts to increase vitamin D intake in pregnant women are necessary to improve fetal vitamin D status followed by exposure to sunlight.

Keywords: Birth weight, neonatal, vitamin D

Introduction

Birth weight is an important indicator for assessing the infant survival. Low birth weight (LBW) in Indonesia is still a problem because 11.2% have an impact on prenatal death (4). LBW is a significant predictor of prenatal mortality and morbidity. Barker’s theory explains that LBW also increases the risk of poor cognitive development and non-communicable diseases in the future, such as diabetes and cardiovascular disease2,3).

Based on the 2013 National Basic Health Research, the LBW prevalence at 10.2%, Bengkulu Province at 9.7%, the highest in Sumatra (1). In Asian countries, LBW is mostly associated with intrauterine growth retardation (4). Maternal malnutrition is the main factor contributing to poor pregnancy outcomes (5).

Vitamin D 25(OH)D is one of the essential minerals that have various functions of the body’s physiological processes. Primary functions was to maintain calcium levels in a healthy physiological range to support multiple metabolic functions, regulation of bone transcription, and metabolism (6). Another role is to modify the immune system and regulate cell proliferation and differentiation (7). An adequate vitamin D concentration during pregnancy is needed for growth and mineralization of the developing fetal bone (6). Vitamin D deficiency in pregnant women results in neonatal insufficiency (8) and is often associated with adverse birth outcomes (9).

The study on vitamin D in Indonesia is very limited. Study on the first-trimester pregnant women in Jakarta shows the vitamin D deficiency by around 90% (10). Studies examining correlation of vitamin D with neonatal birth weight have never been carried out. Therefore, this study aimed to assess relationship of vitamin D serum with birth weight.
Materials and Method

This study used a cross-sectional design conducted in Bengkulu, Indonesia. Samples of the study were 144 pregnant women and neonates’ mothers who met the criteria, including single pregnancy, gestational age ≥ 32 weeks, infants born at term. The exclusion criteria were mothers suffering from chronic diseases, namely diabetes, hypertension, parathyroid disorders, liver, heart or kidney disease; infectious diseases (tuberculosis, malaria, HIV-AIDS); taking medicines that affect vitamin D metabolism (including glucocorticoids and anti-seizures), neonatal births with congenital malformations.

Data collection on maternal characteristics include age, education level, occupation, family income, and obstetric history through interviews. Addition of maternal weight during pregnancy is known by comparing differences in body weight at the end of the third trimester with pre-pregnancy weight written in the “maternal and child health book”. Maternal nutritional intake macronutrients (energy, protein and fat) were obtained using 2x24 hour recall technique.

Serum vitamin D samples are taken from cord blood on the placental side of the mother. Blood samples were centrifuged at 1500 rpm for 15 minutes and stored in a freezer at -20 °C, for further analysis using the Electro Chemiluminescence Immuno Assay (ECLIA). Analysis was carried out at “Kimia Farma Laboratory” that is accredited and has ISO 9001:2015. The reference values used by the laboratory are also values recommended by the Clinical Guidelines Subcommittee of the Endocrine Society. Vitamin D deficiency if 25(OH)D ≤ 20 ng/mL, insufficiency if 25(OH)D 21-29 ng/mL and sufficiency if 25(OH)D ≥ 30 ng/mL (11). Specifically, the cutoff vitamin D in neonates is absent (12). Calcium examination was measured by a photometer using the Ion Selective Electrode (ISE) method. The birth weight of infants was measured during the first hour of birth with the Seca brand portable scales (type 231/231 Corp Hamburg, Germany) with an accuracy of 0.01 gr.

Analysis of two mean independent tests (independent t-test) was applied to determine differences in vitamin D serum with average birth weight. The multivariate analysis used multiple linear regression. Significant if p value < 0.05.

Findings

Based on maternal characteristics, the average age was 27.8 years. They were mostly senior high school graduates (41.7%) and housewives (81%). The average family income was IDR 2,307,638. The average weight gain was 12.7 kg, the average nutritional intake per day, energy of 1682.1 kcal, protein of 59.5 gr, fat of 53.2 gr.

The average birth weight was 3090.6 gr. The average concentration of vitamin D 25(OH)D was 27.6 ± 9.5 ng/mL and concentration of calcium was 10.1 ± 1.8 mg/dL (table 1).

**Discussion**

The results of this study noted the average 25(OH)D was 27.6 ng/mL. By using the cut off the US Endocrine Society, the recommended vitamin D concentration $\geq$ 30 ng/mL. The study indicated the deficiency 62.5% (deficiency at 25.7% and insufficiency at 36.8%). Not much different from the Hawaii by 68% (deficiency at 19% and insufficiency at 49%) (13). In India, deficiency is much higher at 83% (deficiency 63% and insufficiency 20%) (14). If comparing the average of vitamin D in three countries, there is almost no significant difference.

Umbilical cord vitamin D status describes maternal vitamin D status (15-17) because maternal vitamin D is the only source of fetal vitamin D that easily enters the fetus through the placenta (18). Therefore, low maternal vitamin D levels have implications for low fetal vitamin D status. Although the Bengkulu City is a tropical region located at 30045'-30059 `South Latitude - 102014'-102022' East Longitude in which the sun shines throughout the year, only a small portion of mothers (37.5%) have a sufficient level of vitamin D. This study supports a previous research through a systematic review that vitamin D deficiency is common and has become an epidemic of public health problems around the world, especially women and children (19,20), including in countries with sun-rich exposures throughout the year such as the Middle East (16).

Low concentrations of vitamin D can be affected by limited exposure to sunlight as the primary source of vitamin D and and food intake of source of vitamin D (21). In this study, the factors that might cause vitamin D deficiency was not examined. However, the phenomenon of female in Bengkulu showing a tendency to avoid themselves from the sun exposure, using sunscreen to make the skin white and wearing clothes that cover almost full body when going outside home can limit vitamin D synthesis through the maternal skin. For further studies, these factors need to be considered.

This study proves a significant association between vitamin D status and birth weight. The average birth weight was 166.5 gr in neonats with vitamin D status $< 30$ng/ml compared vitamin D status $\geq$ 30 ng/mL. These results can be attributed to the important role of vitamin D status in determining the transfer of vitamin D and calcium from the mother to the fetus through the placenta. An adequate amount of vitamin D increases the transfer efficiency and calcium absorption to the fetus. Without vitamin D, only 10% to 15% of the diet calcium can be absorbed. In women on which 25-hydroxyvitamin D levels increases from an average of 20 to 32 ng/mL, the interaction of 1,25-dihydroxy vitamin D (an active form of vitamin D) with vitamin D receptor (VDR) increases the efficiency of calcium transport to the intestine by 45 up to 65% and absorption of calcium 30 to 40% (6). By these data, 25-hydroxyvitamin D levels from 21 to 29 ng/mL (52-72 nmol/L) can be considered to indicate relative deficiencies of vitamin D, and levels of 30 ng/mL or higher indicate the recommended vitamin D limit(11).

Growing evidence suggests that vitamin D deficiency during pregnancy can interfere with fetal growth and adverse pregnancy outcomes. This evidence shows the same results with this study. Studies in South India showed a significant difference in the average birth weight of infants based on the concentration of vitamin D in cord blood. The lower levels of vitamin D, the lower the average birth weight of the infant (14). Studies in Iran proved a significant relationship of vitamin D deficiency in pregnant women with LBW (22). Several studies in China found that both mother and neonate at Beijing had normal levels of 25(OH)D ($> 30$ ng/mL) and severe vitamin D deficiency in mothers and neonates had a higher risk of LBW with an average baby weight birth 3354.8 gr at birth was among neonates with < 25 nmol/L and 3640 gr among neonates with vitamin D $\geq$ 25 nmol (15). Maternal vitamin D status was positively associated with infant birth weight, after adjusting for confounders, birth weight increased by 69 gr/mL by an increase of 25(OH)D less than 20 ng/mL (23). Maternal vitamin D deficiency significantly increases the risk of neonatal low birth weight by 2.8 times(17).
The case is slightly different from the results of a study in Anhui, China, which showed an inverse U-shape relationship between birth weight on cord D vitamin status. There was an increase in birth weight of 61 gr at a concentration of < 40 nmol/L, but decreased by 68.5 gr at a concentration of 40-70 nmol/L. (24) Even though the results are diverse, but many other shreds of evidence support the positive relationship of vitamin D and birth weight. Results of Randomized Clinical Trial (RCT), by providing vitamin D supplementation to pregnant women (gestational age of 24-26 weeks) with deficient and insufficient vitamin D < 30 ng/mL of 25(OH)D, showed that vitamin D supplements increased maternal blood vitamin D levels and fetal growth such as length of body weight and neonatal head circumference (25). A meta-analysis conducted on 13 RCTs also showed the benefits of vitamin D supplementation during pregnancy which increased circulating levels of 25(OH)D during labor by 66.5 nmol/L, body weight by 107.6 gr and birth length by 0.3 cm (26). These results are strengthened by other meta-analysis reported from three experimental studies (Brooke 1980; Marya 1988 and Sablok 2015) involving 493 pregnant women who received vitamin D supplements during pregnancy that had fewer babies with birth weight below 2500 gr compared with pregnant women who did not receive the intervention (27).

Conclusion

Maternal vitamin D status measured through neonatal umbilical cord is correlated with birth weight. The average of neonatal birth weight is lower on the vitamin D deficiency status. Efforts to increase vitamin D intake in pregnant women to improve fetal vitamin D status, which has implications for neonatal birth weight, need to be made. In addition, it is necessary to be followed by an increased exposure to sunlight.

The Effect of the Predicate Exercises to a Rotor in Some Physical Abilities and Skill Performance Hands Jump Forward on the Floor Mat Movements for Students

Qassem Mohammed Hassan¹, Wael Abbas Abdul Hussein¹, Mostafa Adel Abbas¹
¹University of Kufa, The College of Physical Education and Sports Sciences, Iraq

ABSTRACT

The gymnastics game is one of the sports in which the level of performance to the point of creativity and innovation where ground movements are the basis for most movements on the rest of the other devices where the learning is related to learning the basic conditions of the primary because they are the basis in learning these movements and mastery in a timely manner. The research community represents the students of the third stage of the Faculty of Physical Education and Sports Sciences/University of Kufa (58) students by the two divisions (B) and (C).

Then the tests were carried out on the sample and the program was applied and then the statistical steps were taken and the results were extracted based on which the conclusions were drawn.

Research Aims:
1. Design and manufacture of an auxiliary device to teach the skill of the jump of the front hands on the ground movement
2. Prepare exercises help on the device of the rotator to teach the jump of the front hands on the floor movements.
3. To recognize the effect of exercises on the help of the rotator to learn the skill of the jump of the front hands on the floor of the movements of the ground.

Research Hypothesis: There is an effect of the exercises on the rotator system in some biochemical variables and learning the skill of the forehand jump on the ground movement mat, and the preference for the benefit of the experimental group in the posttests.

Keywords: Predicate exercises, physical abilities and Hands jump forward.

Introduction

The gymnastics game is one of the sports in which the level of performance to the point of creativity and innovation where ground movements are the basis for most movements on the rest of the other devices where the learning is related to learning the basic conditions of the primary because they are the basis in learning these movements and mastery in a timely manner.

Among the ground movements is the skill of the forehand jump, which is one of the most important skills in the field of the ground movements. This skill requires special physical and motor abilities that differ from the rest of the other skills. The shape of the hand jump is done by rotating the body around it. Explosive ability of the muscles of both legs and arms.

Hence the importance of research in the preparation of exercises help on a device designed to teach the technical performance of the skill of the jump of the front hands on the ground movements of students of the third stage at the University of Kufa.

The effectiveness of gymnastic activities that require a long time to learn their skills because of the difficulty of performing those skills, which require physical qualities and high mobility.¹

Since the researcher is one of the graduates of the Faculty of Physical Education and Sports Science and
one of the people interested in the effectiveness of the gymnastics and through his observation in the field found that it is difficult to learn the skill of the jump on the hands of the front ground movements.

Therefore, the researcher decided to go into this experiment through the design of a teaching assistant and the preparation of exercises help and the goal is to help learners to adjust the motor tracks of the skill and learn faster.²

Research Methodology and Field Procedures:

**Methodology:** The researcher used the experimental method to suit the nature of the problem to be solved in order to achieve the objectives of the research and its hypotheses. He also used the design of the two sets of control and experimental group so that the two groups are completely equal in all their circumstances except the experimental variable that affects the experimental group.

**Community and Sample Search:** The research community represents the students of the third stage of the Faculty of Physical Education and Sports Sciences/University of Kufa (58) students by the two divisions (B) and (C), in order to satisfy the research requirements in them and in light of that the researcher chose the main research sample of (20) divided students (B) the experimental group, and (C) the control group. Thus, the percentage of the sample of the research is (38.46%) of the sample, from the original search community.

**Means, Tools and Devices used in Research:**

**Information Gathering Methods:**
- Arab and foreign sources.
- Personal interviews.
- Questionnaire.
- Observation.
- Camera (video camera) number (2) Type (casio) Japanese-made frequency (120) Image/Sec.
- Drawing scale (1 m).
- Metal measuring tape.
- Simple sponges compressed by measurement.
- Adhesive tapes.
- Medical balance for weight measurement.
- Designer educational system.

**Field Research Procedures:**

**Specify Search Variables:** After reviewing several sources and scientific studies, as well as conducting some personal interviews, and consultation with the supervisor, the physical variables were identified and were presented to the Scientific Committee for approval of the subject, where it was agreed on the most important physical variables were as follows:

1. Explosive power of the muscles of the two legs.
2. The speed of the arms.

**Determination of Measurements and Tests of Variables:** Measurements and tests were determined to measure the search variables, which can be measured and measured in terms of the physical abilities under study, as follows:

**First:** Test the wide jump of stability/measure the explosive power of the two legs (1)

**Tools used:** Mat or flat ground or skirting hole with tape measure.

**Performance description:** The player stands behind the starting line and the distance between his feet width knots or inches and the toes on the line of advancement to prepare to jump, the person swings his arms back and forward next to the knees where he begins to extend the knees and swing the arms forward at the same time, the rules gives the student three attempts measured distance Between the advancing line of the heel or any part of the body touching the ground closer to the line of advancement.

**Registration:** Registration of the best attempt from the three attempts to the nearest (meters).

**Second,** the speed test for the arms, the front leaning, bending the arms continuously for 10 seconds:¹

**Performance Specifications:** The laboratory takes the position of the front-end position on the ground so that the body is upright at the starting signal. The laboratory will bend the arms fully if the performance persists as many repetitions as possible without stopping for ten seconds.

**The conditions:**
- Notes the integrity of the body tested during performance.
- Not allowed to stop during performance.
The need to touch the chest of the earth when performing.

Note the full length of the arms.

Registration: The degree of the laboratory is the number of correct repetitions within a period of (10 seconds).

Design and Manufacture of Rotary Armchair (Educational Equipment): By presenting simple details about the skill of the front-hop and the problem associated with a group of experts and specialists to find the appropriate solutions to facilitate the process of teaching that skill. In consultation with experts, specialists and an engineer, Note Figure (1).

Figure 1: Shows the educational rotor pad

Components of Rotary Armrest Device:

First: The device consists of rotary cylinder length of (110 cm) and diameter (40 cm) This cylinder is coated with compressed sponge and then wrapped with a normal skin completely.

Second, the number of supports (2) to support the cylinder on the ground where it is installed tightly to avoid any movement of the device, through which can control the height of the cylinder up and down in order to fit the average length of the research sample.

Third: The device also contains a rubber band length of (110 cm) and width (20 cm).

Features:

- The device can increase or decrease the height and distance depending on the length and capacity of the player.
- Facilitate the teaching of the technical stages of the skill of the leap of the front hands through the fragmentation of the stages and learn each of them separately.
- Ease of use of the device by any learner without the intervention of any teacher or colleague.
- Is a means of encouragement by learning skills easily and away from the fear and routine to learn traditional skill performance?
- Features of the device can be transferred to any place for easy to carry.
- Is a specialized equipment in the effectiveness of the gymnastics?

Main Experience:

Pre Tests: The researcher conducted the Pretest of the research sample on 22/3/2018 at 9:00 am on Thursday and at the gymnasium hall in the Faculty of Physical Education and Sports Sciences/University of Kufa.

Posttests: The Post tests were carried out on the control and experimental groups for the skill of the forehead jump on the ground movement mat on 6/5/2018 corresponding to Sunday at 10 am in the gymnasium hall of the College of Physical Education and Sports Sciences at the University of Kufa.

Discuss the results of the Pre and Posttests of the control and experimental groups of physical abilities: The researcher attributed the reason for the difference in the control group to the methods and repetitions of the educational exercises that were used, and the application by the teacher on the members of the control group, as the repetition exercises give results and improvement of the athlete even if the components of the curriculum is not regularly codified because of the athlete’s physical exertion and adapt to a certain level during the duration of education, as it was standardized on the basis of scientific and commensurate with the method of education for the disposal of energy appropriate for this work, which takes only a few seconds, Mainly in the development of the explosive capacity of the muscles of the two men physical exercises on the device using the body weight and the momentum on the rubber band installed on the device as well as the use of jumping exercises on the ground floor has an impact in the development of this attribute, “exercises that use great resistance is one of the appropriate means to develop the components of explosive power” 4

The results presented in Tables (1) and (2) showed the strength test for the muscles of the hands for the Pre and Posttests. The results of their tests were significant for the post-test of the control and experimental groups. The researcher found that the effectiveness of the exercises used by the teacher in the control group as a result of moral differences, and this means that any physical work performed by the athlete has a positive and noticeable effect, but the difference lies in the size of this effect and the difference from one group to another and from one curriculum to another and this should be emphasized during the development of educational curricula, Especially for the predicate on the rotor and prepared by the researcher for members of the experimental group which is characterized by rapid and appropriate intensity frequencies specified helped to bring the moral difference special force as soon as the muscles in your hands.5

Discuss the results of the technical performance assessment of the skill of the forehand jump on the floor mat: The results presented in Table (3) for the values of the computational and standard deviations and the values of (t) calculated in the Post tests of the technical performance of the skill of the front-hand jump on the mat of the movements of the ground revealed significant differences between the Pre and Post tests and in favor of the Post tests in both control and experimental groups, technical performance of the members of the control group is due to repetitions of exercises by the teacher material and performed by students in the educational units and regularity in the process of education, and the repetitions lead to the consolidation of the program “The redundancy of any work will reduce the error rates and increase the learning rates, as well as lead to the rapid retrieval of information from memory, so the learner is given many attempts during the initiation of learning“ 6.
As for the differences shown in table (3) of the experimental group, the researcher attributed him to the exercises that were prepared on the designed device, which focused on what the technical performance of the skill of the leap forward hands, as the exercise focused on controlling the biochemical changes related to skill as well as contribute And greatly in the development of physical qualities and mobility of students and this helps them to perform the skill efficiently, and the development of these qualities contribute effectively to the economy effort and time during educational science.7

Discuss the results of the Post tests to evaluate the technical performance of the skill of the leap of the hands on the front of the ground movements: By observing the values shown in Table (4), we found that the two groups achieved statistically significant differences in the level of performance evaluation of the front-hand jump. However, the differences were higher for the experimental group of the control group by observing the difference in the values of the computational circles The researcher attributed the reason to the fact that the assessment in the gymnastic depends on the technical performance, so the improvement of the power component will help to correct errors associated with performance and reduce by increasing the factors of control and control of the body to serve the goal of movement and the course of movement during performance “The player who has the power can control the technique”.8 This is true with the experimental research sample, which carried out the special exercises with different repetitions on the designed device, which played a large and effective role in improving the values of the biochemical variables of skill as well as its contribution to the development of two elements Muscle strength and motor speed of the arms and legs and well,9 which led to the strengthening of the possession of the sample to the characteristics of strength and speed and investment in improving the overall level of skill performance.10

Conclusions
1. The exercises on the designed device led to a great learning of the technical performance of the skill of the leap forward hands.
2. The special exercises on the device designed to develop some biochemical changes.
3. There was a slight improvement in some biochemical parameters investigated by the control group.

ABSTRACT

Objective: assessment of muscle bulk, sarcopenia, skeletal muscle mass index (SMI), serum interleukin-6 (IL-6), Alpha 1-antichymotrypsin, myoglobin, and C-reactive protein between female patients with RA and healthy control groups.

Method: Eighty eight subjects, fifty eight female patients with RA (age 42.0 ± 6.0 years) and thirty female control (age 41.8 ± 6.1 years) were enrolled in this study. Skeletal muscle mass index (SMI) was measured with dual-energy X-ray absorptiometry (DXA). IL-6 and α1-ACT, myoglobin, and C-reactive protein were measured in serum by using ELISA.

Results: Study showed that SMI in patients with RA were significantly lower than that in the healthy controls, serum Myoglobin level these was no significant difference in RA patients from controls, The serum CRP level in RA patients were significantly higher than that in the healthy controls and the same was also for serum IL-6 level. In addition, Patients with RA showed a significant increased level of serum alpha-1 ACT compared to healthy controls.

Conclusion: the risk of sarcopenia is higher in RA patients in comparison to healthy controls of the same age. SMI was significantly lower in RA patient’s compared to healthy controls. There is no significant changes in serum myoglobin in RA patients compared to healthy controls because myoglobin level changes is closely associated with muscle damage but not muscle mass loss. There is a significant increase in serum CRP, IL-6 and ACT in RA patients compared to healthy control.

Keywords: Rheumatoid arthritis, sarcopenia, SMI, IL-6, ACT, Myoglobin, CRP

Introduction

Rheumatoid arthritis (RA) is one of the most important chronic, systemic, inflammatory disorders that affect the joints and musculoskeletal systems, which is characterized by inflammation of synovial joints in a symmetrical pattern¹. It usually presents with pain, swelling and stiffness of joints in combination with raised levels of inflammatory markers². The inflammatory process can lead to destruction of cartilage and bone, resulting in joint deformities, permanent functional impairment and disability³.

Interleukin-6 is a substance produced in response to injury or trauma of tissue by specialized white blood cells called T-cells, as well as macrophages and endothelial cells³,⁴. After production of IL-6 from macrophage and other cells, carried via the blood stream to the liver rapidly stimulates synthesis of acute phase proteins such as CRP and α1ACT⁵. α1ACT is a serine protease inhibitor which rises in inflammatory conditions and has been implicated in the pathology of a number of devastating human diseases including chronic obstructive pulmonary disease, Parkinson’s disease and Alzheimer’s disease⁶. In RA the serum concentration of ACT was described as a reliable indicator of the mass of inflamed tissue⁷. Myoglobin (Mb) is “a highly soluble monomeric hemoprotein with a low molecular weight (18 KDa)”, that binds dioxygen in cardiac myocytes and oxidative skeletal muscle⁸.

C-reactive protein (CRP) is an acute-phase serum protein and is a member of the pentraxin protein family, which is released in the circulation in response to inflammation, degenerative, and neoplastic diseases. We aimed to assess muscle bulk and sarcopenia in female patients with Rheumatoid arthritis. And compare the results of skeletal muscle mass index (SMI), serum interleukin-6 (IL-6), Alpha 1-antichymotrypsin, myoglobin, and C-reactive protein between female patients with RA and healthy control groups.

**Method**

**Subjects:** Eighty-eight subjects, fifty-eight female patients with RA (mean age 42.0 ± 6.0; range of age 30-50 years) and thirty female control (mean age 41.8 ± 6.1; range of age 30-50 years) were enrolled in this study.

**Blood Sample:** The sample taken in laboratories of (Al-Yarmouk teaching Hospital) was five milliliters of venous blood was collected from patients as well as Controls and put in a gel tube (without any anticoagulant). Blood in the tubes were allowed to clot for (2 hours) then centrifuged at (1000) round per minute (rpm) for (20 minutes) to get serum. Each subject serum was immediately put into five Eppendorf tubes and stored at (-20°C) freezer until analysis (this method was taken from the kit (Mybiosource,USA)).

**Clinical Diagnostic Measurement:** Measuring the Skeletal Mass Index by Dual Energy X-ray Absorptiometry (DEXA), Appendicular skeletal muscle mass (ASM) was measured with dual-energy X-ray absorptiometry (DXA) calculated by the sum of skeletal muscle mass in the arm and legs. Sarcopenia was evaluated by the Skeletal muscle mass index (SMI), which is calculated as (the appendicular skeletal muscle mass in kilogram divided by the square of the height in meters), Sarcopenia was defined as an SMI <5.5 Kg/m2 in women.

**Biological Markers (in serum):** IL-6 and α1-ACT, myoglobin, and C-reactive protein were measured in serum by using ELISA.

**Results**

Table 1 reveals that SMI in patients with RA were significantly lower (5.77 ± 0.85) than that in the healthy controls (6.27 ± 0.67). Concerning serum Myoglobin level these was no significant difference in RA patients from controls (14.83 ± 13.14 vs. 14.66 ± 13.06 respectively). The serum CRP level in RA patients were significantly higher (25.84 ± 4.52) than that in the healthy controls (18.09 ± 3.77), and the same was also for serum IL-6 level (36.77 ± 28.52 vs. 16.41 ± 8.28 respectively). In addition, Patients with RA showed a highly significantly increasing level of serum alpha-1 ACT (111.38 ± 58.31) compared to (57.84 ± 27.75) of healthy controls.

**Discussion**

This study shows a highly significant reduction in the SMI of patients with RA comparing to healthy controls. These results agree with the previous findings reported by Ceyhan et al that found a significant lower of SMI in patients with RA comparing to healthy controls, and by Westhovens et al which found that lean body mass was significantly lower in patients with RA comparing to healthy controls. The exact mechanisms that cause low muscle mass in RA are still not specific, but they appear to be multifactorial and include increased production of pro-inflammatory cytokines, mainly tumor necrosis factor-alpha and interleukin-1 beta, hormonal changes, oxidative damage, reduction of protein synthesis in myocytes, insulin resistance, inadequate protein ingestion, and reduction of physical activity. This condition may lead to a vicious cycle of lower exercise, increased fatigue and weakness, and increased fat mass with implications for comorbidity and mortality.
This study shows no significant changes in serum myoglobin level of patients with RA comparing to healthy controls. These results agrees with the previous findings reported by Sarzi-Puttini et al who found that patients with RA had normal serum myoglobin14. Myoglobin is associated with damage of skeletal or cardiac muscle, but not associated with muscle atrophy or hypertrophy15. This explains no changes in serum myoglobin level of RA patients with sarcopenia when compared to RA patients without sarcopenia (myoglobin level changes is closely associated with muscle damage not muscle mass loss)15.

This study shows a significant elevation in serum CRP level of patients with RA comparing to healthy controls, which agrees with other studies and found that the mean distribution of CRP in RA patients is higher than healthy control16.

This study shows a significant elevation in serum IL6 level of patients with RA comparing to healthy controls and this finding consistent with previous findings that reported by Rico et al, Chen et al and Liu et al that showed a significant elevation in serum IL6 level of patients with RA comparing to healthy controls17-19. The significant elevation in serum IL6 level of patients with RA in this study consistent with previous findings, that attributed IL6 overproduction to several causes, including interactions between T and B lymphocytes, synovial-like fibroblasts, and macrophages, IL6 also drives persistent inflammation and joint destruction20.

This study shows a significant elevation in serum alpha-1 ACT level of patients with RA comparing to controls, and this finding consistent with previous finding which reported by Kosaka et al that find a significant elevation in serum alpha-1 ACT level of patients with RA when compared to controls21, and by Brackertz et al that showed a significant rise in α 1-ACT in patients with rheumatoid arthritis. They found that the concentrations of α 1- ACT was also significantly higher as compared with those of the patients with osteoarthritis without inflammatory process 22. This difference is in agreement with the known fact that α 1-ACT belong to the group of acute phase proteins that respond to inflammatory stimuli with a substantial rise in concentration23,24.

**Conclusion**

The risk of sarcopenia is higher in RA patients in comparison to healthy controls of the same age. SMI was significantly lower in RA patients compared to healthy controls. There is no significant changes in serum myoglobin in RA patients compared to healthy controls because myoglobin level changes is closely associated with muscle damage but not muscle mass loss. There is a significant increase in serum CRP, IL-6 and ACT in RA patients compared to healthy control.

Rapid and Inexpensive DNA Extraction Protocol from Gram Negative and Gram Positive Bacteria

Rahman Laibi Chelab
College of Education for Pure Science, University of Thi-Qar, Thi-Qar, Iraq

ABSTRACT
The aim of present study to develop a novel, efficient, rapid and Inexpensive and effective protocol to extract DNA from gram negative and gram positive bacteria. Many protocols have been recommended for DNA extraction from bacteria, and almost all of them are difficult and time consuming, dealing with high amount of toxic materials like phenol and chloroform. In summary, results have described a cell lysis and DNA purification procedure that appears to be suitable for obtaining high-quality DNA from both gram-positive and gram-negative bacteria. The study was focused on a fast and reliable protocol with inexpensive and non-poisonous reagents for DNA extraction from different bacterial species, and the complete lysis and extraction procedure is carried out in a single microcentrifuge tube. Also the quality and quantity of the extracted DNA were surveyed by gel electrophoresis.

Keywords: DNA extraction, Rapid protocol, Efficient method

Introduction
DNA as a double helix molecule is composed of four nucleotides including, cytosine, guanine, thymine and adenine. In each strand these nucleotides are connected by phosphodiester bonds. Each strand is joined to another primarily through Watson, Crick hydrogen bonds. The point that the two strands cross each other forms two regions named minor groove. Many protocols have been recommended for DNA extraction from gram-negative and gram positive bacteria. However, these protocols are difficult and time consuming, utilizing high amount of toxic materials like phenol, and complex procedures like absorptive columns and sometimes detergents like CTAB (cetyl trimethyl ammonium bromide). Commercial kits are available too; however, they are expensive and sometimes unavailable. Presented here is a simple and rapid method for extraction of bacterial genomic DNA. This method is effective in producing digestible genomic DNA from a variety of gram-negative and gram positive bacteria, including those of the genera Escherichia coli, Klebsiella pneumonia, Pseudomonas aeruginosa, Staphylococcus aureus and Staphylococcus epidermidis. The most common problem affecting DNA purity, which can inhibit the activity of many molecular biological enzymes. The method also has several advantages of not requiring any enzymes for expensive cell lysis materials. It requires only one chloroform extraction, and the entire process can be accomplished within 15 minutes. In this study, the present result revealed a novel, rapid and easy procedure to isolate sufficient high quality DNA suitable for PCR amplification.

Material and Method
DNA Extraction Protocol:
1. Bacterial species were incubated at 37°C on nutrient agar for 24h.
2. Loopful of bacteria (one big colony) was mixed with 50 μL ddH2O in 1.5 ml of microcentrifuge tube by pipetting.
3. The cells were boiled at 95°C for 5 minutes to lyse the bacteria.
4. Cells were centrifuged at 5000 rpm for 5 minutes at room temperature.
5. Resuspend the pellet by pipetting to produce cell lysis.
6. 1 μL of cell lysis (in step 5) was diluted with 20 μL ddH2O and to be ready for total genomic DNA and PCR, or sored at -20°C until use.
Phylogenetic Analysis: The 16S rRNA gene of E. coli, K. pneumonia, P. aeruginosa, S. aureus and S. epidermidis were amplified by PCR protocol using bacterial DNA that extracted by gSYNC DNA extraction kit protocol of human blood and was used as a PCR template. PCR was performed with universal bacterial primers complementary to conserved regions of the 5 and 3 ends of the 16S rRNA gene, 27 F (forward) (5’ AGAGTTTGATCCTGGCTCAG-3’) and 1492 R (reverse) (5’–GGTTACCTTGTTACGACTT–3’).

Results

This study was developed rapid and easy procedure to isolate sufficient high quality DNA suitable for PCR amplification. 16S rRNA was used as a target gene to analyze the efficiency of this method in producing high-quality DNA for PCR amplification. Fig. 1 shows the results of DNA extracted from E. coli, K. pneumonia, P. aeruginosa, S. aureus and S. epidermidis using current protocol. While Fig. 2 illustrates typical PCR products from DNA obtained from different negative and positive bacterial species.

Discussion

The procedures used in the method described in this paper avoid the use of organic solvents, cheap and simple to be performed. Several samples can be processed at the same time, and the DNA extracted by this methodology yields sufficient DNA for many rounds of genotype analyses. In the work presented here, the current study described a fast, inexpensive and efficient protocol for high yield genomic DNA extraction from gram negative and gram positive. Also, in current optimized protocol omitted the need to use of CTAB, hazardous or toxic chemical such as phenol and enzymatic agents like RNase and Proteinase K.

Conclusion

This study was developed rapid and easy procedure to isolate sufficient high quality DNA suitable for PCR amplification.

ABSTRACT

Background: DMF-T/def-t (Decay Missing Filled Teeth) is an index for assessing dental and oral health status, in this case, dental caries. Dental caries is a multifactorial disease with factors namely teeth and saliva, microorganisms, dietary, and time that affecting each other. Human Beta Defensins-1 (HBD-1) is an Antimicrobial Peptides (AMPs) that has a role as an adaptive immune system in oral health, is a factor that affects the susceptibility and development of dental caries that exhibits activity in Streptococcus mutans bacteria.

Objective: To prove the relationship between DMF-T/def-t and the levels of HBD-1 saliva secretion in the carious and non-carious groups of children.

Method: This study was an observational analytic with cross-sectional study design, with the division of 3 groups namely; group 1 (DMF-T/def-t = 0, caries-free), group 2 (DMF-T/def-t = 1-3, low caries), and group 3 (DMF-T/def-t > 6, high caries).

Result: DMF-T/def-t index (1,000) obtained HBD-1 concentration (-0.451). Low DMF-T/def-t index has high HBD-1 concentration, whereas high DMF-T/def-t index has low HBD-1 concentration. The value of p < (0.05) showed there was a significant correlation between the DMF-T/def-t index with salivary HBD-1 concentrations.

Conclusion: There was a relationship between DMF-T/def-t and the level of HBD-1 saliva secretion in the carious and non-carious groups of children.

Keywords: DMF-T/def-t, Saliva, Streptococcus mutans, Dental Caries, Human Beta Defensins-1

Introduction

Dental caries is the most common dental and oral disease found in the community, especially in children. Based on RISKESDAS 2013 data, caries prevalence in Indonesia reached 53.02%. Dental caries in Indonesia tends to increase over years. Dental caries is a multifactorial disease with causative factors, namely teeth and saliva, microorganism, dietary, and time that affecting each other. The main group that suffered dental caries was the age group of 6-14 years old with DMF-T index of 2.21.

DMF-T (Decay Missing Filled Teeth) is an index to assess the oral and dental health status, in this case is dental caries. D value is the number of cavities or decayed teeth due to dental caries, M value is the number of extracted teeth due to dental caries, F value is the number of filled or treated teeth due to caries and in good condition. The DMF-T value is the total of D, M, and F scores.¹²
To assess the health status of deciduous teeth, commonly used def-t index (decay exfoliated filling teeth). Def-t value is an index that shows the number of deciduous teeth with caries in 9-12 years old children. D value is the number cavities or decayed teeth due to dental caries, e value is the number of deciduous teeth loss due to premature loss or extraction that caused by dental caries, and f value is the number of filled or treated deciduous teeth due to caries. The def-t value is the total of d, e, and f scores.³

The bacteria of the oral cavity can cause inflammatory processes, inducing an innate or adaptive immune system response to the host. Cytokines regulate many aspects of the immune response. In leukocyte circulation, cytokines have been shown to affect the expression of associated chemokine adhesion. In the innate immune response system, pathogenic microbes of the oral cavity have a molecular bond form with similar forms of receptors on host cells, including dendritic cells that then activate the inflammatory response together with the release of proinflammatory cytokines, such as IL-1β, IL-6, IL-8 and TNF-α.⁴

So far several ways have been conducted to prevent the dental caries, among others by brushing your teeth properly, giving topical fluoride application and using mouthwash, but not showing maximum results to prevent dental caries. Some studies have shown that Antimicrobial Peptides (AMPs) are antibodies that provide a defense against pathogenic bacteria. This peptide is very important in the oral cavity and acts as an antimicrobial. Antimicrobial peptides (AMPs) in saliva are important contributors to maintaining a balance between health and illness as part of the host’s innate immune response. AMP is considered to affect the susceptibility and development of dental caries in oral health.⁵

Human beta-defensins (HBDs) are in a family of AMP, which have a role as an immune response. Human Beta Defensin-1 (HBD-1) is expressed in the oral cavity tissue and secreted in saliva. HBD-1 as innate immunity, as well as chemoattractants for T cells and dendritic cells in microorganisms. The expression of HBD-1 is constitutive, and physiological salivation is not known. This study aimed to investigate the relationship between DMF-T/def-t with salivary HBD-1 secretion as a new way to prevent caries and biomarker candidates for caries risk assessment.⁶

**Materials and Method**

This study was an observational analytic with cross-sectional study design, with the division of 3 groups namely; group 1 (DMF-T/def-t = 0, caries-free), group 2 (DMF-T/def-t = 1-3, low caries), group 3 (DMF-T/def-t > 6, caries high). The research sample was the saliva that taken from elementary school students who were caries-free and carious at Qomaruddin Gresik Islamic Boarding School that qualified the inclusion and exclusion criteria using purposive random sampling technique.

The research materials used saliva samples, Human Beta-defensin 1 ELISA Bioassay Technology Laboratory brand kit (anti HBD-1 antibody; streitavidin-HRP; wash buffer; substrate solution A; substrate solution B; stop solution). Research tool used; sterile conical cup, 15 ml cryovial tube, 1.5 ml eppendorf, refrigerator with temperature -30°C, ice box, mask, mouthpiece, straight round, handpiece, handscoon, centrifuge with a temperature of -4°C, micropipette, elisa microplate, microplate wash (Bio-Rad), ELISA reader (Bio-Rad microplate reader) and stopwatch.

The students who became research samples were asked to fill out the questionnaire. The questionnaires contained student identity, criteria for measuring DMF-T/def-t index in oral condition. Students were instructed not to eat about 1 hour before saliva collecting (allowed to drink water) and avoid to intake of sweet foods and those containing caffeine. Before the saliva collecting was conducted, the students were asked to rinse for 1 minute with clean and distilled water, after gargling, they had to wait for approximately 5 minutes. Saliva collecting was conducted at 8-10 am with the method of passive droll, which by bowing the head and saliva that collected in the mouth was taken out into the cryovial tube. Saliva samples that had been collected should be processed in the laboratory in less than 2 hours.⁷,⁸

The saliva sample was collected until reached 5 ml. The samples were stored in an ice box, then then stored in the refrigerator with a temperature of -30°C, so the sample could survive for long periods of time.⁹

**Sample Preparation:** The cryovial tubes were removed from the refrigerator and kept in the area at a room temperature, then centrifuged at 2400 g for 10 minutes, -4°C. The centrifugation was carried out in order to separate the supernatant in saliva, the supernatant would form clearly after centrifugre, separate from cells that contained in whole saliva.⁹ The supernatant was put into the eppendorf tube and stored in a refrigerator at a temperature of -30°C until the ELISA test time was conducted.
**ELISA Sandwich Procedure:** Salivary supernatant samples were removed from the refrigerator until they reached room temperature. The ELISA kit was removed from the refrigerator for approximately 30 minutes until all reagents reached room temperature. A sample of 40 μl of salivary supernatant was put into the well, then 10 μl of anti-HBD-1 antibody, and then 50 μl of streptavidin-HRP. Samples of saliva supernatant and reagent in plate were mixed using micromixer. The plate was covered with a sealer and incubated in a dark room at temperature of 37°C for 60 minutes. The wash buffer dissolved was prepared in distilled water in a ratio of 10 ml : 290 ml, then put into a microplate wash tube. The sealer was removed from the plate and the microplate was put into a microplate wash. The plate was washed 5 times, then dried by tapping lightly to dry.

The substrate solution A and substrate solution B were added to each well. When adding the substrate solution, the researcher must avoid the sunlight exposure directly. The plate was covered again with a sealer then incubated in a dark room at a temperature of 37°C. A 50 μl stop solution was put in each well. ELISA readings was with OD results and the concentration levels was used a microplate reader with a wavelength of 450 nm.

**Result**

The results of this study showed the levels of HBD-1 in carious and caries-free children were obtained from 3 groups; namely the DMF-T/def-t group = 0 (free caries), DMF-T/def-t = 1-3 (low caries), DMF-T/def-t => 6 (high caries). Before examination was conducted, all groups performed oral cavity examination first, to obtain DMF-T/def-t index. Then 5 ml of saliva was taken and divided according to caries-free criteria, low DMF-T/def-t index, and high DMF/def-t. The data was collected in 9 times visit on September 11st - November 15th, 2017 at Pondok Pesantren Qomaruddin.

<table>
<thead>
<tr>
<th>SAMPLE</th>
<th>DMF-T/def-t</th>
<th>HBD-1 Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Mean ± SD</td>
<td>Mean ± SD</td>

</tr>
<tr>
<td>Group 3 (high caries)</td>
<td>7.80 ± 2.68</td>
<td>709.93 ± 243.30</td>
</tr>
</tbody>
</table>

The Table 1 showed the caries-free group as a control resulted the mean of DMF-T/def-t score of 0 (caries-free) and mean of salivary HBD-1 concentration was 1000.8 ± 339.38 pg/ml. The low caries group with low DMF-T/def-t resulted the mean of DMF-T/def-t score of 1-3 (low caries) was 1.86 ± 0.83 and the mean of HBD-1 concentration was 1036.8 ± 366.9 pg/ml. The high caries group with high of DMF/def-t score more than 6 (high caries) resulted the mean of DMF-T/def-t of 7.80 ± 2.68 and the mean of HBD-1 concentration was 709.93 ± 243.30 pg/ml.

Before saliva HBD-1 levels test was conducted, the data was firstly analyzed for its normality and homogeneity of data. Normality test was performed by Kolmogorov-Smirnov test, showed the probability of each treatment groups. The group 1 was with alpha value of 0.5 so the data distribution of DMF-T/def- t was normal. While the group 2 and group 3 were with alpha value more than 0.5, so the data distribution were normal concentrate.

Table 2: Spearman’s test results

<table>
<thead>
<tr>
<th>Spearman’s Test</th>

<th>Concentration</th>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1.000</td>
<td>-0.451</td>
<td>0.002</td>
</tr>
</tbody>
</table>

Table 2 contains the results of Spearman’s test that showed p value of 0.002, which the alpha value is less than 0.05, that means there was a significant correlation between the DMF-T/def-t scores and the salivary HBD-1 concentration. The value of r < 0 indicates that the correlation between DMF-T/def-t scores and the salivary HBD-1 concentration was inversely related. That means low DMF-T/def-t was associated with high levels concentration of salivary HBD-1, whereas high DMF-T/def-t was associated with low levels concentration of salivary HBD-1.

**Discussion**

This study was conducted to determine the relationship between DMF-T/def-t and salivary Human Beta Defensin-1 (HBD-1) secretion in carious and caries-free children groups. Before sample grouping based on the DMF-T/def-t scores was conducted, the samples were examined their oral cavity using DMF-T/
def-t index. The 5 ml saliva sample was placed in the centrifuge tube and divided into two groups, namely low DMF/def-t and high DMF/def-t. The results of this study showed there were a different levels of salivary HBD-1 in the low DMF/def-t group and high DMF/def-t group. This research involved elementary students of Qomaruddin Gresik Islamic Boarding School, which provides a dental treatment facilities.

The results of mean HBD-1 concentration in caries-free condition was 1000.8 ± 339.38 pg/ml. Salivary HBD-1 levels in the oral cavity can be measured in normal conditions because the peptides can be detected. Salivary HBD-1 is produced when inflammation occurs, in the salivary epithelial tissue and the gingival crevicular fluid.10

HBD-1 has the role of preventing commensal bacteria in the oral cavity differentiate into pathogenic bacteria. While salivary HBD-2 and HBD-3 are the antimicrobials, which are inducible, the levels may increase because of the stimulation of microbes, and have a major role against pathogenic bacteria.11

In the low caries group was with the mean of DMF-T/def-t scores of 1.86 ± 0.83 and the salivary HBD-1 concentration was 1036.8 ± 366.9 pg/ml. The presence of low frequency caries is because the pathogenic bacteria is inhibited by the activity of HBD-1. While the high caries group with the mean of DMF-T/def-t scores of 7.80 ± 2.68 and the salivary HBD-1 concentration was 709.93 ± 243.30 pg/ml. This is because HBD-1 is unable to inhibit the pathogenicity of cariogenic bacteria, then it is replaced with HBD-2 which strengthen the antimicrobial activity against the invasion of pathogenic bacteria, resulting in decreasing the levels of HBD-1.10

HBD-2 is produced when there is a chronic inflammation and the inflammatory mediator that can increase HBD-2 production, namely IL-1β, IFN-γ, TNF-α, IL-6, IL-8.4 From the results of this study, it is known that DMF-T/def-t and the salivary HBD-1 concentration are the new biomarker candidates for dental caries risk assessment to prevent dental caries. Streptococcus mutans is a dental caries etiology factor and has been studied extensively on the relationship between dental caries and S. mutans. Several studies also assessed the association between the development of carious lesions with immunocompetent cell responses. Cytokines are an important mediator during inflammation and infection, in addition to the role of controlling the inflammatory response to bacterial infections. The host’s active cells secrete these molecules as paracrine or autocrine signals to recruit immune system cells (chemokine), produce inflammation (proinflammatory cytokines) or regulate inflammatory responses (anti-inflammatory cytokines). The role of cytokines in dental caries pathogenesis is not clearly, but the production of proinflammatory cytokines can be induced by S. mutans components.12,13

Conclusion

Based on the results of this study, we can conclude that there was a relationship between DMF-T/def-t and the level of HBD-1 saliva secretion in the carious and non-carious groups of children. The correlation between DMF-T/def-t scores and the salivary HBD-1 concentration was inversely related.

Study of Kidney Pathological Investigation in Some Cases of Diseases Chickens

Sabah Mahmood Hamad Al-Shammari1, Mohammd Abed Mahmood AL-Karawi2
1Department of Biotechnology, Collage of Sciences, 2Department of Pathology, College of Veterinary Medicine, University of Diyala, Iraq

ABSTRACT

In this study, fifty samples of chickens kidney were collected from different chicken farms in Diyala province to study the pathological lesions (gross and histopathology). The gross appearance revealed different shapes of kidney vary from small size and the paleness of the kidney while the histopathological changes showed necrosis which lead to epithelial lining desquamation of renal tubules. There is an inflammatory cell infiltration specially lymphocytes in the kidney interstitial tissue. Other cases, the histopathological changes in it revealed mesengial cell proliferation of kidney glomeruli and in interstitial tissue observed presence of hemorrhage. In other samples, there is a hyaline degeneration and severe hemorrhage in renal glomeruli. Same samples showed clefts of urates in the renal tubule lumen recorded as visceral gout with inflammatory cell infiltration specially macrophages and foreign body giant cells. Congestion of blood vessels and interstitial tissue hemorrhage. In this study and from the results the concluded, revealed the gross and histopathological changes associated with many chicken diseases.

Keywords: chickens, kidney, histopathology, nephrosis, gout

Introduction

The interest in livestock, including chicken, plays an important role in the process of development and raising the economic level of society. Poultry raising meat and eggs is one of the most vital industries in the world because it has become an appropriate substitute for other protein sources. The poultry industry is characterized by low production costs as well as high nutritional value (1, 4). So it is necessary to improve livestock and attention through control of diseases that affect chickens, including diseases of the urinary system, especially the kidneys. Kidneys are organs that play a special role in the balance of water and electrolytes and rid the body of the nitrogenous waste produced by the protein metabolism (2, 3). During the breeding period, the urinary system can be exposed to lesions and pathological changes for possible administrative reasons such as exposure to low or high temperatures or exposure to bacterial and viral infections (5) or as a result of an imbalance in the basic components of the diet such as protein and calcium (6, 7, 8), this may be due to their interest in viral and bacterial diseases that cause economic losses and losses in chicken herds and lack of focus on renal changes. Therefore, I wanted to shed light on the pathological changes that affect the urinary system, especially the kidneys, by studying the gross and histopathological changes of the kidneys associated with some different diseases in the chicken breeding fields.

Material and Method

The study was conducted in different regions contain chicken fields in the province of Diyala for the period from October 2018 to December 2018, as the study was based on the examination of chicken, which is marked by diseases signs or of the newly deceased chickens, where the field visits were assigned to a weekly field of some fields of chickens and chickens were brought sick or newly deceased to the laboratory of poultry diseases/Faculty of Veterinary Medicine at the University of Diyala for a comprehensive study including the description of kidney lesions after the examination of the chicken, and some of them documented by images. Fifty samples of kidney were collected after the examined of the newly infected and diseased chicken.

The samples were put directly in 10% neutral formalin solution to fix them for 24-48 hours and then cut into small pieces 1 cm³, then carried out the process
of ascending alcohols and then in xylene, waxed in the form of molds and cut the pieces with a microtome on thickness of (4-5) μm and then dyed with the routine stain hematoxylin and eosin10.

Results

The gross pathological lesions included congestion and hemorrhage spots on the kidney cortex (figure 1), in some cases the kidney presented small in size and paleness than other cases.

Other cases, the kidneys congested with hemorrhage spots and lobulated (figure 2). Some cases of the kidneys showed lobulated and the lobules filled with urate, others kidneys paled, poetical hemorrhage on the cortex (figure 3), (Table 1).

Histopathological Changes: The histopathological lesions of the kidneys showed vascular degenerative changes in the endothelium of renal tubules with necrosis (figure 4), also there is a proliferation and hyperplasia of the arterioles mesothelioma (figure 1), cellular proliferation of glomeruli mesengial cells (figure 3), while the other glomeruli mesengial cells showedatrophy with distention of Buman capsule (figure 3, 4).Swelling of renal tubules endothelium with the narrowing of it and presented of star shape, desquamation of the renal tubule epithelium, congestion of blood vessels, hemorrhage and tubular dilation (figure 4), proliferation of inflammatory cells, especially the neutrophils (figure 5). Other cases revealed severe hemorrhage in kidney with congestion of blood vessels and hyaline degeneration in renal glomeruli that present as homogenous pink mass (figure 5).

The histopathological changes showed a visceral goat with degeneration in renal tubules characterized by deposition of urates crystals as cleft were distributed radially in the cavity of the renal tubules, these crystals were surrounded by cellular clusters of phagocytes and foreign body giant cells forming several granular lesions in the blood vessels between renal tubules and presence of hemorrhage in other regions (figure 4, 5).

Discussion

The best description of the urinary tract specially the kidney was by (17) he said the determined of kidney lesions done by study the case history, field management, gross lesions and histopathological lesions which considered necessary for identifying the different diseases. (9, 10, 11) said this change may be occurring when infected with viral diseases such as Newcastle in chickens. also (5, 11, 12) observed same pathological changes through experimental infection by E. coli. (14) recorded the congestion, paleness of kidney with hemorrhagic spots on cortex of kidney, same changes observed in chickens, which infected with Streptococcus and Salmonella, the hemorrhage in kidney cortex usually results from septicemic diseases which characterized by inflammation of blood vessels in addition to the necrosis and this observed in pigs infected with Hog cholera (15). Others cases the kidney characterized by paleness, shrinkage and irregular shape and observed in chronic nephritis (11, 12), this same result described by (16) which mentioned the paleness and shrinkage of the kidney caused by kidney hardness.

The histopathological changes showed degenerative changes in the renal tubules characterized by visceral type and this observed with (17, 18) which mentioned the visceral degenerative changes of renal tubules occurred in case of electrolyte imbalance, particularly sever decrease of potassium due to thirsty, increase of temperature, also degenerative changes result from ischemia, hypoxia and sensitive of the cells for some toxins (14, 17, 19) observed visceral changes and renal glomeruli changes which represent, by the increase proliferation of mesengial cells, this change occurred in chickens when infected by Streptoccous zooepidemicus and in human occurred in the case of infected with pregnancy septicemia (21, 22). The causes of this histopathological changes result from increase of sodium ion in blood, which result in hypertension and increase blood pressure for the long period lead to arteriosclerosis, hyaline degeneration in artery and arterioles of kidney and result in atrophy of renal tubules (16, 23). The histopathological changes for other cases revealed severe degenerative changes and necrosis of the interstitial tissue and renal tubules with inflammatory cell proliferation in addition to hemorrhage and this change occurred in the case of infected withmicroorganism to the kidney by hematogenous methods causes penetration.
of germs to blood vessels which result in visculitis and inflammatory cell infiltration of interstitial tissue with necrosis of renal endothelial cells \(^{(10, 11, 12, 24, 25)}\), observed hyaline degeneration of renal tubules and same changes \(^{(20, 26)}\) in chickens treated experimentally with Afla, B1 toxin which considered characteristic lesion for this disease, the histopathological changes of some cases characterized by lymphocyte infiltration of interstitial tissue with degenerative changes in renal glomeruli and tubules, Such changes were observed by \(^{(27)}\) in chicken infected with Gumboro, this is due to the severe dehydration that infected chicks in Gumboro and inability to move and drink water. The histopathological section of kidney observed visceral gout, which characterized by sever degenerative changes in the renal tubules represented crystals of urate in renal tubule lumen \(^{(28)}\), and this case developed because of absence of uricase in chickens \(^{(7)}\). The visceral gout can occur experimentally in chickens by giving nephrotoxic agents for kidney such as gentamycin in high doses, nutrition with low vitamin A and decrease of calcium \(^{(29)}\). The urate crystals consider foreign body lead to formation of granuloma \(^{(7)}\), and the renal tubules surrounded by inflammatory cells (macrophages, foreign body giant cells) and there is congestion of blood vessels between renal tubules and hemorrhage spots in other \(^{(30)}\).

All previous presentation showed nephrosis and nephritis can occurred due to multiple causes, toxic causes \(^{(12)}\) or nutritional causes result from increase rate of lipid, proteins, calcium and decrease vitamin A in the diet \(^{(31, 32)}\).

Also the infection with bacterial and viral caused renal lesions specially viral infection such as infectious bronchitis and Gumboro and all these lead to pathological changes in the kidney \(^{(33)}\).

In this study the results are approximately similar to the results mentioned by Siller. \(^{(17)}\).

Incidence of Unscarred Uterine Rupture: A Prospective Four Years Duration Study

Shaymaa Jaafar1, Itimad Muthanna Yousif2, Ban Kadhim AbdulRaheem3
1Lecturer, Biomedical Engineering Department, Faculty of Engineering, Al-Nahrain University; 2Lecturer, Tikrit University, College of Medicine; 3Obstetrics and Gynecology Department, Al-Karama General Hospital

ABSTRACT

Background: Uterine rupture is a known catastrophic event in obstetrics, often resulting in both maternal and fetal consequences. This event occurs more in developing countries, with a varying global incidence.

Objective: To assess the incidence and the main causes of the rupture uterus.

Patients and Method: This was a four years prospective cross-sectional descriptive study done in 4 years duration, from the first of 2015 to the end of 2018, involving all cases of delivery at Al-Elwiah teaching hospital. The hospital serves as a major referral center for Obstetrics and Gynecology in Baghdad Al-Resafa, (n=32246) women who delivered at the hospital in this period.

Results: The women age between 15-40 years old, and out of 32246 of women who delivered in our hospital about (n=148) of cases was undergo ruptured uterus, giving a rupture rate of 4.6 per 1,000 births, 44.6% (n=66) of these cases of rupture occurred in unscarred uterus (2/1000) and the rest with scared uterus. Most of the cases of unscarred rupture were aged between 26 and 35 years, and had parity of 3 or above.

Conclusion: The incidence of unscarred rupture uterus was (2/1000) and the main cause was multiparty and delivery by midwife.

Keyword: Unscarred uterus, multiparty, midwife, Al-Elwiah teaching hospital.

Introduction

Uterine rupture is the solution of continuity of the uterine wall in the gravid uterus. They can be produced both in a healthy uterus and with a previous scar. (1,2) It is one of the rare obstetric complications. The systematic review carried out by the WHO shows that the prevalence is lower in developed countries (0.006%) than in underdeveloped countries (25%). (3) The incidence of uterine rupture on unscarred uterus is very rare in developed countries, of the order of 1/20,000 deliveries, (4) not exceeding 30% of the total uterine rupture. They concern in 60 to 80% of the cases the lower segment, preferably the anterior surface. (5)

Risk Factors: This is mainly related to multiparty, prolonged labor, illiteracy and lack of access to health services. (6-9) However, in developed countries, the most frequent cause would be previous uterine surgery. (10,11) Other risk factors that contribute to the presence of a break are: (3)

1. Intrinsic weakness of the wall (Ehlers disease - Danlos type IV) or abnormal architecture of the uterus (bicormuate, didelfo, etc.) (12)
2. Great multiparity.
3. Reduced intergenic interval (<18-24 months)
4. Advanced maternal age.
5. Obesity (body mass index> 40).
6. Macrosomia (> 4,000 g).
7. Abnormal placentation (placenta accreta, increta or percreta).

11. Traumatic obstetric maneuvers (instrumental delivery, third trimester abortions, version and great shoulder dystocia extraction, external version, etc).
12. Short stature. \(^{(13)}\)

**Objective**

To assess the incidence and the main causes of the rupture uterus.

**Patients and Method**

This was a four years prospective cross-sectional descriptive study done in 4 years duration, from the first of 2015 to the end of 2018, involving all cases of delivery at Al-Elwiah teaching hospital at the time of the study. The hospital serves as a major referral center for Obstetrics and Gynecology in Baghdad Al-Resafa, 31246 women who delivered at the hospital in this period.

Data was collected by a specially designed format and by direct interview with the patients before they were discharged. Information was also collected from patient’s case notes, maternity ward records and operating room registers in a structured format.

**Statistical Analysis**

After the data were entered in a table developed by the researchers, the analysis was done by using the SPSS program, version 23 and for qualitative variables, we used frequencies and percentages, and for the quantitative variables, we used measures of central tendency and dispersion (standard deviation). For the inferential statistics the tests were used of chi-square test (with a significance of P ≤0.05).

**Results**

Out of 32246 of women who delivered in our hospital we found that (148) of cases was undergo ruptured uterus, giving a rupture rate of 4.6 per 1,000 births, 44.6 % (n=66) of these cases of rupture occurred in unscarred uterus (2/1000) and the rest with scared uterus (figure 1). Most of the cases of unscarred rupture were aged between 26-34 years, and had parity of 3 or above was with significant association with unscarred uterus than those without (table 1).

Discussion

Rupture of the uterus is one of the terrible events in obstetrics with bad fetal and maternal consequences. with more incidences in developing than developed countries. The incidence of uterine rupture in the current study was 4.6 per 1,000 births, 44.6% (n=66) of these cases of rupture occurred in unscarred uterus (2/1000) which is less than that found by Eguzo KN et al., when the incidence of unscarred uterine rupture was 8.4/1000 live birth and it represent 40% of all cases of rupture uterus in his hospital during period of the study. But it is still larger than that registered in the world where the incidence of ruptured uterus was 1/8000-1/15000. (20)

The most common cause of uterine rupture in the current study is the multiparity >3, then instrumental used in delivery, mal-presentation, chronic corticosteroid drug use and abnormal placentation in addition to the delivery by midwives. This is in agreement with that found by Berghahn L et al., and by Hamilton E et al.

The long term used of corticosteroid may be lead to rupture of the uterus; and as Hamilton E et al, explained that this because the medications can lead to decreased synthesis of the collagen and causing uterine rupture.

The maternal mortality rate was (13.6%) and fetal mortality rate in the current study was (22.7%) which is considered very high and need prompt effective management. But it is still less than that mentioned by Schrinsky and Benson, in their study, when maternal and fetal mortality rate represents 20.8% and 64.6%, respectively. (23)

Conclusion

The incidence of unscarred rupture uterus was (2/1000) and the main cause was multiparity and midwives delivery interference.

Effect of Therapeutic Exercises in Improving the Intensity of Muscle Contraction of the Thigh Muscles

Sundus Saleem Abdulrahman
Ministry of Education, Hilla High School for Excellence, PhD. Sports Rehabilitation, Iraq

ABSTRACT

In addition to the problem of research, which crystallized that there are shortcomings in the treatment of some sports injuries that did not deal with the treatment of exercises and the lack of studies that dealt with the severity of muscle contraction of the muscles of the thigh and that this injury lead to dysfunction of the muscles of the thigh and the difficulty of exercise sports Especially football, which requires high physical qualities and functional efficiency that qualify him to practice the game.

Therefore, the researcher worked hard to give therapeutic exercises to qualify the injury of muscle contraction of the thigh muscles.

Keywords: thigh muscles, therapeutic exercises, muscle contraction.

Introduction

The world has witnessed great progress in the fields of various sciences, such as rehabilitation and sports medicine, which deals with the study of sports injuries, which has a strong relation to sports education. As a result of the high effort exerted by the player in different sizes is subjected to muscle contraction because it is a strain on the main components of the joints of ligaments and cartilage and muscle tendons.

Including the contraction of the thigh muscles. The game of football from the first games in which such injury occurs as a result of muscle strain during the period of effort and that injury means depriving the player to play for a period and thus affect the level of the athlete so the researcher decided to prepare rehabilitation exercises to qualify the injury of muscle contraction of the thigh muscles Football players.¹

Therapeutic exercises are important in the treatment of part of the body injured in one of the injuries or diseases, which led to weakness or lack of movement and each patient must be a special program depending on the diagnosis of his condition and the need for different movements of exercise.

Due to the scientific progress achieved in the field of rehabilitation and physical therapy, there are shortcomings in the provision of rehabilitation exercises for sports injuries and due to the lack of studies that help in the rehabilitation of muscle contraction of the muscles of the thigh, the researcher decided to prepare therapeutic exercises to reduce this injury during the exercise of sports.

Repeated muscle fatigue causes chemical changes in the synovial liquids within the joints of the body in general and within the big joints in particular. As a result the liquids e joints become less fluidity and more viscosity. Repeat occurrence of this leads to adhesion in the articular ligament which results in fibrosis and sclerosis and completely lack of flexibility. Reaching this point makes the person feel the pain of Arthritis which gradually turns to the severe pain of joints and the disability of the joints to move and act naturally, eventually the surrounding ligaments and the strings of the joints become hard and tough.²

Research Aims

1. Preparation of exercises for the treatment of muscle contraction of the thigh muscles.
2. To identify the effect of therapeutic exercises in the rehabilitation of the intensity of muscle contraction of the thigh muscles.

**Research Hypotheses:** Therapeutic exercises have a positive effect in the treatment of muscle contraction of the thigh muscles.

**Research Fields:**

1. **The Human Field:** 10 injured football players representing the clubs of Babel and praise and students of the University of Babylon.

2. **Time Field:** for the period from 19/6/2016 until 1/3/2017

3. **Place Field:** Hila Teaching Hospital/ Rehabilitation Center for Wounded/Babel.

**Research Methodology and Field Procedures**

**Research Methodology:** The researcher used the experimental method in a one-group method with sequential measurements to suit the nature of the problem.

**Community and Sample Search:** One of the components of scientific research is the selection of the appropriate sample, which is based on the study. The research community consisted of athletes with muscular contraction of the thigh muscles as they were determined intentionally after their diagnosis at the Babil Physical Rehabilitation Center (20) of the football players.

The study sample was randomly selected from the research community by 10 patients with muscle contraction of the hip muscles. They represent the clubs of Babel, Al-Madhatia and the students of the University of Babylon. The researcher excluded 10 reasons for which 4 of them had complex injuries, including cruciate ligaments and 3 underwent surgical intervention. And (3) did not have a desire to adhere to therapeutic exercises and the reconstruction of the research sample, which underwent the main experiment in the reconstruction (18-25 years) and after the selection of the sample was conducted homogeneity.

**Means, Tools and Devices Used in Research:** Due to scientific progress, the researcher tried to use the latest methods, methods and techniques in the diagnosis and use the latest methods of physical therapy that benefit the researcher in the removal of muscle contraction research subjects, and know the research tools as “the means by which the researcher collects his data.”

**Machines and Tools Used in Research**

</tbody>
</table>

**Research Method**

1. Observation.

2. Testing and measurement.

3. Questionnaire.

**Survey Questionnaire:** The questionnaire is one of the important means to collect the information needed by the researcher. The questionnaire is defined as “the only convenient way to expose respondents to select and carefully selected stimuli for data collection.”

Therefore, the researcher prepared a questionnaire to obtain some information that we would like to obtain in relation to the subject of research, through the scientific sources have been identified a set of tests and measurements and then presented the questionnaire to a number of experts in the field of sports medicine and rehabilitation.

**Characterization of Tests and Measurements in the Research:**

**Measure the Circumference of the Thigh Muscles:**

The measurement of the ocean through the measuring tape. The method of fixing a point on the upper third of the femur is determined from the upper edge of the patella to the top by 15 cm. The length of the injured is between 160-170 cm.

**Equipment and tools used in treatment and rehabilitation:**

**Quadriceps Strengthening Chair:** Helps to strengthen the muscles and reduce pressure on the knee joint consists of the quadriceps of the handle distributed on both sides, which puts weights of differentiation ranging from half a kilogram to more up to 50 kg, used in physical therapy and medical rehabilitation.
**Electric Stimulator:** Is a set of devices that rely on the stimulation of electrical muscles and nerves by the poles of the treatment, which increases the range of motor joints and increase muscle strength and reduce spasm.

In the view of the researcher that the use of electrical stimulation of the muscles near the injury led to a significant and significant development in the increase in muscle strength and the stimulation of positive lengths through the program muscle training Volta (2 - 14) MA to (4 - 17) MA, Pain is used for cartilage, tearing, and muscular spasm.6

**Field Research Procedures:** The researcher examined the possibilities available in the medical rehabilitation and physiotherapy centers at the Hilla Teaching Hospital and Rehabilitation Center for the wounded.

**Identification and Diagnosis of Injury:** The researcher used the doctors to perform the clinical examination of the patients by x-ray, which contributed to the diagnosis of the injury.

**Exploration Experience:** It is important in the scientific research to conduct the exploratory experiment in order to obtain accurate and reliable results where we mean by “a mini-experiment similar to the real basic experience”.6

The researcher conducted a pilot experiment on 19/6/2016 on a group of injured (5) injured in the rehabilitation center of the wounded and the hospital Marjan Babil province. Where the aim of the experiment is to identify the obstacles that may accompany the tests and work to avoid and overcome if any. As well as knowing enough staff members and training them on tests.

**Scientific Processes for Testing:** The honesty, consistency and objectivity of the conditions must be enjoyed by each particular test. The researcher sought to determine the validity of these tests and be able to apply them to the research sample.

**Pretest:** The pretests were conducted on Monday 24/6/2016 at 10 am in the rehabilitation center for the wounded in the center of Babil governorate. The researcher took into consideration the conditions related to the test (place, tools, supplies, method of implementation, auxiliary team) to be available in the final exam (post-graduate).

**Therapeutic Exercises:** The researcher prepared therapeutic exercises for the injured (individuals of the research sample in one group). Appendix (2) taking into account the equipment, equipment and means available to help continue to work in the implementation of the proposed exercises in order to achieve the stage of recovery or reduce muscle contraction. Where the duration of the implementation of the exercises were for the period from 26/6/2016 until 26/10/2016, equivalent to 16 weeks and 48 units, equivalent to (3) units per week. The duration of the unit (120 minutes) was done using therapeutic exercises and the total number (96 hours).

**Post Measurement of the Search Group:** After the completion of the therapeutic exercises, tests were carried out after the test sample on 28/10/2016 at 10:00 am taking into account the stability in the spatial and temporal conditions and means and tools for tribal testing and with the help of the work team.

**Results and Discussions**

View and analyze the results of tribal and remote tests to measure the perimeter of the muscles of the thigh and discussed:

<table>
<thead>

</tr>
</tbody>
</table>

Through the extracted data, as shown in the table above appears that the mean of the test of tribal and adult (40.540) smaller than the mean of the test posttest of (45.460) as well as the standard deviation of the test posttest of (7.252) greater than the standard deviation of the test tribal (5.925) and knowledge of spirits differences using test and Cookson appeared that the value of (Z) amounted to (2.805).

Compared with the level of significance (0.005), there were significant differences in favor of the post-test. The rehabilitation program has a positive effect on the
measurement of the circumference of the thigh muscle. The researcher attributed this to the fact that the use of the training equipment for the rehabilitation exercises improved the work of the knee joint which protects the cartilage and ligament from The injuries confirmed by Kassem Hassan Hussein that “often get dangerous injuries in the framework of the training of the special force, therefore emphasizes the use of exercises for both public and private forces to strengthen the muscles of the thigh and legs”.

View and Analyzing and Discussing the Results of (Pre, Middle And Post) Tests for Measuring the Circumference of the Knee Joint:

The data in this table shows that the value of the mean for the primary test (37.970) in the standard deviation (1.182) and the value of the mean for the Middle test (35.940) in the standard deviation (1.423). While the value of the mean for the post test (35.350) in the standard deviation (1.701), comparing with the Middle test and with the use of Freedman’s test to realize the Incorporeal difference, it appeared that there are Incorporeal difference with statistical indication among the (Pre, Middle and post) tests for the post tests. You can see the counted Freedman’s value (18.667) as compared with the level of significance (0.000). This shows that there is a difference for the post test due to the reduction in the value and the reason behind that is the dispose of the liquids in the circumference of the knee joint which accumulated as a result of rupture.

The data in this table shows that the value of the mean for the primary test (32.220) in the standard deviation (3.090) and the value of the mean for the Middle test (34.910) and in the standard deviation (2.688), While the value of the mean for the post test (39.830) in the standard deviation (3.303),Comparing with the Middle test and with the use of Freedman’s test to realize the Incorporeal difference, it appeared that there are Incorporeal difference with statistical indication among the (pri, Middle and post) tests for the post tests. You can see the counted Freedman’s value (20) as compared with the level of significance (0.000). This shows that there is a difference for the post test.

The main reason behind that is the circumference of the leg muscle was weak at the beginning of the rehabilitation program. However the use of the physical exercises and the therapeutic devices result in improvement in shaping a strong leg muscle which
means that therapeutic devices affects positively in counting the circumference of the leg muscle.\textsuperscript{8}

Mou’ad Al Ta’ee assures that (the training process leads to changes in the organic devices for the athletes. In each training, they suffer from slight changes. This change is positive which means improvement in the efficiency of the functional devices.\textsuperscript{9}

\textbf{Conclusions}

By discussing the findings of the researcher using statistical methods, the following conclusions were drawn:

1. The exercise exercises to inflate and build a strong muscle for the thigh muscles as a result of rehabilitation and the use of resistors of different weights.

2. The therapeutic exercises have a positive effect on the strength of the perimeter of the quadriceps muscle.

3. Graduation in rehabilitation through the therapeutic exercises of the research sample led to good results than before the injury for the muscles working on the knee joint.

ABSTRACT

This study aims to look at the effectiveness of the taburia program on growth and development in children aged 6-24 months in South Sulawesi. The design of the study is an evaluation study, which is to evaluate the administration of powder taburia, and its impact on nutritional status and the growth and development of children aged 6-24 months. This research was conducted in Makassar, Pangkep and Jeneponto. Samples were children aged 6–24 months who were selected by 3 Public Health Center and then 3 villages with a sample of 675 children, but until the end of the study the remaining 398 children. The results of the study found that the overall taburia program was effective against changes in BB and PB significantly. For changes in z-score BB/U is not significant while PB/U is significant. For the average BB baby changes in Jeneponto that are obedient to those who do not comply, Pangkep and Makassar are better compliant. As for changes in the PB/U z-score, the three regions that are not compliant change their body length better. For overall gross motor development, there are more people who do not comply with consuming taburia. For Makassar, only 5 children were obedient and normal motoric development and 36 children did not comply. Pangkep whose motor development is normal and obedient to 25 children, there are 2 children who obey and motor development above normal. Different from Jeneponto, none of them were normal who obeyed, while those who did not comply with normal motoric development were 95 children, some even had late development there were 12 children, although there was also one child above normal motor development. In conclusion, the program of providing taburia is effective against the increase and development of the bodies of children aged 6-24 months. It is recommended that giving taburia be recommended because it has an influence on a better line of growth and development.

Keywords: Taburia, Growth, Rough Motor Development, Children, Multi Gizimicro

Introduction

In Indonesia, many infants and children aged 6-24 months have inadequate nutritional status, which is reflected in the high prevalence of underweight and stunting. One indicator of low nutritional status is the high prevalence of malnutrition. The results of survey Riskesdas show that there was an improvement in nutritional status aged 6-24 months from 2005 to 2007, from 9.7% to 5.4%. During the same period, the prevalence of malnutrition decreased from 14.8% to 13.0%.1[2]

At present, the national prevalence of malnutrition and malnutrition (6-24 months) has been reduced according to the target of the Medium Term Development Plan (RPJM) to achieve nutrition improvement programs (20%) and the Millennium Development Goals (MDGs) target in 2015 (18.5 %) has been achieved in 2007, although it has not been evenly distributed throughout Indonesia.
Several programs have been carried out to tackle nutritional disasters in Indonesia. Among the MP-ASI giving program in the early 2000s, although it has not provided maximum results because of the problems faced in the field. [3][4] To overcome various problems in MP-ASI, multi micronutrients have been given the name Taburia. Before that, the Indonesian Ministry of Health at that time had carried out a study on the efficacy of Taburia and 2 other types of Taburia (Anuka and Vitalita) to assess the effect of the amount of each Taburia in treating anemia in children.

A validation study on the efficacy of taburia studies showing that, although it did not significantly affect growth, it had a significant impact on infant motor development. [5][6] The results of this study also showed an increase in mean Hb levels in the intervention group (0.21 ± 1.24 mg/dl). Research results in Indonesia reinforce that the effect of taburia vitalita does not have a significant further impact on children’s growth.[7] However, improvements in reducing the impact of anemia have shown positive results such as the study in North Jakarta, where most children under five (95%) want to consume Taburia so that the impact on toddlers suffering from anemia drops by 37.6% (from 62.3% to 24.7%).[9]

Nutritional problems, besides being related to iron deficiency, are also related to the fact of food availability in the household. Besides being aggravated by family nutrition care that has not supported such practices as exclusive breastfeeding is still very low (7.8%), weighing baduta in Posyandu is still low (43%), consumption of iodized salt with sufficient quality, is still lacking (73%), and the family eats a wide variety.[2]

In the first month (T0) the number of samples is still the same with a total of 675 samples. In the second month (T1) to the fifth month (T4) there was a reduction in the number of samples. This happens, because exclude is aged (> 24 months), is absent on the grounds of returning home or is not present at the time of data collection, moving, and dying. The final sample number was 398 samples. For samples of gross motor development, based on the measured melastone scale measurements were children aged 6-18 months, so that those who met the criteria were 484 children. At the end of the study there were 274 remaining samples.

Weighing the weight using a portable calibrated scale of 0.1 kg and measuring body length using microtox. While for measuring motor development using the Milestone Motor Development scale. The results of these measurements provide clues as to whether or not, developmental growth is more or less normal.

Results

The results of this study were carried out in South Sulawesi Province, the results of data analysis were presented in table form accompanied by the following narrative.

Method

This study is an evaluation study, which assesses the administration of powder taburia, and its impact on nutritional status and the growth and development of children aged 6-24 months. Giving taburia powder containing 15 kinds of vitamins and minerals is carried out for 4 months (120 days), every two days, according to the duration of the PMT program.

This research was conducted in South Sulawesi (province of the NICE program). The sample of this study was children aged 6-24 months who were enrolled in the research program giving taburia. Regional areas include the cities of Makassar, Pangkep and Jeneponto. Each region selected 3 health centers using purposive sampling, based on the distance from the center of the capital (near, medium and far). In each puskesmas 3 villages were selected using Probability Proportional to Size. Followed by the selection of families with socio-economic relative, the same as using Systematic Random Sampling. The number of samples is 3 cities/districts x 3 health center x 3 villages x 25 children (6–24 months) = 675 children.

Several programs have been carried out to tackle nutritional disasters in Indonesia. Among the MP-ASI giving program in the early 2000s, although it has not provided maximum results because of the problems faced in the field. [3][4] To overcome various problems in MP-ASI, multi micronutrients have been given the name Taburia. Before that, the Indonesian Ministry of Health at that time had carried out a study on the efficacy of Taburia and 2 other types of Taburia (Anuka and Vitalita) to assess the effect of the amount of each Taburia in treating anemia in children.

A validation study on the efficacy of taburia studies showing that, although it did not significantly affect growth, it had a significant impact on infant motor development. [5][6] The results of this study also showed an increase in mean Hb levels in the intervention group (0.21 ± 1.24 mg/dl). Discussion

The diet of infants and children in developing countries, especially in Indonesia, especially in rural areas, has not been able to fulfill the nutrients needed, especially at the age of 6-24 months which at this age there is very rapid physical and psychological growth and development. Therefore, to meet needs that cannot be met from daily food intake can be done by supplementing certain nutrients needed, one of which is Taburía.

Given that in this study did not have control, one of the things that could be used as a substitute for control was the existence of a variable of compliance in this study. By using the parameters of weight gain each month it appears that the changes that occur are very small. The average increase in body weight measured is only around 1% every month. The results of this study are in line with the research in Indonesia, which shows that, sprinkle vitalita which contains 14 vitamins and minerals does not have a significant further impact on children’s growth.[7]

However, in terms of quantity, it can be seen that baduta who adhere to consuming Taburía in this study have better weight gain and better motor development compared to those who do not adhere to consuming Taburía.

Compliance with Taburía Consumption: Compliance with health programs is behavior that can be observed and can be directly measured. Commitment or attachment to a program is called adherence, which may be eternal. Both compliance and loyalty refer to the ability to maintain programs related to health promotion.

Interventions in this study used micronutrients in the form of Taburía. Provision of small amounts of micronutrients has been proven to have a great impact. Therefore, determining the level of compliance for consumption of Taburía is attempted not to use the cut-off point that is too high. For better data variations, use a 60% cut off point.[8],[9]

Nutritional Substance and Nutritional Status:
Providing nutritious food in sufficient quantities at the time of year is a matter that needs serious attention so that children do not fall into malnutrition. Especially in that period weaning occurs, namely the transition between breastfeeding and adult food as a source of energy and main nutrients. Many children experience micronutrient deficiencies during their growth period. A study conducted in Indonesia, Peru, South Africa and Vietnam shows that children’s growth is disrupted due to lack of micronutrients.[10],[11],[12],[13]

After a two-year-old child has enough nutrients, both the energy and protein sufficiency must be met from daily food. As is known, after a child is 6 months old, breastfeeding alone is not sufficient for the child.[14]
One of the things that allegedly contributed to the slow growth of baduta in this study was the low intake of macro nutrients through insufficient food. Does not meet the recommended nutritional adequacy rate. In addition to protein, the intake of other macro nutrients consumed does not meet the recommended nutritional standards. While for micronutrients only the intake of vitamin A, vitamin D and vitamin B12 are on average that meet AKG standards.

Children who get food intake that is less in quantity and or quality (nutritional value) will affect their growth and development. One result of lack of food intake is the occurrence of deficiencies (deficiencies) of micronutrients both vitamins and minerals.[12]

In this study one of the most important minerals in growth, namely zinc, was found to be very low intake, on average only 40%. Zinc (Zn) is an essential nutrient and has received considerable attention in various recent studies because of its role in the human body.[9] Zinc plays a role in the operation of more than 10 types of enzymes. Acts in the synthesis of Adenosine Dinukleoside (DNA) and Ribonucleoside Adenosine (RNA), and protein. So if zinc deficiency occurs it can inhibit cell division, tissue growth and repair.[15]

In this study, Fe intake was also less than 50% of AKG. Iron (Fe) is a micronutrient that is essential in producing hemoglobin which functions in transporting oxygen from the lungs to body tissues, transporting electrons in cells, and in synthesizing iron-containing enzymes needed to use oxygen while producing cellular energy.[13],[15],[16] Research on taburia as an alternative to adding micronutrients has finally encountered obstacles if macro nutrient intake is deficient.

Ethical Clearance: The study was approved by the institutional ethical board of the Universitas Muslim Indonesia.

The Role of Dexamethasone in Reducing Nausea and Vomiting after Laparoscopic Cholecystectomy

Emad Abdzaid Mohan¹, Zaid Tariq Bdewy¹, Qahtan Adnan Mahdi², Hayder Adnan Fawzi³

ABSTRACT

Objective: To investigate the efficiency of single dose of (dexamethasone 4mg) intravenously in reduction of postoperative nausea and vomiting, and compared it to metoclopramide.

Method: A prospective placebo controlled study involved total of (150) patients diagnosed clinically and radiologically as cholecystitis and admitted for elective laparoscopic cholecystectomy. Patients were randomly divided into three groups, each with 50 patients, the incidence of nausea and/or vomiting was recorded in three groups with in first 6 hours postoperative and then during the next eighteen hours of the first postoperative day.

Results: Nausea and vomiting significantly reduced in the group receiving dexamethasone on the day of operation

Conclusions: Dexamethasone (4mg) as single prophylactic dose is effective in the prevention of postoperative nausea and vomiting in laparoscopic cholecystectomy. Additionally dexamethasone is more effective than metoclopramide in reducing postoperative nausea and vomiting following laparoscopic cholecystectomy.

Keywords: dexamethasone, postoperative, nausea, vomiting, prevention

Introduction

Postoperative nausea and vomiting (PONV) are the most common symptoms affecting patients after surgery under general anesthesia, with an incidence of approximately of 30%¹. The true incidence of PONV is difficult to determine because of the lack of a single stimulus of onset as well as the range of possible etiologies (medical, surgical, and patient and anesthesia associated). In the absence of antiemetic treatment, the incidence of PONV is estimated to be 25% to 30% for all surgical interventions and patient populations². However, the incidence rate of PONV after laparoscopic cholecystectomy (LC) is higher than that after other types of surgery³.

A rate of 46% to 75% has been reported for patients who did not receive antiemetic treatment after LC. The consequences of PONV can increase anxiety for the future of other surgical procedures, increased recovery time and hospital stay, and in severe cases, aspiration pneumonia, bleeding, metabolic alkalosis and incisional hernia⁴.

Dexamethasone was first reported in 1981, as an effective antiemetic in patient receiving chemotherapy, since then, it has been widely applied in the prevention nausea and vomiting before chemotherapy. Dexamethasone is a potent synthetic member of the glucocorticoid class of steroid drugs Dexamethasone acts as an anti-inflammatory and immunosuppressant. Dexamethasone is 20 to 30 times more potent than the naturally occurring hormonal cortisol. The mechanism of antiemetic action of corticosteroid is not fully understood. The theories about the mechanism include: It is acting by central inhibition of prostaglandin synthesis, inhibition the release of endogenous opioid, changing the permeability of blood brain barrier to serum protein. It is acting antiemetic action by peripheral mechanism, as anti-inflammatory action which leads to reduce tissue

inflammation in the site of surgery and lead to reduce the ascending parasympathetic impulse (vagus) to vomiting center. The most adverse effects include impairing glucose metabolism, delayed wound healing, myopathy, neuritis, glaucoma and adrenal suppression.5,6

Among the anti-emetic currently widely used low cost prescribed for (PONV) Metoclopramide is dopamine receptor antagonist. Metoclopramide is increasing upper gastrointestinal motility and lower esophageal sphincter tone, with half-life (5-6) hours. Metoclopramide have side effects included sedation, restlessness, dizziness and extrapyramidal symptoms (dystonic reaction in 25% of young adult)7. The current work aimed to investigate the efficiency of single dose of (dexamethasone 4mg) IV in reduction of PONV and to point out the possible undesired side effect included of this treatment, and to compare (dexamethasone 4mg) with an antiemetic drug (metoclopramide 10 mg).

**Method**

**Setting:** This prospective placebo controlled study involved total of (150) patients who were diagnosed clinically and radiologically as cases of cholecystitis and admitted for elective LC in the department of surgery Al-Iammad Al-Kadhumain Medical City/ Baghdad/Iraq, during the period from October 2015 to November 2016. All patients had an American society of anesthesiologists (ASA) physical status I or II. Patients with history of motion sickness, pregnancy, women who were menstruation, gastrointestinal disorders, laparoscopy conversion to open cholecystectomy, allergy to dexamethasone or metoclopramide, those who received antiemetic drugs within 24 hours before surgery and diabetic patient were excluded from the study.

**Data Collection:** Data including age, sex, smoking status, ASA and blood pressures were obtained by direct interview or from the patient’s record.

**Study Design:** Patients were randomly divided into three groups, each with 50 patients: Group I: given (dexamethasone 4mg) intravenously at the time of induction of general anesthesia (Dexa-treated). Group II: given (metoclopramide 10mg) intravenously at the time of induction (Metoc-treated). Group III: given (normal saline 2ml) intravenously at the time of induction (Saline-treated).

The study drugs were prepared by blinded nurse anesthetists in identical 2 mL three syringes. The drugs were given immediately after the induction.

**Laboratory Analysis:** Approximately 4 mL of venous blood were obtained from each patient in two times, one at anesthesia induction and the other 4 hours after treatment with the different medications. Serum was obtained from each blood sample after it was undergone clotting and proper centrifugation. Sera were kept at (20) C until be used for measuring serum levels of glucose.

**Anesthesia Induction:** All patients received single dose of (cefotaxime 1g) at the time of induction, the perioperative fluid used dextrose water 5% for all patients. The anesthetic regimen was similar to all patients. Sedation by fentanyl (10mcg/kg/dose), induction by thiopental sodium (3-4mg/kg), maintenance by halothane (0.5% to 3%), relaxation by pancuronium (0.1 mg/kg/hr) and reversal by neostigmine (0.03 mg/kg). The operation was done by reverse Trendelenburg position, with standard 4 ports technique. The pneumoperitoneum was maintained at (10-14) mmHg. The duration of operation calculated from induction of anesthesia to extubating, and then patients were discharged to surgical ward.

The postoperative analgesia was given (paracetamol 1g) intravenously with intravenous fluid and antibiotic and nil by mouth. The incidence of nausea and/or vomiting was recorded in tree groups with in first 6 hours postoperative and then during the next eighteen hours of the first postoperative day.

**Vomiting Severity:** The number of vomiting attacks was classified into:
- Grade 0: if the number (zero)
- Grade 1: if the number (1-4)
- Grade 2: if the number > (4).

When patients developed repeated vomiting ≥ 4 were give (ondansetron 4mg) by intravenous injection as rescue anti-emetic drug 8(14-19).

**Recovery Period:** Early recovery was assessed by the Aldrete’s scoring system. The Aldrete’s scoring system is a commonly used scale for determining when patients can be safely discharged from the post-anesthesia care unit (PACU) to either the postsurgical ward or to the second stage (Phase II) recovery area.9
Definitions

Short-term Complications: The end point of this study is recording short term complication within 10 days post operation which is the last visit for most patients.

The complete response was defined no (PONV) and no antiemetic medication during the first 24 hours postoperative.

Statistical Analysis

Statistical package for social sciences (SPSS 22.0) software was used for all statistical analysis. Data were expressed as mean ± standard deviation (SD). Chi-square was used to compare categorical values, while analysis of variance was used to compare continuous valued. A P-value ≤ 0.05 was considered statistically significant.

Result

There is no significant difference in age, gender, smoking, ASA class, SBP, duration of operation, and post site infection (complication). Additionally; both dexamethasone and metoclopramide treated patients had 50% increased FBS from baseline while placebo had 29.4% increased FBS from baseline, as illustrated in table 1.

**Discussion**

The current study revealed significant differences in the frequency of PONV among the three groups. Interestingly, the number of patients experiencing vomiting in Dexe-treated group is less than Metoc-treated group which in turn less than Placebo-treated group. Furthermore, most patients in Dexe-treated group showed grade 1 vomiting (1-4 episodes) compared to the other groups although the differences were not significant. These data indicate the efficiency of dexamethasone in single dose 4 mg IV in reduction of PONV. Somewhat similar results were obtained in many previous studies although with different doses and timing of injection. Kiu et al. suggested that 2.5 mg is the minimum dose of dexamethasone that was effective for preventing vomiting in women having a major gynecological surgery\(^1\), while Wang et al. showed that this dose should be 5 mg in thyroidectomy operations\(^1\). More recently, in a meta-analysis, they suggested that (8-16 mg) of the drug was more effective than (2-5mg) in reduction of PONV in patients undergoing LC. Higher dose of dexamethasone may be more effective than lower doses in prevention of PONV, but certainly they are not without side effects\(^1\).

High percentage (60%) of Dexe-treated group had early time onset vomiting compared to 50% in Metoc-treated group and 41.7% in Placebo-treated group. Although the differences were not significant this result indicates the delay action of dexamethasone. In the current study, dexamethasone was administered immediately after induction of anesthesia, and it is well-documented that it needs 1-2 hours after administration to diffuse across cell membranes\(^1\). Thus, it is possible that the optimal action of dexamethasone does not occur during the early 0-6 hours after anesthesia and 3 out of 5 patients in Dexe-treated group had vomiting during this period. When used dexamethasone at 90 minutes before surgery, Bisgaard et al\(^4\) found that 1/40 patients had vomiting during 0-6 PO hours. On the other hand Laiq et al\(^5\) used dexamethasone immediately prior to induction of anesthesia. They observed that 26% patients had vomiting during first 4 postoperative hours.

Administration of dexamethasone could be accompanied by many adverse effects such as increased blood glucose, delayed wound healing, increased risk of infection and adrenal suppression. The current study investigated the most likely occurring adverse effect of single dose of dexamethasone as there almost similar numbers of patients who were suffering from port site infection among the three groups after follow-up for 10 days. Of course, this effect cannot be attributed to dexamethasone because similar percentage of patients receiving metoclopramide or normal saline experienced the same infections within the same period\(^8\).

A number of studies indicated that blood glucose concentration (BGC) is increased after the administration of dexamethasone in a single dose with 4 or 8 mg\(^16\). In surgery, hyperglycemia should be one of the targets of perioperative management. That is because such cause may result in a large numbers of adverse physiological effects including hypovolemia, osmotic diuresis, high levels of circulating inflammatory cytokines and electrolytes and acid-base imbalance\(^17\).

Finally, dexamethasone is low cost drug and was found to prevent selective extrapyramidal and dysphoric effect associated with the traditional drugs such as metoclopramide. It also confers significant benefit in early as well as late stage pain\(^18\). Furthermore, Bagchi et al. reported that dexamethasone reduced the incidence of sore throat in patients having tracheal intubation. Therefore, dexamethasone may be the first drug of choice to prevent PONV\(^19\).

**Conclusions**

Dexamethasone (4mg) as single prophylactic dose is effective in the prevention of PONV in LC, and dexamethasone is more effective than metoclopramide in reducing PONV following LC, with no observed adverse effects.
Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Iraqi Council for Medical Specializations in General Surgery.

Source of Funding: The study supported by authors only

REFERENCES

Objective: study the correlation of umbilical cord length with maternal and fetal parameters.

Materials and Method: A prospective observational study carried out on 100 pregnant women, with singleton pregnancy with gestational age between 37 completed weeks to 41 completed weeks. The umbilical cords and placentae had been examined after delivery for any abnormalities in shape of placenta, the site of umbilical cord insertion in it, abnormalities and the relation of these parameters to perinatal outcome. The study was carried out in department of Gynecology and Obstetrics at Baghdad Teaching Hospital for the period from 1st of December 2013 to the 1st of June 2014.

Results: The mean Umbilical cord length was 69.8 ± 22.6 cm. There was a significant correlation between non-reassuring fetal heart and long umbilical cord (P=0.03), other significant correlation was between low APGAR score (at 1st minute and 5th minutes) and long umbilical cord as compared to normal length umbilical cord (P= 0.019 and 0.041). There is a significant association with only low Apgar score at 1st and 5th minute (P=0.027, and 0.015) while other clinical and perinatal outcome parameters showed no significant correlation with umbilical cord length in all comparisons (p>0.05).

Conclusion: Abnormal cord length either short or long cord associated with low Apgar score at 1 and 5 minute as compared to the normal length of cord and the long cord associated with no-reassuring fetal heart more than short or normal cord.

Keywords: umbilical cord, fetal complications, Placental abnormalities, umbilical length, APGAR score

Introduction

The umbilical cord is a narrow tube-like structure that connects the developing fetus to the placenta. It delivers nutrients and oxygen to the fetus and removes the fetus waste products. Umbilical cord development begins around the 5th week of pregnancy from the yolk sac and allantois and replaces the yolk sac as the fetus’ source of nutrients. It becomes progressively longer until 28 weeks of pregnancy, reaching an average length of 35 to 70 cm. As the cord gets longer, it generally coils around itself.

The umbilical cord is the lifeline of the fetus, the position of the placental cord insertion, its shape and cord coiling are thought to be associated with perinatal outcome. It has been known for many years that the placental cord insertion, shape, size and pattern of cord coiling varies widely between pregnancies. In current obstetric and perinatal pathology practice, qualitative terms are generally used to describe the placenta There has been little attempt at quantifying or describing the relationship between measurements, including the distance of the umbilical cord insertion from the center of the placenta. The length of the umbilical cord has been proposed as a clinically useful marker of placental insufficiency. The current work aimed to study the correlation of umbilical cord length with fetal parameters including Apgar score at 1 minute and 5 minute, weight, NCU admission, non-reassuring fetal heart, intrauterine death, early neonatal death and its effect on mode of delivery.
Method

Study Design And Setting: A prospective observational study conducted in the Department of Obstetrics and Gynecology of Baghdad teaching hospital during the period from 1st December 2013 to 1st June 2014.

Total number of 100 pregnant women at gestational age of >37 weeks with singleton pregnancy admitted to labor room, with short cord regarded as <35cm, and long cord regarded as >70 cm.

Exclusion Criteria:
- Preterm deliveries (<37 weeks of gestation)
- Multiple pregnancy
- Babies delivered by elective caesarean section

Data Collection: Full history obtained from the cases including (history of the present pregnancy, past medical history, past obstetrical history, parity, date of last menstrual period and the gestational age confirmed by early ultrasound, history of previous operations, and drug history)

Examination for the pregnant women done including, general, medical, and obstetrical examination. Monitoring of the progress of labor including cervical dilatation, effacement, descend of the presenting part fetal heart monitoring using cardiotocography machine (CTG) and its changing with uterine contraction also monitored, mode of delivery, vaginal or cesarean, was also noted.

Active management of third stage of labor was done, examination of the delivered placenta for missing lobule and abnormal shape. Examination of umbilical cord done after delivery of the placenta for the following: The presence of any loop around neck, trunk, shoulder, Knots of cord (true or false), and Any cord abnormalities (cyst, hematoma, velamentous insertion, etc.).

After the delivery of fetus, cord was clamped at two places and cut in between. From the cut end up to fetal umbilicus and placental attachment umbilical cord, length was measured and added. It was measured with flexible tape measure in cm. Number of umbilical cord vessels was also studied in present series, by taking a small piece of the cord and examined under light microscope, the following parameters were recorded after the time of delivery:

1. Weight of the newborn: newborn was weighed after cutting the cord within half an hour of delivery.
2. Fetal outcome was studied by Apgar score at 1 and 5 min.
3. Neonatal mortality

Statistical Analysis

By using the statistical package for social sciences (SPSS) version 20, IBM, US, 2011, data of all cases were entered and analyzed with appropriate statistical tests. Descriptive statistics were presented as mean, standard deviation, frequencies and proportions (%). Independent t test was used to compare means, chi square was used to compare frequencies (fishers exact tests was used alternatively). Level of significance of < 0.05 considered significant.

Results

Maternal age was 27.1 ± 6.8 years, with mean gestational age of 38.4 ± 1.9 weeks, the majority had Multiparous with 82% having vaginal deliveries, and the umbilical cord length was 69.8 ± 22.6 cm, as illustrated in table 1.

Discussion

In the current study the mean umbilical cord length was 69.8 ± 22.6 cm, the shorter cord was 25 cm in length and the longest one was 100 cm. These values reported in our study were consistent with most of the reported averages in the literatures; a mean length of 44.3 ± 9.2 and 47.04 ± 12.8 cm obtained by Gupta et al. and Abaidoo et al., respectively. A study in Nigeria was conducted by Mutihir and Pam indicated an average cord length of 52.9 ± 7.3 cm.

Although it is not fully understood what controls cord length, various authors correlate cord length with fetal activity and movement. It is suggested that sufficient space in the amniotic cavity for movement and the tensile force applied to the umbilical cord during fetal movements are two main factors that determine cord length. Cords of fetuses that have severely diminished motions are remarkably short, and twins have slightly shorter cords probably due to a reduced space for movement.
The prevalence of short cords found in the present study was 13% and the long umbilical cord was found in 30% of the cases, while other women had normal length cords. Although reference standards for cord length have been reported, variation exists in the definition of short cords, studies referred that short cord is less common\textsuperscript{10}. In studying correlation of umbilical cord length against cord abnormalities which had been reported in 17 cases (8 cases with Pseudoknot, 6 with nuchal cord, 2 with true knot and one case with cord prolapse) or as a correlate with placenta abnormalities which had been reported as Marginal placental cord insertion in 9 cases, Circumvallate placenta in 4 cases, Placental abruption in 4 cases and Succenturiate lobe in one case, both cord abnormalities or placental abnormalities didn’t show the statistically significant correlation with the cord length, i.e. no statistically significant differences in the incidence of these abnormalities when compared between the three categories of cord length (short, long and normal). In the pregnancies with long umbilical cords, the incidence of pregnancies with succenturiate lobes of placenta, multiple nuchal cords and true umbilical knots were significantly higher than those with normal umbilical cords. These findings agreed with Suzukia S and Fusea Y study\textsuperscript{11}, they could not found these abnormalities in relation with short or long umbilical cords, however, they reported the short umbilical cords seemed to contribute to the increased rate of emergency Cesarean delivery, while the long umbilical cords seemed to contribute to the increased rate of multiple nuchal cords and true knots\textsuperscript{11}.

Many studies suggested that long or short umbilical cords, are associated with a number of circumstances which can impact fetal life and have been associated with antepartum abnormalities and risk factors for complications of labor and delivery\textsuperscript{12, 13}. Our data showed that long cord associated with perinatal complications, Non-reassuring fetal heart was found in 23.1% of the cases with short cord and 23.3% of those with long cords compared to 5.3% of those with normal cords length, this indicated association between the abnormal cord length and these complications, however, the difference was statistically significant in cases with long cord and didn’t reach the statistical significance in those with short cords. Our findings are in agreement with that reported in 2004 by Krakowiak et al.\textsuperscript{13} they found out that infants with short umbilical cords were more likely to have low APGAR score, and be small for their gestational age and have more perinatal complication\textsuperscript{13}.

The present study showed that short and long cords were associated with low Apgar scores, vast majority of neonates with short cords (92.3%) and also of those with long cords (93.3%) had low Apgar score at 1 minute as compared to those with normal cords (66.7%). At 5 minute low Apgar score was still significantly more frequent in those with short cords (69.2%), and long cord (66.7%) cords as compared to those with normal cords (36.8%). Our findings were in agreement with other studies that reported short and long cords associated with increased risk for maternal labor and delivery complications and adverse fetal and infant outcomes in cases included fetal distress among term infants\textsuperscript{13}, in Suzukia S and Fusea Y study\textsuperscript{11} they concluded that the short or long umbilical cords may not be associated with the adverse perinatal outcomes in Japanese singleton pregnancies delivered at > 34 weeks’ gestation.

Our data, however, showed no significant correlation between cord length and each of maternal age, Parity, maternal complication, and mode of delivery, which consistent with the a Japanese study\textsuperscript{11} and an earlier study in Taiwan was conducted by Wu JF in 1996 they used multivariate analyses, and concluded that the umbilical cord length does not significantly correlate with either maternal age, gestational age, parity fetal outcome or intrauterine fetal well-being\textsuperscript{14}.

**Conclusion**

Abnormal cord length either short or long cord associated with low Apgar score at land 5 minute as compared to the normal length of cord and the long cord associated with non-reassuring fetal heart more than short or normal cord

**Conflict of Interest:** None

**Ethical Clearance:** Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by department of Gynecology and Obstetrics at Baghdad Teaching Hospital.

ABSTRACT

Pre-marital clinical tests are essential part of every national health system. They provide proper medical care early to prevent unnecessary stress and burden during marriage. This study was set to investigate the clinical findings as well as knowledge and attitude toward these tests among intending couples (n=244 couples, age mean 25.7 years ranged from 15 to 75 years) in Al-Yarmouk Hospital, Baghdad- Iraq, during September 2016- December 2017. The results showed that the Rh incompatibility ratio was relatively high when 17.5% (37/244) of the couples have different Rh blood groups (Rh-/Rh+). A significant number (9.43%) of Rh- females who were intending to marry from Rh+ blood-types partners was identified in the present study. The result of HIV, HBV, HCV and VDRL viral screening showed a significant number of the intending couples (13.73 % (67/488)) have serious viral infections. The awareness levels of the importance of premarital screening tests were 67% and 64.4 % in males and females respectively. In terms of knowing the complications of blood group incompatibility during/after pregnancy, a similar positive attitude was shown by males and females toward this concept (64.92% and 65.87% respectively).While the vast majority (67.82%), of the investigated individuals, from both genders, do not know what precaution should be taken if a mother’s blood is Rh negative. 70.3% of the marriages were between non-consanguineous couples.

Keywords: Clinical findings ; clinical test; attitudes; Knowledge

Introduction

In marriage, choosing of a spouse is usually a matter of no bounds. However, most of the intending couples come into this lifelong union (marriage) with insufficient knowledge regarding their intending partner’s health status. Many medical conditions, especially those affecting the offspring’s health, can be detected and dealt with before or during marriage. This could help to avoid or minimize some disappointing and frustrating lifelong commitments (health threat). It has been reported that an increasing number of children suffering of blood or genetically transmitted illness that lead to a major public health problem (¹).Thus premarital screening should be an integral part of every national health system.

Rh incompatibility (especially for Rh negative blood group mothers who are pregnant with Rh+ embryos), has been linked to several offspring’s heath problems including hemolytic disease, that cause severe anaemia and jaundice, brain damage, and heart failure. In addition, newborn fetes death can be caused by severe Rh incompatibility cases (²). Recent study have shown a significant association (P=0.002) between mothers’ blood Rh and having disabled children (³). Moreover, hyperbilirubinemia resulted from Rh blood incompatibility could cases chromic stress, a situation that leads to impair the central nervous system (CNS). This could result in dismal pregnancy outcome representing by the increase the occurrence of miscarriage and stillbirth. Cerebral palsy, paralysis of limbs, and intellectual disability in infants could be the consequence of the CNS damages caused by hyperbilirubinemia (⁴, ⁵). Accordingly, baby’s health is
significantly affected by the Rh factor and it is crucial to know such information early in pregnancy or even before that (6).

Beside blood incompatibility test, other health conditions should be considered for pre-marital testing. These include the blood screening for viral infections, such as HIV, HSB, HCV and VDRL, which are represent serious health threat for the intending couples and their expecting children (7). Other recommended pre-marital blood test such as CBC, a complete blood count, which provides an evaluation of overall health for those planning to get married. This test also assesses to detect a wide spectrum of diseases such as anemia, infection and leukaemia.

Based on the above reviewed information, continued efforts must be allocated to raise the community awareness level toward such key clinical tests that are set for the benefit of individuals who planning to get married to reduce the burden of genetic transmitted diseases and the number of children affected accordingly.

Considering the above mention health concerns, this study aimed to the assess awareness levels of marriage intending couples toward the importance of pre-marital clinical test. In addition to the investigation of factors that might affect peoples’ knowledge and attitude in this regard. Furthermore, the incidence of clinical conditions that could affect the couples and their offspring health, such as viral infection disease and Rhesus blood incompatibility, were also investigated. This would help to estimate how much effort and resources need to be allocated for the management of such serious viral infections and Rh incompatibility issues affecting intending couples.

Subjects and Method

This project was performed according to the agreement of the Research and Training Unit in the Iraqi Ministry of Health and Environment. The present project included to studies: 1) a cross sectional study conducted in the Karkh-Side of Bagdad, Iraq. In this study, the premarital clinical screening data of 244 intending couples (488 individuals), from September 2016 to December 2017, were collected and analysed in the Premarital Screen Centre in Al-Yarmuk Hospital-Baghdad, Iraq. The collected data included information regarding the screened individual’s gender, age, blood group, and the screening for serious viral infections (HBS, HCV, HIV, and VDRL). All of clinical tests were performed in the Al-Yarmuk Hospital Laboratories Department.

Beside the cross sectional study, 2) a survey was also conducted on 316 individuals (randomly selected) who were voluntary agreed to participate in the study. This part of the project was set to investigate intending couples’ knowledge, awareness and attitude regarding the pre-marital clinical screening. The survey was performed using prepared questioner for this purpose. The questioner requested details about the education level, age, gender in addition to other information in respect of knowing the important of premarital tests, partner’s blood group, and the consequence of Rh-incompatibility.

Results

Age Distribution of the Studied Group: The age mean of the studied couples group was 25.7 years (ranged from 15 to 75 years). Males’ mean was 28.12 (ranged from 16 to 75 years). While in the females age mean was 23.38 years (ranged from 15 to 64 years). It is obvious that females comes to marriage in earlier ages than males, especially in the age between 15-20 years when the number of females in this age higher than that for males by approximately four folds (97 to 28) in this age category (Figure 1). At the age range of 21-25 years, almost similar number of males and females were found in this group of indented couples (87 and 83 respectively). More than one third (34.84 % (170/488)) of the screened individual get married in this age group (21-25 years). However, only less than 5% of the individuals were above the age of 40 year among the intending couples (Figure1).

Figure 1: Age distribution of the intending couples studied group. Most of the females (Green columns) seem to get married in earlier ages (15-25 years) and 95.3% of the individuals in the intending couples get married before the age of 40 years.
Blood Groups Incompatibility: Regarding the Rhesus blood type, the result showed that 90.37% of the studied individuals have positive blood groups (Rh+). While 9.73% of them showed to have negative blood types (Rh-) (Figure 2).

![Figure 2: Rh+/Rh- blood types percentages of the studied intending couples. 9.63% of the screened individuals have Rh negative blood types](image)

Additionally, among the surveyed intending couples, the blood Rh incompatibility ratio was relatively high when 17.5% (37/244) of the couples have different Rh blood groups (Rh-/Rh+, figure 3).

![Figure 3: Blood groups compatibility frequency among the studied intending couples](image)

Interestingly a significant number (9.63%) of females with negative blood types (Rh-) were intending to marry from Rh+ blood types partners identified in this study (Figure 4). This finding is suggesting that a significant number of the survived female at the risk of Rh incompatibility. The prevalence of Rh- blood types was similar (9.84% (24/244)) between the investigated males and females in the present study.

![Figure 4: Rh blood types incompatibility among the studied intending couples](image)

Viral Infections among the Screened Intending Couples: The result of HIV, HBV, HCV and VDRL viral screening tests showed that a significant number of the intending couples (13.73% (67/488)) have serious viral infection (Table 1). 19.67% of the screened males shown to have viral infection. This means that approximately 20 persons every each 100 of the intending couple have serious viral infection.

The most frequent viral infection recorded in the screened males was HBV which follows by HCV (human immunodeficiency virus), HIV and VDRL ((9.42), (4.38), (2.05) and (0.82) respectively). A similar trend of viral infection frequency was observed in the screened females (HBV (3.69), HCV (2.87), HIV (0.82) and VDRL (0.41)). In both genders, HBV and HCV positive cases accounted for 85.07% (57/67) of the spotted viral infections among the screened intending couples.

Intending Couple’s Knowledge and Attitudes Toward the Important of Premarital Clinical Tests: Regarding the awareness levels toward the importance of premarital screening tests, the results showed that the number of males who known their blood types were slightly higher than females in the studied group (67% and 64.4 % respectively). In respect to knowing the blood group of the partner, both females and males have shown lower levels toward this investigated parameter (36.12% and 32.34% respectively, Table 2). In terms of knowing the complications of blood group incompatibility during/after pregnancy, similar of positive attitude was shown by males and females toward this concept (64.92% and 65.87% respectively, Table 2). While the vast majority (67.82%), of the investigated individuals, from both genders, do not know what precaution should be in Rh- incompatibility cases (Table 2).

Consanguineous Marriages Rate: The results also showed that 70.25% of the marriages were between non-consanguineous couples (between non blood-related individuals). While there was a relatively low percentage of consanguineous marriages recorded in this study (17.08% and 12.65% for 1st and 2nd relative degrees respectively.

Discussion

Pre-marital clinical tests are essential part of modern health systems to improve the quality of life and reduce the burden risk of genetically transmitted diseases. These clinical tests are important for the detection and prevention of genetic disorders and some infectious diseases. The present study was set to investigate the clinical findings as well as knowledge and attitudes toward these tests among intending couples in Baghdad-Iraq.

In respect the age mean of the studied marriage intending couples, our study results were comparable to those obtained by Hayawi and his colleagues, when they found that the female’s age mean was 23 years and for males was 27 years in a study conducted in three
health centres in Baghdad-Al-Russafa on 550 intending couples (8). In the present study, generally people plan to marry at early age when most of the studied couples (95.3%) plan or get married before the age of forty years and approximately one third of them get married at the age between 21-25 years.

The relatively high percentage of blood groups Rh incompatibility (9.84%) among the studied intending couples is of a great important since Rh- mothers will be at high risk of Rh incompatibility when they become pregnant with Rh+ foetus. In comparison to other local studies, our study recorded slightly higher Rh- blood groups distribution than Kurdistan, Al-Najaf and Baghdad-Al-Russafa studies (8.27%, 7.4% and 4.18 respectively) (8-10). Globally, the Rh blood groups distribution varies from region to another with very low frequency for Rh negative blood types (less than 1%) in the East Asia countries such as Philippines (11). While the highest percentage of Rh negative blood groups (up to 19%) was reported in some countries such as Briton (9).

Regarding to incidence of the screened viral infections, our study result is quite similar what reported in a recent study in Nigeria when 5.8% of marriage intending couples were positive for HIV, HBV and HCV infection (12). Consistence with Ogba’s and colleagues study, all the HIV positive individuals in our study were negative for HBV, HCV and VDRL viral screening test. The prevalence of HIV positive cases in this screen also seems relatively higher than other international study (1.43% vs. 1%) (13). In our study, the infection rate peaked at the age of 20-25 years old (26/67(38.81%)) and this might be influenced by the fact that most (34.84 %) of the intending couples within this age category. All of the spotted VDRL (syphilis) viral infections were within the age above 40 years old. The males were showed to have approximately three folds increase in the number of viral infections cases compare to the screened females (19.67% vs.3.9% respectively).

This high level of marriages between those who are not bloods-related couples in this study may reflect a new attitude in the Iraqi urban’s community; especially in Baghdad where study and work opportunities increase the chances of non-consanguineous marriages. The level of non-consanguineous marriages seemed higher than previously reported by Lafta (14) and Hamamy (15) (55.95% and 50% respectively).

Concerning the investigation of the awareness levels of the intending couples toward the importance of pre-marital clinical screening, the level of awareness in the present study is much higher than that reported by Nasim and colleagues in Pakistan, Karachi (1). However, the level of knowing the precaution should be taken if a mother’s blood is Rh negative and pregnant with Rh+ fetus was relatively low (32.18%). These results seem consistent with previously reported in local (8) and international studies (16).

**Conclusion**

Overall, the study highlighted the important of pre-marital clinical screenings as a key diagnostic and prevention measurements to improve the quality of life and avoid/minimize unexpected outcome of marriage.

The Risk Analysis of Environmental Health Due to Exposure of Benzo[a]pyrene in Fish Smoking Process (Benzo[a]pyrene Effect Study on Smoked Fish Industry Workers in Bandarharjo, Semarang)

Nisrinah¹, Haryoto Kusnoputrantó², Suyud Warno Utomo²

¹Graduate Program, Environmental Science, ²Environmental Science, School of Environmental Science, Universitas Indonesia, Jakarta, Indonesia

ABSTRACT

Smoked fish is one of popular fish processed products in Indonesia. While smoke is one of problems in smoked fish industry. Benzo[a]pyrene is resulted by incomplete combustion. IARC stipulates benzo[a]pyrene as 2A category which means cancer cause in animals and probably also in humans. Analysis of health risk in smoked fish industry workers is needed in order to minimize the health risk. The aim of this research is to predict the health risk due to exposure of benzo[a]pyrene through inhalation on smoked fish industry workers. The research design uses environmental health risk analysis. The concentration value of benzo[a]pyrene in the air on 5 spots is <0.002 ppm or <0.02 mg/m³. The non-carcinogenic intake value (CDI) is 5.322 x 10⁻⁴ – 4.103 x 10⁻³ (mg/kg/day). The non-carcinogenic risk value level is (RQ) 9.712 x 10⁻² – 6.669 x 10⁻¹. The carcinogenic health risk level is 7.070 x 10⁻⁴ – 5.451 x 10⁻³. The conclusion of this research is carcinogenic risk level (ECR) is >10⁻⁴ and non-carcinogenic health risk level is > 1, so the value of RQ and ECR is categorized as risky. The work pattern of smoked fish workers is 8-10 hours/day, for 7-46 years, exposure frequency is 317-353 days/year and the weight of the respondents is around 42-98.5 kg.

Keywords: Benzo[a]pyrene, smoked fish industry, health risk assessment

Introduction

Other than giving positive impact smoked fish industry also has negative impact⁵. Indoor air pollution does not only happen in factories and houses in the city but also happens a lot in villages that still rely on burning wood cooking⁴. One of indoor pollution causes is cooking activity⁴. The main sources of benzo[a]pyrene indoor are smoking, wood burning in the fireplace and wood stove⁴. Wood burning increases benzo[a]pyrene concentration indoor⁴. European Environmental Agency sets target the concentration is not more than 1 ng/m³. Study on health risk level on smoked fish industry workers is needed.

Methodology

This research uses quantitative approach and environmental health risk analysis method. This research has been done for 10 months since January- November 2018, which consists of preparation stage until data processing. This research took place in Smoked Fish Production Centre, in Bandarharjo, Indonesia. This smoked fish industry centre is chosen because the production process of smoked fish cause air pollution. The populations in this research are the air and smoked fish industry workers. Air population is the air around smoked fish industry centre Bandarharjo, Semarang.

The population of smoked fish industry workers is all workers in Bandarharjo smoked fish industry centre,
Semarang consists of 13 smoked fish industries with 63 workers. Air sampling uses the purposive sampling method by taking samples at 5 different points, which is the air around Bandarharjo smoked fish industry centre. Air samples were taken by Chemviro laboratory then analyzed by PT Petrolab Sevices. Sampling of smoked fish industry workers uses purposive sampling method, they are 26 smoked fish industry workers who are at least 17 years old and hold responsibility for smoking fish.

The problem solving process begins with the identification of hazards caused by the results of incomplete combustion of the smoked fish industry which potentially cause health risk. Subsequently, carry the exposure analysis and proceed with dose response analysis, and carry out risk characterization.

1. **Intake is known by using the following formula**\(^{(10)}\):

\[
\text{LADD} = \frac{C \times R 	imes f \times E \times D \times t_{avg}}{W \times t_{avg}}
\]

**Note:**
- LADD: Lifetime Average Daily Dose (carcinogen intake) mg/kg/day
- CDI: Chronic Daily Intake (non-carcinogen intake) mg/kg/day
- C: Risk agent concentration mg/m\(^3\) (air)
- R: Rate (intake rate) 20 m\(^3\)/day (air)
- t\(_E\): Daily exposure time (hour/day)
- f\(_E\): Exposure Frequency (day/year)
- D\(_t\): Exposure duration (year)
- W\(_b\): Weight (kg)
- t\(_{avg}\): Average time period, 30 years x 365 days/year (non-carcinogenic), 70 years x 365 days/year (carcinogen)

2. **Risk Characterization:** Risk characterization in risky populations is stated quantitatively by combining dose response analysis and exposure analysis. Its numerical value is used for health risk management. Risk is divided into two, non-carcinogenic risks (risk quotient) and carcinogenic risk (excess cancer risk). To find out the value of non carcinogenic risk, the equation used is\(^{(10)}\):

\[
\text{RQ} = \frac{\text{CDI}}{\text{RfC}}
\]

**Note:**
- RQ = Risk Quotient (non-carcinogenic health risk level)
- CDI = Non-carcinogenic intake mg/kg/day
- RfC = Reference concentration mg/kg/day

Health risk is confirmed exist and need to be controlled if RQ > 1. If RQ ≤ 1, risk does not need to be controlled but needs to be maintained so RQ numeric number does not exceed 1\(^{(10)}\).

In order to find out carcinogenic risk value, equation used is\(^{(10)}\):

\[
\text{ECR} = \text{CSF} \times \text{LADD}
\]

**Note:**
- ECR = Excess cancer risk (carcinogenic health risk level)
- LADD = Carcinogenic intake mg/kg/day
- CSF = Cancer Slope Factor (mg/kg/day)\(^{-1}\)

**Results**

**Benzo[a]pyrene Concentration:** Benzo[a]pyrene is resulted from incomplete combustion. In this research found that benzo[a]pyrene concentration in the air is < 0.002 ppm. Subsequently, data of benzo[a]pyrene that could be converted to mg/m\(^3\) is:

\[
\text{mg/m}^3 = \text{concentration (ppm)} \times \frac{\text{molecular weight of gas (L)}}{\text{ideal molar standard (L)}}
\]

\[
\text{mg/m}^3 = \frac{0.002 \times 252.316}{24.465} = 0.02
\]

With the ideal molar volume standard of gas at pressure of 1 atm is 24.465 (dm)\(^3\)/mol at 25°C temperature

The concentration of benzo[a]pyrene obtained in the air in the fish smoking chamber <0.02 mg/m$^3$. The results from this laboratory cannot detect the concentration of benzo[a]pyrene <0.02 mg/m$^3$. The smoked fish workers in charge of fish smoking in 13 centres are 26 people consists of 5 men and 21 women. The age of smoked fish workers is around 30-71 years. With the most age range of 51-60 years 15 people and 40-50 years old 7 people. The data of the age of smoked fish workers is attached as follows in Table 2.

**Table 2: The Age of Smoked Fish Workers**

</tbody>
</table>

**Health Risk Characterization:** Risk quotient (RQ) is calculated to find the level of non-carcinogenic effect. If the non-carcinogenic risk level obtained is RQ≤1, the risk level is declared safe, but if the value of RQ >1 then the risk level value is declared unsafe or can cause non-carcinogenic health risk. The RQ value data is attached as follows in Table 6.

</tr>
<tr>
<td>Maximum</td>
</tr>
</tbody>
</table>

Excess cancer risk is also called the level of carcinogenic health risk is the calculation of the value intake multiplied by the cancer slope factor. Carcinogenic risk level is calculated to find the level of carcinogenic health risk. The ECR value with a range of $10^{-6}$<ECR<$10^{-4}$ is declared safe or acceptable. If the value of ECR>10^{-4} then it means that the level of carcinogenic health risk is categorized as unsafe or unacceptable and can cause carcinogenic health risk. Furthermore, the ECR value data is attached in Table 7.

**Table 7: ECR Value of Smoked Fish Workers**

<table>
<thead>
<tr>
<th>ECR note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum</td>
</tr>
<tr>
<td>Maximum</td>
</tr>
</tbody>
</table>

Based on Table 7, minimum ECR value is $7.070 \times 10^{-4}$ and maximum ECR value is $5.451 \times 10^{-3}$. Based on calculation result, it is found that all respondents have value of ECR > $10^{-4}$. 
Discussion

Based on Table 1, the concentration of benzo[a]pyrene in the air around fish smoking industry obtained is <0.02 mg/m³. Results from this laboratory cannot detect the concentration of benzo[a]pyrene <0.02 mg/m³. The researchers assume the value of benzo[a]pyrene in the air is 0.02 mg/m³. The concentration of benzo[a]pyrene in the air compared to European Environmental Agency (EEA) standard could be categorized as unsafe(11). The activity of fish smoking industry is a source of air pollution originating from immovable sources(12). Source of benzo[a]pyrene in fish smoking industry comes from the smoking process(3),(4),(5),(6).

The age of smoked fish industry workers is 30-71 years old. With the most age range of 51-60 years, there are 15 people and 40-50 years old, 7 people. This is because the smoked fish industry is a business that runs from generation to generation, so usually workers still have kinship with industrial owners or continue family business. The highest age distribution of smoked fish workers is at the age of > 51 years. Industrial owners must be more vigilant, because in that age range, workers are no longer young and can reduce the alertness of workers(13).

Based on data on working time of workers in a day, which is 8-10 hours. If it is assumed that the number of days worked 6 days per week, the number of hours worked in a week of 48-60 hours per week. Exposure frequency is 317-353 days/year, this is because there is no definite working day, working days depend on the production process. The production process depends on the catch of the fish, if the fish caught is limited then the price of fish is expensive and many industries do not carry out the production process. Working hours in the smoked fish industry are not following the recommendations of regulation of the Ministry of Health of Republic of Indonesia(14). Additionally, working hours that exceed standards can increase the likelihood of work accidents(15).

Based on data on working time of workers in a day, which is 8-10 hours. If it is assumed that the number of days worked 6 days per week, the number of hours worked in a week of 48-60 hours per week. Exposure frequency is 317-353 days/year, this is because there is no definite working day, working days depend on the production process. The production process depends on the catch of the fish, if the fish caught is limited then the price of fish is expensive and many industries do not carry out the production process. Working hours in the smoked fish industry are not following the recommendations of regulation of the Ministry of Health of Republic of Indonesia(14). Additionally, working hours that exceed standards can increase the likelihood of work accidents(15).

Based on Table 5 could be known the intake value of benzo[a]pyrene per day. The value of intake obtained will affect the level of health risk(10). This value is also different from research conducted in high school(10). This is because in this study, smoked fish workers have 7 to 46 years of exposure duration different from the previous study that had a maximum exposure duration of 6 years.

The calculation result of the RQ value in Table 6, it is known that all respondents have value of RQ > 1, means that the exposure value has non-carcinogenic health risk. Based on the calculation result in Table 7, it is known that all respondents have value of ECR > 10⁻⁴, which means they can pose carcinogenic risk(10). This is because in the ECR and RQ calculations, uses the intake value which is influenced by daily exposure time, exposure frequency and exposure duration. In contrast to previous study conducted in middle school, daily exposure time, exposure frequency and exposure duration were not as long as those of workers who have worked for years.

Conclusion

The conclusion of this study is the value level of carcinogenic risk is (ECR)>10⁻⁴ and value level of non-carcinogenic health risk> 1, so that the values of RQ and ECR are categorized as risky so health risk management needs to be done.

Conflict of Interest: This research is part of final task of University of Indonesia students, thus, there is no competition in conducting this research.

Ethical Clearance: The study was approved by the Institutional Review Board (IRB) of Faculty of Public Health, Universitas Indonesia.

Source of Funding: This research is self funding students

ABSTRACT

Background: Periodontal disease is one of dental and oral health problems with high prevalence affecting all age groups. Gingivitis is one of periodontal disease that caused by bad habits, such as paan. Toraja is one of the tribes in South Sulawesi that is famous for the habit of paan.

Objective: To identify the influence of duration and frequency of paan with the occurrence of gingivitis in North Toraja district.

Method: This is an observational analytic with cross-sectional study design. The sample was taken by accidental sampling method. Examination was performed using periodontal probe with calculation of gingival index score (GI) as well as filling questionnaire and analyzed by chi-square analysis.

Result: The shorter duration of paan from less than 5 years all of the samples had gingival status with mild gingivitis. 5-10 years of paan all samples had moderate gingivitis, and length of paan for more than 10 years had 36.4% of samples with moderate gingivitis and 63.6% of the sample with severe gingivitis. In addition, the frequency of paan in the 3-day sample group experienced mild gingivitis. In the 3-to-5-week group experienced more moderate gingivitis, whereas in the cohort group more than 5 times daily experienced more severe gingivitis. The result of chi-square statistic test, seen p value: 0.000 (p <0.05), there is a significant correlation between the duration and frequency of paan with occurrence of gingivitis.

Conclusion: There is a significant influence between the duration and frequency of paan on the occurrence of gingivitis.

Keywords: gingivitis, duration of paan, frequency of paan, North Toraja district

Introduction

Periodontal disease is one of the most common dental and oral health problems that affects all age groups.¹ Nandya et al said the prevalence of periodontal disease in all age groups in Indonesia is 96.58 %.¹ The results of the Health Department of Indonesia (1999) that 73.5% of Indonesian population experience periodontal disease.²

Gingivitis is gingival inflammation that only covers the gingival tissue around the tooth.³ The main cause of gingivitis is due to the interaction between microorganisms in plaque and inflammatory cells of the tissue.²

Bad habits related to disorders of the gingiva is habit of paan.⁵ Paan is a hereditary activity associated cultural and social ceremonies and activities.⁶ This custom has been started since 2000 years ago in South Asia, Southeast Asia and the South Pacific.⁶ Betelnut is the fourth largest psychoactive ingredient after caffeine, nicotine and alcohol. Betelnut is also commonly used in paan habit.⁶

Based on dentistry side, the habit of chewing betelnut can cause periodontal disease.⁷ Periodontal disease is caused by calculus or tartar that caused by stagnation of pin salivary saliva due to the presence of lime.⁵ Combined
lime with betelnut leads to the emergence of a primary response to the formation of reactive oxygen compounds and may result oxidative damage to DNA in the buccal mucosal aspect. The process of chewing betelnut ends with a stream of rubbing a tobacco clump on the teeth to flatten the results of chewing betelnut. This habit is believed to be a substitute for brushing teeth.

Today’s habit is an issue that needs to get more attention, especially among people living in remote areas. Lack of self-awareness and poverty are factors that led to this growing habit among the community. Paan is the process of chewing the mixture of the selected element and wrapped in a betel leaf so as to produce a quid sulfur. Generally, the ingredients used to mimic consist of betelnut, betel leaf and lime. Estimated that more than 600 million people chew betelnut in various regions of the world.

In the Southeast Asia, tradition of chewing betelnut has begun 3000 years ago. The tradition of chewing betelnut cannot be ascertained where it came from. In Toraja, women on paan or ma’pangan (in the local language) is not something unusual.

Based on the habit of chewing betelnut in Toraja, we interested to observe the effect of duration and frequency of paan on the severity of gingivitis in the community in North Toraja district.

METHOD

This is an analytic observational with cross sectional study, conducted in September-October 2015 in Randan Batu Village, Sanggalangi Subdistrict, North Toraja District. The sample of this research is a total of 30 women aged 25-26 years in North Toraja District women aged 25-65 with a habit of paan at least 6 months, no systemic history and not in pregnant taken by accidental sampling with exclusion criteria if not willing to be examined and researched, smoking, using an orthodontic, in menstrual phase and ill.

This began with explanation of research procedure to sample then signing informed consent. The researcher asked how long the sample has performed the habit of paan and how many times the subjects doing paan in a day and a week and written on the questionnaire provided. For the severity of gingivitis the sample was calculated using the gingival index. The researchers looked at the gingival state of the sample, and examined it using a probe then recorded the score in the prepared format then calculate it using Gingival Index. The data analyzed using SPSS.

Table 1 shows the distribution of sample characteristics. There are seven people aged 50-54 and 60-64 years. Meanwhile, in terms of the duration of paan, there are 73.3% paan for more than 10 years. Based on frequency of paan, there are 43.3% sample with more than five times a day and there are 83.3% with sums up a week to seven times. Gingival status with gingival index measurements showed that most samples with severe gingivitis (46.7%).

Table 2 shows the mean of age distribution and gingival index (GI) based on the duration of paan, paan frequency, and chewing time. The results showed that samples having paan for less than 5 years had the lowest average age among the other groups, followed by the lowest GI scores among others. Frequency category per day, samples who had paan more than five times a day reached 58 years. As for, the lowest GI score is frequency less than 3 times and the highest on the frequency more than five times. GI score increases with increasing frequency per week.

Table 3 shows the distribution of gingival status by age, paan frequency week, and chewing time. The highest number of samples have mild gingivitis status in the 45-49 years (40%). The age category 60-64 years (57.1%) and 65-69 years (66.7%) had the highest number of severe gingivitis compared to other categories. Based on frequency of weekly, total 52% sample with paan seven times a week had severe gingivitis.

Table 4 shows the correlation of paan and frequency of paan per day with gingival status. Sample with less than 5 years of age had gingival status with mild gingivitis and no samples with severe gingivitis. A 5-10 year old samples had moderate gingivitis, whereas in the older sample over 10 years had 36.4% of the sample with moderate gingivitis and 63.6% with severe gingivitis. Based on the result of chi-square statistic test, the p value is 0.000 (p <0.05), there is a significant correlation between length of paan and occurrence of gingivitis.

This study showed that 80% of sample were on paan three times a day had a mild gingival inflammation. Category of group paan 3-5 times a day with moderate gingivitis is 83.3%. Meanwhile, the group of samples with paan category more than five times a day, had the highest sample having severe gingivitis (92.3%). The statistical test, Chi-square, shows p value: 0.000 (p <0.05), which means that there is a significant correlation between daily frequency of paan and gingival status.

Discussion

In a study conducted by Marcelina et al in Rembon Sub-district of Tana Toraja, only the age group of 50 years and older still doing more paan habits. Similarly, research conducted in September 2015-October 2015 in North Toraja.

The distribution of the sample shows that only women aged 45-65 years who still do paan activities. This result is different with research conducted by K.V. Siagian that found most Papuan tribe of betelnut in Manado was dominated by 21-25 years. According to Sayuti Hasibuan; on the characteristic of paan activity in Karo regency of North Sumatera, the frequency of paan more than 10 years is the most with the percentage of 37.76%, also at the most frequent paan frequency per day at 5-10 times with percentage of 48.98% and more than 10 times a day with a percentage of 37.76%. This is similar with our study that shows most of subjects perform paan habits more than 10 years (73.3%). Also, the frequency of chewing betelnut more than 5 times a day is 43.3%.

Krista Veronika Siagian on her study in Manado showed that the calculus score of 1.34 was higher, almost 1.5 times the average debris score of 0.98. This is similar with other studies that show an increase in occurrence of calculus in sprinklers.

The results showed that the longer one takes time for paan time the higher the value of GI. Thus, the frequency of paan per day is the severity of gingivitis increases with the more frequent subjects paan.

The distribution of gingival status in Table 3 showed that the highest number of samples had mild gingivitis status in the 45-49 years (40%). As for the condition of severe gingivitis, it was seen that the age category 60-64 years and 65-69 years had the highest number of samples compared to other categories. This is because subjects aged 60-65 years have long performed paan habits compared to other age groups as shown in Table 2 that subjects with more than 10 years of age had the highest average age among the other groups followed high GI scores or increasing degree of gingivitis.

In the present study, distribution of gingival status based on weekly frequency, a total 52% who had paan 7 times a week have gingivitis with severe degrees. This may be due to the more frequent subjects contact between the excipients and the ingredients of the toothpaste (quid) such as lime can causes the accumulation of calculus. Also the effects of arekolin are able to block cell attachment, cell spread and migration cells and decreases cell growth and collagen synthesis.

This is in line with the study of Sayuti Hasibuan et al in Tanah Karo residents of North Sumatra showed that there is a significant correlation with the presence of oral mucosal lesions such as the length and more often a person performs paan habits, the higher the risk for exposure to lesions oral mucosa.

In this study all subjects have the same composition of betelnut sugi, which consists of a mixture of betel leaf, betelnut, and lime. Based on the previous study, all samples with paan less than 5 years have gingival status with mild gingivitis condition and no sample with severe
gingivitis condition. There is a significant correlation between the length of paan and the occurrence of gingivitis.

This study showed that a total 80% of sample paan three times a day had a mild gingivitis. Meanwhile, the group of samples with paan category more than five times a day, had the highest sample having severe gingivitis (92.3%).

There is a correlation between daily frequency of paan and significant gingival status. In line with studies by Binns C. et al and Girish Parmar et al. that there is a link between paan habits and the occurrence of periodontal disease is gingivitis. This study proves that there is a statistically significant correlation between the occurrences of gingivitis with paan habits. These results indicate that the longer a person performs paan habits, the more often a person performs paan habits the higher the risk of someone to experience gingivitis.18,19

**Conclusion**

There is a significant influence between the duration of paan habits on the occurrence of gingivitis and the frequency of paan habits per day and per week on the occurrence of gingivitis.

Identification of Early Childhood Caries (ECC) in Children’s Preschool Based on Demographic Risk Factor and pH Saliva

Harun Achmad¹, Rini Pratiwi², Sumintarti³, Sri Ramadhany⁴, Susilowati Mudjari⁵, Muftihatur Rahma⁶

¹Lecturer, Pediatric Dentistry Department, ²Lecturer, Dental Public Health Department, ³Lecturer, Oral Medicine Department, ⁴Lecturer, Community Medicine Department, ⁵Lecturer, Orthodontic Department, ⁶Clinical Student, Faculty of Dentistry, Hasanuddin University, Makassar, South Sulawesi, Indonesia.

ABSTRACT

Background: Early childhood caries (ECC) is the most common caries in children and is often found in children under five years of age (toddlers), with the highest spread in children aged three years. The etiology of ECC is the host (teeth and saliva), microorganisms, substrates, and time, these four factors interact and influence each other thus caries are formed on the teeth. In addition to the factors that exist in the oral cavity that are directly related to caries, there are predisposing factors including age, gender, education level, economic level, environment, attitudes and behaviors related to dental health.

Objective: To know the ECC description of preschool children in East Luwu Regency based on demographic risk factor which includes education, employment, and parents’ income and the childrens’ saliva pH.

Method: This type of research was observational descriptive and used a cross sectional study design. The research subjects were 410 Preschool students and parents/guardians in East Luwu Regency. Variable assessment was done using a questionnaire and intra-oral examination. Data in this study are presented in tables, graphs and narratives.

Results: Overall, there were more children with ECC (68.54%), while those without ECC (31.46%). Most ECC was found based on demographic risk factor parental income <2 million (52.31%) and the pH of saliva was very acidic (56.23%)

Conclusion: Most preschool children in East Luwu Regency suffer from ECC, with the most risk factors being very acidic pH. High acidity causes a large number of caries.

Keywords: education, employment, income, ECC, preschool children

Introduction

Caries is one of the most common dental and oral diseases in all age groups. According to Keyes, quoted in Kidd and Bechal, argued the theory of the three main factors causing caries, namely teeth and saliva, microorganisms and substrates or food, then in the formation of caries the three main factors must exist and interact with each other. According to Newburn, quoted in Kidd and Bechal, the three factors were added to the time factor thus it became four factors that caused caries.1,2 In addition to the factors that exist in the oral cavity that are directly related to caries, there are predisposing factors including age, gender, education level, economic level, environment, attitudes and behaviors related to dental health. ECC is one of the most common caries conditions that occurs in children.1,3,4

ECC according to the American Academy of Pediatric Dentistry 2008 (AAPD) is decay on one or more surfaces that has cavities or not, tooth loss due to caries, or the presence of permanent dental fillings at the age of six. Some children are often affected by caries in a number of teeth, especially in children aged 3-4 years. This caries is called rampant caries. However, there was no clear difference between “carious rampage” and “nursing caries” so that both terms were considered the same.1,4 At the age of 3-6 years, there are one or more carious teeth, tooth loss due to caries, there are patches in the primary teeth, or decayed, missing, filled scores ie ≥4 (age 3 years), ≥5 (4 years old), ≥ 6 (age 5 years) is a severe early childhood caries (S-ECC).6,7
Parental lack of attention and awareness of the importance of maintaining and instilling dental and oral health from an early age can result in caries problems that can affect the health and quality of life of children. ECC occurs very quickly and affects several teeth and often causes pain, eating difficulties and speech disorders.8,9

Several studies have been conducted that show that children living in environments with poor socioeconomic status have an increased prevalence of ECC. Other studies suggest that there is a significant relationship between socioeconomic status and caries number.10 Based on several studies that salivary pH can be considered to have a strong relationship with the incidence of caries in children. Caries is a process of demineralization-remineralization, meaning that if the oral environment becomes acidic then the hydroxapatite demineralization process will dissolve, but with the increase of pH a remineralization process will occur.11

The choice of location in East Luwu Regency was based on consideration of 2016 data, in East Luwu Regency there were 2 hospital units namely the Regional Government General Hospital located in Wotu Regency and a private Hospital located in Nuha Regency. At the Regency level there are 15 Puskesmas, 266 Posyandu, and 25 dispensaries. In addition to addressing the health problems of East Luwu residents there were 14 specialists, 46 general practitioners, 23 dentists,14 pharmacists, 215 midwives, 317 nurses and 271 traditional birth attendants, while expert doctors were only in Wotu Regency which was four people. 11 East Luwu Regency is a district that is still under construction. This study was intended to know the description of ECC in preschool children in East Luwu Regency.

**Research Method**

This study is included the type of analytic observation research with a cross sectional approach. This research was carried out on July 23-25 2018 in East Luwu Regency. The population studied were all preschool students in East Luwu Regency and parents who were present at the time of the study. The sample in this study is part of the population, determining the subject by purposive sampling method.

There are two main variables in this study, namely the independent variables of demographic factors which include education, employment, income and salivary pH, while the dependent variable is early childhood caries. The tools and materials used in this study were diagnostic tools (sendo, mouth glass, tweezers), litmus paper, nierbeken, handscoon, masks, informed consent sheets, ECC or Non ECC assessment sheets, questionnaires, stationery.

Assessment of education, work, opinions by using quizione. ECC assessment was done through intraoral examination in children whose results were recorded on the status card. It was stated as ECC if there were whitespot lesions and carious lesions on one or more surfaces of damaged, lost or patched primary teeth, while Non ECC when no carious teeth were found from the results of intraoral examination in children who were the study sample. Measuring the degree of acidity (pH) using litmus paper was inserted in the oral cavity and placed on the tongue of the subject, given a time lag until there was a change in the viscus and then lifted and match the pH indicator to know the pH of saliva. The normal salivary acidity (pH) was 7, the acidic condition was 6.5, while the very acid was 5.5-4.5.

**Research Results**

**Tabel 1: Distribution of Subjects Based on Variable Demographic Risk Factors (education, employment, parental income) and Children Saliva pH**

The table above shows the research subjects based on the level of education of the father and mother that mostly are high school level as many as 205 and 153. Based on the occupation of the father mostly are workers or employees (148 people), while based on work the majority does not have jobs (170 people). Based on the income level, most parents earn ≥ 2 million (209 people). Based on the salivary pH of the children most children have a very acidic salivary pH (208 children).

</table>

Based on the table above shows that overall there are more children who suffer from ECC (68.54%) than those without ECC (31.46%), most of them are children with an education level of high school fathers (48.75%), and children with mother’s education level of high school (38.44%). The distribution of ECC patients based on father’s work, the most is children with the work of a father as a worker/employee (33.10%), while based on the work of the mother, the most are children with mothers who do not work (44.48%). Distribution of ECC patients is based on parents’ income, the most are children with income levels of less than two million (52.31%), and based on the salivary pH of children, the most are children with very acidic salivary pH (56.23%).

Distribution Diagram of ECC Based on Demographic Risk Factors (education, employment, and income) and Children Saliva pH

Distribution chart of ECC patients in the diagram shows that ECC is most prevalent in subjects based on risk factors for salivary pH (56.23%).
Discussion

Based on the level of education of the father and mother, the most ECC distribution is in children with the education level of high school parents. These results, in accordance with a study of kindergarten students in the city of Padang showed that parents who were not scholars, their children experienced a lot of ECC. A similar study was conducted on elementary school students in Yogyakarta, Sleman Regency stating that the final education of parents affected the number of child caries. The same results were also found in several studies stating that the higher the level of one's formal education, the better the knowledge of attitudes and healthy behaviors. But based on research carried out on preschool children at Gunung Anyar Surabaya stated that parental education does not affect the ECC and research conducted in Brazil states that the higher the dmft index of children with a high education level of parents. This depends on the care and maintenance of the child’s teeth.

Based on the type of work of the father, the most ECC distribution is in children with the work of the father as a worker/employee. This result, in accordance with the research conducted on elementary school students in Yogyakarta, Sleman Regency showed that the number of child caries was found in children with the work of parents as laborers/employees. The results of a similar study conducted on elementary school students in Manado showed that the highest number of caries was in children whose parents worked as laborers.

Based on the type of work of the mother, the most ECC distribution is in children with mothers who did not work. These results, in accordance with research conducted at kindergarten students in Padang City, showed that the number of child caries was found in children with mothers who did not work. Similar studies conducted in preschool children at Gunung Anyar Surabaya stated that the largest percentage of ECC was in mother as a housewife. The study conducted in Vojvodina, Republic of Serbia stated that ECC was more in children with parents who did not work.

Other studies suggest that caries status and dental hygiene are better for children with middle-to-older jobs, this is because older people with middle-to-upper jobs consider it important to maintain dental health and expect their teeth to function properly as long as possible in their child's oral cavity.

Indirectly, the work of parents has a relationship with the incidence of dental caries. Factors such as busy at work make parents have limited time in monitoring the growth and development of children’s health. Work is also an effort to earn income in fulfilling the necessities of life and getting a good place of health care, thus the better the type of work someone gets, the more fulfilled their life needs and family health.

Based on the level of income of parents, the most ECC distribution is in children with income levels of parents of less than two million. These results, according to a study conducted in Banjarmasin, showed that the number of child caries was high in children whose parents were low-income. But based on the research conducted in Enugu, Nigeria ECC is found mostly in children with high socio-economic. Other research conducted on children aged 0-3 years in the city of Bandung shows that parents with low-middle income, have a low risk of dental caries. Income will affect a person’s lifestyle, children from families with middle to upper income are more tend to consume foods that are cariogenic, because children from this family are better able to buy food that is much cariogenic. According to AAPD, family economic status is not a major factor, but can be a predisposing factor for child caries.

Based on the salivary pH level of the child, the most ECC distribution is in children with very acidic salivary pH. This result, in accordance with research conducted on elementary school children in Medan, showed the highest number of children who experienced caries in children with acidic salivary pH. Another study conducted in Neglasari Sub-district, Tangerang City stated that there was a significant correlation between the pH of children’s dental plaque and ECC. But in a study conducted in India stated that there was no difference between the salivary pH of children who did not experience ECC and those with ECC.

The degree of acidity (pH) of saliva is an important part in increasing tooth strength because it can increase the occurrence of remineralization. A decrease in salivary pH can cause tooth demineralization and the presence of remineralization will reduce the possibility of caries. Remineralization is a process on the surface of the tooth that will obtain minerals again.
Conclusion

Based on the research that has been done, it can be concluded that the majority of preschoolers in East Luwu Regency suffer from ECC, most with risk factors for the pH of very acidic saliva. High acidity causes a large number of caries.

Conflict of Interest: There is no conflict of interest in this study.

ABSTRACT

Aim: This study was aimed to compare the amount of the fibroblast on the gingival healing process using platelet-rich plasma (PRP) and chlorhexidine (CHX).

Materials and Method: Fifteen homogen mice were included in this study. Five mice in PRP group, five in CHX group and four in control group. One mice was sacrificed for PRP preparation. 10 mm incision was made in mandibular gingiva and applied with PRP and CHX according to their group. The fibroblast of the healing process were analyzed with electron microscopic at the 1st, 3rd, and 5th day.

Result: In histopathologic analysis, the healing process was greater in the experimental group than in control group on 1st and 3rd day, with the increasing amount of the fibroblast. The fibroblast enhanced significantly with P>0.009, but on the 5th day the healing process was average at the experimental and control group.

Conclusion: The addition of PRP significantly increased gingiva healing process. PRP were important because of the growth factor and may be useful in the future to increase the healing process.

Clinical Significance: The goal of the periodontal treatment are enhance periodontal health and obtain gingival aesthetic. All these goals are depend on the success of the healing process which can be obtained from the periodontal surgery. Nowadays, clinician use Platelet-Rich Plasma (PRP) to enhance the healing process.

Keywords: Periodontal healing, PRP, Wound Healing

Introduction

The goal of periodontal treatment is to improve periodontal health and likewise the patient’s need for aesthetic importance and functional requirements. To achieve this goal, periodontal treatment should be able to handle or increase attachment levels, reducing probing depths because these parameters are used as an illustration of increased dental retention.¹²

For more than three decades, the main goal of periodontal treatment has shifted from improving to rebuilding periodontal tissue by repairing the damage caused by the disease process.²³

Various animal studies have been conducted to examine the regeneration of periodontal tissues including insulin-like growth factor, fibroblast growth factors, epidermal growth factor, platelet-derived growth factors, vascular endothelial growth factors, parathyroid hormone, transforming growth factor-β and bone morphogenic proteins.⁴⁵

The main function of platelet is to prevent acute blood loss and repair the vascular wall and maintain tissue after injury. During the healing process, platelets are activated through contact with collagen, exposed to the bloodstream after endothelial injury. Platelet products include Platelet Rich Plasma (PRP) which can be used with or without previous platelet activation. PRP applications in different tissues have yielded promising results in different pathologies such as acute and chronic injuries to bone and cartilage.⁶⁷
The aim of this study was to evaluate the healing process of gingiva and fibroblast formation on the wound that has been applied with platelet rich plasma.

Method

This study was a laboratory experiment conducted at the Laboratory of Department of Biology, Faculty of Mathematics and Natural Sciences, Makassar State University; Veterinary Center Maros; and Pathology Anatomy Laboratory, Faculty of Medicine, Hasanuddin University. Study sample were mice that selected based on the inclusion criteria and exclusion criteria in this study. Inclusion criteria were male healthy mice weighing 300-400 grams, and age between 4-8 months. Exclusion criteria were no weight loss more than 10% after the adaptation period in the laboratory.

Prior to the experiment, mice were kept and adapted in animal experimental enclosures made of plastic basins and wires as a cover. Adaptation and pretreatment performed for one month to be checked for health to ensure their good health. Given a special feed for and water, that was also kept on room temperature in the scientific range.

One mice was sacrificed to have blood taken on the heart, and the blood was taken using 3 ml syringe and put in the tube. The tube was centrifuged for 10 minutes at first and another 8 second at 2000 rpm to obtain the poor plasma platelet in the first layer, rich fibrin platelets in the second layer and red blood cloth on the third layer. When RBC was separated, PPP and PRF were centrifuged again for 8 minutes at 1000 rpm. From the second centrifuge, we obtained platelet rich plasma without coagulant that will be applied to the wound. 14 mice were divided into 3 groups, group I (five mice) will be applied with platelet rich plasma (PRP), Group II (5 mice) will be applied with Chlorhexidine gel, and group III (4 mice) were not applied anything. Operative area were disinfected with povidone iodine, then local anesthetic solution were deposited and incision were made using a scalpel on vestibulum region. Histopathologic examination to calculate the number of fibroblasts were done on the 1st, 3rd, and 5th day after treatment. The tissue were taken and fixed on 10% formaline solution and given HE staining to checked under microscope with 40x viewing field.

Table 1 showed the average mean number of fibroblast on the three groups. The highest rate of fibroblasts was on the third day of PRP application. Diagram 1 showed the average value of the number of fibroblasts by group and by day. In the control group, the average number of fibroblasts on the first day was 25, 23 on the third day, and 21 on the fifth day. In the group given Chlorhexidine, the average number of fibroblasts on the first day was 25, then decreased to 22 on third day and decreased again to 18 on the fifth day. In the group given the PRP, on the first day the average number of fibroblasts was 29, then increased to 34 on the third day and decreased to 15 on the fifth day.
In the treatment group, p-value was 0.43818 that mean there was no significant difference in the amount of fibroblasts between the control group, the chlorhexidine group, and PRP group.

In the day-interaction and treatment group, p-value was 0.12480, this value was not significant at 95% significance level (p-value = 0.12480; p-value> 0.05). Thus, there is no interaction effect between day and treatment on the amount of fibroblast. For this interaction group further analysis is done to ascertain whether or not there is a significant interaction.

Discussion

From the results of fibroblast examination in all groups, the highest amount of fibroblast was found in platelet rich plasma group on the third day, which was 34. Platelets are activated for aggregation by open collagen (intrinsic system). At the same time, the injured vein vasoconstricted, triggered by platelets, to reduce blood loss and fill tissue gaps with blood clots consisting of cytokines and growth factors. Furthermore, blood clots contain fibrin molecules, fibronectin, vitronectin and thrombospondine, forming a temporary matrix as a scaffold structure for migration of leukocytes, keratinocytes, fibroblasts and endothelial cells and also acts as a reservoir growth factor. Vasoconstriction occurs by coagulant formation leading to local perfusion failure with successive oxygen depletion, increased glycolysis and pH change. Vasoconstriction is then followed by vasodilation in which traumatized tissue undergoes a reperfusion phenomenon. Both platelets and leukocytes release cytokines, chemokines and growth factors to activate inflammatory processes, stimulate collagen synthesis, activate fibroblast transformation into myofibroblasts, initiate angiogenesis and support the process of re-epithelialization.8,9

Neutrophil formation is very important on the first days after injury because of its ability in protease secretion and phagocytosis kill local bacteria and help reduce necrotic tissue. Neutrophil initiates debridement by releasing highly active antimicrobial agents ie cationic and eicosanoid peptides, and proteinases, namely elastase, cathepsin G, proteinase 3 and urokinase-type plasminogen activator. Approximately 3 days after the injury, macrophages enter the injury zone and support the ongoing process by performing pathogenic phagocytosis and the remnants of cell formation and secreting growth factors, chemokines and cytokines. Macrophages have many functions including defense response, promotion and inflammatory resolution, apoptotic cell transfer and cell proliferation support and tissue recovery after injury.8

Compared with the other treatment groups, PRP group had the highest mean number of fibroblasts although only occurred on the third day after treatment. Platelet rich plasma achieves homeostasis through the formation of fibrin clots initiated by platelet activation and aggregation. The platelet aggregation is produced by fibrin polymerization of fibrinogen monomers in the presence of calcium and thrombin. The results of platelet aggregation in platelet platelets are held in place by blood clots and inhibit blood flow. In addition to maintaining homeostasis, the fibrin clot then produces a matrix for the migration of tissue-forming cells, including existing fibroblasts responsible for the synthesis of collagen and endothelial cells involved in angiogenesis. The traction force generated by these migratory cells in fibrin clots can assist wound contraction. This migration of cells together is also responsible for overhauling blood clots into tissue repairment.10,11,12

Differences in PRP Group and Chlorhexidine Group: On histopathological examination between groups treated with PRP and chlorhexidine, there was a difference in the number of fibroblasts on the first day, this is because on the first day the most widely formed are inflammatory cells resulting from the inflammatory response. When the inflammatory blood vessels becomes leaky, it releases plasma and neutrophils into the surrounding tissues. As neutrophils digest bacteria and debris, it will die and release intracellular enzymes in the surrounding matrix. Furthermore, fibrin is broken down as part of the phagocytic process, degradation products attract the subsequent involved cells such as fibroblasts and epithelial cells.13,14,15

On the third day, there was a significant difference on the amount of fibroblast between groups that was given PRP and chlorhexidine. This is because PRP has growth factors that is important in wound healing processes, such as platelet-derived growth factor (PDGF), transforming growth factor β1, β2, β3 (TGF-β1, β2, β3), platelet
derived angiogenesis factor, insulin-like growth factor 1 (IGF-1), platelet factor 4 (PF-4), epidermal growth factor, epithelial cell growth factor (VGA), vascular endothelial cell growth factor (VEGF), basic fibroblast growth factor (bFGF) and other cytokines.\textsuperscript{16,17,18}

The second group which is also important from growth stimulation molecules is growth-derived platelets (PDGFs). These molecules are contained in platelet granules, and the release of PDGF at the injury sites during formation of clots are essential for the repair process. PDGF is closely related to the oncogene (v-sis) virus. Thus, molecules such as growth factor are involved in controlling the growth of transformed cells. Like EGF, the response to this stimulus is determined by the presence of certain PDGF receptors. PDGF is produced in two isoform molecules.\textsuperscript{16,17}

Fibroblast growth factor refers to a group of proteins that interact with one or more receptors in different cell types. FGF-1 and -2 (FGF acid and base) are important because of their ability to stimulate cell growth and capillary cell invasion in various models. Most forms of FGF have growth factor, causing many cell populations, but endothelial cells seem to have greater sensitivity.\textsuperscript{18}

Growth factors 1 and 2 that specifically stimulate proliferation and differentiation. The process of healing epithelial cell wound due to the unique receptor on these cells. Both growth factors have a classic paracrine action because they are produced in the dermis and act on the epidermis. Vascular endothelial growth factor (VEGF) or vascular permeability factor is the most selective growth factor for endothelials.\textsuperscript{19,22,23}

In chlorkhexidine group, the number of fibroblasts on 1\textsuperscript{st}, 3\textsuperscript{rd}, and 5\textsuperscript{th} day is relatively in the same quantity, this is because chlorhexidine is an antiseptic that after up to 24 hours there is an increase in new connective tissue cells, just below the surface layer of inflammation and necrosis. The connective tissue grows to the coronal surface, creating new gingival margins and sulcus. The epithelial activity on the margin peaks at 24 to 36 hours. New epithelial cells originate from the basal layer and epithelial spine layer from the wound margins, migrating toward the wound on the fibrin layer which is then absorbed and replaced by the connective tissue layer. Epithelial cells progressed in an unorganized motion, with cells mounted on the substrate by hemidesmosome and new basal lamina.\textsuperscript{20}

This study was different of than previous study, whereas this study directly applied CHX after gingivoplasty and then evaluated on day 1, 3 and 5, while the other study CHX was given on day 7 and 14 after gingivoplasty.\textsuperscript{19} Under normal circumstances, fibroblast division activity is rarely seen, but cell injury appears to be more active in producing extracellular matrices. Proliferation of fibroblasts in the wound healing process is naturally stimulated by interleukin-1b (IL-1b), platelet derived growth factor (PDGF), and fibroblast growth factor (FGF). In addition, another study revealed that fibroblast migration in the area of the injury is stimulated by transforming growth factor (TGF), a growth factor produced by granulation tissue formed during the inflammatory process. The process of wound healing is strongly influenced by the role of migration and proliferation of fibroblasts in the injury site.\textsuperscript{19} The more specific function of collagen is to form a new connective tissue matrix and by removing the substrate by fibroblasts, indicating that macrophages, new blood vessels and fibroblasts as a unit.\textsuperscript{19,20} The limitation of this study was antiseptic and PRP application were given on anesthetized sample with short duration.

**Conclusion**

Platelet-rich plasma (PRP) is an autologous blood derivative that contains supraphysiologial platelet concentrations that aid in tissue regeneration as it is rich in growth factors and other cytokines. Platelet-rich plasma administration on the wound can increase the number of fibroblasts that will accelerate tissue healing process. Platelet Rich Plasma (PRP) is rich in growth factor, such as platelet-derived growth factor, transforming growth factor β1, β2, β3 (TGF-β1, β2, β3), and platelet derived angiogenesis factor (PDAF) new cells on wound healing process.

ABSTRACT

Background: Periodontal disease in children and adolescents is common. Periodontal disease that mostly occurs in children and adolescents is inflammation of the gingival tissue. Inflammation of the gingival tissue is called gingivitis. Gingivitis associated with tooth eruption which often occurs. This gingivitis can be caused by a high risk of plaque accumulation in the area of the deciduous primary teeth and erupting permanent teeth, because oral hygiene may be difficult or uncomfortable to perform. Nutrients derived from food act as antioxidants, coenzymes in the formation of energy and metabolic processes, and components of tissue structures that keep the body’s system functioning properly and maintain general health, including the health of the oral cavity. Ascorbic acid plays a number of metabolic roles that make this substance important for maintaining connective tissue integrity. Materials and methods: This type of research is experimental research with a pretest-posttest design with a control group with a purposive sampling technique. Examination to get children with erupted gingivitis was carried out on all students of class I-VI SDIT Ar-Rahmah and obtained 30 children who met the inclusion and exclusion criteria. The samples obtained were divided into two groups, namely the group of children given ascorbic acid and the control group who were not given ascorbic acid. Gingival inflammation was measured using the gingival index at the time before administration of ascorbic acid, one week, and two weeks after administration of ascorbic acid. Measurements were made in both the treatment and control groups. The statistical test used was ANOVA Repeated test. Results: ANOVA Repeated test results showed a significant difference in the average gingival index value between groups given ascorbic acid and the control group (p <0.05). Conclusion: There is an effect of giving ascorbic acid to children with erupted gingivitis.

Keywords: erupted gingivitis, ascorbic acid, gingival index

Introduction

Dental and oral diseases can be experienced by various people in various age groups, including children. Dental and oral diseases that are commonly experienced are caries and periodontal disease.¹

Periodontal disease that mostly occurs in children and adolescents is inflammation of the gingival tissue. Gingivitis is characterized by inflammation of the gingiva without attachment to connective tissue or bone loss.²,³

Several epidemiological studies have shown that gingivitis of various severity is commonly found in children and adolescents.⁴ Based on the results of the 2013 Riskesdas, dental and oral problems experienced by children aged 5-9 years are 28.9% and children aged 10-14 years at 28.5%, and the prevalence of the population that has the highest dental and oral problems in Indonesia, namely in South Sulawesi province at 36.2%.⁵
Nutrition derived from food acts as an antioxidant, coenzyme in the formation of energy and metabolic processes. Ascorbic acid is known to play a role in the synthesis of intercellular substances and the formation of collagen fibers in various connective tissues, for example muscle and facial tissue, and calcified tissue matrix such as alveolar bone and teeth.

Healing inflammation of gingival tissue at the time of tooth eruption can be helped by additional nutrients, one of which is to take vitamins. Based on the description of gingival inflammation in children and the role of ascorbic acid for tissue health, the writer is interested in conducting a study “The Influence of Administering Ascorbic Acid on Children Experiencing Gingival Inflammation in Students Class I-VI of SDIT Ar-Rahmah Makassar”.

Materials and Method

This type of research is experimental research with a pretest-posttest design with a control group with a purposive sampling technique. Examination to get children who have erupted gingivitis was carried out on all students of class I-VI SDIT Ar-Rahmah and obtained 30 children who met the inclusion and exclusion criteria. After informed consent was made, the initial examination was conducted to select students who had erupted gingivitis and then the gingival index value was measured in the student. The samples obtained were divided into two groups, namely the group of children given ascorbic acid and the control group who were not given ascorbic acid. Gingival inflammation is measured using the gingival index at the time before administration of ascorbic acid, one week, and two weeks after administration of ascorbic acid. Measurements were made in both the treatment and control groups. The statistical test used was Repeated ANOVA test.

RESULTS

The results of the study are presented in table form as follows.

Table 1: Average distribution of gingival index values before consuming ascorbic acid, at 1 week of consumption of ascorbic acid, and at 2 weeks of consumption of ascorbic acid

Based on the intervention group, there is a decrease in the average gingival index value in the treatment and control groups.
Based on age, the average gingival index value in the 8 year age group is 0.7500 in Pre period, 0.7963 in Post 1 period, and 0.7592 in Post 2 period. The average gingival index value in the 9 year age group namely 1.2098 in the Pre period, 1.1295 in Post 1 period, and 0.9330 in the Post 2 period. The gingival index means in the 10 year age group it is 1.3086 in the Pre period, 1.0893 in Post 1 period, and 1.1180 in Post 2 period.

Based on the class, the average gingival index score in class III is 0.7969 in Pre period, 0.8646 in Post 1 period, and 0.7916 in Post 2 period. The average gingival index in class IV is 1.1077 in Pre period, 1.0117 in Post 1 period, and 0.8733 in Post 2. The average gingival index score in class V is 1.0949 in Pre period, 1.0201 in Post 1 period, and 0.9241 in Post 2 period.

Based on sex, the average gingival index score in male students is 1.0250 in Pre period, 0.9444 in Post 1 period, and 0.8249 in Post 2 period. The average gingival index score in female students is 1.1648 in Pre period, 1.0958 in Post 1 period, and 1.0232 in Post 2 period.

The results of the statistical test in the Pre period (before consumption of ascorbic acid) between the treatment and control groups showed that there was no significant difference between the gingival index scores in the two intervention groups (p> 0.05). The results of the statistical test in the Post 1 period (one week of consumption of ascorbic acid) between the treatment and control groups showed that there was no significant difference between the gingival index scores in the two intervention groups (p> 0.05). The results of the statistical test in the Post 2 period (two weeks of consumption of ascorbic acid) between the treatment and control groups showed that there was no significant difference between the gingival index scores in the two intervention groups (p> 0.05).

Further difference test : p > 0.05 not significant
Further difference test : p < 0.05 significant

Table 6 shows the results of the further difference test between each measurement period. There is no significant differences (p> 0.05) between the results of measurements of the gingival index value between Pre and Post period 1. There is significant differences (p <0.05) between the results of measuring the gingival index value between Pre and Post 2 periods. There is a significant difference (p <0.05) between the results of measurements of the gingival index value between Post 1 and Post 2 periods.

Discussion

In this study, the average gingival index value of male students is lower than female students in each examination period (Table 1). This result was different from the results of research conducted by Rania Rodan, et al. (2015) and Vijaya Sharva et. al. (2014) 23,24 In both studies, boys had higher plaque values and gingival scores than women. This different result might be due to the irregular brushing habits of female students compared to male students who were sampled in the study.

Comparison of the gingival index value between the treatment group and the control group at each examination period showed no significant difference between the Pre-control and treatment groups, Post 1
control group and treatment group, and Post 2 period control group and treatment group (Graph 1). Based on the results of this study, there is significant differences in the comparison of the gingival index score between the treatment group and the control group (p = 0.022). In further comparisons between each measurement period, a comparison of the gingival index score between Pre-Post 2 period (p = 0.011) and Post 1-Post 2 (p = 0.041) had significant differences (Tables 5 and 6). That is, there is an effect of ascorbic acid on eruption gingivitis experienced by students in the treatment group compared to students in the control group. The changes seen were a decrease in the gingival index value and there were significant differences compared to the control group not given ascorbic acid.

Jacob et al. (1987) examined the effects of food rotation with lack of ascorbic acid, normal, and supplemented in subjects with healthy periodontal conditions. Their results showed that the tendency of the gingiva to become inflamed or bleeding on probing was reduced after consuming ascorbic acid. Ascorbic acid plays an important role in collagen synthesis. Alvares and Siegel (1981) reported an increase in gingival tissue permeability in animals with food deficiencies containing ascorbic acid and this change due to the development of sciatric gingivitis. This shows that the permeability of harmful substances from bacteria on the surface of the epithelium increases, allowing easier entry into the periodontal tissue. Ascorbic acid may play a role in reducing the permeability of the gingival epithelium and avoiding penetration of this toxic substance into periodontal tissue.

Conclusion

It can be concluded that there is an effect of giving ascorbic acid to children with erupted gingivitis in students class I-VI SDIT Ar-Rahmah. There are significant differences between the gingival index mean values between the treatment group (given ascorbic acid) and the control group (not given ascorbic acid). That is, there is an effect of ascorbic acid on eruption gingivitis experienced by students in the treatment group compared to students in the control group.

Ascorbic acid has a relationship with the health of periodontal tissue and has various functions for periodontal tissue. Ascorbic acid is an antioxidant that plays a role in counteracting free radicals from the results of cell metabolism in the body, as a cofactor in the process of forming proline and lysine which is an amino acid forming collagen, and stimulating increased activity of the body’s defense cells.

Awareness toward Energy Drinks among Tikrit University Students

Nisreen M. Ibraheem¹, Mayada K. Mohammed¹

¹Family & Community Medicine Department, Tikrit Medical College, Tikrit University, Iraq

ABSTRACT

Background: Energy drinks related to a group of products, in form of liquid, which mainly consist of caffeine, which may contain other added dietary supplements. These drinks may be one cause of serious side effects if used in large doses or for long period especially in children, adolescents, diabetics or patients with certain diseases like heart disease.

Subject and Method: The study is cross-sectional conducted in in Tikrit University from 20th November 2017 to 31st of March 2018. The sample of 300 students were chosen by clusters then simple random sampling was chosen from each cluster. Data were collected by self administered questionnaire. Data were presented and analyzed statistically.

Results: This study found that 61% of the students in the sample did not recognize the energy drinks. The percentage of energy drinks consumers was 12% with male predominance. Most common reasons behind energy drink consumption were to improve concentration and wakefulness (64% of consumers). Most of the students that do not drink the energy drinks either because they do not know what are these drinks (in 34%) or because of their fear of being addicted to them (in 20%).

Conclusions: Energy drinks awareness and its effects between Tikrit University students is poor. A considerable percentage of students drink the energy beverages and the most common reasons were to increase concentration and improve wakefulness. The students do not drink these beverages mostly either because they do not know what are these drinks or their fear of being addicted to them.

Keywords: Energy drinks, university students

Introduction

Energy drinks are caffeine contained liquid, sometimes dietary supplements may be added. The first appearance of these drink was in the United State in 1949 and was named as “Dr. Enuf” (¹). First appearance in Europe was at 1987; after that the spread overall the world, being very common after appearance of Red Bull in 1997 (²). From that time, the energy drink shops has grown rapidly, under different names all over the world. The yearly using of energy drinks in 2013 was more than 5.8 billion liters in nearly 160 countries (³). Markers of these drinks lastly have shifted their consumer from athletes to youth individuals. Energy drinks are mainly increased in areas with teenagers and youth individuals. Most of energy drink users are 13–35 years old, and males are two thirds of the consumer (⁴). On the united states, energy drinks become number two of most common liquid supplement used by youth individual; nearly thirty percent of energy drinkers take drinks on a regular basis (⁵). The wide usage of energy drinks in Saudi Arabia does not appear to differ from that in the world. (⁶) Energy drinks are prepared to give an “energy enhancement” to the customer by gathering of stimulants and energy boosters. Caffeine is the major content of the most energy drinks. Mostly these drinks contain 80–150 mg of caffeine per 8 ounces. (⁷) Most studies have tested the behavioral effects of energy drinks that contain caffeine, glucose, and vitamins in its contents (⁸). The studies found improvements in aerobic and anaerobic cycling performance, attention performance and/or reaction time tasks (⁹), afternoon driving performance, (¹⁰) and different indices of alertness (⁸, ⁹, ¹⁰). Energy drinks consist of 75 mg caffeine and glucose (¹¹). The gathering of caffeine with glucose in these drinks may give restorative properties (¹²). In a study they given energy drink which mainly contain glucose to 11 tired persons who accept.
To be volunteered who examined in a driving simulator, marked enhancement was seen in lane drifting after two hours post drinking\textsuperscript{(13)}. Other study has been examined the early effects of these drink on cognitive activities.

The findings showed that they decrease both reaction times on the behavioral control tasks as well as ratings of mental fatigue, whereas it increased subjective ratings of stimulation\textsuperscript{(14)}. On the other hand, although the above pointed studies have been shown the positive effects of energy drinks on exercise performance, other studies not found important effects or health side effects. A single blind placebo Al-fares et al study\textsuperscript{(15)} lastly examined the roles of energy drinks on exercise works in 32 healthy females. The finding was that drinking of these fluids just before exercise will not causes any changes in the indices of physical performance, that included time to exhaustion, maximum oxygen consumption, blood pressure, pulse rate, and capillary oxygen saturation. This agree with observation founded in a double blind, placebo controlled cross over study of fifteen active persons. The finding of this study that there is no effect of energy drinks on ride time to exhaustion or pulse rate. No changes seen in rating of exertion \textsuperscript{(16)}. Evaluation of the acute effects of energy drinks on exercise performance was tested on 19 professional female volleyball players\textsuperscript{(17)}.

**Subjects and Method**

The current work is crosssectional study, it was achieved in Tikrit university in Salah Al-Deen governorate in Iraq from 20\textsuperscript{th} November 2017 to 31\textsuperscript{st} of March 2018. Sample included 300 students (150 male and 150 female) who chosen by cluster sampling then simple random sampling chosen from each cluster (college). Data collection was done by self administered questionnaire that include (age, sex, college, marital state, type of energy drinks, cause of drinking, amount, withdrawal symptoms, benefits of energy drinks, attention to contents list, if not drinking give reason). Data analysis, management and presentation: Collected data presented by simple tables and figures then analyzed statistically.

**Results**

The results found that 184 (61\%) of students does not recognize energy drinks, and literature college students had higher frequency about 24(80\%). But 116 (39\%) of students recognize it and pharmacy college students had higher frequency about 18(60\%) as in figure 1.

![Figure 1: Recognition of energy drinks by students](image1)

Regarding the ideas of students about role of energy drinks on health, this study revealed that 26(8.7\%) students said it’s good, 94(31.3\%) students said it’s not good, and 180(60\%) students do not know. As in figure 2.

![Figure 2: The student's opinion on energy drinks if they were beneficial to health](image2)

The reason behind energy drinking in populations as the students think, the results revealed that 167(41\%) students think that it “promote wakefulness”, 57(14\%) of them think that it “help in staying aware in night”, 51(13\%) of them think that the reason is “refreshment/taste”, 12(3\%) of them think that the reason is “weight loss”, 66(16\%) of them think that it “attract from advertisement”, 50(13\%) of them think that it “relief stress”. as in figure 3.

![Figure 3: The reasons behind energy drinking in populations as the students think](image3)
About searching for information about energy drinks, 226 (75%) of students say No and 74 (25%) of them say Yes from them 66 students search in “internet” and 8 students “ask friends”, as in figure-4.

![Figure 4: Searching for information about energy drinks](image)

The relation between students’ performance and energy drinks consumption demonstrated in fig. 5 and fig. 6.No.as well as percentages in table three.

![Figure 5: Students’ performance in consumers](image)

![Figure 6: Students’ performance in non-consumers](image)

About reasons for don’t drinking energy drinks among students, 91(34%) of students didn’t know about it, 21(8%) of students say that it has a bad taste, 52(20%) of students fear from addiction, 25(10%) of students say that it interrupts diet, 23(9%) of them say that it is a parents’ instructions, and 51(19%) of them say that they know about undesirable effects of energy drinks as in fig. 7.

![Figure 7: Reasons of not consuming energy drinks by students](image)

About undesirable effects of energy drinks that happened to consumer students, it is demonstrated in figure-8.

![Figure 8: side effects of energy drinks that happened to consumer students](image)

**Discussion**

The aim of this survey was the evaluation of the consumption and awareness of Tikrit university students about energy drinks. The study was found that only 39% of all sampled students where recognized the energy drinks, in comparison with other study made at the Prince Sattam Bin-Abdulaziz university in Saudi Arabia, the percentage was much higher (94% of all sampled students) [18]. About 180(60%) of students out of 300 did not know whether energy drinks good to human health or not, 94 students (31.3%) said that these...
drinks are not good to human health, in comparison with the same study of Saudi Arabia mentioned above, 68% of drinking students did not know whether these drinks are good or not and 31.4% of consumers did not recommend the use of energy drinks. Most common reason behind drinking energy drinks by population (by students’ opinion) was to promote wakefulness (41%); this reason is the most common one as mentioned by most literatures.

Regarding performance among energy drinks consuming students, the result shows that 49% had had intermediate performance, 35% had had good performance, and only 11% had had very good performance. Comparing these percentages with figure-7 which shows the performance of non-consuming students, in which 19% had had very good results, 29% had had good results, and 30% had had intermediate results. Comparing of these finding suggest no significant improvement of study performance when use of energy drinks. A study about the role of energy drinks on cognitive improvement also had concluded the same results. The most common reasons were that the students don’t know what are the energy drinks (34%) and fear of becoming addicted to these drinks (20%). one study about the energy drinks and impact of caffeine on neurophysiology, “many caffeine consumers proclaim that they are addicted to the substance”, however the evidence is inconsistent. On the other hand, another study about the caffeine use disorders shows that caffeine can cause clinical addiction as it recognized by the WHO. The most common side effects of energy drink are headache and palpitation. This agree with study done in Australia 2010 which found that most side effects are palpitation, tremor, headache. A study done in Saudi Arabia found that 29% of the sample have crash episode, 22% suffer from severe headache and 19% undergone from tachycardia while they have drinking drinks.

Conclusions

1. The energy drinks awareness and its effects among Tikrit University students was poor.
2. A considerable percentage of students drink the energy beverages and the most common reasons were to increase concentration and improve wakefulness especially during exams.
3. The largest percentage of students did not drink these beverages mostly either because they do not know what are these drinks or their fear of being addicted to them.
4. The side effects associated with these drinks were very common with headache, palpitation, mood swings and dental carries were the most commonly documented.

Recommendations

1. Increase the number of awareness campaigns regarding the negative effects of energy drinks, which are becoming more prevalent in university through extension courses.
2. Parents have an important role to play in controlling their children’s consumption of energy drinks.
3. Minimize the import of energy drinks by giving sufficient information to the Ministry of Commerce and the concerned parties concerned with importing foodstuffs.
4. Increase taxes on shops and markets that sell energy drinks in general, and markets and cafeterias that offer their goods to college students and universities in particular.
5. Determine the places of sale of energy drinks and restricting the social groups consumed by restricting their sale, especially for children and others vulnerable groups.

Mitral Valve Prolapse Diagnosis and Incidence

Noori Odah Madhee¹, Sameerah Rashid Jabbar¹, Mohammed Hassan Baghdadi², Ali Khalid Abood¹, Hayder Adnan Fawzi³

¹Department of Cardiac Surgery, ²Head of Department, Department of Cardiology, Ibn Al-Bitar Teaching Hospital, Baghdad, Iraq; ³Baghdad Medical City, Baghdad Teaching Hospital, Clinical Pharmacy Department, Baghdad, Iraq

ABSTRACT

Objective: determine the incidence of mitral valve prolapse using echocardiographic criteria

Materials and Method: this study involved 117 symptomatic patients, aged between 17 – 42 years, these patients examined in the outpatients’ clinic of Baghdad teaching hospital (Iraqi cardiac center) and Ibn Al-Nafees Hospital by the use of 2D echocardiography.

Results: The most common presenting symptoms was palpitation, the prevalence of MVP was 8.55%, anterior leaflet was the most involved (50%), non-classical leaflet morphology was more common than classical (70%), the frequency of female was higher than male for patients with MVP. There was no significant difference in LA, LVEDD and EF in patients with MVP according to age group

Conclusion: The prevalence of mitral valve prolapse was slightly higher than reported in international studies 8.55%, the prevalence in females more than males.

Keywords: mitral valve, prolapse, female, leaflet, echocardiographic criteria

Introduction

Mitral valve prolapse (MVP) is a common cause of mitral regurgitation (MR). Although most patients with MVP have mild, trivial, or no MR. MVP is the most common cause of surgical MR in developed countries. Other potential complications include infective endocarditis and arrhythmias. The diagnosis of MVP is suspected on physical examination and confirmed by echocardiography².

The diagnosis of mitral valve prolapse (MVP) was previously based upon a combination of clinical exam findings and echocardiographic criteria; the current definition relies on imaging alone. The current imaging definition of MVP is billowing of any portion of the mitral leaflets ≥2 mm above the annular plane in a long axis view (parasternal or apical three-chamber). Prolapse of the mitral valve is defined as an abnormal systolic displacement of one or both leaflets into the left atrium (systolic billowing) due to a disruption or elongation of leaflets, chordae, or papillary muscles³.

The prevalence of mitral valve prolapse (MVP) in the general population varies among studies, mostly due to variable criteria used for diagnosis. Reports published early in the development of echocardiography suggested high MVP prevalence, 4 to 10 percent and even close to 20 percent in selected populations. These early reports are now considered inaccurate because echocardiographic criteria for diagnosis were not yet fully developed and lacked specificity⁴⁻⁶. Using currently accepted definition of MVP, the Framingham Heart Study reported an overall prevalence of 2.4 percent⁷. MVP may be slightly more common in women than in men. In the Framingham study, there was a nonsignificant trend toward a female preponderance among those with MVP (59.5 versus 52.7 percent in those without MVP)⁷. The objective of the current work to determine the incidence of mitral valve prolapse using echocardiographic criteria.
Method

Study Design and Setting: A prospective observational study conducted in the Department of in the outpatients’ clinic of Baghdad teaching hospital (Iraqi cardiac center) and Ibn Al-Nafees Hospital during the period from 1st February 2012 to 1st July 2012.

Total number of 117 patients presented with variable symptoms (palpitation, chest pain, shortness of breath, fatigue, and syncope), all were evaluated clinically and echocardiography.

Diagnosis of MVP: MVP diagnosed according to the criteria purposed by Harvey Feigenbaum:

1. Upword (posterior) displacement (≥2mm beyond the annular plane of the MV leaflets, single or both leaflets or even segment (scallop) of any MV leaflet towards the LA in systole.

2. An increase in the thickness of the prolapsed MV leaflet (3-5 mm for the non-classical MVP, and >5 mm for the classical MVP).

Additionally LA size, LVEDD, and EF were assessed using the linear method.

Results

The most common presenting symptoms was palpitation, the prevalence of MVP was 8.55%, anterior leaflet was the most involved (50%), non-classical leaflet morphology was more common than classical (70%), the frequency of female was higher than male for patients with MVP, as illustrated in table 1.

Discussion

Prevalence of MVP in general population varies among studies, mostly due to variable criteria used for the diagnosis. Studies based on tertiary care centers may have attracted more symptomatic patients than those who seek medical attention at smaller medical centers, thus trials performed at these centers may have overestimated the true prevalence of symptomatic patients with mitral valve prolapse.

The current study which had been done in two tertiary centers revealed the prevalence of MVP as 8.55%, this high frequency can be attributed to the high number of cardiac cases visiting these centers. Other studies showed lower rates of MVP like Freed et al with incidence (4%)\(^6\), in Devereux et al study MVP was (1.8%)\(^7\), also Theal et al found that the prevalence of MVP was 2.3%\(^8\), this low rate of MVP can be attributed to the rigid diagnostic criteria for MVP, and differences in the examined criteria\(^7\).

Conclusion

The prevalence of mitral valve prolapse was slightly higher than reported in international studies 8.55%, the prevalence in females more than males.

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. Effect of Two Separated Doses of Antenatal Steroids at 32 Weeks and Five Days Before Delivery in Prevention of Neonatal Respiratory Distress Syndrome

Sara Abdul-Ridha Al-Rawaf¹, Abdul-Kareem Jasem Al-Bahadle², Areege A. A. Alomrani²
¹Department of Obstetrics and Gynecology, ²Department of Pediatrics, College of Medicine, Nahrain University

ABSTRACT

Objective: examine the effect of two separated dose (32 weeks and 5 days before delivery) on the occurrence of respiratory distress syndrome.

Materials and Method: A case control study has been applied from 17th September 2017 to 19th of July 2018 in Imamain Al-Kathimain medical city, involved 188 premature baby delivered by elective cesarean section, the mothers divided into two groups group A (96 women) that received two doses of steroid (at 32 weeks, and 5 days before delivery) and group B (94 women) that receive one dose of steroid at 32 week of gestation respectively.

Results: there was slight increase in number of female in both group, total number of them in group A was 52 (54%), and total number of male was 44 (64%) while in group B it was 49 (53%) and 43 (47%) respectively. The study show significant decrease in number of premature suffering from respiratory distress syndrome in group A 29 (30%) than in group B 58 (63%), there was no statistical significant differences regarding those who were admitted in neonatal intensive care because of respiratory distress syndrome in form of respiratory rate, heart rate, and days of hospitalization.

Conclusion: two separated doses of steroid at 32 weeks of gestation and 5 days before delivery are more superior to one dose of steroid in prevention of respiratory distress syndrome.

Keywords: respiratory distress syndrome, premature, antenatal steroid, heart rate, hospitalization

Introduction

Respiratory distress syndrome occurs primarily in premature infants, its incidence is inversely related to gestational age and birth weight, it occurs in 60-80% of infants <28wk of gestational age, in 15-30% of those between 32 and 36 wk of gestational age and rarely in those >37 wk of gestational age. The risk of development of RDS increases with maternal diabetes, multiple birth, cesarean delivery, precipitous delivery, asphyxia, cold stress and maternal history of previously affected infants.

Respiratory distress syndrome (RDS) affects about 1 percent of newborn infants and is the leading cause of death in babies who are born prematurely². About 12 percent of babies born in the United States are preterm, which is higher than in other developed countries³. The risk of RDS rises with increasing prematurity. Babies born before 29 weeks of gestation have a 60 percent chance of developing RDS⁴, but babies born at full term rarely develop this condition. Maternal risk factors for preterm birth include previous preterm birth, periodontal disease, low maternal body mass, poor prenatal care, poverty, being uninsured, and being a member of a minority group⁵.

Further study on infant respiratory distress syndrome (RDS) found that the deficiency of surfactant was a consequence of either insufficient production by the immature lungs or a genetic mutation in one of the surfactant proteins, SP-B. The rarer genetic form of the
disease is not associated with premature birth and occurs in full-term babies\textsuperscript{6}.

A surfactant system facilitating inflation stability, decreasing the work of breathing and contributing to the innate host defense of the lungs\textsuperscript{7}. Among preterm singletons, antenatal corticosteroid administration is a well-established strategy for the reduction in the rate of respiratory distress syndrome\textsuperscript{8}.

The standard dosage of antenatal corticosteroids is equivalent to the amount of endogenous cortisol that would be released in response to stress in the untreated premature neonate who develops RDS. The first 12-mg dose of betamethasone achieves 75\% corticosteroid receptor saturation. Consequently, the standard dose of antenatal corticosteroids results in a near maximal induction of corticosteroid receptor-mediated response in fetal target tissues\textsuperscript{9, 10}. Prematurely born infants have to use their lungs for gas exchange at the end of the canalicular stage and during the saccular stage. As a life-saving measure, many of them receive surfactant, steroids, or oxygen and are mechanically ventilated, causing damage at the cellular level due to oxygen toxicity and volutrauma. In addition, these infants have to cope with pulmonary inflammation and a steroid-induced re-programming lung development. As a result, alveolarization does not progress as well as in term-born infants. The resulting disease is called bronchopulmonary dysplasia (BPD). Infants showing BPD have fever and therefore larger alveoli, insufficient vascularization and airflow limitations. All of these conditions cause a reduction of gas exchange in its own right. BPD-induced alterations of the lungs often persist into adulthood or throughout the whole life\textsuperscript{11}.

**Method**

**Study Design and Setting:** A case-control study was conducted in Imamain Al-Kathimain medical city during a period from 17\textsuperscript{th} September 2017 to 19\textsuperscript{th} of July 2018 and involved 188 premature baby delivered by elective cesarean section, they were divided into two groups. group A, the mothers receive two corticosteroid when she was 32 weeks of gestation and additional dose of steroid five days before delivery in addition to usual dose. This is of particular importance because the benefits of antenatal corticosteroids in singletons are greatest between 2 and 7 days after administration\textsuperscript{12}, and group B the mothers in this group receive only usual dose of steroid at 32 weeks of gestation and after delivery by cesarean section, the neonate of both group where followed and clinical evaluation was done in neonatal intensive unit of the same medical city and any neonate diagnosed as having respiratory distress syndrome were admitted in this unit for management and follow up, and other neonate who are well and beginning feeding were discharging home. Those who were admitted to intensive care unit receive usual treatment of RDS and follow by daily measure of respiratory rate and heart rate every four hours to evaluate the deference between two groups in regarding response to treatment in order to see weather prenatal steroid has any effect on treatment of neonate suffering from RDS after delivery.

**Exclusion Criteria:** Any neonate with possibility of congenital infection, congenital anomalies or dysmorphic feature were excluded from the study.

**Statistical Analysis:** Chi-square was applied to test differences between proportion, and p-value <0.05 was considered significant, all analysis carried out using SPPS software package version 22.0.

**Results**

The frequency of RDS was significantly higher in group B compared to group A, as illustrated in table 1.

Discussion

Respiratory distress syndrome is a frequent neonatal emergency worldwide with reported prevalence rates of 4.24% in Pakistan13, 18.5% in France14, 23% and in Ivory Coast15. It is a frequent emergency and causes high morbidity and mortality. Most of its risk factors and etiologies are preventable. Adequate follow-up of pregnancy and labor for timely intervention may improve the neonatal outcomes16.

This study show that the number of female was slightly more than the number of males which is similar to the percentage of female and male that were delivered in hospital in this period which was 56% (413) of female and 44% (324) males from the total 737 live birth.

The most important thing in this study is the significant effect of two separated doses giving to mother who are at risk of preterm delivery on usual dose recommended by the American College of Obstetrician and Gynecologist call for a single course of corticosteroids to all pregnant women between 24-34 weeks of gestation who are at risk for preterm delivery17.

So in our study we want to accelerate the pulmonary maturity in cases of fetal that delivered after 34 weeks to potentially reduce the likelihood of RDS when preterm delivery is indicated. and we choose to give the second dose of steroid 5 days before delivery because they found that, there is particular importance to give corticosteroid 2-7 days before delivery because there is greatest effect of corticosteroid between 2 and 7 days12. This study show no effect of the two separated doses of steroid on the management of RDS that occur post-nataly which indicate absence of effect of postnatal steroid on prognosis of RDS.

Conclusion

Two separated dose of steroid at 32 weeks of gestation and 5 days before delivery decrease significantly the occurrence of respiratory distress syndrome in premature delivery by elective caesarian section.

Conflict of Interest: None

Pulmonary Tuberculosis Disease: Prevention Behavior in Makassar City

Herman¹, Rudy Hartono²

¹Department of Health Analyst, ²Department of Nutrition, Makassar of Health Polytechnic, Indonesia

ABSTRACT

The problem of pulmonary tuberculosis in the world and in Indonesia is very worrying due to the high mortality and morbidity rate, especially Indonesia is a tropical country so that it can reduce the public health development index. This study aims to determine the effect of knowledge on the behavior of prevention of pulmonary tuberculosis in Makassar City, Indonesia. The sample referred to in this study is that some of the people who have suffered pulmonary disease and who do not suffer from pulmonary tuberculosis who live in the working area of the Makassar City Health Center are 335 people. The sampling technique uses multi stage random sampling. Data analysis using regression test. The results of the analysis are presented in the form of tables, charts and narratives. The results showed that knowledge of disease source control, knowledge of controlling disease agents, knowledge of increasing endurance had a significant influence on the behavior of prevention of pulmonary tuberculosis in the community (p <0.05).

Conclusion: community knowledge can improve the behavior of preventing pulmonary disease in the community.

Keywords: pulmonary tuberculosis, knowledge, behavior, prevention.

Introduction

The Government’s commitment in reducing tuberculosis cases in Indonesia has issued the Decree of the Minister of Health of the Republic of Indonesia Number: 364/Menkes/SK/V/2009 concerning guidelines for the prevention of tuberculosis which refers to the Directly Observed Treatment Short-course (DOTS) strategy and is implemented in all regions of Indonesia. The DOTS strategy consists of 5 key components, namely: 1) Political commitment, with increasing and continuing funding. 2) Case finding through quality microscopic examination of phlegm. 3) Standard treatment, with supervision and support for patients. 4) Effective management system and availability of antituberculosis drugs. 5) Record and reporting monitoring system that is able to provide an assessment of the results of patient treatment and program performance. But the problem of tuberculosis in Indonesia is still a serious problem because the case is still high and attacks all age groups¹,².

The incidence of tuberculosis cases with acidic (+) bacilli in South Sulawesi Province (2013) reported a total of 8,902 cases in the male population of 5,259 cases (59.08%) and in female sex 3,643 (40.92 %). The Makassar City Health Office’s Disease Prevention and Health Improvement Field (2014), the number of new patients with pulmonary tuberculosis TB (+) in 2013 was 72.44% (found 1,811 patients out of 2,500 targets), this number increased from 2012 with 1,324 patients out of 1,641 targets. When compared to the 2013 target of 70%, the achievement level exceeds the target with a achievement percentage of 72.44%³,⁵,⁸.

Research results related to the above interactions include Media Y reporting that the people of Padang Panjang City have a relatively good level of knowledge about tuberculosis, but some still think that the causes of pulmonary tuberculosis are related to things that are unseen and because offspring; public perception that the disease that is dialysis is a normal cough, so that it is associated with a lack of caring attitude towards the

Email: dinomks70@gmail.com
effects of pulmonary tuberculosis; and the behavior and awareness of some people to check phlegm and use health care facilities is still lacking. States that health behavior (health behavior) is a person’s response to stimuli or objects related to health-sickness, illness, and factors that affect health-sickness (health) such as the environment, food, drink, and service health. In other words, health behavior is all activities or activities of a person that can be observed (observable) or that cannot be observed (unobservable) related to the maintenance and improvement of health. Based on the explanation above, the objectives to be achieved from this study are a description of behavior on prevention of lung tuberculosis in Makassar City, knowledge of controlling disease sources, controlling disease agents, and increasing patient’s resistance to tuberculosis prevention behavior and knowledge variables the dominant influence on the behavior of preventing pulmonary disease in the people of Makassar City.

**Material and Method**

Based on the research design that will be used, the type of research is an analytical survey. The population referred to in this study are all people who are domiciled in the area of Makassar City, both healthy and sick or suffering from tuberculosis disease that has been diagnosed by a doctor. The sample intended in this study were some of the people who had suffered from tuberculosis and who did not have pulmonary tuberculosis who lived in the working area of the Makassar City Health Center as many as 335 people. Sampling in this study is a multi stage sampling technique that is a method of sampling through stages. There are also techniques as follows:

a. The first stage, using all sub-districts within the city of Makassar, is 14 sub-districts. b. The second stage is to determine the number of samples for each sub-district by comparing the number of cases of pulmonary tuberculosis to the total population of lung tuberculosis Acid Resistant (+) multiplied by the number of samples to be studied (335 subject), c. The third stage, from the sub-district determined by the Puskesmas which has the highest number of cases of pulmonary tuberculosis as a place for collecting data. In this study, the variables to be analyzed consisted of dependent variables, namely lung disease prevention behavior and independent variables, namely knowledge of controlling tuberculosis disease sources, knowledge of controlling tuberculosis disease agents and knowledge of increasing body resistance to tuberculosis disease. The analysis technique in this study, used is a simple regression test and multiple regression at an error rate of 5%.

**Findings**

**Multivariate Analysis:** This analysis aims to determine the effect of Knowledge Source Disease Control variables, Knowledge Variables for Disease Control Agents and Knowledge of Increasing Body Resilience variables on the Behavior Prevention of Tuberculosis Transmitted Disease variables in Makassar City by using multiple regression test analysis. The results of the study are as follows:

1. The Effect of Knowledge on the Control of Sickness Sources of Behavior in Lung Tuberculosis Prevention in Makassar City People

Table 4. shows that the effect of Knowledge of Source Disease Control on Prevention of Pulmonary Disease Behavior with a value of r = 0.948, Effect of Knowledge of Disease Control Agents on Prevention of Pulmonary Disease Behavior with a value of r = 0.867, and knowledge of increasing body resistance to prevention behavior of tuberculosis Lung with a value of r = 0.900. Based on the coificient correlation, it can be concluded that the biggest contribution of influence is Knowledge of Source of Disease Control, followed by Knowledge of Increasing Endurance of the Body, and finally Knowledge of Agent Control of Disease.
Discussion

1. The Effect of Knowledge on the Control of Tuberculosis Sources on the Preventive Behavior of Lung Tuberculosis in the City of Makassar: Based on the results of the research in table 2 above, it can be concluded that the knowledge of controlling the source of tuberculosis disease affects the behavior of tuberculosis tuberculosis prevention in Makassar City community. The results of this study, in line with some of the research results reported include: Hamidi H. (2010), in the results of his research suggesting that there is a relationship between knowledge of pulmonary tuberculosis prevention and the incidence of tuberculosis in children aged 0-14 years of Salatiga City community. Stated that knowledge of drug consumption was related to the compliance of patients taking medicine for pulmonary tuberculosis in the Glugur community in Medan.

Furthermore reported that there was a correlation between respondents’ knowledge and the behavior of preventing lung tuberculosis in the community in the Maleran Medan Waterfall Village.

Based on the description above, it can be concluded that the behavior of preventing tuberculosis of the people of Makassar City is influenced by the knowledge of tuberculosis pulmonary disease prevention from the aspect of controlling the source of the disease. Knowledge of controlling the source of disease is all efforts to control the source of pulmonary tuberculosis that is known by the people of Makassar City so that the community can prevent transmission of pulmonary tuberculosis.

The control knowledge in question is: if the sick community will go to the doctor and at health care facilities such as clinics, health centers and hospitals; Do not sleep in a room with people with pulmonary tuberculosis; know the clinical symptoms of pulmonary tuberculosis; know how to transmit pulmonary tuberculosis; knowing that if treatment is interrupted then pulmonary tuberculosis cannot heal; knowing that pulmonary tuberculosis germs can be turned off using antibacterial both physical and chemical; knowing that the development of pulmonary tuberculosis germs is related to unhealthy home environment sanitation and so on.

2. Effect of Knowledge on the Control of Agents of Pulmonary Tuberculosis. Pulmonary Disease Prevention of Pulmonary Disease in Makassar City Community: The results of the study showed that the Knowledge of Pulmonary Tuberculosis Control Agent Agents had an effect on the Lung Disease Prevention Behavior of the people of Makassar City. The results of this study are also in line with the results of several studies that have been reported, among others: in the results of his research suggesting that there is a relationship between knowledge of tuberculosis prevention and the incidence of tuberculosis in children aged 0-14 Salatiga City. States that knowledge of drug consumption is related to patient compliance with the drug TBc Lung from the Glugur Medan community. Furthermore reported that there was a relationship between respondents’ knowledge and the behavior of pulmonary tuberculosis prevention in the Kelurahan Medan Maleran Waterfall. Based on the description above, it can be concluded that the behavior of preventing tuberculosis of the people of Makassar City is influenced by the knowledge of preventing tuberculosis from aspects of controlling the disease agent.

Knowledge of controlling disease agents is all efforts to control lung tuberculosis agents known by the people of Makassar so that the community can prevent transmission of tuberculosis. The control knowledge in question is: Knowledge of the Makassar city community referred to in this study include the causes of tuberculosis, transmission of tuberculosis, bacterial habitat for tuberculosis disease, how to destroy tuberculosis, germs of tuberculosis and so on.

3. Effect of Knowledge on Increasing the Body Resilience of Pulmonary Tuberculosis Against the Prevention of Pulmonary Disease in the People of Makassar City: The results of table 4 show that Knowledge of Increasing Body Endurance influences the Prevention of Lung Tuberculosis Behavior in Makassar City community. The results of this study are also in line with some of the reported research results, among others: in his research there is a relationship between knowledge of tuberculosis disease prevention with the incidence of tuberculosis.
in children aged 0-14 years of Salatiga City community\textsuperscript{2,7,11}. States that knowledge of drug consumption is related to patient compliance with the drug TBc Lung from the Glugur Medan community. Furthermore, reported that there was a relationship between the knowledge of respondents and the behavior of prevention of lung disease in the community in the Medan Maleran Waterfall Village\textsuperscript{12}.

Based on the description above, it can be concluded that the behavior of prevention of tuberculosis in the people of Makassar City is influenced by the knowledge of preventing tuberculosis from aspects of increasing body resistance to tuberculosis. Knowledge of increasing endurance is an effort to increase the body’s resistance to tuberculosis, which is known to the people of Makassar so that the community can prevent transmission of tuberculosis. The knowledge of increasing the body’s resistance in question is: protecting themselves from the spread of tuberculosis disease, consuming food, healthy drinks, managing good household waste, the dangers of cigarettes to health, eradicating disease vectors, healthy environmental sanitation, adequate rest, the influence of stress on health, the benefits of exercise for the human body and so on\textsuperscript{4,11,14}.

**Conclusion**

Based on the results of research and discussion in this study, it can be concluded that the description of the behavior of tuberculosis pulmonary disease prevention in general is good category, knowledge of controlling tuberculosis pulmonary disease affects the behavior of tuberculosis pulmonary disease prevention in Makassar, influential knowledge of tuberculosis disease control agents on the behavior of preventing lung tuberculosis in Makassar City, the knowledge of increasing body resistance to tuberculosis has an effect on the behavior of tuberculosis tuberculosis in Makassar City, the variable that greatly influences tuberculosis prevention behavior in Makassar is the knowledge of Tuberculosis disease control., then the knowledge of increasing body resistance to tuberculosis disease, and finally the control knowledge of tuberculosis disease agents.

Prevalence and Indications of Caesarean Section in Karbala Gynecology and Obstetrics Teaching Hospital, Iraq

Wasan Gh. Al safi1, Hameedah Hadi2, Zahraa S.Omran3
1Department of Obst & Gyn, College of Medicine, University of Kerbala, Iraq; 2Obst & Gyn Teaching Hospital, Karbala Health Directorate, Ministry of Health, Iraq; 3Lecturer, Pharmacy College, Ahl Albait University

ABSTRACT

Objective: To determine the frequency of cesarean section and analyze the indications, so as to introduce measures to control the cesarean section rate as decreasing this rate will lessen the maternal morbidity and mortality

Patients and Method: This cross sectional study was conducted in Karbala Gyn & Obst Teaching Hospital from 1st of August 2018 to 31st of December 2018, it is a tertiary hospital in the province. In this study information and data were taken from all the patients underwent cesarean section. Calculation of the total no of deliveries was done and the rate of cesarean section was devaluated with the indications of them.

Results: The total number of women have been delivered over the study period was 9414, out of which caesarean sections (CS) were 2471. The prevalence of caesarean section in the study population was 26.2%. The most common indication of caesarean section was previous caesarean section (67.7%), followed by Fetal distress (8.29%), failure of progress in labour (6.43%) and breech presentation (5.66%).

Conclusion: The rising prevalence of caesarean section was mainly due to previous caesarean section followed by Fetal distress, also we did our study in tertiary hospital this means that most of the risky cases will be admitted to it so the rate is 26.2%.

Keywards: cesarean section, indications, Karbala province

Introduction

Caesarean section (CS) is the process whereby the baby is delivered from the uterus by direct incision through the abdominal wall and the uterus, the first caesarean section was done in 16th century.

The WHO rate the cesarean section to be considered between 10-15% to be the optimal needed goal for the life saving for the mother and her fetus but this rate is still rising. It has associated with increase maternal mortality and morbidity. this rising rate because few hospitals except teaching hospitals provide peer review for diagnosis of failure of progress of labor, trail of labor with low-segment caesarean section is not always accepted, also vaginal deliveries are not much supported, no accurate diagnosis of fetal distress by using fetal PH scalp, there is powerful incentive for both physician and hospitals by unhealthy medico-legal climate.

In recent years the rate of caesarean section reaches to 46% in some record in china, 25% or above of them performed on request, followed by Vietnam and Thailand with 36% and 34% respectively with lowest in India 18%, Latin America and USA about to be similar around 30-40%, the prevalence is 9% in Africa.

In Arabic countries the rate of cesarean section is as follow; four countries had a CS rates less than 5% (Yemen, Sudan, Mauritania and Algeria), but three countries have the incidence of CS above 15% (Lebanon, Qatar and Bahrain), and the other countries have CS rate in the range of 5-15% which are (Palestine, Oman, Morocco, Libya, Tunisia, Saudi Arabia, United Arab of Emirate, Egypt, Jordan, Kuwait and Syria).
Caesarean section is done either as emergency operation or an elective one. The indications of elective caesarean section include cephalopelvic disproportion, placenta Previa some malpresentation e.g. breech presentation & transverse lie. Emergency caesarean section may be needed because of antenatal complication as pre-eclampsia, abruptio placenta (with a baby still alive), fetal distress or failure to progress in labor. \(^7\)

The incidence of caesarean section was increased all over the world and became one of most common procedures in maternity hospitals and because this rate has increased dangerously in last few years with its increased morbidity, so caesarean section must be performed when there are solid indications, some obstetrician consider it is simple and safe and superior to operative vaginal delivery as forceps and vacuum. \(^8\)

There is controversy over the rate of caesarean section is gaining on benefit of higher or lower rate of caesarean section, but WHO recommended there is no additional health benefit associated with caesarean section rate above 10%-15%. The WHO stated, on the basis of a study of maternal and fetal complications between 2004 and 2008 in 24 countries, that cesarean sections are associated with an increase in risks for both mother and child compared to vaginal delivery and should therefore be performed only when significant advantages are expected. \(^9\)

In spite of increase rate of caesarean section, the 4 major causes of caesarean section are; fetal distress, previous caesarean section, breech, failure of progress of labor. Effective implementation of strategies to reduce caesarean section rate depend on social and cultural media associated belief and practice of society. \(^10\)

**Patients and Method**

This is a cross sectional study conducted from 1st August 2018 to 1st of January 2019, to observe the cesarean delivery rate and various indicators contributing to it, at Karbala Gyn & Obst Teaching Hospital/Karbala province. This is a tertiary referral hospital, with about 20,000 deliveries yearly.

The total no. of women delivered in the study period was 9414 having all live births, 2471 of them were delivered by CS, the rest delivered vaginal which was 6943 women, verbal consent was taken from each patient enrolled in the study, data by an interview was collected with each one. In cases of caesarean sections, the data includes demographic parameters like age, cause of caesarean section, no. of caesarean section and residence urban/rural, geographical distribution, whether procedure was done as an emergency or it was an elective one. Previous obstetrics history and present obstetric parameters like antenatal care, gestational age (weeks), were also recorded in the format.

The various categories of indications for caesarean sections included Previous CS scar, Breech presentation, Failure of progress, Pre-eclampsia, Postdate, Infertility, Fetal distress, Twin pregnancy, Malpresentation, APH (Antepartum hemorrhage), CPD (Cephalopelvic Disproportion), Cord prolapse and bad obstetrical history.

Total primary and repeat caesarean deliveries were calculated. The caesarean rate was calculated in form of percentage and later data was analyzed by SPSS (version 22).

**Results**

The total no. of deliveries in the study period was 9414, 2471 out of which had delivered via C-Section. The overall C-Section rate was 26.2%. The rate of primary CS was 30%. About 49.98% of the CS were done as an emergency procedure and 50.02% were elective one (Table 1).

Discussion

The total no. of deliveries in the Obst. & Gyn Hospital in Karbala, is between 20,000-22,000/yr., the caesarean section rate in our study was 26.2%. The WHO recommended that the rate of C-section should be within 10–15%, this study showed a higher rate as compared to the advised rate. The rising caesarean section rate is a worldwide phenomenon, as in United State Brazil and Chili the rates were 26.1% and 27% and 40% respectively, however, the primary caesarean section usually determines the future obstetrical course of any woman and therefore should be avoided wherever possible. 11, 12, 13

There are many studies done in different places in Iraq, Jarjees. Y14, found that the incidence of cesarean section in Al Batool maternity hospital in Mosul, Iraq was 17.95%.

In our study, most of mothers who delivered by cesarean section were in the 20–30 and 31–40 years’ age group (54.9%) and (31.7%), respectively. These results were contrary to what was explained in a study conducted by Lin et al15, and Raja et al16, on the association between the age of the patient and cesarean sections, they found...
that the more the age of patients the more the caesarean section rate, this results are explained on proposed that physiological factors related to aging may account for the high number of CS among older women, in our current study we found that there is increased incidence of cesarean sections at 20-30 years similar to the results found by Ratan et al. 

Regarding studying the no. of previous of cesarean sections in the study sample, we found that maximum no. of C-sections was found in patients with previous 1 CS (30%) and the minimum number was in those with previous 4 CS or more (5.58%). These results were same to what was found in a study conducted 2014 by Hafeez et al and Ratan et al and, by Sreetama et al, where they found that the most common cause for cesarean section in their study was previous scar about 22.76%, 29.96% and 31.8% respectively, also we found in our study that the primary cesarean section deliveries form about 30% of all operations different from what Ratan et al found as there were 63.41%, and about similar to Naeem et al.

The most important indication for performing emergency CS was previous CS scar (67.7%) followed by fetal distress (8.29%) and Failure of progress (6.43%) this is similar to what was concluded by Hamida M. et al, as there was 70.49% had previous cesarean scar fetal distress 2.49% and CPD 35.31% our findings were different from Naeem et al, as fetal distress was the leading indication for cesarean section, this may be explained by the previously scarred uterus need close follow up in labour and the admission of patients to Karbala hospital is considered to be high monthly and so the teams and turnover of the women in labour is high. In addition, the lack of fetal blood sampling techniques in this hospital was not available so they depend on fetal monitoring by CTG and color of liquor to conduct suspicion of fetal distress. Other indications in our study were breech presentation (5.66%), Hypertension (2.54%), Infertility (2.5%).

Out of the 2471 caesarean deliveries, 87.85% were from the center of Karbala which is comparable to Hamida M et al as there was 61.7% at the inside of the city in her study. An acceptable ratio of the patient living in areas (outside the center of the city) where have lack of awareness about risk and complications of caesarean section, people are extremely poor, family size is large, they do not believe and follow an antenatal care and consider caesarean birth is safe rapid process, they bring their ladies to the hospital when they are seriously ill and with complications. Those who support this trend point to reduced perinatal morbidity and mortality, but others suggest that a complex medico-legal factors underlie the rise.

Previous caesarean delivery is important Cause of cesarean delivery. And therefore Perform the vaginal delivery experience after a previous cesarean section should be performed in order to control the growing cesarean delivery rate.

In our study Pregnancy-induced hypertension was found in 2.54% of caesarean section cases, while Ratan et al, had 4.87% this cause in his study. Good prenatal care discover such early problems and early management of complications can be prevented and hence the mode of delivery would be different.

In our study (table 5), we have most of the cases delivered at term, i.e. between 37-41 weeks of gestation and this is the acceptable gestation for delivery as most of the causes for cesarean section was previous scar and in labour.

Conclusion

The caesarean section prevalence in our study was 26.2% considering that because our hospital is tertiary one. The rising prevalence of caesarean section was mainly due to previous caesarean section followed by Fetal distress. Certain measures have been recommended to curtail the increasing trend, so we aim to reduce the primary cesarean section and follow guidelines in labour, conducting good antenatal care programs and also advice for having good fetal monitoring system.

Conflict of Interest: this study can be of benefit for the departments belong to Ministry of Health and The Ministry of Higher Education and Scientific Research/ Republic If Iraq.

Source of Funding: Self supplements.

Ethical Clearance: approval is taken from the Karbala Health Directorate and Karbala teaching hospital of gynecology and obstetrics, and verbal permission from women to conduct research.

ABSTRACT

Background: Little health knowledge is related to absence of medical data, inadequate use of protective methods, low drug loyalty rates, elevated health care fees and elevated hazard of hospitalization. This study was aimed to confirm the broad health knowledge of outpatient visitors at Mirjan Teaching Hospital in Al-Hilla city.

Method: A cross-sectional descriptive study using convenience sample that consisted of 300 patients who were visiting the outpatient clinic in Mirjan Teaching Hospital. Simple demographic data were collected. SPSS (version 22) was used for statistical analysis, Chi-squared test was used for nonparametric variables.

Results: Data from current study showed that 64% of participants had poor knowledge and 36% had good knowledge. In addition, results revealed that 46 (15%) of participants were 15-24 years, 118 (40%) were 25-44 years and 36 (45%) were ≥45 years. Also, 138 (46%) of participants were males and 54% (162) were females. Moreover, 46% (140) of participants were living in urban areas; whereas 54% (160) were from rural regions. Illiterate patients represented 14%, those with primary education 37%, those had high school 30%, while those had higher education (university or institute) 19% of the total number of participants.

Conclusions: Poor health knowledge was more dependent on level of education of patients, but did not depend on age, gender or area of residence.

Keywords: Health knowledge, gender, age, area of residence, level of education.

Introduction

Health knowledge is a word presented in the 1970s and of growing meaning in community health and healthcare. It is anxious for the abilities of individuals to see the difficult requests of health in the current civilization. Health knowledgeable means insertion one’s individual health and one’s public and family into the background, accepting which elements are manipulating it, and seeing how to report them. A person with an acceptable degree of health knowledge has the capacity to take duty for one’s personal health as well as one’s domestic health and public health. It is vital to differentiate health knowledge from knowledge in overall.

Knowledge is not simply mentioning to person conversion, but besides to background and social conversion in relations of health knowledge to the cost-effective development and socio-cultural and governmental variation.

Knowledge to health, display a relationship between little knowledge and reduced drugs devotion, information of illness and self-care treatment services.

To maintenance, this method, mentions 4 parts for study: health knowledge test; successful interaction with low-knowledge patients; prices and results of deprived health knowledge; and causative ways of how deprived health knowledge stimulate health.

Health knowledge has grown information, inspiration, and capabilities to admission, know, judge, and put on data in daily life to make rulings and conclusions in health maintenance, illness avoidance, and well performances that continue and encourage excellence of lifecycle.

Sufficient health knowledge allows healthy surroundings, well-organized health policy, actual health encouragement attempts, well self-care with fewer health hazards, well health maintenance consequences, and lesser health maintenance prices.
The survey is concentrated on gauging health knowledge not just in clinical surroundings, but also in residents and public [10].

This study was aimed to confirm the broad health knowledge of outpatient visitors at Mirjan Teaching Hospital in al Hilla city.

Method

A cross-sectional descriptive study I conducted during the period from November 2017 to April 2018 in Hilla city/Iraq. The study recruited a convenience sample consisted of 300 patients who visited outpatient clinics at Mirjan Teaching Hospital. The questionnaires were filled during interviews with patients for 10 to 15 min. The questionnaire consisted of 18 questions derived from short version of the Test of Functional Health Literacy in Adults (S-TOFHLA), The Single Item Literacy Screener (SILS) and the Newest Vital Sign (NVS) [11,12]. It was translated to Arabic language by a translation that used official procedure by [13,14]. A pilot study with 25 patients was directed to evaluate any vague declarations or requests. In addition, reliability analyses were organized for the questionnaire using Cronbach’s alpha (0.6), which signifies the inner dependability of questions. Simple demographic data (i.e. age, gender, educational level and living place) were collected, as well. The answers to questions either “yes” or “no” so we gave 1 score for “yes” answer and 0 score for “no” answer. A total sum of scores from 0-9 represented poor knowledge, while ≥9 represented fair/good knowledge. We used SPSS version 22 for statistical analysis, Chi-squared test for nonparametric variables and the P-value<0.05 represented a significant test.

Results

The total number of patients included in the study was 300; all of them responded to the questionnaire and answered all questions. They were 64% with poor knowledge and 36% were with good knowledge. In addition, data from current study revealed that the sociodemographic criteria of participants were as follows:

1. Age: According to age, participants were divided into 3 categories; 15-24 years (46 (15%)), 25-44 years (118 (40%)) and ≥45 years (136 (45%)).

2. Gender: The males 138 and represented 46% of participants, while females were 162 and represented 54% of participants.

3. Place of living: Participants who lived in urban regions were 140 (46%); whereas those from rural regions were 160(41%).

4. Education level: Participants were 41(14%) illiterate, 111(37%) had primary education, 91(30%) had high school education and 57(19%) were university or institute graduate.

Knowledge and age: When we crosstab knowledge scores with ages of patients, the results showed that approximately 64% of them had poor knowledge and 36% had good knowledge. Those aged≥45 represented 31% of those with poor knowledge, while those aged (25-44) represented 17% of those with good knowledge. Level of knowledge did not correlate with age (P>0.05; Table 1).

Knowledge and Gender: when we crosstab knowledge scores with the gender of patients, results of current study showed that 64% of them had poor knowledge and 36% had good knowledge. Also, 35% of females had poor knowledge and 17% of males had good knowledge. Level of knowledge did not depend on gender (P>0.05; Table 2).

Knowledge and Place of Living: When we crosstab knowledge score with a place of living of patients, results of current study showed that 36% of patients lived in rural areas had poor knowledge, whereas 19% of patients lived in the urban areas had good knowledge. Little knowledge did not depend on the place of living (P>0.05; Table 3).

Discussion

The aim of the study was to evaluate health knowledge of outpatient visitors at a Teaching Hospital in Babylon governorate in Iraq.

So in the current study, poor health knowledge represented 64% of all visitors and good knowledge represented 36% of all visitors. Previous Iranian and American studies showed that 30.3% and 17.8% of their subjects had inadequate health knowledge [15,16].

According to the age of visitors, the age group (45 years and above) represented 31% of participants with poor knowledge. Similar results were reported by [17,18]. While 17% of subjects with good knowledge were aged (25-44) years, [19] reported that 49% of their subjects had good level of knowledge.

According to gender, current study showed that 35% of females had poor knowledge and 17% of males were with good knowledge with no relation between gender and low health knowledge. Similar results were reported by a Lebanon study with no relationship between gender and low knowledge [20]. Other studies showed that 52% of males with good knowledge and 48% of females with good knowledge with significant relationship [21-23].

According to the place of living, the current study showed that 36% of participants lived in rural areas were with poor health knowledge 36%, while only 19% of urban-lived people had good health knowledge. This finding maybe due to the fact that rural areas had inadequate entree to health care and those in rural areas are underserved by primary attention doctors [24,25]. Many rural persons must travel considerable distances for primary medical maintenance than their city complements [20].

According to the level of education, the current study showed that 25% of patients with primary education and had poor knowledge, while 13% of patients with high school education had good knowledge with the significant relation between good knowledge and educational level. These data were in agreement with other studies [20-22].

Limitations: This was the initial survey of health knowledge in Mirjan Teaching Hospital in Al-Hilla city, and that added challenges to conduct the research. The collection of outpatient visitors was by convenience sample. Therefore, the outcomes are not generalizable and may not relate to other outpatient visitors in Iraq. The participation was unpaid. Pharmacy customers who refused to participate might have low health literacy. The random sample would be suggested for forthcoming studies.
Conclusion

While additional investigation is needed to measure health knowledge level and its social elements among a wider and more different Iraqis population. Low health knowledge is more dependent on level of education of patients who visited the hospital, but the low knowledge did not depend on patients’ gender, area of living or age of participants.

Acknowledgements

We would like to thank Abdul-kadhai kadhom daham who helped us to conduct the knowledge tests and help us to collect the sample.

Ethical Clearance: It was obtained from the Scientific Research Committee at Mirjan Teaching Hospital in AL-Hilla Governorate, Iraq.

Kirschner Wires Fixation Versus Closed Reduction Screws in Fracture of Neck Femoral Managemnets in Children and Adolescences

Wejdi A. Al-Fatlawy

Department of Orthopedic Surgery, Medical College, Kufa University, Najaf, Iraq

ABSTRACT

Femoral neck fractures represents less than one percent of all hip fractures and less than one percent of all fractures in pediatric patients. Age is the main variable in decision of type of fixation. We managed 134 patients with femoral neck fractures, Delbet class two and three, during the period between 2011 and 2018 who were followed up for an average period of 18 months at Al-Sader Teaching hospital in Najaf, republic of Iraq. The study included two groups of patients ; first group included 68 cases treated by Kirschner wires fixation (KF) method and group two included 66 cases treated by screws. Findings revealed that in K-wire group, the outcome was good in 57.35%, fair in 33.8%, and poor in 8.8% cases but with screws group the outcome was good in 51.5%, fair in 36.36%, and poor in 12.12%. In conclusion Kirschner wires fixation method is superior than screws fixation method in treatments of femoral neck fractures in children and adolescence.

Keywords: Neck femur fractures, reduction,, percutaneous, fixation

Introduction

Although it is rare incidence of fracture neck femur in children (less than one percent of all fractures affecting the children), their serious complications make its management is focus of most orthopedic surgeons attention. It is more common in males than females. Managements of femoral neck fractures with the presence of an proximal femoral open physis in children may be challenging 1-8. Fracture neck femur is mostly due to high velocity injuries include motor vehicle accidents, fall from height and child abuse but pathological and stress fractures can also happen 9-13.

Pathology: Weakness of proximal femur renders it more susceptible for fracture at that area mostly by transepiphyseal displacement. the mechanism of those fractures is the same in adults and children but the involvement of trocantric apophysis in children results in premature closure of physis. So the growth usually makes these serious complications worse 13-16.

Diagnosis: X-ray, anteropoaterior view with gently extended hip and 15 degrees internal rotation. MRI is needed for diagnosis of stress undisplaced or impacted fractures. MRI can shows the fracture within first 24 hours after injury 9-18.

Classification: Delbets classification is still the best to describe such injuries type1 fracture-separation of proximal femoral epiphysis, type 1a without dislocation, type 1b with dislocation. the most common type which for 40-50 % of all fracture neck femur in children is type 2 which is called transcervical as the fracture line pass through middle part of femoral neck the other 25-30% of this fracture is belong to Cervicotrochanteric type which is called type 3 which pass through base of the femoral neck type 4 is intertrochanteric variety which form 6-15 % and pass from lesser to greater trochanters with best prognosis as it has least incidence of avascular necrosis 1-5,19,20.

Complication and Prognosis: In general, complete healing is expected with such fracture if anatomic reduction and internal fixation is achieved within first 24 hours after injury. the avascular necrosis, non-union,
coxa-vara, and premature physeal fusion which will results in leg length discrepancy are the most common complications which can occurs with such fractures. These complications happen either due to severe initial injury or inappropriate managements\textsuperscript{20-24}. However, the aim of management include lessening of most serious complications of AVN, achieving the anatomical reduction of fragments, growth plate injury avoidance, and stabilization with K- wires, screws or any other methods of fixation permitting early protected weight-bearing\textsuperscript{20-24}.

**Patients and Method**

A retrospective study was conducted between 2011 and 2018, including medical records of 134 cases aged 5-16 years with closed displaced fracture of neck of femur (CDFNF) who were managed at Al-Sader Teaching hospital in Najaf, republic of Iraq, included patient with (CDFNF) aged 5 to 16 years, with successful closed reduction. Patient with one or more of the following was excluded from the study; pathological fracture, Mentally unstable, Cerebral palsy, metabolic bone diseases, needed open reduction., multiple trauma with injury severity score of 25, History of medical disorders that could affect the physiology of the bone, hyperthyroidism, history of previous fracture neck femur, previous surgery on the same side of current fracture and open fracture and concurrent spinal cord injury or sciatic nerve injuries.

**Study Protocol:** A full history and clinical were done for all patients, X-ray in posteroanterior and lateral views was performed with gentle hip extension and 15 degrees internal rotation. MRI and CT-Scan were performed in some patients to prove the diagnosis. Patients were operated on using Black KJs procedure under general anesthesia. The fracture was manipulated with the aid of C-Arm fluoroscope guidance for the correction of distal fragment displacements, if present. Initial attempt of closed reduction was done by traction, internal rotation and abduction, when reduction trail failed, patient shifted to open reduction. All patients received preoperative antibiotics. In first group fixation was made by 1.8-2 mm smooth K-wires while in the second group by 4.5 mm cannulated screws. For 5-9 years children, fixation made by three parallel K-wires, for 10-16 years children, three parallel 4.5 cancellous screws were used. The ends of the k-wires was bent and cut for not more than 5 mm length, and then placed subcutaneously. The wounds are closed in layers and closed drain was put on and removed at the second postoperative day. Hip spica immobilization was only used for children with poor bone biology, inadequate fixation, and unreliable patients. Analgesia was given for 5-7 days. Physiotherapy was started from the discharging day. The partial weight bearing was allowed within 6-9 weeks after injury while full weight bearing was allowed after 12-16 weeks. The K-wires were removed after 6-8 months while the screws was removed after 10-12 months.

Patients were followed up and regularly assessed at the 5th, 10th day, 3rd week, 6th month, 12th month, 18th month and two years, during the subsequent visits, patients were clinically assessed for any complications. The above measurements give the base of the Ratliff criteria (Table 1) which was used in this study. This criteria has high reliability, internal consistency and validity.

The statistical package for social sciences(SPSS) version 25 used in all statistical analysis and procedures. Appropriate statistical tests were applied accordingly a t a level of significance of 0.05 or less to be significant.

**Findings**

The mean age of the patients was 10.4 years (range: 5-16 years). 82(61%) cases were males. Falling from height was the mechanism of injury in 58 cases (43.3%), motor vehicle accidents 48 cases(35.8%), falling on the ground 28 cases (21%). 78 cases (58.2%) sustained a (CDFNF) on the right side and 56 (41.8%) cases on the left side. 86(64%) cases were Delbets type II and 48(36%) cases were Delbets type III (Table 2).
Closed reduction was performed in 48 cases (70.5%) in group one and 46 cases (69.7%) in group two. Open reduction was done for 20 cases (29.5%) in group one and 20 cases (30.4%) in group 2. 75 (56%) of cases was operated upon within less than 24 hours and 34 (25.4%) cases was fixed between 24 -48 hours, 25 (18.7%) cases done after 72 hours but less than one week. The mean union time of group one was 12 weeks and was 16 weeks in group two. The mean hospital stays of group one was 1 day and was 2 days in group 2, (Table 3).

The limitation of movements in internal and external rotation in 25 to 30 degree is the most common complication, accounted for (35.3%) and (45.5%) in group 1 and 2, respectively. Avascular necrosis occurred in 2 cases of group 1 and 4 cases of group 2. Nonunion in 2 cases of group 1 and 4 cases of group 2. Infection reported in 5 cases; 2 cases in group 1 and 3 cases in group 2. Coxa vara was reported in 3 cases of group 1 and 5 cases in group 2, (Table 5).

**Discussion**

Femoral neck fractures makes about 1% of all fractures in children. the existence of an open physis of femoral neck renders the managements of such fractures challenging, so the nonunion, AVN, growth abnormalities., and coxa vara can occur as complications whether it is iatrogenic or spontaneous. A completely healed femoral neck fracture, without the development of osteonecrosis, leads to a good functional The ability to achieve a good outcome by decreasing fixation failure and the rate of nonunion depends on several factors that the surgeon can control namely, the quality of the reduction and obtaining a stable fixation. Stable internal fixation of such fractures facilitate early active mobilization. K-wires and screws not a new methods for treatment of femoral neck fracture in pediatric age group and it has been enormously used by different centers with variable results, the best method is when the sound reduction was achieved and maintained per-operatively before ending of all operative steps 23-27, in our study there is less incidence of all complication in general with K-wires group than with cannulated cancellous screw as smoothness of k-wires renders it less harmful for growth plate than threaded cancellous screws.

Palocaren in 2018 1, concluded that incidence of pediatric femoral neck fracture was rare with its nasty complications. he used same classification system of ours, Palocaren T used K-Wires fixation for younger children than our study with same results. Although he used cancellous screws and pediatric dynamic hip screws ( we missed in our territory), he insisted on early and sound fixation for good outcomes 1.

Moghadam et al 2015 concluded that 40% of cases had complication and agreed our study that the limitation of movements is the most common complication 10.

Yeranosian M et al, 2013. In his systemic review of 935 patients and 30 articles they stated that the incidence of avascular necrosis increases with operative treatment than conservative managements in contrast to coxa vara which reduced with operative measures while nonunion was not affected by operative treatments 19.

Dendane et.al, in 2010 reviewed 21 children with femoral neck fractures treated with longer period of follow up, same iff criteria, same classification system but with older mean age group than our study, They agree with our study as this states fair to good outcomes with a k.wires fixation but with significant incidence of avascular necrosis and early and sound fixation lessen the incidence of complications as most of their patients with complications occurs for those who their fractures was fixed after 48 hours 7.

Song et al,2010 in their comparative study between ORIF and CRIF with 27 cases under 16 years old who stated that operative fixation is associated higher incidence of complications specially avascular necrosis their study disagreed our results 20.

Bali et al,2011 in his study with 36 patients and 10 period of follow up,they concludes that the avascular necrosis is the most common complication while in our like most resents studies the movement limitation is the most common complication9.

Patman and et.al,2013,who retrospectively follow up 16 children with femoral neck fracture after removal of implants and he assess their bone density by Z-score. he stated that the bone density at the neck of femur lose about 15.4 % of their bone density,so he gave a hint that children with this type of fractures needs longer follow up period after implants removal 8.
Moon and Mehman 2006 in their met analysis study with 360 patients, they report avascular necrosis was the most common complications while in our study the movements limitations is the most common complication.  

Ju L et al., 2016 who reviewed retrospectively 58 cases, he used same criteria and same classification system of our study, longer follow up period, average 35.8 months, and found the average healing time of 10.8 weeks, their results showed the higher incidence of avascular necrosis with open methods than with closed one in contrast to coxa vara which occur more with closed groups, they reported that open reduction is best for patients with delayed presentation more than 24 hours. The early operative fixation is insisted on by many authors who agrees with our study as most of complications occur in those who operated upon after 24 hours.

**Conclusion**

Kirschner wire fixation method is superior to screws fixation method with less incidence of movements limitation, avascular necrosis, nonunion, coxa vara and leg length discrepancy as there is a little growth plate damage with smooth k- wires than with cancellous cannulated screws.

Finally, the author would like to thank all participant patients for their cooperation and time hoping they have good health and life. Best regards and appreciation to my colleagues and assistant who take part to support the study.

ABSTRACT

Roughness was chosen as an attribute of the inner ear in order to study its role on the otoacoustic emissions (OAEs) and whether it has an effect or not. The role of roughness on the OAE was studied by using the nonlinear model. The roughness of the basilar membrane (BM) is minimized so that the negligibility at first is almost zero and increases until after a certain number of stages the total neglect of the BM. In this work, it was found that roughness has a very important effect on the OAE and we believe that there are cases of hearing sickness may be due to ear dysfunction in terms of roughness.

Keywords: Otoacoustic, TEOAEs, Roughness, Frequency, Distribution, Latency.

Introduction

Poor taste is the collect pre- eminent introduced by von Helmholtz to mark a penetrating, astir or fantabulous practical summon. This prudent expose evermore accompanies stimuli on every side alongside than one bodiless component within the same critical band. In the non-essential taste, auspices of the immaterial contentment produce beats. The favour of tastelessness to the frequencies of a cherished of rhythmic engaged tones was waggish supposed by von HELMHOLTZ as an acoustical conformably of personal consistency and clanging. In realm principle von Helmholtz set ramble song-like dissonance is an achievement of the ring of tastelessness evoked by beats, a join in wedlock or a chord is accordance when it does not in trouble in the matter of unmannerliness. Pot-pourri of intervals into regular and grating has been a key role to sherd postulate and personal acoustics since the times of ancient theorists. Traditionally, consonance has been united relating to intervals represented by a clue of condensed integers. According to von HELMHOLTZ’s dogma the wrangle why the politic of brace prevalent tuneful occupied tones up small covey degree ratio, is consonant is zigzag the harmonics of the a handful of tones either correspond in quantity and produce minute beats, or are spaced far apart on the rate scale and the beats occur at rates exceeding.

The extent saunter evokes the sensation of offensiveness¹. Auditory Indecency is a side of clarification attached around recurrent and ramp fluctuations in region or frequency, and is everlastingly supposed with reference to such qualities as roughness, raspiness and hoarseness. It is second-hand as a metric in the clinical criticism of preference pretence². The obligation of auditory incivility indubitably parsimonious stranger imperfect spectral or temporal accomplishment. Sensorineural appeal to c visit cancel worsen, by astounding spectral resolution, may therefore alter boorishness perception³.

Crudeness is banderole in impassioned contexts as well. Judgments of the perceived verve of chords carry on a weighty perfect aspect with the chords’ estimated impoliteness values⁴. The master attempts to sculpture OAE great structures in score of arranged turn compensation shot at completely ignored the skirmish of nonlinearity. Respect, both nonlinearity and emerge be published roughness are attitude to be existing and to play the part obese roles in the function of the cochlea. It is favour banner to tag more root their combined definite. Interesting into paper money of the influence of nonlinearity on helix wonderful terms provides the contemptible for extraverted the range of levels go away immigrant which these phenomena are be analytically described. Numerous attempts to qualitatively discuss the combined positive of nonlinearity and wind up successfully roughness have been appreciative in the surround of ephemeral otoacoustic emissions (TEOAEs), mostly recently by Yates and Withnell⁵. The nonlinear
differential recognition of the cochlea to outer clicks, such as zigzag matured by Sound and Kemp, involves the subtracting everywhere of the at bottom rehabilitate confession of the cochlea, except for go elsewhere due to unambiguous coherent care in the dearth of nonlinearity. A notional situation for recording the effects of nonlinear examination on otoacoustic dispossess wonderful structure is presented. The chaperone models of helix kindliness are analyzed, fragile nonlinearity, rise roughness, and a combination of weak nonlinearity and distributed roughness. In attentive, these models are examined in the framework of infringe frequency otoacoustic emissions (SFOAEs). It is superior saunter solo linear whorled reflection truly make plain the underlying properties of helical fine structures. Be cruise as it may, it is shown lose concentration nonlinearity can especially, in sundry cases, seriously house the footing and fixture behaviors of the OAE fine covenant, and actually enhance the pattern of fine structures observed. Otoacoustic emissions (OAEs) are signals that are generated in the cochlea, either in the absence of surface arousal, in which contention they are freshen as spontaneous otoacoustic emissions or (SOAEs) see review by (Bright, 1997), or in confession to foreign agitation, in which assertion they are known as evoked otoacoustic emissions or EOAES. The objurgating on the exhortation steady of latency and steady was debate for the variant peacefulness of the admission. The days mechanisms/places of the selection components were identified by iff the exhortation remainder and by yield off the cochlear roughness in well-defined cochlear richness deeps. The penurious caution that comparable with exotic roughness appearance from basal regions of the cochlea may give an apt generosity to the first otoacoustic admitting, whereas nonlinear mechanisms seem to produce a much smaller additional contribution.

Method

The calculations were performed by the non-linear model using different stimulus levels of (30, 40, 50, 60, 70, 80 and 90) dB, but the level of intensity 50 reflected the best results. The calculations were completed on six stages according to the process of changing the roughness from almost zero to the upper limit of the roughness value.

Results and Discussion

The purpose of this work is to study the character of roughness, which is considered a characteristic of the basilar membrane (BM) and whether roughness has an influential role on the hearing mechanism, especially the otoacoustic emissions (OAEs). The transient evoked otoacoustic emissions (TEOAEs) calculations were performed using the nonlinear model. The basilar membrane of the cochlea in the inner ear is the most important component of the auditory process because the acoustic wave is transmitted as a signal to the brain by the auditory nerve. The roughness of BM is studied in different stages. Where the OAEs are studied in the form of independent steps according to the roughness condition of BM which is presence or absence. The idea is to gradually lose the roughness in the cochlea, where each case is different from the other in relation to the presence of roughness in the BM. In the first case, we assume the absence of roughness along the BM, the next stage is a part of the BM containing roughness. Thus, the part that contains the roughness is greater than the part in the previous stage until the last stage, which is the roughness along the BM.

First Case: In this case, the OAEs is studied on the basis that the hearing mechanism occurs in the absence of roughness and specifically along the length of the BM almost this means that the roughness near zero.

![Image](image-url)
Second Case: Starting from this case, each case has a specific part of the BM that has roughness. This case differs from the first, where the roughness is almost approximate zero in the first case, the second case is that a specific part of the BM has roughness. Fig. 2 shows the details of the energy distribution of the OAEs of the second case.

![Figure 2: The energy distribution of the TEOAEs of second case](image)

Fig. 2 shows the results obtained for the second case. The difference in the results is very clear, since the OAEs of this case appears to be wider in terms of frequency range. In Fig. 2, the range of frequencies with which the OAEs has been obtained in addition to the range of previous case and extends more to approximately 1 kHz. The OAEs in this case improved in comparison to the previous case, the result was obtained by comparing the OAEs of the two cases and it reflected that the effective part of the hearing from the BM was greater in the second case compared to the first case.

The Third Case: In this case, the part that has the roughness is larger than the previous case. Fig. 3 shows the energy distribution of the OAEs of the third case, the roughness is greater than previous cases.

![Figure 3: The energy distribution of the TEOAEs of the third case](image)

The state of the OAEs of the third case illustrated in Fig. 3 clearly shows that it is better than previous case. To analyze the results of this case and compare it with the previous case, the OAE as frequencies of this case is greater than the frequency range of the second case. The second case extended the frequency range to less than 1 kHz, while in the third case the frequency range extended to about 2.5 kHz. The effect of increased roughness is therefore evident in this case.

The Fourth Case: In this case, the part that has the roughness in the BM is larger than the previous cases, so the part that has the roughness is growing in the case after another. Figure (4) shows the energy distribution of the OAEs of the fourth case, roughness is greater than previous cases, the continuous increase of roughness along the BM having a clear role on the frequency map.

![Figure 4: The energy distribution of the TEOAEs of the fourth case](image)

Fig. 4 shows the energy distribution of the OAEs of the fourth case. The extension of the increased roughness along the BM reflects the improvement in the auditory status of the fourth case compared to all the previous cases, where it is clear in Fig.4 that the frequency range of the OAEs extended wider than all other cases. The frequency range of OAEs of the fourth case extended to 3.6 kHz while in the third case it was extended to 2.5 kHz. In comparison with Figure (3) and Figure (4), we note an improvement in the OAEs in the fourth case due to increased roughness in the BM.

Fifth Case: In this case, the part that has roughness is larger than the other parts in all previous cases. In the fifth case. Fig. 5 shows the energy distribution of the OAEs of the fifth case and shows the state of the OAEs and its relationship to increase the extent of roughness.
Figure 5: The energy distribution of the TEOAEs of fifth case

Fig. 5 shows the energy distribution of the OAEs of the fifth case, it shows the case of the OAEs and how it improved by increasing the part of the BM that has the roughness. The extension of the increased roughness along the BM reflects the improvement in the auditory status of the fifth case compared to all the previous cases, where it is clear in Fig. 5 that the frequency range of the OAEs extended wider than all other cases. The frequency range of OAEs of the fifth case extended to 5 kHz while in the fourth case it was extended to 3.6 kHz.

Sixth Case: This case is the last case of the process of increasing roughness, in the sixth case, which is the last case and is the reverse of the first case in terms of roughness, in the first case was considered roughness almost zero, but the six case, the roughness is located along the BM at the highest value. Fig. 6 shows the energy distribution of the OAEs of the last case.

Figure 6: The energy distribution of the TEOAEs of sixth case

This case is considered the final stage in increasing the roughness of the BM, where the roughness is expected to reach 100% of the BM. The results obtained in this case and shown in Fig. 6 are very important and can be analyzed as follows: With total roughness along the BM, we have a good OAEs with a maximum frequency range. Fig. 6 shows clearly that the frequency range reaches more than 6 kHz. The OAEs obtained in the last case is considered the best in comparison with all previous cases where the OAEs is in a good condition is not distorted or incomplete.

The results obtained in this work reflect an important relationship between the audio process and the roughness. The stages of variable values of roughness have shown that the auditory process was clearly affected by roughness. It is an important and effective factor for the auditory process. The results of the work are in agreement with previous studies[11, 12].

Conclusion

The results that obtained in this work illustrate the OAE in the form of stages according to the roughness and its proportion available in the BM. The figures (1-6) show the energy distribution of the OAEs on 6 stages of each stage, different from the other by the roughness. The results were consistent with previous studies and very important points can be deduced from the results as follows:

1. There is an important relationship between roughness and OAE, according to this conclusion, the efficiency of the audio process depends on the roughness.

2. Roughness has a clear effect on hearing efficiency and its effect is either a partial effect or a total effect, when a part of the roughness is lost, the effect is local or partial, when the roughness is completely lost, the damage in the auditory process is complete.

3. The effect of roughness was studied using different stimulus levels (30 40 50 60 70 80 90) dB, the stimulus levels (50 60 70) gave good results, it is deduced that the stimulus level 50 dB was the best in terms of the distinctive results.

4. According to the results in this work, the presence of roughness in a good manner is expected to be
normal ear and hearing condition is normal, but if there is any defect in the mechanism of roughness is expected to be unhealthy ear and hearing condition is not good.

5. In the case of loss of roughness partially or completely means that the ear is sick and there is a problem in hearing depends on the rate of loss, when the roughness is good, the ear is normal and the hearing is good.

Comparison of ACPA and Anti RA\textsubscript{33} Ab as Prognostic Factors in Patients with Rheumatoid Arthritis

Alaa S. Alattabi\textsuperscript{1}, Murtada A. Abood Jaber\textsuperscript{2}, Firas A. Zenki\textsuperscript{3}

\textsuperscript{1}Assistant Professor, \textsuperscript{2}MSC Student, College of Medicine, University of Karbala, Department of Medical Microbiology & Immunology, Kerbala, Iraq; \textsuperscript{3}MSC, Rheumatologist, Imam Hussain Medical City, Rheumatology Unit Kerbala, Iraq

ABSTRACT

**Background:** The Anti RA\textsubscript{33} Ab and ACPA are high specific Abs for RA disorder, ACPA associated with more erosive disorder and Anti. RA\textsubscript{33} Ab with less erosive and has good prognostic factor character.

**Objective:** comparisons Anti RA\textsubscript{33} Ab and ACPA level in rheumatoid arthritis patients and correlation with disease activity.

**Method:** Case-Control Study included patients attended Imam Husain medical City/Rheumatology Department at a period from December-2017 till April-2018, the study included 180 patient and 180 control all patients were diagnosed according to ACR2010-criteria by rheumatologist, permission had been taken from all subjects, venous blood sample had been taken for ESR(westergreen method), CRP, RF(semi-automated Genrui AP54 specific protein analyzer), ACPA & AntiRA\textsubscript{33} Ab (ELISA).

**Results:** mean level of AntiRA\textsubscript{33} Ab in mild, moderate and sever groups of patients 11.97 ± 0.21, 10.71 ± 0.10 and 9.26 ± 0.15 respectively while ACPA (U/ml) level in mild, moderate and sever groups of patients 68.40 ± 14.60, 107.82 ± 22.45 and 160.0 ± 30.51 respectively.

**Conclusion:** The AntiRA\textsubscript{33} Ab can be used as prognostic markers for RA patients and disease controlling and correlated with less sever RA cases.

**Keywords:** DAS, antiRA\textsubscript{33} Ab, ACPA.

Introduction

Rheumatoid Arthritis (RA) is most common autoimmune systemic disorder characterized by symmetrical small joint involvement (pain, swelling and stiffness )\textsuperscript{1}, the inflammatory process involve synovial tissue, cartilage and bones\textsuperscript{2}. the RA effected about 1% of the world population\textsuperscript{3} and worldwide prevalent from 0.2 to 5.3\textsuperscript{4}, while in Iraq the incidence increasing from 1.60% in 2001 to 3.02% in 2011\textsuperscript{5}, both gender s are effected but 2/3 of them are female\textsuperscript{6}; the pathogenesis of RA is multi factorial involve genetics, environmental and immunological factors in which immune complex deposit and initiate type 3 hypersensitivity reaction\textsuperscript{3, 7}; one of the antibodies that involve in the pathogenesis, diagnosis and prognosis of RA is ACPA which is highly specific less sensitive and associated with bad outcome of RA and poor prognostic factor\textsuperscript{8}. RA 33 (HnRNP A2/B1) is other autoantibody of RA that appear early in the disease has diagnostic and prognostic role associated with mild and moderate disease activity and good response to treatment\textsuperscript{9, 10}. The study was designed to estimate the serum level of ACPA and Anti RA33Ab for all patients and compare between them as prognostic factor associated with disease activity.

Subjects and Method

Case-Control Study included 360 subjects. The patients in the study attended Imam Husain medical City/Rheumatology Department at a period from December-2017 to April-2018. The control included 217 healthy people selected randomly, 208 were accepted and 9 were rejected, from the 208 only 180 included in the study all of them underwent for clinical examination by rheumatologist to exclude any inflammatory disorder. The patients were 180 (23 male and 157 female) diagnosed with RA according to ACR/EULAR 2010
by rheumatologist in rheumatology department in Imam Hussein medical city in Karbala. Ethically, the permission had been taken from Karbala health director, Imam Husain medical City/Rheumatology Department and from the patients about collecting blood sample and used their data for research purpose 180 of them accepted whom enrolled in the study and 26 rejected, all of them had 6 criteria or more from 2010 ACR/ EULAR and those Patients with RA disease had other rheumatological disease or other autoimmune diseases such as Psoriasis, ITP or OA, had no recent surgery or wound or acute local inflammation had been excluded, age of the patients range (26-70 years) and from the clinical data the DAS-28-CRP was done for each patient and accordingly RA patients classified depending on the DAS28-CRP to Mild, Moderate and sever by use the equation in web site (https://www.rheumakit.com/en/calculators/das28), and according to treatment response patients divided into good and poor response. Blood sample about 10 ml had been collected from patients and control and used for estimation of ESR, RF, CRP, ACPA and Anti RA33Ab by using western green method for ESR, Genrui Biotech Inc. China RF –Titer kits, Genrui Biotech Inc.china CRP–Titer kits, IBL – Germany ACPA ELISA kits and mybiosources -USA Anti RA33Ab ELISA kits. Using Genrui reader, PA54 for detection RF &CRP Titer and AP22 speedy IF ELISA reader. Data collected statistically analyzed by SPSS version 20.

Results

The study included 360 subject ;180 patients (Female 157(87.22%) and Males 23 (12.78%) ), their age range (26 – 75 years) with mean ± SD (48.46 ± 10.65), the controls groups (180) female 157(87.22%) and male 23(12.78%), their age range (26 – 70 years). With mean ± SD was (48.84 ± 10.58) as in table (1).

Discussion

The females more susceptible for RA than males 87% from sample size of patients groups because of the hormonal factor such as estrogen hormone\(^{(11)}\), the mean disease duration in years was (7.69 ± 6.28) difference among study groups with p.value 0.000, these result was agree with Spanish study that showed the mean ± SD of RA disease duration was (6.1 ± 5.4 years)\(^{(13)}\), and these agree with\(^{(14)}\) was 8 years, the mean DAS28-CRP in patients was (4.30 ± 0.08 and for control group (2.33 ± 0.82) which were statistically significant p value = 0.000* these result was agree with (Cetin et al.,2013) in which the Mean DAS28-CRP (3.4 ± 1.5), the mean ESR \text{ mm/h} assay in patents was (46.65 ± 1.61) and in control was (8.6 ± 0.46) at p.value= 0.000* which was lower than “Iqbal” in which the mean ESR \text{ mm/h} in RA patients was (56 ± 23.5) and in healthy control was (6.9 ± 4.6)\(^{(15)}\) these may because the sample size in “Iqbal” study was 60 patients and the study were 180 patients and may reflect the health awareness of patients with their commitment to treatment and visit rheumatologist between the past 2010 and 2018. the mean CRP \text{ mg/l} for patients and controls were (23.52 ± 1.53), (3.81 ± 0.11) respectively with p.value 0.000* these result for patients higher than in Romania that showed mean CRP \text{ mg/l} was (16.97 ± 5.14) and lower than the control of Romanian study was (5.01 ± 2.22) and the p.value was < 0.0001 because was used the CRP kit that reference value (0 – 0.6 \text{ mg/l}). the mean RF assay in patients and controls were (82.05 ± 6.44 \text{ U/ml}) and (4.98 ± 0.25 \text{ U/ml}) respectively with p<0.000 that result was lower than “Silosi” that showed the mean of RF was (99.27 \text{ U/ml})\(^{(16)}\) because Silosi had be taken 30 patients with mean age 59 years. the mean
ACPA level for patients and controls were (160.38 ± 23.35 IU/ml) and (8.27 ± 0.41 IU/ml) respectively with significant p.value = 0.000* this result agree with study in Collage of Science/University of Baghdad in which ACPA had significant different between RA patients and control with p<0.05(17) and agree with another study that showed the mean ACPA level in RA patients was (133.1 ± 279.7 U/ml)(13), so the ESR, CRP, RF, ACPA was agree with study in College of Medicine, Hanyang University, Seoul, Korea that showed the RA patients level for ESR=74 mm/h* CRP=4.4 mg/dl; RF =89 IU/ml; and anti-CCP=176 U/ml(18). there was significant different of mean level for Anti RA33Ab between patients (10.72 ± 0.12 ng/ml) and control (3.37 ± 0.16 ng/ml) with p.value = 0.000* these study was agree with study that showed significant different between RA patients and control at p.value < 0.05(19).

The patients DAS28-CRP groups comparisons with age, disease duration, ESR, CRP, RF, ACPA and AntiRA33Ab showed the no age difference while the other parameters were statistically significant at P<0.05, the result of ESR, CRP were high in moderate and sever DAS and these result may refer to active inflammation and low level in mild may due to response to therapy and the RF result were high mean level with moderate and sever DAS groups that agree with “Stone” that showed the seropositive member had more destructive, joints damage and extra articular(20), and result were appeare the high level difference of AntiRA33Ab are associated with mild and moderate DAS-CRP but the ACPA had significant with sever DAS-CRP groups this agree with “Al-Mughales” that told that AntiRA33Ab associated with low DAS(9).

The treatments response comparisons with study parameters as with disease duration, DAS-CRP, ESR, CRP, ACPA, AntiRA33Ab that were statistically significant at p.value<0.05 these results agree with many study like “Pillinger” that showed ESR assay can used for rheumatoid arthritis controlling but in combination with another lab and physicians’ investigation, and the CRP more stable than ESR but may increase with any infection not only with the rheumatologic disorders and the CRP level decreased with treatment intakes(21), and high RF poor prognostic factor and also agree with(22) that showed the decrease in the serum levels of rheumatoid factors, usually indicated the response to therapy and agree with “Hochberg” in which poor response to therapy associated with high RF level(23),and associated of ACPA and RA33 Ab was opposite as were low and high level in good response patients and this agree with good responded to treatment these agree with “Sieghart” that showing usage of AntiRA33Ab as diagnostic and prognostic factor for RA patients(10).

**Conclusion**

The AntiRA33Ab had clearly associated with Mild and Moderate RA disease activity and may be useful as good prognostic factor and marker for well response to treatment while ACPA had associated with sever of RA and helpful as poor prognostic factor.

**Recommendation:**
- Included the AntiRA33Ab in the ACR criteria.
- Cohort Study with largest sample size.
- Anti RA33Ab study in other autoimmune disorder.

**Ethical Clearance:** Taken from university of Kerbala and imam Hussain medical city committee.

Ocular Manifestation of Pediatric Systemic Diseases: Interdisciplinary Approach

Debalina Guchhait¹, Anirban Paik¹, Sujata Guha²

¹Senior Optometrist, ²Medical Director, Sankara Nethralaya Kolkata, 147, Mukundapur, E.M. Bypass, Kolkata

ABSTRACT

Early diagnosis of eye diseases in pediatric population is of utmost importance, since many of them are potential enough to cause permanent visual impairment. Among them specific disease like cataract, subluxated lens, corneal disorder, phacomatosis, high refractive error, squint etc can be associated with other systemic involvement. An array of ocular manifestations of hyperthyroidism, hypoparathyroidism, diabetes mellitus, porphyria, cystinosis, mucopolysaccharidosis, Wilson disease, juvenile idiopathic arthritis, systemic lupus erythematosus, Marfan’s syndrome, Weill-Marchesani syndrome, down’s syndrome are described. On contrary, ocular examination provides significant information for the diagnosis and monitoring of systemic disease. In an eye, micro circulatory system can be visualized directly and investigated with precision; neural tissue can be evaluated easily; and the results of minute focal lesions are so prominent that is unmatched with any other body part. This article presents the Ocular manifestation of various paediatric diseases relevant to Clinician.

Keywords: Systemic Disease, Ocular manifestation, Paediatric

Introduction

Examination of the eye provides invaluable information for the diagnosis and monitoring of systemic disease and similarly parameters of systemic condition may indicate ocular involvement. Understanding this bi-directional association for establishment of a proper referral system can secure a child’s general and ocular health, since many systemic diseases involve the eyes in paediatric population.

Though we cannot review with all the diseases in this paper but we have reviewed some particular diseases that may be interesting to pediatrician and eye care practitioner both.

Aim

To build a team approach among the eye care practitioner and pediatrician to reach the best outcome for the proper diagnosis and treatment of paediatric population.

Objective

To identify the most prevalence systemic diseases having most ocular manifestation in paediatric population

Methodology

A comprehensive literature search was conducted from the time period of 1958 to 2018 on Med line, Pub Med, and Google Scholar. Only articles published or translated into the English language were considered. keywords from the full article of each paper was extracted and evaluated.

Congenital Rubella Syndrome

Maternal infection with rubella during pregnancy, especially in the first trimester results in congenital rubella syndrome (CRS) which is an important cause of miscarriage, stillbirth and a series of birth defects like blindness, deafness, congenital heart disease and mental retardation.

Corresponding Author:
Dr. Sujata Guha
Medical Director, MBBS, MS, FRCS (ED)
Sankara Nethralaya Kolkata,
147, Mukundapur, E.M. Bypass, Kolkata-99
Systemic Manifestation: As per global review of CRS sequelae, among infants with CRS, 60% had hearing impairment, 45% congenital heart disease, 27% microcephaly, 25% cataract, 23% low birth weight, 19% hepatosplenomegaly, 17% purpura, 13% mental retardation, and 10% meningoencephalitis.² Usually Congenital Rubella Syndrome is the classic triad of cataracts, sensorineural hearing loss and congenital heart disease.³ The most common cardiovascular lesions are patent ductus arteriosus followed by stenosis of the pulmonary artery and its branches.²

Ocular Manifestation: The most common ocular pathology which is associated with congenital rubella syndrome are Cataract and Pigmentary Retinopathy. Cataract is the most common ocular complication in rubella syndrome and most of the time it is usually bilateral. Strabismus and nystagmus can sometimes be associated with cataract in case of rubella syndrome.⁴ Laboratory diagnosis usually done to detect are blood for TORCH and VDRL.

Marfan’s Syndrome

It is estimated that at least 1 in 213,014 people in the India have the disorder, more than 1,065,070,607 people are affected by Marfan syndrome and related conditions in the India⁴. Worldwide, the incidence of Marfan syndrome is approximately 7–17/100,000.⁷ Marfan syndrome involves a defect in a single copy of a gene called fibrillin-1 (FBN1) located on chromosome 15.⁶ Marfan syndrome is an inherited connective tissue disorder that is transmitted as an autosomal dominant trait.

Systemic Manifestation: Marfan’s syndrome usually appears with a very tall and slender blend, A high, arched palate and crowded teeth, Arachnodactyly. Cardiovascular complication like aortic aneurysm, aortic dissection and valve malformation is common in these case.

Ocular Manifestation: Subluxation of lens is the most common ocular manifestation. It occurs in more than half the people who have Marfan syndrome. Marfan syndrome also increases the risk of a detachment or tear in the retina. People who have marfan’s syndrome tends to develop glaucoma at a very early stage.

Yearly echo cardiography for systemic purpose and a careful review for eye to detect amblyopia and retinal detachment

Weill Marchesani Syndrome

The inheritance of Weill Marchesani syndrome is still uncertain but Most of the reports in literature review support an autostomal recessive inheritance pattern⁸. A diagnosis should be based only on the combination of specific ocular and skeletal abnormalities

Systemic Manifestation: WeillMarchesani syndrome individuals are short in stature, with brachymelia, brachydactyly, stubby spade-like hands and feet, limitation of mobility of jointsand mental handicapped.⁹

Ocular Manifestation: The important anomalies observed in this syndrome are of ocular origin. They include spherophakia, iridodonesis, ectopia lentis, lenticular myopia and pigmentary degeneration of fundii, optic atrophy and glaucoma. Glaucoma, which frequently occurs, leads on to blindness in many cases. Glaucoma can result either due to subluxation of lens or even without subluxation. The spherophakia produces shallow anterior chamber thus producing angle narrowing.⁹

Mucopolysaccharidosis

It is estimated that 1 in 25,000 babies born in the United States will have some form of the mucopolysaccharidoses¹⁰. It is usually autosomal recessive in nature. It is a metabolic disorders which caused by the absence or malfunctioning of lysosomal enzymes that the body needed to break down molecules called glycosaminoglycans.

Systemic Manifestation: Physical symptoms generally include rough facial features like a flat nasal bridge, thick lips, and enlarged mouth and tongue, short stature with disproportionately short trunk (dwarfism), dysplasia (abnormal bone size and/or shape) and other skeletal irregularities, thickened skin, enlarged organs such as liver (hepatomegaly) or spleen (splenomegaly), hernias, and excessive body hair growth. Short and often claw-like hands, progressive joint stiffness, and carpal tunnel syndrome can restrict hand mobility and function.

Ocular Manifestation: The eye’s cornea often becomes cloudy from intracellular storage, and glaucoma and degeneration of the retina also may affect the patient’s vision.

Albinism

Albinism can affect people of all ethnic backgrounds and has been extensively studied. Approximately one
in 17,000 people have one of the types of albinism. It is considered as a group of four autosomal recessive disorders of melanin biosynthesis which is characterized by a generalized reduction in pigmentation of hair, skin and eyes.
